# CYCLOPÆDIA:

OR, AN

## UNIVERSAL DICTIONARY

OF

# ARTS and SCIENCES; <sup>T.c.</sup>/<sub>a.7</sub>

CONTAINING

The DEFINITIONS of the TERMS,

And ACCOUNTS of

The THINGS signify'd thereby,

In the several ARTS,

Both LIBERAL and MECHANICAL,

And the several SCIENCES,

HUMAN and DIVINE:

The Figures, Kinds, Properties, Productions, Preparations, and Uses,  
of Things NATURAL and ARTIFICIAL;

The Rise, Progress, and State of Things ECCLESIASTICAL,  
CIVIL, MILITARY, and COMMERCIAL:

With the several Systems, Sects, Opinions, &c. among Philosophers, Divines,  
Mathematicians, Physicians, Antiquaries, Critics, &c.

*The Whole intended as a Course of Antient and Modern LEARNING.*

Compiled from the best Authors, DICTIONARIES, JOURNALS, MEMOIRS,  
TRANSACTIONS, EPHEMERIDES, &c. in several Languages.

IN TWO VOLUMES.

By *E. CHAMBERS* Gent.

*Floriferis ut apes in salibus omnia libant,  
Omnia nos* ————— *LUCRET.*

VOLUME the SECOND.

L O N D O N :

Printed for James and John Knapton, John Darby, Daniel Midwinter, Arthur Buttsworth, John Senex, Robert Gosling, John Pemberton, William and John Innes, John Osborn and Tho. Longman, Charles Rivington, John Hooke, Ranew Robinson, Francis Clay, Aaron Ward, Edward Symon, Daniel Browne, Andrew Johnston, and Thomas Osborn. M.DCCXXXVIII.

**I** The ninth Letter of the *English* Alphabet, is both a Vowel and a Consonant; agreeable to which two different Powers, it has two different Forms. The *Hebrews* call the *J* Consonant *Jed* (from *J*, Hand and Space, in regard it is supposed to represent the Hand clenched, so as to leave the Space underneath, void. With them, it was pronounced as the Consonant *y*, as it still is among the  *Germans* and some other People. The *Greeks* had no *J* Consonant, and for that reason, used their Vowel *i* instead of it, as coming the nearest in Sound. The *French* and *English* have two kinds of *J* Consonants; the first has a stutling kind of Sound, and serves to modify that of the Vowels, pretty much in the manner of *r*, as *Jew*, just, jovial; the latter is pronounced like the *Hebrew* *Jed*, Instances of which we have in some of our Words, which are indifferently written with a *y* or an *i* before a Vowel, as *Voilage*, *Voyage*, *Loyal*, *Loyal*, &c. in which cases, the *i* is apparently a Consonant, as being a Motion of the Palate, which gives a Modification to the following Vowel. The Vowel *i*, according to *Plato*, is proper for expressing fine and delicate things: On which account, that Verse in *Virgil*,

*Accipiunt inimicum indrem, rimisque fatiscunt;*

Which abounds in *i*'s, is generally admired. The Vowel *i* was the only Vowel which the *Romans* did not mark with a Dash of the Pen, to shew when it was long; instead of which, to denote its Length, they used to make it bigger than ordinary, as in *Pis*, *Flores*, &c. According to *Leffing*, they repeated it, when it was not so long, as in *Di*. They sometimes also denoted the Length of this Letter, by adding *e* to it, and turning it into a Diphthong, as *Direi* for *Dire*, *Omnies* for *Omnis*, &c. *I* was anciently a Numeral Letter, and signified a Hundred, according to the Verse, *I. C. Comparat*, & *Centum significat*. *I* in the ordinary *Roman* way of Numbering signifies One; and when repeated, signifies as many Units as it is repeated times. In Abbreviations and Cyphers, *I* frequently represents the whole Word *Jesus*, whereof it is the first Letter.

**JABAJAHITE**, the Name of a Sect among the *Muslimans*, who, according to *Romans*, teach, that God is not perfectly wise, that his Knowledge does not extend to every thing; and that Time and Experience have furnished him with the Knowledge of many things whereof he was before ignorant: Thus, say they, not being apprized from all Eternity of every Event that shall happen in the World, he is obliged to govern it according to the Chance and Occurrence of those Events.

**JACK** in a *Ship*, is that Sail that is hoisted up at the Sprit-Soil-Top-Mast-Head. In Falconry, *Jack* is the Male of the Birds of Sport.

**JACK** by the *Hedge*, is an Herb that grows wild by Hedge-sides, and under Banks, with a broad Leaf, and hath the Smell of Garlick: It is eaten as other Sallad-Herbs, especially by Country People, and much used in Broth.

**JACK** in a *Lamborn*, or *Will with a Wisp*, and sometimes *Ignis Fatuus*, is a certain Meteor, or clammy Vapour in the Air, which reflects Light in the Dark, commonly haunting Church-yards, Pens, and Privies, as steaming out of a fat Soil: It also flies about Rivers, Hedges, &c. where there is a continual Flux of Air, and leads Persons, who unwarily follow it, out of their way.

**JACOB'S Staff**, is a Mathematical Instrument for taking Heights and Distances; the same with *Cross-Staff*.

**JACOBIN**, *Dominican*. A Name given in *France* to the Religions who follow the Rule of *St. Dominic*, on occasion of their principal Convent, which is near the Gate of *St. James* at *Paris*, and which before they became possessed of it in the Year 1218, was a Hospital of Pilgrims dedicated to the said Saint. Others maintain, that they have been called *Jacobins* ever since they were established in *Italy*, in regard they pretended to imitate the Lives of Apostles. They are also called *Friars Predicants*, and make one of the four Orders of Mendicants. See *Dominican*.

**JACOBITE**, a Sect of Hereticks who were antiently a Branch of the *Eutybians*, and are still subsisting in the *Levant*. They were so called from one *James* of *Syria*, who was one of the Heads of the *Monophysites*, or *Sectaries*, who own'd but one Nature in *Jesus Christ*. The *Monophysites* are a Sect of vast Extent, comprehending the *Armenians*, *Coptis*, and *Abyssinians*, but those among them who are properly *Jacobites*, are but few; and among those too, there is a Division, some being *Romanis'd*, and others perfectly averse to the *Romish Church*: Each of which Parties have their several Patriarchs, the one at *Constatinople*, and the other at *Perzopolis*. As to their Faith, all the

*Monophysites*, both *Jacobites* and others, follow the Doctrine of *Dionysius* touching the Unity of Nature and Person in *Jesus Christ*. *Jacobite* in *England*, is a Term of Reproach bestow'd on such Persons as disallow the late Revolution, and still assert the Rights, and adhere to the Interests of the late King *James* and his Line.

**JACOBUS**, a Gold Coin worth 25 Shillings; so called from King *James* the first of *England*, in whose Reign they were struck. We usually distinguish two kinds of *Jacobus*, the Old and the New; the former worth 25 Shillings, weighing 6 Penny Weight 10 Grains; the latter, called also *Carinus*, worth 25 Shillings, in Weight 5 Penny Weight 20 Grains.

**JADE**, a greenish Stone, bordering on the Colour of Olive, much esteem'd for its Hardness, which exceeds that of *Porphyry*, *Agat*, and *Jaſper*, and only to be cut with Powder of *Diamond*. It is in mighty esteem among the *Turks* and *Poles*, who adorn all their fine Works with it, and especially the Handles of their Sabres. This Stone applied to the Reins, is said to be a Preservative from the *Nephritic Cholick*. *Mr. Boerhaave* tells us, that the Caravans of *Tibet* carry it to *Cochin*, and that the *Gablers* prize it as highly as *Diamond*. The Natives of *South-America* value it on account of the Virtues they attribute to it in the *Epilepsy*, Diseases of the Reins, the Stone and Gravel. In a Treatise of it printed at *Paris*, 'tis called the *Divine Stone*.

**JALAP**, is the Root of a Plant not much unlike our *Bryony*, and is therefore by some called *Bryonia Peruviana*; for it is brought to us chiefly from *Peru* and *New-Spain*. The *Mexicani* call this root *Mexicana nigra*, and therefore as this is sometimes called *Mexicana nigra*, that goes as often by the Name of *Jalapium album*. As this does not appear to have been known to the Antients, it has its place in Medicine only since these parts of *America*, which produce it, have been trade'd for by *Europeans*. That which breaks blackest, most brittle, found, and shining within side, is the best; by reason the resinous Parts, which give it those Properties, are supposed to contain its Medicinal Virtues. Some take great pains to extract its Resin, which is to be done with any spirituous Menstruum, and afterwards want Correctors for it. The most common, is Salt of *Tartar* or *Loaf-Sugar*; but if correctors consists in separating its Parts, as it certainly does, the drawing it from the Root, and making it into a Resin, must be very needless. *Monſieur Boillev*, who hath made several Experiments upon it, says, it is one of the best Cathartics we have, taken as Nature only has prepared it. See *Quincy's Dispensatory*.

**IAMBUS**, in the *Greek* and *Latin* Poetry, is the Name of a Foot in a Verse, consisting of a long and short Syllable, as *Horace* expresses it,

*Syllaba longa brevis subjuncta vocatur Iambus.*

The same Poet calls the *Iambus* a swift rapid Foot, *Pes Citrus*. The Word, according to some, takes its Name from *Iambus*, the Son of *Pan* and *Ecbe*, who invented this Foot, or rather used sharp biting Expressions to *Ceres*, when afflicted for the Death of *Proserpine*. Others rather derive it from the *Greek* *ἰαμβος*, *Pison*, or from *ιαμβή*, *maledice*, *Irail* or *venite*, because the Verses composed of *Iambus*'s were at first only used in *Satire*.

**IAMBIC**, a kind of Verse, found in the *Greek* and *Latin* Poets. An *Iambic* is a Verse consisting wholly, or at least in great part, of *Iambus*'s, or Feet so called. *Iambic* Verses may be considered, either with regard to the Diversity or the Number of their Feet. Under each of which Heads there are distinct kinds, which have different Names. (1.) Pure *Iambics* are those which consist entirely of *Iambus*'s, as the fourth Piece of *Carrollus*, made in praise of a *Ship*:

*Phylax ille, quem videtis Hospites.*

The second kind are those called simply *Iambics*. There have no *Iambus*'s but in the even Feet, tho' there are sometimes *Tribrachia* added to them, excepting to the last, which is always an *Iambus*; and in the uneven Feet they have *Spondees*, *Anapests*, and even a *Dactyle* in the first: Such is that of *Medea* in *Ovid*,

*Sereno potui, perdere an possim regas?*

The third kind are the *Free Iambic Verses*, in which 'tis not absolutely necessary there should be any *Iambus*, excepting in the last Foot; of which kind are all those of *Phedrus*:

*Amittit veritas propinquo, qui alienum appetit.*

In Comedies the Authors seldom confine themselves more, frequently less, as we may observe in *Plautus* and *Terence*: but the sixth is always indispensible at *Iambus*.

As to the Varieties, occasioned by the Number of Syllables, we call an *Iambic*, or *Dimeter Iambic*, that which has but four Feet:

*Quærentur in Sylvis Aëtes.*

Those which have six are called *Trimeters*: These are the most beautiful, and are used principally for the Theatre, particularly in Tragedy; wherein they are vastly preferable to the Verses of ten or twelve Feet used in our modern Drama, in regard they come nearer to the Nature of Prose, and favour less of Art and Affectation.

*Dii Conjugales, tuque genialis Tori  
Lucina Cævis, &c.*

Those with eight are called *Tetrameters*, and are only used in Comedies:

*Pœcium in Loco negligere maximam interdum est Lu-  
cernam.* Terence.

Some add an *Iambic Monometer*, with two Feet:

*Virtus beat.*

They are called *Monometers*, *Dimeters*, *Trimeters*, and *Tetrameters*, that is, of one, two, three, and four Measures, because a Measure consisted of two Feet, the *Greeks* measuring their Verses two Feet by two Feet, or by Epitrites, joining the Iambus and Spondee together. All the *Iambics* hitherto mentioned are perfect; they have their just Number of Feet, without any thing either deficient or redundant. The imperfect *Iambics* are of three kinds, the *Catalectic*, which want a Syllable;

*Muse Jovem caventur.*

The *Brachycatalectic*, which want an entire Foot;

*Muse Jovis Gnate.*

The *Hypercatalectic*, which have either a Foot or a Syllable too much:

*Muse Sorores sunt Minerva,  
Muse Sorores Palladis ingent.*

Many of the Hymns and Anthems, used in the Church, are *Dimeter Iambics*, that is, consisting of four Feet.

S. JAMES of the *Sword*, a Military Order in Spain instituted in 1170, under the Reign of *Ferdinand II.* King of *Leon* and *Galiccia*. Its End was to put a stop to the Incursions of the *Moor*s; three Knights obliging themselves by a Vow to secure the Roads. An Union was proposed and agreed to in 1170, between these and the Canons of *St. Eloy*; and the Order was confirm'd by the Pope in 1175. The highest Dignity in this Order, is that of Grand Master, which has been united to the Crown of *Spain*. The Knights are obliged to make proof of their Descent from Families, that have been noble for four Generations on both sides: They must also make it appear, that their said Ancestors have neither been *Jews*, *Saracens*, nor *Heretics*, nor ever to have been called in question by the Inquisition. The Novices are obliged to serve six Months in the Gallies, and to live a Month in a Monastery; heretofore they were truly Religious, and took a Vow of Celibacy: But *Alexander III.* gave them a Permission to marry. They now make no Vows but of Poverty, Obedience, and Conjugal Fidelity; to which, since the Year 1652, they have added that of defending the immaculate Conception of the Holy Virgin. Their Habit is a white Cloak with a red Cross on the Breast. This is esteem'd the most considerable of all the Military Orders in *Spain*. The King carefully preserves the Office of Grand Master in his own Family, on account of the rich Revenues and Offices, whereof he gives them the Disposal. The Number of Knights is much greater now than formerly, all the *Grandees* choosing rather to be received into this, than into the Order of the Golden Fleece; inasmuch as this puts them in a fair way of attaining to Commands, and gives them many considerable Privileges in all the Provinces of *Spain*, but especially in *Catalonia*.

JANIZARIES, the Grand Signior's Guard, or Soldiers in the *Turkish* Infantry. As, in the *Turkish* Army, the European Troops are distinguished from those of *Asia*, the *Janizaries* are also distinguished into *Janizaries of Constantinople* and of *Damasus*. Their Pay is from two Aspers to twelve *per Diem*; for when they have a Child, or do any signal Piece of Service, their Pay is augmented. Their Dress consists of a Dolyman, or long Robe, with short Sleeves, which is given them annually, by the Grand Signior, on the first Day of *Ramazan*. They wear no Turban, but in lieu of that a kind of Bonnet, which they call *Zavola*, and a long Hood of the same Stuff hanging on their Shoulders. On solemn Days they adorn them with Feathers,

which they stick into a little Case in the forepart of the Bonnet. Their Arms in *Europe*, in a time of War, are a Sabre, a Carabine, or Musquet, and a Carrouch-Box hanging on the left Side. At *Constantinople*, in a time of Peace, they wear only a Staff in their Hand. In *Asia*, where Powder and Fire-Arms are more uncommon, they wear a Bow and Arrows, with a Poniard, which they call *Baniare*. The *Janizaries* were heretofore a Body formidable even to their Masters the Grand Signiors: *Osman* first stripped of his Empire, and afterwards of his Life; and Sultan *Ibrahim* being deposed, and at last strangled in the Castle of the Seven Towers; but they are now much less considerable. Their Number is not fixed. The *Janizaries* are Children of Tribute, raised by the *Turks* on the Christians, and bred up to the military Life. They are taken at the Age of twelve Years, to the end, that forgetting their Country and their Religion, they may know no other Parent but the Sultan. However, generally speaking, they are not now-a-days raised by way of Tribute; for the Carach, or Tax, which the *Turks* impose on the Christians, for allowing them the Liberty of their Religion, is now paid in Money, excepting in some Places, where Money being scarce, the People are unable to pay in Specie, as in *Mangrelia*, and other Provinces near the *Black-Sea*. The Officer who commands the whole Body of *Janizaries*, is called *Janizar Agasi*; in *English*, Aga of the *Janizaries*, who is one of the chief Officers of the Empire. Tho' the *Janizaries* are not prohibited Marriage, yet they rarely marry, nor then, but with the Consent of their Officers, as imagining a married Man to make a worse Soldier than a Bachelor. It was *Osman*, or *Ottoman*, or, as others will have it, *Amarath*, who first instituted the Order of *Janizaries*. They were at first called *Jaja*, that is, Footmen, to distinguish them from the other *Turks*, the Troops whereof consisted mostly of Cavalry. *Ménage*, after *Vassins*, derives the Word from *Genizari*, which, in their Language, signifies *Newcomer*, or *Militar*. *Herbelot* tells us, that *Janizari* signifies a new Band or Troop, and that the Name was first given by *Amarath I.* called the Conqueror, who chusing out one fifth part of the Christian Prisoners, whom he had taken from the *Greeks*, and instructing them in the Discipline of War, and the Doctrines of their Religion, sent them to *Haji Bektafe* (a Person whose pretended Piety rendered him extremely revered among the *Turks*) to the end that he might confer his Blessing on them, and at the same time give them some Mark to distinguish them from the rest of the Troops. *Bektafe*, after blessing them in his manner, cut off one of the Sleeves of the Fur-Gown which he had on, and put it on the Head of the Leader of this new Militia; from which time, viz. the Year of Christ 1361, they have still retained the Name *Janizari*, and the Fur-bonnet. *Vignerot* tells us, that the Discipline observed among the *Janizaries* is extremely conformable, in a great many things, to that used in the *Roman* Legions.

JANIZARY, at *Rome*, is the Name of an Officer or Pensioner of the Pope, called also *Participant*, by reason of certain Rights or Dues which they have in the Annates, Bulls, or Expeditions of the *Roman* Chancery. Most Authors are mistaken in the nature of their Office; but the truth is, they are Officers of the third Bench or College of the *Roman* Chancery. The first Bench whereof consists of Writers, the second of Abbreviators, and the third of *Janizaries*, who are a kind of Correctors and Reviewers of the Pope's Bulls.

JANSENISM, the Doctrine of *Cornelius Jansen*, commonly called *Jansenism*, late Bishop of *Ypres* in *France*, with relation to Grace and Free-Will. *Jansenism* made no great Noise in the World, till after the Death of its Author in 1638. when *Fremund* and *Caleaux*, his Executors, published his Book, entitled *Augustinus*. The whole Doctrine was reduced by the Bishops of *France* into five Propositions, which follow: I. Some Commands of God are impossible to righteous Men, even tho' they endeavour, with all their Powers, to accomplish them: the Grace being wanting by which they should be enabled to perform them. II. In the State of corrupted Nature, a Man never resists inward Grace. III. To merit and demerit in the present State of corrupt Nature, 'tis not requisite a Man should have that Liberty which excludes Necessity; that which excludes Constraint is sufficient. IV. The *Semi-Pelagians* admitted the Necessity of inward preventing Grace to each Act in particular, and even to the beginning of Faith; but they were Heretics, in regard they asserted that this Grace was such, as that the Will of Man might either resist or obey it. V. It is *Semi-Pelagianism* to say, that Jesus Christ died, or shed his Blood for all Men in general. *Jansenism* consists in maintaining this Doctrine, which is done two ways; (1.) By asserting that these Propositions are found and orthodox. (2.) In affirming that they are evil and heretical in the Sense wherein the Church has condemned them; but that this Sense is not

not of *Jansenius*. *Jansenius* has been condemned by the Popes Urban VIII. Innocent X. Alexander VII. and Clement XI.

**JANUARY**, the Name of the first Month of the Year, according to the Computation now used in the West. The word is derived from the Latin *Januarius*, a Name given it by the *Romans*, from *Janus*, one of their Divinities, to whom they attributed two Faces; because, on the one Side, the first Day of *January* looked towards the New-Year, and on the other towards the Old one. The word *Januarius* may also be derived from *Janua, Gate*; in regard this Month being the first, is, as it were, the Gate of the Year. It was introduced into the Year by *Numa Pompilius*; *Romulus's* Year beginning in the Month of *March*. The Christians heretofore fasted the first Day of *January*, by way of Opposition to the Superstition of the Heathens, who, in honour of *Janus*, observed this Day with Feasting, Dancings, Masquerades, &c.

**JAPAN-EARTH**, also called *Careeb*, is an Earth of a dark purple Colour. It is very sultry upon the Palate, seems to melt, like the Bole, in the Mouth, and leaves somewhat of a sweetish Taste behind it. It is famous for stopping Fluxes of all kinds.

**JAPANING**, the Art of varnishing and drawing Figures on Wood, &c. after the same manner as the Workmen do who are Natives of *Japan*, a famous Island not far from the Coast of *China*. The manner of it is this: they take a Pint of Spirit of Wine well dephlegmated, and four Ounces of Gum-Lacca (which last is first broke from the Sticks and Rubbish) and bruising it roughly in a Mortar, they put it to steep in Spring-water, tyed up in a Bag of coarse Linnen, together with a little Castile-Soap, for the space of twelve Hours. This done, they rub out all the Turbure, and add to it a little Allum, and reserve it a-part; then add as much Mastick and white Amber, distilled in a Matrass, with the Spirit of Wine, by a two Days Digestion, frequently stirring it, that it don't stick to the Glass; then strain and press it out into another Vessel. This done, they take the Wood to be japaned, and cover it with a Layer of this Varnish, till it be sufficiently drenched with it; then taking some of the Colour, of which the Figures are to be, they incorporate it with seven times as much of the Varnish, and apply it with a Pencil, going over each part three several times, each a quarter of an Hour after the other: two Hours after this they polish it with Pebble, or Dutch Reeds. As to the Colours used in this Art, for a fair Red, they take *Spanish* Vermillion, with a fourth part of *Venise* Laque. Black, they make of Ivory calcined between two Crucibles; for Blue they use Ultramarine, and only twice as much Varnish as Colour. The rest are applied as above directed, except the Green, which is difficult to make fair and lively, and therefore seldom used. Night-japaning is performed, by applying three or four Layers with the Colours first, then two of pure Varnish uncoloured, made according to the former Process. Before it be dry, they fit some Venturine, or Gold Wire, reduced to Powder, over it, and then cover it with as many Layers of pure Varnish, as render it like polished Glass; and, lastly, rub it over with Tripoli, Oil of Olive, or a Hatrer's Felt.

**JARR** of Oil, is an earthen Vessel containing from 18 to 26 Gallons. A *Jarr* of green Ginger is, about 100 Pounds Weight.

**JASPER**, a precious Stone, not much different from the Agate, excepting in this, that it is more soft, and does not take so good a Polish. In some of these, Nature has amused herself, in representing Rivers, Trees, Animals, Landscips, &c. as if they were painted. The *ferid* Jasper, found in the *Pyreneans*, is usually stained with various Colours, tho' there are some that have but one Colour, as Red or Green; but these are the least valuable. The most beautiful is that bordering on the Colour of Laque, or Purple, next to that the Carnation; but what is now usually taken is Green, spotted with Red. Jasper is a Hebrew Word, and has neither been changed by the Latins, nor us. Some *Greek* Versions give it the Name of *Beryl*. *Onkelos* calls it *Pamber*, in regard of its being spotted like that Animal.

**JATRALEPTIC**, the Name of that part of Physick which cures by Frictions, by the Application of Fomentations and Plasters. It was one *Praxidius*, a Disciple of *Hippocrates*, and a Native of *Corinth*, who first instituted it.

**JAVELIN**, a kind of Spear, or Half-Pike, used by the Ancients, both on Horseback and on Foot. It was five Foot and an half long, and the Steel, wherewith it was headed, had three Sides or Faces, which all terminated in a Point.

**JAUNDICE**, a Disease, which consists in an overflowing of the Bile. Of this there are three kinds; the first, properly called the *Jaundice*, is owing to the yellow Bile, which, in this Case, is too exalted or too abundant in

the Mass of Blood; or perhaps to an Obstruction of the Glands of the Liver, which prevents the Gall's being duly separated from the Blood. The second, called, the *Black Jaundice*, is owing to the same yellow Bile, mingled with Acids. The third, bordering on Green, takes its Rise also from a Mixture of Bile with an Acid; this is usually called the *Green-Sickeness*, and is a Disemper pretty common in young Women. In the *Jaundice*, the White of the Eye and the Skin are yellow, and troubled with an Itching; in the *Black Jaundice* the natural Colour is lost, by reason of an atrabiliary Humour spread underneath the Skin; it first appears brownish, and afterwards of a Lead-Colour. The *Jaundice* often proves a Forerunner of the Dropsy. A Doctor of the Faculty of *Montpellier*, calls the *Yellow Jaundice*, attended with periodical Pains, a Rheumatism of the Liver; and another of the same place, calls it a Quartan Ague of the Liver. In the Journal of *Leipfic*, 'tis asserted that the *Jaundice* is not occasioned by Obstructions. The Acid Spirit of *Sul Ammoniac* is said to be an excellent Remedy against the *Jaundice*. The word is derived from the *French*, *Janniffe*, *Yellowness*, of *Janne*, *Yellow*.  
JAW, see *Maxilla*.

**ICADES**, the Name of an antient Feast, celebrated every Month by the *Epiroean* Philosophers, in memory of their Master *Epiurus*. The Day on which it was held was the 20th Day of the Moon or Month, which was that whereon *Epiurus* came into the World. And hence came the Name *Icades*, *icade* signifying a Score, from *icson*, twenty. They adorned their Chambers on this Day, and bore his Image in State about their Houses, making Sacrifices.

**ICE**, a hard transparent Body form'd from some Liquor congel'd or fix'd. Towards the *Poles* are found vast Piles of Ice reaching two or three hundred Feet above the Surface of the Water, and appearing like Islands; about whose Origin there are different Opinions: Some think 'tis Snow, which falling in great Abundance in these cold Climates, and melting in the Sea, accumulates gradually, till those huge Heaps are at length formed. But the more common Opinion is, that the Ice is formed from the fresh Waters which flow from the neighbouring Lands. *Bartoli* has written an *Italian* Treatise expressly on Ice and Congelation. And the *Alta Eruditorum* furnish us with an Account of a *French* Author on the same Subject. See *Freezing* and *Cold*.

**ICH-DIEN**, the Motto under the Arms of the Prince of *Wales*, which Sir *H. Spelman* judges to be in *Saxon* *Ich Thien*, the *Saxon* *D*, with a transferre Stroke, being the same with *Th*, and signifying, I serve, or am a Servant; as the *Saxon* Kings Ministers were called *Thien*.

**ICHOGRAPHY** in Perspective, is the View of any thing cut off by a Plane parallel to the Horizon, just at the Base or Bottom of it. In Architecture it is taken for the Geometrical Plan, or Platform of an Edifice, or the Ground-Plot of an House or Building delineated upon Paper, describing the Form of the several Apartments, Rooms, Windows, Chimneys, &c. and this is properly the Work of the Master Architect or Surveyor, being indeed the most abstruse and difficult of any. In Fortification it is, in like manner, the Plan or Representation of the Length and Breadth of a Fortrefs, the distinct Parts of which are marked out, either on the Ground itself, or upon Paper. The word is derived from the *Greek*, *ichos*, *Perspective*, and *grapho*, *scribo*, as being a Description of the Footsteps or Traces of a Work. See *Plan*.

**ICHOGLANS**, the Grand Signior's Pages, or white Eunuchs serving in the Seraglio. They are the Children of Christians, and are bred up in an Austerity scarcely to be conceived. These the Sultan prefers to Officers more or less considerable, as they appear more or less devoted to his Service; but 'tis to be observed, they are incapable of Offices till forty Years of Age, unless they have some particular Dispensation from the Grand Signior. They are educated with a great deal of Care in the Seraglios of *Pera*, *Adrianople*, and *Constantinople*. They are under the Direction of a *Capi Aga*, who presides over their Exercises, and treats them with a World of Severity. They are principally conversant in the *Oda*, or *Halls*, where, according to their several Talents or Inclinations, they are instructed in the Languages, in their Religion, or in Exercises of the Body. The word, according to some Authors, is composed of the two *Turkish* words, *ich*, or *ich*, which signifies *within*, and *Oglan*, *Page*. In which Sense *Ichoglan* is a Page serving within-side the Palace or Seraglio. Others derive it from the barbarous *Greek*, *ichoglas*, or *ichoglas*, which was formed from the *Latin* *incola*. These two Etymologies give nearly the same Sense to *Ichoglan*, taking *incola* for *Dominus incola*.

**ICHOR** strictly signifies a thin watry Humour, like Serum, but it is sometimes also used for a thicker kind, flowing from Ulcers. The word is originally *Greek*, and signifies *Sanies*, *Rotcomess*.

**ICHTHYOPHAGI**, Fish-eaters, the Name given to a People, or rather to several different People, who lived wholly on Fishes. *Pliny* places them in the Provinces of *Nanquin* and *Xantun*. *Agarbargius* calls all the Inhabitants from the *Antons* and *Eriopua* to the *Indas*, *Gedrofa*, *Caramania*, *Perfia*, and all the neighbouring Islands, by the Name *Ichthyophagi*. From the Accounts given us of them by *Herodotus*, *Strabo*, *Sabimus*, *Plutarch*, &c. it appears, indeed, that they had Cattle, but that they made no use of them excepting to feed their Fishes withal. They made their Houses of large Fish-Bones, the Ribs of Whales serving them for their Beams. The Jaws of these Animals served them for Doors, and the Mortars wherein they pounded their Fish, and baked it at the Sun, were nothing else but their *Vertebrae*. The word is derived from the *Greek*, *ἰχθυόω*, *Piscis*, *Fish*, and *φάγομαι*, *edo*, *I eat*.

**ICONCLASTES**, a Breaker of Images; a Name which the Church of *Rome* attributes to all who reject the Use of Images in religious Matters; in which Sense, not only the Reformed, but also the *English* Churches are called *Iconoclastes*, and esteem'd by them Heretics, as opposing the Worship of the Images of God and the Saints, and breaking their Figures and Representations in Churches. The word is formed from the *Greek*, *ἰκῶν*, *Image*, *Image*, and *κλάω*, *scindere*, *to break*.

**ICONOGRAPHIA**, Description of Images, or of ancient Statues of Marbles and Copper, of Busts and Semi-busts, of Penates, Paintings in Fresco, Mosaic Works, and ancient Pieces of Mignature. The word is derived from *ἰκῶν*, *Image*, and *γράφω*, *scribo*.

**ICONOLATER**, one who worships Images, a Name which the *Iconoclastes* give to those of the *Romish* Communion, on account of their adoring Images, and of rendering to them the Worship only due to God. The word comes from the *Greek* *ἰκῶν* and *λατρεύω*, *colo*.

**ICONOLOGIA**, Interpretation of various ancient Images, Monuments, and Emblems, from the *Greek* *ἰκῶν*, and *λογία*, *I speak*.

**ICOSIhedron**, is a Solid, which consists of twenty triangular Pyramids, whose Vertices meet in the Center of a Sphere, that is imagined to circumscribe it, and therefore have

their Height and Bases equal; wherefore the Solidity of one of those Pyramids, multiplied by twenty, the Number of Bases, gives the solid Content of the *icosihedron*. This Figure being drawn on Pasteboard, cut half through, and then folded up nearly together, will represent an *icosihedron*.

**ICTERIC**, a Term in Physic, apply'd to such Persons as have the Jaundice, which the *Latins* call *Icterus*, *Aurigo*, or *Nervus Regius*. *Iberic* Medicines are such as are prescribed in Cases of the Jaundice. The Word is derived from the *Greek* *ἰκτερίς*, which some derive further from *ικτήρ*, a kind of Weasel with yellow Eyes.

**ICHTHYOCOLLA**, *Stingless*. *Schroder* says, that this is made from a Fish, which is common in the *Danube*; the Fish having no Bones but about the Head. After it is cut in small pieces, they boil it in Water to a thick Jelly, which is spread abroad and dried, then rolled up, and brought to us in the form we see it in the Shops. It is of a very glutinous Quality, and consequently good in all Disorders, which arise from too thin and sharp a State of the Fluids. The Word is derived from the *Greek* *ἰχθύς*, *Piscis*, *Fish*, and *κόλλα*, *Gluten*, *Glue*.

**IDEA**, A Term by which we mean that immediate Object of the Mind about which we are employ'd when we perceive or think: Thus, when we look at the Sun, we do not see that Luminary itself, but its Image or Appearance convey'd to the Soul by the Organ of Sight; and this Image we call *Idea*. The Origin of *Ideas* has been a long time disputed among the Philosophers. The *Peripateticks* maintain, that external Objects emit Species that resemble them all around, and that these Species striking on our Senses, are by them transmitted to the Understanding; that being material and sensible, they are rendered intelligible by the active Intellect, and are at length received by the passive. Others are of opinion, that our Souls have of themselves the power of producing *Ideas* of Things that we would think upon; and that they are excited to produce them by the Impressions which Objects make on the Body, tho' these Impressions are not Images in any respect like the Objects that occasioned them. And in this, say they, it is, that Man is made after the Image of God, and that he partakes of his Power; for as God made all things out of nothing, and can reduce 'em to nothing when he pleases, so Man can create as many *Ideas* as he pleases, and annihilate them when he has done. Others maintain, that the Mind has no oc-

casion for any thing besides itself to perceive Objects; and that by considering itself and its own Perfections, it is able to discover all things that are without. Others with *Descartes* hold, that our *Ideas* were created and born along with us. *Mullerbach* and his Followers assert, that God has in himself the *Ideas* of all Beings that he hath created; that thus he sees all things, in considering his Perfections to which they correspond; and that as he is intimately united to our Souls by his Presence, our Mind sees and perceives things in Him which represent created Beings; and that it is thus we come by all our *Ideas*. He adds, that tho' we see all sensible and material things in God, yet that we have not our Sensations in him. When we perceive any sensible Object, in our Perception is included both a Sensation and a pure *Idea*. The Sensation is a Modification of the Soul, and it is God who causes it in us: but for the *Idea* join'd with the Sensation, it is in God, and it is in him that we see it. The *Cartesians* distinguish three kinds of *Ideas*. The first innate, and such is that we have of God, as of a Being infinitely perfect. The second adventitious, which the Mind receives in proportion as bodily Objects present themselves to our Senses. Such is the *Idea* of Body, Sound, Figure, Light, &c. The third, according to these Philosophers, are fictions, which are those which the Mind forms, by uniting and adorning the *Ideas* which it already had: and these are called complex. But our great Mr. *Locke* seems to have put this Matter out of dispute, having made it appear that all our *Ideas* are owing to our Senses; and that all innate, created, ficitious, &c. *Ideas*, are mere Chimeras.

He proves, that our Mind has not absolutely any *Ideas* besides those presented to it by the Senses, and those which it forms by its own Operations, on those others which the Senses furnish. So that a Man destitute of one of his Senses, would never have any *Idea* belonging to that Sense; and supposing him destitute of all the Senses, he would never have any *Idea* at all: External Objects having no other way of producing *Ideas* in him, but by means of Sensation. He would have no *Idea*, not even of Reflexion, because in wanting all Sensation, he wants that which should excite in him the Operations of his Mind, which are the Objects of his Reflexion. 'Tis plain therefore there is no innate *Idea*; no general Truth, or first Principle inherent in the Soul, and created with it; no immediate Object of the Mind before it had perceived external Objects by means of the Senses, and reflected on that Perception. Those *Ideas* only seem to be innate, because we find we have them as soon as we come to the Use of Reason, but are, in effect, what we formed from the *Ideas* wherewith the Mind was insensibly filled by the Senses. Thus, when the Mind is employ'd about sensible Objects, it comes by the *Ideas* of bitter, sweet, yellow, hard, &c. which we call Sensation; and when employ'd about its own Operations, perceiving and reflecting on them, as employ'd about the *Ideas* before got by Sensation, we get the *Ideas* of Perception, Thinking, Doubting, Willing, &c. which we call inward Sensation or Reflexion: And these two, viz. external material Things as the Objects of Sensation, and the Operations of our own Minds as the Objects of Reflexion, are the only Originals, whence all our *Ideas* have their Rise. When we have considered these, and their several Modes and Combinations, we shall find they contain our whole Stock of *Ideas*; in so much, that the Understanding does not seem to have the least Glimmering of any *Ideas* that it did not receive from one of those Sources. And thus far the Mind appears merely passive, as not having it in its power to chuse whether it will have these first Beginnings or Materials of Knowledge, or not. For the Objects of Sense will obtrude their *Ideas* upon the Mind, and the Operations of the Mind will not let us be without some (however obscure) Notion of them.

The same excellent Author distinguishes *Ideas* into two kinds, viz. Simple and Complex. Of the former kind are all those *Ideas* which come into the Mind by Sensation: And though the Qualities of Bodies that affect our Senses are in the things themselves so mix'd and united, that there is no Separation between them; yet the *Ideas* they produce in the Mind are simple and unmix'd. Again, some *Ideas* we acquire purely by means of one Sense, as the *Ideas* of Colours only by the Eye, of Sounds by the Ear, of Heat by the Touch, &c. Other *Ideas* we gain by several Senses, as of Space, Extension, Figure, Rest, Motion, &c. for these have their Effect both on the Sight and the Touch. There are other simple *Ideas*, again, form'd in the Mind both by Sensation and Reflexion jointly, as Pleasure, Pain, Power, Existence, Unity, Succession, &c. And of some of these kinds of *Ideas* are all, or at least the most considerable of those simple *Ideas* which the Mind hath, and out of which is made all its other Knowledge. The better to comprehend the Nature of these simple *Ideas*, it will be convenient

nious to distinguish between them as they are *Ideas* or Perceptions in our Minds, and as they are Modifications of the Bodies that cause such Perceptions in us; that we may not think, as is usually done, that they are exactly the Images and Resemblances of something inherent in the Subject: for most of those of Sensation, are in the Mind no more the Likenesses of any thing existing without us, than the Names that stand for 'em are the Likenesses of the *Ideas*. But here the Qualities of Bodies which produce those *Ideas* in our Minds, are to be distinguish'd into Primary and Secondary. Primary Qualities are such as are utterly inseparable from the Body, in what State soever it be; and such as our Senses constantly find in every Particle of Matter, which are Solidity, Extension, Figure, Mobility, and the like. Secondary Qualities are such as are, in reality, nothing in the Objects themselves, but only Powers to produce various Sensations in us by means of their primary Qualities; that is, by the Figure, Bulk, Texture, &c. of their Particles, as Colour, Sounds, Taste, &c. Now the *Ideas* of primary Qualities are in some sense Resemblances of them, and their Patterns do really exist in the Bodies themselves; but the *Ideas* produced in us by those secondary Qualities have no Resemblance of them at all. There is nothing like our *Ideas* existing in the Bodies themselves that occasion them. They are in the Bodies we denominate from them, only a Power to produce those Sensations in us; and what is sweet, warm, blue, &c. in the *Ideas*, is no more than the Bulk, Figure and Motion of the Particles of the Bodies themselves that we call so.

The Mind hath several Faculties of managing these simple *Ideas* that are worthy of notice; as, 1. That of discerning justly and distinguishing rightly between one and another; in this consists the Accuracy of Judgment. 2. That of comparing them one with another in respect of Extent, Degree, Time, Place, or any other Circumstances of Relation or Dependence one on another. 3. The Faculty of compounding or putting together the simple *Ideas* received by Sensation and Reflexion, in order to make complex ones. 4. Children by repeated Sensations having got some *Ideas* fix'd in their Memories, by degrees learn the Use of Signs; and when they can speak articulately, they make use of Words to signify their *Ideas* to others: Hence, the Use of Words being to stand as outward Marks of our internal *Ideas*, and those *Ideas* being taken from particular things; if every particular *Idea* that we take in, should have a particular Name affixed to it, Names would grow endless. To prevent this Inconvenience, the Mind has another Faculty whereby it can make the particular *Ideas* received from such Objects, become general; which is done, by considering them as they are in the Mind such Appearances, separate from all other Existences and Circumstances of Existence, as Time, Place, and other concomitant *Ideas*; and this is called Abstraction; whereby *Ideas* taken from particular Things become general Representatives of all of that kind, and their Names, general Names applicable to whatever exists conformable to such abstract *Ideas*. Thus the same Colour being observed to-day in Chalk or Snow, which we observed yesterday in Paper or Milk, we consider that Appearance alone, make it a Representative of all the same Kind, and give it the Name of Whiteness: By which Sound we always signify the same Quality, whereforever to be met with or imagin'd.

From the Power which the Mind has of combining, comparing, and separating or abstracting the simple *Ideas*, which it acquires by Sensation and Reflexion, all its complex *Ideas* are formed; and as before in the Perception of *Ideas*, the Understanding was passive, so here 'tis active, exerting the Power it hath in the several Acts and Faculties abovementioned, in order to frame compound *Ideas*. All complex *Ideas*, tho' their Number be infinite, and Variety endless, yet may they be all reduced to these three Heads, viz. Modes, Substances, and Relations. Modes are such complex *Ideas*, as however compounded, are not supposed to exist by themselves, but are consider'd as Dependencies on, or Affections of Substances: Such are the *Ideas* signified by the words Triangle, Gratitude, Murder, &c. And these Modes are of two kinds: 1. Such as are only Variations, or different Combinations of the same simple *Ideas*, without the Mixture of any other, as a Dozen, a Score, &c. and these may be called simple Modes. 2. There are others compounded of simple *Ideas* of several sorts put together, to make one complex one, as Beauty, Theft. Substances have their *Ideas* from such Combinations of simple *Ideas*, as are taken to represent distinct particular things, substituting by themselves, in which the supposed or confused *Idea* of Substance, such as it is, is always the first and chief. Relations are a kind of complex *Ideas*, arising from the Consideration or Comparison of one *Idea* with another. Of these, some only depend on the Equality or Excess of the same simple *Ideas* in several Subjects, and these may be called proportional Relations,

such as equal, more, bigger, sweeter. Another occasion of comparing things together, is owing to the Circumstances of their Origin and Beginning; which, not being afterwards to be altered, make the Relations depending thereon as lasting as the Subjects to which they belong. Thus it is with natural Relations, such as Father, Mother, Uncle, Cousin, &c. Thus also it is with Relations by Institution, as Prince and People, General and Army, &c. As to moral Relations, they are the Conformity or Disagreement of *Mens* free Actions to Laws and Rules, whether Human or Divine.

Further, with regard to our *Ideas* it may be observed, that some are clear and distinct, others obscure and confused. Our simple *Ideas* are clear, when they continue such as the Objects represent them to us, when our Organs of Sensation are in a good Tone and Order, when our Memories retain them, and can produce and prefer them to the Mind whenever it hath occasion to consider them; and when, with this, the Mind sees that these simple *Ideas* are severally different one from another: The contrary to which, is what we call Obscurity and Confusion.

Again, *Ideas*, with respect to the Objects whence they are taken, or which they are supposed to represent, come under a threefold Distinction; being, 1. Either real or fantastical. 2. True or false. 3. Adequate or inadequate. By real *Ideas* is meant such as have a Foundation in Nature, such as have a Conformity with the real Being or Existence of Things, or with their Archetypes. Fantastical are such as have no Foundation in Nature, nor any Conformity with that Being to which they are referred as their Archetypes.

Now if we examine our several kinds of *Ideas*, we shall find that, 1. All our simple *Ideas* are real; not that they are Images or Representations of what does exist, but as they are the certain Effects of Powers in Things without us, ordained by our Maker to produce in us such Sensations. They are real *Ideas* in us, in regard, by them we distinguish the Qualities that are really in the Bodies themselves: their Reality lies in the steady Correspondence they have with the distinct Constitutions of real Beings, but whether with those Constitutions to Causes or Patterns, it matters not, so long as they are constantly produced by them. As to complex *Ideas*, in regard they are arbitrary Combinations of simple *Ideas* put together, and united under one general Name, in forming whereof the Mind useth its own Liberty, some are found real, and some imaginary. 2. Mix'd Modes and Relations having no other Reality than what they have in the Minds of Men, are real; nothing more being required to their Reality, but a Possibility of existing conformable to them. These *Ideas* being themselves Archetypes, cannot differ from their Archetypes, and so cannot be chimerical, unless any one jumbles inconsistent *Ideas* in them: Indeed, those that have Names assign'd to them, ought to have a Conformity to the ordinary Signification of those Names, to prevent their appearing fantastical. 3. Our complex *Ideas* of Substances being made in reference to things existing without us, whose Representations they are thought, are no further real, than as they are Combinations of simple *Ideas* really united and co-existing in things without us. Those are fantastical, that are made up of several *Ideas* that never were found united, as Centaurs, &c.

As to true and false *Ideas*, it may be observed, that Truth and Falshood in Propriety of Speech belong only to Propositions; and when *Ideas* are term'd true or false, there is some tacit Proposition, which is the Foundation of that Denomination. Our *Ideas* being nothing else but Appearances or Perceptions in the Mind, can no more be said to be true or false, than single Names of things can be said to be so; for Truth and Falshood lying always in some Affirmation or Negation, our *Ideas* are not capable of them, till the Mind passeth some Judgment of them. In a Metaphysical Sense they may be said to be true, i. e. to be really such as they exist; tho' in things called true, even in that Sense, there seems to be a secret Reference to our *Ideas*, look'd upon as the Standards of that Truth; which amounts to a mental Proposition. When the Mind refers its *Ideas* to any thing extraneous to it, they are then capable of being true or false, because in such a Reference, the Mind makes a tacit Supposition of their Conformity to that thing; which Supposition, as it is true or false, so the *Ideas* themselves come to be denominated. Real *Ideas* are either adequate or inadequate. Those are adequate which perfectly represent those Archetypes which the Mind supposeth them taken from, and which it makes them stand for. Inadequate are such as do but partially or incompletely represent those Archetypes to which they are referred. See Adequate, Truth, Pleasure, Name, Knowledge, Affection, Modes.

IDENTITATE NOMINIS, is a Writ that lies for him who upon a Capias or Exigent is taken and committed to Prison for another Man of the same Name.

IDENTITY of a thing, is its Sameness, or that by which it is itself, and not any thing else. Our Ideas of Identity we owe to that Power which the Mind has of comparing the very Beings of Things, whereby considering any thing as existing at any certain Time and Place, and comparing it with itself as existing at any other Time, &c. we accordingly pronounce it the same or different. When we see any thing in any certain Time and Place, we are sure it is that very thing; and can be no other, how like soever it may be in all other respects: In regard we conceive it impossible, that two things of the same kind, should exist together in the same Place, we conclude, that whatever exists any where at the same Time, excludes all of the same kind, and is there itself alone. When therefore we demand, whether any thing be the same or no, it refers always to something, that existed at such a Time, in such a Place, which it was certain, at that instant, was the same with itself, and no other. We have Ideas of three sorts of Substances. *First*, of Gods; *Secondly*, of Finite Intelligences; *Thirdly*, of Bodies. *First*, God being Eternal, Unalterable, and every where, concerning his Identity there can be no doubt. *Secondly*, Finite Spirits having had their determinate Place and Time of beginning to exist, the Relation to that Time and Place will always determine to each, its Identity, as long as it exists. *Thirdly*, The same will hold of every Particle of Matter to which no Addition or Subtraction is made. These three exclude not one another out of the same Place, yet each exclude those of the same kind, out of the same Place. The Identity and Diversity of Modes and Relations are determined after the same manner, that Substances are: only the Actions of Finite Beings, as Motion and Thought, consisting in Succession, cannot exist in different Times and Places, as permanent Beings: For no Motion or Thought considered as at different Times, can be the same, each Part thereof having a different beginning of Existence. From whence it is plain, that Existence itself is the *Principium Individuationis*, which determines a Being to a particular Time and Place incommunicable to two Beings of the same kind. Thus, suppose an Atom existing in a determined Time and Place, it is evident, that consider'd in any instance, it is the same with itself, and will be so, as long as its Existence continues. The same may be said of two, or more, or any Number of Particles, whilst they continue together: but if one Atom be taken away, it is not the same Mass. In Vegetables, the Identity depends not on the same Mass, and is not applied to the same Thing. The Reason of this, is the difference between an animate Body, and Mass of Matter; this being only the Cohesion of Particles any how united; the other, such a Disposition, and Organization of Parts, as is fit to receive and distribute Nourishment, so as to continue and frame the Wood, Bark, Leaves, &c. (of an Oak, for instance) in which consists the Vegetable Life. That therefore, which hath such an Organization of Parts, partaking of one common Life, continues to be the same Plant, tho' that Life be communicated to new Particles of Matter vitally united to the living Plant. The Cafe is not so much different in Brutes, but that any one may hence see what makes an Animal, and continues it the same. The Identity of the same Man likewise consists in a Participation of the same continued Life, in succeeding Particles of Matter vitally united to the same organized Body. To understand Identity aright, we must consider what Idea, the Word it is applied to, stands for: it being one thing, to be the same Substance; another, the same Man; and a third, the same Person. An Animal is a living organized Body: and the same Animal is the same continued Life communicated to different Particles of Matter, as they happen successively to be united to that organized living Body; and our Notion of Man, is but of a particular sort of Animal. Person stands for an intelligent Being, that reasons, and reflects, and can consider itself the same thing in different Times and Places; which it doth by that Consciousness, that is inseparable from Thinking. By this every one is to himself, what he calls Self, without considering, whether that Self be continued in the same or diverse Substances. In this consists Personal Identity, or the Sameness of a Rational Being: and so far as this Consciousness extends backward to any past Action, or Thought, so far reaches the Identity of that Person. It is the self-same now, it was then: And it is by the same Self, with this present one, that now reflects on it, that that Action was done. Self is that conscious Thinking Thing, whatever Substance, it matters not, which is conscious of Pleasure and Pain, capable of Happiness or Misery; and so is concerned for itself, as far as that Consciousness extends. That with which the Consciousness of this present Thinking Thing can join itself, makes the same Person, and is one Self with it; and so attributes to itself, and owns all

the Actions of that thing, as its own, as far as that Consciousness reacheth. This Personal Identity is the Object of Reward and Punishment, being that by which every one is concerned for himself. If the Consciousness were along with the little Finger, when that was cut off, it would be the same Self, that was just before concern'd for the whole Body. If the same *Servitor*, waking, and sleeping, did not partake of the same Consciousness, they would not be the same Person: *Servitor* waking could not be in justice accountable for what *Servitor* sleeping did; no more than one Twin, for what his Brother Twin did, because their Outrides were so like, that they could not be distinguish'd. But suppose I wholly lose the Memory of some Parts of my Life, beyond a possibility of retrieving them, so that I shall never be conscious of them again; am I not again the same Person that did those Actions, tho' I have forgot them? I answer, We must here take notice what the word I is applied to, which in this Cafe is the Man only: And the same Man being presumed to be the same Person, I is easily here supposed to stand also for the same Person. But if it be possible for the same Man, to have distinct incommunicable Consciousness at different times, it is past doubt the same Man would at different times make different Persons. Which we see is the Sense of Mankind in the solemnest Declaration of their Opinions; Human Laws not punishing the Madman for the sober Man's Actions, nor the sober Man, for what the Madman did; thereby making them two Persons. Thus we say in *English*, Such an one is not himself, or is besides himself; in which Phrases it is insinuated, that Self is changed, and the self-same Person is no longer in that Man. But is not a Man, drunk or sober, the same Person? Why else is he punished for the same Fact he commits when drunk, tho' he be never afterwards conscious of it? Just as much the same Person, as a Man that walks, and does other things in his Sleep, is the same Person, and is as answerable for any Mischief he shall do in it. Human Laws punish both with a Justice suitable to their way of Knowledge: Because, in these Cafes, they cannot distinguish certainly, what is real, and what is counterfeit; and so the Ignorance in Drunkenness or Sleep is not admitted as a Plea. For tho' Punishment be annexed to Personality, and Personality to Consciousness, and the Drunkard is not conscious perhaps of what he did; yet Human Judicatures justly punish him, because the Fact is proved against him, but want of Consciousness cannot be proved for him. But in the great Day, wherein the Secrets of all Hearts shall be laid open, it may be reasonable to think no one shall be made to answer for what he knows nothing of, but shall receive his Doom, his own Conscience accusing, or else excusing him. To conclude, Whatever Substance begins to exist, it must, during its Existence, be the same: Whatever Composition of Substances begin to exist, during the Union of those Substances, the Concrete must be the same. Whatever Mode begins to exist, during its Existence it is the same: And so if the Composition be of distinct Substances, and different Modes, the same Rule holds. Whence it appears, that the Difficulty or Obscurity that has been about this matter, rather arises from Names ill used, than from any Obscurity in the things themselves. For whatever makes the specific Idea, to which the Name is applied, if that Idea be steadily kept to, the Distinction of any thing into the same and diverse, will easily be conceived.

IDEOT in the original *Greek* *ἰδιώτης*, signifies a private Person who has no public Office. Among the *Latins* it is used for *illiteratus, imperitus*; and in our *English Law*, for a Person *non compos mentis*, or a natural Fool. A Person that has understanding enough to measure a Yard of Cloth, number 20 rightly, tell the Days of the Week, &c. is not an Ideot in the Eye of the Law.

IDES, is a Word which was used by the *Romans*, in their Calendar, to distinguish the Days of the Month by. They commonly fell out the 15th of every Month, except in the Months of *March, May, July, and October*, for in these, the *Ides* were on the 15th of the Month. This word is said to be derived from the *Hebrew* word *Idare*, that is, to divide; because the Month is, in a manner, equally divided into two Parts by the *Ides*; and the *Nones* were perhaps so called from *Nono Idus*, the ninth of the *Ides*, because they were in the room of the ninth of the *Ides*. Some others observing, that there were three considerable Varieties in the Motion of the Moon; the first, when she is quite hid under the Beams of the Sun; the second at the first Day of her appearing, when we see her in an Evening, with her Horns proceeding out of his Rays; and the third when she is in her full Light: The common Opinion was, that from thence *ROMANUS* took occasion to divide the Days of the Months; which he began always by the Calends, in the time that the Moon, *sob Radium Solis eclipsetur*, was hid under the

Beams of the Sun; then gave the Name of *Nones*, or *Nove Lune*, to the Day of the first appearing of the New Moon; and *Ides*, say they, took the Name when she was full, and appeared in her Beauty, from the Greek word Ἰδέα, that is, Beauty. From thence they draw an Argument for the Inequality of the Days of the *Nones*; for as it falls out by the Composition of the Motions of the Sun and the Moon, that the Moon comes out of the Beams of the Sun, sometimes sooner, and sometimes later, and that this Diversity is commonly included in the space of two Days; it is likely, they say, that in the time that *Romulus* instituted his Calendar, the Moon was kept a longer time hid under the Beams of the Sun, in the Month of *March*, *May*, *July*, and *October*: wherefore he allowed seven Days to the *Nones* in those four Months, and five Days only to the others, during which, it may be, the Moon got off from the Beams, and appeared sooner. Others draw the word *Ides* from *Idolium*, which was the Name of the Victim offered to *Jupiter*, the Day of the *Ides*, that was consecrated to him. Some derive it from the *Tysons* word *Ist*, which signifies, amongst that Nation, the same as *Ides* among the *Romans*. They allowed eight Days for the *Ides*: Thus the eighth Day of the Month, in those four Months, and the sixth, in the other eight, were accounted the eighth of the *Ides*, and so on, always decreasing to the 12th or 14th, which was called the *Præid*, or *Eve of the Ides*, and on the 13th or 15th was the Day of the *Ides*. This way of accounting is still in use in the *Roman* Chancery, and in the Calendar of the Breviary.

The *Ides of May* were consecrated to *Mercury*; the *Ides of March* were ever esteemed unhappy, after *Cæsar's* Murder on that Day; the Time after the *Ides of June* was reckoned fortunate for those who entered into Matrimony; the *Ides of August* were consecrated to *Diana*, and were observed as a Feast-Day by the Slaves. On the *Ides of September* Auguries were taken for appointing the Magistrates, who formerly entered into their Offices on the *Ides of May*, afterwards on those of *March*. See *Rosinus*, and others, who have written of the *Roman Antiquities*.

**IDIDM**, *Dialect*, the Language of some particular Province, differing, in some respects, from the Language of the Nation in general, whence it is derived. The word comes from the Greek, ἰδίωμα, *Propriety*, of ἴδιος, *proper*, *Idem*.

**IDIOPATHY**, a Disease or Indisposition proper to some particular Member, or Part of the Body, not caused by any other Disease, or preceding Affection, nor having any thing to do with the rest of the Body. It is opposed to *Sympathy*, which happens when the Indisposition takes its Rise from a Disorder in some other Part of the Body. Thus a Cataract in the Eye is an *Idiopathy*; in an Epilepsy is either *Idiopathic* or *Sympathic*; *Idiopathic* when it happens purely thro' some Fault in the Brain, *Sympathic* when it is preceded by some other Disorder. The word is derived from the Greek, ἰδίος, *proper*, *particular*, and πάθος, *Paffion*, *Affection*.

**IDIOSYNCRASY**, in *Physic*, is a Temperament peculiar to some Body, in consequence whereof, whether in Sickness or in Health, it has a more than ordinary Aversion or Inclination to certain things, or is more affected with them, than others usually are. The word is derived from the Greek, ἰδίος, *proper*, *id*, *with*, and σνκρῆσις, *Crafsis*, *Mixture*, *Temperament*.

**IDIOTA** *Inquirendi vel Examinanda*, is a Writ issued out to the Escheator or Sheriff of any County, where the King has notice that there is an *Idiot* naturally born, so weak of Understanding, that he cannot govern or manage his Inheritance, directing him to call before him the Party suspected, and examine him; for the King has the Protection of his Subjects, and by his Prerogative the Government of the Lands and Substance of such as are naturally defective in their own Discretion.

**IDIOTISM**, in Grammar, is an Inflexion of some Verb, a particular Construction of some Phrase or Particle that is anomalous, and deviates from the ordinary Rule of the Language of the Nation, but which is in use in some particular Province of it. Several Authors have written of the *Idiotisms* in the Greek and Latin Languages; that is, of the particular Turns in those Tongues which vary the most from each other, and from the more popular among the modern Tongues: But the Examples of these *Idiotisms* being borrowed from the best Authors, *Idiotism*, in this Sense, cannot properly be called an Irregularity. The word is derived from the Greek, ἰδίος, *proper*.

**IDOL**, a Statue or Image of some false God, to whom Divine Honours are paid, Altars and Temples erected, and Sacrifices made. Thus the *Cællus* at *Rhodes* was an Idol of the Sun, the *Palladium* an Idol of *Minerva*, &c. The word comes from the Greek ἰδωλον, of ἴδω, *Image*, *Figure*.

**IDOLATRY**, the Worship and Adoration of false Gods, or the giving those Honours to Creatures, or the

Works of Man's Hand, which are only due to God. Several Authors have written of the Origin and Causes of Idolatry, and among the rest *Vagins*, *Seiden*, *Goadwin*, and *Tennison*; but 'tis still a Doubt who was the first Author of it. 'Tis generally allowed, however, that it had not its Beginning till after the Deluge, and many are of Opinion that *Babel*, who is supposed to be the same with *Nimrod*, was the first Man that was deified. But whether they had not paid Divine Honours to the Heavenly Bodies before that time, cannot be determined, our Acquaintance with those remote Times being extremely slender. All that can be said with Certainty, is, That 426 Years after the Deluge, when God led *Israël* and his Family out of *Chanaan*, and *Abraham* passed over *Mesopotamia*, *Canaan*, the Kingdom of the *Philistines* and *Egypte*, it does not appear that Idolatry had then got any footing in any of those Countries, tho' some pretend that *Abraham* himself was an Idolater. The first mention we find made of it, is in *Genesis*, chap. xxxix, ver. 19. where *Rachel* is said to have taken the Idols of her Father; for tho' the meaning of the Hebrew word עֲבֹתִים be disputed, yet 'tis evident they were Idols. *Laban* calls them his Gods, and *Isaël* calls them strange Gods, and looks on them as Abominations. *Chaverin*, *German* Antiq. l. 1. maintains *Cain* to have been the first Idolater, and the false Gods that he worshipped to have been the Stars, to whom he supposed God had left the Government of the lower World; but this is mere Conjecture. The principal Causes that have been assigned for Idolatry, are these: (1.) The indelible Idea which every Man has of a God, and the Evidence which he gives of it to himself. (2.) An inviolable Attachment to Sense, and an Habitual of judging and deciding by it, and it only. (3.) The Pride and Vanity of the human Soul, which is not satisfied with simple Truth, but mingles and adulterates it with Fables. (4.) The Ignorance of Antiquity, or of the first Times, and the first Men, whereof we have but a very dark and confused Knowledge by Tradition, they having left no written Monuments or Books. (5.) The Ignorance and Changes of Languages. (6.) The Style of the Oriental Languages, which is figurative and poetical, and personifies every thing. (7.) The Superstition, Scruples, and Fears, inspired by Religion. (8.) The Flattery of Writers. (9.) The false Relations of Travellers. (10.) The Fictions of Poets. (11.) The Imaginations of Painters and Sculptors. (12.) A smattering of *Physic*, that is, a slight Acquaintance with natural Bodies, and Appearances, and their Causes. (13.) The Establishment of Colonies, and the Invention of Arts, which have been perverted by barbarous People. (14.) The Artifices of Priests. (15.) The Pride of certain Men, who have affected to pass for Gods. (16.) The Affection and Gratitude bore by the People to certain of their Great Men and Benefactors. (17.) The Scriptures themselves ill understood. The word comes from the Greek ἰδωλον, *Image*, and λατρεῖν, *service*, is *service*.

**IDYLLION**, in Poetry, is a little gay Poem, containing the Description or Narration of some agreeable Adventures. *Theocritus* is the oldest Author who has written *Idyllions*. The *Italians* imitate him, and have brought the *Idyllion* into modern Use. The *Idyllions* of *Theocritus* have a world of Delicacy; they appear with a clownish, rustic kind of Simplicity, but are full of the most exquisite Beauties; they seem drawn from the Breast of Nature herself, and to have been dictated by the Graces. The *Idyllion* is a kind of Poetry, which paints the Objects it describes; whereas the *Epic* Poem relates them, and the *Dramatic* acts them. The modern Writers of *Idyllions* don't keep up to that original Simplicity observed by *Theocritus*; the People of our Days would not bear so amorous Fiction, resembling the clownish Gallantries of our Peasants. *Bouillon* observes that the shortest *Idyllions* are usually the best. The word is derived from the Greek ἰδωλον, of ἴδω, *Figure*, *Representation*; in regard this Poetry consists in a lively natural Image, or Representation of Things.

**JET**, sometimes called *Black Amber*, is a Mineral, or a fusible Stone, extremely black, formed of a lapidific or bituminous Juice in the Earth, in the manner of Coal: It works like Amber, and has most of its Qualities. It abounds in *Danphure*, but the best in the World is said to be produced in some of the Northern Parts of *England*. There is also a fictitious *Jet* made of Glass, in imitation of the Mineral *Jet*. This is drawn out into long hollow Strings, which are cut, and formed at pleasure. It is much used in Embroideries, and in the Trimmings of Mourning, and may be made of any Colour, tho' 'tis usually black and white.

**JECIGATION**, in *Physic*, is a Trembling or Palpitation felt in the Pulse of a sick Person, which shows that the Brain, which is the Origin of the Nerves, is attacked and threatened with Convulsions.

JECUR. See LIVER.

JECUR UTERINUM: The *Placenta* is by some thus called, from the supposed Similitude of its Office with that of the Liver.

JEJUNUM. See *Intestines*.

JEOPAYLE; a Compound of three French words, *Je ay faille, I have failed*. It is used in a legal Sense, when the Parties to any Suit have, in pleading, proceeded so far, that they have joined Issue, which shall be tried, or is tried by a Jury, and this Pleading or Issue is badly joined, so that it will be Error if they proceed. In this Case one of the Parties might, by their Counsel, shew it to the Court, as well after Verdict given, as before the Jury was charged; But this occasioning great Delays in Suits, for the Redress thereof several Statutes were made, *viz.* 32 H. VIII. c. 30. by which it was enacted, 'That if the Jury have once passed upon the Issue, tho' afterwards there be found a *Jeopayle* in the Pleading, yet shall Judgment be given according to the Verdict of the Jury.' Other Statutes have also been made relating to the same thing, in the time of King James I. and Queen Elizabeth, and yet the Poast little mended.

S. JEROM, the Name of four several Orders of Religious, who are sometimes also called *Jeronymites*. The first, called the Order of St. *Jerom* of Spain, owe their Origin to the third Order of St. *Francis*, whereof the first *Jeronymites* were Members. Gregory the Eleventh confirmed this Order, under the Name of St. *Jerom*, whom they had chosen for their Patron and their Model, and gave them the Constitutions of the Convent of St. *Mary* of the *Sepulchre*, with the Rule of St. *Augustine*; and for Habit, a white Tunic, with a Scapulary, a little Capuche, and a Mantle, all of their natural Colour, without Dying, and of a mean Price. The *Jeronymites* are in possession of the Convent of St. *Lawrence*, in the *Escorial*, where the Kings of Spain are buried. In Spain is likewise an Order of Nuns of St. *Jerom*, founded by a Lady towards the close of the 15th Century. Sixtus put them under the Jurisdiction of the *Jeronymites*, and gave them the Constitutions of the Monastery of St. *Martha* of *Cardona*, which were afterwards changed by *Leo X.* for those of the Order of St. *Jerom*. The second Order of St. *Jerom* is that of Lombardy, called St. *Jerom* of the *Observance*, founded by *Loop d'Orléans* in 1424. in the Mountains of *Caualia*, in the Diocese of *Sevil*. The third Order of *Jeronymites* was founded by *Peter Gambacorti* about the Year 1577; but the Vows they made were only simple till 1568, when *Pius V.* appointed them to be solemn. They have Houses in *Tirol*, *Italy*, and *Bavaria*. The fourth Congregation of *Jeronymites*, are the *Hermites* of St. *Jerom* of *Fresat*, begun in 1560, when *Charles de Montegrane*, of the Family of the Count of that Name, retiring into Solitude, first established it at *Fezama*. It was approved by *Innocent VII.* under the Rule and Constitutions of St. *Jerom*. But *Gregorius*, in 1441 changed it for that of St. *Augustine*. As the Founder was of the third Order of St. *Francis*, they preserved that Habit; but in 1450, *Pius*, permitting such as pleased to change it, occasioned a Division among them. This Order was finally suppressed by *Clement XI.* in 1668.

JESILBASCH, Green-Head, is the Name which the *Persians* give to the *Turks*, because their Emirs wear a Green Turband.

JESSANT, a Term in Heraldry, used when, in a Coat of Arms, a Lion or other Beast is borne over some Ordinary; as over a Chief, a Bend, a Fesse, &c. that Lion or Beast is blazoned *Jessant*, or *Jacent*, that is, lying over all.

JESUATES, an Order of Religious, otherwise called *Apostolical Clerks*. They were founded by *John Columban*, and approved of by *Urban V.* in 1367. at *Fiterba*; where he himself gave, to such as were present, the Habit they were to wear. They followed the Rule of St. *Augustine*, and were ranked by *Pius V.* among the Orders of Mendicants. They were called *Jesuates*, because their first Founders had the Name of *Jesus* continually in their Mouths. For two Centuries the *Jesuates* were mere Seculars; but in 1506, *Paul V.* gave them leave to enter into Holy Orders. In most of their Houses they were employed in Pharmacy, others practised Distillation, and sold *Aqua Vitæ*, which occasioned their being called *Aqua Vitæ-mangers*. Being very rich in the State of *Venice*, that Republic solicited their Suppression, and obtained it of *Clement IX.* their Effects being employed towards supporting the Expences of the War in *Candia*.

JESUITS, an Order of Religious, founded by *Ignatius Loyala*, who are also called the *Company of Jesus*. This Order has rendered itself very considerable by its Missions into the *Indies*, and by its other Employments relating to the Study of the Sciences, and the Education of Youth. The Council of *Trent* calls them, *Clerks Regular* of the *Company of Jesus*. It was in the Year 1538, that *Ignatius*

having assembled ten of his Companions at *Rome*, chosen mostly out of the University of *Paris*, proposed to them to make a new Order. After this he presented the Plan of his Institution to *Paul III.* who appointed three Commissioners to examine it; upon whose Report, the Pontiff confirmed the Institution, under the Name of *The Company of Jesus*, by a Bull in 1540. By this Bull, their Number was restrained to Sixty, but that Restriction was taken away, two Years afterwards, by another Bull. The Order has since been confirmed by several succeeding Popes, who have added many new Rights and Privileges to it. The End principally proposed by this Order, is to gain Converts to the Romish Church, with which View they disperse themselves in every Country and Nation, and with amazing Industry and Address pursue the End of their Institution. No Difficulty so great that they cannot surmount, no Danger so imminent that they will not undergo, no Crimes so shocking that they will not perpetrate, provided it may be of any Service to their Cause. They have no particular Habit, but change and accommodate it to Times and Occasions. This Order consists of five different Classes; Fellows, spiritual Coadjutors, approved Scholars, Lay-Brothers, called also temporal Coadjutors, and Novices. The Fellows, which make the Body of the Company, make the three solemn Vows of Religion publicly, and to these add a special Vow of Obedience to the Head of the Church, as to what regards Missions among Idolaters, Heretics, &c. The spiritual Coadjutors also make public Vows of Chastity, Poverty, and Obedience, but omit the fourth relating to Missions. Approved Scholars are those, who, after two Years Noviciate, have been admitted, and have made three Vows of Religion; not solemn, indeed, but yet declared. These are in the way to become Fellows, or spiritual Coadjutors, according as the General thinks fit. These Degrees, especially that of Fellow, are never conferred till after two Years Noviciate, and seven Years Study, seven of Regency, a third Year of Noviciate, and thirty three Years of Age. The Vows of the Scholars are absolute on their side, but only conditional on the side of the Order; the General having it in his power to dispense with them.

The Order is divided into Assistances, the Assistances into Provinces, and the Provinces into Houses. It is governed by a General, who is perpetual and absolute. He resides at *Rome*, and is elected by a General Congregation of the Order. He has with him, five Persons, who are, as it were, his Ministers. They are called Assistants, and bear the Name of the Kingdom or Country to which they belong, and by whom they are appointed, *viz.* of *Italy*, *France*, *Spain*, *Germany*, and *Portugal*. To these belongs the Care of preparing the Matters of their respective Assistances, and of putting them in a Method to facilitate their Expedition. It is by these, that both Inferiors and Superiors go regularly before the General. They are chosen by the Congregation, and are not only the General's Counsellors to assist him in his Business, but also to observe his Conduct; and, if they find occasion, they may call a general Congregation without his Consent, who may depose him in form; or they have it in their power to depose him, themselves, after having, by Letter, obtained the Suffrages of their Province.

Each Province has four kinds of Houses, *viz.* professed Houses, which can have no Lands belonging to them; Colleges, where the Sciences are taught; Residences, where are a Number of Workmen employed in such Offices, as have any immediate relation to Preaching, Confession, Missions, &c. and Houses of Novices. Among the Colleges there are some called simply Colleges, and others called Seminaries. These last are set aside for the young *Jesuits* to go through their Courses of Philosophy and Theology in; the others are for Strangers. Each Province is governed by a Provincial, and each House by a Superior, who is called a Rector in the Colleges, and a Superior in the other Houses. *Ignatius* regulated the Discipline of these Houses, and especially of the Colleges, by what he had observed in the *Sorbonne*, while he studied at *Paris*. The Fellows of this Order renounce, by a solemn Vow, all Preference, and especially Prelacy; and cannot receive any, unless enjoined thereto by the Pope under pain of Sin. This the Pope sometimes does; inasmuch that they have had eight Cardinals of their Order.

JET D'EAU, a French Word signifying a Fountain, that casts up Water to any considerable Height in the Air. Mr. *Mariotte* saith, That a *Jet d' Eau* will never rise so high as its Reservoirary, but always falls short of it by a Space, which is in a subduplicate Ratio of that Height; and this he proves by several Experiments. He saith also, That if a greater, branches out in many smaller ones, or is distributed thro' several Jets, the Square of the Diameter of the main Pipe, must be proportioned to the Sum of all the

the Expences of its Branches ; and particularly, That if the Reservatory be 52 Foot high, and the Adjutage half an Inch in Diameter, the Pipe ought to be three Inches in Diameter. See *Fountain, Water, &c.*

**JETSON.** See *Flojan*.

**JEWEL-OFFICE.** An Office that takes care of fashioning and weighing the King's Plate, and delivering it out by such Warrants, as they receive from the Lord Chamberlain. When his Majesty makes any Present of Plate, &c. they have the Charge of providing it, with some other things less material. The principal Officer is the Master of the Jewel-Office, whose Salary is 450*l.* per ann. and besides, the Yeoman and Groom, at 106*l.* 15*s.* per ann. each, and a Clerk at 15*l.* 6*s.* 8*d.* which are in the King's Gift. Besides, there are in this Office, in the Gift of the Lord Chamberlain, the Poet-Laureat, at 100*l.* per ann. Salary ; the King's Historiographer, at 200*l.* per ann. the History Painter, and Principal Painter, at 200*l.* per ann. the Painter in Enamel, and the Surveyor and Keeper of the Pictures at 200*l.* per ann. The Goldsmith and Jeweller are employ'd by the Master, and are usually in his Gift.

**JEWS-EAR ;** a kind of Fungus, Mushroom, or spongy Substance, that grows about the Root of the Elder-Tree. It is chiefly used in Decoction, which is found Detergent and Vulnerary, and a good Gargle in fore Throats.

**JEZIDE,** or *Jezidean*, a Term used among the Mahometans to signify an Heretic. *Levenhook* tells us, that the Name is derived from an Emir call'd *Jezide*, who kill'd the two Sons of *Ab, Hufan* and *Hufjan*, two Nephews of *Mahomet* on their Mother's side, and persecuted the Posterity of the Prophet. The *Agreemans*, whose Emir or Prince he was, look'd on him as an Impious and Heretical Person ; and hence took occasion to call all whom they accounted Heretics, *Jezideans*. Some Authors mention the *Jezides* as a particular People, speaking a Language different both from the *Turks* and *Persians*, tho' somewhat akin to the last. They further tell us, that there are two kinds of *Jezides* ; the one Black, the other White. The White have no Slit in the Bosom of their Shirt ; but barely an Opening for the Head to pass thro' ; a thing that they observe with a great deal of strictness, in memory of a Circle of Gold and Light which fell from Heaven upon the Neck of their Grand Scheik or Chief of their Sect. The Black *Jezides* are *Fakirs*, or Religious. The *Turks* and *Jezides* bear a strong aversion to each other ; and the greatest Affront one can put on a *Turk*, is to call him *Jezide*. On the contrary the *Jezides* love the Christians, being persuaded that *Jezide*, their Chief, is Jesus Christ : Or rather because some of their Traditions mention that *Jezide* made an Alliance with the Christians against the Mussulmen. They drink Wine even to Excess when they can get it, and eat Swine's Flesh. They never undergo Circumcision, excepting when they are forced to it by the *Turks*. Their Ignorance is surprizing ; they have no Books. Indeed they pretend to believe in the Gospel, and in the Sacred Books of the Jews, but go without ever reading either one or other of 'em. They make Vows, and go in Pilgrimage ; but have no Mosques, Temples, nor Oratories, no Feasts nor Ceremonies ; all their Religious Worship consisting in singing Hymns to Jesus Christ, the Virgin, *Mefes*, and *Mahomet*. When they pray, they look towards the East, in imitation of the Christians ; whereas the Mussulmen turn towards the South. They believe the Devil may possibly, one day, come into favour again with God ; and that he is the Executor of God's Justice in the other World : for which reason they make it a Point of Conscience not to speak ill of him, lest he should revenge himself of 'em.

The Black *Jezides* are reputed Saints, and 'tis forbidden to weep at their Death ; instead whereof, they make Rejoicings : and yet for the generality they are no more than Shepherds. They are not allow'd to kill the Animals they eat ; that Office belongs to the White *Jezides*. The *Jezides* go in Companies like the *Arabs*. They often change their Habitations, and live in black Tents made of Goat-Hair, and encompass'd with large Rushes and Thorns interwoven. They dispose their Tents in a Circle, placing their Flocks in the middle. They buy their Wives ; the stated Price whereof is 200 Crowns, be they better or worse. They are allow'd Divorce, provided it be to become Hermites. 'Tis a Crime among them to shave the Beard, tho' ever so little. They have some Customs which intimate that they spring originally out of some Sect of Christians : for instance, in their Feasts one of 'em presents a Cup full of Wine to another, bidding him take the Cup of the Blood of Jesus Christ ; which last kisses the Hand of him who presents it, and drinks.

**IGNIS FATUUS.** See *Jack with a Lantern*.

**IGNITION,** in Chymistry, signifies the Application of Fire to Metals, till such time as they become red-hot, without melting ; which happens in Gold and Silver, but especially in Iron. Lead and Tin are too soft and fusible to bear Ignition.

**IGNORAMUS** is a Word used by the Grand Inquest, impannell'd in the Inquisition of Causes Criminal, and Publick, and written upon the Bill, when they dislike their Evidence, as defective or too weak to make good the Presentment. The Effect of which is, that all further Enquiry upon that Party for that Fault is thereby stop, and he deliver'd without farther Answer.

**IGNORANCE,** or *Want of Knowledge*, is chiefly owing to these three Causes ; *First*, Want of Ideas ; *Secondly*, Want of a discoverable Connection between the Ideas we have ; *Thirdly*, Want of tracing and examining our Ideas. *First*, There are some things we are ignorant of for want of Ideas. All the simple Ideas we have, are confined to the Observation of our Senses, and the Operations of our own Minds, that we are conscious of in ourselves. What other Ideas it is possible other Creatures may have, by the assistance of other Senses or Faculties, more or perfecter than we have, or different from ours, it is not for us to determine : but to say or think there are no such, because we conceive nothing of them, is no better an Argument, than if a blind Man should be positive in it, there was no such thing as Sight and Colours, because he had no manner of Idea of any such thing. What Faculties therefore other Species of Creatures have, to penetrate into the Nature and inmost Constitutions of Things, we know not : This we know, and certainly find, that we want other Views of them, besides those we have, to make Discoveries of them more perfect. The Intellectual and Sensitive World are in this perfectly alike, that the Parts which we see of either of them, hold no proportion with that we see not ; and whatsoever we can reach with our Eyes, or our Thoughts of either of them, is but a Point, almost nothing in comparison of the rest. Again, the Want of Ideas, which we yet seem capable of, is another great Obstacle in our way, and keeps us in Ignorance of things, we conceive capable of being known. Bulk, Figure and Motion we have Ideas of ; yet not knowing what is the particular Bulk, Motion, and Figure of the greatest part of the Bodies of the Universe, we are ignorant of the several Powers, Efficacies and Ways of Operation, whereby the Effects we daily see are produced. These are hid from us in some things, by being too remote, in others by being too minute. When we consider the vast Extent of the known and visible Parts of the World, and the Reasons we have to think, that what lies within our Ken, is but a small Part of the immense Universe ; we shall then discover an huge Abyss of Ignorance : What are the particular Fabricks of the great Masses of Matter, which make up the whole stupendous Frame of Corporal Beings, how far they are extended, and what is their Motion, and how continued, and what influence they have upon one another, are Contemplations, that at first glimpse our Thoughts lose themselves in. If we confine our Thoughts to this little Canton, this System of our Sun, and the grosser Masses of Matter, that visibly move about it ; what several sorts of Vegetables, Animals, and Intellectual Corporal Beings, infinitely different from those of our little Spot of Earth, may probably be in other Planets, to the knowledge of which, even of their outward Figures and Parts, we can no way attain, whilst we are confin'd to this Earth, there being no natural Means, either by Sensation or Reflexion, to convey their certain Ideas into our Minds ? There are other Bodies in the Universe no less conceal'd from us by their Minuteness. These insensible Corpufcles being the active Parts of Matter, and great Instruments of Nature, on which depend all their secondary Qualities and Operations, our Want of precise distinct Ideas of their primary Qualities keeps us in incurable Ignorance of what we desire to know about them.

Did we know the mechanical Affections of Rhubarb or Opium, we might as easily account for their Operations of purging and causing Sleep, as a Watchmaker can for the Motions of his Watch. The dissolving of Silver in *Aqua Fortis*, or Gold in *Aqua Regia*, and not vice versa, would be then perhaps no more difficult to know, than it is to a Smith, to understand, why the turning of one Key will open a Lock, and not the turning of another. But whilst we are destitute of Senses acute enough to discover the minute Particles of Bodies, and to give us Ideas of their mechanical Affections, we must be content to be ignorant of their Properties and Operations ; nor can we be assured about them any farther, than some few Tryals we make, are able to reach : but whether they will succeed again another time, we cannot be certain. This hinders our certain Knowledge of universal Truths concerning natural Bodies ; and our Reason carries us herein

very little beyond particular Matter of Fact; and therefore it is Matter of Doubt, that how far soever human Industry may advance useful and experimental Philosophy in Physical Things, yet scientific will still be out of our reach; because we want perfect and adequate Ideas of those very Bodies which are nearest to us, and most at our Command. This, at first sight, shews us how disproportionate our Knowledge is to the whole Extent, even of material Beings; to which, if we add the Consideration of that infinite Number of Spirits that may be, and probably are, which are yet more remote from our Knowledge, and whereof we have no cognizance; we shall find this Cause of Ignorance conceals from us, in an impenetrable Obscurity, almost the whole Intellectual World; a greater, certainly a more beautiful World, than the material: For abating some very few Ideas of Spirit, which we get from our own Mind by Reflection, and from thence the best we can collect of the Father of all Spirits, the Author of them, and us, and all things, we have no certain Information, so much as of the Existence of other Spirits, but by Revelation; much less have we distinct Ideas of their different Natures, States, Powers, and several Constitutions, wherein they agree, or differ one from another, and from us: and therefore in what concerns their different Species and Properties, we are under an absolute Ignorance.

The second Cause of Ignorance, is the want of discoverable Connection between those Ideas we have; where we want that, we are utterly incapable of universal and certain Knowledge, and are, as in the former Case, left only to Observation and Experiment. Thus the mechanical Affections of Bodies, having no Affinity at all with the Ideas they produce in us, we can have no distinct Knowledge of such Operations beyond our Experience, and can reason no otherwise about them, than as the Effects or Appointments of an infinitely wise Agent, which perfectly surpasses our Comprehensions. The Operation of our Minds upon our Bodies is as unconceivable: How any Thought should produce a Motion in Body, is as remote from the Nature of our Ideas, as how any Body should produce any Thought in the Mind. That it is so, if Experience did not convince us, the Consideration of the Things themselves would never be able, in the least, to discover to us. In some of our Ideas there are certain Relations, Habitudes, and Connections, so visibly included in the nature of the Ideas themselves, that we cannot conceive them separable from them by any Power whatsoever; in these only we are capable of certain and universal Knowledge. Thus the Idea of a right-lined Triangle necessarily carries with it an Equality of its Angles to two right ones; but the Coherence and Continuity of the Parts of Matter, the Production of Sensation in us, of Colours and Sounds, &c. by Impulse and Motion, being such wherein we can discover no natural Connection with any Ideas we have, we cannot but ascribe them to the arbitrary Will and Good-Pleasure of the wise Architect. The Things that we observe constantly to proceed regularly, we may conclude do act by a Law set them; but yet by a Law we know not, whereby the Causes work steadily, and Effects constantly flow from them, yet their Connections and Dependencies being not discoverable in our Ideas, we can have but an experimental Knowledge of them. Several Effects come every day within the notice of our Senses, of which we have so far sensitive Knowledge; but the Causes, Manner, and Certainty of their Production, we must, for the foregoing Reasons, be content to be ignorant of. In these we can go no further than particular Experience informs us of Matter of Fact, and, by Analogy, guess what Effects the like Bodies are upon other Trials like to produce. But as to perfect Science of natural Bodies (not to mention spiritual Beings) we are so far from being capable of any such thing, that it may be reckoned lost Labour to seek after it.

The third Cause of Ignorance, is our want of tracing those Ideas we have, or may have; and finding out those intermediate Ideas, which may shew us what Habitude of Agreement or Disagreement they may have one with another: and thus many are ignorant of Mathematical Truths for want of Application, in enquiring, examining, and by due ways comparing those Ideas. See *Knowledge*.

ILIAC, a Term in Physick, applied to a violent and dangerous Disease, called the *Ilac Passion*, or *Mjctere*. It consists in an Expulsion of feculent Matter by the Mouth, accompanied with a Swelling of the lower Ventricle, an intense Pain, and a total Constipation. The immediate Cause of the *Ilac Passion* seems owing to an Irregularity in the Peristaltic Motion of the Guts, viz. when it begins with the lower, and is continued to the higher. Other Causes are the Hardness of the Excrements, Inflammation of the Intestines, and their Engage-

ment in the Anus or Scrotum, as it frequently happens in Hernia's, their twisting, and their entering within one another. Persons afflicted with the *Ilac Passion*, have sometimes been found to return Suppositories and Glitters by the Mouth. Some have been cured of it by swallowing a great Quantity of Quick-silver, or a Musket-Ball: When the Guts are twisted, or enter one within another, the Weight of these Bodies sometimes setting them to rights again. The *Ilac Passion* takes its Name from the lateine *Ilion*, in regard of its being usually affected in that Distemper, or perhaps from the Greek Verb *ilais*, to turn, twist; whence also the Latins call it *Valentus*.

ILIAC VESSELS. See *Artery* and *Vein*.

ILIACUS EXTERNUS, or *Pyrriferimus*, is a Muscle of the Thigh, which arises from the internal concave Part of the *Os Sacrum*, towards the bottom, and descending obliquely along the great Sinus of the *Os Ilium*, from a round fleshy Origin, joins the *Gluteus Medius*, and is inserted by a round Tendon at the Bottom of the Great Trochanter.

ILIACUS INTERNUS, the Name of the Muscle of the Thigh, which arises fleshy from the internal concave Part of the *Os Ilium*; and in its Descent over the inferior Part of it, joins with the *Psoas magnus*, and is inserted with it, under the Termination of the *Peritonaeum*. This, with the *Psoas magnus*, moves the Thigh forward, in walking.

ILIAD, the Name of the first of *Homer's* Poems. The Poet's Design in the *Iliad*, was to shew the *Greeks*, who were divided into several little States, how much it was their Interest to preserve an Harmony and good Understanding among them. In order to which, he sets before their Eyes, the Calamities that befel their Ancestors from the Wrath of *Achilles*, and his Misunderstanding with *Agamemnon*, and the Advantages that accrued to them from their Union. The *Iliad* is divided into twenty four Books, which are marked with the Letters of the Alphabet. *Pliny* gives us an Account of an *Iliad* written on so very slender a Paper, that the whole might be contained in a Nut-shell. For the Conduct of the *Iliad*, see *F. Poffe*, *Madam Dacier*, and *M. de la Motte*. The Critics maintain the *Iliad* to be the first, and yet the best Poem that ever appeared in the World. *Aristotle's* Poetics are almost taken wholly from it; the Philosopher had nothing to do but to form Precepts from the Poet's Practice. Some Authors tell us, that *Homer* invented not only Poetry, but all other Arts and Sciences; and that there are the visible Marks of a perfect Knowledge in every one of them, to be seen in the *Iliad*. The ingenious *Mr. Barner* of *Cambridge* had prepared a Work for the Press, to prove *Salamon* to have been the Author of the *Iliad*. The word is derived from the Greek *ilais*, of *ilais*, *Ilium*, *Troy*, a famous City in *Asia*, which the *Greeks* besieged for the space of ten Years, and at last destroyed, on account of the Rape of *Helena*, which makes the Subject of the Work.

ILIUM. See *Intestines*.

ILIUM OS. See *Ossa Innominata*. These are both derived from *os*, *circumvolv*, to roll about; because the Gut, which is principally called by this Name, is long, and lies in Folds towards the bottom of the Abdomen, and therefore gives many of the adjacent Parts these Appellations.

ILLEVIABLE in Law, signifies something that cannot be levied, and therefore the word *Nihil* is set on a Debt or Due that is illeivable.

ILLUMINATION, the Action of a luminous Body, or Body that emits Light, or the Passion of an opaque Body that receives it.

ILLUMINED, a Church-Term, antiently applied to such Persons as had received Baptism. This Name was occasioned by a Ceremony in Baptism, which consisted in putting a lighted Taper in the Hand of the Person baptized, as a Symbol of the Faith and Grace he had received in the Sacrament.

ILLUMINED, is also the Name of a Sect of Heretics, who sprang up in *Spain* about the Year 1375, and called by the *Spaniards*, *Alumbrados*. Their Leaders were *Villalpando*, a Priest, originally of the *Isle of Tenerife*, and a Carmelite called *Cabrero de Jesus*. These had a great Number of Disciples and Followers, most of whom were apprehended, and clapp'd up in the Inquisition at *Coruna*; some whereof were put to death, and the rest abjured their Errors. Their principal Doctrines were, That by means of a sublime manner of Prayer, which they had attained to, they entered into so perfect a State, that they had no occasion for Ordinances, Sacraments, nor good Works, and that they could give way, even to the vilest Actions without Sin. The Sect of *Illuminated* was revived in *France* in the Year 1634, and were soon after joined by the *Guerriers*, or Disciples of *Peter Guerin*, who together, made but one Body, called also *Illuminated*; but they were so hotly pursued by *Louis XIII.*

that they were soon destroyed. The Brothers of the Holy-Cross are also called *Illuminés*.

**ILLUSTRIOUS**, heretofore in the Roman Empire was a Title of Honour peculiar to People of a certain Rank. It was first given to the most distinguished among the Knights, who had a right to bear the *Latus Clavus*, afterwards they were entitled *Illustres*, who held the first Rank among those called *Honorati*; that is, to the *Præfetti Prætorii*, the *Præfetti Urbis*, *Treasurers*, *Comites*, &c. There were, however, different Degrees among the *Illustres*: As in Spain they have Grandees of the first and second Class, so in Rome they had their *Illustres*, whom they called *Great Majors*, and others *Less*, called *Minors*. For instance, the *Præfatus Prætorius* was a Degree below the Master of the Offices, tho' they were both *Illustres*. The Novel of *Valentinian* distinguishes as far as five kinds of *Illustres*, among whom the *Illustres Administratores* bear the first Rank.

**IMAGE**, a natural, lively Representation of an Object, opposed to a smooth well-polished Surface. The Latin word *Imago*, comes originally from the Greek *ειμαίνω*, *imitari*. *Image* also signifies any artificial Representation performed by Man, as in Painting, Sculpture, and the like: In which sense, the word is now generally used in speaking of Things holy, or Things imagined to be so.

The Use, and Adoration of Images, are Things that have been a long time controverted in the World. The *Lutherans* condemn the *Catholics*, for breaking the Images in the Churches of the Catholics, looking on it as a kind of Sacrilege; and yet they condemn the *Romanists*, (who are professed Image-worshippers) as Idolaters: nor can these last keep pace with the *Greeks*, who go far beyond them in this Point, which has occasioned abundance of Disputes among them. The *Jews* absolutely condemn all Images, and don't so much as suffer any Statues or Figures in their Houses, much less in their Synagogues, or Places of Worship. The *Moslems* have a perfect Aversion to Images, which was what led them to destroy most of the beautiful Monuments of Antiquity, both Sacred and Profane, at *Constantinople*.

The noble *Romans* preserved the Images of their Ancestors with a great deal of Care and Concern, and had them carried in Procession at their Funerals and Triumphs. They were commonly made of Wax or Wood, tho' sometimes of Marble or Brass: They placed them in the Vestibles of their Houses, and they were to stay there, even if the Houses happened to be sold: it being accounted impious to displace them. *Appianus Claudius* was the first who brought them into the Temples, in the Year of Rome 559, and he added Inscriptions to them, shewing the Origin of the Persons represented, and their brave and virtuous Achievements. It was not, however, allowed for all, who had the Images of their Ancestors in their Houses, to have them carried at their Funerals; this was a thing only granted to such as had honourably discharged themselves of their Offices, for those who failed in this respect forfeited that Privilege, and in case they had been guilty of any great Crime, their Images were broken in pieces.

**IMAGE**, in *Philosophy*, signifies the Trace or Mark which outward Objects impress on the Mind, by means of the Organs of Sense. *Image*, in Opticks, signifies an Object projected on the Base of a Convex-Mirror. As the Distance of the Object from the Mirror, is to the Distance from the Image to the Glass; so is the Diameter of the Object, to the Diameter of the Image. This is a Rule which *Mr. Wren* gives us for finding the Diameter of an Image on the Base of a Convex-Glass. See *Optics*. *Image* also signifies the Description of any thing in a Discourse.

**IMAGES**, in *Discourse*, are defined, by *Longinus*, to be, in general, any Thoughts proper to produce Expressions, and which present a kind of Picture to the Mind. But, in the more limited Sense, he says, Images are such Discourses as come from us, when by a kind of Enthusiasm, or an extraordinary Emotion of the Soul, we seem to see the Things whereof we speak, and present them before the Eyes of those who hear.

**IMAGES**, in *Rhetoric*, have a very different Use from what they have among the Poets; the End principally proposed in Poetry is Astonishment and Surprise, whereas the thing chiefly aimed at in Prose, is to paint things naturally, and to shew them clearly. They have this, however, in common, that they both tend to move, each in its kind. These Images, or Pictures, are of vast use, to give Weight, Magnificence, and Strength to a Discourse. They warm and animate a Discourse, and when managed with Art, according to *Longinus*, seem, as it were, to tame and subdue the Hearer, and put him in the power of the Speaker.

**IMAGINATION**, a Power or Faculty of the Soul, by which it conceives, and forms Ideas of Things, by means

of certain Traces and Impressions that had been before made in the Fibres of the Brain, by Sensation. The Organs of our Senses are composed of little Threads, or Fibres, which, at one end, terminate in the outward Parts of the Body and Skin, and at the other in the middle of the Brain. These little Fibres may be moved two ways; either beginning at that end which terminates in the Brain, or that which terminates without. Now the Agitation of these Fibres cannot be communicated to the Brain, but the Soul will perceive something. If then the Agitation begins where Objects make their first Impression, &c. on the external Surface of the Fibres of our Nerves, and is communicated thence to the Brain, the Soul, in that Case, judges that what she perceives is without, that is, she perceives an Object as present: but if only the interior Fibres be moved by the Course of the animal Spirits, or in some other manner, the Soul then imagines, and judges, that what she perceives is not without, but within the Brain; that is, she perceives an Object as absent: And herein lies the Difference between Sensation and Imagination.

But in order to give a more precise and distinct Idea of the Imagination, it must be observed, that as often as there happens to be any Alteration in that part of the Brain where the Nerves terminate, there also happens an Alteration in the Brain; that whenever there is any Motion in that part, to change the Order of its Fibres, there also happens a new Perception in the Soul, and she finds something new, either by way of Sensation or Imagination; neither of which can be without an Alteration of the Fibres in that part of the Brain. So that the Faculty of Imagining, or Imagination, only consists in the Power which the Soul has of forming Images of Objects, by producing a Change in the Fibres of that part of the Brain, which may be called the principal Part, because it corresponds to all the Parts of our Body, and is the Place where the Soul (if it may be so said) immediately resides. It matters not which that Part is, nor whether the Opinion of *Willis* be true, who places the common Sense in the two Bodies, called *Corpus Striatum*, and the Imagination in the *Corpus Callosum*; or that of *Fernelius*, who places Sensation in the *Pia Mater*, that encompasses the Substance of the Brain; or that of *Descartes*, who places it in the Pineal Gland; it suffices that there is some such Part.

Since then the Imagination only consists in a Power which the Soul has of forming Images of Objects, by impressing them on the Fibres of the Brain, it follows, that the larger and more distinct the *Vestigia*, or Tracks of the animal Spirits, which are the Lines or Strokes, as it were, of those Images, are, the more strongly and distinctly the Soul imagines those Objects. Now as the Breadth, Depth, and Cleanness of the Strokes of a Graving depend on the Force wherewith the Graver acts; and the Obedience which the Copper yields; so the Depth and Cleanness of the Tracks of the Imagination depend on the Force of the animal Spirits, and the Constitution of the Fibres of the Brain; and it is that Variety which is found in those two things, to which we owe almost all that vast Difference which we observe in Peoples Minds. Thus, on the one side are Abundance and Scarcity, Briskness and Slowness, Largeness and Smallness of the animal Spirits; and on the other hand Delicacy or Grossness, Humidity or Dryness, Stiffness or Flexibility of the Fibres of the Brain; and, lastly, a particular Relation which the animal Spirits may have with those Fibres. From the various Combinations of which Things, will result a sufficiently great Variety, to account for all the different Characters which appear in the Minds of Men: and from the same Principle flows that Difference which is observed in the same Person's Mind, at different Times, and under different Circumstances, as in Childhood, Manhood, and Old Age, in Sickness, Health, &c. See *Animal Spirits*. It may here be observed, that the Fibres of the Brain are much more agitated by the Impression of Objects, than by the Course of the animal Spirits; and for this reason the Soul is more affected with Objects, which it perceives by Sensation, and which it looks on as present, and capable of giving it Pleasure or Pain, than by those perceived by Imagination, which it judges to be distant. And yet it sometimes happens, that in Persons, whose animal Spirits are extremely agitated by Fasting, Waking, Drinking, a Fever, or some violent Passion, these Spirits move the inward Fibres of the Brain as forcibly as outward Objects do; so that these Persons perceive things by Sensation, which they should only perceive by Imagination; for Imagination and Sensation only differ from each other, as the greater from the less. See *Father Malebranch, Recher. de la Vérité, liv. 2.*

**IMAM** or **IMAN**: A Minister in the *Moslem* Church answering to a Vicar among us. The Word properly signifies Prelate, or Chief; but the *Moslems* frequently apply

apply it to a Person who has the Care and Intendency of a Mosque, who is always there the first, and reads Prayers to the People, which they repeat after him.

The word *Imam* is also applied by way of Excellence to the four Chiefs, or Founders of the four principal Sects in the *Mahometan* Religion. Thus *All* is the *Imam* of the *Perfians*, or of the Sect of *Sabians*; *Abubeker* the *Imam* of the *Sunnies*, which is the Sect follow'd by the *Turks*; *Sapliu* or *Safy*, the *Imam* of another Sect, &c. The *Mahometans* don't agree among themselves about the *Imams* or Dignity of the *Imam*. Some think it of divine Right, and attach'd to a single Family, as the Pontificate of *Aaron*. Others hold, that it is indeed of divine Right, but deny it to be so attach'd to any single Family, as that it may not be transfer'd to another. They add, that the *Imam* is to be clear of all gross Sins, and that otherwise he may be deposed, and his Dignity conferr'd on another. However this be, 'tis certain that after an *Imam* has once been own'd as such, by the Muffulmen, he who denies that his Authority comes immediately from God, is accounted impious; he who does not obey him, a Rebel; and he who pretends to contradict what he says, a Fool, among the orthodox of that Religion.

**IMBARGO**, a Stop or Stay put upon Ships usually by public Authority.

**IMBECILITY**, is a State of Languor, or Decay, wherein the Body is not able to perform its usual Exercises or Functions.

**IMBEZZLE**, to waste, scatter and consume; as where a Person intrusted with Goods, wastes and diminishes them, he is said to *imbezzele* them.

**IMBIBE**, is us'd commonly in the same Sense as *absorb*; as where a dry porous Body takes up another that is moist.

**IMBRICATED**, is us'd by some Botanists to express the Figure of the Leaves of some Plants, which are hollow like an *Imbrax*, or Gutter Tile.

**IMITATION**, in Music, is where one Party imitates the fingering of another either throughout the whole Piece, which is one of the Kinds of Canon, or only during some Measures, which is a simple *Imitation*. Sometimes the Motion or the Figure of the Notes, alone, is imitated; and that, sometimes even by a contrary Motion, which makes what they call a *Retrograde Imitation*. The *Imitation* differs from the *Fugue*, in regard, in the former the Repetition must be a 2d, a 3d, a 6th, 7th, or 9th, either above or below the first Voice: Whereas were the Repetition to an Union a 4th, 5th, or 8th, it would be a *Fugue*.

**IMMACULATE**, without Stain or Sin: A Term much us'd among the *Romanists*, when speaking of the Conception of the Blessed Virgin, they call it *immaculate*: intimating that she was free from Original Sin. When the Cap is given to a Doctor of the *Sabbane*, he is obliged to swear that he will defend the *immaculate* Conception. This was decreed by an Act of the *Synode* in the 14th Century; in imitation of which, 80 other Universities made the same Order. The Military Orders in *Spain* are all solemnly obliged to defend this Prerogative of the Virgin. See *Conception*.

**Conception of the Immaculate Conception**. In most Nunneries there is a Society of secular Maids, whose End is to honour the *immaculate* Conception: Of which they make a public Prostration every Year, and a private one every Day.

**IMMANENT**: A Term in Logic. The Schoolmen distinguish two kinds of Actions; the one transitory, which pass from the Agent to the Patient; the other *immanent*, which continue in the Agent.

**IMMATERIAL**, something devoid of Matter; or that is pure Spirit. Thus God, Angels, the Human Soul, are *immaterial* Beings. *Plato* argues the *Immateriality* of the Soul from the following six Topics. 1. From its Simplicity. 2. From its Independency on the Body, which is two-fold; in its *Essence* and its *Operation*, in existing, and in acting or operating separately. 3. From its Rule and Authority over the Body. 4. From its Likeness and Similitude to God, which discovers itself in the Pleasure it enjoys in spiritual Things, in its aiming at spiritual Objects, &c. 5. From its spiritual Manner of perceiving material Objects. Lastly, From its Indivisibility, Capacity, Activity, Immortality, &c.

