The Quantity of the *Synodical Month* is 29 days, 12 h. 44', 3", 20". See *MOON*.

Lunar *Periodical* MONTH is the Space of time wherein the Moon makes her round thro' the Zodiac; or wherein she returns to the same Point. See *PERIODICAL*.

The Quantity of this Month is 27 days, 7 h. 43'.

The ancient Romans made use of Lunar Months, and made 'em alternately of 29 and 30 Days. They mark'd the Days of each Month by three Terms, viz. *Calends*, *Nones*, and *Ides*. See *CALENDS*, *NONES*, &c.

Lunar *Illuminative* MONTH, is the Space from the first time of her Appearance after New Moon, to her first Appearance after the New Moon following.

Hence, as the Moon appears sometimes sooner after the New Moon, and sometimes later; the Quantity of the *Illuminative Month* is not always the same.

By this Month the Turks and Arabs go. *Astronomical*, or *Natural* MONTH, is that measured by some exact Interval corresponding to the Motion of the Sun, or Moon.

Such are the Lunar and Solar Months above-mentioned. Where note, That these Months can be of no use in Civil Life; where it is requir'd that the Months begin and end on some certain Day. For this reason recourse is had to another form of Months.

*Civil*, or *Common* MONTH, is an interval of a certain number of whole Days, approaching nearly to the Quantity of some Astronomical, either Lunar, or Solar Month. See *DAY*.

These *Civil Months* are various, according to the Astronomical Month they are accommodated to.

*Civil Lunar* MONTHS are to consist alternately of 29 and 30 Days. Thus will two *Civil Months* be equal to two Astronomical ones, abating for the odd Minutes. And, consequently the New Moon will be hereby kept to the first Day of each such *Civil Month* for a long time together.

However, to make 'em keep constant Pace with the *Civil Months*, at the end of each 48 Months, a Month of 29 days must be added; or else every 33d Month must consist of 50 days.

This was the Month in Civil, or Common Use among the Jews, Greeks, and Romans, till the time of *Julius Cæsar*.

*Civil Solar* MONTHS are to consist alternately of 30 and 31 Days; excepting for one Month of the twelve, which for every fourth Year should consist of 30 Days, and the other Years of 29.

This Form of *Civil Months* was introduced by *Julius Cæsar*. Under *Augustus*, the sixth Month, till then from its place call'd *Sexstilis*, was denominated *Augustus*, in honour of that Prince, and to make the Compliment yet greater, a Day was added to it. So that it now consisted of 31 Days, tho' till then it had only contain'd 30. To make up for which, a Day was taken from *February*; so that henceforward it only consisted of 28 Days, and every third Year of 29; tho' before it had ordinarily consisted of 29 Days, &c.

And such are the *Civil* or *Calendar Months* which now obtain thro' Europe. See *CALENDAR*.

*Physiognomical* MONTH, among Chymists, is the space of 40 Days and Nights. See *MENSTRUUM*.

MONTHLY *Cowfers*. See *MENSES*.

MONT-PAGNEL, in Military Matters, an Emicence close without the reach of the Cannon of a Place besieged, where curious Persons post themselves to see an Attack, and the manner of the Siege, without being expos'd to danger.

The Word literally denotes the Post of the Inevulnerable.

MONUMENT in Architecture, a Building destin'd to preserve the Memory, &c. of the Person who rais'd it, or for whom it was rais'd.

Such is a Triumphant Arch, a Mausoleum, a Pyramid, &c. See *MAUSOLEUM*, &c.

The Word comes from the Latin *Monere*, to advise, and advertise.

The first Monuments which the Antients erected, were the Stones which they laid over their Tombs, whereon they wrote the Names and Actions of the deceas'd. See *TOMB*.

These Stones were distinguish'd by various Names according as their Figures were different. The Greeks gave the Name *Stetes* to such as were Square in their Base, and preserv'd the same Depth throughout their whole Length; whence were deriv'd our Square Pilasters, or Attic Columns. See *PILASTER*.

They call'd those *Stetes*, which being round in their Base, ended in a Point at top, which gave occasion to the Invention of diminish'd Columns.

The Name *Pyramids* they gave to those which were square at the Foot, and terminated in a point at top, in manner of a Funeral Pill. See *PYRAMID*.

And the Name *Obelisk*, to those whose Bases were more in Length than in Breadth, and which rose, still lessening, to a very great Height, resembling the Figure of the Spits or Instruments used by the Antients in roasting the Flesh of their Sacrifices, which they call'd *Obelisk*. See *OBELISK*.

The MONUMENT, absolutely so call'd among us, denotes a Magnificent Pillar erected by Order of Parliament, in Memory of the Burning of the City, Anno 1666, in the very place where the Fire began.

It is of the Tuscan Order, 302 Foot high from the Ground, and 15 Foot in Diameter, all of solid *Portland Stone*, with a Stair-Case in the Middle of black Marble. The Pedestal is 21 Foot square, and 40 high; the Front being enrich'd with curious Bas-reliefs.

MOONY. See *MONEY*.

MOOD, or *MODE*, in Logic, call'd also *Syllogistic* Mood, is a proper Disposition of the several Propositions of a Syllogism, in respect of Quantity and Quality. See *SYLLOGISM*.

By proper Disposition, we mean such wherein the Antecedent being true, the Consequent, in virtue of the Form, cannot be false. So that all those Moods or Manners of Syllogisms are at once excluded, where no Conclusion formally follows; or where the Antecedent being true, a false Conclusion may be drawn from it. See *CONCLUSION*, &c.

There are two kinds of Moods; the one direct, & the other indirect: *Direct* Mood is that wherein the Conclusion is drawn from the Premisses directly and immediately; as, Every Animal is a living Thing; every Man is an Animal; therefore every Man is a living Thing.

An *Inverse* Mood, is that wherein the Conclusion is not infer'd immediately from the Premisses, but follows from 'em by means of a Conversion. As every Animal is a living Thing, every Man is an Animal; therefore some living Thing is a Man.

There are fourteen direct Moods; whereof four belong to the first Figure; five to the fourth; 4 to the 2d; and 6 to the 3d. See *FIGURE*.

They are denoted by so many artificial Words framed for that purpose, viz. 1. *Barbara*, *Celarent*, *Darii*, *Ferioq*; 4. *Baralip*, *Celantes*, *Dabatis*, *Fapesmo*, *Frijesom*. 2. *Cesare*, *Cantares*, *Feseno*, *Eaoco*. 3. *Darapli*, *Felapton*, *Djalamis*, *Datje*, *Isarado*, *Tersison*.

The Use and Effect of which Words lie wholly in the Syllables, and the Letters whereof the Syllables consist. Each Word, e. g. consists of three Syllables, denoting the three Propositions of a Syllable, viz. Major, Minor, and Conclusion. Add, that the Letters of each Syllable are either Vowels or Consonants. The Vowels are *A*, which denotes an universal affirmative Proposition; *E*, an universal Negative; *I*, a particular Affirmative; and *O*, a particular Negative.

Thus *Barbara* is a Syllogism of the 1st Figure, consisting of three universal affirmative Propositions: *Baralip* of the 4th Figure, consisting of universal affirmative Premisses, &c. particular affirmative Conclusions, &c. See *BARBARA*, *CELARENT*, *DARII*, &c.

The Consonants are chiefly of use in the Reduction of Syllogisms. See *REDUCTION*.

Mood or *Mode*, in Grammar, is us'd to signify the different Manners of conjugating Verbs, agreeably to the different Actions or Affections to be express'd, e. g. shewing, commanding, wishing, &c. See *VERB*.

Hence arise 3 *Modes*, viz. the *Indicative*, *Imperative*, *Optative*, *Subjunctive*, and *Infinitive*. See *INDICATIVE*, *IMPERATIVE*, *OPTATIVE*, &c.

Some Grammarians reckon but four *Modes*, confounding the Optative with the Subjunctive; 3 and some make fix, dividing the Optative into Potential and Optative.

The Greeks have five *Modes* of Verbs differing in Termination; but the *Latin* have but four.

In English the Terminations are the same in all the *Modes*.

For the Origin of *Modes*, it may be observ'd, that Verbs are of that kind of Words which signify the Manner and Form of our Thoughts; whereof the Principal is Affirmation. Verbs are also form'd to receive different Inflections, as the Affirmation regards different Persons and different Times, whence arise the *Tenses* and *Persons* of Verbs.

But besides these, Men have thought fit to invent other Inflections, to explain what pass'd in their Mind still more distinctly: For, in the first place, they consider'd, that beside the simple Affirmations, as *he loves*, *he is loved*, there were others modified and conditional, as, *if he loves*, *if he should love*. And the better to distinguish these Affirmations from the others, they doubled the Inflections of thofe

those Tenses, or Times, making some serve for simple Affirmations, as *love, loved*; and reserving the rest for Affirmations that were modified; as, if *he should love, might be have loved*: yet they kept not flexibly to their Rules, but sometimes made use of simple Inflections to express Affirmations that were modified; as *est verus, for est veror*. And it is from this last kind of Inflection, that Grammarians have formed the *Mood* they call *Subjunctive*. See **SUBJUNCTIVE**.

But further, besides the Affirmation, the Action of our Will may be taken for a *Mode*, or Manner of our Thought; and Men have found themselves under a Necessity of expressing what they will, as well as what they think. Now we may will a thing in several manners; whereof there are three which may be consider'd as the Principal. First, then, We sometimes will things which don't depend on ourselves, and in that case we only will them by a bare wish, which the *Latin* expresses by the Particle *Utinam*; and we by, *Please God*. Some Languages, as for instance, the *Greek*, have invented particular Inflections for this end; whence the Grammarians have taken occasion to call it the *Optative Mode*: And there seems something like both in the *French, Italian, and Spanish* Tongues, in regard these have a kind of triple Tenses; but in *Latin, English, &c.* the same Inflections serve for the Subjunctive, and for the Optative. For this reason, one may very well retrench this *Mode* from the *Latin* Conjugations; it being the different Inflections that make *Modes*, not the different Manner of signifying, which may be varied to infinity. See **OPTATIVE**.

We sometimes will in another manner; as when we are content it should pass, tho' we don't absolutely desire it; as when *Tenace* says, *Profusar, perdat, peccat*, let him spend, sink, perish. Men might have invented a particular Inflection, to express this Movement, as in *Greek* they have done to express a simple Desire. But they han't done it; and in lieu thereof, make use of the Subjunctive. In *English* we add the Particle, *Let him spend, &c.* Some Authors call this the *Preterit* or *Concessive Mode*.

The third manner of willing, is when what we desire, depending on another Person, of whom we can obtain it, we signify our Will that he do it. And this is the Motion we use, when we command or pray; and to express this Motion, was invented the *Made* we call *Imperative*; which has no first Person in the Singular, because a Man, properly speaking, cannot command himself: In some Languages it has to third Person, because, in strictness, a Man cannot command any Person, but him to whom he speaks and addresses himself. And in regard the Command or Prayer always relates to what is to come, it happens that the Imperative *Made*, and the Future Tense, are frequently used for each other, especially in the *Hebrew*; as, *non occides, thou shalt not kill, for do not kill*. Hence some Grammarians place the Imperative among the Number of Futures. See **IMPERATIVE**.

Of all the *Modes* we have mention'd, the Oriental Languages have none but the last, which is the Imperative; and on the contrary, the modern Languages have none of them any particular Inflection for the Imperative. The Method we take for it in *English*, is either to omit the Pronoun, or transpose it; thus, *I love*, is a simple Affirmation; *Love*, an Imperative: *We love*, an Affirmation; *Love* we, an Imperative.

MOOD, in Philology, } See **MOOD**.

Moon, in Music,

MOON, *Luna*, ☾, in Astronomy, one of the heavenly Bodies, usually rank'd among the Planets; but with more propriety accounted a *Satellite*, or secondary Planet. See **PLANET** and **SATELLITE**.

The *Moon* is an Attendant of our Earth, whom she respects as a Centre, and in whose Neighbourhood she is constantly found; inasmuch as if view'd from the Sun, she would never appear to depart from us by an Angle greater than ten Minutes. See **EARTH**.

As all the other Planets move primarily round the Sun, so does the *Moon* round the Earth: her Orbit is an Ellipsis, in which she is retain'd by the Force of Gravity; performing her Revolution round us in 27 Days, 7 Hours, 43 Minutes; which is also the precise time of her Rotation round her Axis. See **ORBIT**, and **REVOLUTION**.

The mean Distance of the *Moon* from the Earth, is 60 $\frac{1}{2}$  Semi-diameters of the Earth; which is equivalent to 240,000 Miles. See **DISTANCE**.

The mean Eccentricity of its Orbit, is  $\frac{1}{110}$  of its mean Distance, which makes a considerable Variation in that mean Distance. See **ECCENTRICITY**.

The *Moon's* Diameter is to that of the Earth, as 11 to 403; or 2075 Miles: Its mean apparent Diameter is 31 Minutes 15 $\frac{1}{2}$ , and that of the Sun 32 Minutes 12 Seconds. See **DIAMETER** and **SEMI-DIAMETER**.

The *Moon's* Surface contains 14,000,000 square Miles; and its Solidity 5,000,000,000 cubical ones: The Density of the *Moon's* Body is to that of the Earth, as 4891 to

39214, to that of the Sun as 48911 to 10000: Its Quantity of Matter to that of the Earth, nearly as 1 to 39.15; and the Force of Gravity on its Surface, is to that on the Surface of the Earth, as 139.2 to 407.8. See **SOLIDITY**, **DENSITY**, **GRAVITY**, &c.

#### Phenomena of the Moon.

The Phenomena or different Appearances, of the *Moon*, are very numerous: Sometimes she is *increasing*, then *waning*; sometimes *horned*, then *semi-circular*; sometimes *gibbous*, then *full* and *glabular*. See **PHASES**.

Sometimes, again, she illumines us the whole Night; sometimes only a part of it; sometimes she is found in the Southern Hemisphere; sometimes in the Northern: All which Variations having been first observ'd by *Endymion*, an ancient *Grecian*, who first watch'd her Motions, he was fabled to have fallen in love with her.

The Source of most of these Appearances, is, that the *Moon* is a dark, opaque, and spherical Body; and only shines with the *Light* she receives from the Sun: whence only that Half turn'd towards him is illumin'd; the opposite one remaining in its native Darkness. The Face of the *Moon* visible on our Earth, is that part of her Body turn'd towards the Earth; whence, according to the various Positions of the *Moon* with regard to the Sun, and Earth, we observe different Degrees of Illumination; sometimes a large, and sometimes a less Portion of the enlighten'd Surface being visible.

#### The Phases of the Moon.

To conceive the Lunar Phases: Let S (Plate **ASTRONOMY**, fig. 13.) represent the Sun, T the Earth, R T S a Portion of the Earth's Orbit, and A B C D E F G the Orbit of the *Moon*, wherein she revolves round the Earth, in the space of a Month, advancing from West to East: Connect the Centres of the Sun and *Moon* by the right Line S L, and thro the Centre of the *Moon* imagine a Plane M I N, to pass perpendicular to the Line S L: the Section of that Plane with the Surface of the *Moon*, will give the *Line* that bounds *Light* and *Darkness*, and separates the illumin'd Face from the dark one. See **ILLUMINATION**.

Connect the Centres of the Earth and *Moon* by T L, perpendicular to a Plane P I O, passing thro the Centre of the *Moon*; that Plane will give on the Surface of the *Moon*, the Circle that distinguishes the visible Hemisphere, or that towards us, from the invisible one, and therefore call'd the *Circle of Vision*. See **CIRCLE OF VISION**.

Whence it appears, that whenever the *Moon* is in A, the Circle bounding *Light* and *Darkness*, and the Circle of *Vision*, coincide: So that all the illumin'd Face of the *Moon* will be turn'd towards the Earth; in which Case, the *Moon* is with respect to us *full*, and shines the whole Night; with respect to the Sun, she is in *Opposition*; in regard the Sun and *Moon* are then seen in opposite Parts of the Heavens, the one rising when the other sets. See **FULL MOON** and **OPPOSITION**.

When the *Moon* arrives at B, the whole illumin'd Disk M P N is not turn'd towards the Earth; so that the visible Illumination will be short of a Circle, and the *Moon* will appear *gibbous*, as in B. See **GIBBOUS**.

When she reaches C, where the Angle C T S is nearly right, there only one half of the illumin'd Disk is turn'd towards the Earth, and then we observe a *Half Moon*, as in C; and she is said to be *dichotomized* or *bisected*. See **HALF MOON** and **DICHOTOMY**.

In this Situation the Sun and *Moon* are a fourth part of a Circle remov'd from each other; and the *Moon* is said to be in a *quadrant Aspect*, or to be in her *Quadrature*. See **QUADRATURES**.

The *Moon* arriving at D, a small part of the illumin'd Face M P N, is only turn'd towards the Earth; for which reason, the small part that shines upon us, will be seen *filicated*, or bent into narrow Angles or *Horns*, as in D. See **FALCATED**.

At last, the *Moon* arriving at E, shows no part of her illumin'd Face to the Earth, as in D; this Position we call the *New Moon*, and she is then said to be in *Conjunction* with the Sun; the Sun and *Moon* being in the same Point of the Ecliptic. See **NEW MOON**, and **CONJUNCTION**.

As the *Moon* advances towards E, she resumes her *Horns*; and as before the *New Moon*, the *Horns* were turn'd Westward; so now they change their Position, and look Eastward: when she comes at G, she is again in *quadrant Aspect* with the Sun; in H *gibbous*, and in A again *full*.

Here, the Arch E L, or the Angle S T L, contain'd under Lines drawn from the Centres of the Sun and *Moon* to that of the Earth, is call'd the *Elongation* of the *Moon* from the Sun: and the Arch M O, which is the Portion of the illumin'd Circle M O N, that is turn'd towards us, and which is the Measure of the Angle that the Circle bounding *Light* and *Darkness*, and the Circle of *Vision*, make with each other, is every where nearly similar to the Arch

of Elongation E L; or which is the same thing, the Angle S T E is nearly equal to the Angle M L O: as is demonstrated by Geometers. See ELONGATION.

To delineate the Moon's Phases for any time. Let the Circle C O B P (fig. 14.) represent the Moon's Disk turn'd towards the Earth, and let O P be the Lines in which the Semi-circle O M P is projected, which suppose cut at right Angles by the Diameter B C; then making L P the Radius, take L F equal to the Co-sine of the Elongation of the Moon; and upon B C, as the greater Axis, and L I, the less, describe the Semi-Ellipsis B F C; this Ellipsis will cut off from the Moon's Disk the Portion B E C P of the illum'd Face visible on the Earth.

As the Moon illumines the Earth by a Light reflected from the Sun, so is she reciprocally illum'd by the Earth, which reflects the Sun's Rays to the Surface of the Moon, and that more abundantly than she receives them from the Moon. For the Surface of the Earth is above 15 times greater than that of the Moon; and therefore supposing the Texture of each Body alike, as to the Power of Reflecting; the Earth must return 15 times more Light to the Moon, than she receives from it. In New Moons, the illumined Side of the Earth is turn'd fully towards the Moon, and will therefore at that time illumine the dark Side of the Moon; and then the Lunar Inhabitants (if such there be) will have a full Earth, as we, in a similar Position, have a full Moon: And hence arises that dim Light observ'd in the Old and New Moons; whereby, besides the bright Horns, we perceive somewhat more of her Body behind them, the very obscurely. When the Moon comes to be in opposition to the Sun, the Earth seen from the Moon will appear in Conjunction with him, and its dark Side will be turn'd towards the Moon; in which Position the Earth will disappear to the Moon, as that does to us at the time of the New Moon, or in her Conjunction with the Sun. After this, the Lunar Inhabitants will see the Earth in a horned Figure. In fine, the Earth will present all the same Phases to the Moon, as the Moon does to the Earth.

Dr. Hook, accounting for the Reason why the Moon's Light affords no visible Heat, observes, that the Quantity of Light which falls on the Hemisphere of the full Moon, is rarify'd into a Sphere 288 times greater in Diameter than the Moon, e'er it arrive at us; and consequently that the Moon's Light is 104368 weaker than that of the Sun. It would therefore require 104368 full Moons to give a Light and Heat equal to that of the Sun at Noon. See SUN, HEAT, &c.

#### Motion of the Moon.

Tho' the Moon finishes its Course in 27 Days, 7 Hours, which Interval we call a *Periodical Month*, she is longer in passing from one Conjunction to another; which Space we call a *Synodical Month*, or a *Lunation*. See MONTH and LUNATION.

The reason is, that while the Moon is performing its Course round the Earth in its own Orbit, the Earth with its Attendant is making its Progress round the Sun, and both are advanced almost a whole Sign towards the East; so that the Point of the Orbit, which in the former Position was in a right Line passing the Centres of the Earth and Sun, is now more westerly than the Sun; and therefore when the Moon is arriv'd again at that Point, it will not be yet seen in Conjunction with the Sun; nor will the Lunation be compleated in less than 19 Days and a half. See PERIODICAL, SYNODICAL, &c.

Were the Plane of the Moon's Orbit coincident with the Plane of the Ecciptic, i. e. were the Earth and Moon both mov'd in the same Plane, the Moon's Way in the Heavens, view'd from the Earth, would appear just the same with that of the Sun; with this only difference, that the Sun would be found to describe his Circle in the Space of a Year, and the Moon hers in a Month; but this is not the Case; for the two Planes cut each other in a right Line, passing thro' the Centre of the Earth, and are inclin'd to each other in an Angle of about five Degrees. See INCLINATION.

Suppose, e. g. A B (fig. 15.) a Portion of the Earth's Orbit; T the Earth; and C E D F the Moon's Orbit, wherein is the Centre of the Earth: from the same Centre T, in the Plane of the Ecciptic, describe another C D G H, whose Semi-diameter is equal to that of the Moon's Orbit: Now, these two Circles being in several Planes, and having the same Centre T, will intersect each other in a Line D C, passing thro' the Centre of the Earth. Consequently, C E D, one half of the Orbit of the Moon, will be rais'd above the Plane of the Circle C G H, towards the North; and D F C, the other half, will be sunk below it towards the South. The right Line D C, wherein the two Circles intersect each other, is call'd the *Line of the Nodes*, and the Points of the Angles C and D the *Nodes*: whereof, that where the Moon ascends above the Plane of the Ecciptic, Northwards, is call'd the *Ascending Node*, and the *Head of*

the *Dragon*; and the other D, the *Descending Node*, and the *Dragon's Tail*. See NODE. And the Interval of Time between the Moon's going from the ascending Node, and returning to it, a Draconic Month. See DRAGON'S HEAD, &c. DRACONIC MONTH, &c.

If the Line of the Nodes were immoveable, that is, if it had no other Motion, but that whereby it is carry'd round the Sun, it would still look towards the same Point of the Ecciptic, i. e. would always keep parallel to itself; but it is found by Observation, that the Line of the Nodes constantly changes place, and shifts its Situation from East to West, contrary to the Order of the Signs, and by a Retrograde Motion, finishes its Circuit in about 19 Years; in which time each of the Nodes returns to that Point of the Ecciptic, whence it before receded. See CYCLE.

Hence it follows, that the Moon is never precisely in the Ecciptic, but twice, each Period, viz. when she is in the Nodes: throughout the rest of her Course she deviates from it, being nearer or farther from the Ecciptic, as she is nearer or further from the Nodes. In the Points F and E, she is at her greatest Distance from the Nodes; which Points are call'd her *Limits*. See LIMITS.

The Moon's Distance from the Nodes, or rather from the Ecciptic, is call'd her *Latitude*, which is measur'd by an Arch of a Circle drawn thro' the Moon perpendicular to the Ecciptic, and intercepted between the Moon and the Ecciptic. The Moon's Latitude, when at the greatest, as in E or F, never exceeds 5 Degrees, and about 18 Minutes; which Latitude is the Measure of the Angles at the Nodes. See LATITUDE.

It appears by Observation, that the Moon's Distance from the Earth is continually changing; and that she is always either drawing nearer, or going further from us. The reason is this, that the Moon does not move in a circular Orbit, which has the Earth for its Centre; but in an Elliptic Orbit (such as is represented in Fig. 15.) one of whose Foci is the Centre of the Earth. A P represents the greater Axis of the Ellipsis, and the Line of the Apides, and T C, the *Eccentricity*: the Point A, which is the highest Apis, is call'd the *Apogee* of the Moon; and P, the lowest Apis, is the Moon's *Perigee*, or the Point wherein she comes nearest the Earth. See APOGEE and PERIGEE.

The Space of Time wherein the Moon, going from the Apogee, returns to it again, is call'd the *Annualistic Month*. See ANNUALISTIC.

If the Moon's Orbit had no other Motion, but that wherewith it is carry'd round the Sun, it would still retain a Position parallel to itself, and always point the same way, and be observ'd in the same Point of the Ecciptic; but the Line of the Apides is likewise observ'd to be moveable, and to have an angular Motion round the Earth from West to East, according to the Order of the Signs, returning to the same Situation in the Space of about nine Years. See ANGULAR MOTION and ARSIDES.

#### Irregularities in the Moon's Motion.

The Irregularities of the Moon's Motion, and that of her Orbit, are very considerable: For, 1. When the Earth is in her Aphelion, the Moon is in her Aphelion likewise; in which case she quickens her Pace, and performs her Circuit in a shorter time: On the contrary, when the Earth is in its Perihelion, the Moon is so too, and then she slackens her Motion; and thus revolves round the Earth in a shorter space, when the Earth is in her Aphelion, than when in her Perihelion: So that the Periodical Months are not all equal. See PERIODICAL MONTH.

2. Again, when the Moon is in her *Syzygies*, i. e. in the Line that joins the Centres of the Earth and Sun, which is either in her Conjunction or Opposition; she moves swifter, *ceteris paribus*, than when in the Quadratures. See SYZYGIES.

Farther, 3. According to the different Distance of the Moon from the *Syzygies*, i. e. from Opposition or Conjunction, she changes her Motion: In the first Quarter, that is, from the Conjunction to her first Quadrature, she abates somewhat of her Velocity; which, in the second Quarter, she recovers: In the third Quarter, she again loses; and in the last, again recovers. This Inequality was first discover'd by Tycho Brahe, who call'd it the *Moon's Variation*. See VARIATION.

4. Add to this, that the Moon moves in an Ellipsis, one of whose Foci is in the Centre of the Earth, round which she describes Areas proportionable to the Times, as the primary Planets do round the Sun; whence her Motion in the Perigee must be quickest, and slowest in the Apogee.

5. The very Orbit of the Moon is changeable, and does not always persevere in the same Figure; its Eccentricity being sometimes increas'd, and sometimes diminish'd; greatest, when the Line of Apides coincides with that of the *Syzygies*; and least, when the Line of Apides cuts the other at right Angles. See ORBIT.

6. Nor is the Apogee of the Moon without an Irregularity; being found to move forwards, when it coincides with the Line of Syzygies, and backwards, when it cuts the Line at right Angles. See APOGEE: Nor is this Progress and Regress in any measure equal: in the Conjunction, or Opposition, it goes briskly forwards; and in the Quadratures, moves either slowly forwards, stands still, or goes backward. See SYZYGIES.

7. The Motion of the Nodes is not uniform; but when the Line of the Nodes coincides with that of the Syzygies, they stand still; when the Nodes are in the Quadratures, i. e. when their Line cuts that of the Syzygies at right Angles, they go backwards, from East to West; and this, Sir I. NEWTON shows, with the Velocity of  $16''$ ,  $13''$ ,  $24''$ , in an Hour. See NODES.

The only equable Motion the Moon has, is that where-with she turns round her Axis exactly in the same space of Time, in which she revolves round us in her Orbit; whence it happens, that she always turns the same Face towards us.

For, as the Moon's Motion round its Axis is equal, and yet its Motion or Velocity in its Orbit is unequal; it follows, that when the Moon is in its Perigee, where it moves swiftest in its Orbit, that part of its Surface, which, on account of its Motion in the Orbit, would be turn'd from the Earth, is not so, entirely; by reason of its Motion round its Axis: Thus, some Parts in the Limb, or Margin of the Moon, sometimes recede from the Center of the Disk, and sometimes approach towards it, and some Parts, that were before invisible, become conspicuous: which is call'd the Moon's Libration.

Yet this Equability of Rotation occasions an apparent Irregularity; for the Axis of the Moon, not being perpendicular to the Plane of its Orbit, but a little inclined to it: and this Axis maintaining its Parallelism, in its Motion round the Earth; it must necessarily change its Situation, in respect of an Observer on the Earth; to whom, sometimes the one, and sometimes the other Pole of the Moon, becomes visible. Whence it appears to have a kind of Libration. See LIBRATION and AXIS.

#### Physical Laws of the Moon's Motion.

Thus much for the Lunar Phenomena: It remains that we assign the Physical Cause thereof. The Moon, we have observed, moves round the Earth, by the same Laws, and in the same Manner, as the Earth round the Sun and other Planets. The Solution therefore of the Lunar Motion, in general, comes under those of the Earth, and other Planets. See PLANET and EARTH.

As for the particular Irregularities in the Moon's Motion, to which the Earth, and other Planets, are not subject, they arise from the Sun, which acts on, and disturbs her in her ordinary Progress thro' her Orbit; and are all mechanically deducible from the same great Law, whereby her general Motion is directed, viz. the Law of Gravitation or Attraction. See GRAVITATION.

Other secondary Planets, v. g. the Satellites of Jupiter and Saturn, are doubtless subject to the like Irregularities with the Moon; as being expos'd to the same perturbing or disturbing Force of the Sun; but their Distance secures them from our Observation. See SATELLITE and DISTURBING FORCE.

The Laws of the several Irregularities in the Syzygies, Quadratures, &c. see under SYZYGIES, QUADRATURES, &c.

#### The Astronomy of the Moon.

1. To determine the Period of the Moon's Revolution round the Earth, or the Periodical Month; and the Time between one Opposition and another, or the Synodical Month: since, in the middle of a Lunar Eclipse, the Moon is opposite to the Sun: (See ECLIPSE.) Compute the time between two Eclipses, or Oppositions; and divide this, by the number of Lunations, that have pass'd in the mean time: the Quotient will be the Quantity of the Synodical Month.—Compute the Sun's mean Motion during the time of the Synodical Month, and add this to the entire Circle described by the Moon: Then, as the Sun is to  $360^\circ$ , so is the Quantity of the Synodical Month to the Periodical.

Thus, Observations in the Year 1500, November 6. at 12 at Night, observed an Eclipse of the Moon at Rome; and August 1, 1523, at 4 h.  $25'$ , another at Cracow: hence, the Quantity of the Synodical Month is thus determined:

$$\text{Obs. 1. A. 1523 d. 237 h. 42}'$$

$$\text{Obs. 1. A. 1500 d. 310 h. 220}'$$

$$\text{Interval of Time A. 22 d. 295 h. 25.}$$

$$\text{And the Days 5}$$

$$\text{Exact Interval A. 22 d. 297 h. 25}'$$

$$\text{or 11991005}$$

Which divided by 282 Months elapsed, in the mean time, gives the Quantity of the Synodical Month  $42321'$ ,  $9''$ ,  $9'''$ ; that is, 29 days, 12 hours, 41 minutes.

From two other Observations of Eclipses, the one at Cracow, the other at Babylon, the same Author determines more accurately the Quantity of the Synodical Month to be

$$\text{That is 29 d. 11 h.}$$

$$\text{The Sun's Motion in the time 29. 6. 24-18}$$

$$\text{The Moon's Motion 387. 6. 24-18}$$

$$\text{Quantity of the Periodical Month 27 d. 7 h. 45'. 5''}$$

Hence, 1. The Quantity of the Periodical Month being given; by the Rule of Three we may find the Moon's diurnal and hourly Motion, &c. And thus may Tables of the mean Motion of the Moon be constructed. See TABLES; see also DIURNAL and HOURLY.

2. If the Sun's mean diurnal Motion be subtracted from the Moon's mean diurnal Motion; the Remainder will give the Moon's diurnal Motion from the Sun: and thus may a Table of Latitudes be constructed, such as those of *Eudodus*. See LATITUDES.

3. Since in the middle of a total Eclipse, the Moon is in the Node; if the Sun's Place be found for that time, and to this be added six Signs, the Sum will give the Place of the Node. See NODES.

4. From comparing the ancient Observations with the modern, it appears that the Nodes have a Motion, and that they proceed in *Antecedencia*, i. e. from Taurus to Aries, from Aries to Pisces, &c. If then to the Moon's mean diurnal Motion, be added the diurnal Motion of the Nodes, the same will be the Motion of the Latitude; and thence, by the Rule of Three, may be found in what time the Moon goes  $360^\circ$  from the Dragon's Head, or in what time she goes from, and returns to it: That is the Quantity of the *Draconic* Month.

5. If the Motion of the diurnal Apogee be subtracted from the mean Motion of the Moon, the Remainder will be the Moon's mean Motion from the Apogee: and thence, by the Rule of Three, is determin'd the Quantity of the *Anomalistic* Month.

According to the Observations of Kepler, the mean Synodical Month is 29 d. 12 h.  $44'$ ,  $3''$ ,  $24'''$ . Her Periodical Month 27 d. 7 h.  $45'$ ,  $8''$ . The Place of the Apogee for the Year 1700, January 1. Old Style, was  $11 S. 8^\circ$ ,  $57'$ ,  $3''$ . The Place of the Nodes 4 S.  $274. 39'$ ,  $17''$ . Mean diurnal Motion of the Moon  $13^\circ$ ,  $10'$ ,  $35''$ . Diurnal Motion of the Apogee  $6'$ ,  $41''$ . Diurnal Motion of the Nodes  $5'$ ,  $11''$ . Lastly, the Eccentricity 4362 Parts, such, whereof the Diameter of the Eccentric is 10000; and therefore the diurnal Motion of the Latitude is  $13^\circ$ ,  $13'$ ,  $46''$ ; and the diurnal Motion from the Apogee  $13^\circ$ ,  $5'$ ,  $54''$ .

#### Theory of the Lunar Motions and Irregularities.

The Tables of Equation, which serve to solve the Irregularities of the Sun, do likewise serve for those of the Moon. See EQUATION.

But then these Equations must be corrected for the Moon; otherwise they will not exhibit the true Motions in the Syzygies. The Method is thus: Suppose the Moon's Place in the Zodiac, required in Longitude, for any given time; here, we first find, in the Tables, the place where it would be, supposing its Motion uniform, which we call *mean*, and which is sometimes faster, and sometimes slower than the true Motion: then, to find where the *true* Motion will place her, which is also the *apparent*, we are to find in another Table at what Distance it is from its Apogee; for, according to this Distance, the Difference between her true and mean Motion, and the two Places which correspond thereto, is the greater. The true Place thus found, is not yet the *true* Place; but varies from it, as the Moon is more, or less remote both from the Sun, and the Sun's Apogee; which Variation respecting, at the same time, those two different Distances, they are to be both considered and combined together, as in a Table apart. Which Table gives the Correction to be made of the true Places first found: That Place thus corrected, is not yet the *true* Place, unless the Moon be either in Conjunction, or Opposition: If she be out of these, there must be another Correction, which depends on two things taken together, and compared, viz. the Distance of the Moon's corrected Place from the Sun; and of that at which she is with regard to her own Apogee; this last Distance having been changed by the first Correction.

By all these Operations and Corrections, we at length arrive at the Moon's *true* Place for that instant. In this it must be owned, occur prodigious difficulties: The Lunar Inequalities are so many, that it was in vain the Astronomers labour'd to bring 'em under any Rule, before the Great Sir J. NEWTON, to whom we are indebted both for the mechanical Causes of these Inequalities, and for the Method of computing and ascertaining them: So that he

has a World, in great measure, of his own discovering, or rather fabricating.

From the Theory of Gravity he shews, that the larger Planets revolving round the Sun, may carry along with 'em smaller Planets revolving round themselves; and shews, *a priori*, that these smaller must move in Ellipses having their Umbilici in the Centres of the larger; and have their Motion in their Orbit variously disturbed by the Motion of the Sun; and, in a word, must be affected with those Inequalities which we actually observe in the Moon. And from this Theory, argues analogous Irregularities in the Satellites of Saturn.

From this same Theory he examines the force which the Sun has to disturb the Moon's Motion, determines the horary Increase of the Area which the Moon would describe in a circular Orbit by Radii drawn to the Earth — her Distance from the Earth — the Horary Motion in a circular and elliptic Orbit — the mean Motion of the Nodes — the true Motion of the Nodes — the horary Variation of the Inclination of the Moon's Orbit to the Plane of the Ecliptic.

Lastly, From the same Theory he has found the annual Equation of the Moon's mean Motion to arise from the various dilatation of her Orbit; and that Variation to arise from the Sun's force, which being greater in the Perigee, distends the Orbit; and being less in the Apogee, contracts it to be again contracted. In the dilated Orbit, she moves more slowly; in the contracted, more swiftly: and the annual Equation, whereby this Inequality is compensated, in the Apogee, and Perigee is nothing at all; at a moderate distance from the Sun, amounts to  $11', 50''$ ; and in other places is proportional to the Equation of the Sun's Centre, and is added to the mean Motion of the Moon, when the Earth proceeds from its Aphelion to its Perihelion; and subtracted when in its opposite part. Supposing the Radius of the Orbit *magnus* 1000, and the Earth's Eccentricity  $16 \frac{2}{3}$ ; this Equation, when greatest, according to the Theory of Gravity, comes out  $11', 49'', 8''$ . He adds, that in the Earth's Perihelion the Nodes move swifter than in the Aphelion, and that in a triplicate Ratio of the Earth's distance from the Sun, inversely. Whence arise annual Equations of their Motions, proportionable to that of the Centre of the Sun. Now the Sun's Motion is in a duplicate Ratio of the Earth's Distance from the Sun inversely, and the greatest Equation of the Centre which this Inequality occasions, is  $19', 56'', 26''$ , agreeable to the Sun's Eccentricity  $16 \frac{2}{3}$ . If the Sun's Motion were in a triplicate Ratio of its Distance inversely, this Inequality could generate the greatest Equation  $29', 66'', 9''$ ; and therefore the greatest Equations which the Inequalities of the Motions of the Moon's Apogee and Nodes occasion, are to  $29', 56'', 9''$ , as the mean diurnal Motion of the Moon's Apogee, and the mean diurnal Motion of her Nodes are to the mean diurnal Motion of the Sun. Whence the greatest Equation of the mean Motion of the Apogee comes out  $19', 52''$ ; and the greatest Equation of the mean Motion of the Nodes  $9', 27''$ . The former Equation is added, and the latter subtracted, when the Earth proceeds from its Perihelion to its Aphelion; and the contrary in the opposite part of its Orbit.

From the same Theory of Gravity it also appears, that the Sun's Action on the Moon must be somewhat greater when the transverse Diameter of the Lunar Orbit passes through the Sun, than when it is at right Angles with the Line that joins the Earth and Sun: And, therefore, that the Lunar Orbit is somewhat greater in the first case, than in the second. Hence arises another Equation of the mean Lunar Motion, depending on the Situation of the Moon's Apogee with regard to the Sun, which is greatest when the Moon's Apogee is in an Octant with the Sun; and none, when that arrives at the Quadrature, or Syzygies; and is added to the mean Motion, in the Passage of the Moon's Apogee from the Quadrature to the Syzygies, and subtracted in the Passage of the Apogee from the Syzygies to the Quadrature. This Equation, which he calls *Semefris*, when greatest, is, in the Octants of the Apogee, as  $15', 54''$ , at a mean distance of the Earth from the Sun; but it increases and diminishes in a triplicate Ratio of the Sun's distance inversely; and therefore in the Sun's greatest distance, is  $2', 54''$  in the smallest,  $3', 56''$ , nearly. But when the Apogee of the Moon is without the Octants, it becomes less, and is to the greatest Equation, as the Sine of double the distance of the Moon's Apogee, from the next Syzygy or Quadrature, to the Radius.

From the same Theory of Gravity it follows, that the Sun's Action on the Moon is somewhat greater when a Line right drawn through the Moon's Nodes passes through the Sun, than when that Line is at right Angles with another joining the Sun and Earth: And hence arises another Equation of the Moon's mean Motion, which he calls *Secundis Semefris*, and which is greatest when the Nodes are in the Sun's Octants; and vanishes when they are in the Syzygies, or Quadratures; and in other Situations of the

Nodes is proportionable to the Sine of double the distance of either Node from the next Syzygy, or Quadrature: it is added to the Moon's mean Motion while the Nodes are in their Passage from the Sun's Quadratures to the next Syzygy, and subtracted in their Passage from the Syzygies to the Quadratures in the Octants. When it is greatest, it amounts to  $47''$ , at a mean distance of the Earth from the Sun; as appears from the Theory of Gravity: At other distances of the Sun, this Equation in the Octants of the Nodes is reciprocally as the Cube of the Sun's distance from the Earth; and therefore in the Sun's Perigee is  $47''$ ; in his Apogee nearly  $49''$ .

By the same Theory of Gravity, the Moon's Apogee proceeds the fastest when either in Conjunction with the Sun, or in Opposition to it; and returns when it makes a Quadrature with the Sun. In the former Case, the Eccentricity is greatest, and in the latter smallest. These Inequalities are very considerable, and generate the principal Equation of the Apogee, which he calls *Semefris*, or *Semi-menstrual*. The greatest *Semi-menstrual* Equation is about  $12', 18''$ .

*Hæresis* first observ'd the Moon to revolve in an Ellipsis round the Earth placed in the lower Umbilicus: And Halley placed the Centre of the Ellipsis in an Epicycle whose Centre revolves uniformly about the Earth: And from the Motion in the Epicycle arise the Inequalities now observ'd in the Progress and Regress of the Apogee, and the Quantity of the Eccentricity.

Suppose the mean distance of the Moon from the Earth divided into 100000, and let T (Plate *ASTRONOMIA*, Fig. 17.) represent the Earth, and T C the mean Eccentricity of the Moon 5505 parts; produce T C to B, that C B may be the Sine of the greatest Semi-menstrual Equation  $12', 18''$  to the Radius T C; the Circle B D A, described on the Centre C, with the Interval C B, will be the Epicycle wherein the Centre of the Lunar Orb is placed, and wherein it revolves according to the Order of the Letters B D A. Take the Angle B C D equal to double the annual Argument, or double the distance of the true Place of the Sun from the Moon's Apogee once equated, and C T D will be the Semi-menstrual Equation of the Moon's Apogee, and T D the Eccentricity of its Orbit tending to the Apogee equated a second time. Now the Moon's mean Motion, Apogee, and Eccentricity, as also the greater Axis of its Orbit 100000; the Moon's true place, as also her distance from the Earth are found, and that by the commonest Methods.

In the Earth's Perihelion, by reason of the greater force of the Sun, the Centre of the Moon's Orbit will move more swiftly about the Centre C, than in the Aphelion, and that in a triplicate Ratio of the Earth's distance from the Sun inversely. By reason of the Equation of the Centre of the Sun, comprehended in the annual Argument, the Centre of the Moon's Orbit will move more swiftly in the Epicycle B D A, in a duplicate Ratio of the distance of the Earth from the Sun inversely. That the same may still move more swiftly in a simple Ratio of the distance inversely from the Centre of the Orbit D, draw D E towards the Moon's Apogee, or parallel to T C; and take the Angle E D G equal to the Excess of the annual Argument, above the Distance of the Moon's Apogee from the Sun's Perigee in Consequencia; or which is the same, take the Angle C D F equal to the Complement of the true Anomaly of the Sun to  $360^\circ$ ; and let D F be to D C as double the Eccentricity of the Orbit *magnus* to the mean distance of the Sun from the Earth, and the mean diurnal Motion of the Sun from the Moon's Apogee, to the mean diurnal Motion of the Sun from its own Apogee, conjunctly, i. e. as  $53 \frac{1}{2}$  is to 1000, and  $52', 27'', 16''$  to  $59', 8'', 10''$  conjunctly; or as 5 to 100. Conceive the Centre of the Moon's Orbit placed in the Point E, and to revolve in an Epicycle whose Centre is D, and Radius D F, while D proceeds in the Circumference of the Circle D A B D: Thus the Velocity wherewith the Centre of the Moon's Orbit moves in a certain Curve, described about the Centre C, will be reciprocally as the Cube of the Sun's distance from the Earth. The Computation of this Motion is difficult, but will be made easy by the following Approximation. If the Moon's mean distance from the Earth be 100000 parts, and its Eccentricity T C 5505 of those parts, the right Line C B or C D will be found 1175 2, and the right Line D F 53 2. This right Line at the distance T C, subtends an Angle to the Earth, which the transferring of the Centre of the Orbit from the place D to F generates in the Motion of this Centre; and the same right Line doubled, in a parallel Situation, at the distance of the upper Umbilicus of the Moon's Orbit from the Earth, subtends the same Angle, generated by that translation in the Motion of the Umbilicus; and at the distance of the Moon from the Earth subtends an Angle which the same translation generates in the Motion of the Moon; and which may therefore be call'd the *Second Equation of the Centre*.

*Centre.* This Equation at a mean distance of the Moon from the Earth, is as the Sine of the Angle contain'd between the right Line D F, and a right Line drawn from the Point F, to the Moon, nearly; and when greatest, amounts to 2', 25". Now the Angle comprehended between the right Line D F and a Line from the Point D, is found either by subtracting the Angle E D E from the mean Anomaly of the Moon, or by adding the Moon's distance from the Sun to the distance of the Moon's Apogee from the Apogee of the Sun. And as Radius is to the Sine of the Angle thus found, so is 2', 25" to the second Equation of the Centre, which is to be added, if that Sine be less than a Semi-circle, and subtracted if greater: Thus we have its Longitude in the very Syzygies of the Luminaries.

If a very accurate Computation be required, the Moon's Place thus found must be corrected by a second Variation. The first and principal Variation we have already consider'd, and have observ'd it to be greatest in the Oceans. The second is greatest in the Quadrants, and arises from the different Action of the Sun on the Moon's Orbit, according to the different Position of the Moon's Apogee to the Sun, and is thus computed: As Radius is to the versed Sine of the distance of the Moon's Apogee from the Sun's Perigee, in consequence so is a certain Angle P to a fourth Proportional. And as Radius is to the Sine of the Moon's distance from the Sun, so is the Sine of this fourth Proportional and another Angle Q to the second Variation, which is to be subtracted, if the Moon's Light be increasing; and added, if diminishing.

Thus we have the Moon's true Place in her Orbit; and by reduction of this Place to the Ecciptic, the Moon's Longitude. The Angles P and Q are to be determined by observation: in the mean time, if for P be assumed 2', and for Q 1', we shall be near the truth.

#### Nature of the Moon.

1. From the various Phases of the Moon: From her only showing a little part illuminated, when following the Sun ready to set: From that Part's increasing as she recedes from the Sun, till at the distance of 80° she shines with a full Face; and again wains as she re-approaches that Luminary, and loses all her Light when she meets him: From the lucid Part's being constantly turn'd towards the West, while the Moon increases; and towards the East when she decreases; it is evident, that only that part shines on which the Sun's Rays fall: And from the Phenomena of Eclipses, happening when the Moon should shine with a full face, viz. when she is 180° distant from the Sun; and the darkned Parts appearing the same in all Places, it is evident she has no Light of her own, but borrows whatever Light she has from the Sun. See PHASES, ECLIPSE, and SUN.

2. The Moon sometimes disappears in the clear Heaven, so as not to be discoverable by the best Glasses; little Stars of the fifth and sixth Magnitude all the time remaining visible. This Phenomenon Kepler observ'd twice Anno 1580, and 1585; and Hevelius in 1620. Riccioli, and other Jesuits at *Bosnia*, and many People throughout *Holland* observ'd the like April 14, 1642. yet at *Venice* and *Vienna* she was all the time conspicuous. December 23, 1705, there was another total Obscuration: At *Alexis* the first appear'd of a yellowish brown; at *Avignon* ruddy and transparent, as if the Sun had shone through; at *Marseilles*, one part was reddish, the other very dusky; and, at length, tho' in a clear Sky, wholly disappear'd. Here it is evident, that the Colours appearing different at the same time, do not belong to the Moon; but that they are occasion'd by an Atmosphere around her variously disposed in this and that Place, for refracting of these or those coloured Rays.

3. The Eye, either naked, or arm'd with a Telescope, sees some parts in the Moon's Face darker than others, which are call'd Macule, or Spots. Through the Telescope, while the Moon is either increasing or decreasing, the illuminated parts in the Macule appear evenly terminated; but in the bright Parts, the Bound of the Light appears jagged and uneven, composed of dissimilar Arches, convex and concave. (see Tab. ASTRONOMY, Fig. 18.) There are also observ'd lucid Parts dispersed among the darker; and illuminated Parts seen beyond the limits of Illumination; other intermediate ones remaining still in darkness; and near the Macule, and even in 'em, are frequently seen such lucid Specks. Beside the Macule observ'd by the Antients, there are other variable ones invisible by the naked Eye, call'd New Macule, always opposite to the Sun; and which are hence found among those parts which are the soonest illuminated in the increasing Moon, and in the decreasing Moon lose their Light later than the intermediate ones; running round, and appearing sometimes larger, sometimes smaller.

Hence, (1.) As all parts are equally illuminated by the Sun, in as much as they are equally distant from him:

if some appear brighter, and others darker; some reflect the Sun's Rays more copiously than others; and therefore they are heterogeneous. And, (2.) Since the Boundary of the illuminated Part is very smooth and equable in the Macule, their Surface must be so too. (3.) The parts illuminated by the Sun sooner, and deferred later than others that are nearer, are higher than the rest, i. e. stand up above the other Surface of the Moon. (4.) The New Macule answer perfectly to the Shadows of terrestrial Bodies.

4. *Herschel* writes, that he has several times found, in Stars perfectly clear, when even Stars of the 6th and 7th Magnitude were conspicuous, at the same Altitude of the Moon, and the same Elongation from the Earth, and with one and the same excellent Telescope; that the Moon and its Macule do not appear equally lucid, clear, and perpendicular, at all times; but are much brighter, purer, and more distinct at one time than another. From the Circumstances of the Observation, 'tis evident, the reason of the Phenomenon is not either in our Air, in the Tube, in the Moon, nor in the Spectator's Eye; but must be look'd for in something existing about the Moon.

5. *Cassini* frequently observ'd *Saturn*, *Jupiter*, and the fix'd Stars, when hid by the Moon, near her Limb, whether the illuminated or dark one, to have their circular Figure changed into an oval one; and in other Occultations found no alteration of the Figure at all. In like manner, the Sun and Moon rising and setting in a vaporous Horizon, do not appear circular, but Elliptic.

Hence, as we know, by sure Experience, that the Circular Figure of the Sun and Moon is only changed into an Elliptic one by means of the Refraction in the vapoury Atmosphere; 'tis pretty apparent, that at the time when the circular Figure of the Stars is thus changed by the Moon, there is a dense Matter encompassing the Moon, wherein the Rays emitted from the Stars are refracted; and that at other times, when there was no change of Figure, this Matter was wanting.

This Phenomenon is well illustrated by the following Experiment: To the inner bottom of any Vessel, either Plane, Convex, or Concave, with Wax fasten a Circle of Paper; then pouring in Water, that the Rays reflected from the Circle into the Air may be refracted before they reach the Eye; viewing the Circle obliquely, the circular Figure will appear changed into an Ellipsis.

6. The Moon is a dense opaque body, beset with Mountains, Valleys, and Seas. That the Moon is dense, and impervious to the Light, has been shewn; but some parts sink below, and others rise above the Surface; and that considerably, in as much as they are visible at so great a distance of the Earth from the Sun: In the Moon therefore are huge Mountains, and very deep Valleys. *Riccioli* measured the height of one of the Mountains, call'd *St. Catherine*, and found it nine Miles high. Again, in the Moon are spacious Tracts, having smooth even Surfaces, and those reflecting less Light than the rest: Hence, as the Surface of fluid Bodies is naturally even, and as when transparent, they transmit a great part of the Rays of Light, and reflect very little; the Lunar Spots are fluid, transparent Bodies; and as they continue constantly the same, are Seas. In the Moon, therefore, are Mountains, Valleys, and Seas.—Hence again, the lucid parts of the Spots are Islands and Peninsulas.

And since in the Macule, and near their Limbs, are seen some parts higher than others, in the Lunar Seas are Rocks and Promontories.

And since the new Spots are contiguous to the Mountains, and in all respects like the Shadows of Bodies on our Earth; no doubt they are the Shadow of the Lunar Mountains: Whence also appears the Matter of the Moon is opaque.

Note, This Reasoning will be put past doubt by viewing the sensible Horizon from some Eminence: Where it passes over a Plain, the Line will appear smooth and even; where a-croft Mountains and Valleys, irregular and winding; smooth, but dark, &c.

7. The Moon is encompass'd with an heavy and elastic Atmosphere, wherein Vapours and other Exhalations arise, and whence they return in form of Dew and Rain.

In a total Eclipse of the Sun, we find the Moon incircled with a lucid Ring parallel to her Periphery.

Of this, we have too many Observations to doubt: In the great Eclipse of 1713, the Ring was very conspicuous at *London*, and elsewhere. *Kepler* observ'd the same of an Eclipse in 1605, at *Naples* and *Antwerp*; and *Wolfius* of another in 1606 at *Leipsic*, described at large in the *Acta Eruditorum*, with this notable Circumstance, that the part next the Moon was visibly brighter, than that furthest from it; which is confirmed by the Observations of the French Astronomers in the *Memoires de l'Academie*, &c. 1706.

Hence about the Moon is some Fluid, which corresponds to her Figure, and which both reflects and refracts the Sun's Rays. And hence also, this Fluid is denser below,

near the Moon's Body; and rarer above. Now as the Air which incompasses our Earth is such a Fluid, it is manifest there is Air about the Moon; and since the different Density of the Air depends on its different Gravity and Elasticity, no doubt the different Density of the Lunar Air has the same Cause. Again, we have observ'd the Lunar Air is not always equally clear and transparent; sometimes it changes the Spherical Figures of the Stars into Ovals; and in the several total Eclipses just mentioned, there was observed a trembling in the Moon's Limb, immediately before immersion, with an Appearance of thin, light Smoak flying over it during immersion, very apparent in England. And hence, as these same Phenomena are observed in our Air when full of Vapours, it is pretty plain, at the time when these Phenomena are observed in that of the Moon, it is full of Vapours and Exhalations. And, lastly, since at other times the Lunar Air is clear and transparent, producing none of these Phenomena, the Vapours must have been precipitated on the Moon; and therefore either Dew, or Rain, or Snow have fallen.

7. The Moon is a Body in all respects like our Earth, and fitted for the same purposes. For we have shown that it is Describ'd—Opake—has Mountains and Valleys—Sea, with Islands, Peninsula, Rocks, and Promontories—a changeable Atmosphere, wherein Vapours and Exhalations rise and fall—Day and Night; a Sun to illuminate the one, and a Moon the other,—Summer and Winter, &c.

From these, by Analogy, may infinite other Properties and Appendages of the Moon be deduced: From the Changes in the Atmosphere will follow Winds, and other Motions; and according to the different Seasons of the Year, Rain, Mists, Frosts, Snow, &c. From the Inequalities upon the Moon's Surface will arise Lakes, Rivers, Springs, &c.

Now Nature, we know, produces nothing in vain: Rains and Dew fall on our Earth to make Plants vegetate; and Plants take Root, grow, produce Seeds and Fruits for Animals to feed on. But Nature is still uniform and consistent with herself, and like things serve for like Ends: Why then may not there be Plants and Animals in the Moon? To what other purpose is nice a Provision for them?

These Arguments will receive new force when we come to shew that our Earth itself is a Planet; and that when viewed from the other Planets, it appears, in some, like the Moon; in others, like Venus; in others, Jupiter, &c. A Similitude between the Planets, both Optical and Physical, being a strong Presumption their Furniture is alike. See EARTH and PLANET.

To measure the Height of the Mountains of the Moon.

Suppose ED (Fig. 19.) the Moon's Diameter, ECD the Boundary of Light and Darkness; and A the Top of the Hill in the dark part beginning to be illuminated: With a Telescope observe the Proportion of AE, or the distance of A from the Line where the Light commences, to the Diameter of ED: Here we have two sides of a rectangled Triangle A E, CA; the Squares of which added together give the Square of the third; whence the Semi-diameter CD being subtracted, leaves AB, the Height of the Mountain.

Ricciolus, v. g. found the Top of the Hill St. Catherine illuminated at the distance of  $\frac{1}{12}$  of the Moon's Diameter from the Confiner of Light. Supposing, therefore, CE, E 8; and AE, 1; the Squares of the two will be 63, whose Root is 8.062; the length of AC 3 subtracted therefore BC = 8, the Remainder is AB = 0.62. The Moon's Semi-diameter, therefore, is to the Mountain's height as 8 is to 0.62; i. e. as 800 to 62. Supposing, therefore, the Diameter of the Moon 1182 English Miles, by the Rule of Three we find the height of the Mountain 9 Miles.

The Heights, &c. of the Lunar Mountains being measurable, Astronomers have taken occasion to give each its Name. Ricciolus, whom most others now follow, distinguished them by the Names of the Celebrated Astronomers; and by these Names they are still expressed in Observations of the Lunar Eclipse, &c. See the Figure, (Tab. ASTRONOMY, Fig. 20.)

The apparent Magnitude of the Moon.

The Magnitude of the Moon, at rising and setting, is a Phenomenon that has extremely embarrassed the modern Philosophers. According to the ordinary Laws of Vision, it should appear the least when nearest the Horizon, as being then nearest to the Eye; and yet we find the contrary true in fact. Des Cartes, and from him Dr. Wallis, and most other Authors, account for this from the long Series of Objects interposed between the Eye and the Extremity of the sensible Horizon, which make us imagine it more remote than when in the Meridian, where the Eye sees nothing in the way between the Object and itself. This Idea of a great distance, makes us imagine the Moon the bigger: For any Object being seen under any certain Angle, and

believed, at the same time, very remote, we naturally judge it must be very large, to appear under such an Angle at such a distance. And thus a pure Judgment of the Soul makes us see the Moon bigger in the Horizon, than in the Meridian; notwithstanding its Image painted on the Retina is less in the former Situation than the latter.

This Hypothesis, F. Gouye destroys, by observing that the narrower and more confined the sensible Horizon is, the greater does the Moon appear; the contrary of which should happen on the Principle laid down.

Gassendi is of opinion, that the Pupil of the Eye, which is always more open as the Place is more dark; being more so in the Morning and Evening than at other times, by reason the Earth is covered with gross Vapours; and besides, being obliged to pass through a longer Column or Series of 'em, to reach the Horizon, the Image of the Moon enters the Eye at a greater Angle, and is really painted there greater.

In answer to which, it must be said, that notwithstanding this dilatation of the Pupil, occasion'd by the Obscurity; if the Moon be viewed through a little pin-hole made in a Paper, she appears less when in the Horizon.

F. Gouye finding both the Conjectures false, advances a third: He is of opinion then, when the Moon is in the Horizon; the neighbourhood of the Earth, and the gross Vapours wherewith the Moon then appears enveloped, have the same Effect, with regard to us, as a Wall, or other dense Body placed behind a Column; which in that Case appears bigger than when insulate, and incompass'd on all sides with an illuminated Air. Further, it is observed that a Column when fluted, appears bigger than before, when it was plain; the Flutes being for many particular Objects, which by their Multitude occasion the Mind to imagine the whole Object wherof they are composed of a larger extent. The same thing may be said of the several Objects seen towards the Horizon, to which the Moon corresponds at her Rising and Setting. And hence it is that she appears greater full, when she rises or sets between Trees; the narrow, yet distinct Intervals wherof have the same Effect with regard to the apparent Diameter of the Moon, as a greater number of Flutes with regard to the Shaft of a Column.

For the Eclipses of the Moon, see ECLIPSES.

For the Moon's Parallax, see PARALLAX.

To find the Moon's Age. To the Day of the Month add the Epact of the Year, and the Months from March inclusive. The Sum, if under 30; if over, the Excess is the Moon's Age. If the Month have but 30 Days, the Excess above 29 is the Moon's Age.

To find the Time of the Moon's being in the Meridian, or Setting: Multiply her Age, if under 15 Days, by 4; and divide the Product by 5; the Quotient gives the Hour, and the Remainder multiplied by 12, the Minute. If her Age exceed 15, subtract 15, and proceed with the Remainder as before.

To find the Time of the Moon's beginning to shine. Multiply her Age, if under 15, by 48; and divide the Product by 60; the Quotient gives the Hours; and the Remainder the Minutes. If her Age be above 15 Days, subtract the time thus found, from 24; the Remainder gives the time of shining in the Morning.

MOOR, MOOR, a Heath, or barren Tract of Ground. See HEATH.

It is sometimes also used for a *Morass*, *Moss*, or *Fen*. See MORASS.

*Mora Muffa*, in ancient Writings, particularly denotes a *Moss*, or *Peat-Moss*.

MOORING, at Sea, is the laying out of Anchors, in a proper place, for the secure Riding of a Ship. See ANCHOR.

To *Moor a-cros*, is to lay out one of the Anchors on one side, or a-thwart a River, and the other right against it.

To *Moor along*, is to have an Anchor in a River, and a Hawser on Shore.

To *Moor Quarter-boat*, is to moor Quartering, between the two first ways.

MOORING for East, West, &c. is when they observe which way, and on what Point of the Compass the Wind or Sea is most likely to endanger the Ship, and there lay out an Anchor.

MOORS-HEAD, in Chymistry, a Copper-Cap made in form of a Head, to be set over the Chimney of a Reverberating Furnace. See REVERBERATORY.

MOORS-HEAD is also the Head of a Copper or Glass-Still or Alembic, which is luted on to the Body or Cucurbit, and hath a Beak or Pipe to let the Spirit run down into the Receiver.

MOOT, a difficult Case, or Question argued by the Students of Inns of Court, by way of Exercise. See MOOTING.

The Word is formed either from the *Saxon*, *Mooting*, Assembly; or the *French*, *Mor*, Word.

**MOOTING**, the chief Exercise of the Students in the Inns of Court; being the arguing of Cases, which young Uter Barristers, &c. perform at appointed Times, the better to enable them for Practice, and the Defence of their Clients Causes. See **INNS of Court**.

Such, as from their Learning and Standing are call'd by the Benchers to argue *Moot Cases*, are call'd *Uter Barristers*; the rest, who for want of Experience, &c. are not admitted, are call'd *Inner Barristers*. See **BARRISTER**.

The Place where Moot Cases were argued, was anciently call'd a *Moot-Hall*.

In the Inns of Court there is a *Bailiff*, or *Surveyor* of the *Moots*, yearly chosen by the Bench to appoint the *Moot-Men* for the Inns of Chancery, and to keep Account of Performance of Exercises, both there and in the House.

**MOOT-MEN** are those who argue *Moot-Cases*. See **MOOT**.

Out of these *Moot-Men* are chose Readers for the Inns of Chancery; where, in Term-time and in Vacations, they argue Cases in the presence of Attorneys and Clerks.

**MORAL**, any thing relating to the *Manners*, or the Conduct of Life. See **MANNERS**.

Thus, besides the Theological Virtues, as *Faith*, *Hope*, *Charity*, &c. we say there are also *Moral Virtues*, as *Justice*, *Temperance*, &c. See **VIRTUE**.

**MORAL of a Fable**, is the Instruction drawn from it. See **FABLE**.

Thus when *Phœdrus* at the end of a Fable adds, *Hoc illi dicitur qui*, &c. that makes what we call the *Moral*. This, the *Greeks* call'd *ἠθικὸν* when at the end of the Fable, and *ἠθικὸν* at the beginning. The *Latins* call it *Affabulatio*.

**MORAL Sense**, the Faculty whereby we discern, or perceive what is Good, Virtuous, Beautiful, &c. in Actions, Manners, Characters, &c.

A late Author has endeavoured to prove, that it is a peculiar Sense whereby we get the Ideas of these Things; and denominate it a *Moral Sense*. See **MORAL SENSE**.

**MORAL Theology** is that which treats of Cases of Conscience; call'd also *Casualty*. See **CASUALTY**.

**MORAL Certainty**, or Assurance, is used to signify a very strong Probability; in contradistinction to a Mathematical Demonstration. See **CERTAINTY**.

**MORAL Impossibility**, is what we otherwise call a very great, and almost insuperable Difficulty; in opposition to a Physical, or Natural Impossibility. See **IMPOSSIBILITY**.

**MORAL Philosophy**, a Science whose Object is to direct, and turn our Manners; to explain the Reason, and Nature of Actions; and to teach and instruct us how to acquire that Felicity or Happiness which is agreeable to human Nature. See **PHILOSOPHY**.

*Moral Philosophy* is the same with what we otherwise call *Ethics*. See **ETHICS**.

**MORAL Action**, or Acts, are such as render the Rational or Free Agent Good or Evil; and, consequently, Rewardable and Punishable because he doth them. See **GOOD**, &c.

**MORALITY** is a Conformity to those unalterable Obligations which result from the nature of our Existence, and the necessary Relations of Life; whether to God as our Creator, or Mankind as our Fellow-Creature.

**MORASSE**, a *Marsh*, *Fen*, or low moist Grounds, which drain the Waters from above, without having any descent to carry them off again.

*Summer* derives the Word from the *Saxon Mersc*; *Salmasius* from *Mors*, a Collection of Waters; others from the *German Marass*, a muddy Place; and others from *Marses*, of *Marsicium*, a *Marsicis*, i. e. *Ruffus*.

In *Scotland*, *Ireland*, and the North of *England*, they have a peculiar kind of *Morasses*, call'd *Mosses*, or *Peat-Mosses*, whence the Country-People dig their *Peat* or *Turf*. See **TURF**.

The Earl of *Cromartie* gives a particular Account of these *Mosses* in the *Philosophy Transact*. They are cover'd with a heathy Scurf, under which is a black, moist, spongy Earth, in some Places shallower, in others deeper, ordinarily from three or four to seven or eight Feet depth, tho' in some few Places twice or thrice as much.

This black, spongy Earth they cut into oblong Squares with Iron Spades fitted to that end, eight or nine Inches long, and four or five broad; as the Men cut 'em up, they are carried and spread on a dry Ground, to be dried in the Wind and Sun. Some of these become harder, some softer, according to the nature of the Mold or Earth: The more black and solid, the better Fire; and they are the least esteemed which are greyest, the lightest, and most spongy.

When they have cut off one Surface of four or five Inches deep, they proceed downwards to another, and so to a third and a fourth, till they come to the hard Channel, unless they be stop'd with Water, which they also ordinarily remove by making a Channel, if they can; but where they cannot, the Water stagnates. In such wasted Pits, or *Peat-Dikes*, as they call 'em, where Water hinders the

cutting the spongy Earth to the Bottom, the Pits will be fill'd up again in some Years with new spongy Earth; which in process of Time comes to the consistence of *Peat-Moss* as at first, and a hearty Heath-Turf grows over the Top of it. When the *Dikes* are dug down to the hard Channel, the *Mosses* don't renew, as in the other Case; tho' it has been observ'd, that if they be cut down to the Channel, provided the Heathy-Turf cut off from the Top be but laid on the Channel, in course of Time the *Moss* grows again.

These *Mosses* always stand on Plains; tho' they are frequently found on Hills, and near the Top of 'em too; Yet, as that curious Nobleman observes, the *Mosses* have always a descent to 'em, and generally from 'em; inasmuch that he never knew any, where the Water might stagnate. 'Tis the Water draining from above that seems to be the Parent of *Peat*. In many of these *Mosses* are found Quantities of Fir and Oak Wood, usually in whole Trees; for the smaller Branches are seldom found unconserv'd. This Wood is as good for use as any old Wood is; only that having imbibed a deal of Moisture, it takes some time to dry, in order to fit it for use.

There are many Places, where Wood will not grow, where yet the *Mosses* are well stock'd with these Under-ground Timber; but yet it appears there must have been Woods formerly: Else how come they in the *Mosses*? To prove this, that Noble Lord gives us the History and Origin of a *Moss*, in great measure from his own Experience. In the Parish of *Lochbrae*, in the Year 1651, he saw, near the Top of a very high Hill, a Plain about 2 Mile over, then cover'd with a firm standing Wood, but which was so very old, that not only the Trees had no Leaves or Bark on, but the outside for the space of an Inch inward was dead, white Timber, tho' within they were firm. Coming by the same Place 25 Years after, he could not discover the least Appearance of a Tree, but instead thereof a plain green Ground cover'd with a *Moss*; the Trees being all fallen, and having lain so thick over one another, the Green had over-run the whole Timber, by means of the Moisture draining from the Hill above it, and stagnating on the Plain. He adds, that none could pass over it; the Scurf not being firm enough to support 'em. In thirty Years more he found the whole Piece of Ground turn'd into a common *Peat-Moss*, and the Country-People digging Turf and *Peats*.

This accounts for the Generation of *Mosses*, and whence it is that many of them are furnish'd with Timber.

**MORATUR**, or **DEMORATOR**, in Law, signifies as much as *to Demur*; by reason the Party here goes not forward, but rests, or abides upon the Judgment of the Court, who take time to deliberate, argue, and advise thereon. See **DEMURRER**.

When the Council of the Party are of opinion, that the Court or Plea of the adverse Party is insufficient in Law; then he *Demurs*, or abides in Law, and refers the same to the Judgment of the Court.

**MORBID**, **MORBINUS**, in Medicine, is apply'd to signify those Parts, Humours, &c. wherein a *Disease* lies. See **DISEASE**.

**MORBID**, in Painting, is particularly apply'd to fat Flesh very strongly expressed.

**MORBILLI**, in Medicine, a *Disease* popularly call'd the *Measles*. See **MEASLES**.

**MORBUS**, a Term purely Latin, signifying *Disease*. See **DISEASE**.

**MORBUS Comitialis**, is the *Epilepsy*; thus call'd by the *Romans*, because when in any of their public Assemblies Persons fell down with this Distemper, they immediately broke up, and dissolved the *Comitia*, which was the common Appellation for such Courts. See **EPILEPSY**.

*Morbus Regius*,  
*Morbus Virgineus*, } Sec { JAUNDICE.  
*Morbus Gallicus*, } Sec { CHLOROSIS.  
*Morbus Sanguis*, } Sec { VENEREAL Disease.

**MORISCO**, or **MORISS**, a kind of Painting, Carving, &c. done after the Manner of the *Moss*; consisting of several grotesque Pieces and Compartments promiscuously intermingled, not containing any perfect Figure of a Man, or other Animal, but a wild Resemblance of Birds, Beasts, Trees, &c. See **GROTESQUE**.

These are also call'd *Arabesques*, and are particularly used in Embroideries, Damask-Work, &c. See **ARABESQUE**.

*Moresque Dances*, vulgarly call'd *Morrice-Dances*, are those altogether in imitation of the *Moss*, as *Sarabanda*, *Chacon*, &c. which are usually performed with Catinets, Tabours, &c. See **CASTAGNETAS**.

**MORNING**, the beginning of the Day; or the Time of the Sun-rising. See **DAY** and **RISE**.

The Astronomers reckon *Morning*, *Morn*, from the time of Mid-night, to that of Mid-day. Thus an Eclipse is said to begin at 11 a clock in the *Morning*, &c.

**MORNING-STAR** is the Planet *Venus*, when a little to the Eastward of the Sun; that is, when she rises a little before

him. In this Situation she is call'd by the Greeks *Phosphorus*; by the Latins *Lucifer*, &c. See PHOSPHORUS.

MORNING Twilight, see CREPUSCULUM.

MORPHEW, is that Freckle or Scarf which breaks out sometimes upon the Skin, particularly about the Forehead. See FRECKLES.

MORSELLI, and MORSELLA, ancient Names for those Forms of Medicines which were to be chew'd in the Mouth, as a *Louenge*; the Word signifying a little Mouthful. See LOZENGE.

MORSUS *Dumbell*, Devil's Bit; a Plant which seems to have a fringe around its Leaves, is thus call'd.

From a like cause hereto, has the Edge or Selvdige of the *Tabæ Fallopiæ*, obtain'd the same Appellation. See FALLOPIAN.

MORSUS *Canis rabidi*, } See { HYDROPHOBIA.

MORSUS *Viperæ*, } See { VIPER.

MORT d'Ancestre, in Law, see ASSISE of Mort d'Ancestre.

MORTALITY, a Term frequently used to signify a contagious Disease, which destroys great Numbers either of Men, or Beasts.

*Bills of MORTALITY*, are Weekly Lists compiled by the Parish Clerks in and about London, containing the Numbers of such as die of each Disease, as well as of those that are born every Week.

The Bills are of some standing in England, in imitation whereof they are now established at Paris. They are very useful on several accounts, particularly in judging of the Mortality of any Disease, and whether an Epidemic or Infectious Disemper increases or abates.

Mr. *Grant*, who examin'd those of London very accurately, has wrote an express Treatise of 'em. Among other things, he calculates from 'em, that of 100 Persons who are born in the same Week, there are but 64 left at the end of six Years; but 40 at the end of sixteen Years; at the end of twenty six Years, but 25; and the end of thirty six Years, but 16; at the end of forty six Years, but 10; at the end of fifty six, no more than six; at the end of sixty six Years, but 3; at the end of seventy six, but 1; and at the end of eighty Years, they are reduced to none.

He likewise makes it appear, that in England in general, more are born than die; but in London, more die than are born: The Proportion of Births to Burials, in the former, being as 1  $\frac{1}{12}$  to one; in the latter as  $\frac{1}{12}$  to one. That also Cities and Market-Towns are found to bury 1  $\frac{1}{12}$  to 1 Birth. But in Paris they outdo London; their deaths being 1  $\frac{1}{12}$  to 1 Birth. In the Villages of England, fewer die than are born; there being but one death to 1  $\frac{1}{12}$  Births. See MARRIAGE.

MORTAR, or MORTER, in Architecture, is a Preparation of Lime, Sand, &c. mixed up with Water; serving, as a Cement, to bind the Stones, &c. of a Building. See BUILDING, CEMENT, &c.

The Ancients had a kind of Mortar so very hard and binding, that, after so long a Duration, 'tis next to impossible to separate the Parts of some of their Buildings; tho' there are some who ascribe that excessive Strength to Time, and the Insistence of certain Properties in the Air, which is found to harden some Bodies very surprizingly.

De Lorme observes, that the best Mortar is that made of *Puzozelli*; adding, that it penetrates black Flints, and turns 'em white.

The Lime used in the ancient Mortar is said to be burnt from the hardest Stones, and even Fragments of Marble. See LIME.

Mr. *Worledge* observes, that fine Dust makes weak Mortar; and the rounder the Sand, the stronger the Mortar. He therefore advises the Sand to be washed e'er mixed; and adds, that dirty Water weakens the Mortar considerably. See SAND.

The Proportion of Lime and Sand in our common Mortar is extremely variable. *Farrinus* prescribes three parts of Pit-Sand and two of River-Sand to one of Lime; but the Sand here seems to be over-dosed. About London, the Proportion of Sand to quick Lime is as 36 to 25. In some Parts they use equal Quantities of each.

*Welfins* observes, that the Sand should be dry and sharp, so as to prick the Hands when rubbed; yet not earthy, so as to soil the Water it is wash'd in.

*Farrinus* observes, that Fossil-Sands dry sooner than those taken out of Rivers. Whence, he adds, the latter is fittest for the Insides, the former for the Outfides of a Building. He subjoins, that Fossil-Sand lying long in the Air, becomes earthy. *Palladius* takes notice, that of all Sands white ones are the worst; the reason is owing to their want of Asperity.

#### Mixing and blending of MORTAR

Mr. *Felbien* observes that the Ancient Masons were so very scrupulous herein, that the Greeks kept Men constantly employ'd for a long space of time, to each Baston, which

render'd it of such prodigious Hardness, that *Varrinus* tells us the Pieces of Plaster falling off from old Walls served to make Tables. *Felbien* adds, it is a Maxim among old Masons to their Labourers, that they should dilute with the Sweat of their Brow, i. e. labour it a long time, instead of drowning it with Water, to have done the sooner.

Besides the common Mortar used in laying of Stones, Bricks, &c. there are several other kinds. As,

White Mortar, used in Plastering the Walls and Ceilings; made of Ox-Hair mixed with Lime and Water, without any Sand. See PLASTER.

The Mortar used in making of Water-Courses, Cisterns, &c. is very hard and durable, made of Lime and Hog's-Grease, sometimes mix'd with the Juice of Figs, and sometimes with liquid Pitch; after Application it is wash'd over with Linseed-Oil. See CISTERN.

Mortar for Enmaets, &c. is made with red Clay wrought in Water, wherein Horse-Dung and Chimney-Soot has been steep'd. See FURNACE.

Mortar for Sea-Dials on Walls may be made of Lime and Sand temper'd with Linseed Oil; or, for want of that, with scamm'd Milk. This will grow to the Hardness of a Stone.

In Buildings, one part of wash'd Sasp-Ashes mixed with another of Lime and Sand, make a very durable Mortar.

MORTAR, or MORTIER, a Badge, or Ensign of Dignity bore by the Chancellors, and Great Presidents of the Parliaments of France.

It consists of a Piece of Velvet edged with a Gold-Lace. They formerly bore it on their Head, but now in their Hands.

Hence they are call'd *Présidents à Mortier*.

MORTAR-PIECE, a short Piece of Ordnance, very thick and wide, proper for the Carriage of Bombs, Carcasses, Shells, &c. See ORDNANCE, BOMB, CARCASS, &c.

There are two kinds of Mortars; the one haug, or mounted on a Carriage with low Wheels, after the manner of Guns, call'd *Pendent* or *Hanging Mortars*; The other fixed on an immovable Base, call'd *Standing Mortars*.

At the head of the Bore, or Chafe of the Mortar, is the Chamber, for the Charge of Powder. This is usually made Cylindrical, all but the Base, which they make Hemispherical: Tho' some of the later Engineers prefer Spherical Chambers; as the Surface of those being less, under equal Capacities, make less Resistance to the Gun-Powder. See CHAMBER.

The Thickness of the Mortar about the Chamber is to be much greater than about the Chafe; by reason the Gun-Powder makes a much greater Effort about the Chamber than elsewhere. The Diameter of the Chamber to be much less than that of the Bore; by reason Bombs, Shells, &c. are much lighter than Bullets of equal Diameters; and, consequently, less Powder suffices. See BULLET.

To charge, or load a Mortar, the proper Quantity of Gun-Powder is put into the Chamber; and if there be any vacant space, they fill it up with Hay; some chuse a wooden Plug. Over this they lay a Turf; some a wooden Tampian fitted to the Bore of the Piece; and lastly the Bomb, taking care that the Fusee be in the Axis thereof, and the Orifice be turn'd from the Muzzle of the Piece. What remains, is to be fill'd up with Hay, Straw, Turf, &c. so as the Load may not be exploded without the utmost Violence. See CHARGE.

The Quantity of Gun-Powder to be used, is found by dividing the Weight of the Bomb by 50. Tho' this Rule is not always to be strictly observed. See GUN-POWDER.

To elevate the Mortar, so as its Axis may make any given Angle with the Horizon; they apply the Artillery-Level, or Gunner's Quadrant; the use whereof see under the Articles LEVEL and QUADRANT.

An Elevation of 70 or 80 Degrees is what is commonly chofe for rendering Mortars most serviceable in casting Shells into Towns, Forts, &c. tho' the greatest Range be at 45°. See RANGE.

If all Mortar-Pieces were, as they ought to be, exactly Similar, and their Requisites of Powder as the Cubes of the Diameters of their several Bores; and if their Shells, Bombs, Carcasses, &c. were also Similar, then, comparing like with like, their Ranges on the Plane of the Horizon, under the same Degree of Elevation, would be equal; and, consequently, one Piece being well proved, i. e. the Range of the Grand Bomb, Carcass, &c. being found to any Degree of Elevation, the whole Work of the Mortar-Piece would become very easy, and exact.

But since Mortars are not thus Similar, 'tis required that the Range of the Piece at some known Degree of Elevation be accurately found by measuring; and from hence all the other Ranges may be determined.

Thus, to find the Range of the Piece at any other Elevation required; say, as the Site of double the Angle under which

which the Experiment was made, is to the Sine of double the Angle proposed, so is the Range known to the Range required.

Suppose, for instance, 'tis found that the Range of a Piece elevated to 30 Degrees is 2000 Yards; to find the Range of the same Piece with the same Charge when elevated to 45 Degrees: Take the Sine of 60°, the double of 30°, and make it the first Term of the Rule of Three; the second Term must be the Sine of 90°, the double of 45°; and the third the given Range 2000: The fourth Term will be 2310, the Range of the Piece at 45°. If the Elevation be greater than 45°, instead of doubling it, take the Sine of double its Complement to 90°. As suppose the Elevation of a Piece be 50°, take the Sine of 80°, the double of 40°.

Again, if a determinate Distance to which a Shot is to be cast, be given, and the Angle of Elevation to produce that Effect be required; the Range known must be the first Term in the Rule of Three, which suppose 2000 Yards; The Range proposed, which we suppose 1500 Yards, the second Term; and the Sine of 60 double of the Elevation for the Range of 2000 Yards, the third Term. The fourth Term will be found the Sine of 43°, 54', whose half 21°, 55', is the Angle of Elevation the Piece must have, to produce the desired Eff. And if 21°, 55' be taken from 90°, you will have 68°, 4' for the other Elevation of the Piece, with which the same Effect will likewise be produced.

For the greater Ease, and to avoid the trouble of finding Sines of double the Angles of proposed Elevations, *Gulies* and *Tarriell* give us the following Table, wherein the Sines of the Angles sought are had by inspection.

A TABLE of Sines for the Ranges of MORTARS.

Degrees.	Degrees.	Ranges.	Degrees.	Degrees.	Ranges.
90	0	0	0	0	0
89	1	349	66	24	7431
88	2	698	65	25	7660
87	3	1045	64	26	7883
86	4	1392	63	27	8090
85	5	1736	62	28	8290
84	6	2079	61	29	8480
83	7	2419	60	30	8660
82	8	2756	59	31	8829
81	9	3090	58	32	8988
80	10	3420	57	33	9135
79	11	3746	56	34	9272
78	12	4067	55	35	9397
77	13	4384	54	36	9511
76	14	4695	53	37	9615
75	15	5000	52	38	9708
74	16	5299	51	39	9781
73	17	5592	50	40	9844
72	18	5870	49	41	9903
71	19	6157	48	42	9945
70	20	6428	47	43	9976
69	21	6691	46	44	9994
68	22	6947	45	45	10000
67	23	7193			

The Use of this Table is obvious. Suppose, for Instance, it be known by Experiment that a Mortar elevated 15°, charged with three Pounds of Powder, throw a Bomb to the Distance of 350 Fathom; and it be required, with the same Charge, to throw a Bomb 500 Fathom farther; Seek in the Table the Number answering to 15 Degrees, and you will find it 5000. Then as 350 is to 450, so is 5000 to a fourth Number, which is 6428. Find this Number, or that nearest it, in the Table, and against it you will find 109, or 70°; the Angles of Elevation.

For the Weight, Dimensions, &c. of the Bombs, &c. to be cast out of Mortars, and the Lines of the Projection; see BOMB, PROJECTILE, &c.

MORTGAGE, in our Law, is the same with *Hypotheca* in the Civil Law, viz. an Obligation, whereby Land or Tenement of the Debtor, are pawned or bound over to the Creditor for Money or other Effects borrow'd; temporarily to be the Creditor's for ever, if the Money be not paid at the Day agreed on.

The Creditor holding such Land, on such Agreement, is in the same time call'd *Tenant in Mortgage*.

*Glancie* defines *Mortgage*, *Mortuum Vadium*, to be that *cajus fruBus vel redditus interim percepti in nullo se acquiescant*. Thus 'tis call'd *Mortgage*, i. e. *dead Gage*, of *Mort*, Death, and *Gage*, Pledge; because whatever Profit it yields, yet it redeems not itself by yielding such Profit, except the whole Sum borrow'd be likewise paid at the Day; the *Mortgage* being by Covenant to receive the Profits till default of Payment. Others hold it call'd *Mortgage*, because if the Money be not paid at the Day, the Land *moritur*, dies, to the Debtor, and is forfeited to the Creditor.

He who lays this Pawn or Gage, is call'd the *Mortgager*, and he that takes it the *Mortgagee*.

This, if it contain excessive Usury, is prohibited by a Statute 37 Henry VIII.

The *French* sometimes use the Word in the same sense in their Language, where it stands in Contradistinction to a simple Contract, which does not carry with it the main Profits, and which they call *Vif gage*, Live-pledge.

As a *Mortgage* is an Engagement for the Security of the Creditor, all means have been taken to assure him of the Effect; that of the Pawn or Pledge, seems to have been the most ancient, being in reality the same thing, all the difference consists in this, that in a *Mortgage* the Pawn was put into the hands of the Creditor; whereas in a simple Engagement, the Thing remained in the hands of the Debtor. But it was afterwards found much more commodious to engage an Inheritance by a simple Convention, than by an actual Delivery.

Accordingly, this was practised by the *Greeks*, and from them borrow'd by the *Romans*; who, the better to prevent Deceits, fixed up visible Marks to inform the Public, that the Estate was engaged by the Proprietor: Tho' these Marks were found to injurious to the Debtors, that the Use of 'em was at length prohibited.

The *Romans* had four Kinds of *Mortgages*, or *Hypothecae*. The *Conventional*, which proceeds from the Will and Consent of the Contractors; the *Legal*, which is introduced by the Law, and which is therefore call'd *Tacit*. The *Mortgage of the Pretor*, when by the Flight or Refusal of the Debtor, the Creditor was put in possession of his Effects. And the *Judiciary Mortgage*, when the Creditor was put in possession, in consequence of a Decree or Sentence. The Civil Lawyers distinguish twenty-six different Kinds of *Tacit Mortgage*.

MORTIFICATION, in Medicine, &c. a Disease, wherein, the natural Juices of any part quite lose their proper Motions; and by that means fall into a fermentative one, and corrupt and destroy the Texture of the Part.

There are two Species, or rather Degrees of *Mortification*: The one call'd a *Gangrene*, which is a *Mortification* in its first, or beginning State: The other a *Sphacelus*, which is a perfect, or finish'd *Mortification*. See GANGRENE and SPHACELUS.

MORTMAIN, a Term in Law, signifying an Alienation of Lands and Tenements to any Guild, Corporation, or Fraternity, and their Successors; as Bishops, Parsons, Vicars, &c. See ALIENATION.

Such Alienation may not be done without the King's Licence, and that of the Lord of the Manour; or of the King alone, if it be immediately holden of him.

The Presidents and Governours of the Hospitals may, without Licence in *Mortmain*, purchase Land, &c. not exceeding the yearly Value of 5000 *l*. Stat. 14. Car. 2.

The Word literally denotes *Dead-Hand*, being a Compound of *Mort*, dead, and *Main*, Hand.

Thus *Hottoman de Verb. Feodal.* says, *Manus mortua locutio est que separat ut de his quoniam possessio, ut ita dicam immortalis est, quia nunquam heredes habere desinent. Quia de causa res nunquam ad priorem Dominum revertitur. Nam Manus pro possessione dicitur, Mortuus per Antiphrasim pro Immortali, &c.*

The Reason of the Name proceeds from this, that the Services and other Profits due for such Lands, should not, without such Licence, come into a dead Hand, (*Mainmort*), i. e. into a Hand as it were dead, that is, so dedicated to God, or pious Uses, as to be different from other Lands, Tenements, or Hereditaments, and never to revert to the Donor, or any temporal or common Use. *Hottoman* defines *Mort-main* to be the Possession of those who are, as it were, immortal, because they never ceased to have Heirs; so that the Estate never reverts to its first Lord. *Main*, Hand, being used for Possession; and *Mort*, Dead, by Antiphrasis, for immortal.

MORTOISE, or MORTISE, in Carpentry, &c. a kind of Joint, wherein a Hole or Incision, of a certain Depth, is made in the Thickness of a Piece of Wood, which is to receive another Piece, call'd a *TENON*. See TENON.

The Word is originally *French*. *Borel* derives it from *morde*, to bite.

MORTUARY, is a Gift left by a Man at his Death to his Parish-Church, for a Recompense of his Personal Tithes and Offerings, not duly paid in his Life-time. It is not properly and originally due to an Incumbent from any but those of his own Parish: But, by Custom, in some Places of the Kingdom, it is paid to the Parsons of other Parishes, as the Corps passes thro' them.

MOSAIC, MOSAIC Work, or, as some chuse to call it, MUSAIC, from the Latin *Opus Mosaicum*; an Assemblage of little Pieces of Glass, Marble, precious Stones, &c. of various Colours, cut square and cemented on a Ground of Stucco, &c. imitating the natural Colours and Degradations of Painting. See PAINTING.

In this sense *Mosaic Work* includes *Marquetry*, or *Inlaid Work*, *Fanering*, &c. But in the restrain'd sense of the *Word*, it only takes in Works of Stone, Metals and Glass; those of Wood being distinguish'd by the Name of *Marquetry* or *Inlaying*.

Others distinguish otherwise between *Mosaic*, and *Marquetry*. In that properly call'd *Mosaic*, the several Stones are all of the same Colour; and the Changes, and Diminutions of Colours, and Shades, are made by applying different Stones one on another, but all of the same Colour. *Marquetry*, on the contrary, consists of Stones of different Colours; and by these the several Colours, Shades, Degradations, &c. are express'd.

The Critics are divided as to the Origin and Reason of the Name *Mosaic*. Some derive it from *Mosaicum*, a Corruption of *Mosaïcum*, as that is of *Misraim*, as it was call'd among the *Romans*. *Sealiger* derives it from the *Greek* *μωσαιος*, and imagines the Name was given to this sort of Works, as being very fine, and ingenious. *Nebriensis* is of opinion they were so call'd, because *ex illis Picturis ornabantur Mosaïca*.

*Mosaic* seems to have taken its Origin from *Painting*: The fine Effect and Use of Pavements, composed of Pieces of Marble of different Colours so well join'd together, as that when dry'd they might be polish'd, and the whole make a very beautiful and solid Body, which continually trodden upon, and washed with Water, was not at all damaged; gave the Painter the hint; who soon carry'd the Art to a much greater Perfection: so as to represent *Foliages*, *Mosaïques*, and other *Grotesque* Pieces of various Colours, on a Ground of black or white Marble. In fine, observing the good Effect which this kind of Work had in Pavements, and finding that it resisted Water, they proceeded to line Walls therewith, and to make various Figures for the Ornament of their Temples and public Buildings.

But Nature not producing Variety of Colours enough for 'em in Marbles, to paint all kinds of Objects, they be thought of counterfeiting 'em with Glass and Metal Colours; which succeeded so well with 'em, that having given all manner of Tints to an infinite number of little Pieces of these two Matters, to counterfeit Stones of various Colours, in order to get more Colours; the Workmen arrang'd 'em with so much Art, that their *Mosaic* seem'd almost to dispute with Paintings. This way of representing Objects having this advantage, that it resists the Injuries of the Air as well as Marble itself; and even grows more beautiful with Time, which effaces all other kind of Painting.

But the Moderns are gone further, and setting aside Glass and Metals, as too mean Materials, have introduced, along with the finest Marbles, the richest of precious Stones, as *Lapis*, *Agar*, *Cornelians*, *Emeralds*, *Turquoises*, &c.

Of these three Kinds of *Mosaic*-Work, that of colour'd Glass and Metals is now little in use, tho' of a surprizing Lustre and Durableness: of the other two, that of Marbles alone is in common Use; the *Mosaic* of precious Stone being so very dear, that the few Workmen who apply themselves to it, make little else but petty Works, as Ornaments for Altar-Pieces, Tables for rich Cabinets, &c. Tho' out of these must be excepted that sumptuous Chapel of the Dukes of *Tosenny*, which has been so long in hand, and which, if ever it be finish'd, will be a noble Monument of the Magnificence and Piety of those Princes, as well as of the Patience and Address of the Workmen employ'd therein.

We shall however enter into some Detail of the Manner of working in those three Kinds of *Mosaic*; to which we shall add a fourth much newer, yet equally ingenious with any of the rest, made with a kind of *Gypsum* or *Talc*, found in Stone-Quarries about *Paris*.

#### MOSAIC Work of Glass.

This Kind of *Mosaic* they begin with little Pieces of Glass, which they provide of as many different Colours as possible. To this end, the Glassmen's Furnaces being disposed, and their Pots or Crucibles full of the Matter of which Glass is made, or rather of Glass already made, they put what Colour or Dye they think fit in each Crucible, always beginning with the weakest, and augmenting the Strength of the Colours from Crucible to Crucible, till they come to the deepest Die, as in mixing of Colours on a Palette to paint in Oil. When the Glass is well boil'd, and all the Colours in their perfection, they take out the Glass hot, as it is, and lay it on a smooth Marble, flattning it down with another like Marble, and then cutting it into Slices of equal bigness, and about the thickness of an Inch and half. They then with an Instrument, which the *Italians* call *Bocca di Cama*, make other Pieces square, and others of different Figures and Sizes, as occasion requires; these

they dispose orderly in Cases; as in *Painting in Fresco*; 'tis usual to range all the different Tints in Shells, and according to their Colour.

If 'tis desir'd to have Gold, either in the Ground of the Painting, or in the Ornaments, or the *Draperies*, they take some of the Pieces of Glass, form'd and cut in the manner just mention'd. These they moisten on one side with Gum-Water, and afterwards lay 'em over with Gold-Leaf. They then put this Piece, or several Pieces at a time, on a Fire-shovel, which they place in the mouth of the Furnace, after having first cover'd them with another hollow Piece of Glass. Here they continue till such time as they become red-hot; after which the Shovel is drawn out, all at once, and the Gold becomes so firmly attach'd to the Glass, that it will never afterwards leave it.

Now, to apply these several Pieces, and out of 'em to form a Picture, they first make a Cartoon, or Design; this they transfer on the Ground or Plaster, by calquing, as in *Painting in Fresco*. See *Fresco*.

As this Plaster is to be laid thick on the Wall, it will continue fresh and soft a considerable time, so that there may be enough prepar'd at once to serve three or four days. It is compos'd of Lime made of hard Stone, with Brick-dust very fine, Gum-Tragacanth, and Whites of Eggs; when it is thus prepar'd, and laid on the Wall, and made the Design of what is to be represented, with Plyers they take out the little Pieces of Glass, ranging 'em one after another, and still keeping strictly to the light Shadow, different Tints and Colours represented in the Design before; pressing or flattning 'em down with a Ruler, which serves both to sink 'em within the Ground, and to render the Surface even.

Thus, in a long time, and with an infinite deal of trouble, they finish the Work, which is still the more beautiful, as the Pieces of Glass are more uniform, and rang'd at more equal heights. Some of these are executed with so much Justness, that they appear as smooth as a Table of Marble, and as finish'd and masterly as a *Painting in Fresco*; with this advantage, that they have a fine Lustre, and will hold almost for ever.

The finest Works of this kind, that have descended to us, and those whereon the Moderns have retriev'd the Art, almost lost, are those of the Church of *St. Agnes*, formerly the Temple of *Bacchus* at *Rome*; at *Pisa*, *Florence*, and other Cities of *Italy*. The most esteem'd among the Works of the Moderns, are those of *Joseph Pene*, and the Chevalier *Lafosse*, in the Church of *St. Peter* at *Rome*. There are very good ones likewise at *Venice*.

#### MOSAIC Work of Marble, and precious Stones.

These two Kinds of *Mosaic* bear so near a relation to each other, as to the Manner of Working, that to avoid Repetition, we shall give 'em both under one; observing, by the way, wherein the one differs from the other, either in the sawing or the ranging of the Stones.

*Mosaic* of Marble is used in large Works, as in Pavements of Churches, Basilicks, and Palaces; and in the Incrustation and Vaneering of the Walls of the same Edifices. As to that of Stones, especially precious Stones, 'tis only used in small Works, as before observ'd.

The Ground of *Mosaic* Works wholly Marble, is ordinarily a massive Marble, either white or black. On this Ground the Design is cut with a Chisel, having been first calqued. When 'tis dug of a sufficient Depth, i. e. an Inch or more, 'tis fill'd up with Marble of a proper Colour, first cut out, or fashion'd to the Design, and reduc'd to the Thickness of the Indentures, with various Instruments. To make the Pieces, thus insert'd into the Indentures, hold, whose several Colours are to imitate those of the Design, they use a Stac, compos'd of Lime and Marble Dust; or a Mastic, which each Workman prepares differently: after which, the Work is half polish'd with a soft kind of Stone.

The Figures thus mark'd out, the Painter, or Sculptor himself draws, with a Pencil, the Colours of the Figures not determin'd by the Ground, and in the same manner makes Strokes or Hatchings, in the Places where Shadows are to be; and when he has engrav'd with the Chisel all the Strokes thus drawn, he fills them up with a black Mastic, compos'd partly of *Eurpandy*-Pitch, pour'd on hot; taking off, afterwards, what is superfluous, with a piece of soft Stone or Brick, which with Water and beaten Cement, takes away the Mastic, polishes the Marble, and renders the whole so even, one would imagine it only consist'd of one Piece: 'Tis this kind of *Mosaic* we see in the pompous Church of the Invalids at *Paris*, and the fine Chapel at *Versailles*; and wherewith some entire Apartments of that Palace are incrustated.

For *Mosaic* Work of precious Stones; there are required other and more delicate Instruments than those used by Marble; as Wheels, Drills, Tin-Plates, &c. used by *Lapidaries*, and Engravers on Stone.

As none but the richest Marbles and Stones enter this Work, to make 'em go the further, they are sawn into the thinnest Leaves imaginable, scarce exceeding half a Line in Thickness; the Block to be saw'd, is fasten'd firmly with Curds, on the Bench, only rais'd a little on a piece of Wood, one or two Inches high. Two Iron Pins, which are on one side the Block, and which serve to fasten it, serve also to direct the Saw, which with Pieces thus saw'd, are put into a Vice contriv'd for the purpose; and with a kind of Saw or Bow made of fine Brafs Wire, bent on a Piece of Springy Wood, together with Emery steep'd in Water, the Leaf is gradually fashion'd, by following the Strokes of the Design made on Paper, and glaz'd on the Piece. See MARQUETRY.

When there are Pieces enough fasten'd to form an entire Flower, or some other Part of the Design, they are apply'd. The Ground that supports this *Mosaic*, is usually of Free Stone. The Manner wherewith the Stones are join'd together, is a Mastic, or kind of Stuc, laid very thin on the Leaves as they are fasten'd; and the Leaves in this State, apply'd with Flyers. If any Contour, or Side of a Leaf, be not either rounded enough, or squared enough, to fit the Place where it is to be used, when 'tis too large, 'tis brought down with a Brafs File or Rasp, and when too small, is managed with a Drill, and other Lapidary-Instruments.

#### Manner of making MOSAIC Work of Gypsum.

The Gypsum is a kind of coarse Talc, or a shining transparent Stone, found in the Quarries of *Montmartre* near Paris, among the Stones thence dug to make the Plaster of Paris; 'tis different from the Plaster, but retains the Name the Romans gave the Plaster, viz. *Gypsum*. Of this Stone, calcin'd in a Kiln, and beaten in a Mortar, and pass'd thro a Sieve, they make a kind of artificial Marbles, imitating precious Stones, and of these compose a kind of *Mosaic* Work, which comes little short either of the Durableness or Vivacity of the natural Stones; and which has this advantage, that it admits of continu'd Pieces, or Paintings of entire Compartments, without any Joining visible.

Some make the Ground of Plaster of Paris, others of Free-Stone; if the former, 'tis spread in a wooden Frame, of the length and breadth of the intended Work, and about an Inch and half thick. This Frame is contriv'd, as the Tenons being only join'd to the Mortises by single Pins, they may be taken asunder, and the Frame be dismount'd when the Plaster is dry. This Frame they cover on one side with a strong Linnen Cloth, nail'd all around, which being plac'd horizontally, with the Linnen at bottom, is fill'd with Plaster, pass'd thro a wide Sieve. The Plaster being half dry, the Frame is set perpendicular, and left till it be quite dry; then taken out, by dismounting the Frame. In this *Mosaic*, the Ground is the most important Part.

Now to prepare the sifted Gypsum to be apply'd on this Ground, they dissolve and boil it in the best English Glue, and after mixing with it the Colour it is to bear, the whole is work'd up together into the ordinary Consistence of Plaster; and then taken up and spread on the Ground, five or six Inches thick. It must be observ'd, that if the Work be such, as that Mouldings are requir'd, they are form'd with Gouges and other Instruments.

'Tis on this Plaster, thus colour'd like Marble or precious Stone, and which is to serve as a Ground to a Work either of Lapis, Agar, Alabaster, or the like, that the Design to be represented is drawn; having been first pounced or calqued. To hollow or impress the Design, they use the same Instruments with the Sculptors; the Ground whercon they are to work, not being much less hard than Marble itself. The Cavities thus made in the Ground, are fill'd up with the same Gypsum boil'd in Glac, only differently colour'd; and thus are the several Colours of the Original represented. To have the necessary Colours and Tints at hand, they temper Quantities of the Gypsum with the several Colours, in little Pots. When the Design is thus fill'd, and render'd visible, by half polishing it with Brick or soft Stone; they go over it again, cutting such Places as are either to be weaker, or more shadow'd, and filling 'em with Gypsum; which is repeated till all the Colours, added one after another, represent the Original to the Life. The Work being finish'd, is scower'd with soft Stone, Sand and Water; then with Pamico-stone, and lastly, polish'd with a wooden Mullet and Emery. Lastly, the Lustre is given it, by smecting it over with Oil, and rubbing it a long time with the Palm of the Hand; which gives it a Lustre nothing inferior to that of natural Marble.

If 'tis only requir'd to make a variegated Table, or other Work of several Colours; without *Mosaic* Figures, the Process is somewhat different. To this end, they only prepare separately, in large Bowls, as many different Colours as Nature shews in the Marble to be imitated, and after incorporating 'em with the Gypsum and Glue-Water, they

take a Truel-full of each, and dispose 'em in a Trough, without any order; then without mingling 'em, and only by cutting or crossing the Gypsum of each Truel once or twice with each of the rest, they give 'em that beautiful Confusion, which makes the Value of natural Marbles; Of these they then make their Tables, or lay 'em in a Mold, according to the Work to be done.

As to *Marquetry* or *Inlaid-Work*, the Antients were well acquainted with it, and used it for the adorning of their Beds, Tables, and other Moveables; asing for this purpose Ivory, and the richest Woods. But *Friar John of Verona* seems to have contributed the most to its Perfection, by discovering the Secret of dying Woods of all Colours and Degrees; by which means he was enabled to imitate Painting, and even to represent Architecture in Perspective.

They begin with sawing their Woods into Leaves, of the Thickness of one or two Teaths of an Inch; then take Pieces of the Design they are to follow, and fasten 'em to those Leaves, and with a little Steel saw the Contour of the Design. All that is necessary being taken off with the Saw, they give the Shadow to those Places that require it, by placing the Piece in a hot Sand, or otherwise, with the Direction necessary to shadow it more or less. This done, they lay each Piece in its place, on a Ground of another Wood, as dry Oak, and there fasten them with strong Glue.

There are two other Branches of *Mosaic* Work; the one call'd *Damascening*, or *Damask-Work*, consisting in an Assemblage of Gold or Silver Threads, of which are sometimes form'd flat Works, and sometimes Basso-Relievos. See DAMASCENING.

The other is call'd *Shell-Work*, consisting of Shells, artificial Congelations, Petrifications, &c. used in Grottos. See SHELL-Work.

MOSQUE, among the *Mahometans*, is a Temple set apart for the Exercises of Religion. See TEMPLE.

There are Royal *Mosques* founded by the Emperors, as *Salmans* and *Pelides* at *Constantinople*; and Private *Mosques* founded by *Muffies*, *Visiers*, *Bassas*, &c. they are built like large Halls, with Isles, Galleries, and Domes; and are adorned on the inside with Compartments, and Pieces of *Arabesque* Work. On one side is always found a Pool with several Casks.

The *Turks* have converted most of the Christian Churches into *Mosques*. At the top is always plac'd a Crescent.

The Word comes from the *Turkish* *Moschee*, which properly signifies a Temple built of Wood, such as the *Turks* first used. Hence the *Spaniards* derive their *Moscheta*, and the *Italians* *Moscheta*, and the *French* and *English* *Mosque*. *Borel* derives the Word from the *Greek* *μῦσος* Calf, because of the frequent mention of a Cow in the *Ancient*. Others, and with the greatest Appearance of Reason, derive it from the *Arabic* *Moshibah*, a Place of Worship.

MOSSE, *Ufnea* in Natural History, a little Plant of the Parasitic kind, growing on the Barks, &c. of several Trees, as Oak, Poplar, Ash, Cedar, &c. See PARASITE.

The most esteemed, and odoriferous is that of the Cedar; it is of some medicinal Use, being Astringent, and proper to stop Hemorrhagies and Dysenteries.

The Antients took the *Moss* of Trees to be the Effect of a Disorder or Discomposure of the Texture of the Bark; or at most a kind of little Filaments arising from the Bark. But the Moderns find by several Observations, that Mosses are all real, distinct Plants, whose Seed, being extremely small, is inclosed in little Capsules, which bursting of themselves, the Seed is carried off by the Winds, till falling on the Inequalities of the Bark of Trees, it is there stop'd, takes Root, and feeds at the expence of the Tree, as Mouldiness does on Bread, &c. See MOULDINESS.

The different kinds of *Mosses* are very numerous; *Mont. Faillont* reckons 157 several Species in the single Neighbourhood of Paris.

There is also a kind of greenish *Moss* growing on human Skulls that have been long exposed to the Air, call'd *Ufnea*, or *Mossus catvarius*. The Antients made a deal of Use of it as an Astringent, &c. See USNEA.

*Mosses* make an Article of Commerce; there being several kinds used in Medicine, in Perfuming, &c. Among others, the *Sea-Moss*, call'd *Coralline*, (see CORALLINE) and the *Moss* of Cedar and Fir, which enter the Composition of Cypress Powder.

The *Moss* of common Trees, as Oak, Ash, Poplar, &c. is used for Caulking of Vessels. 'Tis also used by Bird-Merchants, to prepare Cages for certain kinds of Birds to hatch in.

The Gardeners, &c. reckon *Moss* among the Diseases, or Infirmities of Plants. See DISEASE.

*Mr. Mortimer*, &c. directs it to be rubb'd, and scraped off with some proper Instrument that will not hurt the Bark of the Tree, or with a piece of Hair-Cloth after a soaking Rain; tho' the surest Cure is by removing the Cause; which is effected by detaining the Land well of

all superfluous Moisture. Or, it may be prevented, in the first planting of Trees, by not setting them too deep.

**MOTÉ, MOTÉ,** of the Saxons, *Gomot*; a Term frequently occurring in our ancient Customs, literally denoting a Meeting, Court, or Plea.

Of **MOTÉS, or Gomotes**, consider'd in the Sense of Assemblies, or Courts, there were divers kinds, as *Wittenagemote, Folkagemote, Schiregemote, Hundredgemote, Burghemote, Wardsgemote, Haldenemote, Swainagemote*, &c. See each under its proper Article, **WITTENAGEMOTE, FOLKAGEMOTE, &c.**

**MOTE, Mota**, was also used for a Fortress, or Castle; or the Site or Place where such Castle stood: As *Mota de Windsor, &c.*

**MOTS** was also a standing Water to keep Fish; or a large Ditch encompassing a Castle, or Dwelling-House. See **MOAT**.

**MOTHER, Mater**, a Female who stands in the Relation of Parent to another. See **PARENT, &c.**

Thus *Eve* is call'd our common *Mother*. *Cybele* among the Antients was the *Mother of the Gods*.

The *Queen Mother* is the same with what we otherwise call *Queen Dowager*. See **DOWAGER**.

We meet with Emphrases on Medals and Inscriptions with the Titles of *Mother of the Camp*; *Mother of the Senate*, *Mother of the Country*: *Mater Senatus, Mater Patrie, &c.* See **FATHER**.

**MOTHER TONGUE**, is properly an original Language, from which others are apparently form'd. See **LANGUAGE**.

Of *Mother Tongues*, Scaliger reckons ten in Europe, was the Greek, Latin, Teutonic or German, Sclavonic, Epuric, Sycilian or European Tartar, Hungarian, Cantabrian, Irish, and British. See **GREEK, LATIN, TEUTONIC, &c.**

**MOTHER CHURCHES** are those which have founded or erected others. See **CHURCH**.

In Beneficiary Matters we say it is not lawful for a Man to enjoy at the same time both the *Mother* and the Daughter: Meaning that the Canon Law does not allow an Abbot, and the Benefices depending thereon, to be held by the same Person.

**MOTHER of Pearl**, see **PEARL**.

*Fits of the MOTHER*, see **HYSTERIC Affection**.

**MOTION**, primarily so call'd, or *Local MOTION*, is a continued, and successive Change of Place; or that State of a Body whereby it corresponds successively to several different Places, or is present successively in several Parts of Space. See **PLACE**.

In this sense, the Doctrine and Laws of *Motion* make the Subject of *Mechanics, or Statics*. See **MECHANICS, &c.**

The ancient Philosophers consider'd *Motion* in a more general and extensive Sense. They defined it by a Passage out of one State into another; and thus made six Kinds, viz. *Creation, Generation, Corruption, Augmentation, Diminution, and Lation, or Local Motion*. See **CREATION, GENERATION, &c.**

Some of the later Schoolmen reduce these six Kinds of *Motion* to four: The first is general, including any Passage from one State to another; under which sense of *Motion* come *Creation, Production, and Mutation*. The second is a Passage of something already existing from one State to another; and thus *Generation* is a *Motion*. The third, a successive Passage of something already existing from one Term to another; and thus *Alteration and Accretion* are Species of *Motion*. The last, is *Lation, or Local Motion*; and thus *Walking* is *Motion*.

But the later Philosophers unanimously deny any other *Motion* beside *Local Motion*; and reduce all the Species above-mentioned to this one: So that we have here only to do with *Local Motion*; whereof the rest are only so many different Determinations, or Effects. See **ACCRETION, ALTERATION, GENERATION, &c.**

Physical Writers, both Antient and Modern, have ever been perplexed about the Nature and Definition of *Local Motion*.

The *Peripatetics* define it by *Abus Entis in potentia, prout in potentia*, Arist. 3. Phys. c. 2. But the Notion is too Abstract and Metaphysical for our Days; and is of no use in explaining the Properties of *Motion*.

The *Epicureans* call it the Migration of a Body, or a part of a Body, from one Place to another. On which Definition, the later *Epicureans* refine, and call it the Migration or Passage of a Body from Space to Space: Thus substituting the word *Space* for that of *Place*.

The *Cartesians* define *Motion* = Passage, or Removal of one Part of Matter out of the Neighbourhood of those Parts immediately contiguous thereto, into the Neighbourhood of others.

Which Definition agrees, in effect, with that of the *Epicureans*; all the Difference between 'em consisting in this, that what the one calls *Body and Place*; the other calls *Matter, and contiguous Parts*.

*Borell*, and other late Writers after him, define *Motion* more accurately and fully, the successive Passage of a

Body from one Place to another, in a determinate time, by being successively contiguous to all the Parts of the intermediate Space.

*Motion*, then, they agree to be the translation of a Body from Place to Place: But they differ infinitely when they come to explain wherein this Translation consists. And hence their Divisions of *Motion* become exceedingly precarious.

*Aristotle*, and the *Peripatetics*, divide all *Motion* into *Natural and Violent*.

*Natural MOTION* is that which has its Principle, or moving Force, within the moving Body. Such is that of a Stone falling towards the Centre of the Earth.

*Violent MOTION* is that whose Principle is without, and against which the moving Body makes a Resistance: Such is that of a Stone thrown upwards.

The Moderns generally divide *Motion* into *Absolute and Relative*.

*Absolute MOTION* is the Change of Place, in any moving Body; whose Celerity, therefore, will be measured by the Quantity of the absolute Space which the moveable Body runs thro'.

*Relative MOTION* is a Mutation of the Relative, or vulgar Place of the moving Body; and has its Celerity accounted by the Quantity of relative Space run thro'.

Others divide *Motion* into *Proper, and Improper or Foreign*.

*Proper MOTION* is a removal out of one proper Place into another, which hereby becomes proper, as being possessed by this Body alone; in exclusion of all others: Such is the *Motion* of a Wheel in a Clock.

*Improper, or Extraneous, or Foreign, or Common MOTION*, is the Passage of a Body out of one common Place into another common Place: Such is that of a Clock when moved in a Ship, &c.

The Reason of all this Diversity seems to arise from the not attending to the different Meanings of the Words; but comprising all in one Definition and Distinction; which they should rather have distinguish'd into several parts.

Some, e. g. in their Definitions of *Motions*, consider the moving Body, not as it regards the adjacent Bodies, but as it regards immovable and infinite Space. Others, again, consider the moving Body, not as it regards infinite Space, but as it regards other Bodies vastly remote. And others, lastly, consider the moving Body, not as it regards remote Bodies, but that Surface only to which it is contiguous.

But these various Meanings once settled, the Dispute clears up; for as every thing that moves may be consider'd in these three several Manners; there hence arise three several kinds of *Motions*; whereof that which regards the Parts of infinite immovable Space, without consideration of the circumbient Bodies, may be call'd *absolutely and truly proper Motion*. That which regards circumbient Bodies vastly remote, which may themselves possibly be moved, we call *relatively common Motion*. The last, which regards the Surfaces of the next contiguous Bodies, in as much as it may want all both absolute and common *Motion*, we call *relatively proper Motion*.

1. An *absolutely and truly proper MOTION* then, is the Application of a Body to different Parts of infinite and immovable Space. This alone is proper and absolute *Motion*, being always generated and changed by Forces impress'd on the moving Body itself, and by those only; and being that to which the real Forces of all Bodies to put others in *Motion* by impulse, are owing; and to which those *Motions* are proportioned. But this *Motion* we cannot investigate or determine accurately; nor can we distinguish, when two Bodies are impress'd on each other, in which of the two, e. g. that which appears to move the more swiftly, or the other which appears to move more slowly, and perhaps even to be at rest, the real *Motion*, and, consequently, the real Force whence the Impulse arose, is placed; nor being able to determine whether the Centre of Gravity, or of the whole System (which is but a Point in infinite Space) is itself at rest or in *Motion*.

2. *Relatively common MOTION* is a Change of the Situation of a Body with respect to other remote circumbient Bodies; and this is the *Motion* we speak of, when we say that Men, Cities, and the Earth itself moves round the Sun. This is also the *Motion* we mean, when we estimate the Quantity of *Motion*, and the Force any Body has to Impel another: For instance, if a wooden Sphere, fill'd with Lead to make it the heavier, be cast from the Hand we use to estimate the Quantity of *Motion*, and the Force which the Sphere has to Impel another, from the Celerity of the Sphere and the Weight of the included Lead; and that truly with regard to the Force itself, and the Effect thereof as it falls under our Senses: But whether the real Power or *Motion* be in the Sphere which appears to strike, or in the Earth which appears to be struck, that, as has been observed above, we cannot determine.

Lastly, *Relatively proper* MOTION is the successive Application of a Body to the different parts of the contiguous Bodies. And thus the *Motion* usually understood in Physical Disputes about the Natures of particular things; as when we say, that Heat, Sound, Fluidity, &c. consist in Motion. This must be added however, that by successive Application of a Body, its whole Surface, taken together, must be conceiv'd successively apply'd to different parts of contiguous Bodies.

From these several Definitions of Motion arise as many Definitions of Place: For when we speak of Motion (or Rest) truly and absolutely proper, then Place is that part of infinite and immovable Space which the Body fills. When of Motion *relatively common*, then Place is a part of any Space or moveable Dimension. When of Motion *relatively proper*, (which is really very improper) Place is then the Surface of the next adjacent Bodies, or sensible Spaces. See PLACE.

The Definition of Rest is pretty well agreed on; but whether Rest be a mere Privation of Motion, or any thing positive, is hotly disputed. *Malebranch*, and others, maintain the former side of the Question. *Cornet*, and others, the latter: The latter contend, that a Body at rest, has no power to persevere in that rest, nor to resist any Bodies that would destroy it; and that Motion may as well be call'd a Cessation of Rest, as Rest of Motion. See REST.

The main Argument urg'd by the former is this: Suppose a Globe at rest, and suppose God cease to will its rest; What will be the Consequence? it will rest still. Let it be in Motion, and let God cease to will its Motion; What will be the Consequence? it will cease to move; that is, be at rest; because the Power whereby a Body in Motion perseveres in that state, is the positive Will of God; that whereby the quiescent Body perseveres, only his private Will.

But this is a manifest *Petio principii*; for the Force or Coercit whereby Bodies, whether moving or quiescent, persevere in those states, is the mere Inactivity of Matter; and therefore were it possible for God not to will any thing, a Body already in Motion, would move for ever; as a Body at Rest, would rest for ever. To this Inactivity of Matter, it is owing that all Bodies rest according to their Quantities of Matter, and that any Body striking another with any given Velocity, will move it in the same Proportion which its Density, or Quantity of Matter has, to the Density or Quantity of Matter of the other.

Motion has ever been esteem'd a Species of Quantity; and its Quantity, or Greatness, which we otherwise call its Momentum, is estimated partly from the length of the Line which the moving Body describes; as if a Body pass over a Line of 100 Feet, the Quantity of its Motion is greater than if it pass'd over 50 Feet: and partly from the Quantity of the Matter moved together, or at the same time, i. e. not from the Bulk or Extension of the Body, but from its Mass or Weight; the Air, and other subtle Matters wherewith the Pores are filled, not entering into the account: As if a Body of two cubic Feet run over a Line of 100 Feet, the Quantity of its Motion is greater than that of a Body of one cubic Foot describing the same Line: For whatever Motion one Whole has, that is had in one Half of the other; and the Motion of the Whole is the Sum of the Motion of all its Parts.

Hence it follows, that for two unequal Bodies to have equal Motions, or Momentums, the Lines which they pass over must be in a reciprocal Proportion of their Masses or Weights, i. e. if one Body have three times the Quantity of Matter that another has, the Line it runs over must be  $\frac{1}{3}$  of the Line run over by the other. If two Bodies then fasten'd to the two Extremities of a Balance or Lever, have their Masses in a reciprocal Ratio of their Distances from the fixed Point, when these are moved they must describe Lines in a reciprocal Ratio of the Masses.

For instance, if the Body A (Tab. MECHANICS, Fig. 50.) have three times the Mass or Weight of B, and each be fasten'd to the Extremities of the Lever A B, whose Fulcrum or fixed Point is C, in such manner as that the Distance B C is thrice the Distance C A; the Lever can't incline either way, but the Space which the less Body moves will be thrice the Space A D, which the greater moves: So that their Motions will be equal; nor is there any reason why the Body A tending downwards, v. g. with four Degrees of Motion, should raise the Body B, rather than B tending downwards likewise with the same four Degrees of Motion, should raise the Body A: They will therefore be in Equilibrium. On which Foundation depends the whole Doctrine of Mechanics.

Hence that great Problem of *Archimedes*, Δειξτε μοι σημειον οπου εστιν η βαρεια κεντρα; with any given Power, how small soever, to raise any Weight given, how great soever; for by increasing the Distance C B infinitely, the Power of the Body A will be increased infinitely. See MECHANICS and EQUILIBRIUM.

As it is allow'd on all hands, that Motion is no essential Attribute of Matter; hence arises a dispute about its Production, and to what Cause it owes its Continuation.

The *Cartesians* maintain, that the Creator at the Beginning impress'd a certain Quantity of Motion on Bodies; and that under such Laws, as that no part of it should be lost, but the same Portion of Motion be constantly prefer'd in Matter. And hence conclude, that if any moving Body strike on any other Body, the former loses no more of its Motion than it communicates to the latter. See CARTESIAN.

His Principle Sir *I. Newton* overturns in the following Words: — 'From the various Compositions of two Motions, it is manifest there is not always the same Quantity of Motion in the World; for if two Balls join'd together by a slender Wire, revolve with an uniform Motion about their common Centre of Gravity, and at the same time that Centre be carried uniformly in a right Line drawn in the Plane of their circular Motion; the Sum of the Motion of the two Balls, as often as they are in a right Line drawn from their common Center of Gravity, will be greater than the Sum of their Motions when they are in a Line perpendicular to that other. Whence it appears, that Motion may both be generated and lost. But by reason of the tenacity of fluid Bodies, and the friction of their Parts, with the Weakness of the elastic Power in solid Bodies, Nature seems to incline much rather to the Destruction than the Production of Motion; and in reality Motion becomes continually less and less. For Bodies which are either so perfectly hard, or so soft, as to have no elastic Power, will not rebound from each other: Their impenetrability will only stop their Motion. And if two such Bodies, equal to each other, be carried with equal but opposite Motions, so as to meet in a void Space, by the Laws of Motion they must stop in the very Place of Concurrence, lose all their Motion, and be at rest for ever, unless they have an elastic Power to give 'em a new Motion. If they have Elasticity enough to enable 'em to rebound with  $\frac{1}{2}$ , or  $\frac{3}{4}$ , or  $\frac{1}{3}$  of the Force wherewith they meet, they will lose  $\frac{1}{2}$ , or  $\frac{3}{4}$ , or  $\frac{2}{3}$  of their Motion. And this is confirmed by Experiments: For if two equal Pendulums be let fall from equal heights, so as to strike full on each other; if those Pendulums be of Lead, or soft Clay, they will lose all, or almost all their Motion; and if they be of any Elastic Matter, they will only retain so much Motion as they receive from their elastic Power.' If it be asked, how it happens that Motion being thus continually lost, should be continually renewed: The same Author adds, that it is renewed from some active Principles. 'Such as the Cause of Gravity, wherewith the Planets and Comets preserve their Motions in their Orbits, and all Bodies acquire a great degree of Motion in falling; and the Cause of Fermentation, wherewith the Heart and Blood of Animals preserve a perpetual Warmth and Motion; the inner parts of the Earth are kept continually warm'd; many Bodies burn and shine; and the Sun himself burns and shines, and with his Light warms and clears all things,' (as also from the Cause of Elasticity, by which Bodies restore themselves into their former Figure;) 'For we find but little Motion in the World, except what plainly flows, either from the active Principles, or from the Command of the Willer.' See GRAVITY, FERMENTATION, ELASTICITY, &c.

As to the Continuation of Motion, or the Cause why a Body once in Motion comes to persevere in it; this has been extremely controverted among Physical Writers, and yet follows very evidently from one of the great Laws of Nature, viz. That all Bodies persevere in their present State, whether of Rest or Motion, unless disturb'd by some foreign Powers. Motion therefore once begun, would be continued in infinitum, were it to meet with no interruption from external Causes; as the Power of Gravity, the Resistance of the Medium, &c. So that *Aristotle's* Principle, Whatever is moving affects Rest, is groundless. See NATURE.

Nor has the Communication of Motion, or the manner how a moving Body comes to affect another at Rest; or how much of its Motion is communicated by the first to the last, been less disputed. See the Laws thereof under the Word PERCUSSION.

MOTION, we have observ'd, is the Subject of Mechanics; and Mechanics is the Basis of all Natural Philosophy; which is hence denominat'd Mechanical. See MECHANICAL.

In effect, all the Phenomena of Nature; all the Changes that happen in the System of Bodies, are owing to Motion; and are directed according to the Laws thereof.

Hence, the modern Philosophers have apply'd themselves particularly to cultivate the Doctrine of Motion; to investigate the Properties, Laws, &c. thereof; by Observation, Experiment, and the Use of Geometry. And to this we owe the great Advantages of the modern Philosophy above that of the Antients; who were extremely disregarding

regardful of Motion; notwithstanding that they seem'd fo sensible of its Importance, that they defined Nature by the first Principle of Motion and Rest of the Substance wherein it is. See NATURAL.

Among all the Antients, there is nothing extant of Motion, excepting some things in Archimedes's Books de Equilibrantibus. To Galilee, a great part of the Doctrine of Motion is owing. He first discover'd the general Laws of Motion, and particularly of the Defcent of heavy Bodies, both at large, and on inclined Planes; the Laws of the Motion of Projectiles; the Vibrations of Pendulums, and stretched Chords; with the Theory of Resistances, &c. which were things the Antients had no Notion of. See DESCENT, PENDULUM, PROJECTILE, RESISTANCE, &c.

His Disciple, Torricelli, polish'd, and improv'd on the Discoveries of his Master; and added to them divers Experiments concerning the Force of Percussion, and the Equilibrium of Fluids. See FLUID. M. Huygens improved very considerably on the Doctrine of the Pendulum; and both he and Borelli on the Force of Percussion. Lastly, Newton, Leibnitz, Varignon, Mariotte, &c. have brought the Doctrine of Motion still nearer to Perfection.

The general Laws of Motion were first brought into a System, and Analytically demonstrated together, by Dr. Wallis, Sir Christopher Wren, and M. Huygens all much about the same time; the first in Bodies not Elastic, and the two last in Elastic Bodies. Lastly, the whole Doctrine of Motion, including all the Discoveries both of the Antients and Moderns on that head, was given by Dr. Wallis in his Mechanica, or de Motu, published in 1669.

MOTION may be consider'd either as Equable, and Uniform; or as Accelerated, and Retarded. Equable Motions again may be consider'd either as Simple, or as Compound. Compound Motion may again be consider'd either as Retilinear, or Curvilinear.

And all these again may be consider'd either with regard to themselves, or with regard to the manner of their Production, and Communication, by Percussion, &c.

Equable MOTION, is that wherein the moving Body proceeds with the same unvary'd Velocity.

The Laws of Equable Motion are as follow; the Reader being only to observe, by the way, that by Mass we mean Quantity of Matter or Weight, express'd by M; by Momentum, the Quantity of Motion or Impetus, express'd by I; by Time, the Duration of Motion, express'd by T; by Velocity, its Swiftines, noted by V; and by Space, the Line it describes, noted S. See MOMENTUM, MASS, VELOCITY.

Thus if the Space be = f, and the Time = t; the Velocity will be also express'd f:t: And if the Velocity = v, and the Mass = m; the Momentum will likewise be = v m.

Laws of Uniform or Equable MOTION.

Theor. I. The Velocities V and v of two Bodies moving equally, are in a Ratio compounded of the direct Ratio of the Spaces S and s, and the reciprocal Ratio of the Times T and t.

Demonst. For  $V = S : T$  and  $v = s : t$ .  
therefore  $V : v :: S t : s T$

$$V : v :: S t : s T$$

Q. E. D.

Schol. This and the following Theorems may be illustrated in Numbers; thus suppose that a Body A, whose Mass is as 7, that is, 7 Pound, in the time of 3 Seconds passes over a Space of 12 Feet; and another Body B, whose Mass is as 5, in the time of 8 Seconds passes over a Space of 16 Feet. We shall then have M = 7, T = 3, S = 12; m = 5, t = 8, f = 16. And therefore V = 4, v = 2. The Case then will stand thus:

$$V : v :: S t : s T$$

4 : 2 :: 12 . 8 : 16 . 3 : 4 . 2 .

Corol. If V = v, then will S t = f T; therefore S t : f : T : f. That is, If two Bodies move equally, and with the same Velocities, their Spaces are as the Times.

Schol. The Corollaries may be illustrated by Numbers, in like manner as the Theorems. Thus suppose S = 12, T = 6, f = 8, t = 4. Then will the V = 12 : 6 = 2, and v = 8 : 4 = 2.

Consequently by reason  $V = v$   
 $S : f = T : t$   
12 : 8 = 6 : 4.

Corol. 2. If V = v, and also S = T; then will S = f, and so the Bodies moving equally, will describe equal Spaces in equal Times.

Theor. II. The Spaces S and s, over which two Bodies pass, are in a Ratio compos'd of the Ratio of the Times T and t, and of the Velocities V, &c.

Dem. For  $V : v :: S t : s T$

Therefore  $V f T = v s T$

And  $S : s :: V T : v t$

In Numbers 12 : 16 :: 4 . 3 : 2 . 8 :: 12 : 16

Corol. If S = f, V T = v t, so that V : v :: t : T. that is, if two Bodies moving equally, describe equal Spaces; their Velocities will be in a reciprocal Ratio of their Times.

In Numbers, if we suppose S = 12, and f = 12. Because S = V T and f = v t; if V = 2 and v = 3, T = 6 and t = 4.

So that we have  $V : v :: t : T$   
2 : 3 = 4 : 6.

Cor. 2. Further, if t = T, then will V = v; and therefore Bodies which move equally, describe equal Spaces in equal Times, and have their Velocities equal.

Theor. III. The Momenta, or Quantities of Motion, of two Bodies moving equally, I and i, are in a Ratio compounded of the Velocities V and v, and the Masses or Quantities of Matter M and m.

Dem. For I = V M, and i = v m; therefore I : i :: V M : v m; that is, the Ratio of I to i is compounded of the Ratio of V to v, and of M to m. Q. E. D.

Cor. 1. If I = i, then will V M = v m; and therefore V : v = m : M. That is, if the Momenta of two Bodies moving equally, be equal; their Velocities will be in a reciprocal Ratio of their Masses.

Cor. 2. And therefore if M = m, V = v; that is, if the Momenta and Masses of two moving Bodies be equal, their Velocities are also equal.

Theor. IV. The Velocities V and v of two Bodies moving equally, are in a Ratio compounded of the direct Ratio of their Momenta I and i, and the reciprocal one of their Masses M and m.

Dem. Since I : i :: V M : v m

$$I v m = i V M$$

$$V : v = I m : i M$$

Q. E. D.

In Numbers 4 : 1 :: 2 . 8 : 10 . 7 = 4 . 2 = 2 . 1 = 4 . 2.

Cor. 1. If V = v, then I m = i M; and therefore I : i = M : m; that is, if two Bodies move equally, and with the same Velocity, their Momenta will be in the same Ratio with their Masses.

Cor. 2. If M = m, I = i; and therefore if two Bodies, that have the same Masses, move equally, and with equal Velocity, their Momenta are equal.

Theor. V. In an equable Motion, the Masses of the Bodies M and m are in a Ratio compos'd of the direct Ratio of their Momenta, and the reciprocal Ratio of their Velocities V and v.

Dem. Since I : i :: V M : v m

Therefore  $I v m = i V M$

$$M : m = I v : i V$$

In Numbers 7 : 5 :: 2 . 8 . 5 : 10 . 4 :: 7 . 1 : 5 : 2 : 7 . 5 .

Cor. If M = m, then will v = i V; and therefore I : i = V : v. That is, if two Bodies moving equally, have their Masses equal, their Momenta will be as their Velocities.

In Numbers, suppose I = 12, i = 8, M = 4, m = 4; then will V = 12 : 4 = 3, and v = 8 : 4 = 2.

Therefore I : i = V : v

12 : 8 = 3 : 2.

Theor. VI. In an equable Motion, the Momenta I and i are in a Ratio compounded of the direct Ratio's of the Masses M and m, and the Spaces S and s, and the reciprocal Ratio of the Times T and t.

Dem. Because V : v :: S t : s T

And I : i :: V M : v m

Therefore  $V I : v i :: V M S t : v m s T$

$$I i + M S t : m s T$$

Q. E. D.

Cor. 1. If I = i, then will M S t = m s T; and therefore M : m = f T : S t, & f = m T : M t and T : t = M S : m s; that is, if two Bodies moving equally, have their Momenta equal, 1. Their Masses are in a Ratio compounded of the direct Ratio of their Times, and the reciprocal one of their Spaces. 2. Their Spaces are in a Ratio compounded of the direct Ratio of the Times, and the reciprocal one of their Masses. 3. Their Times are in a Ratio, compounded of their Masses and their Spaces.

Cor. 2. Further, if M = m; then will f T = S t; and therefore S t = f T; that is, if two Bodies moving equally, have their Momenta, and their Masses equal, their Spaces are as their Times.

Cor. 3. Again, if  $T = t$ , then will  $S = s$ . Two moving Bodies therefore, whose Masses and Momenta are equal, describe equal Spaces in equal Times.

Cor. 4. If besides  $l = i$ ,  $S = s$ ; then will  $mT = Mr$ ; and therefore  $M : m :: T : r$ ; that is, if two moving Bodies, whose Momenta are equal, pass over equal Spaces, their Masses are proportionable to their Times.

Cor. 5. Further, if  $T = t$ , then will  $M = m$ ; and therefore Bodies, whose Momenta are equal, and which moving equally, describe equal Spaces in equal Times, have their Masses equal.

Cor. 6. If besides  $l = i$ ,  $T = r$ ; then will  $MS = mf$ ; and therefore  $S : f :: m : M$ ; that is, the Spaces pass'd over in the same time, by two moving Bodies, whose Momenta are equal, are in a reciprocal Ratio of their Masses.

Theor. VII. In an equable Motion, the Spaces  $S$  and  $f$  are in a Ratio compounded of the direct Ratio's of the Momenta  $l$  and  $i$ , and the Times  $T$  and  $t$ ; and the reciprocal one of the Masses  $M$  and  $m$ .

Dem. Because  $l : i :: M S : m f T$ ,

$$\frac{l m f T : i i M S r}{\text{Wherefore } S : f :: l T m : i r M.}$$

In Numb. 12 : 16 :: 3 : 28 : 5.8.10.7 :: 3.4.1 : 8.2.1 :: 12 : 16.

Cor. 1. If  $S = f$ ,  $l T m = i r M$ ; and therefore  $l : i :: r M : T m$ ,  $M : m :: l T : i r$ ,  $T : r :: i M : l m$ . If two Bodies therefore move equally over equal Spaces,  $t$ . Their Momenta will be in a Ratio compounded of the direct Ratio of the Masses, and the reciprocal one of the Times. 2. Their Masses will be in a Ratio compounded of the Momenta and the Times. 3. The Times will be in a Ratio compounded of the direct Ratio of the Masses, and the reciprocal one of the Momenta.

Cor. 2. If beside  $S = f$ ,  $M = m$ ; then will  $l T = i r$ ; and therefore  $l : i :: r : T$ . That is, Bodies whose Masses are equal, have their Momenta reciprocally proportionable to the Times in which they move over equal Spaces.

Cor. 3. If beside  $S = f$ ,  $T = r$ ; then will  $l M = i m$ ; and therefore two Bodies moving equally, and thro equal Spaces in equal Times, have their Momenta proportionable to their Masses.

Theor. VIII. Two Bodies moving equally, have their Masses  $M$  and  $m$ , in a Ratio compounded of the direct Ratio's of the Momenta  $l$  and  $i$ , and the Times  $T$  and  $t$ , and the reciprocal one of the Spaces  $f$  and  $S$ .

Dem. Because  $l : i :: M S : m f T$ ,  $l m f T = i M S r$ .

$$\text{Wherefore } M : m :: l T f : i r S.$$

In Numbers 7 : 5 :: 9.28.16 : 8.10.12 : 3 : 7.2 : 1.10.3 : 7 : 5.

Again  $l : i :: M S : m f T$ .

In Numbers 28 : 10 : 7.12.8 : 5.16.3 : 7.4.2 : 5.2.1 : 28 : 16.

Cor. 1. If  $M = m$ , then will  $l T f = i r S$ ; and therefore  $l : i :: r S : T f$ ,  $S : f :: l T : i r$ , and  $l : r :: i S : l f$ . That is, in two moving Bodies, whose Masses are equal; 1. The Momenta are in a Ratio compounded of the direct Ratio of the Spaces, and the reciprocal one of the Times. 2. The Spaces are in a Ratio compounded of the Momenta and the Times. 3. The Times are in a Ratio compounded of the direct Ratio of the Spaces, and the reciprocal one of the Momenta.

Cor. 2. If beside  $M = m$ ,  $T = t$ , then will  $l S = i f$ ; and therefore  $l : i :: S : f$ . That is, the Momenta of two Bodies, whose Masses are equal, are proportional to the Spaces pass'd over in equal Times.

Theor. IX. In equable Motions, the Times  $T$  and  $t$  are in a Ratio compounded of the direct Ratio's of the Masses  $M$  and  $m$ , and the Spaces  $S$  and  $f$ , and the reciprocal one of the Momenta  $l$  and  $i$ .

Dem. Because  $l : i :: M S : m f T$ ,  $l m f T = i M S r$ .

$$\text{Wherefore } T : t :: i M S : l m f.$$

Cor. If  $T = t$ ,  $i M S = l m f$ ; and therefore  $l : i :: M S : m f$ ,  $M : m :: l S : i f$ ; and  $S : f :: l m : i M$ . That is, if two Bodies, moving equally, describe equal Spaces in equal Times; 1. Their Momenta will be in a Ratio compounded of the Masses and the Spaces. 2. Their Masses will be in a Ratio compounded of the direct Ratio of the Momenta, and the reciprocal one of the Spaces. 3. The Spaces will be in a Ratio compounded of the direct Ratio of the Momenta, and the reciprocal one of the Masses.

The Laws of MOTIONS uniformly accelerated and retarded.

Def. By an accelerated Motion, we mean such a one as continually receives fresh Accretions of Velocity; and it is said to be uniformly accelerated, when in equal Times its Accretions of Velocity are equal. See ACCELERATION.

By a retarded Motion, is understood such a one, whose Velocity continually decreases; and it is said to be uniform-

ly retarded, when its Decrease is continually proportional to the Time. See RETARDATION.

Axiom. A Body once at rest, will never move, unless some other Body put it in Motion; and when once in Motion, it will continue for ever to move, with the same Velocity, and in the same Direction, unless it be forced from its State by some other Cause: This is evident from that fundamental Axiom in Philosophy, That there is nothing without a sufficient Cause.

Cor. 1. A Body therefore moved by one only Impulse, must proceed in a right Line.

Cor. 2. If then it be carry'd in a Curve, it must be acted on by a double Power; one, whereby it would proceed in a right Line; another, whereby it is continually drawn out of it.

Axiom 1. If the Action and Re-action of two (necessarily) Bodies be equal, there will no Motion ensue; but the Bodies after Collision, will remain at rest by each other.

Axiom 2. If a moving Body be impell'd in the Direction of its Motion, it will be accelerated; if by a resisting Force, it will be retarded. Heavy Bodies descend with an accelerated Motion.

Theor. X. If a Body move with an uniform Velocity; the Spaces will be in a duplicate Ratio of the Times.

Dem. For let the Velocity acquire'd in the Time  $t$  be  $v$ , then will the Velocity acquire'd in the Time  $2t$  be  $2v$ , in the Time  $3t$  be  $3v$ , &c. and the Spaces corresponding to those Times,  $t, 2t, 3t$ , &c. will be as  $t^2, 4t^2, 9t^2$ , &c. (by Theor. 2.) The Spaces therefore are as  $1. 4. 9$ , &c. And the Times as  $1. 2. 3$ , &c. that is, the Spaces are in a duplicate Ratio of the Times. Q. E. D.

Cor. In a Motion uniformly accelerated, the Times are in a sub-duplicate Ratio of the Spaces.

Theor. XI. The Spaces pass'd over by a Body uniformly accelerated, increase, in equal Times, according to the unequal Numbers 1. 5. 9. 13. &c.

Dem. If the Times, wherein a moving Body equally accelerated, proceeds, be as  $1. 2. 5. 4. 5$ , &c. the Space pass'd over in one Moment, will be as  $1$ , in a Moments as  $4$ , in  $2$  as  $9$ , in  $4$  as  $16$ , in  $5$  as  $25$ , &c. (Theor. 10.) If therefore you subtract the Space pass'd over in one Moment, viz. 1. from that pass'd over in two Moments, 4. there will remain the Space corresponding to the second Minute, viz. 3. In the same manner may be found the Space pass'd over in the third Minute,  $9 - 4 = 5$ . The Space corresponding to the fourth Minute,  $16 - 9 = 7$  and so of the rest. The Space of the first Minute therefore is as  $1$ , that of the second as  $3$ , that of the third as  $5$ , of the fourth as  $7$ , of the fifth as  $9$ , &c. Therefore the Spaces pass'd over by a Body, moving with an uniformly accelerated Motion, in equal Times increase according to the unequal Numbers 1. 5. 9. 13. &c. Q. E. D.

Theor. XII. The Spaces pass'd over by a Body equally accelerated, are in a duplicate Ratio of the Velocities.

Dem. For supposing the Velocities to be  $V$  and  $v$ , the Times  $T$  and  $t$ , the Spaces  $S$  and  $s$ ; then will  $V : v :: T : t$ . Wherefore, since  $S : s :: T^2 : t^2$ , (Theor. 10.)  $S : s :: V^2 : v^2$ .

Cor. Wherefore in a Motion uniformly accelerated, the Velocities are in a subduplicate Ratio of the Spaces.

Theor. XIII. Heavy Bodies descend with an uniformly accelerated Motion, in a Medium void of Resistance; if the Spaces be not very great.

Dem. Since heavy Bodies descend with one accelerated Velocity, the Power of Gravity must continually impel them. But the Power of Gravity is found the same at all Distances from the Earth where the Experiment can be made. Therefore heavy Bodies must be driven downwards in the same manner in equal times. If then, in the first Moment of Time, they be impell'd with the Velocity  $v$ , they will be impell'd with the same Velocity  $v$  in the second Moment, and with the same in the 3d, 4th, &c. Moments. Now the Medium being supposed void of all Resistance, (by Hypoth.) they will still retain the Velocity they acquire; and by reason of their equal fresh Acquisitions every Minute, they will descend with a Motion uniformly accelerated. Q. E. D. See GRAVITY.

Cor. 1. The Spaces of Descent therefore, are in a duplicate Ratio of their Times, and also of their Velocities, (Theor. 10, 12.) and increase according to the uneven Numbers 1. 5. 9. 13. &c. (Theor. 11.)

Cor. 2. The Times, and likewise the Velocities, are in a subduplicate Ratio of the Spaces, (Theor. 10, 12.)

Sol. In supposing heavy Bodies to move thro' a Medium void of Resistance, we exclude, at once, all manner of Impediments, under what Name soever they be call'd, or from whatsoever Cause they proceed; and among the rest, that Motion, wherein the Earth revolving on its Axis, carries with it heavy Bodies during the time of their fall; tho' this is not sensible at any moderate distance.

Sol. It was Galileus who first discover'd the Law of the Descent of heavy Bodies; and that too by Reasoning;

tho' he afterwards confirm'd it by Experiments. These he repeated again and again, and still found the Spaces pass'd over as the Squares of the Times: But it must be observed, that the Spaces are not to be taken in the Length, but the Height of the Plane, as will be shewn hereafter. See DESCENT.

The same Experiments were try'd, tho' in a different manner, by Riccioli and Grimaldi, who let fall several heavy Balls of the same Bulk and Weight, 8 Ounces each, from various Altitudes; measuring the Times of Descent by the Vibrations of a Pendulum. The Result of their Experiments is seen in the following Table.

Vibrations.	Time.	Space at the End of the Time.	
		Rom. Feet.	Eng. Feet.
5	0	50	10
10	1	40	30
15	2	50	50
20	3	162	70
25	4	10	90
6	1	C	15
12	2	O	60
18	3	C	135
24	4	C	240

Theor. XIV. If a heavy Body fall thro' a Medium void of Resistance, and from a Height not very great; the Space it passes over is subdule of that which it would pass over in the same time, with the Velocity it has acquir'd at the end of its fall.

Dem. Let the right Line AB (Tab. MECHANICS, Fig. 31.) represent the whole Time of a heavy Body's Descent; and let this be divided into any Number of equal Parts; & the Abscisses AP, AQ, AS, AT, draw the right Lines PM, QI, SH, BC, which may be as the Velocities acquir'd, in those Times, in the Descent. Since then AP : AQ : PM : QI, AP : AS : PM : SH, &c. (Eucl. VI. 2.) it then the Altitude of the Triangle ABC be conceiv'd to be divided into equal Parts infinitely small; the Motion being uniform in a Moment of Time infinitely small; the little Area PPM = P.P.PM as the Space pass'd over in the little Moment of Time P.P. (Theor. 2.) Therefore the Space pass'd over in the Time AB, will be as the Sum of all the little Areas, i. e. as the Triangle ABC. But the Space that would be described in the same Time AB with the uniform Velocity BC, being as the Rectangle ABCD, (Theor. 2.) it will be to the other Space as 1 to 2. (Eucl. I. 41.)

Cor. The Space therefore pass'd over in half the Time AB, with the Velocity BC, is equal to the Space which the heavy Body passes over from a State of Rest in the whole Time AB.

Problem 1. The Time wherein a heavy Body falls from any given Altitude being given; to determine the Spaces it passes over in each part of that Time.

Resol. Let the given Altitude be = a, the Time = t, the Space pass'd over in any part of that Time x. Then by Cor. of Theor. 15.

$$t : x :: t^2 : a$$

$$t^2 x = a$$

$$x = a : t^2$$

The Space therefore pass'd over in the first part of Time is a : t^2, and therefore that pass'd over in the second part of Time = 3 a : t^2; that pass'd over in the third part = 5 a : t^2, &c. (Ibid.)

E. gr. In the above-mentioned Experiments of Riccioli, the Ball descended 240 Feet in four Seconds. The Space therefore pass'd in the first Second = 240 : 16 = 15; that in the next Second = 15.3 = 45; that in the third = 15.5 = 75, &c.

Prob. 2. The Time of a heavy Body's Descent in a Medium void of Resistance thro' any given Space, being given, to determine the Time wherein it will pass over another given Space, in the same Medium.

Resol. and Dem. Since the Spaces are as the Squares of the Times, (Theor. 15.) to the Space the heavy Body moves in the given Time, the Space required in the Question, and the Square of the given Time, seek a fourth Proportional; this will be the Square of the Time required: Its square Root therefore being extract'd, will yield the Time required. E. gr. In Riccioli's Experiments the Ball fell 240 Feet in 4 Minutes; 'tis demanded then how much Time it will take up in falling 135 Feet? This Time will be found =  $\sqrt{(135 : 240)} = \sqrt{(135 : 240)} \sqrt{9} = 3$ .

Prob. 3. The Space a Body falls in any given Time in a Medium void of Resistance being given, to determine the Space it will fall, in any other given Interval of Time.

Resol. and Dem. Since the Spaces are as the Squares of the Times, (Theor. 15.) find a fourth Proportional to the Square of the Time wherein the Body falls thro' the given Space, the Square of the Time wherein it is to fall thro' the Space required, and the Space required; this fourth Proportional will be the Space required.

E. g. Suppose a Ball to fall 240 Feet in four Minutes time; and 'tis inquir'd what time it will spend in falling 135 Feet? The Answer will be found =  $\sqrt{(135 : 240)} = (135 : 240) \sqrt{9}$ .

Theor. XV. If a Body proceed with a Motion uniformly retarded, it will pass over half the Space which it would describe in the same time by an equable Motion.

Dem. Suppose the given Time divided into any Number of equal Parts; and draw the right Lines BC, S, H, Q, I, PM thereto, which are to be as the Velocities corresponding to the Parts of Time a, BS, BQ, BP, BA; so as letting fall the Perpendiculars HE, IF, MG, the right Lines CE, EF, CG, CB may be as the Velocities lost in the Times HE, FI, GM, AB; that is, B C : B Q : B P : B A. Since CE : CF : E H : F I, C G : C B : G M : B A, (Theor. 15.) ABC will be a Triangle, (Eucl. III. 17.) If BA, therefore, be a Moment of Time infinitely small, its Motion will be uniform; and, therefore, the Space described by the moving Body will be as the little Area B b c C (Theor. 2.) The Space therefore described in the Time is as the Triangle ABC, &c. as the Sum of all the little Areas B b c C. Now the Space described by the Body moving uniformly with the Velocity BC in the Time AB, is as the Rectangle ABCD, (Theor. 2.) therefore the former is half of this. (Eucl. I. 41.) Q. E. D.

Theor. XVI. The Spaces described by a Motion uniformly retarded, in equal Times, decrease according to the unequal Numbers 7, 5, 3, 1.

Dem. Suppose the moving Body in the first Instant of Time to pass over seven Feet; I say, that in the second if it be equally retarded, it will pass over 5; in the third 3; and in the fourth 1. For let the equal Parts of the Axis of the Triangle BS, SQ, QP, PA (same Fig.) be as the Times; the Semi-ordinates BC, SH, QI, PM as the Velocities at the beginning of any Time; and the Trapezia BSHC, SQIH, QPML, and the Triangle PAM as the Spaces described in those times, as it appears they will be from Theor. 16. Let then BC = 7 and BS = SQ = QP = PA = 1. Then will SH = 5, QI = 3, PM = 1, (Theor. 15) BSHC = (4 + 7) 1 : 2 = 11/2, SQIH = (3 + 5) 1 : 2 = 4, QPML = (2 + 1) 1 : 2 = 3/2, PAM = 1/2. Consequently the Spaces described in equal Times are as 7, 5, 3, 1. Q. E. D.

For the Cause, &c. of the Acceleration of MOTION, see GRAVITY and ACCELERATION.

For the Cause, &c. of Retardation, see RESISTANCE and RETARDATION.

Laws of the Communication of MOTION.

The Laws wherein Motion is communicated by the Collision and Percussion of Bodies are very different, as the Bodies are either Elastic or Unelastic, and as the Direction of the Stroke is oblique or direct.

What relates to the Collision of Bodies not Elastic, when the Stroke or Shock is direct, will come under the following Laws.

Theor. XVII. A moving Body striking against a Body at rest, will communicate Motion thereto, and both will proceed in the direction of the first; and the Momentum, or Quantity of Motion in the two, will be the same after the Stroke, as in the single one before it.

Dem. For 'tis the Action of the first that gives the latter all the Motion it has; and 'tis the Reaction of the latter that takes off any part of the Motion of the first. Now, as Action and Reaction are always equal, the Momentum acquir'd by the one must be just equal to that lost by the other; so that there is neither loss nor gain from the Stroke.

Corol. The Velocity after the Stroke is found by multiplying the Mass of the first Body by its Velocity before the Stroke, and dividing the Product by the Mass of the second Body.

Corol. Hence if a Body in Motion strike on another moving in the same direction, but more slowly, both will continue their Motion in their first Direction; and the Momenta, or Sum of Motion will be the same after as before the Stroke.

Corol. If two equal Bodies move against each other with equal Velocities, after the Stroke they will both remain at Rest.

Simple MOTION is that produced from some one Power. Compound MOTION is that produced by several conspiring Powers: Powers being said to conspire, when the Direction of the one is not opposite to that of the other; as when the Radius of a Circle is imagin'd to whirl, round on

on its Centre, and a Point in the same Radius is at the same time supposed impell'd straight along it.

*Corol.* All *Circular Motion*, therefore, is Compound. (*Cor. 1. of Motion 1.*)

*Theor. XVIII.* If a moving Body A (*Fig. 52.*) be acted on by a double Power; the one according to the Direction A B, the other according to A C; with the Motion compounded thereof, it will describe the Diagonal of a Parallelogram ND; whose Sides A B and A C it would have described in the same time with each of the respective Powers apart.

*Dem.* If the Body A were only acted on by the Force impress'd along A B; in the first Instant of Time it would be in some Point of the right Line A B as in H, and so in the Line H L parallel to A C; if it were only acted on by the Power A impress'd in the Direction A C, it would in the same Instant of time be in some Point of the Line A C as in I, and so in the Line I L parallel to A B. But since the Directions of the Powers are not opposite to each other, neither of them can impede the other; and therefore the Body in the same Instant of Time will arrive both at the Point H L and at I L; and will consequently be in the Point L, where the two meet. In the same manner it appears that if K M and M G be drawn parallel to A B and A C, the Body in the second Instant of Time will be in M, and at length in D. Q. E. D.

*Cor. 1.* Since about every right Line as AD, a Parallelogram as A B D C, may be constructed by making two equal Triangles A C D and A B D, on one common Base A D; every *rectilinear Motion*, when it may be of service for the Demonstration, may be resolv'd into a compound one.

*Cor. 2.* But as the Proportion of the Sides A C and C D may be various, so also may the right Line A D be described by a Motion compounded various ways; and therefore the same *rectilinear Motion* may be resolv'd into various compound Motions.

*Cor. 3.* Hence if a moveable Body be drawn by three several Powers according to the Directions B A, A D, and A C, (*Fig. 53.*) two of which taken together are equivalent to the third; they will be to each other as the right Lines B D, D A, D C, parallel to their Directions; that is, reciprocally as the Sines of the Angles included between the Lines of their Directions, and the Line of Direction of the third: D B being to A D as the Sine of the Angle B A D to the Sine of the Angle A B D.

*Theor. XIX.* In an equable compound Motion, the Velocity produced by the conspiring Powers, is to the Velocity of each of the two apart, as the Diagonal A D (*Fig. penult.*) of the Parallelogram A B D C, in the Direction of whose Sides they act, to either of those Sides A B or A C.

*Dem.* For in the same time that one of the Powers would carry it over the Side of the Parallelogram A B, and the other over A C separately, join'd together they carry it over the Diagonal A D. The Diagonal A D therefore is the Space described by the conspiring Powers in the same Time: but in an equable Motion the Velocities in the same Time are as the Spaces; the Velocities therefore arising from the conspiring Forces are to the Velocity arising from either Force, as A D to A B or A C. Q. E. D.

*Cor. 1.* The conspiring Forces therefore being given; i. e. the Ratio of the Velocities being given, by the Lines A B and A C given in magnitude, and the Direction thro' these Lines being given in Position, or by the Angle of Direction; the Celerity and Direction of the oblique Motion is given; because the Diagonal is given both in Magnitude and Position.

*Cor. 2.* The oblique Motion however being given, the simple ones are not, *vice versa*, given; because the same oblique Motion may be compounded of various simple ones.

*Theor. XX.* In a compound Motion produced by the same Forces, the Velocity is greater if the Angle of Direction be less; and less, if this be greater.

*Dem.* Let the greater Angle of Direction be B A C, (*Fig. 54.*) the less F A C; since the Powers are supposed the same, A C will be common to each Parallelogram A F C E and B A C D and besides A B = A E. Now 'tis evident that on the footing of the greater Angle, the Diagonal A D is described; and on the footing of the less Angle, A E; and both in the same time, by reason A B = A E. The Velocities therefore are as A D to A E: Wherefore since A D is less than A E, the Velocity on the foot of the greater Angle is less than on that of the less Angle. Q. E. D.

*Cor.* Since the Legs A C and C E, with the included Angle, being given, the Angle C E A, and thence, also, A E is found; the Velocity of the conspiring Powers, and the Angle of Direction, in any particular Case, being given; the Velocity of the compound Motion, and consequently the Ratio of the Velocities produced by the same Powers under different Angles of Directions, may be determined.

For the particular Laws of MOTION arising from the Collision of Bodies both Elastic and Unelastic, and that where the Directions are both perpendicular and oblique, see PERCUSSION.

For Circular MOTION, and the Laws of Projectiles, see CENTRAL FORCE, and PROJECTILE.

For the MOTION of Pendulums, and the Laws of Oscillation, see PENDULUM and OSCILLATION.

PERPETUAL MOTION. See PERPETUAL MOTION.

The celebrated Problem of a perpetual Motion, consists in the inventing of a Machine; which has the Principle of its Motion within itself. M. de la Hire has demonstrated the Impossibility of any such Machine, and finds that it amounts to this, viz. to find a Body which is both heavier, and lighter at the same time; or a Body which is heavier than itself. See MACHINE.

ANIMAL MOTION, is that whereby the Situation, Figure, Magnitude, &c. of the Parts, Members, &c. of Animals are changed.

Under these Motions come all the Animal Functions, as Respiration, Circulation of the Blood, Excretion, Walking, &c. See FUNCTION.

Animal Motions are usually divided into two Species, viz. Spontaneous, and Natural.

Spontaneous, or Muscular MOTION, is that perform'd by means of the Muscles, at the Command of the Will; hence also call'd Voluntary Motion. See MUSCULAR MOTION.

Natural, or Involuntary MOTION, is that effected without such Command of the Will; by the mere Mechanism of the Parts.

Such is the Motion of the Heart, and Pulse; the Peristaltic Motion of the Intestines, &c. See HEART, &c.

Intense MOTION, an Agitation of the Particles, whereof a Body consists. See INTERESTING; see also FERMENTATION, EFFERVESCENCE, &c.

Some Philosophers will have every Body, and every Particle of a Body, in continual Motion. For Fluids, 'tis the Definition they give of such Bodies, viz. that their Parts are in continual Motion. See FLUIDITY.

And as to Solids, they infer the like Motion from the Effluvia continually emitted thro' their Pores. See EFFLUVIA.

Hence they describe Intense Motion, to be a Motion of the internal, and smaller Parts of Matter, continually excited by some external, latent Agent, which of itself is insensible, and only discovers itself by its Effects; appointed by Nature for the great Instrument of the Changes in Bodies.

MOTION, in Astronomy, is peculiarly apply'd to the orderly Courses of the heavenly Bodies. See SUN, PLANET, COMET, &c.

The Motion of the Earth, from West to East, is now generally granted among Astronomers: See it proved under the Article EARTH.

The Motions of the Celestial Luminaries are of two Kinds, Diurnal or Common; and Secondary or Proper.

Diurnal or Primary MOTION, is that wherewith all the heavenly Bodies, and the whole mundane Sphere, appears to revolve every day round the Earth, from East to West. See DIURNAL.

This is also call'd the Motion of the Primum Mobile, and the Common Motion; so distinguish it from that proper to each Planet, &c. 'Tis about the various Phenomena resulting from this Motion, that Astronomy is chiefly employ'd. See ASTRONOMY.

Secondary or Proper MOTION, is that wherewith a Star, Planet, or the like, advances a certain Space every day from West towards East. See MOBILE.

See the several Motions of each Luminary, with the Irregularities, &c. thereof, under its proper Article; EARTH, MOON, STAR, &c.

MOTION of Trepidation. See TREPIDATION and LIBERATION.

MOTION, in Music, is the manner of beating the Measure, to hasten or slacken the Time of the Pronunciation of the Words, or Notes. See MEASURE and TIME.

The Motion, in Songs compos'd in double Time, differs from those in triple Time. 'Tis the Motion that distinguishes Couants and Sarabands, from Gavots, Borces, Chacones, &c.

MOTION is also used among Mechanics, for the Inside of a Watch, &c. more commonly call'd Movement. See MOVEMENT.

MOTIONS, in War, are the Marches, Counter-marches, &c. an Army makes in the changing of its Post.

The great Skill of a General consists in discovering the Enemies Motions, and concealing his own. Nothing is more dangerous, than to make great Motions before a powerful Enemy, ready to come to blows.

MOTION, or Emotion, in Rhetoric, &c. See PASSION.

MOTORII, MOTORII Nerves, the third Pair of Nerves, serving for the Motion of the Eye. See NERVE.

This Pair is united into one near their Insertion into the Brain; by which means, when one Eye is moved towards any Object, the other is directed towards the same. See EYE.

**MOTOS**, a Piece of *Linn*, or Linnen Cloth, seiz'd like Wool, to be put into Ulcers, to stop the Flux of Blood, &c.

**MOTRIX**, something that has the Power or Faculty of Moving. See *VIS MOTRIX*, FACULTY, &c.

**MOTTO**, an Italian Term, literally signifying Word or Saying; used in Arms, Devices, &c. See ARMS and DEVICES.

The *Motto of an Army*, is a short Sentence, or Diction carry'd in a Scroll generally over, sometimes under the Arms; sometimes alluding to the Name of the Bearer, sometimes to the Bearing, and sometimes to neither.

The *Motto*, or Word, says *Gaillon*, is an external Ornament annex'd to Coat-Armour; being the Invention or Conceit of the Bearer, succinctly and significantly express'd usually in three, or four Words, which are set in some Scroll or Compartment, plac'd at the foot of the Escutcheon.

As the *Motto* holds the lowest Place in Arms; so it is the last in Blazoning. In strictness, it should express something intended in the Achievement; but Custom has now receiv'd whatsoever Fancy of the Deviser. See BLAZON.

The Use of *Motto's* is very ancient; History, both sacred and profane, furnishing Instances thereof. Our Ancestors made choice of *Motto's*, to express their predominant Passions, as of Piety, Love, War, &c. or some extraordinary Adventure betwixt them: Most of which, from some such Original, have become hereditary in divers Families.

The *Motto's* of the Royal Family of England, are, *Dien & non Drait*, God and my Right; of the Royal Family of Bourbon, *Espérance*, Hope; of the Order of the Garter, *Honi soit qui mal y pense*, Shame be him that Evil thinks; of the Duke of Norfolk, *Sola Virtus invisita*; of the Duke of Bedford, *Che Sara Jara*; of the Duke of Devonshire, *Ca vendio iustis*, alluding to the Family's Name *Comyns*; of the Duke of Kingston, *Pie repone te*, alluding to the Name *Pierpoint*; of the Earl of Radnor, *Que supra*, alluding to the three Stars in his Arms; of the Earl of Arundel, *Virtus ariste fortior*, alluding to the three battering Rams bore in the Arms; of Fortescue Lord Clinton, *Fortis scutum Jalus Ducum*.

The *Motto of a Device*, is also call'd the *Soul of the Device*. See DEVICE.

**MOVEABLE**, something susceptible of Motion; or that is dispos'd to be mov'd. See MOTION.

Thus a Sphere is said to be the most moveable of all Bodies, i. e. the easiest to move. A Door is moveable on its Hinges: The Magnetical Needle, on a Pin, or Pivot, &c.

*Moveable* is frequently used in Contedistinction to *Fixed*. See FIXED.

**MOVEABLE Feasts**, are such as are not always held on the same Day of the Year, or Month; tho they be, on the same Day of the Week. See FEAST.

Thus, *Easter* is a moveable Feast; being always held on the first Sunday after the full Moon following the 21st of March; which is moveable between the 11th of March, and the 18th of April. See EASTER.

All the other moveable Feasts follow *Easter*, i. e. keep their Distance from it; so that they are fix'd with respect thereto.

Such are *Septuagesima*, *Sexagesima*, *Ash-Wednesday*, *Ascension-Day*, *Pentecost*, *Trinity-Sunday*, &c. Which see under their proper Articles.

**MOVEABLES**, or **MOVEABLE Goods**, by the Civilians call'd *Bona MOBILIA*, are such as are capable of being remov'd from one Place to another; or which may be conceal'd or perverted; as not being fix'd to the Ground, &c.

In England, we have two Kinds of Effects, *Moveable* and *Immoveable*; the *Moveable* are Ready Money, Merchandizes, Bonds, Book-Debts, Cattel, Household Instruments, &c. that are not fasten'd either with Iron or Nail, nor seal'd in the Plaster, but may be transported without either Faction or Detraction.

In the Customary Laws, we say *Moveables* follow the Person, and his proper Habitation; *Immoveables* follow the Body, &c. which Words have different Meanings in different Countries.

Sometimes they signify, that *Moveables* go according to the Custom of the Place where is the Habitation of the Decedent, tho he die in another Place; sometimes they signify, that *Moveables* follow the Custom of the Place where the Defunct died.

**MOVEMENT**, *Motum*, a Term frequently used in the same Sense with *Locomotion*.

The most usual *Movements* are *Watches* and *Clocks*: The first are such as shew the Parts of Time; the second such as publish it. See WATCH and CLOCK.

In its popular Use, among us, *Movement* signifies all the curious Parts of a Watch, Clock, or other curious Engine, which move, and, by that Motion, carry on the Design of the Instrument.

The *Movement* of a Clock, or Watch, is the Inside; or that Part which measures the Time, strikes, &c. exclusive of the Frame, Case, Dial-Plate, &c.

The Parts common to both of these *Movements* are, The *Main-Spring*, with its Appurtenances; lying in the Spring-Box, and in the middle thereof lapping about the Spring-Arbor, to which one end of it is fasten'd. At top of the Spring-Arbor is the *Endless Screw*, and its Wheel; but in Spring-Clocks, this is a Ratchet-Wheel with its Click, that stops it. That which the main Spring draws, and round which the Chain or String is wrapped, is the *Fuly*: This is ordinarily taper; in large Works going with Weights, it is cylindrical, and call'd the *Barrel*. The small Teeth at the bottom of the *Fuly* or Barrel, which stop it in winding up, is call'd the *Ratchet*; and that which stops it when wound up, and is for that end driven up by the Spring, the *Card-gut*. The *Wheels* are various; the Parts of a Wheel, are the *Floop* or *Rim*; the *Teeth*, the *Cry*, and the *Case* or Piece of Brass folder'd on the Arbor or Spindle, whereon the Wheel is rivetted. The little Wheels playing in the Teeth of the larger, are call'd *Pinions*; and their Teeth, which are 4, 5, 6, 8, &c. are call'd *Leaves*; the Ends of the Spindle are call'd *Prows*; and the gutter'd Wheel, with Iron Spikes at bottom, wherein the Line of ordinary Clocks runs, the *Fuly*. We need not say any thing of the *Hand*, *Screws*, *Wedges*, *Stops*, &c. See WHEEL, PIVOT, &c.

#### Theory of Calculating the Numbers for MOVEMENTS.

1. It is to be observ'd, that a Wheel divided by its Pinion, shews how many Turns the Pinion has to one Turn of the Wheel.

2. That from the *Fuly* to the Balance, the Wheels drive the Pinions; consequently the Pinions run faster, or make more Revolutions than the Wheels; but 'tis the contrary from the great Wheel to the Dial-Wheel.

3. That the Wheels and Pinions we write down either as Vulgar Fractions, or in the way of Division in the common Arithmetic; v. g. a Wheel of 60 moving a Pinion of 5, is wrote either  $\frac{12}{1}$ , or better  $5/60$ . And the number of Turns the Pinion has in one Turn of the Wheel, as a Quotient, thus,  $5/60/12$ . A whole Movement may be wrote, as in the adjoining Scheme; where the uppermost Number expresses the Pinion of Report 4, the Dial-Wheel 35, and the Turns of the Pin 9; the second, the Pinion, and Great-Wheel; the third, the second Wheel, &c. the fourth, the Contrast Wheel; and the last, 17, the Crown-Wheel.

Hence, 4. From the Number of Turns any Pinion makes in one Turn of the Wheel it works in, may be determin'd the Number of Turns a Wheel or Pinion has at any greater Distance, viz by multiplying together the Quotients; the Produce whereof is the Number of Turns. Thus,

Suppose the Wheels and Pinions as in the Case  $5/55/11$  adjoining; 11 multiply'd by 9, gives 99, the  $5/55/9$  Number of Turns of the second Pinion 5, in one  $5/40/8$  Turn of the Wheel 55, which runs concentrical, or on the same Spindle with the Pinion 5. Again, 99 multiply'd by 8, gives 792; the Number of Turns the last Pinion has in one Turn of the first Wheel 5.

Hence we proceed to find, not only the Turns, but the Number of Beats; of the Balance in the Time of those Turns. For having found the Number of Turns the Crown-Wheel has in one Turn of the Wheel fougher, those Turns multiply'd by its Notches, give half the Number of Beats, in that one Turn of the Wheel. Suppose, v. g. as in the last Case, the Crown-Wheel to have 720 Turns, 10 of the first Wheel; this Number multiply'd by 15, the Notches in the Crown-Wheel, produces 10800; half the Number of Strokes of the Balance in one Turn of the first Wheel.

The general Division of a *Movement*, is into the Clock and Watch-Parts. See CLOCK-WORK and WATCH-WORK.

**MOVER**, or *first MOVER*. See MOBILE.

**Mould**, or *PERPETUAL MOVER*. See PERPETUAL MOTION.

**MOULD**, in the Mechanic Arts, &c. a Cavity artfully cut, with design to give its Form, or Impression to some softer Matter apply'd therein.

*Moulds* are Instruments of great Use in Sculpture, Foundry, &c. See SCULPTURE, FOUNDRY, &c.

The Workmen employ'd in melting the Mineral or Metallic Gleebe dug out of Mines, have each their several *Moulds*, to receive the melted Metal as it comes out of the Furnace; but different according to the diversity of Metals and Works. In Gold-Mines, they have *Moulds* for Ingots. In Silver-Mines for Bars. In Copper and Lead-Mines for Pigs or Salmons: In Tin-Mines for Pigs and Ingots: And in Iron-Mines for Sows, Chimney-Backs, Anvils, Caldrons, Pots, and other large Utensils and Merchandises of Iron, which are here cast, as it were, at first hand. See GOLD, SILVER, LEAD, TIN, IRON, &c.

The *Founders of large Works*, as Statues, Bells, Guns, and other brass Works, have *Moulds* of Wax, supported within side by what they call a *Core*, and cover'd without side with a Cap or Case. 'Tis in the Space which the Wax took up, which is now melted to leave it free, that the liquid Metal runs, and the Work is form'd; being carried thither thro' a great Number of little Canals which cover the whole *Mould*. See *FOUNDRERY*.

The *Moulds of Coiners* are Frames full of Sand, wherein the Plates of Metal are cast that are to serve for the striking of Species of Gold or Silver. See *COINAGE*.

*Moulds of Founders of small Works* are like the Frames of Coiners. 'Tis in these Frames, which are likewise fill'd with Sand, that their several Works are fashion'd; into which, when the two Frames whereof the *Mould* is composed, are rejoin'd, the melted Brass is run. See *FOUNDRERY*.

*Moulds of Letter-Founders* are partly of Steel, and partly Wood: The Wood, properly speaking, serves only to cover the real *Mould* which is within, and to prevent the Workman who holds it in his Hand, from being incommoded by the impression of the Heat of the melted Metal. Only one Letter or Type can be form'd at once in each *Mould*. See *Letter-Foundery*.

*Moulds in the Manufacture of Paper*, are little Tables composed of several Brasses or Iron Wires tied to each other by another Wire still finer. Each *Mould* is of the bigness of the Sheet of Paper to be made, and has a Rim or Ledge of Wood to which the Wires are fasten'd. These *Moulds* are more usually call'd *Forms*. See *PAPER*.

The Furnacits, Furnace, and Crucible Makers also make use of *Moulds* for a part of their Works, especially Crucibles. They are made of Wood, of the same form with the Crucibles; that is in Form of a truncated Cone. They have Handles of Wood to hold, and turn 'em with, when being cover'd with the Earth, the Workman has a mind to round or flatten his Vessel. See *FURNACISTS*.

*Moulds for Leaden Bullets*, are little Iron Finches, each of whose Branches terminates in a Hemispherical Concave, which when shut, form an entire Sphere. In the Lips or Sides where the Branches meet, is a little Jet or Hole, thro' which the melted Lead is convey'd.

The Glassers have two kinds of *Moulds*, both serving to cast their Lead. In the one they cast the Lead into long Rods or Canes fit to be drawn thro' the Vice, and the Grooves formed therein. 'Tis they sometimes call *Ingot-Moulds*.

In the other they *Mould* those little Pieces of Lead a Line thick, and two Lines broad, fasten'd to the Iron-Bar. These may be also cast in the Vice; which see, see also *GLASSERY*.

The Goldsmiths use the Bones of the Cattle-Fish to make *Moulds* for their small Works; which they do by pressing the Pattern between two Bones, and leaving a Jet or Hole to convey their Silver thro' after the Pattern has been taken out.

*MOULD*, among Masons, a Piece of hard Wood or Iron, hollowed within side, answerable to the Contours of the Mouldings or Cornices, &c. to be form'd. 'Tis is otherwise call'd *Calliper*.

*MOULDs* among Plumbers, the Tables whereon they cast their Sheets of Lead. These they sometimes call simply *Tables*. Besides these, they have other real *Moulds* wherewith they cast Pipes without Soldering. See both the one and the other under *PLUMBERY*.

*MOULDs* among Glass-Grinders, are Wooden-Frames whereon they make the Tubes wherewith they fit their Perspectives, Telescopes, and other Optic Machines. These *Moulds* are Cylinders, of a Length and Diameter according to the Use they are to be apply'd to, but always thicker at one end than the other, to facilitate the sliding. The Tubes made on these *Moulds* are of two kinds; the one simply Paste-Board and Paper; the other of thin Leaves of Wood join'd to the Paste-Board. To make of these Tubes to draw out, only the last or innermost is form'd on the *Mould*; each Tube made afterwards serving as a *Mould* to that which is to go over it; but without taking out the *Mould* from the first. See *TUBE*.

*MOULDs* used in Basket-Making are very simple, consisting ordinarily of a Willow or Other turn'd or bent into an Oval, Circle, Square, or other Figure, according to the Baskets, Panniers, Hampers, Hots, and other Utensils intended. On these *Moulds* they make, or more properly measure all their work; and accordingly have 'em of all Sizes, Shapes, &c.

*MOULDs* among Tallow-Chandlers are of two kinds: The first for the common dip'd Candles, being the Vessel wherein the melted Tallow is diffused, and the Wick dip'd. This is of Wood of a triangular Form, and supported on one of its Angles, so that it has an opening of near a Foot a-top. The other used in the Fabric of *Mould* Candles, is of Brass, Pewter, or Tin: Here each Candle has its several *Mould*. See each under *CANDLE*.

*MOULD* among Gold-Beaters, a certain Number of Leaves of Velum, or pieces of Guts, cut square, of a certain size, and laid over one another, between which they put the Leaves of Gold and Silver which they beat on the Marble with the Hammer. They have four kinds of *Moulds*; two whereof are of Velum, and two of Gut. The smallest of those of Velum consists of forty or fifty Leaves, the largest contains an hundred. For the others, each contains five hundred Leaves.

The *Moulds* have all their several Cases, consisting of two pieces of Parchment, serving to keep the Leaves of the *Mould* in their Place, and prevent their being disorder'd with beating. See *GOLD-Beating*.

*MOULD Candles*, See *MOULD-CANDLE*.

*MOULD*, in Agriculture, &c. a kind of Soil; call'd also *Loam* and *natural Earth*. See *SOIL* and *LOAM*.

The best *Mould* for the Gardeners Purposes, according to Mr. Evelyn, is that of a blackish grey Colour; according to Mr. Sower, that of a lively Chestnut, or Hazle Colour, which cuts like Barter, and does not stick ordinarily, but is short, tolerably light, breaking into small Clods, may be temper'd without crusting or chapping in dry Weather, or turning to Mortar in wet.

Next to Chestnut, are the dark Greys, and Ruffet. The light and dark Ash-Colours are naught, being these commonly found on heathy Ground. The yellowish red is worst of all.

*MOULDINESS*, a Term apply'd to solid Things that corrupt in the Air, from some hidden Principle of Humidity therein; and whose Corruption shews itself by a certain white Down, or Beard on their Surface.

This *Mouldiness*, when view'd with a Microscope, affords a curious Spectacle; being a kind of Meadow out of which arise Herbs and Flowers, some only in the bud, others full blown, and others decay'd; each having its little Root, Stalk, and other Parts: The Figure whereof may be seen in *Hook's Micrographia*. The same thing may be observ'd of the *Mouldiness* that gathers on the Surface of liquid Bodies.

Mr. Bradley observ'd this *Mouldiness* in a Melon very accurately; and found the Vegetation of these little Plants exceedingly quick. Each Plant had its Seeds in great Abundance, which did not seem to be three Hours e'er they began to shoot up, and in six Hours more the Plant was compleat and mature, and the Seed ready to fall. When the Fruit had been cover'd with a *Mould* for six Days, its vegetative Quality began to abate, and was intirely gone in two Days more; then came on a Putrefaction, and the fleshy Parts of the Melon yielded nothing else but a stinking Water, which began to have a gentle Motion in its Surface, and in two days time Maggots appear'd, which in six more laid themselves up in their Bags, where they continu'd four days; and then came out Flics.

*MOULDING*, any thing cast in a *Mould*, or that seems to have been so; tho' in reality it were cast with the Chisell, or the Awl.

*MOULDINGS*, or *Ornaments*, in Architecture, are Projections beyond the Naked of a Wall, Column, Waincoat, &c. the Afficblage whereof forms *Cornices*, *Door-Cases*, and other Pieces of Architecture. See *ORNAMENT*.

Some *Mouldings* are crown'd with a Fillet; others are without, as the Doucine, Talon, Orolo, Torus, Scoria, Astragal, Gula, Corona, &c. See each under its proper Article.

Again, some are adorned with Sculpture, either hollow'd, or in Relief.

*Mouldings* are in Architecture what Letters are in Writing. By the various Dispositions and Combinations of *Mouldings*, may be made an infinite Number of different Profiles for all sorts of Orders and Compositions, Regular and Irregular; and yet all the kinds of *Mouldings* may be reduced to three, *viz. Square*; *Round*; and *Mixed*, i. e. composed of the other two.

For this Reason, those who invented the *Gothic* Architecture, resolving to recede from these perfect Figures, and affecting to use others less perfect, to distinguish their Architecture from the Antique, introduced a new Set of whimsical *Mouldings* and Ornaments. See *GOTHIC*, *GROTESQUE*, &c.

Regular *Mouldings* are either large, as *Doucines*, *Ovules*, *Gulas*, *Talons*, *Torus's*, *Scorias*, &c. or small, as *Fillets*, *Astragals*, *Conges*, &c. which see in their places, *DOUCINE*, *OVOLO*, *ASTRAGAL*, *FILLETS*, &c.

*MOULINET* is a French Term properly signifying a little Mill; being a diminutive of *Moulin*, Mill.

It is used in Mechanics to signify a Roller, which being cross'd with two Levers, is usually apply'd to Cranes, Capstans, and other sorts of Engines of the like nature, to draw Cords, and see up Stones, Timber, &c. See *CAPSTAN*, &c.

*MOULINET* is also a kind of Turn-Style, or Wooden-Cross, which turns horizontally upon a Stake fixed in the Ground; usually placed in the Passages to keep out

Horses, and to oblige Passengers to go and come one by one.

These *Mouths* are often set near the Out-works of Fortified Places at the side of the Barriers, thro' which People pass on foot.

**MOULTING**, in Natural History, see **MOLTING**.

**MOUND**, a Term used for a Bank, Rampart, or other Fence, particularly of Earth.

**MOUND**, in Heraldry, is a Ball or Globe with a Cross upon it, such as our Kings are usually drawn with, holding it in their left Hand, as they do the Scepter in the Right. See **GLOBE**.

**MOUNT, MONS**, an Elevation of Earth, call'd also **Mountain**. See **Mountain**.

The Words *Mount* and *Mountain* are Synonymous; but the former is scarce ever used in Prose, unless when accompanied with some proper Name, as *Mount Zena*, *Mount Gabel*, *Mount Libanon*, *Mount Sinai*, *Mount Atlas*, *Mount Parnassus*, &c.

In Gardening, *Mount* is sometimes also used for a Walk raised on the side of the Garden above the Level of the rest of the Plot.

**Mounts of Piety**, are certain Funds or Establishments in Italy, where Money is lent out on some small Security. We had also *Mounts of Piety* in England, raised by Contribution for the Benefit of People ruin'd by the Exortions of the Jews.

**MOUNTAIN, Mons, MOUNT**, a Part of the Earth rising to a considerable Height above the Level of the Surface thereof. See **EARTH**.

The Origin of *Mountains* is variously assigned by Philosophers: Some will have 'em co-eval with the World, and created along with it.

Others, among whom Dr. *Burner*, will have 'em to take their Rise from the Deluge; arguing, that the extreme Irregularity and Disorder visible in 'em, plainly shews they don't come immediately out of the hand of God, but are the Wrecks of the Old World broken into the Abyss.

Others again, alledge from History, that the Roots of many Hills being eaten away, the Hills themselves have subsided, and sunk into Plains: Whence they conclude, that where the Corruption is natural, the Generation is so too.

This, indeed, appears pretty evident, that some *Mountains* must have been generated gradually, and have grown up in Process of Time, from the Sea-Shells, &c. found in many of 'em; which may be accounted for from a violent Wind blowing the Sand, &c. into huge Heaps, which are afterwards made into a Mass by the Rain, &c. Some among the Divines tell us, that the Earth was created perfectly even; and that when God separated the Water from the Land, he dug Channels in the Earth; and the Earth scoop'd out, he threw up in *Mountains*: but whether the *Mountains* be sufficient to fill all the Channels of the Ocean, let them look to it.

The Uses of *Mountains* are almost infinite; we shall only mention two or three. 1. They serve as Screens to keep off the Cold and nipping Blasts of the Northern and Eastern Winds. 2. They serve for the Production of a great Number of Vegetables and Minerals, which are not found in any other Soil. 3. The long Ridges and Chains of lofty and topping *Mountains* being generally found to run from East to West, serve to stop the Evagation of the Vapours towards the Poles, without which they would all run from the Hot Countries, and leave 'em destitute of Rain.

Mr. *Ray* adds, that they condense those Vapours, like Alembic-Heads, into Clouds, and so by a kind of external Distillation, give Original to Springs and Rivers; and by amassing, cooling, and dissipating them, turn them into Rain, and by that means render the ferrid Regions of the torrid Zone habitable. See **SPRINGS**, &c.

In History we have Instances of *Mountains* travelling a considerable Distance, particularly *Hasket-Marvel-Hill*, if I misremember not, in *Herefordshire*, which is said to have made a considerable Journey.

To measure the Height of a *Mountain*, see **ALTIITUDE**, &c.

That there is another way used by Dr. *Halley* in the Measure of *Sweden-Hill* in *Wales*, by means of a Barometer, the different Heights of whose Mercury at the Top and Bottom of the *Mountain*, give its perpendicular Altitude, accounting 82 Feet perpendicular Ascent, for every Inch varied in the Height of the Mercury. See **LEVELLING**.

**MOUNTAINS in the Moon**, see **MOON**.

**MOUNTING** the Guard, Trenches, Breach, &c. denotes the going upon Duty; being upon Guard, in the Trenches; running to the Breach, &c. See **GUARD**, **TRENCH**, &c.

**MOUNTING** a Cannon, Mortar, &c. is the setting it on its Carriage; or the raising its Mouth. See **CANNON**, **MORTAR**, **CARRIAGE**, &c.

**MOUNTING** in Manufactures, something serving to raise or set off a Work.

Thus the Frame or Border and its Dependencies, makes the *Mounting* of a Looking-Glass.

The *Futl*, or *But*, the *Mounting* of a Musquet, Carabine, &c.

The *Hilt*, &c. the *Mounting* of a Sword.

**MOUNTING** of a Fan, the Sticks which serve to open and shut it, whether they be of Wood, Ivory, Tortoise-shell, Whale-Bone, Indian-Cane, &c. See **FAN**.

**MOURNING**, a particular Dress, or Habit wore, to signify Grief, on some melancholy Occasion.

The Modes of *Mourning* are various in various Countries; as are also the Colours that obtain for that End.

In Europe, the ordinary Colour for *Mourning* is Black; in China, White; in Turkey, Blue, or Violet; in Egypt, Yellow; in Ethiopia, Brown.

The ancient Spartan and Roman Ladies mourn'd in White; and the same Colour obtain'd formerly in Castile on the Death of their Princes. *Herrera* observes, that the last time it was used, was in 1498, at the Death of Prince *Isbn*. Kings and Cardinals mourn in Purple.

Each People have their Reasons for the particular Colour of their *Mourning*: White is suppos'd to denote Purity; Yellow, that Death is the End of human Hopes, in regard Leaves when they fall, and Flowers when they fade, become Yellow. Brown denotes the Earth, whither the Dead return. Black, the Privation of Life, as being the Privation of Light. Blue expresses the Happiness which 'tis hop'd the Deceased does enjoy; and Purple, or Violet, Sorrow on the one side, and Hope on the other; as being a Mixture of Black and Blue.

**MOUTH**, in Anatomy, a part of the human Face, consisting of the Lips, the Gums, the Inside of the Cheeks, and the Palate. See **FACE**, **LIPS**, **GUMS**, &c.

All these Parts are lined with a glandulous Coat, which is continu'd over the whole inner Surface of the Mouth, and all its Parts, the Teeth excepted.

From the Glands of this Coat, thro' innumerable little excretory Ducts, is separated a kind of Salival Juice, which serves to keep the Mouth, and all its Parts, moist, smooth, and slippery. See **SALIVA**.

On the hind part of the Palate, perpendicularly over the Rima of the Larynx, hangs a round, soft, smooth Body, like the End of a Child's Finger, form'd by the Duplication of the Membrane of the Palate, and call'd the *uvula*, which is moved by two Muscles, call'd *Spheroephiplimus* and *Prerygophthalmus*; and suspended by as many Ligaments. See **UVULA**.

Under the Membrane of the Palate, are a great number of Glands pretty conspicuous in the fore-part, like Grains of Millet; whose excretory Ducts piercing the Membrane, open into the Mouth: but towards the hind-part they lie much thicker, and about the Root of the Uvula are gather'd so close to one another, that they seem to form one large conglomerate Gland; which is therefore, by *Perreyen*, call'd *Glandula conglomerata Palatina*. See **PALATE**.

The Gums are, as it were, the Ligaments of the Teeth; which see under **GENCIVA**.

Besides the proper Parts of the Mouth, there are in and about it others, highly serviceable and necessary thereto.

Among which are the Glands; the most considerable whereof are the *Parotides*, the *Glandulae Maxillares*, the *Sublinguales*, and the *Tonsils* or *Amygdalae*; which see in their respective Places. See **PAROTIDES**, &c.

These are the Salival Organs, whence springs all that Liquor we call the *Spittle*, which flows into the Mouth by the respective Ducts, after its Separation from the Blood in the Bodies of the Glands: but the Demand of Spittle is greater in Actions of the lower Jaw, i. e. in Mastication, Deglutition, much Talking, &c. so does the Disposition of these Salival Ducts favour that Discharge on those Occasions.

Mr. *Derham* observes the Mouth, in the several Species, to be nicely adapted to the Uses of such a Part; well fix'd and shaped for the catching of Prey, for the gathering and receiving Food, the Formation of Speech, &c.

In some Creatures it is wide and large, in some little and narrow; in some with a deep Incisure up into the Head, for the better catching and holding of Prey, and more easy Communion of hard, large, and troublesome Food; in others with a shorter Incisure, for the gathering and holding of herbaceous Food.

In Insects it is very notable: in some forcipated to catch, hold and tear the Prey; in some calculeated, to pierce and wound Animals, and suck their Blood; in others strongly ridg'd with Jaws and Teeth, to gnaw and scrape out their Food, carry Burdens, perforate the Earth, nay, the hardest Wood, and even Stones themselves, for Hoels and Neets for their Young.

Nor is it less remarkable in Birds, being neatly shaped for piercing the Air, hard and horny, to supply the want of Teeth; hooked in the rapacious Kind, to catch and hold their

their Prey; long and slender, in those who have their Food to grope for in moorish Places; and broad and long, in those that search it in muddy Places. See *PILL*.

*MOURN* is used in the Courts of Princes, for what relates to their Eating and Drinking.

Hence *Officers of the Mouth, Trauce of the Mouth, &c.*

*Danzler* defines *Mouth*, an Apartment compos'd of several Rooms, as Offices, Kitchens, &c. where the Meat intended for the first Tables, is dress'd by itself. At Court this is call'd the *King's Mouth*.

*MOUTH*, in the Manege, is us'd for the Sensibility a Horse has in that part, where the Bits are apply'd.

*Opening, or Slanting the MOUTH*, of a Cardinal, is a Ceremony us'd in the Conistory at Rome; wherein the Pope shuts a new-elected Cardinal's Mouth, so as he may not speak at all, even tho' the Pope should speak to him; and retains in the mean time depriv'd of all Voice, both active and passive, till the polling of another Conistory, when the Pope opens the Mouth again, making a little Harangue, to teach him how to speak, and comfort himself in the Conistory. See *CARDINAL*.

*MOXA*, a sort of Cotton, or downy Substance, brought from China, and by some said to grow on the lower part of the Mugwort-Leaf.

It is not known for any medicinal Efficacy, but what common Report mentions of its curing the Gout, by burning it upon the Part; yet People have not Faith enough to try it this way: and if they had, in all likelihood, any other Caustic would do as well, and for the same reason.

*MOYENAU*, in Fortification, is a small flat Bastion, commonly plac'd in the middle of an over-long Curtain; where the Bastions at the Extremities are not well defended from the small Shot, by reason of their Distance: This Work is proper for lodging a Body of Musketeers, to fire upon the Enemy from all sides.

*MUCILAGE*, in Pharmacy, &c. a thick, viscus Juice; so call'd, as resembling Snot, or the Mucus of the Nose. See *MUCUS*.

It is prepar'd from Roots, and Seeds pounded in a Mortar, and infused in hot Water, and strain'd thro' a Cloth.

The Seeds chiefly us'd for this purpose, are those of Althæa, Mallows, Symphytum, &c.

*Mucilages* enter the Composition of several Plaisters; they sometimes are also made of Gums and Fruits, as Figs, Quinces, Izing-Glass, &c.

*MUCILAGE* is also a thick, pituitous Matter, evacuated with the Urine in the Gravel, and Dysuria.

*MUCILAGINOUS Glands*, a very numerous Set of Glands in the Joints, first taken notice of, to any purpose, by Dr. *Havers*, in his *Osteology*.

He observes, that there are two sorts; some small, next a kin to millitary Glands, being Glandules plac'd all upon the Surface of the Membranes, which lie over the Articulations.

The other sort are conglomerated, or many Glandules collected, and planted one upon another, so as to make a Bulk, and appear conspicuously. In some of the Joints, there are several of them; in others, there is a single one.

As to the Structure of these large Glands; they consist of small Vesicles, which are not gather'd together into several Lobes, or Bags of Glandules, but are dispos'd upon several Membranes lying over one another, of which Membranes there are several in every one of these Glands, which appear evidently in those who are hydropical. They have their Blood-Vessels, as other Glands, but their Veins have a particular Texture, in their Course, for retarding the Return of the Blood from the Glands, that the *mucilaginous Liquor*, which is not separated with the greatest Expedition, may have time to be separated; which is the Contrivance, wherever a thick Fluid is to be fecern'd. See *ANIMAL Secretions*.

The large *mucilaginous Glands* are variously situated; some in a Sinus form'd in the Joint, others stand near, or over-against the Interstice, between the articulated Bones: but in general, they are so plac'd, as to be squeez'd gently, and lightly press'd in the Infection or Extension of the Joint, in order to yield a Quantity of Mucilage, proportionate to the Motion of the Part, and the present Occasion, without any Injury.

The Design of all these Glands is to separate a *mucilaginous* kind of Liquor, that serves principally to lubricate the Joints, or to make them slippery. It serves likewise to preserve the Ends of the articulated Bones from Attrition and Heating: But all this it doth, in conjunction with the medullary Oil; with which, together, is made a Composition admirably well fitted for those Ends: for the Mucilage adds to the Lubricity of the Oil, and the Oil preserves the Mucilage from growing too thick and viscus.

The Doctor observes the same Glands to lie between the Muscles and Tendons; and supposes that there is the same Mixture of an oily and *mucilaginous* Substance; the one

being that Fat, which is found between the Muscles, and is supply'd by the *Glandule Adiposæ*; and the other separated by the *mucilaginous Glandules*, of which the common Membrane of the Muscles is every where full. This Mixture in the Interstices of the Muscles, lubricates them and their Tendons, and preserves them from shrinking, and growing rigid and dry.

*MUCRO Cardis, or Apex*, in Anatomy, the lower pointed End of the Heart; thus call'd from *Mucro* the Point of a Spear, &c. See *HEART*.

Hence *mucronatus* is apply'd to whatever tends to, or terminates in a Point, like that of a Spear; as *Mucronatum Os*, &c. See *EMISIFORMIS Caricula*.

*MUCOUS Glands*, are three Glands which empty them selves into the Urethra; so call'd by the first Discoverer, Mr. *Casper*, from the Tenacity of the Liqueur which they separate.

The two first discover'd of these, are about the bigness a French Bean, of a depress'd oval Figure, and a yellowish Colour, like the *Prostates*, being on each side the Bulb of the cavernous Body of the Urethra, a little above it. Their excretory Ducts, spring from this internal Surface, next the inner Membrane of the Urethra; into which they open a little lower by two distinct Orifices, just below its bending under the *Ossa Pubis in Perineum*, where they discharge a transparent viscus Liquor. The third *mucous Gland*, is a small, conglobate, yellowish Gland, like the former, but somewhat less, situate above the Angle of Flexure of the Urethra, under the *Ossa Pubis*, in the *Perineum*, near the *Anal*. It has two excretory Ducts, which enter the Urethra obliquely, a quarter of an Inch below the two former; and discharge a Liquor like the former, both in Colour and Consistence. See *URETHRA*.

*MUCUS of the Joints*, is a mucilaginous Liquor, separated by its proper Glands, conveniently plac'd in the Interstices of the Bones, where those Glands are greatly press'd by the Motion of the Parts; it serves to make the Extremities of the Bones or Joints slip more easily. See *BONE*.

*MUCUS of the Urethra*, a viscus transparent Liquor, serving to line and lubricate the Part, that the Seed may slip more freely, without adhering. It comes from Glands lately discover'd by Mr. *Casper*, about the Penis, and is that, which in Women is commonly mistakn for the Semen. See *PENIS*, *SEED*, &c.

*Mucus of the Nigritals*, is separated by its proper Glands, plac'd in the internal Membrane of those Parts. It serves to moisten, lubricate, and defend the Olfactory Nerves; which being extremely soft and naked, would, without such Provision, be soon spoil'd. See *NOSE*, &c.

*MUFTY*, see *MURHT*.

*MUGGLETONIANS*, a Religious Sect, which arose in England, about the Year 1657; denominatd from their Leader *Leobowick Muggleton*, a Journey-man Taylor.

*Muggleton*, with his Associate *Reeves*, set up for great Prophets, and pretended to an absolute Power of saving and damning whom they pleas'd: Giving out, that they were the two last Witnesses of God, that should appear before the End of the World.

*MUID*, a large Measure, in use among the French, for dry Commodities; as Corn, Pulse, Salt, Lime, Coals, &c. See *MEASURE*.

The *Muid* is no real Vessel us'd as a Measure; but an Estimation of several other Measures, as the Septier, Mine, Minot, Bushel, &c.

At Paris, the *Muid* of Wheat, Pulse, and the like, is compos'd of twelve Septiers, each Septier making two Mines, the Mine two Minots, the Minot three Bushels, the Bushel four Quarts, or sixteen Litrons, each Litron 36 cubic Inches, exceeding our Pint by 1 1/2 cubic Inch.

The *Muid* of Oats is double that of Wheat, tho' compos'd like that, of 12 Septiers; but each Septier contains 14 Bushels.

The *Muid* of Charcoal contains 20 Mines, Sacks, or Loads, each Mine two Minots, each Minot eight Bushels, each Bushel four Quarts, &c.

*MUID* is also one of the nine Casks, or regular Vessels us'd in France, to put Wine and other Liquors in.

The *Muid* of Wine divided into two *Deui-Muids*, four *Quarter-Muids*, and eight *Half-Quarter-Muids*, contains 36 Septiers, each Septier 9 Pints, Paris Measure; so that the *Muid* contains 288 Pints. See *MEASURE*.

*MULCT*, a Penalty, or Fine of Money. See *FINE*, *AMERCIAEMENT*, &c.

*MULATTO*, or *MOLAT*, a Name given, in the Indies, to those who are begotten by a Negro Man on an Indian Woman; or an Indian Man on a Negro Woman.

Those begotten of a Spanish Woman and an Indian Man, are call'd *Mestiz*; and those begotten of a Savage by a Man, are call'd *Jamlor*.

These are all very different in Colour, and in their Hair. The Word comes from *Mulat*, or *Mola*, Mule; begotten of two different Species.

MULE, in Natural History, a Beast generated between an Ass and Mare; or between a Horse and a She-Ass.

Mules are a sort of Monsters; and, therefore, don't propagate their kind. See MONSTER.

And yet the Antients mention a sort of Mules that were prolific, in *Phrygia, Syria, Cappadocia, and Africa*. Witness *Aristotle, Hist. Animal. L. VI. c. 36. Varro de Re Rustica, Lib. II. c. 1. Columella, L. VII. c. 36. Theophrastus*, and, after him, *Pliny, L. VIII. c. 44. Seno*, examining the Testicles of a Mule, found Eggs therein, with a sort of Placenta about 'em; which persuaded him that Mules might engender without any Miracle.

The Roman Ladies had Equipages drawn by Mules; as appears from the Medals of *Julia and Agrippina*. And at this day, in Spain the Coaches of the Nobility, and even Princes, are usually drawn by no other than Mules. We are assured that *M. Thuanus*, first President of Parliament, had the fourth Coach in France, in 1585; till which time every body rid to Court, Parliament, &c. on Mules. See COACH.

MULES, among Gardeners, a sort of vegetable Monsters produced by putting the *Farina facundum* of one Species of Plant into the *Pistil* or *Utricel* of another. See GENERATION of Plants.

The Carnation and Sweet-William being somewhat alike in their Parts, particularly their Flowers; the *Farina* of the one will impregnate the other; and the Seed so enliven'd will produce a Plant differing from either. An Instance of this we have in *Mr. Fairchild's Garden at Hoxton*; where a Plant is seen neither Sweet-William, nor Carnation, but resembling both equally; which was raised from the Seed of a Carnation that had been impregnated by the *Farina* of the Sweet-William. These Couplings being not unlike those of the Mare with the Ass, which produce the Mule; the same Name is given 'em; and they are like the others, unable to multiply their Species.

This gives us a hint for altering the Property and Taste of any Fruit, by impregnating one Tree with the *Farina* of another of the same Class; e.g. a Codling with a Pearmain, which will occasion the Codling so impregnated to last a longer time than usual, and be of a sharper Taste. Or if the Winter-Fruits be fecundated with the Dust of the Summer-Seeds, they will decay before their usual time. And from this accidental Coupling of the *Farina* of one with the other, it is that in an Orchard where there is variety of Apples, even the Fruit gather'd from the same Tree differ in their Flavour, and in the Season of Maturity. 'Tis from the same accidental Coupling that proceeds the numberless Varieties of Fruits and Flowers rais'd every Day from Seed. See FARINA and SEED.

MULIEBRIA, a Term sometimes used to signify the Privities of Women; or so much as is otherwise call'd, *Gynaecus*. See PUDENDUM, GYNAECUS.

MULIER, a Term in Law, seeming to be a corruption of the Latin *Mulier*, or the French *Muliere*, better; and signifying the lawful Issue born in Wedlock.

Tho, according to *Glosses*, the lawful Issue is rather call'd *Mulier* than *Mulier*, because gotten on *Mulieres*, and not on *Conubine*: For he calls such Issue *filios Mulieratos*; opposing them to Bastards.

Agreeable to which, *Erasmus* has *frere Mulier*, i. e. the Brother begotten of the Wife; in opposition to *frere Bastard*.

The like seems to obtain in *Scotland*. For *Skene* says, that *Mulieratus filius* is a lawful Son begot of a lawful Wife. If a Man have a Son by a Woman before Marriage, which is a Bastard and Illegitimate; and he after marries the Mother of the Bastard, and they have another Son; this second Son is call'd *Mulier*, and is lawful, and shall be Heir to his Father. We sometimes also find 'em with these Additions, *Bastard cognatus*, and *Mulier puissa*.

MULIER was also antiently used as an Addition, some say for a Wife; others for a Woman born in lawful Wedlock. The former sense is confirmed by *Sir Edward Coke*, who says, that antiently *Mulier* was taken for a Wife, and sometimes for a Widow. *Inst. Fol. 434.*

MULLET, in Heraldry, a Star of five Points; as in the Figure adjoining.

The Mullet is usually the difference, or distinguishing Mark for the fourth Son, or third Brother, or Houfe. See DIFFERENCE.

Tho it is often also borne as Coat-Armour: As here;

Ruby on a Chief Pearl, two Mullet Diamond; being the Coat of the famous Lord *Pertham*, first *Sir Francis Bacon*.

The Herald holds that the Mullet represents a falling Star; others, with more probability, take it for the Rowel of a Spur, call'd by

the French *Mulette*. Whence some Authors will have it pierced.

When it has six Points, it is not call'd a Mullet, but a Star. See STAR.

MULLET, or MOLETTE, a Stone flat and even at bottom, but round a-top; used for Grinding of Matters on a Marble. The Apothecaries use *Mullets* to prepare many of their Ingredients; Painters for their Colours, either dry or in Oil. Mullet is also an Instrument used by the Glass-Grinders; being a Piece of Wood, to one end whereof is cemented the Glass to be ground, whether Convex in a Basin, or Concave in a Sphere or Bowl. The Mullet is ordinarily about six Inches long, turn'd round; the Cement they use is compos'd of Adhes and Pitch.

MULSUM, or MULSA, is a Liqueur made with Honey and Water. See HYDROMEL.

MULTA, or MULTURA *Episcopi*, a Fine, or final Satisfaction antiently given the King by the Bishops, that they might have Power to make their last Wills; and that they might have the Probate of other Mens, and the granting of Administrations.

MULTANGULAR, any Figure, or Body which hath many Angles, or pointed Corners. See ANGLE.

MULTILATERAL, in Geometry, is apply'd to those Figures that have more than four Sides or Angles.

MULTINOMIAL Roots in Mathematics, are such as are compos'd of many Names, Parts, or Members, as  $a + b + c + d$ , &c. See ROOT.

For the Method of raising an infinite *Multinomial* to any given Power, or of extracting any given Root out of such a Power; see a Method of *M. de Moivre* in *Philos. Transact.*

MULTIPLE, MULTIPLEX, in Arithmetic, a Number which comprehends some other Number several times. See NUMBER.

Thus 6 is a Multiple of 2; or, which is the same, 2 is a quota part of 6; 2 being contained in 6 three times. And thus 12 is a Multiple of 6, 4, 3; and comprehends the 1st twice, the 2d thrice, the 3d four times, &c.

MULTIPLE Ratio, or Proportion, is that which is between such Numbers.

If the lesser Term of a Ratio be an Aliquot Part of the greater; the Ratio of the greater to the less is call'd *Multiplex*: And that of the less to the greater *Sub-multiple*. See RATIO.

A *Sub-multiple* Number is that contained in the *Multiple*. Thus the Number 1, 2, and 3 are *Sub-multiples* of 6 and 9. Duple, Triple, &c. Ratios; as also *Sub-duples*, *Sub-triples*, &c. are so many Species of *Multiple* and *Sub-multiple* Ratios. See DUPE, TRIPLE, &c.

MULTIPLICAND, in Arithmetic, is one of the Factors in the Rule of Multiplication; being that Number given to be multiplied by another call'd the *Multiplicator*, or *Multiplicator*. See MULTIPLICATOR.

MULTIPLICATOR, in Arithmetic, a Number multiplied by another call'd the *Multiplicand*. See MULTIPLICAND.

The largest Number is ordinarily made the *Multiplicand*, and placed above the smaller, or *Multiplicator*; but the result is the same which soever of the Numbers be made *Multiplicand* or *Multiplicator*; 4 times 5, and 5 times 4 making the same Sum. See MULTIPLICATION.

MULTIPLICATION, the Art of Multiplying or Increasing the Number of any thing. See MULTIPLYING.

Thus we say the *Multiplication* of the Loaves in the *Widdereck*.

The *Ramenists* hold a real *Multiplication* of the Body of Jesus Christ in the Eucharist; so that every Communicant has a whole Body, &c.

It is ordain'd and established, that none from henceforth shall use to multiply Gold or Silver, nor use the Craft of *Multiplication*; and if any the same do, he shall incur the Pain of Felony. Stat. 5 Hen. 4.

This Statute was made on Presumption that some Persons skilful in Chymistry, could multiply or augment those Metals by Elixirs, or other Ingredients; and change other Metals into very Gold and Silver. Under Henry VI. Letters Patent were granted to certain Persons (who undertook to perform the same, and to find the Philosopher's Stone) to free them from the Penalty in the said Statute.

MULTIPLICATION, in Arithmetic, the Art or Art of multiplying one Number by another, to find the Product. See PRODUCT.

*Multiplicaton*, the third Rule in Arithmetic, consists in the finding of some third Number, out of two others given; wherein, one of the given Numbers is contained as often as Unity is in the other.

Or *Multiplication* is the finding what will be the Sum of any Number added to itself, or repeated as often as there are Units in another: So that *Multiplication* of Numbers is a compendious kind of Addition. See ADDITION.

Thus the Multiplicator of 4 by 5 makes 20, i.e. four times five amount to twenty; which Algebraists express thus,  $4 \times 5 = 20$ . See CHARACTER.

In Multiplication, the first Factor, i.e. the Number to be multiplied, or Multiplicand, is placed over that whereby it is to be multiplied; (see MULTIPLICAND) and the Factum or Product, under both. An Example or two will make the Process of Multiplication easy. — Suppose I would know the Sum of 259 multiplied by 8, or 8 times 259.

Operation.

Multiplicand	_____	_____	_____	259
Multiplier	_____	_____	_____	8
Factum, or Product	_____	_____	_____	2152

Explication.

The Factors being disposed, and a Line drawn underneath, (as in the Example) I begin with the Multiplier thus; 8 times 9 make 72, set down 2, and carry 7 tens, as in Addition; then 8 times 5 make 40, and 7 l carried, 55; set down 5, and carry 5; lastly, 8 times 2 make 16, and with 5 I carried 21, which I put down: so as coming to number the several Figures placed in order, 2, 1, 5, 2, I find the Product to be two thousand one hundred fifty two. See NUMERATION.

Now supposing the Factors to express things of different Species, viz. the Multiplicand Men, or Yards, and the Multiplier Pounds; the Product will be of the same Species with the Multiplier.

Thus the Product of 259 Men or Yards multiplied by 8 Pounds or Pence, is 2152 Pounds or Pence; so many of these going to the 259 at the Rate of 8 apiece. Hence the vast Use of Multiplication in Commerce, &c.

If the Multiplier consists of more than one Figure, the whole Multiplicand is to be added to itself, first, as often as the right-hand Figure of the Multiplier shows, then as often as the next Figure of the Multiplier shows, and so on. Thus  $421 \times 23$  is equal to  $421 \times 3$  and also  $421 \times 20$ . The Product arising from each Figure of the Multiplier, multiplied into the whole Multiplicand, is to be placed by itself in such a manner, that the first or right-hand Figure thereof may stand under that Figure of the Multiplier from which the said Product arises. For Instance;

Multiplicand	_____	_____	_____	421
Multiplier	_____	_____	_____	23
Particular Product of $421 \times 3$	_____	_____	_____	1263
Particular Product of $421 \times 20$	_____	_____	_____	842
The Total Product	_____	_____	_____	9683

This Disposition of the right-hand Figure of each Product, follows from the first general Rule; the right-hand Figure of each Product being always of the same Denomination with that Figure of the Multiplier from which it arises.

Thus in the Example, the Figure 2 in the Product 842, is of the Denomination of tens, as well as the Figure 2 in the Multiplier. For  $1 \times 20$  (that is the 2 of 25) = 20, or 2 put in the Place of tens, or second Place. Hence, if either of the Factors have one or more Cyphers on the right-hand, the Multiplication may be performed without regarding the Cyphers, till the Product of the other Figures be found: To which they are to be then affix'd on the right. And if the Multiplier have Cyphers intermix'd, they need not to be regarded at all. Instances of each follow.

12	35	10	24	80
10	6000	10	30	5006
120	218000	100	72000	48078
				40065
				40113078

Thus much for an Idea of Multiplication, where the Multiplier consists wholly of Integers; in the Praxis whereof 'tis supposed the Learner is apprized of the Product of any of the nine Digits multiplied by one another, easily learnt from the common Table, (see TABLE) or otherwise.

Note, This Multiplication is render'd still easier, and more expeditious by the use of certain Rods, whereon are mark'd the several Progressions of Digits in the Table, and which give the several Multiples of any Sum by inspection, call'd Napier's Bones; the Description and Use whereof see under the head NAPIER'S BONES.

Where the Multiplier is not composed wholly of Integers; as it frequently happens in Builness, where Pounds are accompanied with Shillings and Pence; Yards with Feet and Inches; the Methods of Procedure are as follow:

First Method, Suppose I have bought 37 Ells of Cloth at 15 l. 16 s. 6 d. per Ell, and would know the Amount of the whole, — I first multiply 37 Ells by 15 l. in the common Method of Multiplication by Integers, leaving the two Products without adding 'em up; I then multiply the same 37 Ells by 16 s. leaving, in like manner, the two Products without adding 'em. Lastly, I multiply the same 37 by the 6 d. the Product whereof is 222 d. which divided by 12, (see DIVISION) gives 18 s. 6 d. and this added to the Products of the 16 s. the Sum will be 610 s. 6 d. the Amount of 37 Ells at 15 s. 6 d. the Ell. Lastly, the 610 s. 6 d. are reduced into Pounds by dividing 'em by 20: (see REDUCTION) upon adding the whole, the Amount of 37 Ells at 15 l. 16 s. 6 d. will be found as in the following

Operation.

37 Ells At 15 Pounds.	37 Ells At 16 Shillings.	37 Ells At 6 Pence.
555	594	222
37	37	
590 10 6	18 6	
Product 511 10 6	610 6	

Second Method, Suppose the same Question; reduce the 15 l. 16 s. into Shillings, the Amount will be 276 s. reduce 276 s. into Pence, adding 6, the Amount will be 3318 d. Multiply the 37 Ells by 3318, the Amount will be 122766 d. which divided by 12; and the Quotient 10230 s. 6 d. reduced into Pounds by cutting off the last Figure on the right, and taking half of those on the left, yields 511 l. 10 s. 6 d. the Price of the 37 Ells, as before.

Tho' by these two Methods any Multiplications of this kind may be effected, yet the Operations being long, we shall add a third much shorter, by Aliquot and Aliquant Parts: Observing by the way, that Aliquot Parts of any thing are those contained several times therein, and which divide 'em without any remainder; and that Aliquant Parts are other Parts of the same thing composed of several Aliquot Parts: Both as in the following Table.

Aliquot Parts of a Pound of 20 s.

- 10 s. make half of 20 s.
- 5 s. a fourth.
- 4 s. a fifth.
- 2 s. a tenth.
- 1 s. a twentieth.
- 6 s. 8 d. a third.
- 5 s. 4 d. a sixth.
- 2 s. 6 d. an Eighth.
- 1 s. 8 d. a twelfth.
- 1 s. 4 d. a fifteenth.
- 1 s. 3 d. a twentieth.
- 10 d. a sixteenth.
- 5 d. a forty-eighth.

Aliquant Parts of a Pound of 20 s.

- 3 s. an Aliquant Part composed of a 10th and a 20th.
- 6 s. of a 5th and a 10th.
- 7 s. of a 4th and a 10th.
- 8 s. of two 5ths.
- 9 s. of a 4th and a 5th.
- 11 s. of a half and a 20th.
- 12 s. of a half and a 10th.
- 13 s. of a half, a 10th and 20th.
- 14 s. of a half and a 5th.
- 15 s. of a half and a 4th.
- 16 s. of a half, a 5th, and 10th.
- 17 s. of a half, a 4th, and 10th.
- 18 s. of a half and two 5ths.
- 19 s. of a half, a 4th, and 5th.

To Multiply by Aliquot Parts is nothing else in effect but to divide a Number by 3, 4, 5, &c. which is effected by taking a 3d, 4th, or 5th, &c. from the Number to be multiplied. Example.

To Multiply, viz. by 6 s. 8 d. Suppose I have 547 Ells of Ribbon at 6 s. 8 d. per Ell.

Operation.

Multiplicand	_____	_____	547 Ells.
Multiplier	_____	_____	6 s. 8 d.
Product	_____	_____	4722 l. 13 s. 4 d.

The Question being Stated; take the Multiplier, which according to the Table of Aliquot Parts is the third; and say, the third of 5 is 1, set down 1; the third of 4 is 1, set down 1, remains 1, that is, one ten, which added to 7, makes 17; then the third of 17 is 5; remains 2 Units, i.e. two thirds, or 13 s. 4 d. which place after the Pounds. Upon numbering the Figures 1, 1, and 5, Integers, and 13 s. 4 d. the Aliquot Part remaining, I find the Sum 4722 l. 13 s. 4 d.

For Multiplication by Aliquant Parts: Suppose I would multiply by the Aliquant Part 19 s. I first take for 10 s. half the Multiplicand 3 then for 3, which is the 4th s. and, lastly,

lastly, for 4, which is the 5th. The Products of the three Aliquot Parts that compose the Aliquant Part, being added together, the Sum will be the total Product of the Multiplicand, as in the following Example; which may serve as a Model for Multiplication by any Aliquant Part that may occur.

Multiplicand	—	356 Ells.
Multiplier	—	19 s.
—————		
		178 l. for ten Shillings.
		89 l. for five Shillings.
		71 l. for four Shillings.
—————		
Product	—	338 l. 4 s.

The Proof of Multiplication, is, by dividing the Product, or Factum, by the first Factor, or Multiplicand; or the Quotient be equal to the second Factor, or Multiplier, the Operation is just.

COPY MULTIPLICATION, otherwise call'd Duodecimal Arithmetic, is a very expeditious Method of Multiplying things of several Species, or Denominations, by others likewise of different Species, &c. *E. gr.* Shillings and Pence by Shillings and Pence; Feet and Inches by Feet and Inches, much used in Measuring, &c. The Method is thus.

Suppose 5 Feet 3 Inches to be multiplied

F.	1.
5	3
10	6
4	4
10	6
1	8

the whole Sum makes 12 Feet 3 Inches.

In the same manner may you manage Shillings and Pence, &c.

MULTIPLICATION, in Geometry, or in Lines, is effected by supposing a Line *ab* (Tab. GEOMETRY. Fig. 9.) called the Describent, moving perpendicularly along another *bc*.

For by this means the Describent forms the Rectangle *adcb*; and if it be divided together with the Describent into any Number of equal Parts, will by its Motion describe as many little Rectangles as the Units in the Describent and Describent will produce when multiply'd into one another; *vis.* 27. See DESCRIBENT, &c.

For when the Line *ab* hath moved over one part of *a, d*, it will by its three parts have described the three little Rectangles in the first Column; when it comes to 2, it will have described three more. And this is the Reason why Multiplication in the Latin Tongue is usually expressed by the Word *della*, drawn; (and from hence also comes *Productus*) as if *ab* were multiply'd by *bc*, they say *a b della m b c*, because the Describent is led, as it were, or carried along in an erect Posture upon the Describent, and by that means describes the Rectangle; so that the Rectangle and Product are all one in Geometry.

Now as in all Multiplication Unity is to one Factor as the other is to the Product, Multiplication in Lines may be performed thus:

Let *ab* (Fig. 10.) be to be multiply'd by *a d*: make any Angle at pleasure; on one of the Legs set off *am* = to Unity; and on the same Leg set off *ad*, the Multiplier (3); then for the Multiplicand *ab* (2) from *a* on the other Leg of the Angle; draw *nb*, and parallel to it through *d*, draw *de*, (6). I say, *de* or *6*, is the Product: for *am*: *ad* :: *ab*: *6*.

MULTIPLICATION of Plants, see FOREFRONTITY of Plants.

MULTIPLYING, the producing of one's like. See PRODUCTION.

Mankind multiply'd at a prodigious Rate before the Flood, (see PROFLING.) Rabbits, Fish, and most Insects multiply incredibly. The single Milt of a Cod, examin'd with M. Leuwenhoek's Microscope, was found to contain more Ova than there are Animals on the Face of the Earth. See INSECT, &c.

M. Dulari has several Discourses on the Multiplication of Plants in the *Memoirs of the Royal Academy of Sciences*. He has examin'd the Beech-Tree particularly with this view, and found it to surpass all Imagination. See FOREFRONTITY.

MULTIPLYING, in Arithmetic, is the finding a Number which contains the Multiplicand as often as there are Units in the Multiplier. See MULTIPLICAND, &c.

The Rule of Three consists in Multiplying the third Term by the second, and dividing the Product by the first. See RULE of Three.

MULTIPLYING GLASS, a Lens, or Glass in which Objects appear increased in Number. See LENS.

A Multiplying-Glass, call'd also Polyhedron, is a Glass form'd or ground into several Planes, or Faces, making Angles with one another; through which the Rays of

Light issuing from the same Point undergo different Refractions, so as to enter the Eye from every Surface in a different Direction; so as if they came from several Points.

And thus the same Point is seen in several imaginary Foci; and therefore appears multiply'd. See REFRACTION.

For the Phenomena and Laws of MULTIPLYING-Glasses, see POLYHEDRON.

MULTISILICOUS Plants, are the same with *Cornivertate Plants*, *viz.* those which, after each Flower, have divers distinct, tender, and frequently crooked *Slipae*, or Pods, wherein their Seed is contain'd; and which when they ripen, open of themselves, and let the Seeds drop. See CORNICULATE and GERMINATION.

To this Class belong the Bears-Foot, Columbine, Houf-Leek, Marigolds, &c.

MULTITUDE, MULTITUDO, an Asssemblage, or Collection of a great Number of Things, or Persons; or, more strictly, *Multitudo* is the Abstract whereby things are said to be many.

In which Sense *Multitudo* may be consider'd as Number. See NUMBER.

*Multitudo* is opposed to Unity. See UNITY.

In Law, some will have *Multitudo* to imply at least ten Persons; but Sir *Edw. Coke* says, he could never find it restrain'd by the common Law to any certain Number, but always left to the Discretion of the Judges.

A *MULTO Factori*, or *a minore ad majus*, is an Argument often used by *Littleton*. The force of it is thus: If it be so in a Feoffment passing a new Right; much more is it for the Restitution of an ancient Right. *Coke on Littleton*, fol. 253.

MULTUM, in Arithmetic, If *A* be one, *B* one, *C* one, *D* one, &c. And *B*, *C*, and *D* be not the same with *A*; *A*, *B*, *C*, and *D* are *Multa*, or *Plura*, many. *Wolffius*.

MUM, a very wholesome Drink, the Receipt of which, as recorded in the Town-House of *Brunswick*, the Place of most Note for this Liquor, is as follows:

Take 63 Gallons of Water that has been boiled to the Consumption of a third part; brew it with seven Bushels of Wheat-Malt, one Bushel of Oat-Malt, and one Bushel of ground Beans; when it is tun'd, let not the Hoghead be too full at first, and as soon as it begins to work, put into it of the inner Rind of Fir 3 Pounds, Tops of Fir and Birch 1 Pound, *Carduus Benedictus* 5 Handfuls, Flower of Rosa Solis, one Handful or two, *Barnet*, *Gerony*, *Marjoram*, *Avens*, *Penny-Royal*, wild Thyme, of each a Handful and a half; of Elder-Flowers, two Handfuls or more; Seeds of *Cardamum* bruised 30 Ounces, *Barberries* bruised one Ounce; put the Herbs and Seeds into the Vessel when the Liquor has wrought a while, and after they are added, let the Liquor work over the Vessels as little as may be, then fill it up: at last, when it is stopp'd, put into the Hoghead ten new-laid Eggs unbroken or crack'd, stop it up close, and drink it at two Years end.

Our English Brewers use *Cardamum*, *Ginger*, and *Saffra* instead of the inner Rind of Fir; and add *Walnut-Rinds*, *Madder*, *Red Sanders*, and *Alecampane*.

MUMMY, *MUMIA*, a Carcase, or Body embalmed or dried in the manner of the ancient Egyptians. See EMERALMING.

The Preparation of *Mummy* is of so old a standing, that it was in use in Egypt before the time of *Moses*. The Coffin in which the *Mummy* is contain'd is of *Sycamore-Wood*, which is found to keep sound for the Space of 3000 Years; but it is very different from our *Sycamore*.

*Mummy* is said to have been first brought into use in Medicine by the Malice of a Jewish Physician, who wrote that Flesh thus Embalmed was good for the Cure of divers Diseases, and particularly Bruises, to prevent the Blood's gathering and coagulating. The Turks prevent the Export of *Mummy* into Europe as much as possible.

Properly speaking, *Mummy* is not the Flesh of the Deceased, but the Composition wherewith it is embalmed; but in common use *Mummy* is also used for the Body.

There are two kinds of Bodies call'd by the Term *Mummy*.

The first are only Carcases, dried by the Heat of the Sun, and by that means kept from Putrefaction; frequently found in the dry Sands of *Lycia*. Some say, they are the Bodies of deceased People buried there on purpose to keep 'em entire without Embalming; others that they are the Carcases of Travellers, &c. over-whelm'd with Clouds of Sand rais'd by the Hurricanes frequent in those Deserts. Be that as it will, these *Mummies* are of no use in Medicine, and are only prefer'd as Curiosities.

The second kind of *Mummy* are Bodies taken out of the Pits, or Carcombs near *Cairo*, wherem the Egyptians deposited their Dead after Embalming.

'Tis this makes the *Mummy* so much valued, and to which such extraordinary Virtues are ascribed.

'Tis said, that all the *Mummy* sold in the Shops, whether brought from *Perice* or *Lyon*, or even directly from the *Levant* by *Alexandria*, is factitious, and the Work of certain *Jews*, who knowing the Value the *Europeans* set on the *Egyptian Mummy*, counterfeit it by drying Carcasses in Ovens, after having prepar'd 'em with Dust of Myrrh, Caballin Aloes, *Jessu* Pitch, black Pitch, and other coarse or unwholesome Drugs.

The *French Charlevoix*, it seems, have likewise got the Art of preparing *Mummies*. Their Method is simple enough: Out of the Carcass of a Person hang'd, they take the Brain and Entrails, dry the rest in an Oven, steeping it in Pitch, and other Drugs. And this they sell for right *Egyptian Mummy*.

*Pavani* has a very curious Treatise of *Mummies*, wherein he shews the Abuse thereof; and makes it appear that they can never be of any real medicinal use.

*Mathiolus* is of the same Opinion, after *Serapion*. Both these Authorities take even the *Egyptian Mummies* to be no more than Bodies embalmed with *Pissasphaltum*.

*MUMMY*, *MUMIA*, is particularly us'd for the Liqueur, or Juice oozing from human Bodies Aromatized and Embalmed; gather'd in the Sepulchres. This is the *Mummy* chiefly spok of among the ancient Writers.

*MUMMY* is also a Medicinal Drug, or a viscous Composition partaking of Bitumen and Pitch found in the Mountains and Forests of *Arabia*, and other hot Countreys of the East.

*Disfordis* speaks of a *Mummy* found on the Sea-Coasts near *Epidaurus*, brought thither by the Torrents from the *Cerastian Mountains*, and there dried by the Sun into huge heaps.

It smells like Bitumen mixt with Pitch. The People thereabouts call it *menreal Wax*. In *Latin*, or rather *Greek*, it is call'd *Pyssiphalus*. See *PISSASPHALTUS*.

*Menage*, after *Bechard*, derives the Word *Mummy* from the *Arabic Mumia*; of *Mum*, *Wax*. *Salmastius* from *Amomus*, a kind of Perfume. See *AMOMUM*.

The others hold, that in the *Arabic Tongue*, the Word *Mumia* signifies a Body Embalmed, or Aromatized.

*MUMMY* is also used by some Physicians for I know not what implanted Spirit, found chiefly in Carcasses, when the infused Spirit is fled.

The infused Spirit is sometimes also call'd *Mummy* in living Subjects; and both the one and the other are suppos'd to serve in Transplantation.

A Plant, for instance, bringing this *Mumia* from one Subject to another, the *Mumia* joins and unites itself immediately, and closes with the *Mumia* or Spirit of the new Subject; and from this Union arises a natural and common Inclination between the two Subjects.

And on this Principle they account for Sympathetic or Magnetic Cures. See *SYMPATHETIC*, *MAGNETIC*, &c.

*MUMMY* is also used among Gardeners for a sort of Wax us'd in the Planting and Grafting of Trees. See *GRAFTING Wax*.

*Agricola* directs the Preparation thereof as follows: Take one Pound of common black Pitch, and a quarter of a Pound of common Turpentine; put 'em together in an Earthen-Pot, and set 'em on the fire in the open Air, having something in your Hand to cover and quench it in time; the Matter to be thus alternately lighted and quenched till all the nitrous and volatile Parts be evaporated. To this a little common *Wax* to be added; and the Composition to be set by for use.

To apply it in the dressing of the Roots of Trees, melt it, and dip in the two ends of the Pieces of Root one after another; then put 'em in Water, and plant 'em in the Earth, the small end downward, so that the larger may appear a little way out of the Earth, and so have the benefit of the Air; then press the Earth hard down upon 'em that they may not receive too much wet. See *PLANTING*.

*MUNDICK*, a Marchasite, or Mineral Glebe, found in the Tin Mines, sometimes white, sometimes yellow, and at other times green. See *MARCHASITE*.

It is frequently call'd *Mazy*; and appears to be nothing else but a kind of Sulphur; Fire alone being found to separate it from the Tin, in which case it evaporates into Smoke. See *TIN*.

The *Mundick Ore* is easily distinguish'd by its brown, sad-colour'd Glittering, and by its discolouring the Fingers. Some say it feeds the Tin, and yet allow that where there is much *Mundick*, there is little or no Tin.

*MUNDIFICATIVES*, in Medicine, *Cleanfers*; Medicines, or Unguents, that deterge, and dry, and thus cleanse Ulcers of two kinds of Matter, viz. *Pus* and *Sanies*. See *ULCER*.

The chief Ingredients in these Unguents, are *Gentian*, *Aristolochia*, *Enzla Campana*, and *Vulnery Herbs*. See *DETERGENT*.

*MUNDUS*, *World*. See *WORLD*.

*MUNICIPAL*, a Term in the *Roman Law*, signifying the having the Rights and Privileges of *Roman Citizens*.

This Title the *Romans* frequently bestow'd on foreign

Cities and People; and in effect, it was little more than a Title.

*MUNICIPAL Cities*, *MUNICIPIA*, according to *Mariana*, came somewhat short of the Privileges of the Colonies. See *COLONIES*.

They had no Suffrages or Votes at *Rome*. They were left to be govern'd by their own Laws and Magistrates.

'Tis true, some few *Municipal Cities*, by particular Merit, &c. obtain'd the Liberty of Votes; which occasion'd that receiv'd Distinction of *Municipia sine Suffragio*, & *Municipia cum Suffragio*.

They were to call'd, because *Numeris huius honorarii particeps*; but by *Mensis honorarium*, was meant no more than the bare Appellation of a *Roman*, whereby they were privileged to fight in a Legion, as *Denizens*; and not in auxiliary Bands, as *Affiliates*. See *CITIZEN*.

The first who had the Honour, were the *Cerites*.

*MUNICIPAL*, among us; is now understood of the Customary Laws that obtain in any particular City, or Province; and which have no Authority in the neighbouring Places. See *CUSTOM*.

*MUNICIPAL Officers*, are those elected to defend the Interests of Cities, their Rights and Privileges, and to maintain Order and Policy; as *Mayors*, *Sheriffs*, *Consuls*, *Bailiffs*, &c. See *OFFICE*.

In *Spain*, the *Municipal Offices* are bought. In *England*, they come by Election.

*MUNIMENTS*, or *MINIMENTS*, the Evidences or Writings, whereby a Man is enabled to defend the Title of his Estate. See *MUNIMENT-HOUSE*.

*Wangford* says, the word *Miniment* includes all manner of Evidence.

*MUNIMENT-HOUSE*, a little, strong Apartment in Cathedral and Collegiate Churches, Castles, Colleges, or the like, destined for keeping the Seal, Evidences, Charters, &c. of such Church, College, &c. call'd *Maniments*, or *Miniments*.

The Word is form'd of the *Latin Munio*, I defend.

*MUNIMINA*, the Grants, or Charters of Kings and Princes to Churches; so call'd, because *cum eis muniantur* against all those who would deprive them of those Privileges.

*MUNIONS*, in Architecture, are the short upright Posts or Bars that divide the several Lights in a Window-Frame. See *WINDOW*.

*MUNITION*, or *AMMUNITION*, the Provisions where-with any Place is furnished in order for defence; or where-with a Vessel is stock'd for a Voyage; or that follow a Camp for its Subsistence. See *AMMUNITION*.

*MUNITION-BREAD* is the proportion of Bread distributed every day to the Soldiers of a Garrison or Army. Each Officer is allow'd for many Rations of *Munition-Bread*. See *RATION*.

*MUPHTI*, or *MUPPI*, the Chief, or Patriarch of the *Mahometan* Religion, residing at *Constantinople*. See *MAHOMETANS*.

The *Muphti* is the sovereign Interpreter of the *Alcoran*, and decides all Questions of the Law. See *ALCORAN*, &c.

He takes place of the *Bashaws* and his Authority is often terrible to the Grand Signior himself. 'Tis he guards on the Sword to the Grand Signior's side; which Ceremony answers to the Coronation of our Kings.

*MURAGE*, *MURAGIUM*, in our Customs, a reasonable Toll to be taken of every Cart or Horse coming laden into a City or Town for the Building or Repairing the Walls thereof.

*MURAL*, something belonging to a Wall; which the *Latins* call *Murus*. See *WALL*.

*MURAL Crown*, among the ancient *Romans*, was a kind of Crown indented a-top, like the Basclements of a Wall. See *CROWN*.

The *Mural-Crown* was the Reward of those who first mounted the Walls of the Enemy; whence it was also call'd *Corona obsidionalis*.

*MURAL Arch* is a Wall, or walled Arch placed exactly in the Plane of the Meridian, i. e. upon the Meridian-Line; for the fixing of a large Quadrant, Sextant, or other Instrument, to observe the Meridian Altitudes, &c. of the heavenly Bodies. See *MERIDIAN-LINE* and *MERIDIAN-ALTITUDE*.

*Tycho de Brabe* was the first who us'd a *Mural-Arch* in his Observations; after him *Mr. Flamsteed*, of *la Hire*, &c. used the same means. See *OBSERVATIONS*.

*MURENGERS*, two Officers of great Antiquity in the City of *Chester*, being two of the Principal Aldermen chose yearly to see the Walls kept in good Repair, and to receive certain Toll and Custom for the Maintenance thereof.

*MURING*, the Walling, or raising the Walls of a Building. See *WALL* and *WALLING*.

*MURRAIN*, *Gargyle*, a Mortality, or contagious Disease among Beasts. See *MORTALITY*.

*Murrains* are occasion'd various ways, but principally by a hot, dry Season; or rather by a general Putrefaction of the

the Air, which begets an Inflammation in the Blood, and a Swelling in the Throat, which soon proves Mortal, and is communicated from one to another.

The Symptoms are generally a hanging down and swelling of the Head, rattling in the Throat, short Breath, Palpitation of the Heart, staggering, abundance of Gum in the Eyes, &c. Breath hot, and Tongue shining.

The most remarkable *Murrain* we hear of, is that mentioned in the *Pibils Trans.* which spread itself through Switzerland, Germany, into Poland, &c.

The Contagion seem'd to propagate itself in form of a blue Mist, which fell on the Grass where the Cattel grazed, inasmuch that whole Herds return'd home sick, and being very dull, and forbearing their Food, most of 'em died away in twenty four Hours time. On dissection were found large corrupted Spleens, splanchnous and corroded Tongues, &c. Those People who manag'd them without a due regard to their own Health, were infected by 'em, and died like the Beasts.

Some imagine it had its Rise from noxious Vapours thrown out of the Earth in three distinct Earthquakes perceiv'd in the Neighbourhood of the Place where it began: The Dr. *Stare* rather thinks it owing to Swarms of volatile Insects. The Antidote for the Sound, and the Medicine for the Sick were the same, viz. Equal Parts of Soot, Gun-Powder, Brimstone, and Salt, with as much Water as would wash it down, a Spoonful in a Dose.

MURREY, in Heraldry, a purple Colour, call'd also *Sanguin*. See *Sanguin*.

MURDER, *Homicide*, the Act of killing another with Violence, Injustice, and Effusion of Blood. See *HOMICIDE*.

Among the number of popular Errors, is the Notion which has obtain'd, that the dead Body would bleed in the Presence, or upon the Touch of the Murderer.

The Crime of *Murder* is punish'd with Death in almost all Nations. See *PUNISHMENT*.

In our Law, *Murder* has a peculiar import, so as to denote a wilful and felonious killing another upon premeditated Malice, whether secretly or openly; and whether *English* Man or Foreigner, living under the King's Protection.

This premeditated Malice, which makes the Essence of *Murder*, is twofold; 1. *Express*, where it may be evidently proved that there was ill-will. 2. When one killeth another suddenly, he having nothing to defend himself, as going over a Stile, or the like. For in such a Case, or when a Man killeth a mere Stranger, the Law presumeth he had Malice against him, or else that he would not do it without any manner of Provocation.

The Word is form'd from the *Saxon* *Morth*, which some will have to signify a violent Death; whence the barbarous Latin *Mordrum* and *Mordrum*. Sometimes the *Saxons* express'd it by a Word which imply'd a deadly Work. In the *French* 'tis call'd *Meurtre*, in *Spanish* *Meurtre*, and in *English* *Murder*.

The Word was us'd long before the Reign of *K. Canutus*; tho it does not appear that the *Saxon* *Morth* signifies a violent Death, but Death in general.

Formerly, indeed, *Murder* was restrain'd to a clandestine killing. Thus, *Murdatus homo antiquus dicebatur, cuius Interfectori nesciebatur ubi quomodoque vel quomodoque esset Inventus. Nunc adnotatum est, licet Jacatur quis Murdram fecerit, homicidium pro proditorem.* LEGES Hen. I.

*Arbitrium Nepotum propriis manibus pro proditorem Interfecit, perfidus Moris genere quod Angli Murdram appellant.* Math. Paris, An. 1216.

Self-MURDER, is otherwise call'd *Suicide*. See *SUICIDE*.

MURDERERS, or MURDERING-Pieces, are small Pieces of Ordnance, either of Brass or Iron, having Chambers, (that is, Charges made of Brass or Iron) put in at their Breeches. See *ORDNANCE*.

They are mostly us'd at Sea at the Bulk-Heads of the Fore-Castle, Half Deck, &c. in order to clear the Decks when an Enemy boards the Ship.

MUSCADINE, a rich white Wine, of the Growth of Provence, Languedoc, Cividad, &c. See *WINE*.

The way of making *Muscadine* at *Frontignac* is as follows: They let the *Muscadine* Grapes grow half dry on the Vine; as soon as they are gathered, they tread and press them immediately, and turn up the Liqueur, without letting it stand, and work in the *Yeast*; the *Yeast* occasioning its goodness.

The Word, as well as the Liqueur, is *French*. Some fetch its Original from *Musk*, the Wine being supposed to have a little of the smell of that Perfume; others from *Muscus*, a Fly, because the Flies are extremely fond of its Grapes; as the *Latins* had their *Vinum Apianum*, so call'd *ab Apibus*, from the Bees which feed on it.

MUSCLE, *Musculus*, in Anatomy, a fleshy, fibrous Part of the Body of an Animal, declin'd to be the Organ of Motion. See *MOTION*.

The *Muscle* is a bundle of thin, parallel Plates; and is divided into a great number of Fasciculi, or little *Muscles*,

each inclosed in its proper Membrane, from the internal Surface whereof, pass an infinite number of transverse Filaments, which intersect the *Muscle* into several distinct Areas, fill'd with their respective Fasciculi of Fibres. See *FIBRE*.

A *Muscle* is usually divided into three Parts, the Head, the Tail, and the Belly.

The Head and Tail, which are also call'd *Tendons*, are the two extremes of the *Muscle*; whereof the first is fix'd to the stable part, and the latter to the part intended to be moved. See *TENSION*.

The *Venter* or *Belly* is the body of the *Muscle*, being a thick, fleshy part, into which are insert'd Arteries and Nerves, and out of which issue Veins and Lymphatics.

All these parts of a *Muscle*, the *Belly* and the *Tendons*, are compos'd of the same Fibres: Their only difference consists in this, that the Fibres of the *Tendons* are more closely and firmly bound together than those of the *Belly*, which are more loose. Hence in the *Belly* there is room for a sufficient Quantity of Blood to give 'em an Appearance of Redness; and the Whiteness of the *Tendons* only proceeds from the Blood's being in some measure excluded by the tightness of their Contexture. The difference then between the *Belly* and the *Tendons* seems to be the same that is between a Skin and Thread, and a Cord made of the same Thread.

All the *Muscle* act by having their Bellies inflat'd or swell'd; so by that means they are shorten'd, so as to draw, or press the solid Bodies to which they are fasten'd, according to the direction of their Fibres. All the difficulty then in *Muscular* Motion, is, to assign their Fabric, and the Cause of their swelling.

Every simple *Muscle*, then, consists of one fleshy *Belly*, and two *Tendons*; but may be again divided into others similar, the less; and those again into others still less, yet still similar to the greatest: Which division may be carried on to a degree of Subtlety that exceeds all Imagination; tho 'tis reasonable to think it must have an end. That last, therefore, being similar to the first, must, in like manner, have its *Belly* and *Tendons*; and this is what we ordinarily call a *Muscular* Fibre, in an *Ass*, *bull*, or *Union* of several whereof, a *Muscle*, properly so call'd, consists.

Some take the *Muscular* Fibres to be Productions of the Arteries and Veins, or the Capillaries of those Vessels inoculated with, and continued to each other; by the intumescence of whose Contents, the Extremities are drawn nearer each other, and by consequence, the Bone to which the moveable part is fixed, approximated to the other. But that they are, in truth, neither Veins, nor Arteries, nor Lymphatic Vessels, is evident from the last Observation. Whether they are *Vascular* or whether they only consist of single Threads, may be still a Question.

Dr. *Boerhaave*, from a consideration that the Nerves enter every *Muscle* along with its Veins and Arteries, and that there laying aside their outer Integument, they are so distributed thro the whole Body of the *Muscle*, as that no one Point can be assigned wherein a part of 'em is not found; that those Nerves terminate here; and that in other parts of the Body the Extremities of the Nerves are expanded, as it were, into Membranes; concludes, that the *Muscular* Fibres are nothing else but extremely slender Expansions of the Nerves stript of their Integument, hollow within, and of the Figure of a *Muscle*, and full of a Spirit communicated by the Nerve from its Origin in the Brain or *Cerebellum*, by the continual Action of the Heart. See *NERVE*.

Of these Fibres united, are form'd Fasciculi or Bundles; which, again, have each their several Membrane, wherein they are involv'd, and kept distinct from others. This Membrane is extremely slender and porous within, full of Oil, which is accumulated in time of Rest and spent in Motion, furnished by the Arteries; and this Oil, in conjunction with a smooth mucous Juice secreted by small mucilaginous Glands, interspersed among these Fasciculi, serves to lubricate the parts, and preserve the Fasciculi from fretting on each other.

Now, besides the Nerves, there are Arteries also carried into the *Muscles*, and those in such abundance, and of such contexture, that a Man might be inclin'd to think the whole Body of the *Muscle* compos'd of 'em. These are principally distributed among the Fasciculi, and the Membranes that separate 'em, and perhaps also in the external Surface of each *Fibrilla*, where they terminate in reticular Plexus's, or Folds, in little oily Secretories, small Lymphatics, and perhaps in hollow *Fibrille* like Nerves; which *Fibrille* may again either terminate in the Cavity of the Nervous Muscular Fibres, or make others like 'em. This, at least, is clear, that every Branch of an Artery in the *Muscles* has its corresponding little Vein, which united to the other, increases its Bulk; whence the Blood-Vessels of the *Muscles* are also Lymphatics.

Of two such *Muscles* as have been described, fasten'd in opposite Situations to each other, most of the *Muscles*, we know of, consist.

It has been already observed, that the Tendon of a *Muscle* consists of the same Number of Fibres with the *Muscle* itself; with this Difference, that the Cavity of the muscular Fibres diminishes, and losing of their former Diameter, form one compact, hard, tough, dry, narrow Body, which is but little Vascular: From what has been said then, it appears, that the Redness of a *Muscle* is owing to the Blood; and its Bulk to the Fulcra of the Arteries, Veins, oily Cells, and Lymphatics. Hence we see, why in old Age, Leanness, Consumptions, Atrophies, costless Hear, and hard Labour, their Redness as well as Bulk are so diminished; and yet in old Age, Leanness, &c. the Motion remains. This may be effected, when the *Muscles* have no Redness left; as appears in Insects, whose Flesh is not perceivable.