**IMMEDIATE**, that which precedes or follows some other thing without any Interposition.

**IMMEDIATE**, also signifies something that acts without Means, without Medium, as *immediate* Grace, an *immediate* Cause, &c. There have been great Disputes among Divines about *immediate* Grace. The question in debate was, Whether Grace acted on the Heart and Mind by an *immediate* Efficacy, independent of all external Circumstances; or, Whether a certain Assemblage and Improvement of Circumstances join'd to the Ministry of the Word, might produce a Conversion of Soul.

**IMMEMORIAL**, an Epithet given to the Time or Duration of any thing, whose Beginning we know nothing of: in a legal Sense, a thing is said to be of Time *immemorial*, or Time out of mind, that was before the Reign of our King *Edward II*.

**IMMENSE**, is that whose Amplitude or Extensiveness no Finite Measure whatsoever, or how oft soever repeated, can equal.

**IMMERSION**, an Action by which any thing is plunged into Water or other Fluid. In the first Ages of Christianity, Baptism was performed by *immersion*; by three *immersions*. The Custom of *immersion* is still preserved in *Portugal*, and among the Anabaptists in other Parts. *Immersion*, in Pharmacy, is a Preparation of some Medicine, by letting it steep for some time in Water, in order to take some ill Faculty or Taste from it: as is done in *Rhubarb*, to moderate its Force; in *Lime*, to take away its Salt; and in *Olive*, which are preserved in Brine.

**IMMERSION**, in Astroonomy, is when a Star or Planet is so near the Sun with regard to our Observations, that we cannot see it; being as it were envelop'd and hid in the Rays of that Luminary. *Immersion* is also the Beginning of an Eclipse of the Moon; that is, the moment when the Moon begins to be darkned, and to enter into the Shadow of the Earth. And the same Term is us'd with regard to an Eclipse of the Sun, when the Disk of the Moon begins to cover it. Emergence is the Term opposite to *immersion*, and signifies the moment wherein the Moon begins to come out of the Shadow of the Earth; or the Sun begins to show the Parts of his Disk which were hid before. *Immersion* is frequently applied to the Satellites of *Jupiter*, and especially to the first Satellite; the Observation whereof is of so much Use for discovering the Longitude. The *Immersion* of that Satellite is the moment in which it appears to enter within the Disk of *Jupiter*; and its Emergence the moment wherein it appears to come out. The *Immersion* are observed from the Time of the Conjunction of *Jupiter* with the Sun, to the Time of his Opposition: And the Emergences from the Time of his Opposition to his Conjunction. The peculiar Advantage of these Observations, is, that during eleven Months of the Year, they may be made, at least, every other Day. The Perfection of this Theory, and the Practice thereon, we owe to *M. Cassini*.

**IMMORTAL**, that which will last to all Eternity, that has in itself no Principle of Alteration or Corruption. Thus God and the Human Soul are *immortal*. *Plato* defines *Immortality*, *idea ayvov & ayvov* *ayvov*, animated Essence and eternal Motion; and proves the *Immortality* of the Soul from two kinds of Arguments; the one Artificial, the other Inartificial. Inartificial Arguments are Testimonies and Authorities, whereof he cites several, and adds in general, that all the great Men and Poets, who had any thing divine in 'em, asserted the *Immortality* of the Soul. His Artificial or proper Arguments are either speculative or practical: Of the first kind are those drawn, 1. From the simple, uniform, spiritual and divine Nature of the Soul. 2. From its infinite Capacity. 3. From its desiring and longing after *Immortality*, and its inward Horror of falling into Nothing; proving it absurd that the Soul should die, when Life is its proper and adequate Object. 4. From its rational Activity; proving that whatever has in itself a Principle of rational and spontaneous Motion, by which it tends towards some supreme Good, is *immortal*. 5. From the various Ideas which it has of spiritual things; particularly from the Idea it has of *Immortality*. 6. From its *Immateriality*. His practical or moral Arguments for the *Immortality* of the Soul, are drawn, 1. From the Justice of God, which can never suffer the Wicked to escape unpunished, nor the Good unrewarded after Death. 2. From that Dependence which Religion has on this Opinion, in regard, without this Persuasi on there would be no Religion in the World. 3. From the Opinion which Men have, that Justice and every kind of Virtue are to be cultivated, that they may at last live with God. 4. From the Stings of Conscience, and anxious Sollicitude we are under about a future State.

**IMMUNITY**, a Privilege or Exemption from some Office, Duty, or Imposition: It is particularly understood of the Liberties granted to Cities and Communities. The Princes heretofore granted all kind of *Immunities* to Ecclesiastics, exempting them from all impositions; but the Ecclesiastics of those Days were not so rich as those of ours: They gave all they had to the Poor. There is still a Privilege of *Immunity* in some Places, and especially in *Italy*, belonging to Ecclesiastical Things and Persons; these are exempted from certain Dues, and are shelter'd from the Pursuits of Justice. Tho, there are some Crimes for which they cannot plead the Privileges of *Immunity*, as premeditated Murder &c.

**IMMUTABILITY**, the Condition of something that cannot change. *Immutability* is one of the Divine Attributes.

butes. There is a two-fold *Immortality* in God; a Physical and a Moral one. The Physical *Immortality* consists in this, that the Substance of God does not, nor cannot receive any Change or Alteration. His Moral *Immortality* consists in his not being liable to any Change in his Thoughts, or Designs; but that what he wills, he has will'd from all Eternity.

**IMPALED**, when the Coats of Arms of a Man and his Wife (who is not an Heiress) are borne in the same Escutcheon, they must be marshalled in Pale, i. e. the Husband's on the Right-side, and the Wife's on the Left; and this the Herald's call *Baron and Femme*, two Coats impaled. If a Man hath had two Wives, he may impale his Coat in the middle between theirs; and if he hath had more than two, they are to be marshalled on each side of his, in their proper Order.

**IMPALPABLE**, that, whose Parts are so extremely minute, that they cannot be distinguish'd by the Senses, particularly by that of Feeling.

**IMPANATION**, a Term us'd among Divines to signify the Opinion of the *Lutherans* with regard to the Eucharist; who believe, that the Species of Bread and Wine do remain, together with the Body of our Saviour, after Consecration.

**IMPARLANCE**, or *Emparance*, is a Motion made in Court, on the account of the Demandant by the Tenant, or Declaration of the Plaintiff by the Defendant, whereby he craveth Respite, or any other Day to put in his Answer.

*Imparance* is either general or special. Special is with this Clause, *Salvis omnibus Advantagijs, tam ad Jurisdictionem Curie, quam brevis & Narrationem*. General is made at large, without inserting that, or any like Charge.

**IMPASSIBLE**, that which is exempt from Suffering, which cannot undergo Pain or Alteration. The *Stoics* place the Soul of their Wife Man in an *impassible* imperturbable State.

**IMPASTATION**, a Work of Masonry, made of Stucco, or Stone beaten and wrought up in manner of a Paste. Authors are of opinion that the Obelisks, and the huge Antique Columns still remaining, were made some by *Impastation*, and others by Fusion.

**IMPEACHMENT of Waste**, comes from the French *Empeschement*, Impediment, and signifies a Restraint from committing of Waste upon Lands and Tenements. And therefore he that hath a Lease without *Impachment of Waste*, hath by that, a Property or Interest given him in the Houses and Trees, and may make waste in them without being called to account for it.

**IMPECCABILITY**, the State of a Person who cannot sin. The Word also signifies the Grace, Privilege, or Principle which puts him out of a condition of sinning. The Schoolmen distinguish several kinds and degrees of *Impeccability*: That of God belongs to him by Nature: That of Jesus Christ consider'd as Man, belongs to him by the Hypothetical Union: That of the Blessed is a Consequence of their Condition: That of Men is the Effect of a Confirmation in Grace, and is rather called *Impeccance* than *Impeccability*; accordingly the Divines distinguish between these two, this being found necessary in the Disputes against the *Pelagians*, in order to explain certain Terms in the *Greek and Latin Fathers*, which without this Distinction are easily confounded.

**IMPENETRABILITY**, Quality of that which cannot be pierced or penetrated; a Property of Body which so fills up a certain Space, as that there is no room in it, for any other Body. Dr. Harris defines *Impenetrability*, the Distinction of one extended Substance from another, by means whereof the Extension of one thing is different from that of another: so that two extended things cannot be in the same place, but must necessarily exclude each other. See *Solidity*.

**IMPENITENCE**, a Hardness of Heart, which makes a Person persevere in Vice, and prevents his Repentance. Final *Impenitence* is the Sin against the Holy Ghost, which is neither pardoned in this Life nor that to come.

**IMPERATIVE**, in Grammar, is one of the Modes or Manners of Conjugating a Verb, serving to express a Commandment; as *Go, Come, &c.* In the Hebrew and other Oriental Languages, the Future Tense has frequently an Imperative Signification.

**IMPERFECT TENSE**, in Grammar, signifies an indefinite Time between the present and the past: as, *I taught, I heard.*

**IMPERFECT FLOWERS**, are those which have some Defects, and either want the *Petals*, the little Leaves which stand round the *Flowers*, or the like.

**IMPERFECT NUMBERS**, in Arithmetick, are those whose aliquot Parts taken together, don't make the just Number itself, but either come short of it; in which case they are called *deficient Numbers*; or exceed it, and then they are called *abundant Numbers*.

**IMPERFECT PLANTS**, among the Botanists are such as either really want Flower, and Seed, or are supposed to want them; since no Flower or Seed hath yet been discover'd to belong to the greatest part of them. These Mr. Ray distinguishes according to the Place of their Growth, into,

(1.) *Aquatics*, or such as grow in the Water: and that either, 1. In the Sea, and then they are called *Marine Plants*; and those are either of an hard and stony Consistence, as the Corals, Corallines; or Porous, that is, of a more soft and herbaceous one. Of these some are like Herbs, and are of two kinds; the greater, which are Cauliferous, as the Fucus; the lesser, as the Alga: the others are more of the Mucus, or Fungus Appearance, as the Spongia. 2. *Fresh Water Plants*, and those have either no Leaves, but are Capillaceous, as the Converse; or their Leaves divided into three Parts, as the *Lens Palustris, Lenticula*.

(2.) Such *imperfect Plants* as grow in dry Ground, he divides into, First, Such as have Substance, either woody or fleshy; and these have scarce any thing common to the *perfect Plants*, neither the green herbaceous Colour, nor the Texture of Herbs, nor Flower, Seed, nor Leaf, properly speaking, as all the Fungi, which are, 1. Such as grow on Trees, and therefore called *Arboraceous*, as the *Fungus Laricis*, called Agarick, and the *Fungus Sambucus*, which we call Jews-Ear. 2. *Terrestrial*, and these are either Cauliferous, with Heads either lamellated, or porous underneath, or without Stalks, as the *Pezize of Pliny*, and *Fungus Pulverulentus, Crepitus Lupi*, or common Puff-Balls. 3. *Subterraneous*, as the *Tuber Terra*, or Truffles. Secondly, Such as have a more soft and dry Consistence, and more like that of Herbs; of which some are both cauliferous and branched, as the *Mosses*, or *Mosses*: Others are without Stalks, adhering like a Crust to the Surface of the Earth, Stones, Trees, or Wood; as the *Lichen Terrestris* and *Arboreus*.

**IMPERIAL**, something belonging to the Empire; thus we say, his *Imperial Majesty*, the *Imperial Crown*, &c. *Imperial Cities* in Germany are those which own no other Head but the Emperor. There are a kind of little Commonwealths, the chief Magistrate whereof does Homage to the Emperor, and pays him the *Ransom Month*; but in other respects, and in Administration of Justice, he is Sovereign. *Imperial Cities* have a Right of Coining Money, and of Keeping Forces and fortified Places. Their Deputies assist at the *Imperial Diets*, where they are divided into two Branches, that of the *Rhine*, and that of *Swabia*. There were formerly 22 in the former, and 37 in the latter; but there are now only 48 in all.

*Imperial Chamber* is a Sovereign Court, establish'd for the Affairs of the immediate States of the Empire.

*Imperial Diet*, is an Assembly or Convention of all the States of the Empire. It is usually held at *Ratisbon*; where the Emperor, either in Person, or by his Commissioner, the Electors, Secular and Ecclesiastical Princes, Prelates, Princecesses, Counts, and Deputies of *Imperial Cities*, assist. The *Diet* is divided into three Colleges, which are those of the Electors, the Princes, and the Cities. The Electors alone form the first; the second consists of Princes, Prelates, Princecesses, and Counts; and the third of the Deputies of *Imperial Cities*. Each College has its Director, who presides in the Consultations. The Elector of *Mentz* in the College of Electors; the Archbishop of *Saltzbourg* in that of the Princes; and the Deputy of the City of *Cologne* in that of the Cities. In the *Diet*, each Principality has a Voice; but all the Prelates (so they call the Abbots and Provofts of the Empire) have but two Voices, and all the Counts but four. Tho' the three Colleges agree, yet the Emperor has a negative Voice: when he so consents, the Resolutions pass into a Law, which oblige all the States of the Empire, both mediate, and immediate.

**IMPERSONAL**, Verb in Grammar, is such an one, as is only us'd in the third Person Singular; as *Operetur, Lieat, &c.*

**IMPERVIOUS**, expresses such a Closeness of Pores, or particular Configuration of Parts, as will not admit another thro'.

**IMPETIGO**, is a Cutaneous Foulness, divided into many kinds by the Antients; but a better Knowledge in Secretion, and the Office of the Cutaneous Glands, has taught us the Care of all such Disorders, without having any necessary Recourse to such Distinctions. The Itch and Leprosy take in the several kinds, from the most easy to the most obstinate degree of Infection, according to which the Means of Cure are proportioned.

**IMPETRATION**, an obtaining by Request or Prayer; this Word is us'd in our Statutes for the pre-obtaining of Benefices and Church-Offices in England from the Court of Rome, which did belong to the Disposal of the King and other Lay-Patrons of the Realm; the Penalty whereof was the same with *Provisors*, 25 E. 3.

**IMPING**, is a Term used in Falconry, and signifies the inferring of a Feather in the Wing of a Hawk, in the place of one that is broke.

**IMPLANTATION**: One of the six kinds of Transplantation; used by some People for the Cure of certain Difcalcs. *Implantation* is performed by placing Plants, or at least the Koots of Plants, in a Ground prepared for that purpose, and water'd with what the Patient used to wash himself withal. By which means 'tis pretended the Difcalc is transfused into the Plant. If the Plant happen to die before the Cure be perfected, by reason of the ill Qualities it imbibes, other Plants must be placed instead of it, and the Process be continued as in the first.

**IMPLEAD**, from the French *Plaidier*, to sue, arrest, or prosecute by Course of Law.

**IMPLEMENTS**, comes either from the French Word *Employer*, to employ, or the Latin *Implere*, to fill up; and is used for all things necessary for a Trade, or the Furniture of an Household: in which Sense we frequently find it used in Wills, and Conveyances of Moveables.

**IMPLICIT**, something tacitly comprized or understood; that is, contain'd in a Discourse, Clause, or Proposition, not in express Terms, but only by Induction and Consequence. The Word is derived from the Latin *Plies*, I fold.

**IMPLY** a Contradiction; a Term used among Philosophers to signify the Object of Divine Omnipotence. Thus we say, God can do every thing that does not imply a Contradiction proceeding from God: By which is not meant a Respect of the Action to the Executive Power of God; for God by this Power could do whatever does not imply a Contradiction proceeding from this Power, which would be to say, that God can do what he can do. In that Proposition if therefore is intended a Respect to the other Attributes and simple Perfections of God. Thus God can do whatever does not imply a Contradiction to some other of his Attributes. For instance, he cannot assert a false Religion by his Word, or by Miracle, because this is repugnant to his Goodness and Truth. But because all things that imply a Contradiction, cannot be said to have such a Respect to the Attributes of God; therefore we may say more generally, that those things imply a Contradiction, which involve a Contrariety from the Terms or Object. For there are two things requisite to the Being of any thing; the one on the side of the Agent, *viz.* a Power of Acting; the other on that of the Patient or Object, *viz.* a Non-resistance. For want of the first Condition, there are a thousand things which we cannot do; and for want of the second Condition, there are many things that God cannot do: for that which, when it is affirmed, is yet denied, is impossible.

**IMPORTATION**, is the importing or bringing in of Merchandizes from foreign Countries.

**IMPOSITION OF HANDS**, an Action by which the Evangelical Mission, and the Power of Absolving, is convey'd. *Imposition of Hands* was a Jewish Ceremony, introduced, not by any Divine Authority, but by Custom; it being the Practice among those People, whenever they pray'd to God for any Person, to lay their Hands on his Head. Our Saviour observ'd the same Custom, both when he conferred his Blessing on Children, and when he cured the Sick; adding Prayer to the Ceremony. The Apostles likewise laid Hands on those whom they bestow'd the Holy Ghost on. The Priests observ'd the same Custom when any one was received into their Body. And the Apostles themselves underwent the *Imposition of Hands* a-fresh, every time they enter'd upon any new Design. In the ancient Church *Imposition of Hands* was practis'd on Persons when they marry'd; which the *Abyssinians* still observe. But this Term, which in its original Signification, is general; is restrain'd by Custom, to that *Imposition* which is practis'd at Ordination. *Sponheim* has written a Treatise de *Impositione Manuum*; and *Trilenbarius* and *Branvius* have done the same.

**IMPOSITION**, is also a kind of Transplantation practis'd for the Cure of certain Difcalcs. It is performed, by taking some of the implanted Spirit or Excrement of the Part affected, or of both together, and placing them in a Tree, or a Plant, between the Bark and the Wood, after which it is cover'd up with Mud. Instead of this, some bore a Hole in the Tree with an Auger; and shutting up the Hole again with a Tampion of the same Wood, cover it over with Mud. If 'tis desired the Effect should be lasting, a Tree is chosen that will continue long, as an Oak. If 'tis desired the Effect should be speedy, they chuse a Tree that grows fast; in which last case, the Matter serving as the Medium of Transplantation must be taken out of the Tree as soon as the Effect has followed, because the too great Alteration of the Spirit, might be some prejudice to the Patient.

**IMPOSSIBLE**, that which cannot be done: A Thing is said to be impossible, when it contains two Ideas which

mutually destroy each other, and which can neither be conceived, nor united together in the Mind. Thus it is impossible that a Circle should be a Square; because we conceive clearly that Squareness and Roundness destroy each other by the Contrariety of their Figure. There are two kinds of *Impossible*; the one Physical, the other Moral. A Physical *impossibility* is that which cannot be done by the Powers of Nature. A thing is morally impossible, when of its own nature it is possible, but yet is attended with such Difficulties, as that all things consider'd, it appears impossible. Thus it is morally impossible that all Men should be virtuous; or that a Man should throw the same Number with three Dyes an hundred times successively.

Any thing contrary to Decency and good Sense is also said to be impossible, among those who reason from Moral Topics; thus the Lawyers say, *Omne ius pe impossibile*: Those Conditions are impossible, which Sense and Decorum don't allow to be perform'd, tho in themselves very possible to those who have no regard to good Sense, &c.

**IMPOST**, in Law, is the Tribute or Tax appointed by the Prince, for such Merchandize as is brought into any Haven in his Dominions from foreign Nations: 31 *Elis.* 5. It may be distinguish'd from Custom, in that, Custom properly signifies the Duties paid to the King for Goods shipp'd off or exported: but they are frequently confounded together.

**IMPOSTHUME**, is a Collection of Matter or Pus in any Part of the Body, either from an Obstruction of Fluids in that Part, which makes them change into such Matter; or from a Transfusion of it from some other Part where it is generated.

**IMPOSTS**, in Architecture, are what are sometimes called Chaptrels: being the Parts on which the Feet of Arches stand; or the Capitals of Pillars, that support Arches. These *imposts* conform to their proper Orders. The Tuscan hath a Plinth only; the Dorick two Faces crown'd; the Ionick a Larmier, or Crown, over the two Faces, and its Mouldings may be carv'd; the Corinthian and Composite have a Larmier, Freeze, and other Mouldings. The Projections of the *imposts* must not exceed the Naked of the Pilaster. Sometimes the Entablature of the Order serves for the *impost* of the Arch; and this looks very grand and flatly. The *impost* is a thing very essential to the Composition of the Ordnances; inasmuch that without it, in the place where the curve Line of the Arch meets with the perpendicular Line of the Pillar, there always seems a kind of Elbow.

**IMPOTENCE**, a Want of Strength, Power, or Means to perform any thing. *Impotence* also signifies a natural Defect or Inability to Generation. The Decretals distinguish three kinds of *Impotent*, *viz.* Frigidity, Enchantment, and Inability to the Act. *Impotency* annuls Marriage. The Word is derived from the Preposition *in*, taken privately, and *Potentia* Power.

Divines and Philosophers distinguish two kinds of *Impotency*. The one Natural, the other Moral. The first is a Want of some Physical Principle necessary to an Action, or is something absolutely defective, or that is not free, and at liberty to act; the second is only a great Difficulty, as a strong Habitude to the contrary: a violent Passion or Inclination.

**IMPRECATION**, a Curse, or Wish that some Evil may befall any one. The Antients had their Goddesses call'd *Imprecations*, in Latin *Dire*, i. e. *Deorum Ire*, who were supposed to be the Executioners of evil Consciences. They were call'd *Imprecations* in Heaven, *Furies* on Earth, and *Eumenides* in Hell. The Romans own'd but three of these *Imprecations*, and the Greek two. They invoked them with Prayers and Pieces of Verses to destroy their Enemies. The Word is derived from the Latin *in* and *precari*.

**IMPREGNATION**, is the Emission of the Seed of the Male in Coition, by which the Female conceives, or becomes with young. It is also, hence, figuratively used in Pharmacy, when a Liquor imbibes the Juice of some other Body: Thus a Menstruum is said to be impregnated with a Body dissolved in it, as much as its Pores are able to receive. The Word is derived from the Latin *Impregnare*, of *Pregnans*, a Woman with Child.

**IMPRESSION**, a Term in Philosophy, apply'd to the Species of Objects, which are supposed to make some Mark or *Impression* on the Senses, the Mind, and the Memory. The *Peripateticks* tell us, that Bodies emit Species resembling them, which Species are convey'd by the exterior Senses to the common Sense. These *impressions*, or impress'd Species, being material and sensible, are render'd intelligible by the active Intellect; and when thus spiritualis'd, are call'd Expressions or express Species, as being express'd from the others.

**IMPRESSION**, is also frequently used in speaking of the Editions of a Book, or of the Number of Times that they

they have been printed. Thus *M. Arnold* assures us, there were above 100 Impressions of the *Levins Bible* in one Age; and 'tis affirm'd, that *Thomas à Kempis* of the *Imitation of Christ*, has undergone more Impressions than there have been Months since it was first composed. *Impression*, however, differs from Edition. *Impression*, properly speaking, takes in no more, than what belongs to the Printing, the Letter, Paper, Margin, Page, Distances of Words and Lines, and the Disposition of every thing that may have a good or bad Effect on the Eye. Edition, besides all this, takes in the Care of the Editor, who revised the Copy, corrected or augmented it, adding Notes, Tables, and other like things, which he judg'd might contribute towards making the Book more useful, and correct. Indeed very frequently the word Edition only refers to this latter part; as when, in speaking of the Works of *St. Augustin*, we quote the Edition of *Erasmus*, the *Levants*, *Benedictines*, &c. where we have no regard to the Printing Part, but only to the Care and Pains of the Editor.

**IMPROPER FRACTIONS**, are such as have their Numerators equal to, or greater than their Denominators; as  $\frac{1}{2}$ ,  $\frac{3}{2}$ , &c. which, properly speaking, are not Fractions, but either whole, or mixed Numbers; and are only put into the Form of Fractions, in order to be added, subtracted, multiplied, or divided, &c. See *Fractions*.

**IMPROPRIATION** is a Term used where the Profits of an Ecclesiastical Benefice are in the hands of a Layman: As Appropriation is the Term when it is in the hands of a Bishop, College, &c. the these two are often now used promiscuously; there are said to be 3845 *Improprations* in England.

**IMPROPRIETY**, Quality of something that is not fit or proper. Grammarians observe three kinds of Faults in Language, a Solecism, a Barbarism, and an *Improprity*. An *Improprity* is committed when a Word is used that is not proper, or that has not a suitable Signification.

**IMPULSIVE**, a Term in Philosophy, applied to the Action of a Body that impels or pushes another; as the Arm is said to give an impulsive Motion to the Stone that it throws. Sir *I. Newton* accounts for most of the Phenomena of Nature from attractive and *impulsive Powers*.

**IMPUTATION**, a Term much used among Divines, sometimes in a good, and sometimes in an ill Sense; in the latter it is used to signify the Attribution of a Sin committed by another. Thus the *Imputation* of *Adam's Sin* is made to all his Posterity; all his Descendants, by his Fall, becoming criminal in the sight of God, as if they had fallen themselves, and bearing the Punishment of his first Crime. *Imputation*, when used in a good Sense, signifies the *Imputation* of another's Justice or Merit. Thus the Justice of Jesus Christ is imputed to us, his Merits and the Price of his Sufferings being applied to us: So that the *Imputation* of the Merits of Christ signifies no more among the Reformed, than an extrinsic Justice, which does not make us truly just, but only appear so, which hides our Sins, but does not efface them. For this reason those of the *Romish* Communion decline the Use of the word *Imputation*, and assert that the justifying Grace, which applies to us the Merits of Jesus Christ, not only covers our Sins, but also effaces them; that this Grace is intrinsic and inherent, renewing entirely the inward Man, and renders him pure, just, and without spot before God, and that this Justice is given him on account of the Justice of Jesus Christ, that is, by the Merits of his Death and Passion. In a word, say they, 'tis the Obedience of Jesus Christ that has merited justifying Grace for us, yet it is not the Obedience of Jesus Christ that renders us formally just: And in like manner 'tis not the Disobedience of *Adam* that makes us formally Sinners, but 'tis this Disobedience that has merited for us, both that we should be Sinners, and that we should undergo the Punishment of Sin. The Protestants say, that the Sin of the first Man is imputed to his Descendants; they being looked on as culpable, and punished as such, because of the Sin of *Adam*. The Catholics hold, that this is not enough; we are not esteemed and punished as Criminals, say they, but we are actually criminal ourselves by original Sin. Again, the Protestants say, that the Justice of Jesus Christ is imputed to us, and that our Justification is no more than the *Imputation* of that of Christ; his Sufferings standing instead of ours, and God accepting his Death as a Satisfaction in lieu of our own. But the Catholics teach, that the Justice of Christ is not only imputed, but actually communicated to the Faithful, by the Operation of the Holy Ghost: So that they are not only reputed just, but also made so.

**INACCESSIBLE** Height, or Distance, is that which cannot be measured, by reason of some Impediment in the way, as Water, &c. See *Height*.

**INACTION**, Cessation of Action, a Term much in use in the mystical Divinity; by which is understood a Privation of Motion, or an Annihilation of all the Faculties; by which

the Door is, as it were, shut to all external Objects, and a kind of Extasy is procured, during which God speaks immediately to the Heart. 'Tis this State of *Inaction* that is the most proper for receiving the Holy Spirit, and in this Fit of Dazing, it is that God communicates sublime and ineffable Sentiments and Graces to the Soul. Some don't make it consist in this stupid kind of Indolence, or general Suspension of all Sensation. They say that by *Inaction* they only mean a Cessation of Desires, in which the Soul does not determine itself to certain positive Acts, nor does it abandon itself to useless Meditations, or the vain Speculations of Reason; but demands in general every thing that may be agreeable to God, without prescribing any thing to him. This latter is the Doctrine of the ancient mystic Divines; and the former, that of the modern ones, or Quietists. In general, however, it may be said, that *Inaction* is not the most likely way of pleasing God; 'tis our Actions chiefly by which we are to gain his Favour: he will have us to act, so that *Inaction* cannot be agreeable to him.

**INACTIVITY** of Matter. See *Vis Inertia*.

**INADEQUATE** Idea, is a partial or incomplete Representation of any thing to the Mind. See *Adequate Idea*.

**INALIENABLE**, that which cannot be validly alienated, or made over to another; thus the Dominions of the King, the Church, Minors, &c. are *inalienable*, unless it be with a Reserve of the Right of Redemption, for ever.

**INANIMATE**, a Body that has lost its Soul, or that is not of a Nature capable of having any. Thus a dead Man is an *inanimate Lump*, and Metals are *inanimate Bodies*. The word is derived from the Latin Preposition *in* taken privatively, and *Anima*, Soul.

**INANITION**, a Term in Physic, signifying Emptiness, or the State of the Stomach, when it is empty, and needs Food. There are Flatulencies which proceed from Repletion, and others from *Inanition*, which last are the more dangerous.

**INARTICULATE**, an Epithet applied to such words as are not pronounced distinctly.

**INAUGURATION**, the Ceremony performed at the Coronation of an Emperor or King, or the Consecration of a Prelate; so called, in imitation of the Ceremonies used by the *Romans*, when they were received into the College of Augurs. The word comes from the Latin *Inaugurare*, which signifies to dedicate a Temple, or to raise any one to the Priesthood, having, in order to that, first taken Auguries.

**INCA**, or **YNCA**, the Name which the Natives of *Peru* give to their Kings, and Princes of the Blood. The Chronicle of *Peru* relates the Origin of the *Yncas*, and says, that this Country had been a long time the Theatre of all sorts of Wars, horrible Crimes, and Dissensions; till at length appeared two Brothers, the one called *Mangocapa*, of whom the *Inhabitants* use to tell Wonders; he built the City of *Cusco*, settled Laws and Policy, and taught them to adore the Sun; and he and his Descendants took the Name of *Yncas*, which, in the Language of *Peru*, signifies King, or Great Lord. They grew so powerful, that they made themselves Masters of the whole Country, from *Pasfo* to *Chili*, 1500 Leagues long, and held it till the Divisions between *Yncas Guascar*, and *Ataholipa*; which the *Spaniards* laying hold of, made themselves Masters of *Peru*, and put an end to the Empire of the *Incas*. They do but number twelve of these *Incas*. 'Tis said the most considerable among the Nobles of the Country, still bear the Name of *Inca*.

**INCALESCENCE** denotes the growing hot of any thing by Motion and Friction, or as Quick-lime does, by pouring Water on it, &c. from *in* and *calere*, to grow warm.

**INCAMERATION**, a Term used in the Apostolical Chancery, signifying the Union of some Land, Right, or Revenue to the Dominion of the Pope. The word is derived from the Latin *in*, and *Camera*, Chamber.

**INCANTATION**, Enchantment, Words and Ceremonies used by Magicians to raise Devils; or rather to abuse the Simplicity of the People. The word is derived from the Latin *in*, and *cano*, I sing.

**INCAPACITY** in Matters of Benefices, among the *Romanists*, &c. is of two kinds; the one renders the Provision of a Benefice null in its Original; the other is accessory, and annuls the Provisions, which at first were valid. *Incapacities* of the first kind, are the want of a Dispensation for Age in a Minor, for Legitimation in a Bastard, for Naturalization in a Foreigner, &c. Of the other kind, are grievous Offences and Crimes, the being concerned in seeing a Sentence of Death executed, &c. which vacate the Benefice to all intents, or render the holding it irregular.

**INCARNATION**, in Divinity, signifies the Union of the Son of God with the Human Nature. The Mystery by which Jesus Christ, the Eternal Word, was made Man,

in order to accomplish the Work of our Salvation. The *Indians* own a kind of Trinity in the Godhead, and say, that the second Person thereof, has been incarnate nine times, and will be incarnate a tenth, and give him a different Name in each of these *Incarnations*. See *Kercher. China Illustr.* The *Æra* used among Christians, whence they number their Years, is the time of the *Incarnation*. This *Æra* was first established by *Dionysius Exiguus* about the beginning of the 6th Century, till which time the *Æra of Daselesian* had been in use. Some time after this, it was considered, that the Years of a Man's Life were not numbered from the time of his Conception, (as was done in that *Æra*) but from that of his Birth: which occasioned them to postpone the beginning of this *Æra*, for the space of one Year, retaining the Cycle of *Dionysius* entire, in every thing else. At Rome they reckon their Years from the *Incarnation*, or from the Birth of Christ, that is, from the 25th of December, which Custom has obtained from the Year 1531. In France, England, and several other Countries, they also reckon from the *Incarnation*; but then they differ from the others in the Day of the *Incarnation*, fixing it not to the Day of the Birth, but to the Conception of our Saviour. However, the *Florentines* stick to the Day of the Birth, and begin their Year from *Christmas*. See *Petav. de Diss. Temp. Gradumque de Die Nat.*

INCARNATION signifies the healing and filling up Ulcers and Wounds with new Flesh; and the Medicines which effect this, are commonly called *Incarnatives*, from *in* and *caro, Flesh*.

INCARNATIVE, in *Chirurgery*, is something that makes Flesh grow, rejoin, or unite, and is applied to Remedies, Bandages, and Sutures. An *incarnative* Remedy is such a one as makes the Flesh heal and unite; an *incarnative* Bandage, is a Fillet, with an Eye or Noose at one end of it, so as the other end may be put thro' it. To make use of this Bandage, they apply the middle of it to the Side opposite to the Wound, so that the Aperture may be over the Wound itself; and slipping the other end thro' it, draw the Lips of the Wound close to each other, that they may grow together. An *incarnative* Suture, is such a one as, by rejoining the Lips of a Wound, and keeping them together, by means of a Thread drawn thro' them with a Needle, occasions them to grow up and heal.

INCARTATION, in *Chymistry*, is a Purification of Gold, by means of Silver and *Aqua-Fortis*.

INCENSE, an aromatic, odoriferous Resin. It distils from a Tree, that, according to *Theophrastus*, has Leaves like those of a Pear-Tree, and grows in the Country of *Saba*, in *Arabia Felix*, called by the Antients *Thursifera*, *Incense-bearing*. The Incision for the Resin to ooze out at, is made in the Dog-Days. The Male *Incense* is the best; it is in round, in white drops, fat w<sup>ith</sup>in, and inflames immediately, when laid on the Fire. This is also called *Olibanum*. The Female *Incense* is softer, and more resinous, but of less Virtue than the former. *Incense* is of considerable Use in *Physic*, it warms, dries, and binds. It is used in several Diseases of the Head and Breast, in case of Vomiting, a Diarrhea, or a Dysentery; externally it is used to fortify the Brain, and in healing of Wounds.

Bark of *Incense*, is the Bark of the Tree whence the *Incense* flows, which has the same Qualities with the *Incense* itself. There is another Bark brought from the *Indes*, called also *Bark of Incense*, and sometimes *Jews Incense*, in regard the *Jews* make frequent Use thereof in their Perfumes.

Monna of *Incense*, is the Flower or Farina of *Incense*, occasioned by the Friction of the Grains against each other in the Sacks wherein they carry it. There is also a Soot of *Incense*, which is a Preparation of it.

*Incense* was formerly burnt in the Temples of all Religions, to do honour to the Divinities that were there adored. Many of the Primitive Christians were put to death, because they would not offer *Incense* to Idols. In the *Romish* Church they still retain the Use of *Incense* in many of their Ceremonies, particularly at solemn Funerals, bestowing it on such Persons as they would honour, as on Prelates, &c. and sometimes also on the People. The word comes from the *Latin, incensum*, burnt; taking the Effect, for the Thing itself.

INCEPTIVE, a Word used to express such Moments, or first Principles, which tho' of no Magnitude themselves, are yet capable of producing such. Thus a Point hath no Magnitude itself, but is *inceptive* of a Line which it produceth by its Motion. A Line, considered one way, has no Magnitude as to Breadth, but is capable, by its Motion, of producing a Surface which hath Breadth, &c.

INCEST, a Crime committed by Persons having to do with each other, who are related in a Degree prohibited by the Laws of the Country. Some are of opi-

nion that Marriage ought to be permitted between Kinfolks, to the end that the Affection, so necessary in Marriage, might be heightened by this double Tye; and yet the Rules of the Church have formerly extended this Prohibition even to the seventh Degree, but time has brought it down to the third or fourth Degree. The words *Adultery* and *Incest* are not infamous and indecent, tho' they signify very infamous things; because they represent them as covered with a Veil of Horror, which makes us look on them only as Crimes: the words, therefore, rather signify the Crime of those Actions, than the Actions themselves. Most Nations look on *Incest* with Horror, *Persia* alone excepted. In the History of the ancient Kings of that Country, we meet with Instances of the Brother's marrying the Sister: the Reason was, because they thought it too mean to join in Alliance with their own Subjects, and still more so, to have married into the Families of any foreign Princes.

INCEST, SPIRITUAL, is a Crime committed, in like manner, between Persons who have a spiritual Alliance, by means of Baptism or Confirmation. *Spiritual Incest* is also understood of a Vicar, or other Beneficiary, who enjoys both the Mother and the Daughter; that is, holds two Benefices, the one whereof depends on the Collation of the other. Such a *Spiritual Incest* renders both the one and the other of those Benefices vacant.

INCESTUOUS, the Name of a Sect that arose in Italy about the Year 1065. It had its Beginning at *Ravenna*; the Learned of which Place being consulted by the *Florentines* about the Degrees of Affinity which prohibit Marriage, made answer, that the seventh Generation, mentioned in the Canons, was to be taken on both sides together; so that four Generations were to be reckon'd on one side, and three on the other. They proved this their Opinion by a Passage in *Justinian's* Institutes, where 'tis said, That a Man may marry his Brother's or Sister's Granddaughter, though she be but in the fourth Degree: Whence they concluded, that if my Brother's Grandchild be in the fourth Degree with respect to me, she is in the fifth with respect to my Son, in the sixth with respect to my Grandson, and in the seventh with respect to my great Grandson. *Peter Damian* wrote against this Opinion, and *Pope Alexander II.* condemn'd it in a Council held at *Rome*.

INCH, is a known Measure, the twelfth Part of a Foot, containing the Space of three Barley Corns in length.

Goods are said to be sold by *Incub of Candle*, when a Merchant, or Company of Merchants, as the *East-India* Company, &c. having a Cargo of Foreign Goods arrived, are inclined to make a speedy Sale of them; in which case, notice is usually given upon the Exchange by Writing, and elsewhere, when the Sale is to begin: against which time the Goods are divided into several Parcels, called Lots, and Papers printed of the Quantity of each, and of the Conditions of Sale, as that none shall bid less than a certain Sum more than another has bid before. During the time of Bidding, a small Piece of about an *Incub* of Wax-Candle is burning, and the last Bidder, when the Candle goes out, has the Lot or Parcel expos'd to Sale.

INCHOATIVE, a Term signifying the Beginning of a Thing or Action. *Incobative* Verbs, according to the strict Rules of the *Latin* Tongue, are used by the best Authors indifferently with *Primitives*, having almost all the Tenses in common with them; nay, ordinarily they express our Sentiments with more Violence, and the Actions themselves in a more perfect State.

INCIDE. These Medicines are said to *incide*, which consist of pointed and sharp Particles, as Acids, and most Salts; by the Force or Insinuation of which, the Particles of other Bodies are divided from one another, which before cohered. And thus some expectorating Medicines are said to *incide*, or cut the Phlegm, when they break, it so as to occasion its Discharge.

INCIDENCE, expresses the Direction with which one Body strikes upon another, and the Angle made by that Line, and the Plane struck upon, is called the *Angle of Incidence*. In the Occasions of two moving Bodies, their *Incidence* is said to be perpendicular or oblique, as their Directions or Lines of Motion, make a straight Line, or an oblique Angle at the Point of Contact. Besides what is said under *Angle of Incidence*, (which see) *Sir Isaac Newton's* faith in his Opticks, That the *Sine of Incidence* is either accurately, or very nearly in a given Ratio to the *Sine of Refraction*: (And the Angles of *Incidence*, *Reflexion*, and *Refraction*, are all in one and the same Plane.) Wherefore if that Proportion be known in any one Inclination of the incident Ray, it is known in all; and thereby the *Refraction* in all Cases of *Incidence* on the same Refracting Body, may be determined. Thus if the *Refraction* be made out of Air into Water, the *Sine of Incidence* of the Red Light, is to the *Sine of Refraction*, as 4 to 3. If out of Air into Glass, the Sines are as 17 to 11. In Light

Light of other Colours, the Sines have indeed other Proportions; but the Difference is so little, that it need seldom be consider'd. As for example; Let  $r s$  (in the Figure) be the Surface of the still Water,  $c$  the Point of Incidence, in which any Ray coming in the Air from  $a$  in the Line  $a c$ , is reflected or refracted: To know whether this Ray shall go after such Reflexion, or Refraction; on the Sur-

face of the Water  $r s$ , and in the Point  $c$ , erect the Perpendicular  $c p$ , and produce it downwards to  $q$ . Knowing therefore that the Ray after Reflexion or Refraction will be found somewhere in the Plane of the *Angle of Incidence*  $a c p$  produced; let fall the Sine of that Angle (viz.  $a d$ ) on the Perpendicular  $p c$ ; and then if the Reflected Ray be sought, produce  $a d$  to  $b$ , so that  $a b = a d$ , and draw  $c b$ , which shall be the reflected Ray, because the Angle of Reflexion, and its Sine, are equal to the Angle and Sine of Incidence, as they ought to be. But if the refracted Ray be sought, produce  $a d$  to  $b$ ; so that  $a b$  may be to  $a d$ , as the Sine of the Refraction, to that of Incidence: that is, as 3 to 4. Then with the Radius  $a c$  describing the Circle  $a b c$ , and in the Plane  $a c p$ ; draw the Line  $b c$  parallel to  $p q$ , and cutting the Circumference in  $e$ : Then drawing  $c e$ , That shall be the refracted Ray. For  $i e f$  be let fall perpendicularly on the Line  $p q$ , it shall be the Sine of the Angle of Refraction of the Ray  $c e$ ; and this Sine is equal to  $a b$ , and consequently in proportion to the Sine of the *Angle of Incidence*  $a d$ , as 3 to 4.

*Incidence Point*, in Opticks, is that Point in which a Ray of Light is supposed to fall on a Piece of Glass.

**INCIDENT**, an Event or particular Circumstance. *Incident*, in a Poem, is an Episode or particular Action, tack'd to the principal Action, or depending on it. Thus a good Comedy is full of agreeable *Incidents*, which divert the Spectators, and form the Intrigue. The Poet ought always to make choice of such *Incidents* as are susceptible of Ornaments suitable to the Nature of his Poem. The Variety of *Incidents* well conducted make the Beauty of an Heroic Poem, which ought always to take in a certain number of *Incidents* to suspend the Catastrophe, that would otherwise break out too soon.

**INCINERATION**, in Chymistry, is the Reduction of Vegetables into Ashes; which is done by burning them gently. Thus Fern is reduced into Ashes for the making of Glass. The Word is derived from the Latin Preposition *in*, and *Genis*, Ashes.

**INCISIVE**, in Anatomy, is understood of several Teeth, a double Mucle, and certain Orifices belonging to those Teeth. The *incisive* Teeth, *Incisives* or Cutters, sometimes also called *Risors*, because they show themselves in Laughing, are eight in number, four in each Jaw, situate in the Fore-side, and in the middle of the others. They are shorter and sharper than the others, and are inserted into their *Alveoli* by a single Root or Twang; for which reason they fall easily, especially those of the upper side. They are called *incisive*, because their Office is to cut or incise the Meat. The first proper Muscle of the upper Lip has also the Epithet of *incisive*, because it has its Origin in the Bone of the upper Jaw, near the Place of the *incisive* Teeth; hence it rises, and is inserted into the upper Lip, which it serves to draw up. The maxillary Bones have four internal Orifices, two whereof are called *incisive*, as being directly under the *incisive* Teeth.

**INCLINATION**, a Term used in Medicine and Chymistry, when a clear Liquor is poured off from some Ferments, or Sediment, by only gently sloping the Vessel; which is also called Decantation.

**INCLINATION**, in Physics, expresses the mutual Approach or Tendency of two Bodies, Lines, or Planes towards one another; so that their Directions make either a straight Line at the Point of Contact, or an Angle of a

greater or lesser Magnitude. What the *Angle of Inclination* signifies in Opticks, see in *Angle of Incidence*. The *Inclination* of two Planes is the acute Angle made by two Lines drawn one in each Plane, and perpendicular to their common Section. *Inclination* of the Axis of the Earth is the Angle which it makes with the Angle of the Ecliptic; or the Angle between the Planes of the Equator and Ecliptic. *Inclination* of a Planet is an Arch of the Circle of *Inclination*, comprehended between the Ecliptic, and the Place of a Planet in his Orbit. *Inclination* of a Plane in Dialling, is the Arch of a vertical Circle, perpendicular to both the Plane and the Horizon, and intercepted between them. To find this, take a Quadrant and apply its side to the side of a Square, and apply the other side of your Square to your Plane; if the Plummets fall parallel to the side of the Square, then the lower side of the Square stands level; by which draw an Horizontal Line, whereon erect a Perpendicular, and apply your Square to that Perpendicular; and if the Plummets fall parallel to the side of the Square, then that is also a level Line, and your Plane stands horizontally: If the Plummets fall not parallel to the side of the Square, then turn your Square, until it does, and draw an horizontal Line, on which erect a Perpendicular, to which apply your Square, and observe what Angle your Plummets makes on the Quadrant, with the side of the Square; that is, the Angle of the *Inclination* of the Plane. *Inclination* of a Ray in Dioptricks, is the Angle which this Ray makes with the Axis of Incidence in the first Medium, at the Point where it meets the second Medium. *Inclination* of a Right Line to the Plane is the acute Angle, which this Right Line makes with another Right Line drawn in the Plane thro the Point where the inclined Line intersects it, and thro the Point, where it is also cut by a Perpendicular drawn from any Point of the inclined Lines. *Inclination* of the Planes of the Orbits of the Planets to the Plane of the Ecliptic, are thus. Saturn's Orbit makes an Angle of 2 Degrees 30 Minutes. Jupiter's 1 Degree, and  $\frac{1}{2}$ . Mars's little less than a Degree. Venus's is 5 Degrees and  $\frac{1}{2}$ . Mercury's is almost 7 Degrees.

**INCLINED PLANE**. Besides what has been said under *Descent* of heavy Bodies upon *inclined Planes*, it may be here added: If a Body as B be partly supported by the *inclined Plane* A C, and partly by the Power R acting on a Direction parallel to the Plane A C; then that Power R: is to the Body, or Weight B: as the Sine of the Angle of the *Plane's* Inclination A C B: is to the Radius C A. C D, A D, G F, E D, and H F, being drawn, as in the Figure; the Body B will be sustained, as is

were, by three Forces, or Powers, all acting according to different Directions, and in Equilibrio one to another. The first of which is the Force of Gravity, expressed by B E perpendicular to the Horizon C D. The second the Power R, according to the Direction B R parallel to the Plane A C. And the third is supplied by the Resistance or Contrariety of the *Plane* A C; and is expressed by B H perpendicular thereunto. For Action and Re-action being equal, and one acting directly contrary to the other; the *Plane* which is pressed by the Body or Weight B, according to the Direction of the Perpendicular H E, must act on that Body by a contrary Direction, viz. that of F B or B H. And since these three Powers are all mutually in Equilibrio, and that the Body B is sustained by them, it is plain (when G F is drawn perpendicular to C D, or parallel to B E) that the Force of Gravity will be expressed by G F; and that the Power R: will be to the Power of Gravity :: as G B: to G F; but in the Right-angled Triangle C F G, (F B being a Perpendicular to the Base C G) B G: G F: as G F: G C, and as G C: G C: as A D: A C (by similar Triangles) wherefore the Power R: is to the Force of Gravity: as A D: to A C, or as the Sine of the Angle of Inclination to the Radius. Wherefore the Force by which any heavy Body would descend on any *inclined Plane*, to the Force of the Descent in the Perpendicular, is as the Sine of the Angle of the

*Plane's* Inclination, to the Radius. From hence also it follows, the Inclination of the *Plane* may be so little, that the greatest Weight may be sustained on it by the least Power. For practice therefore, Let the Weight of any Body be *W*, and *P* the Power wanted to sustain it on an inclined *Plane*. By this Theorem,  $R : W :: S. Incl. : P$ ; that is, As Radius is to the Weight :: so is the Sine of the Angle of the *Plane's* Inclination to the Horizon; to the Power sought. The three first of which are given, wherefore the fourth is known.

**INCOGNITO**, a Term borrow'd literally from the *Italian*, us'd when a Person is in any Place where he would not be known. It is particularly applied to Princes or Great Men, who enter Towns or walk the Streets without their ordinary Train, or the usual Marks of their Distinction. The Grandees in *Italy* make a common Custom of walking the Street *incognito*; and always take it amiss, on such Occasions, when People pay their Compliments to them. 'Tis not barely to prevent their being known, that they take these Measures, but because they would not be treated with Ceremony, nor receive the Honours due to their Rank. When the Horfes in Princes, Cardinals, and Ambassadors Coaches have no Taffels, which they call *Fiscals*; and the Curtains, which they call *Bandinielle*, are drawn, they are judg'd to be *incognito*; and no body that meets them is oblig'd to stop or make his Honours to them. The Cardinals also, when they would be *incognito*, leave off the red Hat or Calotte.

**INCOMBUSTIBLE**, that which cannot be burnt or consumed by Fire. Metals melt, Stones calcine, and are yet *incombustible*. Cloth made of *Lapis Amianthus* is *incombustible*; it is clean'd by Fire, but not burnt. See *Asterion*. At *Dole* in *France* is an *incombustible* Taper. *Gregory of Tours* speaks of some wooden Kettles in his Time that bore the Fire as long as those of Iron. *Sylva* undertook to burn down a Tower of Wood which defended *Archeles*, one of *Mitridates's* Lieutenants, but he could not attain his End, it being plaiter'd with *Alumna*. 'Tis *Alumna* Water wherewith these People besmeer themselves, who handle burning Coals, and melt *Spanish* Wax on their Tongues.

**INCOMMENSURABLE**, a Term in Geometry, us'd where two Lines, when compared to each other, have no common Measure, how small soever, that will exactly measure them both. So that after ever so many Repetitions and Subtractions of equal Parts, there will always remain some Part, by which the one is greater than the other. And in general, two Quantities are said to be *incommensurable*, when no third Quantity can be found that will exactly measure them both; or when those Quantities are not to one another as Number to Number, or cannot be express'd by Numbers. For every thing that may be express'd by Number, is commensurable. The Side of a Square is *incommensurable* to the Diagonal, as is demonstrat'd by *Euclid*; but it is commensurable in Power: the Square of the Diagonal being equal to twice the Square of the Side. *Pappus*, lib. 4. *prob.* 17. speaks also of *incommensurable* Angles. As to Surfaces which cannot be measured by a common Surface, they are said to be *incommensurable* in Power.

**INCOMPATIBLE**, that which cannot subsist with another without destroying it. Thus Cold and Heat are *incompatible* in the same Subject; the strongest overcomes the weakest.

**INCOMPOSITE NUMBERS**, are the same with those *Euclid* calls Prime Numbers. In Dr. *Pell's* Edition of *Brachet's* Algebra, there is a Table of *incomposite Numbers*: It doth not only give an orderly Enumeration of all odd Numbers which are not *composite*; but it shews also, that none of the rest are so. This Table being of good use, the Reader is refer'd to it.

**INCORPORATION**, is the mixing of the Particles of different Bodies so together, as to make an uniform Substance or Composition of the whole, without leaving a possibility of discerning the Ingredients, or Bodies mixed in any of their particular Qualities. From *in* and *Corpus* Body.

**INCORPOREAL**, a spirital Substance; that has no Body. Thus the Soul of Man is *incorporeal*, and may subsist independent of the Body. Those Ideas which are independent of Bodies, can neither be corporeal themselves, nor be received within a corporeal Subject. They discover to us the Nature of the Soul, which receives within itself what is *incorporeal*, and receives it in a corporeal Manner too. Whence it is that we have *incorporeal* Ideas even of Bodies themselves. *Fenelon*.

**INCORRUPTIBLE**, that which cannot corrupt. Thus spiritual Substances, as Angels, Human Souls, &c. and thus also Glass, Salt, Mercury, &c. may be called *incorruptible*.

**INCORRUPTIBLES**, is the Name of a Sect that sprung out of the *Encyclopaists*. Their distinguishing Tenet

was, That the Body of Jesus Christ was *incorruptible*; by which they meant, that after and from the Time wherein he was formed in the Womb of his holy Mother, he was not susceptible of any Change or Alteration; not even of any natural and innocent Passions, as of Hunger, Thirst, &c. So that he eat without any occasion, before his Death, as well as after his Resurrection. And hence it was that they took their Name.

**INCORASSATING**, is the rendering Fluids thicker than before, by the Mixture of less fluid Particles. See *Agglutinating*.

**INCORUSTATION**, an Ornament in Architecture, consisting of hard polish'd Stones, or other brilliant Matter dispos'd in Compartments in the Body of a Building. The *Incrustations* in the Castle at *Madrid* are of Porters Work: Those in the *Louvre* of Marble. We say 'tis an *incrustation* of Stone or Marble, when a Wall is lined with them. The Antients call'd their Plasters *incrustation*.

**INCORUSTED COLUMN**, is a *Column* consisting of several Pieces or slender Branches of some precious Marble, masticated or cemented around a Mould of Brick, or other Matter; which is done, not only to save the precious Stone, whether it be Agat, Jasper, or the like, but also for the sake of shewing Pieces of it of uncommon Largeness, by the Neatness and Closeness of the *incrustation*, which renders the Joints imperceptible, where the Mastic is of the same Colour.

**INCUBATION**, the Action of a Hen, or any other Fowl, hatching their Eggs.

**INCUBUS**, or the *Night-Mare*, is the Name of a Disease consisting in an Oppression of the Breat, so very violent, that the Patient cannot speak, or even breathe. In this Disease the Senses are not quite lost, but drown'd and astonish'd, as is the Understanding and Imagination; so that the Patient seems to think some huge Weight thrown on him ready to strangle him. Children are very liable to this Distemper; so are fat People, and Men of much Study and Application of Mind: By reason the Stomach in all these finds some difficulty in Digestion. The *Incubus* seems to be Cousin-German to the Epilepsy and Apoplexy; for if it lasts long, it degenerates into one or other of those Distempers. Others reckon it a kind of Asthma, and call it *Asthma Nocturnum*, and say it proceeds from the same Causes, and is helped by the same Means as the common Asthma. The word *Incubus* is derived from the *Latin* *Incubare*, to lie down on any thing and press it. The *Greeks* call it *ἰνκῦβος*, *Saltator*, Leaper, or one that rushes on a Person.

**INCUMBENT**, in Law, is a Clerk resident in his Benefice with Cure, who is called *Incumbent* of that Church, because he ought to bend his whole Study to discharge his Cure.

**INCURVATION**, is the bending a Bone, or any other Body from its natural Shape. See *Incuration* of the Rays of Light, see *Light* and *Refraction*. From *in* and *curvus*, crooked.

**INCUS**. See *Ear*.

**INDEFINISBLE**, in our Law, signifies what cannot be defeated or made void: As a good and *indefinisble* Estate.

**INDEFINITE**, indeterminate, that which has no certain Bounds, or to which the Human Mind cannot conceive any. *Descartes* uses this Word, in his Philosophy, instead of infinite, both in Numbers and Quantities, to signify an inconceivable Number, or Number so great, that an Unit cannot be added to it: and a Quantity so great, as not to be capable of any Addition. Thus he says, Stars, visible and invisible, are in Number *indefinite*, and not as the Antients held, infinite; and that Quantities may be divided into an *indefinite* Number of Parts, not an infinite Number. *Indefinite* is sometimes used in the Schools to signify something that has but one Extreme; as for instance, a Line drawn from any Point, and extended infinitely: Thus what they call Eternity *à parte ante*, or Eternity *à parte post*, are *indefinite* Durations.

*Indefinite*, in Grammar, is understood of Nouns, Pronouns, Verbs, Particles, Articles, &c. that are left in an uncertain indeterminate Sense, and not fix'd to any particular Time, Thing, or other Circumstance.

**INDELIBLE**, that which cannot be blotted out, or effaced. Thus, Baptism, and the Order of the Priesthood, are *indelible* Characters. The Word is form'd from the *Latin* *delere*, to blot, with the Preposition *in* taken negatively.

**INDEMNITY**, an Act by which one promises to guarantee or save harmless some other Person from any Loss or Damage that might accrue to him on any particular account. From the Negative *in* and *Dammum*, Loss.

**INDEMNITIES**. When a Church is appropriated to an Abbey or College, then the Arch-Deacon loseth his *Inductio*-

duction-Money for ever: In recompence whereof, he shall have yearly out of the Church for appropriate, one or two Shillings, more or less, for a Pension, as was agreed at the time of the appropriating. And this Pension is call'd an *Indemnity*.

**INDENTED**, is a Term in Heraldry, when the Out-Line of a Hordure, Ordinary, &c. is in the Form of the Teeth of a Saw. Thus

**INDENTURE**, in Law, is a Writing comprizing some Contract between two at least; being indented at top answerable to some other, which likewise containeth the same Contract. It differs from a Deed-Poll; in that this last is a single Deed, and is unindented.

**INDEPENDENTS**. The Name of a Religious Sect in England in Holland. They are so call'd, as denying not only any Subordination among their Clergy, but also all Dependency of any other Assembly. They teach, that every separate Church or particular Congregation among them has in itself radically and essentially every thing necessary for its own Government; that it has all Ecclesiastical Power and Jurisdiction; and is not at all subject to other Churches or their Depaties, nor to their Assemblies or Synods. Tho the *Independents* don't think it very necessary to assemble Synods; yet, they say, if any are held, they look on their Resolutions as wise and prudential Councils, not as Decisions to be peremptorily obey'd. They agree, that one or more Churches may help another Church with their Advice and Assistance, and even reprove it when it offends, provided they don't pretend to any superior Authority or Right to excommunicate, &c. In Matters of Faith and Doctrine, the *Independents* agree with the rest of the Reformed; so that the Difference is rather Political than Religious. During the Civil Wars in England, the *Independents* becoming the most powerful Party, and getting to the Head of Affairs, most of the other Sects that were averse to the Church of England, join'd them: Which occasion'd them to be distinguish'd into two Sects. The first are in effect *Presbyterians*, only differing from them in Matters of Discipline. The others, whom M. Spanghem calls *Pseudo-Independents*, are a confused Assemblage of *Anabaptists*, *Seemants*, *Antinomians*, *Familiarists*, *Libertines*, &c.

*F. Orlicus* speaks of their Rise in the following Terms. 'Out of the same Sect (the Presbyterians) had risen some time ago, on pretence of further Reformation, a new Sect, that was not only averse to the Monarch, but the Monarchy, both which it undertook to destroy; and in lieu thereof to form a Republic.—They were call'd by the Name of *Independents*, in regard that professing to carry the Gospel-Liberty still further than the Puritans, they reject'd not only Bishops, but also Synods, pretending each Assembly ought to govern itself independently of all others; in which, said they, consists the Liberty of the Children of God. At first they were only distinguish'd among the Presbyterians as the more zealous from the more indifferent, the more rigid from the more remiss, by a greater Aversion to all Pomp and Pre-eminence both in Church and State, and by a more ardent Desire to reduce the Practice of the Gospel to its primitive Purity. It was their Maxim of Independence that first distinguish'd them, and render'd them suspected to the rest. But they had Address and Artifice enough to gain ground, and in effect made abundance of Profelytes out of all other Parties and Persecutions.'

**INDEPENDENTISM** is peculiar to Great Britain, the British Colonies, and the United Provinces. One Morel in the 16th Century endeavour'd to introduce it into France, but it was condemn'd at the Synod of Rochel, where *Beta* presided, and again at the Synod of Rochel in 1644.

**INDETERMINATE**, in Geometry, is understood of a quantity of Time or Place that has no certain or definite Bounds; see *Indefinite*. An *indeterminate* Problem is that, whereof there may be various Solutions. For instance, if a Number is required that may be a Multiple of 4 and 5; the Answer may be 20, 40, 60, &c. to Infinity. Mr. Proffer calls an *indeterminate* Analysis, that which admits of an infinite Number of different Solutions.

**INDEX**, the Fore-Finger, from *index*, to point or direct; because that Finger is generally so us'd. Hence also the *Extensor Indici* is call'd Indicator. The Greeks call it *Αυξας*, *Licker*; this Finger being us'd to be dip'd in Saucy, &c. in order to taste 'em; after which 'tis usually lick'd; or, as others will have it, because the Nurses use it to take up the Food wherewith they feed their Infants; first licking it, to taste whether or no it be hot.

*Index*, in Arithmetic, is the same with what is sometimes call'd the Characteristic, or Exponent of a Loga-

rithm; and shews always of how many Places the absolute Number belonging to the Logarithm doth consist, and of what nature it is, that is, whether an Integer or a Fraction: Thus, in this Logarithm 2.521293, the Number standing on the Left-hand of the Point is call'd the *Index*; and because it is 2, shews you that the absolute Number answering to it, consists of 3 places: for it is always one more than the *Index*, because the *Index* of 1 is 0; of 10 is 1; and of 100 is 2, &c. As in this Exam-

0 1 2 3 4 5 6 7 8 9

1 2 3 4 5 6 7 8 9

Where the upper Numbers are *Indices* to the lower, And therefore in those small Tables of *Briggs's* Logarithms, where the *Index* is omitted, it must be always supply'd, before you can work by them. If the absolute Number be a Fraction, then the *Index* of the Logarithm hath a negative Sign, and is mark'd thus, 2.562293; which shews the corresponding Number to be a Decimal Fraction of three Places, viz. 2.365. Mr. *Townly* hath a peculiar way of noting these *Indices*, when they express Fractions, and it is now much in use, viz. by taking, instead of the true *Index*, its Arithmetical Complement to 10; and therefore he would write the Logarithm now mention'd, thus, 8.562293. How they are added and subtracted, see in *Addition* and *Subtraction*.

*Index of a Globe*, is a little Stile fixed on to the North-Pole, and turning round with it, pointing to certain Divisions in the Hour-Circle. It is sometimes also call'd *Gnomon*. See *Globe*.

*Index, or Indice*: At Rome there is a Congregation that goes by this Name; whose Business is to examine Books, and to put such as they think fit to prohibit the reading and the selling of, into an *Index*: *Indicte*, or expurgatory *Indicte*, being the Name by which the Catalogues of prohibited Books are call'd; among which, however, there is this difference, that some are condemn'd purely and absolutely; and others only *donec corrigantur*, till they be corrected. Philip II. of Spain, was the first who procur'd an *Index* to be printed of the Books condemn'd by the Inquisition of Spain. Pope Paul IV. took the hint, and in 1559 order'd the Congregation of the Holy Office at Rome to print a second. Pius V. recommended the Matter to the Council of Trent, who made another. After this, the Duke of *Alva* procur'd another to be printed at Antwerp in 1571. Clement VIII. in 1596. printed a very copious one, call'd by the Name of the *Roman*. There were two others publish'd in 1583 and 1612, by the Cardinals *Guisot* and *Sandevell*, and several others by the Inquisitors and Masters of the Sacred Palace. The most considerable of all the *Indices* is that of *Salamanca*, which was made by all the States subject to the King of Spain, and comprehends all the others; coming down as low as the Year 1667.

**INDIAN WOOD**, call'd also *Jamaica* and *Campeche Wood*, is taken out of the Heart of a large Tree growing plentifully in the Isles of *Jamaica*, *Campeche*, &c. It is us'd in Dying; its Decoction is very red: and it has been observ'd, that putting some of this Decoction into two Bottles, and mixing a little Powder of Alum with the one, it will become of a very beautiful Red, which will hold; the other in a day's time becoming yellow, though both Bottles were stop'd from the Air alike: and if a little of the same Decoction were expos'd to the Air, it would become black as Ink in the same space of Time.

**INDICATION**, a Sign discovering or pointing out something to be done. The Physicians use the Word to signify the Invention of a Remedy proper to cure a Disease, from the Knowledge which they have of the Qualities of that Remedy. *Indication* either tends to preserve a natural sound State, which is call'd *vital Indication*, or to remove something disagreeable to Nature. The second *Indication* either relates to Sickness, and is call'd *curative Indication*; or to some antecedent Cause, in which case 'tis call'd *preservative* or *symptomatic Indication*. That part of Physic which treats of *Indications*, is call'd *Semiotica*.

**INDICATIVE**, in Grammar, is the first Mode or Manner of Conjugating Verbs, shewing either the Time present, past, or future. *I love*, is the present Tense; *I loved*, the past; and *I will love*, the future of the *Indicative* Mode.

**INDICATOR**, in Anatomy, a Muscle of the Index, or second Finger following the Thumb. The *Indicator* is the first proper Muscle of the Index; and is so call'd, because it serves us to point at any thing wirhal. It has its Origin in the middle and hind part of the Cubitus, and is inserted by a double Tendon into the second Phalanx of the Index, and to the Tendon of the great Extensor, acting in conjunction with it, in stretching out that Finger.

INDICTION signifies the Convocation of an Ecclesiastical Assembly, as of a Synod or Council, and even a Diet. The word is also used of the several Sessions of the same Councils. And hence it is, that at the end of the Sessions of the Council of *Trent*, the Decree by which the Council appoints the Day of the future Session, is called the *Indiction* of that Session.

By *Roman Indiction* is meant an Epoche, or Manner of accounting Time used by the *Romans*, containing a Cycle or Revolution of fifteen Years, which when expired it returns to Unity again. This Method of Computation has no Dependence on the heavenly Motions. *Petavius* says, there is nothing in Chronology less known than the *Roman Indiction*; he means, than its Origin and Commencement. 'Tis the general Opinion it was instituted in the time of *Constantine*, but this is a mere Guess. There were *Indictions* in the time of the Emperor *Constantin*, as appears from the *Theodosian Code*. The Learned held that the *Indictions* were no more than certain annual Taxes, the Tarif whereof was published every Year: but why they were so called, why confined to a Cycle of fifteen Years, when or on what Occasion instituted, is not known. We find three kinds of *Indictions* mentioned in Aurbors; the *Indiction of Constantine*, beginning on the Calends of September; the Imperial or *Cesarian Indiction*, on the 24th of September; and the *Roman Indiction*, which is that used in the Pope's Bulls, and begins on the 1st of January. The Popes have dated their Acts by the Year of *Indiction*, ever since *Charlemagne* made them Sovereign; before which time they dated them by the Years of the Emperors. At the time of the Reformation of the Calendar in 1582, was reckoned the tenth Year of the *Indiction*: So that beginning to reckon hence, and dividing the Number of Years elapsed between that time and this by 15, the Remainder will be the Year of *Indiction*, corresponding to the present Year of our Lord 1722. viz. 15. This may also be found by adding 3 to the Year of our Lord, and dividing the Sum by 15. The word *Indiction* comes from *Indictio*, which signifies Establishment, Order, or Denunciation. The Time of the *Indiction* among the *Romans*, was that wherein the People were summoned to pay a certain Tribute; and 'tis for this Reason that the Imperial *Indiction* began towards the end of September, because the Harvest being then got in, it was supposed the People could easily pay their Tribute.

INDICTIVE, an Epithet given to certain Feast-Days appointed by the *Roman Magistrates*, viz. the Consul or Praetor. See *Feria*.

INDICTMENT, or ENDITEMENT, in our common Law, signifies as much as *Accusatio* among the Civilians; tho' in some Points it differs. An *Indictment* is a Bill, or Declaration, made in form of Law for the Benefit of the Commonwealth, exhibited as an Accusation of one for some Offence, either criminal or penal, unto Jurors, and by their Verdict found to be true, and presented before an Officer that has Power to punish the same Offence. It seems to be an Accusation, because the Jury that enquireth of the Offence does not receive it, till the Party that offereth the Bill, appearing, subscribe his Name, and proffer his Oath for the Truth of it. It is always at the Suit of the King, and differs from an Accusation in this, that the Preferrer is no way tied to the Proof thereof upon any Penalty, if it be not proved, except there appear a Conspiracy. The word is derived from the French *indictre*, *indicare*, or according to Mr. Lambert, *indicare*.

INDIGESTION, a want of Digestion. In the System of Trituration, *Indigestion*, which is a Cradity, may be very naturally accounted for, from the Relaxation of the Fibres of the Stomach. A bilious *Indigestion*, in the Opinion of *Hecquet*, a great Advocate for Trituration, is owing to too much Force in the Stomach, too much Vivacity in its Oscillations, which spoil the Digestion, by rendering the Trituration imperfect. But this is hardly satisfactory, for it should seem that Digestion would be the more perfect, in proportion as the Force of the Stomach increased. See *Digestion*.

INDIGETES, a Name which the Antients gave to their Gods, or at least to some of them. There are various Opinions about the Origin and Signification of this word; some pretending it was given to all the Gods in general, and others only to the Great Men whom they deified; others say it was given to such Gods as were originally of the Country, or rather such as were the Gods of the Country that bore this Name; and others again hold it was ascribed to such Gods as were Patrons and Protectors of Cities.

Those of the first Opinion maintain, that the Gods were so called by *Antiphrasis*, because they wanted nothing; the word coming from the Verb *indigeo*, I want. If this were true, the word *Indigetes* would signify nearly

the same thing in Latin with the Hebrew *שְׁחַלְלִי*, *Schallal*, which the Scripture frequently gives to God, as signifying, that he is sufficient for himself, and needs nothing. Those of the second Opinion derive the word from *indigare*, to call, invoke; it being these Gods who were ordinarily invoked, and who lent the readiest Ear to the Vows that were made them. To this purpose they cite *Macrobius*, who uses the word *indigare* in that Sense, telling us the Vestals make their Invocations thus, *Apollō Phœbicus! Apollō Pean! Vespales in indigant, Apollō Medice! Apollō Pean!* They add, that their Book of Prayers and Forms of Invocation were called *Indigamenta*. Lastly, others hold *Indigetes* to be derived from *inde genitus*, or *in loco degens*, or from *inde* and *ago* for *dego*, I live, *Indabit*; which last Opinion seems the most probable. In effect it appears, that these *Indigetes* were also called *Local Gods*, *Dii Locales*, or *Topical Gods*, which is the same thing. (2.) The *Indigetes* were ordinarily Men deified, who indeed were, in effect, Local Gods, being esteemed the Protectors of those Places where they were deified; so that the second and third Opinion are very consistent. (3.) *Virgil* joins *Patrii Indigetes*, as being the same thing, *Geor. I. Dii Patrii, Indigetes*. (4.) The Gods to whom the *Romans* gave the Name *Indigetes*, were *Faunus*, *Vesta*, *Jenens*, *Romulus*, all the Gods of Italy; and at *Athenis* *Mincrus*, says *Servius*, and at *Carthage* *Dido*. 'Tis true we meet with *Jupiter Indiges*, but that *Jupiter Indiges* is *Jenens*, not the Great *Jupiter*; as we may see in *Livy*, l. 7. c. 3. in which last sense *Servius* assures us, *Indiges* comes from the Latin, in *Duo ago*, I am among the Gods.

INDIGNATORIUS MUSCULUS, that Muscle is thus called, in effect to draw the Eye from its inner Corner outwards, which gives an Appearance of Scorn and Anger; but this is properly a compound Motion of two Muscles: for which see *Eye*.

INDIGO, a Drug of a deep blue Colour, brought hither from the *West-Indies*. It is drawn from the Leaves of a Plant which the *Spaniards* call *Anil*, and we *Indigo*. The Method of Preparation is this. When the Plant has attained to a certain height, and its Leaves are in a good Condition, they cut them down, and throw them into a kind of Vat, covering them with Water. These they boil together for the space of twenty four hours: at the Top swims a Scum, with all the different Colours of the Rainbow. Then the Water is let off into another Vessel, where they agitate and churn it, as it were, with five or six long Poles, fitted together for that purpose. This they continue to do till the Water becomes of a deep Green, and till the Grain, as they call it, forms itself, which they discover by taking a little of it out into another Vessel, and spitting in it; for if then they perceive a bluish Drug subsiding, they cease to beat. The Matter then precipitates of itself to the Bottom of the Vessel, and when it is well settled, they pour off the Water. After this they take out the *Indigo*, and put it into little Linen Bags, and let it drain; this done, they put it into shallow wooden Boxes, and when it begins to dry, they cut it into slices, and let them harden in the Sun.

There are several kinds of *Indigo*; the best is that called *Serguiffe*, from the Name of a Village where 'tis prepared. We chuse it in flat Pieces, of a moderate thickness, pretty hard, clean, light enough to swim in the Water, inflammable, of a fine blue Colour, marked a little on the Inside with Silver Streaks, and appearing reddish when rubbed on the Nail.

*Indigo* is used among the Painters, who grind and mix it with white to make a blue Colour; for without that Mixture it would paint blackish. They mix it with Yellow, to make a Green Colour. It is also used in Dying, and by the Laundresses, to give a bluish Cast to their Lincn.

In the *Flores Malabaricus* is an Account of the Plant whence *Indigo* is drawn: The Decoction of whose Root is said to be excellent against Nephritic Cholics; its Leaves, applied to the lower Ventricle, good to promote Urine; and the *Indigo* itself of good Use in drying Tumours.

INDIRECT Modes of Syllogisms in Logic, are the five last Modes of the first Figure, expressed by the barbarous words *Baralipon*, *Celantis*, *Dabitis*, *Erifonamur*. 'Tis the Conversion of the Conclusion which renders these Modes indirect. For instance, a Syllogism in *Darii*, and another in *Dabitis* would be perfectly alike, were it not for that Conversion; the Propositions having the same Quantity, and the same Quality, and the middle Term being the Subject in the Major, and the Attribute in the Minor in both. It remains then, that to make a Distinction, that which is the Subject of the Conclusion in *Darii*, is the Attribute in the Conclusion of *Dabitis*; and that which is the Attribute in the first, the Subject in the last.

D A- Every thing that promotes Salvation is advantageous;

R I- There are Afflictions which promote Salvation;

I. Therefore there are Afflictions which are advantageous.

D A- Every thing that promotes Salvation is advantageous;

B I- There are Afflictions which promote Salvation;

T I S. Therefore some things promoting Salvation are Afflictions, or afflicting.

INDIVIDUAL, or INDIVIDUUM, in Logic, is a particular Being of any Species, or that which can't be divided into two or more Beings, equal or alike. The usual Division in Logic is made into Genera, or Genus's, those Genera into Species, and those Species into Individuals. The Schoolmen make a fourfold Distinction of Individuals: (1.) *Individuum Vagum*, is that, which tho' it signifies but one thing, yet may be any of that kind; as when we say a Man, a certain Person, or one said to and so, tho' but one Person is meant, yet that Person, for ought that appears to the contrary, may be any body. (2.) *Individuum Determinatum*, is when the thing is named and determined; as *Alexander*, the River Nile, &c. this is also called *Signatum*. (3.) *Individuum Demonstrativum*, is when some demonstrative Pronoun is used in the Expression; as this Man, that Woman. (4.) *Individuum ex Hypothesi*, only Supposition, when an universal Name or Term is restrained, by the Supposition, to a particular thing; as when we say, the Son of such an one, and it be known that he had but one Son.

INDIVISIBLES, in Geometry, are understood of such Elements or Principles, as any Body or Figure may ultimately be resolved into; and these Elements, or *Indivisibiles*, are, in each peculiar Figure, supposed to be infinitely small. With regard to this Notion, a Line may be said to consist of Points, a Surface of parallel Lines, and a Solid of parallel and similar Surfaces; and then because each of these Elements is supposed indivisible, if in any Figure, a Line be drawn thro' the Elements perpendicularly, the Number of Points in that Line will be the same, as the Number of the Elements. Whence we may see, that a Parallelogram, Prism, or Cylinder, is resolvable into Elements or *Indivisibiles*, all equal to each other, parallel, and like to the Base: A Triangle into Lines parallel to the Base, but decreasing in Arithmetical Proportion; and so are the Circles, which constitute the Parabolic Conoid, and those which constitute the Plane of a Circle, or the Surface of an Isosceles Cone. A Cylinder may be resolved into Cylindrical Curve Surfaces, having all the same Height, and continually decreasing inwards, as the Circles of the Base do, on which they insit. This Method of *Indivisibiles* is only the ancient Method of Exhaustion, a little disguised and contracted, and is now allowed to be of excellent Use in the shortning of Mathematical Demonstrations. Of which take the following Instance in that famous Proposition of *Archimedes*, That a Sphere is two Thirds of a Cylinder circumscribing it. For suppose (as in the Figure) a Cylinder, Hemisphere, and an inverted Cone to have the same Base and Altitude, and

to be cut by infinite Planes, all parallel to the Base, of which *d g* is one; it is plain, the Square of *d b* will every where be equal to the Square of *h e* (the Radius of the Sphere) the Square *h e c = c b* square; and consequently since Circles are to one another as the Squares of the Radii, all the Circles of the Hemisphere will be equal to all those of the Cylinder, deducting thence all those of the Cone: wherefore the Cylinder, deducting the Cone, is equal to the Hemisphere; but it is known, that the Cone is one Third of the Cylinder, and consequently the Sphere must be two Thirds of it.

INDORSEMENT is any thing written on the Back of a Deed or Instrument; as a Condition, written on the back of an Obligation, is commonly called an *Indorsement*, from *in* and *Dorsum*, Back.

INDUCTION, in Logic, is a Consequence drawn in reasoning from several established Principles. Thus the Conclusion of a Syllogism is an *Induction* made from the Premises. An *Induction*, however, may be justly said to be a Syllogism of itself, being a kind of Medium between an Enthymeme and a Gradation, in regard it wants a

Proposition (which, however, is understood) as in the Enthymeme, and abounds in Assumptions (which yet are collateral, or of the same degree) which is the Case in a Gradation. Thus, for instance, every Terrestrial Animal lives, every Aerial Animal also lives, every Aquatic Animal lives, and every Reptile Animal lives; therefore every Animal lives. There are, it may be observed, various Assumptions, from the more general Species of the Animal Kind collected into one, which this Proposition is supposed to precede, viz. every Animal is either Terrestrial, Aerial, Aquatic, or Reptile.

*Suidas* reckons three kinds of *Induction*; that just mentioned, which concludes or gathers some general Proposition from an Enumeration of all the Particulars of a kind, he calls the *Dialectic Induction*. The second, which proceeds by Interrogation, and concludes probably, or with a Verisimilitude, by the Greeks called *ὑποθητική*, and was that which *Socrates* ordinarily made use of, as *Cicero* in his *Topics*, and *Quintilian* have observed. The third kind of *Induction* is properly rhetorical; being a Conclusion drawn from some Example or Authority. This is a very imperfect *Induction*, all its Force lying in a Proposition which is concealed, and which will hardly bear being expressed. Thus he that says, *Cadmus* died bravely for his Country, therefore I must die bravely for my Country, proves nothing, unless this Proposition be carried in mind, that I must do the same with *Cadmus*. Again, *Archimedes*, and the other Mathematicians say, the Sun is much bigger than the Earth; therefore it must be owned the Sun is much bigger than the Earth. Where the Proposition is understood, viz. whatever *Archimedes* and the other Mathematicians say is true.

INDUCTION, in the English Customs, is usually taken for the giving Possession to an Incumbent of his Church, by leading him into it, and delivering him the Keys by the Commissary or Bishop's Deputy, and by his ringing one of the Bells. When a Clerk is instituted into a Benefice, he is to exhibit his Mandate from the Bishop to the Arch-Deacon, or other Person to whom it is directed, and hath a Right thereby to be inducted into his Living; and if he be refused *Induction*, he hath a Remedy both in the Ecclesiastical Court, and also an Action of the Case in the Common Law, against the Arch-Deacon. If the Inductor, or Person to be inducted, be kept out of the Church or House by Laymen, the Writ *de vi Laica* lies for the Clerk, which is directed out of the Chancery to the Sheriff of the County, to remove the Force, &c. If another Clergyman, presented by the same Patron, keep possession, a Spoliation is grantable out of the spiritual Court, whereby the Tithes, &c. shall be sequestered, till the Right be determined. The Arch-Deacon rarely inducts a Clerk by himself in Person, but issues out a Warrant to all Clerks and Lettered Persons within the Arch-Deaconry, empowering any of them to do it in his stead. The usual Form and Manner of *Induction*, is, for the Inductor to take the Clerk by the Hand, and then to lay it on the Key of the Church, which must be then in the Door, and to say, 'By virtue of this Instrument, I induct you into the real, actual, and corporal Possession of the Rectory or Vicarage of —, with all its Fruits, Profits, Members, and Appurtenances.' This done, he opens the Door, and puts the Clerk in possession of the Church, and shuts the Door upon him; who after he hath tolled a Bell (if there be any) comes out, and desires the Inductor to indorse a Certificate of his *Induction* on the Arch-Deacon's Warrant, and that all present will signify it under their Hands. If the Church-Key cannot be had, it is sufficient that the Clerk lays hold of the Ring of the Door, and within the time limited read the Common-Prayer, and Thirty-nine Articles of the Church in the Church-Porch. Within two Months after this, the Clerk must read the Thirty-nine Articles, and all the Service of the Day, both at Morning and Evening-Prayers, and declare his Assent and Consent; he must also then read the Bishop's English Certificate, in which is the Declaration of his Conformity; and of all this he must have two or three good Witnesses, who must sign that they heard him do it, and be ready to attest it, *in voce*, if required; and within three Months after *Induction*, he must also take the Abjuration-Oath at the Quarter-Sessions, or in some one of the Courts at *Westminster-Hall*. The word *Induction* is derived from the Latin *in*, and *duco*, to lead.

INDULGENCE, in the Romish Theology, is the Remission of the Punishment due to a Sin, granted by the Church, and supposed to save the Sinner from Purgatory. They found their *Indulgences* on the infinite Treasure of the Merits of Jesus Christ, the Holy Virgin, and all the Saints, which they suppose the Church has a right of distributing, by virtue of the Communion of Saints. The Roman Jubilee carries with it a plenary or full *indulgence* for all the Crimes committed therein. The Pope also grants Bulls of plenary *Indulgence* to several Churches,

Monasteries, and even to private Persons; and 'tis a frequent thing to have general *Indulgences* for the time of the principal Feasts of a Year. Their Casuists say, that a plenary *Indulgence* does not always prove effectual, for want of complying with the Conditions whereon it was granted.

*Indulgence, Indult, or Indulto*, signifies also a special Favour or Privilege, conferred either on a Community, or a particular Person, by the Pope's Bulls, in virtue whereof he is licensed to do or obtain something contrary to the Intention and Disposition of the common Laws. There are two kinds of *Indults*; the one active, which consists in a Power of nominating and presenting freely, and without reserve, to Benefices that are otherwise limited and restrained by the Laws of the Apostolical Chancery; such are those ordinarily granted to Secular Princes, Cardinals, Bishops, &c. Passive *Indults* consist in a power of receiving Benefices and expectative Graces; of which kind are those of a Parliament, of Graduates, and Mandatories. The *Indult* of Kings is the Power given them of presenting to Consistorial Benefices, either by Treaty, by Favour, or special Privilege. The *Indult* of Cardinals is a Licence for holding Regular as well as Secular Benefices, in disposing of them in commendam, or continuing them, &c. *Indult* of Parliament is a Right or Privilege granted to the Chancellor, Presidents, Counsellors, and other Officers in the Parliaments, to obtain a Benefice of the Collator, upon the King's Nomination directed to him. This is a kind of Advowson or Patronage belonging to the French King, the *Indult* being a Mandate or Grace, by which he is permitted to name to any Collator he pleases, a Counsellor, or other Officer of Parliament, on whom the Collator shall be obliged to bestow a Benefice: so that the Right of the *Indult* resides radically in the King, the Officers being only the Objects thereof. See *Dispensation*.

**INDURATING**, a Term applied to such Things as give a harder or firmer Consistence to others, by a greater Solidity of their Particles, or as dissipate the thinner Parts of any Matter, so as to leave the Remainder harder. Thus a Tumour is indurated, either by the Addition of earthy and solid Particles, as in *Scurvy* and knotty Swellings, or by transpiring the thinner Parts thro' the Skin, whereby the Remainder grows more fixed, as in an *Oedema*.

**INEQUALITY of Natural Days.** See *Equation*.

**INERTIAE VIS.** See *Vitæ inertia*.

**INESCATION**, a kind of Transplantation, practis'd for the Cure of certain Diseases; it consists in impregnating a proper Medium or Vehicle, with some of the Murnia or vital Spirit of the Patient, and giving it to some Animal to eat. 'Tis pretended the Animal unites and assimilates that Murnia with itself, correcting it, and imbibing its vicious Quality, and by that means restoring Health to the Person whereof the Murnia belonged. If the Animal happens to die before the Cure be effected, a second Animal must be pitched on, and the Experiment repeated. Some tell us, that the Blood of the Patient well purified or fermented, does the Business better than any other Part. The word is derived from the primitive Preposition *in*, and *escā*, Food.

**INESCUTCHEON**, in Heraldry, signifies all the *Escutcheons* containing 3 of the Field, and is borne within it, as an Ordinary. Thus, 'tis said, he beareth Ermuin, an *Inescutcheon* Gules. This is also sometimes called an *Inescutcheon of Pretence*, which is borne when a Man marries an Heiress; for then he bears her Coat of Arms on an *Inescutcheon*, or *Escutcheon of Pretence*, in the middle of his own Coat.

**IN ESSE**, Authors make this Difference between a thing in *esse*, and a thing in *potestate*: a thing that is not, but may be, they say is in *potestate*; but a thing apparent and visible, they say is in *esse*, that is, has a real Being *eo instanti*, whereas the other is casual, and at best but a Possibility.

**INFALLIBLE**, that which cannot deceive, or be deceived. Upon this Term stands one of the principal Heads of Controversy between the Reformed and the Catholics. The latter of whom maintain, that the Church, assembled in General Council, is *infallible*, which the former deny. The principal Reasons they give for the *Infalibility*, are drawn from the Obscurity of the Scriptures, the Insufficiency of private Judgment, and the Necessity there is of some *infallible* Judge for the Decision of Controversy. The *Infalibility* of the Pope is a Doctrine of a late standing, and not entirely acquiesced in even in their own Communion. *Du Pin*, a Doctor of the Sorbonne, has written against it, and the late Behaviour of the Cardinal de Noailles, and the protesting Bishops, favoured by a considerable Part of the Clergy of France, shew to how low an Ebb the Pope's *Infalibility* is reduced

in that Country. The word comes from the Latin Preposition *in*, taken privatively, and *fallō*, I deceive.

**INFAMOUS**, in the ordinary Use of the Word, signifies something notoriously contrary to Virtue or Honour. *Aulus Gellius* uses the words *Infames Materias*, for what we ordinarily call *Paradoxes*, i. e. Discourses remote from the common Opinion; Propositions that appear opposite to Truth, &c. as the Elogy of *Thebes*; the Praise of a Quarant Ague, &c.

*Infamous*, in Law, is something void of Honour, that has no Repute or Esteem in the World. There are two kinds of *Infamy*; some being *infamous* by Right, *de Jure*, as those who have been noted by the Laws, or stigmatized by publick Judgments: Others are *infamous* in Fact, *de Facto*, as those who exercise some scandalous Profession, as a Catchpole, a Merry Andrew, a Hangman, an Informer, &c. Heretofore there were Crowns of *infamy* given by way of Punishment to Criminals: they were made of Wool. The word *infamous* is derived from the Latin, *in*, and *Fama*, Fame, Report.

**INFANT**, any Man or Woman under the Age of one and twenty Years is an *Infant* in Law. An *Infant* eight Years of Age, or upwards, may commit Homicide, and be hanged for it, if it appear by any other Act that he had Knowledge of Good and Evil; for here *Malina Suppletit Aetatem*; yet *Coke on Littleton*, *Señ. 403.* says, *An Infant shall not be punished till the Age of fourteen*; which, according to him, is the Age of Discretion.

**INFANTE, INFANTA**, a Title of Honour given to the Children of some Princes, particularly to those of the House of Spain and Portugal. It is usually said that this Title was introduced into Spain, on occasion of the Marriage of *Eleanor of England* with King *Ferdinand of Castile*, and that their Son *Stebes* was the first that bore it. But this is contradicted by *Pelagius Bishop of Oviedo*, who lived in the Year 1100, and informs us, that the Titles *Infante* and *Infanta*, were used in Spain ever since the Reign of King *Euroend II.*

**INFANTRY**, Troops, or Potecs, consisting of Foot-Soldiers.

**INFATUATE**, to prepossess any one in favour of a Person or Thing that does not deserve it, so far as that he can't easily be disabused. The *Romans* called those infatuated Persons *Infatuati*, who fancied they had seen Visions, or imagined the God *Faunus*, whom they called *Fatuus*, had appeared to them. The word *infatuare* comes from the Latin *Fatuus*, Fool, of *fari*, to speak out, which is borrowed from the Greek *φατος*, whence *phos*, which signifies the same with *Vates* in Latin, or *Prophet* in English; and the reason is, because their Prophets or Priests used to be seized with a kind of Madness or Folly, when they began to make their Predictions, or deliver Oracles.

**INFECTION**, is the catching a Disease by some Effluvia or fine Particles, which fly off from some diseased Bodies, and mixing with the Juices of others, occasion the same Disorders, as in the Bodies they came from. The word comes from the Latin Verb *inficere*, which properly signifies to dye of some other Colour; *inficere*, i. e. *facere ut aliquid intus sit, ut occasion something to be imbedded.* See *Purification*.

**INFIDEL**, a Term applied to such Persons as are not baptized, and that do not believe the Truths of the Christian Religion. 'Tis Baptism that makes the specific Difference between an Heretic and an *Infidel*.

**INFINITE**, that which has neither Beginning nor End; in which sense God alone is *infinite*. The word is also used to signify that which has had a Beginning, but will have no End, as Angels, and human Souls. This is what the Schoolmen call *infinitum à parte post*; as, on the contrary, by *infinitum à parte ante*, they mean that which has an End, but had no Beginning.

An *infinite Line* in Geometry, is an indefinite or indeterminate Line, to which no certain Bounds or Limits are prescribed.

*Infinite Quantity.* See *Quantity Infinite*.

*Infinite Series.* See *Series*.

**INFINITELY INFINITE FRACTIONS**, a Term used where all the Fractions, whose Numerator is 1, are together equal to an Unit; and hence it is deduced, that there are not only *infinite* Progressions, or Progressions in *infinitum*; but also *infinitely* farther than one kind of Infinity. That these *infinitely infinite* Progressions are notwithstanding computable, and to be brought into one Sum; and that not only finite, but into one so small, as to be less than any assignable Number: That of Infinite Quantities, some are equal, others unequal; that one infinite Quantity may be equal to two, three, or more Quantities, whether infinite or finite.

**INFINITIVE**, in Grammar, is the Name of one of the Modes serving for the conjugating of Verbs. It does not denote any precise time, nor does it determine the Number or Persons, but expresses things in a loose indefinite Sense, as to reach, &c. In most Languages, both ancient and modern, the *Infinitive* is distinguished by a

Termination peculiar to it, as *ωστος* in the Greek, *serbere* in the Latin, *serire* in the French, *seruire* in the Italian, &c. but the English is defective in this point; so that to denote the *Infinite*, we are always obliged to have recourse to the Article *is*, excepting sometimes when two or more *Infinities* follow each other. The Practice of using a Number of *Infinities* successively, is a great, but a common Fault in Language, as he offers to go to teach to write English. Indeed, where these *Infinities* have no dependence on each other, they may be used elegantly enough; as to mourn, to sigh, to sink, to swoon, &c.

**INFINITY.** The Idea signified by the name *Infinity* is best examined, by considering to what *Infinity* is by the Mind attributed, and then how it frames it. Finite and Infinite are looked upon as the Modes of Quantity, and attributed primarily to things that have Parts, and are capable of Increase or Diminution, by the Addition or Subtraction of any the least Part. Such are the Ideas of Space, Duration, and Number. When we apply this Idea to the Supreme Being, we do it primarily in respect of his Duration and Ubiquity; more figuratively, when to his Wisdom, Power, Goodness, and other Attributes, which are properly inexhaustible and incomprehensible: For when we call them infinite, we have no other Idea of this Infinity, but what carries with it some Reflection on the Number or the Extent of the Acts or Objects of God's Power and Wisdom, which can never be supposed so great, or so many, that these Attributes will not always surmount and exceed, tho' we multiply them in our Thoughts with the *Infinity* of endless Number. We do not pretend to say, how these Attributes are in God, who is infinitely beyond the reach of our narrow Capacities; but this is our way of conceiving them, and these our Ideas of their *Infinity*. We come by the Idea of *Infinity* thus. Every one that has any Idea of any fixed Lengths of Space, as a Foot, Yard, &c. finds that he can repeat that Idea, and join it to another, to a third, and so on, without ever coming to an end of his Additions. From this Power of enlarging his Idea of Space, he takes the Idea of infinite Space, or Immensity. By the same Power of repeating the Idea of any Length or Duration we have in our Minds, with all the endless Addition of Number, we come by the Idea of Eternity. If our Idea of Infinity be got, by repeating without end our own Ideas, why do we not attribute it to other Ideas, as well as those of Space and Duration; since they may be as easily and as often repeated in our Minds as the other? yet no body ever thinks of infinite Sweetness, or Whiteness, tho' he can repeat the Idea of Sweet or White, as frequently as those of Yard or Day? To this it is answer'd, that those Ideas which have Parts, and are capable of Increase by the Addition of any Parts, afford us by their Repetition an Idea of *Infinity*; because with the endless Repetition there is continued an Enlargement, of which there is no end: but it is not so in other Ideas; for if to the perfect Idea I have of White, I add another of equal Whiteness, it enlarges not my Idea at all. Those Ideas, that consist not of Parts, cannot be augmented to what proportion Men please, or be stretch'd beyond what they have received by their Senses; but Space, Duration, and Number being capable of Increase by Repetition, leave in the Mind an Idea of an endless room for more; and so those Ideas alone lead the Mind towards the Thought of *Infinity*. We are carefully to distinguish between the Idea of the *Infinity* of Space, and the Idea of a Space infinite. The first is nothing but a supposed endless Progression of the Mind over any repeated Idea of Space: But to have actually in the Mind the Idea of a Space infinite, is to suppose the Mind already pass'd over all those repeated Ideas of Space, which an endless Repetition can never totally represent to it; which carries in it a plain Contradiction. This will be plainer, if we consider *Infinity* in Numbers. The *Infinity* of Numbers, to the End of whose Addition every one perceives there is no Approach, easily appears to any one that reflects on it: But how clear soever this Idea of the *Infinity* of Numbers be, there is nothing yet more evident, than the Absurdity of the actual Idea of an infinite Number.

**INFIRMARY,** a Place where the Sick belonging to any Society or Community are disposed.

**INFLAMMATION,** in Phisic, is understood of a Tumour, occasioned from an Obstruction; by means whereof the Blood flowing into some Part faster than it can run off again, swells up, and causes a Tension, with an unusual Soreness, Redness, and Heat. The immediate Cause, therefore of all *Inflammations*, is an overflowing of Blood. Other Causes, more remote, may be the Density and Coagulation of the Blood, or the Relaxation and Contusion of the Fibres. Physicians have given particular Names to the *Inflammations* of several Parts. That of the Eyes is call'd *Ophthalmia*, that of the Lungs *Peripneumonia*, and that of the Liver *Hepatitis*. The word *Inflammation*

comes from the Latin *in*, and *Flamma*, Flame.

**INFLATION,** a blowing up; is the stretching or filling any flaccid or distensible Body, with a flatulent or windy Substance. From the Latin *in* and *flatus*, of *flu*, I blow.

**INFLECTION,** in Optics, is a multiplicate Refraction of the Rays of Light, caused by the unequal Density of any Medium, whereby the Motion or Progress of the Ray is hindered from going on in a right Line, and is inflected or deflected by a Curve, saith Dr. Hook, who first took notice of this Property: And this, he saith, differs both from Reflection and Refraction, which are both made at the Superficies of the Body, but this in the middle of it within. Sir Isaac Newton, as you will find under *Light*, discover'd also by plain Experiment this *Inflection* of the Rays of Light; and M. de la Hire saith, he found, That the Beams of the Stars being observed in a deep Valley, to pass near the Brow of a Hill, are always more refracted, than if there were no such Hill, or the Observations were made on the top thereof; as if the Rays of Light were bent down into a Curve by passing near the Surface of the Mountain. Sir Isaac Newton in his Optica makes several Experiments and Observations on the *Inflection* of the Rays of Light; which see under *Light* and *Rays*.

**INFLECTION,** in Grammar, is the Variation of Nouns and Verbs, in their several Cases, Tenses, and Declensions. *Inflection* is a general Name, under which are comprehended both the Conjugation and Declension.

**INFLECTION POINT** of any Curve, in Geometry, signifies the Point or Place where the Curve begins to bend back again a contrary way: As for instance, when a curve Line, as A F K, is partly concave, and partly convex towards any right Line, as A B, or towards a fixed Point, then the Point F, which divides the concave from the convex Part, and consequently is at the Beginning of the one, and End of the other, is called the *Point of Inflection*, as long as the Curve, being continued in F, keeps its Course the same; but it is called the *Point of Retrogression*, when it inflects back again towards that Part or Side, from whence it took its Original. See Fig. 2.

Before the Theory of this *Inflection*, and *Retrogression* of Curves, can be understood, it may be necessary to explain this general Principle. Whatsoever finite Quantity (or if it be a Fluxion, it is all one) goes on continually increasing or decreasing, it cannot change from a positive to a negative Expression, or from a negative to a positive one, without first becoming equal to an infinite or nothing. It is equal to nothing, if it doth continually decrease, and equal to an infinite, if it doth continually increase. To illustrate this, let there be two Circles touching one another in the Point E (Fig. 1.) their Diameters A E and E I lying in one and the same right Line. Let A E or E I be = *d*. Let the Distance between the Extremity A and any Ordinate in either of the Circles be = to *x* perpe-

(Fig. 1.)

ually. I consider now, what will be the Expressions of the Lines intercepted between E the Point of Contact of the Circles; such as are the Lines E B and E F intercepted between E and the Ordinates C B and G F. It is certain therefore, that taking a Point, as B, any where between A and E, that then the Expression of the intercepted B E is *d* - *x*; but taking a Point, as F, between E and I, the Expression of the intercepted E F, shall be *x* - *d*. For A B, or A F, being taken for *x* indifferently, the Values of the intercepted Lines will appear with this Change of Signs. In one case therefore the Expression is positive, in the other negative. But as the Points B or F approach to E, the Quantities B E and E F decrease continually, and at the Point E are equal to nothing. So that it is plain there is no passing from a positive to a negative Expression, in this case, of a Quantity continually decreasing, without passing thro' nothing. For the other part, let us consider the Tangents (as D A or H I) cut off by Lines continually drawn from E, the Point of the Circle's Contact. If C B, or G F, be put equal to *y*, the Expression

Expression of any such Tangent will be  $\frac{y d}{a-x}$ , or  $\frac{y d}{x-d}$ , according as we take it on the one or the other side of the Point E; in one case therefore it is positive, in the other negative. But as the Points B or F approach to E, the Tangents DA and H increase continually, and at the Point E they become infinite. Therefore a Quantity that continually increaseth, cannot pass from a positive to a negative Expression, without being infinite. All this is universally true, whether it be a finite Quantity or a Fluxion that we consider. There is no changing from positive to negative, without passing thro' nothing or infinite. Applying this therefore to a Fluxion, it will follow from hence, That the Fluxion of a Quantity that expresseth a Maximum or a Minimum, must be equal to nothing, or to infinite. And upon this Foundation, we may now easily proceed to the Points of Inflection and Retrogression. In order to find a general Theorem to assist us in this Matter, let us consider the Curve A F K, (Fig. 2.) whose Diameter is the right Line A B; and its Ordinates P M, e f, parallel to one another. If through the Point F be drawn the Ordinate Applicate E F, together with the Tangent F L; and from any other Point, as M on the same side with A F, be drawn the Ordinate Applicate M P, as likewise the Tangent M T: It is evident, (1.) In these Curves that have a Point of Inflection, that the Abscissa A P increases continually, and that the Part A T of the Diameter, intercepted between A the Origin of the Axis, and T the Concurrence of the Tangent and the Axis, increaseth such time as the Point P fall upon E, and after it again begins to diminish: From whence it is apparent, that A T must become the Maximum A L, when the Point P falls upon the Point E required. (2.) In those Curves that have a Point of Retrogression, it is evident that the Part A T increaseth continually, and that the Abscissa increaseth so long, till the Point T fall upon L, after which it again diminisheth: From whence it is clear, that A P must become a Maximum, when the Point T falls upon L. Now if

A E be put = x, E F = y, then will A L be  $\frac{y x - x^2}{y}$ , whose Fluxion, which is  $\frac{y^2 x - y x^2 - x^2}{y^2}$  (supposing x invariable) being divided by x; the Fluxion of A E must become nothing or infinite; that is,  $\frac{-y^2}{y^2}$  = nothing or infinite: So that multiplying by y<sup>2</sup>, and dividing by -y, y will be = to nothing or infinite; which in the Sequel will serve for a general Form to find F the Point of Inflection or Retrogression. For the nature of the Curve A F K being given, the Value of y may be found in x; and taking the Fluxion of this Value, and supposing x invariable, the Value of y will be found in x<sup>2</sup>, which being put equal to nothing, or infinity, serves in either of these Suppositions to find such a Value of A E, as that the Ordinate E F shall intersect the Curve A F K in F, the Point of Inflection or Retrogression. Of this we shall only give one Example.

Let A F K (Fig. 3.) be a protracted Semicycloid, whose

Base is longer than the Circumference of the generating Circle A D B, whose Center is C. It is required to find

E in the Diameter A B; so that the Ordinate Applicate E F shall cut the Semi-cycloid in F, the Point of contrary Flexion. Suppose the known Quantities A D B = a, E K = b; A B = c, and the unknown Quantities A E = x, E D = z, the Ark A D = s, E F = y; then by the Property of the Cycloid  $y = z + \frac{b z}{a}$ , and therefore

$$y = z + \frac{b z}{a}; \text{ But by the Property of the Circle } z = \sqrt{z c x - x x}, \text{ consequently } z = \frac{c x - x x}{\sqrt{z c x - x x}}$$

$$\text{and } x (\sqrt{x^2 + z^2}) = \frac{c x}{\sqrt{z c x - x x}}: \text{ Therefore substituting for } z, \text{ and } x \text{ their respective Values, we have}$$

$$y = \frac{a c x - a x x + b c x}{a \sqrt{z c x - x x}}, \text{ and the Fluxion thereof, (supposing } x \text{ invariable) is } \frac{b c x - a c x - b c c x x}{z c x - x x \sqrt{z c x - x x}} = 0,$$

that is, A E (x) = c +  $\frac{a c}{b}$  and C E =  $\frac{a c}{b}$ . Hence it is evident, That to have F a Point of contrary Flexion, b must be greater than a; for if it be less, then C E would exceed C B. Concerning the Inflection of the Rays of Light, see Light.

INFLUENCE, a Quality supposed to flow from the Bodies of the Stars, or the Effect of their Heat and Light, to which the Astrologers vainly attribute all the Events that happen on the Earth. The Alchymists, who make it the Philosopher's Stone, tell us, that every thing in Nature is produced by the Influence of the Stars, which, in their Passage thro' the Atmosphere, imbibe many of its moist Parts, the grossest whereof they deposit in the Sands and Earths where they fall; that these filtrating thro' the Pores of the Earth, descend even to the Center, whence they are driven, by the central Fire, back again to the Surface, and in their Ascent, by a natural kind of Sublimation, as they find Earths well disposed, they form natural Bodies, as Metals, Minerals, and Vegetables, &c. Thus Chymistry consisting in an artificial Imitation of these natural Operations, and in applying active Principles to passive Principles, 'tis pretended it can form natural Bodies, make Gold, &c.

INFLUENT, a Term used where any Liquor or Juice, by the Contrivance of Nature, and the Laws of Circulation, falls into another Current and Receptacle. 'Tis us'd in respect to the common Receptacle in the human Body, the Chyle is its influent Juice, and so is the Bile to the Gall-Bladder, and Viscal-Blood to the Heart in its Diastole; and the like.

IN FORMA PAUPERIS, in Law, is when any Man that hath a just Cause or Suit, either in the Chancery, or any of the Courts of Common Law, will come before the Lord-Chancellor, or Master of the Rolls, or either of the Chief Justices, or Chief Baron, and make Oath, that he is not worth five Pounds, his Debts paid; either of the said Judges will, in his own proper Court, admit him to sue in *Forma Pauperis*, and he shall have Counsel, Clerk, or Attorney assigned to do his Business, without paying any Fees.

INFORMATION, in Law; see *Inditement*. Information for the King is the same; that for a common Person we call Declaration, and is not always done directly by the King, or his Attorney, but sometimes by another, who sues as well for the King as himself; on a Breach of some Penal Law or Statute, wherein a Penalty is given to the Party that will sue for the same.

INFORMATUS NON SUM, or *Non sum Informatus*; a formal Answer made of course by an Attorney, who is commanded by the Court to say any thing he thinks good in behalf of his Client; who having nothing material to say, makes answer he is not inform'd: on which, Judgment passes for the other Party.

INFORMIS, *informed*, that which has not the Form or Perfection it should have. In Astronomy we use the Terms *Selle Informes*, for such Stars as have not yet been reduced into any Constellation. Of which kind there was a great Number left by the ancient Astronomers, tho' *Hevelius*, and some others of the Moderns, have provided for the greatest part of them, by making new Constellations.

INFRACTION, a Rupture or Violation of a Treaty, a Law, Ordinance, &c. from the Preposition *in*, and the Supine of *frango*, to break.

INFRA-LAPSARI, the Name of a Sect, who maintain, that God has created a certain Number of Men only to be damned, without allowing them the means necessary to save themselves, if they would. This Doctrine they maintain in different manners, the Sect itself being divided into two Branches. Some of them hold, that

that God independently of every thing, and antecedently to all Knowledge or Foresight of the Fall of the first Man, resolved to signalize both his Mercy and his Justice; his Mercy, by creating a certain Number of Men, to make them happy to all Eternity; and his Justice, by creating likewise a Number of other Men, to be miserable to all Eternity. Others hold, that God did not take this Resolution, but in consequence of Original Sin, and of the Knowledge which he had from all Eternity, that *Adam* would commit it: for, say they, Man, by this Sin, having forfeited all Pretences to his original Justice, deserves nothing now but Punishment. All Mankind is become a Mass of Corruption, which God may abandon to eternal Destruction, without any Impeachment of his Justice. However, to shew his Mercy too, as well as his Justice, he has resolved to select some out of this Mass, to sanctify them, and to make them happy. Those who maintain the Doctrine in the first manner, are called *Supra-lapsarii*, as believing that God formed the Resolution of damning a Number of Men, *supra Lapsum*, before *Adam's* Fall, and independently of it. Those of the second Opinion, are called *Infra-lapsarii*, as holding that God made that Resolution, *infra Lapsum*, after his Knowledge of the Fall, and in consequence thereof.

**INFRA-SPINATUS**, a Muscle that arises from the inferior Parts of the Bass, Spine, and Under-Costa of the Scapula, and filling the lower Inter-capulum, passes on between the Spine and Teres Minor in a triangular Form, and growing tendinous at the Cone, is inserted into the Head of the Humerus, and draws directly backwards.

**INFULA**, a Name anciently given to some of the Pontifical Ornaments. *Festus* tells us, that the *Infule* were Filaments or Fringes of Wool, wherewith the Antients used to adorn their Priests, their Victims, and even their Temples. Several Authors confound the *Infula* with the Mitre, Tiara, or Cap wore by the Priests; but there was a great deal of Difference. The *Infula* was properly a Fillet or Headband of white Wool, covering that Part of the Head where the Hair grows, as far as the Temples, whence, on each Side, hung down two Strings, called *Vitæ*, to bind it withal; and this has given occasion to some Authors to confound the *Infule* with *Vitæ*. The *Infula* was the same thing to Priests that the Diadem was to Kings, viz. the Badge of their Dignity and Authority. The Difference between the Diadem and the *Infula* consisted in this, that the Diadem was flat and broad, and the *Infula* rounded and twisted.

**INFUNDIBULUM**, a Latin Word, signifying a Funnel; whence many Parts in an human Body, having a Resemblance thereto in Shape, are thus called; as the *Infundibulum Cerebri*, and *Infundibulum Renum*; for which see *Brain* and *Kidneys*; and some Parts of Plants, for the same reason, are called *Infundibuliformes*. See *Flowers*.

**INFUSION** is a Part of Pharmacy, whereby the Virtues of Plants, Roots, and the like, are drawn out, by letting them steep in some convenient Menstruum. *Infusum* is used in Bodies of a lax Texture, whose Parts are so light, as not to admit of a greater Motion, without hazard of flying away in Vapour. Its Use is to communicate the Virtues out of Bodies to Liquors, either in order to augment their Force, or correct their ill Qualities. Some *Infusions* are made in common Water, others in Wine, Vinegar, Milk, Spirit of Wine, &c.

*Infusum* is also used to signify the Action of conveying a Liqueur into the Body by the Veins. Some Physicians have found out a new Method of Purging, by infusing a Cathartic into the Veins, which operates pretty much after the manner of a Clyster.

**INGEMINATED FLOWERS**, are when one Flower stands on, or naturally grows out of another.

**INGENIT**, inborn, signifies any Disease, or Habit, that comes into the World with a Person, and is nearly the same with Hereditary.

**INGENUOUS**, among the *Romans*, was a Title applicable to a Person who was born free, or of free Parents. A Person was accounted *ingenuus* if only the Mother were free, and the Father a Servant. These could give their Votes, and enjoy Offices, from which the *Liberi*, or Freed Men, &c. were debarred. *Isidore* says, they are called *Ingenui qui Libertatem habent in Genere, non in Fæto*, who are born free, not those who acquire their Freedom.

*Ingenuus* is sometimes also used to signify the Native of a Country, in contradiction to a Foreigner.

**INGLUVIES**, or Crop, a part which in granivorous Fowls serves for the immediate Reception of the Food, where it remains some time for Maceration, before it be transmitted to the Stomach. This *Ingluvies* is furnished with Glands, which, the Patrons of Fermentation maintain, convey a Menstruum thither, that impregnates the Aliment, and serves instead of Mastication.

**INGOT** is a little Wedge or Mass of Gold and Silver or an uncertain Quantity of Bullion.

**INGREDIENTS** are all the Simples which go into the Composition of any Medicine, Ointment, Sauce, &c.

**INGRESS**, in Astronomy, signifies the Sun's entering the first Scruple of one of the four Cardinal Signs, especially *Aries*.

**INGRESSU**, in Law, a Writ of Entry, whereby a Person seeks Entry into Lands or Tenements. It lies in various Cases, and has various Forms.

**INGROSSATOR MAGNI ROTULI**, is the same as Clerk of the Pipe, which see.

**INGROSSER**, in Common Law, is one that buys Corn growing, or any Provisions, before the Market, to sell again; it also signifies a Clerk, who writes Records or Instruments of Law in Skins of Parchment.

**INGUEN** is that Part of the Body, reaching from the Head of the Thigh to above the secret Parts, and is commonly called the Groin. *Inguinialis* is given to any Subdivisions made of that Part, or any thing therein contained, or applied therewith by way of Medicine, or the like. The word is pure Latin, and is derived, according to some, from *Unguen*, Ointment, because these Parts are frequently anointed. Others derive it from *ango*, because Pains happen frequently there; others again from *inguen*, because the genital Parts are here.

**INHARMONICAL RELATION** is a Term in Music. See *Relation inharmonical*.

**INHERENCE**, a Term in Philosophy, applied to the Junction or Connexion of an Accident with its Substance. Thus Quantity has a necessary Inherence with a natural Body.

**INHERITANCE** is a Perpetuity in Lands and Tenements to a Man and his Heirs: This word *Inheritance* is not only understood where a Man hath *Inheritance* of Lands and Tenements by Descent or Heritage, but also every Fee-Simple and Fee-Tail, that a Man hath by his Purchase, may be said to be by *Inheritance*, for that his Heirs may inherit after him.

**INHIBITION** is a Writ to inhibit or forbid a Judge from further proceeding in the Cause depending before him; sometimes *Prohibition* and *Inhibition* are put together: but *Inhibition* is most commonly a Writ issuing out of a higher Court to a lower and inferior; and *Prohibition* out of the King's Court to an inferior Court.

**INJECTION**, in Pharmacy, is any liquid Medicine made to be injected by a Syringe, Clyster-Pipe, or any other Instrument into any Part of the Body. It is likewise a common Term for filling the Vessels with coloured Wax, or any other proper Matter, to shew their Figures and Ramifications; a thing frequent among Anatomists.

**INITIALIA**, a Name anciently given to the Mysteries of *Cereri*. See *Ceresalia*.

**INITIATED**, a Term properly used in speaking of the Religion of the antient Heathens, where it signifies to be admitted to a Participation of the Mysteries of Religion; tho' the word is also sometimes used in speaking of other Religions, and even of Philosophy and other Sciences. The Antients never discovered the deeper Mysteries of their Religion, nor even permitted some of their Temples to be open to any but those who had been initiated in certain Orders. The word comes from the Latin *initiatum*, of *initiare*, *initiare*. *Initiari* properly signifies to begin sacrificing, or to receive or admit a Person to the beginning of Mysteries, or of Ceremonies of less importance. *Cajetan*, upon *Atheniensis*, observes, that all the Mysteries were not communicated at once to the Persons who presented themselves for the Priesthood, but that at first they purified them, then admitted them to the less considerable Matters to dispose them for the more important, and at last they drew the Veil quite, and laid open all the most sacred and solemn Parts of Religion.

**INJUNCTION** is a Writ grounded upon an interlocutory Order in Chancery, sometimes to give possession to the Plaintiff, for want of the Defendant's Appearance; sometimes to the King's ordinary Court, and sometimes to the Court-Christians, to stop Proceedings in a Cause, upon Suggestion made, that the Rigour of the Law, if it take place, is against Equity and Conscience in that Case.

**INJURY**, in the general meaning of the word, signifies any thing contrary to Justice and Equity. The Civilians define *Injury* a private Offence, committed designedly, and with an evil Intention, to any Man's Prejudice. The Author of the Rhetorics to *Herenius* says, *Injuria est que aut Passione, aut Cervicia, aut Turpitudine, Corpus, Anus, aut Finem alioquin violant*. Action on an *Injury* is annual, that is, no Reparation could be required after the Expiration of a Year. By the Law of the twelve Tables, where the *Injury* was the breaking of a Limb, the injured Person might demand *Talionem*, that is, he might break the

fame Limb of the Criminal. For the breaking of a Bone there were considerable pecuniary Punishments assigned; For other *Injuries* only twenty *Shillings* were decreed, which the Poverty of those times thought a sufficient Penalty; but the Praetors afterwards finding this too slender a Satisfaction, in lieu thereof appointed the injured Person to set a Rate on the *Injury*, which they afterwards increased or lessened as they thought good. The word is derived from the *Latin* Preposition *in*, which here has a negative Force, and *Jas, Law, Right*; *Injuria dicitur unde quod non Jure fit*. The Antients made a Goddess of *Injury*, and called her *Ate*. *Homer* makes her the Daughter of *Jupiter*, and says, she did mischief to every body, even to her Father; that she was very nimble and tender-footed, and walked altogether on Mens Heads, without ever touching the Ground.

**INK**, the common Writing-Ink is a Composition of Vitriol, Galls, Gum and Water. Printing-Ink is made of Nut-Oil or Linseed-Oil, Turpentine, and a kind of Black.

*Indian, or Chinese Ink*, is an admirable Composition, and has been in vain attempted to be imitated in *Europe*. It is not fluid like our Writing-Inks, but solid, like our Mineral Colours, the much lighter. They make it of all Figures, but the most usual is rectangular about a quarter of an Inch thick. Some of them are gilt with Figures of Dragons, Birds, Flowers, &c. In order to this, they have little wooden Molds, so curiously wrought, that we could hardly equal them in Metals. Before you use this Ink, there must be a little hollow Marble, or other Stone, with Water in it, on which the Stick of Ink must be ground, till the Water becomes of a sufficient Consistence. It makes a very black shining Ink, and tho' it be apt to sink when the Paper is thin, yet it never runs or spreads; so that the Letters are always smooth and evenly terminated, how big soever they be. It is of great Use in designing, because it may be weakened or diminished to any degree one pleases; and there are abundance of things which can't be represented to the Life without it. The *Chinese* make it with Sinoak-Black of different kinds, but the best is made of the Smoak of fat Pork, burnt at a Lasp. They mix a kind of Oil with it, to make it more smooth, and add other odorous Ingredients to take away the Rankness of the Smell. After they have mixed it into a Paste of a proper Consistence, they put it into a Mold to figure it.

**INLAND**, implies any thing situated in the main Land, or Heart of a Country far from the Sea-Coasts. Hence *Inland Bills* in Trade are such Bills as are payable in the same Land wherein they are drawn.

**INMATES**, are such Persons as are admitted (for their Money) to live in the same House with another Man, tho' in different Rooms, and which go in at the same Door jointly with others to whom the House belongeth, and which are not able to maintain themselves. These are inquirable in a Court-Let.

**INNATE HEAT**. See *Calidum Innatum*.

**INNATE IDEAS**, or Principles, are certain primary Notions or Characters, supposed to be stamped on the Mind of Man when it first receives its Being, and which it brings into the World with it; but the Doctrine of *Innate Ideas* is abundantly confuted by *Mr. Locke*. See *Idea*.

**INNINGS**; Lands recovered from the Sea, by draining and banking, are so called.

**INNOCENTS-DAY**, the Name of a Feast celebrated in Commemoration of the Infants murdered by *Herod*. heretofore it was the Custom to have Dances in the Churches on this Day, wherein were Persons who represented Bishops, by way of Derision of the Episcopal Dignity. This appears by a Canon of the Council of *Cyrene*, held in 1260, which expressly forbids it.

**INNOMINATI**, *Gli Innominati, Anonymi*, Persons who have no Names; a Title by which the Academists of *Parnassus* distinguish themselves. Most Cities in *Italy* have an Academy, and each has its proper Name; thus those at *Parnassus* entitle themselves *Gli Innominati*, as if it was their Name to have no Name at all.

**INNOMINATUM**, in general, signifies any thing without a Name. Many Parts of the Body are left under this indistinct Term, as the *Innominata Glanulosa Oculi*, now called *Caruncula Oculi*. See *Eye*. *Innominata Tonica Oculi*. See *Eye*. *Innominatum Os*. See *Uvula*.

**INNS**. Our Colleges of Municipal or Common Law, Professors, and Students, are still called *Inns*; the old *English* word for Houses of Noblemen, Bishops, and others of extraordinary Note, which is of the same Signification with the *French* word *Hôtel*.

*Inns of Court*, are so called, as some think, because the Students there are to serve the Courts of Judicature, or else because anciently these Colleges received none but the Sons of Noblemen and better sort of Gentlemen, as *Fortescue* affirms. Of these we have four; viz. the two *Temples*, heretofore the Dwelling of the Knights-Templars,

purchased by some Professors of the Common Law about 300 Years ago; and *Lincolns-Inn* and *Grays-Inn*, anciently belonging to the Earls of *Lincoln* and *Gray*. These Societies are no Corporations, nor have any Judicial Power over their Members, but have certain Orders among themselves, which have, by Consent, the force of Laws: for lighter Offences they are only excommunicated, or put out of Commons; for greater, they lose their Chambers, and are expelled the College; and when once expelled out of one Society, they are never received by any of the others. The whole Company of Gentlemen in each Society may be divided into four Parts, Benchers, Utter-Barristers, Inner-Barristers, and Students. See *Benchers* and *Barrister*.

*Inns of Chancery* were probably so called, because anciently inhabited by such Clerks as chiefly studied the forming of Writs, which regularly belonged to the Curriers, who are Officers of Chancery. The first of these is *Thornes-Inn*, begun in the Reign of *Edward III.* and since purchas'd by the Society of *Lincolns-Inn*; then *New-Inn*, *Clements-Inn*; *Chiffords-Inn*, anciently the House of the Lord *Chifford*; *Staple-Inn*, belonging to the Merchants of the Staple; *Lyons-Inn*, anciently a common Inn with the Sign of the Lion; *Furnivals-Inn*, and *Bernards-Inn*.

These were heretofore preparatory Colleges for younger Students, and many were entered here before they were admitted into the *Inns* of Court. Now they are mostly taken up by the Attorneys, Solicitors, &c. They belong also to some of the *Inns* of Court, who send yearly some of their Barristers to read to them.

**INUENDO**, from *innoo*, to beck or nod with the Head, is a word frequently used in Writs, Declarations, and Pleadings. The Use of it is only to declare and ascertain the Person or Thing which was named, or left doubtful before; as he (*innuendo*, the Plaintiff) is a Thief, mention being before made of another Person.

**INOCULATION**, in Agriculture, is a kind of Grafting, or an artificial Operation, by which the Bud of one Fruit-Tree is set into the Stock or Branch of another, so as to make different sorts of Fruit grow on the same Tree. There are various ways of performing this. The ancient Method was by making a shallow laceration in the Bark, where the Knot of a Shoot or Oculus (whence the Operation takes its Name) begins to bud forth, into which a promising Shoot of another kind was inserted, and the Incision closed up with fat Earth or Clay. The Method of *Inoculation*, now in the best Repute, is as follows: They cut off a vigorous Shoot from the Tree that is to be propagated, a Month before or after *Midsummer*; then chuse out a smooth Place in the Stock (which should not be of above three or four Years Growth) making a perpendicular Slit in the Bark a little above an Inch long, and another at right Angles to it, at the lower end, to give way to the opening of the Bark. This done, the Bark is gently loosened from the Wood on both Sides with a Penknife, beginning at the bottom; they then prepare the Bud, cutting it off from the aforesaid vigorous Shoot, and taking with it as much of the Wood above as below it, and as near as may be to the Length of the slit in the Stock. When the Bud is thus cut off, they take out the woody part of the Bud, and put the Bud itself in, between the Bark and the Wood of the Stock, at the Cross-slit before opened, leading it upwards by the Stalk, where the Leaf grew, till it exactly closes. They then bind it about with Woolen Yarn, the better to make all Parts of it close exactly, that the Bud may embody itself with the Stock, which it will do in three Weeks time. This Operation is said to be best performed in a cloudy Day, or in an Evening; and 'tis observed, that the quicker 'tis done, the better it succeeds. This Practice has the advantage of Engrafting in a great many respects, both as it is more secure, it seldom failing of having effect, especially if two or three Buds are put into the same Stock, and as its Success is more readily discovered. Indeed when large Stocks are to be practised on, *Inoculation* is not proper, and they are obliged to have recourse to Grafting. This one Rule is observed to hold universally, viz. that no Success is to be expected in *Inoculation*, if the Sap does not run well, that is, if the Bark won't part readily from the Wood of the Stock.

In a Physical Sense, *Inoculation* is used for the Transplantation of Distempers from one Subject to another, particularly for the Ingraftment of the Small-Pox, which is a new Practice among us, but of ancient Original in the *Eastern* Countries. The best Method of performing the Operation is as follows: After the Body is rightly disposed and prepared, by proper Diet and Evacuations, two small Incisions are made, one in the muscular part of the Arm, about the Place where an Issue is usually cut, and the other in the Leg of the opposite Side; then being provided of a small Quantity, as a Drop or less of well-concocted *variolous Matter*, chose from the distinct or best sort of Passules, before the Turn of the Distemper, and imbibed

imbibed by two small Doffils of Lint; these are immediately put into the Incisions, whilst the Matter remains warm, and are kept on by a proper Bandage. In a day or two the Bandages are opened, the Lint thrown away, and only Colewort-Leaf applied over the Incisions. This Dressing is continued daily. The incisions usually grow sore, inflame and enlarge of themselves, and discharge Matter more plentifully as the Dissemper rises. The Eruptions generally appear within eight or ten days after the Operation, during which time the Patient is not confined, or obliged to observe a very strict Regimen. The Practice seems to be useful, because the most proper Age, the most favourable Season of the Year, most regular Method of Preparatio, and all possible Precautions may here be used, according to the Wishes of the Patient, his Parents, and Physician; Advantages impossible to be had when the Dissemper is caught in the natural way. It has also been constantly observed, that the best sort of Small-Pox is hereby occasioned, that the Eruptions are few, the Symptoms light, the Danger next to none, the Recovery easy, and that the Patient is equally secured from this Dissemper for the future, as he would be by having gone thro' it in the natural manner.

**INORDINATE PROPORTION** is thus: Supposing three Magnitudes in one Rank, and three other proportional to them in another, you compare them in a different Order; as if there are in one Rank these three Numbers, 2, 3, 9; and in another Rank these other three, 8, 24, 56, proportional to the precedent, in a different Order, so that 2 shall be to 3 as 24 to 56, and 3 to 9 as 8 to 24. Then casting away the mean Terms in each Rank, conclude the first 2 in the first Rank is to the last 9, as 8, the first of the other Rank, to the last 56.

**INOSULATION.** See *Anastomosis* and *Artery*.

**IN PACE**, a Latin Term, in use among the Monks, to signify a Prison, where such of them are shut up as have committed any grievous Fault. Formerly there us'd to be a word of Ceremony at the putting a Religions in *pace*, but now 'tis not much regarded. Such as are shut up in perpetual Imprisonment, are also said to be in *pace*. Sometimes also the words *repositus in pace* are used by way of Allusion to a Custom in the Romish Church, of praying that the Souls of the Defunct may rest in Peace. Those words are also frequently seen at the bottom of Epitaphs, in lieu of those used by the ancient Romans, S.T.T.L. i. c. Si tibi Terra Levit, Light lie the Earth; & sit bonus Cineri non onerosa tua.

**IN PROMPTU**, a Latin word used among the French, tho' not rarely in the English. It signifies a Piece made off-hand, extemporary, without any previous Meditation, by the mere Vivacity of Imagination. Many Authors pique themselves on their *in promptu's*, which yet were done at leisure, and in cold blood.

**INQUIRENDU**, is an Authority given to a Person, or Persons, to enquire into something for the King's advantage.

**INQUISITION**, or the Holy Office, an Ecclesiastical Jurisdiction established in Spain, Portugal, and Italy, for the Trial and Examination of such Persons as are suspected to entertain any religious Opinions contrary to those professed in the Church of Rome. It is called *Inquisition*, because the Judges of this Office take cognizance of Crimes on common Report, without any legal Evidence. Some People fancy they see the Original of the *Inquisition* in a Constitution made by Pope Lucius, at the Council of Verona, in 1184, in regard he there orders the Bishops to get Information, either by themselves, or by their Commissaries, of all such Persons as were suspected of Heresy; and distinguishes the several Degrees, of Suspected, Convicted, Penitent, and Relapsed, &c. However, 'tis generally allowed, that it was Pope Innocent III. who laid the first Foundations of the Holy Office, and the *Fandis* and *Albigenses* were what gave the occasion to it. He sent several Prebts, with St. Dominic at their head, to Toulouse, in order to blow up a Spirit of Zeal and Persecution amongst the Prelates and Princes. These Missionaries were to give an account to the Pope of the Number of Heretics in those Parts, and of the Behaviour of the Princes and Persons in Authority, and thence they acquired the Name of *Inquisitors*; but these original Inquisitors had not any Court, or any Authority, they were only a kind of Spiritual Spies, who were to make Report of their Discoveries to the Pope. The Emperor Frederic II. at the beginning of the 13th Century, extended their Power very considerably, and committed the taking cognizance of the Crime of Heresy to a Set of Ecclesiastical Judges; and as Fire was the Punishment decreed for the Obdurate, the Inquisitors determined indirectly with regard both to the Persons and to the Crimes: by which means the Laity was cut off from its own Jurisdiction, and abandoned to the Zeal and devout Madness of the Ecclesiastics. After the Death of Frederic, who had long

ago repented the Power he had given the Churchmen, as having seen some of the Fruits of it; Pope Innocent IV. erected a perpetual Tribunal of Inquisitors, and deprived the Bishops and Secular Judges of the little Power the Emperor Frederic had left them. And this Jurisdiction, which depended immediately on himself, he took care to introduce into most of the States in Europe. But the Inquisitors were so fiery hot, and made such horrible Butchery among the reputed Heretics, that they raised an universal Detestation, even in some Catholic Countries, themselves. Hence it was that their Reign proved very short both in France and Germany, nor was even Spain entirely subject to them till the time of Ferdinand and Isabella in 1448, when their Power was increased, under pretence of clearing the Country of *Judaism* and *Mahometanism*.

The Power of the *Inquisition* is very much limited in some Countries, particularly at Venice, where it is received under such Modifications, as prove a great Check on its Authority. Indeed at Venice it seems rather a political than a religious Contrivance, and serves rather for the Security of the State than of the Church. There are Appeals from the Subaltern *Inquisitions* in Italy, to the Congregation of the Holy Office residing at Rome. 'Tis the constant Practice of the *Inquisition*, to affect, in all their Proceedings, to inspire as much Terror and Amusement as possible; every thing is done with the profoundest Silence and Secrecy, and with the greatest Rigour and Impartiality. When a Person is seized, all the World abandons him, nor the nearest Friend dares speak a Word in his Defence; that alone would be enough to render them suspected of Heresy, and would bring them within the Claws of the *Inquisition*. The Criminals are seized, examined, tried, tortured, and, unless they recant, condemned and executed, without ever seeing or knowing their Accusers; whence the Revengeful have a fair occasion of wreaking their Malice on their Enemies. When the *Inquisition* has done with them, and condemned them to death, they are turned over to the Secular Arm, with a word of Prayer and pious Intreaty, that their Lives may not be touched. Time is no manner of Security in points of Heresy, nor does the Grave itself shelter the Accused from the Pursuits of the *Inquisition*; even the Deceased have their Trials, and they proceed in all their Form and Solemnity against dead Carcasses. The Executions are always deferred till the Number of the Condemned is very great, that the Multitude of Sufferers may strike the deeper Horror, and make the Scene more terrible and shocking.

The *Inquisition* of Rome is a Congregation of twelve Cardinals, and some other Officers, where the Pope presides in Person. This is accounted the highest Tribunal in Rome; it began in the time of Pope Paul IV. on occasion of the spreading of *Lutheranism*.

The *Inquisition* is very severe in the Indies. 'Tis true, there must be the Oaths of seven Witnesses to condemn a Man; but then the Depositions of Slaves or Children are taken. The Person is tortured till he condemns himself, for his Accusers are never brought to confront him. Persons are accused for the slenderest Expression against the Church, or even for a disrespectful Word of the *Inquisition*. The Standard of the *Inquisition* is a red Damask, on which is painted a Cross, with an Olive-Branch on one side, and a Sword on the other, with those words of the Psalm, *Exerce, Domine, & judica Causam meam*.

**INQUISITION**, in Law, is a manner of proceeding in Matters criminal by the Office of the Judge, or by the great Inquest before Justices in Eyre. Inquisitors among us are Sheriffs, Coroners *super visum Carceris*, or the like, who have Authority to enquire into certain Cases.

**INROLEMENT**, in Law, is the Registering, Recording, or Entering of any lawful Act in the Records of Chancery; as a Recognizance acknowledg'd, or a Statute, or a Fine levied; or in the Rolls of the Exchequer, King's-Bench, or Common-Pleas, or in the Hustings at Guild-Hall, London, or by the Clerk of the Peace in any County.

**INSCONCED**, is a Term in the Military Art, implying that a Part of an Army have fortified themselves with a Sconce or small Fort, in order to defend some Pass, &c. See *Sconces*.

**INSCRIBED**, in Geometry: A Figure is said to be inscribed in another, when all the Angles of the Figure inscribed touch either the Angles, Sides, or Planes of the other Figure.

*Inscribed Hyperbola*, is such an one, as lies intricely within the Angle of its Asymptotes, as the Conical Hyperbola doth.

**INSCRIPTION**, a Title affixed to any thing, to give some particular Knowledge thereof. Antiquaries are very curious, in examining ancient inscriptions found on Stones, and other Monuments of Antiquity. *Sacchiniantho*, Cotemporary, as 'tis said, with *Gideon*, drew most of the Memoirs, whereof

whereof his History is compos'd, from *Inscriptions*, which he found in Temples and on Columns, both among the Heathens and the Hebrews. It appears indeed that the Antients engrav'd upon Pillars the Principles of Sciences, as well as the History of the World. Those mentioned by *Herodotus* shew, that this was the first way of instructing People, and transmitting Histories and Sciences to Posterity. This is confirm'd by *Plato*, in his *Hyparchus*, wherein he says, that *Pisistratus* engrav'd, on Stone-Pillars, Precepts useful for Husbandmen. *Pliny* assures us, that the first publick Monuments were made with Plates of Lead; and the Treaties of Confederacy, made between the *Romans* and the *Jews*, were writt'n upon Plates of Brass; that, says he, the *Jews* might have something to put them in mind of the Peace and Confederacy concluded with the *Romans*. The *Greeks* and *Romans* were great Dealers in *Inscriptions*, and were extremely fond of being mentioned in them; and hence it is that we find so many, in those Countries of ancient Learning, as that large Volume have been compos'd of them; as the Collection of *Gruter*, &c. Since *Gruter's* Collection, *Tb. Reinensis* has published another huge Volume of *Inscriptions*. *M. Fabretti* published another Volume at *Rome* in 1699, wherein he has corrected abundance of Errors that had escap'd *Gruter*, *Reinsius*, and other Antiquaries, &c. and added a great Number of *Inscriptions* omitted by them. Since all these, *Grœvius* has published a complete Collection of *Inscriptions*, in three Volumes in *Folio*.

In *France* is an Academy of *Inscriptions* and Medals, consisting of ten honorary and ten pensionary Members, ten Associates, and as many Novices, who are to meet twice a Week, and to employ themselves in the Examination of Medals and ancient Monuments, and other Parts of *Greek* and *Roman* Literature, and to compose a History of the Kings of *France*, from Medals. Such was the Academy at the time of its Institution, or rather Re-Establishment, in the beginning of this Century; but as they are not now wholly employ'd about Medals and *Inscriptions*, they have changed their Name for one of a greater Latitudo, and are call'd the Academy *des Belles Lettres*.

INSCRUTABLE, in Theology, is usually understood of the Secrets of Providence, and the Judgments of God, which cannot be found out, or into which Human Reason cannot penetrate.

INSECTS, a kind of little Animals so call'd by the Antients, because in some of 'em the Body seems to be cut; as in *Ants*, whose Belly seems divided into two: or perhaps, because the Bodies of *Insects* are compos'd of several Circles or Rings, as Worms, Caterpillars, &c. which are a kind of Incisions, whence the Name might probably arise. *Mr. Ray*, in his *Methodus Insectorum*, thus distinguisheth the several kinds of *Insects*. *Insects* are either, 1. *Amphibiotica*, or such as do not change their Form; Or, 2. *Metamorphotica*, such as do really change their Form. Those that do not change their Form, are either, (1.) *Aspida*, without Feet; or, (2.) *Pedata*, with Feet: and of these there are some kinds that eat their Skins, and others that do not. *Insects* without Feet are either Terrestrial or Land-*Insects*, or Aquatic. Terrestrial *Insects* are, 1st, either such as are produced on the Land, or in the Earth, and not in Water; as the *Lumbrici Terrestres*, which are either of the larger sort, and are call'd Dew-Worms; or of a smaller size: And of these, there are some Red, and others Green with yellow Tails; which last are commonly call'd Gilt-Tails. Or, 2dly, such as are found in the Bowels of Animals: And of these some are found in the Intestines of Men; as, (1.) The *Lumbrici Terrestres*; (2.) *Lumbrici Lani*, which are also call'd *Tæne*; (3.) *Cæcæbrum*, which some will have to be only the Fragments of the *Tæne*. (4.) The *Ascarides*, which are chiefly found in the *Rektum*. Those Worms which are found in the Intestines of Beasts are of two sorts, the *Oblongæ*, and *Pelvicæ*, of the thickness of an Horse-hair, and therefore call'd *Ferriaculi Scitiformes*: And the *Breves* and *Crossifera*, which often are found in Horses, and are call'd the *Botte*. To this Genus of Terrestrial *Insects*, many natural Historians refer Snails, whether with or without Shells.

Water *Insects* without Feet, not changing Form, are either, 1st, of the greater sort, which have a peculiar way of moving, by first fixing their Head to the ground, and then drawing up their Tail towards it, &c. Of these, some are *Teretes*, round and smooth, of which there are three sorts; as the Medicinal *Hirudines* or Leaches, the common black Horse-Leaches, and the ash-colour'd Sea-Leaches: But there is also a sort of this kind, which is smaller and flatter, which are found sticking to Stones in the bottom of little Brooks. Or, 2dly, of the lesser sort, which have a different way of crawling or moving from the former. These are also either round or flat: Of the round sort, there is one that is black with two small Horns on its Head, and is found sticking to wet Stones in the watry Tops of Hills; and another which is red, of about a finger's length, with a For-

ceps at the Tail, found at the bottom of Fishponds, and stagnant Waters. The flat sort are very small and thin, and are call'd Flukes, being sometimes found in Waters, and sometimes in the Branches of the *Perus Biliaris* in Sheep.

*Insects* not changing Form, and having Feet, are either, 1. *Hexapoda*, with 6 Feet. 2. *Othapoda*, with 8 Feet. 3. *Decapodapoda*, with 14 Feet. 4. *Polypoda*, with many Feet. 1st, those that have but six Feet, are either, (1.) Terrestrial, and these are, first, of a larger kind; as, [1.] The yellowish *Insect*, found in rotten decaying Oaks. [2.] The black one, on the Ground, call'd by *Mosset*, *verruvorus*. [3.] The black one, living under Ground, with a Forceps at the Tail. [4.] A white sort, with square black Spots on its Back. [5.] The *Farinarium*, bred in Meal, of a whitish Colour. Or, secondly, a Smaller Sort; some of which are found about the Bodies of Animals: as, (1.) The *Cimex*, Bug or Wall-Loafe, of a Hinking Smell. (2.) *Ricinus*, the Tick. (3.) *Pediculus*, the common Loafe. (4.) *Pediculus ferus seu inguinalis*, the Crab-Loafe. (5.) *Pulex*, the Flea; of all which there are various kinds. Others are not troublesome to Animals, as, 1. One that in Bigness and Figure resembles a Loafe, but is very nimble and swift, and is found in Books and rotten Wood. 2. Another there is with a very long Body, and a forcipital Tail. 3. The black *Insect*, found often in the Flowers of the *Chelidonium*. 4. A subterraneous Sort, a little whitish: One that skips like a Grasshopper, but is much less.

(II.) Aquatic; as, [1.] The *Pediculus Marinus Grandis*, which adheres to Fishes. [2.] The *Spidula Fluviantilis*, with a Pyramidal Tail, and two Hairs or Bristles at the end. *Insects* not changing Form, and having eight Feet, are either with a Tail, as the Scorpion, or without, as the Spider; of which some spin no Web, have but two Eyes, and very long Legs, as the *Opilio* or the Shepherd. Some do spin a Web, and of these they count three sorts: 1. The *Aranea Coleoptrænsis Abdomine imido*, *Inbruto*, &c. *clav.* 1. The Spider with the Thorax, or middle part of his Body, as big as the Abdomen. 2. The Spider with the long Abdomen, found among Reeds, Rushes, Grass, &c. (2.) The *Ricini Gihpedes*, which are some more flat and compress'd; as the rambling Ticks that run over the Bodies of Animals, but don't fasten; and some more round and thick, which do adhere to the Skin. (3.) The *Syrines* or Mites.

*Insects* not changing Form, and with fourteen Feet, and therefore call'd *Tetramorpha*, are the *Aselli*; of which there are three sorts: As, 1. the *Sea-Asellus*; the longest and largest of all; living amongst the Rocks. 2. *Asellus Lividus*, which rolls itself up into a Ball. The common Wood-Lice, Sows, or Chese-bugs. 3. *Asellus Agninus*, with a forked Tail; not rolling itself up. To this Species may be added, (1.) The *Asellus Marinus figura brevis*, rolling itself up. (2.) *Asellus Aquarum dulcium*, with long Legs and two Bristles on its Tail. (3.) *Pulex Aquaticus*, both in fresh and salt Water. (4.) *Pediculus Aquaticus*, which fattens upon Fish.

*Insects* not changing Form, with twenty-four Feet. These have the eight Fore-Feet lesser, and the sixteen hinder-ones larger. There are two kinds of them observed; both with long Bodies, one larger and of an obscure Colour, among the Rocks by the Sea-side; the other of a Silver Colour, found in Hoases. There is a Kind with thirty Feet, of an oblong Shape, Chestnut Colour, and full starfish Body, usually lying under Logs, and Trunks of Trees. It is very agile and swift.

*Insects*, not changing Form, with many Feet, call'd *aspidula*, are some on Land, and either roundish in Body, with all their Legs rising out of the middle of the Belly, (nearly as the *Julus*, or more flat and compress'd, with their Legs, not rising, as before, from a Point in the middle of their Body, but growing along on the Sides; as the *Scolopendra*. And some of this kind are aquatic, of which *Mr. Ray* makes three Differences: (1.) The *Cornifis* Lugs, used for Baits in catching Fish, with 38 Legs, and a smooth roundish Body. (2.) The *Scolopendra Marina Corpore plano*. (3.) *Animalculum Bierpor*, or rather *Bicaudatum*, lying in the Clefts of Stones, under the Salt-water.

*Insects* which do really undergo a Change of their Form, are call'd *Metamorphotica*; of which *Swammerdam* hath given the best Account: Tho' he shews that this word is improperly us'd, since there is by no means any real Transformation, but only an Explication of the Parts of the Animal, latent before, in miniature, (as it were) in the *Ovum*, or *Nympha*, like the Plant in the Seed) and an Increase of all the Parts by proper Degrees.

The first Species of Transformation or Change, which *Swammerdam* makes the second, is instantaneous, there being no sensible Rest or Stop between the old and the new Form. And the *Insects* of this Order do not lose their Motion at the time they shift the *Pellicula*, at least not to appearance. And *Swammerdam* describes the second Or-

der of Change to be, when the *Vermiculus* (leaving the former Shape of the *Nymphæ*, with which it appeared in the Egg, and subsided without Food) now beginning to feed, hath its Members or Parts visibly increased and stretched out, and takes the Form of a new *Nymphæ*, which is not without Motion; and from thence becomes a flying *Insect*. Of this sort are, (1.) The *Libella*, or *Perle*, which are produced from an *Insect* of six Feet, and which *Mosses* takes for the *Padæ Marinus*, or, as before he calls it, *Leontia Aquatica*. Out of the crustaceous Skin, or Husk, of this *Insect*, the *Libella* breaks by a Pifture, which begins between the Eyes, and is continued to the Roots of the Wings, and is there joined to the lateral Fiffures. (2.) The *Omnes Sycopteres*, whose characteristic Marks (according to *Willoughby*) are, 1. A long *Prothorax*, not spiral, but frait. 2. Their upper Wings to the middle are thick, and like Leather; thence to the Ends thin and membranous. 3. There is the Figure of St. Andrew's-Cross on their Backs. (5.) The *Lacusta*, which *Willoughby* refers to the *Aceratophora*. (4.) The *Grylli-Campesitres*. (5.) The *Grylli-Domestici*, or Crickets. (6.) The *Grylli-Talpa*, Mole-Cricket. (7.) The *Cicada*, or Grasshopper. (8.) The *Blatta*, according to *Swammerdam*. (9.) The *Tipula Aquatica*, which run very swiftly on the Surface of the Water, and have a Sting in their Mouths like the *Cimex*, or Ticks. (10.) The *Scorpions Aquaticæ*, with a Sting also in its Mouth. (11.) The *Mosæ Aquaticæ*, called by *Andreæandus*, *Apes Amphibia*. (12.) The *Hemerosus*, or *Ephemeræ*, or *Diaria* of *Swammerdam*. (13.) The *Ferula*, or *Aricularia*.

The second Species of Transmutation includes such *Insects*, as undergo a double Metamorphosis, or Change of Shape. (1.) Into a *Chrysalis*, or something analogous to it. (2.) Into a flying *Insect*. These Kinds of *Insects*, a while before they change, lie quite still, without Feeding, or changing Place; and in respect of their Wings are, (1.) *Kerbtier*, or *Vagin-pennis*, as the *Scarabæi*, Beetles. (2.) *pterygæ*, whose Wings are open and expanded: And the Wings of these are either farinaceous, as the *Papilionæ*, &c. or membranous, as the *Apes*, *Musæ*, &c. and these are either *diurnæ*, with two Wings, or *nocturnæ*, with four Wings.

The *Scarabæi* may be divided, (1.) In respect of their Horns, into the *Nasivorus*, *hucrona*, and *Cervus volans*, or *Taurus*. (2.) In respect of their *Antennæ*, which are of many Kinds; whereof the most eminent are those called *Copriicorni*. (3.) With regard to their Motion, as the *Saltatoris*. (4.) With regard to their Colour, as *Cantharides*. To the Beetle-kind may be refer'd the *Cicindela*, or Glow-Worm; the *Scaphitrus* called by *Willoughby* *hæmorrhoides*; the *Proscarabæus*, or Oil-Beetle, so called from its emitting from its Joints a kind of Oil, on its being pressed or squeezed. The *Anelytra*, with farinaceous or meaty Wings, are called *Papilionæ*, Butter-flies; and these are either *Diurnal*, or *Nocturnal*. The specific Distinction of the *Diurnal* is, that they always fertile with their Wings erect, are produced from an angulous *Aureta*, and have their *Antennæ* studded: of these there are about fifty sorts observed in England. The nocturnal Butter-flies, or *Phalena*, are vastly numerous, and cannot very clearly be methodized. But for Memory and Distinction's sake, they may be divided into, (1.) The *Geometrigene*, which come from the *Erucæ*, (called *Geometra* from the Manner of its Walk, which is *Angustans*, by curling up its Back like the Handle of a Cup) with 8 or 10 Feet.

(2.) Such as come from *Erucæ* with 14 Feet: Of this kind, which is very numerous, there hath been distinguished the *Phalena Foscilata*, whose Wings are in Patches or Arca's of different Colours. *Phalena Lineata*, whose Wings are marked with transverse Lines. *Phalena Punctata*, whose Wings are marked with one or more Points: and these excepted, all the others are distinguished into greater and lesser, and of a middle Size, between both. One of the larger Kinds may be distinguished also by their inner Wings running out beyond the upper, when they sit, or rest: And another by the Appearance of the Figure of Eyes upon the Wings: And a third, by their long Tails, and narrow sharp Wings; which by some are called *Phalena Prodæricæ*, or *Accipitrinæ*. The *Anelytra*, with membranous Wings, are *Bees*, *Flics*, *Wafps*, *Bombylis*, *Crabronæ*, &c. And to this kind the *Culex Fulgans*, according to *Swammerdam*, or *Gnat* is refer'd; as also the *Formica*, or Ant. And hither must be refer'd such Water *Insects*, as are covered by a *Tæca*, according to the Observations of *Willoughby*. These have either, (1.) an immovable *Tæca*, or Case, which is fixed to the Stones; and this Case is either of a round Figure, or one more compress'd and flat. (2.) A moveable, portable *Tæca*, and these are commonly called *Phygæna*: And this *Tæca* is either, (1.) *Strait*, and that either compos'd of Straws, and little *Fossine* lying parallel one to another; of which there are two Kinds; a greater, where the *Fossine* are two Inches

long; and a lesser, which are very common, and are called Straw-Worms. Or else the *Fossine* is transversely, and are shorter, having sometimes pieces of Shells, or Stones, intermix'd with them: Others, whose Cases are frait also, have no *Fossine*; but always either Sand, or Gravel: And of these some have the *Tæca* round, and are called *Cod-baits*; others are flat and compress'd. (2.) Crooked, or horned, which run tapering; of these Mr. Ray reckons four Kinds; a greater and less Black-foot; and a greater and less Ash-colour'd one. These all produce Flies with large Wings like Butter-flie.

The third Species of Transmutation, is a simple Change from a *Vermiculus* to a flying *Insect*; but yet with a sensible *desinis*, rest, or stop, between one Form and the other. This Change *Swammerdam* thus describes: "The *Vermiculus* excluded from the Egg gets Nourishment by little and little from without, and under that first Skin, or Covering, hath its Members increased by Degrees; not slipping it, or putting it off as other *Vermiculi* do when they change into *Nymphæ*, but assuming the Figure of a *Nymphæ* in it: For a time it is quite motionless, till the superfluous Moisture is evaporated, and then, in a few Days, recovers its Motion again, and casting off "this Skin, which is as it were double, it becomes a Fly." Of this kind are our Flea-flies, and all the *Nymphæ Vermiformes*, the *Fespe* *Ichneumonæ*, &c.

As to the Generation of *Insects*, the World is now generally convinced that they are not bred of Corruption, but *ex Ovo*; tho the contrary was believ'd by the Ancients, because of the vast Numbers that were sometimes hatch'd as it were at once, and because they could not discern the particular Manner of their Propagation. *Malybbis*, *Swammerdam* and *Redi*, have abundantly disprov'd the Doctrine of Equivocal Generation, as well as the Chimerical Transformation of the Caterpillar into the Butter-fly, and other like Metamorphoses; and have shewn, that all the Members of the Butter-fly were enclosed under the Skin or *Nymphæ* of the Caterpillar, as the Parts of a Plant are in the Seed.

*Insects* take particular Care to deposite their Eggs, or Seed, in such Places where they may have a sufficient Incubation, and where the Young when hatch'd may have the Benefit of proper Food till they become able to flit for themselves. Those whose Food is in the Water, lay their Eggs in the Water; those to whom Flesh is a proper Food, in Flesh; and those to whom the Fruits, or Leaves of Vegetables are Food, are accordingly reposit'd, some in this Fruit, some in that Tree, and some in that Plant, and some on another, but constantly the same Kind on the same Tree, &c. As for others that require a more constant and greater Degree of Warmth, they are provided by the Parent Animal with some Place in or about the Body of other Animals; some in the Feathers of Birds, some in the Hair of Beasts, some in the Scales of Fishes, some in the Nose, some in the Flesh, nay some in the Bowels, and inmost recesses of Man, and other Creatures. And as for others to whom none of those Methods are proper, they make them Nests by Perforation in the Earth, in Wood, in Combs, and the like, carrying in and sealing up Provisions that serve both for the Production of their Young, and for their Food, when produced.

In Flies, Butter-flies, &c. it is observ'd, there is a kind of Gluten, by which the Female fastens her Eggs to the bearing Buds of Trees, &c. so that the Rains cannot wash them off. These Eggs will not be hurt by the greatest Frost. Mr. *Andry*, in his Book *De la Generation de Vers dans le Corps de l'Homme*, takes notice, that the Ancients were mistaken in denying that *Insects* did breathe, on the account of their wanting Lungs: For modern Observations convince us, that *Insects* have a greater Number of Lungs than other Animals. The Ancients thought also that *Insects* had no Blood, because many of them had no red Lignor like our Blood: But it is not the Colour, but the Use of the Lignor that is to be regarded. They believ'd also that *Insects* had no Hearts; whereas our Microscopes do now discover, that when *Insects* have several Lungs, they have also several Hearts; and in particular, it is found, that Silk-Worms have a continued Chain of Hearts, from the Head almost to the very Extremity of the Tail. And it is this Number of Hearts and Lungs that occasions those *Insects* to give Signs of Life a long while after they are divided into several Parts. He observes also, that it is wrong to call *Insects* imperfect Animals, since they want no Parts either necessary or convenient for their Use, or to render them complex in their Kind. There are some, who affirm that the Earth-Worms, and those Round-tail'd Worms, which are found in the Intestines of Men and Horses, &c. also Snails and Horse-Leaches are Hermaphrodites; but that such Worms as become Flies, and Silk-Worms are not so, being of no Sex, but are Nests full of real Animals, which we see in time come out with Wings.

The Moderns have proceeded much further in the Knowledge of *Insects* than the Antients, as having the Advantages of the Microscope which distinguishes their minute Parts, whereof they have publish'd Draughts and Descriptions. Dr. *Hesh* has publish'd a Micrography in *Julie*; and *Fran. Reaſi*, a Physician at *Florence*, has publish'd several Figures with new and curious Experiments of his own. *Sig. Malpighi*, *Barboletti*, the *Philosophical Transactions of London*, *Paris*, and *Leipsic*, have a great Number of fine Observations and Experiments on *Insects*. *Swammerdam* has written a general History of *Insects* in *Dutch*, and assures us, there are above 400 Writers on this Subject; among others are *Watson*, *Gesner*, *Adrovandus*, *Maffier*, *Harvey*, *Fabrianus* at *Aquapendente*, *Coodart*, &c. *Hueſſen*, Painter to the Emperor *Rudolphus*, has given very good Designs of above 300 Species, *Coodart* has described above 400, and Mr. *Allan* has given us a new History of our English *Insects*, with very beautiful Figures.

**INSEMINATION**, one of the four Kinds of Transplantation, in use for the Cure of certain Diseases. It is performed by mixing the Medium impregnated with the *Materia* taken from the Patient with some fat Earth wherein has been sown the Seed of a Plant appropriate to that Disease; but Care must be taken from time to time to sprinkle it with the Water wherein the Part affected has been wash'd. 'Tis suppos'd the Diseases will decline in proportion as the Plant grows. By *Momia*, is here meant a Part of the vital Spirit of the Patient.

**INSERTION**, a Term frequently us'd in Physic, to signify the Implication of one Part within another. The *Insertion* of the Bones, Muscles, and Nerves in the Members of an Animal, is exceedingly artful. The *Vena Cava* has its *Insertion* in the right Ventricle of the Heart. *Insertion* is also us'd in Agriculture for the Inclosing a Graft within the Cleft of a Tree.

**INSESSUS**, is a kind of Half-Bath, usually prepared with a Decoction of several Herbs, proper for the lower Parts, wherein the Patient lies down to the Navel. It has several Uses, as the easing of Pain, softening of Parts, dispelling of stultent Matter, and frequently, promoting of the *Menses*.

**INSINUATION**, a cunning and covert way of creeping into Favour. *Insinuation* of a Will, among the Civilians, is the first Production of it, or the leaving it with the Register in order to its Probate.

**INSIPID**, that which has nothing in it sharp or pungent enough to affect the Palate, Tongue, &c. and to occasion that Stagnation we call Tasting.

**INSITIO**, a Term in Botany, us'd in the same Sense with engrafting; signifying in general the insertion and Uniting of any Cyon, Bud, &c. into the Substance of the Stock: And is of various kinds.

**INSOLATION**, in Pharmacy, is a Preparation of Fruits, Drugs, &c. by exposing them to the Heat of the Sun's Rays; either to dry them, or to bake or sharpen them, as is done in Vinegar, Figs, &c. The Word comes from the Latin Verb *insolare*, which is us'd by *Pliny* and *Celsus*, and signifies to expose to the Sun.

**INSOLVENT**, a Term applied to such Persons as have not wherewithal to pay their just Debts: A Person dying, and not leaving Estate sufficient to discharge these, is said to die *insolvent*.

**INSPECTOR**, a Person to whom the Care and Conduct of any Work is committed.

The Jews have an Officer in their Synagogue, whom they call *Inspektor*, [T], *Hazan*. His Business consists principally in inspecting or overlooking the Prayers and Lessons, in preparing and shewing them to the Reader, and in standing by him to take care he reads right, and if he make Mistakes, to correct him. In the Roman Law, *Inspektors* were such Persons as examin'd the Quality and Value of Lands and Estates, in order to the adjusting or proportioning Taxes and Impositions to every Man's Estate.

**INSPIRATION**, among Divines, &c. implies the conveying of certain extraordinary and supernatural Notices or Motions into the Soul. Thus the Prophets are said to have spoken by Divine *Inspiration*; and the Sinner is converted, when he ceases to resist the *Inspiration* of Grace. Some Authors reduce the *Inspiration* of the Sacred Writers to a particular Care of Providence, which prevented any thing they had said from failing, or coming to nought; maintaining they never were really inspired, either with Knowledge or Expression. According to *M. Simon*, *Inspiration* is no more than a Direction of the Holy Spirit, which never permitted the Sacred Writers to be mistaken. And it is a common Opinion, that the *Inspiration* of the Holy Spirit regards only the Matter, not the Style or Words; which seems to fall in with *M. Simon's* Doctrine of Direction. Among the Heathens, their Priests and Priestesses were said to be divinely inspired when they gave Oracles. The Poets, too, laid claim to it; and to this end, always invoked *Apollon* and the Muses at the beginning of any great Work.

*Inspiration*, in Physic, is understood of that Action of the Breath, by which the Air is admitted within the Lungs. This Admission of the Air depends immediately on its Spring or Elasticity, at the time when the Cavity of the Breait is enlarged by the Elevation of the Thorax and Abdomen, and particularly by the Motion of the Diaphragm downwards: so that the Air does not enter the Lungs, because they are dilated; but those dilate, because the Air enters within them. Nor is this the Dilatation of the Breait which draws in the Air, as is commonly thought; tho' this is a Condition absolutely necessary to *Inspiration*, but an actual Intrusion of the Air into the Lungs. See *Respiration*.

**INSPISSATE**, a Term us'd in Pharmacy for that Operation whereby a Liqueur is brought to a thicker Consistence, by evaporating the thinner Parts: and thus Juices, as that of Liquorice, are *inspissated*.

**INSTALMENT**, is a Settlement, or inflating any Person in his proper Place. It is sometimes confounded in Law with Abatement. The Word is chiefly us'd for the Induction of a Dean, Prebendary, or other Ecclesiastical Dignitary into the Possession of his Stall, or proper Seat in the Cathedral Church to which he belongs: it is sometimes called *Installation*. This Term is likewise commonly us'd for that Ceremony wherein the Knights of the Garter are placed in their Rank at *Windſor*. The Word is derived from the Latin *in* and *Stallum*, a Term us'd for a Seat in Church, in the Choir, or a Seat or Bench at a Court of Justice, &c. The *Vossius* is of opinion, the Word is pure German.

**INSTANT**, is such a part of Duration, wherein we perceive no Succession; or is that which takes up the time of only one Idea in our Minds. The Schools distinguish three kinds of *Instants*; a temporary, a natural, and a rational *Instant*. A temporary *Instant* is a part of Time immediately preceding another: Thus the last *Instant* of a Day precedes immediately and really the first *Instant* of the following Day. A natural *Instant* is what we otherwise call a Priority of Nature, which is observed in things that are subordinated in acting; as first and second Causes; Causes and their Effects. For the nature of things requires, that if there be a second Cause, there must be a first; and that there must be a Cause, if there be an Effect. A rational *Instant*, is not any real *Instant*, but a Point which the Understanding conceives to have been before some other *Instant*, founded on the nature of the things which occasion it to be conceiv'd. For instance, as God has made several things voluntarily, which he could, otherwise, have let alone; there is a reasonable Foundation to conceive God such as he is in himself, before he had made any of those voluntary Determinations: but as there was no real *Instant*, when God had not form'd any Determination, this *Instant* is call'd a rational *Instant*, by way of opposition to an *Instant* of Time.

**INSTAURATION**, the Re-establishment of a Religion, a Church, &c. The Word is derived from the old Latin *Instaurans*, which signified every thing necessary for the tilling and managing of Grounds; as Cattel, Tools, Harnes, &c.

**INSTINCT**, a Disposition or natural Sagacity wherewith Animals are endued, by virtue whereof they are enabled to provide for themselves, know what is good for them, and determined to preserve and propagate the Species. It bears some Analogy to Reason, and supplies the Defect of it in Brutes.

**INSTITUTE**, to ordain, found, or establish any thing. Thus *Moses* instituted the Ceremonies of the Old Law, and Jesus Christ the Sacraments of the New.

**INSTITUTION**, is the Act of the Bishop, or one commission'd by him to act, whereby any Clerk is invested with the Spiritualities of a Rectory or Vicarage. The Clerk kneels down before the Bishop, whilst he pronounces these Words of *Institution*: (*Instituo te Rectorem Ecclesie de A. B. cum Curâ Animarum, & accipe Ceram tuam & massam*) and the Clerk holds the written Instrument, with the Episcopal Seal annexed, in his hand during the Ceremony. But the Clerk must have Induction after this, without which he has no Right to his Temporalities, if the Benefice be not a Donative. Before the Clerk is instituted, he must subscribe the 39 Articles of Religion, in the Presence of the Ordinary (or his Substitute) and the Ordinary is not bound to offer them, but the Clerk is to offer to subscribe them: and he must subscribe them without Reserve, Exception, or Qualification, or else his *Institution* is *ipſo facto* void, and null, and the Church is still vacant. At the same time the Ordinary requires the Clerk to subscribe the other two Articles, mention'd in the 26th Canon about the King's Supremacy, and the Lawfulness of the Use of the Liturgy. The Clerk must also before *Institution* subscribe to that part of the Declaration enjoyn'd by the Act of Uniformity, 24 Car. 2. c. 24. viz.

I will conform to the Liturgy of England, as by Law established. Before *Institution*, he must also take the Oaths mention'd in the first Statute of *William and Mary*, c. 8. instead of the former Oaths of Allegiance and Supremacy required by *Stat. 1 Edw.* And then he must take the Oath against Simony, join'd by the 40th Canon, and the Oath of Canonical Obedience. And he is to have Certificates given him of his subscribing the Declaration contained in the Act of Uniformity, in *English*, in a distinct Instrument, under the Hand and Seal of the Bishop; and of his other Subscriptions and Oaths in *Latin*. The Clerk ought by all means to have Witnesses of his *Institution*, his taking the Oaths, making Subscriptions, &c. and therefore he should desire some present to write their Names on the back of his Instruments; and make Memorandums who they are, and where they live. The Church, by *Institution*, is full against all Persons, but the King; and the Clerk by it may enter upon the Glebe, and take the Tythes: but he cannot let or grant them, nor sue for them, if they are refused to be paid. After *Institution* the Clerk is to receive a written Mandate from the Ordinary to the Arch-Deacon, or other proper Person, in order to his *Induction*: which see.

**INSTITUTIONS**, or *Institutes*: Part of the first of the four Tomes or Volumes of the Civil Law; being a Compendium or Summary of the whole in four Books, composed by *Troniamus, Theophilus* and *Doroteus*, by order of the Emperor *Justinian*, for the Use of young Students; who having the first Elements of the whole Profession in this little Treatise, might the sooner gain a competent Knowledge of it, without being discouraged by the Bulk of the former Books. *Institutions* are likewise a System of Laws, or Rules in any particular Science; and so Physical or Medicinal *Institutions* are such as teach the necessary *Præcepta* to the Practice of Medicine, or the Cure of Diseases.

**INSTRUMENT**, properly signifies any thing that serves as a Cause to produce an Effect.

*Instrument*, is also used in Law to signify some public Act or authentic Deed, by means whereof any Truth is made apparent, or any Right or Title establish'd in a Court of Justice.

*Instruments of Sacrifice*, are Ornaments in the Antique Architecture; as Vases, Patères, Candlesticks, Knives, wherewith the Victims were kill'd, &c. Instances of which, we see in a Corinthian Pæcæ in the Remains of a Temple behind the Capitol at Rome, &c.

**INSULATED**, by the *French* call'd *isolee*, and the *Latin* *Insulatus*; is a Term apply'd to a Column that stands alone, or free from any contiguous Wall, &c. like an Island in the Sea; whence the Word is derived.

**INSULT**, a Military Term, used for the attacking of any Post with open Force, without the Apparatus of Trenches, Saps, or any regular Approaches.

**INSUPER** is a Word used by the Auditors of the *Exchequer*: In their Accounts, they say, so much remains *insuper* to such an Accountant; that is, so much remains due on such an Account.

**INSURANCE**, is Security given in Consideration of a Sum of Money paid in hand, to make good Ships, Merchandises, Houses, &c. to the Value of that for which the Reward is received, in case of Loss by Storm, Pirates, Fire, &c.

**INTACTÆ** are Right Lines to which Curves do continually approach, and yet can never meet with them: These are usually call'd *Asymptotes*, which see.

**INTAGLIO**'s, precious Stones, having the Heads of great Men, Inscriptions, and the like, engraven on 'em; such as we frequently see set in Rings, Seals, &c.

**IN-TAKER**, a Name antiently given to certain Banditti or Robbers, who inhabited a part of the North of *England*, and who made frequent Excursions into the very middle of *Scotland*, plundering the Inhabitants wherever they came. Those who made the Expeditions were call'd *Out-Parters*, and those who were left behind to receive the Booty *In-Takers*.

**INTEGERS**, from the *Latin* *Integrum*, signifies, in Arithmetic, whole Numbers, in contradistinction to Fractions.

**INTEGRAL**: the *Integral* Calculus in the new Analysis, is that which answers to the differential Calculus. This last has been completely explained by the Marquis de l'Hospital, but the other still remains imperfect, having been but little cultivated.

*Integral*, among the Schoolmen, is understood of those Parts which enter the Composition of any Whole. Thus the Arms, Legs, &c. are *integral* Parts of the Body.

**INTEGUMENT**, a Term in Anatomy, apply'd to the Skins or Membranes, which cover the Parts within the Body, as the Coats or Tunics of the Eye. The word is originally *Latin*, and signifies any kind of Covering.

**INTELLECT**, a Term used among the Philosophers, to signify that Faculty of the Soul, usually call'd the Un-

derstanding. The *Peripatetics* make two kinds of *Intellects*, the Active and the Passive; the Active is that which receives the impressed Species emitted by Objects to the exterior Senses, which convey to the common Sensorium. These impressed Species being material and sensible, are rendered intelligible by the Active *Intellect*, and fit to be received into the Passive *Intellect*. The Species, so spiritualized, are call'd expressed Species, as being express'd from those others impressed, and it is by these that the *Intellect* comes to know material things: in effect, however, the two *Intellects* have nothing really distinct from each other.

**INTELLIGIBLE**, any thing capable of being understood or conceived by the Mind. The Philosophers have invented certain Beings that are purely intelligible, and only subsist in the Understanding; such are the *Entia Rationalia*, Universal Ideas, and other Chimeras. The *intelligible*, or intellectual World, is the Idea of the World in the Divine Mind, frequently referred to by *Malebranch*.

**INTENDANT**, one who has the Conduct, Inspection, and Management of any thing. This is a Title very frequent among the *French*: they have their *Intendants* of the Marine, who are Officers in the Sea-Ports, whose Business is to take care the Ordinances and Regulations relating to Sea-Affairs be observed; *Intendants* of the Finances, who have the Direction of the Revenues; *Intendants* of Provinces, who are appointed by the King, to take care of the Reformation of Justice, Policy, and Finances in the Provinces; *Intendants* of Buildings, of Houses, &c.

**INTENDMENT OF LAW**, the Understanding, Intention, and true Meaning of the Law. The Judges ought to judge according to the common Intendment of the Law. *See*.

**INTENT**, in the Civil Law, is to begin or commence an Action or Process.

**INTENTION**, in Law; is a Writ which lies against him who caters after the Death of the Tenant in Dower, or other Tenant for Life, and holds out him in the Reversion or Remainder.

**INTENTION**, in Physic, is that Judgment or particular Method of Cure, which a Physician forms to himself from a due Examination of Symptoms.

In Physic, it signifies the Increase of any Power or Quality, as Heat, Cold, &c. as Remission signifies its Decrease or Diminution.

In Metaphysics, it is used for the Exertion of the intellectual Faculties with more than ordinary Vigour: when the Mind with Earnestness fixes its View on any Idea; considers it on all sides, and will not be called off by any Solicitation.

The Schoolmen also use the Terms *first* and *second Intention*. A Term of *first Intention* is that which signifies a thing; the *first Intention* of Man, in establishing Words, being to express Things, or the Ideas they have of Things. A Thing of *second Intention* is that which does not signify a Thing, but another Term or Sign. Thus a Tree, a Man, &c. are Terms of *first Intention*, and the Terms in Rhetoric, Grammar, &c. as Figure, Kind, &c. are Terms of *second Intention*.

**INTERCALARY-DAY**, is usually understood of the odd Day inserted in the Leap-Year. The Word is derived from the *Latin* *Intercalaris*, of *Calo calare*, which antiently signified to call with a loud Voice; an *intercalary* among the *Romans* signifying a Day inserted between two other Days; which for that reason was proclaim'd by the Priests with a loud Voice.

**INTERCOLUMNS**, or *Intercolumniation*, in Architecture, signify the Spaces between the Columns. The *Intercolumns* must always be proportion'd to the Height and Bulk of the Columns. *Vitruvius* calls it *Intercolumnium*: And according to that Author, the *Intercolumnium* is of five kinds; viz. *Pychnostyle*, *Sistyle*, *Eustyle*, *Diostyle*, and *Aræostyle*: which see explain'd in their places. For a Medium, some Authors have laid down the following Proportions for the *Intercolumns*. In the Tuscan Order, the *Intercolumnium* must be four Diameters of the Body of the Column below; in the Doric three; in the Ionic two; in the Corinthian two, one quarter; in the Composite one and a half.

**INTERCESSOR**, a Person who prays or intercedes in behalf of another. In the *Roman* Law *Intercessor* was the Name of an Officer, whom the Governours of Provinces appointed principally to raise Taxes and other Dues. See the third Law of *Just. Code*.

*Intercessor* was also a Term heretofore apply'd to such Bishops, as, during the Vacancy of a See, administer'd the Bishopric, till a Successor to the deceased Bishop had been elected. The third Council of Carthage calls these *Intercessores*. The word *intercessor* comes from the *Latin* *inter* and *cedo*, I go between.

**INTERCOMMONING**, is when the Commons of two Mannors lie together, and the Inhabitants of both have

time out of mind caused their Cattel to feed promiscuously in each.

**INTERCOSTAL**, in Anatomy, signifies any thing between the Ribs. There are two *intercostal* Nerves, which are so call'd, because in descending they pass near the Roots of the Ribs. They are formed in the Brain, by three Branches of Nerves, two whereof come from the sixth Pair, and the third from the fifth. The *intercostal* Nerves have a great Communication with those of the eighth Pair, and send several Branches to the Breast and lower Ventricle. There are also two *intercostal* Arteries; the upper, which comes from the Subclavian, and distributes itself within the four Spaces of the upper Ribs; and the under, which comes from the lower Trunk of the great Artery, and diffuses itself within the Spaces between the eight lower Ribs and the neighbouring Muscles. There is also a Vein call'd *intercostal*, which arises from the four Spaces between the upper Ribs, and terminates in the Subclavian.

*Intercostal Muscles* are the external and internal, which are forty-four in number, one of each sort being between every two Ribs: They arise from the lower Edges of each superior Rib, and are inserted into the upper Edges of each inferior Rib. Their Fibres cross one another; those of the external run obliquely from the back-part forwards; but those of the internal from the fore-part backwards: they are thin and fleshy.

**INTERDICT**, a Censure inflicted by a Pope or Bishop, suspending the Priests from their Functions, and depriving the People of the Use of Sacraments, Divine Service, and Christian Burial.

*Interdict* is properly understood of a general Excommunication of a Country or City, as appears by the Decretals. There is a local and a personal *interdict*; where these two are join'd, the *interdict* is said to be mix'd. This Punishment, as well as general Excommunications, were but little known till the Time of Pope Gregory VII. In Excommunicating a Prince, all his Adherents, that is, his Subjects who retain their Allegiance, are excommunicated, and the whole Country is under an *interdict*. In the Reign of King John, the Kingdom of England lay under a Papal *interdict* for above six Years together: It began A. D. 1208. In Imitation of the Popes, the Bishops also began to *interdict*; and it became a common thing for a City or Town to be excommunicated for the sake of a single Person whom they undertook to shelter. But this Severity was found to have such ill Effects, that they have been oblig'd to moderate it. An *interdict* is denounced, and taken off again, with the same Formalities as an Excommunication.

In the Common Law, the word *Interdiction* is used also in the same Sense as in the Canon Law, where it is defin'd to be *Censura Ecclesiastica prohibens Administrationem Divinorum*.

*Interdicts*, in the Roman Law, were certain *Formulae* of Words, by which the Praetor, when the Possession of any thing was contested between many, order'd or forbid something to be done with it, till the Buiness of Right or Property should be legally determin'd. Which *Formulae* were call'd *interdicts*, because they related to the Possession of the thing in the *interim*; or till the Right was ascertain'd. They had three kinds of *interdicts*, *Prohibitoria*, *Restitutoria*, and *Exhibitoria*. *Prohibitoria* were those by which the Judges forbid any one to vex another in the Possession of any thing legally belonging to him. *Restitutoria* were those by which the Judges appointed any one, who had been expelled out of his Estate, to be repossessed before his Right was legally ascertain'd; and this was the same with what they call'd the *Reintegrans*. *Exhibitoria* were those by which any thing in dispute was order'd to be exhibited, as a Testament, &c.

There was also a second Division of *interdicts*, viz. into *Adiudicande*, *Reintegrande*, and *Recoverande*. The first tend to the acquiring a new Possession, as the *interdict quorum bonorum*, &c. the second to the keeping an old one

till it was further determin'd, as the *Uti possidetis*, &c. the last to the recovering one lost, as *Unde vi*, &c.

*Interdiction of Water and Fire*; a Sentence anciently pronounced against such, as for some Crime were to be banish'd. They were not directly adjudged to Banishment; but by giving order that no body should receive them, but deny them Fire and Water, they were condemn'd, as it were, to a Civil Death; and this they call'd *Legimus Exilium*. *Uty*.

**INTEREST**, is the Sum reckoned for the Loan and Forbearance of some principal Sum lent for, or due at a certain time, according to some certain Rate, and therefore call'd Principal, because it is the Sum that procures the *Interest*, or from which the *Interest* is reckon'd, and is either Simple or Compound.

(1.) Simple *Interest* is counted from the Principal only, and is easily computed by the Simple or Compound Golden Rule, thus: Let that which is the principal Cause of the *Interest* be put in the first place, and that which betokeneth Time be in the second place, and the remaining in the third; under this conditional Part place the two other Terms, each under its like, and there will be a Blank to supply under one of those above, either under the first, second, or third: As for Example, if 100 *l.* in twelve Months gain 6 *l.* (this is the conditional Part) what shall 50 *l.* get in three Months? Place them down as in the Rule.

*l. Numbr. l.*

100 . 12 . 6

50 . 3

Here the Blank

will be under the third Place, multiply the three last for a Dividend, and the two first for a Divisor, the Quotient of these gives the sixth; that is,  $6 \times 50 \times 3 = 900$ , and  $100 \times 12 = 1200$ . Now  $1200 \div 900 = 1\frac{1}{3}$  required. But if the Demand had been, in how many Months would 50 *l.* have gained 15 *s.* or if 100 *l.* in twelve Months gain 6 *l.* what shall the Principal be that in three Months would gain 15 *s.* In these two Cases the Blank would have been under the first or second Term: Then, by the Rule, multiply the first, second, and last for a Dividend, and the third and fourth for a Divisor; the Quotient is the Answer.

*l. Numbr. l.*

100 . 12 . 6

3 . 75 = 15 *s.*

Then by the Rule  $100 \times 12 \times 75 = 900000$  and  $6 \times 3 = 18$  900. (50 *l.* required.)

This Rule shews Simple *Interest*, and all that belongs to it with Ease, and was thus found: Put P for the Principal, T for the Time, and G for the Gain in the Conditions, and p, r, g answering, it will be, P : G :: r : p ;  $\frac{G \cdot P}{P}$ . And T : G P ::  $\frac{G \cdot P \cdot T}{T \cdot P} = g$ , which is the first

Rule; that is, multiply the three last for a Dividend, and the two first for a Divisor. And because  $\frac{G \cdot P \cdot T}{T \cdot P} = g$ ,

therefore  $G \cdot P = T \cdot P \cdot g$ , and consequently  $r = \frac{T \cdot P \cdot g}{G \cdot P}$

and  $p = \frac{T \cdot P \cdot g}{G \cdot r}$ , which is the second Rule.

(2.) Compound *Interest* is that which is counted from the Principal, and Simple *Interest* forborn, called also *Interest upon Interest*; but because this hath now no Place in human Affairs, it being rendered illegal, it is not worth while to know how to compute it. But besides the ways of computing *Interest*, we shall here give another very plain, easy, and ready Method of computing all Simple *Interest* and Discount; as also the way to find the Amount or present Value of any Sum of Money, or of any Annuity, or other yearly Payment, &c. for any Term not exceeding an hundred Years. And in order to this, the following Table of Shillings, Pence, and Farthings, reduced to the Decimal Parts of Pounds, is peculiarly necessary.

## SHILLINGS, PENCE, and FARTHINGS, reduced to the Decimal Parts of a POUND.

s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.

## Examples of the Use of the preceding TABLE.

What Decimal Part of a Pound is 7 d? Look in the Table for 7 d. and even with it you will find .059167, which is the Decimal required. What Decimal Part of a Pound is 17 s. 6 d? You will find the Decimal of 17 s. to be .85, and the Decimal of 6 d. to be .055 which added, makes .905, and answers the Question. What is the Value of this Decimal .09375 in Shillings, Pence, and Farthings? Look in the Table, and you will find it to be 1 s. 10 d. 4. Observe, that if you cannot find in the Table the exact Decimal sought for, to take that which is nearest to it, and you can never err above half a Farthing. Knowing thus the Use of these Decimal Tables, all the Business of Simple Interest will be very easily understood, and dispatched as followeth.

The yearly Interest of any Sum of Money is had; by only multiplying the principal Sum by the hundredth Part of the Rate of Interest: For the Product in Decimals is the true Answer. For Example, what is the Interest of 75 l. for one Year, at the Rate of six per Cent?

75 = Principal.

.06 = the hundredth Part of 6 l.

4.50 the Product, which is 4 10 00

What is the yearly Interest of 157 l. 17 s. 6 d. at 5 l. per cent?

157.875 is the Decimal for 157 l. 17 s. 6 d.

.05 the Hundredth Part of five Pounds.

7.89575 which is the Decimal answering to 7 l. 17 s. 10 d. 2, the Interest of 157 l. 17 s. 6 d. for one

Year at 5 l. per Cent. and so for any other Rate or Sum whatsoever. When thus the Interest for one Year is found, divide it by 365, and the Quotient will be the Interest for one Day. Thus .05 being the Interest of one Pound for one Year, if you divide that Decimal by 365, (containing the Work as long as you please) you will have .0001370137, &c. for a Quotient, which will be the Interest of one Pound for one Day, and at any per Cent. Then will this Decimal .000137, &c. found as above, if you multiply it continually by the Principal, the Number of Days, and the Rate of Interest, become of itself an Interest-Table for any Sum of Money, for any Time, and at any Rate:

As for Example, what is the Interest of 150 l. for 365 Days at 6 l. per Cent.

00002739726028

150

410958904200

365

150000000035000

6

9.0000000198000, which Decimal gives the Answer, near enough for any Use, to be nine Pounds.

By the same Rule .02 divided by 365, will give, in the Quotient, the Interest of one Pound for one Day, at 2 per Cent. and .05, divided by 365, will do the same at 5 per Cent. and thus these Numbers following were found.

The Interest of one Pound for one Day, at all Rates, from 1 to 10 per Cent.

At 1 l. per Cent. is 000027397260, &c. as above.

1 ——— 000054794512

2 ——— 000082191784

3 ——— 000109589041

4 ——— 000136986301

5 ——— 000164383562

6 ——— 000191780822

7 ——— 000219178082

8 ——— 000246575342

9 ——— 000273972602, &c.

And when thus the Interest of one Pound for one Day and any Rate is found, then that Interest, multiplied by 2, 3, 4, 5, 6, 7, 8, and 9, &c. gives the Interest of any Sum of Money at the same Rate.

Take an Example at 5 l. per Cent.

Interest of 1 l. for 1 Day is 000027397260

2 ——— 000054794512

3 ——— 000082191784

4 ——— 000109589041

5 ——— 000136986301

6 ——— 000164383562

7 ——— 000191780822

8 ——— 000219178082

9 ——— 000246575342

And then it is easy to find that the *Interest* of 1 l. being, as before, 000082, &c. that of

10 will be 000822 \*  
 100 ——— 008219  
 1000 ——— 082192 \*  
 10000 ——— 8219178 \*  
 100000 ——— 82191781

Because moving the Point of Separation still one Place nearer to the Left-Hand, multiplies any Decimal by 10, 100, 1000, &c. as is shewn under Decimals. And thus Tables of daily *Interest* may be made at pleasure. The Reason of the Stars above set to some of the Numbers, is to shew, that in the Contraction of a Decimal Fraction to fewer Places, it is proper to add one to the last Figure retained, when the next Figure to it, which is omitted, exceeded 5.

To finish this Account of *Interest*, we shall here subjoin the ingenious Mr. *Barton's* new and universal Method of Simple *Interest*, correctly, concisely, and easily finding the *Interest* of any Sum, for any Number of Days, at any Rate *per Cent.* by one General Rule.

Places ——— 12 3 4 5 6 7 8 9 10  
**RADIX** ——— 0000027397  $\frac{10}{100}$  l. Sterling.  
 (General Rule) multiply the Principal, Time, Rate, and Radix one into another, and it's done.

EXAMPLE 1.

Interest of 1. 271 for 112 Days at 3 per cent. per ann.

112  
 20352  
 3  
 91056  
 24657  
 273  
 13  
 1  
 2494 Answ. l. 2 : 9 : 10  $\frac{1}{2}$

EXAMPLE 2.

Interest of 1. 110 for 71 Days at 4 per cent. per ann.

11  
 781  
 5  
 3905  
 8219  
 2465  
 13  
 1069 Answ. l. 1 : 1 : 4  $\frac{1}{2}$

EXAMPLE 3.

Interest of 5000 l. for 60 Days at 4 per cent. per ann.

60  
 30  
 4  
 12  
 32. 876 Answ. l. 32 : 17 : 6  $\frac{1}{2}$

EXAMPLE 4.

Interest of 1. 800 for 125 Days at 6 per cent. per ann.

8  
 6  
 6  
 16438 Answ. l. 16 : 8 : 9  $\frac{1}{2}$

Any Annual Sum given, to find what that is per Day.

EXAMPLE 5.

1. 164 per ann. what is that per Day ?

2739  
 1643  
 109  
 449 Answ. s. d. 8 : 11  $\frac{1}{2}$

EXAMPLE 6.

1. 1000 per ann. what is that per Day ?

2. 739 Answ. l. 2 : 14 : 9  $\frac{1}{2}$

EXPLICATION.

In Example 1. the principal Time and Rate multiplied one into another, make 91056, by which 1 multiply the Radix thus 5 because 9 is in the 5th Place, with my Left-hand I hold a Quill's Point in the 5th Place in the Radix; then I multiply by the said 9, beginning five Figures (more or less) to the right of the Quill, and when I come to the fourth Figure, on the right of the Quill, I set its Product down, and all the rest onwards, observing when I come to the said 5th Place to make the [.] and the Product is 2.4657: Then I remove the Quill into the fourth Place of the Radix (because 1 stands there in the whole Number) and multiply by 1 (ever observing punctually the last Rule) and the Product is .0273; then 0 in the third place makes nothing, for 5 in the second place (putting the Quill there) the Product is .0013; and for 6 in the first Place the Product is .0001 (placing them ever in the Order you see) I add them together (never setting but three Decimals down) and find their Sum 2.494, and its Value thus.

If any thing is to the left of the [.] it's Pounds (l. s.) the first Figure to the right of the [.] doubled is Shillings (s.) from the second Figure take 5 if you can (if you cannot its whole is Tens) and make the Shillings one more (9): the Remainder (4) in the second place, is Tens, which added to the third (as Units) is Farthings (44 Farthings): for every 10 in that put away 1 (44 Farthings put away 2 is 42 Farthings): the Remainder brought into Pence (10 s.) compleats the Answer (l. s. 9. 10  $\frac{1}{2}$ ).

*Contraction.*] A Cypher or Cyphers (having no Figure to the Right) may be cancelled (I have noted them with a Dash) multiplying the real Figures one into another; but observe that the Figures by which you are to multiply the Radix, are to be used as if every cancelled Cypher stood before them. In Example 2. the 3905 is used like and in reality is 39050. In Example 3. five 0's are cancelled, therefore I use 12 like 1200000, putting the Quill for the 2 in the 6th Place in the Radix, and, for brevity's sake, multiply by 12 or once.

Any annual Sum given, to find what that is per Day; ever imagine two 0's put to the Right of it, then multiply the Radix by it, and it's done.

*Remarks.*] (1.) If Cyphers be added to the Numerator of the Vulgar Fraction, and that Dividend be divided by the Denominator, the Radix may be increased to any Number of Places.

(2.) If the Radix be multiplied by 3, 4, 5, 6, &c. it will be a Radix for 3, 4, 5, 6, &c. per cent. and save the trouble of always multiplying by the Rate.

INTERJECTION, in Grammar, is an Expression used to denote some sudden Motion or Passion of the Mind; as *oh! he!* &c. As the greatest part of the Expressions used on these occasions, are taken from Nature alone; the real *Interjections* in most Languages are Monosyllables. And as all Nations agree in those natural Passions, so do they agree in the Signs and Indications of them; as of Love, Mirth, &c. Some deny the *Interjections* to be Words, or any part of Speech, and make them mere natural Signs of the Motions or Passions of the Mind, expressed by these inarticulate Sounds, several whereof, Brutes have in common with us. But as these are Passions, and must be represented in Discourse, the *Interjection* has a good Foundation in Nature, and is a necessary Part of Speech. The *Greeks* confound their *Interjections* with Adverbs, and the *Hebrews* confound them with their Adverbs and Prepositions, calling them all by the general Name *Particel*.

INTERIM: A Term borrow'd from the *Latin*, signifying in the mean time. Charles the Vth was the first who brought it into use, in order to compose the Disturbances of *Germany*. It was a kind of Ordinance or Regulation to be observ'd in the Empire, with regard to [the] Articles of Religion then controverted, till such time as they should be determin'd by a Council; and was therefore call'd *Interim*. It was said to have been drawn up by two Catholics and a Protestant. But as it retain'd most of the Doctrines and Ceremonies of the *Romanists*, excepting that of Marriage, which was allow'd to Priests, and Communion, which was administer'd to the Laity under both Kinds; most of the Protestants rejected it: those who admitted it, were nick-named *Interimists* or *Adaptivists*: Indeed the *Interim* equally disgusted both Parties, the Protestants and Catholics. Besides this, there were two other

*Interims* made; the one call'd the *Interim* of *Leippsie*; the other made by the *Divines* of *Franconia*, who refusing to accept the two former, made another for themselves.

**INTERLINEATION**, something inserted between two Lines.

**INTERLOCUTORY ORDER**, is that which decides not the Cause, but only settles some intervening Matter relating to the Cause; as where an Order is made by Motion in Chancery, for the Plaintiff to have an Injunction, to quit his Possession till the hearing of the Cause: This, or any other such Order, not being final, is *interlocutory*.

**INTERLOPE**, is to intercept or disturb the Traffic of a Company; to take up a new Trade or Employment, to the prejudice of those who were brought up in it: And *Interlopers* are properly those, who without due Authority hinder the Trade of a Company or Corporation lawfully establish'd, by dealing in the same way.

**INTERLUCAION**, in Husbandry, is a letting in of Light between, by lopping, or cutting away of Boughs.

**INTERLUDE**, an Entertainment exhibited on the Theatre between the Acts of a Play; to amuse the Spectators while the Actors take breath, and shift their Dresses; or to give time for changing the Scenes and Decorations. These *Interludes* usually consist of Songs, Dances, Feats of Activity, Concerts of Music, &c. In the ancient Tragedy, the Chorus sung the *Interludes*, to shew the intervals between the Acts. *Aristotle* and *Horace* give it for a Rule, that the *Interludes* should consist of Songs built on the principal Parts of the Drama: But since the Chorus has been laid down, Dancers, Buffoons, &c. ordinarily furnish the *Interludes*.

**INTERMEDIATE**, something betwixt two. It is usually understood of the Space of Time elapsed from any certain Point to any other.

**INTERMEWING**, in Falconry, is an Hawk's Mewing from the first Change of her Coat till she turn white.

**INTERMITTENT** signifies a Cessation of any particular Action for some time, and that Time is called the *Interval*: Thus Fevers which go off, and soon return again, as also any other Distempers, are called *Intermittent*, in opposition to those which are always continued; and a Pulse which after so many Strokes, stops, or loses one in its due time, is call'd an *intermittent Pulse*. With regard to this it has been observed, that as often as the Ventricle is much inflated with Wind, the *Nervus* or *Plexus Cardiacus* at its Orifice must suffer a Contraction, which being continued to the Heart, will occasion a Twitching; and this, as it is more or less violent, will produce a simple Intermittion of Pulse, or a real Palpitation of the Heart.

**INTERNAL ANGLES**, are all Angles made by the Sides of any right-lin'd Figure within: also the two Angles between the parallel Lines on each side the crossing Line, as *a* and *d*, *e* and *e* in the Figure are call'd the two *internal Angles*, and are always equal to two right ones. The Angles *c* and *d* are also called *internal* and *opposite Angles* in respect of *a* and *b*. The Sum of all the *internal Angles* of any right-lin'd Figure, is equal to twice as many right Angles as the Figure hath Sides, except 4. For since every such Figure from a Point taken within it, can be divided into as many Triangles as it hath Sides, and since the Sum of the Angles of each Triangle is equal to 2 right Angles (32. Prop. 1. *Euc.*) that will make twice as many Angles as the Figure hath Sides; from which Sum take away all those Angles about the Point *e*, which (by 13. Prop. 1. *Euc.*) are equal to 4 right Angles; wherefore the remaining Sum of all

the *internal Angles* is equal to twice as many right Angles, as the Figure hath Sides, except 4.

**INTERNODII**, in Botany, are those little Spaces contained between any two Knots or Joints of the Stalk of a Plant; and in Anatomy, the *Extensor* *Pollicis*, which see, are also so called.

**INTEROSSEI MANUS**, are the Muscles which move the Fingers, thus called from their Situation, as being contained between the Spaces of the Bones of the *Metacarpus*: Some reckon six of them, and others eight; the one half lie between the Spaces these Bones leave towards the Palm of the Hand, and they are called the *interossei*, arising from the upper part of the Bones

of the *Metacarpus* next the *Carpus*; and being inserted on the internal Sides, of the first Bones of the Fingers with the *Lumbricales*, they are the *Adductores Digtorum*, for they bring the Fingers to the Thumb. The other half are contained in the Spaces that the Bones of the *Metacarpus* leave on the Back of the Hand; they rise from the upper Part of the Bones of the *Metacarpus*, next the *Carpus*, and are inserted on the external Sides of the first Bones of the Fingers; and these are the *Abductores Digtorum*, for they draw the Fingers from the Thumb.

*Interossei Pedis*, the Muscles which move the Toes; in Number, Use, Origin, and Insertion, they answer exactly to those of the Hand. See *Interossei Manus*.

**INTERPOLATION**, a Term used by the Critics in speaking of ancient Writings and Manuscripts, to which some spurious Additions or Alterations have been since made. For the ascertaining an *Interpolation*, P. *Risner* gives us the five following Rules. 1. That the Piece supposed to be interpolated appear to have all the Antiquity it pretends to. 2. That there be good Proofs that it has been interpolated. 3. That the supposed *Interpolations* agree to the Time of the Interpolator. 4. That the *Interpolations* don't touch the Foundation of the Work, be not too frequent, nor entirely disfigure the Piece. 5. That the Restitution made, agree perfectly to the rest of the Work.

**INTERPOSITION**, the Situation of a Body between two others hiding them, or preventing their Action: Thus the Eclipse of the Sun is occasion'd by an *Interposition* of the Moon between the Sun and us; and that of the Moon by the *Interposition* of the Earth between the Sun and Moon.

**INTERPRETER**, a Person who explains the Thoughts, Words, or Writings of some others, which before were unintelligible. The word *Interpres*, according to *Isidore*, is composed of the Preposition *inter* and *pres*, as signifying a Person in the middle betwixt two Parties, to make them mutually understand each other's Thoughts. Others derive it from *inter* and *pres*, i. e. *Fiduciosus*, a Person who cautions another.

There have been great Debates about interpreting the Scripture: The *Romanists* contend, that it belongs absolutely to the Church, adding, that where she is silent, Reason may be consulted; but where she speaks, Reason is to be disregarded. The Protestants generally allow Reason the Sovereign Judge in the Case; tho' some among them have a strong regard to Synods and others to the Authority of the Primitive Fathers. Lastly, others have recourse to the Spirit within every Person to interpret for them. Which is what *Bochart* calls *ambrosius in auro*.

**INTERREGNUM**, the Time during which a Throne is vacant, or a Kingdom without a Head. In Hereditary Kingdoms there are no *Interregnums*, at least they are very rare. In Elective Kingdoms, the *Interregnums* are extremely liable to Factions and Disorders. In Germany, the Emperors have lost the greatest part of their Dominions during the *Interregnum*.

**INTERREX**, a Magistrate who governs during an *Interregnum*, or in the Interval between the Death of a Monarch, and the Election or Inauguration of his Successor. This Magistrature was establish'd in old Rome, and was almost as ancient as the City itself. After the Death of *Remulus* there was an *Interregnum* of a Year, during which the Senators were each *Interrex* in their turn, five Days a-piece. After the Establishment of Consuls and a Commonwealth, tho' there were no Kings, yet the Name and Function of *Interrex* was still preserved. For when the Magistrates were absent, or there was any Irregularity in their Election, or they had abdicated, so that the *Comitia* could not be held, provided they were unwilling to create a Dictator, they made an *Interrex*, whose Office and Authority was to last five Days; after which they made another. To the *Interrex* was delegated all the Regal and Consular Authority, and he perform'd all their Functions. He assembled the Senate, held *Comitia* or Courts, took care the Election of Magistrates was according to the Rules. Indeed, at first it was not the Custom for the *Interrex* to hold *Comitia*; at least we have no Instance of it in the ancient Roman History. The *Patricii* alone had the Right of electing an *Interrex*. This Office fell with the Republic, when the Emperors made themselves Masters of every thing.

**INTERROGATE**, a Judiciary Act, performed by a Judge or Commissioner deputed to examine or question a Party; who first gives his Oath that he will answer truly to every thing he is *interrogated*.

**INTERROGATION** is a Figure in Rhetoric, in which the Passion of the Speaker introduceth a thing by way of Question; to make its Truth more conspicuous. It is a kind of *Apitrophe* which the Speaker makes

makes to himself; and it must be own'd, that this Figure adds an uncommon Briskness, Action and Force to Discourse.

*Interrogation*, in Grammar, is a Point which serves to distinguish such Parts of a Discourse, where the Author speaks as if he were asking Questions. Its Form is this ?

**INTERRUPTION**, is the same with Disjunction of Proportion in Geometry, it is noted thus (:) and signifieth the breaking off of the Ratio in the middle of four disjunct or discrete Proportionals, as A : B :: C : D; that is, as A is to B so is C to D.

*Interruption* is also a Figure in Rhetoric, wherein a Person breaks off his Discourse suddenly, to shew some Passion.

**INTERSECTION**, in Mathematics, signifies the Point or Line wherein two Lines or two Planes cut each other. Thus we say, that the mutual *Intersection* of two Planes is a Right Line. The Centre of a Circle is in the *Intersection* of two Diameters. The Central Point of a regular or irregular Figure of four Sides is the Point of *Intersection* of the two Diagonals. The Equinox happens when the Sun is in the *Intersection* of the Equator and Ecliptic.

**INTERSOILING**, in Husbandry, is laying one kind of Soil or Mould upon another; as Clay on Sand, Sand on Earth, &c.

**INTERSPINALES COLLI**, the Name of five Pair of small Muscles discover'd by Mr. Cooper; and by him so call'd from their Position. They arise from each double Process of the Spine of the Neck, and run from the upper one to the next below, into which they are inserted. They serve to approximate and draw together the *Vertebrae* of the Neck, and are more especially proper to this Part, as having both Origin and Insertion in it.

**INTERSTELLAR**, is a Word used by some Authors to express those Parts of the Universe that are without and beyond our Solar System; in which are supposed to be several other Systems of Planets moving round the fixed Stars as the Centers of their respective Motions: And it is to be true, as it is not improbable, That each fixed Star is thus a Sun to some habitable Orbs, that move round it, the *Interstellar* World will be infinitely the greater part of the Universe.

**INTERTIES**, or **INTERDUCES**, in Architecture, are those small Pieces of Timber that lie horizontally betwixt the Summers, or betwixt them and the Sill or Refon.

**INTERTRANSVERSALES COLLI**: Certain Muscles between the transverse Processes of the *Vertebrae* of the Neck, of the same Size and Figure with the *Interspinales*, and observed by the same Author. See *Philosoph. Transact.* vol. 21. p. 152.

**INTERVAL**, the Distance or Space between two Extremes, either of Time or Place. The Word comes from the Latin *Intervalum*, which, according to *Lisibore*, signifies the Space *inter Festum & Maram*, between the Dish and the Wall. Others say, that the Stakes or Piles, driven into the Ground in the ancient Roman Bulwarks, were called *Falla*, and the Interstices or Vacancy between them *Intervalla*.

**INTERVAL**, in Music, is the Difference between two Sounds in respect of Acute and Grave, or that imaginary Space terminated by two Sounds differing in Acuteness or Gravity. When two or more Sounds are compared in this Relation, they are either equal or unequal in the Degree of Tune. Such as are equal are call'd *Unisons*, with regard to each other, as having one Tune; the other being at a distance from each other, constitute what we call an *Interval* in Music, which is properly the Distance in Tune between two Sounds. *Intervals* are distinguish'd into Simple and Compound. A simple *Interval* is without Parts or Division, a Compound consists of several lesser *Intervals*. But this Distinction regards Practice only, because there is really no such thing as a least *Interval*. Besides, by a simple *Interval* is not meant here the least practis'd, but such as tho it were equal to two or more lesser which are in use, yet when we would make a Sound move so far up or down, we always pass immediately from one of its Terms to the other. What is meant then by a compound *Interval*, will be very plain: It is such, whose Terms are in Practice taken either in immediate Succession; or such where the Sound is made to rise and fall from the one to the other, by touching some intermediate Degrees; so that the whole becomes a Composition of all the *Intervals* from one Extreme to the other. What we here call a simple *Interval*, the Ancients call'd a *Diapason*, and the Compound they call'd a *Syston*. Each of these has Differences; even of the Simple there are some greater, and others less: but they are always Discord; but of the Compound or System, some are Concord, others Discord. *Unisons*, 'tis plain, cannot possibly have any Variety; for where there is no difference, as in Unisonance, which flows from a Relation of Equality, 'tis plain there can be

no Distinction: Unisons therefore must all be Concord. But an *Interval* depending on a Difference of Tune, or a Relation of Inequality, admits of Variety; and so the Terms of every *Interval*, according to their particular Relation or Difference, make either Concord or Discord. Some indeed have retained the word *Concord* to *Intervals*, making it include a Difference in Tune, but this is precarious; for as the word *Concord* signifies an Agreement of Sounds, 'tis certainly applicable to Unisons in the first Degree: *Intervals*, 'tis plain, may differ in Magnitude, and there may be an infinite Variety according to the possible Degrees of Tune; for there is no Difference so great or little, but a greater or a less may possibly be conceived. 'Tis true, with regard to Practice, there are Limits which are the greatest and least *Intervals* our Ears are Judges of, and which may be actually produced by Voice or Instrument.

The Degrees of Tune are proportional to the Numbers of Vibrations of the sonorous Body in a given Time, or the Velocity of their Conics and Recourses. Now these Differences in Tune constitute, as has been already said, the *Intervals* in Music; these therefore must be greater or less, as the Differences are; and 'tis the Quantity of these, which is the Subject of the Mathematical Part of Music. Those *Intervals* are measured not in the simple Differences or Arithmetical Ratio's of the Numbers expressing the Lengths or Vibrations, but in their Geometric Ratio's; so that the same *Interval* depends on the same Geometrical Ratio, and vice versa. It is however to be observed, that in comparing the Equality of *Intervals*, the Ratio's expressing them must be all of one Species; otherwise this Absurdity will follow, that the same two Sounds may make different *Intervals*. To describe the particular Methods of measuring the Inequality of *Intervals*, would be too tedious: this one Rule may be observed, that, to determine in general, which of two or more *Intervals* are the greatest, take all the Ratio's as proper Fractions, and the least Fraction will be the greatest *Interval*.

The Ancients were extremely divided about the measuring of *Intervals*. *Pythagoras* and his Followers measur'd them by the Ratio's of Numbers. They supposed the Differences of Gravity and Acuteness to depend on the different Velocities of the Motion that causes Sound; and thought, therefore, that they could only be accurately measured by the Ratio's of those Velocities. Which Ratio's were first investigated by *Pythagoras*, on occasion of his passing by a Smith's Shop, and observing a Concord betwixt the Sounds of Hammers striking on the Anvil. *Aristonemus* opposed this. He thought Reason and Mathematics had nothing to do in the case, and that Sense was the only Judge in the Dispute; the other being too subtle to be of any use. He therefore determined the 8ve, 5th, and 4th, which are the most simple Conords, by the Ear; and by the Difference of the 4th and 5th, he found out the Tune: which once settled as an *Interval* the Ear could judge of, he pretended to measure every *Interval* by various Additions and Subtractions made of these mentioned one with another: But this Method is very inaccurate. *Proley* keeps a middle Course betwixt the two. He finds fault with the one for despising Reason, and with the other for excluding Sense; and shews how these two may mutually assist each other in this Matter. See *Tune*, &c.

**INTESTATE**, a Person who dies without making a Will. An Heir *ab Intestate*, is a Person who inherits an Estate by some other Right, than that of Will or Testament. Heretofore, those who died *intestate*, were held infamous, and accused; in regard, by the Canons of several Councils, every Person was injoin'd to bequeath a part of his Estate (and *Marbora Paris* says it was at least to be a tenth part) to the Church, for the Safety of his Soul; which, a Person who neglected to make a Will, and to leave this Legacy to the Church, was judg'd to have abandon'd. Several Councils took on them to command the Priests to solicit dying Persons to be charitable to the Church; and this they did so earnestly, that Absolution and the Viaticum were denied to those whom they could not prevail on; so that they made no difference between these *Intestates* and Self-Murderers: and they were alike denied Christian Burial. *Du Cange* adds, that all who died without Absolution, without receiving the Viaticum, and without leaving Alms to the Church (even tho they died suddenly) had their Effects seiz'd and confiscated to the Use of the Church, the Bishop, &c.

In our *English* Law there are two kinds of *Intestates*; the one of *Fullis*, which are those who make no Will at all, the other of *peris*, which are those who make a Will; but it is null and void, either from the Executors refusing to act, or from some other Cause in which he is judg'd to die *intestate*.

**INTESTINE MOTION**, of the *Parts of Fluids*. Where the attracting Corpufcles of any Fluid are elastic, they muft neceffarily produce an *Inteftine Motion*; that is, a vifible Motion or Change of Place among the minute Parts of a fluid Body: and this greater or lefs according to the Degrees of their Elasticity, and attractive Forces. For two elastic Particles after meeting will fly from one another (abftracting the Refiftance of the Medium) with the fame degree of Velocity, with which they met: But when in flying back from one another, they approach other Particles, their Velocity will be increased. See *Elasticity* and *Fermentation*.