The Fibres, Fasciculi, Arteries, and Nerves may be separated from each other in a live or a dead Body, without breaking. They are always in a degree of Tension, and endued with a contractive Force; so that when cut asunder, the Ends fly back from each other; and then they become shorter, their Bulk is less'n'd, and they contract themselves into a wavy undulating kind of Surface, and throw off their proper Juices. Hence it appears they are always in a state of Violence, are ever opposing their Elongation, ever endeavouring to shorten themselves, but more in a live Body than a dead one; and therefore require Antagonists. 2. If the Cerebrum be strongly compress'd, or have any violent Contusion; if it be suppurated, obliterated, or torn, the voluntary Action of all the *Muscles* immediately ceases, as well as all Sense and Memory; however the spontaneous Action of the *Muscles* in the Heart, Lungs, the *Viscera*, and Vital Parts, remains. 3. The same Alterations being made in the Cerebellum, the Action of the Heart, Lungs, and Life itself, ceases; when yet the Vermicular Motion continues a long time after in the Ventricle and Intestines. 4. The Nerve of any *Muscle* being compress'd, tied up, corrupted, or cut, all the Motion of that *Muscle*, both Vital and Voluntary, immediately ceases; and if a nervous Trunk sending Branches to several *Muscles*, be thus bound up, cut, &c. they are all affected in the same manner. 5. The same things being done in any part of the spinal Marrow, the Action of all the *Muscles* whose Nerves arise from the part affected, is destroy'd: And, 6. The same things being done to the Artery which carries Blood to one or more *Muscles*, the Effect is the same. 7. The Tendon of a *Muscle* in Action does not undergo any sensible Alteration, but the Belly shortens, becomes hard, pale, swollen, protuberant; and the Tendons are approached nearer, and the more moveable part fasten'd to the Tendon, is drawn towards the other less moveable; which Action of a *Muscle* is call'd its *Contraction*, which is much greater and stronger than that inherent Contraction observed under the first Phenomenon; and therefore is not natural, but superadd'd. 8. The Tendon of a *Muscle* out in Action, is still the same; but the Belly softer, redder, laxer, longer, and flatter; and this state of a *Muscle* is call'd its *Relaxation*, tho' it is usually owing to the contrary Action of its Antagonist; for that being frustrated, the Contraction of the other continues, as not being balanced by the Action of an Antagonist. 9. If one Antagonist remain at Rest while the other is in Action, the Member in that case will be bent; if both act at the same time, it will be fix'd and immovable; if neither act, it will be indifferent, and ready to be moved whether the least excess shall carry it. 10. All these Changes mentioned in the 7th, 8th, and 9th Articles, are performed in the smallest Moment of Time, and in the whole *Muscle* at once; so that they can pass and repass reciprocally without leaving any Trace in the Body behind them. 11. By injecting warm Water into the Artery of a quiescent *Muscle*, even that of a dead Carcass its Contraction is restored; and that longer after Death. 12. The Bulk of a *Muscle* is increased rather than diminished by every Experiment of its Contraction. 13. A Limb being bent, by some external force, against the Will, the Flexor *Muscle* of that Member assumes a state of Contraction, as if it acted by its proper Motion; tho' not altogether so strenuously. 14. The Will remains indifferent, all the voluntary *Muscles*, and all their Vessels are equally full, and moved by the Blood and Spirits equally convey'd to 'em, and that throughout the whole Body at once.

For the Application of this Structure of the MUSCLES, in accounting for the great Phenomenon of Muscular Motion, see MUSCULAR Motion.

As the Muscular Fibres, or, which comes to the same, the Fasciculi of Muscular Fibres, have not always the same Situation with regard to each other, nor run in the same direction, but sometimes run parallel to the muscles and their Tendons; and are sometimes disposed obliquely both to their Tendons and to each other; hence there arises two different kinds of *Muscles*.

The one Direct and Parallel, which some call *Simple Muscles*.

The other Inclined, or Oblique; call'd *Compound Muscles*.

Under the first of these kinds are included several other Species; for, first, Either the fleshy Fibres run straight from one Extremity to the other, as in the *Sarcines*, &c. or are turn'd into a Circle, as in the *Sphincters* of the Bladder, and Anus; or twisted into a Spiral, as in the *Orpheagus*; And hence they come to be call'd *Recti*, *Obliqui*, and *Spirales*. See RECTI, OBQUICLARES, &c.

The second kind also includes various Species, according to the various Angles which the oblique Fibres make with the Tendons; some inclining equally to each Tendon, so as to form a Rhombus, or acute angled Parallelogram with 'em, the *Muscles* are hence call'd *Rhomboidales*, others rising from two parallel Tendons, are directed obliquely into one common Tendon, as in the *Biceps* of the Hand; and others, lastly, arising from the Periphery of the Circle, concur in a Centre, and form *Muscles* call'd *Radiati*. See RHOMBOIDES, RADIATI, &c.

There are divers Species, and Divisions of *Muscles*.

Some Authors distinguish them into *Muscles of Voluntary*, and of *Involuntary* or *Natural* or *Necessary Motion*.

The *Muscles of Involuntary*, or *Necessary Motion*, have their contracting and extending Powers within themselves, and have no Antagonist; such are the Heart and Lungs supposed to be. See HEART and LUNGS.

The *Muscles of Voluntary Motion*, which we more peculiarly denominate *Muscles*, and which are those we have here chiefly regard to, have each of 'em their Antagonist *Muscles*, which act alternately in a contrary Direction; the one being stretched and extended, while the other is contracted at the Motion of the Will. See MOTION.

The *Muscles* have also different Names from their different Actions, Situations, Forms, &c. Those which serve to move the same Members contrary ways, are call'd *Antagonists*; and those that concur to the same Action, *Fellows*, or *Parti*. See ANTAGONIST, &c.

*Digestives* are those which have two Bellies; *Triglostris* those with three. See DIGESTIVE.

*Sphincters* are those destined to shut several Apertures and Passages in the Body; as the *Muscle* at the Neck of the Bladder, and that of the Anus, which have the same Effect with the String of a Purse to close those Parts. See SPHINCTER.

Some *Muscles* have two or three Heads, call'd *Biceps* and *Triceps*. See BICEPS, TRICEPS, &c.

We call *Elevators* those which lift up or raise the Parts; *Depressors*; those which move 'em downwards. See ELEVATOR, &c.

*Flexors* those who bend 'em; *Extensors* those which stretch 'em out; *Adductors* those which move the Parts inwards; *Abductors* those which move 'em outwards; *Rotators* those which move 'em round. See FLEXOR, EXTENSOR, ABDUCTOR, ADDUCTOR, ROTATOR, &c.

The *Muscles* have also different Names from their different Figure; some resembling a *Ball*, some a *Lizard*; and some a *Turbet*: Some are *Triangular*, others *Square*, others *Scaleous*, others *Pentagonal*, others *Pyramidal*, *Round*, &c. Whence come the Names of *Deltoides*, *Rhomboides*, *Scalenus*, *Trapezius*, &c. See DELTOIDES, SCALenus, TRAPEZIUS, &c.

Anatomists are not agreed on the Number of *Muscles* in the human Body; some reckon 529; some 446; and others only 435. The Calculus, according to these last, is as follows:

Two of the Forehead; two of the Occiput; six of the Eye-Lids; twelve of the Eyes; seven of the Nose; eight of the external Ear; four of the internal Ear; thirteen of the Lips; eight of the Tongue; four of the Palate; fourteen of the Larynx; seven of the Pharynx; ten of the *Ot Hyoides*; twelve of the Under-Jaw; fourteen of the Head; eight of the Neck; eight of the *Omoplates*; eighteen of the Arms; twelve of the Elbows; eight of the *Radii*; twelve of the *Carpis*; forty eight of the Fingers; fifty seven of use in Respiration; six of the Loins; ten of the *Abdomen*; two of the Testicles; one of the Bladder; four of the *Penis*; four of the *Anus*; thirty of the *Thighs*; twenty two of the Legs; eighteen of the Feet; forty four of the Toes. The following Table of the Names and Offices of the several *Muscles* in the Body, is extracted from Dr. Keil.

A TABLE of the MUSCLES from Dr. Keil.

*Frontales*, they pull the Skin of the Forehead upwards.

*Occipitales*, pull the Skin of the Hind-head upwards.

*Abducens* } *Auricularum*.

*Depressor* } *Auricularum*.

*Internus Mallei*, distends the *Tympanum*.

*Externus Mallei*, relaxes the *Tympanum*.

*Obliquus Mallei*.

*Musculus Strapidi*, moves the *Stirrup*.

*Cerrugator Superiis*.

*Levator Palpebrae superioris*, lifts up the upper Eye-Lid.

*Orbicularis Palpebrarum*, shuts both Eye-Lids.

*Atollens*  
*Deprimens* } *Oculorum.*  
*Abductor*  
*Additor*  
*Obliquus major*, pulls the Eye forwards, and obliquely downwards.  
*Obliquus minor*, pulls the Eye forwards, and obliquely upwards.  
*Atollens*  
*Dilatans* } *Nares.*  
*Deprimens*  
*Incisivus*, pulls the upper Lip upwards.  
*Triangularis*, pulls it downwards.  
*Caninus*  
*Elevator Labii inferioris* } pull the lower Lip upwards.  
*Quadratus*, pulleth it downwards.  
*Zygomaticus*, draws both Lips obliquely to either side.  
*Orbicularis*, draws both Lips together.  
*Buccinator*, thrusts the Meat between our Teeth.  
*Temporalis*  
*Mafficer* } pull the Jaw upwards.  
*Pterygoides internus*, draws the Jaw to either side.  
*Pterygoides externus*, draws the Jaw forwards.  
*Quadratus*, pulleth the Jaw and the Cheeks downwards.  
*Digastricus*, pulleth the Jaw downwards.  
*Peristaphilinus Internus*, pulls the Uvula forwards.  
*Peristaphilinus Externus*, pulls the Uvula backwards.  
*Stylohyoideus*, draws the Tongue upwards.  
*Geniohyoideus*, pulls it out of the Mouth.  
*Ceratohyoideus*, pulls it into the Mouth.  
*Gracohyoideus*, pulls the *Os Hyoides* and Tongue upwards and forwards.  
*Sternohyoideus*, pulls the *Os Hyoides* downwards.  
*Milohyoideus*, pulls it obliquely upwards.  
*Ceratohyoideus*, pulls it obliquely downwards.  
*Stylohyoideus*, pulls it to either side, and somewhat upwards.  
*Stylopharyngeus*, pulleth up, and dilateth the *Pharynx*.  
*Oesophagicus*, straightens the *Pharynx*.  
*Semithyroideus*, pulls the *Thyroideis* downwards.  
*Hysthyroideus*, pulls the *Thyroideis* upwards.  
*Cricohyoideus*,  
*Cricocarynoideus* } *Pecticus.*  
*Cricocarynoideus* } *Lateralis.*  
*Thyroarynoideus*, dilates the *Glottis*.  
*Arynoideus*, contracts the *Glottis*.  
*Splenius*  
*Complexus* } move the Head backwards.  
*Rectus major*  
*Rectus minor* } nod the Head backwards.  
*Obliquus inferior*  
*Obliquus superior* } perform the Semi-circular Motion of the Head.  
*Myotoides*  
*Rectus internus major*  
*Rectus internus minor* } nod the Head forwards.  
*Rectus Lateralis*, nods the Head to one side.  
*Intercostales interni & externi*  
*Subclavini*  
*Serratus Anticus major*  
*Serratus Pecticus superior*  
*Triangularis*  
*Serratus Pecticus inferior* } pull the Ribs upwards in Inspiration.  
*Sacrospinalis* } make the Motion of the Ribs downward in Expiration the swifter.  
*Diaphragma*, used in Inspiration and Expiration.  
*Obliquus externus* } compriseth the Parts contained in the lower Belly;  
*Obliquus internus* } assist the Motion of the Ribs downwards in Expiration; and help to bend the Vertebrae of the Loins forwards.  
*Pyramidalis*  
*Longissimus Dorsi*, keeps the Body erect.  
*Transversalis Dorsi*, moves the Body obliquely backwards.  
*Interspinalis*, draws the acute Processes near one another.  
*Quadratus Lumborum*, pulls the Vertebrae of the Loins to one side.  
*Longus*  
*Sacculus* } bend the Vertebrae of the Neck.  
*Ploas parvus*, helps to bend the Vertebrae of the Loins.  
*Cremaster*, draws up the Testicles in the Act of Generation.  
*Erectores Penis*.  
*Transversalis Penis*.  
*Acceleratores Urinae*.  
*Erectores Clitoridis*.  
*Sphincter Pectice*, contracts the Neck of the Bladder, [that the Urine may not run continually].  
*Levatores Ani*, draw up the Anus.  
*Sphincter Ani*, shuts the Anus.  
*Serratus Anticus minor*, draws the Shoulder-Blade forwards.  
*Trapezius*, moves it upwards, backwards, and downwards.  
*Romboides*, pulls it backwards.  
*Levator Scapulae*, pulls the Shoulder-Blade upwards.  
*Deltoideus*  
*Supra-Spinatus*  
*Circoabradialis* } lift the Arm upwards.

*Teres major*  
*Latissimus Dorsi* } pull the Arm downwards.  
*Pectoralis*, moves the Arm forwards.  
*Infra-Spinatus*  
*Transversalis*  
*Subscapularis* } draw the Arm backwards.  
*Biceps*  
*Brachiius internus* } bend the Fore-Arm.  
*Longus*  
*Erectus*  
*Brachiius externus* } extend the Fore-Arm.  
*Anconaeus*  
*Rotundus* } perform the Motion of Pronation, or turn the *Quadratus* } Palm of the Hand downwards.  
*Longus* } perform the Motion of Supination, or turn the *Brevis* } of the Hand upwards.  
*Cubitus internus*  
*Radius internus* } bend the Wrist.  
*Cubitus externus*  
*Radius externus* } extend the Wrist.  
*Palmaris*, helps the Hand to grasp any thing closely.  
*Palmaris brevis*, makes the Palm of the Hand concave.  
*Sublimis*  
*Profundus* } bend the Fingers.  
*Extensor Digitorum Communis*.  
*Lumbricales*, assist in bending the first Joint of the Fingers.  
*Interossei interni*, draw the Fingers to the Thumb.  
*Interossei externi*, draw the Fingers from the Thumb.  
*Flexor Pollicis longus*.  
*Flexor Pollicis brevis*.  
*Extensor primi*  
 ——— *Secundi*.  
 ——— *Tertii Internedii Pollicis*.  
*Tenar*, draws the Thumb from the Fingers.  
*Abductor*, draws the Thumb to the Fingers.  
*Abductor Indicis*.  
*Extensor Indicis*.  
*Hypothenar*, draws the little Finger from the rest.  
*Extensor Auricularis*.  
*Psoas*  
*Iliacus* } bend the Thigh.  
*Pectineus*  
*Gluteus major*  
*Gluteus medius* } extend the Thigh.  
*Gluteus minor*  
*Triceps*, pull the Thigh inwards.  
*Pyramiformis*  
*Gemini* } they move the Thigh outwards.  
*Quadratus*  
*Oleavator internus* } help to move the Thigh obliquely, and *Obliuator externus* } circularly.  
*Semimembranosus*  
*Biceps* } bend the Leg.  
*Gracilis*  
*Rectus*  
*Vastus externus*  
*Vastus internus* } extend the Leg.  
*Cruceus*  
*Sartorius*, makes the Legs cross one another.  
*Pepitens*, turns the Leg somewhat inwards.  
*Membranosus*, turns it a little outwards.  
*Tibialis Anticus*  
*Peroneus Anticus* } bend the Foot.  
*Graciliscemus*  
*Soleus* } extend the Foot.  
*Plantaris*  
*Tibialis Posticus*, moves the Foot inwards.  
*Peroneus Posticus*, moves the Foot outwards.  
*Profundus*  
*Sublimis* } bend the four lesser Toes.  
*Lumbricalis*  
*Longus*  
*Brevis* } extend the four lesser Toes.  
*Flexor Pollicis*.  
*Extensor Pollicis*.  
*Tenar*, draws the great Toe from the rest.  
*Abductor*, draws it to the rest.  
*Flexor Pollicis Longus*.  
 ——— *Brevis*.  
*Abductor Minimi Digiti*  
*Interossei interni* } draw the Toes toward the great Toe.  
*Interossei externi*, draw them from the great Toe.  
*Transversalis*, brings all the Toes close to one another.

The word *Muscle* is derived from the Greek *μῦς*, or the Latin *Mus*, a Mouse; on account of the Resemblance it is supposed to bear to a skin'd Mouse. The *Linnæus* also call it *Lacertus*. *Stens*, and other later Authors, reckon the Heart among the number of *Muscles*, in regard its Composition and

and Action don't differ in any thing from those of other Muscles.

**MUSCULAR**, or **MUSCULOUS**; something that relates to the Muscles; or that partakes of the nature thereof. See **MUSCLE**.

In this sense we say, *Muscular Fibre, Muscular Coat, Muscular Fleck, Muscular Vein, Muscular Arteries, &c.*

**MUSCULAR Fibres** are the fine Threads, or Fibres, already described, whereof the Body of Muscles is composed. See **MUSCLE**.

Anatomists are exceedingly divided as to the nature of these Fibres. Some will have 'em Blood-Vessels, viz. Veins, and Arteries; others Nerves, &c. See **ARTERY**, **NERVE**, &c.

Some restrain *Muscular Fibres* to the longitudinal red, call'd also *Fleshy Fibres*: The transverse, and spiral Ramifications wherewith the former are bound about, they call *Nervous Fibres*. See **FIBRE**.

Dr. Morgan endeavours to prove, that all the Fibres that enter the Structure and Composition of a Muscle, are endued with an intrinsic Elasticity, Spring, or Power of contracting and restoring themselves, as a given Weight or Force, by which they may be stretch'd; and that this Elasticity, or contractive restitutive Power being a natural inherent Property of the Fibres themselves, does not depend on the Mixture, Rarefaction, or Effervescence of any Fluids or Humours whatsoever. See **MUSCULAR Motion**.

**MUSCULAR Membrane**, or **Membrana MUSCULOSA**, a Membrane supposed to invest the whole Body, immediately under the Adipose Membrane; call'd also *Panniculus Carnosus*, and *Membrana Muscularis Communis*. See **PANNICULUS Carnosus**.

**MUSCULAR Arteries**, are two Arteries proceeding from the Subclavians, and distributed among the *Hind-Muscles* of the Neck; as also to the Arteries of the Loins. See **ARTERY**. They are divided into *Upper* and *Under*.

The *Upper-Musculars* proceed from the large Artery, and lose 'emelves in the Fleck.

The *Under-Musculars* are Branches of the inner Iliac Arteries.

The Name is also given to two Arteries of the Thigh, the one call'd the *Internal-Muscular*, as being distributed among the inner *Muscles* of the Thigh; the other the *External-Muscular*, because it proceeds to the outer Part.

**MUSCULAR-Veins**, is also a Name given to several Veins; two whereof come from the Skin and the *Hind-Muscles* of the Thigh, and terminate in the Subclavians. See **VEIN**.

There are three others also call'd *Musculars*, and distinguish'd into *Upper*, *Middle*, and *Under*; the first terminates in the Trunk of the *Vena Cava*, the two others open into the external Iliac Vein.

**MUSCULAR Fleck**. See **Muscular FLECK**.

**MUSCULAR Motion**, is the same with voluntary or spontaneous Motion; thus call'd, because effected by means of the Contraction and Dilatation of the *Muscles*. See **MOTION**, **MUSCLE**, &c.

The Mechanism of a *Muscle* we have deliver'd at large; but how this Mechanism is employ'd to produce Motion in Animals, is matter of endless doubt.

The generality of Writers suppose the Belly of the *Muscle* to be swell'd, and thus its Extremes brought nearer; and consequently the Parts it is fix'd to, moved.

The Structure of a *Muscle* we have shewn to be such as renders it capable of being swell'd and contracted, and by that means of having its Extremities brought nearer each other, which is its proper Action: But how the Contraction is effected, is the Point in dispute.

The generality of Authors account for it from the Influx of some Fluid into the Muscular Fibres: Others solve it from the natural Elasticity of those Fibres.

The Retainers to a Fluid, again, are divided as to the particular Fluid employ'd for this purpose.

From the Structure and Phenomena of the *Muscles* above laid down, we may gather the Properties of the hidden Cause that moves the *Muscles*; viz. 1<sup>st</sup>, That it may either be present or absent in a *Muscle*; and therefore, *adly*, May enter into it, and go out again; i. e. *saly*, It is derived to it from some other Place, and passes from it elsewhere. And, *ably*, All this, by an instantaneous Direction of the Will. *5thly*, And in the same Moment of Time, wherein the *Muscle* is contracted, must pass from within outwards to every Point of the Surface of the *Muscle*; that is, *sibly*, it must be at once equally distributed throughout the whole Belly of the *Muscle*: And therefore, *7thly*, fill and dilate the Membranes of the Fibres, change 'em out of an oblong into a more spherical Figure, lengthen their less Diameter, and diminish their longer, and so draw the Tendons nearer each other. *Lastly*, that it must have its Rise from the *Cerebrum* and *Cerebellum*, the Origin of the Nerves and be strong enough to overcome those Obstacles which here strongly resist it. To conclude then, it must be a moist

fluid, subtil, active Body; and be apply'd with some Energy within the *Muscle*.

Now all the Fluids in the Body that have any Pretensions to these Properties, that are any way qualified to produce the Phenomena above; or that have been alleg'd as the Cause of *Muscular Motion*, are the *Animal Spirits*; (or, as our late Writers call it, the *Nervous Juice*) and the *Blood*; but as each of these singly scarce appears adequate to the Effect, hence Authors have suppos'd 'em to mix in the *Muscles*, and each to contribute to the Action of the other. But the *Animal Spirits* seem to have the greatest number of Advocates, tho' their Existence was never yet fully prov'd; besides that the manner of their Action, as assign'd by Authors, seems to be arbitrary and precarious.

Some, with the great Dr. Willis, make the Tendons a Receptacle for the Spirits, which are rais'd at the Instigation of the Will, and sent thence into the Belly of the *Muscle*, where meeting with the active Particles of the Blood, they ferment, and cause an Intumescence, and so contract the *Muscle*.

Others, amongst whom Des Cartes and his Followers, allow no Receptacle for 'em but the Brain, send 'em thence thro' the Nerves like Lightning at every Summons of the Will; because they can't allow the Tendons to be a proper Lodgment, on account of the Closeness of their Consistence, nor can believe that the *Animal Spirits* should remain there inactive.

Others, among whom M. du Verney, imagine this Intumescence may be without Fermentation by the *Animal Spirit*, and a Juice from the Arteries running into the Tendons and Fleshy Fibres, and extending them, as Ropes, &c. swell in moist Weather.

Dr. Boerhaave, and others, maintain, that every Muscular Fibre, besides its Vein, Artery, and Nerve, has also from Space to Space, several little Cavities, or Pores of an oblong Figure, when the *Muscle* is slack or flaccid; but the Blood circulating thro' the *Muscle*, is continually depositing into those Pores a sulphurous Recrement, abounding with Alkaline Salts, which meeting with the Spirits that flow by the Nerves into these same oval Pores, their Nitro-Aerial Particles ferment, with the saline ones of the Sulphurous Recrement, and, by a kind of Explosion, so distend the Pores, as to change the long oval Figure into a round one; and thus the *Muscle* is contracted.

Boerhaave takes the Fibres of a *Muscle* to consist of a Chain of divers Rhombus's or Lozenges, whose Areas are enlarged or contracted as the Nervous Juice, with the Lympha and Blood, are let into, or forced out of 'em, at the Instance of the Soul.

Dr. Cron supposes every Fleshy Fibre to consist of a Chain of little bladders, or Globules, communicating with each other; into which the nutritious Juice, and one or two more Liquors entering, do, by means of the natural Heat, make an Effervescence; by which the Body of the *Muscle* is extended, &c.

Dr. Chesne takes the small *Fibrille* of the *Muscles* to be so many slender elastic Canals, bound about by small transverse parallel Threads, which divide the hollow *Fibrille* into so many elastic *Cylinders* or *Vesicles*, which are orbicular, being formed of two concave Segments of a Sphere; into every one of which *Vesicle*, an Artery, Vein, and Nerve enter; the two first to carry and bring back the Blood, the last to carry thither the *Liquidum Nervosum*, or Nervous Juice, which mingling in the *Vesicle* with the Blood, does, by its acid pointed Particles, prick and break the Globules of the Blood, so as to let out the imprisoned elastic Air (contained in the Globules) into those little *Vesicles*; whereby the elastic Cells of the Fibres will be blown up, and thereby their Longitudinal Diameters from Cell to Cell strained: and thus must contract the Length of the whole Fibre, and so move that Organ to which one of the Tendons is fix'd.

Dr. Keil, not contented with this Theory, sets up another, wherein the same Structure of the *Muscle* is supposed, and the same Fluids; viz. the Blood and Nervous Juice, the Agents or Instruments of Contraction; but instead of the pungent Particles of the Nervous Juice piercing the Globules of Blood, and setting at liberty the imprisoned elastic Air, he accounts for the Whole from the Doctrine of Attraction.

He endeavours to shew, that the Distension of the *Vesicles* of the Fibres is not owing to their being fill'd with a greater Quantity of Blood and *Animal Spirit* than before their Contraction; but to a Rarefaction arising from the Mixture of those two Fluids, by means whereof they come to possess a greater Space.

To account for this Rarefaction of the Blood and Spirits in the *Vesicles* of the Muscular Fibres, he supposes a small Globule of Air between the Particles of a Fluid, which Particles have a strong attractive Force, whereby they endeavour to come together: By pressing every way equally

on the Globule of Air, they will hinder its escape between them. But the Force whereby they endeavour to come together being vastly greater than that of Gravity, the Globule of Air must be considerably condensed; but the Force of Elasticity being proportional to that of its Condensation, the Force wherewith the airy Globule endeavours to expand itself, will likewise be vastly great; so that if the *Nisus* of the Particles of the Fluid to come together should be taken off, the Air between 'em would expand itself with a considerable Force. Now, if upon the mixing of another Fluid, the Particles of the first Fluid should be more strongly attracted to the Particles of this other Fluid, than they were before to one another, their *Nisus* to one another would then cease, and give the inclosed Globule of Air liberty to expand itself; so that the whole Fluid will take up a greater Space than it did before: But when the Particles of the two Globules come to be united together, they will again inclose the Globule of Air that lies between them, and, by their mutual Attraction, soon bring it to its former State of Condensation.

Now, that the Blood contains a great Quantity of Globules of Air, is evident from the great Quantity it yields in the Air-Pump; and that the Particles of the Blood have a strong attractive Force, cannot well be deny'd. Upon the meeting, then, of these two Fluids in the Vessels of the Fibres, the Nervous Juice, consisting of smaller Particles than the Blood, must, from what *Sir I. Newton* has proved of the Rays of Light, attract the Particles wherewith they are compos'd more strongly than those do one another; and consequently the *Nisus* of those Particles to one another ceasing, the condensed Globule of Air will expand itself with a considerable Force; whereby each Vessel of the Fibre will be distended, and consequently, therefore, shorten'd; i. e. the whole *Muscle* will be contract'd: but when the Particles of the Globule of Blood are well mixed with the Nervous Fluid, they will both together inclose the Globule of Air again, and compress it into as small a Space as it was before: And thus the Contraction of the *Muscle* must immediately cease, till fresh Blood and Spirits, still succeeding one another, continue the Inflation of the Vessels. But when a *Muscle* has been strongly attracted for some time, the Quantity of Spirits spent being more than can be prepar'd in the Space of Time by the Glands which supply its Nerves, the Inflation of the Vessels must fall, and the *Muscle* grow feeble and weak. And thus that ingenious Author conceives the Vessels to be distended without any Ebullition or Effervescence; and their Distension to cease without any Precipitation, or flying-off of the Aerial Globules thro' the Pores of the *Muscles*.

He proceeds to shew how artfully the Mechanism of the Fibres is contriv'd for Contraction. 'Tis a known Experiment, that a Bladder blown up and distended as to its Capacity, but contract'd as to Length, will raise a Weight to some determin'd Height. Two Bladders, therefore, thus blown up, and communicating with each other, he argues, will raise the Weight double the Height, and three Bladders thrice the Height, &c. So that if there were a String of Bladders join'd together, of equal Bulk, and like Figures, the Space thro' which the Weight would rise, would be proportionable to the Number of Bladders, i. e. to the Length of the String. Now each Fibre of a *Muscle* consisting of an infinite Number of small Vessels, resembles a String of Bladders; so that the Contraction of the *Muscle* is always proportionable to the Length of its Fibres.

Farther, the Vessels wherewith the Fibres consist being very small, tho' one large Bladder might raise a Weight as high as several small ones, yet the Quantity of elastic Fluid used in the Inflation will in that case be much greater than when the Weight is rais'd by a String of small ones.

For, supposing two Bladders of similar Figures, but the Diameter of the one triple that of the other; then will the one require twenty-seven times the Quantity of elastic Fluid to expand it that the other does, and will also expand to twenty-seven times the Space; and yet three of the less Bladders join'd together, (he goes on) will raise the Weight to the same Height that the bigger one does; but with nine times less Expence of elastic Fluid, and take up but a ninth part of the Space. By diminishing, therefore, the Bigness of the Vessels, and increasing their Number, the Force required to distend them, and the Distension itself, may be diminished in any given proportion, and come at last to be insensible. Suppose a Bladder, v. g. of a determinate Bigness, can raise a Weight a Foot; a hundred Bladders, whose Diameters are each a hundredth Part of the former, being blown up, will raise the Weight to the same Height; but the Force required to inflate them, and the Swelling of all put together, will be ten thousand times less than the large one.

Again, if a Weight of a determin'd Bigness can be rais'd to a certain Height by a Bladder, or one String of Bladders, to which the Weight is tied; twice that Weight may be rais'd by two such Bladders, or Strings; thrice by three, &c. and, consequently, the Weight a *Muscle* can raise, will be always as the Number of its Fibres, i. e. as its Thickness, supposing the Distension of the Vessels equal, and the absolute Strength of one *Muscle* to that of another, as their Bulks.

*Dr. Boerhaave* finding all the Requisites before laid down, for the Action of the *Muscles* in the nervous Juice, or animal Spirits, and in no other Fluid in the Body, thinks it needless to have recourse to a Mixture of several Liquors where one will do; and therefore makes no scruple to attribute the whole Business to it alone. The manner of Action he conceives thus.

Suppose the Spirit, from any Cause, to be moved more swiftly from the Origin of some one Nerve, than thro the rest; the influx will here be greater into the *Muscular* Fibre open to this Nerve than into another: This will therefore be more dilated; and the other Phenomena, mentioned above, will succeed. The same Cause continuing, the Effect will be increased, so that in a Moment of Time, the whole will be swell'd up; and while the same Determination lasts, will remain contract'd: And this obtaining in an infinite number of *Fibrille* at once, the whole *Muscle* will be inflated. Hence it necessarily follows, that as the Celerity is increased in one Nerve, the Motion will be less in another; this therefore being relax'd, the Effort in contraction will be the stronger. For which Reason, all the turgid Fibres of a *Muscle* will compress the intermediate Spaces and Blood with a great Force; whence the Veins will be emptied, and the Arteries being compress'd, will repel the grosser, that is, the red parts of the Blood, but will drive the more subtle parts by the Force of the Heart and their own, into the most minute Canals; and thus the Crue being expell'd, the whole Body of the *Muscle* will be found to act by a subtle Humour concurring from the Nerves and Arteries.

Thus are all the Phenomena accounted for; without any other Assumption than an accelerating Force in the Origin of the Nerves; which is common to all Hypotheses, and which can't be traced any further.

All other Hypotheses, therefore, *Boerhaave* absolutely rejects; nor makes the least account of *Galen's* incorporeal Power inflating the *Muscles*; the nitrous Spirit of the Nerves mixing with the Oil of the Blood, and so rarifying it; the acid Parts of the nervous Juice mixing with the alcalious ones of the Blood; the Ebullition of the Air, and the arterious Juice; and the increase or diminution of attractive Force of the minute Corpuscles of the Humours, as repugnant to Sense, Experience, the Laws of Matter, and of Mixture, and to the Phenomena of the *Muscles*.

*Dr. Astruc* has gone a good way towards proving the nervous Juice alone concern'd in *Muscular Motion*; and that the Blood has no share in it; by the following Experiment, which he tried several times with the same success.

Cutting open the *Abdomen* of a live Dog, and removing the Intestines out of the way, he bound up the *Aorta* where it divaricates into the *Iliac* Arteries, with a Thread, so as to confine each *Iliac* and the *Hypogastric* Artery very closely; then sewing up the *Ergastric* Muscles, he found the Sensation and Motion still as brisk and vivid in the Dog's *Posterior*, as before. So that when once set at liberty, he stood on all four, and walk'd with his usual Ease and Firmness; tho' it is certain there could not be one drop of Blood convey'd to those hind parts.

*Astruc*, however, differs from *Boerhaave* in the manner wherein this nervous Juice acts; nor will allow that Celerity, wherewith the *Muscles* act at the Command of the Will, to be owing to the Velocity of the Juice sent thro the Nerve, but to an Impression given to one extremity of the Thread, and communicated thro all the intermediate Parts to the other Extremity; supposing the Nerves in their natural State to be turgid, and full of Spirits; so that if the Extremity in the Sensory be ever so little press'd by the Accession of any new Spirit, as much will be instantly expell'd at the other Extreme, and *vice versa*; a small Impression given to the outer Extremity of the Nerve will immediately move the other Extreme open to the Sensory, so that part of it will drop out: Which accounts for Sensation, as well as *Muscular Motion*.

Lastly, *Dr. Lower* and *Mr. Casper*, and after them, *Dr. Morgan*, the last Writer on the Subject, setting aside all adventitious Fluids, account for *Muscular Motion* from the intrinsic Elasticity of the nervous *Fibrille* contracting and restoring themselves against the stretching Force of the Circulating Blood.

This System, *Morgan* endeavours to evince from the following Considerations:

1. All the Vessels in an Animal, consisting of flexible, distractile Fibres, are in a state of Tension; i. e. are both stretch'd transversely and longitudinally by their contained Fluids: Thus, e. gr. let a Vein, or Artery be cut, and the opposite Sides of the Vessel cut contract, and come nearly to a contact about the Axis; while the two ends receding both ways, leave a Chasm, which shows that the Vessel, while in its natural State, was distended both ways; and, consequently, that Contraction in all their Dimensions, is the natural intrinsic Action of the Vessels or Fibres.

And the same might be deduced, *a priori*, from the Growth of Animals; for by the increased Quantity of the accumulated Blood, the Vessels must necessarily be enlarged every way. Now, against this distending Power of the Fluids, the solid Muscular *Fibrille* continually exert a contractive, or resistive Force, by which they are kept in their proper State of Tension.

2. That this contractive Power of the Muscular Fibres is a natural intrinsic Property of the Fibres themselves, and does not depend on any Mixture, or mutual Action of Fluids, is evident from hence, that these Fibres retain the same Property, after they are taken out of the Body and dried; as we see in Tongues, Cat-gut, and other such like Cords or Strings cut out of the Muscular Coats and Skins of Animals, which may be stretched out to a considerable length beyond their natural State; and when the stretching Force or Weight is taken off, they will immediately contract again by their native Spring.

3. While a Muscle contracts, the Blood is squeezed out, and during its state of Contraction, it is more hard and solid than before; that is, it contains less Blood when contracted, than when stretch'd; which shows, that the Contraction cannot be by the addition of another Fluid from the Nerves mixing with the Blood in the Muscles.

4. No such Fluid in the Nerves could ever be found, as being mixed with the Blood, would occasion such Fermentation or Expansion. But supposing the Muscular Cells thus inflated, no such effect could follow as shortening the Muscle in length, and swelling it in thickness: But the Consequence must be, that the Muscle would be lengthened as well as thickened; that is, it must increase its Dimensions proportionably every way, which is the proper Action of the Fluids on the Solids.

If then it be said, that these Bladders, when the Musc le is stretched, are drawn into oblong Spheroids; and when inflated by the mixture of the nervous Fluid, reduced to a spherical Figure; by which means their Axes are shortened, and their conjugate Diameters enlarged: 'Tis answer'd, that these small Vessels are soft, flexible, distractile, and equally yielding every way; and since an included expansive Fluid must press its containing Vessels equally yielding every way, and equally expansive; a Vessel, notwithstanding such Distension, must retain its natural Figure, and be equally stretch'd in all Directions.

Again, since the Blood circulates freely thro' these Muscular Cells, it is plain, that as soon as they begin to inflate, it must be immediately push'd forward with an increased Velocity in the Course of its Circulation, which must prevent any such Inflation in the Muscles. Before these Vessels, therefore, can be distended in the manner suppos'd, the Exit of the Fluid must be hinder'd; that is, the Circulation must be stop'd. If any one doubt of this, let him try whether he can blow up a Bladder, or other Vessel, that is open at both ends, and where the expansive Fluid has as free an Egress as Ingress.

Thus much premis'd, the natural Action of a Muscle will be easily explain'd. From its Structure, it follows, that on the Contraction of its transverse and spiral Fibres, which are the Ramifications of the Nerves, the longitudinal, red, and fleshy Fibres, or Blood-Vessels, which constitute the Body of the Muscle, must be squeezed and drawn together, as being compell'd to follow the Motion of these elastic Cords; by which means the Blood-Vessels being compress'd, must be forced, with some Impetuosity, thro' the Muscle, and propell'd forward in the Course of its Circulation.

Now if the Blood should hereupon stop, and return no more to the Muscle, 'tis plain the Muscle must for ever remain in this contracted State, as its proper and natural State of Quiescence to which it tends, and where it would rest: But the Blood having receiv'd a fresh Impetus by the Contraction, and returning upon the Muscle in the Course of its Circulation, again rushes into the Blood-Vessels, which being enlarged in all their Dimensions by the Force of the returning Blood, the transverse and spiral nervous Fibres must be hereby stretch'd, and the Muscle extended; by this means the Blood-Vessels being brought to their natural extent, and consequently the distending Force of the Blood ceasing, the contractive Power of the Nerves will in that state begin to act again, and restore themselves with the same Force by which they were extended, till the returning Blood re-enters the Muscle, and stretches it again.

MUSEÆUM, was originally us'd to signify a Place in the Palace of *Alexandria*, which took up at least a fourth part of the City; so call'd as being destin'd and set apart to the *Muses*, and the Sciences. See *Musa*.

Here were lodg'd and entertain'd a great number of learned Men, who were divid'd into Companies or Colleges, according to the Sciences or Sects whereof they were Professors.

To each House or College, was allotted a handsome Revenue.

This Establishment is attributed to *Ptolemy Philadelphus*, who here fix'd his Library. See *LIBRARY*.

Hence the word *Museum* has pass'd into a general Denomination, and is now apply'd to any Place set apart as a Repository of Things that have some immediate Relation to the Arts or the *Muses*, whence the Word first took its Rise. See *REPOSITORY*, &c.

The *MUSEUM* at *Oxford*, call'd the *Ashmolean MUSEUM*, is a noble Place erected at the Expence of the University, for the promoting and carrying on several Parts of curious and useful Learning. It was begun in 1679, and finished in 1683; at which time, a valuable Collection of Curiosities was presented to the University by *Elias Ashmole Esq;* and the same day there deposited, and afterwards digested and put in a just order by *Dr. Plot*, who was constituted first Keeper of the *Museum*.

Divers considerable Accessions have been since made to the *Museum*; as of Hieroglyphics, and other *Egyptian* Antiquities by *Dr. Huntington*; of an entire Mummy by *Mr. Gouyeur*; of a Cabinet of natural Rarities by *Dr. Lister*; as also of divers *Roman* Antiquities, Altars, Medals, Lamps, &c.

Over the Entrance of the *Museum* is this Inscription;

MUSEÆUM ASHMOLEANUM, SCHOLA NATURALIS HISTORIÆ, OFFICINA CHYMICA.

MUSES, Fabulous Divinities of the ancient Heathens, who were supposed to preside over the Arts, and Sciences.

The Ancients admitted nine *Muses*, and made them the Daughters of *Jupiter* and *Mnemosyne*, or Memory.

At first, indeed, their Number was but three, viz. *Melete*, *Mneme*, and *Aole*; *Greek* Words signifying Memory, Singing, and Meditation. But a certain Sculptor of *Sicyon* having Orders to make three Statues of the three *Muses* for the Temple of *Apollo*, and mistaking his Instructions, made three several Statues of each *Muse*; these however were found so beautiful, that they were all set up in the Temple, and from that time they began to reckon nine *Muses*: To whom *Hesiod* afterwards gave Names; viz. *Calliope*, *Clio*, *Erato*, *Thalia*, *Melpomene*, *Terpsichore*, *Euterpe*, *Polymnia*, and *Urania*.

Each of these were supposed to preside over their respective Art; *Calliope* over Heroic Poetry; *Clio* over History; *Melpomene* over Tragedy; *Thalia* over Comedy; *Euterpe* over Wind-Music; *Urania* over Astronomy; *Terpsichore* over the Harp; *Erato* the Lute; *Polymnia* Rhetoric.

They are painted Young, Handsome, and Modest, agreeably dress'd and crown'd with Flowers. Their usual Abodes were about Mount *Helicon* in *Boeotia*, and Mount *Parnassus* in the *Thrace*. Their Business was to celebrate the Victories of the Gods, and to inspire and assist the Poets; and hence the Custom of invoking their Aid at the beginning of a Poem. See *INVOCATION*.

It must not, however, be imagin'd, that the Deities thus invoked, are consider'd even by the ancient Poets themselves as Divine Persons, from whom they expect any real Help. Under the Name of *Muse* they wish for the Genius of Poetry, and all the Conditions and Circumstances necessary for a happy Execution of their Undertaking.

They are mere Allegories and Manners of expressing themselves poetically; as when they make Gods of Sleep, of Fame, of Revenge, and other natural and moral things. See *Gen*.

Accordingly, the *Muses* are of all Ages, Countries, and even of all Religions. There are Christian as well as Heathen *Muses*, Latin, *Greek*, *English*, *French*, &c. There are also new *Muses*, which appear every day in favour of those who, disdaining things too trite and common, chuse to strike out of the Road.

When *Virgil* wrote his *Eclogues*, he invoked the *Sicilian Muse*, because he imitated *Theocritus*; and the *Sicilian* Poet having succeeded; the *Roman* beg'd for a Genius as happy as that of this *Islander*.

The *Muses* of the Poet *Lusitanus* had never inspir'd any Person before him. 'Tis plain, from the Doctrine of his Book, what kind of Divinity it was he invoked. He addresses himself to *Venus*, but at the same time tells us, that none of the Gods trouble themselves with human Affairs. His *Muses* therefore must of necessity be mere Allegories.

The Word *Musc*, according to *Phormans*, is derived from the Greek *μῦς*, which signifies the same with *ζῆν*, to search. Others derive it from *μῦσος*, similar, or alike; all the Sciences being bound and united together. *Eusebius* derives it from *μῦς*, to initiate, to infract. *Plato* and *Schlegler* from *μῦσος*, *olympicare*, because to them are attributed the Invention of the Arts; and 'tis they who produced them. Lastly, *Heinfius* and *Vossius* derive it from the Hebrew מוֹשֶׁה *Mosar*, Science, *Disciplina*.

The *Muscs* are call'd by various Names; *Camene*, *Heliocentides*, *Parnassides*, *Amidies*, *Pierides*, *Pezagides*, *Aganimpides*, *Thepiades*, *Libethrides*, and *Castalides*.

**MUSHROOM, or MUSHROON**, in Natural History, a Plant, of a Form and Structure very different from that of all other Plants; having neither Seeds, nor Flowers, that have ever yet been discover'd. See **PLANT, SEED, &c.**

There are various kinds of *Mushrooms*; and the Vulgar call by this Name all that come under the general Head of *Fungus*. See **FUNGUS**.

They are all us'd with some suspicion, tho' some are more harmless, as well as more delicious than others. Those us'd among us, are *Mushrooms of the Wood*, call'd *Morils*, and of the *Meadows*, call'd *Clumpignons*, which are gathered in Autumn, and esteem'd for their Whiteness above, their Vermilion underneath, and the Sweetness of their Smell.

Mr. *Bradley* mentions a hundred kinds of *Mushrooms*, which he has seen in *England*; besides those very numerous small ones, which continue the Mouldiness of Liquors, Fruits, &c. which last are such quick Growers, that they arrive at perfection in less than 12 Hours. See **MOULDINESS**.

The *Fungoides* only differs from a *Mushroom* in its external Form; and the *Coralloides* are of the same Species, tho' of a different Name, as being branch'd like Coral; and *Truffles* come under the same kind. See **CORALLOIDES, TRUFFLES, &c.**

*Martbus* mentions *Mushrooms* which weigh'd 30 Pounds each, and were as yellow as Gold. *Fer. Imperatus* tells us he saw some which weigh'd above a hundred Pounds; and, to add no more, the *Journal des Savans* furnishes us with an account of some growing on the Frontiers of *Hungary* which were a full Charcoal Load.

The Origin and Production of this Plant has extremely puzzled the Botanists. How a Plant should be produced without a Seed, is a Mystery; and yet the best Microscopes are not able to discover any appearance of a Seed; and the manner of cultivating this Plant, seems to make it still more probable that it has not any.

M. *Tournefort* gives a very curious Account of their Culture, in the *Memoirs of the French Academy*, the Substance of which we shall here present the Reader withal.

All the Secret of bringing up *Mushrooms* speedily and in abundance, consists in ranging Balls of Horse-Dung about the bigness of the Fist, in Lines, at the distance of about three Feet from each other, and at the depth of one Foot under Ground, and covering these over with Mould, and that again with Horse-Dung.

If this be done in *April* in the beginning of *August* the pieces of Dung will begin to whiten, and grow mouldy, being thro' all over with little Hairs, or fine white Threads, branch'd, and woven about the Straws whereof the Dung is compos'd. The Dung now loses its former excrementitious Smell, and spreads an admirable Odour of *Mushrooms*.

According to all Appearance these white Threads are no other than the open'd Seeds or Buds of *Mushrooms*, which Seeds were before inclosed in the Dung, but in so small a compass, that they could not be perceiv'd till after they had thro' themselves into little Hairs. By degrees the Extremity of these Hairs grows round into a kind of Button, which swelling by little and little, at length opens itself into a *Mushroom*, whereof the lower part is a kind of Pedicle bearded in the place where it enters the Ground, and at the other end loaden with a kind of roundish Capita; or Head, in manner of a Calotte, which expands itself without producing either Grains or Flowers that are sensible; the bottom is spread with *Lamine*, which proceeding from the Centre to the Circumference, may be call'd the *Leaves of the Mushroom*.

At the foot of each *Mushroom* are found an infinite number of little ones not bigger than the Head of a Pin, which the others are at their growth. The Buds of the *Mushrooms*, or the white Hairs of the Dung, preserve themselves a long time without rotting, if kept dry; and if laid again on the Ground, will produce.

*Mushrooms*, then, are nothing else but the Produce of what we call the Mouldiness of Horse-Dung: But what Analogy is there between these two things? Or how should so artful and delicate a Structure as this of a Plant result from the mere fortuitous Concourse of a few Juices, differently agitated?

It seems past doubt then, that *Mushrooms*, like all other Plants, have their Origin in Seeds: Now we know that the Seeds of Plants cannot vegetate every where; there are first required certain Juices proper to penetrate their Coats, to excite a Fermentation, and to join themselves to the little parts thereof, and increase them. Hence arises that infinite Diversity of Places, wherein different Species of this Plant are produced. There are some which will only grow on some other particular Plants, whose Trunk, Bark, or Roots, alone have the Juices proper for them.

What M. *Tournefort* mentions from Mess. *Lowry* and *Mery*, is still more surprizing: There is a Species of *Mushrooms* which grow on the Pillers and Bandages apply'd to the Fractures, &c. of the Patients in the *Hôtel-Dieu*. After which, it will not be at all surprizing that *Horsel-Dung* prepared in the manner M. *Tournefort* mentions, should be a Soil or Matrix capable of making common *Mushrooms* grow.

Hence it seems to follow, that the Seeds of *Mushrooms* should be spread in an infinite number of Places where they do not vegetate, and in a word throughout the whole Earth; and the same may be said of a great number of other Plants.

It must be own'd, the Imagination is shock'd at such a prodigious Multitude of different Seeds, thrown every where at random, and in many Places to no purpose; but a little Reasoning will put the Matter of Fact past doubt.

*Dioscorides* tells us, he was assur'd that Pieces of the Bark of the Poplar-Tree being laid in the Ground over *Horsel-Dung*, there would grow out of them very good *Mushrooms*. *Ruel* says, that by boring the Trunk of a white Poplar-Tree near the Root, and washing it with *Leven steep'd in Water*, *Mushrooms* spring out of it, as it were, instantly. He adds, that the Hillslocks produce several kinds of *Mushrooms*, if the Stubble be burnt on 'em in the rainy Season.

M. *Tournefort* tells us, on his own Knowledge, that where the Stubble is burnt in *Provence*, *Languedoc*, and the Islands of the *Archipelago*, there arise great Quantities of black Poppies in the first Autumnal Rains, which disappear the Year following; so that they are never found but on burnt Lands. And we know that after the Burning of *London*, the Ground as far as the Fire reach'd, thro' up with vast Quantities of *Erysimum Latifolium Majus Glabrum*. One of the chief Reasons, if not the only one, why Mountains produce Plants different from the Plains or Valleys; Places become fenny, from the same Places when they were dry; is the difference in the nutritious Juices found in those Places. Without this, how shall we account for the Origin of *Millet* or *Hypocystus*, which are never known to grow in the Earth, at least without adhering to some other Plant; the one growing on Trees, the other to the Root of the *Cytus*? Why do the Ivy and Vine of *Canada*, the Pellitory, *Polypody*, the Species of *Capillaries*, grow only on the Trunks of Trees, on Walls, and in the Clefts of Rocks, unless it be that the Juices of those Places are the best adapted to them?

These and other incontestable Facts prove plainly both the vast Multitude of Seeds dispersed every where, and the Necessity of certain Circumstances to make 'em vegetate.

If to this Speculation on the invisible Seeds of Plants, we join that of the invisible Eggs of Insects, which must be allow'd equal thereto, the Earth will be found full of an inconceivable Infinity of Animals and Vegetables, perfectly form'd, and designed, as it were, in Miniature, and only waiting for certain favourable Circumstances to enable them to make their Appearance in large. How rich then must the Hand be, that has sown with so much Profusion?

We have been the more particular on this Head, on account of the Oddness of the Phenomena; and because what is here said of *Mushrooms* will give light into the Generation of all other Vegetables, &c. whose Seeds are yet undiscover'd.

Dr. *Lister*, indeed, thinks he has found out the Seeds of *Mushrooms*. He instances particularly in the *Fungus Porus*, *Craffus magnus* L. B. the Texture of whose Gills is like a Paper prick'd full of Pin-holes. These Gills, he makes no doubt, are the very Flower and Seed of this Plant; when it is ripe, the Gills are easily separable from the rest of the Head, each Seed being distinct from other, and having its Impression in the Head of the *Mushroom*, just as the Seed of an *Artichoke* hath in the bottom of it; the bigger end of the Seed is full and round, and they are dispos'd in a spiral Order like those of the *Artichoke*: And the same he thinks of all other *Mushrooms*, however differently figur'd. If it happens that these, when sown, prove sterile, and don't produce their Kind, it is no wonder; there being whole Genus's of Plants that come up, and flower, and seed, yet their Seed was never known to produce Plants of their Kind, being no more than a barren volatile Dust, as all the *Orchides*, or *Bee-Flowers*.

MUSIC, the Science of Sound, consider'd as capable of producing Melody, or Harmony; or, the Art of disposing and conducting Sounds, consider'd as grave and acute; and of proportioning them among themselves, and separating them by just Intervals, pleasing to the Sense. See SOUND.

Mr. *Maisieu* better defines *Musick*, a Science that teaches how Sounds under certain Measures of Tune, and Time, may be produc'd, and so order'd or dispos'd, as either in Consonance (i. e. joint Sounding) or Succession, or both, as they may raise agreeable Sensations.

From this Definition, the Science naturally divides itself into two general Parts, *Speculative* and *Practical*.

The first, the Knowledge of the *Materia Musica*, or how to produce Sounds in such Relations of Tune, and Time, as shall be agreeable in Consonance, or Succession, or both; By which, we don't mean the actual Production of these Sounds by an Instrument or Voice, which is merely the mechanical or effective Part; but the Knowledge of the various Relations of Tune and Time, which are the Principles, out of which the Pleasure sought derives. See TUNE.

The 2d, How these Principles are to be apply'd; or how Sounds, in the Relations they bear to *Musick* (as those are determin'd in the first part) may be order'd, and variously put together in Succession and Consonance, so as to answer the End: And this we call the Art of *Composition*, which is properly the practical Part of *Musick*. See COMPOSITION.

Some add a third Branch, viz. the Knowledge of *Instruments*; but as this depends altogether on the first, and is only an Application or Expression of it, it cannot come regularly under the Definition, and consequently is no part of the Division of the Science.

The first Branch, which is the contemplative Part, divides itself into these two, viz. the Knowledge of the Relations and Measures of Time, and the Doctrine of Time itself.

The former is properly what the Antients call'd *Harmonice*, or the Doctrine of Harmony in Sounds, as containing an Explication of the Grounds, with the various Measures and Degrees of the Agreement of Sounds, in respect of their Tune. See HARMONICA.

The latter is what they call'd *Rythmica*, because it treats of the Numbers of Sounds or Notes with respect to Time; containing an Explication of the Measures of long and short, or swift and slow, in the Succession of Sounds. See RYTHMICA.

The second Branch, which is the practical part, as naturally divides into two parts, answering to the parts of the first.

That which answers to the *Harmonica*, the Antients call'd *Melœpœia*, because it contains the Rules of making Songs, with respect to Tune, and Harmony of Sounds; tho' we have no reason to think the Antients had any thing like Composition in Parts. See MELOPœIA.

That which answers to the *Rythmica*, they call'd *Rythmopœia*, containing Rules for the Application of the Numbers and Time. See RYTHMOPœIA.

We find a strange Diversity in the ancient Writers, as to the Nature, Office, Extent, Division, &c. of *Musick*.

The Name is suppos'd originally form'd from *Musa*, Muse; the Muses being suppos'd to be the Inventors thereof. *Kircher*, however, will have it take its Name from an *Egyptian* Word, as supposing its Restoration after the Flood to have begun there, by reason of the Reeds, &c. on the Banks of the Nile. *Hesychius* tells us, the *Athenians* gave the Name *Musick* to every Art.

*Hermes Trismegistus* defines *Musick* to be the Knowledge of the Order of all things; which is also the Doctrine of the *Pythagorean* School, and of the *Platonists*, who teach, that every thing in the Universe is *Musick*.

Agreeable to which wide Sense, some divide *Musick* into *Divine* and *Mundane*.

The first respecting the Order and Harmony that obtains among the Celestial Minds; the other, the Relations and Order of every thing else in the Universe. *Plato*, however, by the *Divine Musick*, understands that which exists in the Divine Mind, viz. these Archetypal Ideas of Order and Symmetry, according to which God formed all things: And as this Order exists in the Mundane Creatures, he calls it *Mundane Musick*.

Which last Species they again subdivided into four, viz.

1. *Elementary Musick*, or the Harmony of the Elements of Things.

2. *Celestial Musick*, or the *Musick* of the Spheres; comprehending the Order and Proportions in the Magnitudes, Distances and Motions of the heavenly Bodies, and the Harmony of the Sounds resulting from those Motions.

3. *Human Musick*, which consists chiefly in the Harmony of the Faculties of the human Soul, and its various Passions; and is also consider'd in the Proportion, Temperament and mutual Dependence of the Parts of the Body.

4. What, in the proper and limited sense of the Word, is call'd *Musick*; which has for its Object, Motion, consider'd

as under certain regular Measures and Proportions, by which it affects the Senses in an agreeable manner.

Now as Motion belongs to Bodies, and as Sound is the Effect of Motion, and cannot be without it, but all Motion does not produce Sound; hence this last Branch of *Musick* became subdivided.

Where the Motion is without Sound, or as 'tis only the Object of Sight, it was either call'd *Musica Orchestra* or *Saltatoria*, which contains the Rules for the regular Motions of Dancing; or *Musica Hypocœtica*, which respects the Motion and Gestures of the Pantomimes.

When the Motion is perceiv'd only by the Ear, i. e. when Sound is the Object of *Musick*, there were three Species; viz. *Harmonica*, which considers the Differences and Proportions with respect to Grave and Acute; *Rythmica*, which respects the Proportion of the Sounds as to Time, or the Swiftness and Slowness of their Successions; and *Metrica*, which belongs properly to the Poets, and respects the Art of making Verses.

*Aristides Quintillanus*, *Bacchius*, and other ancient Writers, define *Musick* the Knowledge of Singing, and of the Things belonging thereto; which he calls the Motions of the Voice and Body: as if the Singing itself consisted only in the different Tones of the Voice.

The same Author, considering *Musick* in the largest sense of the Word, divides it into *Contemplative* and *Active*. The first, he says, is either *Natural* or *Artificial*. The *Natural* is either *Arithmetical*, because it considers the Proportion of Numbers; or *Physical*, which examines the Order of the Things of Nature.

The artificial he divides, as above, into *Harmonica*, *Rythmica*, *Metrica*.

The *Active*, which is the Application of the artificial, is either *Enthousiastic* (as in Oratory); *Organical* (or Instrumental Performance); *Orbital* (for Voice and singing of Psalms); *Hypocœtical*, in the Motions of the Pantomimes. To which some add *Hydrarchical*, tho' in reality no more than a Species of the Organical; in which, Water is used, for the producing or modifying of Sound.

*Porphyry* makes another Division of *Musick*, taking it in the limited Sense, as having Motion both dumb and sonorous for its Object; and without distinguishing the Speculative and Practical, he makes its Parts these six, viz. *Rythmica*, for the Motions of Dancing; *Metrica*, for the Cadence and Recitation; *Organica*, for the Practice of Instruments; *Pœtica*, for the Numbers and Feet of Verses; *Hypocœtica*, for the Gestures of the Pantomimes; and *Harmonica*, for Singing.

The *Musical Faculties*, as they call them, are *Melœpœia*, which gives Rules for the Tones of the Voice or Instrument; *Rythmopœia*, for Motions; and *Pœsia*, for making Verses.

*Musick* appears to have been one of the most ancient of Arts. And of all others, *Pœnic Musick* must undoubtedly have been the first Kind. For Man had not only the various Tones of his own Voice to make his Observations on, before any other Art or Instrument was found out, but had the various natural Strains of Birds, to give him occasion to improve his own Voice, and the Modalations of Sounds it was capable of.

Of many ancient Authors who agree in this Conjecture, we shall only mention *Lucretius*, who says,

*Ab Liquidis Avium Voces imitator Ore,  
Ante fuit multo quam levis Carmina Cantu,  
Concelebrare Homines possent, Aereſque juvare.*

The first Invention of string'd Instruments he ascribes to the Observation of the Winds whistling in the hollow Reeds.

As for other kind of Instruments, there were so many Occasions for Chords or Strings, that Men could not be long in observing their various Sounds, which might give Rise to string'd Instruments. See CHORD.

And for the pulsatile Instruments, as *Drums* and *Cymbals*, they might arise from the Observation of the hollow Noise of concave Bodies.

*Plato* says, in one place, ascribes the first Invention of *Musick* to the God *Apollo*, and in another to *Amphion*, the Son of *Jupiter* and *Antiope*. This last, however, is pretty generally allow'd to have been the first who brought *Musick* into Greece, and to have been the Inventor of the Lyre. The Time he lived in, is not agreed upon. See LYRA.

To him succeeded *Chiron*, the Demi-God; *Demodochus*; *Hermes Trismegistus*; *Olympus*; *Orpheus*, whom some make the first Introducer of *Musick* into Greece, and the Inventor of the Lyre; *Pedanius*; *Terpander*, who was Contemporary with *Lycæmus*, and set his Laws to *Musick*. To him some attribute the first Institution of *Musical Modes*, and the Invention of the Lyre; *Thales*; and *Thamyris*, who is said to have been the first Inventor of Instrumental *Musick* without Singing.

These were the eminent Musicians before Homer's Time. Others of a later Date, were *Lafus Herminensis*, *Melinipides*, *Philostratus*, *Timotheus*, *Phrynis*, *Epigenis*, *Lysander*, *Simmicus*, and *Diadros*; who were all considerable Improvers of Music. *Lafus* is said to have been the first Author who wrote on Music in the Time of *Darius Hyftaspes*; *Epigenis* invented an Instrument of forty Strings, call'd the *Epigonium*. *Simmicus* also invented an Instrument, call'd *Simmicianum*, of thirty-five Strings. *Diadros* improv'd the *Tibia*, by adding new Holes; and *Timotheus* the *Lyre*, by adding a new String; for which he was fined by the *Lacedaemonians*.

As the Accounts we have of the Inventors of Musical Instruments among the Antients, are very obscure; so are also the Accounts what those Instruments were; we scarce know any thing of them besides the bare Name.

The general Division of Instruments, is into *Stringed Instruments*, *Wind Instruments*, and the *Pulsatile Kind*. Of *Stringed Instruments*, we hear of the *Lyra* or *Cithara*, the *Psalterium*, *Trigon*, *Sambuca*, *Pellis*, *Magada*, *Barbiton*, *Tejtade*, *Epigonium*, *Simmicianum*, and *Pandora*, which were all struck with the Hand, or a *Plectrum*; and which see in their Places.

Of *Wind Instruments*, we hear of the *Tibia*, *Fistula*, *Hydraulic Organs*, *Tubo*, *Cornua*, and *Lituro*.

The *Pulsatile Instrument*, were the *Tympanum*, *Cymbalum*, *Crepitaculum*, *Tintinnabulum*, *Crotalum*, and *Sistrum*; which see.

Music has even been in the highest Esteem in all Ages, and among all People. Nor could Authors express their Opinion of it strongly enough, but by inculcating, that it was used in Heaven, and was one of the principal Entertainments of the Gods, and the Souls of the Blessed.

The Effects ascribed to it by the Antients, are almost miraculous; by means hereof, Difcates are said to have been cured, Unchastity corrected, Seditions quell'd, Passions rais'd and calm'd, and even Madness occasion'd. *Athenus* assures us, that antiently all Laws Divine and Civil, Exhortations to Virtue, the Knowledge of Divine and Human Things, Lives and Actions of illustrious Men, were written in Verse, and publickly sung by a Chorus to the Sound of Instruments; which was found the most effectual means to impress Morality, and a right Sense of Duty on the Mind.

Music made a great part of the Discipline of the antient *Pythagoreans*, and was used by them to draw over the Mind to laudable Actions, and sente in it a passionate Love of Virtue. It being their Doctrine, that the Soul itself consists of Harmony; and therefore by Music, they pretended to revive the primitive Harmony of its Faculties. By this primitive Harmony, they meant that which, according to their Dogma, was in the Soul, in its pre-existent State in Heaven. See *PYTHAGOREAN*.

Dr. *Wallis* has endeavour'd to account for the surprising Effects ascribed to the antient Music; and charges them principally on the Novelty of the Art, and the Hyperbols of the antient Writers: Nor does he doubt but the modern Music, *caeteris paribus*, would produce Effects at least as considerable as the antient. The truth is, we can match most of the antient Stories of this kind in the modern Histories. If *Timotheus* could excite *Alexander's* Fury with the *Phrygian* Sound, and fouth him into Indolence with the *Lydian*; a more modern Musician is said to have driven *Eric King of Denmark* into such a Rage, as to kill his best Servants. Dr. *Newentit* tells us of an *Italian*, who by varying his Music from brisk to solemn, and so vice versa, could move the Soul, so as to cause Distraction and Madness. And Dr. *Soub* has founded his Poem, call'd *Musica Incurans*, on an Instance he knew of the same thing.

Music, however, is not only found to exert its Force on the Affections, but on the Parts of the Body also; witness the *Goffen Knight*, mention'd by Mr. *Boyle*, who could not contain his Water at the playing of a Bag-pipe; the *Woman*, mention'd by the same Author, who would burst out in Tears at the hearing of a certain Tune, with which other People were but little affected: To say nothing of the true Story of the *Taramada*. We have an Instance in the History of the *French Academy*, of a Musician's being cured of a violent Fever, by a little Concert occasionally play'd in his Room.

Nor are our Minds and Bodies alone affected with Sounds, but even inanimate Bodies. *Kircher* tells us of a large Stone, that would tremble at the Sound of one particular Organ-pipe; and *Morboff* mentions one *Peter*, a *Dutch man*, who could break *Rummer-Glasses* with the Tone of his Voice. *Meyssene* also tells us of a particular Part of a Pavement, that would shake and tremble, as if the Earth would open, when the Organs play'd. Mr. *Boyle* adds, that Seats will tremble at the Sound of Organs; that he has felt his Hat do so under his Hand, at certain Notes both of Organs and Discourse; and that he was well inform'd, every well-built Vault would answer some determinate Note.

There is a great Dispute among the Learned, whether the Antients or Moderns best understood and practis'd Music: Some maintaining that the antient Art of Music, by which such wonderful Effects were perform'd, is quite lost; and others, that the true Science of Harmony is now arriv'd to much greater Perfection, than was known or practis'd among the Antients.

This Point is no other way to be determined, but by comparing the Principles and Practice of the one with those of the other.

As to the Theory or Principles of Harmonics, 'tis certain we understand it better than they; because we know all that they knew, and have improv'd considerably on their Foundations. The great Dispute then lies on the Practice.

With regard to this, it may be observ'd, that among the Antients, Music, in the most limited Sense of the Word, included *Harmony*, *Rythmus*, and *Verse*; and consisted of Verses sung by one or more Voices alternately; or in Choirs, sometimes with the Sound of Instruments, and sometimes by Voices only.

Their Musical Faculties, we have already observ'd, were *Melopoeia*, *Rythmopoeia*, and *Poesis*. The first whereof may be consider'd under two Heads, viz. *Melody* and *Symphony*. As to the latter, it contains nothing but what relates to the Conduct of a single Voice, or making what we call *Melody*. Nor do they appear to have ever thought of the Concert, or Harmony of Parts. This then was no part of the antient Practice, but entirely a modern Invention, to which we are beholden to *Guido Arezzino*, a *Benedictine Friar*. We would not, however, be understood to mean, that the Antients never join'd more Voices or Instruments than one together in the same Symphony; but that they never join'd several Voices, so as that each had a distinct and proper Melody, which made among them a Succession of various Concords, and were not in every Note Unisons, or at the same Distance from each other as Octaves. This last indeed agrees to the general Definition of the Word *Symphonia*; yet 'tis plain that in such Cases, there is but one Song, and all the Voices perform the same individual Melody. But when the Parts differ, not by the Tension of the whole, but by the different Relations of the successive Notes, this is the modern Art, which requires so peculiar a Genius, and on which account the modern Music has much the advantage of the antient. For further satisfaction on the Subject, see *Kircher*, *Perrault*, Dr. *Wallis*, Mr. *Maisel*, and others; who unanimously agree, that after all the pains they have taken to know the true State of the antient Music, they could not find the least reason to think there was any such thing in their Days as Music in Parts. See *SYMPHONY*, *SYNAULIA*, &c.

The antient Musical Notes are very mysterious and perplexed: *Bectius* and *Gregory* the Great first put 'em into a more easy and obvious Method. It was in the Year 1204, that *Guido Arezzino*, a *Benedictine of Arezzo* in *Tuscany*, first introduced the Use of a Staff with five Lines, on which, with the Spaces, he marked his Notes by setting a Point up and down upon 'em, to denote the Rise and Fall of the Voice; the *Kircher* mentions this Artifice to have been in Use before *Guido's* Time. See *NOTE*, *STAFF*, &c.

Another Contrivance of *Guido's* was to apply the six Musical Syllables *ut, re, mi, fa, sol, la*, which he took out of the *Latin Hymn*,

UT <i>queant Laxis</i>	REsonare flebit
MIRA <i>Gestorum</i>	FAMULI turorum
SOLVE <i>polliti</i>	LALI <i>reatum.</i>

O *Pater Aboe.*

Beside his Notes of Music, which, according to *Kircher*, he distinguished the Tones, or Modes, and the Seats of the Semi-tones, he also invented the Scale, and several Musical Instruments, call'd *Polyplestra*, as *Spinets* and *Harpicards*. See *NOTE*, *GAMUT*, &c.

The next considerable Improvement was in 1250, when *Joannes de Moris*, Doctor at *Paris*, invented the different Figures of Notes, which express the Times, or Length of every Note, at least their true relative Proportions to one another, now call'd *Long*, *Breves*, *Semi-breves*, *Crotchets*, *Quavers*, &c.

The most antient Writer of Music, we have already observ'd, was *Lafus Herminensis*; but his Work, as well as those of many others both *Greek* and *Roman*, are lost. *Aristoxenus*, Disciple of *Aristotle*, is the eldest Author extant on the Subject; after him came *Euclid*, Author of the Elements: *Aristides Quintilianus* wrote after *Cicero's* time. *Alypius* stands next; after him *Gauderius* the Philosopher, and *Nicomachus* the *Pythagorean*, and *Boccius*. Of which seven *Greek* Authors, we have a fair Copy, with a Translation and Notes, by *Melchiorius Pralensy*, the celebrated Mathematician, wrote in *Greek* of the Principles of Harmonics, about the time of the Emperor *Antoninus Pius*. This Author keeps a Medium between the *Pythagoreans* and *Aristoxeni-*

nians. He was succeeded at a good distance by *Manuel Bryennius*.

Of the *Latins* we have *Bovinius*, who wrote in the time of *Theoderic the Goth*, and *one Cassiodorus*; about the same time *Martianus*, and *St. Asaphus* not far remote. Of the *Moderns* are *Zarin*, *Sulinas*, *Vincenzo Galileo*, *Dani*, *Kircher*, *Meyenne*, *Paran*, *de Caux*, *Perrault*, *Wallis*, *Des Cartes*, *Holdsworth*, *Malcolm*, &c.

NOTE.

MUSK, a kind of Perfume, of a very strong Scent; only agreeable when moderated by the Mixture of some other Perfume. See PERFUME.

It is found in a kind of Bag, or Tumour growing about the bigeigns of a Hen's Egg under the Belly towards the genital Parts of a wild Beast of the same Name; and appears to be nothing else but a kind of bilious Blood there congealed, and almost corrupted.

The Animal is pretty common in the Kingdoms of *Estan*, *Tampin*, and some other, as *Crobin China*, &c. But the most esteemed are those in the Kingdom of *Tibet*.

They inhabit the Woods and Forests, where the Natives hunt 'em down; when the Beast is kill'd, they cut out the Bladder under the Belly, separate the coagulated Blood, and dry it in the Sun, where it is reduced into a light friable Substance almost of the nature of a Powder, of a dusky reddish Colour; and acquires a very strong and disagreeable Smell. It is then tied up again in Vessels, and exported to other Countreys; and this is the Musk which we use.

What the Ancients have wrote of it, is fabulous, viz. that it comes from the Testicles of a Castr, which, to stop the pursuit of the Hunter, castrates itself. The occasion of their Error may be owing to this, that among the *Indians* the Musk Animal goes by the name of *Capiv*.

Musk is in considerable use among the Perfumers and Confectioners; tho' much less now than formerly. It is supposed to fortify the Heart and Brain; and is good against Deafness; but is little used in Medicine, as being apt to occasion the Vapours.

The Word comes from the *Arabic* *Muscha*, Musk; whence was form'd the common *Greek* *μύσκη*.

MUSKET, or MUSQUET, a Fire-Arm bore on the Shoulder, and used in War; to be fired by the Application of a lighted Match. See FIRE-ARM.

The length of the *Musket* is fixed to three Feet eight Inches from the Muzzle to the Touch-Pan, and its Bore is to be such as may receive a Ball of 22 to 24 in a Pound.

*Muskets* were antiently bore in the Field by the Infantry; at present they are little used save in the Defence of Places.

MUSKETOON, a little *Musquet*, shorter, tho' thicker than the ordinary *Musquet*.

It is fired by the collision of a Steel and Flint in the Lock; whereas the *Musquet* is fired by a Match. Its Bore is a 35th part of its Length; and carries five Ounces of Iron, or seven and a half of Lead, with an equal Quantity of Powder.

MUSSLIN, MUSLIN, or MOUSSELIN, a fine Cloth, wholly of Cotton; so call'd as not being even, but having a downy Nap on its Surface resembling Moss, which the *French* call'd *Mousse*.

There are various kinds of *Mussins* brought from the *East-Indies*, chiefly *Bengali*; *Beteller*, *Tarnatan*, *Multimoles*, *Tanjels*, *Terindames*, *Davaes*, &c.

MUST, sweet Wine, newly pressed from the Grape; or the new Liquor press'd from the Fruits before it has work'd or fermented. See WINE.

MUSTARD, a Preparation of a Grain of that Name, ground or beaten up with Vinegar, or the *Must* of Wine; whence its Name.

MUSTARD-SEED, in *Latin* *Sinapi*, gives the Denomination to a Species of Topical Medicines call'd *Sinapius*. See SINAPIS.

*Mustard-Seed* is also used in preparing Chagrine. See CHAGRINE.

MUSTER, a Review of Military Forces, in order to take account of their Numbers, Condition, Accoutrements, Arms, &c.

The Word is form'd of the *French* *Mustrer*, Specimen. See REVIEW.

MUSTER of Record (*Stat. 18 Hen. 6.*) is to be enrolled in the Number of the King's Soldiers. See ROLL.

MUSTER-Master General, or Master of the King's MUSTERS, is an Officer in an Army, who takes account of every Regiment, their Number, Horses, Arms, &c.

MUSTER-ROLL, are Lists of the Soldiers in every Troop, Company, Regiment, &c.

MUSULMAN, a Title by which the *Mahometans* distinguish themselves; signifying, in their Language, True

Believy, or Orthodox. In *Arabic* they call it *Moslem*, *Mosleman*, and *Mosolman*. See MAHOMETAN.

The Name was first given the *Sarazens*; as is observed by *Leontavus*. There are two kinds of *Mosulmans*, very averse to each other; the one call'd *Sunn*, and the other *Chay*. The *Sunn* follow the Interpretation of the Alcoran given by *Omer*; and the *Chay* are Followers of *Holy*. The Subjects of the King of *Persia* are *Chay*; and those of the Grand Signor, *Sunn*.

Some Authors will have it, that *Mosulman* signifies *Swear*, that is, Pledged; and that the *Mahometans* give themselves the Appellation, as believing themselves all Pledged.

*Martinius* is more particular as to the Origin of the Name, he derives it from the *Arabic* *مجاهد* *Mojahad*, Saved, taken out of Danger; and observes, that the *Mahometans* establishing their Religion by Fire and Sword, massacred all those who would not embrace it, and granted Life to all that did, calling them *Mosulmans*; i. e. *Exempt* & *periculo*, whence the Word, in course of Time, became the distinguishing Title of all those of that Sect, who have affixed to it the signification of *True Believer*.

MUSULMANISM, see MAHOMETANISM.

MUTATION, the Act of Changing; or, sometimes the Change itself. See CHANGE and PERMUTATION.

'Tis one of the LAWS of Nature, that the Mutation of Motion is ever proportional to the moving Force impress'd. See NATURE.

MUTATION, in the antient Music, signifies the Changes, or Alterations that happen in the Order of the Sounds which compose the Melody.

*Aristareus* says it is, as it were, a kind of Passion in the Order of the Melody. See MELODY.

The Changes are, first, in the Genes; when the Song begins in one, as the *Chromate*, and passes into another, as the *Diatone*. Secondly, in the System; as when the Song passes out of one *Tetrachord*, as *Meson*, into another, as *Diagesmemon*; or more generally, when it passes from a high place of the Scale to a lower, or contrarily, i. e. part of it is sung high, and part low. Thirdly, in the Mode or Tone, as when the Song begins in one, as the *Doric*; and passes into another, as the *Lydian*. Fourthly, in the *Melopoeia*, that is, when the Song changes the very Air, so as from Gay and Spiritly, to become Soft and Languishing; or from a Manner that expresses one Passion or Subject, to the Expression of some other.

MUTE, in Grammar, a Letter which is not founded, or heard in the Pronunciation; or a Letter which yields no Sound of itself and without a Vowel. See LETTER.

The Consonants are ordinarily distinguished into *Mutes* and *Liquids*, or half Vowels. See CONSONANT.

The *Mutes* in the *English* Alphabet are *ELEVEN*, viz. P, C, D, G, H, K, P, Q, T. They are call'd *Mutes* because a Liquid can't be founded in the same Syllable before them, as *ras*; but a *Mute* may be pronounced in the same Syllable before a Liquid, as *pra*. See LIQUID.

MUTE, Dumb, a Person that cannot speak, or has not the use of Speech. See DUMBNESS.

*Mutes* and *Dwarfs* make their Fortune in the Grand Signer's Seraglio. The *Mutes* serve as Executioners to take off Persons of the first Rank.

MUTE, in Law, he that stands Dumb, or Speechless.

A Pleinceer may stand *Mute* two manner of ways; 1. When he speaks not at all: In which Case it is enquired, whether he stand *Mute* of Malice, or by the Act of God: If by the latter, then the Judge, *ex Officio*, ought to enquire whether he be the same Person; and of all other Pleas, which he might have pleaded if he had not stood *Mute*. 2. He is said to be *Mute* when he pleads not Guilty, or does not directly answer, or will not put himself upon the Enquest to be tried.

MUTILATION, the retrenching, or cutting away of any Member of the Body.

The use of the Word is also extended to Structures and Buildings, where any part is wanting, or the Projection of any Member is broke off.

MUTILATION is sometimes understood in a more immediate manner for *Castration*. See CASTRATION.

MUTUAL, a relative Term, denoting something that is reciprocal between two or more Persons. See RECIPROCAL.

Thus we say *Mutual Assistance*, *Mutual Aversion*, &c.

There are *Mutual*, or reciprocal Duties, Offices, &c, between Superiors, and Inferiors; the King and his Subjects; the Master and his Servants, &c.

*Vangelas* makes a Distinction between *Mutual* and *Reciprocal*. *Mutual*, according to him, is understood of what is between two only; and *Reciprocal* of what is between more than two. But this Decision is little regarded in common use.

A **MUTUAL Testament** is that made by two Persons leaving their Effects reciprocally to the Survivor.

**MUTULE, MUTUEUS**, in Architecture, an Ornament, otherwise call'd *Modillon*. See **MODILLION**.

The only difference between *Mutule* and *Modillon* consists in this, that the former is used in speaking of the Doric Order, and the latter in the *Corinthian*. See **DOIC**, &c.

The *Mutules* in the *Doric* answer to the *Triglyphs*; whence some make *Gutse*, or Drops to hang. See **GUTTE**.

**MUTUUM**, in the Civil Law, is a Loan simply fo call'd; or a Contract introduced by the Law of Nations, whereby a thing consisting in Weight, as suppose Bullion; in Number, as Money; or in Measure, as Corn, Timber, Wine, &c. is given to another, upon Condition that he shall return another thing of the same Quantity, Nature, and Value on demand.

This, therefore is a Contract without Reward: So that where Use or Interest arise, there must be some particular Article in the Contract whereon it is founded.

**MUZZLE** of a Gun, is strictly the Moulding or Circle which encompasses, and strengthens the Mouth of it.

**MYOLOGLOSSUM**, in Anatomy, a Pair of Muscles thus call'd, because arising about the backside of the *Molares*, or Grinding-Teeth, and inserted into the Ligament of the Tongue; helping to pull it upwards. See **TONGUE**.

These are the same with what Mr. *Cowper* calls *Styloglossum*. See **STYLOGLOSSUM**.

**MYLOHYOYDEUM**, in Anatomy, a broad, but short Muscle lying immediately under the *Brester* Muscle of the Jaw, and which springing from the lower Margin on each side the under Jaw, is inserted into the Basis of the *Ossis Hyoidis*. See **HYOIDES**.

Besides the common Use ascribed to this Muscle, which is to move the *Hyoides*, the Tongue, and the Larynx both upwards, inwards, and side-ways; its Series of transverse Fibres have a further use when it is at rest; and that is to compress the Glands under the Tongue, and by that means promote the discharge of Saliva into the Mouth from the lower salival Ducts. Whence it is we use this Muscle when we want Saliva in the Mouth.

**MYOCEPHALE**, in Anatomy, a little part of the *Tumida Uvea*; so call'd, as resembling the Head of a Fly. See **UVULA**.

The Word is form'd of the Greek *μύς* Fly, and *κεφαλή* Head.

**MYOLOGY**, in Anatomy, a Description of the Muscles; or the Knowledge of what relates to the Muscles. See **MUSCLE**.

Anatomy is divided into *Osteology*, *Myology*, &c. See **ANATOMY**.

The Word is form'd of *μύς*, *μῦς*, a Muscle, and *λογία*, Discourse.

**MYOMANCY**, a kind of Divination, or Method of foretelling Events by means of Mice. See **DIVINATION**.

Some Authors hold *Myomancy* one of the most ancient Kinds of Divination; and think it is on this account that *Jsaiah*, lvi. 17. reckons Mice among the abominable things of the Idolaters. But beside that it is not certain that the Hebrew Word *מַיִם* used by the Prophet, signifies a Mouse; 'tis evident it is not Divination by that Animal, be it what it will, in here spoke of; but the eating it.

**MYOPES**, Persons who are short-sighted; or, as we popularly call it, *Farblind*. See **SHORT**.

*Myopes* are properly such as see remote Objects confusedly, and near ones distinctly. See **MYOPIA**.

The defect of *Myopia* is not in the Optic Nerve, the Pupil, or the like; but in the Form of the Crystalline, or the distance of the Retina from the same. The Crystalline being rounder, or more convex than ordinary, the Rays will be render'd more Convergent than ordinary in passing thro the same (see **REFRACTION**); by this means they will be brought to meet, or concur at the less distance from the Crystalline; so that if the Retina be at its usual distance, they will concur e'er they reach it. 'Tis the too great nearness, then, of the Retina to the Crystalline, that constitutes the *Myopia*.

*Myopes* have their Sight very durable; and rarely come to need Spectacles. See **SPECTACLES**.

Those who labour under the opposite Defect, are call'd *Presbyta*. See **PRESBYTA**.

The Word is form'd of *μύς*, Fly; by reason remote Objects appear to them like Flies; or, perhaps, by reason the same Conformation of the Eye is observed in Flies.

**MYOPIA**, *Short-sightedness*, a Confusion or Obscurity of Sight, when directed to remote Objects. See **VISION**, **SHORT**, &c.

The *Myopia* is owing to the too great Convexity of the Ball of the Eye, and particularly of the Crystalline; whence it happens that the visual Rays concur before they reach the Retina. See **MYOPIA**.

For this Reason, to see an Object distinctly, they must either apply it close to the Eye; or use a concave Glass. See **CONCAVE**.

The *Myopia* wears off by time, the Eye growing flatter and flatter as Persons draw towards old Age. See **EYE**.

**MYOTOMIA**, from *μύς* *Myosialis*, a Muscle, and *τομή* *toμή*, to cut; is a Dissection of the Muscles.

**MYRIAD**, the Number of Ten Thousand.

Whence *Myriarchus*, a Captain, or Commander of Ten Thousand Men.

**MYRMECIA**, in Medicine, a kind of Wart growing on the Palm of the Hand, and Soal of the Foot; hard, and less than those call'd *Thymi*: they have also deeper Roots, and are more painful. They are usually broad at bottom, and narrow at top.

**MYRMIDONS, MYRMIDONES**, in Antiquity, a People of *Thessaly*, fabled to have arose from Ants, or Pismires, upon a Prayer put up to that purpose by King *Iacus* to *Jupiter*, after his Kingdom had been dispeopled by a severe Pestilence.

In *Horace*, and *Virgil*, the *Myrmidons* are *Achilles's* Soldiers.

**MYRMILLO**, a kind of Gladiator in ancient Rome; call'd also *Murmullo*. See **GLADIATOR**.

*Turcodani* derives the Name from the *Myrmidons*.

**MYRABOLANS**, a kind of Medicinal Fruit, brought from the *Indies*; much more used in the *Arabic* than the *Greek* Pharmacy; and more among the Ancients than the Moderns; and still more abroad than in *England*.

There are five kinds of *Myrabolans*: The first call'd *Citrone*, of a yellowish red, hard, oblong, and the size of an Olive. The second call'd *black*, or *Indian Myrabolan*, the bigness of an Acorn wrinkled, without Stone. The third, *Chebulæ Myrabolan*, the size of a Date, of a yellowish brown, pointed at the end. The fourth *Embleis*, round, rough, the size of a Gall, of a dark brown. The last call'd *Belleris*, hard, yellow, round, the size of an ordinary Prune, less angular than the rest.

*Myrabolans* of each kind are slightly Purgative, and Astringent.

The Word comes from the Greek *μύρα* Unguent, and *βαλλω* Acorn; as being in form of Acorns, and used in Medicine.

**MYRRH**, a kind of Gum, or Resin issuing, by Incision, and sometimes spontaneously, from the Trunk, and larger Branches of a Tree growing in *Arabia*, *Egypt*, and especially *Abyssinia*. See **GUM**.

Authors are not agreed about the Tree which produces this Gum: 'Tis true, they all make it small, and thorny; but disagree about the Form of its Leaves.

The Incisions are made twice a Year, and the *Myrrh* oozing out is received on Rush-Mats, disposed underneath.

The Druggists sell two kinds of *Myrrh*, viz. *Myrrh in Tears*, which they call *Saite*; the other *Ungulata*, or *Nail'd*.

Of the first kind, the best is in bright yellow, transparent Drops, friable, light, of a strong disagreeable smell: But this is very rare; and most of that in use is the *Nail'd Myrrh*, so call'd from little white Spots observed thereon, much like those on the Nails of the Fingers. The best is in little Masses, or Tears, red, and transparent; which, when broke, contain a kind of unctuous Liquor, the most precious part of the *Myrrh*, and the real *Saite* of the Ancients. See **STACTE**.

This Gum enters a great number of Medicinal Compositions. Its Bitterness renders it good for the Stomach, and against Worms; 'tis chew'd to prevent Infection from contagious Diseases. Dr. *Quincy* says it is excellent to cleanse and strengthen the Womb, and against tickling Rheums; a good Detergent; and as such much added externally in Unguents for the Healing of Wounds; and makes the principal ingredient used in Embalming. The Chymists draw from it Oils, Spirits, Tinctures, &c. to which they attribute extraordinary Virtues.

The Word comes from *μύρα*, I run, or trickle.

The Ancients had Vesicles of a kind of *Myrrh*, call'd *Vasa Myrrhina*, *Myrrhina Peda*, &c. Some say they were made of what we now call *Agar*, others of *Oxys*, others of *Coraline*, and others of a Gum congealed and condensed.

**MYRTIFORMES Carunculae**, in Anatomy, little Caruncles, or fleshy Knots adjoining to, or rather in the Place of the *Hymen* in Women. See **CARUNCLE**.

They are about the bigness of Myrtle-Berries, whence they take their Name; and are supposed by some to be largest in Maids, and by degrees to grow less thro the use of Venus.

Others, and with more probability, derive them from the broken Membrane of the *Hymen*, whose Fragments shrunk up, they take them to be. See **HYMEN**.

MYRTLE, MYRTLES, the Berries, or Fruit of a Shrub well known under the Name of *Myrtle*, growing common in Spain, especially in the Mountains of *Lasserra Morena*, &c.

There are two kinds of *Myrtle*, Male and Female; the latter whereof produces the best Berries, and in the greatest Quantity.

The Fruit is at first green, but becomes black insensibly within; it is a white Seed in form of a Crescent, solid, hard, and of an astringent Taste; while the Fruit continues on the Trees, 'tis succulent and smooth, and only becomes acid and wrinkled, because dried in the Sun for the convenience of Carriage.

They are much used in Medicine, especially in France, where they prepare Oils, Syrups, &c. from 'em.

The Perfumers likewise use 'em in their Perfumes, and draw an Essence from 'em. The German Dyers make a blue Colour from 'em. In England the Leaves and Branches are used for Tanning of Leather.

MYSTERY, MYSTERIUM, something secret, or hidden; impossible, or difficult to be comprehended.

The Word is primarily used in speaking of certain Truths revealed in Scripture, into the understanding whereof human Reason cannot penetrate: Such are the Doctrine of the Trinity, the Incarnation, &c. See TRINITY, &c.

The Word comes from the Greek *μυστα*; and that, according to some Etymologists, from *μυσ* Claudo, taceo, I shut, I am silent, and *μα*, Mouth; but then whence comes the *ρ*? Must the *m* of *μυσ* be converted into an *r*? The Word, then, is derived with more Propriety from the Hebrew *תוסתר*, to hide, whence is form'd *תוסתר* *Myster*, a hidden thing.

We have an Epitome of the *Mysteries of Faith*, or the *Mysteries of Christianity*, in the Symbols, or Creeds, compiled by the Apostles, the Council of Nice, and St. Athanasius. See CREEDS.

In all these, mention is made of the *Mystery of the Trinity*; the *Mysteries of the Incarnation* of the Son of God, his Death and Passion, and his Descent into Hell for the Redemption of Mankind. Of his Resurrection the third Day, his Ascension to Heaven, his sitting at the right Hand of God, and his coming again to judge the World. Of the Divinity, and Co-equality of the Holy Ghost with the Father and the Son: Of the Unity of the Church: Of the Community of Saints; the participation of the Sacraments; and the general Resurrection.

These are the principal *Mysteries of Faith*; which the Church declares necessary to be known and believ'd, in order to Salvation.

From the earliest Ages there have been particular Festivals instituted by the Church in honour of these *Mysteries*; to return Thanks to God for having revealed them, and to oblige the Ministers and Pastors to instruct the People therein. See FEASTS.

Such are the Feast of the *Mystery of the Incarnation*, call'd also *Christmas*; that of the *Circumcision*, *Passion*, *Resurrection*, &c. See INCARNATION, CIRCUMCISION, EASTER, EPIPHANY, &c.

The Heathen: too had their *Mysteries*: The Egyptian Priests concealed the *Mysteries* of their Religion; and Philosophy under Hieroglyphics. See HIEROGLYPHS.

Those who revealed the *Mysteries of the Iliad* were severely punished; and none were trusted with them but those formerly initiated, and sworn to secrecy.

But these were not call'd *Mysteries*, as being incomprehensible, or rais'd above the ken of Reason; but because they were cover'd, and disguis'd under Types, and Figures, to raise the greater Veneration in the People.

The *Mysteries of Paganism* were celebrated in Growth's, fitter to conceal Crimes than to hold religious *Mysteries* in.

In Scripture-Language, the Term *Mystery* is used with some Latitude. He that reveals Secrets, (or *Mysteries*) makes known to thee what shall come to pass; Dan. ii. 29. There is a God in Heaven that reveals *Mysteries*, ch. v. 28.

In which Places, *Mystery* is any thing not to be known without Divine Revelation.

We speak the Wisdom of God in a *Mystery*, which God had resolv'd before all Ages to reveal for our Glory, 1 Cor. ii. 7. We are to be accounted (says St. Paul) as Ministers of Jesus Christ, and Dispensers of the *Mysteries of God*, 1 Cor. iv. 1. Tho' I understand all *Mysteries*, and have the Knowledge of all things, if I have not Charity, I am nothing, 1 Cor. xiii. 2. Behold I shew you a *Mystery*, 1 Cor. xv. 51. By reading my Epistle, you may understand my Knowledge in the *Mystery of Christ* at Ephes. iii. 4. And in the following Verses he adds, that this *Mystery* is, that the Jews are Fellow-Heirs, and make but one Body with the Jews, being Sbarers with them in the Promises of God

in the Gospel. Holding the *Mystery of the Faith* in a pure Conscience, 1 Tim. iii. 9. When the seventh Angel begins to sound his Trumpet, the *Mystery of God shall be finish'd*, as he has declared to his Servants the Prophets, Reel. x. 7.

In all which Passages, the Word *Mystery* is taken for the secret hidden Things, which God has discover'd by his Ministers the Prophets, Jesus Christ, and the Apostles.

MYSTICAL, MYSTIC, something Allegorical, or *Mysticisms*. See MYSTERY, ALLEGORY, &c.

The Commentators on the Scriptures, besides a literal, find also a *mystical* and a moral Meaning.

The Bible, they contend, is a Book written both within side, and without side. Within side, with regard to the *mystical*, internal, sublime, and hidden Sense; and without side with regard to the literal and grammatical Sense, immediately express'd by the words.

In effect several of the ancient Fathers, and Doctors of the Church, understand the Books mentioned in *Ezech. ii. 9.* and in the *Apocalypse. v. 1.* which were wrote both within side and without, of the Scriptures.

The literal and *mystical* Sense they think are here fairly intimated.

The Sense of Scripture, say they, is either that immediately signified by the Words and Expressions in the common use of Language: or it is mediate, sublime, typical, and *mystical*; wherein the things themselves signified, are made to signify still other and further things, according to the particular Design, and Intention of God, and the Prophets and Apostles inspired by him. See TYPICAL.

The literal Sense they again divide into literal *Proper*, which is contained in the Words taken simply and properly:

And literal *Metaphorical*, where the Words are to be understood in a figurative and metaphorical Sense; as where the Right-Eye is command'd to be pluck'd out, &c. Wherever the proper literal Sense contains any thing absurd or indecent, there recourse must be had to the literal *Metaphorical*.

All Scripture has a true literal Sense, but not always a *Mystical* one. We must always understand it in the literal Sense, when it speaks immediately of any of the Laws of Nature, of Charity, of doing Good, when it gives us Instructions for the Conduct of Life, for the Regulating our Manners, when it relates any Matter of Fact, or any Point of History.

The same Passage of Scripture has sometimes several literal Senses, express'd and signified immediately by the Words taken in their proper and their figurative Sense, and which appear to have been all intended by the inspir'd Person who spoke them, as having been all understood by others of them. As those Words in *John ii.* These are my Son, this day have I begotten thee; which St. Paul understands according to the strict Letter in Heb. i. of the Generation of Jesus Christ in time: And in *Acts xiii. 33.* he takes them in a metaphorical Sense, and applies them to our Saviour's Resurrection. Thus in *Hosea xi. 1.* the Words of the Prophecy, I have call'd my Son out of Egypt, are understood literally of the Children of Israel whom God brought out of Egypt under the Conduct of Moses; and yet in *Matth. ii. 15.* they are understood metaphorically of Jesus Christ. See PROPHECY.

The *Mystical Sense* of Scripture is that which the things express'd by the Words signify further; or it is a second Signification, and Expression signified by the first; this second being express'd immediately by the first, and mediately by the Words themselves. Writers allow of three kinds of *Mystical* Sense in the Word of God: The first corresponding to Faith, and call'd *Allegorical*; the second to Hope, call'd *Anagogical*; and the third to Charity, call'd the *Tropological Sense*.

The four Senses, and their Applications are included in the Latin Distich,

*Littera gesta docet, quid credas Allegoria,  
Moralis quid agas, quo tendas Anagogia.*

Sometimes the same Word in Scripture is taken in all the four Senses. Thus the word *Jerusalem* literally signifies the Capital of *Judea*; Allegorically, the Church Militant; Tropologically and Morally, a Believer; and Anagogically, Heaven.

So, that Passage in *Genesis, Let there be Light, and there was Light*; signifies, according to the Letter, Corporal Light; by Allegory, the Messiah; in the Tropological Sense, Grace; and Anagogically, the Light of Glory.

MYSTICS, MYSTICI, a kind of Religious Sect, distinguished by their professing pure, sublime, and perfect Devotion, with an entire disinterested Love of God, free of all

all selfish Considerations. See PIETISTS, MOLINOSISTS, &c.

The *Mystics*, to excuse their fanatic Extasies, and amorous Extravagancies, alledge that Passage of St. Paul; *The Spirit prays in us by Sighs and Groans that are unutterable.* Now, if the Spirit, say they, pray in us; we must resign ourselves to its Motions, and be sway'd, and guided by its Impulse, by remaining in a State of mere Inaction. See QUIETISM.

Passive Contemplation is that State of Perfection to which the *Mystics* all aspire. See CONTEMPLATION.

MYSTIC Theology, is a refined and sublime kind of Divinity, profess'd by the *Mystics*. It consists in a Knowledge of God, and Divine things, not acquir'd in the common way, but infused immediately by God, and which has the Effect to move the Soul in an easy, calm, devout, affective manner; to unite it intimately to God; to illumine the Understanding, and warm and coliven the Will in an extraordinary manner.

Among the Writings attributed to *Dionysius the Areopagite*, is a Discourse of *Mythic Theology*. Several others have wrote on the same Subject, both Antients and Moderns.

MYTHOLOGY, the History of the fabulous Gods, and Heroes of Antiquity; and the Explanation of their Mysticries, of their Religion, their Fables, and Metamorphoses. See GODS, FABLES, METAMORPHOSES, &c.

*Natalis Comes* has wrote a *Mythology*.

The Word is *Greek*, and signifies a Discourse or Description of Fables; from *μῦθος* *Fabula*, and *λογος* *Sermo*, Discourse.

MYURUS, in Medicine, a Pulse which is continually weakening by insensible Degrees; so that the second Beat is fainter than the first; the third than the second, &c. See PULSES.

The Word is formed of the *Greek* *μῦς*, like a *Mouse's Tail*; which is compounded of *μῦς*, *Mouse*, and *ὄψις*, *Tail*; the Diminution of the Pulse being supposed like that of the thickness of the Tail of that Animal, which grows less from the Root to the Tip.

N.

**N,** A Liquid Consonant, and the 13th Letter of the Greek, Latin, English, &c. Alphabets. See LETTER and ALPHABET.

The N is a *d*, pass'd thro' the Nose; so that when the Nose is stopped by a Cold, or the like, 'tis usual to pronounce *d* for *n*. M. l'Abbe de Dangeaux observes, that in the French, the *n* is frequently a meer Nasal Vowel, without any thing of the Sound of a Consonant in it. He calls it the *Solemn* Vowel.

The Hebrews call their *N Nun*, which signifies *Sea*, as being supposed the Offspring of *M*; partly on account of the resemblance of Sound, and partly on that of the Figure. Thus from the *M*, by omitting the last Column, is form'd *N*; and thus from the Capital *N*, by omitting the first Column, is form'd the Greek *Minuscule n*. Hence for *Biennius*, &c. the Latins frequently use *Biennus*, &c. And the Greek *ν* at the end of a Word, they convert into an *m*; as *καμαχων*, *Pharmacum*, &c.

N before *p*, *b*, and *m*, they change into *m*, and frequently into *l* and *r*, as *in-ludo*, *illudo*; *in-rige*, *irigo*, &c. In which they agree with the Hebrews, who, in lieu of *Nun*, frequently double the following Consonant; and the Greeks, who do the same, as when for *Musici*, they write *musici*, &c.

The Greeks also, before *α*, *γ*, *ζ*, *ρ*, changed the *ν* into *γ*: in which they were followed by the ancient Romans, who for *Angulus* wrote *Agulus*; for *anceps*, *asceps*, &c.

The Latins retrench the *n* from Greek Nouns ending in *us*; as *Amor*, *Lex*; *Sexus*, *Draco*. On the contrary, the Greeks add it to the Latin ones ending in *o*; as *admir*.

N, among the Aoticms, was a Numeral Letter, signifying 900; according to the Verse in *Baronius*,

*N, quaque Nonaginta numerus designat balendos.*

And when a Line was struck over it, *N̄*, Nine Thousand.

Among the ancient Lawyers, *N. L.* stood for *Non Lique*, i. e. the Cause is not clear enough to pass Sentence upon.

N<sup>o</sup>, in Commerce, &c. is used as an Abbreviation of *Numero*, Number. Thus also in Medicine, *Caryophyllorum*, N<sup>o</sup> vi. signifies six Cloves.

NAONASSAR, in Chronology. The *Æra* of NAONASSAR is famous. We know but little of the History of the Man; only that he was King of *Babylon*, and was also call'd *Eteclus*; tho' some will have him the *Baldan* mention'd in *Isaiab xxxix. 1.* and *2 Kings xx. 12.* Some even conjecture that he was a *Mede*; and that he was set on the Throne by the *Babylonians*, upon their rising and shaking off the Subjection of the *Medes*.

The Beginning of this Prince's Reign is of great Importance in Chronology; by reason *Ptolemy* assures us, there were Astronomical Observations made by the *Chaldeans* from *Naboussar* to his Time: and *Ptolemy*, and the other Astronomers, account their Years from that Epocha.

From the Observations quoted by *Ptolemy*, it follows, that the first Year of this *Æra* is the 747th Year before *Jesus Christ*; and the 397th of the *Julian* Period. See EPOCHA.

The Years of this Epocha are *Egyptian* Years, of 365 Days each; commencing on the 26th of *February*, and reckoning, according to the Computation of Astronomers, from *Noen*. See YEAR.

NADIR, in Astronomy, the Point opposite to the Zenith; i. e. that Point directly under our feet; or a Point in a right Line drawn from our Feet thro' the Center of the Earth, and terminating in the Under-Hemisphere. See ZENITH.

The Zenith and Nadir are the two Poles of the Horizon, each 90° distant from it, consequently each in the Meridian. See HORIZON.

The Word *Nadir* is pure *Arabic*.

The Sun's Nadir, is the Axis of the Cone projected by the Shadow of the Earth; thus call'd, in regard that Axis being prolonged, gives a Point in the *Æcliptic* diametrically opposite to the Sun.

NAVI, in the Animal Oeconomy, Marks made on the Fetts by the Imagination of the Mother, in longing for any thing.

See these accounted for under the Article MONSTER. See also FORTUS and IMAGINATION.

NAIANT, or NAIANT, that is, *Swimming*; a Term in Heraldry, used in the blazoning of Fishes, when drawn in an Horizontal Posture, *Pis*-wise, or transversely, a-cross the *Escutcheon*; that being their *Swimming* Posture. See FISHES.

NAIDS, or NAIDES, a sort of Heathen Divinities, supposed to preside over Fountains and Rivers. See GOD. *Strabo* says, the *Naids* were Priestesses of *Bacchus*.

The Word comes from the Greek *ναίω*, to glide, or *ναίω*, to slide, *imbolito*.

NAILING of Cannon, the driving of a Nail, or Iron Spike, by force, into the Touch-hole of a Piece of Artillery; so as to render it useless to the Enemy. See CANNON.

NAILS, in the Animal Body, a kind of horny Excrecences, growing over the Ends of the Fingers and Toes of Men, and several other Animals; much of the same nature with the Hoofs of others. Hoofs being nothing else but a Number of small Husks, answering to so many Papille of the Skin; it may be concluded, that Nails are no more but the Covers, or Sheaths of the *Papille Pyramidales* of the Skin, on the Extremities of the Fingers and Toes, which dry, harden, and lie upon one another. See PAPPILLE.

Their Use is to defend the Ends of the Fingers in handling any hard and rugged Bodies; that Part being exceedingly sensible, by reason of the great Number of Nerves which terminate here for the Sensation of Feeling. See FEELING.

The Nails are form'd, and grow after the same manner as the rest of the Body; their Nourishment they receive from their Roots, as is easily observable from the white Specks sometimes seen on them, and which constantly recede from the Root.

The Romans were very curious in the Cutting of these Nails, and had it done by Artists, who made an Employment of it.

The *Chirurgie* Doctors and *Litterati* pique themselves on the excessive Length of their Nails. *F. le Compté* says, some of them wear Nails near as long as their Fingers. See CIRCUMCISION.

NAILS in Building, &c. are little Metallic Members, serving to bind or fasten the Parts together, &c.

The several Kinds of Nails are very numerous. As *Back* and *Bottom* Nails; made with flat Shanks to hold fast, and not open the Wood: *Clamp* Nails, those proper to fasten the Clamps in Buildings, &c. *Clasp* Nails, whose Heads clasping and sticking into the Wood, render the Work smooth, so as to admit a Plane over it: They are of two Kinds, viz. long, proper for fine Buildings of Fir, &c. and strong, fit for Oak, and other hard Wood. *Clench* Nails, those used by Boat, Barge, &c. Builders; proper for boarded Buildings, that are to be taken down, because they will drive without splitting, and draw without breaking. *Claw* Nails, those ordinarily used for nailing on of Closets to Axle-Trees. *Deck* Nails, those proper for fastening of Decks in Ships, doubling of Shipping, and Floors laid with Planks. *Dog* Nails, proper for fastening of Hinges to Doors, &c. *Flat Points* are of two kinds, viz. Long, much used in Shipping, and proper where there is occasion to draw, and hold fast, yet no necessity of Clenching. *Jabent* Nails, those commonly used to nail thin Plates of Iron to Wood. *Lead* Nails, used to nail Lead, Leather and Canvas to hard Wood. *Port* Nails, commonly used to nail Hinges to the Ports of Ships. *Pound* Nails, are four-square in the Shank; much used in *Norfolk*, *Suffolk* and *Essex*, tho' scarce elsewhere, except for piling. *Ribbing* Nails, used to fasten the Ribbing, to keep the Ribs of Ships in their place in Building. *Ryse* Nails, are drawn four-square in the Shank, and commonly in a round Tool. *Robber* Nails, chiefly used to fasten Rother-Irons to Ships. *Round-head* Nails, proper to fasten in Hinges, or other Uses, where a neat Head is required. *Scupper* Nails, much used to fasten Leather and Canvas to Wood. *Sharp* Nails, much used, especially in the *West-Indies*, made with sharp Points, and flat Shanks. *Sheeting* Nails, used to fasten Sheeting-Boards to Ships: the Rule for their Length, is to have them fall three times as long as the Board is thick. *Square* Nails, of the same Shape as sharp Nails, chiefly used for hard Woods. *Tacks*, the smallest of Nails, are to fasten Paper to Wood; *Middle*, for Wool-Cards and Oars; *Large*, for Upholsterers, and Pumpes.

In Lathing, 500 Nails are ordinarily allowed to a Bundle of five-foot Laths. In Flooring, 200, i. e. 240 are allowed for a Square of Flooring.

Nails are said to be toughened, when too brittle, by heating them in a Fire-Shovel, and putting some Tallow or Grease among them.

NAIL is also a sort of Long Measure, chiefly used in the Commerce of Cloths; consisting the 16th Part of a Yard. See YARD and MEASURE.

**NAIRANGIA**, a kind of Divination, in use among the *Arabs*, drawn from several *Phænomena* of the Sun and Moon. See **DIVINATION**.

The Word is form'd from the *Arabic Nairan*, the Plural of *Nair*, Light.

**NAISSANT**, in Heraldry, is applied to a *Lion*, or other Animal, shewing only the Head, Shoulders, Fore-feet, and Legs, with the Tip of the Tail; the rest of the Body lying hid under the Shield, or some Charge, or Ordinary thereon; from which it appears to be issuing or arising.

*Naissant* differs from *Issuant*, in that the Animal in the former Case issues out at the middle, and in the latter, at the bottom, of the Shield or Charge. See **ISSUANT**.

*F. Menestrier* says, *Naissant* is only used for Animals, which shew the bare Head as arising out of the Extremity of the Chief, or from above the Fessic.

**NAKED**, in Architecture. The **NAKED** of a *Wall*, &c. is the Surface, or Plain, from whence the *Projectures* arise; or which serves as a Ground to the *Projectures*. See **PROJECTURE**.

Thus, we say, a *Pilaster* ought to exceed the *Naked* of the *Wall* by so many Inches; and that the *Foliages* of a *Capital* ought to answer to the *Naked* of the *Column*. See **COLUMN**, &c.

**NAKED FIRE**, is a Term used by the *Chymists* for an *Open Fire*; or one where the containing *Vessel* is immediately exposed to the *Fire*. See **PIAZ** and **HEAT**.

**NAKED SEEDS**, in Botany, are such *Seeds* of *Plants* as are not inclosed in any *Pod*, or *Cafe*. See **PLANT** and **SEED**.

**NAM**, or **NAAM**, in Law, the taking, or distraining another Man's moveable Goods. This is either lawful, or unlawful.

*Lawful Naam*, is a reasonable *Distrain*, proportionable to the Value of the Thing distrained; and was anciently call'd either *Vif* or *Mort*, as it was made of quick or dead *Charrel*.

*Unlawful Naam*, is so either by the *Common Law*, as when a *Man* takes another's *Beasts* doing damage in his *Ground*; or by a *Man's* particular *Fact*, as by reason of some *Contract*, &c. And hence *Namaton*, the *Act* of *distraining*, or taking a *Distrain*. See **DISTRRESS**.

In *Scotland*, the Word is particularly used for *Impounding*.

**NAME**, a Word, whereby Men have agreed to express some Idea; or which serves to design, or express a Thing, or Subject spoken of. See **WORD**.

This the *Grammarians* usually call a *Noun*, tho' their *Noun* is not of quite so much Extent as our *Name*. See **NOUN**.

*Seneca*, *Lib. II. de Beneficiis*, observes that there are a great Number of Things which have no *Name*; and which, therefore, we are forced to call by other borrowed *Names*. *Ingenis est*, says he, *Resum Copia sine Nominis quas cum propriis Appellativis signare non possunt, alienis Accommodatis utuntur*: Which shews why in the *Course* of this Dictionary, we frequently give very different *Senses* to the same *Word*.

It was *Adam* that first gave Things their *Names*, *Gen. ii. 19. Formavit, spiritus, Dominus Deus, de humo caestibus Animantibus Terrae, & Universis Volatilibus Caeli, & omnibus Bestiis Terrae, adducit ea ad Adam, ut videret quid diceret Ea, omne enim quod vocavit Adam Animae Praesentis ipsam est Nomen ejus. Ver. 20. Appellavitque Adam Nominibus suis caestibus Animantia, & omnia Volatilia Caeli, & omnes Fessiat Terrae.*

*Names* are distinguished into *Proper* and *Appellative*.

*Proper Names*, are those which represent some individual Thing, or Person, so as to distinguish it from all other Things of the same Species: as *Socrates*, which represents a certain *Philosopher*.

*Appellative*, or *General Names*, are those which signify common Ideas; or which are common to several Individuals of the same Species, as *Horse*, *Animal*, *Man*, *Oak*, &c.

*Proper Names* are either call'd *Christian*, as being given at *Baptism*, or *Sirnames*: the first, imposed for distinction of Persons; answering to the *Roman Praenomen*. See **PRÆNOMEN**.

The second for the *Distinction* of Families, answering to the *Names* of the *Romans*, and the *Patronimicus* of the *Greeks*. See **SURNAMES**.

Originally every Person had but one *Name*; as among the *Jews*, *Adam*, &c. among the *Egyptians*, *Joseph*; among the *Chaldees*, *Nimrod*; the *Medes*, *Astages*; the *Greeks*, *Diomedes*; the *Romans*, *Romulus*; the *Gauls*, *Divitiacus*; the  *Germans*, *Arminius*; the *Britains*, *Cassibelan*; the *English*, *Henrich*, &c. And thus of other Nations, except the *Savages* of *Mount Atlas*, whom *Pliny* and *Marcellinus* represent as *Animi, nameless*.

The *Jews* gave the *Name* at the *Circumcision*, viz. eight Days after the *Birth*: The *Romans* to Females the same Day, to Males the ninth; at which time they held a Feast, call'd *Nemusalia*.

Since *Christianity* has obtained, most Nations have followed the *Jews*, *Baptizing*, and giving the *Name* the eighth Day after the *Birth*; except our *English* Ancestors, who,

till of late, *baptized*, and gave the *Name* on the *Birth-Day*.

The first *Imposition* of *Names* was founded on different Views, among different People; the most common was to mark the good Wishes of the Parents, or to irritate the Children to the good Fortune a happy *Name* form'd to promise: Hence *Vulcor*, *Castor*, *Faustus*, *Statorius*, *Probus*, &c.

Accordingly we find such *Names*, by *Cicero* call'd *Bona Nomina*, and by *Tacitus*, *Fausita Nomina*, were still first enrolled, and ranged in the *Roman Musters*; first called to serve at the first Sacrifices in the *Foundation* of *Colonies*, &c. And, on the contrary, *Livy* calls *Arvius Umbro*, *Alommandi omnis Nomen*: as *Plautus*, on occasion of a Person named *Lycos*, i. e. *Greedy Wolf*, says;

*Vosmet nunc facite conjecturam ceterum  
Quid id sit hominis, cui Lycos nomen fiet.*

Hence, *Plato* recommends it to Men to be careful in giving happy *Names*; and the *Pythagoreans* taught expressly, that the *Minds*, *Actions*, and *Successes* of Men were according to their *Name*, *Genius*, and *Fate*. Thus, *Pavoniam*, ex hoc Nominis vitio lona Praesumptio; and the common Proverb, *Bona Nomen bonum Omen*: And hence the *Foundation* of the *Onomantia*. See **ONOMANTIA**.

Hence *Caesars* takes it for granted, that the *Names*, in all Nations and Languages, are significant, and not simple Sounds, for mere distinction sake. This holds not only among the *Jews*, *Greeks*, *Latins*, &c. but even the *Turks*; among whom, *Adalid* signifies *God's Servant*; *Soliman*, *Peaceable*; *Mahomet*, *Glorified*, &c. And the *Savages* of *Hispaniola*, and throughout *America*, who, in their Languages, name their Children *Glistening Light*, *Sun-Bright*, *Fine Gold*, &c. And they of *Congo* by the *Names* of *Precious Stones*, *Flowers*, &c.

To suppose *Names* given without any Meaning, however, by the *Alteration* of Languages, their Signification may be lost, that learned Author thinks, is to reproach our Ancestors; and that contrary to the sense of all ancient Writers. Thus *Porphyry* notes, that the *Barbarous Names*, as he calls them, were very emphatical, and very concise: And accordingly, it was esteemed a Duty to be *φειδύνας*, or *φειδύνομαι* *Homines*: as *Severus*, *Protenus*, and *Aurelianus*, are called *φειδύνομαι* *Imperatores*.

And it was the usual way of giving *Names*, to wish the Children might discharge their *Names*: Thus when *Gastrius*, King of France, named *Clotarius* at the Font, he said, *Crescat Puer, & hujus sit Nominis Executor*.

The ancient *Britains*, the same Author adds, generally took their *Names* from Colours, because they painted themselves; which are now lost, or remain hid among the *Welsh*: When they were subdued by the *Romans*, they took *Roman Names*; some of which still remain, corrupted; tho' the greatest part are become extinct, upon the Admission of the *English-Saxons*, who introduced the *German Names*, as *Gudus*, *Pendus*, *Oswald*, *Edward*, &c. The *Danes*, too, brought with them their *Names*; as *Swayne*, *Harrold*, *Knute*, &c. And the *Normans*, at the Conquest, brought in other *German Names*, as originally using the *German Tongue*; such as *Robert*, *William*, *Richard*, *Henry*, *Herk*, &c. after the same manner as the *Greek Names*, *Apollus*, *Boetius*, *Symonachus*, &c. were introduced into *Italy*, upon the Division of the *Empire*. After the Conquest, our Nation, which had ever been averse to foreign *Names*, as deeming them unlucky, began to take *Hebrew Names*; as *Martineau*, *David*, *Sampson*, &c.

The various *Names* antiently, or at present obtaining among us, from what Language or People soever borrowed, are explained by *Caesars* in his *Romans*.

As to the Period when *Names* began to be multiplied, and *Sirnames* introduced, &c. See **SURNAMES**.

Of late Years, it has obtained among us, to give *Sirnames* for *Christian Names*; which some dislike, on account of the Confusion it may introduce. *Caesars* relates it as an Opinion, that the Practice first began in the Time of *Edward VI.* by such as would be Godfathers, when they were more than half Fathers. Upon which, some were persuaded to change their *Names* at *Confirmations*; which it seems, is usual in other Countries. Thus, two Sons of *Henry II. of France*, christen'd *Alexander* and *Hercules*, changed them at *Confirmation* into *Henry* and *Francis*.

In *Monasteries*, the Religious assume such *Names* at their *Admittance*; to shew they are about to lead a new Life, and have renounced the World, their Family, and even their *Name*: v. g. *Sister Mary* of the *Incarnation*, *Brother Henry* of the *Holy Sacrament*, &c.

The *Popes* also change their *Name* at their *Exaltation* to the *Pontificate*; as a Custom first introduced by *Pope Sergius*, whose *Name*, till then, as *Platin* informs us, was *Swines-head*. But *Baronius* refers it to *Pope Sergius I.* and *Onuphrius* to *John XII.* or *XIII.* who, at the same time, adds a different reason for it from that of *Platin*, viz. that

'twas done in Imitation of St. Peter and St. Paul, who were first called Simon and Saul. Indeed Pope Marcellus, of late, refused to change his Name.

In Italy, 'tis frequent to join the Name of some Saint, in a kind of Devotion, to the Christian Name; as *Joannes Baptistina Spinola*, &c.

Among the Antients, those deified by the Heathen Consecrations, had new Names given them; as *Romulus* was called *Quirinus*; *Melchioris*, *Portunus*, &c. See CONSECRATION.

New Names were also given in Adoptions, and sometimes by Testament; thus *L. Aemilius*, adopted by *Scipio*, took the Name of *Scipio Africanus*; and thus *Augustus*, who was first called *Theron*, took the Name *Obavian* by Testament. See ADOPTION.

Names were also changed at Emancipations into new Cities. Thus *Lucanus*, at his first being made free of Rome, took the Name, *Lucius Tarquinus Priscus*, &c. and Slaves, when made free, usually assumed their Masters Names. See FREEDOM, SLAVE, &c.

Those called to the Equestrian Order, if they had false Names, were always new named, *Novimus Insignemur veterans; Romanorum*. And among the Primitive Christians, it was the Practice to change the Names of the Catechumens: thus the Renegado *Lucianus*, till his Baptism, was called *Lucius*.

Of the NAME, a Phrase, or Dictum frequent among Historians and Genealogists, to denote Persons of the same Quality, and Name, 'Tis near nine hundred Years since the Emperors of the West first began to distinguish themselves in this manner by their Number; and in the *Italia Sacra* of *Ughellar*, we meet with a Charter of the Emperor *Louis le Delbonnaire*, Anno 818. wherein he styles himself the First of the Name. *Le Blanc* mentions a Charter of the Year 1084. wherein the Emperor *Henry III.* styles himself King of Italy, the Fourth of the Name; and Emperor, the Third of the Name.

Some French Writers observe, that in a Manuscript preserved in the King's Library, their *Louis XI.* is only stiled the Ninth of the Name; *Louis le Delbonnaire*, and *Louis the Summeryer*, not being then reckon'd in the Number, by reason they were Emperors, as well as Kings of France: On which Footing, the present King, instead of the Fifteenth, should only be the Thirteenth of the Name.

**NAMIUM** *Vesitium*, in our Law-Books, an unjust taking of the Cattle of another, and driving them to an unlawful Place, pretending Damages done by them. In such Case, the Owner of the Cattle may demand Satisfaction for the Injury, which is call'd *Placitum de Namiis Vesito*.

**NAPE**, is used for the hind-part of the Neck; by reason of the soft short Hair growing thereon, like the Nap of a Cloth. See NECK.

**NAPHTA**, or **NAPHTHA**, a kind of liquid Sulphur or Bitumen, very soft, and inflammable, exuding out of the Earth in several Places in *Chaldea*; particularly the Place where flood the ancient *Babylon* is and still found in several Provinces of Italy and France, particularly in *Avoygne*, and near *Ravenna*. See SULPHUR and BITUMEN.

That of France is soft and black, like liquid Pitch, and of a fetid Smell; that of Italy is a kind of *Petrol*, or a clear Oil, of various Colours, oozing out of a Rock, situate on a Mountain in the Dauchy of *Macedonia*. See PETROL.

*Naptha* is esteemed penetrating, resolutive, and vulnerary; but its Vertues are little known in Medicine: its chief Use is in Lamps, &c. on account of its Inflammability.

The Turks call the *Naptha*, *Carab Salsis*, black Mastic, to distinguish it from Pitch. *Fogius* has an express Treatise on *Naptha*, *Antient and Modern*: He says, 'tis a Flower of Bitumen, of more force than any other Bitumen.

The Word, in the original *Chaldee*, signifies *Stillave*, to ooze, or drop; *Naptha*, according to *Pliny*, running like a kind of Bitumen.

**NAPIERS**, or **NEPERS Bones**. See NEPERS BONES.

**NARCOTICS**, in Medicine, Opiates, or Medicines, that excite Drowsiness and Sleep. See OPIATES.

*Narcotics* act, by calming and diminishing the Motion of the Blood and Spirits.

Authors are of various Opinions, as to the Manner wherein *Narcotics* operate. The Antients tell us, 'tis by their being cold in nature. *Erasmuller*, after *Willis*, takes the Animal Spirits to be composed of a fluid volatile Salt; and thinks they are dissolved by the Mixtures of Sulphurs and Oils, wherewith *Narcotics* abound. *M. Andry's* Opinion is, that the Salt of *Narcotics*, dissolves in any Liqueur whatever, and that their ramous Branches becoming thus disengaged from the Salts, are embarrassed among one another, and thus stop the Course of the Blood and Spirits. Lastly, others think, that *Narcotics* close the Orifices of the Nerves and thus block up the Passage of the Spirits.

*Lower*, in his Treatise of *Veneris*, thinks, that the Operation of *Narcotics* is not the same in all; Drowsiness being

being producible from a great Variety of different Causes. See SLEEP.

The Word comes from the *Greek* *νεμεωδης*, of *νεμεωδης*, *Drowsiness*.

**NARRATION**, in Oratory and History, a Recital, or Rehearsal of a Fact as it happen'd, or as it is supposed to have happen'd.

This is of two kinds, either *Simple* and *Historical*; as where the Auditor or Reader is supposed to hear or read of a Transaction at second hand; or *Artificial* and *Fabulous*, as where their Imaginations are raised, and the Action, as it were, re-acted before them.

The *Narration*, according to the Writers of Rhetoric, makes the second part of a just Speech, or Harangue; viz. that immediately following the *Exordium*. See ORATION. It makes the whole of a History; abating for the occasional Reflections, Epifodes, and Digressions. See HISTORY.

*Orce* requires four Vertues in a *Narration*, viz. Perspicuity, Probability, Brevity, and Sweetness.

The *Narration* is rendered *perfectum*, by observing the Order of Time, by using none but proper and known Terms, and by reciting the Action uninterceptedly.

It is rendered *probabile*, by the Credibility of the Narrator; by the Simplicity and Openness of the *Narration*, by avoiding nothing far remote from the common Sense and Opinion of Mankind, and by a precise Detail of Circumstances.

It is rendered *brief*, by taking it up no higher than is just necessary; nor fetching it back, as that impertinent Author in *Horne*, *Qui Gemine Bellum Trojanum ordatur ab ovo*: And by avoiding trivial Circumstances.

Lastly, it is rendered *fecer*, by using smooth, numerous, and well-sounding Words; by arranging them, so as to avoid any Harshness, or Clashing. By the Greatness, Novelty, and Unexpectedness of the Things related; and by enriching it with Tropes and Figures; as frequent Admirations, Exclamations, Interrogations, Expectations, Suspences, surprising Events; by Grief, Joy, Fear, &c. See TRAGEDY.

**NARRATION**, in Poetry, is used particularly for the Action, or Event, that makes the Subject of an Epic Poem. See ACTION.

*P. Bayle* observes, that the Actions in Poetry are equally susceptible of the two kinds of Oratorical *Narration*; and that each constitutes a particular Species of Poetry.

Those under the Artificial, or Active Form, are now call'd *Dramatic*. See DRAMA.

And those only related by the Poet, who here performs an Historian, are call'd *Epic*. See EPIC.

In the Drama, the *Narration* is the whole of the Piece; in the *Epic*, 'tis only a Part, tho' in effect it is the principal Part, and the Body of the Poem. 'Tis preceded by the *Proposition* and *Invocation*, which *Poëta* calls the *Prooemium*; and is frequently interrupted by the Poet's speaking in Person, demanding Pardon, Favour, &c. See INVOCATION, &c.

The *Narration* includes the whole Action, Epifodid, with all its Circumstances and its Ornaments. See EPISODE.

'Tis in this Part that the Action is to be begun, carried on, and ended. 'Tis this, is to shew the Causes of all that is related: in this the Difficulties are to be proposed and resolved, and the Persons, both human and divine, are here to shew their Interests, their Manners, and their Qualities, by their Actions and their Discourse: and all this is to be described with the Beauty, the Majesty, and Force of Verse, Style, Sentiments, Comparison, and other Ornaments proper to the Subject in general, and to each thing in particular.

The Qualities of the Epic *Narration* are, that it be agreeable, probable, moving, surprising, and active.

*Horatius* speaks of the *Utile* and *Dulce* as on the same Footing. *Poëta* looks on the *Utile* as an essential Property; and the *Dulce* as no more than an additional Quality.

**NASAL**, something belonging to the Nose, *Nasus*. As the Nose-piece of a Helmet, &c.

**NASAL**, in Grammar, &c. a Term applied to those Sounds, or Letters, in whose Formation, the Nose is the principal Organ; and particularly where the Sound form'd is pass'd thro' the Nose. See LETTER.

In most English Words, the Sounds expressed by the Characters *an, en, in, on, un*, are simple Sounds; and proper *Nasal* Vowels.

**NASALIA**, in Medicine, a sort of Remedies to be taken by the Nose; call'd also *Errhines*. See ERRHINES.

**NASI** Or, in Anatomy, a thin Bone, making the upper Part of the Nose. See NOSE.

**NATALIS**, **NATALIS Dies**, or **NATALITIUM**, properly signify a Man's Birth-Day.

The Word was first used among the Heathens, to signify the Feast held on the Anniversary of the Birth of an Emperor; whence it came, in time, to signify any sort of Feast.

And accordingly, in the *Fable*, we meet with *Natalis Solis*, Natalis

*Natalis Invisi*, &c. The Primitive Christians, finding it thus established, used it in the same manner; and hence we meet in the ancient Martyrologists with *Natalis Calixti*, for the Feast of the Supper, or Maundy-Thurs'day. *Natalis Cælestis*, for the Pontificate of St. Peter: *The Natalis*, or *Natalitium* of such a Church, for the Feast of the Dedication.

The Word *Genethlion* is used by the Greeks in the same sense as *Natalis*, or *Natalitium*, among the Latins.

The *Ludi Natalitii*, Natal Games, were Games introduced on the Anniversaries of the Birth-Days of their great Men.

The Natal Ring, *Anulus Natalitius*, was a Ring only worn on the Birth-Day.

NATES, in Anatomy, a Term expressing those two fleshy Parts of the Body, popularly called the *Hips*, or *Eustocks*.

NATES *Cerebri*, are two Circular Prouberances of the Brain, situate on the back-side of the *Medula Oblongata*, near the *Cerebellum*. See BRAIN.

NATION, a Collective Term, used for a considerable People, inhabiting a certain Extent of Ground, enclosed within certain Limits, and under the same Government.

Each Nation has its particular Character: "It proverbially said, Light as a *Frenobian*, Wagghish and Silly as an *Italian*, Grave as a *Spaniard*, Wicked and Unlucky as a *German*, Fierce as a *Scotchman*, Drunken as a *German*, Idle as an *Irishman*, Deceitful as a *Greek*, &c.

NATION is also used in some Universities, for a certain Distinction of the Scholars, or Professors of Colleges: Thus the Faculty of *Paris* consists of four Nations; viz. that of *France*, that of *Normandy*, that of *Picardy*, and that of *Germany*; which are again, excepting that of *Normandy*, distinguished into Tribes; each Tribe has its Deacon.

The *German Nation* comprehends all foreign Nations, *English*, *Italian*, &c. When the Procurator of the *French Nation* speaks in publick, his Style is, *Honoranda Gallorum Natio*. He of *Ficardy* says, *Fidelissima Picardorum Natio*. He of *Normandy*, *Veneranda Normannorum Natio*. He of the *Nation of Germany*, *Constantissima Germanorum Natio*.

NATIONAL *Synod*. See SYNOD.

NATIVE, is applied to a Person consider'd as born in a certain Place; or deriving his Origin therefrom.

The more accurate Writers distinguish between a *Native* of a Place, and being born therein. *Born* signifies no more than the having been there produced, or brought into the World, whether that were the proper Country, or Habitation of the Parents, or whether they were there only by accident, as *Strangers*, &c. Whereas *Native* refers to the proper Mansion, or Residence of the Parents and the Family; and where the Person has his Education. And hence a Person may be a *Native* of one Place, and born at another. Thus *Jesus Christ* is call'd a *Nazarene*, and *Gallilean*, as a *Native*; tho' he were born at *Bethlehem in Judæa*.

NATIVE, NATIVUS, in our ancient Law-Books, signified a Person who was born a Slave; by which he differ'd from one who had sold himself, or became a Slave by his own Deed.—*Servi enim alios Bondos dicimus alios Nativos, alios Villanos. Bondi sunt qui passivis Vinculis se adstrinxerunt. De Nativis, infra. Villani sunt qui Glebe ascripti Villon colunt Dominicam, nec exire licet sine Domini Licentia.* Spelm.

NATIVE Tenentes, in our old Law-Books, are Tenants who hold Native Land; i. e. Land subject to the Services of *Natives*. Spelman.

NATIVE de Supte, were Villains or Bond-men by Birth or Family.—There were also *Nativi Conventianarii*, who were Villains by Contract or Covenant. *Servi enim alii natura, alii facti, alii emptive, alii redemptive, alii sua vobis alienis dantur.* LL. Hen. I. cap. 76. In *Common* it was a Custom, that if a Freeman married *Natives*, and brought her ad *Libertum Tenementum* & *Libertum Thorum*, and had two Daughters, one of them was free, and the other a Villain. *Bracton Lib. 4.*

NATIVITY, *Natal-Day*, or the Day of one's Birth. The Term is chiefly used in speaking of Saints, &c. The *Nativity* of St. *John Baptist*, &c. When we say absolutely the *Nativity*, it is understood of that of *Jesus Christ*, or the Feast of *Christmas*. See FEAST.

'Tis commonly held, that *Pope Telesphorus* was the first who decreed the Feast of the *Nativity* to be held on the 25th of *December*. *John*, Archbishop of *Nice*, in an Epistle upon the *Nativity* of *Jesus Christ*, relates, that at the instance of St. *Cyril* of *Jerusalem*, *Pope Julius* procured a strict Inquiry to be made into the Day of our Saviour's *Nativity*; which being found to be on the 25th of *December*, they began thenceforth to celebrate the Feast on that Day. See CHRISTMAS.

In ancient Law-Books, *Nativity*, *Nativitas*, signifies *Bondage*, or *Servitude*.

NATIVITY, in Astrology, the same with *Horoscope*. See HOROSCOPE.

Causing the *Nativity*, or by Calculation seeing to know how long the *Queen* should live, &c. was made *Felony*. An. 23 *Edw. 6. 2.*

NATRON, or ANATRON, in Natural History, a kind of black, greyish Salt, taken out of a Lake of stagnant Water, in the Territory of *Terrana in Egypt*. See SALT.

'Tis much of the nature of *Nitre*, whence it is called *Egyptian Nitre*, and is even supposed to be the proper *Nitre* of the Antients. See NITRE.

'Tis a popular Error, that all Bones or Stones thrown into this Lake, are by degrees converted into *Natron*. It makes a great Ebullition, when mixed with Acids; whence it is ranked as of the Alkali Kind.

'Tis used in the *Whitening* of *Linens*; but burns them, if not corrected by a Mixture of *Ashes*. See WHITENING.

The *Natron* of *Egypt*, as described by *Pliny*, *Martialis*, and *Agrippa*, is an Alkali Salt perforated in manner of a *Sponge*, and of a *Lixivial Taste*.

Its Principles, Dr. *Leigh* takes to be chiefly two; viz. a *Sea-Salt*, and an *Urinous Salt*. The first, he takes it for granted, it receives from the Earth; the second, from the Air.

Dr. *Houington*, who was on the spot, says the *Natron* is thought to rise from the bottom of the Lake; where, by the Heat of the Sun, it is condensed, and hardened into the Form we see it in; But his Opinion is, that 'tis rather separated by the Sun from the Water.

M. de la *Chambre* adds, that three or four Days before the Nile begins to overflow, there falls a certain Dew, of a fermentative Virtue, inasmuch as to leave a *Pail* exposed to it, and that at the same time the *Natron* rises.

*Hippocrates*, *Galen*, *Martialis*, *Dioscorides*, &c. mention it as of use in *Physic*; and M. de *Cles* is even of opinion, that all the *Mineral Waters* of *France* are impregnated with this kind of *Nitre*; and that 'tis hence they derive their *Medicinal Virtues*.

It is of singular Efficacy in fertilizing of Ground; which Dr. *Leigh* accounts for, by supposing its volatile Particles heated by some subterraneous Fire, or by the Warmth of the Sun; and thus readily made to ascend up the minute Tubes of Plants, and carry with them the Juices of the Earth.

*Pliny* derives the Invention of *Glass* from some of this *Natron* accidentally melted down into the Sand, where it run into Streams of *Glass*. See GLASS.

This *Nitre* is distinguished from *Salt Petre*, by its fermenting with Acids, which *Salt Petre* will not do; by its volatile Spirit, its lixivial Smell, by the clammy insipid Substance it yields, &c. It agrees with *Salt Petre*, in that, by dropping Spirit of Sulphur upon it, it shoots into pyramidal Crystals. Dr. *Leigh* thinks it comes nearer a *Sal Armoniac* than *Salt Petre*. See SALT PETRE.

Dr. *Lifter* conjectures, that most of the *Salt Water* of the Lakes of *Egypt*, having pass'd thro' the Bodies of those vast Animals wherewith they are stocked, as *Crocodiles*, *Hippopotami*, &c. must of consequence be reared *Urinous*, or *Salino-Urinous*; which is a Composition of *Sal Armoniac*. See SAL ARMONIAC.

NATTA, or NATA, or NASSA, or NAPPA, in Medicine, a Tumor arising in several Parts of the Body.

*Blasior* defines it, a large, soft, reddish, painful Tumor, arising usually on the Back, sometimes on the Shoulders; its Root is very small, yet it grows so prodigiously, that it sometimes equals a *Melon*, or *Gourd*.

*Nate*, or, as some call them, *Nates*, oftentimes appear on the Neck, much after the manner of *Tulpe*. See TULPE.

They are of the *Oedematous Kind*, and are to be extirpated by *Incision*, and their Return prevented by red precipitate, *Vitriol*, or burnt *Allom* strew'd on the Place.

*Barboline* mentions a *Lady*, who cur'd herself of a *Nata*, by biting it off.

NATURAL, something concerning *Nature*, belonging to *Nature*, arising from a Principle of *Nature*, or conformable to the ordinary Course and Order of *Nature*. See NATURE.

When a Stone falls downwards, we vulgarly say it does it by a *Natural Motion*; but if it be thrown upwards, its Motion is said to be violent. So *Water* suspended in a sucking Pump, is said to be out of its *Natural Place*: Cures wrought by Medicines, are *Natural Operations*; but the miraculous ones wrought by *Christ*, *Supernatural*. See SUPERNATURAL, &c.

NATURAL Children, are those born out of lawful Wedlock. See BASTARD.

NATURAL Horizon, is the sensible or physical Horizon. See HORIZON.

NATURAL LAW. See LAW OF NATURE.  
NATURAL DAY, } See } DAY.  
NATURAL YEAR, } See } YEAR.

Hair

**NATURAL Faculty**, is that Power, arising from the Blood's Circulation, which is conspicuous in all the Secretions performed within the Body; that Secretion alone excepted, which is made at the Origin of the Nerves: See FACULTY.

**NATURAL Functions**, in the Animal Oeconomy, are those Actions whereby things taken into the Body, are changed, and assimilated, so as to become Parts of our Body. See FUNCTION.

These are the Actions of the *Viscera*, the Vessels that receive, retain, move, change, mix, fecerco, apply, excrete, and spend the Humours of the Body. See DIESTION, NUTRITION, &c.

**NATURAL Inclinations**, are those Tendencies, or Motions of the Mind, towards things seemingly good, which are common, in a greater or less degree, to all Mankind.

**Natural Inclination**, according to F. Mallebranche, is the same thing with regard to Minds, that Motion is with regard to Bodies; and as all the Varieties in the Material World arise from the several Motions of Bodies, so do all those of the Intellectual World from Inclinations; and as all Motions are the Results of Impressions immediately communicated by the Finger of the Creator; so all Inclinations are certainly nothing else but continual Impressions of the Will of the Creator, on that of the Creature; and must therefore of necessity be agreeable to his; and therefore can naturally have no principal End, but his Glory; nor any secondary one, but their own Preservation, and that of others; both still with regard to his Will who gave them Being.

Now, as, properly speaking, there is but one Love in God, viz. that of himself; so he only impresses one Love or Desire in us, which is that of Good in the general. 'Tis this general Love, or Desire, is the Principle of all our particular ones; as, in effect, 'tis the Will itself: The Will being defined to be a continual Impression of the Author of Nature, which carries the Mind of Man to Good in general. See WILL.

But the Impression towards Good in the general, doth not only proceed from God, but also all our Inclinations to particular Goods; as, v. g. Self-preservation, &c. See PASSION.

**NATURAL History**, a Description of any of the Natural Products of the Earth, Water, or Air; v. g. Beasts, Birds, Fishes, Metals, Minerals, and Fossils; together with such extraordinary Phenomena, as at any time appear in the external World; such as Meteors, and Monsters, &c. See HISTORY.

Beside *General Natural History*, as those of *Pliny*, &c. there are *Particular ones*; and that of two kinds: The first, those which only consider one kind of Things, such as the *History of Shells*, of *Dr. Lister's of Fishes*, of *Willoughby's*; that of *Birds*, of the same; that of *Plants*, of *Rays*, or *Rosinets*; those of *Insects*, of *Swammerdam*, and *Mouffet*; that of *Animals*, of *Gejner's*; that of *Fossils*, of *Lockwood*, &c.

The second, those which consider the several kinds of natural Things found in particular Countries, or Provinces; as the *Natural History of Dauphine*, by *Chorier*; that of the *Natural History of the Antilles*, by F. *Terre*, and M. *Lemaitre*; those of *Oxfordshire* and *Staffordshire*, by *Dr. Plot*; that of *Lancashire*, by *Leigh*; of *Northamptonshire*, by *Morton*; and that of the same County, expected from *Mt. Bridges*; that of the *Western Islands*, by *Martin*, &c.

**NATURAL Philosophy**, that Science which considers the Powers of Nature, the Properties of Natural Bodies, and their mutual Action on one another; otherwise call'd *Physic*. See PHYSICS.

**NATURAL Magic** is that which only makes use of natural Causes. See MAGIC.

**NATURAL Cause**, see CAUSE.

**NATURAL**, in Heraldry, is used where Animals, Fruits, Flowers, &c. are blazon'd with the Colours they naturally have, tho' different from the common Colours of Heraldry; and this is to prevent the Armories being accus'd of Falsity, when blazon'd with the Names of Colours unknown in Heraldry.

**NATURAL**, in Music, is used variously. Sometimes, it is taken for *Diatonic*; and sometimes for *Physical*, in which latter Sense, *Natural Music* is that performed by Natural Organs, i. e. Vocal Music, in contradistinction to Artificial, or Instrumental.

**NATURAL Harmony** is that produced by the *Natural*, and Essential Chords of the Mode. See HARMONY.

**NATURAL Note** is used in opposition to *Flat* and *Sharp Notes*, which are call'd Artificial Notes. See NOTE, SCALE, &c.

**NATURAL** is also used for something coming immediately out of the hands of Nature, in opposition to *Enthusiasm*, or *Artificial*, which signifies something wrought by Art.

*Bishop Wilkins* observes, that there appears a world of difference between *Natural* and *Artificial* Things when view'd with Microscopes; the first ever shews adorn'd with

all imaginable Elegance and Beauty; the latter, tho' the most curious in the World, infinitely rude and unshewn. The finest Needle appears a rough Bar of Iron; and the most accurate Engraving or Embossment, as if done with a Mattock or Trowel.

**NATURALIST**, a Person who has studied *Nature*, and is well versed in *Natural Bodies*, especially in what relates to Metals, Minerals, Stones, Vegetables, and Animals.

*Aristotle*, *Aelian*, *Pliny*, *Solinus*, and *Theophrastus* were the greatest *Naturalists* among the Antients; but they fell into abundance of Errors, which have been corrected by the happy Industry of the Moderns. *Abravantes* is the most Copious and Complete of the modern *Naturalists*; his Work is in seventeen Volumes in *Islo*.

**NATURALIZATION**, in Law, the Act of Naturalizing any one, or of putting any Foreigner into the Condition of a natural-born Subject, and entitling him to the Rights and Privileges thereof. See DENIZEN.

In *France*, *Naturalization* is the King's Prerogative; in *England* 'tis only done by Act of Parliament. In *France*, *Swiss*, *Savoyards*, and *Scotts*, need not any *Naturalization*, being reputed *Requiescens*, or *Natives*.

**NATURALIS**, *Res Naturales*, in Medicine: In every Animal, howsoever sick and diseas'd, there is still remaining some degree of Life, and Strength; and the Causes and Effects of each: These are call'd *Naturalis*, *Natural things*, things according to Nature; and sometimes barely *Nature*; in contradistinction to *Non-Naturalis*, which see.

**NATURE**, *Natura*, *quæ*, is a Term very variously used. *Aristotle* has a whole Chapter wrote expressly to enumerate the various Acceptations of the Greek Word *quæ*, render'd in *English*, *Nature*; and among *Latin Writers*, the different Acceptations are so many, that a certain Author reckons up fourteen or fifteen. *Mr. Boyle*, in a precise Treatise of the vulgarly receiv'd Notion of *Nature*, gives us eight principal ones.

**NATURE**, then, is used for the System of the World; the Machine of the Universe, or the Assemblage of all created Beings.

In this Sense we say, the *Author of Nature*; the Sun is call'd the *Eye of Nature*, because he illuminates the Universe, and the *Father of Nature*, because he warms the Earth, and makes it fruitful. And thus we say of the *Phoenix*, or a *Chimæra*, that there is no such thing in *Nature*.

Instead of the word *Nature* in this Sense, *Mr. Boyle* to avoid Ambiguity, and Abuse of the Word, proposes to have *World*, or *Universe* substituted. See WORLD.

**NATURE**, in a more confined Sense, comprehends the several kinds of Beings, Created and Increased; Spiritual and Corporal. See ENS.

In this Sense, we say, *Human Nature*, meaning all Men together that possess the same Spiritual, Reasonable Soul. *Angelic Nature*; the *Divine Nature*, &c.

And in this Sense, the School Divines say, *Natura Naturans*, & *Natura Naturata*, speaking of God, who is the *Natura Naturans*, as giving Being and *Nature* to all others; in opposition to the Creatures; who are the *Natura Naturata*, as receiving their *Nature*.

**NATURE**, in a still more restrained Sense, is used for the Essence of a thing; or that which the Schoolmen call the *Quiddity* thereof, that is, the Attribute which makes it what it is.

In this Sense, the *Cartesians* say, 'tis the *Nature* of the Soul to think.

And here the word *Essence*, *Mr. Boyle* would have obtained, in lieu of *Nature*. See ESSENCE.

**NATURE** is particularly used for the establish'd Order, and Course of material Things, the Series of Second Causes, or the Laws which God has imposed on the Motions impressed by him. See CAUSE.

In this Sense it is we say, *Physics* is the Study of *Nature*. *Nature* makes the Night succeed the Day; *Nature* has made Respiration necessary to Life, &c.

Thus *S. Thomas* defines *Nature* a kind of divine Art, given to Beings, which carries them to the End they are determin'd for: In effect, *Nature*, in this Sense, is nothing else but that Concatenation of Causes and Effects, or that Order and Oeconomy which God has established in the Parts of his Creation.

In this Sense too we say, that Miracles are Effects above the Powers of *Nature*: So Art forces or surpasses *Nature*, by means of Machines, and moving Powers, by reason they produce Effects which exceed what we find in the common Course of Things. See MIRACLE, &c.

**NATURE**, again, is taken for an Aggregate of Powers belonging to any Body, especially a living one.

In this Sense Physicians say, that *Nature* is strong, weak, or spent; or, that in such a Disease, *Nature* left to herself, will perform the Cure.

**NATURE**, still more strictly, is used for the Action of Providence, the Principle of all things; or, that spiritual Being which is diffus'd throughout the Creation, and

moves and acts in all Bodies, and gives them certain Properties, and procures certain Effects. See PROVIDENCE.

In this, which Mr. Boyle considers as the most usual Sense, Nature is nothing else but God, acting himself, and according to certain Laws he himself has fix'd. See GOD.

This seems pretty agreeable to the Opinion of many of the Antients, who made Nature the God of the Universe, the *Totus*, who presides over, and governs all; who others own'd this an imaginary Being, and by Nature meant no more than the Qualities, or Vertues which God has given his Creatures, and which their Poets and Orators took occasion of personifying.

F. Mellebranche says, the Nature so much talk'd of in the Schools is fit for nothing but to lead us back to Idolatry; the antient Heathens hereby understanding something, which, without being God, acts continually throughout the Universe. Thus the Idol Nature must be an actual Principle, which, with the concurrence of God, is the next and immediate Cause of all the Changes which befall Matter. Which seems to fall in with the Opinion of the *Anima Mundi*; as if Nature were a Substitute of God, or a collateral Cause with God, or a middle Being between God and created Things. See ANIMA MUNDI.

Aristotle defines Nature, *Principium & Causa motus & ejus in quo est prima per se & non per accident.* A Definition so obscure, that none of his Commentators, with all their Glosses, have been able to render it intelligible.

This Principle, which the Peripatetics call'd Nature, they supposed to act necessarily; and was therefore destitute of Knowledge or Liberty. See NECESSITY.

This also the Stoics conceived Nature as a certain Spirit or Virtue diffus'd throughout the Universe, which gave every thing its Motion, so that all must be dragg'd away by the invariable Order of a blind Nature, and an inevitable Necessity. See FATE.

In speaking of the Action of Nature, no more is to be understood, but that Bodies act on one another, in a manner agreeable to the general Laws of Motion which the Creator has established.

In this lies the Mystery of that great Word, which is only a compendious way of expressing the Action of all Bodies: But the Mechanism of Bodies, would, perhaps, better express what is here meant by Nature. See MECHANISM.

Some, Mr. Boyle observes, will have the Nature of a thing to be only the Law that it receives from the Creator, and according to which it acts on all Occasions. But this is an improper, and figurative Expression.

The same Author proposes a Notion of Nature as more fit than any yet given to pass for the principal one of Nature; with regard to which many Axioms and Expressions relating to that Word, may be conveniently understood. In order to this, he distinguishes between General and Particular Nature.

General Nature he defines the Aggregate of the Bodies that make up the World in its present State, consider'd as a Principle by virtue whereof they act and suffer according to the Laws of Motion prescribed by the Author of things.

Particular Nature of any Subordinate or Individual consists in the general Nature apply'd to a distinct Portion of the Universe. Or it is a Convention of the Mechanical Properties (as Magnitude, Figure, Order, Situation, and Local Motion) of Parts convenient and sufficient to constitute of, or entitle to, its particular Species or Denominations, the particular Body they make up; the Concourse of all these being consider'd as the Principle of Motion, Rest, &c.

Laws of NATURE, are Axioms, or general Laws, and Rules of Motion, and Rest observed by natural Bodies in their Actions on one another; and in all the Changes which befall them in their Natural State. See LAW.

The Laws of Nature, and of Motion, are, in effect, the same; Custom, indeed, has made some difference, and we find Authors call the particular Cases of Motion, Laws of Motion; which see under MOTION; the more General, or Catholick ones, and those from which, as from Axioms, the others are deduced, they call Laws of Nature.

Of these, Sir Isaac Newton has established three.

#### Laws of NATURE.

1. Every Body perseveres in the same State, either of Rest, or uniform rectilinear Motion; except so far as it is forced to change that State by some foreign Force.

Thus Projectiles perseverate in their Motions, except so far as they are retarded by the Resistance of the Air, and the Cause of Gravity; and thus a Top, whose Parts by their Cohesion, are continually drawing one another out of their rectilinear Motion, only ceases to run round because resisted by the Air, and the Friction of the Plane whereon it moves. And thus the larger Bodies of the Planets and Comets preserve their progressive and circular Motions a long time undiminished in Regions void of all

sensible Resistance. See *Vis Inertiae*, RESISTANCE, and MEDIUM.

2. The Change of Motion is ever proportional to the moving Force whereby it is effected, and in the Direction of the Right Line whereon that Force is impress'd.

If a certain Force produce a certain Motion; a double Force will produce double the Motion; a triple Force triple the Motion, whether it be impress'd all at once, or successively, and by degrees. And this Motion (since it is ever directed to the same Point with the generating Force) if the Body were in Motion before, is either to be added to it, as if the Motions conspire; or subtracted from it, as where contrary; or added obliquely, as where oblique; and is compounded with it, according to the Determinations of each.

3. Reaction is always contrary and equal to Action; or the Actions of two Bodies upon one another are always mutually equal, and directed contrary ways.

Whatever presses, or pulls another, is equally press'd or pull'd thereby. Thus, if I press a Stone with my Finger, the Finger is equally press'd by the Stone. If a Horse draw a Weight by a Rope, the Horse is equally drawn back towards the Weight; for the Rope being equally stretch'd each way, will with an equal Endeavour to relax itself, drive the Horse toward the Stone, and the Stone towards the Horse, and will hinder the Progress of the one, as much as it promotes that of the other.

Again, if any Body by striking on another, do in any manner change its Motion, it will, itself, by means of the other, undergo an equal Change in its own Motion, by reason of the Equality of the Pressure.

In these Actions the Changes are equal; not those, we mean, of the Velocities, but those of the Motions, the Bodies being supposed free of any other Impediments. For the Changes of Velocities, which are likewise made contrary ways, in as much as the Motions are equally changed, are reciprocally proportional to the Bodies. See REACTION.

This Law also obtains in Attractions. See ATTRACTION.

NATURE, in Profody: A Syllable is said to be long or short by Nature, to signify that it is so without any Rule of Grammar, to render it so by Position, or otherwise.

NAVAL, something relating to Ships, or Navigation. See SHIP and NAVIGATION.

In this sense we sometimes say, Naval Strength, a Naval Embark, &c.

NAVAL Crown, *Corona Navalis*, among the antient Romans, a Crown adorn'd with Figures of Prows of Ships, confer'd on Persons who in Sea-Engagements first boarded the Enemy's Vessel. See CROWN.

The *A. Gellius* seems to speak generally, where he says, the Naval Crown was adorn'd with Prows of Ships; *Lipsum* distinguishes two kinds of Naval Crown: The one he calls Simple, the other *Suprastrata*.

The first he supposes plain, and given to the common Soldiers, &c. The latter much more Glorious, adorn'd with Prows of Ships, and only given to Generals, or Admirals, who had gain'd some important Victory at Sea.

NAVE, in Architecture, *Navis Ecclesie*, the Body of a Church; or the Place where the People are dispos'd; reaching from the Rail or Balluster of the Choir to the chief Door. The Antient Greeks call'd it *Pronaos*. See CHURCH.

The Nave of a Church belongs to the Parishioners; 'tis they are to repair it, &c.

*Baldus* derives the Word from the Greek *naos*, Temple; which *Salmastius* brings from *navis*, a Ship; by reason the Vault or Roof of a Church bears resemblance to a Ship.

NAVEL, a Part in the middle of the Belly, by Anatomists call'd *Umbilicus*. See UMBILICUS.

NAVEL-String, by Anatomists is call'd *Funiculus Umbilicalis*. See FUNICULUS.

NAVICULARE Os, in Anatomy, the third Bone in the Foot, between the *Astragalus*, and the *Ossa Cuneiformia*, thus call'd from *Navis*, a Ship, to which it bears some Resemblance; for which reason likewise it is sometimes call'd *Cymbiforme*, from *Cymba*, a Boat, and *Scaphoides*, from a Greek Word of the like import. See FOOT.

It has behind it a large *Sinus*, which receives the fore convex Head of the first Bone, and before it, is convex; 'tis distinguished into three Heads, which are received into the *Sinus* of the *Ossa Cuneiformia*.

NAVIGATION, the Art, or Act of Sailing; or of conducting a Vessel from one Place to another, the safest and most commodious way.

This Art, in the full Latitude of the Word, comprehends three parts; viz. First, the Art of constructing and building Ships. (see SHIP.) Second, the loading of Ships. (see EMBARK.) And, Third, the Direction and Government of

of the Ship; which is in a peculiar Sense call'd *Navigation*, or *Sailing*. See *SAILING*.

In this restrained Sense of the Word, *Navigation* is either *Improper*, or *Proper*.

The first, usually call'd *Coasting*, is where the Ports are on the same, or a very neighbouring Coast; and where the Vessel is seldom out of sight of Land, or out of reach of Sounding. See *COASTING*.

In this, little else is required, but an Acquaintance with the Lands, the Compaſs, and Sounding-Line; each of which see in its Place, *COMPASS* and  *SOUNDING*.

The latter is where the Voyage is long, and cut in the main Ocean. In this, besides the Requisites in the former, are likewise required the use of *Mercator's Chart*, *Azimuth*, and *Amplitude Compasse*, *Log-Line*, and other Instruments for Celestial Observations, as *Quadrants*, *Forestaffs*, &c. See each Instrument, &c. in its Place.

*Navigation* turns principally on four things; two whereof being known, the rest are easily found from them by the *Tables*, *Scales*, and *Charts*.

These four things are, the Difference in Latitude, Difference in Longitude, the Reckoning or Distance, and the Course or Rumb of the Wind.

The *Latitudes* are easily found, and with sufficient Accuracy. See *LATITUDE*.

Nor is there any thing wanting to the Perfection of *Navigation*, but to determine the *Longitude*.

The Mathematicians of many Ages have applied themselves with the utmost Assiduity to supply this grand *Defideratum*, but hitherto in vain; notwithstanding the magnificent Rewards of several Princes and States to the Discoverer.

For the various Methods that now occasionally obtain at Sea, see *LONGITUDE*.

The *Course* and *Distance*, we have already observed, are had by the *Log-Line*, or dead Reckoning, and the *Compaſs*.

The Poets refer the invention of the Art of *Navigation* to *Neptune*, some to *Jacobus*, others to *Heracles*, others to *Jafon*, others to *Janso*, who is said to have made the first Ship.

See *SHIP*. Historians to the *Engineers*, the *Phoenicians*, *Tyrrians*, and the ancient Inhabitants of *Babylon*.

Some will have it, the first hint was taken from the flight of the Kite; others, as *Oppian de Piscibus*, Lib. I. from the Fish call'd *Nanctus*. Others ascribe it to Accident: But Scripture refers the Origin of so useful an Invention to God himself, who gave the first Specimen thereof in the Ark built by Noah under his Direction. For the Raillery the good Man underwent on account of his Enterprize, shews evidently enough, the World was then ignorant of any thing like *Navigation*, and that they even thought it impossible.

However, History represents the *Phoenicians*, especially those of their Capital *Tyre*, as the first *Navigators*; being urged to seek a foreign Commerce by the Narrowness and Poverty of the Slip of Ground they possess'd along the Coasts; by the Conveniency of two or three good Ports; and by their natural Genius to Traffic.

Accordingly, *Lebanon*, and the other neighbouring Mountains furnishing them with excellent Wood for Ship-building, in a short time they were Masters of a numerous Fleet, which constantly hazarding new *Navigationes*, and settling new Trades, they soon arriv'd at an incredible Pitch of Opulency and Populouſness: inſomuch as to be in a Condition to send out Colonies; the Principal of which was that of *Carthage*, which keeping up their *Phoenician Spirit* of Commerce, in time not only equal'd *Tyre* itself, but vastly surpass'd it; sending their Merchant-Fleets thro' *Heracles's Pillars*, now the Straights of *Gibraltar*, along the Western Coasts of *Africa* and *Europe*; and even, if we believe some Authors, to *America* itself, the Discovery whereof so many Ages afterwards, has been so glorious to the *Spaniards*. See *COMMERCE*.

*Tyre*, whose immense Riches and Power are represented in such lofty Terms both in sacred and profane Authors, being destroy'd by *Alexander the Great*; its *Navigation* and Commerce were transfer'd by the Conqueror to *Alexandria*, a new City, admirably situated for those purposes, propos'd for the Capital of the Empire of *Asia*, which *Alexander* then meditated: And thus arose the *Navigation* of the *Egyptians*, which was afterwards so cultivated by the *Ptolemys*, that *Tyre* and *Carthage* (which last, after having a long time disput'd Empire with the *Romans*, was at length subdu'd) were quite forgot.

*Egypt* being reduced into a *Roman Province* after the Battel of *Actium*, its Trade and *Navigation* fell into the hands of *Augustus*; in whose time *Alexandria* was only inferior to *Rome*, and the Magazines of the Capital of the World wholly supplied with Merchandises from the Capital of *Egypt*.

At length, *Alexandria* itself underwent the Fate of *Tyre* and *Carthage*; being surpris'd by the *Saracens*, who, in spite of the Emperor *Heraclius*, overſpread the Northern Coasts of *Africa*, &c. whence the Merchants being driven,

*Alexandria* has ever since been in a languishing State, tho' still it have a considerable Part of the Commerce of the Christian Merchants, trading to the *Levant*.

The Fall of *Rome*, and its Empire, drew along with it, not only that of Learning, and the polite Arts, but that of *Navigation*; the *Barbarians*, into whose hands it fell, contenting themselves with the Spoils of the Industry of their Predecessors.

But no sooner were the more Brave among those Nations well settled in their new Provinces, some in *Gaul*, as the *Franks*; others in *Spain*, as the *Goths*; and others in *Italy*, as the *Lombards*; but they began to learn the Advantages of *Navigation* and Commerce, and the Method of managing them, from the People they had subdu'd; and this with so much success, that in a little time some of them became able to give new Lessons, and set on foot new Institutions for its Advantage.

Thus it is to the *Lombards* we usually ascribe the Invention and Use of *Banks*, *Book-keeping*, *Exchange*, and *Rechange*, &c. See *BANK*, *EXCHANGE*, &c.

It does not appear which of the *European People*, after the Settlement of their new Masters, first took themselves to *Navigation* and Commerce; some think it began with the *French*, tho' the *Italians* seem to have the justest Title to it; and are accordingly ordinarily look'd on as the Restorers, hereof, as well as of the polite Arts, which had been banish'd together, from the time the Empire was torn asunder.

'Tis the People of *Italy* then, especially, and particularly those of *Venice* and *Genoa*, who have the Glory of this Restoration; and it is to their advantageous Situation for *Navigation*, they in great measure owe their Glory.

In the bottom of the *Adriatic* were a great number of marshy Islands, only separated by narrow Channels, but those well fenced, and almost inaccessible, the Residence of some Fishermen, who here supported themselves by a little Trade of Fish and Salt, which they found in some of these Islands. Thither, then, the *Venets*, a People inhabiting that part of *Italy* along the Coasts of the Gulph, retir'd, when *Alaric* King of the *Goths*, and afterwards *Attila* King of the *Huns*, ravag'd *Italy*.

These new Islanders, little meaning that this was to be their fixed Residence, did not think of composing any Body Politic; but each of the seventy two Islands of this little *Archipelago*, continued a long time under its several Masters, and each made a distinct Common-wealth: When their Commerce was become considerable enough to give Jealousy to their Neighbours, they began to think of uniting into a Body. And it was this Union, first begun in the sixth Century, but not completed till the Eighth, that laid the sure Foundation of the future Grandeur of the State of *Venice*.

From the time of this Union, their Fleets of Merchantmen went out to all the Parts of the *Mediterranean*, and at last to those of *Egypt*, particularly *Cairo*; a new City, built by the *Saracen* Princes on the Eastern Banks of the Nile; where they traded for their Spices, and other Products of the *Indies*.

Thus they flourish'd, increas'd their Commerce, their *Navigation*, and their Conquests on the *Terra firma*, till the famous League of *Cambray* in 1508, when a number of jealous Princes conspir'd to their Ruin; which was the more easily effected by the Diminution of their *East-India* Commerce, which the *Portuguese* had got a part of, and the *French* another.

*Genoa*, which had apply'd itself to *Navigation* at the same time with *Venice*, and that with equal success, was a long time a dangerous Rival, disput'd with it the Empire of the Sea, and shared with it the Trade to *Egypt*, and other Parts both of the East and West.

Jealousy soon began to break out, and the two Republics coming to blows, 'twas three Centuries almost continued War, e'er the Superiority was ascertain'd; when towards the end of the fourteenth Century, the fatal Battel of *Chios* ended the noble Strife: The *Genuese*, who till then had usually the Advantage, having now lost all; and the *Venetians* almost become desperate, at one happy Blow, beyond all Expectation, secur'd to themselves the Empire of the Sea, and Superiority in Commerce.

About the same time that *Navigation* was retriev'd in the Southern Parts of *Europe*, a new Society of Merchants was form'd in the North, which not only carried Commerce to the greatest Perfection it was capable of till the Discovery of the one and other *India*, but also form'd a new Scheme of Laws for the Regulation thereof, which still obtain under the Name of *Life and Custom of the Sea*.

This Society is that famous Association of the *Hanse Towns*, commonly suppos'd to have begun about the Year 1164. See *HANSE TOWNS*.

The modern State of *Navigation* in *England*, *Holland*, *France*, *Spain*, *Portugal*, &c. is too popular to need a particular Detail. See *COMMERCE* and *COMPANY*.

We shall only add, that in examining the Reasons of Commerce's passing successively from the *Venetians, Genoese, and Hans-Towns*, to the *Portuguese and Spaniards*; and from those again to the *English and Dutch*; it may be established as a Maxim, That the Relation of Commerce and Navigation, or, if we may be allow'd to say it, their Union, is so intimate, that the Fall of the one, inevitably draws after it the other; and that they will always either flourish or dwindle together.

Hence for many Laws, Ordinances, Statutes, &c. for its Regulation; and hence particularly that celebrated *Act of Navigation*, which an eminent Author calls the *Palladium*, or tutelary Deity of the Commerce of England; which is too important not to be here mentioned; as it is the standing Rule, not only of the *English* among themselves, but also of other Nations with whom they traffic.

*Act of English Navigation*, is a Statute whereby the Parliament of England have settled every thing relating to Navigation and Commerce.

Till this Act, all Nations were at liberty to import all kinds of Merchandizes, whether of their own Growth, or laden elsewhere, and that on their own Vessels.

Crowell first perceiving the Prejudice this Liberty did to the *English* Commerce, which was now almost wholly in the hands of Foreigners, chiefly the *Dutch*, whom he hated; animated the *English*, by several Acts of his Parliaments, to refuse their Trade into their own hands; and particularly passed an Act prohibiting the *Dutch* from importing any Merchandizes, except those of their own Growth or Manufacture, which were very few.

Upon the Restoration, the first Parliament Charles II. call'd, distinguishing, in Crowell, the Politician from the Parricide, condemn'd the Memory of the one, and follow'd the Plan of the other with regard to Navigation and Commerce; by passing that celebrated *Bill or Act of Navigation*, which still subsists in its full Latitude, and its antient Vigour. Its Date is the 23d of September 1660. Its chief Articles follow.

1. That no Merchandizes shall be imported or exported to or from any of the *English* Colonies in *Asia, Africa, or America*, but on Vessels built within the Dominions of England, or really belonging to *Englishmen*, and whose Masters, and at least three fourths of the Crew are of that Nation, on pain of Forfeiture of the Goods and Vessel.

2. That no Person born out of the Subjection of England, or not naturaliz'd, shall exercise any Commerce in those Colonies for himself, or others.

3. That no Merchandizes of the Growth of *Asia or America*, shall be imported into any of the Dominions of England on any other than *English* Vessels.

4. That none of the Commodities of Europe shall be imported into England by any other Vessels than those of the Parts, Countries, and States where the Commodities grow, or are manufactured.

5. That all Kinds of Fish, and Train-Oils not fish'd by *English* Vessels, imported into England, shall pay double Duties.

6. That the Commerce from Port to Port in England and Ireland shall be carried on wholly by *English* Vessels and Merchants.

7. That none but *English* Vessels shall reap the Benefit of the Diminutions made, or to be made in the Customs.

8. All foreign Vessels are prohibited importing into England and Ireland any of the Commodities of *Muscovy*, or even any Masts, or other Woods, foreign Salt, Pitch, Rosin, Hemp, Raisins, Prunes, Oils of Olive, any kind of Corn, or Grain, Sugars, Ashes and Soap, Wine, Vinegar, Brandy, Currants, and other Commodities the Product of the *Turkish* States, except Vessels built in the Places where the Commodities grow or are manufactured, or where 'tis usual to take them up; and unless the Master and three fourths of the Crew be Natives of the Country where they are laden.

9. That to prevent all false Declarations to favour the Entry of foreign Goods, all those mention'd in the last Article shall be deem'd to belong to Strangers that are not brought in Vessels of the Quality mention'd in the first Article; and as such shall pay the Duties us'd to be paid by other Commodities.

10. That to prevent Frauds in buying and disguising foreign Vessels, the Proprietors shall take an Oath that they really belong to them, and that no Foreigner has any part in them.

11. That *English* Vessels, or reputed *English*, may import into the Dominions of England, any Merchandizes of the Levant, tho' not taken up in the Places where they grow, or are manufactured. Provided it be in some Part of the *Mediterranean* beyond the Straights of *Gibraltar*. And the same is understood of Commodities brought from the *East-Indies*; provided they be taken up in some Port beyond the Cape of *Good-Hope*: And those from the Ca-

maries, and other Colonies of *Spain*; and the *Acres*, and other Colonies of *Portugal*, which are allow'd to be ship'd, the one in *Spanish* Ports, the other in *Portuguese*.

12. These Penalties, Prohibitions, and Confiscations not to extend to Goods taken from the Enemies of England, nor to Fish caught by the *Scots*, or their Corn, and Salt, which may be imported into England by the *Scotch* Vessels.

5. Five Shillings per Ton Duty is imposed on every *French* Vessel arriving in any Port of England, so long (and even three Months longer) as 50 Sols per Ton lies on the *English* Vessels in France.

Lastly, That Sugars, Tobacco, and other Commodities of the Growth of the *English* Colonies, shall not be imported into any other Part of Europe, but the Dominions of England. And that Vessels going out of the Ports of the same Crown for the *English* Colonies, shall give 1000 l. Security, if under one hundred Tons, and 2000 l. if above, e'er they depart, that they will import their Cargo into some Port in the said Dominions; and the like, e'er they quit those Colonies, that they will land their whole Cargo in England.

NAVIS, *Argo Navis*, or the Ship *Argo* in Astronomy, a Constellation of the Southern Hemisphere. See ARGU.

NAUMACHIA, NAUMAGIUM, a Spectacle, or Show, among the antient Romans, representing a Sea-Fight.

The Word is also us'd for a Circus compass'd with Seats and Porticos; the Pit whereof, serving as an Arena, was fill'd with Water for the exhibiting of Sea-Fights. See CIRCUS.

There were several of these *Naumachias* at Rome; three built by *Augustus*, one by *Claudius*, and another by *Domitian*. Nero's *Naumachia* serv'd for the Reverse of his Medal.

The Word comes from the Greek *ναυς*, Vessel, and *μαχη*, pugna, fight.

NAUSEA, in Medicine, a Retching, or Propensity and Endeavour to Vomit; arising from a Loathing of Food, excited by some viscid Humour that irritates the Stomach, and urges it thus to discharge itself; or a Nausea is when the thoughts or sight of proper Food create a Sickness in the Stomach, or a Tendency to Vomit.

The usual Causes of a Nausea, and *Amnesia*, are hard Drinking, great Heat, a Fever, Consumptions, Laxness of the Stomach occasion'd by Tea, &c. Narcotics, as Tobacco, Passions of the Mind, Suppression of Evacuations inducing a Plethora, foul Stomach, tenacious Humours lodg'd therein, &c.

*Aesculapeus* defines a Nausea Anatomically, to be a retrograde Spasmodic Motion of the Muscular Fibres of the *Oesophagus*, Stomach, and Intestines; attended with Convulsions of the Abdominal Muscles, and the *Septum transversum*. See VOMITING.

Nausea and Vomiting only differ from one another, as more or less Violent. The Nausea is properly the Effort the Stomach makes to Vomit, which has not always the Effect.

The Word is Latin, form'd from the Greek *ναυνη*, of *ναυς*, Navis, Ship; In regard, People, at the beginning of their Voyages, are usually inclin'd to Vomiting.

NAUTICAL Planisphere, a Description of the Terrestrial Globe upon a Plane, for the use of Mariners. See PLANISPHERE and SEA-CHART.

NAUTICAL Chart, see SEA-CHART.

NAUTICAL Compass, the Sea-Compass, see COMPASS.

NAUTICUS, in Anatomy, a Muscle; call'd also *Tibialis Posterior*. See TRIABIALIS.

NAUTILUS, in Natural History, a petrified Shell, found in the Earth; in other respects like those found in the Sea, or in Rivers. See FOSSIL, PETREFACTIO, SHELL, and STONE.

NAVY, the Fleet, or Shipping, of a Prince, or State. See FLEET.

The Direction of the *Navy Royal of England* is in the Lord High-Admiral, and under him in the Principal Officers and Commissioners, who all hold their Places by Patent. See ADMIRAL.

Principal Officers of the Navy are four, viz. The Treasurer, whose Business is to receive Moneys out of the Exchequer, and to pay all the Charges of the Navy, by Warrant from the Principal Officers. The Comptroller, who attends, and comprolls all Payment of Wages, is to know the Rates of Stores, to Examine and Audit all Accounts, &c. The Surveyor, who is to know the State of all Stores, and see Wants supply'd, to estimate Repairs, charge Boatswains, &c. with what Stores they receive; and at the End of each Voyage, to State and Audit Accounts. And lastly, The Clerk of the *Mts*, whose Business is to Record all Orders, Contracts, Bills, Warrants, &c.

Commissioners of the Navy, are five. The first Executes that Part of the Comptroller's Duty which relates to the Victuallers Accounts. The second, another Part of the said Comptroller's Duty relating to the Accounts of the Store-keepers of the Yards. The third has the Direction of the

Navy at the Port of *Portsmouth*. The fourth has the fame at *Chatham*. And the fifth at *Plymouth*.

The Navy was antiently Victualled by Contract; but the Victualling is now under Commissioners, who keep their Office on *Tower-Hill*. See *VICTUALLING-Office*.

The ordinary Expence of the Navy in a Year of Peace, continuing in Harbour, is so well regulated, that it amounts to scarce 130000 *l. per Annum*.

The number of Ships and Vessels in the Navy, as it stood in the Year 1710, are 7 First-Rates, 13 Second-Rates, 48 Third-Rates, 65 Fourth-Rates, 68 Fifth-Rates, 40 Sixth-Rates, 5 Fire-Ships, 7 Bomb-Vessels, 18 Yachts, 1 Advice-Boat, 2 Brigantines, 7 Sloops, 4 Store-Ships, 13 Hulks, 26 Hoys, 2 Smacks. See *RATE*.

**NAZAREATE**, the State and Condition of a Nazarite, or Nazarite among the Jews. See *NAZARITE*.

The Nazareate was a Separation from the rest of Mankind; particularly in three things; 1. In that the Persons devoted hereto drank no Wine. 2. In that they did not shave their Hair. 3. In avoiding the Touch of dead People, which they held a Defilement.

The Nazareate was of two Kinds, the one Temporary, the other for Life. The Rabbins enquire what the Term of the Temporary Nazareate was, and determine it by the *Cabbala*; for since, in Scripture, *Numbers vi. 5.* where 'tis said, *Dominus sanans erit, the Hebrew Verb, מרץ erit*, consists of four Letters; the first and third whereof taken as numeral Letters, do each make 10, and the rest each 5, all together 30; the Term of the Nazareate, say they, was 30 Days. See *CABBALA*.

**NAZARITE**, or **NAZAREN**, in the Old Testament, is used for a Person distinguished and separated from the rest, by something extraordinary, either his Sanctity, Dignity, or some Vow.

In the Book of Numbers, ch. vi. we find the Vow of a Nazarite described; i. e. the Vow whereby a Man or Woman separate themselves to the Lord; and the Conditions, or Effects thereof as to Abstinence, &c. See *NAZAREATE*.

The Word comes from the Hebrew נזיר *Nazir*, to distinguish, separate; in which it differs from *Nazaren*, an Inhabitant of the Country call'd *Nazareth*, which comes from נזר *Nazir*, or *Nazer*, to shave, preserve.

**NAZARITES**, or **NAZARENES**, were likewise a Kind of Sectaries in the Church, in the first Ages thereof.

S. *Epiphanius* tells us the *Nazareans* were the same with the Jews in every thing relating to the Doctrine and Ceremonies of the Old Testament; and only differ'd from them in this, that they added Christianity thereto, professing to believe that Jesus Christ was the Messiah.

There were two Kinds of *Nazareites*, the one *Pure*, who kept the Law of *Moses* and Christianity together; the other, real *Ebionites*. See *EBIONITES*.

Ecclesiastical Writers tell us, that St. *Matthew* preached the Gospel to the Jews at *Jerusalem*, and the rest of *Palestine*, in their own Language; and that accordingly they had his Gospel written in the Hebrew of that Time. And S. *Epiphanius* adds, that this Gospel was preserved entire among the *Nazareans*; only he doubts whether they might not have retrench'd the Genealogy of Jesus Christ, which was not in the Copy of the *Ebionites*. S. *Jerome*, who translated it out of Hebrew into Greek and Latin, says, A great many People took the Hebrew Gospel used by the *Nazareans* and *Ebionites*, to be the Original of S. *Matthew*.

Hence *Boninus* in his *Annals* says, if the Vulgate Latin Version were to be reform'd, it should rather be done by the Hebrew Original, than by the Greek; which is but a Copy.

*Cajetan* treats this Opinion of *Boninus* as impious, as not being able to conceive how the Authority of the Greek Version should depend on a Text quite lost. He adds, That it was never used by any but the *Nazareans*, *Ebionites*, and some other Heretics; and that it was full of Fables, as having been alter'd and corrupted by those Heretics.

**NEALING**, or rather **ANNEALING**, a Term used for the Preparing of several Matters by heating or baking them in an Oven, or the like.

**NEALING of Glass**, is the baking of Glass to dry, harden, and give it the due Consistence, after it has been blown, and fashion'd into the proper Works. See *GLASS*.

This is usually perform'd in a kind of Tower, call'd the *Leer*, built over the Melting-Furnace. See *FURNACE*.

**NEALING of Glass** is also used for the Art of Staining Glass with Metal Colours. See *PAINTING on Glass*.

**NEALING of Steel**, is the heating it in the Fire to a blood-red Heat; and then taking it out, and letting it cool gently of itself. See *STEEL*.

This is done to make it softer, in order to Engrave or Punch upon it. See *TEMPERING*.

**NEAP-TIDES**, the Tides in the 2d and 4th Quarters of the Moon; which are low Tides, in respect of the Spring-Tides. See *TIDES*.

**NEAT-WEIGHT**, the Weight of a Commodity without the Cask, Bag, or Case. See *WEIGHT*.

**NEBULOUS**, Cloudy, in Astronomy, a Term apply'd to certain of the fix'd Stars, which shew a dull, hazy Light, and are less than those of the sixth Magnitude, and so scarce visible to the naked Eye, to which, at best, they only appear like little dusky Specks or Clouds.

Through a moderate Telescope, these *Nebulous Stars* plainly appear to be Congeries or Clusters of several little Stars. See *STAR*.

In the *Nebulous Star* call'd *Procyon*, in the Breast of *Canes*, there are reckon'd 36 little Stars; three of which, Mr. *Hansford* gives us in his Catalogue. See *CANES*.

In the *Nebulous Star* of *Orion* are reckon'd 21. F. In *Compte* adds, that in the *Pleiades* are 40; 12 in the Star in the middle of *Orion's* Sword; in the extent of two Degrees of the same Constellation, 500; and 2500 in the whole Constellation. See *ORION*.

**NEBULY**, **NEBULE**, or **NEBULOUS**, in Heraldry, a Term used when a Coat is charged with several

little Figures, in form of Clouds, running within one another; or when the Out-line of a Bordure, Ordinary, &c. is indented or waved, after the manner in the adjoining Figure.

**NECESSARY**, in a Philosophical Sense, that which cannot but be, or cannot be otherwise. See *NECESSITY*.

The Schoolmen make a great many Kinds, or Divisions herof: As,

**NECESSARY in Cause**: when there is a Cause from which an Effect must necessarily follow. **NECESSARY in Predication**. And, **NECESSARY in Being**.

There is also a **Logical NECESSARY**: **Physical NECESSARY**; **Metaphysical**, and **Moral NECESSARIES**.

**NECESSITY**, what is done by a necessary Cause, or by an irresistible Power; in opposition to Liberty. See *LIBERTY* and *POWER*.

*Necessity* is usually confounded with Constraint; yet, in God, the *Necessity* of being Good is not any Constraint, but a Perfection. In effect, *Necessity*, according to *Rebeckensan*, differs from Constraint in this, that the former is join'd with the Pleasure and Inclination of the Will, to which Constraint is contrary.

*Simplicius*, from *Plato* and *Epictetus*, distinguishes two Kinds of *Necessity*; the one *Violent* or *Coactive*, which is opposite to Liberty; the other *Spontaneous* or *Voluntary*, very consistent with it; for this, adds he, it is that necessitates all things to act according to their Nature, as being consensual to them; since *voluntatis*, a thing that moves itself, must of *Necessity* be moved according to its own Nature, i. e. the Will: That is, since it is *voluntas*, a Self-mover, it must necessarily move according to its own Nature, i. e. spontaneously.

This Distinction is admitted by many of the Divines, particularly S. *Augustine*, who urges it against the *Pelagians*, as is shewn by *Jansenius*.

The Schools distinguish a **Physical Necessity**, and a **Moral Necessity**; a **Simple**, **Absolute Necessity**, and a **Relative** one.

A **Physical NECESSITY** is the want of a Principle, or of the natural Means necessary to act, which is otherwise call'd a **Physical** or **Natural Impotence**. See *IMPOTENCE*.

A **Moral NECESSITY**, or **Impotence**, is only a great Difficulty, such as that arising from a long Habitude, a strong Inclination, or violent Passion.

A **Simple**, or **Absolute NECESSITY**, is that which has no dependence on any State, or Conjunction, or any particular Situation of things, but is found every where, and in all the Circumstances in which the Agent can be supposed.

Such is in a blind Man the *Necessity* he is under of not distinguishing Colours.

**Relative NECESSITY**, is that which places him in a real Incapacity of acting, or not acting in those Circumstances, and that Situation he is found in; tho' in other Circumstances, and another State of things, he might act, or not act.

Such, in the Opinion of the *Jansenists*, is the *Necessity* of doing Evil in a Man, who, with a violent Passion, has only a feeble Grace to resist it; or the *Necessity* of doing well in a Man, who having Grace of seven or eight Degrees of Strength, has only Concupiscence of two or three Degrees to withstand.

All these Kinds of *Necessity* are opposite to Liberty; since even in the last, 'tis as impossible for the Man to act, or not act, as if he were in a State of *Absolute*, *Simple*, and *Physical Necessity*.

The Schoolmen admit other Species of *Necessity*; *Antecedent*, *Concomitant*, *Consequent*, &c.

**Antecedent NECESSITY**, is that arising from an antecedent Cause,

Cause, necessarily operating. Such is the Necessity of the Sun's Rising to-morrow Morning.

*Concomitant Necessity* arises from an antecedent and necessary Cause, but depends on the Circumstances of the Effect; the Effect all the while being free. Thus 'tis necessary Peter should sit, supposing he is sitting.

**NECK**, a Part in the human Body, and in that of several other Animals, between the Head and the Trunk of the Body. See **Body**.

All Animals have Necks except those without Lungs and Voice, as Fishes and Frogs.

The upper Part before is call'd the *Throat*; and the lower Part the *Pannus Adami*. The Hole between the two *Clavicles* is call'd the *Jugulum*, by the Greeks *αγονη*, Murthor; it being very easy to kill in this Part. The hind Part of the Neck is call'd *Cervix*; and the Hole between the first and second *Vertebra*, the *Nape*; that underneath, *Epnosis*.

Its lateral Parts commence from the bottom of the Ears, and are call'd *Parotides*.

The inner Parts of the Neck are seven *Vertebrae*, the *Trachea*, *Larynx*, *Jugular Veins*, *Carotid Arteries*, the intercostal Nerve, that of the eighth Pair, with the Recurrent, and several Muscles. See each Part under its proper Article.

The Necks of *Quadrupeds*, Mr. Derham observes, are always equal to the Length of their Legs; to enable them to reach the Ground for their Food, without stooping the Body. See **QUADRUPED** and **LEG**.

Indeed, the Elephant is an Exception to the Rule; its Neck is very short; but then it has a peculiar Provision by a Probotis, or Trunk. See **PROBOTIS**.

Another thing remarkable in the Necks of Graminivorous Quadrupeds, is a strong, tendinous and insensible *Aponeurosis*, or Ligament, braced from the Head to the middle of the Back; by means whereof they are enabled constantly to hold down the Head, tho' very heavy, to gather their Food without Pain or Labour.

**NECROLOGY**, a Book, anciently kept in Churches and Monasteries; wherein were register'd the Benefactors to the same, the Time of their Deaths, and the Days of their Commemoration; as also the Deaths of the Priors, Abbots, Religious Canons, &c.

This was otherwise call'd *Calendar*, and *Obituary*. See **CALENDAR**, &c.

The Word comes from the Greek *νεκρος*, *Mors*, Death, and *λογος*.

**NECROMANCY**, the Art, or Art of communicating with Devils, and doing surprising Feats by their Assistance; particularly calling up the Dead: From *νεκρος*, *Death*, and *μαντις*, *Enchantment*. See **MAGIC**, **SORCERY**, &c.

**NECROSIS**, in Medicine, a complex Mortification of any part; call'd also *Sideratio* and *Sphacelus*. See **SPHACELUS**, &c.

The Word is Greek, *νεκρωσις*, where it has the same Signification.

**NECTAR**, among the ancient Poets, the Drink of the fabulous Deities of Antiquity.

**NEEDLE**, a very familiar little Instrument, or Utensil, made of Steel, pointed at one end, and pierced at the other; used in Sewing, Embroidery, Tapistry-Work, &c.

Needles make a very considerable Article in Commerce; and the Consumption thereof is almost incredible. The Sizes are from N<sup>o</sup> 1, the largest; to N<sup>o</sup> 25, the smallest.

There is scarce any Commodity cheaper than Needles; which will appear something extraordinary to the Reader, after he has been shown the infinite Number of Operations they undergo e'er brought to Perfection.

#### Manufacture of NEEDLES.

German and Hungary Steel is of most repute for Needles. The first thing, is to pass it thro' a Coal-fire, and under a Hammer, to bring it out of its square Figure into a Cylindrical one. This done, 'tis drawn thro' a large Hole of a Wire-drawing Iron; return'd into the Fire, and drawn thro' a second Hole of the Iron, smaller than the first; and thus successively from Hole to Hole, till it have acquir'd the degree of Fineness requir'd for that Species of Needles; observing every time it is to be drawn, that it be drawn over with Lead to render it the more manageable. See **WIRE-DRAWING**.

The Steel thus reduced into a fine Wire, is cut in Pieces of the length of the Needle intended. These Pieces are flattened at one end on the Anvil, in order to form the Head and Eye. They are then put in the Fire, to soften 'em further, and thence taken out, and pierc'd at each extreme of the flat Part, on the Anvil, by force of a Punction of well temper'd Steel, and laid on a leaden Block, to bring out, with another Punction, the little Pieces of Steel remaining in the Heads.

The Corners are then filed off the Squares of the Heads, and a little Cavity filed on each side the flat of the Head. This done, the Point is form'd with a File; and the whole filed over. They are then laid to heat red-hot, on a long, flat, narrow Iron, crooked at one end, in a Charcoal-fire; and when taken out thence, are thrown into a Basin of cold Water to harden. On this Operation, a good deal depends; too much heat burns 'em; and too little leaves 'em soft; the Medium is only to be learnt by Experience.

When harden'd, they are laid in an Iron-Peel, on a Fire more or less brisk, in proportion to the Thickness of the Needles, taking care to move 'em from time to time; this serves to temper 'em, and take off their Brittleness; Care, here, too, must be taken of the degree of Heat.

They are then frightened one after another with the Hammer; the Coldness of the Water used in hardening 'em having twisted the greater part of 'em.

The next Process is the Polishing. To do this, they take twelve or fifteen Thousand Needles, and range 'em in little Heaps against each other on a Piece of new Backum, sprinkled with Emery Dust. The Needles thus disposed, Emery Dust is thrown over 'em, which is again sprinkled over with Oil of Olives. At last, the whole is made up into a Roll, well bound at both ends.

This Roll is then laid on a Polishing Table, and over it a thick Plank loaden with Stones, which two Men work backwards and forwards a day and half, or two days successively. By which means, the Roll thus continually agitated by the Weight and Motion of the Plank over it, the Needles within side being rubb'd against each other with the Oil and Emery, are infensibly polish'd.

In Germany, instead of Hands, they polish with Water-Mills.

After Polishing, they are taken out, and the Filth wash'd off 'em with hot Water and Sosp; then wiped in hot Bran a little moisten'd, placed, with the Needles, in a round Box suspended in the Air by a Cord, which is kept stirring till the Bran and the Needles be dry. The Needles thus wiped in two or three different Brans, are taken out and put in wooden Vessels to have the good separated from those whose Points or Eyes have been broke either in polishing or wiping; the Points are then all turn'd the same way, and smooth'd with an Emery-stone turn'd with a Wheel.

This Operation finishes 'em; and there remains nothing but to make 'em into Packets of two hundred and fifty each.

**Chirurgeons NEEDLES**, are crooked, and their Points triangular. They are of different Sizes, and bear different Names according to the Purposes they are used for.

The largest are Needles for Amputation; the next, Needles for Wounds; the finest, Needles for Stitches. They have others very short and flat, for Tendons; others, still shorter, and the Eye placed in the middle, for the tying together of Vessels, &c. See **SUTURE**, &c.

**Magnetic NEEDLE**, in Navigation, &c. a Needle touch'd with a Load-stone, and suspended on a Pivot or Centre, on which, playing at liberty, it directs itself to certain Points in, or under the Horizon. See **MAGNET**.

**Magnetic Needles** are of two Kinds, viz. *Horizontal* and *Inclinary*.

**Horizontal NEEDLES**, are those equally balanced on each side the Pivot which sustains 'em; and which, playing Horizontally, with their two extremes point out the North and South Points of the Horizon. For their Application and Use, see **COMPASS**.

**Construction of an Horizontal NEEDLE**. A Piece of pure Steel is provided, of a length not exceeding six Inches, lest its Weight impede its Volubility; very thin, to take its Verticity the better; not perforated with any Holes, &c. for Ornament sake, which prevent the equable diffusion of the Magnetic Virtue.

A Perforation is made in the middle of its Length, and a brass Cap or Head folder'd on, whose inner Cavity is Conical, so as to play freely on a Stile or Pivot, headed with a fine Steel Point.

The North Point of the Needle in our Hemisphere is made a little lighter than the Southern, the Touch always destroying the Balance, if well adjusted before, and rendering the North End heavier than the South, and thus occasioning the Needle to dip. See **DIPPING-NEEDLE**.

Now to give the Needle its Verticity, or directive Faculty, 'tis to be rubb'd leisurely on each Pole of a Magnet, from the South Pole towards the North; first beginning with the Northern End, and going back at each repeated rub, towards the South. A Rub in a contrary Direction takes away the Power communicated by the former. See **POLE** and **TOUCHING**.

If after Touching, the Needle be out of its Equilibrium, something must be filed off from the heavier Side, till it balance evenly.

*Needles in Sea-Compasses* are usually made in a Rhomboidal, or oblong Form. See their Structure under the Article *COMPASS*.

A *Needle*, on Occasion, may be prepared without touching it on a Load-stone: For a fine Steel *Needle*, gently laid on the Water, or delicately suspended in the Air, will direct itself to the North and South.

Thus, also, a *Needle* heated in the Fire, and cooled again, in the Direction of the Meridian, or even only in an erect Situation, acquires the same Faculty. See *MAGNETISM*, *POLAR*, &c.

The *Needle* is not found to point precisely to the North, except in very few Places; but deviates from it, more or less, in different Places, and that too at different Times; which Deviation is call'd the

*Declination of the NEEDLE*, the Variation of the Horizontal *Needle* from the Meridian; or the Angle it makes with the Meridian, when freely suspended in a Horizontal Plane. See *DECLINATION*.

*Inclinatory, or Dipping-Needle*, see *DIPPING-Needle*.

*NEEP-Tides*, see *NEAP-Tide*.

A Ship is said to be *Benepeled* when she wastes Water to bear her off the Ground.

*NEFASTUS*, a Latin Term. The Romans us'd the Term *Dies Nefasti*, for those Days whereinto was not allow'd to administer Justice, or hold Courts; nor for the Pretor to pronounce the three solemn Words or *Formula's* of the Law, *do, dico, addico*, I give, I appoint, I adjudge. See *FASTUS*.

These Days were distinguish'd in the Calendar by the Letter *N*, or by *N. P. Nefastus Primus*; as when the Day was only *Nefastus*, for the first Part thereof. See *DAY*.

*NEGATION*, in Logic, an Act whereby the Mind separates one Idea from another; or affirms the one is different from the other. As, the Soul is not the Body.

*NEGATIVE*, a Term that denies, or implies a Denial, of any thing.

Logicians, &c. say, A *Negative* cannot be proved but by converting it into an Affirmative.

*NEGATIVE Heretics*, in the Language of the Inquisition, are those, who being accused of Heresy, by Witnesses, whose Evidence they don't deny, still keep on the *Negation*, make open Profession of the Catholic Doctrine, and declare their abhorrence of Heresy.

There are also *Negative Schismatics*, and *Positive* ones. In the *Negative*, 'tis sufficient to reject the Errors of a Church without separating from it, or setting up a distinct Society.

*NEGATIVE Pains*, the Laws whereby certain Persons are excluded from Honours, Dignities, &c. without inflicting any direct and positive Pains.

*NEGATIVE Quantities*, in Algebra, those affected with the Sign —. See *QUANTITY*.

*Negative Quantities*, are the Effects of positive ones; where Positive end, these *Negative* ones commence. See *POSITIVE*.

*NEGATIVE Pregnant*, in Law, a *Negative* which implies or brings forth an Affirmative: As if a Man being impleaded to have done a thing on such a Day, and in such a Place, denies he did it, *Nihil sibi forma declarat*; which implies nevertheless that he did it in some sort.

*NEGATIVELY, NEGATIVE*, in the School-Philosophy, is variously us'd in contradistinction to *Positively*. See *POSITIVELY*.

*NEGRO'S*, a Kind of Slaves, which make a considerable Article in the modern Commerce.

The *Negro's*, properly call'd *Black's*, or *Moors*, are a People of Africa, whose Country extends on each side the River *Niger*, and is call'd *Nigritia*: Tho, whether the People communicated their Name to the River, &c. or received it therefrom, is not easily determined.

The Origin of *Negro's*, and the Cause of that remarkable Difference in Complexion from the rest of Mankind, has much perplex'd the Naturalists; nor has any thing satisfactory been yet offer'd on that head. See *BLACKS*.

They are brought from *Guinea*, and other Coasts of Africa, and sent into the Colonies in America, to cultivate Sugar, Tobacco, indigo, &c.

This Commerce, which is scarce defensible on the foot either of Religion, or Humanity, is now carried on by all the Nations that have Settlements in the *West-Indies*; particularly the *English*, *Dutch*, *Spaniards*, and *Portuguese*; the *Spaniards*, indeed, have few *Negro's* at first hand, but have always treated with other Nations, to furnish them therewith: Thus they were formerly furnished by the Company of the *Grilles*, established at *Genoa*; since by the *Affrenta in France*; and since the Peace of *Utrecht*, by the *English* *South-Sea-Company*. See *ASSIANT* and *COMPANY*.

The best *Negro's* are brought from *Cape Verde*, *Angola*, *Senegal*, the Kingdom of *Joloffes*, that of *Galland*, *Damel*, the River *Gambia*, &c.

A *Negro* between 17 or 18 and 30 Years of Age, was antiently only valued at about 45 *l.* in the Commodities pro-

per for that Country, which are *Brandies*, *Iroo*, *Linnen*, *Paper*, *Brass-Pots*, *Basons*, &c. But their Value is now much enhanced, and it is seldom they meet with a good *Negro* for five Pounds. They frequently give seven or eight.

There are various ways of procuring them: Some, to avoid Famine, sell themselves, their Wives and Children, to their Princes, or great Men, who have wherewithall to subsist them. Others are made Prisoners in War; and great numbers seiz'd in Excursions, made for that very purpose by the petty Princes upon one another's Territories; in which 'tis usual to sweep away all both Old and Young, Male and Female.

The *Negro's* make a frequent Practice of surprising one another while the *European* Vessels are at Anchor, and dragging those they have thus caught to 'em, and selling them in spite of themselves; and 'tis no extraordinary thing to see the Son sell, after this manner, his Father or Mother, and the Father his own Children, for a few Bottles of Brandy, or a Bar of Iron.

As soon as the Ship has its Complement, it immediately makes off; the poor Wretches, while yet in sight of their Country, falling into such deep Grief and Despair in the Passage, that a great part of 'em languish, fall into Sickness, and die: others of 'em dispatch themselves, by refusing any Food; or others by stopping their Breath, in a manner peculiar to themselves, by turning and folding their Tongue, which immediately strangles them; others dash out their Brains against the Ship; and others jump over board.

The only sure means to preserve 'em, is to have some Musical Instrument play to 'em, be it ever so mean. But this excessive Love for their Country abates as they get further off.

At their arrival in the Colonies, each *Negro* is sold for 38 or 40 Pounds. They make the chief Riches of the Inhabitants of the Islands, &c. A Man, e.g. who has twelve *Negroes*, is esteem'd a rich Man.

*NEIE*, *NAP*, *NARRA*, in our antient Customs, a Bond-Woman, or She-Villain. See *NATIVES*.

Antiently, Lords of Manors sold, gave, or assigned their *Neifs* and *Natives*. See *SLAVE*, *VILLAIN*, &c.

*Writ of NEIFTY*, is an antient Writ whereby the Lord claim'd such a Woman for his *Neif*.

*NEIPTIST PATES*, a Writ which lies for a Tenant against the Lord forbidding him to distrain on the Tenant, who has formerly prejudiced himself by doing or paying more than he needed.

*NEMEAN Games*, one of the four kinds of Games, or Combats, celebrated among the antient *Greeks*. See *GAMES*.

Some say, they were instituted by *Hercules*, on occasion of his killing the *Nemean Lion*; and that it was on that account they had their Name, as also the Place of Celebration, the Forest of *Nemea*.

Others relate, That the seven Chiefs sent to *Thules*, under the Conduct of *Polydeces*, being extremely pinch'd in their Journey with Thirst, met with *Hippolyte* of *Lemnos*, who had in her Arms *Opheles* Son of *Lycotas*, Priest of *Jupiter*, and *Eurydice*. They begging her to show 'em some Water, she laid the Child down on the Grass, and conducted 'em to a Well. In her Absence, a venomous Serpent kill'd the Child; upon which the Nurse, out of an excess of Grief, grew desperate. The Chiefs, at their return with her, kill'd the Serpent, buried the young *Opheles*, and to divert *Hippolyte*, instituted the *Nemean Games*.

*Pausanias* refers the Institution thereof to *Adrastus*, and the Restoration thereof to his Descendants.

Lastly, *Hercules*, on his Victory over the *Nemean Lion*, augmented the Games, and consecrated them to *Jupiter Nemeanus*. *Aelian* says, 'Twas indeed the seven Chiefs going to the Siege of *Thules*, that instituted them; but adds, that 'twas in favour of *Prometheus*.

They were open'd with Sacrificing to *Nemean Jove*, appointing him a Priest, and proposing Rewards for such as should be Victors in the Games.

They were held every three Years, in the Month call'd *Pancosia* by the *Corinthians*, and *Isidorosion* by the *Athenians*.

The *Athenians* were the Judges, and sat clothed in black, to express the Origin of the Games. As they were instituted by Warriors, none at first were admitted to 'em but Military Men, and the Games themselves were only *Equestrian* and *Gymnic*; at length they were open to the People, and other Kinds introduced.

The Conquerors were crown'd with Olive, till the time of the War with the *Medes*; when, a Blow they receiv'd in that War, occasion'd them to change the Olive for Smalage, a funeral Plant. The others maintain, that the Crown was originally Smalage, on account of the Death of *Opheles*, otherwise call'd *Archemorus*; this Plant being supposed to have receiv'd the Blood which run from the Wound made by the Serpent.

**NEMINE** *Contradicente*, i. e. *Nem* *contradicting it*, a Term chiefly used in Parliament, when any Matter is carried with universal Consent.

**NENIA**, or **NENIA**, in the antient Poetry, a kind of Verses sung at the Obsequies of the Dead. See **OSQUIS**.

Authors represent them as sorry Compositions, sung by hired Women-Mourners. The first Rise of these *Nenia* is ascribed to the *Phrygians*.

The Word comes from the *Greek nenia*, on which *Stalger* observes that it should be wrote in *Latin Nenia*, not *Nenia*.

*Guehart* notes *Nenia* to have antiently been the Name of a Song to Lull Children a-sleep, and conjectures it to come from the *Hebrew נן* *Nin*, Child.

In the Heathen Antiquity, the Goddess of Tears and Funerals was call'd *Nenia*, whom some suppose to have given that Name to the Funeral-Song; and others to have taken her Name from it. Some will have the one, and some the other, form'd from the Sound or Voice of those that weep.

**NEOMENIA**, in the Schools, &c. a Term used for the New Moon. See **MOON**.

Some say, the *Jews* reckon'd two kinds of *Neomenie*, or New Moons; the first on the Day of her Conjunction with the Sun; the second on that of her Apparition, or *Phasis*; and add, that they celebrated two Passovers, by reason of the uncertainty which of these Days it should be held on.

*F. Harduain*, on the contrary, maintains, they had no other *Neomenia* but that of the Moon's Conjunction with the Sun; which it was easy to ascertain by Astronomical Calculation: whereas the other was liable to Mistakes; the Moon sometimes not showing herself till four or five days after her Conjunction. See **PASSOVER**.

**NEOPHYTES**, **NEOPHYTE**, i. e. *New Plants*, in the Primitive Church, were new Christians; or the Heathens newly converted to the Faith.

The Fathers never discover'd the Mysteries of their Religion to the *Neophytes*.

The Term is still apply'd to the Converts which the Missionaries make among the Infidels. The *Japanese Neophytes* in the latter end of the 16th, and beginning of the 17th Century, are said to have shewn Prodiges of Courage and Faith, equal to any in the Primitive Church.

The Word has formerly been likewise used for New Priests, or those first admitted into Orders; and sometimes for the Novices in Monasteries.

Originally the Word signifies a *New Plant*, being form'd of the *Greek νεος*, new, and *φυς*, I produce, *q. d.* newly born; *Baptism*, whereby they commenced *Neophytes*, being a kind of new Birth.

**NEPENTHE**, in Pharmacy, a Name given to an Opiate, or *Laudanum*, by *Theo. Swingerus*, from the great Opinion he had of its giving Ease in all manner of Pain; the Word importing as much, from the Privative, *νε*, non, or *abique*, without; and *πενθος*, *Latus*, Sorrow.

The *Nepenthe* mention'd in antient Authors, was a Plant, now unknown. *Homer* says, it was a Plant of *Egypt*; and adds, that *Helena* made use of it to charm her Hells, and make 'em forget their Pains.

Some Authors say, it was the Plant we call *Heliconium*, and others *Enopia*. *M. Peir* has a Dissertation on the antient *Nepenthe*.

**NEPER'S**, **NAIPER'S**, or **NAPIER'S Bones**, an Instrument, whereby Multiplication and Division of large Numbers are much facilitated and expedited; so call'd from its Inventor *J. Neper*, Baron of *Merchiston* in Scotland.

*Construction of NEPER'S Bones.*

Five Rods, Plates, or *Lamelle*, are provided of Wood, Metal, Horn, Pastboard, or other Matter, (Tab. **ALGEBRA**, Fig. 1.) of an oblong Form, and divided each into nine little Squares; each of which is resolv'd into two Triangles by Diagonals.

In these little Squares are wrote the Numbers of Multiplication Table; in such manner as that the Units, or right-hand Figures, are found in the right-hand Triangle; and the Tens or the left-hand Figures, in the left-hand Triangle: As in the Figure.

*Use of NEPER'S Bones in Multiplication.*

To multiply any given Number by another; dispose the *Lamelle* in such manner, as that the top Figures may exhibit the Multiplicand; and to these, on the left-hand, join the *Lamelle* of Units; in which seek the right-hand Figure of the Multiplier; and the Numbers corresponding thereto, in the Squares of the other *Lamelle*, write out, by adding the several Numbers occurring in the same Rhomb together, and their Sums. After the same manner write out the Numbers corresponding to the other Figures of the Multiplier; let them be disposed under one another as in the common Multiplication; and lastly, add the several Numbers into one Sum.

For Example. Suppose the Multiplicand 5978, and the Multiplier 937. From the outermost Triangle on the right-hand (Tab. **ALGEBRA**, Fig. 2.) which corresponds to the right-hand Figure of the Multiplier 7, write out the Figure 6, placing it under the Line. In the next Rhomb, towards the left, add 9 and 5; their Sum being 14, write the right-hand Figure, viz. 4, against 6; carrying the left-hand Figure, 1, to 4 and 3, which are found in the next Rhomb. The Sum 8, join to the 46, already put down: after the same manner, in the last Rhomb, add 6 and 5, the latter Figure of the Sum 11, put down as before, and carry 1 to the 3 found in the left-hand Triangle; the Sum 4 join as before on the left of 1846: Thus will you have the *Fallum* of 7 into 5978; and after the same manner will you have the *Fallum* of the Multiplicand, into the other Figures of the Multiplier: The whole added together gives the whole Product.

5602186

*Use of NEPER'S Bones in Division.*

Dispose the *Lamelle* so, as that the uppermost Figures may exhibit the Divisor; to these, on the left-hand, join the *Lamelle* of Units. Descend under the Divisor, till you meet those Figures of the Dividend, wherein 'tis first requir'd, how oft the Divisor is found, or at least the next less Number, which is to be subtracted from the Dividend; the Number corresponding to this, in the Place of Units, write down for a Quotient. By determining the other parts of the Quotient after the same manner, the Division will be complicated.

For Example. Suppose the Dividend 5601386, and the Divisor 5978; since it is first asked how often 5978 is found in 56013, descend under the Divisor, (Tab. **ARITH.** Fig. 3.) till in the lowest Series you find the Number 53802, approaching nearest to 56013; the former whereof is to be subtracted out of the latter, and the Figure 9 corresponding thereto in the *Lamelle* of Units write down for the Quotient. To the Remainder 2218, join the following Figure of the Divisor 8; and the Number 17934 being found, as before, to be the next less Number thereto, the corresponding Number in the *Lamelle* of Units, 3, is to be wrote down for the Quotient; and the Subtraction to be continued as before. After the same manner the third and last Figure of the Quotient will be found to be 7; and the whole 937.

**NEPHEW**, a Term relative to Uncle and Aunt, signifying a Brother or Sister's Son; who, according to the Civil Law, is in the third Degree of Consanguinity; and according to the Canon Law, in the second. See **AGNATION** and **COGNATION**.

The Word is form'd from the *Latin Nepos*; which in the corrupt Ages of that Language signified the same thing.

**NEPHRITES**, or **NEPHRITICUS Dolor**, in Medicine, a Name given to a painful Disease occasion'd by the Stone or Gravel in the Kidneys. See **STONE**.

The Word is borrow'd from the *Greek νεφρις*, Disease of the Reins; from *νεφρος*, Reins. See **KIDNEY**.

The *Greeks* give the Name *νεφρις*, to the first Vertebra of the Loins, from its neighbourhood to the Kidneys. See **VERTEBRA**.

**NEPHRITIC**, something that relates to the Kidneys. See **KIDNEY**.

The Word is form'd of the *Greek νεφρος*, Reins, Kidney. **NEPHRITIC Colic**, is a Colic or Pain arising from a Stone or Gravel in the Reins, &c.

This is the most cruel of all Colics. See **COLIC**.

**NEPHRITICS**, Medicines proper for Diseases of the Kidneys, particularly the Stone. See **STONE**, &c.

Such particularly are the Roots of *Althea*, *Dog's Grafts*, *Sparagrafts*, *Sago*, *Pellitory of the Wall*, *Mallows*, *Pimpernella*, *red Chick-Peas*, *Peach-Kernels*, *Turpentine*, &c. See **LITHONTRIPIC**.

**NEPHRITICUM Lignum**, a kind of Medicinal Wood growing in *New Spain*, chiefly in the Kingdom of *Mexico*; call'd by the *Indians*, *Cool* *Tzapalacpatly*, as being sovereign against *Nephritic* Pains. See **WOOD**.

It must be chosen well clear'd of its Bark and Rind; it is of a bitter Taste, and a reddish yellow Colour; but when infused in cold Water, gives it a sky-blue Tincture, when view'd by a false Light, and a gold Colour, by a true one: A little of any Acid being mixed with the Tincture, both Colours disappear, but a little Oil of Tartar restores its sky-blue. See **COLOUR**.

Some substitute *Ebony*, and others red *Brasil* Wood for *Lignum Nephriticum*, but the Deceit becomes apparent by infusing it in Water.

**NEPHRITICUS Lapis**, a precious Stone, so call'd from its extraordinary Virtues against the Stone and Gravel in the Kidneys. See **STONE**.

'Tis a kind of Jasper, of a greyish Colour, mix'd with a little blue, sometimes white and black; and only differs from Jasper, in its being harder, and always without any thing of red.

'Tis brought chiefly from *New Spain*, where it is sometimes found in Pieces large enough to make moderate Caps. There is some likewise found in *Old Spain* and *Bohemia*.

This Stone is very dear, by reason of the wonderful Virtues ascribed to it. A Cup made of it was sold for 1600 Crowns in the time of the Emperor *Rudolphus II*.

The best for Medicinal Use is of a bluish grey, fat and unctuous, as *Tale of Venice*.

The *Indians of New Spain*, who first discover'd its use, and taught it the *Europeans*, wear it hung about their Neck, after having cut it in various Figures, chiefly Beaks of Birds: Whence some *Charletans* take occasion to counterfeit it, by cutting *Jade*, and other Stones, into like Figures; and sell it at great Prices to those who have an Opinion of its *Nephritic* Faculty.

**NEPOTISM**, a Term us'd in *Italy*, in speaking of the Authority which the Pope's Nephews, i. e. his Bastards, have in the Administration of Affairs, and in the Care the Popes take to raise and enrich them.

Many of the Popes have endeavoured to reform the Abuses of *Nepotism*, but hitherto in vain. *Leti* has wrote expressly on the Subject, *De Nepotismo*.

**NEPTUNALIA**, Feasts held among the Antients in honour of *Neptune*.

The *Neptunalia* differ'd from the *Consualia*, in that the latter were Feasts of *Neptune*, consider'd as presiding over Horses and the Manage. See **CONSUALIA**.

Whereas the former were Feasts of *Neptune* in the general, and nor consider'd under any particular Quality. They were celebrated on the 13th of the Calends of *August*.

**NEREIDS**, or **NEREIDES**, Fabulous Deities of the Antients, supposed to inhabit the Sea. See **GOD**.

The *Nereids* were fifty in number; all the Sons of *Neptune* by the Nymph *Doris*. Their Name and Genealogies are described by *Hesiod*.

**NERVE**, in Anatomy, a round, white, long Body, like a Cord, composed of several Threads, or Fibres; deriving its Origin from the Brain, or the Spinal Marrow; and distributed throughout all the Parts of the Body; serving for the Conveyance of a Juice call'd *Animal Spirit*, for the performance of Sensation and Motion. See **SENSATION**, **MUSCULAR MOTION**, &c.

For the Origin of the Nerves: From every Point of the Cortex of the Brain, there arise minute medullary Fibres; which, in their Progress uniting together, at length become sensible, and thus constitute the Medulla of the Brain, and the Spine. See **CORTEX**, **MEDULLA**, &c.

Hence they are continued, and in their farther Progress, become distinguish'd or separated by Coats which are detach'd to them from the *Dura* and *Pia Mater*, into several distinct *Fasciculi*, or *Nerves*; resembling, in the Position of their component *Fibrille*, so many Horses Tails, wrapp'd up in a double Tunic. See **FIBRA**.

'Tis probable that the medullary Fibres of the *Cerebellum*, rising up towards the fore-parts of the *Medulla Oblongata*, do, part of them, join the *Nerves* arising thence, but so as still to retain their different Origin, Progress, and Functions. The rest of the Fibres of the *Cerebellum* are mix'd with those of the Brain, as that there is, perhaps, no part of the whole *Medulla Oblongata*, or *Spinalis*, where there are not found Fibres of each kind; and thus, to constitute the Body of each *Nerve*, both kinds of Fibres contribute; tho' the end and effect of each be quite different. See **CEREBELLUM**, &c.

The *Nerves* thus form'd, and sent from the *Medulla Oblongata* and *Spinalis* while within the *Cranium*, are ten Pair; tho' very improperly so accounted; inasmuch as most of them do in reality consist of several distinct, very large *Nerves*.

From the Spinal Marrow, continued without the *Cranium*, there arise, after the like manner, thirty Pair, to which may be added another Pair sent from the *Vertebrae* of the Neck, augmented in its Progress by Branches from the second and third Pair, and at last join'd to the eighth Pair.

All these, while within the *Medulla*, are pulposus; as soon as they quit it, they acquire a Sheath, or Case, wherewith being defended, they proceed to the *Dura Mater*, which is perforated into an open *Vagina*, reaching as far as the *Foramina* of the *Cranium*, destin'd for the transmission of *Nerves*; where the nine first Pair, and the *Accessory Pair*, assuming this *Vagina*, or Case, pass safely out of the *Cranium*.

The other thirty and one Pair descend thro' Spaces between the Commissures of the *Apophyses* of the *Vertebrae*; whence, firm, hard, and well cloath'd as they are, they are dispersed thro' all, even the smallest Points of the solid Parts of the Body yet known. See **SOLIDUM**.

The Coats, or Covers of these *Nerves* are every where invested with Blood-Vessels, Lymphatics, and other Vesicles of a very tight Texture, which serve to collect, strengthen, and contract the *Fibrille*; and from which many of the Phenomena of the *Nerves*, and of *Diseases*, are accountable.

As soon as the last Extremities of the *Nerves* are about to enter the Parts to which they belong, they again lay aside their Coats, and become expanded either into a kind of thin *Membrana*, or into a soft Pulp. See **MEMBRANE** and **FLESH**.

Now, upon considering first, That the whole vascular Medulla of the Brain goes to the constituting of the *Fibrille* of the *Nerves*; nay, is wholly continued into, and ends in them; Secondly, That upon compression, tearing, dispersion, putrefaction, &c. of the Medulla of the Brain, all the Actions used to be perform'd by the *Nerves* arising thence, are immediately abolished, even tho' the *Nerves* continue entire and untouched; Thirdly, That the *Nerves* themselves are every where found lax, pendulous, crooked, retrograde, and oblique, yet effect Motion and Sensation almost instantaneously; Fourthly, That when close bound or compress'd, tho' in all other respects entire, they lose all their Faculty in those Parts between the Ligature and the Extremes to which they tend, without losing any in those Parts between the Ligature and the Medulla of the Brain, or *Cerebellum*: it evidently appears, that the nervous *Fibrille* do continually take up a Humour or Juice from the Medulla of the Brain, and transmit it by so many distinct Canals to every Point of the whole Body; and by means hereof alone perform all their Functions in Sensation, Muscular Motion, &c. See **SENSATION** and **MUSCLE**.

Which Humour is what we popularly call *Animal Spirit*, or the *Nervous Juice*. See **ANIMAL SPIRIT**.

Nor does there appear any Probability in that Opinion maintain'd by some; viz. That the *Nerves* perform all their Action by the Vibration of a tense *Fibrilla*; which is inconsistent with the nature of a soft, pulposus, flaccid, crooked, wavy *Nerve*, and with that nice distinctness wherewith the Objects of our Senses are represented, and Muscular Motions perform'd.

Now, after the same manner as the Arterial Blood is perpetually carried into all the Parts of the Body furnish'd with these Vessels; so we conceive a Juice prepar'd in the Cortex of the Brain and *Cerebellum*, convey'd thence every Moment thro' the *Nerves* to every Point of the solid Body. The smallness of the Vessels in the Cortex, as exhibited in *Ray's Microscopium*, which yet are only Arteries, and therefore incredibly thicker than the last *Emultery* derived thence, shew how slender these hollow *Nervous Ductus* must be. But the great Bulk of the Brain compared with the exceeding Smallness of each *Fibrilla*, shews, that their number must be great beyond the limits of all Imagination.

And again, the great Quantity of Juice constantly brought hither, and violently agitated, will occasion a constant *Plenitude*, *Oppression*, and Action of these little Canals.

But, a fresh Juice is every moment prepar'd, and the last is continually protruding the former; as soon as it has done its last Office, it seems to be driven out of the last Filaments into the smallest Lymphatic *Venule*, both about the Glands, and elsewhere; thence into the Lymphatics somewhat larger; and again from these to the common Lymphatic Vessels with the Valves of Veins, and at length into the Veins and the Heart; and thus like the other Juices of the Body, does it make its Circuit round the Body. See **CIRCULATION** of the *Spirits*.

Upon the whole, if we consider the great Bulk of the Brain, *Cerebellum*, *Medulla Oblongata*, and *Medulla Spinalis*, with regard to the Bulk of the rest of the Solids of the Body; the great number of *Nerves* distributed hence throughout the whole Body; that the Brain and *Crura*, that is the Spinal Marrow, are the Basis in an Embryo, whence, according to the great *Malpighi*, the other parts are afterwards form'd; and lastly, that there is scarce any part of a Body, but what feels or moves; it will appear very probable, that all the solid parts of the Body are wove out of nervous Fibres, and consist wholly of 'em. See **STAMEN**.

The Antients only allow'd of seven Pairs or *Conjugations* of *Nerves*, proceeding from the Brain; which, with their Functions, they comprised in these two Latin Verses:

*Optica prima, oculus movet altera, tertia gustas,  
Quarta; quinta audit, sexta est, septima linguae.*

But the Moderns, as before observ'd, reckon ten, which are as follow.

**NERVES** of the Brain, or *Cerebrum*.

*Olfactory NERVES*, *Par Olfactorium*, or the *Olfactory Pair*, arises in the fore-part of the Brain, just below the *Of Frontis*; these being pretty thick near the *Of Crisiformis*, are

there call'd *Processus Papillares*, which Dr. Drake takes to be a proper Name in that Place, than that of *Nerves*; they appearing rather Productions of the *Medulla Oblongata*, whence the *Olfactory Nerves* arise, than distinct *Nerves*. As soon as they have made their way thro' the *Ori Gibriforme*, they are distributed throughout the Membranes of the Nose. Their Use is in the Sensation of Smelling. See SMELLING.

**OPTIC NERVES.** These pass the Skull thro' two Perforations in its Basis, a little above the *Sella Equina*, and are thence convey'd to the Tunics of the Eye; whereof, the *Retina*, supposed to receive the Objects of Vision, is an Extension of the inner or medullary part alone. See VISION and RETINA.

**NERVES that move the Eyes, Oculorum Motorii**, arise from the *Crossa* of the *Medulla Oblongata*, near the Annular Protuberance; whence they march out between two Branches of the Cervical Artery; and passing out of the Skull at an irregular oblong hole, immediately under the former, are spent on those Muscles of the Eyes call'd *Acrotic*, *Depressor*, *Abductor*, and *Obliquus inferior*; except some small Fibres spent in the Muscles of the upper *Palpebra*. See EYE.

**PATHETIC NERVES**, arise behind the *Tegula*, and passing out of the Skull at the same Foramen with the former Pair, spend themselves wholly on the Trochlear Muscle.

**Fifth Pair of NERVES**, the largest of all those coming from the Brain, has its use as well as distribution more extensive; serving both for Sense and Motion, for Touch and Taste. It sends Branches not only to the Eyes, Nose, Palate, Tongue, Teeth, and most parts of the Mouth and Face, but also to the Breast, lower Venter, *Præcordia*, &c. by means of the Intercostals, which are partly composed of Branches of this *Nerve*; whence arises a Consent or Sympathy between the several Parts of the Body. See CONSENT of Parts.

It arises from the Annular Protuberance, near the *Processus Cerebelli*, and is at its Origin very large, but before its egress from the *Dura Mater* is divided into two Branches, each consisting of innumerable nervous Fibres, whereof those of one Branch are pretty tough and firm, the other soft and lax. A little beyond the *Sella*, it forms a *Plexus* call'd *Gangliiformis*, near which, each *Nerve* is divided into an anterior and posterior Branch.

The anterior or Fore-Branch, after a few Twigs sent to the *Dura Mater*, enters the Receptacle on each side the *Sella*; whence it sends off one or two Twigs to the Intercostal; and as soon as it emerges thence, is again subdivided into three nearly equal Branches. The uppermost passing the Foramen *Lacernum* into the Orbit of the Eye, is immediately subdivided into three less Branches; the first of which, after sending Twigs to the *Tunica Adnata*, *Glandula Lacrymalis*, the Muscles that draw up the Nose, and the orbicular Muscles, running over the Muscle which draws up the upper Eye-lid, is spent on the Muscles of the Forehead, and the common Integuments of the forehead of the Head.

The second Branch running under the *Patheticus* and *Natorum*, is divided into two; whereof the outer and smaller sends off several *Fibrille* into the Fat that envelopes the Optic *Nerve*; and joining with others from the third Pair, forms a sort of *Plexus* on the Trunk of the Optic *Nerve*; whence *Fibrille* are detach'd into the *Musculus Depressor*, *Abductor*, and the *Tunica Sclerotica*. The inner and bigger Slip is subdivided into four Twigs; the first running over the Optic *Nerve*, enters the *Sclerotica*, and is spent in that Membrane. The second, returning into the Skull by a peculiar Perforation, pierces the *Dura Mater*, and, sometimes turning back again, passes out of the Skull thro' one of the Holes of the *Gibriforme*, and is distributed into the interior Membrane of the Nose. The third Twig is spent partly on the Eye-lids and their orbicular Muscles, the external Integument of the Nose, and the Muscles which draw it upwards. The fourth is distributed by several Twigs into the Eye-lids and orbicular Muscles. The third Slip of the upper Branch is spent on the *Glandula Insensitiva* and *Tunica Adnata*.

The less inferior Branch, e'er it leave the Skull, enters the Orbit of the Eye, and running along the outside of the *Musculus Abductor*, goes out again at a little Perforation peculiar to it; after which it divides into several Fibres, some of which go to the Integuments of the Cheeks; the rest to the Muscles that raise the upper Lip. As soon as it quits the Skull at the third Foramen, it is subdivided into three little Branches, the first of which, after some Twigs bestowed on the *Maffeter*, the Teguments of the Face, the Gums, and upper Teeth; enters a peculiar Sinus of the Bone making the lower part of the Orbit, and goes out at a Hole particular to it; after which it divides into several *Fibrille* which go to the Teguments of the Face, the upper Lip, the Muscle that draws the lower part of the Nose laterally, and the inner Muscle of the Nose.

The second small Branch running downwards behind the *Ducts* which go from the Nose to the *Faeces*, is divided

into two; the upper whereof is distributed by many Twigs into the *Membrana Pituitaria*. The lower, passing a peculiar Hole on the hind and lateral part of the Bone of the Palate, is distributed into that spongy Flesh that lines the Palate, and the tough Membrane that covers it.

The third little Branch is spent on that part of the *Membrana Pituitaria* that lines the *Fauces* upon the *Uvula* and Muscles thereabouts, and upon the *Tongue*.

The greater or posterior Branch, after sending a few Twigs to the *Dura Mater*, passes the Skull thro' the fifth Foramen; and having sent off some Twigs to the *Buccinator*, *Maffeter*, and the Muscles of the lower Jaw, is divided into three considerable Branches.

The first passes to the Root of the Tongue, and thence proceeding forwards, sends several Branches to the Maxillary Glands. It sends others along the inner Substance of the Tongue, which end in Capillaries at its Extremity, and joining every where with the Branches of the ninth Pair, serve both the Muscles and Papillary Glands, and contribute to the Taste, as well as the Motion of the Tongue.

The second, or middle Branch, after distributing a Twig into the Maxillary Glands, and the Muscles *Styloglossus*, and *Myloglossus*, enters the hollow of the lower Jaw, along which it runs accompanied with Branches of the Carotid Arteries and little Veins, which return to the internal Jugulars; and besides sending off a Twig to each Tooth, with the Membranes of the foresaid Vessels, contributes to form a Membrane which lines the whole Sinus. At the fourth Grinder it divides into two; the less whereof runs to the joining of the Jaw; the bigger, passing out at a peculiar Perforation, is divided into several Fibres, which are disposed into the Muscles of the lower Lip and Chin.

The third or exterior Branch, is spent on the parotid Glands.

Sixth Pair of NERVES, or the *Gastrosii*, rise from the Medullary Tracts of the *Centrum Ovale*, below the annular Process, and proceeding forwards, enters the same Receptacle, or Sinus of the Skull, on the side of the *Sella*, as the fifth Pair does; whence sending off a Twig to join those of the fifth Pair, in their passage to the Intercostals, it goes out of the Skull at the same Hole with the *Motorii Oculorum*, and ends in the abducent Muscles of the Eye; sending whilome Twigs to the Tongue. See TONGUE.

The Seventh Pair, or *Auditory NERVES*, arising from the medullary Tract of the fourth Ventricle, and passing out of the Skull thro' a Hole of the *Ori Petrosum*, divides into two Branches, or *Portions*, a hard and a soft one. The hard entering a little Sinus in the upper part of the Bone that continues the Barrel of the Ear; sends off a Twig which distributes itself into the *Dura Mater*, except some small Twigs which go to the Membrane that lines the Ear, to the internal Muscles that line the Ear, and the fine Membrane that clothes the inside of the Cavity of the *Sphynx Mammillaris*. After this, the hard Branch sends off two other Twigs, one to the eighth Pair, the other to the *Tympanum*, whose Chord it forns; whence creeping over the *Malleolus*, it goes out of the Ear, and sends a Ramification to the Tongue.

The same hard Branch, coming out of the *Processus Mammillaris*, sends some Twigs to the *Maffeter*, and others to the Glands about the Ear; where it divides into two other Ramifications; the interior bestowed on the Glands, the Cheek, and the upper Lips, the rest on the lower *Palpebra*, and the external part of the Face. The exterior Ramification, bestowing some *Fibrille* on the Glands, out of which it issues, divides into two; the upper distributed into the *Quadratus* and outer parts of the under Lip; the lower spent on the Integuments of the fore and lateral part of the Neck, lower Jaw, and the *Maffoid* Muscle.

The soft and larger *Portion* of this Pair divides into three Ramifications, the upper whereof passes a small Foramen into the *Concha*, where expanding, it forms a fine Membrane which lines its inner Surface. The second and third Ramifications are also spent on the inner parts of the *Concha* and semicircular *Ducts*, which they furnish with Membranes, the immediate Organs of Hearing. See HEARING.

Eighth Pair of NERVES, or the *Par Vagum*, springs from the *Medulla Oblongata*, a little above the *Olivaria Corporis*, and passes out of the Skull thro' the same Perforations with the lateral *Sinus* of the *Dura Mater*.

This, in its progress, is join'd by the *Par Accessorius*, and a little further by a Twig of the hard part of the seventh Pair, and at the second *Vertebra* of the Neck by the *Nerve* that issues from the Cervical Marrow; and detaches several Twigs to the Muscles of the *Larynx*, *Gula*, Neck, &c. particularly the *Gangliiform Plexus*, form'd by its Union with a Branch of the Intercostal. Hence descending to the *Thorax*, it makes another *Plexus* under the *Clavicula*, whence arises the *Recurrent Nerve* on the right side, as on the left it has its Rise from the Trunk of the *Nerve* itself. The right *Recurrent* is reflected at the Axillary Artery, the left at the descending Branch of the *Aorta*; each running aside the

*Trachea*, impart some Twigs to it, and terminate in the Muscles of the *Larynx*. Their Use is in the Formation and Modulation of the Voice. See VOICE.

Against the Origin of the *aorta* it sends off a Branch towards the Heart; which dividing into two, the lesser twigs about the Pulmonary Vein; the bigger proceeds to the *Pericardium*, and Heart; after having cut off a Twig, which with others from the Intercostals, make the *Plexus Cordiacus superior*: proceeding still farther, it sends out several Ramifications, which, meeting together, make the *Plexus Pneumonicus*, whence arise Fibres that constrict the Vessels and Vesicles of the Lungs. In its Passage downwards, it distributes several Branches to the *Oesophagus*, along which it runs.

About the lower Vertebrae of the Neck, the Trunk divides into two Branches, the external and internal, communicating all along by several Ramifications, and at length reuniting. The rest of this Pair joins with the Intercostals in the formation of several *Plexus*'s in the lower Venter, and in them seems to terminate. See PLEXUS.

Along with these, and wrapp'd up in the same Coat from the *Dura Mater*, passes the

*Accessory NERVE*, or *Par Accessorium*. It has its Origin from the *Medulla* contain'd in the Vertebrae of the Neck. Soon after its return out of the Skull, it leaves the *Par Vagus* again, and is distributed into the Muscles of the Neck and Shoulders.

*Intercostal NERVES*, consist of nervous Filaments derived partly from the Brain, viz. Branches of the fifth and sixth Pair; and partly from the Spinal Marrow, by those Branches they receive from the Vertebrae Nerves.

In each Trunk of these Nerves, e'er it arrives at the Thorax, are two *Cervical Plexus*'s, the upper whereof receives a Branch from each Trunk of the *Par Vagus*; the under sends out several Ramifications to the *Oesophagus* and *Aspera Arteria*, and particularly a large one to the recurrent Nerve. From the same *Plexus* descend two other Ramifications to the *Cardiac Plexus*; which are join'd a little lower by a third, from which the *Intercostal Nerve* descending to the Clavicles, divides into two, and embraces and constricts the subclavian Artery; thence entering the Thorax, it receives three or four Twigs from the upper *Vertebrae Nerves*, together with which it constitutes the *Intercostal Plexus*; and thence descending along the sides of the Vertebrae, and receiving a nervous Twig from each of them to the *Os Sacrum*, and entering the Abdomen, it forms several considerable *Plexus*'s, viz. the *Lienaris*, *Hepaticus*, the two *Renales*, *Mesentericus magnus*, and two little ones in the *Pelvis*. See PLEXUS.

Ninth Pair of NERVES, *Motus Linguae*, arise from the middle of the *Centrum Ovale*, by three or four small Twigs, and go out of the Skull near the Process of the *Occiput*; and send their Branches to the Tongue.

They may be likewise call'd *Gustatorii*, as they contribute, together with the Branches of the fifth and sixth Pair, to the Sensation of Tasting. See TASTING.

Tenth Pair of NERVES, arise by two or three Branches from the *Medulla oblongata*, just below the *Corpora Pyramidalia* and *Olivaria*, or rather, at the beginning of the *Medulla Spinialis*; whence reflecting a little backwards, it goes out of the Skull between the first Vertebra of the Neck, and the Process of the *Occiput*.

It is spent on the external Muscles of the Head and Ears. See EAR, &c.

*NERVES from the Spinal Marrow.*

The *Spinal NERVES*, (i. e. those springing from the *Medulla* after its egress out of the Skull, where it lays aside the name *Oblongata*, and assumes that of *Spinialis*) are thirty Pair: Of which, some are reckoned as belonging to the Neck, as having their Origin thence, and call'd *Cervical Nerves*; others to the *Dorsum*, or Back, and call'd *Dorsal Nerves*; others to the Loins, call'd *Lumbal Nerves*, and the rest to the *Os Sacrum*.

*Cervical NERVES*. Of these there are seven Pair: The first Pair arise between the first and second Vertebra of the Neck, and, contrary to the rest, come out before and behind; whereas the other six Pair come out laterally from the Junctures of the Vertebrae, thro' particular Perforations near the transverse Processes. They go to the Muscles of the Head and Ear.

The second Pair contributes the main Branch towards the formation of the *Diaphragmatic Nerves*, which, according to *Vicquien*, spring only from the fourth and sixth Pair.

The three last Pair of the Neck joining with the two first of the *Dorsum*, or Thorax, make the *Brachial Nerve*.

All the *Cervical Nerves* send innumerable Branches to the Muscles, and other parts of the Head, Neck, and Shoulders.

*Dorsal NERVES* are in number twelve. These, excepting what the two upper pair contribute to the *Brachial*

*Nerves*, are generally distributed into the Intercostal and Abdominal Muscles, the *Pleura* and external parts of the Thorax.

*Lumbal NERVES*, are five Pair: The first of which sends two Branches to the lower side of the Diaphragm. The second some Twig to the General Parts, and others, as well as the three following, to give the first Roots to the *Cranial Nerves*. The rest of the Branches of the *Lumbal Nerves* are distributed into the Muscles of the Loins and adjacent Parts.

*NERVES of the Os Sacrum*, are six Pair; the first three or four Pair whereof are bestow'd wholly on the *Cranial Nerves*; the rest on the Muscles of the *Atus Vesicae*, and General Parts.

*Brachial NERVES*, are the Offspring, partly of the *Cervical*, and partly of the *Dorsal*. These, after the several Branches whereof they are compos'd have been variously complicated and united, run but a little way in a Trunk e'er they divide again into several Branches, variously distributed into the Muscles of the Skin and Arms.

*Diaphragmatic NERVES*, are likewise the Offspring of the *Cervical*. These, after joining in a Trunk, run thro' the *Mediastinum* undivided, till they arrive near the Diaphragm, into which they send off several Branches; some into the Muscular, others into the Tendinous part of it.

*Cranial NERVES*, consist of an Union of six or seven Pair, viz. the three last of the *Lumbal*, and three or four first of the *Os Sacrum*. These, after having spent their upper Branches on the Muscles of the Thigh and Skin, as far as the Knee, proceed in a Trunk downwards, which sends its Branches to the Extremities of the Toes, supplying as it goes, the Muscles and Skin of the Leg and Foot. This is the largest and firmest nervous Trunk in the Body.

*NERVES*, in Botany, are long, tough, Striops running either a-crofs, or length-wis of the Leaves of Plants. See LEAVES.

*NERVES*, in Architecture, are the Mouldings of the Projecting-Arches of Vaults; or those arising from the Branches of Ogives, and crossing each other diagonally in Gothic Vaults, serving to separate the Pendentives. See VAULT, OGIVE, &c.

*NERVOSA Corpora*, in Anatomy. See CAVERNOSA Corpora.

*NERVOUS Spirit*, or Juice, is a pure, subtle, volatile Humour, better known by the Name of *Animal Spirit*; secreted from the Arterious Blood in the Cortical Part of the Brain, collected in the *Medulla Oblongata*, and thence driven, by the force of the Heart, into the Cavities of the Nerves; to be convey'd by them throughout the Body, for the Purposes of Sensation and Animal Motion. See SPIRIT.

NEST, see NIDUS.

*NESTORIANS*, a Sect of ancient Heretics; still, as 'tis said, subsisting in some parts of the Levant.

They take their Name from *Nestorius*, who, of a Monk, became a Priest, and a celebrated Preacher, and was at length, after the Death of *Sylvestrius* in 428, rais'd by *Theodosius* to the See of *Constantinople*.

At first he shew'd a world of Zeal against Heresy in his Sermons before the Emperor; but at length taking the liberty to say, that he found in Scripture, that *Mary* was the Mother of *Jesus*, but that he no where found, that *Mary* was the Mother of God, his Auditory was shock'd, and a great part of 'em retir'd from his Communion.

His Writings were soon spread thro' *Syria* and *Egypt*, where he made many Converts, notwithstanding the vigorous Opposition of *St. Cyril*.

His distinguishing Tenet was, that there are two Persons in *Jesus Christ*; and that the Virgin was not his Mother as God, but only as Man.

The Doctrine was condemn'd in the Council of *Ephesus*, at which assisted above 200 Bishops; and *Nestorius* was anathematiz'd and deposed from his See.

*Nestorius* was not the Author of this Error; but borrow'd it at *Antioch*, where he had studied. *Theodosius Mopsuestianus* had taught the same before him.

'Tis something difficult to determine whether or no the *Coelites* Christians, who still profess *Nestorianism*, have precisely the same Sentiments with *Nestorius*, whom they still esteem as their Patriarch. They have made several Reunions with the *Romish* Church, but none of 'em have subsisted long. The most considerable was that under the Pontificate of *Paul V*.

Till the time of *Pope Julius III*, they acknowledg'd none but one Patriarch, who assumed the Quality of Patriarch of *Babylon*; but a division arising among 'em, the Patriarchate became divided, at least for a Time; and a new Patriarch was appointed by that Pope, who made his Residence at *Caesarea* in *Mesopotamia*; whose Successor, however, unable to withstand the Power of the Patriarch of *Babylon*, was obliged to retire within the Confines of *Persia*. Thus

Matters stood till the Pontificate of *Paul V.* under whom there was a solemn Re-union with the *Romish Church*, whom their Patriarch solemnly own'd for the Mother, &c. of all Churches; sending his Ministers to Rome to negotiate the Union, and composing an Explication of the Articles of Religion, where their Disputes with the *Romish Church* were represented as only verbal, &c.

**NET, NEAT**, in Commerce, something pure, and adulterated with any foreign Mixture.

Thus, Wine is said to be *Net* when not falsify'd or balderdash'd; and Coffee, Rice, Pepper, &c. are *Net*, when the Filth and Ordure are separated from them.

A Diamond is said to be *Net* when it has no Stains or Flaws; a Crystal, when transparent throughout.

**NET** is also used for what remains after the Tare has been taken out of the Weight of any Merchandize; i. e. when it is weigh'd clear of all Package. See **TARE**.

Thus we say, a Barrel of Cochineal weighs 450 Pounds; the Tare is 50 Pounds, and there remains *Net* 400 Pounds.

**NET-PRODUCE**, a Term used to express what any Commodity has yielded, all Tare and Charges deducted.

The Merchants sometimes use the *Italian Words*, *Netto procedido*, for *Net-PRODUCE*.

**NET-MASONRY**, see **MASONRY**.

**NETE Hyperboreum**, in the ancient Music, the name of the highest and most acute of the Chords of the Lyre, or the ancient Scale, or Diagramma. See **DIAGRAMMA**.

It answer'd to the *A, mi, la*, of the third Octave of the Organ, or the modern System.

The Word is composed of the *Greek* *νετη* and *υπερβολων*, i. e. *The last of the highest Chords*.

**NETE Diastemmenon**, in the Ancient Music, was one of the Chords of the Lyre, or System of the Antients. See **DIAGRAMMA**.

It answer'd to the *E, fi, mi*, of the third Octave of the Organ, or modern System.

The Word comes from the *Greek* *νετη* and *διαστηματον*, *last of the separate ones*; where is understood the word *Chord*.

**NETE Synemmenon**, in the Ancient Music, the Name of the highest Chord of a Tetrachord of the *Greek System*, added to make the *b* *soft* fall between the *Mesè* and *Paramesè*, i. e. between *la* and *si*. See **DIAGRAMMA**.

This Chord had the same Sound with the *Parante Diastemmenon*, or our *la* by *b* *musit*.

The Word comes from the *Greek* *νετη* and *συνεμμενον*, *the last of those added*; where is understood the word *Chord*.

**NEURITICS**, or **NERVINES**, in Medicine, Remedies proper for Discauses of the Nerves, and Joints.

Such are Betony, Lavender, Rosemary, Sage, Laurel, Marjoram, and other among the Cephalics.

The Word is form'd from the *Greek* *νευρις*, *Nervus*. Hence also

**NEUROGRAPHIA**, in Anatomy, a Description of the Nerves. See **NERVE**.

**Raim. Vreidstus**, a Physician of Montpellier, has an excellent Treatise in *Latin*, under the Title *Neurographia Universalis*, where he shews, that there are more Ramifications of the Nerves in the Skin, than in the Muscles, and all the other parts. See **SKIN**.

**Duncan**, another Physician of the same Place, has a Treatise call'd *Neurographia Rationalis*.

*Neurographia* is something more general than **NEUROLOGY**, which implies a Discourse of the Nerves; in as much as the former may be understood, not only of Discourses on the Nerves, but also of Figures and Engravings, representing them; whereas the latter is restrained to discoursing alone.

**NEUTER**, a Person free or indifferent, who has espous'd neither Party, and is neither Friend nor Foe.

Thus we say a Judge is to be *Neuter* in the Causes he judges; and thus, we say, in Questions, where Reason appears *Neuter*, a Man must ever incline to the Side of the Unhappy.

**NEUTER**, in Grammar, is used for a sort of Gender of Nouns which are neither Masculine, nor Feminine. See **GENDER**.

The *Latins* have three kinds of Genders, Masculine, Feminine, and *Neuter*. In *English*, and other modern Tongues, there is no such thing as *Neuter Nouns*. See **NOON**.

**Verbs NEUTRA**, by some Grammarians call'd *Intransitive Verbs*, are those that govern nothing, and that are neither active nor passive. See **VERB**.

When the Action express'd by the Verb has no Object to fall upon, but the Verb alone supplies the whole Idea of the Action, the Verb is said to be *Neuter*; as *I sleep*, *you yawnest*, *he sneezes*, *we walk*, *ye run*, *they stand still*.

Some divide *Verbs Neuter* into, *1<sup>st</sup>*, Such as don't signify any Action, but a Quality; as *albert*, it is white; or a Situation, as *foeter*, he sits; or have some relation to Place, as

*albert*, he is present; or some other State or Attribute, as *regnat*, he rules, &c.

And, *adly*, those that do signify Actions, tho' those such as don't pass into any Subject different from the Actor; as *to drive*, *to leap*, *to play*, &c.

But this latter kind sometimes cease to be *Neuter*, and commence active; especially in *Greek* and *Latin*, when a Subject is given them; as *vivere vitam*, *ambulare viam*, *pugnare pugnam*. Thus the old *French Poets* say, *Soupirer son tourment*; the *English*, *to sigh his Woe*, &c.

But this is observed only to obtain where something particular is to be express'd, not contain'd in the Verb; as *vivere vitam beatam*, to live a happy Life; *pugnare bonam pugnam*, to fight a good fight, &c.

According to the *Abbot de Dangeau*, *Verbs Neuter* may be divided into *active* and *passive*; the first those that form their Tenses in *English* by the auxiliary Verb *to have*; in *French* by *avoir*. The second those that form them in *English* with the Verb *to be*; in *French*, *ere*.

Thus, *to sleep* and *to yawn*, *to derome* and *to errare*, are *Neuters active*. *To come*, and *to arrive*, are *Neuters passive*.

The same Author subdivides each Kind into several Branches. See **VERB**.

**NEUTRALITY**, the State of a Person or Thing that is *Neuter*. See **NEUTER**.

**NEUTRAL Salts**, among Chymists, are a sort of intermediate Salts between Acids and Alkalies; partaking of the nature of both. See **SALT**, **ACID**, and **ALKALY**.

**Mr. Boyle** also gives the Appellation *Neutral* to a sort of Spirits, differing in divers Qualities both from Vinous, Acid, and Urinous Spirits. These he also calls *Anonymous* and *Adspersion* Spirits. See **ADSPERSION**.

**NEWEL**, in Architecture, the upright Post, which a Pair of Winding Stairs turn about; or that part of the Stair-Case which sustains the Steps. See **STAIR**.

The *Newel* is a Cylinder of Stone, which bears on the Ground, and is form'd by the ends of the Steps of the Winding-Stairs.

There are also *Newels* of Wood, which are pieces of Wood placed perpendicularly, receiving the Tenants of the Steps of Wooden-Stairs into their Mortices, and wherein are fitted the Shafts and Rails of the Stair-Case, and the Flights of each Story.

**NEW-MOON**, that State of the Moon a little before, and a little after her Conjunction with the Sun. See **MOON** and **CONJUNCTION**.

**NEWTONIAN Philosophy**, the Doctrine of the Universe, and particularly of the heavenly Bodies; their Laws, Affections, &c. as deliver'd by Sir *Isaac Newton*. See **PHILOSOPHY**.

The Term *Newtonian Philosophy*, is apply'd very differently; whence divers confused Notions relating thereto.

Some Authors, under this *Philosophy*, include all the Corpufcular *Philosophy* consider'd as it now stands correct'd and reform'd; by the Discoveries and Improvements made in several parts thereof, by Sir *I. Newton*. In this sense it is that *Gravesande* calls his *Elements of Physics*, *Introductio ad Philosophiam Newtonianam*.