**INTESTINES**, in Anatomy, are the fame with what we ordinarily call the Guts or Bowels. Thefe feem to be nothing but a Continuation of the Stomach, confifting of the fame Number of Coats, and fabricated in the fame manner; they are proceeded with various Circumvolutions and Inflexions to the *Anus*, thro' which they difcharge the excrementitious part of their Contents out of the Body. They are, when feparated from the Mefentery, to which they are all along connected, of a very great Length, ordinarily about fix times as long as the Perfons whole they were. And tho' they feem to be but one continued Channel or Fiftula, yet becaufe in feveral Parts their Magnitude, Figure, and Thicknefs are different, they are in general divided into the thick and thin, and thefe again are each of them fubdivided into three; the three thin are called *Duodenum*, *Jejunum*, and *Ileum*; and the thick *Cecum*, *Colon*, and *Reftum*. They have all of them in common a kind of Vermicular Motion, which, beginning at the Stomach, is propagated downwards, and is called the *Periftaltic Motion*. To facilitate that, they are generally lubricated with a great deal of fat, efppecially the thick ones, whole Surface being fomething more uneven, and the Contents lefs fluid than thofe of the thin, they need fomething more to make them flide eafy.

The firft of the thin Guts is called *Duodenum*, and reaches from the right Orifice of the Stomach, as far as the *Vertebre* of the Back on the left Side, where, at the firft Angle made by the *Inteftines* it ends, which is about 12 Inches, from which Meafure it feems to have taken its Name. This Meafure however is far from being very exact, as being much too largely computed. Into this Gut the Gall-Duct and Pancreatic-Duct empty themfelves, and their feveral Liquors mix with the Chyle. The next *Inteftine* is the *Jejunum*, fo called, becaufe it is generally found more empty than the reft; which may be occafioned partly by the Fluidity of the Chyle, which is greater in this *inteftine* than in any of thofe that follow it; and partly by its Capacity, being fomething larger than that of the *Duodenum*, and therefore it gives a freer Passage, and perhaps alfo the Irritation of this Gut thro' the Acrimony of the Bile, which is difcharged upon the *Inteftines* a little before the beginning of this Gut, may contribute fomething towards accelerating the Passage of the Contents. However, it may feem fufficient, that thro' the great Number of Lacteals, with which this Gut abounds more than any other, the Defcent of the Contents, which are here deprived of the moft fluid Parts, fhould in the reft be more fluggifh, by reafon of their greater Confiftence. This *Inteftine* is allowed to poffefs almoft the whole Umbilical Region, and its Length is generally computed to be about twelve or thirteen Hands breadth. The *Ileum*, which is the third *Inteftine*, is fituated below the Navel, and fills the *Illa* with its numerous Folds and Convolutions. It is the longeft of all the *Inteftines*, being eftimated to be one and twenty Hands long: But thefe Eftimates are fomething arbitrary, becaufe it is not exactly fettled among Anatomifts, where the *Jejunum* ends, or the *Ileum* begins; neither is it eafy or neceffary to do it. In both this and the preceding *Inteftine*, the Inner Tunic is much corrugated, the loofe Folds of which have been thought to do in fome meafure the Office of Valves, and have therefore by Authors been called *Valvulae Conniventes*; which are framed, as in the Stomach, only by the inner Coat being larger than the outward.

Next follow the thick *Inteftines*, the firft of which is called the *Cecum*, which has a lateral Infertion into the upper end of the *Colon*, and is not perforated at its other Extremity, but hangs to it like the Finger of a Glove, and is about three or four Inches long. The true Ufe of this part is not yet determined, and fome late Anatomifts have thought that the Name likewife is miftaken, not allowing this to be the *Cecum* of the Antients, which they imagined to be that thick globous part of the *Colon*, which is immediately appended to the *Ileum*, and therefore they have given this part the Name of *Appendicula Vermiformis*. This *Cecum*, or Appendix, is proportionably bigger in Infants than Adults, and in many other Animals even fmaller than in Men, and is, at the unperforated Extremity, flightly connected to the right Kidney. The next of the thick *Inteftines* is the *Colon*, which is much the largeft, and

moft capacious of them all. It begins with the *Cecum*, and is with that connected to the right Kidney. Thence with a winding Courfe it proceeds towards the Liver, where it is fometimes tied to the Gall-Bladder, and by that tinged with yellow. From the Liver it runs a-crofs under the Bottom of the Stomach, where it is by very fine thin Membranes faftned to the Spleen, and marches over the left Kidney, where its Cavity is fometimes very much frightned, and defending fo to the bottom of the *Omentum*, and from thence returning to the upper part of the *Omentum*, and there making the Figure of a Circumflex, it ends in the *Reftum*. At the Entrance of the *Ileum* into this Gut is placed a *Valve*, formed out of the Production of the inward Coat of the *Ileum*, which, like the Finger of a Glove, when its Extremity is cut off, hangs loofe in the Cavity of the *Colon*, by which means it ftops the return of the Excrements, tho' fometimes, as in Inverfions of the Periftaltic Motion, it proves not fufficient for that Ufe. It has a great many *Cellulae*, or, as it were, diftinct Cavities, framed by a Coarction of the Gut by two Ligaments, or Bundles of membranous flefhy Fibres, about half a Finger broad, each running on either fide the Gut oppofite to each other, the whole Length of it, and as it were girding it in at certain Difftances, thereby making it relemble a Glass Incorporator, ufed in mixing Oil and Vinegar. The next and laft of the *Inteftines* is the *Reftum*, which reaches from the *Omentum* to the *Anus*, and is plain without Cells. It is faft tied to the *Ossa Sacrum* and *Coccygis*, by means of the *Perritoneum*, and in Men to the Neck of the Bladder of Urine, in Women to the *Vagina Uteri*, to which it is ftrongly connected by a membranous Subftance. That Subftance of the *Vagina* and *Inteftine* are hardly diftinguifhable from one another. The Length of this Gut is ordinarily about a hand's Breadth and an half, and its Capacity about the Thicknefs of three Fingers; its lower end, the *Anus*, is furnifhed with three Mufcles, *viz.* the *Sphincter Ani*, and *Levator Ani*; which fee.

There are alfo in the *Inteftines*, a great Number of *Glands*, which, in the *Inteftina Tenues*, are gathered together in Heaps, as it were like Bunches of Grapes. In thefe *Inteftines* they are very fmall, and were it not for their Coarctions, fcarce remarkable. But in the *Inteftina Crassa* they are much larger, not gathered like the others, but difperfed; and, tho' very numerous, come under the Denomination of *Solitary Glands*. Thefe Glands difcharge a Liquor into the *Inteftines*, whether ordinarily for any thing more than the Lubrication of the *Inteftines*, and diluting their Contents, is not certain; tho' thro' thefe feems the greateft part of the Difcharge to be made, which, either upon extraordinary Fluxes, or upon the Administration of Cathartics, we have frequent Occafion to obferve. Thefe *Inteftines*, in general, are furnifhed with Blood from the Mefenteric Arteries, which is returned by the Mefenteric Veins: But the *Duodenum* receives a Branch of an Artery from the *Celiac*, which is called *Duodena*, to which answers a Vein of the fame Name, that likewife returns the Blood to the *Porta*; the *Reftum* receives others, which are called *Hemorrhoids*; the internal from the inferior Mefenteric, and the external from the Hypogaftic, with Veins correffponding of the fame Name, that alfo go to the *Porta*. Thefe Veffels fpend the *Inteftines* with abundance of Ramifications, and are frequently diversified in feveral Subjects of the fame Species; much lefs are they to be depended upon for an uniform Appearance in Animals of different kind. The Nerves of the *Inteftines* come fome of them from thofe of the Stomach, and fome from the great Mefenteric Plexus, which diftributes Branches to all the *Inteftines*. The remaining Veffels of the *Inteftines* are the *Lymphaticis*, and *Vene Laeteae*, which fee.

**INTRIGUE**, an Affemblage of Events or Circumftances occurring in an Affair, and perplexing the Perfons concerned in it. *Tripan* tells us the word is properly understood of Chickens, that have their Feet intrangled in Hair, and is derived from the *Greek* *in* and *trigē*.

In this fenfe *Intrigue* is ufed to fignify the *Nodus*, or Plot of a Play or Romance, or that Point wherein the principal Characters are the moft embarruffed, through the Artifice and Oppofition of certain Perfons, or the unfortunate falling out of certain Accidents and Circumftances. In a Tragedy, Comedy, or Epic Poem, there are always two *Designs*; the firft and principal is that of the Hero of the Piece; the fecond contains the *Designs* of all thofe who oppofe him. Thefe oppofite Causes produce oppofite Effects, to wit, the Efforts of the Hero for the Execution of his *Design*, and the Efforts of thofe who thwart it. As thofe Causes and *Designs* are the beginning of the Action, fo thofe Efforts are the middle, and form a Knot or Difficulty, which we call an *Intrigue*, that makes the greateft part of the Poem. It lafts as long as the Mind of the Reader or Hearer is fufpended about the Event of thofe oppo-

site Efforts; the Solution or Catastrophe commences when the Knot begins to unravel, and the Difficulties and Doubts begin to clear up. The *Intrigue* of the Iliad is twofold; the first comprehends the three Days fighting in *Achilles's* Absence, and consists, on the one side, in the Resistance of *Agamemnon* and the *Greeks*, and on the other in the inexorable Temper of *Achilles*. The Death of *Patroclus* unravels this *Intrigue*, and makes the beginning of a second. *Achilles* resolves to be revenged, but *Heitor* opposes his Designs, and this forms the second *Intrigue*, which is the last Day's Battel. In the *Aeneid* there are also two *Intrigues*; the first is taken upon the Voyage and Landing of *Aeneas* in *Italy*, the second in his Establishment there. The Opposition he met with from *Juno*, in both these Undertakings, forms the *Intrigue*. As to the Choice of the *Intrigue*, and the Manner of unravelling it, 'tis certain they ought both to spring naturally from the Ground and Subject of the Poem. *Buffa* gives us three Manners of forming the *Intrigue* of a Poem; the first is that already mentioned; the second is taken from the Fable and the Design of the Poet; in the third the *Intrigue* is so laid, as that the Solution follows from it of course. See *Catastrophe*.

**INTRINSIC**, a Term applied to the inner, real, genuine Values, Properties, &c. of any thing, in opposition to their extrinsic, apparent, or popular Values, &c.

**INTRONATI**, the Name of an Academy at *Stenna* in *Italy*. The Members of this Academy contented themselves, at their first Institution, with establishing the following six short Laws: (1.) To pray. (2.) To study. (3.) To be merry. (4.) To offend no body. (5.) Not to credit too lightly. (6.) To let the World talk.

**INTRUSION**, in the Canon Law, signifies the Enjoyment of a Benefice, or the Exercise of an Office, without a good Title to it. *Intrusion* disqualifies the Party from ever holding the Benefice. The word is derived from the Latin Verb *intrudere*, to thrust in, or enter by Force.

**INVALID**, a Person wounded, maimed, or disabled for Action by Age. At *Chelsea* and *Greenwich* are magnificent Hospitals, or rather Colleges, built for the Reception and Accommodation of *Invalids*, or Soldiers worn out and disabled in the Service. At *Paris* is a College of the same kind, called *les Invalides*, which is accounted one of the finest Buildings in that City.

**INVERTED**, in Heraldry, signifies the just Reverse of *Engraul'd*; which see.

**INVENTION**, a Subtily of Mind, or somewhat peculiar in a Man's Genius, which leads him to the Discovery of things that are new.

*Invention*, in Rhetoric, signifies the finding out, and the Choice of Arguments which the Orator is to use for the proving of his Point, or the moving of his Hearers Passions. *Invention*, according to *Cicero*, is the principal Part of Oratory. He wrote four Books of *Invention*, whereof we have but two remaining. This *Invention* of the Orators cannot, according to my Lord *Bacon*, be properly called *Invention*; to invent is to discover things not yet known, not to recollect those that are; whereas the Use and Office of this Rhetorical *Invention* is only out of the Stock of Knowledge laid up in the Mind, to select such Articles as make for the purpose. The same Author divides this Faculty of *Invention* into two Parts, the one topical, the other promptuary; the first points out the way in which we are to pursue the Argument, the latter only lays up and disposes things, for which we have frequent occasions in the Mind.

*Invention*, in Poetry, is understood of every thing, that the Poet adds to the History of the Subject he has chosen, and of the Term that he gives it.

*Invention*, in Painting, is the Choice which the Painter makes of the Objects that are to enter the Composition of his Piece. *Da Pule* observes, that *Invention* is different from *Disposition*, and that 'tis those two things together that form *Composition*: For after having made a good Choice of Objects proper for the Subject, they may be ill-disposed; and then tho' the *Invention* be ever so good, the *Disposition* or *Ordonnance* will be faulty, and the Piece will displeas. Of all the Parts of Painting, *Invention*, doubtless, is that which gives the Painter the fairest Occasions of showing his Genius, his Imagination, and good Sense. *M. Felicien* gives the general Name *Invention* to every thing that depends on the Genius of the Painter, as the *Ordonnance*, the *Disposition* of the Subject, and even the Subject itself, when it is new. But the Term *Invention*, taken in this Sense, is no Term peculiar to Painting, but agrees also to other Arts. In another place *M. Felicien* distinguishes *Invention* into two kinds; to wit, that which arises immediately from the Mind of the Painter, and that which he borrows from some other. The first is, when he invents the Subject himself, and the second when he borrows it from History, Fable, &c. but he always affixes the same Idea to *Invention*.

*Janfen d'Almeida* has written an Oonomasticon of *Invention*, wherein are shewn, in an Alphabetical Order, the Names of the Inventors, and the Time, Place, &c. where they were made. *Panacollis* has written a Treatise of old *Inventions* that are lost, and new ones that have been made: *Polydore Virgil* has also published six Books of the *Inventions* of Things.

**INVENTORY**, in Law, is a Catalogue or Repertory orderly made of all a dead Man's Goods and Chattels, prized by four or more credible Men, which every Executor or Administrator is obliged to exhibit to the Ordinary at such time as he shall appoint. The Use of the *Inventory* is borrow'd from the Civil Law, for whereas by the Law of the ancient *Romans*, the Heir was obliged to answer all the Testator's Debts; by which means, Heritage sometimes became rather prejudicial than profitable: To obviate this Inconvenience, *Justinian* ordain'd, That if the Heir would first exhibit a true *Inventory* of all the Testator's Effects, he should be no further charged than to the Value of the *Inventory*.

*Inventory*, in Trade, is a List or particular Valuation of Goods, &c.

**INVERSE** is understood of a manner of working the Rule of Three, or of Proportion, that seems to be inverted, or to go backwards. In the Rule of Three direct the first Term is to the second, as the third is to the fourth; that is, if the second be greater than the third, or less than the first, in any Proportion, the fourth is less than the third in the same Proportion. But in the *inverse* Rule, the fourth Term is as much greater than the third, as the second is less than the first. In the *inverse* Rule, therefore, the Proportion is not, as the first is to the second, so is the third to the fourth; but as the fourth is to the first, so is the second to the third. For instance, in the Direct Rule we say, If three Yards of Tapestry cost twenty Pound, how many will fix cost? The Answer is forty. In the *inverse* Rule we say, If twenty Workmen make ten Yards in four Days, in how many Days will forty do it? The Answer is in two Days.

**INVERSE PROPORTION**. See *Preparation*.

**INVERSION**, an Action, by which any thing is inverted, or turned backwards. Problems in Geometry and Arithmetic are often proved by *Inversion*, or making a contrary Rule or Demonstration.

**INVERSION**, in Grammar, is where the Words of a Phrase are ranged in a manner, not so natural as they might be; for instance, Of all Vices the most abominable, and that which least becomes a Man, is Impurity. Here's an *Inversion* in the natural Order is this, The most abominable of all Vices, and that which least becomes a Man, is Impurity. An *Inversion* is not always disagreeable, but sometimes has a good Effect, and is used with Design.

**INVEST** signifies to confer on any one the Title of a Fee, Dignity or Office, or to ratify and confirm what has been obtained elsewhere. The Emperor pretends to a Right of investing several Princes both in *Germany* and *Italy*. There was formerly a particular Ceremony for the investing of Bishops.

*Invest*, in the military Art, signifies the opening of the Siege of a Place, and the incamping an Army round it to block up all its Avenues, and to prevent all Ingress and Egress. 'Tis the Cavalry that always begin to invest a Place. The word comes from the Latin *in* and *vestire*, to clothe.

*Invest*, in Law, signifies to put in possession. A Tenant is *invested* by giving him a Verge or Rod into his Hands, and administering an Oath, which is call'd *investing*. Others define it thus, *Investire est in suum Jus aliquem intrudere*, to give Livery of Seisin or Possession. See *Investiture*.

**INVESTIGATION** properly signifies the searching or finding any thing out by the Tracks or Prints of the Feet. Hence the Mathematicians and Schoolmen, &c. came to use the Term in their respective Researches. *Investigation* of a Theme is the Art, Method, or Manner of finding the Themes in Verbs, that is, the primitive Tense, Mode, and Person of any Verb, far removed from its Source. To understand a *Greek* Author, 'tis absolutely necessary to be well acquainted with the Method of investigating a Theme. This Theme, in the *Greek* Tongue, is the present Tense of the Indicative Mood. *Cicero* was the first who introduced this Term into Grammar; he gives the Title *Investigatio Thematica*, to that part where he teaches the manner of finding whence any Person or Tense of a Verb proceeds, and of reducing it to its primitive Diction, or of finding its Indicative.

**INVESTITURE** is used both for the Right of investing any one, and the Act of investing him. This consists in receiving the Faith and Homage, by which the Vassal becomes seized and possessed of a Fee by his Lord. *Investiture* was antiently performed by a Form of Words, afterwards by the Delivery of such things as had the nearest

Resemblance to what was transferred. Thus Land passed by the Delivery of a Turf, and to shew the Trees were transferred at the same time, a Bough was cut, and delivered along with it. But in After-times the things by which *investitures* were made, were not so strictly observed. Many were invested by the Delivery of a Staff, a Glove, a Knife, a Piece of a Cloak, of a Strap, and a Girdle, by pricking the Thumb, by giving the Keys, a Spit, a Blow, a Ring, a Turf, a Bough, a Straw, &c. The *Investiture* of a Kingdom, or Lordship, was performed by a Standard, a Banner, a Cap, a Sword, a Bow, Arrows, Spers, &c. The Symbols were sometimes preserved in the Republics of the Houses, and were annexed to the Titles.

*Investiture* was also used with regard to spiritual Benefices. This was frequently performed by delivering the Crozier and Pastoral Ring. The Kings of England and France, the Emperors of Germany, &c. had formerly this Right: so that on the Death of a Prelate, his Clergy sent the Crozier, &c. to their Sovereign, to be used at the Ceremony of investing his Successor. The first who disputed this Privilege with them, was Gregory VI. Gregory VII. did it to some purpose; he excommunicated the Emperor Henry IV. and forbid all Ecclesiastics, under pain of Excommunication, to receive the *Investiture* at the hands of Secular Princes. Paschal II. however, was obliged to confirm Henry V. in the Right of giving *Investitures*; but repenting what he had done, he excommunicated him, and reduced him to a Necessity of begging Absolution. At length that Emperor was obliged, by Pope Gelasus II. solemnly to renounce all *Investitures* and Elections. In ancient Authors we meet with eighty different Forms of *Investiture*.

**INVOCATION**, an Action by which we adore God, and call on him for his Assistance. The *Romanists* also practise *Invocation* of Saints, begging them to intercede with God in their behalf. This is one of the grand Articles of Dispute between the *Romanists* and the *Reformed*.

*Invocation*, in Poetry, is an Address which the Poet makes at the beginning of his Work, wherein he calls for the Assistance of some God, particularly of his Muse, or the Divinity of Poetry. This part is absolutely necessary in an Epic Poem, in regard the Poet relates things which he could not be supposed to know, unless some Deity inspired him. Besides, this serves his Readers as an Example of Piety and Devotion, which is the Foundation of his whole Work. To these it may be added, that the Gods themselves are to have a part in the Action, and 'tis not decent he should see them to work, without first asking their leave. Indeed in the Course of an Epic Poem, there are usually several *Invocations*, particularly where any thing extraordinary or miraculous comes to be related: as when *Virgil* describes the Metamorphosis of *Aeneas's* Fleet into Sea-Nymphs; but the first *Invocation* is always the most considerable.

In the *Invocation*, *Boiss* considers two things; the first is that the Poet requests, the second to what Deity he addresses his Request. As to the first, *Homer* has joined the *Invocation* so closely to the Proposition, that he seems to invoke his Muse for the whole Work. *Virgil*, on the contrary, only requests his Muse to furnish him with a part of his Subject, and even mentions what particular Part it is he desires. After proposing his Matter in all its Extent, he beseeches the Muse to acquaint him with the Cause of it. As to the Deity invoked, the same Author observes, that it must always be, either the Divinity that presides over Poetry in general, or that which presides over the particular Subject of this Work. *Ovid's Invocation*, in his *Metamorphoses*, is of this latter kind, and so is that of *Lucretius*, those of *Homer* and *Virgil* are of the former kind; they only invoke the Muses, and thus they distinguish between the Divinities who preside over Poetry, and those who preside over the Actions of the Poem, and who have Parts in it. By the way, it may be observed, that the Deities invoked are not looked on, even by the Poets themselves, as Divine Personages, whence they expect any real Assistance. Under the Name of Muse, they wish for the Genius of Poetry, and for all the Conditions and Circumstances necessary for the Execution of their Design. These are mere Allegories, or Manners of expressing themselves poetically; just as when they make Gods of Sleep, of Rest, Fame, and other natural and moral Things. Thus the Muses come to be of all Ages, Countries, and Religions; there are *Pagan*, *Christian*, *Greek*, *Latin*, and *English* Muses.

**INVOLUTION**, a Term in Algebra signifying the raising of any Quantity from its Root to any Height assigned. Suppose, for instance,  $a + b$  were to be squared or raised to its second Power; we say, *involve*  $a + b$ ; that is, multiply it into itself, and it will produce  $a + a + a + b + b$  of the same Quantity. And if it be involved again, or if that Square be multiplied by the Root, the Cube or

third Power will be produced, *vide*  $aaa + 3aab + 3aba + bbb$ . See *Evolution*.

**INVOICE**: A particular Account of Commodities, Custom, Provision, Charges, &c. sent by a Merchant to his Factor or Correspondent in another Country.

**JOACHIMITES**: The Name of a Sect the Followers of *Joachim*, Abbot of *Flora* in *Calabria*, who was esteemed a Prophet while he lived, and left, at his Death, several Books of Prophecies, besides other Works. In 1145, he and his Works were condemn'd together by the Council of the *Lateran*, and by the Council of *Alex* in 1260. It seems they were particularly fond of certain Ternaries. The Father, said they, operated from the Beginning till the Coming of the Son; the Son from that time to theirs, *vide* the Year 1260. and the Holy Spirit then took it up, and was to operate in his turn. They divided every thing that related to Men, Time, Doctrine, and Manner of Living, into three Classes or States, according to the three Persons in the Trinity; every one of which States either had already, or was hereafter to succeed in its turn; and hence they call'd their Divisions *Ternaries*. The first Ternary was that of Men. This comprehended three States or Orders of Men; the first State was that of married People, which had lasted, according to them, the whole Period of the Father; that is, the time of the Old Testament: The second was that of Clerks, which lasted during the time of the Son: The third was that of Monks, wherein was to be an uncommon Effusion of Grace, by the Holy Spirit. The second Ternary was that of Doctrine, which they divided also into three: The Old Testament, which they attributed to the Father; the New, which they attributed to the Son; and the Everlasting Gospel, which they attributed to the Holy Spirit. In the Ternary of Time, they gave all the Time elapsed from the Beginning of the World till the Coming of Christ, to the Father; in which Time, said they, the Spirit of the Law of *Moses* prevailed. They gave to the Son the 1250 Years from Jesus Christ to their Time; during which, the Spirit of Grace prevailed. Lastly, the third, which was to come, and which they call'd the Time of the greatest Grace, was for the Holy Spirit. Another Ternary consisted in the Manner of Living. In the first Time, under the Father, Men lived according to the Flesh; in the second, under the Reign of the Son, Men lived according to the Flesh and the Spirit; in the third, which was to last to the end of the World, they were to live according to the Spirit. The *Joachimites* maintain'd, That in the last Times all Sacraments and Signs were to cease; and the Truth was to appear openly, and without any Veil.

**JOBBER**, a Person who undertakes *Jobbs*, or small Pieces of Work. In some Statutes it is used for a Person who buys and sells Cattel for others.

**JOGHI'S**: The Name of a Sect of Heathen Religious in the *East-Indies*. They never marry, nor hold any thing in private Property; but live on Alms, and practise strange Severities. They are subject to a General, who sends them from one Country to another to preach. They are properly a kind of penitent Pilgrims, and are supposed to be a Branch of the ancient *Gymnosophists*. They frequent principally such Places as are consecrated by the Devotion of the People; and pretend to live several Days together without eating or drinking. After having gone thro a Course of Discipline for a certain Time, they look on themselves as impeccable, and privileged to do any thing: upon which they give a Loose to their Passions, and run into all manner of Debauchery.

**JOINING OF ISSUE**. See *Issue*.

**JOINT**, the Junction, Articulation, or Assemblage of two or more things. *Joint*, in Architecture, is the Separation between the Stones, which is fill'd with Mortar, Plaster, or Cement. In Carpentry, &c. *Joint* signifies the several Manners of assembling or fitting Pieces of Wood together: Thus we say, *A Dove-tail Joint*, &c.

**JOINT-RULE**. See *Carpenters Joint-Rule*.

**JOINT-TENANTS**, in Law, are those who come to, and hold Lands and Tenements by one Title, *pro Indiviso*, or without Partition. These are distinguish'd from sole or several Tenants, from Parceners and from Tenants in Common: Antiently they were call'd *Particeps*, and not *Heredes*. They must jointly plead, and jointly be impeached by others; which is common to them and Coparceners. But *Joint-Tenants* have a sole Quality of Survivorship, which Coparceners have not. So that if there be two or three *Joint-Tenants*, and one hath Issue, and dies; then he, or those *Joint-Tenants* that survive, shall have the whole by Survivorship.

**JOINTURE**, is a Covenant whereby the Husband, or some other Friend in his behalf, maketh over to his Wife, on Condition of Marriage, certain Lands and Tenements for Term of Life, or otherwise.

**JOISTS**, in Architecture, are those Pieces of Timber framed into the Girders and Summers, on which the Boards

Boards of the Floors are laid: They are from six to eight Inches square, and ought seldom to lie at a greater distance from each other than ten Inches, never than twelve; nor ought they ever to be longer than ten Foot, or to lie less into the Wall than eight Inches. Sometimes the Carpenters furr their Joists, as they call it, that is, lay two Rows of Joists one over the other.

**JONCTURE, or JOINTURE:** The same with Joint.

**IONIC, in Architecture,** is the Name of one of the five Orders. The first Idea of it was given by the People of *Ionia*; who, according to *Vitruvius*, form'd it on the Model of a young Woman, dress'd in her Hair, and of an easy elegant Shape: whereas the Doric had been form'd on the Model of a strong, robust Man. The *ionic* Column is the third in order; and is distinguish'd from the Composite, in that it has none of the Leaves of Acanthus in its Capital; and from the Tuscan, Doric and Corinthian, by the Volutes, or Rams-Horns, which adorn its Capital: and from the Tuscan and Doric, too, by the Channels or Flutings in its Shaft. These Flutings are in number 24. They are not always concave from the top of the Shaft to the bottom; but for that third of it next the Base, are fill'd up with a kind of Rods or Canes, by the French call'd *Baton*; and in the other two thirds, are left hollow, or striated, in imitation of the Folds or Plaits of a Garment. This Column is a Medium between the Massive and the Delicate Orders, the Simple and the Rich. Its Height is 18 Modules, or 9 Diameters of the Column taken at the bottom. When it was first invented, its Height was but 16 Modules; but the Antients, to render it still more beautiful than the Doric, augmented its Height, by adding a Base to it, which was unknown in the Doric. *M. le Clerc* makes its Entablement 4 Modules and 10 Minutes, and its Pedestal 6 entire Modules: so that the whole Order makes 28 Modules to Minutes. This said, the Temple of *Diana* at *Ephesus*, the most celebrated Edifice of all Antiquity, was of this Order. At present it is properly us'd in Churches and Religious Houses, in Courts of Justice, and other Places of Tranquillity and Devotion. This Order has one advantage above any of the rest, and it consists in this, that the fore and hind parts of its Capital are different from its Sides. But this is attended with an Inconvenience, when the Ornament is to turn from the Front of the Building to the Side: To obviate which, the Capital may be made Angular, as is done in the Temple of *Fortuna Virilis*. *Scamozzi*, and some other modern Architects, have introduced the upper part of the Composite Capital in lieu of the *ionic*; imitating that of the Temple of *Concord*, whose four Sides are alike: to render it more beautiful, the Volute may be made a little oval and inclining. See *Order* and *Volute*.

*Ionic* Dialls, in Grammar, is a manner of Speaking peculiar to the People of *Ionia*. At first it was the same with the ancient *Attic*, but passing into *Asia*, did not arrive at that Delicacy and Perfection to which the *Athenians* attain'd. Instead of that, it rather degenerated, in *Asia Minor*; being corrupted with the Admission of foreign Idioms. In this *Diall* it was that *Hierodotus* and *Hippocrates* wrote.

*Ionic Transmigration* was heretofore a very celebrated Epoch. It took its Rise from the Retreat of the *Athenians* Colonies, who, upon the Death of *Cadmus*, put themselves under the Command of his Son *Nelus*, and establish'd the twelve Cities of *Ionia* in *Asia*. These Colonies, according to *Eratosthenes*, were establish'd 50 Years after the Return of the *Heracleids*; and, according to *Marston*, 77 Years after the taking of *Troy*.

*Ionic* Self, was the first of the ancient *Sells* of Philosophy; the others were the *Dadic* and *Eleatic*. The Founder of this *Self* was *Thales*, who being a Native of *Miletus* in *Ionia*, occasion'd his Followers to assume the Appellation of *ionic*. 'Twas the distinguishing Tenet of this *Self*, That Water was the Principle of all Natural Things. This is what *Pindar* alludes to in the beginning of his first *Olympic* Ode.

**JOURNAL,** a Day Book, Register, or Account of what pass'd daily.

In Merchants Accounts, the *Journal* is a Book into which every particular Article is pos'd out of the Waste-Book, and made Debtor: This is to be very clearly express'd, and fairly engros'd.

*Journal*, in Sea Affairs, is a Register kept by the Pilots; wherein particular notice is taken of every thing that happens to the Ship from Day to Day, and from Hour to Hour, with regard to the Winds, the Rhumbs, the Rake, Soundings, &c. in order to enable them to adjust their Reckoning, and determine the Place where they are.

*Journal* is now become a common Name for many of our News-Papers, which detail the daily Transactions of Europe. It is also used for the Title of several Books

which come out at stated Times, and give Abstracts, Accounts, &c. of the several new Books that are publish'd, and the several new Improvements daily made in Arts and Sciences. The first *Journal* of this kind was the *Journal des Savans*, printed at *Paris*. The Design was set on foot for the Ease of such as are too busy or too lazy to read the entire Books themselves. It seems an excellent way of satisfying a Man's Curiosity, and of becoming learned upon easy Terms: And so useful is it found, that it has been executed in most other Countries, tho' under a great Variety of Titles. Of this kind are the *Philosophical Transactions of London*; the *Acta Eruditionum* of *Leipsic*; the *Republique des Lettres*; the *Bibliothèque Universelle* & *Cabiste* of *M. le Clerc*; the *Memoirs of Treves*, &c. In 1692, *Juncker* printed in *Latin*, An *Historical Treatise* of the *Journals of the Learned*, publish'd in the several Parts of Europe; and *Walfart*, *Kurbardus*, *Gottelius*, and *Stracius*, have done something of the same kind. The *Memoirs of the Academy of Sciences*; those of the *Academy des Belles Lettres*; The *Miscellanea Naturæ Curiosorum*, which ended in 1705; The Experiments of the *Academy del Cimento*: The *Acta Philo-Sophicorum Naturæ & Artis*, which appear'd from *March 1686* to *April 1687*, and which are a History of the *Academy of Bressa*; and the *Miscellanea Berolinensia*, or *Memoirs of the Academy of Berlin*, are not properly *Journals*, tho' they are frequently rank'd in the Number.

*Juncker* and *Walfart* give the Honour of the first Invention of *Journals* to *Plinius*. His *Bibliotheca*, however, is not altogether the same with our *Journals*; nor was his Design the same. It consists of Abridgments and Extracts of Books that he had read during his Embassy in *Pessia*.

*M. Salo* first began the *Journal des Savans* at *Paris* in 1665, under the Name of the *Sieur Hadouville*; but his Death soon after interrupted the Work. Upon this the *Abbot Galvus* took it up, and he in the Year 1674, gave way to the *Abbot de la Roque*, who continued it nine Years, and was succeeded by *M. Coufin*, who carried it on till the Year 1702, when the *Abbot Begnon* instituted a new Society, and committed the Care of continuing the *Journal* to them. It was now improved, and published under a new Form. This Society is still continued, and *M. de Foyer* has the Inspection of the *Journal*; which is no longer the Work of any single Author, but of a great Number. The other French *Journals* are the *Memoirs and Conferences on Arts and Sciences*, by *M. Denis*, during the Years 1672, 1673, and 1674. New Discoveries in all the Parts of *Physic* by *M. de Eleggny*. The *Journal of Physic*, began in 1684, and some others discontinued almost as soon as began. The *Nouvelles de la Republique des Lettres*, News from the Republic of *Lettres*, were began by *M. Bayle* in 1684, and carried on by him till the Year 1687, when *M. Bayle* being disabled by Sickness, his Friends *M. Bernard* and *M. de la Roque* took 'em up, and continued 'em till 1699. After an Interruption of nine Years, *M. Bernard* resumed the Work, and continued it to the Year 1710. The *History of the Works of the Learned*, by *M. Baynne*, was begun in 1686, and ended in 1720. The *Universal Historical Dictionary*, by *M. le Clerc*, was continued to the Year 1692, and contained twenty five Volumes. The *Bibliothèque Classique*, of the same Author, began in 1703. The *Memoirs of a History of Sciences and Arts*, usually call'd *Memoirs de Trevoux*, from the Place where they are published, began in 1701. The *Essays of Literature* reach'd but to a twelfth Volume in 1702, 1703, and 1704; these only take notice of ancient Authors. The *Journal Litteraire*, by *Father Hugo*, began and ended in 1705. At *Hamburg* they have made two Attempts for a French *Journal*, but the Design fail'd: an *Ephemeric* *Spanius* has also been undertaken, but that soon disappear'd. A *Journal des Savans*, by *M. Darris*, appear'd in 1694, and was drop'd the Year following. That of *M. Chazaux* began at *Berlin* in 1596, held out three Years; and an Essay of the same kind was made at *Genoa*. To these may be added, the *Journal Litteraire*, began at the *Hague* in 1713, and that of *Verdun*, and the *Historique Litteraire de la Grande Bretagne*, by *M. de la Roche*, whereof there have already been four Volumes, and which is confin'd to English Books alone.

The English *Journals* of this kind are the *History of the Works of the Learned*, begun at *London* in 1699. *Censura Temporum* in 1708. About the same time there appear'd two new ones; the one under the Title of *Memoirs of Literature*, containing little else but an English Translation of some Articles in the foreign *Journals*, by *M. de la Roche*; the other a Collection of those Tracts, entitled *Bibliotheca Curiosa, or a Miscellany*.

The Italian *Journals* are that of *Abbot Nazari*, which lasted from 1668 to 1681, and was printed at *Rome*. That of *Venice* began in 1671, and ended at the same time with the other; the Authors were *Peter Moretti* and *Francis Moretti*. The *Journal of Parma*, by *Roberti* and *Father Bacchini*,

*chini*, was dropped in 1690, and resumed again in 1692. The *Journal of Ferrara*, by the Abbot *de la Torre*, begun and ended in 1691. *La Galeria di Monera* begun in 1696, is the Work of a Society of Men of Letters. Signior *A. pagliola Zene*, Secretary to that Society, began another *Journal* in 1710, under the Auspice of the Grand Duke; it is printed at *Venice*, and several Persons of Distinction have a hand in it. The *Fests Evadits della Bibliotheca Polonae* were published at *Parma*.

The principal among the *Latin Journals* is that of *Leipfic*, under the Title of *Acta Eruditorum*, begun in 1682. *P. P. Manzani* begun another at *Parma*. The *Novi Litteraria Marti Balthici*, lasted from 1698 to 1708. The *Journal of Hambourg* begun in 1703. The *Acta Litteraria ex Manuscriptis*, and the *Libliotheca Curiosa*, begun in 1705, and ended in 1707, are the Work of *M. Strucius*. *M. Kuffler* and *M. Sike* in 1697, began a *Bibliotheca* of new Books, and continued it for two Years. The *Swiss Journal*, called *Novi Litteraria Helvetica* was begun in 1702 by *M. Schaecher*; and the *Acta Medica Hafnensis*, published by *E. Bartholin*, make five Volumes, from the Year 1671, to 1679.

There are two *Low-Dutch Journals*; is the one under the Title of *Bezoekte avan Europe*; it was begun at *Ratterdam* in 1692, by *Peter Ralbus*, and continued from 1702 to 1708, by *Messieurs Sewel* and *Gaverus*; the other is by a Physician, called *Ruiter*, who began in 1710.

The *German Journals* of best Note are the *Monatlichen Unterredungen*, which held from 1689, to 1698. The *Bibliotheca Curiosa*, begun in 1704, and ended in 1707, both by *M. Tenzel*. The *Journal of Hambouer*, begun in 1700, and continued for two Years by *M. Esnard*, under the Direction of *M. Leibnitz*, and was afterwards carried on by others. The *Theological Journal*, published by *M. Lefebvre*, under the Title of *Actes and News*, that is, Old and New. A third at *Leipfic* and *Frankfort*, the Authors *Messieurs Waldreich*, *Krause*, and *Groschuffus*; and a fourth at *Hall*, by *M. Turk*.

**JOURNEY-MAN**, from the *French Journee*, Day or Days-Work, antiently signified a Person who wrought with another by the Day; the now by the Stature it extends to those likewise who covenant to work with another in their Occupation or Trade by the Year.

**JOY**, See *Pleasure and Pain*.

**JOYNDER**, in Law, is the coupling or joining of two Persons in one Action or Suit against another.

**JOYNERY**, the Art of working in Wood, and of fitting or assembling various Parts or Members of it together: The French call it *Moufferie*, from *Minostraria*, small Work, by which it is distinguish'd from Carpenary, which is conversant in the larger and less curious Works.

**IPECACUANHA**, a little Root, about the Thickness of a moderate Quill, brought hither from several Places in the *West-Indies*. There are three kinds of it, viz. a brown, a grey, and a white one; the first is most esteemed in Physic; it is firm, twisted, difficult to break, of a sharp bitter Taste, and grows in *Brazil* in the Gold-Mines. The Root of the grey *Ipecacuanha*, in its Virtue and Colour, is inferior to the former; it grows at the feet of Mountains, and in Meadows, and other moist Places. The *Spaniards* call it *Mezquite*. The white *Ipecacuanha* differs from both the others, not only in Colour, but in Figure too, not being twisted or rugged like them, but rather resembling the Root of white Dittany. The *Ipecacuanha* is purgative and astringent, it is also a gastric Vomitive, and is found one of the best and surest Remedies hitherto discovered for a Dyfentery.

**IRASCIBLE**, a Term in the old Philosophy, applied to an Appetite, or a Part of the Soul where Anger, and the other Passions that animate us against things difficult or odious, reside. Of the eleven kinds of Passions attributed to the Soul, the Philosophers ascribe five to the *Irascible Appetite*; to wit, Wrath, Boldness, Fear, Hope, and Despair; the six others are charged on the concupiscible Appetite, viz. Pleasure, Pain, Desire, Aversion, Love, and Hatred. *Plato* divided the Soul into three Parts, the reasonable, *irascible*, and concupiscible Parts. The two last, according to that Philosopher, are the corporeal and mortal Parts of the Soul, which give rise to our Passions. *Plato* fixes the Seat of the *Irascible Appetite* in the Heart, of the Concupiscible in the Liver, as the two Sources of Blood and Spirits, which alone affect the Mind.

**IRENARCHA**, the Name of a military Officer in the *Greek Empire*; his Business was to provide for the Peace, Security, and Tranquillity of the Provinces. In *Justinian's Code* it is mentioned, that the *irenarche* are sent into the Provinces to maintain the public Peace, by punishing Crimes, and putting the Laws in execution. Besides this, there was another *irenarche* in the Cities, to whom belonged the preserving of Peace, and quelling Sedition among the Citizens. This Officer was sometimes called *Professor Urbis*. The Emperors *Theodosius* and *Honorius* suppressed the Office of the *irenarche*, on account of their

abasing their Trust, and distressing and persecuting the People, instead of maintaining Peace among them. The word is composed of the *Greek irene*, Peace, and *arche*, Prince, from *arche*, Command, Office.

**IRIS**, a Rainbow, occasioned by a Reflection of the Rays of the Sun in a watry Cloud. The word is derived from the *Greek iris*, to speak, to tell; as being a Meteor that is supposed to foretell Rain. See *Rain-bow*.

*Iris* signifies also that fibrous Circle next the Pupil of the Eye: See *Eye*. It also signifies those changeable Colours, which sometimes appear in the Glasses of Telescopes, Microscopes, &c. which are so call'd from their Similitude to a Rain-bow: as is that colour'd Spectrum, which a Triangular Prismatic Glass will project on a Wall, when placed at a due Angle in the Sun-beams.

**IRON**, a hard, fusible and malleable Metal, of vast Use in the Affairs of Life. It consists of an Earth, Salt, and Sulphur, but all impure, ill mix'd and digested, which render it extremely liable to rust. It is the hardest, driest, and the most difficult to melt of all Metals. It may be soften'd by heating it often in the Fire, hammering it, and letting it cool of itself; and it is harden'd by extinguishing it in Water. It may be render'd white, by cooling it in Sal Armoniac and Quick-lime. The strongest Temper of *Iron* is said to be that, which it takes in the Juice of strain'd Worms. A red-hot *Iron* applied to a Roll of Sulphur, dissolves and sinks into a fine Dust. *Iron* has a great Conformity with Copper, and they are not easily separated when solder'd together; whence arises that uncommon Friendship which the Poets feign between *Mars* and *Venus*. It has a great Conformity, too, with the Loadstone: *Robarts* says, it is itself an imperfect Loadstone, and that if it be a long time exposed in a certain Situation, it becomes a real Loadstone; and mentions the *Iron* in the Steeple of *Notre Dame* at *Chartres* as an Instance.

There are several kinds of *Iron*, that have Properties very different from one other. As, 1. *English*, which is coarse, hard, and brittle, fit for Fire-Bars and such Uses. 2. *Swedish*, which, of all others, is the best used in *England*: It is a fine tough sort, will best endure the Hammer, and is fittest to file, and in all respects the best to work upon. 3. *Spanish*, which would be as good as the *Swedish*, were it not subject to red-fer, that is, to crack betwixt hot and cold. 4. *German Iron*. This kind goes by the Name of *Dart Spare*, because it is brought hither from thence, and is wrought into Bars of three quarters of an Inch square. This is a coarse *Iron*, and only fit for ordinary Uses. There is another sort used for making of Wire, which is the softest and toughest of all. This is not peculiar to any Country, but is indifferently made wherever *Iron* is made, tho' of the worst sort; for 'tis the first *Iron* that runs from the Mine-Stone, when 'tis melting, and is reserved purely for the making of Wire.

Generally speaking, the best *Iron* is the softest and toughest, and that which, when it breaks, is of an even greyish Colour, without any of those glittering Specks, or any Flaws or Divisions like those seen in broken Antimony.

To give *Iron* a blue Colour, with a Grind-stone rub off the black Scurf, then heat it in the Fire, and as it grows hot it will change Colour by degrees; become first of a gold Colour, and then of a beautiful blue. Sometimes the Workmen rub a Mixture of Indigo and Salad-Oil on it, while 'tis heating, and let it cool of itself.

Square and flat Bars of *Iron* are sometimes twisted, for Ornament; and the manner of doing it is this: After the Bar is square or flat forged, they give it a flame Heat, or if the Work be small, but a blood-red Heat; and then 'tis easy to twist it about as much or as little as they please, with the Tongs, Vice, or the like.

The several Heats which Smiths give their *Iron* in working, are, 1. A sparkling or welding Heat, which is used when they double up their *Iron*, or weld two Pieces of *Iron* together, end to end. 2. A flame or white Heat, which is used when the *Iron* has not its Form and Size, but must be forged into both. 3. A blood-red Heat, which is used when the *Iron* has already its Form and Size, but wants a little hammering to smooth and fit it for the File. If the *Iron* be made too hot, it will red-fer, i. e. break or crackle under the Hammer while 'tis working, between hot and cold. For the Manner of making and preparing *Iron*, see *Iron-Works*. To make *Iron* into Steel, see *Steel*.

**IRON-MOULD**S are certain yellow Lumps of Earth or Stone, found in Chalk-pits, about the Children in *Oxfordshire*, which are really a kind of indigested *Iron Ore*.

**IRON-ORES**, and *Iron-Works*: Of these we have a great number in most parts of *England*, but those in the Forest of *Dean* in *Gloucestershire* are in the most repute. The Ore is there found in great abundance, differing much in Colour, Weight and Goodness. The best, call'd *Brass Ore*, is of a blueish Colour, very penderous, and full of little shining

finishing Specks, like Grains of Silver; this affords the greatest Quantity of Iron, but being melted alone, produceth a Metal very short and brittle, and therefore not so fit for common Use. For the remedying whereof, the Workmen make use of another sort of Material, termed *Cinder*, which is nothing but the Refuse of the Ore, after the Metal has been extracted; and which being mingled with the other, in a due Quantity, gives it the excellent Temper of Toughness, that causeth this Iron to be preferred before any other brought from foreign Parts. After they have provided their Ore, their first Work is to calcine it, which is done in Kilns, much after the fashion of our ordinary Lime-Kilns: these they fill up to the top with Coal and Ore, *stratum super stratum*; that is, one Layer upon another: and so putting Fire to the bottom, they let it burn till the Coal be wasted, and then renew the Kilns with fresh Ore and Coal in the same manner as before. This is done without Fusion of the Metal, and serves to consume the more droffy part of the Ore, and to make it malleable, supplying the bearing, and washing, that are used in other Metals. From hence they carry it to their Furnaces, which are built of Brick or Stone, about twenty-four Foot square on the outside, and near thirty Foot in Height within, not above eight or ten Foot over where it is widest, which is about the middle; the top and bottom having a narrow Compass, much like the Shape of an Egg. Behind the Furnace are fixed two huge Pair of Bellows, the Noses of which meet at a little hole near the bottom; these are compressed together by certain Butrons, placed on the Axis of a very large Wheel, which is turned about by Water, in the manner of an Over-shot-Mill. As soon as these Butrons are slid off, the Bellows are raised again by the Counterpoise of Weights, whereby they are made to play alternately, the one going its Blast the time the other is rising. At first they fill these Furnaces with Ore and Cinder, intermix'd with Fuel, which in these Works is always of Charcoal, laying them hollow at the bottom, that they may more easily take fire; but after they are once kindled, the Materials run together into a hard Cake or Lump, which is sustained by the fashion of the Furnace: and through this the Metal, as it melts, trickles down into the Receivers set at the bottom, where there is a Passage open, by which the Men take away the Scum and Dross, and pour out the Metal, as they see occasion. Before the Mouth of the Furnace lies a great Bed of Sand, where they make Furrows of the Shape into which they would have their Iron cast. As soon as the Receivers are full, they let in the Metal, which is made so very fluid by the Violence of the Fire, that it not only runs to a considerable distance, but stands afterwards boiling for a good while. When the Furnaces are once at work, they keep them constantly employ'd for many Months together, never suffering the Fire to slacken Night or Day, but still supplying the wanting of the Fuel, and other Materials, with fresh, poured in at the top: Charcoal is used also further in this Work, for Sea-Coal will not do. From these Furnaces the Workmen bring their Sows and Pigs of Iron, as they call them, to their Forges, where it is wrought into Bars.

**IRON-SICK:** A Ship or Boat is said to be *Iron-sick*, when her Spikes are so eaten with Rust, or Nails, and so worn away, that they make Hollows in the Planks, whereby the Ship leaks.

**IRONY,** is a Figure in Speech, wherein we plainly intend something very different from what our Words express; as when we seem to praise a Person at a time when we evidently rally and discommend him. Hence *Quintilian* calls it *Dectrologium*, *Dissimulation*, and *Illosum*. Thus we say, *John's a very honest Fellow*; meaning, he's a rank Knave. The *Irony* discovers itself rather in the Tone of the Speaker than in the Words. It is derived from the *Greek*, *ironia*, *Dissimulation*.

**IRRADIATION,** signifies an Emission or shooting out of subtle Effluvia from one Body to another. See *Quality*.

**IRRATIONAL NUMBERS,** are the same as *Irrational Numbers*; which see.

*Irrational Quantities:* See *Rational Quantities*.

**IRREGULAR,** something that deviates from the common Forms or Rules. Thus we say an *irregular* Fortification, an *irregular* Building, an *irregular* Figure, &c. In Grammar there are several Declinations and Conjugations that are *irregular*, anomalous, or Heteroclitics. Among Casuists the Term *irregular* is applied to a Person who is unqualified for entering into Orders, as being a Bastard, Maimed, &c. or to an Ecclesiastic, who is interdicted, suspended, or censured, and by that means rendered incapable of holding a Benefice, or discharging any of the sacred Functions.

**IRREGULAR BODIES,** are Solids not terminated by equal and like Surfaces.

**IRREGULAR COLUMN,** in Architecture, is such a one as not only deviates from the Proportions of any of the five Orders, but whose Ornaments, whether in the Shaft or Capital, are absurd and ill-chosen.

**IRREPLEVABLE,** in the Common Law, signifies what may not be replevied, or set at large, upon Sureties.

**IRRORATION,** a kind of Transplantation used for the Cure of certain Diseases. It consists in the sprinkling every Day either Trees, or other proper Plants, with the Urine or Sweat of the Patient, or with the Water wherein his Body, or at least the Part affected, has been washed, till such time as the Disease is removed. As soon as the Sprinkling has been made, they throw fresh Earth on it, in order to prevent the Virtue of the *Mumia*, that is, of the vital Spirit of the Liquid, from evaporating into the Air.

**ISCHIADIC,** an Epithet given by the Physicians to two Veins of the Foot, which terminate in the Crural. The first, called the *Great Ischiadic*, is formed by ten little Branches, proceeding from the Toes, which uniting together, pass by the Muscles of the Calf of the Leg. The lesser *Ischiadic* is formed from several Ramifications, proceeding from the Skin and Muscles, which encompass the Articulation of the Thigh. They are also called *Sciatic*. The Word is derived from the *Greek* *ischios*, or *ischos*, *Cassa*, the *Ship*.

**ISCHIATICA.** See *Sciatica*.

**ISCHIUM,** in Anatomy, is the Name of one of the Bones of the Thigh, wherein is a deep Cavity, called *Coxyla*, or *Acetabulum*, which receives the Head of the Thigh-Bone. This Cavity is encompassed with a cartilaginous Circle, which serves to strengthen the Thigh. The *Ischium* is one of the *Ossa innominata*, which see. The word is derived from the *Greek* *ischos*, *Robor*, *Strength*.

**ISCHURIA,** in Physic, is a Disease that consists in an entire Suppression of Urine. It is occasioned by any thing that may obstruct the Passages of the Reins, Ureters, or the Neck of the Bladder, as Sand, Stone, Phlegm, &c. It may also be occasioned by an Obstruction of the Nerves, which pass to the Reins or Bladder, as we see it is, in a Paralysis of the lower Parts from the Diaphragm. The too great Distension of the Bladder may also produce the same Effect; for the Fibres being much lengthened, and consequently condensed, the Spirits necessary for their Contraction cannot get Admittance; whence it is that Persons, who have retained their Urine a long time, find a great deal of difficulty in discharging it. The word is derived from the *Greek* *ischos*, *I stop*, and *Urina*, *Urine*.

**ISELASTIC,** the Name of a kind of Combat, or Game, celebrated in the Cities of Greece and Asia in the time of the Roman Empire. The Victor at these Games had very considerable Privileges conferred on him, after the Example of *Augustus*, and the *Athenians*, who did the like to the Conquerors at the *Olympic*, *Pythian*, and *Isthmian* Games. They were crowned on the spot, immediately after their Victory, had Pensions allowed them, were furnished with Provisions at the public Cost, and were carried in Triumph into their Country.

**ISIA,** Feasts and Sacrifices antiently solemnized in honour of the Goddess *Isis*. The *Isia* were full of abominable Impurities, and for that reason those who were initiated were obliged to take an Oath of Secrecy. They held for nine Days successively, but were so abominable, that the Senate abolished them at Rome, under the Consulate of *Piso* and *Gabinus*. Two hundred Years after this they were re-established by the Emperor *Commodus*, who himself assisted at them, appearing among the Priests of that Goddess with his Head shaven, and carrying the *Amnis*.

**ISIACI,** Priests of the Goddess *Isis*. *Dioscorides* tells us, they bore a Branch of Marine Abyssinthium in their hands instead of Olive. They sang the Praises of the Goddess twice a-day, *viz.* at the rising of the Sun, when they opened her Temple; after which they begged Alms the rest of the Day, and, returning at night, repeated their Oisions, and shut up the Temple. Such was the Life and Office of the *Isiaci*; they never covered their Feet with any thing but the thin Bark of the Tree *Papyrus*, which occasioned *Prudentius* and others to say they went bare-footed. They wore no Garments but Linnen, because *Isis* was the first who taught Mankind the Culture of this Commodity. See *Dionysius Siculus*, and *Plutarch's Isis* and *Osiris*.

**ISINGLASS:** See *Ithyssaella*.

**ISLAND,** a Tract of Ground encompassed round with the Sea, or with Rivers. This Term is opposed to the Continent or *Terra Firma*. Some conclude from *Gen. x. 5.* and from *Ezck. xliii. 25.* that *Islands* are as antient as the World, and that there were some at the beginning. Whatever become of this Proof, 'tis by no means probable, that the large *Islands*, far remote from the Continent, are new, or that they either arose out of the Sea, or were torn from the main Land. Nor is it less true, that there have been

new Islands formed, by the casting up of vast Heaps of Clay, Mud, Sand, &c. as that for instance of *Tong-mang*, in the Province of *Toungsin* in *China*: or by the Violence of the Sea, which have torn off large Promontories from the Continent, as the Antients imagined *Sooly*, and even *Great Britain* were formed. It is also certain, that some have emerged above the Waves, as *Santorin* formerly, and three other Isles near it lately; the last in 1707, which rose from the bottom of the Sea after an Earthquake, that was supposed to have loosen'd it from its hold.

Several Naturalists are of opinion, that the Islands were formed at the Deluge; & others think they have been separated from the Continent by violent Storms, Inundations, and Earthquakes. These last have observed, that the *East-Indies*, which abound in Islands more than any other part of the World, are likewise more armoyed with Earthquakes, Tempests, Lightning, Vulcano's, &c. than any other Part. *Varenus* thinks most of these Opinions true in some Instances, and believes that there have been Islands produced each of these ways. *St. Helena*, *Ascension*, and other steep rocky Islands, he supposes to have become so, by the Sea's overflowing their neighbouring Champains. By the heaping up huge Quantities of Sand, and other terrestrial Matters, he thinks the Islands of *Zea-land*, *Japan*, &c. were form'd. *Sonatra* and *Ceylon*, and most of the *East-Indian Islands* he thinks were rent off from the main Land; and concludes, that the Islands of the *Archipelago* were form'd in the same way; imagining it probable, that *Democritus's* Flood might contribute towards it. The Antients had a Notion, that *Delos*, and some few other Islands, rose from the bottom of the Sea. Which, how fabulous soever it may appear, agrees with later Observations. *Seneca* takes notice that the Island *Trafalga* rose thus out of the *Aegean Sea* in his time, of which the Mariners were Eye-witnesses. They had also an opinion, that there are some Islands which swim in the Sea. *Tales*, indeed, thought that the whole Earth which we inhabit, floated, thus, in the Sea; but his Opinion is easily refuted, the Channel of the Sea being found continuous to the Shore: But floating Islands are no ways improbable, especially if the Earth whereof they consist be light and sulphureous. *Seneca* says, that near the *Caspian* he saw such an Island, and mentions several others of the same kind; and it was even a common Opinion among the Antients, that all the *Cyclopes* had done the same. *Gryphindler* has written a *Latin* Treatise expressly on *Islands*, de *Insulis*.

ISLES, in Architecture, are Sides or Wings of a Building.

ISOCHRONAL LINE, is that in which a heavy Body is supposed to descend without any Acceleration. *Leibnitz* in the *Act. Erud. Lips.* for February 1689, hath a Discourse on this Subject, in which he shews, That a heavy Body with a degree of Velocity acquired by the Descent from any Height, may descend from the same Point, by an infinite Number of *Isoschronal Curves*, which are all of the same Species, differing from one another only in the Magnitude of their Parameters, such as are all the *Quadrato-Cubical Paraboloids*, and consequently similar to one another. He shews also, there, how to find a Line, in which a heavy Body descending shall recede uniformly from a given Point, or approach uniformly to it.

ISOCHRONES; a Term applied to such Vibrations of a Pendulum as are performed in equal Times: of which kind are all the Vibrations or Springs of the same Pendulum, whether the Arcs it describes be longer or shorter; for when it describes a shorter Arc, it moves so much the slower; and when a long one, proportionably faster.

ISOMERIA, in Algebra, is a Method of freeing an Equation from Fractions, which is done by reducing all the Fractions to one common Denominator, and then multiplying each Member of the Equation by that common Denominator. Thus e. g.  $\frac{x^2}{2} + axx = a b b$  becomes  $x^2 + 4axx - 4abb = 4abb$ .

ISOPERIMETRAL FIGURES, are such as have equal Perimeters or Circumferences.

ISOSCELES Triangle, is a Triangle which hath two equal sides; so which it may be added, that the Angles opposite to the equal Sides are equal, and a Line drawn from the Top or Vertex, cutting the Base into two equal Parts, is perpendicular to the Base. e. g. Let the *Isosceles Triangle* be A P C, and let its Base A C be supposed to be divided into two equal Parts in M: I say, P m is perpendicular to A C, and the Angle P M A is equal to the Angle P M C;

for the Triangle Z has all its Sides equal to those of X, and therefore must have all its Angles equal also respectively to those in X: And then the Angle P m A = P m C, because they are both right; therefore P m is perpendicular to A C, and the Angle P A M = P C m.

ISSUANT, a Term in Heraldry, understood of a Lion, or other Animal, in a Coat of Arms, that seems just issuing out from under a Chief, Fesse, a Houle, a Wood, or the like, and only shews half his Body. It is not easy to distinguish the Lion *Issuant* from the Lion *Naisstant*. Some say, the *Issuant* is that which comes out from behind the Field of some ample Ordinary, showing his Head, Neck, the Tips of his Fore-Legs and his Tail against the chief of the Coat; whereas the *Naisstant* has its Rise about the middle of the Field, and shews all his Fore-part, with the Tip of his Tail, as if he were rising out of the Earth.

ISSUE, is a Term in Common Law, having divers Applications; sometimes it is taken for the Children begotten between a Man and his Wife; sometimes for Profits growing from Amerciaments or Fines; and sometimes from Profits of Lands and Tenements; sometimes for that Point of Matter depending in Suit, whereupon the Parties join, and put their Cause to the Tryal of the Jury: And yet in all these it hath but one Signification, which is an Effect of a Cause preceding; as the Children are the Effect of the Marriage between the Parents: The Profits growing to the King or Lord, from the Punishment of any Man's Offence, is the Effect of his Transgression: The Point referred to the Tryal of twelve Men, is the Effect of Pleading or Process. *Issue*, in this last Signification, is either General or Special.

General *Issue* seemeth to be that whereby it is referred to the Jury to bring in their Verdict, whether the Defendant hath done any such thing as the Plaintiff lays on his charge: For example, If it be an Offence against any Statute, and the Defendant plead Not Guilty; this being put to the Jury, is call'd the *General Issue*. And if a Man complain of a private Wrong, which the Defendant denieth, and pleads no Wrong, nor Diffinity; and if this be referred to the Jury, it is likewise the *General Issue*.

The *Special Issue* then must be that, when Special Matters being alleged by the Defendant in his Defence, both Parties join thereupon, and so grow rather to a Demurrer, if it be *Questio Juris*; or to a Tryal by the Jury, if it be *Questio Facti*.

ISSUES, in Phisic, are small artificial Apertures in a fleshy part of the Body, to drain off superfluous Moisture, or give vent to any noxious Humour. They are usually made in the Arms, Legs, or Back, either by Caustics or Incision. Caution is used to place them about the middle of a Muscle, that the necessary Motion of the Parts may not incommode them, or pain the Patient. There is an easy way of making an *Issue*, which succeeds best in Children; tis done after this manner: Having applied a small piece of blistering Plaster, about the bigness of a small Pea, to the Part where you would have an *Issue*, and letting it lie on for a few Hours, it will cause a Blister; the Skin being rais'd, apply a Pea as usual, and compress it tight with a Bandage, till by degrees it sinks in, and forms an *Issue*. *Issues* are very useful in many Distempers, several of which, when obstinate, cannot be cured without them; as an *Hydrocephalus*, *Ophthalmia*, *Old Ulcers*, &c.

ISTHMUS, a narrow Neck or Slip of Ground that joins two Continents, or joins a Chersonesus or Peninsula to the *Terra firma*; and separates two Seas. The most celebrated *Isthmus's* are those of *Panama* or *Darien*, which joins *North* and *South America*; that of *Suez*, which connects *Asia* and *Africa*; that of *Corinth*, or *Peloponnesus*, in the *Mores*; that of *Crim-Tartary*, otherwise called the *Tanica Chersonesus*; that near the Island of *Romania* and *Erissa*, or the *Isthmus of the Thracian Chersonesus*, twelve Furlongs broad; being that which *Xerxes* undertook to cut through. The Antients had several Designs of cutting the *Isthmus* of *Corinth*, which is a rocky Hillock, about ten Miles over; but they were all vain, the Invention of Sluices being not then known. There have been Attempts, too, for cutting the *Isthmus* of *Suez*, to make a Communication between the *Red-Sea* and the *Mediterranean*. The word comes from the Greek *isthmus*, a Neck. Hence Anatomists use the Term for several Parts of the human Body, particularly that narrow Part of the Throat situate betwixt the two Tonfils; and the Ridge that separates the two Nostrils.

ISTHMIAN GAMES were sacred Sports, the third, in order, of those so much celebrated in ancient *Greece*. *Plutarch*, in the Life of *Theseus*, tells us, they were instituted by that Hero in imitation of *Heracles*, who had before instituted the *Olympian Games*; but *Archias* refers their Institution to *Melivra* or *Palaem*, whom the *Latin* call *Pertunus*. Others say they were instituted by *Nisus*, Son of *Neptune*; and others by *Sisyphus*, Brother of *Achamas*,

mar, King of Corinth, about 1350 Years before Christ: however this be, 'twas in the *Isthmus* of Corinth they were celebrated, and hence arose their Name. *Athenians* and others say, the Conqueror's Prize at these Games was a Crown of Parley. *Plutarch* and *Strabo* say, it was at first a Crown of Pine, that this was afterwards changed for one of Parley, but that at length the Pine was returned; and to this was added a Reward of 100 Silver Drachmas. These Games were held every three Years, and esteemed so sacred, that after the Destruction of Corinth, the *Syracians* were charged with the keeping them up. They were so celebrated, and the Concourse at them was so great, that only the Principals of the most remarkable Cities could have place in them. The *Athenians* had only as much room allotted them as the Sail of a Ship, which they fast yearly to *Delos*, could cover.

**ITALIAN**, the Language spoke in *Italy*. This Tongue is derived principally from the *Latin*, and of all the Languages formed from the *Latin*, there is none that carries with it a more visible Character of its Original than the *Italian*. It is accounted one of the most perfect among the modern Tongues, containing Words and Phrases to represent all Ideas, to express all Sentiments, to deliver one's self on all Subjects, to name all the Instruments and Parts of Arts, &c. 'Tis complained indeed, that it has too many Diminutives and Superlatives, or rather Augmentatives; but without any great reason: for if those words convey nothing further to the Mind besides the just Ideas of Things, they are no more faulty than our *Placenames* and *Hyperboles*. The Character of the *Italian* Tongue it must be owned, however, is very different from that of our own, which is the Reason perhaps why we are so apt to find fault with it: for though the *Italian* be proper for all kinds of Writing, for all Styles, and for all Subjects; yet there are many of their celebrated Authors that don't succeed when translated into *English*, and which an *Englishman* cannot read, with pleasure, even in their Original. The Language corresponds to the Genius of the People, they are slow and thoughtful, and accordingly their Language runs heavily, though smoothly, and many of their Words are lengthened out to a great degree. They have a good Taste in Music, and to gratify their Passion this way, have altered abundance of their primitive Words, leaving out Consonants, taking in Vowels, softening and lengthening out their Terminations for the sake of the Cadence. Hence the Language is rendered extremely musical, and succeeds better than any other in Opera's, and some Parts of Poetry, but it fails in Strength and Nerves: hence also a great part of its Words, borrowed from the *Latin*, become so far disguised, that they are not easily known again. The Multitude of Sovereign States into which *Italy* is divided, has given occasion to a great Number of different Dialects in that Language; which, however, are all good in the Place where they are used. The *Tuscan* is usually preferred to the other Dialects, and the *Roman* Pronunciation to that of the other Cities; whence came the *Italian* Proverb, *Lingua Toscana in Bocca Romana*. The *Italian* is generally pretty well understood throughout *Europe*, and is frequently spoken in *Germany*, *Poland*, and *Hungary*. At *Constantinople*, in *Greece*, and in the Ports of the *Levant*, the *Italian* is used as commonly as the Language of the Country; indeed in those Places it is not spoke so pure as in *Tuscany*, but is corrupted with many of the proper Words and Idioms of the Place, whence it takes a new Name, and is called *Frank Italian*. See *Lampage*.

**ITALIAN HOURS**, are the 24 Hours of the natural Day, accounted from the Sun-setting of one Day to the same again the next Day. This way of reckoning was used by the *Jews* of old, and by the *Italians* to this day.

**ITALIC**, the Name of a Character in Printing. See *Printing*.

**Itale**, the Name of a Sect of ancient Philosophers, founded by *Pythagoras*; they were so called, because that Philosopher taught in *Italy*, spreading his Doctrine among the People of *Tarentum*, *Metapont*, *Hieracola*, *Naples*, &c. See *Pythagoric*.

**ITCH**, a Disease of the Skin, wherein it is corrupted by the ouzing out of certain sharp saline Humours, which gather into Pusules, and occasion a Pruritus or Itching. There are two kinds of *Itch*, a humid and a dry kind. The latter has been usually supposed to be owing to an atrabilarious Humour, and the former to a saline Pituita: They are both contagious. Dr. *Bersnius* has given a much more rational Account of the Cause of this Dilemper than any Author before him. He examined several Globules of the Matter pick'd out of the Pusules of itchy Persons with a Microscope, and found them to be minute living Creatures, in shape resembling a Tortoise, of brisk Motion, with six Feet, a sharp Head, and two little Horns at the end of the Snout. Hence he makes no scruple to impute this contagious Disease to the continual biting of

these Animalcules in the Skin, by means of which some Portion of the Serum ouzing out thro the small Apertures of the Cutis, little watry Bladders are made, within which the Insects continue to gnaw, the Insects are forced to scratch, and by scratching increase the Mischief; breaking not only the little Pusules, but the Skin too, and some little Blood-Vessels, and so make Scabs, crusty Sores, &c. Hence we may easily perceive how the *Itch* comes to be catching, since these Creatures, by simple Contact, easily pass from one Body to another, their Motion being wonderfully swift, and they crawling on the Surface of the Body, as well as under the Cuticula. Hence also we learn the reason of the Cure of this Disease by Lixiviall Washes, Baths and Ointments, made of Salts, Sulphurs, Mercury, &c. these being very powerful in killing the Vermine lodged in the Cavities of the Skin, which scratching will never do; they being too minute to be caught under the Nails. And if in Practice it is found that this Disease, after it seem'd to be cured by Uncion, frequently recurs again; this is easily accounted for, since tho' the Ointment may have killed all the living Creatures, yet it may not, possibly, have destroy'd all their Eggs laid, as it were, in the Nets of the Skin; from which they afterwards breed again, and renew the Dilemper.

**ITINERANT JUDGES**, or *Judices*, are such as were formerly sent with Commissions into divers Countries, to hear chiefly such Causes as were call'd Pleas of the Crown; or the fame with *Justices in Eyre*: which see.

**ITINERARY**: The Description that a Traveller makes of the Course of his Journey, and of the Curiosities, &c. that he observed. The *Itinerary* of *Antonine* shews all the grand Roman Roads in the Empire, and all the Stations of the Roman Army. It was made by order of the Emperor *Antoninus Pius*, but is now very defective, having suffer'd extremely under the hands of the Copists and Editors.

**JUBILEE**, a Church-Solemnity, or Ceremony observed at *Rome*, wherein the Pope grants a Plenary Indulgence to the Universal Church; as many of them, at least, as visit the Churches of *St. Peter* and *St. Paul* at *Rome*. The *Jubilee* was first establish'd by *Boniface VIII.* in 1300. in favour of those who should go *ad Limina Apostolorum*, and was only to return every hundred Years. The first Celebration brought in such store of Wealth to *Rome*, that the *Germans* call'd this the Golden Year. This occasion'd *Clement VI.* to reduce the Period of the *Jubilee* to 50 Years. *Urban VI.* appointed it to be held every 35 Years, that being the Age of our Saviour; and *Sixtus IV.* brought it down to every 25, that every Person might have the Benefit of it once in his Life. *Boniface IX.* granted the Privilege of holding *Jubilees* to several Princes and Monasteries: For instance, to the Monks of *Canterbury*, who had a *Jubilee* every 50 Years.

*Jubilees* are now become more frequent, and the Pope grants them as often as the Church or himself have occasion for them. There is usually one at the Inauguration of a new Pope. To be entitled to the Privileges of the *Jubilee*, the Bull enjoins Fasting, Alms, Prayers. It gives the Priests a full Power to absolve, in all cases, even those otherwise reserved to the Pope; to make Commutations of Vows, &c. in which it differs from a Plenary Indulgence. During the Time of *Jubilee*, all Indulgences are suspended.

One of our Kings, viz. *Edward II.* caused his Birth-Day to be observed in manner of a *Jubilee*, when he became 50 Years of Age; but not before or after. This he did, by releasing Prisoners, pardoning all Offences but Treason, making good Laws, and granting many Privileges to the People.

There are particular *Jubilees* in certain Cities, when several of their Festals fall on the same Day: As *Pary* in *Vevey*, for instance, when the Feast of the Annunciation happens on Good Friday; and at *Lyons*, when the Feast of *St. John Baptist* concurs with the Feast of *Corpus Christi*. In 1640 the *Jesuits* celebrated a solemn *Jubilee* at *Rome*: that being the Centenary, or hundredth Year from their Institution; and the same Ceremony was observed in all their Houses throughout the World.

*Jubilee*, among the *Jews*, was understood of every fiftieth Year, being that following the Revolution of seven Weeks of Years; at which time all the Slaves were made free, and all Inheritances reverted to their ancient Owners.

The word *Jubilee*, according to some Authors, comes from the Hebrew *Jobel*, which signifies fifty. But this must be a Mistake; for the Hebrew *Jubel*, does not signify fifty; neither does its Letters, taken as Cyphers, or according to their Numerical Power, make that Number; being 10, 6, 2, and 50, that is 48. Others say, that *Jobel* signifies a Ram, and that the *Jubilee* was proclaim'd with a Ram's-horn, in memory of the Ram that appear'd to *Abraham* in the Thicket. *Mosur* derives the Word from *Jubal*, the first Inventor of Musical Instruments, which for that rea-

son were call'd by his Name; whence the words *Jolel* and *Jubilee* came to signify the Year of Deliverance and Remission, because proclaim'd with the Sound of one of those Instruments, which at first was no more than the Horn of a Ram.

*Jubilee*, or *Jubilæus*, is also us'd among the *Romanists* to signify a Religious who has been fifty Years in a Monastery, or an Ecclesiastic who has been in Orders fifty Years. Such veteran Religions are dispens'd with in some places from attending Masses, or a strict Observation of any other of their Rules. *Jubilæus* also signified a Man a hundred Years old; and a Possession or Prescription for fifty Years. *St. Hieron.* non invenitur in Scripturis, inquiratur de *Seminaribus*; & si sub eorum *Jubilæus* non sit, sine *Imperatore* maneat in eternum.

**JUDAICUS LAPIS**, a grey, soft, brittle Stone, in form of an Acorn, having Lines drawn regularly on its Surface, as if they were turn'd: It is us'd in Physic to dissolve the Stone in the Bladder.

**JUDAISM**: The Religious Doctrines and Rites of the *Jews*. *Judaism* was warrant'd by Divine Authority, being deliver'd to that People immediately from Heaven; it was, however, but a temporary Dispensation, and was to give way, at least the Ceremonial Part of it, at the Coming of the *Messias*. For a compleat System of *Judaism*, see the Books of *Moses*. *Judaism* was antiently divided into several Sects; the principal whereof were the *Pharisees*, *Sadducees*, and *Essenians*: which see. At present there are but two, viz. the *Karaites*, who admit of no Rule of Religion, but the Law written by *Moses*; and the *Rabbinists*, who add to the Law, the Traditions of the *Talmud*. It has been observ'd, that *Judaism*, of all other Religions, is that which is the most rarely abjur'd. In the 18th of *Edward I.* the Parliament granted the King a Fifteenth for the Expulsion of *Judaism*. See *Cantus*, *Spencer*, and *Goodwin*.

In *England*, formerly, the *Jews* and all their Goods belonged to the chief Lord where they lived, and he had such absolute Property in them, that he might sell them, for they had not liberty to remove to another Lord without leave. *Mat. Paris* tells us, that *Henry III.* sold the *Jews* to *Earl Richard* his Brother for a Term of Years, that *quis Rex excoaraverat, Comes edificaverat*.

They were distinguished from the *Christians* both living and dying, for they had proper Judges and Courts wherein their Causes were tried, and they wore a Badge on their outward Garments upon the Breast, in the shape of a Table, and were fined if they stir'd abroad without such Badges. They were never buried in the Country, but brought up to *London*, and buried without the Walls.

**JUDGE**, an Officer appointed by the Powers of any Country, to distribute that Justice to their Subjects which they can't administer in Person. The Character of *Judge* is a part of the Regal Authority, whereof the Prince divideth himself.

The *English Judges* are all chosen out of the *Serjeants* at Law, and are constituted by Letters Patents. Their Commissions are bound with this Limitation, *Fosturi quod ad Justitiam pertinet secundum Legem & Consuetudinem Angliæ*; and at their Creation they take an Oath, that they will indifferently minister Justice to all them that shall have any Suit or Plea before them; and this they will not forbear to do, tho' the King by his Letters, or by express Word of Mouth, should command the contrary. They have Salaries of 1000 *l.* per annum each from the King, besides very considerable Perquisites, and this Salary is granted them, *quandiu bene se gesserint*, to keep them free and independent of the Court. See *Justitice*.

*Judge*, in Scripture, is understood of certain eminent Persons chosen by God himself to govern the *Jews*, from the time of *Josias* to the Establishment of the Kings. The *Judges* were not ordinary Magistrates, being only sent on extraordinary Occasions, as to head the Armies, to deliver the People from their Enemies, &c. *Salsian* has observ'd, that they not only presid'd in the Courts of Justice, but were also at the Head of Councils, of Armies, and of every thing that concern'd the Government of the State; tho' they never assum'd the Title either of Princes, Governors, or the like. The same Author has observ'd seven Points wherein they differed from Kings: (1.) They were not hereditary. (2.) They had no absolute Power of Life and Death, but only according to the Laws, and dependantly of them. (3.) They never undertook War at their own pleasure, but only when they were appointed by God, or call'd to it by the People. (4.) They exacted no Tribute. (5.) They did not succeed each other immediately, but after the Death of one there was frequently an Interval of several Years e'er a Successor was appointed. (6.) They did not use the Ensigns of Sovereignty, the Scepter or Diadem. (7.) They had no Authority to make any new Laws, but

were only to take care of the Observation of the *Lævitic* of *Moses*. In some respects they resembled *Kings*, viz. 1. Their Authority was given them for Life; and not for a limited Time: 2. They ruled alone, and without any dependence, which occasion'd *Josephus* to call their State Monarchical. The *Hebrews* were governed by fifteen *Judges* for the Space of 340 Years, viz. from the time of *Othniel* their first, to that of *Heli* their last *Judge*.

**JUDGES**, or the Book of *Judges*, is a Canonical Book of the Old Testament, containing the History of the *Judges*, whereof we have been speaking. The Author is not known. 'Tis probable the Work did not come from any single Hand, being rather a Collection of several little Histories, which at first were separate, but were afterwards collected by *Ezra* or *Samuel* into a single Volume; and, in all likelihood, were taken from the antient Journals, Annals, or Memoirs, compos'd by the several *Judges*.

**JUDGMENT**, a Faculty of the Soul, by which she perceives the Relation that is between two or more Ideas. Thus when we judge that the Sun is greater than the Moon, the Understanding first compares the two Ideas of the Sun and the Moon, and finding the Idea of the Sun greater than that of the Moon, the Will perfectly acquiesces in that Perception, nor puts the Mind upon any further Enquiry. 'Tis not the Understanding then that judges, as is ordinarily thought; *Judgments* and Reasonings, on the part of the Understanding, are but mere Perceptions: 'tis the Will alone that judges in reality, in acquiescing in what is represented to it by the Understanding. The only Difference, then, between Perception, Judgment, and Reasoning, so far as the Understanding is concern'd in them, is this, That it perceives a thing simply, without any relation to any other thing in a simple Perception, that it perceives the Relations between two or more things in *Judgments*, and lastly that it perceives the Relations that are between the Relations of things in Reasonings: So that all the Operations of the Understanding are in effect no more than pure Perceptions.

When we perceive, for instance, twice 2, or 4, this is no more than a simple Perception; when we judge that twice 2 are 4, or that twice 2 are not 5, the Understanding does no more than barely perceive the Relation of Equality that is between twice 2 and 4, or of Inequality between twice 2 and 5. Further, Reasoning consists in perceiving the Relation, not between two or more things, for that would be a *Judgment*, but of two or more Relations of two or more things. Thus when I conclude that four being less than six, twice two being four, are by consequence less than six; I perceive not only the Relation of Inequality between two and six, (for this were only a *Judgment*) but also the Relation of Inequality between the Relation of twice 2 and 4, and the Relation between 4 and 6: Which constitutes a Reasoning. The Understanding therefore only perceives, and 'tis the Will that judges, and reasons in assisting voluntarily to what the Understanding represents.

Indeed, when the things which we consider, appear clear, and perfectly evident, it seems as if it were not voluntarily that the Mind consents to 'em; whence we are led to think, that 'tis not the Will, but the Understanding, that judges of 'em. But to clear this Point, it must be observ'd, that the things which we consider, never appear intirely evident till the Understanding has examin'd them on all sides, and has perceiv'd all the Relations necessary to judge of 'em; whence it happens, that the Will not being able to will any thing without Knowledge, cannot assent on the Understanding; that is, cannot desire it to represent any thing new in its Object, as having already view'd it on all the sides that have any relation to the Question in hand. It is oblig'd, then, to rest in what has been already represented, and to cease to agitate and disturb it any further: in which Cessation it is, that *Judgment* consists. This Rest or *Judgment*, then, not being free, when things are in their last Evidence we are apt to imagine that it is not the Effect of the Will. So long as there is any thing obscure in the Subject that we consider, or that we are not fully satisfied that we have discover'd every thing necessary to resolve the Question, as it happens in most of those things that are difficult, and that contain various Relations; we are then at liberty not to acquiesce, the Will may command the Understanding to pursue its Enquiries further, and to make new Discoveries: whence it is, that we are more ready to allow the *Judgments* form'd on these Subjects to be voluntary.

Most Philosophers, however, maintain that even the *Judgments* which we form on obscure things are not voluntary, and will have our consenting to the Truth to be an Action of the Understanding, which they call Assent, to distinguish it from our consenting to Goodness, which they attribute to the Will, and call it Consent. But their

Error is owing to this, that in our present State, we frequently see things to be evidently true without the least reason to doubt of 'em; in which case the Will is not at liberty either to give or refuse her Assent; but it is not so in Matters of Goodness; there being nothing, which we don't know some reason for forbearing to love. So that we here perceive a manifest Indifference, and are fully convinced that when we love any thing, even God for instance, we use our Liberty, and do it voluntarily. But the Use we make of our Liberty is not so apparent, when we consent to the Truth, especially when it appears perfectly evident: And this leads us to think that our Consent to Truth, that is, our *Judgment*, is not voluntary; as if an Action, to be voluntary, must be indifferent: As if the Blessed above did not love God voluntarily, because they cannot be diverted from it by any other thing; nor we consent freely to this evident Proposition, That twice 2 are 4, because we have no appearance of Reason to dissuade us from it. See *Will, Liberty, Truth, Goodness*.

*Judgment*, in a legal Sentence, is a Sentence or Decision pronounced by Authority of the King, or other Power, either by their own Mouth, or by that of their Officers whom they appoint to administer Justice in their stead. Of *Judgments* some are definitive, others only preparatory, provisional, or interlocutory. The ancient words of *Judgment* are very significant, *Consideratum est, &c.* because *Judgment* is ever given by the Court upon Consideration had of the Record before them. In every *Judgment* there ought to be three Persons, *Alter, Rex, and Index*.

**JUDICATURE**, the Profession of those who administer Justice. *Judicature*, is a kind of Prerogative. The word is also used to signify the Extent of the Jurisdiction of a Judge, and the Court wherein he fits to do Justice.

**JUDICIUM DEI**, *Judgment of God*, was a Term anciently understood of an extraordinary Trials of several Crimes; as those by Arms and single Combat, those by Fire or red-hot Plow-shares, by plunging the Arm in boiling Water, or the whole Body in cold Water, in hopes God would work a Miracle rather than suffer Truth and Innocence to perish: *Si se super defendere non possit, Judicio Dei scilicet. Aqua vel Ferro fieri de eo Justitia.* These Customs were a long time kept up, even among Christians, and are still in Use in some Nations. See *Ordeal, Water, &c.* These Trials were held in the Churches, in presence of the Bishops, Priests, and Secular Judges, after three Days Fasting, Confession, Communion, and a world of Adorations and Ceremonies, described at large by *de Cange*.

**JUGULAR**, a Term, among Anatomists, applied to certain Veins of the Neck, which terminate in the Subclavians. There are two on each Side; the one external, receiving the Blood from the Face and the external Parts of the Head; and the other internal, which receives the Blood from the Brain.

*Jugular* is also applied to certain Glands of the Neck, in the Spaces between the Muscles. They are in Number 14, and are found of different Figures, some larger, others less; they are fastened to each other by certain Membranes and Vessels, and their Substance is like that of the Maxillaries. They separate a Lympha, which is conveyed by those Vessels to the adjacent Muscles. 'Tis an Obstruction in those Glands which occasions the King's-Evil. *Denti*.

**JUICE**, a liquid Substance, which makes part of the Composition of Plants, communicating itself to all the other Parts, and serving to feed and increase them. *Juice* is that to Plants, which Blood is to Animals. There are *Juices* aqueous, vinous, oleaginous, gummos, resinous, and bituminous, of all Tastes and Colours. Dr. *Lifter* observes, that most *Juices* of Plants coagulate, whether they be such as are drawn from the Wounds of a Plant, or such as spontaneously exude; he having made Curds and Cakes of the *Juices* of a great Number of Plants. He adds, that as the *Juices* of Plants seem to be compounded and mixed of Liquors of different kinds; 'tis probable, if the Caseous Part be narcotic, for instance, the Whey may not be so; or the one may be hurtful, and the other a good and useful Medicament. See *Sap, Gum, &c.*

The word *Juice* is also applied to several of the Fluids in an animal Body. The nervous *Juice* is a Liquor which, according to some Physicians, is found in the Nerves, whence it takes its Name. *Glisson, Wharton, and Willis* were the first who made mention of the nervous *Juice*; they take it to be a kind of Vehicle to the animal Spirit, preventing them from dissipating too hastily, and think it also serves to nourish the Parts of the Body; but a great part of our modern Physicians deny the Existence of this *Juice*.

*Pancreatic Juice* is a Liquor separated in the Glands of the Pancreas. See *Pancreas*.

*Juice* is also applied to the Vapours and Humidities inclosed in the Earth. Thus they say *Chrysal* is formed of a lapidific *Juice*, and Metals are formed of Vapours and *Juices* condensed in the Earth.

**JUUBE**, the Fruit of a Tree of the same Name, growing very commonly in *Provence*, and some other Parts. The *Juubes* are about the Size of a Plum, oval, red without, yellow within, of a sweet, very commonly, viscid Taste; they are peccoral and aperitive, soften the Acrimony of the Humours, and promote a Discharge by the *Sputum*. *Pliny* tells us, that *Sextus Papinius* brought the first *Juubes* from *Syria*, and Truffles from *Africa*, towards the End of *Augustus's* Reign.

**JULAP**, in Pharmacy, is an easy agreeable Potion prescribed to sick Persons: It usually consists of distilled Waters, or light Decoctions, frequently sweeten'd with Sugar or clarified Juices. It is sometimes used as the ordinary Drink in certain Diseases, but usually as a Vehicle for other Forms of Medicines; serving to correct the peccant Humours, to restore the declining Strength of the Heart, and to promote Sleep. The word, according to *Menneg*, is derived from the *Arabic*, *Ginlap*, or rather from the *Greek* *Zandma*. *Olearius* derives it from *Gulap*, a *Persian* Word, signifying *Rose-Water*.

**JULE**, a kind of ancient Hymn sung by the *Greeks*, and after them by the *Romans*, during the time of their Harvest, in honour of *Ceres* and *Bacchus*; in order to render those Deities propitious. The word is derived from the *Greek* *ιαυ*, or *ιαυω*, a Sheaf. This Hymn was sometimes also called *Demetrale*, or *Demetriale*, that is, *Isle of Ceres*.

**JULIAN YEAR**, is the old Account of the Year, still in use among us in *England*; it is so called from its Founder *Julius Cæsar*, and by that Name is distinguished from the *New*, or *Gregorian* Account, used in several Parts of *Europe*. It is either Common or Bissextile; the Common consists of 365 Days, and the Bissextile of 366. *Sagehen*, whom *Cæsar* made use of in the Reformation of the Calendar, judged the mean Solar Year to consist of just 365 Days and six Hours; and on this Ground it was that *Cæsar* appointed one Year in four to be Bissextile, and the other three Common. See *Year*.

The *Julian* Period is of great Use in Chronology, and was invented by *Scaliger*; it consists of 7980 Years, the Product of the three Cycles multiplied into each other, viz. the Indiction, which is 15; the Golden Number 19; and the Cycle of the Sun 28. It is made to commence before the Creation of the World, and that more or less, according to the Hypothesis that is followed. Its principal Advantage consists in this, that the same Years of the Cycles of the Sun, Moon, and Indiction, belonging to any Year of this Period, will never fall together again till after the Expiration of 7980 Years, which, according to the received Opinions, will scarce happen before the Consummation of all things. The first Year of the Christian Era, in all our Systems of Chronology, is always the 4714th of the *Julian* Period.

To find what Year of the *Julian* Period any given Year of Christ answers to, work thus: To the given Year of Christ add 4713 (because so many Years of the *Julian* Period were expired before A. D. 1.) and the Sum gives the Year of the *Julian* Period sought. For Instance, I would know what Year of the *Julian* Period A. D. 1720 answers to: Now  $1720 + 4713 = 5433$ , the Year sought of the *Julian* Period. On the contrary, having the Year of the *Julian* Period given, to find what Year of Christ answers thereto: From the Year of the *Julian* Period given, subtract 4713 (for the Reason above-mentioned) and the Residue will be the Year sought. For Instance, I would know what Year of Christ answers to the *Julian* Period 6453; wherefore  $6453 - 4713 = 1740$  the Year sought. If the Year of the *Julian* Period given be less than 4713, then subtract the same from 4714 (which is the Year of the *Julian* Period that answers to the Year of Christ 1.) and the Residue will shew how long before (the beginning of the common Computation from the Nativity of) Christ, the given Year of the *Julian* Period was. For Instance, the City of *Rome* is said to have been built, J. P. 5960, I would know therefore how long it was built before Christ. Now  $4714 - 3960 = 754$ , wherefore *Rome* was built 754 Years before Christ. It is called *Julian* as being adapted to the *Julian* Year. See *Period*.

**JULUS**, a Name which the Botanists give to those Wormlike Tufts, or Palms, as they are called, in Willows, which, at the beginning of the Year, grow out, and hang prodigious down from Hazels, Walnut-Trees, &c. Mr. *Ray* thinks them to be a kind of Collection of the Stamina of the Flowers of the Tree, because in fertile Trees and Plants they have abundance of seminal Vessels and Seed-Pods.

**JULY**, the seventh Month in the Year, when the Sun enters the Sign of *Leo*. About the 24th Day of this Month

Month the Dog-Days begin. The French call this the Month of Red-Fruit, and with Reason, says Quintus, because they are then in their height. On the 17th Day of this Month, according to Hippocrates and Pliny, the Dog-Star rises, the Sea boils, Wine turns, Dogs go mad, the Bile is increased and irritated, and all Animals decline and languish, &c. The word is derived from the Latin *Julus*, the Surname of C. Cesar the Dictator, who was born in it. Mark Antony first gave it this Name; before, it was called *Quintilis*, as being the fifth Month of the Year, in the old Roman Calendar established by Romulus, which began in the Month of March. For the same reason Augustus was called *Sextilis*, and September, October, November, and December still retain the Name of their first Rank.

*Quæ sequitur, Numero nobis notata suis.* Ovid. Fast.

**JUNCTURE**, is any kind of Joint, or closing of two Bodies.

**JUNE**, the sixth Month of the Year, when the Sun enters the Sign of Cancer. In this Month is the Summer Solstice. The word comes from the Latin *Junius*, which some derive à *Juno*. Ovid, in the 6th of his *Fastii*, makes the Goddess say,

*Junius à vestro Nemine Nomen habet.*

Others rather derive it à *Junioribus*, this being for young People, as the Month of May was for old ones.

*Junius est Jucundum qui fuit ante Saturnum.*

**JUNIPER-BERRIES**, the Fruit of a Shrub of the same Name; much used in Medicine. *Linnaeus* had a vast Opinion of them, and thought they deserved a whole Treatise to be wrote of them. The Rob (a Form of Medicine now out of use) made of the expressed Juice of the Green Berries, has been called the *Theriac Germanorum*; so much have they been in esteem amongst them for anti-pellicular Qualities. They are certainly carminative, but their most remarkable Properties are in scouring the Viscera, and particularly the Reins and Urinary Passages, as all of the Turpentine-kind do. The Wood of this Shrub is also of considerable Use in Physic, it strengthens the Stomach, expels Wind, clears the Lungs, provokes the Menes, and removes Obstructions of the Viscera. It is further said to be Sudorific, Cephalic, and Hystric. From it they draw a Spirit, a Tincture, an Elixir, Extract, and a Ratiſia. This said it will last an hundred Years without corrupting; and the Chymists add, that a Coal of Juniper, covered with Ashes of the same kind, will keep fire an entire Year.

**JUNTA**, an Assembly, Council, or Society, of several Persons meeting for the Dispatch of any Business. This Term is particularly in use in the Spanish and Portuguese Affairs. On the Death of Charles II. King of Spain, the Kingdom was governed, during the Absence of Philip V. by a Junta. In Portugal they have three considerable Juntas, the Junta of Commerce, that of the three Estates, and that of Tobacco. The first was established by King John IV. this is a Council of Marine. The same King assembled the States of his Kingdom to create the Tribunal of the Junta of the three Estates. K. Peter II. created the Junta of Tobacco in 1675, it consists of a President and six Counsellors.

Junta was the Name of a Society of Bookfellers or Printers at Venice, who published many beautiful and correct Editions of Books, which still go by the Name of Juntas.

**IVORY**, the Tooth or Tusk of an Elephant growing on each side of his Trunk, in form of an Horn. Ivory is much esteem'd for its Colour, its Polish, and the Fineness of its Grain when wrought. *Discordius* says, that by boiling it the space of six hours with the Root of Mandragoras, it becomes so soft and tractable, that one may manage it as he pleases. The Ivory of the Isle of Ceylon and that of the Isle of *Arbon* have this Peculiarity, that they never become yellow, as that of the *Terra-firma* and *East-Indies*; on which account 'tis much dearer.

Black Ivory is no more than Ivory burnt, and drawn into a Leaf when it is become black. It is ground with Water, and made up into little Cakes or Troches, used by the Painters.

**JUPITER**, one of the seven Planets; its Character is ♃. Its Orbit is situate between Saturn and Mars. It has a Rotation round its own Axis in 9 Hours, 56 Minutes; and a periodical Revolution round the Sun in 4332 Days, 12 Hours. It is the biggest of all the Planets. Its Diameter to that of the Sun appears, by Astronomical Observations, to be as 1077 is to 10000, to that of Saturn as 1077 to 889, to that of the Earth as 1077 to 104. The Force of Gravity on its Surface is to that on the Surface of the Sun as

797,15 is to 10000, to that of Saturn as 797,15 to 534557; to that of the Earth as 797,15 to 407,932. The Density of its Matter is to that of the Sun as 7404 to 10000, to that of Saturn as 7404 to 6011, to that of the Earth as 7404 to 3951. The Quantity of Matter contained in its Body is to that of the Sun as 9,248 to 10000, to that of Saturn as 9,248 to 4,23, to that of the Earth as 9,248 to 0,0044. The mean Distance of Jupiter from the Sun is 5201 of those Parts, whereof the mean Distance of the Earth from the Sun is 1000, tho' *Kepler* makes it 5196 of those Parts. *M. Cassini* calculates Jupiter's mean Distance from the Earth to be 515,000 Semi-Diameters of the Earth. *Gregory* computes the Distance of Jupiter from the Sun to be above five times as great as that of the Earth from the Sun; whence he gathers, that the Diameter of the Sun, to an Eye placed in Jupiter, would not be a fifth part of what it appears to us; and therefore his Disk would be twenty-five times less, and his Light and Heat in the same Proportion. The Inclination of Jupiter's Orbit, that is, the Angle formed by the Plane of its Orbit, with the Plane of the Ecliptic, is 1 Deg. 20 Min. His Excentricity is 250; and *Huygens* computes his Surface to be four hundred times as large as that of our Earth. See *Solar System*.

Jupiter is one of the superior Planets, that is, one of the three above the Sun. Hence it has no Parallax, its Distance from the Earth being too great, to have any sensible Proportion to the Diameter of the Earth. Though it be the greatest of the Planets, yet its Revolution about its Axis is the swiftest. Its Polar Axis is observed to be shorter than its Equatorial Diameter; and Sir I. Newton determines the Difference to be as 8 to 9. So that its Figure is a Spheroid, and the Swiftness of its Rotation occasions this Spheroidism to be more sensible than that of any other of the Planets. Jupiter appears almost as large as Venus, but is not altogether so bright. He is eclips'd by the Moon, by the Sun, and even by Mars. *Hædelius* observed Jupiter's Diameter 7 Inches, having Inequalities like the Moon. He has three Appendages, call'd Zones, or Belts, which Sir I. Newton thinks are form'd in his Atmosphere. In these are several *Masles*, or Spots; from whose Motion, the Motion of Jupiter round its Axis is said to have been first determined. The Discovery of this is controverted between *Eustachius*, *P. Gassinius*, *Cassini*, and *Compani*.

The four little Stars, or Moons, which move round Jupiter, were first discover'd by *Galileo*, who call'd them the *Astra de Mediceis*; but we the Satellites of Jupiter. *Cassini* observed, that the first or innermost of these Satellites was five Semi-diameters of Jupiter distant from Jupiter itself, and made its Revolution in 1 Day, 18 Hours, and 32 Minutes. The second, which is somewhat greater, he found 8 Diameters distant from Jupiter, and its Revolution 3 Days, 13 Hours, and 12 Minutes. The third, which is the greatest of all, is distant from Jupiter 13 Semi-diameters, and finishes its Course in 7 Days, 3 Hours, and 50 Minutes. The last, which is the least of all, is distant from Jupiter 25 Semi-diameters; its Period is 16 Days, 18 Hours, and 9 Minutes. These four Moons must make a very pleasing Spectacle to the Inhabitants of Jupiter, if it be true there are any; for sometimes they rise all together; sometimes they are all together in the Meridian, ranged one under another; and sometimes all appear in the Horizon, and frequently undergo Eclipses: the Observations whereof are found of especial Use in determining the Longitude. *Cassini* has made Tables for calculating the Immersions and Emergences of Jupiter's first Satellite.

The Day and Night are of the same Length in Jupiter all over his Surface, viz. five Hours each; the Axis of his Diurnal Rotation being nearly at right Angles to the Plane of his Annual Orbit. Though there are four primary Planets below Jupiter, yet an Eye placed on his Surface would never perceive any of them, except Saturn; unless, perhaps, as Spots passing over the Sun's Disk, when they happen to come between the Eye and the Sun. The Parallax of the Sun, view'd from Jupiter, will scarce be sensible, no more than that of Saturn; neither being much above 20 Seconds; so that the Sun's apparent Diameter in Jupiter will not be above six Minutes. The outermost of Jupiter's Satellites will appear almost as big as the Moon does to us, viz. five times the Diameter, and 25 times the Disk of the Sun. Dr. *Gregory* adds, that an Astronomer in Jupiter would easily distinguish two kinds of Planets, four nearer him, viz. the Satellites, and two, viz. the Sun and Saturn, more remote. The former, however, will fall vastly short of the Sun in Brightness, notwithstanding the great Disproportion in the Distances and apparent Magnitudes. From those four different Moons, the Inhabitants of Jupiter will have four different kinds of Months, and the Number of Moons in their Year will not be less than 4000. These Moons are eclips'd as often as, being in opposition to the Sun, they fall within the Shadow of Ju-

planets; and again, as oft as being in conjunction with the Sun, they project their Shadows to *Jupiter*, they make an Eclipse of the Sun to an Eye placed in that part of *Jupiter* where the Shadow falls. But in regard the Orbits of these Satellites are in a Plane which is inclined to, or makes an Angle with the Plane of *Jupiter's* Orbit, their Eclipses become central when the Sun is in one of the Nodes of these Satellites; and when out of this Position, the Eclipse may be total, tho' not central, because the Breadth of *Jupiter's* Shadow is nearly decuple to that of the Breadth of any of the Satellites; and the apparent Diameter of any of these Moons is nearly quintuple the apparent Diameter of the Sun. 'Tis owing to this remarkable Inequality of Diameters, and the small Inclination the Plane of the Orbits of these Satellites has to the Plane of *Jupiter's* Orbit, that in each Revolution there happen Eclipses both of the Satellites and of the Sun: tho' the Sun be at a considerable distance from the Nodes. Further, the inferior among these Satellites, even when the Sun is at its greatest distance from the Nodes, will occasionally eclipse and be eclipsed by the Sun to an Inhabitant of *Jupiter*; tho' the remotest of them, in this case, escapes falling into *Jupiter's* Shadow, and *Jupiter* into his, for two Years together. To this it may be added, that one of these Satellites sometimes eclipses another, where the Phases must be different, nay frequently opposite to that of the Satellite falling into the Shadow of *Jupiter* just mention'd; for in this, the Eastern Limb immergeth first, and the Western immergeth last: but in the others 'tis just the Reverse.

The Shadow of *Jupiter*, tho' it reaches far beyond its Satellites, yet falls short of any other Planet; nor could any other Planet, *Saturn* alone excepted, be immersed in it, even tho' it were infinite. Indeed, *Jupiter's* Shadow could not reach *Saturn*, unless *Jupiter's* Diameter were half that of the Sun; whereas, in effect, 'tis not one ninth of it.

The Courses of *Jupiter's* Satellites, and their various Eclipses, would render Navigation very sure and easy on the Globe of *Jupiter*. Even we, at this distance, can make very good use of them; those Eclipses being found one of our best means for determining the Longitude at Sea. For the Manner of calculating them, see *see Satellites*.

Among the Alchemists, *Jupiter* signifies the Philosophers Stone. The Gentlemen of this Profession apply every thing to their Art which the Fable mentions of the God *Jupiter*; pretending the Fables are to be understood in a figurative Sense; for instance, *Jupiter* is the Master of the Gods, and Gold, say they, is the most precious of Metals. Mercury is the Ambassador of *Jupiter*; and this shows with how much ease *Mercury* insinuates into every thing. *Jupiter* holds the Thunderbolt as his Scepter; which evidently points out the external Sulphur used in Projection. *Jupiter* has the Heavens for his ordinary Habitation; this shows the volatile, dry, and hot. The Debauches of *Jupiter*, who fought for Pleasure in the low, but prolific and fruitful Earth, discover, say they, its Fecundity; and that Gold might be formed, were the way of preparing it discover'd. In a word, *Jupiter* is the Son of *Saturn*, which shows some Resemblance between the Qualities of Gold and Lead.

JURATS are in the nature of Aldermen, for government of their several Corporations, as the Mayor and Jurats of *Maidstone*, *Rye*, *Winchester*, &c. So *Jersey* hath a Bailiff and twelve Jurats, or sworn Assistants, to govern the Island.

JURIS-CONSULTUS, among the *Romans*, was a Person learned in the Law, a Master of Juris-prudence, and who was consulted on the Interpretation of Laws and Customs, and on the difficult Points in Law-Suits. The fifteen Books of the *Digest* were compiled wholly from the Answers or Reports of the ancient *Juris-Consulti*. *Tribonians*, in destroying the two thousand Volumes whence the *Code* and *Digest* were taken, has deprived the Public of a world of things which would have given 'em light into the Office of the ancient *Juris-Consulti*. We should scarce have known any thing beyond their bare Names, had not *Pompilius*, who lived in the second Century, taken care to preserve some Circumstances of their Office. The *Roman Juris-Consulti* seem to have been the same with our Chamber Counsellors, who arrived at the Honour of being consulted, through Age and Experience, but never pleaded at the Bar. Their pleading Advocates or Lawyers never became *Juris-Consulti*. In the Times of the Commonwealth the *Advocati* had by much the more honourable Employment; as being in the ready way to attain to the highest Preferments. They then decipher'd the *Juris-Consulti*, calling them in derision *Formularii* and *Leveti*, as having invented certain Forms, and certain Monosyllables, in order to give their Answers the greater appearance of Gravity and Mystery. But in process of time they became so much esteem'd, that they were call'd *Prudentes* and *Sapientes*, and the Emperors appointed their Judges to follow their

Advice. *Augustus* advanced them to be public Officers of the Empire; so that they were no longer confined to the petty Counsels of private Persons. *Bern. Rechinus* has written the Lives of the most famous *Juris-Consulti*, who have lived within these 2000 Years.

JURISDICTION is a Power or Authority which a Man hath to do Justice in cases of Complaint made before him. There are two kinds of *Jurisdiction*, the one Ecclesiastical, the other Secular. Secular belongs to the King and his Delegates: Ecclesiastical to Bishops and their Deputies. Bishops, &c. have two kinds of *Jurisdiction*, the one Internal, which is exercised over the Conscience in things purely Spiritual; and this they are supposed to hold immediately of God: The other is a Privilege which some Princes have given them of terminating Disputes between Ecclesiastics and Laymen.

JURIS-PRUDENCE, the Knowledge of what is just and unjust, or of the Laws, Rights, Customs, Statutes, &c. necessary for the doing of Justice. *Civil Juris-Prudence* is that of the Roman Law, *Canonial* that of the Canon Law, *Federal* that of Fees.

JUROR, in a legal sense, is one of those twenty-four or twelve Men, who are sworn to deliver Truth upon such Evidence as shall be given them touching any matter in question. The Punishment of Petty Jurors attainted of giving a Verdict contrary to Evidence, willingly, is very severe. See *Attaint*.

JURY, in Common Law signifies either Twenty-four or Twelve Men sworn to enquire of the Matter of Fact, and declare the Truth upon such Evidence, as shall be delivered them touching the Matter in question. The Jury is to be chosen out of the same Class or Rank with the Accused, and if he be a Foreigner, he may demand a Jury half Foreigners and half Englishmen. There are ordinarily Thirty-six impannell'd, whereof in Criminal Cases the Person accused has the Liberty to challenge or set aside Twenty-four, and to pick out Twelve at his pleasure. These Twelve are present at the Trial, since which they withdraw into a Chamber by themselves, where they are to be shut up without Fire or Candle, Victuals or Drink, till such time as they agree in their Verdict, and declare unanimously that the Defendant is either Guilty of the Charge laid against him, or Not Guilty. Upon which, the Judge passes the Sentence prescribed by the Law. In England there are three sorts of Trials, viz. One by Parliament, another by Battle, and a third by Assize or Jury. The Trial by Assize (be the Action Civil or Criminal, Public or Private, Personal or Real) is referred for the Fact to a Jury, and as they find it, so passeth the Judgment. This Jury is not only used in Circuits of Justices Errant, but also in other Courts and Masters of Office: But tho' it appertains to most Courts of the Common Law, yet is it most remarkable in the Half-Year Courts of the Justices Errant, commonly call'd the Great Assizes, and in the Quarter-Sessions; and in them it is most ordinarily called a Jury, and that in a Civil Cause: whereas in other Courts, it is usually called an Inquest, and in the Court-Baron a Jury of the Homage. In the General Assize there are usually many Juries, because there are a great many Causes, both Civil and Criminal, commonly to be tried; whereof one is called the Grand Jury, and the rest the Petty Juries; of which, it seems, there should be one in every Hundred.

The Grand Jury consists of Twenty-four Grave and Substantial Gentlemen, or some of the better sort of Yeomen, chosen indifferently by the Sheriff out of the whole Shire, to consider of all Bills of Indictment prefer'd to the Court; which they do either approve, by writing upon them *Billis vera*; or else disallow, by indorsing *Ignominios*. Such as they do approve, if they touch Life and Death, are further refer'd to another Jury, to be consider'd of, because the Case is of much importance; but others of lighter moment are, upon their allowance, without more work, fined by the Bench: except the Party traverse the Indictment, or challenge it for Insufficiency, or remove the Cause to a higher Court by *Certiorari*; in which two former Cases it is refer'd to another Jury, and in the latter, transmitted to a higher. And precisely upon the allowance of this Bill, by the Grand Inquest, a Man is said to be indicted: Such as they disallow, are delivered to the Bench, by whom they are forthwith cancelled or torn.

The Petty Jury consists of Twelve Men at the least, and are impannell'd as well upon Criminal as upon Civil Causes: Those that pass upon Offences of Life and Death, do bring in their Verdict either Guilty or Not Guilty; whereupon the Prisoner, if he be found Guilty, is said to be convicted, and so afterwards receiveth Judgment and Condemnation; or otherwise is acquitted, and set free. Those that pass upon Civil Causes Real, are all, or so many, as can conveniently be had, of the same Hundred, where the Land or Tenement in question doth lie, being four at least; and they, upon due Examination, bring in their Verdict either for the Demandant or Tenant.

**JURY-MAST:** so the Scamen call whatever they set up in the room of a Mast, lost in a Fight or by a Storm, with which they make shift to sail, instead of the Mast which they have lost.

**JUS CORONÆ,** the Rights of the Crown, is part of the Law of England, which differs in many things from the general Law concerning the Subject. See on *Litt.*

**JUS PATRONATUS,** in Law, is the Right of presenting a Clerk to a Benefice.

**JUS and JURA,** see Law, Right.

**JUST,** a Combat on Horseback, Man against Man, arm'd with Lances. Antiently, *Justs* and Tournaments made a part of the Entertainment at all solemn Feasts and Rejoicings. The Spaniards borrow'd these Exercises from the Moors, and call them the *Caste-Play*. This is the same with the *Ludus Trojanns* antiently practis'd by the Youth of Rome. The Turks use it still, and call it lancing the *Gord*. The difference between *Justs* and Tournaments consists in this, That the latter is the Genus, of which the former is the Species. Tournaments were all kinds of Military Races and Engagements, made out of Gallantry and Diversion. *Justs* were such particular Combats where Parties were near each other, and engaged with Lance and Sword: The Tournament was frequently performed by a Number of Cavaliers, who fought in a Body. The *Just* was a single Combat of one Man against another: Though the *Justs* were usually made in a Tournament, after the general Rencontre of all the Cavaliers, yet they were sometimes singly, and independent of any Tournament. He who appear'd for the first time at a *Just*, forfeited his Helm or Casque, unless he had forfeited before at a Tournament.

The Word is derived from the Latin *justa*, because the Combatants fought near one another. *Salmastius* derives it from the modern Greek *zoustra*, or rather *zouces*, which is used in this sense by *Nicetporus Gregorius*. Others derive it from *Justia*, which in the corrupt Age of the Latin Tongue was used for this Exercise; this being supposed to be a more just and equal Combat than the Tournament.

**JUSTICE,** is a constant Desire or Inclination to give every one his Due, or a Habit by which the Mind is always dispos'd and determin'd to give every Man his own. *Justice* may be divided into Distributive, Commutative, and Legal. *Distributive Justice* is concern'd in Matters of Government, and of Beneficence, and is either remuneratory or punitive; it observes an Equality in dealing Rewards and Punishments, according to each Man's Condition and Merit: for as Actions are either good or evil, for the good, Rewards must be assign'd, and for the evil, Punishments; and herein a Geometrical Proportion is observed. *Commutative Justice* is conversant in Matters of Commerce, and in the equal Commutation or Exchanging of things, and proceeds according to an arithmetical Equality, without any regard to Persons and Circumstances. *Legal Justice* is that which resides in the State or Monarch, by whose Power and Authority the Effects of commutative and distributive *Justice* are frequently suspended or suspended; as in a Dearth of Corn, if a Person that has a Stock by him will not sell it, it shall be taken from him; and the like.

**JUSTICE** is likewise the Name of an Officer appointed by the King or Commonwealth, to do Right by way of Judgment. He is called *Justice*, and not *Justice*, because he was antiently called *Justicia*, and not *Judicarius*, and because he has his Authority by Deputation, as Delegate to the King, and not *Jure Magistratus*; and therefore cannot depare any other in his stead, the *Justice* of the Forest only excepted. Of these *Justices* we have various kinds in England.

*Justice*, or Chief *Justice* of the King's Bench, is the capital *Justice* of Great Britain, and a Lord by his Office. His Business is chiefly to hear and determine all Pleas of the Crown, that is, such as concern Offences against the Crown, Dignity, and Peace of the King, as Treasons, Felonies, &c. See *King's Bench*.

*Justice*, or Chief *Justice* of the Common-Pleas, is he who, with his Assistants, hears and determines all Causes at the Common Law, that is to say, all Civil Causes between common Persons, as well Personal as Real, and he is a Lord by his Office. This Officer was formerly not only Chief *Justice*, but also Chief Baron of the Exchequer, and Master of the Court of Wards. He usually fat in the King's Palace, and there executed that Office, formerly performed per *Consuetudinem Palatii*; he determined, in that Place, all the Differences happening between the Barons and other Great Men. He had the Prerogative of being Vicegerent of the Kingdom, whenever the King went beyond Sea, and was usually chosen to that Office out of the prime Nobility; but his Power was reduced by King Richard I. and King Henry I. His Office is now divided, and his Title changed from *Capitalis Anglie Justiciarius*, to *Capitalis Justiciarius ad Pleas*, &c. See *Common-Pleas*.

*Justice* of the Forest is a Lord by his Office, and hath Power and Authority to determine Offences committed in the King's Forests, &c. which are not to be determined by any other Court or *Justice*, except such as are appointed by special Commission to assist him in his Office. Of these there are two, whereof the one hath Jurisdiction over all the Forests on this side Trent, and the other beyond it. By many antient Records it appears to be a Place of great Honour and Authority, and is never bestowed but on some Person of great Distinction. The Court where this *Justice* sits, is called the *Justice-Seal* of the Forest. This is the only *Justice* who may appoint a Deputy; he is also called *Justice in Eyre* of the Forest.

*Justices in Eyre*, *Justiciarii itinerantes*, or *Errantes*, are so termed from the old French word *Eyre*, i. e. *Iter*. These, in antient time, were sent with Commission into divers Counties to hear such Causes, especially, as were termed Pleas of the Crown; and that for the Ease of the Subject; who must else have been harried to the Courts of Westminster, if the Cause were too high for the County-Courts. According to some, these *Justices* were sent once in seven Years, but others will have them to be sent often. *Cowden* says, they were instituted in the Reign of King Henry II. but they appear to be of an older Date. They were much like our *Justices* of Assize at this Day, tho' for Authority and Manner of Proceeding very different.

*Justices of Assize*, are such as were wont, by special Commission, to be sent into this or that County, to take Assizes, for the Ease of the Subjects: for whereas these Actions pass always by Jury, so many Men might not, without great Damage and Charge, be brought up to London; and therefore *Justices*, for this purpose, by Commission particularly authorized, were sent down to them. These continue twice every Year to pass the Circuit, by two and two, thro' all England, dispatching their several Business by several Commissions; for they have one Commission to take Assizes, another to deliver Goals, and another of Oyer and Terminer, &c. See *Assize*.

*Justices of Goal-Delivery*, are such as are commissioned to hear and determine Causes appertaining to those, who for any Offence are cast into the Goals. Their Commission is now turned over to the *Justices of Assize*.

*Justices of Nisi Prius* are now all one with *Justices of Assize*, for it is a common Adjourment of a Cause in the Common Pleas to put it off to such a Day; *Nisi Prius Justiciarii occurrent ad eas Partes ad capiendos Assisas*; and from the Clause of Adjourment, they are called *Justices of Nisi Prius*, as well as *Justices of Assize*, by reason of the Writ and Actions they have to deal in.

*Justices of Oyer and Terminer*, were *Justices* deputed, on some special Occasions, to hear and determine some particular Causes. The Commission of Oyer and Terminer is directed to certain Persons, upon any Insurrection, heinous Demeanour, or Treasons committed.

*Justices of the Peace*, are Persons of Interest and Credit, appointed by the King's Commission to attend the Peace of the Country where they live; of whom, some, for special Respect, are made of the *Quorum*, because no Business of Importance may be dispatched without the Presence, or Assent of them, or one of them. See *Quorum*. The Office of a *Justice of the Peace* is to call before him, examine, and commit to Prison all Thieves, Murderers, wandering Rogues, those that hold Conspiracies, Riots, and almost all Delinquencies, that may occasion the Breach of the Peace and Quiet of the Subject; to commit to Prison such as cannot find Bail, and to see them brought forth in due time to Trial. The Original of *Justices of the Peace* is referred to the fourth Year of *Edw. III.* They were at first called *Wardens of the Peace*.

**JUSTIFICATION**, in Theology, is that Grace which renders a Man just in the Sight of God, and worthy of eternal Happiness. The *Romanists* and *Reformed* are extremely divided about the Doctrine of *Justification*; the latter contending for *Justification* by Faith alone, and the former by good Works. See *Imputation*.

**JUSTNESS**, the Exactness or Regularity of any thing. The word is particularly used in Matters of Language or Thought. The *Justness* of a Thought consists in a certain Preciseness or Accuracy, by which every part of it is perfectly true, and pertinent to the Subject. *Justness* of Language consists in using proper and well-chosen Terms; in not saying either too much or too little. *M. de Mev*, who has written on *Justness* of Mind, distinguishes two kinds of *Justness*; the one arising from Taste and Genius, the other coming from good Sense or right Reason. There are no certain Rules to be laid down for the former, viz. to shew the Beauty and Exactness in the Turn, or Choice of a Thought; the latter consists in the just Relation which things have to one another.

**JUVENALIA**, Games, Exercises of Body, or Combats, instituted by *Nero* the first time his Beard was shaved. They were celebrated in private Houses, and even the

Women had a share in them; they were the same with the *Neremiana*.

JUXTA-POSITION, is that Disposition of Parts in

any Body, whereby they are joined and combined together.

## K

**K** A double Consonant, and the 10th Letter of the Alphabet. It is borrowed from the *Greek Kappa*; and was but little used among the *Latins*. *Probian* looked on it as a superfluous Letter, and says, it was never to be used except in words borrowed from the *Greek*. *Danfgnius*, after *Salust*, observes, that it was unknown to the antique *Romans*. Indeed we seldom find it in any *Latin* Authors, excepting in the word *Kalendi*, where it sometimes stands in lieu of a C. *Karibage* is frequently spelt on Medals with a K, SALVIS AUGG. CAES. FEL. KART. and sometimes the Letter K alone stood for *Caribage*. *M. Bezer* has observed, that a Capital K, on the Reverse of the Medals of the Emperors of *Constantinople*, signified KONSTANTINUS; and on the *Greek* Medals he will have it to signify ΚΟΙΝΗ ΣΥΡΙΑ, *Cele-Syria*. *Lipfius* observes, that K was a Stygma antiently marked on the Foreheads of Criminals with a red-hot Iron; and *Quintilian* tells us, that in his time some People had gotten a mistaken Notion, that wherever the Letters C and A occurred at the beginning of a Word, K ought to be used instead of the C.

The Letter K has various Significations in old Charters and Diplomas; for Instance, K R stood for *Chevis*, K R C for *Caru Civitas*, K R M for *Carmen*, K R A M N, *Caru Amnicus nofter*, K S Chast, K T *Capite nofter*, &c.

The *French* never use the Letter K, excepting in a few Terms of Art, and proper Names borrowed from other Countries. *Mabuccori*, in his Dialogue of the Letters, brings in K complaining, that he has been often in a fair way to be banished out of the *French* Alphabet, and confined to the Countries of the North. In *English* the K is used much more than needs be, particularly at the ends of Words after C, as in *Publick*, *Physick*, &c. where it is of no manner of Service.

K is also a Numeral Letter, signifying 250, according to the Verse;

*K quoque docentes 25 quinqueaginta senclit.*

When it had a Stroke at top, it stood for 150000.

KABIN, or KEBIN, a temporary Marriage, in use among the *Mahometans*. The *Kabin* is contracted before the *Cadi*, in whose Presence the Man espouses the Woman for a certain time, upon condition that if he quits her at the end of that Term, she shall be allowed a certain Sum of Money. Some Authors say, that the *Kabin* is only permitted among the *Persians*, and in the Sect of *Ali*; but others maintain that it is also practised among the *Turks*.

KADARE, or KADARITE, the Name of a Sect among the *Mahometans*, who deny the Favourite Tenet of the *Muslimans*, Predestination; and maintain the Doctrine of Liberty and Free-Will in all its Latitude.

KALENDAR, See *Calendar*.

KALENDS, See *Calends*.

KALI, a Plant, otherwise called *Glasswort*; it grows in the Sands on the Sea-shore, where the People sow it in order to burn it green. Of its Ashes they make Soap, Glass, Alkali-Salt, &c. This Plant grows in great abundance in *Egypt* and *Syria*; its Name *Kali* was given it by the *Arabs*. It is found pretty plentifully, too, in *Languedoc*, where the People turn it to a very good account. This manner of preparing it is this: When the Tree is grown up to its pitch, they cut it down, and let it dry; afterwards they burn and calcine it in certain Pits like Lime-Kilns dug in the Ground for that purpose, which are close covered up with Earth, so as no Air may come at the Fire. The Matter by this means is not reduced into Ashes only, but made into a very hard Stone, like Rock-Salt, which they are forced to break with Hammers to get it out, and this Matter they call *Salicor*, or *Sande en Pierre*. They make such Quantities of it here, that they export it into several other Countries, but principally into *Italy*, where the *Venetians* manufacture it into those beautiful Glasses, which they afterwards return into most Countries in *Europe*. However, the *Salicor* made here is inferior to that brought from *Alicant*. The best is in little dry porous Stones, of a bluish grey Colour, and full of little Eyes or Holes.

KAN, the Name of an Officer in *Persia*. The *Kans* are the same things in *Persia* that *Gouvernours* are in *Europe*: There are *Kans* of Provinces, Countries, and Cities, who have different Additions to distinguish them.

KAPI, a Term in the *Eastern* Countries for Gate. Thus the chief Gate of the Palace of the Emperor of *Persia* is called *Alla Kapi*, the Gate of God. Thus also the Officer who has the Command of the Grand Signior's Palace-Gates, is called *Kapigibi Babii*.

KARATA, a kind of Aloe growing in *America*. Its Leaves, when boiled, are made into a Thread, of good use in making Cloth, Fishing-Nets, &c. Its Root, or Leaves, thrown into the River, stun the Fishes to that degree, that they are easily taken with the Hand. Its Stalk, when dried and burnt, burns like a Match; and when briskly rubbed on a harder Wood, takes fire, and consumes itself.

KARKRONI, a Building where the Royal Manufactures of *Persia* are carried on. Here are made their Tapestries, Cloth of Gold, Silk, Wool, and Brocades, Velvets, Tassera's, Coats of Mail, Sabres, Bows, Arrows, and other Arms. There are also Painters in Miniature, Goldsmiths, Lapidaries, &c.

KARLE, a *Saxon* Word, used in our Laws, sometimes for a Man, and sometimes for a Servant, or Clown. Hence the *Saxons* call a Scaman a *hofsarle*, and a Domestic Servant *Hofsarle*: whence, by Corruption, comes our word *Charle*.

KASI, a Term in the *East*, applied to the fourth Pontiff of *Persia*, who, at the same time, is the second Civil Lieutenant, and judges of Temporal as well as Spiritual Affairs. He has two Deputies who determine Matters of less Consequence, particularly Quarrels arising in Coffee-houses, which make a great part of their Business.

KAURYSAOUL, a Body of Soldiers, who form the last of the five Bodies of the King of *Persia's* Guards. They are in Number 2000, all Horse, commanded by the Constable, and in his Absence by the Captain of the Watch. They keep watch in the Night around the Palace, serve to keep off the Crowd when the King goes on Horseback, keep Silence at the Audience of Ambassadors, seize the *Kans* and other Officers when disgraced, and cut off their Heads when the King commands it.

KAY, a Wharf or Place by the Water-side, in a Sea-Port, for the loading and unloading of Merchandise. The Number of these in *England* is determined by Act of Parliament. The Verb *enjoye*, in old Writers, according to *Scaliger*, signifies to keep in or restrain; and hence came our Term *Kay*; the Ground where they are made being bound in with Planks and Posts.

KAYAGE, the Money, or Toll, paid for loading or unloading Wares at Kays.

KEBER, the Name of a Sect among the *Persians*. Those of this Sect are, for the generality, rich Merchants. Tho' they inhabit in the middle of *Persia*, and are found in great Numbers in the Suburbs of *Ispahan*, yet 'tis not known, whether or no they are originally *Persians*, as having nothing in common with the other *Persians* but the Language. They are distinguished by their Beard, which they wear very long, and by their Dress, which is quite different from the rest. They are in effect Heathens, but are in great Reputation for the Regularity of their Life. Some Authors say they adore the Fire, in imitation of the antique *Persians*; but this is contradicted by others: They believe the Immortality of the Soul, and have some things like what the Antients taught of Hell and the *Elysian* Fields. When any of them die, they let loose a Cock in his House, and drive it out into a Field; if a Fox seizes it, and bears it off, they make no doubt but the Soul of the Deceased is saved. If this first Experiment don't satisfy them, they have recourse to a second, which is conclusive; they carry the Carcass into the Church-yard, and prop it up against the Wall with a Fork: if the Birds peck out the right Eye, they look on him as one of the Predestinated, and bury him with a great deal of Ceremony, letting him down gently into the Grave; but if the Birds begin with the left Eye, they conclude him a Reprobate, and throw him headlong into a Ditch. The word *Keler* signifies Infidel, from the *Turks's* *Keapber*, a Renegade, or, rather, they both come from *كبر*, *Capbar*, which, in the *Chaldee*, *Syriac*, and *Arabic*, signifies to deny.

KEBLEH, or KIBLEH, a Term used among the *Turks*, for that Point or Quarter to which they turn themselves when they make their Prayers. *Mahomet* at first durst not propose any other *Ketlebs* to his Followers; but the Temple

of Jerusalem, which was the *Kelbeh* of the Jews and *Christians*. In course of time, however, being willing to bring his own, off from any Communication in Matters of Religion with the Jews and *Christians*, he appointed them, in the Alcoran, to turn themselves, at Prayer, towards the Temple of Mecca, from which time they called those two Temples the *Kelbetan*, or two *Kelbehs*. *Ricaut* adds, that 'tis not the Temple of Mecca, properly speaking, that the *Turks* call *Kelbeh*, but rather the large square Tower in the middle of the Amphitheatre of the Mosque.

*Kelbeh* is also used for an Altar, or rather a Niche, as *Ricaut* calls it, which the *Mahometans* have in all their Churches, and which is placed very exactly on that Side towards the Temple of Mecca. Hence the word *Kelbeh* comes to be used metaphorically for the Object or End proposed, or the Intention a Man has in doing a thing. Thus the *Kelbeh* of Kings is their Crown and Authority, that of Men of Business Money, that of Gluttons good Cheer, &c.

**KEBLEH-NOMA**, the Name which the *Turks* and *Perfians* give to a little Pocket Compass, which they always carry with them, in order to place themselves the more exactly when they go to Prayers.

**KEDGING**, a Sea-Term, used when a Vessel is brought up or down a narrow River by the Wind, tho' the Tide be contrary to it. To do this the Scamen let their Fore-fail, or Foretop-fail, and the Mizzen, and let her drive with the Tide, that they may flat her about; if she come too near the Shore, they have a little Anchor ready, called the *Kedger*, or *Kedge-Anchor*, with a Hawser fastened to it from the Ship; and this Anchor they drop in the midst of the Current, by which means they wind her Head about, and this done, take up the Anchor again.

**KEEL**, the Name of the lowest Piece of Timber in a Ship, in the Bottom of her Hull, one End whereof is at the Stern, the other at the Stem; into this are all the Ground-Timbers and Hooks fastened and bolted fore and aft. When a Ship hath a deep Keel, she is said to have a rank Keel, and this serves to keep her from rolling.

**KEEPER of the Forest**, otherwise called *Chief Warden of the Forest*, is an Officer that hath the principal Government of all things belonging to a Royal Forest, and the Check of all the other Officers. The Lord Chief Justice in Eyre of the Forest, when he thinks fit to hold his Justice-Seat, sends out his general Summons to the *Keeper* forty Days before, to warn all Under-Officers to appear before him at a Day assigned in the Summons.

**Keeper of the Great Seal** is a Lord by his Office, and filled *Lord Keeper of the Great Seal*. He is one of the King's Privy Council, through whose Hands pass all Charters, Commissions, and Grants of the King under the Great Seal, without which Seal, all such Instruments, by Law, are of no force; for the King is, in the Interpretation of the Law, a Corporation, and passeth nothing firmly but under the said Seal, which is, as the public Faith of the Kingdom, in the highest Esteem and Reputation. The *Lord Keeper* hath the same Place, Authority, Pre-eminence, Jurisdiction, Execution of Laws, and all other Customs, Commodities, and Advantages as the *Lord Chancellor of England* hath for the time being. Both these Officers cannot properly subsist at the same time, since the Statute of 5 *Edw.*

**Keeper of the Privy Seal** is a Lord by his Office; thro' whose Hands pass all Charters, signed by the King, before they come to the Great Seal, and some things which do not pass the Great Seal at all. He is of the King's Privy Council, and was antiently called Clerk of the Privy Seal.

**KERAMIAN**, the Name of a Sett among the *Maulmen*, so called from *Mohammed Ben Keram* its Author. The *Keramians* maintain, that whatever the Alcoran says of the Arms, Eyes, and Ears of God, is to be understood literally; so that they admit the *Targintass*, that is, a kind of Corporcity in God; which however they explain variously.

**KERANA**, a long Trumpet, in form of a Speaking-Trumpet, used by the *Perfians*: To the Sound of this they add a confused Noise of Hautboys, Timbrels, Drums and other Instruments every Evening at Sun-set, and two Hours after Midnight.

**KERMES**, a kind of Husk or Excreffence, as 'tis generally thought, about the Bigness of a Juniper-Berry, round, smooth, and shining, of a beautiful Red, and full of a mucilaginous Juice of the same Colour. It is found sticking to the Leaves and Bark of a kind of *Ilex* or *Helm-Oak*, in Spain, *Lampyredae*, and other hot Countries. It has a viscid Smell, a bitter, tho' agreeable Taste, and its Liquor contains an infinite Number of little round or oval Eggs. The Origin of the *Kermes* is supposed owing to a little Worm, which pricking the *Helm-Oak*, to draw its Food from it, raises a little Tumor or Vesicle, which fills with Juice, and as it ripens becomes red. When the *Kermes* is dried, there comes out of it an infinite

Number of little Insects and Flies, so small that they are scarce sensible; inasmuch that the whole inward Substance seems converted into them: For this reason it is that they sometimes call it *Vermillion*, (unless, perhaps, it be so call'd from its beautiful Vermillion Colour.) To prevent that Inconvenience, they usually steep the *Kermes* in Vinegar before they dry it. They draw the Juice or Pulp from the *Kermes*, and make a Syrup of it, by adding a sufficient Quantity of Sugar. Sometimes they dry the Pulp separate from the Husk, which Pulp, thus dried, they call *Pajfet of Kermes*. The Grain of *Kermes* is of great use in Physic. It is Cardiac, Defecative, Astringent, fortifies the Stomach, and prevents Abortion; of this, it is made that celebrated Confection, call'd *Athermel*. It is, however, of greater use in dying Scarlet.

The manner of preparing it for Dying, is as follows: The Grain being taken when ripe, they spread it on Linnen; and at first, while it abounds most in Moisture, turn it twice or thrice a day, to prevent its heating: till such time as there appears a red Powder among it; then they separate it, passing it thro' a Searce, and then again they spread abroad the Grain on the Linnen; till they perceive the same Redness of Powder, when they repeat the sifting: and thus they proceed, till they discover a red Powder on the Surface of the Grain, which is still pass'd thro' the Searce till it yield no more. In the beginning, when the small red Grains are seen to move, as they will do, they are sprinkled over with strong Vinegar, and rubb'd between the Hands. Were not this Precaution taken, out of every Grain would be formed a little Fly, which would skip and fly about for a day or two, and at last changing its Colour, fall down dead. The Grain being quite emptied of its Pulp or red Powder, is wash'd in Wine, and then expos'd to the Sun; after this, 'tis put up in small Sacks, putting along with it, the Proportion of red Dust that the Grain had afforded.

According to *M. Mayssin's* Experiments made at *Montpellier*, the Grain of *Kermes* has the Effect of Galls when mix'd with Vitriol, and makes a good Ink. Mix'd with Oil of Tartar or Lime-Water, its Colour turns from a Vermillion to a Crimson Colour. In a Decoction of Tournifol Flowers it retains its proper Colour. They have not been able to get a fix'd essential Salt from it, but a volatile Salt it yields in abundance; which, in *M. Mayssin's* opinion, would have a better Effect in Medicine, if taken in a Liquid, than when inclosed in Conferences and Confections, which hinder its Action. Those who have observed the Manner of producing the *Kermes* in the hot Countries tell us, that the little Grains gather'd on the *Ilex Cocciferus* change into a great number of little Maggots of a red Colour, which run backwards and forwards in the Tree where they were bred; and wherever they stay any time, leave the Semen of those Grains, which break out the Year following. These the *Greeks* call *Coccus*, the *Latins* *Vermiculæ*, and those of the Country, *Grains of Vermillion*, because of the Worms, Maggots, or Butterflies, into which the Grain changes.

**KERNE**, a Term in the ancient *Irish* Militia, signifying a Foot-Soldier. Camden tells us, the Armies of *Ireland* consisted of Cavalry, call'd *Gallaghers*, and Infantry lightly armed, called *Kernes*. The *Kernes* bore Swords and Darts; to the last were fitted Cords, by which they could recover them after they had been launched out. *Kerne*, in our Laws, signifies idle Persons or Vagabonds.

**KEY**, a little Iron Instrument for the opening of Locks. Its Use and Figure are too well known to need a particular Description. *L. Malinotus* has written a Treatise of Keys, printed at *Upsal*. He derives the Latin Name *Clavis* from the *Greek κλειον, claudo, I shut*, or from the Adverb *clam, privately*; and adds, that the Use of Keys is not known in some Parts of Sweden. The first Invention of Keys is owing to one *Theodore of Samos*, according to *Pliny* and *Polydore Virgil*; but this must be a Mistake, the Use of Keys having been known before the Siege of *Troy*, and mention is even made of them in the 19th Chapter of *Genesis*. *Malinotus* is of Opinion, that Keys, at first, only served for the untying certain Knots, where-with they antiently secured their Doors; but the *Laconic Keys*, he maintains, were nearly a-Kin in use to our own; they consisted of three single Teeth, and made the Figure of an E, of which Form there are some still to be seen in the Cabinets of the Curious. There was another Key, called *Barabazeyes*, made in the manner of a Male-Skrew, which had its corresponding Female in a Bolt affixed to the Door. Key, hence, becomes a general Name for several things that shut up, or close other things.

**Key** of an Arch or Vault is the last Stone placed a-top of a Vault, which being wider and fuller at the Top than Bottom, wedges, as it were, and binds in all the rest. This Key is different in the different Orders; in the *Tuscan* and *Doric* 'tis a plain Stone, having a Projedture; in the *Ionie* 'tis cut and wavy in Veins, af-

ter the manner of *Cassides*; in the *Cornithian* and *Composite*, 'tis a *Casside* enriched with Sculpture, Foliages, &c.

Key is also used for Ecclesiastical Jurisdiction, and for the Power of Ex-communicating and Absolving. Thus the *Romanists* say, the Pope has the power of the *Keys*, and can open and shut Paradise as he pleases, grounding their Opinion on that Expression of Jesus Christ, *I will give thee the Keys of the Kingdom of Heaven*. In S. Gregory we read, that 'twas the Custom heretofore for the Popes to send a Golden Key to Princes, wherein they inclosed a little of the Filings of St. Peter's Chains, kept with a world of Devotion at Rome, and that these *Keys* were worn in the Bosom, as being supposed to contain some wonderful Virtues.

Key is also a Term in Polygraphy and Steganography, signifying the Alphabet of a Cypher, which is a Secret known only to the Person who writes the Letter, and him who decyphers it. Some Cyphers have a single Key, where the same Characters are used throughout, in other Cyphers the Characters are varied, and the Key must be double. In this Sense it is that we use the words *Key* of a Book, *Key* of an Author, as being let by it into some Secrets, with regard to Persons, Times, Places, &c. which don't appear without it.

Key, in Music, is a certain fundamental Note or Tone, to which the whole Piece, be it Concerta, Sonata, Cantata, &c. is accommodated, and with which it usually begins, but always ends. To get an Idea of the Use of the *Key*, it may be observed, that as in an Oration there is a Subject, viz. some principal Person or Thing to which the Discourse is referred, and which is always to be kept in view, that nothing unnatural and foreign to the Subject may be brought in; so in every regular Piece of Music there is one Note, viz. the *Key*, which regulates all the rest. The Piece begins, and ends in this; and this is, as it were, the musical Subject, to which a regard must be had in all the other Notes of the *Key*. Again, as in an Oration there are several distinct Articles, which refer to different Subjects, yet so as that they have all a visible Connection with the principal Subject, which regulates and influences the whole; so in Music there may be various subaltern Subjects, that is, various *Keys*, to which the different Parts of the Piece may belong; but then they must be all under the Influence of the first and principal *Key*, and have a sensible Connection with it. Now to give a more distinct Notion of the *Key*, we must observe, that the Octave contains in it the whole Principles of Music, both with respect to Consonance or Harmony, and Succession or Melody; and that if either Scale be continued to a double Octave, there will, in that Case, be seven different Orders of the Degrees of an Octave, proceeding from the seven different Letters with which the Terms of the Scale are marked. Any given Sound therefore, i. e. a Sound of any determinate Pitch or Tune, may be made the *Key* of the Piece, by applying to it the seven natural Notes arising from the Division of an Octave, and repeating the Octave above or below at pleasure. The given Note is applied as the principal Note or *Key* of the Piece, by making frequent Closes or Cadences upon it; and in the Progress of the Melody no other but those seven natural Notes can be admitted, while the Piece continues in that *Key*, every other Note being foreign to the Fundamental, or *Key*: For Instance, suppose a Song begun in any Note, and carried on upwards or downwards by Degrees and Harmonical Distances, so as never to touch any Notes but what are referable to that first Note as a Fundamental, i. e. are the true Notes of the natural Scale proceeding from the Fundamental; and let the Melody be so conducted thro' those natural Notes, as to close and terminate in the Fundamental, or any of its Octaves above or below, that Note is called the *Key* of the Melody, because it governs all the rest, limiting them so far, as that they must be, to it, in relation of the seven essential Notes of an Octave; and when any other Note is brought in, 'tis called, going out of the *Key*. From which way of speaking, viz. a Song's continuing in, or going out of the *Key*, it may be observed, that the whole Octave, with its natural Notes, come under the Idea of a *Key*, tho' the Fundamental, or principal Note is, in a peculiar Sense, called the *Key*. In which last Sense of the word *Key* (viz. where it is applied to one fundamental Note) another Note is said to be out of the *Key*, when it has not the Relation to that Fundamental of any of the natural Notes belonging to the continuous Division of the Octave. Here too it must be added, with respect to the two different Divisions of the Octave, that a Note may belong to the same *Key*, i. e. have a just musical Relation to the same Fundamental in one kind of Division, and be out of the *Key* with respect to the other.

Now a Piece of Music may be carried through several

*Keys*; i. e. it may begin in one *Key*, and be led out of that into another, by introducing some Note foreign to the first, and so on to another: but a regular Piece must not only return to the first *Key*, but those other *Keys*, too, must have a particular Connection with the first. It may be added, that those other *Keys* must be some of the natural Notes of the principal *Key*, tho' not any of them at pleasure.

As to the Distinctions of *Keys*, we have already observed, that to constitute any given Note or Sound, a *Key*, or fundamental Note, it must have the seven essential or natural Notes added to it, out of which, or their Octaves, all the Notes of the Piece must be taken, while it keeps within the *Key*, i. e. within the Government of that Fundamental. 'Tis evident therefore there are but two different Species of *Keys*, which arise according as we join the greater or less Third, these being always accompanied with the sixth and seventh of the same Species; the third *g*, for instance, with the sixth and seventh *g*; and the third *f* with the sixth and seventh *f*. And this Distinction is expressed under the Names of a *Sharp-Key*, which is that with the third *g*, &c. and the *Flat-Key*, which is that with the third *f*, &c. whence 'tis plain, that how many different Closes forever there be in a Piece, there can be but two *Keys*, if we consider the essential Difference of *Keys*; every *Key* being either flat or sharp, and every *Sharp-Key* being the same, as to Melody, as well as every flat one. It must be observed, however, that in common Practice the *Keys* are said to be different, when nothing is considered but the different Tune, or Pitch of the Note, in which the different Closes are made: In which Sense the same Piece is said to be in different *Keys*, according as it is begun in different Notes, or Degrees of Tune. To prevent any Confusion which might arise from using the same Word in different Senses, M. *Motelin* proposes the word *Mode* to be substituted instead of the word *Key*, in the former Sense; that is, where it expresses the melodious Constitution of the Octave, as it consists of seven essential, or natural Notes, besides the Fundamental; and in regard there are two Species of it, he proposes, that with a third *g* be called the greater Mode, and that with a third *f* the lesser Mode; appropriating the word *Key* to those Notes of the Piece in which the Cadence is made; all of which may be called different *Keys*, in respect of their different Degrees of Tune. To distinguish then accurately between a Mode and a *Key*, he gives us this Definition, viz. an Octave, with all its natural and essential Degrees, is a Mode, with respect to the Constitution or Manner of dividing it; but with respect to its Place in the Scale of Music, i. e. the Degree or Pitch of Tune, it is a *Key*; tho' that Name is peculiarly applied to the Fundamental: whence it follows, that the same Mode may be with different *Keys*, i. e. an Octave of Sounds may be rais'd in the same Order and Kind of Degrees which makes the same Mode, and yet be begun higher or lower, i. e. be taken at different Degrees of Tune with respect to the whole, which makes different *Keys*; and, *vice versa*, that the same *Key* may be with different Modes, i. e. the Extremes of two Octaves may be in the same Degree of Tune, yet the Division of them be different. See *Modulation*, *Harmony*, *Melody*, *Close*.

*Keys* also signify those little Pieces in the forefront of an Organ, Spinnet, or Virginal, by means whereof the Jacks play, so as to strike the Strings of the Instrument; and Wind going to the Pipes, by raising and sinking the Sucker of the Sound-board. They are in number 28 or 29. In large Organs there are several Sets of these *Keys*, some to play the small secondary Organ, some for the main Organ, some for the Trumpet, and some for the Echoing-Trumpet. In some there are but a part that play, the rest being for Ornament. There are twenty Slits in the large *Keys*, which make the Half-Notes. M. *Balinski* of *Danzig* pretends to have invented a new kind of *Keys* vastly preferable to the common ones. With these, he says, he can express Sounds, which follow each other in a continual Geometrical Proportion, and so can furnish all the Sounds in Music, and by consequence all the imaginary Intervals and Accords; whereas the common *Keys* do but furnish some of them.

KHAZINE, the Grand Signior's Treasury. Here are kept Registers of Receipts, Accounts of Provinces, *i*. Drawers mark'd with the Years and the Places Names. Here also is kept part of the Emperor's Wardrobe. Every Day of the Divan this Treasury is opened, either to take out or put something in. And the Principal Officers who have the Charge of it, are all to assist at this Opening. The *Tobouch-Nachi*, in their Presence, first breaks the Wax wherewith the Key-hole had been seal'd up, and carrying it to the Grand Visier, that Minister first kisses it, and then draws out of his Bosom the Grand Signior's Gold Seal; in the mean time he looks narrow-ly

ly after the Officer, who, when he has done his Business in the Treasury, locks and seals up the Place, and returns the Seal to the Vizier with the same Ceremony as before. Besides this, there are other Apartments for the Money, where the Officers are never allowed to enter with any Clothes that have Pockets in them.

**KIDNEY**, or *Reino*, a Part of an Animal, whose Use is to separate the Urine. The *Kidneys* are situate on each Side, the one between the Liver and *Musculus Lumbaris*, on the right Side; the other between the Spleen and the same Muscle on the left Side. In Man the right is lower than the left, but in *Quadrupedes* 'tis usually the contrary; they are fastened to the Loins and the Diaphragm by their exterior Membrane, and to the Bladder by the Ureters; the right is also fastened to the Intestine Caecum, and the left to the Colon: their Figure resembles a Bean, or rather a Crescent, being curve on the side of the *Vena Cava*, and on the outside gibbous. There are ordinarily but two *Kidneys*, tho' sometimes there are found three, and sometimes four, and sometimes but one. In Men they are commonly about five Inches long and three broad, and one and an half thick: Their Substance is composed of Glands, and very small urinary Pipes, or Canals; the Glands form the Circumference, and serve to separate the Urine; the Papillae, or urinary Tubes, form the inner part, they come out of the Glands, and carry the Urine into a Cavity, in the concave Part of the *Kidney*, called the *Pelvis*, whence it passes thro' the Ureters into the Bladder. The *Kidneys* are covered with two Membranes, they have each of them Arteries and Veins; the Arteries come from the *Aorta*, and the Veins terminate in the *Cava*; these are all called *Emulgens*. They have Nerves also, which take their Origin from the *Plexus Renalis*, formed by the Ramifications of the intercostal Nerve, and the Nerves of the Loins. The *Kidneys* secrete the Urine from the Blood, which, by the Motion of the Heart, is driven thro' the Arteries into the emulgent Arteries, and these carry it into the little Glands, where its Serosity being separated, is received in at the Orifices of the urinary Pipes, which go from the Glands to the Pelvis, and thence runs by the Ureters into the Bladder: the Blood, which could not enter the Glands, is brought back by the emulgent Veins. See *Urine*, *Sercretion*, &c.

**KILDEKRIN**, is a kind of Liquid Measure, which contains two Firkins, or eighteen Gallons; and two such *Kildekrins* make a Barrel.

**KING**, a Monarch or Potentate, who rules singly and sovereignly over a People. *Cambden* derives the word *King* from the Saxon *Cuning*, of *Can*, Power, or *Ken*, Knowledge, wherewith every Monarch is supposed to be invested. The *Latin Rex*, the *Sybian Reiki*, the *Punic Resek*, and the *Spanish Rey* and *Roy*, come all, according to *Puffet*, from the Hebrew *DNK*, *Kofeb*, Chief, or Head.

*Kings*, both among the ancient Greeks and Romans, were Priests as well as Princes. *Virgil* speaking of *Annu*, King of *Delos*, says,

*Rex Anius, Rex idem Haminum Pbaeque Sacraior.*

As to the Romans, *Livy* and *Dionysius* are express; they say, that tho' *Numa* instituted a great Number of Orders of Priesthood, yet some he discharged himself, and in Person. After the Expulsion of *Kings*, they were obliged to create a *Rex Sacrorum*, a King of the Sacrifices, for the Administration of the Priestly Part of the Royalty.

Among the Greeks, the King of *Perfia* had antiently the Appellation of the Great King; the King of France now has that of the Most Christian King, and the King of Spain that of Catholic King. The King of the Romans is a Prince chosen by the Emperors, as a Coadjutor in the Government of the Empire. The Hungarians formerly gave the Name King to their Queen *Mary*, to avoid the Infamy which the Laws of that Country call on those who are governed by Women: Accordingly she bore the Title of King *Mary*, till her Marriage with *Stefan*, at which time she laid aside her Kingship, and took up the Quality of Queen.

The Kings of England, by the Lateran Council under Pope *Julian* II. had the Title of *Christianissimus* conferred on them, and that of *Defender of the Faith* was added by Pope *Leo* X. tho' it had been used by them some time before. The Title of *Grace* was first given to our Kings about the time of *Henry* IV. and that of *Highness* and *Majesty* to *Henry* VIII. In all public Instruments and Letters the King styles himself *Nos*, *We*, tho' till the time of King *Jahn* he spoke in the singular Number. Our Lawyers say, the King of England is a mixed Person, a Priest as well as a Prince. At his Coronation he is anointed with Oil, as the Priests and *Kings* of *Israel* were, to intimate, that his Person is sacred. The Laws make it High-Treason barely to imagine or intend the Death of the King; and, because the Destruction of the King may ensue that of his great Counsellors or Officers, 'tis Felony in any of the King's Servants to conspire even that: tho' in other

capital Cases, 'tis a Rule, that *Voluntas non reputabitur pro Facto*, and an Englishman shall not, in any other Case, be put to death, unless the Deed follow the Intent.

His Office (as he promises at his Coronation) is to preserve the Rights and Privileges of the Church, the Prerogative of the Crown, the Laws and Customs of the Realm, &c. or, as *Forrester* has it, he is *pugnare Bella Populi sui & eos religiose pducere*. He acknowledges no Precedence in any other Prince but the Emperor. He has the supreme Right of Patronage, called *Patronage Paramount*, over all the Ecclesiastical Benefices in England.

He has Power, by his Prerogative, without any Act of Parliament, to make War or Peace, make Leagues and Treaties, give Commissions for impressing Soldiers, dispose of Magazines, Castles, Ships, public Monies, &c. He convokes, adjourns, prorogues, and dissolves Parliaments, and may refuse his Assent to any Bill passed by both Houses, without giving his Reasons for it. He may increase the Number of Members of either House at pleasure, by creating new Peers, and bestowing Privileges on other Towns for sending Burgesses to Parliament. He has power to enfranchise an Alien, and make him a Denizen. Debts due to him are always to be satisfied in the first place, in case of Execution, &c. and till his Debt is discharged, he may protect the Creditor from the Arrests of others. He may distrain for the whole Debt on a Tenant that holds but part of the Land, is not obliged to demand his Rent as others are, may sue in what Court he pleases, and distrain where he lists. In all doubtful Cases, *semper presumitur pro Rege*: no Statute restrains him unless he be particularly named. In all Cases where the King is Plaintiff, his Officers, with an Arrest, may enter; and if Entrance be denied, break open a House, and seize the Party: tho', in other Cases, a Man's House is his Castle, and has a Privilege to protect him against all Arrests. He has the Custody of the Persons and Estates of Idiots and Lunatics; he is *Ultimus Heres Regni*, to him revert all Estates, when no Heir appears. All Treasure-Trove (i. e. Money, Plate, or Bullion found, and the Owners not known) belongs to him; so all Waifs, Strays, Wrecks, Lands recovered from the Sea, Gold and Silver Mines, Royal Fishes, &c. belong to him. He can unite, separate, enlarge, or contract the Limits of Bishoprics or Ecclesiastical Benefices, and by his Letters erect new Bishoprics, Colleges, &c. He can dispense with the Rigour of the Ecclesiastical Laws, except those that have been confirmed by an Act of Parliament, or declared by the Bill of Rights, as for a *Bard* to be a Priest, for a Bishop to hold a Benefice *in commendam*, &c. He has Power to dispense with several Acts of Parliament and penal Statutes, by a *Non obstante*, where he himself is alone concerned; to moderate the Rigour of the Law, according to Equity; to pardon a Man condemned by Law, except in Appeals of Murder; to interpret by his Judges in Statutes and Cases not defined by Law.

The Laws esteem him God's Vicegerent on Earth, and ascribe various Perfections to him, not belonging to any other Man. No Flaw or Weakness is found in him, no Injustice or Error, no Negligence, Infamy, Strain, or Corruption of Blood. By his Crown he is *ipso facto* cleared of all Attainder: No Nonage or Minority are allowed in him, and his very Grants of Lands, tho' held in his natural Capacity, cannot be avoided by Nonage. Nay more, the Law ascribes a kind of Perpetuity, or Immortality, to him; *Rex Anglie non moritur*. His Death is termed his Demise, because the Crown is thereby demised to another. He is said not to be liable to Death, as being a Corporation of himself, that lives for ever. There is no *Interregnum*, but the Minute one *King* dies, his Heir is King, fully and absolutely, without any Coronation, Ceremony, &c. To these it may be added, that the Law attributes a kind of Ubiquity to the King; he is, in a manner every where, in all his Courts, and therefore cannot be non-suited.

Some things, however, there are which he cannot do, viz. he cannot do Wrong, nor can he divest himself, or Successors, of any part of his Regal Prerogative, Authority, &c. There are several things also which he cannot do, *Salvo Jure*, *Salvo Juramento*, & *Salvo Conscientia sua*. In particular there are two things which he cannot do without the Consent of Parliament, viz. Make new Laws, or raise new Taxes.

King of the Sacrifices, was the Title of a Priest or Minister of Religion in ancient Rome. He was superior to the *Flamen Dialis*, but inferior to the *Pontifex Maximus*. He was created at the *Omnia*, or Assembly of the Centuries, and was at first chosen out of the Number of the *Patricii*. He could not, during his Office, hold any Magistracy, nor baragane the *Peo. l.* He presided at all the Sacrifices, proclaimed the Feasts, &c. His Wife bore the Title of *Queen of the Sacrifices*, and had herself a part in the Ceremonies of Religion.

KINGDOM, among the Chymists, is a Term, which they apply to each of the three Orders, or Classes of natural Bodies's Animal, Vegetable, and Mineral.

KINGS AT ARMS, Officers of great Antiquity, and usually of great Authority; they direct the Heralds, preside at their Chapters, and have the Jurisdiction of Armoury. In England we have three kinds, viz. *Garter, Clarenceux, and Norrey*.

The first and principal is called *Garter*, instituted by Henry V. His Office is to attend the Knights of the Garter at their Assemblies, to marshal the Solemnities at the Funerals of the highest Nobility, and to carry the Garter to Kings and Princes beyond the Sea; on which occasion he is to be joined in Commission with some principal Peer of the Kingdom.

The next is *Clarenceux*, so called from the Duke of Clarence, to whom he first belonged. His Office is to marshal and dispose the Funerals of all the inferior Nobility, as Barons, Knights, Esquires, and Gentlemen, on the South-side of the Trent.

The third is *Norrey*, or *Northern*, whose Business is to do the same on the North side of the River Trent. These two last are called *Provincial Heralds*, in regard they divide the Kingdom between them into two Provinces.

These two last, by Charter, have power to visit Noble Families, to set down their Pedigrees, distinguish their Arms, appoint Persons their Arms, and, with *Garter*, to direct the Heralds.

Antiently the *Kings at Arms* were created and solemnly crowned by the Kings of England themselves; but of later Days the Earl Marshal has a special Commission, at every Creation, to perform the King.

To the former may be added *Lyon, King at Arms for Scotland*, who is the second *King at Arms for Great Britain*; he is invested and crown'd with great Solemnity. To him belongs the publishing the King's Proclamation, the marshalling Funerals, reversing Arms, &c.

KING'S-BENCH, a Court, or Judgment-Seat, so called, in regard the King is supposed to sit in Person as Judge of the Court, and may do so whenever he pleases; for which reason all Writs, and other Proceedings in this Court, are made returnable *coram vobis*, that is, before the King himself, and not *coram Justitiariis vestris*, as is the Form in the *Common Pleas*. The Judges of this Court are the Chief Justice, and three other Judges. In this Court are principally determined Matters relating to the Crown, and the Peace. When any Person is aggrieved by any Order of Justices, or Quarter-Sessions, they have recourse hither; the Rights of Elections of Mayors, Bailiffs, Constables, &c. are often, upon *Mandamus*'s, brought before this Court to be settled, and Prohibitions are hence issued out to stay Proceedings in the Ecclesiastical, Admiralty, or any inferior Court, where the Matters appear to be tryable at Common Law. The Subject hath also a Right to sue any Person in this Court for any Debt or Contract, as well as in any other Court, and may so advantageously and expeditiously proceed. The Chief Justice is constituted by Writ, and is to hold, *Quandam se bene gesserit*, and so cannot be displaced without some great Misdemeanour; tho' formerly the Chief Justice, and other inferior Judges, were made only *durante bene placito*, and accordingly were turned out at the King's pleasure. The Salary of the Lord Chief Justice used to be but 1500 *l. per ann.* but 'tis now 500 *l. per Term*. He presides under his Majesty in this Court; but when the Court divides, in giving Judgment upon any special Argument, he hath but one Voice: so that if the Opinion of the Court should be equally divided, the Matter must rest till one of the Judges shall see just Reason to alter his Opinion. He is to attend the Lords in Parliament, tho' he has no Vote, unless he be a Peer himself, but is to give his Opinion and Advice to the House by virtue of a Writ of Assistance; and is frequently therefore consulted by them, both in making and repealing Laws, and in altering or explaining them. He makes a Return of all Writs of Error in Parliament directed to this Court, and with his own Hand delivers the Writ of Error, and a Transcript of the Proceedings in the Cause into the House of Lords. The three inferior Judges of this Court go the Circuits, and are in Commission of Oyer and Terminer at the *Old-Bailey*, their Salary is 375 *l. per Term*, to which they, as well as the Chief Justice, are entitled, tho' they happen not to sit one Day in Court in the Term, unless they give their Assent, or slightly, as, on a *Score Facias*, to be charged with Negligence; and these also hold by *Quandam se bene gesserit*. There are several Officers belonging to this Court, as two chief Clerks or Prothonotaries, who are supposed to enter all the Pleadings and Judgments between Party and Party, altho' this is done by an *Entering-Clerk* under them; and all Writs of *Latiarum non amittit*, *Writs of Habeas Corpus*, &c. are subscribed with the Names of these chief Clerks. The

Secondary adds as the Master of the Office on the Pleas Side, and is the Chief Clerk's Deputy; his Office is to examine any Person, who is to be sworn an *Entering-Clerk*, or Attorney at large, whether he is duly qualified, and to present him to the Chief Justice. He also signs all Judgments, and gives Costs upon them; and the Court, upon any Motion, in relation to the irregular Practice of any Clerk or Attorney, generally refers the Examination thereof to him. He also takes all Affidavits in Court (unless on the Crown-side) and takes the Acknowledgment of all Deeds in Court.

KING'S-SILVER, is that Money due to the King in the Court of Common-Pleas, *pro Licentia Concordandi*, in respect of a Licence there granted to any Man for levying a Fine.

KINTAL, or *Qintal*, is a Weight of One Hundred Pounds, more or less, according to the different Usage of divers Nations. The *Kintal of Suisna* is 125 Pounds, 3 Ounces, 9 Drams; or 120 Pounds, 7 Ounces, 12 Drams; but that of *Aleppo* is 465 Pounds, 11 Ounces, 15 Drams.

KIPPER-TIME is a Space of Time between the Festival of the *Imaging of the Holy Cross*, May the 3d, and *Twelfth-Day*; during which, Salmon-Fishing in the River *Thames*, from *Gravoynd to Henley*, is forbidden by *Rot. Parl. 50 Edw. 3.*

KIRKMOTE, a Synod; sometimes 'tis taken for a Meeting in the Church or Vestry.

KIRK-SESSIONS, the Name of a petty Ecclesiastical Judicatory in Scotland. Each Parish, according to its Extent, is divided into several particular Districts, every one of which has its own Elder and Deacon to oversee it. A Consistory of the Ministers, Elders, and Deacons of a Parish form a *Kirk-Session*. This meets once a Week, the Minister being Moderator, but without a negative Voice. It regulates Matters relating to publick Worship, Elections, Catechizing, Visitations, &c. It judges in Matters of less Scandal; but greater, as Adultery, are left to the Presbytery, and in all Cases an Appeal lies from it to the Presbytery.

KIZILBACHE, a Turkish word, signifying *Red-Head*. This Term the Turks have applied, by way of Obloquy, to the Persians, ever since *Ismael Saphi*, Founder of the Family now reigning in Persia, ordered his Soldiers to wear a red Cap, round which is a Scarf or Turban with a dozen Plaits in it, in memory of the twelve *Ismaels*, Successors of *Ali*, from whom he pretended to descend. *Vigenere* writes the word *Kozeibaji*, and adds, that according to the vulgar Interpretation among the Persians, the twelve Plaits signify the twelve Sacraments of their Law. But as this does not satisfy him, he looks out for another Original, and tells us there is a Mystery in it, derived from the ancient Paganism, when the Persians adored the Fire, whose Heat is denoted by the red Colour, which in some measure symbolizes with the Sun, held by them in the highest Veneration. He adds, that the twelve Plaits shew the twelve Months of the Year, and the twelve Signs in which that Luminary performs his Course.

KNAVE is an old Saxon Word for a Man-Servant, and is so used in 14 *E. 3. Stat. 1. c. 3.* *Vesfegan* thinks it comes from the Dutch *Knave*, signifying the same. It sometimes also signifies a Male-Child, or Boy, in which sense a *Knave Child* hath been frequently used, formerly, in contradiction to a Girl; and in this sense *Wickliff* uses the word in his Translation of *Exodus 1. 16.* and other Places of the Bible. In the old Saxon Translation of *Mat. 8. 6.* *Puer meus jacet in Domo Paralyticus*, was turned, *Myn Knave*.

*Knave* was sometimes also used as an additional Title, as *Wilhelmus Couper de Denby, Knave, &c.* 'Tis a common Opinion, that *Rom. 1. 1.* was translated, *Paul a Knave of Jesus Christ*. This Mistake has been occasioned by a Bible in the Duke of *Lauderdale's* Library, where the word *Knave* is inserted in less Characters than the others, and a Rasure may be easily discerned.

KNIGHT, in its original German, *Knute*, signifies a lusty Servant. The Word has since been used for a Soldier or Man of War. We have but one Instance among us, where the word *Knights* is used in the first Sense, and that is in *Knights of the Shire*, who properly serves in Parliament for such a County. In the Latin, French, Spanish, Italian, and Dutch Languages, *Knights* is express'd by a Word which properly signifies a Horseman, as being usually employ'd on horseback. Indeed our Common Law calls them *Miles*, Soldiers, because they commonly held Lands, in *Knights-Service*, to serve the King as Soldiers in his Wars; in which sense the word *Miles* was used *pro Falsitate*. The word *Knights* now signifies a Person, who for his Vertue and martial Prowess, is, by the King, raised above the Rank of Gentlemen, into an higher Class of Dignity and Honour. *Knighthood* being usually conferred

for personal Desert, dies with the Person deserting, and does not defend to his Heirs.

*Knighr* was the first Degree of Honour, in the antient Militia, and was conferred with a great deal of Ceremony on those who had distinguish'd themselves by some notable Exploit in Arms. They were originally said to be adopted, which we now call dubb'd; as being suppos'd, in some measure, the Sons of him who knighted them. The Ceremonies at the Creation of a *Knighr* have been various. The principal were a Box on the Ear, and a Stroke with a Sword on the Shoulder. Afterwards they put on him a Shoulder-belt and gilt Sword, Spurs, and the other military Accoutrements; after which, being armed as a *Knighr*, he was led in great Pomp to the Church. The Manner of making a *Knighr* with us, is described by Camden in a few words: *Qui Equitum Dignitatem suscipit, flexis Genibus leuiter in Hauus prostratur, Principes sibi Verbis affatur, Sus vel sibi Cerealis an Num deo, Sarge vel sibi Eques in Nomine Dei.* This is meant of *Knighrs-Bachelors*, which is the lowest, the most antient Order of *Knighrhood* among us. *Knighrs* grew so very numerous, that the Dignity became of much less Repute. *Charles V.* is said to have made 500 in a single Day: On which account therefore, new Orders of *Knighrhood* were instituted, in order to distinguish the more deserving from the Crowd. For the several kinds of *Knighrs* among us, see *Bachelor*, *Banneret*, *Baronet*, *Bath*, &c.

*Knighr* is also understood of a Person admitted into any Order, either purely military, or military and religious, instituted by some King or Prince according to a certain Formula, with certain Marks and Tokens of Honour and Distinction: as the Order of the Garter, of the Elephant, of the Holy Ghost, of Malta, &c. All which see under their proper Names.

*Knighr*, among the Romans, was the second Degree of Nobility, following immediately that of the Senators. At the time of founding the City of Rome, the whole Militia of Romulus consisted in 3000 Foot and 300 Horse; which three hundred Horse were the Original of the Roman *Equites* or *Knighrs*. These made the second Order that had Places in the Senate. *Manlius* and *Sergius* are of opinion, that besides the Equestrian Order, and those *Knighrs* immediately below the Senators, Romulus instituted a Military Order in opposition to the Infantry. But no antient Author takes notice of any Order of *Knighrhood*, instituted on purpose for the War, nor any other *Knighrs* but those 300, which, as we have observed, were the first Foundation of the Equestrian Order. They had a Horse kept then at the public Charge; but when they were taken in among the Senators, they resign'd that Privilege. To be a *Knighr*, 'twas necessary they should have a certain Revenue; that their Poverty might not disgrace the Order: And when they fail'd of the prescribed Revenue, they were expung'd out of the List of *Knighrs*, and thrust down among the Plebeians. Ten thousand Crowns is computed to have been the Revenue required. The *Knighrs* grew so very powerful, that they became a Balance between the Power of the Senate and the People. They neglected the Exercises of War, and betook themselves principally to Civil Employments in Rome; insomuch that *Pliny* observes, in his time they had no longer a Horse kept at the public Expence. Some say, that the Order of *Knighrs*, distinct from the People, did not begin before the Time of the *Gracchi*; Others say, the Privilege was then first granted them, that no Judge should be chosen, but out of their Order: Some time after which, they took 'em into the Senate. This however is certain, 'twas only from that time that a certain Revenue was necessary, and that this intitled them to the *Knighrhood*, without being descend'd from antient *Knighrs*.

*KNIGHT-ERRANT*, a pretended Order of *Knighrs*, whereof ample mention is made in old Romances. They were a kind of Heroes who travel'd the World in search of Adventures, redressing Wrongs, rescuing Damfels, and raking all occasions of signaling their Profects. This Romantic Bravery of the Old *Knighrs* was heretofore the Chimera of the *Spartans*; among whom, there was no Cavalier but had his Mistress, whose Esteem he was to gain by some heroic Action. The Duke of *Alva*, for all his Age and Gravity, is said to have vow'd the Conquest of *Portugal* to a young Lady.

*KNIGHTHOOD*, a Military Order or Honour; a Mark or Degree of antient Nobility, or Reward of Personal Virtue and Merit. There are four kinds of *Knighrhood*; Military, Regular, Honorary, and Social. Military is that of the antient *Knighrs*, who acquired it by high Feats of Arms. These are call'd *Milites* in antient Charters and Titles, by which they were distinguish'd from bare *Bachelors*, &c. Several Princes have been installed Military *Knighrs* with a great deal of Ceremony. These *Knighrs* were girt with a Sword and a Pair of gilt Spurs,

whence they were call'd *Equites Armati*. Regular *Knighrhood* is understood of such of the Military Orders, which profess to wear some particular Habit, to bear Arms against the Infidels, to succour and assist Pilgrims in their passage to the Holy Land, and to serve in Hospitals where they should be receiv'd; as *Knighrs Templars*, *Knighrs of Malta*, &c. which see. Honorary *Knighrhood* is that which Princes confer on other Princes, and even on their own Great Ministers and Favourites; as *Knighrs of the Garter*, of *St. Michael*, &c. Social *Knighrhood* is that which is not fixed, nor confirm'd by any formal Institution, nor regulated by any lasting Statutes; of which kind there have many risen on occasion of Factions, of Tilts and Tournaments, Masquerades, &c.

*Knighrhood* is not hereditary, but acquired. It does not come into the World with a Man, like Nobility; nor can it be revoked. The Sons of Kings, and Kings themselves, with all other Sovereigns, heretofore had *Knighrhood* confer'd on 'em as a Mark of Honour. They were usually knighted at their Baptism or Marriage, at their Coronation, before or after a Battle, &c.

The Abbot *Bernardo Juslinieni*, at the beginning of his History of *Knighrhood*, gives us a very compleat Catalogue of the several Orders, according to whose Computation they are in number 92. *Favin* has given us two Volumes of 'em, under the Title of *Treatise of Honour and Chivalry*. *Mennius* has publish'd *Delicite Equitum Ordinum*, and *And. Menck* has written *de Ordinibus Militaribus*. *Nelol* has traced their Original, and *Gellar* in his *Astrucial Index* has given us their Institutions. To these may be added, *Father Menestrier's Antient and Modern Knighrhood*, *Nichiel's Tresor Militaire*, *Caraman's Theologia Regularis*, *Miran's Origines Equitum sive Militarum Ordinum*.

*KNIGHT-MARSHAL*, is an Officer in the King's House, having Jurisdiction and Cognizance of any Transgression within the King's House and Verge; as also of Contracts made there, whereof one of the House is Party.

*KNIGHTS OF THE SHIRE*, or *Knights of Parliament*, are two *Knights* or Gentlemen of Worth chosen on the King's Writ in pleno Comitatu, by such of the Freeholders of every County as can expend 40*s.* per annum. These, when every Man who had a *Knights-Fee* were customarily constrain'd to be *Knights*, were of necessity to be *Milites Gladii cincti*, for so the Writ runs to this day; but now Custom admits *Esquires* to be chosen to this Office. They must have at least 300*l.* per annum; and their Expences are to be defray'd by the County, though this be seldom, now, required.

*KNIGHTS*, in a Ship, are two Pieces of Timber, to each of which go four Shivers, three for the Halliards, and one for the Top-Ropes: they are usually in the figure of some Head. One of 'em stands aft the Main-Mast, and for that reason is call'd the *Main-Knighr*; another stands abaft the Fore-Mast, on the second Deck, and is call'd the *Fore-Knighr*.

*KNIGHT-SERVICE*, a Tenure whereby several Lands in this Nation were antiently held of the King; which drew after it Homage, Eschange, Wardship, Marriage, &c. But taken away by the Statute 12 Car. 2.

*KNIGHTS-FEE*, an antient Law-Term, signifying so much Inheritance as is sufficient to maintain a *Knighr* with suitable Retinue; which, in *Henry the Third's* days was reckon'd at Fifteen Pounds. But Sir *T. South* rates it at 40*l.* By a Stat. 1 Edw. 2. such as had 20*l.* per annum in Fee or for Life, might be compelled to be *Knights*; but this Statute is repeal'd 17 Car. 1.

*South* says, that there were found in *England*, at the time of the Conqueror, 60,211 *Knights-Fees*; according to others, there were 60,215, whereof the Religious Houses, before their suppression, were possess'd of 28,015. According to *Oske*, a *Knights-Fee* contain'd twelve Plow-Lands.

*KNOT*, part of a Tree whence it shoots out Branches or Roots. The Wood is harder and closer in the *Knots* than in any other part, but it is also more subject to split. Vines and low Fruit-Trees are lopp'd at the second *Knott* of the new Shoot. The Use of the *Knots* of Plants is to strengthen the Stem: They serve also as Seneces to Elstrate, purify, and refine the Juice rais'd up for the Nourishment of the Plant.

The Divisions of the Log-Line at Sea are also call'd *Knots*. These are usually seven Fathoms or forty-two Feet asunder, but they should be fifty Feet; and then as many *Knots* as the Log Line runs out in half a Minute; so many Miles doth the Ship sail in an Hour, supposing her to keep going at an equal rate, and allowing for Yaws, Lee-way, &c.

*Knott*, in Medicine, is a Tuberosity form'd in the Joints of old Gouty People, consisting of a thick viscous, crude, indigested Pituita, accompanied with a bilious Humour; hot and acrimonious; the grossest and most terrestrial part whereof clogs and converts into a stony Substance like Chalk: whence *Knots* are ingendred; like Stones

in the Bladder. The Physicians sometimes call 'em *Tephi*.

*Knot*, or *Nodus*, is also used for the Intrigue of a Romance or Dramatic Piece: that is, for that part where the Persons are the most embarrassed, by a Conjunction of Affairs whose End it is not easy to foresee. *Arifotle*, under this Term, includes all the Incidents of a Tragedy, from its Beginning to the Place where it begins to unravel. The *Knot* holds as long as the Mind is kept suspended on the Event. The *Knot* ought always to last to the middle of the fifth Act, otherwise the rest of the Piece becomes feeble and languishing.

*Order of the Knot*, the Name of a Military Order in the Kingdom of Naples, instituted in the Year 1352, by Queen *Janel*, on occasion of the Peace establish'd between her and the King of Hungary, by means of her Marriage with *Louis* Prince of Tarentum. The Order consisted of sixty Knights. *Clement VI* approved this Order, and gave it the Rule of *St. Basil*: It chose *St. Nicholas* for its Protector, but dwindled away after the Death of its Founders.

KNOWLEDGE, according to *Mr. Locke*, consists in the Perception of the Connection and Agreement, or Disagreement and Repugnancy of our Ideas. Thus we know that White is not Black, by perceiving that these two Ideas do not agree. Again, in knowing that the three Angles of a Triangle are equal to two right ones; what do we more than perceive that Equality to two right ones doth necessarily agree to, and is inseparable from the three Angles of a Triangle? As to the Agreement or Disagreement of Ideas, we may reduce the whole Doctrine, (consequently the whole Stock of our Knowledge) to these four Heads; viz. Identity or Diversity, Relation, Co-existence, and Real Existence.

With regard to the Identity or Diversity of our Ideas, we may observe, That 'tis the first Act of the Mind to perceive its own Ideas, and so far as it perceives them, to know each what it is, and thereby to perceive their difference, that is, the one not to be the other: By this the Mind clearly perceives each Idea to agree with itself, and to be what it is; and all distinct Ideas to disagree. This it does without any Pains or Deduction, by its natural Power of Perception, and Distinction; and this Men of Art have reduced to those general Rules, viz. What is, is; and, It is impossible for the same thing to be, and not to be. But no Maxim can make a Man know it clearer, that Round is not Square, than the bare Perception of those two Ideas which the Mind at first sight perceives to disagree. The next kind of Agreement or Disagreement the Mind perceives in any of its Ideas, may be call'd Relative, and is nothing but the Perception of the Relation between any two Ideas, of what kind soever; that is, their Agreement or Disagreement one with another, in the several ways or respects the Mind takes of comparing them. The third sort of Agreement or Disagreement to be found in our Ideas, is Co-existence or Non-Co-existence in the same Subject, and this belongs particularly to Substances. Thus when we pronounce concerning Gold that it is fixed, it amounts to no more but this, that Fixedness, or a Power to remain in the Fire unconfum'd, is an Idea that always accompanies that particular Sort of Yellowness, Weight, Fusibility, &c. which makes our complex Idea signified by the word *Gold*. The fourth Sort is that of actual and real Existence, agreeing to any Idea. Within these four Sorts of Agreement or Disagreement, seems contained all the Knowledge we have, or are capable of; for all that we know or can affirm concerning any Idea, is, That it is, or is not the same with some other; as that Blue is not Yellow: that it does or does not co-exist with another in the same Subject; as that Iron is susceptible of magnetical Impressions: that it hath that or this Relation to some other Ideas, as That two Triangles, upon equal Bases, between two Parallels, are equal: or that it has a real Existence without the Mind, as, That God is.

The Mind becomes possess'd of Truth in several manners, each of which comes under the Term Knowledge. Thus when the Mind has a present View of the Agreement or Disagreement of any of its Ideas, or of the Relation they have one with another, it is call'd actual Knowledge. Secondly, a Man is said to know any Proposition, when having once evidently perceived the Agreement or Disagreement of the Ideas whereof it consists, and so lodg'd it in his Memory, that whenever it comes to be reflected on again, the Mind assents to it without Doubt or Hesitation, and is certain of the Truth of it: And this may be call'd Habitual Knowledge. And thus a Man may be said to know all those Truths which are lodg'd in his Memory, by a foregoing, clear, and full Perception. Of Habitual Knowledge there are two sorts; the one consists of such Truths laid up in the Memory, as whenever they occur to the Mind, it actually perceives the Relation that is between their Ideas; and this is in all those

Truths where the Ideas themselves, by an immediate View, discover their Agreement or Disagreement one with another. The other is of such Truths, whereof the Mind having been convinc'd, it retains the Memory of the Conviction, without the Proofs. Thus a Man that remembers certainly, that he once perceived the Demonstration, That the three Angles of a Triangle are equal to two right ones, knows it to be true, when that Demonstration is gone out of his Mind, and cannot possibly be recollected: But he knows it in a different way from what he did before, namely, not by the Intervention of those immediate Ideas, whereby the Agreement or Disagreement of those in the Proposition was at first perceived; but by remembering, that is, knowing, that he was once certain of the Truth of this Proposition. That the three Angles of a Triangle are equal to two right ones. The Immutability of the same Relations between the same immutable things, is now the Idea, that shows him, that if the three Angles of a Triangle were once equal to two right ones, they will always be so. And hence he comes to be certain, that what was once true, is always true; & what Ideas once agreed, will always agree; and consequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

As to the different Degrees, or Clearness of our Knowledge, it seems to lie in the different way which the Mind has of perceiving the Agreement or Disagreement of any of its Ideas. When the Mind perceives this Agreement or Disagreement of two Ideas immediately by themselves, without the Intervention of any other, we may call it *Intuitive Knowledge*, in which Cases the Mind perceives the Truth, as the Eye doth Light, only by being directed towards it. Thus the Mind perceives, that White is not Black; that three are more than two, and equal to one and two. This Part of Knowledge is irresistible, and, like the bright Sun-shine, forces itself immediately to be perceived, as soon as ever the Mind turns its View that way. It is on this Intuition that depends all the Certainty and Evidence of our other Knowledge, which Certainty every one finds to be so great, that he cannot imagine, and therefore cannot require a greater. The next Degree of Knowledge is, where the Mind perceives not this Agreement or Disagreement immediately, or by the *Juxta-Position*, as it were, of the Ideas, because those Ideas, concerning whose Agreement or Disagreement the Enquiry is made, cannot by the Mind be so put together as to shew it. In this Case the Mind is oblig'd to discover the Agreement or Disagreement, which it searches for, by the Intervention of other Ideas: and this is that which we call Reasoning. And thus if we would know the Agreement or Disagreement in Bigness, between the three Angles of a Triangle, and two right Angles, we cannot do it by an immediate View and Comparison of them, because the three Angles of a Triangle cannot be brought together at once, and compar'd with any other one or two Angles; and so of this the Mind has no immediate, or intuitive Knowledge. But we must find out some other Angles, to which the three Angles of a Triangle have Equality; and finding those equal to two right ones, we come to know the Equality of those three Angles to two right ones. Those intervening Ideas, which serve to shew the Agreement of any two others, are call'd *Proofs*; and where the Agreement or Disagreement is by this means plainly and clearly perceived, it is call'd *Demonstration*. A Quickness in the Mind to find those Proofs, and to apply them right, is that which is call'd *Sagacity*. This Knowledge, tho' it be certain, is not so clear and evident as intuitive Knowledge; it requires Pains and Attention, and steady Application of Mind, to discover the Agreement or Disagreement of the Ideas it considers, and there must be a Progression by Steps and Degrees before the Mind can in this way arrive to any Certainty. Before Demonstration there was a Doubt, which, in intuitive Knowledge, cannot happen to the Mind, that has its Faculty of Perception left in a Degree capable of distinct Ideas, no more than it can be a Doubt to the Eye (that can distinctly see White and Black) whether this Ink and Paper be all of a Colour. Now in every Step that Reason makes in Demonstrative Knowledge, there is an Intuitive Knowledge of that Agreement or Disagreement it seeks with the next intermediate Idea, which it uses as a Proof; for if it were not so, that yet would need a Proof, since without the Perception of such Agreement or Disagreement there is no Knowledge produced. By which it is evident, that every Step in Reasoning, that produceth Knowledge, has intuitive Certainty; which when the Mind perceives, there is no more required but to remember it, to make the Agreement or Disagreement of the Ideas, concerning which we enquire, visible and certain. This intuitive Perception of the Agreement or Disagreement of the intermediate Ideas in each Step, and Progression

of the Demonstration, must also be exactly carried in the Mind; and a Man must be sure that no part is left out, which, because in long Deductions, the Memory cannot easily retain, this Knowledge becomes more imperfect than intuitive, and Men often embrace Fallshoods for Demonstrations.

It has been generally taken for granted, that Mathematicks alone are capable of demonstrative Certainty; but to have such an Agreement or Disagreement, as may be intuitively perceived, being, as we imagine, not the Privilege of the Ideas of Number, Extension, and Figure alone; it may possibly be the want of due Method and Application in us, and not of sufficient Evidence in Things, that Demonstration has been thought to have so little to do in other Parts of Knowledge. For in whatever Ideas the Mind can perceive the Agreement or Disagreement immediately, there it is capable of intuitive Knowledge; and where it can perceive the Agreement or Disagreement of any two Ideas, by the intuitive Perception of the Agreement or Disagreement they have with any intermediate Ideas, there the Mind is capable of Demonstrations, not limited to the Ideas of Figure, Number, Extension, or their Modes. The Reason why it has been generally supposed to belong to these only, is because, in comparing their Equality or Excess, the Modes of Numbers have every, the least Difference, very clear and perceivable: And in Extension, tho' every the least Excess is not so perceptible, yet the Mind has found out Ways to discover the just Equality of two Angles, Extensions, or Figures; and both Numbers and Figures can be set down by visible and lasting Marks. But in other simple Ideas, whose Modes and Differences are made, and counted by Degrees, and not Quantity, we have not so nice and accurate a Distinction of their Differences, as to perceive or find ways to measure their just Equality, or their least Differences. For those other simple Ideas being Appearances or Sensations produced in us, by the Size, Figure, Motion, &c. of minute Corpufcles singly insensible, their different Degrees also depend on the Variation of some, or all of those Causes; which since it cannot be observed by us in Particles of Matter, whereof each is too subtle to be perceived, it is impossible for us to have any exact Measures of the different Degrees of these simple Ideas. Thus, for instance, not knowing what Number of Particles, nor what Motion of them is fit to produce any precise Degree of Whiteness, because we have no certain Standard to measure them by, nor means to distinguish every, the least Difference; the only help we have, is from our Senses, which in this Point fail us. But where the Difference is so great as to produce in the Mind Ideas clearly distinct, these Ideas of Colours as we see in different kinds, Blue and Red (for instance) are as capable of Demonstration, as Ideas of Number and Extension. What is here said of Colours, holds true in all secondary Qualities. These two then, Intuition and Demonstration, are the Degrees of our Knowledge; whatever comes short of one of these, is but Faith, or Opinion, not Knowledge, at least in all general Truths. There is indeed another Perception of the Mind employed about the particular Existence of finite Beings without us, which going beyond Probability, but not reaching to either of the foregoing Degrees of Certainty, passes under the Name of Knowledge.

Nothing can be more certain, than that the Idea we receive from an external Object, is in our Minds: This is intuitive Knowledge; but whether we can thence certainly infer the Existence of any thing without us, corresponding to that Idea, is that whereof some Men think there may be a Question made, because Men may have such an Idea in their Minds, when no such Thing exists, no such Object affects their Senses. But it is evident, that we are invincibly conscious to ourselves of a different Perception, when we look on the Sun in the Day, and think on it by Night; when we actually taste Wormwood, or smell a Rose, or only think on that Savour, or Odour: so that we may add to the two former sorts of Knowledge, this also of the Existence of particular external Objects, by that Perception and Consciousness we have of the actual Entrance of Ideas from them, and allow these three Degrees of Knowledge, viz. intuitive, demonstrative, and sensitive. But since our Knowledge is founded on and employed about our Ideas only, will it follow thence, that it must be conformable to our Ideas, and that where our Ideas are clear and distinct, obscure and confused, there our Knowledge will be so too? We answer, No: For our Knowledge consisting in the Perception of the Agreement or Disagreement of any two Ideas, its Clearness or Obscurity consists in the Clearness or Obscurity of that Perception, and not in the Clearness or Obscurity of the Ideas themselves. A Man (for instance) who hath a clear Idea of the Angles of a Tri-

angle, and of Equality to two right ones, may yet have but an obscure Perception of their Agreement, and so have but a very obscure Knowledge of it: But obscure and confused Ideas can never produce any clear or distinct Knowledge, because as far as any Ideas are obscure or confused, so far the Mind can never perceive clearly, whether they agree or disagree: Or, to express the same thing in a way less apt to be understood, he that hath not determined Ideas to the Words he useth, cannot make Propositions of them, of whose Truth he can be certain.

From all this it follows; (1.) That we can have no Knowledge farther than we have Ideas. (2.) That we have no Knowledge farther than we can have Perception of the Agreement or Disagreement of our Ideas, either by Intuition, Demonstration, or Sensation. (3.) We cannot have an intuitive Knowledge, that shall extend itself to all our Ideas, and all that we would know about them; because we cannot examine and perceive all the Relations they have one to another by Juxta-Position, or an immediate Comparison one with another. Thus we cannot intuitively perceive the Equality of two Extensions, the Difference of whose Figures makes their Parts uncapable of an exact immediate Application. (4.) Our rational Knowledge cannot reach to the whole Extent of our Ideas, because between two different Ideas, which we would examine, we cannot always find such Proofs as we can connect one to another, with an intuitive Knowledge in all the Parts of the Deduction. (5.) Sensitive Knowledge reaching no farther than the Existence of Things, actually present to our Senses, is yet much narrower than either of the former. (6.) From all which it is evident, that the Extent of our Knowledge comes not only short of the Reality of Things, but even of the Extent of our own Ideas. We have the Ideas of a Square, a Circle, and Equality, and yet perhaps shall never be able to find a Circle equal to a Square.

The Affirmations or Negations we make concerning the Ideas we have, being reduced to the four Sorts above-mentioned, viz. Identity, Co-existence, Relation, and Real Existence, let us enquire how far our Knowledge extends in each of these. (1.) As to Identity and Diversity, our intuitive Knowledge is as far extended as our Ideas themselves; and there can be no Idea in the Mind, which it does not presently, by an intuitive Knowledge, perceive to be what it is, and to be different from any other. (2.) As to the Agreement or Disagreement of our Ideas of Co-existence, our Knowledge herein is very defective, tho' 'tis in this that the greatest and most material Parts of our Knowledge concerning Substances consists: For our Ideas of Substances being nothing but certain Collections of simple Ideas, co-existing in one Subject, (our Idea of Flame, for instance, is a Body hot, luminous, and moving upwards.) When we would know any thing farther concerning this or any other sort of Substance, what do we but enquire what other Qualities or Powers these Substances have or have not? which is nothing else but to know what other simple Ideas do, or do not exit with those that make up that complex Idea. The Reason of this is, because the simple Ideas, which make up our complex Ideas of Substances, have no visible necessary Connection or Inconsistence with other simple Ideas, whose Co-existence with them we would inform ourselves about. These Ideas being likewise for the most part secondary Qualities, which depend upon the primary Qualities of their minute or insensible Parts, or on something yet more remote from our Comprehension; it is impossible we should know which have a necessary Union or Inconsistence one with another, since we know not the Root from whence they spring, or the Size, Figure, and Texture of Parts on which they depend, and from which they result. Besides this, there is no discoverable Connection between any secondary Quality, and those primary Qualities that it depends on. We are so far from knowing what Figure, Size, or Motion produceth, (for instance) a yellow Colour, or sweet Taste, or sharp Sound; that we can by no means conceive how any Size, Figure, or Motion, can possibly produce in us the Idea of any Colour, Taste, or Sound, whatsoever; there being no conceivable Connection between the one and the other. Our Knowledge therefore of Co-existence reaches little farther than Experience. Some few indeed of the primary Qualities have a necessary Dependence, and visible Connection one with another: As Figure necessarily supposeth Extension; receiving or communicating Motion by Impulse, supposeth Solidity; but Qualities co-existent in any Subject, without this Dependence and Connection, cannot certainly be known to co-exist any farther, than Experience by our Senses informs us. Thus tho' upon Tryal, we find Gold yellow, weighty, malleable, fusible, and fixed; yet because none of these have any evident Dependence or necessary Connection with the

other, we cannot certainly know, that where any four of these are, the fifth will be there also, how highly probable soever it may be. But the highest Degree of Probability amounts not to Certainty, without which there can be no true Knowledge: For this Co-existence can be no farther known, than it is perceived; and it cannot be perceived but either in particular Subjects, by the Observation of our Senses, or, in general, by the necessary Connection of the Ideas themselves. As to Incompatibility or Repugnancy to Co-existence, we know that no Subject can have of each sort of primary Qualities, more than one Particular at once, as one Extension, one Figure; and so of sensible Ideas peculiar to each Sense: For whatever of each kind is present in any Subject, excludes all other of that sort; for instance, one Subject cannot have two Smells, or two Colours at the same time. As to Powers of Substances, which makes a great part of our Enquiries about them, and is no inconsiderable Branch of our Knowledge; our Knowledge, as to these, reaches little farther than Experience, because they consist in a Texture and Motion of Parts, which we cannot by any means come to discover; and, I doubt, whether with those Faculties we have, we shall ever be able to carry our general Knowledge much farther in this Part. Experience is that which in this Part we must depend on, and it were to be wished that it were more improved. We find the Advantages some Meas generous Parts have this way brought to the Stock of natural Knowledge; and if others, especially the Philosophers by Fire, had been so wary in their Observations, and sincere in their Reports, as those who call themselves Philosophers ought to have been, our Acquaintance with the Bodies here about us, and our Insight into their Powers and Operations, had been yet much greater. As to the third sort, the Agreement or Disagreement of our Ideas in any other Relation; this is the largest Field of Knowledge, and it is hard to determine how far it may extend: this Part depending on our Sagacity in finding intermediate Ideas, that may shew the Habitudes and Relations of Ideas, it is an hard matter to tell when we are at an end of such Discoveries. They, who are ignorant of Algebra, cannot imagine the Wonders of this kind that are to be done by it: and what farther Improvements and Helps, advantageous to other Parts of Knowledge, the sagacious Mind of Man may yet find out, it is not easy to determine. This at least we may believe, that the Ideas of Quantity are not those alone that are capable of Demonstration and Knowledge; and that other, and perhaps more useful Parts of Contemplation would afford us Certainty, if Vices, Passions, and domineering Interest did not oppose or menace Endeavours of this kind.

The Idea of a supreme Being, infinite in Power, Goodness, and Wisdom, whose Workmanship we are, and on whom we depend; and the Idea of ourselves, as understanding rational Creatures; would, if duly considered, afford such Foundations of our Duty, and Rules of Action, as might place Morality among the Sciences capable of Demonstration; wherein we need not doubt, but that from Principles as incontestable as those of the Mathematicks, by necessary Consequences the Measure of Right and Wrong might be made out to any one, who will apply himself, with the same Indifference and Attention to the one, as he doth to the other of these Sciences. The Relations of other Modes may certainly be perceived, as well as those of Number and Extension. Where there is no Property, there is no Injustice, is a Proposition as certain as any Demonstration in *Euclid*; for the Idea of Property being a Right to any thing, and the Idea of Injustice being the Invasion or Violation of that Right, it is evident, that these Ideas being thus established, and these Names annexed to them, I can as certainly know this Proposition to be true, as that a Triangle has three Angles equal to two right ones. Again, no Government allows absolute Liberty; the Idea of Government being the Establishment of Society, upon certain Rules or Laws, which require Conformity to them; and the Idea of absolute Liberty being for any one to do whatever he pleases, I am as capable of being certain of the Truth of this Proposition, as of any in Mathematicks.

What has given the Advantage to the Ideas of Quantity, and made them thought to be more capable of Certainty and Demonstration, is, *First*, That they can be represented by sensible Marks, which have a nearer Correspondence with them than any Words or Sounds. Diagrams drawn on Paper are Copies of the Ideas, and not liable to the Uncertainty that Words carry in their Signification; but we have no sensible Marks that resemble our moral Ideas, and nothing but Words to express them by, which tho', when written, they remain the same; yet the Ideas they stand for may change in the same Man, and it is very seldom that they are not different in diffe-

rent Persons. *Secondly*, Moral Ideas are commonly more complex than Figures; whence those two Inconveniences follow, (1.) That their Names are of more uncertain Signification: the precise Collection of simple Ideas they stand for, not being so easily agreed on, and so the Sign that is used for them in Communication always, and in Thinking often, does not readily carry with it the same Idea. (2.) The Mind cannot easily retain those precise Combinations so exactly and perfectly, as is necessary in the Examination of the Habitudes and Correspondencies, Agreements or Disagreements of several of them one with another, especially where it is to be judged of by long Deductions, and the Intervention of several other complex Ideas, to shew the Agreement or Disagreement of two remote ones. One part of these Disadvantages in moral Ideas, which has made them be thought not capable of Demonstration, may in a good measure be remedied by Definitions, setting down that Collection of simple Ideas which every Term shall stand for, and then using the Term steadily and constantly for that precise Collection.

As to the fourth sort of Knowledge, *viz.* of the real actual Existence of Things, we have an intuitive Knowledge of our own Existence, a demonstrative Knowledge of the Existence of God, and a sensitive Knowledge of the Objects that present themselves to our Senses. And hitherto we have examined the Extent of our Knowledge, in respect of the several Sorts of Beings that are. There is another Extent of it in respect of Universality, which will also deserve to be considered; and this in regard our Knowledge follows the Nature of our Ideas. If the Ideas, whose Agreement or Disagreement we perceive, are abstract, our Knowledge is universal; for what is known of such general Ideas, will be true of every particular thing in which that Essence, that is, that abstract Idea is found: And what is once known of such Ideas, will be perpetually and for ever true; so that, as to all general Knowledge, we must search, and find it only in our own Minds; and it is only the examining our own Ideas that furnishes us with it. Truths belonging to Essences of Things (that is, to abstract Ideas) are eternal, and are to be found out by the Contemplation only of those Essences; as the Existence of Things is to be known only from Experience. As to the Reality of our Knowledge, it is evident, that the Mind knows not Things immediately, but by the Intervention of the Ideas it has of them. Our Knowledge therefore is real only so far, as there is a Conformity between our Ideas, and the Reality of Things. But how shall we know when our Ideas agree with Things themselves? To which it is answered, There are two Sorts of Ideas, that we may be assured agree with Things; these are, (1.) Simple Ideas, which since the Mind can by no means make to itself, must be the Effect of Things operating upon the Mind in a natural way, and producing therein those Perceptions, which, by the Will of our Maker, they are ordained and adapted to. Hence it follows, that simple Ideas are not Fictions of our Fancies, but the natural and regular Productions of Things without us, really operating upon us; which carry with them all the Conformity our State requires, which is to represent Things under those Appearances they are fitted to produce in us. Thus the Idea of Whiteness, as it is in the Mind, exactly answers that Power which is in any Body to produce it there; and this Conformity between our simple Ideas, and the Existence of Things, is sufficient for real Knowledge. (2.) All our complex Ideas, except those of Substances, being Archetypes of the Mind's own making, and not referred to the Existence of Things as to their Originals, cannot want any Conformity necessary to real Knowledge; for that which is not designed to represent any thing but itself, can never be capable of a wrong Representation. Here the Ideas themselves are considered as Archetypes, and Things no otherwise regarded than as conformable to them. Thus the Mathematician considers the Truth and Properties belonging to a Rectangle or Circle only, as they are Ideas in his own Mind, which possibly he never found existing mathematically, that is, precisely true; yet his Knowledge is not only certain, but real, because real Things are no farther concerned, nor intended to be meant by any such Propositions, than as Things really agree to those Archetypes in the Mind. It is true of the Idea of a Triangle, that its three Angles are equal to two right ones; it is true also of a Triangle, where-ever it exists: What is true of those Figures, that have barely an Ideal Existence in the Mind, will hold true of them also, when they come to have a real Existence in Matter. Hence it follows, that moral Knowledge is as capable of real Certainty as Mathematicks: For Certainty being nothing but the Perception of such Agreement, by the Intervention of other Ideas, our moral Ideas, as well as mathematical, being Archetypes themselves, and so adequate

or complex Ideas, all the Agreement or Disagreement we shall find in them, will produce real Knowledge, as well as in mathematical Figures. That which is requisite to make our Knowledge certain, is the Clearness of our Ideas; and that which is required to make it real, is that they answer their Archetypes. But it will here be said, That if moral Knowledge be placed in the Contemplation of our own moral Ideas, and those are of our own making, what strange Notions will there be of Justice and Temperance? What Confusion of Virtues and Vices, if every Man may make what Ideas of them he pleases? To which it is answered, No Confusion or Disorder at all in the Things themselves, nor the Reasonings about them, no more than there would be a Change in the Properties of Figures, and their Relations one to another, if a Man should make a Triangle with four Corners, or a Trapezium with four right Angles; that is, in plain English, change the Names of the Figures, and call that by one Name which is called ordinarily by another. The Change of Name will indeed at first disturb him, who knows not what Idea it stands for; but as soon as the Figure is drawn, the Consequences and Demonstration are plain and clear. Just the same is it in moral Knowledge: Let a Man have the Idea of taking from others, without their Consent, what they are justly possessed of, and call this Justice if he pleases; if he that takes the Name there, without the Idea put to it, will be mistaken, by joining another Idea of his own to that Name; but strip the Idea of that Name, or take it, such as it is, in the Speaker's Mind, and the same things will agree to it, as if you called it Injustice. One thing we are to take notice of, That where God, or any other Law-maker, has defined any moral Names, there they have made the Essence of that Species to which that Name belongs; and there it is not safe to apply or use them otherwise; but in other Cases it is bare Impropriety of Speech to apply them contrary to the common Usage of the Country they are used in. (3.) But the complex Ideas, which we refer to Archetypes without us, may differ from them, and so our Knowledge about them may come short of being real; and such are our Ideas of Substances. These must be taken from something, that does, or has existed, and not be made up of Ideas arbitrarily put together, without any real Pattern. Herein therefore is founded the Reality of our Knowledge concerning Substances, that all our complex Ideas of them must be such, and such only, as are made up of such simple ones, as have been discovered to co-exist in Nature: And our Ideas being thus true, tho' not perhaps very exact Copies, are the Subjects of real Knowledge of them. Whatever Ideas we have, the Agreement we find they have with others, will be Knowledge. If those Ideas be abstract, it will be General Knowledge; but to make it real concerning Substances, the Ideas must be taken from the real Existence of Things. Where-ever therefore we perceive the Agreement or Disagreement of our Ideas, there is certain Knowledge; and where-ever we are sure those Ideas agree with the Reality of Things, there is certain real Knowledge.

As to the Improvement of our Knowledge, it being the received Opinion amongst Men of Letters, that Maxims are the Foundation of all Knowledge, and that Sciences are each of them built upon certain Propositions, from whence the Understanding was to take its Rise, and by which it was to conduct itself in its Inquiries in the Matters belonging to that Science; the beaten Road of the Schools has been to lay down, in the beginning, one or more general Propositions, called Principles, as Foundations whereon to build the Knowledge that was to be had of that Subject. That which gave occasion to this way of Proceeding, was the good Success it seemed to have in Mathematicks, which, of all other Sciences, have the greatest Certainty, Clearness, and Evidence in them. But if we consider it, we shall find that the great Advancement and Certainty of real Knowledge Men arrived to in these Sciences, was not owing to the Influence of these Principles, but to the clear, distinct, and complex Ideas their Thoughts were employed about; and the Relation of Equality and Excess to clear between some of them, that they had an intuitive Knowledge, and by that a way to discover it in others, and this without the help of those Maxims. For is it not possible for a Lad to know, that his whole Body is bigger than his little Finger, but by virtue of this Axiom, The whole is bigger than a Part; nor be assured of it, till he has learned that Maxim? Let any one consider from what has been said, which is known first and clearest by most People, the particular Instance, or the general Rule, and which it is that gives Life and Birth to the other. These general Rules are but the comparing our more general and abstract Ideas, which Ideas are made by the Mind, and

have Names given them, for the easier Dispatch in its Reasonings: But Knowledge began in the Mind, and was founded on Particulars, tho' afterwards perhaps no Notice be taken thereof; it being natural for the Mind to lay up those general Notions, and make the proper Use of them, which is to disburden the Memory of the cumbersome Load of Particulars. The way to improve in Knowledge, is not to swallow Principles with an implicit Faith, and without Examination, which would be apt to mislead Men, instead of guiding them into Truth; but to get and fix in our Minds clear and complex Ideas, as far as they are to be had, and annex to them proper and constant Names: and thus barely by considering our Ideas, and comparing them together, observing their Agreement or Disagreement, their Habitudes and Relations, we shall get more true and clear Knowledge by the Conduct of this one Rule, than by taking up Principles, and thereby putting our Minds into the Disposal of others. We must therefore, if we will proceed as Reason advises, adapt our Methods of Inquiry to the Nature of the Ideas we examine, and the Truth we search after. General and certain Truths are only founded in the Habitudes and Relations of abstract Ideas; therefore a sagacious methodical Application of our Thoughts for the finding out these Relations, is the only way to discover all, that can with Truth and Certainty be put into general Propositions. By what Steps we are to proceed in these, is to be learned in the Schools of the Mathematicians, who from very plain and easy Beginnings, by gentle Degrees, and a continued Chain of Reasonings, proceed to the Discovery and Demonstration of Truths, that at first sight appear beyond human Capacity. This may reasonably be said, that if other Ideas, that are real as well as nominal Essences of their Species, were pursued in the way familiar to Mathematicians, they would carry our Thoughts farther, and with greater Evidence and Clearness than, possibly, we are apt to imagine. This is Reason sufficient to advance that Conjecture above-mentioned, viz. That Morality is capable of Demonstration as well as Mathematicks; for moral Ideas being real Essences, which have a discoverable Connection and Agreement one with another, so far as we can find their Habitudes and Relations, so far we shall be possessed of real and general Truths.

In our Knowledge of Substances, we are to proceed after a quite different Method; the bare Contemplation of their abstract Ideas (which are but nominal Essences) will carry us but a very little way in the Search of Truth and Certainty. Here Experience must reach us what Reason cannot, and it is by trying alone, that we can certainly know what other Qualities co-exist with those of our complex Idea; for instance, whether that yellow, heavy, fusible Body, I call Gold, be malleable or no; which Experience (however it prove in that particular Body we examine) makes us not certain that it is so in all, or any other yellow, heavy, fusible Bodies, but that which we have tried: because it is no Consequence one way or the other from our complex Idea. The Necessity or Inconsequence of Malleability hath no visible Connection with the Combination of that Colour, Weight, and Fusibility in any Body. What is here said of the nominal Essence of Gold, supposed to consist of a Body of such a determinate Colour, Weight, and Fusibility, will hold true, if other Qualities be added to it. Our Reasonings from those Ideas will carry us but a little way in the certain Discovery of the other Properties in those Masses of Matter wherein all those are to be found. As far as our Experience reaches we may have certain Knowledge, and no farther. It is not denied, but that a Man, accustomed to rational and regular Experiments, shall be able to see farther into the Nature of Bodies, and their unknown Properties, than one that is a Stranger to them: But this is but Judgment and Opinion, not Knowledge and Certainty. This would make it suspected, that Natural Philosophy is not capable of being made a Science. From Experiments and Historical Observations we may draw Advantages of Ease and Health, and thereby increase our Stock of Conveniences for this Life; but beyond this, it is to be feared, our Talents reach not, nor are our Faculties able to advance farther. From whence it is obvious to conclude, that since our Faculties are not fitted to penetrate the real Essence of Bodies, but yet plainly to discover to us the Being of a God, and the Knowledge of ourselves, enough to give us a clear Discovery of our Duty and great Concernment, it will become us, as rational Creatures, to employ our Faculties about what they are most adapted to, and follow the Direction of Nature where it seems to point us out the way. For it is rational to conclude, that our proper Employment lies in those Enquiries, and that sort of Knowledge which is most suited to our natural Capacities, and carries in it our greatest Interest; and therefore it is that Morality is

the proper Science and Business of Mankind in general (who are both concerned and fitted to search out their *Somma Bona*) as several Arts, conversant about the several Parts of Nature, are the Lot and private Talent of particular Men, for the common Use of human Life, and their own particular Subsistence in this World.