And in this sense the *Newtonian* is the same with the *New Philosophy*, and stands contradistinguish'd to the *Cartesian*, the *Peripatetic*, and the ancient *Corpufcular*. See **CORPUSCULAR**, **PERIPATETIC**, **CARTESIAN**, &c.

Others, by *Newtonian Philosophy*, mean the Method or Order which Sir *I. Newton* observes in philosophizing; viz. the Reasoning, and drawing of Conclusions directly from Phenomena, exclusive of all previous Hypotheses; the beginning from simple Principles; deducing the first Powers and Laws of Nature from a few select Phenomena, and then applying those Laws, &c. to account for other things. To this Purpose, the same *Gravesande* explains himself in his *Institut. Newton. Philof.*

And in this sense, the *Newtonian Philosophy* is the same with the *Experimental Philosophy*; and stands oppos'd to the Ancient *Corpufcular*. See **EXPERIMENTAL**, &c.

Others, by *Newtonian Philosophy*, mean that wherein Physical Bodies are consider'd Mathematically; and where Geometry and Mechanics are apply'd to the Solution of Phenomena: In which sense, the *Newtonian* is the same with the *Mechanical* and *Mathematical Philosophy*. See **MACHANICAL**.

Others, again, by *Newtonian Philosophy*, understand that part of Physical Knowledge, which Sir *I. Newton* has handled, improved, and demonstrated, in his *Principia*.

Others, lastly, by *Newtonian Philosophy*, mean, the new Principles which Sir *I. Newton* has brought into *Philosophy*; the new System founded thereon; and the new Solution of Phenomena thence deduced; or that which characterizes, and distinguishes his *Philosophy* from all others. Which is the sense wherein we shall here chiefly consider it.

As to the History of this *Philosophy*, we have but little to say: It was first made public in the Year 1686, by the

Author, then a Fellow of *Trinity-College, Cambridge*; and in the Year 1713, republished with considerable Improvements. Several other Authors have since attempted to make it plainer; by setting aside many of the more sublime Mathematical Researches, and substituting either more obvious Reasonings, or Experiments, in lieu thereof; particularly *Whiston* in his *Prolett. Phys. Mathematicar. and Græcæ* and in *Element. & Infit.*

Notwithstanding the great Merit of this Philosophy, and the universal Reception it has met with at home, it gains ground very slowly abroad; *Newtonianism* has scarce two or three Adherents in a Nation; but *Cartesianism*, *Huygenianism*, and *Leibnitzianism* remain still in possession.

The *Philosophy* itself is laid down chiefly in the third Book of the *Principia*. The two preceding Books are taken up in preparing the way, and laying down such Principles of Mathematicks as have the most relation to *Philosophy*: Such are the Laws and Conditions of Powers. And these, to render them less dry and geometrical, the Author illustrates by *Sevelis* in *Philosophy*, relating chiefly to the Density and Resistance of Bodies, the Motion of Light, and Sounds, a Vacuum, &c.

In the third Book he proceeds to the *Philosophy* itself; and from the same Principles deduces the Structure of the Universe; and the Powers of Gravity, whereby Bodies tend towards the Sun and Planets; and from these Powers, the Motions of the Planets and Comets, the Theory of the Moon and the Tides.

This Book, which he calls de *Mundi Systemate*, he tells us, was first wrote in the popular way: But considering, that such as are unacquainted with the said Principles, would not conceive the Force of the Consequences, nor be induced to lay aside their ancient Prejudices; for this Reason, and to prevent the thing from being in continual Dispute; he digested the Sum of that Book into Propositions, in the Mathematical manner; so as it might only come to be read by such as had first consider'd the Principles. Not that it is necessary, a Man should master them all. Many of them, even the first-rate Mathematicians, would find a Difficulty in getting over. 'Tis enough to have read the Definitions, Laws of Motion, and the three first Sections of the first Book; after which, the Author himself directs us to pass on to the Book de *Systemate Mundi*.

The several Articles of this *Philosophy*, are deliver'd under their respective Heads in this Dictionary; as SUN, MOON, PLANET, COMET, EARTH, AIR, CENTRIPETAL Force, RESISTANCE, MEDIUM, MATTER, SPACE, ELASTICITY, &c. A general Idea, or Abstract of the Whole, we shall here gratify the Reader withal; to shew in what Relation the several Parts stand to each other.

The great Principle on which the whole *Philosophy* is founded, is the Power of Gravity. This Principle is not new: *Kepler*, long ago, hinted it in his *Inventio. ad Mot. Martis*. He even discover'd some of the Properties thereof, and their Effects in the Motions of the primary Planets: But the Glory of bringing it to a Physical Demonstration was reserved to the *English Philosopher*. See GRAVITY.

His Proof of the Principle from Phenomena; together with the Application of the same Principle to the various other Appearances of Nature, or the deducing those Appearances from that Principle, constitute the *Newtonian System*; which, drawn in Miniature, will stand thus.

I. The Phenomena are, 1. That the Satellites of *Jupiter* do, by Radii drawn to the Center of the Planet, describe Areas proportional to their Times; and that their Periodical Times are in a sesquialterate Ratio of their Distances from its Centre: in which all Observations of all Astronomers agree. 2. The same Phenomenon holds of the Satellites of *Saturn*, with regard to *Saturn*; and of the Moon with regard to the Earth. 3. The periodical Times of the primary Planets about the Sun, are in a sesquialterate Ratio of their mean Distances from the Sun. But, 4. The primary Planets do not describe Areas any way proportional to their periodical Times, about the Earth; as being sometimes seen Stationary, and sometimes Retrograde with regard thereto. See SATELLITES, PERIODS, &c.

II. The Powers whereby the Satellites of *Jupiter* are constantly drawn out of their resistilinear Course, and retain'd in their Orbits, do respect the Center of *Jupiter*, and are reciprocally as the Squares of their Distances from the same Centre. 2. The same holds of the Satellites of *Saturn* with regard to *Saturn*; of the Moon with regard to the Earth: And of the primary Planets with regard to the Sun. See CENTRIPETAL Force.

III. The Moon gravitates towards the Earth, and by the Power of that Gravity is retain'd in her Orbit: And the same holds of the other Satellites with respect to their primary Planets; and of the Primaries with respect to the Sun. See MOON.

As to the Moon, the Proposition is thus proved: The Moon's mean distance is 60 Semidiameters of the Earth; her Period, with regard to the fix'd Stars, is 27 Days, 7

Hours, 45 Minutes; and the Earth's Circumference 123249600 Paris Feet. Now, supposing the Moon to have lost all its Motion, and to be let drop to the Earth, with the Power which retains her in her Orbit; in the space of one Minute she will fall  $15 \frac{1}{2}$  Paris Feet; the Arch she describes in her mean Motion at the distance of 60 Semidiameters of the Earth being the versed Sine of  $15 \frac{1}{2}$  Paris Feet. Hence, as the Power as it approaches the Earth, increases in a duplicate Ratio of the distance inversely; so, as at the Surface of the Earth, 'tis 60 x 60 greater than the Moon: A Body falling with that Force in our Region must, in a Minute's time, describe the space of 60 x 60 x  $15 \frac{1}{2}$  Paris Feet; and 15 Paris Feet in the space of one Second.

But this is the Rate at which Bodies fall, by their Gravity, at the Surface of our Earth; as *Huygens* has demonstrated, by Experiments with Pendulums. Consequently, the Power whereby the Moon is retain'd in her Orbit, is the very same we call Gravity: For if they were different, a Body falling with both Powers together, would descend with double the Velocity, and in a Second of Time describe 30 x Feet. See DESCENT of Bodies.

As to the other secondary Planets, their Phenomena with respect to their primary ones, being of the same kind with those of the Moon about the Earth; 'tis argued, by Analogy, they depend on the same Causes: It being a Rule or Axiom all Philosophers agree to, That Effects of the same kind, have the same Causes. Again, Attraction is always mutual, i. e. the Reaction is equal to the Action. Consequently, the primary Planets gravitate towards their secondary ones; the Earth towards the Moon, and the Sun towards 'em all. And this Gravity, with regard to each several Planet, is reciprocally as the Square of its distance from its Centre of Gravity. See ATTRACTION, REACTION, &c.

IV. All Bodies gravitate towards all the Planets; and their Weights towards any one Planet, at equal distances from the Centre of the Planet, are proportional to the Quantity of Matter in each.

For the Law of the Deflect of heavy Bodies towards the Earth, setting aside their unequal Retardation from the Resistance of the Air, is this; that all Bodies fall equal spaces in equal times: But the nature of Gravity or Weight, no doubt, is the same on the other Planets, as on the Earth. See WEIGHT.

Suppose, e. g. such Bodies raised to the Surface of the Moon, and together with the Moon deprived at once of all Progressive Motion, and drop'd towards the Earth: 'Tis shewn, that in equal Times they will describe equal Spaces with the Moon; and, therefore, that their Quantity of Matter is to that of the Moon, as their Weights to its Weight.

And, that since *Jupiter's* Satellites revolve in times that are in a sesquialterate Ratio of their Distances from the Centre of *Jupiter*, and consequently at equal Distances from *Jupiter* their accelerating Gravities are equal; therefore, falling equal Altitudes in equal Times, they will describe equal Spaces: just as in heavy Bodies on our Earth. And the same Argument will hold of the primary Planets with regard to the Sun. And the Powers whereby unequal Bodies are equally accelerated, are as the Bodies; i. e. the Weights are as the Quantities of Matter in the Planets. And the Weights of the primary and secondary Planets towards the Sun, are as the Quantities of Matter in the Planets and Satellites.

And hence are several Corollaries drawn relating to the Weights of Bodies on the Surface of the Earth, Magnetism, and the Existence of a Vacuum. Which see under the Articles VACUUM, WEIGHT, and MAGNETISM.

V. Gravity extends itself towards all Bodies, and is in proportion to the Quantity of Matter in each.

That all the Planets gravitate towards each other, has been already shown; likewise, that the Gravity towards any one consider'd apart, is reciprocally as the Squares of its Distance from the Centre of the Planet: Consequently, Gravity is proportional to the Matter therein. Further, As all the Parts of any Planet, A, gravitate towards another Planet, B; and the Gravity of any part is to the Gravity of the whole, as the Matter of the part is to the Matter of the whole; and Reaction equal to Action: The Planet B will gravitate towards all the Parts of the Planet A; and its Gravity towards any part, will be to its Gravity towards the whole, as the Matter of the part is to the Matter of the whole.

Hence, we derive Methods of finding and comparing the Weights of Bodies towards different Planets; of finding the Quantity of Matter in the several Planets; and their Densities: Since the Weights of equal Bodies revolving about Planets, are as the Diameters of their Orbits directly, and as the Squares of the Periodical Times, inversely; and the Weights at any distance from the Centre of the Planet are greater or less in a duplicate Ratio of their distances, inversely: And since the Quantities of Matter

n the Planets are as their Powers at equal Distances from their Centres: And, lastly, since the Weights of equal <sup>2</sup>nd homogeneous Bodies towards homogeneous Spheres, are, at the Surfaces of the Spheres, as the Diameters of those Spheres; and, consequently, the Densities of heterogeneous Bodies are as the Weights at the Diameters of the Spheres. See DENSITY.

VI. The common Centre of Gravity of the Sun, and all the Planets, is at rest: And the Sun, tho' always in Motion, yet never recedes far from the common Centre of all the Planets.

For, the Matter in the Sun being to that in *Jupiter* as 1035 to 1; and *Jupiter's* distance from the Sun to the Semi-diameter of the Sun in a Ratio somewhat bigger; the common Centre of Gravity of *Jupiter* and the Sun, will be a Point a little without the Sun's Surface. And by the same means the common Centre of *Saturn* and the Sun will be a Point a little within the Sun's Surface: And the common Centre of the Earth, and all the Planets will be scarce one Diameter of the Sun distant from the Centre thereof. But the Centre is always at rest: Therefore, tho' the Sun will have a Motion this and that way, according to the various Situations of the Planets, yet it can never recede far from the Centre. So that the common Centre of Gravity of the Earth, Sun, and Planets may be esteem'd the Centre of the whole World. See SUN and CENTRE.

VII. The Planets move in Ellipses that have their *Foci* in the Centre of the Sun; and describe Areas proportional to their Times.

This we have already laid down *à posteriori*, as a Phenomenon: And now, that the Principle of the heavenly Motions is shewn, we deduce it therefrom *à priori*. Thus: Since the Weights of the Planets towards the Sun are reciprocally as the Squares of their Distances from the Centre of the Sun; if the Sun were at rest, and the other Planets did not act on each other; their Orbits would be Elliptical, having the Sun in their common Umbilicus; and would describe Areas proportional to the Times: But the mutual Actions of the Planets are very small, and may be well thrown aside. Therefore, &c. See PLANET and ORBIT.

Indeed, the Action of *Jupiter* on *Saturn* is of some consequence; and hence, according to the different Situations and Distances of those two Planets, their Orbits will be a little disturbed. See DISTURBING Force.

The Sun's Orbit too, is sensibly disturbed by the Action of the Moon: And the common Centre of the two describes an Ellipsis round the Sun placed in the Umbilicus; and with a Radius drawn to the Centre of the Sun, describes Areas proportional to the Times. See EARTH and SATURN.

VIII. The Aphelia and Nodes of the Planets are at rest. Excepting for some inconsiderable Irregularities arising from the Actions of the revolving Planets and Comets.—Consequently, as the fix'd Stars retain their Position to the Aphelia and Nodes; they, too, are at rest. See NODE, STAR, &c.

IX. The Axis, or Polar Diameter of the Planets, is less than the Equatorial Diameter.

The Planets, had they no diurnal Rotation, would be Spheres; as having an equal Gravity on every side: But by this Rotation, the Parts receding from the Axis, endeavour to rise towards the Equator, which, if the Matter they consist of be fluid, will be affected very sensibly. Accordingly *Jupiter*, whose Density is found not much to exceed that of Water on our Globe, is observed by the Astronomers to be considerably less between the Poles, than from East to West. And on the same Principle, unless our Earth were higher at the Equator than towards the Poles, the Sea would rise under the Equator, and over-flow all near it. See SPHEROID.

But this Figure of the Earth, Sir *J. Newton* proves likewise *à posteriori*; from the Oscillations of Pendulums being slower, and smaller, in the Equatorial, than the Polar Parts of the Globe. See PENDULUM.

X. All the Moon's Motions, and all the Inequalities in those Motions, follow from these Principles: *E. gr.* Her unequal Velocity, and that of her Nodes, and Apogee in the Syzygies and Quadratures; the differences in her Eccentricity, and her Variation, &c. See MOON, QUADRATURE, SYZYGY, &c.

XI. From the Inequalities in the Lunar Motions, we can deduce the several Inequalities in the Motions of the Satellites. See SATELLITES.

XII. From these Principles, particularly the Action of the Sun and Moon upon the Earth, it follows, that we must have Tides; or that the Sea must swell and subside twice every Day. See TIDES.

XIII. Hence likewise follows, the whole Theory of Comets; as, that they are above the Region of the Moon, and in the Planetary Spaces; that they shine by the Sun's Light reflected from them; that they move in Conic Sections, whose Umbilici are in the Centre of the Sun;

and by Radii drawn to the Sun, describe Areas proportional to the Times; that the Orbits, or Trajectories, are very nearly Parabolas; that their Bodies are solid, compact, &c. like those of the Planets, and must therefore acquire an immense heat in their *Perihelia*; that their Tails are Exhalations arising from them, and encompassing them like Atmospheres. See COMET.

The Objections rais'd against this Philosophy, are chiefly against the Principle Gravity; which some condemn as an occult Quality, and others as a *miraculous*, and preter-natural Cause; neither of which have longer any room in found Philosophy. Others, again, set it aside, as destroying the Notion of Fortices; and others, as supposing a *Falsum*. But these are all abundantly obviated under the Articles GRAVITY, ATTRACTION, VORTEX, VACUUM, QUALITY, &c.

NEXUS of Matter, see COHESION.

NICHE, in Architecture, a Cavity, or Sinking, in the Thickness of a Wall; to place a Figure, or Statue in. See STATUE.

The larger Niches serve for Groups of Figures; the small ones for single Statues, sometimes only for Bulls.

The Word comes from the *Italian* *Nicchie*, Sea-Shell; in regard the Statue is here inclosed as in a Shell; or, perhaps, by reason of the Shell wherewith the Top of some of them is adorn'd.

Great Care must be taken to proportion the Niches to the Figures; and that the Pedicels of the Figures be proportion'd to the Niches.

Round NICHE, is that whose Plan and Circumference are Circular.

Square NICHE, That where they are Square.

Angular NICHE, That form'd in a Corner of the Building.

Ground NICHE, That which, instead of bearing on a Massive, has its Rise from the Ground; as the Niches of the Portico of the Pantheon at Rome: These are otherwise call'd Tribunals. See TRIBUNAL.

Niches are sometimes made with Rustic-work, sometimes with Shell-work, and sometimes of Crai'd, or Arbor-work.

NICHO LAITANS, or NICOLAITANS, one of the most ancient Sects in the Christian Church. It had its Name from *Nicholas*, a Person ordain'd a Deacon of the Church of *Jerusalem* together with *St. Stephen*.

The distinguishing Tenet of the *Nicholaitans*, as represented by Ecclesiastical Historians, is, that all Married Women should be common; to take away all occasion of Jealousy.

Other Authors tax *Nicholas* with other Impurities; but *Clement Alexandrinus* imputes them all to his Disciples, who, he says, abused their Master's Words. *Nicholas*, it seems, having a very beautiful Wife, was suspected by the Apostles as jealous of her, and as being a lascivious Man.

To remove this suspition, he call'd his Wife; and to shew he was not at all attach'd to her, offer'd any of them the liberty of espousing her. This is confirm'd by *Eusebius*, who adds, that *Nicholas* never had more than one Wife.

Other things charg'd on the *Nicholaitans*, are, That they made no scruple of eating Meats offer'd to Idols: That they maintain'd that the Father of *Jesus Christ* was not the Creator: That some of them adored one *Barbelo*, who inhabited the eighth Heaven, and who proceeded from the Father, and was the Mother of *Jaldabaoth*; or, according to others, of *Sabaoth*, who had forcibly taken possession of the seventh Heaven. Others of them gave the Name *Protonias* to the Mother of the heavenly Powers; but all ascribe infamous Actions to her, and with her authorize their own Impurities. Others siewed Books, and pretended Revelations under the Name of *Jaldabaoth*.

*Irenaeus* and *Epiphanius* relate these and other Extravagancies; and represent the *Nicholaitans* as Authors of the Sect of *Gnostics*. See GNOSTICS.

*Cocceius*, *Hoffman*, *Farring*, and *Mains*, take the Name *Nicholaitan* to be coin'd, to signify a Man addicted to Pleasure and Debauchery; adding, that it has nothing to do with *Nicholas* one of the seven Deacons. And, as the Doctrine of the *Nicholaitans* is mention'd in the *Apocalypse*, immediately after mention made of *Balaam*, and his Doctrine, they compare the two Names *Balaam* and *Nicholas*, which, in their Originals, the one in *Greek*, the other *Hebrew*, have nearly the same signification, *vid.* Prince, or Master of the People.

*Mains* adds, 'twas probable enough the *Nicholaitans* might value themselves on being the Disciples of one of the seven Deacons; but that it was without any ground; notwithstanding what the Antients, ever too credulous, have represented to the contrary.

NICOTIANA, or *Herba Nicotiana*, a Term given to Tobacco; from *Nicot* the French Ambassador at the Court of *Portugal*, who first sent it into France in 1560, and gave it his

his own Name; as he himself tells us in his Dictionary. See **TORACCO**.

**NICTITATING Membrane**, in Anatomy, a thin Membrane which covers the Eyes of several Creatures, and shelters them from Dust, or too much Light; yet is so thin, that they can see indifferently well through it. See **EVIL**.

The *Nictitating Membrane* is chiefly found in the Bird and Fish Kind. See **BIRD** and **FISH**.

This *Membrane* in the Eagle's Eye, is remarkably close and firm, insomuch as to be accounted as a second Eye-lid; and hence that remarkable Firmness of the Eagle's Sight in viewing the Sun. See **EAGLE**.

**NIDUS**, *Nest*, a Depository, wherein certain Animals, Fowls particularly, Insects, and Reptiles lodge their Eggs, for Incubation; and wherein, when hatch'd, they nurse their Young till they become able to shift for themselves.

The Word is *Latin*, and supposed to be derived from *Nider*, strong, or ill Smell; in regard the Nests of Animals usually stink.

Mr. *Derham* says, he has often wonder'd how Wasps, Hornets, and other Insects that gather dry Materials (as the Dust of Wood scraped off for that purpose) should find a proper Matter to cement and glue their Combs, and line their Cells; but he adds, That in all probability 'tis in their own Bodies: as in the *Tinea Feltivora*, the Cad-Worm, &c.

*Gedart* observes of his *Ernes* that fed on Leaves, that it made its Cell on Leaves glued together with its own Spittle.

**NIECE**, a Term relative to Uncle and Aunt, signifying Brother or Sister's Daughter; which, in the Civil Law, is the third Degree of Consanguinity, and in the Canon Law, the second. See **AGNATI** and **COGNATI**.

**NIENT** *Complaint*, in Law, an Exception taken to a Petitioner unjust; because the thing desired is not in that Act, or Deed wherein the Petition is grounded.

Thus, a Person desires of the Court to be put in Possession formerly adjudg'd to him among other Lands: The adverse Party pleads that this Petition is not to be granted, by reason the Petitioner had a Judgment for certain Lands and Houses, yet this House is not comprized therein.

**NIEPE**, **NEPE**, or **NEEP Tides**, are those Tides which happen when the Moon is in the middle of the second and last Quarters. See **TIDE**.

The *Niepe-Tides* are opposite to the Spring-Tides; and as the highest of the Spring-Tides is three Days after the Full or Change, so the lowest of the *Niepe* is four Days before the Full or Change; on which occasion the Seamen say, That it is *deep Niepe*.

When a Ship wants Water, so that she cannot get out of the Harbour, off the Ground, or out of the Dock, the Seamen say, *She is Nieped*.

**NIGHT**, that Part of a Natural Day, during which the Sun is underneath the Horizon. See **DAY**.

Or *Night*, is that Space of Time wherein the Sun is out of our Hemisphere.

Under the Equator the *Nights* are always equal to the Days. Under the Poles, the *Night* holds half the Year.

The ancient *Galls* and *Germans* divided their Time not by Days, but *Nights*; as appears from *Tacitus* and *Cæsar*. And the People of *Iceland* and the *Arabs*, do the same at this day. The same is observed of our *Saxon* Ancestors.

Thus, in the Council of *Clovesiot*, Anno 824, we read, *Ibi finita est prescripta conventione coram Episcopo post 30 Noctes, illius Juramentum ad Westminster dedatum est*. Whence our Custom of saying, *Seven-night, fort-night*, &c.

**NIGHT-Mare**, a popular Name for a Disease by the Greek Physicians call'd *Ephialtes*, and the *Latins*, *Incolus*; to which People lying a-sleep on their Backs, and having their Stomach charg'd with heavy Food difficult of Digestion, are very liable. See **INCUSUS**.

The Disease makes the sleeping Patient appear as if oppress'd with a huge Weight on the Breast; whence he ordinarily imagines some Spectre or Phantom stopping his Breath.

The Disease does not arise, as was antiently imagin'd, from gross Vapours filling the Ventricles of the Brain; but rather from a too great repletion of the Stomach which prevents the Motion of the Diaphragm, and, of consequence, the Dilatation of the Breast necessary to Respiration.

Others take it to be produced by a Convulsion of the Muscles of Respiration. See **EPHIALTES**.

*Esmeller* observes, That the *Arabs* call this Disease a *Nocturnal Epilepsy*; since upon its prevailing much, it degenerates into an Epilepsy; and is in effect the *Prodromus* hereof in young People, as in old ones of an Apoplexy.

**NIHIL**, **NIHILUM**, *Nothing*; among the School Philosophers, is what has no real *Essence*, and is only conceived negatively, and denominated by a Negative. See **ESS.**

**NIHIL** *Capiat per Billam, or per Breve*, is a Form used when Judgment is given against the Plaintiff, so as to bar his Action, or overthrow his Writ.

**NIHIL Dicere**, is a failing to put in an Answer to the Plaintiff's Plea by the Day assign'd.

**NIHILI Aliam**, see **POMPHYLIX**.

**NIHILS**, or **NICHILS**, *Illicus*, which the Sheriff that is uppos'd says are nothing worth, and Illeivable; for the Insufficiency of the Parties that should pay them.

*Clerk of the NICHILS*, *Nichilorum Clericus*, is an Officer of the Exchequer who makes a Roll of the Sums which are *Nichil's* by the Sheriff. See **EXCHEQUER**.

**NILOMETRE**, an Instrument used among the Antients, to measure the height of the Water of the Nile, in its over-flowings. See **OVERFLOWING**.

In the French King's Library is an *Arabic* Treatise on *Nilometres*, entitl'd *Nili si alud al Nil*; wherein are described all the over-flowings of the Nile from the 11 Year of the *Hegira* to the 875th.

*Herodotus* mentions a Column erected in a Point of the Island *Dalra*, to serve as a *Nilometre*: And there is still one of the same kind in a Mosque of the same Place.

As all the Riches of *Egypt* arise from the over-flowing of the Nile, the *Egyptians* used to supplicate them at the hands of their *Scrapis*, and committed the most execrable Crimes, as Actions, forsooth, of Religion, to obtain the Favour. This occasion'd *Constantine* expressly to prohibit these Sacrifices, &c. and to order the *Nilometre* to be removed into the Church; whereas till that time it had been in the Temple of *Scrapis*. *Julian* the Apostate, had it replaced in the Temple, where it continued till the Time of the Great *Theodosius*. See on the Subject of *Nilometres*, the *Alta Eruditionum Lipsi*, Anno 1686.

The Word comes from the Greek *νίλος*, Nile, (and that from *νίος*, New Mud; or, as others will have it, from *νίω*, I flow, and *νίω*, muddy) and *μέτρον*, Measure.

The Greeks ordinarily call'd the *Nilometre*, *Nilscope*.

**NIMBUS**, in Antiquity, a Term signifying a Circle, observed on certain Medals, around the Heads of some Emperors; answering to the Circles of Light, or *Aureole*, plac'd around the Images of Saints.

The *Nimbus* is seen on the Medals of *Maurice*, *Phosar*, and others, even of the upper Empire.

**NIMETULAHITE**, a kind of Religious among the *Turks*; so call'd from *Nimetulabi* their Initiator.

When a *Turk* would be admitted into the Order, he is to shut himself up close in a Chamber forty Days, tied down to four Ounces of Food per Day. The term expired, the *Nimetulabites* take him by the Hand, and lead him a *Moorish* Dance accompanied with an infinity of ridiculous Actions, or Gestures; till the violence of the Exercise, with his former Regimen, throw him down on the Ground. This Fall is construed an Extasy, during which he is supposed to have a Vision.

The *Nimetulabites* meet every *Monday* in the Night-time, and sing Hymns to God, &c.

**NIPPLÉ**, see **BREASTS**.

**NISSI PRIS**, in Law, a Writ Judicial, which lieth in Cases, where the Jury being impanell'd, and returned before the Justice, one of the Parties requests to have such Writ, for the Ease of the Country, whereby to will the Sheriff to cause the Inquest to come before the Justices in the same Country.

It is call'd a Writ of the *Nisi PRIS*, and its Effect is, that the Sheriff is hereby commanded to bring to *Westminster* the Men impanell'd at a certain Day, or before the Justices of the next Assizes, *Nisi die Lunæ apud talem Locum pris venerint*, &c.

**NITRE**, in Natural History, a sort of Salt, thus call'd by the Antients; by the Moderns, more usually, *Saltpetre*. See **SALTPETRE**.

Naturalists differ as to the Point whether our Saltpetre be the *Nitre* of the Antients. *G. C. Scheibauer* has a particular Treatise on the Subject, *de Nitro tam veterum tam nostrorum Commentarius*.

Most other Authors hold the antient *Nitre* to be Mineral or Fossil; whereas our Saltpetre is Artificial. *Scrapion* says, their Mines of *Nitre* were like those of common Salt, and that it was form'd out of running Water congel'd in its Progress into a sort of Stone. He adds, That their *Nitre* was of four kinds, distinguish'd by the Countries whence it came; viz. the *Armenian*; *Roman*; *African*; call'd *Apbromite*, and by *Arcæna*, *Burach*; and the *Egyptian*, which was the most famous, giving Name to all the rest; itself denominated from *Nitrus*, a Province in *Egypt*, where it was found in great abundance. He assures us, too, that their *Nitre* was of diverse Colours, viz. white, red, and livid; that some was cavernous, like a Sponge; others close and compact; others transparent like Glass; and others fæly.

*Sebelbauer* gives a different Account: The Antients, he observes, distinguish'd between *Nitres*, *Nitre*, *Azules*, *Apbromite*, and *Agel's Nitri*, *Spuma Nitri*, or *Scum of Nitre*. He

He adds, That *Agricola*, &c. is mistaken in asserting that there were antiently Mines in *Lydia*, *Magnesia*, *Caria*, &c. out of which *Nitre* was dug like Stones out of a Quarry: And that the *Nitre* used by the Antients was brought out of several Countries mentioned by *Pliny*, L. xxxi. c. 10. A Lake in *Macedonia*, whose Waters were *Nitrous*, and in the middle whereof, however, was a Spring of fresh Water, furnish'd the greatest Quantity, and the best: It was call'd *Calistronum* from a neighbouring Cape in the Gulf of *Thessalonica*, and was form'd like a Craft on the Surface of the Water during the Dog-days. The Waters of the Lake *Astomus* in *Babylonia*, and those of certain Springs near *Chalcis*, were sweet and potable towards the Surface, yet *nitrous* at bottom.

There was also *Nitre* gather'd on the Ground near *Philippi*, in *Thrace*; but it was little, and of no great value.

The Valleys of *Medea* also furnish'd some. And there were *Nitre*-Pits in *Egypt*, as there are Salt-Pits among us. See *NATRON* and *NITRIAN Waters*.

The chief Virtue the Antients ascribe to their *Nitre*, is, that of drying, deenergizing, and attenuating; and, as such, it was used in Ulcers, Disorders of the Eyes, the Itch, the Bite of Serpents, Gout, &c. They also took it inwardly to resolve and attenuate viscid Humours: But its cooling Quality, whereof the modern Physicians make so much use, they were unacquainted withal.

'Tis excellent in Diseases of the Heart, accompanied with a propensity to vomit.

Abundance of our Physicians are full of the Notion of a *volatile Nitre* abounding in the Air; and a world of Phenomena they account for from the Operation of the Particles thereof. See *AIR*.

That the Atmosphere abounds with Saline Particles, is most certain; for being filled continually with Effluvia from the Earth and Sea, it must needs have from both a great Quantity of Saline Corpuscles; and these will be of different Kinds, according to the Variety of those Salts from whence they are derived. See *SALT*.

But why these should be mostly supposed of a *Nitrous* nature, is not so easy to prove; for Saltpetre is by no means found in greater Quantity than the other Salts, especially common Salt; nor is it of a much more volatile Nature than they, nor capable of being raised more easily, or by a lesser heat. But since Soot, and that which produces it, Smoak, is found to abound very much with a truly volatile Salt; and since such a kind of Salt is produced frequently by the Putrefaction of Animal and Vegetable Bodies, 'tis probable the Air may abound with Salts of this kind, among many other decomposed ones of different Natures and Names. See *ATMOSPHERE*, &c.

*Spirit of NITRE*, see *SPIRIT*.

**NOBILIARY**, a Collection, or Historical Account of the Noble Families of a Province, or Nation.

*Covier* has published a *Nobiliary* of *Dauphine*; and *Caumartin*, another of *Provence*. The *Germani* are particularly careful of their *Nobiliaries*, to keep up the Purity of their Families.

**NOBILISSIMUS**, in Antiquity, a Title, or Quality given to the Princes of the Imperial Family. See *TITLES*.

*F. Duvernois* advances, That the Title *Nobilissimus* was first given under the Emperor *Julian*; yet we find the Title, *Nobilis Caesar*, or *Nob. C.* that is, *Nobilissimus Caesar*, on Medals long before that Time, even as early as *Trojan*. So that even *M. Tillemont* is mistaken where he says, The Quality of *Nobilissimus* is not to be found in History before the Time of *Constantine the Great*, who first gave it to his two Brothers; after which it was attributed to such of the Emperor's Children as were not *Cæsars*.

*Trifan* adds, That the *Cæsars* bore the Title of *Nobilissimi* in all Ages; but that the *Nobilissime* first became a distinct independent Dignity in the Time of *Constantine the Great*.

**NOBILITY**, a Quality that dignifies, or renders a Thing Noble; particularly, that raises a Person possess'd thereof above a Peasant, or Commoner. See *NOBLE*.

In *England*, indeed, but no where else, the Term *Nobility* is restrain'd to Degrees of Dignity above Knighthood. See *KNIGHT*.

Some refer the Origin of *Nobility* in *Europe* to the *Goths*; who, after they had seiz'd a Part of *Europe*, rewarded their Captains with Titles of Honour, and call'd them *Nobles*, *Nobles*, to distinguish them from the common People.

*Nobility*, in *England*, is only confer'd by the King, and that by Patent; in virtue whereof, it becomes Hereditary. In other Countries there are other ways of acquiring it.

Thus, in *France*, &c. there are several Offices which convey perfect *Nobility*, and such as descend to Posterity. Such are all Offices of the Crown, those of *Counsellor* of *State*, &c.

Others they have which only communicate an Accessory, or Personal *Nobility*, which dies with the Person. Thus, a

*Counsellor* in *Parliament* enjoys all the Rights and Exemptions of *Nobility*; yet his Son is never reputed *Noble*; unless there have been a Succession of them, and both Father and Grandfather have been *Noble*; which they call *Pairie* & *Accomplishment*.

They have a third Kind of *Nobility*, call'd *Nobility of the Bell, de la Cloche*; which is what the Mayors and Sheriffs of certain Cities, as *Lions*, *Bourges*, *Rosbeh*, *Parisiers*, &c. acquire in virtue of their Magistracy.

The *Nobility* of *England* is call'd the *Peerage* of *England*. See *PEERAGE*.

Its Degrees are only five, viz. That of a *Duke*, *Marquis*, *Earl* or *Count*, *Viscount*, and *Baron*. See each Degree under its proper Article, *DUKE*, *MARQUISS*, &c.

The Privileges of the *English Nobility* are very considerable: They are all esteem'd as the King's Hereditary Counsellors; and are privileged from all Arrests, unless for Treason, Felony, breach of Peace, Condemnation in Parliament, and Contempt of the King. No Supplicative can be granted against them; no *Capias*, or *Excois*, sued against them for Action of Debt, or Treasures; no *Excois* lies against them: In Criminal Cases, they are only to be tried by a Jury of Peers, who are not put to their Oath; but their Verdict upon their Honour suffices. In their Absence they are allow'd a Proxy to Vote for them; and in all Places of Trust are allow'd to constitute Deputies, by reason of the Necessity the Law supposes them under of attending the King's Person.

*Gulden* observes, That if an Appeal of Murder or Felony be sued by a Commoner, against a Peer, he shall be tried by Commoners, not Peers.

No Peer may go out of the Kingdom without the King's leave: If any have leave, he is to return upon the King's Wit, or to forfeit Goods and Chattels.

*Anton. Mathewson* observes, That *Nobility* among the *Romans* was a quite different thing from what it is among us. The *Nobles* of the *Romans* were either those rais'd to the Magistrature, or descended from Magistrates: There was no such thing as *Nobility* by Patent.

*Bartoli* says, That Doctors, after they have held a Chair in a University for twenty Years, became *Noble*; and are entitl'd to all the Rights of Counts. See *COUNT*.

But this Claim is not admitted at Court, &c. the *Bartoli's* Sentiments be back'd with those of several other Authors, particularly *Chaussain* in his *Consuetudin. Burgundic*; *boyer jur la Coutume de Berry*; *Faber de Dig. def. &c.* which last, however, restrains *Bartoli's* Rule to Doctors in Law, and Princes Physicians. See *DOCTOR*.

By an Edict of the *French King*, in 1669, 'tis declared, That Trade shall not derogate from *Nobility*, provided the Person don't sell by retail. See *COMMERCE*.

In *Bretagne*, by ancient Custom, a *Noble* loses nothing by Trading even in retail: But he resumes all his Rights as soon as he ceases Traffic; his *Nobility* having slept all the time.

In *Germany*, a Woman not *Noble* by Birth doth not become e. g. a Countess, or Baroness, by marrying a Count, or Baron. A Lady of the higher Degree, indeed, becomes a Princess by marrying a Prince; but this doth not hold of a Lady of the lower *Nobility*. See *MARRIAGE*.

On the Coast of *Malabar*, Children are only capable of being *Noble* by the Mother's side; it being allow'd them to take as many Husbands as they please, and to quit them when they think good.

**NOBLE**, a Person who has a Privilege which raises him above a Commoner, or Peasant; either by Birth, by Office, or by Patent from his Prince. See *NOBILITY*.

In *England*, the word *Noble* is of a narrower import, than in other Countries, being confin'd to Persons above the Degree of Knights; whereas, abroad, it comprehends not only Knights, but also what we simply call *Gentlemen*. See *KNIGHT*, *GENTLEMAN*, &c.

The *Nobles* of *England* are also call'd *Peers Regni*, as being *Nobilitate Pares*, tho' *Grads Impares*. See *PEER*.

The Word comes from the *Latin*, *Nobilis*, form'd from the antient *Nobilitas*, distinguishable, remarkable.

The *Venetian Noblesse* is famous: 'Tis in this that the Sovereignty of the State resides. It is divided into three Classes: The first only comprehends 24 Families.

The second includes the Descendants of all those who were wrote in the golden Book, in 1289, and destined to govern the State, which then began to be Aristocratic.

The third consists of such as have bought the Dignity of *Noble Venetians*.

This last Class is only admitted to the inferior Employments; The two former, to all indifferently.

The Title of *Noble Venetian* is sometimes also given to foreign Kings, Princes, &c.

**NOBLE**, or *Re's Noble*, a Mosey of Account containing 6 s. 8 d. See *MONEY*.

The Noble was anciently a real Coin, under the Denomination of *Noble*, or *Rafe Noble*. See COIN.

Authors observe, that there has not been any Piece of Gold or Silver of this Name, coin'd with us, since 9 H. V. They were first coin'd by Edw. III. in 1334.

The Noble contain'd 80 *d.* the same with the present Money of Account: Its half was call'd *Obolus*, containing 40 *d.* its fourth part the *Quadrans*, or Parting in those days, 20 *d.*

**NOCTAMBULI**, a Term of equal import with *Somnambuli*, applied to Persons who have a Habit of rising, and walking about in their Sleep. See SLEEP.

The Word is a compound of the Latin *Nex*, Night, and *ambulo*, I walk.

*Senekus*, *Horstius*, *Claudianus*, and *Hilanius*, who have wrote of Sleep, give us divers unhappy Histories of such *Noctambuli*.

The Disorder consists in this, that the proper Organs of Muscular Motion are at liberty, while the Organs destined for Sensation are bound up, or in a State of Inaction. See MUSCULAR MOTION and SENSATION.

To conceive the Cause, it is to be observ'd, that the Laws of the Union of the Soul and Body, are such, as that certain Ideas follow upon certain Motions of the Fibres of the Brain; and certain Motions of those Fibres upon certain Ideas. Now, by much thinking on any one thing, the Fibres acquire some permanent Situation, which gives a freer Passage to the Spirits towards a certain part of the Body than ordinary. If then the Animal Spirits become too copious, or too much agitated, or consist of parts too solid; they throw themselves into the Passages they find the most open, glide into the Nerves and Muscles corresponding to those Passages, and there produce the Motions proper to those Muscles.

Accordingly, the Body rises and walks; tho' the Soul be excluded from thinking on the Objects that use to employ it on such occasions.

The Bilious, according to *Horstius*; the Melancholic, according to *Salus*; and the Sanguine, according to *Libanius*, are the most subject to those nocturnal Vagaries.

The Remedies are all such things as temper the Agitation of the Spirits, and relax the Fibres; as Bleeding, and all Coolers, either internally or externally: Aperitives too, have a good effect; but the best Remedy is Cold-Bathing.

**NOCTILUCA**, among Naturalists, a Species of Phosphorus, so call'd because it shines in the Night, and without any Light being thrown on it; as that made of Urine, &c. by which it is distinguished from the other Species of Phosphorus, which, e'er they shine, must be exposed to the Sun-Beams; such as is the *Bolanian-Stone*, &c. See PHOSPHORUS and BOLANIAN-STONE.

Mr. Boyle, in a particular Treatise on the Subject, gives an Account of three *Noctilucæ*. The first, invented by *Krafft*, he calls the *Consistent*, or *Onniscious Noctiluca*, as being of a Texture not unlike that of a Cherry-Gum. This, on account of its uninterrupted Action, is, by the *Germani*, call'd the *Consistent Noctiluca*; among us it is now known under the denomination of *Solid Phosphorus*.

The second, *Liquid*, invented by the said *Krafft*; being only a Dissolution of the former in a convenient Liquor. The third Kind was prepared by Mr. Boyle himself; and of a different Nature from both the other; for, it would not shine of itself, like either of them, but required the Contact of the Air (tho' not any external Rays or Heat) to make it produce Light, which would be very durable, in a well-stopp'd Vessel. Add, that it was not the Body that shone, but an Exhalation, or Effluvia mix'd with the Air; on which accounts, the Inventor gives it the Denomination of the *Aerial Noctiluca*.

The same Mr. Boyle, afterwards, prepared another sort; which, from the little pellucid Fragments, or Crystals therein, he denominated the *Icy Noctiluca*.

**NOCTURNAL**, something that relates to *Night*, *Nex*; in contradistinction to *Diurnal*. See NIGHT and DIURNAL.

In this sense we say, *Nocturnal Assemblies*; *Nocturnal Pollution*, &c. See POLLUTIONS, &c.

**NOCTURNAL Pains**, a frequent Concomitant of Venereal Disorders, which can only be palliated with Narcotics; nothing but a Mercurial Course, or a long continued use of Diet-Drinks can entirely remove them.

**NOCTURNAL Arch**, in Astronomy, the Arch of a Circle described by the Sun, or a Star, in the Night.

*Semi-NOCTURNAL Arch of the Sun*, is that Portion of a Circle he passes over between our Meridian, and the Point of the Horizon wherein he rises; or, between the Point of the Horizon where he sets, and our Meridian.

**NOCTURNAL**, is particularly used for a *Star-Dial*, or an Instrument used to determine the Hour of the Night;

chiefly at Sea, from the Altitude, or Depression of some of the Stars about the Pole. See DIAL.

There are *Nocturnals* of various Contrivances; some of them Projections of the Sphere: Those ordinarily used are adapted either to the Pole Star, or the two Stars in *Ursa minor*, call'd the *Guards*.

#### Construction of the NOCTURNAL.

The Instrument consists of two Circular Plates, (Tab. NAVIGATION, Fig. 13.) applied on each other. The greater, which has a Handle to hold the Instrument, is about 2½ Inches Diameter, and is divided into 12 Parts, agreeing to the 12 Months; and each Month subdivided into every fifth Day: And so as that the middle of the Handle corresponds to that Day of the Year, wherein the Star here regarded has the same right Ascension with the Sun.

If the Instrument be fitted for two Stars, the Handle is made moveable. The upper left Circle is divided into 24 equal Parts, for the 24 Hours of the Day, and each Hour subdivided into Quarters, as in the Figure. These 24 Hours are noted by 24 Teeth; to be told in the Night. Those at the Hours 12, are distinguished by their length. In the Centre of the two circular Plates, is adjusted a long Index A, moveable upon the upper Plate. And the three Pieces, viz. the two Circles and Index, are join'd by a Rivet which is pierc'd thro' the Centre, with a Hole two Inches in Diameter for the Star to be observ'd thro'.

#### Use of the NOCTURNAL.

Turn the upper Plate till the longest Tooth mark'd 12, be against the Day of the Month on the under Plate; then bringing the Instrument near the Eye, suspend it by the Handle, with the Plane nearly parallel to the Equinoctial; and viewing the Pole-Star thro' the Hole of the Centre, turn the Index about, till, by the Edge coming from the Centre, you see the bright Star or Guard of the little Bear; if the Instrument be fitted to that Star; and that Tooth of the upper Circle, that is under the edge of the Index, is at the Hour of the Night on the edge of the Hour-Circle, which may be known without a Light, by accounting the Teeth from the longest, which is for the Hour 12.

**NODATED Hyperbola**, a kind of Hyperbola, which, in turning round, crosses itself. See CURVE and HYPERBOLA.

**NODE**, *Nodus*, in Chirurgery, a Tumour arising on the Bones, usually proceeding from some Venereal Cause. See TUMOR and BONE.

It seems generated of a thick, cold, viscid Humour, which is often found very difficult to resolve.

They frequently apply to it a leaden Plate cover'd with Mercury. The Cure is first attempted by *Emplast. de Ranis cum Mercurio*; which failing, some Mercurial Unguent is now and then rubb'd on them; and afterwards Mercurial Plasters made of *Cinnabar*, &c. applied.

Some Physicians call it *Exostosis*; others give the Name *Nodus* to all Tumours arising on the Joints, and Nerves.

**NODE**, *Nodus*, is also used for the Tumors, or Protuberances arising on the Joints of old Gouty People; call'd also *Topoi*. See TOPUS.

They are supposed to be form'd of a thick, crude, heavy, viscid indigestible Matter; mix'd with a hot, sharp, bilious Juice, the grosser and more terrestrial Part whereof being detain'd, grows into a stony sort of Concretion. See GOUT.

**NODES**, in Astronomy, the two Points wherein the Orbit of a Planet intersects the Ecliptic. See ORBIT and ECLIPTIC.

Such are the two Points C and D, (Tab. ASTRON. Fig. 53.) whereof the *Node C*, where the Planet ascends Northwards above the Plane of the Ecliptic, is call'd the *Ascending Node*, the *Northward Node*, and the *Head of the Dragon*; and thus mark'd 62. The other *Node D*, where the Planet descends to the South, is call'd the *Descending Node*, the *Southward Node*, or the *Dragon's Tail*; thus mark'd 19. See DRAGON'S HEAD and TAIL, &c.

The right Line D C, wherein the two Circles intersect, is call'd the *Line of the Nodes*. See LINE.

It appears from Observation, that the Line of the *Nodes* of all the Planets constantly changes its Place, and shifts its Situation in *consequencia*; i. e. from East to West, contrary to the Order of the Signs.

Thus, by a retrograde Motion, the Line of the Moon's *Nodes* finishes its Circuit in 19 Years; in which time, after having receded from any Point of the Ecliptic, it returns to the same. See MOON.

When the Moon is in the *Nodes*, she is also in the Ecliptic, viz. twice in each Period; when she is at her greatest

greatest distance from the Nodes, viz. in the Points E, F, these said to be in her Limits. See LIMIT.

The Moon must be in one of the Nodes when there is an Eclipse, either of the Sun or Moon. See ECLIPSE, PLANET, &c.

NODE, in Dialling, is sometimes used for the Style, Index, or Gnomon of a Dial. See GNOMON.

Sometimes it is also used for a Hole in the Ceiling of a Room, or in the Window, for the making of a Dial on the Floor, Wall, or the like.

NODUS, or Knot, see KNOT.

NOBIS in Poetry, &c. see INTERIUS.

NOBULUS, in Pharmacy, a Bag of Medicinal Ingredients put into Beer or Wine, the Tincture whereof the Patient is to take.

NOETIANS, a Sect of ancient Heretics, Disciples of Noctus, an Episcopus, the Master of Sabellus.

They only allowed of one Person in the Godhead; viz. the Father; and accordingly taught, that 'twas God the Father that suffered: An Error, says Epiphanius, who wrote an hundred Years after Noetius, never heard of before; 'tis certain there had been other *Patropassians* in the Church before him. See PATRIPASSIAN.

Being reprehended by his Superiors, Noetius made them this Answer: *What harm have I done? I adore not only God; I own none but him. He was born, suffered, and is dead.*

NOLI *metangere*, in Medicine, a kind of Cancer, or a malignant Eruption in the Face, occasioned by an extremely sharp, corrosive Humour. 'Tis said to be very dangerous reaching it; for, frequently, in endeavouring to cure it, 'tis irritated the more, and the Patient's Death hastened.

Hence its Name, which literally signifies, *don't touch me.*

NOLI *metangere*, is chiefly used among us for an external Ulcer in the *Ale* of the Nose; proceeding often from a Venereal Cause, tho' sometimes the Effect of a Scrophulous Constitution. See ULCER.

It does not always confine itself to the *Ale*, but will spread and corrode the very Substance of the Nose. The Cure is difficult, especially when it arises from a bad Constitution.

The Botanists also describe a Plant under this denomination, which is derives from a singular Property it has, of darting out its Seed when ripe, upon the first approach of the Hand to touch its Pods. See SEMINATION.

NOMADES, a Name given, in Antiquity, to several Nations or People, whose whole Occupation was to feed and tend their Flocks; and who had no fix'd Place of Abode, but were constantly shifting, according to the Conveniences of Pasturage.

The most celebrated among the Nomades were those of *Africa*, who inhabited between *Zenigitania* to the East, and *Mauritania* to the West.

*Salsit* says, they were a Colony of *Persians* brought into *Africa* with *Hercules*.

The Nomades of *Asia* inhabited the Coasts of the *Caspian-Sea*.

The Nomades of *Syria* were, and still are, the Inhabitants of *Little Tartary*.

The Word comes from the Greek *νόμος*, I feed.

NOMANCY, the Art of divining the Fates of Persons by means of the Letters that form their Names. See NAME.

NOMANCY is more usually call'd *Onomancy*. See ONOMANCY.

The Word is a Compound of the *Latin*, *Nomen*, Name, and *uincina*, Divination.

Nomancy, or, as it should rather be call'd, *Nominomancy*, or *Oenomancy*, seems to be nothing else but the Cabalistic *Gematria*. See CABALA.

NOMARCHA, in Antiquity, *Egypt* was antiently divided into several Regions, or Quarters, call'd *Nomarches*, from the Greek *νόμος*, taken in the Sense of a Division; and the Officer who had the Administration of each *Noma* from the King, was call'd *Nomarches*, from *νόμος*, and *ἀρχή* Command.

NOMBRIL Point, in Heraldry, is the next below the Fess-Point; or the very Centre of the Escutcheon. Supposing the Escutcheon divided into two equal Parts below the Fess; the first of these Divisions is the *Nombri*; and the lower the *Raile*. See POINT and ESCUTCHEON.

NOME, or NAME, in Algebra, is any Quantity with a Sign prefixed or added to it, whereby it is connected with some other Quantity; upon which the whole becomes a *Binomial*, or *Trinomial*, &c. See QUANTITY.

Thus  $a + b$  is a Binomial, whose Names are  $a$  and  $b$ ; and  $a + b + c$  a Trinomial, whose Names are  $a$ ,  $b$ , and  $c$ , &c. See BINOMIAL, TRINOMIAL.

NOMENCLATOR, among the *Romans*, was usually a Slave, who attended Persons that stood Candidates for

Offices, and prompted them the Names of all the Citizens they met, that they might solicit them, and call them by their Names; which among that People, was the highest piece of Civility. See CANDIDATE.

The Nomenclator was also call'd *Protestator*.

NOMENCLATOR of the *Roman Church*, was an Officer, whose Business was to call the Persons whom the Pope invited to Dinner. He also listen'd to those who demanded Audience; in the same manner as those now retain'd by the Cardinals, call'd *Auditors*.

NOMENCLATURE, a Catalogue of several of the more usual Words in any Language, with their Significations; compiled in order to facilitate the Use of such Words to those who are to learn the Tongue.

We have *Latin*, *Greek*, *French*, &c. *Nomenclatures*.

NOMINA *Villiarum*, an Account of the Names of all the Villages, and the Possessors thereof, in each County, drawn up by the several Sheriffs, at the Instance of King *Edw. I.* and return'd by them into the Exchequer; where it is still preserved.

NOMINALS, or NOMINALISTS, a Sect of School-Philosophers, the Disciples and Followers of *Ockham*, an *English Cordelier* in the 14th Century.

The *Nominalists* were great dealers in Words; whence they were vulgarly denominated *Word-fellers*.

They had the denomination *Nominalist*, because, in opposition to the *Realists*, they maintain'd, that Words, not Things, were the Object of Dialectics. See REALISTS, &c.

This Sect had its first Rise towards the end of the 11th Century, and pretended to follow *Porphyry* and *Aristotle*; but it was not till *Ockham's* time that they bore this Name.

The *Nominals* were the Founders of the University of *Leipsic*: There are many yet abroad, who pique themselves on being *Nominals*.

The *Nominals*, with the *Stoics*, admit the formal Conceptions, or Ideas of Things, as the Subject and Foundation of Universality; but to this they add Names, which represent and signify, after the same univocal manner, and without any distinction, a great variety of single things alike in Genus and Species.

Whence it is they are call'd *Nominals*; as pretending, that to become Learned, 'tis not enough to have just Ideas of things, but 'tis likewise required to know the proper Names of the *Genera* and *Species* of Things, and to be able to express them clearly and precisely, without Confusion, or Equivocation.

NOMINATION, the Action of Naming, and appointing a Person for some Function, Employ, or Benefice.

The Word is chiefly used for the Right of Presenting to a Benefice, &c. See BENEFICE, &c.

In Common Law, however, there is a difference between *Nomination*, and *Presentation*; the former being properly a Power which a Man has, by virtue of a Manor, or otherwise, to appoint, or name a Clerk to a Patron of a Benefice, to be by him presented to the Ordinary. See PRESENTATION and COLLATION.

NOMINATIVE, in Grammar, the first Case of Nouns which are declinable. See CASE.

The simple Position, or laying down of a Noun, or Name, is call'd the *Nominative Case*; yet it is not so properly a Case, as the Matter or Ground whence the other Cases are to be form'd, by the several Changes and Inflections given to this first Termination. See NOUN.

Its chief use is to be placed in Discourse before all Verbs, as the Subject of the Proposition, or Affirmation; as, *Deus regit me*, the Lord governs me; *Deus exaudivit me*, God hearkens me.

NOMINATOR, he who names, or presents a Person to an Office, or Benefice.

Hence *Nominatus*, the Person named or presented.

*Errand* observes, there are some Customs where the *Nominator* is responsible for the Solvability of the *Nominee*.

NOMOCANON, a Collection of Canons, and of Imperial Laws, relating or conformable thereto. See CANON.

The first *Nomocanon* was made by *Johannes Sebastianus* in 554.

*Phocas*, Patriarch of *Constantinople* in 883, compiled another *Nomocanon*, or Collection of the Civil Laws with the Canons: This is the most celebrated. *Balsamon* made a Commentary on it in 1180.

NOMOCANON, is also a Collection of the antient Canons of the Apostles, Councils, and Fathers, without any regard to Imperial Constitutions; such is that published by *M. Cocher*.

NOMOCANON again, is sometimes used for a Penitential Book of the *Greeks*.

The Word is composed of the Greek *νόμος*, Law; and *κανών*, Canon, Rule.

**NON-Ability**, in Law, an Exception taken against the Plaintiff, or Defendant, upon some Cause, why he cannot commence a Suit in Law; as for Præmunire, Outlawry, Profess'd in Religion, Excommunicate, or a Stranger born.

This last holds only in Actions real, and mixed; and not in personal, except he be both a Stranger and an Enemy.

The Civilians say, that such Man hath not *Perjoniæ standi in judicio*.

**NON admittas, or Ne admittas**, a Writ which lies for the Plaintiff in a *Quære Impedit*, or him that has Action of *Darre in Procentment* depending in the Common-Bench, and fears the Bishop will admit the Clerk of the Defendant during the Suit between them.

**NON-Appearance**, a Default in not Appearing in a Court of Judicature. See APPEARANCE.

**NON-Claim**, in Law, the omission, or neglect of him who ought to challenge his Right within a time limited. See CLAIM.

By such neglect, he is either barr'd of his Right; as at this day, upon *Non-claim* within five Years after a time, and Right to him accrued; or of his Entry by Descent, for want of *Claim* within five Years after the Descension.

**NON Molestans**, a Writ which lies for him who is molested contrary to the King's Protection granted him.

**NON Omittas**, a Writ which lies where the Sheriff having deliver'd a former Writ to a Bailiff of a Franchise in which the Parry it is to be served on, dwells; and the Bailiff having neglected to do it: Upon the Sheriff's returning, that he deliver'd it to the Bailiff; this second Writ shall be directed to the Sheriff, charging him to execute the King's Command himself.

**NON Povoendo in Officio, & Juratis**, a Writ granted on divers Occasions to Men for the freeing them from serving on Offices and Jurics; as by reason of Old Age, &c. See JURY, &c.

**NON Procedendo ad Assisam Regis inconsulto**, a Writ to stop the Trial of a Cause appertaining to one who is in the King's Service, &c. till the King's Pleasure be further known.

**NON sane Memoriae, or Non sane Memoriae**, is an Exception taken to an Act declared by the Plaintiff or Defendant to be done at a time when the Parry that did it was Mad, or non in his Wits; as to a last Will, &c. See NON Compos.

**NON san Informatus**, See INFORMATUS non san.

**NON-Residence**, in Law, is applied to such Spiritual Persons as are not resident on, but do absent themselves, for one Month together, or two at several times of the Year, from their Benefices. See BENEFICE.

Regularly, Personal Residence is required of Ecclesiastical Persons upon their Cures. See RESIDENCE.

**NON-Residencia pro Clericis Regis**, is a Writ directed to the Ordinary, charging him not to molest a Clerk employ'd in the King's Service, on account of his *Non-Residence*.

**NON Suit**, in Law, a Renunciation of the Suit, by the Plaintiff or Defendant; most commonly upon the discovery of some Error, or Defect, when the Matter is so far proceeded in, as that the Jury is ready at the Bar, to deliver their Verdict.

The Civilians term it *Litis renunciatio nem*.

**NON Compos mentis**, a Phrase denoting a Person not to be of sound Memory, or Understanding.

Of this, in common Law, there are said to be four Kinds: First, an Idiot born; Secondly, He that by Accident loseth his Memory and Understanding; Thirdly, a Lunatic, that has *Lucida intervalla*, sometimes has Understanding, and sometimes not; Fourthly, He that by his own act, for a time, depriveth himself of his right Senses, as a Drunkard: But this last kind shall give no Privilege to him or his Heirs.

A Descent takes away the Entry of an Idiot, tho the want of Understanding were perpetual.

**NON obstante, notwithstanding**, in Law, a Term, or Clause usual in Statutes and Patents. All Grants of *sub Pensionibus*, and every Non obstantie therein contained, shall be void. Henry III. took up the Clause *Non obstantie*, (first introduced by the Pope) in his Grants.

**NON-obstantie**, in the Romish Canon Laws, makes the third part of the Provisions of the Court of Rome; beginning with *Non obstantibus*; and comprizing Absolutions of Censures, Rehabilitations, and necessary Dispensations, for the Enjoyment of Benefices. None inferior to the Pope can use the Clause *Non-obstantie*.

**NON Term**, the Time of Vacation between Term and Term. See VACATION.

It was antiently call'd *the Times or Days of the King's Peace*. See PEACE of God and the Church.

Among the Romans it was call'd *Ferrie*, or *Dies Nefasti*. See FERIE and NEFASTI.

**NON est factum**, in Law, an Answer to a Declaration, whereby a Man denieth that to be his Deed whereupon he is impleaded.

**NON est Culpa-bilis, He is not Guilty**, in Law, the general Plea to an Action of Trespas, whereby the Defendant absolutely denies the Fact charg'd on him by the Plaintiff; whereas in other special Answers, the Defendant grants the Fact to be done, but alleges some Reasons in his Defence, why he lawfully might do it.

As this is the general Answer in an Action of Trespas, i. e. a Criminal Action civilly prosecuted; so is it in all Actions criminally follow'd, either at the Suit of the King, or others, wherein the Defendant denies the Crime objected to him.

**NON Plevin, Non plevina**, a Default in not Replevying of Land in due time.

**Hengam** writes, That the Defendant should be sure to replevy his Lands seiz'd by the King, within fifteen Days. And that if he neglects, then, at the Instance of the Plaintiff at the next Court-Day, he shall lose his Seisin, *sent per defaultum post defaultum*.

By Stat. 9 Edw. 2. it was enacted, That no Person should thenceforward lose his Land because of *Non Plevin*.

**NON-Tenure**, an Exception to a Count, whereby the Parry urges, that he holdeth not the Land mentioned in the Count, or at least some part of it.

*Writ* distinguishes *Non-Tenure* into *General* and *Special*. The first, where one denies himself ever to have been Tenant to the Land in question. The second, where he only alleges that he was not Tenant the Day whereon the Writ was purchased.

**NON liquet, it does not appear**: A Verdict given by a Jury, when a Matter is to be defer'd to another Day of Trial. See VERDICT.

The same Phrase was used among the Romans; after hearing the Cause, such of the Judges as thought it not sufficiently clear to pronounce upon, cast a Ballot into the Urn with the two Letters *N L*, for *Non Liquet*.

**NON-Entity, Nihil, or Nothing**, is whatever has no real Being, and is only conceived Negatively, or only claims a negative Denomination. See ESSE, ESSENCE, &c.

**NON-Naturals**, in Medicine, *Res Non Naturales*, are the Causes and Effects of Diseases, whether near or remote. See DISEASE.

Physicians have digested all the Causes of Diseases into six Classes, which they call the six *Non-naturals*. These are,

1. Air. 2. Meat and Drink, 3. Motion and Rest. 4. The Passions of the Mind. 5. Excretions and Retentions. 6. Sleep and Waking. See each under its proper Article, AIR, MEAT, DRINK, &c.

They are thus call'd, because by their use or abuse they become either Good, *Naturals*, or Evil, *Contra-naturals*.

But the Division, in effect, is of no great use; the Causes of Diseases being much more commodiously laid down otherwise. See DISEASE.

**NON-Ære and Decime** were Payments antiently made to the Church by those who were Tenants of their Farms.

The *Nonæ* were the Rent or Duty claim'd for things belonging to Husbandry; the *Decime* were claim'd in Right of the Church. See DECIME.

**NONAGE**, in Law, an Incapacity of doing certain things from a want of Age. See AGE.

The Term of *Nonage* is different, with regard to different things. In Matters of Inheritance, a Man is in his *Nonage* till twenty-one Years; for Marriage till fourteen, &c. See MINORITY.

**NONAGESIMAL**, in Astronomy, the 90th Degree of the Ecliptic, reckon'd from its Eastern Point. See ECLIPTIC.

The Altitude of the *Nonagesimal* is equal to the Angle of the Ecliptic, and passes thro the Poles thereof: Whence the Altitude of the *Nonagesimal*, under a given Elevation of the Pole, is easily found.

If the Altitude of the *Nonagesimal* be subtracted from 90°, the Remainder is the Distance of the *Nonagesimal* from the Vertex.

**NONAGIUM**, in Law, the ninth part of moveable Goods; antiently paid in nature of a Mortuary; being claim'd by the Clergy upon the Death of those of their Parish. See MORTUARY.

At first it was a third Part of the Goods, and was call'd *Terragium*; till by a Bull of Clement VI. it was reduced to a Ninth.

**NONAGON**, a Figure having nine Angles and Sides. See POLYGON.

**NONCONFORMISTS**, the Name of a Religious Sect, or rather of a number of Sects, in England.

The Term was antiently confin'd to the Puritans, or rigid Calvinists; at present it extends to all who dissent from the established Church, the Romanists alone excepted. See DISSENTER.

The Word had its Rise from a Declaration of King Charles I. who appointed that all the Churches of England and

and *Sotilans* should have the same Ceremonies and Discipline; as the Acquiescence wherein, or Dissenting from which, determined *Conformity*, and *Nonconformity*.

**NONCUPATIVE**, in the Schools, a Term used to express something that is only nominal, or has no Existence but in Name.

*Felix* of *Urgel* maintain'd, that Jesus Christ, as Man, was only God *Noncupatively*, i. e. only by Name. *Acuin*, in his Answer to *Felix*, maintains, that 'tis to fall into *Nestorianism* to distinguish two Sons of God in Jesus Christ, the one Natural, the other Adoptive; and two Gods, the one Real, the other *Noncupative*.

**NONCUPATIVE**, or *Noncupative Will*, in Law, a last Will or Testament only made verbally, or *in voce*, and not put in Writing. See **WILL** and **TESTAMENT**.

**NONES**, **NONA**, in the *Roman Calendar*, the fifth Day of the Months *January, February, April, June, August, September, November, and December*; and the seventh of *March, May, July, and October*: These four last Months having six Days before the *Nones*, and the others only four. See **CALENDAR**.

The Word apparently has its Rise hence, that the Day of the *Nones* was nine Days before the *Ides*, and might be call'd *Nono-Idus*. See **IDES**.

*March, May, July, and August* had six Days in their *Nones*; by reason these alone in the ancient Constitution of the Year by *Nones*, had 31 days apiece; the rest having only 29, and *February* 30. But when *Cæsar* reform'd the Year, and made other Months contain 31 Days, he did not likewise allot them six Days of *Nones*. See **CALENDAR**, **YEAR**, **MONTH**, &c.

**NONE**, is also one of the seven Canonical Hours, in the *Romish Church*.

*Nove* is the last of the lesser Hours that comes before *Peiper*; and answers to three a-clock in the Afternoon. See **VESPER**.

The single Office, and that for the Dead, end at *Noves*, which *Father Rojovsky* observes, was anciently the Hour for the breaking up of the *Synaxis*, or usual Meetings at Church of the Primitive Christians.

The Hour of *Noves* was also the usual time for taking the Repast on Fast-days; so some would keep the Fast till Night. See **FAST**.

**NONUS** *Hæmori Placentini*, in Anatomy, a Muscle, call'd also *Rotundus minor*. See **ROTUNDUS**.

**NORMAL LINE**, in Geometry, is used for a *perpendicular Line*. See **PERPENDICULAR**.

**NORROY**, or *North Key*, i. e. Northern King; the Title of the third of the three Kings at Arms, or Provincial Heralds. See **KING** at **ARMS**, and **HERALD**.

His Jurisdiction lies on the North side of *Trent*, whence his Name; as *Clarencieux*, on the South. See **CLARENCEUX**.

**NORTH**, in Cosmography, one of the Cardinal Points of the Horizon, being that intersection of the Horizon and Meridian nearest the *North-Pole*. See **CARDINAL POINT** and **HORIZON**.

**NORTH-STAR**, the last in the Tail of the little Bear; call'd also the *Pole-Star*. See **POLE-STAR**.

**NORTH Wind**,  
**NORTH Pole**,  
**NORTH Sea**,  
**NORTH Sea Company**,  
**NORTH Wall**,  
**NORTH Wind**, &c. } See { **WIND**.  
**NORTH East**, a Rhumb, or Point, in the middle between the East, and the North. See **RHUMB** and **POINT**.

**NORTH West**, is a Point or Rhumb in the middle between the North and West. See **WEST**, &c.

**NORTH North East**, **North East** and **by East**, are Subdivisions of the Compass between the North and East. See **WIND**.

**NORTHERN Sign**, are those six on the North side of the Equator. See **SIGN**.

**NORTHERN Light**, or *Aurora Borealis*, See **AURORA BOREALIS**.

**NORTHERN Aspect** or *Exposure*, See **EXPOSURE**.

**NORTHING**, in Navigation, the difference of Latitude a Ship makes in sailing towards the North Pole. See **SAILING**, **LATITUDE**, &c.

**NOSE**, the external Organ of Smelling; or that Part in Men, rais'd in the middle of the Face. See **FACE**.

The Nose is usually divided by Anatomists into external and internal; a division of very little service.

It is farther subdivided into several Parts which make up its external Figure: Whereof the first is the *Dorsum*, or Ridge, running along the whole length of it; one part whereof, about the middle, more prominent than the rest, is call'd the *Spine*; and the Extreme, which in many is turn'd round, the *Osciculus*: The Sides are call'd the *Alæ* or *Pennis*.

The Teguments of the Nose are common to the rest of the Face. Under these appear the Muscles of the Nose,

which are three Pair, viz. the *Elevatoræ Alæ Nasi*, serving to pull the *Alæ* upwards, and turn them outwards; the *Dilatatoræ Alæ Nasi*, which draw them from each other, and widen the external Apertures of the Nostrils; and the *Contractoræ Alæ Nasi*, which draw them downwards nearer each other; and at the same time the upper Lip also downwards. See each Muscle described under its proper head, **ELEVATORS** *Alæ Nasi*, &c.

The Frame of the Nose is chiefly supported by two Bones, which end in Cartilages, of a triangular Figure; and are divided in the middle by a third, call'd *Septum*, into two Partitions, call'd the *Nares*, or *Nostrils*.

This *Septum* likewise ends in a Cartilage; by means of which Cartilages, the lower part of the Nose is render'd moveable, which the upper, being perfectly ossificous, is not. The Cartilages of the *Alæ* are tied to the other by Ligaments, which loose Connexion renders them moveable.

The Bones of the Nose are either *Proper*, or *Common*. The first of the *Proper*, are the two external ones that constitute the *Dorsum*, and are join'd to the *Os frontis*, the fourth Bone of the upper Jaw, and to each other, usually *per bonyonem*. See **DORSUM NASI**.

In the Concave of the Arch of these two Bones, at their Union internally, is placed the bony part of the *Septum*. Its upper part joins the *Os Ethmoides*; but in Adults is continued so as the *Ethmoides*, and its Process, call'd *Crista Galli*, appear of a piece with the *Septum*. The *Septum* is thinnest in the middle, and divides the right Nostril from the left; tho its Position is seldom perpendicular. It is capp'd with another thin Bone, from its Figure call'd *Vomer Aratus*, and is join'd to the fourth Bone of the upper Jaw, and to the *Os Palati*. See **SEPTUM**.

The other proper Bones are the *Turbinatæ*, or *Spongiose*, two of which are usually found in each Nostril, sometimes three, one over the other. The middlemost, when there are three, is so placed as to shelter the Perforation of the *Anterior maxille Superioris* into the Nostril, and prevents the sudden rushing in of Air from the Nostril into the *Antrum*. They are all very porous, and turn'd, not unlike the Shell *Concha Veneris*. In Quadrupeds, these Bones are very numerous. See **SPONGIOSA**.

The common Bones of the Nose are such as make Protes for the *Foramina Narium*, and help to compose the Parts adjacent. The largest of these is the fourth Bone of the upper Jaw, which has the greatest share in framing the *Foramina*. See **JAW**.

These fourth Bones, with the *Septum* and *Os turbinatæ*, chiefly frame the internal Parts of the *Foramina*. In the upper part, a Portion of the *Os frontis*, the inside of the *Os Unguis*, the *Os Crisiosum*, with part of the *Sphenoides*; and backwards towards the Fauces, the *Os Palati*, help to compose the *Foramina*.

Beside the Cavities circumscribed by the Bones now mentioned, the *Foramina* have several collateral Cavities that open into them: The largest is that call'd *Antrum Genæ*; by Dr. *Higboure*, *Antrum maxille Superioris*, framed in the fourth Bone of the upper Jaw, near two Inches long, and an Inch broad; the bony Parts of which, with the *Sphenoides*, make the *Foramen lacrimæ externum*. Its lower Surface makes a thin Covering to all the Roots of the *Molares*, and *Canini*; which frequently upon drawing a Tooth, to which it sticks, is taken along with it, whereby this Cavity is open'd into the *Alveolus*, and consequently into the Mouth.

All these Cavities of the Nose and Cheek, as also the *Os turbinatæ*, *Septum*, &c. are invest'd with a Membrane furnish'd with large Arteries from the *Carotides*; and Veins, which empty themselves into the *Jugulars*; and Nerves, from the fifth Pair, as well as the *Olfactory Nerves*.

In this Membrane are a great number of small Glands, placed very near each other, from whence flows all that *Pisina*, commonly discharg'd at the Nostrils.

By means of this Mucus or *Pisina* is the Membrane kept soft, and defended from the Injuries of extraneous Bodies, especially those of the Air, which must pass this way in Inspiration when the Mouth is shut. See **MUCUS**.

By this means, the Olfactory Nerves, here diffus'd, are render'd capable of the Perception of odoriferous Effluvia; which the dryness of the Part would be apt to destroy. See **SMELLING**.

Besides this use of the Nose, which is the principal, Nature has made it, as it were, a *Diversorium* to the Eyes; there being a considerable Passage into each Nostril that empties itself under the middle *Os turbinatæ*, arising from two Apertures call'd *Puncta Lacrymalia*, at the great *Canthus*.

By this way, the superfluous Moisture of the Eyes is carried off, which would otherwise incommode the Cheeks; as in effect it does, when those Parts are affected with any disorder; as in the *Agyptiæ*, and *Pisina Lacrymalis*. See **PISTULA**, &c.

The Diseases to which the Nose is subject, are a *Coryza*, *Ozena*, *Polypus*, *Sarcena*, and *Noli me tangere*, beside Sneezing, and a loss of Smelling. See each in its Place.

*Ambr. Parce* in his 23d Book, mentions an Italian Chirurgion, who had the Art of retorning lost *Noses*, or making them come again after they were cut off. His Method was to make an Aperture in his Patient's Arm, and there to engraff the mutilated *Nose*; the Arm being bound up for 24 days, the *Nose* took Root in the Wound, and glued itself with the Flesh of the Arm, and grew to its Bulk; which done, he cut off the Flesh of the Arm, and fashion'd the *Nose* to his liking, apply'd it in its place, and heal'd the Wounds at leisure.

This Operation we see barbarous'd in *Ussubras*: So learned *Talacotius*, &c. and also in the *Alta Eruditionum Lipsii*, Anno M.D.C.LXXXII.

*Hagarop*, a *Dane*, maintains, that the *Nose* is in some measure fitted for an Organ of Sight, and that a Man may see thro' it; grounding his Opinion on the Authority of *Smetius*, who in his 5th Book of *Medicinal Miscellanies*, relates of his own Knowledge, that a Youth, quite blind in other respects, could see the Light, and was able to discern the Whiteness of Flowers by the *Nose*.

But, for our part, we should rather account for these Sensations from the Faculties of feeling and smelling, than those of seeing: Not but there is a very great resemblance between the various Organs of Sense, enough to give ground to the Opinion, that they only differ as more or less delicate; for which reason we don't absolutely reject the Instance given by *Grimaldi*, of a Man who could distinguish Colours by his feeling.

The Nerves, whose Texture and Constitution, for any thing we know, is the same throughout the whole Body, are confessedly the Vehicles of all Sensations from without; and those are all deposited in the same Sensory, whether they be brought from the Eye, the Ear, the *Nose*, &c. and that singular Apparatus, observable in each Organ, seems rather intended for the *Leve esse*, than the *Effie* of that Sense; rather to stop and detain the transient Effluvia, to collect them where too scanty, disperse them where too copious, soften them where too rude, and break their force where too violent, and by this means to proportion them to the several degrees of Fineness, Tendron, &c. of the Nerves of the respective Organs, in order to render the Sensations adequate to the ends; than to produce them.

**SENSATION.**  
In *Tartary*, the greatest Beauties are those who have the least *Noses*. *Rulovius* mentions the Wife of the Great *Cinghis-can*, the Mother of *Tamerlane*, as a celebrated Beauty, because she had only two Holes for a *Nose*. In most other Countries, *Chino* excepted, great *Noses* are in honour.

The *Crim-Tartars* break the *Noses* of their Children while young, as thinking it a great piece of Folly to have their *Noses* stand before their Eyes.

**NOSICOLOGY**, a Discourse, or Treatise, of *Diseases*. See **DISEASE**.

The Word is compounded of *nosus*, Malady, Disease, and *logos*. Hence,

**NOSOCOMIUM**, an Hospital, or Infirmary, for the Reception of the Dicaes'd. See **HOSPITAL**, **LAZAR**, &c.

**NOSTRILS**, *Nares*, the two Apertures or Cavities of the *Nose*, thro' which the Air passes, and which serve to convey Odours, and to carry off the *Pituita* separated in the *Sinus* of the Base of the *Cranium*. See **NOSE**.

The *Nostrils* are separated by a Cartilage, and lined with a very sensible Membrane. See **SMELLING**.

*Cicero* observes, that the Situation of the *Nostrils* so near the Mouth, is very convenient; as the judging of the Smells of Meats and Drinks, is a great part of their Office: he adds, that their erect Position argues the Creator's Wisdom, in regard all Odours rise from below upwards. See **OPONON**.

**NOT** *Guiltly*, see **NON EST CULPABILIS**.

**NOTARICON**, the third Part, or Species of the *Jewish* Cabbala. See **CABBALA**.

Rabbi *Nathan*, in his great *Aruch*, says, that *Notaricon* is when a single Letter is taken for the Sign of a Thing, i. e. for a whole Name. He adds, that the Word comes from the Latin *Notarius*, a Person who writes in Notes, or Short-hand. R. *Elias Levina* gives the same Account in his *Tschetes*, except that in lieu of one Letter for a Word, he mentions two or three.

But after all, neither the one nor the other is alone sufficient: For as a single Letter frequently makes a Word; so in *Notaricon*, a whole Word sometimes stands for a single Letter.

There are therefore two principal Kinds of *Notaricon*: The first is, when by *Apheresis*, or *Apscope*, the first or last Letters of several Words are join'd to make a single Word or Phrase; which therefore is of two kinds, the one Initial, the other Final; and each is done several Ways, viz. either by taking the Letters the common way, or backwards. Tho, there is also a third kind made, as the Rabbins call it, by Leaps, i. e. by leaping over some Letters.

The first of these Kinds, which the Rabbins call *Rafshe* *Tshebosh*, appears very ancient; and is supposed by some, well verfed in the *Hebrews*, to have took its Origin from the *Psalms*, and other Places of Scripture, proceeding alphabetically, i. e. the first Verse beginning with *N*, the first Letter of the Alphabet; the second with *Q*, the second Letter, &c. See an Instance of this first Kind of *Notaricon* under the Head **MACHABEE**.

The second Kind is also very common, and call'd *Sophe* *Tshebosh*, i. e. the End of Words. For instance, by telling the last Letters of the Words, *הן שמו שרן*, *Mish gadmas nomen est*, *Qualitas?* they find the Name of God *Tshebosh*. This is still more paerile, when they take the Letters backwards.

The third Kind is more modern, more gross, and perplexed. Here a Letter gives a whole Word, instead of a Word's only giving a Letter; so that a Word shall furnish a whole Phrase.

Thus, for an example; in the first Word of *Genesis*, *הווננו*, in the Beginning, is found he created the Heavens and the Earth, the Sea, the *Abyss*, &c.

**NOTARY**, a *Scribe*, or *Scrivener*; or one who takes Notes, and short Draughts of Contracts, or other Instruments. See **NOTE**.

**NOTARY**, *Notarius*, among the *Romans*, was a Name common to all who wrote under the Direction of others, or who received, and kept Sentences, and Contracts.

From the 44th Novel of *Jufinian*, it appears, that Contracts were first wrote in Notes, or Abbreviations, by the *Notaries* or Clerks of the *Tabelliones*; and were not yet obligatory. Afterwards they were wrote at length by the *Tabellio* himself, then sign'd and seal'd. See **TABELLIO**.

**NOTARY**, is particularly used for an Officer, who draws, and keeps Notes and Minutes of Contracts, Obligations, and other Instruments, pass'd before him, and delivers out authentic Copies, &c. thereof.

*Rogeeus* distinguishes between *Natarii*, *Notaries* and *Tabelliones*: *Notaries*, he says, in several Cities, are only to receive and pass the Minutes of Contracts, and to deliver them to the Parties in brief; being obliged to carry them to the *Tabelliones* to be kept, and to have engross'd Copies delivered out to the Parties.

He adds, that the *Notaries* were anciently Clerks of the *Tabelliones*; and that separating, by degrees, from their Masters, they at length erected Offices of their own; and at last took place of the *Tabelliones*, who were suppress'd.

They had their Name *Notaris* from *Note*; because anciently they wrote in Notes, or Short-hand.

**NOTARIES** are now little used among us, except in Mercantile Affairs; tho' in *France* they still subsist in their Legal Capacity. The *Notaries* of the *Chancery* are called the King's Counsellors, and Note-Keepers.

Those among us, are called *Notaries Publici*; and have the drawing, passing, keeping, issuing, &c. of all the Deeds, Contracts, Charter-parties, &c. in the Mercantile World. In their Books are also register'd Profests, Remonstrances, &c.

In the first Ages of the Church, there were *Ecclesiastical* *Notaries*, whose Office was to collect and preserve the Acts of the Martyrs. They were supposed to have been first instituted by *St. Clement*. Their Number was seven, and they were dispos'd in the seven Quarters or Regions of *Rome*.

*Pope Fabian*, judging the Short-hand of the *Notaries* too obscure for common Use, added seven Sub-lessons to 'em, to transcribe at length what the *Notaries* drew in short.

At length these *Notaries* were laid aside, and two other Kinds establish'd in their stead, viz. *Apofolical* *Notaries*, and *Epifcopal* *Notaries*; whose Business lies in Spiritual and Beneficial Instruments.

**NOTATION**, is Arithmetic, the Art of Characterizing Numbers, or of designing them by proper Figures. See **CHARACTER**.

The Choice of Arithmetical Characters is arbitrary: Hence, in various Nations, they are various. But perhaps there are none so commodious as those commonly used in *Europe*, usually said to have been invented by the *Arabs*, and thence call'd *Arabic* Characters; tho' *Dr. Wallis* observes, that *Aleph*, an *Arab*, refers the Invention to the *Indians*. See **NUMERAL CHARACTER**.

The *Greeks*, *Hebrews*, and other Eastern Nations, as also the *Romans*, express'd Numbers by the Letters of their common Alphabet. See **LITERAL CHARACTER**.

**NOTATION**, in Algebra, is the representing of Quantities by Letters of the Alphabet; or calling them by those Names. See **QUANTITY**, **CHARACTER**, &c.

**NOTE**, *Notaria*, Mother's Spun. See **NEVUS**.

**NOTE**, *Nota*, a Mark made in a Book or Writing, where there occurs something remarkable, and worthy of particular Notice.

**NOTE**, is also used for an Observation, or Explication of some Passage in an Author, added in the Margin, at the bottom of the Page, or elsewhere, by an Editor.

In this sense, *Note* stands contra-distinguished to *Text*. See *TEXT*.

The *Notes* make the principal Differences in the Editions of *Classic*, &c. Authors. We have *Virgil's Notes*, *Horace's*, *Tenney's*, &c. with *Ramus's Notes*, the *Dauphin's Notes*, *Dacier's Notes*, *Bentley's Notes*, *Hare's Notes*; with *Notæ Variorum*, &c. See *VARIORUM*.

*NOTE* is also a *minute*, or short Writing, containing some Article of Business. In this sense we say, a *Promissory Note*, a *Note under hand*, a *Bank Note*, &c. See *PROMISSORY*, *BANK*, &c.

To *Note a Bill*, is when a Public Notary goes to be a Witness, or take notice that a Merchant will not accept or pay it. See *BILL*.

*NOTE of a Fine*, is a Brief of a Fine made by the Chirographer, before it be ingrossed. See *FINE* and *CHIROGRAPHER*.

*NOTE* is also used for a Character, or Abbreviation, serving to denote, or express something in a little compass. See *CHARACTER*, *SYMBOL*, *ABBREVIATURE*, and *NOTATION*.

The ancient Notaries wrote all in *Notes*, or Short-hand; whence they were sometimes denominated *Carvers*, *Quæ notis Carsum verba expedeant*. See *NOTARY*.

*NOTES* in Music, are Characters which mark the Tones, i. e. the Elevations, and Fallings of the Voice; and the swift-ness, or slowness of its Motions. See *SOUND*.

In the general, under *Notes* are comprehended all the Signs, or Characters used in Music, for the making Harmony of Sounds. See *CHARACTER*.

But, in Propriety, the Word only implies the Marks which denote the degree of Gravity, or Acuteness, to be given each Sound. See *GRAVITY*.

The *Greek* used the common Letters of their Alphabet for musical *Notes*; and in regard more *Notes* were needed than they had Letters, the defect was supply'd by the different Situation of the Letters, viz. by placing of them upright, inverted, &c. and by cutting off, or doubling some Strokes.

Thus the same Letter *Pi*, express'd different *Notes* in all the following forms, Π, Η, Ξ, Ζ, Φ, Ψ. For every several *Mode* they had 18 Signs.

Now, *Alphisi* gives us Signs for 15 different *Modes*, which with the differences of the *Genera*, and the distinction between Voice and Instrument, Mr. *Maclein* observes, makes in all 1600 *Notes*. Not that they had so many distinct Characters; but the same Character has different Significations, on different Occasions. Thus  $\theta$  in the *Diatonic Genus* is *Lycaeus Hypaton* of the *Lydian Mode*; and *Hypate meson* of the *Phrygian*.

The *Latins*, in the time of *Sextius*, had castr'd themselves of so needless a Burthen; and only used the first 15 Letters of their Alphabet for *Notes*. Thence, Pope *Gregory* considering that the Octave was the same in effect with the first, and that the order was the same in the upper and lower Octave of the Gamut, reduced to seven; which were to be repeated in a different Character.

At length, in the 11th Century, a *Florentine*, one *Guido Aretin*, in lieu of the Letters, substituted the six Syllables *ut, re, mi, fa, sol, la*; placing them on different Lines, and marking them with Points. Lastly, it was thought proper to add *Notes* likewise in the Spaces. See *GAMUT*.

Of the seven musical *Notes*, *ut, re, mi, fa, sol, la, si*, the first six are ascribed to *Aretin*, who is said to have invented them at *Pumpisa* in the Duchy of *Ferrara*. The seventh, viz. *si*, was added, according to some, by *Vander Puten*; according to others, by *LeMoire*. It serves very good purposes, in avoiding the difficulty of the Divisions remaining in *Guido's* Scale.

Indeed *Vissiu* won't allow *Guido* the Honour of inventing any of them; but shews that the *Egyptians* had used them long before him; in which he is confirmed by the Testimony of *Halicarnassæus*: However, common Fame ascribes to him not only the *Notes*, but also the Lines, Letters, or Clefs, Flats, and Sharps.

The *Notes ut, re, mi*, &c. he is said to have taken from a Hymn in the Vespers of S. J. *Baptist*, *Ut queant Laxis resonare fibris*, &c. See *MUSIC*.

Hitherto the *Notes* only served to express the Degrees of Tone; they were all of equal value as to time; till about the Year 1350, *John de Meurs*, a Doctor of *Paris*, gave different Figures to the different Points, to express the Quantity of Time each was to be dwelt upon.

There are three things to be consider'd in these *Notes*. 1. The Quantity, i. e. the size and figure of the head. 2. The Quality, i. e. the Colour of the head, whether it be white or black, full or open. 3. The Properties, as the *Italians* express themselves, viz. whether the Note is accompanied with a Virgula, or Comma, or not. It must likewise be consider'd whether the *Notes* be separate and distinct, or bound together.

The several musical *Notes*, are, the *Large*, which contains 3 Measures, the *Morjonus* makes it 12. (See its Figure under *CHARACTER*;) the *Long*, containing 4 Measures; the *Brevet*, containing 2; the *Semibreve*, containing 1; the *Minon*  $\frac{1}{2}$ ; the *Crochet*  $\frac{1}{4}$ ; the *Quaver*  $\frac{1}{8}$ ; and the *Demiquaver*  $\frac{1}{16}$ .

Usually we only distinguish six principal *Notes*, represented by as many different Characters, viz. the *Semibreve*; equal to two Minims; the *Minon*, equal to two Crochets; the *Crochet*, equal to two Quavers; the *Quaver*, equal to two Demiquavers; and the *Semiquaver*, equal to two Demifemiquavers. See each under its proper Article, *SEMI-BREVE*, *MINIM*, *CROCHET*, &c.

The Mathematicians compute, that one may make 720 Changes, or Varieties with six *Notes*, without ever repeating the same twice; and that of the *Notes* of each Octave, one may make 40320 different Tunes, or Songs. See *CHANGE*, *COMBINATION*, &c.

*NOTHING*, *Nihil*, *Nihilum*, or *Non Ens*, see *NIRIL*.

The Schoolmen distinguish between *Nothing* taken strictly, which is what is impossible, or implies a Contradiction; and *Nothing* taken more generally: which is both possible, and impossible while in a State of possibility. See *POSSIBLE*.

Again, they distinguish *Nothing* into *Negative*, which is the absence of Reality in any Subject; and *Privative*, which is the absence of Reality in a Subject capable thereof, or wherein it ought to be found.

*NOTHUS*, a *Latin* Term, properly signifying *Ballard*, or a Person of ignominious Birth. See *BASTARD*.

Hence it is apply'd figuratively by Physicians, &c. to such Diseases as tho, in respect of a Similitude of Symptoms, &c. they have the same Denomination as some others; yet are of different Origin, Seat, or the like, from the same. See *EMPYEMA*, &c.

*NOTUS*, is sometimes also used for the back part of the Chest.

*NOTHÆ Costæ*, in Anatomy, the five lowest Ribs on each side; call'd *Ballard*, or Spurious Ribs, in regard they don't join with the Breast-Bone as the other Ribs do, nor are they, as the others are, bony, but cartilaginous. See *RIBS*.

*NOTION*, in Logic, an Idea, or Representation of any thing, in the Mind. See *IDEA*.

*M. Leibnitz* is very accurate in the Distinction of *Notions*, in the *Alta Erud. Læp. Anno 1684*.

A clear *NOTION*, he defines to be such a one as suffices us to recollect the Object; v. gr. that a given Figure is reckon'd in the number of Triangles.

An *obscure NOTION*, is that which doth not suffice to recollect the Object; such, v. gr. is that of a Plant, which upon seeing, you are in doubt whether or no it be the same you had seen elsewhere, and which is call'd by this or that Name.

*Distinct NOTION* is that wherein you are able to assign the very Marks, or Characters by which you recollect the thing; v. gr. That a Circle is a Figure terminated with a curve Line returning into itself, the several Points whereof are equally distant from one and the same intermediate Point.

A *confused NOTION* is that wherein you are not able to assign the Marks or Characters whereby you recollect the Object; tho it be resolvable into them. Such, v. gr. is the *Notion* of red Colour.

An *adequate NOTION*, that wherein you have distinct *Notions* of the Marks or Characters whereof it is composed; such, v. gr. is the *Notion* of a Circle above instanced, where you have distinct *Notions* of the Curve returning into itself, of the intermediate Point, and of the equal Distance and Termination.

An *inadequate NOTION*, that wherein you have only a confused *Notion* of Characters that enter a distinct one.

Some confused *Notions* are admitted into Mathematics; viz. such whose resolution is of no great Consequence to any Demonstrations.

Thus, *Euclid* does not resolve the *Notion* of Equalities, tho it enter the *Notion* of an equilateral Triangle, a Rhombus, &c. inasmuch as the Propositions for whose Demonstration it should be used, are easily granted without such a detail; as, v. gr. that things equal to the same third, are equal to one another, &c. But no *Notions* are admitted into the Number of Mathematical Definitions, except distinct ones, and those too as adequate as possible, or as occasion requires. See *DEFINITION*.

The Schoolmen distinguish *Notions* into *formal*, and *objective*; and each of these they subdivide into *first*, and *second*.

A *first formal NOTION*, is the Knowledge we have of any thing according to what it is, or has in itself; as the Knowledge of Fire, *quatenus* Fire; of a light Body, *quatenus* light, &c.

A *first objective* NOTION, is the thing itself known, according to what it is, or has in itself; as the Fire known as Fire, &c.

*Second formal* NOTION, is the Knowledge of a thing according to what it receives from the Understanding; as, of Fire, that it is the Subject; and not the Predicate.

*Second objective* NOTION, is what agrees to the thing by means of the Operation of the Intellect, or what it receives from the Intellect.

Common NOTIONS, call'd also *Prænotions*, *προνοήσεις*, and *κατανοήσεις*, are certain Principles supposed to be innate, and which therefore are self-evident, i. e. appear, or are known by their own Light, without the Intervention of any Medium, or Proof; being impress'd, as it were, by the Finger of God; to serve as the Foundations of all our Conclusions in the Sciences, which are to be demonstrated hereby. See *INNATE IDEA*.

These common Notions, consider'd as the Foundations of Sciences, are call'd *Axioms*. See *AXIOM*.

They are call'd *common*, not as if they actually and necessarily perceived by every Person, that no body could be ignorant of, or deny them; but because they are judged to be true, and certain by all Persons of sound Reason. For the same Reason as we say, *Such a Foot is wholesome*; nor that it is so to all Men, but to all that are of a sound Body, and Constitution. *Artisan Topic*, c. 4.

There are two kinds of common Notions, viz. *Theoretical*, which lay the Ground-works for Speculation; such are, Every thing either is, or is not; nothing can be made by itself; the whole is greater than a part; equal things being added to equal, the Sums are equal: And *Practical*, which lay the Foundation for Honesty, and good Morals; such are, God is to be loved and worshipp'd; our Parents to be honour'd; to give every body their due; to do as we would be done by. —

Some Philosophers, however, and those of best Note, deny the Reality of any Innate, or Common Notions; urging, that the Mind does not need any actual Notions to prepare it to think, but that an innate Faculty of Thinking may suffice; as appears in an Infant, from its perception of Pain, Taste, Colour, &c. They add, that the common Organs of Sense, if they have but Objects presented to them, and the Faculty we have of reflecting on, and variously combining or ordering the Ideas received thereby, are sufficient to furnish us with all the Stock of Knowledge we have. See *KNOWLEDGE*.

NOTITIA, NOTICE, a Term us'd for something that has come under the Knowledge of a Person. Hence *Notification*, the Action of giving Notice, &c.

NOTITIA is also us'd as the Title of certain Books composed for giving a particular Knowledge of the Places, Roads, &c. of a Province or Kingdom, Diocese, &c. as appears by the *Notitia Imperii*, &c.

M. Valais has given a *Notitia Galliarum*, which is a Collection of the several Names the Cities and Provinces of that Kingdom had bore at different times.

The *Notitie Dignitatum Imperii*, both Eastern and Western, are of the utmost use both in the Roman and in Ecclesiastical History; yet are they of little Service, at least to young People, without good Notes; such are those of *Panzerolus*, &c. And unless the Text, which is strangely corrupted and mutilated, be supplied.

NOTORIOUS, something known, manifest, and publick.

Hence *Arts Notoria*, a Chimerical Science or Art, whereby it is pretended a Person may arrive at the Knowledge of all Things, all Sciences, &c. And that by Insufion, without any Labour, or Trouble, beside that of making a few Ceremonies.

NOTRE DAME, Our Lady, a Term frequently us'd for the Holy Virgin.

Hence *Feasts of Notre Dame*; the Office of *Notre Dame*; Congregations, Nunneries, Orders of *Notre Dame*. See *VIRGIN*.

NOVALE, in our ancient Customs, Land newly plow'd, and converted into Tillage; and which had not been till'd within the Memory of Man, before.

—*Quis Novale semel sinit, semper erit Novale quoad decimarum retentionem vel solutionem*. What was once *Novale*, will ever remain so, as to the paying, or non-paying of Tythes. Thus, *Excepta decima Novalia cuiusdam Terre quam de novo excoluerunt*. Pat. 6 Edw. 3. See *FALLOW*.

NOVALE is sometimes also us'd for fallow Land, i. e. Land which has been plow'd for two Years, and rests, or lies fallow one more; or that lies fallow every other Year. See *FALLOW*.

NOVATIANS, a Sect of ancient Heretics, so call'd from *Novatus*, an African Bishop; and *Novatian* a Priest of Rome.

*Novatian* first separated himself from the Communion of Pope Cornelius, on pretence of his being too easy in admitting

to Repentance those who had fallen off in times of Perfection.

*Novatus* coming to Rome, join'd himself to the Faction of *Novatian*; and both maintain'd, That there was no other admission into the Church but by the Repentance in Baptism; grounding their Opinion on that of St. Paul: *It is impossible for those once excommunicated, and who have tasted the heavenly Gift, if they fall away, to retrieve themselves by Repentance*.

Not that they denied but a Person fallen into any Sin, how grievous soever, might obtain Pardon by Repentance; for they themselves recommended Repentance in the strongest Terms. But their Doctrine was, That the Church had it not in its power to receive Sinners into its Communion; as having no way of remitting Sins but by Baptism, which, once received, could not be repeated.

In process of Time, the *Novatians* softened and moderated the Rigour of their Master's Doctrine; and only refused Absolution to very great Sinners.

The two Leaders were profcribed, and declared Heretics, not for excluding Penitents from Communion; but for denying that the Church had a Power of remitting Sins.

The *Novatians* were also call'd *Cathartes*, from *καθαρός*, pure, q. d. *Puritan*.

NOVATION, or *Innovation*, in the Civil Law, a change, or alteration of an Obligation, whereby it becomes extinguish'd, or annihilated.

Thus when an Obligation is discharged without receiving any Money; but a simple Promise is accepted in its stead; this occasions a *Novation*.

There are two kinds of *Novations*; the one voluntary, the other necessary and constrained.

*Necessary* NOVATION is that made in consequence of a Sentence, or Decree of Justice.

*Voluntary* NOVATION is made three ways, viz. by changing the Cause of the Obligation without the Intervention of any other Person; by changing the nature of the Obligation; and by Delegation, as when the Debtor makes over a Debt to the Creditor for his Satisfaction.

In all these Cases there is a will to *Innovate*: Accordingly *Justinian* says, *Voluntate non Lege innovandum*.

NOVEL, New; see *ROMANCE*.

NOVEL, in Jurisprudence, a Term us'd for the Constitutions of several Emperors, viz. *Justin*, *Tiberius*, *Leo*, and particularly *Justinian*. See *CONSTITUTION* and *LAW*.

Most of *Justinian's* Novels were originally *Greek*; and afterwards, translated into *Latin*. Their Number 165, compriz'd in nine Collections, or Chapters. See *CIVIL LAW*.

They had their name *Novel*, either from their making a great Alteration in the Face of the ancient Law; or, as *Cujas* rather thinks, because made on new Cases, not yet consider'd, and after the revival of the Code, compiled by order of the Emperor.

Wherever *Arcadius* speaks of *Novels*, he means those published in *Greek* by *Justinian*; the *Latin* Version of them made in the time of *Zacharias*, he calls *Authentica*, by reason of its Exactness and Fidelity. See *AUTHENTICA*.

NOVEL Assignment, in an Action of Trespas, is an Assignment of Time, Place, or such like, in a Declaration, more particularly than it was in the Writ.

NOVEL Diffesin, see *ASSIZE* of *Novel Diffesin*.

NOVEMBER, the eleventh Month in the Year; but the ninth in the Year of *Romulus*; whence its Name. See *MONTH*.

NOVENDIAL, or *Novendial*, in Antiquity, a Sacrifice among the *Romans*, held on occasion of any Prodigy's appearing to menace them with ill Fortune. See *SACRIFICE*.

It had its Name from the Term of its Celebration, viz. *Novem dies*, Nine Days.

NOVENSILES, in Mythology, a Species of Gods worshipp'd among the ancient *Romans*.

The *Du Novensiles*, were the Gods of the *Sabines*; adopted by *Romulus*, and a Temple built to them in consequence of a Vow by King *Tatius*.

Some Antiquaries take the Name to have been given to those which were left placed among the Number of the Gods; as *Hercules*, *Vesta*, *Sanctity*, *Fortune*, &c.

NOVEMVIR, a Magistrature of *Athen*, in the Number of the *Nine*.

The *Novemviri* were the chief Magistrates of the City: Their Office only held for one Year. Their Chief was call'd *Arben*, whose Name was recorded in the *Athenian* Feasts; as, at Rome, that of the Consuls. See *ARCHON*.

The second bore the Title of King, the third that of *Polemarcha*, i. e. Chief of the Troops, and the remaining six, *Thesmoeteres*.

NOVICE, a Person not yet skill'd or experienced in an Art or Profession.

In the ancient Roman Militia, *Noviti*, or *Novitia*, were the young raw Soldiers, distinguished by this Appellation from the Veterans. See VETERAN.

In the ancient Orders of Knighthood, there were *Novices*, or Clerks in Arms, who went thro a kind of Apprenticeship e'er they were admitted Knights. See KNIGHT.

NOVICE is particularly used in Monasteries for a Religious yet in his, or her Year of Probation, and who has not made the Vows. See NOVICIATE.

In some Convents the Subprior has the Direction of the *Novices*. In Nunneries, the *Novices* wear a white Veil; the rest a black one.

A *Novice* is not esteemed dead in Law, but is capable of Inheriting till the time of actual Profession; nor can his Benefices be given away, during the Year of Probation, without his consent.

The Council of Trent prohibits a *Novice* from assigning over his Benefices till two Months before the Expiration of his Year of Probation; and he may even resume them if the Profession be null.

A *Novice* is not allow'd to make any Donation to his Superior, by reason of the Dependence he is under.

*Novices* may either quit the Convent during their *Noviciate*, or may be turn'd off by the Convent.

NOVICIATE, a Year of Probation, appointed for the Trial of Religious, whether or no they have a Vocation, and the necessary Qualities for living in the Rule; the Observation whereof they are to bind themselves by Vow. See PROBATION.

The *Noviciate* lasts a Year at least; in some Houses more. 'Tis esteem'd the Bed of the Civil Death of a *Novice*, who expires to the World by Profission. See VOW and PROFESSION.

NOVICIATE is also used for the Houses, or Places where *Novices* are instructed.

In this sense, the *Noviciate* is frequently a Cloister separated from the grand Dormitory.

NOUN, *Nomen*, in Grammar, a Name, or a Word that expresses the Subject spoke of; or expresses a Subject whereof something is, or may be, affirmed; as *Man, Lord, Whiteness, Henry, &c.* See WORD and NAME.

A *Noun*, therefore, in Language, answers to an Idea in Logic. See IDEA.

The generality of Subjects spoke of have particular Names; yet there are others, which, without being attach'd to the same particular Subject, are yet real *Nouns*.

Thus, beside the particular Name, which each Person bears, and whereby others denote him, he gives himself another when he speaks of himself; as *I and My Self*.

'Tis only the more particular Names that in Grammar have retain'd the Quality of *Nouns*; the more general ones are call'd Pronouns. See PRONOUN.

*Nouns*, again, are to be view'd in another Light, viz. as divided into *Nouns Substantives*, and *Nouns Adjectives*.

They are call'd *Substantives* when the Objects they design are consider'd simply, in themselves, and without any regard to their Qualities. See SUBSTANTIVE.

They are call'd *Adjectives* when their Objects are consider'd as clothed with any Qualities. See ADJECTIVE.

Thus, when I say simply the *Heart*, the word *Heart* is call'd a *Noun Substantive*; inasmuch as it does not express any of its Qualities: But if I say, the *generous Heart*, or the *perfidious Heart*, I then consider the *Heart* as accompanied with the Quality *generous*, or the Quality *perfidious*. For this reason, the Words *generous* and *perfidious* are call'd *Nouns Adjectives*, because they add a Quality to the Object.

But in effect the Object is alone design'd by the *Nouns Substantives*; which in this view are alone the proper *Nouns*.

*Adjectives*, at bottom, are only Modificatives of *Nouns*; tho in one view they may be consider'd as *Nouns*; viz. as they don't so much represent a Quality or Circumstance of the Object, as the Object itself, clothed with that Quality or Circumstance. Nor must it be omitted, that a *Noun Adjective* frequently becomes a *Substantive*: For as its nature is to express the Quality of an Object, if that Quality happen to be the Object itself spoke of, then, according to our first Definition, it becomes a *Substantive*.

Thus, if I say a *good Intention*, the word *good* is here an *Adjective*, representing the Intention as clothed with the Quality of Goodness; but if I say the *Good is to be chosen*, 'tis evident that *Good* is here the Subject spoke of, and of consequence is a *Noun Substantive*. Nor are there Cases wanting wherein *Nouns Substantives* become *Adjectives*.

'Tis true, in the common use of Grammar, *Nouns* that are really *Adjectives*, are not reckon'd as such; none being esteem'd as such, but those which without any, or at least any considerable change in their Inflection and Termination, are join'd indifferently to *Nouns Substantives* of different Genders.

*Nouns* are again divided into *Proper* and *Appellative*.

*Nouns Proper* are those which express a particular Thing or Person, so as to distinguish it from all other Things of the same Kind, as *Severus*. See PROPER.

*Nouns Appellative*, are those common to several Individuals of the same Kind, as *Man, Angel, &c.* See APPELLATIVE.

NOURISHMENT, see NUTRITION.

NOWED, *Nowe*, i. e. *Known*, in Heraldry, is applied to the Tails of such Creatures as are very long, and sometimes represented in Coat-Armour as if fixed up in a Knot.

NUBECULA, *little Cloud*, in Medicine, a Term sometimes used for a Disease in the Eye, wherein Objects appear as thro a Cloud, or Mist.

The *Nubecula* seems to arise from certain gross Particles detain'd in the Pores of the *Cornea*, or swimming in the aqueous Humour, and thus intercepting the Rays of Light.

NUBECULA is also used for a Matter, in form of a Cloud, suspended in the middle of the Urine. This they sometimes also call *Cinerosa*. See URINE.

NUCHA, the binder Part, or Nape of the Neck; call'd also *Cervix*. See CERVIX.

NUCHTHEMERON, see DAY.

NUCIFEROUS, from *Nux*, a Nut, and *fero*, to bear; Botanists call all Trees thus, which bear Nuts.

NUCKLANÆ *Glandule*, in Anatomy, a Number of small Glands situate in that part of the Skull wherein the Orbits of the Eyes are, between the abducent Muscle of the Eye, and the upper part of the *Oss Jugale*. See GLAND and CRANIUM.

They were thus denominated from their Inventor Dr. *Nuck*.

The same Author gave his Name to a Salivary Duct, *Ductus Nuckianus*. See SALIVARY, &c.

NUCLEUS, a *Latin Word*, literally denoting the Kernel of a Nut, or Stone-Fruit; or, more strictly the edible Part contained within the Skin of the Kernel. See FRUIT.

Botanists use it in a larger sense, for any Fruit or Seed contained within a Husk or Shell.

*Hevelius*, and some other Astronomers, use the Word *Nucleus* for the Body of a Comet, which others call its *Head*, in contradistinction to its *Tail*, or *Beard*. See COMET.

Some also apply the Term *Nucleus* to the Central-Parts of the Earth, and other Planets; as supposing them to be loose from the exterior Part, which they consider as a Cortex or Shell. See MAGNETISM.

NUCLEUS, in Architecture, is the middle Part of the Flooring of the Antients; consisting of Cement which they put betwixt a Lay, or Bed of Pebbles, cemented with Mortar made of Lime and Sand.

NUDE *Contract*, *Nudum Pactum*, a bare Contract, or Promise of a Thing without any Consideration: *Ex quo, say the Lawyers, non vitur adio*. See CONTRACT and COVENANT.

NUDE *Matter*, see MATTER.

NUDITIES, in Painting, and Sculpture, those Parts of a human Figure not cover'd with any Drapery; or those Parts where the Carnations appear. See CARNATION.

NUEL, or rather *Newel* of a Stair-Case, see NEWEL and STAIR-CASE.

NULLITY, the Quality of a thing null, i. e. void, and of no effect; by reason of something contrary to Law, or Custom, or to Form.

There are two kinds of *Nullities* to invalidate a Contract, Title, &c. viz. *de facto*, and *de jure*. The former where the thing commences *Null ipso facto*, as soon as the thing is proved: In the latter, the Act does not immediately become Null, but a handle is given thereby to have it intirely annul'd or set aside. See DE FACTO, &c.

NUMBER, in Arithmetic, a Collection, or Assemblage of several Units. See UNIT.

*Secius* chuses to define *Number* to be that whereby the Quantity of any thing is express'd. Agreeably to which, Sir I. NEWTON conceives *Number* to consist, not in a Multitude of Units, as *Euclid* defines it, but in the abstract Ratio of a Quantity of any kind to another Quantity of the same kind which is accounted as Unity. And on this view he divides *Number* into three Kinds, viz. *Integers, Fractions, and Surds*. See each under its proper Article, INTEGER, FRACTION, and SURD.

*Wassius* defines *Number* to be something which refers to Unity as one right Line refers to another. Thus, assuming a right Line for Unity, a *Number* may likewise be express'd by a right Line.

A less general Definition of *Number*, that Author thinks won't comprehend the several kinds of whole Numbers, Fractions, Rationals, and Surds.

The Schoolmen, keeping to *Euclid's* Definition, hold *Number* to consist of Matter and Form: The Matter is the things number'd; e. g. Coins: The Form, the Idea whereby

whereby comparing the several Pieces, we bring them into one Sum, as ten: So that *Number* depends altogether on the Mind of the Person that numbers; whence changing the Idea at pleasure, an hundred Men shall only be call'd one, or it shall be two, or four, &c.

Hence, say they, the Form of a *Number*, is not any thing added to the things number'd; for the Idea is a mere Mode of the Mind, not any thing superadded to the things. And hence, tho' there may be some Efficacy in a *Number*, consider'd with respect to the Matter, as when we say, *A triple Rope is not easily broke*; yet there is none in respect to Form: For what Alteration should my Idea make? And hence the Folly of the Philosophy of *Numbers*.

The same Philosophers call *Number a discrete Quantity*: *Quantity*, as it admits of more and less; and *discrete*, since the several Units it consists of are not united, but remain distinct.

For the Manner of designing, or characterizing *Numbers*, see NOTATION.

For that of expressing or reading those already characteriz'd, see NUMERATION.

Mathematicians, considering *Number* under a great many Circumstances, different Relations, and Accidents, make many Kinds of *Numbers*.

A *determinate NUMBER*, is that refer'd to some given Unit; as a Ternary, or three; which is what we properly call a *Number*.

An *indeterminate NUMBER*, that refer'd to Unity in the general; which is what we call *Quantity*. See QUANTITY.

*Homogeneous NUMBERS*, are those refer'd to the same Unit.

*Heterogeneous NUMBERS*, those refer'd to different ones. For every *Number* supposes some determinate Unit, which is determined by the Notion to which we have regard in *Numbering*. E.g. 'tis a distinguishing Property of a Sphere, that the several Points of its Surface are equidistant from its Centre: If then, this be laid down as a Note of Unity, all Bodies to which it agrees will have the nature of Unity; and are the same Units, *quatenus* contain'd under this Notion. But if Spheres be distinguished, e.g. with regard to the Matter they are compos'd of; then those which before were the same Units, commence different. Thus, six golden Spheres and three golden Spheres are *homogeneous Numbers* among themselves; and three brass Spheres and four silver ones, are *heterogeneous Numbers*.

*Whole NUMBERS*, call'd also *natural Numbers*, and *Integers*, or simply *Numbers*, are all the various Assemblages of Unity, or the Ideas we have of several Multitudes; or, according to *Wolffius*, all those which, in the manner of expressing, refer to Unity, as a Whole does to a Part.

*Broken NUMBERS*, or *Fractions*, are those consisting of several parts of Unity, or those which refer to Unity as a Part to the Whole. See FRACTION.

*Rational NUMBER*, is that commensurable with Unity.—*Rational whole Number*, is that whereof Unity is an *Aliquot part*.—*Rational broken Number*, that equal to some *Aliquot part* or parts of Unity.—*Rational mixt Number*, that consisting of a whole *Number* and a broken one, or of Unity and a Fraction. See FRACTION.

*Irrational NUMBER*, or *Irrad*, a *Number* incommensurable with Unity. See SURD.

*Even NUMBER*, that which may be divided into two equal parts, or without Remainder or Fraction; as 4, 6, 8, 10, &c. The Sum, as also the Difference, and the *Fallsum*, or Produce of any Number of even *Numbers*, is always an even *Number*.

An even *Number* multiply'd by an even *Number*, produces an evenly even *Number*.

An even *Number* is said to be evenly even, when it may be measur'd or divided without any Remainder by another even *Number*.

Thus, twice four being eight, eight is an evenly even *Number*.

A *Number* is said to be unevenly even, when it may be equally divided by an uneven *Number*; as 20, which may be divided by 5.

*Uneven NUMBER*, that which exceeds an even *Number* at least by Unity; or which cannot be divided into two equal Parts. Such are 3, 5, 7, 9, 11, &c.

The Sum, or the Difference, of two uneven *Numbers*, makes an even *Number*; but the *Fallsum* of two makes an uneven one.

If an even *Number* be added to an uneven one, or if the one be subtracted from the other; in the former Case, the Sum, in the latter the Difference, is an uneven *Number*. But the *Fallsum* of an even and an uneven *Number*, is even.

The Sum of any even *Number* of uneven *Numbers*, is an even *Number*; and the Sum of any uneven *Number* of uneven *Numbers*, is an uneven *Number*.

*Primitive* or *prime NUMBER*, is that which is only divisible by Unity; as, 3, 7, 11, &c.

*Prime NUMBERS* among themselves, are those which have no common Measure beside Unity; as 13 and 19.

*Compound NUMBER*, is that divisible by some other *Number* besides Unity; as 8, divisible by 4, and by 2.

*Compound NUMBERS* among themselves, those which have some common Measure beside Unity; as 15 and 25.

*Perfect NUMBER*, that whose *Aliquot Parts* added together, make the whole *Number*; as 6, 28, &c. The *Aliquot Parts* of 6, being 3, 2, and 1 = 6. And thus of 28, being 14, 7, 4, 2, 1, which together make 28.

*Imperfect NUMBERS*, those whose *Aliquot Parts* added together, make either more or less than the Whole, whereof they are Parts.

*Imperfect NUMBERS*, are distinguish'd into *Abundant* and *Defective*.

*Abundant NUMBERS*, are those whose *Aliquot Parts* added together, make more than the *Number* whereof they are Parts; as 12, whose *Aliquot Parts*, 6, 4, 3, 2, 1, make 16.

*Defective NUMBERS*, are those whose *Aliquot Parts* added together, make less than the *Number* whose Parts they are; as 16, whose *Aliquot Parts*, 8, 4, 2, and 1, only make 15.

*Plane NUMBER*, that arising from the Multiplication of two *Numbers*; e.g. 6, which is the Product of 3 multiply'd by 2. The *Numbers* which thus multiply'd produce a *Plane Number*, as here, 2 and 6, are call'd the *Sides* of the Plane.

*Square NUMBER*, the Product of any *Number* multiply'd by itself; thus 4, the *Fallsum* of 2, by 2, is a *square Number*. See SQUARE.

Every *square Number* added to its Root, makes an even *Number*.

*Cube NUMBER*, the Product of a *square Number*, multiply'd by its Root; e.g. 8, the Product of the *square Number* 4, multiply'd by its Root 2. See CUBE.

All *Cube Numbers*, whose Root is less than 6, e.g. 8, 27, 64, 125, being divided by 6, the Remainder is their Root itself. Thus 8 being divided by 6, 2, the Remainder of the Division, is the Cube Root of 8. For the *Cubic Numbers* beyond 125; 216, the Cube of 6, divided by 6, leaves no Remainder; 343, the Cube of 7, leaves a Remainder 1, which added to 6, gives the Cube Root of 343. And 512, the Cube of 8, divided by 6, leaves 2, which added to 6, makes the Cube Root of 512. So that the Remainders of the Divisions of the Cubes above 216, divided by 6, being added to 6, always give the Root of the *Cubic Number* divided; till that Remainder be 5, and of consequence 11 the Cube Root of the *Number* divided: But the *Cubic Number* above this, being divided by 6, there remains nothing, the Cube Root being 12. Thus, if you continue to divide the higher Cubes by 6, you must not add the Remainder of the Division to 6, but to 12, the first Multiple of 6; and thus coming to the Cube of 18, the Remainder of the Division must not be added to 6, nor to 12, but to 18; and thus in infinitum.

Mois. de la Hire, from considering this Property of the *Number 6*, with regard to *Cubic Numbers*, found that all other *Numbers* rais'd to any Power whatsoever, had each their Divisor, which had the same effect with regard to them, that 6 has with regard to Cubes. And the general Rule he has discover'd, is this: If the Exponent of the Power of a *Number* be even, i.e. if that Power be rais'd to the 2d, 4th, 6th, &c. Power, it must be divided by 2, and the Remainder, if there be any, added to 2, or to a Multiple of 2, gives the Root of the *Number* corresponding to its Power, i.e. the 2d or 6th Root, &c. But if the Exponent of the Power of the *Number* be uneven, i.e. if it be rais'd to the 3d, 5th, 7th, &c. Power, the Duple of that Exponent will be the Divisor which shall have the Property here requir'd.

*Polygonal NUMBERS*, the Sums of Arithmetical Progressions, beginning with Unity. These, where the Difference of Terms is 1, are call'd *Triangular Numbers*; where 2, *Square Numbers*; where 3, *Pentagonal Numbers*; where 4, *Hexagonal Numbers*; where 5, *Heptagonal*, &c. See POLYGON.

*Pyramidal NUMBERS*, the Sums of Polygonal *Numbers*, collected after the same manner as the Polygons themselves are gather'd out of Arithmetical Progressions, are call'd *first Pyramidal Numbers*.

The Sums of the first *Pyramidals*, are call'd *second Pyramidal*. The Sums of the second *Pyramidals*, are call'd *third Pyramidal*, &c.

In particular, they are call'd *Triangular Pyramidal Numbers*, if they arise out of *Triangular Numbers*. *First Pentagonal Pyramidal*, if they arise out of *Pentagons*, &c. See PYRAMID.

*Cardinal NUMBERS*, those which express the Quantity of Units; as 1, 2, &c.

*Ordinal NUMBERS*, those which express the Order or Rank; as 1st, 2d, 3d, &c.

*Golden NUMBER*, in Chronology, a Period of 19 Years, invented by Meton the Athenian; at the end whereof, the same Lunations return in the same Days, tho' not precisely in the same Hour and Minute of the Day. See PERIOD and LUNATION.

Hence this Period, call'd by the *Greeks*: *Enneadecacteteris*, is not perfectly just; there being a *Proemissus*, or Leap, at the end of each 312 Years, i. e. in that time, the Lunations fall out a Day sooner than the *Golden Number* expresses them. See *PROEMISSUS*.

This, among other things, was what engag'd Pope Gregory XIII. to reform the Calendar, to throw out the *Golden Number*, and substitute the Cycle of Epacts instead of it. For the Use of the *Golden Number*, which, in the *Julian Calendar*, serves to find the New Moons, only serves in the *Gregorian* to find the Cycle of Epacts. See *EPIACT*; see also *CYCLE*, and *CALENDAR*.

This Number is said to have had its Name, *Golden*, from the Greatness of its Use; or because the *Athenians* receiv'd it with so much Applause, that they had it writ in the publick Market in Letters of Gold.

M. Cassini defines the *Golden Number* after a new manner. He says, 'tis the Number of Years elaps'd since that which had the New Moon on its first Day; as that of the Year 1500, whose *Golden Number* was 0; which he takes for his Epocha. See *MEYONIC*.

NUMBER, in Grammar, is a Modification of Nouns, Verbs, &c. to accommodate them to the Varieties in their Objects, consider'd with regard to Number. See *NOUS*, &c.

Nouns or Names agreeing to several Things, may be consider'd either as apply'd to one of those Things singularly, or to a Number of them; and those either consider'd as several, or as united. To distinguish these Cases, two Numbers have been invented, the *Singular* and *Plural*.

When a Noun indicates an Object consider'd as single, or alone, or a number of them consider'd as united together, 'tis said to be of the *Singular Number*; as a Tree, a Troop, a Temple. See *SINGULAR*.

When it indicates several Objects, and those as distinct, it is of the *Plural Number*; as Trees, Temples. Thus when I speak of myself, as making part of several others, instead of I, I say We, &c. See *PLURAL*.

The *Greeks* have a third Number, which they call the *Dual Number*, as signifying two. The *Hebrews* have something like it; but then it only takes place when the Words signify a thing double either by Nature, as the Hands, the Eyes, &c. or by Art, as Scissars, Tonges, &c.

As to Common and Appellative Names, they seem all naturally to require a *Plural Number*, yet are there several which have none; as the Names of Gold, Steel, &c.

The Difference of Numbers in Nouns is express'd by a Difference of Termination or Ending.

In *English*, the *Singular* is usually converted into *Plural*, by adding s; as Tree, Trees; Hand, Hands, &c. Where the Pronunciation requires it, as when the *Singular* ends in s, or x, β, or c, 'tis usually done by the Addition of es instead of s.

The *Plurals* of Adjectives, tho' vary'd from the *Singulars* in most other Languages; yet in *English* are generally the same. See *VERB*.

NUMBERS, in Poetry, Oratory, Music, &c. are certain Measures, Proportions, or Cadences, which render an Air, Verse, or Period, agreeable to the Ear. See *VERSE*, *MEASURE*, &c.

Poetical and Prosaic Numbers, are somewhat different: Poetical NUMBERS consist in a certain Harmony, in the Order, Quantities, &c. of the Feet and Syllables; which make the Piece musical to the Ear, and fit it for Singing; for which all the Verses of the Ancients were intended. 'Tis of these Numbers *Virgil* speaks in his 14th *Eclogue*.

—Numerus manini si verba tenerem.

And again, in the 15th *Eclogue*:

Tum vero in Numerum Fanoq; Feroq; videtes  
Ludere——

The Numbers are what constitute the Air and Character of a Verse; and denominate it smooth, or soft, or low, or rough, or rapid, or serious. The following Lines of *Milton* furnish an Instance of soft easy Numbers.

Then feed on Thoughts, which voluntary move  
Harmonious Numbers; as the ransall Bird  
Sings darkling, and in softest Covers hid,  
Tunes her Nocturnal Note:——

How different from the Numbers of these:

Arms meet with Arms, Fauchons with Fauchons clash,  
And Sparks of Fire, strike out from Armour, Blast,  
But when loud Surges lash the founding Shore,  
The hoarse rough Verse should like the Torrent roar.

Rhetorical or Prosaic NUMBERS, are a sort of simple unaffected Harmony, less glaring than that of Verse; yet

such as is perceiv'd, and affects the Mind with Pleasure. The Numbers are that by which the Style is said to be easy, free, round, flowing, &c. See *STYLE*.

A fine Instance of Numbers we have in that Passage of *Tully* for *Marcellus*: *Nulla est tanta vis, tantaq; copia que non ferret ac viribus debilitari frangiq; possit*. All the Beauty of which would be entirely lost to any tolerable Ear, if the Numbers were a little inverted, thus: *Nulla est vis tanta, & copia tanta que non possit debilitari frangiq; viribus & ferret*.

Numbers are a Thing absolutely necessary in all Writing, and even all Speech. Hence *Aristotle*, *Tully*, *Quintilian*, &c. lay down abundance of Rules as to the best manner of intermixing *Dactyls*, *Spondees*, *Anapests*, *Iambus*, &c. and *Dieterich Meisner*, &c. in order to have the Numbers perfect.

The Substance of what they have done, is reducible to what follows: 1. The Style becomes numerous, by the alternate Disposition and Temperature of long and short Syllables; so, as that the Multitude of short ones neither render it too hasty, nor that of long ones too slow and languid.

Thus, *Tully* to *Cesar*: *Domuisti Gentes inumanitate barbari; multitudine innumerabiles, locis infinitas, omni copiarum genere abundantes*, &c.

Sometimes, indeed, long or short Syllables are design'dly thrown together, without any such Mixture; to paint the Celerity or Slowness of a Thing by that of the Numbers; as,

Quadrupedante patrem senem quat ungula compans.  
Æncid. l. 8.

Lubantes Ventis, Tempestatesq; Soporatis.

Id. l. 1.

2. The Style becomes numerous by the intermixing of Words of one, two, and more Syllables; i. e. gr. *Vixis & visus non ad dependendum sed ad confirmandum adiacium*. Whereas the too frequent repetition of Monosyllables renders the Style pitiful, and grating; e. gr. *Hæc in Re nos bis non feret*.

3. It contributes greatly to the numerousness of a Period, to have it clos'd by magnificent and well sounding Words; as, *Qui locus quietus ac tranquillitatis plenissimus fore videbatur, in eo maxime molestiarum, & turbulentiſſima tempestates existerrunt*.

4. The Numbers depend not only on the nobleness of the Words in the Cloſe, but of those in the whole tenor of the Period; as in the fine Oration of *Cicero* for *Festus*, Brother of one of the Vestal Maids. *Nature pati, Judicet, arat Deorum immortalium, Vestique matris, quotidianis Virginitum Lavamentationibus de Vestro Judicio commoverit*.

5. To have the Period flow easily and equably, the harsh concurrence of Letters and Words is to be studiously avoided, particularly the frequent meeting of rough Consonants; as *Artifudorum, Rex Rexes*: The beginning the first Syllable of a Word with the last of the preceding; as, *Res mihi misere sum*: The frequent repetition of the same Letter or Syllable; as in that Verse of *Ennius*, *Africa terribilis tremat horrida terra tumultu*: And the frequent use of like-sounding Words; as *Amatrices, Adjatrices, Prefigiatrices fuerunt*.

Lastly, The utmost Care is to be taken, left in aiming at Oratorical Numbers, you fall into Poetical ones; and instead of Prose, write Verse; which even *Cicero* himself is sometimes guilty of; witness, *Com loquatur tanti fluxus geminisque ficiant*. See *VERSE*.

NUMERAL Letters, those Letters of the Alphabet, which are generally used for Figures; as I, V, X, C, D.

NUMERAL Characters. See *CHARACTER*.

NUMERALS, in Grammar, are those Words which express Numbers; as Six, Eight, Ten, &c. See *ORDINALS*.

NUMERATION, in Arithmetic, the Art of valuing, pronouncing, or reading, any Number, or Series of Numbers. See *NUMBER*.

The Characters whereby Numbers are ordinarily express'd, are the nine following ones, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9. It being the Law of the common Numeration, that when you are arriv'd at ten, you begin again, and repeat as before; only expressing the Number of Tens.

*Weigelius*, indeed, shows how to number without going beyond a Quaternary, i. e. by beginning to repeat at each Fourth. And *Leibnitz*, in what he calls his *Binary Arithmetic*, begins to repeat at every Second; only using two Characters, 1 and 0. But these are rather Matters of Curiosity than Use. See *BINARY Arithmetic*.

That the nine Numerical Notes may express not only Units, but also Tens or Decads, Hundreds or Centuries, Thousands, &c. they have a local Value given them; so, as that when either alone, or when placed in the right-hand place, they denote Units; in the second place, Tens; in the third, Hundreds; in the fourth, Thousands. See *NOTATION*, &c.

Now, To express any written Number, or assign the proper Value to each Character; Divide the proposed Number by Comma's into Classes, allowing three Characters in each Class; beginning at the right-hand. Over the right-hand Figure of the third Class, add a small Mark or transverse Line; over the right-hand Figure of the fifth Class, add two Marks or transverse Lines; over that of the seventh, three, &c. The Number to the left of the first Comma, express by Thousands; that which has over it the first transverse Line, express by Millions; that with two, by Billions; that with three, by Trillions, &c. Lastly, the left-hand Character of each Class, express by Hundreds; the middle one, by Tens; and the right-hand one, by Units. Thus will the Numeration be effected.

E. gr. The following Numbers, 2<sup>00</sup>, 125, 473<sup>00</sup>, 613, 578<sup>00</sup>, 455, 597, is thus express'd or read: Two Trillions, one hundred twenty Millions of Billions, four hundred twenty three Billions, six hundred thirteen Thousands of Millions, and five hundred seventy eight Millions, four hundred and thirty two thousand, five Hundred and ninety seven.

**NUMERATOR**, in Arithmetic, a Term used in speaking of Fractions. It signifies the Number that denotes the Parts of the Integer, and is placed over the little Bar, which separates it from the under Number, call'd the Denominator, which shews into how many Parts the Integer is divided. See DENOMINATOR.

Thus, e. g.  $\frac{7}{10}$  expresses seven Tenths; where 7 is the Numerator, and 10 the Denominator. See FRACTION.

**NUMERICAL**, something that relates to Number.

**NUMERICAL Algebra**, is that which makes use of Numbers instead of Letters of the Alphabet. See ALGEBRA.

**NUMERICAL Difference**, is the difference whereby one Individual is distinguished from another. See INDIVIDUAL.

Hence a thing is said to be Numerically the same, *idem Numero* or *numerat*, when it is the same in the strictest Sense of the Word. See UNITY and IDENTITY.

**NUMERO**, in Commerce, &c. a Term prefixed to any Number of things; marked, or abbreviated thus, N<sup>o</sup>.

De NUMERO, i. e. by Tale, is used in ancient Authors for the payment, e. gr. of a Pound in a certain Number of Pieces, e. gr. 20 Shillings; in contradiction to a *Libra pennis*, or Pound weighed out. See POUND.

**NUMISMATOGRAPHIA**, a Greek Term used for the Description and Knowledge of ancient Medals and Coins, whether of Gold, Silver, or Brass. See MEDAL and COIN.

*Fulvius Ursinus*, *Augustine* Bishop of Terracena, *Erizzo* a noble Venetian, and *Sambucus* a Polish Gentleman, have all been successful in the *Nomismatographia*: Nor must the more modern Authors on the same Subject be omitted; viz. the two *Menzabarba's*, *Patin*, *Spanheim*, *Hardwin*, *Murel*, *Vailant*, *Jobers*, *Händel*, *Bezer*, and among ourselves, *Evelyn*.

**NUMMO**, a Piece of ancient Roman Money; whereof there were two Kinds: the one Gold, the other Silver. See MONEY.

The Gold Nummus, call'd *Stater* and *Aureus*, weigh'd two Drachms, and was worth, according to *Bodens*'s Computation, about 16s. Sterling.

The Silver Nummus was just the Roman *Denarius*, which weigh'd one Drachm. See COIN.

The Jewish Nummus was their Shekel. See SHEKEL.

**NUN**, **NONNE**, an old Word, antiently used for a Female Religious; and still retain'd in that sense in our Language; and in other Languages, particularly the French; but by way of Radical and Burlesque. See RELIGIOUS.

Hence also *Nunnery*, a Monastery of Female Religious. See MONASTERY.

The Word comes from *Nonna*, *Nonnana*, or *Nonnana*; all Latin Terms, first used for Penitents, then for Religious.

*Borel* derives it from *Nonni*, or *Nonna*, which in Italian signifies Grandfathers, or Grandmothers. And adds, that it was apply'd by way of Honour to the Woman, as that of Father to the Man, *Religiōis*. See FATHER.

**NUNDINAL**, a Name which the Romans gave to the eight first Letters of the Alphabet, used in their Calendar. See LETTER.

This Series of eight Letters, A, B, C, D, E, F, G, H, is placed and repeated successively from the first to the last Day of the Year; one of these always express'd the Market-Days, or the Assemblies call'd *Nundinae*, quasi *Novendanae*, because they returned every nine Days.

The Country People, after working eight Days successively, came to Town the ninth, to sell their several Commodities, and to inform themselves of what related to Religion and Government.

Thus the *Nundinal* Day being under the Letter A, on the 18, 26, 34, and 42<sup>d</sup> Days of January, &c. the Letter D will be the *Nundinal* Letter of the Year following.

These *Nundinals* bear a good deal of resemblance to the *Dominical* Letters; which return every eight Days, as the *Dominicals* did every nine. See DOMINICAL LETTERS.

**NUNTIO**, an Ambassador from the Pope, to some Catholic Prince or State; or a Person who attends, on the Pope's behalf, at an Assembly of several Ambassadors. See EMBASSADOR.

The Word *Nuntio* has the same Import with *Embassador*, but is restrict'd in its Use to the Embassadors of Popes alone; as that of *Intercunctor* is to his Envoy Extraordinary.

*Erasmus* informs us, that when he first came to Court, the *Nuntio* had only the Title of *Embassador*.

The *Nuntio* has a Jurisdiction, and may delegate Judges in all the States he resides, except in France, where he has no Authority but that of a simple Embassador.

**NUPER Obiit**, in Law, a Writ which lies for a Co-heir being deposed by her Co-partner, of Lands or Tenements, whereof their common Father or Ancestor died seized in Fee Simple.

If the Ancestor died seized in Fee Tail, the Co-heir deposed shall have a *Formedon*. See FORMEDON.

**NUPTIAL**, something that relates to Marriage: See MARRIAGE.

**NURSERY**, in Gardening, is generally used in the same sense as *Semmary*, viz. for a Seed-plot for the raising of young Trees, or Plants. See SEMINARY.

Some Authors, however, make a difference between the two; holding *Nursery*, properly, not to be a place wherein Plants are sown; but a place for the reception and rearing of young Plants, which are removed, or transplanted thither from the Seminary, &c.

Mr. *Lawrence* recommends the having several *Nurseries* for the several kinds of Trees: One for tall *Standards*; viz. Apples, Ashes, Elms, Limes, Oaks, Pears, Sycamores, &c. Another for *Dwarfs*, viz. such as are intended for Apricocks, Cherries, Peaches, Plumbs, &c. And a third for *Ever-Greens*.

The *Nursery* for *Standards* should be in a rich, light Soil; sown, with the proper Seeds, in *October*, or *November*. For Apples and Pears, Crab- and Wild-Pear Kernels, are to be preferred for Stocks: *Elms* and *Limes* are to be raised from planted Suckers: *Walnuts* to be sown with the green Shell upon 'em, to preserve them from Mice. This *Nursery*, if it be well managed and wooded for two Years, the Crabs and Pears will be fit for Grafting and Inoculating the third Year. See ORCHARD.

Firs and Pines are to be raised from these little Seeds, taken out of their large Apples.

The *Nursery* for *Dwarfs* does best by itself, that it may not be over-top'd by taller Trees. Stones of Apricocks and Peaches are not proper to raise those Trees; but in lieu thereof, sow the Stones of the Pear-Plumb, Muffel or *Banana Morvan* Plumb; which prove better and more lasting than the former. For Stocks for all sorts of Cherries, black Cherry-Stones do best. See STONE.

Mr. *Mortimer* directs all Stone-Fruit to be sown quickly after gathering; for that if they be kept, they will be two Years e'er they come up. Add, that if they have not all the Moisture of the Winter to rot the Shells, the Kernel will scarce come up at all.

To furnish the *Nursery* of *Ever-Greens*, the several sorts of Seeds or Berries, as Yew, Holly, Juniper, &c. are to be put in so many distinct Pits or Boxes, with fine Mould over them, and thus buried for a year; after which, they are to be taken out and sown.

If they were to be sown when gather'd like other Seeds, they would not come up the first year, nor grow so kindly.

**NUSANCE**, in Law, is used not only for a thing done to the annoyance of another in his Fee Lands or Tenements; but also the Abize or Writ lying for the same.

The Writ of *Nusance*, de *Nocumentis*, is either simply de *Nocumentis*, or de *parvo Nocumentis*.

*Mansuet* makes three Kinds of *Nusances* in the Forest; the first, *Common Nusance*; the second, *Special Nusance*; the third, *General Nusance*.

Writs of *Nusances* are now popularly term'd *Trespass*, and Actions upon the Case. See TRESPASS, &c.

The Word is derived from the French *Nurt*, to hurt.

**NUT**, *Nux*, a sort of Fruit, inclosed in a hard Cortex or Shell. See FRUIT.

Of these we have divers Kinds; small Nuts, Filberds, Chestnuts, Walnuts, &c. See FILBERD and NUX.

**NUTATION**, in Astronomy, a kind of Trepidation, or tremulous Motion of the Axis of the Earth; whereby, in each annual Revolution, it is twice inclined to the Ecliptic; and as often returns to its former Position. See EARTH.

That the Moon has a like Motion, is shewn by Sir *I. Newton*, in the first Book of his *Principia*; but he observes withal, that this Motion must be very small; and scarce sensible. See MOTION and AXIS.

**NUTMEG**, a kind of Aromatic Nut, or Spice, brought from the *East Indies*; whereof there are two Kinds, *Male* and *Female*. See SPICE.

The *Female* is that chiefly used among us; its Form is round, its Smell agreeable, and its Taste hot and pungent.

The *Male* is a wild Nut, of a longish Form, and without either Taste or Smell; yet sometimes put off, while yet in the Pod, for the *Female*.

The *Nutmegs* are enclosed in three different Covers: The first, thin, reddish, of an agreeable Smell and aromatic Taste, call'd *Mace*; by others, tho' improperly, *Flower of Nutmeg*. This wraps up the Shell, and opens in proportion as the Pod grows. The Shell, which makes the second Cover, is hard, thin, and blackish. Under this, is a greenish Film of no use; and in this is found the *Nutmeg*, which is properly the Kernel of the Fruit. Every *Nutmeg* has a little Hole in it, which some ignorantly take for a Defect.

The best *Nutmegs* are those gather'd in *April*. They must be chosen heavy, of a whitish brown Colour, well marbled without side, reddish within, having a fat unctuous Humour, and an agreeable Smell.

As to the *Mace*, it must be chosen in large Leaves of a high Colour, like the *Nutmeg* in Taste and Smell. See *MACE*. *Nutmegs* consist green, are excellent to fortify the Stomach, and restore the natural Heat. They are particularly effectual Carminative. The Powder, *Duke*, effect'd a Sovereign against Rheumatis, is only *Nutmeg* pulverized with Sugar, and a little *Cinnamon*.

*Nutmegs*, by Distillation, or Expression, yield an Oil, said to have wonderful Virtues.

The whole Commerce of *Nutmegs* is in the hands of the Dutch East-India Company.

The *Nutmeg-Tree* is propagated after a particular manner. *Troenerius* tells us, that the Birds devouring the *Nutmeg* when ripe, give it back whole by Stool; and that thus falling down to the Ground, bein'ard with a viscid Matter, it takes Root, and produces a Tree. See *MISLETOE*.

**NUTRITION**, in the Animal Oeconomy, the Accretion or Apposition of new Parts in the Body, similar to those it already consist'd of; either for its Augmentation, or for the Reparation of such as are wore off.

By the continual Motion of the Fluids in the minute Vessels of the Body, and the Actions of the Muscles, &c. small Parcels are of necessity wore off from the Solids, become mix'd with the Fluids, move with them, and are at length eliminated and exhaled thro' the Pores. See *PORE* and *SOLID*.

And at the same time, the Fluids, diminish'd as they are by a constant Attrition, apply to the Orifices of the perspiring Vessels, and vanish out of the Body. See *PERSPIRATION*.

Hence the Animal Body, by the very Condition of its Frame, becomes soon liable to Destruction.

To preserve Life, therefore, 'tis necessary that a Restitution be made to the Juices and Solids of the Body; equal, and similar to those lost in those Motions; which is what we call the Action of *Nutrition*.

Now the lost Juices are easily supply'd by Meat, Drink, Air, &c. taken into the Stomach, digested, converted into Chyle, then into Blood, and thence secreted by the proper Ducts, and carry'd by the Action of the Body, to the proper Receptacles; after the manner laid down under the Articles *DIGESTION*, *CHYLIFICATION*, *SANQUIFICATION*, and *SECRETION*.

But the *Nutrition* of the solid Parts is much more obscure. This indeed has proved the Subject of infinite Doubts and Differences among Authors; nor had we any rational or satisfactory Account of the same, till that of the accurate *Boerhaave*, whose Doctrine is as follows.

Every solid Part of the Body consists of other lesser ones, in all respects like the larger; Vessels, e. g. of Vesicles, and those of others still smaller; Bones of *Officulae*, &c. Which Structure goes beyond all Limits of Sense, however assisted by Art; as appears by the Experiments and Observations of *Malpighi*, *Kayser*, *Leeuwenbeck*, and *Husk*. Yet is it scarce possible this Division and Subdivision should be infinite, as that of Foods and Juices is.

Again, it appears from Microscopes, Injections, small Wounds, Excisions, &c. that the solid Parts of the Body are very small, compared with the Fluids; and it is almost demonstrable from considering the Rise, and Generation, of the Vessels, and the Resolution of the greater Vessels into their smaller constituent ones, that all the solid Mass in the Body is constructed of mere Nerves, as its Elements. See *NERVE*, *STAMEN*, &c.

And in effect, all this Mass, an incredibly small Particle only excepted, at first arose out of what was a very small Colligament, much like the nervous Juice itself; as is abundantly shown by the great *Malpighi* in his two Treatises on incubated Eggs. For neither does the White of the Egg nourish, till, by means of the Incubation, it have pass'd innumerable degrees of Fluidity, from its first Thickness to that exceeding Subtility wherein it terminates. But

even then, the Liqueur thus given to the Embryo, is exceedingly thick, in comparison with what it is to be when converted into its Vessels and *Viscera*.

Now the first tender Solids arising from this subtle Humour, do again pass insensibly intermediant Degrees, e'er they arrive at their utmost State and Consistence; as is shewn by *Malpighi* in Eggs, and by *Kayser* in Embryos and *Fetus's*. Hence, therefore, it follows, that the Solids, in their first Formation out of the Liquids whence they arise, only differ from 'em in Rest, Cohesion, and Figure. Therefore such a Particle, now in its fluid State, will become a part of the Solid to be form'd out of it, as soon as there happens to be a Power to effect its Cohesion with the other solid Parts; howsoever that Cohesion is effected.

This Cohesion is easily produced in a Fibre already form'd, if there happen to be a proper Cavity in the Solid, left open by some lost Particle, and at the same time a Particle in the Fluid, answerable thereto in Bulk, Figure, and Nature; and lastly, a Power wherewithal to intrude it into that Place, or accommodate it thereto. Thus will arise a real *Nutrition* of the Solids in the minute Vessels, by whose Union the large ones are form'd; that is, in the Nerves, or in Vessels similar thereto. Which being impregnable by any other Liquid than that brought into these Vessels; it appears very evident that the nervous Juice, at least a Juice perfectly like it, is the immediate Matter of *Nutrition*: Whence *Nutrition* appears one of the last and most perfect Actions in the Body; since to have this laudable, all the precedent Actions must of necessity have been so. See *STRAIT*.

The Chyle therefore, which some make the immediate Matter of *Nutrition*, is, indeed, fitted to fill the larger Vessels, but cannot nourish or restore them. This, when attenuated, chang'd, more intimately mix'd in the Lungs by means of Respiration, and thus fitted for the Passage of certain Vessels, is, indeed, render'd fitter, yet far from being quite fit, to be the Matter of *Nutrition*. See *CHYLE*.

But, by the repeated Action of the Lungs, the *Viscera*, Vessels, &c. there is form'd out of this Humour, a soft, tenuous, plastic, insipid Serum, which thickening by the Fire, becomes perfectly like the White of an Egg. This Fluid, therefore, has in it all the Conditions found in that from whence, by sure Experience, we know all the solid Parts of an Animal, arise, by mere Incubation. It is therefore a step nearer, but is not yet quite disposed for *Nutrition*. Much less is the Crour, or red, globular Part of the Blood so. Neither are yet fitted to enter the Vessels; yet both the one and other are, by different Authors, made the *Nutritive Juice*. See *BLOOD*, *SERUM*, and *CROR*.

But as the Heat of Incubation, so the Action of the *Viscera* and Vessels, on the Serum, introduces various Changes therein; till at length a part of it be render'd subtle enough for the Purpose required. This, when exhausted, is instantly repaired; and thus we have the true immediate Matter of *Nutrition*.

But this same Humour losing too many of its oily Parts, by many repeated Circulations, is render'd too sharp; and being likewise strip'd of its most liquid Parts, from the same Cause, becomes too dense; and is thus render'd unfit for this Secretion. Hence the necessity of new Chyle, and new Food, to keep up *Nutrition*.

The Matter of *Nutrition* thus ascertain'd; the *Manner* whereby, and the *Cause* whereby it is effected, are as follow. A Juice being driven directly thro a full, conic or cylindrical, elastic or rigid Canal; if its Course be from a wider to a narrower Part, or if it have any thing to oppose its Motion, will endeavour to stretch the Sides of its Canal according to the Axis of its Length. This must be the Case, every where in the Body, except, perhaps, in the Veins and Receptacles. By this *Nijus*, or Endavour, how weak soever, continually repeated, the Vessels will be insensibly lengthen'd out; and in lengthening, will be made more and more slender. Hence the last Extremities of the Vessels, which in Man are extremely small, are continually stretch'd and render'd less and less coherent, i. e. still nearer and nearer to Dissolution; and thus at length will they cohere so weakly, as scarce to differ from Fluids.

While such Motion goes on, therefore, and the Propulsion is continu'd, there will, of necessity, happen these two things: First, the outermost Particles of the minutest Tubes being torn off, will again be converted into a kind of Humour, what part of the Body soever they stick in. Secondly, the smallest Particles, which by their Union composed the slenderest *Fibrille*, will be so separated from each other, as to leave open Interstices in those Places, where, before, they were open. Both these Effects will be produced at all times, and in all parts of the Body, so long as Life continues; especially where Nature is strong, and the Actions of the Body violent. But the same Humour whereby these Effects are produced, containing abundance of Particles similar to those thus separated and lost, conveys and applies them to those Interstices, by that very *impetus* whereby it con-

endeavours to distend the Canals; and thus intercepted, at length, it forms, adapts, and fattens them, so as to adhere in the same manner as the former.

The Matter, Preparation, Application, Energy of Motion, still remaining the same; what from time to time is lost, is thus presently restored; and the Solids continue in the same State as before, i. e. they are perpetually *novis'd*, and supply'd, and preserv'd.

In this the Creator's Wisdom is very conspicuous; in that the same Power which inevitably destroys, does repair again at the same time, and by the same Action; and that the greater the Loss is, the more copious is the Supply; and lastly, that those Parts, first spent in the Action of the Body, are the first restored.

Further, 'tis evident that the newer, the more tender, and the nearer the moving Cause these Vessels are, the more easily will they be lengthen'd, distended, destroy'd and repair'd: Our Bodies, therefore, the nearer to their Origin, the more do they grow. For, the Action still continuing, the greater Vessels become more extended by their Fluids; and at the same time the smaller, whereof the Membranes or Coats of the larger are composed, are compress'd, dried, and at last concreted, and grow up; whence arises a Firmness, indeed, of the Fibres, but a Loss of the Vessels.

Thus what were, formerly, Vessels, commence mere hard Ligaments; and thus the Fluids once fix'd, the several Vessels coalesce: from the Concurrence of these Causes arise the Strength, Hardness, Rigidity, and Thickness of the solid Parts.

Hence, the Number of Vessels in Embryo's, and as Age comes on, sensibly diminishes; and hence it is that their Weakness constantly declines, and their Strength and Firmness increases. In young People, therefore, the Quantity of Humours is redundant, and greatly exceeds the Solids: In old Men, the Solids exceed the Fluids. And hence we see the Reason, Manner, and Appearance of Growth, State, Declension, and at length of Death from pure old Age. See DEATH.

A Person who considers this Account, and compares it with what is actually observable in the Body, will find every Circumstance to obtain: Thus the whole *Constitio* is every where, and at all times, constantly desquamating, peeling off, and again renewing; and thus the Hair, Nails, Teeth, continually rabb'd, torn, and wore off, come again; Parts taken off from the Vessels, and the Bones, soon grow again. And the Sordes, or Filth, rabb'd off from the Extremities of the Vessels, when examin'd by a Microscope, or diluted and view'd in Water, appear plainly to consist both of solid and fluid Parts; and those carry'd off by Washing, Shaving, &c. are the same.

Hence, too, we see that a general Increase of the Bulk of the Body, with regard to Habit, as in fat, fleshy, brawny Persons, does not arise from any Increase of the Solids, but by their Extension into larger Cavities, crowded with stagnant Humours. And hence Fatness becomes hurtful, as it loads, weakens, and suffocates. See FATNESS.

Whence arises a very considerable Distinction between *Nutrition* and *Repletion*; to which a Physician must have especial regard: the one strengthening and condensing the Vessels, the other weakening, loosening, and extending the same. See PLETHURE.

Hence, lastly, we see why the Fabric of the Solids is not destroy'd by the contain'd Fluids; how our Machine comes to subsist so long; why, when a Nerve is corrupted, the *Nutrition* of that part it belongs to, ceases; and why the same obtains in an Artery: Why in an Embryo there are no Solids, in a *Fetus* very few, in old Men a great deal; and why even the Nerves, Tendons, Arteries, and Receptacles, become first Cartilaginous, then Bony.

**NUTRITION of Plants.** See VEGETATION, SAP, CIRCULATION, &c.

**NUTRITION**, in Pharmacy, a kind of Preparation, consisting in the gradual Mixture of Liquors of different Natures, by stirring them together till they have acquired a thick Consistence; as in making *Butter of Saturn*, or *Unguentum Nutritum*.

**NUTRITIOUS Juice.** See NUTRITION.

**NUTRITIVE Faculty.** See FACULTY.

**NUTRITUM**, a desiccative, cooling, Unguent, prepared by the Agitation and *Nutrition* of some Preparation of Lead, with Oil and Vinegar, or the Juice of *Solanum*, in a Mortar. See UNGUENT.

**NUX Vomica**, the Fruit, or, as some will have it, the Stone of the Fruit of a Tree, growing in several Parts of *Egypt*, or in the Islands *Timor* and *Ceylon*.

It is round and flat, of a grey Mouse-colour without, and various Colours within; sometimes yellow, sometimes white, sometimes brown. The largest, whitest, newest, and cleanest, are the best.

This Drug is an assured Poison for all Animals except Men. See POISON.

On the contrary, *Hermannus*, *Botanic Professor at Leyden*, who has wrote expressly on it, says that those of *Timor* and *Ceylon* are excellent Sudorifics, and to be rank'd among Diuretic Medicines.

**NUX GALLA.** See GALLS.

**NUX Indica**, the Fruit of the Tree call'd *Caca*. See CACAO.

**NYCTAGES**, a Religious Sect, distinguish'd by their inveighing against the Practice of waking in the Night to sing the Praises of God; in regard, said they, the Night was made for Rest.

The Word comes from the Greek *νύξ*, *Night*.  
**NYCTALOPIA**, or *Nicturra Cœcitas*, a Disease of the Eyes, which prevents their seeing, when the Sun is set, and the Light begins to diminish. See BLINDNESS. *Celsus* calls it *Inbecillitas Oculorum*.

Others will have the *Nyctalopia* to be properly a Disease, that prevents the seeing by Day, not by Night; which is the sense *Hippocrates* uses it in; and in which sense it is supposed owing to the Spirits being too much dissipat'd in the Day, but collect'd by Night. See SIGHT.

However, in the general, any Disease which prevents the seeing at any particular time, when others see, is call'd *Nyctalopia*.

*Boerhaave* says, the *Nyctalopia* consists in this, that the Uvea is immovable, and at the same time very open.

The Word comes from the Greek *νύξ*, *Night*, and *αὐρα*, *Ray*; this Animal being said to see less by Day than Night.

In the *Philosophical Transactions*, we have an Instance of a *Nyctalopia*, or *Nicturra Cœcitas*, in a Youth of twenty Years of Age; who had been affected with it as long as he could remember. *Dr. Parham* assures us, he had a good Sight all Day, and distinguish'd Objects at all Distances as well as any body; but when Twilight once came, he was quite blind, and saw nothing at all; nor could make scarce any use either of Fire, Candle, or Glasses. Yet his Eyes, upon Examination, shew'd nothing at all amiss; nor had he any Vertigo, or other Disease of the Head. The Cloudiness, as he himself told the Doctor, used to come gradually on him like a Mist, as Day-light declined. He always saw alike in all Aspects of the Moon, felt no Pain by Fire or Candle-light, and was the same in Summer as Winter.

*Dr. Briggs* accounts for the Cause thus: "As Vapours are raised in great quantity during the Day-time; which being condensed by the Coldness of the Evening, fall again, and render the Air, near the Earth, the thicker; so, perhaps, the Humours in the Eyes of this Youth may be affected; and, in the Evening, rendered grosser, and more turbid. As we see in Urines, which frequently grow clear, or turbid, as Heat or Cold is apply'd to them. By such Thickens or Spissitude of the Humours, the Rays being either reflected, or too much refracted, do not reach the Retina, or at least strike it too feebly."

**NYCTELIA**, *Oryza*, or Feasts in honour of *Bacchus*; so call'd, because held in the Night-time. See OROYA.

A great part of the Ceremony consisted in running thro' the Streets, with Bottle and Glass in hand, drinking; but there was no Impurity supradict'd in them.

The *Athenians* celebrated the *Nyctelia* every three Years, at the beginning of the Spring.

**NYMPH**, *ΝΥΜΦΗ*, in Mythology, a sort of Heathen Divinity, supposed to preside over Waters, Rivers, and Fountains. See GODDESS.

Some extend the Word further, and comprise under it the Goddesses of the Fountains, Forests, and Trees; call'd particularly *Oreades*, *Dryades*, and *Hamadryades*.

*Mourfnus* is of opinion, the Greeks borrow'd their Notion of these Divinities from the *Phœnicians*; for *Nymphs* in their Language signifying *Soul*, the Greeks imagin'd, that the Souls of the ancient Inhabitants of Greece were become *Nymphs*. Particularly the Souls of those who had inhabited the Woods, were call'd *Dryades*; those who had inhabited the Mountains, *Oreades*; those who had dwelt on the Sea-Coasts, *Nereades*; and lastly, those who had their Place of Abode near Rivers, or Fountains, *Naides*. See DRYADES, OREADES, &c.

The Word *Nymph*, according to some other Authors, comes from the Greek *νύμφη*, a *Bride*, or Woman newly marry'd; and was apply'd to these Deities, because represented under the Figure of young Maids.

Others derive *Nymph* from *Νύμφη*, *Water*; in regard of their inhabiting near the Waters.

**NYMPHA**, among Naturalists, a Term sometimes used for the little Skin wherewith Insects are enclosed, both while they are in the Egg, and after they have undergone an apparent Transformation. See INSECT.

Others use the Word *Nymphs* for the Change itself of the *Erucas*, or Worm, into a flying Animal, after having laid aside its former Skin; which, as *Swammerdam* shews, is not effected by any proper Transformation, but by simple Accretion, or Growth of the Parts, whence the Skin

is by degrees stretched, and at last bursts; as is the Case, likewise, in Chickens and Frogs. But the generality of Authors use *Nymphæ* for the Insects themselves, while they have yet only the Form of Worms or Maggots.

The Word properly signifies *Bride*, or *new-married Woman*; it being now, when it has laid aside its former Skin, that it begins to shew all its Parts distinctly. In this Change it loses its Motion for a while, as when in the Egg; so that these Insects are twice in their *Nymphæ* State; first, in the Egg, which is their first *Nymphæ*; and again in this Change, which is their second.

The only difference between them consists in this, that in the latter the Members appear more distinctly. *Saunders* calls this latter *Nymphæ Aurea* or *Aurea*, and *Christoforus*; and the other simply *Nymphæ*. The *Nymphæ* are otherwise distinguish'd into *Nymphæ Animal Vermiformis*, and *Vermiculus Oviparus*.

The Eggs of Bees first change into Maggots; these Maggots, inclos'd in their *Alveoli* or Cells, are transform'd into *Alveoli* or *Nymphæ*, and twelve Days afterwards come out Bees.

NYMPHÆ, or *ALÆ*, in Anatomy, are two soft, spongy, red Bodies, descending from the Top of the *Clitoris* to the Sides of the urinary Passage; thus reaching to about the middle of the Orifice of the *Vagina*: where they grow less and less, till they disappear. See *CLITORIS*, &c.

Their Breadth is uncertain, usually in Maids half a finger: sometimes they are larger, and are capable of being distended to a great degree; so as to hang a good way out of the Pody: whence, in some, these, as well as the *Clitoris*, have been forced to be cut. See *NYMPHOTOMIA*.

The Use of the *Nymphæ* is, by swelling in the Act of Coition, to embrace the *Penis*, and by their Sensibility to affect the Woman, and mutually invite to Procreation. See *GENERATION*.

Their Substance is very spongy, compos'd of Membranes, and Vessels loosely cohering, and therefore distensible.

NYMPHÆUM, among the Antients, a public Hall, or Building, magnificently adorn'd and dispos'd for Banqueting and Entertainment; where those who wanted Conveniencies at home, held their Marriage-Fests, &c.

Some Authors rather take the ancient *Nymphæum* for a Grotto, adorn'd with Statues, Jets, and other Ornaments; and that it had its Name, by Corruption, from *Lymphæum*, of *Lympha*, Water: In which sense it must have been a public Bath.

The Word comes from the *Greek* *νυμφα*, *Sponse*.

NYMPHOMANIA, in Medicine, the same with *Furor Uterinus*. See *UTERINUS*.

NYMPHOTOMIA, in Chirurgery, a Retrenchment or Cutting off part of the *Nymphæ*, when they are so large and tumid, as to prevent the Consummation of Marriage, or render it very difficult. See *NYMPHÆ*.

The *Egyptians*, *Galen* observes, frequently practis'd the *Nymphotomia*; but in our Parts of the World, it is rarely found necessary.

When it happens to be so, the *Casuists* give their Judgment, that the Woman is oblig'd to undergo it.

The *Nymphotomia* is properly the Circumcision of Women. See *CIRCUMCISION*.

## O.

**O**, The fourteenth Letter of the Alphabet; and the fourth Vowel. See LETTER and VOWEL.  
The Grammarians call it a close Vowel; because pronounced in shutting the Mouth.

Among the *Latins*, the *O* bore so great an Affinity with the *U*, that they frequently confounded them; writing *Confol*, and pronouncing *Conful*. See *Grener's Inscript.*

Thus, also, they wrote *Aquon* for *Equon*, *Arcelus* for *Arculus*, *Compascous*, *Duamvor*, &c.

The *Greeks* had two *O's*, viz. *Omicron*, *o*, and *Omega*, *o*; the first pronounced on the tip of the Lips, with a sharper Sound; the second in the middle of the Mouth, with a fuller Sound, equal to *oo* in our Language. The long and short Pronunciation of our *O* are an Equivalent to the two *Greek* ones; the first as in *obey*; the second as in *suppse*.

*O*, among the *Antients*, was a Numerical Letter, signifying Eleven; as in the Verse,

*O Numeram gestat qui nunc nuncimus estat.*

When a Dash was added at top, as *O*, it signify'd eleven Millions.

Among the *Irish*, the Letter *O* at the beginning of the Name of a Family, is a Character of Dignity, annexed to great Houses. Thus in the History of *Ireland*, we frequently meet with the *O Neals*, *O Carrolls*, &c. considerable Houses in that Island.

*Comden* observes, that 'tis the Custom of the Lords of *Ireland*, to prefix an *O* to their Names, to distinguish them from the Commonalty.

A Majuscule *O*, in Music, is a Note call'd by us *Semi-breve*; by the *Italians*, *orendo*; making what they call *Tempo perfero*. See *NOTE*.

The *Antients* used *O* as a Mark of triple Time; from a Notion that the Ternary, or Number 3, was the most perfect of Numbers, and therefore properly express'd by a Circle, the most perfect of Figures.

*O N*, in the Exchequer. As soon as a Sheriff enters a Person into his Account for Issues, Amerciaments, and mean Profits; the Practice is to mark on his Head *O N*, which signifies, *Operatur nisi habeat sufficientem Exonerationem*; and immediately he becomes the King's Debtor, and a *Debet* is set on his Head.

Upon this the Parties become Debtors to the Sheriff, and are discharg'd to the King. See *SHERIFF*.

*OAK-PITS*, *OAK-APPLES*, or *OAK-CONES*, in Natural History, a kind of *Galls*, or Extraneousities arising out of the *Oak*.

For their Generation and Use, see *GALLS*.

*OAKHAM*, *OARAM*, or *OAKUM*, in the Sea-Language, denotes the Matter of old Ropes untwisted, and pull'd out again into loose Hemp, like Hurd of FLAX, to be used in the Calking of Ships. See *CALKING*.

*OAR*, or rather *ORE*, in Natural History, the Mineral Gleebe, or Earth dug out of Mines, to be purify'd, and the Metalline Parts procur'd, and separated from the same. See *MINE* and *METAL*.

The *Oar* is frequently call'd the *Mineral*; and among the *Antients*, *Marchosite*; and the *Moderns* affix another Idea to that Name. See *MINERAL* and *MARCHASITE*.

*OAR*, in Navigation, an Instrument whereby a Boat, Barge, Galley, &c. is row'd, or advanc'd along the Water. See *ROWING*; see also *BOAT*, *GALLEY*, &c.

In a Vessel with *Oars*, the Water is to be consider'd as the Point of Support, or *Fulcrum*; the *Oar* as a Lever; the Boat as the Burden to be moved, and the Rower's Hand the moving Power. See *LEVER*.

The Burden is to be consider'd as apply'd to that Point of the Lever, where the *Oar* rests on the Boat: The greater therefore the Distance of the Hand from that Point, and the less the Distance of the Water from that Point, the greater Effect will the *Oar* have.

*OARISTUS*, or *OARYSTUS*, a Term in the *Greek* Poetry, signifying a Dialogue betwixt a Husband and his Wife; such as that in the *Vith Book* of the *Iliad*, between *Heitor* and *Andromache*.

*Scaliger* observes, that the *Oaristus*, properly, is not any particular little Poem, or any entire Piece of Poetry; but a part of a great one. He adds, that the Passage now cited in *Homer*, is the only proper *Oaristus* extant in the ancient Poets.

*OATH*, *Jur-jurandum*, is usually defined a Religious Assertion, or Affeavation; wherein a Person invokes the Almighty, renounces all Claim to his Mercy, or even calls for the Divine Vengeance upon himself, if he speak falsely.

Some Civilians look on this Definition as too lax, since it may agree to Perjury; and would have this essential to an Oath, that the thing affirm'd be true. But this is arbitrary. See *PERJURY*.

An *Oath* is citecud a kind of Civil Medium, between the Person that gives it, and him to whom it is given; whereby some Controversy, or other Matter, which could not otherwise be determin'd, is brought to an Issue.

Its Form, and the Ceremonies it is attended withal, are arbitrary, and various, in various Countries.

The *Oaths* we make to God are call'd *Vows*, and in some Cases *Sacraments*. See *VOW* and *SACRAMENT*.

*OATH*, in a Legal Sense, is a solemn Action, whereby God is call'd to witness the Truth of so Affirmation given before one or more Persons, empower'd to receive the same.

Legal *Oaths* end with, *So help me God*; anciently with, *So help me God at his Holy Dome*, i. e. *Judgment*. See *DOMEDAY*.

Our Law-Books say, this *Oath* is call'd a *Corporal Oath*; because the Party, when he swears, touches the Gospels with his right Hand. But in some old Customs of *Anglo* and *Mann*, it appears that *Corporal Oath* was a simple Affirmation, or Vow of Faith and Fidelity, made by a Vassal who was no Liege, by lifting up his Hand; in contradiction to that made by a Liege Vassal, by laying his Hand on the Gospel. See *HOMAGE*, *FELTY*, *VASSAL*, &c.

An *Oath* is call'd *Canonica Purgatio*, because allow'd by the Canons; to distinguish it from *Falgore Purgationes*, viz. by Battle, Fire Ordeal, &c. which the Church always disallow'd. See *PURGATION*, *ORDEAL*, *COMBAT*, *DUEL*, *CHAMPION*, &c.

In small Matters, which the Plaintiff could not prove, or if he could, if his Proof were set aside, the Defendant might purge himself by his own *Oath*; which was call'd *Jurave propria Mann*.

But in Matters of more weight, he was to bring other credible Persons, usually of the same Quality with the Plaintiff, to swear that they believed the Defendant had sworn the Truth.

These were call'd *Sacramentales*; and their Number was greater or less, according to the Quality of the Defendant, and the Nature of the Thing in question. Hence, *Jurave duodevna Mann*.

*OATH* is also used for a solemn Promise faithfully to execute or observe something. Tryals in Common Law depend on Twelve, or Twenty-four Men, who take their *Oaths* to declare the Truth, as it shall appear to them. See *JURY*.

In this sense we say *State Oaths*; the *Oath of Supremacy*, *Oath of Allegiance*, *Oath of Abjuration*. See *ALLEGIANCE*, *SUPREMACY* &c.

At the meeting of a new Parliament, the Commons, all take the *Oaths* of Allegiance, Supremacy, and Abjuration. See *PARLIAMENT*.

Kings and Princes swear to the Performance of the Treaties they make: Tho, anciently, they did not swear of themselves; but others swore in their Name.

Thus in a Treaty in 1177, between the Emperor *Frederic Barbesia*, Rorer King of *Scily*, Pope *Alexander III.* and the Cities of *Lombardy*; the Count de *Dieffe*, by the Emperor's Order, swore, upon the Soul of that Monarch, that he would faithfully observe the Peace; and, at the same time, *Romanus* Archbishop of *Solerna*, and Count *Roger*, swear, on the Gospel, that when the Emperor's Messengers should arrive in *Scily*, King *Roger* should procure some of his Lords to swear for him.

*OAZY*, or *OARY Ground*; so the Seamen call soft, slimy, or muddy Ground.

*OBEDIENCE*, *OBEDIENTIA*, *Canonica OBEDIENTIA*. See *CANONICAL*.

*Obedientia*, in our ancient Customs, was used in the general, for every thing that was enjoy'd the Monks by the Abbot.

In a more restrain'd sense, *Obedientia* was used for the Farms which belong'd to the Abbey, to which the Monks were sent *vi civium Obedientie*, either to look after the Farms, or collect the Rents.

Hence, also, those Rents themselves were call'd *Obedientie*.

*OBELISK*, *OBELISCUS*, a quadrangular Pyramid, very slender, and high; rais'd as an Ornament, in some public Place, to shew some Stone of enormous Size, and frequently charg'd

charg'd with Inscriptions and Hieroglyphica. See MONUMENT.

The Difference between Obelisks and Pyramids, according to some, consists in this, that the latter have large Bases, and the former very small ones.

The *Cardan* makes the difference to consist in this, that Obelisks are to be all of a piece, or consist of a single Stone, and Pyramids of several. See PYRAMID.

The Proportions of the Height and Thickness are nearly the same in all Obelisks; that is, their Height is nine, or nine and a half, sometimes ten times their Thickness; and their Thickness, or Diameter at-top is never less than half, nor greater than threefourths of that at bottom.

This kind of Monument appears very ancient; and we are told was first made use of to transmit to Posterity the principal Precepts of Philosophy, which were engraven in hieroglyphical Characters hereon.

In Africa-times they were used to immortalize the Actions of Heroes, and the Memory of Persons beloved.

The first Obelisk we know of, was that raised by *Ramises*, King of *Egypt*, in the time of the Trojan War. It was 40 Cubits high, and, according to *Herodotus*, employ'd 20000 Men in the Building. *Ptoem*, another King of *Egypt*, raised one of 45 Cubits; and *Prolemys Philadelphus* another of 88 Cubits, in memory of *Aspene*.

*Augustus* erected one at *Rome* in the *Campus Martius*, which serv'd to mark the Hours on a horizontal Dial drawn on the Pavement. See DIAL.

*F. Kireber* reckons up 14 Obelisks celebrated above the rest, viz. that of *Alexandria*, that of the *Barberins*, those of *Constantinople*, of the *Mons Esquilinus*, of the *Campus Flaminius*, of *Florence*, of *Hilopolis*, of *Ludovisio*, of *S. Mabur*, of the *Medici*, of the *Vatican*, of *M. Celus*, and that of *Pamphila*.

The Egyptian Priests call'd Obelisks the Sun's Fingers, because serving as Styles, or Gnomons to mark the Hours on the Ground. The *Arabs* still call them *Pharaoh's Needles*: whence the *Italians* call them *Aguglia*; and the *French*, *Agulles*.

*Borel* derives the Word from the Greek *ἄσπερ*, a Branch, Spindle, Point, or a kind of long Javelin.

*Pliny* says, the Egyptians cut their Obelisks in form of Sun-Beams; and that in the Phoenician Language, the word Obelisk signifies Ray.

OBELISK, in Grammar, is a Character, in form of a Dagger (†) serving to refer the Reader to some Note, or other Matter in the Margin. See CHARACTER.

OBELUS, in Antiquity, is a little Line, or Stroke, like a Needle; whence its Name, *ἄσπερ*, Needle.

The Word is chiefly used in speaking of *Origen's Hexapla*; wherein he distinguishes, with an Asterisk, or Star, the Supplements he makes to the Text of the *Septuagint*, where it falls short of the *Hebrew* meaning; and with an Obelus, or little Line (—) those Places where the *Septuagint* had any thing not in the *Hebrew*. See HEXAPLA.

*St. Jerom* says, the Obelus was only used in those Places where something was to be retrench'd from the *Septuagint*, as superfluous; and the Asterisk in those that were defective.

These Marks frequently occur in ancient Manuscripts. Usually the Obelus is accompanied with two Dots; the one above, the other underneath, as (•)•; and the Asterisk, a *St. Andrew's Cross*, contain'd with four Points.

OBESITY, in Medicine, the State of a Person too much charg'd with Fat, and Flesh; otherwise call'd *Corpulency*. See FAT.

*Emmeller* defines it to be such an increase both of the Venter and Limbs, as impedes the Actions of the Body, especially Motion and Respiration.

*Obesity*, *Boerhaave* observes, does not consist in the Solids of the Body being increased, but by their being distended to a greater Pitch by the abundance of Humours collected in them. See SOLID, &c.

Hence, *Obesity* occasions several Diseases; usually Apoplexies.

It was held infamous among the *Lacedaemonians*. History tells us of a *Spaniard* who had been so exceedingly Fat, that when he became lean again, his Skin would make several turns or folds quite around him. *Semeterus* mentions a Man that weigh'd 600 Pounds.

*Emmeller* affirms, that there is no better Remedy against *Obesity* than *Acetum Scitonicum*. *Borel* recommends the Chewing of Tobacco; which *Emmeller* dissuades, lest it induce a Consumption.

OBJECT, in Philosophy, something apprehended, or perceived to the Mind, by Sensation, or by Imagination. See SENSATION and IMAGINATION.

Or, OBJECT is something that affects us by its Presence; or something that moves the Eye, Ear, or some of the other Organs of Sense; or, at least, is represented to us by the Imagination.

Thus, Ideas are the immediate Objects of the Mind in thinking; Bodies, their Relations, Attributes, &c. the mediate.

The word *Object* is derived from the *Latin*, *Objicere*, to prefer to, to set before; which is composed of *ob* and *jacere*, I lie against. Whence the School-Philosophers define it to be that about which a Power, Act, or Habit, is employ'd. Thus, Good is the Object of the Will; Truth of the Understanding; So, Colour is the Object of Sight; Sound of Hearing, &c. See OBJECTIVE.

There are several Conditions require to an Object of Sense; as, that it be Material; that it be within a certain Distance, of a competent extent, its sensible Qualities sufficiently intense, &c.

'Tis the Object that reflects or emits the Rays of Light which occasion Vision. Objects of themselves are invisible; we only seem to perceive them because the different Texture of their Surface, disposing them to reflect differently colour'd Rays, occasion in us several Sensations of Colour, &c. which we attribute to them. See COLOUR, VISION, &c.

The Objects of the Eye, or of Vision, are painted on the Retina; tho' not erect, but inverted, according to the Laws of Optics. This is easily shewn from *Cartes's* Experiment of laying bare the vitreous Humour on the back part of the Eye; and clapping over it a bit of white Paper, or the Skin of an Egg, and then placing the fore-part of the Eye to the Hole of a darkned Room.

By this means is had a pretty Landskip of the Objects abroad, painted invertedly on the back of the Eye. See RETINA.

How, in this Case, the Objects which are painted inverted should be seen erect, is matter of Controversy. See SERRING.

The Schoolmen distinguish Objects into *next*, *proxima*, which are those the Power, or Habit is immediately employ'd on; in which sense, Colour is the next Object of Sight: And *remote*, which are those only perceiv'd by means of the former; in which sense, the Wall is the remote Object of Sight, since we only see it by means of its Colour, &c.

Hence it appears that there is a sort of subordination of Objects. But, note, that a next Object, with regard to a remote one, is properly a Subject, not an Object. See SUBJECT.

They also distinguish Objects *per se*, which are what properly move or affect our Senses; and these are the sensible Qualities: And Objects *per Accidentem*, which are Substances, and only affect us by being invested with sensible Qualities. See QUALITY and SUBSTANCE.

Again, they distinguish between Common Objects, which are such as affect divers Senses, as are Motion, Figure, &c. And Proper Objects, which only affect one. See SENSE.

OBJECT-Glass of a Telescope, or Microscope, is the Glass placed at that end of the Tube which is next the Object. See TELESCOPE, MICROSCOPE, and GLASS.

To prove the Regularity and Goodness of an OBJECT-GLASS.

Strike two concentric Lines on a Paper, the one having its diameter the same with the Breadth of the Object-Glass; the other half that Diameter: Divide the inner Circumference into six equal parts, and making six fine small Holes therein with a Needle; cover one side of the Glass with this Paper. Then exposing it to the Sun, receive the Rays that pass thro' these six Holes, on a Plane, at a just distance from the Glass; and by withdrawing or approaching this Plane, from or to the Glass, we shall find whether the Rays that pass thro' these six Holes, unite exactly together at any distance from the Glass; if they do, we may be assured of the Regularity of the Glass; that is, of its just Form; and at the same time we obtain exactly the Glass's Focal Length.

Indeed, there is scarce any better way of proving the Excellency of an Object-Glass, than by placing it in a Tube, and trying it with small Eye-Glasses at several distant Objects; for that Object-Glass that represents Objects the brightest, and most distinct, that bears the greatest Aperture, and most convex, and concave Eye-Glasses, without colouring or haziness, is the best.

To prove whether Object-Glasses be well center'd.

Hold the Glass at a due distance from the Eye; and observe the two reflected Images of a Candle; where those Images unite or coalesce, there is the true Centre. If this be in the middle, or Central-Point of the Glass, 'tis truly center'd.

OBJECT is also used for the Matter of an Art or Science; or that about which it is employ'd: in which sense, the Word coincides with *Subject*. See SUBJECT, &c.

The School-Philosophers distinguish divers kinds of Objects in the same Science, viz.

*Material* OBJECT, which is the thing itself that is consider'd, or treated of: And thus it is the human Body is the Object of Medicine.

*Formal Object*, is the manner of considering it: And thus the same human Body consider'd with a view to the healing it, is the *Formal Object* of Medicine.

*Objctum quod complexum*, of an Art, is the aggregative Whole; or a Collection of all the objective Conclusions, or Consequences found in the Science. *Objctum quod incomplexum*, is a Collection of all the Subjects of the objective Conclusions. Thus, therefore *Air* is *clastic*, is the complex Object of one Branch of Physics; and *Air* itself, or the Subject of the Conclusion, the incomplex Object of the same Branch.

*Objctum quo Complexum*, is a Collection of all the objective Antecedents of the Science. *Objctum quo incomplexum*, is a Collection of all the Mediums, or Arguments contain'd in those Antecedents, and whereby those Conclusions are proved.

In these Cases the *Object* is said to be *complex*, inasmuch as it includes both an Affirmation and Negation; and *incomplex*, as it includes neither: *Quod*, as being that which (*quod*) is shewn in the Science; and *quo*, as being that whereby (*quo*), the Conclusions therein are proved.

They have here, also, an *Object per se*, and *per accidens*; *Objctum adequatum*, and *inadequatum*; *Attributionis*, and *Attributum*.

**OBJECTION**, in Reasoning, something urged to overthrow an Opinion; or, a Difficulty rais'd against an Allegation, or Proposition of a Person we are disputing withall.

The answering of *Objections* comes under that Branch of Oratory, or that Part of an Oration call'd the *Confirmation*, or *Confutation*. See **CONFIRMATION** and **CONFUTATION**.

**OBJECTIVE**, *Objctivus*, is used in the Schools in speaking of a thing which exists no otherwise than as an Object known. The *Essence*, or Existence of such thing is said to be *Objective*. Others call it *Ratio Objectiva*. See **OBJECT**.

The Word is also used for the Power or Faculty by which any thing becomes intelligible; and for the Act itself, whereby any thing is presented to the Mind, and known.

Hence a thing is said to exist **OBJECTIVELY**, *Objctivè*, when it exists no otherwise than in being known; or in being an Object of the Mind. See **EXISTENCE**.

This, some will have to be a real *Essence*; others deny it. See **ESSE**.

**OBIT**, in our ancient Customs, was a funeral Solemnity, or an Office for the Dead; commonly performed when the Corps lay uninter'd in the Church.

**OBIT** is also an Anniversary-Office, or Mass, held yearly in the Romish Church, on a certain day, in memory of a Person deceased. See **MASS** and **ANNIVERSARY**.

One of the most ancient *Obits* in Europe, is that of King *Chilabert*, founded in the Abby of *St. Germaini Desprez*; and said on the Eve of *St. Thomas's* Day.

The Tenure of *Obit*, or Chantry Lands held of the Subjects, is decreed to be extinct with us, by *Stat. 1 Edu. 6*. See **TENURE**, **SERVICE**, &c.

**OBITUARY**, a Register, wherein are wrote the Names of the Dead, and the Days of their Burial. See **REGISTER**.

These in some Places are call'd *Mortuaries*. See **MORTUARY**.

The Term is sometimes also used for a Book containing the Foundation, or Institution of the several *Obits*; but this is more frequently call'd *Martyrology*. See **MARTYROLOGY**.

**OBLATA** properly signifies things given, or offer'd, particularly to the King, by any of his Subjects. See **OFFERING**.

In the Exchequer, *Oblata* signifies old Debts; brought, as it were, together, from preceding Years, and put to the present Sheriff's Charge.

These are thus call'd, by reason the *Oblata*, or Offerings were to strictly look'd to in the Reigns of King *John* and *Henry III.* that they were enter'd into the Fine-Roll, under the Term *Oblata*, and if not paid, put in charge to the Sheriff.

**OBLATI**, antiently, were secular Persons, who resign'd themselves, and their Estates to some Monastery, and were admitted as Lay-Brothers. See **LAY-BROTHER**.

There were some of these *Oblati*, properly call'd *Donati*, who gave their Persons, their Families, and Effects; and even enter'd into a kind of Servitude themselves and their Descendants. They were admitted by putting the Bell-Ropes of the Church around their Necks, and as a Mark of Servitude, a few Pence on their Heads.

These *Donati* took Religious Habits, but those different from the Monks.

In the Archives of the Abby of *St. Paul de Verdun*, is a Permission given in 1360, to a Man of that Abby to marry a Wife, on condition, that of the Children arising from the Marriage, one half should belong to the Abby in quality of *Oblati*; the other half to the Bishop. This kind of

*Oblati* are said to have taken their first Rise in the Eleventh Century.

In the earlier Times, those only were call'd *Oblati* whom their Parents engaged from their Infancy to the Monastic Life. Those who embraced it themselves, when at an Age capable of Choice, were call'd *Converts*.

The *Oblati* made no Profession, yet kept the Celibate, lived in Obedience to the Superiors, and did the drudgery of the Monastery; yet they differ'd from Servants, who were allow'd to marry. The *Oblati* and *Donati* were Servants of Devotion, as the others were of Condition.

*Heloy* says, the *Oblati* differ'd from *Converts*, inasmuch as the latter made the Profession, and wore the Habit.

**OBLATI** were also in France a kind of Lay-Monks, antiently placed by the King in all the Abbies and Priors in his Nomination; to whom the Religious were obliged to give a Monk's Allowance, on account of their ringing the Bells, and sweeping the Church and the Court.

These Places were usually fill'd with lame Soldiers and Invalids, some of whom had Pensions or Benefices without any Duty; but these *Oblati*, with their Penions, have since been all removed to the Hotel of the Invalids at Paris.

**OBLATIONS**, **OFFERINGS**, properly denote *Sacrificia*, or things offer'd to God. See **SACRIFICE**.

In the Canon Law, *Oblations* are defined to be any thing offer'd, by godly Christians, to God and the Church, i. e. to the *Presbiter*, whether they be moveable or immoveable.

*Oblations* were antiently of various kinds, viz. *Oblationes Altaris*, which the Priests had for saying Mass; *Oblationes Defunctorum*, given by the last Wills of the Faithful to the Church; *Oblationes Mortuorum*, those given by the Relations of the Dead, at Burials; *Oblationes Penitentium*, those given by Penitents; and *Oblationes Pentecostales*. See **PENTECOSTALES**.

Till the fourth Century, the Church had no other fixed Revenues, nor any other means of Subsistence, but *Oblations*. See **TYTHE**.

**OBLIGATION**, an Act whereby a Person engages, or binds himself, or is bound by another, to do something; as to pay a Sum of Money, to be Surety for any one, &c.

The Acceptance of a Bill of Exchange is a kind of *Obligation*. See **BILL**.

The exacting of Interest on a Sum due by a simple *Obligation*, is accounted *Usury*. See **USURY**.

All *Obligations* arise from Contracts, or *quasi* Contracts; from Crimes, or *quasi* Crimes; and in the Roman Law, were either *Civil*, or *Prætorian*; i. e. either approved by the Civil Law, or introduced by the Prætor.

There are three kinds of *Obligations*; *Natural*, *Civil*, and *Mixed*.

*Natural* **OBLIGATIONS** are founded on the mere Bond of natural Equity, without any Civil Necessity, and without producing any Action of Constraint: Such is the *Obligation* of a Minor.

*Civil* **OBLIGATION**, is that supported on Civil Authority alone, and which induces a Constraint, without any Principle or Foundation in natural Equity: Such is the *Obligation* of a Man condemn'd unjustly.

Lastly, a *mixed* **OBLIGATION**, or an *Obligation* both Natural and Civil, is that which being founded in natural Equity, is further confirm'd and enforced by Civil Authority.

There are Personal *Obligations*, Hypothecary *Obligations*, *Obligations* of Goods, others by Body, *Obligations* solidary, others for a Part or Portion.

**OBLIGATION**, in a more strict Sense, is an Instrument, or Bond, containing a Penalty with a Confession annexed, for payment of Money at a certain time; or for Performance of Covenants, &c.

A Bill is commonly without a Penalty, and without Condition; yet a Bill may be *obligatory*. See **ON LIEN**.

Till the Conquest, Writings were render'd *Obligatory* by certain Marks of Gold Crosses, &c. The Normans first introduced the Custom of making Bills and *Obligations* with a Print or Seal in Wax set to every one's Signet, attested by three Witnesses. See **SIGNATURE**, **SEAL**, &c.

**OBLIQUATION**, in *Cosmoptics*. *Cutibus of Oblination*, is a right Line drawn perpendicular to a Mirror, in the Point of Incidence, or Reflexion of a Ray. See **CATHETUS**, **MIRROR**, &c.

**OBLIQUE**, in Geometry, something *a-flant*, *in-direct*; or that deviates from the Perpendicular. See **PERPENDICULAR**.

**OBLIQUE** *Angle*, in Geometry, is an Angle that is either acute, or obtuse; i. e. any Angle, except a right Angle. See **ANGLE**.

**OBLIQUE-angled Triangle**, is that whose Angles are *Oblique*, i. e. either obtuse or acute. See **TRIANGLE**.

**OBLIQUE** *Line*, a Line which falling on another, makes an *oblique* Angle. See **LINE**.

A Line falling *obliquely* on another, makes the Angle on one side obtuse, and that on the other, acute.

**OBLIQUE PLANE**, in Dialling, are such as decline from the Zenith, or incline toward the Horizon. See **DIAL-PLANE**.

The **Obliquity**, or **Quantity**, of this Inclination, or Reclination, is easily found by a Quadrant; it being an Arch of some Azimuth, or vertical Circle, intercepted between the Vertex of the Plane and of that Plane.

This Azimuth, or vertical Circle, is always perpendicular to the Plane. See **DIALLING**.

**OBLIQUE PERCUSSION**, is that wherein the Direction of the striking Body, is not perpendicular to the Body struck; or is not in a Line with its Center of Gravity. See **PERCUSSION**.

The Ratio an *oblique* Stroke bears to a perpendicular one, is demonstrated to be as the Sine of the Angle of Incidence to the Radius.

**OBLIQUE POWERS**. See **POWERS**.

**OBLIQUE PROJECTION**, in Mechanics, is that where a Body is impell'd in a Line of Direction, which makes an *oblique* Angle with the Horizontal Line. See **PROJECTION**.

**OBLIQUE SPHERE**, in Geometry, is that whose Horizon cuts the Equator *obliquely*; and one of whose Poles is rais'd above the Horizon, equal to the Latitude of the Place. See **SPHERE**.

'Tis this Obliquity that occasions the Inequality of Days and Nights. See **NIGHT** and **DAY**.

Those who live under an *oblique* Sphere (as we, and all those in the temperate Zone, do) never have their Days and Nights equal; except in the Equinoxes. See **EQUINOX**.

**OBLIQUE ASCENSION**, in Astronomy, an Arch of the Equator intercepted between the first Point of *Aries*, and that Point of the Equator which rises together with a Star, &c. in an *oblique* Sphere. See **ASCENSION**.

The *oblique* Ascension is number'd from West to East; and is more or less according to the different Obliquity of the Sphere.

**OBLIQUE DESCENSION**, an Arch of the Equator, intercepted between the first Point of *Aries*, and that Point of the Equator, which sets with a Star, &c. in an *oblique* Sphere; and reckon'd from West to East. See **DESCENSION**.

The Difference between the right and *oblique* Ascension, is call'd the *Ascensional Difference*. See **ASCENSIONAL**.

To find the **OBLIQUE ASCENSION** and **DESCENSION** by the Globe. See **GLOBE**.

**OBLIQUE SAILING**, in Navigation, is when the Ship is in some intermediate Rhumb, between the four Cardinal Points; and thus makes an *oblique* Angle with the Meridian, and continually changes both its Latitude and Longitude. See **RHUMB**.

*Oblique Sailing* is of three Kinds; viz. *Plain Sailing*, *Mercator's Sailing*, and *Great Circle Sailing*. See **SAILING**.

The Seamen also call the Application of the Method of calculating the Parts of *oblique* plane Triangles, in order to find the Distance of a Ship from any Cape, Head-Land, &c. *Oblique Sailing*.

**OBLIQUE, OBLIQUE**, in Anatomy, is us'd, substantively, for several Muscles of the Head and Eye; particularly, the

**OBLIQUUS CAPITIS MAJOR**, or **PAR OBLIQUUM INFERIUM**, the sixth Muscle of the Head; so call'd, because serving to turn the Head aside: tho' it has neither its Origin nor Insertion in the Head. See **HEAD**.

It rises fleshy from the external Parts of the Spine of the second Vertebra of the Neck, and swelling into a fleshy Belly, runs *obliquely* to the transverse Process of the first Vertebra.

This forms rank among the Muscles of the Neck. See **NECK**.

**OBLIQUUS CAPITIS SUPERIOR**, or **MINOR**, the seventh Muscle of the Head, which springing fleshy from the transverse Process of the second Vertebra of the Neck, and ascending *obliquely*, is inserted laterally into the Occiput.

Others will have its Origin to be in the Occiput, where the common Opinion places its Insertion; its Insertion they make in the transverse Process of the first Vertebra, near that of the same Side.

The two *oblique* Muscles, by pulling the transverse Process, give the Head a semi-circular Motion. See **VERTEBRA**.

**OBLIQUUS OCULI SUPERIOR**, or **MAJOR**, the fifth Muscle of the Eye. See **EYE**.

It has its Origin in the upper part of the Orbit; whence tending upwards towards the inward *Canthus* of the Eye, it passes thro' a Cartilage on the Bone of the Forehead, call'd *Trachelus*; whence also the Muscle itself is call'd *Trachelianus*; thence it is reflected to its Termination in the *Sclerotica*, on the back part of the Ball of the Eye.

When this Muscle acts, that part of the Ball of the Eye is drawn downwards towards the *Trachelus*, whereby the Pupil is directed downwards, towards the lesser *Canthus*, and at the same time the whole Ball of the Eye somewhat outwards.

**OBLIQUUS OCULI INFERIOR**, or **MINOR**, rises from the external Margin of the lower part of the Orbit, near the inner *Canthus*; whence rising towards the outward *Canthus*, it terminates near the other.

It draws the Ball of the Eye outwards, and turns its Pupil upward, contrary to the former.

**OBLIQUUS DESCENDENS**, or **DEPRESSOR**, a very broad Pair of Muscles of the Abdomen, each covering one half thereof, and part of the Thorax; so call'd from the *oblique* Course of its Fibres. It arises from the two last true Ribs and five spurious ones; and is indented with the *Serratus Major Anticus* by five or six Digitations, each whereof receives a Nerve from the Intertices of the Rib: It springs likewise from the Margin of the *Ilium*; and ends in a broad Tendon in the *Linea Alba*.

Besides the ordinary Use ascribed to it by all Anatomists, which is to compress the Intestines and Bladder; *Cawper* and *Gleason* attribute to it another, which is to turn the Trunk of the Body without moving the Feet.

**OBLIQUUS ASCENDENS**, or **ACCELERATOR**, lies under the lower part of the former; running with a Course just contrary, from the lower part upwards. Its fleshy Fibres have their Origin from the Edge of the *Ilium*, and end at the spurious Ribs. It terminates with a large double Tendon in the *Linea Alba*; the upper part whereof creeping over the *Musculus Rectus*; and the other creeping under it, and joining together at the *Linea Alba*; do, as it were, sheath the *Rectus*.

Its Use is to shut and compress the Belly, as also the Cavity of the Thorax in Respiration; and it assists, with its Antagonists, the *Descendens*, in turning the Body without moving the Legs.

**OBLIQUUS AURIS**, lies in the external Part of the Canal of the Aqueduct; whence passing upwards and backwards, it enters the *Tympanum*, by a very *oblique* Sinuosity immediately above the Bony Circle, to which the *Tympanum* is fix'd; and is inserted into the slender Process of the Malleus.

**OBLIQUE CASES**, in Grammar, are all the Cases of the Declensions of Nouns, besides the Nominative. See **CASE**.

**OBLIQUITY**, that which denominates a Thing *oblique*. See **OBLIQUE**.

The *Obliquity of the Sphere*, is the Cause of the Inequality of Seasons, of Nights and Days. See **SEASON**, &c.

**OBLIQUITY OF THE ECLIPTIC**, is the Angle which the Ecliptic makes with the Equator. See **ECLIPTIC**.

Mess. *Cassini* and *de la Hire*, make the *Obliquity of the Ecliptic*, by their Observations,  $23^{\circ}, 29'$ . M. *le Chevalier de Louville*, from later Observations, makes it  $23^{\circ}, 28', 41''$ .

The same Author, giving the History of the several Determinations of this *Obliquity*, by all Astronomers in all Ages, observes, that it constantly diminishes; and thence takes occasion to suspect, that the real *Obliquity of the Ecliptic* itself may have been diminish'd since the time of the ancient Astronomers.

He goes so far, as even to fix the Proportion of the Diminution, which he makes to be at the rate of half a Minute in fifty Years. According to an ancient Tradition among the *Egyptians*, mention'd by *Herodotus*, the Ecliptic was formerly perpendicular to the Equator.

The Libration of the Sphere makes some Alterations in the *Obliquity of the Ecliptic*; so that *Wolffius* reckons a great *Obliquity* of  $23^{\circ}, 53'$ ; a mean *Obliquity* of  $23^{\circ}, 41'$ ; and a small one of  $23^{\circ}, 30'$ .

**OBLONG**, in Geometry, a Figure longer than it is broad. See **FIGURE**.

Thus, a Rectangle, or Parallelogram, is an *Oblong*; see **PARALLELOGRAM**; and an Ellipsis an *Oblong*; see **ELLIPSE**.

**OBLATA TERRE**, in our ancient Law-Books, is a certain Quantity of Land, which some Authors fix at half an Acre; tho' others make it but half a Perch. *Thomasius* says, that *Oblatum Terre* contains ten Feet in length, and five in breadth. See **FARDINGDEAL**.

**OBIOLUS**, an ancient Silver Money, of *Athenis*, the sixth part of a Drachma; worth somewhat more than our Penny. See **DRACHMA**; see also **COIN**.

The Word comes from the Greek *obolus*, of *obolus*, *Needle*; either because it bore the Impression of a Needle; or because, according to *Enschinus*, it was in form thereof. But those now in the Cabinets of Antiquaries, are round.

**OBIOLUS** was also us'd among our Ancestors for half a Noble, or Florin; where the Noble was esteem'd as the Penny; and its quarter part a Farthing.

In effect, in the old Histories and Accounts of Coins, we are to understand, by the Word *Denarius*, the whole Coin, be it Angel, Rial, &c. by the *Obolus* its half; and by *Quadrans* its fourth Part. See MONEY.

**OBOLUS**, in Medicine, is used for a Weight of ten Grains; or half a Scruple. *Dr Cange* says it weighs three Carats, or four Grains of Wheat: Others divide the *Obolus* into six *Aerolia*; and the *Aerolia* into seven Minutes. Others divide it into three *Siliquae*, each *Siliqua* into four Grains, and each Grain into a *Lenell* and half. See GRAIN, &c.

Among the *Scolians*, *Obolus* was the Weight of a Pound. **OBREPITIONOUS**, a Quality of a Letter Patent, or other Instrument bearing some Favour, Title, or Concession; denoting it obtain'd of a Superior by Surprise, or by concealing from him the Truth, which was necessary to have been express'd, to render it valid.

In this sense the Word stands oppos'd to *Surreptionous*, where some Fairhood has been express'd, in order to procure it the more easily.

Obreption annuls the Grant, wherever found. By the Canon Law, a Person demanding a Benefice, without expressing those he is already possess'd of, forfeits, &c. by the *Obreption*.

**OBRIINES**, an Order of Knights instituted in the XIIIth Century, by *Conrade* Duke of Mascon and Cujavia; whom some Authors also call Duke of Poland.

He first gave them the Name of *Knights of Jesus Christ*. Their first Grand Master was *Bruno*. Their chief End was to defend the Country from the *Prussians*, who were yet Idolaters, and committed great Cruelties.

Duke *Conrade* putting them in possession of *Fort Obirin*; they hence took a new Name: and it was agreed between them, that whatever Lands they conquer'd from the *Prussians*, should be equally divided with him.

But the *Prussians* blocking up the Port, so that none of the Knights could get out; the Order became useless, and was soon suppress'd. Upon this, *Conrade* call'd in the *Teutonic Knights*. See TEUTONIC Order.

**OBSCURA Camera**. See CAMERA obscura.

**OBSCURA Clave**. See CLARO obscura.

**OBSCURE**, something that is dark, or that only admits a little Light. See LIGHT and SHADOW.

**OBSCURE** is also used in a figurative sense, for a thing that is not clear, express, and intelligible; or that does not fully apprehend; or that may be construed in divers Senses.

**CLARE Notion**, or Idea. See NOTION and IDEA. **OBSCURITY**, that which denominates a Thing obscure. *Obscurity* is a Fault that may either be in the Perception, or in the Discern.

*Obscurity in the Perception*, arises chiefly hence, that we do not conceive Things as they are, or as we find them; but as we judge them to be, e'er we know them: so that our Judgment precedes our Knowledge, and is made the Rule, or Standard, of our Conceptions. Whereas Nature and Reason direct, that Things should be judg'd of according as they are known; and that they are to be known, not as they are in themselves, but only in such manner as God was pleas'd to have them known.

*Obscurity in the Discern*, may arise, first, from the Ambiguity of the Sense; secondly, from the Figures or Ornaments of Rhetoric; thirdly, from the Novelty, or Obscurity of the Words.

**OBSECRATION**, in Rhetoric, a Figure whereby the Orator implores the Assistance of some God, or Man. See FIGURE.

This Figure *Cicero* makes admirable use of, for K. *Deiotarus* to *Cesar*—*Per Dexterae te istam oro, quam Regi Deietaro hospes, hospiti paraxisti: Istem inquam dexterae non sum in bellis & in preliis, quam in tranqviis & sedem firmavorem.*—Thus *Virgil*:

*Quod te per Culi jucundam launen & Aras  
Per Genitorem oro, per Spem surgentis Iuli  
Eripe me his involvit malis*

**OBSEQUIES**, *Funeral Solennities*, or Ceremonies performed at the Burials of eminent Personages. See FUNERAL.

The Word is derived from the Latin *Obsequium*, Obedience; these *Obsequies* being the last Devours we can render to the Deceased.

**OBSERVANCE**, literally denotes the Act of observing a Rule, Law, or Ceremony.

Hence the Term is sometimes also used for a Rule, Statute, or Ordinance to be observ'd.

**OBSERVANCE**, *OBSEVANTIA*, is particularly understood, in a Monastic Sense, of a Community of Religious, who are tied to the perpetual Observation of the same Rule. In which sense the Word coincides with *Congregation*, or *Order*. See ORDER, &c.

The Cordeliers denominate themselves the *Religious of the Observance*; the *great* and the *lesser Observance*. See CORDELIERS.

Among the *Bernardines*, there are Monks of the strict *Observance*, who eat nothing but Fish. See BERNARDINE.

**OBSERVANTINES**, Religious Cordeliers of the *Observance*. In Spain, there are bare-footed *Observantines*.

**OBSERVATION**, in the Sea-language: The Seamen call an *Observation* the taking the Sun's, or any Star's Meridian Altitude, in order thereby to find their Latitude. See MERIDIAN-Altitude.

For the Method of making an *Observation*, see LATITUDE.

The finding of a Latitude from the Meridian-Altitude observed, they call *working of an Observation*.

**OBSERVATIONS** in Astronomy, see CELESTIAL Observations.

**OBSERVATORY**, a Place destined for observing the Heavenly Bodies; or, a Building usually in form of a Tower, rais'd on some Eminence, for making of Astronomical Observations.

The more celebrated *Observatories*, are, 1. The *Greenwich Observatory*, built in 1676, by Order of King Charles II. at the solicitation of Sir *Jonas Moor* and Sir *Christopher Wren*; and furnished with the most accurate Instruments by the same; particularly a noble Sextant of 7 Feet Radius, with Telescope-Sights.

The Person to whom the Province of Observing was first committed, was Mr. *J. Flamsteed*; a Man, who, as Dr. *Halley* expresses it, seem'd born for the Employment. For the space of fourteen Years, with unwearied Pains he watch'd the Motions of the Planets; chiefly those of the Moon, as was giving him in charge; that a new Theory of that Planet, exhibiting all her Irregularities, being found, the Longitude might hence be determined.

In the Year 1690, having provided himself of a Mural-Arch of 7 feet Diameter, well fix'd in the Plane of the Meridian, he began to verify his Catalogue of the fixed Stars, which hitherto depended altogether on the Distances measured with the Sextant, after a new and very different Manner, viz. by taking the Meridian-Altitudes, and the Moments of Culmination, or the right Ascension and Declination.

This Instrument he was so pleas'd with, that he laid the use of the Sextant almost wholly aside. Thus was the Astronomer Royal employ'd for thirty Years; in the Course of which Time, nothing had appear'd in public, worthy so much Expence and Preparation: So that the Observer seem'd rather to have been employ'd for his own sake, and that of a few Friends, than for the Public; tho it was notorious, the Observations that had been made were very numerous, and the Papers swell'd to a great Bulk.

This occasion'd Prince *George* of Denmark, in the Year 1704, to appoint certain Members of the Royal Society, viz. the Honourable *Fr. Roberts*, Sir *C. Wren*, Sir *I. Newton*, Dr. *Gregory*, and Dr. *Abraham*, to inspect *Flamsteed's* Papers, and cause out of them such as they should think fit for the Press; purposing to print them at his own Expence: But the Patroon of the Work dying, e'er the Impression was half finished, it lay still for some time; till at length it was resum'd by order of Queen *Anne*; and the Care of the Press committed to Dr. *Abraham*; and that of Correcting, and supplying the Copy, to Dr. *Halley*.

Such was the Rise and Progress of the *Historia Caelestis*; the principal Part whereof is the Catalogue of fixed Stars, call'd also the *Greenwich Catalogue*. See CATALOGUE.

The *Greenwich Observatory* is found by very accurate Observation to lie in 51° 28', 30", North Latitude.

2. The *Paris Observatory* built by the late *Louis XIV.* in the *Faubourg St. Jacques*.

It is a very singular, but withal a very magnificent Building; the design of M. *Perrault*. 'Tis 80 feet high, and a-top is a Terrace. 'Tis here M. *de la Hire* has been employ'd.

The Difference in Longitude between this and the *Greenwich Observatory* is 29', 20" West.

In it is a Cave, or Cellar, 170 feet descent, for Experiments that are to be made fur from the Sun, &c. particularly such as relate to Congelations, Refrigerations, Indurations, Conservations, &c.

3. *Tycho Brahe's* Observatory was in the little Island *Ween*, or *Saerlet Island*; between the Coasts of *Schonen* and *Zeland*, in the *Baltic*.

It was erected and furnished with Instruments at his own Expence; and call'd by him *Uraniburg*.

Here he spent twenty Years in observing the Stars. The Result is his Catalogue. See CATALOGUE.

Mr. *Gordon*, in *Phil. Trans.* observes, that this was none of the finest Places for some kind of Observations, particularly the Risings and Settings; as lying too low, and being land-

lock'd on all the Points of the Compass but three; and the Land-Horizon exceedingly rugged and uneven.

4. *Pekin Observatory.* Father *Le Compe* describes a very magnificent *Observatory* erected and furnished by the late Emperor of *China*, in his Capital, at the Intercession of some Jesuit Missionaries, chiefly Father *Vénédicte*, whom he made his chief Observer.

The Instruments are exceedingly large; and the Divisions less Accurate, and the Contrivance, in some respects, less Commodious than those of the *Europeans*. The chief are an Armillary, Zodiacal Sphere of 6 Paris feet Diameter, an Equinoctial Sphere 6 feet Diameter, an Azimuthal Horizon 6 feet Diameter, a large Quadrant 6 feet Radius, a Sextant 8 feet Radius, and a Celestial Globe 6 feet Diameter.

**OBSESSION**, the Action of being beset by an Evil Spirit; which, without entering the Body, torments, and, as it were, besieges the Person without: In which it differs from *Possession*. See *POSSSESSION*.

The Marks of *Obsession*, according to some, are a being hoisted into the Air, and thrown violently down without being hurt; speaking Languages never learnt; having an Aversion to all Acts and Offices of Religion, &c.

Some Physicians look on all Cases of *Obsession* as Natural, and curable by natural Medicines, particularly an Unguent call'd *Unguentum Carrubieri*, with Purgatives, or Vomitives.

Of this Opinion is Doctor *Gabriel Cauder*, Member of the *Leopoldine Academy*; which he strengthens with the Testimony of *Frobenius*, in his *Treatise de Fascinationibus*; and *Ganulus de Coralibus*, who observes, that it has been confest'd by many Witches and Sorcerers, that the Plant *Mellepertuis*, *Hypericon*, and other Simples, &c. incommode them terribly, and prevent their Operations,

He confirms this Sentiment hence, that the Devil in those he thus besets, makes use of the Melancholic Humour or the *atra Biliis*, and the grosser Impurities of the Blood, without always acting immediately of himself. For which he refers to the Books of *Melchior Scapulus* and *Jerem Jordan*, de *Divino in homine*; and gives the Process of a Cure of a manifest *Obsession* of a Child of a Year old at *Delitzschsburg*, three Leagues from *Leipfic*.

**OBSDIONALIS**, an Epithet the *Romans* gave to a fort of Crowns wherewith they honour'd such of their Generals as had deliver'd a Roman Army besieged by the Enemy, and had oblig'd them to decamp. See *CROWN*.

It was also call'd *Graminea*, because made of Grass, or Herbs found on the Spot, or Soil.

'Twas the Soldiery who bestow'd this Crown; which, doubtless, was the reason of its not being of a more precious Matter.

The Word comes from the *Latin Obsidio*, Siege.

**OBSTRUCTION**, in Medicine, a Lett or Stoppage of the Passage of the Humours in the Body of an Animal. See *DISEASE*.

*Obstructions* are supposed to arise from the gross Parts of the Blood, detain'd in the Extremities of the Vessels, and thus blocking them up.

Some Physicians doubt whether there be any such thing as *Obstructions* in the Viscera; and rather attribute the Inconveniencies usually ascrib'd to *Obstructions*, to the Acrimonies and Crudities of the Stomach; But their Reasons are not convincing. 'Tis true, *Obstruents* may not perhaps be so frequent as is usually suppos'd; and many of the Symptoms ascrib'd to them, are doubtless owing to Disorders of the Stomach; but then there's no denying that there are any *Obstructions* at all in the Viscera, &c. Schirrus's, and other kinds of Tumours are incontrollable Proofs hereof. See *TUMOUR*, *SCHIRRUS*, &c.

*Obstruents* frequently prove the Causes of Dropsies. See *DROPSY*.

**OBTURATOR**, in Anatomy, a Name given to two Muscles of the Thigh; by reason of their shutting, or covering up the Foramen or Aperture between the *Os Pubis*, and the Hip-Bone.

The *Obturator internus* and *maspularis* are the two Parts, or Divisions that make the *Ovium*. See *GEMINI* and *MARSUPIALIS*.

The *Obturator externus* arises fleshy from the exterior Margin of the *Os Pubis* and *Ischium*, and is insert'd tendinous at the Root of the great Trochanter.

**OBTUSE** literally imports blunt, dull, &c. in opposition to acute, sharp, brisk, &c. See *ACUTE*, &c.

**OBTUSE Angle**, in Geometry, an Angle of more than 90 Degrees, i. e. more than a Quadrant of a Circle; or an Angle greater than a right Angle. See *ANGLE*.

**OBTUSE-ANGLED Triangle**, is a Triangle one of whose Angles is obtuse. See *TRIANGLE*.

**OBVENTIONS**, OBVENTIONES, in our antient Law-Books, signify Offerings.

Sometimes the Word also signifies Rents, and Revenues properly of Spiritual Livings.

**OCCASIO**, in our antient Law-writers, is taken for a Tribute which the Lord imposes on his Vassals or Tenants, *Propter occasiones beluam & aliarum Necessitatum*.

And hence *Occasionari* signifies to be charged or loaded with Payments.

**OCCASIONAL Cause**, &c. See *CAUSE*, &c.

**OCCIDENTAL**, a Term us'd chiefly in respect of Commerce, to distinguish Commodities brought from the *West-Indies*, i. e. *América*, from those brought from the *East-Indies*; which are said to be *Oriental*. See *Oriental*.

In this sense we say, *Occidental Bézard*; see *BEZARD*, *Occidental Pearl*; see *PEARL*.

**OCCIPITAL**, in Anatomy; a Term applied to the Parts of the *Occiput*; or of the hinder Part of the Head. See *OCCIPUT*.

**OCCIPITAL Bone**, See *OCCIPITIS Os*.

**OCCIPITALES**, or **OCCIPITAL Muscles**, are a Pair of Muscles of the Head, whose Origin is in the same Place with that of the *Frontales*, i. e. in the upper Part of the Head near the Vertex, but which go a quite opposite Course, viz. from before, hindwards, and are insert'd into the lower Part of the hairy Scalp, or Skin of the *Occiput*; which they serve to draw upwards.

Dr. *Waker* observes, that the *Occipitalis* and *Frontalis* are one continued digastric Muscle on each side; that Part call'd the *Occipitalis*, after a small Ascens, becomes thin Tendon, and marches over the whole *Bregma*, where it divides; the one Part going on to the *Oz Jugale*, the other, growing fleshy, acquires the Name *Frontalis*. See *FRONTALIS*.

**OCCIPITIS Os**, or *Os prore*, in Anatomy, the fourth Bone of the *Cranium*; so call'd from its situation in the *Occiput*. See *OCCIPUT*.

'Tis the hardest and thickest of all the Bones of the *Cranium*. Its Figure is triangular. In new-born Children it is divided into four; but grows up, and becomes one in time.

It is join'd to the Bones of the *Sinciput*, at the *Lambdoideæ Suture*; as likewise to the *Pteriosa*, and *Oz Sphenoides* at the *Sphenoidæ Suture*.

The Parts of this Bone are either solid, or hollow, i. e. empty. The solid are two Processes, call'd *Carene*. The hollow Parts are either *Foramina*, or *Sinu's*.

The *Foramina* are either Common, or Proper: The Common are two, one on each side common with the *Ossa Pteriosa*, affording a Passage to the Nerves, *Par Vagus*, and to the internal Jugular Veins.

The proper *Foramina* are five: The first is very large, and thro this it is that the spinal Marrow passes. Two others give passage to the Nerves of the Tongue, and the two last an entrance to the cervical Arteries. See *NERVE*, &c.

It has two large *Sinu's* within-side, for the reception of the two Hemispheres of the *Cerebellum*. See *CEREBELLUM*.

On each side the *Foramina* which give Passage to the spinal Marrow, is usually a Process lined with a Cartilage, articulated with the first *Feretra* of the Neck. In lieu of this, is sometimes only a Prominence of the Bone; which, or the Process where 'tis found, receives the Insertions of the Muscles of the Head, whereof there are ten, viz. the *Par sphenium*, *Par complexum*, *Par retinum majus externum*, *Par retinum minus externum*, *Par obliquum inferius*, *Obliquum interius*, *Par mastoideum*, *Retinum internum majus*, *Retinum internum minus*, and *Retinum laterale*; each of which see in its proper Place.

**OCCIPUT**, the hinder Part of the Head, or Skull; or the Part whereto is the *Oz Occipitis*. See *HEAD*, *CRANIUM*, &c.

*Scalpetus* observes, that the Cauterization of the *Occiput* is very frequent in many Places.

**OCCULT**, something secret, hidden, or invisible.

The *Occultæ Sacrae* are Magic, Necromancy, Cabbals, &c. See *MAGIC*, &c.

*Agrippa* has several Books of *Occult Philosophy*, full of the vainest, wildest Dreams; and *Fludd* nine Volumes of the *Cabbala*, or *Occult Sciences*, wrapt up under Figures, or Hermetic Characters.

Weak Philosophers, when unable to discover the Cause of an Effect, and unwilling to own their Ignorance, say it arises from an occult Virtue, an occult Cause, an occult Quality. See *QUALITY*, &c.

**OCCULT**, in Geometry, is us'd for a Line that is scarce perceivable, drawn with the Point of the Compasses, or a black-lead Pencil. See *LINE*.

*Occuli*, or dry Lines, are us'd in several Operations; as the raising of Plans, Designs of Building, Pieces of Perspective, &c. They are to be effaced when the Work is finished.

**GLI OCCULTI**, of *Brescia*, in *Italy*, are the Academists of that City. See *ACADEMY*.

**OCULTATION**, in Astronomy, the Time a Star, or Planet, is hid from our Sight in an Eclipse. See ECLIPSE.

**Circle of perpetual OCULTATION**, is a Parallel in an oblique Sphere, as far distant from the depressed Pole, as the Pole is from the Equator.

Between this Line and the Pole, all the Stars contain'd, do never rise; but lie constantly hid under the Horizon of the Place.

**OCUPANCY**, in the Civil Law, is the Possession of such things as at present belong to no private Persons, but, however, are capable to be made so; as by seizing or taking of Spoils in War; of things wild by Nature, as Birds, and Beasts for Game, &c. or by finding things before undiscovered, or truly lost, or loit by their proper Owners.

**OCUPANT**, in Law. If a Tenant hold Lands, &c. for the Term of another's Life; and such Tenant die first, leaving that other to survive; he that first comes to hold that Term out, is call'd an *Occupant*, by reason his Title comes by the first Occupation.

So if a Tenant for his own Life, grant over his Estate to another; if the Grantee dies, there shall be an *Occupant*.

**OCUPATION**, in Law, the putting a Man out of his Freehold in time of War.

This is all one with the *Disseisin* in time of Peace; only that the former is deem'd not so great an Offence. See DISSEISIN.

The Word is also used for the Holding, Tenure, or Possession; as when it is said, such Land is in the Tenure or Occupation of such a Man, that is, in his Possession. See POSSESSION.

**OCUPATIONS**, in the Statute de Bigamis, are taken for Usurpations upon the Kings, by using Liberties or Franchises a Person is not entitled to.

As an unjust Entry upon the King into Lands and Tenements, is call'd an *Intrusion*; so an unlawful using of Franchises, is call'd an *Occupation*.

**OCUPAVIT**, in Law, a Writ that lies for him who is ejected out of his Land, or Tenement in time of War; as a *Novel Disseisin* lies for one ejected in time of Peace. See DISSEISIN.

**OCEAN**, the grand Sea, which encompasses or invests the whole Earth. See EARTH and SEA.

The Ocean is that vast Sea wherein the two grand Continents known to us, the new and old, are inclosed like Islands. See CONTINENT, &c.

By Computation it appears, that the Ocean takes up considerably more of what we know of the terrestrial Globe, than the dry Land. See TERRAQUEOUS-GLOBE.

Dr. Keil computes the Surface of the whole Ocean to be 8,540,506 Square Miles; so that supposing the Depth of the Ocean at a Medium to be  $\frac{1}{2}$  of a Mile, the Quantity of Water in the whole will be 21,372,626  $\frac{1}{2}$  Cubic Miles.

Yet Dr. Burner computes that all the Waters in the Ocean were not sufficient to drown or overflow the dry Land so high as the Scriptures say it was at the Deluge: Seven or eight Oceans, according to him, would scarce have sufficed. See DELUGE.

The Ocean penetrating the Land at several Straights, quits its Name of Ocean, and assumes that of Sea, or Gulf; so that where are usually added some Epithet to distinguish it; as *Mediterranean-Sea*, *Persian-Gulf*, &c. See SEA and GULF.

In very narrow Places it is call'd Straights, *Sims*. See STRAIGHT.

The Ocean takes different Names according to the divers Courneys it borders on; as the *British Ocean*, *German Ocean*, &c.

According to *Moly*, the Ocean may be commodiously divided into *Superior*, or Upper; and *Inferior*, or Lower.

The *Upper Ocean*, which the Antients call'd the *Exterius*, as encompassing all the known Parts of the World, he subdivides, according to the four Cardinal Points, into the *Northern*, *Southern*, *Eastern*, and *Western*.

The *Northern Ocean*, call'd also *Glacial*, *Frozen*, and *Scythian*, is that Part of the *Upper Ocean* next the North-Pole, bounded on the South with the Arctic Circle, and the Northern Coasts of *Europe* and *Asia*, and on the North with the unknown Lands about the Pole.

'Tis call'd the *Icy*, or *Frozen Ocean*, because these who have attempted a Passage thro it to *China*, &c. have always been stop'd with the Ice; and *Scythian*, because washing the Coasts of *Scythia*.

The *Western*, or *Atlantic Ocean*, is that Part of the *Grand Ocean* which washes the Western Coasts of *Europe* and *Africa*, extending from the Arctic Circle to the Equinoctial.

*Southern*, or *European Ocean* is that Part reaching from the Equinoctial to the unknown Antarctic Lands.

*Eastern*, or *Indian Ocean*, has its first Name from its Situation to the East; as its latter from *India*, the chief Country it washes.

It reaches from the Coast of *Ajan* to the Isle *Ann Larrens*, i. e. of *Tibet*.

The *Inferior*, or *American Ocean*, is that vast Part of the *Grand Ocean* which washes the Coasts of *America*; unknown, in great measure at least, to the Antients. It is divided into three Parts, &c.

1. The *North Sea*, which washes the Eastern Coasts of *America*, from the Arctic Circle to the Tropic of *Capricorn*.

2. The *Magellanic-Sea*, extending from the Tropic of *Capricorn* to the *Terra Australis Incognita*.

3. The *South Sea*, or *Pacific*, which washes the Western Coasts of *America* to the East, as far as the Isle of *Tavore*; and from South to North from the Tropic of *Capricorn* to the Land of *Tasja*.

For the *Subtleties* of the OCEAN, see SALTNESS.

For the *Tides* observed in the OCEAN, see TIDES.

*Phil. Salsness*, in 1664, printed a Dissertation entitled, *Oceanus Miscroscopus*, dedicated to *Bartolin*; wherein he shews that there is a circular Motion in the Waters, like that of the Blood in the human Body: That they all come from the Ocean, and return thither again. The Thought is *Solomon's*, *Ecclesi*. ch. 7. See VAPOUR, SPRING, &c.

The word *Ocean* comes from the Latin *Oceanus*, of the Greek  $\omega\kappa\epsilon\alpha\upsilon\sigma$ , which *Enthastius* fetches from *ωκεανος*, to slide swiftly. Others say, the Greeks borrow'd it from the Phœnicians, who call'd the Circumference of the Ocean *Okean*, from the Hebrew  $\text{אֹכְיָן}$  *Hog*, Circuit, Ambit.

**OCHLOCRATIA**, a Form of Government, wherein the Populace has the whole Power and Administration in its own hand.

The Word comes from the Greek  $\omega\chi\lambda\omicron\sigma$ , Multitude, and  $\rho\alpha\tau\eta\sigma$ , Power.

**OC'AGON**, in Geometry, a Figure of eight Sides and eight Angles. See FIGURE and POLYGON.

When all the Sides and Angles are equal, it is call'd a *Regular Ohagon*, or an *Ohagon* that may be inscribed in a Circle.

**OCTAGON**, in Fortification, is a Place that has eight Bastions. See BASTION.

**OCTAHEDRON**, in Geometry, one of the five Regular Bodies, consisting of eight equal Faces, or eight Equilateral Triangles. See REGULAR BODY.

The *Ohahedron* may be conceiv'd as consisting of two Pyramids put together at their Bases. See PYRAMID.

In Solidity therefore is had by multiplying the quadrangular Base of either, by one third of the perpendicular Height of one of them; and then doubling the Product. See SOLIDITY.

The Square of the Side of an *Ohahedron* is in a subduplo Ratio of the Diameter of the circumscribing Sphere.

**OCTAHET ERIDES**, in Chronology, &c. the Space, or Duration of eight Years.

The Word is form'd from the Greek  $\omega\kappa\tau\eta\epsilon\tau\epsilon\upsilon\sigma$ , composed of  $\omega\kappa\tau\eta$ , Eight, and  $\epsilon\tau\eta\sigma$ , Year.

**OCTANT**, or **OCTILE**, in Astronomy, an Aspect, or Position of two Planets, &c. wherein their Places are distant an eighth Part of a Circle, or 45 Degrees, from one another. See ASPECT.

**OCTAPLA**, a Term in the sacred Learning, used for a kind of *Psalter* Bibles, consisting of eight Columns. See BIBLE and PSALTER.

In the 1<sup>st</sup> Column was the Hebrew Text in Hebrew Characters; in the 2<sup>d</sup>, the same Text in Greek Characters; in the 3<sup>d</sup> the Greek Version of *Aquila*; in the 4<sup>th</sup> that of *Symmachus*; in the 5<sup>th</sup>, the *Septuagint*; in the 6<sup>th</sup>, that of *Theodotion*; in the 7<sup>th</sup>, that call'd the fifth; the last was that call'd the sixth.

*Origen* was the Author of the *Ohapla*, as well as of the *Tetrapla*, and *Hexapla*. See HEXAPLA, &c.

The Word implies something with eight Rows, or Columns.

**OCTATEUCH**, in the sacred Literature, is used for the eight first Books of the Old Testament; viz. *Genesis*, *Exodus*, *Leviticus*, *Numbers*, *Deuteronomy*, *Isaiah*, and *Judges*.

*Procopius of Gaza*, has ten Commentaries on the *Ohateuch*.

**OCTAVE**, in Music, an harmonical Interval consisting of 8 Tones, or Degrees of Sound. See INTERVAL and DEGREE.

The most simple Perception the Soul can have of true Sounds, is that of *Unison*; in regard the Vibrations there begin and end together. The next to this is the *Ohave*; wherein the more acute Sound makes precisely two Vibrations, while the graver or deeper makes one; and wherein, by consequence, the Vibrations of the two meet at every Vibration of the more grave. See TUNE, GRAVITY, &c.

Hence *Unison* and *Ohave* pass almost for the same Concord. See UNISON.

Hence also the Proportion of the Sounds that form the *Ohave* are in Numbers, or in Lines, as 2 to 1: so that two Chords or Strings of the same Matter, Thickness, and

Tension, one whereof is double the length of the other, produce the *Octave*. See *CHORD*.

The *Octave* is call'd by the Ancients *Diapfatan*, because containing all the simple Tones and Concords; all of which derive their Sweetness from it, as they arise more or less directly out of it. See *CONCORD*.

To be just, it must contain diatonically 7 Degrees, or Intervals; and consequently 8 Terms, or Sounds, whence its Name, *Octave*.

The *Octave* containing in it all the other simple Concords, and the Degrees being the Differences of these Concords; it is evident the Division of the *Octave* comprehends the Division of all the rest. See *SYSTEM*.

By joining, therefore, all the simple Concords to a common Fundamental, we have the following Series:

$$1 : \frac{2}{1} : \frac{3}{1} : \frac{4}{1} : \frac{5}{1} : \frac{6}{1} : \frac{7}{1} : \frac{8}{1} \\ \text{Fund. 3d l, 3d g, 4th, 5th, 6th l, 6th g, 8ve.}$$

Again, the System of *Octaves* containing all the original Concords; and the compound Concords being the Sum of *Octaves*, and some lesser Concord; in order to have a Series to reach beyond an *Octave*, we must continue them in the same Order thro a second *Octave*, as in the first; and so on thro a third and fourth *Octave*. Such a Series is call'd the Scale of Music. See *SCALE*.

The Composition of *Octaves* may be carried on infinitely, yet three or four *Octaves* is the greatest length we go in ordinary Practice. The old Scales went no further than two, or at most three *Octaves*, which is the full compass of an ordinary Voice. And, notwithstanding the Perfection of the *Octave*, yet after the third, the Agreement diminishes very fast; nor do they ever go so far at one Movement, as from one extreme to the other of a double or triple *Octave*; seldom beyond a single *Octave*: Nor is either Voice or Instrument well able to go beyond. To form a fourth *Octave*, if the acuter String be half a Foot, which is but a small Length to give a clear Sound; the longer must be eight Feet. If then we go beyond the fourth *Octave*, either the acute Term will be too short, or the grave one too long.

The *Octave* is not only the greatest Interval of the seven original Concords, but the first in degree of Perfection. As it is the greatest Interval, all the less are contain'd in it: Indeed, the manner wherein the less Concords are found in the *Octave*, is somewhat extraordinary; viz. by taking both an harmonical and arithmetical Mean between the Extremes of the *Octave*, and then both an arithmetical and harmonical Mean between each Extreme, and the most distant of the two Means last found; i. e. between the less Extreme and the first arithmetical, and between the greater Extreme and the first harmonical Mean, we have all the lesser Concords. See *CONCORD*.

Mr. *Milcombe* observes, that any Wind-Instrument being over-blown, the Sound will rise to an *Octave*, and no other Concord; which he ascribes to the Perfection of the *Octave*, and its being next to Unison.

From this simple and perfect Form of the *Octave*, arises this peculiar Property, that it may be doubled, tripled, &c. and still be Concord; i. e. the Sum of two or more *Octaves* are Concord; so the more Compound, gradually, the less agreeable. He adds, there is that Agreement between its Extremes, that whatever Sound is Concord to one Extreme of the *Octave*, is so to the other.

*Des Cartes*, from an Observation of the like kind, viz. that the Sound of a Whistle or Organ-Pipe, will rise to an *Octave*, if forcibly blown; concludes, that no Sound is heard, but its acute *Octave* seems someway to echo or resound in the Ear.

*OCTAVE*, or *OCTAVIS*, in Law, the 8th day after any Feast, inclusively.

Among the *Romanists*, *Octave* is used for the Space, or Period of 8 Days allow'd for the Celebration of a Feast, or Service in commemoration of some Saint, or on other solemn Occasions.

*Easter, Whitsonide, S. John Baptist, S. Lawrence, Epiphany, the Dedication*, &c. are celebrated with *Octaves*.

The Office in the *Octave* is semi-double.

*OCTIL*, or *OCTANT*, in Astrology, an Aspect of two Planets when distant from each other by an 8th of the Zodiac, i. e. a Sign and half, or 45°.

*OCTOBER*, is the 8th Month of the Year, in *Romanus's* Calendar; tho the 10th in that of *Numa, Julius Cesar, &c.* See *MONTH, CALENDAR, &c.*

It hath always retain'd its first Name, in spite of all the different Names the Senate and Roman Emperors would have given it: For the Senate order'd this Month should be call'd *Faustina*, in honour of *Faustina* the Wife of *Antoninus* the Emperor. *Commodus* would have had it bear the Name of *Invictus*; and *Domitian* made it be call'd *Domitianus* according to his own Name.

*OCTOSTYLE*, in the ancient Architecture, the Face of a Building or Ordinance, containing 8 Columns.

The 8 Columns of the *Octostyle* may either be disposed in a right Line, as in the *Pseudopiptere* Temple of *Vesta*, and in the *Paestens*; or in a Circle, as in the round *Mamupore* Temple of *Apollon* Pythour at *Delphi*, &c.

*OCTO TALE*, see *TALER*.

*OCULARES Dentes*, or *Cymodontes*, the Eye-Teeth; see *TEETH*.

*OCULI Caneri*, see *CRABS-EYES*.

*OCULI*, Eyes, in Botany, the Gemme, or Buds of a Plant just putting forth, or the Knobs out of which the Buds arise. See *BUD* and *GERM*; see also *PRUNING, EX-CRAFTING, &c.*

*OCULUS*, in Anatomy, see *EYE*.

*ODA*, in the *Turkish* Seraglio, signifies a *Clas, Chamber, or Order*. See *SERAGLIO*.

The Grand Signor's Pages are divided into five Classes or Chambers, call'd *Oda*. See *PAGE*.

The first, which is the lowest in Dignity, is call'd the *Great*, from the Number of Persons that compose it.

These are the Juniors, who are taught to read, write, and speak the Languages; which are the *Turkish* for this World; the *Arabic* for Paradise; and the *Persian* for Hell, by reason of the Heresy of the People who speak it.

The second is call'd *Little*; where, from the Age of 14 or 15 Years, the Youth are train'd up to Arms, and the Study of such polite Learning as the *Turks* are acquainted withall; viz. Logic, Arithmetick, Geometry, and a little Astrology.

In each of these Chambers, is a Page of the Privy-Chamber who commands them, as the Prefects in the Colleges of the Jesuits.

The third Chamber call'd *Kilar-Oda*, comprehends two hundred Pages; which, beside their other Exercises, are commanded by the *Kileragy Bachs*, for the service of the Buxtery and Fruiterry.

The fourth only consist of twenty-four, which, under the *Khasnedo-Bachs*, take care of the Treasure in the Grand Signor's Apartment, where they never enter with any Clothes on that have Pockets.

The fifth is call'd *Khas-Oda*, i. e. Privy-Chamber, and consists of forty Pages, which attend the Emperor's Bed-Chamber. The first of this Chamber is call'd *Os-Bach*, the second *Sakor*, &c.

Eight of these Pages keep constant Guard every Night in the Emperor's Bed Chamber. They are posted in several Places, some nearer him, others farther off, according to their degrees in the Chamber. They are to take care the Light kept constantly in the Chamber, don't glare in his Eyes, and awake him; and if they find him disturb'd with any troublesome Dream, to take care he be awaked by one of the Ag's.

*ODABACHI*, or *ODOBASSI*, an Officer in the *Turkish* Soldiery, equivalent to a Sergeant, or Corporal among us.

The common Soldiery, and *Janisaries* call'd *Oldachi*, after having serv'd a certain Term of Years, are preferr'd, and made *Bispelars*; and of *Bispelars* in time become *Oda-bachi's*, i. e. Corporals of Companies, or Chiefs of certain Divisions, whose Number is not fix'd, being sometimes ten, and sometimes twenty.

Their Pay is 6 Doubles per Month, and they are distinguish'd by a large Felt, a foot broad, and above a foot long, hanging on the Back with two long Oirich Feathers.

*ODE*, in the ancient Poetry, a Song; or Composition proper to be sung, and compos'd for that purpose; the singing usually accompanied with some musical Instrument, chiefly the Lyre; whence the *Ode* became denominated *Lyric*. See *SONG* and *LYRIC*.

*Ode*, in the modern Poetry, is a Lyric Poem, consisting of long and short Verses, distinguish'd into *Stanzas*, or *Strophes*, wherein the same measure is preserved throughout.

The Word comes from the Greek *oide*, Singing.

The *Odes* of the Ancients, *Poetus* observes, had a regular Return of the same kind of Verse, and the same Quantity of Syllables in the same Place of every similar Verse: "But there is nothing (says he) but confusion of Quantities in the modern *Odes*; so that to follow the natural Quantity of our Syllables, every Stanza will be a different Song."

He should have observ'd, however, that all the ancient *Odes* were not of such kind. But he proceeds: "The Moderns have no regard to the natural Quantity of the Syllables, and have introduced an unnatural and barbarous Variety of long and short Notes, which they apply without any regard to the natural Quantity of the Syllables: so that it is no wonder our vocal Music has no effect." *de Psem. Cantu*. See *VERSE, VOCAL MUSIC, QUANTITY, &c.*

Among the Ancients, *Ode* signified no more than a Song; with us, they are different things. Their *Odes* were generally in honour of their Gods; as many of those of *Pindar*

dar and Heroæ: sometimes on other Subjects; as those of *Amorcan, Sappho, &c.*

The *English Odes* are generally composed in praise of Hero's and great Exploits; as those of *Prius, of Welford, &c.*

The distinguishing Character of the *Ode* is *Sweetness*: The Poet is to sooth the Minds of his Readers by the variety of the Verse, and the delicacy of Words, the beauty of Numbers, and the description of things most delightful in themselves. Variety of Numbers is essential to the *Ode*.

At first, indeed, the Verse of the *Ode* was but of one kind; but for the sake of Pleasure, and the Music to which they were sung, they by degrees so varied the Numbers and Feet, that their Kinds are now almost innumerable. One of the most considerable is the *Pindoric*, distinguish'd by the Boldness and Rapidity of its Flights. See *PINDARIC*.

The ancient *Ode* had originally but one Stanza, or *Strophe*; but was at last divided into three Parts: The *Strophe, Antistrophe, and Epode*; the *Priests* going round the Altar, singing the Praise of the Gods, call'd their first Entrance *Strophe*, i. e. turning to the left; the second, turning to the right, they call'd *Antistrophe*; i. e. returning. And accordingly, the Song, in those different Places, was call'd *Ode* and *Epode*. See ΣΤΡΟΦΗ and ΑΝΤΙΣΤΡΟΦΗ.

Lastly, standing still before the Altar, they sang the remainder; which they also call'd *Epode*. See ΕΠΟΔΕ.

ODEUM, among the Antients, was a Place destined for the Rehearsal of the Music to be sung on the Theatre.

ODEUM was also used for other Buildings that had no relation to the Theatre: *Pericles* built an *Odeum* at *Athenis*, where musical Prizes were contended for. *Panjanias* says, that *Heracl* the *Athenian* built a magnificent *Odeum* for the Sepulchre of his Wife.

The *Latin* Writers also use the Word *Odeum* for the Choir of a Church. Grammmarians are exceedingly in the dark about the signification of the Word among the Antients.

ODIO & AIA, antiently call'd *Breue de lono & malo*, is a Writ sent to the Under-Sheriff, to enquire whether a Man, being committed to Prison on suspicion of Murder, be committed on *Malice*, or *Will*, or upon just suspicion.

ODONTALGIA, in Medicine, the Tooth-Ach; one of the most common, yet most cruel Pains the Body is subject to. See TOOTH.

Its Cause is a sharp Serosity, thrown on the Membrane that lines the Sockets, or *Alveoli* of the Teeth. The Liquor is sometimes so very sharp and corrosive, that it eats away the Teeth by little and little, and makes 'em fall piece-meal.

Its more remote Causes are Sugars, very hot things, and very cold Acids, &c.

The Disease is frequently attended with an Inflammation, or *adematous* Tumor of the Jaw. It is sometimes also owing to a Worm found in the Root of the Tooth.

The *Curious Nature*, Decad II. mention an *Odontalgia* cured by a Box on the Ear given the Patient; and add an Instance of Blindness and *Odontalgia* caused by shaving a Man's Beard. The very sight of a Remedy frequently drives away the Pain.

The Word is form'd from the Greek *ὀδῶν*, Tooth, and *ἄλγος*, Pain.

ODONTOIDES, in Anatomy, an *Apophysis* in the middle of the second *Vertebra*; so call'd from its resemblance to a Tooth. See VERTEBRA.

Its Surface is somewhat unequal, that the Ligament which comes out of it and binds it to the *Occiput*, may take the better hold.

It is also encompassed with a solid Ligament, contriv'd on purpose to prevent the spinal Marrow from being compress'd by this *Apophysis*.

The Word is form'd from the Greek *ὀδῶν*, Tooth, and *ἰδῶν*, Form.

ODOR, or ODOUR, see SMELL.

ODORAMENTUM, in Pharmacy, a Medicine apply'd for the benefit of its smell, whether it be fetid, or agreeable. See SUPPLEMENTUM.

Such are frequently used in *Hysteric* and *Hypocondriac* Disorders; e. g. *Asa fetida, Camphor, &c.*

ODORATION, see SMELLING.

ODOUROUS and ODORIFEROUS Things, are such as exhale a brisk, agreeable Smell, sensible at a distance.

Such are the *Jessamin, Rose, Tuberose, &c.*

ODYSSEE, an Epic Poem of *Homer*; wherein he relates the Adventures that befel *Ulysses* in his Return to *Italy* from the Siege of *Troy*. See EPIC.

The Design of the *Iliad*, *F. Bessa* observes, is to instruct the *States of Greece* consider'd as united in one Body, or as Parts of the Whole; and that of the *Odyssey*, to instruct their *several States*, consider'd in their private Capacities. See ILLIAN.

A State consists of two Parts: The Head which commands, is the first; and the Members that obey, the second. Now, Instructions are required both for the one and the other; but it is possible to have them both convey'd under the same Person.

The Fable, then, of the *Odyssey* is as follows: A Prince had been obliged to quit his Country, and lead an Army of his Subjects upon a foreign Expedition: after having gloriously executed this, he was upon his Return home; but in spite of all his Endeavours, was detained for several Years by Tempests which threw him on several Countreys very different from one another as to Manners, Customs, Polity, &c.

In the Dangers he had to struggle withall, his Companions, neglecting his Advice, all perish, thro their own default. In the mean time, the great Men of his Country, abusing his Absence, commit strange Disorders in his Palace, squander his Treasure, lay Snare for his Son, and will needs force his Wife to chuse a Husband among them; all this from an Opinion he was entirely lost. But at length he returns; and having discover'd himself to his Son, and some others of his Friends who had persisted in their Allegiance, he becomes an Eye-Witnes of their Infidelity; punishes them as they desert'd, and restores that Peace and Tranquillity to his Island, which had been banished during his Absence. See FABLE.

The Truth or Moral whereto this Fable is founded, is, that a Person's Absence from home, so as that he cannot have an Eye to his Affairs, occasions great Disorders. Accordingly, the Hero's Absence is the principal and most essential Action of the Piece; and takes up the greatest Part of the Poem.

This Poem, *Joseph* adds, is more calculated for the People, than the *Iliad* is, where the Subjects are rather ill us'd out of the ill Conduct of the Princes, than by their own fault. The great Names of Hero's, *Ulysses, &c.* don't here represent the poorest Peasants left than Princes, *Cajars, Alexanders, &c.* The meanest People are as liable to ruin their Estates and Families by Negligence, &c. as the greatest; and accordingly have as much need of *Homer's* Lectures, and are as capable of profiting by them, as Kings themselves. See ENZYD.

*Gerard Creeft*, a Dutchman, in a Book intitled ΟΜΗΡΟΣ-ΕΡΠΑΙΟΣ, printed at *Dort* in 1704, endeavors to prove that the Subjects of *Homer's* two Poems are taken from the Scriptures; and that that of the *Odyssey*, in particular, is nothing else but the Adventures of the *synclater* till the Death of *Moses*; and that the *Odyssey* was composed before the *Iliad*, the Subject wherof is the taking of *Jericho*. What Fancies!

The Word is form'd from the Greek *ὀδυσσεύς*, of *ὀδύσσειν*, *Ulysses*.

OECONOMICS, that Part of Moral Philosophy which teaches how to manage the Affairs of a Family, or Community. See MORALITY and OECONOMY.

OECONOMUS, a Person appointed to direct, and manage a vacant Church Revenue, or that of an Hospital or Community.

OECONOMUS was also antiently used for a Protector, or Advocate, who defended the Rights and Effects of Churches, Monasteries, &c. See ADVOCATE and AVOUEE.

The Name was also given to a Church-Officer who took care of the Buildings and Repairs of the Church, and received and distributed Alms according to the Directions of the Bishop.

In this sense, the sixth Council appoints that every Church have its *Oeconomus*.

OECONOMY, the prudent Conduct, or discrete, frugal Management of a Man's Estate, or that of another.

To recommend *Oeconomy*, a modern Author observes, that Land as good as most in *England* is let at 20 s. an Acre per Annum; and sold at 20 Years Purchase, or for 20 Pounds. Now, in an Acre of Land are 43560 square feet, and in 20 Pounds are 4800 Pence: by which dividing 43560, the Quotient will be 9, and 360 remaining; which shews that one Penny will Purchase 9 square feet and almost 13 inches of Land, viz. a Piece 3 feet long and 3 broad, and something more.

Whence it follows, that two Shillings purchases a Piece of Ground of 216 Feet 3 inches 18 feet long, and 12 feet broad; enough to build a pretty Hoofe upon, and room for a little Garden.

*Animal Oeconomy*, the first Branch of the Theory of Medicine; or that which explains the Parts of the human Body, their Structure and Use; the Nature and Causes of Life and Health, and the Effects or Phenomena arising from them. See MEDICINE.

This is otherwise call'd *Physiology*; and its Objects just enumerated are call'd *Naturals, or res secundum Naturam*. See NATURALS.

Legal, or Jewish OECONOMY or Dispensation, is the manner

ner wherein God thought good to guide and govern his People under the Ministry of *Moses*.

This included not only the Political and Ceremonial Laws; but also the Moral Law, inasmuch as it pronounced a Curse on all those who did not fulfil it perfectly.

*Evangical, or Christian Oeconomy, or Dispensation*, is used in opposition to the Legal; and comprehends all that relates to the Covenant of Grace, which God has made with Men by Jesus Christ.

**OECUMENICAL**, signifies as much as *General, or Universal*.

The Word is form'd of the Greek *oikoumene*, of *oikos*, the habitable Earth; or, the whole Earth.

In this sense we say, an *Oecumenical Council, or Synod*; meaning one at which the whole Christian Church assisted, or were invited to. See **COUNCIL**.

Dr *Cange* observes, that many of the Patriarchs of *Constantinople*, assumed to themselves the Quality and Denomination of *Oecumenical Patriarchs*; particularly *John the First* in 190, and *Cyril* his Successor.

*Gregory the Great of Rome*, was exceedingly enraged at it; pretending it was a Title of Pride, and a Character of Antiquity; as supposing the Title *Oecumenic* to imply Universal Bishop, or Bishop of all the World; whereas, in effect, it imply'd no more, than the Quality of Chief of the Eastern Church; in like manner as the first Doctor of the Church of *Constantinople* was call'd *Doflor Oecumenicus*.

The Title *Oecumenical Bishop* was first offer'd *Leo I.* but he refus'd it; nor did his Successors accept of it for a long time. The 5th Council of *Constantinople* gave it to *John*, Patriarch of the City; so some of the *Kowans* pretend that the Emperor *Phocas* gave it, by way of Proterence, to the Bishop of *Rome*.

But those of *Constantinople* have preserv'd it; and so late as the Council of *Nisus*, that Patriarch us'd the Title. But *Oecumenical* here is only to be understood as of the Extent of each Patriarch. See **PATRIARCH**.

**OEDEMA, or OEDEMATOUS Tumor**, a Tumor which appears whitish, soft, and lax, without any notable change of Colour, Heat, Pain, or Pulsation; and which yields to the Pressure of the Finger so as for some time to retain the Dent or Impression thereof. See **TUMOR**.

The general Cause of *Oedematous Tumors*, is vulgarly supposed to be a *Plenia*, as it is call'd, or a phlegmy Humour in the Body. Contusions, Fractures, Luxations, &c. when of long standing, often give rise to *Oedemas*, especially in Dropsical and Aged Persons; so do irregular Living, want of Exercise, Ruptures, Disorders of the Lymphatics, Defluxions of Humours, Weakness of the Joints, &c.

Its chief Seat is the Legs: In a *Lencephlegmatia*, the whole Body is *Oedematous*. It frequently comes upon other Diseases, especially *Clinics*; and is familiar to Women with Child. 'Tis dangerous when it tends to an *Abscess*; when it hardens, it becomes scirrhus. See **OEDEMATOUS**.