The Ways to enlarge our Knowledge, as far as we are capable, seem to be these two: The first is, to get and settle in our Minds, as far as we can, clear, distinct, and constant Ideas of those Things we would consider and know; for it being evident that our Knowledge cannot exceed our Ideas, where they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear Knowledge. The other Art is of finding out the intermediate Ideas, which may shew us the Agreement or Repugnancy of other Ideas, which cannot be immediately compared. That these two, (and not relying on Maxims, and drawing Consequences from some general Propositions) are the right Method of improving our Knowledge in the Ideas of other Modes, besides those of Quantity, the Consideration of mathematical Knowledge will easily inform us: Where, First, we shall find, that he who has not clear and perfect Ideas of those Angles or Figures, of which he desires to know any thing, is utterly thereby incapable of any Knowledge about them. Suppose a Man not to have an exact Idea of a right Angle, Scalenum, or Trapezium, and it is clear that he will in vain seek any Demonstration about them. And farther it is evident, that it was not the Influence of Maxims, or Principles, that had led the Masters of this Science into those wonderful Discoveries they have made. Let a Man of good Parts know all the Maxims of Mathematicks never so well, and contemplate their Extent and Consequences as much as he pleaseth, he will, by their Assistance, scarce ever come to know, that the Square of the Hypotenuse, in a right-angled Triangle, is equal to the Square of the two other Sides. This, and other mathematical Truths, have been discovered by the Thoughts otherwise applied. The Mind had other Objects, other Views before it, far different from those Maxims, which Men, well enough acquainted with those received Axioms, but ignorant of their Method who first made these Demonstrations, can never sufficiently admire.

Our Knowledge, as in other Things, so in this, has so great a Conformity with our Sight, that it is neither wholly necessary, nor wholly voluntary. Men, who have Senses, cannot chuse but receive some Ideas by them; and if they have Memory, they cannot but retain some of them; and if they have any distinguishing Faculty, cannot but perceive the Agreement or Disagreement of some of them one with another. As he that has Eyes, if he will open them by Day, cannot but see some Objects, and perceive a Difference in them; yet he may chuse whether he will turn his Eyes towards an Object, curiously survey it, and observe accurately all that is visible in it. But what he doth see, he cannot see otherwise than he doth; it depends not on his Will to see that Black which appears Yellow. Just thus it is with our Understanding: All that is voluntary in our Knowledge, is the employing or withholding any of our Faculties from this or that sort of Objects, and a more or less accurate Survey of them; but they being employed, our Will hath no power to determine the Knowledge of the Mind one way or other; that is done only by the Objects themselves, as far as they are clearly discovered. Thus he that has got the Ideas of Numbers, and has taken the pains to compare one, two, and three, to fix, cannot

chuse but know they are equal. He also that hath the Idea of an intelligent, but weak and frail Being, made by, and depending on another, who is Eternal, Omnipotent, perfectly Wise, and Good, will as certainly know that Man is to honour, fear, and obey God, as that the Sun shines when he sees it. But yet he these Truths never so certain, never so clear, he may be ignorant of either, or both of them, who will not take the pains to employ his Faculties as he should, to inform himself about them.

KUL, or KOUL, a Turkish Term, properly signifying a Slave, or Servant. *Meninsky* tells us, the Name is given to all the Soldiers in the Ottoman Empire, particularly to those of the Grand Signior's Guard, and the Infantry. The Captains of the Infantry, and those who command the Guards, are called *Kul Zabablers*, and the Soldiers of the Guard *Kips Kulleri*, i. e. *Slaves of the Crown*. Others say, that all who hold any Places depending on the Crown, or receive Wages from it, in a word, all who are in any measure the Grand Signior's Servants, take the Title of *Kul*, as more creditable than that of Subject; even the Grand Vicer and the Bashiwa value themselves upon it. A *Kul*, or Slave, of the Grand Signior has Authority to abuse any who are only his Servants; and a Subject that should affront a *Kul*, or Slave, would be severely punished. The *Kuls* are entirely devoted to the Will of the Grand Signior, and look on it as a kind of Martyrdom that merits Heaven, when they die either by his Order, or in the Execution of his Commands.

KURTCHI, the Name of a Militia among the Persians. The word, in its Original, signifies Army, and is applied to a Body of Cavalry, consisting of the Nobility of the Kingdom of Persia, and the Posterity of the conquering Turks, who placed *Ismael Sephi* on the Throne. They are in Number about 18000 Men. Their Commander is called *Kurtchi Bafchi*, which was formerly the first Post in the Kingdom.

KYPHONISM, an ancient Punishment, frequently undergone by the Martyrs in the Primitive Times. The Body of the Person who was to suffer was anointed with Honey, and so exposed to the Sun, that the Flies and Wasps might be tempted to torment him. This was performed in three Manners; sometimes they only tied the Patient to a Stake; sometimes they hoisted him up into the Air, and suspended him in a Basket; and sometimes they stretched him out on the Ground, with his Hands tied behind him. *Suidas* gives us the Fragment of an old Law, which punished those, who treated the Laws with Contempt, with *Kyphonism* for the space of twenty Days, after which they were to be precipitated from a Rock, dressed in Womens Habit. The word is originally Greek, and comes from *kypon*, which signifies the Stake to which the Patient was tied, the Collar fitted to his Neck, or an Instrument wherewith they tormented him. The Scholiast, on *Aristophanes*, says, it was a wooden Lock, or Cage, and that it was called *kypon* from the Verb *kypono*, to croak, or bend, because it kept the Tortured in a crooked bowing Posture. Others say, Logs of Wood were laid over their Heads, to prevent their standing upright. *Hesychius* defines the *kypon*, a Piece of Wood, whereon Criminals were stretched and tormented; and 'tis probable the word might signify all these several things. It was a General Name, wherof these were the Species.

KYSTUS, in Medicine, is the Name of a Bag, or Membrane, in form of a Bladder, full of unnatural Humours. The word comes from the Greek *kystra*, Bladder.

**L**, *El* is the Name of the Eleventh Letter of the Alphabet; it has a sweet Sound, and is pronounced by applying the Tongue to the Palate. *Paffers* observe, that *l* has been frequently used for *b*, as *elubo* for *ebubo*; for *d*, as *alipe* for *adipe*; *ralius*, *ralium*, from *rodens*; for *e*, as *mailla* for *mistica*; for *n*, as *areilla* for *aroina*, *lelle* for *lene*, *caligo* for *conligo*; for *r*, as *frater* for *frater*, *balatrones* for *bratrones*; for *s*, as *avile* of *am* and *esum*, *equilo* for *equiso*; for *t*, as *epuleis* for *equifetis*, *Tibels* for *Tibets*. The double *ll* is a modern Contrivance, and was never used among ancient Roman Authors. They wrote *alium* not *allium*, *macellum* not *macellum*, *polvere* not *polvere*. Two *ll* were changed into *ll*, as *billas* *salie*, *adras* *alios*, *edibus* *salium*; and *r* into two *ll*, as *bira* *billas*, *saturare* *saturare*, &c. and *l* into *x* or *sill*, as *ala* *axilla*, *mala* *masilla*, *velum* *vesillum*. *d* was also used for *l*, *n* for two *ll*, and *r* for one *l*. *l* is frequently used instead of *d*, as in *Ulyffes* from the Greek *Ὀδυσσεύς*, in the *Æolie* Dialect *Ἰλίου*. Thus also for *Dantia* we say *Lantia*; for *dæruma*, *læruma*, &c.

There are several People, for instance, the *Chinefe* in *Afia*, the *limoi* in *America*, &c. who cannot pronounce the *r* but always change it into *l*. Thus when any of 'em have been baptiz'd by the Name of *Petrus*, *Franciscus*, &c. they always pronounce it *Petlus*, *Franciscus*, &c. The *Spaniards* and *Welsh* usually double the *l* at the beginning of a Word, which sounds nearly the same with our *bl* or *fl*.

The Figure of our *L* we borrow'd from the *Latins*, who from the *Greeks*, and they again from the *Hebrews*, whose *Lamed* is perfectly like ours, excepting that the Angle is somewhat more acute.

*L* was also a numeral Letter among the Antients, and is still so in the Roman Cyphering, signifying fifty; according to the Verse,

*Quinquies L denos numero designat balendas.*

When a Dash was added at top *L*, it stood for fifty thousand. *L* was used for fifty as being half a *C*, which signified a hundred, and was formerly written thus *L*, which according to *Pajquier* makes two *LL*, the one upright, the other inverted.

The French *Louis d'Ors* have a Cross on 'em, consisting of eight *L*'s interwoven and disposed in form of a Cross.

The Epocha's on Greek Medals are usually written with the ancient *Lambda* *L*; which, according to the Tradition of the Antiquaries, stands for *Δυναστας*, a Poetical Word, unknown in common Speech, signifying *Amo*, and which 'tis probable was more used in *Egypt* than Greece.

**LABARUM**, an Ensign or Standard bore before the Roman Emperors in the Wars: it consisted of a long Lance, with a Staff at top, crossing it at right Angles; from which hung a rich Streamer, of a purple Colour, adorn'd with precious Stones. Till the Time of *Constantine* it had an Eagle pointed on it, but that Emperor, in lieu thereof, added a Cross with a Cypher expressing the name of *Jesus*. He chose fifty of the bravest Men in his Guards to bear it on their shoulders, each in his turn. *Eusebius* tells us, that in the Battle against *Maxentius*, the Person who bore it being fatigued gave it to another, and that he had no sooner parted with it but he was kill'd; and the Strokes he receiv'd while the *Labarum* was in his charge, not being able to wound him. The Author adds, he had this Miracle from the Emperor's mouth. This Standard the Romans took from the  *Germans*, *Dace*, *Sarmate*, *Pannonians*, &c. whom they had overcome.

The Name *Labarum* was not known before the Time of *Constantine*, but the Standard itself, in the form we have described it, abating the Symbols of Christianity, was used by all the preceding Emperors. Some derive the word from *labor*, as if this finished their Labours; some from *λαβω*, Piety; others from *λαβω*, to take; and others from *λαβω*, Spoils. The *Labarum* has afforded ample matter for Criticism, and has been discours'd of by *Fuller*, *Aleians*, *Cujas*, *Gyraldus*, *Lipfius*, *Mercusius*, *Vissus*, *Huffman*, *Volius*, *Du Cange*, &c.

**LABEL**, is a long thin Brass Ruler, with a small Sight at one end, and a Centre Hole at the other; commonly used with a Tangent Line on the Edge of a Circumferenter, to take Altitudes, &c.

*Label* in the Law is a narrow Slip of Paper or Parchment affixed to a Deed or Writing, in order to hold the appending Seal. So any Paper annexed by way of Addition, or Explication, to any Will or Testament, is called a *Label* or *Codicil*.

*Label*, in Heraldry, a kind of Addition to the Arms of a younger Brother, to distinguish him from the elder. It is esteem'd the most honourable of all others, and is formed by a Filler usually placed in the middle, and is along the Chief of the Coat without touching its Extre-

mitica. Its Breadth ought to be a ninth part of the Chief. It is adorn'd with Pendants somewhat like the Drops under the Triglyphs in the *Doric* Frontice. When there are above three Pendants, the Number must be specified in Blazoning: There are sometimes six in the Coats of younger Brothers.

**LABIAL**, a Term in Law used in the same sense with *Oral*. *Labial* Officers are such as are only made by Word of Mouth, or even by Writing, where there is no valuable Consideration: In Courts of Equity these are not regarded. The Grammmarians, and especially the Orientals, apply the Terms *Labial*, *Dental*, *Guttural*, to such Letters as are pronounced with the Lips, the Teeth, or the Throat.

**LABIATE FLOWERS**, from the word *Labium*, a Lip, is a Term applied by Herbalists to such Flowers, as have one or two Lips, some of which represent a kind of Helmet or Monk's Hood. See *Flower*.

**LABORATORY**, or *Elaboratory*, in Chymistry, the Place where the Chymists perform their Operations, where their Furnaces are built, their Vessels kept, &c. In general, the Term *Laboratory* is applied to any Place, where Physical Experiments and Operations in Pharmacy, Chymistry, &c. are performed. The *Laboratory* of an Hospital is the Place where the Remedies are made up.

**LABYRINTH**, among the Antients was a large intricate Edifice cut out into various Iles and Meanders running into each other, so as to render it difficult to get out of it. There is mention made of four celebrated *Labyrinths* of Antiquity. That of *Crete* is the most famed; it was built by *Dædalus*, and it was hence that *Theseus* made his Escape by means of *Ariadne's* Clue. That of *Egypt*, according to *Pliny*, was the oldest of all, and was subsisting in his Time, after having stood 3600 Years. He says it was built by King *Persesus* or *Tibisis*, but *Herodotus* makes it the Work of several Kings; it stood on the Banks of the Lake *Myris*, and consisted of 12 Palaces and 1500 Apartments: *Mela* says, *ter mille domos*. That of *Lemnos* was supported by Columns of wonderful Beauty, there were some Remains of it at the Time when *Pliny* wrote. That of *Italy* was built by *Porsenna* King of *Ustruria*, for his Tomb.

*Labyrinth*, in Anatomy, is the Name of the second Cavity of the Internal Ear, which is hollowed out of the *Oss Petrosum*, and is so call'd as having several Windings in it. This Cavity is divided into three Parts; the first is that call'd the *Vestibulum* of the *Labyrinth*, because it leads in to the other two. The second comprehends three Canals crook'd semicircularly, and thence call'd Semicircular Canals, placed on one side of the *Vestibulum*, towards the back of the Head; and the other call'd the *Cochleæ*, situate on the other side. See *Ear*. *Dr. Vieussens* observes, that the Bone out of which the *Labyrinth* is dug, is white, hard, and very compact, that the Ethereal Matter of Sounds laden with Impressions striking against its side, may lose little or nothing of its Motion, but communicate it entire to the Nerves of the *Ear*.

**LACCA**, a Gum, or rather Wax, hard, red, brittle, clear and transparent, brought from *Malabar*, *Bengal*, and *Pegu*, and used in dying of Scarlet, &c. Authors differ as to the Production of this curious Wax. *F. Tabard*, who was on the spot, tells us that a kind of little Ants fixing themselves to the Branches of several Trees, leave behind them a reddish Moisture, which lying exposed to the Air and Sun, hardens in five or six days time. Some imagine this is not the Production of the Ants, but a Juice which they draw out of the Tree, by making little Incisions in it; and in effect, the Trees where the *Lacca* is found, do yield a Gum: but then 'tis of a very different Nature from the *Lacca*. The Ants are, as it were, a kind of Bees, and the *Lacca* is their Honey. They work at it eight Months in the Year, and the rest of the time lie by, because of the Rains.

To prepare the *Lacca*, they first separate it from the Branches to which it adheres, pound it in a Mortar, and throw it into boiling Water; and when the Water is well dyed, they pour on fresh, till such time as it will tinge no more. Part of the Water thus tinged is evaporated in the Sun; after which, the thicken'd Tincture is strain'd through a Linnen Cloth.

*M. Geoffroy* examining the Gum *Lacca*, found it to be a kind of Comb, such as the Bees and some other Insects are accustomed to make. Upon breaking it into pieces, it appears divided into a great number of *Atrioles* or little Cells of an uniform figure, and which plainly shew that it never ouz'd from Trees. These Cells are not mere Excrements, as some imagine, but are intended for something to be deposited in 'em. And accordingly are found to contain little Bodies, which the first Observers took

for the Wings or other Parts of the Insects that produced the *Lacea*. These little Bodies are of a beautiful Red; and when broke, make a Powder as fine as Cochineal. 'Tis most probable these Cells are designed to lodge the young Brood, as those of the Bees; and that these little Carcasses are the Embryo's of Insects, or perhaps their Skins.

There are several sorts of *Lacea*: that mention'd in the last Article is the natural; when it is prepared, as in the former, those kinds of dry Cells are not seen. M. *Geoffroy* reckons six or seven different Kinds; besides which, there are several Paſts used by the Painters, that go by this name, or that of *Laque*. This Gum boil'd in Water with Acids, makes a beautiful Red Dye. The *English* and *Dutch* use it in Scarlet.

*Lemery* having examined the Gum *Lacea* chymically, judges it to be a mean Mixture between a Gum and a Resin, more abundant in Salt than Oil.

*Artificial Lacea, or Laque*, is a coloured Substance, drawn from several Flowers; as the Yellow from the Flower of the Juniper, the Red from the Poppy, and the Blue from the Iris or Violet. The Tinctures of these Flowers are extract'd by distilling them several times in *Aqua Vitæ*, or by boiling them over a Stove-Fire in a Lixivium of Pot-ashes and Alum. Artificial *Lacea* is also made of Brasile boil'd in a Lixivium of the Branches of the Vine, adding a little Cochineal, Terramerita, Alum calcin'd, and Arsenic incorporated with the Bones of the Cuttle-fish pulveriz'd, made up into little Cakes and dry'd. If it is to be very red, they add Juice of Citron to it; to make it brown, they add Oil of Tartar. Dove-colour'd or Columbine *Lacea* is made with Brasile of *Fernambouc* steep'd in distill'd Vinegar for the space of a month, mix'd with Alum incorporated in the Bones of the Cuttle-fish.

**LACERNA**, the Name of a Garment worn by the Antients. It was a kind of Cloke made of Wool, only used by the Men; they wore it over the *Toga*, and when that was not on, over the *Tunica*. It was at first very short, but growing popular in the *Roman Army*, was soon lengthen'd. The *Lacerna* was scarce known in *Rome* till the Time of the Civil Wars and the Triumvirate. Then indeed it came into fashion, for the Soldiers being then frequently in the City, or at the City-Gates, the Sight became familiar to the Citizens, and they fell into the Use of it; insomuch that it became the common Dress of the Knights and Senators, till the Time of *Valentinian* and *Theodosius*, when the Senators were prohibited the wearing of it in the City. The *Lacerna* was the same with the *Chlamys* and *Birrus*. *Martial* mentions *Lacernæ* of ten thousand Sesterces price. The word comes from the Greek *λακων* or *λακων*, a Garment.

**LACHRYMALIS GLANDULA**, in Anatomy, the Name of a small oblong Gland situate above the Eye, near the little Canthus, whence proceed two or three small Ducts, which opening on the inner Surface of the Eye-lid, filtrate a Serosity serving to moisten the Ball of the Eye, and to facilitate its Motion. Near the larger Angle is also a little Eminence, in form of a Caruncle, which some have taken for another *Glandula Lachrymalis*, but by mistake, this being no more than the Duplication of the inner Membrane of the Eye-lids. On the same side, near the lesser Angle, are two little Perforations, call'd *Puncta Lachrymalia*; which are the Openings of a little membranous Bag at the Entrance of the Excretory Canal, that descends into the Cavity of the Nose, by which means the superfluous Moisture of the Eye is discharged into the Nose. On the same side is a very small Bone, one of those of the upper Jaw, sometimes call'd *Oss Lachrymale*, but more usually *Oss Unguis*.

*Fistula Lachrymalis* is a Fistula in the larger Angle of the Eye. It usually happens after an Abscess formed in the Bag above mention'd, by means of the Serosity lodg'd there; which being retain'd too long, becomes acrimonious, and occasions an Ulcer which frequently degenerates into a Fistula.

**LACHRYMALIA PUNCTA**, in Anatomy, two little Apertures in the extreme Angles of each Eye-lid, into which an aqueo-saline pellucid Humour, secreted from the Blood by the *Glandula Lachrymalis*, is convey'd, and thence carried off by the Lachrymous Canals into a little Bag in the Canal of the Nose; whence by a Pipe, always open, it is carried into the Cavity of the Nose immediately under the lower *Oss Sphenoidem*. Hence appears the Reason why People in crying run at the Nose. This Humour separated by the *Glandula Lachrymalis*, serves to moisten and lubricate the Ball of the Eye, and prevent any hurtful Attrition: When it is secreted in any great quantity, so as to overflow the Eye-lids, it is call'd Tears.

**LACHRYMATORIES** were antiently small Earthen Vessels, wherein the Tears of the weeping Friends that surviv'd were deposited, and buried with the Ashes and Urns of the Dead. Some of these are still seen in the Cabinets of the Curious.

**LAC LUNE**, Milk of the Moon. See Milk.

**LACONISM**, a short, brisk, sententious Speech, in the manner of the *Lacedæmonians*, who were remarkable for the Closeness and Conciseness of their way of delivering themselves.

**LACTATION**, the giving of Suck, and the Time the Mother doth that Office to her Young.

**LACTEAL VEINS**, a kind of long slender Tubes for the Conveyance of the Chyle from the Intestines to the common Reservoiratory: They were first discovered by *A. Jellius* an Italian Physician in 1622, and call'd *Lactæal*, from the Liquor they contain, which resembles that of Milk. Their Coats are so thin, as to be invisible, except when distended with Chyle or Lympha. They arise from all the Parts of the small Guts, and as they run from the sides of the Guts to the Glands in the Mesentery, unite and form larger Branches, called *Vena Lactææ primi generis*. The Mouths of these *Lactæals*, which are open into the Cavity of the Guts, from whence they receive the Chyle, are so small as not to be seen by the best Microscope. It was necessary they should be smaller than the finest Arteries in the Body, that nothing might enter to stop the Circulation of the Blood. The same Extremity of the *Lactæals* has likewise communication with the Capillary Arteries of the Guts, by which they receive a Lympha that dilutes, and propels the Chyle forwards, and washes the *Lactæals* and Glands, that they might not fur, and be obstructed by the Chyle's staying in them upon falling. The other Extremity of the *Lactæals* discharges the Chyle into the vesicular Cells of the Glands dispersed up and down the Mesentery: And from these arise other *Lactæals* of a larger size, which carry the Chyle immediately into the *Receptaculum Chyli*; these are called *Lactææ secundi generis*. The *Lactæal Veins* have Valves at several distances, which hinder the Chyle from returning back into the Intestines.

It is still doubted whether or no the *Intestina Crassa* afford any *Lactæals* or not. The Impossibility of human Dissection proper for such an Enquiry, gives no room either to affirm or deny. But the Contents of the *Intestina Crassa* seem not likely to afford much Chyle, and therefore if there be any, 'tis probable they are very few.

In Brutes, if dissected at a reasonable time after feeding, as two or three hours, the *Lactæals* appear very tumid and white; and if wounded, the Chyle flows plentifully from 'em. But if inspect'd when the Stomach of the Animals has lain some time empty, they appear like Lymphatics, visible indeed, but fill'd with a transparent Liquor. That the *Lactæals* have a Communication from the Cavities of the Intestines, is demonstrated by their Contents, the Chyle; but how their Pores are dispos'd to receive it, has not yet been discovered: Nor is there any way known whereby to fill the *Lactæals* from the Cavities of the Guts after Death. 'Tis probable then, their Entrance into the Gut is oblique, since neither Wind nor Liquors can pass from thence. As 'tis found these Pores can only receive any thing in the living State, we may be allow'd to imagine that 'tis the Peristaltic Motion of the Guts which disposes them in that State to receive the Chyle. And this may be done by means of the Circular and Longitudinal Fibres of the Intestines still applying the Internal Coats of the Guts to their Contents, by which means its Pores absorb the Chyle from the Excrementitious Part.

**LACTEA VIA**, the Milky Way. See Galaxy.

**LACUNÆ**, among Anatomists the Name of certain excretory Canals. Between the fleshy Fibres of the Uterer and the Membrane of the Vagina in Women, is found a whitish glandulous Body about a finger thick, running round the Neck of the Bladder, having a great number of excretory Ducts, which *Craef* calls *Lacune*, and which terminate in the lower part of the Orifice of the Womb, conveying thither a slimy Matter, that mixes with the Seed of the Male. See Generation.

**LACUNAR**, in Architecture, an arched Roof or Ceiling, more especially the flanking or flooring above the Portico's and Piazza's.

**LADANUM**, or *Ladanosum*, in Pharmacy, the Name of a Gummos or Resinous Matter oozing out of the Leaves of a Shrub call'd *Cistus Ladanosifera*, which is very common in the hot Countries, and whereof there are various kinds. They gather the *Ladanosum* by means of Goats, which browsing on the Leaves of this Shrub, return to the Stable with their Beards loaden with a fat Substance, which the Peasants rake off, with a kind of Combs made for that purpose. This Matter they thus collect into Lumps, and, as 'tis mix'd with the Goats Hair and other Impurities, call it *Ladanosum* in the Beard, or natural *Ladanosum*. Others draw Cords over the Leaves and other Parts of the Shrub, and scraping off what had stuck to the Cords, make up the *Ladanosum* into little Balls. *Ladanosum* is used in Physick to soften, digest, attenuate

and resolve. That which is brittle, of an ash-colour, sweet-scented, &c. is the best. *Pietro della Valle* tells us he was inform'd by the *Indians*, that *Ladansum* is formed like Dew, and falls from Heaven like *Manna*, that it is gather'd on the Leaves of a Plant, a Palm and an half high; that after gathering they boil it, by which means it becomes soft like Wax.

*Liquid Ladansum* is a Preparation of the natural *Ladansum*, by melting and purifying it from the *Hairs*, &c. This is sometimes sold for a black Amber.

**LAGAN**, at first was the Right which the chief Lord of the Fee had to take Goods cast on the Shore by the Violence of the Sea, but afterwards signified a Right which any one had to Goods shipwrecked and floating in the Sea, because being remote from the Shore, it could not be determined to whose Fee they properly belonged. The word *Lagan* comes from the *Sassu* *Liggan*, *enbare*, *to lie*, and not from *lagere*, *to bind*, as some will have it, because the Goods are frequently tied together to prevent their sinking.

**LAGOPHTHALMIA**, a Disease of the Eye-Lids, when the upper Lid is so contracted that the Eye can't be quite shut, but remains open even in the time of Sleep. The word comes from the Greek *λαγος*, *Hare*, and *ὀφθαλμῖς*, *Eye*: this being the Property of the Eyes of Hares.

**LAIR** is a Term in Hunting, for the Place where Deer harbour by day; also a Place where Cattle usually rest under some Shelter, the Ground being enriched by their Dung.

**LAKE**, a large Quantity of Water inclosed in the Cavity of some Island Peak, of a considerable Extent and Depth. Properly speaking, however, those only are called *Lakes*, which receive and emit Rivers. *Lakes* are of four kinds; (1.) Such as neither emit nor receive Rivers. (2.) Such as emit Rivers without receiving any. (3.) Such as receive without emitting any. (4.) Such as both receive and emit Rivers. Of the first kind some are perennial, others temporary; the temporary owe their Origin most of them to Rain, and to the Cavity or Depression of the Place where they are lodged. In the *Indies* they make artificial *Lakes*, which they wall about, to catch the Rain in wet Seasons, and preserve it for their Use in the dry ones. There are several of this kind of *Lakes*, formed by the Inundations of the Sea and Rivers, particularly the *Nile* and *Niger*; which, when they retire within their Banks, leave Floods of Water, which the Inhabitants take care to inclose, to serve as a Magazine for the ensuing Months. The Generation of perennial *Lakes* may be also referred to Rain, where the Cavity is so deep as to receive a Quantity in Winter more than the Heat of the Sun will exhale in Summer; so 'tis probable many of these *Lakes* have their Springs at bottom, by which they are continually supplied. To this Class may be referred the *Turloughs*, i. e. *Terrus Lani*, or *Land-Lakes* in *Ireland*, which are *Lakes* one part of the Year, and the rest very smooth Fields: At the bottom of these *Turloughs* are found Holes, through which the Water runs in Winter, and sinks towards Summer.

The second Species of *Lakes*, which emit without receiving Rivers, is very numerous; they owe their Origin to Springs, the Cavities where the Spring is found not being able to contain all the Waters it yields.

The third kind, viz. those which receive Rivers without emitting any, apparently owe their Origin to those Rivers, which, in their Progress from their Source, falling into some ample Cavity, are collected together, and form a *Lake* of such Dimensions as may lose as much by Exhalation as it continually receives from its Spring; or sometimes happening on a soft spongy Soil, that imbibes the Water, and transmits it to the neighbouring Grounds. The Number of these is small.

The fourth Species both receives and emits Rivers. Of these we reckon three different kinds, as the Quantity of Water they emit is greater, equal, or less than that they receive. If the Quantity they emit be greater, 'tis plain they must have a Spring at the bottom; if less, there must be some subterraneous Ducts or Canals, or else the Earth must be spongy; if it be equal, we gather that they have neither any hidden Springs nor Canals. Of these *Lakes* we have a great Number, and those very considerable ones.

The Generality of *Lakes* consist of fresh Waters, as most of those which are supplied either from some Spring far from the Sea, or a River, or from the Rain: Some few of Salt-water; as those produced by the inundation of the Sea, or by its Immission through some Duct of the Earth, or that have Salt Springs at bottom. Dr. *Halley* is of Opinion, that all great perennial *Lakes* are salt, either in a greater or less Degree, and that this Saltness increases with Time, and on this Foundation proposes a Method for determining the Age of the World.

The large *Lakes*, wherewith the Northern Regions a-

bound, serve for very good Purposes, inasmuch as the warm Vapours arising from them serve for a Defensive against the pinching Cold of those Climates. To this it is owing, that *Ireland*, *Scotland*, &c. are less affected with Frosts than much warmer Countries.

**LAMA**, the Title of an Order of Priests among the *Western Tartars*, on the Frontiers of *China*; these *Lama's* are held in great Veneration. They have a Grand *Lama*, who is their High-Priest, and who is the second Person in the Kingdom, being the next in Authority to the King. He receives Homage and Adoration not only from the People, but from the neighbouring Kings; none of whom are ever intruded, without sending Ambassadors to him to obtain his Benediction. The *Lama's* are extremely superstitious, and are remarkably given to Magic.

**LAMBATIVES**, a Form of Medicines to be lick'd off the End of a Liquoric-Stick. The same with *Lindus's*, *Lobbeck's*, and *Eeleym's*, which see.

**LAMBDOIDES**, in Anatomy, an Epithet applied to the third proper Suture of the Cranium, in regard it resembles the Form of a Greek  $\lambda$  *Lambda*; for the same reason it is sometimes called *Trochloides*, as bearing some Resemblance to a Greek  $\tau$  *Tpsilon*.

**LAMELLE**, a Diminutive of *Lamina*, little thin Plates, whereof the Scales and Shells of Fishes, &c. are composed.

**LAMIE**, among the Antients, were esteemed a kind of Demons, or evil Spirits, who, under the Form of beautiful Women, devoured Children. *Horace* makes mention of them in his *Art of Poetry*. Some Authors call them *Lamie*, or *Lamianae*. *Philophrastus* says, they are also called *Larax*, or *Lemures*, as if they were the same thing. *Eschylus* will have the word to be *Pæoniæan*, and derives it from  $\lambda\alpha\mu\iota\alpha$ , *to devour*, alluding the Fable of the *Lamie* came from *Lybia*.

**LAMINÆ**, thin Plates or Tables, whereof any thing consists, particularly the human Skull, which are two, the one laid over the other.

**LAMMAS-DAY**, *quasi Lamb-mas*, is the first of *August*, so called, as some will have it, because Lambs were not then fit to eat, as being grown too big. Others derive it from a *Saxon* word, signifying *Loaf-Mass*, because on that Day our Forefathers made an Offering of Bread made with new Wheat. On this Day the *Tenants*, who formerly held Lands of the Cathedral Church in *Tork*, were bound by their Tenure to bring a Lamb alive into the Church at High-Mass. See *Gale*.

**LAMP**, a Preparation of Oil, &c. in a proper Vessel, for burning. The Use of lighted Lamps in Churches and Places of Devotion is very antient. In the City of *Fez* is a Mosque wherein are 900 brazen Lamps burning every Night. In *Turkey* all their Illuminations are with Lamps. *Polydore Virgil* ascribes the first Invention of Lamps to the *Egyptians*, and *Herodotus* describes a Feast of Lamps held annually in *Egypt*.

*Kircher* shows the manner of preparing Lamps which diffuse a Light so disposed, as to make the Faces of those present appear black, blue, red, or any other Colour. There has been a great Dispute among the Learned about the Sepulchral Lamps of the Antients: some maintain they had the Secret of making Lamps that were inextinguishable, alluding several that had been found burning at the opening of Tombs 15 or 16 Hundred Years old. But others treat these Relations as Fables; and others think that the Lamps which before were extinguish'd; take Light a-fresh upon the Admission of fresh Air. Dr. *Pier* however is of Opinion such perpetual Lamps are things practicable, and has himself made some Proposals of this kind. The *Linum Abstinum* he thinks may do pretty well for the Wick, and that Naptha, or Liquid Bitumen, constantly springing into some of the Coal Mines, will answer for the Oil. If the *Asbestos* won't make a perpetual Wick, he thinks there is no matter in the World that will; and argues that the Tradition of such Lamps must be fabulous, or that they made them without Wicks. Of this Kind he thinks it possible to make one of the Bitumen springing into the Coal Mines at *Pitchford* in *Shropshire*; which, he says, like other liquid Bitumens, will burn without a Wick. He makes a Proposal too, for imitating those Lamps that kindle on the Immission of fresh Air; by inclosing some of the liquid Phosphorus in the Receptacle of an Air Pump; which, under those Circumstances, will not shine at all, but on letting in the Air into the Receptient, there will possibly, says he, appear as good a perpetual Lamp as some that have been found in the Sepulchres of the Antients.

*Cavden's Lamp*, is a Contrivance of that Author which furnishes it self with its own Oil. It consists of a little Column of Brass, Tin, or the like, well closed every where, excepting a small Aperture at Bottom, which opens into the Middle of a little Neck where the Wick is placed. Here the Oil cannot get out, but in proportion as

it spends, and so clears the Passage of that little Aperture. This Kind of Lamp has become much in Use within these twenty or thirty Years; but it has several Inconveniences, as that the Air gets into it by Stars and Gluts; and that when the Air in the Cavity comes to be much rarefied by Heat, it drives out too much Oil, so as sometimes to extinguish the Lamp. Dr. Hook and Mr. Boyle have invented other Lamps that have all the Conveniences of *Cordani's*, without the Inconveniences. See some Improvements in the Doctrine of Lamps under *Mirror*.

**LAMPADARY**, an Officer in the ancient Church of *Constantinople*. His Business was to see the Church well lighted, and he bore a Taper before the Emperor, the Empress, and the Patriarch, when they went to Church, or in Procession. The Taper born before the Emperor was encompassed with various Circles of Gold in manner of Crowns, those held before the Empress and Patriarch had but one. It seems they were of emblematical Use, and were intended to keep those great Persons in mind, that their Light was to illumine those underneath them. See the *Greek Euchology*, *Bejamin*, &c.

There were also *Lampadaries* in the Emperor's Palaces; at first the Privilege was only granted to the Great Officers of the Crown, and the Chief Magistrates, but afterwards the Emperor allowed it to other inferior Officers, as *Quefiers*, *Treasurers*, &c. Together with the Taper, they bore before the Magistrates the Emperor's Image, &c. On which account, 'tis probable, they were first permitted to have a *Lampadary*. The word is formed from the *Latin*, *Lampas* a Lamp.

**LAMPADIAS** is a kind of bearded Comet, resembling a burning Lamp, tho' of several Shapes; for sometimes its Flame or Blaze runs tapering upward like a Sword, and sometimes is double or triple pointed.

**LAMPERS**, is a kind of Swelling in the Mouth of an Horse, so called because it is cured by burning with a Lamp, or an hot Iron; it proceeds from abundance of Blood referring to the first Furrow of the Mouth, near the Fore-teeth, that causes the said Furrow to swell as high as his Gathers, which will hinder his feeding, and makes him let his Meat fall half chewed out of his Mouth again. It is a natural Infirmary which every Horse has first or last, and every common Smith can cure.

**LAMPETIANS**, a Sect of ancient Hereticks who fell in with some of the Opinions of the *Arians*. Their Founder *Lampetius* is said to have been one of the Chiefs of the *Marcionites*. They condemn'd all Kind of Vows, particularly that of Obedience, as inconsistent with the Liberty of the Sons of God.

**LAMPORPHORUS**, a Name antiently given to the *Nesphytes* during the seven Days that succeeded their Baptism. In the Ceremony of Baptism the new Christian was cloth'd with a white Robe, which he wore for the Week following, and was thence call'd *Lamporphorus*, which signifies a Person wearing a shining Garment, from *λαμπος* and *φορος*, I carry. The *Greeks* also give this Name to the Day of the Resurrection, in regard their Houses were adorned and illumined on this Day with an infinite Number of Torches as a Symbol of the Light which that Mystery diffused in the World.

**LANAR**. See *Lanner*.

**LANCE**, an offensive Weapon, bore by the ancient Cavaliers in form of a half Pike. It consisted of three Parts, the Handle, the Wings, and the Dart. *Pliny* attributes the Invention of Lances to the *Ethians*. *Varro* and *Aulus Gellius* say, the Word *Lance* is Spanish; whence others conclude the Use of this Weapon was borrow'd by the People of Italy from the *Spaniards*. *Dionysius Siculus* derives it from the *Gauls*, and *Jesius* from the *Greek* *λάνχη*; *Peerson* from the *Celtic*, and *Borell* from the *Hebrew*.

**LANCETI**, a Name given by the ancient Laws of *England* to a kind of Vassals who were obliged to work for their Lord one Day in a Week from *Michaelmas* to *Autumn*, either with Fork, Spade, or Flail, at the Option of the Lord.

**LANCETTE**, is a Chirurgion's little Knife, straight-pointed, two edged, used in opening Veins, &c.

**LANDAU**, a Tree in the *Moluccas*, whereof the Natives make their Bread. When it is fell'd they cleave it into two in the Middle, and dig out the Pith, which is even eatable when it comes fresh out of the Tree. They chop it very small, till such time as it is reduced into a kind of Powder somewhat like Meal. This done, they put it in a Searce made of the Bark of the same Tree, and place the Searce over a Cistern made of its Leaves, pouring Water upon it, and by this means separating the pure Part of the Powder from the Veins of Wood where-with the Pith abounds. The Flower thus filtrated, they call *Sagu*; they make it into Paste, and bake it in earthen Furnaces; and this they do with so much Expedition, that in three or four hours a Man makes as much Bread

as will feed an hundred Persons a day. From the same Tree they draw a Liquor as agreeable to drink as our Wine. The Leaves, when they are young, are cover'd with a kind of Cotton, whereof they make their Cloth, and as they grow older they serve them to tie their Houses. The larger Veins of these Leaves serve 'em for Stakes in building; and of the smaller they make a kind of Hemp, wherewith they make very good Ropes.

**LAND-CHEAP**, is an ancient customary Fine paid either in Cattle or Money, upon the alienating or selling of Land in some particular Mannor, or within the Liberty of some Borough; as at *Malden* in *Essex*, a Payment is still made of 12 d. in every Mark of the Furchafic-Money, for certain Lands and Houses sold in that Town.

**LAND-FALL**, is a Sea-Term, signifying to fall in with the Land. Thus when a Ship out at Sea expects to see Land in a little time, and it so happens that she doth, they say they have made a good *Land-fall*.

**LAND-GABLE**, an ancient Term for a Tax or Rent issuing out of Land.

**LAND-LOCKED**. A Ship is said to ride *Land-locked*, when she is at Anchor in such a Place where there is no Point open to the Sea, so that she is safe from the Violence of Winds and Tides.

**LANDSKIP**, or *Landfcape*, the View or Prospect of a Country, extended as far as the Eye will carry. *Landships* in Painting, are Pieces representing some Champaign or Rural Subject, as Hills, Vales, Rivers, Country Houses, &c. where human Figures are only introduced as Accidents or Circumstances. This is esteemed one of the lowest Branches of Painting.

**LANGREL SHOT**, is a sort of Shot used at Sea; it is made of two Bars of Iron, with a Joint in the Middle, by which means it can be shortened, and so put the better into the Gun; and at each End there is an half Bullet either of Lead or Iron. When it is discharged, it flies out at length, and is of use to cut the Enemies Rigging, &c.

**LANGUAGE**, a Set of Words which any People have agreed upon, in order to communicate their Thoughts to each other. The first Principles of all Languages, *F. Buffier* observes, may be reduced to Expressions signifying, 1<sup>st</sup>, The Subject spoke of. 2<sup>dy</sup>, The Thing affirmed of it. 3<sup>dy</sup>, The Circumstances of the one and the other: But as each Language has its particular Ways of expressing each of these; Languages are only to be looked on as an Assemblage of Expressions, which Chance or Caprice has established among a certain People; just as we look on the Mode of Dressing, &c. 'Tis Use and Custom is the Rule of a Language, and these hold their Empire independent of Reason or any other Cause: Nor has Reason any thing to do in Language, unless to study or reach it, such as it is: Here then commences Grammar; a just Plan of which, supposes a Language already introduced by Use, and without pretending to alter or amend a title, only furnishes Reflections, call'd Rules, to which the Manners of speaking used in that Language can be reduced; which Assemblage of Reflections is what we call the Grammar of that Language. This Remark may obviate an Abuse introduced among Grammarians, who are ever crying out, *Use is in this Point opposite to Grammar, or the Language here frees itself from the Rules of Grammar, &c.*

'Tis Chance then to which we owe Usage and Usage that makes the Rules and Measures of a Language. Use indeed is somewhat dubious, and may be divided into good and bad: If 'tis ask'd wherein the difference between these lies; 'tis in this, that the one is better established or authorised than the other: And it be ask'd wherein that Difference of Authority consists, 'tis answer'd, that in dead Languages, that which makes the good Use is the Writings of the best Authors in that Language: And if it be further questioned, which are the best; those are allow'd such who wrote when that State was in its greatest Glory. Thus the Age of *Augustus* being the most distinguished by great Men who then flourish'd, we call that good *Latin* which is conformable to the Manners of Speaking used by Authors who wrote fifty Years before, and fifty after the Reign of that Emperor. As to the living Languages, their good Use, or their Mode, is derived from the Expressions used by the most eminent Persons among that People; whether as to Quality and Authority, or as to Learning and the Reputation of writing well. With this View *M. Fagelas* defines the Use of a Language, The Manner of Speaking used by the best Part of the Court, conformably to the Manner of Writing among the best Part of the Authors of the Time. But this Definition, how judicious soever, may occasion infinite doubt; for which is to be deem'd the best Part of the Court and of the Writers? Each Party doubtless thinks itself the best. *F. Buffier*, therefore, very justly, instead of the best Part substitutes the greatest Part, which brings the Matter to a Certainty; the most numerous

rous Part being something fix'd and palpable, whereas the most found Part may be insensible or arbitrary. See Grammar.

There is found a constant Resemblance between the Genius or Natural Complexion of each People and the Language they speak. Thus the *Greeks*, a polite but voluptuous People, had a Language perfectly suitable, full of Delicacy and Sweetness. The *Romans*, who seem'd only born to command, had a Language noble, nervous, and august; and their Descendants, the *Italians*, are sunk into Softness and Effeminacy, which is as visible in their Language as their Manners. The Language of the *Spaniards* is full of that Gravity and Haughtiness of Air which make the distinguishing Character of the People. The *French*, who have a World of Vivacity, have a Language that runs extremely brisk and lively. And the *English*, who are naturally blunt, thoughtful, and of few Words, have a Language exceedingly short, concise, and sententious.

The Diversity of Languages is generally allowed to have took its Rise from the Confusion of *Babel*, both by *Jews*, *Christians*, and *Mahometans*: But the Manner in which this Diversity was effected, is still in dispute among the Learned. The Question is, Whether God only expunged the Remembrance of the Signification of Terms in those who built the Tower; or whether he immediately inspired them with new Words. *Sealiger* holds that they only forgot the Meaning of the Words, and named one thing instead of another; tho' all indifferently spoke the Hebrew Tongue. Nor does *Cajetan* allow that they immediately spoke different Languages: the Confusion of Tongues he thinks might be very well effected, without introducing a Multiplicity of Languages. See *Ziegler de Confusione Linguarum Babylonica ad Genes. XI.*

As to the Point of Antiquity, that too has been extremely controverted. *Herodotus* tells us, that in the Dispute between the *Egyptians* and *Phrygians* about the Antiquity of their Languages, *Phameticus* King of *Egypt*, ordered two Children to be brought up, with express Prohibition not to have one Word pronounced before them, but to leave Nature to speak of her self; and the first Word they spoke happen'd to be *Beccos*, which in the *Phrygian* Language signifies Bread. The *Egyptians* however were not convinced with this Proof. The *Arabs* dispute the Point of Antiquity with the *Hebrews*: But the *Jews*, jealous even to Excess of the Honour of their Nation, positively insist on it, that the Hebrew Tongue, such as it is found in the Holy Scriptures, is the primitive Language, and that spoken by the first Man. Others maintain that the Language spoken by *Adam* is lost, and that the *Hebrew*, *Chaldean*, and *Arabic*, are only Dialects of that original Tongue. So far are they from giving the Priority to the *Hebrew*, that they maintain *Abraham* spoke *Chaldee* before he pass'd the *Euphrates*; and that he first learn'd the *Hebrew* in the Land of *Canaan*: so that this was not a special Language consecrated to the People of God, but was originally the Language of the *Canaanites*.

*M. le Clerc* is of Opinion the *Hebrew* is far inferior to the *Greek*, both in Copiousness, Elegancy and Perspicuity; it is dry and destitute of Ornaments, insomuch that wanting Expressions to vary the Phrase, the same Periods are perpetually returning. The *Rabbins* say 'tis so pure and chaste, that it has no proper Names for the Parts of Generation, nor for those by which the Excrements are discharged. The *Arabic* is held the most copious of all Languages; it has 300 different Words to express a Lion, and no less than 1200 for a Sword.

Languages are divided into mutilate or original Languages, as the *Hebrew* and *Arabic* in the East, the *Tentonic* and *Sclavonic* in the West; and into secondary or derived Languages, which are those formed out of a Mixture of several Tongues, as *Latin*, *French*, &c. *Kircher* will have the *Coptic* a Mother Tongue, independent of all others; and *Du John* maintains the *Gothic* to be primitive, and the Mother of all the *Tentonic* Tongues; that is, of all those spoke in the North. Some add the *Haque* and *Low Britton* to the Number of Mother Tongues, imagining them to have been those of the ancient *Celtæ* or *Gauls*.

The learned or dead Languages are those which only subsist in Books, which must be learned by the Rules of Grammar, as the *Greek*, *Hebrew*, *Syriac*, and *Chaldee*. See these under *Hebrew*, *Greek*, &c. *Raimond Lully* solicited the Establishment of the Study of these Languages a long time in the 13th and 14th Centuries. At length, in the Year 1312, *Pope Clement* and the Council of *Vienne*, appointed that in the Court of *Rome*, and in the Universities of *Paris*, *Oxford*, *Bologna*, and *Salamanca*, there should be instituted Professors of each, who should have Salaries from the respective Courts. The Monks however vigorously oppos'd the spreading of these Studies, and with so much Success, that *Erasmus* tells us in his Time, *Greece posse suspensum Hebraice prope Hæreticism.*

The living Languages are those still spoke in some Country or other, and which may be learn'd by Conversation. The most popular among these are the *French*, *Italian*, *Spanish*, and *English*; which see under their respective Names.

The *Spaniards* seem to place the Nobleness and Gravity of their Language, in the Number of Syllables, and the Swelling of Words; and speak less to make themselves understood, than to make themselves admired. Their Terms are big and sonorous, their Expressions haughty and boisterous, and Pomp and Ostentation run thro' all they say: their Language cannot paint a Thought to the Life; it always magnifies it, frequently distorts it; and does nothing if it do not exceed Nature. The *Italian* Tongue does not swell up Things to that Degree, but it adorns and embellishes them more; yet these Ornaments and Embellishments are not real Beauties. The *Italian* Expressions, thus rich and brilliant, are like those Faces cover'd with Patch and Paint, which make a fine Show; but that Finery, all Deceit. The *French* Language (as some of their Authors express themselves) is simple without Lowness, bold without Indecency, elegant and florid without Affectation, harmonious without Swelling, majestic without Pride, delicate without Softness, and strong without Roughness. As to the Points of Strength and Majesty, the *French* must give Way to the *English*, which in these, as well as in Copiousness, exceeds most of the living Languages; as far as it comes behind some of them in Smoothness and Delicacy. Of all the modern Languages, the *English* is allowed to be the closest and the most clear, the chasteest and the most reserved in its Diction, the most judicious and severe in its Ornaments: Of all others it is the most honest, open, and undesigning; it won't bear double-meanings, nor can it palliate or hide Non-sense: bad Sense and good *English* being Things inconsistent. With all its Sublimity it is gay and pleasant on occasion; but its Gaity is still moderated and restrained by good Sense; it hates excessive Ornaments, and for the greater Simplicity, would almost chafe to be naked: It never dresses more than Decorum and Necessity requires. The *Spanish* resembles those Rivers whose Waters are always swelling, and always muddy and turbulents; that never keep long within their Channel, but are ever overflowing, and their Overflowings ever noisy and precipitate. The *Italian* is like those pleasing Rivulets that purr agreeably among the Stones, and glide in Meanders through Meadows full of Flowers. The *French* resembles one of those beautiful Streams that always run briskly, but at the same time smoothly and equally; without much Noise or much Depth. The *English*, like the *Nile*, preserves a Majesty even in its Abundance; its Waters roll rapidly, notwithstanding their Depth; it never roars but when its Banks are too narrow, nor overflows without enriching the Soil. The *Latin* is the common Mother of the three former, but the Daughters have very different Genius's and Inclinations. The *Spanish*, a haughty Dame, that piques herself on her Quality, and loves Excess and Extravagancy in every thing. The *Italian*, a Coquette, full of fine Airs; always appearing dress'd, and taking all Occasions of showing her Finery: to be admired, being all she aims at. The *French*, an easy Prude, that has her Share of Modesty and Discretion, but on occasion can lay them both aside. The *English* is of a more Masculine Temperament. 'Tis not only of a different Family from the others, but appears of a different Sex too: Its Virtues are those of a Man: indeed 'tis the Product of a colder Climate and a rougher People, and its Features may be somewhat coarser than those of its Neighbours; but its Faculties are more extensive, its Conduct more ingenious, and its Views more noble. See *English*, *French*, &c.

*Ennius* and *Cæcrops* are celebrated for their Knowledge of various Languages. *Mithridates* King of *Pontus* understood twenty two Tongues, which was the Number of different People over whom he commanded; and those Languages he knew so well, that he was able to harangue each of his People in their own Language. 'Twas a Saying of *Charles* the 6th, that so many Languages as a Man understands, so many times he is Man. *Sultan Selman's* Interpreter spoke perfectly well 17 different Languages. But among the Moderns none have been more remarkable in this Way than *Pojellus*, who, besides a perfect Knowledge of all the dead Languages, was so well acquainted with the living, that 'tis said he could have made the Tour of the Globe without the Use of an Interpreter.

*Bilshander* has written of the Analogy and Proportion of all Languages and Letters, *De ratione Communis Linguarum*, in 1518. *Gesner* of the difference of Languages in 1572. *Lazius* published an Introduction to the Learning of the politest Languages in a common Method, in 1548. *Mexifler* a Scheme of 40 different Languages, and different Dialects.

lects, Specimens of each whereof he gives in the Lord's Prayer, in 1593. De Reolet, in his Addition to the World of Doves, has published the *Pater-noster* in all the Languages spoke among Christians; and M. Chamberlayne has lately proposed to do the same in 100 Languages, a Specimen of which has been already published. *Aberia Gensidi* wrote of the Mixture of Languages, in 1603. And Father Reimier's Discourse on Etymologies, is a Work of the same Kind. In 1613, Dorer published a Treasure of the History of Languages; and Guichart of the Etymological Harmony of Languages; in 1619. Breewood has made curious Enquiries into the Difference of Languages and Religions.

Among the *Multæ*, the Word *Language* is used for Nation. The Order of Knights is divided into eight Languages, three whereof are for France, viz. the Language of Provence, of Auvergne, and of France; two for Spain, those of Castile and Arragon; and the other three are the Languages of Italy, England, and Germany. Each of these Languages has its Chief, who presides in Assemblies of the Language to which he belongs.

LANGUED, a Term in Heraldry, applied to such Animals whose Tongue appears out of their Mouths, being of a Colour different from that of the Animal.

LANGUOR signifies a Faintness, which may arise from a Want or Decay of Spirits thro' Indigestion, or too much Exercise; or from an additional Weight of Fluids, from a Diminution of Secretion by the common Discharges.

LANIGEROUS, anything that bears Wool. Hence Lanigerous Trees, among Herbalists, are those Trees that bear a woolly downy Substance, as the black, white, and trembling Poplars, Osiers, and Willows of all Sorts.

LANTHORN, an Utensil of transparent Matter, serving for the Preservation and Conveyance of Light, notwithstanding the Inconveniences of Wind or Weather. *Epistetus's* Lanthorn is said to have been sold for 3000 Drachms. Lanthorns are made of Glass, Horn, Paper, &c. That of *Diogenes* was held in great Veneration among the Antients; and that of *Judas* is still preserved in the Treasury of St. Denis, as a very curious Picce of Antiquity. Lanthorns were formerly made of the Horn of a wild Bull call'd *Urus*; which when cut into thin Laminae, *Pliny* tells us was very transparent. A Dark Lanthorn, is a Lanthorn with only one Opening, or Light, which, too, may be closed up, when the Light is to be intirely hid, and may be presented to the Person one would see, without being perceiv'd one's self. The Antients had their Dark Lanthorns, but they differ'd from ours; they were covered with four Skins, one of each Side or Light, three whereof were black, and only the fourth transparent. *Cassaubon* who gives us the Description, took it from a Manuscript of *Julius Frontinus*. These were principally used in their Armies when they were to march privately off from their Enemies in the Night-time. The Word *Lanthorn* is derived from the Latin *laterna* of *late*, I am hidden, *eo quod lucem habet interiori clausam*, in regard the Light is hidden within, *lays* *lyfide* and *Lambin*. But according to *Pearson*, *Laterna* comes from the Celtic *Letern*; and according to *Salmasius*, *Lanthorn* comes from *late*, to regard it bears a Lamp or a Light.

In China they have a celebrated Feast call'd the Feast of Lanthorns, held on the 15th Day of the first Month: 'Tis so call'd from the infinite Number of Lanthorns hung out in the Houses and Streets; which, 'tis said, is not less than two hundred Millions; insomuch that it rather appears a Fit of Madness than of Feasting. On this Day are expos'd Lanthorns of all Prices, whereof some are said to cost 1000 Crowns. Some of their Grandees retrench somewhat every day out of their Table, out of their Drefs, Equipage, &c. to appear the more magnificent in Lanthorns. They are adorn'd with Gilding, Sculpture, Painting, Japanning, &c. and as to their Size, 'tis extravagant; some are from 25 to 30 Foot Diameter: they represent Halls and Chambers, and two or three such Machines together would make handsome Houses; so that in China they are able to eat, lodge, receive Visitors, have Balls, and act Plays in a Lanthorn. To illumine them, they should have Bonfires; but as that would be inconvenient, they content themselves with lighting up in them an infinite Number of Torches or Lamps, which at a distance have a beautiful Effect. In these they exhibit various Kinds of Shews to divert the People. Besides these monstrous Lanthorns, there is an infinite Number of less: these usually consist of six Faces or Lights, each about 4 Feet high, and one and a half broad, framed in Wood finely gilt and adorned; over these they stretch a fine transparent Silk, curiously painted with Flowers, Trees, and sometimes Human Figures: the Painting is very extraordinary, and the Colours extremely bright; and when the Torches are lighted, they appear very beautiful and surprising.

*Lamborn* in Architecture, a kind of little Dome raised over a large one, or over the Roof of a Building, to give Light, and to serve for a Corona, or to finish the Building. The Word is also used for a square Cage of Carpentry, with Glafs in it, placed over the Ridge of a Corridor, or a Gallery between two Rows of Shops, to illumine them, as that in the *Royal-Exchange, London*.

*Magie Lamborn*, in Opticks, the Name of a Machine, which in the Dark represents various Images and Spectres on a Wall, or other white Surface, so odd and surprising, that those who are not in the Secret, think them the Effect of Magie. See *Magie*.

LANUGO signifies a Down, or soft woolly Substance, which grows upon some Plants, which therefore are call'd lanuginous Plants.

LAPIDARY, an Artificer who cuts precious Stones. The Word is also applied to Merchants who trade in 'em, and Virtuoso's well vers'd in their Nature, Kind, &c. in which Sense, the present *Great Mogul* is said to be one of the greatest Lapidaries in the World.

The Art of cutting precious Stones is very ancient; but like other Arts, its Original was very imperfect: The *Frochs* have succeeded in it the best; and the Lapidaries of Paris, who have been a Corporation since the Year 1290, have carried it, especially cutting of Diamonds call'd Brillants, to its last Perfection. There are various Machines used in the cutting of precious Stones, according to the Quality of the Matter to be cut. The Diamond, which is extremely hard, is cut and form'd on a Wheel of soft Steel, turn'd by a kind of Mill, with Diamond Dust, temper'd in Oil of Olives; and this serves to polish 'em as well as to cut 'em. Oriental Rubies, Saphires, and Topazes, are cut and form'd on a Copper Wheel, with Oil of Olives, and Diamond Dust: they are polish'd on another Copper Wheel, with Tripoli and Water. Rubies, Emeralds, Hyacinths, Amethysts, Grenats, Agats, and other Stones less hard, are cut on a Leaden Wheel, with Smalt and Water, and polish'd on a Tin Wheel with Tripoli. Turquois of the old and new Rock, Lapis, Girafol, and Opal, are cut and polish'd on a Wooden Wheel with Tripoli. See *Diamond, Ruby*, &c.

*Lapidary Stile*, is a Stile proper for Inscriptions. This is a kind of Medium between Prose and Verse; the jejune and the brilliant are here equally to be avoided. *Cicero* has prescribed the Rules of it; *Accidat sporres Oratio varia, vehement, plena spiritus. Omnis Sententiarum Gravitate, omnino Verborum ponderibus effi utendum.* The *Lapidary Stile*, which was lost with the ancient Monuments, has been retriev'd at the Beginning of this Age, by Count *Enmanuel Tbesaurus*: It is now used various Ways at the beginning of Books; and even Epistles Dedicatory are composed in it, whereof we have no Example among the Antients.

LAPIDESCENT, from *Lapis* a Stone, anything which has a Property of turning Bodies into a stony Nature, as many Spring-Waters will do to Flices of Wood, and other like Substances. See *Petrification*.

LAPIDIFICATION, in Chymistry; an Action by which any Substance is converted into Stone: This is done by dissolving a Metal, for instance, in a corrosive Spirit or Menstruum, and afterwards boiling that Dissolution into the Confluence of a Stone. *Lapidification* is practis'd in Metals, fixed Salts, and Salts of Plants. The Term is also used in making artificial Stones. See *Petrification*.

LAPIS CALAMINARIS. See *Calamine*.

LAPIS DE GOA. See *Goa-Stone*.

LAPIS INFERNALIS, a caustick Stone prepared various Ways; sometimes of strong Soap-Lees evaporated to a Dryness, and the Remainder kept in a Glafs well stopp'd from the Air: sometimes it is made of Vitriol and Tartar, calcined Sal Armoniac, and Quick-Lime boil'd in Water to a strong Lixivium, then strain'd and evaporated till it is dry.

LAPIS LAZULI, a Mineral Stone of a blue Colour. *Pliny* and *Diophrastes* make it a Sand, *Agriola* a Mineral found in the Veins of the Earth; but the truth is, 'tis a mere Stone, call'd by way of Excellence *Lapis*, or *Lapis Lazuli*. When perfect, 'tis studded with little Specks or Stars of Gold; for which Reason, *Mefne* calls it *Lapis Stel-latus*: and to be good, should be able to resist Fire and Smoak, and to come out of 'em with new Lustre. It is found in Mines of Gold, Silver, and Copper, as also in Pits of Marble; which last is that generally in Use. Naturalists distinguish three Kinds of *Lapis*. The first call'd old Rock, which is pure, smooth, a fine blue, with beautiful yellow Streaks like Veins of Gold, which yet are frequently no more than Veins of Pyrites. The second call'd the new Rock, is stuffed with common Stones; its Colour is weaker, and its Price lower: these two Kinds are brought from *Pessia* and *Siam*; the third Kind is brought from the Mountains of *Auvergne*. This is mix'd with the common Rock whence it is dug, it is of a pale blue, and is sprinkled with greenish Spots, with Veins

of Pyrites. This when sufficiently charged with Spots of Green, is sold for the *Armenian Stone*. The *Lapis* is of some Use in Medicine; they prepare it by calcining and washing it several times; which done, it makes an Ingredient in the famous Confection of *Alkermes*. Sometimes, in spite of all its Lotions, it continues to be a Purgative, by reason of the Vitriolic Matter it contains.

**LAPIS MEDICAMENTOSUS**, the medicinal Stone, a Composition of green and white Vitriol, Alum, Anatron of *Sandwich*, common Salt, and Salt of Tartar, melted over the Fire, and stir'd till they thicken; then mix'd with Powder of Venice, Cerufs, and *Armenian Bole*, stirring the whole till it grows hard. This is said to fasten the Teeth, preserve the Gums, heal and dry up Ulcers and Wounds, and is used in Injections, and in Compositions for sore Eyes.

**LAPSE**, a Slip or Omission of a Patron to present a Clerk to a Benefice within six Months of its being void; in which Case the Benefice is said to be in *Lapse*, or *lapsed*.

**LAQUEARIUS**, the Name of a Kind of Athleta among the Antients: In one Hand he held a kind of Snare, wherewith to embarras and intrangle his Antagonist, and in the other a Poniard to stab him. The Word comes from the Latin *Laqueus*.

**LAQUEUS** in Chirurgery is a Band so tied, that if it be attracted, or pressed with Weight, it shuts up close. Its Use is to extend broken or disjointed Bones, to keep them in their Places, when they are set, and to bind the Parts close together.

**LAR-BOARD** is the Left-hand Side of a Ship when you stand with your Face to the Head.

**LARCENY**, in Law, is a Theft of personal Goods or Chattels in the Owner's absence. In respect of the Thing stolen, it is either great or small; great *Larceny* is when the Things stolen, tho' severally, exceed the Value of 12 *d.* Petty *Larceny* is when the Goods stolen exceed not that Value. The stealing of a Horse or a Cow, was formerly reckoned petty *Larceny*. The Civilians define *Larceny*, a fraudulent Subtraction of another Man's Property, with design to appropriate it without the Owner's Leave. When it is done by Force, it is called a Robbery. By the Roman Law, the Penalty of simple and secret *Larceny*, was the returning it twofold; and of manifest *Larceny* fourfold: Manifest *Larceny* was where the Criminal was taken in the Fact; simple, where he was not. The *Lacedaemonians* never punished *Larceny*, provided the Person were not caught in the Fact; but on the contrary, it was applauded as a Mark of Dexterity and Address: The *Circassians* are said to honour it at this day; inasmuch that at their publick Feasts their Youth are not suffered to drink, if they have not performed something remarkable in that Way. *Solinus* tells us, that in *Sardinia* there was a Fountain that had the Virtue of discovering a Person that had committed *Larceny*. The Word comes from the French *Larcin*, and that from the Latin *Larcinarius*.

**LARENTINALIA**, the Name of a Feast among the Romans. Some take this for a Feast of the *Lares*, but 'tis no wife probable, that the 22d Day of December being consecrated to them under the Name of *Compitalia*, the 23d should also be devoted to them under a new Name. *Mamius*, *Goltzius*, *Rofinus*, and others take *Larentinalia* to be the same with *Laurentinalia*, which see.

**LARES**, among the Antients, were a kind of Domestic Genii, or Divinities, worship'd in Houses, and esteem'd the Guardians and Protectors of Families; supposed to reside in the Chimney-Corner. *Plutarch* distinguishes between Good and Evil *Lares*, as he had before done between Good and Evil *Genii*. There were some public, others private. *Apuleius* tells us the Domestic *Lares* were no more than the Souls of departed Persons, who had lived well, and discharged the Duties of their Station; whereas those who had done otherwise, were Vagabonds, wandering about and frightening People, and call'd *Larvae* and *Lemures*. The first were also call'd *Penates*, and were worship'd under the figures of little Marmousets, or Images of Wax, Silver, or Earthen Ware. The Pantheons, or Images representing several Gods at once, were also call'd *Lares*. *Harpocration* had one of these. *Farro* and *Maecobius* say the *Lares* were the Children of *Mania*. *Ovid* makes them the Children of *Mercury* and the Naid *Lara*, whom *Lactantius* and *Asconius* call *Larunda*. The Temple of the *Lares* was in the eighth Region of *Rome*. *T. Tatius* King of the *Sabines* was the first who built a Temple to the *Lares*. The Chimney and Fire-place in the House were particularly consecrated to 'em. The *Lares* were also genial Gods, and were supposed to take care of Children from their birth. 'Tis for this reason, that when *Maecobius* tells us the *Egyptians* had four Gods who presided over the Births of Children, viz. the *Genius*, *Fortune*, *Love* and *Necessity*, call'd *Proffites*; some interpret him as if he had said the *Egyptians* had

*Lares*; but there was a world of difference between the *Lares* of the Romans and the *Proffites* of the *Egyptians*.

The public *Lares* were also call'd *Compitalia*, from *Compitum* a Cross-Way, and *Viales* from *Via* a Way or public Road; as being placed at the Meetings of Roads and in the High-ways, and esteem'd the Patrons and Protectors of Travellers. Their private *Lares* took care of particular Houses and Families: These they also call'd *Proffites* from *proffo*,

*Quod praestant oculis omnia tuta suis.* Ovid. Fast.

They gave the name *Urbani*, i. e. *Lares* of Cities, to those who had Cities under their Care; and *Hospitalis*, to those who were to keep their Enemies off: There were also *Lares* of the Country, called *Rurales*, as appears by several Antique Inscriptions.

The Antients differ extremely about the Origin of the *Lares*: *Apuleius* assures us they were the Posterity of the *Lemures*. *Nigidius*, according to *Arnobius*, made 'em sometimes the Guardians and Protectors of Houses, and sometimes the same with the *Caretors* of *Samothracia*, which the Greeks call *Idean Daityles*, and wherof we have made mention under the words *Caretors* and *Daityle*. Nor was *Farro* more consistent in his Opinion of these Gods; sometimes making them the Names of Heroes, and sometimes Gods of the Air.

*Terentian* tells us, the Custom of worshipping the *Lares* arose from this, that they antiently interred their Dead in their Houses, whence the credulous People took occasion to imagine their Souls continued there also, and proceeded to pay 'em divine Honours. To this it may be added, that the Custom being afterwards introduced of burying in the Highways, hence they might take occasion to regard 'em as Gods of the Highways. The Victim offered to the *Lares* in the public Sacrifices, was a Hog: In private they offered 'em Wine, Incense, a Crown of Wool, and a little of what was left at the Table. They crown'd them with Flowers, particularly the Violet, Myrtle, and Rosemary. Their Symbol was a Dog, which was usually represented by their side, on account of its Fidelity and the Service it does to Man, in watching his House. They were also represented as clothed in a Dog's Skin. See *Penates*. On the *Lares*, see also *Arnobius*, *Lactantius*, *Augustin de Civit. Natalis Comen*, *Lambin on Plant. Antiq.* and on *Hor. Casaubon* on *Sueton*. &c.

**LARGE**, a Sea-Term. See *Veering*.

**LARMIER**, in Architecture, a flat square massive Member of the Cornice, between the Cymatium and Ovolo; so called from its Use, which is to disperse the Water, and to cause it to fall at a distance from the Wall drop by drop, or as it were by Tears, *Larme* in French signifying a Tear. The *Larmier* is also call'd *Corona*: See *Entablature* and *Corona*.

**LARYNGOTOMIA**, a Chirurgical Operation, or an Incision in the Trachea or Wind-pipe between two of its *Annuli* or Rings, in order to give passage for the Breath, when there is danger of Suffocation, from an Inflammation of the Larynx, &c. *Dr. Mejerus* observes, that in all Medicine there is not one Method that works so great a Change, for the better, in so short a time. However, it is seldom practis'd, in regard that Gap which appears on the cutting a Throat, (the divided Parts being then drawn towards their more fixed Ends) together with the great Efflux of Blood when the Jugulars and Carotid Arteries are also wounded, create in most Men a Dread of the Operation, and make many believe all Wounds of the Trachea mortal. The same Author makes no scruple however to say it ought to be practis'd in Quinzies, and other Dangers of Suffocation from Causes of a like nature with 'em; from an extraordinary Care which he himself had wrought in this way. The word is derived from the Greek *λαρυγξ* and *τομή*, *seco*. This is the same with *Bronchotomy*. See *Bronchotomy*.

**LARYNX**, in Anatomy, is the upper Part, or Head of the Trachea, lying below the Root of the Tongue, and before the Pharynx. It is one of the Organs of Respiration, and the principal Instrument of Voice. Its Body is almost wholly cartilaginous, and it is to be constantly open to give room for the Air to pass and repass. Its Figure is circular, tho' it jets out a little before, and is a little flattened behind, lest it should incommode the Oesophagus whercon it is placed. The *Larynx* is of different Diameters, according to the different Ages; in young People 'tis narrow, whence their Voice comes to be acute; in those more advanced in Years, 'tis more ample, which occasions their Voice to be stronger and deeper. In Men 'tis bigger than in Women, for which reason Mens Voice is more grave than that of Women. It appears the less in Women, in regard the Glands, situate at the bottom of the *Larynx*, are bigger in Women than in Men. The *Larynx* moves at the time of Deglutition; when the Oesophagus is lowered for Reception

Reception of the Food, the *Larynx* raises itself to compress it, and facilitate its Descent.

There are five different kinds of Parts belonging to the *Larynx*, viz Cartilages, Muscles, Membranes, Nerves, and Glands. Its Cartilages are the Thyroids, Cricoides, Arytenoides, Glottis, and Epiglottis, by means of which it can easily dilate and contract, shut and open itself. These form the whole Body of the *Larynx*, and grow dry and harden, in proportion as the Person grows old, whence the *Larynx* sometimes appears as if it were bony. The biggest of these is the Thyroides or Scutiformis, this guards the Forepart, and has its Name from some supposed Resemblance it bears to a Shield. It is of a Concavo-convex square figure, the hollow part being inward, and the gibbous outward, having a little Prominence in the middle, called *Pannus Adami*, as if some of the forbidden Fruit had stuck in *Adam's* Throat, and occasioned that Swelling. The second is called *Cricoides*, or *Anularis*, from its Resemblance to a Ring which the *Turks* put on their Thumb for the drawing of their Bows. The forepart of this is very narrow, coming under the other Cartilage, but behind it is broad, thick, and strong, being as it were the Basis of all the others. The third and fourth are called *Arytenoides*, or *Gastales*, from the Figure of an *Awer*, which these two together somewhat resemble. At the Juncture of these two there is a little Cleft, or Chink, in form of a little Tongue, and for that reason called *Glottis*, or *Lingula*. Through this Chink the Air descends into the Lungs, and the pituitous Matter ejected by coughing in Catarrhs is let out. It serves also for modulating the Voice, and is imitated in Flutes and the Pipes of Organs. Over the Glottis lies a fifth Cartilage called the Epiglottis, which is very thin and soft, and in Non-adults almost membranous, concave on the under Side, and convex on the upper: It defends the Entrance of the *Larynx*, and hinders the Liquids which in drinking slip over it into the Oesophagus, from falling into the Trachea. The *Larynx* has seven Pair of Muscles, which serve to move its several Cartilages, and to contract or dilate them at pleasure; two Pair of them are common, the other five proper: the proper are those which have both their Origination and Insertion into the *Larynx*, the common have only their Insertion there. Of the former Kind are the *Cricothyroides*, which moves the scutiform Cartilage; the *Crico-arytenoides Posticæ*, which serves, by its Contraction, to draw the *Arytenoides* Cartilage, and to open the Rima. The third is the *Arytenoides*; this serves to bring the two Cartilages of that Name together, and to shut the Rima. The fourth is the *Crico-arytenoides Laterales*; and the fifth the *Thyro-crico-arytenoides*, which shuts the *Larynx*. The common Muscles are the *Sternothyroides*, which serve to draw down the Thyroid Cartilage, and the *Hyothyroides* which lift up that Cartilage. The *Larynx* has but two Membranes, the one external, which is a Continuation of that which covers the Trachea; and the other internal, which is the same that lines the whole Mouth: It receives two Branches of Nerves from the Recurrents, and it is moistened by four large Glands, two situate above called *Tonsils*, and two underneath call'd *Thyroids*.

The *Larynx* is of very considerable Use, not only in forming and modulating the Voice, by the different Apertures of its Rima or Chink, but also in compressing the Lungs in a greater or less Degree by the Air: For if the internal Diameter of the *Larynx* had been equal to that of the Trachea, the Lungs could have undergone little or no Compression at all; nor, consequently, without the *Larynx* could we have reaped any Advantage from Breathing, in regard the Air would not have resisted that Force wherewith it is driven out in Expiration, nor consequently could the Compression have been made in the Lungs, which is found necessary for the Commixture of the Globules of the Blood, and the mixing of the two Fluids, Air and Blood, together. For the Action of the *Larynx* in Sound, see *Glottis* and *Sound*; see also *Epiglottis*, *Trachea*, &c.

**LASH**, the Sea-Word for binding up to the Ship's side Masts, Butts of Water or Beer, or Pieces of Timber to make spare Top-Masts. When any thing is thus fasten'd to the Ship, it is called *Lashing*. But the *Lashers* are properly those Ropes only, which bind fast the Tackles, and the Breaches of the Ordnance, when they are haled, or made fast within board.

**LASKING**, a Sea-Term. See *Feering*.

**LASSITUDE**, among Physicians, expresses that Weakness or Heaviness of Members that proceeds from a distemper'd State of Body, and not from Exercise; either from an Increase of Bulk, from a Diminution of proper Evacuation, or from too great a Consumption of that Fluid which is necessary to maintain the Force and Spring of the Solids, as in Fevers and Convulsions; or from a vitiated Secretion of that Juice, whereby the Fibres are

not supplied either in due Quantity or Quality. The Remedy in the first Case is Evacuation, in the latter proper Diet, or such Alterative Medicines as influence such a Secretion.

**LAST**, or *Left*, in general signifies the Borden, or Load of a Ship. It is also used for a certain Weight and Measure, which is various in various Countries; tho in the general, the *Last* is estimated at 4000 *lb.* weight. A *Last* of Cod-Fish, White Herrings, Meal, and Ashes for Soap, is 12 Barrels for each; Of Corn or Rape-Seed 10 Quarters: Of Gunpowder 24 Barrels, or 2400 *lb.* weight: Of Red Herrings 20 Cades; Of Hides 12 Dozen: Of Leather 20 Dickers: Of Pitch or Tar 14 Barrels: Of Wool 12 Sacks: Of Stock-fish 1000: Of Flax or Feathers 1700 *lb.* weight.

**LASTAGE**, or *Leffage*, according to *Rafsal*, is a Duty exacted in some Fairs and Markets to carry things bought where one will. *Lastage*, says another Author, is properly that Custom, which is paid for Wares sold by the Last. In a Law of R. 1. the second *Lastage* is taken for the Balance or Lading of a Ship. Lastly, *Lastage* is sometimes used for Garbage, Rubbish, or such Filth.

**LAST HEIR**, is he to whom Lands come by Escheat for want of lawful Heirs; which in many Cases is the Lord whereof they are held, but in others the King.

**LATERAL EQUATION**, in Algebra, an Equation having only one Root; whereas a Quadratic hath two, and a Cubick 3 Roots, &c. And such Equations can be determined and constructed by the Interfection of two Right Lines, which is a Composition of  $x + 1 = 2$ . But a Quadratic cannot be determined or constructed, without a Strait Line and a Circle cutting each other.

**LATERAN**, was originally the proper Name of a Man, whence it descended to an ancient Palace in Rome, and to the Buildings since erected in its place: Particularly to a Church called *S. Jobæ of the Lateran*, which is the principal See of the Popedom.

*Councils of the Lateran* are those held in the Basilique of the *Lateran*: Of these there have been five, held in 1123, 1129, 1179, 1215, and 1513.

*Canon Regular of the Congregation of the Lateran*, is a Congregation of Regular Canons, whereof that Church is the principal place. 'Tis pretended, there has been an Uninterrupted Succession of Clerks, living in common, from the Time of the Apostles, and that a number of these were establish'd in the *Lateran* in the Time of *Constantine*. But the Canons were not introduced till the Time of *Leo I.* and these held the Church 800 Years, till the Reign of *Boniface*, who took it from 'em, and placed Secular Canons in their room, 150 Years after, the Regulars were reinserted.

A **LATERE**, a Latin Term used for the Qualification of Cardinals whom the Pope sends as Legates into foreign Courts, who are called *Cardinals a latere*, as being his Holiness's Counsellors in ordinary and Assistants. See *Legate*. The Guards of Princes were heretofore called *Laternets*, because always attending at their Sides, a *latere*. *Du Cange*, in his Glossary, says there were antiently Counts a *latere*, and Monitors a *latere*.

**LATH**, in Building, long, thin, narrow Slips of Wood used in Tying and Walling. These are divided into three kinds, with regard to the different Woods they are made of, viz Heart of Oak, Sap-Laths and Deal-Laths: the two last used only for Ceiling and Partitioning, and the first only for Tying. Again, *Laths* are distinguish'd into three kinds more, with regard to their Length, viz. into 5 foot, 4 foot, and 3 foot *Laths*; tho the *Sizate* allows but of two lengths, viz. those of 5 foot and of 3, each of which are to be an inch and half in breadth, and half an inch in thickness. These are what *Varronius* calls *Alutrices*.

**LATHE**, or *Leathe*, a very useful Engine for the turning of Wood, Ivory, Metals, and other Materials. The Invention of the *Lathe* is very antient. *Diodorus Siculus* says, the first who used it was a Nephew of *Dedalus*, named *Talot*. *Pliny* ascribes it to *Theodore of Samos*, and mentions one *Thebriels*, who render'd himself very famous by his Dexterity in managing the *Lathe*.

With this Instrument the Antients turn'd all kinds of Vases, many whereof they enrich'd with Figures and Ornaments in Basso Relievo. Thus *Virgil*,

*Lenta quibus Turno facili superaddita Vis.*

The Greek and Latin Authors make frequent mention of the *Lathe*, and *Cicero* calls the Workmen who used it *Vasculares*. 'Twas a Proverb among the Antients, to say a thing was formed in the *Lathe*, to express its Delicacy and Juftness.

The *Lathe* is composed of two wooden Cheeks or Sides, parallel to the Horizon, having a Groove or Opening between; perpendicular to these, are two other Pieces called Puppets, made to slide between the Cheeks, and to be fix'd down at any Point at pleasure. There have two

Points, between which the Piece to be turned is sustained; the Piece is turn'd round, backwards and forwards, by means of a Spring put round it, and fastened above to the End of a pliable Pole, and underneath to a Treadle or Board moved with the Foot. There is also a Rest which bears up the Tool, and keeps it steady.

As 'tis the Use and Application of this Instrument that makes the greatest Part of the Art of Turning, we refer the particular Description thereof, as well as the Manner of applying it in various Works, to that Head. See *Turning*.

**LATHE**, in our Law. See *Leibe*.

**LATIAR**, a Feast, or Ceremony instituted by *Tarquinius Saperbus*, in honour of *Jupiter Latialis*. The Founder only appointed one Day for this Feast; the first Consul added another to it upon concluding the Peace with the *Latins*; a third was added after the People who had retired to the *Mont Sacer* were returned to *Rome*; and a fourth after appeasing the Sedition raised on occasion of the Consulship, in which the People would needs have a Share. These four Days were called the *Latin Ferie*, and every thing done during the Course of these *Ferie*, as Feasts, sacrifices, Offerings, &c. were called *Latiarcs*. *Tarquinius* having made a Treaty of Alliance with the *Latins*, proposed, in order for perpetuating it, to erect a common Temple, where all the *Allics*, the *Romans*, *Latins*, *Hernici*, *Vulsi*, &c. should assemble themselves every Year, hold a kind of Fair, exchange Merchandises, feast, sacrifice, and make merry together. Such was the Institution of the *Latian*.

**LATICLAVUS**, a Garment of Distinction and Dignity among the *Romans*. It was a kind of Tunic, or long Coat faced with one or two Slips of Purple applied lengthwise to the two Sides of the Tunic. In the *Laticlavus* these Slips were pretty broad, and in the *Angusticlavus* narrower; though there is nothing about which the Learned differ more, than the Difference between those two Habits. There were Buttons set on the *Laticlavus*, which appear'd like the Heads of large Nails; whence some think it took its Name. The Senators, Prætors, and the chief Magistrates of Colonies and municipal Cities, had a Right to wear it. The Robe called *Prætexta*, was wore over the *Laticlavus*. When the Prætor pronounced Sentence of Death, he put off the *Prætexta*, but retained the *Laticlavus*.

**LATINE**, a dead Language first spoken in *Latium*, and afterwards at *Rome*, and still used in the *Romish* Church, and among the Men of Learning. Some Authors rank the *Latin* among the Number of original Languages, but by Mistake: It is formed principally from the *Greek*, and particularly the *Æolic* Dialect of that Tongue; tho' it has a great Number of Words which it borrow'd from the Languages of the *Etruri*, *Osci*, and other ancient People of *Italy*; and their foreign Commerce and Wars, in course of Time, added a great many more. The *Latin* is a strong, firm Language, perfectly suitable to the Character of the People who spoke it. We have, still, Works of every kind, admirably well written in *Latin*, tho' there are an infinite Number lost. The *Latin* is more figurative than the *English*, less pliant than the *French*, less copious than the *Greek*, less pompous than the *Spanish*, less delicate than the *Italian*, but closer and more nervous than any of them. For a while, the *Latin* Tongue was confined almost wholly within the Walls of *Rome*; nor would the *Romans* allow the common Use of it to their Neighbours, or to the Nations they subdued. *Cæsar* observed that even in his Time *Greek* was used almost among every People, but the *Latin* only confined to a very narrow Compass; *Græca loquuntur in omnibus fere Gentibus, Latina suis finibus exiguis sane cunctantur*. By degrees they were brought to grant the Use of it as a Favour, and in time became sensible of the Necessity there was of its being generally understood for the Convenience of Commerce; and accordingly used their utmost Endeavours that all the Nations subject to their Empire, should be united by some common Language; so that at length they imposed that as a Law, which they had before granted as a Favour. After the Translation of the Seat of the Empire, from *Rome* to *Constantinople*, the Emperors of the East, being always desirous of retaining the Titles of *Roman* Emperors, appointed the *Latin* to be still retained in Use both in their Rescripts and Edicts, as appears by the Constitution of the Eastern Emperors collected in the *Theodosian* Code: But at length the Emperors neglecting the Empire of the West, abandon'd all Care of the *Latin* Tongue, and allowed their Judges to pass Sentence in *Greek*; and accordingly we find the Emperor *Justinian's* Novels composed in *Greek*. *Charlemagne* coming to the Empire of the West, appointed the Proceedings in sovereign Courts to be in *Latin*; and the Notaries were to draw their Acts and Instruments in the same Tongue: This Practice continued a long time through a great Part

of *Europe*, but at length it gave way, and the *French* took place of the *Latin*, not only in *France*, but in some measure in *England* too; and the Reason given for it, was, that aundance of Difficulties arose about the understanding of *Latin* Terms. The *Latin* however was prodigiously degenerated and corrupted e'er it came to be laid aside.

The Incursions of the *Goths* and *Vandals* into *Italy*, brought an inundation of foreign Words and Phrases into it; inasmuch that *Valla* and *Nanctius* call *Bortius* the last *Latin* Author. However, that was not all, but when it once got into the Courts of Justice, it was still worse handled; till at last being introduced amongst the Monks, and become the common Language of Missals and Breviaries, it was debauched to that degree, that it was almost become scandalous to use it. In this Condition it was found at the time of the Reformation; when *Vives*, *Erasmus*, &c. began to open the way for its Recovery: since which time, Monkish Latinity has been declining, and all Endeavours have been used to retrieve the pure Language of the *Augustan* Age. 'Twas said of Cardinal *Bowles*, that he would never read the Breviary, for fear of corrupting his fine *Latin*.

**LATIN CHURCH**, is a Term used for the *Romish* Church, by way of Opposition to the *Greek* Church.

**LATISSIMUS DORSI**, in Anatomy, is a Muscle called so from its Shape, covering almost the whole Back. It hath a thin broad tendinous Beginning, which comes from the posterior part of the Spine of the Ilium, from the superior Spines of the *Os Sacrum*, from all the Spines of the Vertebrae of the Loins, and from the seven lower of the Thorax; it passeth by the inferior Angle of the Scapula, from which some of its fleshy Fibres sometimes arise, and is inserted with the *Teres major*, by a strong and broad Tendon, with which it pulls the Arm downwards: It is also called *Ani Scalpator*, because it carries the Arm to the *Anus*.

**LATITAT**, a Wit, whereby all Men in personal Actions are called originally to the *King's-Bench*; and it hath this Name, as supposing the Defendant does lurk, and lie hid, and therefore being served with this Wit, he must put in Security for his Appearance at the Day: by this Wit, a Man being brought in, is committed to the Marshal of the *King's-Bench*, in whose Custody when he is, he may be sued upon an Action in that Court.

**LATITUDE**, in Geography, is the Distance between the Equator and Zenith, or vertical Point of any Place, reckoned on the Degrees of the Meridian, or the Secularies of the Equator. *Latitude* of a Place is its Distance from the Equator; and is either Northern or Southern, according as the Place whose *Latitude* is spoke of, is on this or that Side of the Equator. Thus *London* is said to be in 52 Degrees, thirty Minutes, Northern *Latitude*.

Circles parallel to the Equator, are called Circles of *Latitude*, because they show the *Latitudes* of Places by their Intersection with the Meridian. If through the Poles of the World we conceive innumerable great Circles drawn, these are called *Secularies* of the Equator; and by their help the Position of every Point, either on Earth, or in the Heavens, with regard to the Equinoctial (that is, the *Latitude* of any Point) is determined. One of these *Secularies* passing thro' any Place in the Earth's Surface, is called the Meridian of that Place, and on it the *Latitude* of that Place is measured.

The *Latitude* of a Place, and the Elevation of the Pole of that Place above the Horizon, are Terms used indifferently for each other, in regard the *Latitude* and the Elevation of the Pole are always equal, (as will appear by *Fig. 4. Plane Geography*) where the Circle *H Z Q* represents the Meridian, *H O* the Horizon, *ECQ* the Equator, *Z* the Zenith, and *P* the Pole. Here the *Latitude* of the Place, or its Distance from the Equator, is the Arch *Z E*, and the Elevation of the Pole, or its Distance from the Horizon, the Arch *P O*. Now the Arch *P E* between the Pole and the Equator, is a Quadrant of a Circle, and the Arch *Z O*, from the Zenith to the Horizon, is likewise a Quadrant. Therefore the two Arches *Z E* and *P O* must be equal; and taking away the Arch *Z P*, which is common to both, there will remain the Arch *Z E* equal to the Arch *P O*: that is, the *Latitude* of the Place equal to the Height of the Pole above the Horizon. Thence we have a Method of measuring the Circumference of the Earth, or of determining the Quantity of a Degree on its Surface: For by going directly Northward or Southward, till the Pole be elevated one Degree more or less, and then measuring that Interval accurately, we shall have the Number of Miles in a Degree of a great Circle of the Earth's Globe. See *Degree*.

The Knowledge of the *Latitude* of the Place, is of the utmost Consequence both in Geography, Navigation, and Astronomy: The Methods of determining it both at Sea and Land, are as follow.

We have already observed that the Altitude of the Pole is always equal to the Latitude, for which Reason the Latitude might be best found by observing the Pole's Height: but in regard the Pole is only a mathematical Point, and no ways to be observed by our Senses, its Height cannot be determined in the same manner as that of the Sun and Stars, &c. for which Reason another Manner has been contrived. In order to this, a Meridian Line is first drawn; the Method of doing which, see under the Word *Meridian*. Place your Quadrant on this Line, so as its Plane may be in the Plane of the Meridian; then take some Star near the Pole, v. g. the Pole Star, which never sets, and observe both its greatest and least Altitude (see *Quadrant*.) Let the greatest, v. g. be SO, (Fig. 5. *Plat. Geography*) and the least O; the Half of which PS or P $\frac{1}{2}$ , deducted from the greatest Altitude SO, or added to the least O will give PO, the Altitude of the Pole above the Horizon, which is equal to the Latitude of the Place.

The Latitude may also be found, by having the Sun's, or a Star's Declination, and Meridian Altitude taken with a Quadrant or Altrolabe. The Method is this: Observe the Meridian Distance of the Sun from the Vertex or Zenith, which is always the Complement of his Meridian Altitude; and add to this the Sun's Declination, when the Sun and the Place are on the same Side the Equator, or subtract the Declination when they are on different Sides: the Sum in the former Case, and the Difference in the latter, will be the Latitude required. But when the Declination of the Sun is greater than the Latitude of the Place, which is known from the Sun's being nearer to the elevated Pole than the Vertex of the Place is, as it frequently happens in the Terrid Zone; then the Difference between the Sun's Declination, and his Zenith Distance, is the Latitude of the Place. If the Sun, or Star, have no Declination, but move in the Equinoctial that Day; then the Elevation of the Equator will be equal to his Meridian Altitude, and consequently his Meridian Altitude is the Complement of the Latitude to 90. This latter Method is best accommodated to the Uses of Navigation, as being practicable at Sea: but the former Method preferable at Land.

Latitude, in Astronomy, is the Distance of a Star or Planet from the Equator, or from the Sun's Orbit, towards one of the Poles of the Zodiac. Through the Poles of the Equator, cutting the Equator at Right Angles, called Circles of Latitude, or Secondaries of the Equator: By means of which, every Star and Point of the Heavens is reduced to the Equator, and has its Place in regard thereto determined. The Latitude of a Star is an Arch of one of these Secondaries, intercepted between that Star and the Point where it intersects the Equator; in which it differs from the Declination, which is the Distance of a Star from the Equator towards one of the Poles of the World: So that the Geographical Latitude is the same thing with the Astronomical Declination, and the Astronomical Latitude a quite different thing. The Sun never has any Latitude, but the Planets have: For which reason, in the common Sphere the Zodiac has some Breadth. The Antients only allow'd six Degrees on each Side the Equator, but the Moderns have extended it to nine. According to the Observation of some of the modern Astronomers, the greatest Latitude of the Planets is not always the same; but Venus never exceeds 9 Degrees Northern Latitude, Mercury 5 Degrees, the Moon in her Quadrant with the Sun 5 Degrees; Saturn 2 Degrees, 50 Minutes; Jupiter 1 Degree, 50 Minutes; Mars 7 Degrees, 31 Minutes. When they have no Latitude, they are said to be in the Nodes of the Equator, or in the Intersection of their Orbit with that of the Sun; and in this Situation it is that they eclipse, or are eclipsed by the Sun.

North Ascending Latitude is when the Moon proceeds from the Ascending Node towards her Northern Limit, or greatest Elongation; North Descending Latitude, when the Moon returns from her Northern Limit to the Ascending Node: South Descending Latitude, is when she proceeds from the Descending Node to her Southern Limit; South Ascending Latitude, is when she returns from her Southern Limit to her Ascending Node: And the same holds good of the other Planets. Heliocentric Latitude of a Planet, is its Distance from the Equator, such as it is seen from the Sun; and this, when the Planet comes to the same Point of its Orbit, is always the same, and unchangeable. Geocentric Latitude of a Planet, is the Distance of the Planet from the Equator, as it is seen from the Earth: And this, though the Planet be in the same Point of its Orbit, yet is not constantly the same, but alters according to the Position of the Earth, in respect to the Planet. See *Heliocentric* and *Geocentric*.

Dr. Halley has some Considerations in the *Philosophical Transactions*, which make it probable the Latitudes of some

of the principal fix'd Stars, particularly *Polaris*, *Sirius*, and *Arcturus*, alter in time; whence it may be argued, the rest likewise alter, tho' the Variation may be less conspicuous in these, by reason they are supposed at a greater Distance from us. See *Star*.

LATITUDINARIAN, among the Divines, signifies a moderate Person, not over-closely tied to any religious Opinions, but thinks there is a Breadth or Latitude in the Road to Heaven.

LATOMIA properly signifies a Quarry, or Place whence Stones are dug. These were antiently used as Goals for Criminals. *Dionysius* had a Place of this kind dug in a Rock near *Syracuse*, where an infinite Number of People were shut up. *Cicero* reproaches *Verrus* with imprisoning Roman Citizens in *Latomia's*; so that *Latomia* became a general Name for a Prison, and the Prisoners inclosed in 'em, were called *Latomarii*. The Word comes from the Greek  $\lambda\alpha\tau\omicron$  Stone, and  $\tau\iota\mu\omega$  I cut.

LATRIA, in Theology, is a religious Worship due only to God. The *Romanists* say they honour God with the Worship of *Latria*, and the Saints with the Worship of *Dulia*. But these Terms, however distinct, are usually confounded. This Worship of *Latria*, besides its inner Characters, has its external Marks to distinguish it; the principal whereof is Sacrifice, which cannot be offered to any other but God himself, as being a solemn Acknowledgment or Recognition of the Sovereignty of God, and our Dependance on him. Mr. *Dalitz* seems to own that some of the Fathers of the fourth Century allowed the Distinction between *Latria* and *Dulia*. The Word comes from the Latin *latrare*, to lie hid. See *Idolatry*.

LATUS RECTUM, a Term in Conicks, the same with *Parameter*; which see.

LATUS TRANSVERSUM of the Hyperbola, is a Right Line intercepted between the Vertices of the two opposite Sections; or that part of the common Axis which is between the Vertices of the upper and lower Cone, as the Line ED (in Fig. 5. *Plat. Conicks*) where also Dd and Ee may be the Parameters, or Latus Rectums belonging to the two opposite Sections GLRO, and OEO. To this *Latus Transversum* answers the longest Diameter in the Ellipsis; which *Apollonius* calls the transverse Axis or Diameter. *Latus Primarium* is a Right Line belonging to a Conick Section drawn thro' the Vertex of the Section of the Cone, and within it; as the Line EE or DD in the Figure above refer'd to.

LAVATORY, or LAVADERO, a Name given to certain Places in *Chili* and *Peru*, where Gold is got out of Earth by washing. M. *Frezar* gives us the following Description of the *Lavatories* of *Chili*: They dig deep into the Earth, in such Places as they have reason to expect Gold in; and in order to facilitate this Digging, turn a Stream of Water upon the Spot, loosening the Earth as much as possible all the time, that the Current may have the greater Effect, and tear up the Earth more strongly. When they are got to the Earth they want, they turn off the Stream, and dig dry. The Earth that they, now, get is carried on Mules, and discharged into a Basin, made somewhat in the manner of a Smith's Bellows, into which a little Rivulet of Water runs with a great deal of Rapidity, dissolving the Parts of the Earth, and carrying every thing away with it excepting the Particles of Gold, which by their great Weight precipitate to the Bottom of the Basin, and mix with a fine black Sand, where the smaller Parts are almost as much hidden as before they were in the Earth. Sometimes they find very considerable Pieces in *Lavatories*, particularly Pieces of twenty-four Ounces each. There are several *Lavatories*, where they find *Pepitas*, or Grains of Virgin Gold, of a prodigious Size. Among others they tell of one that weighed 512 Ounces, bought by the Count de la *Moncloa*, Viceroy of *Peru*. Nine or ten Leagues to the East of *Cuzimbo*, are the *Lavatories* of *Andacoll*, the Gold whereof is twenty-three Carats fine. Their Work, here, always turns to great Profit, excepting when the Water fails them. The Natives maintain that the Earth is *evadese*, that is, it produces Gold continually; because after having been washed sixty or eighty Years, they find it impregnated afresh, and draw almost as much out of it as at first.

LAUDANUM, a Name given by the Chymists to certain Preparations of Opium, by reason of their excellent Qualities, as who should say *laudandum* from *laudare*, to praise. To these several add Coral, Pearls, Treacle, &c. *Lawsonius* is esteemed an excellent Medicine, it eases Pain, stops the spitting of Blood, the Flux of the Menfes and Hemorrhoides, &c.

LAUDS, or LAUDES, the second Part of the ordinary Office of the Breviary, said after Matins, though here before it ended the Office of the Night. The *Laudes* consist principally of Psalms, Hymns, &c. whence they took their Name. See *Matins* and *Breviary*.

**LAUGHTER**, an Action which Authors attribute to the fifth Pair of Nerves, which by sending Branches to the Eye, Ear, Lips, Tongue, Palate and Muscles of the Check, Parts of the Mouth, *Præcordia*, &c. there hence arises a Sympathy between all these Parts, i. e. when one of them is acted upon, the other are proportionally affected. Hence a favoury thing seen or smelt, affects the Glands and Parts of the Mouth; a thing seen or heard, that is shameful, affects the Cheeks with Blushes: on the contrary, if it please and tickle the Fancy, it affects the *Præcordia* and Muscles of the Mouth and Face with Laughter; if it cause Sadness and Melancholy, it likewise affects the *Præcordia*, and demonstrates itself, by causing the Glands of the Eyes to emit Tears. And Dr. Willis accounts for the Pleasure of Killing from the same Causes, the Branches of this fifth Pair being spread to the Lips, the *Præcordia*, and the genital Parts; whence arises a Sympathy between those Parts.

**LAUNCH**, in the Sea-Phrase, is to put out; thus they say, *launch a Ship out of the Dock, or out of the Key, &c.*

**LAURA**, a Place where Monks antiently dwelt. Authors can't agree about the Difference between a *Laura* and a Monastery. Some pretend that a *Laura* was a Monastery, wherein there lived at least a thousand Monks; but this is in no wise credible. The more credible Opinion is, that the antient Monasteries were the same with the Modern, consisting of large Buildings, divided into Halls, Chapels, and Cells, possessed by the Monks, each of whom had his Apartment; but the *Lauræ* were a kind of Villages, whereof, each several House was inhabited by one or two Monks at the most; so that the Houses of the Chartreux seem, in some measure, to represent the antient *Lauræ*, and those of the other Monks proper Monasteries. The Term *Laura* was only understood of the religious Places in *Ægypt* and the *East*, where their Houses stood apart from each other, and were not joined by any common Cloister, the Monks that inhabited them only meeting in publick once a Week. The word comes from the Greek *λαύρα*, *Hunter, Village*.

**LAUREATION**, a Term in the *Scottish* Universities, used for the Action of taking up the Degree of a Master of Arts, to which the Students are admitted after four Years Study in the University.

**ST. LAURENCE**, an Order of Regular Canons, so called from the Monastery of *S. Lawrence d'Orléans* in *Damphine*. This Congregation is said to have been founded by *St. Bennet*. It was destroyed by the *Vandals*, and continued uninhabited till the middle of the 11th Century. In 1057, *Odo* Count of *Sussex* gave it to one *Gervard* and his Canons. This Donation was confirmed in 1065, by *Cambert* Bishop of *Turin*, who added to it above forty other Churches. By which means a very considerable Congregation was formed, to whom the succeeding Popes and Counts of *Sussex* granted a great many Privileges. It had thirty Priors. The Chief, who is the Prior of the Congregation, bears the Title of Provost, and exercises a spiritual Jurisdiction throughout his Provostship.

**LAURENTIALIA** were Feasts instituted by the *Roman* People, in Honour of *Acta Laurentia*, kept during the Feasts called *Saturalia*, which afterwards were solemnized as a part thereof. She was a debauched Woman, and nursed *Romulus* and *Remus*, which occasioned the Fable to say, *That a She-Wolf suckled them*. She afterwards married a very rich Man, who brought her great Wealth, which, at her death, she left to the *Roman* People, in consideration whereof they performed her these Honours.

**LAW**, a Command or Precept coming from some superior Authority, to which an inferior is obliged to obey; or, more properly, a Command or Mandate of some Person, or Power, whose Precept carries with it the Reason of Obedience. Thus the Commands of God with respect to Men, of a City with regard to the Citizens, and universally of all powerful Beings in respect to those who cannot resist, are called their *Laws*. The Nature of a *Law* will be the most clearly discovered, by shewing wherein it differs from Covenant, Counsel, and Right or Equity, with all which it is frequently confounded. The Difference between a Counsel and a *Law* will be best determined from the Difference between Counsel and Command. Now a Counsel is a Precept wherein the Reason of Obedience is taken from the Thing itself prescribed; a Command is a Precept, wherein the Reason of Obedience depends on the Will of the Prescriber; for we cannot properly say, *sic volo, sic jubes*, unless *scilicet pro ratione voluntas*. But since in *Laws* we do not obey for the sake of the thing itself, but for the sake of the Person who prescribes it, a *Law* is not properly a Counsel, but a Command. A *Law* comes from a Person who has a power over those whom he commands, a Counsel from him who has no such power. To do what is enjoined by a *Law* is an Act of Duty, what by a Counsel an Act of Choice or Free-will. A Counsel is directed to his Advantage who

receives it, a *Law* to his who gives it. A Counsel only takes effect over those who are willing, a *Law* over those that are unwilling. Lastly, the Authority of the Counsellor is taken away at the Discretion of him to whom the Counsel is given; but the Authority of the Legislator is not taken away at the Discretion of him on whom the *Law* is imposed.

*Law* is always confounded with Covenant, by those who take *Law* to be nothing else but *επιταγήματα* or Forms of Living determined by the Consent of Mankind: Among whom is *Aristotle*, who defines a *Law*, a Declaration determined by the common Consent of a City, shewing in what manner Things are to be done; which is not so much the Definition of a *Law*, as of a *Civil Law*: nor yet properly of a *Civil Law*; for this common Consent is no more than a mutual Covenant, which does not oblige any Person, and consequently is not any *Law*, till some supreme Power be constituted with a Power to compel, and to make it penal to transgress it. Here then the Covenant is confounded with the *Law*, which leads into Absurdities; for a Covenant is a Promise, a *Law* a Command. In a Covenant 'tis said, *I will do*; in a *Law*, *do*. By a Covenant we are obliged, (that is, we must perform because of our Promise) by a *Law* we are preserved under that Obligation (that is, we are forced to perform for fear of the Punishment awarded by it); a Covenant obliges by itself, a *Law* preserves the Obligation by force. In a Covenant therefore we consider what is to be done *ex se* we are obliged to do it; in a *Law* we are obliged to *do*, in the first place, and what is to be done is determined afterwards.

*Law* is confounded with Right or Equity, by those who persist in doing what is permitted by the *Divine Law*, tho' prohibited by the *Laws* of the Country. What is prohibited by the *Divine Law*, cannot be permitted by the *Civil Law*, nor what is commanded by the *Divine Law* be prohibited by the *Civil Law*; but what is permitted by the *Divine Law*, may notwithstanding be prohibited by the *Civil Law*: for the inferior *Laws* have a power of restraining the Liberty left the superior *Laws*, tho' they cannot enlarge it. Now Right or Equity is a natural Liberty, not constituted by *Laws*, but free of them; for take away *Laws*, and Liberty is complete. This Liberty is first restrained by the *Natural* and the *Divine Law*, the rest restrained by the *Civil Laws*; and what remains unrestrained by the *Civil Law*, may be again restrained by the Constitutions of particular Cities and Societies. There is a great Difference therefore between *Law* and Right, *Lex & Jus*; for *Law* is a Chain, but Right, a Liberty; and they differ as two Contraries.

All *Law* may be divided, with respect to its different Authors, into *Divine* and *Human*. The *Divine*, again, may be considered as twofold, with respect to the two different Manners in which God notifies his Will to Man, *viz.* *Natural* (or *Moral*) and *Positive*. *Natural* is that which he has made known to all Mankind, by that innate Light, called *Natural Reason*; *Positive* is that which He has revealed by his Prophets; as those *Laws* delivered to the *Jews*, relating to the *Divine Worship* and *Polity*, which may be called *Divine-Civil Laws*, as being peculiarly directed to that People. Again, *Natural Law* may be divided into that natural *Law* of Men, which, in a peculiar Sense, is called *The Law of Nature*, and the natural *Law* of Countries, commonly called *The Law of Nations*. The Precepts are the same in both. But because, when Societies are once instituted, certain personal Properties become vested in Men, that *Law* which, when we speak of the Duties of Men severally, we call *The Natural Law*, when transferred to Cities or Countries, we call *The Law of Nations*.

Again, All *Human Laws* are *Civil*; for, according to *Hobbes*, the State of Man out of Society is a State of War, wherein no one being subject to another, there can be no other *Law* besides the Dictates of *Natural Reason*, which is the *Divine Law*. *Civil Laws* may be divided with regard to the Difference of the subject Matter, into *Sacred* and *Secular*. *Sacred* are those that relate to Religion, that is, to the Ceremonies and *Worship* of the Deity, and which are not prescribed by any *positive Divine Law*. *Secular* are those that relate to Property, &c. commonly call'd by the name *Civil*.

Further, *Civil Laws* considered with regard to the two Offices of the Legislator, *viz.* to judge, and to compel, may be divided into two Branches; the one *Distributive*, the other *Vindicative* and *Pænal*. *Distributive* is that Branch by which every Man has his Right; or that which constitutes the Rules and Measures of Things, whereby we know what belongs to us, and what to others, so as we may not disturb or interrupt others in the Enjoyment of their own, nor be interrupted by them, and what each Man may lawfully do or not do. *Vindicative* is that Branch by which the Punishments to be inflicted on those

who violate the *Laws* are determined. The Distributive and Vindicative are not two Species of *Laws*; but two Parts of the same *Law*. For if a *Law* say no more than *Whatever you catch in your Net in the Sea shall be yours*, 'tis in vain; for the another take from you what you have caught, 'tis still yours; in regard in the State of Nature, where all things are common, yours and another's are the same thing. So that what the *Law* defines to be yours, was yours before that *Law*, and will be yours after it, the possessor'd by another. A *Law* therefore is but an empty Sound, unless it determine the thing to be yours in such a sense, as to forbid every body else from disturbing you in the possession of it. But such Prohibition will be vain, unless there be a Penalty annex'd to it. A *Law* therefore must contain both those Parts, that which prohibits, and that which punishes. The first whereof, which is call'd Distributive, is prohibitory, and speaks to all. The latter, call'd Vindicative or Penary, is Mandatory, and speaks only to the public Officers. Whence it follows, that to all *Civil Laws* there is annex'd a Penalty, either implicitly or explicitly: and where that Punishment is not ascertain'd, either by Writing or by Example, 'tis supposed to be Arbitrary, and to depend on the Pleasure of the Legislator; for that is no *Law*, which may be violated *impune*.

Moreover, *Civil Laws* considered with regard to the different Manners of promulgating them are of two kinds; *Scripte* and *Non-Scripte*, those written, and those not written. By written, I mean those which require either the Voice or some other Sign of the Legislator's Will to become *Laws*. Those unwritten, are such as need no other Promulgation besides the Voice of Nature, or Natural Reason; of which kind are all *Natural Laws*. Hence it appears, that the *Natural Laws* be described in the Writings of Philosophers, they are not therefore to be call'd, *Written Laws*. Nor are the Writings of Lawyers *Laws*, for want of the Supreme Authority: nor the *Responsa Prudentum*, or Opinions of Judges *Laws*, excepting so far as they are allow'd by the Supreme Power to pass into Use; and then they are call'd *Leges Scripte*, *written Laws*; not because of their Use, but because of the Will of the Supreme Power, which is argued from their passing into Use.

The first Principle, or *Law of Nature*, according to *Hobbes*, is Self-preservation. *Thomasius* will have it to be our own Happiness, which falls in at last with the Sentiment of *Hobbes*. *Puffendorf* maintains it to be Sociality. *Valentine Alberti*, the Belief that we are the Image of God. *Henry* and *Somner Cocceius*, the Will of God. *Grætius*, Right Reason. *Felthelmus*, the intrinsic Decency or Turpitude of Actions. *Stimæsius* and *Janus*, that we are to love God, Ourselves, and our Neighbour. *M. Regis* says, that the *Laws of Nature* are the Dictates of Right Reason, which teach every Man how he is to use his natural Right; and the *Laws of Nations*, the Dictates in like manner of Right Reason, which teach every State how to act and behave themselves towards others.

*Law* is also used for the several Policies of States and People, or the Maxims and Rules they have agreed upon or receiv'd from their Magistrates, to live in Peace and mutual Society. The *Laws* of the Twelve Tables were the ancient *Laws of the Romans*, for which the *Decemviri* were sent into Greece, and which serv'd them for the Ground-work of all their Jurisprudence. The celebrated *Laws* of the more modern Days are those of the *Angli*, *Veneti*, or *Toscani*, of the *Bell* or *Bavarians*, those of the *Burgundi*, of the *Rymarii*, *Germani*, *Danes*, and *Norwegiani*, of the *Franki*, the *Friseni*, the *Lombardi*, the *Gothic Laws*, the *Martians* or *Mercian Law*; the *Laws of the Saxons*, *Scoti*, *Sicilians*, *Vijigoti*, the *Laws of Oleron*, the *Mohamitan Law*, the *Salic Law*, the *Law Gombette*. See *Salic*, *Semptuary*, &c.

Among the first *Romans*, the word *Law* properly signified an Ordinance of the People made at the Request of a Magistrate, particularly a Consul. These Ordinances differ'd from the *Pleiscita* and *Senatus-Consultis*, and even from other Ordinances made at the Request of any other Magistrate besides a Consul, tho' those to bore the name of *Law*. Thus the *Aquilian* and *Falcidian* were only Tribunes when they made their Request, yet we still say the *Aquilian Law*, the *Falcidian Law*. The *Laws of the Romans* are distinguished, 1<sup>st</sup>. By the Name of him at whose Request they were pass'd; as the *Cornelian Law*, the *Julian Law*, &c. 2<sup>dy</sup>. By the Matter or Subject of the Law; and hence came the Terms *Testamentary Laws*, *Judiciary Laws*, *Agriarian Laws*, &c. 3<sup>dy</sup>. Sometimes by the Crimes against which they were made; for instance, the *Laws* touching Poisonings, Parricides, &c. the *Laws* of Concussion, Peculate, &c. The *Code* and *Adventura* are the *Laws* and Constitution of the *Roman Emperors*: The *Digest* a Compilation made by the Emperor *Justinian's* Order of the several Opinions and Judgments of

the most Learned in the *Roman Law*; to which he gave the Sanction of *Laws*, as appears by the Epistle preface'd to the Work: And 'tis this that constitutes the *Roman Law*.

The *Lex Taliensis*, or *Law of Lake for Lake*, is the most ancient and equitable *Law* in the World. It was observ'd by the *Hebrews*.

The *Law of England* consists of three Parts. 1. The Common *Law*, which is the most ancient and general *Law* of the Realm. 2. Statutes, or Acts of Parliament. 3. Particular Customs. The Common *Laws of England* are derived from the *English*, *Saxons*, and *Danes*, and were antiently divided into three Parts, viz. the *Mercian Laws*, the *West-Saxon Laws*, and the *Danish Laws*. Those call'd *Mercian* were compiled by *Mertius* Queen of the *Britons*, from whom there was a Province call'd *Provincia Merciorum*. Many *Laws* were published by *Ethelred* King of *Kent*, by King *Ina* and *Offa*: But *Alfred*, who subdued the whole Kingdom, having revised all the *Laws* of his Predecessors, retain'd those which he thought proper, and abolish'd the rest; whence he was call'd *Anglicanorum Legum Conditor*, and these *Laws* were call'd *West-Saxonum*. But the Kingdom being afterwards subdued by the *Danes*, they introduc'd another *Law* call'd *Danalog*, by which their People were governed: And they being afterwards destroy'd, *Edward the Confessor* out of the former *Laws* compos'd that which we now call the Common *Law*; for which reason he is call'd by our Historians, *Anglicanorum Legum Revisitor*. These *Laws* were only general Customs observ'd thro' the Nation, and for that reason were call'd *Common*: And perhaps also because *Leges omnibus in commune redditis*, to be observ'd by all with such Amendments as were made by his Father. *William the Conqueror* did not enact many new *Laws*, but confirm'd the old; viz. *St. Edward's Laws*, and abrogated none that any way concern'd Compositions or Mults of Delinquents.

The Common *Law* is also call'd *Lex non scripta*, (not but that we have most of 'em written in the old *Norman Dialect*) but because it cannot be made by Charter or Parliament; for those are always Matters of Record, whereas Customs are only Matters of Fact, and are no where but in the Memory of the People, and of all *Laws* must be the best for the *English*: for the *Written Laws* made by King and Parliament, are impos'd upon the Subjects before any Probation or Trial whether they are beneficial to the Nation, or agreeable to the Nature of the People, except where they are first made temporary, and for their experientia'd Usefulness afterwards made perpetual; but Customs bind not till they have been tried and approved Time out of Mind.

Besides the Common *Laws of England* in general, there are in several Parts of it certain Customs and Common Usages, which have the force of Common *Law* among those People to whose Property they belong; as *Borough-English*, a Custom fo' call'd as not being in use out of *England*, where the youngest Son, or for want of Sons the youngest Brother, is to inherit, the eldest being supposed to have learnt the Father's Trade, and the youngest the least able to shift for himself. See *Gavelkind*.

Where the Common *Law* is silent, then we have *Statute Laws* made by the several Kings of *England*, with the Advice and Consent of both Houses of Parliament.

Besides these, we make use of the Civil and Canon *Laws* in Ecclesiastical Courts. See *Civil* and *Canon*. We have also *Military* or *Martial Law*, in use among the Soldiery in time of War; and *Forest Law*, for the Regulation of Forests. See *Military*, *Forests*, &c.

*Law* has also a special Signification, wherein it is taken for that which is lawful with us, and not elsewhere; as *Tenant by the Curtesy of England*, and so elsewhere; to wage *Law* (*vadare Legem*) and to make or do *Law* (*facere Legem*). When an Action of Debt is brought against one upon some secret Agreement or Contract, the Defendant may wage his *Law* if he please; that is, swear, and certain Persons with him, that he owes the Plaintiff nothing: But this is only allow'd in case of the Plaintiff's want of Evidence, and when he cannot prove his Sums by any Deed or open Act. When one wages his *Law*, he shall bring with him six or many of his Neighbours as the Court shall assign (Sir Ed. Coke says, eleven) to swear with him that they believe in their Consciences he hath sworn truly; and these in the Civil *Law* are call'd *Comparatores*. The Offer to make Oath is call'd the *Wager of Law*, and when it is accomplish'd, it is call'd the making or doing of *Law*. This Custom is said to have obtained, formerly, among the *Egyptians*.

The Word *Law* is also used figuratively, in speaking of the Rules or Order according to which anything is perform'd. Thus we say, the *Laws of Motion*, the *Laws of Mechanics*, the *Laws of Fluids*, the *Laws of a Game*, &c. See *Motion*, &c.

**LAW OF ARMS**, is that which gives Precepts how rightly to proclaim War, to make and observe Leagues, to attack the Enemy, and to punish Offenders in the Camp.

**LAWING OF DOGS**, a Term used in our Law-Writers. Thus Mastiffs must be *Lawed* every three Years; *Compton Juris*, fol. 163. that is, three Claws of the Fore-Foot shall be cut off by the Skin, or the Ball of the Fore-Foot cut out.

The Word *Law* is derived from the *Saxon*, *Lag* or *Langh*. **LAWLESS COURT**. On *Kings-bill* at *Rockford* in *Essex* every Wednesday Morning next after *Michaelmas-Day*, at *Cock-Crowing*, is held a Court vulgarly call'd the *Lawless Court*. They whipper, and have no Candle, nor any Pen and Ink but a Coal; and he that owes Suit or Service there, forfeits double his Rent every hour he is missing. This Court is call'd *Lawless*, because held at an unlawful Hour, or *quia dicitur sine lege*. It is mention'd by *Cambden*, who says this servile Attendance was imposed on the Tenants for conspiring at the like unseasonable Time to raise a Commotion.

**LAWLESS MAN**, *Essex*. See *Outlaw*. **LAW OF MARQUE**, from the *German* Word *Marech*, a Bound or Limit, is a Law so call'd, by which those who are driven to make use of it, take the Goods or Shipping of the Party that has done 'em wrong, and of whom they cannot get ordinary Justice whenever they can take them within their own Bounds or Precincts. See *Reprisals*.

**LAW MERCHANT**, is become a Part of the Laws of the Kingdom; it consists in this, that if there be two joint Merchants of Wares, and one of 'em dies, his Executor shall have the Moiety: which is not so in the Case of others, nor Merchants.

**LAW OF THE STAPLE**, the same with *Law Merchants*.

**LAW OF MOLMUTIUS**. See *Molmutian Laws*. **LAW OF MOTION**, or of *Nature* (taken in a physical Sense.) See *Motion*.

**LAW OF OLERON**. See *Oleron*.

**LAW SPIRITUAL**, is the Ecclesiastical or Canon Law allow'd by the Laws of the Realm; so far as it is not against the Common Law, nor against the Statutes and Customs of the Kingdom. And regularly, according to such Ecclesiastical Laws, the Ordinary and other Ecclesiastical Judges do proceed in Cases within their Cognizance. See *Canon*.

**LAXATIVE**, in Medicine, is used to signify a loose State or Disposition of the Body, so as to go frequently to stool. Hence *laxative* Medicines are such as promote that Disposition, which they do by some smooth softening Quality, taking away the Tenacity of the Fibres, and facilitating the Passage of the Contents of the intestinal Tube thro it; for which Reason all oily Substances come under this Class. See *Purgatives*.

**LAY**, an old *French* Word, signifying Moan, or Complaint. *Lay* is also the Name of a kind of ancient Poetry, consisting of very short Verses. There were two sorts of *Lays*, the great and the little; the great *Lay* was a Poem, consisting of twelve Couplets of Verses of different Measures; the little *Lay* was a Poem consisting of sixteen or twenty Verses, divided into four Couplets. These *Lays* were the *Lyric* Poetry of the old *French* Poets, who were imitated by some among the *English*. They were principally used on melancholy Subjects, and are said to have been formed on the Model of the *Trochaic Verses* of the *Greek* and *Latin* Tragedies. *Father Morgues* gives us an extraordinary Instance of one of these ancient *Lays* in his Treatise of *French Poetry*:

*Sur l'Appui du Monde  
Que faut il qu'on fonde  
D'Espoir ?  
Cette Mer profonde,  
En Debris secoude  
Fait voir  
Cabre au Matin, Ponde  
Et l'Orage y gonde  
Le Soir.*

**LAY THE LAND**, a Sea-Phrase, used for failing out of sight of Land, in which Case, they say, they have *laid the Land*; and if another Point of Land exclude the sight of the former, they say, they have *laid the first Land* in. *Lay-Land* in Husbandry is also *Fallow Ground* which lies unutilled.

**LAY-BROTHER**, among the *Romanists*, is a pious but illiterate Person, who devotes himself, in some Convent, to the Service of the Religious. He wears a Habit different from theirs, nor ever enters into the Choir or the Chapter. He is not in any Orders, nor does he make any Vow, excepting of Contancy and Obedience. A *Lay-Brother* is also used for an illiterate Religious, who takes care of some of the temporal Concerns of the Convent, as the Kitchen, the Gate, &c. There are also *Lay-*

*Brothers*, who make the three Vows of Religion. In the Nunneries are also *Lay-Sisters*, who never enter the Choir, &c. and who are only retained for the Service of the Convent. The Institution of *Lay-Brothers* began in the eleventh Century. The Persons on whom this Title was conferred, were such as were too ignorant to become Clerks, and who therefore applied themselves wholly to bodily Work. It seems to have taken its Rise from hence, that the Laity in those Days had not, for the generality, the least Tincture of Learning; whence also those came to be called Clerks, by way of Distinction, who had studied a little, and were able to read. The word comes from the *Latin* *Laiicus*, of the *Greek* *laikos*, *People*.

**LAYERS**, are the low Branches of Trees or Shrubs, which are covered with good Mould when you would raise their Kind from them, leaving out their Ends till they are rooted; when they are to be cut off.

**LAYMAN**, a Person not engaged in any Order of Ecclesiastics.

*Layman*, among Painters, is a Statue of Wood, whose Joins are so made that it may be put into any Posture. its chief Use is for the casting and adjusting of Draperies for the clothing of Figures.

**LAZARETTO**, or **LAZAR-HOUSE**, a publick Building in form of an Hospital, for the Reception of poor Sick. In some Countries it is appointed for Persons coming from Places suspected of the Plague to quarantine in. This is usually a large Building, at a distance from any City, whose Apartments stand at a distance from each other, &c. where Ships are unladen, and their Equipage is laid up for forty Days, more or less, according to the Time and Place of Departure.

**St. LAZARUS**, the Name of a military Order instituted at *Jerusalem* by the Christians of the *West*, when they became Masters of the *Holy Land*. They received Pilgrims under their Care, guarded them on the Roads, and defended them from the Insults of the *Mahometans*. Some say it was instituted in 1119. Pope *Alexander IV.* confirmed it by a Bull in 1255, giving it the Rule of *St. Augustine*. The Knights of this Order being driven out of the *Holy Land*, part of them retired into *France*, and were established there under *Louis III.*, who bestowed on them the Country of *Boigny* near *Orleans*. *Innocent VIII.* suppressed the Order of *St. Lazarus* in Italy in 1496, or rather united it to that of *Malta*. *Leo X.* re-established it in Italy in the beginning of the 16th Century. In 1572, *Gregory XIII.* united it in *Spain* to that of *St. Maurice*, just instituted by Duke *Emanuel Philibert*. In *France* this Order was united to that of *N. D. of Mount Carmel* in 1608, and had some new Advantages conferred on it by the late King *Louis XIV.* The Knights of *St. Lazarus* are allowed to marry, and yet have Pensions upon Benefices.

*Fathers of St. Lazarus*, or *Lazarites*, a Name given to certain Regular Clerks of a Congregation instituted in *France* in the 17th Century by *M. Vincent*. They take their Name from a House in the *Faubourg of Paris*. They have a Seminary in *Paris*, called *The Seminary des Bons Enfants*. The Vows they make are simple, and on occasion may be dispensed withal.

**LEAD**, a coarse, heavy, impure Metal, of all others the softest and most fusible, when purified; is called by the Chymists *Stannum*. Those who have made an Analysis of it, find it contains a little Mercury, some Sulphur, and a great deal of bituminous Earth. *Lead* is found in various Countries, but abounds particularly in *England*. 'Tis found, too, in several kinds of Soils and Stones, some whereof, besides, contain Gold, some Silver, others Tin, &c. 'Tis melted on a Furnace provided for the purpose, with a strong Coal-Fire upon it; as it melts, it runs thro' a Canal on one Side of it, leaving the Earth, Stone, and Scorra, with the Ashes of the Coals. 'Tis purified by skimming it e'er cold, and throwing Suet and other fat Bodies into it. Some very able Naturalists observe, that the Weight of *Lead* increases, either in the open Air, or under Ground. *Mr. Boyle* observes this particularly of the *Lead* of Churches, which, he says, frequently grows both in Bulk and Weight, so as to become too ponderous for the Timber that before sustained it; which some account for from the Impurity, Heterogeneity, and loose Texture of its Parts, by means whereof the Particles of the Air getting Admission within its Pores, are attracted, and easily assimilated to it. But others, who rely wholly on Experience, absolutely deny the Effect, as also that it is reproduced in Mines before exhausted, by letting them lie long open to the Air, which others assert. *Lead* is found of a lighter or deeper Colour, according as it is more or less purified, tho' some make a difference in the Colour of the Ore, always esteeming that most which is the whitest.

*Lead* is a Metal of much Use; it easily melts, and mixes with Gold, Silver, and Copper, and communicates, as they talk, its Humidity to them; but not being

ing able to endure the Violence of the Fire which they undergo, it retires, and carries with it all that was heterogeneous in them; so as neither Gold nor Silver are refined without Lead. To which it may be added, that the coarser kind of precious Stones, boiled in Lead, are thereby rendered much more brilliant.

Lead is much used in Building, particularly for Covering, Gutters, Pipes, and Glass. Lead is either cast into Sheets in a Mold, or milled; which last is found by much the least ferricible, not only on account of its Thinness, but also because 'tis so exceedingly stretched in milling; that when it comes to lie in the hot Sun, it shrinks and cracks, and consequently will not keep out the Water. The Lead used by Glaxiers is first cast into slender Rods, twelve or fourteen Inches long, called *Canes*; which being afterwards drawn thro' their Vice, comes to have a Groove on either Side for the Panes of Glass; and this they call *Torned Lead*.

The Method of paling or folding Lead for fitting on of Imboid Figures, &c. is by placing the Part where on the Figure is to be paled, horizontal, and throwing on it some pulverized Rosin; under this place some Coals, till such time as the Rosin becomes reddish, and rises in Pimples; then apply the Figure, and rub some soft Solder on to the joining: when this is done, the Figure will be paled on, and as firm as if it had been cast on it.

*Paracelsus* asserts, that Lead reverberated into Minium, melted into Glass, reduced into Cerufs, and burnt into Litharge, immediately resumes its original Figure, upon the dexterous Application of a lixivial Salt. The Antients, according to *Schindlerus*, used to compose Books of Plates of Leaves of Lead.

For the Manufacture of Lead, see *Plumbers*.

There are various Preparations of Lead, serving for various Purposes:

*Lead-Dust*, a Preparation used by the Potters, made by throwing Charcoal-Dust in melted Lead, and stirring them a long time together; to separate the Coal again, they only wash it in Water, and dry it afresh. Its Use is to give a Varnish and Gloss to their Works.

*Burnt-Lead* is a Chymical Preparation used in Medicine, made of Plates of Lead melted in a Pot with Sulphur, and reduced into a brown Powder.

*White Lead*, used by Painters, is only thin Plates of Lead dissolved by Fumes of boiling Vinegar. See *Cerufs*. Mafficots of several Colours, and the Sandix, are also Preparations of Lead. See *Mafficot* and *Sandix*.

Litharge of Gold or Silver, is only the Lead used in purifying Copper. See *Litharge*.

*Red Lead*, a Preparation of Mineral Lead calcined, used by Painters, Putters, and Physicians. See *Minium*.

By help of Chymistry there are also drawn from Lead, Salts, Balsams, Oils, Vinegar, a Magistery, &c. distinguished under the Name of *Saturn*, to amuse the Ignorant.

*Salt or Sugar of Lead*, or *Saturnum Saturni*, is an essential Salt of Vinegar, incorporated with the proper Substance of Lead, dissolved in the Spirit of Vinegar. *Balm of Lead*, or *Saturn*, is an Oil drawn from the Salt of Lead by Distillation, after having dissolved it in Spirit of Turpentine. Magistery of Lead is the Calx of Lead purified and subtilized, which is made of Lead dissolved in *Aqua fortis*, pouring a filtrated Salt water into it; whence results a Magistery extremely white, which, when softened by several Lotions, is mixed with Pomatams for the Face and Complexion.

*Black Lead*, a kind of Mineral Stone, of a black Colour, but silvered, and shining, found in Lead Mines, and appearing to be nothing else but Lead not yet arrived at Maturity; much used for Pencils or Crayons for designing. 'Tis melted like the common Lead.

*Mr. Glanville* observes, that the Smoke of the Lead-Works in *Somerfetshire* is a prodigious Annoyance, and subjects both the Workmen, and the Cattel that graze about them, to a mortal Disease. The Trees that grow near them have their Tops burnt, and their Leaves and Outfides discoloured and scorched.

When the Lead-Ore is dug out, they beat it small, then wash it clean in a running Stream, and sift it in Iron Raddlers. Their Hearth or Furnace is made of Clay or Firestone; this they fer in the Ground, and on it build their Fire, which they light with Charcoal, continuing it with young Oaken Gads, blown with Bellows, by Mens treading on them. After the Fire is lighted, and the Fire-Place hot, they throw their Lead-Ore on the Wood, which melts down into the Furnace, and then with an Iron Ladle they take it out, and upon Sand cast it into what Form they please.

The Mine-Men sometimes find the Vein run up into the Roots of Trees, and yet don't observe any Difference between those and other Trees. When the Mine is near the Surface, the Grafs is sometimes found yellow. They make no account of the *Virgula Drivinatoria*; yet say, that

when a Mine is open, they may guess by it how far the Vein will lead. The Ore runs sometimes in a Vein, sometimes dispersed in Banks; it lies many times between Rocks; some of it is harder, others milder; sometimes they have branched Ore in the Spar; about the Ore is Spar and Chalk, and another Substance, which they call *Crozier*.

LEAF, LEAVES, part of a Plant, ordinarily very thin and flat, growing in the Spring, and falling off in Autumn. There are some Plants without Leaves, as Truffles and Mushrooms. As to the Structure of Leaves, *Dr. Grew* observes, that their Fibres never stand on the Stalk in an even Line, but always in an angular or circular Posture, and their vascular Fibres or Threads are 3, 5, or 7. The Reason of which Position is for their more erect Growth and greater Strength of the Leaf. Another Observable in the Fibres of Leaves, is their orderly Position, so as to take in an eighth part of a Circle, as in Mallows; in some a tenth, but in most a twelfth. The same Author observes six several Parts intended by Nature for the Preservation of Gems; viz. Leaves, Sunfoils, Interfoils, Stalks of Leaves, Hoods, and Mantlings that cover them. The Skin or Coat of the Leaves is no more than that of the Branches extended, as Gold, by beating, is reduced into Leaves. In the Gem they are folded, sometimes in two, and sometimes in several Plains, somewhat after the manner of a Fan. If the Leaf be too thick to plait commodiously in two, and to be ranged against each other; or if they be in too small a Number, and their Fibres too delicate, instead of being plaited, they are rolled up, and form either a single Roll, as the Leaves of the Mountain Cowslip, which are thick; or two Rolls, which begin at each Extremity of the Leaf, and meet in the middle. There are some Plants whose Leaves form three Rolls, as Fern; several Leaves are covered with Hair of several Figures, those of Lavender and Olive-Tree have Hair resembling Stars.

Botanists consider the Leaves of Plants, with regard to their Structure, to their Surface, Figure, Consistence, their Edges, Situation, and Size. With regard to their Structure, Leaves are either single, as those of the Apple-Tree, Pear-Tree, &c. or double, as those of Angelica, Parsley, &c. With regard to their Surface, Leaves are either flat, as the Nymularia, Aflurum, Organy, Androsæum, Brionia Canadensis, &c. or hollow, as those of the Onion and Asphodel; or in Bunches, as several kinds of Kali, Salico, and House-Leeks. With regard to their Consistence, Leaves are either thin and fine, as those of St. Job's-Wort, and Dog's Grafs; or thick and gross, as those of Porcalata; or fleshy, as those of several kinds of House-Leeks; or woolly, as those of the Wool-Blade. With regard to their Edges, Leaves are either cut slightly, as some Species of Geum, and Cannabis Lutea; or deep, as Trefoil, &c. With regard to their Situation, Leaves are either alternate, that is, ranged alternately, as the Phyllica; or opposite to each other, as the Phyllireca, and some Species of the Rubia. With regard to their Size, Leaves are either very big, as those of the Colocasia and Spondylium; or moderate, as those of Biftort, the Fig-Tree; or small, as those of the Apple-Tree, Pear-Tree, Peach-Tree; or very small, as those of Mille-Pertuis, or St. Job's-Wort.

Leaf, or *Leaves*, is also used to express the most sensible and agreeable Parts of Flowers. 'Tis true, all Flowers have not Leaves, and 'tis sometimes difficult to determine which is to be called the Leaves, and which the Calix of the same Flower. To prevent the confounding of the Leaves of the Flower with those of the rest of the Plant, the former are called *Petala*, from a Greek Word which the Botanists have adopted into their Latin Descriptions, when they speak of the Leaves of Flowers. The Leaves of Plants they call *Folia*, and those of the Flowers *Petala*. See *Petalum*.

*Leaves in Architecture*, an Ornament in the Corinthian Capital, and thence borrowed into the Composite; consisting in the Representation of a double Row of Leaves covering the Vase, Tympanum, or Neck of the Column. These Leaves are usually made in imitation of those of the Acanthus, sometimes of those of Olive, and sometimes of Laurel. The Leaves are divided, each making three Ranges of lesser, and are bent, a-top, one third of their Height. See *Capital*, *Acanthus*, &c.

LEAGUE, an Extent of Ground, considered lengthwise, serving to measure the Distances of one Place from another, and containing more or less Geometrical Paces, according to the different Usages and Customs of Countries.

A Sea League is 3000 Geometrical Paces, or three English Miles; the large Leagues of France, are usually 3000, and in some Places 3500 Paces; the mean or common League is 2400 Paces, and the little League 2000. *Chorier* observes, that the ancient Gaulish Leagues were but 1500 Paces. The Spanish Leagues are larger than the French, 17 Spanish Leagues

Leagues make a Degree or 60 French Leagues, or 69  $\frac{1}{2}$  English Statute Miles. The Leagues of Germany and Holland contain four Geographical Miles each. The Persian Leagues are nearly the same with the Spanish, that is, they are equivalent to four Italian Miles; which comes pretty near to what Herodotus mentions of the Parafanga, an ancient Measure among the Persians, containing thirty Stadia, eight whereof, according to Strabo, make a Mile. The Persians mark their Leagues by Trees, as the ancient Romans did by Stones, Lapidary; for which reason they call them *Agge*, a Turkish Word signifying Tree. In Japan the League consists of 1800 Fathoms. These are all distinguished by little Hillocks, raised on purpose by the Road-side. See the Leagues of most Countries, reduced to the Roman Foot, under the word Mile.

The word comes from *Leaca*, or *Leaga*, an ancient Gaulish Word, as *Menage* has proved from *Isidore*, St. Jerome, Am. Marcellinus, &c. Some derive the word *Leaca* from *leues* white, in regard the Gauls, in imitation of the Romans, marked the Spaces and Distances of their Roads by white Stones.

LEAGUE, an Union or Confederacy between Princes and States for their mutual Aid, either in attacking some common Enemy, or in defending themselves. There have been several holy Leagues entered into by the Christians against the Saracens and Infidels, sometimes also called *Crispades*. The League is used by way of Eminence for that famous one on foot in France, from the Year 1576, to 1593. Its Intent was to prevent the Succession of Henry IV. who was of the Reformed Religion, to the Crown, and it ended with his Abjuration of that Faith. The Leagues, or Confederates, were of three kinds: The zealous Leagues aimed at the utter Destruction, not only of the Hugonots, but also of the Ministry. The Spanish Leagues had principally in view the transferring the Crown of France to the King of Spain, or the Infanta his Daughter. The moderate Leagues aimed only at the Extirpation of Calvinism, without any Alteration of the Government. The Word comes from *liga*, which, in the corrupt Latin, was used for Confederation, *Quod quis eam alio ligatur*.

LEAKAGE, is a Leaking or Leak in a Vessel, through which the Liquor runs out: Also an Allowance made to a Merchant in Liquid Goods of 12 *l. per cent.* Also an Allowance of Brewers of 2 in 24 Barrels of Ale, and 3 in 23 Barrels of Beer.

LEAP-YEAR, or Bissextile, is every fourth Year, so called from its *leaping* a Day more that Year than in a Common Year; for in the Common Year any fixed Day of the Month changeth successively the Day of the Week, but in the Leap-Year it skips or leaps over one Day. The Common Year hath 365 Days in it, but the Leap-Year 366 Days, and then February hath 29 Days, which, in the Common Year hath but 28. To find the Leap-Year, this is the Rule;

Divide by 4, what's left shall be,  
For Leap-Year, for page 1, 2, or 3.

For Example; what is the Year 1720, a Leap-Year, or Common Year

4) 1720 (430

There is 0 Remainder, so that it is Leap-Year.

LEASE, in Law, signifies a Demise, or letting of Lands, Tenements, Right of Common, Rent, or any Hereditament unto another, for Term of Years, or for Life, for a Rent reserved, and is either written, called also *Indenture*, *Deed Poll*, or *Lease* in writing; or by word of Mouth, called *Lease Parol*. The Party that leteth this Lease is called the *Lessor*, and the Party to whom it is let the *Tessee*. A Lease hath in it six Points; (1.) Words sufficient to import a Demise. (2.) A Lessee named. (3.) A Commencement from a Day certain. (4.) A Term of Years. (5.) A Determination. (6.) A Reservation of Rent.

LEASH is a Term used in the Game for three Creatures of any Kind, as a *Leash* of Greyhounds; as a Brace prefixed two.

LEAVEN, any thing that will make a Body swell by means of the moist subtil and penetrating of its Parts; which being agitated and divided, divide and agitate the more gross, as we may observe in Paite, in several Liquors, &c. The word comes from *leavannus*, a *leavannus*, because Leaven makes the Paite, &c. rise. See Ferment.

LEAVER. See Leaver.

LECTICARIUS, an Officer in the Greek Church, whose Business it was to bear off the Bodies of those who died, and to bury them. The chief of the *Lecticarii* was the Deacon. The Romans had two Kinds of *Lecticarii* different from those of the Greeks, and who answered nearly to the Office of our Chairmen.

LECTISTERNIUM, a religious Ceremony among the ancient Romans; it consisted in a Festival prepared, and

solemnly given in the Temple. And because, according to the Custom of those Times, they placed Beds around the Tables, and for the Statues of the Gods on those Beds, in the same manner as Men sat at Meals: They call'd this Practice *Lechisternium*, from *Lechus*, Bed, and *sternere* of *sterno* to spread, prepare. In this Ceremony the *Ephuleni* (mentioned under that Head) presided. Casaubon has observed from a Passage in the Scholiast of *Pindar*, that the Greeks had also the *Lechisternium* in Use. Livy observes that the first *Lechisternium* seen in Rome, was that which held for eight Days successively, in honour of *Apollo*, *Latoa*, *Diana*, *Heracles*, *Mercury*, and *Neptune*, on occasion of a contagious Difease that kill'd all their Cattle, in the Year of Rome 354, tho' *Valerius Maximus* mentions one before that.

LEE, a Term variously used at Sea, but its general Use is to signify the Part opposite to the Wind: Thus the *Lee-shore* is that on which the Wind blows, and therefore to be under the *Lee* of the Shore, is to be close under the Weather-shore, or under Wind. When they say *A-lee* the *Helm*, they mean, put the Helm to the *Lee-ward* Side of the Ship. They say also, take care of the *Lee-latch*, which is a Word of Command to the Man at the Helm, to take care that the Ship do not go to the *Lee-ward* of her Course; wherefore they call a *Lee-ward* Ship one that is not fast by a Wind, or which doth not fail so near the Wind, nor make so good way as she should. To lay a Ship by the *Lee*, or to come by the *Lee*, is to bring her so, that all her Sails may lie flat against her Masts and Shrouds, and that the Wind may come right upon her Broad-side. The *Lee-way* of a Ship, is the Angle made by the Line on which the Ship should run, according to her Course, or the Point of the Compass steered upon, and the real Line of the Ship's Way; for all Ships are apt to make some *Lee-way*, wherefore in casting up the Log-board, something must always be allowed for *Lee-way*. The ordinary Rules are these: (1.) If the Ship be upon a Wind, you must allow one Point for *Lee-way*, (2.) If the Wind blow hard, so that you are forced to take in one Top-sail, allow two Points for *Lee-way*. (3.) If it blow so hard, that both Top-sails must be taken in, and the Sea runs high, allow three Points for *Lee-way*. (4.) If her Fore-sail being furled, she try under a Main-sail or Mizzen, she will make her way four Points before the Beam. (5.) If she try with a Main-sail only, she will make her way near three Points before the Beam. But (6.) If under a Mizzen only, she will make her way about two Points before the Beam.

LEES, the grossest and thickest Parts of Wine, Oil, and other Liquors; or the Sediment found at bottom of the Vessel. A kind of gravelly Sand is made with the Lees of Wine burnt and prepared, used by Dyers, &c. which ought to stand as a Caution to People troubled with the Stone, &c. The Word comes from the French *Lie*, and that either from *Limus Modus*, or from *Lyes* one of the Surnames of *Bacchus*; or according to *Du Cange*, from *Lia*, a corrupt Latin Word signifying the same thing. The Vinegar-Makers make a great Trade of the Lees of Wine dried and made into Cakes, after having squeezed out the Remains of the Liquor in Presses.

LEET, an old Saxon Word for a Law-day; from the Saxon *Lite* little, quasi a little Court; or from the German *Laet*, i. e. a Country Judge. The Court-*Leet* is a Court held by the Lord of a Manor, tho' in reality 'tis the King's Court, in whose Manor forever it is held, in regard the Authority thereof belongs originally to the Crown, and is derived thence to other Persons: It is a Court of Record, and inquires of all Offences under High-Treason, tho' it cannot punish many, but must certify them to the Justices of Assize.

LEGACY in Law, any particular Thing given by a Last Will and Testament; for if the whole Estate be so given, it is said to be Hereditary, and he to whom it is so given, is called *Heir* by the Civilians; though in common Law, the Distinction is this, that he to whom all the Man's Lands and Hereditaments descend by Right of Blood, is *Heir* *Natus*; the other to whom 'tis bequeath'd is called *Heir* *Falsus*. In the Ecclesiastical Sense *Legacy* was formerly a Soul-Seat, a Bequest to the Church, or accustomed Mortuary; and this was to hold good, even tho' the Testament it self were declar'd null and invalid.

LEGALIS HOMO, in Law; a Person who stands *velius* in Curia, not out-law'd, nor excommunicated, nor defamed; and in this Sense are those Words so often used, *Probi* & *Legales* *Homines*. Hence Legality is taken for the Condition of such a Man.

LEGATE, a Prelate whom the Pope sends as Embassador to any sovereign Prince. There are three Kinds of Legates, viz. *Legatus a latere*, *Legatus de latere*, and *Legatus by Office*, or *Legatus Nati*. Of these the most considerable are the *Legatus a latere*; such are those whom the Pope commissions to take his Place in Councils, so called, in regard

the Pope never gives this Office to any but his greatest Favourites and Confidants, who are always at his Side, *à latere*: that is, to the Cardinals. He may confer Benefices without Mandate, legitimate Bastards to hold Offices, and has a Cross carried before him as the Ensign of his Authority. The *Legatus à latere*, are those who are not Cardinals, but are yet intrusted with an Apostolical Legation. *Legatus* by Office are those who have not any particular Legation given them, but who by virtue of their Dignity and Place in the Church become *Legati*. Such are the Archbishops of *Rome* and *Alex*. But the Authority of these *Legatus* is much inferior to that of the *Legatus à latere*. The Power of a *Legatus* is sometimes given without the Title. Some of the Nuncio's are invested with it.

The Term *Legatus* comes from that of *Legatus*, which *Varro* derives from *legere* to chuse, and others from *legare*, *delegare*, to send, delegate. See *Wicgng's* *tr.*

LEGATORY, a Term used in speaking of the Government of the ancient *Romans*; *Angulus* divided the Provinces of the Empire into Consular, *Legatory*, and Pre-fidial. *Legatory* Provinces were those whereof the Emperor himself was Governour, but where he did not reside, but admittit Affairs by his Lieutenant or *Legatus*.

LEGATUS, or LEGAT, among the *Romans*, was an Officer of Distinction, who commanded under the first or leading Officer. Of these there were two Kinds, viz. a *Legatus* in the Army under the General, answering to our Lieutenant-General, and a *Legatus* in the Provinces under the Proconsul or Governour. When any considerable Person among the *Roman* Citizens had occasion to pass thro' any of the Provinces, the Senate gave him the Title of *Legatus*; that is, of Envoy from the Senate, to the end he might be received with the greater Respect, and that the Cities and Towns thro' which he travelled might defray his Expences. This they call'd a free Legation, in regard the Person was not incumber'd with any Trust, and might lay it aside as soon as he pleas'd.

LEGEND, was originally a Book used in the old *Romish* Churches, containing the Lives of Saints and Martyrs came to be call'd *Legends*; because Chapters were to be read out of them at *Matins*, and in the Recollections of the Religious Houses. The Golden Legend is a Collection of the Lives of the Saints, compiled by *James de Voragine*, Vicar General of the *Dominicans*, and afterwards Archbishop of *Genoa*, who died in 1298. It was received into the Church with a world of Applause, which it maintained for 200 Years; but, in effect, is so full of ridiculous and romantic Accounts, that the *Romanists* themselves are now generally ashamed of it. The Word *Legend* it self is on that account come into disrepute.

*Legend* is also used to signify the Words or Letters engraven about the Edges, &c. of Coins. Thus the Legend of a French Crown, is, *Sit nomen Domini Benedictum*; that of a *Moidre*, in hoc Signo vivit; and on those of the last Emperors of *Constantinople*, we find, *Jesus Christus Basileus Basileum*, *IHS XPS NIKA*, *Jesus Christus Venerit*.

*Legend*, is also used for the Inscriptions of Medals, which serve to explain the Figures or Device. In strictness, the *Legend* differs from the Inscription; this last properly signifying Words placed on the Reverse of a Medal, in the place of Figures. It seems as if the Antients had intended their Medals should serve both as Images and as Emblems; the one for the common People, and the other for Persons of Quality and Parts: the Images to represent the Faces of Princes, and Emblems to represent their Virtues and great Actions: So that the *Legend* is to be looked on as the Soul of the Medal, and the Figures as the Body. Every Medal has two *Legends*, that on the Front, and that on the Reverse. The first, for the generality, serves only to distinguish the Person by his Name, Titles, Offices, &c. the latter is intended to express his noble and virtuous Sentiments, his good Deeds, and the Advantages the Public has reap'd by him; this however does not hold universally, for we sometimes find the Titles flated between both Sides, and sometime the *Legend*. In the Medals of Cities and Provinces, as the Head is usually the Genius of the Place, or at least some Deity adored there; the *Legend* is the Name of the City, Province, or Deity, or of both together; and the Reverse, some Symbol of the City, &c. frequently without a *Legend*; sometimes with that of one of its Magistrates. The Subjects of *Legends* are the Virtues of Princes, the Honours they have receiv'd, Consecrations, signal Events, public Monuments, Deities, public Vows, Privileges, &c.

*Legends* and Inscriptions of Medals, are either in *Latin* or *Greek*. The *Greek* Character, consisting of Majuscule or Capital Letters, appears uniform on all the Medals, no Change or Alteration appearing in confronting the several Characters, tho' 'tis certain there was in the ordinary Use

and Pronunciation. All we observe on Medals, is sometimes a Mixture of *Greek* and *Latin* Letters. The Character was preserved in all its Beauty till the time of *Gallien*. From the time of *Constantine*, and for the Space of 500 years, the *Latin* Tongue alone was used in the *Legends* of Medals, even in those struck at *Constantinople*. *Michael* began the first, whose *Legend* was in *Greek*, and from his Time the Language, as well as the Characters, began to alter for the worse.

LEGION, a kind of Regiment or Body of Forces, whereof the *Roman* Armies were composed. The Number of Soldiers and Officers whereof the *Legion* consisted, was different at different Times: But 'tis impossible to determine the precise Time and Manner of their Alteration. In the Time of *Romulus* each *Legion* consisted 3000 Foot, and a Hundred *Equites*, or Knights: These were divided into three Bodies, which made as many Orders of Battel. Each Body consisted of ten Companies, or Manipules, ranged at some distance from each other, tho' in the same Front. Each Body had two General Officers to command it, called *Tribunes*, and each Manipule two Centurions. Under the Centurions the *Legion* consisted of 4000 Men, who made four Bodies, commanded by a Consul or one of his Lieutenants, and each *Legion* had its share of Cavalry, which was from two to three hundred Horse. Afterwards, in the time of *Marius*, these four Divisions of the *Legion* were united into one, and augmented, and Cohorts were appointed from five to six hundred Men, each under the Command of a Tribune. Each Cohort consisted of three Companies or Manipules, each Manipule of two Centurions, and the *Legion* divided into ten Cohorts, who made as many distinct Battalions disposed in three Lines; so that the *Legion*, then, consisted of five or six Thousand Men. *Isidore* tells us, that the *Legion* consisted of six Thousand Men, divided into sixty Centurions, thirty Manipules, twelve Cohorts, and two Hundred Troops. According to the *French* Academy, the *Legion* consisted of six Thousand Foot, and seven Hundred twenty-five Horse. The *Legions* were by far the most considerable part of the *Roman* Army; their Number in the time of *Augustus* was thirty-three; they were composed wholly of *Roman* Citizens. The Allies formed a Body of Auxiliary Forces. The Standard bore by the *Legions* was as various. At first a Wolf, in honour of that which suckled *Romulus*, afterwards a Hog; by reason, says *Romulus*, War is only undertaken with a View to Peace, which was concluded by sacrificing a Hog. Sometimes they bore the Minotaur, to remind their General that their Designs were to be kept secret, and inaccessible as the Minotaur in the Labyrinth. They also bore a Horse, a Boar, &c. *Pliny* tells us, that *Marius* was the first who changed all these Standards into Eagles. The Word *Legion* comes from the *Latin* *legere*, to chuse; because when the *Legions* were raised, they made choice of such of their Youth as were the most proper to bear Arms.

LEGISLATOR, he who makes the Laws of a Kingdom, or State, which he has founded. The principal ancient Legislators are, *Moses*, Legislator of the *Hebrews*; *Mercurus Trimegistus* and *Isocrates* of the *Egyptians*; *Italus* of the *Oenotrians*; *Thestus*, *Draco*, and *Solon* of the *Athenians*; *Zoroaster* of the *Babrians*; *Charondas* of the *Capadocians*; and *Charondas*, or *Phalacas*, of the *Carthaginians*; *Andromachus* of the *Chalcidians*; *Eudoxus* of the *Cnidians*; *Philo* of the *Corinthians*; *Ephorus* and *Minos* of the *Cretans*; *Pythagoras* of the *Crotomates*, and most of the Cities of *Greece*; *Major* *Parmenides* and *Zeno* of *Elea* in *Lucania*; *Arribas*, or *Tharexas*, of the *Epirotes*; *Zamolxis* of the *Gete*; *Phoromeus* of the *Greeks*; *Baccus* of the *Indians*; *Saturus* of *Italy*; *Macarius* of the *Iste* of *Leibes*; *Zaleneus* of the *Levrians*; *Nicodorus* *Abdeta* of the City of *Mutina*; *Hippodone* of *Milens*; *Charondas* of *Rheggio*; *Lycurgus* of the *Locedemonians*; *Archytas* of *Tarentum*; *Philonus* of the *Thebans*. At *Rome* the People were, in great measure, their own Legislators, tho' *Solon* may be said, in some sense, to have been their Legislator, in regard the *Decemvirs*, who were created for the making of Laws, borrowed a great Number from those of *Solon*.

LEGITIMATION, an Act by which Natural Children are rendered legitimate. The Father and Mother by marrying render their Children begotten before Marriage legitimate, and this is called *Legitimation, per subsequens Matrimonium*. The Right of *Legitimation* was a thing unknown to Princes till the time of *Constantine*, but since his Time has been exercised by most of them. The *Greek* Emperors invented several kinds of *Legitimation*. *Anastafius* put it in the power of the Father to legitimate his natural Children by a bare Adoption, provided he had no legitimate Children. But *Justin* by his Constitution, and *Justinian* by his Novel 74, abolished this *Legitimation*, as fearing the too easy access to *Legitimation* should encourage Concubinage. In lieu of this he established a way

way of *Legitimation* by the Emperor's Letters. This rendered *Barthards* capable of attaining to Honours, and even of succeeding to Inheritances, provided the Persons were legitimated with the Consent of their Father and Mother; which is agreeable to the Canon Law.

**LEGS**, the lower Parts of the Bodies of Animals, serving them for Support and for Motion. Some Anatomists divide the Foot of Man into three Parts, *viz.* the Thigh, the *Leg*, and the lesser Foot. In the *Leg* there are two considerable Bones, the one called *The Great Foote*, or the *Tibia*; the other *The Little Foote*, or the *Fibula*.

The *Legs* and Feet of the several Animals, Mr. *DeBam* observes, are exactly conformable to the Posture, Make, way to the Motion and Exercises of those Animals. In some they are made for Strength only, in others for Agility and Swiftness; in some for walking and running, in others for swimming, in others for digging, and in others for flying. In some more lax and weak for traversing the plain Land, in others stiff and rigid for Ice and Precipices. In some shod with tough and hard Hoofs, some whole, some cleft. In some the Feet are composed of Toes, some short for only going, others long to supply the Place of Hands; some armed with Talons to catch and tear their Prey, some with short Nails to confirm their Steps in running and walking. In Birds the *Legs* are curved for their easy Perching, Rooting, and Rest, as also to help them on the Wing in taking their Flight, and to be therein com. modiously tucked up to the Body, so as not to obstruct their Flight. In some long for wading, &c.

*Legs* of a Triangle; when one Side of a Triangle is taken as a Base, the other two are called *Legs*.

**LEGUMEN**, in Botany, is that Species of Plants called *Pulse*; which are so named as being gathered with the Hand, by which they are distinguished from Wheat, Corn, &c. which are mowed or reaped. Of this kind are all that grow in Pods, as Beans, Pease, &c. In the general, all Plants, which have a Papilionaceous, or Butterfly-like Flower, are reckoned by Mr. Ray among the *Legumina*. The word *Legumen*, according to *Favos* and *Servius*, is formed *ex eo quod Manus legatur, & non fecatur*; in regard it is gathered with the Hand, and not cut.

**LEMMA**, a Term chiefly used in Geometry. It signifies an Assumption, or preparatory Proposition, laid down to clear the way for some following Demonstration: frequently prefix'd to Theorems, in order to render their Demonstration less perplex'd and intricate, and to Problems in order to make their Resolution more easy and short. Thus to prove a Pyramid one third of a Prism, or Parallelepiped, of the same Base and Height with it; the Demonstration whereof in the ordinary way, is difficult and troublesome, this *Lemma* may be premis'd, which is proved in the Rules of Progression; That the Sum of the Series of the Squares in Numbers in Arithmetical Progression, beginning from 0, and going on 1, 4, 9, 16, 25, 36, &c. is always subsitrite of the Sum of as many Terms equal to the greatest; or is always  $\frac{1}{2}$  of the greatest Term multiplied by the Number of Terms. Thus to find the Inflection of a Curve Line, this *Lemma* is first premis'd; That a Tangent may be drawn to the given Curve in a given Point. Thus in Physics, to the Demonstration of most Propositions, such *Lemmata* as these are necessary first to be allowed; That there is no Penetration of Dimensions; That all Matter is divisible; and the like. As also in the Theory of Medicine, That where the Blood circulates, there is Life, &c.

**LEMNIAN EARTH**, a Medicinal Astringent, used in the same Cases as Bole, which see. It hath its Name from the Island of *Lemnos*, whence it is chiefly brought: Many form it into round Cakes, and impress a Seal upon it, whence it is call'd *Terra Sigillata*.

**LEMONADE**, a Drink prepared of Water, Sugar, and Citrons or Lemons. This delicious Liqueur is so popular in Paris, that it has given its Name to a new establish'd Company, call'd *Lemonadiers*.

**LEMURES**, Sprites, Hobgoblins; Restless Ghosts of departed Persons, who return to torment the Living. These are the same with the *Larve*, which the Ancients imagined to wander round the World, to frighten good People, and plague the bad. For this reason, at Rome they had their *Lemuralia*, or Feasts instituted to appease the *Manes* of the Defunct. *Serapier* explains the *Manes* thus: The Soul of Man released from the Bands of the Body, and freed from performing his bodily Functions, becomes a kind of Demon or Genius, formerly called *Lemures*. Of these *Lemures*, those that were kind to their Families, were called *Lares Familiares*; but those, who for their Crimes were condemned to wander continually without meeting with any Place of Rest, and terrified good Men, and hurt the bad, were vulgarly called *Larve*. An ancient Commentator on *Hierac* mentions, that the *Romans* used the Term *Lemures* for *Remors*; which last

Word was formed from *Remus*, who was kill'd by his Brother *Romulus*, and who returned to Earth to torment him. But *Apicius* observes, that in the ancient *Latin* Tongue *Lemures* signified the Soul of a Man separated from the Body by Death.

**LEMURIA**, or *Lemuralia*, the Name of a Feast solemnized at Rome on the ninth of May, to pacify the *Manes* of the Dead, or in honour of the *Lemures*. The Institution of this Feast is ascribed to *Remulus*, who to rid himself of the Phantoms of his Brother *Remus* (whom he had ordered to be murdered) appearing always before him, ordained a Feast called after his Name *Remuria*, and *Lemuria*. They offered Sacrifices for three Nights together, during which time all the Temples of the Gods were shut up, nor any Marriage permitted. There were a world of Ceremonies in this Feast, chiefly intended to exorcise the *Lemures*, and to prevent their appearing or giving any disturbance to the Living.

**LENTITIVE**, in Physic, is any softening resolute Remedy, that mollifies the Part diseas'd, and dissipates any sharp Humour collected there. *Lentivo*, in Pharmacy, is a gentle Electuary, composed of Sena, Polyopdy, &c. so called in regard it purges easily, and by resolving.

**LENS**, in Dioptricks, is any Glass (not very thick) which either collects the Rays of Light into a Point, in their passage through it, or disperses them further apart, according to the Laws of Refraction. *Lens*'s have various Figures; that is, are terminated by various Surfaces, from which they acquire various Names. Some are plane on one side, and convex on the other; others convex on both sides; both which are ordinarily called *Convex Lens*'s: tho' when we speak accurately, the former is call'd *Plano-Convex*. Again, some are plane on one side and concave on the other, and others are concave on both sides, which are both usually rank'd among the *Concave Lens*'s; tho' when distinguished, the former is call'd a *Plano-Concave*. Others again are concave on both sides; others are concave on one side, and convex on the other, which are call'd *Convexo-Concave* or *Concavo-Convex Lens*'s, according as the one or the other Surface is more curve, or a Portion of a less Sphere. It is to be here observ'd, that in every *Lens* terminated in any of the forementioned manners, a right Line perpendicular to the two Surfaces is call'd the *Axis* of the *Lens*. Which *Axis*, when both Surfaces are spherical, passeth thro both their Centres; but if one of 'em be plain, it falls perpendicularly upon that, and goes thro the Centre of the other.

For *Convex Lens*'s, the Laws of their Refraction, and their Effects depending thereon, are as follow.

A Ray of Light EG near the *Axis*, (*Fig. 1. Plate Opticks*) and parallel thereto, striking on the plane Surface of a *Plano-Convex Lens*, directly opposite to the luminous Body, after Refraction concurs with the *Axis* in the Point F; and if C be the Centre of the Convexity, CF will be to CL, that is, the Distance of the Centre from the Point of Concourse or Focus, will be to the Distance of the Centre from the Convex Surface, in the Ratio of the Refraction. See *Refraction*.

For the plane Surface being directly opposed to the luminous Body, the Ray EG is perpendicular to AB, and therefore will pass unrefracted to H: Thus it strikes on A H still parallel to the *Axis*; and therefore coming out of a denser Medium into a rarer, will meet the *Axis* of the *Lens* in F, and so, as that CF will be to EL in the Ratio of the Sine of the refracted Angle to the Sine of the Angle of Inclination. As will be demonstrated under the Head *Refraction*.

*Cor.* If then the Refraction be out of a Glass *Lens* into Air CF: EL :: 3 : 2, and therefore FL = 2 CL. That is, parallel Rays near the *Axis* will concur at that is the distance of the Diameter. Again, if the Refraction were out of a *Water-Lens*, i. e. out of a *Plano-Concave Lens* fill'd with Water, CF: EL = 4 : 3, and therefore EL =  $\frac{3}{4}$  CL. i. e. parallel Rays near the *Axis* will concur with it at the distance of half the Diameter. So that if a lighted Candle be placed in the Focus of a *Plano-Concave Lens*, that is, in the Point F, distant from the Surface of the *Lens* A L B, by the length of the Diameter, and from the Surface of the *Water-Lens*, by half the Diameter, its Rays after Refraction will become parallel. See *Refraction*.

If the Ray K I (*Fig. 2. Plate Opticks*) near the *Axis* of a *Plano-Convex Lens*, and parallel thereto, strike on its convex Surface A H B, after a double refraction it will meet the *Axis* in F; so as that H G will be to G C, and G E to F H in the Ratio of the Refraction.

For the Ray K I, parallel to the *Axis* E G, by virtue of the first Refraction in I, will tend to the Point G, so as G H will be to G C in the Ratio of the Sine of the Angle of Inclination to the Sine of the Refracted Angle: therefore by virtue of the second Refraction in L, it will concur

concur with the Axis in F; so as GD will be to ED in the Ratio of the Sine of the refracted Angle, to the Sine of the Angle of Inclination: (See Refraction.) So that the Semidiameter and Thickness of the *Plano-Convex Lens*, with the Ratio of Refraction being given, hence arises a Method of determining the Focus of parallel Rays striking on the Convex Surface. For

Cor. Hence, if the *Lens* be Glass,  $FD = 2 CH - \frac{1}{2} HD$ . So that if two thirds of the Thickness of the *Lens* be inconsiderable (as in Practice it usually happens) parallel Rays meet with the Axis at the Distance of the Diameter from the *Lens*, even when they strike on the Convex Surface.

So that as to the Place of the Focus, 'tis the same thing whether the plane Surface, or the convex one, be turned to a Luminary of parallel Rays; tho' it appears both from Experience and trigonometrical Calculation, that there are more Rays united in a less Space, if the convex Surface, than if the plane one be turned towards the Sun.

If the *Lens* were full of Water  $ED = 3 CH - \frac{1}{2} HD$ . Wherefore if  $\frac{1}{2} HD$  be inconsiderable  $FD = 3 CH$ , or if  $\frac{1}{2} HD$  be inconsiderable  $FH = 3 CH$ . Parallel and near Rays, therefore, are united at the Distance of half the Diameter, if the Refraction be in Water, even when the Convex Surface is opposed to the luminous Body. Hence, also, arises a Method of determining the Focus of parallel Rays striking on a *Lens* Convex on both Sides, the two Semidiameters, and the Thickness of the *Lens*, being given.

On these Principles is founded the Structure of refracting Burning-Glasses; the Sun's Light and Heat being exceedingly augmented in the Focus of a *Lens*, whether Convex or *Plano-Convex*; since the Rays falling parallel to the Axis of the *Lens*, are reduced into a much narrower Compass; so that 'tis no wonder they burn some Bodies, melt others, and produce other extraordinary Phenomena. See *Burning-Glass*.

If a luminous Body be placed in the Focus behind a *Lens*, whether *Plano-Convex*, or Convex on both Sides; or whether equally or unqually, the Rays after Refraction become parallel.

Hence by means of a *Convex-Lens*, or a little Glass Bubble full of Water, a very intense Light may be projected to a vast Distance. See *Mirror*.

And this furnishes us with the Structure of a Lamp or Lantern, to project an intense Light to any immense Distance: For a *Lens* convex on both Sides, being placed opposite to a Concave Mirror; if in the common Focus of both be placed a lighted Candle, or Wick, the Rays reflected back from the Mirror to the *Lens*, will be parallel to each other; and after Refraction will converge, till they arrive at the Distance of the Semi-diameter, after which they will again diverge. But the Candle being likewise in the Focus of the *Lens*, the Rays it throws on the *Lens* will be parallel; and therefore a very intense Light meeting with another equally intense, at the Distance of the Diameter from the *Lens*, the Light will be surprising; and tho' it afterwards decrease, yet the parallel and diverging Rays going a long way together, it will be very great at a very great Distance. Lanterns of this kind are of considerable Service in the Night-time to discover remote Objects, and are used with Success by Fowlers and Fishermen, to gather their Prey together, in order to take them.

If it be required to have the Light at the same time transmitted to several Places, as through several Streets, &c. the Number of *Lens*'s and Mirrors are to be increased. See *Lamp*.

If the luminous Body placed in the Focus, be of a large Extent, the Rays flowing from Points sensibly distant from each other, can't be parallel, but will constitute several Trains or Pencils of Rays parallel to each other.

The Images of Objects opposed in any manner to a *Convex-Lens*, are exhibited, invertedly, in its Focus.

Hence if a Paper be applied to a *Convex-Lens* (especially in a dark Room) at the distance of its Focus, the Images of Objects shining upon it, will be represented distinctly, and in their natural Colours thereon: Nor is the Focus of the Sun's Rays any thing else, in effect, but the Image of the Sun. Hence in Solar Eclipses, the Sun's Image, eclipsed as it is, may be burnt by a large *Lens* on a Board, &c. a very entertaining Phenomenon!

Hence also, if a *Convex-Lens* of any kind, be exposed both to nearer and remoter Objects, and a Paper at the same time be applied, so as to receive the Images of Objects distinctly, the Distance of the Focus from the *Lens*, and thence the Diameter of the Convexity, may be determined.

If a Concave-Mirror be so placed, as that an inverted Image formed by Refraction thro' a *Lens*, be found between the Centre and the Focus, or even beyond the Centre; it will again be inverted by Reflexion, and so appear erect in the first Case beyond the Centre, and in the lat-

ter between the Centre and the Focus. On these Principles is built the *Camera Obscura*; which see.

The Diameter of the Image of an Object delineated beyond a *Convex-Lens*, is to the Object itself in a Ratio of the Distance of the Image, to that of the Object.

Since then the Image of a remoter Object, is less distant from the *Lens*, than that of the nearer, the Image of the more remote, will be less than that of the nearer. And because the Distance of the Image from the *Lens* is greater, if the *Lens* be a Segment of a greater Sphere, than of a less; hence the Image will be greater in the former Case than in the latter. The Image therefore will be of such a Magnitude, as it would be of, were the Object to shine into a dark Room thro' a little Hole upon a Wall, at the same Distance from the Hole, as which the Focus is from the *Lens*. When an Object is less distant from a *Lens* than the Focus of parallel Rays, the Distance of the Image is greater than that of the Object, otherwise the Distance of the Image is less than that of the Object; in the former Case, therefore, the Image is greater than the Object, in the latter, less.

If the Images be made greater than the Objects, they will not appear distinctly; because in that Case there are fewer Rays which meet after Refraction in the same Point; whence it happens that Rays proceeding from different Points of an Object, terminate in the same Point of an Image, which is the cause of Confusion. Hence it appears that the same Aperture of a *Lens* mayn't be admitted in every Case, if we would keep off the Rays which produce Confusion. However, tho' the Image is then most distinct, when no Rays are admitted but those near the Axis, yet for want of Rays the Image is apt to be dim.

If the Eye be placed in the Focus of a *Convex-Lens*, an Object view'd thro' it, appears erect and enlarg'd, in a Ratio of the Distance of the Object from the Eye, to that of the Eye from the *Lens*, if it be near 3 but infinitely, if remote. See *Microscope*; see also *Prism*.

For *Convex-Lens*'s, their Laws are as follow.

If parallel Rays strike on a *plano-Convex-Lens* KL, and FC be to FB in the Ratio of the Refraction, the Rays will diverge from the Axis, and the Point of Divergency, or Dispersion, call'd the virtual Focus, will be F. (Fig. 3. *Plane Opticks*)

For the Ray HI, parallel to the Axis, is perpendicular to KL, and will therefore pass unrefracted to E. Wherefore FC being to FB in the Ratio of Refraction, F will be the virtual Focus. See *Refraction*.

If then the *Lens* be Glass,  $FH = 2 BC$ ; i. e. the virtual Focus F will be distant from the *Lens* KL by the Space of the Diameter 2 BC.

If the Refraction be in Water  $FH = 3 BC$ ; i. e. the virtual Focus F will be distant from the *Lens* KL a Diameter and an half 3 BC.

If the Ray AE, parallel to the Axis FP, strike on a *Lens* Concave on both sides; and both FC be to FB, and IP to PH in the Ratio of Refraction; and  $FP : PH :: FB : BG$ ; G will be the Point of Dispersion, or the virtual Focus. (Fig. 4. *Plane Opticks*)

If therefore the Refraction be in a *Glass-Lens*, the Sums of the Semi-diameters CB and HI, will be to the Diameter of the Concavity of either 2 HI, as the Semi-diameter of the other CB, to the Distance of the virtual Focus from the *Lens* BG.

Hence the Sun's Rays striking on a *Concave Lens*, their Light after Refraction will be considerably weakened; so that the Effect of *Concave-Lens*'s is opposite to that of convex ones.

Lastly, An Object view'd thro' a *Concave Lens*, appears erect, and diminished in a Ratio compounded of the Ratio's of the Space in the Axis, between the Point of Incidence, and the Point to which an oblique Ray would pass without Refraction, to the Space in the Axis between the Eye and the Middle of the Object; and the Space in the same Axis between the Eye and the Point of Incidence, to the Space between the Middle of the Object and the Point, the oblique Ray would pass to without Refraction.

Tho' the Properties of *Lens*'s have been here considered principally with regard to Rays falling near the Axis, and parallel thereto; yet the Reasoning will be easily transfer'd to Rays remoter from the Axis, and falling in any Direction. Thus we may say universally, that in a *Convex Lens*, all parallel Rays become converging, and concur in a Focus; that diverging Rays either become less diverging, or run parallel, or converge; and that converging Rays converge the more: All which Alterations are more sensible in oblique Rays, than in perpendicular ones, by reason the Angles of Incidence in that Case are greater.

In *Concave Lens*'s all parallel Rays become diverging, diverging Rays diverge more; converging Rays either converge less, or become parallel, or go out diverging; all which things hold of oblique as well as direct Rays, but more sensibly in the first.

A *Len*, one of whose Surfaces is Convex, and the other Concave, is called a *Mensural*; the Properties of which see under *Mensural*. See also the *Theory of Lens's demagnified under Refraction*, and the Application thereof under *Microscope*, *Telescope*, *Burning-Glass*, *Focals*, &c.

Some confine *Lens's* within the Diameter of five or six Lines, and will have such as exceed that Diameter, call'd *Lenticular Glasses*. *Lens's* are distinguish'd with regard to their Preparation into ground and blown: *Blown Lens's* are little Globules of Glass melted in the Flame of a Lamp or Taper: (see *Microscope*) but the Figure of these is seldom exact; besides that the Smoke of the Lamp cleaves to the Surface in melting: on both which accounts they come short of the Clearness of those that are ground, or turned and polish'd in the Lathe, in little Copper Basons or Dishes. The Secret is now found of making these exquisitely small, so as some of 'em don't exceed in Diameter the sixth part of a Line, which are found to magnify Objects several Millions of times.

The *Manner of grinding Lens's*: A little Piece of Copper is cemented to the End of the Arbor of a Lathe, and turned, till it form a Dish or Bason of the Diameter of the *Len* required. Then a Piece of clear Glass is cemented on one of its flat Sides to the end of a little Mandrel with black Spanish Wax, and thus ground, on the Side not cemented, on a Grindstone, with Water, till it have nearly acquired a Convex Figure. 'Tis finished in the Lathe, by turning it in the Bason, with fine wet Sand, or Free-stone. (See *Bason*.) The Free-stone must be often repeated fresh, till the *Len* appear very round; when it is come to that Point, they cease to take any fresh Stone, but continue to turn it in the Bason, till the Remains of the Sand be become so fine as to have polish'd it. This, they perceive, when, upon wiping it, the Image of the Window of the Place is seen painted on its Surface; if it don't, 'tis wetted in Water without any Sand, and turned till it have got a Polish. The Bason is then covered, within-side, with two or three Folds of Linnen, and the Polish finished with Putty, or *Tripoly of Venice* steeped in Water. 'Tis known to be perfectly polish'd, when, viewing it with a Magnifier, there appear no Traces of the Sand. The Cement is then broke off, and the Side polish'd, cemented; to work and grind the other as before, till the Edges of the *Len* be become sharp, and it be perfectly polish'd on either side. When finish'd, 'tis washed in Spirit of Wine, to take off all Remains of the Wax. See *Microscope*.

LENT, *Quadragesima*, or *Quarantine*, a Time of Mortification, consisting of the Space of forty Days, wherein those especially of the *Romish* Church are enjoined to fast, in Commemoration of our Saviour's miraculous Fasting so long in the Desert, and by way of Preparation for the Feast of *Easter*. In the ancient *Latin* Church, *Lent* only consisted of 36 Days. In the 12th Century, to come somewhat nearer the Miracle, some took upon them to add four Days more, which, in time, became a general Practice; and the Church of *Milan* is said still to take up with the ancient 40.

According to *St. Jerome*, *St. Leo*, *St. Augustine*, and others, *Lent* must have been instituted by the Apostles. Their way of Reasoning is this: Whatever is generally received throughout the whole Church, and whose Institution we don't find in any Council, must be esteemed to have been established by the Apostles. Now, such, they say, is the Fast of *Lent*. Its Institution is not spoke of in any Council, but many of the ancient Councils, particularly that of *Nice*, that of *Laodicea*, &c. and some of the Fathers, particularly *Tertullian*, speak of it as a thing of some standing. The Reformed generally hold *Lent* to be a superstitious Institution, set on foot by some vain Enthusiasts, who durst undertake to ape the Miracles of Jesus Christ, as in effect it appears to have been from a Passage of *Irenaeus*, quoted by *Eusebius*. Some will have it to have been first introduced by *Pope Telesphorus*, in the 13th Century; others, who own that there was a kind of Abstinence observed in the ancient Church before *Easter*, yet contend that it was voluntary, and was never enjoined by any Law till the 13th Century.

There was some Difference between the Practice of the *Greek* and the *Latin* Church as to the Business of *Lent*; the *Greeks* beginning it a Week sooner, but at the same time allowing more Days of Intermission than the *Latins*: those who held it seven Weeks, did not fast on Saturdays, as those who observed it but six did.

The ancient *Latin* Monks had three *Lents*; the Grand *Lent* before *Easter*; another before *Christmas*, call'd, the *Lent* of *St. Martin*; and a third after *Whitsunday*, call'd that of *St. John Baptist*: each of which consisted of forty Days. The *Greeks*, besides that before *Easter*, observed four others; that of the *Apostles*, of the *Assumption*, of *Christmas*, and of the *Transfiguration*; but they reduced each of them to the space of seven Days. The *Jacobites* added a fifth, which they call *The Repentance of Nine-*

*veh*; and the *Maronites* a sixth, call'd *The Exaltation of the Holy Cross*. By the 8th Canon of the Council, 'tis ordain'd, 'That if any Persons, without evident Necessity, eat Flesh in *Lent*, they shall be deprived the Use of it all the rest of the Year.

The forty Days in *Lent*, say some, are observed in remembrance of the forty Days wherein the World was drowned; others of the forty Years wherein the *Jews* wandered in the Desert; of the forty Days allowed *Nineveh* for Repentance; the forty Stripes by which Malefactors were to be corrected; the forty Days fasted by *Moses* at the receiving of the Law; the forty Days fasted by *Elias*; or the forty Days fasted by our Saviour.

LENTIGO, a freckly or scurvy Eruption upon the Skin, such especially as is common to Women in the time of Child-bearing. Authors distinguish this Eruption into several kinds.

LENTIL, the Name of a Weight among the old *Romans*. It was the hundred and eighth Part of a Drachm. A *Lentil* and an half made a Grain. The Word is a Diminutive of *Len*.

LENTISCUS, the Wood of a Tree of the same Name, of some Use in Physic; it is astringent and fortifying, and much used for Tooth-Picks. It contains a kind of Gum, or rather resinous Pitch, much like Mastic, or perhaps the Mastic itself or Incense of *Perfisa*, so highly commended by *Strabo*. The *Lentiscus* has nearly the same Properties with the *Sanders*, but has more of the Turpentine in it, and sometimes passes by Urine.

LEO, *Lion*, the fifth of the twelve Signs of the Zodiac. This the Astrologers account a hot dry Sign, and the House of the Sun. The Antients gave it 27 Stars, besides 8 *informes*: *Kepler* gives it 40, and *Boyer* 43; two whereof are of the first Magnitude, two of the second, five of the third, &c. See *Star*.

See *Leonis*, the *Lion's Heart*, one of the most considerable Stars in the Heavens. See *Star*.

LEONTICA, the Name of a Feast or Sacrifice celebrated among the Antients, in honour of the Sun. They were called *Leontica*, and the Priests who officiated at them *Leoni*, in regard they represented the Sun under the Figure of a *Lion* radiant, bearing a *Tiara*, and gripping in his two fore Paws the Horns of a Bull, who struggled in vain to disengage himself. The Critics are extremely divided about this Feast, some will have it to be anniversary, and make its Return not in a Solar, but a Lunar Year; but others hold its Return to be more frequent, and give Instances where the Period was not above 220 Days. The Ceremony was sometimes also call'd *Mithraice*, *Mithra* being the Name of the Sun among the ancient *Perfians*. There was always a Man sacrificed at these Feasts till the time of *Hadrian*, who prohibited it by a Law. *Commodus* introduced the Custom afresh, after whose time it was again exploded.

LEONTINE, in Poetry, a kind of Verses which rhyme at every Hemistic, the middle always chiming to the end; of which kind we find several ancient Hymns, Epigrams, Prophecies, &c. For instance, *Martius* speaking of the Poetry of *Loreuzo Gambaro* of *Brescia*, says,

*Brixia, vestrae merulae Volamina Vatis,  
Non sunt nostris tergere digna Nates.*

The following one is from the School of *Saleria*;

*Ut Vires Pecunae de pombis incipe Cannam.*

The Origin of the Word is somewhat obscure, *Pasquier* derives it from one *Leontius*, or *Leontus*, who excelled in this way, and dedicated several Pieces to *Pope Alexander III*. Others derive it from *Pope Leo*, and others from the Name of *Lion*, as being the loftiest of all Verses. *M. Lamber* makes the *Leontine* Rhyme the same with what the *French* call *The Rich*, and we *The Double Rhyme*; i. e. where two Syllables have the same Orthography, Accentuation, and Pronunciation with two others.

LE ROY LE VEUT. By these Words the Royal Assent is signified by the Clerk of the Parliament to public Bills; to private Bills this Assent is expressed by *soit fait comme il est Desiré*.

LE ROY S'ADVISERA. By these Words to a Bill, presented to the King by his Parliament, are understood his absolute Denial of that Bill in a more civil way; and the Bill thereby becomes wholly null and void.

LEPIDOIDES, in Anatomy, the Name of the scaly Suture of the Cranium, from the *Greek* *lepis*, Scale, and *oides*, Form, Figure.

LEPRA, *Leprosy*, a foul contagious Disease, seated in the Cuticle or Surface of the Skin, arising, as most other cutaneous Diseases do, from thin salt Humours, thrown off from the Blood, and arrested by the Density and Closeness of the Cuticula. This Distemper has been much more frequent in former Times than at present, and much more in the hot Countries of the *East*, particularly among the *Jews*, than among us; for the Salts which,

by the Appointment of Nature, are to be eliminated thro' the Pores of the Skin, along with the recementitious Serum, their proper Vehicle, are, in hot Countries, conveyed in greater plenty to the Surface of the Body, than in these Northern Regions they ordinarily are; and sticking in their Passage in the thin dry Membrane of the Cuticle, the aqueous Parts, which are their Vehicle, slip away from them by insensible Evaporation, and leave them there to corrode and fret it, till at length, thro' the Quantity so gathered, the Membrane becomes dry, brittle, and white, which is the Cause of that Disqualification, or falling away in white Scales: that Whiteness as well as the Brittleness proceeding merely from the Quantity of these Salts, which are themselves white; and when the Moisture is drawn from them, being accumulated, and having insinuated themselves into the Pores of the Cuticle, dissolve the Continuity of it by their Points and Edges, which, so dead and broken, is apt, on the least Friction, to fall off as above-mentioned. This is what they call the *Lepra Grecorum*, from its Frequency among that People.

*Lepra Arabum* was another Species of the Distemper, which tho' different in Appearance, as carrying a dry scabby Crust, yet seems only a different Degree of the same Disease. For as in the former Case the Salts, being left destitute of their Humidity, are not so active, and therefore affect only the Cuticle; in the latter Case these Salts, with their Vehicle, crowding faster than they can be evaporated thro' the Pores of the Skin (being still in *fluore*, and so more caustic) corrode deeper, and eat not only the Cuticle, but the excretory Vessels, and Surface of the Skin itself, which thereby spews out a Liqueur somewhat thicker than usual; which, when the thinnest and most aqueous Parts are evaporated, are condensed into that Crust or Scab, which is the distinguishing Character of this Disease.

*Galen* defines the *Lepra* to be an Effusion of thick disorderly Blood, that corrupts the whole Habitude of the Body. *Avicenna* calls it *An Universal Cancer*. The Greeks give it the Name of *κασιδιαισις*, in regard the Patient has his Skin rough, wrinkled, and unequal, like that of an Elephant. The *Lepra* begins within-side, a long time before it appears without-side. It was frequent in Europe in the Xth and XIth Centuries, but seems at present quite extinct, unless we allow the Venereal Disease to be the same with the *Lepra*; as it was the Opinion, among many others, of the Great *Piscarini*, and as has been lately endeavoured to be proved by Mr. *Becker*, in a Treatise expressly on the Subject in the *Philosophical Transactions*. The Symptoms of the ancient *Lepra*, as laid down by *Galen*, *Arceus*, *Pontanus*, *Agrieta*, *Cardan*, *Varanda*, *Gorden*, *Perent*, and others, are as follow: The Patient's Voice is hoarse, and comes rather thro' the Nose than the Mouth; the Blood full of little white shining Bodies, like Grains of Millet, that upon filtration separate themselves from it; the Serum is scabious, and destitute of its natural Humidity, inasmuch that Salt applied to it does not dissolve; it is so dry, that Viceger poured on it boils; and is so strongly bound together by little imperceptible Threads, that calcined Lead thrown into it swims. The Face resembles a Coal half extinct, unctuous, shining, and bloated, with frequent hard Knobs, green at bottom, and white at top. The Hair is short, stiff, and bristled, and not to be torn off without bringing away some of the rotten Flesh to which it adheres; if it grows again, either on the Head or Chin, 'tis always white. Athwart the Forehead run large Wrinkles, or Furrows, from one Temple to the other; the Eyes red and inflamed, and shine like those of a Cat; the Ears swollen and red, eaten with Ulcers towards the bottom, and incompassed with little Glands; the Nose sunk, because of the rotting of the Cartilage; the Tongue dry and black, swollen, ulcerated, divided with Furrows, and spotted with Grains of white; the Skin covered with Ulcers, that die and revive on each other, or with white Spots or Scales like a Fish; it is rough and insensible, and when cut, instead of Blood, yields a saivous Liqueur. It arrives in time to such a Degree of Insensibility, that the Wrist, Foot, or even the large Tendon may be pierced with a Needle, without the Patient's feeling any Pain. At last the Nose, Fingers, Toes, and even Privy Members fall off entire, and by a Death peculiar to each of them anticipate that of the Patient. 'Tis added, that the Body is so hot, that a fresh Apple, held on the Hand an Hour, will be dried and wrinkled, as if exposed to the Sun for a Week.

*Martineau Paris* says, that in *Christendoms* there were fifteen Thousand Hospitals for Lepers; but the Disease having been discontinued for two Hundred Years, the Revenues of those Hospitals were abused, and Persons seized themselves *leprosi*, to be entitled to the Provision; which occasioned their Regulation in some Coun-

tries, and their entire Suppression in others. In France they were united to the Order of the Religious of *St. Lazarus* and *Mount Carmel* in 1664, and the Administration of them given to the Knights of that Order; in England they have been converted to other Purposes.

Formerly the Causes of Lepers were committed to the Ecclesiastical Tribunals, and it was prohibited to prosecute a Leper before a Lay-Judge, in regard they were under the Protection of the Church, which separated them from the rest of the People by a Ceremony still to be seen in the Rituals.

The *Lepra* appeared differently in different Nations, according to the Climate and the Manner of Living; whence it was distinguished into several kinds, as the *Lepra Arabum*, *Lepra Grecorum*, &c. As to the Cure, that which proved effectual in those Southern Countries, fails among us, where the strongest Medicaments, and the most powerful Mercurials are necessary. Bathing is judged to be of good Use in the *Lepra*. Dogs and Hares are said to be subject to this Disease. Among the *Indians* a white Man is despised, this passing with them for the Mark of a Leper. The word *Lepra* is derived from the Greek *λεπρος*, Skin, in regard this Disease forms a kind of Scales on the Skin.

LEPUS, the Hare, is a Southern Constellation. See *Star and Constellation*.

LESSOR and LESSEE, are Terms of the Common Law. The *Lessor* is he that leaseth out Lands or Tenements to another for Term of Life, for Years, or at Will; and the Person to whom such a Lease is made, is called the *Lessee*.

LETHARGY, in Medicine, a Disease consisting in a profound Drowziness or Sleepiness, wherein the Patient can scarce be awaked; or, if awaked, remains stupid, without Sense or Memory, and presently sinks again into his former Sleep. The *Lethargy* is usually accompanied with a Fever and Delirium. The *Lethargy*, *Berberiave* makes a gentle Apoplexy, arising from the same Causes, and to be known and cured in the same manner. Some Authors distinguish the *Lethargy* from the *Coma*, in that this latter is without a Fever, or at most is preceded with a violent one, whereas the *Lethargy* is attended with a slow one. *Celsus* ranks the *Lethargy* in the Number of acute Diseases, the Patient usually dying on the 7th Day. A *Lethargy* frequently succeeds a Frenzy. The Word comes from the Greek *λεθηρ*, Oblivion, and *αργος*, Numbness, *Lousiness*.

LETHE, or LATHE, a Measure or Portion of Lands, making one of the ancient Divisions in England. King *Elfred* divided England into Counties, as it stands at present, those Counties he divided into Hundreds or Tithings. The Hundred was a Division, wherein were an hundred Officers to secure the Peace; the *Lethe* or *Lathe* comprehended three or four of these Hundreds. *Lethe* was also the Jurisdiction of a Vicount, or a kind of Assize, held once a Year in each Village about *Michaelmas*. Whether this was instituted by *Elfred*, or no, is a Question.

LETTER, a Sign or Character either in Print or in Writing, by which any People have agreed to express the several Sounds, used in conveying their Thoughts to each other in Speech: Or a Letter may be defined, A simple un compounded Sound of the Voice, that cannot be subdivided into any more simple, and generally marked with a particular Character. It must be owned however, strictly speaking, a Letter is not the Sound itself, but rather the Sign of a Sound, for the *αυση* of the Greeks comes from writing, and the *littera* of the Latins from *lincando*, or *lincendo*, each signifying something marked on Paper. Where a Sign or Character does not express a Sound entirely simple, but one resolvable into several, it is not so properly a Letter as an Abbreviation, containing in itself as many Letters as its Power does simple Sounds. This is evident in the *Latin* *ſ*, *x*, and the Greek *ϛ*, *ϙ*, *ϛ*, &c. which are composed of *ε*, *ϛ*, *κ*, *ϛ*, *ϛ*, *ϛ*, *ϛ*, &c. On the contrary, a simple Sound, tho' expressed by several Characters, is yet to be esteemed one Letter, for *th*, *ph*, are single Letters, as much as *z*, *θ*, and *ſ*.

Letters make the first part or Elements of Grammar; an Assemblage of these make Syllables, of those Words, and of these Sentences. The Alphabet of every Language consists of a certain Number of these Letters, which ought each to have a different Sound, Figure, and Signification. As the Difference of articulate Sounds was so express the different Ideas of the Mind, so one Letter was originally intended to signify only one Sound, and not, as at present, to express sometimes one Sound, and sometimes another; which Practice has brought a great deal of Confusion into the Languages, and render'd the Learning of the modern Tongues infinitely more difficult than it would otherwise have been. This Consideration, together with the Poverty of all the known Alphabets, and their want of some Letters to express certain Sounds by, has occasioned several Attempts towards an universal Alphabet, to contain an Enumeration of all such single Sounds

Sounds or Letters as are used in any Language. A thing of very considerable Use; and a Specimen of which is given us by Mr. Lohmck, in the *Philosophical Transactions*.

There are few things on which there has been so much written as on the Original Hebrew Letters; since Origen, *Eschelus Cesarjensis*, St. Jerome, &c. have made it the Subject of their Enquiry. If they don't always go back to the Beginning of the World, and the Origin of Letters, 'tis at least enquired what were the Characters made use of by Moses to transmit the Law to Posterity, or those used by the other Historians and Prophets of the Old Testament, or even those used by the Hebrews before the *Babylonian Captivity*. With regard to which, there are three principal Opinions: Some imagine the ancient Hebrew Letters the same with those now in Use; of this Opinion are several Doctors of the *Talmud*, *Postellus*, *Buxtorf*, &c. The second Opinion is of those who believe the *Samaritan Letters* the more ancient; which is now the more common Opinion, as without doubt it is the elder: Several *Miscellaneous* and *Genaric* Doctors, many of the Rabbins and Fathers, *Origen*, *Jerom*, *Eschelus*, *Beza*, *Genebrard*, *Ramban*, *Bellarmino*, *Sealiger*, *Drauf*, *Capella*, *Bibliander*, *Iserecomod*, *Montanus*, *Walton*, the two *Vassins*, *Ischart* and *Bernard* are of this Opinion. The third is, that from the beginning there were two Characters, the one sacred, the other profane; and this is the Opinion of *Azarius*, *A. de Bartenora*, *Postel*, *Buxtorf*, *Covringius*, &c. But this Distinction of two kinds of Characters seems a mere Chimera. See P. Somer's on the *Samaritan Medals*, where he proves that the Letters in the Inscriptions of those Medals are the genuine original Hebrew Characters.

As to the first Letters, what they were, who first invented them, and among what People they were first in use, there is still room to doubt; however, setting aside Conjectures and Prejudice, the Business of Antiquity seems to lie between the *Egyptians* and *Chinese*. *Pbdo* attributes the first Invention of Letters to *Abraham*; *Tolpebus*, *S. Irenaeus*, and others, to *Enoch*; *Bibliander*, to *Adam*; *Eupolemus*, *Eschelus*, *Cleemus Alexandrinus*, *Corn. Agrippa*, &c. to *Moses*; *Pomponius Mela*, *Herodian*, *Rufus*, *Fejrus*, *Pliny*, *Lucretius*, &c. to the *Phoenicians*; *S. Cypprian* to *Suturn*; *Tacitus* to the *Egyptians*, and some to the *Ethiopian*.

The *Egyptian Mummies* and *Obelisks* prove a great Antiquity on the Side of the Hieroglyphics; but if the *Chinese Chronology* may be credited, their Characters are vastly more ancient than those of the *Egyptians*. The *Chinese* make *Fah*, the first of their Kings, the Inventor of their Letters, and compute him to have lived 2950 Years before Christ. During all which time they pretend to have certain and written Accounts in their Books. If this holds true, their Character must be older than *Moses* by 1400 Years, and even before *Menes* the first King of *Egypt* by 500 Years: So that the *Chinese Letters* appear to be the most ancient of that kind, and the Book *Pekim*, said to be written by *Fohi*, the most ancient Book.

But as *China* is so remote, and had so little Communication with these Parts of the World, we may reasonably make another Enquiry into the Original of Letters in the higher Parts of *Asia*, *Egypt*, and *Europe*. Here indeed the *Egyptians* seem to have the best Title. 'Tis more probable from the *Obelisks*, &c. that their Hieroglyphics were the first manner of writing, and the Original Characters in these Parts, as being prior to *Moses*, and made, at least in great measure, while the *Israelites* were Slaves among them, and of consequence not well qualified for Inventions so very curious and judicious. Whether *Cadmus* and the *Phoenicians* learnt Letters from the *Egyptians*, or from their nearer Neighbours of *Jndab* and *Samarita*, is a question; since some of the Books of the Old Testament being written in Letters, is more likely to have given them the Hint than the Hieroglyphics of *Egypt*. But when or wheresoever the *Phoenicians* learnt this Art, it is generally agreed, that *Cadmus*, the Son of *Aganor*, first brought Letters into *Greece*, whence, in the following Ages, they spread over the rest of *Europe*.

According to *Cicinius*, *Moses* invented the Hebrew Letters, *Abraham* the *Syriac* and *Chaldee*; the *Phoenicians* that of *Asia*, brought into *Greece* by *Cadmus*, and thence by the *Pelassians* into *Italy*; *Nevstrata* the *Latin*; *Ifts* the *Egyptian*; and *Valsila* that of the *Goths*.

*Rudbeckus*, who in his *Atlantica* claims the Glory of all Inventions from all other Nations for the *Sweeds*, maintains that the *Tonians* had Letters before *Cadmus*; that at the time of the Siege of *Troy*, the *Greeks* had but 16 Letters, whereas the *Phoenicians* had 22: whence he concludes, that it was not either *Cadmus* or the *Phoenicians* who taught this Art to the *Greeks*. But in regard the ancient Northern Nations had just 16 Letters, like the *Greeks*, he concludes the *Greeks* must either have taught them to the People of the *North*, or have learnt 'em of them. But because the Form and Make of the *Rothic Letters* is more coarse than that of the *Greek Letters*, he concludes that these last

must be derived from the former; taking it as a Principle, that those who derive any thing from another, polish and perfect it. He even asserts, that by the *Golden Apples* which *Hercules* was obliged to steal, must be understood the Letters in use among the *Hyperboreans*.

The Letters F, G, H, K, Q, X, Y, Z, were unknown to the ancient *Romans*, as is proved by *Doljpinus* in his *Ortographia*, where he traces the Origin of the several Letters.

The *Grammarians* distinguish Letters into Vowels and Consonants; into Mutes, Diphthongs, Liquids, and Characteristics. The *Hebrews* divide their Letters into Gut-tural, *a, b, c, g, s, aleph, he, cheth, hain*; Dental, *s, n, r, zain*, *t, d, f, reth*; Labial, *l, m, n, p*; buch, *mem, vau, phe*; Lingual, or those of the Tongue, *s, i, l, n, daleth, tau, lamod, nan*; and those of the Palate, *z, h, k, ghimel, jod, caph, coph*.

The Art of assembling Letters to form Words, and of combining the one and the other into a number of different Senses, is a Secret unknown to the *Chinese*. Instead of the Letters of an Alphabet, they at first, like the *Egyptians*, used Hieroglyphics; they painted rather than wrote: striving by the Natural Images of Things drawn on Paper, to express and communicate their Ideas to one another. To write a Bird, they were obliged to paint its Figure; and to signify a Forest, they drew a great number of Trees. A Circle served for the Sun, and a Crescent for the Moon. But this Manner of writing was not only very incommodious, but also very imperfect. For besides that they could but express their Thoughts by halves, even that little that they could express was but very imperfectly conceiv'd; and it was scarce possible not to be frequently deceived in it. Further, they were under a necessity of writing large Volumes to say very little Matters, in regard their Pictures took up a great deal of room. To remedy these Inconveniences, they changed by little and little their Manner of Writing, making it more simple, the less natural. They even invented several Characters, to express things that did not come within the reach of Painting to represent, as Voice, Smell, Thoughts, Passions, and a thousand other Objects that have no Body or Figure. From several simple Strokes, they afterwards framed others more compound, and in this manner multiplied their Letters and Characters to Infinity, contriving one or more for every Word. This Abundance of Letters seems the Source of that Ignorance which we find among the *Chinese*. Their whole Lives being spent in learning their Letters, they have no time to apply themselves to the Study of Things, but think themselves very learned when they are able to read. There are scarce any of 'em that know all their Letters: They think 'tis a great progress they have made, when after forty or fifty Years hard Study they are able to understand fifteen or twenty thousand. But the Generality of their learned Men come far short of this: *Father Le Compte* is of opinion, that the greatest Doctor among 'em never understood half of their Letters well; for the whole Number he reckons Eighty Thousand. This is a prodigious Inconvenience to Foreigners, of which the *Missionaries* into that Country make loud Complaints. Among the *Chinese Letters*, there are some now almost worn out of use, and only preserved out of Respect to Antiquity. There is a second Class much less ancient than the former, only used in public Inscriptions. A third much more regular and beautiful, used in Printing, and even in ordinary Writing. However, as the Strokes are to be distinctly formed, they can't be wrote with any expedition. For this reason they have invented a fourth kind, where the Strokes being closer, and less distant from each other, allow them to be writ with more ease and readiness. And this they call the running Letters.

The *Americans* had no Letters before the Discovery of that Country by the *Spaniards*. The *Acanabas* engrave their Memorable Events and Epochs on Stones and Metals. Their Songs supply the rest. In *Peru* and *Chili*, to keep an Account of their Goods and Chattels, and to preserve the Memory of their particular Affairs, the *Indians* have recourse to certain Knots of Wool, which by the Variety of their Colours and Ties, serve instead of Characters and Writing. The Knowledge of these Knots, which they call *Quipos*, is one of their great Sciences; but which is always kept as a Secret, and never revealed to the Children till the Fathers think themselves at the end of their days.

The *Printers* distinguish their Letters into Capital, Majuscule, or Initial Letters, which serve for the Titles of Books, proper Names, &c. And Minuscule or Small Letters, which are again divided according to their Size, into *Pearl*, *Nonparcil*, *Pica*, *Great Canon*, &c. See *Type and Printing*. They have also their History or Figured Letters engraven on Wood or Metal, which take place of the Illumined Letters of the ancient Manuscripts.

*Numerical Letters*, are those used by the ancient Romans instead of Cyphers, to express their Numbers by. These *Numerical Letters* are seven in number, C, D, I, L, M, V, X; which are all form'd in describing a Circle, and drawing two Lines thro it, crossing each other at right Angles in the Center.

*Dominical Letter*, see *Dominical*.

*Nundinal Letter*, see *Nundinalia*.

**LETTERED**, *Letrados*, *Letrados*, an Epithet given to such Persons among the *Chinese* as are able to read and write their Language. These alone are capable of being made *Mandarins*.

This is also the Name of a particular Sect either in Religion, Philosophy, or Politicks, consisting principally of the Learned Men of that Country: among whom 'tis call'd *Yehs*, i. e. Learned. It had its Rise in the Year of Christ 1400; when the Emperor, to awaken the native Affection of the People for Knowledge, which had been quite banished by the preceding Civil Wars among 'em, and to stir up Emulation among the *Mandarins*, chose out forty-two of the ablest among their Doctors, to whom he gave a Commission to compile a Body of Doctrine agreeable to that of the Antients, which was then become the Rule or Standard of the Learned. The Delegates applied themselves to the Business with a world of Attention; but they seem rather to have wrested the Doctrine of the Antients, to make it consist with theirs, than to have built up theirs to the Model of the Antients. They speak of the Deity as if it were no more than mere Nature; or the Natural Power or Virtue that produces, disposes, and preserves the several Parts of the Universe. It is, say they, a pure, perfect Principle without Beginning or End; 'tis the Source of all Things, the Essence of every Being; and that which determines it to be what it is. They make God the Soul of the World, say he is diffused throughout all Matter, and produces all the Changes that happen there. In short, 'tis not easy to determine whether they resolve God into Nature, or lift up Nature into God; for they ascribe to it many of those things which we attribute to God. This Doctrine, in lieu of the Idolatry that prevailed before, introduced a refin'd kind of Atheism. The Work being composed by so many Persons of Learning and Parts, and approved by the Emperor himself, was received with infinite Applause by all the World. Many were pleas'd with it, in regard it seem'd to subvert all Religion: others approved it, because the little Religion that it left 'em could not give 'em much trouble. And thus was form'd the Sect of the *Literati*, which consists of the Maintainers and Adherents to this Doctrine. The Court, the *Mandarins*, and the Persons of Fortune and Quality, &c. are generally Retainers to it; but a great part of the common People still hold to their Worship of Idols. The *Literati* freely tolerate the *Mahometans*, because they adore, with them, the King of Heaven and Author of Nature; but they bear a perfect Aversion to all other Sects of Idolaters among 'em, and it was once resolv'd to extirpate them. But the Disorder this would have occasion'd in the Empire, prevented it: they now content themselves with condemning them in general as Heretics; which they do solemnly every Year at *Pekin*.

**LETTER OF CREDIT**, among Merchants, a Letter which a Merchant or Banker gives a Person he trusts in, to take up Money of his Correspondents in remote places, in case of need. *Letters of Credit*, tho different from those of *Exchange*, yet have the same Privileges, to compel the Payment of Sums received in consequence of 'em.

**LETTER OF EXCHANGE**, see *Bill of Exchange*; see also *Exchange*.

**LETTER OF LICENCE**, in Trade, is an Instrument or Writing granted to a Man who has fail'd or broke, sign'd and seal'd by his Creditors; which *Letter* usually gives a longer Time for Payment: so that the Debtor having such an Assurance, can go about his Business without fearing an Arrest.

**LETTERS OF ATTORNEY**, are Writings authorizing an Attorney, that is, a Man appointed to do a legal Act in our stead. As a Letter of Attorney to give Seisin of Lands, to receive Debts, to sue a third Person, &c.

**LETTERS OF MART**, are Letters under the Privy Seal, granted to the King's Subjects; empowering them to take by Force of Arms, what was formerly taken from them contrary to the Law of *Mart*: and regards any Nation with whom Truce is broken. See *Reprisal*.

**LETTERS PATENTS**, are Writings seal'd with the Great Seal of *England*, whereby a Man is authorized to do, or enjoy any thing, that otherwise of himself he could not. And they are so call'd by reason of their Form, because they are open, with the Seal affixed, ready to be shewn for the Confirmation of the Authority given by them. Common Persons may grant *Letters Patents*; but they are rather call'd *Patents* than *Letters Patents*, yet for difference those granted by the King are call'd *Letters Pa-*

*ents Royal*. *Letters Patents* conclude with *Teſte meipſo*, *Charters* with *his Teſtibus*.

**LETTERS OF RESPITE**, Letters issued out by a Prince in favour of honest unfortunate Debtors, against too rigorous Creditors, whereby Payment is delay'd, for a certain Term. The Use of these Letters is very ancient: *Cassiodorus* observes, they were in use in the Time of *Theodoric King of the Goths*; others will have 'em introduced towards the End of the eleventh Century by Pope *Urban II.* in favour of those who went on the *Cruisades*. They are still in use in *France*, and some other Countries: and take their Name *à respirando*, because they give the Debtor a breathing while.

**LEVANT**, in Geography, signifies any Country situate to the East of us, or the Eastern side of any Continent or Country, or that on which the Sun rises. In Matters of Commerce, &c. the Word is generally restrain'd to the *Mediterranean Sea*, or the Country on the Eastern part of it: Hence our Trade thither is call'd the *Levant Trade*, and a Wind that blows from thence out of the *Streight of Bosphorus*, is call'd a *Levant Wind*.

**LEVANT AND COUCHANT**, in Law, is when Cattel have been for long in another Man's Ground, that they have lain down, and have risen again to feed.

**LEVARI FACIAS**, a Writ directed to the Sheriff for the Levying a Sum of Money on his Land and Tenements who has forfeited a Recognizance.

**LEVATOR**, an Epithet which the Anatomists give to several Muscles, whose Use is to raise or lift up the Parts to which they belong. There are *Levators* of the *Eyelids*, see *Atrolens Palpebr.* of the *Omnoplate*, see *Omnoplate*; of the *Anus*, see *Anus*; and of the *Scapula*, see *Scapula*.

**LEUCOMA**, in Phycis, is a little white Spot on the Cornea of the Eye, call'd by the *Latins*, *Albugo*. It is occasioned by an Humour gather'd in this Membrane, or by the Scar following a Wound, or by an Ulcer in this Part, as sometimes happens in the Small-Pox. The Word is *Greek*, and is formed from λευκος, *white*.

**LEUCOPHLEGMATTA**, a kind of Dropsy, otherwise call'd *Staphylosis*. It consists in a Tumor or Bloating of the whole outer Surface of the Body, or some of its Parts; white and soft, easily giving way to the Touch, and preserving the Impression made by the Finger for some time. It may either be owing to some Disorder of the Blood, which in this Disease is of a pale Colour, viscid, and cold; or to an aqueous Humour extravasated, and gathered together in the Muscles and the Pores of the Skin. The Word is *Greek*, and comes from λευκος, *white*, and φλεγμα, *Phlegma*, *Pblegm*.