*Hippocrates* uses the word *Oedema* for any Tumor in general.

There are also *Spurious Oedemas*; in which case the pituitous Humour is mix'd with other Humours; whence the Tumor becomes *Erysipelatous, Scirrhus*, and sometimes *Cyffous*; and hence *Wens, &c.*

The Word comes from the Greek *oedema*, whence *oedema*, a Tumor contrary to *Nausea*.

**OEDEMATOUS**, in Medicine, something that is of the nature of an *Oedema*; seiz'd, or afflicted with an *Oedema*.

Thus we say an *Oedematous Arm, Oedematous Legs, &c.*

The Physicians divide Tumours into *Inflammatory, Oedematous, Scirrhus, Serpibulous, Cancerous*, &c. See **TUMOR**.

*Oedematous Tumors* seldom, of themselves, prove dangerous, or mortal; but when they are of long continuance, the effect of old Age, or a dropsical Habit; when they grow hard, scirrhus, painful, or come to suppurate, the Cure is generally tedious and uncertain. Those which attend Wounds, Fractures, or the like, are less difficult to cure. See **OEDEMA**.

They are easily discuss'd in their first Formation by the external Application of Solutions of Bay-Salt, Nitre, crude Sal Armoniac, &c. in Spanish Wine, Urine, Lime-Water, or other lixivious Fluids; while the Patient submits to a Course of Purgatives, to discharge the Matter repell'd by such Applications.

Under the Class of *Oedematous Tumors*, are ranked *Candy-lamata, Crispe, Rhegmatit, Thyrs, Talpa* and *Nate*, the *Ganalis* and *Pyloracum*. See each under its proper Article, **CONDYLOMA, CRISTA, &c.**

**OENOLEUM**, in Pharmacy, a Mixture composed of thick black Wine and Oil of Roses.

In Fractions with Wounds, where the Bone is not bare, *Scalcius* orders that the Compresses, to make them stick, be drench'd with *Oenoleum*, to looth the Pain, and prevent an Inflammation; and the Bandages to be every day moisten'd

with the same, till the inflammation be out of all danger.

The Word is form'd from the Greek *oinos*, Wine, and *oleum*, Oil.

**OENESTERIA**, in Antiquity, Sacrifices, held by the Youth of *Athens*, before the first time of cutting the Hair, and shaving the Beard.

These Sacrifices were offer'd to *Hevencs*; and the Quantity of what was offer'd was regulated by Law.

The Etymology of the Word, which comes from *oinos*, Wine, shews that the Matter thus offer'd was Wine.

**OENOPTES**, a kind of Officer or Cenfor at *Athens*, who attended at their Feasts, regulated the number of Cops each was to drink, and took care that none drank too much or too little.

Those who would not be kept within the bounds of Temperance, were call'd by the *Oenoptes* to the *Atropagus*. They were also call'd *Eyes, Oculi*.

**OESOPHAGÆUS**, in Anatomy, one of the Muscles of the *Pharynx*, which it encompasses round like a Ring. See **PHARYNX**.

'Tis single, and serves to squeeze the Aliment down, by closing the *Pharynx* after the manner of a *Sphincter*; whence some call it the *Sphincter Gulae*; others call it the *Dejectator*, or Swallower. See **SPHINCTER, DEJECTIVUS, &c.**

Dr *Drake* will have it no more than a Production of the *Pretyropharyngeus*, whose Fibres surround the *Pharynx* from a tendinous Line on the back part of it: Tho' *Verbeeyen* makes it a distinct Pair.

**OESOPHAGUS**, in Anatomy, the *Gula*, or Gullet; a membranous Pipe or Passage, whereby our Food and Drink is convey'd to the Stomach. See **FOOD, &c.**

The *Oesophagus* descends from the Mouth to the Stomach, between the *Spina Arteria* and the *Vertebrae* of the Neck and Back, in a straight Line, excepting for a little declension about the fifth *Vertebrae* of the *Thorax*, where it turns a little to the right, to make way for the great Artery, which runs along with it to the ninth; where turning again towards the left, it crosses the Artery, and piercing the *Diaphragm*, ends at the left Orifice of the Stomach. See **STOMACH**.

It consists of several Coats or Membranes, usually reckoned three; tho' some make four, others five or six, allowing the *Cysta Viliosa* to be one: Which last division, Dr *Drake* follows as most accurate.

The first Coat is *membranous*, and only design'd for a Covering for the rest; and seems only a continuation of the outward Membrane of the Stomach, derived from the *Peritonaeum*, the same derive it from the *Pleura*, and others from the *Diaphragm*.

The seco'd is *Muscular*, consisting of strong, fleshy Fibres, like other Muscles; so that it seems to make the Gullet a hollow fistulous Muscle. According to *Stens* and *Wills*, it consists of two Orders of Fibres, going from top to bottom in spiral Lines, contrary to and decussating each other. Which Description is very exact of the Gullet of Ruminants, but not so of that of Men. In Men it consists of two fleshy *Lamellae*, like two distinct Muscles: The outward composed of straight longitudinal Fibres; the inner of annular Fibres, without any observable Angles. The use of this Coat is to promote Deglutition: The longitudinal Fibres, when in contraction, shortning the *Oesophagus*, and making its Capacity larger to admit of the Matter to be swallow'd; and the annular, on the contrary, contracting the Capacity, and closing behind the descending Aliment, press it downward. So that the two Orders of Fibres seem to act as Antagonist-Muscles to each other. See **DEGLUTITION**.

The next Coat, call'd the *Vascular*, consists of a double Membrane; the outer form'd of irregular Fibres and innumerable Vessels interwoven; the inner, of straight longitudinal Fibres mix'd with little Glands; whence some call it the *Glandulosa*. This Membrane adheres closely to another within, call'd the *Nervous-Coat*, which is exceedingly fine, and made up of excessively slender Fibres, variously dispos'd. It is continu'd to that which covers the Fauces, Mouth, and Lips; whence it happens, that tickling the bottom of the Fauces by vellicating this Membrane, provokes a retching to Vomit. See **VOMITING**.

This Membrane is the Organ of Sensation; and in this Part, as some think, is the Seat of Thirst; or the Organ whereby the Appetite of Drinking is excited. See **THIRST**. It is lined inwardly with a villous Crust, which Dr *Drake* takes to be the excretory Ducts of the Glands, and not unlike the *Canicula* of the *Cat*, to defend the subjacent Membrane. In Excoeciations, this is sometimes cast out at the Mouth.

The upper opening of the *Oesophagus*, situated at the bottom of the Fauces, is call'd the *Pharynx*. See **PHARYNX**.

**OESYPON**, a kind of fatty Mucilage, of the consistence of an Unguent; of a greyish Colour, and a sickish disagreeable

agreeable smell, drawn from the greasy Wool growing on the Throats and between the Burtocks of Sheep.

This Wool they wash, boil it in Water to scower, let the Lotions or Decoctions stand for some time, and from the top skim off a fatty Substance, which being strain'd thro' a linen Cloth, and set to cool, makes the *Oxygon*, much used externally to resolve, soften, and appease Pain.

The Word is form'd from the Greek *in*, Sheep; and *onyx*, to be corrupted; the *Oxygon* being a filthy, and, as it were, corrupted Matter, drawn from Sheep.

*OFFA Alba*, a Name *Van Helmont* gives to the white Coagulum arising from a mixture of the rectify'd Spirit of Wine with Spirit of Urine.

*Nos*, The Spirit of Urine must be distill'd from well fermented Wine; and that must be well dephlegmated, else no *Offa* will arise.

**OFFERTORY**, an Anthem sung, or play'd on the Organ, at the time the People are making an Offering. See ANTHEM and OFFERING.

Antiently the *Offertory* consisted of a Psalm sung with its Anthem; tho' it is somewhat dubious whether the Psalm was sung entire; St. *Gregory* mentioning, that when it was time, the Pope looking at the Choir who sang it, gave the Sign when they should end.

The Name *Offertory* was also given to the Linnen whereon the Offerings were laid. Dr. *Harris* says, 'twas properly a Piece of Silk or fine Linnen wherein the Offerings of each Church were wrapp'd up.

**OFFICE, OFFICIUM**, in a moral Sense, *Duty*; or that which Virtue and right Reason directs us to do.

*Virtus*, according to *Chadon*, is the *Purpose* of doing well; the thing which immediately follows, or arises from this Purpose, is *Obedience*; which same is also denominated *Officiam*; so that an *Office* is the Object of an Obedience to Virtue. See VIRTUE.

*Cicero*, in his Discourse of *Offices*, censures *Panaetius*, who had wrote before him on the same, for omitting to define the Thing or Subject on which he wrote; yet does he himself fall under the same Censure. He insists much on the Division of *Offices*; but forgets the Definition. In other of his Pieces we find him defining an *Office* to be an Action which Reason requires to be done: *Quod autem ratione absum sit, id Officium appellamus*. De Finib.

The *Greeks*, he observes, made two Species of *Offices*; *Perfect*, call'd by them *agathos*; and *Common*, or indifferently, call'd *xythos*; which they define *fo*, as, that what is absolutely right, makes a *perfect Office*; and what we can only give a probable Reason for, an *intermediate Office*. See REASON.

**OFFICE**, in a Civil Sense, the mutual Aid, and Assistance which Men owe to one another.

Benevolence inspires a Man with an Endeavour to do good *Offices* to all Mankind. See COMMON PLACE.

**OFFICE** is also a particular Charge, or Trust, whereby a Man is authoriz'd to do something. See OFFICER.

*Lexjeun* defines it a Dignity attended with a public Function.

The Word is primarily used for those of Judicature and Policy; as the *Office* of a Secretary of State, of a Justice of Peace, of a Sheriff, &c.

*Offices* are either Venal, or not Venal: *Venal Offices* are those bought with Money. *Venal Offices* are also distinguish'd into two kinds; viz. *Dominal* and *Casual*; *Dominal*, or *Offices in Fee*, are those absolutely torn off and separated from the King's Prerogative, so as not to become Vacant by death, but passing in the nature of a Fee, or Inheritance. See FEE.

Of these we have but few Instances among us, which go beyond a first Reversion.

*Casual Offices* are those given for Life, by Patent, Commission, &c. and which become vacant, by the Officer's death, to the King's profit; unless the Officer have before resign'd, or dispell'd of it.

The Venality of *Offices* is of no long standing. See VENALITY.

**OFFICE** is also used for a Place, Apartment, or Board, appointed for the Officers to attend in, for the discharge of their respective *Offices*, or Employments.

Such are the Secretary's Office, the Six Clerks Office, the Paper-Office, Sines-Office, the Prothonotary's Office, Pipe-Office, King's School-Office, Exchequer-Office, Office of the Ordnance, &c. See each in its Place, SECRETARY, SIX CLERK, PAPER, SIGNET, EXCHEQUER, ORDNANCE, &c.

Of such *Offices*, some are distinguish'd by the Name of *Poures*, and others of *Chambers*; as the *Board of Green Cloth*, &c. See GREEN CLOTH, CHAMBER, &c.

Where the Inquisition obtains, the Tribunal thereof is call'd the *Holy-Office*. See INQUISITION.

In the Canon-Law, *Office* is used for a Benefice which has no Jurisdiction annex'd to it. See BENEFICE.

**OFFICE** is also used, in Law, for an Inquisition made to the King's Use of any thing found by Inquisition made *ex Officio*.

Thus to traverse an *Office*, is to traverse an Inquisition taken of *Office* before an *Exchequer*.

To return an *Office*, is to return that which is found by virtue of the *Office*.

In this sense there are two sorts of *Offices* issuing out of the Exchequer by Commission; viz. an *Office* to intitle the King in the thing inquir'd into; and an *Office* of Instruction.

**OFFICE** is also used for Divine Service celebrated in public. See LITURGY.

St. *Jerom* is the Person, who, at the Request of *Pope Damasus*, is said to have first distributed the Psalms, Epistles, and Gospels in the Order they are now found in the *Romish Office*. The *Popes Gregory* and *Gelasius* added the Prayers, Responses, and Verses; and St. *Ambrose* the Graduals, Hallelujahs, &c.

In the *Romish Church*, *Office* is particularly used for the manner of performing the *Office*; which varies every Day. Thus they say the *Office* of Sunday; of such a Saint, &c. The *Office* is either single, half double, or double.

Again, *Office* is apply'd to the particular Prayer which is prefer'd in honour of a Saint. When any Person is Canoniz'd, a particular *Office* is at the same time assign'd him out of the common *Office* of the Confessors, the Virgin, or the like. See SAINT and CANONIZATION.

Thus we say, the *Office* of the Virgin; of the Holy Spirit; of the Passion; the Holy Sacrament, &c. The *Office* of the Dead is rehears'd every day, excepting Feast-days, among the *Catholics*. The *Office* of the Holy Virgin is also added to the *Office* of the Day, in the Order of *Bernardines*.

**OFFICES**, with regard to Architecture, are all the Lodges and Apartments that serve for the necessary Services and Occasions of a Great House or Palace; particularly those which have a relation to Eating; as Kitchens, Parterres, Brew-Houses, Confectionaries, Fruitries, Granaries, &c. as also Wood-houses, Equeries, &c. See HOUSE, BUILDING, &c.

The *Offices* are commonly in the Backcourts; sometimes they are sunk under-ground, and well vaulted, &c.

**OFFICER**, a Person provided of a Charge, or Office. See OFFICE.

Great OFFICERS of the Crown, or State, are the Lord High Steward, the Lord Chancellor, the Lord High Treasurer, the Lord President of the Council, the Lord Privy-Seal, the Lord Great Chamberlain, the Lord High Constable, the Earl Marshal, and Lord High Admiral. See each under its proper Article, CHANCELLOR, TREASURER, MARSHAL, &c.

OFFICERS of Justice, are those who are charg'd with the Administration of Equity and Justice in the Courts thereof. See COURT.

Royal OFFICERS are those who administer Justice in the King's Name; as the *Judges*, &c. See JUDGE.

Subaltern OFFICERS, those who administer Justice in the name of Subjects; such are those who act under the Earl-Marshal, Admiral, &c.

OFFICERS of Policy, are those in whom the Government and Direction of the Affairs of a Community are invest'd; as Mayors, Sheriffs, &c. See POLICY.

OFFICERS of War, are those who have Command in the Forces.

These are either General, Field, or Subaltern Officers.

General Officers are such whose Command is not limited to a single Troop, Company, or Regiment; but extends to a whole Body of Forces; such are the General, Lieutenant-Generals, Major-Generals, and Brigadiers. See GENERAL, &c.

Field Officers are such as have Command over a whole Regiment; such are the *Maitres de Camp*, Colonels, and Majors.

Subaltern Officers, are the Lieutenants, Cornets, Ensigns, Sergeants, and Corporals. See each Officer under his proper Article, CAPTAIN, COLONEL, &c.

Commission OFFICERS are such as are appointed by the King's Commission; thus call'd in contradistinction to *Half Officers*, or *Warrant Officers*, who are appointed by the Colonel's, or Captain's Warrant.

Sea-OFFICERS, or Officers of the *Marine*, are those who have Command in Ships of War.

Flag-OFFICERS are the Admirals, Vice-Admirals, and Rear-Admirals. See FLAG, ADMIRAL, &c.

OFFICERS of the Household, are the Lord Steward, Treasurer of the Household, Comptroller, Cofferer, Master, Clerks of the Green-Cloth, &c. The Lord Chamberlain, Vice-Chamberlain, Gentlemen of the Privy and Bed-Chamber, Gentlemen-Ushers, Grooms, Pages, Master of the Wardrobe, of the Ceremonies, &c. The Master of the Horse, Veneur, Equeries, Surveyors, &c. See HOUSEHOLD, see also each Officer in his proper Article.

Staff OFFICERS are such as in the King's Presence bear a white Staff; and at other times, going abroad, have a white Staff borne before them by a Footman bare-headed.

Such are the Lord Steward, Lord Chamberlain, Lord Treasurer, &c.

The white Staff is taken for a Commission; and at the Death of the King, the Officers break their Staff over the Hearse made for the King's Body, and thereby discharge their inferior Officers.

OFFICIAL, in the Canon-Law, the Bishop's Deputy, or Licentiate; or an Ecclesiastical Judge appointed by a Bishop, Chapter, Abbot, &c. See COURT.

Of such there are two Kinds; the one, as it were, Vicar-General of the Church; exercising Jurisdiction throughout the whole Diocese, call'd by the Canonists *Officiarius Principalis*; in our Statute-Law the Bishop's Chancellor. See CHANCELLOR.

There is no Appeal from his Court to the Bishop; his being esteem'd the Bishop's Court. See BISHOP'S COURT.

The other kind, call'd *Officiarius Foraneus*, as having his Jurisdiction *foris*, & *extra Civitatem*, is erected by the Bishop when the Diocese is very large; having a certain Extent of Territory assign'd him, wherein he resides.

This *Officiarius* has but a limited Jurisdiction, tho he have *universitatem Casarum*, and exercise it in the Bishop's Name. Our Statute Laws call him Commissary. See COMMISSARY.

The Bishops, especially those of large Sees, finding themselves oppress'd with a multiplicity of Business; at first, discharged a part of it upon their Archdeacons and Priests; to whom they gave Commissions revocable at pleasure. These they call'd *Vicarii*, or *Officiales*.

As we don't meet with this Term any where before the Constitutions of *Sextus*, 'tis pretty apparent the Custom had not its Rise till the End of the 13th Century.

In process of Time, the Function was divided into two; and the Title *Officiarius* given to those with whom the Bishop entrusted the Exercise of litigious Justice; and that of *Vicari General*, or *Grand Vicari*, to those who had the voluntary Jurisdictions.

The Number of *Officiales* was soon excessively multiply'd; and not only Bishops, but Chapters and Archdeacons would have their *Officiales*.

The *Officiales*, by degrees, had drawn to their Cognizance and Jurisdiction, most of the Civil Causes; till they were taken out of their hands by Appeals, &c.

OFFICIAL, in Common Law, is a Deputy appointed by an Archdeacon for the executing of his Jurisdiction.

OFFICIALTY, the Court, or Jurisdiction, whereof the *Officiarius* is Head.

The Practice of *Officiales* is now reduced into a little Compass; and Actions of Promises, and Dissolutions of Marriages, are the principal things transacted therein.

OFFICIAL, in Pharmacy, a Term apply'd to such Medicines, whether Simple or Compound, as the College of Physicians requires to be constantly kept in the Apothecary Shops, ready to be made up in extemporaneous Prescription. See PRESCRIPTION.

The *officiarius Simples* are appointed, among us, by the College of Physicians; and the manner of making the Compositions directed in their Dispensatory. See DISPENSATORY, COMPOSITION, &c.

The Word is form'd of the *Latin Officina*, Shop. OFFING, in the Sea-Language, that part of the Sea a good distance from Shore; where there is deep Water, and no need of a Pilot to conduct the Ship into Port.

Thus if a Ship from Shore be seen sailing out to Sea-ward, they say the Bands for the Offing; and if a Ship having the Shore near her, have another a good way without her, or towards the Sea, they say, that Ship is in the Offing.

OFF-SETS, in Gardening, &c. are young Shoots that spring, and grow from Roots that are round, tuberos, or bulbous.

The Word is also used for the loose, outer, brown Skins in Tulips, Onions, &c.

OFF-SETS, in Surveying, are Perpendiculars let fall, and measur'd from the Stationary-Lines, or the Lines between one Station and another, to the Hedge, Fence, or Extremity of the Inclosure. See SURVEYING.

OGEE, or O G, as it is frequently wrote, or OGIVE, in Architecture, a Moulding, consisting of two Members, the one concave, and the other convex; the same with *Cymation*. See CYNAMIUM.

*Vitræus* makes each Member a Quadrant of a Circle; *Scamozzi*, and some others, make them somewhat flatter, and strike them from two equilateral Triangles.

Its Form bears some resemblance to that of an S.

OGIVE is also used for an Arch, or Branch of a Gothic Vault, which, in lieu of being Circular, passes diagonally from one Angle to another, and forms a Cross between the other Arches which makes the side of the Square, whereof the Arches are Diagonals. See ARCH and VAULT.

The middle, where the *Ogives* cut or cross each other, is call'd the Key, which is sometimes cut in form of a

Rose, or a *Cul de Lampe*. The Members or Mouldings of the *Ogives* are call'd Nerves, Branches, or Reins; and the Arches which separate the *Ogives*, double Arches. See VAULT.

OGRESSES, or AGRESSES, in Heraldry, see PELLETZ.

OIL, a fatty, unctuous, inflammable Matter, drawn from several natural Bodies. See FAT.

The word *Oil* is sometimes apply'd to the Juices which distil naturally from Plants and Trees; as Balm, &c. but more strictly to those Juices drawn by Expression from Plants, Fruits, Grains, or Seeds; as *Oil of Olive*, *New-Oil*, &c. See EXPRESSION.

The Word is form'd from the *Latin Oleum*, of *Olea*, Olive-Tree, the Fruit whereof abounds in such Juice. See OLIVE.

The Kinds of *Oils*, their Properties, Manners of Expression, &c. are almost infinite: For the generality of them, the Reader is refer'd to the proper Articles; such as could not be more conveniently inserted, are as follow.

*OIL of Olive*, is the most popular, and most universal of all others; being that chiefly used in Medicine, in Foods, Salads, and in the Manufactures. See SALAD, &c.

It is drawn from Olives by Presses or Mills made for the purpose. The Fruit is gather'd when at its utmost Maturity in December and January, as it begins to redden; when 'tis put under the Mill, as soon as gather'd, it yields that *Oil* so very sweet, and of so charming an Odour, call'd *Virgin-Oil*. But, as the Olives newly gather'd yield but little *Oil*, those who rather regard Quantity than Goodness, leave them on the Ground for some time, e'er they press them.

Neither the Smell nor Taste of this second *Oil* is very agreeable; tho there is a third Kind still worse, which is the common *Oil* procur'd by throwing boiling Water on the Pressings, and repressing them more strongly.

The consumption of this *Oil* is incredible; the South Parts of France, Provence, Languedoc, &c. as also Candia, some Parts of Italy, &c. yield vast Quantities. Its use every body knows; it being reputed one of the most universally useful things in the whole World.

*OIL of sweet Almonds*, cold drawn, or without Fire, is prepared various ways. Some peel the Almonds as they pound 'em; others pound 'em without peeling. Some warm 'em in luke-warm Water; others in *Infusio Martis*; some only bruise 'em; others beat 'em into a Paste. In effect there are as many different ways of preparing this *Oil*, as there are Persons who make it their business to prepare it.

In this diversity, *Powers* gives us a Method easier and less expensive than any of the rest; which, it should seem, we cannot do better than follow.

Method of preparing Oil of sweet Almonds by Expression, without Fire.

Take a Pound and a half of peel'd sweet Almonds, new and dry; after pounding 'em in a Mortar, pass 'em thro' a coarse Sieve, lay 'em in a Hair-Cloth, and put 'em under the Press between two Plates of Copper, Steel, or the like; press 'em gently; and when all the unctuous and fluid Part is express'd, you will have a sweet *Oil* without any Sediments, which is scarce avoidable in any of the other manners.

*Palm OIL*, or *Oil of Senegal*, a thick unctuous Liqueur, of a yellow Colour, and a Violet-smell; so call'd because drawn, by Ebullition or by Expression, from the Fruit of a kind of Palm-Tree, growing in several Places of Africa, especially in *Senegal*.

The Africans use this *Oil* as we do Butter; and burn it when old. In Europe 'tis esteem'd a sovereign Remedy against cold Humours; and even said to give ease in the Gout. 'Tis sometimes counterfeited with Wax, *Oil of Olives*, *Iris*, and Turmeric; but the Trick is found out either by Air or Fire. The Air alters the Colour of the Genuine, and leaves the Counterfeit unchanged; and on the contrary, Fire changes the Counterfeit, not the Genuine.

*OIL of Camomile*, an *Oil* made with the Flowers of this Plant steep'd in *Oil of Olives*, and expos'd to the Sun in the heat of Summer: Its Colour is blueish; some add *sicc Turpentine*. It is the most esteem'd when old. 'Tis used for the cure of several kinds of Wounds; and is reputed a kind of Balm.

*OIL of Pease*, see NAPHTA.

*OIL of Amber*, see AMBER.

*OIL of Antimony*, or *Batter of Antimony*, see ANTIMONY.

*OIL of Arsenic*, or *Batter of Arsenic*, see ARSENIC.

*OIL of Spice*, or *Spike*, an *Oil* drawn from the Flowers or little Leaves of a Plant of the same Name, growing in the South Parts of France, resembling our Lavender. 'Tis of a white Colour, and an aromatic Smell; and is the only *Oil* dissolvable

dissolvable in *Sandarach*; whence the genuine *Oil* is easily distinguished from the counterfeit, which is *Oil of Turpentine* mix'd with a little *Petrol*. It is used by Painters and Farriers; and is of some use in Medicine, where it makes a part in several Galenical Compositions.

*OIL of Balm*, see *BALM*.  
*OIL of Box*, see *BEN*.  
*OIL of Cacao*, see *CACAO*.  
*OIL of Camphor*, see *CAMPHOR*.  
*OIL of Cinnamon*, see *CINNAMON*.  
*OIL of Castor*, see *CASTOREUM*.  
*OIL of Wax*, see *WAX*.  
*OIL of Clove*, see *CUMIN*.  
*OIL of Fennel*, see *FENNEL*.  
*OIL of Nutmeg*, see *NUTMEG*.  
*OIL of Guaiacum*, see *GUAIACUM*.  
*OIL of Cloves*, see *CLOVES*.  
*OIL of Lavender*, see *LAVENDER*.  
*OIL of Lentisc*, see *LENTISCUS*.  
*OIL of Lime*, see *LIME*.  
*OIL of liquid Amber*, see *BALM*.  
*OIL of Mace*, see *NUTMEG*.  
*OIL of Millpertuis*, see *MILLPERTUIS*.  
*OIL of Maribolis*, see *SCORPION*.  
*OIL of Neroli*, see *ORANGE*.  
*OIL of Nuts*, see *NUT*.  
*OIL of Orange*, see *ORANGE*.  
*OIL of black Pitch*, see *PITCH*.  
*OIL of Rosemary*, see *ROSEMARY*.  
*OIL of Sardine*, see *SARDINE*.  
*OIL of Sage*, see *SAGE*.  
*OIL of Cotton*, see *COTTON*.  
*OIL of Sulphur*, see *SULPHUR*.  
*OIL of Turpentine*, see *TURPENTINE*.  
*OIL of Thyme*, see *THYME*.  
*OIL of Torisic*, see *TORISIC*.

*Virgin OIL*, is understood of *Oils* express'd from Olives, Nuts, &c. fresh gather'd, without being heated, too much press'd, &c. See *OIL of Olives*.

*Granulated OIL* is that fix'd in little Grains; this is the best, and most esteem'd, especially of *Oils of Olives*.

*Oil* frequently takes new Names from the Drugs mix'd with it; as *Oil of Roses*, which is that mix'd with *Roses*; *Oil of Saffron*, that persum'd with *Saffron*.

*Plato* observes, that *Oil* is destructive to all Plants; and he adds too, to the Life of all Animals, except those of Man, to which it is agreeable, as also to the rest of his Body. He adds further, that 'tis very useful to the external parts of the Body, but hurtful to the internal. *Fernelius* observes that *Oil* softens, moistens, and lubricates the Body, and takes off the sense of Weariness; for which reason the *Greeks* call it *Asopon*; and renders the Body prompt and agile. *Discoeurides* says it cures Leprosy, &c.

*Oil*, among the Chymists, is the second of the Elements, or Hypostatical Principles; otherwise call'd *Sulphur*. See *ELEMENT*, *PRINCIPLE*, and *SULPHUR*.

All natural Bodies yield *Oil*, either by Distillation; Putrefaction; or Liquefaction call'd *per Deliquium*: And hence the Chymists will have it necessary Ingredient in the Composition of all Bodies. They make it the Principle of Odours; and to the Diversities thereof, ascribe all the differences of Bodies in respect of Smells. See *SMELL*.

All Plants yield a fixed *Oil* at the end of Distillation; but Aromatic ones beside this yield another *Oil*, which rises after the Phlegm, and at the beginning of the Distillation: This they call an *Essential Oil*, because it retains the natural smell of the Plant; whereas the second *Oil*, even that of Aromatic Plants, stinks intolerably. See *ESSENTIAL*.

M. *Houber*, from an Observation that Plants which yield the most Acid, yield likewise the most *Oil*; took occasion to think that the Acid might assist the *Oil* to disengage itself from the Body, and to rise in Distillation; which he found to answer in the Experiment. Mineral Acids prov'd to have more force on the *Oils* of Plants, and put 'em in a condition of rising in Distillation, and in greater Quantity by the Action of Fire, than Vegetable ones. Accordingly, whereas the Perfumers find a deal of difficulty in raising essential *Oil* of *Roses*; and scarce get an Ounce out of an hundred Pounds of the Flower: M. *Houber*, on his Principle, got at least one third more; viz. by laying the *Roses* fifteen days in Water impregnated with Spirit of Vitriol, before Distillation.

The Chymists Doctrine of Principles, Mr. *Boyle* shew'd to be very deficient in the Article *Oils*: For the Characteristic of a Sulphur, or that which denominates a thing such, is Inflammability: Now, there are at least three Substances manifestly different in Consistence, Texture, or both; which, according to that Notion, ought to be refer'd to Sulphurs: For sometimes the inflammable Substance obtain'd from a mix'd Body by means of Fire, appears in form of an *Oil* that will not mix with Water;

sometimes in form of an inflammable Spirit, which will readily unite with that Liquor; and sometim'es also in form of a consistent Body almost like common Sulphur. *Produce* of *Chym. Prin.*

*Dr. Sars in Philos. Transact.* gives us a Scheme, or Analysis of *Oils*. He distinguishes *Oils* into Vegetable, Animal, and Mineral.

The Vegetable he divides into *Essential*, and not *Essential*.

The *Essential* again, are either perfect Stillations made by the Analysis of the Chymist's Fire; where the oleaginous Particles are truly separated from all other; as those from the Seeds of Cummin, Fennel, and Dill: or light and ethereal, usually drawn from the Tops of Plants, and specifically lighter than Water, some of 'em than Spirit of Wine; as those from Thyme, Wormwood, Hyssop, Lavender, Rosemary, Penny-royal, Rue, Sage, Savin, &c. Or ponderous, which commonly sink in Water.

Those not *Essential*, are imperfect, or made by Expression; which are decomposed of several parts of the Plants; as of Almonds, Olives, Wallnuts, Lime, Rape, &c.

The Animal *Oils* are either those of the solid Parts, as Harts-horn, Human-Skull, Hoofs, &c. Or those of the Fluids, as of Human-Blood.

Lastly, the Mineral *Oils* are those of Amber, Petroleum, Barbadoes Tar, and Bees-Wax.

Of these *Oils*, there are twelve that by a Mixture of compound Spirit of Nitre, make an Ebullition, Explosion, and Flame. Eighteen that make an Ebullition and Explosion without Flame: And four that produce neither. See *EBULLITION*, *FLAME*, &c.

*Oil-Bags*, a Vessel in Birds, replete with an unctuous Substance, secreted by one, sometimes two, Glands for the purpose, disposed among the Feathers; which being press'd by the Bill or Head, emits its oily Matter, for the Dressing and Preening the Feathers. See *FEATHER* and *FRENNING*.

*ointment*, in Pharmacy and Surgery, &c. See *UNGUENT*.

*OKER*, or *OKER*, in Natural History, a yellow, dry, fat, soft, fossil Earth; found in Copper and Lead Mines, sometimes in those of Silver, and sometimes in Mines of its own. See *EARTH*.

Others seem more rightly to refer *Oker* to the Class of Semi-metals, than of Earths. It consists, according to them, of Earth and a Metal, particularly Iron, combined. See *SEMI-METAL*.

Mr. *Boyle* assures us he has seen a Piece of *Oker* richer in Metal than most Iron-Ores; and which was even render'd magneetical by heating and then cooling it in a perpendicular position. See *MAGNET* and *MAGNETISM*.

Some Authors esteem *Oker* proper to promote the melting of Metals, when they are too harsh and brittle; but its chief Use is in Painting.

'Tis only the yellow *Oker* is natural; the red is prepared from the yellow by calcining it in the Fire till it have acquir'd its redness.

The Beds are usually from one hundred fifty to two hundred foot deep; and their thickness from four to eight Inches, between a white Sand which covers them a-top, and a yellow argillous Earth underneath.

The best *Oker* is that of *Berry in France*. There are several Kinds dug up in *England*, all bordering on the red; some of them used in polishing Looking-Glasses.

The Word comes from the *Greek* *αργεα*, yellow Earth.

*Oker*, in effect, is always impregnated with Iron, and is what generally gives to the Chalybeate Springs their medicinal Virtues; many of which we see, upon standing of the Water, will deposit the *Oker* at the bottom of the Vessel.

*OLD AGE*, see *LONGEVITY*.

*OLEAGINOUS*, something that partakes of the nature of *Oil*; or out of which *Oil* may be express'd. See *OIL*.

Thus Olives, Nuts, Almonds, &c. are oleaginous Fruits, or Fruits out of which *Oil* is express'd. See *FRUIT*. Pines, Firs, &c. are oleaginous Woods, yielding Rosin, Turpentine, &c. See *ROsin*, &c.

Of all Woods, oleaginous ones burn the best. See *FUEL*. An oleaginous Urine in malignant Fevers is a sign of Death. See *URINE*.

*OLECRANUM*, in Anatomy, an Eminence behind the Bend of the Elbow; being the Part whereon the Arm bears when we rest on the Elbow. See *ARM*.

This Eminence is nothing else but the posterior Apophysis of the Head of the Ulna, which stays that Bone, and prevents its slipping back; so as to form an acute Angle when the Arm is bent. See *ULNA*.

The *Olecranon* is received into the hind Sinus of the lower end of the Humerus; and with the fore Protuberance of the Ulna, which is received into the fore Sinus of the Humerus, forms a perfect Ginglymus, whereby the two Bones move as on a Hinge.

**OLERON-Laws**, or the *Sea-Laws* of **OLERON**, are a Set of ancient Laws, relating to Maritime Affairs, made by K. Richard I. See **LAW**.

They are thus call'd, because made in the *Oleron*, an Island in the Bay of *Aquitaine*, at the Mouth of the River *Charente*.

**OLFACTORY Nerves**, in Anatomy, the first Pair of Nerves springing out of the *Medulla oblongata*; so call'd as being the immediate Instruments of Smelling. See **SMELLING**.

The Antients call'd them *Processus Papillares*; which Dr. *Drake* thinks a more suitable Name, till their arrival at the *Os cribrosum*; in regard they rather appear Productions of the *Medulla oblongata*, than distinct Nerves; against which, their manifest Cavities, and their Communication with the Ventricles, argue. See **MEDULLA oblongata**.

The *Olfactory Nerves* have their Rise just below the *Os frontis*, and are distributed in the Membranes of the Nose. See **NERVE**.

**OLIBANUM**, in Pharmacy, a kind of Gum, or Resin, usually call'd male *Frankincense*. See **INCENSE**.

It has its name *Olibanum*, quasi *oleum Libani*; because distilling in form of an Oil, from a Tree on Mount *Libanus*.

It is brought to us in large white Tears, bordering a little on the yellow; very heavy, of a sharp bitter Taste, and a briak Smell.

'Tis distinguish'd from the female, or common *Incense*, by the largeness of the Drops. 'Tis very glutinous, consequently strengthening; and partakes enough of the Turpentine to render it somewhat detergent; 'tis more used in compound strengthening Plasters, than in inward Compositions.

**OLIGARCHY**, a Form of Government, wherein the Administration is in a few Persons; such are the States of *Venice* and *Genna*.

The *Oligarchy* amounts to the same thing with an *Aristocracy*. See **ARISTOCRACY**.

The Word is form'd from the Greek *ολιγος*, few; and *αρχη*, Command, Government.

**OLIO**, or **OLLIO**, a savoury Dish, or Food, composed of a great variety of Ingredients.

The Forms of *Olios* are various; to give a Notion of the strange Asssemblage, we shall here add one from so approved Author.

Take Ramp of Beef, Neat's Tongues boil'd and dry'd, and *Salsola* Sausages; boil 'em together, and after boiling two Hours, add Mutton, Pork, Venison, and Bacon, cut in bits; as also Turnips, Carrots, Onions, and Cabbage, Borage, Endive, Marigolds, Sorrel, and Spinage; then Spices, as Saffron, Cloves, Mace, Nutmeg, &c. This done, in another Pot put a Turkey or Geese, with Capons, Pheasants, Widgeons, and Ducks, Partridges, Teals, and Stock doves, Snipes, Quails, and Larks, and boil them in Water and Salt. In a third Vessel, prepare a Sauce of white Wine, strong Broth, Butter, Bottoms of Artichokes and Chestnuts, with Colliflowers, Bread, Marrow, Yolks of Eggs, Mace and Saffron. Lastly, dish the *Olio*, by first laying out the Beef and Veal, then the Venison, Mutton, Tongues, and Sausages, and Roots over all; then the largest Fowls, then the smallest, and lastly pour on the Sauce.

**OLITORY**, a Kitchen-Garden, or a Garden of Herbs, Roots, &c. for Food. See **GARDEN**.

**OLIVARIA Corpora**, in Anatomy, are two Protuberances in the under part of the Brain, placed on each side the *Corpora Pyramidalia*, towards the lower end; having their Name from their Figure, which resembles that of an Olive. See **BRAIN**.

**OLIVE**, a Stone-Fruit, which yields plenty of Oil; the Produce of the Olive-Tree. See **OIL**.

There are three Kinds of *Olivæ*, frequently sold; different in Size and Goodness; viz. those of *Perona*, which are the best; those of *Spain*; and those of *Provence*.

The *Olivæ*, while on the Tree, are intolerably bitter, without any thing of that delicious Taste which procures them admittance at the richest Tables. To fit 'em for that, they must be prepared as follows.

*Manner of Preparing, or Pickling OLIVES.*

In the Month of *June* and *July*, long e'er the *Olivæ* are fit to yield their Oil, they are gather'd, and laid to steep some days in fresh Water; when taken out, they are put in another Water prepared with *Barilla*, or *Kali*, with *Ashes* of Olive Stones calcin'd; or at least with *Lime*.

They are next laid in a Liquor of Water and Salt, with which they are put in those little Barrels, wherein they are brought to us. To give 'em the Flavour, they throw over 'em an Essence usually composed of Cloves, Cinnamon, Coriander, and Fennel. This Essence is a kind of

Secret among those who deal herein; and, in effect, 'tis in this that all the difficulty of the Preparation lies.

*Manner of Drawing Oil of OLIVES.*

The *Olivæ* being gather'd, are laid for some time on the Ground to drain, and to ripen further; they are then ground into a Paste with a Mill-stone: The Paste is put in large Frails, and boiling Water pour'd over them. Lastly, the whole is press'd; by means whereof the Oil is easily separated, and swims a-top of the Water.

**OLIVE-Colour**, is a yellow, mingled with black. The Term is chiefly used in speaking of the Tinct of the Complexion. The *Spaniards* and *Indians* are rarely white; generally *Olive-complexion'd*.

**OESTRUM Veneris**, Extasy of Desire, or Love; a Term sometimes given the *Clitoris*, from the lascivious Titillation it is capable of. See *Clitoris*.

**OLYMPIAD**, in Chronology, a Space, or Period of four Years; whereby the *Greeks* reckon'd their Time. See **EPOCHA**.

This Method of Computation had its Rise from the *Olympic Games*, which were celebrated every fourth Year, near the City *Pisa*, or *Olympia*, in *Peloponnesus*. See **OLYMPIC**.

The first *Olympiad* commenced, according to some, in the Year 5928 of the *Juban* Period; the Year from the Creation 3208; the Year before Christ 776; and 25 Years before the Foundation of *Rome*: Or rather, as others will have it, in the Year of the World, 3511; the Year of the *Julian* Period, 3941; and 25 Years before the Building of *Rome*.

The *Peloponnesian* War begun on the first Year of the 87th *Olympiad*. *Alexander the Great* died the first Year of the 114th; and *Jesus Christ* was born the first Year of the 197th *Olympiad*.

The *Olympiads* were also call'd *Annæ Iphæi*, from *Iphæus*, who instituted, or at least renew'd the Solemnity of the *Olympic Games*.

We don't find any Computation by *Olympiads* after the 364th, which ended with the Year of Christ 440.

In a Charter of our K. *Erabelbert*, the Years of his Reign are reckoned by *Olympiads*.

**OLYMPICS**, or **OLYMPIC Games**, were solemn Games, famous among the ancient *Greeks*; instituted, according to some, by *Hercules* in honour of *Jupiter*; and held every 4th Year, or every 49th Month, on the Banks of the *Alpheus*, near *Olympia* a City of *Elis*; to exercise their Youth in five Kinds of Combats. See **GAMES**.

These Games became so considerable, that the *Greeks* made 'em their Epochs; distinguishing their Years by the Returns of the *Olympiads*. See **OLYMPIAD**.

Those who were Conquerors in them, were so honour'd by their Country-men, that at their Return, a piece of the Wall of the City was pull'd down to give passage to their Chariot. The Prize contended for, was a Crown of Laurel. See **OLYMPIONICS**.

**OLYMPIC Fire**, is sometimes used for the Fire arising from the Sun's Rays collected in the Focus of a Burning-Glass. See **FIRE** and **BURNING-Glass**.

*Gli OLYMPICI*, the Title of the Academists of *Vicenza*, in *Italy*. See **ACADEMY**.

**OLYMPIONIC**, *Olympionics*, in Antiquity, an Appellation given to those who came off Victorious in the *Olympic Games*. See **OLYMPIC**.

The *Olympionics* were infinitely honour'd in their Country, as being esteem'd to have done it immortal Honour. The *Athenians* particularly, were so lavish in their Presents to the *Olympionics* their Country-men, that *Solon* found it necessary to restrain their Liberality by a special Law, which import'd that the City should give 500 Drachmas to the *Olympionics*; which amounted to about 58 Ounces of Silver, or Weight. No very considerable Sum.

**OMBRE**, a celebrated Court-Game at Cards; play'd by two, by three, or by five Persons; but generally by three.

In *Ombre* by three, nine Cards are dealt to each Party; the whole *Ombre* Pack being only 401 by reason the Eights, Nines, and Tens are thrown aside: He that wins, must take five Tricks, or four when the other five are divided, so as one have two, and the other three.

The Game of *Ombre* is borrow'd from the *Spaniards*; and requires all the Pilegen and Gravity of that People in the playing. The Name signifies as much as the Game of *Man*; *Ombre*, or *Humble*, in *Spanish*, signifying Man, in allusion to the Thought, and Attention requir'd herein. We shall here give an Idea of the Oeconomy thereof.

In *Ombre* by three; after the Cards are dealt, if none of the Parties think their hand strong enough to attempt for the Stake or Game, they all pass; and, after something put down to the former Stake, deal over again. If any will

will attempt for it, he henceforth is call'd the *Ombre*; and the other two become leagu'd together, like two Partners at Whisk, to defend it against him. Note, each has the refusal of being *Ombre*, according to his Order of Seniority.

There are two ways of his undertaking for the Game: In the first, which is the most usual, after chusing what he will have Trumps, he *discards*, or lays aside what number of his Cards he pleases, and in their lieu takes an equal Number from the remainder of the Pack; the like do the other two. The other way is, when he dare trust to his own Hand, and therefore declines to discard, or change any Cards, but leaves that to the others; which is call'd playing *sans prendre*: If he gains the Point in this latter Case, he reaps somewhat extraordinary, more than in the first.

If he fail, he is said to be *leas't*; and the Failure is call'd a *Remise*, or *Rejette*; and if one of the Defenders of the Stake win more Tricks than he, he is said to win *Cadille*, and takes up the Stake the *Ombre* play'd for: And in both cases, the *Ombre* is to forfeit the Value of the Stake play'd for to the Board.

If the *Ombre* win all the nine Tricks; it is call'd winning the *Foie*, and he reaps doubly; and if he attempt it, and miscarry, he suffers proportionably. The Overights, and Irregularities committed in the course of the Game, are call'd *Escapes*, and subject the Persons chargeable therewith to Forfeitures.

Lastly, as to the Order and Value of the Cards at *Ombre*, it is to be observ'd, that the Ace of Spades, call'd *Spadille*, is always the first or highest Trump, in whatever Suit the Trump be; the Duce of Trumps, when Trumps is of either of the black Colours; or the Seven, if of the black, is the second Trump, and call'd *Momille*; the Ace of Clubs, call'd *Baïste*, the third; and if either of the red Suits be Trump, the Ace of that Suit, call'd *Punto*, the fourth. The rest in the black Suits are valued according to the following Order, *viz.* King, Queen, Knave, Seven, Six, Five, Four, and Three. In the red Suits they follow thus; King, Queen, Knave, Duce, Three, Four, Five, and Six.

The three first, or principal Trumps, are call'd *Manadres*; which have this Privilege, that they are not obliged to attend an inferior Trump when it leads; but for want of another small Trump, the Person may renounce Trumps, and play any other Card. Add, that if the three *Manadres* be in the hands of the *Ombre*, in case he be beaten, he is to forfeit for 'em; or, if he gain his Point, he is to have a confideration for 'em; but for nothing less than three. And it must be further noted, that the Trumps immediately succeeding these, *viz.* Punto, King, Queen, &c. if they be found in the same hand with the former, are also reputed as *Manadres*, and to be allowed, or forfeited for like the rest: And this as low as the Sequence reaches without interruption.

There are some Varieties in the manner of playing the Game of *Ombre*: Sometimes he who has *Spadille*, is oblig'd to play, let his Game be ever so bad; which is call'd *Force Spadille*. Sometimes, when all have play'd, a Person undertakes the Game on condition of discarding, and making up his hand e'er he names Trump; which is call'd *Gasparille*.

In *Ombre* by five, which some even prefer to that by three, as not requiring so much Attention; only eight Cards a-piece are dealt; and five Tricks must be won, otherwise the *Ombre* is beaten.

Here the Person who undertakes the Game, after naming the Trump, calls a King to his Assistance; upon which, the Person in whose hand the King is, without discovering himself, is to assist him as a Partner, and to share his Fate. If between both, they can make five Tricks, the *Ombre* wins; and then the auxiliary King shares the Spoil; and *vice versa*.

If the *Ombre* venture the Game without calling in any King; this too is call'd playing *sans prendre*; in which case the other four are all against him, and he must win five Tricks alone, or be beaten. The rest is much the same as by three; *mutatis mutandis*.

*OMBRE de Soleil*, in Heraldry, *Shadows of the Sun*, is when the Sun is borne in Armour, so, as that the Eyes, Nose, and Mouth, which at other times are represented, do not appear.

*OMELET*, a Fricasseer, or Preparation of Eggs, with other Ingredients in a Pan; very usual in Spain.

*Ménage* derives the Word from the Italian *Ammella*, little Soul; which, he says, that People use for the nice Bits among the Entrails of Fowls, &c. used for Fricassees, as Livers, Hearts, Kidneys, Gizzards, &c. From whence, by resemblance, is form'd *Amelette*, a Fricassee of Eggs: The *Tripod* derives the Word from *zua*, together, and *lone*, to dilute, moisten, mix; and *M. de la Meste le Foyer* from the French *Ouf*, Egg, and *melce*, mingled.

The Forms of *Omelets* are various: A noted Author in this way, prefers the following one. The Eggs being

beaten, are to be season'd with Salt and Pepper, and then fried in Butter made boiling hot: This done, Gravy to be poured on, and the whole strew'd with Chives and Parsley shred small. When one side is fried enough, it is to be turn'd on the other.

There are also *Omelets* with Sugar; *Forced Omelets*; *Omelets* the *Turkish* way, &c.

*OMEN*, a Sign, or Indication of something Future, taken from the Mouth of a Person speaking.

*Festus* derives the Word *Omen* from *Omenes*, *quod sit ver.* See *AVOURY*.

*OMEN Prærogativum*, among the *Romans*, was the Vote of the first Tribe or Century, in their *Comitia*.

When a Law, &c. was proposed, or an Election to be made, an Urn was brought in to the Priests there present, into which were cast the Names of the Tribes, or Centuries, or *Curia*; as the *Comitia* were either *Tributa*, or *Centuriata*, or *Curiata*. And the Lots being drawn, that Tribe, Century, &c. whose Name came up first, was call'd *Tribus*, or *Centuria Prærogativa*, because their Voices were ask'd first. And so much did the *Romans* depend on this Prærogative Century, that the rest generally follow'd them. Hence a Person who had the Voices of the Prærogative, was said to have the *Prærogative Omnia*.

*OMENTUM*, in Anatomy, the *Coel*, *Epiploon*, *Rete*, or *Retinulum*, a fat, thin Membrane spread over the Intestines, and following them in all their Sinuosities. See *INTESTINES*.

It reaches from the bottom of the Stomach (to which it is connected) to the Navel, at which it ordinarily terminates; tho' in some Subjects it goes further, so as upon a Rupture of the *Peritonæum*, to fall into the *Scrotum*. Besides the Stomach, it is fasten'd to the concave Part of the Liver, the back-side of the *Duodenum*, part of the *Colon*, the Spleen, and the Spleen; its other Extremity to the small Guts.

Its Form resembles that of a Pouch, or Sachel, which may be inflated with a Blow-pipe to the Capacity of a Gallon.

Its Substance is membranous, consisting of two Leaves, or Coats, between which, and on the Surfaces of which, are innumerable Veins, Arteries, Nerves, and *Vasa Adiposa*, or Fat Vessels, variously interwove, and by their Intersections dividing the Part into a Multitude of little *Arcules*, resembling the Meshes of a fine Net; whence its Name, *Rete*.

The Fat, in its proper Ducts, running along with the other Vessels, renders these *Arcules* very obscure; while the intermediate Spaces are fill'd with a transparent Membrane, full of small Holes; so that the whole appears a beautiful kind of Net. Its Arteries come from the *Cœliac* and *Mesenteric*, and its Veins run to the *Porta*, and are call'd *Epiploon*; its Nerves from the Intercostals.

The Fat, here, as in the *Membrana Adiposa*, is either brought by the Ducts into the *Adipose* Cells, or deliver'd from the Cells into the Ducts; for the Fineness of the Vessels, &c. renders their Course exceeding difficult to trace: 'Tis even doubted whether or no they be hollow. *Malpighi*, and many others, incline to the former Opinion; and take the *Omentum* to be nothing else but a large Pouch, full of innumerable little ones, fill'd with Fat; they add, that the *Ductus Adiposi* are real Vessels arising out of the *Omentum*, and spreading themselves, by means of the *Membrana Adiposa*, throughout the whole Body; distributing Fat to every Part, in the same manner as the Arteries distribute Blood. See *FAT* and *DUCTUS Adiposi*.

The particular Use of the *Omentum* is to promote the Peristaltic Motion of the Guts, by lubricating them with its oily Substance, which transmits thro' its Pores; and by following them in their Doublings and Windings, to serve as a Bellet to slide upon; and by filling up their Hollows, preventing their being too much distended with Flatulencies, yet giving way to them when replene with Aliment.

The *Omentum* is single in all Animals, excepting Monkeys, in which it is triple or quadruple.

*OMOPHORUM*, a little Cloak, antiently worn by the Bishops, over their Shoulders; thereby to represent the good Shepherd who brings home the stray'd Sheep on his Shoulders.

For this reason it was put off at the opening of the Gospels, because then the true Shepherd Jesus Christ, was supposed present in Person.

Some confound the *Omophorium* with the *Pallium* wore by the Patriarchs; but there was this difference, that the *Pallium* was a long Cloak, of Purple, and was peculiarly reserved for Patriarchs; tho' since given to some Bishops by way of distinction. See *PALLIUM*.

The Word is pure Greek, form'd from *ὤμος*, Shoulder, and *φορος*, I carry.

*OMOPLATE*, in Anatomy, is used in the general for the Shoulder; but, particularly for two Bones situate on the hind part of the upper Ribs, one on each side.

These Bones are broad, and especially in the middle; thick in their *Apophyses*; of a triangular Form, concave within, and convex without; and are join'd to the Clavicles and Arms.

The Word comes from the Greek *ομοσπονδία*, Shoulder, and *ομοσπονδία*, broad.

OMPANORATE, the Title bore by the Priests of the Island of *Madagascar*.

These are the School-Masters of the Country, and teach Arabic and Writing. They have several Books, but none of them contain more than some Chapter of the *Almanac*, and a few physical Recipes.

They are divided into several Orders, bearing some Resemblance to our Ecclesiastical Dignities: As *Ombiafse*, Secretary, or Physician; *Tison*, Subdeacon; *Moudadzi*, Deacon; *Faqide*, Priest; *Caribon*, Bishop; *Lamlamaba*, Archbishop; *Ompisiquidi*, Prophets or Diviners; *Sabaha Calif*, or Chief of the Religion.

The *Ompanorates* deal much in Talismans, and other Charms, which they call *Hitiade*, and which they sell to the Grandees of the Place. They also make little Statues or Images, call'd *Aols*, which they consult as Oracles; and to which they ascribe various Powers; as the making rich, destroying Enemies, &c. They have public Schools, where they teach their Superstitions and Sorceries. The *Ompisiquidi* practise Noomancy, and are mostly consulted on Diseases, and the Success of Affairs; resolving all Questions by Figures drawn on a little Table, cover'd with Sand.

OMPACIN, in Pharmacy, a kind of Oil, pretended to be drawn from Olives while yet green, and sour; but *Powet* charges it as an Imposture; adding, that Olives yield no Oil at all till perfectly ripe. See OIL and OLIVE.

The Word is derived from the Greek *ομας*, unripe Grape.

OMPHALOCELE, in Medicine, a kind of *Hernia*, or Tumor, in the Navel; arising like other *Hernia's* from a Relaxation or Rupture of the *Peritonæum*. See HERNIA.

Its remoter Causes are violent Strains, loud Cries, abundance of ferous Humour, difficult Delivery, &c.

The Word is form'd from the Greek *ομφαλον*, Navel, and *κίλη*, Tumor. 'Tis otherwise call'd *Exomphalus*. See EXOMPHALUS.

OMPHALO-Mesenteric, in Anatomy. All *Fetor's* are wrap'd in at least two Coats, or Membranes; most of them have a third, call'd *Allantois*, or Urinary. Some, as the Dog, Cat, Hare, &c. have a fourth, which has two Blood-Vessels, viz. a Vein and an Artery, call'd *Omphalo-Mesenteric*, because passing along the String to the Navel, and terminating in the *Mesentery*. See FORTUS, SECUNDINE, &c.

OMPHALOPTIC, in Optics, a Glass that is convex on both sides, popularly call'd a Convex-Lens. See CONVEX-LENS.

ONANIA, and ONANISMS, Terms some late Emperics have framed to denote the Crime of Self-pollution; mentioned in Scripture to have been practis'd by *Onan*, and punished in him with Death. 'Tis the same with what in other places of Scripture, particularly *Levit. ch. xx.* is call'd *giving of Seed to Moloch*; for which the Punishment allotted is stoning to Death. See POLLUTION.

ONDEE, in Heraldry, see WAVY.

ONERANDO *pro rata Portionis*, a Writ which lies for a Joint-Tenant, or Tenant in Common, when distress'd for more Rent than the Proportion of his Land comes to.

ONGLEE, is used by the *French* Heralds to denote the Talons or Claws of Beasts or Birds, when of Colours different from the Body.

ONIROCRATIA, in Divination, the Art of Expounding Dreams. See DREAM, DIVINATION, &c.

It appears from several Passages of Scripture, that there was, under the Jewish Dispensation, such a thing as foretelling future Events by Dreams; but then there was a particular Gift, or Revelation required for that purpose.

It should seem hence, that Dreams are really significative, and do forbode something to come; and all that is wanting among us in the *Onirocratia*, the Art of knowing what; yet 'tis the Opinion of many, that Dreams are mere Chimeras; bearing, indeed, some Relation to what has pass'd, but none to what is to come. As to the Case of *Joseph*, 'twas possible for God, who knew all things, to discover to him what was in the Womb of Fate; and to introduce that, he might take the occasion of a Dream: Not but that he might as well have foretold it from any other Accident or Circumstance whatever. Unless God, to give the Matter more weight, should purposely communicate such a Dream to *Pharaoh*, in order to fall in with the popular Notions of Dreams and Divination, which then prevail'd among the *Egyptians*.

The word *Onirocratia* is form'd from the Greek *ονειρος*, Dream, and *κρατος*, I possess.

ONIROCRITIC, a Title given to Interpreters of Dreams, or those who judge of Events from the Circumstances of Dreams.

The Word is form'd from the Greek *ονειρος*, Dream, and *κριτος*, Judgment.

There is no great regard to be had to those Greek Books call'd *Onirocriticis*; nor do we know why the Patriarch of *Constantinople* and others should amuse themselves with writing on so pitiful a Subject.

*Rigault* has given us a Collection of the Greek and Latin Works of this kind; one attributed to *Astrampolus*, another to *Nicophorus* Patriarch of *Constantinople*; to which are added the Treatises of *Artemidorus*, and *Achver*. But the Books themselves are little else but Reveries; a kind of waking Dreams, to explain and account for sleeping ones.

The Secret of *Onirocriticis*, according to them all, consists in the Relation supposed to be between the Dream, and the Thing signify'd; but they are far from keeping to the Relations of Agreement and Similitude; and frequently have recourse to others of Dissimilitude, and Contrariety.

ONIX, or ONYX, in Natural History, a precious Stone, accounted a Species of Opake Agat. See PRECIOUS Stone, AGAT, &c.

Its Colours are usually white and black, which appear as distinct as if laid on by Art. There are some brought from *Arabia*, mix'd with a greyish Hue; which, after taking off one Lay or Zone, shew another underneath, of a different Colour. Whence it takes the Name *Morpheus* or *Camebuis*, q. d. another Stone. White Zones or Girdles are essential to an *Onix*.

The Word *Onix*, in the Greek Language, signifies Nail; the Poets making this Stone to have been form'd by the *Paros*, from a Piece of *Venus's* Nails, cut off by *Cupid* with one of his Arrows.

*Disparides* and *Galen* rank Alabaster among the number of *Onix's*; tho' this is very remote from the Sentiment of the Moderns. See ALABASTER.

ONKOTOMY, in Chirurgery, the Operation of opening a Tumor, or Abscess; from the Greek *ονκος*, Tumor, and *τομη*, cut. See TUMOR, &c.

ONOMANCY, or NOMANCY, the Art of divining the good or evil Fortune to befall a Man, from the Letters of which is his Name. See NAME.

*Oronastius* was a very popular and reputable Practise among the Ancients: The *Pythagoreans* taught, that the Minds, Actions and Successes of Men, were according to their Fate, Genius, and Name; and *Plato* himself seems somewhat inclinable to the same Opinion. *Aulonius* expresses it to *Prætor*, thus:

*Qualem creaverit Moribus,  
Jussit vocari Nominem,  
Mundi supremus Aristor.*

Thus he plays with tipping *Meres*, as tho' her Name told she would drink mere Wine, without Water, or, as he calls it, *Merum Merum*. Thus *Hippolitus* was observed to be torn in pieces by his Coach-Horses, as his Name import'd; and thus *Aquasimon* signify'd he should linger long before *Troy*. *Prætor*, that he should be redeem'd out of Bondage in his Childhood. Hitherto may be also referred that of *Claudius Rutilius*:

*Nominibus certis creantur decurrere Mares?  
Moribus aut potius Nominis certa dari?*

'Tis a frequent Observation in History, that the greatest Empires and States have been founded and destroy'd by Men of the same Name. Thus *Cyrus*, the Son of *Cambyses*, began the *Persian* Monarchy; and *Cyrus*, the Son of *Darius*, ruin'd it. *Darius*, Son of *Hystaspes*, restor'd it; and again, *Darius*, Son of *Acemans*, utterly overthrow'd it. *Philip*, Son of *Aminar*, exceedingly enlarged the Kingdom of *Macedonia*; and *Philip*, Son of *Antigonus*, wholly lost it. *Augustus* was the first Emperor of *Rome*, *Augustus* the last. *Constantine* first settled the Empire of *Constantinople*; and *Constantine* lost it wholly to the *Turks*.

'Tis an Observation of the like kind, that some Names are constantly unfortunate to Princes: As *Caius* among the *Romans*; *John* in *France*, *England*, and *Scotland*; and *Henry* in *France*.

One of the great Rules of *Onomancy* among the *Pythagoreans*, was, That an even Number of Vowels in a Name signify'd an Imperfection in the left Side of the Man; and an odd Number, in the right. Another Rule was, that those Persons were the most happy, in whose Names the Numerical Letters, added together, made the greatest Sum; for which reason, say they, it was that *Abdies* vanquish'd *Hector*; the Numerical Letters in the former Name amounting, forsooth, to a greater Number than in the latter.

And it was doubtless from a Principle much of the same kind, that the young *Romans* toss'd their Mistress at their

their Meetings, as often as there were Letters in their Names. Thus *Martial*,

*Necia sex Cyathis, septem Infusa bilator.*

*Rhedoginus* describes a singular kind of *Onomantia*: Thus *Theodorus*, King of the *Goths*, being curious to know the Success of his Wars against the *Romans*, an *Onomantical* Jew order'd him to shut up a Number of Swine in little Styes, and to give some of them *Roman*, to others, *Gothic* Names, with different Marks to distinguish them; and there to keep them to a certain Day: which being come, upon inspecting the Styes, they found those dead, to whom the *Gothic*, and those alive, to whom the *Roman* Names were given: Upon which the Jew foretold the Defeat of the *Goths*.

The Word *Onomantia* is form'd from the Greek *ὄνομα*, Name, and *μαντία*, Divination. Indeed there is something singular in the Etymology: for, in strictness, *Onomancy* should signify Divination by *Affixes*; from *ὄνομα*, *ἄνιστος*, and *μαντία*. And to signify Divination by Names, it should be *Onomatomania*.

**ONOMATOPEA**, in Grammar, &c. a Figure of Speech, whereby Names and Words are form'd to the Resemblance of the Din or Sound made by the Thing signify'd; as *Troops-Track*, from the Noise the Ladies make at this Game: And from the same Source arises the *Buzzing* of Bees, the *Grating* of Hogs, the *Cackling* of Hens, the *Singing* of People asleep, the *Clashing* of Arms, &c.

The rarest Etymologies are those deduced by the *Onomatopoeia*. See **ETYMOLOGY**.

The Word is form'd from the Greek *ὄνομα*, Name, and *ποιέω*, *ῖναι*, I make, feign.

**ONONYCHITES**, something that has the Hoof, that is, the Feet of an *Ass*: A Name the Heathens, in the first Century, gave the God of the Christians, because they owned and adored the same God with the *Jews*. Now 'twas a Notion, (howsoever it had its Rise) as appears from *Car. Tacitus*, *Hist. lib. 5. c. 16*. That the *Israelites*, much afflicted with Thirst, were led to a Spring by an *Ass* going to drink; and that in gratitude for the Benefit, they worshipp'd an *Ass*; and that the Christians did so likewise. See *Tertull. Apol.*

The Word is form'd from the Greek *ὄνομα*, *ἄς*, and *ὄνυξ*, Hoof.

**ONTOLOGY**, or **ONTOLOGY**, the Doctrine, or Knowledge of *Essence*, of *Being*, in the General, or Abstract. See **ESS.**

*Ontology* coincides with what in the Schools we more usually call *Metaphysics*. See **METAPHYSICS**.

**ONYMANCY**, or as some have it, **ONYMANCY**, a kind of Divination by means of the Nails of the Fingers. See **NAIL**.

The ancient Practice was to rub the Nails of a Youth with Oil and Soor, or Wax; and to hold up the Nails thus rubbed against the Sun. Upon them were supposed to appear Figures or Characters, which shew'd the Thing requir'd.

Hence, our modern Chiromancers call that Branch of their Art, which relates to the Inspection of Nails, *Onychomancy*.

The Word is form'd from the Greek *ὄνυξ*, Nail, and *μαντία*, Divination.

**OPACITY**, in Philosophy, a Quality of some Bodies, which renders them *opaque*, i. e. impenetrable to the Rays of Light. See **LIGHT**.

The Term *Opacity* is used in opposition to *Transparency*. See **TRANSPARENCY**.

*Opacity*, according to the *Cartesians*, consists in this, that the Pores of the Body are not all situate, or directly before each other; or rather, not pervious every way.

But this Doctrine is deficient; for tho' it must be allow'd that to have a Body transparent, its Pores must be straight, or rather, open every way: Yet how it should happen, that not only Glass and Diamonds, but even Water, whose Parts are so very moveable, should have all their Pores open and pervious every way; and at the same time, the finest Paper, or the thinnest Gold Plate, should exclude the Light for want of such Pores, is inconceivable. So that another Cause of *Opacity* must be found.

Now, all Bodies have vastly more Pores or Vacuities, than are necessary for an infinite Number of Rays to find a free Passage thro' them in right Lines, without striking on any of the Parts themselves. For since Water is nineteen times lighter, i. e. rarer, than Gold; and yet Gold itself is so very rare, that Magnetic Effluvia pass freely thro' it without any opposition; and Quicksilver is readily receiv'd within its Pore, and even Water itself by Compression, it must have much more Pores than solid Parts: Consequently, Water must have at least forty times as much Vacuity as Solidity. See **PORE**.

The Cause therefore why some Bodies are *opaque*, does not consist in the want of rectilinear Pores, pervious every way; but, either in the unequal Density of the Parts; or in the Magnitude of the Pores, and being either empty, or fill'd with a different Matter; or by means whereof the Rays of Light, in their Passage, are arrested by innumerable Refractions and Reflexions; till, falling at length on some solid Part, they become quite extinct, and are utterly absorb'd. See **RAY** and **REFRACTION**.

Hence Cork, Paper, Wood, &c. are *opaque*; while Glass, Diamonds, &c. are pellucid. For in the Confiner, or joining of Parts alike in Density, such as those of Glass, Water, Diamonds, &c. among themselves; there arises no Refraction or Reflection; by reason of the equal Attraction every way. So that such of the Rays of Light as enter the first Surface, pass straight thro' the Body; excepting such as are loit and absorb'd, by striking on solid Parts. But in the bordering of Parts unequal in Density; such as those of Wood and Paper, both with regard to themselves, and with regard to the Air or empty Space in their larger Pores, the Attraction being unequal, the Reflections and Refractions will be very great; thus the Rays will be unable to pass thro' such Bodies, being continually banded about, till they become extinct. See **ATTRACTION**, &c.

That this Interruption, or Discontinuity of Parts, is the chief Cause of *Opacity*, Sir *Isaac Newton* argues to appear hence, that all *opaque* Bodies immediately begin to be transparent, when their Pores become fill'd with a Substance of equal, or almost equal Density with their Parts: Thus Paper dipt in Water or Oil, the Stone call'd *Oculus Mundi* steep'd in Water, Linen Cloth dipt in Oil or Vinegar, and other Substances soak'd in such Fluids as will intimately pervade their little Pores, become more transparent than before. On the contrary, the most transparent Substances, by emptying their Pores, or separating their Parts, may be render'd very *opaque*: Thus Salts, or wet Paper, or *Oculus Mundi*, by drying; Horn, by scraping; Glass, by pulverizing or flawing; and Water itself, by being beat into Bubbles or Froth, are render'd *opaque*.

Indeed, to render Bodies *opaque* and colour'd, their Interstices must not be less than of some determinate Size: For the most *opaque* Bodies that are, if their Parts be very minutely divided, as when Metals are divided in Acid Menstruums, become perfectly transparent. See **COLOUR**, **TRANSPARENCY**, &c.

**OPAL**, a precious Stone, of various Colours. See **PRECIOUS STONE**.

In it are seen the Red of the Ruby, the Purple of the Amethyst, the Green of the Emerald; besides Yellow, and sometimes Black and White.

When the Stone is broke, most of these Colours disappear; which shews that they arise by Reflection from one or two principal ones.

Its Form is always either round or oval; its prevailing Colour white. Its Diversity of Colours makes it almost of equal Value with a Saphir or Ruby.

*Tacennier* says, perhaps somewhat too positively, that there are Mines of *Opal* in *Turkey*. Other Authors, ancient and modern, say, *Cyprus*, *Arabia*, *Egypt*, *Babecia*, and *Hungary*, produce it; whence it is distinguish'd into two kinds, *Oriental* and *Occidental*. 'Tis too soft to bear polishing with Pewter or Lead; so that they are obliged to polish it with *Tripoli*.

*Pliny* among the Ancients, and *Panta* and *Albertus Magnus* among the Moderns, are very copious on the Virtues of the *Opal*; forsooth, because it has the Colours of all the other precious Stones, it must have all their Virtues too. The Ancients call'd it *Paideros*, from its promoting Love and Good-Will. *Pliny* and *Solinus* mention a Species of *Opal*, call'd *Excentalaba*, which had fixty Colours.

*Artificial Opal*. In the *Philosoph. Transact.* Mr. *Colepreffe* gives us an account of the manner of counterfeiting *Opal*, as practis'd at *Harlem*. He says, the Counterfeit is very lively, and thinks it only perform'd by the Degrees of Heat, which produce the Colours. When the Composition is melted, they take out some on the Point of an Iron Rod, which being cool'd either in the Air or Water, is colourless and pellucid; but being put into the Mouth of the Furnace on the same Rod, and there turn'd by the Hand for a little space, hath its little Bodies so variously pos'd in various Parts of the same Piece, that the Light falling on them, being variously modify'd thereby, represents the several Colours seen in the natural *Opal*. He adds, the Colours may be destroy'd and restored, according to the various Motions of its Particles by Heat.

**OPALIA**, or **OPICONSIVA**, Feasts celebrated at *Rome*, in honour of the Goddess *Opis*. *Varro* says, they were held three days after the Expiration of the *Saturnalia*.

According to *Macrobius*, they were held the nineteenth of *December*, which was one of the Days of the *Saturnalia*. He adds,

adds, that these two Feasts were celebrated in the same Month, because *Saturn* and *Ops* were Husband and Wife; and that it was to them we owe the Invention of Corn and Fruits: for which reason, the Feast was not held till the Harvest and Fruit-time were entirely over.

Lastly, he observes, that the Vows offer'd to the Goddeſs, were made sitting on the Ground; to shew that she was Earth, the Mother of all things.

OPENING a *Vein*, see BLEEDING.

OPENING *Flank*, in Fortification, is that part of the Flank which is cover'd by the Orillon. See FLANK.

OPENING of *Trenches*, is the first Breaking of Ground by the Besiegers, in order to carry on their Approaches towards a Place. See TRENCH.

OPENING of *Gates*, in Astrology, is, when one Planet separates from another, and precisely applies to a third bearing Rule in a Sign opposite to that ruled by the Planet with which it was join'd.

OPERA, a Dramatic Composition set to Music, and sung on the Stage; accompanied with musical Instruments; and enrich'd with magnificent Dressings, Machines, and other Decorations.

*Pyrote fays*, that 'tis essential to the Opera to keep the Mind, the Eyes, and Ears in an Enchantment: *S. Ercowend* calls the Opera a chimerical Assemblage of Poetry and Music; where the Poet and Musician each cramp the other.

The Opera we derive from the *Venetians*, among whom 'tis held one of the principal Glories of their Carnival. See COMEDY.

While the *English* and *French* Comic and Tragic Theatres were forming, the *Venetians* invented the Opera: The *Abbot Perrin*, Introducer of Embassadors to *Gaston Duke of Orleans*, was the first who form'd the Design of introducing 'em into *Paris*; and he obtain'd the King's Privilege for the same in 1669. And it was not long e'er it pass'd thence into *England*. The Spectator observes, that the *French* Music agrees with their Accent and Pronunciation, much better than the *English*; and are at the same time better calculated for the gay Humour of that People. See RECITATIVE.

At *Rome* they have a kind of *Spiritual Opera's*, frequent in *Lent*; consisting of Dialogues, Duos, Trios, *Ricornella's*, Chorus's, &c. The Subject whereof is taken out of the Scripture, the Life of some Saint, or the like. The *Italians* call 'em *Oratorios*: The Words are frequently *Latin*; and sometimes *Italian*.

OPERATION, in general, the Act of exerting, or exercising some Power, or Faculty, upon which an Effect follows. See POWER.

The noblest Operation of Man, is that by the Schoolmen call'd *Vital*, or *Immanent*, viz. the Operation of the Mind; which, with regard to the Understanding, is threefold: Apprehension or Perception, Discretion or Judgment, and Reasoning or Discourse. See APPREHENSION, JUDGMENT, and DISCOURSE. The directing of these makes the Object of Logic. See LOGIC.

With regard to the Will, the immanent Operations are *Willing* and *Nilling*; to which are refer'd *Loving* and *Hating*. See WILL.

OPERATION, in Medicine, a methodical Action of the Hand, on the human Body; to re-establish Health. See CHIRURGERY.

Bleeding is a very common, but at the same time a dangerous Operation. See PHLEBOTOMY and BLEEDING.

Trepanning is one of the finest Operations in Chirurgery. See TREPANNING. The *Cesarian Operation* is the cutting a Woman with Child, and drawing out the Child through one side. See CESARIAN.

The other Chirurgical Operations, are *Sutures*, *Topping*, *Castrating*, *Cutting* for the *Pitula*, *Amputation*, *Extirpation*, *Copping*, &c. See each in its Place in this Work.

OPERATION is particularly us'd in Medicine, for the Manner wherein any Remedy produces its salutary Effect; or that Series of Actions, mediate and immediate, whereby the remote End is effected. See MEDICINE.

See the Operations of each Kind of Medicines under the proper Head, SPECIFICS, PURGATIVES, EMETICS, OPIATES, &c.

OPERATIONS, in Chymistry, are the Processes, or Experiments, by means whereof the proper Changes are produced in Bodies, and the Effects of the Art procur'd. See CHYMISTRY.

Now, the Changes Chymistry produces in Bodies are reducible to two Kinds, viz. an Union of Parts, and a Separation thereof: Thus Chymistry either separates *Spirits*, *Salts*, *Oils*, &c. or compounds 'em together.

A Chymical Operation, then, consists in changing the Situation of the Parts; particularly, either in moving some Parts, but not the Whole, which is call'd *separating*; or in adding new Parts, which is call'd *uniting*.

All Chymical Operations, therefore, are reducible to two Kinds, viz. such whereby the Parts of Bodies before join'd

or united, are separated, which the antient Chymists call'd *Solution*; and such whereby the Parts before dis-joined are combined, or united, call'd *Congelation*. See SOLUTION and COAGULATION.

Some, however, object Digestion as a third Species of Operation, not reducible to either of 'em: But *Berberace* shews, that it is a Composition of both. See DIGESTION.

Most Chymists, however, look on this Division as scarce accurate and minute enough, and subdivide it into a number of particular, or subordinate Operations; as *Calcination*, *Vinification*, *Distillation*, *Sublimation*, *Cobaltation*, *Amalgamation*, *Fermentation*, *Putrefaction*, &c. See each in its Place, CALCINATION, VITRIFICATION, SUBLIMATION, DISTILLATION, FERMENTATION, &c.

OPERATION, in Theology, is us'd for the Actions both of the Word, and the Man, in Jesus Christ.

The Orthodox teach, that there are two Operations in Jesus Christ, the one divine, the other human; and not one *Theandric Operation*, as was the Doctrine of the *Monothelites* and *Monophysites*. See THEANDRIC, &c.

OPERATOR, in Medicine, &c. a Person who operates, or works with the Hand, on the human Body, to preserve, or restore, its Health.

Thus we say *Operator for the Stone*, meaning a *Lithotomist*, or a Person who cuts. See LITHOTOMY. *Operator for the Eyes*, a Person who cures Cataracts, &c. See CATARACT. *Operator for the Teeth*, a *Tooth-Drawer*. See TOOTH.

OPHITES, in Natural History, a sort of variegated Marble; or otherwise call'd *Serpentine*. See MARBLE and SERPENTINE.

It is thus call'd from the *Greek ops*, *Serpent*; by reason its Spots resemble those of that Animal.

OPHITES is also a Sect of antient Heretics, who sprung out of the *Gnostics*; so call'd from their worshipping the Serpent that seduced *Eve*.

This Serpent, they taught, was instructed thoroughly in all Knowledge; and make it the Father and Author of all the Sciences. On which Principle they built a thousand Chimeras; part of which may be seen in *St. Epiphanius*. See Gnostic.

They laid this Serpent was the Christ; that he was very different from Jesus born of the Virgin, into whom, said they, the Christ descended; and that 'twas this Jesus, not the Christ, that suffered. Accordingly, they made all those of their Sect renounce Jesus.

The *Scythians*, or *Schives*, mentioned by *Theodoret*, were either the same with the *Opbites*, or very little different from them.

OPHIUCHUS, in Astronomy, a Constellation of the Northern Hemisphere; call'd also *Serpentarius*. See SERPENTARIUS.

OPHTHALMIA, or OPHTHALMIA, in Medicine, a Disease of the Eyes; properly, an Inflammation of the *Tunica Adnata*, or *Conjunctiva*; accompanied with a redness, heat, and pain. See EYE.

The *Ophthalmia* is either moist, or dry: In the first, there is a shedding of Tears; in the second, none at all.

It sometimes happens in the *Ophthalmia*, that the two Eye-lids are so distorted, that the Eye continues constantly open, without being able to shut; which is call'd *spasmus*; sometimes the Eye-lids are so fasten'd together, that the Eye cannot be open'd, which is call'd *spasms*, *q. d.* closure of things that should be open.

The immediate Cause of the *Ophthalmia*, is the Blood flowing in too great abundance in the little Vessels of the *Adnata*, so as to stagnate therein, and distend them. The remote Causes are the same with those of other Inflammations.

*Celsus* calls the *Ophthalmia*, *Lippitus*, by reason of a Gum sticking to the Eye-lids in this Disease, which the *Latins* call *Lippa*.

In Summer 'tis frequent to have Epidemic *Ophthalmia's*. Snow apply'd to the afflicted Eye, is reputed a good Remedy for the *Ophthalmia*: The *Ephemerides* of the *Leopoldine Academy* mention an *Ophthalmia* cured by applying Cows-dung, while hot, between two linnen Cloths, to the Eye. A Fox's Tongue, and the Fat and Gall of a Viper, are empirical Preservatives against the *Ophthalmia*.

The Word is form'd from the *Greek ophthalmos*, Eye.

*Piscain*, and some others, distinguish an external and internal *Ophthalmia*; the first in the *Adnata*, which is that hitherto spoke of; the second in the *Retina*. The Symptoms or Indications of the latter, are *Musee volutantes*, Dust seeming to fly in the Air, &c. See MUSCÆ, &c.

This, when inveterate, degenerates, or ends in a *Gutta Serena*, or *Amanorisi*. See GUTTA SERENA, &c.

The Care of *Ophthalmia's*, according to the modern Practice, depends chiefly on the due repetition of Purgatives. If these fail, recourse is had to Vesicatories, Issues, Setons, &c. The *Piscain* prefers Bleeding; it being his Observa-

tion, that no Disease requires copious bleeding so much as the *Ophthalmia*.

**OPHTHALMICS**, Medicines proper for Diseases of the Eyes; as *Ophthalmic Waters*, *Ophthalmic Powders*, *Ointments*, &c. See EYES.

There is an excellent *Ophthalmic* prepared of Sagar of Saturn.

The fifth Pair of Nerves of the Brain, dividing into three Branches; the first is call'd *Ophthalmic*, because it goes to the Eye: This again subdivides into two Branches, after sending out several Twigs which encompass the Optic Nerves, and are distributed in the *Choroides*. See NERVE.

**OPHTHALMOGRAPHIA**, that Branch of Anatomy which considers the Structure and Composition of the Eye; the Use of its Parts, and the principal Effects of Vision. See EYES.

Our Countryman, Dr. *William Briggs*, has published an excellent *Ophthalmographic*, and *Plempius* another.

The Word is form'd from the Greek *ὄψαθρα*, Eye; and *γραφία*, Description.

**OPHTHALMOSCOPIA**, that Branch of Physiognomy which considers a Person's Eyes; to deduce thence the Knowledge of his Temperament, Humour, and Manners. See PHYSIOGNOMY.

**OPHATE**, in Medicine, any Composition wherein Opium is an Ingredient. See OPIUM.

The Word is frequently also apply'd to Confections, Antidotes, and Electuaries; tho' some say 'tis only properly applicable to soft Compositions: In which sense it is denoted an internal Remedy, variously compos'd of Powders, Pulps, Liqueurs, Sugar, or Honey, reduced into a soft Consistence. See CONFECTION, ELECTUARY, &c.

The *Opate of Solomon* is a Composition of great Fame, so call'd from one *Solomon*, a Physician, its Inventor; and first published by *Laurence Joubert*.

There are a particular kind of *Opates*, call'd *Incuratives*, for the Teeth and Gums, made of Alum, Sumach, Lignum Aloe, Myrrh, Mastic, &c. reduced into Powder.

**OPHATES** is also used in the general for all Medicines given with an Intention to procure Sleep; in which sense the Word is of the same Import with *Narcotics*, *Hypnotics*, *Soporifics*, and *Pacifica*. See SLEEP, NARCOTIC, HYPNOTIC, &c.

The Operation of *Opates*, or the manner wherein they produce their Effect in the Body, Dr. *Quincy* thus lays down:

All Pain is a Stimulus on the Part affected, and is attended with Contractions of the pained Membranes, which occasion a greater Afflux than ordinary of the nervous Juice that way: On the other hand, Pleasure, or a delightful Sensation in any part, is accompanied with a smooth Undulation, and easy Reflux of the nervous Juice towards the Brain. This is, as it were, the Entertainment of the Mind; with which being taken up, it doth not determine the Spirits to the Organs of Motion: that is, there is such a Relaxation of the muscular Fibres, and such a Disposition of the nervous Fluid, as is necessary to Sleep. See PAIN, &c.

Now, 'tis known that an agreeable Sensation produced in the Stomach, together with a distention of its Membranes, is the immediate Cause of that Sleepiness, to which we are inclinable after Eating; the one engaging the Mind, the other acting on the Body. For Pleasure amuses the Soul, and the Fulness of the Vessels in the Brain, checks and hinders, in some measure, the derivation of the nervous Juice into the Organs.

Now, to apply this; a moderate Dose of an *Opate*, usually transports People with a pleasing Sensation, to that degree, that, as they often express themselves, they are in Heaven; and tho' they do not always sleep, (which proceeds from the presentation of pleasing Images to the Mind so strongly, that, like Dreams, they do over-engage the Fancy, and so interrupt the State of Rest) yet they enjoy so perfect an Indolence and Quiet, that no Happyness in the World can surpass the Charms of so agreeable an Extasy.

Thus we have from these Medicines, but in a far more eminent degree, all these Effects which are observed to follow upon that grateful Sense in the Stomach, which a moderate Fulness produceth. For no Bodies are so fit and able pleasingly to affect our sensible Membranes, as those which consist of volatile Parts, whose Activity is tempered and allay'd by the Smoothness of some which are lubricating and oily; for they lightly rarify the Juices of the Stomach, and cause a pleasant Trillulation of its nervous Coat, whereby there is induced an agreeable Plenitude, and the Mind is entertained with Ideas of Satisfaction and Delight.

And thus, we easily see upon what Mechanism the other Virtues of *Opates* depend; for their easing Pains, checking Evacuations, &c. proceed not only from the Mind's being taken up with a pleasing Sense, whereby it is diverted from a disagreeable one; but all Pain being attended with a Contraction of the Part, the Relaxation of the Fibres, which they cause, eludes and destroys the Force of the Stimulus.

*Opates* are found to abate immoderate Secretions and Evacuations, which they do by removing that Irritation of the Organs, whereby they are occasion'd. And herein lies the increasing Quality of those Medicines, in that the twitching Sense upon the Membranes of the Lungs, Bowels, &c. being less'n'd, the sharp Humour is suffer'd to lodge there in a greater Quantity, before it is so troublesome as to be thrown off and expell'd; it being all one as if there were no Irritation of the Part, if the uneasy Sense thereof be not regarded by the Mind. And these Effects will all be heighten'd by the Mixture of the *Opate* Particles with the Blood; which is hereupon rarify'd, and distends its Vessels, especially those of the Brain; and this does still, to a greater degree, lessen the Influx of the nervous Fluid to the Parts, by pressing upon the *Tubuli*, or little Canals, through which it is deriv'd. Whence the reason of that Difficulty of breathing, which *Opates* occasion; this Symptom being inseparable from the Rarefaction of the Blood in the Lungs.

**OPINION**, a probable Belief; or a doubtful, and uncertain Judgment of the Mind. See BELIEF.

*Opinion* may be strictly defined the Assent of the Mind to Propositions not evidently true at first sight; nor deduced, by necessary Consequence, from others that are so; but such as carry the Face of Truth. See TRUTH, and ERROR, also FAITH, &c.

The Schools define it, *Assensus Intellectus cum formidine de opposito*; An Assent of the Understanding, with some fear or distrust on the contrary part. Thus the Logicians say, that Demonstration begets Science, or Knowledge; and probable Arguments beget *Opinion*. See KNOWLEDGE and PROBABILITY.

Wherever the Mind's Acquiescence in a Truth proposed to it, is accompanied with any Doubt, this is what we call an *Opinion*. See DOUBTING.

*Faint* makes *Opinion* a Medium between Knowledge and Ignorance; clearer and more express than Ignorance; yet more obscure and unsatisfying than Knowledge. See IGNORANCE.

**OPISTHOTONOS**, in Medicine, a kind of Convulsion, wherein the Body is bent backwards, so as to form; as it were, a Bow; in which sense the Word is used in opposition to *Empyrotismus*, wherein the Body is bent forwards. See CONVULSION.

The *Opisthotonus* arises from a tonic Motion of the Muscles of the posterior Parts of the Body; especially those on the back of the Head.

The Word is compounded of the Greek *ὀπισθον*, backward, behind, and *tonos*, to stretch, to bend.

**OPIUM**, in Pharmacy, &c. a Juice drawn from the Head of the black Poppy, and afterwards inspissated. See POPPY.

When the Juice flows of itself, thro' Incisions made in the Poppy Heads, it is properly call'd *Opium*; when drawn by Expression, it assumes the Name of *Messimum*. See MESSIMUM.

The difference between the Qualities and Virtues of the two Juices, is very considerable: The former is preferable on all accounts; but it is exceeding rare; the *Turks*, among whom it is produced, and who make great use of it, never allowing it to be exported: so that it is the latter that is ordinarily used among us, and sold for *Opium*.

'Tis mostly brought from the *Levant* and *Cairo*; generally very impure; the *Levantes*, to shorten their Labour, and to have the more Juice, drawing it equally from the Heads and the Leaves of Poppies, by Expression, and then reducing it to the thickness of an Extract by Fire.

It must be chosen dry, the smoothest, and blackest possible, of a deorsly smell, and neither rugged, nor sticky, nor all in a Mass.

'Tis a popular Error, that there is any such thing as *white Opium*; for tho' the Juice as it runs from the Heads of the Poppies be of a Milk-colour, it always becomes of a very deep brown as it thickens. Wherever it is found yellowish or soft, 'tis a sign the Juice has not had Fire enough.

Prepared *Opium* is call'd *Laudanum*; of which there are two Kinds: the one, *Simple*; extracted by means of Rain-Water, and Spirit of Wine: The other *Compound*, call'd *Laudanum Opianum*; wherein there enter several other Ingredients. See LAUDANUM.

The Uses of *Opium* are to sooth Pain, to excite Sleep, to stop Vomiting and Looseness. Its Dose is from half a Grain to two Grains. Some Persons, who have much habituated themselves to it, can take 50 or 60 Grains. *Charas* says, he has taken 12 Grains himself; and adds, he knew one who made no scruple of 36. And in the *Philos. Transf.* we have an instance of one *Mrs. Lovelock*, who, in a Fever, in three days time, took 102 Grains.

It raises the Spirits, occasions agreeable Sensations, and has much the same effect with Wine or strong Spirits. The *Turks* ordinarily take to the quantity of a Drachm when

they go to Battel, or undertake any Affair that requires Vigour and Force.

*Opium* Rops, for a time, all Overflowsings of Humours, Fluxes, Hemorrhages, &c. probably from the smoothness and roundness of its Parts, which by a kind of Tiltation, oblige the Intestines, and other Vessels to contract themselves. See *OPHATES*.

*Willis, Sylvius*, and *Muller* look on *Opium* as a coagulating Poison, which fixes the Spirits in the Nerves. *Wepfer* and *Piscarn*, on the contrary, maintain it to be a hot dissolving Poison, which subtilizes the Blood, exalts and reduces it into Vapours, which bloat up the Arteries; and the bloated Arteries compressing the Veins and Nerves, shut up the Passage of the Spirits. See *POISON*.

By Analysis, it is found to contain a great deal of volatile Salt.

The Word is form'd from the *Greek* *ops*, Juice. **OPOBALSAMUM**, in Pharmacy, a whitish Juice, Gum, or Resin, distilling from the Branches of a Tree call'd *Balsamm*, or the *Balm-Tree*. See *BALM*.

'Tis whitish, pretty thick, transparent, of a Small approaching Turpentine, but much more agreeable.

'Tis the same with the celebrated *Balsamm verum*, or *Balm of the Lemons*; at least the difference is not visible, nor can Authors fix it. See *BALM*.

It obtains a Place among the Alexipharmics, and is a good Ingredient in the *Theriaca Andromachi*, and *Mithridate*; very ill supply'd with the expressed Oil of Mace for a Succedaneum, which does not at all come up to the subtilty and activity of its Parts, but is of a much heavier Texture.

This, as all other Balsams, is Suppurative, Deterfivè, and Incarnating, apply'd outwardly to Tumors, Ulcers, or green Wounds. See *BALSAM*.

**OPOPANAX**, or **OPOFONAX**, in Pharmacy, a Gum, yellow without-side, white within, fat, brittle, of an agreeable Taste, and a very strong Smell. See *GUM*.

The *LARUS* call it *Panacea Heracleum*, from *Heracles*, who is suppos'd to have invented it, or rather who first discover'd its specific Virtues. 'Tis one of the three celebrated *Panacea*, or universal Medicines, they attributed such wonderful Virtues to. The two others are the *Astepium* and *Chironium*; the first found by *Esculapius*, the second by *Chiron*. See *PANACEA*.

The Gum *Opopanax* flows by Incision from a Plant growing abundantly in *Achaia*, *Beotia*, *Phocis*, and *Macedonia*: while 'tis liquid, 'tis white; but as it dries and hardens, it assumes a beautiful golden yellow.

There are three Kinds imported; that in Tears; that in the Mass; and that counterfeited, or flattened.

The first is the best, and the second is the better, as it has the more Tears; the third is a rank Sophistication, and good for little.

It is little us'd internally; tho' *Estuellar* ranks it among Cathartics. Its chief Use is in the Cure of Wounds; whence it enters the Composition of the *Unguentum Divinum*, with the *Gelbanum*, *Anusimac*, and *Edellium*.

The Word is form'd from the *Greek* *ops*, Juice, and *panax*, the Name of the Tree which yields it.

**OPILATION**, in Medicine, the Act of obstructing, or stopping up the Ducts, or Passages of the Body, by evil or peccant Humours. See *OBSTRUCTION*.

The Word is chiefly us'd for Obstructions of the lower Belly.

Viscid, heavy Foods, difficult of Digestion, are *oppressive*; don't pass off well, but stop in the Mouths of the Vessels.

**OPPONENT**, a Person who withstands, or opposes another. See *OPPOSITION*.

The Term is chiefly us'd in speaking of Scholastic or Academic Disputes or Exercises, where a Person who opposes a Thesis, or impugns it by his Objections, is call'd *Opponent*, *Opponent*.

**OPPOSITES**, *Opposita*, simply, among Logicians, are such Things as differ among themselves; so, as not to differ in like manner with some third. By which Circumstance, *Opposites* differ from *Disparates*.

The Schoolmen reckon four Kinds of *Opposites*; viz. *relatively*, *contrarily*, *privatively*, and *contradictorily* *Opposites*. For either, say they, the Opposition is between *Ens* and *Ens*, or between *Ens* and *Non Ens*: If the former, it is either with a dependant *Ens*, which makes a *relative* Opposition, the lowest of all; or an independent one, which is a *contrary* one: If with a *Non Ens*, it is either with a *Non Ens secundum quid*, which is *privative*; or with a *Non Ens simpliciter*, which is the highest Opposition. See *RELATIVE*, *CONTRARY*, *PRIVATIVE*, and *CONTRADICTORY*.

*Opposites*, *Opposita*, complexly, are Propositions that clash with each other: As, Man is an Animal; and Man is not an Animal. See *OPPOSITION*.

*Opposite Angles*. If a Line ST (Tab. GEOMETRY, Fig. 46.) meet two other Lines, AP and BR, in different

Points A and B, but in the same Direction; the Angles  $x$  and  $y$ , as also  $z$  and  $y$ , hereby form'd, are call'd *opposite Angles*; particularly,  $x$  the external *opposite Angle*, and  $z$  the internal *opposite Angle* of  $y$ .

**OPPOSITE Cones**, or a *double Cone*, two similar Cones, vertically *opposite*, and having the same common Axis. See *CONE*.

**OPPOSITE Sections**, are the two Hyperbolas made by a Plane cutting both those Cones.

If a Cone be cut by a Plane through its Vertex, and afterwards by a second Plane parallel to the former; this latter Plane produced thro' the *opposite Cone* will there make the *opposite Sections*. See *SECTIONS*.

**OPPOSITION**, in Geometry, the Relation of two Things, between which a Line may be drawn perpendicular to both.

**OPPOSITION**, in Logic, a Quality of Disagreement, between Propositions that have the same Subject, and the same Attribute. See *PROPOSITION*.

*Opposition*, is said by Logicians to be either Complex, or Incomplex.

*Incomplex*, or *Simple OPPOSITION*, is the Disagreement of two things, which will not suffer each other to be in the same Subject: Thus Heat is opposed to Cold; Sight to Blindness, &c. Which *Opposition* has already been observed to be of four Kinds. See *OPPOSITE*.

*Complex OPPOSITION*, is defined by *Aristotle* to be the affirming, and denying the same Predicate of the same Subject, not taken equivocally for the same, according to the same, in the same manner, and at the same time: As *Socrates* is learned; and *Socrates* is not learned.

The later Schoolmen, deviating from their Master, define *Opposition* an Affection of the Enunciation, whereby two absolute Propositions, the same Extremes being sapposed in the same Order, and Number, and understood, without any ambiguity, of the same thing, oppose each other, either in respect of Quantity, or of Quality; or of both.

According to the former Definition, there are three Species of *Opposition*; *Contrary*, *Subcontrary*, and *Contradictory*: According to the second, a fourth Species is admitted, viz. *Subaltern*.

To know how and wherein, Propositions are opposite, they must be compared in Quantity and Quality, all the ways they can be compared in. If they be opposite in Quality and Quantity; i. e. if the one be Affirmative, and the other Negative; the one Universal, the other Particular, they are said to be *contradictory*; v. gr. No Pleasure is allow'd; some Pleasure is allow'd. See *CONTRADICTORY*.

If they be only opposite in Quality, and not in Quantity, they are call'd *Contraries*, if Universal; and *Sub-contraries*, if Particular; v. gr. All use of Wine is Evil; no use of Wine is Evil. Some Means of preferring Reputation are allow'd; some Means of preferring Reputation are not allow'd. See *CONTRARY*, &c.

If the Propositions be only opposite in Quantity, they are call'd *Subalterns*; v. gr. Every Man is liable to Sin; some Man is liable to Sin. But this last is no proper *Opposition*; inasmuch as the universal Proposition always includes the particular one.

Singular Propositions, which can only be opposed in Quality, are reducible to contradictory ones.

The essential Properties of Propositions consider'd with regard to their *Opposition*; are, 1. That of two contradictory Propositions, there is one always true, and another false. 2. Two contrary Propositions can never be both true; but may be both false. 3. Sub-contrary Propositions may be all true at the same time; as happens when the Attribute is accidental to the Subject; but when it is essential to it, the one is true, the other false. 4. Subalterns may be either true or false at the same time; or the one may be true, the other false. If the Attribute be essential to the Subject, the subaltern Affirmatives are true, and the Negatives false; but if the Negatives deny the Subject an Attribute incompatible with the Subject, they will be both true. When the Attribute is accidental to the Subject, the universal Subaltern is ordinarily false, and the particular one true.

**OPPOSITION**, in Rhetoric, a Figure, whereby two things are assembled together, which appeared incompatible; as when *Horace* says, a *wife's Folly*.

In *Rosbaw's* Notion, this Figure, which seems to deny what it establishes, and contradicts itself in Appearance, is very Elegant.

**OPPOSITION**, in Astronomy, is that Aspect, or Situation of two Stars, or Planets, wherein they are diametrically opposite to each other, or  $180^\circ$  a-part. See *CONJUNCTION*.

When the Moon is diametrically *opposite* to the Sun, so that she shows her whole illumined Face; she is said, with regard to the Sun, to be in *Opposition*; and she is then said to be in her *Full*, and shines all Night long. See *PERIGEE*.

Eclipses of the Moon never happen but when she is in Opposition with the Sun, and when they both meet in the Nodes of the Ecliptic. See ECLIPSE. Mars in his Opposition to the Sun, is nearer the Earth than he is to the Sun.

OPPROBRIUM *Lapis*, see *Lapis VITUPERII*.

OPSONOMUS, in Antiquity, a Magistrate of Athens, whereof there were two, or three; chosen out of the Senate, or Council. Their Office was to inspect the Fish-Market, and to take care that every thing were done in Order, and according to the Laws.

OPTATIVE, in Grammar, the third Mood of the Conjugations of Verbs, serving to express an ardent Desire or Wish for any thing. See MOOD.

Instead of a particular Mood, or a particular Set of Inflections to express this Desire, the *English*, *Latin*, &c. express it by an Adverb of Wishing prefix'd to it. The *Latin* by *Utinam*; the *French* by *Plût à Dieu*; and the *English* by *Would to God*, &c.

In these Languages, setting aside the Adverb, the Optative is the same with the Subjunctive; the Inflections of the Verb, which make what we call the Moods, are the same in both.

Indeed, in the *Greek*, the Wish is express'd by a particular Inflection, thence call'd Optative; and in the *French*, *Spanish*, and *Italian*, there is something like it; their triple Tenses serving the same purposes. But the Optative Mood may be safely retrench'd from the *Latin* and *English*. See SUBJUNCTIVE.

OPTERIA, among the Antients, Presents made to a Child, the first time a Person saw it.

The Word was also used for the Presents which the Bridegroom made his Bride when she was conducted to him; this being the first time he saw her. See *Barthal. de Pæp. Fer.*

The Word is form'd from the *Greek* *οπταριος*, I see.

OPTICS, is properly the Science of direct Vision. See VISION.

Tho', sometimes, the Word is used in a larger Sense for the Science of Vision, or Visibles in general: In which Sense it includes Catoptrics, and Dioptrics; and even Perspective. See CATOPTRICS, DIOPTRICS, and PERSPECTIVE.

*Optics* in its more extensive Acceptation, is a mix'd Mathematical Science, which explains the manner wherein Vision is perform'd in the Eye; treats of Sight in the general; and gives the Reasons of the several Modifications or Alterations which the Rays of Light undergo in the Eye; and shews why Objects appear sometimes greater, sometimes smaller, sometimes more distinct, sometimes more confused, sometimes nearer, sometimes more remote. See LIGHT, EYE, &c.

In this extensive Signification, it is consider'd by Sir *Is. Newton* in his admirable Work call'd *Optics*.

*Optics* makes a considerable Branch of Natural Philosophy; both as it explains the Laws of Nature, according to which Vision is perform'd; and as it accounts for abundance of Physical Phenomena, otherwise inexplicable. For what can be determined about Light, Colours, Transparency, Opacity, Brightness, Meteors, the Rainbow, Parhelia, &c. but on Principles of *Optics*? What about the Nature of the Stars? The Structure of the Mundane System? The Motions of the Planets? The Eclipses of the Luminaries? &c.

*Optics*, therefore, make a considerable Part of Astronomy. See ASTRONOMY.

From *Optics* likewise arises *Perspective*; all the Rules whereof have their Reason or Foundation in *Optics*. Indeed *Taquet* makes *Perspective* a part of *Optics*; and *John Archbishop of Canterbury*, in his *Perspectiva Communis*, calls *Optics*, *Catoptrics*, and *Dioptrics* by the Name *Perspective*. See PERSPECTIVE.

Enclid has wrote on the ancient *Optics* and *Catoptrics*: *Dioptrics* were unknown to them. *F. Honorat. Fabri* has an Abridgment of *Optics*, *Catoptrics*, and *Dioptrics*. *Father Eibhard* a Century of Problems in *Optics*. *Vieljeux*, and *Albano* have done well on the Principles of *Optics*. *Father Kircher* has a large Volume on the Secrets of *Optics*, of Light, and Shadow; and its surprising Effects, which pass on the People for Magic. We have also *P'Optique & Catoptrique* of *F. Meslange*, Paris 1651. *Dioptrique Oculaire* of *Fath. Chersin*, Paris 1671. *Pol. Christ. Scheineri Optica*, Lond. 1651. *Jacobii Gregorii Optica*, Lond. 1663. *Jab. Bap. Porta de Refractione Opticæ*. *Barroviæ Lectiones Opticæ*, Lond. 1669. *Principes Generale de l'Optique*, by *Mr. Leibnitz*, in the *Lectio Acta*, 1682. *L'Œculaire au Œcille*, or *Dioptrica Practica*, *Carol. Ant. Mancini*, Bologna 1660, 4°. *Physico-Mathesi*, de *Lunæ*, *Coloribus & Iris*, per *F. Mar. Grimaldi*, Bononiæ 1665, 4°. *Cogitationes Physico-Mechanicæ de Natura Visionis*, per *Joban. Ott. Scaphysam*, Heidelberg. 1670, 4°. And, who ought to have been named first, the great *Sir I. Newton*, in his *Optics*, *English* and *Latin*, 4°.

OPTIC-NERVES, the second Pair of Nerves, springing from

the *Cross* of the *Medulla Oblongata*, and passing thence to the Eye. See NERVE.

These Nerves approach, by degrees, in their recess from their Origin; and at length meet, in the Basis of the Brain, near the Infundibulum. Thence they again separate, but without decussating; and proceed, one to each Eye. See EYE.

They are cover'd with two Coats, which they take from the *Dura* and *Pia Mater*; and which, by their Expansions, form the two Membranes of the Eye, call'd the *Uvea* and *Cornea*. See UVULA, &c.

The *Retina*, which is a third Membrane, and the immediate Organ of Sight, is only an Expansion of the fibrous, or inner, and medullary Part of these Nerves. See RETINA.

The Contraction of the *Optic-Nerve* seems to be different from that of the other Nerves, which all appear to consist of hard Fibres: For this, e'er it enters the Orbit of the Eye, is only a Coat or Cover form'd by the *Pia Mater*, and including a Production of the *Medulla* of the Brain; which is easily separated from it. At its entrance into the Eye, it takes another Coat from the *Dura Mater*; which two Coats are bound together by exceedingly fine Filaments: That from the *Pia Mater* is continued in the *Choroides*, and that from the *Dura Mater* in the *Uvea*.

From their Entrance within the Orbit, to the Ball of the Eye, the *Medulla*, enclosed under the two Coats, is separated into a number of little Cells answering to each other. See VISION.

OPTIC-Pencil, or Pencil of Rays, is that Assemblage of Rays by means whereof any Point or Part of an Object is seen. See PENCIL and RADIANT.

Some *Optic* Writers laugh at the Notion of *Optic-Pencil*, and maintain 'em mere Chimeras.

OPTIC-PYRAMID, in Perspective, is the Pyramid A B C O (Tab. PERSPECTIVE, Fig. 12.) whose Base is the visible Object A B C; and its Vertex, in the Eye O; form'd by Rays drawn from the several Points of the Perimeter to the Eye.

Hence also appears, what is meant by *Optic Triangle*.

OPTIC RAYS, are particularly used for those wherewith an *Optic-Pyramid*, or *Optic-Triangle*, is terminated; as O A, O C, O B.

OPTIC AXIS, is a Ray passing through the Centre of the Eye; or the middle of the *Optic-Pyramid*, &c.

OPTIC Chamber, see *Camera OESCURA*.

OPTIC-GLASSES, are Glasses round either concave, or convex, so as either to collect, or disperse the Rays of Light; by means whereof Vision is improved, and the Eye strengthened, preserved, &c.

For the manner of Grinding and Polishing *Optic-Glasses*, see GRINDING, POLISHING, GLASS, &c.

For their Phenomena, see LENS, MIRROR, &c.

The Principal among *Optic-Glasses*, are *Telescopes*, *Microscopes*, *Spectacles*, *Reading-Glasses*, *Magic Lamberns*, &c. See the Construction and Use of each under its proper Article, TELESCOPE, MICROSCOPE, SPECTACLE, MAGIC LAMBERN, &c.

OPTIC PLACE of a Star, &c. is that Point of its Orbit in which it appears to be, to our Eye. See PLACE.

This is either *true*; as when the Eye is supposed at the Centre of the Earth, or Planet it inhabits; or *apparent*, as when at the Circumference. See APPARENT, PLANET, &c.

The difference between the two, is the *Parallax*. See PARALLAX.

OPTICAL INEQUALITY, in Astronomy, is an apparent Irregularity in the Motions of far distant Bodies; so call'd, because not really in the moving Bodies, but arising from the Situation of the Spectator's Eye: So that were the Eye in the Centre, it would always see the Motions uniform.

The *Optical Inequality* may be thus illustrated: Suppose a Body revolving in the Periphery of a Circle A B D E F G Q, (Tab. OPTICS, Fig. 40.) and moving through equal Arches AB, BD, DE, EF, in equal Times; and suppose the Eye in the Plane of the same Circle, but at a distance from it, viewing the Motion of the Body from O: When the Body goes from A to E; its apparent Motion is measured by the Angle A O B, or the Arch H L, which it will seem to describe. But in an equal time, while it moves thro' the Arch B D, its apparent Motion will be determin'd by the Angle B O D, or the Arch L M, which is less than the former Arch H L. And when arrived at D, it will be seen at the Point M of the Line N L M. But it spends the same time in describing D E, which is equal to A B or B D; and when arrived at E, is still seen at M; appearing Stationary in all the Space from D to E. When it arrives at E, the Eye will see it in L; and at G, will appear at H; so that it will seem to have gone retrograde: And, lastly, from Q to P, it will again appear Stationary.

OPTIMATES, in Antiquity. One of the Divisions of the Roman People, was into *Optimates* and *Populares*.

According to Tully's Description, the *Optimates* were the best Citizens; or those who desir'd their Actions might be approved by the better Sort; and the *Populares* those, who, out of a Thirst of Vain-glory, did not so much consider what was right, as what would please the Populace, and get an Interest in them. But others rather make the *Optimates* to be the vigorous Assertors of the Dignity of the Chief Magistrate, and the Sticklers for the Grandeur of the State; who cared not if the inferior Members suffer'd, if it were for the Advancement of the Commanding Powers: And the *Populares* those who courted the Favour of the Populace, and encouraged them to demand larger Privileges, to bring Matters nearer to a Level.

OPTION, the Power, or Faculty of Wishing, or Chusing; or the Choice a Person makes of any thing.

When a new Suffragan Bishop is consecrated, the Archbishop of the Province, by a customary Privilege, claims the Collation of the first vacant Benefice, or Dignity, in that See, according as he shall chuse; which Choice is call'd the Archbishop's *Optio*.

OR, in Heraldry, *Yellow*, or the Colour of Gold. See COLOUR and METAL.

Without this, or Argent, there can be no good Army.

In the Coats of Nobles, it is call'd *Toppaz*; and in those of Sovereign Princes, *Sol*. It is represented in Engraving by small Points, or Dots, all over the Field, or Bearing; as in the Figure.

It is accounted the Symbol of Wisdom, Temperance, Faith, Force, Constancy, &c.

ORACLE, an Answer, usually couch'd in very dark and ambiguous Terms, suppos'd to be given by Demons of old; either by the Mouth of their Idols, or by those of their Priests, to the People who consulted them on Things to come.

In this sense we say, the Priests were ever in a Rage when he gave Oracles. *Ablanovost* observes, that the Study or Research of the Meaning of Oracles, was but a heartless Thing; and that they were never understood till after the Accomplishment. Historians relate, that *Cæsar* was trick'd by the Ambiguity and Equivocation of the Oracle:

*Illos reddis nunquam in bello perditis.*

ORACLE is particularly used for the Demon who gave the Answer, and the Place where it was given. See DEMON.

The principal Oracles of Antiquity are, that of *Aia*, mention'd by *Heredotus*; that of *Amphiaras*; that of *Abia*, mention'd at *Didymus*; that of the Camps at *Lacedæmon*; that of *Dadon*; that of *Jupiter Ammon*; that of *Nubæra*, in the City *Amara*, near the *Caspian* Sea; that of *Trochimus*, mention'd by *Heredotus*; that of *Chyropolis*; that of *Clarus* in *Tonia*; that of *Miletus*; that of *Mabius*; that of *Patarea*; that of *Pella* in *Macedonia*; that of *Phoebædes* in *Gleucia*; that of *Sinpe* in *Paphlagonia*; that of *Omphalos*'s Head, mention'd by *Philostratus* in his Life of *Apollonius*.

But of all others, the Oracle of *Apollis Pythias* at *Delpbos*, was the most celebrated; this was consult'd, *ex æneris æssort*, by most of the Princes of those Ages. See PYTHIUS.

M. Bayle observes, that at first it gave its Answers in Verse; and that it fell at length to Prose, upon the People's beginning to laugh at the Poorness of its Versification.

'Tis a pretty general Opinion among the more Learned, that Oracles were all meer Cheats and Impollures; either calculated to serve the avaritious Ends of the Heathen Priests, or the political Views of the Princes.

M. Bayle says positively, they were meer human Artifices, in which the Devil had no hand. He is strongly back'd by *Van Dale*, and M. *Fontenelle*, who have wrote expressly on the Subject.

There are two Points in dispute on the Subject of Oracles, *viz.* whether they were human, or diabolical Machines; and whether or no they ceased upon the Publication or Preaching of the Gospel.

*Plutarch* has a Treatise on the ceasing of some Oracles; and *Van Dale*, a Dutch Physician, has a Volume to prove they did not cease at the Coming of Christ; but that many of them ceased long before; and that others held till the fall of *Paganism*, under the Empire of *Theodosius the Great*; when *Paganism* being dispersed, these Institutions could no longer subsist.

*Van Dale* was answer'd by a German, one *Melinus*, Professor of Theology at *Leippsic*, in 1685. M. *Fontenelle* espous'd *Van Dale*'s System, and improv'd upon it in his *History of Oracles*; and shew'd the Weakness of the Argument used

by many Writers in behalf of Christianity, draws from the ceasing of Oracles.

F. *Mabius*, a learned Jesuit, has answer'd both *Van Dale* and *Fontenelle*. He labours to prove that there were real Oracles, and such as can never be attributed to any Artifices of the Priests or Priestesses; and that several of these became silent in the first Ages of the Church, either by the Coming of Jesus Christ, or by the Prayers of the Saints.

This Doctrine is confirm'd by a Letter from Father *Beaueber*, Missionary, to Father *Mabius*; wherein 'tis declared, that what Father *Mabius* says of the ancient Oracles, is experienced every day in the *Indies*.

It seems, according to the Missionary, that the Devil still gives Oracles in the *Indies*; and that, not by Idols, which would be liable to Impollure; but by the Mouths of the Priests, and sometimes of the By-standers: 'tis added, that these Oracles, too, cease, and the Devil becomes mute, in proportion as the Gospel is preach'd among them.

'Twas *Eschylus* who first endeavour'd to persuade the Christians, that the Coming of Jesus Christ had struck the Oracles dumb; tho' it appears from the Laws of *Theodosius*, *Gratian*, and *Valentinian*, that the Oracles were still consulted as low as the Year 385. *Cæsar* says, the Oracles became dumb, in proportion as People, growing less credulous, began to suspect them for Frauds.

*Plutarch* alleges two Reasons for the ceasing of Oracles: The one was *Apollis*'s Chagrin; who, it seems, took it in judgdon to be interrogated about so many Trifles. The other was, that in proportion as the *Gætic*, or Demons, who had the Management of the Oracles, died, and became extinct, the Oracles must necessarily cease. He adds a third, and more natural Cause of the ceasing of Oracles, *viz.* the fourth State of *Greece*, ruin'd and desolated by Wars. For, hence, the Smallness of the Gains, let the Priests sink into a Poverty and Contempt, too bare to cover the Fraud.

Most of the Fathers of the Church took it to be the Devil that gave Oracles; and look'd on it as a pleasure he took to give dubious and equivocal Answers; to have a handle to laugh at them. *Fossius* allows, that 'twas the Devil who spoke in Oracles; but thinks that the Obscurity of his Answers, was owing to his Ignorance as to the precise Circumstances of Events. That artful and studied Obscurity, wherein the Answers were couch'd, shew'd the Embarrass of the Devil was under; as those double Meanings they usually bore, provided for their Accomplishment. Where the Thing foretold, did not happen accordingly, the Oracle, forsooth, was misinterpreted.

*Eschylus* has preserv'd some Fragments of a Philosopher, call'd *Democritus*; who, out of Reicement for his having been so often fool'd by them, wrote an ample Confutation of all their Impertinences: "When we come to consult of thee, says he to *Apollis*, if thou seest what is in Futurity, why dost thou use Expressions that won't be understood? "Dost thou not know that they won't be understood? "If thou dost, thou steepest pleasure in abusing us; if thou dost not, be inform'd of us, and learn to speak more clearly. I tell thee, that if thou intendest an Equivocque, the Greek Word whereby thou affirm'st that *Cæsar* should overthrow a great Empire, was ill chosen; and that it could signify nothing but *Cæsar*'s conquering *Cyrus*. If Things must necessarily come to pass, why dost thou amuse us with thy Ambiguities; what dost thou, Wretch as thou art, at *Delpbos*; employ'd in muttering idle Prophesies!"

But *Democritus* is still more out of humour with the Oracle, for the Answer which *Apollis* gave the *Athenians*, when *Xerxes* was about to attack *Greece* with all the Strength of *Asia*. The *Pythian* declar'd, that *Minevia*, the Protectress of *Athen*, had endeavour'd in vain to appease the Wrath of *Jupiter*; yet that *Jupiter*, in compliance to his Daughter, was willing the *Athenians* should save themselves in wooden Walls; and that *Salamine* should behold the Loss of a great many Children, dear to their Mothers, either when *Ceres* was spread abroad, or gather'd together.

Here *Democritus* loses all patience with the God of *Delpbos*: "This Contest, says he, between Father and Daughter, is very becoming the Gods. 'Tis excellent, that there should be contrary Inclinations and Interests in Heaven.—Pure Wizard, thou art ignorant whose the Children are, that *Salamine* shall see perish; whether *Greeks* or *Persians*. 'Tis certain, they must be either one or the other; but thou needst not have told so openly, that thou knewest not which. Thou conceal'st the Time of the Battle under those fine poetical Expressions, Either when *Ceres* is spread abroad, or gather'd together: "And wouldst thou bamboozle us with such pompous Language! Who knows not that if there be a Sun-fight, it must either be in Seed-time or Harvest? 'tis certain it cannot be in Winter. Let Things go how they will, thou wilt secure thyself by this *Jupiter*, whom *Minevia* is endeavouring to appease. If the *Greeks* lose the Battle,

"*Jupiter*

"Jupiter prov'd inexorable to the last; if they gain it, why then *Minerva* as length prevail'd." —

ORACLES of the *Sibyls*, see *STRYLLINE* Oracles.

ORAL, something deliver'd by the Mouth or Voice.

In this sense we say, *Oral Tradition*, &c. See *TRADITION*.

ORANGE, a Fruit, too well known to need a particular Description; yet yielding too many Kinds of Merchandise, to be pass'd over.

The *Latin* call it *Aurantium* or *Malus ansonum*, Golden Apple, from its Colour.

Oranges are ordinarily brought from *Nice*, *Centa*, the Isles of the *Hiercs*, *Genna*, *Provence*, *Parangal*, the *American* Islands, and even *China* and the *Coasts* of *India*.

They were first brought into *Europe* from *China*, by the *Portuguese*; and 'tis said the very Tree, whence all the *European* Orange-Trees were produc'd, is still preserv'd at *Lisbon*, in the House of the Count *S. Laurent*.

Those most esteem'd, and that are made Presents of as *Rarities*, in the *Indies*, are no bigger than a *Billiard-Ball*; when sweeten'd with a little *Sugar*, they are esteem'd excellent for Disorders of the *Breast*.

Oranges are ordinarily consist'd in Halfs and Quarters. They are first peel'd, then scoop'd and dry'd in a *Stove*.

Oranges is the *Orange-Peel* cut in pieces and candied. *Italy* furnishes a great deal of *Flower of Oranges*, either dry or liquid.

The *Water* of *Flower of Oranges*, call'd *Water of Naples*, comes mostly from *Provence*. To be good, it must be very bitter, and not above a *Year* old.

There are various Oils drawn from *Oranges*: The Oil of *Neroli* is the *Produce* of the *Flowers* by *Distillation*. That drawn from the *Skin* by *Water* and an *Alembic*, is altogether as good. There is also an Oil drawn from little *Oranges*, or *Orangeleaves*, by steeping them five or six Days in common *Water*, and distilling them with the same *Water* in an *Alembic*. These Oils are all esteem'd good for destroying of *Worms* in *Children*; but are very apt to be sophisticated with Oil of *Ben*, or that of sweet *Almonds*.

ORANGEADE, a Drink made of *Orange-Juice*, *Water*, and *Sugar*.

*Lenoxey* says, it may be given to *People* in the height of a *Fever*.

ORANGE COLOUR, is a Colour that partakes equally of *Red* and *Yellow*; or is a *Medium* between the two. See *COLOUR*.

In *Heraldry*, the Term *Orange* is given in *Blazon* to all Roundels that are *Tenne* or *Tawney*.

ORANGERY, a Gallery in a *Garden*, or *Parterre*; exposed to the *South*; but well clos'd with a *Glafs* *Window*, to preserve the *Oranges* in, during the *Winter* *Season*.

Orangery is also used for the *Parterre*, where the *Oranges* are expos'd in kindly *Weather*. The *Orangery* of *Versailles* is the most magnificent that ever was built.

ORATION, a *Speech*, or *Harangue*, fram'd according to the *Rules* of *Oratory*; and spok'd in public. See *ORATORY*.

All the *Kinds* of *Orations* may be reduc'd to three *Heads*: viz. the *Demonstrative*, the *Deliberative*, and the *Judicial*.

To the demonstrative Kind belong, *Panegyrics*, *Genealogies*, *Epithalamia*, *Epicidia*, *Eucharistia*, *Epinecia*, and *Comendationes*. See *PANEGYRIC*, *GENEALOGIC*, &c.

To the deliberative Kind belong, *Perjuasions*, *Dissuasions*, *Exhortation*, and *Commendation*.

To the judicial Kind belong, *Accusation*, *Confirmation*, *Confutation*, &c. See each under its proper Article, *CONFIRMATION*, &c.

ORATORY, the *Art* of speaking well; the same with *Rhetoric*: the difference between the two being only in the *Names*; the first of which is *Latin*, the other *Greek*. See *RHETORIC*.

ORATORY is also used among the *Romanists*, for a *Closet*, or little *Apartment*, in a *large* *House*, near a *Bed-Chamber*, furnish'd with a little *Altar*, or an *Image*, for private *Devotion*.

The ancient *Oratories* were little *Chappels*, adjoining to *Monasteries*, wherein the *Monks* said their *Prayers* &er they had any *Churches*. Several little *Councils* and *Synods* have condemn'd the Use of private *Oratories*. See *CHAPEL*.

In the *Vith* and *Vith* *Centuries*, *Oratories* were little *Churches*, frequently built in *Church-yards*; without either *Baptistry*, *Cardinal* *Priest*, or any public *Office*; the *Bishop* sending a *Priest* to officiate occasionally.

ORATORY is also used for a sort of *Society*, or *Congregation* of devout *Persons*; who form a kind of *Monastery*, and live in *Community*; but without being oblig'd to make any *Vows*: Thus,

*Priests* of the *ORATORY*, are a *Community* of *Secular* *Priests*, who live together in a *Mosaic* *Manner*, but without any *Vows*; first establish'd at *Rome*, about the *Year* 1590, by *S. Philip Neri*, a *Florentine*, under the *Title* of *Oratory* of *Santa Maria* in the *Vallicella*.

On the *Model* of this, the *Cardinal Berni* establish'd a *Congregation* of the *Oratory* of *Jesus* in 1612, in *France*; which has since increas'd: so that there are now 60 *Houses* of *Priests* of the *Oratory*.

There is some difference, however, between the *Italian*, and *French* *Institutions*: *S. Philip Neri*, to prevent the *Confusion* which the great *Number* of *Houses* usually occasion in *Congregations*; would have his to be a *single* *House*. And the others were at *liberty* to form the like *Congregations*, yet they should have no *Dependance* on one another.

For this reason, the *Houses* of the *Oratory* in *Italy* and *Flanders* are all *Independent*; whereas those in *France* have a *Relation* to each other, and all depend on the same *Chief*, who has the *Quality* of *Superior* *General*; and, with three *Affiliates*, governs the whole *Congregation*. See *CONGREGATION*.

ORB, ORBIS, in *Astronomy*, a *Spherical* *Body*, or *Space*, contain'd under two *Superficies*; the one *Convex*, the other *Concave*. See *SPHERE*.

The ancient *Astronomers* conceiv'd the *Heavens*, as consisting of several vast, *azure*, *transparent* *Orbs*, inclin'd in one another: Or vast *Circles*, which in their *Area* include the *Bodies* of the *Planets*; the *Radii* whereof are compris'd between the *Centre* of the *Earth*, and the highest *Point* to which the *Planet* rises; supposing the *Earth* to be in the *Centre*. See *HEAVENS*.

There are *Orbs* *Concentric*, i. e. having the same *Centre* and *Orbs* *Eccentric*. See *CONCENTRIC*, &c.

The *Magnus Orbis*, or *Great Orb*, is that wherein the *Sun* is suppos'd to revolve; or rather that wherein the *Earth* makes its annual *Circuit*. See *ORBIT*.

ORB, in *Astronomy*. An *Orb* of *Light* is a certain *Sphere* or *Extent* of *Light*, which the *Astrologers* allow a *Planet* beyond its *Centre*.

They say, that provided the *Aspects* do not fall within this *Orb*, they have almost the same effect, as if they pointed directly against the *Centre* of the *Planet*. See *ASPECT*.

The *Orb* of *Saturn's* *Light* they make to be 20 *Degrees*; that of *Jupiter* 12. that of *Mars* 7°, 30'. that of the *Sun* 17°. that of *Venus* 8°. that of *Mercury* 7°. that of the *Moon* 12°, 30'.

ORBICULARE Os, Orbicular Bone, in *Anatomy*, is one of the *Bones* of the inward *Ear*; tied by a slender *Ligament* to the *Sides* of the *Lobes* of the *Ear*; and named from its *Figure*, which is round. See *EAR*.

It was first discover'd by *Fran. Sydenh*: its *Use* is in the *Extension* and *Relaxation* of the *Tympanum*. See *TYMPANUM*.

ORBICULARIS, or *Constrictor Labiorum*, in *Anatomy*, is one of the *Muscles* of the *Lips*. See *CONTRACTOR*.

The *Orbicularis* is single; its *Fibres* make a *Ring* about the *Mouth*, and serve to constrict and draw up the *Lips*, and by that means to shut the *Mouth*, &c. It also serves to advance, or stretch them outwards; and has the chief part in the *Action* of *Kissing*. Whence it is also call'd *Osculatorius*, or the *Kissing* *Muscle*.

*Verbeeyn* will not have it one *Muscle*, but a *Pair*, whose *Fibres* meet, and join at both *Corners* of the *Mouth*; the other *Authors* are unanimous in making it single, and call it a *Sphincter*. See *SPHINCTER*.

ORBICULARIS, or *Depressor Palpebrarum*, is a *Muscle* springing from each *Corner* of the *Eye*, and answer'd by another of like *Figure* and *Structure* in the lower *Eye-lid*; which are therefore often consider'd as one *Orbicular* *Muscle*. See *EX-LID*.

Its *Fibres* invoin the *Eye-lids*, and are inserted into 'em, not unlike the *Sphincters* of other *Parts*. It is fasten'd to that part of the *Maegis* of the *Orbit*, towards the *Nose*, made by the fourth *Bone* of the upper *Jaw*.

ORBIT, in *Astronomy*, the *Part* of a *Planet* or *Comet*; or the *Line* describ'd by its *Centre* in its proper *Motion* in the *Heavens*. See *PLANET*, &c.

The *Sun's*, or rather the *Earth's* *Orbit*, is the *Curve* which it passes along in its annual *Revolution*; call'd the *Ecliptic*. See *ECLIPTIC*.

The *Orbit* of the *Earth*, and that of all the primary *Planets*, is an *Ellipsis*; in one of whose *Foci*, the *Sun* is plac'd; in which *Ellipsis* they move according to this *Law*, that a *Radius* drawn from the *Centre* of the *Sun* to the *Centre* of the *Planet*, always describes *Areas* proportional to the *Times*. See *EARTH*, *SUN*, &c.

The ancient *Astronomers* made the *Planets* describe *circular* *Orbits*, with an uniform *Velocity*. *Copernicus* himself could not believe they should do otherwise; *Fieri nequit*, says he, *ut Caeleste corpus simplex uno Orbe inaequaliter moveatur*. So that to account for their *Inequalities*, they were oblig'd to have recourse to *Eccentrics* and *Epicycles*; from the embarrass whereof, *Copernicus* himself could not entirely disintangle himself. See *EPICYCLE*, &c.

But after him came Astronomers, who, with a little more Physics, have made no difficulty of changing these circular *Orbits* into Elliptic ones; and of making 'em move with different Velocities in different Parts thereof.

Of these Elliptic *Orbits*, there have been two kinds assign'd: The first, that of *Kepler*, which is the common Ellipsis; to which *Joh. Ward*, tho' he himself keeps to it, thinks one might venture to substitute circular *Orbits*, by using two Points taken at equal Distances from the Centre on one of their Diameters, as they do in the Foci of the Ellipsis. The second is that of *M. Cassini*; whose Character is this, that the Products of the right Lines drawn from each Point of its Circumference are every where equal; whereas in the common Ellipsis, 'tis the Sum of those right Lines that is always the same. See ELLIPSES.

*M. Varignon* shows how inconsistent *Copernicus's* Sentiment is with the Mechanism of the Heavens: Since the Forces which Planets have to retain 'em in their *Orbits*, must almost always conspire to make 'em move with really different Velocities; and that among an infinity of Cases, there is but one wherein they can move uniformly.

The Semi-diameter of the Earth's *Orbit*, *Dr. Gregory* makes 94,696,969 Miles English; and the Semi-diameter of *Saturn's Orbit* about 10 times as great.

The *Orbits* of the Planets are not all in the same Plane as the Ecliptic, or the Earth's *Orbit* round the Sun; but variously inclined to it, and to one another. But still the Plane of the Ecliptic intersects the Plane of the *Orbit* of every Planet in a right Line, which passes through the Sun. See INCLINATION.

The Quantities of the Inclinations of the Planes of the *Orbits* of the primary Planets to that of the Ecliptic, are as follow: That of *Saturn*, is an Angle of a Degree  $\frac{1}{2}$ ; That of *Jupiter*, an Angle of 1 Deg. 30 Min. That of *Mars* is almost a Deg. *Venus* is a little more than 3 Deg. 20 Min. And that of *Mercury* a little more than 7 Deg. See SATURN, MARS, VENUS, &c.

The *Orbits* of *Comets*, *Cassini* takes to be Rectilinear; but *Dr. Halley*, from Sir *Isaac Newton's* Theory, shews them to be parabolical, having the Sun in one of their Foci. See COMET.

ORBITS, in Anatomy, the two large Cavities, wherein the Eyes are plac'd. See EVE.

Their Figure is pyramidal: They are form'd of six several Bones; and are perforated at bottom, to give passage to the Optic Nerves.

ORBITER, in Anatomy, a Name sometimes given to two Holes or Cavities, either from their Resemblance of, or Nearness to, the *Orbits* of the Eyes.

The *Orbiter Externus*, is the Hole in the Cheek-Bone below the *Orbit*.

The *Orbiter Internus*, is a Hole in the Coronal-Bone of the Scull, within the *Orbit*. See CORONAL.

ORCHARD, a Seminary or Plantation of Fruit-Trees, chiefly Apples. See FRUIT-TREE.

'Tis a Rule among Gardeners, that those *Orchards*, *ceteris paribus*, thrive best, which lie open to the South, South-West, and South-East; and are fence'd from the North: the Soil dry, and deep.

*Orchards* are stock'd by Transplantation; seldom by Semination. See PLANTING, NURSERY, &c.

The Season for transplanting Apple-Trees into *Orchards*, is in the Months *October* and *November*. If the Leaves be not all off at the time they are remov'd, they must be pull'd off. They are likewise to be prun'd. Trees may be transplant'd into *Orchards* after three Years Grafting; and ought not to be set at a less distance than eight Yards, nor greater than fourteen: And the richer the Land, the greater the Distance.

The Trees are transplant'd to best purpose, when young; for Trees ten or twelve Years old, a narrow Trench must be dug the *November* before, deep enough to meet the spreading Roots, at such a distance all around the Tree, as the Roots are to be cut off at. In making the Trench, the Roots to be cut off clean, and without splitting or bruising the Bark, and the Trench fill'd up again. This will enable the Tree, upon Removal, to draw more Nourishment than otherwise it would, and so thrive better in its new Mansion. See TRANSPLANTATION, INOCULATION, ENGRAFTING, &c.

The Side-Branched of all tall *Orchard Fruit-Trees*, are to be cut off till the Tree be arriv'd at the height desir'd. If the Tree be to spread low, some are to be left on each Side; so as to form a kind of Balance. For the first three Years, at least, they must not grow thick and bushy-headed; this must be prevented, by cutting off some of the inside Shoots, and such as grow cross each other, or pendant. See PRUNING.

The Soil, if not rich enough, is to be amended in two or three Years; by opening it around the Tree, and on the outside the Ground first dug, when the Tree was set; and

in a Month's time filling it up again with a proper Compost or Manure. See MANURE; see also PRUNING and COMPOST.

ORCHESTRA, in the Drama, the lower part of the ancient Theatre; made in form of a Semi-Circle, and surrounded by the Seats. See THEATRE.

It was so call'd, because in the *Grecian* Theatres it was a Place where they kept their Balls; from *ὄρχησθαι*, which signifies to dance.

The *Orchestra* among the *Greeks* made a part of the Scene; but on the *Roman* Theatres, none of the Actors went down to the *Orchestra*, which was taken up with Seats for the Senators; answering nearly to the *Pit* in our Theatre. See SCENE, &c.

ORDEAL, or ORDAEL, or ORDEL *Purgation*, a Form of Trial, i. e. of evincing Innocence or Guilt; practis'd in *England* in the time of *Edward the Confessor*, and since, as low as King *John* and King *Henry III.* See TRIAL.

It was call'd *Purgatis Vulgaris*, or *Judicium*, in opposition to *Bellum*, or *Combat*, the other Form of Purgation. See PURGATION and COMBAT.

The Practice of *Ordeals* did not only obtain in *England*, but also in *France* and *Germany*: It was condemn'd by *Pope Stephen II.* and abolish'd by a Declaration of *Henry III.*

The *Ordeal* was of various Kinds, viz. that of Fire, that of red-hot Iron, that of cold Water, that of judicial Postage, that of hallow'd Cheese, that of boiling Water, that of the green Cross, and that of Dice laid on Relicks, cover'd with a woollen Cloth.

But the more popular Kinds were those of red-hot Iron and Water: the first for Freeman, and People of fashion; the second for Peasants. See JUDICIUM, FIRE, WATER, &c.

'Tis a popular Story in our Histories, that *Emma*, Mother of *Edward the Confessor*, being accus'd of too much Familiarity with the Bishop of *Leicester*, demanded the *Ordeal* of red-hot Iron; and pass'd bare-footed, and hood-wink'd, over nine red-hot Plough-shares, without touching any of them.

The Word, in the original *Saxon*, signifies a great Judgment. There were particular Masses for these *Ordeals*.

ORDEFF, or OREDEFF, a Word frequently us'd in Charters of Privileges, for a Liberty whereby a Man claims the Ore found in his own Ground. See ORE.

It properly signifies Ore lying under ground; as, a Delf of Coal, is Coal lying in Veins under ground.

ORDER, in Architecture, a System of the several Members, Ornaments, and Proportions of Columns, and Pilasters: Or, a regular Arrangement of the projecting Parts of a Building; especially those of a Column: so as to form one beautiful Whole. See COLUMN.

*Perrault* defines an *Order* to be what is regulated by the Ordinance, when it prescribes the Proportions of entire Columns, and determines the Figure of certain Parts proper to them, according to the different Characters their different Uses and Ends require. See ORDONNANCE.

*M. Le Clerc* defines an *Order* to be a Column charg'd with an Entablature, and supported on a Pedestal.

The Definitions *Vitravianus*, *Barbare*, *Scamozzi*, &c. give of *Order*, are so obscure, that it were vain to repeat them; without dwelling, therefore, on the Definition of a Word, which *Cassian* has establish'd; 'tis sufficient to observe, that there are five *Orders* of Columns; three whereof are *Greek*, viz. the *Doric*, *Ionic*, and *Corinthian*; and two *Italic*, viz. the *Tuscan*, and *Composite*.

The three *Greek Orders* represent the three different Manners of Building, viz. the *Solid*, *Delicate*, and *Mean*; the two *Italic* ones are imperfect Productions thereof. The little regard the *Romans* had for these last, appears hence, that we don't meet with one Influence in the Antique, where they are intermix'd. That Abuse the Moderns have introduc'd, by the Mixture of the *Greek* and *Latin Orders*, *Dawkins* observes, arises from their want of Reflection on the Use made thereof by the Antients.

The Origin of *Orders* is almost as ancient as human Society: The Rigour of the Seasons first led Men to make little Cabins, to retire into; at first, half under ground, and the half above, cover'd with Stubble: At length growing more expert, they plant'd Trunks of Trees an-end, laying others a-cross, to sustain the Covering. See ARCHITECTURE.

Hence they took the Hint of a more regular Architecture; for the Trunks of Trees, upright, represent Columns: the Girts, or Bands, which serv'd to keep the Trunks from bursting, express'd Bases and Capitals; and the Summers laid a-cross, gave the Hint of Entablatures; as the Coverings, ending in Points, did of Pediments. This is *Vitravianus's* Hypothesis; which we find very well illustrated by *M. Blondel*. See CAPITAL, PEDESTAL, &c.

Others take it, that Columns took their Rise from Pyramids, which the Antients crested over their Tombs; and that the Urns, wherein they enclos'd their Ashes, repre-

vented the Capitals, whose Abacus was a Brick, laid thereon to cover the Urns: But *Vitrucius's* Account appears the more natural.

At length, the *Greeks* regulated the Height of their Columns on the foot of the Proportions of the human Body: The *Doric* represented a Man of a strong, robust Make; the *Ionie* that of a Woman; and the *Corinthian* that of a Girl: Their Bases and Capitals were their Head-Dresses, their Shoes, &c. See *BASE*, &c.

These Orders took their Names from the People, among whom they were invented: *Scamozzi* uses significative Terms to express their Character; when he calls the *Tuscan*, the *Gigantic*; the *Doric*, the *Herculean*; the *Ionie*, the *Maternal*; the *Composite*, the *Heroic*; and the *Corinthian*, the *Virginal*. See each Order under its proper Article, *TUSCAN*, &c.

To give a general Idea of the Orders; it must be observ'd, that the whole is compos'd of two parts at the least, viz. the *Column*, and *Entablature*; and of four parts at the most; when there is a *Pedestal* under the Column, and one *Acrotér*, or little Pedestal, a-top of the Entablature: That the Column has three parts, viz. the *Base*, the *Shaft*, and the *Capital*; the Entablature has three likewise, viz. the *Architrave*, the *Frieze*, and *Cornich*: Which Parts are all different in the several Orders. See each Part under its proper Article.

*Tuscan* ORDER is the first, most simple, and solid; its Column is seven Diameters high; and its Capital, Base, and Entablature, have but few Mouldings for Ornaments. See *TUSCAN*.

*Doric* ORDER, is the second, and the most agreeable to Nature. It has no Ornament on its Base, or on its Capital. Its height is eight Diameters. Its Frieze is distinguish'd by Triglyphs and Metopes. See *DORIC*.

*Ionie* ORDER, is the third; and a kind of mean Proportional between the solid and delicate Manner. Its Capital is adorn'd with Volutes, and its Cornich with Denticles. See *IONIC*.

*Mich. Angelo*, contrary to all other Authors, gives the *Ionie* a single Row of Leaves at the bottom of the Capital.

*Corinthian* ORDER, invented by *Callimachus*, is the fourth, the richest, and most delicate. Its Capital is adorn'd with two Rows of Leaves, and eight Volutes, which sustain the Abacus. Its Column is ten Diameters high, and its Cornich has Modillions. See *CORINTHIAN*.

*Composite* ORDER, the fifth and last, (tho' *Scamozzi* and *le Cleve* make it the fourth) is so call'd, because its Capital is compos'd out of those of the other Orders; having the two Rows of Leaves of the *Corinthian*, and the Volutes of the *Ionie*. It is also call'd the *Roman*, because invented among that People. Its Column is ten Diameters high; and its Cornich has Denticles, or simple Modillions. See *COMPOSITE*.

*Rustic* ORDER, is that adorn'd with Rustic Capitals, Bofages, &c. See *RUSTIC*.

*Attic* ORDER, is a little Order of low Pilasters, with an architrav'd Cornich for its Entablature; as that of the *Caille* of *Versailles* over the *Ionie* on the side of the Garden. See *ATTIC*.

*M. Blondel* calls the little Pilasters of *Attics* and *Mezzanines*, *filse Orders*.

*Persian* ORDER, is that which has Figures of *Persian* Slaves, instead of Columns, to support the Entablature. See *PERSIAN*.

*Caryatic* ORDER, is that whose Entablature is supported with Figures of Women, instead of Columns. See *CARYATIDES*.

*Gothic* ORDER, that which deviates from the Ornaments and Proportions of the *Antique*; and whose Columns are either too massive, in manner of Pillars; or too slender, like Poles: its Capitals out of all measure; and carv'd with Leaves of wild *Acanthus*, *Thistles*, *Cabbage*, or the like. See *GOthic*.

*French* ORDER, is a new contriv'd Order, wherein the Capital consists of Attributes agreeing to that People; as *Cocks-Heads*, *Flowers-de-Lys*, &c.

Its Proportions are *Corinthian*: Such is that of *M. le Brun*, in the Grand Gallery of *Versailles*; and that of *M. le Cleve*. *M. le Clerc* gives a second *Tuscan* Order, and a *Spanish* Order, besides his *French* Order. The *Tuscan* he ranks between the first *Tuscan* and *Doric*. Its height he makes 23 Semi-diameters, 22 Minutes. The Column to have 15, the Pedestal 5, and the Entablature 3, and 22 Minutes: And he proposes its Frieze to be adorn'd with *Turtles*, which are the Arms of *Tuscany*.

The *Spanish* Order he places between the *Corinthian* and *Composite*. The whole Order he makes 50 Semi-diameters, 28 Minutes; whereof the Column has 29, and 25 Min. the Pedestal 16, and 18 Min. and the Entablature 4, and 15 Min. The Horns of the Abacus he sustains with little Volutes; the middle, in lieu of a Rose, has a Lion's

Snout: that Animal being the Symbol of *Spain*; and expressing the Strength, Gravity, and Prudence of that Nation.

ORDER, is also used for a Class or Distinction of the Members of the Body of a State; with regard to Affinities, Precedence, &c.

In this sense, Order is a kind of Dignity, or honourable Quality, which, under the same Name, is common to several Persons; and which, of itself, does not give them any particular public Authority, but only Rank, and a Capacity of arriving at Honours and Employments.

To abridge this Definition; Order is a Dignity, with an Aptitude for a public Employ; by which it is distinguish'd from an Office, which has the Exercise and Function of a public Trust. See *OFFICE*.

In this sense, Nobility is an Order, &c. Clericature an Order, &c. See *NOBILITY*, &c.

ORDER is also the Title of certain ancient Books, containing the Divine Office, with the Order and Manner of its Performance.

*Roman Order*, that wherein are laid down the Ceremonies which obtain in the *Roman* Church.

ORDER, in Astronomy. A Planet is said to go according to the Order of the Signs, when it is direct; and proceeding from *Aries* to *Taurus*, thence to *Gemini*, &c. It goes contrary to the Order or Succession of the Signs, when retrograde, i. e. when it goes back from *Pisces* to *Aquarius*. See *DIRECTION*, *RETROGRADATION*, &c.

ORDER, in War, an Arrangement of the Parts of an Army, either by Land or Sea; or a Disposition of the Battalions, and Squadrons, of Men, or Vessels, for marching or engaging.

An Order of *Battel*, consists of one, two, or three Lines.

An Order of *March*, is dispos'd in two or three Columns, according to the Ground. The Orders and Evolutions make the Science of *Tactics*. See *TACTICS*.

Order is particularly used for the equal Distance of one Rank or File from another. The usual Order in Files is three Foot; in Ranks six Foot. The open Order is twice as much.

ORDERS, by way of Eminency, or Holy ORDERS; a Character peculiar to Ecclesiastics, whereby they are set apart for the Ministry. See *ORDINATION*.

This the *Romans* make their sixth Sacrament. See *SACRAMENT*.

In the Reformed Churches, there are but three Orders; viz. Bishops, Priests, and Deacons: In the *Romish* Church there are seven, exclusive of the Episcopate: All which the Council of *Trent* enjoins to be received and believ'd on pain of *Anathema*.

They are distinguish'd into *Petty*, or *Secular Orders*; and *Major*, or *Sacred Orders*.

The *Petty*, or *Minor Orders*, are four; viz. those of Porter, of Exorcist, of Reader, and of Acolytes. Those in *Petty Orders* may marry without any Dispensation. In effect, these *Petty Orders* are only look'd on as Formalities, and as Degrees necessary to arrive at the higher Orders; yet the Council of *Trent* is very serious about them; enjoins that none be admitted into them, without understanding *Latin*; and recommends it to the Bishops to observe the Intervals of conferring them, that the Persons may have a sufficient time to exercise the Functions of each Order: Yet it leaves the Bishops a Power of dispensing with those Rules; so that the four Orders are usually conferr'd the same day, and only make the first part of the Ceremony of Ordination.

The *Greeks*, as well as the Reform'd, disavow these *Petty Orders*, and pass immediately to the Sub-diaconate.

Their first Rite, *Flamy* dates in the time of the Emperor *Justinian*. There is no Call nor Benefice requir'd for the four *Petty Orders*; and a Bastard may even enjoy them without any Dispensation; nor does Bigamy disqualify.

The *Sacred*, or *Major Orders*, we have already observ'd, are three; viz. those of Deacon, Priest, and Bishop. See *DEACON*, *PRIEST*, and *BISHOP*.

The Council of *Trent*, retrieving the ancient Discipline, forbids any Person being admitted to the *Major Orders*, unless he be in peaceable possession of a Benefice sufficient for a decent Subsistence; allowing no Ordinations on Patronies or Penfions; except where the Bishop judges it for the Service of the Church.

A Person is said to be promoted to *Orders per saltum*, when he has not before pass'd the inferior Orders. The Council of *Constantinople* forbids any Bishop being ordain'd without passing all the Degrees; yet Church-History furnishes us with Instances of Bishops consecrated, without having pass'd the Order of Priesthood: and *Panormus* still thinks such an Ordination valid.

*Military* ORDERS, are certain Companies of Knights, instituted by Kings and Princes; either in defence of the Faith, or on other Occasions, as to confer Marks of Honour, and

and make distinctions among their Subjects. See KNIGHT.

There have been five Orders purely Military in England; viz. those of the Knights of the Garter, Knights Bannerets, Knights of the Bath, Knights Bachelors, and Knights Bannerets. See the Institution of each under its proper Article, GARTER, BATH, BARONET, &c.

The French have had five Military Orders, viz. that of the Genette, instituted by Charles Martel & but which soon fell. The Order of the Virgin Mary, since call'd the Order of the Star, instituted by King John in 1352. The Order of St. Michael, instituted in 1469, by Lewis IX. The Order of the Holy Spirit, or the like Ribbon; the Knights of the Holy Spirit are first to be Knights of St. Michael. Order of St. Louis, instituted by Louis XIV. in 1693.

The Princes of the Blood, Marshals of France, Admiral, and General, become Knights of St. Louis by their Office.

Religious Military Orders, are those instituted in defence of the Faith, and privileged to say Mass; and withal prohibited Marriage, &c.

Of this kind are the Knights of Malta, or of St. John of Jerusalem; such also were the Knights Templars, the Knights of Calatrava, Knights of St. Lazarus, Teutonic Knights, &c. See each under its proper Article, MALTA, TEMPLAR, &c.

Father Posignani accounts those Military Orders where Marriage is not allow'd, real Religious Orders. F. Poppebroch says, it is in vain to search for Military Orders before the XIIIth Century.

Religious ORDERS, are Congregations or Societies of Religious, living under the same Superior, in the same Manner, and wearing the same Habit. See RELIGIOUS and CONGREGATION.

Religious Orders may be reduced to five kinds, viz. Monks, Canons, Knights Mendicants, and Regular Clerks. See each under its proper Article, MONK, CANON, &c.

Father Mabillon shews, that till the IXth Century, almost all the Monasteries in Europe follow'd the Rule of St. Benedict; and that the distinction of Orders did not commence till upon the Reunion of several Monasteries into one Congregation. That S. Odo, Abbot of Cluny, began first this Reunion, bringing several under the Dependence of Cluny; That, a little afterwards, in the XIth Century, the Camaldules arose; then, by degrees, the Congregation of Vallombrosa; the Cistercians, Carthusians, Augustines; and at last, in the XIIIth Century, the Mendicants. He adds, that Lupus Servatus, Abbot of Ferrieres, in the IXth Century, is the first that seems to distinguish the Order of St. Benedict from the rest, and to speak of it as a particular Order. See BENEDICTINE.

White Order is the Order of Regular Canons of St. Augustine. See AUGUSTINE.

Black Order, the Order of Benedictines. These Names were first given these two Orders from the Colour of their Habit; but are disused since the Institution of several other Orders, who wear the same Colours.

Grey Order, the ancient Name of the Cistercians; but since the change of the Habit, the Name suits 'em no more. See CISTERCIANS.

ORDER, in the Geometry of Curves, see LINE and CURVE.

ORDINAL, ORDINALE, in our Law-Books, a Book containing the Order, or Manner of performing Divine Offices: *In quo ordinatur Missa, &c.*

ORDINAL, in Grammar, an Epithet given to such Numbers as mark the Order of things, or in what Rank they are placed. See NUMBER.

That, First, Second, Tenth, Hundredth, &c. are Ordinal Numbers.

ORDINANCE, or ORDONNANCE, a Law, Statute, or Command of a Sovereign, or Superior. See LAW, &c.

Ordinance of Parliament, is ordinarily used in the same Sense as Statute, or Act of Parliament. See STATUTE.

In the Parliament Rolls, Acts are often call'd Ordinances of Parliament: Tho' in some Cases we find a difference made between the two; Ordinances being only temporary things, and capable of being alter'd by the Commons alone; whereas an Act is a perpetual Law, and cannot be alter'd but by King, Lords, and Commons. See ACT.

Sir Edward Coke, however, asserts, That an Ordinance of Parliament is to be distinguish'd from an Act, inasmuch as the latter can be only made by the King, and the threefold Consent of the Estates; whereas the former is ordained with or by two of them.

Ordinance of the Forest, is a Statute made in the 34th Year of Hen. I. relating to Forest Matters. See ASSISE.

In the French Jurisprudence, Ordonnances are such Laws as are established by the King's Authority alone. All Ordinances begin with *a nos Prejens & a venir Salus*.

ORDINANCE, or ORDANCE, is also a general Term

for all sorts of Great Guns, or Cannon, used in War. See GUN and CANNON.

The several Parts of a Piece of Ordnance are thus nam'd, viz. The Outside, round about the Piece, is call'd the Superficies of her Metal. The Substance, or whole Mass of Metal is call'd her Body. The Part next us, when she stands ready to fire, the Breech or Coyle; and the Pummel, or round Knob at the end of it, the Cascadell; by some the Cascadell-Dovek. The Trunnions are the two Knobs, Spindles, or Ears, which hold the Piece in the Carriage. Manguions or Dolphins in the German Guns, are two Handles placed on the Back of the Piece near the Trunnions, and near the Centre of Gravity, to mount and dismount 'em more easily. The Rings about it are four: The Base-Ring is that which is next below the Touch-hole: The next above the Touch-hole is call'd the Reinforced-Ring: The next to that the Ornament-Ring: That at the Mouth, the Muzzle-Ring, or the Freeze: All the Rings near the Mouth are sometimes call'd the Freezes. As to the internal Parts; the whole Cavity or Bore of the Piece is call'd her Chafe. That part of the Cavity between the Trunnions and the Muzzle or Mouth, the vacant Cylinder: The part from the Trunnions to the end of the Cavity, or so much of it as containeth (or is loaded with) the Powder and Shot, is call'd the Chamber. The Diameter of the Mouth, the Calibre. The Space between the Shot, and the hollow Superficies of the Piece within, is call'd the Vent; being the difference between the Diameter of the Shot, and of the Mouth of the Piece.

Ordnance in England is distinguish'd into two kinds, viz. Field-Pieces, which are from the smallest to twelve Pounders; and Cannon of Battery, which are from a Calverin to a whole Cannon.

Each of these Divisions is again subdivided; the first into Bafe, Rabinet, Falconet, Falcon, Minion ordinary, Minion largest, Saker least, Saker ordinary, Demi-culverin least, and Demi-culverin ordinary. The second into Culverin least, Culverin ordinary, Culverin largest, Demi-cannon least, Demi-cannon ordinary, Demi-cannon large, and Royal whole Cannon.

The Lengths and Weights of each whereof, as also the Weights of the Bullets they carry; see express'd in a particular Table under the Article CANNON. See also each Piece under its proper Head, CANNON, DEMI-CANNON, CULVERIN, SAKER, &c.

The Strength and Serviceableness of a Piece of Ordnance depends very much on the thickness of the Metal, especially about its Chamber and Breech, which is call'd its Fortification.

Of this there are three Degrees both for Cannons and Culverins: Such as are ordinarily fortify'd, are call'd Legitimate Pieces. Those whose Fortification is lessen'd, are call'd Bazard Pieces. Those doubly-fortify'd, are call'd Extraordinary Pieces. The Fortification of a Gun is reckon'd from the thickness of the Metal at the Touch-hole, at the Trunnions, and at the Muzzle, in proportion to the Diameter of the Bore. The doubly-fortify'd Pieces are a full Diameter of the Bore in thickness at the Touch-hole,  $\frac{1}{2}$  of it at the Trunnions, and  $\frac{1}{3}$  at the Muzzle: The lessen'd Cannons have but  $\frac{2}{3}$ , or  $\frac{1}{2}$  of the Diameter of their Bore, in thickness at the Touch-hole,  $\frac{1}{3}$  at the Trunnions, and  $\frac{1}{4}$  at the Muzzle. All the double-fortify'd Culverins, and all the lessen'd Pieces of that kind, have a Diameter and  $\frac{1}{2}$  at the Touch-hole,  $\frac{1}{3}$  at the Trunnions, and  $\frac{1}{4}$  at the Muzzle. And the ordinary fortify'd Culverins, are every way as the double-fortify'd Cannon; and the lessen'd Culverins as the ordinary Cannon, in all respects. The ordinary-fortify'd Cannons have  $\frac{2}{3}$  at the Touch-hole,  $\frac{1}{3}$  at the Trunnions, and  $\frac{1}{4}$  at the Muzzle.

ORDINANCE, in Painting, for ORDONNANCE.

ORDINARY, something that happens, or passes frequently, usually. See EXTRAORDINARY.

Thus we say, the Ordinary Course of Things: Whatever is done without Miracles, is done by ordinary Agents.

Embassador, or Envoy in ORDINARY, he who is sent to reside staidly, and for a number of Years, in the Court of some Prince or State, to keep up a good Understanding, and see to the Interests of his Nation. See EMBASSADOR, ENVOY, RESIDENT, &c.

ORDINARY is also apply'd to several Officers and Servants belonging to the Household, who attend on common Occasions.

Thus we say, Physician in Ordinary, &c.

ORDINARY, in the Civil Law, is any Judge vested with Authority to take cognizance of Causes, in his own Right, as he is a Magistrate; and not by Deputation. See JUDGE.

ORDINARY, in Common and Canon Law, is the Bishop of the Diocese; or he who has Ordinary Ecclesiastical Jurisdiction within that Territory; and the Collation to Benefices therein. See BISHOP, COURT, ECCLESIASTICAL, &c.

There

There are several Chappels, Chapters, Abbeys, &c. exempted from the Jurisdiction of the Ordinary. See CHAPPEL, ABBEY, &c.

The *Romish* Canonists call the Pope Ordinary of Ordinaries, since by the Lateran Council he has usurped the Right of Collating, by Prevention, to all Benefices; in exclusion of the Ordinary Collators. See COLLATION.

ORDINARY of *Affairs* and *Sessions*, was a Deputy of the Bishop of the Diocese, antiently appointed to give Malfeasors their Neck-Verdict, and judge whether they read or not; also to perform Divine Service for 'em, and assist in preparing them for Death.

ORDINARY, or *Honourable* ORDINARY, in Heraldry, a Denomination given to certain Charges properly belonging to that Art. See CHARGE.

The *Honourable Ordinaries* are ten in Number, viz. the Chief, Pale, Bend, Fesse, Bar, Crozier, Saltire, Chevron, Bordure, and Orle. See each in its Place, CHIEF, PALE, &c.

The *Heralds* give several Reasons for their being call'd *Honourable*; viz. 1. Their great Antiquity, as having been used ever since Armoury was set on foot. And, 2. for that they denote the Ornaments most necessary for noble and generous Men: Thus the Chief represents the Helmet, Wreath, or Crown, covering the Head: The Pale represents his Lance or Spear: The Bend and Bar, his Belt: The Fesse his Scarf: The Crozier and Saltire, his Swords: The Chevron, his Bouts and Spurs: And the Bordure and Orle, his Coat of Mail.

As to the allotting or distributing of these Ordinaries, some Authors write, that when a Gentleman having behav'd himself gallantly in Fight, was presented to the Prince or General, and a suitable Coat-Armour ordered him; if he were wounded on the Head, they gave him a Chief; if in the Legs, he had a Chevron; and if by his Sword and Armour were discoloured with the Blood of Enemies, a Crozier or Bordure.

Some Authors have attempted to increase the Number of *Honourable Ordinaries* to twenty; adding to those above-mentioned, the plain Quarter, the Girou, the Escutcheon, Coppe dexter and sinister, Embranch dexter and sinister, Chausse dexter and sinister, and the Point. But these are not yet authorized.

ORDINARI, in Antiquity, a sort of Gladiators; being those appointed to exhibit Combats on certain stated days, &c. See GLADIATOR.

ORDINATES, in Geometry, and Conics, are Lines drawn from any Point of the Circumference of an Ellipsis, or other conic Section, perpendicularly across the Axis, to the other side. See CONIC SECTION.

The *Latus* call 'em *Ordinatum applicate*: Such are the Lines M M, (Tab. CONICS, Fig. 26.) any of each of these, as the Lines E M, are properly only *Secus ordinates*, tho' popularly call'd *Ordinates*. See SEMI-ORDINATE.

In *Curves of the second Order*; if any two parallel right Lines be drawn so as to meet the Curve in three Points: a right Line which cuts these Parallels so, as that the Sum of two Parts terminating at the Curve on one side the Secant, is equal to the third part terminated at the Curve on the other side; will cut all other right Lines parallel to these, and that meet the Curve in three Points, after the same manner; i. e. so as that the Sum of the two Parts on one side will be always equal to the third Part on the other side; and these three Parts equal on either side, Sir Isaac Newton calls *Ordinatum applicata*, or *Ordinates of Curves of the second Order*. See CURVE.

ORDINATE in a Parabola, } PARABOLA.  
ORDINATE in an Hyperbola, } HYPERBOLA.  
ORDINATE in an Ellipsis, } ELLIPSIS.

ORDINATE Ratio, is that wherein the Antecedent of the first Ratio is to its Consequent as the Antecedent of the second is to its Consequent. See RATIO.

ORDINATION, the Action of conferring Holy Orders; or of initiating a Candidate into the Diaconate, or Priesthood. See ORDERS.

The *Ordination of Bishops* is properly call'd *Consecration*. See BISHOP and CONSECRATION.

*Ordination* has always been esteem'd the principal Pre-rogative of Bishops; and they still retain the Function as a Mark of Sovereignty in their Diocese. In the antient Discipline, there was no such thing as a vague and absolute *Ordination*; but every one was to have a Church, whereof he was to be ordained Clerk or Priest.

In the 12th Century, they grew more remiss, and ordained without any Title or Benefice. See BENEFICE.

The Council of Trent restored the antient Discipline, and appointed that none should be ordained but those who were provided of a Benefice sufficient to subsid 'em. The Shadow of which Practice still obtains among us.

The Reformed hold the Call of the People the only thing essential to the Validity of the Ministry; and teach, that *Ordination* is only a Ceremony which renders the Call more August and Authentic. The Council of Rome in 744,

orders that no *Ordinations* shall be held except on the first, fourth, seventh, and tenth Months.

With us, *Ordination-Days* are the second Sunday in Lent, Trinity-Sunday, and the Sunday following the first Wednesday after September the 14th, and December the 13th.

Pope Alexander II. condemns *Ordination per saltum*, as they call it; i. e. the Passage to a superior Order without having pass'd the inferior.

ORDNANCE, or ORDINANCE-Office, is the standing, grand Magazine of Arms, Habilliments, Instruments, and Utensils of War, as well by Sea as Land; not only for those lodged in the Tower, but in all the Garisons, Castles, Forts, &c. in Great Britain, from whence, as occasion requires, his Majesty's Armies, &c. are supply'd. See OFFICE and ORDINANCE.

The Officers of the *Ordinance* are, the *Master-General*, from whom are derived all Orders and Dispatches relating to the same, as the Service shall best require. This Post has of late been annexed to the Office of General and Commander in Chief. See MASTER.

Under him is a *Lieutenant-General of the Ordinance*, who receives Orders from the *Master-General*, and the rest of the Prime Officers at the Board; sees 'em duly executed; orders the firing of the Guns on Days of Rejoicing, and sees the Train of Artillery fitted out, when order'd to the Field. See LIEUTENANT.

NEXT to him is the *Surveyor-General*, who has the Inspection of the *Ordinance*, Stores, and Provisions of War, in the Custody of the Store-keepers; he allows all Bills of Debt, keeps a Checque on Labourers, &c. See SURVEYOR.

Under these is a *Clerk of the Ordinance*, who records all Orders and Instructions given for the Government of the Office; with all Patents, Grants, Names of Officers, &c. draws all Estimates for Provisions, and supplies all Letters, Instructions, Commissions, Deputations, Contracts, &c. serves as a Checque between the two Accountants of the Office, the one for Money, the other for Stores.

This Office hath also a *Store-keeper*, who takes into his Custody all *Ordinance*, Ammunition, Stores, &c. thereto belonging; and indents, and gives in legal Security for the safe keeping thereof; and renders an exact Account from time to time.

Here is also a *Clerk of the Deliveries*, whose Duty is to draw up all Provisions, either at the Tower, or any other of his Majesty's Magazines, to see them duly executed, &c. And a *Treasurer*, thro' whose hands passes the Money of the whole Office, as well for payment of Salaries, as Debentures.

ORDONNANCE, or ORDINANCE, in Painting, the Disposition of the Parts of a Painting, either with regard to the whole Piece, or to the several Parts; as the Groups, Masses, Contrasts, Aspects, &c. See PAINTING.

The *Doctrine of ORDONNANCE* is compriz'd in the following Rules.

In the *Ordonnance* there are three things regarded, viz. the Place, or Scene, where; the Distribution, how; and the Contrast.

In the first, regard is to be had to the *Disposition* of things to serve as a Ground-Work; and to the *Plan*, or Position of Bodies: Under the former wherof, come, 1. The *Landscape*; whether an uninhabited Place, where there is a full liberty of representing all the Extravagancies of Nature; or inhabited, where the Marks of Cultivation, &c. must be exhibited. See LANDSCAPE.

2. The *Building*, whether Rustic; wherein the Painter's Fancy is at liberty; Or *Regular*; wherein a nice Attention is required to the Orders. See ORDER.

3. The *Mixture* of both; wherein 'tis a Maxim to compose in great Pieces, and make the Ground-Plot big enough; to neglect some little Places, in order to bestow more on the whole Mass; and to shew the more considerable Places with the more advantage; and to make some Agitation in all the things that move.

As to the *Plan* of Bodies; they are either solid; which again are either by Nature, and which must be proportion'd to their Places; or Artificial, where regard must be had to the Rules of Geometry, Perspective, Architecture, &c. Or they move; which they do, either by a voluntary Motion, wherein care must be had to proportion 'em to their Situation, and to strengthen 'em by the regarding Equilibrium; or by some extraordinary Power, as Machines, &c. where the Causes of their Motions must appear. Or they are things at a distance. In all which, an even Plane must still be propos'd to find their precise Situation, and settle their Place by sudden breaks and distances agreeable to their Perspective. See EQUILIBRIUM, PERSPECTIVE, &c.

In placing the Figures, regard must be had, 1. To the Group, which connects the Subject, and stays the Sight. In this are to be consider'd the Knot, or Node, which binds the Group; and the Nearness of Figures, which we may

call the Chain, as it holds 'em together; that the Group be sustain'd by something loose and distinct from it; and by the same join'd and continued to the other Groups; And that the Lights and Shadows be so dispos'd, as that we may at once see the Effects of all the Parts of the Composition. See **GROUP**.

2. To the *Attitudes*, wherein forced Attitudes are to be avoided; and simple Nature shewn in her most advantageous Postures. In weak and lean Figures, the Nudities not to be shewn; but occasions of covering 'em sought. In all human Figures, special Care to be taken, the Head be well placed between the Shoulders; the Trunk on the Haunches, and the whole on the Feet. See **ATTITUDES**.

3. To the *Drapery*; which is to be adjust'd so, as it may appear real Garments, and not Stuffs loosely thrown on. The Folds to be so dispos'd, as to leave the great parts wherein the Nudity may appear, free; ranging the little Folds about the Joints, and avoiding 'em on the Reliefs of the Members. And, lastly, to dispose the Draperies, by raising the Stuff, and letting it fall lightly, that the Air sustaining the Folds, may let 'em fall soft. See **DRAPEERY**.

Lastly, in the *Contrast*, are to be consider'd the Actions, which vary infinitely: The Aspects, which, in Actions of the same kind, may, by their difference, make a Contrast: The Situation, according as they meet above or under the Sight, far or near. And, lastly, the Custom; which extends, indeed, to all parts of Painting, but is particularly to be regard'd in the *Ordonnance*; to be managed discretely, however, and stiffness and formality avoided. See **CONTRAST**.

**ORDONNANCE**, in Architecture, is nearly the same as in Painting; viz. the Disposition of the Parts of a Building, both with regard to the whole, and to one another. See **BUILDING**.

*Vitruvius* defines *Ordonnance* to be that which regulates the Size of all the Parts of a Building with respect to their Use.

This Definition is censur'd by *M. Perrault*, who takes the *Ordonnance* to consist in the Division of the Plan or Spot of Ground whereon the Building is to be rais'd; i. e. in the apportioning or laying it out, agreeable with the intended Dimensions of the whole Fabric; which *Mr. Evelyn* expresses in fewer Words by the determining of the Measures of what is assign'd to compose the several Apartments.

On this Foundation, *Ordonnance* is the judicious Contrivance of the Plan or Model; as when the Court, Hall, Lodgings, &c. are neither too large nor too little: But the Court, &c. affords convenient Light to the Apartments about it, and is large enough for usual Access. The Hall of fit Capacity to receive Company; the Bed-Chambers accordingly, &c. When these Divisions are either too great or too small with respect to the Place, as a large Court to a little House, or a little Chamber in a magnificent Palace; the fault is in the *Ordonnance*.

This the Antients call'd *Taxis*; and distinguish'd it from *Diataxis*, Disposition; which is, where all the Parts and Members of a Building are assign'd their just Place and Situation with regard to their Quality, Office, Rank, &c. without any regard to the Dimensions or Quantity: As, that the Vestibule or Porch precede the Hall, the Hall the Parlor, that the Withdrawing Room, &c. The Bed-Chambers, again, to the Sun-rising; Libraries, Galleries of Paintings, and Cabinets of Curiosities, &c. to the North.

ORE, see **OAR**.

**ORGAL**, the Lees of Wine dried, and used by Dyers to prepare the Cloth for more readily taking their several Colours. See **DYING**, **COLOUR**, **TARTAR**, &c.

**ORGAN**, in Music, the largest and most harmonious of all Wind-Instruments. See **MUSIC**.

The Invention of the Organ is very ancient, tho' it is agreed it was very little us'd till the VIIIth Century. It seems to have been borrow'd from the *Greeks*. *Vitruvius* describes one in his tenth Book. The Emperor *Julian* has an Epigram in its praise. *St. Jerome* mentions one with twelve Pair of Bellows, which might be heard a thousand Fades, or a Mile; and another at *Jerusalem*, which might be heard to the Mount of Olives. The Structure of the modern Organ may be conceiv'd as follows.

The Organ is a Buffet containing several Rows of Pipes. The Size of the Organ is usually express'd by the length of its largest Pipe: Thus we say an Organ of 32 Feet, of 16 Feet, of 8 Feet, and of 4 Feet. Church Organs consist of two Parts, viz. the main Body of the Organ, call'd the great Organ; and the Positive, or little Organ, which is a small Buffet usually placed before the great Organ.

The Organ has at least one Set of Keys, when it has only one Body; and two or three, when it has a Positive. The large Organs have four, sometimes five Sets. Besides, the Pedals or largest Pipes have their Key, the Stops or Touches whereof are play'd by the Feet. The Keys of an Organ

are usually divided into four Octaves; viz. the second Sub-Octave, first Sub-Octave, middle Octave, and first Octave. Each Octave is divided into twelve Stops or Frets; whereof the seven black mark the natural Sounds, and the five white the artificial Sounds; i. e. the Flats and Sharps. So that the Keys usually contain 48 Stops, or Touches. Some Organs add to this Number one or more Stops in the third Sub-Octave, as well as in the second. Note, in Harpsichords and Spinets, the natural Stops or Keys are usually mark'd white, the artificial ones black. The Pedals have about two or three Octaves at the pleasure of the Organist: So that the number of Stops is undetermined.

Each Key or Stop press'd down, opens a Valve or Flap, which corresponds, lengthwise, to as many Holes as there are Rows of Pipes on the Sound-Board. The Holes of each Row are open'd and shut by a Register or Ruler pierced with 48 Holes. By drawing the Register, the Holes of one Row are open'd, because the Holes of the Register correspond to those of the Sound-board. So that by opening a Valve, the Wind brought into the Sound-board by a large Pair of Bellows, finds a Passage into the Pipe which corresponds to the open Hole of the Sound-board. But by pushing the Register, the 48 Holes of the Register, not answering to any of those of the Sound-board, that Row of Pipes answering to the push'd Register are shut. Whence it follows, that by drawing several Registers, several Rows of Pipes are open'd; and the same thing happens, if the same Register correspond to several Rows. Hence the Rows of Pipes become either Simple, or Compound; Simple, when only one Row answers to one Register; Compound, when several. The Organists say, a Row is Compound, when several Pipes play upon pressing one Stop.

The Pipes of the Organ are of two kinds; the one with Mouths, like our Flutes; the other with Reeds. The first call'd Pipes of Mutation, consist,

1. Of a Foot A A B B, (Tab. **MUSIC**, Fig. 1.) which is a hollow Cone, and which receives the Wind that is to sound the Pipe. 2. To this Foot is fasten'd the Body of the Pipe B D D. Between the Foot and the Body of the Pipe is a Diaphragm, or Partition E E F, which has a little, long, narrow Aperture to let out the Wind. Over this Aperture is the Mouth B C C; whose upper Lip C C, being level, cuts the Wind as it comes out at the Aperture.

The Pipes are of Pewter, Lead mix'd with a twelfth Part of Tin, and of Wood. Those of Tin are always open at their Extremities; their Diameter is very small, their Sound very clear and shrill. Those of Lead mix'd, are larger; the shortest open, the longest are quite stop'd; the mean ones partly stop'd, and having besides a little Ear on each side the Mouth, to be drawn closer, or set farther asunder, in order to raise or lower the Sound. The wooden Pipes are made square, and their Extremity stop'd with a Valve or Tampion of Leather. The Sound of the wooden and leaden Pipes is very soft; the large ones stop'd, are usually of Wood; the small ones of Lead. The longest Pipes give the greatest Sound; and the shortest the most acute: Their Lengths and Widths are made in the reciprocal Ratio's of their Sounds; and the Divisions regulated by their Rule, which they call *Diapason*. But the Pipes that are shut only have the Length of those that are open, and which yield the same Sound. Usually, the longest Pipe is 16 Feet; tho' in extraordinary Organs 'tis 32. The pedal Tubes are always open, tho' made of Wood and of Lead.

A Reed-Pipe consists of a Foot A A B B, (Tab. **MUSIC**, Fig. 2.) which carries the Wind into the Shalor, or Reed C D, which is a hollow Demi-cylinder, fitted at its Extremity D, into a kind of Mould I, by a wooden Tampion F G. The Shalor is cover'd with a Plate of Copper E E F F, fitted at its Extremity F F into the Mould by the same wooden Tampion: Its other Extremity E E is at liberty; so that the Air entering the Shalor, makes it tremble or shake against the Reed; and the longer that part of the Tongue which is at liberty F L, is made, the deeper is the Sound. The Mould I, which serves to fix the Shalor or Reed, the Tongue, Tampion, &c. serves also to stop the Foot of the Pipe, and to oblige the Wind to go out wholly at the Reed. Lastly, in the Mould is folder'd the part H H K K, call'd the Tube, whose inward opening is a continuation of that of the Reed. The Form of this Tube is different in the different Ranks of Pipes.

The degree of Acuteness and Gravity in the Sound of a Reed-Pipe, depends on the Length of the Tongue, and that of the Pipe C K, taken from the Extremity C of the Shalor, to the Extremity K of the Tube.

The Quality of the Sound depends on the Width of the Reed, the Tongue, and the Tube; as also on the Thickness of the Tongue, the Figure of the Tube, and the Quantity of Wind.

To diversify the Sounds of the Pipes, they add a Valve to the Port-vent, which lets the Wind go in Fits or Shakes.

**Hydraulic ORGAN**, a Musical Machine that plays by means of Water.

Of these there are several in Italy in the Grotto's of Vineyards. *Ctesibius of Alexandria*, who lived in the Reign of *Ptolemy Evergetes*, is said to have first invented *Organs* that play'd by compressing the Air with Water, as is still practis'd. *Archimedes* and *Vitruvius* have left us Descriptions of the *Hydraulic Organ*. *Felicien, de la Vie des Arabes*.

In the Cabinet of *Q. Christina*, is a beautiful and large Medallion of *Valentinian*, on the reverse whereof is seen one of these *Hydraulic Organs* ; with two Men, one on the right, the other on the left, seeming to pump the Water which plays it, and to listen to its Sound. It has only eight Pipes, placed on a round Pedestal. The Inscription is *PLACEA SPETRI*.

**ORGAN**, or **ORGUES**, in War, is a Machine composed of several Harquebuss or Musket-barrels, bound together ; by means whereof several Explofions are made at the same time ; used to defend Breaches, and other Places attack'd.

**ORGAN** is also used in the General for any thing framed, and destined for some certain Action, Use, or Operation. See **FUNCTION**.

Hence, **ORGAN**, or **ORGANICAL Part**, in Physiology, is such a Part of the Body as is capable of the performance of some perfect Act, or Operation. In which sense, all the Parts, even the most simple, might be denominated *Organical*.

These *Organs* are divided into *Primary*, and *Secondary*. The first are those composed of similar Parts, and appointed for some one single Function : Such as consist of several of these, tho' appropriated to one single Action, are called of the *secondary kind*.

Thus the Veins, Arteries, Nerves, and Muscles, are *Primary Organs* ; and Hands, Fingers, &c. *Secondary Organs*.

**ORGAN of Sense**, is that part of an animal Body by means whereof it perceives external Objects. See **SENSE**.

These, some divide into *Internal*, which is the Brain ; and *External*, viz. the Eye, Ear, Nose, &c. See **BRAIN**, **EYE**, **EAR**, **NOSE**, &c.

**ORGANICAL**, in the ancient Music, was that Part performed with Instruments. See **MUSIC**.

The *Organical* comprehended three Kinds of Instruments ; viz. *Wind Instruments*, as the Trumpet, Flute, &c. *Strunged Instruments*, as the Lute, Lyre, &c. And *Pulsatile Instruments*, or those play'd on by beating, as Drums, &c. See each in its place, **TRUMPET**, &c.

**ORGANICAL Part**, is that Part of an Animal or Plant destined for the performance of some particular Function. See **ORGAN** and **PART**.

**ORGANICAL Disease**, is a Disease in an *organical Part* of the Body, whereby its Function is impeded, suspended, or destroy'd. See **BODY**, **DISEASE**, &c.

**ORGANICAL Description of Curves**, is the Method of describing them on a Plane, by the regular Motion of a Point. See **CURVE**.

**ORGASM**, *Orgasmus*, in Medicine, an Impetus, or too quick Motion of the Blood, or Spirits ; whereby the Muscles are convulsed or moved with uncommon Force. See **SPIRIT**, **CONVULSION**, &c.

The Word is Greek, *οργασμος*, denoting violence, force, onfer.

**ORGIA**, in Antiquity, Feasts, and Sacrifices in honour of *Bacchus*, instituted by *Orpheus*, and chiefly celebrated on the Mountains by wild, distracted Women, call'd *Bacchantes*. See **BACCHANALIA**.

*Enthusiasm* derives the Word and the *οργια*, fury, madness. Others from *ορος*, Mountain ; because *Orpheus* removed from Thrace to Mount *Citheron*. Others from *οργια*, a Place consecrated to some Divinity. Others from *οργια*, to remove, repulse ; in regard the Prophane were to be driven away.

*Servius* says, that at first *Orgia* was a common Name for all kinds of Sacrifices among the *Greeks* ; of the same import with the word *Ceremonies* among the *Romans*.

The *Orgia* were also call'd *Orphica*, from their Initiator.

**ORGUES**, or **ORGAN**, in War, see **ORGAN**.

**ORGYIA**, an ancient Greek Measure, see **MEASURE**.

**ORIENT**, *Orient*, in Geography and Astronomy, the East, or East-point of the Horizon. See **EAST**.

It is thus call'd from the Latin *Orive*, to arise ; because it is in this Point the Sun rises. See **RISING**.

**ORIENT Equinoctial**, is particularly used for that Point of the Horizon wherein the Sun rises when it enters the Signs *Aries* and *Libra*. See **SPRING** and **AUTUMN**.

Northward of this is denominated *Orient Aestival* ; and Southward, *Orient Hybernai*.

**ORIENTAL**, something situated toward the East with regard to us ; in opposition to *Occidental*.

In this sense we say, *Oriental Pearl*, *q. d.* such as are found in the *East-Indies*. See **PEARL**.

**ORIENTAL Languages**, meaning the *Hebrew*, *Syriac*, *Chaldee*, and *Coptic*. See **LANGUAGE**.

**ORIENTAL Bezaard**, see **BEZAARD**.

In Astronomy, a Planet is said to be *Oriental*, when it rises in the Morning before the Sun. See **RISING**.

Hence *Oriental*, the turning a thing towards the East, or disposing it so as it may look towards the East.

In most Religions, particular *Circ* has been taken to have their Temples *oriental*. *St. Gregory Thaumaturgus* is said to have made a Mountain give way, because it prevented the *orienting* of a Church he was building.

**ORIFICE**, the Mouth or Aperture of a Tube, or Pipe, or other Cavity. See **TUBE**.

In Anatomy, **ORIFICE** is particularly used for the Mouths of the several Ducls, Vessels, and other Cavities ; as of the Bladder, Uterus, Stomach, &c.

The upper *Orifice* of the Stomach is the part where Hunger is felt ; the lower *Orifice* is call'd the *Pylorus*. See **HUNGER** and **PYLORUS**.

There are some Operations in Chymistry, where the *Orifice* of the Vessel must be seal'd hermetically. See **HEMATICALLY**.

The word *Orifice* is also used by Extension for the Aperture of a Wound, or Ulcer. See **WOUND** and **ULCER**.

**ORIGENIANS**, a Sect of ancient Heretics, who even surpass'd the Abominations of the *Gnostics*.

*St. Epiphanius* speaks of 'em as still subsisting in his time ; but in very small Number. He seems to fix their Rise about the time of the great *Origen* ; but does not say they took their Name from him. He distinguishes 'em from the *Origenists*, whom he derives from *Origen Adamantius* ; adding, indeed, that they first took their Name from one *Origen* ; by which he intimates, that it was not the Great. And *St. Augustine* says expressly it was another.

As to their Doctrine, all that Modesty will allow to be said, is, that they rejected Marriage ; that they used several Apocryphal Books, as the Acts of *St. Andrew*, &c. and that to excuse their open Crimes, they accused the Catholics of doing the same in private.

**ORIGENISTS**, Followers of the Errors of *Origen*. *St. Epiphanius* insists very largely on the Errors of this Father ; but as he declares himself too warmly against him, there may be somewhat of Exaggeration in what he says. Nor do *St. Jerom*, or *Theophilus of Alexandria*, seem to have kept their Zeal within the proper bounds in speaking of *Origen*. For which Reason, no doubt, it was that *St. Chrysostom* himself was accused of being an *Origenist*, because not so vehemently bent against him. *Origenism* spread itself chiefly among the Monks of *Egypt*.

**ORIGINAL**, a first Draught, Design, or Autograph of any thing ; serving as a Model, or Exemplar, to be imitated, or copied. See **DESIGN**, **MOULD**, &c.

Scarce any of the ancient Titles, Tenures, &c. are now found in the *Originals*. They are only *Vidimas*'s, or Copies collated with the *Originals*.

**ORIGINAL Sin**, is that Crime we become guilty of at our Birth ; by the Imputation of *Adam's* Disobedience. See **SIN**.

*Father Malvernon* accounts for *Original Sin* from Natural Causes, thus : Men at this day retain, in the Brain, all the Traces and Impressions of their first Parents. For as Animals produce their like, and with like Traces in the Brain ; whence it is that Animals of the same kind have the same Sympathies and Antipathies, and do the same things on the same Occasions : So our first Parents, after their Transgression, received such deep Traces in their Brain, by the Impression of sensible Objects, that 'twas very possible they might communicate 'em to their Children.

Now, as 'tis necessary, according to the Order established by Nature, that the Thoughts of the Soul be conformable to the Traces in the Brain ; it may be said that as soon as we are form'd in the Womb, we are infected with the Corruption of our Parents : For having Traces in the Brain like those of the Persons who gave us being ; 'tis necessary we have the same Thoughts, and the same Inclinations with regard to sensible Objects.

Thus, of course, we must be born with Concupiscence, and *Original Sin*. With Concupiscence, if that be nothing but the natural Effort the Traces of the Brain make on the Mind to attach it to sensible things ; and with *Original Sin*, if that be nothing but the Prevalency of Concupiscence ; nothing in effect, but these Effects consider'd as Victorious and as Masters of the Mind and Heart of the Child.

**ORIGINALIA**, in the Exchequer, are Records, or Transcripts sent to the Remembrancer's Office, out of Chancery ; and differ from *Records*, which contain the Judgments and Pleadings in Suits tried before the Barons.

**ORILLON**, in Fortification, a small rounding of Earth, lined with a Wall; raised on the Shoulder of those Batteries that have Calicements; to cover the Cannon in the retired Flank, and prevent their being dismounted by the Enemy.

There are other forts of *Orillons*, properly call'd *Shoulder-rives*, or *Epaulettes*, almost of a square Figure. See **EPAULEMENT**.

**ORION**, in Astronomy, one of the Constellations of the Southern Hemisphere. See **CONSTELLATION**.

The Word is form'd from the Greek *Ὠρεον*, to rain; the Antients supposing that it rais'd *Tecperts* at its rising and setting.

*Stars in the Constellation Orion*, in *Ptolemy's Catalogue* are 17, in *Tycho's 62*, in the *Britannic Catalogue 80*. The Names, Situations, Magnitudes, Longitudes, and Latitudes whereof are as follow:

*Stars in the Constellation ORION.*

**ORION'S River**, in Astronomy, a Constellation call'd *Eridanus*. See **ERIDANUS**.

**ORLE**, **ORLET**, or **ORLO**, in Architecture, a Fillet under the *Owls*, or *Quarter-round* of a Capital. See **FILLET**.

When 'tis at the Top or Bottom of the Shaft, 'tis call'd *Cantharus*. See **CANTHARUS**.

*Pallado* also uses the Word for the Plinch of the Bases of Columns and Pedestals. See **PLINTH**.

The Word is *French*; form'd from the *Latin*, *Orleum*, or *Orlam*; of *Ora*, a Border, or Litt.

**ORLE**, in Heraldry, an Ordinary in form of a Fillet, drawn round the Shield, near the Edge or Extremity thereof.

Its Breadth is but half that of the Bordure, which contains a sixth part of the Shield; the *Orle* only a twelfth: Add, that the *Orle* is its own breadth distant from the Edge of the Shield; whereas the *Bordure* comes to the Edge itself. See **BORDURE**.

There is sometimes one *Orle*, sometimes two, and sometimes three: When there are three or more, they take up the whole Shield.

The form of the *Orle* is the same with that of the Shield; whence it resembles an *Incuscutcheon*: as in the Figure adjoining.

When an *Orle* is flower'd, 'tis call'd a *Tressure*. If a Round of Martlets, *Cinque-foils*, &c. be placed about any Ordinary, in manner of an *Orle*, they are said to be *en Orle*, &c.

**ORLOPE**, in the Sea Language, the uppermost Space or Deck in a great Ship, from the *Main-Mast* to the *Mizen*.

**ORNAMENTS**, in Architecture, express all the Sculpture, or Carved Work, wherewith a Piece of Architecture is enrich'd. See **SCULPTURE** and **ENRICHMENT**.

*Vitruvius* and *Vignola* also use the Word to signify the *Entablature*. See **ENTABLATURE**.

*Ornaments*, in *Relievo*, are those cut in the Contours of Mouldings; as *Leaves*, *Shells*, *Scrolls*, *Flowers*, &c. *Ornaments*, in *Cross*, those cut within the Mouldings; as *Eggs*, *Flutes*, &c. See **MOULDING**.

**ORNITHOLOGY**, that Branch of Natural History, which considers and describes *Birds*, their Natures, Kinds, &c. See **BIRD**.

We have an excellent *Ornithology* of *Fr. Willoughby Esq*; and another of *Mr. Ray*, a *Posthumous Work*, which is only an Abridgment of the former, with the Addition of his *History*; and several Kinds wanting in the other.

*Willoughby*, herein, speaks with assurance of a Swan that lived 300 Years; and a Goose that they were obliged to kill at 80, by reason of its *Mischievousness*.

The Word is form'd from the *Greek* *ὄρνις*, and *λογος*, *Discourse*.

**ORNITHOMANCY**, a kind of Divination, or of arriving at the Knowledge of Futurity, by means of Birds. See **DIVINATION**.

*Ornithomancy*, among the *Greeks*, was the same with *Augury* among the *Romans*. See **AUGURY**.

**ORPHAN**, a Child, or Minor, destitute of Father; or that has neither Father, nor Mother.

Hence the *Trojan*, or Followers of *Jafes*, finding themselves, at his Death, without Chief or Conductor, took the Appellation of *Orphans*.

**ORPHANS Mary**, or **Tax**. See **DUTY**.

**ORPIMENT**, or **ORPIN**, by the *Latins*, *Auripigmentum*, a Mineral, or Semi-Metal, usually found in Copper Mines; and supposed to contain Particles of Gold; which may be extracted by Chymistry, but which were never found to countervail the Expence. See **MINERAL** and **SEMI-METAL**.

*Orpiment* is found in Stones, or Glebes, of several Sizes, and Figures: Its Colour is always yellow, intermixed with other Shades; as green, red, orange, &c.

Sometimes 'tis found almost quite red; which is the proper *Sandarach* of the Antients. See **SANDARACH**.

But that usually call'd *red Orpiment*, or *red Arsenic*, is only the yellow *Orpiment* heated to a great degree, and put in a Crucible, with Oil of Hemp-Seed, Olives, or Nuts.

Painters, Farriers, &c. make a great Consumption of this Mineral; but as it is found a violent Corrosive, and a dangerous Poison, it must be used with a great deal of Precaution.

*Orpiment* must be chosen of a Golden Yellow, easy to scale, and the Scales very thin, small, and shining like Gold.

Some make three Kinds of *Orpiment*; *White*, which is the same with *Arsenic*: See **ARSENIC**. *Yellow*, which is the proper *Orpiment*; and *Red*, which is *Sandarach* or *Realgal*. See **REALGAL**.

The *Indians* use *Orpiment*, corrected with Juice of Lemons, with good Success against Fevers.

**ORTEIL**, in Fortification. See **BRAME**.

**ORTHODORON**, an ancient Greek Measure. See **MEASURE**.

**ORTHODOXY**, a Soundness of Doctrine, or Opinion, with regard to all the Points and Articles of Faith.

*Orthodoxy* is used in opposition to *Heterodoxy*, or *Heresy*. See **HERESY**.

The Word is form'd from the Greek *ορθος*, Right, and *δοξα*, Opinion, Judgment.

**ORTHODOXY**, or *Fest of ORTHODOXY*, is also a solemn Feast in the Greek Church, instituted by the Emperors *Theodora*; still held on the first Sunday of *Lent*, in memory of the Restoration of Images in Churches, which had been taken down by the *Iconoclastes*. See **ICONOCLASTES**.

**ORTHOAGONAL**, in Geometry, *Right-angled*. When the Term is referred to a plain Figure, it supposeth one Leg or Side to stand perpendicular to the other; When spoken of Solids, it supposeth their Axis to be perpendicular to the Plane of the Horizon.

**ORTHOGRAPHY**, in Grammar, the Art of Writing, or Spelling justly, and with all the necessary Letters. See **WRITING** and **SPELLING**.

The Word is form'd from the Greek *ορθος*, and *γραφω*, *recta scriptio*.

That Diversity found in most of the modern Languages, especially the *French*, between the Pronunciation and *Orthography*, makes one of the principal Difficulties in acquiring 'em; yet does it arise from the same Source as the Languages themselves. See **LANGUAGE**.

The *Goths*, e. g. forming a new Language from the ancient *Latin*, took the Liberty to model the Words to their Fancy: At first, indeed, 'tis probable they wrote as they pronounced; but, by degrees, finding that Words pronounced with all their Letters sounded harsh, they began to pronounce more smoothly. Thus, in speaking, they thought fit to soften that Harshness resulting from the concurrence and clashing of Consonants; but as the *Orthography*, or Writing, did not offend the Ear, it still continued on its former footing.

Attempts have been since made to reduce the Writing to the Pronunciation, or to make us write as we speak; which has occasion'd great Disputes. *Pelleterius of Mass* was the first who pleaded for the Change of the *Orthography*; and after him *Maigner*, *Peter Ramus*, *de Bois*, *Ménage*, and others; but in vain.

They have, however, occasion'd a Schism among Writers, which has done more harm than the evil they intended to reform: The *French* Writers being now divided into two Parties; one of which retains to the *old*, and the other to the *new Orthography*. The latter, *F. Buffier* observes, is the more considerable Body, yet are they divided among themselves; some being for carrying the Reformation much farther than others.

The chief Matters urged in behalf of the ancient *Orthography*, are, that by changing it, we should lose sight of the Origin and Etymology of Words borrow'd from the Greek and *Latin*, &c. That it does not matter what Characters are used to express Sounds in writing, provided one know the relation between those Characters and the Sounds they represent: That by a necessary consequence of such Change, the Language would in time be all alter'd, and we should lose the Use of our old Authors; as ours, in their turn, would likewise become unintelligible.

What is alledged for the new *Orthography*, is, its being more commodious, natural, easy, short, &c.

Some Authors take a middle Course between the two Extremes; retrenching the Letters where they are absolutely useless, as the *s* in an infinity of Words; and yet studiously retaining all the Letters whereon the Etymology has any dependence.

In the *English*, the *Orthography* is more vague, and unascertain'd, than in any other Language we know of. Every Author, nay almost every Printer, has his particular System. Nay, 'tis scarce to well with us as that *r* We not only differ from one another; but there is scarce any that confits with himself. The same Word shall frequently appear with two or three different Faces in the same Work. See **ENGLISH**.

The Antients who have wrote Treatises of *Orthography*, are *Pellus Longus*, *Marius Vibronius*, *Flavius Caper*, *Cassiodorus*, and *Beda*. Among the Moderns, *Tercetius*, *Lipsius*, *Dausgusius*, *Scioppia*, *Valla*, and *Manutius* the younger, have wrote on the same Subject.

*Orthography* makes one of the great Divisions, or Branches of Grammar. See **GRAMMAR**.

**ORTHOGRAPHY**, in Geometry, the Art of Drawing, or delineating the fore-right Plan of any Object, and of expressing the Heights or Elevations of each Part.

It is call'd *Orthography* from its determining things by perpendicular Lines falling on the Geometrical Plane.

**ORTHOGRAPHY**, in Architecture, is the Elevation of a Building. See **ELEVATION**.

The *Orthography* is either External, or Internal.

*External Orthography* is a Delineation of the external Face or Front of a Building; exhibiting the principal Wall, with its Apertures, Roof, Ornaments, and every thing visible to an Eye placed before the Building.

*Internal Orthography*, call'd also a *Section*, is a Delineation, or Draught of a Building, such as it would appear, were the external Wall removed. See **SECTION**.

To lay down the **ORTHOGRAPHY** of a Building.

Draw a right Line for a Basis or ground Line, (Tab. **PERSPECTIVE**, Fig. 13.) A B, and at one end erect a Perpendicular A D. Upon A B set off the widths and distances of the Gates, Windows, &c. On the right Line A D, set off the Heights of the several Parts visible in the Face of the Building, e. g. of the Doors, Windows, the Roof, Chimneys, &c. and apply a Ruler to each Point of Division. The common Intersections of the right Lines drawn from three Points parallel to the Lines A B and A D, determine the external *Orthography* of the Building: And after the same manner is the internal *Orthography* laid down. See **PERSPECTIVE**.

**ORTHOGRAPHY**, in Fortification, is the Profile, or Representation of a fortify'd Place; or a Draught so conducted, as that the length, breadth, height, and thickness, of the several Parts are express'd; such as they would appear, if it were perpendicularly cut from Top to Bottom. See **PROFILE** and **FORTIFICATION**.

**ORTHOGRAPHY**, in Perspective, a Delineation of the fore-right Plane of any Object. See **PERSPECTIVE**.

**ORTHOGRAPHIC Projection** of the Sphere, is a Representation of the several Points of the Surface of the Sphere, as they would appear to the Eye, placed at an infinite distance; so call'd, because the Perpendiculars from any Point of the Sphere, will all fall in the common Intersection of the Sphere with the Plane of the Projection. See **PROJECTION**.

**ORTHOPNEA**, in Medicine, a great difficulty of Respiration, wherein the Patient is obliged to sit, or stand, to be able to breathe. See **RESPIRATION**.

An *Orthopnea*, is a Species, or Degree of an Asthma. See **ASTHMA**.

It may be caused from Pus, thick, or mucilaginous Juices or Polypus in the *Bronchia*; mercurial, and other Fumes, hindering the playing of the Lungs; Stoppage of Evacuations; Cachexies, ill Digestions, or whatever affords viscid Chyle, or occasions the Blood to run slower through the Lungs, either by straitening the Canals, or thickening the Blood, or hindering the Motion of the Animal Spirits, so that they cannot elevate the Breath; or that causes the Blood to be more rarefy'd, or more in Quantity, so that there is not sufficient room to receive it into the Vessels of the Lungs.

The Word is compounded of *ορθος*, right, and *πνεω*, to respire, breathe.

**ORTIVE**, *Ortus*, in Astronomy. *Ortus* or Eastern Amplitude, is an Arch of the Horizon intercepted between the Point where a Star rises, and the East Point of the Horizon, or the Point where the Horizon and Equator intersect. See **AMPLITUDE**.

**ORVIETAN**, an Antidote, or Counter-poison; so call'd, because invented and propagated by an Operator from *Orvieto* in *Italy*; who made Experiments thereof in his own Person, on the public Stage, after taking several Doses of Poisons. See **ANTIDOTE** and **POISON**.

In *Chearr's Pharmacopoeia* is a Method of making *Orvietan*; where it appears that *Traieac* is one of the principal Ingredients. See **TRIAEACA**.

**OS**, in Anatomy, see **BONZ**.

**Os Pubis**,  
**Os Sacrum**,  
**Os Ischium**,  
**Os Iliacum**,  
**Os Femoris**, &c.

Sec { **PUBIS**.  
**SACRUM**.  
**ISCHIUM**.  
**HYOIDES**.  
**FEMUR**, &c.

**OSCHEOCELE**, in Medicine, a kind of *Hernia*, whereof the Intestines descend into the *Serenum*. See **HERNIA**.

The Word is form'd from the *Greek* *ὄσχος*, *Serenum*, and *κύβη*, *Tumor*.

**OSCHOPHORIA**, in Antiquity, Feasts instituted by *Thebes*, in acknowledgment for his having destroy'd the *Minotaur*, and by that means freed his Country, *Athena*, from the Tribute of seven young Men, which were to be sent every Year into *Grete*, to be devoured by that Monster. See **MINOTAUR**.

Some say the *Oschophoria* were instituted in honour of *Minerva* and *Bacchus*, who had assisted *Thebes* in his Enterprize. Others, that they were in honour of *Bacchus* and *Arriadne*.

To celebrate the *Oschophoria*, the young People who had Fathers and Mothers alive, run to the Temple of *Bacchus* and that of *Minerva*, with Grapes in their Hands. He who arrived there first, was the Conqueror; and was to perform the Sacrifice by pouring out of a Phial a Mixture of Wine, Honey, Cheese, Flower, and Oil.

The Word is form'd from the *Greek* *ὄσχος*, Branch of a Vine laden with Grapes, and *φωρ*, I bear. *Plutarch* says, the *Oschophoria* were so named, because instituted by *Thebes* when on his Return to *Athena*; and the Feast celebrated after the *Vintage*.

**OSCILLATION**, in Mechanics, *Vibration*; or the reciprocal Ascent, and Descent of a Pendulum. See **PENDULUM**.

*Axis* of **OSCILLATION**, is a right Line, perpendicular to the apparent horizontal one, and passing thro' the Centre of the Earth; about which the Pendulum oscillates. See **AXIS**.

If a simple Pendulum be suspended between two Semi-cycloids, whose generating Circles have their Diameter equal to half the Length of the Thread; all the *Oscillations*, howsoever unequal, will be *Isochronal*, or *Equi-diurnal*. See **ISOCHRONAL**.

The Time of the entire *Oscillation* thro' any Arch of a Cycloid, is to the Time of the perpendicular Descent thro' the Diameter of the generating Circle, as the Periphery of the Circle to the Diameter. See **CYCLOID**.

If two Pendulums move in similar Arches, the Times of *Oscillations* are in a subduplicate Ratio of their Lengths.

The Numbers of *Isochronal Oscillations*, perform'd by two Pendulums in the same Time, are reciprocally as the Times wherein the several *Oscillations* are perform'd. See **CLOCK**.

*M. Huygens's* whole Doctrine of *Oscillation*, is founded on this Hypothesis; That the common Centre of Gravity of several Bodies, connected together, must return precisely to the same height whence it fell; whether those Weights return conjointly, or, whether after their Fall, they return separately; each with the Velocity it had then acquired. See **CENTRE** of Gravity.

This Supposition was oppos'd by several, and very much suspected by others. And others who inclined to believe it true, yet thought it too daring to be admitted into a Science, which demonstrates every thing.

At length *M. Bernoulli* demonstrated it by strict Geometry; by restoring the Weights to a Lever. After his Death, a more easy and natural Demonstration of the Centre of *Oscillation* was advanc'd by his Brother. The Substance whereof may be conceiv'd as follows.

A simple Pendulum of a determinate Length and Weight, rais'd to a determinate Height, whence it is to fall till it recover its vertical Line; employs, in that Fall or Demi-Vibration, a determinate Space of Time, which cannot be either greater or less. Which Time is necessarily such, because the agitative Force, i. e. the Force which produces the Motion of the Pendulum, is determin'd in every thing that concurs to the Formation thereof: so that it can only cause one certain Effect.

The agitative Force of the Pendulum is form'd of three Things: 1<sup>o</sup>. Of the Power or Moment of the Weight. 2<sup>o</sup>. Of the Mass or Body tied to the end of the inflexible Rod. 3<sup>o</sup>. Of the Distance of that Body from the Point of Suspension, or, which is the same, of the Length of the Rod or the Pendulum.

Now, 1<sup>o</sup>. The Power of the Weight, be the Cause what it will, is that Power which makes a Body fall, and that, v. gr. at the rate of fourteen Foot, in the first Second of Time. 'Tis visible, then, that this Force is the Effect of a Quantity which determines those fourteen Feet; and that a heavy Body would pass more or less Space in that same first Second, if the Force of the Weight were greater or less.

2<sup>o</sup>. As that Force is apply'd to each Point, or infinitely small Part of a Body, the greater this Body is, or the larger its Mass, the greater Quantity of Motion or Force it has.

3<sup>o</sup>. The Distance of the moving Body from the Point of Suspension, or the Rod, is always the Radius of a Circle, whereof the moving Body describes an Arch: And of consequence the greater the Radius is, *ceteris paribus*, the larger Arch the Body describes. And at the same time, the greater Height it falls from, the greater Velocity it acquires.

Now, the agitative Force of the Pendulum, is only that of the Body fasten'd to the End of the Rod. So that it is the Product of the Force of the Weight, of the Mass of the Body, and of its Distance from the Point of Suspension. The Force of the Weight therefore being always the same; and a Body or Weight fasten'd to the End of the Rod, always the same; 'tis impossible that two simple Pendulums of a different Length should be *Isochronal*, or should make their Vibrations in the same time: for by virtue of those different Lengths, the Velocities will be unequal, and of consequence, the Times of their Vibrations.

But if it be suppos'd that there are in Nature different Forces of Weight; it will then be possible that two simple Pendulums of different Lengths, should be *Isochronal*; the one animated by the natural Weight, the other by the imaginary one. If the imaginary Weight be greater than the natural one, the Pendulum imagin'd *Isochronal* to the natural one, will necessarily describe a larger Space or Arch in the same time; and of consequence the Weight will be fasten'd at a greater Distance from the Point of Suspension. Tho, to have an *Isochronism*, the two agitative Forces of the two Pendulums must be equal; yet of the three Things which compose these Forces, there are already two greater in the imaginary, than the real Pendulum: the third, therefore, i. e. the Mass of its Weight, must be diminish'd in the necessary Proportion. As the Space or Arch describ'd by the imaginary Pendulum, is greater than that by the natural Pendulum, in the same Ratio as the imaginary Weight is greater than the natural one; and a Radius of that Arch, greater in the same Ratio, are two Things inseparable: the two Weights will be always to one another, as those two Radii, or the two Lengths of the two Pendulums; which always gives the Expression of the imaginary Weight, and by a necessary Consequence, that of the diminish'd Mass of the Weight of the imaginary Pendulum. If the Weight be imagin'd less than that of the natural one, 'tis easy to observe how it is to be taken; but that were needless in our Design.

If now there be a compound Pendulum, charg'd with two Weights fasten'd to the same Rod; *M. Bernoulli* conceives each of those Weights removed to a greater Distance from the Point of Suspension, than it was before; but both to the same; and, diminish'd in Mass, in a due Proportion; so as that both together only make one simple Pendulum, animated with one Weight the Expression whereof is had, and *Isochronal* to the natural compound Pendulum.

Thus we shall have one simple natural Pendulum *Isochronal* to the compound natural one, by having a simple natural Pendulum *Isochronal* to the simple imaginary Pendulum before found; which is very easy: since as the imaginary Weight is to the natural, so is the Length of the simple imaginary Pendulum, to the Length of the simple natural Pendulum; and 'tis there is the Centre of *Oscillations* requir'd.

*Centre* of **OSCILLATION**, in a suspended Body, is a certain Point therein, each Vibration whereof is perform'd in the same manner, as if that Point alone were suspended at that Distance from the Point of Suspension.

Or, it is a Point, wherein, if the whole Length of a compound Pendulum be collect'd; the several *Oscillations* will be perform'd in the same time as before. See **PENDULUM**.

Its Distance, therefore, from the Point of Suspension, is equal to the Length of a single Pendulum, whose *Oscillations* are *Isochronal* with those of the compound one. See **CENTRE** of *Oscillation*.

**OSCITATION**, the Act popularly call'd *Yawning*. It is perform'd by expanding almost all the Muscles of voluntary Motion at the same time; but most considerably those of the Lungs: by inspiring a great Quantity of Air, very slowly, and after retaining it some time, and rarifying it, by

expelling it again slowly, and restoring the Muscles to their natural State.

Hence, its Effects are to move, accelerate, and distribute all the Humours of the Body, equally thro' all the Vessels; thereby disposing the Organs of Sensation, and all the Muscles of the Body, for the Performance of their respective Functions.

OSCUA, in Anatomy, a Term used for the Orifices, or Openings of the lesser Vessels. See ORIFICE, VESSEL, &c.

OSCULUM, in the new Analysis. A Circle described on the Point C, as a Centre (Tab. ANALYSIS, fig. 12.) with the Radius of the Evolute M C, is said to *oscilate*, kiss, the Curve described by Evolution in M; which Point M is call'd by the Inventor Huygens, the *Osculum of the Curve*. See EVOLUTE.

The Line M C, is also call'd the *Radius of the Osculum*. See RADIUS.

The Evolute BCE, is the Place of the Centres of all the Circles that *oscilate* the Curve A M I, described by Evolution. See EVOLUTION.

The Doctrine of the *Oscula of Curves*, is owing to Monf. Leibnitz, who first shew'd the Use of Huygens's Evolute in measuring the Curvatures of Curves. See CURVE.

OSCUUM PACIS. Antiently it was a Custom in the Church, that in the Celebration of Mass, after the Priest had consecrated the Wafer, and spoke the Words, *Pax Domini volens*, the People kiss'd each other, which was call'd *Oscium Pacis*. When this Custom was abrogated, another arose; and while the Priests spoke the Words, a Deacon or Sub-Deacon offer'd the People an Image to kiss; which they call'd, *Paxem*.

OSIANDRIANS, the Name of a Sect among the Reformed; so call'd from Andrew Osiander, Father of Luke.

Their distinguishing Doctrine was, That Man is justify'd formally, not by the Faith and the Apprehension of the Justice of Jesus Christ, or the Imputation of our Saviour's Justice, according to the Opinion of Luther, and Calvin; but by the essential Justice of God.

*Demi-Osiandrians*, were such among the *Osiandrians*, as held the Opinion of Luther and Calvin with regard to this Life; and that of Osiander with regard to the other: asserting, That Man is justify'd here by Imputation, and hereafter by the essential Justice of God.

OSSA, in Anatomy. See BONES.

OSSICLE, *little Bone*; a Diminutive of *O*, Bone. See BONE.

In this sense, the Term is used among Anatomists.

Bosmits also use it for the Stone of a Cherry, Plum, Apricot, or other Stone-Fruit. See STONE-FRUIT.

OSSIFICATION, in the Animal Economy, the Formation of the Bones. See BONE.

Bones, Dr. Drake argues, are form'd out of the most comminuted or broken part of the Blood; since we see that the Blood of old Men, which by a long Course of Circulation, becomes in a manner unfit for the common Office of Nutrition, will however *ossify*, and convert into Bones, many of the Tendons and Ligaments, and even the Coats of the Vessels themselves; whose Substance being next to the Bones the most compact, admits only of the smallest Particles of the Blood; which therefore soonest become *ossified*, as they are frequently found. See NUTRITION, &c.

OSTENSIO, was a Tax antiently paid by Merchants, &c. for leave to shew or expose their Goods to Sale in Markets.

OSTENSIVE Demonstrations, in Logic, such as plainly and directly demonstrate the Truth of any Proposition; in which they are distinguished from Apagogical ones, or Deductions *ad absurdum*, or *ad impossibile*, which prove the Truth propos'd, by demonstrating the Absurdity or Impossibility of the contrary. See DEMONSTRATION.

These *Ostensive Demonstrations* are of two sorts; some of which, barely, but directly, prove the thing to be; which they call *en*; and others demonstrate the Thing from its Cause, Nature, or essential Properties, and these are call'd in the Schools *orth*.

OSTEOCOLLA, in Natural History, *q. d. glue-bone*, a white, or ash-colour'd Stone, shaped like a Bone, and by some supposed to have a quality of uniting broken Bones; on which account it is order'd in some Plasters; but the present Practice has no such Dependence on it.

OSTEOCOPE, an acute Pain, wherein the Patient is affected as if his Bones were breaking.

It arises from a sharp Humour vellicating the *Pergastium*, or Membrane wherewith the Bones are invested.

It is particularly incident to scorbatic and pecky Persons. The Word is form'd from the Greek *ostion*, Bone, and *scopos*, to break.

OSTEOLOGY, that Part of Anatomy which teaches

the nature of the Bones of the human Body; their Form, Disposition, Articulation, Use, &c. See BONE.

Dr. Clopton Havers has given us an *Osteology*; in good repaire.

The Word is form'd from the Greek *ostion*, Bone, and *logos*, Discourse.

OSTIA, in Anatomy, a Term used indifferently with *Oscula*, *Orifices*, &c. for the Mouths or Apertures of the Vessels of the Body; as the *Ostia Vagine*, &c. See VAGINA.

OSTRACISM, a kind of popular Judgment or Condemnation among the *Athenians*; or a Sentence of Banishment against Persons whose too great Power render'd them suspected to the People; or, whose Merit and Credit gave Umbrage lest they should attempt something against the public Liberty, and their Power degenerate into Tyranny. See BANISHMENT.

It had its name *Ostracism*, in regard the People gave their Votes, by writing the Name of the Person to be banish'd in a Shell *ostracum*, and casting the Shells into an Urn.

This kind of Banishment had nothing infamous in it, as not being for any Crime; but, on the contrary, was held very honourable, as it was a Mark of Popularity.

It lasted for ten Years, but the banish'd Person had the full enjoyment of his Estate all the time.

*Ostracism* was null, unless there were 6000 Citizens in the Assembly of the People.

OSTRACITES, in Natural History, a kind of crusty Stone, reddish, and in form of an Oyster-shell, and, like that, separable into *Lamine*; found in several Places in Germany; and held of good Service in the Gravel.

Dr. Home, in the *Philos. Transact.* says, it rather dissolves the little Stones than forces 'em out, as not being remarkably Diuretic. He adds, that he prescribes it in Powder with a third part of *Flores Chamomeli*. The Dose is from half a Drachm to a whole one in white Wine.

OSTRACITES is also the Name of a kind of *Cadmia* found at the bottom of the Furnaces wher Copper is purify'd. 'Tis very heavy, and resembles an Oyster-shell, whence its Name. It is esteem'd astringent and detensive; and is an Ingredient in several Unguents. See CADMIA.

OTACOUSITIC, a Term apply'd to Instruments which aid or improve the Sense of Hearing. See HEARING.

The Word is form'd from the Greek *oticon*, Ear, and *aitis*, I hear. See ACOUSTIC.

OTALGIA, in Medicine, a Pain in the Ear.

The *Otalgia* usually arises from an Inflammation; sometimes from a sharp serous Humour, which vellicates the Membrane wherewith the Canal of the Ear is lined. It is sometimes also occasion'd by a Wound or Ulcer in that Part, or from some pungent Matter gather'd within the Ear.

The Word is form'd from the Greek *otitis*, Ear, and *algos*, Pain.

The Smoke of Tobacco convey'd into the Ear through a Pipe, *Emmett* recommends as good to alluage this Pain; as also *Millepedes* in a proper Vehicle of Oil.

The *Otalgia* sometimes arises from a Worm in the Ear; which is to be drawn our alive, or kill'd within. Warm Milk tempts the Worm to come forth; Wormwood Juice destroys it within. See WORMS.

OTIOSI, in the Hebrew Customs. The Learned are exceedingly divided about the *Decem Otiosi*, ten idle Persons in the Jewish Synagogues.

Some say, they were the three Presidents and the seven Readers; others that they were ten Persons hired to attend constantly at the Synagogue, because, without the Number Ten, it could be no regular Synagogue, nor legal Assembly; so that the *Decem Otiosi* were ten idle Folks kept in pay, to form, by their Presence, a legal Synagogue. See SYNAGOGUE.

*Varius* in his *Archi-Synagoga*, refutes this Opinion; and will have them to be ten Directors, or Officers in the Synagogue. He shews that each Synagogue had its Directors; and that the Number was greater or less according to the Dignity of the Synagogue; that the smallest had at least two; that, from the first times, each Synagogue had its Chief, call'd *Archi-Synagogus*, who had two Colleagues, to be present at the Ceremonies, and other Acts of Religion, and to take care every thing were done with decency; but that the *Archi-Synagogus* reserv'd to himself the Power of Teaching; That besides these three, the *Archi-Synagogus* nam'd several Readers, who read in the Synagogue every Saturday; and that these made the *Decem Otiosi* of the Synagogue; so call'd, because being disengaged from all other Employment, their whole Attendance was on Divine Service.

OVA, *Eggs*, in Natural History, see EGG.

OVA, in Anatomy, &c. are little spherical Bodies, in form of Bubbles, or Bubbles; consisting of two concentric

tric Membranula, replete with a limpid Humour like the White of an Egg; found under the external Membrane of the Ovaries of Women, and connected to the minute Orifices of the Vessels that compose the Substance of the Ovaries themselves by a Calix. See OVARY.

After the use of Venery, they swell sensibly, become more and more pellicid, their Membranes grow thicker, and at length raise that of the Ovary, in form of Papule; at last, breaking the Membrane of the Ovary, they are detach'd from their Calix, taken into the Cavities of the Fallopian Tubes, and thence convey'd into the Womb; where, being cherish'd and impregnated with the Male Seed, they commence Embrio's; or, for want of that, are again ejected. See CONCEPTION, FALLOPIAN Tube, MATRIZ, EMBRIO, &c.

OVA, in Architecture, are Ornaments in form of Eggs, carved on the Contour of the Ovals, or Quarter-round; and separated from each other by Anchors or Arrows Heads. See OVULO and QUARTER-ROUND.

The English usually call these Ornaments Eggs and Anchors.

Instead of Eggs, the Antients sometimes used Hearts; on which Foundation it was, that they introduced Arrows; to symbolize with Love.

OVAL, or Ellipsis, is an oblong curvilinear Figure, with two unequal Diameters; or, a Figure inclosed with a single curve Line, imperfectly round, its length being greater than its breadth; like an Egg, whence its Name. See OBLONG.

The proper Oval, or Egg-shape, is an irregular Figure, being narrower at one end than the other; in which it differs from an Ellipsis, which is the Mathematical Oval, and equally broad at each end.

The common People confound the two together; and the Geometricians also call the Oval, a false Ellipsis. See ELLIPSES.

The Method of describing an Oval chiefly used among Workmen, is, by a Cord, or String, as F. M. B. (Tab. GEOMETRY, Fig. 43.) whose length is equal to the greater Diameter of the Oval, and which is fasten'd by its Extremes to two Points or Nails E, f, plant'd in its longer Diameter; by which means the Oval is made as much longer, as the two Points or Nails are further a-part.

OVALE Foramen, in Anatomy, see FORAMEN Ovale.

OVALE Centrum, see CENTRUM Ovale.

OVULO, Ovum, in Architecture, a round Moulding, whose Profile, or Sweep, in the Ionic and Composite Capitals, is usually a Quadrant of a Circle; and whence it is also popularly call'd the Quarter-Round. See QUARTER ROUND. It is usually enrich'd with Sculptures among the Antients, in form of Chestnut-Shells; whence Vitruvius, and others of the Antients, call it *Echinus*, *Chestnut-Shell*. See ECHINUS.

Among us, it is usually cut with the Representation of Eggs, and Anchors, or Arrows-Heads, plac'd alternately; whence its Italian Name *Ovulo*, Latin *Ovum*, and French *Oeuf*. See OVA.

OVARY, in Anatomy, that Part of an Animal wherein the Ova or Eggs are form'd and lodg'd. See OVA.

The Ovaries in Women, are also call'd *Testes Muliebres*, Female Testicles; from their Use, which the Antients supposed analogous to that of the *Testes* in Men. See TESTES.

They are two in Number; lying near the ends of the Fallopian Tubes, two Fingers distance from the Uterus, to which they are connected by a strong Ligament, call'd *Vas deferens*, and in some measure by the Fallopian Tubes, and the broad Ligament about the Region of the *Illum*. They are fasten'd to the *Peritonaeum* by the Spermatic Vessels, by which means they are kept suspended about the same Height with the *Fundus Uteri*. See UTERUS.

Their Figure is Semi-oval; their Surface somewhat uneven; their Size different in the different Stages of Life. At the time of Puberty, when largest, they usually weigh a Drachm and half.

They are cover'd with a common Membrane from the *Peritonaeum*; their Substance is whitish, compos'd of a number of little thin membranous and slender Fibres, interwoven with Arteries, Veins, and Nerves.

Among these Fibres and Vessels are interspersed a number of little round Bodies, like Bladders; full of a limpid Substance, and call'd Ova, or Eggs, of great Use in Generation. See GENERATION.

OVATION, in the Roman History, a lesser Triumph allow'd to Commanders, for Victories won without the Effusion of much Blood; or for the defeating Rebels, Slaves, Pyrates, or other unworthy Enemies of the Republick. See TRIUMPH.

Their Entry was on foot, sometimes on horseback; but never in a Chariot; and they wore Crowns of Myrtle, call'd *Ovales*, having all the Senate attending in their Retinue.

The Word *Ovaris*, according to *Servius*, is deriv'd from *Ovis*, Sheep; because the Conqueror sacrific'd a Sheep on this occasion to *Jupiter*; whereas in the great Triumph, they sacrific'd a Bull. Others derive it from the Sound or Din of the Acclamations and Shouts of Joy made by the People in honour of the Solemnity; the People and Soldiery, on this occasion, redoubling the Letter O, as in the greater Triumph they did the Words *Io Triumphe*.

The Ovation was first establish'd in the Year of Rome 250, or 251; in honour of the Consul *Publius Valerius*, after his defeating the *Sabines*.

OVELTY of Services, in our Law-Books, an Equality of Services; as when the Tenant *Paravail* owes as much to the *Meln*, as the *Meln* does to the Lord Paramount.

OVER-RAKE, in the Sea-Language. When a Ship riding at Anchor, doth so over-beat her way into an Head-Sea, that she is wash'd by the Waves breaking in upon her; they say, the Waves do *Over-raise* her.

OVER-REACH, in the Manage, is when a Horse strikes his hind Feet against his fore Legs.

The Word is also used for a Strain, or painful Swelling of the Matter-Sinew of an Horse; occasion'd by such *Over-reach*.

OVER-FLOWING. See INUNDATION. The *Over-flowing* of Lands, used by our Husbandmen, is chiefly effected by diverting the Streams of Rivers, Brooks, Land-Floods, or Springs, or some part of them, out of their natural Channel.

When the Streams lie too low for this, they are made use of to turn such Engines as may raise a sufficient Quantity of Water to do it. The most usual Engine, on this occasion, is the *Persian Wheel*. See PERSIAN Wheel.

OVER-RULING an Objection, in Law, is the rejecting, or setting it aside.

OVER-RUNNING a Page, among Printers, is the ranning it over again, and disposing the Lines in a different manner. See PRINTING, CORRECTING, &c.

OVERSAMENSA, an ancient Fine or Penalty, impos'd, before the Statute of *Hue and Cry*, on such Persons, as bearing of a Murder or Robbery, did not pursue the Malefactor.

OVERT-ACT, a Term in Law signifying an open Act; or an Act capable of being manifested and proved; in which sense it is distinguish'd from an intentional Act.

So an *Over* Word, is a plain, open Word; from the French, *Overt*.

OVICULUM, in the ancient Architecture, a little *Ovum*, or Egg.

*Baldus* will have this to be the *Lesbian Astragal* of *Vitruius*. See ASPRACAL.

Some use the Word *Oviculum* for *Ovulo*. See OVULO.

OVILIA, or SEPTA, in ancient Rome, a Place in the *Campus Martius*, at first rail'd in, like a Sheep's Pen; whence its Name: Afterwards it was mounted with Marble, beautify'd with Walks and Galleries; as also with a Tribunal, or Seat of Justice: within which Precinct the People frequently assembled, to give their Suffrages for the Election of Magistrates. See CAMPUS.

The Ascend into the *Ovilia* was not by Stairs, but by Bridges made for the time; every Parish, Tribe, and Century, as the Assembly was *Centuriato* or *Tributo*, &c. having its proper Bridge. Whence the Proverb, *de Ponte deficiendus*, where a Person is to be barred from giving his Vote. See COMITIA.

OVIPAROUS, in Natural History, a Term apply'd to such Animals, as produce their Young *ab Ovo*, from Eggs; as Birds, Insects, &c. See OVO, INSECT, ANIMAL, &c.

The *Oviparous* Kind stands in opposition to those which bring forth their Young alive, call'd *Viviparous* Animals; as Man, Brutes, Reptiles, &c. See GENERATION, &c.

*Oviparous Animals*, may be defin'd to be such as conceive Eggs, which they afterwards bring forth; and from which, by the Incubation of the Parent, or some other Principle of Warmth and Fermentation, at length arise Animals; which after they have spent the Moisture or Humour they were surrounded withal, and are grown to a sufficient Bulk, Firmness, and Force; break their Shell, and come forth.

The *Oviparous* Kind, beside Birds, includes divers Species of Terrestrial Animals; as Serpents, Lizards, Tortoises; Crabs, Lobsters, Frogs, &c. See OVARY.

OUNCE, *Unctia*, a little Weight, the sixteenth part of a Pound *Avoirdupois*; and the twelfth of a Pound Troy. See WEIGHT and POUND.

The *Ounce Avirdupois* is divided into eight Drachms, and the Drachm into three Scruples. The *Ounce Troy* into twenty Penny Weights, and the Penny Weight into twenty-four Grains. See DRACHM, PENNY-WEIGHT, &c.

The *Ounce* makes the eighth Part of the French Mark, and is divided into three Gros, or Drachms; the Drachm into three Penny Weights, or Scruples; and the Scruple into twenty-four Grains: each Grain computed to weigh a Grain of Wheat. See GRAIN, &c.

All precious Merchandizes, as Gold, Silver, Silk, &c. are sold by the *Ounce*. See GOLD, SILVER, STANDARD, &c.

*Ounce Pearls*, are those too small to be sold by Tale; usually call'd *Seeds of Pearl*. See PEARL.

*Ounce Cottons*, are certain Cottons brought from *Damascus*, of a Quality superior to the rest. See COTTON.

The Word *Ounce* is deriv'd from the Latin *Unctio*, the twelfth Part of any Whole; particularly in Geometrical Measures, an Inch, or the twelfth Part of a Foot. See INCH.

Whence, UNCIAL Letters, large Letters used in Inscriptions, supposed to be an Inch high. See UNCIAL.

OURAN, or OURAN SOARQUES; the Title of a Sect of Magicians, in the Island *Grobbocanore*, in the *East-Indies*.

The Word implies *Men-Devils*; these People, it seems, having the Art of rendering themselves invisible, and passing where they please, and by that means, doing infinite mischief: for which reason the People hate and fear them mortally, and always kill them on the spot, when they can take them.

In the *Portuguese History*, printed 1581, *Falio*; mention is made of a Present made by the King of the Island, to *Britnia*, a *Portuguese* Officer, consisting of twelve of these *Ouzans*; with whom he made Incurions on the People of *Tidore*, kill'd great Numbers, &c.

To try whether, in effect, they had the Faculty ascribed to them, one of them was tied by the Neck with a Rope, without any possibility of disengaging himself by natural means; yet in the Morning 'twas found he had slipp'd his Collar.

That the King of *Tidore* might not complain, *Britnia* made war on him with Devils, he dismiss'd them at length into their own Island.

OUSTED, in our ancient Law-Books, a being removed, or put out of possession. From the *French Ouster*, to remove, to take away.

OUSTER *le Main*, or OYER *le Main*, to remove or take off the Hand, in Law, denotes a Livery of Lands out of the King's Hands; or a Judgment given for him that traversed or sued a *Monstrans le Droit*. See MONSTRANS *le Droit*.

When it appear'd upon the Matter discuss'd, that the King had no Right or Title to the Land he had seiz'd; Judgment was given in Chancery, that the King's Hands be removed. And thereupon, *Amovetur Manus* was awarded to the Echeator to restore the Land, &c.

But now all Wardships, Liveries, *Ouster le Main*, &c. are taken away and discharged by Statute 12 Car. 2.

OUSTER *le Mer*, in Law, a Cause of Excuse or Effoin; where a Man not appearing in Court upon Summons, it is alleg'd that he was then beyond the Seas.

The Term is compounded of the *French Oultra*, and *le Mer*, *q. d.* beyond the Sea.

OUTFANGTHEF, a Privilege whereby a Lord is enabled to call any Man (dwelling in his Fee, and taken for Felony in another place) to Judgment in his own Court.

The Word is form'd from the Saxon *ut, extra*, without; *fang, capio vel capus*; and *deaf, Thief*: *q. d.* For *extra-capus*.

OUT-LAW, *Utlawans*, one depriv'd of the Benefit of the Law; and left out of the King's Protection. See OUT-LAWRY.

*Beaſton* says, an *Out-Law* forfeits every thing he has; and that from the time of his *Outlawry*, he wears a Wolf's Head; and any body may kill him *Impune*: especially if he defend himself, or fly. But in the beginning of King *Edward* the Third's Reign, it was resolv'd by the Judges, that it should not be lawful for any Man, but the Sheriff alone (having lawful Warrant therefore) to put to death a Man *out-law'd*.

OUTLAWRY, or UTLAWRY, the Punishment of him, who being call'd into Law, and lawfully fought, does (after an Original Writ with a *Nil habes, tres Writs of Capias, alias & pluries*, return'd by the Sheriff, with a *Non est Inventus*, and an Exigent with a Procla-

mation awarded thereupon) contemptuously refuse to appear.

He must also be call'd at five County-Court-Days, a Month between each one; and if he appear not in that time, *Pro Ex-lege tenentis, cum Principi non obediat, nec Legi, & ex parte excipiantur*; *i. e.* he shall be pronounced to be out of the King's Protection, and deprived of the Benefit of the Law.

The Effect of which is, if he be *out-law'd* at the Suit of another, in a Civil Cause, he shall forfeit all his Goods and Chattels to the King: If on Felony, all his Lands and Tenements, which he has in Fee, or for Life, and all his Goods and Chattels. And then, according to *Bracton*, he may perish without Law, &c. A Minor, or a Woman, cannot be *out-law'd*. A Woman is said to be *wiv'd*, where a Man is *out-law'd*.

OUT-WORKS, in Fortification, those Works made without side the Ditch of a fortified Place, to cover and defend it. See WORKS and FORTIFICATION.

The most ordinary of these are Ravelins, or Half-Moons, form'd between the two Bastions, on the flank Angle of the Counterescarp, and before the Curtain, to cover the Gates and Bridges. See RAVELIN.

OUT-RIDERS, are Bailiffs Errant, employ'd by Sheriffs, or their Deputies, to summon People in the remotest Parts of their Hundreds, to the County or Hundred Courts. See BAILIFF.

OUT-PARTERS, in our ancient Writers, were a sort of Thieves, or Highway-men, on the Frontiers of *Scotland*, who rode about to fetch in such things as they could lay hold on. See INTAKERS.

OUVERTURE, or OVERTURE, *Opening*, or *Preſiding*; a Term used for the Solemnities at the beginning of a public Act, or Ceremony; as of an Opera, Tragedy, Concert of Music, &c.

The *Overture* of the Theatre, or Scene, is a piece of Music, usually ending with a Fugue.

The *Overture* of the Jubilee is a general Procession, &c.

OVUM *Philosophicum*, or *Gymnasium*, is a glass Body, of an oval Form, and resembling an Egg. See BODY.

OWLER, a Master of a Ship, or other Person, that conveys Wool, or other prohibited Goods in the Night, to the Sea-side, in order to ship them off, contrary to Law.

The Name is derived hence, that, like *Owl*, they only fly abroad in the Night-time.

OWSE, among Tanners, is Oaken Bark beaten, or ground small; to serve in the Preparation of Leather. See BARK and TANNING.

OXGANG of Land, is ordinarily taken, in our old Law-books, for fifteen Acres; in *Latin*, *Bovarus Terre*, *q. d.* quantum sufficit ad iter vel alium unius Bovis; as much as an Ox will plow. In *Linsinghire* they still corruptly call it *Oskie* of Land.

OXYCRATE, in Pharmacy, &c. a Mixture of Water and Vinegar.

The usual Proportion is one Spoonful of Vinegar to five or six of Water.

*Oxyerate* is proper to assuage and refresh. They make Fomentations of *Oxyerate*, Clysters of *Oxyerate*, &c.

The Word is form'd from the Greek *ξυς*, sharp, four, and *κρυσταλ*, I mix.

OXYCROCEUM, in Pharmacy, a Preparation much used in Plaisters, for Fractures, and to form Callus; is composed chiefly of Saffron, with Gums dissolved in Vinegar.

The Word is form'd from the Greek *ξυς*, sharp, four, and *κροκος*, Saffron.

OXYGALA, *Sour-Milk*. The *Turks* use this as a popular Drink, and call it *Ignr*. *Pescene* says, they drink four Milk diluted with Water, which is found to cool and nourish, much better than the Milk alone.

The Word is form'd from the Greek *ξυς* and *γαλα*.

OXYGONOUS, in Geometry, *acute-angled*; something with an Angle less than 90 Degrees. See ACUTE.

The Word is chiefly apply'd to Triangles, where the three Angles are all acute, or less than 90 Degrees each. See TRIANGLE.

OXYMEL, in Pharmacy, a Mixture of Honey and Vinegar.

There are two kinds of *Oxymels*; the one simple, the other compound.

The simple *Oxymel* is composed of two parts of good Honey, and one of White-Wine Vinegar, boil'd into the consistence of a Syrup; proper to incise and scour any Phlegm adhering to the Throat and Breast.

*Compound Oxyzel* only differs from the simple, in that to the Honey and Vinegar, they add the Decoction of the five major aperitive Roots, with the Seeds of Smallage, Parsley, and Fennel. It is used to open Obstructions of the Liver and Spleen.

The Word is form'd from the Greek *ὄζος*, four, and *μέλι*, Mel, Honey.

*OXYREGMIA*, in Medicine, a Sourness or Acidity of the Stomach-Liquor, occasioning Belches. From *ὄζος* and *ῥεγμῆ*, *ῥεγῆ*. See *RUCTATION*.

*OXYRRHODON*, a Mixture of two Parts of Oil of Roses, and one part of Vinegar of Roses, stir'd together for some time.

To these are sometimes added distill'd Waters. It is used for Inflammations, and to dry up Tetters.

*Scalder* prescribes it as follows; Two Whites of Eggs beaten, one Ounce and half of Vinegar of Roses, four Ounces of Rose-Water, and two Ounces of Oil of Roses.

The Word is composed of the Greek *ὄζος*, four, and *ῥοδόν*, Rose.

*OXYSACCHARUM*, a Syrup prepared with Vinegar, the Juice of four Pomegranats, and Sugar; used to cool, refresh, and resist the malignity of peccant Humours. From *ὄζος*, four, and *σακχαρῶν*, Sugar.

*OYER*, seems to have been antiently used for what we call *Affize*. See *ASSIZE* of *Novel Dissessin*.

*OYER and Terminer*, is a Commission especially granted to some eminent Persons, for the hearing and determining one or more Causes.

It is the first and largest of the five Commissions,

by which our Judges of Affize do sit in their several Circuits. See *JUSTICE*.

Antiently it was only in use upon some sudden Outrage or Insurrection in any Place. See *ASSIZE*.

The Term is French, and literally denotes to *hear* and *determine*. In our Statutes it is sometimes wrote *Oyer and Determiner*.

*OYER de Record*, is a Petition made in Court, praying that the Judges, for better Proof sake, will be pleased to hear, or look upon any Record.

In the like Sense one may demand *Oyer* of Bond, Deed, or Covenant.

*OYES*, a Corruption of the French *Oyes*, hear ye; being a Term, or Formula whereby the Cryers, in our Courts, enjoin Silence, or Attention e'er they make Proclamation of any thing.

*OZÆNA*, in Medicine, a fetid Ulcer, in one or both Nostriils; wherein the Humour is very acrid or corrosive, sanious, and sometimes mixed with a bloody Mucus. See *ULCER*.

It sometimes proceeds from neglected or ill-managed Wounds, Contusions, &c. in the Nostriils; especially in Scorbutic, Scrophulous, or Venereal Habits; and sometimes follows the Small-Pox.

It often spreads and eats thro' the *Ale*; and at other times preys into the *Sepsum Nasi*, *Cariloge*, and *Os Palati*; especially in Venereal Cases. Whence the great danger of the Nose in that Distemper. See *VENEREAL*.

The Word is Greek, *ὄζα*, which signifies the same thing.

## P A C

**P**, A Consonant, and the fifteenth Letter in the English Alphabet. See LETTER, CONSONANT, &c.  
When the P is follow'd with an H in the same Word, it has the Sound of an F; thus, *Philosophy* is pronounced *Filosophy*.

P and B are so like each other, that *Quintilian* declares, that in the Word *obtinuit*, his Reader required him to put a b, but that his Ears could hear nothing but a p, *optinuit*: Hence in ancient Inscriptions, and old Glossaries, it appears, these two Letters have been often confounded. See B.

Several Nations still pronounce one for the other, the Germans particularly, who say, *potum vinum* for *bonum vinum*.

*Pharac* observes, it was usual for those of *Delphos* to say *pharis* for *pharis*, *pharis* for *pharis*; and among the Latins, as often as an s followed, the b was changed into a p, as *scribo*, *scripsi*.

P in the Italian Music frequently represents *piuovo*; which is what in our Music we call *sfz*, i. e. the Force of Voice, or Instrument, are to be diminish'd, so as to make a Kind of Echo.

P P signifies *piu piano*, i. e. more soft, or a second Echo weaker or more remote than the former; and P P P signifies *piuissimum* faintest of all, or a third Echo, the Voice being, as it were, lost in the Air.

P. M. among Astrologers is frequently used for *post meridiem*, or Afternoon; and sometimes for *post mane*, after the Morning, i. e. after Midnight. See MORNING.

P was also used among the Ancients as a Numeral Letter, signifying the same with the G, viz. an hundred; according to the Verse of *Ugolin*.

*P finitum cum G numerum monstratur habere.*

Tho' *Borenius* thinks it rather stood for seven. See what has been observ'd, with respect to these Numeral Letters in general, under the Letter A.

When a Dash was added a-top p,  $\bar{p}$ , it stood for four hundred Thousand.

St. *Jerom* observes, on *Daniel*, that the Hebrews had no P, but that the *ph* serv'd 'em instead thereof. Adding, that therein but one Word in the whole Bible read with a P, viz. *aphod*.

P, in Prescription, is used for *Pugil*, or the eighth Part of a Handful. See PUIGIL.

P. E. signify *Partes Equales*, equal Parts of any Ingredients; otherwise denoted by 2 or *ana*. See ANA.

P P signify *Pulvis Patrum*, i. e. *Jesuit's Powder*, or the Cortex in Powder; which is so called, because first brought into Europe by those Fathers. See CORTEX.

PABULUM is sometimes used among Naturalists for *Fuel*; or that Part in combustible Bodies, which the Fire immediately acts on, or is supported by. See FIRE.

The oily or sulphurous Part of Fuels is the only proper *Pabulum*. 'Tis that alone, wherein Fire can inhere. See FUEL, SOLIDUM, &c.

PACALIA, a Feast held among the ancient Romans, in Honour of the Goddess *Pax*, Peace.

*Abraham*, de *Laus. Virgin.* and *Bibb. Patrum*, speaking of the impure Festivals and Ceremonies of the Heathens, calls one of 'em *Pacalia*, which Passage *Gronovius* charges as faulty, alleging, that there was no Feast of that Name, but that it should have been *Pacalis*.

The Ancients, who personified, and even deified every Thing, were not forgetful of Peace. She had an Altar at *Rome*, and a stately Temple, and religious Rites were paid her with great Solemnity.

PACE, *Passus*, *Step*, a Measure, taken from the Space between the two Feet of a Man, in walking. See MEASURE.

The ordinary Pace of a Man is two Foot and a Half. The Geometrical or German Pace is five Feet. See FOOT.

The Ancient, Roman, and modern Italic Mile consists of a thousand Paces, *Mille Passus*. The French League is 3000 Paces, the German 4000. See MILE, LEAGUE, &c.

PACE, in the Manage, is a certain Manner of Motion or Progression of a Horse.

The Natural Paces of a Horse are three, viz. the *Walk*, *Trot*, and *Gallop*, to which may be added an *Amble*; because some Horses have it naturally. See each under its proper Article, TROT, GALLOP, &c.

For the artificial Paces, see AIRS.

Horses that mix their Paces, i. e. shuffle betwixt a Walk and Amble, &c. are seldom of any Value. The Defect proceeds from their fretful, fiery Temper; and sometimes from a Weakness either in their Reins or Legs.

PACE is more particularly understood of that easy low Motion wherein the Horse raises the two Feet diametrically opposite at the same time; call'd also *Amble*. See AMBLE.

PACIFIC, something peaceful, or free from Troubles, Tumults, &c. See PEACEABLE.

Geographers call the South Sea, *Mare Pacificum*, the Pacific Ocean; as being less infested with Storms than the Atlantic. *M. Frezier* affirms, it does not deserve that Appellation,

## P A D

and that he has seen as violent Tempests there in as in any other Sea: But *Magellan*, happening to have a very favourable Wind, and not meeting with any thing to ruffle him, when he first traversed this vast Ocean in 1520, gave it the Name, which it has retained ever since. *Marty*, however, adds, that the Wind is so regular, that the Vessels wou'd frequently go from *Acapulco* to the *Philippine* Islands, without shifting a Sail.

In the ancient Church, they gave the Name *Pacific Letters* to all Sorts of Letters Testimonial, given by the Bishop or Chorepiscopus to their Priests when they had occasion to travel abroad, certifying that the Bearer was a Catholic, and in Communion with the Church. The Life of Pope Sixtus I. taken from the Pontifical of Pope *Damasus*, mentions that Pope as the first who introduced those Letters call'd *Formate* or *Canonice*, *Communitatis*, *Communicatorie*, *Ecclesiastice*, & *Pacifice*.

PACIFICATION the Act of Re-establishing the public Peace and Tranquillity.

The Word is particularly appropriated to the Periods put to the Religious Broils rais'd in France, in the Year 1562, by the Edict of *Nantes*; and the Civil Comotions, between the *English* and *Scots*, ended in 1636. See EDICT.

PACIFICATOR is commonly understood in the same Sense with *Mediator*: But *Wicquefort* makes a Difference.

The Peace being concluded between France and England, in 1621, the Instruments on each Side were put in the Hands of certain Embassadors, who had been employed as *Pacificators*, not as *Mediators*; to be kept till such Time as the Ratiifications had been exchanged. So, the Archbishop of *Pise*, the Duke of *Tiffney's* Embassador at *Madrid*, was never esteem'd a *Mediator*, tho' the French Embassadors allow'd him to be present at the Conferences held with the Commissioners of *Spain*, to act as a *Pacificator* of the Differences between 'em. The Grand Duke had not offer'd his Mediation; nor wou'd France have accepted it. *Wicquefort*, p. 2. Sect. 2.

PACK in Commerce. A Pack of Wood is a Horse's Load, containing 17 Stone, and 2 Pounds, or 140 Pound Weight. See SAREEAR and WOOL.

PACT, PACTUM, or PACTIO in Law, a Treaty, Covenant or Convention between divers Parties. See COVENANT.

The Word is form'd of the Latin *pacisci*, to bargain, agree, &c.

The Lawyers say, *Ex nudo pacto non oritur Lex*. See CONTRACT.

PACTUM, PACTIO, PACT is particularly used in the Civil Law, for the Consent of two or more Parties to the same Thing.

*Duorum aut plurium in idem consensus*, L. III. §. 2. ff. de pactis.

There are two Species of Conventions, viz. the *Pact* and *Contract*. A *Pact* against good Manners, against publick or natural Equity, is null.

PACTA COVENANTA, in Poland, are the Articles agreed on between the King and the Republic; and which they mutually oblige each other to observe.

PADDOCK or *Paddock-Cowse*, a Piece of Ground, conveniently taken out of a Park, ordinarily a Mile long, and a Quarter of a Mile broad, encompassed with Pales, or a Wall, for the exhibiting of Races with Greyhounds for Wagers, Plates, or the like. See PARK.

At one End of the *Paddock* is a little House, where the Dogs are to be enter'd, and whence they are flipp'd, near which are Panns to inclose two or three Deer for the Sport.

The Deer, when turn'd loose, run all along by the Pale; and the Spectators are placed on the other Side.

Along the Course are several Posts, viz. the *Low-post*, 160 Yards from the Dog-house and Panns. The *Quarter of Mile Post*, *Half Mile Post*, *Pinching-post*; and the *Ditch*, a Place made to receive the Deer, and preserve 'em from farther Pursuit.

Near the Ditch, are placed Judges or Triers. The Keeper, to slip the Dogs fairly, puts a *falling Collar* upon each, to slip thro' a Ring, and the Deer being turned loose and put forward by a Teazer, as soon as it is arriv'd at the Law-post, the Dog-house Door is thrown open and the Dogs flipp'd.

If now, the Deer swerve so much, as that his Head is judg'd nearer the Dog-house than the Ditch, before he arrive at the Pinching-post; it is no Match; but must be run over again three Days after. If there be no such Swerve, but the Deer runs straight as far as the Pinching-post, then the Dog nearest him, if he chance to swerve, or by any Accident, be blanch'd; or if there be no such Swerve, &c. the Dog that leaps the Ditch first, wins the Match.

PADUAN, among Medallists, a Modern Medal in Imitation of the Antique; or a new Medal struck with all the Marks and Characters of Antiquity. See MEDAL.

with a considerable *Impetus* will break thro' the Interstices of the Fibres, where it is less than the Capacity of such Interstices, and moved obliquely: And because the Superficies of the Fibres are not wont to be contained under Geometrical Right Lines, but to have Particles standing out and prominent; these it divides from one another. And thus any Body, of whatsoever Figure, may occasion in us Pain, fo it be big enough to distend the Vessels beyond their wonted Measure, or small enough to enter the Pores in the Sides of a Canal, with an *Impetus* in the Manner intimated.

And what is thus advanced, with relation to Things within the Vessels, may be easily apply'd to others out of the Vessels.

**PAIN**, in Medicine, consider'd as a Symptom of a Disease, makes a considerable Article in a Palliative Cure. See PALLIATIVE.

Pain is mitigated or asswaged divers Ways; as 1. by diluting and softening of Acrimonies, with warm Water mix'd with Flower apply'd by way of Drink, Fomentation, Clyster or Bath. 2. by resolving and washing away Obstructions, by the same Means and Resolvents. 3. By relaxing the nervous Vessels, with Drinks, Fomentations, Baths, the Species of Relaxants, Anodynes and Aperients. 4. By correcting the Acrimony itself with proper Remedies. 5. By freeing the obstructed, and acrimonious Parts from the too much Pressure of the vital Humour; and by softening, and suppurating, and depurating 'em. 6. By rebating or desending the Sense by Narcotics, either internally or externally. See NARCOTICK, &c.

**PAIN FORS, & DURE**, in Law, an especial Punishment for one, who being arraigned of Felony, refuses to put himself upon the ordinary Trial of God and his Country, and thereby stands mute by the Interpretation of Law. See MUTE.

This is vulgarly called *Pressing to Death*. The Process whereof is thus prescribed:

"He shall be sent back to the Prison, whence he came, and be laid in some low dark Houfe, where he shall lie naked on the Earth, without any Litter, Rashes, or other Cloathing, and without any Raiment about him, but only something to cover his Privy-Members; and he shall lie upon his Back with his Head covered, and his Feet; and one Arm shall be drawn to one Quarter of the Houfe, with a Cord, and the other Arm to another Quarter, and his Legs in the same Manner: Let there be laid upon his Body Iron, or Stone, as much as he may bear, or more; and the next Day following, he shall have three Morfels of Barley-Bread without Drink; and the second Day he shall have Drink three Times, as much at each Time as he can drink, of the Water next unto the Prison, except it be running Water; without any Bread: And this shall be his Diet, till he dies.

**PAINIM**, the same with *Pagan*. See PAGAN.

**PAINTING**, the Art of representing natural Bodies, and giving 'em a Kind of Life, by the Turn of Lines, and the Degrees of Colours.

*Painting* is said to have had its Rise among the *Egyptians*: And the *Greeks*, who learn'd it of 'em, carried it to its Perfection; if we may believe the Stories related of their *Apelles*, and *Zeusis*.

The *Romans* were not without considerable Masters in this Art, in the later Times of the Republic, and under the first Emperors; but the foundation of *Barbarians*, who ruin'd Italy, proved fatal to Painting, and almost reduced it to its first Elements. It was in *Italy*, however, that the Art returned to its ancient Honour, and in the Beginning of the XVth Century; when *Cimabue*, betaking himself to the Pencil, translated the poor Remains of the Art, from a *Greek Painter* or two, into his own Country.

He was succeeded by some *Florentines*: The first who got any Reputation was *Ghirlandajo*, *Michael Angelo's* Master; *Pietro Perugino*, *Raphael Urbino's* Master; and *Andrea Verocchio*, *Leonardo Da Vinci's* Master.

But the Scholars far surpassed the Masters; they not only effaced all that had been done before 'em, but carried Painting to a Pitch from which it has ever since been declining.

'Twas not by their own noble Works alone that they advanc'd Painting; but by the Number of Pupils they bred up, and the Schools they form'd.

*Angelo*, in particular, founded the School of *Florence*; *Raphael*, the School of *Rome*; and *Leonardo*, the School of *Milano*; to which must be added, the *Lombard's* School, establish'd about the same time, and which became very considerable under *Georgian* and *Titian*. See SCHOOL.

Besides the *Italian* Masters, there were others on this Side the Alps, who had no Communication with those of *Italy*; such were *Albert Durer*, in *Germany*; *Holbein*, in *Switzerland*; *Lucas*, in *Holland*; and others in *France* and *Flanders*: but *Italy*, and particularly *Rome*, was the Place where the Art was practis'd with the greatest Success; and where, from Time to Time, the greatest Masters were produced.

To *Raphael's* School, succeeded that of the *Caracci*, which has lasted, in its Scholars, almost to the present Time; wherein the *French Painters*, by the Munificence of the late *Louis XIV.* seem almost in Condition to vie with those of *Greece* or *Italy*.

In *Paris* they have two considerable Bodies of Painters, the one, the *Royal Academy of Painting and Sculpture*, the other the *Community of Masters in Painting, Sculpture, &c.* See ACADEMY.

The Art of *Painting* is divided, by *Freyssy*, into three principal Parts, *Invention, Design, and Colours*; to which some add a fourth, viz. *Dispositum*.

*Felicien* divides *Painting* into the *Composition, the Design, and Colours*.

Monf. *Tetshin*, Painter to the late King, divides it, somewhat more accurately, into the *Design or Draught, the Proportion, the Expression, the Clair-obscure, the Ordonnance, and the Colouring*; to which his *English* Translator adds the *Perspective*. Under each of these Heads, he gives us the Rules and Sentiments of the best Masters, which see under their proper Articles in this Dictionary, *DESIGN, PROPORTION, EXPRESSION, CLAIR-OBSCURE, ORDONNANCE, COLOURING, &c.*

*Painting* is of various Kinds, with regard to the Materials us'd; the Matter whereon they are applied; and the Manner of applying 'em.

Hence come *Painting in Oil*; *Painting in Water-Colours, or Lining*; *Painting in Fresco*; *Painting on Glass*; *Painting in Enamel*; and *Painting in Miniature*.

**PAINTING in Oil**. The Art of *Painting in Oil* was unknown to the Ancients; and it was a *Flemish Painter*, one *Johannes van Eyck*, or *Johannes de Bruges*, who first discover'd and put in practice in the Beginning of the XIVth Century: 'Till him, all the Painters wrought in *Fresco*, or in *Water-Colours*.

This was an Invention of the utmost Advantage to the Art; since, by means hereof, the Colours of a *Painting* are preserv'd much longer and better, and receive a Lustre and Sweetness which the Ancients could never attain to, what Varnish soever they made use of to cover their Pieces.

The whole Secret only consists in grinding the Colours with Nut Oil or Linseed Oil: But it must be own'd, the Manner of Working is very different from that in *Fresco*, or in *Water*; by reason the Oil does not dry near so fast; which gives the Painter an Opportunity of touching, and retouching all the Parts of his Figures, as often as he pleases: Which, in the other Kinds, is a Thing impracticable.

The Figures too are here capable of more Force and Boldness; in as much as the Black becomes blacker, when ground with Oil than with *Water*; besides that, all the Colours, mixing better together, make the Colouring sweeter, more delicate and agreeable, and give an Union and Tenderness to the whole Work, inimitable in any of the other Manners.

*Painting in Oil* is perform'd on *Walls, on Wood, Canvas, Stones* and all Sorts of *Metals*.

To *PAINT on a Wall*: when well dry, they give it two or three Washes of boiling Oil; till the Plaster remain quite greasy, and will imbrace no more. Over this they apply defecative or drying Colours, viz. white Chalk, red Oker, or other Chalks beaten pretty stiff: This Couch or Lay being well dry, they sketch out, and design their Subject; and at last paint it over, mixing a little Varnish with their Colours; to save the Varnishing afterwards.

Others, to fortify their Wall the better against Moisture, cover it with a Plaster of Lime, Marble-Dust, or a Cement made of beaten Tiles soak'd with Linseed Oil; and at last prepare a Composition of *Greek Pitch, Mastic* and thick Varnish boil'd together, which they apply hot over the former Plaster: When dry, they lay on their Colours as before.

Others, in fine, make their Plaster with Lime-Mortar, Till-Cement, and Sand; and this dry, apply another of Lime, Cement, and Machefer or Iron Scum; which being well beaten and incorporated with Whites of Eggs and Linseed Oil, makes an excellent Couch or Plaster. When dry, the Colours are applied as before.

To *PAINT on Wood*; they usually give their Ground a Couch or Lay of White temper'd with Size; or they apply the Oil above-mentioned: The rest, as in *Painting on Walls*.

To *PAINT on Linnen or Canvas*; the Canvas being stretch'd on a Frame, they give it a Couch or Lay of Size: When dry, they go over it with a Pumice-Stone, to smooch off the Knots. By means of the Size the little Threads and Hairs are all laid close on the Cloth, and the little Holes stopp'd up, so as no Colour can pass thro'.

When the Cloth is dry, they lay on Oker, which is a natural Earth, and bears a Body; sometimes, mixing with it a little white Lead to make it dry the fomer. When dry, they go over it with the Pumice-Stone to make it smooth.

After this, they sometimes add a second Lay composed of white Lead, and a little Charcoal Black, to render the Ground of an Ash-Colour, observing in each Manner to lay on as little Colour as possible, that the Cloth may not break, and that the Colours, when they come to be painted over, may preserve the better.

In some *Paintings of Titian* and *Paolo Veronese* we find they made their Ground with *Water*, and painted over it with Oil; which contributed much to the Vivacity and Freshness of their Works: For the *Water Ground*, by imbracing the Oil of the Colours, leaves them the more beautiful; and the Oil itself taking away a deal of their Vivacity.

As little Oil therefore is to be used as possible, if 'tis desired to have the Colours keep fresh: For this Reason some mix 'em up with Oil of Aspic, which evaporates immediately, yet serves to make 'em manageable with the Pencil.

To PAINT on Stones or Metals, 'tis not necessary to apply Size, as on Cloth; it suffices to add a slight Couch of Colours, before you draw your Design; nor is even this done, on Stones where 'tis desired the Ground shou'd appear, as in certain Marbles of extraordinary Colours.

All the Colours used in Fresco are good in Oil, except White of Lime and Marble Dust. See COLOUR.

Those chiefly used are *White Lead or Cernisi*, yellow and white *Mastic*, *Orpiment*, *Black Lead*, *Cinnabar* or *Vermillion*, *Lacca*, blue and green *Aspes*, *Indigo*, *Lamp-Black*, *Burnt Ivory*, and *Verginease*, &c. See the Preparation, &c. of each under its proper Article, *CERUSS*, *ORPIMENT*, *VERMILLION*, *LACCA*, *INDIGO*, &c.

As to Oils, the best are those of Walnuts, of Linseed, Aspic, and Turpentine. The defeciated or drying Oils, are a Nut-Oil boil'd with Litharge and Sandara, others with Spirit of Wine, Mastic and Gum-Lacca. See VARNISH.

To have a Varnish that shall dry readily, they mix Spirit of Wine with Turpentine.

PAINTING in Water-Colours. See LIMEING.

PAINTING in Fresco. See FRESCO.

PAINTING in Miniature. See MINIATURE.

PAINTING on Glass. See GLASS.

PAINTING in Enamel. See ENAMEL.

PAINTING in Mosaic. See MOSAIC-WORK.

PAIR, a Collective Term, used for two equal and similar Things ordinarily joined together; tho' more frequently for artificial Things, than for natural Ones.

As a *Pair* of Gloves, of Stockings, of Shoes, &c.

It is also used in compound Things, for two Parts alike each other, tho' they only make one Whole; as a *Pair* of Scissars, &c.

And for a Set or System of several Things join'd to make another complear, as a *Pair* of Bag-pipes, &c. and lastly, by Extension, for a Thing that is single, as a *Pair* of Tables, &c.

PAIR, *Par*, in Anatomy, an Assemblage or Conjunction of two Nerves, having their Origin together in the Brain or Spine, and thence distributed into the several Parts of the Body, one on the one Side, and the other on the other. See NERVE.

Thus we say the *first Pair*, *second Pair*, &c. the *Par ossea*, *Par quatuor*, &c. and sometimes the *Olfactory Pair*, *Ophthalmic Pair*, &c. See VAGOM.

PALACE, *Royal-House*, a Name generally given to the Dwelling-Houses of Kings, and Princes. See HOUSE.

In Course of Time the Name has also been applied to the Houses of other Persons; taking different Epithets, according to the Quality of the Inhabitants; as *Imperial Palace*, *Royal Palace*, *Pontifical*, *Cardinal*, *Episcopal*, *Ducal Palace*, &c.

*Procopius* derives the Origin of the Word *Palace* from a Greek, called *Palas*, who gave his own Name to a magnificent House he had built: Adding that *Augustus* after him, gave the Name *Palatium* to the House of the Roman Emperors on the Hill; which, for that Reason, was called the *Palatine Mount*. Others take it the contrary Way; and say, that *Romulus's* House, wherein *Augustus* lived, was properly called *Palatium*, because situate on the *Palatine Mount*. See PALATINE.

Be this as it will, 'tis certain, *Palatium*, from a proper Name, in Time, became common to all Houses of Kings.

And as the Kings usually heard and determined Causes in their Houses, in what Part of the Realm's soever Justice; hence also *Palatium* became a Name for a Court of Justice; thus the French have their *Palais*, &c. See COURT.

PALANQUIN, a Kind of Chair, or Chair bore by Men on the Shoulder; much used by the People of *China* and the East, as a Vehicle for their Conveyance from Place to Place.

PALATE, *Palatum*, in Anatomy, the Flesh that composes the *Roof*, i. e. the upper and inner Part of the Mouth. See MOUTH.

The *Palate* is lined with a glandulous Coat, under which are great Numbers of pretty conspicuous Glands, scatter'd in the Fore-part of it like Grains of Millet, with many Interstices, whose excretory Ducts, piercing the Membrane, open into the Mouth; but towards the Hind-part, they lie much thicker; and about the Root of the *Uvula* are gathered so close together, that they appear to form one pretty large conglomerate Gland, called by *Verbeyn*, *Glandula Conglomerata Palatina*.

Towards the Bottom of the *Palate*, behind the *Uvula*, is a pretty large Perforation, which, a little from its Orifice, divides into two, each whereof goes to one of the Nostrils.

Many take the *Palate* to be the Organ of Tasting. See TASTE.

*Du Lauremer* says, the *Palate* has its Name from the Latin *Pala*; because enclosed with two Rows of Teeth, resembling little Stakes which the Latins call *Pala*.

PALATI OZ, a small square Bone, forming the Hind-part of the *Palate*, and join'd to that Part of the *Oz Maxillare*

which forms the Fore-part of the *Palate*. See PALATE & MAXILLA SUPERIOR.

PALATINATE, a Province or Signory, possess'd by a *Palatine*; and from which he takes his Title, and Dignity. See PALATINE.

The *Palatinates*, now subsisting, are either those of *Germany* or *Poland*.

Those of *Germany* are the Principalities of the Upper and Lower *Rhine*, i. e. of *Bavaria* and the *Rhine*. The *Palatinates*, in *Poland*, are the Provinces and Districts of the *Polish* Grandees or Senators, who are the Governors thereof.

PALATINE, *Comes Palatine*, or *Comes Palatinum* in the ancient Customs, was a Title given to all Persons who had any Office or Employment in the Prince's *Palace*. See COUNTY.

*Mathews* says, that *Palatinates* were originally those who had the Superintendance of the *Palace*; the same with what the Greeks call'd *Chorepate*, and the French, *Maitres Des-palais*; tho', in Time, the Name became more general.

The only *Palatinus* of this Kind, now subsisting, is the *Palatine* of the *Rhine*.

The Title *Palatine* was afterwards conferr'd on those delegated by the Prince to hold a Court of Justice in some Province; and to such among the Lords as had a *Palace*, i. e. a Court of Justice in their own Houses.

The French Writers make the *Palatinates* of *Champagne* to be the first, who bore the Title; which, they will have it, the Germans and other People borrowed from them; not they from the Germans.

At present the Word *Palatine* is restrained to a Prince of *Germany*, or a Lord of *Poland* possess'd of a *Palatinate*. See PALATINATE.

The Word is derived hence, that anciently the Emperors sent the Judges of their *Palace*, whom they call'd *Comites Palatini*, or *Palato-graves*, to correct the Abuses of the other Judges in the Provinces of *Saxony*, *Bavaria*, *Franconia*, and the *Rhine*. See PALSGRAVE.

In the Codes we find a Title, *De Palatinis Sacrarum Largitionum*, who were a Kind of Treasurers of the Empire.

PALATINI Ludi, among the Romans, were Games instituted in Honour of *Julius Cæsar*, as some will have it, or as others, of *Augustus*. See GAME.

'Tis pretended that *Dion* calls 'em *Augustales*; which should seem to confirm the second Sentiment. Indeed, 'tis certain, that he says *Livia* instituted particular Games on the *Palatine Mount*, in Honour of that Prince; but he apparently distinguishes them from those called *Augustales*. See AUGUSTALES.

The Romans had also their *Apollo Palatinus*, a Surname of that Deity, given him in respect of the Temple erected to him by *Augustus* on the *Palatine Mount*, in Consequence of a Report of the *Aruspices*, which required it to be done: *Augustus* enrich'd it with a noble Library, as is intimated by *Herodotus*, Lib. I. Epist. III. v. 25.

The *Palatine Tribe* was one of the four Tribes, into which *Rome* was anciently divided by *Servius Tullius*. See TRIBE.

PALATO Salpingeæ, called also *Musculus Tube novæ Valsalvæ*, and *Pterygostaphilinus Externus*, A Muscle arising broad and tendinous from the Edge of the lunated Part of the *Oz Palati*, several of its Fibres being spread on the Membrane that covers the *Foramen Narium*; whence growing into a small thin Tendon, it is reflected about the Hook like the Process of the inner Wing of the *Processus Pterygoideus internus*, and is inserted carnosus, into all the membranous, fleshy, and cartilaginous Parts of the Tube which leads from the *Palate* to the Ear.

It is used to dilate and keep open this Tube.

PALATO-STAPHILINUS, in Anatomy, a Muscle call'd also *Pterygostaphilinus internus*. See PTERYGOSTAPHILINUS.

PALE a little pointed Stake, or Piece of Wood, used in making Inclosures, Separations, &c. See PALISSADE.

The *Pale* was an Instrument of Punishment and Execution among the ancient Romans, &c. still continues so among the *Turks*. Hence *Empaling*; the passing a sharp *Pale* thro' the Fundament up the Body. See EMPALING.

The Word comes from the Latin *Palus*, which signifies the same Thing; whence *Paliffade*, &c.

PALES, or *Pikes*, in Carpentry, are Rows or Files of Stakes drove deep into the Ground, to make wooden Bridges over Rivers. See PALIFICATION.

They serve to support the Beams which are laid a-cross them, from one Row to another; and are strongly bound together with Cross-Pieces.

PALÉ, in Heraldry, one of the Honourable Ordinaries of an Escutcheon. See ORDINARY.

The *Pale* is a Representation of a Pale or Stake, placed upright, and comprehending the whole Height of the Coat, from the Top of the Chief to the Point.

When single, it is to contain one Third of the Breadth of the Shield. When there are several they are proportioned so, as that two take up two Fifths of the Shield; and three take up three Sevenths; and in those Cases, the Num-

ber of Pieces is specified as well as that of those they are charged withal, &c.

*Pales* are bore various Ways, as *Wavy*, *Crenelle*, *Fruitt*, *Indented*, *Ingrated*, &c. There are also *Cometed* and *Flaming Pales*, which are Pointed, sometimes Waved, &c.

The *Pale* in an Armoury is a Mark of Jurisdiction. See the adjoining Figure; He bears *Gules a Pale Or*.

A Coat is said to be *Paled*, when it is equally charg'd with Pales of Metal and Colour.

It is *Counter Paled* when it is cut and the two Demi-Pales of the Chief, tho' of Colours the same with those of the Points, yet differ in the Place where they meet; so as if the first of the Chief be Metal, that corresponding to it, underneath, is of Colour.

The Coat is said to be *Palissé*, when the *Pales* are pointed like those used in the Defence of Places.

*Du Cange* derives the Word from the Latin Name *Palles*, a Piece of Tapitry. He adds, that the Ancients gave the Name *Pales* to the Hangings of Walls. Thus, a Chamber was said to be *Paled* with Cloth of Gold, with Silk, &c. as consisting of Bands or Stuffs of two Colours. Hence the Origin of the Word *Pale* a Stake, &c. The Arms of *Arrogare* *Paled* with Gold and Gules.

*Zerullian* observes, that the *Romans* planted Pales to serve as Boundaries of Inheritances; and that they consecrated them to the God *Terminus*, under the Name of *Pali Terminales*. *Ovid* tells us, they were crowned and adorned with *Flowers*, *Festons*, &c. The God was worshipped before these *Pales*.

In *PALE*, is applied to Things born one above another, in Manner of a *Pale*.

*Party per PALE* is where the Shield is divided by a single Line thro' the Middle, from Top to Bottom. See *PARTY* and *PALY*.

*PALED Flowers*, in Botany, are those that have Leaves set about, or surrounding a Head, or Thrum; as in *Mari-golds*, &c.

*PALESTRA*, among the ancient *Greeks*, a publick Building, where the Youth exercised themselves in Writing, Running, Quoits, &c. See *GYMNASIUM*.

Some say it consisted of a College, and an Academy; the one for Exercises of the Mind, the other of the Body. But most Authors rather take *Palestra* to be a *Xylus* or mere Academy for Bodily Exercises, according to the Etymology of the Word *πάλας*, Wrestling, one of the chief Exercises amongst the Ancients. See *XYSTUS*.

The Length of the *Palestra* was mark'd out into *Stadia*, each equal to 125 Geometrical Paces; and the Name *Stadium* was given to the *Arena* whereon they ran. See *STADIUM*.

*PALESTROPHYLAX*, among the Ancients, was the Governour of the *Palestra*; and of the Exercises perform'd therein. See *PALESTRA*.

This Officer was also called *Xystarcha*. See *XYSTARCH*. The Word is form'd from the Greek *παλαστρικός* *gálaξ* *Guardian*.

*PALILIA*, a Feast among the ancient *Romans* in Honour of the Goddess *Pales*. Some call 'em *Parilia*. See *FEAST*. They were celebrated by the Shepherds on the first of *May*; to beseech that Goddess to take care of their Flocks, and preserve 'em from Wolves, and Diseases.

Part of the Ceremony consisted in lighting Heaps of Straw, and jumping over them.

*PALILICIUM*, in Astronomy, a fix'd Star of the first Magnitude, in the *Bow's-Eye*; called also *Aldebaran*.

Its Longitude in Mr. *Flemstead's* Catalogue is 5°. 27'. 00". Its Latitude 5°. 29'. 49". South.

*Phny* gives the Name *Pallidicum* to the *Hyades*. See *HYADES*.

*PALINDROME*, a Verse, or Sentence, which runs the same, read either backwards, or forwards.

The Word is Greek, *παλινδρομή*, *retro current*, turning backwards: Such is the Verse

*Roma tibi subito movibus ibit amor.*

Some People of Leisure have refined upon the *Palindrome*, and compos'd Verses, each Word whereof is the same backwards as forwards. As that Influx in *Camden*.

*Odo tenes milium, madidam mappam tenet Anna,  
Anna tenet mappam madidam, milium tenet Odo.*

*PALING*, in Agriculture, &c. a Kind of Fence-work, for Fruit-Trees, &c. planted in Fields, &c. See *FENCE*.

It consists of three small Posts driven into the Ground at a Foot and a Half Distance; with Cross-Bars nail'd to each other, near the Top.

In fixing the *Pales* in Form of a Triangle, Room is to be left for the Tree to play and bow by the high Winds without galling.

The Trees to be bound to a Stake for a Year or two; after which, Fern or Straw may be stuffed in betwixt the Tree and uppermost Rails to keep it upright.

If the Place be open to Deer, Rabbits, or the like, a Post to be nail'd to the Bar between every two Pales.

*PALINGENESIA*, a Term signifying *New Birth*; or the Passage of the Soul of a Defunct into another Body.

The *Palingenesia* is almost the same thing with the *Metempsychosis* taught by *Pythagoras*, and still believed by the *Brachmans*, *Bonians* and other Philosophers of the East. See *METEMPSYCHOSIS*.

The Word is Greek, form'd of *παλιν* over-again, a-new, and *γενεσις* *Genesis*.

*PALINODY*, a Discourse contrary to a preceding one. Hence the Phrase *Palinodium Canere*, to sing *Palinody*; to make a Recantation.

The Word, in the original Greek, signifies to sing a-fresh. Hence it has pass'd as a general Name for Poems, &c. which contain a Recantation in Favour of a Person the Poet had before offended.

The Poet *Stesichorus* is said to be the first Author of the *Palinody*. The sixth Ode of the 1. Book of *Horace* beginning, *O Mater pulchra*, is a true *Palinody*.

*PALINTOCIA*, in Antiquity, a Term used in two Senses. 1. For the Delivery of a Child a second Time: Thus the second Birth of *Bacchus*, proceeding out of *Jupiter's* Thigh, was a *Palintocia*.

2. *Palintocia* was also used for the Repetition of Usury, or the refunding of Interests. The *Megarians*, having expell'd their Tyrant, ordain'd the *Palintocia*; that is, they made a Law, that all the Creditors should return to their Debtors the Interests they had received for Monies lent.

The Word is form'd from the Greek *παλιν* a-fresh, a-new, and *τοκία* of *τόκος*, I bring forth.

*PALISSADE* or *PALISSADO*, in Fortification, an Inclosure with Stakes or *Pales* driven into the Ground, eight or nine Inches thick; and nine Foot long, three whereof are hid under Ground.

It is used to fortify the Avenues of open Forts, Gorges, Half-moons, the Bottoms of Ditches, and the Parapets of Covered ways; on the Talus of Ramparts; the Top of the Out-works, &c.

There are *Palissades* made perpendicular; others are made inclining to the Ground, that the Ropes cast over 'em, to tear 'em up, may slip.

*PALISSADES turning*, are an Invention of Mr. *Cochornes*, in order to preserve the *Palissades* of the Parapet from the Besiegers Shot.

He orders them so, that as many of them, as stand in the Length of a Rod, or in about ten Foot, turn up and down like Traps; so as not to be in Sight of the Enemy till they just begin on their Attack; and yet are always ready to do the proper Service of *Palissades*.

*PALISSADE*, in Gardening, an Ornament in the Allies of Gardens, wherein Trees are planted, which bear Branches from the Bottom, and which are spread in such a Manner, as to appear like a Wall covered with Leaves.

*Palissades* are made of *Jelamin*, *Filices*, &c.

*PALISSE*, in Heraldry, a Range of *Palissades* before a Fortification, represented on a *Fesse*, rising up a considerable Height; with the Field appearing thro' them. As in the Figure adjoining.

*PALL*, in Heraldry, a Kind of Cross, after the Manner of the adjoining Figure; blazoned thus: He beareth *Gules, a Cross Pall Argent*.

*PALLA*, among the old *Romans*, a Mantle which Women wore over the *Gown*, call'd *Stola*. See *STOLA*.

It was bore on the left Shoulder, whence passing to the other Side, under the right Arm, the two Ends were bound under the left Arm, leaving the Breast and Arm quite bare.

It made abundance of Plaites or Wrinkles; whence, according to *Varro*, it had its Name, viz. from *mallo*, *Vibro*, I shake, I am very moveable.

Among the *Gauls* there was also a Kind of *Palls* wore by the Men, call'd *Gallica Palla*.

*PALLADIUM*, in Antiquity, a Statue of the Goddess *Pallas*, preserv'd in *Troy*; whereon the Fate of the City depended.

The Tradition was, that in building a Citadel, in Honour of *Pallas*, and a Temple in the most elevated Part thereof; the *Palladium* dropp'd from Heaven, and mark'd out the Place, which the Goddess was pleas'd to possess. After this, *Apollo* gave an Oracle, importing, that *Troy* should never be taken while the *Palladium* was found within its Walls: Which occasioned *Diomed* and *Ulysses* to undertake the stealing thereof.

This said, there was anciently a Statue of *Pallas* preserv'd at *Rome*, in the Temple of *Vesta*: which some pretended to be the true *Palladium* of *Troy*, brought into *Italy* by *Æneas*: It was kept among the sacred Things of the Temple, only known to the Priests and Vestals.

This Statue was esteem'd the Destiny of *Rome*; and there were several others made perfectly like it, to secure it from being stolen. See *ANCYLE*.

There was also a *Palladium* in the Citadel of *Athens*, plac'd there by *Nicias*.

These *Palladiums*, in all Probability, were no other than a Kind of *Talisman*. See *TALISMAN*.

**PALLET**, among Painters, a little oval Table, of Wood, or Ivory, very thin and smooth on; and around which the Painters place the several Colours they have occasion for, ready for the Pencil. See *COLOUR*.

The Middle serves to mix the Colours on, and to make the Tints requir'd in the Work. It has no Handle, but in Lieu thereof, a Hole at one End, to put the Thumb through to hold it.

The Word comes from the Latin *Palæta*.

**PALLET**, among Pottery, Crucible-Makers, &c. is a wooden Instrument, almost the only one they use, for forming, beating, and rounding their Works. See *POTTER*.

They have several Kinds; the largest are oval, with a Handle; others are round, or hollow'd triangularly; others, in fine, in manner of large Knives, serving to cut off what is superfluous on the Moulds of their Works.

**PALLEY**, in Gilding, is an Instrument made of a Squirrel's Tail; us'd to take up the Gold Leaves from the Pillow, to apply and extend 'em on the Matter to be gilt. See *GILDING*.

**PALLEY**, in Heraldry, is the Moiety or Half of the *Pale*; or a small *Pale*, half the Breadth of the usual one. See *PAL*.

The *Pallet* must never be charg'd with any thing, either Quick or Dead; neither can it be divided into two equal Parts, but it may be into four, for one fourth Part of the *Pallet*, or  $\frac{1}{2}$  Part of the *Pale*, is called an *Endorse*. See *ENDORSE*.

If the *Pale* be upon any Beast, they say, the Beast is *Decorated* with the *Pale*: But if the Beast be upon the *Pale*, they say, he is *supported* by the *Pale*.

**PALLEY** is also a Part belonging to the Balance of a Watch or Movement. See *WATCH* and *MOVEMENT*.

**PALLIATION**, the Action of mitigating, soothing, or disguising a Thing.

Hence, in Medicine, *Palliatio* is us'd for the quieting and assuaging of Pain, and providing against the severer Symptoms of a Disease, when nothing can be directly level'd against the Cause. See *PALLIATIVE*.

**PALLIATIVE Indication**, is where the Symptoms of a Disease give too much Trouble, and Danger, to have their Cure deferr'd till the Disease, whereon they depend, is removed. See *INDICATION*.

Here, the Symptoms, themselves, are to be cured, or mitigated a-part: And hence,

**PALLIATIVE Cure**, is the Answering of a *Palliatio* Indication; or the Removal, or Mitigation of the Symptoms of a Disease; the Cause of the Disease still remaining. See *CURE*.

*Berthæus* observes, that every Mitigation of a Symptom takes away somewhat from the Disease itself; so that to cure all the Symptoms together, is almost to cure the whole Disease. See *SYMPTOME*.

The principal Symptoms which call for such a Cure are Thirst, Pain, too much Waking, and Faintings. See each under its proper Article. *PAIN*, *THIRST*, *WAKING*, &c.

**PALLIER**, or *Pallier*, in Building, a Landing-Place in a Stair-Case; or a Step, which, being broader than the rest, serves to rest upon. See *STAIR-CASE*.

The Term is pure *French*, and not much us'd in *English*. In Perrons, or large Stair-cases, where there are sometimes several *Palliers* in the same Range, or Line, they ought to have at least the Width of two Steps.

Those in the Turns of Stair-cases ought to be as broad as long. *Vitruvius* calls the *Palliers* or Landing-Places of Theatres *Diazomata*.

**PALLIFICATION**, in Architecture, is the piling of the Ground-work; or strengthening it with Piles, or Timber driven into the Ground; which is practis'd, when they build upon a moist or marshy Soil. See *FOUNDATION*.

**PALLIO cooperire**. It was an ancient Custom, where Children were born out of lawful Wedlock, and their Parents afterwards intermarried; that those Children, together with the Father and Mother, shou'd band *Pallio cooperiti* under a Cloth spread over them, while the Marriage was a solemnizing; which was a Kind of Adoption, and had the Effect of a Legitimation.

Thus *Robert Grosbeak*, the famous Bishop of *Lincoln*, in one of his Letters, *In signum legitimisationis nati ante Matrimonium consueverunt post sub pallio super Parentes coram extenuis, in Matrimonii solemnisatione*.

*Selden*, in his Notes on *Fleta*, adds, that the Children of *John of Gaunt*, Duke of *Langcaster*, by *Catherine Swinford*, tho' legitimated by Act of Parliament; yet were cover'd with the Pall at the Time of the Marriage of their Parents.

**PALLIUM** or **PALL**, a Pontifical Ornament wore by Popes, Patriarchs, Primates and Metropolitans of the *Romish* Church over their other Garments, as a Sign of their Jurisdiction. See *PONTIFICALIA*, *EPISCOPALIA*, &c.

'Tis in Form of a Band, or Fillet, three Fingers broad, and encompasses the Shoulder; whence by some Authors it is called *Superbrumerale*. It has Pendants, about a Palm long, both before and behind; with little *Lamine* of Lead rounded at the Extremes, and covered with black Silk, with four red Crosses.

The *Pallium* is made of white Wool, shorn from off two Lambs, which the Nuns of *St. Agnes* offer every Year, on the Day of her Feast, at the signing of the Mass, *Agnus Dei*.

The Lambs are received by the two Canons of the Church of *St. John de Lateran*; who deliver 'em into the Hands of the Apostolical Sub-deacons, to whom belongs the feeding and shearing of 'em in Scanton, and who alone have the Right of making these *Palliums*; which, when made, they lay over the Bodies of *St. Peter* and *St. Paul* in the Grand Altar of their Church, making Prayers over 'em all Night, according to the Form prescrib'd for that Purpose in the *Romans* Ceremonial.

Some, with *Ensebinus*, will have the *Pallium* to have been introduced by *Pope Linus*; adding, that as the *Episcop* was the Mark of the Pontifical Authority in the *Jewish* Synagogue, so is the *Pallium* in the *Christian* Church. See *EPISCOP*.

Others have observ'd, that there is no Mention made hereof before the Year 556.

Lastly, others will have it first granted by *Constantine* the Great, to *Pope Silvester*; from whence it pass'd to the other Patriarchs and Archbishops.

The Pope pretends to the sole Right of Conferring the *Pallium*; tho' some Patriarchs have granted it to their Suffragans, having first receiv'd it themselves from the *Roman* See.

Antiently the Pope us'd to send the *Pallium*, to certain of his Diocesan Bishops, on whom he laid a good Part of his Authority, and who were a Kind of a Collaterals to him, as the *Patricii* were to the Emperors.

The first, who receiv'd it in *France*, was *Vigilius*, Archbishop of *Arles*, in order, as *Possuvius* observes, to give him the Precedence over the other Bishops.

Antiently they went to *Rome* to seek it in Person; afterwards, it was sent by the Pope's Legates. At last the Custom was introduced of sending Persons express to demand it, with this Form, *Insuper, Insuper, Insuper, Insuper!*

A Metropolitan, till he have received the *Pallium*, cannot consecrate Bishops, or Churches, may not be call'd Archbishop, &c. Upon a Translation he must have the *Pallium* afresh; and till then cannot hold a Synod, nor perform any of his Archiepiscopal Functions.

The *Pallium* was antiently inter'd with the Person.

The Use of the *Pallium* is restrain'd to certain Seasons and Occasions; none but the Pope having the Right of wearing it always and in all Places. The Pope sometimes sends it to Bishops on his own Accord; and has sometimes given the Right hereof to particular Churches. Among the *Greeks* all the Bishops wear the *Pallium*.

In ancient Titles, &c. we find mention made of another *Pallium*, which was a long Garment spread over with Crosses. *Tertullian* says, it was a distinguishing Garment of the Christians; that of the Heathens being call'd *Vega*.

**PALM**, *Palmæ*, *Span*, an ancient *Roman* long Measure, taken from the Extent of the Hand. See *MEASURE*.

The antient *Roman Palmæ* was of two Kinds: The *Great Palm*, taken from the Length of the Hand, contained 12 Fingers, Digits, or Finger's-Breadths; equal, according to *Moggi*, to seven *English* Inches, and eight Tenths. See *DIUIT*.

The *Small Palm*, taken from the Breadth of the Hand, contained 4 Digits or Fingers, equal to two *English* Inches, and two Thirds.

Yet *Daviler* makes the antient *Roman Palmæ* to be equal to 9 *French* Inches, equivalent to eight *English* Inches  $\frac{1}{2}$ .

The *Greek Palm* or *Spitha* was of two Kinds. The *Small* contained four Fingers, equal to 1 Inches  $\frac{1}{2}$ . The *Great* contained 5 Fingers. The double *Greek Palm*, call'd *Dicbas*, contained 8 Fingers.

The modern *Palm* is different in different Places where it obtains.

At *Rome* it contains 7 Inches  $\frac{1}{2}$ : At *Naples*, according to *Riccioli*, 8 Inches: At *Genoa*, according to *M. Spier*, 8 Inches  $\frac{1}{2}$ : At *Morocco* and *Fes*, 7 Inches  $\frac{1}{2}$ : In *Languedoc*, and some other Parts of *France*, the *Palm* is 8 Inches  $\frac{1}{2}$ .

At *Leghorn* there are two Kinds of *Palmæ*, the one for Woolens, the other for Silks. The first one Third shorter than the latter.

**PALMA**, in Anatomy, the Inside of the Hand. See *HAND*.

**PALMS**, among Botanists, white Buds, shooting out of Willow, or Sallows, before the Leaf; of the Expansives whereof, the Leaves themselves are form'd. See **BUD** and **GERMINATION**.

**PALM-SUNDAY**, the Sunday next before *Easter-Sunday*; or the last Sunday in *Lent*. See **LENT**.  
It has been thus called from the primitive Days, on Account of a pious Ceremony then in use, of bearing *Palms* in Memory of the Triumphant Entry of *Jesus Christ* into *Jerusalem*, eight Days before the Feast of the *Passover*, described by *St. Matthew* Chap. XXI, *St. Mark* Chap. XI, and *St. Luke*, Chap. XIX.

The Ancients had also other Names for this Day. For 1. they called it *Dominica Compositum*, i. e. *Sunday of the Composites*; because on that Day the Catechumens came to ask the Bishop Leave to be admitted to Baptism, which was conferr'd the Saturday following. See **BAPTISM** and **CATECHUMEN**.

They had also, then, given 'em the *Symbol* or *Credo* to get off by Heart, to be repeated to the Bishop in the Ceremony of Baptism. See **SYMBOL**.

2. They called it *Capitulivium*, the *Sunday of washing the Head*; by reason those, who were to be baptized the following Sunday, were prepared by washing their Head this Sunday.

Some Time afterwards they called it *Indulgentia Sunday*; by reason the Emperors and Patriarchs used to distribute Gifts on that Day. See **INDULGENCE**.

**PALMARIS**, in Anatomy, a Muscle serving to contract the *Palm* of the Hand, in grasping.

It arises from the internal Protuberance of the *Humerus*, and by a long and slender Tendon, passes above the annular Ligament to the Palm of the Hand; where it expands itself into a large Aponeurosis, which cleaves close to the Skin above, and to the Sides of the *Metacarpi* below, and to the first Phalanx of the Fingers; by which means it makes four Cases for the Tendons of the Fingers to pass thro'.

This Muscle is sometimes wanting, but the Aponeurosis is always there.

**PALMARIS brevis** or *Quadratus*, a Muscle that lies under the Aponeurosis of the first. It arises from the Bone of the *Metacarpus* that sustains the little Finger, and from that Bone of the *Carpus* which lies above the rest. It goes transversely, and is inserted into the eighth Bone of the *Carpus*.

It serves to draw the Palm of the Hand into a concave Figure.

**PALMER**, in our ancient Writers, is used for a *Pilgrim*; and sometimes for a *Craze*, on Account of a Staff made of the *Palm-Tree* which they ever afterwards bore as a Badge of their Devotion. See **PILGRIM**, **CROISER**, **CROISADE**, &c.

**PALMISTRY**, a Kind of Divination, perform'd by inspecting the *Palm* of the Hand; call'd also *Chiro-mancy*. See **CHIRO-MANCY**.

**PALMULARII**, more properly call'd **PARMULARII**, in Antiquity, a Sort of Gladiators, who fought, arm'd with a Sort of a little Buckler, call'd *Parma*. See **GLADIATOR** and **PARMA**.

**PALPABLE**, something that may be perceiv'd by the Senses, especially the Sense of Feeling.

Hence *Impalpable-Powder*. See **POWDER**.  
**PALPEBRÆ**, in Anatomy, the *Eye-Lids*; or those moveable Covers which serve to screen, and defend the Eyes. See **EYE**.

They consist of a thin muscular Membrane, covered without-side with a strong, yet flexible Skin; and lined within-side with a Production, as some think, of the *Percutaneous*. Their Edges are fortify'd with a soft Cartilage, by Means whereof, they are enabled to close the better.

Out of these Cartilages grow a Palliade of stiff Hairs call'd *Cilia*; of great Use to warn the Eye of the Approach of Danger, either in sleeping or waking; to keep off Motes, Flies, &c. in the Air, and break the too fierce Impression of the Rays of Light. See **CILIA**.

These Hairs, it is observ'd, only grow to a certain convenient Length, and never need cutting, as most others do; add to this, that their Points stand out of the way; those of the upper Eye-lid being bent upwards, as those of the lower downwards; so nice was Nature, in such small Matters.

At the Commissure, or Joining of the upper and under Eye-lids are formed two Angles call'd *Cambri*. See **CAMBRI**.

In the Inner of these is a Gland call'd *Glandula Lacrymalis*, from which proceed two or three Ducts, which, opening on the inner Surface of the Eye-lid, serve to moisten the Ball of the Eye, and keep its Membranes from growing harsh and dry. See **GLANDULA LACRYMALIS**.

Near the other Angle, is a Gland call'd *Innominate*; which helping by several Branches to irrigate the Eye, the Over-plus is carried to the greater Angle and transmitted to the Nose thro' the *Puncta Lacrymalia*. See **LACRYMALIA PUNCTA**.

By these Glands it is, that the Humour, call'd *Tears*, is secret'd. See **TEARS**.

The Eye-lids are both moveable, especially the upper, which has two Muscles to raise and depress it, call'd *Atroliens*, and

*Deprimens* or *Orbicularis*. See **ATROLIENS**, **DEPRIMENS**, &c.

In Quadrupeds the lower *Palpebra* is moveable, and the smaller; in Birds, on the contrary, the lower is immovable, and the greater. Animals that have hard Eyes, as Lobsters, and the Generality of Fishes have no *Palpebra*; as being sufficiently secured without.

In the Generality of Brutes is a Kind of third Eye-lid, which is drawn, like a Curtain, to wipe off the Humidity which might incommode the Eyes; It is called the *Nictitating Membrane*. See **NICTITANS**.

The Monkey is almost the only one that wants it; as being furnish'd, like Man, with Hands to wipe the Eye on Occasion.

**PALPITATION**, in Medicine, a preternatural Beating, or Pulsation of the Heart. See **PULS**, &c.

The *Palpitation* of the Heart, is an Irregularity in the Motions of that *Viscus*, whereby it is driven with Violence towards the Ribs, in its Contraction, attended with a great Feebleness of Pulse. See **HEART**.

There are several Degrees of *Palpitation*: Sometimes 'tis great, sometimes moderate, sometimes small; 'tis sometimes so impetuous, as to be heard and seen.

The *Trepidation* or Trembling of the Heart differs from the *Palpitation*. In the former the Pulsations are faint, slow, and faltering; in the latter the Shakes are immoderate, violent, and convulsive. See **TREPIDATION**.

The Cause of the *Palpitation*, according to *Boerhaave*, is usually an inordinate and violent *Impetus* of the vital Spirits into the *Villi* of the Heart; as in violent Passions, sudden Fear, hysterical Affections, violent and sudden Motions. Sometimes it is owing to an Irritation of the Fibres of the Heart, occasion'd by some sharp *Stimulus*; as an Inflammation of the Heart or *Pericardium*, or some other Disorder thereof from a Sore, Worm, Hair, an *Aneurysm*, &c.

Sometimes it arises from a thick, copious, polyposus Blood; and sometimes from the Arteries, being become cartilaginous or bony; or their Extremities obstructed therewith.

In the *Diction. de Trevoux*, an Author, himself afflicted with this Disease, makes a particular Disquisition into its Nature, and Cause.

Anatomy, he observes, shews us a great Number of occasional Causes of this Disease: But Physicians are still at a Loss to determine the efficient Cause.

The Moderns, with better Reason than the Ancients, seek for it in the Blood of the Pulmonary Artery, which is supposed to rebound impetuously towards the right Ventricle of the Heart; by being prevented from pursuing its Course towards the other Vessels of the Lungs, stop'd by some Obstruction, or compressed from various Causes.

In opening the Carcasses of People dead of this Disease, or subject to it while living, Worms or *Polypus*'s have been found in the Ventricles of the Heart, and Dropsies or Abscesses in the *Pericardium*.

In some the Heart is extraordinarily big, and the Pulmonary Artery dilated to double, or quadruple its ordinary Capacity, with Obstructions of the Pulmonary Vein, consisting of cartilaginous Matters which cream its Cavity to close, that as *Blanchard* tells us, in his Anatomy, 'tis sometimes difficult even to get a Pin in.

From these Observations, some have concluded, that the Capillary, &c. Vessels of the Lungs, opposing an impassable Dike to the Course of the thickest Part of the Blood, driven thither by the Contraction of the Heart, so as only a small Quantity can find a Passage through them; the first must make an Effort against their Sides, and oblige them to give way and stretch them out, in Proportion to the Quantity of Blood impelled against them by the Contraction of the Heart.

But because the Pulmonary Artery cannot stretch wide enough to receive all the Blood of the right Ventricle driven thither at a Contraction; and since the Blood, by reason of Obstructions, cannot continue its progressive Motion, in Proportion to the Velocity wherewith it is impelled, by the Contraction of the Heart; the Heart at each Contraction fails to express into the Pulmonary Artery, all the Blood it contain'd in its right Ventricle.

Thus that Part of the Blood which remains, receiving the whole Shock impress'd by the Contraction, returns it again to the Heart by Reflection, striking impetuously against its Sides, and making it bound and shoot towards the Ribs.

The same Consequences will arise from Obstructions of the *Aorta*, preventing the entire Evacuation of the left Ventricle; and generally, from all Obstructions or Compressions of the Vessels, as *Polypus*'s, Abscesses, and Dropsies in the Parts near the Heart. As to Worms, their biting, and gnawing of the fibrous Parts of the Heart, must occasion violent Reflexes of Spirits towards the Brain, follow'd with a copious Effusion of other Spirits into the Nerves of the Lungs, by the Consent of Parts. And by such Means violent and convulsive Contractions will be occasion'd throughout the whole Texture of the Lungs, which opposing the free Passage of the Blood may occasion a *Palpitation of the Heart*.

The same Disease may arise from a Compression of the Lungs, occasioned by the extraordinary Rarefaction of viscid and imbecillate Juices, sojourning in the Stomach and Intestines; which dilate those Parts to that Degree, that the Diaphragm and Lungs, being extremely straightened, the Blood cannot circulate without Abundance of Difficulty; a *Palpitation* therefore must ensue; which will last as long as that Rarefaction in the first Passages.

Such, according to modern Physicians, are the immediate Causes of the *Palpitation* of the Heart: The remote or occasional Causes are whatever may occasion such Obstruction of the Pulmonary Artery, &c.

In the same Work, another Physician lays down Winds or *Flatus*, as a Cause of the *Palpitation*; he adds that the Ancients, to a Man, look'd on that as the most ordinary Occasion thereof: In Effect, says he, from this Source may be deduced a Multitude of Causes of sympathetic *Palpitation*, by Means of the Ventricle, the Diaphragm, Mediastina, &c.

Others will have the sole Cause of *Palpitation* to be a viscid Blood; which, by its extraordinary Rarefaction, dilating the Pulmonary Artery, and, by that means, opening the Cavity of its Capillary Vessels towards their Extremes; or, by this Dilatation, compressing the other little Vessels of the Lungs, prevents the Blood from continuing its circulating Motion with Freedom; and, by that means, opening the Cavity of its Capillary Vessels towards their Extremes; or, by this Dilatation, compressing the other little Vessels of the Lungs, prevents the Blood from continuing its circulating Motion with Freedom; and thus occasions a *Palpitation* of the Heart.

All these Authors hold the *Palpitation* a dangerous Disease, and *Galen* observes, that those troubled with it, when young, never live to grow old.

According to M. *Pison*, a Doctor of the Faculty of *Paris*, the *Palpitation* of the Heart may arise, either from a too abundant Serosity, swelling the proper Membrane of the Heart; as *Galen* suppos'd to be the Case in opening a Monkey; or from too great a Quantity of Water contained in the *Pericardium*; by which means, the Heart being straighten'd, and disabled from moving with its usual Freedom, is oblig'd to make several Jerks or half Beats, instead of the regular Motions it had before; or, again, from a Serosity thrown into the Ventricles of the Heart, either from the grand Vessels which furnish the Blood, or from the Lungs, or from the Brain.

Of these three Causes, the most ordinary seems to be the too great Extension of the *Pericardium*, by Water, as it is found to be in the Bodies of most of those open'd after this Disease. See *PERICARDIUM*.

The distinct Causes have their different Symptoms. The boiling Serosity, thrown out of the Blood-Vessels into the Heart, shews itself by sudden Beatings of the Temples, Whizzings in the Ear, dim Sight, wandering Pains in various Parts of the Body.

In that produced by the Abundance of Water in the *Pericardium*, or from the Humour swelling the proper Membrane of the Heart; the Heart seems as if suffocated in Water; the Pulse weak, the *Palpitation* continual, or nearly so, together with a Feverishness, and a Difficulty of breathing. To which may be added, that the Disease comes by little and little.

The *Palpitation* arising from the Serosity is cured by bleeding, the other by purging.

**PALSGRAVE**, a Term used among the *German*, of the same Import with *Palatine*. See *PALATINE*.

It is compounded of the Latin, *Palatinum*, and the Dutch, *Grave*, Governor, i. e. Governor or Superintendent of a Prince's Palace. See *GRAVE*.

**PALSUS**, *Paralysis*, in Medicine, a Disease, wherein the Body or some of its Parts, lose their Motion, and sometimes their Sensation.

The Causes of the *Palsy* are an impeded Influx of nervous Spirits into the *Villi* of the Muscles; or of the artesian Blood into their Vessels, which may happen from some Fault, either in the Brain, the Nerves, Muscles or their Vessels.

The *Palsy* is said to be *perfect* or *complete*, when there is a Privation of Motion and Sensation at the same Time.

*Imperfect*, when one of the two is destroy'd, the other remaining.

The *Palsy* is either Universal, Lateral, or Particular.

The first, call'd *Paraplegia* or *Paraplexia*, is a general Imobility of all the Muscles that receive Nerves from the *Cerebrum* or *Cerebellum*, except those of the Head: Its Cause is usually suppos'd to reside in the Ventricles of the Brain, or in the Root of the spinal Marrow.

*Erwiner* makes this a distinct Disease from the *Paraplexis*, which he supposes to consist in a Relaxation of the Ligaments and Membranes serving for Motion; but the *Paraplegia* in a mere Obstruction of the Nerves.

The *Paraplegia* is seldom a primary Disease, usually a secondary one, attending or following an Apoplexy, *Storbutus*, *Corns*, *Arthritis*. See *PARALEGIA*.

The second, call'd *Hemiplegia* is the same Disease with the *Paraplegia*; only that it affects but one Side of the Body: Its Cause is the same, only restrained to one Side of the Brain or spinal Marrow.

The third, call'd *particular Paralysis* or *Palsy*, is where some particular Part or Member alone is affected; *L. gr.* where the Motion of the Arm or Leg is destroy'd.

Dr. *Quincy* observes, that a *Paralysis* where Motion is destroy'd, Sensation remaining, may be produced, first, by too much Humidity, stretching the muscular Fibres in Length. Secondly, from cold Things, which thicken the Juices. Thirdly, from external Compression. Fourthly, from hot Things, which straighten the supple Membranes and Vessels. All these Causes affect either the Blood, or Muscles; the former, by thickening that Tumor so that it cannot suddenly rarify; and the latter, by relaxing the Muscles into too great a Length, by too much Moisture, or contracting them into too narrow Dimensions by too much Heat. But the Sensation may yet be preserv'd, because, notwithstanding all these Hindrances, the animal Spirits and Nerves may not be at all affected.

The Causes of the *Paralysis* where Sensation is destroy'd, Motion remaining, he observes, may be all those Things which so far thicken the animal Spirits in the Nerves, arising below the *Cerebellum*, that tho' indeed they may flow into the Muscles thro' the Nerves, and there, by the Occasion of some Liquor secreted from the Blood, rarify; yet they cannot alone flow in such Quantities into the Nerves, as from a very slight Cause to be made to undulate; whence Sensation will cease without losing the Motion of the Part.

The Causes of this Kind are also whatsoever render those Nerves more lax and moist, and so less apt for lively Vibrations; the animal Spirits flowing in the mean time into the Muscles, from whence Motion is perform'd without Sensation.

The Cure of the *Palsy*, according to *Waldemid*, does not differ much from that of the Venereal Disease. Internally, Mercurials, Sudorifics, and Decoctions of the Woods are good: Externally, Unctions, particularly of spirituous and penetrating Things, not on the Part affected, but on the *Spina Dorsii*.

**PALUDAMENTUM**, in Antiquity, a Garment worn by the *Romans* in Time of War; being the Coat of Arms of their principal Men, especially the General; who, for that Reason, were distinguish'd by the Name *Paludati*.

The Soldiers, having only short Coats, were therefore named *Segati*. See *SAGA*.

This Garment was open on the Sides, with short Sleeves, like Angels Wings, and came down no lower than the Navel.

It was either white or red; and *Valerius Maximus* remarks it was an ill Omen to *Craesus*, that they gave him a black *Paludamentum*: *Pallium est triditum est Paludamentum, eus in proelio cinctibus albis aut purpureis dari soleret.*

*Corvus* says they wore the *Yoga* in Peace, and the *Paludamentum* in War. Hence *Togam Paludamento mutavit.*

**PALY**; when an Escutcheon is divided into six, eight, or ten even Divisions *Pale-wise*, i. e. by perpendicular Lines drawn from the Top to the Bottom: It is blazoned *Paly*, of six, eight, or ten *Esc. Pieces*. See *PALÉ*.

If the Number be odd, then the Field is first named, and the Number of the *Pales* specified.

The like is to be understood also of *Berry* and *Bendy*. See *BARRY*, &c.

**PALY-BENDY** is, when a Coat is divided, both *Pale* and *Bend-wise*; as here: The Field *Paly-Bendy, Topaz and Diamond*.

**PAMPINIFORME Corpus**, in Anatomy, a Sort of *Plexus*, or Knot of Blood-Vessels, form'd by the Spermatic Veins; which, in their Progress thro' the *Testes*, conflux into a Body, call'd *Corpus Veriforme Pampiniforme*, or *Pyramidale*. See *PYRAMIDALE CORPUS*. See also *TESTICLE*, *SPERMATIC VEIN*, &c.

**PANACEA**, an universal Medicine; or a Remedy for all Diseases. See *ELIXIR*, &c.

The Word is form'd from the *Greek* *παν* all, *αἰσιν*, I cure.

The accurate *Boerhaave* overturns the Notion of *Panacea's*; and shews, from the different Causes, Natures, Effects, Scars, &c. of Diseases, that several may be cured by one Medicine; but, all, by once.

He observes, that the most universal Remedies known are *Water*, *Fire*, *Mercury* and *Opium*; and adds, that by these alone, cautiously disguis'd, some have acquir'd the Reputation of universal Physicians. See *MERCURY*, *OPIMUM*, &c.

**PANACES**, or **PANACEOUS**, a Name applied to several Plants, by reason of the extraordinary Virtues ascribed to them.

There are three of these *Panaces*; the *Heracleon*, *Asclepeon*, and *Chironion*; so called from their Inventors, *Heracles*, *Asclepius*, and *Chiron*.

The first is the *Spondylium majus* of *J. Bauhin*; in the Root and Stem of this is drawn, by Ictiun, the Gum *Opopanax*. See *OPOPANAX*.

The *Astiphan*, according to some Botanists, is a Kind of *Ferula*, which *Ges. Bauhin.* calls *Libanotis Ferula Joho & semina*.

The *Chironium*, according to some is a Kind of *Helianthemum*.

**PANADA**, or *Fanastelle*, a Diet, consisting of Bread boil'd in Water, to the Consistence of a Pulp; given to sick Persons whose Digestion is weak, or to whom stronger Foods would be improper. See **DIE T**.

'Tis sometimes made thin; to serve as a Drink; and sometimes likewise sweetened, &c. to render it more palatable.

The Word is form'd from the principal Ingredient *Panis* Bread.

**PANAGE** or **PANNAGE** in our ancient Customs. See **PANNAGE**.

**PANARIS** or **PAYORYCHIA**, in Medicine, a painful Tumour or Inflammation, arising on the Extremities of the Fingers or Toes, popularly call'd, among us, *Whitlow*.

It is occasion'd by a sharp or saline Humour, lodg'd between the Bone and *Periosteum*, and the Nerves and Tendons.

An infallible Remedy for it, is to open it either with the Point of a Lancet, or with some Unguent, and then to dip the Finger in a *Lixivium* of Vine Ashes.

The *Panaris* is exceedingly restless. Beside the mild Kind call'd *Whitlow*, there is also a malignant Kind, call'd a *Felton*. It sometimes tends to an Imposthume, but more usually Gangrenes.

The Word is form'd from the Latin *Panarium*, which we find in *Apuleius*; and that from the Greek *panarion*, i. e. an Abscess at the Root of the Nails.

For the *Panaris*, after bleeding, and the universal Remedies, *Dr. Boerhaave* orders the Patient to hold his Finger a good while in a rotten Egg, or a putrid'd Mouse. *Hippocras* adds, he has seen a Finger as big as an Arm, by means of a *Panaris*, cured by rubbing it with Blood, then wrapping it up in a Mole-Skin. *Riversius* adds, that to hold the Finger affected in a Cats Ear, cures a *Panaris* in two Hours. *Observat. 63. Cent. 4.*

**PANATHENÆA**, in Antiquity, a Feast celebrated at *Athenis*, in Honour of *Minerva*, whom the Greeks call'd *Athena*.

*Hæroclitus* and *Suidas* refer their Institution to *Erichonius* IV. King of *Arctus* who lived before *Trojanus*. *Theophrastus*, alone, says the Feast was establish'd by *Orpheus*.

Be this as it will, till *Theophrastus*, this was a particular Feast of the City of *Arctus*, and was call'd simply *Arctæus*: But that Prince uniting all the People of *Arctis* into one Republic, they all assisted at the Feast; whence the Name *Panathenæa*, i. e. Feast of all *Arctis*.

In Effect all *Arctis* was present; and each People sent a Bollock for the Sacrifices, and for the Entertainment of the vast Multitude of People assembled.

If they eat a great deal, it appears they did not drink less; witness the Vessels they drank out of, which were call'd *Panathenæica*, each of which held two Congiuses and a half. See **CONGIUS**.

There were two Kinds of *Panathenæa*; the Great, celebrated every five Years; and the Little, every Year, or every three Years; if we may credit the Author of the Argument of *Demosthenes's* Oration against *Midias*.

In the *Panathenæa* was held one of the Processions which the Antients call'd *Pompæ*, composed of the briskest old Men, each whereof bore, in his Hand, an Olive-Branch; whence they were call'd *Tallopatori*.

This was to do honour to *Minerva*, in Quality of Inventress of the Olive-Tree; on which Account they had likewise Combats, wherein the Victors were rewarded with Vessels of Oil, and crown'd with Olive-Crowns. It was a Crime in any of the Spectators to be clad in black.

The Ceremonies were the same in the great, and the little *Panathenæa*; excepting a Banner wherein the Actions of the Goddess were represented in Embroidery perform'd by Maids, with the Names of those who had distinguish'd themselves in the Service of the Republic; which was only bore at the Greater.

**PANCARPUS**, in Antiquity, a Sort of Spectacle, or Show which the Roman Emperors frequently exhibited to the People. See **SPECTACLE**.

The *Pancarpus* was a Kind of Chase, or Hunt. For the Performance hereof, a Number of Beasts, as Hares, Deer, Bullocks, &c. were shut up in the *Circus* or Amphitheatre; into which Trees were frequently transplanted, so as to form a Kind of Forest, wherein the Beasts were let loose; whence the *Pancarpus* was also call'd *Sylvæ*.

The Beasts were thus abandon'd to the People, i. e. to all who were dispos'd to share in the Pleasure of the Chase; who pursued, shot, killed and cut in Pieces all they could lay hold of.

*Heliogabalus*, the *Gordian's* and *Probus*, gave this Diversion very frequently.

*Casiodorus*, *Cujas*, *Pitbois*, &c. make the *Pancarpus* and *Sylvæ* the same thing; *Salmasius* will have them different. The *Sylvæ*, according to him, was a Diversion, as that above described; but the *Pancarpus* a Combat, wherein robust People,

bited for that Purpose, fought with wild Beasts; which Opinion he confirms from *Cassian*, *Justinian*, *Claudian*, *Firmicus*, *Martial* and *Cassiodorus*.

The Word is form'd from the Greek *παν* all and *καρπος* Fruit.

Hence the Name was also given by the *Arbians* to a Sacrifice, wherein all Kinds of Fruits were offer'd.

**PANCHREAS** } See **PANCHREAS**.

**PANCHREATIC** } See **PANCHREATIC JUICE**.

**PANCHREST**, *Panchrestes*, in Medicine, a *Poultice*, or Remedy for all Diutempers.

The Word is form'd from the Greek *παν* all, *κρησις* Utility; useful.

**PANCHYMAGOGUE**, in Pharmacy, an Extract of Aloes;

*Rhubarb*, *Senna*, *Scammony*, *Jalap*, *Agaric*, *Coloquintida* and *Black Hellebore*. See **EXTRACT**.

Its Name arises hence, that being a Composition of all the Kinds of Purgatives, it has the Virtue of purging all the Humours of the Body at once. See **PURGATIVE**.

The Word is form'd from the Greek *παν* all, *κρησις* Success, Juice; and *αγρυ* dulce, to draw off.

**PANCRATIUM**, among the Antients, a Kind of intermix'd Exercise, consisting of the *Luctus* or Wrestling, and Boxing or *Progymnas*.

The *Pancretium* was the third *Gymnastic* Exercise, and was not introduced till long after the former. See **GYMNASTIC**.

The People, who engaged in these Exercises, were call'd *Pancretiastæ*; which Name was also given to such as did not confine themselves to one Exercise, but succeeded in several different ones.

The Word is compounded of *παν* all, and *κρησις* Force.

**PANCREAS**, in Anatomy, popularly call'd the *Sweetbread*, a huge conglomerate Gland; or a Body composed of an infinite Number of little Glands, tied up in the same common Membrane; situate at the Bottom and Hind-part of the Stomach, and reaching from the *Duodenum* to the Spleen. See **GLAND**, **STOMACH**, &c.

The Glands it consists of are bound together both by the Vessels, and by a Membrane proper to each of them; and all together are loosely cloath'd with a thin Membrane, from the *Peritoneum*.

Its Colour is Carnation; its Form like that of a Dog's Tongue, 8 or 9 Fingers long, 2½ broad, and one thick; its Weight 4 or 5 Ounces.

Its Arteries come from the *Cœliacæ*; its Veins go to the *Portæ*; its Nerves come from the *Hepaticæ plexus*.

Each little Gland has an excretory Duct, which uniting form one common excretory Duct, call'd *Ductus Pancreticus Virsungii*, from *Virsungus*, Professor of Anatomy at *Padua*, the Discoverer thereof.

This Duct, running along the Middle of the *Pancreas*, opens into the Cavity of the *Duodenum*, generally by two Mouths, the one four or five Fingers below the *Pylorus*, sometimes at the same Orifice with the *Ductus Cholædocus*; the other lower. 'Tis of the Bigness of a Raven's Quill, near the Intestines, but less, further off. *De Graaf* observes, that it is frequently double.

The *Pancreas* serves to separate a peculiar Humour from the Blood, call'd the *Pancretic Juice*. See **PANCHREATIC JUICE**.

The Word is form'd from the Greek *παν* all, and *κρησις* Caro, Flesh.

**PANCREAS FOLLIS**, in Comparative Anatomy, is a large Gland in the Middle of the Mesentery of some Brutes, especially Dogs; to which, most of the *Lacteals* resort; and whence the Chyle is conveyed, by large Vessels, that have their Rise immediately from the Intestines, and call'd *Lactes secundæ Generis*. See **MESENTERY**.

It has its Name from the Author who first took notice of it *Asellius*. See **LACTEAL**.

*M. Perrault* observes, that the Fish, call'd *Place*, has 440 *Pancreas's*; tho' it has but five Ducts opening into the Intestines, each of which correspond to 80 *Pancreas's* and 2 of them to 100 a-piece.

**PANCHREATIC JUICE**, an insipid, limpid Juice; or Humour separated from the Blood, and prepared in the *Pancreas*. See **PANCREAS**.

This Juice is not acid, as most Authors have supposed; nor alkaline, as some others; but, a little saline, and much resembling the *Salsus* in its Origin, Vessels, and Properties.

'Tis carried by the *Pancretic Duct* into the *Duodenum*, where it serves to dilate the Chyle, to render it more fluid and fit to enter the Mouths of the *Lacteals*; and perhaps to temper and dilute the *Bile*, to change its Viscidity, Bitterness, Colour, &c. and make it mix with the Chyle, in order to reduce the several Tastes, Odours, and Properties of the several Foods into one homogeneous one. See **BILE**, **CHYLE**, and **CYCLIFICATION**.

*Theo. Jansson* will have the *Pancretic Juice* to have been known to *Hippocrates* and *Galen*.

*De Graaf*, a Dutch Physician, has found Means of collecting a Quantity of it for Experimenters; and has publish'd a Treatise express'd *de Succo Pancretico*.

*Bruner* relates, that the *Pancreatic Duct*, in several Dogs having been tied, and cut; they still continued to eat, and drink, and perform all the other Functions of Life as usual. One of them seem'd only to have the better Stomach for it.

**PANDECTS, PANDECTA**, in Juris-prudence, the Digest, or Collection made by *Justinian's* Order, of 534 Decisions or Answers of the ancient Lawyers, on so many Questions occurring in Law; to which that Emperor gave the Force and Authority of Laws by the Epistle prefixed to them. See **DIGEST**.

The Word is form'd from the Greek *πανδηκτα*, i. e. Compilation, or a Book containing all Things. Others, as *Beroli*, will have it form'd from *παν* all; as if these Books contained the whole Doctrine of the Law.

The *Pandects* consist of fifty Books, and make the first Part of the Body of the Civil Law. See **CIVIL LAW**.

They were design'd by two  $\pi$ ; but the Copists taking those  $\pi$  for *ff*, the Custom arose of quoting them by *ff*.

*Papius* extends the Signification of *Pandects*, to the Old and New Testament.

The *Florentine Pandects* are those printed from a famous ancient Manuscript at Florence.

**PANDECTA Medicinæ**. There are also *Pandects* of Medicine, a Kind of Dictionary of Things relating to Medicine, compiled by *Matt. Sylvaticus* of *Mantua*, who lived about the Year 1297.

*Leucoclevis* has also publish'd *Pandects* of Turkey; and *Bishop Beveridge* *Pandects* of the Canons.

**PANDICULATION**, that Restlessness, Stretching, and Uneasiness, which usually accompany the cold Fit of an Intermitting Fever. See **INTERMITTING FEVER**.

It is supposed to arise from a convulsive Dilatation of the Muscles, whereby Nature endeavours to throw off something that disturbs her.

**PANDORON**, a musical Instrument, used among the Antients; resembling the Lute. See **LUTE**.

It has the same Number of Strings; but they are of Brass, and of Consequence give a more agreeable Sound.

Its Frets are of Copper, like those of the Cistron; its Back flat, like that of the Guitare; and the Rims of its Table, as well as its Ribs, cut in Semi-circles.

*Du Cange* observes, that *Varro*, *Jidore*, and others of the Antients, mention it as having only three Strings.

The Word, according to some, is form'd from the Greek *παν* and *δωρον*, i. e. all Gift, or all Sorts of Gifts. *Jidore* derives the Name from its Inventor *Pandorus*; others from *Pan*, to whom they attribute its Invention, as well as that of the Flute.

**PANEGYRIC**, an Oration in Praise of some extraordinary Person, or Virtue. See **ORATION**.

The *Panegyric* is rank'd among the demonstrative Kinds of Orations. See **DEMONSTRATIVE**.

It has its Name from *παν* all, and *εγω* I assemble, because it was anciently held in public, and solemn Assemblies of the Greeks, either at their Games, their Feasts, Fairs, or religious Meetings.

To make them the more solemn, they used to begin with the Praises of the Deity, in whose Honour the Games, &c. were celebrated; then they descended to the Praise of the People or Country where they were celebrated; then to the Princes or Magistrates who presided at them; and at length, to the Champions, especially the Conquerors who had gain'd the Prize.

*F. de Colonia* lays down two Methods, or Series of observ'd in *Panegyrics*.

The *Artificial*, where, without any Regard to the Order of Time, every Thing is reduc'd to certain Heads. Thus, *Tully* refers the whole Praise of *Pompey* to his Skill in War, his Virtue, Authority, and Felicity.

The other *Natural*, wherein the Order and Time of History are observ'd. This Series he divides into three Periods, the Space before the Person's Birth, that wherein he lived, and if he be dead, that which follow'd his Death. This Natural Series requires much less Art, Genius, &c. than the other.

The Places or Sources of *Panegyric* are chiefly the Family, Country, *Argues* at his Birth, his Virtues, the Talents of his Body and Mind, Honour, Riches, Manner of his Death, and the Consequences thereof.

**PANEGYRIC**, is also the Name of a Church-Book, in use among the Greeks; so call'd, as consisting of *Panegyrics* or Discourses in Praise of *Jesus Christ* and the Saints. See **GREEN**.

'Tis found in MS. in most Churches; but is not the same in all; each Church having its particular Saints; and the Compiler of this Kind of Books, usually suiting their Collections to the Taste of their own Devotion.

They are dispos'd according to the Order of Months, and frequently consist of 12 Volumes, answering to the 12 Months of the Year.

**PANEL**, or **PANNEL**, in Law, is deriv'd by *Spelman*, from *Panella* a Schedule, or Page; in which Sense we say a *Panel* of Parchment, a Counter-*Panel* of an Indenture, &c.

But it is more commonly used for a Schedule or Roll, containing the Names of such Jurors, as the Sheriff returns to pass upon the Trial.

Hence the *Empanelling* of a Jury is the Entering of their Names, by the Sheriff, into a *Panel*, or little Schedule of Parchment. See **JURY**. In *Panella Affect*, &c., *Coke on Littleton* will have *Panel* to be an English Word, signifying a little Part; as being a Diminutive of the Word *Pans*, Part. But *Spelman* takes this for an Over-sight.

**PANEL**, in Joinery, &c. See **PANNEL**.

**PANES**, in the ancient Theology. See **SATYR**.

**PANIC**, or *Panic-Fear*, a Term used for a needless, or ill-grounded Fright.

*Polyenus* fetches the Origin of the Phrase from *Pan*, one of the Captains of *Bacchus*, who, with a few Men, put a numerous Enemy to rout, by a Noise which his Soldiers raised in a rocky Valley, favour'd with a great Number of Echoes. This Stratagem making their Number appear much greater than it really was, the Enemy quitted a very commodious Encampment, and fled.

Hence all ill-grounded Fears have been call'd *Panicks* or *Panic Fears*; and 'twas this gave Occasion to the Fable of the Nymph *Echo's* being belov'd by that God.

Others derive the Origin of the Expression hence, that in the Wars of the *Titans* against the Gods, *Pan* was the first who struck Terror into the Hearts of the Giants. *Theon* on *Aratus* says, he did it by means of a Sea-Shell which serv'd him for a Trumpet, whereof he was the Inventor.

**PANICULA, PANICLE**, in Botany, called also *Faba* a soft woolly Beard, or String, whereon the Seeds of some Plants hang, pendulous, as in Reeds, Millet, &c.

Such are hence call'd *Paniculated Plants*. See **PLANT**.

**PANNAGE, PANAGE**, or **PAWNAGE**, are used in our Law-Books, &c. for the Malt of Woods; as of Beech, Acorns, &c.

As also for the running and feeding of Swine or other Cattel in Forests, and the Monies taken by Agistors for the same.

*Pannagium liberum*, or free *Pannage*, was a Liberty of free running of Swine in certain Forests and Woods; which was a Privilege, granted to certain private Persons, and several religious Houses. *Linwood* defines *Pannagium Pastus Pecorum in Nemoribus*, & in *Silvis*, ut *post de Glandibus* & aliis fructibus arborum *lysostrivum*, quarum fructibus aliter non solent colligi.

It is also mentioned 20 Car. II. *Quisque villanus habens decem Porcos, dat annua Pecunia de Pannagio*; by which it appears, that one Hog in 10 was given to *Pannage*.

**PANNEL**, in Law. See **PANEL**.

**PANNEL**, or **PANEL**, in Joinery, &c. a Tympanum or square Piece of thin Wood, sometimes curv'd, fram'd, or groov'd in a larger Piece between two Mounts or upright Pieces, and two Traverses or Cross-Pieces.

Hence *Pannels* or *Panes* of Glass, are Compartments or Pieces of Glass of various Forms, Square, Hexagonal, &c.

**PANNEL**, in Masonry, one of the Faces of a hewn Stone. See **STONE**.

*Pannel* of a Saddle, two Cushions full of Hair or Flocks, placed on each Side the Saddle to prevent the Bow from hurting the Horse. See **SADDLE**.

The Word is form'd from the French, *Panneau* of *Pan*, flat-side.

**PANNICULUS**, in Anatomy, a Term frequently used for a Membrane. See **MEMBRANE**.

Hence, *Panniculus adiposus*, &c. is the same with *Membrana adiposa*, &c. See **ADIPOSA**, &c.

The Word is Latin, form'd by Diminution, from *Pannus*, Cloth, & a little Cloth or fine Web.

**PANNICULUS Carnosus**, is a fleshy Membrane, which the ancient Anatomists supposed to be common to the whole Body; and to be the fourth Integument or Covering thereof, after the *Epidermis*, *Cutis*, and the *Adiposus*. See **SKIN**.

This fleshy *Pannicle*, according to them, is a thick Membrane, which covers the whole Body; and even becomes muscular in some Parts: But the latest Anatomists deny any such Membrane in the human Body; maintaining, that what the Antients call'd the fleshy *Pannicle*, is only the fat or adipose one. *Dr. Drake* makes it a double Membrane, one Half of which forms the *Membrana adiposa*, the other Half the *Membrana carnis* of the Muscles. The Use the Antients ascrib'd to the fleshy *Pannicle* was to wrinkle and contract the Skin; but the Truth is, where-ever the Skin wrinkles, there are particular Muscles for the Purpose, call'd *Cutaneous Muscles*. See **CUTANEOUS**.

These Muscles the Antients own'd; but said their Office was confin'd to particular Motions; adding, that there are Places where no Fat is found between the *Cutis* and the fleshy *Pannicle*; which is false.

Further, even in Animals which do move the Skin; this *Pannicle* is no more than a cutaneous Muscle, as well as the *Dartos*.

Some of the modern Anatomists, however, admit the fleshy *Pannicle*, and deny the adipose one; supposing the latter, in reality, only a Part of the former. See **FAT** and **FLESH**.

**PANNIER**, in Architecture. See **CORBEL**.

**PANNUS**, in Medicine, &c. a Disease of the Eye, popularly call'd the *Web*; and by the *Arabs*, *Zobel*.

The *Pannus* is an Excrescence arising on the *Abnata* or *Conjunctiva*; is less hard and membranous than the *Unguis*; and representing a Web, or Tissue of little Veins swell'd with Blood. See **CONJUNCTIVA**.

Its Cause is an Obstruction of the Blood in the minute Vessels of that Tonic. Its Cure is almost the same with that of the *Pterigion* or *Unguis*; between which, and the *Pannus*, there is a great Affinity. See **PTERIGION**.

The chief Difference is, that in the *Unguis*, the membranous Excrescence only covers Part of the Eye, after the manner of a Nail; whereas in the *Pannus* it covers the whole.

**PANTALON** or **PANTALON**, the Name of an ancient Garment, frequent among our Fore-fathers, consisting of Breeches and Stockings all of a Piece.

The Word comes from the *Italians*, who first introduced this Habit, and who are call'd *Pantaloni* from St. *Pantaleon*, who was formerly their Patron.

**PANTALON**, on the Theatre, is a Buffoon or Mask who performs High and Grotesque Dances, and shews violent and extravagant Postures and Airs.

The Word is also used for the Habit or Dress these Buffoons usually wear; which is made precisely to the Form of their Body, and all of a-piece from Head to Foot. Hence those who wear a Habit of this Kind, for Convenience, under their other Cloaths are call'd *Pantalons of Venice*.

**PANTHEA**, among the *Romans*, were single Statues, composed of the Figures or Symbols of several different Divinities. See **STATUE**.

Father *Joubert*, who calls them *Pantheons*, and who has observed them on several Medals, says their Heads are most commonly adorn'd with Symbols belonging to several Gods.

An Instance hereof we have in a Medal of *Antoninus Pius*; which at the same time represents *Serapis*, by the Bushel it bears; the *Sun*, by the Crown of Rays; *Jupiter Ammon*, by the Ram's Horns; *Pluto*, by the large Beard; and *Ejusapius*, by the Serpent twisted in his Hand. See **STATUE**.

M. *Baudelet*, in a Dissertation on the *Laves*, will have the *Pantheons* to have had their Rise from the Superstition of those, who, taking several Gods for the Protectors of their Houses, united them all in the same Statue, by adorning it with the several Symbols, proper to each of those Deities. See **LARÆ**.

**PANTHEON**, in Architecture, is a Temple, or Church of a circular Form; dedicated to all the Gods, or all the Saints. See **TEMPLE** and **CHURCH**.

It is thus named from the Greek *παν* all, and *θεο* God.

The *Pantheon* of ancient *Rome*, is, of all others, the most celebrated, and that whence they all take their Name. It was built by *Agrippa*, Son-in-law of *Augustus*, in his third Consulate, 25 Years before *Christ*. It was dedicated by him to *Jupiter Ultor*, *Jupiter the Revenger*; and had the Name *Pantheon*, by reason of the great Number of Statues of the Gods ranged in Niches all around; and because built round, to represent Heaven, the Residence of all the Gods. It had but one Door, and one Window; receiving all its Light from the Top of its Dome.

The Pope, obtaining it of the Emperor *Phocas*, converted it into a Church, without any Alteration in the Building, and dedicated it to the Virgin and all the Martyrs. And it still subsists at *Rome* under the Title of *Notre Dame della Rotonda*. See **ROTONDA**.

The *Pantheon* of *Nismes*, was a Temple in that City, where there were 12 Niches or Statues, supposed to have been destin'd for the 12 great Gods.

In the *Écarial* is a magnificent Chapel, call'd *Pantheon*, 55 Feet in Diameter, and 38 high, from the Pavement which is of Marble and Jasper inlay'd. The whole Inside of the Chapel is of black Marble, excepting the *Luterna* and some Ornaments of Jasper and red Marble.

In this Chapel are deposited the Bodies of the Kings and Queens: there are only Places made for 26; eight of which are already fill'd. See **ESCARIAL**.

**PAPAL CROWN** is a deep Cap, or Mitre of Cloth of Gold, encompassed with three Coronets or Circles of Gold, adorn'd with Flowers; and the Whole enrich'd with precious Stones; having a Globe at top, finish'd with a Cross. See **CROWN**.

**PAPILLA**, in Anatomy, *Nipple* or *Tost*, a Prominence arising from the Middle of the Breast, or *Mamma*. See **BREAST**.

The Colour of the *Papille* is various; in different States, and Stages of Life, it is reddish, bluish, blackish. They are encompassed with a pale brownish Circle, call'd the *Areola*.

The lacteal Tubes, coming from the several Parts of the Breast, terminate in the *Papille*, with several nervous, or spongyous *Emiffaries* which communicate with each other by *Anastomoses*, thro' which, in sucking, the Milk is drawn. See **MILK**.

**PAPILLÆ Pyramidales**, are little Eminences arising from the subcutaneous Nerves.

Under the *Cutis* lies a thick Congeries of Nerves, wove into a Kind of Membrane; together with Arteries, Veins, and

Lymphatics: These Nerves standing out above the Level form little *Papille*, which laying aside the outer Coat given them by the *Dura Mater*, form the *Corpus varicillare*, first observ'd by *Malgigi* in the Feet, Hands, and Tongue; and since shewn by *Reyfish*, throughout the whole Body. See **RETICULARIS**.

These *Papille* are still most numerous and conspicuous in the Places of acute Sense, as the Tongue, Glans of the *Penis*, *Vagina*, *Labia*, *Oscophagus*, Ventricle, small Intestines, and Tips of the Fingers and Toes, where the *Cutis* they are covered withal is extremely thin. See **CUTIS**.

In the other Parts of the Body the *Cutis* is thicker, and the *Papille* much fewer, smaller, &c. See **RETICULAR BODY**.

These *Papille* are supposed to be the immediate Organ of Feeling. See **FEELING**.

**PAPILLÆ** of the Tongue, are little Eminences of the Tongue; so call'd from their Resemblance to the *Papille* of the Breast. See **TONGUE**.

From the papillary Tonic of the Tongue arise numerous nervous *Papille*, which, penetrating the viscous Substance over them, terminate under the Surface of the Tongue. See **PAPILLARY**.

It is by means of these *Papille* that the Tongue is supposed to have its Faculty of Tasting. See **TASTING**.

**PAPILLÆ**, or *Caruncule Papillares* of the Kidneys, are Bundles of little urinary Pipes, join'd together in the inner Substance of the Kidneys. See **KIDNEY**.

They end in short tubulous Bodies, or larger Pipes, answering in Number to the *Papille*, which are usually 12; and are call'd *Fistule Membranæ*; being only Productions of the membranous Cell, call'd the *Pelvis*. See **PELVIS**.

The *Papille* serve to distill the Urine separated from the Arteries, and brought them by the urinary Pipes, into the *Pelvis*. See **URINE**.

**PAPILLARY**, in Anatomy, an Epithet given to a Tonic or Membrane of the Tongue, call'd *Papillary Tonic*, *Papillary Membrane*, or *Papillary Body*.

The *Papillary Tonic* or *Body* is the third Tegument, plac'd beneath the exterior Membrane which lines the Tongue, and the viscous Substance next under the same. See **TONGUE**.

The *Papillary Tonic* is full of Nerves derived from the fifth and ninth Pair. From this Tonic arise little Eminences, call'd *Papille* or *Papillary Eminences*. See **PAPILLA**.

The Salts and Juices of Bodies, striking against these Prominences, occasion Undulations therein, which are immediately communicated to the Spirits contained in the Nerves, which carry them to the Brain, &c. See **TASTING**.

**PAPILLARY Processes**, a Name the Antients gave to the Olfactory Nerves, from the Place of their Origin, to the *Ori-brosum*. See **NERVE**.

Dr. *Drake* thinks this Name becomes them better in this Place than that of Nerves: in regard they rather appear Productions of the *Methalle Oblongata*; whence the Olfactory Nerves arise, than distinct Nerves; against which their manifest Cavities, and their Communication with the Ventricles, argue.

**PAPILIONACEOUS**, in Botany, the Flowers of some Plants are thus call'd, by Botanists, as representing something of the Figure of a *Papilio* or Butterfly, with its Wings display'd. See **PLANT**.

They have four such Leaves, joined together at the Extremities; one in the Middle of the Flower is larger than the rest, and by some call'd *Fevillum*.

The Plants, that have this Flower, are of the leguminous Kind, as Pease, Vetches, &c.

**PAPPUS**, in Botany, that soft light Down, which grows out of the Seeds of some Plants, as Thistles, Dandelion, Hawkweed, &c. and which buoys them up so in the Air, that they may be blown any where about with the Wind. See **SEMINATION**.

This distinguishes a Class or Kind of Plants, which are hence denominated *Pappus*, or *Pappi Floræ*.

**PAR**, in Commerce a Kind of Equality among Monies; or how much a Person must give of one Kind of Species, to render it just equivalent to a certain Quantity of another.

The *Par* differs from the *Course* of Exchange in this, that the *Par* of Exchange shews what other Nations shou'd allow in Exchange; which is certain and fix'd: But the *Course* shews what they will allow in Exchange; which is uncertain and contingent, sometimes more, sometimes less. See **EXCHANGE**.

The *Par* of Exchange of the French Crowns of 60 *Sols* or 45 *6 d. Sterl.* with Foreign Monies, both real and imaginary, of most of the Trading Cities of Europe, follows; and whence also the Relation or Parity of those other Monies among themselves, appears.

The French Crowns of 60 *Sols* is equivalent to 54 Pence *Sterl.* of England; to 100 *Deniers* Gros of Holland; and to 101, of those of Cologne. To 48 *Sols-Lubs* of Germany and *Hambury*. To 88 *Crowns* of *Ausbury* and 90 of *Francfort*, 83 of *Bolsann*, and 84 of *Switzerland*. To 8 *Julio's* and an half of *Rome*, and as many of *Anconis*; to three *Tellors* of *Florence*, 58 *Soldi* of *Leghorn*, 83 of *Genova*, 94 of *Milan*, 60

of *Nova*; to 5 *Lires* or *Livres* of *Genoa*, 4 *Lires* and 10 *Soldi* of *Lucca*, 8 *Lires* of *Bergamo*, 3 *Lires* and 15 *Soldi* of *Savoy*; to 9 *Carpini* of *Neples*, and as many of *Sicily*; 21 *Grains* and three *Fifths* of *Venice*, 24 of *Newbourg*; to 372 *Maravedis* of *Spain*, to 600 *Rays* of *Portugal*, to 4 *Tarusi* and 15 *Grains* of *Altole*, to 120 *Aspers* of *Constantinople*, to a *Deni-Lingre* of *Gold* of *Hungary*, to 2 *Florins* of *Liege*, 3 of *Strasbourg* and 20 of *Reamus*, to 90 *Grains* of *Graci's* of *Poland*, and 24 of *Berlin*, to 80 *Marks* of *Copper* of *Sweden*, to 50 *Grives* or *Grifs* of *Copper* of *Muscovy*, and lastly to 4 *Hors* of *Denmark*.

PAR, in Anatomy. See PAIR.

PAR, a Term of Nobility. See PEER.

PARABLE, a Fable, or Allegorical Instruction founded on something real, or apparent in Nature or History; from which some Moral is drawn, by comparing it with some other Thing, wherein the People are more immediately concerned.

Such are those Parables of the *Ten Virgins*, of *Dives and Lazarus*, of the *Prodigal Son*, &c. in the New Testament. St. Matthew says our Saviour never spake to the People but by Parables.

F. de Colonia calls the Parable, a Rational Fable. See FABLE. The Word is form'd from the Greek  $\pi\alpha\rho\alpha\beta\alpha\lambda\eta$  to compare. Whence Aristotle defines it a Similitude drawn from Farm to Farm. Cicero calls it a Collation, others a Simile.

In the New Testament it is used variously. In Luke IV. 23. for a Proverb or Adage. In Math. XXV. 15. for a Thing darkly and figuratively express'd. In Heb. IX. 9. for a Type. In Luke XIV. 7. for a special Instruction. Math. XXIV. 32. for a Similitude or Comparison. The Hebrews call it  $\text{מָשָׁל}$  from  $\text{שָׂלַט}$  to predominate, to assimilate; whence the Proverbs of Solomon are call'd  $\text{מְשָׁלִים}$  Parables or Proverbs.

Aquinas defines Parable a similitudinary Discourse; or a Speech which says one thing and means another. Glossius more accurately defines it a Simile wherein a fictitious Thing is related as real, and compared with some Spiritual Thing, or accommodated to signify it.

Some make Parable differ from Fable; Grotius and others will have them the same. Kircher derives the Use of Parables from the Egyptians.

PARABOLA, in Geometry, a Figure arising from the Section of a Cone, when cut by a Plane parallel to one of its Sides. See SECTION.

From the same Point of a Curve, therefore, only one Parabolæ can be drawn: All the other Sections within those Parallels being Ellipses; and all without, Hyperbolas. See CONE.

Wolffius defines the Parabolæ to be a Curve wherein the Square of the Semi-ordinate is equal to the Rectangle of the Abscissæ, and a given right Line call'd the Parameter of the Axis or *Latus rectum*.

Hence, a Parabolæ is a Curve of the first Order; and as the Abscissæ increase, the Semi-ordinates increase likewise; consequently the Curve never returns into itself. Hence also the Abscissæ is a third Proportional to the Parameter and Semi-ordinate; and the Parameter a third Proportional to the Abscissæ and Semi-ordinate; and the Semi-ordinate a mean Proportional between the Parameter and Abscissæ.

To describe a Parabolæ. The Parameter A B Tab. Conicæ. Fig. 8. being given; continue it to C, and from B let fall a Perpendicular, to N. From Centres taken at Pleasure, with the Compasses open to A, describe Arches cutting the right Line B V to I, II, III, IV, V, &c. And the right Line BC in 1, 2, 3, 4, 5, &c. Then will B I, B 2, B 3, B 4, B 5, &c. be Abscissæ, B I, B II, B III, B IV, B V, &c. Semi-ordinates. Wherefore if the Lines B 1, B 2, B 3, &c. be transferr'd from the Line BC to that BN, and in the Points 1, 2, 3, 4, &c. Perpendiculars be rais'd, 1 I = B I, 2 II = B II, 3 III = B III, &c. The Curve passing thro' the Points I, II, III, &c. is a Parabolæ; and P N its Axis.

Every Point of the Parabolæ may also be determined geometrically. E.g. If it inquired whether the Point M be in the Parabolæ or no? From M to BN let fall a Perpendicular M P. And let P N be equal to the Parameter A B; upon B N describe a Semicircle. For if that pass thro' M, the Point M is in the Parabolæ.

In a Parabolæ the Distance of the Focus from the Vertex is to the Parameter in a subquadruple Ratio: And the Square of the Semi-ordinate is quadruple the Rectangle of the Distance of the Focus from the Vertex, into the Abscissæ.

To describe a Parabolæ by a continued Motion. Assuming a right Line for an Axis, let A Fig. 9. = A P = a. In A fix a Ruler D B cutting the Axis P D at right Angles. To the Extremity of another Ruler E C, fasten a Thread fix'd at its other Extreme in the Focus F which is to be = A D + A F. If then a Style or Point be fix'd to the Ruler E C, and the Ruler be carried first to the Right then to the Left, according to the Direction of the other D B; the Style will mark out a Parabolæ: For F M will be constantly = E M = P F =  $a + \frac{1}{4} x$ , and consequently the Point M is in a Parabolæ.

Properties of the PARABOLA.

The Squares of the Semi-ordinates are to each other as the Abscissæ; and the Semi-ordinates, themselves, in a subtriplicate Ratio of the Abscissæ.

The Rectangle of the Sum of the two Semi-ordinates into their Difference, is equal to the Rectangle of the Parameter into the Difference of the Abscissæ: The Parameter therefore is to the Sum of the two Semi-ordinates, as their Difference to the Difference of the Abscissæ.

In a Parabolæ the Rectangle of the Semi-ordinate into the Abscissæ, is to the Square of the Abscissæ, as the Parameter to the Semi-ordinate.

In a Parabolæ the Square of the Parameter is to the Square of one Semi-ordinate, as the Square of the other Semi-ordinate to the Rectangle of the Abscissæ.

In a Parabolæ the Subtangent is double the Abscissæ, and the Subnormal the subduplicate the Parameter.

Quadrature of the Parabolæ. See QUADRATURE.

Rectification of the Parabolæ. See RECTIFICATION.

Centre of Gravity of a Parabolæ. See CENTRE OF GRAVITY.

Centre of Oscillation of the Parabolæ. See OSCILLATION.

PARABOLA'S of the higher Kinds are Algebraic Curves, defin'd by  $a x^m - x = y^n$ . E.g. by  $a^2 x = y^3$ ,  $a^3 x = y^4$ ,  $a^4 x = y^5$ ,  $a^5 x = y^6$ , &c. See CURVE.

Some call these Paraboloides; particularly, if  $a^2 x = y^3$ ; they call it a Cubical Parabolæ, if  $a^3 x = y^4$ , &c. They call it a Biquadratic Parabolæ, or a Surdesimal Parabolæ. And in respect of these, the Parabolæ of the first Kind, above explained, they call the Apollonian or Quadratic Parabolæ.

Those Curves are likewise us'd to be referred to Parabolæ's wherein  $a x^{m-1} = y^n$ , as E.g.  $a x^2 = y^3$ ,  $a x^3 = y^4$ , which some call Semi-parabolæ's. They are all comprehended under one common Equation  $a^m x^{m-1} = y^n$ , which also extends to other Curves, v.g. to those wherein  $a^2 x^3 = y^4 = y^5 = y^6$ ,  $a^3 x^4 = y^5 = y^6$ , &c.

Since in Parabolæ's of the higher Kinds,  $y^n = a x^{m-1}$ ; if any other Semi-ordinate be call'd v, the Abscissæ corresponding to it, will be  $v^n = a x^{m-1}$ ; consequently  $y^m$ ;  $v^n$ ;  $a^{m-1} x^m$ ;  $a^{m-1} v$ . That is  $x : a$ . This a common Property, therefore, of these Parabolæ's, that the Powers of the Ordinates are in the Ratio of the Abscissæ.

But in Semi-parabolæ's  $y^m : v^n :: a x^{m-1} : x^{m-1} : v^{m-1} : v$ . Or the Powers of the Semi-ordinates are as the Powers of the Abscissæ, one Degree lower. E.g. In Cubical Semi-parabolæ's, the Cubes of the Ordinates  $y^3$  and  $v^3$  are as the Squares of the Abscissæ  $x^2$  and  $v^2$ .

Apollonian PARABOLA, is the Common, or Quadratic Parabolæ or Parabolæ of the first Kind; so call'd by way of Distinction from Parabolæ's of the higher Kinds: Which see.

Quadratic PARABOLA, is the same with the Apollonian: Which see.

PARABOLAN, PARABOLANUS, among the Antients, was a Sort of Gladiator; call'd also Confessor. See CONFESSOR.

The Name was given them from the Greek  $\pi\alpha\rho\alpha\beta\alpha\lambda\eta$  of  $\beta\alpha\lambda\lambda\omega$  to throw, precipitate; in regard they threw themselves on Danger and Death.

PARABOLAN is also us'd in Church-History, for a Set of People, especially in Alexandria, who devoted themselves to the Service of Churches, and Hospitals. The Parabolans were not allowed to withdraw themselves from their Function, which was the Service of the Sick. They made a Kind of Priory, amounting sometimes to 600 Persons; depending on the Bishop.

The Design of their Institution was, that the diseas'd, especially those infected with the Plague, might not be without Attendance.

PARABOLIC Space, the Space or Area contained between any entire Ordinate as V V Tab. Conicæ Fig. 8. and the Curve of the incumbent Parabolæ.

The Parabolic Space is to the Rectangle of the Semi-ordinate into the Abscissæ, as 2 to 3; to a Triangle inscribed on the Ordinate as a Base, the Parabolic Space is as 4 to 3.

Every Parabolic and Paraboloidal Space is to the Rectangle of the Semi-ordinate into the Abscissæ as  $m x y : (m + r)$  to  $x y$ , that is, as  $r$  to  $m + r$ .

Segment of a Parabolic Space, is that Space included between two Ordinates. See SEGMENT.

Quadrature of a Parabolic Segment. See QUADRATURE.

PARABOLIC Pyramidoid, a solid Figure, generated by supposing all the Squares of the ordinate Applicates in the Parabolæ, to placed, as that the Axis shall pass thro' all their Centres at Right Angles; in which Case the Aggregate of the Planes will be arithmetically proportional.

The Solidity hereof is had by multiplying the Base, by half the Altitude; the Reason whereof is obvious: for the component Planes being a Series of Arithmetical Proportionals beginning from 0, their Sum will be equal to the Extremes multiply'd by half the Number of Terms, that is, in the present Case, equal to the Base multiply'd by half the Height.

**PARABOLIC CONE**, a solid Figure form'd by multiplying all the DB's *Tab. Cones* Fig. 10. into the DS's; or which amounts to the same, on the Bale APB erect a Prism, whose Altitude shall be A 8 or PS; this will be a *Parabolical Cone*; which of necessity will be equal to the *Parabolical Pyramid*; inasmuch as the component Rectangles, in one, are severally equal to all the component Squares in the other.

**PARABOLIC CONOID**, a solid Figure generated by the Rotation of a *Semi-parabola* about its Axis, and is  $\therefore$  of its circumference Cylinder.

The Circles conceived to be the Elements of this Figure, are in an arithmetical Proposition, decreasing towards the Vertex.

A *Parabolic Conoid* is to a Cylinder of the same Base and Height, as 1 to 2; and to a Cone of the same Base and Height, as  $1\frac{1}{2}$  to 1.

**PARABOLIC SPINDLE**. See PYRAMOID.

**PARABOLIC SPECULUM MIRROR**. See MIRROR.

**PARABOLOIDES**, in Geometry, *Parabola's* of the higher Kinds. See PARABOLA of the higher Kinds.

**QUADRATURE of a PARABOLOID**. See QUADRATURE.

**RECTIFICATION of a PARABOLOID**. See RECTIFICATION.

**Centre of Gravity of a PARABOLOID**. See CENTRE.

**QUADRATIC PARABOLOID**, *Cubical Paraboloïd*, *Sursolidal Paraboloïd*. See PARABOLA of the higher Kinds.

**PARACENTESIS**, in Chirurgery, an Operation in Chirurgery, popularly call'd *Tapping*.

It consists in the opening a little Hole in the lower Venter or Belly, to let out Waters collected in the Capacity thereof, or between the Teguments, in an *Aster* or *Water-Dropsy*. See DROPSY.

The Antients cut the Aperture with a Lance; but the Moderns punch it with a Kind of Silet or Boddin; clapping a *Cannula* or Tap into the Hole when made, to carry off the Water. See CANNULA.

The Operation is usually perform'd two or three Fingers Breadth on one Side the Navel, sometimes a little lower, but always so as to avoid the *Linea Alba*.

The Water is usually drawn off at several Times, as the Patient's Strength will allow; and a new Puncture is made, every Time the Belly is thus to be emptied.

The *Paracentesis* does not often succeed, tho' often repeated; because the Root of the Ductate, notwithstanding the carrying off the Water by this Means, is still left behind.

The Word is form'd from the Greek  $\pi\alpha\rho\alpha\sigma\epsilon\iota\varsigma$  with, and  $\kappa\alpha\tau\alpha\upsilon\pi\omicron\upsilon\sigma\iota\varsigma$  pricking.

Some Authors give the Name *Paracentesis* to all Operations either with the Lance, the Needle, or Panch; not excepting the Operation of Coching for Cataracts; founded on the Etymology of the Word; others restrain it to Apertures made in the Head, Breast, Belly and Scrotum; and others to the single Operation of *Tapping in Dropsy*.

**PARACENTRICK Motion of Imperis**, in Astronomy, a Term used for so much as a revolving Planet approaches nearer to, or recedes farther from the Sun, or Centre of Attraction. See ATTRACTION.

Thus if a Planet in A *Tab. Astronomy* Fig. 25. move to B, then is SB T — SA = b B, the *Paracentrick* Motion of that Planet.

**PARACENTRIC Solicitation of Gravity or Levity** amounts to the same with the *Vit Centripeta*, and, in Astronomy, is expressed by the Line AL Fig. 16. drawn from the Point A parallel to the Ray SB (infinitely near S A) till it intersect the Tangent BL.

**PARACLET**, a Name the Church has given to the Holy Spirit; from  $\pi\alpha\rho\alpha\kappa\lambda\epsilon\tau\alpha\varsigma$ , *Comforter, Advocate*.

**PARACYNANCHE**, in Medicine. See PARASYNANCHE.

**PARADE**, the Shew, or Expofal of any Thing to view, in all its Advantages and Ornaments.

Bed of *Parade*, is that wherein a Person lies in State.

**PARADE**, in War, is the Appearance of the Officers and Soldiers at a Post assign'd them, to put themselves under Arms, in the best Order they can; either to mount, or break up the Guard; or to form a Battalion, or on some other Occasion.

**PARADE**, in Fencing, the Action of Parrying, or Turning off any Blow, or Stroke.

There are as many Kinds of *Parades* as of Strokes and Attacks. *Parade* inward, outward, above, below, feign'd, &c.

**PARADIGM** or **PARADIGM**, an Example, or Influence of something feid, or done. See EXAMPLE.

The Word is form'd of the Greek  $\pi\alpha\rho\alpha\delta\iota\gamma\mu\alpha$  Exemplar, of  $\pi\alpha\rho\alpha$  and  $\delta\iota\gamma\mu\alpha$  *ostendo*, q. d. *javva ostendo*.

**PARADISE**, a Garden of Delights; a Term primarily used for the Place wherein *Adam* was feated, during his Innocence; and from which he was expell'd for disobeying God; call'd in a stricter manner, the *Terriftrial Paradise*.

The Word is form'd of the Greek  $\pi\alpha\rho\alpha\delta\iota\varsigma$  Orchard, a Place stored with Apples, and all Kinds of Fruit. *Moses* calls it the Garden of Eden.

The Critics are in dispute about the precise Place of *Paradise*. Some will have it in *Judea*, in the Place where now is

the Lake *Genesareth*; others, in *Syria*, toward the Springs of the *Orontes*, and *Cerysiorrhes*: But, in neither of those Places do we discover any Track of the Rivers wherewith *Paradise*, in *Moses's* Description, was water'd. Others place it in the greater *Armenia* near the Mountain *Ararat*, where *Noah's* Ark was left; and imagine they there discover the Sources of the four Rivers which water'd the Garden of *Eden*, viz. *Euphrates*; *Habekel*, now the *Tigre*; *Gihon*, now *Araxes*; and *Pison*, now *Phazoos*. But Sir J. Chardin asserts us, in his Travels, that the *Phazoos* springs out of the Mountains of *Caucasus*, Northward of the Kingdom of *Isaerets*, and far enough from Mount *Ararat*: Beside that in *Armenia*, we have no Signs of the Countries of *Havilah* and *Ethiopia*, which those Rivers water'd after their departing from *Eden*.

There are various other Opinions, as to this Point: *Postellus* will have *Paradise* placed under the North-Pole; grounding his Notion upon an ancient Tradition of the *Egyptians* and *Babylonians*, that the Ecliptic or Sun's Way was at first at Right Angles to the Equator; and so pass'd directly over the North-Pole. Others are again limiting it to any one Place, and contend, that it included the whole Face of the Earth, which was, as it were, one continued Scene of Pleasures, till alter'd upon *Adam's* Transgression.

But the most common, and withal, most probable Opinion is that of *Hophkinst, Huet, Bochart, &c.* who place it between the Confluence of the *Euphrates*, and *Tyger*, and their Separation. These Rivers are two of those wherewith the Garden of *Eden* was water'd: *Pison* was a Branch arising out of one of them after their Separation; and *Gihon* another Branch arising from the other, on the Side of *Armenia* or the West: Accordingly *Ethiopia*, one of the Countries which these Rivers water'd was, incontestably, *Aravia Deserta*, for *Moses* calls his Wife, who was of this Country, an *Ethiopian*; and *Havilah*, the other Country, must be the *Chiffian*, in *Persia*; where there were anciently found *Gold, Balmum, the Onyx, &c.* mentioned in *Moses's* Description.

**PARADISUS**, among ancient Church-Writers, was a square Court, before Cathedrals, surrounded with *Piazza's*, or Portico's for walking under, supported by Pillars. *Matthew Paris* calls it *Parvulus*.

**PARADOX**, in Philosophy, a Proposition seemingly absurd, because contrary to the receiv'd Opinions; but yet true.

The *Copernican* System is a *Paradox* to the People; the Learned are all agreed of its Truth.

There are even *Paradoxes* in Geometry; a Number whereof are collected by the Jesuit *Marie Boine*: among others is this, that the Contain'd is greater than the Containing.

The Word is form'd from the Greek  $\pi\alpha\rho\alpha\delta\omicron\varsigma$ , *contra*, against, and  $\delta\omicron\varsigma$  a Opinion.

**PARADOXI**, or **PARADOXOLOGI**, among the Antients, were a Kind of Mimes or Buffoons, who diverted the People with their Drolling. See PANTOMIME.

They were also call'd *Ordinaris* for this Reason apparently, that, as they spoke without Study or Preparation, they were always ready.

They had another Denomination, viz. *Nimicologi* q. d. Tellers of Children's Tales: And, beside, were call'd *Artaologi*, of *arsu*, Virtue as talking much of their own rare Talents and Qualifications.

**PARÆNESIS**, *parainesis*, a Greek Term, signifying Admonition, Instruction, Precept, or Exhortation.

The Word is form'd of  $\pi\alpha\rho\alpha$  and  $\nu\epsilon\sigma\iota\varsigma$ , *Laudo*.

**PARAGE**, in Law, and Customs, an Equality of Name, Blood, or Dignity, but more especially of Land, in the Partition of an Inheritance between Co-heirs. See PEEBAGE.

**PARAGE**, *Paragium*, was particularly us'd in ancient Customs, for an Equality of Condition among Nobles, or Persons holding Nobly: Thus, when a Fief is divided among Brothers; in this Case, the younger hold their Part of the Elder by *Parage*, i. e. without any Homage or Service.

This still obtains, in some Measure, in *Scotlands*, where the Husbands of the younger Sisters are not obliged to any Faith or Homage to the Husband of the Elder; nor their Children, to the second Degree.

This *Parage* being an Equality of Duty or Service among Brothers and Sisters, some have call'd it *Fratrage* and *Parentage*. The Customary of *Normandy* defines the *Tenure* by *Parage* to be, when, a noble Fief being divided among Daughters, the Eldest does Homage to the chief Lord for all the rest, and the youngest hold their Parts of the Eldest by *Parage*, i. e. without any Homage or Fealty. *Parage* ceases at the sixth Degree inclusively. It likewise ceases, when any of the Sheres sell their Part. See HOMAGE.

**PARAGOGE**, in Grammar, a Figure, whereby a Word is lengthen'd out, by adding a Syllable at the End thereof; as in *dicier* for *dicet*. See FIGURE. Or

**PARAGOGIC**, in Grammar, something added to a Word without adding any thing to the Sense thereof. In the Hebrew, the  $\eta$  is frequently *Paragogic*; as  $\eta\alpha\gamma\alpha\delta\eta$  for  $\eta\alpha\gamma\alpha$  I will praise.

The Use of *Paragoric* Letters is only to give a more full and agreeable Sound to Words, either for the Sake of the Verse, or the Period.

The Word is form'd of the Greek *παράγωμι* I add; compounded of *πάρα* and *γωμι*.

PARAGORICKS, Medicines prescrib'd with an Intention to assuage Pain. See PAIN.

They are thus call'd, from the Greek *παράγωμι* I mitigate, or abate; but are more ordinarily denominated *Opiates*. See OPIATE.

PARAGRAPH, a Term originally in Juris-Prudence, signifying a Section, or Division of the Text of a Law; otherwise call'd an *Article*.

Thus, such a Law is said to be divided into so many *Paragraphs*. The Character of a *Paragraph* in a Quotation is, §. See CHARACTER.

The Greek Poets also used *Paragraphs* to mark the Couplet, Strophes, and other Divisions of Odes, and other poetical Works.

PARAGUAY, or PARAGOUÉ, in Nat. History, a celebrated Plant, of the Shrub Kind, growing in some Provinces of South America, especially at Paraguay, whence its Name; tho' better known, of late, among us, under the Denomination of *Sauv-Sea Tea*.

This Plant, which does not rise above a Foot and half high, has very tender Branches, and Leaves like those of Senna; it may be look'd on as a Kind of Occidental Tea, which, like the Oriental, is taken infused in hot Water, to which it communicates a Colour and Smell nearly like those of the best Tea seen in Europe.

There are two Kinds of *Paraguay*, the one call'd simply *Paraguay*; the other *Caama*, by the Spaniards, *Terra-Caama*; which last is most esteem'd, and sold for a Third more than the other.

The first the Spaniards call *Terra-Caama*, i. e. Herb with little Sticks, because full of broken Branches, and is chiefly used by Domestic Slaves: The latter is the Drink of the richest. But both are of so much Use, and esteem'd of such absolute Necessity, that no body in that Part of America will live without 'em. The Works of the Mines of *Potosi* would stand still, but that the Masters take care to supply the poor Slaves that labour therein, with *Paraguay*. Nor will a Servant engage himself with any Master, but upon this among other Conditions, that he have nothing but *Paraguay* for Drink.

The *Paraguay* makes one of the most considerable Articles of the South American Commerce. At *Pern*, *Chilly*, and *Buenos Aires*, there are above two Millions Worth sold per Annum; which passes almost altogether thro' the Hands of the Jesuits. The Use of *Paraguay* began lately to obtain in England; where many People seem'd to like it as well as Tea. But Foreigners say, that their Approbation flow'd as much from their Interest as their Taste; in regard they come so easily by it, by reason of their Commerce with the Spaniards of *S. America*, and *Buenos Aires*, since the Treaty of *Utrecht* in 1713.

The Preparation of the Plant, and the making it into a Drink is much the same with that of Tea, except that they infuse both Leaves and Wood, that they drink it immediately out of the Vessel 'tis made in; without letting it have Time to infuse, by reason of the black Tincture it gives; and that, to prevent Leaves and all from coming, they suck it thro' a silver, or glass Pipe, which goes round the Company one after another. *Frezier*.

Beside all the Virtues which the Eastern People ascribe to their Tea; as to be good in Diseases of the Head, Breath, Stomach, against Pleurisy, and to restore Sleep; the Americans attribute to theirs this further of purifying all Kinds of Water, how foul and corrupted soever, by only infusing it therein, either hot or cold. Thus, having always some of it with 'em, if they meet with none but the worst Waters in the vast Deserts to be cross'd in going from *Buenos Aires* to *Pern* and *Chilly*, they are not afraid to drink it, after steeping some of the Plant a little while therein. It is also held sovereign against the Scurvy, and purid Fevers.

PARALEPSIS, in Rhetoric, a Feint, or Pretence of omitting or passing over a Thing, and yet expressing it. See FIGURE.

When the Imagination is warm'd, and Reasons and Arguments present themselves in abundance; the Orator would willingly lay 'em all down, in Form; but, for Fear of wearying his Audience, only produces some of 'em *en passant*, and without dwelling on them; and this is call'd a *Paralepsis*; for Instance, *I pass over in Silence the many Injuries I have receiv'd, &c. I never insist on his last Outrage.*

PARALIPOMENA, a Supplement of Things omitted, or forgot in some preceding Work, or Treatise.

In the Canon of Scripture, there are two Books of *Paralipomena*, call'd also *Chronicles*; being a Supplement to the four Books of Kings, the two first whereof are also call'd Books of *Samuel*.

*Quintus Calaber* has a Work entitled, the *Paralipomena of Homer*.

The Word is form'd from the Greek *παράγωμι*, *praterwmito*, I pass by.

Some Authors use the Word *Subrelictiorum* instead of *Paralipomenon*.

PARALLAX, in Astronomy, an Arch of the Heavens intercepted between the true Place of a Star, and its apparent Place. See PLACE.

The true Place of a Star is that Point of the Heavens, B, *Tab. Astronomy Fig. 27*, wherein it would be seen by an Eye placed in the Centre of the Earth, as at T. The apparent Place is that Point of the Heavens C, wherein the Star appears to an Eye on the Surface of the Earth, as at E.

Now, as in Effect, we view the Celestial Bodies not from the Centre but from the Surface of our Earth, which is a Semi-diameter distant from the Centre; we see it by a visual Ray, which passing thro' the Centre of the Star, and proceeding thence to the Surface of the Mundane Sphere, marks out another Point C, which is its apparent Place.

This Difference of Places, is what we call absolutely the *Parallax*, *παράλλαξις*, or the *Parallax of Altitude*; by *Copernicus* call'd the *Commutation*; which, therefore, is an Angle form'd by two visual Rays, drawn, the one from the Centre, the other from the Circumference of the Earth, and traversing the Body of the Star; and is measured by an Arch of a great Circle intercepted between the two Points of true and apparent Place C and B.

PARALLAX is also used for the Angle made in the Centre of the Star, by two right Lines, drawn, the one from the Centre, the other from the Surface of the Earth.

The Angle is also call'd *Parallactic Angle*. See PARALLACTIC ANGLE.

Hence the *Parallax* diminishes the Altitude of a Star, or increases its Distance from the Zenith, and has, therefore, a contrary Effect to the Refraction. See REFRACTION.

The *Parallax* of the Altitude, C B is, strictly, the Difference between the true Distance from the Zenith C A, and the apparent Distance B A. See PARALLACTIC ANGLE.

The *Parallax* is greatest in the Horizon; in the Zenith, or Meridian, a Star has no *Parallax* at all, the true and apparent Places, then co-inciding.

The Horizontal *Parallax* is the same, whether the Star be in the true or apparent Horizon.

The fix'd Stars have no sensible *Parallax*, by reason of their immense Distance to which the Semi-diameter of the Earth is but a mere Point. See STAR.

Hence also the nearer a Star is to the Earth, the greater is its *Parallax*, at an equal Elevation above the Horizon; *Saturn* is so high, that we have much ado to observe any *Parallax* at all.

The *Parallax* increases the right and oblique Ascension, diminishes the Descension, diminishes the Northern Declination, and Latitude in the Eastern Part, increases it in the Western; increases the Southern in the Eastern and Western Part; diminishes the Longitude in the Western Part, increases it in the Eastern. The *Parallax*, therefore, has just opposite Effects to the Refraction. See REFRACTION.

PARALLAX of Declination, is an Arch of a Circle of Declination S I, *Fig. 28*, whereby the *Parallax* of the Altitude increases or diminishes the Declination of a Star. See DECLINATION.

PARALLAX of Ascension and Descension, is an Arch of the Equator D d, *Fig. 29*, whereby the *Parallax* of the Altitude increases the Ascension, and diminishes the Descension. See ASCENSION and DESCENSION.

PARALLAX of Longitude, is an Arch of the Elliptic T t, *Fig. 28*, whereby the *Parallax* of the Altitude increases or diminishes the Longitude. See LONGITUDE.

PARALLAX of Latitude, is an Arch of a Circle of Latitude S I, whereby the *Parallax* of Altitude increases or diminishes the Latitude. See LATITUDE.

PARALLACTIC ANGLE, called also simply *Parallax*, is the Angle made in the Centre of the Star by two right Lines, drawn, the one from the Centre of the Earth T B, *Tab. Astronomy, Fig. 27*, the other from its Surface E B.

Or, which amounts to the same, the *Parallactic Angle* is the Difference of the Angles C E A, and B T A, under which the real and apparent Distances from the Zenith are seen. See PARALLAX.

The Sines of the *Parallactic Angles* ALT and AST, *Tab. Astron. Fig. 30*, at the same or equal Distances from the Zenith SZ; are in a reciprocal Ratio of the Distances of the Stars from the Centre of Earth T L and T S. Hence the *Parallax* of the remoter Star S, is less than the *Parallax* of the nearer L, at the same Distance from the Zenith; as before observ'd.

The Sines of the *Parallactic Angles* M and S, of Stars equally distant from the Centre of the Earth T, are as the Sines of the Distances seen from the Vertex Z M and Z S.

Hence, as the Distances from the Vertex Z decrease, i. e. as the Altitudes decrease, the *Parallax* decreases; and hence, also, the *Parallax* affects the Altitude of the Star, from the Horizon to the Zenith.

The Doctrine of *Paralleles* is of the utmost Importance in Astronomy; both for the determining of the Distances of the Planets, Comets, and other *Phænomena* of the Heavens; for the Calculation of Eclipses; and for determining the Longitude. See PLANET, DISTANCE, LONGITUDE, and ECLIPSE.

Methods of finding the *Parallels* of the Celestial *Phænomena* are various: Some of the principal and easiest follow.

To observe the *Parallax* of a Celestial *Phænomenon*.

Observe when the *Phænomenon* is in the same Vertical with a fix'd Star which is near it; and measure its apparent Distance from this Star. Observe, again, when the *Phænomenon* and fix'd Star are in equal Altitudes from the Horizon; and again measure their Distance: the Difference of those Distances will be, very nearly, the *Parallax* of the Star.

The *Parallax* of a *Phænomenon* may be likewise found by observing its Azimuth and Altitude; and by marking the Time, between the Observation and its Arrival at the Meridian.

All, requir'd to find the *Parallax* of the Moon, is the *Parallax* of right Ascension: i. e. to find the Effect of the Magnitude of the Semi-diameter of the Earth, with regard to the *Phænomenon* of its Motion, 'tis sufficient to know how far the Meridian, to which the Eye refers to, deviates from the true Meridian. This is what M. Cassini found and practis'd, with regard to Mars; and which M. Maraldi has since practis'd, with regard to the Moon. The whole Mystery here consists in having the Moon's true Motion, which refers to the Centre of the Earth; and its apparent Motion, which refers to the Place of Observation. The Difference of these, which is greatest in the Horizon, or Horary Circle of 6 o' Clock, gives the Horizontal *Parallax*, for that Latitude whence the general *Parallax*, or that under the Equator is easily found: The *Parallax* of any Parallel being to that of the Equator, as the Semi-diameter of this Parallel is to that of the Equator. See the *Practise* of this Method exemplify'd in finding the *Parallax* of Mars.

The popular Method for that of the Moon, Wolfius gives us as follows:

To observe the Moon's *Parallax*.

Observe the Moon's Meridian Altitude, with the greatest Accuracy, (See ALTIMETER) and mark the Moment of Time: This Time being equated; (See EQUATION) compute her true Longitude and Latitude; and from these find her Declination, (See DECLINATION) and from her Declination and the Elevation of the Equator find her true Meridian Altitude. If the observ'd Altitude be not meridian, reduce it to the true Altitude for the Time of Observation. Take the Refraction from the observ'd Altitude, and subtract the Remainder from the true Altitude: the Remainder is the Moon's *Parallax*.

By this means Tycho in 1582, Oct. 12. Her. 5'. 19". from the Moon's Meridian Altitude observ'd, 13°. 38'. her *Parallax* 54 Minutes. See MOON.

To observe the Moon's *Parallax* in an Eclipse.

In an Eclipse of the Moon, observe when both Horns are in the same Vertical Circle; in that Moment take the Altitudes of both Horns; the Difference of the two being halved and added to the least, or subtracted from the greatest, gives nearly the visible Altitude of the Moon's Centre. But the true Altitude is nearly equal to the Altitude of the Centre of the Shadow at that Time. Now we know the Altitude of the Centre of the Shadow; because we know the Sun's Place in the Ecliptic, and its Depression under the Horizon, which is equal to the Altitude of the opposite Point of the Ecliptic in which the Centre of the Shadow is. Thus have we both the true and apparent Altitude; the Difference whereof is the *Parallax*.

From the Moon's *Parallax* A S T Fig. 30. and Altitude S R, to find her Distance from the Earth.

By her apparent Altitude given, we have her apparent Distance from the Zenith, i. e. the Angle Z A S; or by her true Altitude the Angle A T S. Wherefore, since, at the same Time, we have the *Parallelic* Angle S; and the Semi-diameter of the Earth is reputed, By plain Trigonometry we shall have the Moon's Distance in Semi-diameters of the Earth; thus: as the Sine of the Angle S is to the opposite Side given, so is the Sine the other Angle T, to the Side required T S.

Hence, according to Tycho's Observation, the Moon's Distance at that Time from the Earth was 62 Semi-diameters of the Earth. Hence also, since, from the Moon's Theory, we have the Ratio of her Distances from the Earth in the several Degrees of her Anomaly; those Distances being found by the Rule of Three in Semi-diameters of the Earth, the *Parallax* is thence determined to the several Degrees of the true Anomaly.

De la Hire makes the greatest Horizontal *Parallax* 1°. 1'. 25". the smallest 54' 5". The Moon's Distance, therefore, when in her Perigee is 53 $\frac{1}{2}$ ; that is, almost 56 Semi-diameters; in her Apogee 69 $\frac{1}{2}$ ; that is, 63 $\frac{1}{2}$  Semi-diameters.

To observe the *Parallax* of Mars.

1. Suppose Mars in the Meridian and Equator, in H. Tab. Astronomy Fig. 31. and that the Observer under the Equator in A;

observes him culminating with some fix'd Star. 2. If now the Observer were in the Centre of the Earth, he wou'd see Mars constantly in the same Point of the Heaven with the Star; and therefore, together with it in the Plane of the Horizon, or of the sixth Hourly. But since Mars, here, has some sensible *Parallax*, and the fix'd Star none, Mars will be seen in the Horizon, when in P, the Plane of the sensible Horizon; and the Star, when in the Plane of the true Horizon; observe, therefore, the Time between the Transits of Mars and of the Star thro' the Plane of the sixth Hour. 3. Convert this Time into Minutes of the Equator; by this means we shall have the Arch P M, to which the Angle P A M, and consequently the Angle A M D is nearly equal, which is the Horizontal *Parallax* of Mars.

If the Observer were not under the Equator, but in a Parallel, I Q, that Difference will be a less Arch Q M. Wherefore, since the little Arches, Q M and P M, are as their Sines A D and I D; and since A D G is equal to the Distance of the Place from the Equator, i. e. to the Elevation of the Pole; and therefore, A D to I D, as the whole Sine to the Co-sine of the Elevation of the Pole; say, as the Co-sine of the Elevation of the Pole I D is to the whole Sine A D; so is the *Parallax* observ'd in I, to the *Parallax* to be observ'd under the Equator.

Since Mars and the fix'd Star cannot be commodiously observ'd in the Horizon; let 'em be observ'd in the Circle of the third Hour: And since the *Parallax* there observ'd, T O, is to the Horizontal one, P M, as I S to I D; 3 say, as the Sine of the Angle I D S, or 45° (since the Plane D O is in the Middle between the Meridian D H and the true Horizon D M) to the whole Sine, so is the *Parallax* T O to the Horizontal *Parallax* P M.

If Mars be likewise out of the Plane of the Equator; the *Parallax* found will be an Arch of a Parallel; which must, therefore, be reduced, as above, to an Arch of the Equator.

Lastly, if Mars be not stationary, but either direct, or retrograde; by Observations for several Days, find out what his Motion is every Hour, that his true Place from the Centre may be assign'd for any given Time.

By this Method, Cassini, to whom we owe this noble Invention, observ'd the greatest Horizontal *Parallax* of Mars to be 25 Seconds, or a little less. By the same Method Mr. Flamsteed found it near thirty Seconds.

By the same Method the same Author Cassini observ'd the *Parallax* of Venus.

It must be here noted, that the Observation is to be made with a Telescope, in whose Focus are fix'd in A B four Threads cutting each other at right Angles A, B, C, D. The Telescope to be turn'd about, till some Star near Mars be seen to pass over some of the Threads; A B and C D being parallel to the Equator; and therefore, A C and B D representing Circles of Declination. Thus, by means of the perpendicular Threads, the Situations of the Star, and of Mars in the Meridian, will be determined.

To find the Sun's *Parallax*.

The great Difficulty of the Sun renders its *Parallax* too small to fall under even the nicest immediate Observation: Indeed, many Attempts have been made both by the Antients and Moderns; and many Methods invented for that Purpose. The first, that of Hipparchus, follow'd by Ptolemy, &c. was founded on the Observation of Lunar Eclipses; the second, was that of Aristarchus, whereby the Angle subtended by the Semi-diameter of the Moon's Orbit, seen from the Sun, was sought from the Lunar Phases: But, these both proving deficient, Astronomers are forced to have Recourse to the *Parallels* of the Planets nearest us, as Mars and Venus; for from their *Parallels* known that of the Sun, which is inaccessible by any direct Observation, is easily deduced.

For from the Theory of the Motions of the Earth and Planets, we know at any Time the Proportion of the Distances of the Sun and Planets from us; and the Horizontal *Parallels* are in a reciprocal Proportion to those Distances: Knowing, therefore, the *Parallax* of a Planet, that of the Sun may be found from it.

Thus, Mars, when opposite to the Sun, is twice as near as the Sun is, his *Parallax*; therefore, will be twice as great as that of the Sun; and Venus, when in her inferior Conjunction with the Sun is sometimes nearer us than he is; her *Parallax*, therefore, is greater in the same Proportion.

Thus, from the *Parallels* of Mars and Venus, the same Cassini found the Sun's *Parallax* to be ten Seconds, which implies his Distance to be 225052 Semi-diameters.

In an Observation of the Transit of Venus over the Sun, which will be seen in May, 1761. Dr. Halley has shewn a Method of finding the Sun's *Parallax* and Distance to a great Nicety, viz. to a five hundredth Part of the Whole. See SUN.

The *Parallax* of the Stars, with regard to the Earth's annual Orbit.

The Stars have no *Parallax*, with regard to the Earth's Semi-diameter; yet, with regard to the Earth's annual Orbit; 'tis justly expected that some *Parallax* be found. See ORBIT.

The Axis of the Earth in its annual Motion describes a Kind of Cylinder, which being prolong'd to the Heaven of the fix'd Stars, there forms a circular Circumference; each Point whereof is the Pole of the World for its respective Day: so that the Situation of the apparent Pole, with regard to any of the fix'd Stars changes very considerably in the Course of a Year.

Could this be found by Observation, it wou'd irrefragably evince the annual Motion of the Earth round the Sun, and remove that only Objection which lies against it, arg'd by Riccioles, from no such *Parallels* being observ'd. See EARTH.

Accordingly Dr. Hook attempted to find it by observing the various Distance of a fix'd Star from the Zenith, in different Parts of the Earth's Orbit; and Mr. Flamsteed, from the Accels and Recels of a fix'd Star from the Equator at different Times of the Year, and with Success: The Result of his Observations being, that the Distance of a fix'd Star, near the Pole, was found 40 or 45 Seconds nearer it at the Winter Solstice than at the Summer one, for seven Years successively.

M. Cassini the Younger allows the Observations of Flamsteed to agree with those made at the Royal Observatory; but he denies the Consequences: he says the Variations in the Distance of the Pole Star are not such as they shou'd be, supposing the Motion of the Earth; and accounts for them from a Supposition that the Stars, like the Sun, turn or revolve on their Centres, and that some of 'em have their Hemispheres unequally luminous: Whence, when the more shining Hemisphere is turn'd towards us, the Stars appear bigger, consequently more remote than when the darker is towards us. See STAR.

PARALLAX is also us'd in levelling, for the Angle contain'd between the Line of true Level, and that of apparent Level. See LEVELLING.

PARALLEL, in Geometry, from the Greek *παραλλήλος*, equidistant; is a Term applied to Lines, Figures and Bodies, which, being prolong'd, are still at equal Distance from one another.

PARALLEL Right Lines, are those which, tho' infinitely produced, never meet.

Thus, the Line OP, *Tab. Geometry*, Fig. 36. is parallel to QR. See LINE.

Parallel Line is us'd in Opposition to Lines converging and diverging. See CONVERGING.

Some define an *inclining* or *converging Line*, that which will meet another at a finite Distance; and a *Parallel* that which wou'd only meet at an infinite Distance.

Others define a Perpendicular the shortest of all Lines that can be drawn to another; and a *Parallel* the longest. For the Orthodoxy of these Definitions of Parallelism we don't undertake.

Geometricians demonstrate, that two Lines, parallel to the same third Line, are also parallel to one another; and that if two *Parallels* OP and QR, *Tab. Geometry* Fig. 36. be cut by a transverse Line ST, in A and B, 1. The alternate Angles *x* and *y* are equal. 2. The external Angle *z* is equal to the internal opposite one *y*; and thirdly, That the two internal opposite ones *x* and *y* are also equal to two right ones.

It is shewn on the Principles of Opticks, that if the Eye be placed between two *Parallel* Lines, they will appear to converge towards a Point opposite to the Eye. And if they run to such a Length, as that the Distance between them be but as a Point thereto, they will there appear to co-incide.

*Parallel Lines* are described by letting fall equal Perpendiculars, and drawing Lines through their Extremes, by sliding the Compasses open to the desir'd Width along a Line, &c. or by a

PARALLEL Ruler, call'd also *Parallelism*, an Instrument consisting of two wooden, brass, or steel Rulers A B, and C D; Fig. 37. equally broad every-where, and so join'd together by the Cross-blades E F and G H, as to open so different Intervals, recede and recede, yet still retain their *Parallelism*.

The Use of this Instrument is obvious; for one of the Rulers being applied to P S, and the other drawn to a given Point V; a right Line A B, drawn by its Edge, thro' V, is a *Parallel* to R S.

PARALLEL Rays, in Opticks, are those which keep at an equal Distance to each other, from the visible Object to the Eye, which is supposed to be infinitely remote from the Object. See RAY.

PARALLEL Planes are those Planes, which have all the Perpendiculars drawn betwixt them equal to each other. See PLANE.

PARALLELS of PARALLEL Circles, in Geography, call'd also *Parallels* of Latitude, and Circles of Latitude, are lesser Circles of the Sphere, conceived to be drawn from West to East thro' all the Points of Meridian; commencing from the Equator, to which they are parallel, and ending with the Poles. See CIRCLE.

They are call'd *Parallels of Latitude*, &c. because all Places lying under the same *Parallel*, have the same Latitude. See LATITUDE.

PARALLELS of Latitude, in Astronomy, are lesser Circles of the Sphere parallel to the Ecliptic, imagin'd to pass thro' every Degree and Minute of the Colures. See LATITUDE.

They are represented on the Globe by the Divisions of the Quadrant of Altitude, in its Motion round the Globe, when view'd over the Poles of the Ecliptic. See GLOBE.

PARALLELS of Altitude or Altitudes, are Circles parallel to the Horizon, imagin'd to pass thro' every Degree and Minute of the Meridian between the Horizon, and Zenith; having their Poles in the Zenith. See ALTITUDE.

On the Globes they are represented by the Divisions on the Quadrant of Altitude, in its Motion about the Body of the Globe, when view'd to the Zenith. See GLOBE.

PARALLELS of Declination, in Astronomy, are the same with *Parallels* of Latitude in Astronomy. See DECLINATION.

PARALLEL Sphere, that Situation of the Sphere, whereis the Equator co-incides with the Horizon, and the Poles with the Zenith and Nadir. See SPHERE.

In this Sphere all the *Parallels* of the Equator become *Parallels* of the Horizon, consequently no Stars ever rise or set; but all turn round in Circles parallel to the Horizon; and the Sun, when in the Equinoctial, wheels round the Horizon the whole Day. After his rising to the elevated Pole, he never sets for six Months; and, after his retiring again to the other Side of the Line, never rises for six Months longer.

This Position of the Sphere is theirs who live under the Poles; if any such there be. Their Sun is never above 23°. 50'. high.

PARALLEL Sailing, in Navigation, is the Sailing under a Parallel of Latitude. See SAILING.

Of this there are but three Cases. 1. Given, the Departure, and Distance; required the Latitude. The Canon is, As Difference of Longitude is to Radius: So is Distance, to Co-fine of the Latitude.

2. Given Diff. of Longitude between two Places under the same *Parallel*, required their Distance. The Canon is, As Rad. to Diff. of Longitude: So is Co-fine of Latitude to Distance.

3. Given the Distance between two Places in the same Latitude; required their Difference of Longitude. The Canon is, As the Co-fine of Lat. to Distance: So is Rad. to Diff. of Longitude.

PARALLELOPIPED, in Geometry, one of the regular Bodies, or Solids, comprehended under six Rectangular and Parallel Surfaces, the opposite ones whereof are equal: As in the Figure *Tab. Geometry* Fig. 38. See REGULAR.

Two Cubes, laid together, Side by Side, constitute a *Parallelo-piped*: And the same may be said of a square Beam, whose two Extremes are square, and Sides long Squares.

Properties of the PARALLELOPIPED.

All *Parallelo-pipeds*, Prisms, and Cylinders, whose Bases and Heights are equal, are, themselves, equal.

A diagonal Plane divides the *Parallelo-piped* into two equal Prisms: A Triangular Prism, therefore, is half a *Parallelo-piped* upon the same Base and of the same Altitude. See PRISM.

All *Parallelo-pipeds*, Prisms, Cylinders, &c. are in a Ratio compounded of their Bases and Altitudes: Wherefore, if their Bases be equal, they are in Proportion to their Altitudes; and conversely.

All *Parallelo-pipeds*, Cylinders, Cones, &c. are in a triplicate Ratio of their homologous Sides; and also of their Altitudes.

Equal *Parallelo-pipeds*, Prisms, Cones, Cylinders, &c. reciprocate their Bases and Altitudes.

To measure the Surface and Solidity of a *Parallelo-piped*.

Find the Areas of the *Parallelograms* I L M K, L M O N. See PARALLOGRAM. Add their into one Sum, and multiply that Sum by 2: The *factum* will be the Surface of the *Parallelo-piped*. If then the Base I L M K be multiplied by the Altitude L N, the Product will be the Solidity.

Suppose *v. g.* L M = 36 M K = 15 M O = 12. Then,

LM = 36	LM = 36	MK = 15
MK = 15	MO = 12	MO = 12
180	72	30
36	36	15
L I K M 540

4608		
2304		
2304 Superficies.		
27648 Solidity.		

PARALLELISM, the Quality of a *Parallel*; or that which denominates it such: Or it is that whereby two Things, *v. g.* Lines, or Rays become equi-distant from one another. See PARALLEL.

Thus, we say remote Objects are scarce perceptible, by reason of the *Parallelism* of the Rays.

PARALLELISM of the Earth's Axis, in Astronomy, or, Motion of *Parallelism*; is that Situation or Motion of the Earth's Axis,

Axis, in its Progress thro' its Orbit, whereby it still looks to the same Point of the Heavens, viz. towards the Pole Star; so that if a Line be drawn parallel to its Axis, while in any one Position, the Axis, in all other Positions or Parts of the Orbit, will always be parallel to the same Line. See AXIS.

This *Parallelism* is the necessary Result of the Earth's double Motion; the one round the Sun, the other round its own Axis. Nor is there any Necessity to imagine a third Motion, as some have done, to account for this *Parallelism*. See EARTH.

'Tis to this *Parallelism* that we owe the Vicissitude of Seasons, and the Inequality of Day and Night. See SEASON. See also DAY, &c.

**PARALLELISM of Rows of Trees.** The Eye placed at the End of an Alley of two Rows of Trees, planted in parallel Lines, never sees 'em parallel, but always inclining to each other, towards the further Extreme.

Hence the Mathematicians have taken Occasion to enquire in what Lines, the Trees must be disposed, to correct this Effect of the Perspective, and make the Rows still appear parallel; parallel they must not be, but diverging; but according to what Law must they diverge: The two Rows must be such, as that the unequal Intervals of any two opposite or corresponding Trees may be seen under equal visual Angles.

On this Principle, *F. Fabri* has asserted, without any Demonstration, and *F. Tacquet*, after him, demonstrated by a long and intricate Synthesis, that the two Rows of Trees must be two opposite Semi-Hyperbolas.

*M. Varignon* has since, in the Memoirs of the French Academy, *Année 1717*, found the same Solution by an easy and simple Analysis. But he renders the Problem much more general, and requires not only that the visual Angles be equal, but to have them increase or decrease in any given Ratio; provided the greatest do not exceed a right Angle. The Eye, he requires to be placed in any Point, either just at the Beginning of the Ranges, or beyond, or on this Side.

All this laid down, he supposes the first Row to be a right Line, and seeks what Line the other must be, which he calls the Curve of the Range. This he finds must be an Hyperbola, to have the visual Angles equal. The straight and hyperbolic Rows will be seen parallel to Infinity; and if the opposite Semi-hyperbola be added, we shall have three Rows of Trees, (the straight one in the Middle) and all three parallel.

Nor is it required this second Hyperbola be the Opposite of the first, i. e. of the same Kind, or have the same transverse Axis: 'Tis enough if it have the same Centre, its Vertex in the same right Line, and the same conjugate Axis. Thus the two Hyperbolas may be of all the different Kinds possible; yet all have the same Effect.

Again, the straight Row being laid down as before; if it be required to have the Trees appear under decreasing Angles; *M. Varignon* shews, that if the Distance be in a certain Ratio, which he determines; the other Line must be a parallel straight Line. But he goes yet further; and supposing the first Row any Curve whatever, he seeks for another that shall make the Rows have any Effect desired, i. e. be seen under any Angles equal, increasing, or decreasing.

**PARALLELOGRAM**, in Geometry, a Quadrilateral Figure, whose opposite Sides are parallel, and consequently equal to each other. See QUADRILATERAL.

A *Parallelogram* is generated by the equable Motion of a right Line always parallel to itself. See FIGURE.

When the *Parallelogram* has all its four Angles right, and only its opposite Sides equal, it is call'd a *Rectangle* or oblong. See RECTANGLE.

When the Angles are all right, and the Sides equal, it is call'd a *Square*. See SQUARE. If all the Sides be equal, and the Angles unequal, it is call'd a *Rhombus* or *Lozenge*. See RHOMBUS.

If both the Sides, and Angles be unequal, it is call'd a *Rhomboides*. See RHOMBOIDES.

Properties of the PARALLELOGRAM.

In every *Parallelogram*, what Kind soever it be of, *E. gr.* that *A B C D* *Tab. Geometry* Fig. 39. A Diagonal *D A* divides it into two equal Parts; the Angles diagonally opposite *B C*, and *A D*, are equal, the opposite Angles of the same Side *C D*, and *A B*, &c. are, together, equal to two right Angles; and each two Sides, together, greater than the Diagonal.

Two *Parallelograms* *A B C D*, and *E C D F* on the same or equal Base *C D*, and of the same Height *A C*, or between the same Parallels *A F*, *C H* are equal. Hence two Triangles *C D A* and *C D F* on the same Base, and of the same Height, are also equal. Hence, also, every Triangle *C F D* is half a *Parallelogram* *A C D B*, upon the same or an equal Base *C D*, and of the same Altitude, or between the same Parallels. Hence also a Triangle is equal to a *Parallelogram*, having the same Base, and half the Altitude, or half the Base and the same Altitude. See TRIANGLE.

*Parallelograms*, therefore, are in a given Ratio, compounded of their Bases and Altitudes. If then the Altitudes be equal, they are as the Bases, and conversely.

In similar *Parallelograms* and Triangles, the Altitudes are proportional to the homologous Sides; and the Bases are cut

proportionally thereby. Hence, similar *Parallelograms* and Triangles are in a duplicate Ratio of their homologous Sides, as also of their Altitudes, and the Segments of their Bases: They are, therefore, as the Squares of the Sides, Altitudes, and homologous Segments of the Bases.

In every *Parallelogram*, the Sum of the Squares of the two Diagonals, is equal to the Sum of the Square of the four Sides.

This Proposition, *M. de Lagry*, takes to be one of the most important in all Geometry; he even ranks it with the celebrated 47th of *Euclid*, and with that of the Similitude of Triangles; and adds, that the whole first Book of *Euclid* is only a particular Case hereof. For, if the *Parallelogram* be not rectangular, it follows that the two Diagonals are equal; and, of consequence, the Square of a Diagonal, or which comes to the same Thing, the Square of the Hypotenuse of a right Angle, is equal to the Squares of the two Sides. If the *Parallelogram* be not rectangular, and, of consequence, the two Diagonals be not equal; which is the most general Case; the Proposition becomes of vast Extent. It may serve, for Instance, in the whole Theory of compound Motions, &c.

There are three Manners of demonstrating this Proposition: The first by Trigonometry, which requires 21 Operations; the second Geometrical and Analytical; which requires 15. *M. de Lagry* gives a more concise one, in the *Mémoires de l'Acad.* which only requires 7. See DIAGONAL.

To find the Area of a rectangular *Parallelogram*, *A B C D*. Find the Length of the Sides *A B*, and *A C*; multiply *A B* into *A C*; the Produce will be the Area of the *Parallelogram*. Suppose *E. gr.* *A B* to be 345; *A C* 123. The Area will be 42435.

Hence 1. Rectangles are in a Ratio compounded of their Sides *A B* and *A C*. 2. If, therefore, there be three Lines continually proportional; the Square of the middle one is equal to the Rectangle of the two Extremes; and if there be four proportional Lines; the Rectangle under the two Extremes is equal to that under the two middle Terms. See RECTANGLE.

Other *Parallelograms*, not rectangular, have their Areas found by resolving them, by Diagonals, into two Triangles; and adding the Areas of the separate Triangles into one Sum. See TRIANGLE.

Centre of Gravity of a *Parallelogram*. See CENTRE OF GRAVITY. See also CENTROBARIC Method.

PARALLELOGRAM, or PARALLELISM, or PARALLELOGRAMIC PRORACTOR, is a Machine used for the ready and exact Reduction or Copying of Designs, Schemes, Prints, &c. in any Proportion; which is done hereby without any Knowledge or Habit of Designing.

The *Parallelogram* is also called *Pentagraph*. See its Description and Use under the Article PENTAGRAM.

PARALOGISM, in Logic, a false Reasoning; or a Fault committed in a Demonstration, and a Consequence is drawn from Principles that are false, or not proved; or when a Proposition is pass'd over, which should have been proved by the Way.

A *Paralogism* differs from a *Sophism*, in this, that the *Sophism* is made out of Design and Subtlety; and the *Paralogism* out of Mistake, and for Want of a sufficient Light and Application. See SOPHISM.

Yet the Medicines de *Ferr-Royal* don't seem to make any Difference between them. None of the Pretenders to the Quadrature of the Circle but have made *Paralogisms*. See QUADRATURE.

PARALYSIS, in Medicine, a Disease popularly call'd *Palsy*. See PALSY.

The *Paralysis* only differs from the *Paresis* as the greater from the less. See PARESIS.

Authors distinguish the *Paralysis* into a *Paraplegia*, or *Paraplexia*, *Hemiplegia*, and, particular *Paralysis*.

The first is a Palsy of the whole Body. See PARAPLEGIA. The second, of one Side of the Body. See HEMIPLEGIA. The third of some particular Member, which is the proper *Palsy*.

The Word *Paralysis* is form'd from the Greek *παραλύω*, I unbind; This Disease being supposed to unbind the Nerves, and Muscles. Hence

PARALYTIC, a Person affected with the *Paralysis* or *Palsy*. See PALSY, &c.

PARAMETER, in Geometry, a constant right Line, in several of the Conic Sections; call'd also *Latus rectum*. See LATUS RECTUM.

In a *Parabola* *V B V* *Tab. Conics* Fig. 9. the Rectangle of the Parameter *A B*, and any Abscissa, *E. gr.* *B 3*, and Semiordinate  $\frac{3}{4}$  III. See PARABOLA.

If all the Sides, and Angles of a Quadrilateral Figure be equal, it is call'd a Square; which some make a Species of *Parallelogram*, others not. See SQUARE.

In an Ellipsis and Hyperbola, the Parameter is a third Proportional to the conjugate and transverse Axis. See ELLIPSI, &c. HYPERBOLA.

PARAMOUNT, in our Law, signifies the supreme Lord of the Fee. See LORD and FEE.

There may be a Tenant to a Lord, that holdeth himself of another Lord; the former Lord is called Lord *Mesne*; and the other, Lord *Paravassant*. But even the Term Lord *Paravassant*, is only comparative; for as one Man may be great, compared to a less, and little, being compared with a greater; So none simply seems to be Lord *Paravassant* but the King, who is Patron *Paravassant* to all the Benefices in *England*. See KING. PATRON, &c.

PARAMESE, in the ancient Music, the ninth Chord or Sound in the *Diagramma* or Scale of Music. See DIAGRAMMA.

The Word is Greek, and signifies *juxta mediam*, next to the Middle; its Situation in the first State of the Scales, being next the *Mesè* or middle Chord. See CHORD.

PARANYMPH, PARANYMPHUS, among the Antients, the Person who waited on the Bride, and directed the Nuptial Solemnities; called also *Aufpex*, because the Ceremony began with taking *Aufpex*.

In strictness, however, the *Paranymphe* only officiated on the Part of the Bridgroom; on the Part of the Bride, 'twas a Woman officiated, call'd the *Promissa*.

The *Jews* had likewise a Kind of *Paranymphe*, which the *Talmud* and the *Rabbins* call *שופרים* *Schufsehim*, *q. d.* Companions of the Spones. The IVth Council of *Carthage* appoints, that, when the married Couple come to ask the Priest's Blessing, they be presented, either by their Fathers and Mothers, or by the *Paranymphe*.

PARAPET, in Fortification, a Defence or Skreen, on the Outside of a Rampart, raised six or seven Foot high, to cover the Soldiers and the Cannon from the Enemy's Fire. See DR-ENCE.

*Parapets* are raised on all Works, both within and without the Place; and even on the Approaches. See WORK.

The *Parapet Royal*, or that of the Rampart, is to be of Earth, Cannon-proof, from 18 to 20 Foot thick. See RAMPART. Before the *Parapet* is a *Banquette*, or little Eminence, a Foot and half high, for the Soldiers to stand on. See BANQUETTE.

The *Parapets* of the Wall is of Stone. The *Parapets* of the Trenches is either made of the Earth dug up, Gabions, Fascines, Sacks of Earth, or the like.

The *Parapet* of the Corridor is the *Glacis* or *Espalanade*. See ESPLANADE.

PARAPET, is also a little Wall, breast-high, rais'd on the Brinks of Bridges, Keys, or high Buildings; to serve as a Stay, and prevent People's tumbling over.

*Parapet* gives us, from *Jos. Maria Subregrus*, a curious Collection of Names, which the Antients and Moderns have given to this Kind of *Parapets*: The *Latins* call'd them *Suberre*, and *Bastie*, whence the Names *Bastion* and *Bastille*. They also call'd them *Pagnumata Lorice*, and *Antemuralia*. The *Spaniards* call'd them *Barbacanes*; the *Italians*, *Parapetti*, because of their defending the Breach, *petto*; whence our *Parapet*.

PARAPH, a particular Character, Knot, or Flourish, which People habituate themselves to make always in the same Manner at the End of their Name, to prevent their Signature from being counterfeited. See OYSTER.

The *Paraph* of the Kings of *France* is a Grate, which the Secretaries always place before their own, in all Letters, &c. *Ménage* derives the Word from *Parapapibus*.

PARAPHERNALIA, or PARAPHERNA, in the Civil Law, those Goods which a Wife brought her Husband, besides her Dowry, and which were still to remain at her Disposal, exclusive of her Husband; unless there were some particular Provision made to the contrary, in the Marriage Contract. See DOWER.

In his *Rebus quot extra Dotem Mulier habet & quas Græci κατὰ τὴν ὄψιν, ἢ ἄλλω, ὕστερον προδίδουσι, Vir habet communione*. Cod. de *actis*.

The grand Customary of *Normandy*, gives a different Sense to the Word: It calls *Paraphernalia* the Moveables, Linnen, and other Female Necessaries, which are adjudg'd to the Wife, in prejudice of the Creditors, when she renounces the Succession of her Husband.

The Word is form'd from the Greek *παρα* beyond, or over, and *πῆρ* Des, Dower.

PARAPHIMOSIS, in Medicine, a Disorder of the *Penis*, wherein the Prepuce is strunk, and withdrawn behind the Glans, so as not to be capable of being brought to cover the same. See PREPUCE and GLANS.

This happens oftentimes in venereal Disorders, where the Humours of a Gleet frequently prove so sharp, as to cause this Retraction. There sometimes arises a Necessity in this Case to snip or cut the Prepuce open, otherwise the Humours will be pent up under it, and do a great deal of Mischief. See PHIMOSIS.

PARAPHRASE, an Explication of some Text in clearer and more ample Terms, whereby we supply what the Author might have said or thought on the Subject.

*Cicero* looks on *Erasmus's* *Paraphrases* on the New Testament, as such extraordinary Works, that he makes no scruple to declare, he thinks the Author to have been divinely inspired, when he penn'd 'em.

*Chaldee* PARAPHRASE, is a Phrase frequent among the Critics and Divines. There are three *Chaldee* *Paraphrases* on the *Pentateuch*. That of *Onkelos*, which some take to be the same with *Aquila*: And which others take to have been that *Onkelos* which the *Talmudists*, in the *Treatise Gittin*, make a Nephew of the Emperor *Tiber*. See PENYATEUCH.

The second is a *Paraphrase* of *Jonathan*; the third is called the *Targum* of *Jerusalem*. See TARGUM.

The *Chaldee* *Paraphrase* on the Prophets is of *Jonathan* Son of *Uziel*, whom some confound with *Theodotion*.

The Author of the *Chaldee* *Paraphrase* on the Hagiographic Books is unknown. Some attribute it to one *Josaph*, surnamed the *Squinter*; others to *Rabbi Arlas*. Others say, there is so much Difference in the Style, that no one Person can have been the Author.

PARAPHRENESES, or PARAPHRENETIS, or PARAPHRENTIS, in Medicine, a Kind of Phrenzy, the Cause whereof was attributed, by the Antients, to an Inflammation of the Ventricle, the Liver, and especially the Diaphragm. See PHRENZY.

They also call'd it a *Pseudo Phrenesis*, false Phrenzy, to distinguish it from the true one, which they made to consist in an Inflammation of the Brain and its *Meninges*.

The Moderns don't make any such Distinction in Phrenzies: They all come from the same Cause; but that Cause is either an Inflammation of the Brain, nor of the Diaphragm. See MANIA, MELANCOLIOLY, &c.

*Paraphrenitis*, among the modern Physicians, is an Inflammation of the *Mediastinum*, or *Pleura*, about the Diaphragm, attended with a continual Fever, and exquisite Pain in the Parts affected, on contracting the abdominal Vessels, as also a *Delirium* and arising of the *Hypochondria*.

PARAPLEGIA, or PARAPLEXIA, in Medicine, a Species of *Paralysis*, or Palsy, usually succeeding an Apoplexy. See PALSY and APOPLEXY.

The *Paraplegia* is a general Palsy, affecting the whole Body, the Head alone excepted. *Boerhaave* defines it an Immobility of all the Muscles below the Head, that have Nerves from the *Cerebrum* and *Cerebellum*.

Sometimes, Sensation as well as Motion are destroyed hereby; sometimes only one of them.

Its Original is usually suppos'd to be some Disorder, or Obstruction in the fourth Ventricle of the Brain, or in the Beginning of the spinal Marrow.

*Emmer* distinguishes the *Paraplegia* from the *Paralysis*. The *Paralysis*, according to him, is a Relaxation and Retention of the Ligaments and Members ministering to Motion; not from any Obstruction of the Nerves, but from a Relaxation of the nervous Parts: Whereas the *Paraplegia* arises from some Obstruction of the Nerves.

The latter usually succeeds an Apoplexy, Epilepsy, Convulsions, Vertigo's; the former, the *Scorbutus*, Hypochondriacal Disease, Colic, &c.

The Word comes from the Greek *παρα* much, and *πῆρ* to strike.

PARAPLEXIA, in Medicine. See PARAPLEGIA.

PARASANG, an ancient *Persian* Measure, different at different Times, and in different Places; sometimes it is 30, sometimes 40, and sometimes 50 *Stadia* or Furlongs. See MEASURE and STADIUM.

The Word, according to *Littleton*, has its Rise from *Parasab Angarum*, *q. d.* the Space a Post-man rides from one Station, *Angaria*, to another.

PARASCENIUM, or *Postscenium*, among the *Romans*, was a Place behind the Theatre, whither the Actors withdrew to dress, undress, &c. See THEATRE.

PARASCEVE, the sixth Day of the last Week of *Leut*, popularly, *Good-Friday*.

*St. John* says our Saviour was crucified on the *Parasceve* of the Passover, *i. e.* on the Eve or Day of Preparation of the Passover. For *Isidore* and *Papias* observe, that the Word in the original Greek signifies Preparation, and was applied among the *Jews* to *Friday*, because on that Day they used to prepare what was necessary for the Celebration of the *Sabbath*. See PASSOVER.

Hence what our Translation of the new Testament renders Preparation of the Sabbath, *M. Simon*, and some others call *Parasceve*. See PREPARATION.

PARASELENE, in Physiology, *Mock-Moon*, a Meteor, or Phenomenon, encompassing the Moon, in form of a luminous Ring; wherein is sometimes observ'd one, sometimes two apparent Images of the Moon.

The *Paraselenes* are form'd after the same Manner as the *Parhelis*, or *Mock-Suns*. See PARHELION.

The Word is form'd from the Greek *παρα* near, and *σῆλη* Moon.

PARASITE, PARASITUS, among the *Greeks*, was originally a very reputable Title; the *Parasites* being a King of Priests, or at least Ministers of the Gods; in the same manner, as at *Rome* were the *Ephores*. See EPHORUS.

They took care of the sacred *Corn*; or the Corn destined for the Service of the Temples and the Gods, *vis.* Sacrifices, Feasts,

Feasts, &c. They had even the Intendance over Sacrifices, and took care they were duly performed.

At Athens there was a Kind of College of twelve Parasites; each People of Attica furnishing one; who was always chosen out of the best Families.

Polysius adds, that Parasite was also an honourable Name among the ancient Gauls; and was given to their Poets.

PARASITES, or PARASITICAL Plants, in Botany, a Kind of diminutive Plants, growing on Trees, and so called from their Manner of living and feeding, which is altogether on others. See PLANT.

Such is Moss, which was antiently supposed the Effect of a Derangement of the Texture of the Bark; or a Kind of Rust; or, at most, little Filaments arising from the Bark: But from many Observations of the Moderns, it appears, that Mosses are real Plants, whose Seed is exceedingly fine, and inclosed in very little Caspide; which bursting of themselves, the Seed is driven by the Wind, and, at length, detained in the Inequalities of the Barks of Trees; where it takes Root and is fed at the Expence thereof. See Moss.

Of these Mosses M. Vaillant reckons no less than 137 Species, all in the Neighbourhood of Paris; which, with the Lichens and Milleto's, make the Genus of the Parasite Plants. See MILETO, &c.

The most pernicious of these Parasites, to the Trees that support 'em, are the Lichens; which appear on the Barks of Trees, in Form of a Crust, mix'd with Yellow and a dirty White. See DISEASE of Plants.

M. de Reffion gives us a Remedy for this Disease, in the French Memoirs of the Acad. Roy. It consists in making an Incision thro' the Bark to the very Wood, from the first Branches to the Earth; the Bark closes again in a little Time; and always preserves itself clean and free from Mosses for the future.

This Aperture renders the Course of the Sap more free, and prevents the Forming of those Inequalities so favourable to the Production of Mosses. The Incision, he adds, is to be made from March to the End of April; and on that Side turn'd most from the Sun.

PARASOL, a little Moveable, in manner of a Canopy, bore in the Hand to screen the Head from the Sun, Rain, &c. more usually called Umbrella.

'Tis made of Leather, Taffety, Oil-Cloth, &c. mounted on a Stick, and open'd or shut at Pleasure, by Means of Pieces of Whale-bone that sustain it.

The East Indians never stir out without a Parasol. The Word is French: that used against Rains is sometimes called Parasol.

PARASTATA, in the antient Architecture, an Impost, or Kind of Anta or Pilaster, built for the Support of an Arch. See ANTA.

Mr. Evelyn makes the Parastata expressly the same with Pilaster. See PILASTER. Douvler, the same with Insest. See IMPOST.

PARASTATÆ, or Epididymide, in Anatomy, are two tuberosus, varicose Bodies, lying upon, and adhering to, the upper Part of the Testicles; whereof they properly appear to be a Part; tho' different from the rest, in Form and Consistence. See TESTICLE.

The Parastatæ consist, like the Testicles, of a Convolution of femina Tubuli, mix'd with Blood-Vessels; the Difference between 'em lying only in this, that, in the Parastatæ, the Tubuli are united into one; the various Convolutions of which, being more firmly bound together by a strong Membrane, arising from the Tunica Albuginea, it feels more compact than the Testicles. See SPERMATIC, &c.

The Parastatæ and Testicles are said to be enclosed in three proper Membranes; the first Muscular, derived from the Cremaster Muscle; the second, called the Vaginalis; the third, the Albuginea. See each under its proper Article.

PARASYNANCHE, in Medicine, a Kind of Angina or Squinancy, wherein the exterior Muscles of the Throat are inflamed. See SQUINANCY.

The Word comes from *παρὰ* *συν* *ἀνω* to suffocate.

PARATHESIS, in the Greek Church, the Prayer which the Bishop rehearses over the Carthusians, stretching his Hands over 'em to give 'em Benediction; which they receive, bowing the Head under his Hands.

PARATHESIS, in Grammar, a Figure whereby two or more Substantives are put in the same Case. See FIGURE.

PARATILMUS, in the antient Greek Jurisprudence, a Name given to the Punishment imposed on Adulterers who were poor and unable to stand the common Penalty.

It consisted either in making 'em run a Horse-Radish up the Anus; which they called *αἰσθησιβωσις*; or in tearing up the by Roots, the Hair about the Fundament, &c. which they called *αἰσθησιβωσις*, or *τοξ*, pluck up.

PARATITLES, PARATITLA, in Jurisprudence, short Notes, or Summaries of the Titles of the Digest, and Code; which have been made by several Lawyers, in order to compare, and examine the Connection of the several Parts with one another.

We have Parasities of Cajas, of Maron, &c. *Cloffeinent* has a second Comment on the Parasities of Cajas.

PARAVAIL, in Law, the lowest Tenant; or he that is immediate Tenant to the Land. See TENANT.

He is called *Tenant Paravail*; because it is presumed he hath Profit and Avail by the Land.

PARAZONIUM, or *Sispe*, among Medallists, a Scepter, round at the two Ends in Manner of a Trancheon or Commander's Staff; or a Kind of Pontard or short Sward; represented as wore at the Girdle, on several antient Medals.

Antiquaries are much divided on the Explication of the Parazonium; as, indeed, the Form and Manner of bearing it are very different. It is sometimes thrown a cross the Shoulders in Manner of a Quiver.

PARBOILING, in Pharmacy, &c. a Term applied to Fruits, Herbs, &c. which are boiled a little while, to draw out the first Juices, to be afterwards inspissated or thickened. See BOILING.

PARCÆ, *Definies*, Goddesses, who, according to the antient Pagan Theology, preside over the Lives of Men.

These the Antients frequently confounded with the *Fates*, or *Definies*; and, in effect, the *Parcæ*, according to Plato, were the Daughters of Necessity, and *Definity*. See FATE and DESTINY.

The *Parcæ* were three, *Clebo*, *Lachesi*, and *Atropis*; because, forsooth, all Things have their Beginning, Progress, and End.

Hence the Poets tell us, the *Parcæ* span Men's Lives; that *Clebo* held the Distaff, and spun the Thread; *Lachesi* turned the Wheel; and *Atropis* cut it.

The Antients represent the *Definies* divers Ways: *Lucina*, in the Shape of three poor old Women, having large Locks of Wool, mix'd with Daffodils on their Heads; one of which holds a Distaff, the other a Wheel, and the third a Pair of Scissars, wherewith to cut off the Thread of Life. Others represent them otherwise: *Clebo* appearing in a long Robe of divers Colours, wearing a Crown upon her Head, adorned with seven Stars, and holding a Distaff in her Hand; *Lachesi* in a Robe full of Stars, with several Spindles in her Hands; and *Atropis* clad in black, cutting the Thread with large Scissars.

The Antients imagined that the *Parcæ* used white Wool for a long and happy Life; and black, for a short and unfortunate one.

PARCEL-MAKERS, two Officers in the Exchequer, that make the Parcels of the Escheator's Accounts, wherein they charge them with every Thing they have levied for the King's Use, within the Time of their Office, and deliver the same to one of their Auditors of the Court to make an Account with the Escheator thereof. See ESCHATOR.

PARCENERS, *quasi Parcelators*. See CO-PARCENERS.

PARCHMENT, in Commerce, &c. Sheep's or Goat's Skin prepared after a peculiar Manner, which renders it proper for several Uses; particularly for writing on and covering of Books, &c.

The Word comes from the Latin *Pergamenum*, the antient Title of this Manufacture; which 'tis said to have took from the City Pergamus, to one of the Kings whereof its Invention is ascribed.

Parchment is begun by the Skinner, and ended by the *Parchment-Maker*. It makes a very considerable Article in the French Commerce: 'Tis made in most of their Cities; and, besides the Consumption at Home, they send vast Quantities abroad; particularly to England, Flanders, Holland, Spain, and Portugal.

That call'd *Virgin Parchment*, and which superstitious People believe to be made of a Kind of Caul, wherein some Children are inclosed in the Womb; is nothing but a somewhat thinner and finer Sort than the rest, proper for certain Purposes, as Fans, &c. and made of the Skin of an abortive Lamb, or Kid.

MANUFACTURE OF PARCHMENT.

The Skin having been shripp'd of its Wool, and pass'd the Lime-Pit; (after the Manner described under the Article CHAMOIS.) The Skinner stretches it on a Kind of Frame, consisting of four Pieces of Wood, mortis'd into each other at the four Angles, and perforated lengthways from Distance to Distance, with Holes, furnished with wooden Pins that may be turn'd at Pleasure, like those of a Violin.

To stretch the Skin on this Frame, they make little Holes all around it, and thro' every two Holes draw a little Skewer; to this Skewer they tie a Piece of small Packthread, and tie that over the Pins; so that coming to turn the Pins equally, the Skin is stretch'd tight every Way, like that of a Drum.

The Skin being thus sufficiently stretch'd on the Frame; the Flesh is par'd off with a sharp Instrument for the Purpose; this done, 'tis moistened with a Rag, and a Kind of white Stone or Chalk, reduced to a fine Dust, strew'd over it; then with a large Pumice-Stone, flat at Bottom, much after the Manner of a Mullet for grinding Colours, they rub over the Skin as if about to grind the Chalk; and thus scower off the Remains of the Flesh. They then go over it again with the iron Instrument; again moisten it as before, and again rub it with

the Pumice-Stone without any Chalk underneath; this smooths and softens the Flesh-Side very considerably. They drain it again, by passing over it the Iron Instrument as before.

The Flesh-Side thus drain'd, they pass the Iron on the Wool, or Hair-Side; then, stretch it tight on the Frame by means of the Pins, and go over the Flesh-Side again with the Iron; this finishes its draining; and the more the Skin is drained, the whiter it ever becomes.

They now throw on more Chalk, sweeping it over with a Piece of Lamb-skin that has the Wool on; this smooths it still farther, and gives it a white Down or Nap. 'Tis now left to dry, and when dried, taken off the Frame, by cutting it all round.

The Skin, thus far prepared by the Skinner, is taken out of his Hands by the Parchment-Maker; who first scrapes or pares it dry on the Summer, with an iron Instrument like that above-mentioned, only finer and sharper; with this, work'd with the Arm from Top to Bottom of the Skin, he takes away about one Half of its Thickness. The Skin, thus, equally pared, on both Sides, they pass the Pumice-Stone over both Sides, to smooth it. This last Preparation is perform'd on a Kind of Form or Bench cover'd with a Sack stuff'd with Flocks, and leaves the Parchment in a Condition for writing on.

The paring of the Skin dry on the Summer, is the most difficult Preparation in the whole Process of Parchment-making, for which Reason the Skinners seldom dare meddle with it; but usually leave it to those more experienced in it: The Summer, whereon it is performed, is a Calf-Skin well stretch'd on a Frame, serving as a Support to the Skin which is fasten'd a-top of it with a wooden Instrument, that has a Notch cut in it. Lastly, that the iron Knife may pass the easier, between the Summer and the Skin to be pared, they put another Skin which they call the Counter-Summer. The Parings thus taken off the Leather, are us'd in making Glue, Size, &c. See GLUE, &c.

What we call *Yellow* is only Parchment made of the Skins of abortive Calves, or at least of sucking Calves; 'tis finer, whiter, and smoother than the common Parchment; but is prepared in the same manner as that, abating that 'tis not pass'd thro' the Lime-Pie.

**PARCO FRACIS**, in Law, a Writ that lies against him who violently breaks open a Pound, and takes out Beasts thence, which, for some Trespass done, were lawfully impounded. See POUND.

**PARDON**, in Law, a Remission, or Forgiveness of a felonious, or other Offence against the King.

This our Lawyers make twofold; as the one, *ex Gratia Regis*, the other, *per Cours de Ley*. The first is that, which the King out of some special Regard to the Person, or some other Circumstance, grants by his absolute Prerogative or Power. The other is that he grants, as the Law and Equity persuades, for a slight Offence; as Homicide Casual, &c.

**PARDON**, in the Canon Law, is an Indulgence which the Pope grants to suppos'd Penitents, for Remission of the Pains of Purgatory, which they have merited for the Satisfaction of their Sins. See INDULGENCE.

The grand Title for the Dispensation of *Parsons* is the *Justitice*. See JUSTICE.

In this Sense, *Pardon* is properly the Angelic Salutation, said to the Virgin at the Sound of three little Strokes of a Bell, rung in the Morning, Noon, and Night, in Order for the Person to be entitl'd to Indulgences.

**PARDONERS**, in our ancient Customs, were Persons who carried about the Pope's Indulgences, and sold 'em to the highest Bidders. See INDULGENCE.

**PARAGORICKS**, in Medicine, Remedies which assuage Pain; the same with what we otherwise call *Anodynes*, and *Opiates*. See ANODYNE and OPIATE.

The Word is Greek *παρορικός*.

**PARALECON**, in Grammar, a Figure, whereby a Word, or Syllable, is added to the End of another.

**PARALIA**, or *Paralitia*, in Physiology. See PARALITIA.

**PARERA BRAVA**, the Root of a Plant growing in the *West-Indies*; chiefly *Mexico* and *Brazil*; citcom'd a Specific for the Cure of the Stone and Gravel.

The Name, which in the original *Portuguese*, signifies *Wild-Vine*, or *Bastard-Vine*, bears a good deal of Analogy to the Plant, which bears Branches laden with Leaves perfectly like those of the Vine; and which, like them, creep along Walls and Trees.

The *Portuguese* value this Root on an equal footing with the *Ipecacuanha*. Some Druggists call it, by Corruption, *Parada Brava*.

M. Geoffroy attributes the Efficacy of this Root, in Nephritic Cases, to its dissolving the viscid Matters, whereby the Particles of the Sand, &c. were cemented together: And hence, he gives it with the same Intention in Jaundices, Asthma's, &c. It is given in Decoction.

The *Portuguese* hold it also a Remedy for Dysenteries, Quinses, Bites of venomous Beasts, &c.

**PARENCHYMA**, or *PARENCHYMOS Flob*, in Anatomy, a

Term us'd for the peculiar Substance of several Parts of the Bodies of Animals, as the Heart, Lungs, Liver, Spleen, Kidneys, &c. thus call'd from the Greek *παρυσμα*, Effusion, &c. generated by a Collection and Condensation of Juice. See FLESH. *Empiricists* first gave the Name; as imagining the Substance of these Parts not to be Vascular like the rest, but to consist of a Mass or Coagulum of Blood, stagnated in the Vessels of the Parts: But the Moderns reject this Opinion: The Observations made by Microscopes, Injections, &c. clearly shewing, that the Heart is a true Muscle, (See HEART) the Lungs and Spleen, Clusters of membranous Vessels, and Vessels (See LUNGS and SPLEEN) and the Liver and Kidneys, Compositions of Glands, thro' which the Bile and Urine are filtrated. See LIVER and KIDNEYS.

**PARENCHYMA** of a Plant. Dr. Grew gives the Name *Parenchyma* to the *Pith* or *Pulp*; or that inner Part of the Plant, thro' which the Juice is suppos'd to be distributed. See PLANT, PITH, &c.

This, when view'd with a Microscope, appears to resemble Marrow; or rather a Sponge; being a porous flexible dilatable Substance. See MEDULLA.

Its Pores are innumerable, and exceedingly small; receiving as much Humour as is requisite to fill and extend them; which Disposition of Pores it is, that is suppos'd to fit the Plant for Vegetation and Growth. See VEGETATION.

The *Parenchyma* is white, at first, but changes its Colour, in Proportion as the Root grows thicker. Thus it becomes yellow in the Root of the Bastard Rubarb, and red in that of the Snake-weed. See PLANT.

**PARENT**, a Term of Relation, applicable to those from whom we immediately receive our Being. See FATHER and MOTHER.

**PARENTALE**, de *Parentale se tollere*, in the ancient Customs, signified a Renunciation of one's Kindred, and Family.

This was done in open Court, before the Judge, and in the Presence of twelve Men, who made Oath, they believed it was done for a just Cause.

We read of it in the Laws of *Hon. I.* after such Abjuration, the Person was incapable of inheriting any Thing from any of his Relations, &c.

**PARENTALIA**, in Antiquity, funeral Obsequies; or the last Duties paid by Children to their deceased Parents. See OBSEQUES.

**PARENTHESIS**, in Grammar, a Number of Intercalary Words, inserted in a Discourse; which interrupt the Sense, or Thread, but which seem necessary for the fuller understanding of the Subject.

The Word is form'd of the Greek *αεσι* inter, between, and *αεσις* Position, &c. *ita* between.

The politest of our modern Writers avoid all *Parentheses*; as keeping the Mind in suspense, embarrassing it, and rendering the Discourse less clean, uniform and agreeable: Long and frequent *Parentheses* are intolerable; especially in Verse, which they ever render dull, and languid, and like to Prose.

The proper Characteristic of a *Parenthesis*, is that it may be either taken in, or left out, the Sense and Grammar remaining entire.

In Speaking, *Parentheses* are to be pronounced with a different Tone; and in writing, are inclos'd between ( ) ; to distinguish them from the rest of the Discourse.

The Character itself is also call'd a *Parenthesis*. See CHARACTER.

**PARERE**, in Commerce, an *Italian* Term which begins to be naturalized. It signifies the *Advice* or *Counsel* of a Merchant or Negotiator; for that such a Person, being consulted on any Point, introduces his Answer, in *Italian*, with *Mi pare*, i. e. *I think*, it seems to me.

The Method of Negotiating, especially, that of Bills of Exchange, being borrow'd from the *Italians*, most trading Cities, especially *Lyons*, retain the Use of *Parere*; which are the *Advices* or *Opinions* of Merchants and Negotiators; and which serve as *Acts* before Notaries, when given by Authority of a Judge-Conservator, or at a particular Consultation, for maintaining the Right of the Consulter.

M. Sevroy has an excellent Treatise, intitled, *Parere, ou Avis et Conseils sur les plus Importantes Matieres du Commerce*; Containing the Resolution of the most difficult Questions relating to Bankrupts and Failures, Bills of Exchange, Orders without Dates or Expression of Value, Blank-signings, Renewing of Bills of Exchange, those drawn or accepted by Women in Behalf of their Husbands, or during the Minority of the Drawer, &c.

**PARERGA**, a Term sometimes us'd in Architecture, for Additions, or Appendages, made, by way of Ornament, to a principal Work.

It is sometimes also us'd in Painting for little Pieces, or Compartments on the Sides, or in the Corners of the principal Piece.

**PAREISIS**, in Medicine, a Disease call'd also *Paralysis* and *Pally*. See PARALYSIS, &c.

**PARGETING**, in Building, is us'd for the Plastering of Walls; sometimes for the Plaster itself. See PLAISTER.

*Parquing* is of various Kinds; as, 1. White Lime and Hair Mortar laid on bare Walls. 2. On bare Laths, as in partitioning and plain Ceiling. 3. Rendering the Infides of Walls or double Partition-Walls. 4. Rough-casting on Heath-Laths. 5. Plastering on Brick-work, in Imitation of Stone-work; and the like upon Heath-Laths.

**PARHELION, PARHELION, or PARELION**, in Physiology, *Aurora-Sol*, a Meteor, in Form of a very bright Light; appearing a-side of the Sun; form'd by the Reflexion of his Beams in a Cloud properly posited. See METEOR.

The *Parhelis* usually accompany the Corona, or large Crowns; are placed in the same Circumference, and at the same Height. Their Colours resemble those of the Rain-bow; the Red and Yellow on the Side towards the Sun; and the Blue and Violet on the other. See RAINBOW.

Tho' there are Corona sometimes seen entire, without any *Parhelis*; and *Parhelis* without Corona. See CORONA.

In the Year 1619, was seen at Rome a *Parhelion* of five Suns; and in 1666, another at Arles of six.

The Word is form'd from the Greek *παρὰ ἵκνητα*, near, and *ἥλιος*, Sun.

M. Mariotte accounts for the Appearance of *Parhelis*, from an Infinity of little Parcels of Ice floating in the Air, which multiply the Image of the Sun, either by refracting and breaking his Rays, and thus making him appear where he is not; or by reflecting 'em, and serving as Mirrors. See MIRROR, &c.

The known Laws of Reflexion and Refraction have given a Handle for Geometrising on these Phenomena; and M. Mariotte has determined the precise Figure of the little Icicles, and their Situation in the Air, the Size of the Corona or Circles which accompany the *Parhelis*, and the Colours wherewith they are painted, by a Geometrical Calculus.

Mr. Huygens accounts for the Formation of a *Parhelion*, in the same Manner, as for those of the Halo, &c. by supposing a Number of small icy Cylinders, with opaque Kernels, carried in the Air, neither in a perpendicular nor parallel Direction, but inclined to the Horizon in a certain Angle, nearly half a right one.

To make the Effect of these Cylinders manifest, M. Huygens produced to the Academy of Paris, a glass Cylinder a Foot long, with an opaque Cylinder of Wood in the Middle, and the ambient Space fill'd with Water and transparent Ice; which Cylinder being exposed to the Sun, and the Eye put in the requisite Situation, there were successively seen all the Refractions and Reflexions, necessary for the Phenomena of the *Parhelis*. See HALO.

**PARIETALIA Offa**, in Anatomy, the third, and fourth Bones of the Cranium; so called, because they form the *Parietes*, or Sides of the Head. See CRANIUM.

Their Substance is finer and thinner than that of the Coronals and Occipitals. Their Figure is square; their Size surpasses that of the other Bones of the Head; and their Situation, in the lateral Parts, which they possess entirely.

The Sagittal Suture connects them at the upper Part; the Coronals joins their Fore-part to the Os Frontis; the Lambdoidal joins them by the Hind-part to the Occipital Bone; and, lastly, the squamous Suture joins them by the Lower-part to the Offa Petrosa.

The outer Surface of these Bones is very smooth and polished; the inner, rough and uneven; full of Impressions, which the Arteries of the *Dura Mater* have made by their continual Pulsation before they were ossified.

**PARIETES, Sides**, in Anatomy, a Term used for the Inclosures, or Membranes, that stop up or close the hollow Parts of Bodies, especially those of the Heart, the *Uterus*, and the *vis*. See HEART, THORAX, &c.

The *Parietes* of the two Ventricles of the Heart are of unequal Strength and Thickness, the left exceeding the right, because of its Office, which is to force the Blood thro' all Parts of the Body; whereas the right only drives it thro' the Lungs. See VENTRICLE, &c.

**PARISH**, the Precinct or Territory of a *Parish* Church. See CHURCH. See also PAROCHIAL.

In the ancient Church, there was one large Building in each City, for the People to meet in; and this they call'd *Parish*. But the Signification of the Word was afterwards enlarged, and by *Parish* was meant a Diocese, or the Jurisdiction of a Bishop, consisting of several Churches; unless we will suppose, as some do, that those Bishops were only Pastors of single Churches. See DIOCESE and BISHOP.

At least, the Word now retains its original Meaning.

*Du-Rois* observes, that Country *Parishes* had not their Origin before the 11th Century; but those of Cities are more ancient. The City of *Alexandria* is said to have been the first that was divided into *Parishes*. *Baronius* says, that in the Time of Pope *Cornelius*, there were 46 *Parishes* in Rome.

The Division of England into *Parishes*, is attributed to Honorius Archbishop of *Canterbury*, in 636. *Cambden* reckons 9284 *Parishes* in England. *Glambergham* makes, at present, 9913.

The Word comes from the Latin *Parochia*, of the Greek *παροικία*.

*Du-Rois* observes, that the Name *parochia* was antiently

given to the whole Territory of a Bishop, and derives it from Neighbourhood; because the Primitive Christians, not daring to assemble openly in Cities, were forced to meet secretly in Neighbour-houses.

**PARISH-PRIEST**; the Parson, or Minister who holds a *Parish* as a Benefice. See PARSON.

If the predial Tythes be appropriated, the Parson is called *Rector*. See RECTOR. If they be impropriated, he is call'd *Vicar*. See VICAR.

**PARISIS**, a Money of Account; formerly a real Money; struck at Paris; at the same Time with the *Tournois*, struck at *Tours*. See MONEY and COIN.

The *Parisis* exceeded the *Tournois* by one Fourth; so that the Livre or Pound *Parisis* was 25 *Sols*; and the Livre *Tournois* 20. The *Sols* and *Deniers*, *Parisis*, &c. in Proportion. See LIVRE, SOL, &c.

**PARK**, an Inclosure stock'd with wild Beasts, *tam Sylvestres, quam Campêtres*; say our old Lawyers.

*Crompton* observes, that a Subject may hold a *Park* by Prescription, or the King's Grant, which he can't do a Forc'd. See FOREST.

A *Park* differs from a Chase or *Warren*; for that a *Park* must be enclosed; if it lie open, it is a good Cause of seizing it into the King's Hand; as a free Chase may be, if it be enclosed. Nor can the Owner have any Action against such as hunt in his *Park*, if it lie open. See CHASE.

*Du-Cange* refers the Invention of *Parks* to King Henry I. of England; but *Speelman* shews, 'tis much more antient; and was in use among the *Anglo-Saxons*.

*Zoaninus* assures us, the antient Kings of *Persia* had *Parks*. The Word is originally *Celtic*, where it signifies an Inclosure, or Place shut up with Walls.

**PARK** is also used for a moveable Pallisade set up in the Fields to inclose Sheep in to feed, during the Night.

The Shepherds shift their *Park*, from Time to Time, to dung the Ground, one Part after another.

**PARK** is also used for a very large Net, disposed on the Brink of the Sea, with only one Hole which looks towards the Shore; and which becomes dry, after the Flood is gone off; so that the Fish has no Way left to escape.

**PARK**, in War, or *Park of the Artillery*, a Post in a Camp, our of Cannon Shot; where the Cannon, artificial Fires, Powder, and other warlike Ammunition are kept, and guarded, by Pike-men only, to avoid all Casualties that might happen by Fire. Every Attack, at a Siege, hath its *Park* of Artillery.

**PARK** of Provisions, is another Place in a Camp, on the Rear of every Regiment, which is taken up by the Suters, who follow the Army with all Sorts of Provisions, and sell them to the Soldiers.

**PARLEY**, a Conference with an Enemy, &c. of the *French Parler* to speak, talk.

Hence to beat or sound a *Parley*, is to give a Signal for the holding of such a Conference by Beat of Drum, or Sound of Trumpet.

**PARLIAMENT**, a Grand Assembly, or Convocation, of the Three Estates of the Kingdom, *viz.* Lords Spiritual, Lords Temporal, and Commons, summoned to meet the King, to consult of Matters relating to the Common-weal; and particularly to enact and repeal Laws. See ESTATE.

The two Houses of *Parliament* are the King's Grand Council. See COUNCIL.

'Till the Conquest, the great Council, consisting only of the great Men of the Kingdom, was call'd *Magnatum Convocatus*, and *Prelatorum procerumque Concilium*. The Saxons, in their own Tongue, call'd it *Witenagemote*, i. e. Assembly of the Wise.

After the Conquest, about the Beginning of the Reign of K. *Edw.* I. Some say, in the Time of *Hen. I.* it was call'd *Parlementum*, q. d. Speechment, from the *French Parler*, to speak; tho' it still only consisted of the great Men of the Nation: 'Till in the Reign of *Hen. III.* the Commons were also called to sit in *Parliament*: The first Writs sent out to summon them bore Date 49 *Hen. III.* Anno 1217.

*Parliaments* are to be summoned, prorogued, and dissolved by the King alone: Nor can a *Parliament* begin without the King's Presence. See KING.

At first new *Parliaments* were call'd every Year; by degrees their Term grew longer. In the Time of King *Charles II.* they were held a long Time with long Interruptions between. Both which were found of so ill Consequence, that in the Beginning of the Reign of K. *William*, an Act was pass'd, whereby the Term of all *Parliaments* was restrain'd to three Sessions, or three Years; hence call'd the *Triennial Act*. Since that, from other Views, the Period of *Parliaments* is again, 3 *Georgii*, lengthen'd to seven Years.

A *Parliament* is call'd by the King's Writ, or Letter, directed to each Lord, commanding them to appear; and, by other Writs, directed to the Sheriffs of each County, to summon the People to elect two Knights for each County, and one or two Burgesses for each Borough, &c.

Antiently, all the People had Votes in the Elections; till it was enacted by *Hen. VI.* That none but Freeholders, residing in the County, and who had a yearly Revenue of 40 s. should

be admitted to vote; nor were any to be closted that were under 41 Years of Age.

That the Members might attend in *Parliament* with more Freedom, they, and all their menial Servants, were privileged from all Arrests, Attachments, Imprisonments, &c. for Debts, Trespasses, &c. *ex uno, morando ad propria Rescendos*; burnot from Arrests for Treason, Felony, and Breach of Peace.

The Place where the *Parliament* meets, is wherever the King pleases; of late, it has been in the Palace of *Westminster*; the Lords and Commons each in distinct Apartments. In the Lord's House the Princes of the Blood are placed in distinct Seats; the great Officers of State, Dukes, Marquisses, and Bishops on Forms; and the Viscounts and Barons on others across the House; all according to their Order of Creation, Place, &c. See *PRECEDENCY*.

The Commons sit promiscuously; only the Speaker has a Chair at the upper End; and the Clerk and his Assistant a Table near him. Before any Matters be done, all the Members of the House of Commons take the Oaths, and subscribe their Opinions against Transubstantiation, &c. which Test, the Lords too, tho' they don't take the Oaths, are obliged to take.

The House of Lords is the sovereign Court of Justice of the Realm, and the Demier Resort: The House of Commons the grand Inquest, but no Court of Justice. See *PERS* and *COMMONS*.

*As to the Manner of debating and passing Bills in Parliament*; Any Member may move to have a Bill brought in for any thing, which, upon a Question put, being agreed to by a Majority, that Person with others are ordered to prepare and bring in the same. When ready, a Time is appointed for a Reading: after reading it by the Clerk, the Speaker reads the Abstract thereof, and puts the Question, whether or no it shall have a second Reading? after a second Reading, the Question is, whether or no it shall be committed? which is either to a Committee of the whole House, if it be of Importance; or to a private Committee, any Member naming the Persons. See *COMMITTEE*.

The Committee appointed, and a Chairman chosen, the Chairman reads the Bill, Paragraph by Paragraph, puts every Clause to the Question, fills up Blanks, and makes Amendments, according to the Opinion of the Majority. The Bill thus gone thro', the Chairman makes his Report at the Side-bar of the House, reads all the Additions and Amendments, &c. and moves for Leave to bring up the Report to the Table; which granted, he delivers it to the Clerk, who reads the Amendments, &c.

The Speaker then puts the Question, whether they shall read a second Time; and, if agreed to, reads them himself. To so many as the House acquiesces in, the Question is now put, whether the Bill, thus amended, shall be engross'd and writ fair in Parchment, and read a third Time? The Bill engross'd, the Speaker holds it in his Hand; and asks if it shall pass? If the Majority be for it, the Clerk writes on it, *Sic vultis aux Seigneuris*. Or, in the House of Lords, *Sic vultis aux Communes*.

If a Bill be rejected, it cannot be any more proposed during that Session. See *BILL*.

Forty Members constitute a *House of Commons*, and eight a *Committee*. A Member of the Commons, to speak, stands up, uncovers, and directs his Speech to the Speaker only. If what he says be answered by another, he is not allowed to reply the same Day, unless personally reflected on. Nor may any Person speak more than once to the same Bill in the same Day.

In the Lord's House they vote, beginning at the Puish or lowest Baron, and to go orderly to the highest, every one answering a-part, *Content* or *Not Content*. In the House of Commons, they vote by *Yea's* and *Nay's*; and if it be dubious, which is the greater Number, the House divides. If the Question be about bringing any Thing into the House, the *Ye's* go out; if it be about any the House already has, the *Nay's* go out. In all Divisions, the Speaker appoints four Tellers, two of each Opinion. In a Committee of the whole House, they divide by changing Sides, the *Ye's* taking the right, the *Nay's* the left of the Chair, and then there are but two Tellers.

If a Bill pass one House, and the other demur at it, a Conference is demanded in the Painted Chamber, where certain Members are deputed from each House; and here the Lords sitting cover'd, the Commons standing bare, the Cafe is debated. If they disagree, the Affair is null; if they agree, this, with the other Bills that have pass'd both Houses, is brought down to the King, in the House of Lords, who comes thither cloth'd in the Royal Robes and with the Crown on, before whom the Clerk of the *Parliament* reads the Title of each Bill, and as he reads, the Clerk of the Crown pronounces the Royal Assent or Dissent.

If it be a public Bill, the Royal Assent is given by these Words, *Le Roy le veut*. If a private one, by *Sic jussit comme il est desira*. If the King refuses the Bill, the Answer is, *Le Roy s'excuse*. If it be a Money Bill, the Answer is, *Le Roy remercie ses Loyaux Sujets, accepte leur Benevolence Et aussi le Veut*.

The Bill for the King's general Pardon has but one Reading. The Number of Members in the House of Lords is un-

certain; as increasing at the King's Pleasure. The Members of the House of Commons, when full, are 552, viz. 92 Knights of Shires; 52 Deputies for the 25 Cities, *London* having 43; 16 for the 8 Cinque Ports; 2 for each University; and, finally, 332 for 180 Boroughs, beside 12 Boroughs for *Wales*, and 45 Members for *Scotland*.

*PARLIAMENT* is sometimes also used for other Assemblies beside those of the States of the Realm. Thus we read that the Abbot of *Croyland* was used to call *Parliaments* of his Monks, to consult of the Affairs of the Monastery: And, at this Day, an Assembly of the two Temples, call'd to consult of their common Affairs, is call'd a *Parliament*. See *TEMPLE*.

*PARLIAMENTS of France*, are Courts or Assemblies establish'd by the King, to judge of the Differences between particular Persons, and to pronounce on Appeals from Sentences given by inferior Judges. See *COURT*.

There are ten of these *Parliaments* in *France*. That of *Theouaise*, establish'd in 1303; That of *Dijon*, in 1476; That of *Grenoble*, in 1455; That of *Rouen*, in 1499; That of *Reims* in *Bretagne*, in 1553; That of *Bourdeaux*, in 1502; That of *Aix*, in 1501; That of *Metz*, in 1633; That of *Pau* in *Bearn*, in 1519; And that of *Paris*.

The *Parliament of Paris* is the Principal, and that whose Jurisdiction is of the greatest Extent. This is the chief Court of Justice throughout the Realm. It consists of six Chambers: the grand Chamber, where Causes of Audience are pleaded; and five Chambers of Inquests, where Processes are adjudg'd in Writing. See *CHAMBER*.

Under their second Race of Kings, the *Parliament*, like that of *England*, was the King's Council; gave Audience to Ambassadors, and consulted of the Affairs of War and Government.

The Kings, like ours, presided in 'em, without being, at all, Masters of their Resolution. But, in later Times, their Authority has been abridg'd, the Kings having reserv'd the Decision of the grand Affairs of the Public to their own Councils; leaving none but private ones to the *Parliaments*.

*PARLIAMENTUM Inchoatum*, a Denomination given to a *Parliament* held at *Coventry*, 6 Hen. IV. wherunto, by special Precept to the Sheriffs of the several Counties, no Person fill'd in the Law was to be called.

*PARLIAMENTUM Infirmum*, was a *Parliament* held at *Oxford*, An. 41 Hen. III. thus call'd, say our Chronicles, because the Lords came with great Retinues of armed Men to it; and many Things were violently transacted therein, against the King's Prerogative.

*PARLIAMENTUM Diabolicum*, was a *Parliamentum* held at *Coventry*, 38 Hen. VI. wherein *Edward* Earl of *March* afterwards King, and several others, were attained. The Acts pass'd herein were annull'd by the succeeding *Parliament*.

*PARLIAMENTUM de la Bouche*, was a *Parliament* in *Edward* II's Time, whereto the Barons came armed against the two *Spencers*, with colour'd Bands on their Sleeves for Distinction.

*PARLOIR, PARLOUR*, in Nunneries, a little Room, or Closet, where People talk to the Nuns, thro' a Kind of grated Window.

The Word is form'd from the *French Parler*, to talk; and hence also our *Parleur*.

Antiently, there were also *Parlours* in the Convents of Monks, where the Novices used to converse together, at the Hours of Recreation; but there were listening Places over, from whence the Superiors cou'd hear what they said; such a one there still subsists in the Abbey *St. Germain de Pres*.

In the Order of *Fauillans*, the *Parlour* is a little Room open on all Sides, placed at each End of the Dormitory, where the Monks talk together, it not being allow'd them to speak in the Dormitory.

*PARMA*, among Antiquaries, a Kind of antient Buckler. See *BUCKLER*.

*Polybius* describes the *Parma* as very strong, round, three Foot in Diameter, and big enough to cover the whole Body; Yet *Servius*, on the *Æneid*, and even *Virgil* himself mention it as a light Piece of Armour, in Comparison of the *Clypeus*. See *SHIELD*.

*PARMESAN*. See *PAPUAN*.

*PAROCHIAL*, something belonging to a *Parish*. See *PARISH*.

Every Church is either Cathedral, Collegiate, or *Parochial*. See *CHURCH*.

*Cathedral* is where there is a Bishop's See, or Seat, call'd *Cathedra*. *Collegiate*, consists either of regular Clerks, professing some religious Order; or of Dean and Chapter. See *CATHEDRAL, COLLEGIATE, &c.*

*Parochial* Church is that instituted for the performing of divine Service to the People who dwell within a certain Compass of Ground.

*PARODY*, a popular Maxim, Adage or Proverb. See *PROVERB*.

The Word is form'd from the *Greek παρὰ* and *ἔστι*, *Via, Way*, as being trite, or passing among the People.

*PARODY*, is also a poetical Pleasantry, consisting in applying the Verses of some Person, by Way of Ridicule, to another; or in

An *essential Part* is that, whereby, with the Concurrence of some other, an essential Whole is constituted. Thus Body and Soul are essential *Parts* of Man.

An *integral or integral Part* is that which is necessary to the Integrity of the Whole; as a Head is of a Man, &c.

In Anatomy, we divide the *Parts* of the human Body into *Containing and Contained*; into *Similar and Dissimilar*; the *Similar*, again, into *Spermatie and Sanguin*, &c. See SIMILAR, &c.

They also call *Noble or Essential Parts*, those absolutely necessary to Life, as the Heart, Lungs, Liver, Brain, &c. The *Natural or General Parts*, popularly call'd *Privy Parts*, are those ministering to Generation. See GENERATION.

The finest Books of Physicians are those treating of the *Use of the Parts*. Nature, we say, always discharges itself on the weak *Part*, the *weakest Part*, the *Part affected*, &c.

In Chymistry, Bodies are said to be resolved into their *minute Parts*, their *Component Parts*, &c. See CHYMISTRY, ANALYSIS, ELEMENT, &c.

That Art is said to separate the *Heterogeneous Parts* from the *Heterogeneous*; Volatile, subtle, sulphureous, mercurial &c. *Parts*, from the fixed, crass, earthy, viscid &c. *Parts*. See VOLATILE, FIXED.

In Geometry and Astronomy, *Part* is applied to the Divisions of Lines, and Circles: The Semi-diameter of the Circle, call'd also the Radius and whole Sine is divided into an hundred thousand *Parts*; the Circumference of the Circle into 360 *Parts*, or *Degrees*, on which two Divisions all the Celestial Computations are made. See DEGREE, &c.

*Aliquot Part*, is a Quantity which, being repeated any Number of Times, becomes equal to an Integer; thus 6 is an aliquot *Part* of 24; and 5 an aliquot *Part* of 30, &c. See ALIQUOT. See also a Table of *Aliquot and Aliquant Parts*, under the Article MULTIPLICATION.

*Aliquant Part*, is a Quantity which, being repeated any Number of Times becomes always either greater or less, than the Whole. Thus 5 is an aliquant *Part* of 17; and 9 an aliquant *Part* of 10, &c. See ALIQUANT.

The aliquant *Part* is resolvable into aliquot *Parts*. Thus 15, an aliquant *Part* of 30, is resolvable into 10 a half and 5 a fourth *Part* of the same. See a Table of the *aliquant Parts* of a Pound under MULTIPLICATION.

*Proportional Part* is a *Part* of Number agreeable and analogous to some other *Part* or Number; or a *Medium* to find out some Number or *Part* unknown by Proportion and Equality of Reason. See PROPORTION.

*Similar PARTS* are those which are to one another, as their Wholes are to one another. See SIMILITUDE.

*PART*, in Music, a Piece of the Score or Partition, wrote by itself, for the Convenience of the Musician; or it is one or more of the Successions of Sounds which make the Harmony, wrote a-part. See PARTITION.

Or, the *Parts* are the Sounds made by several Persons singing, or playing in Concert. See CONCERT.

Music in *Parts* was unknown to the Antients; they had but one *Part*; all their Harmony consisted in the Succession of Notes; none in the Consonance. See MUSIC and SYMPHONY.

There are four principal *Parts*; the *Treble, Bass, Tenor, and Counter-tenor*. See TREBLE, BASS, TENOR, &c.

Some compare the four *Parts* in Music, to the four Elements: The *Bass* represents the Earth; the *Tenor*, Water; *Counter-tenor*, Air; and the *Treble*, Fire.

*PART*, in Trigonometry. In a rectangular spherical Triangle A B C. *Tab. Trigonometry* Fig. 22. that *Part* lying between two others, considered as Extremes, is call'd by some Authors, the *middle Part*.

Thus, if A B and B C be the extreme *Parts*, the Angle B will be the *middle Part*.

If the *Parts*, considered as Extremes, be contiguous to the middle *Part* and one of the Extremes; those are call'd *conjunct Parts*.

Thus, if B be the middle *Part*, A B and B C will be the *conjunct Parts*.

If between the Extremes, and the middle *Part*, there lie another, beside a Right Angle; then the *Parts* are said to be *separate* or a-part, *E. S. P.* If B be the middle Term, A C and C will be *separate Parts*; because, between the middle *Part* B and the extreme C, there lies the Hypotenuse B C; and between the middle *Part* B, and the other extreme A C, beside the Right Angle, there lies the Leg A B. See TRIANGLE.

Those *Parts*, either join'd to the middle *Part* or separated from it, are call'd *Lateral Parts*.

*PARTS of Speech*, in Grammar, are all the Sorts of Words which enter the Composition of a Discourse. See WORD and SPEECH.

The Grammarians usually admit of eight *Parts* of Speech, viz. *Noun, Pronoun, Verb, Participle, Adverb, Conjunction, Preposition and Interjection*. See each in its proper Place, NOUN, PRONOUN, &c.

*Part of Fortune*, in judiciary Astrology, is the Lunar Horoscope; or the Point wherein the Moon is, at the Time when

the Sun is in the ascending Point of the East.

The Sun in the Ascendant is supposed to give Life; and the Moon disposes the radical Moisture, and is one of the Causes of Fortune. In Horoscopes, the *Part of Fortune* is represented by a Circle divided by a Cross.

*PARTIERRE*, in Gardening, that open *Part* of a Garden into which we enter, coming out of the House; usually, set with Flowers, or divided into Beds, incomparted with Plant-bands, &c. See GARDEN.

The *Parterre* is a level Division of Ground, which, for the most *Part*, faces the South and best Front of a House, and is generally furnished with Greens, Flowers, &c.

These are divers Kinds of *Parterres*, as *Bowling-Green* or *plain Parterre*; *Parterres of Embroidery*; *cut in Shell*, and *Scroll-work*, &c. with Sand-Alleys between them.

An oblong, or long Square is accounted the most proper Figure for a *Parterre*; the Sides whereof, to be as two, or two and a half to one.

*PARTI, PARTIE* or *PARTY* or *PARTED* in Heraldry, is applied to a Shield, or Escutcheon, denoting it *divided*, or marked out into *Partitions*. See SHIELD.

The *French* Heralds, from whom we borrow the Word, have but one Kind of *Parti*, the same with our *Parti per Pale*, which they call simply *Parti*; but, with us, the Word is applied to all the Sorts of Partitioning; and is never used without some Addition to specify the particular one intended.

Thus we have *Parti* or *Parted per Cross*, *per Chief*, *per Pale*, *per Fess*, *per Bend Dexter*, *per Bend Sinister*, *per Chevron*, &c. See QUARTERING.

The Humour of our Ancestors, *Colombiere* observes, turning much upon Exploits of Arms and Chivalry; they used to prefer the batter'd and hack'd Armour as honourable Symbols of their hardy Deeds; and those who, had been in the honest Service, were distinguished by the many Cuts and Bruises that appear'd on their Shields. To perpetuate the Memory hereof, says the same Author, they caused them to be painted on their Shields, and thus handed down to Posterity. And when Heraldry grew into an Art, and Officers were appointed to direct the Manner of Bearing, and Blazoning; they gave Names to those Cuts, answerable to the Nature thereof; appointing four, from which all the others proceed: These are *Parti* (in English, *Parti per Pale*) *Coupee* (in English, *Parti per Fesse*) *Tranche* (in English, *Parti per Bend Dexter*) and *Taillie* (in English *Parti per Bend Sinister*). See COUPE, TRANCHE, &c.

*Parti per Pale*, is when the Shield has received a perpendicular Cut in the Middle, from Top to Bottom. See PALE, &c.

*Parti per Fesse* is when the Cut is a-cross the Middle, from Side to Side. See FESSE.

*Parti per bend Dexter*, is when the Cut falls on the upper Corner of the Shield on the right Hand, and descends a-thwart to the opposite lower Corner. See BEND.

*Parti per bend Sinister*, is when the Cut, falling on the upper left Corner, descends a-cross to the opposite lower one.

From these four Partitions have proceeded an infinite Number of others of various and extravagant Forms.

*Speiman* in his *Aspilogia* observes, that the present Divisions of Escutcheons were unknown in the Reign of the Emperor *Theodosius*; were brought up in the Time of *Charlemain*, or later; little used among the English in the Days of *K. Henry II.* but more frequently under *Edw. III.*

The erect or upright Section, he observes, is called, in Latin, *Polaris*, from its Resemblance to a *Palis*, or Stake; and two Costars are often entire on the Sides, the Husbands on the Right, and the Wives on the Left. The direct Section a-cross, being in the Place of a Belt, is call'd *Balticus*, &c.

When the Shield is *Parti*, and *Coupe*, it is said to be *Ecartele*. See ECARTELE.

It is said to be *Parti from one to the other*, when the whole Shield is charg'd with some honourable Bearing divided by the same Line that parts the Shield; here, 'tis a Rule, that one Side be of Metal, and the other of Colour. Thus he bears *Sable Parti d'Argent*, *Spread Eagle Parti* from one to the other.

*PARTICIPATION*, that which gives us a *Part*, or Share in any thing, either of Right or of Grace.

In Italy they distinguish *Participation Officers*, as Prothonotaries, &c. which have a real Function; from *honorary ones*; which have only a Title, without any Duty or Employ.

*PARTICIPLE*, in Grammar, an Adjective form'd of a Verb; so called, because it participates of some of the Properties of the Verb; still retaining the Regimen and Signification thereof: Whence most Authors confound 'em with Verbs. See VERB.

There are two Kinds of *Participles*, the one call'd *Active*, because expressing the Subject which makes the Action of the Verb; as *legens, audiens*, reading, hearing: The other call'd *Passive*, because expressing the Subject that receives the Action of the Verb, as *lectus, auditus*, read, heard.

As our Adjectives are not declined, the *Participles*, being real Adjectives, are not declined neither: In the Latin, &c. where the Adjectives are declined, the Pronouns Active are declined

declined likewise; thus they say *audians, audientis, audienti*, &c. and in the French the Pronouns Passive are declinable like their other Adjectives, as *J'ay in, ois a lui, nous avensius, &c.*

We take this Occasion to observe, that Declension is a Thing perfectly accidental to the several Kinds of Words, i. e. the changing or not changing the Termination: The *Latins, E. gr.* have indeclinable Nouns, as *Corus* and *Nequam*, yet both *Latins* and *Italians* decline their Adverbs as *fortius, fortissime; bene, benissimo*, &c. and some Nations scarce conjugate their Verbs at all. Indeed the *English* do it very little in Comparison with the *Latins, Greeks, French*, &c.

In our Language the *Participle* and Gerunds, are not at all distinguishable. See GERUND.

**PARTICLE**, in Physics, the minute Part of a Body; of an Affluence or Coalition of several whereof Natural Bodies are compos'd. See BODY.

*Particula* in the new Philosophy, is frequently used in the same Sense with *Atom* in the ancient *Epicurean* Philosophy; and *Corpuscle* in the later. See ATOM and CORPUSCLE.

Some of the more accurate Writers, however, distinguish 'em; making *Particula* an Affluence or Composition, of two or more primitive, and physically indivisible Corpuscles or Atoms; and *Body*, an Affluence or Mass of several *Particulae* or secondary Corpuscles. See ELEMENT.

Indeed, the Distinction is of no great Moment; and, as to most Purposes of Physics, *Particulae* may be understood as synonymous with *Corpuscle*. *Particulae*, then, are, as it were, the Elements of Bodies: 'Tis the various Arrangement, and Texture of these, with the Difference of the Cohesion, &c. that constitute the various Kinds of Bodies, *hard, soft, liquid, dry, heavy, light*, &c.

The smallest *Particulae* or Corpuscles cohere with the strongest Attractions, and compose bigger *Particulae* of weaker Cohesion; and many of these cohering compose bigger *Particulae* whose Vigour is still weaker; and thus on for divers Successions till the Progression end in the biggest *Particulae*, whereon the Operation in Chymistry, and the Colours of natural Bodies depend, and which, by cohering compose Bodies of sensible Bulk. See MATTER.

The Cohesion of the *Particulae of Matter*, the *Epicureans* imagined was effected by Means of hooked Atoms; the *Aristotelians* by Rest, that is, by nothing at all. But Sir *Isaac Newton* shews it is done by means of a certain Power whereby the *Particulae* mutually attract or tend to each other. See COHESION.

By this Attraction of the *Particulae* he shews that most of the *Phenomena* of the lesser Bodies are effected; as those of the heavenly Bodies are by the Attraction of Gravity.

For the Laws of this Attraction of the *Particulae*. See ATTRACTION.

All Bodies, the same great Author shews, consist of the same solid perfectly hard *Particulae* or Corpuscles.

**PARTICL**, in Grammar, a little indeclinable Word, consisting of one or two Syllables at the most. See WORD, &c.

Those alone are properly *Particulae* which are not declined nor conjugated. *Brighams* calls *Particulae*, *Manners of Words*, because rather serving to express the Circumstances and Manners, of other Ideas and Objects of the Mind, than to represent any distinct Objects of their own.

*Particulae* may be reduced under three Heads: The first shew the Manners or Qualities of Words, by being added to them; call'd *Adverbs*. See ADVERB.

The second denote some Circumstances of Actions and join Words to Words, Sentence to Sentence, &c. See CONJUNCTION.

The third express the Emotions of the Soul. See INTERJECTION.

'Tis in the right Use of *Particulae*, Mr. *Locke* observes, that more particularly consists the Clearness and Beauty of a good Style. To express the Dependence of his Thoughts and Reasonings one upon another, a Man must have Words to shew what Connection, Restriction, Distinction, Opposition, Emphasis, &c. he gives to each respective Part of his Discourse. This cannot be rightly understood, without a clear View of the Postures, Stands, Turns, Limitations, Exceptions, and several other Thoughts of the Mind. Of these there are a great Variety much exceeding the Number of *Particulae*, that most Languages have to express them by; for which Reason it happens that most of these *Particulae* have divers, and sometimes almost opposite Significations.

Thus the *Particula But* in *English*, has several very different Significations; as in, *But* to say no more; where it intimates a Stop of the Mind in the Course it was going, before it came to the End of it. I saw *but* two Planets: Here it shews that the Mind limits the Sense to what is express'd with a Negation of all other. You pray, *but* it is not that God would bring you to the true Religion, *but* that he would confirm you in your own. The former of these intimates a Supposition in the Mind, of something otherwise, than it should be; the latter shews that the Mind makes a direct Opposition between that and what goes before. All Animals have Sense, *but* a Dog is

an Animal: Here it signifies the Connection of the latter Proposition with the former.

**PARTICLES** is also a Term used in Theology, and particularly in the Greek Church, where 'tis call'd *μυστα*. In the *Latin* Church the Name *Particulae* is given to the Creams or little Pieces of Consecrated Bread. In the Greek Church they have a particular Ceremony, call'd *ἡ ἁγιασμα*, of the *Particulae*, wherein certain Creams of Bread not consecrated, are offer'd up in Honour of the Virgin, St. *John Baptist*, and several other Saints. They also give the Name *ἁγιασμα*, Oblation, to such *Particulae*. *Gabriel*, Archbishop of *Philadelphia*, has a little Treatise express'd *ἡ ἁγιασμα*, wherein he endeavours to shew the Antiquity of this Ceremony, in that it is mentioned in the Liturgies of St. *Cyryllus*, and *Basil*.

There has been a considerable Dispute on this Head, between the Reformed and the Catholic Divines. *Advertus* and *Leonides* explain a Passage in the Theory of *Germanus*, Patriarch of *Constantinople*, where he mentions the Ceremony of the *Particulae* as in use in his Time; in Favour of the former: Messieurs de *port Royale* contest the Explanation: But M. *Simon* in his Notes on *Gabriel of Philadelphia*, endeavours to shew, that the Passage is an Interpolation; not being found in the ancient Copies of *Germanus*: And consequently that the Dispute is from the Purpose.

**PARTICLA**, *out of Sphere*, in Astronomy. See PARTICULA *ex-fors*.

**PARTICULA ex-fors**, in Astronomy, the Difference between the Equatorial Triangle L A C, (*Tab. Astronom. Fig. 32*, and its Fellow, B L Z. See EQUATION.

To find the *Particula ex-fors*, the Menstrual Eccentricity A C, and the Annual Augment of Longitude H A D, being given; from the *Dista* in the Triangle B C A, find the Hypotenuse A B to the Angle C; and to the Angle C A B: and C B. Multiply C B into half the Menstrual Eccentricity A C; the Product is the Area of the Triangle A C B. Find likewise the Area of a Circle described by the Radius of the Eccentric B L. Then as the Area of the Circle is to 360° or 1296000; so is the Area of the Triangle A C B to its Value in those Seconds: which Value is the *Particula ex-fors*.

**PARTICULAR**, a relative Term, referring to Species, or Individual; and opposed to General, or Universal. See GENERAL, &c.

In the Schools, *Particular* is defined to be something included under an Universal; as Man under Animal. Sometimes it is taken for an Individual, as *Peter*. See INDIVIDUAL.

There is this Difference between *Particular*, and *Singular*, that *Particular* denotes a Thing taken as a Part; as *Peter* in respect of Mankind: Whereas *Singular* denotes the Part taken after the Manner of a Whole; as *Peter* considered in himself.

**PARTICULARIST**, among Polemical Divines, a Person who holds for Particular *Grace*, i. e. who teaches or believes that *Christ* died for the Elect only; and not for Mankind in general. See GRACE.

**PARTIES**, in Law, are those who are named in a Deed, or Fine, as *Parties* to it; as those that levy the Fine, and to whom the Fine is levied. See FINE.

So those that make any Deed, and they to whom it is made, are call'd *Parties in the Deed*. See DEED.

**PARTICLE Aspect**, in Astrology, the most exact and full Aspect that can be. See ASPECT.

**PARTING**, or **DEPARTING**, a Method of separating Gold and Silver by Means of *Aqua fortis*. See GOLD and SILVER.

The Method hereof, see under the Articles *DEPART* and *REFINING*.

**PARTITION**, the Act of parting, or dividing, or distributing a Thing. See DIVISION and DISTRIBUTION.

The Name *Partitionis Oratoria*, is also given to a Dialogue of *Cicero's* between him and his Son; in regard the Discourse is, as it were, parted or divided between 'em.

**PARTITION**, in Law, a dividing of Lands, descended by the Common-Law, or Custom, among Co-heirs, where there are two at least.

This *Partition* is made four Ways, whereof three are by Agreement, the fourth by Compulsion.

The first *Partition* by Agreement is, when they divide the Land equally themselves into so many Parts as there are Co-heirs; the second, when each chuses some of their Friends to make Division for them.

The third is by drawing Lots, thus: Having first divided the Land into as many Parts, as there are Persons, they write every Part severally in a distinct Scroll, and wrapping it up, throw each into a Hat, or such like Thing; out of which each one draws according to his Superiority; and so the Land is severally allotted.

The fourth *Partition*, which is by Compulsion is, when one or more of the Heirs, by Reason of the R. f. of some other, sues out a Writ of *Partitionis faciendae*; by Force whereof they shall be compelled to divide.

In *Kent*, where Land is of Gavel-kind Nature, they call their *Partition*, *Shifting*.

*Partition* also may be made by Joint-Tenants in common, by Assent, by Deed, or by Will.

**PARTITION**, in Music, the Disposition of the several Parts of a Song, set on the same Lest; so as upon the uppermost Ranges of Lines are found the *Treble*; in another the *Bass*; in another the *Tenor*, &c. that they may be all sung or play'd jointly or separately. See **PART**, **MUSIC**, &c.

**PARTITION**, in Architecture, that which divides or separates one Room or Apartment from another.

**PARTITION**, in Heraldry. See **QUARTERING**, **PARTNER**, and **PARTNERSHIP**. See **PASCINES**, and **CO-PARTNER**.

**PARTURITION**, the Act of bringing forth, or being delivered of Young. See **DELIVERY**.

**PARTUS**, in Medicine and Law, the *Delivery* of a Woman, or the Birth of a Child. See **DELIVERY** and **BIRTH**.

*Cæsarum Partus*, is that where the Mother is cut open, and the Child taken out at one Side. See **CÆSAREUS**.

**PARTY** or **PARTIE**, a Faction, Interest, or Power, considered as opposite to another. See **FACTION**.

The *French*, and *Spaniards* are always of opposite *Parties*: *England* has, for upwards of a Century, been divided into two *Parties*. See **WHIG** and **TORY**.

**PARTY**, in Law. See **PARTIS**.

**PARTY**, in the military Sense, is used for a Body of Men, whether Cavalry, Infantry, or both, commanded out on any Expedition. A *Party* of Cavalry carried off a great Number of Cattle. Those who go out on *Parties* should have an Order in writing from the commanding Officer, and be at least twenty in Number, if Foot, or fifteen, if Horse; otherwise they are reputed as Brigands.

*Partis Jury*, in Law. See **MEDIAS Lingue**.

**PARTY**, in Heraldry. See **PART**.

**PARULIS**, in Medicine, an Inflammation of the Gums, attended with a violent Pain, and an Apotheme; sometimes ending in an Ulcer, and sometimes in a Cancer, Fistula, Gangrene, &c.

*Smeritus* orders it to be cured by Reversion, Derivation, and proper Gargarisms. Care is to be taken in the Beginning to prevent the Apotheme.

The Word is *Greek*, form'd of *parag* near, and *pas* Gingivæ, Gum.

**PASCHAL**, something belonging to the Jewish Passover, or the Christian Easter. See **PASSOVER**. See also **EASTER**.

The *Passchal Lamb* is a Lamb the Jews eat with a deal of Ceremony, in Memory of their having been brought out of Slavery in *Ægypt*. It should be eaten standing, their Loins girt, the Staff in the Hand, &c.

**PASCHAL RENTS**, are Rents or annual Duties paid by the inferior Clergy to the Bishop, or Arch-deacon, at their Easter Visitation: They are also called *Synodals*. See **SYNODALS**.

**PASCHAL Letter**, in Church-History, a Circular Letter, which the Patriarch of *Alexandria*, first, then the Pope, anciently wrote to all the Metropolitans, to inform 'em of the Day whereon the Feast of *Easter* was to be celebrated. See **EASTER**.

**PASQUIN**, a mutilated Statue, seen at *Rome*, in a Corner of the Palace of the *Vrives*.

It takes its Name from a Cobler of that City, called *Pasquin*, famous for his Sneers and his Gibes; and whose Shop was the Resort of a Number of idle People, who diverted themselves with bantering Folks as they pass'd by.

After *Pasquin's* Death, as they were digging up the Pavement before his Shop, they found a Statue of an ancient Gladiator, well cut, but maim'd and half spoil'd. This they set up in the Place where 'twas found, at the Corner of the deceased Master *Pasquin's* Shop; and, by common Consent, call'd it by the Name of the *Defunct*.

From that Time all Satires, and Lampoons are ascribed to this Figure, are put in its Mouth, or pasted against it; as if they came from *Pasquin's* reliquies.

*Pasquin* usually addresses himself to *Marforio*, another Statue in *Rome*; or *Marforio* to *Pasquin*, whom they make reply.

The Answers are usually very short, poignant, and unlucky: When *Marforio* is attack'd, *Pasquin* comes to his Assistance; and *Pasquin* is assisted by *Marforio* in his Turn, i. e. the People make the two Statues speak just what they please. See **MARFORIO**.

**PASQUINADE**, or **PASQUIL**, is, properly, a satyrical Libel fasten'd to the Statue of *Pasquin*. See **PASQUIN**.

Hence, by Extension, the Term becomes used for any Satire, Lampoon, or Sneer upon the Public, or the ruling Powers.

There is this Difference between a *Pasquinade* and a *Satire*; that the End of the latter is to correct and reform; whereas that of the former is only to scoff and expose.

The *Italians* have publish'd several Books which they call *Pasquinos in estaf*.

**PASS**, **PASSADE**, in Fencing, a Leap or Advance upon the Enemy.

Of these there are several Kinds; as *voluntary Passes*, com-

mencing from the left Foot out of Measure of the firm Foot; as when the Enemy is not expected. Others necessary, made after a Push from the right Foot; where being to press'd by the Enemy, as not to have Time to retire; you endeavour to seize the Guard of his Sword.

The Measure of the *Passis*, when the two Smalls of the Swords are to be near, as that they may touch one another. There are *Passes*, *within*, *above*, *beneath*, *to the right*, *the left*, *Passes* under the Sword, over the Line, &c.

**PASS of Arms**, in Chivalry, a Place which the ancient Knights undertook to defend, *E.g.* a Bridge Road, &c. not to be pass'd without fighting the Perilous who kept them.

The Knights who held the *Pass* hung up their Arms on Trees, Pales, Columns, &c. erected for the Purpose; such as were disposed to dispute the *Pass*, touched one of these Armories with his Sword; which was a Challenge the other was obliged to accept. The Vanquish'd gave the Victor such Prize as was before agreed on.

**PASS-PORT**, a Licence, or Letter from a Prince, or Governor, granting Liberty and Safe-Conduct to travel, enter, and go out of his Territories, freely and without Molestation.

The *Pass-Port* is, properly, given to Friends, and the Safe-Conduct to Enemies. See **SAFE-CONDUCT**.

*Passquier* takes *Pass-Port* to be used for *Passes-par-tout*. *Basilic* mentions a very honourable *Pass-Port* given by an Emperor to a Philosopher; in these Terms: *If there be any one on Land, or on Sea, hardy enough to molest Ariston; let him consider whether he be strong enough to wage War with Cæsar.*

**PASS-PORT** is also used for a Licence granted by a Prince for the importing or exporting Merchandizes, Moveables, &c. without paying the Duties.

Merchants sometimes procure such *Pass-Ports* for certain Kinds of Commodities; and they are always given to Embassadors and Ministers, for their Baggage, Equipage, &c.

**PASS-PORT** is also a Licence obtain'd for the importing or exporting of Merchandizes deem'd Contraband, and declared such by Treaties, &c. as Gold, Silver, precious Stones, Ammunition of War, Horses, Corn, Wool, &c. upon paying Duties.

**PASS-Parole**, a Command given in the Head of an Army, and thence communicated to the Rear; by passing it from Mouth to Mouth.

**PASS-par-tout**, a Master-key; or Key that opens indifferently several Locks belonging to the same Lodge or Apartment. See **KEY**.

**PASS-Passant**, a Fagot, or a pretended Soldier, not enroll'd, whom the Captain or Colonel makes pass in Review, or Muster, to shew that his Company is complete, or to receive the Pay thereof to his own Profit. See **FACTORY**, &c.

In France the *Passes-volants* are condemn'd to be mark'd on the Check with a *Fleur-de-lis*.

**PASSA**, or *Passa Uva*, in Pharmacy, a Term apply'd to those dried Grapes, which we call *Raisins*. See **RAISIN**.

*Uve Passée* is sometimes also used, with less Propriety, for *Figs*. See **FIG**.

**PASSADE**, or **PASSADO**, in Fencing, a Thrust or Pass. See **PASS**.

**PASSADE**, is also a Benevolence or Alms given to poor Passengers.

In the Manage, it signifies a Turn, or Course of a Horse backward and forwards on the same Plot of Ground.

**PASSAGE**, in Commerce, *Right of Passage* is an Impostion which some Princes exact by their Officers or Farmers, in certain narrow close Places of their Territories, either at Land or Sea; on all Vessels, Vehicles, and Carriages of all Kinds; and even sometimes on Persons, and Passengers coming in or going out of Ports, &c.

The *Passage* of the Sound, (that famous Strait which carries us out of the *German* into the *Baltic* Sea) is the most celebrated *Passage* in *Europe*. The Rights belong to the King of *Denmark*, and are paid at *Elseneur* or *Cronembourg*.

All Nations who traffic into this Part of the North, are subject to this Right; the *Swedes*, indeed, were exempted from it by the Treaty of 1658, by their seizing the other Side of the Strait; but by the Treaty of 1720, they are excluded the Privilege; and put on the same Footing with their Neighbours. *Crowwell* was bent on exacting this *Passage* from the *Danes*; and had, doubtless, effected it, but that 'ere the Fleet he sent for the Purpose arriv'd there, he died.

*Birds of Passage*, are such as only come at certain Seasons, and then disappear again; being supposed to pass the Sea to some other Climate. See **MIGRATION**.

The *Birds of Passage* are the Stork, Swallow, Nightingale, Martin, Woodcock, Quail, &c. There are also *Fishes of Passage*, as Herrings, Mackerel, &c.

Mr. *Derham* produces it as a remarkable Instance of Instinct, that, — the stork in the heavens knoweth her appointed times, and the turtle, and the crane, and the swallow observe the time of their coming — Jer. vii. 7. No doubt, the Temperature of the Air, and their natural Propensity to breed their Young, are the great Incentives to this Migration: But how these untaught, unthinking Creatures, should so exactly know the belt and on-

ly proper Seasons to go and come from a Place that would obstruct their Generation, or not afford convenient Food for them and their Young; or how they shou'd know which Way to steer their Course, and whither to go; is a difficult Consideration. *Psalm. lxxv. l. vii. c. 3.*

**PASSAGE, or Passage,** in the Manage, an Action wherein the Horic raises two Legs together, a hind and a fore Leg, in Form of St. Andrew's Cross; when, setting those two on the Ground again, he raises the other two; and thus alternately; never gaining above a Foot of Ground at a Time.

The Beauty of the *Passage* consists in keeping the Legs a good while in the Air; setting that aside, the Motion of the Legs in the *Passage* is the same as in pacing and trotting.

**PASSAGE,** in Music, a Portion of an Air, or Tune, consisting of several little Notes, as Quavers, Demi-quavers, &c. lasting one, two, or at most, three Measures.

Thus what the *Italians* call *contra punto d'un sol passo*, is a Portion in the Beginning of the Song, consisting of one, two, or three Measures, which is to be imitated in other Notes; not with the same Strings or Tones, but only observing the same Motion, Number, and Figure as in the Notes of the first *Passage*; which is one of the Kinds of *contra punto perfradate*.

**PASSALORHYNCHITES,** a Sect of Montanists in the second Century; who made Profession of perpetual Silence, and, the better to maintain it, kept the Thumb continually on their Lips; founding their Practice on that of the *Psalmist*, *Set a guard, O Lord, on my Mouth.* St. Jerome mentions his having met with some of 'em in his Time. See **MONTANISTS**.

**PASSANT,** in Heraldry, a Term applied to an Animal in a Shield, appearing to walk; or, to the ordinary Posture of terrestrial Animals.

Thus we say, he bears *Gules* two *Lions Passants* over one another.

In most Beasts, except *Lions*, they frequently use *Tripping*, instead of *Passant*.

**PASSION,** a Term understood of the different Motions, and Agitations of the Soul, according to the different Objects that present themselves to the Senses. See **SOUL**.

In Propriety, all those Motions whereby the Soul is carried towards any Thing; as Love, Ambition, Revenge, &c. are rather Actions than *Passions*; and on the contrary, those Motions whereby the Soul finds itself interrupted in its Action, as Grief, &c. are the only real *Passions*. See **ACTION**.

We find various Modifications and Impressions of Pleasure and Pain, inseparably annex'd by an establish'd Law of Nature, to the several Judgments we form concerning Good and Evil: These Judgments, with their respective Modifications of Pleasure or Pain annex'd, according to the various Appearances and Relations of the Object considered, either as good or evil, present or absent, certain or uncertain, probable or improbable, possible or impossible, and affecting the Machine in a certain Manner peculiar to the Modifications; make what we call the *Passions*.

How, or by what Means, this mutual Action and Communication between Soul and Body is effected, we are, in a great Measure, ignorant: We have but very obscure and faint Notions of any Thing prior, or more simple to resolve it into; except the immediate Will and Agency of the first Cause itself. See **COMMUNICATION**, **CAUSE**, &c.

*Malebranche* defines the *Passions* to be all those Emotions naturally arising in the Soul, on occasion of extraordinary Motions of the animal Spirits, and the Blood: In Opposition to those Motions of the Soul which are common to us with pure Intelligences, and which he calls *Natural Inclinations*. See **NATURAL INCLINATION**.

Tho' the *Passions* be inseparable from Inclinations; and tho' a Man be only capable of sensible Love or Hatred, because he is capable of spiritual Ones; yet does it appear just in that Author to distinguish between them. *Passions* are much stronger and warmer than Inclinations; their Objects are different, and so are their Causes: *Passions* and Inclinations differ just as much as Sense and Imagination.

In Effect, the *Passions* of the Soul are Impressions of the Author of Nature, which incline us to our Bodies, and all Things that may be of Use to their Preservation: Natural Inclinations are Impressions of the Author of Nature, which determine us primarily to love him, as our Supreme Good.

The Philosophers are not agreed about the Number and Division of the *Passions*: The ordinary Division is thus; the *Passions* of the Concupiscible Appetite, are *Pleasure* and *Pain*, *Desire* and *Aversion*, *Love* and *Hatred*: Those of the Irascible Appetite, are *Anger*, *Courage*, *Fear*, *Hope*, and *Despair*. See the Authors on the Subject of the *Passions*; *Des Carves*, who considers them physically; *Coeffens* who gives us the *Tableau*, Picture of the *Passions*; *Le Chamber*, the Characters of the *Passions*; and *Fatib. Sensault*, the Use of the *Passions*.

Dr. *Cheyne* considers the *Passions* as either *Spiritual* or *Animal*: The *Spiritual Passions* he defines to be those Sentiments produced in the Soul by external Objects, either spiritual Ones

immediately, or material Ones, by the Mediation of the Organs of the Body.

The *animal Passions* he defines by those Effects produced by Spirits or Bodies, immediately on the Body.

Hence as outward Objects may be consider'd either as Goods or Evils; the most natural Division of the *Passions*, whether Spiritual, or Animal, as they regard those Objects, is into *Pleasurable* and *Painful*. And in this Sense all the *Passions* may be reduced to *Love* and *Hatred*; of which *Joy*, and *Sorrow*, *Hope* and *Fear*; are only so many Modifications, or Complexions, according to the various Appearances, Postures, &c. of the Object.

In Effect, all the *Passions* may not only be reduced to two, *vis.* *Love* and *Hatred*; but, perhaps, to one, *Love*; and even that may be all resolved into *Self-love*; and that into a Principle of *Self-preservation*, or necessary invincible Desire of Pleasure or Happiness. The Rest are only Rivulets from this Source; or special Applications of this Principle to particular Occasions.

Thus the Desire of any Thing under the Appearance of its Goodness, Suitableness, or Necessity to our Happiness constitutes the *Passion* of *Love*; the Desire of eschewing or avoiding any Thing apprehended to be mischievous, hurtful, or destructive, constitutes *Hatred* or *Aversion*: The Desire of a Good, which appears at the same Time probable, and in our Power constitutes *Hope*; but if the Good appear improbable, difficult, or impossible, it constitutes *Fear* or *Despair*: The unexpected Gratification of *Desire* is *Joy*: The Desire of Happiness to another under Pain, or Suffering, is *Compassion*; and the Desire of another's Punishment, *Revenge* or *Malice*, &c.

The single Desire of Happiness, then, is the Spring or Motive of all our *Passions*; as those are of all our Actions. Some wife and reasonable Motive, or End of Action, says Dr. *Morgan*, is certainly necessary to all wise and reasonable Action; to act without a Motive, wou'd be the same Thing as not to act at all, that is, such an Action cou'd answer no further or better End than not acting; and consequently the Action, as well as the Agent, wou'd be so far insignificant and useless. He who shou'd have no Object at all of his Love or Aversion, Hope or Fear, Joy or Grief, must be simply and purely indifferent to all Action; and consequently must either be in a State of perfect Rest and Inaction, or in a State, equivalent thereto; wherein the Actions of such a Being cou'd be of no more Significance, than the uncertain Fluctuation of an Atom, or the Whivering of a Feather in the Air.

The natural, or occasional Cause of all the *Passions*, *Malebranche* makes to be the Motion of the animal Spirits, which are diffus'd thro' the Body to produce, and preserve a Disposition therein, suitable to the Object perceiv'd; to the End, the Body and Mind may mutually assist each other on this Occasion; it being the Order of the Creator, that our Will be followed by Motions of the Body proper to execute them; and that the Motions of the Body mechanically excited in us by the View of external Objects, be accompanied with a *Passion* of the Soul which inclines us to will or nill what appears serviceable or noxious to the Body.

'Tis a continual Impression of the Will of the Creator, that unites us thus intimately to a Piece of Matter, and occasions this Reciprocation of Motions and Sensations: Were this Impression of the Creator's Will suspended a Moment, we shou'd be deliver'd from all Dependence, all *Passions*, &c. For, what People usually imagine of a necessary Connection between the Motions of the Spirits and Blood, and the Emotions of the Soul, is inconceivable.

Some little Parts of the Bile, say they, move with some Violence among the Fibres of the Brain: Therefore the Soul must necessarily be agitated with some *Passion*; and this *Passion* be *Anger*, rather than *Love*. What Relation can we conceive between the Pulsis of an Enemy, a *Passion* of Contempt or Hatred, and a bodily Motion of the Parts of the Blood, striking against certain Parts of the Brain? How can the Union or Alliance of two Things so different as Spirit or Matter be effected, but by the omnipotent Will of the Author of Nature?

'Tis a Point, about which the Divines and Philosophers can never agree; whether this Relation and Connection of Thoughts of the Mind, and Motions of the Body, be the Gift of Nature, or the Punishment of the first Sin? And whether the *Passions* be the Institution of Nature, or the Corruption thereof. Indeed, considering the good and wise Purposes the *Passions* serve, and that absolute Necessity they are of; 'tis surprising it shou'd ever be doubted, that they are essential to human Nature.

This Union or Relation is found in all Men; but in different Degrees, and of different Extent, according to the different Temperaments, Conditions, Ages, Sexes, Occasions, Objects, &c. *E. gr.* Thus, our Union or Relation to sensible Objects we have seen, is stronger than that to Things we have only heard talk of. And thus the Great have a Relation to many more Things, than others, tho' Slavery is more extensive. A General, *E. gr.* retains or has a Relation to all his Soldiers, as they all respect him; and 'tis this Slavery that us-  
fully

usually occasions his Generosity : The Desire of being esteem'd by all in whose Sight he is frequently, obliges him to sacrifice more reasonable Pleasures.

'Tis thus throughout the World ; Vanity animates Virtue, otherwise we should never have such Lengths gone. Again, Children don't mind the same Things with grown People ; Women look no farther than their Families and Neighbourhood ; But Men retain to their whole Country ; 'tis for them to defend it ; they mind Honours, Offices, &c. Nor is there a less Variety resulting from the different Circumstances and Employments of People.

The Disposition of Mind in a married Man differs much from that of a Bachelor. The People in Monasteries have both the Mind and Heart turn'd very differently from People who live in the World. They are united to much fewer Things ; but then the Attachment is much closer and stronger. Their Passions move in a little Sphere ; and like the Sun's Rays, in a convex Lens, are assembled, as it were, in a Focus.

In every Passion there may seven Things be distinguish'd : The first, the Judgement the Mind makes of an Object ; or the View of the Relation the Objects bears to us. The second, a new Determination of the Motion of the Will towards that Object ; supposing it to appear a good. The third, the peculiar Sensations or Modifications which accompany them ; as the Sensation of Love, Hatred, Desire, or Joy ; which Sensations are always different in the different Passions, and, as it were, the Characteristics thereof. The fourth, a new Determination of the Course of the Blood and Spirits, towards the several Parts of the Body : Before the Sight of the Object of the Passion, the animal Spirits were pretty equally diffused throughout the Body ; but the Presence of the new Object disturbs the whole Oeconomy ; and the greatest Part of the Spirits are sent into the Muscles of the Arms, Legs, Face, &c. The fifth is the sensible Emotion of the Soul, which finds itself shaken by this sudden Over-flowing of spirits. The sixth, is the different Sensations of Love, Hatred, &c. caus'd, not by the intellectual View of Good or Evil, but by the different Shakes or Pulses, the animal Spirits occasion in the Brain. The last is a certain Sensation of Joy, or inward Satisfaction, which detains the Soul in its Passion, and arrests its being in the State it ought to be with Regard to that Object.

PASSIONS, in a View to Medicine, make one of the six Non-naturals, of the utmost Consequence, with respect to Health or Disease. See NON-NATURAL.

In Consequence of the several Judgements we form concerning Objects, as either Good or Evil, the Organs of Sensation and Motion, viz. the nervous Fibres, are variously impress'd or stimulated ; whence arise certain Sensations, and certain Modifications of Motion, which, 'tis apparent, are reciprocal, and follow mutually from each other, whether the Impulsion be supposed first made on the Body, or on the Mind : that is, any strong violent Motion made on the Organs, will excite a painful Sensation in the Mind ; or any such painful Sensation first excited in the Mind from the bare Consideration of an Object will impress a violent Motion on the Organs. And, on the contrary, an easy and placid Undulation, impress'd originally by the actual Impulse of Objects, will excite a pleasurable Sensation in the Mind ; or a pleasurable Sensation excited in the Mind, from the mere Contemplation of an Object, will be follow'd with a like easy, placid Undulation of the Organs.

The painful Passions, then, as well as bodily Pain, impress the nervous Fibres with a violent Motion which brings 'em alternately into forcible Contractions, and Dilatations, or strengthens and increases their muscular Force, and Action. While then this Pain or Uneasiness of Desire, annex'd to the Passions, and impress'd on the Nerves, is moderate and restrain'd within the Bounds of Nature ; Such stimulating Desires have a good Effect ; as they strengthen muscular Motion, keep up the Circulation of the Blood, promote the natural Secretions, and excite a Man to such Actions and Exercises, wherein animal Life, Health, and Vigour consist. But where the Uneasiness annex'd to the Passion is too violent, such a continual Stimulus will gradually derive a too great Proportion of Blood to the stimulated Organs, by which the Vessels will be over-stretch'd, and distended, their muscular Force gradually impair'd, and the Equilibrium of the Blood and Juices be interrupted. And hence, from a mere painful Sensation, will arise a complicated Train of bodily Illnesses and Pains, in Consequence of the establish'd Laws of the Union and Communication of Soul and Body.

Again, while we are wearing off the Uneasiness of Desire, annex'd to any Passion, we feel a sensible Pleasure, or agreeable Emotion ; and the Organs, hereupon falling into easy, uniform, placid Undulations, the too great Current of the Blood toward them is diverted, and the Equilibrium restored. As soon as the Uneasiness is all gone, the Pleasure ceases, and terminates in meer Indolence, which disposes the Person to Rest and Inaction ; till the Return of some fresh Desire, stimulating to farther Action, renew the same Succession, and interchangeable Series of Pains and Pleasure.

And this is the Circle of animal Life : as the Stimulus of Desire throws off the Indolence of Rest, and excites to Action ;

So the Gratification moderates the Pain of Desire, creates a Pleasure at first, and then terminates in the former Indolence and Inaction ; till fresh Desires returning, stimulate to farther Action, and continue the same Round.

Dr. Cleyne divides the Passion, into Acute and Chronical ; after the same Manner, and for the same Reason as Diseases are so divided.

The Acute Passions, whether pleasureable or painful, he observes, have much the same Effect, and operate after the same Manner as Acute Diseases do. They excite a brisk Circulation of the Fluids, and constringe the Solids for some short Time. Thus, sudden gusts of Joy or Grief stimulate the Nervous Fibres, and the Coats of the Animal Tubes, and thereby give a greater Celerity to their included Fluids ; and the Functions of the Heart and Lungs being involuntary, they have their more necessary and immediate Effects on them. Thus, both sudden Joy and Grief make us Breath short and quick, and render the Pulse small and frequent. Tho' retaining our Breath sometime to reflect more intently on any painful Object, forces at length a strong Expiration, which becomes a Sigh. Thus a sudden painful Idea, making a quick Circulation, and thereby throwing a great quantity of Blood upward, makes it appear in the superficial Vessels of the Face, Neck, and Breast, and so produces a Blush. The same Principles will account for the effects of Fear and Anger, which make us change Colour, and look Red or Pale as the Blood is accelerated or retarded in its Course. Sudden, and great Fear do convulse the Nervous System, that they sometimes alter the Position of the Parts : Thus the Hair shall stand an end in a Fright, and the Nerves be render'd so stiff and rigid, as to stop at once the Animal Functions, whence Fainting, and sometimes Death.

Chronical Passions, waste the Nervous System gradually. Those Nerves employ'd in considering, brooding over, and fixing such a Set of Ideas in the Imagination, must be worn out and impair'd ; and the rest, by disuse, render'd resty and unactive, lifeless and destitute of a sufficient Flux of warm Blood and due Nourishment. Thus does long Grief, dark Melancholly, hopeless Love, over Weening, Pride, &c. impair the Habit ; and sometimes when long indulg'd, terminate in Madness ; the Reason is, that a constant Habit of fixing one Thing in the Imagination, begets a ready Disposition in the Nerves, to produce again the same Image, till the Thought of it become Spontaneous and Natural, like Breathing, or the Motion of the Heart. Thus the *Yogurs in India* fix one or both Hands by long holding 'em up, so as that they cannot bring them down again. *Essay of Health, &c.*

Bur Dr. Morgan seems to have gone almost beyond any Body in explaining the Origin, and effects of the Passions.

From a Course of actual Observations of the several Phenomena in the Body, which attend the several Passions, viz. The State of the Pulse, Respiration, Warmth, Digestion, &c. that ingenious Author these general Conclusions :

I. That all the grateful, or pleasureable Passions raise the vital Tide, strengthen and quicken the Pulse, diffuse the natural Heat, and take off any antecedent Stimulus, or Pressure upon the Abdomen and inferior Organs : And, on the contrary, the painful Passions sink and depress the Blood, weaken the Pulse, recall and concenter the natural Heat, and fix a Spasmodic or Compression on the inferior Organs.

II. All the Passions impress their characteristic Sensations, or Modifications of Pleasure and Pain, especially upon the Oesophagus, and upper Orifice of the Stomach.

III. That they impress their different Modifications on the Muscles of the Larynx, and thus discover themselves by the different Modulation and Tone of the Voice.

And hence he infers, that the Nerves of the eighth Conjugation, or *Par Vagus*, are the principal Instruments of the Passions ; by means whereof, they are variously impress'd, modified, and organized : These, therefore, which are dispersed to all Parts of the Breast and Abdomen, particularly the Heart, Lungs, Stomach, Liver, Oesophagus, Diaphragm, Intestines, the Organs of Generation, &c. he considers as *Patheticks of the first Order* ; the Intercostal, which accompanies all the Divisions of the *Par Vagus*, he calls *Patheticks of the second Order* : The Nerves which serve the Muscles employ'd in Respiration, and have the nearest Communication with those of the *Par Vagus*, by means of the Intercostal, he calls *Patheticks of the third Order* ; and, the Nerves which immediately dispense Sense and Motion to the several Parts of the Head, and have a remoter Communication with the *Par Vagus*, the *Patheticks of the fourth Order*. See NERVE.

According to this Gradation, then, the Organs which are immediately supplied with Nerves from the *Par Vagus*, or *Patheticks of the first Order* will be first affected in the Passions, and with the smallest Degree of impress'd Motion, with which the Parts communicating immediately with the intercostal, or *second Order of Patheticks*, keep Pace and are affected

fect'd almost at the same Time, and with the same Motion: Then the Organs supply'd with the *third Order of Patheticks*, or the Nerves employ'd in the Muscles of Respiration, are affected. And lastly, the Organs of Sense and Motion in the Brain itself, by which Sensation and Imagination are performed, are put in a forcible Emotion; by which the ordinary Operations of Sense, Judgement, &c. are much disturbed.

This gradual Rise and Progress of the *Passions* is confirm'd by Fact; Observation and Experience; but how they are generated, and by what Steps they make their Advances, requires some farther Consideration.

It may be observ'd, then, that the Quantity of Motion impress'd on the pathetic Nerves in any *Passion*, is always proportional to the Strength of the Desire; but such impress'd Motion is not always uniform or equably diffus'd thro' the whole pathetic System; for as the largest and most numerous Branches of the Pathetick Nerves are spent on those Parts which derive their Blood from the descending Trunk of the *Aorta*, viz. the Stomach, Spleen, Kidneys, &c. upon any Motion too forcibly impress'd or too long continued, these inferior Organs are the first and greatest Sufferers; whence the Blood flowing impetuously and irregularly to the Parts thus stimulated, they become over-stretch'd; and hence a Sense of Pain, Weight and Oppression.

By this means the Head and superior Parts being deprived of their due Share of Blood, the Pulse must sink, the natural Heat diminish and retire, and a Sense of Cold and Constriction be felt about the *Oesophagus*, where the Branches of the *Per Vagum* are very numerous: And hence the Patient will be excited to sigh, groan, moan, cry out, and complain, and discover in the Tone of the Voice, and Modulation of the Muscles of the Larynx, the Characteristics of the prevailing *Passion*.

Such is the State of Nature under the painful *Passions*, where the strong Desire of Good is attend'd with an Appearance of Difficulty, or Improbability: where the same Desire is attend'd with a seeming Probability of obtaining, or effecting it; this Appearance, by moderating the Intensity of the Pain of the Desire, and taking off the too violent Action of the pathetic Nerves on the inferior Organs, puts the pathetic System in an easy, natural, uniform Undulation; by which the *Equilibrium* of the Blood being restored, the pleasurable *Passions* of Love, Joy, Hope, &c. will be rais'd: And in this Case the Pulse will rise, and the natural Heat be diffus'd, and by the Action of the Pathetick Nerves on their proper Organs the several Symptoms be produced which discover their placid Emotions. Where the Desire is very Keen, and Intense, we see what a prodigious Force it will impress on the Nerves, by the Actions of Mad-men, and Men in a Fright. In this Case, the Stimulus of Desire being exceeding strong, and the impress'd Motion universal; the pathetic Nerves of the fourth or last Order come to be affected; that is, the Organs of Sensation and Imagination in the Brain are brought into such violent Vibrations, as to disturb the Operations of Reason.

And from this violent Perturbation of the pathetic Nerves in the Brain, Mad-men have their Imagination as strong and vivid as Sensation itself. See IMAGINATION.

Hence, also, we may observe the Heights, or Extremes of the two contrary painful and pleasurable *Passions*; the one rising at length into a Mania or raving Madnets, and the other sinking into a hypocondriack Melancholy. The principal Seat of the one is the Brain; and of the other, the Viscers of the Abdomen, especially the Spleen and Mesentery. The one inflames and over-heats, the other chills and freezes the Imagination: The one hangs over the Understanding like a glaring, dazzling Light, which animates and leads us on with Zeal and Vehemence; the other like a thick, black, and dismal Cloud, that sinks all the Powers of Nature into the Depths of Misery and Dispair. See MANIA and MELANCHOLY.

PASSIONS in Poetry, the *passionate* Sentiments, Gestures, Actions, &c. which the Poet gives his Persons.

The *Passions* are, as it were, the Life and Spirit of the longer Poems. Their Necessity in Tragedy and Comedy is obvious; nor can the *Epopæa* subsist without 'em. See TRAGEDY, COMEDY, &c.

'Tis not enough, the Epic Narration be surprizing; it must likewise be moving, and passionate; hurrying away the Reader's Mind, and filling it with Anxiety, Joy, Terror, or some other violent *Passion*, and this for Subjects it knows are feign'd. See NARRATION.

Tho' *Passions* be always necessary, yet, all are not equally necessary, or suitable to all. Comedy has Joy, and agreeable Surprizes for its part: Tragedy on the contrary, has Terror, and Compassion. The proper *Passion* of the *Epopæa* is Admiration; tho' the *Epopæa*, as a Medium between the two others, takes in both their Kinds of *Passions*; as we see in the Griefs of the fourth Book of the *Aeneid*, and the Games and Divisions of the fifth. Admiration in effect, is consistent with ease, we admire with Joy the Things that surprize us agreeably, and with Terror and Grief those that amaze and afflict us.

Besides the general *Passion*, which distinguishes the Epic from Dramatic Poems; each *Epopæa* has its peculiar *Passion*, which distinguishes it from other Epic Poems. This peculiar

*Passion* still follows the Character of the Hero. Thus Wrath and Terror reign in the *Iliad*, because *Achilles* is wrathful, and *Andromache* *Andromache* the most terrible of Men. The *Aeneid* is all in the tender, softer *Passions*; such being the Character of *Eneas*. The Prudence of *Ulysses*, not allowing these Excesses, we find none of 'em reign in the *Odyssæe*.

As to the conducting of the *Passions*, to make 'em have their Effect, there are two Things required, viz. that the Audience be prepar'd or dispos'd to receive 'em; and that several incompatible *Passions* be not mix'd together.

The Necessity of disposing the Audience, is founded on the natural Necessity of taking up Things where they are, in order to remove 'em elsewhere. The Application of this Maxim is easy; a Man is calm, and at Ease, and you wou'd put him in a *Passion* by a Discourse made on purpose. You must begin, then, in a calm Manner; by this Means you join your self to him; and afterwards, walking together, he wou'd fail to follow you in all the *Passions* to which you lead him insensibly.

If you shew your Anger as first, you'll be as ridiculous, and will have as little Effect, as *Ajax* in the *Metamorphoses*; in whom the ingenious *Ovid* gives a fine Example of this falling. He begins his Harangue in the Height of *Passion*, and with the most violent Figures, before his Judges, in the deepest Tranquillity.

*Sigeis torvo,  
Littora pressexit, clausaque in Littore, vultus,  
Protendensq; naras, Signus probo Jupiter! inquit  
Aut rates castigas, & mecum consertur Ulysses.*

The necessary Dispositions arise from some preceding Discourse; or, at least from some Action, which has already begun to raise the *Passions* 'ere they are mention'd. The Orators themselves, sometimes use this last Means: For tho', ordinarily, they don't raise the *Passions* till the End of their Discourse; yet, when they find their Audience already moved, 'twou'd be ridiculous in 'em, by an unseasonable Tranquillity, to lay 'em again.

Thus, the last time *Cassius* came to the Senate, the Fathers were so shock'd at his Presence, that those near the Place where he sat down, rose up, retired, and left him alone. On this Occasion, *Cicero* had too much Sense to begin his Oration with the usual Tranquillity and Coolness of Exordiums. By this Means he'd have pulled and abated the Indignation of the Senators against *Cassius*; which it was his Business to spirit up, and inflame; and wou'd have eas'd the Parricide of that Contemnation, the Behaviour of the Senators had given him; and which it was his Design to aggravate. Omitting therefore, the first Part of his Oration, he takes his Auditors in the Condition he finds 'em; continues and augments their *Passions*. *Quousque tandem abutere, Catilina, patientia nostra? Quousque nos etiam furor iste tuus eludet? Quousque ad finem sese effrenata insubrit audacia? Nihilne voluerunt praesidium palatii, nihil orbis Vigilia, nihil timor populi, nihil, &c.*

The Poets are full of Instances of this Kind; where the *Passion* is prepar'd or kept up by Actions. *Dido* in *Virgil* begins a Discourse like *Ajax*; *probo Jupiter! ibi hic, ait, &c.* But then the Motions are here well dispos'd; *Dido* is before represented under terrible apprehensions of *Aeneas*'s quitting her, &c.

*Seneca*'s Conduct, indeed, is quite opposite to this Rule. If he has a *Passion* to raise, he is sure first to take from his Audience any Disposition they might have to be affected. If they be in Grief, Fear, or the Expectation of something horrible, &c. He'll begin with some fine Description of the Place, &c. In the *Tragedies, Hebe* and *Andromache*, being prepar'd to hear the violent and barbarous Death of their Son *Phygon*, whom the *Greeks* precipitated from the Top of a Tower; what boot'd it to tell them, that of the Spectators who crowded from all Quarters to see the Execution, some placed themselves on Stones, which the Ruins of the Wall's occasion'd to Project; that others shook their Legs, as being placed too high, &c. *Alta roperi, cuius i Coenae crella summas turba libavit pedes, &c.*

The second Thing required in the Management of the *Passions*, is, that they be found pure and disengag'd from any Thing that might prevent their Effect.

*Polymythy*, therefore, i. e. a Multiplicity of Fables, Actions, or Histories, must be avoided: All Adventures much broken, and hard to be retain'd; and all Intrigues intricate and difficult to conceive, are at once excluded. These embarrass the Mind, and require so much Attention, that there is none to spare for the *Passions*. The Soul must be free and disengag'd to feel; and we divert our selves even from our real Sorrows, by an Application to other Things.

But of all others, the greatest Enemies to the *Passions*, are the *Passions* them selves: They oppose and destroy one another, and if two opposite ones *E. gr.* Joy and Sorrow meet in the same Object; they will neither of 'em stand it. 'Tis the Nature of these Habitudes that imposes this Law: The Blood and Spirits cannot move gently and equally, as in a State of Tranquillity, and at the same Time be stopp'd, and

suspended with some Violence, occasioned by Admiration. Nor can they be in either of those Situations, while Fear calls 'em from the outer Parts of the Body, to assemble 'em about the Heart; or Rage sends 'em into the Muscles, and makes 'em act there with Violences very opposite to the Operations of Fear.

The Causes and Effects, therefore, of the Passions in the Soul, are to be studied, to be able to manage 'em with all their Force. *Virgil* furnishes two Examples, of what we have said about the Simplicity and Disengagement of each Passion, in the Deaths of *Camilla* and *Polixena*. See the *ÆNEID*.

**PASSION** in Heraldry, or the *Crest of Passion*, a Cross thus called, because, in Shape of that wherein our Saviour suffer'd, i. e. not cross'd in the Middle, but near the Top; with Arms short in proportion to the Length of the Shaft. See *CROSS*.

**PASSION-WEEK**, the Week next preceding *Easter*. See *EASTER*.

It is thus call'd from our Saviour's *Passion*, i. e. his Crucifixion, which happen'd on the *Friday* of this Week, now call'd *Good-Friday*.

*Illic* **PASSION**. See *ILIC* *Passion*.

**PASSIVE**, a term of Relation, implying a Thing to suffer, or undergo the Action of some other; which in respect hereof is denominated *Active*. See *ACTIVE*.

In all Generations, the School Philosophers conceive an active Power and a *Passive*. See *POWER*.

In civil Life, we say such a Person in such an Election, has both an active Voice, and a *Passive*, i. e. he is both capable of Electing and being Elect'd. See *VOICE*.

Some also use the term *Passive Debt*, for a Debt which we owe another; in contradistinction to an Active Debt, which is owing us. See *DEBT*.

The Chymists divide their Principles or Elements into Active and *Passive*. The *Passive* are such as have no active Force inherent in themselves; and only act by being join'd with some of the other. See *PRINCIPLE*.

Such are Phlegm, and Earthy some say also, Salt, and, in effect, all but Sulphur, or Fire, which they will have the only principle of Action and Motion in the Universe. See *EARTH*, *SULPHUR*, *FIRE*, &c.

*Passive Prayer*, in the Language of the Mystick Divines, is a total Suspension or Ligature of the intellectual Faculties, in virtue whereof the Soul remains, of it self and its own Power, impotent as to the producing of any Effects. The *Passive State*, says *Plotinus*, is only *Passive* in the same Sense as Contemplation is so, i. e. it does not exclude perceivable, disinterested Acts, but only unquiet ones, or such as tend to our own Interest. In the *Passive State*, the Soul has not properly any Activity, any Situation of its own: 'Tis a mere infinite flexibility of the Soul, which the feeblest impulse of Grace gives Motion to. *Id.*

**PASSIVE** in Grammar, is a second Voice, or Inflection of Verbs; which of Active become *Passive*, by admitting, in the modern Languages, new auxiliary Verbs; in the Ancient, by new Terminations. See *VERB*, *VOICE*, &c.

The *English Verbs* become *Passive*, by taking the auxiliary Verb *I am*, in lieu of *I have*, whenwith the Active are conjugated: The *French* by *Je suis*, in lieu of *J'ay*; the *Italian*, by *Io so*, for *Io ho*, &c.

The *Latin Verbs* become *Passive*, by changing their Terminations; as *Auget* for *Augetur*, &c. *Anat* for *Anatur*, &c.

The *English Verbs* *Passive* are nothing else, in effect, but the Verb *I am*, in all its Inflections join'd to the Participle *Passive*; as, *I am rais'd*; in *Latin laudor*, in *French Je suis loué*; I have been rais'd; *J'ay été loué, laudatus sum*, &c.

**NEUTER PASSIVE**, is a Verb that has a *Passive* Conjugation, but a Neuter Signification. See *NEUTER*.

Of these, there are a very small Number in *Latin*, more in *French*, fewer in *English*: As, I am enter'd, *ingressus sum, je suis entré*, &c. But Grammarians are frequently mistaken here; taking Verbs for Neuters *Passives*, which in effect are Actives, and only differ in that they act on themselves, by adding the Pronoun Personal; and which on that footing shou'd rather be Neuters-Active, than Neuters-*Passives*.

Some admit of no genuine *Passive* Verbs in the modern Tongues; such we mean as answer to the Notion of *Passives* in the Ancient, where all is done by different Terminations. On which footing, there shou'd be none but Actives *Passive* and Neuters *Passive*.

**PASSOVER**, a solemn Feast, celebrated among the *Jews*, on the fourteenth Day of the Moon next after the vernal Equinox. See *FEAST*.

This Feast was call'd by the Ancient *Latins* and *Greeks* *Passiva*; not from *passio* suffer, as *Lactantius* weakly imagines; but from the *Hebrew* פֶּסַח *Passah*, *Passage*, Leap; the Design of the Feast being to commemorate the destroying Angels *passing* over the Houses of the *Israelites*, when he enter'd in, and destroy'd the first born in those of the *Egyptians*.

Yet, many weakly imagine that it was in Memory of their *passing* the Red Sea, that this *Passover* was instituted; tho' 'tis certain the Feast was held, and had its Name before the

*Israelites* took a Step of their Way out of *Egypt*; and consequently several Days before their passing the Red Sea.

Beside the *Passover* celebrated on the fourteenth of the first Month; there was a second *Passover* held on the fourteenth of the second Month after the Equinox, instituted by God in favour of Travellers and Sick Persons who cou'd not attend at the first, nor be at *Jerusalem* on the Day.

The *Greeks*, and even some of the Catholic Doctors, from the XVIII Chapter of *St. John*, take occasion to conclude that *Jesus* anticipated the Day mark'd for the *Passover* in the Law; but the Authority of three Evangelists seems to crinice the contrary.

*F. Lamy*, is of Opinion, he did not attend at the *Passover* the last Year of his Life; which Sentiment has drawn upon him Abundance of Opposers.

*F. Harcourt* maintains, that the *Galileans* celebrated the *Passover* on one Day, and the *Jews* on another. See *SAMARI-TAN*.

**PAST-BOARD**, a kind of thick Paper, form'd of several Sheets pasted together. See *PAPER*.

There is also a coarse kind of *Past-board*, made of old Paper and old *Past-board*, beaten in a Mortar with Water, and reduced into a kind of Pulp; to which is added a little Paste, to give the Mass a Consistence; after which it is form'd in a Mould; and to finish it, laid in a Press, to squeeze out all the Water, and reduce it to its proper Thickness.

Each Kind is distinguish'd by Numero's, which express its Fineness and Value: The finest is cover'd on both Sides with a very white smooth Paper, others only on one Side; and others on both Sides with common Paper.

The chief Use of *Past-board* is in the Binding of Books, Letter-Cases, Hat-Cases, Gloves, &c. See *BOOK-BINDING*.

**PASTE**, in Cookery, a soft Composition of Flower, wrought up with proper Fluids, as Water, Milk, or the like, to serve as a Case or Coffin, therein to bake Meats, Fruits, &c.

*Paste*, is the Basis, or Foundation of Pyes, Tartes, Pasties, Pasties, and other Works of Pastry. See *PASTRY*, &c.

**PASTE**, is also us'd in Confectionary, &c. for a Preparation of some Fruit, made by beating the Pulp thereof, with some Fluid or other admixture, into a soft pappy Consistence, spreading it into a Dish, and drying it with Sugar, till it become as pyable as an ordinary Paste. See *CONFECT*.

It is us'd occasionally for making the Crufts, and Bottoms of Pyes, &c.

Thus they make Almond Pastes, Apple *Pastes*, Apricock *Pastes*, Cherry, Curran, Lemon, Plum, Peach, Pear *Pastes*.

**PASTE**, is also us'd for a Preparation of Wheaten Flower, boil'd up, and incorporated with Water; us'd by various Artificers, as Upholders, Saddlers, Bookbinders, &c. instead of Glue or Size, to stiffen or cement their Cloths, Leathers, Papers, &c.

**PASTER** of a Horse, the Distance between the Joint next the Foot, and the Coronet of the Hoof.

This Part should be short, especially in middle sized Horses; because long *Pasters* are weak, and cannot so well endure Travel.

The *Pastern*-Joint, after travelling, is apt to be crown'd, i. e. to have a Swelling round it beneath the Skin, in form of a Circle; an Inch broad.

**PASTIL**, among Painters, &c. a Sort of Paste, made of several Colours, ground up with Gum-Water, either together or separately; in order to make Crayons to paint with on Paper or Parchment. See *CRAYON*.

**PASTIE**, is also us'd for a dry Composition, yielding a fragrant Smell when burnt in a perfuming Pan, to clear and sweet the Air of a Chamber.

It is composed of odorous Resins, mixt with Aromatic Woods, or Drugs pulveriz'd, and incorporated with Mucriages of Gum Tragacanth.

Some call 'em *Officers of Cyprus*.

There are also *Pastils* for the Mouth, eaten to procure a sweet Breath.

There have several Names, and consist of several Preparations, as *Muscadines*, *Conserves*, &c.

**PASTIE**, is sometimes also us'd for the Plant otherwise call'd Wood or Glass-wort. See *WOOD*.

**PASTIE** in Confectionary, is a Preparation of Sugar with Lemon-Water, &c. boil'd up with Gum-Water, strain'd, beat up, and by the Addition of more dry Sugar, work'd into a pyable Paste, and thus form'd into round or oblong Figures, and dry'd in the Stove.

**PASTINATION**, a Term somerimes us'd in Agriculture, for the Act of opening, loosening, and preparing the Earth for planting. See *EARTH* and *PLANTING*.

**PASTORAL**, something that relates to Shepherds, *Pastorals*. The Poets represent the *pastoral* Life, and *pastoral* Manners in the most agreeable Light. We must not imagine 'em to agreeable in Nature as in their Descriptions.

**PASTORAL**, in Poetry, a poetical Piece, the Subject whereof is something in the *Pastoral*, at least the rural Life, and the Persons Shepherds, at least Rusticks. See *POEM*.

Most Authors, except the *English*, esteem *Pastoral* of the Dramatic Kind; and define it a Dramatic Piece, the Persons whereof are clad like Nymphs and Shepherds, and act their own Amours.

The Scene is always in the Fields or the Woods; whence *Tasso* calls *Pastoral*, *Fabla Bucagere*.

Such are the *Pastor Fido* of *Guarini*, the *Aminta* of *Tasso*, the *Sylvia* of *Moliere* the French Poet; the *Comus* of *Milton*, &c.

*Tasso* assumes to himself the Honour of having invented *Pastorals*; but the first Idea of this Kind of *Drama* seems to be *Boccaccio's* *Duc*, who made the first Attempt of this Kind in 1552. But *Tasso's Aminta*, which did not appear till the Year 1573, effacing what had been done by *Boccaccio*; the first Author was forgot, and *Tasso* led the Inventor.

'Tis certain this Kind of *Pastoral* Fablc, compos'd according to the Rules of the Stage, was unknown among the Ancients. The *Greeks* and *Latins* have indeed introduc'd Shepherds in their Eclogues; but these Eclogues had nothing Theatrical in 'em; nor were the Shepherds ever brought upon the Stage. See *ECLOGUE*.

This Kind of Dramatic *Pastoral* is still but little known among us; nor have we any Thing considerable under the Title of *Pastorals*, but Country-pieces after the manner of the Eclogues or Idyllions of the Ancients. See *IDYLLION*.

Every *Pastoral*, however, even in this last View, shou'd have a little Plot, or Fable, which may deserve the Title of a *Pastoral* Scene. It must be Simple, and but one; yet, not so as to refuse all Digressions, provided they be but small. This Rule of the Plot is every where observ'd by *Virgil*.

PASTORAL-STAFF. See *CROZIER*.

PASTRY, the Branch of Cookery, which teaches the Preparation of *Paste* with several favoury Ingredients of Flesh, Fruits, Spices, Sugar, Butter, &c. See *PASTE*.

PASTRY, is chiefly convertant in the making of Pies, Pasties, Pasties, Cakes, Biscuits, &c. See *PYE*, *PASTY*.

PASTURA, in our Law-Books, is any Place where Cattle are occasionally fed; by which it differs from *Pastus*, which is a Place set wholly a-part for feeding, and never plough'd.

*Pastura*, says *Limbede*, *Omne Genus pascentis significat, five in prati, five in insula, five in Agris, five in Campis: sed Pastura est locus principaliter deputatus providens pascentis ut puta in Montibus, Moris, Marjicis & planis non cultis nec arvis.*

PASTURE Ground is that not cultivated; that is, neither Meadow, nor Arable; but reserved for the feeding of Cattle.

The best Domains are those consisting in *Pasture*, they need no Tilling. *Holland* is a Contry abounding much in *Pasture*.

PASTUS, the Procuration, or Provision which the King's, or Lords Tenants, are bound to make for 'em at certain Days, or Seasons, or as often as they make a Progress to their Lands.

This, in many Places, has been converted into a pecuniary Fee; as in the Procurations of the Clergy. See *PROCURATION*.

PASTY, in Cookery, a Work of Pastry; being a Preparation of some proper Meat, as Beef, Venison, Lamb, or the like, well beaten up to a Pulp, and highly season'd; put up in a Paste, and then baked in an Oven.

They also make *Veal-pasties*, *Umbles-pasties*, *Kidney-pasties*, *Marrow-pasties*, &c.

PATAVINITY, PATIVINITAS, among Critics and Philosophers, a Fault objected to *Titus Livy*, which he derived from his Contry *Padua*, *Patavinum*.

*Agrippa Pollio*, as we are inform'd by *Quintillian*, tax'd *Livy* of *Pativinity*: What this *Pativinity* consisted in, has given the Critics a World of Pain.

*Paulo Beni*, Professor of Eloquence in the University of *Padua*, is of Opinion, it must be understood of the Inclination of that Historian to *Pompey's* Party: But wou'd *Pollio* have reproach'd him with an Inclination from which he himself was not exempt?

*Pignorus* will have the *Pativinity* to consist in *Livy's* retaining the vicious Orthography of his Country-men of *Padua*, who wrote *five* and *quasi*, for *five* and *quasi*, which he proves from several ancient Inscriptions.

*Et. Reffin*, takes the *Pativinity* to be only a faulty Pronunciation, which shock'd the delicate Ears of the People in the Court of *Augustus*; and favour'd a little of that Contry.

*Murbohus* believes it to be a certain Turn of Expression, and some Phrases peculiar to the *Paduæ*.

All we know for certain, is, that it was a Fault in the Language of *Livy*, not in the Sentiments or Manners. In all probability, 'tis one of the Delicacies that are lost in a dead Language. *M. Balzac* cou'd not ridicule his *Dostard* better than by supposing he valued himself on having discover'd the *Pativinity* objected by *Pollio* to *Livy*.

*Dan. Georg. Morbohus*, has an express Treatise, *De patavinitate Liviana*, Printed at *Kiel* in 1685; where he explains, very learnedly, the Urbanity and Peregriinity of the *Latin Tongue*:

PATE in Fortification, a kind of Platform, like what they call an Horse-shoe; not always regular, but generally Oval, encompassed only with a Parapet, and having nothing to flank it. See *HORSE-SHOE*.

It is usually erected in Marshy Grounds, to cover a Gate of a Town.

PATEE, or PATTEE, a Term in Heraldry for a Cross, small in the Centre, and widening towards the Extremities as in the Figure adjoining. The Field is Sable, a Cross *Patee* Argent, by the Name of Cross.

This Form of a Cross is called also *Formet*. See *FORMET*.

PATELLA, in Anatomy, a Bone which covers the Fore-part of the Joynt of the Knee; call'd also *Mola*, *Rosula*, and popularly, the *Knee-Pan*. See *MOLA*.

The *Patella* is roundish on the Out-side, somewhat of the Figure of a Shield, cover'd with a smooth Cartilage, and about two Inches in Diameter; over it slide the Tendons of the Muscles which extend the Leg, as on a Trochlea, or Pulley.

But its more immediate Use is to hinder the Leg from being bent forwards in Extension; which wou'd of necessity be the Case in this Articulation, did not this Bone, like a Bolster, check its rolling forwards; as the Olecranon does the fwing of the Cubitus backwards. See *OLECRANUM*.

In an erect Posture, when one Foot is set forwards, the whole Weight of the Body bears on the *Patella*; which in this Situation, hinders the Knee from bending backwards, and straining the Muscles that inflect it behind.

Hence it was that *Galenus* Wrestler, who had dislocated his *Patella*, found so much Pain in going down Hill.

PATENA, in the *Roman* Church, the Cover or Lid of the Chalice, made of the same Metal therewith, serving to hold the Particles of the Host; and given the People to kiss when they make an Offering. It has its Name *Patena*, a *Patendo*; and is a general Name in *Catholica* for any broad flat Vessel.

PATENT, or Letters Patent, in Law, the King's Letters, seal'd with the Great-Seal; serving to convey the Title or Property of some Grant, Favour, Privilege of a new Establishment, or the like. See *LETTERS PATENTS*.

They have their Name in opposition to *Letters de Cachet*; because deliver'd open, *ut patent omnibus*; whereas the other are seal'd. It is to be noted, that *Patents* differ from *Writs*; and that a *Cotoner* is made by *Writ*, not by *Patent*. See *Writ*.

PATENTE, is he, to whom the King grants his Letters Patent.

PATERA, among Antiquaries a *Goblet*, or Vessel, used by the *Romans* in their Sacrifices; wherein they offer'd their consecrated Meats to the Gods; and wherewith they made Libations. See *SACRIFICE* and *LIBATION*.

On Medals, the *Patera* is seen in the Hands of several Deities, and frequently in the Hands of Princes, to mark the Sacredotal Authority, join'd with the Imperial, &c.

Hence, *F. Jonber* observes, that beside the *Patera*, there is frequently an Altar upon which the *Patera* seems to be a pouring.

The *Patera* was of Gold, Silver, Marble, Brass, Glass, or Earth; and they us'd to enclose it in Urns with the Ashes of the Deceased, after it had serv'd for the Libations of Wine and other Liquors at the Funeral.

The *Patera* is an Ornament in Architecture, frequently seen in the *Doric* *Freze*; and the Tympan of Arches.

The Word is form'd from the *Latin* *Pater*, of *Pater* I am open; *quod patet*, because it has a great Aperture; in contradiction to *Bottles*, &c. which have only narrow Necks, or whose Aperture is less than the Body of the Vessel.

PATER-NOSTER, the *Lord's Prayer*; a Form so call'd from the two Initial Words thereof.

PATER-NOSTER is also us'd for a Chapelet or string of Beads; because, serving to Number the Rehearsals of that Prayer. See *CHAPLET*.

PATER-NOSTERS, in Architecture, are certain Ornaments placed underneath Ovols, cut in form of Beads, round, or Oval. See *BEAD*.

PATER-NOSTREE in Heraldry. A *Cross Pater-nostree*, is a Cross, made up of Beads, as in the Figure adjoining. See *CROSS*.

Note, This Cross is to be so shadowed in drawing, as that the Sphericity of the Beads may appear to distinguish 'em from *Besants*, &c.

PATERNITY, the Quality of a Father. See *FATHER*. There is an immediate Relation between the Paternity of the Father, and the Filiation of the Son, in the Mystery of the Trinity, See *TRINITY*.

The Divines have a long Time disputed, whether *Paterni-ty* be a real and specific Character, which absolutely distinguishes the Father from the Son; or whether it be a mere Relation of Oeconomy and Subordination. On the one Hand, if *serenity* be supposed incommunicable to the Son, and if it constitute a real and positive Distinction; this amounts to *Trinitarism*. See *TRINITARIUM*.

On the other Hand, if *Paternity* be only regarded as a Mode, or a term of Order and Oeconomy; there is no essential and intrinsic Difference between the Father and Son; which is nothing less than *Subellianism*. See *SABELLIAN*.

*PATH of the Vertex*, a Term frequently us'd by Mr. *Fleming*, signifying a Circle, described by any Point of the Earth's Surface, as the Earth turns round its Axis.

This Point is consider'd as Vertical to the Earth's Centre; and is the same with what is call'd the *Vertex* or *Zenith* in the *Ptolemaic Projection*.

The Semi-Diameter of this Path of the *Vertex*, is always equal to the Complement of the Latitude of the Point or Place that describes it; that is, to that Place's Distance from the Pole of the World.

*PATHETIC*, something that relates to the *Passions*; and particularly, that is proper to awake, or excite them. See *PASSION*.

The *Pathetic*, and the *Sublime* have a near Affinity. See *SUBLIME*. See also *STYLE*.

The Word comes from the Greek *πάθος*, *Passion*.

*PATHEIC*, in Music, something very moving, expressive, passionate, capable of exciting Pity, Compassion, Anger, or the like *Passion*.

In this Sense, we say a *Pathetic Fugue*, *Pathetic Song*, &c. The Chromatic Genus, with its major and minor Semi-tones, either ascending or descending is very proper for the *Pathetic*; as is also an artful Management of Discords; Variety of Motions, now brisk, now languishing, now swift, now slow.

*Nicentius*, tells us of a Musician at *Genoa*, who excell'd in the *Pathetic*; to that Degree, that he was able to play any of his Auditors into *Distraction*; he adds, that the great Means he made Use of, was the Variety of Motions, &c.

*PATHETIC*, in Anatomy, the fourth of the ten pair of Nerves, which arise out of the *Medulla Oblongata*. See *NERVE*.

The *Pathetici* are the smallest Nerves of the Brain; they have their Origin in the lower part of the *Medulla Oblongata*, behind the *Nates* and *Telles*.

They have their Name *Pathetici*, from their serving to move the Eyes in the various *Passions*; and are by some call'd *Amaotrii*, from the great Use made thereof by Lovers, in *Ogling*, &c.

*PATHOGNOMONIC*, in Medicine, an Essential Sign or Characteristic; or a Symptom peculiar to, and inseparable from some Disease; and every Stage thereof. See *SYMPTOM*.

Thus *Blanchers*, and after him *Harris*, &c. But the Truth is, there is nothing in all Medicine that Answers to the Idea of a *Pathognomonic*; Disease and Symptoms are too complicated. See *DIAGNOSTIC*.

*PATHOLOGY*, that part of Medicine which considers *Diseases*; both those of the Body, and the Mind; their Natures, Causes, Symptoms, &c. See *DISEASE*.

The Word is form'd from the Greek *πάθος* *Passion*, *Suffering*, and *λογία*, *Discourse*.

*PATHOS*, a Greek Word, *πάθος*, signifying *Passion*; us'd in speaking of the Movements, which the Orator excites in his Audience.

There is a World of *Pathos* in his Discourse.

We sometimes also Use the Word for Energy or Strefs.

*PATIENT*, among Physicians, a Person under the Direction of a Physician, or Surgeon, to be cured of some Disease.

*PATIENTIÆ Musculus*, in Anatomy. See *LEVATOR SCAPULÆ*.

*PATONCE*, in Heraldry, a *Cross Patonce*, a Cross of the Figure adjoining, He bears Gules, a Cross *Patonce*, Argent, by the Name of *Lairmer*. It comes near to the *Cross Florey*, and only differs in some Circumstances of the Ends. See *FLOREY*.

*PATRES Conscripti*, in Antiquity, a Denomination given the Senators of *Rome*. See *SENATOR*, *PATRICIAN*.

The first hundred Senators appointed by *Romulus*, were call'd simply *Patres*, *Fathers*; another hundred being added by *Romulus* and *Tatius*, upon the Union of the two People; these latter were call'd *Patres minorum Gentium*, and the former *Majorum Gentium*.

At length, *Tarquinius Priscus* making up the Number 300, the two latter Classes were call'd *Patres Conscripti*; because, *Adscripti* wrote down to the former.

Those afterwards chosen from among the Knights, were call'd *Patres Allecti*.

*PATRIARCH*, one of these first Fathers who liv'd to-

wards the Beginning of the World; and who became famous by their long Lines of Descendants.

*Abraham*, *Isaac*, *Jacob*, and his twelve Sons are the *Patriarchs* of the Old Testament: The Number of Children is the *Benediction*, and the Character of a *Patriarch*.

*PATRIARCH*, is also us'd in Christendom for the Bishops in Possession of some of the grand Sees, independent of the papal Jurisdiction. See *BISHOP*.

The *Patriarchate* has been always esteem'd the supreme Dignity in the Church: So that to rise by Degrees, the Bishop had only under him the Territory of the City, whereof he was Bishop; the *Metropolitan* commanded a Province, and had for Suffragans the Bishops of his Province; the *Primate* was the Chief of a Diocese, and had several *Metropolitans* under him; and the *Patriarch* had under him several Dioceses, and *Primates* 'emselves were under him. See *METROPOLITAN*.

But this Order was not always observ'd. See *PRIMATE*. *Usher*, *Pagi*, *de Marca* and *Morin*, attribute the Establishment of the Grand *Patriarchate* to three Apostles. They suppose that the Apostles, according to the Description of the World then given by Geographers, pitch'd on the three principal Cities in the three Parts of the known World, viz. *Rome* in Europe; *Antioch* in Asia; and *Alexandria* in Africa; and thus form'd a Trinity of *Patriarchates*.

Others, far from attributing this Institution to St. *Peter*, maintain that the Name *Patriarch* was unknown at the Time of the Council of *Nice*; and that for a long Time afterwards, *Patriarchs* and *Primates* were confounded together: as being all equally Chiefs of Dioceses; and equally superior to *Metropolitans*, who were only Chiefs of Provinces.

Hence it is that *Socrates* gave the Title *Patriarch* to all the Chiefs of Dioceses, and reckons ten of 'em.

In Effect, it does not appear that the Dignity of *Patriarch* was attach'd, and affect'd to the five grand Sees of *Rome*, *Constantinople*, *Alexandria*, *Antioch*, and *Jerusalem*, till after the Council of *Calcedon* in 451. For when the Council of *Nice* regulated the Limits and Prerogatives of the three *Patriarchs* of *Rome*, *Antioch*, and *Alexandria*, it did not give 'em the Title of *Patriarchs*, tho' it allow'd 'em the Pre-eminence and Privileges thereof. Thus, when the Council of *Constantinople* adjudg'd the second Place to the Bishop of *Constantinople*, who, till then, was only a Suffragan of *Heraclius*; it said nothing of his *Patriarchate*.

Nor is the Term *Patriarch* found in the Decree of the Council of *Calcedon* whereby the fifth Place is assign'd to the Bishop of *Jerusalem*; nor did these five *Patriarchs* govern all the Churches.

There were still many Independent Chiefs of Dioceses, who, far from owning the Jurisdiction of the grand *Patriarchs*, call'd 'emselves *Patriarchs*; such as that of *Aquiles*; nor was *Carthage* ever subject to the *Patriarch* of *Alexandria*.

The Authority of the *Patriarchs* grew by insensible Degrees, till at length all Affairs of Moment, within the Compass of their *Patriarchate*, came before them; either at first hand, or by Appeal from the *Metropolitans*.

They consecrated Bishops, appointed the Time of *Easter*, &c. Nothing in short was done without consulting 'em; and their Decrees were executed with the same Respect as those of Princes.

The *Latin Church* was unacquainted with *Patriarchs* till the VI. Century; and the Churches of *Gaul*, *Britain*, &c. were never subject to the Authority of the *Patriarch* of *Rome*, whose Authority only extended to the suburbicary Provinces.

There was no Primacy, no Exarch, or *Patriarch* own'd here; but the Bishops, with the *Metropolitans*, governed the Church in Common.

Indeed, after the name *Patriarch* became popular in the West; it was attributed to the Bishops of *Bourges* and *Lions*; but it was only in the first signification: viz. as Chiefs of Dioceses.

*De Gongo* adds, that there have been some Abbots, who have bore the Title of *Patriarchs*. See *ABBOT*.

*PATRIARCH*, is also us'd for the chiefs of several Churches in the East, who live out of Communion with the *Roman Church*: as the *Patriarch* of the *Armenians*, residing in a Monastery of St. *Gregory*; the *Patriarch* of the *Nestorians*, call'd *Annas*, the *Patriarch* of the *Copti*, the *Joachim*, &c. See *ARMENIANS*, *COPTI*, *JACOBITES*, &c.

*PATRIARCHAL*, in Heraldry, A *Cross Patriarchal* is so call'd, because the Shaft is twice cross'd; the lower Arms being longer, and the Upper shorter.

Such a Cross is said to belong to *Patriarchs*, as the Triple Cross does to the Pope.

*PATRICIAN*, in ancient *Rome*, a Title given to the Descendants of the Hundred, or according to others, of the two Hundred first Senators, chosen by *Romulus*, and by him call'd *Patres*, *Fathers*. See *SENATOR*, *PATRES*, &c.

*Patricians*, therefore, were then the ancient Nobility; in Opposition to the *Plæbeians*. See *PLÆBIAN*.

But the Cognizance and Character of these ancient Families being almost lost and extinguish'd, by a long Course of Years, and frequent changes in the Empire; a new Kind of *Patricians*

*Patricians* were set on Foot; who had no pretensions from Birth; but their Title depended wholly on the Emperor's Favour.

This new *Patriciate*, *Zoninus* tells us, was erected by *Constantine*; who attributed the Quality to his Councillors; calling 'em *Patrici*, not because descended from the ancient Fathers of the Senate, but because they were the Fathers of the Republic, or of the Prince.

This Dignity in time, became the highest of the Empire. *Justinian* calls it *Suavium dignitatem*, in effect, the *Patricians* had the Precedence of *Consularis*, and took Place before 'em in the Senate.

This Dignity was only conferr'd on those who had gone thro' the first Offices of the Empire; or had been *Consuls*.

We frequently read of *Patricians* among the *English Saxons*.

Pope *Adrian* made *Charlemaign* take the Title of *Patrician* ere he took the Quality of Emperor; other Popes have given the Title to other Kings and Princes, by reason of his Eminence.

**PATRICIANS, or PATERNIANS** ancient Sectaries, who disturbed the Church in the Beginning of the third Century.

They had their Name from their Founder *Patricius*, Preceptor of a Marcionite, call'd *Symonachus*.

His distinguishing Tenet, was that the Substance of the Flesh is not the Work of God, but that of the Devil; on which Account, his Adherents bore an implacable Hatred to their own Flesh; which sometimes carried 'em so far as to kill 'em selves.

They were also call'd *Tasiani*. See **TATTIAN**.

**PATRIMONY**, a Right, or Estate, which a Person inherits from his Ancestors.

The Name was also antiently given to the Effects, or Revenues wherewith a Church or religious House was endowed.

In this Sense, we say the *Patrimony* of the Church of *Rimini*, of *Milan*, &c.

The Duchies of *Urbino* and *Spoletis*, are call'd *St. Peter's Patrimony*. The Church of *Rome* had *Patrimones* in several Countries, in *France*, *Africa*, the *Alps*, *Sicily*, &c.

To make what belong'd to the Churches the more respect'd, they usually gave their *Patrimones* the Name of the Saints they held in the highest Veneration.

Thus the Church of *Reverna*, call'd its Inheritance the *Patrimony* of *St. Apollinaris*; that of *Milan* the *Patrimony* of *St. Ambrose*, &c. as is observ'd by *Fra. Peale*.

**PATRIASSIANS**, a Name given to the *Sabellians*; because they did not believe 'twas the Son, but the Father himself that was Crucified. See **SABELLIAN**.

The Council of *Antioch* held by the *Eusebians* in 345, says, that those whom the *Romans* call *Patriassians*, the *Eastern* People call'd *Sabellians*; it adds the Reason of the Name *Patriassians* in their Condemnation; *viz.* supposing that by the Incarnation of the Father, they render'd him Comprehensible and *Possible*.

**PATROLL**, or **PATROUL**, antiently *Patrol*, in War, a Round, or March made by the Guards, or Watch in the Night-time; to observe what passes in the Streets, and to secure the Peace and Tranquillity of the City or Camp.

The *Patroll* consists of a Body of five or six Men detach'd from a *Corps de Guard*, and commanded by a Sergeant.

**PATRON**, a Term us'd in various Acceptations, tho' all reducible to the Relation of a Protector and Guardian.

Particularly, in the Church of *Rome*, a Saint, whose Name a Person bears, or under whose Protection he is put, and whom he takes particular Care to invoke; or a Saint in whose Name a Church or Order is founded; or a Person who first establish'd it, and who is chosen Protector, are call'd *Patrons* thereof.

*St. Peter* and *St. Paul* are the *Patrons* of the Church of *St. Genevieve*, *St. Denis* the Patron of the City *Paris*, *St. George* of *England*, *St. Benedict* the Patron of the *Benedictines*, *St. Michael* of the *Armours*, *St. Ignatius* of the *Jesuits*, &c.

**PATRON**, **PATRONUS**, among the *Romans*, was us'd for two different Persons.

They call'd *Patron* the Master, who had freed his Slave. And hence, as the Right, and Relation of Master expir'd, that of *Patron* commenc'd.

For the *Romans*, in giving their Slaves their Freedom, did not despoil 'em selves of all Rights and Privileges in 'em: The Law still subjected the freed Men to considerable Services and Devoirs to their Patrons, the Neglect whereof was severely punish'd. See **SLAVE**.

The principal Right which *Patrons* had, was that of being the legal Heirs of their freed Men, if they died without law ful Issue born after their Emancipation and Intestate.

By the *Papian* Law it was further provided, that if the Estate of the freed Men were 10000 *Sesterces*, and he had three Children, the *Patron* should have a Child's Portion. See **FREED-MAN**, **LIBERTUS**, **ENFRANCHISEMENT**, &c.

**PATRON**, was also a Name which the People of *Rome* gave to the Person, under whose Protection they put themselves.

The common People usually chose some Person of Eminence and Authority to whom they paid all Kinds of Honour and Respect, denominated 'em selves his *Clients*: And the *Patron* on his Side owed them his Credit and Protection.

By this reciprocal Relation was the *Patron* bound to his Client, and the Client to his *Patron*. See **CLIENT**.

**PATRON**, in Navigation, a Name given in the *Mediterranean*, to the Person who commands the Vessel and Seamen; sometimes to the Person who steers it; the former in other Places call'd *Master*, the second *Pilot*. See **MASTER** and **PILOT**.

**PATRON**, in the Canon and Common Law, a Person who founds, or endows a Church or Benefice, and reserves to himself the Right of Patronage. See **PATRONAGE**.

The King is *Patron Paramount* of all Ecclesiastical Benefices in *England*. See **KING**, **PARAMOUNT**, &c.

**PATRONAGE**, the Right belonging to the Founder of a Church or Benefice. This Right consists in having the Nomination or Presentation to the Benefice by him founded or endow'd; in having the honourable Rights of the Church, in being enter'd in the Chancel, &c. See **BENEFICE**.

Of *Patronages*, some are *Lay*, others *Ecclesiastical*.

*Lay-patronage* is a Right attach'd to the Person, either as Founder, or as Heir of the Founder; or as Possessor of a Fee to which the *Patronage* is annex'd.

*Ecclesiastical Patronage* is that a Person is entitled to by Virtue of some Benefice which he holds.

If an Ecclesiastical have a Right of *Patronage* on his own Bottom, independent of his Ecclesiastical Capacity; this is still *Lay-Patronage*.

*Lay-Patronage* is either *real* or *personal*: *Real* is that attach'd to the Gible, or to a certain Inheritance.

*Personal* is that belonging immediately to the Founder of the Church, and transmissible to his Children and Family, without being annex'd to any Fee.

*Personal Patronage* cannot be alienated or sold; *Real* may, together with the Gible to which it is annex'd. There mu't ever be some Body or Matter to fix it to, in order to its being transfer'd to another.

The Origin of the Right of *Patronage*, we find in the 10th Canon of the Council of *Orange*; where it is express'd that a Founder may present to the Diocesan the Clerks he thinks proper for his Church. By a Law of *Justinian* it is ordain'd, that the Founders of Churches may not put Clerks in 'em on their own Authority; but only present them to the Bishop.

Some Canonists look on the Right of *Patronage*, as a Kind of Ecclesiastical Servitude. See **SERVITUDE**.

The Right of *Patronage* sleeps, but is not lost; while a Person is out of the Communion of the Church.

*Arms of Patronage*, in Heraldry, are those, a Top whereof are some Marks of Subjection and Dependence: Thus the City of *Paris* bears three *Flowers-de-lis* in chief, to shew her Subjection to the King.

The Cardinals on the Top of their Arms bear those of the Pope, who gave 'em the Hat, to shew that they are his Creatures.

**PATIES**, in Heraldry, the Paws of a Beast. See **PAW**.

**PAVAGE**, in our old Law-Books, Money pay'd towards the paving of Streets or High-ways. See **PAVEMENT**.

**PATRONOMIC**, a Term which Grammmarians use; for those Names, which the Greeks gave to the Race, or Lineage; and which were form'd from him who was Chief, or Founder thereof. See **NAME**.

Thus the Descendants of *Aacus*, were call'd *Aacides*; and those of *Hercules*, *Heraclides*.

These *Patronymic* Names the *Romans* call'd *Gemilitia*, which amounts to our Surnames. See **SUR-NAME**.

Thus, those of the present reigning Family in *France*, are call'd the *Bourbons*; those of the late in *England*, the *Stewarts*, &c. The Word is form'd from the Greek *patris* Father, and *opus*, Name.

**PAVAN**, or **PAVANE**, a Grave Dance, derived from the *Spartans*; wherein the Dancers make a kind of Wheel, or Tail before each other, like that of a Peacock, whence the Name. See **DANCE**.

The *Pavane* was antiently in great repute; and was danced by Gentlemen with Cap and Sword; by those of the Long Robe, with their Gowns; by Princes with their Mantles, and by the Ladies with their Gown-tails trailing on the Ground.

It was call'd the *Grand Ball*; from the Solemnity, wherewith it was perform'd.

To moderate its Gravity, 'twas usual to introduce several Flourishes, Passades, Capers, &c. by way of *Episodes*.

In *Tablature* or Score is given at large by *Thomas Arbeau* in his *Orchesographie*.

**PAVEMENT**, a Lay of Stone, or other Matter, serving to cover and strengthen the Ground of divers Places, for the more commodious walking on, or the Passage of Carriages.

The Word is form'd from the *Latin Pavimentum*, of *Pa-*

wire, to beat down the Earth, in order to make it firm and strong.

In England, the Pavements of the Grand Streets, &c. are usually Flint, or Pebble; Courts, Esquieries, Kitchens, Halls, Churches, &c. Tiles, Bricks, Flagg, or Fire-Stone; sometimes a Kind of Free-Stone, and Rag-Stone. See STONE.

In some Cities, *E. gr. Venice*, the Streets, &c. are paved with Brick; Churches sometimes with Marble, and sometimes with Mosaic-Work, as the Churches of St. Mark at Venice.

In France, the public Roads, Streets, Courts, &c. are paved with Grey, a Kind of Free-Stone.

In Amsterdam, and the chief Cities of Holland, they call their Brick Pavement the *Boulevard Masters Pavement*, to distinguish it from the Stone or Flint Pavement, which usually takes up the Middle of the Street, and which serves for Carriages; the Brick which borders it being destined for the Passage of People on Foot.

Pavements of Free-Stone, Flint, and Flagg, in Streets, &c. are laid dry, *i. e.* are retained in a Bed of Sand; those of Courts, Esquieries, Ground Rooms, &c. are laid in a Mortar of Lime and Sand; or in Lime and Cement, especially if there be Vaults or Cellars underneath.

Some Masters, after laying a Floor dry, especially of Brick, spread a thin Mortar over it; sweeping it backwards and forwards to fill up the Joints.

Thirty two Square Bricks laid flat pave a Yard square; 64 of Edge wise.

The Square Tiles us'd in Paving, call'd Paving-bricks, are of various Sizes, from 6 to 12 Inches Square. See BRICKS.

Pavements of Churches, &c. frequently consist of Stones of several Colours; chiefly black and white, and in several forms, chiefly Square, and Lozenge, artfully disposed.

Indeed, there needs no great variety of Colours to make a surprising variety of Figures and Arrangements. *M. Truchet*, in the Memoirs of the French Academy, has shewn by the Rules of Combination, that two Square Stones divided diagonally into two Colours, may be join'd together Chequerwise 64 different Ways; which appears surprising enough; since two Letters or Figures are only combined two Ways.

The Reason is, that Letters only change their Situation with regard to first and second; the Top and Bottom remaining the same: But in the Arrangement of these Stones, each admits of four several Situations, in each whereof the other Square may be chang'd 16 Times, which gives 64 Combinations.

Indeed, from a further Examination of these 64 Combinations, he found there were only 32 different Figures; each Figure being repeated twice in the same Situation, tho' in a different Combination; so that the two only differ'd from each other by the Transposition of the darker or higher Squares. See COMBINATION.

Pavement of a Terrace, is that which serves for the covering of a Plat-form; whether it be over a Vault, or on a Wooden Floor. See TERRACE.

Those over Vaults are usually Stones squared, and bedded in Lead.

Those on Wood, call'd by the Latins *Pavimenta contrignata*, are either Stones with Beds for Bridges; Tiles for Ceilings in Rooms, or Lays of Mortar, made of Cement and Lime, with Flints or Bricks laid flat, as is still practis'd by the Eastern and Southern People a Top of their Houses. See PLAT-FORM.

All those Pavements which lye open, are call'd by the Latins *Pavimenta substatia*.

Mosaic Pavement. See MOSAIC WORK.

Projection, or Perspective of a PAVEMENT, See PERSPECTIVE.

PAVILLION, in Architecture, from the Italian *Padiglione*, Tent, of the Latin *Populus*; signifies a Tower, or Building usually insulated, and under a single Roof; sometimes Square; and sometimes in form of a Dome.

*Pavillions* are sometimes also projecting Pieces, in the Façade of a Building, marking the Middle thereof; sometimes the *Pavillion* flanks a Cover, in which Case 'tis call'd *Angular Pavillion*. The *Lozere* is flank'd with four *Pavillions*. *Pavillions* are usually higher than the rest of the Building.

There are *Pavillions* built in Gardens; popularly call'd Summer-houses, Pleasure-houses, &c.

There are Gallies or Forts which only consist in a single *Pavillion*.

PAVILLION, in War, a Tent, rais'd on Posts, to lodge under in the Summer-time. See TENT.

PAVILLON, is also us'd in the General, for Flags, Colours, Ensigns, Standards, Banners, &c. all which, Authors usually confound with one another. See FLAG, ENSIGN, STANDARD, BANNER.

The Custom of bearing pointed *Pavillions*, as at present, first came from the *Mahometan Arabs*, at the Time they first seiz'd on Spain.

Till then, all Colours were stretch'd on cross Pieces like Church Banners; whence they were call'd in Latin, *Vexilla quasi Velilla*, a Diminutive of *Vela*, Sails.

The Pirates all along the Coast of the *Atlantic* and *Barbary*, bear Hexagonal *Pavillions*. 'Tis Gules, charg'd with a little *Yark*, drest'd in his *Turban*; tho' contrary to their Law, which prohibits the making any Image of a Man; from an Opinion that those who make the Figure here, will be oblig'd to furnish a Soul to the Figure at the Day of Judgement, or in Default thereof be damo'd.

But this Portrait it seems is that of *Heli Sulphar*, *Mahomet's* Son-in-law, to whose Party the *Africans* adhere; and who appointed his Picture to be represented on their Banners; imagining himself too terrible to the Christians, that a mere View of his Image wou'd put 'em to flight; as we are told by *Lezmolesius*.

PAVILLON, in Heraldry, a Covering in form of a Tent, which invests, or wraps up the Armories of divers Kings and Sovereigns, depending only on God and their Word. The French *Heralds* hold, that none but Sovereign Monarchs may bear the *Pavillion* justice, and in all its parts.

It consists of two Parts, the Top, which is the Chapeau, or *Coronet*, and the Curtain which makes the Cloak. Those who are Elective, or have any Dependence, say the *Heralds*, must take off the Head, and retain nothing but the Curtains.

The Use of *Pavillions* and Cloaks in Armories is derived from the ancient *Lombroquins*, which are sometimes found stretch'd out in form of Coverings; and tuck'd back on either Side.

Others will have it derived from the ancient Tournaments, wherein were expos'd the Arms of the Knight in rich Tapestry Work, on Tents and *Pavillions*, which the Chiefs of the Quadrills rais'd to shelter themselves, till the Time of entering the Lists.

PAULIANISTS, a Sect of Hereticks, so call'd from their Founder *Paulus Samosatensis*, a Native of *Samosata*, elected Bishop of *Antioch* in 262.

This Heresiarch denied the Distinction of Persons in the Trinity, with *Sabellius*; and taught with *Ariemov* that the Word descended into *Jesus*; and that after having perform'd by him what he desir'd to do, he re-ascended to his Father.

He distinguish'd two Persons in *J. C.* the Word and the Christ: The latter, according to him, was only God in regard of his Holiness; accordingly he did not baptize in the Name of the Father and Son, &c. For which Reason the Council of *Nice* order'd those baptized by him to be re-baptized.

Being condemn'd by *Dionysius Alexandrinus*, in a Council; he abjur'd his Errors to avoid Deposition; but soon after resum'd 'em, and was actually depos'd by another Council in 270.

PAULICIANS, a Branch of the ancient *Manichees*; so call'd from their Christain, one *Paulus an Armevian*, in the VIIIth Century. See MANICHEE.

The *Paulicians* by their Number, and the Countenance of the Emperor *Neposorus*, became formidable to all the East.

To the other Opinions of the *Manichees*, they are said to have added an Abhorrence of the Cross; and to have employ'd it in the most servile Offices, out of disdain.

The Empress *Theodora*, Turels of the Emperor *Michael* in 845, wou'd oblige 'em either to be converted, or to quit the Empire: Upon which several of 'em were put to Death, and more retir'd among the *Syrronens*; but they were not all exterminated.

Towards the End of the ninth Century, they were able to maintain War against the Emperor *Basil*; and even preach'd long after this in *Bulgaria*; whence they spread into several other Parts of Europe.

The *Paulicians* were also call'd *Publicans*, and *Poplicans*. See PUBLICAN, &c.

PAVO, in Astronomy. See PEGASUS.

PAUPER, in Law, See FORMA PAUPERIS.

PAUSARY, PAUSARIUS, in ancient Rome, an Officer, who in the solemn Pumps or Processions of the Goddesses *Isti*, directed the Stops or *Pauses*.

In these Ceremonies, there were frequent Stands at Places prepared for the Purpose; wherein the Statues of *Isti* and *Andonis* were set down, much after the Manner of the resting Places in the Procession of the Holy Sacrament in the *Romish* Church.

These Rests were call'd *Manifones*; the Regulation whereof was the Office of the *Pausarii*.

From an Inscription quoted by *Solinus*, it appears that the *Romans* had a kind of College or Corporation of *Pausaries*. See COLLEGE.

The Name *Pausary* was also given to an Officer in the *Roman* Gallies, who gave the Signal to the Rowers, and mark'd the Times and *Pauses*; to the End they might act in concert, and row all together.

This was done with a Musical Instrument. *Hyginus* says, that in the Ship *Argo*, *Orpheus* did the Office with his Lute.

PAUSE, a Stop, or Cessation of speaking, singing, playing, &c.

The Use of Pointing in Grammar, is to make proper *Pauses* in certain Places. See POINTING.

There is a *Pause* in the Middle of each Verse; in a Hemistich, 'tis call'd the *Rest* or *Respo*. The

The Word is form'd from the *Latin* *Pausa*, which we find in *Loversius* and *Plautus* in the same Sense.

**PAUSE**, in Music, a Character of Silence and Repose; call'd also by some, a *Mute figure*; because it shews that some of the Parts are to be Silent, while the others continue the Song; either for the sake of some Figure or Imitation, or to give a breathing Time, or to give room for another Voice, &c. to answer what this Part sung, as in Dialogues, Echoes, &c.

The Ancients had two kinds of Pauses; the one call'd by the *Italians*, *Initial Pause*; because, first placed at the Beginning of the Piece, tho' sometimes after, and regularly before the Circle O, or the Semi-circle C.

They had also Pauses after the Characters of the Measure, and in the Course of the Piece.

A *general Pause* is a general Cessation or Silence of all the Parts.

*Demis-pause* is a Cessation for the Time of half a Measure.

We also say *Pause of a Minum*, *Pause of a Semibreve*, *long Pause*, *Pauses of Crosses*, and *Semi-Crosses*; which are Names given by the *Italians*, to express the different values of Pauses. For the Signs or Characters of Pauses. See CHARACTER.

**PAW**, *Patte*, in Heraldry, the Fore-foot of a Beast cut off short. If the whole Leg be retain'd, it is call'd *Gambé*.

Lions-paws are much us'd in Armoury.

**PAWN**-broker. See BROKER.

**PAWNAGE**. See PANNAGE.

**PAX** *Dei*. See PEACE of GOD.

**PAX** *Ecclesie*. See SANCTUARY.

**PAX** *Regis*, See PEACE of the King. *Longe debet esse*

*Pax Regis à parte sua, ubi residens fuerit, à quatuor partibus loci illius, hoc est quatuor miliaria & tres Quadrantes, & Novem ac Latitudinem, & novem pedes, & novem palmos, & novem Grana hordei, &c.* See EDU. CONFESS.

*Ad Pacem redire*, to restore to the Peace, is to reverse an Out-lawry; whereby a Person is restored to the Benefit of the King's Peace. See OUT-LAWRY.

*Rex potest dare quod suum est, hoc est pacem suam, quam integram sibi sit.* BRACON. Lib. 3.

**PAYMENT**, the Discharge of a Debt, either by Money really paid, or by Bills of Exchange, &c. See DEBT, &c.

*Prompt PAYMENT*, a popular Term in *English* and *American*, is, when a Debtor acquits what he owes before the Expiration of the Term granted by the Creditor.

The Discount for *Prompt Payments* on most Merchandises is usually 1 per Cent. See DISCOUNT.

**PAY**, in the Sea Language. The Seamen say, *pay more Cable, i. e.* let out more Cable; and *pay cheap* that is, at the turning the Anchor out of the Boat, to turn it out faster.

**PEACE**, in its general Signification, stands in opposition to War. See WAR.

In our Law-Books, &c. *Peace* is restrain'd to a quiet, and inoffensive Carriage towards the King, and his People. *Laub. Eirensarib.*

Where any Man stands in danger of Harm from another, and makes Oath thereof before a Justice of the Peace; he must be secur'd by good Bond, which is call'd *binding to the Peace*, &c. See FRANK-PLEDGE, See also CONSERVATOR, and JUSTICE of the Peace.

*Time of Peace* is when the Courts of Justice are open, and the Judge and Ministers of the same may by Law protect Men from Wrong and Violence, and distribute Justice to all. See *Coke on Little*. See also TERM.

*Peace of the King*, mention'd in the Stat. 6. Ric. 2d. &c. is that Security that the King promises his Subjects, and others taken into Protection; both for Life and Goods. See SURV of the King's Peace.

*Peace of God* and the Church, mention'd in our ancient Law Books, is that Rest and Cessation which the King's Subjects had from Trouble and Suit of Law, between the Terms. See VACATION.

*Peace of the Plough*, that whereby the Plough, Plough-Tackle, and Plough-Cattle are secured from Distresses. See *Fitzh. Nat. Brev.*

Thus Fairs may be said to have their *Peace*, because no Man may be troubled in them, for any Debt contracted elsewhere.

*Clerk of the PEACE*. See CLERK of the Peace.

**PEACOCK**, *Pavo*, in Astronomy, a Constellation of the Southern Hemisphere; unknown to the Ancients; not visible in our Northern Parts of the World. See CONSTELLATION.

**PEAN**, in Heraldry, is when the Field of a Coat of Arms is Sable, and the Ponderings, Or.

**PEARL**, in natural History, a hard, white, clear Substance, usually roundish, found in a testaceous Fish, resembling an Oyster; and rank'd in the Number of precious Stones.

The Fish wherein the *Pearls* are found, is three or four times the Size of the common Oysters; and is usually call'd *Pearl*, or *Mother of Pearl*, by the Naturalists, *Pinnus Marnius*.

Each *Mother-Pearl* ordinarily yields ten or twelve of 'em; tho' an Author, who treats of their Production, pretends to have seen an hundred and fifty in the same Fish; but those in different Degrees of Perfection. The most perfect still drop first; the rest remaining at the Bottom of the Shell. The Formation of *Pearls* has puzzled both the ancient and modern Naturalists; and given Occasion to a great Number of Hypotheses, many of 'em wild and extravagant enough: The Ancients, *Pliny*, *Solinus*, &c. will have 'em to be form'd of Dew. The Fifth, say they, rise every Morning to the Surface of the Water, and there open their Shells, to imbibe the Dew of Heaven; which, like a Liquid Pearl, insinuating into the Body of the Oyster, fixes its Salts, and their assumes the Colour Hardness and Form of *Pearls*; as some Liquors are converted into Crystals in the Earth; or the Juice of Flowers into Honey and Wax in the Bee-hive.

But this, how plausible soever, is apparently false: For the Oysters grow fast to the Rocks, and no Body ever yet saw any of 'em appear on the Surface of the Water.

Others will have *Pearls* to be the Eggs of the Fishes they are found in: But neither does this consist with the Phenomena. For *Pearls* are found throughout the whole Substance of the Oyster, in the Head, the Coat that covers it, the circular Muscles that terminate in it, the Ventricle, and in general in all the fleshy and muscular Parts; so that there is no Appearance that *Pearls* should be in the Oysters what the Eggs and Sperm are in Fowls and Fishes. For, beside that there is no particular Place defined for their Formation; the Anatomists have not been able to find any Thing that bears any Relation to what passes in this Respect in other Animals.

This, indeed may be said, that as in a Hen there is an Infinity of little Eggs, in form of Seeds; some whereof grow and ripen, whilst the Rest continue nearly in the same State; so in each Oyster is usually found one *Pearl* much larger, and that ripens much faster, than the Rest. This *Pearl* sometimes grows big enough to hinder the Oyster from shutting, in which case the Fish rots and dies.

Others, with M. *Geoffroy* the younger, rank *Pearls* among the Bezoards; as comprehending under that Class all Stones form'd in Lays or Strata in the Bodies of Animals. See BEZOARD.

M. *Reaumur*, has a very curious Piece on the Subject of the Formation both of the Shells and *Pearls*, in the Memoirs of the French Academy, An. 1717. He observes that *Pearls* are form'd like other Stones in Animals, as those *E. gr.* in the Bladder, Kidneys, &c. and that they are apparently the Effects of a Disease of the Fish.

In Fish, they are all form'd of a Juice extravasated out of some broken Vessels, detain'd, and fix'd among the Membranes.

To evince the possibility of this, he shews that the Shells of Sea-Fishes, as well as those of Snails, &c. are wholly form'd of a glutinous, stony Matter, ouzing out of the Body of the Animal (See SHELL). Now 'tis no wonder that an Animal which has Vessels wherein circulates a sufficient Quantity of stony Juice to build, thicken, and extend a Shell; should have enough to form Stones, in case the Juice destined for the Growth of the Shell shall chance to overflow, and burst forth in any Cavity of the Body, or among the Membranes.

To confirm this System, he observes, that the inner Surface of the common *Pearl*-Muscle, found on the Coasts of Provence, is of a *Pearl*, or *Mother of Pearl* Colour, from one part of its Extent, which he determines, to another; after which it becomes reddish: Now there are *Pearls* of two Colours found in the Shell; and the Colours of the *Pearls* are precisely the same with those of the Shell; nay, more, each Kind of colour'd *Pearl* is found in the corresponding colour'd Part of the Shell, which shews, that in the same Place wherein the Transpiration of a certain Juice had form'd, and would have continu'd to form a Couch, or Lay of Shell of a certain Colour; the Vessels which convey'd that Juice being broke, there is made a little Mass or Collection of the Juice, which hardening, becomes a *Pearl* of the same Colour with the part of the Shell to which it corresponds.

Add to this, that the Silver, or *Pearl*-colour'd part of the Shell is form'd of Strata or Lays over one another, like an Onion; and the reddish Part of little cylindrical, short Fibres applied against one another. The *Pearls* of the two Colours have this Difference of Texture; not but they are both compos'd of concentric Couches; but those of the reddish *Pearls* are much less sensible; and, besides, have Threads, which like *Radii*, proceed from their Centre to their Circumference.

These Circumstances seem effectually to determine the Formation of *Pearls*, and to establish the new System beyond Contention.

As to the Formation of the *Pearl*-Fish; tho' 'tis the most natural Opinion, that this Fish, like all others, produces Eggs or Spaw, whose exterior Surface at first is soft and viscous, but changes and hardens by degrees into Shell; yet, we must

not leave unmention'd the popular Hypothesis of the *Parovus*, viz. that in rainy Weather the Brooks of the neighbouring Lands that empty 'emselves all along the Coasts, run near two Leagues on the Surface of the Sea without mixing therewith. For a While, the suspended Water remains its natural Colour and Sweetness; but at length, the Heat of the Sun condensing it, forms it into a Kind of light transparent Froch; this done, it presently divides into an infinity of Parts, each whereof appears as if animated, moving this way and that, like little Insects. The Fishes sometimes catch at 'em as they pass by; but soon abandon 'em. By degrees their Skin thickening and hardening, they at length become heavy enough to sink to the Bottom, and assume the Figure of Oysters.

The Perfection of Pearls, whether round, in form of Pearls, or Olives, or irregular, consists chiefly in the Lustre and Clearness of the Colour which they call the *Water*. There are some whose Water is white; which are those most esteem'd, in *Europe*. The Water of others borders on the Yellow, which some *Indians* and *Arabs* prefer to the White. Others are of a Lead-colour, others border on Black; and others are quite Black.

They are less liable to change with wearing; in 80 or 100 Years they usually become of little value; especially the white Ones, which turn Yellow, and spoil in 40 or 50 Years time.

The Difference of Colours doubtless arises from the different Parts of the Oyster wherein they are form'd. When the Seed happens to be thrown into the Mensity or Liver, or the Parts corresponding thereto, 'tis no wonder if the Impurities of the Blood change the Natural White.

In *Europe*, Pearls are sold by the *Carat*-weight, the *Carat* containing four Grains.

In *Asia*, the Weights us'd for Pearls are different, in different States. See *CARAT*.

The Term *Pearl* is only properly applied to what grows independent of the Shell. The Shell itself is call'd *Mother* of *Pearl*. See *MOTHER* of *Pearl*.

Those Pieces which have grown thereto, and have been since separated by the Address of the Workman, are call'd *Wings* of Pearls; which are in effect nothing but roundish Excrescences, or Pieces of the Shell; tho' frequently us'd for real Shell. See *WEN* of *Pearl*.

*Pearls*, *F. Benbow* observes, have this Advantage over precious Stones dug out of Rocks, &c. that the Latter owe their Lustre to the Industry of Men; Nature only, as it were hews 'em out, and leaves the finishing of 'em to Art: But the Former are born with that beautiful Water which gives 'em their Value. They are found perfectly polish'd in the Abysses of the Sea; and Nature has put the last Hand to 'em ere they are separated from the Mother.

*Pearls* of unusual Figures, i. e. neither round, nor in the Pear-form, are call'd *Baregans*, or *Scotch-Pearls*: Those of unusual Sizes, are call'd *Parangans*; as that of *Cleopatra* valued by *Pliny* at five hundred thousand Crowns; that brought in 1574 to *Ferdinand II.* of the Size of a Pigeons Egg, valued at 14400 Ducats; that of the Emperor *Rudolph*, mention'd by *Beetham*, call'd *La perregina*, or the incomparable, of the Size of a Muscade Pear, and weighing 30 *Carats*; and that mention'd by *Tavernier*, in the Hands of the Emperor of *Perfia*, in 1633, bought of an *Arab* for 30000 Tomans, which at 3 *l.* 9s. the Toman, amounts to 110400 *l.* Sterling.

*Pearls*, are of some Use in Medicine; but 'tis only the smallest Sort, call'd *Seed* of Pearls that is there us'd. The Quality required, is, that they be white, clear, and transparent; and truly oriental. They serve to make Cordial Potions, formerly much valued, but now fall'n much from their ancient Reputation; and scarce own'd by any but *Charlatans*.

The Ladies also use certain Preparations of Pearls, as they are made to believe, for their Complexion; such as the Whites of Pearls, Flowers, Essences, Spirits, Tinctures, &c. of Pearls; but they are all apparently Deceits.

**PEARL Fisheries.**

*Pearl* is fish'd in the Seas of the *East-Indies*; in those of *America*; and in some parts of *Europe*.

**PEARL-Fisheries of the East,** are

I. The Island of *Babren*, or *Bakoren*, in the *Persian* Gulph. This the *Portuguese* were Masters of while they held *Ormuz* and *Mascata*; but it has been returned to the *Sophs* of *Perfia*, since the Time that Prince, with the Assistance of the *English*, took from 'em *Ormuz*, and the *Arabs*, *Mascata*.

II. The Fishery of *Catifa*, on the Coast of *Arabia Felix*, over-against *Babren*.

III. That of *Manar*, a Sea-port in the Isle of *Ceylon*. The Pearls here fish'd, are the finest in all the East for their Water and Roundness; but they seldom exceed four *Carats*.

Lastly, there are Pearls fish'd on the Coast of *Japan*; but they are coarse and irregular, and little minded.

The *Pearls* of *Babren* and *Catifa* are those commonly sold in the *Indies*; they border a little on the Yellow, but the *Eastern* People don't value 'em the less for it; they esteem it a Sign of their being Ripe and Mature, and are persuaded, that those which have this yellowish Tincture naturally, never change their Colour; and that on the contrary, the white Water does not hold above thirty Years, 'ere the *Pearl* assumes a fishy yellow Colour; by reason of the Heat of the Climate, and the Sweat of the Persons who wear 'em.

*American* PEARL Fisheries, are all in the great Gulph of *Mexico*, along the Coast of the *Terra-Firma*. There are five of 'em.

I. The Fishery of *Cobagns*, an Island five Leagues from new *Andalusia*, in 20 Deg.  $\frac{1}{2}$  N. Lat.

II. That of the Island *Margurites*, or *Pearl* Island.

III. That of *Coaguero* near the *Terra-Firma*.

IV. That of the River *de la Hoch*, call'd *la Reucheria*.

V. That of *St. Martha* sixty Leagues from the River *de Castace*.

The *Pearls* of these three last Fisheries are usually of a good Weight; but ill form'd, and of a Livid-Water. Those of *Cobagns* seldom exceed 5 *Carats*; but are found in abundance. But the greatest Quantity, and the finest, both with regard to Weight and Water, are those of the Island *Margurites*.

PEARL Fishery in *Chinese Tartary*, is near the City *Nipetros*, situate on a Lake of the same Name: The Pearls here are less beautiful than those of *Bakoren*; and the Fishery less plentiful. 'Twas this Fishery that occasioned the War between the *Chinese* and *Muscovites*, terminated towards the End of the last Century, by the Jesuits *Perreira* and *Gerbillon*; and the Lake, which is of great Extent, divided between the two Nations; each whereof had pretended to the whole.

There are some *Pearl* Fisheries in the *South-Sea*, but they are very inconsiderable.

PEARL Fisheries of *Europe*, are in some Places on the Coasts of *Scotland*, and in a River of *Bavaria*: But the Pearls found here are no ways comparable to those of the *East-Indies*, or of *America*; tho' they serve for Necklaces, fold sometimes for a thousand Crowns and upwards.

*Manner of Fishing for PEARLS in the East-Indies.*

There are two Seasons of *Pearl*-Fishing in the Year; the first in *March* and *April*, the second in *August* and *September*; the more Rain falls in the Year, the more plentiful are the Fisheries.

In the Opening of the Season, there are found sometimes two hundred and fifty Barks on the Banks. In the larger Barks are two Divers, in the smaller, one. Each Bark puts off from Shore ere Sun-rise, by a Land-breeze, which never fails; and returns again by a Sea-breeze, which succeeds it about Noon.

As soon as the Barks are arrived, and have cast Anchor, each Diver binds a Stone six Inches thick, and a Foot long under his Belly; which is to serve him as Ballast, and prevent his being driven away by the Motion of the Water; and to enable him to walk more steadily a-cross the Waves.

Beside this, they use another very heavy Stone to one Foot, whereby they are sunk to the Bottom of the Sea in a Moment. And as the Oysters are usually strongly fasten'd to the Rocks, they arm their Fingers with Leather Mittens, to prevent their being wounded in scraping 'em violently off; and some even carry an Iron Rake for the Purpose.

Lastly, each Diver carries down with him a large Net, in manner of a Sack, tied to his Neck by a long Cord the other End whereof is fasten'd to the Side of the Bark. The Sack is designed for the Reception of the Oysters gather'd from the Rock, and the Cord to pull up the Diver when his Bag is full, or he wants Air.

In this Equipage he precipitates himself, sometimes above 60 Foot under Water. As he has no Time to lose there, he has no sooner arriv'd at the Bottom, than he begins to run from Side to Side, sometimes on a Sand, sometimes on a Clayey Earth, and sometimes among the Points of Rocks; tearing off the Oysters he meets withal, and cramming 'em into his Budget.

At whatever Depth they be, the Light is so great, that they easily see whatever passes in the Sea, with the same Clearness as on Land. And to their Contentation, they sometimes see monstrous Fishes, from which, all their Address in mudding the Water, &c. won't save 'em; but they become their Prey; and of all the Perils of the Fishery, this is one of the greatest and most usual.

The best Divers keep under Water for half an Hour, the rest don't stay le's than a Quarter. During which Time, they hold their Breath without the Use of Oils, or any other Liquors. See *DIVING*.

When they find 'emselfs straiten'd, they pull the Rosp to which the Bag is fasten'd, and hold fast by it with both Hands

Hands, when the People in the Bark, taking the Signal, heave 'em up into Air and unload 'em of their Fish, which is sometimes five hundred Oysters, sometimes not above fifty.

Some of the Divers need a Moment's Respite to recover Breath; others jump in again instantly, continuing this violent Exercise without Intermission, for many Hours.

On the Shore they unload their Barks, and lay their Oysters in an infinite Number of little Pits, dug four or five Foot square in the Sand; raising heaps of Sand over 'em to the Height of a Man, which, at a Distance, look like an Army rang'd in Battle.

In this Condition they are left, till the Rain, Wind, and Sun have oblig'd 'em to open, which soon kills 'em. Upon this the Flesh rots and dries, and the Pearls, thus disengaged, tumble into the Pit upon taking the Oysters out.

The Flesh of the Fish is excellent, and if what some Naturalists maintain be true, viz. that the Pearls are Stones, form'd there by the ill Constitution of the Body, as sometimes happens in Men, and in the *Zeceors*; this Disease does not alter the Humours; at least, the *Parous*, who eat 'em, don't find any Difference between those that have Pearls and those that have none.

After clearing the Pits of the grosser Fish, they sift the Sand several times, to separate the Pearls. But what Care soever they take herein, they always lose a great many. After cleaning and drying the Pearls, they are pass'd thro' a Kind of Sieves, according to their Sizes. The smallest are sold for Seed of Pearls; the rest are put up by Auction, and sold to the highest Bidder.

Manner of Fishing for Pearl in the West-Indies.

The Season for Fishing is usually from *October* to *March*. In this Time there set out from *Caribogena* ten or twelve Barks, under the Convoy of a Man of War, call'd *Larmadilla*. Each Bark has two or three Slaves, Divers.

Among the Barks, there is one call'd *Capitans*; to which all the rest are oblig'd to bring at Night what they have caught in the Day, to prevent Frauds. The Divers never last long, by reason of the great Hardships they sustain; continuing sometimes under Water above a Quarter of an Hour.

The rest is the same, as in the *East-India* Fisheries. The *Indians* knew the Value of their Pearls before the Discovery of *America*; and when the *Spaniards* arriv'd there, they found great Quantities stor'd up, which the *Americans* set great Value on. But they were almost all imperfect, and their Water yellow and smoaky; by reason they us'd Fire in opening the Fishes.

In the *Dictionnaire de Commerce*, is a Table of the Value of Pearls, communicated to the Author by an able Hand. As Pearls make a very curious Article in Commerce, and as their Value is a Thing little known among us; we shall here give the Reader an Abridgement of the same, reduced to our Money, on the Foot of 1 s. 6 d. Sterling the French Livre, or 4 s. 6 d. the French Crown.

Value of all kinds of Pearls, with regard to their different Weight.

Seeds of PEARLS.

	l.	s.	d. per Oz.
Seeds of Pearls not perforated, fit for grinding, are worth	00	09	
Fine Seed of Pearls perforated for small Necklace or Embroidery,	01	01	
Ditto a little larger,	01	16	

Ragged, or Irregular PEARLS.

Of 36 Grains, or 9 Carats	262	10	00
Of 40 Grains, or 10 Carats	300	00	00

As to Pearls in form of Pears, tho' equally perfect, and of equal Weight with the round Ones, their Value is much inferior: However, when two are found that match well, their Value is but less by one third.

Falsè PEARLS, are counterfeit, or factitious Pearls, resembling the true Ones in Water or Colour. These anciently were only made of Glass; with a Kind of Tincture of Quick-silver Within-side, afterwards they us'd Wax, cover'd over with a fine Brilliant Fish Glue.

There has since been invented in *France*, another manner of making 'em, so near the natural Ones in Lustre and Water, that they deceive a good Eye. These are what the Ladies now generally wear in defect of true Pearl; little Necklaces whereof they despise; and the great ones being generally too dear.

Method of making Falsè Pearls.

This curious Invention is owing to the *Sieur Jeain*, and is the more to be valued, in that, 'tis not only very simple, but prevents the ill Effects of falsè Pearls, made with Quick-silver within, or Fish Glue without.

That ingenious Artist having observ'd, that the Shell of a little Fish call'd *Abbe*, found plentifully in the River *Norve*, had not only all the Lustre of the real Pearls; but that after dissolving it in Water, it return'd to its former Brilliant upon drying; he bethought himself of setting a Piece thereof in the Cavity of a Bead, or Grain of *Girafol*, which is a kind of Opal or Glass, bordering much on the Colour of Pearl. The Difficulty was to get it in there, and when in, to spread it equally throughout the Bead.

A little Glass Tube six or seven Inches long, and a Line and half in Diameter, but very sharp at one End, and a little crooked, serv'd for the introducing of the Matter, by blowing it with the Mouth, after having taken up a Drop with the pointed Extremity of the Tube; and to spread it throughout the inner Circumference, he contented himself to shake it gently a long Time, in a little Oiler-Basket lined with Paper.

The dissolved Shell, fixt'n'd by this Motion in the Inside of the Crystalline, resumes its Lustre as it dries. To increase this Lustre, in Winter, they lay the Beads in a Hair Sieve, or a Boiling-cloth, which they suspend to the Ceiling, and under it, at 6 Foot Distance, lay heaps of hot Ashes. In Summer they suspend 'em in the same Manner, but without any Fire.

The Pearls, thus well dried, become very Brilliant; and nothing remains but to stop up the Aperture, which is done by melted Wax, convey'd into it with a Tube like that us'd in introducing the dissolved Shell.

After clearing off the superfluous Wax, they perforate the Pearls with a Needle, and string 'em; and thus they commence Necklaces.

Mother of PEARL, is the Shell of the Pearl-Oyster, or Fish wherein the Pearls are form'd. See PEARL.

The Shell within-side is very smooth, and polish'd, and of the Whiteness and Water of Pearl itself; and it has the same Lustre without-side, after the first *Lamine*, or Leaves which make the outer Coat of this rich Shell Fish, have been cleared off with *Aqua fortis* and the *Lapidaries* Drill.

Mother of Pearl is us'd in inlay'd Works, in *China* Vernish, and in several Toys, as Snuff-boxes, &c.

Wens of PEARL, are certain Excrecences, or prominent Places, in form of half Pearls; sometimes found in the Bottom of the Pearl Shells.

The *Lapidaries* have the Address to Saw off these Prominences, to join 'em together, and to Ule 'em in several Works of Jewellery, as if they were really Pearls.

PEARL, in Heraldry, is us'd by such as *Maze* with precious Stones, instead of Colour and Metals, for Argent, or White. See ARGENT.

PEARL, *Pua*, or *Web* in Medicine, an unnatural Speck, or thick Film over the Eye. See PANNUS. See also UNDOLE.

PECCANT in Medicine, an Epithet given to the Humours of the Body, when they offend either in Quantity or Quality, i. e. when they are either Morbid, or in too great Abundance. See HUMOUR.

Most Diseases arise from *Peccant* Humours, which are either

either to be corrected by Alteratives and Specificks, or evacuated. See DISEASE, &c.

PECK, a Measure, or Vessel us'd in measuring Grains, Pulse, and the like dry Matters. See MEASURE.

The Standard, or Winchester Peck, contains two Gallons; each Gallon weighing about eight Pound Troy. See GALLON.

Four Pecks make a Bushel; four Bushels a Comb or Carcock, &c. See BUSHEL.

Besides the general, or Winchester Peck, there are Local Pecks, containing some more, some less, as the Lancaster Peck containing six Gallons, &c.

PECOUETS Duct, in Anatomy, the Thoracic Duct; thus call'd from its Discoverer Pecquet. See THORACIC DUCT.

PECTEN *Arboris*, in Botany, is the Grain of the Wood of any Tree. See WOOD.

PECTEN, in Anatomy, is us'd by some Authors for the *Regio pubis*, or lower Part of the *Hypogastrium*. See HYPOGASTRIUM.

PECTINIS Os in Anatomy, the same with Os Pubis. See OS PUBIS.

PECTINEUS, in Anatomy, the third of the fifteen Muscles of the Thigh; so call'd, because it has its Origin in the Fore-part of the Os Pectinis.

Its Insertion is in the Thigh, under the left Trochanter; the Pectineus, with the *Psoas* and *Iliacus*, draw the Thigh forwards, and of Consequence bend it.

PECTORAL, something relating to the Breast, *Pectus*. See BREAST.

In the Roman Church, Bishops and regular Abbots wear a Pectoral Cross, i. e. a little Cross of Gold, hanging from the Neck down the Breast.

PECTORAL Medicines, or simply Pectorals, are Remedies proper to strengthen and relieve the Breast and Stomach; or against Dificases of the Breast and Stomach.

Their ordinary Intensions are either to attenuate, or thicken the Humours of those Parts, which cause Coughing, &c. and render 'em fit to be expectorated, or spit out.

PECTORALE, or PECTORAL, in the Jewish Law. See RATIONALE.

PECTORALIS, in Anatomy, a Muscle which moves the Arm forwards. It arises by a fleshy and semicircular Beginning, from the *Clavicus*, *Sternum*, and Cartilages of the six superior Ribs; and covers a great Part of the Breast, and is inserted by a short, but strong and broad Tendon into the upper and inner Part of the *Humerus*, between the *Biceps* and *Deltoideus*.

Its Fibres, near their Insertion, decussate one another. Those which come from the *Clavicus*, or first Ribs, are on the Lower-side of the Tendon, and those from the inferior Ribs on the Upper-side of the Tendon.

Naturalists observe a special Mark of Providence in the Size and Strength of the Pectoral Muscle in different Animals. 'Tis by the Action of this Muscle, that the flying of Birds is chiefly perform'd: Accordingly it is much larger and stronger in Birds than in any Animals not made for flight.

*Borelli* observes, that in Men the Pectoral Muscles are small; scarce the 50th or 70th Part of all the other Muscles: But in Birds they are vastly large, equalling, nay, exceeding in Bulk and Weight all the other Muscles of the Birds together. See FLYING.

PECTORALIS internus. See TRIANGULARIS.

PECTORIS os, the same as STERNUM. See STERNUM.

PECULATE, PECULATUS, in the Civil Law, the Crime of pilfering the Public Money, by a Person who is the Manager, Depositary, or Receiver thereof; so call'd, *quasi pecunie ablatæ*.

The Civil Lawyers use *Peculate* for any Theft of a Thing Sacred, Religious, Public, or Fiscal. *Peculate* is prosecuted even on the Criminals Heir.

PECULIUM, the Stock which a Person in the Power of another, as a Slave, a Minor, &c. may acquire by his own Industry, without any Advance or Assistance from his Father or Master, but merely by their Permission.

The Romans had a Civil and a Military *Peculium*.

The Word is usually deriv'd a *Pecunia* & *Pecoribus*, because the whole Estate antiently consisted in Money and Cattle.

Hence *Peculium* comes to be us'd among the *Romanists*, for what each Monk or Religious reserves and possesses to himself.

Some say that the *Peculium* of a Religious, when prefer'd to a Cure, does not cease to belong to the Monastery; and that the Property thereof never absolutely resides in the Religious.

PECUJIAR in the Canon Law, a particular Parish or Church, that hath Jurisdiction within it self, for Probate of Wills, &c. Exempt from the Ordinary, and the Bishops Courts, and peculiarly belonging to the Archbishop. See ARCH-BISHOP.

In the Province of *Canterbury* are 57 such *Peculiari*.

The King's Chapel is a *Royal Peculiar*, exempt from all spiritual Jurisdiction, and refer'd to the Visitation and immediate Government of the King himself, who is supreme Ordinary. See CHAPEL.

It is an ancient Privilege of the See of *Canterbury*, that whereforever any Mannors or Advowsons do belong to it, they forthwith become exempt from the Ordinary, and are reputed *Peculiari*.

Court of PECULIARS, is a Court where the Affairs of *Peculiari* are transacted. See COURT.

PECUNIA, Money, in our old Law Books, &c. is sometimes us'd for Cattle, and sometimes for other Goods, as well as Money. See MONEY, &c.

In the Emendat. of the Laws of *Edward* the Confessor, by *Will.* the 1st, it is order'd that no *Tithe Pecunia*, living *Pecunia*, i. e. *Chattel* be bought or sold, except within Cities; and that before three sufficient Witnesses. See CHATTEL.

Again, *Qui habet 30 Denariatos vocæ Pecunia*, &c. In *Domesday*, *Pecunia* is frequently us'd, *pro pecude*; as, *Pasture ad pecuniam Ville*; & *pecunia Ecclesie*, was antiently us'd for the Estate of the Church.

*Pecunia Sepulchralis*, was Money antiently paid to the Priest at the opening of the Grave, for the Good and Behoof of the deceased's Soul, and which our *Saxon* Ancestors call'd *Soul-Soot*, and *Anime Symbolum*.

PEDAGE, Toll, or a Local Right exacted on Persons, Goods, and Carriages passing thro' certain Places. See TOLL.

*Pedage* is usually levied for the Repairing of Roads, Bridges, Causeways, the Paving of Streets, &c.

Antiently, those who had the Right of *Pedage*, were to keep the Roads secure, and Answer for all Robberies committed on Passengers between Sun and Sun; which is still observed in some Parts of *England*, and in *Italy*, where there are Guards call'd *Statuaries*, establish'd for the Security of Merchants, particularly at *Terracina*, on the Road between *Rome* and *Neples*.

PEDAGOGUE, a Term of Reproach, us'd for a Tutor, or Master, to whom is committed the Discipline and Direction of a Scholar; to be instruct'd in *Grammar* and other Arts.

The Word is form'd from the *Greek παιδαγωγος, paiderum duxor*, leader of Boys. *M. Fienry* observes, that the *Greeks* gave the Name *Pedagogue* to their Slaves, appointed to attend their Children, lead 'em, and teach 'em to walk, &c.

PEDAGOGUES, among the *Romans* were likewise Slaves, to whom was committed the Care and Instruction of Children.

PEDALS, the large Pipes of an Organ, so call'd, because play'd and stop'd with the Foot. See ORGAN.

The *Pedals* are the largest Pipes in the Machine, they are made Square, of Wood usually thirteen in Number.

They are of modern Invention, and serve to carry the Sounds an *Octave* deeper than the rest.

PEDANEUS, in the Civil Law, a petty Judge; who has no formal Seat of justice, but hears Causes standing, and without any Tribunal.

The Word is form'd from *Stans in Podibus*; and is us'd among the Antients in opposition to the *Roman* Magistrates, who were seated on Chariots, in *Sella Curuli*, or had a Tribunal or Bench rais'd on high.

The *Roman Pedanes*, therefore, were such as had no Tribunal, nor *Prætorium*, but render'd Justice *de Plano*, or *Plano pede*.

From the 8a Novel, it appears that the Emperor *Zeno* establish'd these *Pedanes*, in the See of every Province; and that *Justinian* erected seven of 'em at *Constantinople*, in manner of an Office; granting 'em Power to judge in any Sum as high as 300 Crowns.

PEDANT, a School-Master, or *Pedagogue*, who professes to instruct and govern Youth, teach 'em the Humanities and the Arts. See PEDAGOGUE.

PEDANT is also us'd for a coarse, unpolish'd, stiff, Man of Learning, who makes an impertinent Use of the Sciences, and abounds in vile, unseasonable Criticisms and Observations. *Zacier* defines a *Pedant*, a Person who has more Reading than good Sense.

*Pedants*, are People ever arm'd with Points and Syllogisms; breathe nothing but Dispute and Chicanery, and pursue a Proposition to the last Limits of Logic. *Mabranche* describes a *Pedant* as a Man full of false Erudition, who makes a Parade of his Knowledge, and is ever quoting some Greek or Latin Author, or hunting back to a remote Etymology.

*St Evremont* says, that to paint the Folly of a *Pedant*, we must represent him turning all Conversations to some one Science he is best acquainted withal.

There are *Pedants* of all Conditions, and of all Robes; and *Wicomefort* says, an *Embaſſador* always attentive to Formalities and Decorums, is nothing else but a *Political Pedant*.

**PEDANTRY**, or **PEDANTISM**, the Quality or Manner of a *Pedant*.

To swell up little and low Things, to make a vain Show of Science, to heap up Greek and Latin without Judgement, to pull and tear those who differ from us about a Passage in *Suetonius*, or the Etymology of a Word, to stir up all the World against a Man for not admiring *Cæsar* enough, to be interested for the Reputation of an Ancient as if he were our next of Kin, is what we properly call *Pedantry*.

**PEDESTAL**, in Architecture, the lowest Part of an order of Columns; being that which sustains the Column; and serves it as a Foot or Stand. See **COLUMN**.

The Word is form'd from the Latin *Pes Pedis*, Foot and *Columna*.

The *Pedestal*, call'd by the Greeks, *Stylobates* and *Stereobates*, consists of three principal Parts; viz. a square Trunk or *Dye*, which makes the Body; a *Corniche*; the Head; and a *Base* the Foot of the *Pedestal*. See **DYE**, **CORNICHE**, and **BASE**.

The *Pedestal* is properly an Appendage to a Column; not an essential Part thereof; tho' *M. le Clerc* thinks 'tis Essential to a complete Order. See **ORDER**.

The Proportions and Ornaments of the *Pedestal*, are different in the different Orders; *Vignola*, indeed, and most of the Moderns make the *Pedestal* and its Ornaments in all the Orders, one third of the Height of the Column, including the *Base* and *Capital*; but some deviate from this Rule.

*M. Perrault* makes the Proportions of the three constituent Parts of *Pedestals* the same in all the Orders, viz. the *Base* or *Socle* one fourth of the *Pedestal*; the *Corniche* an eighth Part; and the *Socle* or *Plinth* of the *Base* two thirds of the *Base* it self. The Height of the *Dye* is what remains of the whole Height of the *Pedestal*.

*Jussieu* **PEDESTAL**, is the simplest, and the lowest. *Palladio* and *Scamozzi*, make it three Modules high; *Vignola* 5. See **PROPORTION**.

Its Members in *Vignola*, are only a *Plinth* for a *Base*, the *Dye*, and a *Talon* crowned, for a *Corniche*.

The *Jussieu* Column has rarely any *Base*. See **TUSCAN**.

*Doric* **PEDESTAL**, *Palladio* makes four Modules, five Minutes high, *Vignola* Modules four Minutes.

In the *Antique*, we not only don't meet with any *Pedestals*; but even, not with any *Base* in the *Doric* Order.

The Members in *Vignola's* *Doric* *Pedestal*, are the same with those in the *Jussieu*, with the Addition of a *Mouchoir* in its *Corniche*. See **DORIC**.

*Jonic* **PEDESTAL**, in *Vignola* and *Serlio*, is 6 Modules high; in *Scamozzi* 5; in the Temple of *Fortuna Viriis* 'tis 7 Mod. 13 Min.

Its Members and Ornaments are mostly the same with those of the *Doric*, only a little richer.

The *Pedestal* now usually follow'd, is that of *Vitruvius*; tho' we don't find it in any Work of the *Antique*.

Some in lieu hereof Use the *Attic* *Base*, in imitation of the *Ancients*. See **ATTIC**.

*Corinthian* **PEDESTAL**, is the richest and most delicate. In *Vignola* 'tis 7 Mod. high; in *Palladio* 5 Mod. 1 Min. in *Serlio* 6 Mod. 15 Min. in the *Colosseum* 4 Mod. 2 Min.

Its Members in *Vignola* are as follows: in the *Base* are a *Plinth* for a *Socle*, over that a *Frieze* carved; than a *Reglet*, a *Gula* inverted and enrich'd, and an *Atragal*.

In the *Dye* are a *Reglet*, with the *Conge* over it, and near the *Corniche* a *Reglet* with a *Conge* underneath.

In the *Corniche* is an *Atragal* a *Frieze*, *Fillet*, *Atragal*, *Gorge*, *Talon*, and a *Fillet*. See each under its proper Article.

*Composite* **PEDESTAL**, in *Vignola*, is of the same Height with the *Corinthian*, viz. 7 Mod. in *Scamozzi* 6 Mod. 2 Min. in *Palladio* 6 Mod. 7 Min. in the *Goldsmitbs* Arch 7 Mod. 8 Min.

Its Members in *Vignola*, are the same with those of the *Corinthian*; with this Difference, that whereas these are most of 'em enrich'd with Carvings in the *Corinthian*, they are all plain in the *Composite*.

Nor must it be omitted, that there is a Difference in the Profiles of the *Base* and *Corniche* in the two Orders.

The Generality of Architects, *Daviler* observes, use *Tables* or *Panels*, either in *Reliefs* or *Crosses*, in the *Dyes* of *Pedestals*; without any regard to the Character of the Order. Those in *Reliefs*, he observes, only fit the *Jussieu* and *Doric*; the three others must be indent'd; which he adds, is a Thing the *Ancients* never practis'd, as being contrary to the Rules of Solidity.

*Square* **PEDESTAL**, is that whose Height and Width are equal; as that of the Arch of the *Lions* at *Vernon*, of the *Corinthian* Order; and such, some Followers of *Vitruvius*, as *Serlio*, *Philander*, &c. have given to their *Tuscan* Orders.

*Double* **PEDESTAL**, is that which supports two Columns, and is more in Width than Height.

*Continued* **PEDESTAL**, that which supports a Row of Columns without any Break or Interruption; such is that

which sustains the fluted *Ionic* Columns of the Palace of the *Talieres* on the Side of the Garden.

**PEDESTALS** of *Statues*, are those serving to support Figures or *Statues*. See **STATUE**.

*Vignola* observes, there is no Part of Architecture more Arbitrary, and wherein more Liberty may be taken than in the *Pedestals* of *Statues*; there being no *Laws* prescribed by *Antiquity*; nor any even settled by the *Moderns*.

There is no settled Proportion for these *Pedestals*; but the Height depends on the Situation, and the Figure they sustain. Yet, when on the Ground, the *Pedestal* is usually two thirds, or two fifths of that of the *Statue*: But the more Massive the *Statue*, the longer the *Pedestal*.

Their Form, Character, &c. are to be Extraordinary and Ingenious, far from the Regularity and Simplicity of the *Pedestals* of Columns. The same Author gives us a great Variety of Forms, Oval, Triangular, Multangular, &c.

**PEDICLE**, in Botany, the little Stalk or Tail, whereby the Leaf, Fruit, or Flower is connected to its Branch or Stem. See **FLOWER**, **LEAF**, &c.

Flowers will keep full a long Time after gathering, by immersing their *Pedicles* in Water.

The great Secret of preserving Fruits for the Winter, is to seal up their *Pedicles* with Wax.

Cberries with the shortest *Pedicles*, are esteem'd the best.

The Pistil of the Flower frequently becomes the *Pedicle* of the Fruit. See **PISTIL**.

The Word is a Diminutive of the Latin, *Pes* Foot.

**PEDIMENT**, in Architecture, a Kind of low Pinnacle; serving to crown an Ordinance, or finish a Frontispiece; and placed as an Ornament over Gates, Doors, Windows, Niches, Altars, &c. See **CROWNING**, &c.

The Pinnacles of the plainest Houses, *Vitruvius* observes, gave Architects the first Idea of this noble Part; which still retains the Appearance of its Original. See **PINNACLE**.

The Parts of the *Pediment* are, the *Tympanum*, and its *Corniche*.

The first is the *Panel* naked, or Area of the *Pediment*, enclos'd between the *Corniche*, which crowns it, and the *Entablature*, which serves it as a *Base* or *Socle*. See **TYPANUM**, &c.

Architects have taken a deal of Liberty in the Form of this Member: Nor do they vary less as to the Proportion of the *Pediment*.

The most beautiful, according to *Daviler*, is that where its Height is about one fifth of the Length of its *Base*.

It is described thus: divide the Line *a b* (Tab. Architecture Fig. 11.) which is the Length of the *Base*, into two equal Parts, in the Point *c*, by means of the Perpendicular *f g*; in this Perpendicular, take the Part *e d*, equal to *a c*; and from the Point *d*, as a Centre, describe the Arch *a e b*. The Point of the Perpendicular cut in *e*, will be the Top of the *Pediment* *a e b*; and the *Corniche*, and the Triangular Space included thereon, the *Tympanum*.

*Vitruvius* calls the *Pediments*, *Festigia*; a Word which signifies a Roof rais'd, or pointed in the Middle, which Form among the *Romans* was peculiar to Temples. All their Dwelling-houses are cover'd in the *Plat-form* manner; and *Salmestius* on *Solin* observes, that *Cæsar* was the first who obtain'd leave to Roof his House with a *Ridge* or *Descant*, after the manner of Temples. See **PLAT-FORM**.

*Pliny* tells us, that *Pediments* were first made to place *Statues* upon, whence they were call'd *Plæfæ*.

The *Pediment* is usually Triangular, and sometimes an equilateral Triangle, call'd also a *pointed Pediment*; sometimes it is Circular; tho' *Felicion* observes, that we have no Instance of round *Pediments* in the *Antique*, beside those in the Chapels of the *Ratonde*.

Sometimes its upper *Corniche* is divided into three or four Sides, or *right Lines*. Sometimes the *Corniche* is cut, or open a Top; which is an Abuse introduced by the *Moderns*, particularly *Michael Angelo*; for the Design of this Part, at least over Doors, Windows, &c. being chiefly to shew rtho' underneath from the Rain; to leave it open in the Middle, is to frustrate its End.

Sometimes the *Pediment* is form'd of a couple of *Rolls*, or *Wreaths*, like two *Consoles* join'd together. See **CONSOLE**.

Sometimes the *Pediment* is without *Base*, or its lower *Corniche* is cut out, all but what is below'd on two Columns, or *Pilasters*, and on these an Arch or *Sweep* rais'd, in lieu of an *Entablature*; of which *Serlio* gives an Instance in the *Antique*, in a *Corinthian* Gate at *Foligno*, in *Umbria*; and *Daviler*, a more Modern one, in the Church of *St Peter* at *Rome*.

Under this kind of *Pediments*, come those little arch'd *Corniches*, which form *Pediments* over Doors and Windows, supported by two *Consoles*, in lieu either of *Entablature* or Columns.

Sometimes the *Pediment* is made double, i. e. a less *Pediment* is made in the *Tympanum* of a larger, on account of some Projecture in the Middle; as in the Frontispiece of the Church of the Great *Jesus* at *Rome*; but this Repetition is

an abuse in Architecture; tho' author'd by very good Buildings; as the large Pavilion of the *Loggia*, where the *Caryatides* support three *Pediments* one in another.

Sometimes the *Tympanum* of the *Pediment* is cut out, or left open, to let in light; as we see under the Portico of the Capitol at *Rome*.

Lastly, this open *Pediment* is sometimes triangular, and enrich'd with Sculpture, as *Roses*, *Leaves*, &c. as we find it in most of the *Gothic Churches*.

*M. le Clerc* observes, that the *Modillions* in the Corniche of the *Pediment* shou'd always answer exactly over those of the Entablature. Indeed, *Vitrucius* says, the Ancients did not allow any *Modillions* at all in *Pediments*. See *MODILLION*.

The same *M. le Clerc* observes, that the Corniche which serves the *Pediment* as a Base, shou'd have no *Cymatium*; by reason the *Cymatium* of the rest of the Entablature, when it meets the *Pediment*, passes over it.

This Change of Determination occasions a considerable Difficulty; the *Cymatium*, in this Case, appearing too broad in the Turn of the Angle. To remedy which, the Architects have recourse to several Expedients.

A pointed *Pediment* may crown three Arches; but a circular *Pediment* can only crown one agreeably.

One wou'd never use above two *Tympana* over each other in the same Frontispiece; and even where there are two, 'twou'd be proper to have the lower Circular, the upper pointed.

The Word is form'd of the French *Pere* and *Degree*, *q. d.* Degree of Fathers or Ancestors.

**PEDIGREE**, *Descent or Genealogy*. See *DESCENT* and *GENEALOGY*.

**PEDICULARIS Morbus**, in Medicine, the *loosy Distempers*; a Disease arising from some uncommon Corruption in the Body, which generates infinite Quantities of Lice on the Skin.

*Herod* died of the pedicular Disease.

The Word comes from the Latin *Pedicularis*, *Loose*.

**PEDILEAN**, in Antiquity. The City of *Athena* was antiently divided into three different Quarters; one on the Descent of a Hill; another on the Sea-shore; and a third in a Plain between the two.

The Inhabitants of the middle Region were call'd *Pedileans*; or according to *Aristotle*, *Pediaci*; those of the Hill, *Diacrians*; and those of the shore, *Paralians*.

These Quarters usually compos'd to many different *Factions*; *Puffblasts* made use of the *Pedileans* against the *Diacrians*.

In the time of *Solon*, when a Form of Government was to be chosen, the *Diacrians* wou'd have it *Democratic*; the *Pedileans* demanded an *Aristocracy*; and the *Paralians* a mixt Government.

The Word is form'd from the Greek *pedis* plain, flat.

**PEDIÆUS**, in Anatomy, is the second of the Extensor Muscles of the Foot, *Ped*, whence its Name. See *FOOT*.

It has its Origin in the lower Part of the *Peroneus*, and annular Ligament; and is divided into four Tendons, which are inserted into the external Part of the first Articulation of the four Toes.

Its Use is to extend the Foot together with the first of the Extensors, call'd *Extensor Communis*. See *EXTENSOR*.

**PEDO BAPTISMUM**, See *PEDO BAPTISMA*.

**FEDUNCULI**, in Anatomy, two medullary Processes of the *Cerebellum*, whereby that Part is join'd to the *Medulla oblongata*. See *CEREBELLUM* and *MEDULLA*.

*Willis*, who first gave 'em the Name, observed in 'em three distinct Processes on either Side, the two first whereof go to the *Testes*, the second directly from the *Cerebellum* to the *Medulla oblongata*, decussating the former, and fastning the *Processus Annularis*. And the third, springing from the hind Process of the *Cerebellum*, is inserted into the *Medulla oblongata*; looking like an additional Chord to it.

**PEDIS Ablissio**, Cutting off a Foot; a Punishment antiently inflicted among us: as appears by the Laws of *William the Conqueror*, by *Inquisitus* and other Authors.

*Inquisitus* no quis occidatur, vel suspendatur, pro aliquo Culpo, sed eruatut Oculi, Abscidantur Pedes, vel Testiculi, vel manus, &c. *Leg. Will. Cap. 1.*

So *Inquisitus*, sed penna perditionis dextri sui pedis, &c.

**PEDOMETER**, or **PODOMETER**, or *Way-wisier*, a Mechanical Instrument, in form of a Watch; consisting of various Wheels with Teeth, catching in one another; all dispos'd in the same Plane; which by means of a Chain or String fastned to a Man's Foot, or the Wheel of a Chariot, advance a Notch each Step, or each Revolution of the Wheel; so that the Number being mark'd on the Edge of each Wheel, one may number the Paces, or Measure exactly the Distance from one Place to another. See *WAY-WISER*.

The Word is form'd from the Greek *πῆξ*, *Pe*, Foot; and *μετρον*, Measure.

**POMERETRY**, is sometimes, also, us'd for a *Surveying Wheel*, an Instrument chiefly us'd in measuring Roads; popularly call'd the *Way-wisier*. Which see

**PEDRERO**, or **PETTERERO**, a small Piece of Ord-

nance, chiefly us'd on board Ships; for the discharging of Nails, broken Iron, or *Partridge Shot* on an Enemy attempting to board. See *ORDNANCE* and *MORTAR*.

They are generally open at the Breach, and their Chamber made to take out, to be loaded that Way, in lieu of the Muzzle. See *CHAMBER*.

**PEEK**, in the Sea Language, a Term us'd in various Senses.

*E. gr.* an Anchor is said to be *a-peek*, when the Ship being about to weigh, comes over her Anchor, so as the Cable hangs perpendicularly between the Hawse and the Anchor; the bringing of a Ship into which Position they call *heaving a-peek*.

A Ship is said to *ride a-peek* when she lies with her Main and Fore-yards hoisted up; having one End of her Yards brought down to the Shrouds, and the other rais'd up an End; which is chiefly done when she lies at rest in Rivers, lest other Ships falling foul on her, shou'd break her Yards.

To *rise a broad Peek*, denotes the same, excepting that the Yards here are only rais'd to half the Height.

To *Peek the Miffen*, is to put the Miffen-yard perpendicularly by the Mast.

The Room in the Hold, from the Bits forward to the Stern, where Men of War keep their Powder, and Merchant Men their Victuals, is also call'd the *Peek*.

**PEER**, *Peer*, denotes an equal, or one of the same Rank and Condition.

Hence, in some Councils or Assemblies, we find, *with the Consent of our Peers, Bishops, Abbots, &c.*

Afterwards, *Peer* was applied to the Vassals or Tenants of the same Lord, who were oblig'd to serve and assist him in his Courts: They were call'd *Peers*, because equal in Function, and *Peers to Fees* or *Fees*; because, holding Fees of the Lord; or because their Business in Court was to sit and judge under their Lord of Disputes arising on Fees. See *VASSAL*.

The Number of Peers required to sit in Court, was at least four; and when there happen'd to be too many Peers in the same Lordship, the Lord usually chose out 12 who had the Title of *Peers* by way of Distinction and Eminence. See *VASSAL*.

There are Instances of Women, who have assist'd at Judgements, on account of their Tenements, not of their being Wives of *Peers*.

The Origin of these *Peers* of Fees is as ancient as that of the Fees they were appointed to judge of; from these we derive our common *Juries*, and our Peers of the Realm. See *JURY* and *Peer of the Realm*.

**PEER of the Realm**, a noble Lord, or a Person who has a Seat, and Vote in the Upper-house of Parliament; hence call'd the *House of Peers*. See *NOBLE* and *PARLIAMENT*.

There are five Degrees of Peerage, or Nobility, *vis.* That of a *Duke*, *Margues*, *Earl*, *Vicomte*, and *Baron*. See each under its proper Article *DUX*, *MARQUESS*, *EARL*, &c.

'Tis the King confers the *Peerage*, by honouring the Person with some of these Titles by Patent. See *NOBILITY*.

**PEERS, PAIRS of France**, are the twelve grand Lords of France.

The Institution of these *Peers* is very uncertain; some refer it to *Hugo Capet*, at the Time when the Dukes and Counts chang'd the Offices they then held of the King into perpetual Fees. But this is impossible; *Champagne* not being then crected into a County. Indeed *Pasquier* observes, that 'tis an old Tradition there has been 12 *Peers* in all Ages.

Of these *Peers*, six are Dukes, and six Counts, Comptes; of these again, six are Ecclesiasticks, and six Lay-men. The Archbishops of *Rheims*, Bishops of *Laon*, and *Langres* are Dukes and *Peers*; the Bishops of *Noyons*, *Chalon* on the *Marne*, and *Beauvais*, are Counts and *Peers*.

The Dukes of *Burgundy*, *Normandy*, and *Aquitain* were Lay-peers and Dukes; and the Counts of *Flanders*, *Champagne*, and *Toulouse* Lay-peers and Counts.

These Lay-peers still assist at the Coronation of the Kings in Ceremony, and by way of Representatives; where each performs the Functions attach'd to his respective Dignity; tho' the Peerships be in reality all, except *Flanders*, reunited to the Crown. Six Lords of the first Quality are chose to represent 'em.

The Ecclesiastic *Peers* usually assist in Person. At present, the Title *Peer in France* is bestowed as, in *England*, on every Lord or Person, whose Fee is crected into a Lordship or Peership.

The Word according to *Pasquier*, is derived from *Patrians*, the first Dignity in the *Eastern Empire*, on the Model whereof he supposes these *Peers* to have been instituted.

But others with more probability derive the Title from the *Patres Curie*, or *Fees*, because of their being equal to each other.

These *Peers Curie*, on whose Model they suppose 'em to have been crect'd, were a Kind of Vassals depending on the all same Lord, whom they were obliged to attend and assist in Court.

All Feodal Matters or Disputes among Vassals relating to their Fees or Dependances, were terminated by the superior Lord of the two contending Parties, and by their Peers in Fee.

If the Process were between the Lord and the Vassal, the Lord took no Cognizance of it, and the Peers alone judg'd it. See PEER.

Hence, all Lords or Nobles being *Peeres Nobilitate*, i. e. all equally entitled to the Privileges of Nobility, are denominated *Peeres Regni*, Peers of the Realm.

Some Authors attribute the first Institution of Peers of the Realm to *Charlemagne*; but with little probability; since most of the Fiefs which bear the Names of Dutchies, &c. or give Titles to the Peers, were not created into Dutchies, &c. till long after. The Dukes, &c. in those Days being no more than simple Governors of Provinces, without any other Title or Privileges. See DUBE.

The more probable Opinion is, that Peers were first instituted by *Philip* the young, of France, about the Year 1219; and that they first acted in Capacity of Peers at the Coronation of his Son.

PEERAGE, the Dignity of a Peer, attach'd to a Dutchy, Earldom, or the like. See PEER.

The Kings of England and France confer Peerage at Pleasure. His present Majesty of England offer'd his Parliament to resign that Branch of his Prerogative, and to have the Number of Peers limited.

The Reason insisted on, was the Inconveniences accruing to the State from an Arbitrary and immoderate Use thereof. The Prince having it hereby in his Power to throw what Number of his Creatures he pleases into the Upper-house of Parliament.

The twelve Peers created at once in the late Reign, was a main Argument in behalf of the Peerage Bill.

'Tis recorded as a popular Saying of King Charles, that if his Friends cou'd but secure him a House of Commons, he'd throw his whole Troop of Guards into the Upper-house, but he'd have the Peers.

*26 Sold Lands in Peerage*, in the ancient Customs, was a Tenure which obliged the Person to assist the Lord's Bailiff in his Judgements; as all the ancient Vassals, call'd Peers did. See PEER and VASSAL. See also TENURE.

PEER, or PIER, in Building, a Massive of Stone, &c. opposed, by way of Fortrefe, against the Force of the Sea, or a great River; for the Security of Ships, that lye at Harbour in any Haven.

Such is the Peer of Dover described by *Cambden, Brit. The Haven and Peer of great Tarnmouth*, mention'd aad. Car. II.

The Word in this Sense, is form'd from the French *Pierre*, Stone. See PIEDROIR.

PEERS are also used in Architecture for a Kind of Pilasters or Buttresses, raised for support, strength, and something for Ornament.

PEGASUS, among the Poets, a Horse imagin'd to have Wings; being that whereon *Bellerophon* was imbled to be mounted when he engaged the *Chimera*. See CHIMERA.

The opening of the Fountain *Hippocrene*, on Mount *Helicon*, is ascribed to a blow of *Pegasus's* Hoof.

It was feign'd to have flown away to Heaven; where it became a Constellation. Hence

PEGASUS, in Astronomy, a Constellation of the Northern Hemisphere, in form of a flying Horse. See CONSTELLATION.

The Stars in this Constellation in *Ptolemy's* Catalogue are 20, in *Tycho's* 19, in the *Britannic* Catalogue 92. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

Stars in the Constellation PEGASUS.

**PEGMATES**, or **PEGMARES**, in Antiquity, a Name given to certain *Gladiators*, as well as Artificers, among the *Romans*.

The Ancients sometimes exhibited Shews of certain Machines, call'd *Pegmata*. These were a Kind of Scaffolds, variously adorn'd, somewhat after the Manner of those now us'd for Fire-works.

These Scaffolds being made to play, either threw up into the Air the Matters wherewith they were charg'd; and among the rest, Men, who were thus sacrific'd to afford the People Diversion; or they precipitated 'em into Holes dug in the Ground, where they lighted their Funeral Piles; or into the dens of wild Beasts.

Now, both the miserable People thus sacrific'd, and the Workmen that made and play'd the Machines, were call'd *Pegmates*.

According to *Cassiodorus*, Fire was set to the Scaffold, and the *Pegmates* were to have 'emselfes thro' the Flames, and the Wrack of the Machine.

*Lippus* says simply, that the *Pegmates* were such *Gladiators* as fought on Scaffolds erected for that purpose.

They were also call'd *Petastartes*. See *GLADIATOR*.

**PIERCED**, in Heraldry; when an ordinary, or Charge in Heraldry hath a Hole in it, so that the Field appears through; they say that ordinary, or charge, is *Pierced*. See *PIERCED*.

**PELAGIANS**, ancient Heretics, well known in the Church by the Writings of *St. Augustin*. See *HERETIC*.

The Author of this Sect, *Pelagius*, properly call'd *Morgan*, was an Irish Monk, Cotemporary with *St. Jerome*, and *St. Augustin*. He quitted his Country to go and live in the East; according to the Custom of the Monks of those Days, who were not attach'd to particular Houses like those of our Days.

He absolutely denied all original Sin, which he held to be the mere Invention of *St. Augustin*; and taught that Men are entire Masters of their Actions, perfectly free Creatures, in opposition to all Predestination, Reprobation, Election, &c. See *ORIGINAL SIN*, *PREDESTINATION*.

He own'd indeed that the natural Power of Man needed to be assisted by the Grace of God, to enable him to work out his own Salvation; but by this Grace, he only meant outward Assistance, viz. the Doctrines of the Law and of the Gospel. See *GRACE*.

Tho' when press'd by those Words of *St. Paul*, *Deus est cuius qui operatur in nobis*, &c. he own'd that 'tis God, in effect, that makes us will what is good, when he warns and excites us by the Greatness of the Glory we are to obtain, and by the Promise of Rewards; when he makes us love him, by revealing his Wisdom, &c.

These are *Pelagius's* own Words, as cited by *St. Augustin*; who confutes him, and shews that beside these exterior Graces, there are required other real and interior ones.

*Pelagius* own'd further, that the Will of Man is indeed aided by a real Grace; but added that this Grace is not absolutely necessary in order to live well; but only helps us to do well with the more ease.

*Julian*, one of his Adherents went further yet; and own'd that the Assistance of Grace was absolutely necessary, to enable us to do perfect Works.

In effect, the grand Doctrine of the *Pelagians*, was, that a Man might accomplish all the Commands of God by the mere force of Nature; and that the Gifts of Grace were only necessary to enable him to act more easily, and more perfectly.

**PELAGIAE**, in natural History, a Term used to express such *Sea-Shells* and *Fishes*, as never, or very rarely, are found near the Shores; but always reside in the Deep, or in those parts of the Bottom of the Sea, which are most remote from Land. See *SHELL*.

The Word is form'd of the Greek *πυλαίος*, *Marine*, belonging to the Sea.

**PELLS**, Clerk of the *PELL*. See *CLERK of the Pells*.

**PELLICAN**, among Chymists, a Kind of double Vessel; ordinarily of Glass; us'd in distilling Liquors by Circulation. See *DOUBLE VESSEL*, and *CIRCULATION*.

**PELLICAN**, is also an Instrument us'd by Chirurgeons, &c. to draw Teeth.

**PELLICAN**, again, is the Name of an ancient Piece of Ordinance, equal to a Quarter-Culverin, and carrying a Ball of six Pounds. See *CULVERIN*.

**PELLICLE**, **PELLICULA**, a Diminutive of *Pellis*, Skin; a thin Film, or Fragment of a Membrane or Skin. The *Epidermis* or *Cuticula*, is a little *Pellicle* covering the *Dermis*, *Curtis*, or Skin. See *CUTICLE*.

The Valves of the Veins and Arteries are insensible *Pellicles*, which open and shut to promote the Circulation. See *VALVE*.

When any Chymical Solution is evaporated in a gentle Heat till a thin Skin or Film arise a Top, 'tis call'd an *Evaporation* or a *Pellicle*, wherein there is but just Liquor enough left to keep the Salts in fusion. See *EVAPORATION*.

**PELLETS**, in Heraldry, a Name given those Roundies which are Black; call'd also *Ogreffer* and *Gun-stones*.

**PELLICOIDES**, in Geometry, a Figure, in form of a *Hatchet*; whence its Name; from the Greek *πίλλαιος* *Hatchet* and *ἴσος* form.

Such is the Figure *BCDA*, Tab. Geometry *Fig. 45*. contain'd under the two inverted Quadrantal Arks *A B* and *A D*, and the Semi-circle *B C D*.

The Area of the *Pellicoides* is demonstrat'd to be equal to the Square *A C*, and that, again, to the Rectangle *E B*: It is equal to the Square *AC* because it wants of the Square on the left-hand, the two Segments *AB* and *AC*, which are equal to the two Segments *BC* and *CD*, by which it exceeds on the Right-hand.

**PELLUCID**, a Term of the same Import as *Diaphanous* or *Transparent*, See *TRANSPARENT*, &c.

*Pelucid*, stands oppos'd to *Opake*. See *OPAKE*.

The Word is form'd of the Latin *Pelliceo* or *Perluceo*, I shine thro'.

**PELLUCIDITY**, *Diaphaneity* or *Transparency*. See *TRANSPARENCY*, &c.

**PELLTA**, in Antiquity, a kind of Buckler, us'd among the Ancients. See *BUCKLER*.

The *Pelta* was small, light, and more manageable than the *Parma*. See *PARMA*.

It appears from *Virgil*, and other Authors, that the *Pelta* was the Buckler us'd by the *Amaozons*: And *Xenophon* observes that the *Pelta* of the *Amaozons* was like a Leaf of Ivy.

*Pliny* speaking of the *Indian* Fig-tree, says its Leaves are the Width of the *Amaozonian* *Pelta*. *Servius* on the *Aeneid* says, the *Pelta* resembled the Moon in her first Quarter.

**PELVIS**, in Anatomy, the lower-part of the Cavity of the *Abdomen*; thus call'd from its resemblance to a Basin or Ewer, call'd in Latin, *Pelvis*. See *ABDOMEN*.

The *Pelvis* is always much larger in Women than Men, to give Room for the Growth, &c. of the *Fetus*.

'Tis well fortified with Bones, to screen the Contents from external Injuries.

**PELVIS**, of the *Kidneys*, a large Membranous Sinus, or Cell, in the concave Part of the *Kidneys*. See *KIDNEY*.

From the twelve *Papillae* of the *Kidneys*, arise twelve Canals, call'd *Fistulae Membranaceae*. These at length are collect'd into three large Branches, which being at last united into one, form the *Pelvis*; and this again, contracting it self, terminates in a Membranaceous Pipe, call'd the *Ureter*. See *PAPILLAE* and *URETER*.

The Urine, then, separated from the Blood by the Urinary Pipes; convey'd by them into the *Papillae*, and taken up by the *Fistulae Membranaceae*; is brought into the *Pelvis*, and thence discharg'd into the Ureter, thence into the Bladder, &c. See *URINE*.

**PEN**, according to *Cambden*, originally signifies a high Mountain; which was thus call'd among the ancient *Britons*, and even *Gauls*.

And hence that tall Range, which parts *Italy* and *France*, is call'd *Apennines*. See *MOUNTAIN*.

**PEN**, is also a little Instrument, usually form'd of a Quill, and serving to write withal. See *WRITING*.

*Duroe* **PENS**, are those made of Quills which have been pass'd thro' hot Althes, to take off the grosser Fat and Moisture thereof. See *QUILL*.

**Fountain-PEN**. See *FOUNTAIN-PEN*.

**PEN-Stock**, a sort of *Sluice* or Flood-gate, plac'd in the Water of a Mill-pond, or the like, to retain or let go the Water at Pleasure. See *SLUICE*.

**PENANCE**, is properly the Exercise of *Penitence*; and may be defin'd a Punishment, either voluntary, or impos'd by a legal Authority, for the Faults a Person has committed. See *PUNISHMENT*.

In this Sense the *Romans* define it a Sacrament, wherein a Person, who has the requisite Dispositions, receives Absolution at the Hand of the Priest, of all Sins committed since Baptism. See *SACRAMENT*.

Too Legitimate *Penance* they require three Things, Contrition, Abolition, and Satisfaction.

Their Priests receive a Power of administering the Sacrament of *Penance*, when they receive the Priesthood; but to exercise this Power, 'tis required they have the Jurisdiction of an Ordinary, i. e. that they have a Benefice, either Original or Delegated; with the Approbation of the Bishop to hear Confessions.

**PENANCE**, is particularly us'd in the *Romish* Church, for the Penalty which a Confessor imposes, for the Satisfaction of the Sins wherof a Person is absolv'd. See *CONFESSION* and *ABSOLUTION*.

The ancient Discipline, *De-pen* observes, was very severe on the Head of *Penance*. For great Crimes People were excluded the Communion of the Church, expell'd the Assemblies of the Faithful, oblig'd to fast, and to mortify 'emselfes publicly, even at the Church Door, cut their Hair, go always on Foot, &c.

He adds, that those who had done publick *Penance*, were never admitted into the Clergy; and that publick *Penance* was never

never granted more than once. Those who fell a second Time were never to be reconciled to the Church, and were to look for Pardon only at the Hands of God.

**PENANCE**, in our Canon-Law, is an Ecclesiastical Punishment, chiefly adjudg'd to the Sin of Fornication. The Punishment is thus prescribed by the Canons: The Delinquent to stand in the Church Porch on some Sunday bare Head and bare Foot, in a white Sheet, with a white Wand in the Hand; here bewailing himself, and begging every one to pray for him. Then to enter the Church, falling down, and kissing the Ground; and at last, placed on an Eminence in the Middle of the Church, against the Minister, to declare the Foulness of the Crime, odious to God, and scandalous to the Congregation.

If the Crime be not notorious, the Canons allow the Punishment to be commuted at the Parties Request, for a pecuniary Mult, for the Benefit of the Poor, &c.

**PENATES**, in the ancient Mythology, a Term applied to all the Domestic Gods, whom the Ancients adored in their Houses; whence they are ordinarily confounded with the *Lares*. See *LARES*.

Authors are not all agreed about the Origin of the *Dii penates*, who were properly the Tutelary Gods of the *Trojans*, and were only adopted by the *Romans*, who gave 'em the Title of *Penates*.

*De Mourin*, in his Notes on *Dido's* Epistle to *Aeneas*, relates at large what he has met withal in the ancient Writers on this Subject; *Dionysius Halicarnassensis* tells us that *Aeneas* first lodg'd these Gods in the City *Lavinium*; and that his Son *Ascanius*, afterwards, upon building the City *Alba*, translated 'em thither; but that they return'd twice miraculously to *Lavinium*. The same Author adds, that in *Rome* is still seen a dark Temple, shaded by the adjacent Buildings, wherein are the Images of the *Trojan* Gods, with the Inscription *Penates*, which signifies *Penates*. See *DENATES*.

These Images represent two young Men sitting, each of which holds a Lance. I have seen, adds *Dionysius*, several other Statues of the same Gods in ancient Temples; who all appear like young Men dress'd in a Habit of War.

*Varro* teaches these *Penates* from *Samosbrato* to *Pbrygian*, to be afterwards transported by *Aeneas* into *Italy*.

*Macrobius*, who relates this from *Varro*, adds, that they were call'd *Penates* from the *Latin* Words *Per quos penitus spiramus*, which seems a mere Subtlety. The real Etymology must be sought in the *Pbrygian*, not the *Latin* Tongue.

*Refinus* distinguishes among the *Penates*: He makes an Order of *Penates of the Heavens*; such as *Pallas* in the Ethereal Region, *Jupiter* in the middle Region, and *Juno* in the lowest; *Penates of Cities*, *Penates of private Families*, &c.

So that in effect, the *Dii penates* were the Guardian or tutelary Gods of every Thing. See *Gon*.

*Coera*, in *Annius Gellius*, derives the Word hence, *quod penes nos nati sunt*. Yet, in his Book *de Nat. Deor.* he says 'tis foem'd from *Penus*, Provision; or, perhaps, adds he, *quod penitus infident*. Others say, *quia calculator in penetralibus*.

'Tis a popular Question among the Learned, who were the *Penates of Rome*? Some say *Vesta*, others *Neptune* and *Apollo*; *Vivros* says *Castor* and *Pollux*, with whom agrees *Vossius*, who adds that the Reason of their choosing *Castor* and *Pollux* in quality of *Penates*, might be the important Service they did the *Romans* in the War against the *Latins*.

Nor are Authors more unanimous on the Subject of the *Penates*, which *Aeneas* brought into *Italy*. Some say they were *Neptune* and *Apollo* who built the Walls of *Troy*; others *Jupiter*, *Juno*, and *Minerva*; others *Castor* and *Terra*.

**PENCIL**, an Instrument used by Painters, for the Application of their Colours. See *COLOUR*.

There are *Pencils* of various kinds, and made of various Matters: The most usual are of Badgers and Squirrels Hair, those of Swans-down, and those of Boars Bristles; which last are bound on to a Stick bigger, or less, according to the Uses they are destined for; and when large are call'd *Brushes*.

The others are inclin'd in the Barrel of a Quill. The Word comes from the *Latin*, *Penicillum*, which signifies the same Thing. The Ancients, *M. Fulvius* observes, had *Pencils* made of little Pieces of Sponge; whence doubtless, the Story of the Painter, who not able to express the Foam of a Dog, succeeded by throwing his *Sponge* at the Picture.

**PENCIL-CASE**. See *PORTE-CRATON*.

**PENCIL OF RAYS**, in Opticks, is a double Cone of RAYS, joined together at the Base; one of which hath its Vertex in some point of the Object, and has the Glass *G L S*. (Tab *Opticks* Fig. 39) for its Base; and the other has its Base on the same Glass, but its Vertex in the point of Convergence; as at *C*. See *RAY*, &c.

Thus *B G S C* is a *Pencil of Rays*; and the Line *B L C* is call'd the *Axis of that Pencil*.

**PENDANT**, an *Ear-ring*, or Ornament of some precious Matter, wore by the Ladies; hung by a Hole made for that purpose thro' the Ear; and frequently enriched with Diamonds, Pearls, and other precious Stones.

The *Pendants* of the *European Ladies* are nothing in comparison with those wore by the *E. Indians*, both Men and Women; among whom 'tis the Fashion to lengthen out the Ears, and to enlarge the Hole, by putting in *Pendants* of the Size of Saucers, set with Stones.

The Queen of *Calicut*, *Pyrar* tells us, and other Ladies of her Court, have their Ears, by this Means, weigh'd down as low as their Breasts, and even lower; imagining this a main point of Beauty; and the Holes large enough to pass the Fist thro'.

The *Moscois*, who are the common People, are not allowed to wear their Ears so long as the *Nobles*, who are the Noblest; three Fingers length are the utmost stretch allow'd the Former.

In the *W. Indies*, *Columbus* named a certain Coast *Oreja*, by reason he found People with Holes in their Ears big enough to pass in an Egg thro'.

They make Holes, too, in their Lips and Nostils, and hang *Pendants* at 'em; which is also practis'd by the *Mexicans* and other Nations.

**PENDANT**, in Heraldry, a Term applied to the Parts hanging down from the Label, to the Number of 3, 4, 5, or 6 at most: These must be specified in Blazoning, when there are more than three. See *LABEL*.

They resemble the Drops at the Bottom of the Triglyphs in the Doric Frieze.

**PENANT FEATHERS**, in Fackory, are those Feathers, which grow behind the Thighs of an Hawk. See *FEATHER*.

**PENDANTS**, among Florists, a Kind of Seeds, growing on Stamina, or Chives; such are those in the middle of Tulips, Lillies, &c.

**PENDANTS of a Ship**, are of two Kinds.

I. Those long Colours or Streamers, cut pointing out towards the End, and there divided into two Parts, and hung out at the Heads of the Masts, or at the Yard-arm Ends, are call'd *Pendants*; and used for flew, and sometimes for distinction of Squadrons. See *COLOUR*, *FLAG*, &c.

II. That short Rope is call'd a *Pendant*, which at one End is fastened to the Head of the Mast, or to the Yard, or to the Clew of the Sail, and at the other End, hath a Block and Shiver, to receive some running Rope into.

Thus, the *Pendant* of the Tackle is made fast to the Head of the Mast; and the *Pendants* of the Back-stays are fastened to, and hang down on the inside of the Shrouds.

All the Yard-arms, except the Masten have of these *Pendants*, into which the Braces are receiv'd.

**PENDENTIVE**, in Architecture, the whole Body of a Vault, suspended out of the Perpendicular of the Walls, and bearing against the Arc-boutants. See *VAULT*.

*Daviler* describes it as a Portion of a Vault between the Arches of a Dome, usually enrich'd with Sculpture: And *Fulvius*, as the Plain of the Vault, contain'd between the double Arches, the forming Arches and the Ogives. See *Ogive*.

The *Pendentives* are usually of Brick, or soft Stone; but Care must be taken that the Couches or Beds of Masonry be always laid level, and in right Lines proceeding from the Sweep whence the Rise is taken.

The Joints too must be made as final as possible, to save the Necessity of filling 'em up with Wood, or of using much Mortar.

**PENDULOUS**, *hanging down*; a Name Botanists give to those Flowers which hang downwards; the Stalk not being able to sustain 'em upright. See *FLOWER*.

**PENDULUM**, in Mechanicks, any heavy Body so suspended as that it may vibrate, or swing backwards and forwards, about some fix'd Point, by the force of Gravity. See *VIBRATION*.

The Vibrations, or alternate Ascent and Descend, of the *Pendulum*, are call'd its *Oscillations*. See *OSCILLATION*.

The Point on which it vibrates, is call'd the Centre of *Sty-pension* or Motion. See *CENTRE* and *SUSPENSION*.

And a right Line passing thro' the Centre, parallel to the apparent Horizon, is call'd the *Axis of Oscillation*. See *AXIS*.

The Vibrations of a *Pendulum*, are all *isochronal*, or effected in spaces of Time perfectly equal. See *ISOCRONAL*.

And hence the *Pendulum* becomes the most accurate Chronometer, or Instrument for measuring Time, in the World. See *TIME* and *CHRONOMETER*.

And hence also its Vibrations are proposed as an invariable and universal Measure of Lengths for the most distant Countries and Ages. See *MEASURE*.

For a *Vibration* being once found precisely equal to a second of Time of the Suns mean Motion; if v.g. the Horary Foot (as *M. Huygens* calls the third Part of his second *Pendulum*) compared to the *Englsh* Standard Foot, be as 592 to 5603 'will be easy, by Calculation, to reduce all the other Measures of the World to these Feet; the Lengths of *Pendulums*, reckon'd from the Point of Suspension, to the Centre of the Ball, being to each other, as the Squares of the Times wherein

whence the several Oscillations are perform'd; and therefore reciprocally as the Squares of the Numbers of Oscillations perform'd in the same Time.

On this same Principle, M. Mouton, Canon of Lyons, has a pretty Treatise, *de mensura posteris transfundenda*.

Mr. Huygens lays down the Length of a Pendulum that shall swing Seconds, to be 3 Feet, 5 Inches, and 2 Tenths of an Inch; according to Sir J. Moor's Reduction; which agrees perfectly with M. Mouton's Pendulum 8 Inches 1 Tenth long, or Vibrate 132 times in a Minute: so that this may be relied on as a sure Measure.

Note, the Lengths of Pendulums are usually measur'd from the Centre of Motion.

The First who observ'd this noble Property, the *Isochronisms* of Pendulums, and made Use thereof in measuring Time, Starminus tells us, was Ricciolus; after him Tycho, Longrenus, Wendelius, Merfenne, Kircher and others hit on the same Thing; tho' without any Intimation of what Ricciolus had done.

Huygens first applied the Pendulum to Clocks. See Pendulum Clock.

Pendulums are either Simple or Compound. Simple PENDULUM, is that consisting of a single Weight, as A, consider'd as a Point; and an inflexible right Line, as AC, consider'd as void of Gravity, suspended on a Centre C, and voidable about it. (Tab. Mechanicks Fig. 36.)

Compound PENDULUM, is that which consists of several Weights, so fix'd as to retain the same Distance both from one another, and from the Centre about which they vibrate.

The Doctrine and Laws of PENDULUMS.

A Pendulum rais'd to B, thro' the Arch of the Circle B A; will fall, and again rise, thro' an equal Arch, to a Point equally high, D; and thence fall to A, and again rise to B; and thus continue rising and falling reciprocally, for ever.

For suppose H I a horizontal Line, and B D parallel thereto; if the Ball A, which we here consider as a Point, be rais'd to B; the Line of Direction B H, being Perpendicular from the Centre of Gravity B to the Horizontal Line H I, falls without the Base, which is the Point C.

The Ball therefore cannot rest, but must descend. See DESCENT.

But being retain'd by the Thread B C, from falling perpendicularly thro' B H; it will fall thro' the Arch B A. Consequently, when the Centre of Gravity arrives at the Bottom; A has the same force, it wou'd have acquired in falling from K; and will therefore be able to rise equally high as if it had, i. e. in descending thro' the first half of its Vibration, it acquires a Velocity by the continual Acceleration of its Fall; and as this Velocity is always proportionable to the Height whence it falls, as being in some measure the Effort thereof; it is still able to make it remount to the same Height, supposing according to the System of Galileo, that the Velocities are always the square Roots of the Heights. See ACCELERATION.

Since then the Thread prevents the Pendulum going off in the Tangent A I, it must ascend thro' the Arch A D, equal to that A B.

All the Force therefore which it had acquired by falling, being exhausted; it will return by the force of Gravity thro' the same Arch A D, and again rise from A to B; and thus for ever. Q. E. D. See GRAVITY.

Experience confirms this Theorem, in any finite Number of Oscillations; but if they be supposed infinitely continued, there will arise a Difference. For the Resistance of the Air, and the Friction about the Centre C, will take off part of the Force acquired in falling; whence it will not rise precisely to the same Point whence it fell.

Thus the Ascend continually diminishing, the Oscillation will be at last stopp'd, and the Pendulum hang at rest. See RESISTANCE and FRICTION.

II. If a simple Pendulum be suspended between two Semi-cycloids C B and C D. (Tab. Mechanicks Fig. 37) whose generating Circles have their Diameters C F equal to half the length of the Thread C A; so as the Thread in Oscillating be wound about 'em; all the Oscillations, however unequal in Space, will be Isochronal, or perform'd in equal Times; even in a resisting Medium.

For since the Thread of the Pendulum C E, is wound about the Semi-cycloid B C, the Centre of Gravity of the Ball E, which is here consider'd as a Point, by its Evolution, will describe a Cycloid B E A D; as is shewn from the Doctrine of Infinites; but all Ascents and Descents in a Cycloid are Isochronal, or equal in Time: Therefore the Oscillations of the Pendulum are also equal in Time Q. E. D. See CYCLOID.

Hence, if with the length of the Pendulum C A, a Circle be described from the Centre C; since a Portion of the Cycloid near the Vertex A, is almost described by the same Motion; a small Arch of the Circle will almost coincide with the Cycloid.

In little Arches of a Circle, therefore, the Oscillations of Pendulums will be Isochronal as to Sense; however, unequal in 'em selves; and their Ratio to the Time of perpendicular Descent thro' half the length of the Pendulum, is the same with that of the Circumference of a Circle to its Diameter.

Hence also, the longer the Pendulums are, that oscillate in Arches of a Circle; the more Oscillations are Isochronal; which agrees with Experiment; for in two Pendulums of equal lengths, but oscillating in unequal Arches, provided neither Arch be very great, you'll scarce discern any inequality in an hundred Oscillations.

Hence also, we have a Method of determining the Space which a heavy Body, falling perpendicularly, passes over in a given Time. For the Ratio which the Time of one Oscillation has to the Time of the Fall thro' half the Length of the Pendulum, being thus had; and the Time wherein the several Vibrations of any given Pendulum being found; we have the Time of the Fall thro' half the length of the Pendulum. And hence may collect the Space it will pass over in any other Time.

The whole Doctrine of Pendulums oscillating between two Semi-cycloids, both Theory and Practice, we owe to the great Huygens; who first publish'd the same in his *Horol. Oculatior. five demonstrationes de Motu Pendulorum*, &c.

All The Action of Gravity is less in those Parts of the Earth where the Oscillations of the same Pendulum are slower, and greater where they are swifter.

For the Time of Oscillation in a Cycloid, is to the Time of Perpendicular Descent thro' the Diameter of the generating Circle, as the Periphery of the Circle to the Diameter.

If then, the Oscillation of the same Pendulum be slower; the Perpendicular Descent of heavy Bodies is likewise slower; i. e. the Motion is less accelerated, or the Force of Gravity is less; and conversely. See GRAVITY.

Hence, as 'tis found by Experiment, that the Oscillations of the same Pendulum are slower near the Equator, than in Places less remote from the Pole; the force of Gravity is less towards the Equator than towards the Poles. And consequently the Figure of the Earth is not a just Sphere, but a Spheroid. See EARTH and SPHEROID.

This M. Richier found by an Experiment made in the Island Cayenne, about four Degrees from the Equator; where a Pendulum 5 Foot, 8 Lines  $\frac{1}{2}$  long, which at Paris Vibrates seconds, was to be shorten'd a Line and a Quarter to reduce its Vibrations to Seconds.

M. des Hayes, in a Voyage to America, confirms the Observation of Richier; but adds, that the Diminution establish'd by that Author, appears too little.

M. Coupler the younger, upon his return from a Voyage to Brasil and Portugal, tells in with M. des Hayes, as to the Necessity of shortening the Pendulum towards the Equator more than Richier has done. He observ'd, that even at Lisbon the Pendulum which beats Seconds, must be two Lines  $\frac{1}{2}$  shorter than that of Paris; which is shorter than that of Cayenne, as fix'd by Richier; tho' Cayenne be in 24 Degrees less Latitude than Lisbon.

The Truth is, this Diminution does not proceed regularly: Mefs. Picart and de la Hire, found the Length of the Pendulum which beats Seconds exactly the same at Bayonne, at Paris, and at Uraniberg in Denmark; tho' the first be in 45<sup>o</sup>  $\frac{1}{2}$  of Latitude, and the last in the Latitude 55<sup>o</sup> 3'.

Hence M. de la Hire takes occasion to suspect that the Diminution is only Apparent; and that E. g. the Iron Yard, wherewith M. Richier measur'd his Pendulum, might be lengthen'd by the great Heats of the Isle of Cayenne; not the Pendulum shorten'd by the approach towards the Line.

To confirm this, he tells us he found, by very careful Experiments, that an Iron Bar, which exposted to the Frost was 6 Foot long was lengthen'd  $\frac{1}{2}$  of a Line by the Summer's Sun. See DILATATION, HEAT, THERMOMETER.

IV. If two Pendulums vibrate in similar Arches, the Times of the Oscillations are in the Subduplicate Ratio of their Lengths.

Hence the Lengths of Pendulums vibrating in similar Arches, are in a Duplicate Ratio of the Times wherein the Oscillations are perform'd.

V. The Numbers of Isochronal Oscillations perform'd in the same Time by two Pendulums, are reciprocally as the Times wherein the several Oscillations are perform'd.

Hence, the Lengths of Pendulums vibrating in similar and small Arches, are in the Duplicate Ratio of the Numbers of Oscillations perform'd in the same Time, but reciprocally taken.

VI. The Lengths of Pendulums suspended between Cycloids, are in a Duplicate Ratio of the Times wherein the several Oscillations are perform'd.

And hence they are in a Duplicate Ratio of the Numbers of Oscillations perform'd in the same Time, but reciprocally taken: and the Times of Oscillations in different Cycloids are in a Subduplicate Ratio of the Lengths of the Pendulums. VII. 76

VII. To find the Length of a Pendulum, which shall make any assign'd Number of Vibrations in any given Time.

Let the Number of Vibrations requir'd, be 50 in a Min. and the Length of the String, counted from the Point of Suspension, to the Centre of Oscillation, or round Ball at the End of it be requir'd: 'Tis a fix'd Rule that the Lengths of Pendulums are to each other, as the Squares of their Vibrations and Contrarywise: Now 'tis agreed that a Pendulum vibrating Seconds (or 60 times in a Minute) is 39 Inches, and  $\frac{1}{2}$  of an Inch; say therefore as the Square of 50 (which is 2500) to the Square of 60, (which is 3600) so is 39, 2. to the Length of the Pendulum requir'd: which will be found to be 36 Inches &c.

Note, In Practice, since the Product of the mean Time, will always be 1411200 (that is the Product of the Square of 60, multiplied by 39, 2.) that is 3600  $\times$  39, 2. you need only divide that Number by the Square of the Number of Vibrations assign'd; and the Quotient will give the Length of a Pendulum, that shall vibrate just so many times in a Min.

VII. The Length of a Pendulum being known, to find the Number of Vibrations it will make in a given Time.

This being the Reverse of the Former; say, As the Length given, suppose 56, 4, is to the Length of the Standard Pendulum swinging Seconds, viz. 39, 2; so is the Square of the Vibrations of the Standard Pendulum in the given Time, v. gr. a Minute, to the Square of the Vibrations sought: that is, as 56: 4139: 2, 3600: 2500.

And the Square Root of 2500, will be 50, the Number of Vibrations sought.

But for Use, here, (as in the former Problem) you need only divide 1411200 by the Length; and it gives the Square of the Vibrations; as there you divided by the Square of the Vibrations, to find the Length.

On these Principles, Mr. Derham has constructed a Table of the Vibrations of Pendulums of different Lengths in the Space of a Minute.

Pend. length in inches	Vibrat. in a Minute	Pend. length in inches	Vibrat. in a Minute
1	375.7	30	68.6
2	265.6		
3	216.9	39.2	68.0
4	187.8		
5	168.0	40	59.5
6	153.3	50	53.4
7	142.0	60	48.5
8	132.8	70	44.9
9	125.2	80	42.0
10	118.8	90	39.6
20	84.0	100	37.5

Note, These Laws, &c. of the Motion of Pendulums, will scarce hold strictly, unless the Thread that sustains the Ball, be void of Weight, and the Gravity of the whole Weight be collected in a Point.

In practice, therefore, a very fine Thread, and a small Ball, but of a very heavy Matter, are to be used. A thick Thread, and a bulky Ball disturb the Motion strangely; for in that Case, the Pendulum, of Simple, becomes compound; it being much the same as if several Weights were applied to the same inflexible Rod in several Places.

The Use of Pendulums in measuring Time in Astronomical Observations, and on other Occasions where a great Degree of Preciseness is requir'd; is too obvious to need a Description. Either the Length of the Pendulum may be adjust'd before its Application, and made to vibrate the desired Time, v. g. Seconds, half Seconds, &c. by Article VI. or it may be taken at Random, and the Times of the Vibrations afterwards determined from Article VIII.

For the Use of the Pendulum in measuring remote inaccessible Distances, &c. by means of Sound, &c. See SOUND.

PENDULUM CLOCK, a Clock, which derives its Motion from the Vibration of a Pendulum.

'Tis controverted between Galileo and Huygens, which of the two first applied the Pendulum to a Clock; for the Pretensions of each. See CLOCK.

After Huygens had discover'd that the Vibrations made in Arches of a Cycloid, however, unequal they were in extent, were all equal in Time; he soon perceiv'd that a Pendulum applied to a Clock, so as to make it describe Arches of a Cycloid, would rectify the otherwise unavoidable Irregularities of the Motion of the Clock; since, tho' the several Causes of those Irregularities should occasion the Pendulum to make greater or less Vibrations; yet, in virtue of the Cycloid, it would still make 'em perfectly equal; and thus the Motion of the Clock govern'd thereby, would be preserv'd perfectly equable. See CYCLOID.

But the Difficulty was to make the Pendulum describe Arches of a Cycloid; for, naturally, the Pendulum being tied to a fix'd Point, can only describe Arches of Circles about the same.

Here M. Huygens hit on a Secret which all the World is now ter of: The Iron Rod or Wire which bears the Bob at Bottom, he tied a Top to a Silken Thread, placed between two Cycloidal Checks, or two little Arches of a Cycloid, made of Metal. Hence the Motion of Vibration, applying incessantly from one to 't'other of those Arches, the Thread, which is extremely flexible, easily assumes the Figure thereof; and by Means hereof 'tis demonstrat'd, that the Weight suspended at the other End of the Rod, will describe a just Arch of a Cycloid.

'Tis is doubtless one of the most useful and ingenious Inventions many Ages have produced: By means whereof, we have Clocks which won't err a single Second in several Days.

'Tis true, the Pendulum is liable to its Irregularities; how minute soever they may be; M. de la Hire thinks there is still room to improve it.

The Silk Thread by which it is suspended, he observes shortens in moist Weather, and lengthens in dry; by which means the Length of the whole Pendulum, and consequently the times of the Vibrations are varied.

To obviate this Inconvenience, M. de la Hire, in lieu of a Silk Thread, used a little fine Spring; which was not indeed subject to shorten and lengthen; but which he found grew stiffer in cold Weather, and made its Vibrations faster than in warm.

He had therefore recourse to a stiff Wire or Rod, Firm from one End to 't'other. Indeed, by this means he renounc'd the Advantages of the Cycloid; but he found, as he says, by Experience, that the Vibrations in Arches of Circles are performed in Times as equal, provided they be not of too great Extent, as those in Cycloids. But the Experiments of Sir J. Moor and others, have demonstrat'd of the contrary.

The ordinary Causes of the Irregularities of Pendulums, Mr. Derham ascribes to the Alterations in the Gravity, and Temperature of the Air; which increase and diminish the Weight of the Ball, and by that means make the Vibrations greater and less: An Accession of Weight in the Ball being found by Experiment to accelerate the Motion of the Pendulum.

A Weight of Six Pound added to the Ball, Mr. Derham found, made his Clock gain 13 Seconds every Day.

A general Remedy against these Inconveniences of Pendulums, is to make 'em long, the Bob heavy, and to vibrate but a little way: this is the usual means in England; the Cycloidal Checks being generally overlook'd.

To correct the Motion of Pendulum Clocks; the usual Method is to screw and let down the Ball; but a very small Alteration here having a very great Effect; Mr. Derham prefers Huygens's Method, which is to have a small Weight or Bob to slide up and down the Rod above the Ball, which is to be immovable: tho' he improves on the Method, and recommends having the Ball to screw up and down, to bring the Pendulum near its Gage; and the little Bob to serve for the nicer Corrections, as the Alteration of a Second, &c.

Mr. Huygens orders the Weight of this little Corrector to be equal to that of the Wire, or 50<sup>th</sup> of that of the great Ball: He adds a Table of the Alterations, the several fittings thereof will occasion in the Motion of the Pendulum; wherein it is observable, that a small Alteration towards the lower End of the Pendulum, makes as great an Alteration in Time, as a greater rising or falling does when higher.

PENDULUM ROYAL, a Name given among us to a Clock, whose Pendulum swings Seconds, and goes eight Days; shewing the Hour, Minutes, and Seconds. See CLOCK.

The Numbers of such a Piece are thus calculated; first cast up the Seconds in 12 Hours, and you will find them to be 43200 = 12  $\times$  60  $\times$  60. The swing Wheel must be 30 to swing 60 Seconds in one of its Revolutions: Now let  $\frac{1}{2}$  43200 = 21600, be divided by 30, and you will have 720 in the Quotient, which must be broken into Quotients; the first of them must be 12 for the great Wheel which moves round once in 12 Hours. 720 divided by 12, gives 60, which may also be conveniently broken into 8 ) 96 ( 12 two Quotients, as 10 and 6, or 5 and 12, or 8 ) 64 ( 8 and 7  $\frac{1}{2}$ ; which last is most convenient: and 8 ) 60 ( 7  $\frac{1}{2}$  if you take all your Pinions 8, the Work will stand thus.

According to this Computation, the great Wheel will go about once in 12 Hours, to shew the Hour; the second Wheel once in an Hour, to shew the Minutes; and the swing Wheel once in a Minute, to shew the Seconds. See MOVEMENT and CLOCK-WORK.

PENECILLA, in Pharmacy, a Lozeng, made round by rolling; the same as Toruscula; thus call'd from Penecillus a Penel, which it resembles in shape.

PENECILLUS, among Chirurgeons, is used for a Tent, to be put in Wounds or Ulcers. See TENT.

**PENETRATION**, the Action whereby one Thing enters another, or takes up the same Place. See **PLACE**.

The School-men define **Penetration**, the Co-existence of two or more Bodies; so, as one is present, or has its Extension in the same Place as the other. See **EXISTENCE** and **BODY**. See also **MATTER**, **SOLIDITY**, &c.

In **Physics**, the real **Penetration of Bodies** is held absurd, i. e. that two Bodies should be at the Time in the same Place: accordingly **Impenetrability** is laid down as one of the essential Properties of Matter. See **IMPENETRABILITY**.

What we popularly call **Penetration**, only amounts to the Matter of one Body's being admitted into the Vacuity of another. See **VACUITY**, **DIMENSION**.

Such is the **Penetration of Water thro' the Substance of Gold**. See **WATER**, **GOLD**, &c. See also **HARDNESS**.

**PENIDIUM**, in Pharmacy, *Barly-Sugar*; a Preparation of Sugar, made by boiling it up with a Decoction of Barley, till it become Brittle; which done, it is turn'd out upon a Marble, arointed with Oil of Sweet Almonds, kneaded with the Hands like putt; and while yet hot, drawn out into Sticks twisted like Corda. See **SUGAR**.

*Penidas* are very good against Colds, to moderate the Acrimonies of the Breat, promote Expectoration, &c.

Dr. Quincy uses the term *Pemiatum*, for a kind of clarified Sugar, with a Mixture of Starch, made up into Bolus's.

**PENINSULA**, in Geography, a Portion, or Extent of Land, joining to the Continent by a narrow Neck, or *Isthmus*; the rest encompassed with Water. See **ISTHMUS**.

Such is *Peloponnesus*, or the *Mores*, *Africa*, &c.

*Peninsula* is the same with *Cheersonsus*. See **CHEERSONSUS**.

The Word is compounded of the *Latin*, *Pene*, and *Insula*; *q. d.* almost Island, which the *French* pertinently enough render *presque Isle*.

**PENIS**, in Anatomy, a part of the Body, from its form, call'd also the *Tors*; and by way of Eminence the *Member*, or *virile Member* as being one of the principal Organs of Generation in the Male Kind. See **GENERATION**, and **MALE**.

It is fasten'd to the lower Part of the *Os Pubis*, and the upper Part of the *Isthmus*: Its Body consists of the two *Corpora Cavernosa*, the *Corpus Cavernosum Urethrae*, and the *Urethra* itself.

The *Corpora Cavernosa* of the *Penis*, call'd also *Corpora Nervosa* & *Spongiosa*, &c. have two distinct Origins in the *Os Pubis*; whence they proceed, growing both in bulk and thickness, till they meet the *Corpus cavernosum of the Urethra*; where they join; leaving an Interslice or Channel for its Passage along 'em; and thus continue their Progress, connected together by a membranous Body call'd the *Septum*, and terminating at length in the Glans. See **CAVERNOSA Corpora Penis**.

The Cavernous Body of the Urethra, includes the *Urethra* or Urinary Passage. Its form contrary to that of the other Cavernous Bodies, is largest at the two Extremes, and smallest in the Middle.

That Part inclosed between the two Origins of the Cavernous Bodies of the *Penis*, Mr. Cowper calls the *Bulb of the Urethra*: Its other Extremity being dilated, forms the Body call'd the *Glans*. See **URETHRA**, **BULB** and **GLANS**.

The *Penis* receives Arteries from the internal Iliac Branches, and Umbilical Arteries; and these at Length subdividing into innumerable Branches, from the capillary Extremities thereof arise so many Veins; in whose Channels are Apertures corresponding to so many Cells, which communicating with each other, empty 'emselves into larger Venous ducts, running on the superior Surface of the *Penis*; some whereat join the Veins of the Prepuce; others make one large Trunk, call'd *Vena Penis*, which marching on the *Dorsum Penis* to the *Prostate*, there divides and enters the internal Iliac on either Side.

The *Penis* has Nerves from a Trunk composed of a Coalescence of the third of the *Os Sacrum*, and a Branch of the great Crural: These ascending the Cavernous Bodies, expand 'emselves o'er the upper Surface thereof, and are thence distributed to all Parts of the *Penis*.

It has Lymphæducts very numerous on its Surface under the Skin, which discharge 'emselves into the Glandular Inguinales. See **SEED** and **URINE**.

The *Penis* has two pair of Muscles, and an odd one; the odd Muscle is call'd *Accelerator Urinae*: its upper Part, which covers the Bulb, serves to streighten the Veins passing thro' it from the *Corpus Cavernosum of the Urethra*, and thus hinders the Reflux of the Blood in Erection; and by repeated Contractions, drives the Blood into the Bulb towards the Glans. Its Elevation serves to compress the Channel of the *Urethra*, and to force out the contain'd Seed or Urine. See **ACCELERATOR URINE**.

The first pair of Muscles is call'd the *Erectores Penis*. By their Action the *Penis* is sustain'd, and drawn towards the *Pubes*; and by the Assistance of the suspensory Ligament of the *Penis*, this *Vena Penis* is applied to the transverse Ligament of the *Os Pubis*, and the reflux Blood hinder'd from

passing that way; whereby the *Capora Cavernosa* become distended. See **ERECTORES Penis**.

The last pair of Muscles are the *Transversales Penis*, which vary in various Subjects, and are sometimes wanting: Their Use is to dilate that Part of the Cavernous Body of the Urethra, to which they are fasten'd. See **TRANSVERSALES Penis**.

The *Penis* has also three Glands, first discover'd by Mr. Cowper; these all empty 'emselves into the *Urethra*, and from the Tenacity of the Liguor they separate, are call'd the *Mucous Glands*. See **MUCOUS GLANDS**.

The whole Compages of the *Penis* is invest'd with a Cellulose Membrane, of admirable Texture; which again is cover'd with a firm nervous Coat; and that with a *Corticis and Cutis*: The Duplicature of the *Cutis* on the Glans, makes the Prepuce. See **PREPUTIUM**.

It is tyed to the lower Part of the Glans by a Ligament, call'd the *Frenum*. See **FRENUM**.

By another Ligament, call'd *Suspensorium*, the *Penis* is held up to the *Os Pubis*. See **LIGAMENTUM suspensorium Penis**.

The Use of the *Penis* is for the Evacuating of the Seed and Urine. See **SEED** and **URINE**.

Indeed, Dr. Drake, from a View of its Structure, thinks it originally intended for the former only; and that the Conveyance of the Urine was not consider'd by Nature in the Mechanism of this Part.

He adds another Use, viz. the Incitement to the Propagation of the Species.

In Effect, without such an Instrument, the Seed of the most fertile Animals cou'd not be convey'd to the Place of Prolinication: Add to this, that an Alternation of Erection and Flaccidity is absolutely necessary; the first for the Performance of its Office, the second for the Security of the Part.

Without an Erection, it were impossible to emit and lodge the Seed where it ought to be; and with a constant one, almost as impossible to secure the Part from Injuries; not to mention the Loss of Insatiation, which wou'd be the Consequence of constant Erection. See **SATYRIASIS**, &c.

The Cause of the Erection of the *Penis* is the Blood distending the *Capora Cavernosa*; as is evident from many Experiments; among the rest, from tying the *Penis* of a Dog in *Court*, in which nothing is found but Blood. And hence, in the Bodies of Criminals that hang long after death, the *Penis* becomes erected, by the Blood's falling to the inferior Parts, and stopping there.

The Cavernous Body of the Urethra is erected by the *Musculi Acceleratores*, embracing the Veins of its Bulb. See **ERECTION**.

**PENITENCE**, *Pœnitentia*, is sometimes used for a State of Repentance, and sometimes for the Act of Repenting. See **REPENTANCE**.

**PENITENCE** is also used for a Discipline or Punishment attending Repentance, more usually call'd *Penance*. See **PENANCE**.

**PENITENCE**, is also the Title of several religious Orders, consisting of converted Debaschees, and reform'd Prostitutes; or of Persons who devote 'emselves to the Office of reclaiming 'em.

Of this latter Kind is the Order of *Penitence* of St. Magdalen, establish'd about the Year 1272, by one Bernard, a Citizen of *Marseilles*; who devoted himself to the work of converting the Courtesans of that City.

Bernard was seconded by several others; who making a kind of Society, were at length created into a religious Order by Pope Nicholas III. under the Rule of St. Augustin.

F. Gelsay adds, that they also made a religious Order of the *Penitents*, or Women they converted, giving 'em the same Rules and Observances which they themselves kept.

The Congregation of *Penitence of the Magdalen at Paris*, owed its Rise to the preaching of F. Tisseran, a *Franciscan*; who converted a great Number of Courtesans about the Year 1492.

Leuis, Duke of Orleans, gave 'em his House for a Monastery; or rather, as appears by their Conditions, Charles VIII. gave 'em the Hotel, call'd *Boisgogne*, whence they were removed to St. George's Chapel in 1572. By Virtue of a Brief of Pope Alexander, Simon, Bishop of Paris, in 1497, drew 'em up a Body of Statutes, and gave 'em the Rule of St. Augustin.

To qualify a Woman for Admission, it was required that she had committed the Sin of the Flesh: None were admitted above 35 Years of Age.

Till the Beginning of the last Century, none but *Penitents* were admitted; but since its Reformation by Mary Avoquin, in 1626, none have been admitted but Maids; who, however, still retain the ancient Name *Penitents*. See **PRÉSENTS**.

**PENITENTS**, are certain peculiar Friars, or Societies of Persons who assemble together for Prayers, make Processions bare footed their Faces cover'd with Linnen, and give 'emselves Discipline.

There are white *Penitents* in Italy, at *Avignon*, and at *Lyon*: There are also blue *Penitents*, and black *Penitents*, which last assist Criminals at their Death, and give 'em Burial.

*Mabillon* tells us, that at *Turin* there are a Set of *Penitents* kept in pay, to walk thro' the Streets in Procession, cut their Shoulders with Whips, &c.

*PENITENTS*, or *Converts of the Name of Jesus*, a Congregation of Religious in *Sevil*; consisting of Women, who have led a licentious Life; founded in 1550.

This Monastery is divided into three Quarters: one for professed Religious; another for Novices; a third for those under Correction.

When these last give Signs of a real Repentance, they are removed into the Quarter of the Novices; where, if they don't behave 'emself well, they are remanded to their Correction. They observe the Rule of *St. Augustin*.

*PENITENTS of Orvieto*, are an Order of Nuns, instituted by *Anthony Sinocelli*, a Gentleman of *Orvieto*.

The Monastery he built, was at first destined for the Reception of poor Girls, abandoned by their Parents, and in danger of losing their Virtue.

In 1663, it was crested into a Monastery, for the Reception of such as having abandoned 'emself to the Flesh, were willing to take up and consecrate 'emself to God by solemn Vows. Their Rule is that of the *Carmelites*.

These Religious have this in peculiar, that they undergo no Novitiate. All they require is, that they continue a few Months in the Monastery in a secular Habit; after which they are admitted to the Vows.

*PENITENTIAL, PENITENTIALE*, an Ecclesiastical Book, retain'd among the *Romanists*; wherein is prescribed what relates to the Imposition of *Penance*, and the Reconciliation of *Penitents*. See *PENANCE* and *PENITENT*.

In the Capitularies of *Charlemaign*, the Priests are enjoind to study well their *Penitential*.

There are various *Penitentials*; the *Roman Penitential*; that of *Venerable Bede*; that of *Pope Gregory III.* &c.

*PENITENCIARY*, an Office, or Tribunal in the Court of *Rome*; wherein are examined and deliver'd out the secret Bulls, Graces, or Dispensations relating to Conscience, Confession, &c. See *BULL*, &c.

The Expeditions of the *Penitentiary* are seal'd up with red Wax; and sent clost; directed to the Confessors.

*PENNATA Folia, winged Leaves*; amongst *Botanists*, are such Leaves of Plants, as grow directly one against another, on the same Rib, or Stalk as: those of Ash, Walnut Trees, &c. See *LEAVES, PLANT*, &c.

*PENITENTIARY*, is also an Officer, or Dignitary in some Cathedrals, vested with Power from the Bishop to absolve Cases reserv'd to him; on which Account he is call'd the *Bishop's Ear*.

In some Places there is a *Grand Penitentiary*, and a *Sub-Penitentiary*. *Augustinus* says, that *Pope Simplicius* chose some among the *Roman Priests* to preside over *Penances*. At present the *Pope* has his *Grand Penitentiary*; who is a Cardinal, and the Chief of the other *Penitentiary Priests* establish'd in the Patriarchal Churches of *Rome*, who consult him in difficult Cases.

He presides in the *Penitentiary*, dispatches Dispensations, Absolutions, &c. and has under him a *Regent*, and twenty four *Proctors* or *Advocates* of the  *sacred Penitentiary*.

*PENNON*, a Standard with a long Tail; antiently belonging to a simple Gentleman; properly us'd as a Guidon to place over a Tent. See *GEIRON*, &c.

It is oppos'd to the *Banner*, which was square; and hence, when any one was to be made a *Banneret*, the Ceremony consisted in Cutting off the Tail of his *Pennon*, and thus converting it into a *Banner*. See *BANNER*, or *BANNERET*.

The word comes from the *Latin, Pennus, Cloath*.

*PENNY*, or *PENY*, in Commerce, an ancient *English Coin*, which had formerly considerable Course; but is now generally divid'd into an imaginary Money, or Money of Account. See *MONEY* and *COIN*.

The ancient *English Penny, Penig* or *Pening*, is the first Silver Coin struck in *England*; nay, and the only one Current among our *Saxon Ancestors*, as is agreed by *Cambden Steteman, Dr. Hicks*, &c.

Hence, *Penny*, in ancient Statutes, &c. is used for all Silver Money. *Cambden* derives the Word from the *Latin, Pennus, Money*, in the general; and hence the *Ward-Penny, Awer-penny, Hundred-penny, Tithing-penny, and Brethal-penny*.

The *Penny* was equal in Weight to our *Three-pence*; five of 'em made one *Shilling*, or *Sixling Saxon*; thirty a *Mark* or *Mancuss*, equal to our 7*l. 6*s.** See *MARK, MANCUSS* &c.

Till the Time of King *Edward I.* the *Penny* was struck with a Cross so deeply indented in it, that it might be easily broke, and parted, on occasion, into two parts; thence call'd *Half-pennys*; or into four, thence call'd *Fourthings*, or *Farthings*. See *FARTHING*.

But that Prince coin'd it without Indenture; in lieu of which he first struck round *Half-pence* and *Farthings*.

He also reduc'd the Weight of the *Penny* to a Standard; ordering that it should weigh 32 Grains of Wheat, taken out of the Middle of the Ear.

This *Penny* was call'd the *Penny Sterling*. See *STERLING*.

Twenty of these *Pence* were to weigh an Ounce; whence the *Penny* became a Weight, as well as a Coin. See *PENNY WEIGHT*.

The *Penny Sterling*, is now nigh disused as a Coin, and scarce subsists, but as a Money of Account; containing the 12th Part of a *Shilling*. See *SHILLING*. Or the two hundred and fortieth Part of a *Pound*. See *POUND*.

The Course of Exchange between *England* and *France*, is settled on the Foot of so many *Pence Sterling*, for a *French Crown* of three *Livres*. See *EXCHANGE*.

The *French Penny*, or *Denier*, is of two Kinds; the *Paris Penny*, call'd *Denier Paris*; and the *Penny of Tours*, *Denier Tournois*. See *DENIER*.

The *Dutch Penny*, call'd *Pening*, is a real Money, worth about one fifth more than the *French Penny Tournois*.

The *Penny* is also used as a Money of Account, in keeping Books by *Pounds, Florins* and *Patards*; twelve *Pennins* make the *Patard*; and twenty *Patards* the *Florin*. See *FLORIN*.

At *Hambourg, Nuremberg*, &c. the *Penny of Account*, is put equal to the *French Penny Tournois*. Eight of 'em make the *Kreuz*; and 60 the *Florin* of those Cities; and 90 the *French Crown*, or 4*s. 6*d.** *Sterling*.

*PENNY-WEIGHT*, a *Troy Weight*, containing 24 Grains; each Grain weighing a Grain of Wheat gather'd out of the Middle of the Ear, well dried. See *WEIGHT* and *GRAIN*.

Twenty of these *Penny-weights* make an Ounce *Troy*. See *OUNCE*.

A *Penny-weigh* of Gold Bullion Standard, is worth four *Shillings*; and of Silver Bullion, Three-pence. See *GOLD* and *SILVER*.

The Name took its rise hence, that this was actually the Weight of one of our ancient Silver *Penninges*. See *PENNY*.

*PENNY-POST*. See *PENNY-POST*.

*PENSA Libra*, in our ancient Customs, a Pound of Money paid by Weight, not by Tale. See *POUND* and *LIBRA*.

*PENSION*, a yearly Appointment, or Sum of Money paid any one for Services, or Considerations already past. See *PENSIONARY*.

That which in the two Temples is call'd a *Parliament*, and *Lincoln's-Inn* a *Council*, is in *Gray's-Inn* termed a *Pension*; that is, an Assembly of the Members of the Society, to consult of the Affairs of the House. See *PARLIAMENT*, &c.

*Pensions* are also certain annual Payments of each Member to the House, for certain Occasions.

When a *Pension-Writ* is issued, none sued thereby in the Inns of Court, shall be discharged, or permitted to come into Commons, till all Duties be paid.

Hence a *Pension-Order* in the same Inn, is a peremptory Order against such of the Society as are in Arrear for *Pensions*, and other Duties.

*PENSIONARY*, or *PENSIONER*, a Person who has a *Pension*, Appointment, or yearly Sum, payable during Life, by way of Acknowledgement; charg'd on the Estate of a Prince, Company, particular Person, &c.

In the *Romish Countries*, 'tis frequent to have *Pensions on Benefices*: These were antiently granted with a great deal of Ease, under pretence of Infirmities, Poverty, &c. But since the XII. Century, these Pretences were carried so far, that the Incumbents, or Titularies of Benefices were little more than Farmers.

This oblig'd the spiritual Powers to fix the Causes, and the quantities of *Pensions*. *Pensions* are now only creatable by the *Pope*; and are never to exceed one third of the Revenue, two thirds being still to remain to the Incumbent.

*PENSIONARY*, is also the first Minister of the States of the Province of *Holland*. See *STATES*.

The *Pensionary* is Chairman in Assemblies of the States of that Province; he proposes the Matters to be consulted on, collects the Votes, forms and pronounces the Resolutions of the States, opens Letters, confers with foreign Ministers, &c.

He is charg'd with inspecting the Finances, preserving the Rights of the Province, maintaining the Authority of the States, and seeing to the Observation of Laws, &c. for the good of the State.

He affits in the College of Deputy-Cancellors of the Province, who represent the Sovereignty in the Absence of the States; and is perpetual Deputy of the States General of the United Provinces.

His Commission is only given for five Years; after which 'tis deliberated whether or no it shall be renew'd. Indeed, there is no Instance of its having been revoked. Death only puts a Period to the Functions of this important Minister.

Formerly, he was call'd the *Advocate of the Province*: The Title *Pensionary* was only given at the Time *Barneveld* had the Office.

*Grævus* calls him in Latin, *Abſeſſor Jurisperitus*; *Merrila*, *Abſeſſor Generalis*; *Matheus*, *Prokitor* at *Leiden*, *Conſultorius Penſionarius*; which is the Quality the States give him in their Inſtruments.

**PENſIONARY**, is alſo the firſt Miniſter of the Regency of each City, in the Province of *Holland*. See **PROVINCE**.

His Office is to give his Advice in Matters relating to the Government, either of the City in particular, or of the State in General; and in Aſſemblies of the States of the Province is Speaker in behalf of his City.

Yet, the Functions of theſe *Penſionaries* is not alike every where: In ſome Cities they only give their Advice; and are never found in Aſſemblies of the Magiſtrates, except when expreſſly call'd thither: In others they attend conſtantly; and in others they even make the Propoſitions on the Part of the Bourgeois Maſters, draw up their Concluſions, &c.

They are call'd *Penſionaries*, becauſe they receive an Appointment of *Penſion*.

**Gentlemen-PENſIONERS**, a Band of Gentlemen, whoſe Buſineſs is to Guard the King's Perſon in his own Houſe; and who for that End wait in the preſence Chamber.

They were firſt ſet on Foot by *K. Henry VII.* The Number is Forty; and oblige to keep three double Horſes and a Servant, who is to be arm'd: ſo that they properly make a Troop of Guards; and have accordingly been maſter'd by their own Officers: but this part of Duty, to which they are ſwore, the King uſually diſpenſes with.

Their Officers are a Captain, Lieutenant, Standard-bearer, and Clerk of the Choque.

Their ordinary Arms are gniſt Pole-Axes, with which they attend the King to and from the Chapel Royal; receiving him in the Preſence Chamber, or coming out of his private Lodging; as alſo at all great Solemnities. Their *Penſion* 100*l.* per Annum.

**PENTACHORD**, an ancient muſical Inſtrument, with five Strings; whence the Name, of *πεντε*, five, and *χορδης* Chord, String.

The Invention of the *Pentachord* is refer'd to the *Scythians*: The Strings were of Bullocks Leather, and were ſtruck with a *Plectrum* made of Goats Horn.

**PENTACROSTICK**, a Set or Series of Verſes ſo diſpoſ'd, as that there are always found five Acroſticks of the ſame Name, in five Diviſions of each Verſe. See **ACROSTIC**.

**PENTAGON**, in Geometry, a Figure with five Sides, and five Angles; whence its Name; from the Greek *πεντα* five, and *γωνια* gonia. See **POLYGON**.

If the five Sides be equal, the Angles are ſo too; and the Figure is call'd a *regular Pentagon*: As Fig. 47. Tab. Geometry.

Moſt Cittadels are regular *Pentagons*. See **CITTADEL**.

The moſt conſiderable Property of a *Pentagon* is, that one of its Sides, v. g. *D E*, is equal in Power to the Sides of a *Hexagon*, and a *Decagon* inſcribed in the ſame Circle *A B C D E*: that is, the Square of the Side *D E* is equal to the Sum of the Squares of the Sides *D A* and *D B*.

*Pappus* has alſo demonſtrated that twelve regular *Pentagons* contain more than twenty Triangles inſcribed in the ſame Circle. *Lib. 5. prob. 45.*

The *Dodecahedron*, which is the fourth regular Body, conſiſts of twelve *Pentagons*. See **DODECAHEDRON**.

**Projection or Perſpective of a PENTAGON**. See **PERSPECTIVE**.

**PENTAGRAPH**, an Inſtrument whereby Deſigns, Prints, &c. of any Kind, may be copied in any Proportion; without a Perſon's being ſkill'd in drawing. See **DEMONSTRATION, REDUCTION, &c.**

The Inſtrument is otherwiſe call'd a *Parallelogram*. See **PARALLELOGRAM**.

The common *Pentagraph* (repreſented Tab. *Miſcellany* Fig. 6.) conſiſts of four Rulers or Wooden Rulers, two of 'em from 15 to 18 Inches long, the other two half that length. At the Ends, and in the Middle of the longer Rulers, as alſo at the Ends of the ſhorter are Holes; upon the exact fixing whereof the Perfection of the Inſtrument chiefly depends. Thoſe in the Middle of the long Rulers are to be at the ſame diſtance from thoſe at the ends of the long ones, and thoſe of the ſhort ones; ſo that when put together they may always make a *Parallelogram*.

The Inſtrument is fitted together for uſe, by ſeveral little Pieces, particularly a little Pillar, Fig. 1. having at one End a Screw and Nut, whereby the two long Rulers are joined; and at the other a little Knot for the Inſtrument to ſlide on. The Piece 2 is a Rivet with a Screw and Nut, wherewith each ſhort Ruler is faſten'd to the Middle of each long one. The Piece 3 is a Pillar, one End whereof being hollow'd into a Screw, has a Nut to fit it.

At the other End is a Worm to ſcrew into the Table: when the Inſtrument is to be uſed, it joins the Ends of the two ſhort Rulers. The Piece 4 is a Pen, Portcraque, or Pencil, ſcrew'd into a little Pillar. Laſtly, the Piece 5 is a Braſs-point, moderately blunt, ſcrew'd likewiſe into a little Pillar.

*Uſe of the PENTAGRAPH or Parallelogram.*

1. To Copy a Deſign in the ſame Scale or Bigneſs as the Original: Screw the Worm 3 into the Table; lay a Paper under the Pencil 4, and the Deſign under the Point 5. This done, conducting the Point over the ſeveral Lines and Parts of the Deſign, the Pencil will draw or repeat the ſame on the Paper.

2. If the Deſign be to be reduced *E. gr.* into half the Space; the Worm muſt be placed at the End of the long Ruler 4; and the Paper and Pencil in the Middle. In this Situation conduct the Braſs-point over the ſeveral Lines of the Deſign as before; and the Pencil at the ſame Time will draw its Copy in the Proportion requir'd; the Pencil here only moving half the Lengths that the Point moves.

Hence, on the contrary, if the Deſign be to be enlarged by one half: The Braſs-point, with the Deſign, muſt be placed in the Middle, at Fig. 3. the Pencil and Paper at the End of the long Ruler, and the Worm at the other.

3. To enlarge or reduce in other Proportions, there are Holes drill'd at equal Diſtances on each Ruler, viz. all along the ſhort ones, and half way the long ones; in order for placing the Braſs Point, Pencil, and Worm in a right Line therewith; *i. e.* if the Piece carrying the Point be put in the third Hole, the two other Pieces muſt be put each in its third Hole.

If then, the Point and Deſign be placed at any Hole of the great Rulers, and the Pencil with the Paper at any Hole of the ſhort Ruler, which forms the Angle therewith; the Copy will be leſs than half the Original. On the contrary, if it be placed at one of the Holes of that ſhort Ruler, which is parallel to the long Ruler, the Copy will be greater than half the Original.

The Conſtruction of this Inſtrument requires a Degree of Accuracy, which moſt of our Inſtrument Makers are Strangers to; for which reaſon there are very few of the Inſtruments that ſucceed. Few will do any Thing tolerably but ſtraight Lines; and many of 'em not theſe.

**PENTAMETER**, in Poetry, a kind of Verſe, conſiſting of five Feet. See **VERSE** and **FOOT**.

The two firſt Feet of a *Pentameter*, may be either Daſtyls, or Spondees; the third always a Spondee; and the two laſt Anapaſts.

It is uſually join'd to Hexameters, in Elegies, Epiſtles, Epigrams, and other little Pieces. There is no work of *Pentameters* alone. See **HEXAMETER**.

The Word is form'd from the *πενταμετρος*, *q. d. ſive* *Meaſures*.

**PENTAPETALOUS Plants**, are ſuch whoſe Flower conſiſts of five Leaves. See **PELAT**.

**PENTAPOLIS**, in Geography, &c. a Country wherein are five Cities.

The Name has been given to ſeveral Countries, particularly the Valley wherein ſtood the five infamous Cities deſtroy'd by the Shower of Fire and Brimſtone, in the Time of *Abraham*.

'Tis commonly ſuppoſed, this Country was the Place where now ſtands the Lake *Alphardites*, or dead Sea: *Senſon* places it in the Neighbourhood of this Lake, but without any Proof. *D'Herbort* calls this the *Pentapolis of the Soudanes*.

The *Pentapolis of Egypt* was in the *Cyrenæica*, on the Sea of *Libya*; its five Cities were *Berenice*, *Aſiutic*, *Ptolemais*, *Cyrene*, and *Apollonia*.

Among the ancient Geographers and Hiſtorians, we likewiſe read of the *Pentapolis of Libya*, now call'd *Meſſatra*; the *Pentapolis of Italy*; and the *Pentapolis of Aſia Minor*.

**PENTAPTOTON**, in Grammar, a Noun which has only five Caſes. See *Aptote* and **CASE**.

**PENTASTICH**, in Poetry, a Stanza, or Diviſion of a Poem, conſiſting of five Verſes. See **STANZA**.

**PENTASTYLE**, in Architecture, a Work wherein are five Rows of Columns.

Such was the *Porrico* begun by the Emperor *Gallian*, and which was to have been continued from the *Flaminian Gate* to the Bridge *Milvian*, *i. e.* from the *Porto del Popolo*, to the *Ponte-nole*.

**PENTATEUCH**, in the ſacred Learning, the five Books of *Moſes*, at the Head of the Old Teſtament; viz. *Genſis*, *Exodus*, *Leviticus*, *Numbers*, and *Deuteronomy*. See **BIBL.**

The Word is form'd from the Greek *πεντατευχον*.

*Pere Simon*, in his *Hiſt. Crit. An. V. Teſt.* produces a good Number of Paſſages to prove that *Moſes* was not wholly the Author of the *Pentateuch*, as we now have it. Indeed, thoſe apparent Interpolations at the End, are ſufficient to determine the Point; it being abſurd to ſuppoſe *Moſes* the Author of the Account of his own Death and Burial, and of the Compariſon between him and the ſucceeding Prophets in *ſpſac*.

Theſe interpolated Paſſages are uſually attributed to *Eſdras*; who, on his Return from the *Babylonish* Captivity, is ſup-

supposed to have publish'd the Old Testament, or at least a Part of it corrected and enlarg'd. See CANON.

There are two famous *Pentateuchs*, or Editions of the *Pentateuch*, which have a long Time disputed the Preference, both as to Antiquity, and as to Character, viz. that of the *Jews*, call'd the *Jewish* or *Hebrew Pentateuch*, wrote in *Chaldean* or *Affyrick* Characters; and that of the *Samaritans* wrote in the *Samaritan* or *Phœnician* Character.

Each is maintain'd to be the ancient *Hebrew*; tho' the Generality of the Critics give it in behalf of the latter. See HEBREW.

Indeed, as to the Point of Matter, they are generally pretty conformable to each other; each has all the interpolated Passages above-mention'd, tho' the *Samaritans* has one or two more, not in the *Hebrew*. The first Passage in *Deut.* 27. 4 where an Altar is enjoin'd to be built, and Sacrifices to be offer'd at Mount *Ebal*, or rather Mount *Gerizim*, which Passage was doubtless joind in to countenance the *Samaritan* Worship, and represent it of equal Antiquity with that of the Temple of *Jerusalem*. See SAMARITANS.

Indeed, Mr. *Whiston* declares he sees no Reason to accuse the *Samaritan* of Corruption, in these Points, but rather the *Jewish*; and earnestly concludes that the Former is an uncorrupted Copy of the Books of *Moses*, originally derived from the first Separation of the ten Tribes 'emselves, in the Days of *Jeroboam*; the contrary whereof is apparent from the mere confessed Interpolations ascribed to *Esdras*, who lived several hundred Years after the time of *Jeroboam*.

But the grand Difference is in the Character: The *Jewish* being in the *Chaldean* or *Affyrick* Character, and the *Samaritan* in the *Phœnician*, i. e. the *Canaanitish* Character; this latter seems to have an Advantage over the vulgar *Jewish Pentateuch*; yet is *Prideaux* of Opinion, the Latter is only a Transcript from the Former, out of the *Chaldean* into the old *Hebrew* Character. One great Reason he gives, is, that there are many Variations in the *Samaritan*, manifestly occasioned by mistaking the similar Letters in the *Hebrew* Alphabet; which Letters having no Similitude in the *Samaritan* Character, 'tis evident the Variations must have arisen in transcribing from the vulgar *Hebrew* into the *Samaritan*; not the contrary way.

Add to this, that *Simon*, *Aliv*, and many other learned Men take the *Chaldean* or *Affyrick* Character to have been the Character always in use among the *Jews*; and the *Samaritan* or *Canaanitish*, or as it is also call'd the old *Hebrew* Character, to have never been used by the *Jews* before the Captivity, in any manner, either in Books or on Medals. See CHARACTER.

Hence the *Pentateuch* must have been transcribed into that Character; and that, probably, to render it legible to the Inhabitants of *Samaria*, who upon the first Introduction of the *Pentateuch* might probably be vers'd in no other Character.

*Usher* takes the *Samaritan Pentateuch* to have been compiled by *Dositheus* a *Samaritan*, mention'd by *Origen* to have adulterated the *Pentateuch*. *Du-fin* supposes it the Work of some modern *Samaritan*, whom he imagines to have compiled it chiefly out of the different Copies of the *Palestinian* and *Babylonian Jews*, and the *Syriac*; because it sometimes agrees with one, and sometimes with another.

PENTATHLON, in Antiquity, the five Exercises performed in the Grecian Games, and for which Prizes were proposed. See EXERCISES, GAME, &c.

These Exercises were Wrestling, Boxing, Leaping, Running and Quoit-playing.

He who bore away the Prize in 'em all, was call'd *Pentathletis*; by the *Latins*, *Quincurrus*; as the five Exercises themselves were by those latter People call'd *Quinquerrimus*.

PENTATONON, in the ancient Music, a Concord, by us call'd the greater Sixth. See SIXTH.

It consists of four Tones, and a major and minor Semitone; whence the Name *Pentatonon*, i. e. five Tones.

PENTECOST, *Whitsuntide*, a solemn Feast of the Church, held in Commemoration of the Descent of the Holy Ghost on the Apostles; as described in the Acts. See FEAST.

It has its Name from the Greek *πενήντης*, *Quinquagesimus* 50th, because held on the fiftieth Day after Easter. See EASTER.

In the ancient Church, *Pentecost* finish'd the Paschal Time, or *Easter-Season*; wherein, as *Tertullian*, *St. Jerome*, &c. observe, *Hallelujah* was sung every where, the Office celebrated standing, no Fasting allowed, &c.

The *Jews* likewise had a Feast, they call'd *Pentecost*, or *Quinquagesimus*; solemnized in Memory of the Laws being given to *Moses* 50 Days after their Departure out of *Egypt*.

PENTECOSTALS, antiently, were pious Oblations made at the Feast of *Pentecost*, by the Parishioners, to their Parish Priest; and sometimes by inferior Churches or Parishes, to the principal Mother Church. See OBLATION.

These Parish *Pentecostals* were also call'd *Whitsun-Farthings*; and their *Sam* was divided into four Parts, of which one went to the Priest, one to the Poor, one towards the Re-

pair of the Parish Church, and one to the Bishop. See WHITSON-FARTHING.

PENTECONTIORS, a Vessel with fifty Oars.

PENTESTRINGUS, in Antiquity, a Sort of Pillory, with five Holes; wherein were fastned the Legs, Arms, and Heads of Criminals, to prevent their stirring.

PENTHEMIMERIS, in the Greek and Latin Poetry, part of a Verse consisting of two Feet, and a long Syllable.

The Word is Greek *πενήμιμυρος*.

PENULTIMA, or PENULTIMATE, in Grammar, &c. a Syllable, or Foot, immediately before the last.

Hence *Antepenultimate* is that before the *Penultimate*, or the last but two.

The Word is form'd from the Latin, *Penes* & *ultimus*, almost last.

PENULTIMATE, in Music. *M. Brossard* will have it the same with what the Greeks call'd *Paranete*; tho' others won't allow the *Paranete* to be the *Penultimate* Chord, but the next thereto.

The *Penultimate* of the *separate*, *Paranete Diezeugmenon*, is a Name the Ancients gave to one of the Chords of their Lyre or System; corresponding to the *D, la, re*, of the third Octave of the modern System.

*Penultimate* of the *Acute*, Or *paranete Hyperbœion*, a Chord of the ancient System, answering to the *G, re, sol*, of the third Octave of the modern System.

PENUMBRA, in Astronomy, a faint or partial Shade, observ'd between the perfect Shadow and the full Light, in an Eclipse. See SHADOW.

The *Penumbra* arises from the Magnitude of the Sun's Body: were he only a luminous Point, the Shadow would be all perfect; but by reason of the Diameter of the Sun, it happens that a Piece which is not illuminated by the whole Body of the Sun, does yet receive Rays from a Part thereof.

Thus suppose *S* the Sun (Tab. Astronomy Fig. 47.) and *I* the Moon, and the Shadow of the latter to be projected on a Plane as *G H*. The true proper Shadow of *I*, viz. *G H*, will be incompar'd with an imperfect Shadow or *Penumbra* *H L* and *G E*, each Portion whereof is illuminated by an entire Hemisphere of the Sun.

The Degree of Light or Shadow of the *Penumbra* will be different in different Parts, as those Parts lye open to the Rays of a greater or lesser Part of the Sun's Body: Thus from *L* to *H*, and from *E* to *G* the Light continually diminishes; and in the Cornices of *G* and *H*, the *Penumbra* becomes lost and confounded with the total Shade; as, near *E* and *L*, it is confounded with the total Light.

The *Penumbra* must be found in all Eclipses, whether of the Sun, the Moon, or the other Planets, primary, or secondary; but it is most considerable with us in Eclipses of the Sun; as in the Case here refer'd to.

In Eclipses of the Moon, the Earth is incompar'd indeed with a *Penumbra*; but 'tis only sensible to us on the Earth near the total Shadow: An Observer placed on a Plane, whereon the Shadow falls, might observe the whole *Penumbra*, as in Eclipses of the Sun. Thus an Eye placed at *I* or *F*, will only see the Semi-diameter of the Sun; the rest being hid behind the Moon. Going from *I* towards *H*, the more and more of the Sun is hid, till it be lost in the Shadow itself, &c.

Hence we have Eclipses of the Sun when the Shadow never touches the Earth, provided the *Penumbra* doth but reach it; and hence there is a Difference observ'd in Eclipses of the Sun, as the Shadow itself, or a greater or less Degree of the *Penumbra*, passes over a Place. See SUN.

But Eclipses of the Moon appear the same in all Places where they are visible. See MOON.

When the Shadow itself falls on the Earth, the Eclipse is said to be *Total* or *Central*; when only the *Penumbra* falls on it, the Eclipse is said to be *partial*. See ECLIPSE.

The *Penumbra* extends infinitely in length, inasmuch as to each point of the Diameter of the Sun, there answers a space infinite in length into which no Rays enter from that Point, tho' there do from others. Two Rays drawn from the two Extremities of the Earth's Diameter, and which proceed still diverging, make the two Edges of the *Penumbra*; which, of Consequence, is continually growing in Width, and is infinite, also in this Sense.

All that infinite Space is the *Penumbra*, except the Triangle of the Shadow included in it.

The Figure of this Space comprehending the Shadow, is a Trapezium, one of whose Sides is the Diameter of the Earth & the opposite Side parallel thereto is an infinite Line, i. e. the Width of the *Penumbra* projected to infinity, and the two other Sides the two Rays drawn from the two Extremities of the Diameter of the Sun, by those of the Diameter of the Earth, and which prolong'd back beyond the Sun, will intersect in a certain Point, making an Angle equal to the apparent Diameter of the Sun; which Angle may be call'd the Angle of the *Penumbra*.

Now the *Penumbra* will be the greater as this Angle, or which is the same Thing, as the Star is greater, the Planet re-

maintaining the same: And if the Diameter of the Planet be increased, the Star remaining the same, 'twill be the same as if the Diameter still receded from the Angle of the *Penumbra*.

*M. de le Hire* examines the different Degrees of the *Penumbra*, and represents 'em Geometrically by the Ordinates of a Curve, which shall be among 'emselfes, as the different Parts of the Sun's Disk, wherewith a Body placed in the *Penumbra* is enlighten'd.

**PEPPER**, an Aromatic Fruit, or Grain of a hot, dry Quality; chiefly used in the seasoning of Meats. See *SPICE*.

It is the Product of a Shrub growing in several Parts of the *East-Indies*, chiefly *Java*, *Samatra*, *Malacca*, and the Coasts of *Maabar*. The Plant is very weak and of the reptile Kind, and for that Reason usually planted at the Foot of the larger Trees, as the *Arecæ*, *Cocos*, &c.

The *Pepper* grows in Grapes or Climbers; at first green, as they ripen they grow red; and at last, after being expos'd to a White to the Sun, become black, in the Condition we see 'em.

The Fruit is gather'd in *November*. It must be chosen large, well fed, not wrinkled, without Dust, with a good many white Grains in it; and Care be taken the largest Grains han't been pick'd out to make white *Pepper*.

*White PEPPER* is the Fruit of the same Plant with the Black, and is prepared from it by moistening it with Sea-Water, and then exposing it to the Sun, and cutting away the outer Bark, which abandoning the Grain, leaves it white.

Indeed, *M. DeLion*, a late Traveller, says, they strip off the Skin, by beating it before it be quite dry; or by soaking it in Water after it has dried, and then beating it.

Many Authors, and among the rest *Plinius*, will have the white *Pepper* to be natural, and the Fruit of a different Plant from the Black; but *M. DeLion*, who expressly declares the contrary from his own long Experience, seems to put the Matter past doubt.

White *Pepper* must be chosen after the same manner as black; with this further Care, that it han't been whiten'd.

*Pepper* that is fold ground, is very apt to be sophisticated; the Black with burnt Crust of Bread, &c. the White with beaten Rice.

Long *PEPPER* is a kind of *Pepper* denominated from its form, which in Length and Thickness equals a Child's Finger; it consists of an assemblage of Grains join'd close to one another, of a brownish Colour, bordering without on red, and within on black; and grows by a long Pedicle to a Plant, like that of the black *Pepper*, but lower, and its Leaves smaller and greener.

Its Taste resembles that of the former, but less sharp. There are three kinds of this *Pepper*, that of the *East-Indies*, that of *America*, and that of *Ethiopia*, call'd also Grain of *Zelon*: Tho' the first alone is the proper long *Pepper*; the rest resembling it but little.

It must be chosen new, large, heavy, well fed, hard to break, without Dust or Mixture; its chief Use is in Medicine, where it enters several Galenic Compositions, among the rest *Tresacle*.

*Guinea PEPPER*, is a red *Pepper*, of a Coral Colour, much esteem'd by the *Americans*, from among whom 'tis brought, and by them call'd *Chile*, by the *Spaniards* *Pimenta*, and the *French*, *Garden Coral*.

'Tis now cultivated pretty commonly in *France*, especially in *Languedoc*; used in making *Vinegar*, and likewise confectioned with Sugar. It must be chosen new, in large Pods, dry, entire, and red.

There are four Kinds, the first call'd by the *Americans* *Chilchotes*; the second very small *Chiltepín*, both of a very pungent Taste; the third *Tonalchiles*, moderately hot, and eaten by the Natives like other Fruit with Bread; the fourth *Chilpela-gua*, moderately pungent, much used by the *Spaniards* in the Preparation of Chocolate; there is also a fifth Kind call'd *Agu*, growing in *Peru*.

*Jamaica PEPPER*, call'd by the *Dutch* *Annoni*, is the Fruit of the Tree that yields the *Indian Wood*, growing plentifully in *Jamaica* and other *American* Islands.

It is a real *Aromatic*, and may supply the Defect both of Cloves, Nutmeg, and Cinnamon; the *French* call it the *round Clove*, from its Taste resembling that Spice.

**PERACUTUM MENSTRUUM**. See *MENSTRUUM*.

**PENY**. See *PENNY*.

**PEPASMUS**, in Medicine, the digesting and ripening of morbid Humours. See *MATURATION*, *DIGESTION*.

The Word is Greek *πεπασμος*.

**PEPASTIC**, or **PEPTIC**, in Medicine, a kind of Medicament, of the Consistence of an Emplaster; proper to bring vitious and corrupt Humours to a Head, and dispose 'em for Suppuration. See *RIPENER* and *DIGESTIVE*.

Butter, Roots of Mallows, of Flowers-de-lis, Onions and Leaves of Oxylapathum are esteem'd good *Peplasticks*, or *Maturatives*.

The Word is form'd from the Greek *πεπασιν* to digest or ripen.

**PEPIA**, popularly **PEP** or **PIP**, a Disease of Fowls; consisting in a little white dry Pellicle, arising on the Tongue, from their having thirled much.

Among Falconers, the *Pepia* is a Disease arising in the Tongues of their Birds, from eating Salt and stinking Flesh.

**PEPISIS**, in Medicine, the Coction, or digesting of Foods, or Humours in the Body. See *COCTION* and *DIGESTION*.

The Word is Greek, *πεψη*, boiling.

**PEPTIC**, in Medicine. See *PEPASTIC*.

**PEPUZIANs**, a Sect of ancient Heretics, otherwise call'd *Phrygians*, or *Catephrygians*.

They had their Name *Peputians* from a Pretence that *J. C.* appear'd to one of their Prophetesses in the City *Peputia* in *Phrygia*, which was their holy City. See *QUINTILIANS*.

**PER Descentum**, by *Descent*, in Chymistry, a particulate manner of Distillation. See *DESCENT*.

**PER Deliquium**. See *DELIQUIMUM*.

Salt of Tartar, dissolved by the coldness or moisture of the Air, is call'd Oil of Tartar *per Deliquium*, &c. See *TARTAR*.

**PER Arsis**, **PER Tesis**. Terms in Music. *Per* is a Latin Preposition, signifying *by*, *during*; *Arsis* and *Tesis* are Greek Words, the first wherof signifies *Elevation*; the second *Position*.

*Per Tesis*, signifies *in beating* or during the first time of the Measure; *Per Arsis*, *in rising*, or in the last Time of the Measure.

A Song, Counter-point, Fugue, &c. are said to be *per Tesis*, when the Notes descend from the Acute to the Grave; and on the contrary, that they are *per Arsis*, when the Notes ascend from Grave to Acute.

**PERAMBULATION of the Forest**, the Surveying or Walking about the Forest, or the Limits of it, by Justices or other Officers thereto appointed, to set down the Metes and Bounds thereof, and what is within the Forest, and what without. See *PURLEU* and *FOREST*.

**PERAMBULATIONE facienda**, is a Writ commanding the Sheriffs to make *Perambulation*, and set down the Bounds of two or more Manours, whose Limits are not so well known.

**PERAMBULATOR**, in Surveying, an Instrument for the measuring of Distances, call'd also *Pedometer*, *Way-wifer*, and *Surveying Wheel*. See *PEDOMETER* and *SURVEYING-WHEEL*.

Its Advantages are its Handiness, and Expedition; its contrivance is such, as that it may be fitted to the Wheel of a Coach; in which it performs its Office, and measures the Road without any Trouble at all.

There is some Difference in its make: That now most usual, as most Convenient, is as follows.

*Construction of the PERAMBULATOR or Way-wifer.*

The *Perambulator* (represented Tab. *Surveying* Fig. 25.) consists of a Wheel a Foot 7 Inches and an half in Diameter; consequently half a Pole, or eight Foot and 3 Inches in Circumference. On one End of the Axis is a Nut  $\frac{1}{4}$  of an Inch in Diameter, divided into 8 Teeth, which upon moving the Wheel round, fall into the 8 Teeth of another Nut  $\epsilon$ , fix'd on one End of an Iron Rod  $\mathcal{R}$ , and thus turn the Rod once round, in the Time the Wheel makes one Revolution. This Rod lying along a Groove in the Side of the Carriage of the Instrument, has at its other End a square Hole, into which fits the End  $\phi$  of the little Cylinder  $\mathcal{P}$ . This Cylinder is disposed under the Dial-plate of a Movement, at the End of the Carriage  $\mathcal{B}$ , in such manner as to be moveable about its Axis. Its End  $\sigma$  is cut into a perpetual Screw, which falling into the 32 Teeth of a Wheel perpendicular thereto; upon driving the Instrument forward, that Wheel makes a Revolution, each 16 Pole. On the Axis of this Wheel is a Pinion with six Teeth, which falling into the Teeth of another Wheel of 60 Teeth, carries it round every 16th Pole, or half Mile.

This last Wheel then carrying a Hand or Index round with it, over the Divisions of the Dial-plate whose outer Limb is divided into 160 Parts, corresponding to the 160 Poles 3 points out the Numbers of Poles pass'd over.

Again, on the Axis of this last Wheel, is a Pinion containing 20 Teeth, which falling into the Teeth of a third Wheel that has 40 Teeth, drives it once round in 320 Poles, or a Mile. On the Axis of this Wheel is a Pinion of 12 Teeth, which falling into the Teeth of a fourth Wheel that has 72 Teeth, drives it once round in 12 Miles.

This fourth Wheel carrying another Index, over the inner Limb of the Dial-plate, divided into 12, for Miles, and each Mile subdivided into Halves, Quarters, and Furlongs, serves to Register the Revolutions of the other Hand, and to keep Account of the half Miles and Miles pass'd over as far as 12 Miles.

*Use of the PERAMBULATOR or Way-wifer.*

The Application of this Instrument is obvious from its Construction. Its proper Office is in the Surveying of Roads, and

and large Distances, where a great deal of Expedition, and not over much Accuracy is required. 'Tis evident the driving it along, and observing the Hands; has the same Effect as dragging the Chain, and taking account of the Chains and Links. See therefore the Article CHAIN.

PERCEPTION, in Philosophy, a simple Comprehension; or that simple Idea of a Thing, which we conceive without making any Affirmation or Negation. See IDEA.

If that Idea exhibit any Image to the Mind, it is call'd Imagination; if it exhibit none, it retains the general Name of Perception. See IMAGINATION.

Thus when we hear the Word *Vires*; the Idea we then form in the Mind, is call'd an *Imagination*. But when we hear of a Thing, whereof no Image can be fram'd as of *doubling*, the Idea we then have is a mere *Perception*. See SENSATION.

It may be observ'd, that the Idea's we receive by Perception, are often alter'd by the Judgement, without our taking notice of it; thus a Globe being set before our Eyes, the Idea thereby imprint'd, is a flat Circle, variously shadow'd; But being accustom'd to perceive what kind of Appearances convex Bodies are wont to make in us; the Judgement alters the Appearances into their Causes; and from that Variety of Shadow or Colour names to itself the Perception of a convex Figure of one uniform Colour. See JUDGEMENT.

This in many Cases, by a settled Habit, is perform'd so readily, that we take that for the Perception of our Sensation, which is but an Idea form'd by the Judgement; so that one serves only to excite the other, and is scarce taken notice of itself: as a Man who reads or hears with Attention, takes little notice of the Characters or Sounds; but of the Idea's which are excited in him thereby.

The Faculty of Perception, seems to be that which puts the Distinction between the animate and inanimate Parts of the Creation. *Vegetables*, some of them, have some degree of Motion, and upon different Application of other Bodies, alter their Figures and Motions; and have hence obtained the Name of *sensitive Plants*: Which, however, is the Result of mere Mechanism, and no otherwise produced, than the shortening of a Rope by the Affusion of Water. But Perception is a Metaphysical Principle, and found in some Degree in all Animals; and in them alone.

PER MIMINA, in Pharmacy, an intimate and perfect Mixture of natural Bodies; wherein their very *Mimma*, i. e. their Atoms, or first component Particles are supposed to be accurately blended together. See MIXTURE.

If Silver and Lead be melted together, they will mingle together *Perminima*.

PER-SE, in Chymistry. When a Body is distill'd singly, and without the usual addition of any other Matter to raise it; it is said to be *distill'd Per-se*. See DISTILLATION.

The genuine Spirits of Harts-horn, are those rais'd *Per-se*, in opposition to those distill'd by the addition of Chalk.

PER-SE, in Logic. A Thing is said to be consider'd *Per-se*, when it is taken in the Abstract. See ABSTRACT.

PERCH, Pole or Rod, a long Measure, much us'd in surveying and measuring of Land. See MEASURE.

Among the old *Romans*, and still among Geometricians, the *Percha*, *Perch*, is ten foot; and they otherwise call it the *Catena*, *fimus*, and *Decempeda*. See DECEMPEDA.

In *England*, the *Statute Perch* contains 16 Foot and  $\frac{2}{3}$ , and for Coppice-woods, &c. 18 Foot: 40 square Perches make a *Rood*, and 160 an *Acre*. See ROOD and ACRE.

The *Customary Perch* is various in various Counties: In *Staffordshire* 'tis 24 Foot; in the Forest of *Siberwood* 21, the Foot there being 8 Inches, the Measure whereof was mark'd on the Chancel Wall of *Eatonstow*, and in the Church of *St. Mary* in *Nottingham*. See FOOT.

In *Hersfordshire*, a *Perch* of walling is 16 Foot; a *Perch* of Ditching 21 Foot, &c.

In *France*, the *Perch* is from 18 to 23, and even 27 of their Feet.

PERCHANT, among Fowlers a Decoy-bird, which the Fowler has fasten'd by the Foot, and which flutters about the Place where 'tis tied, to draw other Birds to it, and give the Fowler an Occasion of catching 'em.

PERCOLATION, in Medicine, &c. the Action of Filtrating. See FILTRATION.

PERCUSSION, in Physicks, the Impression a Body makes in falling or striking upon another; or the Shock or Collision of two Bodies, which concurring, alter each others Motion. See MOTION and COLLISION.

*Percussion* is either direct or oblique.

*Direct Percussion*, is where the Impulse is given in the Direction of a right Line perpendicular to the point of Contact.

In Spheres, therefore, the *Percussion* is *direct*, when the Line of Direction passes thro' both their Centres. See DIRECT.

*Oblique Percussion*, is where the Impulse is given in the Direction of a Line *Oblique* to the Point of Contact. See OBLIQUE.

*Dollrine of PERCUSSION, or the Laws of Motion, resulting from the PERCUSSION of Bodies.*

In Bodies either perfectly hard, or perfectly soft, and void of all Elasticity; the Laws of Percussion are easily determin'd: but since, even the hardest Bodies have their share of Elasticity; and in Elastic Bodies, the Laws are very different, and much more intricate; having been first ascertain'd in the Philosoph. Transact. by Sir Ch. Wren, Dr. Wallis, and Mr. Huygens; we shall lay down each a-part.

*Laws of PERCUSSION in Bodies not Elastic.*

I. If a Body in Motion as *A* (Tab. Mechanicks Fig. 40.) strike directly against another at rest *B*: the first will lose just as much of its Motion as it communicates to the 2<sup>d</sup>; so that the two will proceed thence with an equal Velocity, as if collected into one Mass.

If *A* therefore be triple of *B*, it will lose one fourth of its Motion; so, that if before, it moved thro' a Line of 24 Foot in a Minute, it will now only move 18.

II. If a moving Body *A*, strike against another already in Motion, *B*; the first will increase the Velocity of the latter; but will lose less of its own Motion than if the latter had been at rest: Since all here requir'd, is that some Degrees of Motion be added to those it already has, to make 'em both proceed with an equal Velocity.

Suppose *E. gr.* the Body *A* with 12 Degrees of Motion, to strike against the other *B*, left by half, and at rest: The first will transfer 4 Degrees of its Motion to the latter, and retain 8 to itself: But if it strike with 12 Degrees of Motion on the other already moving with three Degrees, it will communicate two Degrees; for *A* being double of *B*, this need only half the Motion to make it proceed with the same Velocity.

III. If a moving Body *A*, strike on another *B*, either at rest, or moving more slowly, and either in the same Direction, or in a contrary one; the Sum of the Momenta, if the Bodies move in the same Direction; or their Difference, if they move in a contrary one, will be the same after the Percussion as before.

IV. If two equal Bodies *A* and *B* meet each other with equal Velocities; after the Congress, they will both remain at rest.

V. If a Body *A*, strike directly on another at rest *B*, its Celerity after the Stroke, is to its Celerity before it; as the Weight *A* is to the Sum of the Weights *A* and *B*: if therefore the Weights were equal, the Celerity after the Shock will be half of that before it.

VI. If a Body in Motion, *A* strike directly on another moving more slowly, but in the same Direction; the Velocity after the Shock, will be equal to the Sum of the Momenta, divided by the Sum of the Weights.

VII. If two equal Bodies moving with different Velocities, strike directly against each other; after the Conflict, they will proceed with the Semi-difference of the Velocities, wherewith they were moved before it.

VIII. If two Bodies *A* and *B* meet directly with Velocities that are reciprocally as their Weights; after the Conflict, they will both remain at rest.

IX. If two Bodies *A* and *B* meet directly with the same Velocity, the Celerity after the Impulse will be to that before it, as the Difference of the Weights to their Sum.

X. If two Bodies meet directly with any Velocity whatever, the Celerity after the Stroke will be equal to the Semi-difference of the Momenta, divided by the Sum of the Weights.

To determine the Momentum lost by the Conflict: multiply the Celerity which the Body had before the Conflict, into its Mass: Thus have you the Momentum before the Conflict. In like manner, multiply the Celerity after the Conflict into the Mass: Thus have you the Momentum after the Conflict. The latter Moment therefore being subtracted from the former Leaves the Loss. Hence may the Magnitudes of the Strokes be estimated.

XI. A direct or perpendicular Stroke is to an Oblique one; as the whole Sine is to the Sine of the Angle of Incidence.

*Laws of PERCUSSION in Elastic Bodies.*

In Bodies perfectly Elastic, the Force of Elasticity is equal to the force wherewith they are compress'd, i. e. the Collision of two such Bodies on each other, is equivalent to the Motion which either of 'em would acquire, or lose, by mere simple Impulse. This Force exerting itself contrary ways; a Motion equivalent thereto must be subtracted from the Motion in the impelling Body, and added to that in the Body impell'd by mere Impulse, to find their Velocities after Percussion. See ELASTICITY.

XII. If a Body strike directly on an immovable Obstacle, either one, or both of 'em being Elastic; the Body will be reflected with the same Velocity wherewith it struck, and in the same Line.

For if the Elasticity were away, the whole force of the Body wou'd be spent in breaking the Obstacle, and its Motion wou'd be stop'd: The whole Force therefore is spent in compressing the Elastic Body; by which means it acquires an Elastic Force equal thereto: since then, the Elasticity, when the compressing Force is spent, reduces the Body into its former state; it repells the other with the same Force wherewith it struck; consequently it will rebound with the same Velocity. And because an Elastic Body restores itself in the same Direction wherein it was compress'd; (there being no reason why it shou'd change its Direction) the Body will rebound in the same right Line.

XIII. If an Elastic Body strike obliquely on an immovable Obstacle, it will rebound in such manner as to make the Angle of Reflexion equal to the Angle of Incidence. See REFLEXION.

XIV. If an Elastic Body *A*, strike directly against another at rest *B*; after Percussion, *A* will remain at rest, and *B* proceed with the same Velocity which *A* had before the Shock, and in the same Direction.

For if the Bodies were not Elastic, each wou'd proceed after the Stroke in the same Direction, and with half the Velocity; but since the Elastic Force acts in the same Direction wherein the Compression is made, and is equal to the compressing Force; it repells *A* with half its Velocity, and therefore stops its Motion; but it drives *B* further, with half its Velocity, and therefore accelerates its Motion. 'Tis therefore carried after the Shock with the whole Celerity wherewith *A* was carried before it, and *A* remains at rest.

Hence, since *A* (Tab Mechanicks Fig. 41.) transfers all its force to *B*; *B* in like manner will transfer it to *C*; *C* again to *D*, and *D* to *E*. Wherefore, if there be several equal Elastic Bodies, mutually touching each other; and *A* be struck against *B*; all the intermediate ones remaining at rest, the last alone, *E* will be mov'd; and that with the Velocity wherewith *A* struck against *B*.

XV. If two equal Elastic Bodies *A* and *B* meet directly, and with equal Velocity; each will rebound with the same Velocity wherewith it struck, and in the same Direction.

For setting aside the Elasticity, both wou'd remain at rest: Their whole Force therefore is spent in the Compression; but their Elastic Force whereby they rebound in the former Direction, is equal thereto: This force therefore acting equally on each Body *A* and *B* will produce the same Celerity in each; and that, equal to the former. So that they will rebound with the Celerity wherewith they struck.

XVI. If two equal Elastic Bodies *A* and *B* strike directly against each other with unequal Velocities; after the Shock they will rebound with interchanged Velocities.

For suppose the Bodies to concur with the Velocities  $C + e$  and  $C$ : If they meet with the same Velocity  $C$ , after the Shock, they wou'd both move with the Velocity  $C$ . If *B* were at rest, and *A* shou'd strike upon it with the Celerity  $e$ ; after the Shock, *A* wou'd remain at rest, and *B* be mov'd with the Celerity  $e$ . Therefore the Excess of Celerity  $e$ , wherewith *A* is carried, is transfer'd wholly by the Conflict to *B*: *A* therefore is mov'd with the Celerity  $C$ , and *B* with the Celerity  $C + e$ .

Hence, after Percussion, they recede from each other with the same Velocity as, before, they concurr'd.

XVII. If an Elastic Body *A*, strike on another equal one, induc'd with a less Degree of Motion, *B*; after Percussion, both will proceed in the same, viz. the former, Direction, and with interchanged Velocities.

For suppose *A* to strike with the Velocity  $C + e$ , upon *B* moving with the Velocity  $C$ . Since by reason of the equal Velocities  $C$  and  $C$ , there arises no Impulse; 'tis the same thing as if *A* struck on *B* with the sole Celerity  $e$ , on *B* at rest. But in that case *A* wou'd remain at rest, and *B* move with the Velocity  $e$ : Therefore, after Percussion, *A* will move with the sole Celerity  $C$ ; and *B* with the Celerity  $C + e$ , both according to the former Direction, there being nothing to change that Direction.

XVIII. If a Body *A* strike on another *B*, the Stroke is the same as wou'd be made by the Body *A* striking on *B* at rest, with the Difference of their Velocities.

Hence, since the Elastic Force is equal to the Percussion; it acts on the Bodies *A* and *B* with the Difference of the Velocities they had before the Congress.

XIX. To determine the Velocities of any two Elastic Bodies *A* and *B*, striking directly on each other with any Velocities.

If the Elastic Body *A* strike on *B*, either at rest, or moving slower than *A*; the Velocity *v. g.* of *A* after Percussion, is found thus: as the Sum of the Weights is to double of either of 'em, suppose, in this Case, of *B*; so is the Difference of the Velocities before the Congress, to a Velocity, which subtracted

from the Velocity of *A* before the Impulse (in the other Case added to it) leaves the Velocity of *A* after the Congress.

If the two Elastic Bodies *A* and *B* meet each other; the Velocity of *A* after the Impulse is found thus: As the Sum of the Weights, is to the double of either of 'em, suppose of *B*; so is the Sum of the Velocities before Collision, to a Velocity which subtracted from the Velocity of *A* before Collision, leaves its Celerity after Collision.

XX. If an Elastic Body *A* strike directly on another at rest *B*; its Velocity after Percussion will be to its Velocity before it, as the Difference of Weights is to their Sum: But the Velocity it communicates to *B* is the same, as double the Weight of *A* to the Sum of the Weights.

After Percussion, therefore, the Velocity of *A* is to the Velocity of *B*, as the difference of Weights, to the double of *A*.

XXI. If two Elastic Bodies, *A* and *B*, strike directly on each other with Velocities that are reciprocally proportional to their Weights; after Collision, they will rebound with the same Velocity wherewith they met.

XXII. In the direct Collision of Bodies, the same respective Velocity is preserv'd, i. e. in a direct Concurrence, the Difference of Velocities is the same before and after the Shock; and in a direct mutual Encounter, the difference of Velocities after the Shock is the same with their Sum before it.

Hence they retire from each other after the Impulse, with the same Velocity wherewith they met.

XXIII. In the Collision of Elastic Bodies, there is not always preserv'd the same Momentum, or as the Cartesian expresses it, the same Quantity of Motion; but it is sometimes increas'd, and sometimes diminish'd.

'Tis a Mistake, therefore of Cartes and his Followers, that the same Quantity of Motion is still preserv'd in the World. See CARTESIAN.

XXIV. If two Elastic Bodies, *A* and *B*, meet, or overtake each other directly, the Sum of the Facts of the Masses into the Squares of the Velocities, remains the same before and after the Congress.

Hence the same Quantity of Force is likewise preserv'd in the Congress.

XXV. To determine the Motion of two Bodies *A* and *B*, (Fig. 43.) striking obliquely against each other, whether they be Elastic, or not Elastic.

The Motion of the Body *A*, along *AC*, is resolvable into two others, in the Directions *AE* and *AD*; and the Motion of *B* along *BC* into two others according to *BF* and *BG*; and the Velocities thro' *AD* and *BF* are to the Velocities thro' *AC* and *BC* as the right Lines *AD*, *BF*, *AC*, *BC*; now, since the right Lines *AE* and *BG* are parallel, the Forces acting according to these Directions are not mutually opposite, and must therefore be consider'd in the Congress. But since the Lines *AD* and *BF*, or which is the same, *EC* and *GC* constitute the same right Line perpendicular to *DC*; 'tis the same as if the Bodies *A* and *B* shou'd meet directly with Velocities that are as *EC* and *GC*. Find therefore the Velocity of *A* and *B* according to the Rules above laid down.

Suppose *E. g.* the Velocity of the rebounding Body *A* to be as *CH*; since the Motion along *AE* is not chang'd by the Congress, make *CK = AE*, and complete the Parallelogram *HCKI*; the Diagonal *CI* will represent the Motion of *A* after Congress: for after Percussion, the Body will move according to the Direction *CI*, and with a Velocity as *CI*. In the same manner it will be found that the rebounding Body *B* will move along the Diagonal of the Parallelogram *CM*; in which *LM = BG*. The Velocities therefore after Percussion are as *CI* to *CM*.

Centre of Percussion that Point wherein the Shock or Impulse of the percussive Bodies is the greatest. See CENTRE.

The Centre of Percussion is the same with the Centre of Oscillation, if the percussive Body revolve round a fix'd Axis. See OSCILLATION.

If all the Parts of the percussive Body be carried with a parallel Motion, or with the same Velocity; the Centre of Percussion is the same with the Centre of Gravity. See GRAVITY.

PERDONATIO Utlogia, in Law, a Pardon for one who is out-law'd. See PARDON and OUT-LAWRY.

PERDUE, a Soldier placed in a dangerous, and almost desperate Post.

The Word is French, and literally signifies *lost*. Thus we say *Enfants Perdus*, for the Forlorn Hope of an Army. See FORLORN.

To lie *Perdue*, is to lie flat on the Belly, to lie closely in wait.

PEREMPTORY, in Law, an Epithet applied to an Action, Exception, &c. signifying 'em to be absolute, final, and determinate; not to be alter'd, renew'd, or restrain'd. Thus in our Law-Books we find *Peremptory Action*, *Peremptory Nonsuit*, *Peremptory Exemption*, &c.

PERENNIAL, in Botany, is applied to *Ever-green*, or Plants, which preserve their Leaves and Verdure all the Year. See *Ever-green*.

**PEREGRINE**, *foreign, outlandish*; a Term applied among Astronomers, to a Planet, when found in a Sign where it has none of its Essential Dignities.

**PERFECT**, (something to which nothing is wanting; or that has all the Requisites. See **PERFECTION**.)

**PERFECT**, in Arithmetic, *Perfect Number* is that, all whose aliquot Parts added together, make the same Number with the Number whereof they are such Parts. See **NUMBER**.

**PERFECT** in Grammar, *Preter- or Preterit-perfect Tense*, is an Inflection, marking a Time perfectly past, as I have heard. *Plusquam perfect*, is an Inflection, expressing a Time more than perfectly past, as I had heard, &c. See **TENSE**.

**PERFECT** in Music, something that fills and satisfies the Mind and the Ear.

In this Sense we say, *Perfect Cadence, Perfect Concord*, &c. See **CONCORD**, **CADENCE**, &c.

The Ancients had two kinds of Modes, the Major and Minor; and each of these again was either *Perfect* or *Imperfect*. See **MODE**.

The Word *Perfect* when join'd with the Words *Musical* and *Time*, usually express triple Time or Measure; in opposition to double Time, which they call'd imperfect. See **TIME**, **TRIPLE**, &c.

**PERFECT**, in Physiology, A *perfect Animal*, is used by some Writers for that which is born by univocal Generation, in opposition to Infants, which pretend to be born by equivocal Generation. See **GENERATION**, **UNIVOCAL**, **EQUIVOCAL**, &c.

**PERFECT Flowers**, are such as have Petals, Pistils, Stamens and Apices. See **FLOWER**.

**PERFECTION** is divided into *Physical, Moral* and *Metaphysical*.

*Physical, or natural Perfection*, is that whereby a Thing has all its Powers or Faculties, and those too, in their full Vigour; all its Parts both Principal and Secondary, and those in their due Proportion, Constitution, &c.

In this Sense a Man is said to be *Perfect* when he has a sound Mind in a sound Body.

This *Perfection* is by the Schoolmen, frequently call'd *imperfecta*, by reason a Thing is hereby enabled to perform all its Operations.

*Moral Perfection*, is an eminent Degree of Virtue, or moral Goodness; to which Men arrive by often repeated acts of Piety, Beneficence, &c.

This, some subdivide into *Absolute* or *Inherent*, which is actually in him to whom we attribute it; and *Imputative* which exists in some other, and not in him it is attributed to.

*Metaphysical, or Transcendental* or *Essential Perfection* is the Possession of all the essential Attributes, or of all the Parts necessary to the Integrity of a Substance: Or it is that whereby a Thing has, or is provided of every thing belonging to its Nature. See **ESSENCE**.

This is either *Absolute*, where all Imperfection is excluded; such is the *Perfection* of God: Or *Secundum quid*, and in its kind. See **GOOD**.

**PERFECTISSIMATE**, a Quality or Dignity whereof we find mention made in the Code.

*Perfectissimi* were those with whom the Emperors intrusted any Office, Administration or Government. *Alicui imagin'd* the Name had been only given to the Governors of *Hispania Tarraconensis*, and *Norica*; but *Caesar* has shewn the contrary in his *Lexicon Jurisduci*. The *Perfectissimi* were inferior to the *Clarissimi*, tho' that Word imply *most perfect*. See **CLARISSIMI**.

**PERFIDIA**, in Music, a Term borrowed from the *Italian*; signifying an Affectation of doing always the same Thing, of following the same Design, continuing the same Motion, the same Song, the same Passage, and the same Figures of Notes.

Such are the stiff Basses of Chacones, &c. because depending wholly on the Caprice of the Composer.

**PERFORANS Memus**, in Anatomy, a Muscle of the Hand; call'd also, from its Action, *Flexor 3<sup>ti</sup> Internodii digitorum manus*.

It arises fleshy from the fore and upper Part of the Ulna, and the Ligament which joins that and the Radius; and after forming a pretty thick fleshy Body, is split into four round Tendons; which passing under the annular Ligament, and thro' the Slits in the Tendons of the former, are inserted into the third Bone of each Finger. See **FINGER**.

**PERFORANS Pedis**, in Anatomy, a Muscle of the Foot, call'd also *Profundus*; and from its Action, *Flexor 3<sup>ti</sup> Internodii digitorum pedis*, & *Flexor Magnus*.

It rises from the upper and Back-part of the Tibia, and passing under the Inner Ankle and Ligament, that ties the Tibia and Os Calcis together, divides into four Tendons, which passing the Holes of the Perforans, are inserted into the third Phalanx of the lesser Toes.

There is a *Massa Carnis*, or fleshy Substance that arises from the *Os Calcis*, and which joins the Tendons of this Muscle where the Lumbricales begin.

**PERFORATUS Manus**, in Anatomy, a Muscle of the Fingers, thus call'd from the *Perforations* of its Tendons by those of the *Perforans*; sometimes *Flexor Secunda Internodii*, from its Action; and sometimes *Sublimis*.

It arises tendinous from the internal Protruberance of the Humerus, and the Upper-part of the Radius before; and being parted into four, passes under the annular Ligament; whence it sends several Tendons into the Upper-part of the Phalanx of each Finger: Every Tendon having at the first Internode, a Slit or *Perforation* for the Admission of the Tendons of the Perforans.

**PERFORATUS Pedis**, in Anatomy, a Muscle of the Foot, call'd also *Flexor pedis*, & *sublimis*.

It arises from the inner and lower Part of the Calcaneum; and sends a Tendon to every Bone of the second Phalanx of each of the four less Toes. In this, as the *Perforans* of the Hand, there is a Slit in each Tendon about the first Joint, which lets thro' the Tendon of the *Perforans*.

**PERFUME**, an agreeable Odour, striking the Sense of Smelling. See **ODOUR** and **SMELL**.

The generality of *Perfumes* are made or compos'd with Musk, Amber-greece, Civet, Rose, and Cedar-woods, Iris, Orange-Flowers, Jastem, Jonquils, Tuberoses, and other odoriferous Flowers.

Therein also enter Stomach, Frankincense, Benjain, Cloves, Mace, and other like Drugs, commonly call'd *Aromatics*. See **AROMATIC**.

Some perfumes are also compos'd with Aromatic Herbs, as Lavender, Marjoram, Sage, Thyme, Hyssop, &c.

*Perfumes* were anciently much in Use; particularly those wherein Musk, Ambregreece, and Civet, enter; they are now generally disused, since People have become sensible of the Harm they do the Head. In *Spain* and *Italy* they are still in Use.

**PERFUMES**, *Suffrins*, in Pharmacy, &c. are Topic, or external Medicines, compos'd of certain Powders and Gums, which being mix'd together, and thrown on the Coals, produce a Vapour or Smoak, Salubrious in several Diseases. See **SUFFRINS** and **SUFFUMENTUM**.

Fits of the Mother are cured by a *Perfume* of Partridge Feathers, old Leather, &c. burn'd. Mercury is sometimes applied by way of *Perfume*, call'd *Perfume* of Cinnabar.

For those whose Brain is too humid, Tobacco is prescribed by way of *Perfume*.

These are dry *Perfumes* made up in Troches, Pills, &c. of Oilbanum, Mastic, Aloe, &c. and moist viscous ones of the Juices of Herbs, &c.

**PERIANTHEUM**, in Botany the little green Leaves which compass the Bottom of a Flower; call'd by Dr. *Grew* the *Empaleum*, and by others the *Calyx*. See **CALYX**. See also **FLOWER**.

The Use of the *Periantheum* is to be a Support, Security, and it were Bands, to the other Parts of the Flower.

Mr. Ray observes, that Flowers, whose Leaves or Petals are strong, as Tulips, have no *Periantheum*, as needing none. Carnations, &c. whose Petals are long and slender, have their *Periantheum* of one piece; others, as the Knap-weed, &c. have it of several Pieces, and in divers rounds, and all with a counterchangeable Respect to each other, for the greater Strength and Security of 'emselves, and the Petals, &c. they include.

The Word is form'd from the Greek *peri* about and *anthos* Flower.

**PERIAPTA**, a kind of Medicines, otherwise call'd **PERIAPTA**, *Appendix* and *Annuleti*; which being tied about the Neck, are supposed to prevent, or cure Diseases. See **AMULET**. See also **PHLEACTERY**.

**PERICARDIARY**, an Epithet given to Worms generated in the Pericardium, or Capsula of the Heart. See **WORMS** and **PERICARDIUM**.

M. *Andry* makes these one of the twelve Kinds of Worms engender'd in the human Body: They sometimes occasion Convulsions; the Paroxysms whereof last but a little while, but return incessantly.

These Worms are accompanied with a frightful Paleness of the Face, a low Pulse, violent Pains of the Stomach and Breaſt.

They sometimes occasion a Palpitation of the Heart. See **PALPITATION**. M. *Andry* adds, that they have been known to occasion sudden Death.

**PERICARDIUM**, in Anatomy, a Capsula, or Pouch, which includes the Heart. See **HEART**.

It consists of a double Membrane; the Inner arising from the Coats of the Vessels of the Heart, and the Outer from the Mediastinum. Its Figure resembles that of the Heart, Conical; and it embraces the Heart laxly, allowing Room for its Pulsation.

'Tis connected either immediately, or by Vesiculae emitted from it, to the Sternum, Back, Jugulum, and in human Bodies to the tendinous Part, or Centre of the Diaphragm; whereas in Brutes it is loose.

Its Use is supposed to be to defend the Heart; as likewise to contain a soft serous Humour, which serves to lubricate

cate and moisten the Heart, and prevent any Inflammation that might probably arise from the dry Friction of the Heart and its Capisula. But this latter Use is controverted; for some take the Humour found in it to be unnatural, and will have it forcibly separated by the convulsive Agonies supervening in the Article of Death. In effect, Anatomists are puzzled to find whence it should come, or from what Vessels it is secreted.

The word *Pericardium* is form'd from the Greek *περι* about and *καρδια* Heart.

Dr. Keil, in his Treatise of *Anim. Secretion* shows that the Liqueur in the *Pericardium* must be the most Fluid of any separated from the Blood, because its Particles unite first, and are secreted first. For those Particles which unite first, will have the greatest attractive Force, consequently their Particles must be the most Spherical and most Solid; and therefore their Contact the least of any, therefore the most Fluid. See FLUIDITY.

In the Memoirs of the French Academy, *M. de Mortal* gives an Instance of a *Pericardium*, which being open'd, the Liqueur contain'd therein, was found congeal'd into a Consistence fit to be cut with a Knife, and two square Fingers thick about the Heart.

PERICARPIA, from *περι*, circum, about, and *Carpi* the Wrist, are Medicines that are applied to the Wrist.

PERICARPUS, in Botany, a Pellicle, or thin Membrane, inclosing the Fruit or Grain of a Plant. See FRUIT, SEED, &c.

The Word is form'd of the Greek *περι* about and *καρπι* Fruit.

PERICHORUS, in Antiquity, a Name given by the Greeks, to their profane Games and Combats; i. e. to such as were not consecrated to any of the Gods. See GAMES.

The Word in the Original, signifies *near* or *neighbouring*; apparently, because none but the People of the Neighbourhood attended at these obscure Exercises.

The Champions did not fight in Honour of any God or Heroe, as in the others; but only for the prize Sake.

The Word is form'd from the Greek *περι* about and *χωρη* Country.

PERICRANIUM, in Anatomy, a thick solid Coat or Membrane, covering the out Side of the *Cranium* or Skull. See CRANIUM.

Some call it by the general Name of *Periosteum*, because of its adhering to the Bone; others divide it into two Membranes, the under whereof immediately invests the Skull, they call *Periosteum*; and the upper the *Pericranium*. But in effect, 'tis but one double Membrane, consisting, as most others do of two Coats. 'Tis supposed to have its Origin from the dura Mater; which passing thro' the Sutures of the Skull, by means of several Filaments forms this thick Membrane: At least, 'tis still found connected to the dura Mater by Fibres transmitted from it to the Membrane, thro' the Sutures.

About the Origin of the temporal Muscles, the two Coats of the *Pericranium* part; the Outer passing over those Muscles, and the Inner still adhering close to the *Cranium*. See PARIOSTEUM.

The Word is form'd from the Greek *περι* about and *κρανιον* Head.

PERIDROME, PERIDROMUS, in the ancient Architecture, the Space, Gallery, Alley, or the like, in a Periptere, between the Columns and the Wall. *Salmassius* observes that the *Peridromes* served for Walks among the Greeks.

PERIOECI, in Geography, such Inhabitants of the Globe as have the same Latitudes, but opposite Longitudes; or live under the same Parallel, and the same Meridian, but in different Semi-circles of that Meridian. See GLOBE.

These have the same common Seasons throughout the Year; and the same Phenomena of the heavenly Bodies; but their Hours, or times of the Day, are opposite to each other. When v. g. with the one 'tis Mid-day; with the other 'tis Mid-night. See DAY and SEASON.

The Word is form'd from the Greek *περι* about and *οικου* inhabit.

PERIEGETES, a Greek Term, signifying a Person who conducts another about a Thing, to show it him, &c.

It is applied in Antiquity to Geographers; especially to those who described the Sea-Coasts: Thus *Dionysius* is sild *Periegetes*, for publishing a Geography in Hexameter Verses; which *Enstatius* has commended on, both, in Greek.

The Name *Periegetes* was also given to those who conducted Strangers about in Cities, to shew 'em the Antiquities, Monuments, Curiosities, &c. thereof.

These *Periegetes* were the same with what they now call Antiquaries in Italy. See ANTIQUARY.

PERIGEUM, PERIGEE, in Astronomy, that point of the Heavens, wherein the Sun and Planets are at their least Distance from the Earth. See ECCRATIC.

The Moon in her *Perigee* is 53 or 54 Semi-diameters of the Earth distant from us. See MOON.

The Term is but little used, except in the Ptolemaic System; where the Earth is placed in the Centre of the World, and the Distances of the Planets chiefly consider'd with regard thereto; being form'd of the Greek *περι* about and *γη* Terra, Earth.

The Copernicans use the Word *Perihelium* in lieu of *Perigee*; and because they place the Sun in the Centre. See PERIHELUM.

PERIHELUM, in Astronomy, that point of the Orbit of a Planet, or Comet, wherein it is at its least Distance from the Sun. See PLANET, COMET, SUN, &c.

The Word is form'd from the Greek *περι* about and *ηλιος* Sol, Sun.

The ancient Astronomers, in lieu hereof used *Perigeeum*, because they placed the Earth in the Centre. See PARIAGEUM.

PEREGRINARY, PEREGRINARIUS, in the ancient Monasteries, a Monk to whom was committed the Care of receiving, and entertaining Strangers, or Visitors.

PERIMETER, in Geometry, the Ambit, or extent, that bounds a Figure or Body. See FIGURE.

The Perimeters of Surfaces, or Figures, are Lines; those of Bodies are Surfaces. See SUPERFICIES.

In circular Figures, &c. instead of Perimeter we say *Circumference* or *Periphery*. See PERIPHERY.

The Word is form'd from the Greek *περι* about and *μετρον* Measure.

PERINEUM, in Anatomy, the Space between the *Pennis* or *Scrotum*, and the Fundament; properly the Ligamentous Seam; call'd by the Latins, *Femen*, and *Intercæmænum*.

The Word *Perineum* is form'd from the Greek *περι* about and *νηος* to inhabit.

PERINDE *Valere*, in the Canon Law, a Dispensation granted a Clerk, who being legally incapable of a benefice, or other ecclesiastical Function, is, *de facto*, admitted to it. See DISPENSATION.

The *Perinde Valere*, is a kind of Writ; thus call'd from two Words therein, signifying the Dispensation to be equivalent or tantamount to a legal Capacity.

PERIOCHA, an Argument containing the Sum of a Discourse.

PERIOD, in Astronomy, the Time taken up by a Star or Planet, in making a Revolution; or the Duration of its Course, till it return to the same Point of the Heavens. See REVOLUTION.

The Sun's, or rather the Earth's *Period*, is 365 Days, five Hours, 40 Min. That of the Moon 27 Days, 13 Hours, 9 Min. &c. See SUN, MOON, &c.

The *Periods* of the Comets are now many of 'em pretty well ascertain'd. See COMET.

There is a wonderful Harmony between the Distances of the Planets from the Sun, and their *Periods* round him; the great Law whereof is, that the Squares of the *Periodic Times* are *ever proportional to the Cubes of their mean Distances from the Sun*. See PLANET.

The several *Periods* and mean Distances of the several Planets are as follow.

PERIODS.					
	Days	h.	u	mean Dist.	
Saturn	10579	6	36	26	953800
Jupiter	4332	12	20	35	520110
Mars	686	23	27	30	152369
Earth	365	6	9	30	100000
Venus	224	16	49	24	72333
Mercury	87	23	15	53	38710

PERIOD, in Chronology, an Epocha or interval of Time, by which the Years are accounted; or a Series of Years, whereby, in different Nations, and on different Occasions Time is measur'd. See TIME.

Such are the *Callippic*, and *Metonic Periods*, two different Corrections of the Greek Calendar; the *Julian Period*, invented by *Jos. Scaliger*; the *Victorian Period*, &c.

*Metonic Period*, or *Cycle*, call'd also the *Cycle of the Moon*, is a Series of 19 Years, which claps'd the new and full Moons, are supposed to return to the same Day of the solar Year: It was thus call'd from its Inventor *Meton*. See METONIC. See also CYCLE.

*Callippic Period*, is a Series of 76 Years, returning in a perpetual Circle; which claps'd the new and full Moons, are supposed to return to the same Day of the solar Year. The *Callippic Period* is an improvement on the *Metonic* of 19 Years, which proving inaccurate, *Callippus* the *Athenian* multiplied it by 4, and thus arose the *Callippic Period*. See CALLIPPIC.

*Hipparchus's Period*, is a Series of 304 solar Years, returning in a constant round; and restoring the new and full Moons to the same Day of the solar Year; according to the Sentiment of *Hipparchus*.

This *Period* arises by multiplying the *Callippic Period* by 4. *Hipparchus* assumed the Quantity of the solar Year to be 365 Days, 5 Hours, 55' 12". And hence concluded that in 104 Years, *Callippus's Period* would Err a whole Day. He therefore multiplied the *Period* by 4, and from the Product, cast away an entire Day. But even this does not restore the new and full Moons to the same Day throughout the whole *Period*.

*Period*: But they are sometimes anticipated 1 Day 8 Hours, 23' 29" 20".

**VICTORIAN PERIOD**, an Interval of 532 Julian Years, which claps'd, the new and full Moons, return on the same Day of the Julian Year; according to the Sentiment of *Victorius* or *Victorius*, who lived in the Time of Pope *Hilary*.

Some ascribe this *Period* to *Dionysius exiguus*; and hence call it the *Dionysian Period*: others call it the *great Paschal Cycle*; because invented for computing the Time of *Easter*.

The *Victorian Period*, is produced by multiplying the Lunar Cycle 19, by the solar Cycle 18; the Product of which is 342. But neither does this reiturne the new and full Moons to the same Day throughout its whole Duration; by 1 Day, 16 Hours, 58' 59" 40".

**JULIAN PERIOD**, a Series of 7980 Julian Years; arising by the Multiplication of the Cycles of the Moon, the Sun, and Indictions into one another; commencing from the first Day of *January*, in the Julian Year. See **JULIAN**.

The *Julian Period* is also produced by multiplying the *Victorian Period* by 15. Since every Year in the *Julian Period* has its particular Cycles of the Moon, Sun, and Indictions; *E. gr.* only the first has the Moon's Cycle 1, the Sun's Cycle 1, and the Cycle of Indictions 1; all the Years of this *Period* are accurately distinguish'd from each other.

This *Period* was invented by *Scaliger*, as a common receptacle of *Epocha's*, to facilitate the reduction of Years of a given *Epocha*, to those of another *Epocha* likewise given. It agrees with the *Constantinopolitan Epocha*, or *Period*, used by the *Greeks*, except in this that the Cycles of the Sun, Moon, and Indictions, are reckon'd differently; and in that the first Year of the *Constantinopolitan Period* differs from that of the *Julian Period*.

**CONSTANTINOPOLITAN PERIOD**. See **JULIAN PERIOD**. **PERIOD**, in Grammar, a little Compass of Discourse, containing a perfect Sense, distinguish'd at the End by a Point or full Stop (.), and its Members or Divisions mark'd by Comma's, Colon, &c. See **SENTENCE**, **POINT**, &c.

*De Caeque* defines *Period* a short, but perfect Sentence, consisting of certain Parts or Members, depending one on another, and connect'd together by some common Vinculum.

That celebrated Definition of *Aristotle* is; a *Period* is a Discourse which has a Beginning, a Middle, and an End, all visible at one View.

A *Period* of two Members, *Cicero* supplies us with: *Argo & mihi meae pristinae vitae Constantiam, C. Caesar, intercessione spernisti; & his omnibus ad bene de republica sperandam quasi signum aliquod sustulisti.*

A *Period* of three Members, the same *Cicero* gives us in the Exordium of his *Mantua Oration*: *Nunc cum aetere per etatem hujus Antiquitatem loci contingere non audeam; siaturque nihil bene nisi perfectum ingenio, elaboratum Industria offerri oportere: Omne meum tempus amicorum temporibus transfudituram putavi.*

A *Period* of four Members he gives us in that admirable Description of the Punishment of *Parricides*. *Haec omnia ut auctore animam de Caelo non queant: Ita Moriturus ut corpus esse terra non tangat: Ita jecturatur fluctibus ut nunquam abluatur: Ita postremo ejiciatur ut ne ad Scaevae quidem mortui conquiscent.*

The Laws and Measures of *Periods* are pretty strictly regarded by Orators; at least by the ancient ones: In ordinary Discourse, and in the modern *Troques*, Authors are much less severe.

In Oratory, the Members of *Periods* are to be equal or nearly equal; that the Pauses or Rests of the Voice at the close of each Member may be nearly equal; but in Writing no ways intended for rehearsal, this is disregarded. Common Discourse allows of *Periods* both longer and shorter than Oratory; which admits of none less than two Members, nor greater than four. Short, mutilated *Periods* break the Stream, and check the Course of the Sublime; and long ones embarrass and keep the Mind too long in Suspense; and even strain the Voice which is never to stop but at the Ends of *Periods*.

The *Periods* allow'd in Oratory are three: A *Period* of two Members, call'd by the *Greeks*, *Diactilo*, and the *Latins*, *Bimembri*: A *Period* of three Members, *Trico*, or *trimembri*; and a *Period* of four, *Quadrimembri*, *Tetraactilo*. See **MEMBER**.

A strict Oratorical *Period* does not allow of either more or fewer than these: 'Tis possible indeed to introduce a *Period* of one Member, call'd by *Aristotle* *Monoco*, or simple *Period*; but 'twill be reputed a Flaw; and is a Thing never to be practis'd by the Masters. The *Period* may be likewise prolonged to five or six Members, but then it changes its Name; and instead of *Period* commences what they call a *periodical Speech*.

*Phalares*, *Hermogenes*, *Terence*, &c. confine the just *Period* (call'd by the *Latins*, *Ambitus* and *Circuitus*;) to four Members; agreeably to the Distich

*Quatuor a membris plenum formare videlicet  
Ratusa Circuitum, five Ambitus illo vocetur.*

Of which Sentiment is *Cicero*, who in his *Orator*, says, *Constat ille Ambitus & plena comprehensio e quatuor sere partibus quae membra dicuntur, ut & aures compleat, & ut brevier sit quam satis sit, neque longior*: An Instance of a periodical Oration he gives us in the Opening of his *Oration* for *Archias* the Poet. *Si quid in me sit ingenii, Judices, quod sentio quam sit exiguus; aut si qua exercitatio dicendi, in qua me non injicior mediocriter esse versatum; aut si buisje rei ratio aliqua ad optimam artium studii & disciplinae profecta, a qua ego consuevi nullum *Archias* meae temporis abhoruisse; coram vobis omnium vel in prius hic *A. Licinius* fructum a me repetere prope suo jure debet.*

*Periods* are said to be either *rotundi*, round, or *quadrati*, Square, according to their different Oeconomy and Cadences. A *square Period* is that consisting of 3 or 4 equal Members, formally distinguish'd from each other; as that of *Cicero* on the Punishment of *Parricides*. A *round Period* is that whose Members or Parts are so connect'd, and fitted into each other, as that the Junctures or Commiffures are scarce seen; but the whole slides equally round; without any notable Stops or Inequalities. Such are the *Dico* and *Trico* of *Cicero* above-mention'd.

**PERIOD** is also used for the Character (.) wherewith the *Periods* of Discourse are terminated and express'd; popularly call'd a *Full-stop* or *Point*. See **POINTING**.

Father *Zusser* observes two Difficulties in the Use of the *Period* or *Point*, i. e. in the distinguish'ing it from the Colon, or double *Point*; and in determining justly the End of a *Period*, or perfect Sentence.

'Tis observ'd that the Supernumerary Members of a *Period*, separated from the rest by Colons and Semicolons, usually commence with a Conjunction. (See **COLON**.) Yet 'tis certain these same Conjunctions sometimes rather begin new *Periods*, than supernumerary Members of old ones. 'Tis the Sense of Things, and the Authors own Discretion that must make the proper Distinction which of the two in effect it is. No Rules will here be of any Service, unless this be admitted as one; that when what follows the Conjunction is of as much extent as what precedes it, 'tis usually a new *Period*; otherwise not.

The second Difficulty arises hence, that the Sense appears perfect in several short detached Phrases, wherein it does not seem there shou'd be *Periods*: A Thing frequent in free Discourse; as, *we are all in Suspense; make your Proposals immediately; you'll be to blame for detaining us longer*. Where 'tis evident that simple Phrases have perfect Senses like *Periods*; and ought to be mark'd accordingly; but that the Shortness of the Discourse making 'em easily comprehended, the *Pointing* is neglected.

The Word *Period* in the original *Greek* *περιόδος* signifies *ambit*, *circuit*.

**PERIOD**, in Numbers, is a Distinction made by a Point or Comma, after every sixth Place, or Figure; and is used in Numeration, for the readier distinguish'ing and naming the several Figures or Places; which see under **NUMERATION**.

**PERIOD**, in Medicine, the Space of Time a Distemper continues, from its Beginning to its Declension. See **DISTEMPER**.

Hence, such as return after a certain Space, with like Symptoms, are call'd *periodical Distempers*; such are *Agues*, intermitting Fevers, &c. See **FEVER**.

In the *Phil. Transact.* Dr. *Keilijove* gives us an Instance of a *periodic Palsy*; Dr. *Cole* an Instance of a *periodic Convulsion*. See **CONVULSION**, **PALSY**, &c.

**PERIODIC**, something that terminates and comprehends a *Period*. See **PERIOD**.

A *periodic Month*, is the Space of Time wherein the Moon dispatches her *Period*, or *periodic Motion*, viz. 27 Days, 7 Hours, 43 Minutes; in which Time she returns to the same Point of the Zodiac, wherein she was when she left the Sun. See **MONTH**.

*Periodic Distempers*, are such as decline and rise again with similar Symptoms alternately.

*Periodic*, in Grammar, is applied to a *Stile* or *Discourse* that has Numbers; or which consists of just, and artful *Periods*. See **NUMBERS**.

**PERIODIC** *Sanguinis*, the Circle of the Blood, or the Tour it makes round the Body, for the Support of Life. See **CIRCULATION**.

**PERIODEUTA**, a Church Officer among the *Greeks*; establish'd by the Council of *Laodicea*, in Towns, &c. where there were no Bishops.

The *Periodes* were a Kind of rural Deans, so call'd, according to *Zonaras*, because always on the Road, going from one Quarter to another to keep the People in their Duty. See **RURAL**.

Hence, *Gregory of Thessalonica* calls 'em *Ambulantes*, *Walkers*. *Baseman* calls 'em *Exarche*, by which Name they are still known among the *Greeks* at this Day. See **EXARCHA**.

**PERIOPHTHALMIUM**, in natural History, a thin Skin, which Birds can draw over their Eyes, to defend 'em without shutting their Eye-lids. The same with the *Nitritating Membrane*. See **NITRITATING Membrane**. The

The Word is compounded of the Greek  $\pi\epsilon\pi\lambda\alpha\iota$  about, and  $\epsilon\pi\theta\alpha\lambda\mu\acute{o}\varsigma$  Eye.

**PERIOSTEUM**, in Anatomy, a Membrane, pretty tough, and extremely sensible, covering the whole exterior Surface of all the Bones of the Body; the Teeth alone excepted. See **BONE**.

It is derived from the Dura Mater, and consists principally of Fibres detach'd thence; besides which it receives other Fibres from the Membrana Communis of the Muscles, or as Dr. *Havers* imagines, from the fleshy Fibres of the Belly of the Muscles, which intersect the Former.

That Part of it which covers the Cranium or Skull, is by a peculiar Name call'd the *Pericranium*. See **PERICRANIUM**.

The *Periosteum* is very thin every where; tho' not every where alike. It adheres closely to the Bone; and in some Places is observ'd to send Fibres into the very Substance thereof.

Its principal Use is to defend the Muscles and Tendons from being fretted in their Action by the attrition of the hard Substance of the Bones; and to give Notice, by its sensibility, of any Thing that might annoy the Bones.

Indeed, this last Use is controverted; some of the latest Anatomists maintaining that the *Periosteum* is insensible.

The Word is form'd from the Greek  $\pi\epsilon\pi\lambda\alpha\iota$  about and  $\epsilon\pi\theta\alpha\lambda\mu\acute{o}\varsigma$ .

**PERIPATETICKS**, a Sect of Philosophers, the Followers of *Aristotle*; or the Maintainers of the *Peripatetic Philosophy*; call'd also *Aristotelians*. See **ARISTOTELIAN**.

*Cicero* tells us that *Plato* left two excellent Disciples, *Xenocrates* and *Aristotle*, who founded two Sects, which only differ'd in Name; The Former taking the Appellation of *Academicks*, who were those that continued to hold their Conferences in the Academy, as *Plato* had done before; the other who follow'd *Aristotle* were call'd *Peripateticks*; from  $\pi\epsilon\pi\alpha\tau\epsilon\tau\epsilon\iota\varsigma$ , I walk, because they disputed walking in the *Lycæum*. See **LYCÆUM**.

*Annonius* fetches the Name *Peripatetic* from *Plato* himself, who only taught walking; and adds that the Disciples of *Aristotle*, and those of *Xenocrates* were equally call'd *Peripateticks*; the one *Peripateticks* of the Academy, the other *Peripateticks* of the *Lycæum*; but that at length, the Former quitted the Title *Peripatetic* for that of *Academic*, on occasion of the Place where they assembled; and the Latter retain'd simply that of *Peripatetic*. See **ACADEMIC**.

The greatest and best Part of *Aristotle's* Philosophy, he borrow'd from his Master *Plato*; *Seranus* affirms confidently, and says he is able to demonstrate it, that there is nothing exquisite in any part of *Aristotle's* Philosophy, Dialectics, Ethics, Politics, Physics, or Metaphysics, but is found in *Plato*. And of this Opinion are many of the ancient Authors, *Clement Alexandrinus*, &c. See **PLATONISMS**.

*Gale* endeavours to shew that *Aristotle* borrow'd a good deal of his Philosophy both Physical about the *first Matter*; and Metaphysical about the *first Being*, his Affections, Truth, Unity, Goodness, &c. from the sacred Books; and adds from *Cherchus*, one of his (*Aristotle's*) Scholars, that he made use of a certain *Jes*, who assisted him therein.

*Aristotle's* Philosophy preserv'd itself in *paris naturalibus*, a long Time; none of his Followers or Commentators having dared to make any Innovations therein: Till the Beginning of the XIIIth Century; when it began to be new model'd. A reform'd System of *Peripatetickism* was first introduc'd into the Schools, in the University of *Paris*; from whence it soon spread throughout *Europe*; and has subsisted in the Schools to this Day, under the Name of *School Philosophy*. See **SCHOOL**, &c.

The Foundation hereof is *Aristotle's* Doctrine, frequently misunderstood; oftener misapplied: Whence the Retainers thereto may be denominat'd *reformed Peripateticks*.

Out of these have sprung at several Times several Branches, the chief are the *Thomists*, *Scotists*, and *Nominalists*: See each under its proper Article, **THOMIST**, **SCOTIST**, and **NOMINAL**.

**PERIPATETIC Philosophy**, the System of Philosophy, taught and establish'd by *Aristotle*, and maintain'd by his Followers the *Peripateticks*. See **PERIPATETICKS** and **PHILOSOPHY**.

A Specimen of the *Peripatetic Philosophy*, See under **ARISTOTELIAN**.

**PERIPETIA**, in the Drama, that part of a Tragedy wherein the Action is turn'd, the Plot unravel'd, and the whole concludes. See **TRAGEDY**.

The *Peripetia* is properly the Change of Condition whether happy or unhappy, which the principal Person or Persons undergo; arising from some Discovery or Incident, which gives a new turn to the Action.

The *Peripetia* therefore coincides with the Catastrophe, or Unravelling; unless we make the *Peripetia* to depend on the Catastrophe, &c. as an effect on its Cause. See **CATASTROPHE** and **UNRAVELLING**.

The *Peripetia* is sometimes induced by Remembrance or Discovery, as in the *Oedipus*, where the Messenger sent from *Cornibus* to invite *Oedipus* to the Crown, informs him that *Polybus* and *Merope* were not his Father and Mother; which begins a Discovery, that *Leius*, whom he had kill'd, and *Jo-*

*castus* whom he had then to Wife, were his Father and Mother, and throws him into the deepest Distress. See **DISCOVERY**.

This Instance *Aristotle* calls a *double Peripetia*.

The Qualities of the *Peripetia* are, that it be probable and necessary; in order to which it must be the natural Result, at least the Effect, of the foregoing Actions, or of the Subject itself; nor start out from any foreign, or collateral Cause.

Sometimes the *Peripetia* is occasion'd without any Discovery; as in the *Antigone of Sophocles*, where the Change in *Creon's* Fortune is produced by the Effect of his own Obstinacy; and sometimes by a mere Change of the Will, which, tho' the least artful, yet, Mr. *Dryden* observes, may be so manag'd as to become exceedingly beautiful.

These two Cases *Aristotle* calls *simple Peripetias*; in these, the Change only consists in a Passage out of Trouble and Action, into Tranquillity and Rest. See **FABLE**, **ACTION**, &c.

The Word *Peripetia* is form'd from the Greek  $\pi\epsilon\pi\eta\tau\epsilon\iota\varsigma$ , *something falling into a different State*.

**PERIPHERY**, in Geometry, the Circumference, or Bounding-Line of a Circle, Ellipsis, Parabola, and other similar Figures. See **CIRCUMFERENCE**, **CIRCLE**, &c.

The *Periphery* of every Circle is suppos'd to be divided into 360 Degrees, which are again subdivided, each into 60 Minutes, the Minutes into Seconds, &c. See **DEGREE**, **MINUTE**, &c.

The Divisions of Degrees, therefore, are Fractions, whose Denominators proceed in a sexagesimal Ratio: As, the Minute is  $\frac{1}{60}$ , the Second  $\frac{1}{3600}$ , the Third  $\frac{1}{216000}$ . See **SEXAGESIMAL**.

But these Denominators bring troublesome; in their stead are used the Indices of their *Logarithms*; hence the Degree, being the Integer, or Unit, is mark'd by 0, the Minute by 1, Second by 2. &c. See **MINUTE**, **SECOND**, &c.

Geometricians demonstrate that a Circle is equal to a Triangle, whose Base is equal to the *Periphery*, and Altitude to the Radius. See **TRIANGLE**.

Hence it follows that Circles are in a Ratio compounded of their Peripheries and Radii. But they are also in a duplicate Ratio of the Radii; therefore the *Peripheries* of Circles are to each other as their Radii; and since the *Periphery* of one Circle is to its Radius, as the *Periphery* of any other to its Radius; The Ratio of the *Periphery* to the Diameter is the same in all Circles.

The Word is form'd from the Greek  $\pi\epsilon\pi\eta\tau\epsilon\iota\varsigma$  *Circumfers*, I surround.

**PERIPHRAISIS**, in Rhetoric, *Circumlocution*, a Circuit or Tour of Words, much affected by Orators, to avoid common and trite manners of Expression. See **CIRCUMLOCUTION**, **FIGURE**.

The *Periphrasis* is of good use on many occasions; and we are frequently forc'd to have recourse to it, to make Things be conceiv'd, which it is not proper to name.

'Tis a Piece of Politeness to suppress the Names, and only intimate, or design 'em. These Turns of Expression are particularly serviceable in Oratory; for the Sublime admitting of no direct Citations, there must be a Compass taken to inform the Authors, whose Authority is borrow'd. A *Periphrasis* by turning round a proper Name to make it understood, amplifies and raises the Discourse; but Care must be taken it be not too much swell'd; nor extended mal a propos, in which Case it becomes flat and languid.

The Word in the original Greek  $\pi\epsilon\pi\eta\tau\epsilon\iota\varsigma$ , signifies *Circumlocution*.

**PERIPLUS**, a Voyage or Navigation round a certain Sea, or Sea Coasts.

*Arrian* has described all the Coasts of the black Sea, after having inspect'd 'em in Quality of General of the Emperor *Arrian*, to whom he dedicates the Description under the Title of *Periplus of the Euxine Sea*.

**PERIPNEUMONIA**, in Medicine, an Inflammation of some Part of the Thorax, properly of the Lungs; attended with an acute Fever, and a Difficulty of breathing. See **LUNGS**, &c.

The *Peripneumonia* is distinguish'd into *vera*, *trax*; and *mitis*, *spontans*.

The *vera* is a real Inflammation of the Lungs, attended with a symptomatical Fever, and a Cough; by the Former of which it is distinguish'd from an Asthma; and by the latter from a Pleurisy. See **ASTHMA** and **PLEURISY**.

Its usual Causes are, want of Exercise, hard Study, Suppression of natural Evacuations, a moist Air, or the like.

When it arises from a Phlegmon, the Patient spits pure Blood; when it is Erysipelatous, the Sputum is yellow, and not much tinged with red. In this last, the Breast is not so much contracted, but the Fever more violent.

The *Peripneumonia* is more dangerous, tho' less painful than a Pleurisy: Its usual way of going off is by Expectoration of well concocted reddish, yellow, or white Matter. The flowing of the Menfes, or any Hemorrhage, a Diarrhea, Abscesses about the Ears, or other Parts, are also good Prognosticks.

The Medicines prescribed are mostly the same that obtain in Asthmatick and Pleuriticck Cases,

The Word is form'd from the Greek *περι* about, and *πνευμων*, LUNGS.

**PERIPNEUMONIA** *Nosta* or *Sparia* is a Disease of the LUNGS, arising from a heavy pituitous Matter generated throughout the whole Mass of Blood, and discharged upon the Lungs.

'Tis known by the Viscidity, Paleness, and Slowness of the Blood, Ropiness of the Saliva, Paleness and Want of Scent of the Urine, Swellings and Obstructions in the minister Vessels, short Breath, Oppression in the Thorax, &c. worn out, phlegmatic, cold, pithical, catarrhus, Constitutions, are most liable to it. It begins with a Febricleness, Indolence, Weariness, Difficulty of Breathing, Oppression of the Breath, Feverishness; and goes on without any great Appearance of danger to Death itself, without any Prognostic thereof in the Urine, Pulse, &c. It is cured by Blood-letting, Clysters, thin Diet, Diluents, Absorbents and Aperiens.

**PERIPTERE**, in the ancient Architecture, a Building compass'd without-side by a Series of insulated Columns, forming a kind of Isle all around.

Such were the Basilic of *Antonine*, the Septizon of *Severus*, the Portico of *Pompey*, &c. The *Peripteres* were properly Temples, which had Columns on all the four Sides; by which they were distinguish'd from the *Prostyles* and *Amphiprostyles*, the one of which had no Columns before, and the other none on the Sides. See **PROSTYLE**, &c.

*M. Perrault* observes, that *Periptere* in its general Sense, is the Name of a Genus, including all the Species of Temples which have Portico's of Columns all around; whether the Columns be Diptere, or Pseudo-diptere, or simply *Periptere*, which is a Species that bears the Name of the Genus, and which has its Columns distant from the Wall by the Breadth of an Intercolumination. See **TEMPLE**.

For the Difference between *Periptere* and *Peristyle*. See **PERISTYLE**.

The Word is form'd from the Greek *περι*, *circum*, about and *πτερυξ*, *Ala*, Wing.

**PERISCI**, in Geography, those Inhabitants of the Earth, whose Shadows do, in one and the same Day, successively turn to all the Points of the Horizon. See **SHADOW**.

Such are the Inhabitants of the frozen Zones, or those who live within the compass of the Arctic and Antarctic Circles for, as the Sun never goes down to them after he is once up, but always round about, so do their Shadows; in so much, that in the same Day they have their Shadows on all Sides. See **ZONE**.

And hence the Name, from the Greek *περυσια*, *Circum umbrae*.

**PERISKYTIISM**, in Chirurgery, an Operation perform'd by the Ancients on the Cranium. See **CRANIUM**.

The *Periskyrtion* is an Incision which they made under the Coronal Suture, reaching from one Temple a-cross to the other, and penetrating to the Bone of the Cranium: its Intention was to separate the Pericranium from the Skull. See **PERICRANIUM**.

The Word is form'd from the Greek *περι* and *στυρα* to sic.

**PERISSACHOREGIA**, a Term found in the Code, about the Meaning whereof Authors are much divided.

*Alicar*, and some others will have it to be the Name of an Office viz. that of Curator of the *Annona* or Provisions; from *περυσια* Abundance and *χορηγος* to bring. Others take it to be the Office of a Magistrate who was to look to the Augmentation of the *Annona*, and the Distribution of the same.

*Dem. Moeri* will have it to signify a Donative or Distribution made to the Soldiers over and above their Pay. See **DONATIVE**.

**PERISTALTIC**, in Medicine, a Motion proper to the Intestines, wherein the several Parts are successively contracted from above downwards, in a manner resembling the creeping of a Worm; whence it is also call'd the *Vermicular Motion*. See **INTESTINES**.

The *Peristaltic Motion* is perform'd by the Contraction of the circular and longitudinal Fibres, whereof the fleshy Coat of the Intestines is compos'd. 'Tis by Means hereof, that the Chyle is driven into the Orifices of the lacteal Veins, and the Excrements press'd downwards, and at last expell'd. See **CHYLE** and **EXCREMENT**.

When this Motion comes to be deprav'd, and its Direction changed, so as to proceed from below upwards, it produces what we call the *Iliaic Passion*. See **ILIAIC Passion**.

*M. Perrault*, in an exact Treatise on the *Peristaltic Motion*, observes, that tho' 'tis ordinarily, only attributed to the Intestines; yet, it is really an Action common to all the Parts of the Body which alter, prepare, concoct the several Humours and Spirits, which are the Matter and Instruments of animal Action. In effect, he gives the Name to all the Motions whereby the Cavities of the Body are press'd and compress'd.

The Word is form'd from the Greek *περισταλα* and literally implies something *ferri all a-round*.

**PERISTAPHILINUS**, in Anatomy, a Name some give

to the Muscle of the Uvula, inore properly denominat'd *Peri-tylopharyngeus*. See **UVULA** and **PERI-TYLOPHARYNGEUS**.

**PERISTYLE**, in the ancient Architecture, a Place, or Building, incompass'd with a Row of Columns on the Sides; by which it is distinguish'd from the *Periptere*, where the Columns are dispos'd without-side. See **PERIPTERE**.

Such was the Hypetre Temple of *Vernovius*; and such are now some Basiliques in *Rome*, several Palaces in *Italy*, and most Cloisters of Religious.

Yet, the Word *Peristyle* is still us'd indifferently for a Range of Columns, either within or without a Building: As the Corinthian *Peristyle* of the Portal of the *Louvre*, &c.

The Word is form'd from the Greek *περι* about and *στυλος*, Column.

**PERISYSTOLE**, in Medicine, the Pause or Interval between the two Motions of the Heart, or Pulse; viz. that of the Systole or Contraction, and that of the Diastole or Dilation. See **SYSTOLE** and **DIASTOLE**. See also **PULSE** and **HEART**.

**PERITONÆUM**, in Anatomy, a thin, soft Membrane, covering and containing all the Viscera of the lower Belly. See **VISCERA** and **ABDOMEN**.

Its Figure and Size answer to those of the lower Belly, which it lines throughout; its internal Surface is smooth, and lin'd with an unctuous Humour, serving to prevent its wounding the Intestines, and other Parts it touches, as well as to lubricate and facilitate their Motion; when the Glands which furnish it are obstructed, the *Peritonæum* grows thick, as 'tis frequently found in Dropsies.

The external Surface is fibrous and unequal, that it may adhere more firmly to the Muscles of the Abdomen, *Linea Alba*, *Osia pubis*, *Iliolum*, *Ilium*, *Sacrum*, and the *Vertebrae Lumbares*, to which it is fasten'd; and from the last whereof, many suppose it to have its Origin.

It is also connected to the interior or convex Surface of the Liver, which it suspends; and the Part employ'd in this Action, is call'd the *Ligamentum Suspensorium Hepatis*.

The *Peritonæum* is double every where, but most apparently so from the Navel to the Os pubis, and near the Lumbar *Vertebrae*, as appears not only from its extraordinary Thickness in both, but from its Spontaneous parting in the latter, to receive the Kidnies.

It is perforated in the upper Part to give Passage to the *Oesophagus*, *Aorta* and *Cava*; in the under, for the *Fundament*, the Neck of the *Matrix*, and the Vessels that go to the *Thighs*; and in the Fore-part to give Passage to the *Umbilical Vessels*.

Its exterior Coat has two Processes; which in Men fall down into the *Scrotum*, wrap up the *Spermatick Vessels*, and dilating make the *Tunica Vaginalis* of the Testicles; in Women they form a Cover for the round Ligament of the Womb.

The *Peritonæum* receives Veins and Artries from the *Mammaries*, *Diaphragmaticæ*, *Epigastricæ*, *Sacræ*, and *Lumbares*; Nerves from the Os Sacrum and *Loins*. *Dr. Rudbeckius* pretends to have likewise discover'd *Lymphaticks*, which being scarce visible, except in *Hydropic Cases*, an't much taken notice of.

In morbid Cases, great Quantities of Serum have been found between the Duplicitures of this Membrane, when there was none in the Cavity of the Abdomen; which constitutes the true *Tympany*. See **TYMPANY**.

The Use of the *Peritonæum* is to contain, and keep in their Place the Viscera of the Abdomen: This is so manifest, that when ever this Membrane happens to be broke, or extraordinarily dilated, some of the Parts are apt to fall down, and to form those Tumors call'd *Hernia's* or *Ruptures*. See **HERNIA**.

The Term *Peritonæum* is Greek, and is derived from the Verb *περιεστειρο* circumtendo, I stretch all a-round.

**PERITROCHUM**, in Mechanicks, a Wheel or Circle, as *A B*, (Tab. Mechanicks, Fig. 44.) concentric with the Base of a Cylinder, and moveable together with it, about an *Axis E F*.

The *Axis*, with the *Wheel*, and *Lever* fix'd therein to move it, make that mechanical Power, call'd *Axis in Peritrochio*. See *Axis* in **PERITROCHIO**.

*Axis* in **PERITROCHIO**, in Mechanicks, one of the fix mechanical Powers, or simple Machines, contriv'd for the raising of Weights. See its Structure, Doctrine, Application, &c. under the Article *Axis in Peritrochio*.

**PERJURY**, in Law, the Crime of swearing falsely in a lawful Oath, administer'd by one who has Authority, in any Matter relating to an Issue, or Cause in Question; whether it be of the Persons own accord, or by Suboragation of another. See **OATH**.

If a Man call me *perjur'd*, I have my Action upon the Case. If he calls me *forsworn* no Action lies, because the Forswearing may be extra-judicial.

*Perjury* is usually excepted out of general Acts of Grace.

The Punishment of *Perjury* is *Collustratum*, the Pillory, or burning the Criminal in the Forehead with a *P*, rooting up his Trees, and confiscating his Goods. See **PILLORY**, &c. **PER-**

**PERMEABLE**, denotes a Body consider'd as its Pores are capable of letting somewhat pass thro' 'em. See **POROS**.

**PER MINIMA**, in Medicine, denotes a perfect Mixture of the smallest Particles of several Bodies, or Ingredients. See **MIXTURE** and **MINIMA**.

**PERMUTATION**, the Truck, or Exchange of one Thing for another. See **EXCHANGE**.

The Commerce of the Ancients, was perform'd wholly by way of Permutation. See **COMMERCE**.

**PERMUTATION**, in the Canon Law, a real and active Exchange of two Benefices. See **BENEFICES**.

*Permutation*, is a Means of bringing Benefices into Commerce without Simony. See **SIMONY**.

The Conditions requir'd to a canonical *Permutation* are; 1. That there be Benefices *permuted* on either Side; tho' the Revenues be unequal; and in Case of Inequality, no Compensation to be made in Money; but only a Pension charged on the bigger. 2. That each of the *Permutants* quit his Benefice, and make a Procuration *ad resignandum*. 3. That the *Permutation* be followed by a Collation of the Ordinary. 4. That the Ordinary be inform'd of the Cause of the *Permutation*. 5. That those to whom the Prefertion or Election to the Benefices belongs, give their Consent; or in Cases of their Refusal, that the Content of the *Dioecesis* be had.

The chief Rules of *Permutation* are, that if one of the *Permutants* cannot enjoy, he re-enters with full right into the Benefice he has quitted; and that if he die 'ere he have accomplish'd the *Permutation* on his Part by the taking of Possession, the *Permutant* who has accomplish'd, remains both Benefices, unless they fall into the Regale.

**PERMUTATIONS of Quantities**, in Algebra, the Changes, Alterations, or different Combinations of any Number of Quantities. See **COMBINATION** and **CHANGE**.

**PERMUTATIONE** *Archidiaconatus & Ecclesie vicarii annexæ cum Ecclesijs & prebendis*, is a Writ issued to an Ordinary, commanding him to admit a Clerk to a Benefice upon Exchange made with another. Reg. of Writs.

**PERMY & PER TOUT**, a joint Tenant is said to be *seiz'd* of the Land he holds jointly *Per my & Per tout*, i. e. he is *seiz'd* by every Parcel, and by the whole, *Totum tenet, & nihil tenet, sc. totum communium & nihil separatim*. *Bracton*.

**PERNANCY**, in Law, the taking or receiving any Thing; from the *French* *Prenare*, to take.

Tithes in *Pernancy* are Tithes taken in kind. See **TITHES**.

**PERNIO**, in Medicine, a Disease afflicting the Hands and Feet in Winter-time, popularly call'd a *Kibe* or *Chilblain*. See **CHILBLAIN**.

The Parts affected swell, inclining from a white to a bluish Colour, itch and ache; yet, the Tumour vanishes without any Exacerbation, upon anointing the Part with Petrol.

**PERNOR of Profits**, he who takes, or receives the Profits of any Thing; from the *French* *Prenere*, *Taker*.

**PERONE**, in Anatomy, a Bone of the Leg, more usually call'd *Fibula*. See **FIBULA**. Hence

**PERONÆUS Anticus, longus or primus**, a Muscle of the Leg, arising fleshy and tendinous from the Head to the Middle of the *Perone*; whence running as in a Pulley, thro' the Channel on the hind Part of the outer Ankle Bone, it is inserted into the Upper-end of the Bone of the Metatarsus, which joins the great Toe: The Office of this Muscle is to draw the Foot upwards.

**PERONÆUS Posticus, brevis, or secundus**, a Muscle sometimes also call'd *Semispinosus*, arising fleshy and sharp in the Back-part of the *Perone*; whence, continuing down the Outside of the Bone till below the Middle, it forms a smooth, strong, flat Tendon, which runs thro' the same Channel at the Bottom of the Malleolus externus, with the *Loengus*, to be Out-side of the Os Metatarsi of the little Toe: Its Office is to pull the Foot upwards.

**PERORATION**, in Rhetoric, the *Epikegne*, or last Part of an Oratio; wherein, what the Orator had insisted on thro' his whole Discourse is urg'd a-fresh, with greater Vehemence and Passion: Thus *Quintilian*. See **ORATION**. The *Peroration* consists of two Parts, 1. *Recapitulatio*, wherein the Substance of what is diffus'd throughout the whole Speech, is collected briefly, and cursorily; and form'd up with new Force and Weight. See **RECAPITULATION**.

And, 2. The *Moving of the Passions*; which is so peculiar to the *Peroration*, that the Masters of the Art call this Part *sedes affectuum*. See **PASSIONS**.

The Passions to be rais'd in the *Peroration* are various, according to the various Kinds of Orations: In a Panegyric, Love, Admiration, Emulation, Joy, &c. In an Invective, Hatred, Contempt, &c. In a Deliberation, Hope, Confidence or Fear.

The Qualities required in the *Peroration* are, that it be vehement and passionate; and that it be short: Because, as *Cicero* observes, Tears soon dry up.

The *Peroration* was *Cicero's* Master-piece: Here that great Orator not only fet his Judges and Auditors on Fire, but even seem'd to burn himself; especially when he was to raise Pity and Commiseration towards the accused; where, as he himself tells us, he frequently fill'd the Forum with Weeping

and Lamentation. He adds, that where there were several Orators to speak for the same Person, the *Peroration* was always reserv'd to *Cicero*; and subjoins, that if he excell'd herein, 'twas not owing to Genius, but to the Grief he himself shew'd. This is abundantly evident in his *Milonian Peroration*; where he says *sed satis fit: neque enim pro Læcœvius iam loqui possunt; & hoc se Læcœvius deservit vocat*—and in that for *Rebrutus Postumus*: *sed jam, quoniam, ut spero, scdm quoniam potui, tibi præstiti, Postumæ, reddam etiam Læcœvius quos debet— Jam intreat se beatissimo ferus quam sit carus tuis, & me dolor debilitat, includitque vocem*.

**PERPENDICULAR**, in Geometry, a Line falling directly on another Line, or so as to make equal Angles on each Side; call'd also a *normal* Line. See **LINE**.

Thus the Line *IG*. (Tab. Geometry Fig. 57.) is *Perpendicular* to the Line *KH*. i. e. makes right and equal Angles therewith:

From the very Notion of *Perpendiculars*, it follows; 1. That the *Perpendicularity* is mutual, i. e. if a Line as *IG* be *Perpendicular* to another, *AB*; that other, is also *Perpendicular* to the first.

2. That only one *Perpendicular* can be drawn from one Point in the same Place.

3. That if a *Perpendicular* be continu'd thro' the Line it was drawn *Perpendicularity* to; the Continuation will also be *Perpendicular* to the same.

4. That if there be two Points of a right Line, each of which is at an equal Distance from two Points of another right Line; that Line is *Perpendicular* to the other.

5. That a Line which is *Perpendicular* to another, is also *Perpendicular* to all the Parallels of the other. See **PARALLEL**.

6. That a *Perpendicular* Line is the shortest of all those which can be drawn from the same Point to the same right Line.

Hence the Distance of a Point from a Line, is a right Line drawn from the Point *Perpendicular* to the Line or Plane; and hence the Altitude of a Figure is a *Perpendicular* let fall from the Vertex to the Base. See **DISTANCE**.

To erect a *Perpendicular* *GI* on any given Point *G*, in a right Line *ML*; one Foot of the Compasses being in *G*, with any Interval at Pleasure, cut off equal Parts on each Side *GH* and *GK*; from the Points *K* and *H*, with an Interval greater by half than *KH* strike two Arches intersecting in *I*; the right Line *GI* is *Perpendicular* to *ML*.

*Perpendiculars* are best describ'd in Practice by means of a Square; one of whose Legs is applied along that Line to, or from which the *Perpendicular* is to be let fall or rais'd. See **SQUARE**.

To erect a *Perpendicular* on the End of a given Line, suppose at *P*; open your Compasses to any convenient Distance, and setting one Foot in *C*, describe the Arch *RPS*; lay a Ruler from *C* through *C*, it will find the Point *R* in the Arch, whence draw *PR*, which is *Perpendicular* to *PM*.

To let fall a *Perpendicular* on a given Line *MP*, from a given Point *L*; set one Foot of the Compasses in *L*, and with the other cross the given Line in the Points *M* and *G*. Then setting the Compasses in *G* and *M*, strike two Arches intersecting each other below in *S*: Then lay a Ruler from *L* to *S*, and the Line *KL* describ'd thereby is the *Perpendicular* requir'd.

**PERPENDICULAR** to a *Parabola*, is a right Line cutting the *Parabola* in the Point in which any other right Line touches it, and is also itself *Perpendicular* to that Tangent. See **PARABOLA**.

A Line is said to be *Perpendicular* to a Plane, when it is *Perpendicular* to all the Lines it meets with in that Plane; and a Plane is *Perpendicular* to another Plane, when a Line in one Plane is *Perpendicular* to the other Plane. See **PLANE**.

**PERPENDICULARITY of Plants**, is a curious *Phænomenon*, in Nat. History, first observ'd by *M. Dodart*, and publish'd in an express Essay on the *Affection* of *Perpendicularity*, observable in the Stems or Stalks of all Plants, of the Roots of many, and even of the Branches as much as possible.

The Matter of Fact is, that tho' almost all Plants rise a little crooked; yet, the Stems shoot up perpendicularly, and the Roots sink down *Perpendicularly*: Even such as by the Declivity of the Soil come out inclin'd, or such as are diverted out of the *Perpendicular* by any violent Means; again straighten themselves, and recover their *Perpendicularity*, by making a second and contrary Bend or Elbow, without rectifying the first.

A common Eye looks on this Affection without any Surprise; but a Man that knows what a Plant is, and how form'd, finds it a Subject of Astonishment.

In effect, each Seed contains a little Plant, already form'd, and needing nothing but to be unfolded: The little Plant has its little Root; and the Pulp, which is usually separated into two Lobes, is the Foundation of the first Food the Plantule draws, by its Root, when it begins to germinate. See **SEED**, **RADICLE**, &c.

Now, if a Seed in the Earth, be so disposed, as that the

Root of the little Plant be turn'd downwards, and the Stem upwards, and even *Perpendicularly* upwards; 'tis easy to conceive that the little Plant coming to unfold itself, 'tis Stalk and Root need only follow the Direction they have, to grow *Perpendicularly*. But 'tis known the Seeds of Plants whether sown of themselves, or by the Help of Man, fall in the Ground at random; and among an infinite Number of Situations with regard to the Stalk of their Plant, the *Perpendicular* one upwards is but one. See SEMINATION.

In all the rest therefore, 'tis necessary the Stalk redress or rectify itself, in order to get out of the Ground: But what Force is it, that effects this change, which is certainly a violent Action? Is it that the Stalk finding a less Load of Earth above it, goes naturally that way where it finds the least Obstacle? Were this so, the little Root when it happens to be uppermost, must for the same Reason follow the same Direction, and moult on high.

M. Dodart, therefore, to account for two such different Actions; has recourse to another System: He supposes that the Fibres of the Stalks are of such a Nature, as that they contract and shorten by the Heat of the Sun, and lengthen out by the Moisture of the Earth: And on the contrary, that the Fibres of the Roots contract by the Moisture of the Earth, and lengthen by the Heat of the Sun.

When, then, the Plantule is inverted, and the Root a-Top; the Fibres which compose one of the Branches of the Root are not equally exposed to the Moisture of the Earth; the lower Part is more exposed than the Upper. The Lower therefore must contract the most; which Contraction is again promoted by the lengthening of the Upper, whereon the Sun acts with the greatest Force. Of Consequence, therefore, this Branch of the Root must recoil towards the Earth, and insinuating thro' the Pores thereof get underneath the Bulb, &c.

By inverting this reasoning, 'tis easy to shew how the Stalk comes to get uppermost.

In a Word, we may imagine that the Earth attracts the Root to itself, and that the Sun contributes to its Defecation; and on the contrary, that the Sun attracts the Stem, and the Earth, in some measure, tends it towards the same.

As to the second Straightness, viz. that of the Stalks in the open Air; he takes it to arise from the Impression of external Causes, particularly the Sun and Rain. For the upper Part of a Stalk that is bent, is more exposed to the Rain, Dew, and even Sun, &c. than the under. Now both these Causes, in a certain Structure of the Fibres, tend equally to freighten the Part most exposed, by the Shortening they successively occasion it; for Moisture shortens by swelling, and Heat by Dissipation. Indeed, what that Structure is which gives the Fibres such different Qualities; or whereon it depends, is still a Mystery.

M. de la Hire Accounts for the *Perpendicularity* of the Stems or Stalks of Plants thus: He imagines that in Plants, the Root draws a coarser and heavier Juice; and the Stem and its Branches a finer and more volatile one. And, in effect, most Naturalists conceive the Root as the Stomach of the Plant, where the Juices of the Earth are subtilis'd, so as to become able to rise thro' the Stem to the Extremity of the Branches. This Difference of Juices supposes larger Pores in the Roots than the Stalk, &c. and in a Word, a different Texture; which Difference must be found even in the little invisible Plant inclosed in the Seed: In this Plantule, therefore, we may conceive a point of Separation; such, as that all on one Side *E. g.* the Root, shall be unfolded by the grosser Juices, and all on the other Side by the more subtle Juices.

Suppose, now, the Plantule when its Parts begin to unfold, to be entirely over-turo'd; the Root a Top, and the Stalk below: the Juices which enter the Root will still be coarsest, and when they have open'd and enlarg'd the Pores, so as to admit Juices of a determinate Weight, those Juices still pressing the Root more and more, will drive it downwards, and this the more, as the Root more extended or enlarg'd: For the Point of Separation being conceived as the fixed Point of a Lever, they will act by the longer Arm. At the same Time the volatile Juices having penetrated the Stalk, will tend to give it a Direction from below upwards; and by reason of the Lever, will give it more and more every Day. Thus is the little Plant turn'd on its fix'd Point of Separation; till it be perfectly erect.

The Plant thus erected; the Stalk, we know, shou'd continue to rise *Perpendicularly*, to give it the more firm Biding and enable it to withstand the Effort of Wind and Weather.

The Manner wherein this is effected, M. Parent lays down thus: The nutritious Juice being arriv'd at the Extremity of a rising Stalk; if it evaporate, the Weight of the Air which encompasses it on all Sides, will make it ascend vertically; and if it do not evaporate, but congeal, and remain fix'd to that Extremity whence it was ready to go off; the Weight of the Air will give it the same Direction: so that the Stalk will have acquir'd a very little new Part, vertically laid over it: Just as in a Candle held any how obliquely to the Horizon, the Flame still continues Vertical, by the Pressure of the Atmosphere. The new Drops of Juice that succeed, will

follow the same Direction; and as all together form the Stalk; that must of course be Vertical, unless some particular Circumstance intervene.

As to the Branches, which are at first suppos'd to proceed laterally out of the Stalk in the first Embryo of the Plant; tho' they shou'd even come out in a horizontal Direction, yet must they raise 'emselves upwards by the constant Direction of the nutritious Juice; which at first scarce meets any Resistance in a tender, supple Branch; and even afterwards tho' the Branch grow more firm, yet will it act with the more Advantage: since the Branch being become longer, furnishes it with a longer Arm of a Lever. The slender Action of a little Drop becomes very considerable, by its Continuity; and by the Assistance of such favorable Circumstances. Hence may be accounted for, that regular Situation and Direction of the Branches, which all, and always, neatly, make the same constant Angle of 45° with the Stem and one another. See BRANCH.

M. Affrus, accounts for the *Perpendicularity* of the Stems, and their Redressing themselves; on these two Principles; 1° That the nutritious Juice arises from the Circumference of the Plant, and terminates in the Pith: 2° That Fluids contained in Tubes either parallel or oblique to the Horizon, gravitate on the lower Part of the Tubes, and not at all on the Upper.

For hence it easily follows, that in a Plant posited either obliquely or parallel to the Horizon, the nutritious Juice will act more on the lower Part of the Canals than the upper, and by this Means, insinuate more into the Canals communicating therewith, and be collected more copiously therein; thus the Parts on the lower Side will receive more Accretion, and be more nourish'd than those on the upper; the Consequences whereof must be, that the Extremity of the Plant will be oblig'd to bend upwards.

The same Principle brings the Seed into its due Situation at first: In a Bean planted upside down, the Plum and Radicle are easily perceiv'd with the naked Eye, to float, at first, directly for about an Inch; but thence forth they begin to bend, the one downward, and the other upward. The like is seen in a heap of Barley, to be made into Malt; in a Quantity of Acorns, laid to sprout in a moist Place, &c. each Grain of Barley in the first Case, and each Acorn in the second, has a different Situation; and yet, all the Sprouts tend directly upward, and the Roots downward, and the Curvity or Bend they make is greater or less as their Situation approaches more or less to the direction wherein so Curvature at all wou'd be necessary. Now, two such opposite Motions cannot arise without supposing some considerable Difference between the two Parts: The only one we know of, is, that the Plum is fed by a Juice, imported to it by Tubes parallel to its Sides, whereas the Radicle imbibes its Nourishment at all the Pores in its Surface. As oft, therefore, as the Plum is either parallel, or inclin'd to the Horizon, the nutritious Juice feeding the lower Parts more than the upper, will determine its extremes to turn upward, for the Reasons already assign'd. On the contrary, when the Radicle is in the like Situation, the nutritious Juice penetrating more copiously thro' the upper Part than the under; there will be a greater Accretion of the former, than the latter; and consequently the Radicle will be bent downwards. And this mutual Curvity of the Plum and Radicle must continue, till such Time as their Sides are nourish'd alike, which cannot be till they are Perpendicular. *Mémoires de l'Acad. Royale des Sciences. An. 1708.*

PERPETUAL, something that endures always, that lasts for ever. See ETERNITY.

The Term is sometimes also us'd for a Thing that lasts, or holds, during a Person's Life.

Thus Offices, &c. held *durante vita*, are sometimes call'd *Perpetual Offices*: In this Sense M. Fontenelle is said to be *Perpetual Secretary* of the Royal Academy of Sciences. Hence the French call him absolutely *M. le Perpetuel*.

PERPETUAL MOTION, in Mechanics, is a Motion which is supplied and renew'd from itself, without the Intervention of any external Cause; or it is an uninterrupted Communication of the same Degree of Motion from one Part of Matter to another, in a Circle, (or other Curve returning into itself) so as the same Momentum still returns perpetually undiminished upon the first mover. See MOTION.

To find a *perpetual Motion*, or to construct an Engine; &c. which shall have such a Motion, is a famous Problem that has employ'd the *Mathematicians* of two thousand Years; tho' none perhaps have prosecuted it with Attention and Earnestness equal to those of the present Age.

Infinite are the Schemes, Designs, Plans, Engines, Wheels, &c. to which this long'd for *perpetual Motion* has given Birth: 'Twere as endless as impertinent to give a Detail of 'em all.

None does any of 'em deserve particular Mention, since they have all equally prov'd Abortive. It wou'd rather be of the Nature of an *Abortus* than a Complement, to distinguish the Pretenders hereto; when the very Thing they are commemorated for, carries with it so disagreeable an Idea.

In effect, there seems but little in Nature to countenance all this Affiduity and Expectation: Among all the Laws of Matter and Motion, we know of none yet, which seems to lay any Principle or Foundation for such an Effect. See NATURE.

Action and Re-action are allow'd to be ever equal; and a Body which gives any Quantity of Motion to another, loses just so much of its own: But under the present State of Things; the Resistance of the Air, the Friction of the Parts of Machines, &c. do necessarily retard every Motion. See RESISTANCE.

To keep the Motion on foot, therefore, 1. Either there must be a Supply from some foreign Cause; which in a *perpetual* Motion is excluded.

Or, 2<sup>o</sup> all Resistance from the Friction of the Parts of Matter, must be removed; which implies a Change in the Nature of Things. See MATTER.

For by the second Law of Nature, the Changes made in the Motions of Bodies, are always proportional to the impress'd moving Force, and are produc'd in the same Direction with it; no Motion, then, can be communicated to any Engine, greater than that of the first Force impress'd. See COMMUNICATION and PERCUSSION.

But, on our Earth, all Motion is perform'd in a resisting Fluid; and must therefore of necessity be retarded; consequently a considerable Quantity of its Motion will be spent on the Medium. See MEDIUM.

Nor is there any Engine or Machine wherein all Friction can be avoided; there being in Nature no such Thing as exact Smoothness, or perfect Congruity; The Manner of the Cohesion of the Parts of Bodies, the small Proportion the solid Matter bears to the Vacuities between them, and the Nature of those constituent Particles not admitting it. See FRICTION.

This Friction, therefore, will also in Time sensibly diminish the impress'd, or communicated Force; so that a *perpetual* Motion can never follow, unless the communicated Force be so much greater than the generating Force, as to recompense the Diminution made therein by all these Causes: but *ut ait quod non habet*, the generating Force cannot communicate a greater Degree of Motion than it hath itself.

The whole Business of finding a *perpetual* Motion, therefore, comes to this, viz. to make a Weight heavier than itself, or an elastic Force greater than itself. See MACHINE.

Or 3<sup>o</sup>, and lastly, there must be some Method of gaining a Force equivalent to what is lost, by the artful Disposition and Combination of Mechanic Powers: To which last Point, then, all Endeavours are directed; but how, or by what Means such Force shou'd be gain'd, is still a Mystery.

The Multiplication of Forces, 'tis certain avails naught; for what is gain'd in Force is still lost in Time, so that the Quantity of Motion still remains the same.

All Mechanicks cannot really make a little Force equal, or superior to a larger; and wherever a less Force is found in *Equilibrium* with a larger v. g. 25 Pounds with 100, 'tis a Kind of Deception of the Sense; the Equilibrium is not strictly between 100 Pounds and 25; but between 100 Pounds, and 25 moving, or disposed to move four times as fast as the 100.

To consider the Weights 100 and 25 as fix'd, and immovable, they 5<sup>o</sup> wou'd seem, some how, rais'd beyond 'emselvs; which is one of the Sham-miracles of Mechanicks, that has deceiv'd Millions; but which is easily dissipated by considering the four Degrees of Velocity, which are to be given to the 25 Pounds, and which require a Force equal to the Excess of 100 above 25 Pounds.

A Force of 10 Pounds mov'd with ten times the Velocity of the 100 Pounds, wou'd have equal'd 'em in the like Manner; and the same may be said of all the possible Products equal to 100. But in fine, there must still be 100 Pounds of Force on each Side, what way soever they be taken; whether in the Matter, or in the Velocity.

This is an inviolable Law of Nature; by which nothing is left to Art, but the Choice of the several Combinations that may produce the same Effect. See LAW OF NATURE.

PERPETUAL, or endless Screw. See SCREW.

PERPETUAL Pills, *Pillule perpetue*, among Physicians, are Pills made of *Regulus of Antimony*; which being swallow'd, and voided 50 Times, will purge every Time, with undiminisht Force. See ANTIMONY.

PERPETUAL Glan'dules, in Anatomy, are those which are natural; thus distinguish'd from the adventitious ones. See GLAND.

PERPETUITY, in the Canon Law, the Quality of a Benefice that is irrevocable, or whose Incumbent cannot be deprived; except in certain Cases determin'd by Law. See BENEFICE.

'Tis asserted with Reason, that the *Perpetuity* of Benefices is establish'd by the ancient Canons, and that the Priests are inseparably attach'd to their Churches, as by a spiritual Marriage. 'Tis true, by the Corruption of the Times, the secular Priests being fallen into great disorder, and even Contempt; the Bishops antiently call'd the Religious to their Assistance, and committed to them the Cure of Souls, and

the Administration of Parishes; still retaining 'em back again to their Cloisters, when they thought fit, and revoking them *ad Nuntum*.

But this vague and uncertain Administration only lasted to the XII Century, when Benefices return'd to their essential *Perpetuity*.

PERQUISITE, any Thing gotten by a Man's own Industry, or purchas'd with his own Money; in contradistinction to that which descends to him from his Father, or Ancestors.

PERQUISITS of Court are those Profits which arise to a Lord of a Manor, by Virtue of his Court-Baron, over and above the certain yearly Profits of his Land; as Fines of Copy-holds, Harriots, Amerciements, Waifes, Strays, &c.

PER QUÆ servatis, is a Writ judicial, issuing from the Note of a Fine, and lies for the Cognizee of a Manor, Scignory, chief Rent, or other Services, to compel him that is Tenant of the Land at the Time of the Note of the Fine levied, to return to him.

PERRON, in Architecture, a Stair-Cafe lying open, or without-side the Building; properly, the Steps in the Front of a Building, which lead into the first Story when rais'd a little above the Level of the Ground. See STAIR-CASE.

*Perrons* are made of different Forms and Sizes, with regard to the Space and Height they are to lead to.

Sometimes the Steps are round, or Oval; more usually Square.

PERRUKE, was antiently used for a long Head of natural Hair, such, particularly, as there was care taken in the Adjusting and Trimming of The Laties call'd *Cour*, whence part of *Gaul* took the Denomination of *Gaulia Comata*; from the long Hair which the Natives wore as a Sign of Freedom. See HAIR.

An ancient Author says, that *Abraham's Perruke* weigh'd 200 Shekels.

*Perruque*, is now us'd for a Set of false, or borrow'd Hair; curl'd, buckled, and sew'd together on a Frame or Cawl; antiently call'd a *falsè Perruque*.

*Menage* derives the Word from the Greek *μεινριζ* which signifies the same Thing.

'Tis doubted whether or no the Use of *Perrukes* was known among the Ancients. 'Tis true, they us'd false Hair; *Mertal* and *Juvonal* make merry with the Women of their Time, for making 'emselvs look young with their borrow'd Hair; with the Men who chang'd their Colours according to the Seasons; and the Doctors who hoped to deceive the Destinies by their white Hair.

But these seem to have scarce had any Thing in common with our *Perrukes*; and were at best compos'd of Hair painted, and gl'd together: Nothing can be more ridiculous than the Description *Lausperidius* gives of the Emperor *Constantinus's Perruke*: 'Twas powder'd with scrapings of Gold, and oil'd (if we may use the Expression) with glutinous Perfumes for the Powder to hang by.

In effect, the use of *Perrukes*, at least on their present footing, is not an hundred Years old: The Year 1629 is reckon'd the Epocha of long *Perrukes*; at which time they began to appear in *Paris*; whence they spread by degrees throughout the rest of *Europe*.

At first it was reputed a Scandal for young People to wear 'em; by reason the Loss of the Hair at that Age was attributed to a Disease, the very Name whereof is a Reproach; but at length the Mode prevail'd over the Scruple; and now all Ages and Conditions wear 'em; foregoing, without any Necessity, the Conveniences of their natural Hair.

'Twas sometime, though, 'ere Ecclesiastics came into the Fashion: The first who assum'd the *Perruke* were some of the French Clergy, in the Year 1663; nor is the Practice yet well authoriz'd. The Cardinal *Grimaldi* in 1684, and the Bishop of *Lausanne* in 1688, prohibited the Use of the *Perruke* to all Priests without a Dispensation and Necessity. *M. Thiers* has a Treatise express'd, to prove the *Perruke* indecent in an Ecclesiastic, and directly contrary to the Decrees and Canons of Councils. A Priest's Head embellish'd with an artificial Hair curiously adjust'd, he effects a Monster in the Church; nor can he conceive any Thing so scandalous as an Abbot with a florid Countenance, bespighten'd with a jolly *Perruke*.

PERRY, a Drink made of Peas, after the like manner as Cyder from Apples.

The best Fruit for this Use are such as are least fit for eating; *E. gr.* the Borberry-Pear, Hurst-Pear, Boreland-Pear, and Chook-Pear; and still the redder they are the better.

The Method of preparing *Perry* is perfectly the same with that of preparing Cyder. See CYDER. Only Note, that the Fruit must be perfectly ripe. Some mix Creaks with 'em to mend the Ligor.

PER SE, in the Schools, is sometimes oppos'd to *per accidens*; in which Sense a Thing is said to agree with another *Per se*, when the Agreement is not owing to any accidental Event, but that is found in the intrinsic Principles of the Things themselves.

Sometimes *Per se* is opposed to *Per aliud*; in which Sense God alone is said to have a Being *Per se*, as not deriving it from any other, but having it necessarily and of himself.

Sometimes again, *Per se* signifies as much as, of its own Nature, or in virtue of its own Enty: Thus the Sun is said to give light *Per se*; and Quantity is extended *Per se*.

Among Logicians, a Thing is said to be known *Per se*, *Per se visum*, when we immediately perceive it upon the first proposing of the Terms: As that the Whole is greater than its Parts. See AXIOM.

The Philosophers go so far as to consider the Mode of a Thing existing *Per se*, or that which constitutes its Existence such; which they call *Perferty*, *Perfetas*. See EXISTENCE.

PERSECUTION, a Word which literally imports any Pain, Affliction, or Inconvenience, which a Person designedly inflicts on another.

But, as a Term, Perfection is restrain'd to the Sufferings of Christians, in Behalf of their Religion; particularly to those of the primitive Christians, under the Heathen Emperors *Nero*, *Licinius*, *Diocletian*, &c.

They reckon ten of these Perfections; New lighted the First. *Lactantius* has written the History of the Deaths of *Persecutors*; tho' some question whether that Work he really his or not. Bishop *Burnet*, who has turn'd it into *Englisch*, makes no great doubt of it.

PERSEVERANCE, in Theology, a Christian Virtue, whereby we are enabled to persist in the way of Salvation to the End.

The final *Perseverance* of the Saints is an Article much controverted between the *Arminians* and *Calvinists*: The latter of whom maintain it for Grace to be lost; and therefore make *Perseverance* to the End, a necessary Consequence thereof; which the former deny; believing the most confirm'd Believers never out of a Possibility of falling See GRACE.

PERSEUS, in Astronomy, a Constellation of the Northern Hemisphere. See CONSTELLATION.

The Stars in this Constellation, in *Ptolemy's* Catalogue are 29; in *Tychon's* as many; in the *Britannic* Catalogue 57. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow:

Stars in the Constellation PERSEUS.

Names and Situations of the Stars.	Longit.	Latitude.	Magnit.
	West.	North.	
In <i>Andromeda's</i> Foot, according to <i>Ptolemy</i> and <i>Tychon</i> ; according to <i>Bayer</i> in <i>Perseus</i> .	20 08 36	35 23 45	4
In the Middle of the Sword	16 19 14	40 13 15	5
	11 52 02	36 18 37	6
	12 09 56	34 26 01	6 7
	15 39 10	38 57 37	6
	19 02 06	41 13 15	6
	15 45 35	35 09 28	6
South in the Hilt of the Sword against North, (the Hand)	19 56 48	40 43 20	5 6
	20 18 34	41 03 20	6
Small one under the Hand	19 44 42	35 57 44	6
	20 39 23	39 28 49	7
	22 47 39	37 06 23	7
North of the Informer before <i>Medusa's</i> Head	16 32 13	33 13 10	5
the preced. Shoulder ( <i>dasy's</i> Head)	20 19 25	31 36 07	4
In the upper Arm	18 25 56	36 57 26	6
	24 23 27	37 26 50	4
South of the Informer before <i>Medusa's</i> Head	17 19 22	20 55 22	4
the preced. Informer under <i>Medusa's</i> Head	16 36 31	17 46 05	6 5
In <i>Perseus's</i> Head (the Head)	23 35 30	34 20 12	5
Subseq. and left. before <i>Medusa's</i> Head	18 08 09	20 44 42	6
(the Head)	16 51 09	14 24 47	5 6
Preced. in <i>Medusa's</i> Head	19 24 36	31 42 11	4
Left of Informer, and <i>Medusa's</i> Head in the hind Shoulder	18 13 28	17 24 46	6
	25 62 10	24 50 05	3
In the upper Part of the Arm	27 10 38	37 27 42	5 6
South in <i>Medusa's</i> Head	20 34 30	20 33 13	4
In the Middle of the Back <i>Algal</i>	24 49 20	30 38 55	4
Bright one in <i>Medusa's</i> Head	21 50 43	23 23 47	2 3
In the lower Part of the Arm	23 21 13	26 04 22	4
That under <i>Algal</i>	22 01 28	20 55 56	4 5
	26 52 42	30 42 10	6 7
	24 38 48	24 49 51	6
	26 54 54	23 33 42	6
Against the Preced. and South, Side	25 07 54	33 58 05	5 6
A Lucid one against the hind Part	27 46 04	30 05 20	2

	II 10 48 29	26 52 59	6

PERSIAN, or the PERSIAN Tongue, one of the living oriental Languages; spoke in the Empire of *Perfia*. See LANGUAGE.

The *Persian* has two Particularities not found in any of the other Eastern Tongues, The one that it has an auxiliary Verb, answering to the Verb *sum* of the *Greek*; the other, that it has an Aorist: Both these it borrow'd from the *Macedonians*, after the Conquest of *Alexander*. See GREEK.

PERSIAN Wheel, in Agriculture, is a Machine for raising a Quantity of Water sufficient to over-flow Lands bordering on the Banks of Rivers, &c. where the Stream is too low to do it alone. See WHEEL.

PERSIAN or PERSIC, in Architecture, a Name common to all Statues of Men, serving instead of Columns, to support Entablatures. See STATUE.

They only differ from Caryatides, in that those represent Statues of Women. See CARYATIDES.

The *Persian* is a Kind of Order of Columns, first practis'd among the *Athenians*; on occasion of a Victory their General *Pausanias* obtain'd over the *Persians*. As a Trophy of this Victory, the Figures of Men dress'd in the *Persian* Mode, with their Hands bound before them, and other Characters of Slavery, were charg'd with the Weight of Doric Entablatures; and made to do the Office of Doric Columns. See ORDER.

*Persian* Columns, *M. le Clerc* observes, are not always made with the Marks of Slavery; but are frequently used as Symbols of Virtues, Vices, of Joy, Strength, Valour, &c. as when made in the Figure of *Hercules* to represent Strength, of *Mars*, *Mercury*, *Fauns*, *Satyres*, &c.

PERSIAN Era and Year. See EPOCHA and YEAR.

PERSON, an individual Substance, of a rational or intelligent Nature. See SUBSTANCE, and INDIVIDUAL.

The Father and Son are reputed, in Law, as the same Person; an Ambassador represents the Person of his Prince. See EMBASSADOR.

In Theology the Godhead is divided into three Persons; but here the Word *Person* carries a peculiar Idea, very different from that attach'd to it every where else; being only used for want of a Term more pertinent and expressive. See TRINITY.

The Word *Person*, *Persons* is said to be borrow'd a *Personando*, from personating, or counterfeiting; and is supposed to have first signified a Mask; by Reason, says *Boetius*, in *Lavus Concoctus sunt volutus*, and hence the Actors who appear'd mask'd on the Stage, were sometimes call'd *Lavositi*, and sometimes *Personati*.

Hence, adds *Boetius*, as the several Actors represented each their single individual Man, viz. *Oedipus*, or *Chremes*, or *Hecuba*, or *Medeis*; for this Reason, other People, who were also distinguish'd by something in their Form, Character, &c. whereby they might be known; came also to be call'd by the *Latin* *Personae*, and by the *Greek* *ypocrita*.

Again, as these Actors rarely represented any but great and illustrious Characters; the Word came at length to import the *Mask*, as being a Thing of the greatest Regard and Dignity among human Matters. And thus Men, Angels, and even God himself were call'd *Persons*.

Things merely corporeal, as a Stone, a Plant, or a Horse, were call'd *Hypocrita*, or *Supposita*; but never *Persons*. See HYPOSTASIS, &c.

Hence also, the Learned imagine, the same Name *Person* came to be used to signify some Dignity, whereby a *Person* is distinguish'd from another; as a Father, Husband, Judge, Magistrate, &c. in which Sense we are to understand that of *Cicero*: *Cicero* never speaks of *Propepe*, but in Terms of Honour and Respect; but he does many hard and injurious Things against his *Person*.

This for the Name: as for the Thing, we have already defin'd *Person*, an individual Substance of a reasonable Nature; which is the same *Boetius's* Definition.

Now a Thing may be individual two ways; 1. Logically, as it cannot be predicated of any other; as *Cicero*, *Plato*, &c. 2. Physically, in which Sense a Drop of Water separated from the Ocean may be call'd an individual. *Person* is an individual Nature in each of these Senses: Logically says *Boetius*, since *Person* is not spoke of universals, but only of Singulars and Individuals; we don't say the *Person* of an Animal or a Man, but of *Cicero* and *Plato*: And physically, since *Scrates's* Hand or Foot are never consider'd as *Persons*.

This last Kind of Individual is denominated two ways; positively, as when the *Person* is said to be the whole Principle of Acting; for, to whatever Thing Action is attributed, that do the Philosophers call a *Person*: And negatively, as when we say, with the *Thomists*, &c. that a *Person* consist in this, that it does not exist in another as a more perfect Being.

Thus, a Man, tho' consisting of two very different Things, viz. Body and Spirit, is not two *Persons*; since neither Part alone is a whole Principle of Action; but one *Person*, since the Manner of his consisting of Body and Spirit, is such as constitutes one whole Principle of Action: nor does he exist in any other as a more perfect Being, as *E. g.* *Scrates's* Foot does in *Scrates*, or a Drop of Water in the Ocean.

So *Christ*, tho' consisting of two different Natures, viz. the Divine and Humane, is not two *Persons*, but one Divine *Person*; the human Nature, in him, not being a whole Principle of Action; but existing in the other more perfect one. By the Union of the Divine and human Nature: one Individual, or Whole is constituted; that is one Principle of acting; for whatever *Christ's* Humanity does, that does his Divinity jointly therewith: So that there is but one *Person* in *Christ*, and one Operation, which is call'd *Theandrie*. See *THEANDRIC*.

**PERSON**, in Grammar, a Term applied to Verbs and Pronouns, which being conjugated, are applicable to three different *Persons*. See *VERB*, &c.

*I* love is a Verb used in the first *Person*; *thou lovest* designes the second *Person*; *he loveth* marks the Third: And thus in the Plural Number. See *NUMBER*.

*I, thou, he*, are Pronouns of the first, second, and third *Persons*. See *PRONOUN*.

Verbs agree with their Nouns in Tense, Number, and *Person*. See *CONSTRUCTION*, and *CONCORD*.

**PERSON**, *Person*, in dramatic Poetry, the Name and Part of an Actor; or of him represented by the Comedian.

At the Head of dramatic Pieces come the *Dramatis Personae*, the List of Actors, and Characters that are to appear on the Stage.

The ancient Tragedy was only a simple Chorus: *T. Buffis* was the first who introduced a *Person* to relieve the Chorus; *A. J. J. J.* added a second. See *TRAGEDY*. See also *CHORUS*, &c.

*F. Buffis* observes, that in the Epic and Dramatic Poem, the same *Person* must reign throughout, i. e. must sustain the chief Part thro' the whole Piece, and the Characters of all the other *Persons* be subordinate to him. See *CHARACTER*. See also *HERO*.

**PERSONA**, in Law. See *PARSON*.

**PERSONABLE**, in Law, implies the being able to hold, or maintain, a Plea in Court.

That is, as the Civilians would express it, *habere personam standi in Judicio*.

Thus they say, the Defendant was judg'd *Personable* to maintain this Action: *Old Nar. Brev. in Kitchin Fol. 124.* The Tenant pleaded that the Wife was an *Alien*, born in *Portugal*, without the Ligeance of the King; and Judgment was ask'd whether she shou'd be answer'd? The Plaintiff said he was made *Personable* by Parliament.

**PERSONABLE**, is also used to signify a Capacity to take any Thing granted or given. See *CAPACITY*.

**PERSONAL**, something that concerns, or is restrain'd to the *Person*. See *PERSON*.

In Disputes among the Learned, there is ever something *Personal* intermix'd; in *Ethicks* 'tis a Maxim that all Faults are *Personal*, i. e. don't pass to our Descendants.

A *PERSONAL Action*, in Law, is that levied directly, and solely against the *Person*, in opposition to a real or mix'd Action. See *ACTION*.

**PERSONAL Goods**, or *Personal Estate*, is that consisting of Money, Moveables, &c. which every *Person* has in his own Disposal, in opposition to Lands and Tenements, which are call'd *real Estate*. See *ESTATE*, and *GOODS*.

That is defin'd a felonious taking a way another Man's moveable *Personal Goods*. See *THEFT*.

**PERSONAL Titles**, are Titles paid of such Profits as come by the Labour of a Man's *Person*; as by buying and selling; gains of Merchandize, Handicraft, &c. See *TITHES*.

**PROMISS PERSONAL**, or *Verb PERSONAL*, in Grammar, a Verb, or Procon, conjugated in all the three *Persons*. See *VERB* and *CONJUGATION*.

In Opposition to *Impersonals* which have only the third *Person*. See *IMPERSONAL*.

**PERSONALITY**, in the Schools, the Quality of *Person*; or that which constitutes an Individual in the Quality of *Person*. See *PARSON*.

The Philosophers being used to consider Matter, and Form in every other Thing; do the same in *Person*. The Matter of *Person*, according to them, is a singular Substance, endued with Reason. For, Substance may, at the Pleasure of God, either be, or not be a *Person*; in as much as the human Nature in *Christ* is not a *Person*. The Form of *Person* which they call *Subsistency*, *Suppositivity*, and *Personality*, is that by which the fore said Substance becomes individual.

The School Divines are divided about what it is that distinguishes the several *Personalties* in the Trinity: some will have it to be only the different Relations; others, as *Fioraventini* contend for more incommunicable Substance: *S. Bonaventura*, and *S. Thomas*, take it to be the different Origins, that distinguish the *Personalties*; which Opinion is the most follow'd. See *IDENTITY*.

**PERSONALITY**, in Law. An Action is said to be in *Personality*, when it is brought against the right *Person*.

**PERSONATI**, among Botanists, are such Flowers as express the gaping Mouths of some living Creatures.

**PERSONIFYING**, or *PERSONALISING*, the feigning a *Person*; or attributing a *Person* to an inanimate Being; or giving it the Figure, Sentiments, and Language of a *Person*.

The Poets have *personified* all the Passions; and made Divinities of them, which were worship'd by the Heathens; as the Goddess *Perfuzion*, the God *Sleep*, the *Furies*, *Envy*, *Discord*, *Fame*, *Fortune*, *Victory*, &c. See *GOD*, See also *MACHINE*.

*Personifying* is essential to Poetry, especially the *Epoica*. See *POETRY* and *EPIC*.

**PERSPECTIVE**, the Art of Delineating visible Objects on a plane Surface, such as they appear at a given Distance or Height, upon a transparent Plane, placed perpendicular to the Horizon, between the Eye and the Object. See *DELINEATING*.

This, we particularly call *linear Perspective*, as regarding the Position, Magnitude, Form, &c. of the several Lines, or Contours of Objects; and expressing their Diminution: In Opposition to the *Aerial Perspective*, which regards the Colour, Lustre, Strength, Boldness, &c. of distant Objects, consider'd as seen thro' a Column of Air; and expresses the Diminutions thereof.

The former is a Branch of Mathematicks: Some make it a Member of Opticks; others a Rivulet therefrom; and its Operations, are all Geometrical. See *OPTICKS*.

The latter is a Part of Painting, and consists wholly in the Conduct of the Colours, their different Tints, or Degrees, Force, Weakness, &c. See *COLOR* and *COLORING*.

Some make a third Kind of *Perspective*, viz. *Specular Perspective*; which represents the Objects in Conical, Spherical, or other Mirrors, erect, and clear; whereas on Linn and other Planes appear confused and irregular. See *MIRROR*.

To conceive the Nature of *Perspective*; i. e. *Linear Perspective*: Suppose a Glass-plane *H I*, (Tab. *Perspective* Fig. 1.) rais'd perpendicularly on a horizontal Plane; and the Spectator *S*, directing his Eye *O*, to the Triangle *ABC*; If now we conceive the Rays *AO*, *OB*, *OC*, &c. in their Passage thro' the Plane, to leave their Traces or Vestigia, in *a*, *b*, *c*, &c. On the Plane; there will appear the Triangle *abc*; which, as it strikes the Eye by the same Rays *a O*, *b O*, *c O*, by which the Species of the Triangle *ABC* is carried to the same; it will exhibit the true Appearance of the Triangle *ABC*, tho' the Object shou'd be remov'd; the same Distance and Height of the Eye being preserv'd. See *VISION*, *POINT*, *PLANE*, *LINE*, &c.

The Business of *Perspective* then, is to shew by what certain Rules the Points *a*, *b*, *c*, &c. may be found Geometrically: And hence also, we have a mechanical Method of delineating any Object very accurately; See *DESIGNING*.

*Perspective* is either employ'd in representing the Ichonographies, or Ground-plats of Objects, as projected on *Perspective* Planes. See *ICHOGRAPHY*.

Or in Scenographies, or Representations of the Bodies themselves. See *SCENOGRAPHY*.

The general Laws of each, are subjoin'd; in order to which it is necessary to premise the following Lemmas in *Perspective*.

1. That the Appearance of a right Line is ever a right Line; whence, the two Extremes being given, the whole Line is given.  
2. That if a Line be Perpendicular to any right Line drawn on a Plane, it will be Perpendicular to every other right Line drawn on the same Plane.

# Tab: Perspective

3. And that the Height of a Point appearing on the Plane, is to the Height of the Eye, as the Distance of the objective Point from the Plane, to the Aggregate of that Distance and the Distance of the Eye.

*Ichnographic PERSPECTIVE; or the Laws of the Projection of Plane Figures.*

*Perspective of a Point.*

To exhibit the Appearance of an objective Point, H. (Fig. 2.) From the given Point, draw a Perpendicular to the fundamental Line  $DE$ . From the fundamental  $D$  cut off  $IK = IH$ ; thro' the Point of Sight  $F$  draw a horizontal Line  $EP$ ; and make  $FP$  equal to the Distance of the Eye  $EL$ : Lastly from the Point  $I$  to the Point of Sight  $F$  draw  $FI$ ; and from  $K$  to the Point of Distance  $P$ , the Line  $PK$ . The Intersection  $b$  is the Appearance of the objective Point. See POINT.

Hence, 1. Since, the Appearance of the extreme Points of a right Line being given, the Appearance of the whole Line is given; the Ichnographic Projection of any Rectilinear Figure may be had by this Method. See RECTILINEAR.

And, 2. Since any Number of Points of a Curve Line may by this means be projected on the Perspective Plane; the Projection of Curve Lines may likewise be effected after the same manner. See CURVE.

3. Therefore, this Method will likewise suffice for Mixtilinear Figures; and is consequently universal.

There are indeed other Methods deliver'd by other Authors, but this is the most usual. To conceive its force and effect, it will be proper to illustrate it with some Examples.

*Perspective of a Triangle.*

To find the Appearance of a Triangle,  $ABC$ , (Fig. 3.) whose Base  $AB$  is parallel to the fundamental Line  $DE$ . To the fundamental Line  $DE$  draw a Parallel at an Interval equal to the Altitude of the Eye. Assume a fundamental Point  $V$ , opposite to this either directly or obliquely, as the Case requires. Transfer the Distance of the Eye from  $V$  to  $K$ . From the several Angles of the Triangle  $ACB$ , let fall Perpendiculars  $A1, C2, B3$ ; set off these Perpendiculars upon the fundamental Line  $DE$  opposite to the Point of Distance  $K$ . From  $1, 2, 3$ , draw right Lines to the fundamental or principal Point  $V1, V2, V3$ . From the Points  $A, B$  and  $C$  of the fundamental Line  $DE$  draw other right Lines  $AK, BK, CK$ , to the Point of Distance  $K$ .

Since  $a, b$ , and  $c$  are the Appearances of the Points  $A, B$  and  $C$ ; the right Lines  $ca, ab$  and  $bc$ , being drawn,  $abc$  will be the Appearance of the Triangle  $ACB$ .

After the same Manner is a Triangle projected on a Plane, where the Vertex  $C$  is opposed to the Eye: All here requir'd, is, that its Situation on the Geometrical Plane be changed, and the Vertex  $C$  turn'd towards the fundamental Line  $D$ .

*Perspective of a Square.*

To exhibit the Appearance of a Square,  $ABDC$  (Fig. 4.) seen obliquely, and having one of its Sides  $AB$  in the fundamental Line. The Square being view'd obliquely assume the principal Point  $V$  in the horizontal Line  $HR$ , in such manner as that a Perpendicular to the fundamental Line may fall without the Side of the Square  $AB$ , at least, may not bisect it; and make  $VK$  the Distance of the Eye. Transfer the Perpendiculars  $AC$  and  $BD$  to the fundamental Line  $DE$ ; and draw the right Lines  $KB, KD$ , as also  $AV, VC$ . Then will  $A$  and  $B$  be their own Appearances; and  $c$  and  $d$  the Appearances of the Points  $C$  and  $D$ . Consequently  $Acdb$  is the Appearance of the Square  $ABDC$ .

If the Square  $ACBD$  should be at a Distance from the fundamental Line  $DE$ ; which yet rarely happens in Practice; the Distances of the Angles  $A$  and  $B$  must likewise be transfer'd to the fundamental Line: As is evident from the preceding Problem. And since, even the oblique View is not very common; in what follows, we shall always suppose the Figure to be posited directly opposite to the Eye; unless, where the contrary is expressly mention'd.

4. To exhibit the Appearance of a Square  $ABCD$  (Fig. 5.) whose Diagonal  $AC$  is Perpendicular to the fundamental Line. Continue the Sides  $DC$  and  $CB$  till they meet the fundamental Line in  $1$  and  $2$ . From the principal Point  $V$ . set off the Distance of the Eye to  $K$  and  $L$ . From  $K$  to  $A$  and  $1$  draw right Lines  $KA$  and  $K1$ ; and from  $L$  to  $A$  and  $2$ , the right Lines  $LA, L2$ . The Intersections of these Lines will exhibit the Appearance of the Square  $ABCD$  view'd Angle-wise.

5. To exhibit the Appearance of a Square  $ABCD$  Fig. 6. viewed another,  $1 MGH$  is inscrib'd; the Side of the greater,  $AB$ , being in the fundamental Line; and the Diagonal of the less, Perpendicular to the Fundamental. From the principal Point  $V$ , set off, each way, on the horizontal

Line  $HR$ , the Distances  $VL$  and  $VK$ ; draw  $VA$  and  $V2$ ; and  $KA$  and  $L2$ ; then will  $Acdb$  be the Appearance of the Square  $ACDB$ . Produce the Side of the inscrib'd Square  $1H$ , till it meet the fundamental Line in  $1$ ; and draw the right Lines  $K1$ , and  $KM$ ; then will  $1bghM$  be the Representation of the inscrib'd Square  $1HGM$ .

Hence is easily conceiv'd the Projection of any Figures inscrib'd in others.

*Perspective of a Pavement.*

5. To project a Pavement consisting of square Stones, view'd directly. Divide the Side  $AB$  transfer'd to the fundamental Line Fig. 7. into as many equal Parts as there are square Stones in one row. From the several points of Division, draw right Lines to the principal Point  $V$ ; and from  $A$  to the Point of Distance  $K$ , draw a right Line  $AK$ ; and from  $B$  to the other Point of Distance  $L$ , draw another  $LB$ . Thro' the Points of the Intersections of the corresponding Lines, draw right Lines  $V$  on each Side, to be produced to the right Lines  $AV$ , and  $B$ . Then will  $AfgB$  be the Appearance of the Pavement  $AFGB$ .

*Perspective of a Circle.*

6. To exhibit the Appearance of a Circle. 1. If the Circle be small, circumscribe a Square about it. Draw Diagonals and Diameters  $ba$  and  $dc$  (Fig. 8.) intersecting each other at right Angles; and draw the right Lines  $fg$  and  $bc$  parallel to the Diameter  $dc$  thro'  $b$  and  $f$ ; as also thro'  $c$  and  $g$  draw right Lines meeting the fundamental Line  $DE$  in the Points  $3$  and  $4$ . To the principal Point  $V$  draw right Lines  $V1, V3, V4, V2$ ; and to the Points of Distance  $L$  and  $K$ , draw the right Lines  $L2$  and  $K1$ . Lastly connect the Points of Intersection,  $a, b, d, f, b, c, c, g$ , with the Arches  $a, b, d, f, b, c, c, g$ . Thus will  $abdfbcgcca$ , be the Appearance of the Circle.

If the Circle be large, on the Middle of the Fundamental  $AB$  (Fig. 9.) describe a Semicircle; and from the several Points of the Semicircle,  $C, F, G, H, I$ , &c. to the fundamental Line, let fall perpendiculars  $C1, F2, G3, H4, I5$ , &c. From the Points  $1, 2, 3, 4, 5$ , &c. of  $AB$  draw right Lines to the principal Point  $V$ , as also a right Line from  $B$  to the Point of Distance  $L$ ; and another from  $A$  to the Point of Distance  $K$ . Thro' the common Intersections, draw right Lines as in the preceding Problem; thus shall we have the Points  $c, f, b, h, i$ , which are the Representations of these  $A, C, F, G, H, I$ , which being connected as before, give the Projection of the Circle.

Hence appears not only how any curvilinear Figure may be projected on a Plane; but also how any Pavement, consisting of any kind of Stones, may be delineated in Perspective.

Hence also, appears what Use the Square is of in Perspective, for even in the second Case we use a Square divided into certain Arcs, and circumscribed about the Circle; tho' it be not delineated on the geometrical Plane in the Diagram.

*Perspective of a regular Pentagon.*

7. To represent a regular Pentagon, having a broad Limb, terminated by Lines parallel thereto: 1°. From the several Angles of the exterior Pentagon  $AB, C, D, E$ , Fig. 10. to the fundamental Line  $TS$ , let fall Perpendiculars  $A0, B1, C2, D3, E4$  which, as in the former, transfer to the fundamental Line. Connect the Points  $1, 2, 3, 4$  to the principal Point  $V$ ; and the Points  $1, 2, 3, 4$  to the Point of Distance  $K$ . Thus will the common Intersections represent the Appearance of the exterior Pentagon. 2. If now, from the inner Angles  $G, H, I, L$ , the Perpendiculars  $G0, H5, K6, I7, L8$ , be in the like manner let fall; and the rest be done as in the former; we shall have the Representation of the inner Pentagon. The Pentagon  $AB, C, D, E$ , therefore, with its Limb, is represented in Perspective.

This Problem is added for the sake of an Instance of the Projection of a Figure that has a broad Limb, or Edge.

It must be here observ'd, that if the Magnitudes of the several Parts of an Object, be given in Numbers, together with the Height and Distance of the Eye; its Figure is to be first constructed by a geometrical Scale; and the fundamental Point with the Point of Distance  $1$ , to be determin'd by the same.

Nor is it always necessary, that the Object be delineated under the fundamental Line, in the Projection of Squares and Pavements; its best left alone. But where it's necessary, and Space is wanting; draw it a-part; find the Divisions in it, and transfer 'em to the fundamental Line in the Plane.

Threads being hung in the principal Point, and the Point of Distance, and stretch'd to the Points of the Divisions of the fundamental Line; the common Intersection of the Threads will give the Projection of the several Points without Confusion; a Thing much to be fear'd from the Multiplicity of Lines to be drawn.

*Scenographic Perspective; or the Projection of Bodies on a Plane.*

On the given Point *C*, (Fig. 11.) to raise a Perspective Altitude, anywaie to the given objective Altitude *P Q*. On the fundamental Line, raise a Perpendicular *P R*, equal to the given objective Altitude. From *P* and *Q* to any Point, as *T*, draw right Lines *P T* and *Q T*. From the given Point *C* draw a right Line *C K*, parallel to the fundamental Line *D E*; and meeting the right Line *Q T*, in *K*. In *K*, erect a Perpendicular to *K G*, viz. *I K*; this *I K* is the scenographic Altitude requir'd.

*Perspective of a Solid*

To exhibit the Scenography of any Solid. Find the Projection of its Base in the Ichnographic Perspective; and in the several Points thereof erect the Perspective Altitude: Thus will the Scenography of the Solid be finish'd, except for what relates to the Shadow, which must be superadd'd from the Laws of Shadows, deliver'd under the Article *Shadow*. For an Example.

To exhibit the scenographic Perspective of a Cube view'd Angle-wise: Since the Base of a Cube view'd Angle-wise, and standing on a geometrical Plane is a Square view'd Angle-wise; draw a Square on the perspective Plane, after the manner laid down above, raise the Side of the Square *H I* (Fig. 12.) perpendicularly in some Point of the fundamental Line *D E*; and to any Point *V*, of the horizontal Line *H R*, draw right Lines *V I* and *V H*. From the Angles *a*, *b*, and *c*; draw *e 1*, *a 2* parallel to the fundamental Line *D E*. From the Points 1 and 2 raise *L 1* and *M 2* Perpendicular to the same. Lastly, Since *H I* is the Altitude to be rais'd in *a*, *L 1* in *b* and *b* and *M 2* in *c*; in *a* raise *f 1*, Perpendicular to *a E*; and in *b* and *c*, raise *b g* and *c e* Perpendicular to *b c*; and lastly raise *d h* Perpendicular to *a 2*; and let *a f* be equal to *H I*, *b g* and *c e* to *L 1* and *b d* to *M 2*; If then the Points *g*, *h*, *e*, *f* be connected by right Lines, the Scenography will be finish'd.

This Method is general; but its Application is not equally obvious in every Case; see it farther illustrated under the Article *SCENOGRAPHY*.

*PERSPECTIVE of Building, &c.*

In the Practice of the Perspective of Building, &c. Great regard is had to the Height of the horizontal Line; all above the horizontal, being seen in the upper Part, and all above it in the under Part, whence Perspective becomes divided into the *high* and *low Sight*; both which will be well illustrated by what follows.

To represent a Building (v. g. Palace, College, &c.) in Perspective. 1. Take the Ichnography, or Ground-plan of the Building; its Lengths, Breadths, and Depths; by actual measuring. See *ICHOGRAPHY*; and take its Altitude with a Quadrant. See *ALTIMETER* and *QUADRANT*.

2. Make a Scale divided into two or three hundred equal Parts, either actually, or so as that each division signify ten Parts: By this Scale lay down the Ground-plan, as in Figure 13. This done, having a long Rule, and a Square, which by sliding on the Rule helps you to draw your Perpendiculars easiest, reduce it into Perspective, in its Scenographic Appearance.

Then having drawn a Line towards the Bottom of the Paper for the Front or Base Lines; *F L* Fig. 14. divide it into as many equal Parts as you find the Building has in the Ichnography, or more if you please: This will serve for a Scale to determine the several Heights, &c. and to these Divisions, with a black Lead Pencil draw Lines from the Centre, when you have chosen it; which Choice requires Judgement on two accounts.

For, if the Centre be too nigh the Front-line, then the Depth of the whole Building will fore-shorten too much; if too far off, it will not fore-shorten enough. This may be illustrated thus; set an open Tankard, or the like on a Stand, so as that it be a little lower than your Eye; if you be a great Distance from it, you can see very little or nothing into it; if you come nigher to it by degrees, you will perceive the farther Edge seem to be rais'd a little higher than that next you, so that you may feel a little Way into it; if you come very nigh it, you see too deep into it more than can well be express'd in Picture. We shall therefore find some one Place, which we must conclude the most convenient for the Draught, and which may be in general determin'd to be as far off the Front-line as the Front-line is long: This Rule, tho' it has just grounds, yet we sometimes dispense with it *pro re nata*; and that we may express Things with the better Appearance.

4. Consider how to place this Centre with such Advantage as that we may express those Things most, which we chiefly design to do; for as to the bottom and top Lines of the Sides of the Building that run from us in or nigh the direct Line to the Centre, tho' you see the upper Part very well,

yet the Sides that fall between the Ground-line and Top, fall to very near one another, that 'twould be very difficult to express Particulars in them; so that the Centre must be well chosen in reference to this.

Those Buildings therefore, you would see most of, must be plac'd as far off as you think convenient from the direct Line that runs to the Centre; and the farther they are, the plainer they are.

Place then those Things you would see least of, nighest the direct Lines; and see whether the others fall according to your Mind; but this must be done after you have drawn your Diagonal, which is the next Thing.

5. Having pitch'd on your Centre, and having from it drawn Lines to every Division of the Front-line, you are to determine your Diagonal, *A R*, thus: Having with a pair of Compasses measur'd the Length of the Front-line, take your Compasses, and putting one Foot in the Centre, see where the other will reach in the Horizon: (on both Sides if you please) where it rests, from that Point draw a thwart Line from it to the last Division of the Front; and this will be truly drawn, or pretty nigh to the Truth. That this is so, you may consider how it falls in respect of the two last Centre-lines: For if where the next Line from the last is intersected by the Diagonal, you draw a Parallel to the Front between them, as at *A 10*, you will have a *Rhombus*; if then all the Sides be pretty equal, you may be sure you are nigh the right; but if the Sides that run toward the Centre be too long, then Things will not fore-shorten enough; if the Sides be not long enough, then they will fore-shorten too much.

6. After the Front-line is thus divided, the Centre fix'd, and the Diagonal plac'd, take the Breadth of the Chappel *A B*, which in the Ichnography is shewn to be twenty Parts; because this Line is Perpendicular, it must run toward the Centre, therefore reckon twenty in the Diagonal, and the Rule laid parallel to the Front in that Point, will give you a Point in the Centre-line which will give the Breadth of the Chappel; Consequently a Line drawn from *A*, to *B*, puts it into the Ichnographic Perspective. The Length of the Chappel being seventy Divisions in the Front-line; reckon seventy from *B*, parallel to the Front-line, and there you will have a Point at *C*.

The Depth of the Building from the Chappel Northward, being 115 from the Chappel, I reckon from *D*; (where it cuts the Diagonal at ten) onwards in the Diagonal; and at 115 in the Diagonal, with my Rule as before parallel in this Place in the Front, I have the Point *Z*, in the Central-line. Its Breadth being thirty, I reckon three Divisions, and there is the just Breadth there; and so on in every particular Part.

Having plac'd the Ichnography into Perspective, you may then give every Thing its proper Height thus:

7. The Height of the Chappel being 30, I reckon 30 on the Front-line, and with this Length by a Square clapt to the Front-line, I drop a Perpendicular to that Height, and so where the other Side of the Chappel is plac'd, having reckon'd the Height upon a supposed Parallel, there I draw another Line in that Height; then joining these several Heights by several Lines, you have the Profiles of each Building.

Now to diversify these several Lines, that they confound you not, make the Ichnography, when you lay it into Perspective, in discontinued crooked Lines, the Heights in prick'd Lines, and the Tops of each Building in continued Lines, as the Centre-lines are, in the Table. You will likewise find the Centre, tho' 'tis not here express'd, as likewise the Point of Distance, by continuing the Diagonal up to the supposed Horizon where it and the Eye is plac'd.

Having done thus, your Art must be employ'd for the particular Expressions of Things, by drawing and shadowing, which is the Life of this half-form'd Figure, and which we leave to the Painter.

It remains that we speak of the *Low-sight*: Here we suppose the Horizontal just the Height of the Eye, about 5 Foot from the Basis; tho' 'tis generally plac'd higher, even to a third Part of the Height of the Building, that the Side Buildings may be express'd more gracefully.

The Diagonal is best determined by dividing the last Division of the Basis-into 5 Parts at *G*. Fig. 14 taking 4 of these, sometimes the whole 5, because we determin'd before, that the Length of the Front-line was the Distance of the Eye in the Horizon to the Point of Distance: But here I take 4, and then make this the Distance in the Horizon between the Eye and the Point of Distance. You may then either graduate the Plan at the several Intersections of the Diagonal with the Centre-lines, or else suppose it so; and then raise the Building, as you will find by Perspectives enough of this Sort every where to be met with.

PERSPECTIVE, is also us'd for a Kind of Picture or Painting, frequently seen in Gardens, and at the Ends of Galleries; design'd expressly to deceive the Sight by representing the Continuation of an Alley, a Building, Landscips, or the like.

**PERSPECTIVE Plane**, is a Glass, or other transparent Surface, suppos'd to be placed between the Eye and the Object, Perpendicular to the Horizon, unless the contrary be expressly mention'd. See **PLANE**.

Such is the Plane, *H I* (Fig. 15.) between the Eye *O* and the Object *A B C*, cutting the optic Rays in *a, b, c*.

This, form call the *Section*; some the *Table*, and others the *Glass*. See **SECTION**.

**PERSPIRATION**, in Medicine, the Action of evacuating the Juices of the Body, through the Pores of the Skin. See **EVACUATION**, **PONE**, and **SKIN**.

When this Evacuation is copious enough to be perceiv'd by the Senses, as in Sweat, the *Perspiration* is said to be *sensible*; where it escapes the Notice of the Senses, as is the Case in the ordinary State of the Body, the *Perspiration* is said to be *insensible*. See **SWEAT**.

The Word *Perspiration* us'd simply, and without any Adjective, is understood of insensible *Perspiration*. *Sanctorius*, the great *Paduan* Physician, was the first who took Notice of this Evacuation: To him we owe both the Invention and Perfection of the Doctrine of *insensible Perspiration*.

The Vessels thro' which the *Perspiration* is perform'd, lie obliquely open under the Squamæ or Scales of the Cuticle or Scarf-skin. They are inconceivably small: From a Calculation of *Leewenthoek*, it appears that the Mouths of 150000 of 'em may be cover'd with a common Grain of Sand. See **CUTICLE**; **MILITARY Gland**.

Thro' these Vessels is continually transfusing a subtle Humour, from every Point of the Body, and throughout the whole Expanse of the Cuticle.

The Matter evacuated this way, is found by sure Experience to be more than equal to that evacuated all the other Ways, i. e. by Stool, Urine, &c. *Sanctorius* found in Italy, under the Circumstances of a moderate Diet, middle Age, and easy Life, that the Matter insensibly perspired was  $\frac{1}{2}$  of that taken in for Food: so that there only remain'd  $\frac{1}{2}$  for Nutrition, and the Excrements of the Nose, Ears, Intestines, Bladder, &c. See **EXCREMENT**.

The same Author shews, that as much is evacuated by insensible *Perspiration* in one Day, as by Stool in fourteen Days; particularly, that in a Night's Time, about sixteen Ounces is ordinarily sent out by Urine, four Ounces by Stool; and above forty Ounces by *insensible Perspiration*.

He also observes, that if a Man eat and drink 8 l. in a Day, 5 l. of it is spent in insensible *Perspiration*, and adds as to the Times, that within 5 Hours after eating there is perspired about 1 l. from the 5th to the 12th Hour about 3 l. and from the 12th to the 16th scarce half a Pound.

The Benefits of insensible *Perspiration* are so great, that without it, *Borelli* says, animal Life cou'd not be preserv'd.

The great Subtlety, Equability, and Plenty of the Matter thus perspired, its Increase after Sleep, &c. constitute the grand Symptoms of a perfect State of Health; and the chief Means of preserving the same. See **HEALTH**.

On the contrary, the departing from these is the first sure Sign, and perhaps Cause, of Diseases. See **DISEASE**.

*Perspiration* is performed, preserved, and increased by the Viscera, Vessels, Fibres; by Motion or Exercise as far as the first Appearance of Sweat, by moderate Use of Venery; Sleep of 7 or 8 Hours, the Body well cover'd yet not loaden with Bed-cloaths, Cheerfulness, light fermented yet solid Food, not Far; pure, cold, heavy Air, &c.

The contraries of all these, as also the Increase of the other Excretions, diminish, prevent, deprave it.

Hence we see the Cause, Effect, &c. of this perspirable Matter, its Use is preserving the Parts soft and flexible, in supplying what's lost, but chiefly in preserving the nervous Papillæ moist, fresh, lively, fit to be affected by Objects, and to transmit their Impressions. See **NERVE**, **SENSATION**, &c.

Too much *Perspiration* occasions weakness, swoonings, sudden Death; too little or none at all occasions the Vessels to dry, wither, and perish. Hence also the larger Emunctories, come to be obstructed; hence the Circulation is disturb'd, sharp Humours retain'd; hence Pusillity, Crudity, Fevers, Inflammations, Imposthumes. See **DISEASE**.

To determine the State and Conditions of the *Perspiration*, so necessary for judging of those of the Body, *Sanctorius* invented a weighing Chair, whereby he examin'd the Quantity, Degree, &c. of *Perspiration* in several Circumstances of the Body, under several Temperatures of the Air, in the several Intervals of eating, drinking, sleeping, &c. See **WEIGHING Chair**.

Some of the more extraordinary Phenomina observ'd herewith, are; that for some time after eating the *Perspiration* is least of all. That between the 5th and 12th Hour after Meals *Perspiration* is greatest. That riding either on Horseback, in a Coach, or Ship, &c. brisk Motion on the Ice, &c. but above all, a brisk Friction of the Skin; promote *Perspiration* surprisingly. That in sweating the *Perspiration* is much less than at other Times: And that *Perspiration* is always much less in Women than Men.

**PERTICA** or **PERTICATA terra**, in our old Law Books, is the fourth Part of an Acre. See **ROOD**.

*Continet in sacra superficie 40 perticas*. See **PERCEN**.

**PERVISE** or **PARVISE**, a Term in our old Law Books.

*Forselius* says, *Placitantes (sibi post meridiem) se accertum ad pervilum & abbi cum ferventibus ad legem & abbi*. Selden in his Notes on *Forselius*, defines this to be an Afternoon's Exercise, or Moot, which the Pleaders held for the instruction of the younger Students; bearing originally the same Name with the Parvise in *Oxford*. See **MOOT**.

*M. Sauer* says, that *Pervise* signifies *palatii Artium vel area illa a fronte ante Westmonasteriensi, hodie the Palatium*. See **PARADISUS**.

*Speelman* observes, that the Lawyers tum'd thither to meet their Clients not to hold Moors.

**PER VIGILUM**, in Medicine. See **VIOLIA**.

**PERUVIAN-Bark**. See **CORTEX Peruvianus**.

**PES**, a long Measure, in *English*, better call'd a Foot. See **FOOT**.

*Pes Fovee*. *Nostandum est quod pes fovee usitatus tempore Ric. Oxij in Arrentatione cancellorum, scilicet est, signum & sensus in pariete Cancelli Ecclesie de Edwinstowe & in Ecclesia B. Marie de Nottingham, & alius pes continet in longitudine octidocim pedes, & in arrentatione quorundam Vassalorum Pertica 20, 21, & 24 pedum usq. fuit, &c.*

*Pes Monete*, in ancient Records, signifies a true and reasonable Adjustment of the real Value of all current Coin. See **STANDARD** and **COIN**.

**PESA**, an old Law Term, for a Wey, or certain weight of Cheefe, Wool, &c. See **WEY**.

**PESADE**, in the Manage, that Action taught a Horse, wherein he rises with his fore Feet, and bends 'em up to his Body, without stirring the hind Feet.

The *Pesade* is the first Lesson taught a Horse, in order to bring him to Curvetts, &c. unless he perform this well, he'll never go well in any Air, yet is he not to be taught it at the first Riding.

**PESAGE**, a Custom or Duty paid in certain Markets, &c. for weighing of Merchandises, or Wares. See **WEIGHING**.

**PESSARY**, in Medicine, a solid Medicament, of the Length and Thickness of the Finger, but a Pyramidal Form; convey'd into the natural Parts of a Woman to provoke, or put a Stop to the Menstru, or to prevent a Descent of the Matrix, or on other Occasions of those Parts.

At one End 'tis fasten'd to a little Ribbon, by which it may be drawn out or pleasur'd.

It consists of Cork, or other light Wood, or of a little Linen Bag, full of Powders, incorporated with Wax, Oil, and Cotton; cram'd close together to make it solid enough for intromission.

The Word is form'd from *Greek πησις*, which signifies the same Thing.

**PESTILENCE**, in Medicine, a contagious Disease, usually mortal; popularly known under the Name of Plague. See **PLAQUE**.

The Word is form'd from the *Latin Pests*.

**PEST-HOUSE**, a Lazaretto or Infirmary, where Goods, Persons, &c. infected, or suspected to be infected with some contagious Disease, are disposed and provided for. See **LAZARETTO**.

**PESTILENTIAL Fevers**, among Physicians, are such as do not only afflict the Patient with a vehement Heat, but also a malignant and venomous Quality. See **FEVER**.

**PESTIS**. See **PLAQUE**.

**PETALA**, in Botany, the Leaves of a Flower; so call'd to distinguish 'em from the Leaves of the Plant. See **LEAF**.

By Flower is properly meant, That assemblage of Parts call'd *Stamina* and *Pistils*, which serve for propagation of the Kind. See **FLOWER**.

The colour'd Leaves which encompass those Parts, are in reality no more than Cases or Covers to secure and screen the generative Parts; unless, as *Mr. Bradley* conjectures, they may serve to secrete some fine Juice for the Nourishment of the Seed. See **GENERATION of Plants**.

The most easy Division of Flowers is into simple Flowers, i. e. those form'd of *Stamina* and *Pistils* only; and compound Flowers, whose *Stamina* and *Pistils* are encompass'd with *Petals*, call'd by *Dr. Grew* the *Foliation*, and by *Mr. Ray* *Folia*. See **FOLIATION**.

Compound Flowers again, are either encompass'd with a single *Petalum*, or Piece; or with several Pieces; the first of which are call'd *Monopetalous*, the second *Polypetalous* Flowers. See **MONOPETALOUS**, &c.

Again, from the regular or irregular Configuration of the *Petals*, *M. Jussieu* makes another Division of Flowers into Classes; as regular and irregular *Monopetalous*; regular and irregular *Polypetalous*, &c. See **POLYPETALOUS**.

Nature shews a World of Art in the folding up of the *Petals*, in the Perianthium, before they begin to blow or expand: Of these Foldings *Dr. Grew* notes the following Varieties, viz. the close Couch as in *Roses*; the concave Couch as in

*Blattaria flore albo*, the single Plait as in Pease-blossoms; the double Plait as in Blue-bottles. The Couch and Plait together as in Marigolds, &c. The Rowels in Ladies Bower; the Spire as in Mallows; and lastly the Plait and Spire together as in *Convolvulus Devenici Folio*.

The Calyx or Perianthium sometimes serves in lieu of Petala. See CALYX.

The Word is form'd from the Greek *πλάτα* a Leaf; and in that Language serves indifferently for the Leaves of the Plant and the Flower.

PETALISM, PEXALISM, in Antiquity, a Kind of Exile, or Banishment for the Term of five Years. See BANISHMENT.

The *Petalium* at Syracuse was nearly the same Thing as the *Ostracium* at Athens; except that the latter was for 10 Years, and the former only for five. See OSTRACISM.

The *Petalium* was perform'd by the Peoples writing the Name of the Person condemn'd, on a Leaf; whence the Name, from *πέταλον*, Leaf.

PETALOIDES, a Name sometimes given to Urine, when it seems to have little Leaves or Scales in it. See URINE.

PETAMINARIUS, in Antiquity, a Name given to certain Persons who perform'd extraordinary Feats of Activity; took perilous Leaps, Vaults, &c.

The Word is form'd from the Greek *πέταμα*, I fly.

Some Authors write it *Petiminarius*, and derive it from *Petium*, which according to *Servius* signifies the Bunch of a Camel, in Allusion to the Manner wherein they bent the Body in exhibiting Postures, &c.

PETARD, in War, a Kind of Cannon, very short, narrow at the Breach, and wide at the Muzzle; made of Copper mix'd with a little Brass; or of Lead with Tin; usually about 11 Inches long, and seven and an half Broad at the Mouth; weighing from 50 to 60 Pound. See CANNON and ORDINANCE.

Its Charge is from five to six Pounds of Powder, which reaches to within three Fingers of the Mouth: The Vacancy is fill'd with Tow, and stopp'd with a Wooden Tampion; the Mouth being strongly bound up with Cloth tied very tight with Ropes.

'Tis fitted into a Wooden Plank that has a Cavity cut into it to receive the Mouth of the Gun; after the manner express'd in the Fig. 10. Tab. Fortification.

Its Use is in a clandestine Attack, to break down Gates, Bridges, Barriers, &c. to which it is hung, which it does by means of the Wooden Plank.

'Tis also used in Countermines to break thro' the Eoemles Galleries, and give vent to their Mines.

Some, instead of Gun-powder for the Charge use one of the following Compositions, viz. Gun-powder 7 Pounds, Mercur. Sublimat. 1 Ounce, Champhor 8 Ounces; or Gun-powder 6 Pound, Mercur. Sublimat. 3 Ounces, and Sulphur 3; or Gun-powder 6, beaten Glas 4 an Ounce, and Camphor 1.

Petards are sometimes also made of Wood, bound round with Iron Hoops.

The Invention of Petards is ascribed to the French Hugonots in the Year 1579: their most signal Exploit was the taking the City Calvers by their Means, as we are told by *d'Avignon*.

PETECHIÆ, are Spots in the Skin, like Flea-Bites, which come out in some Fevers.

Hence *Petechial* Fever is the spotted Fever, commonly so called. See FEVER.

PETER-pence, an ancient Levy, or Tax of a Penny on each House throughout England. See TAX.

It was call'd *Peter-pence*, because collected on the Day of St. Peter at *vinonia*; by the Saxons it was call'd *Rome Feoh* i. e. the Fee of Rome, and also *Rome-foor*, and *Rome-penny*, because collected and sent to Rome; and lastly it was call'd *Heath-Money*, because every Dwelling-house was liable to it, provided there were 30 Pence *vive pecunie* belonging to it, nay, and every religious House; the Abby of St. Albans alone excepted.

This *Peter-pence* was at first given as a Pension, or Alms, by the King of the West Saxons, in the Year 725, being then in Pilgrimage at Rome: And the like was done by *Offa King* of the Mercians, throughout his Dominions in 794.

It was not intended as a Tribute to the Pope, but chiefly for the Support of the English School or College at Rome: the Pope, however, went halves with the College; and at length swallow'd almost the Whole.

At first it was only an occasional Contribution; but became at last a standing Tax; being establish'd by the Laws of King *Canute*, Edward the Confessor, the Conqueror, &c.

The Bishops who were charg'd with the Collecting it, employ'd the rural Deans and Archdeacons therein. Edward the III. first forbade the Payment, but it soon return'd and continu'd till the Time of King Henry VIII, when *Polydore Virgil* refused there as the Popes Receiver-General.

PETIT Cape. See CAP.

PETIT Serjeanty, in Law. See SERJEANTY.

PETITIO Inductarum, in the civil Law, the same as Imparance in common Law. See IMPARANCE.

PETITIO Principii, in Logic, a begging of Principles; or a precarious supposing a Thing to be true, or taking it for granted, when it really remains either dubious, or else is expressly denied.

This we popularly call *begging the Question*.

PETITION, a Supplication in form, made by an inferior to his Superiour; especially to one having Jurisdiction. See SUPPLICATION.

PETRA lana, in our ancient Customs, a Stone of Wool, See STONE.

PETRARIA, in ancient Writers, is sometimes taken for a Quarry of Stones; and in other Places for a great Gun, call'd a *Petard*; 'tis often mention'd in old Records and Historians in both Senses.

PETRE Oil, the same as Petroleum. See PETROLEUM.

PETRIFICATION, or PETRIFICATION, in Phisiology, the Action of converting Fluids, Woods, and other Matters into Stone. See STONE.

The Faculty of petrifying Wood is ascribed to several Springs, Lakes, &c. The ancient Naturalists mention a River whose Waters turn'd Bodies into Marble, by mere contact; nay, which being drunk petrified the Viscera of the Drinker.

*Floren habens Cicones, quod postum saxes reddis  
Viscera, quod tactis inducis Marmora rebus.*

*Seneca* relates, that the Mud of this River is of such a Nature as to harden and glue together the Parts of Bodies. As, says he, the Dust of Pazzuoli, by barely touching Water becomes Stone; so this Water, by touching any Solid, sticks, and grows to it: Whence Things cast into it, are immediately taken out Stones. *Pliny* adds very well, that Wood cast into this River, is presently found cover'd with a stony Bark or Rind; and subjoins the Names of several other Rivers which do the same; particularly the River *Silyris* near *Tarentum*, whose Waters are yet found very wholesome.

To *Pliny's* List we might add many more among ourselves; particularly the Lake *Labmond* in Scotland, &c.

But, in effect, there does not seem any real Transmutation of the woody Nature into the Nature of Stone, in any of these Cases; all that is done is this, the Stony Particles which before floated in the Liquor are now lodged, and deposited in the Pores of these Substances, in such manner, and in such Plenty as to leave little else but the Appearance of a Stone.

Petrifications too, are frequently nothing else but incrustations of stony Particles, which surround the Bodies immerg'd, as Salts float upon and adhere to them. See INCrustation.

*Varenius* has a Conjecture that Waters only petrify Woods by means of certain minute, sharp, and pointed Particles lodg'd therein, which cut the longitudinal Fibres of the Wood in an infinite Number of Points, and thus destroy the Form they were distinguish'd from Stone.

Near *Nasfoss* is a little River, whose Water the People turn off into little Canals; where, in a little Time it petrifies; and of this petrified Water is built a large *Caravanfere* in the Neighbourhood.

Petrifications of Waters, or Juices of the Earth are incontestable. In the Place call'd *as Covas Goutières* in France, the Water falling from the Upper-parts of the Cave to the Ground, immediately hardens into little Stones, of such Figures as the Drops falling either singly, or upon one another chance to exhibit.

Of this Kind of Caves we have several in England; Mr. *Derham* mentions one on the Top of *Bredon* hill in *Worcestershire*; to which we may add another call'd the *Elve-hole* in *Wiltshire* in *Wiltshire*; li'd a-top with these stalactical Stones, hanging like Icicles; which are manifestly nothing else but Exudations or Exillations of some petrifying Juices out of the rocky Earth there. See STALACTITES. See also LABRYNTH.

The Word is form'd from the Greek *πέτρα* Stone, and the Latin *fo* or *facio* to become, to do.

PÉTROBRUSSIANS, a religious Sect, which arose in France, and the Netherlands, about the Year 1126; so call'd from their Leader *Peter Bruys* a Provincial.

The chief of *Bruys's* Adherents was a Monk, one *Henry*; from whom the *Petrobrussians* were also call'd *Henricians*.

*Peter* the venerable Abbot of *Clugny*, has an express Treatise against the *Petrobrussians*; in the Preface to which he reduces their Opinions to five Heads. 1. They denied that Children before the Age of Reason can be justified by Baptism; in regard, 'tis our own Faith that saves by Baptism. 2. That no Churches are to be built, but those that already are, to be pull'd down; an Inn being as proper for Prayer as a Temple, and a Stable as an Altar. 3. That the Cross ought to be pull'd down and burnt, in regard we ought to abhor the Instruments of our Saviour's Passion. 4. That Jesus Christ is not in the Eucharist, and that this Sacrament is vain. 5. That Sacrifices, Alms, Prayers, &c. don't avail the Dead.

*F. Langlois* objects Manichæism to the *Petrobrussians*; and says they maintain'd two Gods, the one Good, the other Evil; but this we rather esteem an Effect of his Zeal for the Catholic

Catholic Cause, which determin'd him to blacken the Adversaries thereof, than any real Sentiment of the *Petrobruffians*.

**PETROJOANNITES**, the Followers of *Peter John*, or *Peter Joannus*, i. e. *Peter* the Son of *John*, who liv'd in the XII. Century.

His Doctrine was not known till after his Death; when his Body was taken out of his Grave and burnt.

His Opponents were, that he alone had the Understanding of the true Sense wherein the Apostles preached the Gospel; that the reasonable Soul is not the Form of the Man; that there is no Grace infused by Baptism; that Jesus Christ was pierced with a Lance on the Cross 'ere he expir'd.

**PETROL**, *PETROLEUM*, q. d. *Petra oleum*, Oil of Rock; an Oleaginous Juice, issuing out of the Clefts of Rocks. See **OIL**.

Befide artificial and vegetable Oils, i. e. those drawn from Plants, &c. by Expression; there are also natural and mineral Oils issuing of themselves from the Entrails of the Earth; call'd by a common Name *Petroils*, or *Petroles*.

These, according to all Appearance, must be the Work of subterraneous Fires, which raise, or sublime the more subtle Parts of certain bituminous Matters that lie in their Way. These Parts being condens'd into a Liqueur by the Cold of the Vaults of Rocks, are there collected, and Ooze thence through Clefts and Apertures, which the Disposition of the Ground furnishes 'em withal.

**PETROL**, then is a Liquid Bitumen; only differing by its Liquidity from other Bitumens, as Asphaltum, Jet, &c. See **BITUMEN**.

The *Naphtha*, which is either a Liquid, or at least a very soft Bitumen, is much the same with the *Petrol*. See **NAPHTHA**.

Hitherto there has been little *Petrol* found, except in hot Countries. *Olearius* says he saw above 50 Springs of it near *Sennacchia* in *Perfia*: There are *Petroils* in the Southern Provinces of *France*; but the best are those in the Duchy of *Molens*, first discover'd by *Aristo* a Physician, in 1640, in a very barren Valley, 12 Leagues from the City of *Molens*.

There are three Canals dug with great Expence in the Rock; by which three different Kinds of *Petrol* are discharg'd into little Basins or Reservoirs: The first is white, clear, and fluid as Water, of a brisk penetrating Smell, and not disagreeable; the second of a clear Yellow, less fluid, and a less brisk Smell than the White; the third a blackish Red of thicker Consistence, and a Smell more approaching that of Bitumen.

*M. Bonilac* has made several Experiments on the *Petrol*, describ'd in the Hist. of Acad. of Sciences M. DCC. XV. He observes, that he could not raise any Phlegm or saline Spirit by any Distillation, either in *Balneo Mariae*, or in a Sand heat: All that would rise was Oil; at the Bottom of the Pellican remain'd an exceeding small Quantity of a thickish, brownish Matter.

Hence, to use *Petroleum* in Medicine, it must be prepar'd just as it is. 'Tis a Remedy Nature has prepar'd to our Hands; it is found very warm and penetrating; and commended in many outward Complaints, Rheumatick and Arthritic Pains, and paralytick Limbs.

**PETRONEL**, a Sort of Harquebus or Hand-gua. See **HARQUEBUS**.

**PETROSA Offa**, in Anatomy, two Bones of the Cranium. See **CRANIUM**.

The fifth and sixth Bones of the Skull are those of the Temples; so call'd a *Temporibus*, because they show the Age of Man; the Hairs hereon turning grey before any of the rest. See **TEMPLES**.

Their Upper-part is squamous or Scaly, the lower *Perrons*, i. e. hard or stony, and hence they come here to be denominated *Petrofa*.

The *Offa Petrofa* are the smallest proper Bones of the Cranium: Their Upper-part is Semi-circular, and their Lower of a Rocky Make. They are situated in the lateral and lower Parts of the Head; bounded a-top by the squamous Suture, which joins 'em to the Parietalia; behind by the Lambdoidea, which joins them to the Occipital, and connects them to the *Sphenoides*.

Each has two Sinus's before and behind the Sphenoidal; the Exterior lin'd with a Cartilage, receiving the Process of the lower Jaw; the Interior receives the Lower-part of the *Sinus Lateralis* of the *Dura Mater*.

Each again has four Processes; three External, and one Internal; of the External, the first is call'd *Zygomatious* or *Os Jugale*; the second *Mastoides* or *Mammillaris*; the third *Styloides*, each whereof see under its proper Article. **ZYGOMATICUS**, &c.

The internal Process is properly call'd the *Os petrosium*: This is pretty long and large, containing the whole *Monsus Auditorius* and Cavity of the *Tympanum*. See **TYMPANUM** and **EAR**.

**PETTEIA** or **PETTIA**, in the ancient Musick, a *Greek Term*, to which we have no corresponding one in our Language.

The *Melopoia*, i. e. the Art of arranging Sounds in Succession so as to make Melody, is divided into three Parts, which the *Greeks* call *Lepsis*, *Mixis*, and *Chrosis*, the *Latins* *Samptio*, *Mixtio*, and *Ufus*; and the *Italians* *Præsa*, *Miscolamento*, and *Ufo*.

The last is also call'd by the *Greeks* *Παρτα*, *Pettia*, and by the *Italians* *Pettia*.

*Pettia* or *Pettie*, then is the Art of making a just Discriment of all the Manners of ranging, or combining Sounds among themselves, so as they may produce their Effect, i. e. so as they may express the several Passions intended to be rais'd; thus, *E. g.* it shows what Sounds are to be us'd, and what not, how often any of 'em are to be repeated, with which to begin, and with which to end, whether with a grave Sound to rise, or an Acute one to fall, &c.

'Tis the *Pettia* that makes the Manners of the Musick; it being this that chuses out this or that Passion, this that or Motion of the Soul to be awaken'd, and whether it be proper to excite it in this or that occasion.

The *Pettie* therefore is in Musick what the *Manners* are in Poetry. See **MANNERS**.

We don't see whence the Word shou'd have been taken by the *Greeks* unless from *Περλο* their Game of Chess; the musical *Pettia* being a Combination and Arrangement of Sounds, as Chess is of Pieces call'd *παιρο*, *Calash*, *Chess-Men*.

**PETTY-Bag**, an Office in Chancery; the three Clerks whereof Record the Return of all Inquisitions out of every Shire, make all Patents of Customers, Gaugers, Controllers, &c. See **CHANCERY**.

**PETTY-Fogger**, from the *French* *Petite*, little, and the *Saxon* *fogge* Wooer, Suiter, &c. A little, Sticking, Solicitor, or Jobber in Law-disputes, without either Skill or Confidence.

**PETTY-Larceny**, in Law, small Theft; or the stealing of Things under the Value of 12d. See **LARCENY**.

The Punishment, anciently, was sometimes the Loss of an Ear; sometimes Cudgelling: After *Edward III.* it was for along Time Whipping, but is now Transportation.

**PETTY-Pates**, among Confectioners, a sort of small Pies, made of *Marsh* Pane, and fill'd with sweet Meats.

**PETTY-Singles**, among Falconers, are the Toes of a Hawk. See **HAWK**.

**PETTY-Tally**, in the Sea Language, a competent Allowance of Victuals, according to the Number of the Ships Company.

**PETTY-Treason**, in Law, the Crime of a Servant's killing his Master, a Wife's killing her Husband, a Child's killing his Parent, or a Clergyman's killing his Prelate to whom he owes Obedience. See **TREASON**.

The Punishment of *Petty-Treason* is, that the Criminal shall be drawn on a Sledge, or Hurdle to the Gallows, and there hanged.

The Punishment of *Petty-Treason* in a Woman is the same with that of High-Treason, viz. drawing and burning alive. See **PUNISHMENT**.

**PETUM**, See **NICOTIANA**.

**PEVETTS**, the Ends of the Spindle of a Wheel in a Watch. The Holes into which they run, are call'd *Pevett-Holes*. See **WATCH**.

**PEWTER**, a fictitious Metal, used in domestick Utensils. The Basis of *Pewter* is Tin, which is converted into *Pewter* by the Mixture of six Pounds of Brass, and fifteen Pounds of Lead, with an hundred Weight of Tin.

Beside this Composition which makes the common *Pewter*, there are others for other Occasions; compounded of Tin, mix'd with *Regulus* of Antimony, Tin-Glass and Copper, in several Proportions. See **TIN**.

*Pewter* has occasionally serv'd for Money. In the *Philosoph.* Transact. *M. Pustland* informs us, that *K. James II.* turn'd all the *Pewter* Vessels, &c. of the Protestants in *Ireland* he could seize, into Money; Half-Crowns were somewhat bigger than Half-pence, and other Pieces in proportion. See **MONEY** and **COIN**.

He order'd it to be Current in all Payments: Whence, our Author observes, People absconded for fear of being paid their Debts: He mentions *Crown-pieces* of this Metal, with this Legend on the Rim, *MELIORIS TESSARA FAYI*.

**PHENOMENON**, in Physicks, an extraordinary Effect, or Appearance in the Heavens, or on Earth; discover'd by Observation of the Celestiall Bodies, or by physical Experiments; and whose Cause is not obvious. See **OBSERVATION**, **EXPERIMENT**, &c.

Such are *Meteors*, *Comets*, uncommon Appearances of Stars, and Planets, Earthquakes; such also are the Effects of the Magnet, Phosphorus, &c. See **METEORS**, **COMET**, **STAR**, **PLANET**, **EARTHQUAKE**, **MOONET**.

'Tis a Maxim, that Hypothesis is best, which solves most *Phænomena*. See **HYPOTHESIS**.

The *Phænomena* of Comets are inconsistent with the Solidity of the Heavens, suppos'd in the Ptolemaic Hypothesis

and with the Plenitude of the Heavens asserted by the Cartesians. See PTOLOMAIC, PLENTITUDE, &c.

The Word is form'd from the Greek *φαίνω*, I appear.

Sir *Is. Newton* shews, that all the *Phænomena* of the heavenly Bodies, follow from the Attraction of Gravity, which intercedes those Bodies; and almost all the *Phænomena* of the lesser Bodies from the Attraction and Repulsion between their Particles: So simple is Nature. See GRAVITATION, ATTRACTION, COHESION, PARTICLES, &c.

PHAGEDENIA, in Chirurgery, &c. a deep, bloated Ulcer, which eats and corrodes the neighbouring Parts; so call'd from the Greek *φάγω* I eat. See ULCER.

Hence, *Phagedenic Medicines*; such as are used to eat off fungous, or proud Flesh, particularly,

PHAGEDENIC Water, in Chymistry, a Water drawn from quick Lime; so call'd from its Efficacy in the Cure of *Phagedenic Ulcers*. See LIME.

To prepare this Water, they put two Pounds of fresh quick-Lime in a large Earthen-pot, and pour upon it about ten Pounds of rain Water; these they let stand together two Days, stirring 'em frequently: At last, leaving the Lime to settle well, they pour off the Water by Inclination, filtrate it and put it up in a Glass Bottle, adding to it an Ounce of Corrosive Sublimed in Powder; which, of white becomes yellow, and sinks to the Bottom of the Vessel.

The Water being settled, is fit for Use, in the cleansing of Wounds and Ulcers, and to eat off superfluous Flesh: Especially in Gangrenes; in which Case may be added a third or fourth Part of Spirit of Wine. See GANGRENE.

The Ephemerides of the Academy of the *Curiosi Naturæ*, relate that *Phagedenic Ulcers* have been frequently cured with Sheeps Dung.

PHALANX, in Antiquity, a huge, square, compact Battalion, form'd of Infantry fer close to one another, with their Shields join'd, and Pikes turn'd cross ways; insomuch that it was almost impossible to break them.

It consisted of 8000 Men: *Livy* says, that this sort of Battalion was invented by the *Macedonians*, and that it was peculiar to them; whence, among Writers, it is sometimes call'd the *Macedonian Phalanx*.

St. *Euremond* observes, that the *Macedonian Phalanx* had the Advantage of Valour and Strength over the *Roman Legion*. See LEGION.

PHALANX, is also applied by Anatomists, to the Rows of the small Bones of the Fingers, as if rang'd in order of Battle. See FINGER.

PHALÆCUS, in Poetry, a kind of Verse, in Use among the *Greeks* and *Latins*; consisting, like the *Sapphic*, of five Feet, the first a Spondee, the second a Dactyl, the three last Trochees. See VERSE, FOOT, SPONDEE.

The *Phalæcus* is very proper for Epigrams. *Carrhus* excell'd in it. See EPIGRAM.

PHALLOPHORI, in Antiquity, a Name given at *Sicyon* to certain *Mimes*, who ran about the Streets smutted with black, clothed in Sheeps Skins, bearing Baskets full of various Herbs, as *Chervil*, *Branca Urina*, *Violet*, *Ivy*, &c.

They danced in Cadence and were crown'd with *Ivy*, in honour of *Bacchus*.

The Word is form'd from the Greek *φαλλός* Skin and *φορος* I bear.

PHALICA, in Antiquity, Feasts, or Sacrifices celebrated at *Athens*, in honour of *Bacchus*. See FEAST.

The *Phalica* were instituted on the following Occasion: One *Pegasis*, a Citizen of *Eubœus*, having carried some Statues of *Bacchus* to *Athens*; drew the Laughter and Contempt of the *Athenians*. Soon after this they were seiz'd with an Epidemic Disease, and upon consulting the Oracle how to get free of it, they were answer'd that there was no Way but to receive *Bacchus* in Pomp: They did it, and thus instituted the *Phalica*; wherein, besides the Statues and Trophies of the God, they bore Figures of the Parts affected tied to *Thyrri*.

PHANATIC, PHANATICUS, a *Visionary*; one who fancies, or thinks, he sees Spectres, Spirits, Apparitions, or other imaginary Objects, even when awake; and takes 'em to be real. See PHANTASY.

Such are *Phenetics*, *Necromancers*, *Hypochondriac* Persons, and *Lycanthropi*. See PHRENATIC, HYPOCHONDRIAC, LYCANTHROPUS &c. See also WITCHCRAFT, IMAGINATION, &c.

Hence the Word is also applied to Enthusiasts, Pretenders to Revelation, new Lights, Prophecies, &c.

PHANTASM, PHANTASMA, PHANTOM, a Species of an Object perceiv'd by an external Sense, and retain'd in the Phantasy. See SPECIES and PHANTASY.

PHANTASY, or FANCY, the *Imagination*; the Second of the Powers, or Faculties of the sensitive or rational Soul, by which the Species of Objects receiv'd in the common Sense, are retain'd, recall'd, further examin'd, and either compounded or divided. See IMAGINATION.

Others define the *Phantasy* to be that internal Sense or Power, whereby the Idea's of absent Things are form'd, and presented to the Mind, as if they were present. See SENSE.

The Organ of this Sense is vulgarly suppos'd to be the middle Part of the Brain; and its objects, all the Species communicated to it by the common Sense, by the comparing of which it frames infinite others to itself. See IMAGE.

In Melancholic, and mad Men this Faculty is very strong, representing many extravagant and monstrous Things; and framing its Images as lively as those of Sensation; whence the Visions and Deceptions those Persons are liable to. See PASSION, DELIRIUM, &c.

In Poets and Painters, that same Faculty is to be the Predominant one; to enable 'em to feign, and pursue and execute their Fictions or Fables with more Strength, Consistency, &c. See FABLE, POETRY, &c.

In Men it is suppos'd to be subject to Reason, but in Brutes it has no Superior; this being the *Ratio Brutorum*, or what we call Reason in Brutes. See REASON and BRUTE.

The *Phantasy* is free from the Ligature or Suspension of Sleep, witness our Dreams, &c. See SLEEP and DREAM.

Some Philosophers apply the Word *Phantasy*, in a more general Signification, viz. for what we usually call *Sensus Communis*, the common Sense. See COMMON SENSE.

PHANTASTIC, in Musick. *Phantastic Style*, is a Style proper for Instruments; or a free, easy manner of Composition. See STYLE.

PHANTASTICAL Colours, is a Denomination given by the *Peripateticks* to those Colours exhibited by the Rainbow, or a Prism; as supposing 'em not to be real Colours, but only *Phantasies* or Deceptions of the Sight. See COLOUR.

But many Experiments of the Moderns, and particularly those of Sir *Isaac Newton* demonstrate the contrary; and prove them as real as any other Colours in Nature. See PRISM, and RAIN-BOW.

PHARISEES, a celebrated Sect among the ancient *Jews*; so call'd, say some, because separated from the rest by the Austerity of their Life, by their professing a greater Degree of Holiness, and a more religious Observation of the Law.

This is the Import of the Word *Pharis* in the *Hebrew*, or rather the *Chaldeæ Tongue*; whence is form'd the Greek *φειραϊσ* and the *Latin Pharisæus*.

St. *Jerom*, and several of the *Rabbins* maintain this Etymology; which is very agreeable to the State and Character of the *Pharisees*; who were not only distinguish'd from the rest by their manner of Life, but by their Habit.

'Tis very difficult to fix the precise Origin of the *Pharisees*. The *Jesute Serrarius* places their first Rise about the Time of *Eldas*; because 'twas then the *Jews* first began to have Interpreters of their Traditions. *Maimon*, on the other Hand, will not have this Sect to have rose among the *Jews*, till a little before the Time of Christ. Others, perhaps with more probability, refer the Origin of the *Pharisees* to the Time of the *Maccabees*.

Be this as it will *Pharisæism* is still the prevailing Doctrine in the *Jewish Religion*; that huge Number of Traditions in the *Talmud* which bear so great a Sway among the *Jews*, coming all from the *Pharisees*. See TRADITION and TALMUD.

*Jofephus*, who describes their Dogmata, says, that they attributed all to Deity, and to God; so, however, as not to deprive Man of his free Agency; which *Sinusius of Siena* thus explains: The *Pharisees* believ'd that all Things were done by Deity, i. e. with Gods foreknowledge, and in Consequence of his immutable Decree; the Will of Man still remaining free and unaffected: *Fate, lex est Dei prescientis & immobilitis decreti omnia geri; mansueti tamen libero Luminis libertatis assensu*.

They own'd the Immortality of the Soul, and a future State; but admitted at the same Time a kind of Metempsychosis, or Transmigration of Souls. See METEMPSYCHOSIS.

The *Pharisees* were great Sticklers for the allegorical or mystical Sense of the Scriptures; whence most of Converts made to Christianity among the *Jews* were of the *Pharisees*.

In effect, the *Pharisees* were in every Thing directly opposite to the *Saducees*. See SADUCEES.

PHARMACEUTICA, that part of Physick which directs the Use, Preparation, &c. of Medicines. See PHARMACY.

PHARMACOLOGY, a Treatise of Medicines; of the Art of preparing 'em, judging of 'em, &c. See PHARMACY.

PHARMACOPOEIA, a *Dispensary*; or a Treatise containing the Preparations of the several Kinds of Medicines, with their Use, manner of Application, &c. See DISPENSARY. We have various *Pharmacopœia's*; as those of *Bauderon*, *Quercetan*, *Zwelfer*, *Charras*, *Bates*, *Salmon*, *Lemery*, &c.

The latest and most rational, and that in most Esteem, is *Quincy's Pharmacopœia officialis & extemporanea*.

The Word is form'd from the Greek *φάρμακον*, Remedy, and *ποιέω* I make.

PHARMACOPOLA, an *Apothecary*; or a Person who prepares and sells Medicines. See APOTHECARY.

The Word is seldom used but by way of ridicule. It is form'd from the Greek *φάρμακον* and *πολις* creator, to sell.

**PHARMACUM**, a Medicament, or Medicine. See MEDICINE. Hence,

**PHARMACY**, that Branch of Medicine which teaches the Choice, Preparation, and Mixture of Medicines. See MEDICINE.

*Pharmacy* is divided into *Galenical* and *Chymical*.

*Galenical* PHARMACY, call'd also simply *Pharmacy*, is that deriv'd to us from the Ancients; consisting in the Knowledge and Management of the several Parts of the *Materia Medica*, now in the Hands of the Apothecaries. See **GALENICAL**.

The chief Obstacle in the Way of the Improvement of *Pharmacy*, is the Physicians neglecting of *Pharmacy*.

*Chymical* PHARMACY, call'd also *Spagyric* and *Hermetical*, is that introduced by *Paracelsus*, who calls it *Ars destillatoria*; consisting in the resolving of mixed Bodies, into their component Parts, in order to separate the usefule and ill, and collect and exalt the Good. See **CHEMISTRY**.

The Word is deriv'd from the Greek *pharmakon* Remedy.

—Simples, vulgar, familiar, easily prepar'd, readily procur'd Simples, *Pliny* well observes, were the only Remedies intended by Nature: so soon as Fraud was got into the World, and Men began to live by their Wits; Shops were soon set up; and Life offer'd every Man to Sale. Straight, innumerable Compositions; endless, inexplicable Mixtures, are cri'd up; *Arabia* and *India* are crowded into a Draught; and a Plaster for a little Ulcer fetch'd from the red Sea. When as the proper Remedies are those the Poore every Day feed on.

—Hist. Nat. lib. 24. c. 1.

**PHAROS**, **PHARE**, or **PHANAL**, a *Light-house*; a Pile rais'd near a Port, where a Fire is kept burning in the Night to guide and direct Vessels near at Hand.

The *Pharos* of *Alexandria* was antiently very famous, in so much as to communicate its Name to all the rest; the *Colossus* of *Rhodes* serv'd as a *Pharos*.

*Osannus* says, *Pharos* antiently signified a Streight, as the *Pharos* or *Pharo* of *Melissa*. See **STREIGHT**.

**PHARSANG**, or **PARASANG**, a *Perfian* Measure of 40, 50, or 60 Furlongs. See **PARASANG**.

**PHARYNX**, in Anatomy, the upper Opening of the *Oesophagus* or *Gullet*, situate at the Bottom of the *Fauces*. See **OESOPHAGUS**.

The *Pharynx* is that Part particularly call'd the *Gula* or the *Throat*. It being in this Part of the *Gullet* the Action of Deglutition commences, and where 'tis chiefly perform'd. It is assist'd by three Pair of Muscles which compose the *Pharynx*. See **DEGLUTITION**.

The first call'd the *Stylopharyngeus* serves to draw up and dilate the *Pharynx*; the second the *Pterygopharyngeus* serves to constrict it; the third, which is call'd the *Oesophagus* serves to close it; see each under its proper Article. **STYLOPHARYNGEUS**, &c.

The Word in the original Greek *pharos* signifies the same.

**PHASES**, in Astroonomy, the several Appearances, or QUANTITIES of Illumination of the Moon, Venus, Mercury and the other Planets; or the several MANNERS wherein they appear illuminated by the Sun. See **PLANET**.

The Variety of *Phases* in the Moon is very remarkable. Sometimes she Increases, sometimes Wanes, sometimes is bent into *Horns*, and again appears like a Semi-circle, at other Times is *Gibbous*, and prettily resembles a full circular Face. See **CRESCENT**, **FALCATED**, **GIBBOUS**, &c.

For the Theory of the *Lunar-Phases*. See **MOON**.

As to the *Phases* of Venus, the naked Eye does not discover any; but the Telescope does. *Copernicus* antiently prophesied, that after Ages wou'd find that Venus underwent all the Changes of the Moon; which Prophecy was first fulfill'd by *Galileo*, who directing his Telescope to Venus, observ'd her *Phases* to emulate those of the Moon; being sometimes full, sometimes horn'd, sometimes gibbous. See **VENUS**.

And Mercury does the same— all the Difference between these, and those of the Moon; is, that when these are full the Sun is between them and us; whereas, when the Moon is full, we are between her and the Sun. See **MERCURY**.

The Word is form'd from the Greek *phaino*, *appareo*, I appear.

*Sutton* puzzled the Astronomers a long Time with his strange Variety of *Phases*. *Hewelius* and others found him: 1. *Aenospherical*. 2. *Triphspherical*. 3. *Spherico-austated*. 4. *Elliptico-austated*. 5. *Spherico-cuspitated*. But *Huygens* shews, that those monstrous *Phases* are all owing to the Imperfection of their Telescopes. That great Author assist'd by the best Telescopes noted three principal *Phases*; viz. *Jan. 16, 1656*. he was round, *Octob. 15, Brachiated*, and *Decemb. 17, 1657*. *Austated*. See **SUTTON**.

To determine the Phases of an Eclipse for any given Time.

Find the Moon's Place in her visible Way for that Moment; and thence, as a Centre, with the Interval of the Moon's Semi-diameter, describe a Circle. Find in like manner the Sun's Place in the *Ecliptic*, and thence, with the Semi-diameter

of the Sun describe another Circle: The Intersection of the two Circles shews the *Phases* of the Eclipse, the Quantity of Obfuscation, and the Position of the Cusps or Horns. See **ECLIPSE**.

**PHEONS**, in Heraldry, the Barbed Heads of Darts and Arrows; usually represented of the adjoining Figure. Sable, a Fesse Ermine between three *Pheons*; by the Name of *Egerston*.

**PHIAL**, **PHIALA**, a little Glass-bottle, popularly call'd a *Vial*.

The Word is form'd of the Greek *phiala* which signifies the same Thing.

**PHIDITIA**, or **PHILITIA**, in Antiquity, Feasts celebrated with great Frugality at *Lacedaemon*.

The *Phiditia* were held in public Places, and in the open Air; Rich and Poor assist'd at 'em a like; and on the same footing; their Design being to keep up Peace, Friendship, and a good Understanding, and Equality among all the Citizens great and small.

*Strawger* says, they who attended at this Feast, each brought a Bushel of Flower, eight Measures of Wine, call'd *Corus*, and five Minæ of Cheese, and as much Figs.

The *Phiditia* of the Greeks were much the same with the *Charitia* at *Rome*. See **CHARITIA**.

**PHILADELPHUS**, in Antiquity, a Title, or Sur-name, bore by several ancient Kings; form'd from the Greek *philo* Friend, loving and *adelphos*, Brother, *q. d.* who loves his Brother.

*Ptolemy* *Philadelphus* erected a Library at *Alexandria*, and furnished it with 50000 Volumes, by the Advice, and with the Care of *Demetrius Phalareus*. See **LIBRARY**.

It was the same *Philadelphus*, that procur'd the Greek Version of the Books of *Moses*, call'd the *Septuagint*. See **SEPTUAGINT**.

Father *Chamillart* has a Medal of the Queen of *Comagenis*, which bears the Title of *Philadelphus*; without any other Name. *M. Vailleur* also tells us that *Philip* King of *Syria* had the Title of *Philadelphus*.

**PHILANTHROPY**, a Love of Mankind; a general Benevolence toward the Species. See **BENEVOLENCE**.

**PHILAUTIA**, **PHILAUTY**, in the Schools, *self Love*; a vicious Complaisance for a Man's self. From the Greek *philo*, amicus, and *autis*, ipse.

**PHILIPPICKS**, in Literature, a Name given to the Orations of *Demosthenes* against *Philip* King of *Macedon*. See **ORATION**.

The *Philippicks* are esteem'd the Master-pieces of that great Orator: *Longinus* quotes Abundance of Instances of the Sublime from 'em; and points out a thousand latent Beauties therein. In effect, that Pathetic wherein *Demosthenes* excell'd, the frequent Interrogations and Apostrophe's wherein he attack'd the Indolence of the *Athenians*, where cou'd they be better employ'd? How much Delicacy fower there be in the Oration against *Leptinus*, the *Philippicks* have yet the Advantage over it, were it only on account of the Subject, which gives *Demosthenes* so fair a Field to display his chief Talent, we mean with *Longinus*, that of moving and astonishing.

*Demosthenes Halicarnassensis* ranks the Oration on the *Halonesis* among the *Philippicks*, and places it the 8th in Order; but tho' the Authority of that great Critic be of no small Weight; yet, that Force and Majesty whereby *Cicero* Characterizes the *Philippicks* of *Demosthenes* seems to exclude the Oration on the *Halonesis* out of the Number; and authorise the almost universal Opinion of the Learned, who reject it as spurious.

*Libanus*, *Plotius* and others; and above all the Languidness of the Style, and the Lowness of the Expressions which reign throughout the Whole, fater it on *Hegesippus*.

*M. Tourneil* has given an excellent French Translation of the *Philippicks*.

'Tis an extraordinary Thing to see so much Spirit in a Translation: so much of the Strength and Energy of *Demosthenes*, in a modern Tongue; and that too so weak a one as the French.

**PHILIPIC** is also applied to the fourteen Orations of *Cicero* against *Marc Anthony*.— 'Twas *Cicero* himself that gave 'em this Title in his Epistles to *Brutus*; and Posterity have found it so just that it has been perpetu'd to our Times.

*Joceval* calls the Second the *Divine Philippick*, and witnesses it to be of great Fame, *Confricue Divina Philippica Fama*. That Orator's entitling his last and most valued Orations after the *Philippicks* of *Demosthenes*, shews the high Opinion he had of 'em.

*Cicero's Philippicks* cost him his Life; *M. Anthony* having been so irritated with 'em, that when he was arriv'd at the *Trincurator*, he procur'd his Murder, cut off his Head, and stuck it up in the very Place whence the Orator had deliver'd the *Philippicks*.

**PHILIPPISTS**, the Followers of *Philip Melancthon*.

That Reformer having strenuously oppos'd the *Ubiqvists*, who arose in his Time; and the Dispute growing still hotter after his Death: The University of *Wittenberg*, who espoused *Absconction's* Opinion, were call'd by the *Flaccians*, who attacked it, *Philippists*. See *UBIQUIST*.

**PHILIZERS**, or **FLAZERS**, Officers in the *Nisi Prius* Office; who make out all Process upon Original Writs, (which are made out by the Curfours, such as *Capias*, *alias*, *& plures*, &c.) and to whom the original Writs are brought after returned by the Sheriff, as well for their Warrants in suing out such *Capias*, &c. on them, as for them to fill with the *Costus Brevis*. See *FLAZERE*.

It is to be observed, that the Subject cannot bring any Action in this Court by original in Debt, but must proceed by Bill; and where an Action is brought in this Court by Original, if the Defendant for Delay, or thro' any Mis-entry, or mistake in the Proceedings or Return of Process, is advis'd to bring a Writ of Error; the Writ of Error must be returnable in Parliament, and not in the Exchequer-chamber, as are other Writs of Error upon Actions which are brought in this Court by Bill.

**PHILO**, a Term originally Greek, form'd of *philos*, *amicus*, Friend, Lover; is us'd in Composition in several Words in our Language. As,

**PHILO-ELUTHERUS**, a Lover of Liberty; of *philos* and *elutheros*, *Aber. free*.

**PHILOLOGY**, a Science, or rather Assemblage of several Sciences, consisting of Grammar, Rhetorick, Poetry, Antiquities, History, and Criticism.

*Philology*, is a Kind of Universal Literature, conversant about all the Sciences, their Rise, Progress, Authors, &c. See *LITERATURE*.

*Philology*, makes what the French call the *Belles lettres*. Antiently, *Philology* was only a part of Grammar. See *GRAMMAR*.

*Erastophilens*, Library Keeper at *Alexandria*, was the first who bore the gay Title of *Philologus*, according to *Sustomus*; or that of *Criticus*, according to *Clement Alexandrinus*. He lived under *Ptolemy Philadelphus*, and died in the 145th *Olympiad*. See *CRITICISM*.

The Word is form'd from the Greek *philos*, and *logos*, Lover of Discourse, or Words.

**PHILOMATH**, **PHILOMATHES**, a Lover of the Mathematicks, &c. See *MATHEMATICKS*.

**PHILONIUM**, in Pharmacy, an Opiate, whereof there are two Kinds; the *Roman* and the *Persian Philonium*. See *OPIMATE*.

The *Roman*, call'd also the great *Philonium*, took its Name from the Physician *Philo* who invented it. It consists of the Seeds of *Julianum*, *Poppy*, and other Ingredients. 'Tis us'd to promote Sleep, against Colds, Colicks, &c.

The *Persian Philonium* consists of several Ingredients, among which are *Opium*, *Terra Sigillata*, *Lapis Hematites*, *Castor*, and *Saffron*. 'Tis us'd to stop Hemorrhages, Dysenteries, &c.

**PHILOPATOR**, in Antiquity, a Title, or Sur-name, assumed by several of the Kings of *Egypt* and *Syria*.

*Ptolemy Philopator* succeeded *Ptolemy Evergetes*; and had for his Successor *Ptolemy Philometer*. See *EVERGETES*.

The *Syrans* had their *Selenus Philopator*, *Antiochus Philopator*, &c.

**PHILOSOPHER**, a Person well versed in *Philosophy*; or who makes Profession of, or applies himself to the Study of Nature and Morality. See *PHILOSOPHY*.

The Sects of *Philosophers* are very numerous; and their Dogmata, or Tenets very contradictory. See *SECT*.

*Helicon* and some of the Chymists denominate themselves *Philosophers by Fire*. See *CHYMISTRY*.

The Alchymists and Adepti are frequently denominated the *Philosophers* by way of Eminence. See *ALCHYMIST*, &c.

**PHILOSOPHERS STONE**, the great Object of Alchymy, is a long sought-for Preparation, which shall transmute impurer Metals, as *Tin*, *Lead*, and *Copper* into *Gold* and *Silver*. See *TRANSMUTATION*.

There are three ways whereby the Alchymists have attempted to arrive at the making of *Gold*: The first by *Separation*; for every Metal yet known, contains some Quantity of *Gold*: Only, in most, the Quantity is so little that it wont defray the Expence of getting it out.— The second by *Meturation*; for the Alchymists hold Mercury to be the Basis and Matter of all Metals; that Quicksilver purg'd from all heterogeneous Bodies wou'd be much heavier, denser and simpler than the Native Quicksilver; And that by subtilizing, and purifying and digesting it with much Labour, and long Operations, it may be converted into pure *Gold*. This Method of *Meturation* is only for Mercury. The other Metals it is ineffectual for, on two accounts: 1<sup>o</sup>, Because their Matter is not pure Mercury, but has other heterogeneous Bodies adhering to it. And 2<sup>o</sup>, by reason the Digestion whereby Mercury is turn'd into *Gold* wou'd not succeed in other Metals, in regard they had not been long enough in the Mines. Weight is the individual and inimitable Character of *Gold*, &c.

Now Mercury has ever some Impurities in it; and those Impurities are lighter than Mercury. Cou'd those be purged quite out, as it does not appear impossible but they might, Mercury wou'd be as heavy as *Gold*; and what is as heavy as *Gold* is *Gold*, or at least is very easily made *Gold*. See *GOld*.

The third Method is, that of *Transmuting*; or of turning of all Metals readily into pure *Gold*, by melting 'em in the Fire, and casting a little Quantity of a certain Preparation into the fused Matter; upon which, the *Faces* immediately retire, are volatiliz'd and burnt, and so carried off; and the rest of the Mass turn'd into pure *Gold*. Now, that which works this change in the Metals is call'd the *Philosophers-stone*. See *TRANSMUTATION*.

Whether this third Method be possible or not is very hard to say. We have so many Testimonies of Persons, who on all other Occasions speak perfect Truth, that 'tis somewhat hard to say they lye in this, that they have been Masters of the Secret. All required is to do that by Art which Nature does in many Years and Ages. For *Lead* and *Gold* do but differ little in Weight. Therefore there is not much in *Lead* beside Mercury and *Gold*. Now, if I had any Body which wou'd agitate all the Parts of *Lead*, as to burn all that is not Mercury therein; and had some Sulphur to fix the Mercury; wou'd not the Mass remaining be converted into *Gold*? There is nothing in Nature so heavy as *Lead*; *Gold* and Mercury only excepted. 'Tis evident, therefore, there is something in *Lead* that comes very near to *Gold*. But in *Lead* there is some heterogeneous Matter independent both of Mercury and *Gold*. If now 19 Ounces of *Lead* be dissolved by the Fire, and 8 Ounces be thus destroyed; we shall have good *Gold*; the Ratio of *Lead* to *Gold* being as 11 to 19. If then the *Philosophers-stone* can purify the mercurial Metal in *Lead*, so as nothing shall remain but the pure mercurial Body, and you can fix and coagulate this, by means of Sulphur; out of 19 Ounces of *Lead* you will have 11 of *Gold*. Or, if you reduce the *Lead* from 11 to 14, you will then have converted it into Mercury; and if you further purify this Mercury from 14 to 19 you will have *Gold*; provided you have but a Sulphur to fix and coagulate it withal. Such is the Foundation of the *Philosophers-stone*; which the Alchymists contend to be a most subtle, fix'd, concentrated Fire, which as soon as it melts with any Metal, does by a magnetic Virtue immediately unite itself to the mercurial Body of the Metal, volatilizes and cleanses off all that is impure therein, and leaves nothing but a Mass of pure *Gold*. See *ELIXIR METAL*, *MERCURY*, &c.

**PHILOSOPHERS Tree**, a Chymical Preparation, call'd also *Arbor Dianna*, *Dianna's Tree*. See *DIANNA'S Tree*.

**PHILOSOPHICAL**, something that relates to *Philosophy*, See *PHILOSOPHY* and *PHILOSOPHER*.

Thus we say a *Philosophical Thesis*, a *Philosophical Principle*, a *Philosophical Definition*, &c.

PHILOSOPHICAL Month. }  
PHILOSOPHICAL Tree. } See MENSTRUUM.  
PHILOSOPHICAL Transactions. } TREE.  
TRANSACTIONS.

**PHILOSOPHICAL Egg**, among the Chymists, is a thin Glass Vessel, or Bubble, of the Shape of an Egg; with a long Neck or Stem; us'd in Digestions. See *DIGESTION*.

**PHILOSOPHIZING**, the Act of considering some Object of our Knowledge; examining its Properties, and the Phenomena it exhibits; enquiring into their Causes or Effects, and the Laws thereof: the whole conducted according to the Nature and Reason of Things; and directed to the Improvement of Knowledge.

The Rules of *Philosophizing*, *Regule Philosophandi*, as establish'd by Sir *Isaac Newton*, are; 1. That no more Causes of a natural Effect be admitted than are true, and suffice to account for the Phenomena thereof.— This agrees with the Sentiments of most Philosophers, who hold that Nature does nothing in vain; and that it were vain to do that by many things which might be done by fewer.

2. Natural Effects, therefore, of the same Kind, proceed from the same Causes. Thus *E.g.* the Cause of Respiration is one and the same in Man and Brute; the Cause of the Defect of a Stone, the same in *Europe* as in *America*; the Cause of Light the same in Culinary Fire, and in the Sun; the cause of Reflection the same in the Planets as the Earth.

3. Those Qualities of Bodies which are not capable of being heighten'd, and remitted, and which are found in all Bodies where Experiments can be made; must be look'd on as universal Qualities of all Bodies. See *QUALITY*.

Thus the Extension of Body is only perceiv'd by our Senses, nor is it perceiv'd in all Bodies: But since it is found in all that we have Perception of, it may be affirm'd of all. So we find that several Bodies are hard; and argue that the Hardness of the Whole only arises from the Hardness of the Parts: Whence we infer that the Particles, not only of those Bodies which are sensible, but of all others, are likewise hard. Lastly, If all the Bodies about the Earth gravitate towards the Earth, and this according to the Quantity of Matter in each; and the Moon

Moon gravitates towards the Earth, also, according to its Quantity of Matter, and the Sea again gravitates towards the Moon; and all the Planets and Comets gravitate toward each other: It may be affirm'd universally, that all Bodies gravitate toward each other in the Creation. This Rule is the Foundation of all *Philosophy*.

**PHILOSOPHY, PHILOSOPHIA**, the Knowledge or Study of Nature and Morality, founded on Reason and Experience. See KNOWLEDGE.

*Philosophy* owes its Name to the Modesty of *Pythagoras*, who retained the Title *σοφιστῆς*, given to his Predecessors *Thales, Pythagoras, &c.* as too assuming; and contented himself with the Appellation *φιλοσοφῶν, quasi patris tibi scilicet, a Friend or Lover of Wisdom*.

*Charrin* rather derives the Name from *σοφία*, Study, and *φιλο*, *q. d. Solummodo sapientia*. *Pythagoras*, says he, conceiving that the Application of the human Mind, ought rather to be call'd *Study* than *Science*; set aside the Appellation *Wise*, and in lieu thereof took that of *Philosopher*: For having disburst with great Judgment and Learning before *Leontius* King of the *Phœnijs*; that Prince ask'd him what Art he profess'd; or in what Points his Wisdom chiefly lay? To which he answer'd, that he neither underit any Art, nor was he a *σοφιστῆς*, but a *σοφιστῆς*. Which Title *St. Augustus* observes, took to well with other Authors; that whoever excelled in any thing relating to Wisdom or Knowledge had no other Appellation. Accordingly, *Socrates, Plato, &c.* ever refrain'd from the swelling Title of *Sophist*. See **SOPIST**.

The Word *Philosophy* is used in various Significations among ancient and modern Writers: In its laxer Sense, it signifies the *Love of Truth*; thus *Plato* frequently calls it *φιλοσοφία*.— In other Places it signifies the *Knowledge of many Things*: Thus *Zeno* calls *Philosophy* *κατάθεσις* *Comprehensio*; because comprehending all Truth: Agreeable to which is *Cicero's* Definition of *Philosopher*, *vis*. He who studies to know the Natures and Causes of all Things human and divine, and to attain to every good Rule and Method of Life.

In a stricter Sense, *Philosophy* is frequently confin'd to some Science, or Branch of Science, *v. g.* to *Logic*, as we find it in *Plato* and *Aristotle*; to *Physicks*, or the Knowledge of Nature, in which Sense it was chiefly us'd in the *Ionian School*; and to *Ethicks*, or the Rules of Morality; Thus *Clemens Alexand.* relates, *that among the Greeks there are Philosophers who hold Disputes about Virtue*.

Agreeably hereto *Pythagoras* defines *Philosophy*, a *Meditation of Death*; by which, according to *Plato* and *Clemens* is meant an Abstraction or Retirement from the Body; which *Apolonius* thus explains: *A Philosopher is to study nothing so much as to set his Soul at Liberty from its Correspondence with the Body*: Thus *Cicero* calls *Philosophy* *Art vita*, and *Seneca*, *lex vita*; and thus *Plutarch*— *Constancy, Fidelity, and a sound Mind, are the real Philosophy*; all the other *Parts of Wisdom, serving any other Way, are Pretinueses and Curiosities*: And in this Sense it was, that *Philosophy* chiefly flourish'd in the School of *Socrates*, afterwards call'd the *Academic School*, and among the *Stoicks*. See **ACADEMIC** and **STOIC**.

Lately, *Philosophy* is frequently us'd by *Pythagoras* and *Plato* for *Metaphysics*, or the Knowledge of God; which *Plato* calls the true *Philosophy*, others the *Prima Philosophia*; and in respect whereof, the *Platonists* call all other *Philosophy*, *Natural*, *v. g. v. g. v. g.*

*Gale* includes all the several Ideas hitherto deliver'd, under this one general Definition: *Philosophy* is the Knowledge of things Notional, Natural, Moral, and Supernatural, first granted by God to our first Parents, and transmitted to us for the Honour of the Creator, and the Good of the Universe.

That Definition of *Epicurus* is pretty comprehensive: *Philosophy* consists in three Things; the Practice of Precepts, the Reason of Precepts, and the Proof of Precepts.

Some have given the following Epithets to the ancient *Philosophy*, under its several Stages: *Philosophy*, say they, became *Impious* under *Diogenes*; *Vicious* under *Epicurus*; *Hypercritical* under *Zeno*; *Impudent* under *Dionysius*; *Covetous* under *Democritus*; *Voluptuous* under *Metrodorus*; *Fantastical* under *Crates*; *Scurrilous* under *Menippus*; *Licentious* under *Pyrrho*; *Ignorant* under *Cleanthes*, &c.

The several *Dogmata* maintain'd by the several *Philosophers*, are infinite: *Cicero* makes no scruple to aver, that There is nothing in the World, how absurd soever, but has been maintain'd by one *Philosopher* or other.— From the first Broachers of new Opinions, and the first Founders of Schools, *Philosophy* is become divided into innumerable *Sects*; some Ancient, and others Modern; such are the *Platonists*, *Peripateticks*, *Epicureans*, *Stoicks*, *Pyrrhonians* and *Academicks*; and such are the *Cartesians*, *Newtonians*, &c. See the *Rite*, *Doctrines*, &c. of each *Sect* under its proper Article **PLATONIST**, **PERIPATETICK**, **EPICUREAN**, **STOICK**, **PYRRHONIAN**, **ACADEMIC**, **CARTESIAN**, **NEWTONIAN**, &c.

*Philosophy* may be divided into two Branches, or consider'd under two *Habitudes*, *Theoretical* and *Practical*.

*Theoretical*, or *Speculative PHILOSOPHY*, is that employ'd in mere Contemplation, and which terminates therein. Such is *Physicks*, which is a bare Contemplation of Nature, and natural Things. See **PHYSICKS**.

*Theoretical Philosophy*, again, is usually subdivided into three, *viz. Pneumaticks*; *Physicks*, or *Somaticks*; and *Metaphysics*, or *Ontology*.

The First considers Beings abstracted from all Matter; its Object are Spirits; their Nature, Properties, Effects, &c. See **SPIRIT** and **PNEUMATICKS**.

The Second considers Matter and material Things; its Objects are Bodies, their Properties, Laws, &c. See **BODY** and **PHYSICKS**.

The Third extends to each indifferently; its Objects are either Body or Spirit. See **METAPHYSICKS**.

In the Order of our Discovery, or Arrival at the Knowledge of 'em, *Physicks* is first, then *Metaphysics*; the third arises from the two consider'd together: After an Acquaintance with God, ourselves, and natural Bodies, we come to consider what is common to 'em all, the Attributes that agree to all, and thus form a Sort of universal *Philosophy*, or *Doctrine de Ente* in general. See **ONTOLOGY**, **ENS**, **ESSENCE**, &c.

But in teaching, or laying down these several Branches to others, we observe a contrary Order; beginning with the most Universal, and descending to the more Particular. And hence we see why *Peripateticks* call *Metaphysics*, and the *Cartesians* *Pneumaticks*, the *Prima Philosophia*.

Others prefer the Distribution of *Philosophy* into four Parts, *viz. 1. Pneumaticks*, which considers, and treats of Spirits. 2. *Somaticks*, of Bodies. The third compounded of both, *Anthropology*, which considers Man, in whom both Body and Spirit are found. The 4. *Ontology*, *i. e.* which treats of what is common to all the other three.

*Practical PHILOSOPHY*, is that which lays down the Rules of virtuous and happy Life; and excites us to the Practice thereof.

*Practical Philosophy*, is properly *Ethicks* alone, or the Method of leading a virtuous and happy Life: Yet, most Authors divide it into two, answerably to the two Sorts of human Actions to be directed thereby, *viz. Logicks*, which govern the Operations of the Understanding. See **LOGICKS** and **UNDERSTANDING**.

And *Ethicks* properly so call'd, which direct those of the Will. See **ETHICKS** and **WILL**.

**NATURAL PHILOSOPHY** } See { **NATURAL**  
**MORAL PHILOSOPHY** } See { **MORAL**.

**PHILOSOPHY** is also frequently us'd for the particular Doctrine, or System of Opinions, broach'd by some considerable Philosopher, and espous'd and adher'd to by his Followers. See **SYSTEM** and **HYPOTHESIS**.

In this Sense we say the

<p><i>Mosaic</i> <i>Epicurean</i> <i>Aristotelian</i> <i>Platonian</i> <i>Cartesian</i> <i>Newtonian</i> <i>Hermetical</i></p>	}	<p><b>PHILOSOPHY</b>. See</p>	<p><b>MOASIC</b> <b>EPICUREAN</b> <b>PERIPATETIC</b> <b>PLATONIC</b> <b>CARTESIAN</b> <b>NEWTONIAN</b> <b>HERMETICAL</b>.</p>
--	---	-------------------------------	---

**PHILOSOPHY** is also us'd for a certain Manner of Philosophising; or certain Principles, upon which all the Enquiries thereby made, do turn.

In this Sense we say

<p><i>Corpuscular</i> or <i>Atomical</i> <b>PHILOSOPHY</b>. <i>Mechanical</i> <b>PHILOSOPHY</b>. <i>Experimental</i> <b>PHILOSOPHY</b>.</p>	}	<p>See</p>	<p><b>CORPUSCULAR</b>. <b>MECHANICAL</b>. <b>EXPERIMENTAL</b>.</p>
---	---	------------	--

**PHILOSOPHY**, again, is consider'd with regard to the Age, or the Place wherein it was taught.

In this Sense we say

*Scholastic* or *School* **PHILOSOPHY**. See **SCHOLASTICK**.  
*New* **PHILOSOPHY**, &c.

**FILTRATION**, or **FILTRATION**, the Separation of the finer Part of a Fluid, from the Coarser; by passing it through a *Filtre*, *viz.* a Linnen Cloth, Shabby Skin, Brown Paper, or the like. See **FILTRATION**.

**FILTER**, **FILTRE**, **FILTRUM**, in Pharmacy, &c. a Strainer, or Filtre. See **FILTRE**.

**FILTRE**, or **FILTRE**, is also us'd for a Drug, or Preparation, which 'tis pretended will excite Love. See **CHARM**.  
*Filters*, are distinguish'd into *erme* and *spurious*: The *Spurious* are Spells or Charms, suppos'd to have an Effect beyond the ordinary Laws of Nature, by some magic Virtue; such are those said to be given by old Women, Witches, &c. See **MAGICK** and **WITCHCRAFT**.

The true *Philtres* are those supposed to work their Effect by some natural and magnefic Power.

There are many grave Authors who believe the Reality of these *Philtres*; and alledge matter of Fact in Confirmation of their Sentiments: among the rest, *Van-Helmout*, who says, that upon holding a certain Herb in his Hand for some time, and taking afterwards a little Dog by the Foot with the same Hand; the Dog follow'd him wherever he went, and quite deserted his former Master.

He adds that *Philtres* only demand a Conformation of *Mumia*; and on this Principle accounts for the Phenomena of Love transfused by the Touch of an Herb; for, says he, the Heat communicated to the Herb, not coming alone, but animated by the Emanations of the natural Spirits; determines the Herb towards the Man, and identifies it to him: Having, then received this Ferment, it attracts the Spirit of the other Object magnetically, and gives it an amorous Motion. See *MUMIA* and *TRANSPLANTATION*.

But this is mere Cant; and all *Philtres*, whatever Facts may be alleg'd, are mere Chimeras.

Naturalists ascribe an Effect somewhat of Kin to that of a *Philtre* to *Cantbarides*, taken inwardly; these, 'tis true, tend to excite love, or rather Lust: but 'tis Lust in the General, not determin'd to any particular Object; and they do it no otherwise than by irritating the Fibres of the Nerves and Muscles, by whose Action the *Emisso Seminis* is effected. See *CANTHARIDES*.

The Word *Philtre* is form'd from the *Greek* *philtre* to love. *PHIMOSIS*, in Medicine, a Disease of the *Pennis*, wherein the Preputium is glued, or strongly constricted upon the Glans; so as not to be capable of being drawn back, to uncover the Glans. See *GLANS* and *PREPUCE*.

The Word is also used for a Disease of the Eyes, wherein the Eye-lids are so bound together by the Mediation of some glutinous Matter, as not to be open'd.

The Word is *Greek*, and properly signifies a Ligature with Packthread, *ϕιμασις*, denoting Packthread.

Sometimes a *Phimosi* conceals Shankers on, or about the Glans; and sometimes is so violent as to prevent the flowing out of the Matter, whence it causes an Inflammation or Morification of the Part.

The Cure of a Paraphimosi in no ways differs from that of a *Phimosi*, except in the Use of Injections; and in both Cases, if they still prove obstinate, the Prepuce must be cut, in order to reduce it to its natural State or Situation.

*PHLEBOTOMY*, in Medicine and Chirurgery, *Bleeding*; or the Art or Operation of letting Blood. See *BL. OON*.

The Word is compounded of the *Greek* *φαιλα*, Vein, and *τομος*, to cut.

*Phlebotomy* is a Manner of Evacuation of the utmost Importance in Medicine, an Idea of its Effects, with the Reason of its Use may be conceiv'd from what follows.

'Tis evident the Blood throws out of the Heart, while it strikes upon the antecedent Blood, and drives it forwards, transfers to it Part of its own Motion, and is therefore so much retarded in its own Motion. Hence, if Blood be drawn out of the Basiliic Vein of the right Arm; the succeeding Blood, or that carried by the axillary Artery, or right Subclavian, will be less hinder'd in its Motion, than it was before that Vein was open'd; for Part of the Blood being taken away by the opening of that Vein, there remains behind a lesser Quantity in the axillary Vein, or less is contained between the further Extremity of the axillary Artery and the Heart, than was before: therefore the Blood being let out by the Vein, the Remainder in the Artery will be less impeded in its Motion than before. See *PULSE*.

Hence the Blood of that Artery which communicates with the Vein that is opened, will flow with a greater Velocity after the Aperture is made than before. Consequently, while the Blood is flowing out of the Vein in the Arm, that thrown out of the Heart into the Aorta, will find less Resistance in the ascending Trunk, than in the Descending; and will therefore flow faster in the Ascending, than in the descending Trunk: And thence too it will find less Resistance in the right Subclavian Artery than in the left.

Lastly, it hence appears, that the Blood being let out of a Vein in the right Arm, the remaining Blood in the right axillary Artery runs with a greater Velocity into the Artery of that Arm that is contiguous to it, than through the thoracic Artery, or the right Scapulary, which is likewise contiguous to it; because, when the Blood is not supposed to be drawn out from any Vein corresponding to the thoracic Artery, or into which this discharges itself, there is proportionally a greater Impediment to the Motion of the Blood in the thoracic Artery, than in that of the Arm. But because the Velocity of the Blood in the subclavian Artery, or the right Axillary, is greater than in the Left; the Velocity in the right Thoracic will also be greater than in the left thoracic Artery. Hence it is manifest, that the Blood being let out of a Vein in the right Arm; the greatest Velocity of the remaining Blood will be in the Artery of that Arm, because it immediately empties its Blood into the Vein that is open'd; and the next

greatest Velocity will be in the thoracic Artery, or Scapulary of the same Side, going out from the axillary Artery. But the Velocity of the Blood will be far less in the brachial Axillary, and thoracic Arteries on the left and opposite Side; and least of all in the Arteries arising from the descending Trunk of the Aorta.

On this View it may easily be gathered, what is to be done in the several Circumstances of *Blood-letting*: For instance, if we would prevent the Increase of any Humour from the Blood stagnating in the left Leg, or bring it about, that as little Blood as possible, should flow to that Leg in any given space of Time; first, Blood is to be taken from the Arm or Leg of the right Side, because this is truly making what is call'd a *Rescision*.

Again, if Blood be drawn away on the same Side, and from some Vein that receives the Blood from a Branch of that Trunk which transmits it to the swell'd Part; it will occasion a greater Derivation of Blood to that Limb.

As to what relates to the whole Habit; in all Lentors and Viscidities, if there be a due Strength and Elasticity remaining in the Solids, *Phlebotomy* will make the remaining Blood circulate the faster, and become thinner and warmer; but in a Plethora, from Debauch, and no large Quantities of spirituous Nourishment, or from a Diminution of Perspiration, where the Blood yet retains its natural Fluxility, *Phlebotomy* will make the remaining Mass circulate slower, and become cooler.

In the former Case, a Diminution of the Resistance in the Blood-Vessels, will increase the contractile Powers of those Vessels, and make them beat faster, and circulate their Contents with greater Velocity; but in the latter Case a Diminution of the Quantity of a spirituous Blood will lessen the Quantity of Spirit secreted in the Brain, the Consequence of which will be that the Heart and Arteries will not contract so often nor so strongly as before, and therefore the Blood will move slower, and become cooler. See *HEART* and *ARTERY*.

And on these Things depend the whole Doctrine of *Blood-letting*. See *EVACUATION*.

*PHLEGM*, in Chymistry, is an aqueous and insipid Fluid, supposed to be found in all natural Bodies; coinciding with what the other Philosophers call *Water*. See *WATER*.

*Phlegm* makes the 4th of the Chymical Elements, of Elementary Principles. See *PRINCIPLE* and *ELEMENT*.

In the Distillation of Vinegar, as also of all Minerals and inodorous Vegetables, *Phlegm* comes out first; in that of Wine last. See *DISTILLATION*.

This *Phlegm* is supposed to be the common Vehicle and Diluter of all solid Bodies; and in proportion to its Quantity in the Mixture, are the other Parts more languid and disabled in their Attractions; yet, on the Chymists Principles, *Phlegm* shou'd be a Principle of Action; as being necessary to the Dissolution of the Salt in Bodies, without which the Salt must remain inactive. See *SALT*.

It is much to be question'd whether this *Phlegm* can ever be procur'd without any Mixture of other Matters; that which has the least must come nearest to the Nature of a Principle; and on that account Rain-water shou'd afford it most.

*Phlegm*, *Boerhaave* observes, drawn by Distillation from Vegetables, does always carry with it some what of the Smell of the Vegetable, which it derives partly from the Oil, and partly from the Spirit residing therein. The same *Phlegm*, by frequently reiterated Distillations, lays aside most of this Smell, and approaches nearer to pure Water, but never becomes perfectly such. Add, that the purest distill'd Water, if exposed a few Days to the Sun, is much changed, and render'd turbid.

That *Phlegm* is not an elementary Body, Mr. *Boyle* argues from its different Powers and Properties; the *Phlegm* of Wine, and most Liquors, have Qualities that make them differ from mere Water, and from one another; the *Phlegm* of Vitriol that Author observes is an effectual Remedy against Burns; and a valuable Nostrom for discharging hard Tumours; that of Vinegar will extract a Saccharine Sweetness out of Lead, and even dissolve Corals with long Digestion; and that of Sugar of Lead, is said to dissolve Pearls.

In Effect, the Characters which serve to denominate a Fluid, *Phlegm*, or Water, among the Chymists, are Insipidity and Volatility; yet, Quicksilver has all these, which no Body pretends to be *Phlegm*. Add, that it appears from several Experiments, that Water itself, by repeated Distillations, may be converted into Earth. Yet Water, the same Author observes, has a much faster Pretence to be an Element, than any of the *tria prima*.

Add, that as to the Qualities which occasion that Name to be given any visible Substance, viz. its being Fluid, Insipid, and inodorous; we have never yet seen any of these separated Substances, which the Chymists call *Phlegm*, perfectly destitute both of Taste and Smell.

Common Salt, and several other saline Bodies distilled ever to dry, will each yield a large Quantity of *Phlegm*; which can no other way be accounted for, but from this, that among the various Operations of the Fire, on the Matter of a Concrete, several Particles of that Matter are reduc'd to a Shape

Shape and Size, requisite to compose such a Liquor as the Chymists call *Phlegm*, or Water.

**PHLEGM**, in the Animal Oeconomy, is one of the four Humours, whereof the Ancients supposed the Mass of Blood to consist. See HUMOUR, and BLOOD.

*Phlegm* is the name that is otherwise called *Pituita*. See PITUITA.

**PHLEGMAGOGUE**, a Medicine proper to purge, *Phlegm*, or Pituita. See PURGATIVE.

Agaric, Hermodiactyls, Turbith, &c. are *Phlegmagogues*. The Word is form'd from the Greek *phlegma, pituita*, and *agogos* to drive.

**PHLEGMATIC**, a Temperament wherein *Phlegm*, or Pituita, is the prevailing Humour. See TEMPERAMENT and PHLEGM.

*Phlegmatic* Constitutions are subject to Rheums, Defluxions, &c. See CONSTITUTION.

**PHLEGMON**, in Medicine, a general Name for all Tumors form'd of the Blood. See TUMOR.

An Inflammation, attended with a considerable swelling of the Part, constitutes a *Phlegmon*. See INFLAMMATION.

If the Blood be good, and laudible, and only peccant in Quantity, 'tis call'd a *true Phlegmon*.

When corrupted and adulterated with Bile, or Pituita, 'tis call'd a *bad Phlegmon*; in which case it participates of the *Erysipela*, *Oedema*, or *Schirrus*.

The Blood here extravasated produces a Heat, Redness, Tension, Reticency, Pulsation, and great Pain.

The Bubo, Carbuncle, Furuncle, Pustules, and other Tubercles arising from the Blood, are all reducible to the *Phlegmon*. See BUBO, CARBUNCLE, &c.

The Ophthalmia, Paracides, Squinancy, and even Pleurisy and Peripneumony, are Species of the *Phlegmon*. See each under its proper Article.

The Word is form'd from the Greek *phlegma*, to cause an Inflammation.

**PHLOGOSIS**, in Medicine, a Degree of the *Ophthalmia*.

When the Inflammation of the Eye is light and gentle it is call'd a *Phlogosis*; when very severe, *Chemosis*. See OPHTHALMIA.

**PHLYACOGRAPHIA**, among the Ancients, a merry and burlesque Imitation of some grave and serious Piece; particularly a Tragedy travestied into a Comedy. See TRAVESTY.

The *Phlyacography* was the same thing with the *Hilarody*, or *Hilarotragedy*. See HILARODY.

There were several Kinds of *Phlyacography*; which had their several Names. See *Salmastus* on *Solin*.

The Parodies which have been made of some Parts of the best Poets, as the *Virgil Travesty* of *Scarron* and *Cotton*; the *Rival Queens* of *Gibber*, from the *Rival Queens* of *Lee*; some Pieces of Opera's, the Musick whereof is applied to low and ridiculous Words, come under the Notion of *Phlyacographies*.

The Word is form'd from the Greek *phlyacoma, nugari*, to trifle.

**PHLYCTENÆ** or **PHLYCTENES**, little white itching Vesicles, arising on the Skin, chiefly between the Fingers, and about the Wrist, and full of a limpid Serum.

They sometimes degenerate into the Itch, and sometimes into Tetters. See ITCH, &c.

They are cured like other cutaneous Eruptions. See PSORA and PUSTLE.

**PHLYCTENÆ** are also little ulcerous Vesicles, arising sometimes on the Adnata, sometimes on the Cornes, of the Eye, like so many little Blisters full of Water; popularly call'd *Blisters in the Eyes*.

They shew like Grains of Millet; and when produced by a sharp corroding Humour, occasion violent Pain: The Pustles on the *Adnata* are red; those on the *Cornes* blackish, if near to the Surface, but whiter if deeper.

They are cured by Excitants and Exiccants.

**PHLYSTENE** or **PHLYSTENA**, in Medicine, a Disease which produces Bubo's, full of a ferous Humour. See BUBO.

The *Phlystene* is a kind of Pox.—The Bubo's it occasions are sometimes big, livid, pale, black, or any Colour different from that of the natural Flesh.—When pierc'd, the Flesh frequently appears ulcerated under 'em.

They are usually occasion'd by a hot, sharp Humour, and arise on all Parts of the Body; but are most dangerous on the *Cornes* of the Eye.

The Word is form'd from the Greek *phlysta, phlysta* of *phlystos*, *ebullio*, I boil, bubble, &c.

**PHOENIGMA**, a Medicine which raises Redness, with Blisters, on the Places it is applied to. See ELYSIUM, &c.

Such are Mustard-Seed, Pepper, Vesicatories, &c. See VESICATORY, SINAPISM, &c.

*Phoenigma's* are applied to draw the Humour to the Part they are applied on, and divert it from the Part affected. See REVULSION.

The Word is form'd from the Greek *phoenix*, red.

**PHOENIX**, in Astronomy a Constellation of the Southern Hemisphere; unknown to the Ancients, and invisible in our Northern Parts. See CONSTELLATION.

The Constellation took its Name, and Form from that of a Bird famous among the Ancients; but generally look'd upon by the Moderns as fabulous.

The Naturalists speak of it as single, or the only one of its Kind: They describe it as of the Size of an Eagle; its Head finely crested, with a beautiful Plumage; its Neck cover'd with Feathers of a Gold Colour, and the rest of its Body Purple, only the Tail white intermix'd with Carnation; and its Eyes sparkle like Stars.—They hold that it lives five or six hundred Years, in the Wilderness: That when thus advanced in Age, it raises itself a funeral Pile of Wood and Aromatic Gums; then it lights it with the wasting of its Wings, and thus burns itself; and from its Ashes arises a Worm, which in time grows up to be a *Phoenix*.

Hence the *Phoenicians* gave the Name *Phoenix* to the Palma-Tree, by reason when burnt down to the very Root, it rises again fairer than ever.

**PHONASCIA**, the Art of forming the human Voice. See VOICE.

In ancient Greece, there were Combats, or Contests, establish'd for the Voice, as well as other Parts of the *Gymnastice*. See GYMNASTICE.

These Combats were still held in the Time of *Galen*; and it was these that brought the *Phonascia* into Vogue.

The Word is form'd from the Greek *phona, voice*.

Hence the Masters of this Art, or those who taught the Art of managing the Voice, were call'd *Phonasci*; under whose Tutorage were put all those destin'd to be Orators, Singers, Comedians, &c.

**PHONICKS**, the Doctrine, or Science, of Sounds; otherwise call'd *Acousticks*. See ACOUSTICKS.

The Word is deriv'd from the Greek *phona, sound*.

*Phonicks* may be considered as an Art, analogous to Opticks; and may be divided, like that, into *direct*, *reflected* and *refracted*.

These Branches the Bishop of *Ferns*, in allusion to the Parts of Opticks, denominates *Phonicks*, *Diaphonicks*, and *Cataphonicks*.

*Phonicks* is improvable both with regard to the Object; and with regard to the Medium or Organ.

As to the Object, *Sounds*, it may be improved both with regard to the begetting, and the propagating of Sounds;

The first, in speaking, or pronouncing, in whistling, or singing, or hollowing, or luring, which are all distinct Arts and all improvable.—The second by the Position of the sonorous Body.

With regard to the Medium, *Phonicks* may be improved by the Thinness and Quietness thereof, and by the sonorous Body being placed near a smooth Wall, either plain or arch'd, especially cycloidally or elliptically; hence the Theory of Whistling-Places. See WHISTLING.

Add to these, that by placing the sonorous Body near Water, its Sound is mollified; that by placing it on a Plain, the Sound is convey'd to a greater Distance than on uneven Ground, &c. See SOUND.

As to the Organ, the Ear: It is help'd by placing it near a Wall, (especially at one End of an Arch, the Sound beginning at the other;) or near the Surface of Water, or of the Earth.

And by Instruments, as the *Semiataphonicon*, or Speaking-Trumpet. See SPEAKING-TRUMPET.

By an Instrument to help weak Ears, as Spectacles do Eyes; by an Instrument to take in vastly remote Sounds, as Telescopes do Objects; by a Microphone, or magnifying Ear-Instrument; by a Polyphone or multiplying Ear-Instrument. See EAR, &c.

*Cataphonicks*, or Reflected Hearing, may be improved by several Kinds of artificial Echoes; for in general, any Sound falling either directly or obliquely, on any dense Body, of a smooth Surface, whether plain or arch'd, is beat back again, or reflected, i. e. does echo more or less. See ECCHO.

**PHOSPHORUS**, a Matter which shines, or even burns, spontaneously, and without the Application of any sensible Fire. See FIRE and LIGHT.

The Word is form'd from the Greek *phos, light*, and *phos, carry*.

*Phosphorus* is either *Natural* or *Artificial*.

*Natural PHOSPHORI* are Mitters which become luminous at certain Times, without the Assistance of any Art, or Preparation.

Such are the Glow-Worms, frequent in cold Countries; Flies, and other shining Insects, in hot Countries; rotten Wood, the Eyes, Blood, Scales, Flesh, Sweat, Feathers, &c. of several Animals; Diamonds when rubb'd after a certain manner; Sugar and Sulphur when pounded in a dark Place; Sea-Water, and some Mineral-Waters when

9 T

briskly

briskly agitated; a Cat's or Horse's Back, duly rubb'd with the Hand, &c. in the Dark; nay, Dr. *Crow* tells, that upon rubbing his own Body briskly with a well warm'd Shirt, he has frequently made both to shine; and Dr. *Sloane* adds, that he knows a *British* Gentleman and his Son, both whose Stockings will shine after much walking.

All Natural *Phosphori* have this in common, that they don't shine always, and that they never give any Heat. See *NOCTILUCA*.

But that which of all Natural *Phosphori* has occasioned the most Speculation is the *Barometrical* or *Mercurial Phosphorus*.

*Barometrical* or *Mercurial PHOSPHORUS*.—M. *Picard* first observed that the Mercury of his Barometer, when shaken in a dark Place, emitted Light; with this Circumstance, that in shaking the Mercury with Rapidity, sometimes above and sometimes below its Equilibrium with the Air, the Light is only seen when below it, where it appears as if adhering to the upper Surface.

But this Light is not found in the Mercury of all Barometers, which occasions a great Difficulty.

M. *Bernoulli*, upon examining the Circumstances of this Phenomenon, invented a Solution of the same: He imagines that upon the Mercury's descending, the *Vacuum* in the Tube increasing, there issues out of the Mercury to fill up this Excess of Vacuity, a very fine subtile Matter before dispers'd throughout the Pores of this Mineral; and that at the same time there enters thro' the Pores of the Tube another finer Matter: Thus, the first Matter emitted out of the Mercury and collected over its Surface striking impetuously against that received from without, has the same Effect with *Des-Cartes's* first Element against the second; that is, produces the Motion of Light. See *LIGHT*.

But why, then, is not the Phenomenon common to all Barometers? To this he answers, That the Motion of the subtile Matter out of the Mercury may be weaken'd, and prevented by any heterogeneous Matter collected on its upper Surface into a Kind of Pellicle; so that the Light should never appear but when the Mercury was perfectly pure.

This Reasoning was confirm'd from the Experiments of several Barometers which he made according to this Plan; but the *Royal Academy of Sciences*, who repeated the Experiments with Barometers made after the same manner, did not meet with the same Success; the Light being found in some not in others.

M. *Hamborg* therefore conjectured, that the Difference consisted in the different Qualities of the Quicksilver: In some, he observ'd, they used Quick-Lime to purify it; in others, Steel-Filings. The Mercury, then, raising in the Distillation, and passing thro' the Lime, might take away Parts thereof, capable, by their extreme Smallness, to lodge in its Interstices. Hence, as Quick-Lime always retains some fiery Particles, 'tis possible, in a Place void of Air, where they swim at Liberty, they may produce this Lustre.

Mr. *Haukbee* has several Experiments of the Mercurial *Phosphorus*—passing Air forcibly thro' the Body of Quick-silver placed in an Exhausted Receiver, the Parts were violently driven against the Side of the Receiver, and gave all around the Appearance of Fire; continuing thus till the Receiver was half full again of Air.

From other Experiments he found, that tho' the Appearance of Light was not producible by agitating the Mercury in the same Manner in the common Air; yet that a very fine Medium nearly approaching to a *Vacuum* was not at all necessary.

And, lastly, from other Experiments he found, that Mercury enclos'd in Water, which communicated with the open Air, by a violent shaking of the Vessel wherein it was enclosed, emitted Particles of Light in great plenty, like little Stars.

By including the Vessel of Mercury, &c. in a Receiver, and exhausting the Air, the Phenomenon was chang'd; and, upon shaking the Vessel, instead of Sparkles of Light the whole Mixture appear'd one continued Circle of Light.

*Artificial PHOSPHORI* are such as owe their luminous Quality to some Art, or Preparation.

Of these there are three Kinds: The first burns and consumes every combustible it touches; the other two have no sensible Heat.

The first, or *Burning Phosphorus*, may be made of Urine, Blood, Hairs, and generally of any Part of an Animal that yields an Oil by Distillation.—The Matter it is most easily drawn from is human Urine.

'Tis of a yellowish Colour, and of the Consistence of hard Wax, in the Condition 'tis left by the Distillation; and in this State is call'd *Phosphorus Fulgurans*, from its Coruscations; and *Phosphorus Smaragdinus*, because its Light is frequently green or blue, especially in Places that are not very dark; and *solid Phosphorus* from its Consistence.

It dissolves in all Kinds of distill'd Oils; and in that state is call'd *liquid Phosphorus*.

It may be ground in all Kinds of fat Pomatums; in which Case it makes a *luminous Unguent*.

So that the *Phosphorus fulgurans, Smaragdinus, Solid and Liquid Phosphorus, and Luminous Unguent*, are all the same Drug, under different Circumstances.

It was invented by Mr. *Kunkel*, Chymist of the Elector of Saxony; brought into *France* by M. *Krafft*, a Physician of *Dresden*, by whom it was communicated to Mr. *Boyle*.

In 1676, M. *Elsholz*, publish'd a Treatise expressly on it, at *Berlin*; and in 1680, Mr. *Boyle* publish'd another in *English* under the Title of *Noctiluca*. See *NOCTILUCA*.

M. *Hamborg* first made of it at *Paris* in 1679, and communicated the Method of Preparation to the Publick.

*Preparation of the Solid Phosphorus, or Phosphorus of Urine.*

Evaporate a good Quantity of Urine of Beer-Drinkers to the Consistence of Honey. Cover it up in an Earthen Vessel, and let it three or four Months in a Cellar to ferment and putrify.—Mix a double quantity of Sand, or Powder of Pot-shards with one Part of this Urine; put it into a Retort, fitted to a long-neck'd Receiver, with two or three quarts of Water.—Distil it in a naked Fire in a reverberatory Furnace; at first gently; after two Hours, augment the Fire gradually, till all the black fetid Oil be drawn off.—Raise the Fire to the highest degree; upon which white Clouds will come into the Receiver and fix by little and little on one side, in form of a yellowish Skin; and another part will precipitate to the Bottom in Powder.—Keep the Fire thus violent for three Hours till no more Fumes arise.—Let all cool, and unloose the Vessels; and throwing more Water into the Receiver shake all well about to loosen what sticks to the Sides.—Pour the whole into a Glas-Vessel to settle.

The Volatile Salt will now dissolve in the Water, and the *Phosphorus* and Oil sink to the Bottom; pour off the Water, and gathering the remaining Matter together, put it into a Glas-Vessel with a little fresh Water; and digest it in a Sand-Heat stirring it from Time to Time with a wooden Spatula.

By this means the *Phosphorus* will separate from the Oil, and sink to the Bottom: Pour off the Oil, and make up the *Phosphorus*, while hot, into Sticks for Use.

*Boerhaave* gives us other Ways of preparing *Phosphorus*: Recent Urine, he observes, digested three or four Days in a tall Glas, with a Heat no greater than that of a healthy Man, grows red, fetid, and cadaverous: This digested Urine being put to distil in a Retort, yields a clear fetid Liqueur, then a yellow volatile Salt, which evaporated to the Consistence of a *Sops*, and mix'd with four times its Weight of dry Sand, and the Distillation continued in a cover'd Retort, there successively comes over, by greater and greater degrees of Fire, a fetid brown Oil, bluish Fumes, and a gross thinning Matter which sinks in Water, and is the *solid Phosphorus*.

To make it more directly, and to the best Advantage, it may be proper to take a sufficient Quantity of human Urine, afforded by a Person not much given to drink Wine, and exhale it away in an open Vessel to a Rob, or the Consistence of Honey; then let it to putrify for half a Year, and upon Distillation it will afford a large Proportion of Salt; after which, if six times its own Quantity of Sand, or Brick-Dust, be added to the Remainder, and the Distillation be continued, as in the Case last mentioned, the *Phosphorus* will fall into the Water.—Or it may commodiously be prepared, by suffering the Rob of Urine to digest for two Years in an open Vessel in the open Air; during which time a slimy, faculent, unctuous, earthy Matter will fall to the bottom; which being frequently wash'd with pure Water, wherein it will not dissolve, will leave a white Matter behind it, neither of an Alkaline, Acid, Saline, or Terrestrial, nor scarce of an unctuous Nature; and this is of it self a proper Matter for the making of *Phosphorus* by Distillation with Sand.

*Properties of the solid Phosphorus.*

1<sup>st</sup>, With this *Phosphorus* one may write on Paper, as with a Pencil, and the Letters appear like Flame in the dark; yet in the Light nothing appears but a dim Smoak.

2<sup>dy</sup>, A little Piece rubb'd between two Papers, takes Fire instantaneously.—If Care be not taken in the Management of it, there is danger of burning the Fingers, the *Phosphorus* being exceedingly inflammable. See *FIRE*.

3<sup>dy</sup>, Its burning is very vehement, and penetrates deeper into the Flesh than common Fire; and 'tis very difficult to extinguish'd.

M. *Cassini* happening to press a Piece in a Cloth between his Fingers, the Cloth immediately took Fire; he endeavor'd to put it out with his Foot, but his Shoe caught the Flame, and he was oblig'd to extinguish it with a Brafs-Ruler, which cast forth Rays in the Dark for two Months after.

The *Solid Phosphorus* never spoils, provided it be kept in a Phiol full of Water; that in form of an Unguent does not keep so well; and the *Liquid Phosphorus* worst of all.

The *Liquid Phosphorus* is made by digesting in Horse-Dung, a little Bit or some Scrapings of the *Solid*, for two Days, in Oil, or Essence, of Cloves, Oil of Turpentine, or the like.

After Dissolution the Oil will be so impregnated with it, that upon opening the Bottle, the Matter will appear on a Flame.

*Experiments with the Liquid Phosphorus.*

By washing the Face, Hands, or the like, with the *Liquid Phosphorus*, Dr. *Save* tells us, they will be made to shine very considerably in the Dark, and the Lustre thereof be communicated to adjacent Objects, yet without any Offence to the Skin.

As soon as a Candle is brought in, the Shining disappears, and no Change perceivable.

This *Phosphorus* emits frequent Flashes like Lightning, even when close stopp'd; especially in warm Weather. Hence Mr. *Boyle* takes occasion to draw a Parallel between Lightning and *Phosphorus*.

The second Kind of *Artificial Phosphorus*, is a Preparation of a Stone call'd the *Bolsian Stone*, from a City of that Name in *Italy* which it is found.

The first who undertook to make this Stone luminous, was a Chymist of that City call'd *Vincenzo Casciariolo*.

*Poteras*, *Licetus*, &c. have described the Process, but mistakenly: M. *Homburg*, who made a Journey to *Italy* expressly to learn the Preparation, first communicated the same to M. *Lemery*, who publish'd it in the 7th Edition of his Chymistry. See the Method under the Article *BOLSIAN Stone*.

This *Phosphorus* has not any sensible Heat; and only becomes luminous after being expos'd to the Sun, or the Day-light, when it resembles a burning Coal, and preserves its Light five or six Minutes in the dark, during which Time it dwindles; and to recover its Light must be expos'd afresh to the Air.

The third Kind of *Phosphorus* call'd the *Hermetic Phosphorus* or *Phosphorus Baldaini*, is a Preparation of *English Chalk*, with *Aquafortis* or Spirit of Nitre by the Fire.

This makes a Body considerably softer than the *Bolsian Stone*; but it has all the Qualities thereof.

It has its Name from its Inventor *Baldain*, a *German Chymist*, call'd *Hermes*, in the Society of the *Nature Curiosorum*, whence its other Name *Hermetic*.

Some of the late Chymists have hit on other Sorts of *Phosphori*.

Monk *Homburg*, in a Process upon the Fecal Matter, happening to calcine it with Alum, accidentally produced a new *Phosphorus*, in form of a Powder, the least quantity of which taken out of a close Vessel, and expos'd to the Air upon a Piece of Paper, in a Moment's Time would take Fire, and set the Paper a smoking, and presently burn it or any combustible Matter it came near.

This it would do, equally by Night and Day; and without rubbing or heating, or mixing it with any other thing to promote the Inflammation; in which he observes, it differ'd from all the artificial *Phosphori* hitherto known. For that *e. gr.* of Urine, requires a small Degree of Warmth to enable it to shine, or take Fire; and the *Bolsian Stone*, and *Phosphorus Baldaini* only shine by Day-Light.

In Effect, M. *Lemery* the younger has at length discover'd that there is scarce any Animal or Vegetable Matter but will afford *Phosphorus*.—This he experienced in the Seeds *Farinae*, Honey, Sugar, Leaves, Flowers, Woods, Roots and Oils of divers Plants; the Blood and Flesh of Calves, Sheep, Flies, Worms; the Yolks of Eggs, &c. The human Skull, Bones, Fat, Nails; and the Dung of all Animals.

The principal thing added to all these Matters to make *Phosphorus* of them, is Alum, which is indispensably requisite; nor can any other Salt how near a kin hower hereto, even tho' it yield the very same Principles, be substituted hereto. As to the Means, or the Operation whereby it is to be made, Calcination appears to be the essential Part.

*Physical Cause of the Phenomena of Phosphorus.*

As to the *Rationale* of the Effects, it may be observ'd, that in most of the *Natural Phosphori*, there is a brisk Attraction or Friction concern'd; which we may suppose either to give the minute Parts of the Substance the proper Motion and Agitation necessary to convert them into Fire, if Fire be so producible, (as *Bacon*, *Boyle*, *Newton*, and the generality of the *English Philosophers* have suppos'd it is) or to expel and emit the Particles of Fire naturally contained in them. See *FIRE, FLAME, FRICTION, ATTRITION, &c.*

In the *Falitious* Sorts, we may note, that a long Process by Fire is usually required, wherein the Matter under-

goes divers Coctions, Torrefactions, Calcinations, Distillations, &c. in the Course whereof a considerable Quantity of Fire must necessarily be imbibed, and may possibly be retain'd therein.

In that *e. gr.* prepared of the Fecal Mitter, M. *Homburg* observes, the aqueous Part of the Substance must necessarily have all been evaporated, with the greatest Part of the Oil and volatile Salt, leaving Pores or Vacuities in the Places they possess'd; so that what remains, is a spongy Tissue of Earth and fix'd Salt, having nothing in its Loculi, or Cavities, but some of the Matter of the Fire which has been arrest'd and detain'd therein; such as in Quick-Lime.

This being suppos'd, we know that the fix'd Salt, which is here pretty copious, will readily absorb the Moisture of the contiguous Air; and the sudden Introduction of such Moisture into the Pores of the Powder must produce a Friction, which may excite a small Degree of Heat; and this join'd with what Fire was there already laid up, may make a Heat sufficient to give Fire to the small Remains of Oil too closely link'd with the Salt to have been carried off by the Calcining Fire: So that we have here every thing necessary to Heat and Light. See *HEAT, &c.*

What confirms this Doctrine is, that if the Powder be kept in a Vessel not sufficiently close; the Air, insinuating by Degrees, moistens and saturates the Powder, but so slowly, as not to produce Friction enough to set it on Fire; so that it is spoilt, and disshel from taking Fire ever after: much as Quick-Lime, which after it has lain some time in the Air, ceases to grow hot even by the Affusion of Water.

The Reason why Quick-Lime, which contains a deal of Particles of Fire, as well as our Powder, does not conceive Heat by the Access of the Air, or the Ingress of its Moisture into the Pores thereof, but that Water must be thrown thereon, is, that the Quick-Lime being more thoroughly calcined retains too little fix'd Salt to imbibe the Moisture readily and copiously enough to excite the necessary Friction.

And the Reason why Quick-Lime does not produce a Flame, as the Powder does, even when Water is cast on it, is, that it did not retain enough of the Oily Matter to afford Flame: For if Oil be mix'd with it, a Flame will readily ensue. *Mem. de l'Acad. An. 1711.*

PHOSPHORUS in Astronomy, is the Morning-Star, or the Planet *Venus*, when she goes before the Sun. See *VENUS*.

The *Latins* call it *Lucifer*. The *French*, *Etoile de Berger*. The *Greeks*, *Phosphorus*, from  $\phi\omega\varsigma$ , Light, and  $\psi\phi\omega$  I bear, bring.

PHOTASCIATERICA, a Term some Authors use for the Art of Dialling. See *DIALLING*.

The Names is derived hence, that the Art not only shews the Hours by the Shadows of a Gnomon, whence it is call'd *Sciatrica*, from *scia*, Shadow; but sometimes also by means of the Sun's Light, as in *Spor-Dials*, *Reflecting-Dials*, &c. from  $\phi\omega\varsigma$ , Light. See *DIAL*.

PHOTINIANS, a Sect of ancient Hereticks, who denied the Divinity of *Jesus Christ*. See *HERETICK*.

They took their Name from *Photinus* their Chief, Bishop of *Sirmium*, and Disciple of *Marcellus*.

He maintained, as *Leo* tells us in one of his Sermons, that *Jesus Christ* was true Man, but not true God, nor born before all Ages; that he only began to be *Christ* when the *Holy Ghost* descended upon him; and that he was call'd *only Son*, for no other Reason but because the Virgin had no other.

He was convicted of his Error, and deposed by a Synod of *Arians* held at *Sirmium* in 351.

PHRASE, PHRASES, in Grammar, a certain elegant Fashion or Manner of Speech, peculiarly belonging to this or that Occasion, this or that Art, or this or that Language.

Thus we say an *Italian Phrase*, an *Eastern Phrase*; a *Poetical Phrase*, or *Rhetorical Phrase*. See *IDIOM*.

A few elegant Phrases, pertinently applied, are an Ornament of Discourse; but if they come too thick they have an ill Effect, and make the Style favour of Affectation. See *STYLE*.

The Word *Phrase* is sometimes also used for a short Sentence, or small Set or Circuit of Words constructed together. See *SENTENCE*.

In this Sense *Father Buffier* divides Phrases into *Complete* and *Incomplete*.

*Phrases* are *Complete* where there is a Noun and a Verb, each in its proper Function, *i. e.* where the Noun expresses a Subject, and the Verb the thing affirm'd of it.

*Incomplete Phrases* are those where the Noun and Verb together only do the Office of a Noun; consisting of several Words without affirming any thing, and which might be express'd in a single Word.

Thus, that which is true, is an *incomplete Phrase*, which might be express'd in one Word, *Truth*: as, that which

is true satisfies the Mind; or Truth satisfies the Mind.

**PHRASEOLOGY, PHRASEOLOGIA**, a Collection of the Phrases, or elegant Expressions, in any Language. See **PHRASE**.

**PHRENES**, in Anatomy, the *Diaphragm*. See **DIAPHRAGM**.

It was thus call'd by the Ancients, from *ᾠλή*, Mind; as imagining this the Seat of the rational Soul. Hence

**PHRENESIS, PHRENSY**, or *Distraction*. See **PHRENITIS**.

**PHRENETIC Nerves**, call'd also *Diaphragmatic* and *Stomachic Nerves*, are nervous Branches deriv'd from the Cervical Nerves, which joining in a Trunk, run through the Mediastinum undivided, till arriving near the Diaphragm, they again divide, and send off divers Branches, some into the muscular, others into the tendinous Part thereof. See **NERVE** and **DIAPHRAGM**.

**PHRENIC Vessels**, is a Term applied to a Vein, and some Arteries of the human Body; from their passing through the Diaphragm.

The *Phrenic Artery* arises out of the descending *Aorta*, and distributes itself into the Diaphragm and Pericardium. See **ARTERY**, **AORTA**, &c.

The *Phrenic Veins* are two Veins which the Descending *Cava* receives immediately after its piercing the Diaphragm. See **VEIN CAVA**.

**PHRENITIS, PHRENESIS, PHRENSY**, in Medicine, a constant and vehement Delirium, or Distraction; accompanied with an acute Fever, raving, waking, &c. See **DELIRIUM**.

It differs from the *Mania*, and *Melancholly*, in that these are without Fevers. See **MANIA**, &c.

It has its Name from *ᾠλή*, *Mens*, the Understanding; or as some will have it from *ᾠλή*, the Diaphragm, in regard the Ancients supposed it to have its Seat in that Part. See **DIAPHRAGM**.

Physicians generally make the *Phrenitis* to consist in an Inflammation of the Meninges of the Brain; and distinguish it from the *Paraphrenitis*, which they suppose to be an Inflammation of the Diaphragm. See **PARAPHRENITIS**.

*Willis* will have them the same Disease, and both to consist in an Inflammation of the Animal Spirits. He only distinguishes them as the Inflammation arises from the *Cerebrum* alone, or from the *Cerebrum* and *Cerebellum* together; and concludes, that they both arise after a Fever, from the boiling Blood's throwing its adult Recrements into the Brain.

*Boerhaave* makes the *Phrenitis* either *træ*, wherein the *Cerebrum*, or Meninges, or both, are inflamed; or *symptomatic*, where the Matter of a Fever is transfused into the *Cerebrum*.

The true one either kills on the third, fourth, or fifth, or seventh Day; or changes into a *Mania*, *Lethargy*, *Comus*, &c. Tremors, Gnashing of the Teeth, grumous Blood distilling from the Nose, are Prognosticks of Death.

The Disease is oftent' the Effect of Inflammatory or Malignant Fevers; tho' it sometimes also arises from a Suppression of the natural Evacuations, as the *Menses*, &c.

The Cure is the same as of an *Apoplexy*; but where the Evacuations are concern'd, they must first be rectified. See **APPOPLEXY**.

**PHRYGIAN Mode**, in Music. See **MODE**.

**PHRYGIANS, PHRYGES, or PHRYGASTES**, as S. *Epiphanius* calls 'em, were ancient Heretics, a Branch of the *Montanists*; so call'd from *Phrygia* a Place where they abounded.—They esteem'd *Montanus* their Prophet; and look'd on *Moximilla* and *Priscilla* as great Prophetesses. See **MONTANISTS**.

This Spirit of Prophecy, or rather Enthusiasm, was their distinguishing Character. in the Business of the Trinity they were orthodox.

**PHTHIRIASIS**, in Medicine, the *Morbus Pedicularis*, or Louzy Disease, wherewith Children, and even sometimes Adults are afflicted. See **PEDICULARIS**.

Its Cause is in the Seeds of that Vermin laid in the Cuticle, which here happening to prove a proper *Nidus*, cherishes and softens the Seed so as to hatch it. See **WORMS**.

The Linnen Cloths us'd by Goldsmiths to wipe their Vessels with after gilding, are excellent against the *Phthiriasis* by reason of the Mercury they contain, when applied by rubbing the Child's Head.

The Word is form'd from the Greek *ᾠλή*, Louzy.

**PHTHISIS**, in Medicine, in its general Sense, is any kind of Consumption of the Body, in what part soever it be seated, or from what Cause soever it arise. See **CONSUMPTION**.

Thus we have a *Nervous Phthisis*, *Renal Phthisis*, *Dorsal Phthisis*, *Pulmonary Phthisis*, &c.

But in its proper Sense, *Phthisis* is restrain'd to a *Pulmonary Consumption*, or a Consumption arising from an Ul-

cer or other Disorder of the Lungs, accompanied with a slow hectic Fever, which wastes, extenuates, and consumes the muscular Flesh. See **LUNGS**, &c.

*Sydenham* observes, that the hectic *Phthisis* usually has its Origin in the Winter's Cold; from a sharp Humour trickling down upon the Lungs, where, like a Catarrh, it irritates them so as to raise a Cough. See **COUGH**.

This by degrees brings on other Symptoms; as a spitting, first of a viscid *Spittle*, then a heavy fetid *Pur*, then of pure Blood, and sometimes of the very Substance of the Lungs rotted by a long Exulceration; with Night-Sweats, falling of the Hair, and a colliquative Flux which is soon followed by Death.

The same Author adds, that *Phthisis* kills two thirds of those that die of Chronic Diseases. See **CHRONIC**.

In the last Stage of the *Phthisis* the Nose appears sharp, the Eyes hollow, the Temples fallen, the Ears cold and contracted, the Skin about the Forehead hard and dry, and the Complexion greenish, or livid, &c. which is call'd the *Facies Hippocratica*.

Among the Causes of the Disease may also be reckon'd Intemperance as it brings on a *Plethora* or *Cacoehymia*, *Peripneumonies*, *Asthma's*, *Pleurisies*, &c. *Morton* adds, that the *Phthisis* frequently arises from an ill Conformation of the Breast; which is either *Natural*, as when the Breast is too narrow, the Neck too long, &c. or *Accidental*, where there happens a Curvity or Distortion of the Breast;—among the Symptoms he reckons a *Nausea*, or Reaching, with a Heat in the Palms of the Hands, and Redness in the Cheeks, all after Eating.

For the Cure;—*Sydenham* orders the Defluxion to the Lungs, in the first Stage, to be abated by Blood-letting, &c. and Pectorals to be us'd, accommodated to the various States of the Diseases, viz. *Incrassatives*, *Attenuatives*, to assuage the Hætic, &c. with Emulsions, *Asses-Milk*, &c. and Balsamics, to cure the Ulcer.

But the chief Assistance in this Disease is from riding constantly on Horseback, where the Patient need not confine himself to any Laws of Diet, &c. This alone, he adds, is almost as sure a Cure for a *Phthisis*, as the *Cortex* for an Intermittent Fever. See **EXERCISE**.

*Dr. Boyard* recommends Butter-Milk as an admirable Succedaneum to Asses-Milk.—*Sylvius* lays, he knows of no Medicine, either internal or external, so good against fresh Ulcers of the Lungs, as Balm of Sulphur, especially when prepared with Oil of Anise. See **SULPHUR**.

*Emmeller* observes, that the Cough of *Phthisical* People is at first only Stomachal; at length it becomes Pulmonary. He adds, that Vomitories are good in a beginning *Phthisis*, Purgatives by all means to be avoided; and commands the Use of Medicines made of Tobacco, not only as they promote Expectoration; but as Vulnerary.

'Tis a common Observation, that in those Countries where they burn Turf, People are rarely affected with the *Phthisis*; which *Willis* ascribes to the Sulphur abounding therein, and recommends Tincture of Sulphur as the best Remedy he knows of in any Cough without a Fever; adding, that a Suffumigation, or Smother, of Sulphur and Arsenic has frequently prov'd a Cure in the most desperate *Phthisis*.

*Bonetus* holds the *Phthisis* to be contagious; and that there are frequently Instances of its being communicated by Cloths, Linnen, Beds, &c.

*Pitcairn* recommends *Mercurius Dulcis*, in the Beginning of a *Phthisis*. And *Barbette* and *Culbarch* assert, that, contrary to the Opinion of most Authors, they have frequently us'd Acids with Success in *Phthisis*. See **HECTIC**, &c.

The Word is form'd from the Greek *ᾠλή*, Corruption, Attenuation, &c.

**PHYGETHLON**, in Medicine, is defined by *Celsus*, a hard flat Tumor, somewhat resembling a Pustle; occasioning an intense Pain, and sometimes a Fever. See **TUMOR**.

The *Phygethon* only differs from the *Phyma*, in that it does not rise so high; it ripens very slowly, and produces but little Pus. See **PHYMA**.

The Latins call it *Fomæ*, or *Parasæ*, and sometimes *Panicula*.—*Gorræus* defines the *Phygethon*, a *Phlegmon* arising on the glandulous Parts, especially about the Neck, Armpits, and Inguen; which last is call'd a *Bubo*. See **PHLEGMON**, &c.

The *Phygethon* has the same Causes, and the same Symptoms with the common *Bubo*. See **BUBO**.

It frequently arises after Fevers, and Pains of the Belly, and is cured like other Inflammations.

The Word is derived from the Greek *ᾠλή*, I engender.

**PHYLACTERY**, in Church-History, a Slip of Parchment, wherein was wrote some Text of Holy Scripture, particularly of the Decalogue; which the more devout People among the *Jews* wore on the Forehead, the Breast, or the Neck, as a Mark of their Religion.

In the general, the Ancients gave the Name *Phylactery* to all kinds of Charms, Spells, or Characters which they wore about them, as Amulets, to preserve 'em from Dangers or Disasters. See *CHARM*, *AMULET*, &c.

The Primitive Christians also gave the Name *Phylacteries* to the Frames wherein they inclosed the Relicks of their dead.

*PHYMA*, or *PHYMUS*, in Medicine, a roundish pointed Tumor, arising on the Glandular Parts, especially under the lower Jaw. See *TUMOR*.

The *Phyma* is smaller and smoother, less red and painful, than the *Phygethon*. See *PHYGETHON*.

It is easily cured in Children; more difficultly in Adults, but in those it is more rare. It is remedied by affusing Nature in the Work of Maturation; as, by a suppurating Cataplasm, &c.—It is supposed to have its Rise from a pituitous Blood; and is most common in Children, where it frequently arises from too tight Bandages.

*Gorrux* observes, that some make *Phyma* a general Name for all Tumors, or Apothumes, that mature and suppurate readily, of what kind soever, or in whatsoever glandulous Part they arise. See *APOTHUME*.

*PHYSIC*, or *PHYSICK*, the Art of Healing; properly called *Medicine*.

For the Rise; Progress, Division, &c. of *Physic*; See *MEDICINE*.

The Word is form'd from the Greek *physis*, Nature; in regard Medicine consists principally in the Observation of Nature. See *PHYSICKS*.

*PHYSICAL*, something belonging to, or really existing in Nature. See *PHYSICKS*.

In this Sense we say a *Physical Point*, in opposition to a Mathematical one which only exists in the Imagination. See *POINT*.

A *Physical Substance*, or Body, in opposition to Spirit, or Metaphysical Substance, &c. See *SUBSTANCE*, &c.

*PHYSICAL*, or *sensible Horizon*. See *HORIZON*.

*PHYSICIAN*, a Person who professes Medicine, or the Art of Healing. See *MEDICINE*.

The Ancients distinguished their *Physicians* into various Classes or Sects:—As, *Methodical Physicians*, those who proceeded in a certain regular Method, founded upon Reason; deducing Consequences therefrom, to particular Cases. See *METHODICAL*.

*Dogmatical Physicians*, those who laid down Principles, and reason'd from those Principles, and from Experience. See *DOGMATIC*.

*Empirical Physicians*, those who kept wholly to Experience, and excluded all Use of Reason in Medicine.—Such was *Serapion*, *Apollonius*, *Glaucus*, &c. See *EMPERICAL*.

Again, *Clinical Physicians* were those who visited their Patients a-bed, to examine their Cases. See *CLINIC*.

In opposition to the *Emperists*, who sold their Medicines in the Streets, &c.

They had also their *Astrological Physicians*, *Botanic Physicians*, *Anatomical Physicians*, *Chirurgeons*, *Iatraliptes*, or those who applied external Unctions and Frictions, &c.

*Cosmetick Physicians* for the Complexions; *Ophthalmic Physicians* for the Eyes; *Vulnery Physicians* for Wounds, &c.

Among the Moderns, a general *Physician* includes almost all these several Kinds: Regular *Physicians* are contr'distinguished from *Empirical Physicians*, who prescribe at random; having one or two Remedies which serve in all Diseases. See *EMPERICAL*.

*Galenic Physicians* are those who prescribe gentle, natural and ordinary Medicines. See *GALENICAL*.

*Spagyric* or *Chymical Physicians* are those who prescribe violent Medicines drawn from Minerals, &c. by Fire. See *SPAGYRICAL* and *CHYMICAL*.

*PHYSICKS*, by the *Latin* call'd *PHYSICA*, the *Greeks* *phusika*, and by us frequently *PHYSIOLOGY*, or *Natural Philosophy*, is the Doctrine of Natural Bodies, their Phenomena, Causes, and Effects; their various Affections, Motions, Operations, &c. See *PHILOSOPHY* and *NATURE*.

Mr. *Locke* would likewise have *God*, *Angels*, and *Spirits*, come under *Physicks*, which more usually are refer'd to *Metaphysicks*. See *METAPHYSICKS*.

The Word is derived from *physis*, Nature. See *PHYSIOLOGY*.

The Origin of *Physicks* is refer'd by the *Greeks*, to the Barbarians, viz. the *Brachmans*, *Magi*, and the *Hebrew* and *Egyptian* Priests. See *BRACHMANS*, *MAGI*, &c.

From these it was derived to the *Greek* Sages or *Sophi*, particularly *Thales*, who is said to have first profess'd the Study of Nature in Greece. See *SOPHI*.

Hence it descended into the *Pythagoric*, *Platonic*, and *Peripatetic* Schools; whence it was propagated into *Italy*, and thence thro' the rest of Europe; by the *Druids*, *Bards*, &c. had *Physicks* of their own. See *PYTHAGOREAN*, *PLATONIC*, and *PERIPATETIC*; see also *DRUID*, *BARD*, &c.

*Physicks* may be divided, with regard to the manner wherein it has been handled, and the Persons by whom, into  
1<sup>o</sup> *Symbolical*, such was that of the old *Egyptians*, *Pythagoreans* and *Platonic*; who delivered the Properties of Natural Bodies under Arithmetical and Geometrical Characters, and Hieroglyphics. See *SYMBOL*, *GEOMETRY*, *HEROGLYPHICS*, &c.

2<sup>o</sup> *Peripatetic*, or that of the *Aristotelians*, who explain'd the Nature of things by Matter, Form, and Privation, Elementary and Occult Qualities, Sympathies, Antipathies, Attractions, &c. See *ARISTOTELIAN*, &c.

3<sup>o</sup> *Experimental*, which enquires into the Reasons and Natures of Things from Experiments; such as those in Chymistry, Hydrostaticks, Pneumaticks, Opticks, &c. See *EXPERIMENT*, &c.

This has been much cultivated since the Time of my Lord *Bacon*; and continues to be so, with good Success.

The Experiments of the Academists of *Cambray*, of the Royal Society, of the Royal Academy, and even of private Persons; particularly *Mr. Boyle*, *Sir I. Newton*, *Mr. Hooke*, &c. have been of infinite Service in *Physicks*; and 'tis to these, in great measure, that the Advantage of the modern Philosophy above the ancient is due.

4<sup>o</sup> The *Mechanical* or *Corporeal*, which explains the Appearances of Nature from the Matter, Motion, Structure, and Figure of the Bodies, and their Parts; all according to the settled Laws of Nature and Mechanicks. See *CORPUSCULAR* and *MECHANICAL*.

*PHYSIOGNOMICKS*, a Term used by some Physicians and Naturalists, for such Signs as are taken from the Countenance to judge of the State, Disposition, &c. of the Body and Mind. See *SIGN* and *PHYSIOGNOMY*.

*PHYSIOGNOMY*, the Art of knowing the Humour, Temperament, or Disposition of a Person, from Observation of the Lines of the Face, and the Characters of its Members, or Features.

*Baptista Porta* and *Robert Fludd* are the top modern Authors on *Physiognomy*.—The ancient ones are the *Sophist Adamantius*, and *Aristotle*; the *Physiognomy* of which last we have translated into *Latin* by *de Lacuna*.

The Word is form'd from the Greek *physis*, Nature, and *gnosis*, I know.

There seems to be something in *Physiognomy*; and it may perhaps bear a much purer Philosophy than what these Authors were acquainted with.—This, at least, we dare say, that of all the fanciful Arts of the Ancients, disus'd among the Moderns, there is none has so much Foundation in Nature as this.

There is an apparent Correspondence between the Face and the Mind; the Features and Lineaments of the one are directed by the Motions and Affections of the other: there is even a peculiar Arrangement of the Members of the Face, a peculiar Disposition of the Countenance, to each particular Affection; perhaps to each particular Idea of the Mind. See *PASSION*.

In effect, the Language of the Face, *Physiognomy*, is as copious, nay, perhaps, as distinct and intelligible, as that of the Tongue, *Speech*.—Thanks to bounteous Nature, she has not confin'd us to one only Method of conversing with each other, and of learning each other's Thoughts; we have several: We don't wholly depend on the Tongue, which may happen to be bound; and the Ear, which may be deaf; but in those Cases we have another Recourse, the Countenance and the Eye; which afford us this further Advantage, that by comparing the Reports of the Tongue, (a Member exceedingly liable to deceive) with those of the Face, the Prevarications of the former may be detected.

The Foundation of *Physiognomy* is this: The different Objects that present themselves to the Senses, nay, the different Ideas that arise in the Mind, do each make some Impression on the Spirits; and each an Impression correspondent or adequate to it's Cause; therefore each a different Impression.

If it be ask'd how such an Impression should be effect'd; 'tis easy to answer, that it follows from the Economy of the Creator, who has fix'd such a Relation between the several Parts of the Creation; to the end we may be apprized of the Approach or Retreat of things useful or hurtful to us.

If this be't philosophical enough, take the manner in the *Cortican* Language, thus: The Animal Spirits moved in the Organ by an Object, continue their Motion to the Brain; whence that Motion is propagated to this, or that particular part of the Body, as is most suitable to the Design of Nature; having first made a proper Attention in the Face, by means of its Nerves, especially the *Pathetic* and *Ocularum Mastoideum*.

The Face, here, does the Office of a Dial-Plate; the Wheels and Springs within-side the Machine actuating its Muscles, shew what is next to be expected from the striking Part. Not that the Motion of the Spirits is continu'd all the Way by the Impression of the Object; the Impression

bably terminates in the Medulla of the Brain; the common Fund of Spirits; the rest Dr. *Swiber* imagines may be effected much after the same manner as the Air is convey'd into the Pipes of an Organ, which being uncover'd, the Air rushes in, and when the Keys are let go stopp'd again. See CONSENT of Parts.

Now if by repeated Acts, or the frequent entertaining of a favourite Passion, or Vice, which natural Temperament has hurried one to, or Custom dragg'd; the Face is often put in that Posture which attends such Acts; the Animal Spirits will make such patent Passages thro' the Nerves, (in which the Essence of a Habit consists; see HASTITUDE); that the Face is sometimes unalterably set in that Posture; (as the *Indian* Religions are by a long continued sitting in strange Postures in their Pagods) or at least falls insensibly and mechanically into that Posture, unless some present Object disport it therefrom, or Dissimulation hide it. See FACIET.

This Reasoning is confirm'd by Observation: Thus we see great Drinkers, with Eyes generally set to the Nose; the adreduct Muscles being oft employ'd to put 'em in that Posture, to view their lov'd Lignor in the Glass in the time of Drinking; whence those Muscles are also denominated the *ibitory Muscles*.

Thus also lascivious Persons are remarkable for the *Oculorum morbus petalonia*, as *Petrionius* calls it.

Hence we may account for the *Quakers* expecting Face, waiting the Spirit; the melancholly Face of most Sectaries; and the studious Face of Men of great Application of Mind, &c.

Were our Observation a little more strict and delicate, we might doubtless not only distinguish Habits, and Tempers but even Professions.—In effect does there need much Penetration to distinguish the fierce Look of the veteran Soldier, the contentious Look of the practis'd Pleader, the solemn Look of the Minister of State, &c.

PHYSIOLOGY, the Doctrine of Nature, or Natural Bodies; call'd also *Physicks*, and *Natural Philosophy*. See PHYSICKS, &c.

The Word is form'd of *φύσις*, Nature, and *λόγος*, Discourse, Reason.

It is to be observ'd, that the Word *Physiology* properly denotes only an internal reasoning or discoursing, which stops or terminates in the Speculation, or abstract Contemplation of its Object, viz. Natural Appearances, their Causes, &c. and does not direct or prescribe Rules for the making of natural things, as, gr. Stones, Plants, &c.

In this View Chymistry does not properly belong to *Physiology*, but is a kind of a counter-part thereto, as imitating or mimicking Nature, rather than considering and explaining her. See CHYMISTRY.

PHYSIOLOGY is particularly used for a Branch of Medicine, which considers Nature with Regard to the Cure of Diseases; particularly the human Body, its Parts, Structure, Health, Life, Functions, Oeconomy, &c. See MEDICINE.

*Physiology*, in this Sense, is the same with what we otherwise call the Doctrine of *Animal Oeconomy*. See OECONOMY.

PHYTOLOGY a Discourse upon Plants; or a Description of their Forms, Kinds, Properties, &c. See PLANT.

The Word is compounded of the *Greek* *φύσις*, Plant, and *λόγος*, Discourse, or *λόγος*, *seribere*, I describe, rehearse.

PIA Mater, in Anatomy, call'd also *Mater tenuis*, and *Mening tenuis*, a fine Coat, or Membrane, immediately investing the Brain. See MATER, MENING and BRAIN.

PIACHE, PIAZZA, a cover'd arch'd Walk, or Portico. See PORTICO and PIAZZA.

PLASTER, a *Spanish Money*, more ordinarily call'd *Piece of Eight*. See PIECE of Eight.

PIAZZA, in Building popularly call'd *Pioche*, an *Italian* Name for a Portico. See PORTICO.

The Word literally signifies a broad open Place, or Square; whence it became applied to the Walks, or Portico's around them.

PICA, in Medicine, call'd also *Malacia*, a Depravation of Appetite, which makes the Patient absurdly cover things unfit for Food, or incapable of nourishing; as, Coals, Ashes, Plaster, Salt, Lime, Chalk, Vinegar, Pepper, &c. See APPETITE.

The *Pica* is frequent in Girls, and Women with Child; Men are more rarely affected with it.—The Disorder is seldom original; but usually an Effect of an Hypochondriacal Infirmary in Men; and a Chlorosis, Stoppage of the Menstrues, or their Eruption about the second Month of Pregnancy, in Women: Sometimes it is hereditary in Children, from some Cause affecting the Mother. See MONSTER.

The Disease is usually supposed to have its Rise from a vitious Ferment of the Stomach; to which may be added Disorders of the Imagination, occasioned by ill Examples and ridiculous Prejudices. See IMAGINATION.

In the *Philosophical Transactions*, Dr. *Fairfax* gives us an Instance of a Woman in *Scow Market*, who was invited by

her *Pica* to suck the Wind out of Bellows; which as often as the cou'd be took into her Body with open Mouth, forcing it in by blowing with both Hands, the Bellows inverted.—He adds, he knew another in the same Circumstances whom nothing would satisfy but cracking Cinders under her Feet.

Something like this has also been found in Brutes.—The last mentioned Author mentions a Greyhound Bitch, who 5 or 6 Days before casting her Whelps, long'd for another Bitch's Whelps, and eat them all up, and would have eat the Bitch herself. Thus it is that Sows are sometimes known to eat up whole Litters of Pigs.

The usual Remedies in the *Pica* are Bleeding, Purgings, Vomiting, and Cholybeats.

PICA, in Printing, See PRINTING Letter.

PICARDS, a Religious Sect, who arose in *Bohemia*, in the XVth Century; so call'd from their Author, one *Picard*.

He drew after him a great Number of Men and Women, pretending he would restore them to the primitive State of Innocence wherein *Adam* was created; and accordingly himself assumed the Title of the *New Adam*.

Under this Pretence he taught his Followers to abandon themselves to all Impurity; making them believe that therein consisted the Liberty of the Sons of God; and that all those not of their Sect were in Bondage.

He first began in *Germany*, and the *Low Countries*; persuading many to go naked, and giving them the Name of *Adamites*.—After this, seizing an Island, he fix'd himself and his Followers therein; appointed his Women to be common, but allowed none to enjoy them without his Permission. So that when any Man desired a Woman he carried her to *Picard*, who gave him leave in these Words, *Go, increase, multiply and fill the Earth*.

At length, *Zisca*, the Great General of the *Hussites*, so famous for his Victories over the Emperor *Sigismund*, struck with their Abominations, march'd against them; and making himself Master of their Island, put them all to Death, except two, whom he spared to inform himself of their Doctrine.

PICKAGE, or PICKAGE, from the *Latin Pica*; an ancient Custom, or Duty, paid at Fairs and Markets, for breaking the Ground and pitching up Stalls, or Standings.

This Profit of *Picage* was usually given or granted in Charters for holding a Fair, or Market.

PICKET, or PICKET, or PICKET, in Fortification, a Stake sharp at one End, and usually shod with Iron; used in laying out the Ground, to mark the several Measures and Angles thereof.

There are also larger *Pickets*, drove into the Earth to hold together Fascines, or Faggots, in any Work cast up in haste.

PICKETS are also Stakes drove into the Ground by the Tents of the Horse, in a Camp, to tie their Horses to; and before the Tents of the Foot, where they rest their Muskets or Pikes round about them in a Ring.

When an Horseman hath committed any considerable Offence, he is often sentenced to stand on the *Picket*; which is to have one hand drawn up as high as it can be stretch'd, and thus to stand on the Point of a *Picket*, or Stake, only with the Toe of his opposite Foot; so that he can neither stand or hang well, nor ease himself by changing Feet.

PICKETS are also Stakes with Notches towards the Top, to which are fastened the Cordages of Tents.—Thus, to *pitch the Picket*, is to encamp.

PICKET in Gaming. See PICQUET.

PICKLE, a Brine, or Liquor, ordinarily compos'd of Salt, Vinegar, &c. sometimes with the Addition of Spices, &c. wherein Meats, Fruits, &c. are preserv'd and season'd.

PICKLE is also used substantively for a Fruit, Root, Leaf, or other Vegetable Matter, prepared in *Pickle*, to be used by way of Sauce, &c.

They *pickle* Artichokes, Mushrooms, Ashen-Keys, Berberies, Alparagans, Beans, Broom-Buds, &c.

PICQUEERING, PICKERING, or PICKERONING, a little flying War, or Skirmish, which the Soldiers make when detach'd from their Bodies, for Pillage, or before a main Battle begins.

PICQUET, or PICKET, a celebrated Game at Cards, in Use throughout the polite World. See GAME and CARDS.

It is play'd between two Persons, with only thirty two Cards; all the Daces, Threes, Fours, Fives, and Sixes, being let aside.

In reckoning at this Game every Card goes for the Number it bears, as a Ten for ten; only all Court-Cards go for eleven, and the Ace for ten: And the usual Game is 100 up.—But in playing, the Ace wins the King, the King the Queen, and so down.

Twelve Cards are dealt around, usually by two and two; which done, the Remainder are laid in the middle: If one of the Gamesters find he has not a Court-Card in his Hand, he is to declare he has *Carte blanche*, and tell how many Cards he will lay out, and desire the other to discard, that

he may shew his Game, and satisfy his Antagonist that the *Carte blanche* is real; for which he reckons ten.

Each Person discards *i. e.* lays aside a certain Number of his Cards, and takes in a like Number from the Stock.—The first, of the 8 Cards, may take 5, 6, or 7; the Dealer, and the Remainder if he pleases.

After discarding, the eldest Hand examines what Suit he has most Cards of; and reckoning how many Points he has in that Suit; if the other have not so many in that or any other Suit he tells one for every Ten of that Suit.—He who thus reckons most is said to win the *Point*.

The Point being over, each examines what Sequences he has of the same Suit, *viz.* how many *Tierces*, or Sequences of three, *Quartes* or fours, *Quintes* or fives, *Sixtiemes* or six, &c. For a Tierce they reckon three Points, for a Quart four, for a Quinte fifteen, and for a Sixieme sixteen, &c. And the several Sequences are distinguished in Dignity by the Cards they begin from: Thus, Ace, King, and Queen, are call'd Tierce major; King, Queen, and Knave, Tierce to a King; Knave, Ten, and Nine, Tierce to a Knave, &c. and the best Tierce, Quart, or Quint, *i. e.* that which takes its Descent from the best Card, prevails; so as to make all the others in that hand good, and destroy all those in the other hand.—In like manner a Quart in one hand sets aside a Tierce in the other.

The Sequences over, they proceed to examine how many Aces, Kings, Queens, Knaves, and Tens, each holds; reckoning for every three of any sort, three: But here, too, as in Sequences, he that with the same Number of Threes, has one that is higher than any the other has, *e. g.* 3 Aces, has all his others made good hereby, and his Adversary's all set aside.—But four of any sort always set aside three.

All the Game in Hand being thus reckoned, the Eldest proceeds to play; reckoning one for every Card he plays above a Nine; and the other follows him in the Suit; and the highest Card of the Suit wins the Trick.—Note, unless a Trick be won with a Card above a Nine, (except the last Trick) nothing is reckon'd for it; tho' the Trick serves afterwards towards winning the Cards: And that he who plays last does not reckon for his Cards unless he wins the Trick.

The Cards being play'd out, he that has most Tricks reckons ten for winning the Cards.—If they have Tricks alike neither reckons any thing.—The Deal being finish'd, and each having mark'd up his Game, they proceed to deal again as before, cutting afresh each time for the Deal.

If both Parties be within a few Points of being up, the *Carte blanche* is the first thing that reckons; then the Point; then the Sequences; then the Threes; then the tenth Cards.

He that can reckon 30 in hand, by *Carte blanche*, Points, Quintes, &c. without playing, 'er the other has reckon'd any thing, reckons ninety for them—and this is call'd a *Regique*;—if he reckons above 30, he reckons so many above 90.

If he can make up 30 part in hand and part by play, 'er the other has told any thing, he reckons for them 60.—And this is call'd a *Pique*. Whence the Name of the Game.

He that wins all the Tricks, instead of 10, which is his Right for winning the Cards, reckons 40,—and this is call'd a *Capot*.

**PICTSWALL**, in Antiquity, a famed Piece of Roman Work, begun by *Adrian* the Emperor, on the Northern Bounds of England, to prevent the Incurfions of the *Pills* and *Scots*. See **WALL**.

At first it was made only of Turf, strengthened with Palisadoes; till the Emperor *Severus*, coming in Person into Britain, built it with solid Stone, reaching eighty Miles in Length, from the *Iris* to the *German Sea*, or from *Carlisle* to *Newcastle*; with Watch-Towers garrison'd at the Distance of a Mile from each other.

It was ruined several Times by the *Pills*, and often repaired by the *Romans*.—At last *Attila*, a Roman General, rebuilt it of Brick; and the *Pills* ruining it the Year following, it was no longer regarded, but as a Boundary between the two Nations.

The Wall was eight foot thick, and twelve high from the Ground; it run on the Northside of the Rivers *Tyne* and *Irling*, up and down several Hills; the Tract or Remains of it is to be seen this Day in many Places both in *Cumberland* and *Northumberland*.

**PICTURE**, a Piece of Painting; or a Subject, represented in Colours, on Canvas, Wood, or the like, and inclosed in a Frame. See **PAINTING**.

**PIE-POUNDER-COURT**, an ancient Court, mention'd in many of our Statutes, to be held in Fairs; for the rendering of Justice to Buyers and Sellers; and the Redress of Grievances arising therein. See **FAIR**.

It had its Name either because most ordinarily held in Summer, and the that Suiters heret were chiefly Country-Clowns, with dusty Feet, call'd by the French, *pieds poudrez*; or from the Expedition intended in the hearing of Causes

proper thereto; 'er the Dust went off the Plaintiff and Defendant's Feet.

The *Sevens* called it *ceajung-xemot i. e.* a Court of Merchandise; or for the Decision of Disputes relating to buying and selling.—*Deffor* and *Student* observe that it is only held during the Continuance of the Fairs, &c.

**PIECE**, in Commerce, signifies, sometimes, a whole; and sometimes, only a Part of a whole.

In the first Sense, we say, a Piece of Cloth, of Velvet, &c. meaning a certain Quantity of Yards, regulated by Custom; being yet entire and not cut. See **CLOTH**.

In the other Signification we say, a Piece of Tapstry, meaning a distinct Member wrought a-part, which with several others make one Hanging. See **TAPESTRY**.

A Piece of Wine, of Cyder, &c. is a Cask full of those Liquors.

**PIECE**, in matters of Money, signifies, sometimes, the same thing with *Species*; as when we say this Piece is too light, &c. See **SPECIES**.

Sometimes, by adding the Value of the Species, 'tis said to express such as have no other particular Name; as, a Piece of 8 Rials, a Piece of 25 Sols, &c.

In England the Piece is sometimes used for twenty Shillings Sterling; and sometimes for a Guinea. See **GUINEA**, and **POUND**, and **STERLING**.

**PIECE of Eight**, or *Pistole*, is a Silver Money, first struck in Spain, afterwards in other Countries; and now current in most Parts of the World. See **COIN**.

It has its Name *Piece of Eight*, or *Rial of Eight*, because equal to 8 Silver Rials. See **RIAL**.

Its Value is nearly on the same Foot with the French Crown; *viz.* 4*l.* 6*s.* Sterling.—In 1687, the Proportion of the simple Rial to the Pistole was changed; and in lieu of 8 Rials they gave 10.—At present the Reduction is on its ancient Standard.

There are two kinds of Pistoles or Spanish Crowns; the one struck at *Porto*, the other at *Mexico*: These latter are a little Matter heavier than the former, but in return they are not quite so fine.

The *Piece of Eight* has its Diminutions; *viz.* the Demi-Pistole, or Piece of 4 Rials; the Quarter, or Piece of 2; the half Quarter, and the Sixteenth.—The Exchange between Spain and England is made in Pieces of Eight. See **EXCHANGE**.

**Piece**, is also a kind of Money of Account, or rather a manner of accounting used among the Negroes of the Coast of *Angola* in *Africa*. See **MONEY**.

The Price of Slaves, and other Commodities, here negotiated, as also the Duties paid the petty Kings, are estimated on both sides in Pieces.

Thus, these Barbarians require 10 Pieces for a Slave; the Europeans in like manner value the Money, or Merchandise, to be given in Exchange, in Pieces. See **COMMERCE**.

Ten Aniboles, *e. g.* are 1 Piece; a Barrel of Powder of ten Pounds, 1 Piece; a Piece of blue Salempouris, 4 Pieces; ten brass Balons, 1 Piece.

**PIECE**, in Heralry, is an Ordinary, or Charge. See **ORDINARY**.

The honorable Pieces of the Shield are the Chief, fess, bend, pal, bar, Crois, Saltier, Chevron; and in general all those which may take up one third of the Field, when alone, in what manner so ever it be.

**PIECES**, in the Military Art, are Cannons, or great Guns, used at Sieges, &c. call'd Pieces of Ordnance, battering Pieces, &c. See **ORDNANCE**, **CANNON**, &c.

*Field-Pieces* are those placed in the Front of an Army, &c. See **FIELD-PIECES**.

**PIEDOUCH**, in Architecture, a little Stand, or Pedestal, either long or square, enrich'd with Moulding; serving to support a Bust, or other little Figure. See **PEDESTAL**, **BUST**, &c.

The Word is French; form'd from the *Italian*, *peduccio*, little foot.

**PIEDROIT**, in Architecture, a *Pier*; or a kind of square Pillar, part whereof is hid within a Wall. See **PIER** and **PILLAR**.

The only thing wherein it differs from a Pilaster, is, that the latter has a regular Base and Capital, which the other wants. See **PILASTER**.

**PIEDROIT** is also used for a *Peer*, or Jamb of a Door, or Window; comprehending the Chambrant, Chamfering, Leaf, &c. See **DOOR**, **WINDOW**, &c.

**PIERCED**, in Heralry, is when an Ordinary is perforated, or struck through, shewing, as it were, a Hole in it.

This *Piercing* is to be expressed in Blazon, as to its Shape: Thus if a Crois have a square Hole, or Perforation in the Center, it is blazon'd, *Square Pierced*, which is more proper than quarterly pierced, as *Leigh* expresses it; and accordingly the French call it *Percle en quare*.—When the Hole, or Perforation, is round, it must be expressed *Round Pierced*; which *Gibson*, in Latin calls *Perforation*, because all Holes made with Piersers, or Augers, are round.—If the Hole in the

Center be in the Shape of a Lozenge, it is expressed *Pierced Lozenge way*.

All Piercings must be of the Colour of the Field, because the piercing implies the showing of that which is under the Ordinary, or Bearing.—Tho' when such Figures appear on the Center of a Cross, &c. of another Colour, the Cross is not to be supposed *pierced*, but that the Figure on it is a Charge, and must be accordingly blazoned. See CROSS, &c.

**PIEACED**, among Farriers, to *pierce a Horse's Shoe leam*, is to pierce it too near the Edge of the Iron.—To *pierce it far*, is to pierce it further in.

**PIES**, in our ancient Law Books. *Freres Pies*, were a sort of Monks, so called because they wore black and white Garments, like Magpies.—They are mentioned by *Walsingham*, p. 124. *In quodam veteri cimiterio, quod fuerat quondam fratrum, quos Freres pies veteres appellabant.*

**PIESTRUM**, *piestrer*, an Instrument wherewithal to beat in pieces the Bones of the Head, in drawing a Child out of the Womb.

**PIETANTIA**, a *Pittance*; or Portion of Victuals distributed to the Members of a College, upon some great Festivals. See *PITANCE*.

**PIETISTS**, a Religious Sect lately sprang up among the Protestants of Germany.

The *Pietists* seem to be a kind of mean, between the Quakers of England, and the Quietists of the Romish Church. See *QUIETISM* and *QUAKER*.

Their Author was *Spenerus*, from whom they learnt to despise all Ecclesiastical Polity, all School Theology, all Forms and Ceremonies; and to give themselves up to Contemplation and the mystic Theology. See *MYSTIC*.

The *Pietists* are esteemed *Adiaphorists*, or indifferentists, i. e. in the German way of talking, they receive and allow of all Sects among Protestants, particularly the *Calvinists*; contrary to the Practice of other *Lutherans*.—Hence a *Lutheran* of *Danzick* defines *Pietism* an Assemblage of the Hypotheses, or Systems, of *Anabaptists*, *Schwartzfeldians*, *Weigelians*, *Rabbinians*, *Lohdists*, *Quakers*, &c. who under Pretence of a new Reformation, and in hopes of better Times, let aside the *Augsburg* Confession.

The same Author charges them not only with Schism, but with Heresy; in that they believe with the *Donatists*, that the Effect of the Sacraments depends on the Piety and Virtue of the Minister; that Creatures are Emanations from the Substance of God; that a State of Grace is a real Possession of the Divine Attributes, and a true Deification; that one may be united to God, tho' he deny the Divinity of *Jesus Christ*; that all Error is innocent, provided the Will be but sincere; that Preventing-Grace is natural, and that the Will begins the Work of Salvation; that one may have Faith without any Supernatural Assistance; that all Love of the Creature is original; that a Christian may avoid all Sin; that one may enjoy the Kingdom of God in this World.

These things we find charg'd on the *Pietists*, in a Book intitled, *Manipuli Objectionum Antipietisticarum*.—Indeed this looks like polemical Exaggeration, at least 'tis certainly too with regard to a good part of them.

In effect there are *Pietists* of several kinds; some are in gross Illusions, and carry their Errors to the overturning a good part of the Christian Doctrine; others are only visionaries; and others very honest good People, who disgusted with the Coldness and Formality of other Churches, and charm'd with the fervent Piety of the *Pietists*, are attach'd to their Party, without giving into the greed of their Errors.

**PIG of Lead**. See *FOTHER* and *LEAD*.

**PIGER Hewicum**, *Sloshful Henry*, a slow distilling Chymical Furnace; call'd also *Athamor*. See *ATHANOR* and *FURNACE*.

**PIGMENTS**, *PIGMENTA*, Preparations used by Painters, Dyers, &c. to impart Colours to Bodies, or to imitate particular Colours. See *COLOUR*.

When Glass is stained, or coloured, as in Painting on Glass, or for the counterfeiting of Gems, or Precious Stones; the *Pigment* is usually of a Metalline, or a Mineral Nature. See *ENAMEL*; see also *PAINTING on Glass*.

**PIGMY**, or *PYGMY*, *μυσα*, the Length, or Extent, between the Elbow and the Extremity of the Hand; the Fifth being shut; popularly call'd *Cubit*. See *CUBIT*.

Hence the Name has pass'd to a diminutive People of *Thrace*, much talk'd of in old Authors; said to have generated at five Years of Age, and to have been old at eight; famous for their War with the *Cranes*, which makes the Subject of a fine *Latin* Poem of Mr. *Addison*.

The Word is derived from the Greek *μυσα*, *Cubit*.

**PIKE**, an offensive Weapon, consisting of a Shaft of Wood, twelve or fourteen Foot long; headed with a flat, pointed Steel.

The *Pike* was a long time in use in the Infantry, to enable them to sustain the Attack of the Cavalry; but is now taken from them, and the Bayonet, which screws on at the End of the Carbine, substituted in its Place.

Yet the *Pike* still continues the Weapon of Foot-Officers, who fight *Pike* in hand, salute with the *Pike*, &c.

*Pliny* says the *Lacedaemonians* were the Inventors of the *Pike*.—The *Macedonian Phalanx* was a Battalion of *Pikemen*. See *PHALANX*.

The Name *Pike* is said to be derived from a Bird call'd by the French *Pie*, by us Wood-Pecker, whose Bill is so sharp as to pierce Wood like an Ager.—*Du Cange* derives it from the base *Latin* *Pica*, or *Picca*, which *Tharbins* supposes to have been so call'd *quasi Spica*, because resembling a kind of Ear of Corn. *Olivarius Ferrarius* derives it a *spicalo*.

M. *Faucher* says, 'tis the *Pike* gave Name to the *Picards*, and *Picardy*, which he will have to be modern, and to have been given on occasion of that People's renewing the use of the *Pike*, the Etymology whereof he fetches from the French *piquer*, to prick; others will have the Name *Picard* to have been given that People by reason of their Readiness to pick Quarrels; call'd in French *Piques*.

**PIKE**, in Commerce.—To *trade with the Pike*, à la *pique*, is a kind of Commerce which the Europeans hold with certain savage Nations, wherein they are to keep on their Guard, and as it were Sword in Hand.—Thus it is we treat with the Savages of *Canada*, &c. and some Negroe Nations on the Coast of *Africa*.

*Trading with the Pike*, is also a kind of prohibited Traffic which the English and Dutch maintain in several Parts of the Spanish West Indies, near the Colonies which those two Nations have in the *Caribbee* Islands.

Perhaps it should be call'd *Trading at the Pike*, i. e. the Vessel at Anchor; in regard this Commerce, which is prohibited on Pain of Death, is only practis'd in Roads where Vessels lie at Anchor, waiting for the Spanish Merchants, who sometimes by Stealth, more frequently with the Connivance of the Governors, &c. come to exchange their Gold Pieces of Eight, *Cochineal*, &c. for the European Merchandizes.

Some will have it *trading at the Pike*, i. e. at a *Pike's* Length, or Distance; by reason of the Distance Strangers are obliged to keep at. See *COMMERCE*.

**PILA** or **PILUS**, among our ancient Writers, denotes the Arms-side of a Piece of Money. The Denomination arose hence, that anciently this Side bore an Impression of a Church built on Piles. *Fleta lib. 1. cap. 29. He who brings an Appeal of Robbery or Theft against another, must show the certain Quantity, Quality, Price, Weight, Number, Measure, Valorem & Pilum*; where *Pilum* signifies *figuram Monetae*.

**PILA**, *Peer*, in Building, a Massive of Masons Work in manner of a Pillar; usually hexagonal. See *PEER*.

Such are those serving as *Fulcrs*, to separate and support the Arches of a Stone Bridge, or the Beams of a wooden Bridge.

The *Peers* of a Stone Bridge are not to be less than one sixth Part of the Arch, nor more than a fourth. See *BRIDGE*.

The Word comes from the *Latin*, *Pila*, said in the same Sense by *Virrovius*; and this, probably, from *πίλος*, *coqis*, *coarctis*.

*Evrius* observes, that *Pile* and their *Quidras*, as we see them in ancient Altars and Monuments, were used for Inscriptions; but the shorter and more massy serve for Arches and Buttresses to solid Work.—They were sometimes made half circular: But the Ancients prefer'd those pointed at right Angles, as best able to resist the Current.

**PILASTER**, in Architecture, a square Column, sometimes insulated, but more frequently let within a Wall, and only shewing a fourth or fifth Part of its Thickness. See *COLUMN*.

The *Pilaster* is different in different Orders; it borrows the Name of each Order, and has the same Proportions and the same Capitals, Members, and Ornaments, with the Columns themselves. See *ORDER*.

*Pilasters* are usually without either Swelling or Diminution, as broad at top as at the bottom; tho' some of the modern Architects, as M. *Mansard*, &c. diminish them at top, and even make them swell in the middle, like Columns; particularly when placed behind Columns. See *DIMINUTION*.

*Pilasters*, M. *Perrault* observes, like Columns, become of different Kinds, according to the different Manner wherein they are applied to the Wall.—Some are wholly detach'd, call'd by *Virrovius*, *Parastatae*; others have three Faces clear out of the Wall; others two; and others only one; all call'd by *Virrovius*, *Antae*. See *ANTA* and *PARASTATA*.

Insulate *Pilasters* are but rarely found in the Antique.—The chief Use they made of *Pilasters* was at the Extremities of Portico's, to give the greater Strength to the Corners.

There are four principal Things to be regarded in *Pilasters*; viz. their Projecture out of the Wall, their Diminution, the Disposition of the Entablature when it happens to be common to them and to a Column, and their Fluting and Capitals.

1<sup>o</sup> Then, the Projecture of *Pilasters* which have only one Face out of the Wall, is to be one eighth of their Breadth; at most not above one sixth. When they receive Impacts against

against their Sides, the Projecture may be a Quarter of their Diameter. See PROJECTURE.

2<sup>d</sup> *Pilasters* are but seldom diminish'd, when they have only one Face out of the Wall.—Indeed where they stand in the same Line with Columns, and the Entablature is continued over both, without any Break, the *Pilasters* are to have the same Diminution with the Columns; that is to say, on the Face respecting the Column; the Sides being left without any Diminution.

3<sup>d</sup> *Pilasters* are sometimes fluted, tho' the Columns they accompany be not; and, on the other hand, the Columns are sometimes fluted, when the *Pilasters* that accompany them are not.

The Flutings of *Pilasters* are always odd in Number, except in half *Pilasters*, meeting at inward Angles; where four Flutings are made for three, &c. See FLUTING.

4<sup>d</sup> The Proportions of the Capitals of *Pilasters*, are the same as to Height with those of Columns, but differ in Width, the Leaves of the former being much wider, because *Pilasters*, tho' of equal Extent, have only the same Number of Leaves for their Girt, viz. Eight.—Their usual Disposition is to have two in each Face, in the lower Row, and in the upper Row one in the middle, and two halves in the Angles, in the Turns whereof they meet.—Add to this, that the Rim of the Vase or Tambour is not frust as the lower Part is, but a little circular and prominent in the middle. See CAPITAL, &c.

In *Pilasters* that support Arches, the Proportions, *Palladio* shews, must be regulated by the Light they let in; and at Angles, by the Weight they are to sustain. For which Reason, says Sir Henry Wotton, a rustic Superficies best becomes them.

PILASTER-Brick. See BRICK.

PILCHARD Fishing. See PILCHARD FISHING.

PILE, in Antiquity, a Pyramid built of Wood, whereon were laid the Bodies of the deceased, to be burnt. See BURNING; see also FUNERAL, BURNING, &c.

PILE is also used in Building, for great Stakes ram'd into the Earth for a Foundation to build upon in marshy Ground. See FOUNDATION; see also PALLIFICATION.

*Amsterdam*, and some other Cities are wholly built upon Piles. The Stoppage of *Dogenham-Breach* is effected by Dove-tail Piles, i. e. Piles mortis'd into one another, by a Dove-tail Joint. See DOVE-TAIL.

PILE is also used, among Architects, for a Mass, or Body, of Building.

PILE, PILEA, in Coinage, is the Punchion, or Matricle, which, in the old way of coining with the Hammer, contained the Arms, Cross, or other Figures and Inscriptions, to be struck for the Reverse of the Species. See COIN and SPECIES.

Accordingly we still call the Arms Side of a Piece of Money, the *Pile*, and the Head the *Cross*; because in the ancient Monies, a Cross usually took the Place of the Head in ours. See COINING.

Hence the Game of *Cross* and *Pile*.

Some will have it call'd *Pile*, *Pila*, because on this side, in our ancient Coins, there was an Impression of a Church built on Piles.—In some ancient Writings *Pila* is used to signify the particular Figure or Impression of Money.—Thus *Fleta*; *He who bring an Appeal of Robbery, or Theft, against another, must shew the certain Quantity, Quality, Price, Weight, Number, Measure, Value, and Pile*.

PILE, in Heraldry, an Ordinary, in form of a Point inverted, or a Stake sharpen'd; contrasting from the Chief, and terminating in a Point towards the Bottom of the Shield, somewhat in manner of a Wedge.

It is form'd probably in Imitation of the *Roman Pila*, which was a tapering Dart about five Feet long, and sharpen'd at the Point with Steel.

The *Pile* is born inverted, engrailed, &c. like other Ordinaries, and issues indifferently from any Point of the Verge of the Escutcheon.—*He beareth a Pile Gules, by the Name of Chandois*.

PILES, in Medicine, a Disease, by Physicians, call'd *Hæmorrhoids*. See HÆMORRHOIDS.

PILETTUS, in our ancient Forest Laws, *Et quod Forestarius sui non portabat sagittas barbatus sed pilettos*. *Christo Rogeri de Quincy*: where the Word imports such Arrows as had a round Knob a little above the Head, to hinder them from going far into the Mark; from the Latin *Pila*, which signifies any round thing like a Ball.

PILGRIM, PELORIM, of the *Teutonic Pilgrim*, the *French Pelerin*, or the *Italian Pellegrino*, of the *Latin Peregrinus*, one who travels thro' foreign Countries to visit holy Places, and to pay his Devotion to the Reliques of dead Saints.

The Humour of going on Pilgrimage anciently prevail'd exceedingly; particularly about the Time of the *Croisades*. See *CROISADE* and *CROISE*.

Several of the principal Orders of Knighthood were establish'd in Favour of *Pilgrims* going to the *Holy Land*, to fe-

care them from the Violences and Infaits of the *Saracens* and *Arabs*, &c. such as the Order of the *Knights Templars*, the *Knights Hospitallers*, *Knights of Malta*, &c. See ORDER, *TEMPLAR*, *MALTA*, &c.

PILLAGE, among Builders, is sometimes used for a square Pillar, standing behind a Column to bear up the Arches; having a Base and Capital as a Pillar has. See PILLAR.

PILLAR, in Architecture, a kind of irregular Column; round and insulad; deviating from the Proportions of a just Column. See COLUMN.

*Pillars* are always either too massive or too slender for a regular Architecture. In effect, *Pillars* are not restrained to any Rules; their Parts and Proportions are arbitrary.

Such e. g. are the *Pillars* which support *Gothic* Vaults and Buildings, &c.

A square *Pillar* is a massive Work, call'd also a *Peer* or *Piedroit*, serving to support Arches, &c. See *PEER* and *PIEDROIT*.

*Butting Pillar* is a *Bottress*, or Body of *Malonry*, rais'd to prop or sustain the Shooting of a *Vault*, *Arch*, or other Work. See *BUTTRESS*.

PILLAR, in the *Manage*, signifies the Centre of the *Volts*, *Ring*, or *Manage-Ground*, round which a *Horse* turns; whether there be a wooden *Pillar* placed therein or not.

There are also other *Pillars* in *Manages* on the Circumference or Side; placed at certain Distances by two and two.—To distinguish these from that of the Center, they are call'd the *two Pillars*.

When these latter are spoken of, it is usual to say, *Work the Horse between the two Pillars*.—When the former, it is call'd, *working round the Pillar*.

The Use of the *Pillar* in the Center, is for regulating the Extent of *Ground*, that the *Manage* upon the *Volts* may be perform'd with Method and Justice; and that they may work in a Square by Rule and measure upon the four Lines of the *Volts*; and also to break narrowly high mettled *Horses*, without endangering the *Rider*.

The *two Pillars* are placed at the Distance of 2 or 3 Paces the one from the other.—The *Horse* is put between these, to teach him to raise before, and yerk out behind; and put himself upon rais'd Airs, &c. either by the Aids or Chastisement.

PILLE of *Foddray*, or PILL of *Foddray*, in the County of *Lancaster*, a Defense built on a Creek of the Sea, call'd *Pile*, by the Idiom of the County, for a *Pile* or *Fort* built for the Safe-Guard or Protection of any Place.

This *Pile* was erect'd there by the *Abbot of Furness*, in the first Year of *Edw. III. Camb. Brit. Rex.*—*Deidimus Henrico Comiti Northumb. Insulam, Castrum, Pelam & Dominium de Alia*, &c. *Rot. Pat. 1 Hen. IV.*

PILORY was anciently a Post erected in a cross Road, by the Lord, as a Mark of his Seigniority, with his Arms on it, and sometimes a Collar to the Criminals to.

At present, *Pilory* is a wooden Machine, whereon certain Criminals, as *Perjurors*, &c. are fastened, and expos'd to the publick Derision. See PUNISHMENT, *PERJURY*, &c.

In the Laws of *Conutus* 'tis call'd *Healsfang*.—Sir *Henry Spelman* says 'tis *supplicii macula ad Indubitates, magis quam parricidii*.

'Twas peculiarly intended for the Punishment of *Bakers* who should be caught tripping in the Weight or Fineness of their Bread.—In old Charters it is call'd *Colstrigium*. See *COLLESTRIGIUM*.

The *Pilory* in *Paris* is in the middle of a round Tower, with Openings on every side.—'Tis moveable on an Axis, or Arbor; round which the Executioner gives the Criminal the Number of Turns appointed in Court; stopping him at each Opening to shew him to the People.—'Twas intended for several Kinds of Criminals, particularly fraudulent Bankrupts; and all who made a *Cession*, or Surrender of their Effects to their Creditors, were oblig'd to make some Turns round the *Pilory* on Foot with a green Cap on. See *BANKRUPT*, *CESSION*, &c.

PILLULA, PILL, in Pharmacy, a Form of Medicine, taken dry; resembling a little Ball; invented in favour of such as cannot a-way with Medicinal Draughts; as also to keep in Readiness for occasional Use without decaying.

*Pills* are of various Kinds, Anodyne, Somniferous, Laxative, Aperitive, Hyfferic, Antinephritic, &c. but principally Cathartic.

The Basis of *Pills* is usually *Aloes*; with which are mix'd *Agaric*, *Turbith*, *Hermodactyls*, *Senna*, *Rhubarb*, *Mercury*, *Storax*, &c.

Perpetual *Pills*, *Pillula perpetua*, are *Regulus of Antimony* made up into *Pills*; thus call'd, because being swallow'd and voided 50 times, they will purge every Time with undiminis'd Force. See *ANTIMONY*.

The *Aloephanes* or *Arumiac Pills of Mesue*, are usually call'd *Polychrestes*, as being supposed to collect the Humours from all Parts, to enable Nature to call 'em out more easily.

*Recieve Pills*, are a sort of Pills good against Coughs, so call'd from the Greek *βίη*, Cough.—They are also call'd *Nyctogastriades*, because left to dissolve under the Tongue.

*Pills* are usually wrapp'd up in Leaf-Gold, in Sugar, or the like, to prevent the ill Taste being perceived.

They take their Name from the Latin, *Pila*, Ball.

**PILOT, PILOTE**, by the Dutch call'd **PILOOT**, the Italians **PILOTA**, the Spaniards **PILOTO**, in Navigation, an Officer on board a Ship, who watches her Course, and directs it. See COURSE, SAILING, &c.

There are two kinds of *Pilots*; the one a *Coasting Pilot*, well acquainted with the Coasts, Ports, Roads, Bars, Sands, &c. and who commands in Sight thereof. See COASTING.

The other an Officer who makes Observations and takes Altitudes out at Sea, uses the Quadrant, Fore-Staff, watches the Compass, &c. See OBSERVATION, ALTITUDE, &c.

There are also *Pilots* of Havens, Rivers, &c. call'd *Lochmanns*. See LOCHMAN.

The *Pilot* is always the second Person in the Ship; whether it be a Man of War, or a Merchant-Man.—In the former the Captain is the first, the *Pilot* the second. In a Merchant-Ship, the Master is the first, the *Pilot* after him. The *Pilot* is also the Steer-man, who stands at the Helms, and manages the Rudder. See STEERAGE, HELM, and RUDDER.

*Menage* derives the Word *Pilot* from *Provia*, *q. d.* he who governs the Prow, or Head. Others fetch it from the old French, *Pile*, Ship.

**PIMENTO, PIMENTA**, or *all-Spice*; an Aromatic Grain; call'd also *Guinea-Pepper*. See PEPPER.

**PIN**, in Commerce, a little necessary Utensil, chiefly used by the Women in adjusting of their Dress.

The Form and Application of this little Movable need no Description; but its Consumption, and the Number of Hands it employs, are too considerable to be pass'd by unnoted.

*Pins* are now altogether made of Brass-Wire blanch'd: Formerly they likewise made them of Iron-Wire, which being blanch'd like the others pass'd, for Brass; but the ill Effects of those *Pins* has quite discarded their Use.—The French however could not be driven off from 'em, without several Arrests of Parliament. By a Sentence of the Lieutenant de Police, July 1695, the Seizure of some Millions of those *Pins* was confirm'd, and the *Pins* condemn'd to be burnt by the common Executioner.

The *Pins* most esteemed in Commerce are those of England; those of Bourdeaux are next, then those made at Ragle, Naigle, and some Places in Normandy.

The Perfection of *Pins* consists in the Stiffness of the Wire, and its blanching, in the Heads being well turn'd, and the Points filed.

The London pointing and blanching are the most esteemed; because after forming the Points on the Stone, they smooth them again on the Polisher; and in blanching use fine Tin well coin'd, and sometimes Silver-Leaves prepared by the Gold-Beaters; whereas in other Parts they use a Mixture of Tin, Lead, and Quicksilver, which not only blanches worse than the former, but is also dangerous, by reason of the ill Quality of that Mineral, which renders a Puncture with a *Pin* thus blanch'd very difficult to cure.

The Consumption of *Pins*, and the Number of Artificers employ'd in the Manufacture thereof are incredible. In *Paris* alone there were anciently above 1000 People employ'd in it, at present there are none; yet is there every Year sold above 50000 Crowns worth of the *Pin-Wire*, to the *Pinmakers* of the neighbouring Places, all brought thither from *Stochholm*.—In the little Town of Ragle in Normandy, there are computed at least 500 Workmen employ'd in the *Pin-Manufacture*; the whole City being peopled therewith.

Notwithstanding that there is scarce any Commodity cheaper than *Pins*, there is none that passes thro' more Hands e'er they come to be sold.—They reckon 25 Workmen successively employ'd in each *Pin*, between the drawing of the Brass-Wire, and the sticking of the *Pin* in the Paper.

*Pins* are distinguished by *Numbers*, the smallest call'd from N<sup>o</sup> 3, 4, 5. thence to the 14th; whence they are only accounted by two to two, *viz.* N<sup>o</sup> 16, 18, and 20, which is the largest Size.

Beside the white *Pins*, there are also black ones made for Mourning, from N<sup>o</sup> 4, to N<sup>o</sup> 10.—These are usually of Iron-Wire.

Lastly, there are *Pins* with double Heads, of several *Numbers*, used by the Ladies to fix the Buckles of their Hair for the Night, without Danger of being disturb'd by their pricking, &c.

One of the Article of the Statutes of the ancient *Pinmakers* of *Paris*, was, That no Master should open more than one Shop for the Sale of his Wares, except on *New-Year's-Day*, and the Eve thereof: This we mention in an Age of Luxury and Profusion, to recollect the agreeable Simplicity of our Forefathers, who contented themselves with giving *Pins* for New-Years-Gifts.

Hence the Custom of still giving the Name *Pins*, or *Pin's Money*, to certain Presents which accompany the most considerable Bargains; in which 'tis usual to give something towards the *Pins* of the Wife, or Children, of the Person with whom the Bargain is struck.

*Ad PINNAS bibere*, is a Method of drinking, used among the *Danes* in England.—The Custom was to fix a *Pin* in the Side of a wooden Cup or Bowl; which *Pin*, each Guest was to drink bare, upon Penalty of forfeiting.

*PIN-and-Web*, a horny Induration of the Membranes of the Eye, not greatly unlike a Cataract. See CATARACT. The *Pin* and *Web* is the same with what we otherwise call *Pannus*, *Unguis*, *Prerygium*, &c. See PANNUS, PRERYGIUM, &c.

*PIN-Wheel*, of a Clock, the same with the striking Wheel. See WHEEL and CLOCK.

**PINDARIC**, in Poetry, an Ode form'd in Imitation of the manner of *Pindar*. See ODE.

The *Pindaric* Manner is distinguish'd by the Boldness and Height of the Flights, the Suddenness and Surprisingness of the Transitions, and the seeming Irregularity, Wildness, and Enthusiasm of the whole.

*Pindar*, whence the manner takes its Name, was of *Thebes*. He flourish'd about 478 Years before *Christ*; and was contemporary with *Aeschylus*: What we have remaining of his is a Book of Odes, all in Praise of the Victors at the *Olympian*, *Pythian*, *Nemean*, and *Isthmian* Games; whence the first is entitled the *Olympians*, the second the *Pythians*, the third the *Nemans*, and the fourth the *Isthmians*.

*Pindar* is full of Force and Fire; his Thoughts sententious, his Style impetuous; his *Sallies* daring, and frequently running as it were at random: he affects a beautiful Disorder, which is the Effect of the greatest Art.

The supposed Irregularity of his Numbers has made several of his Imitators imagine themselves *Pindaric* Poets; by the meer Wildness and Irregularity of their Verses.—None of our Writers seem to have succeeded in the *Pindaric* Character, but Mr. *Comley*.

In a *Pindaric* Ode, the Plan of the whole is to be drawn first, and the Places mark'd out where the elegant *Sallies* and *Wandings* may best be, and how the Returns may be justly made to the Subject.

**PINCHING**, in Gardening, a sort of pruning; perform'd by nipping or breaking off the Branches, or Sprigs of a Plant, or Tree, between the Nails of two Fingers. See PRUNING.

Most Gardeners hold, that *pinching* contributes to the Abundance of the Fruit, as well as of the Branches; and say, that young Shoots, thus lopp'd, are less apt to grow black and die, than when cut with a pruning Knife.

The Season for *pinching* is chiefly in April or May, sometimes 'tis also practis'd in June and July.

*Pinching* is most usual in Melons, Cucumbers, &c. *Quintings* also prescribes it for Fruit-Trees.

It is chiefly to be practis'd on the large Branches towards the Top of the Tree, which are useless and yet consume a great Quantity of good Sap. It must rarely be practis'd on the large Branches below; which ought always to be preserv'd for the Winter's pruning, that they may yield others, the following Year, fit to fill the empty Places.—Nor must the Operation of *pinching* be perform'd on the tender Shoots; because having only just Sap enough for themselves, when they come to put forth more Branches in the Place where they are *pinch'd*, the small Stock of Sap allotted them being divided, will starve them.—The Operation is perform'd within two or three Eyes of the Branch they grow out of.

The Effect of *pinching* is, that instead of one useless, perhaps buriful, Wood-Branch, a vigorous Tree will put forth two or three at the Eyes remaining; and the Sap being thus divided, the Branches may be less, and fit for Wood and Fruit.

**PINCHING**, in the Manage, is when, the Horse standing, the Rider holds him fast with the Bridle-hand, and applies the Spurs just to the Hairs of his Sides, without pricking him.

*Pinching* is accounted an Aid, spurring a Correction. See AID.

**PINEA**, or **PIGNE**, in Commerce, a Term used in *Peru* and *Chili*, for a kind of light, porous Masses, or Lumps, form'd of a Mixture of Mercury and Silver-Dust from the Mines. See SILVER.

The Ore, or Mineral of Silver, being dug out of the Veins of the Mine, is first broke, then ground in Mills for the Purpose, driven by Water with Iron Pestles of 200 Pound-Weight.—The Mineral thus pulveriz'd, is next sifted, then work'd up with Water into a Paste, which when half dry, is cut into Pieces, call'd *Cuerpo's*, a Foot long; weighing each about 2500 Pound.

Each *Cuerpo* is again kneaded up with Sea-Salt, which dissolving incorporates with it.—They then add Mercury, from 10 to 20 Pound for each *Cuerpo*, kneading the Paste a-fresh till the Mercury be incorporated therewith. This

Office being exceedingly dangerous, by reason of the ill Qualities of the Mercury, is the Lot of the poor *Indians*. See *MERCURY*.

This Amalgamation is continued for 8 or 9 Days: Some add Lime, Lead, or Tin Ore, &c. to forward it; and in some Mines they are obliged to use Fire.—To try whether or no the Mixture and Amalgamation be sufficient, they wash a Piece in Water, and if the Mercury be white, it has had its Effect, if black it must be further work'd.

When enough, it is sent to the Lavatories, which are large Basins that empty successively into one another.—The Paste &c. being laid in the uppermost, the Earth is then wash'd from it into the rest by a Rivulet turn'd upon it; an *Indian* all the while stirring it up with his Feet, and two other *Indians* doing the like in the other Basins. See *LAVADERO*.

When the Water runs quite clear out of the Basins, they find the Mercury and Silver at Bottom, incorporated.—This Matter they call *Pella*, and of this they form the *Pined's* by expressing as much of the Mercury as they can; first by putting it in woollen Bags and pressing and beating it strongly; then by stamping it in a kind of wooden Mould of an Octagonal Form at bottom whereof is a Brass-Plate pierced full of little Holes.

The Matter being taken out of the Mould is laid on a Trivet, under which is a large Vessel full of Water; and the whole being cover'd with an earthen Head, a Fire is made around it.

The Mercury still remaining in the Mixture is thus reduc'd into Smoke, and at length condensing is precipitated into the Water, leaving behind it a Mass of Silver Grains of different Figures, which only joining or touching at the Extremes render the Matter very porous and light.

This, then, is the *Pined's* or *Pipes's* which the Workmen endeavour to sell secretly to the Vessels trading to the *South Sea*; and from which those who have ventur'd to engage in so dangerous a Commerce have made such vast Gains.—Indeed the Traders herein must be very careful, for the *Spanish* Miners are errant Knaves, and to make the *Pignes* weigh the more, make a Practice of filling the middle with Sand or Iron. See *COMMERCE*, *PIKE*, &c.

**PINEAL**, **PINEALIS**, in Anatomy, a Name which *Des Cartes* gives to a Gland in the third Ventricle of the Brain; from its Resemblance to a Pine-Apple. See *GLAND* and *BRAIN*.

This Gland he makes the *Sensorium*, or Seat of the reasonable Soul. See *SENSORIUM*.

Other Authors call it *Covoides* and *Conarium*. See *CONARIUM*.

**PINGUEDO**, among Anatomists, that sort of Fat of Animals lying next under the Skin. See *FAT*.

**PINION**, in Mechanics, an Arbor, or Spindle, in the Body whereof are several or Notches, into which catch the Teeth of a Wheel that serves to turn it round. Or a *Pinion* is a lesser Wheel, which plays in the Teeth of a larger. See *WHEEL*.

In a Watch, &c. its Notches (which are commonly 4, 5, 6, 8, &c.) are call'd *Leaves*, and not Teeth as in other Wheels. See *WATCH*.

*Pinion of Report*, is that *Pinion* in a Watch which is commonly fix'd on the Arbor of the great Wheel, and which in old Watches used to have but four *Leaves*; it drives the Dial-Wheel, and carries about the Hand. See *WATCHWORK*.

The Quotient, or Number of Turns to be laid upon the *Pinion of Report*, is found by this Proportion: As the Beats in one Turn of the great Wheel, are to the Beats in an Hour; so are the Hours of the Face of the Clock, (viz. 12, or 24) to the Quotient of the Hour-Wheel, or Dial-Wheel divided by the *Pinion of Report*, that is, by the Number of Turns which the *Pinion of Report* hath in one Turn of the Dial-Wheel: which in Numbers is 26928 : 20196 :: 12 : 9.

Or rather thus; as the Hours of the Watches going, are to the Numbers of the Turns of the Fly; so are the Hours of the Face, to the Quotient of the *Pinion of Report*—If the Face be 12, then 16 : 12 :: 12 : 9. But if 24, the Proportion is 16 : 12 :: 24 : 18.

This Rule may serve to lay the *Pinion of Report* on any other Wheel, thus: As the Beats in one Turn of any Wheel, are to the Beats in an Hour; so are the Hours of the Face, or Dial-Plate of the Watch, to the Quotient of the Dial-Wheel, divided by the *Pinion of Report*, fix'd on the Spindle of the aforesaid Wheel. See *CALCULATION*.

**PINK**, or *Flute*, a Vessel used at Sea, masted and rigged like other Ships; only that she is built with a round Stern; and the Bends and Ribs compassing so, as that her Sides bulge out very much. See *VESSEL*.

This Disposition renders the *Pinks* difficult to be boarded; and also enables them to carry greater Burdens than others.

They are often used for Store-Ships and Hospital-Ships in the Fleet.

**PINK** among Painters, a sort of yellow Colour. See *YELLOW* and *PAINTING*.

**PINNA**, a *Latin* Word signifying a Feather. See *FEATHER*.

It is also used figuratively in divers Arts, to express things which bear some Resemblance, in Form, to Feathers; and as the Fins of Fishes, &c. See *FIN*.

**PINNA Auris**, in Anatomy, See *EAR*.

**PINNA Nosi**, the same as *Ala Nosi*. See *NOSE*.

**PINNACE**, a small Vessel, with a square Stern, having Sails and Oars, and carrying three Masts; chiefly used as a Scout for Intelligence, and for landing of Men. See *VESSEL*.

One of the Boats belonging to a great Man of War, serving to carry the Officers to and from the Shore, is also call'd the *Pinnace*. See *BOAT*.

**PINNACLE**, in Architecture, the Top, or Roof, of a House, terminating in a Point. See *ROOF*.

The Word comes from the *Latin* *Pinna*, or *Pinnaculum*.—This kind of Roof among the Ancients was appropriated to Temples; their ordinary Roofs were all flat, or in the Platform Way. See *PLATFORM*.

'Twas from the *Pinnacle*, that the Pediment took its Rise. See *PEDIMENT*.

**PINNATA Folia**, from *Pinna*, a Feather, in Botany, are such Leaves of Plants, as are deeply jagged, cut, or indented, resembling a Feather in Shape. See *LEAVES*.

**PINNING**, in Building, the fastening of Tiles together, with Pins of Heart of Oak; for the Covering of a House, &c. See *TYLES* and *COVERING*.

**PINT**, a Vessel or Measure used in estimating the Quantity of Liquids, and even sometimes of dry things. See *MEASURE*.

The *English Pint* is twofold; the one for Wine-Measure, the other for Beer and Ale-Measure.

The *Wine Pint* contains a full Pound, *Avoir-du-pois*, of common running Water; two Pints make a Quart, two Quarts a Pottle, two Pottles a Gallon, &c. See *GALLON*, *QUART*, &c.

The *Paris Pint* is estimated at one sixth of the ancient *Coinque*; and contains two Pounds of common Water: It is divided into Chopines, which some call Septiers; the Septier into two Demi-Septiers, the Demi-Septier into two Poissons, each Poisson containing 6 Cubic Inches.—Two Pints make a Quart, *Quarteau*, which some call a Pot: The *Pint of S. Denis* is almost double that of *Paris*.

*Budeus* derives the Word *Pint* from the *Greek* *πίννα*, *Ménage*, from the *German* *Pinte*, a little Measure of Wine; *Nisus* from the *Greek* *πίννα*, to drink.

**PINTLE**, among Gunners, an Iron Pin which serves to keep the Cannon from recoiling. See *CANNON*, *ORDNANCE*, *RECOIL*, &c.

**PINTLES**, in a Ship, are Hooks by which the Rudder hangs to the Stern-Post. See *RUDDER*, &c.

**PIONEER**, in War, a Labourer employ'd in an Army, to smooth the Roads, pass the Artillery a-long, dig Lines and Trenches, Mines, and the other Works.

*Ménage* derives the Word from the *Latin* *Peditones*, and *Pesarii*; or from *Pannionis*, a People of *Asia*, whose principal Employment was to dig the Earth in Mines, &c.

**PIP**, **PEP**, or **PEPIA**, a Disease among Poultry; consisting of a white thin Skin or Film, that grows under the Tip of the Tongue, and hinders their feeding.

It usually arises from want of Water, or from drinking Puddle-Water, or eating filthy Meat.—It is cured by pulling off the Film with the Fingers, and rubbing the Tongue with Salt.—Hawks are particularly liable to this Disease. See *HAWK*.

**PIPE**, in Building, &c. a Canal or Conduit for the Conveyance of Water, and other Liquids. See *CANAL*.

*Pipes* for Water, Water-Engines, &c. are usually of Lead, Iron, Earth, or Wood.—Those of Timber are usually either Oak or Alder. See *TIMBER*.

Those of Iron are cast in the Forges; their Length about two Foot and a half; several of which are piec'd together, by means of four Screws at each End, with Leather, or old Hat between them to stop the Water.

Those of Earth are made by the Potters.—These are fitted into one another, one End being always made wider than the other.—To join them the cloier, and prevent their leaking, they are cover'd with Pitch and Tow.—Their Length is usually about the same with that of the Iron *Pipes*.

The Wooden *Pipes* are bored with large Iron Augers of different Sizes, succeeding one another from less to larger; the first pointed, the rest form'd like Spoons, increasing in Diameter from one Inch to six.—They are fitted into the Extremities of each other, and are sold by the Foot.

Linden *Pipes* are of two kinds the one folder'd, the other not folder'd: For the Construction of each Kind whereof, see *PLUMBERY*.

For the *PIPES of Organs*: See *ORGAN*.

**PIPE** is also a popular Machine used in the smoking of Tobacco; consisting of a long slender Tube, made of Earth or Clay; having at one End a little Vase, or Furnace, call'd the

the *Bowl*, for the Reception of the Tobacco; the Fumes whereof are drawn by the Mouth thro' the other End. See TOBACCO.

Pipes are made of various Fashions, long, short, plain, work'd, white, varnish'd, unvarnish'd, of various Colours, &c.—The *Turks* use Pipes three or four Foot long, made of Reeds, or of Wood bor'd; at the End whereof they fix a kind Nut, of bak'd Earth, which serves as a Bowl, and which they take off after smoking.

The Word is borrow'd from the *Latin* *Pipa*.  
PIPE is also a Vessel, or Measure, for Wine, and Things measured by Wine-Measure. See MEASURE.

The Pipe, or Butt, contains two Hogheads, four Barrels, or 126 Gallons; and is computed to weigh about 9 Hundred, 2 Quarters, and 17 Pound. See HOGHEAD, &c.

The Pipe is little used in *France*, except in *Angou and Poitou*, where it consists of two Boisseaux, equal to a Muid and half of *Paris*; the Muid consisting of 36 Septiers, and the Septier of 9 Pints.

PIPE, PIPA, in Law, is a Roll in the Exchequer, call'd also the *Great Roll*. See ROLL and EXCHEQUER.

PIPE-Office, is an Office wherein a Person call'd the *Clerk of the Pipe* makes out the Leases of Crown-Lands, by Warrant from the Lord-Treasurer, or Commissioners of the Treasury, or Chancellor of the Exchequer. See CLERK of the Pipe.

All Accounts of Sheriffs, &c. are made up by the Clerk of the Pipe, and he gives the Accountants their *Quintus off*. To this Office are brought all Accounts which pass the Remembrancer's Office, and Remain there; that if any stated Debt be due from any Person, the same may be drawn down into the great Roll of the Pipe; upon which the Comptroller issues out a Writ, call'd, the *Summons of the Pipe* for Recovery thereof. See REMEMBRANCE.

All Tallies which vouch the Payment of any Sum contained in such Accounts, are examined, and allowed by the chief Secondary of the Pipe. See TALLY.

Besides the Clerk, in this Office are eight Attornies, or sworn Clerks, and a Comptroller.

PIRATE, a Person, or Vessel, that robs on the high Seas, or makes Descents on the Coasts, &c. without the Permission or Authority of any Prince or State. See PRIVATEER.

When *Pirates* are caught they are usually hang'd up without Remission, or any formal Trial; sometimes in the next Port; sometimes on board the Vessel that takes them.

In different Parts they are differently denominated; as in the *West Indies*, *Buccannets*, *Free-boaters*, &c.—In the *Mediterranean*, *Corsairs*, &c. See BUCCANER, CORSAIR, &c.

Alexander reproaching a Pirate with his Condition, was answer'd, If I am a Pirate, 'tis because I have only a single Vessel; had I a Fleet I should be a mighty Conqueror.

The Word comes from the *Greek* *πύρ*, Fire, because they use to burn the Ships, Houses, &c. of the Islands where they make Descents.

PIRATE was also anciently used for the Person to whose Care the Mole, or Port, of a Haven, in *Latin* *Pera*, was intrusted. See PERA.

Sometimes, too, according to *Spelman*, it was used *pro militis maritimo*; for a Sea-Captain or Soldier.

After in the Life of King *Alfred*, tells us, *justit navis longas fabricari, impositis que piratis in illis vias maris custodiendas commisit*.

PIRETHRA, or PYRETHRA, or PIRETTE, or PELLITORIX, a Medicinal Root brought from *Tania*, of a hot, diffusive Quality, used as an Alexipharmic and Phlegmagogue; as also to assuage the Toothach; and in the Composition of Vinegar.

'Tis of a moderate Length, the Thickness of the little Finger, greyish without, whitish within, and of a sharp, burning Taste.

'Tis pretended it took its Name from *Pyrrhus* King of *Epirus*; but there is no great Occasion for having recourse to a Mystery; its burning Quality being sufficient to give it the Name *Pirethra*, from the *Greek* *πύρ*, Fire. It must be chosen new, dry, hard to break, &c.

It is call'd a Salivary Root, because being held in the Mouth its Pungency promotes the Evacuation of Saliva.

PIROUETTE, or PIERROT, in the Manage, a Turn or Circumvolution which a Horse makes, without changing his Ground.

*Pirouettes* are either of one Tread or *Piste*, or of two.—The first is an entire short Turn which the Horse makes upon one Tread, and almost in one Time; in such manner as that his Head comes to the place where his Tail was, without putting out his Haunches.—In the *Pirouette* of two Treads, or *Pistes*, he takes a small Compass of Ground, almost his Length; and marks both with the fore-part and the hind. See PISTE.

The Word is *French*, and literally signifies *Whirligig*.

PIS-ASPHALTUM, a Compound of Bitumen and Pitch; See BITUMEN, &c.

There are two Kinds; the one Natural, the other Artificial.

The Natural is the same with what we otherwise call *Asphaltum*, or *Jenyth Pitch*. See ASPHALTUM.

The Artificial is prepared with equal Parts of the *Jenyth*-Pitch and common Black-Pitch melted together. See PITCH.

This latter Kind is what is usually sold in the Shops for the former.—The Coarseness of the black Colour, and the Fetidness of the Smell serves to distinguish it.

The Ancients used both kinds in embalming their Dead. See EMBALMING.

The Word is form'd from the *Greek* *πῖς*, Pitch; and *ασφαλῆς*, Bitumen.

PISCARY, in our ancient Statutes, the Liberty of Fishing in another Man's Waters. See FISHING.

PISCES, in Astronomy, the twelfth Sign, or Constellation of the Zodiac. See SIGN and CONSTELLATION.

The Stars in *Pisces*, in *Ptolemy's* Catalogue, are 38. In *Tychon's*, 33. In the *Berlinian* Catalogue, 100.—The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

Stars in the Sign PISCES.		Right Ascension	Longitude	Latitude	Magn.
Names and Situations of the Stars.	Sign	° ' "	° ' "	° ' "	
	♓	11 06 22	7 22 49	B 7	6

PISCIS *Polana*, in Astronomy, is a Constellation of the Southern Hemisphere, unknown to the Ancients, and invisible to us in their Northern Regions. See CONSTELLATION.

PISCINA, in Antiquity, *Fish-Pond*; a large Basin, in an open public Place, or Square; where the Roman Youth learnt to swim; and which was surrounded with a high Wall, to prevent the casting of Filth into it. See SWIMMING.

PISCINA was also the square Basin in the middle of a Bath. See BATH.

The Word is form'd from the Latin *Piscis*, Fish; because Men here imitated Fishes in swimming; and because Fishes were actually kept in some of them.

PISCINA *Probativa*, was a Pool, or Reservoir of Water, near the Court of Solomon's Temple; so call'd from the Greek *πυλωνα*, Sheep, because they here wash'd the Beasts destin'd for Sacrifice. See SACRIFICE.

By this *Piscina* it was that our Saviour wrought the miraculous Cure of the Paralytic.

Daviler observes, there are still remaining five Arches of the Portico, and part of the Basin of this *Piscina*.

PISCINA, or *Lavatory*, among the Turks, is a large Basin in the middle of the Court of a Mosque, or under the Portico's that encompass it. See MOSQUE.

Its Form is usually a long Square, built of Stone or Marble, furnish'd with a great Number of Cocks; wherein the Musulmen wash themselves before they make their Prayers; as being persuaded that Ablution effaces Sin. See ABLUATION.

PISSELEUM *Indicum* seems to be what passes in the Shops for *Barbades Tar*.—It has a strong Smell not unlike the common Tar, and is not very pleasant to Sight or Taste. It is accounted a good Balsamick, and where the Stomach

can diftense with it will do great Service in many Disorders of the Breast, which has also been experienced of common Tar. See TAR.

PISTACHO, or PISTACH Nut, a Fruit brought from several Parts of Asia, chiefly *Alippo* and *Perfia*.—When wrapt in all its Coats, 'tis of the Size of a green Almond; but when stript of all but its Shell it resembles a small Nut. The Kernel is red without and green within, its Taste very agreeable.

The Tree that produces it is a kind of Turpentine-Tree: The Nuts are to be chosen new, heavy, and full; as to those that are broken, such as have kept their Colours best are to be prefer'd; for as to the Size 'tis a Fancy.

*Pistachos* are apterive, proper to give Vigour, and are used in Emulsions, &c. in Phthisical and Nephritical Cafes. They also enter several Ragoists; are comfited, made into Conserves, &c.

The Word is form'd from the Latin *Piscinium*, of the Greek *πυλων*; whence according to *Menege* the City *Pistacum* took its Name.

There is likewise a kind of false *Pistach*, brought from the *Caribbee* Islands, which some confound with the real ones, tho' very different, both with regard to the Plant that produce them, and their Quality. The Plant does not grow above a Foot high. Nor does the Fruit grow on the Branches, but is found in Pods adhering to the Root.—The Pod sometimes only contains a single Nut, which it resembles an Olive; but usually, several; and in that Cafe they are irregular. The Substance is white, compact and heavy.

This Fruit is rarely eat raw, because of the ill Effects it produces; 'tis usually roasted or comfited; is used in Ragoists; and to make *Ratiffa's*.

PISTIE, in the Manage, the Track, or Tread, which a Horse makes upon the Ground he goes over; and which may be either single or double.

If the Rider makes him go but an ordinary Gallop, in a Circle, or rather Square, he will make but one; if he either makes him gallop with his Haunches in, or go *Terra à Terra*, he will make two *Pistes*, one with the fore-part, another with the hind.—And the same if the Rider makes him passage, or go side ways, either in a strait Line, or upon a Circle.

The Word is French, and literally signifies a Track. PISTIL, in Botany, a little upright Part in the middle of the Calyx, or the Leaves of Flowers; call'd also the *Style*. See STYLE.

The *Pistil* is an essential Part of a Flower; and the principal female Organ of Generation; it being in this that the Seeds or young Plants are form'd. See FLOWER.

It arises from the Pedicle of the Flower, or the Center of the Calyx, and at length becomes the young Fruit, which is sometimes hid in the Calyx, and sometimes quite out. See FRUIT, CALYX, &c.

The Figure of the *Pistil* is very different in different Flowers: Sometimes 'tis a little Stalk, which enlarges at the two Ends like a Pefile; sometimes 'tis a mere Stamen or Thread: Sometimes 'tis round, sometimes square, triangular, oval, &c. Almost all *Pistils* are furnish'd at top, either with fine Hairs, which make a kind of Velvetting; or with little Filaments dispos'd in Plumcs; or are beset with little Vesicles full of a glutinous Juice.

Some Flowers have several *Pistils*; or rather the *Pistille* terminate in several Branches, or Horns, which have their Rise from as many young Fruits, or as many different Capsules, containing Seeds.

All these *Pistils*, or whatever Form they be in, have certain Apertures at their Tops, or certain Clefts continued the whole Length, to the Base or Embryo's of the Fruit.—This is very visible in the Lilly, Daffodil, and Melon; by cleaving the *Pistils* length-wise, or cutting them transversely.—If after cutting the *Pistil* of the Lilly, you immerse one Extremitie in Water, and suck thro' the other End, the Water will rise thro' it, as through a Pipe.

By opening the *Pistils* in their different States or Growths, it appears evidently, that 'tis these form the young Fruits; and contain within them the Embryo's of the Seeds; whether those Seeds be diffus'd thro' the whole Length of the *Pistil*; or whether they be all inclos'd in its Base: And that they are always open a-top, and perforated, either more or less sensibly, to the Bottom: Though this Cavity is frequently effaced as the young Fruit grows; and sometimes a Part of the *Pistil*, which *Malpighi* calls the *Style*, or Needle, dries and falls off.

The *Pistil*, we have observ'd, is the Female Organ of Generation; its Base does the Office of the *Uterus*, or Womb, in Women; and its Length that of the *Vagina*. See UTERUS and VAGINA.

It is encompass'd with the Stamina, the Apices whereof are full of a fine Dust, call'd the *Farina Escudans*; which bursting its Vesicles, or Apices, when mature, is shed on the upper Part of the *Pistil*, and thence convey'd by

Cavity thereof to the Base or Uterus; where being fed with a fine Juice, separated by the Flowers, it grows, expands, and thus forms the Embryo of a young Fruit. See STAMINA, FARINA, &c.

For a more distinct Account of the Process of Generation of Plants. See PLANT.

PISTOL, a little Fire-Arm, bore at the Saddle-Bow, the Girdle, or in the Pocket. See FIRE-ARM.

The *Pistol* is said to have taken its Name from *Pistoya* a City in Italy; where, as *Fausher* tells us, they were first made.—*Borel* derives the Word from *Pifada*, Pipe, the Barrel of this Piece bearing some Resemblance to a Flute, &c.

PISTOLE, or *Double*, in Commerce, a Gold Coin, struck in Spain, and several Parts of Italy, Switzerland, &c. See COIN.

It has its Augmentations, and Diminutions; which are *Quadruple Pistoles*, *Double Pistoles*, and *Half Pistoles*.

The *Pistole* is about the same Weight, Fineness, and Value, with the *French Louis d'ors*, viz. equal to Sixteen Shillings and Six Pence, Sterling.

In Spain the *Pistole* is accounted equal to four Pieces of Eight, 32 Rials, 1088 Maravedis, old Money; 1360 Maravedis, new Money; and 2040 Maravedis of *Billon*, the old Money current at *Seville*, *Cadix*, in *Andalusia*, &c. being 25 per Cent. better than the imaginary Money they reckon by at *Madrid*, *Bilboa*, &c. which Augmentation was made by *Charles II.* in 1686. to prevent the Exportation of Money out of the Kingdom. See MONEY.

Most of the Exchanges in Italy are made on the Foot of the *Pistole*. See EXCHANGE.

PISTON, a Part, or Member in several Machines, particularly Pumps, Air-Pumps, Syringes, &c. call'd also *Embolus*, and popularly the *Sucker*. See EMBOLUS.

The *Piston* of a Pump is a short Cylinder of Metal, fitted exactly to the Cavity of the Barrel or Body; and which being work'd up and down alternately therein, raises the Water; and when rais'd presses it again, so as to make it force up a Valve, wherewith it is furnished, and so escape thro' the Nose of the Pump. See PUMP.

The *Pistons* of Air-Pumps, Syringes, &c. See described under AIR-PUMP, and SYRINGE.

PIT and *Galvay*, in our ancient Customs. See FURCA & FOSSA.

PITANCIARIUS, an Officer in the ancient Monasteries, whose Business it was to provide and distribute the *Pitances* of Herbs and Meat, amongst the Monks. See PRYFANCE.

PITCH, PIX, a kind of tenacious Juice, or Gum, drawn from fatty Woods, chiefly Pines and Firs; used in Shipping, in Medicine, and various other Arts.

*Pitch* is properly a Juice of the Bark; and is conceived to be no other than the Oil thereof inspissated and turned black, farther than in the Balsam. See BARK and BALM.

The Method of drawing, or procuring, it, is by cleaving the Tree into little Billets, which they lay in a Furnace having two Apertures, thro' one of which the Fire is put, and thro' the other the *Pitch* is gathered; which oozing from the Wood runs along the bottom of the Furnace into Basins or Receptacles for the Purpose.—The Smoak which is here very thick, gives it the black Colour we find it withal.—Some will only have our common *Pitch* to be the *Left Running*, and Tar to be the *Right*. See TAR.

*Wheeler* gives us another Manner of drawing *Pitch*, used in the Levant.—A Pit is dug in the Ground two Ells in Diameter a-top, but contracting as it goes deeper: This they fill with Branches of Pine, cloven into Shivers.—The top of the Pit is then covered over with Fire, which burning down to the bottom, the *Pitch* distils and runs out at a Hole made therein.

*Pitch* acquires different Names according to its different Preparations, Colours, and Qualities. As it distils from the Wood it is called *Barras*, but afterwards assumes a double Name, the finest and clearest being called *Galipot*, and the coarser, mottled *Barras*.

Of the *Galipot* is made what we call *white Pitch*, or *Burgandy Pitch*, which is nothing but the *Galipot* melted with Oil of Turpentine; tho' some will have it a native *Pitch*, distilling from a Resinous Tree growing in the Mountains of the *Franco-Comte*.

Of the same *Galipot* is likewise prepared what we call *Rosin*; by boiling the *Pitch* to a certain Consistence, and making it up in Cakes. See ROSIN.

The black *Pitch*, which is what we properly call *Pitch*, is the liquid *Galipot* burnt and reduced into the Form and Consistence we see it in by mixing Tar with it while hot.

The best is that brought from Sweden and Norway.—Its Goodness consists in its being of a shining black, dry, and brittle.

*Naval Pitch*, *Pix Navalis*, is that drawn from old Pines, rag'd and burnt like Charcoal.—This, with the Mixture of Tow or beaten Cables, serves for the pitching of Vessels.

*Naval Pitch* is also that scraped from off the Sides of old

Vessels; and which is supposed to have acquired an astringent Virtue, by means of the Salt-Water.—It serves to make Plasters; tho' 'tis certain the Apothecaries usually substitute the common black *Pitch* in its stead.

*Greek-Pitch*, or *Spanish Pitch*, is that boil'd in Water till it have lost its natural Smell; upon which it becomes dry and pliable.

The Ancients call'd it *Colophony*, from *Colophon* a City in Greece, whence great Quantities were brought. See COLOPHONY.

Oil of PITCH, *Oleum Picinum*, is an Oil procured from Pitch, by separating the aqueous Matter that swims a-top of the melted Pitch.—This for the great Virtues attributed to it also call'd *Balm of Pitch*.

PITCH, in Building, is the *Angle*, a Gable End, and consequently the whole Roof of a Building, is set to. See GABLE.

If the Length of each Rafter be  $\frac{1}{2}$  of the Breadth of the Building; the Roof is said to be *true pitch*.

If the Rafters are longer, 'tis said to be a *high* or *steep pitch'd* Roof; if shorter, which seldom happens, it is said to be a *low* or *flat pitch'd* Roof. See ROOF, RAFTER, &c.

PITCH is also a Sea-Term.—When a Ship falls with her Head too much into the Sea, or beats against it so as to endanger her Top-Masts, they say, she will *pitch her Masts by the board*.

PITCHING-Pence, a Duty, commonly of one Penny, paid for pitching or setting down every Sack of Corn, or Pack of Merchandise, in a Fair or Market.

PITH, PIT, or PITTE, the inward, central Part of a Tree, or Plant; answering to the Medulla, or Marrow, of an Animal. See PLANT, TREE, &c.

Some will have the Circulation of the Sap to be effected by means of the *Pith*; others by the Bark; and others by the Wood. See SAP, CIRCULATION, &c.

PITHIA, and PITHIAN. See PYTHIA and PYTHIAN.

PIT, *Cavea*, of a Theatre, all that Space between the Amphitheatre, or Galleries, and Theatre or Stage; call'd by the Ancients *Orchestra*, and by the French *Parterre*. See THEATRE, &c.

This being the most commodious Part, it was here the Roman Senate was placed. See ORCHESTRA.

It has its Name *Pit*, in Latin *Cavea*, from its being sunk below the Level of the Stage. See STAGE.

PITTACIUM, *πυττακιον*, in Chirurgery, a Name which some Authors give to a little Cloth spread with a Salve, to be laid on a Part affected.

PITTANCE, or PITANCE, PIETANCE, PITANICA, the Commons, or Allowance of Meat, be it Fish, Flesh, or the like, flately eaten at Meals, besides Bread.

The Word is not much used except amongst Religious, and those who live in College or Community.—*Du Cange* derives it from *Pinkantia*, used in the lower Latin for a Monachal Portion given to two Monks in the same Dish, consisting of something better than Pulse.

Hence we sometimes also find it denote a Meal, or Commons, better than ordinary; such as is allowed in Communities on Feast Days.

Others derive the Word *a pietate*; and others, with *Salmafus*, from *Pittacia*, a Meis, or Portion, allowed the Soldiers, mentioned in several Laws of the *Theodosian Code*.—'Tis added, that the Word *Pittacia* properly signified a Title, or written Label, added a-top of the Vessels, to shew what was within-side, or how it was intended.

PITUITA, one of the four Humours found in the Bodies of Animals, on which their Temperament is commonly supposed to depend. See HUMOUR and TEMPERAMENT.

The *Pituita*, call'd also *Phlegm*, is properly the most viscid, and glutinous Part of the Blood, repaired in the largest Glands, where the Contortions of the Arteries are greatest, and give the greatest Retardation to the Blood's Velocity; as in the Glands about the Mouth and Head. See SACCRETION and PHEGMA.

The Class of *Phlegmagogues*, as *Manna*, &c. are supposed to purge *Pituita*. See PHEGMOGOGUE, PURGATIVE, MANNA, &c.

The Physicians give several Epithets to the *Pituita*, according to its Condition or Qualities, as *Saline*, *Vitreous*, *Cyffear*, *Acid*, &c.

The *Pituita* is supposed to be the prevailing Humour in cold, heavy, slow People, inclined to Scrofulas and Study; as the *Bile* in those inclined to War, &c. See PHEGMOGOGUE.

The *Pituita* discharged at the Nostrils, is separated in the Membrane that lines the Cavities of the Nose, Cheeks, &c. See NOSE.

Its Use is to keep the Membrane soft, and defend it from Injuries of extraneous Bodies, especially those of the Air, which passes this Way in Inspiration when the Mouth is shut.

**PITUITARY Gland** is a Gland in the Brain, somewhat difficult to be seen without removing it out of its Place. See **BRAIN**.

It is of the Size of a very large Pea, in the Sella of the Os Sphenoides, under the Infundibulum, wherewith it communicates; receiving from it a Lympha, or Juice, which the Infundibulum derives from the Plexus Choroideus and pineal Gland; and from this Lympha does the Gland take its Name. See **INFUNDIBULUM**, &c.

It also filtrates a Juice itself; separating from the Blood, a white Liqueur very subtilè, and apparently very spirituous. See **SPIRITS**.

M. *Littre* observes a Sinus, or Reservoir, of Blood, which touches this Gland; and which is open to it in the Place of Contact, so that the Gland lies partly in the Blood.—This, that Author takes to do the Office of a *Batemum Morie*, in keeping the Gland in the Degree of Warmth necessary for the Discharge of its Functions.

This Gland is found in all Quadrupeds, Fishes, and Fowls, as well as in Men.

M. *Littre* gives an Instance of a tedious Disease, and at length Death, arising from an Obstruction and Inflammation of this Gland.

**PIVOT**, a Foot, or Shoe of Iron, or other Metal, usually conical, or terminating in a Point; whereby a Body, intended to turn round, bears on another fix'd at Rest, and performs its Circumvolutions.

Large Gates, &c. usually turn on *Pivots*.—The Ancients tell us, they had Theatres in *Rome* that held Eighty thousand People; which yet turn'd on a single *Pivot*. See **THEATRE** and **AMPHITHEATRE**.

**PLACARD**, or **PLACART**, or **PLACERT**, a foreign Term, frequent in Gazettes, tho' scarce yet naturaliz'd.

It signifies a Leaf, or Sheet of Paper, stretch'd and applied upon a Wall, or Post.—Edicts, Regulations, &c. are to be made publick in *Placards*.

The Word *Placard* is also us'd for a Libel, or Lampoon.—At *Rome*, *Placards* against the Pope are frequently fix'd in the Night-time, to the Statue of *Pasquin*. See **PASQUINADE**.

**PLACARDS**, in Architecture, the Decoration of the Door of an Apartment; consisting of a Chamberlaine, crown'd with its Frieze or Gorge; and its Corniche sometimes supported by Consoles. See **DOOR**.

**PLACARD**, in our Customs, a Licence whereby a Person is permitted to shoot in a Gun, or to use unlawful Game. See **GAME**.

**PLACE**, *Locus*, in Philosophy, that Part of immovable Space which any Body possesses. See **BODY** and **SPACE**. *Aristotle* and his Followers, divide *Place* into External and Internal.

*Internal Place* is that Space or Room which the Body fills or contains.—*External* is that which includes or contains the Body; call'd by *Aristotle*, the first or concave and immovable Surface of the ambient Body.

'Tis controverted in the Schools, whether *Internal Place* be a real Entity, or only an Imaginary Being; i. e. whether it be any thing intrinsically; or only an Aptitude and Capacity of receiving Bodies.

Some maintain it a positive Being, Incorporeal, Eternal, Independent, and Infinite; and assert it to be no other than the Immediety of the Godhead.

The *Cartesians*, on the contrary, hold *Internal Place*, abstractly consider'd, to be no other than the very Extension of the Bodies contained therein; and therefore in no wise different from the Bodies themselves.

The Schoolmen likewise dispute whether *External Place* be movable or immovable. Its Immobility is argued from this Consideration, that what moves must necessarily leave its *Place*, which it cannot do if it go along with the movable. Others charge an Absurdity on this Opinion of *Aristotle*, viz. That hence it follows, that a Body really at rest is continually shifting *Place*: A Tower, for instance, on a Plain, or a Rock in the middle of the Sea, in regard the one and the other are continually inclosed with new Air or new Water, must be said to be in Motion, or to change *Place*.

To solve this Difficulty, and ward off the Absurdity which follows from *Aristotle's* laying down *External Place* as immovable; infinite Expedients have been had recourse to.—The *Scotists* contend for *Place's* being immovable, by Equivalence.—Thus, when the Wind blows, the Air which invelsed the Surface of the Tower does indeed recede, but then other similar and equivalent Air takes place.—The *Thomists* chuse to deduce the Immobility of *External Place*, from keeping the same Distance from the Center, and the Cardinal Points of the World.—The *Nominalists*, from a Correspondence with certain virtual Parts of the Divine Immediety.

The *Cartesians* deny *External Place* to be either a surrounding Surface, or a Body surrounded, or a mean Term

between the two; and conceive it to be the Situation of a Body among adjacent Bodies consider'd as at rest.—Thus the Tower shall be deemed to remain in the same *Place*, tho' the ambient Air be changed, since it retains the same Situation, with regard to the neighbouring Hills, Trees, and other Parts of the Earth.

Sir *Isaac Newton* better and more intelligibly distinguishes *Place* into *Absolute* and *Relative*.

*Absolute* and *Primary Place* is that Part of infinite and immovable Space which a Body possesses. See **ABSOLUTE**.

*Relative* or *Secondary Place* is the Space it possesses considered with regard to other adjacent Objects.—Dr. *Clarke* adds another kind of *relative Place*, which he calls *relatively common Place*, and defines it that part of any movable or measurable Space which a Body possesses, which *Place* moves together with the Body. See **MOTION**.

*Place*, Mr. *Locke* observes, is sometimes likewise taken for that Portion of infinite Space possess'd by the material World; tho' this, he adds, were more properly call'd *Extension*. See **EXTENSION**.

The proper Idea of *Place*, he says, is the relative Position of any thing, with regard to its Distance from certain fix'd Points; whence we say, a thing has or has not chang'd *Place*, when its Distance is not alter'd with respect to those Bodies.

For the *Vision* of **PLACE**. See **VISION**.

**PLACE**, in Opticks, or *Optic PLACE*, is the Point to which the Eye refers an Object. See **OPTIC**.

Thus the Points D and E (*Tab. Optics, fig. 68.*) to which two Spectators in D and E refer the Object C, are call'd *Optic Places*. See **VISION**.

Here, if a right Line joining the *Optic Places* D and E, be parallel to a right Line passing thro' the Eyes of the Spectators A, B; the Distance of the *Optic Places* D, E will be to the Distance of the Spectators A and B, as the Distance of one of the *Optic Places* from the *Place* of the Object E, C, to the Distance of the other Spectator from the same Object A, C.

*Optic PLACE* of a Star, is a Point in the Surface of the Mundane Sphere, as C or B, (*Tab. Astronomy Fig. 27.*) wherein a Spectator in E, or T, sees the Center of the Star S. See **STAR** and **PLANET**.

This is divided into *true* and *apparent*.

*True* or *real Optic PLACE* is that Point of the Surface of the Sphere, B, wherein a Spectator, placed in the Center of the Earth C, sees the Center of the Star or Phenomenon.—Or a Point among the fix'd Stars, determined by a Line drawn from the Center of the Earth, through that of the Star, and terminated in C among the Stars. See **SPHERE**.

*Apparent* or *visible Optic PLACE* is the Point of the Surface of the Sphere, wherein a Spectator, placed on the Surface of the Earth E, sees the Center of the Star S.—Or a Point found by a Line passing from the Spectator's Eye through the Star, and terminated in the Sphere of the Stars.

The Distance between the *two Optic Places* is what we call the *Parallax*. See **PARALLAX**.

**PLACE** of the Sun, a Star, or Planet, simply, denotes, the Sign and Degree of the Zodiac, which the Body is in. See **SUN**, **STAR**, &c.

Or, it is that Degree of the Ecliptic, reckoned from the Beginning of *Aries*, which the Planet's, or Star's Circle of Longitude cuts; and therefore coincides with the Longitude of the Sun, Planet, or Star. See **LONGITUDE**.

As the Sine of the Sun's greatest Declination, 23° 30' : to the Sine of any present Declination given or observed, v. g. 23° 15' : is so is Radius : to. To the Sine of his Longitude 81° 52' : which if the Declination were North, would give 20° 52' of *Gemini*, if South 20° 52' of *Capricorn*, for the Sun's *Place*. See **PLANET**.

*MOON'S PLACE* is that Point of her Orbit wherein she is found at any Time. See **MOON** and **ORBIT**.

This, by reason of the great Inequalities in the Lunar Motions, which render a Number of Equations and Reductions necessary e'er the just Point be found, is of various kinds; viz. her *Stitious Place*, which is the Moon's *Place* once equated; her *Place nearly true*, which is her *Place* twice equated; and the Moon's *true Place*, which is her *Place* thrice equated. See **EQUATION**.

*Eccentric PLACE* of a Planet in its Orbit, is the *Place*, or Point of its Orbit, wherein a Planet would appear if seen from the Sun.

Thus suppose NEOR the Ecliptic, NPOQ the Planet's Orbit, the Sun in S, the Earth in T, and the Planet in P : the right Line SP express'd the *Eccentric Place* in the Orbit.

*HELIOCENTRIC PLACE*, of a Planet, or its *PLACE reduced to the Ecliptic*, or the *Eccentric Place in the Ecliptic*, is that Point of the Ecliptic to which a Planet, view'd from the Sun, is refer'd. See **HELIOCENTRIC**.

This coincides with the Longitude of a Planet view'd from the Sun. See **LONGITUDE**.

Thus the right Line RS (*same Fig.*) design's the *Heliocentric Place*, or *Place* regard'd to the Ecliptic.

*Geocentric PLACE* is that Point of the Ecliptic, to which a Planet view'd from the Earth is refer'd. See *GEOCENTRIC*.

Thus, NEOR (*same Fig.*) representing the Ecliptic, &c. TR will represent the *Geocentric Place*.

*PLACE* of Radiation, in Optics, is the Interval, or Space in a Medium or transparent Body, thro' which any visible Object radiates. See *RADIATION*, &c.

*PLACE*, in Geometry, is a Line used in the Solution of Problems; more usually call'd by the *Latin Name LOCUS*.

See the Doctrine of *Geometrical Places*, under the Article *LOCUS*.

*PLACE*, in War, is a general Name for all kinds of Fortresses, where a Party may defend themselves; and may be defined to be a *Place* so dispos'd, as that the Parts which encompass it, defend and flank one another. See *FORT* and *FORTIFICATION*.

A *Strong PLACE*, is a *Place* flank'd and cover'd with Bastions. See *BASTION*.

*Regular PLACE*, is that whose Angles, Sides, Bastions, and other Parts are equal; and is usually denominated from the Number of its Angles, as a *Pentagon*, a *Hexagon*, &c. See *PENTAGON*, *HEXAGON*, &c.

*Palma nova*, built by the *Venetians*, is a *Dodecagon*. See *DODECAGON*.

*Irregular PLACE* is that whose Sides and Angles are unequal.

*PLACE* of Arms, in Fortification, is a strong City, or Town, pitch'd upon for the chief Magazine of an Army. See *ARMS*.

*PLACE* of Arms in a City, is a large open Spot of Ground, where the Garrison holds its Rendezvous at Reviews, and in Cases of Alarm, to receive Orders from the Governor. See *GARRISON*.

*PLACE* of Arms in a Siege is a spacious Place cover'd from the Enemy, where the Soldiers are kept ready to sustain those at work in the Trenches, and to be commanded to the Places where they are wanted.

*PLACE* of Arms particular, in a Garrison, is a Place near every Bastion, where the Soldiers, sent from the grand Place to the Quarters assigned them, relieve those that are either upon the Guard, or in fight.

*PLACE* of Arms without, is a Place allowed to the Covert Way, for the planting of Cannon, to oblige those who advance in their Approaches to retire.

*PLACE* of Arms in a Camp, is a large Space at the Head of the Camp, for the Army to be rang'd in and drawn up in Battalia.

There is also a *Place* for each particular Body to assemble in. See *CAMP*.

*PLACE* of Arms of a Troop, or Company, is the Spot of Ground on which the Troop, or Company, is drawn up. See *TROOP*, &c.

*PLACE*, among Logicians, Orators, &c. is the Seat of an Argument, or that from which it is taken. See *ARGUMENT* and *TOPIC*.

There are two sorts of *Places*, viz. *Inartificial* and *Artificial*.—The first, the *Place* of Testimony, Authority, &c. The second, that of Reason; as when we argue from Universals, *e. gr.* from Genus, Species; from Causes, as the End, Efficient, Matter, Form, &c.

*Common PLACE*. See *COMMON PLACE*.

*PLACE* of Units, Tens, &c. See *UNITY* and *NUMERATION*.

*PLACENTA*, in Anatomy, a fleshy Mass, found in the Womb of a pregnant Woman; wherein the Ancients supposed, the Blood was purified and prepared for the Nourishment of the Fœtus. See *FŒTUS*.

Hence they also call'd it *Hepar Uterinum*, the Liver of the Womb; as if it did the Office of a Liver in preparing the Blood. See *LIVER*.

It is call'd by the Moderns *Placenta*, *q. d.* Cake or Cheese-Cake; because in Form of a Cake.

The *Placenta* is supposed by some to be only a Mass of coagulated Blood; for in the pressing, or washing it, it dissolves; and its real Use to be, to serve as a Pillow for the Umbilical Vessels to rest on. See *UMBILICAL*.

Its Figure is not unlike that of a Plate without Brims; three quarters of a Foot over, and sometimes a Foot. It is round, generally Concave or Convex. The Concave Side adheres to the Uterus, and is uneven, having divers Protuberances and Pits, by which it makes Impressions upon, and receives them from, the Uterus.—Its Place in the Uterus, whatever some pretend, is not certain.

In Women, unless in case of Twins, &c. there is but one: However, the Number generally answers the Number of the Fœtus.—In some Brutes, especially Oxen or Sheep, they are very numerous, sometimes near an hundred, even for one Fœtus, small, and resembling pretty large conglomerate Glands.

From the external or concave Side, which likewise has its Protuberances, tho' cover'd with a smooth Membrane, issue the Umbilical Vessels, which are in great Plenty distributed thro' the whole Substance of it. See *UMBILICAL*.

Some even imagine this Part to be nothing else but a Plexus of the Vein and Arteries, by whose Extremities opening into the Sides of the Hypogastrick Vessels, the Circulation is perform'd between the Mother and the Fœtus; for that side of the *Placenta*, which adheres to the Womb, appears to be nothing but the Extremities of an infinite Number of small Threads, which, in Labour, dropping out of the Pores in the sides of the Hypogastrick Blood-Vessels, into which they had insinuated themselves, is the occasion of the Flowing of the Lochia, till the Uterus collapses, or the Pores, by the natural Elasticity of the Vessels, contract by Degrees. See *LOCHIA*.

'Tis a great Dispute among the Anatomists of the Royal Academy of Paris, whether the *Placenta* have any external Coat, whereby it is connected to the Womb.—M. Aery maintains it has none; and that nothing hinders the Blood of the Mother from passing out of the Womb into the *Placenta* and thence to the Fœtus: In which Opinion he is seconded by M. Robault. Mess. *Frobenius* and *Winston* maintain the contrary; in a subsequent Memoir M. Robault endeavours to shew, that the *Placenta* is no particular Part, but only a Portion of the Chorion condens'd or thicken'd. See *CHORION*.

*PLACITA*, *Plas*, a Term frequent in our Laws and Customs. See *PLA*.

Originally, *Placita* signified certain publick Assemblies, of all Degrees of Men, wherein the King presided, and where the great Affairs of the Kingdom were consulted upon.

These Assemblies were call'd *Placita generalia*; because *Generalitas universorum majorum tam Clericorum quam Laicorum ibidem convenirent*.—And, hence, the Decrees, Ordinances, Sentences, &c. of the Assembly were also call'd *Placita*.

*Sim. Danielmenges* tells us they were held in the open Fields; for, says he, *Nallam oportet Regem in literis assignare curiam, quia ubi rex judicat in aperto, ibi est Curia sua*. See *COURT* and *CURIA*.

Some will have these *Placita generalia*, and *Curia Regis*, to be much the same with what we now call a *Parliament*. See *PARLIAMENT*.

The Lords Courts came hence also to be call'd *Placita generalia*, tho' oftener *Curia generalis*; because all their Tenants and Vassals were oblig'd to appear in them. See *LORD VASSAL*, &c.

We also meet with *Placitum nominatum*, for the Day appointed a Criminal to appear in and make his Defence, *Leg. Hen. I.*—And *Placitum factum*, *i. e.* when the Day is laps'd.

My Lord Coke derives the Word a *placitum*, *quia bene placitum super omnia placet*. Indeed this seems a very fanciful Definition; and others have more Reason in deriving it from the *German Plats*, or the *Latin Plateis*, Fields, or Streets, where these Assemblies were originally held.

*PLACITARE*, in the old Law-Books, signifies to plead Cases. See *PLEADING*.

*Mos placitandi ante conquestum, fuit curiam aldermanno, & proceribus, & eorum Hundredaribus, sc. Baronibus, Majoribus, Melioribus, Senioribus & Urbani. M. in Bibl. Cott. sub Tit. Vitellius*.

Hence, *Placitor*, a Pleader.—*Ralph Flambard* is recorded to be *totius Regni Placitor*, in *William* the second's Time.

*PLACITUM*, in Law, a Sentence of the Court; or an Opinion, Ordinance, or Decree. See *SENTENCE*, *DECREE*, *CANON*, &c.

*PLAFOND*, or *PLATFOND*, in Architecture, the Ceiling of a Room, whether it be flat or arch'd; lin'd with Plaster, or Joiners-Work, and frequently enriched with Paintings, &c. See *CEILING*.

*PLAFOND* is also more particularly used for the Bottom of the Projecture of the Larmier of the Corniche; call'd also *Soffit*. See *SOFFIT* and *LARMIER*.

*PLAGIARY*, in Philology, *Author-Theft*; or the Practice of pilloining other Peoples Works, and putting them off for a Man's own.

Among the *Romans*, *Plagiarius* was properly a Person who bought, sold, or retain'd, a free Man for a Slave; so call'd, because the *Flavian Law* condemn'd such a Person to be whipp'd, *ad plagas*. See *SLAVE*.

*Thomasius* has an express Treatise de *plagio litterario*; wherein he lays down the Laws and Measures of the Right which Authors have to one anothers Commodities.—Dictionary-Writers, at least such as meddle with Arts and Sciences, seem exempted from the common Laws of *Morus* and *Tuum*; they don't pretend to set up on their own bottom, nor to treat you at their own Cost.

Their Works are supposed, in great Measure, Assemblages of other Peoples; and what they take from others they do it avowedly, and in the open Sun.—In effect, their Quality gives

gives them a Title to every thing that may be for their purpose, wherever they find it; and if they rob, they don't do it any otherwise, than as the Bee does, for the publick Service. Their Occupation is not pillaging, but collecting Contributions; and if you ask them their Authority, they'll produce you the Practice of their Predecessors of all Ages and Nations. See DICTIONARY.

**PLAGUE, PESTIS, PESTILENCE**, a very acute, destructive, malignant, and contagious Disease; usually proving mortal. See DISEASE.

The *Plague* is commonly defined by a malignant Fever; but *Diemerbroek* thinks the two ought to be distinguished; the Fever not being the Essence, but only a Symptom, or Effect, of the *Plague*. See FEVER.

The *Plague* is reckoned by *Dr. Lister*, and many others, as an Exotic Disease, never bred or propagated in *England*, but always imported from abroad, and particularly from the *Levant*, the Coasts of *Asia* the lesser, *Egypt*, &c. where it is familiar.—*Sydenham* observes, that it rarely infects *England* oftener than once in 40 Years; but, thro' the Mercy of *God*, 'tis now 60 Years since we have been visited.

The Origin, and Cause of the *Plague* has been a celebrated Subject of Controversy among Physicians.—The Disorder is generally supposed to be communicated by the Air; but how, and in what manner the Air becomes thus deadly, is the Question. Some will have Infects the Cause of *Plagues* as of Blights; which being brought in Swarms from other Parts by the Winds, are taken into the Lungs in Respiration, mix with the Blood and Juices, and attack and corrode the *Viscera*. See BRIGHT.

*Mr. Boyle* attributes it principally to the Effluvia or Exhalations breathed into the Atmosphere, from noxious Minerals. See EXHALATION, &c.

The Air, in effect, is depraved in far more Places than improved, by being impregnated with subterraneous Expirations.—Indeed among the Minerals known to us, there are many more noxious than wholesome; and the Power of the former to do Mischief, is more efficacious than of the latter to do good, as we guess by the small Benefit Men receive in point of Health, by the Effluvia of any Mineral or other known Fossil, in comparison of the great and sudden Damage often done by the Expirations of Orpiment, Sandarach, and white Arsenic. See POISON.

Amongst the various sorts of Particles wherewith the Atmosphere is replete, some may be so small, and solid, or so conveniently shaped, as to enter many of the numerous Orifices of the minute Glandules of the Skin, or at other Pores thereof. Thus, tho' neither Paper, nor Bladder, be pervious to the Elastic Parts of the Air; yet may either of them be easily penetrated by other Corpuscles of the Atmosphere; and *Mr. Boyle* has prepared a dry Body, which being inclosed in either, would, without wetting or discolouring or any ways sensibly altering them, pass in a trice thro' the Pores thereof, in such Plenty, as to exert a manifest Operation on Bodies placed at some Distance beyond them.

This is confirmed from the sudden Check almost every Summer given to the *Plague* at *Grand Cairo*; for since morbid Causes operate more effectually than curative ones, it seems more than probable, that Exhalations ascending from under Ground, may produce pestilential Fevers, and the *Plague* itself; since the Corpuscles which impregnate the *Egyptian* Air upon the swelling of the Nile, put a speedy stop not only to the Contagion, but to the Malignity of the *Plague*, assuaged even by the Summer's Heat, which there is excessive. See INUNDATION.

'Tis possible there may be noxious Minerals in a Country, that are not often able to produce Pestilences; they may be in Strata, or Beds, so deep, that even a small Earthquake shall not affect them, tho' a more violent Shock may. See STRATA, EARTHQUAKE, &c.

And hence may we account for the *Plague's* raging in some Parts of *Africa* once in thirty, or once in a hundred Years; since there may be periodical Paroxysms, or grand and vehement Commotions in subterranean Parts, tho' not yet observed in them.

'Tis probable peculiar kinds of venomous Exhalations may sometimes be emitted, especially after Earthquakes; and thus occasion mortal Diseases in Animals of one kind and not of another, and in this or that Place, and not elsewhere.—*Fernelius* gives us an Account of a *Plague*, or *Murrain*, in 1574, which invaded none but Cats. *Dionysius Halicarnassensis* mentions a *Plague* which attacked none but Maids: And that which raged in the Time of *Genesis* killed scarce any Women, and very few but lusty Men. *Boterus* mentions another *Plague*, which assuaged none but the younger sort; and we have Instances of the same kind of a later standing. *Cardan* speaks of a *Plague* at *Basil*, with which the *Spaniards*, and not the *Italians*,  *Germans*, or *French* were infected; and *Job. Vtembovier* takes notice of a cruel *Plague* at *Copenhagen*, which, tho' it raged among the *Danes*, spared the  *Germans*, *Dutch*, and *English*, who went with all Freedom, and without the least Danger, to the Houses of the infected.

The *Plague*, according to *Sydenham*, usually begins with a Chilliness, and shivering, like the Access of an intermitting Fever; then comes on a Nausea, with vehement Vomiting, an intense Pain about the Region of the Heart, as if pinch'd in a Press, and a burning Fever, which continually preys on the Patient, 'till either Death, or the Eruption of some Bubo, Parotis, or other Tumor, in the Inguina or Axilla, or behind the Ears, relieve him, and discharge the Matter of the Disease. Sometimes, indeed, it attacks without any Fever; purple Spots appearing all at once, the certain Signs of present Death; but this rarely happens except at the beginning of some terrible *Plague*. It has also been known to make its first Appearance in Tumors, without any Fever, or other violent Symptom.

Heaviness, Pain in the Stomach Head and Back, Cardialgic, broken Sleep, Anxiety, Alteration in the Look, Difficulty of breathing, Hiccough, Syncope, Delirium, convulsive Twitchings, Diarrhea, Eyes sunk or inflamed, Tongue black and dry; vehement Drought, fetid Breath; Carbuncles, Spots livid purple green, &c. are also Symptoms usually attending this Disease.

A great deal depends on the Circumstances of the Tumors, or *Plague Sores*: as they appear, and increase, the Fever abates; and as they sink, or diminish, recovers again. When they happen about the Time of the Crisis, and suppurate kindly, they are good Prognosticks of a happy Recovery. See CRISIS.

In Acute Diseases, says *Hippocrates*, Prognosticks are ever fallacious. However, in the terrible *Plague* at *Nimwegen*, *Diemerbroek*, who attended the Sick through the whole Progress thereof, relates, That those taken ill about New and Full Moon rarely escaped; that Faintings, Swoonings, and Palpitations of the Heart, were usually deadly Signs; an intermitting Pulse always mortal; Drownings, Sneezings, tremulous Motions, Doting, sore Throat, &c. were ill Omens: Pleuritis, always mortal; Costiveness a good Sign; a Diarrhea almost constantly fatal: Bloody Stools or Urines always presaged ill.

As to the Cure, Physicians are much divided. It is generally attempted with Alexipharmacicks and Cardiacs, with the Assistance either of Sudorifics, or Phlebotomy, or both.—Many eminent Physicians, both ancient and modern, highly commend Blood-letting; *Sydenham*, particularly, says, that if used copiously, and in time, it never yet did harm; but that Sudorifics often prove pernicious: *Diemerbroek*, on the contrary, with other very experienced Writers, protest against Phlebotomy as very dangerous; and often deadly; The chief Hopes they build in Diaphoretics and Sudorifics; Emetics and Purgatives are absolutely forbid: and yet *Dr. Sayer* used the former with good Success, in the Beginning of the Disease in the *Plague* at *London*, Ann. 1640. See ALEXIPHARMIC, &c.

The Juice of Lemons is commended as of singular Efficacy in the *Plague*, and pestilential Fevers. *Piso* relates that it is the principal Remedy of the *Indians*, and protests he never knew any thing come up to it. *Dr. Harris* observes that the same is what the *Turks* have principally Recourse to.—Camphor is also much extoll'd. This, *Ermaster* assures us, was the Basis of *Heinsius's* Antipestiferential Oil, who had a Statue erected to him when dead, in the City of *Vergo*, for the Service he had done hereby.—It was prepared of equal Quantities of Camphor, Citron Bark, and Amber.—The Viperine Salt and Rob of Elder-Berries are also commended.

For Preservatives against this Disease, they are usually summ'd up in the popular Distich;

*Hæc tria labificem tollunt averbia pestem,  
Mox, longe, tarde, ecæ, recede, redi.*

Cauteries, and especially Issues, and Setons in the Inguina, are found of great Service in preserving from Infection. A Piece of Myrra held in the Mouth in contagious Places, is also commended. But *Diemerbroek* assures, that there is nothing better in this Intention, than smoking Tobacco; but he adds, that it was only so to such as had not made the Practice familiar to them. The other Preservatives used by that great Author, were the *Rod. Helmi*, Cardomans; White-Wine Vinegar, and Chearfulness; and when he found his Spirits low, as if the Disease were taking Possession, a Cup of generous Wine, sometimes to a Degree of Drunkenness.

**PLAGUE WATER**, *Aqua Epidemica*, is one of the Compound Waters of the Shops. See WATER.

**PLAIN**, an Epithet applied to various Things, generally importing them to be smooth, even, level, or superficial, or simple, or obvious, or the like.

In this Sense the Words stand opposed to rough, solid, &c.

It is a Maxim in Heraldry, that the plainer the Coat the nearer to Antiquity.—Plain Coats are such as are least encumber'd. See COAT, &c.

**PLAIN Figure**, in Geometry, is an uniform Surface, from every Point of whose Perimeter, right Lines may be drawn to every other Point in the same. See **FIGURE**; see also **PLANE** and **SURFACE**.

**PLAIN Angle** is an Angle contain'd under two Lines, or Surfaces. See **ANGLE**.

It is so call'd in contradistinction to a fold Angle. See **SOLID**.

**PLAIN Triangle** is a Triangle included under three right Lines, or Surfaces; in opposition to a spherical, and a mixt Triangle. See **TRIANGLE**.

**PLAIN Trigonometry** is the Doctrine of plain Triangles, their Measures, Proportions, &c. See **TRIGONOMETRY**.

**PLAIN Glass, Mirror, &c.** in Optics, is a Glass or Mirror, whose Surface is flat or even. See the **PHENOMENA LAWS** of plain Mirrors, under the Article **MIRROR**.

**Plain Mirrors** are what we popularly call *Looking-Glasses*; see the manner of grinding, polishing, and preparing them, under the Article *Looking-Glass GRINDING*.

**PLAIN Tyle**, See **TYLE**.

**PLAIN Scale**, is a thin Ruler, whereon are graduated the Lines of Chords, Sines, Tangents, Secants, Logues, Rhombs, &c. of ready Use in most Parts of the Mathematicks, chiefly in Navigation. See **LINE**, &c.

See its Description and Use under the Article **SCALE**.

**PLAIN Chart**, in Navigation, is a Sea-Chart, wherein the Meridians and Parallels are represented by parallel straight Lines; and where, of Consequence, the Degrees are the same in all the Parallels of Latitude.

See the *Properties, Construction, &c.* of this **Chart** under the Article **CHART**.

**PLAIN Sailing**, in Navigation, is the Art of working the several Causes and Varieties in a Ship's Motion, on a plain Chart. See **PLAIN CHART**.

**Plain Sailing** is founded on the Supposition of the Earth being a Plane or flat; which, tho' notoriously false, yet Places being laid down accordingly, and a long Voyage broke into many short ones; the Voyage may be tolerably perform'd by it, near the same Meridian.

In *Plain Sailing* it is imagined, that by the Rhumb-Line, Meridian, and Parallel of Latitude, there always will be formed a Right-angled Triangle; and that so posited, as that the Perpendicular may represent Part of the Meridian, or North and South Line, containing the Difference of Latitude: The Base of the Triangle, represents the Departure; and the Hypotenuse the Distance sail'd.—The Angle at the Top is the Course, and the Angle at the Base the Complement of the Course; any two of which, with the Right-Angle being given, the Triangle may be protract'd, and the other three Parts found. See **TRIANGLE**.

For the *Doctrine of Plain Sailing*, see **SAILING**.

**PLAIN Table**, in Geometry, &c. an Instrument used in the Surveying of Land; whereby the Draught, or Plan, is taken on the Spot, without any future Protraction or plotting. See **SURVEYING**, **PLOTTING**, &c.

The *Plain Table*, represented *Tab. Surveying, Fig. 31.* consists of a Parallelogram of Wood, about 15 Inches long and 12 broad; round this goes a Boxen jointed FRAME, by means whereof a Sheet of Paper is fasten'd tight to the Table, so as Lines may be conveniently drawn upon it.

On each side the Frame, which may be put on either side upwards, towards the inward Edge, are Scales of Inches, subdivided, for the ready drawing of Parallel Lines.—Beside which, on one side are project'd the 360 Degrees of a Circle, from a Brass Center in the middle of the Table, (each Degree halved) with two Numbers to every 10th Degree, the one expressing the Degree, the other its Complement to 360, to save Subtraction: On the other side are project'd the 180 Degrees of a Semicircle, from a Brass Center in the middle of the Table's Length, and at  $\frac{1}{2}$  of its Breadth; each Degree halvd, and every Tenth noted with two Numbers, viz. the Degree and its Complement to 180°.

To one side of the Table is fitted a Compass, for placing the Instrument by; and the whole is fix'd by a Socket, upon a three leg'd Staff for a Stand, on which it is turn'd round, or fasten'd by a Screw, as occasion requires.—Lastly, to the Table belongs an Index, which is a Ruler at least 16 Inches long, and 2 broad; and usually graduated with Scales, &c. and having two Sights perpendicularly placed on its Extremities. See **SIGHT**, **STAFF**, **BALL**, and **SOCKET**, &c.

#### Use of the PLAIN-Table.

To take an Angle by the Plain Table: Or to find the Distance of two Places accessible from the same third.—Suppose D, B, DS (*Tab. Surveying, Fig. 32.*) the sides of the Angle required; or AB the Distance required. Place the Instrument horizontally as near the Angle as possible; and assume a Point in the Paper on the Table, v. g. C. To this Point apply the Edge of the Index, turning it about this and that way, 'till thro' the Sights you see the Point B, and in this Situation of the Ruler, draw by its Edge the Line C E

indefinitely. After the same manner turn about the Index on the same Point, 'till thro' the Sights you see the Point A; and draw the right Line c d indefinitely.—Thus have you the Quantity of the Angle laid down.

Measure the Lines c A, c B, with a Chain; (see **CHAIN**), and from a Scale, set off the Measures thus found, (see **SCALE**) on the respective Lines; which suppose to reach from c to b, and from c to a.—Thus will c b and c a be proportional to c B and c A.

Transfer the Distance ab to the same Scale, and find its Length; the Length thus found, will be the Length, or Distance, of A B required.

<sup>2</sup> To find the Distance of two Places, one whereof is inaccessible, by the Plain Table.—Suppose the Distance required A B; (*Fig. 33.*) and A the accessible Point <sup>1</sup> Place the Plain Table in C; look thro' the Sights 'till you see A and B; and draw ac and cb. Measure the Distance from your Station to A, and set it off from the Scale, upon c a. <sup>2</sup> Remove the Table to A, where place it so, as that the Point a representing A, and the Index laid along the Line ac, you see, backwards, the former Station C. (*Note*, in this fixing the Instrument, lies the Use of the Compass; for the Needle will hang over the same Degree of the Card in the first and the second Case; so that some set the Instrument by the Needle alone; others only use it to shorten the Trouble, by bringing the Instrument nearly to its due Position by means thereof; and then fixing for good by the Back-Sight.) <sup>3</sup> The Instrument fix'd, turn the Sights to B; and draw the Line ab. <sup>4</sup> On the Scale, measure the Interval ab; which will be the Distance of A B required.

<sup>3</sup> To find the Distance of two inaccessible Places by the Plain Table.—Suppose the Distance of A B (*Tab. Surveying, Fig. 34.*) required. <sup>1</sup> Chasing two Stations in C and D; in the first C, place the Plain Table; and thro' the Sights look to D, B and A; drawing by the Edge of the Index, the Lines c d, c b, c a.—<sup>2</sup> Measure the Distance of the Stations CD; and set this off, from a Scale, on c d.—<sup>3</sup> Removing the Table from C, fix it in D; so as the Point d hanging over the Place D, and the Index lying along the Line c d, thro' the Sights you see the former Station C. The Instrument thus fix'd, direct the Sights to A and B, and draw the right Lines d a and d b. Lastly, find the Distance of a b, on the Scale; this will be the Distance of A B required.

After the same Manner, may the Distance of any Number of Places be found from two Stations; and thus may a Field, part of a Country, &c. be survey'd.

<sup>4</sup> To take the Plot of a Field from one Station, whence all the Angles may be seen; with the Plain Table.—Place the Instrument in the Station, assume a Point in the Paper, to represent the same, v. g. C. (*Fig. 21.*) Laying the Edge of the Index to this Point; direct it to the several Angles of the Field, A B C D E F, &c. and draw indefinite Lines by its Edge, towards every Angle, viz. C a, C b, C c, &c. measure the Distance of each Angle from the Station, viz. C a, C b, C c, C d, &c. and from a Scale set it off from C on its corresponding Line; the Extremities hereof will give Points, which being connected by Lines will represent the Field.

<sup>5</sup> To take the Plot of a Field, Wood, or the like, by going round the same; with the Plain Table.—Place the Instrument horizontally at the first Angle, v. g. A. The Needle on the Meridian of the Card; and assuming a Point on the Paper, to represent it, to that Point lay the Index, directing it 'till thro' the Sights you see a Mark in the Angle B. And draw an indefinite Line along it; measure the Distance of A and B, and from a Scale set it off on the Line thus drawn; the Extremity of this Distance will represent the Point B. Remove the Instrument to B, where set it so as that the Needle hang over the Meridian of the Card; and so as the Index lying along the Line laid drawn, you see the former Station A thro' the Sights: here fasten it, lay the Index to the Point B, and turn it, 'till thro' the Sights you see the next Angle C; in this Situation draw a Line as before, measure the Distance B C, and set it off from a Scale on the Line.—Remove the Instrument to C, where, fixing it by the Needle, and the Back-Sight, as before, turn the Index on the Point C, 'till you see the next Angle D; draw the Line, measure, and set off the Distance C D as before, and remove the Plain Table to E; where fix it, as before, look to the next Angle F, draw the Line, measure, and set off the Distance, &c.

In this manner having compass'd the whole Field, you'll have its whole Perimeter plotted on the Table; which may be now call'd up and its Contents found, as in the Article of **SURVEYING**.

#### Manner of finishing Paper on the Plain Table.

When in large Parcels of Ground, the Plot is found to exceed the Dimensions of the Plain Table, and to run off from the Paper; the Sheet must be taken off the Table, and a fresh one put on, The way of managing which finishing is as follows.—Suppose H, K, M, Z, (*Fig. 35.*) the Limits of the

*Plain Table*; so that having laid down the Field from A to B, thence to C and D; you want room, the Line DE running off the Paper: Draw as much of the Line DE as the Paper will well hold, viz. DO. And by means of the Divisions on the Edge of the Frame, draw the Line PQ thro' O, parallel to the Edge of the Table HM; and thro' the Point of Intersection O, draw ON parallel to MZ. This done, take off the Frame, remove the Sheet, and clap a fresh one (Fig. 56.) in its stead; drawing on it a Line RS near the other Edge parallel thereto. Then lay the first Sheet on the Table, so as the Line PQ lie exactly on the Line RS, to the best Advantage, as at O. Lastly, draw as much of the Line OD, on the fresh Sheet, as the Table will hold; and from O continue the Remainder of the Line D, to E. From E proceed with the Work as before to F, G, and A.

*Use of the Plain Table, at a Theodolite, Semicircle, or Circumferentor.*

The great Inconvenience of the *Plain Table* is, that its Paper renders it impracticable in moist Weather. Even the Dew of the Morning and Evening is found to swell the Paper considerably, and of consequence to stretch and distort the Work.—To avoid this inconvenience, and render the Instrument useful in all Weathers; by leaving off the Paper, and setting up a Pin in the Centre, it becomes a *Theodolite*, a *Semicircle*, or a *Circumferentor*, and practicable like them.

The *Plain Table* stripp'd of its Paper, becomes either a *Theodolite*, or a *Semicircle*, or as that side of the Frame which has the Projection of the Degrees of a Circle, or a *Semicircle*, is turn'd upwards. If it be to serve for a *Theodolite*; the Index, which as a *Plain Table* turns on any Point as a Center, is constantly to turn about the Brass Center Hole in the Middle of the Table.

If for a *Semicircle*, it must turn on the other Brass Center Hole; in both Cases 'tis done by means of a Pin rais'd in the Holes.

When the *Plain Table* is to serve as a *Circumferentor*; screw the Compass to the Index, and both of them to the Head of the Staff, with a Brass Screw-Pin fitted for the Purpose; so as the Staff and Table standing fix'd, the Index, Sights, &c. may be turn'd about and vice versa.

To take an Angle by the *Plain Table*, considered as a *Theodolite*.—Apply the Quantity of the Angle EKG (Fig. 20.) required. Place the Instrument at K, the *Theodolite* Side of the Frame upwards, laying the Index on the Diameter. Turn the whole Instrument about, the Index remaining on the Diameter, 'till thro' the Sights you spy E. Screw the Instrument fast there, and turn the Index on its Center, 'till thro' the Sights you spy G.

The Degree here cut on the Frame by the Index, is the Quantity of the Angle sought; which may be laid down on Paper by the Rules of common Protraction. See PROTRACTION.

Thus may you proceed to do every thing with the *Plain Table*, as with the common *Theodolite*. See THEODOLITE.

To take an Angle with a *Plain Table*, considered as a *Semicircle*.—Proceed in the same manner with the Instrument consider'd as a *Semicircle*, as when consider'd as a *Theodolite*; only laying the Semicircular Side upwards, and turning the Index on the other Center Hole in the middle of the Length, and at about  $\frac{1}{2}$  of the Breadth of the Table. See SEMICIRCLE.

To take an Angle with the *Plain Table*, considered as a *Circumferentor*.—Suppose the former Angle EKG required. Place the Instrument at K, the Flower-de-luce towards you. Direct the Sights to E, and observe the Degree cut by the South End of the Needle which suppose 296. Turn the Instrument about, the Flower-de-luce still towards you, and direct the Sight to G, noting the Degree cut by the other End of the Needle, which suppose 182. Subtract the less from the greater, the Remainder 114° is the Quantity of the Angle sought. If the Remainder chance to be more than 180° then it must be again subtracted from 360. This second Remainder will be the Angle required; which may be protracted, &c. as under the Article PROTRACTION.

Thus may you proceed to do every thing with the *Plain Table*, as with the common *Circumferentor*. See CIRCUMFERENTOR.

*PLAIN Number*, is a Number that may be produced by the Multiplication of two Numbers into one another.—Thus 20 is a *plain Number*, produced by the Multiplication of 5 into 4. See NUMBER.

*PLAIN Problems*, in Mathematics, is such an one, as cannot be solved Geometrically, but by the Intersection either of a Right Line and a Circle; or of the Circumferences of two Circles. See PROBLEM.

Such is the Problem following.—Given, the greatest Side, and the Sum of the other two Sides, of a Right-angled Triangle; to find the Triangle.—Such also is this, To describe a Trapezium that shall make a given Area of four given

Lines. Such Problems can only have two Solutions, in regard a Right Line can only cut a Circle, or one Circle cut another in two Points.

*PLAIN Place*, in Geometry, *Locus planus*, or *Locus ad planum*, a Term which the ancient Geometricians used for a Geometrical Locus, when it was a right Line, or a Circle; in opposition to a solid Place, which was an Ellipsis, Parabola, or Hyperbola.

Their *plan Loci* the Moderns distinguish into *Loci ad rektam*, and *Loci ad Circulam*. See LOCUS.

*PLAIN*, in Heraldry, is sometimes used for the Point of the Shield, when coup'd square; a Part remaining under the Square, of a different Colour, or Metal, from the Shield.

This has been sometimes used as a Mark of Bastardy, and call'd *Chastepagne*: For when the legitimate Descendants of Bastards have taken away the Barr, Fillet, or Traverse bore by their Fathers, they are to cut the Point of the Shield, with a different Colour call'd *Plain*. See BASTARD, DIMINUTION.

*PLAIN*, or *PLANE*, in Perspective, in Mechanics, Astronomy, &c. See PLANE.

*PLAIN*, in Law, is the propounding or exhibiting any Action, real or personal, in Writing. See ACTION.

Hence, the Party making this *Plain*, is call'd Plaintiff. See PLAINTIFF.

*PLAINTE*, in the ancient Customs of France, was a Request, or Petition, presented to the King, against the Judges of the Provinces, and afterwards against Bailiffs and Seneschals; for denying Justice, or for rendering Judgment contrary to the Laws of the Realm.

For in those Days there was no Appeal from their Decisions; but they all pronounced at the last hand: So that the *Plainte* was not directed against the Party, but against the Judge; who was ajourn'd to see his own Sentence declared null.

This was a kind of Supplement to the Way of Appeals, which was then shut up.—These *Plaines*, in the Capitalities of Charlemaign, are call'd *Blasphemie*.

*PLAIN* TITFE, in Law, be that sues, or complains, in an Assize, or in an Action personal; as, in an Action of Debt, Trepass, Deceit, Detinue, and the like. See ACTION.

*PLASTER*, in Building. See PLASTER, MORTAR, &c.

*PLASTER*, in Medicine. See EMPLASTER.

*PLAIT*. See FOLD.

*PLAN*, a Representation of something drawn on a Plane. See PLANE; see also MAP, CHART, &c.

Such are Maps, Charts, Ichographies, &c. See PLANISPHERE.

*PLAN*, in Architecture, &c. is particularly used for a Draught of a Building, such as it appears, or is intended to appear, on the Ground; shewing the Extent, Division, and Distribution of its Area into Apartments, Rooms, Passages, &c. See BUILDING.

The *Plan* is the first Device or Sketch the Architect makes; it is also call'd the *Group'd-Plan*, *Plan-Form*, and *Ichography* of the Building. See ICHOGRAPHY, &c.

The *Geometrical Plan* is that wherein the solid and vacant Parts are represented in their natural Proportion.

*Rais'd Plan* is that where the Elevation, or Upright, is shewn upon the *Geometrical Plan*, so as to hide the Distribution. See ELEVATION.

*Perspective Plan* is that conducted and exhibited by Degradations, or Diminutions, according to the Rules of Perspective. See PERSPECTIVE.

To render the *Plans* intelligible, 'tis usual to distinguish the Massives with a black Walk. The Projections on the Ground are drawn in full Lines, and those supposed over them in dotted Lines. The Augmentations or Alterations to be made, are distinguished by a Colour different from what is already built; and the Feints of each *Plan* made lighter as the Stories are rais'd.

In large Buildings 'tis usual to have to many several *Plans* for the first three Stories.

For the *Perspective* of a *PLAN*. See PERSPECTIVE.

*PLANCERE*, in Architecture, the under Part of the Corona, or Drip; making the superior Part of the Cornice, between two Cymatiums. See CORONA, CORNICE, &c.

*PLANE*, or *PLAN*, *PLAINS*, *PLANUM*, in Geometry, a *plain Figure*; or a Surface, lying evenly between its bounding Lines. See PLAIN.

*Walfus* defines it a Surface, from every Point of whose Perimeter a Right Line may be drawn to every other Point in the same.

As the right Line is the shortest Extent from one Point to another; so is a *Plane* the shortest Extension between one Line and another. See LINE and SPACE.

*PLANES* are frequently us'd in Astronomy, &c. for imaginary Surfaces, suppos'd to cut, and pass thro' solid Bodies; and on this Foundation it is that the whole Doctrine of Conic Sections and of the Sphere turn. See SECTION.

When

When a *Plane* cuts a *Cone* parallel to one of its sides, it makes a *Parabola*; when it cuts the *Cone* parallel to its Base, it makes a *Circle*. See *CONICKS*.

The *Sphere* is wholly explained by *Planes*, imagin'd to cut the *Celestial Luminaries*, and to fill the *Areas* or *Circumferences* of their *Orbits*. See *SPHERE*.

Astronomers shew, that the *Plane* of the *Moon's Orbit* is inclined to the *Plane* of the *Earth's Orbit*, or the *Ecliptic*, by an Angle of about 5 Deg. and passes thro' the *Center* of the *Earth*. See *ORBIT*.

The *Intersection* of this *Plane* with that of the *Ecliptic*, has a proper *Motion* of 3' 11" each Day, from East to West; so that the *Nodes* answer successively to all the *Degrees* of the *Ecliptic*, and make a *Revolution* round the *Earth* in about 19 Years. See *NODES*.

The *Planes* of the *Orbits* of the other *Planets*, like that of the *Ecliptic*, pass thro' the *Center* of the *Sun*.—The *Plane* of the *Orbit* of *Saturn*, is inclined to the *Ecliptic* by 2° 33' 30", and cuts it, at present, in the 22d Degree of *Cancer* and *Capricorn*. See *INCLINATION*; see also *MOON* and *PLANET*.

The *Centre* of the *Earth*, then, being in the *Plane* of the *Moon's Orbit*, the *Circular Section* of that *Plan* in the *Moon's Disk*, is represented to us in Form of a *Right Line* passing thro' the *Center* of the *Moon*.—This *Line* is inclined to the *Plane* of the *Ecliptic* by 5° when the *Moon* is in her *Nodes*: But this *Inclination* diminishes as that *Planet* recedes from the *Nodes*; and at three *Degrees* distance, the *Section* of the *Moon's Orbit* in its *Disk*, becomes parallel to the *Plane* of the *Ecliptic*. The *same* *Appearances* attend the *primary Planets*, with regard to the *Sun*.

But the *Case* is very different in the *Planets* seen from one another, especially from the *Earth*.—The *Planes* of their *Orbits* only pass thro' the *Center* of the *Earth* when they are in their *Nodes*: In every other *Situation*, the *Plane* is rais'd above the *Orbit* of the *Planet*, either to the *North* or the *South*. And the *Circular Section* of the *Plane* of the *Orbit* on its *Disk*, or in the *Orbit* of one of its *Satellites*, does not appear a *Right Line*, but an *Ellipsis*, broader or narrower as the *Earth* is more or less elevated above the *Plane* of the *Orbit* of the *Planet*.

*PLANE*, in *Mechanicks*.—A *Horizontal PLANE*, is a *Plane* level or parallel to the *Horizon*. See *HORIZON*.

The determining how far any given *Plane*, &c. deviates from a *Horizontal one*, makes the whole *Business* of *Leveling*. See *LEVELLING*.

*Inclined PLANE*, in *Mechanicks*, is a *Plane* which makes an *oblique Angle* with an *Horizontal Plane*. See *OBLIQUE*.

The *Doctrine* of the *Motion* of *Bodies* on *Inclined Planes* makes a very considerable *Article* in *Mechanicks*; the *Substance* whereof is as follows:

#### Laws of the Descent of Bodies on an INCLINED PLANE.

If a *Body* be placed on an *inclined Plane*, its *relative Gravity* will be to its *absolute Gravity*, as the *Length* of the *Plane*, *v. gr.* AC (*Tab. Mechanicki, Fig. 58.*) to its *Height* AB. See *GRAVITY*.

Hence, 1° since the *Ball D* only gravitates on the *inclined Plane*, with its *relative Gravity*; the *Weight L*, applied in a *Direction*, parallel to the *Length* of the *Plane*, will retain or suspend it, provided its *Weight* be to that of the *Ball*, as the *Altitude* of the *Plane* BA is to its *Length* AC.

2° If the *Length* of the *Plane* CA be taken for the *whole Sine*; AB will be the *Sine* of the *Angle* of *Inclination* ACB.—The *absolute Gravity* of the *Body*, therefore, is to its *relative Gravity* applied on the *inclined Plane*; and therefore, also, the *Weight D* to the *Weight L* acting according to the *Direction* DA which sustains it; as the *whole Sine* to the *Sine* of the *Angle* of *Inclination*.

3° Hence the *relative Gravities* of the *same Body* on different *inclined Planes*, are to each other as the *Sines* of the *Angle* of *Inclination*.

4° The *greater*, therefore the *relative Gravity* is, the *greater* is the *Angle* of *Inclination*.

5° As, therefore, in a *vertical Plane*, where the *Inclination* is greatest, *viz.* perpendicular, the *relative Gravity* degenerates into *absolute*; so in a *horizontal Plane*, where there is no *Inclination*, the *relative Gravity* vanishes.

II. To find the *Sine* of the *Angle* of *Inclination* of a *Plane*, on which a given *Power* will be able to sustain a given *Weight*.—Say, as the given *Weight*, is to the given *Power*, so is the *whole Sine* to the *Sine* of the *Angle* of *Inclination* of the *Plane*. Thus, suppose a *Weight* of 1000 be to be sustained by a *Force* of 50; the *Angle* of *Inclination* will be found 2° 52'.

III. If the *Weight L* descend according to the *perpendicular Direction* AB, and raise up the *Weight D* in a *Direction* parallel to the *inclined Plane*; the *Height* of the *Ascend* of *D* will be to that of the *Descent* of *L*, as the *Sine* of the *Angle* of *Inclination* C, to the *whole Sine*.

Hence, 1° The *Height* of the *Descent* CD of the *Weight L* is to the *Height* of the *Ascend* DH of the *Weight D*; reciprocally as the *Weight D* to the *equivalent Weight L*.

2° Since then CD=DH, and the *Actions* of the *equipopondering Bodies D* and *L* are equal; the *Moments* of the *Weights D* and *L* are in a *Ratio* compounded of their *Masses*, and *Altitudes*, thro' which they ascend or descend in a *Plane*, either inclined or perpendicular.

3° The *Powers* that raise *Weights thro' their Altitudes* reciprocally proportional to them, are equal.—This *Des Cartes* assumes as a *Principle* whereby to demonstrate the *Powers* of *Machines*. Hence we see why a *loaden Waggon* is drawn with more *Difficulty* on an *inclined* than an *horizontal Plane*; as being press'd with a *Part* of the *Weight* which is to the *whole Weight* in a *Ratio* of the *Altitude* to the *Length*.

IV. *Weights E* and *F*, equipoponderating upon *inclined Planes AC* and *CB* of the *same Height CD*, are to each other as the *Lengths* of the *Planes AC* and *CB*.

*S. Stevius* gives a very pretty *Demonstration* of this *Theorem*, which, for its *Easiness* and *Ingenuity*, we shall here add.—Put a *Chain*, whose *Parts* do all exactly weigh in *Proportion* to their *Length*, over a *Triangle*, G I H: (*Fig. 59.*) 'Tis evident the *Parts GK* and *KH* do balance each other. If then *IH* did not balance *GI*, the *preponderating Part* would prevail; and there would arise a *perpetual Motion* of the *Chain* about *G I H*; but this being absurd, it follows, that the *Parts* of the *Chain IH* and *G I*; and consequently all other *Bodies* which are as the *Lengths* of the *Planes IH* and *I, G* will balance each other.

V. A *heavy Body* descends on an *inclined Plane*, with a *Motion* uniformly accelerated. See *ACCELERATION*.

Hence, 1° The *Spaces* of *Descent* are in a *duplicate Ratio* of the *Sines*, and likewise of the *Velocities*; and therefore in *equal times* increase according to the *unequal Numbers* 1, 3, 5, 7, 9, &c.

2° The *Space* pass'd over by a *heavy Body* descending on an *inclined Plane*, is subscale of that which it would pass over in the *same Time*, with the *Velocity* it has acquired at the *End* of its *Fall*.

3° *Heavy Bodies*, therefore, descend by the *same Laws* on *inclined Planes*, as in *perpendicular Planes*. Hence it was, that *Galileo*, to find the *Laws* of *perpendicular Descent*, made his *Experiments* on *inclined Planes*, in regard to the *Motions* being slower in the latter than the former; as in the following *Theorem*.

VI. The *Velocity* of a *heavy Body* descending on an *inclined Plane*, at the *End* of any given *Time*; is to the *Velocity* which it would acquire in falling perpendicularly, in the *same Time*; as the *Height* of the *inclined Plane* is to its *Length*.

VII. The *Space* pass'd over by a *heavy Body* on an *inclined Plane AD*, (*Fig. 60.*) is to the *Space AB*, it would pass over in the *same time* in a *perpendicular Plane*: As its *Velocity* on the *inclined Plane* is to its *Velocity* in the *perpendicular Descent*, at the *End* of any given *time*.

Hence, 1° The *Space* pass'd over in the *inclined Plane*, is to the *Space* it would descend in the *same time* in the *perpendicular Plane*, as the *Altitude* of the *Plane AB* to its *Length AC*; and therefore as the *Sine* of the *Angle* of *Inclination* to the *whole Sine*.

2° If, then, from the *Right Angle B*, a *Perpendicular* be let fall to *AC*; AC: AB :: AB: AD. So that in the *same time* wherein the *Body* would fall perpendicularly from *A* to *B*; in an *inclined Plane* it will descend from *A* to *D*.

3° The *Space*, therefore, of *perpendicular Descent* being given in the *Altitude* of the *Plane AB*; by letting fall a *Perpendicular* from *B* to *AC*, we have the *Space AD* to be pass'd over in the *same time* on the *inclined Plane*.

4° In like manner, the *Space AD*, pass'd over on the *inclined Plane*, being given; we have the *Space AB*, thro' which it would descend perpendicularly in the *same time*, by raising a *Perpendicular* meeting the *Side* of the *Plane* in *B*.

5° Hence in the *Semicircle ADEFB*, the *Body* will descend thro' all the *Planes AD, AE, AF, AC*, in the *same time*; *viz.* in that time wherein it would fall thro' the *Diameter AB*, supposing that *perpendicular* to the *horizontal Plane LM*.

VIII. The *Space AD*, pass'd over in an *inclined Plane AC*, being given; to determine the *Space* which would be pass'd over in any other *inclined Plane* in the *same time*.

From the *Point D* erect a *Perpendicular DB*, meeting the *Altitude AB* in *B*; then will *AB* be the *Space*, thro' which the *Body* would fall perpendicularly in that time. Wherefore if from *B* a *Perpendicular BE* be let fall to the *Plane AF*; *AE* will be the *Space* in the *inclined Plane* which the *Body* will pass over, in the *same time* wherein it falls perpendicularly from *A* to *B*; and consequently *AD* will be the *Space* in the *other inclined Plane AC*, which it passes thro' in the *same time*.

Hence, since AB is to AD, as the whole Sine to the Sine of the Angle of Inclination C. And AB is to AE as the whole Sine to the Sine of the Angle of Inclination F; the Spaces AD and AE, which the Body will pass over in the same Time on different inclined Planes, are as the Sines of the Angles of Inclination, C and F, and reciprocally as the respective Gravities on the same Planes. And consequently, also, reciprocally as the Lengths of Planes equally high AC and AF.—Whence the Problem may be resolved various Ways by Calculation.

IX. The Velocities acquired in the same time on different inclined Planes, are as the Spaces pass'd over in the same Time.—Hence, also, they are as the Sines of the Angles of Inclination C and F; reciprocally as the respective Gravities on the same Planes; and reciprocally as the Lengths of equally high Planes, AC and AF.

X. A Body descending on an inclined Plane AC, when it arrives at the horizontal Line CB, has acquired the same Velocity which it would have acquired in a perpendicular Descent AB, to the same horizontal Line CF.

Hence, <sup>10</sup> A heavy Body descending thro' different inclined Planes, AC, A C, A F, has acquired the same Velocity when it arrives at the same horizontal Line CF.

Hence also a Body containing its Descent thro' several contiguous inclined Planes acquires the same Velocity which it would acquire in descending perpendicularly to the same horizontal Plane.

XI. The Time of Descent along an inclined Plane AC, is to the Time of perpendicular Descent thro' AB, as the Length of the Plane AC, to its Altitude AB: But Times of Descents thro' different inclined Planes equally high AC and AG, are as the Lengths of the Planes.

XII. If the Diameter of a Circle AB, (Fig. 60.) be parallel to the horizontal Line LM; a Body will descend from any Point of the Periphery D, E, or C to B, along an inclined Plane DC, EB, and CB, in the same Time wherein it will descend thro' the Diameter AB. Hence,

XIII. The Descents of a Body thro' a Semicycloid DEF, (Fig. 61.) and thro' any Arch thereof BAK, are always equidurnal, or perform'd in the same Time; on which Principle is built the Doctrine of Pendulums vibrating in a Cycloid. See CYCLOID and PENDULUM.

Laws of the Ascent of Bodies on Inclined Planes.

I. If a Body ascend in a Medium void of Resistance, in any Direction, whether perpendicular, or along an inclined Plane; its Motion will be uniformly retarded. See RETARDATION.

Hence, <sup>10</sup> A Body ascending either perpendicularly or obliquely, in such a Medium passes over a Space which is double of that it would pass over in the same Time on a horizontal Plane, with an uniform Celerity equal to that it has at the Beginning of its Motion.

<sup>20</sup> Such Spaces, therefore, perform'd in equal Times, decrease in a retrograde Order, as the uneven Numbers 7, 5, 3, 1: and therefore the Ascent is so much impeded; consequently, when the impress'd Force is exhausted, the Body will descend again by the Force of Gravity.

<sup>30</sup> They are therefore, inversely, as the Spaces describ'd in the same Times by a Body descending thro' the same Altitude.—For, suppose the Time divided into four Parts; In the first Moment, the Body A descends thro' the Space 1, and B ascends thro' 7; in the second, A descends thro' 3, B ascends thro' 5, &c.

<sup>40</sup> Hence, a Body rising with an impress'd Force, ascends to that Altitude, from which it must fall to acquire that Velocity in falling, wherewith it ascended.

<sup>50</sup> Hence, by falling it acquires a Force to rise again to the Height whence it fell. See PENDULUM.

II. The Time wherein a Body ascends to a given Altitude, being given; to determine the Spaces pass'd over each Moment.—Suppose the same Body to descend from the same Altitude in the same time; and find the Spaces pass'd over each Moment. (See MOTION.) These, taken inversely, are the same with the Spaces of Ascent required.

Suppose, *v. g.* A Body projected perpendicularly, to ascend thro' a Space of 240 Feet in 4 Seconds; and the Spaces of Ascent perform'd in the several Times required? If, now, the Body had descended, the Descent in the first Minute had been 15 Feet, in the second 45, in the third 75, in the fourth 105, &c. The Descent therefore will be in the first Moment 105, in the second 75, &c.

III. If a Body descend either perpendicularly thro' D A, (Fig. 61.) or in any other Surface FED, and with the Velocity it has there acquired, again ascend along another Surface DC, at Points equally high, *e. gr.* at G and H, and Q, and D, it will have the same Force and the same Velocity.

Hence, if a Body descend along any Surface, FED, and again ascend along another similar and equal Surface DGC; 'tis the same as if it pass'd over the several Parts of the same Line twice.

Whence, the Times of Ascent and Descent thro' equal Spaces are equal.

On this Principle is founded the Construction and Use of Pendulums. See PENDULUM and OSCILLATION.

PLANE of Gravity, or Gravitation, is a Plane supposed to pass thro' the Center of Gravity of the Body, and in the Direction of its Tendency; that is, perpendicular to the Horizon. See GRAVITY and GRAVITATION.

PLANE of Reflection, in Catoptics, is a Plane which passes through the Point of Reflection; and is perpendicular to the Plane of the Glass; or reflecting Body. See REFLECTION.

PLANE of Refraction is a Plane drawn thro' the incident and refracted Ray. See REFRACTION.

Perspective PLANE, is a plain pellucid Surface, ordinarily perpendicular to the Horizon, and placed between the Spectator's Eye and the Object he views; thro' which the optic Rays, emitted from the several Points of the Object, are supposed to pass to the Eye, and in their Passage to leave Marks that represent them on the said Plane. See PERSPECTIVE.

Such is the Plane HV; (Tab. Perspective Fig. 1.) some call it the Table, because the Desight, or Perspective of the Object, is supposed to be thereon; others, the Section, from its cutting the visual Rays; and others, the Glass, from its suppos'd Transparency.

Geometrical PLANE, in Perspective, is a Plane parallel to the Horizon, whereon the Object to be delineated is supposed to be placed.

Such is the Plane LM. (Fig. 1. Tab. Perspective)—This Plane is usually at right Angles with the Perspective Plane.

Horizontal PLANE, in Perspective, is a Plane passing thro' the Spectator's Eye, parallel to the Horizon, cutting the Perspective Plane when that is perpendicular to the Geometrical one, at right Angles.

Vertical PLANE, in Perspective, a Plane passing thro' the Spectator's Eye, perpendicular to the Geometrical Plane; and usually parallel to the Perspective Plane. See VERTICAL.

Objective PLANE, in Perspective, is any Plane situate in the horizontal Plane, whole Representation in Perspective is required. See OBJECT.

PLANE of the Horopter, in Optics, is a Plane that passes thro' the Horopter, A B, (Tab. Optics Fig. 67.) and is perpendicular to a Plane passing thro' the Optic Axes ICH. See HOROPTER.

PLANE of the Projection, in the Stereographic Projection of the Sphere, is the same with the perspective Plane, which see. See also PROJECTION, &c.

PLANE of a Dial, or Dial PLANE, the Surface whereon a Dial is drawn. See DIAL.

We have Horizontal, Vertical, Inclining, Declining, Reclining, Declining, Direct, &c. Dial Planes. See INCLINING, DECLINING, RECLINING, DIRECT, &c.

PLANE Glass, Mirror, &c. See PLAIN Glass, Mirror, &c.

PLANE, in Joinery, &c. an Edge-Instrument, used to pare or shave Woods smooth, even, &c.

It consists of a Piece of Wood, very smooth at bottom, serving as a Stock, or Shaft; in the middle whereof is an Aperture, thro' which passes a Steel Edge, or Chisel, obliquely placed, and very sharp, which takes off the Inequalities of the Wood it is slid along.

The Plane acquires various Names according to its various Forms, Sizes and Uses: as, <sup>10</sup> The Fore-Plane, which is very long, and is that commonly first used. The Edge of its Iron is not ground straight, but rises with a Convex-Arch in the middle, to bear being let the ranker; its Use being to take off the greater Irregularities of the Stuff, and to prepare it for the Smoothing Plane.

<sup>20</sup> The Smoothing Plane is short and small, its Iron, fine; it takes off the greater Irregularities left by the Fore-Plane, and prepares the Wood for the Jointer.

<sup>30</sup> The Joiner is the longest of all; its Edge very fine, not standing out above a Hair's Breadth; it comes after the Smoothing-Plane, and is chiefly intended to shoot the Edge of a Board perfectly straight for jointing smooth Tables, &c.

<sup>40</sup> The Strike-Block is like the Joiner, but shorter; its Use, to shoot short Joins, &c.

<sup>50</sup> Rubber-Plane, used to cut the upper Edge of a Board, flat or square, down into the Stuff; so as the Edge of another, cut after the same manner, may join in with it on the Square; it is also used to strike Fak's in Mouldings. Its Iron is full as broad as its Stock, that the Angle may cut straight; and it delivers its Shavings at the Sides, not, like the others, at the Top.

<sup>60</sup> The Plow, a narrow Rabet-Plane, with the Addition of two Staves, whereon are Shoulders, and on the Shoulders a Fence.—Its Use is to plow a narrow square Groove on the Edge of a Board, &c.

<sup>70</sup> Moulding-Planes; of these there are various Kinds, accommodated

accommodated to the various Forms and Profiles of the Mouldings; (See MOULDING) as the Round Plane, the Hollow, the OG, the Snake's Bill, &c. which are all of several Sizes, from half an Inch to an Inch and half. See MOULDING, &c.

To use the Moulding Plane on soft Wood, as Deal, Pear-Tree, &c. they set the Iron to an Angle of 45° with the Base or Sole of the Plane. On hard Wood, v. gr. Ebony, Box, &c. they set to an Angle of 80°; sometimes quite upright. To work on hard Wood, the Edge or Basil is ground to an Angle of 18 or 20 Deg: on soft Wood, to an Angle of about 12°. For the more acute the Basil, the smoother the Iron cuts; but the more obtuse, the stronger.

PLANE, among Fowls.—To plane, is to fly or hover as a Bird does, without moving its Wings. See FLYING, HAWK and HAWKING.

PLANET, PLANETA, in Astronomy, a Celestial Body, revolving round the Sun as a Centre, and continually changing its Position, with respect to the other Stars; whence its Name was given. Wanderer; in opposition to a fix'd Star. See STAR.

The Planets are usually distinguished into Primary and Secondary.

The Primary PLANETS, call'd also, simply, Planets, by way of Eminence, are those which move round the Sun as their proper Center.—Such are Saturn, Jupiter, Mars, the Earth, Venus, and Mercury.

Secondary PLANETS are such as move round some Primary Planet, as their respective Center, in the same manner as the Planets do round the Sun.—Such are the Moon moving round our Earth; and those others moving round Saturn and Jupiter, properly call'd Satellites. See the Doctrine of Secondary Planets, under the Article SATELLITES.

The Planets, or Primary Planets, are in Number six; which are again distinguished into Superior and Inferior.

The Superior PLANETS are those further off the Sun than our Earth is.—Such are Mars, Jupiter, and Saturn.

The Inferior PLANETS are those nearer the Sun than our Earth, and situate between the Earth and Sun.—Such are Venus and Mercury. See the Order, Position, &c. of the Planets represented to the Eye, Tab. Astronomy, Fig. 44.

The Planets are represented by the same Characters as the Chymists use to represent their Metals by, on account of some supposed Analogy between those celestial and subterraneous Bodies. See METAL and CHARACTER.

Saturn is represented by the Character ♄.—This Planet, by reason of its great Distance appears to the Eye with a feeble Light.—It performs its Revolution round the Sun in about 30 Years. See SATURN.

Jupiter, mark'd ♃, is a bright refulgent Star, finishing its Course round the Sun in about 12 Years. See JUPITER.

Mars, characteris'd ♃, is a ruddy fiery colour'd Planet, finishing its Course in about two Years. See MARS.

Venus, ♀, is the brightest of all the Planets, constantly attending the Sun, and never distant from him above 47 Degrees.—It finishes its Course in about eleven Months. See VENUS.

When it goes before the Sun, 'tis call'd Phosphorus, and Lucifer; and when it follows him Hesperus. See PHOSPHORUS, &c.

Mercury, ☿, a little bright Planet, the Sun's constant Companion, from whose side it never departs above 28°, and by that means usually hid in his Splendor.—It performs its Course in about three Months. See MERCURY.

To which we now add, Tellus, the Earth, mark'd ♁ or ♂, performing its Course about the Sun, between Mars and Venus, in the Space of a Year. See EARTH.

From these Definitions, a Person may easily distinguish all the Planets.—For if after Sun-set he see a Planet nearer the East than the West, he may conclude 'tis neither Mercury nor Venus; and may determine whether 'tis Saturn, Jupiter, or Mars, by the Colour and Light: By which also he may distinguish between Mercury and Venus.

#### Nature of the PLANETS.

From the several Phases and Appearances of the Planets, they are found to be all perfectly like the Moon; which we have shewn to be perfectly like our Earth; whence it follows, that the Planets, too, are dark, opaque, spherical, &c. Bodies, like our Earth. See MOON.

This may be shewn almost to a Demonstration.—1° Venus, observ'd with a Telescope, is rarely found full, but with variable Phases like those of the Moon; her illumined Part first turn'd towards the Sun, viz. toward the East when she is the Morning-Star, and the West when the Evening-Star.—And the like Phases are observ'd in Mercury and Mars.

2° Galendus first, and after him others, have observ'd Mercury on the Face of the Sun, across which he appeared to pass like a black round Spot. See TRANSIT.—Morxus in 1610, also observ'd Venus in the Sun; where she made the same Appearance.

3° De la Hire, in 1700, with a Telescope of 16 Foot, discover'd Mountains in Venus, larger than those of the Moon, See MOUNTAIN.

4° Cassini observ'd two Spots in Venus; four in Mars, likewise observ'd by Campani; and several, at several times, in Jupiter; and from his Observations of these Spots found that they had a Rotation round their Axes; and even determin'd the Velocity of that Rotation, or the Period wherein it was effected, v. g. That of Jupiter, 9 Hours 56'. That of Mars 24 Hours 40'. And that of Venus, 24 Hours. See SPOT.—And since the Sun, Moon, Jupiter, Mars, Venus, and the Earth, are found to revolve on their Axes, i. e. to have a diurnal Rotation; no doubt Mercury and Saturn have the same; tho' the great Nearness of the former to the Sun, and the great Distance of the latter, prevent any Spots from being observ'd on them, whence that Rotation might be demonstrated.

5° In Jupiter are observ'd two Swaths, or Belts, brighter than the rest of his Disk, and moveable; sometimes found in one part sometimes in another, sometimes broader sometimes narrower. See BELT.

6° In 1609 were first observ'd three little Stars, or Moons, moving about Jupiter by Sim. Adams; and in 1610 the same were observ'd by Galilæus: These are now frequently observ'd to disappear in a clear Sky, when Jupiter happens to be diametrically interposed between them and the Sun.—Whence it appears they are void of Light, at such Time

when the Sun's Rays, intercepted by Jupiter, cannot be propagated to them in right Lines; and hence also, that, like the Moon they are opaque Bodies, illumined by the Sun; and hence, again, since Jupiter does not illumine his Satellites when found behind him, he himself, in that Part turn'd from the Sun, may be argu'd to be void of Light.

7° When Jupiter's Moons are diametrically interposed between Jupiter and the Sun, there is seen a round Spot on Jupiter's Disk, which is sometimes larger than the Satellite itself.—Whence it appears, that the Satellites are opaque Bodies, illumined by the Sun, that they project a Shadow upon the Sun, and that the round Spots seen in Jupiter are the Shadows of the Satellites. Whence, also, the Intersection of the Shadow being found to be a Circle, the Shadow must be conical; and therefore the Figure of the Satellites, at least as to Sense, is spherical.

8° The Earth being between Jupiter and the Sun; if, at the same Time, any of the Satellites happen to be between Jupiter and the Sun, it is lost in Jupiter's Light; tho' sometimes appearing like a black Spot.—This Phenomenon has been frequently observ'd by Cassini and Maraldi, who have likewise noted very considerable Alterations in the apparent Magnitudes of the Satellites; for which no Reason could be given from the Distance of Jupiter, the Sun, or the Earth; v. g. That the fourth, which is usually the smallest, is sometimes the largest; and the third, which is usually the largest, sometimes the smallest.—Hence, as the Satellites are illumined by the Sun, even then when immerg'd in Jupiter's Light, yet do appear obscure, there must be some Alterations in their Atmospheres, to prevent the Sun's Rays being equally reflected from every Part of their Surface; which must likewise be the Cause why their Shadow is sometimes larger than themselves.

Now, to sum up the Evidence.—1° Since in Venus, Mercury, and Mars, only that Part of the Disk illumined by the Sun, is found to shine; and, again, Venus and Mercury, when between the Earth and the Sun, appear like dark Spots or Macule, on the Sun's Disk; 'tis evident, that Mars, Jupiter, and Mercury, are opaque Bodies, illumined with the borrow'd Light of the Sun. And the same appears of Jupiter, from its being void of Light in that Part to which the Shadow of the Satellites reaches, as well as in that Part turn'd from the Sun; and that his Satellites are opaque, and reflect the Sun's Light, is abundantly shewn. Wherefore since Saturn, with his Ring and Satellites, do only yield a faint Light, fainter considerably than that of the fix'd Stars; tho' these be vastly more remote; and than that of the rest of the Planets: 'tis past doubt, he, too, with his Attendants, are opaque Bodies.

2° Again, since the Sun's Light is not transmitted thro' Mercury and Venus, when placed against him; 'tis plain they are dense opaque Bodies; which is likewise evident of Jupiter, from his hiding the Satellites in his Shadow; and, therefore, by Analogy, the same may be concluded of Saturn.

3° From the variable Spots in Venus, Mars, and Jupiter, 'tis evident those Planets have a changeable Atmosphere; which changeable Atmosphere may, by a like Argument, be infer'd of the Satellites of Jupiter; and therefore, by similitude the same may be concluded of the other Planets.

4° In like manner, from the Mountains observ'd in Venus; the same may be suppos'd in the other Planets.

5° Since then Saturn, Jupiter, both their Satellites, Mars, Venus, and Mercury, are opaque Bodies, shining with the Sun's borrow'd Light, are furnish'd with Mountains, and encompass'd

encompass'd with a changeable Atmosphere; they have, of consequence, Waters, Seas, &c. as well as dry Land, and are Bodies like the Moon, and therefore like the Earth.

Q. E. D.  
And hence, nothing hinders but that the Planets may be concluded to be inhabited.

As to the Planetary Inhabitants; *Huygens* in his *Cosmotheoria* argues very plausibly for their Existence, from the similitude of the Planets with our Earth; those, like this, being opaque, dense, uneven, round, heavy, illuminated and warm'd by the Sun; having Night and Day, Summer and Winter, &c. *Wolffius* deduces something relating hereto from Arguments of another kind.—Thus e. g. 'Tis scarce to be doubted, that the Inhabitants of *Jupiter* are much larger than those of the Earth; and in effect of the Giant Kind. For it is shewn in Optics, that the Pupil of the Eye dilates in a strong Light, and contracts in a weak one; wherefore, since in *Jupiter* the Sun's Meridian Light is much feebler than on the Earth, by reason of *Jupiter's* greater Distance from the Sun; the Pupil will need to be much more dilatate in the Inhabitants of *Jupiter*, than in those of the Earth. But the Pupil is observ'd to have a constant Proportion to the Ball of the Eye; and the Eye to the rest of the Body; that in Animals, the larger the Pupil the larger the Eye, and the larger the Body.

To ascertain the Size of these jovial Inhabitants, it may be observ'd that the Distance of *Jupiter* from the Sun, is to the Earth's Distance from the same, as 26 to 5; the Intensity of the Sun's Light in *Jupiter* is to its Intensity on the Earth, in a duplicate Ratio of 5 to 26; but 'tis found by Experience, that the Pupil dilates in a Ratio greater than that wherein the Intensity of Light decreases; otherwise, a Body at a great Distance might be seen as clearly as a nearer: The Diameter, therefore, of the Pupil in its greatest Dilatation, in *Jupiter*, is to its Diameter in the like state in the Earth, in a Ratio greater than that of 5 to 26.—If then we put it, as 10 to 26, or as 5 to 13; since the ordinary Stature of the Inhabitants of the Earth is computed at 5 English Feet, 4 Inches and  $\frac{1}{2}$ ; (which *Wolffius* tells us is his own Height) the ordinary Stature of *Jupiter's* Inhabitants will be found 14 Feet  $\frac{2}{3}$ , which is very nearly the size of the Giant *Os*, mention'd by *Moses*, whose Iron Bed was 9 Cubits long and its Breadth 4. See GIANT.

#### The Motion of the PLANETS.

That the Planets do all revolve round the Sun as their Center, and not round the Earth, is evident from a thousand Phenomena.—1<sup>o</sup> The Orbit wherein *Venus*, e. g. moves, does certainly encompass the Sun, and therefore in describing that Orbit, the Planet must turn round the Sun. See ORBIT.

That her Orbit includes the Sun, appears hence that she is sometimes above the Sun, sometimes below it, sometimes beyond it, and sometimes on this side; all which are evident from the Circumstances of her Phases. See PHASES.

That she does not move round the Earth is no less apparent from her being ever observed in the same Quarter with the Sun, never receding from him above 45<sup>o</sup>.—She never therefore comes to be in opposition to the Sun; no, not to be in a Quartile Aspect, or to have a Quarter of the Heavens between them; both which, like the Earth, she must frequently have, did she attend and move round the Earth.

2<sup>o</sup> That *Mercury* revolves round the Sun appears in like manner from his Phases, which resemble those of *Venus* and the Moon; and from its Neighbourhood to the Sun, from whom *Mercury* never recedes so far as *Venus* does.

3<sup>o</sup> That the Orbit of *Mars* includes the Sun, is evident from that Planet's being found both in Conjunction and Opposition with the Sun; and in both Cases shining with a full Face.—Indeed, from the same Circumstances it appears, that the Orbit of *Mars* encompasses the Earth; but then, it follows, likewise, from *Mars's* Diameter appearing seven times as big when in Opposition, as when in Conjunction, that he is seven times nearer the Earth, in the latter than the former Position. The Earth therefore is far from being the Center of *Mars's* Motion; but *Mars* is ever nearly at the same Distance from the Sun.—Again, *Mars* view'd from the Earth moves very irregularly; is sometimes seen to proceed slower, sometimes faster; sometimes stands still, sometimes goes backward; (see *Reasons whereof*, see under the Article OPTIC Irregularity) but view'd from the Sun, will ever appear to move with the same constant uniform Tenor; whence 'tis evident, he respects the Sun, not the Earth, as the Center of his Motion.

4<sup>o</sup> The same Appearances whence *Mars* is shewn to revolve round the Sun as a Center, are likewise observ'd in *Jupiter* and *Saturn*; whence the same Conclusion may be made of them.

Lastly, that the Earth revolves round the Sun, as a Center, is evident from her Place which we observ'd to be between the Orbits of *Mars* and *Venus*; and from the Pha-

nomens of the superior Planets view'd therefrom.—If the Earth stood still we should never see those Planets either stationary or retrograde; the Earth therefore moves, but it is still found between the Orbits of *Mars* and *Venus* which encompass the Sun; therefore the Earth too encompasses the Sun.

To this Astronomical Demonstration, may be added a Physical Demonstration, of the Earth's Motion from *Sir Isaac Newton*.—It appears from abundant Observations, that either the Earth turns round the Sun, or the Sun round the Earth, so as to describe equal Area's in equal times: But he demonstrates, that Bodies revolving about one another by such Law, do of Necessity gravitate towards each other. (See GRAVITATION.) Whence if the Sun gravitate to the Earth, Action and Reaction being still equal, the Earth will likewise gravitate toward the Sun. (See REACTION.) But he proves, further, that two Bodies gravitating towards each other, without directly approaching one another in right Lines, must both of them turn round the common Center of Gravity of both.—The Sun and Earth, therefore, do both revolve round one common Center.—But the Earth being but a Point in comparison of the Sun, the common Center of Gravity of the two, will be within the Sun's Body, and not far from its Center.—The Earth, therefore, revolves round a Point, within the Body of the Sun; and therefore round the Sun. See EARTH and SUN.

The Orbits of the Planets are all Ellipses; one of whose Foci is in the Sun.—This, *Kepler* first found from *Tycho's* Observations; before him all Astronomers took the Planetary Orbits for eccentric Circles. See ORBIT, ELLIPSIS, ECCENTRIC.

The Planes of these Orbits do all intersect in the Sun; nor are their Extremities far apart.—In effect, they are but little inclined to one another; and the greatest Angle any of them makes with the Plane of the Earth's Orbit, i. e. of the Ecliptic, is that of *Mercury*, which lies at an Angle of 6<sup>o</sup> 52'; that of *Venus* is 3<sup>o</sup> 23'; that of *Mars* 1<sup>o</sup> 52'; that of *Jupiter* 1<sup>o</sup> 20'; and that of *Saturn* 2<sup>o</sup> 30'.

The Line wherein the Plane of each Orbit cuts that of the Earth, is call'd the Line of the Nodes; and the two Points wherein the Orbits themselves touch that Plane, the Nodes. See NODE.

The Distance between the Center of the Sun, and the Center of each Orbit, is call'd the Eccentricity of the Planet. See ECCENTRICITY.

And the Angle at which each Plane cuts that of the Ecliptic, the Inclination of the Plane. See PLANE, INCLINATION, and ECLIPTIC.

To account for the Motion of the Planets about the Sun; there needs nothing but to suppose an uniform projectile Motion, in straight Lines, at first given them; and a Power of Attraction or Gravitation, such as we observe in all the great Bodies in our System.—For a Body A, (Tab. Astronomy, Fig. 6.) proceeding uniformly along the Line AB; will, by the Intervention of the attracting Body C, be every Moment diverted out of its rectilinear, and bent into a curvilinear, Path; according to the Laws of Central Forces. See CENTRAL Force.

If, then, the projectile Motion be perpendicular to a Line CA, drawn from the attracting Body C; and its Velocity so proportion'd to the Force of Attraction of A, as that the centripetal and centrifugal Forces are equal, i. e. that the Centus to fall to the central Body C, in a right Line, AC; and that to proceed in the Direction of the Tangent, AB, balance each other: The Body will revolve in a circular Orbit AB,  $\gamma$ ,  $\delta$ , &c. See CENTRIPETAL and CENTRIFUGAL.

'Tis not improbable, that at the Beginning, this was the State of things; and that the Velocities impress'd on the several Planets were so combin'd with their respective Masses and Distances from the Sun at which they were to roll; as that their Momenta should counter-balance the Sun's attractive Force, and be precisely counter-balanced thereby; whence the primitive Orbits must have been perfect Circles, from which they don't even now deviate very far; the Eccentricity of the Earth's Orbit being only  $\frac{1}{1000}$  of its Semidiameter. See ECCENTRICITY.

If the Planet's projectile Motion be not perfectly adjusted to the Sun's Attraction; the Orbit described will be an Ellipse.—If it be too swift, the Orbit will be greater than a Circle, and the nearer Focus coincide with the central Body; if too slow, the Orbit will be less than a Circle, and the further Focus coincide with the central Body.

Indeed the Form of the Planetary Orbits, does not only depend on the Adjustment of the first projectile Velocity with the Sun's Attraction, but also on the Direction wherein that Motion was originally impress'd.—If that Direction were according to the Tangent AB, as above supposed, and the central Forces exactly balanced, the Orbit would be circular; but if that Direction were oblique, in any manner, whether ascending to or descending from the Sun, the Planet, notwithstanding any Adjustment of its Velocity to the Attraction, would be an Ellipse. See PROJECTILE.

The Motions of the *Planets* in their elliptic Orbits are not equable, by reason the Sun is not in their Centers but their Focus.—Hence they move, sometimes faster and sometimes slower, as they are nearer or farther from the Sun; but yet these Irregularities are all certain, and follow according to an immutable LAW.—Thus; suppose the Ellipsis BEP, &c. (*Tab. Astronomy, Fig. 61.*) the Orbit of a *Planet*; and the Focus S, the Sun's Place; AP the Axis of the Ellipsis, is called the *Line of the Aphides*; the Point A the higher *Apsis* or *Aphelion*; P the lower *Apsis* or *Perihelion*; SC the *Eccentricity*; and ES the mean Distance of the *Planet* from the Sun. See APSES, APHELION, PERIHELION, &c.

Now the Motion of the *Planet* in its Perihelion, is swiftest; in its Aphelion, slowest; at E the Motion as well as the Distance is mean, i. e. such as would describe the whole Orbit in the same time it is really described in.

The Law whereby the Motion is regulated in every Point of the Orbit, is, that a *Line*, or *Radius*, drawn from the Center of the Sun to the Center of the *Planet*, and thus carried along, with an angular Motion, does always describe an Elliptic Area proportional to the Time.—Suppose, e. g. the *Planet* in A, and thence in a certain Time to proceed to B; the Space or Area the Ray SA describes, is the Triangle ASB; when, at length the *Planet* arrives at P, if from the Center of the Sun S there be drawn SD, in such manner as that the elliptic Area PSD is equal to that ASB; the *Planet* will here move thro' the Arch PD, in the same time wherein it moved thro' the Arch AB; which Arches are unequal, and nearly in a reciprocal Proportion to their Distance from the Sun. For from the Equalities of the Areas it follows, that the Arch PD must exceed A B as much as S A exceeds S P.

This Law was first demonstrated by *Kepler*, from Observation; and is since accounted for from *Physicks*: And to this all Astronomers, now, subscribe, as of all others that which best solves the Planetary Phenomena.

#### Computation of a PLANET'S Motion and Place.

As to the Periods and Velocities of the *Planets*; or the Times wherein they perform their Courses; they are found to have a wonderful Harmony with their Distances from the Sun, and with one another. The nearer each *Planet* is to the Sun, the quicker still being its Motion; and its Period the shorter.—The great Law they here all immutably observe is, that the Squares of their periodical Times are as the Cubes of their Distances from the Centre of their Orbits. See PERIOD, DISTANCE, &c.

This Law we owe to the Sagacity of *Kepler*, who found it to obtain in all the primary *Planets*; as Astronomers have since found it to do in the secondary ones. See SATELLITE.

*Kepler* deduced this LAW, merely from Observation and Comparison of the several Distances of the *Planets* with their Periods: The Glory of investigating it from *Physical Principles*, is due to Sir *Isaac Newton*, who has demonstrated this, in the present state of things, such a LAW was inevitable. See GRAVITATION.

A *Planet's* Motion or Distance from its Apogee, is call'd the mean Anomaly of the *Planet*; and is measur'd by the Arch, or Area, it describes in the Time.—When the *Planet* arrives at the middle of its Orbit, or the Point G, the Distance or Time is call'd the true Anomaly.—When the *Planet's* Motion is reckon'd from the first Point of *Aries*, 'tis call'd its Motion in Longitude, which is either mean, viz. such as the *Planet* would have were it to move uniformly in a Circle; or true, which is that wherewith the *Planet* actually describes its Orbit, and measur'd by the Arch of the *Ecliptic* it describes. See ANOMALY, LONGITUDE, &c.

Hence may the *Planet's* Place in its Orbit for any given Time after it has left the Aphelion, be found.—For suppose the Area of the Ellipsis so divided by the Line SG, that the whole elliptic Area may have the same Proportion to the Area ASG as the whole periodical Time wherein the *Planet*, describes its Orbit, has to the Time given: In this Case G will be the *Planet's* Place in its Orbit. See PLACE.

The Phenomena of the inferior *Planets*, are their Conjunctions, Elongations, Stations, Retrogradations, Phases, and Eclipses. See CONJUNCTION, ELONGATION, STATION, RETROGRADATION, &c. under their respective Articles.

The Phenomena of the superior *Planets* are the same with those of the inferior; with an Additional one, viz. Opposition. See OPPOSITION, &c.

The particular Phenomena, Circumstances, &c. of each *Planet*, see under the Name of the respective *Planet*, &c.

The general Proportions, Diameters, Surfaces, Solidities, Distances, Gravities, Degrees of Light, &c. of the several *Planets*; see under the Articles SOLAR SYSTEM, DIAMETER, SEMIDIAMETER, &c.

PLANETARY, something that relates to the *Planets*. In this Sense we say Planetary Worlds, Planetary Inhabitants, &c. See PLANET.

PLANETARY System, is the System, or Asserblage of the *Planets*, primary and secondary, moving in their respective Orbits, round their common Center, the Sun. See SOLAR SYSTEM.

PLANETARY Hours in Chronology. See HOUR.

PLANIMETRY, PLANIMETRIA, that Part of Geometry which confideth Lines and plain Figures; without any Consideration of Heights or Depths. See GEOMETRY; see also LINE and FIGURE.

The Word is particularly restrained to the Mensuration of Planes, or Surfaces; in opposition to Stereometry, or the Mensuration of Solids. See MEASURING.

PLANISPHERE, a Projection of the Sphere and the several Circles thereof, on a Plane; as, upon Paper, &c. See PLANE, SPHERE, and PROJECTION.

In this Sense, Maps of the Heavens and the Earth, wherein are exhibited the Meridians, and other Circles of the Sphere, are called Planispheres. See MAP.

PLANISPHERE is sometimes consider'd as an Astronomical Instrument, used in observing the Motions of the heavenly Bodies; consisting of a Projection of the Celestial Sphere upon a Plane, representing the Stars, Constellations, &c. in their proper Situations, Distances, &c. See STAR and CONSTELLATION.

Such is the Astrolabe, which is a common Name for all such Projections. See ASTROLABE.

In all Planispheres, the Eye is supposed to be a Point viewing all the Circles of the Sphere, and referring them to a Plane whereon the Sphere is as it were flatten'd.—This Plane is call'd the Plane of the Projection.

A Perspective Plane is only a Plane of Projection placed between the Eye and the Object, so as to contain all the Points which the several Rays drawn from the Object to the Eye impress thereon. (See PERSPECTIVE PLANE.)—But in Planispheres, or Astrolabes, the Plane of the Projection is placed beyond the Object; which is the Sphere.

The Plane of the Projection is always some of the Circles of the Sphere. See CIRCLE.

Among the infinite Number of Planispheres, which the different Planes of Projection, and the different Positions of the Eye, would furnish; there are two or three that have been prefer'd to the rest.—Such are that of *Ptolemy*, where the Plane of Projection is parallel to the Equator.—That of *Gemma Frisius*, where the Plane of Projection is the Color, or Solstitial Meridian, and the Eye the Pole of the Meridian.—That of *Johannes de Royas*, a *Spaniard*, whose Plane of Projection is a Meridian, and the Eye placed on the Axis of that Meridian, at an infinite Distance. This last is call'd the *Analemma*. See ANALEMMA.

The common Defect of all these Projections is, that they distort and alter the Figures of the Constellations, so as it is not easy to compare them with the Heavens; and that the Degrees in some Places are so small, that they afford no Room for Operation.

All these Faults *M. de La Hire* has provided against in a new Projection, or Planisphere; where 'tis propos'd the Eye shall be so placed, as that the Divisions of the Circles projected shall be sensibly equal in every Part of the Instrument.—The Plane of his Projection is that of a Meridian.

PLANO-CONCAVE Glass, or LENS, is that, one of whose Surfaces is concave, and the other plain. See GLASS.

The Concavity is here supposed to be spherical, unless the contrary be express'd.—For the Properties, Grinding, &c. of Plano-Concave Lens's, see LENS; see also GRINDING, &c.

PLANO-CONVEX Glass, or LENS, is that, one of whose Surfaces is convex, and the other plain. See CONVEX.

The Convexity is supposed to be spherical, unless the contrary be express'd. For the Properties, Grinding, &c. of Plano-Convex Lens's. See LENS, &c.

PLANT, PLANTA, an Organical Body, consisting of a Root, essentially, and probably too, a Seed; and producing usually Leaves, a Stem, Branches, and Flowers. See ROOT, &c.

Or, a *Plant* may be defined, in *Boerhaave's* manner, to be an Organical Body composed of Vessels and Juices; to which Body belongs a Root or Part whereby it adheres to some other Body, and particularly the Earth, from which it derives the Matter of its Life, and Growth. See VEGETABLE.

A *Plant* is distinguished from a *Fossil* by its being organical, and consisting of Vessels and Juices; (See FOSSIL) and from an *Animal*, by its adhering to another Body, and deriving its Nourishment therefrom. See ANIMAL.

*Plant* is a general Name, under which are comprized all vegetable Bodies, as Trees, Shrubs, and Herbs. See TREE, SHRUB, and HERB.

From the Observations of *Malpighi*, *Dr. Grew*, *M. Reaume*, *Bradley*, and others, there appears a great Similitude between the Mechanism of Plants, and Animals; the Parts of the former seem to bear a constant Analogy to those of the latter; and the Vegetable and Animal Oeconomy appear both form'd on the same Model.—To give an Idea hereof

hereof, it will be necessary to describe the Parts whereof *Plants* consist.

*Structure and Oeconomy of PLANTS.*

The Parts of *Plants* are—1<sup>o</sup> *The Root*; a spongy Body, whose Pores are disposed to admit certain humid Particles prepared in the Ground: On the Size of the Vessels and Pores of the Root, the Quality of the Root is found much to depend.—*Boerhaave* considers the Root as compos'd of a Number of absorbent Vessels, analogous to the Lacteals in Animals. And *M. Remeau* takes it to do the Office of all the Parts in the Abdomen which minister to Nutrition; as the Stomach, Intestines, &c. See *ROOT*.

2<sup>o</sup> *The Wood*, which consists of Capillary Tubes, running parallel from the Root throughout the Stalk.—The Apertures of these Tubules are ordinarily too minute to come under the cognizance of the Eye, unless in a Piece of Charcoal, Cane, or the like. These Tubes *Mr. Bradley* calls *Arterial Vessels*; it being thro' these that the Sap rises from the Root. See *WOOD*.

3<sup>o</sup> Beside these, are other larger Vessels, disposed on the out side of the Arterial Vessels between the Wood and the inner Bark, and leading down to the Covering of the Root.—These the same Author calls the *Venal Vessels*, and supposes them to contain the liquid Sap found in *Plants* in the Spring, &c. See *VEIN, SAP, &c.*

4<sup>o</sup> *The Bark*, which is of a spongy Texture, and, by many little Strains passing between the Arteries, communicates with the Pith. See *BARK*.

5<sup>o</sup> *The Pith, or Pecten*, which consists of little transparent Globules, chain'd together somewhat like the Bubbles that compose the Froth of Liqueur. See *PITH*.

Add, that the Trunk and Branches of a Tree bear a Resemblance to the exterior Members or Limbs of an Animal, which it may subsist without, tho' their rotting and Mortification frequently occasion a total Destruction thereof.—Accordingly, we find the like Effects from the wounding or lopping of a Tree, as that of a Limb, viz. an Extravasation, Callus, &c.

Now, for the Oeconomy or Use of these Parts.—The Root having imbibed the saline and aqueous Juices of the Earth, and fill'd itself therewith for the Nourishment of the Tree; those are put in Motion by Heat, i. e. are made to evaporate into Steam, which from the Root enters the Mouths of the Arterial Vessels, and mounts to the top with a force answerable to the Heat that puts it in Motion.—By this means it gradually opens the minute Vascules roll'd up in the Buds, and expands them into Leaves.—Now, as all Vapours, upon feeling the Cold, naturally condense; so this, when arriv'd at the extreme Parts of the Arteries, i. e. the Buds of the Tree, meeting the cold Air condenses into a Liquor, in which Form it returns by its own Weight, thro' the Venal Vessels, to the Root, leaving behind it such Parts of its Juice, as the Texture of the Bark will receive, and requires for its Sustainance.

Thus does the Juice continue to circulate; till the Winter's Cold congealing it into the Consistency of a Gum, it stagnates in the Vessels; in which State it remains till the fresh Warmth of the succeeding Spring puts it in Motion again: upon which it renews its former Vigour, pushes forth Branches, Leaves, &c.

This short View of the Vegetable Oeconomy will bear some further Illustration; there being several curious Points here touch'd, and, as it were, folded up in *Semine*.—The Principle, then, whereby the Root, after imbibing its Food, determines it to mount upward, contrary to its natural Gravity, is somewhat obscure: Some will have it effected by means of the Pressure of the Atmosphere, in the same manner as Water is rais'd in Pumps: But this is precarious, as being founded on a Supposition that the absorbent Tubules are void of Air; besides, that the Atmosphere could not raise the Juice 32 Foot high, whereas there are Trees much higher. See *ATMOSPHERE*.—Others have recourse to the Principle of Attraction, and suppose the Power that raises the Sap in Vegetables to be the same with that whereby Water ascends in Capillary Tubes, or in Heaps of Sand, Ashes, or the like; but neither will this alone suffice to raise Water to the Tops of Trees. See *ATTRACTION, ASCENT, CAPILLARY, &c.*

One would suspect, therefore, that the first Reception of the Food, and its Propagation thro' the Body, were effected by different Means; which is confirmed by the Analogy of Animals. See *FOOD, HEART, &c.*

The Motion of the Nutritious Juices of *Plants* is produced much like that of the Blood in Animals, by the Action of the Air; in effect, there is something equivalent to Respiration throughout the whole *Plant*. See *RESPIRATION*.

The Discovery of this we owe to the admirable *Malpighi*, who first observ'd that Vegetables consist of two Series or Orders of Vessels.—1<sup>o</sup> Those abovementioned, which receive and convey the alimental Juices; answering to the Ar-

teries, Lacteals, Veins, &c. of Animals.—2<sup>o</sup> *Tracheae*, or Air-Vessels, which are long hollow Pipes, wherein Air is continually received and expelled, i. e. inspired and expired; within which *Tracheae*, the same Author shews, all the former Series of Vessels are contained. See *TRACHEA*.

Hence it follows, that the Heat of the Year, nay, of a Day, of a single Hour, or Minute, must have an effect on the Air included in these *Tracheae*, i. e. must rarify it, and consequently dilate the *Tracheae*; whence also must arise a perpetual Spring, or Source of Action, to promote the Circulation in *Plants*. See *HEAT, RAREFACTION, &c.*

For, by the Expansion of the *Tracheae*, the Vessels containing the Juices, are press'd; and by that Means the Juice contained is continually propelled and so accelerated; by which same Propulsion, the Juice is continually comminuted and rendered more and more subtiler, and so enabled to enter Vessels still finer and finer; the thickest Part of it being at the same time secreted and deposited into the lateral Cells, or Loculi of the Bark, to defend the *Plant* from Cold; and other external Injuries. See *BARK*.

The Juice having thus gone its Stage; from the Root to the remote Branches, and even the Flower; and having in every Part of its Progress deposited something both for Attainment and Defence; what is redundant passes out into the Bark, the Vessels whereof are inoculated with those where-in the Sap mounts; and thro' these it descends to the Root, and thence to the Earth again.—And thus is a Circulation effected. See *CIRCULATION of the Sap*.

Thus is every Vegetable acted on by Heat during the Day-time, especially while the Sun's Force is considerable; and the Sap-Vessels thus squeez'd and press'd, and the Sap protruded, and rais'd, and at length evacuated, and the Vessels exhausted: And in the Night again, the same *Tracheae* being contracted by the Cold of the Air, the other Vessels are relax'd and relex'd, and so disposed to receive fresh Food for the next Days Digestion, and Excretion.—And thus *Plants* may be said to eat and drink in the Night-time. See *NUTRITION*.

The Vessels or containing Parts of *Plants*, consist of meer Earth, bound or connect'd together by Oil, as a Gluten; which being exhausted by Fire, Air, Age, or the like, the *Plant* moulders, or returns again into its Earth, or Dust.—Thus in Vegetables burnt by the intensest Fire, the Matter of the Vessels is left entire, and indissoluble by its utmost Force; and, consequently, is neither Water, nor Air, nor Salt, nor Sulphur, but Earth alone. See *EARTH*.

The Juice, or Sap, of a *Plant*, is a Humour furnished by the Earth, and changed in the *Plant*; consisting of some fossil Parts, other Parts derived from the Air, and Rain; and others from putrified Animals, Plants, &c. consequently, in Vegetables are contained all kind of Salts, Oil, Water, Earth; and probably all kinds of Metals too, inasmuch as the Ashes of Vegetables, always yield somewhat which the Loadstone attracts. See *IRON, MAGNET, &c.*

This Juice enters the *Plant* in Form of a fine and subtle Water, which the nearer it is to the Root, the more it retains of its proper Nature; and the further from the Root, the more action it has sustain'd, and the nearer it approaches to the Nature of the Vegetable. See *DIGESTION*.

Consequently, when the Juice enters the Root, the Bark whereof is furnished with excretory Vessels fitted to discharge the excrementitious Part; it is earthy, watry, poor, acid, and scarce oleaginous at all. See *SAP*.

In the Trunk and Branches it is further prepared; tho' it still continues acid, as we see by the tapping or perforating of a Tree in the Month of *February*, when it distils a watry Juice apparently acid. See *TAPPING*.

The Juice being hence carried to the Germs, or Buds, is more concoct'd; and here having unfolded the Leaves, these come to serve as Lungs for the Circulation and further Preparation of the Juice.—For those tender Leaves being expos'd to the alternate Action of Heat and Cold, moist Nights and hot scorching Days, are alternately expanded and contracted; and the more on the account of their reticular Texture. See *LEAVES*.

By such means the Juice is still further altered and digested; as it is further yet in the *Petals*, or Leaves of the Flowers, which transmit the Juice, now brought to a further Subtility, to the *Stamina*.—These communicate it to the *Farina*, or Dust in the Apices; where having undergone a further Maturation, it is shed into the *Pistil*; and here having acquired its last Perfection, it give Rises to a new Fruit or *Plant*. See *PETALA, STAMINA, APICES, FARINA, PISTIL, &c.*

*Generation of PLANTS.*

The *Generation of Plants* does also bear a close Analogy to that of some Animals; particularly such as want Local Motion; as Mussels, and other immovable Shell-Fish, which are Hermaphrodites, and contain both the Male and Female Organs of Generation. See *HERMAPHRODITE*.

The Flower of the *Plant*, for all its Finery, is found to be the Pudentum, or principal Organ of Generation; but the Use of so much Mechanism, and so many Parts has been but little known.—We shall instance in a Tulip.

Its Flower consists of six *Petalas*, or Leaves; from the Bottom whereof, at the middle, arises a kind of Tube called the *Pistil*; and around this are disposed pretty fine Threads called *Stamina*, arising likewise from the Bottom of the Flower, and terminating in little Branches-a-top, call'd *Apices*, replete with a fine Dust call'd *Farina*.—For the further Explanation of the Parts of Generation see *PISTIL*, *STAMEN*, *FARINA*, &c.

This is the general Structure of the Flowers of *Plants*; tho' diversified infinite Ways, and to such degree, that some have no sensible *Pistil*, others no *Stamina*; others have *Stamina* without any *Apices*; and what exceeds all the rest some *Plants* have no *Flowers*.—But, allowing the Structure now represented to be, as in effect it is, the most common; and that these Parts which seem wanting are usually only left apparent: The Generation of *Plants*, in general, may be well accounted for.

The Fruit is usually at the Basis of the *Pistil*, so that when the *Pistil* falls, with the rest of the Flower, the Fruit appears in its stead.—Indeed, frequently, the *Pistil* is the Fruit itself; but still they have both the same Situation in the Center of the Flower, whose Leaves disposed around the little Embryo, only seem destined to prepare a fine Juice in their little Vessels, for its Support, during the little Time they last, and it requires: tho' *Mr. Bradley* takes their chief Use to be to defend the *Pistil*, &c.

The *Apices* of the *Stamina* are little Capsules, or Bags full of a *Farina* or Dust, which upon the Capsule growing ripe and bursting, fall out.

*M. Trauerfort* took this Dust to be only an Excrement of the Food of the Fruit, and the *Stamina* to be no more than a kind of excretory Ducts, which filtrated this useless Matter, and thus discharg'd the Embryo-Plant. But *Mr. Morland*, *M. Geoffroy*, and others, find nobler Uses for this Dust. —According to their System, 'tis this Dust that falling on the *Pistil* fecundifies the Grain or Fruit inclosed therein; and hence they call it the *Farina fecundans*.—Thus the *Farina* should be the Male Part of the *Plant*, and the *Pistil* the Female.

*Mr. Bradley*, at the bottom of the *Pistil* of the *Lilly*, observes a Vessel which he calls the *Uterus*, or *Womb*, wherein are three Ovaries fill'd with little Eggs, or Rodiments of Seed, like those found in the Ovaria of Animals; which, he adds, always decay and come to nothing, unless impregnated by the *Farina* of the same Plant, or some other of the same Kind.—The *Stamina*, he says, serve for the Conveyance of the Male Seed of the *Plant*, to be perfected in the *Apices*; which when ripe, bursting forth in little Particles like Dust, some of them fall into the Orifice of the *Pistil*, and are either convey'd thence into the Uteric, to fecundify the female Ova, or lodg'd in the *Pistil*, where, by their magnetic Virtue, they draw the Nourishment from the other Parts of the *Plant* into the Embryo's of the Fruit, making 'em swell, grow, &c.

The Disposition of the *Pistil*, and the *Apices* about it, is always such, as that the *Farina* may fall on its Orifice.—'Tis usually lower than the *Apices*; and when we observe it to be grown higher, we may conjecture the Fruit has begun to form itself, and has no further occasion for the Male Dust. Add to this, that as soon as the Work of Generation is over, the Male Parts, together with the Leaves, fall off, and the Tube leading to the Uterus begins to shrink. Nor must it be omitted, that the top of the *Pistil* is always either cover'd with a sort of Velvet Tunicle, or emits a gummy Liquor, the better to catch the Dust of the *Apices*.—In Flowers that turn down, as the *Acanthus*, *Cyclamen*, and the *Imperial Crown*, the *Pistil* is much longer than the *Stamina*; and that the Dust may fall from their *Apices* in sufficient Quantity on the *Pistil*.

This System favours much of that admirable Uniformity found in the Works of Nature; and carries with it all the seeming Characteristics of Truth; but 'tis Experience alone must determine for it.—Accordingly, *M. Geoffroy* tells us, that all the Observations he had ever made, the *Plant* was rendered barren, and the Fruits became abortive, by cutting off the *Pistils* before the Dust could impregnate them; which is since confirm'd by other Experiments of *Mr. Bradley*.

In many kinds of *Plants*, as the *Willow*, *Oak*, *Pine*, *Cypress*, *Mulberry-Tree*, &c. the Flowers are *sterile*, and separate from the Fruit. But these Flowers, *M. Geoffroy* observes, have their *Stamina* and *Apices*, whose *Farina* may easily impregnate the Fruits, which are not far off.

Indeed there is some Difficulty in reconciling this System to a Species of *Plants* which bear Flowers without Fruits, and another Species of the same Kind and Name which bear Fruits without Flowers; hence distinguish'd into *Male* and *Female*: of which kind are the *Palm-Tree*, *Poplar*, *Hemp*, *Hops*, &c.—For how should the *Farina* of the Male, here come to impregnate the Seed of the Female?

*M. Trauerfort* conjectures, that the fine Filaments, Tomentum, or Down, always found on the Fruits of these *Plants*, may serve instead of Flowers, and do the Office of Impregnation.—But *M. Geoffroy* rather takes it, that the Wind, doing the Office of a Vehicle, brings the *Farina* of the Males to the Females.

In this opinion he is confirm'd by a Story in *Jovianus Pontanus*; who relates, That in his Time there were two *Palm-Trees*, the one Male, cultivated at *Brindes*, the other Female, in the Wood of *Ortramus*, 15 Leagues a-part; that this latter was several Years without bearing any Fruit; till at Length rising above the other Trees of the Forest, so as it might see (says the Poet) the Male *Palm-Tree* at *Brindes*, it then began to bear Fruit in abundance.

Here, *M. Geoffroy* makes no doubt, the Tree then only began to bear Fruit, because in a Condition to catch on its Branches the *Farina* of the Male, brought thither by the Wind.

For the manner wherein the *Farina* fecundifies; *M. Geoffroy* advances two Opinions.—1<sup>o</sup> That the *Farina* being always found of a sulphurous Composition, and full of subtle penetrating Parts, (as appears from its sprightly Odour) falling on the *Pistils* of the Flowers; there resolves, and the subtlest of its Parts penetrating the Substance of the *Pistil* and the young Fruit, excite a Fermentation sufficient to open and unfold the young *Plant* inclosed in the Embryo of the Seed.—In this Hypothesis the Seed is supposed to contain the *Plant* in Miniature, and only to want a proper Juice to unfold its Parts and make them grow.

The 2<sup>d</sup> Opinion is, that the *Farina* of the Flower is the first Germ, or Bud of the new *Plant*, and needs nothing to unfold it and enable it to grow, but the Juice it finds prepared in the Embryo's of the Seed.

These two Theories of Vegetable Generation, the Reader will observe, bear a strict Analogy to those two of Animal Generation: viz. either that the young Animal is in the *Semen Masculinum*, and only needs the Juice of the Matrix to cherish and bring it forth; or that the Animal is contained in the Female Ovum, and needs only the Male Seed to excite a Fermentation, &c. See CONCEPTION, GENERATION, &c.

*M. Geoffroy* rather takes the proper Seed to be in the *Farina*; inasmuch as the best Microscopes don't discover the least Appearance of any Bud in the little Embryo's of the Grains, when examined before the *Apices* have shed their Dust.—In leguminous *Plants*, if the Leaves and *Stamina* be removed, and the *Pistil*, or that Part which becomes the Pod, be viewed with the Microscope, e'er yet the Flower be opened; the little green transparent Vesiculae, which are to become the Grains, will appear in their natural Order; but still shewing nothing else but the mere Coat, or Skin of the Grain. If the Observation be continued for several Days successively, in other Flowers, as they advance, the Vesiculae will be found to swell, and by degrees to become replete with a limpid Liquor; wherein, when the *Farina* comes to be shed, and the Leaves of the Flower to fall, we observe a little greenish Speck, or Globule, floating about at large.—At first there is not any Appearance of Organization in this little Body; but in time, as it grows, we begin to distinguish two little Leaves like two Horns. The Liquor diminishes insensibly, as the little Body grows, till at length the Grain becomes quite opaque; when, upon opening it, we find its Cavity fill'd with a young *Plant* in Miniature; consisting of a little Germ or Plumula, a little Root, and the Lobes of the Bean or Pea.

The manner wherein this Germ of the Apex enters the Vesicula of the Grain, is not very difficult to determine.—For, besides that the Cavity of the *Pistil* reaches from the top, to the Embryo's of the Grains, those Grains, or Vesiculae, have a little Aperture corresponding to the Extremity of the Cavity of the *Pistil*, so that the small Dust, or *Farina*, may easily fall thro' the Aperture into the Mouth of the Vessels, which is the Embryo of the Grain.—This Cavity, or Cicatricula, is much the same in most Grains, and 'tis easily observed in Pease, Beans, &c. without the Microscope. The Root of the little Germ is just against this Aperture, and 'tis thro' this it passes out when the little Grain comes to germinate.

The Process of Nature in the Generation of Vegetables, and the Apparatus she has contriv'd for that Purpose are so curious, and so little and so lately known among us, that we shall illustrate them further with Figures; taking the Melon for our Example, in regard the Parts of Generation are here very distinct.

By the way it must be observed, that tho' the Melon contains both Sexes, yet the Disposition of the Organs differs, here, from the general one above rehears'd in the Instance of the Tulip: In effect, in the Melon are two distinct Flowers, or Blossoms, the one doing the Male Office, the other the Female; which we shall therefore call the *Male* and *Female Flower*.

Fig. 13. (*Tab. Nat. History*) represents the Male Flower, or Blossom, of the Melon, the Leaves being stripp'd from off the Circle FF;—A B E represent the Head, placed in the Center of the Flower, and form'd of the Circumvolutions of the Apices B, and sustained by four Columns G G G G. —The Part B of the Head represents the Circumvolutions of the Apices while yet shut; and the Part E represents them open, and covered with the Farina, which they before contained, but which is diffused on the outside when the Plant arrives at Maturity. Each Apex forms a kind of Canal separate by a Partition into two. A Grain of the Farina is represented by D. —Fig. 14. H, in the former Figure, represents the Pedicle that sustains the Flower, and which in the Male-Flower produces nothing.

Fig. 15. represents the Female Flower or Blossom of the Melon, or that which bears the Fruit.—The Leaves are stripp'd off the Circle FF, as before, the better to shew the other Parts. The Knot of the Flower, or the Embryo of the Fruit is represented by A. The Pistil is represented by B B; and is only a Continuation of the Embryo of the Fruit A. The top of the Pistil spreads, in B B, into several oblong Bodies, each separable into two Lobes. These Bodies are very rough, furnish'd with Hairs and little Vesicles proper to catch the Dust of the Male Flower, and to conduct them to the Mouths of the Canals, which communicate as far as the Cells of the Grains contained in the young Fruit. Upon cutting the Pistil transversely in its smallest Part, we find as many Canals as there are Divisions in its Head; which Canals correspond to as many little Cells, each including two Orders of Grains, or Seeds, ranged in a spongy Placenta.

This Doctrine of Generation, affords us a Hint how to alter, improve, &c. the Taste, Form, Flowers, Quality of Fruits, &c. viz. by impregnating the Flower of one, with the Farina of another of the same Class.

To this accidental coupling and intermixing it is, that the humbler Varieties of new Fruits, Flowers, &c. produced every Day; with many other Phenomena in the vegetable Kingdom: are to be ascribed. See MULE.

The Affliction of Perpendicularity observed in the Stalks or Stems of Plants, as well as in their Branches and Roots makes a fine Speculation.—'Tis a Phenomenon never attended to till very lately. The Cause is very subtle, and has employ'd the Wits of several of the present Set of Philosophers, particularly *Affrus, de la Hire, Dodart, and Porem;* see their several Systems under the Article PERPENDICULARITY.

Nor is that constant Parallelism observed in the Tufts of Trees, to the Soil or Ground they grow upon; a Circumstance to be over-look'd. See PARALLELISM.

For the Fecundity of Plants, &c. See FECUNDITY, &c.

#### Distribution of PLANTS.

Plants may be divided, with regard to the manner of their generating, into 1<sup>o</sup> *Males*, or such as bear no Fruit or Seed, and have only the Male Organ of Generation, viz. the Farina.—Of this kind are the Male Palm-Tree, Willow, Poplar, Hemp, Nettle, and Hop-Tree.

2<sup>o</sup> *Females*, or such as bear Fruit, and have the female Organ, viz. the Pistil, or Uterus, but want the Farina.—Such are the female Palm, Willow, Poplar, &c.

3<sup>o</sup> *Hermaprodites*, or such as have both male and female Parts, the Farina and Pistil.

These are again subdivided into those in whose Flower both Sexes are united; as the Lily, Gilliflower, Tulip, and such the greater Part of the vegetable Species; whose Pistil is surrounded by the Stamina.—And those whose male and female Parts are distinct, and at a Distance from each other; such is the Rose, whose Uterus is beneath the Petals; the Melon, and all of the Cucurbit Kind, which have their male and female Flowers a-part; and all Fruit, Nut, and Nut-bearing Trees, as the Apple, Plum, Gooseberry; the Walnut, Hazle, Philbad, Oak, Beech, Pine, Cypress, Cedar, Juniper, Mulberry, Plantane, &c. which have Catkins.

Plants may be again distinguished, with regard to their Food, and the Element they live in; into—1<sup>o</sup> *Terrane*, which are those that live only on Land; as Oaks, Beech, &c.

2<sup>o</sup> *Aquatic*, which live only in Water; either in Rivers, as the Water-Lily, Water-Plantane, &c. or in the Sea, as the Fucus, Coral, Coralline, &c.

3<sup>o</sup> *Amphibious*, which live indifferently either in Land or Water; as the Willow, Alder, Mintsh, &c.

Plants are again distributed, with regard to their Age or Period, into 1<sup>o</sup> *Annual*, which are those whose Root is form'd and dies in the same Year; such are the leguminous Plants, Wheat, Rye, &c. 2<sup>o</sup> *Biannuals*, which only produce Flowers and Seeds, the second or even third Year after their being rais'd, and then die; such are Fennel, Mint, &c. 3<sup>o</sup> *Perennial*, which are those that never die after they have once bore Seed; of these some are Ever-Greens, as the Asarabacca, Vio-

let, &c. others lose their Leaves one Part of the Year, as Fern, Colts-foot, &c.

Plants again are distinguished with regard to their Magnitude, &c. into, 1<sup>o</sup> *Trees*, Arbores; as the Oak, Pine, Fir, Elm, Sycamore, &c.—2<sup>o</sup> *Shrubs*, Suffrutices; as the Holly, Box, Ivy, Juniper, &c. and—3<sup>o</sup> *Herbs*, as Mint, Sage, Sorrel, Thyme, &c. See TREE, SHRUB, and HERB.—But this Division is rather popular, than just and philosophical.

The Botanists give us more accurate and minute Arrangements, or Distributions, of the Vegetable Kingdom, into Classes, Genera, Species, &c. with regard to their Nature, Characters, &c. 'Tis a Point they are not well agreed upon from what Consideration the Division into Genera is best taken; some, as *Gesner, Columna, Tarnsefort*, &c. choosing the Flower and Fruit; and others taking in the Roots, Leaves, Stems, &c. See farther under the Article GENUS.

Our ingenious Mr. Ray distributes Plants into 25 Genera, or Classes, under the following Denominations.

1<sup>o</sup> *Imperfect Plants* which are such as appear to want the Flower and Seed.—Such are, Corals, Sponges, Fungus, Truffles, Moss, See CORAL, SPONGE, MUSHROOM, TRUFFLE, and MOSS.

2<sup>o</sup> *Plants producing an imperfect Flower, and whose Seed is too small to be discern'd by the naked Eye*;—such are Fern, Polyphy, &c. See FLOWER.

3<sup>o</sup> *Those whose Flowers want Petals*;—such are Hops, Hemp, Nettles, Docks. See PETALA, HOPS, &c.

4<sup>o</sup> *Those with a compound Flower, and which emit a milky Juice when cut or broke*; as Lettuce, Dandelion, Succory, &c. See COMPOUND FLOWER.

5<sup>o</sup> *Those with a compound Flower of a discous Form, and whose Seed is ming'd with Down*; as Colts-foot, Flea-bane, &c. See WINGED.

6<sup>o</sup> *Herbs capitatae*, or those whose Flower is composed of long filitious Flowers gathered into a round Head, and covered with a fealy Coat; as the Thistle, great Burdock, Blue-bottle, &c.

7<sup>o</sup> *Corymbiferous Plants* with a discous Flower, but no Down; as the Daisy, Yarrow, Corn-Marygold, &c. See CORYMBUS.

8<sup>o</sup> *Plants with a perfect Flower, but only one Seed to each Flower*, as Valerian, Agrimony, Barner, &c.

9<sup>o</sup> *Umbelliferous Plants*, with a Flower of five Petals; and two Seeds to each Flower. See UMBELLÆ.—This being a large Genus is subdivided into seven Species, viz. those with a broad flat Seed like a Leaf, as wild Garden Parsnip; with a longish and larger Seed, swelling in the middle, as Cow-weed, and wild Chervil; with a shorter Seed, as Angelica; with a tuberos Root, as the Earth-nut; with a small striated Seed, as Carways, Saxifrage, and Burnet; with a rough hairy Seed, as Parsly, and wild Carrot; with intire Leaves subdivided into Jags, as Senicle, and Thoro-Wax.

10<sup>o</sup> *Stellate Plants*, whose Leaves grow round the Stalks; at certain Intervals, in form of Stars; as Mug-Weed, Madder, &c. See SYLLATE.

11<sup>o</sup> *Rough leaved Plants*, which have their Leaves placed alternately, or in no certain Order along the Stalks; as Hounds-Toonage, Mouse-Ear, &c.

12<sup>o</sup> *Suffruticee, or Verticillate Plants*, whose Leaves grow by pairs, on their Stalks, one Leaf right against another, the Flower being monopetalous, and usually in form of a Helmet; as Thyme, Mint, Pennyroyal, Vervain, &c. See VERTICILLATE.

13<sup>o</sup> *Poly spermous*, or those with many naked Seeds, at least five, succeeding their Flower; as Crows-foot, Marsh-Mallows, Cinquefoil, Strawberries, &c. See POLYSPERMIOUS.

14<sup>o</sup> *Bacciferous Plants*, or such as bear Berries; as Briony, Honeysuckle, Solomon's-Seal, Lily of the Valley, Nightshade, Asparagus, &c. See BACCIFEROUS, BERRY, &c.

15<sup>o</sup> *Multifluous, or Corniculate Plants*, which after each Flower produce several long slender Siliques, or Cases wherein their Seed is contained; as Orpine, Navel-wort, Bears-foot, Columbines, &c. See MULTISILICUOSUS, &c.

16<sup>o</sup> *Vasculiferous Plants*, or those with a Monopetalous Flower, and which, after each Flower, have a Vessel beside the Calyx, containing the Seed; as Henbane, Bindweed, Rampions, Fox-Glove, Eye-Bright, &c. See VASCULIFEROUS, &c.

17<sup>o</sup> *Those with an uniform tetrapetalous Flower*, bearing their Seeds in oblong filitious Cases; as Stockgilly-Flower, Mustard, Radish, &c.

18<sup>o</sup> *Vasculiferous Plants*, with a *femine tetrapetalous Flower*, but of an anomalous or uncertain kind, and in reality only monopetalous, falling off altogether in one; as Speedwell, Fluellin, Plantane, yellow and wild Poppy, &c.

19<sup>o</sup> *Leguminous Plants*, or such as bear Pulse, with a Papilionaceous Flower, consisting of four Parts joined at the Edges; as Pease, Beans, Vetches, Tares, Lentils, Liquorice, Trefoil, &c. See LEGUMINOUS.

20<sup>o</sup> *Visciferous Plants*, with a *pentagonal* or five-headed Flower; as Maiden-Pinks, Campions, Chickweed, St. Johns-Wort, Flax, Primrose, Wood-Sorrel, &c.

21<sup>o</sup> *Plants with a true bulbous Root*; as Garlic, Daffodil, Hyacinth, Saffron, &c. See BULB.

22<sup>o</sup> Those whose Roots approach nearly to the bulbous Form; as Flower-de-luce, Cockoo-pint, Baltard Hellebore, &c.

23<sup>o</sup> *Culmiferous Plants*, with a grassy Leaf, and an imperfect Flower, having a smooth hollow jointed Stalk, with a long sharp pointed Leaf at each Joint, and the Seeds contained in a chaffy Husk; as Wheat, Barley, Rye, Oats, and most kinds of Grass. See CULMIFEROUS.

24<sup>o</sup> *Plants with a grassy Leaf*, but not *Culmiferous*, with an imperfect or staminate Flower; as Rushes, Cats-Tail, &c.

25<sup>o</sup> *Plants whose Place of Growth is uncertain*; chiefly Water-Plants, as the Water-Lilly, Milk-Wort, Mouse-Tail, &c.

For the Transmutation of one Species of Plants into another. See TRANSMUTATION, DEGENERATION, &c.

The Properties and Virtues of Plants have been observed by some Naturalists to bear an Analogy to their Forms.—In the *Philosophical Translations*, we have a Discourse of Mr. James Petiver, to shew, That Plants of the same or like Figure, have the same or like Virtues and Uses.—Thus, the Umbelliferous Tribe, he observes, have all a Carminative Taste and Smell, are powerful Expellers of Wind, and therefore good in all flatulent Disorders.—The Galleate or Verticillate Kind are a Degree warmer, and more powerful than the last, and therefore may be reputed Aromatick, being proper for Nervous Disorders.—The Tetrapetalous Kind are hot like the two former, but exert their Power in a different Way, viz. by a Diuretick Volatile Salt, which makes them of Use in Chonical Diseases, Obstructions, Cachexias, &c.

PLANTA, in Anatomy, the lowest Part, or Sole of the Foot of Man. See FOOT and SOLE.

PLANTAGENET, in History, an Addition, or Surname, bore by many of our ancient Kings. See SURNAME, &c.

The Term *Plantagenet* has given infinite Perversion to the Critics and Antiquaries, who could never settle its Origin and Etymology.—'Tis allowed it first belonged to the House of Anjou, and was brought to the Throne of England by Henry II. where his Male Posterity preserved it till the Time of Henry VII. a Space of above 400 Years.

'Tis disputed who it was that first bore the Name. Most of our English Authors conclude, that our Henry II. inherited it from his Father Geoffrey V. Earl of Anjou, Son of Fulk V. King of Jerusalem, who died in 1144.—This Geoffrey they will have the first of the Name; and our Henry II. the Issue of Geoffrey by Maud only Daughter of Henry I. the second.

Yet *Ménage* will not allow Geoffrey to have bore the Name; and in effect the old Annalist of Anjou, J. Bourdigne, never calls him so.—The first, *Ménage* adds, to whom he gives the Appellation, is Geoffrey third Son of this Geoffrey V.

Yet must the Name be much more ancient than either of these Princes, if what *Skinner* says of its Origin and Etymology be true.—That Author tells us, that the House of Anjou derived the Name from a Prince thereof, who having kill'd his Brother to enjoy his Principality, took to Repentance, and made a Voyage to the Holy Land to expiate his Crime; disciplining himself every Night with a Rod made of the Plant *Genêt*, Broom; whence he became nick-named *Planta-genêt*.

Now, 'tis certain that our Geoffrey made the Tour of Jerusalem; but then he did not kill his Brother; nor did he go there out of Penance, but to assist King Amuris his Brother.—Who then should this Prince of the House of Anjou be? Was it Fulk IV? 'Tis true he dispossest his elder Brother Geoffrey, and clapt him in Prison, but did not kill him; nay, Bourdigne observes, he was even released out of the same by his Son Geoffrey V. already mentioned.

Further, this Fulk did make a Journey to Jerusalem, and that, too, partly out of a penitential View; we are assured by Bourdigne, he did it out of Apprehension of the Judgments of God and eternal Damnation, for the great Effusion of Christian Blood, in the many mortal Battles he had been in.—The Annalist adds, that he made a second Voyage; but 'twas to return God Thanks for his Mercies, &c. To which we may add, that Fulk was never call'd *Plantagenet*; so that what *Skinner* advances appears to be a Fable.

There is another common Opinion which appears no better founded; and 'tis this, that the Name *Plantagenet* was common to all the Princes of the House of Anjou, after Geoffrey V; whereas in Fact the Name was only given to a few; and that, as it should seem, to distinguish them from the rest. Thus Bourdigne never applies it to any but the third Son of Geoffrey V; and distinguishes him by this Appellation from the other Princes of the same Family.—Tho' 'tis certain it was likewise given to the elder Brother, Henry of England, as before observed.

PLANTARIS, in Anatomy, a Muscle which has a fleshy Beginning, from the back part of the external Protuberance of the Thigh-bone, and descending a little way between the Gemellus and Soleus, becomes a long and slender Tendon, which marches by the inside of the great Tendon over the Os Calcis to the bottom of the Foot; and expands itself under the Sole, upon the *Mafculus perforatus*, to which it adheres closely, as the *Palmaris* does in the Hand. See FOOT, PALMARIS, &c.

Some reckon this among the Extenders of the Foot. See EXTENSOR.

PLANTATION, in the Colonies, a Spot of Ground which some Planter or Person arrived in a new Colony, pitches on to cultivate and till for his own Use. See COLONY.

PLANTING, in Agriculture and Gardening, the setting of a Tree, or Plant, taken up from its former Place, in a new Hole or Pit proportionable to its Bulk; throwing fresh Earth over its Root, and filling up the Hole to the Level of the other Ground. See PLANT, TRANSPLANTING, GARDENING, &c.

PLANTING an Orchard. See ORCHARD.

PLANTING of Forest-Trees. See SEMINARY, TREE, &c.

PLANTING of Wall-Fruit-Trees.—After 2 Years Growth in the Nursery, Stone-Fruit, being first inoculated or grafted, are ready for Removal; which is best done in October or November.

To prepare the Soil for its new Guest; a Hole is dug 2 foot deep; or if the Soil be not very good, the Pit is made shallower, and Earth rais'd above it.—With the Soil dug up, they frequently mix either a rich Soil from elsewhere; or a Manure, so as the Mixture be at least as rich as the Soil out of which the Plant came.

The Hole being half fill'd up with this Compost, it is trodden down, to afford a firm Rest to the Root, all the Extremities whereof are cut off, and the Tree fitted to the Wall by cutting off such Branches as grow directly either towards or from-wards the Wall, and leaving only the side Branches, which are to be nailed to it.

This done, the Tree is set in its Hole, as far from the Wall as is consistent with the Heads spreading thereon; that the Root may have the more room backwards, and the Hole then fill'd up with the Compost.

If the Soil be poor 'tis proper to manure round the Tree; and in the end of February, to cover it with Fern or Straw.—'Twill be necessary to prune and nail the Tree to the Wall, at least twice or thrice every Year. See WALL-FRUIT.

Reverse-PLANTING, is a Method of Planting wherein the ordinary Position of the Plant, or Shoot, is inverted; the Branches being set in the Earth, and the Roots rest'd into the Air.

*Agricola* mentions this monstrous Way of planting, which he assures us succeeds very well in moist, or all sorts of Fruit-Trees, Timber-Trees, &c. foreign and domestick.

*Bradley* affirms us to have seen a Lime-Tree in Holland growing with its first Roots in the Air, which had shot our Branches in great Plenty; at the same time that its first Branches were turned into Roots and fed the Tree.

The industrious Mr. Fairchild has practis'd the same at home; and gives us the following Directions for the Performance thereof.

Choose a young Tree of one Shoot, of Alder, Elm, Willow, or any other Tree that takes root readily by laying. Bend the Shoot gently down till the extreme Part be in the Earth, and so let it remain till it has taken good Root.—This done, dig about the first Root, and gently take it up out of the Ground till the Stem be nearly upright; in which state stake it up.

Then prune the Roots, now crested in the Air, from the Bristles and Wounds they received in being dug up; and anoint the pruned Part with a Composition of 4 Parts of Bees-Wax, 2 of Rosin, and 2 of Turpentine, melted together and applied pretty warm.—Then prune off all the Buds or Shoots upon the Stem, and dress the Wounds with the same Composition, to prevent any collateral Shootings; and leave the rest to Nature. See FECUNDITY.

PLANTING, in Architecture, denotes the disposing of the first Courses of solid Stone on the Masonry of the Foundation, laid level according to the Measures, with all the Exactness possible. See FOUNDATION, BUILDING, HOUSE, &c.

PLASM, PLASMA, a Mould, wherein any Metal, or such like running Matter, which will afterward harden, is cast. See MOULD; see also PLASTIC.

PLASTER, or PLASTER, in Building, a Composition of Lime, sometimes with Hair, sometimes with Sand, &c. to parget or cover the Nudities of a Building. See PARGETING.

PLASTER of Paris, is a Fossil-Stone, of the Nature of a Lime-stone; serving many Purposes in building; and used likewise in Sculpture, to mould and make Statues, Baso Reliefs

Relievs; and other Decorations in Architecture. See STONE, STATUE, &c.

It is dug out of Quarries, in several Parts of the Neighbourhood of Paris; whence its Name.—The finest is that of *Montmartre*.

This *Plaster* is of two kinds, viz. *Crude*, or in the Stone; and *burnt*, or beaten.

The *crude* is the native *Plaster* as it comes out of the Quarry; in which state 'tis used as Shards in the Foundations of Buildings.

The *burnt Plaster* is a Preparation of the former, by calcining it like Lime in a Kiln or Furnace, and then beating it into Powder, and diluting and working it. See LIME, &c. In this state it is used as Mortar or Cement in Buildings. See MORTAR.

This, when well sifted and reduced into an impalpable Powder; is used to make Figures and other Works of Sculpture; and is besides of some Use in taking out Spots of Grease, &c. in Stuffs and Silks. See FIGURE, SCULPTURE, &c.

In the *Plaster-Quarries* is also found a kind of false Talc, wherewith they counterfeit all kinds of Marble. See MARBLE, GYPSUM STONE, &c. See also PLASTER.

PLASTIC-*Virtue*, a Faculty of forming, or fashioning any thing. See FACULTY.

The Word comes from the Greek *πλαστικός*, of *πλασσω*, *tingo*, *I fashion*, *form*, &c.

Some of the ancient *Epicureans*, and perhaps the Peripatetics too, imagined, a *Plastic Virtue* to reside in the Earth; or at least to have anciently resided therein; and that 'twas by means hereof and without any extraordinary Intervention of a Creator, that it first put forth Plants, &c. See EARTH, WORLD, &c.

Nay, some of them, whether seriously or not we don't undertake, taught, that Animals, and even Man, were the Effect of this *Plastic Power*. See PLATONIST, PERIPATETIC, &c.

PLASTICE, or the PLASTICK *Art*, a Branch of Sculpture; being the Art of forming Figures of Men, Birds, Beasts, Fishes, Plants, &c. in Plaster, Clay, Stone, &c. See SCULPTURE, PLASTER, &c.

The Workmen concerned herein are called *Plaster*.

*Plastice* differs from Carving, in that here the Figures are made by Addition of what wants: But in Carving always by Subtraction of what is superfluous. See CARVING.

The *Plastic Art* is now chiefly used among us in Fret-work-Cielings; but the *Italians* apply it to the Mantlings of Chimneys with great Figures. See FRET-WORK, CIELING, &c.

PLAT, a popular Term among Mariners, &c. for a Sea Chart. See CHART.

PLATA, PLATE, in Commerce, a Spanish Term, signifying Silver; as Vellon, which they pronounce Veillon, signifies Copper. See SILVER, COIN, &c.

These two Terms are not only used to express the Species of those Metals struck in Spain, but also to distinguish between several of their Monies of Account.—Thus they fix a Ducat of Plata, and a Ducat of Vellon; a Rial of Plata, and a Rial of Vellon; which Denominations augment and diminish the Value by almost one half; 34 Maravedis of Plata being equal to 63 of Vellon; and the Piece of Eight being only 272 Maravedis of Plata, but 510 of Vellon. See DUCAT, PIECE of EIGHT, RIAL, and MARAVEDIS.

PLATE, in Commerce, denotes Gold or Silver wrought into Vessels for domestick Uses. See GOLD, SILVER, MARK, PUNCHION, &c.

PLATE, in Heraldry, is a round, flat Piece of Silver, without any Impression; but as it were form'd ready to receive it.

The Term is used only by English Heralds: for in other Nations they are known by the Name of Bezants, Argent. See BEZANTS.

PLAT-BAND, in Gardening, a Border, or Bed of Flowers, along a Wall, or the side of a Parterre; frequently edg'd with Box, &c. See BORDER, PARTERRE, EDGING, &c.

PLAT-BAND, in Architecture, is any flat square Moulding, whose Height much exceeds its Projecture. See MOULDING.

Such are the Fries or Fælix of an Architrave, and the Plat-band of the Modillions of a Cornich. See ARCHITRAVE, CORNICH, &c.

The Plat-band is signified in *Vitruvius*, and others, by the Words *Fascia*, *Tenia*, and *Corfa*. See FASCIA, TENIA, &c.

PLAT-BAND, of a Door or Window, is used for the Lintel, where that is made square, or not much arch'd. See LINTEL.

These *Plat-bands* are usually cross'd with Bars of Iron, when they have a great Bearing: But 'tis much better to ease them by Arches of Discharge built over them. See DOOR, WINDOW, &c.

PLAT-BANDS of *Fluting*, the Lifts or Fillets between the Flutings of Columns. See FLUTING.

PLAT-FORM, in War; is a Place prepared on the Ramparts, to raise a Battery of Cannons upon. See RAMPART, BATTERY, &c.

It is made by the heaping up of Earth on the Rampart; or by an Arrangement of Mangers, rising insensibly for the Cannon to roll on; either in a Cademate, or on an Attack in the Out-works.

PLATFORM, in Architecture, is a Row of Beams, which support the Timber-Work of a Roof, and lie on the top of the Wall, where the Entablature ought to be raised.

The Word is also used for a kind of Terrace-Walk, or even Floor, on the top of a Building, from whence we may take a fair Prospect of the adjacent Country.

Hence an Edifice is said to be cover'd with a *Platform*, when it is flat a-top, or has no Ridge. See ROOF.

Most of the Oriental Buildings are thus cover'd; as were all those of the Ancients.—*Cæsar* was the first among the *Romans* who procur'd Leave to Build his House with a Ridge, or Pinnacle. See PINNACLE.

PLATFORM, or *O-top*, in a Man of War, is a Place on the lower Deck, about the Main Mast, and round about the main Capstan; where Provision is made for the wounded Men, in time of Service.—It is between the Main-Mast and Cockpit.

PLATONIC, something that relates to *Plato*, his School, Philosophy, Opinions, or the like. See PLATONISM.

PLATONIC *Bodies*, are the same with that we otherwise call *Regular Bodies*. See REGULAR BODIES.

PLATONIC *Love*, denotes a pure spiritual Affection, subsisting between the different Sexes, abstracted from all carnal Appetites, and regarding no other Object but the Mind, and its Beauties; or a sincere disinterested Friendship, subsisting between the same Sex, abstracted from any selfish Views, and regarding no other Object but the Person.

The Term took its Rise from the Philosopher *Plato*, a strenuous Advocate for each Kind. See PLATONISM.

The World has a long time laugh'd at *Plato's* Notions of Love and Friendship.—In effect, they appear arrant Chimeras, contrary to the Intentions of Nature, and inconsistent with the great Law of Self-Preservation; which Love and Friendship are both ultimately resolvable into. See PASSION.

PLATONIC *Year*, or the *great Year*, is a Period of Time determined by the Revolution of the Equinoxes; or the Space wherein the Stars and Constellations return to their former Places, with regard to the Equinoxes. See YEAR, STAR, PRECESSION of the Equinoxes, &c.

The *Platonic Year*, according to *Tychon Brahe*, is 25816; according to *Kicilius* 25020; according to *Cassini* 24800 Years.

This Period, which is more than five times the Age of the World, once accomplish'd; it was an Opinion among the Ancients, that the World was to begin a-new, and the same Series of things turn over again. See PERIOD.

PLATONISM, the Doctrine and Sentiments of *Plato* and his Followers, with regard to Philosophy, &c. See PHILOSOPHY.

The Founder of this System of Philosophy, *Plato*, the Son of *Aristotle*, was an *Athenian*; born about the Year of the World 3623; who after having spent his Youth in Exercises of the Body, Painting, and Poetry, became a Disciple of *Socrates*.—After his Master's Death, he applied himself to *Cratylus* and *Hermogenes*; 'till being a Master of the Greek Philosophy, he travelled into *Italy*, where he learnt that of the *Pythagoreans*. See PYTHAGOREAN.

Hence he proceeded into *Egypt*; where, in thirty Years Residence he became fully acquainted with the Secrets of the *Egyptian* Priests. See SYMBOL.

At his Return to *Athens* he began to rettle the Stock of Learning he had collected, among his Countrymen; philosophizing daily in the Academy, a delicious Villa in the Neighbourhood of that City. See ACADEMY.—And hence his Disciples were called *Academicks*.

In Physics, he chiefly followed *Heraclitus*; in Ethics and Politics, *Socrates*; in Metaphysics, *Pythagoras*.

After his Death, two of the principal of his Disciples, *Aristotle* and *Xenocrates*, continuing his Office, and teaching, the one in the Academy, the other in the Lyceum; form'd two Sects, under different Names, tho' in other respects the same; the one retaining the Denomination of *Academicks*; see ACADEMICK. The other assuming that of *Peripateticks*. See PERIPATETICK.

In after-times, about the first Ages of the Christian Church; the Followers of *Plato* quitted the Title of *Academicks*, and took that of *Platonists*.

'Tis supposed to have been at *Alexandria* in *Egypt* that they first assumed the new Title; after having restored the ancient Academy, and re-establish'd *Plato's* Sentiments; which in process of Time had many of them been laid aside.

*Porphyry, Plotin, Iamblichus, Proclus, and Plotarch,* are those who acquired the greatest Reputation among the Greek Platonists. And among the *Latin, Apuleius, and Chalcidius*.—Among the *Hebrews, Philo Judaeus*.—The modern Platonists own *Plotin* the Founder, at least the Reformer, of their Sect.

The *Platonic Philosophy* appears very consistent with the *Mosaic*; and a great Party of the primitive Fathers follow the Opinions of that Philosopher, as being favourable to Christianity.—*Justin* is of Opinion, *Plato* could not learn many things he has said in his Works, from mere Natural Reason; but thinks he might have learnt them from the Books of *Moses* which he read when in *Egypt*.

Hence *Numerius, the Pythagorean*, expressly calls *Plato* the *Aristo Moses*; and upbraids him with Plagiarism in that he stole his Doctrine about the World and God, from the Books of *Moses*.

*Theodoret* says expressly, that he has nothing good and commendable about the Deity, and his Worship, but what he stole from the *Hebrew Theology*; and *Clement Alexandrinus* calls him the *Hebrew Philosopher*.

*Gale* is very particular in his Proof of the Point, that *Plato* borrowed his Philosophy from the Scriptures, either immediately, or by means of Tradition; and, beside the Authority of ancient Authors, brings some Arguments from the thing itself.—As, *e. gr.* *Plato's* Confession that the *Greeks* borrowed their Knowledge of the one infinite God, from an ancient People, better and nearer to God than they; by which People, our Author makes no doubt, he meant the *Jews*: from his Account of the State of Innocence; as, that Man was born of the Earth, that he was naked, that he enjoy'd a truly happy State, that he conversed with Brutes, &c.—In effect, from an Examen of all the Parts of *Plato's* Philosophy, Physical, Metaphysical, and Ethical; this Author finds in every one, evident Characters of its sacred Original.

As to the Manner of the Creation, *Plato* teaches that the World was made according to a certain Exemplar, or Idea, in the Divine Architect's Mind. And all things in the Universe, in like manner, he shews, do depend on the Efficacy of eternal Ideas.

This Ideal World is thus explained by *Didymus*: "*Plato* supposes certain Patterns, or Exemplars of all sensible things, which he calls *Ideas*; and as there may be various Impressions taken off from the same Seal; so is there a vast Number of Natures existing from each Idea." This Idea he supposes to be an eternal Essence, and to occasion the several being in Nature to be such as itself is: And that most beautiful and perfect Idea which comprehends all the rest, he maintains to be the World.

Further, *Plato* teaches that the Universe is an intelligent Animal, consisting of a Body and a Soul.—The first Matter whereof this Body was form'd, he observes, was a rude indigested Heap, or Chaos: Now, adds he, the Creation was a mixt Production; and the World is the Result of a Combination of Necessity and Understanding, *i. e.* of Matter, which he calls Necessity, and the Divine Wisdom.

For the *Anima Mundi*, or Soul of the World; see *ANIMA MUNDI*.

The Principles, or Elements, which *Plato* lays down, are Fire, Air, Water, and Earth. See *ELEMENT*.

He supposes two Heavens, the *Empyrean*, which he takes to be of a fiery Nature, and to be inhabited by Angels, &c. And the *Starry Heaven*, which he teaches is not adamantine or solid, but liquid and spirable. See *HEAVEN*.

His *Physics*, or Doctrine of *Corpore*, is chiefly laid down in his *Timaeus*; where he argues on the Properties of Body, in a Geometrical Manner; which *Aristotle* takes occasion to reprehend in him.—His Doctrine of *Atente* is delivered in his 10th Book of *Laws*, and his *Parmentides*.

*St. Augustin* commends the *Platonic Philosophy*; and even says, that the *Platonists* were not far from Christianity: He adds, that the Generality of the new Platonists of his Time embraced the Faith.

*Justin Martyr* professes, that *Plato's* Doctrine was of the utmost Advantage to him, in helping him to believe the Mysteries of the Christian Faith.—To which it may be added, that it was in good Measure by *Plato's* Help that *Origen* confuted *Celsus*. See *TRINITY*, &c.

Indeed the late Author of *Platonisme dévoilé*, carries things to an extravagant Length when he contends, that the Dogmas of our Religion are only the Opinions of *Plato*; that the Fathers give us nothing of the Mysteries thereof but what they learnt from him; and that Christianity is only a palpable Platonism.—To which Opinion *M. le Clerc* seems a little inclined. See *GOD, FATHERS*, &c.

**PLATONISTS.** See *PLATONISM*, and *ACADEMICKS*.

**PLATTOON**, in War, a small, square Body of 40 or 50 Men, drawn out of a Battalion of Foot, and placed between the Squadrons of Horse, to sustain them; or in Embuscades, Straights, and Duffles, where there is not room

for whole Battalions, or Regiments.—*Platoons* are used when they form the hollow Square to strengthen the Angles. See *MUSQUETEER, HOLLOW SQUARE, BATTALLION*, &c.

The Grenadiers are generally posted in *Platoons*. See *GRENADEIER*.

The Word is form'd, by Corruption, of the *French Peloton*, a Bottom, or One of Thread.

**PLATTS**, on board a Ship, are flat Ropes, made of Rope-Yarn, and woven one in another. See *ROPE*, &c.

Their Use is to save the Cable from galling in the Haule; or to wind about the Flukes of the Anchors, to save the Pendant of the Fore-sheet from galling against them.

**PLATYSMA, Myoides**, in Anatomy. See *QUADRATUS Gena*.

**PLAY, Lusus.** See *GAME*, and *GAMING*.

**PLAY**, in Poetry, &c. See *DRAMA, TRAGEDY, COMEDY*, &c.

**PLAY-HOUSE.** See *THEATRE, AMPHITHEATRE*, &c.

**PLEA**, *Placitum*, in Law, that which either Party in a Cause alledgeth for himself in Court. See *PLACITUM, CAUSE*, and *COURT*; see also *PLEADING*, &c.

*Pleas*, are either of the *Crown*, or *Common Pleas*. *Pleas of the Crown*, are all Suits in the King's Name, for Offences committed against his Crown and Dignity, or against his Crown and Peace.—Such are Treasons, Felonies, Misprisions of either, and Mayhem. See *TREASON, FELONY*, &c.

*Edward I.* enfeoffed *Walter de Burgo* in the Land of *Ostler* in *Ireland*, &c. excepting the Pleas of the Crown, *viz.* Rapefall, willful Firing, and Treasore-trove. *Can. tit. Ireland*.

*Common Pleas* are those agitated between common Persons; tho', by the Definition above laid down, they should comprise all other except those there enumerated, notwithstanding the King be a Party.

*Plea* may further be divided into as many Branches as *Actions*; in as much as they are in reality the same thing. See *ACTION*.

There is also *Foreign Plea*, whereby Matter is alledged in any Court, that ought to be tried by another.—As if one by Estreat to another in a Court-Bar. See *FOREIGN*.

*Pleas of the Sword*.—*Ranulph Earl of Chester*, 2<sup>d</sup> Hen. III. granted to his Barons of *Cheshire*, an ample Charter of Liberties, exceptit *placitis ad gladium mecum pertinentibus*.

The Reason of the Exception was, that *William the Conq.* gave the Earldom of *Chester* to his half-Brother *Hugh*, commonly called *Lupus*, Ancestor of this *Ranulph*, *Tenere ita libere ad Gladium, sicut ipse Rex tenuit Angliam ad Coronam*.

Accordingly in all Indictments for Felony, Murder, &c. in the County Palatine, the Form was, *Contra pacem Domini Comitit, gladium & dignitatem suam*, or *contra dignitatem Gladii Ceitria*.—Such were the Pleas of the Dignity of the Earl of *Chester*. See *GLADIUS*.

Court of *Common Pleas*, call'd also *Common Bench*. See *COMMON PLEAS*.

**PLEADING**, a Discourse spoke at the Bar, in Defence of the Cause of a Party. See *PLEA* and *BAR*.

From the Time of the Conquest, all Pleading was perform'd in *French*, 'till the Time of *Edward III.* when it was appointed that the Pleas should be pleaded in *English*, but to be enter'd, or recorded, in *Latin*. See *LATIN*.

At *Athens*, and even in *France* and *England*, it was prohibited to have any form'd or prepared Pleadings, or to amuse the Court with long artificial Hverages; only, in important Matters, 'twas the settled Custom to begin the Pleading with a Passage in holy Scripture. See *TEXT*.

'Tis but of late Years that Eloquence was admitted to the Bar; and it may be said there is scarce any Nation in Europe where it is less practiced or encouraged than among us.—The Elocution of the Bar, like that of the Pulpit, despises the Rules of Rhetoric. See *ACTION, ELOQUENCE, ORATORY*, &c.

**PLEADINGS** are properly the Allegations of the Parties to the Suits, made after the Count, or Declaration. See *DECLARATION*.

In this Sense the *Pleadings* express what is contained in the Bar, Replication, and Rejoinder; and not what is in the Declaration itself.—Hence Defaults in the Matter of Declaration, are not comprized within the *Mispleadings*, or insufficient Pleadings, which only extends to that committed in the Bar, Replication, or Rejoinder. See *BAR, REPLICATION*, and *REJOINDER*.

**PLEASURE**, the Effect of a Sensation or Perception agreeable to the Mind, or of the Gratification of some Appetite. See *APPETITE, SENSATION*, &c.

*Pleasures* may be distinguished into two Kinds.—The first, those which anticipate, or go before, the Reason; such are all agreeable Sensations.—These are popularly call'd *Pleasures of Sense*, or of the Body. See *SENSE*.

The second are those which do not precede or anticipate either the Senses or Reason.—These we call *Pleasures of the Mind*.—Such is the Joy arising from a clear Perception of some

some future Good, or confused Sensation of a present one. See *MIND*.

For an instance of either.—A Man frequently finds *Pleasure* in eating a Fruit he was before unacquainted withal. This is *anticipating Pleasure*, which he feels e'er he knows the Fruit to be good.

On the other hand, a hungry Hunter expects, or perhaps actually finds, *Vicissitudes*; where the Joy he conceives, is a *Pleasure* that follows from the Knowledge of his present or future Good. See *PAIN*.

*Pleasure* and *Pain* seem to be no other than Engines in Nature's Hand; whereby we are directed to consult our own Preservation, and avoid our Ruin.—To things that may contribute to the one, as Food, Vener, &c. she has annexed *Pleasure*; and to those that may conduce to the other, as Hunger, Diseases, &c. *Pain*: She durst not leave it to our Discretion, whether we'd preferre and propagate the Species or not; but, as it were, constrains us to both: Were there no *Pleasure* in eating, nor *Pain* in Hunger, what Numbers would be starved, thro' Negligence, Forgetfulness, or Slothfulness. What is it induces People to the Office of Generation, but *Pleasure*? without this the World had scarce subsisted to this Time.

Among the Multiplicity of things to be done, and to be avoided for the Preservation of animal Life, &c. how should we have distinguished between the one and the other, but for the Sensations of *Pleasure* and *Pain*? These are not only Spurs, to urge us on, but also Guides to direct us whither we are to go. Wherever Nature has fix'd a *Pleasure*, we may take it for granted, she there enjoins a Duty; and something is to be there done, either for the Individual or the Species.

Hence it is that our *Pleasures* vary at different Stages of Life; the *Pleasures*, e. gr. of a Child, a Youth, a grown Man, an old Man, &c. all tending to those particular things required by Nature in that particular State of Life, either for the Preservation, simply, or for that and Propagation, &c.

Hence, from the different Constitutions of the Body, at different Ages, it were very easy to account for all the particular Tastes and Pleasures thereof: Not by deducing the *Pleasures* mechanically from the Disposition of the Organs in that State; but by considering what is necessary for the Perfection, and well-being of the Individual in that State, and what it is to contribute to that of the Species.—In a Child, e. gr. mere Preservation in the present State is not enough; it must likewise grow: to bring this to pass, Nature has made the Returns of Hunger, &c. more frequent, as well as more acute; and the *Pleasures* of feeding more exquisite. And that the Excess of Aliment in Proportion to the Bulk of the Body may be dispens'd withal, she has made one of the great *Pleasures* of that State, to consist in a Series of sportive Exercises, by means whereof the Parts of the Body come to be opened and expanded, and arrive at Maturity. This done, the *Pleasures* that conducted thereto disappear; and others suited to the new State, succeed. See *NATURAL Inclination*; see also *PASSION*.

For the *Pleasures* of Beauty, Music, &c. See *BEAUTY*, *MUSIC*, &c.

**PLEBEIAN**, **PLEBEIUS**, a Person of the Rank of the Populace, or Common People. See *POPULACE*, and *COMMON*.

The Term is chiefly us'd in speaking of the ancient *Romans*, who were divided into *Senators*, *Knights*, and *Plebeians*. See *SENATOR*, *KNIGHT*, &c.

**PLEBANUS**, was anciently the Title of a Rural Dean. See *RURAL Dean*.

The Denomination arose hence, that these Deaneries were then affixed to the *Plebana*, or chief Mother-Church within such a District, which at first was usually ten Parishes.

The Term seems also to have been us'd for a Parish-Priest, of such a large Mother-Church, as was exempt from the Jurisdiction of the Ordinary, so that he had the Authority of a Rural Dean committed to him by the Archbishop, to whom the Church was immediately subject.

**PLEBISCITUM**, among the *Romans*, a Law enacted by the Common People, at the Request of the Tribune, or some other Plebeian Magistrate. See *LAW*.

The Word *Plebiscitum* is particularly apply'd to the Law which the People made, when upon a Misunderstanding with the Senate, they retired to the *Aventine Mount*. See *CIVIL Law*.

**PLEDGE**, **PLEGIUS**, or **PLEGGIS**; in Common-Law, a Surety, or Gage, either real or personal, which the Plaintiff finds to prosecute his Suit. See *GAGE* and *SURETY*.

The Word is sometimes also us'd for *Frank Pledge*, which see. See also *PLEGGERY*.

To *Pledge*, in Drinking, denotes to warrant, or be Surety to one that he shall receive no harm while he is taking his Draught.

The Phrase is refer'd by our Antiquaries, to the Practice of the *Danes*, heretofore in *England*, who frequently us'd to

stab, or cut the Throats of the Natives while they were drinking.

**PLEGGERY**, or **PLEGGERY**, Suretyship, or an Undertaking, or answering, for another. See *SURETY* and *PLEDGE*.

The Appellant shall require the Constable and Marshal to deliver his Pledges, and to discharge them of their *Pleggery*; and the Constable and Marshal shall ask leave of the King to acquit his Pleggs, after that the Appellant is come into the Lists to do his Devoir. *Orig. Jur. ex Vet. Cod. AIS. in Bibl. Selden.*

**PLEGIIS acquietandis**, a Writ that lies for a Surety, against him for whom he is Surety, in case he pay not the Money at the Day. *Fitz. Nat. Brev.*

**PLEDGET**, in Chirurgery, a kind of flat Tent, made, not to enter a Wound, but to be laid upon it, to imbuhe the superfluous Humours, and keep it clean and dry. See *TENT* and *WOUND*.

**PLEIADES**, in Astronomy, an Assemblage of seven Stars, in the Neck of the Constellation *Taurus*. See *STAR*.

They are thus call'd from the Greek *πλεῖστον*, to sail; as being terrible to Mariners, by reason of the Rains and Storms that frequently rise with them.

The *Latin* call them *Verigilia*, from *Ver*, Spring; because of their rising about the Vernal Equinox. See *VERIGILIA*.

The largest is of the third Magnitude, and call'd *Lucida Pleiadum*. See their several *Longitudes*, *Latitudes*, *Magnitudes*, &c. under the Article *TADRUUS*.

*Poetical PLEIADES*, is a Name which the *Greeks* gave to seven celebrated Poets, flourishing under the Reign of *Ptolemy Philadelphus*.

In Imitation of the *Greeks*, *Rosford* form'd a *Pleiad* of the *French* Poets, under the Reign of *Henry II.*—It consisted of *Duport*, *Rosford*, *du Bellay*, *Bulleau*, *Boif*, *Tyard*, and *Jodelle*.

On the same Model, some of their Authors are projecting a new *Pleiad* of the *Latin* Poets of the present time; But they are not yet agreed about the Names of those that are to compose it; much less on him who shall be the *Lucida Pleiadum*.—*M. Boiller* has nam'd *F. Ropin*, *F. Coumaire*, *F. de la Rue*, *M. de Senteuil*, *M. Menage*, *M. du Perier*, and *M. Petit*.

**PLENARTY**, in Law, a Term us'd in Matters of Benefices, in opposition to *Vacancy*. See *VACANCY*, *VACATION*, &c.

Institution is a good *Plenary* against a common Person, but not against the King, without Induction. See *INSTITUTION*. *Chke on Lit.*

**PLENARY**, something compleat, or full.—Thus we say the Pope grants *Plenary Indulgences*, i. e. full and entire Remissions of the Penalties due to all Sins. See *INDULGENCE*.

The Word is form'd of the *Latin Plenarius*, of *plenus* full.

**PLENILUNIUM**, in Astronomy, that Phase or state of the Moon popularly call'd the *Full-Moon*. See *MOON*.

The Word is a Compound of the *Latin plenus*, and *Luna*.

**PLENIPOTENTIARY**, a Person who has full Power and Commission to do any thing.

The Word is chiefly us'd in speaking of the Ministers or Embassadors sent from Princes or States, to treat of Peace, Marriages, and other important Matters. See *MINISTER*, *EMBASSADOR*, &c.

The first thing done in Conferences of Peace, is, to examine the Powers of the *Plenipotentiaries*. See *TREATY*.

The Word is compounded of *plenus* full, and *Potentia* Power.

**PLENITUDE**, the Quality of a thing that is full; or that fills another.

In *Physic*, it is chiefly us'd for a Redundancy of Blood and Humours. See *REPLETION*.

Physicians reckon two kinds of *Plentitude*.—The one call'd *ad Vires*, when the Abundance of the Blood oppresses the Patient's Strength.

The other *ad Vasa*, when it fills the Vessels too much; swelling to a Degree of bursting. See *PLETHORA*.

**PLENUM**, in *Physic*, a Term us'd to signify that state of things, wherein every Part of Space, or Extension, is supposed to be full of Matter.—In opposition to a *Vacuum*, which is a Space supposed devoid of all Matter. See *VACUUM*.

The *Cartesians* adhere firmly to the Doctrine of an absolute *Plenum*.—This they do on this Principle, that the Essence of Matter consists in Extension; from whence, indeed, the Consequence is very easy, that wherever there is Space or Extension, there is Matter. See *EXTENSION*.

But this Principle we have shewn to be false; and therefore the Consequence drawn from it falls to the Ground. See *MATTER*.

But that there is a real Vacuum in the Nature of things, is likewise demonstrated by Arguments *a posteriori*, under the Article VACUUM.

**PLEONASM**, **PLEONASMUS**, in Rhetoric, a Figure of Speech, whereby we make use of Words seemingly needless and superfluous, in order to express a Thought with the greater Force and Energy. Such is, *I saw it with my own Eyes*, &c. See FIGURE.

The *Pleonasm* is call'd by the *Latins*, *Redundancy*. See REDUNDANCY.

**PLEONASM**, in Grammar, is usually defined a Fault in Discourse, wherein we say more than needs.—As, *he heard it with his Ears*.

*M. Faugelas* will not allow the Phrase, *I saw it with my own Eyes*, to be a *Pleonasm*; inasmuch as there are no superfluous Words in it; none but what are necessary to give a stronger Assurance of the thing affirmed.—'Tis sufficient that one of the Phrases fix somewhat more than the other, to avoid the Imputation of a *Pleonasm*.

In effect, tho' we give the Name *Pleonasm* to any thing that is not necessary, or that enters the Discourse independently of the Sense, or Construction; yet there are frequently Words which in that View would be impertinent yet are used to good purpose to give a greater Force, or Grace to Discourse.

*He spoke with his Mouth*, is a *Pleonasm* in English; 'tis none in Latin; *Palatilis vis, sic ore locutus*.—Some French Authors deny *unintelligible*, to unite together, to be a *Pleonasm*.

The Word is form'd from the Greek *πλεονασμῶς*, *Superabundancy*.

**PLEKOTICKS**, in Medicine, a kind of Remedies, otherwise call'd *Incarnatives*. See INCARNATIVE.

The Word is form'd from the Greek *πλεονάζω*, I fill.

**PLETHORA**, in Medicine, such an Abundance of any good and laudable Humour as proves hurtful to the animal Functions. See HUMOUR, &c.

*Plethora* is chiefly understood of the Blood; tho' sometimes of the other Humours. See BLOOD.

The *Plethora* is the Consequence of a good Chylification, Sangrification, &c. attended with a too sparing Discharge by Perspiration, &c.

It is usually described as either *ad vitæ*, or *ad usûs*. See PLENTITUDE.

The *Plethora* is chiefly produced in a Body whose Organs of Digestion are strong, Blood-Vessels lax, Diet full of good Juice, Temperament sanguine, Mind at ease and indolent, at a middle Age, and in a moist Air.—It renders Heat and Motion intolerable; stretches the great Vessels, and compresses the smaller. And hence Stiffness, and Heaviness, and on the least occasion, Raptures in the Vessels, Suffocations, &c. See DISEASE.

*Dr. Friend* makes the Catamenia, or Menstrua, the mere Result of a *Plethora*; and will have them only an Evacuation for Relief against the Quantity of the Blood, which he supposes to be natural to Women, from the Humidity of their Temperature, the Smallness of their Vessels, &c. Hence a Conservation in the Blood-Vessels, of a Superfluity of Aliment remaining over and above what is excreted by the common Ways. See MENSTRU.

**PLEVIN**, in Law, a Warrant, or Assurance. See REPLEVIN, WARRANT, &c.

**PLEURA**, in Anatomy, a Membrane which lines the Breast and encloses all the Parts contained therein; being of the same Figure and Extent with the Thorax itself, and of the same Substance with the Peritonæum. See THORAX.

'Tis very fine and thin, yet manifestly double; thickest about the Back, where it is fastened to the Ligaments of the Vertebrae.—In the middle of the Thorax it is doubled, which Duplication forms what we call the *Mediastinum*, which divides the Thorax longitudinally into two Parts. See MEDIASTINUM.

The Use of the *Pleura* is to defend the Inside of the Thorax, and render it smooth, that the Lungs may not be hurt in their Motion. See LUNGS.

The Word is derived from the Greek *πλευράς*, *Side*. The *Latins* call it *Succingens*.

**PLEURITIS**, **PLEURISY**, in Medicine, a violent Pain in the Side, attended with an acute Fever, a Cough, and a Difficulty of breathing.

The *Pleurisy* arises from an Inflammation of some Part of the Pleura, to which is frequently joined that of the exterior and superficial Part of the Lungs. See INFLAMMATION and PLEURA.

It usually arises upon cooling too hastily, after violent Heat; as by drinking cold Water, lying open to the Air, &c.

This Inflammation seizes any part of the Integuments of the Thorax, viz. either the Pleura or Mediastinum; and therefore the pricking Pain may be felt in any Part of the Thorax; but the place it most ordinarily infects is the Side; sometimes the right, sometimes the left, sometimes higher, sometimes lower.

This makes what we call the *Pleuritis vera*, or *true* or *internal Pleurisy*; in opposition to the *Notha*, or *spurious* or *external Pleurisy*, which is a Pain in the Side, without any Fever, and frequently without any Cough; and is supposed to arise from a sharp Serosity lodg'd on the Pleura, or higher among the intercostal Muscles.

The great Remedy in the *true Pleurisy* is copious and repeated Bleeding. In Adults, *Sydenham* observes, it is seldom cured with less than the Loss of forty Ounces of Blood.—By omitting Phlebotomy the Patient is frequently suffocated.

The *Pleurisy* sometimes succeeds another Fever; occasion'd by a Precipitation of the Febrile Matter upon the Pleura.

When it rises to an Impothume, it is call'd *Empyema*. See EMPYEMA.

When it happens in the Mediastinum, or Diaphragma, it is call'd *Parapneumonia*. See PARAPNEUMONIA.

*Ersmuler* recommends Sudorifics in the *Pleurisy*; and observes, that much more regard is to be had to the Sputum that attends the Cough than the Urine.—*Baglivi* notes, that *Pleurisies* are frequently occult; and gives this Method of discovering them.—Make the Patient lie on his right or left Side, and bid him breath strongly and Cough: If he feel any Pain or Heaviness after it, he's certainly pleurick.—The same Author adds, that a hard Pulse is a certain Attendant of the *Pleurisy*.

*Riverius* gives us Influences of notable Cures perform'd herein by Cupping and Scarification.

**PLEXUS**, in Anatomy, a Name common to several Parts in the Body, consisting of little Vessels interwove in form of Net-work. See VESSEL.

The Nerves, in their Progress, form several *Plexus's*; especially the Par Vagum, or eight Pair, the Intercostals, and the fifth. See NERVE.

The Par Vagum, at its Interfection with the intercostal Nerve, forms the *Plexus Gangliiformis superior* and inferior. See GANGLIOFORMIS.—A Branch of this Nerve joining near the Heart, with others from the intercostals, forms the *Plexus Cordiacus superior*. See CARDIACUS.—A little further it sends off several Branches, which reuniting, form the *Plexus Pneumonicus*. See PNEUMONICUS.—In each Trunk of the Intercostal, before it arrives at the Thorax, are two *Plexus Gangliiformes*, call'd *Plexus Cervicales*.—When arrived in the Thorax, it receives three or four Twigs from the Vertebral Nerves, together with which it constitutes the *Plexus Intercostalis*, whence descending into the Abdomen, it forms that famous Piece of Network, call'd on the Right Side *Plexus Hepaticus*, and on the Left *Plexus Splenicus*.—

From the Hepatic *Plexus* arise a Number of Branches, proceeding some to the Liver, others to the Pancreas, others to the Capsula of *Gilson*, and other larger ones to the Right Kidney.—The Splenic *Plexus* sends out Branches to the left Part of the Ventricle and Pancreas, the Spleen, the left Atrial Capula and left Kidney.—Lastly, several Branches both from the Hepatic and Splenic *Plexus* passing along the Mesenteric Arteries, especially the upper to which they serve as a kind of Cover, form the *Mesenteric Plexus*, which bears some Resemblance to a Sun, from the Circumference whereof proceed several little Branches or Threads in manner of Rays, continued thence to the Intestines; tho' still accompanying the Arteries. See MESENTERIC, &c.

**PLEXUS Chorooides** is a wonderful Contexture of small Arteries and Veins, and, as some say, Lymphatics, in the Brain, on each side of the Thalami Nervorum Opticorum, and just over the Pineal Gland. See CHOROIDS and BRAIN.

It is sometimes also call'd *Plexus Reticularis*, from its net-like Structure. See RETICULARIS.

**PLICA**, in Medicine, a Disease of the Hair, peculiar to Poland, and hence denominated *Polonica*; tho' there are Instances of it in Hungary, Alsatia, Switzerland, &c. See HAIR.

The *Plica* is a severe, malignant, and dangerous Disease, wherein the Hair of the Head is matted and gl'd together beyond all Possibility of being extricated; attended with a grievous Disorder of all the Limbs of the Body; and before the Hair become complicated, a violent Pain; a Sweat usually attending it.

An unreasonable cutting off of the Hair in this Case is dangerous; nor is there any proper and adequate Remedy for the Disease yet discover'd.

**PLIGHT**, in our old Law-Books, a Term which signifies sometimes, the Estate with the Habitude and Quality of the Land; tho' sometimes it extends to the Rent-Charge, and a Possibility of a Dower. *Cokes Inst. fol. 221.*

**PLINTH**, in Architecture, a flat square Member, in form of a Brick; whence its Name.

The Word comes from the Greek *πλατὴν*, *Erick*.

The *Plinth* is used as the Foot, or Foundation of Columns; being that flat square Table, under the Mouldings of the Base and Pedestal, at the Bottom of the whole Order; seeming to have been originally intended to keep the

This is an ancient Piece of Husbandry, *Xenophon*, *Pindar*, and *Virgil* recommend it: witneſſe thoſe Verſes of *Virgil*.

*Alternis idem tanſas, ceſſare Novales,  
Et ſequem patiere ſiſu dareſcere campum.*

Georg. lib. 1.

**PLOW**, or **PLOW**, in Navigation; an ancient Mathematical Inſtrument, made of Box, or Pear-tree, uſed to take the Height of the Sun or Stars, in order to find the Latitude. See **HEIGHT**, **LATITUDE**, &c.

It admits of the Degrees to be very large, and is much eſteemed by many Artiſts; tho' now generally diſuſed among us. See **ALTITUDE**.

**PLOW-Land**, or **PLOUGH-Land**. See **CARUCATA Terra**.

**PLOW-Alms**, a Duty anciently of a Penny, paid to the Church for every *Plough-Land*, or Hide of Land. See **HIDE**.

*De qualibet Carucata juxta inter Poſcha & Pentecosteſtem unum denarium, qui dicitur Ploſ-Almes. Monſt. Ang.*

**PLUG**, a large wooden Peg wherewith to ſtop the Bottom of a Ciftern, Caſk, Pipe, or the like.

**PLUMAGE**, the Feathers, or Covering of Birds; *For the Mechanism*, &c. whereof, ſee **FEATHER**.

In Falconry, *Plumage* is particularly underſtood of the Feathers under a Hawk's Wing. See **HAWK** and **HAWKING**.

The Falconers alſo give their Hawks Parcels of ſmall Feathers to make them caſt; and theſe they call *Plumage*. See **CASTING**.

**PLUMB**, in Matters of Spicery. See **CURRANTS** and **RAISINS**.

**PLUMB-Line**, a Term among Artiſcers for a *Perpendicular Line*. See **PERPENDICULAR**.

It is thus call'd becauſe uſually deſcribed by means of a Plummer. See **PLUMMER**.

**PLUMBAGO**, among the Ancients, was the Oar of the Black-Lead, uſed in making Pencils for deſigning, &c. See **BLACK-LEAD**.

*Pemet* adds, that *Plumbago* was the Sea-Lead of the Ancients; who, he notes, took that Drug for a Production of the Sea, not a Mineral, as it really is; but this is ſcarce credible.

**PLUMBERY**, the Art of caſting, preparing, and working Lead; and of uſing it in Buildings, &c. See **LEAD**.

The Word is form'd of the *Latin Plumbum*, Lead.

The Lead uſed in *Plumbery* is furniſh'd from the Lead-Works in large Ingots, or Blocks, call'd *Pigs* of Lead, ordinarily weighing about an hundred Pounds a-piece.

As this Lead melts very eaſily, 'tis eaſy to caſt Figures hereof, of any kind, by running it into Moulds of Braſs, Clay, Plafter, &c. See **FOUNDRY** and **STATUE**.

But the chief Article in *Plumbery*, is the Sheets and Pipes of Lead.—'Tis theſe make the Baſis of the Plumbers Work in Building; the Proceſs of theſe, therefore, we ſhall give a Deſcription of:

*Method of caſting large Sheets of Lead.*

The Lead deſign'd for this uſe is melted in a large Cauldron or Furnace, uſually built with free-Stone and Earth, fortified on the out-ſide with a Maſſive of Shards and Plafter. At the bottom hereof is a Piece funk lower than the reſt, wherein is diſpoſed an Iron Pot, or Peel, to receive what may remain of the Metal after the Sheet is run. The Furnace is ſo rais'd above the Area of the Floor as that the Iron Pot juſt reſts thereon.

To Uſe the Furnace they heat it with Wood laid within it; that done they throw in the Lead, pell-mell with the burning Coals, to melt.—Near the Furnace is the Table, or Mould, whereon the Lead is to be caſt.—It conſiſts of large pieces of Wood, well jointed, and bound with Bars of Iron at the ends. Around it runs a Frame, conſiſting of a Ledge or Border of Wood two or three Inches thick, and one or two high from the Table. The ordinary Width of the Tables is from three to four Foot; and their Length from 18 to 20 Foot.

The Table is cover'd with fine Sand; prepared, by moiſtening it with a Watering-Pot, then working it with a Stick; and at laſt, to render it ſmooth and even, beating it flat with a Mallet, and planing it with a Ruler or Slip of Braſs.

Over the Table is a kind of Rake of Wood, which bears and plays on the Edges of the Frame by means of a Notch cut in either End thereof; and ſo placed, as that between it and the Sand is a Space proportionable to the intended Thickneſs of the Sheet.—The Uſe of this Rake is to drive the Matter, while yet liquid, to the Extremity of the Mould.

A-top of the Table is an Iron Pan, Peel, or Shovel, bearing, before, on the Edge of the Table itſelf, and behind

on a Trestle ſomewhat lower than the Table.—Its Uſe is in conveying the Metal into the Mould; and the Deſign of its oblique Diſpoſition is, that it may by that means be able to retain the Metal, and keep it from running off at the fore-ſide, where it has no Ledge.—Some of theſe Peels are big enough to hold fifteen or fixteen hundred Weight of Lead, and even more.

Things being thus diſpoſed, with a large Iron Ladle they take out the melted Lead, Coals and all, out of the Furnace; and with this, mix'd as it is, fill the Iron Peel.—When full, they take out the Coals, and clear the Lead with another Iron Spoon pierc'd after the manner of a Scummer.

This done, they hoist up the lower Part of the Peel by its Handle; upon which the liquid Matter running off and ſpreading it ſelf on the Mould, the Plumber conducts and drives it to the Extremity of the Table by means of the Rake, which the Workman paſſes along the Ledges, and thus renders the Sheet of an equal Thickneſs.—The Sheets thus caſt there remains nothing but to edge them, *i. e.* to take off the two Sides with a Plane, in order to render them ſmooth and ſtraight.

*Method of caſting thin Sheets of Lead.*

The Table or Mould here uſed is of a Length and Breadth at diſcretion, only lodg'd on one ſide.—Inſtead of Sand they cover it with a Piece of woollen Stuff, naited down at the two Ends to keep it tight; and over this lay a very fine linnen Cloth.—The Feet of the Table are uneven, ſo that it does not ſtand horizontal, but moderately inclined.

Great Regard is had to the Lead while melting, that it have the juſt Degree of Heat, ſo as it may run well, yet not burn the Linnen.—This they judge of by a Piece of Paper; for if the Paper take fire in the liquid Lead, 'tis too hot, and if it be not ſhrunk and ſcorch'd a little, 'tis not hot enough.

Being then in its juſt degree, they have a Rake, but different from that deſcribed in the former Article; as ſerving both for Peel and Rake, to contain, and to conduct the liquid Lead.—'Tis in effect a wooden Box without any bottom, only cloſed on three Sides. It is pretty high behind, but the two ſides, like two acute Angles, ſill diſmiſh to the tip, from the Place where they are join'd to the third or middle Piece where they are of the ſame Height therewith, *viz.* 7 or 8 Inches high.—The Width of the middle makes that of the Rake, which again makes that of the Sheet to be caſt.

The Rake is placed a-top of the Table, which is, before; cover'd in that Part, with a Paſte-board that ſerves as a bottom to the Box, and prevents the Linnen from being burnt while the liquid Lead is pouring in.—The Rake is ſo diſpoſed on the Table, as that the high'eſt Part looks to the lower end of the Table, and the two ſloping Sides to the higher End.

The Rake is now fill'd with Lead according to the Quantity to be uſed; which done, two Men, one at each ſide the Table, let the Rake deſcend down the Table, or elſe draw it down with a Velocity greater or leſs, as the Sheet is to be more or leſs thick; the Thickneſs of the Sheet ſill depending on the Promptitude wherewith the Rake ſlides down the Inclining Mold.

Theſe fine ſmooth Sheets of Lead are ſometimes uſed between the Joints of large Stones in great Buildings, &c.

*Method of making Pipes without ſoldering.*

To make theſe Pipes they have a kind of Furnace, conſiſting of a large Iron Furnace or Cauldron, ſupported on a pretty high Iron Stand. The Cauldron is encompass'd with a Maſſive of Bricks and Loam; only leaving a Mouth or Paſſage for the Conveyance of Wood underneath, and lighting the Fire; and another little Aperture behind, to ſerve as a Vent-hole.

In this Furnace they melt the Lead, after firſt heating it with a Fire underneath: To forward the Fuſion they put in burning Faggots along with the Metal.—The Metal is ſkimmed and laden off with the Inſtruments mentioned above.

Near the Furnace is a Bench, furniſh'd at one End with a little Mill, with Arms or Levers to turn it withal.—A ſtrong Girt, arm'd with an Iron Hook at one Extremity, is faſſened by the other to the Axis of the Mill, around which it turns when in Motion. On this Bench the Moulds of the Pipes are placed horizontally; and the Mill and the Girt ſerve to draw out the Iron Core after the Pipe is caſt.

The Moulds of theſe Tubes are of Braſs, and conſiſt of two Pieces which open and that by means of Hooks and Hinges their inner Callibr, or Diameter, is according to the Size of the Pipe to be made; their Length is uſually two Foot and a half.

In the middle is placed a Core, or round Piece of Braſs or Iron, ſomewhat longer than the Mould, and of the Thickneſs

The Method of *Plotting*, where the Angles are taken by the Theodolite, *i. e.* by *Back-sight* and *Fore-sight*, (as 'tis call'd, see BACK-SIGHT, &c.) is somewhat different.—To prepare the Angles for *plotting*, the Quantity of each must first be found; by subtracting the Degrees of the Foresight and Back-sight from each other: The Remainder is the Angle to be protracted. See THEODOLITE.

The Use of parallel Lines is here excluded, and instead of laying the Protractor constantly on, or parallel to, Meridians; its Direction is varied at every Angle.—The Practice is thus: Suppose the former Inclosure to have been survey'd with the Theodolite, after the manner of Back-sight and Fore-sight; and suppose the Quantity of each Angle to be found by Subtraction. An indefinite Line is drawn at random as AK Fig. 21; and on this the measured Distance, *e. gr.* 3 Chains, 22 Links, set off, as in the former Example if now the Quantity of the Angle A have been found 140°; the Diameter of the Protractor is to be laid on the Line AK, with the Center over A, and against the Number of Degrees, *viz.* 140, a Mark made, an indeterminate dry Line drawn thro' it, and the Distance of the Line AB laid down from the Scale thereupon.

Thus we gain the Point B; upon which laying the Center of the Protractor, the Diameter, along the Line AB; the Angle B is protracted, by making a Mark against its Number of Degrees, drawing a dry Line and setting off the Distance BC as before.

Then proceed to C; laying the Diameter of the Protractor on BC, the Center on C protracts the Angle C, and draw the Line CD: Thus proceeding, orderly, to all the Angles and Sides, you'll have the Plot of the whole Inclosure ABC, &c. as before.

**PLOTTING SCALE**, a Mathematical Instrument usually of Wood, sometimes of Brass, or other Matter; and either a Foot, or half a Foot long. See SCALE.

It is denominated from its Use in plotting of Grounds, &c. See PLOTTING.

On one side of the Instrument (represented *Tab. Surveying, Fig. 32.*) are seven several Scales, or Lines, divided into equal Parts.—The first Division of the first Scale is subdivided into ten equal Parts, to which is prefix'd the Number 10, signifying that 10 of those Subdivisions make an Inch; or that the Divisions of that Scale are Decimals of Inches.

The first Division of the second Scale is likewise subdivided into 10, to which is prefix'd the Number 16, denoting that 16 of those Subdivisions make an Inch.—The first Division of the third Scale is subdivided in like manner into 10, to which are prefix'd the Number 20.—To that of the fourth Scale is prefix'd the Number 24; to that of the fifth 32; that of the sixth 40; that of the seventh 48; denoting the Number of Subdivisions equal to an Inch, in each, respectively.

The two last Scales are broke off before the end, to give room for two Lines of Chords mark'd by the Letters *e. c.* See CHORD.

On the back side of the Instrument is a Diagonal Scale, the first of whose Divisions, which is an Inch long if the Scale be a Foot, and half an Inch, if half a Foot, is subdivided, diagonally, into 100 equal Parts.—At the other end of the Scale is another Diagonal Subdivision, of half the length of the former, into the same Number of Parts, *viz.* 100. See DIAGONAL.

Next the Scales, is a Line divided into hundredth Parts of a Foot, number'd 10, 20, 30, &c. and a Line of Inches subdivided into tenth Parts mark'd 1, 2, 3, &c.

#### Use of the PLOTTING Scale.

1. *Any Distance being measured with the Chain, to lay it down on a Paper.*—Suppose the Distance to be 6 Chains 50 Links. Draw an indefinite Line; set one foot of the Compasses at Figure 6 on the Scale, *e. g.* the Scale of 20 in an Inch, and extend the other to 5 of the Subdivisions, for the 50 Links: This Distance being transferr'd to the Line, will exhibit the 6 Chains, 50 Links, required.

If 'tis desired to have 6 Chains 50 Links take up more or less Space, take 'em off from a greater or lesser Scale, *i. e.* from a Scale that has more or fewer Divisions in an Inch.

To find the Chains and Links contain'd in a right Line, *e. g.* that just drawn, according to any Scale, *e. g.* that of 20 in an Inch.—Take the Length of the Line in the Compasses; and applying it to the given Scale, you'll find it extend from the Number 6 of the great Divisions, to 5 of the small ones: hence the given Line contains 6 Chains 50 Links.

**PLOUGH**, or **PLOW**, in Agriculture, a popular Machine for the breaking up of Ground; consisting of a Train or Carriage, with two large Irons; the one pointed the other edg'd; serving to cut and open the Ground, and draw Furrows therein. See AGRICULTURE, PLOUGHING, &c.

The Parts of the Plough are, the *Plough-Beam*, the

*Handle*, *Tail*, *Sallet*, *Hales* or *Staves*, *Neck* or *Share-Beam*, *Earth-board*, *Mould-board*, *Bread-board*, *Furrow-board*, *Shield-board*, &c. The *Sheath*, *Share-Iron*, *Collar*, *Plough-Pin* and *Collar-Links*, *Plough-Pillow* and *Bolster*, and sometimes *Wheels*.

The Structure and Contrivance of the Plough is various in various Kinds of Grounds: A particular Description of all would be endless.—The most usual are

1<sup>o</sup> The *double wheel'd Plough* used throughout *Hertfordshire*, &c.—This is apparently one of the best, strongest, and of easiest Draught, of any; and suits all kinds of Lands except miry Clays in Winter; which are apt to clog the Wheels, which are about 18 or 20 Inches high, and the Furrow-Wheel sometimes larger than the other.

2<sup>o</sup> The *Lineshire Plough* is singular in its Shape, and very good for Marsh or Fenny Lands, subject to Weeds and Sedges, but free from Stones; by reason of its Collar and the Largeness of its Share, which is often a Foot broad and very sharp.

3<sup>o</sup> The *Suffex single Wheel Plough* is of a clumsy Make, very wide in the Beach; so that the Draught of it must be very hard.—It is chiefly remarkable for its Shape.

4<sup>o</sup> The *Cuxton* or *Trenching Plough*, invented to cut Drains about *Cuxton* in *Cambridgeshire*, in stiff miry Clay-Grounds.—It is larger than ordinary, and has two Coulters one before the other; which bending inwards cut each Side of the Trench.—The Mould-board is three times the usual Length, to cast the Turf a great way off from the Trench.

It cuts a Trench a Foot wide at bottom, a Foot and half at top, and a Foot deep; and is drawn with twenty Horses.

5<sup>o</sup> The *Dray-Plough* is the most common.—It is made without either Wheel or Foot; of an easy Draught; best in Winter, for miry Clays, where the Land is soft.

6<sup>o</sup> The *Spanish Plough* varies much in its make from our common *Ploughs*. 'Tis a kind of Semicircle, pitch'd on one End, with the convex Side turn'd to the Plowman, and the concave Side (a little inclined) to the Horse. Its Tail is in a right Line with the Share.

With this *Plough* and one Horse the *Spaniards* plough two or three Acres of their light Ground in a Day.

7<sup>o</sup> The *Colchester Plough* is a fine light Wheel *Plough*, with which two Horses will cut up two Acres of their light Land in a Day.—It is peculiar for its Iron Earth-board made rounding, which turns the Turf better than any other *Plough* yet invented.

8<sup>o</sup> One *Wheel Plough* may be used in almost any kind of Ground; being lighter and nimbler than other *Wheel-Ploughs*.

9<sup>o</sup> The *Double Plough*. In this, there is one *Plough* fix'd to the side of another; so that by means of four Horses and two Men a double Furrow is plough'd, the one by the side of the other.

10<sup>o</sup> Add to these another kind of *Double Plough*, whereby two Furrows are plough'd at once, one under another, by which the Earth is stirr'd up 12 or 14 Inches Depth, which is of great Benefit.

**PLOUGH**, among Bookbinders, is a Tool wherewith they cut the Leaves of Books smooth. See BOOK-BINDING.

**PLOUGH-MONDAY**, the next Monday after *Twelfth-day*, when the Plough-men in the North Country draw a *Plough* from Door to Door, and beg *Plough-Money* to drink.

**PLOUGHING**, one of the principal Operations in Agriculture, perform'd with the *Plough*. See *PLOUGH*.

*Ploughing* is principally either that of *Lays*, or of *Fallows*.—*Ploughing of Lays* is the first cutting up of *Grass-Ground* for Corn; which is usually done in *January*, when the Earth is wet and the Turf tough, so as to hold turning without breaking; in which the Perfection of this kind of ploughing consists.

*Ploughing of Fallows*, call'd also *fallowing*, is a Preparing of Land by *ploughing*, long before it be plough'd for Seed.—This is a considerable Benefit to Lands, few of which will bear above two Crops successively without such Respite. Hence *Lords* use to bind their Tenants to it once in 3 Years.

When this is done twice, 'tis call'd *twifallowing*, when thrice *trifallowing*, &c.

The first is as soon as the Husbandman has done sowing his Corn; and this is to be very shallow, well turn'd, and clapp'd close together.—The second is in *June*; when they go the full Depth.—The third, about the beginning of *August*.—If it rise full of Clods they harrow it down; but soon *strick* *Sizes*, or plough it up again into *Ridges*.

In *Staffordshire*, beside the three Summer *Fallowings*, they usually give their Land a Winter *fallowing*. *Pliny* commends the *ploughing* of Lands four times; and so does *Virgil*:

*Ille demum seges vocis respondet avovi  
Agricola bis qua solum, bis frigora sentit.*

Georg. lib. 1.

This is an ancient Piece of Husbandry, *Xenophon, Pindor,* and *Virgil* recommend it: witness those Verses of *Virgil*.

*Altemis idem tonsas, cessare Novaleis,  
Et sequem patiere sic duretere campum.*  
Georg. lib. 1.

**PLOW**, or **PLow**, in Navigation; an ancient Mathematical Instrument, made of Box, or Pear-tree, used to take the Height of the Sun or Stars, in order to find the Latitude. See **HIGHT**, **LATITUDE**, &c.

It admits of the Degrees to be very large, and is much esteemed by many Artificers; tho' now generally disused among us. See **ALTIITUDE**.

**PLOW-Land**, or **PLOUGH-Land**. See **CARBONATA Terra**.

**PLOW-Alms**, a Duty anciently of a Penny, paid to the Church for every **Plough-Land**, or Hide of Land. See **HIDE**.

*De qualibet Caracata junctis inter Pascha & Pentecostem unum denarium, qui dicitur Plou-Almes. Monast. Ang.*

**PLUG**, a large wooden Peg wherewith to stop the Bottom of a Cistern, Cask, Pipe, or the like.

**PLUMAGE**, the Feathers, or Covering of Birds; For the Mechanisms, &c. wherof, see **FEATHER**.

In Falconry, **Plumage** is particularly understood of the Feathers under a Hawk's Wing. See **HAWK** and **HAWKING**.

The Falconers also give their Hawks Parcels of small Feathers to make them cast; and these they call **Plumage**. See **CASTING**.

**PLUMB**, in Matters of Spicery. See **CURRENTS** and **RAISINS**.

**PLUMB-Line**, a Term among Artificers for a **Perpendicular Line**. See **PERPENDICULAR**.

It is thus call'd because usually describ'd by means of a Plummet. See **PLUMMET**.

**PLUMBAGO**, among the Ancients, was the Oar of the Black-Lead, used in making Pencils for designing, &c. See **BLACK-LEAD**.

*Pomet adds*, that **Plumbago** was the Sea-Lead of the Ancients; who, he notes, took that Drug for a Production of the Sea, not a Mineral, as it really is; but this is scarce credible.

**PLUMBERY**, the Art of casting, preparing, and working Lead; and of using it in Buildings, &c. See **LEAD**.

The Word is form'd of the Latin *Plumbum*, Lead. The Lead used in **Plumbery** is furnish'd from the Lead-Works in large Ingots, or Blocks, call'd **Pigs of Lead**, ordinarily weighing about an hundred Pounds a-piece.

As this Lead melts very easily, 'tis easy to cast Figures hereof, of any kind, by running it into Moulds of Brass, Clay, Plaster, &c. See **FOUNDERY** and **STATUE**.

But the chief Article in **Plumbery**, is the Sheets and Pipes of Lead.—'Tis these make the Basis of the Plumbers Work in Building; the Process of these, therefore, we shall give a Description of:

#### *Method of casting large Sheets of Lead.*

The Lead destined for this use is melted in a large Cauldron or Furnace, usually built with free-Stone and Earth, fortified on the out-side with a Massive of Shards and Earth. At the bottom hereof is a Place sunk lower than the rest, wherein is disposed an Iron Pot, or Peel, to receive what may remain of the Metal after the Sheet is run. The Furnace is so rais'd above the Area of the Floor as that the Iron Pot just rests thereon.

To Use the Furnace they heat it with Wood laid within it; that done they throw in the Lead, pell-mell with the burning Coals, to melt.—Near the Furnace is the Table, or Mould, whereon the Lead is to be cast.—It consists of large pieces of Wood, well jointed, and bound with Bars of Iron at the ends. Around it runs a Frame, consisting of a Ledge or Border of Wood two or three Inches thick, and one or two high from the Table. The ordinary Width of the Tables is from three to four Foot; and their Length from 18 to 20 Foot.

The Table is cover'd with fine Sand; prepared, by moistening it with a Watering-Pot, then working it with a Stick; and at last, to render it smooth and even, beating it flat with a Mallet, and planing it with a Kuler or Slip of Brass.

Over the Table is a kind of Rake of Wood, which bears and plays on the Edges of the Frame by means of a Notch cut in either End thereof; and so placed, as that between it and the Sand is a Space proportionable to the intended Thickness of the Sheet.—The Use of this Rake is to drive the Matter, while yet liquid, to the Extremity of the Mould.

A-top of the Table is an Iron Pan, Peel, or Shovel, bearing, before, on the Edge of the Table itself, and behind

on a Trestle somewhat lower than the Table.—Its Use is in conveying the Metal into the Mould; and the Design of its oblique Disposition is, that it may by that means be able to retain the Metal, and keep it from running off at the fore-side, where it has no Ledge.—Some of these Peels are big enough to hold fifteen or sixteen hundred Weight of Lead, and even more.

Things being thus disposed, with a large Iron Ladle they take out the melted Lead, Coals and all, out of the Furnace; and with this, mix'd as it is, fill the Iron Peel.—When full, they take out the Coals, and clear the Lead with another Iron Spoon pierced after the manner of a Scummer.

This done, they hoist up the lower Part of the Peel by its Handle; upon which the liquid Matter running off and spreading it self on the Mould, the Plumber conducts and drives it to the Extremity of the Table by means of the Rake, which the Workman passes along the Ledges, and thus renders the Sheet of an equal Thickness.—The Sheets thus cast there remains nothing but to edge them, *i. e.* to take off the two Sides with a Plane, in order to render them smooth and straight.

#### *Method of casting thin Sheets of Lead.*

The Table or Mould here used is of a Length and Breadth at discretion, only ledg'd on one side.—Instead of Sand they cover it with a Piece of woollen Stuff, matted down at the two Ends to keep it tight; and over this lay a very fine linnen Cloth.—The Feet of the Table are uneven, so that it does not stand horizontal, but moderately inclined.

Great Regard is had to the Lead while melting, that it have the just Degree of Heat, so as it may run well, yet not burn the Linnen.—This they judge of by a Piece of Paper; for if the Paper take fire in the liquid Lead, 'tis too hot, and if it be not shrunk and scorch'd a little, 'tis not hot enough.

Being then in its just degree, they have a Rake, but different from that describ'd in the former Article; as serving both for Peel and Rake, to contain, and to conduct the liquid Lead.—'Tis in effect a wooden Box without any bottom, only clos'd on three Sides. It is pretty high behind, but the two sides, like two acute Angles, still diminish to the tip, from the Place where they are joined to the third or middle Piece where they are of the same Height therewith, *viz.* 7 or 8 Inches high.—The Width of the middle makes that of the Rake, which again makes that of the Sheet to be cast.

The Rake is placed a-top of the Table, which is, before, cover'd in that Part, with a Platte-board that serves as a bottom to the Box, and prevents the Linnen from being burnt while the liquid Lead is pouring in.—The Rake is so disposed on the Table, as that the highest Part looks to the lower end of the Table, and the two sloping Sides to the higher End.

The Rake is now fill'd with Lead according to the Quantity to be used; which done, two Men, one at each side the Table, let the Rake descend down the Table, or else draw it down with a Velocity greater or less, as the Sheet is to be more or less thick; the Thickness of the Sheet still depending on the Promptitude wherewith the Rake slides down the Inclining Mould.

These fine smooth Sheets of Lead are sometimes used between the Joints of large Stones in great Buildings, &c.

#### *Method of making Pipes without folding.*

To make these Pipes they have a kind of Furnace, consisting of a large Iron Furnace or Cauldron, supported on a pretty high Iron Stand. The Cauldron is encompass'd with a Massive of Bricks and Loam; only leaving a Mouth or Passage for the Conveyance of Wood underneath, and lighting the Fire; and another little Aperture behind, to serve as a Vent-hole.

In this Furnace they melt the Lead, after first heating it with a Fire underneath: To forward the Fusion they put in burning Faggots along with the Metal.—The Metal is skimmed and laden off with the Instruments mentioned above.

Near the Furnace is a Bench, furnish'd at one End with a little Mill, with Arms or Levers to turn it withal.—A strong Girt, arm'd with an Iron Hook at one Extremity, is fasten'd by the other to the Axis of the Mill, around which it turns when in Motion. On this Bench the Moulds of the Pipes are placed horizontally; and the Mill and the Girt serve to draw out the Iron Core after the Pipe is cast.

The Moulds of these Tubes are of Brass, and consist of two Pieces which open and shut by means of Hooks and Hinges their inner Calliber, or Diameter, is according to the Size of the Pipe to be made; their Length is usually two Foot and a half.

In the middle is plac'd a Core, or round Piece of Brass or Iron, somewhat longer than the Mould, and of the Thick-

ness of the Inner Diameter of the Pipe.—This Core is pass'd thro' two Copper Rundles, one at each end of the Mould, which they serve to close, and to these Rundles is join'd a little Copper Tube about two Inches long, and of the Thickness the leaden Pipe is intended to be of.—By means of these Tubes the Core is retained in the middle of the Cavity of the Mould.

The Core being in the Mould, with the Rundles at its two Ends, and the Lead melted in the Furnace; they take it up in a Ladle and pour it into the Mould by a little Aperture at one End, made in form of a Funnel.

When the Mould is full, and the Metal cold, they pass the Hook of the Girt into a Hole at the End of the Core, and turning the Mill with the Hand, draw out the Core.—They then open the Mould, and take out the Pipe.

If they desire to have the Pipe lengthen'd; they put one End thereof in the lower End of the Mould, and pass the End of the Core into it; then that the Mould again and apply its Rundle and Tube as before, the Pipe just cast serving for Rundles, &c. at the other End.

Things thus replaced, they pour in fresh Metal into the Mould; thus repeating the Operation till they have got a Pipe of the Length required.

*Pipes made of Sweet-Lead soldered.*

The Plumbers have wooden Cylinders, or Rollers, of the Length and Thickness required; and on these they form their Pipes, by wrapping the Sheet around 'em; soldering up the Edges all along, thus—After grating the Lead well with a Grater, they rub Rosin over the Part thus grated; then pour on it some Solder melted in a Ladle, or else melt it with a hot soldering Iron, smearing those Parts where they would not have the Solder catch with Chalk, or the Soil of the Hand.

The Solder which the Plumbers use, is a Mixture of two Pounds of Lead with one of Tin. See SOLDER, see also TIN and TINNING.

PLUMBUM. See LEAD.