**LEVEL**, a Mathematical Instrument, serving to draw a Line parallel to the Horizon, to lay off Floors, the Courses of Masonry, &c. horizontally, to measure the difference of Ascend or Descend between several Places, to convey Water, drain Pans, &c. The Word comes from the *Latin Libella*, the Cross Beam that forms the Brachia of a Balance, which to be just, must stand horizontally. There are several Instruments of different Contrivance and Matter, that have been invented for the Perfection of Levelling; all of which, for the Practice, may be reduced to these that follow.

*Water Level*, which shows the horizontal Line by means of a Surface of Water, or other Liquid; founded on this Principle, that Water always naturally places itself level. The most simple is made of a long wooden Trough or Canal, whose Sides are parallel to its Base; so that being equally fill'd with Water, the Surface thereof shows the Line of *Level*: this is the *Charshates* of the Antients, described by *Vitruvius*, *Lib. 8. Chap. 6.* This *Level* is also made with two Cups fitted to the two Ends of a Pipe, 3 or 4 Foot long, about an Inch in Diameter; by means whereof the Water communicates from the one to the other Cup: and this Pipe being moveable on its Stand, by means of a Ball and Socket, when the two Cups become equally full of Water, their two Surfaces mark the Line of *Level*. This Instrument, instead of Cups, may be made with two short Cylinders of Glass 3 or 4 Inches long, fasten'd to each Extreme of the Pipe with Wax or Mastic. Into the Pipe is fill'd some common or coloured Water, which shows itself through the Cylinders, by means whereof, the Line of *Level* is determined; the Height of the Water, with respect to the Center of the Earth, being always the same in both Cylinders. This *Level*, tho' very simple, is yet very commodious for levelling of small Distances.

*Air Level*, that which shows the Line of *Level*, by means of a Bubble of Air inclosed with some Liquor in a Glass Tube of an indeterminate Length and Thickness, whose two Ends are sealed hermetically; that is, are closed with the Glass itself, by heating it with the Flame of a Lamp, till it become soft and tractable. When the Bubble of Air fixes itself at a certain Mark made exactly

in the Middle of the Tube, the Plan or Ruler wherein it is fixed is *level*. When it is not *level*, the Bubble will rise to one End. This Glass Tube may be set in another of Brass, having an Aperture in the Middle, whence the Bubble of Air may be observed. The Liquor where-with the Tube is fill'd, is ordinarily either Oil of Tartar, or *Aqua fecundis*; those not being liable to freezing as common Water, nor to Rarefaction and Condensation as Spirit of Wine. The Invention of this Instrument is ascribed to Mr. Thevenot.

*Air Level with Sights*, is an Improvement on that last described, which by the Addition of more Apparatus, becomes more commodious and exact: It consists of an *Air Level 1*, (*Plat. Surveying, Fig. 4.*) about eight Inches long, and seven or eight Inches in Diameter, set in a Brass Tube 2, with an Aperture in the Middle. The Tubes are carried in a strong freight Ruler, a Foot long, at whose Ends are fixed two Sights exactly perpendicular to the Tubes, and of an equal Height, having a square Hole, form'd by two Fillets of Brass, crossing each other at right Angles, in the Middle whereof is drilled a very little Hole 3 through which little Hole, a Point on a *Level* with the Instrument is descried. The Brass Tube is fastened on the Ruler by means of two Screws, one whereof, mark'd 4, serves to raise or depress the Tube at pleasure, for bringing it towards a *Level*. The Top of the Ball and Socket is riveted to a little Rule that springs, one End whereof is fasten'd with Screws to the great Ruler, and the other End has a Screw 5, serving to raise and depress the Instrument when nearly *level*. This Instrument is yet less commodious than the following one, because tho' the Holes be ever so small, yet they will still take in too great a Space to determine the Point of *Level* precisely.

*Air Level with Telescope Sights*. This *Level* (*Plat. Surveying, Fig. 5.*) is like the last *Plate Fig.* with this Difference, that instead of plain Sights, it carries a Telescope to determine exactly a Point of *Level* at a good distance. The Telescope is in a little Brass Tube, about 15 Inches long, fastened on the same Rule as the *Level*. At the End of the Tube of the Telescope, mark'd 1, enters the little Tube 1, carrying the Eye-Glass, and a Hair horizontally placed in the Focus of the Object-Glass 2; which little Tube may be drawn out, or push'd into the great one, for adjusting the Telescope to different Sights. At the other End of the Telescope is placed the Object-Glass: The Screw 3, is for raising or lowering the little Fork carrying the Hair, and making it agree with the Bubble of Air when the Instrument is *level*; and the Screw 4, is for making the Bubble of Air agree with the Telescope. The whole is fitted to a Ball and Socket. M. Huygens is said to have been the Inventor of this *Level*; which has this Advantage, that it may be inverted, by turning the Ruler and Telescope half round: And if then the Hair cut the same Point that it did before the Turn, 'tis a Proof the Operation is just. It may be here observed, that one may add a Telescope to any kind of *Level*, by applying it upon, or parallel to the Base or Ruler, when there is occasion to take the *Level* of remote Objects.

*Plumb or Pendulum Level*: That which shews the Horizontal Line by means of another Line perpendicular to that described by its Plumbet or Pendulum. This Instrument (*Plat. Surveying, Fig. 6.*) consists of two Legs or Branches, join'd together at Right Angles; whereof that which carries the Thread and Plumbet, is about a Foot and an half long. This Thread is hung towards the Top of the Branch, at the Point 2. The Middle of the Branch where the Thread passes is hollow, that so it may hang free every where but towards the Bottom at the Place 3, where there is a little Blade of Silver, whereon is drawn a Line perpendicular to the Telescope. The said Cavity is cover'd by two Pieces of Brass, making, as it were, a kind of Case, lest the Wind should agitate the Thread; for which reason the Silver Blade is cover'd with a Glass, to the end that it may be seen when the Thread and Plumbet play upon the Perpendicular. The Telescope 1, is fasten'd to the other Branch or Leg of the Instrument, and is about two Foot long, having a Hair placed horizontally across the Focus of the Object-Glass; which determines the Point of *Level*, when the Spring and Plumbet hang against the Line on the Silver Blade. All the Accuracy of this Instrument depends on the Telescope's being fitted at Right Angles to the Perpendicular. It has a Ball and Socket, by which it is fasten'd to its Foot, and is said to have been the Invention of M. Picard.

*Reflecting Level*: That made by means of a pretty long Surface of Water, representing the same Object inverted, which we see erect by the Eye; so that the Point where these two Objects appear to meet, is in a *Level* with the Place where the Surface of Water is found. This is the Invention of M. Marriotte. There is also another *Reflecting Level*, consisting of a Mirror of Steel or the like, well polish'd, and placed a little before the Object-Glass of a

Telescope suspended perpendicularly. This Mirror must make an Angle of 45 Degrees with the Telescope; in which Case the Perpendicular Line of the said Telescope is converted into an Horizontal; which is the same with the Line of *Level*. The Invention of this is owing to Mr. Cassini.

We have another *Level* of Mr. Hoggens's Invention, consisting of a Telescope *a*, (*Plat. Surveying, Fig. 7.*) in form of a Cylinder, going through a Ferril, in which it is fasten'd by the middle. This Ferril has two flat Branches *b b*, one above, and the other below; at the ends whereof are fasten'd little moving Pieces, which carry two Rings, by one of which the Telescope is suspended to a Hook at the end of the Screw 3, and by the other a pretty heavy Weight is suspended, in order to keep the Telescope in *Equilibrium*. This Weight hangs in the Box 5, which is almost fill'd with Linseed Oil, Oil of Walnuts, or other Matter that will not easily coagulate, for more aptly settling the Balance of the Weight and Telescope. The Instrument carries two Telescopes close and very parallel to each other, the Eye-Glass of the one being against the Object-Glass of the other, that one may see each way without turning the *Level*. In the Focus of the Object-Glass of each Telescope must a little Hair be strain'd horizontally, to be rais'd and lower'd as occasion requires, by a little Screw. If the Tube of the Telescope be not found level when suspended, a Ferril or Ring 4 is put on it, to be slid along, till it fixes to a *Level*. The Hook on which the Instrument is hung, is fix'd to a flat Wooden Cross, at the Ends of each Arm whereof, there is a Hook serving to keep the Telescope from too much Agitation in using or in carriage. To the said flat Cross is applied another hollow Cross, that serves as a Case for the Instrument; but the two Ends are left open, that the Telescope may be secured from the Weather, and always in a condition to use. The Foot of this Instrument is a round Brass Plate, to which are fasten'd three Brass Ferrils moveable by means of Joints wherein are put Staves: And on this foot is placed the Box. See the *Figure*.

*Major's Level*, is composed of three Rules, so joined as to form an Isosceles Rectangle, somewhat like a Roman A; at the Vertex whereof is fasten'd a Thread, from which hangs a Plumbet; which passes over a fiducial Line marked in the Middle of the Base, when the thing to which the *Level* is applied, is horizontal; but declines from the Mark, when the Thing is lower on one Side than the other.

*Carpenters and Painters Level*, consists of a long Ruler, in the Middle whereof is fitted, at Right Angles, another somewhat bigger, at the Top whereof is fasten'd a Line with a Plumbet; which, when it hangs over a fiducial Line at Right Angles with the Base, shews that the said Base is horizontal. These two last Levels, tho' very common, are esteem'd the best for the Practice of Building, tho' the Operations made by 'em must needs be short.

*Gunnery Level*, for levelling Cannons and Mortars, is an Instrument (*Plat. Surveying, Fig. 8.*) consisting of a Triangular Brass Plate about four inches high, at the bottom of which is a Portion of a Circle divided into 45; which Number is sufficient for the highest Elevation of Cannons and Mortars, and for giving Shot the greatest Range. On the Center of this Segment of a Circle is screw'd a piece of Brass, by means whereof it may be fix'd or moved at pleasure. The End of this Piece of Brass is made so as to serve for a Plumbet and Index, in order to shew the Degrees of different Elevations of Pieces of Artillery. This Instrument has also a Brass Foot to set upon Cannon or Mortars, so as when those Pieces are horizontal, the whole Instrument will be perpendicular. The Use of the Instrument is obvious; and consists in placing the Foot thereof on the Piece to be elevated, in such manner as that the Point of the Plumbet may fall on the proper Degree: This is what they call *levelling* the Piece.

*Artillery Foot Level*, is in form of a Square, having its two Legs or Branches of equal Length; at the Juncture whereof is a little Hole, whence hangs a Thread and Plumbet playing on a perpendicular Line in the Middle of the Quadrant: It is frequently divided into 90 Degrees, or rather into twice 45 Degrees from the Middle. This Instrument may be used on ordinary Occasions, by placing the Ends of its two Branches on a Plane; for when the Thread plays perpendicularly over the middle Division of the Quadrant, that Plane is assuredly *level*. To use it in Gunnery, place the two Ends on the Piece of Artillery, which you may raise to any proposed Height by means of the Plumbet, whose Thread will give the Degree above the *Level*.

LEVELLING, an Operation with a Level, for finding a Line parallel to the Horizon, at one or more Stations, in order to determine the Height of one Place with respect to another; for the laying off Grounds even, regulating

of Defeats, draining of Morasses, conducting of Waters, &c. One Place is said to be higher than another, or out of Level with it, when it is more remote from the Centre of the Earth; and a Line equally distant from the Centre of it in all its Points, is called the Line of true Level; whence, because the Earth is round, that Line must be a Curve, and make a part of the Earth's Circumference, or an Arch concentrical with it, as the Line BCFG; *Plate Surveying, Fig. 9.* all the Points whereof are equally distant from the Centre of the Earth A. But the Line of Sight which the Operations of Levels give, is a Tangent or a Right Line perpendicular to the Semi-diameter: One Extreme of which Tangent, being the Point of Contact, the other will be that of a Secant drawn from the Centre of the Earth; and the Point which determines it, will be above the Surface of the Earth, and of the true Level, as much as that Secant exceeds the Radius or Semi-diameter of the Earth.

This Extremity of the Tangent is said to be in the apparent Level, as being that given by the Sight, but is easily reduced to the true Level, because we know by Trigonometry, how much each Secant exceeds the Radius; and because by measuring we have discovered the precise Length of that Radius. It was for want of the Knowledge of this, the Antients were not able to reduce the apparent Level to the true one; and accordingly, to prevent falling into an Error, never level'd above 50 Feet at once, where such Reduction was not necessary. By the Tables since made, it appears that at the Distance of 100 Yards, the apparent Level is raised above the true one about  $\frac{1}{4}$  of a Line: So that the Antients, in this respect, were more scrupulous than needed. By means of this Reduction, we are now able to level Distances of one or two Miles, at one Operation, which the Antients could not do in less than 300.

The Operation of Levelling is as follows: Suppose the Height of the Point A (*Plate Surveying, Fig. 10.*) on the Top of a Mountain, above that of the Point B, and at the Foot thereof required: Place the Level about the middle Distance, between the two Points, as in D, and Staffs in A and B, and let there be Persons instructed with Signals for raising and lowering on the said Staffs little Marks of Pasteboard, or other Matter. The Level being placed horizontally by the Bubble, &c. look towards the Staff A E, and cause the Mark to be raised or lowered, till the Middle, upper Edge, or other most conspicuous Part appear in the visual Ray. Then measuring exactly the perpendicular Height of the Point A above the Point E, which suppose 6 Feet 4 Inches, set that down in your Book; then turn the Level horizontally about, that the Eye-Glass of the Telescope may be fill next the Eye when you look the other way (if you have only plain Sights, the Instrument need not be turned) and cause the Person at the Staff B to raise or lower his Mark, till some conspicuous part of it fall in the visual Ray, as at C, then measure the perpendicular Height of C above B, which suppose 16 Feet, 16 Inches; set this also down in the Book above the other Number of the first Observation; subtract the one from the other, the Remainder will be 10 Feet, 4 Inches, which is the Difference of Level between A and B, or the Height of the Point A above the Point B. Where Note, that if the Point D, where the Instrument is fixed, be in the middle between the two Points A and B, there will be no Necessity for reducing the apparent Level to the true Level, the visual Ray in that Case being raised equally above the true Level.

If it be further required to know whether there be a sufficient Defect for conveying Water from the Source A to the Point B, *Plate Surveying, Fig. 11.* Here in regard the Distance from A to B is considerable, 'tis required that several Operations be made. Having then chosen a proper Place for the first Station, as at I, set up a Staff in the Point A near the Source, with a proper Mark to slide up and down the Staff as L, and measure the Distance from A to I, which suppose 2000 Yards. Then the Level being adjusted in the Point I, let the Mark L be raised and lowered till such time as you spy some conspicuous Part of it thro' the Telescope or Sights of the Level, and measure the Height A L, which suppose 13 Feet 5 Inches. But in regard the Distance A I is 2000 Yards, you must have recourse to your Table for a Reduction, subtracting 11 Inches, which will leave the Height A L 12 Foot 6 Inches; and this note down in your Book. Now turn the Level horizontally about, so as the Eye-Glass of the Telescope may be towards the Staff at A; and fixing up another Staff at H, cause the Mark G to be moved up and down, till you spy some conspicuous Part thro' the Telescope or Sights. Measure the Height H G, which suppose 6 Yards, 4 Feet, 2 Inches. Measure likewise the Distance of the Points I H, which suppose 2500 Yards; for which Distance, according

to the Table, 4 Inches, 8 Lines, must be subtracted from the Height H G, which consequently will but leave 6 Yards, 3 Feet, 9 Inches, 4 Lines, to be taken down in your Book.

This done, remove the Level forwards to some other Eminence, as E, whence the Staff H may be view'd, as also another Staff at D, the Place whither the Water is to be convey'd. The Level being again adjusted in the Point E, look back to the Staff H; and managing the Mark as before, the visual Ray will give the Point F. Measure the Height H F, which suppose 11 Feet, 6 Inches. Measure likewise the Distance H E, which suppose 1000 Yards; for which Distance the Table gives 2 Inches, 9 Lines of Abatement; which being taken from the Height H F, there will remain 11 Feet, 3 Inches, 3 Lines, which enter in your Book. Lastly, turning the Level to look at the next Staff D, the visual Ray will give the Point D. Measure the Height of D from the Ground, which suppose 8 Feet, 3 Inches. Measure also the Distance from the Station H to B, which suppose 900 Yards; for which Distance the Table gives 2 Inches, 3 Lines of Abatement; which being taken from the Height B D, there will remain 8 Feet, 9 Lines, which enter as before.

For the Manner of entering down Observations in your Book, observe that when a proper Place or Station for the Level, between the two Points, has been pitched upon, you must write down the two Heights observed at that Station, in two different Columns, viz. under the first Column, those observed in looking thro' the Telescope when the Eye was from the Source, or towards the Point, which we may call *Back-Sights*; and under the second Column those observed, when the Eye was next the Source, which we call *Fore-Sights*, in the manner following:

	Back-Sights.	Fore-Sights.	
	Foot. Inc. Line.	Foot. Inc. Lin.	
First Height	} 12 : 6 : 0	Second Height	21 : 9 : 4
Corrected		Fourth Height	8 : 0 : 9
Third Height		11 : 3 : 3	
	43 : 9 : 3		29 : 10 : 1

Having summed up the Heights of each Column separately, subtract the lesser from the greater, the Remainder will be the Difference of Level between the Points A and B; as in this Example,

Feet.	Inc.	Lin.
29	10	1
43	09	3

6 : 00 : 10 The Difference of Height or Level between the Points A and B.

If the Distance of the two Points be required, add all the Distances measured, together, and dividing the Difference of Height by the Yards of the Distances, for each 200 Yards you will have a Defect of about 2 Inches, 9 Lines.

*Levelling Staffs* are Instruments used in Levelling, serving to carry the Marks to be observ'd, and at the same time to measure the Height of those Marks from the Ground. They usually consist each of two long square Wooden Rulers, made to slide over one another, and divided into Feet, Inches, &c.

For the common Occasions of Levelling to be perform'd without much Apparatus of Instruments, Time, or Trouble, the following Method is recommended. Set a Pole upright in a Spring, Pond, River, or other Place where Water is to be brought, and mark how many Feet and Inches of it are above Water. Then set up another Pole, of equal length with the other, in the place to which the Water is to come. Place the Center of a Quadrant on the top of this last Pole, the Plommet hanging free; spy thro' the Sights the Top of the Pole that is in the Water, and if the Thread cuts any Degree of the Quadrant, the Water may be convey'd by a Pipe laid in the Earth. If you can't see from one Extreme to the other, the Operation may be repeated in the manner already directed.

Dr. Halley suggests a new Method of Levelling, which has been put in practice by some of the French Academy: This is performed wholly by means of the Barometer, in which the Mercury is found to be suspended to so much the less Height, as the Place is further remote from the Centre of the Earth. Hence it follows, that the different Heights of the Mercury in two Places give the Difference of Level. Mr. Derham, from some Observations he made at the top and bottom of the Monument, found that the Mercury fell  $\frac{1}{2}$  of an Inch at every 82 Foot of perpen-

perpendicular Ascend, when the Mercury is at 30 Inches. Dr. Halley allows of  $\frac{1}{75}$  of an Inch for every 50 Yards; which, considering how accurately the Barometers are now made, an Inch in some of 'em being divided into an hundred or more Parts, all very sensible, he thinks this Method sufficiently exact to take the Levels for the Conveyance of Water, and less liable to Errors than the common Levels. The same Author found a Difference of  $\frac{3}{8}$  Inches 8 Tenths between the Height of the Mercury at the top and bottom of *Straw Hill* in *Wales*.

LEVER, in Mechanics, an inflexible Right Line supported by a single Point on a Fulcrum or Prop; and used for the raising of Weights: being either void of Weight itself, or at least having such a Weight as may be balanced. The Lever is the first of those call'd *Mechanical Powers* or *Simple Machines*, as being of all others the most simple, and is chiefly applied for raising Weights to small Heights. It has its Name Lever from its Office *levare* or *lever*, to raise.

In a Lever there are three things to be principally considered: 1. The Weight to be rais'd or sustain'd, as O, (*Plate Mechanick*, Fig. 1.) 2. The Power by which it is to be rais'd or sustain'd, as B. 3. The Fulcrum or Prop D, whereon the Lever is sustain'd, or rather on which it moves round, the Fulcrum remaining fixed.

The Lever is threefold: Sometimes the Fulcrum is placed between the Weight and the Power, as in Fig. 1. *Plate Mechanick*; and thus we call a Lever of the first kind. Sometimes the Weight is between the Fulcrum and the Power, which is the second kind; as in Fig. 2. And sometimes the Power acts between the Weight and the Fulcrum; Fig. 3. the third kind.

The Power of the Lever is founded on the following Theorem, viz. That the Space or Arch described by each Point of a Lever is as its Distance from the Fulcrum or Prop.

From hence it follows, that the Action of a Power and the Resistance of the Weight increase in proportion to their Distance from the Fulcrum. And hence also it follows, that a Power will be able to sustain a Weight, if the Distance of the Point in the Lever to which it is applied, be to the Distance of the Weight, as the Weight to the Intensity of the Power; which if it be ever so little increased, must raise the Weight. See this Doctrine demonstrated under the Word *Mechanic Powers*, and further illustrated under the Word *Balance*: between which and the Lever there is a great Analogy; a Lever of the first kind being a sort of Steel-yard to raise Weights.

The Power and Action of the Lever will be fully illustrated by the following Propositions.

I. If the Power applied to a Lever of any kind sustain a Weight, the Power is to the Weight in a reciprocal Ratio of the Distances from the Fulcrum. This is the Converse of that demonstrated under the Head *Mechanic Powers*.

II. The Weight of a Lever of the first and second kind AB, the Distance of the Centre of Gravity from the Fulcrum CV, and the Distances of the Weight and the Power AC and CB, being all given; to find the Power that will sustain it.

Suppose the Lever void of Gravity, but in lieu thereof a Weight hung at V; if then A C be made to CV as the Gravity of the Lever to a fourth Number, we shall have the Weight which the Lever is able to sustain, and this subtracted from the given Weight, the Remainder will be the Weight to be sustain'd by the Power. Let CB then be to CA as the remaining Weight to a fourth Weight; and we shall have the Power to be applied in B, in order to sustain the given Weight with the given Lever.

III. The Gravity of a Lever of the first or second kind AB, the Distance of its Centre of Gravity from the Fulcrum CV, the Distances of the Power and the Weight BC and CA being all given, to find the Weight to be sustain'd.

Find the Part of the Weight sustain'd by the Lever alone, as in the former Problem; in the same manner find the other Part of the Weight which the Power applied in B is able to sustain: Add the two Numbers together, the Sum is the Weight required.

IV. The Gravity and Centre of Gravity F of a Lever of the second kind CB, with the Weight G, its Distance from the Fulcrum CA, and from the Power CB, being given; to find the Power capable to sustain the Weight.

Suppose the Lever void of Gravity, but in lieu thereof a Weight equal thereto hung in F, the Power required to sustain the Lever alone. Then find the Power requisite to sustain the given Weight G; add the Powers together, the Sum will be the Power required.

V. If a Power applied to a Lever of any kind lift a Weight, the Space of the first is to that of the last, as this last to a Power able to sustain the same Weight;

whence it follows, that the Gain of Force is always attended with the Loss of Time, and *vice versa*.

LEVERET, a young Hare, so call'd in the first Year of its Age.

LEVIGATION signifies the Reduction of any hard ponderous Bodies, as Coral, Tully, Precious Stones, &c. into a light subtle Powder, by grinding upon Porphyry, a Sea-shell, Marble, Stone, &c. as Painters do their Colours. This is much used in Pharmacy and Chymistry, but unless the grinding Instruments are extremely hard, they will wear away, so as sometimes to double the Weight of the Medicine thus managed.

LEVITE, a Hebrew Priest, or Sacrificer, so call'd as being of the Tribe of Levi, or the Descendant of the Patriarch of that Name. In the Primitive Church they also gave the Name Levite to the Deacons, and Ministers of the Altar. The Levites of the Old Law had no settled Lands allotted 'em for their Maintenance, but lived chiefly of the Offerings made to God. They were distributed through all the Tribes, each of which gave some of their Cities to the Levites, with Grounds in their Neighbourhood for the Subsistence of their Flocks. According to the Numeration made by *Solomon*, from the Age of Twenty there were Thirty-eight Thousand capable of serving: Twenty-four Thousand of these he appointed for the daily Ministry under the Priests; Six Thousand to be inferior Judges in the Cities, and to decide Matters relating to Religion, and of no great consequence to the State; Four Thousand to be Door-keepers, and to take care of the Riches of the Temple; and the rest to do the Office of Chanters or Singers.

The Word comes from the Latin *Levita*, which is form'd from the Greek *λεωτες*; the Root of which is the Name *Levi*, which was given to this Patriarch by his Mother *Leah*, from the Hebrew *לוי לואה*, to be tied or united; *Leah* hoping, by the Birth of this Son, to be more closely link'd to her Husband *Jacob*.

LEVITY, the Privation or Want of Weight in any Body, when compared with another that is heavier, in which sense it is oppos'd to Gravity. The Schools maintain that there is such a thing as positive and absolute Levity, and impute to this the Rise or Emergence of Bodies lighter in Specie than the Fluids wherein they rise. But besides that the common Sense of Mankind discovers that Levity is only a Relative Term, we find by Experience that all Bodies tend towards the Earth, some slower, and some faster, in all Fluids or Mediums, whether Water, Air, &c. Thus Cork is said to be lighter than Gold, because under equal Dimensions the Gold will sink in, and the Cork swim upon Water. *Archimedes* hath demonstrated, That a solid Body will float any where in a Fluid of the same specific Gravity, and that a lighter Body will keep above a heavier. The Reason of this is because of Bodies falling towards the Earth, those which have a like number of equal Parts have equal Gravity; since the Gravity of the Whole is the Sum of the Gravity of all its Parts. Now two Bodies have an equal number of equal Parts, if under the same Dimensions there are no Intervals destitute of Matter; whence it follows, that as no Portion of Matter is so small, but that Body wherein it is contained may be wholly divided into Parts equally small, there can be no reason for the Descent of these, which will not equally hold for the Descent of that. Hence it may be concluded, that those Bodies which do not equally gravitate under the same Dimensions, do not contain the same equal Portions of Matter; and therefore when we see, that a Cube of Gold subsides in Water, at the same time that an equal Bulk of Cork swims upon it, 'tis evident that the Gold must have a greater number of equal Parts of Matter under the same Bulk than the Cork, or the Cork must have a greater number of Vacuities than the Gold; and that there are also in the Water, a greater number of Vacuities than in Gold. Hence we have a clear Idea both of Density or Gravity, and of Levity; and know, that the latter cannot in a strict sense be accounted any thing positive, but a mere Negation or Absence of Body, which determines that Body to be lighter than another which contains more Matter.

Dr. Hook's 'tis true, seems to maintain something like a positive Levity. This, if we mistake not, is what he means by the Term *Levitacion*; viz. a Property of Bodies directly contrary to that of Gravitation towards the Sun. This he thinks he has discovered in the Streams of Comets, which tho' they had a Descent from the Nucleus of the Comet towards the Sun, yet they quickly return'd, and went opposite to the Sun, and that to a prodigious Extent. In effect, where the Power of Gravitation ceases, it should seem some such contrary Force does begin, whereof we have Instances in the Phenomena of Attraction. This is what Sir I. Newton calls the *Vis Repellens*, and appears

pears to be one of the Laws of Nature; without which it would be hard to account for Rarefaction, and some other Appearances. See *Repulsion*.

**LEURE**, in Falconry, a piece of red Leather, cut in form of a Bird, or a Ball set off with a Beak, Claws, and Wings, hung out on a Crook by the Falconer to reclaim his Birds. They sometimes tie Meat to the *Leure*, wherewith to feed the Bird. The Word comes from the Latin *Lorum*, tho others derive it from *Lora*, *Craffinefi*, *Decet*.

**LEVY** signifies to gather or exact; as to *levy* Money, to *levy* Troops. *Levy* is sometimes also used to erect or set up; as to *levy* a Mill; also to raise or cast up, as to *levy* a Ditch, to *levy* a Fine, &c. from the French *lever*, to raise.

**LEX**, see *Law*.

**LEX AMISSA**, or *Lexen amittere*, in Law is understood of an infamous perjured Person, who is said to *lose his Law*; or, as *Bracton* has it, *non est sibi ius dignus Lex*.

**LEX JUDICIALIS**, is properly *Purgatio per Judicium Ferri*, sometimes call'd simply *Judicium*.

**LEX SACRAMENTALIS**; *Purgatio per Sacramentum*.

**LEX TERRÆ**, is the Law and Custom of the Land, by which Name it is distinguish'd from the Civil Law.

**LEXICON**, the same with Dictionary. The Word is seldom used, excepting in speaking of certain ancient Greek Dictionaries which bear this Name. 'Tis derived from the Greek *λέξω* *Diction*, of *λέγω* *I speak*.

**LIBATION**, a Ceremony in the Heathen Sacrifices, wherein the Priest spill'd some Wine, Milk, or other Liquor, in honour of the Deity to whom the Sacrifice was offered, after having first tasted it himself. *Alexander* is said to have sacrific'd a Bull to *Neptune*; and for an Offering to the Sea-Gods, threw the Golden Vessel, used for the *Libation*, into the Sea. *Libations* were also in use under the Law of *Moses*, being enjoined by God in *Exodus* xxix. and *Numbers* xv. See *Lippus* on *Libationis*.

**LIBEL**, a Writing containing Injuries, Reproaches, or Accusations against the Honour and Reputation of any Person, particularly of a Superior or Governour. *Plinius* is of opinion that a Writing, how injurious soever it is, cannot be call'd a *Libel*, if the Author's Name be in it. *Libellers*, among the ancient *Romans*, were punish'd with Death, but in After-Times they were only whipp'd. *Augustus* rank'd *Famosos Libellos*, Defamatory Libels, among the Crimes *Lesæ Majestatis*, of High-Treason. *F. Bandini* has publish'd a Comment on the Imperial Laws against *Libel*. Scandalous Pictures are reckon'd amongst *Libels*.

The Lawyers say a *Libel* may be either in *Scriptis*, or *fine Scriptis*. In *Scriptis*, when a Writing is composed or published to another's Disgrace, which may be done *Verbis*, and *Cantibus*; as where this is maliciously repeated or sung in the presence of others: Or *elic Traditio*, when the *Libel*, or any Copy of it, is delivered out to scandalize the Party. *Famosus Libellus sine Scriptis*, may be two-fold. (1.) *Pilularis*, as to paint the Party in a shameful, or ignominious manner: Or, (2.) *Signis*, as to fix a Gallows, or other ignominious Signs, at the Door of the Party, or elsewhere. The Punishment of Libelling in *England*, is putting the Criminal on the Pillory, Whipping, &c.

*Libel* also signifies the Original Declaration of any Action in the Civil Law.

**LIBELLATICI**. Under the Persecution of *Devis* there were several Christians, who, to prevent their being oblig'd to renounce the Faith, and sacrifice to Idols in Public, made Application to the Magistrates, and abjured their Faith in private, obtaining Certificates of 'em, either by Intreaty, or by Money; by which they were attested to have complied with the Orders of the Emperor, and were thereby sheltered from any further Molestation on account of their Religion. These Certificates were call'd *Libelli*, whence the People who obtained them came to be denominated *Libellatici*. Others, particularly the *Centuriones* of *Magedon*, are of Opinion, that the *Libellatici* were only such as sed the Magistrates with Money, to screen them from Persecution, and from being oblig'd to renounce Christianity. *M. Tullianus* retains somewhat of each Opinion; he thinks the *Libellatici* applying themselves to the Magistrates, bought off the Sacrificing and Abjuration, and obtained Letters, by which they were declared to have renounced Christ, and sacrific'd to Idols, tho' in effect they had done neither.

**LIBERAL ARTS**, in opposition to Mechanical Arts, are such as depend more on the Labour of the Mind, than on that of the Hand; that consist more in the Speculation than the Operation, and that have a greater Regard to Amusement and Curiosity, than the servile Mechanical Works: Such are Grammar, Rhetoric, Painting, Sculpture, Architecture, Music. The *Liberal Arts* used formerly to be sum'd up in the following Latin Verse.

*Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra.*

And the Mechanical Arts, which however are innumerable, under this;

*Ras, Nona, Arma, Faber, Vulcanus, Lana, Rates.*

The Word comes from the Latin *Liberalis*, which among the *Romans* signified a Person who was not a Slave, and whose Will, of consequence, was not check'd by the Command of any Master.

**LIBERALIA**, Feasts celebrated by the ancient *Romans* in honour of *Bacchus*. These were the same with those which the *Greeks* call'd *Dionysia* and *Agonia*; which see.

They took their Name from *Libera*, i. e. Free; a Title confer'd on *Bacchus*, in memory of the Liberty or Freedom which he granted to the People of *Bœtia*; or perhaps because Wine, whereof he was the reputed Deity, delivers Men from Care, and sets their Minds at ease and freedom. *Varro* derives the Name of this Feast from *Libera*, considered as a Noun Adjective, and signifying Free; because the Priests were free from their Function, and eas'd of all Care during the Time of the *Liberalia*. For, in effect, it was the old Women who officiated in the Ceremonies and Sacrifices of these Feasts.

**LIBERIA**, a Feast held among the *Romans* on the Day wherein their Children laid aside their Juvenile Habits, and assumed the Robe call'd *Toga Libera*. The *Libera* were kept on the sixteenth of the Calends of *April*; that is, the 17th of *March*.

**LIBERTIN**, among the *Romans*, was what we call a Free Man, a Person set free from a Legal Servitude. These still retain'd some Mark of their ancient State. He who made a Slave free, had a Right of Patronage and of Patron over the *Libertin*; if the *Libertin* fail'd of shewing due Respects to his Patron, he was restor'd to his Servitude; and if the *Libertin* died without Children, his Patron was his Heir.

**LIBERTINES**, the Name of a Sect in Religion, that arose in the Year 1525. Their principal Tenets were, That there is but one only Spirit, who is that of God; who is diffus'd through all Things, which is and lives in all Creatures; that our Souls are nothing but this Spirit of God: That the Soul dies with the Body; that Sin is a mere Chimera, and only subsists in Opinion, for that it was God that did all, both Good and Evil; that Paradise is a Dream, and Hell a Phantom, invented by the Divines, and Religion a State-Trick to keep Men in Awe; that spiritual Regeneration consists in nothing but fixing the Remorse of Conscience; Repentance in avowing to have done no Evil; and that it is lawful, and even expedient to dissembel in Matters of Religion. To these they added horrible Blasphemies against *Jesus Christ*, saying, he was nothing but a mere *Je ne sçai quoi*, composed of the Spirit of God, and of the Opinion of Men. These Maxims occasioned their being call'd *Libertines*; and the Word has been used in an ill Sense ever since.

They spread principally in *Holland* and *Brabant*. Their Leaders were one *Quintin* a *Picard*, and another call'd *Chopin*, who associated with him, and became his Disciple.

**LIBERTY**, is usually understood of that State wherein a Man acts freely; or that Power by which he determines himself voluntarily either to Good or Evil, to this thing or to that: Or *Liberty* is an active Indifference of the Will, to will, or not will any thing. *F. Malbranche* gives us a still more Philosophical Definition. The Will he defines to be that Impression, or natural Motion, which inclines towards Good in the general; and by *Liberty* he understands, that Power which the Mind has of determining this general Impression towards such Objects as please us; and so of directing our general Inclinations to some particular Things: whence it is easy to perceive, that tho' all natural Inclinations be voluntary, yet they are not all free; not, we mean, with a Freedom of Indifference, which includes a Power of willing, or not willing; or of willing quite the contrary to that which our natural Inclinations lead us to: For tho' 'tis voluntarily and freely that we love Good in general, it being absurd to suppose we should love any thing without the Will, or that the Will can ever be constrain'd; yet we don't love freely, (in the Sense just laid down) because 'tis not in the power of the Will not to desire to be happy. It must be observed, however, that the Mind, considered as determined towards Good in general, cannot divert its Motion to any particular Good, unless the same Mind, considered as capable of Ideas, have some Knowledge of that particular Good. That is, in plainer Terms, the Will is a blind Power, that cannot apply itself to any thing but what the Understanding represents to it: So that the Power which the Will has to determine its Impression towards general Good, or its natural Inclinations, variously, consists in the Power it has to command the Understanding to represent some

some particular Good. Thus, a Person, for instance, represents some Dignity to himself as a Good to be with'd not, immediately the Will desires this Good; that is, the Impression which the Mind continually receives towards Good in general, determines it to this Dignity. But as that Dignity is not the universal Good, nor is conceived clearly and distinctly as such by the Mind, (for the Mind cannot conceive a thing clearly which is not;) the Impression we have towards Good in general, is not entirely exhausted by that particular Good; the Mind has an Inclination to go further; it does not love that Dignity necessarily or invincibly, and in this respect is free. Now its Liberty consists in this, that not being fully convinced that this Good contains in it all the Good it is capable of loving, it may suspend its Judgment and its Love. The Case is nearly the same with regard to the Knowledge of Truth. We love this as we do the Enjoyment of Good, by a natural Impression; which Impression is not invincible in the latter, excepting Evidence be full, and our Knowledge of the Object complete: We have the same Liberty in our false Judgments, that we have in our irregular Appetites. See Judgment, Will, &c.

Most of the Schoolmen confound Liberty and the Will together, and make one Definition serve for 'em both. They distinguish Liberty into a great many Kinds; as Liberty of Contrariety, *Contrarietatis* which is a Liberty of doing two things not only different, but contrary to each other. Liberty of Contradiction, is a Power of doing a thing, or letting it alone. Jesus Christ had not the Liberty of Contrariety, with regard to Good and Evil, for he could not do Evil; but he had a Liberty of Contradiction with regard to Good. Next Liberty, *Proxima*, is a full absolute Freedom of doing any thing. Liberty remote, is a Liberty that comprehends a natural Power, tho' embarrass'd with Obstacles, which it is in its power to remove, and to attain to a next Liberty. Thus he who has not actual Grace necessary for the fulfilling of his Duty, but has yet the actual Grace of Prayer, has a next Liberty with regard to Prayer, and a remote Liberty with regard to his Duty.

Cicero defines Liberty the Power of living after a Man's own Desire, without any Cause or Impediment to oblige him to do one thing rather than another. The Doctrine of Pelagius, with regard to Liberty, is built on Philosophy, which does not allow us to have lost our original Liberty of doing good.

**LIBERTY OF CONSCIENCE**, a Right or Power of making Profession of any Religion that a Man sees fit. This seems to be a natural Right; it is vigorously opposed by the Generality of the *Romanists*, and even by many of the Reformed, tho' it seems as if the Reformation could scarce subsist without it.

**LIBRA**, Balance, one of the twelve Signs of the Zodiac, exactly opposite to *Aries*.

**LIBRA**, one of the Mechanical Powers. See Balance.

**LIBRA**, the ancient Roman Pound, borrowed from the *Sicilians*, who called it *Libra*. It was divided into twelve Uncies, or Ounces, equal to about 10½ Ounces of our Weight. The Divisions of their *Libra* were the *Uncia* 1, the *Sextans* 2, the *Quadrans* 4, the *Triens* 3, the *Quincunx* five Ounces, the *Semis* six, the *Septimus* seven, the *Denarius* eight, the *Denarius* nine, the *Dextrarius* ten, the *Densus* eleven; lastly, the *As* weighed twelve Ounces, or one *Libra*. The Roman *Libra* was used in France for the Measure of their Coin till the time of *Charlemagne*, or perhaps till that of *Philip I.* in 1093. their Sols being proportioned, as that twenty of them were equal to the *Libra*. By degrees it became a Term of Account, and every thing of the Value of twenty Sols was called a *Livre*. See *Livre*. The Romans had also a Coin called *Liber*, equal to twenty *Denarii*. *Seaher* will have it, that *Libra* was even among them a Term of Account, not a Coin. See *Pesul*.

**LIBRA PENZA**, in our Law-Books, is a Pound of Money in Weight: it being usual in former Days not only to tell the Money, but to weigh it; in regard many Cities, Lords, and Bishops having their Mints, coin'd Money, and often very bad too: for which reason, tho' the Pound consisted of 20 Shillings, they always weigh'd it.

**LIBRARI**, among the Antients, were properly those who transcribed in beautiful, or at least legible Characters, what had been wrote by the *Naturii* in Notes and Abbreviatures. The Word was also used for Copists, or those who wrote Books for the Book-sellers.

**LIBRARY**, an Apartment or Place destined for the placing of Books; or the Books themselves lodg'd in that Apartment. Some Authors refer the Origin of *Libraries* to the *Hebrews*, and observe that the Care they took for the Preservation of their Sacred Books, and the Memory of what concern'd the Actions of their Ancestors, became an Example to many other Nations, and particularly the *Egyptians*. *Oswandrius* King of *Egypt* is said

to have taken the hint first, and had a *Library* built in his Palace, with this Inscription over the door, *Υους λαιουον*. Nor were the *Ptolemys*, who reign'd in the same Country, less curious and magnificent in Books. The Scripture speaks of a *Library* of the Kings of *Persia*, *Esdas* V. 15. VI. 1. which some imagine to have consisted of the Historians of that Nation, and of Memoirs of the Affairs of the State; but, in effect, it appears rather to have been a Depository of Laws, Charters, and Ordinances of the Kings. The Hebrew Text calls it the *Book of Treasures*, and afterwards the *House of the Books of Treasures*. We may with more justice call that a *Library*, mention'd in the second of *Esdas* to have been built by *Nebuchad*, and in which were preserv'd the Books of the Prophets and of *David*, and the Letters of their Kings.

The first who erected a *Library* at *Athen*, was the Tyrant *Pisistratus*; and yet *Strabo* refers the Honour of it to *Aristotle*. That of *Pisistratus* was transported by *Xerxes* into *Persia*, and afterwards brought by *Solomon Nicator* to *Athen*. Long after, it was plundered by *Sylla*, and re-established by *Hadrian*. *Plutarch* says, that under *Eumenes* there was a *Library* at *Pergamus* containing 20000 Books. *Tarantian*, a celebrated Grammarian, Contemporary with *Pausanias*, had a *Library* of 3000 Volumes: That of *Ptolemy Philadelphus*, according to *Amianus Marcellinus*, contain'd 7000, all in Rolls, burnt by *Cesar's* Soldiers. *Constantine* and his Successors erected a magnificent one at *Constantinople*, which in the eighth Century contain'd 300000 Volumes, all burnt by order of *Leo Isaacus*; and among the rest, one wherein the *Iliad* and *Odyssey* were written in Letters of Gold on the Guts of a Serpent.

The most celebrated *Libraries* of ancient Rome were the *Ulpian* and the *Palatin*. They also boast much of the *Libraries* of *Paulus Emilius*, who conquer'd *Pesinus* of *Lucilius Lucullus*, of *Asinius Pollio*, *Atticus*, of *Julius Severus*, *Domitian*, *Seranus*, *Pamphylus*, *Martyr*, and the Emperors *Gordon* and *Trajan*.

Antiently every large Church had its *Library*; as appears by the Writings of *St. Jerome*, *Anastasinus*, and others. *Pope Nicholas* laid the first Foundation of that of the *Vatican* in 1450. It was destroy'd by the Confable *barbaron* in the sacking of Rome, and restored by *Pope Sixtus V.* and has been considerably enrich'd with the Ruins of that of *Heidelberg*, plunder'd by *Count Tilly* in 1622.

One of the most complete *Libraries* in Europe is said to be that erected at *Florence* by *Cosmo de Medici* 5 over the Gate whereof is wrote, *Labur ubique Labore*. Tho' it is now exceeded by that of the French King; begun by *Francis I.* augmented by *Cardinal Richelieu*, and completed by *M. Colbert*. The Emperor's *Library*, according to *Lambecius*, consists of 80000 Volumes, and 13940 Curious Medals.

The *Bodleian Library* at *Oxford*, built on the Foundation of that of *Duke Humphrey*, exceeds that of any University in Europe, and even those of all the Sovereigns of Europe, except the Emperor's and French King's, which are each of 'em older by a hundred Years. It was first open'd in 1622, and has since found a great number of Benefactors; particularly *Sir Rob. Cotton*, *Sir H. Savil*, Archbishop *Land*, *Sir Kenelm Digby*, *Mr. Allen*, *Dr. Pascol*, *Mr. Selden*, and others. The *Vatican*, the *Medicean*, that of *Bellarmino* at *Venice*, and those just mention'd, exceed the *Bodleian* in Greek Manuscripts; which yet outdoes 'em all in Oriental Manuscripts. As to printed Books, the *Ambrosian* at *Milan*, and that of *Wolffenbuttel*, are two of the most famous, and yet both inferior to the *Bodleian*. The *Cotton Library* consists wholly of Manuscripts, particularly of such as relate to the History and Antiquities of England; which, as they are now bound, make about 1000 Volumes.

**LIBRATA TERRÆ**, a Portion of Ground containing 4 Osgangs, and every Osgang 13 Acres. With us it is so much Land as is yearly worth 20 s. In *Henry the III'd's* time, he that had *quindecim Libratas Terræ*, was to receive the Order of Knighthood.

Some say, that as Money is divided into Pounds, Shillings, Pence, and Farthings, the same Degrees are to be observed in the Division of Lands; and therefore as *Quadrans* signifies a Farthing, so *Quadrantata* is the fourth part of an Acre, *Oblata* an half, *Denaria* a whole Acre, *Solidata* 12 Acres, and *Librata* 20 times 12 Acres, i. e. 240 Acres.

*Splonius* compares an Acre to a Mark in Money; and as in one there are 160 Pence in Money, so in the other there are 160 Perches of Land.

**LIBRATION**, in Astronomy, which some call *Trepidation*, an apparent Irregularity in the Motion of the Moon, by which she seems to librate or shake about her own Axis, sometimes from the East to the West, and sometimes from the West to the East; whence some Parts in her Western Limb or Margin recede from the Centre of the Disk, and sometimes move towards it.

Some of those Parts which were before visible, set and hide themselves in the invisible side of the Moon, and afterwards become again conspicuous. This *Libration* of the Moon is owing to her equable Rotation round her own Axis, and her unequal Motion in the Perimeter of her Orbit. For if the Moon moved in a Circle, whose Centre co-incided with the Centre of the Earth, and turn'd round its Axis in the precise Time of its Period round the Earth; the Plane of the same Lunar Meridian would always pass thro' the Earth, and the same Face of the Moon would be constantly and exactly turn'd towards us. But since the real Motion of the Moon is an Ellipsis, in whose Focus is the Earth, and the Motion of the Moon about the Earth is equable; or, which is the same thing, every Meridian of the Moon by the Rotation describes Angles proportional to the Times: the Place of no one Meridian will constantly pass thro' the Earth.

**LIBRATION OF THE EARTH,** that Motion, whereby the Earth is so retain'd in its Orbit, as that its Axis continues constantly parallel to the Axis of the World. This, *Copernicus* calls the Motion of Libration; and may be illustrated thus: Suppose a Globe, with its Axis parallel to that of the Earth, pointed on the Flag of a Mast, moveable on its Axis, and constantly driven by an East Wind, while it falls round an Island, 'tis evident the pointed Globe will be so librated, as that its Axis will be parallel to that of the World in every Situation of the Ship.

**LICENCE,** a Permission or Leave granted by a Superior. *Ugolinus* appointed four Years to be spent in the Study of the Law; after which, those who had discharged this Obligation, were said to have Licence, or Permission, to retire from Study. And hence the Word comes to be used in this sense among us.

Licence is also used for the Letters or Certificates taken out in the Universities, whether in Law, Physic, or Divinity. Licence in the *Sermones* is a Period of two Years, which the Bachelors are obliged to pass in assisting at Acts, and disputing in 'em, to qualify themselves for being admitted Doctors.

**LICENCES,** in Painting, are the Liberties which the Painter takes in dispensing with the Rules of Perspective, and the other Laws of his Art.

*Poetical Licence* is the Liberty which Poets claim of dispensing with the ordinary Rules of Grammar; and anciently the Poets had much greater Licences than are now allow'd. The *Greeks*, by having recourse to the several Dialects of their Tongue, could lengthen out a Word if it were too short, or retrench something from it if it were too long. The old Poets did what they pleas'd with their Language, and subjected it not only to all their Necessities, but their Caprices too.

*Et data Romanis cœnia est indigna Poetis.*

But these became ridiculous in course of Time; and the Poets are now depriv'd of most of their ancient Privileges.

**LICENCE TO ARISE,** in Law, is a Liberty or Space of Time given by the Court to a Tenant, to arise out of his Bond, who is *clôn'd de Male Lētis* in a real Action.

**LICENTIATE,** he who has obtain'd the Degree of a Licence. Most of the Officers of Judicature in *Spain* are known by no other Name than that of *Licentiate*. To pass *Licentiate* in the Canon Law, Civil Law, or Physic, they must have studied seven Years, in Divinity ten. A *Licentiate* among us is usually understood of a Physician who has a Licence to practise, granted him by the College or Bishop of the Diocese. A Person practising Physic without such Licence, in case his Patient dies under his hands, is guilty of Felony in the eye of the Law.

**LICHEN,** a cataceous Dissemper, in many respects the same with a Leprosy; for which, a Mofs of the same name is said to be an extraordinary Remedy: but this the present Practice seldom meets with.

**LIEGE,** properly signifies a Vassal who holds a kind of Fee, that binds him in a closer Obligation to his Lord than other People. The Term seems to be deriv'd from the *French* *lier*, to bind; in regard of a Ceremony used in rendering Faith or Homage, which was by locking the Vassal's Thumb or his Hand in that of the Lord, to shew that he was fast bound by his Oath of Fidelity. *Cujas*, *Vigier*, and *Eignon* chuse rather to derive the Word from the same Source with *leuds* or *leuds*, loyal, faithful. But *De Cange* falls in with the Opinion of those who derive it from *Litis*; a kind of Vassals so firmly attach'd to their Lord on account of Lands or Fees held of him, that they were obliged to do him all manner of Service, as if they were his Domestic. He adds, this was formerly call'd *Litruum Servitium*, and the Person *Lige*. In this sense the Word is used *Lex. Ebra.* cap. 29. *Ser. Job* *Tuella* *Revis* *Ligea* *debet esse*; that is, wholly under his Protection.

By *Liege Homage* the Vassal was obliged to serve his Lord towards all, and against all, excepting his Father. In which sense, the Word was used in opposition to *simple Homage*; which last only obliged the Vassal to pay the Rights and accustomed Dues to his Lord, and not to bear Arms against the Emperor, Prince, or other Superior Lord: So that a *Liege Man* was a Person wholly devoted to his Lord, and intirely under his Command.

However, as the Word *Liege* is variously used by Authors, it must be observ'd that there were formerly two kinds of *Liege Homage*: the one by which the Vassal was obliged to serve his Lord, against all without exception, even his Sovereign; the other, by which he was to serve him against all, except such other Lords as he had formerly ow'd *Liege Homage* to.

In our old Statutes, *Lieges* and *Liege People* are Terms peculiarly appropriated to the King's Subjects, as being *Ligei*, *Ligati*, or obliged to pay Allegiance to him, *8 Hen. 6. 14 Hen. 8. &c.* The private Persons had their *Lieges* too—*Reinoldus Dei gratia Abbas Ramstie, prepositus & hominibus de Brancastre, & omnibus vicinis Francie & Anglie, Salutem. Scitis me dedisse terram Uffe, in Depedace (boche Depedale) suis Josepho & Ussi ejus Alfine—ca Condoune quod effectus sunt homines Ligei. Lib. Rames.*

*Omnibus, &c. Reginaldus Rex Insularum, Salutem. Scitis quod deveni homo Ligeus Domini Regis Anglie Johannis, contra omnes Mortales quomodo vixerit, & inde ei fidelitatem & sacramentum prestasti, &c. MS. penes W. Dugdale.*

**LIENTERY,** in Physic, a kind of Looseness wherein the Food passes so suddenly thro' the Stomach and Guts, as to be thrown out by Stool with little or no Alteration. The *Lientery* is owing either to a Defect in the Ferment of the Stomach, or to a Relaxation of the Pylorus, attended with too brisk an Irritation of the Fibres of the Ventricle, that instead of retaining the Aliment it lets it pass. Excess of Drinking sometimes occasions this Disease, by relaxing the Stomach, and especially the Pylorus, too immoderately. The Antients were of opinion the *Lientery* was owing to the too great Smoothness and Slipperiness of the Inside of the Intestines, by which they let the Food slip off before it was digested; and hence they gave it this Name, which is formed from *λίον*, *polyhed*, and *λίστερ*, *intestine*.

**LIE UNDER THE SEA:** The Sailors say, a Ship lies under the Sea, when her Helm being made fast a Lie, she lies fo-a-Hull, that the Sea breaks up on her Bow, or Broad-side.

**LIEUTENANT,** a Deputy or Officer who holds the place of a Superior, and discharges that Function in his absence, which he ought to exercise in person. Of these some are Civil, as *Lords Lieutenants* of Kingdoms, who are the King's Viceroy, and govern in his stead; *Lords Lieutenants* of Counties, see *County*. But the Term is most popular with Military Men, among whom there is a Variety of *Lieutenants*. As,

*Lieutenant-General*, the second Officer in an Army, who commands a Body of Forces, a Detachment, Quarter-Attack, &c. under the General.

In France they have also *Lieutenants-General* of their Naval Forces, who command immediately under the Admirals.

In Holland they have a *Lieutenant-Admiral*, which is the same with what we call a Vice-Admiral.

*Lieutenant-General* of the Ordnance, is he who has the Charge of the Artillery, Batteries, &c. under the Master-General, or in his absence.

*Lieutenant-Colonel*, in a Body of Horse, is the first Captain of the Regiment; he commands in the absence of the Colonel, taking place of all the other Captains.

*Lieutenant-Colonel* of Foot, is the second Officer in the Regiment; he commands in the absence of the Colonel, and in a Battle takes post at his Colonel's Left. The Dragoons have also a *Lieutenant-Colonel*; but the Horse have not, properly, any.

**LIFE,** the Duration of Animal Being, or the Space of Time that passes between their Birth and Death. Life is also used for the Constitution; or the Principle of Heat and Motion that animates Bodies, and makes 'em Perceive, Act, and Grow; in which sense, Life is divided into Animal, Sensitive, and Vegetative. Life, in a strictly physical sense, is the Circulation of the Blood.

*My Lord Bacon* makes the Prolongation of Life one of the three Branches of Medicine; the other two relating to the Preservation of Health, and the Care of Diseases. And the Theory of this he numbers among the *Desiderata*. Some Means or Indications that seem to lead to it, he lays down as follows.

Things are preserved in two manners; either in their Identity, or by Reparation. In their Identity, as a Fly or Ant in Amber, a Flower or Fruit or Wood in a Conservatory of Snow; a dead Carcase in Balsams. By Reparation, as a Flame, and as Mechanical Engines, &c. To attain

attain to the Prolongation of *Life*, both these Methods must be used, and the Human Body must be preserved both as Inanimates, as Flame, and as Mechanical Instruments are preserved. Hence arise three Intentions for the Prolongation of *Life*: Retardation of Consumption, proper Reparation, and Renovation of what begins to grow old. Consumption is occasion'd by two kinds of Depredation; a Depredation of the Innate Spirit, and a Depredation of the Ambient Air. These may be each prevented two ways; either by rendering those Agents less predatory, or by rendering the passive Parts (viz. the Juices of the Body) less liable to be prey'd on. The Spirit will be render'd less predatory, if either its Substance be condensed, as by the Use of Opiates, Griec, &c. or its Quantity diminished, as in spare and monastic Diets; or its Motion calm'd, as in Idleness and Tranquillity. The Ambient Air becomes less predatory, if it be either less heated by the Rays of the Sun, as in cold Climates, in Caves, Mountains, and Anchories Cells; or be kept off from the Body, as by a dense Skin, the Feathers of Birds, and the Use of Oil and Unguents without Aromatics. The Juices of the Body are rendered less liable to be prey'd on, either by making them harder, or more moist and oily. Harder, as by a coarse sharp Diet, living in the Cold, robust Exercises, and some Mineral Baths. Softer, as in the Use of sweet Foods, &c. in abstaining from Salts and Acids, and especially in such a Mixture of Drink, as consists wholly of fine subtile Particles without any Acrimony or Acidity. Reparation is performed by means of Aliment. Alimentation is promoted four ways: By the Concoction of the *Viscera*, so as to extrude the Aliment; by exciting the exterior Parts to the Attraction of the Aliment, as in proper Exercises and Frictions, and some Unctions and Baths; by the Preparation of the Food it self, so as it may more easily insinuate it self, and in some measure anticipate the Digestion, as in various Ways of dressing Meats, mixing Drinks, fermenting Breads, and reducing the Virtues of these three into one; by promoting the Act of Assimilation it self, as in seasonable Sleep, some external Applications, &c. The Renovation of what begins to grow old, is performed two ways, by the Intercour of the Habit of the Body, as in the Use of Emollients, Emplastors, Unctions, &c. of such a nature, as do not extract, but impress; or by purging off the old Juices, and substituting fresh ones, as in Seasonable Evacuations, Attenuating Diets, &c.

The same Author adds these three Axioms: That the Prolongation of *Life* is to be expected rather from some stated Diets, than either from any ordinary Regimen, or any extraordinary Medicines; more from operating on the Spirits, and mollifying of the Parts, than from the Manners of feeding; and this mollifying of the Parts without, be performed by Consubstantial, Imprints, and Occlusents. See *Longevity*.

LIGAMENT, a Term in Anatomy. In its general Signification, *Ligament* is any thing that ties or binds one Part to another, in which Sense the Antients used the Word for Membranes, Skin, Flesh, Veins, and Arteries, as being common *Ligaments*. But in its more proper Signification, *Ligament* is a white, tough, solid inflexible Body, inclosing and keeping together the Joints of the Body. It has no conspicuous Cavities, nor has it any Sense; lest it should suffer on the moving of the Bones, and is very different according to the different Parts where it is found. It is harder than a Membrane, yet softer than a Cartilage; its principal Use is to gird and strengthen the Joints, to prevent the Dislocation of the Bones, and even to fasten them together when they have no Articulation. It also serves as a Covering to the Tendons, to separate them from the Muscles, and to hold up the suspended Entrails, lest their Weight should throw them down; such are the *Ligaments* of the Liver, the Bladder, and Matrix. They are of different Substances, some hard, others soft, membranous, nervous, and cartilaginous: as also of different Figures and Situations. Some arise from Bones, others from Cartilages, and others from Membranes. The *Ligament* is the most Terrestrial of all the Parts of the Body after the Bone and Cartilage, being cold, dry, hard, and insensible like them.

In particular, the several *Ligaments* of the Body are the cartilaginous *Ligaments*, which bind the four Bones of the Metacarpus with the Carpus. The *Ligaments* of the Spine are very strong, being fitted to the Articulations of the Vertebrae, to prevent their Luxations in violent Motions. They are of two kinds, the one thick and fibrous, in form of a Crescent, which bind them both at top and bottom; and the others membranous, serving to fasten them the more securely. The *Ligaments* of the Liver are two in Number, the first, which is the chief, called *Ligamentum Suspensivum*, holds it suspended to the

Diaphragm, penetrating into the Substance of the Liver, to hold it the more firmly; the latter is larger, but more lax, it comes from the external Coat of the Liver, and is fastened to the Cartilage Xiphoides. Some add a third, which is formed out of the Umbilical Vessels, which in Adults dry up and become a *Ligament*. There are two *Ligaments* belonging to the Tongue, one that fastens it by its Root to the *Os Hyoides*, and another larger, inserted into the middle and inferior Part; this last is called, *The Bridle of the Tongue*. There are also *Ligaments* belonging to the Spleen. The *Penis* has a strong *Ligament*, call'd *Suspensorium Penis*, from its Office in holding up the *Penis* to the *Os Pubis*; it arises from the Foreparts of those Bones, and is fastened to the upper Part of the *Corpora Cavernosa Penis*; it has another *Ligament*, which fastens the Prepuce to the Glans. The *Uterus* has four *Ligaments*, two of them called broad, and two round from their Figure; the broad *Ligaments* are membranous, and arise from the *Procerfus* of the *Peritonaeum*, and are fastened to the lateral Parts of the *Fundus* or Bottom of the *Uterus*, and serve to prevent the *Fundus* from falling down upon the Neck, as it sometimes happens when these *Ligaments* are too much relaxed. The round *Ligaments* arise from the Sides of the Womb, at the place where the *Tubo Fallopiæ* are joined to it. At their first Rise they are broad, but, by degrees, as they recede farther from the Womb, grow round and smooth; and as the spermatic Vessels do in Men, pass betwixt the Duplication of the *Peritonaeum*, and so out of the *Abdomen* thro' the *Foramina* of the oblique and transverse Muscles of the *Abdomen*, and running obliquely on the *Os Pubis*, terminate under the Fat near the *Cistitis*. By the Passages of these *Ligaments*, Women, and Girls especially, are exposed to inguinal Ruptures, as Men are by the Passages of the spermatic Vessels. The Substance of the broad *Ligaments* is membranous, loose, and soft, whence some have compared them to the Wings of a Bat, and called them *Alæ Vespertilionum*. The round *Ligaments* are of a firmer Texture, and consist of a double Membrane, wrapping up in it Veins, Arteries, Nerves, and Lymphæducts, and both these and the former have been sometimes taken for Muscles. By these *Ligaments* the *Uterus* is kept so tight, that no Violence of internal Flatulency or Humours can raise it above its Place.

LIGAMENTUM ANNULARE. See *Wrist*.

LIGAMENTUM CILIARE. See *Ciliary Ligamentum*.

LIGAMENTUM LATUM, and ROTUNDUM. See *Generation, Parts of, proper to Women*.

LIGATURE, in Chirurgery, a Bandage or Fillet of Cloth or Linnen, serving to bind the Arm, and facilitate the Operation of bleeding. *Ligature* is also the Art and Manner of disposing and applying Bandages for the closing of Wounds, and performing many of the Operations of Chirurgery. There are various kinds of *Ligatures*. Some Authors reckon them upwards of five hundred.

*Ligature*, among the mystic Divines, signifies a total Suspension of the superior Faculties or intellectual Powers of the Soul. They pretend that when the Soul is arrived at a perfect Contemplation, she remains deprived of all her Operations, and ceases to act, in order to be more ready and prepared to receive the Impulse and Communications of Divine Grace. This passive State of these contemplative People they call their *Ligature*.

*Ligature* is also used to signify a kind of Bandage or Fillet, tied round the Neck, Arm, Leg, or other Part of the Bodies of Men or Beasts, to divert or drive off some Disease, Accident, &c.

*Kempfer* tells us of an uncommon kind of *Ligature* in use among the People of *Maccassar*, *Java*, *Malacca*, *Siam*, &c. By this Charm, or Spell, a Man binds up a Woman, and a Woman a Man, so as to put it out of their power to have to do with any other Person; the Man being thereby rendered impotent to any other Woman, and all other Men impotent to the Woman. Some of their Philosophers pretend, that this *Ligature* may be effected by the shutting of a Lock, the drawing of a Knot, the sticking of a Knife in the Wall at the Point of Time wherein the Priest is joining a Couple together, and that a *Ligature* thus effected may be dissolved by the Spouse's urining through a Ring. This Piece of Superstition is said to obtain also amongst the Christians of the *East*. The same Author tells us, that during the Ceremony of Marriage in *Russia*, he observed an old Fellow lurking behind the Church-Door, and mumbling over a Heap of Words, and at the same time cutting a long Rod which he held under his Arm into pieces; which, it seems, is a common Practice at the Marriages of great Persons, and done with Design to elude and counterwork any other Person that might possibly be inducing the *Ligature*.

The Secret of inducing a *Ligature* is delivered by the same Author, as he was taught in on the Spot by one of their Adepts; which being a Curiosity, we shall not scruple to add: *Pocilla Amasium, vel Conyx maritimus Ligatus, absterget a Conchibus Alis, Priapus, Indusio*—at *Seminis quantum passit excipiet. Hoc probe concolation sub limine Domus sue in Terram sepeliat. In quondam sepulchro reliquit, tandem ejus basia in nullis preterquam (in fascinationi) Servitium obediit, & prius ab hoc Nexu non liberabitur quam ex clausuro Iovinis liberetur ipsum lineum. Vixit vesta, Vir Lelli Sciam Ligatus, mensuration ab eo lineum comborito; ex cineribus cum propria Urina solvati, efformato Figuram Priapi, vel si Cineres Isaacule fringens non sufficienti eodem subigit eum Parte Terre quam recent perminxerit. Formatum Iovem cave efficitur, sicomque assertato Loco siccio, ne Humorem contrahat. Quamvis sic servaverit, omnes Arenas dum ad Scopum Socia collimaverit, momento contabescit: Ipse vero Dominus—Abruvum hunc suum prius humectat, quamvis sic manebit, tandem suspensio nexu Priapus ipsi parebit, quin & alios quotquot Famina proferant admiserit.*

M. Marston mentions another Form of *Ligature* which he received from a Bramine at Indolitan: 'If, says he, the little Worm in the Wood *Luberaria Kara* be cut into two, and the one Part flies, and the other not; if the stirring Part be bruised and given with half a Beetle to a Man, and the other half to a Woman, the Charm will keep each from ever having to do with any other Person.' *Philosophical Transactions, Numb. 168.*

*Ligatures*, among Printers, are Types consisting of two Letters, or Characters which serve to connect two Letters together, as *ff, ff, fi*. The old Editions of the Greek Authors are extremely full of *Ligatures*; the *Ligatures* of *Stephens* are by much the most beautiful. Some Editions have been lately printed without any *Ligatures* at all, and there was a Design to explode them quite out of Printing. Had this succeeded, the finest ancient Editions would in time have grown useless, and the reading of old Manuscripts have been rendered almost impracticable to the Learned themselves.

LIGHT, a Term used in various Senses: Sometimes it signifies that Sensation occasioned in the Mind by the View of luminous Bodies; sometimes that Property in those Bodies, whereby they are fitted to excite those Sensations in us; and, lastly, some mean by it a certain Action of the luminous Body on the Medium, between that and the Eye, by means whereof they suppose the one to act on the other, and this they call *secondary*, or *derived* Light, to distinguish it from that of luminous Bodies, which is called *primary*, or *innate*.

*Aristotle* explains the Nature of *Light*, by supposing some Bodies to be transparent, as Air, Water, Ice, &c. but since in the Night-time we don't see any thing thro' those Bodies, he says, they are only transparent potentially; whereas in the Day they become really and actually transparent: and since 'tis *Light* alone that can reduce that Power into Act, he defines *Light* to be the Act of the transparent Body considered as such; *ὅτι δὲ εἶναι ἰσχυρὸν τῷ ἀσπασίῳ ἢ ἀσπασίῳ*. He adds, that *Light* is not Fire, nor is it any thing bodily radiating from the luminous Body, and transmitted thro' the transparent one; but the mere Presence of Fire, or some other luminous Body at the transparent one. This is *Aristotle's* Doctrine of *Light*, which his Followers mistaking, have foisted on him another, very different; making *Light* and Colours to be Qualities of the luminous and colour'd Bodies themselves, and in all respects like those Sensations which they occasion in us: adding, that Lacid or Colour'd could not produce any Sensations in us, unless they had something similar in themselves, since *nihil dat quod in se non habet*. But the Sophism is apparent; for we find that a Needle in pricking the Flesh gives us Pain, which no body ever imagined to exist in the Needle. But that 'tis not necessary there should be any Similitude between the Quality of the Object, and the Sensation it produces, appears still more evident from a Glass Prism, which is found to exhibit Blue, Yellow, Red, and other Colours extremely vivid, and yet no body will say there is any thing in the Glass Prism like those Sensations.

The *Cartesians* have refined considerably on this Notion of *Light*, and own, that *Light*, as it exists in the luminous Body, is nothing else but a Power or Faculty of exciting in us a very clear and vivid Sensation; adding, that what is required to the Perception of *Light*, is, that we be so formed as to be capable of such Sensations, that in the hidden Pores of transparent Bodies there be a certain subtle Matter, which by reason of its exceeding Smallness may penetrate even Glass, and yet be strong enough to shake certain Capillaments at the bottom of the Eye; and, lastly, that this Matter be impelled by the luminous Body, so as to move the Organ of Sight. Primary

*Light* therefore, they say, consists in a certain Motion of the Particles of the luminous Body, whereby they are enabled to propel every way the *Materia Subtilis* lodged in the Pores of transparent Bodies, and secondary or derived *Light* in a *Conatus* to Motion, or an Inclination of that Matter to recede from the Centre of the luminous Body in right Lines.

Father *Malebranch* explains the Nature of *Light*, from a supposed Analogy between it and Sound; the latter, 'tis allowed, is produced by the shaking or Vibrations of the infensible Parts of the sonorous Body, which Vibrations, if they be greater or less, that is, if they ran through greater or less Arches of the same Circle, are still performed in the same time, and the Sounds produced by them only differ in a greater or less Degree of Strength; but if there be a greater Number of Vibrations, in the same time, in one sonorous Body than in another, these being closer, become of a different kind: and thus their Sounds also differ, forming what we call different Tones or Notes; the quick Vibrations forming the acute, and the slower the grave Notes. Thus he supposes it to be with *Light* and Colours. All the Parts of a luminous Body are in a very rapid Motion, which, by very quick Shakes, is constantly compressing the subtle Matter between the luminous Body and the Eye, and excites Vibrations of Pressure. As these Vibrations are more great, the Body appears more luminous; as they are more quick or more slow, the Body is of this or that Colour.

This Hypothesis, how ingenious soever, is now deservedly discarded, since the great Discoveries made by Sir *Isaac Newton* on this wonderful Phenomenon. The primary *Light* they talk of, we now know consists wholly in a certain Motion of the Particles of the lucid Body, whereby they don't propel any fictitious Matter supposed to be lodged in the hidden Pores of transparent Bodies, but throw off, from the luminous Body, certain very small Particles, which are emitted every way with great force: And the secondary or derived *Light* consists, not in a *Conatus*, but a real Motion of these Particles receding every way from the luminous Body in right Lines, and with an incredible Velocity. For if *Light* consisted in a mere Pressure or Pulse, it would be propagated to all Distances in the same Instant of Time; the contrary of which appears from the Phenomena of the Eclipses of *Jupiter's* Satellites, whose Immersions, as the Earth approaches towards *Jupiter*, are found to anticipate somewhat on the true time, and to commence sooner; and again as the Earth retires from *Jupiter*, their Emergions, which alone in that Case can be observed, happen later and later, lose time: deviating thus, very considerably on either side, from the true time marked by the Tables. This was first observed by M. *Romer*, and since by other Astronomers; the Reason of which is not owing to any Eccentricity, but does apparently follow from this, that the *Light* of the Sun reflected from the Satellites has further to travel, e'er it reaches the Eye, in the one Case than in the other, by a Space equal to the Diameter of the Earth's annual Orbit. *Light* therefore, like other real Bodies, does not move instantaneously, but in Time. Sir *Isaac Newton* has shewn past contradiction, that the *Light* of the Sun is near seven Minutes in its Passage to the Earth, which is the Space of 50,000,000 Miles; a Velocity 10,000,000 Times greater than that wherewith a Ball flies out of the Mouth of a Cannon.

Further, if *Light* were not a Body, but consisted in a mere Pressure or Pulsion, it would never be propagated in right Lines, but would be continually inflected *ad Umbra*. Thus Sir *Isaac Newton*, 'A Pressure on a fluid Medium (i. e. a Motion propagated by such a Medium) beyond any Obstacle which impedes any Part of its Motion, cannot be propagated in right Lines, but will be always inflecting and diffusing itself every way to the quietest Medium beyond that Obstacle. The Power of Gravity tends downwards, but the Pressure of Water rising from it tends every way with an equable Force, and is propagated with equal Ease, and equal Strength in Curves as in straight Lines. Waves, on the Surface of the Water, gliding by the Extremes of a very large Obstacle, inflect and dilate themselves, still diffusing gradually into the quietest Water beyond that Obstacle. The Waves, Pulses, or Vibrations of the Air, wherein Sounds consist, are manifestly inflected, tho' not so considerably as the Waves of Water, and Sounds are propagated with equal Ease thro' crooked Tubes, and thro' direct Lines; but *Light* was never known to move in any Curve, nor to inflect itself *ad Umbra*.' The Rays of *Light* therefore are small Corpuscles, emitted with exceeding Celerity from the luminous Body. As to the Force wherewith these Corpuscles are emitted, so as to enable them to move at the inconceivable Rate of 7,000,000 Miles in a Minute, hear the same great Author: 'Among Bodies of the same Kind

\* Kind and Virtue, by how much any one is smaller, by so much is its attractive Power greater, in proportion to its Bulk. This Power we find stronger in small Magnets than in large ones, regard being had to the Difference of their Weights; and the Reason is, that the Particles of small Magnets being nearer each other, more easily unite their Forces intimately together, and act conjointly. For the same Reason the Rays of Light, being of all other Bodies the most minute, it may be expected that their attractive Powers should be of all others the strongest. And how strong in effect they are, may be gathered from the following Rules: \* The Attraction of a Ray of Light, according to the Quantity of its Matter, is to the Gravity which any projected Body has, according likewise to the Quantity of its Matter, in a Ratio compounded of the Velocity of the Ray of Light, to the Velocity of that projected Body, and of the Bending or Curvature of the Line, which the Ray describes in the Place of Refraction, to the Bending or Curvature described by that projected Body; provided, however, the Inclination of the Ray to the refracting Surface be the same with that of the projected Body to the Horizon. From which Proportion I gather, that the Attraction of the Rays of Light is above 1,000,000,000,000,000 times greater than the Gravity of Bodies on the Surface of the Earth, in proportion to the Quantity of Matter in each, if the Light pass from the Sun to the Earth in the Space of seven Minutes. But now as in Algebra, where affirmative Quantities cease, there negative ones begin; so in Mechanics, where Attraction ceases, there the repelling Power must succeed: Therefore a Ray of Light, as soon as it is cast off from the luminous Body by the vibrating Motion of its Parts, and is got out of the Sphere of its Attraction, is propelled with an immense Velocity. See *Attraction and Repulsion*.

The wonderful Divisibility of the Parts of Matter is no where more apparent than in the Minuteness of the Particles of Light. Dr. Newenham has computed, that an Inch of Candle, when converted to Light, becomes divided into 269617040 Parts. The Expansion or Extension of any Portion of Light is inconceivable; Dr. Hook shows 'tis as unlimited as the Universe; proving it from the immense Distance of some of the fixed Stars, the Light whereof becomes sensible to the Eye by means of a Telescope; nor, adds he, is it only the great Bodies of the Sun or Stars that are thus able to disperse their Light thro' the vast Expanse of the Universe; but the smallest Spark of a lucid Body must do the same, even the smallest Globule struck from a Steel by a Flint.

Dr. Gravesend affirms a lucid Body to be that, which emits or gives Fire a Motion in right Lines; and makes the Difference between Light and Heat to consist in this, That to produce the former, the fiery Particles must enter the Eye in a rectilinear Motion, which is not required in the latter: On the contrary, an irregular Motion seems more proper for it, as appears from the Rays coming directly from the Sun to the Top of the Mountain, which have not near that Effect with those in the Valley, agitated with an irregular Motion by several Reflections. Whether or no there be always Light where there is Fire, is disputed among Authors, as also whether or no there be any luminous Body without Heat; Heat being a Motion that may be infinitely diminished, and Light a Matter that may be infinitely rare; to which we may add, that no Heat is sensible to us, unless it be more intense than that of our Organs of Sense.

Sir Isaac Newton observes, that Bodies and Light act mutually on one another; Bodies on Light, in emitting, reflecting, refracting, and inflecting it; and Light on Bodies, by heating them, and putting their Parts into a vibrating Motion, wherein Heat principally consists. For all fix'd Bodies, he observes, when heated beyond a certain Degree, do emit Light, and shine; which Shining, &c. appears to be owing to the vibrating Motion of the Parts; and all Bodies abounding in earthy and sulphureous Particles, if sufficiently agitated, emit Light, which way soever that Agitation be effected. Thus Sea-Water shines in a Storm, Quick-silver when shaken in Vacuo, Cats or Horses when rubb'd in the dark; and Wood, Fish, and Flesh when putrefied.

The late Mr. Hooke has furnish'd us with a great Variety of Instances of the artificial Production of Light on the Attrition of Bodies naturally not luminous; as of Amber rubb'd on Woollen Cloth in vacuo, of Glass on Woollen, of Glass on Glass, of Oyster-Shells on Woollen, and of Woollen on Woollen, all in vacuo. On the several Experiments whereof, he makes the following Reflections: That different sorts of Bodies afford remarkably different kinds of Light, different both in Colour and in Force; That the Effects of an Attrition are various, according to the different Preparations and Managements of

the Bodies that are to endure it; and that Bodies which have yielded a particular Light, may be brought by Friction to yield no more of that Light.

M. Bernoulli found by Experiment that Mercury amalgamated with Tin, and rubb'd on Glass, produced a considerable Light in the Air; that Gold rubb'd on Glass did it still in a greater degree; but that of all others the most exquisite Light was that produced by the Attrition of a Diamond; being equally vivid with that of a burning Coal briskly agitated with the Bellows.

Mr. Boyle tells us of a piece of shining rotten Wood, which upon exhauſting the Air from it was extinguish'd; but upon its Re-admission, seem'd to come to life again, and shone as before: being no doubt a real Flame, and like other Flames not to be preserv'd without Air. See *Phosphorus*.

That the Particles of Light are attracted by these of other Bodies, is evident from innumerable Experiments. This Phenomenon was first observed by Sir I. Newton, who found by repeated Tryals, that the Rays of Light in their passage near the Edges of Bodies, whether opaque or transparent, as Pieces of Metals, the Edges of Knives, broken Glasses, &c. are diverted out of the right Lines, and always inflected or bent towards those Bodies. This Action of Bodies on Light is found to exert itself at a sensible Distance, tho it always increases as the Distance is diminish'd; as appears very sensibly in the passage of a Ray between the Edges of two thin Plates at different Apertures, in which there is something very peculiar, the Attraction of one Edge being increased as the other is brought nearer it. The Rays of Light in their passage out of Glass into a Vacuum are not only inflected towards the Glass, but if they fall too obliquely, will revert back again to the Glass, and be totally reflected. The Cause of which Reflection cannot be attributed to any Reflexion of the Vacuum, but must be entirely owing to some Force or Power in the Glass, which attracts or draws back the Rays as they were passing into the Vacuum. And this appears further from hence, that if you wet the posterior Surface of the Glass with Water, Oil, Honey, or a Solution of Quick-silver, then the Rays which would otherwise have been reflected will pass into and through that Liquor: which shews that the Rays are not reflected till they come to that posterior Surface of the Glass, nor even till they begin to go out of it; for if at their going out they fall into any of the foreſaid Mediums, they will not then be reflected, but persist in their former Course, the Attraction of the Glass being in this Case counter-balanced by that of the Liquor.

From this mutual Attraction between the Particles of Light and other Bodies, arises two other grand Phenomena, which we call the *Reflexion* and *Refraction* of Light.

We know that the Determination of a Body in Motion is chang'd by the Interposition of another Body in its way. Thus Light impinging on the Surface of solid Bodies, should be turn'd out of its course, and beaten back or reflected, so as like other falling Bodies to make the Angle of its Reflexion equal to that of Incidence. This 'tis found by experience Light does, and yet the Cause of this Effect is different from that just now assign'd: the Rays of Light are not reflected by striking on the very Parts of the reflecting Bodies, but by some Power equally diffused throughout the whole Surface of the Body, whereby it acts on the Light, either attracting or repelling it without Contact: by which same Power, in other Circumstances the Rays are refracted; and by which also, the Rays are first emitted from the luminous Body; as is abundantly proved, by great variety of Arguments, by Sir I. Newton. See *Reflexion*.

That great Author puts it past doubt, that all those Rays which are reflected, tho they approach the Body infinitely near, yet never touch it; and that those which do really strike on the solid Parts of Bodies, adhere to 'em, and are as it were extinguish'd and lost. If it be ask'd, how it happens, since we ascribe the Reflexion of the Rays to the Action of the whole Surface of the Body without Contact; how, I say, it happens that all the Rays are not reflected from every Surface, but while some are reflected, others pass through and are refracted: The Answer given by Sir I. Newton is as follows—Every Ray of Light in its passage thro any refracting Substance, is put into a certain transient Constitution or State, which in the progress of the Ray returns at equal Intervals, and disposes the Ray at every Return to be easily transmitted thro the next refracting Surface, and between the Returns to be easily reflected by it: which Alternation of Reflexion and Transmission appears to be propagated from every Surface and to all Distances. What kind of Action or Disposition this is, and whether it consist in a circulating or vibrating Motion of the Ray or the Medium, or somewhat else, he does not inquire; but allows those who are fond of Hypotheses to suppose that the Rays

of *Light*, by impinging on any reflecting or refracting Surface, excite Vibrations in the reflecting or refracting Medium, and by that means agitate the solid Parts of the Body. These Vibrations, thus propagated in the Medium, move faster than the Rays, so as to overtake them; and when any Ray is in that part of the Vibration which conspires with its Motion, its Velocity is increased, so that it easily breaks thro' a refracting Surface: but when it is in a contrary part of the Vibration, which impedes its Motion, it is easily reflected, and consequently that every Ray is successively disposed to be easily reflected or transmitted by every Vibration which overtakes it. The Return of which Disposition of any Ray to be reflected, he calls *Fits of easy Reflexion*; and those of its Disposition to be transmitted, he calls *Fits of easy Transmission*; and the Space between the Returns, the *Interval of the Fit*. The Reason then why the Surface of all thick transparent Bodies reflect part of the *Light* incident on 'em, and refract the rest, is, that some Rays at their Incidence are in Fits of easy Reflexion, and others of easy Transmission. For the Properties and Laws of reflected *Light*, see *Reflexion and Mirrour*.

Further, a Ray of *Light* passing out of one Medium into another of different Density, and in its passage making an oblique Angle with the Surface that separates the Mediums, will be refracted or turn'd out of its right Line; by reason the Rays are more strongly attracted by a denser than a rarer Medium.

That these Rays are not refracted by striking on the solid Parts of Bodies, but without any Contact, by that same force wherewith they are emitted and reflected, exerting itself differently in different Circumstances, is proved in great measure by the false Arguments which demonstrate Reflexion to be perform'd without Contact. For the Properties, &c. of refracted *Light*, see *Refraction, Lens, &c.* In Island Chrytal is observed a kind of double Refraction, very different from what we find in any other Body: the Rays that fall obliquely being not only dispersed, with a double Refraction in one and the same Surface, but even the perpendicular Rays themselves are moit of 'em divided into two Beams by means of the same double Refraction; which Beams are of the same Colour with the incident Beams, and are equal in degree of *Light*, at least nearly, to each other: Whence the great Philosopher, so often cited, takes occasion to suspect that there are in *Light* some other original Properties besides those hitherto described; and particularly, that the Rays have different Sides endued with several original Properties. For of these Refractions, the one is performed in the usual manner, i. e. the Sine of Incidence is to that of Refraction as 3 is to 5; and the other in an unusual manner: and yet the same Ray is refracted sometimes in the one manner, and sometimes in the other, according to the various Positions which its several Sides have, in respect of the Chrytal. These Dispositions, he shews, must have existed originally in the Beams, without having undergone any Alterations in that respect, by the Chrytal. Every Ray of *Light* therefore has two opposite Sides, the one originally endued with a Property wherewith its unusual Refraction depends, and the other not endued with that Property.

Sir I. Newton having observed the vividly colour'd Image projected on the Wall of a darken'd Room, by the Sun-beams transmitted thro' a Prism, to be five times as long as broad; setting himself to inquire into the Reason of this Disproportion, was led from other Experiments to the *Experimentum Crucis*; whence he discovered the Cause of the Phenomenon to be, that some of the Rays of *Light* were more refracted than others, and therefore exhibited several Images of the Sun under the appearance of one, extended lengthwise. Thence he proceeded to conclude, that *Light* itself is an heterogeneous Mixture of Rays differently refrangible. Hence he distinguishes *Light* into two kinds, viz. that whose Rays are equally refrangible, which he calls Homogeneous, Similar or Uniform *Light*; and that whose Rays are unequally refrangible, which he calls Heterogeneous *Light*.

There are but three Affections of *Light*, wherein he observed its Rays to differ, viz. Refrangibility, Reflexibility, and Colour; and those Rays which agree in Refrangibility, agree also in the other two: whence they may be well defined Homogeneous, tho' in some other respects they may possibly be Heterogeneous. Again, the Colours exhibited by Homogeneous *Light*, he calls Homogeneous Colours; and those produced by Heterogeneous *Light*, Heterogeneous Colours. These Definitions laid down, he advances several Propositions.

As 1<sup>st</sup>, That the Sun's *Light* consists of Rays differing by indefinite Degrees of Refrangibility. 2<sup>dy</sup>, That Rays which differ in Refrangibility, when parted from one another, do proportionably differ in the Colours which they exhibit. 3<sup>dy</sup>, That there are as many simple and ho-

mogeneous Colours, as Degrees of Refrangibility, for to every Degree of Refrangibility belongs a different Colour. 4<sup>thly</sup>, Whiteness in all respects like that of the Sun's immediate *Light*, and of the usual Objects of our Senses, cannot be compounded of simple Colours, without an indefinite Variety of them; for to such a Composition there are required Rays endued with all the indefinite Degrees of Refrangibility, which infer as many simple Colours. 5<sup>thly</sup>, The Rays of *Light* do not act on one another in passing thro' the same Medium. 6<sup>thly</sup>, The Rays of *Light* do not suffer any Alteration of their Qualities from Refraction, nor from the adjacent quiescent Medium. 7<sup>thly</sup>, There can no Homogeneous Colours be produced out of *Light* by Refraction, which are not commix'd in it before; since Refraction, as was before observ'd, changes not the Qualities of the Rays, but only separates those which have divers Qualities by means of their different Refrangibility. 8<sup>thly</sup>, The Sun's *Light* is an Aggregate of Homogeneous Colours; whence Homogeneous Colours may be call'd Primitive or Original.

We have already observ'd that the Rays of *Light* are composed of dissimilar or heterogeneous Parts; some of them being in all probability greater, others less. Now the smaller the Parts are, by so much the more refrangible they are, i. e. they are so much the more easily diverted out of their rectilinear Course; and those Parts which differ in Refrangibility, (i. e. in Bulk) we have also observ'd differ in Colour. Hence arises the whole Theory of Colours. Those Parts, e. g. which are the most refrangible, constitute Violet Colour; that is, the most minute Particles of *Light* when separately impelled on the Organ, do there excite the shortest Vibrations in the Retina, which are thence communicated by the solid Parts of the Optic Nerve into the Brain, and excite in us the Sensation of Violet Colour, the dimmest and most languid of all other Colours: And those Particles, on the contrary, which are the least refrangible, constitute a Ray of a Red Colour; i. e. the greatest Particles of *Light* excite the longest Vibrations in the Retina, and so convey the Sensation of a Red Colour, as being the most bright and vivid of all others. The other Particles being distinguished into little Rays, according to their respective Magnitudes and Degrees of Refrangibility, excite intermediate Vibrations, and so occasion the Sensations of the intermediate Colours; in like manner as the Vibrations of the Air, according to their different Magnitudes, excite the Sensations of different Sounds. The Colours then of these little Rays not being any adventitious Modifications of them, but connate, primitive, and necessary Properties, resulting in all probability, from their different Magnitudes, must be perpetual and immutable, not to be altered by any Reflexion, Refraction, or other subsequent Medication. See the *Doctrine of Colours, and down under Colour*. For the Manner in which *Light* affects our Senses, and how it contributes to Vision, see *Vision*.

*LIGHT* is also used to signify the Disposition of Objects with regard to the receiving of *Light*; thus we say, a Painting is seen in its proper *Light*, when its Situation, with regard to the *Light*, is the same with that for which it was painted.

LIGHTS ABOARD SHIPS. See *Signals*.

LIGHTS, in Architecture, are understood of the Openings of Gates and Windows, and other Places thro' which the Air and *Light* have a Passage. In the Pantheon all the *Light* comes from on high; it has no *Light* but in the Dome.

LIGHTS, in Painting, are those Parts of a Piece that are illuminated, or that lie open to the Luminary, by which the Piece is supposed to be enlightened; and that for this reason are painted in bright vivid Colours: in which sense *Light* is opposed to Shadow. *Light* is also used for the luminous Body that emits it. There are various kinds of *Light*; general *Light*, as the Air; particular *Light*, as a Fire, a Candle, and even the Sun. Different *Lights* have very different Effects on the Piece, and occasion a Difference in the Management of every Part. A great deal therefore depends on the Painters chusing a proper *Light* for his Piece to be illuminated by, and a great deal more in the Conduct of the *Lights* and Shadows when the Luminary is pitched upon. The Strength and Relief of a Figure, as well as its Gracefulness, depends entirely on the Management of the *Lights*, and the joining of those to the Shadows. The *Light* a Figure receives, is either direct or reflected, to each of which special Regard must be had. The Doctrine of *Lights* and Shadows makes that Part of Painting, called *Chiar-oscuro*, which see.

LIGHT-HORSE, an ancient Term in our English Customs, signifying an ordinary Cavalier or Horseman lightly armed, and so as to enter a Body or Regiment; in opposition to the others, who were heavily accoutred, and armed at all Points.

**LIGHTER**, a small floating Vessel. *Lighers* are of several kinds; as,

A Ballast Gun, A clove *Lighter*, A Kicle,  
A Camel, A Huy, An open *Lighter*.

**LIGHTNESS**, see *Levity*.

**LIGNUM ALOES**, or *Wood of Aloe*; see *Aloe*. *Lignum Caffie*, see *Cassia*. *Lignum Balsami*, see *Balsam*.

**LIKE QUANTITIES**, in Algebra, are such as are expressed by the same Letters, equally repeated in each Quantity. Thus 2 *b*, and 3 *b*, and 9 *ff*, and 3 *fff* are like Quantities; but 2 *b*, and 3 *bb*, and 9 *ff*, and 3 *fff* are unlike ones, because the Quantities have not every where the same Dimensions, nor are the Letters equally repeated. *Like Signs* in Algebra are when both are Affirmative, or both Negative; but if one be Affirmative, and the other Negative, they are unlike Signs. Thus + 6 *d*, and + 5 *d*, have like Signs; but 9 *f*, and - 7 *f* have unlike Signs. *Like Figures* in Geometry are such as have their Angles equal, and the Sides about these equal Angles proportional. *Like Arcs* in the Projection of the Sphere in *Plans* are Parts of lesser Circles, containing an equal Number of Degrees with the corresponding Arcs of greater ones. *Like Solid Figures* in Geometry, are such as are contained under like Planes, equal in Number.

**LIMB**, the outermost Border or graduated Edge of a Quadrant, or the like Mathematical Instrument; or the Circumference of the Primitive Circle in any Projection of the Sphere in *Plans*. Astronomers observe the lower and the upper *Limb* of the Sun, in order to find its true Height, which is that of his Center.

*Limb* also signifies the outermost Border or Edge of the Sun or Moon, when the Middle or Disk is hid in an Eclipse of either Luminary.

*Limb* is also used among Botanists for the outer Edge or Border of Plants, their Leaves, and Flowers.

**LIMB**, or **LIMBUS**, is also a Term in the *Remiss* Theology, used for that Place where the Patriarchs are supposed to have waited for the Redemption of Mankind, and where they imagine our Saviour continued from the time of his Death to that of his Resurrection. *Du Cange* says, the Fathers called this Place *Limbus*, *ex quo sit Limbus Inferorum*. The word *Limbus* is also used by the Catholics for the Place destined to receive the Souls of Infants who die without Baptism; who have not deserved Hell, as dying in Innocence, nor yet are worthy of Heaven, because of the Imputation of Original Sin.

**LIME**, Calcined Stone, Marble, Free-stone, Chalk, or other Matter burnt by a large Fire in a Kiln or Furnace built expressly; to be afterwards used in the Composition of Mortar, for building; the Fire taking away all its Humidity, and opening its Pores, so that it becomes easily reducible to Powder. Quick *Lime* or Unslack'd *Lime* is that which comes out of the Furnace; Slack'd *Lime* is that wash'd or steep'd in Water, and reserv'd for the making of Mortar. The best *Lime* is that made of the hardest and firmest Stones, and which is slack'd at its coming out of the Furnace. Sir *H. Wotton* looks on it as a great Error in the *English* to make *Lime* as they do, of Refuse, and Stuff without any Choice; whereas the *Italians*, at this day, and much more the Antients, burnt their firmest Stones, and even Fragments of Marble where it was plentiful; which in time became almost Marble again for its hardness, as appears in their standing Theatres, &c.

We have two kinds of *Lime* in common use in England; the one made of Stone, and the other of Chalk; whereof the former is much the strongest. That made of soft Stone or Chalk is fittest for plastering of Ceilings and Walls within doors; and that made of hard Stones, for Buildings and for plastering without doors. Good *Lime* may also be made of Mill-stone, not coarse and sandy, but fine and greasy; as also of all kinds of Flints; tho' tis hard to burn 'em, unless in a Reverberatory Furnace, as being apt to run to Glass.

*Dioussant* recommends *Lime* made of Sea-shells as the best, but *Goldman* finds fault with it, as being impatient of Moisture, and therefore easily peeling off from the Out-sides of Walls: It is, however, the common *Lime* used in the *Indies*.

Before the Stones be thrown into the Kiln, they are to be broke in pieces; otherwise the Air contain'd in their Cavities, too much expanded by the Heat, makes 'em fly with so much violence as to damage the Kiln. According to *Alberti* and *Palladio*, *Lime* will not be sufficiently burnt in less than sixty Hours intense Heat.

The Marks of a well-burnt *Lime*, according to *Alberti*, are, that its Weight is to that of the Stone in a sesquialterate Proportion; that it is white, light, and sonorous; that when flaked it sticks to the Sides of the Vessel: To which *Beccbler* adds, that when flaked it sends forth a copious thick Smoke; and *Dioussant*, that it needs a great deal of Water to flake it.

To preserve *Lime* several Years, flake and work it up; dig a Pit under ground, into which let it pass thro' a hole

open at the bottom of the Vessel. As soon as the Pit is full, cover it up with Sand, to prevent its drying; thus keeping it moist till it be used. *Beccbler* gives another Method: Cover a Stratum of *Lime* two or three foot high with another of Sand of the like height; pour on Water enough to flake the *Lime*, but not to reduce it to dust after flaking. If the Sand cleave into Chunks, as the Smoke ascends, cover 'em up, so as no Vent may be given thereto. This *Lime*, he adds, keeps ten or twelve Years, will be like Glue; and will, further, be of particular Use in painting Walls, as being no way prejudicial to the Colours. See *Mortar*.

*Lime* is much used by Tanners, Skinners, &c. in the Preparation of their Leather.

*Lime*, or *Calc*, in Chymistry, is a kind of fine Powder, or *Ashes* remaining of Metals or Minerals, that have been a long time in a violent Fire. See *Calc*.

*Lime* is of some medicinal Use, being applied externally in Delicative and Consumptive Medicines. Its Water is said to be an excellent Medicine, taken internally. *M. Boerhaave* has written an ample Account of its Effects in the *French Memoirs*, in good measure from his own Experience. But he observes it succeeded much better in *Holland*, &c. than in *France*. It is a powerful Alterant, and like a pure Alkaline Water, fitted to blunt and destroy acid Ferments, which are the Principles of all Obstructions, and the Cause of most Chronic Diseases. Its principal Use is in a Cachexy, Green-sickness, Dropsy, Scurvy, Obstructions of the Liver, Spleen, &c. It is made by pouring six Pounds of hot Water on one of Quick-Lime, leaving them to soak and macerate for the space of 24 Hours.

**LIME-STONE**, is a Stone of a whitish Colour, which being burnt in a Kila, enters the Composition of Mortar, Plaster, &c. which see.

**LIMITATION OF ASSIZE**, in Law, is a certain Time set down by the Statute, wherein a Man must allege himself or his Ancestors to have been seiz'd of Lands sued for by Writ of Assize.

**LIMITED PROBLEM**, signifies a Problem that has but one only Solution, or which can be done one only way; as to make a Circle pass through three Points given, not lying in a Right Line, to describe an equilateral Triangle on a Line given, &c.

**LIMITS** of a Planet, its greatest Excursion or Distance from the Ecciptic.

**LIMNING**, the Art of Painting in Water-Colours; in contradiction to Painting properly so called, which is done in Oil-Colours.

*Limning* is much the more Ancient Kind of Painting: Till a *Flemish* Painter, one *John van Eyck*, better known by the Name of *John of Bruges*, found out the Art of Painting in Oil, the Painters all painted in Water and in Fresco alone, both on their Walls, on Wooden Boards, and elsewhere. When they made use of Boards, they usually glued a fine Linnen Cloth over 'em; to prevent their opening; then laid on a Ground of White; lastly, they mix'd up their Colours with Water and Size, or with Water and Yolks of Eggs, well beaten with the Branches of a Fig-Tree, the Juice whereof thus mix'd with the Eggs; and with this Mixture they painted their Pieces.

In *Limning* all the Colours are proper enough, excepting the White made of Lime, which is only used in Fresco. But the Azure and Ultramarine must always be mix'd up with Size, or with Gum, in regard the Yolks of Eggs give yellow Colours a greenish Tincture. But there are always applied two Lays of hot Size 'er the Colours, mix'd even with Size, are laid on; the Composition made with Eggs, and the Juice of the Fig-tree, being only used for touching up and finishing, and to prevent the Necessity of having a Fire always at hand to keep the Size hot; yet 'tis certain, that the *Sino-Colours* hold the best, and are accordingly always used in Cartoons, &c. This Size is made of Shreds of thin Leather, or of Parchment.

To *limn* on Linnen, they chuse that which is old, half worn, and close. This they stamp with White Lead, or with a fine Plaster beaten up with Size; which once dry, they go over it with a Lay of the same Size.

The Colours are all ground in Water, each by itself; and in proportion as they are required in working, are diluted with Size-Water. If the Yolks of Eggs are desired, they dilute 'em with Water made of equal Quantities of common Water and Vinegar, with the Yolk, White and Shell of an Egg, and the Ends of the little Branches of a Fig-tree cut small, all well beaten together in an Earthen Pan.

If 'tis desired to varnish the Piece when finish'd, they go over it with the White of an Egg well beaten, and then with Varnish. This, however, is only to preserve it from the Wet; for the great Advantage of *Limning* consists in its being free from any Lustre; in regard all its Colours thus void of Lustre may be seen in all kinds of Lights; which Colours in Oil, or cover'd with Varnish, can't.

LINCTUS, a Form of Medicine the same as *Limbative*, and probably from the same Derivation; or from *Lingua* the Tongue, as being to be licked up with the Tongue. See *Ectyema*.

LINE, a small French Measure, consisting of the 12th part of an Inch, or 144th part of a Foot. The Geometricians, notwithstanding its Smallness, conceive it divided into six Points.

LINE, in Genealogy, is a Series or Succession of Relations in various Degrees, all descending from the same common Father. *Direct Line* is that which goes from Father to Son, which is the Order of Ascendants and Descendants. *Collateral Line* is the Order of those who descend from some common Father related to the former, but out of the *Line* of Ascendants and Descendants. In this are placed Uncles, Aunts, Cousins, Nephews, &c.

LINE, in Geometry, is a Quantity extended in Length only, without either Breadth or Thickness, and is formed by the Motion of a Point. There are two kinds of Lines, viz. Right Lines and Curve Lines. Thus if the Point A move towards B, (Fig. 1. *Plat. Geometry*) by its Motion it describes a Line; and this, if the Point go the nearest way towards B, will be a Right or Straight Line, whose Definition therefore will be the nearest or shortest Distance between any two Points, or a Line all whose Points tend the same way. If the Point go any way about, as in any of the Lines A C B, A e B, it will trace out either a crooked Line, as the upper A c B; or else two or more straight ones, as in the lower A C B.

Lines considered as to their Positions, are either Parallel, Perpendicular, or Oblique; the Construction and Properties whereof, see under *Parallel*, *Perpendicular*, &c.

Euclid in his second Book treats mostly of Lines, and of the Effects of their being divided, and again multiplied into one another; the Substance of his Doctrine may be thus demonstrated Algebraically. (1.) If there be two Lines  $z$  and  $x$  one of which, as  $z$ , is divided into any number of Parts, as into  $a + e + i + o$ , the Rectangle under the two whole Lines  $z x$  is equal to the Sum of all the Rectangles made by  $x$  multiplied into the Parts of  $z$ .

$$Z \begin{array}{|c|c|c|c|} \hline a & e & i & o \\ \hline \end{array}$$

that is,  $z x = z a + z e + z i + z o$ . This is so plain, it needs no proof. (2.) If a Right Line, as  $z$ , be divided into two Parts  $a + e$ , the Rectangles made by the whole Line, and both its Parts, are equal to the Square of the whole Line: That is,  $z a + z e = z z$ . For  $z a = a a + a e$ ; and  $z e = a e + e e$ ; therefore  $z z = a a + z a + z e$ . (3.) Let the Line  $z$  be cut into  $a + e$ ; then shall the Rectangle under the whole Line ( $Z$ ) and the Part ( $a$ ) be equal to the Square of that Part  $a$ , together with the Rectangle made by the two Parts  $a$  and  $e$ ; that is,  $Z a = a a + a e$ .  $Z \begin{array}{|c|c|} \hline a & e \\ \hline \end{array}$  For  $Z a = a a + e a$ . And  $a + e x = a a + a e$ . (4.) The Square of any Line, as  $Z$ , divided into any two Parts,  $a$  and  $e$ , is equal to both the Squares of those Parts, together with the Rectangles made out of those Parts, that is,  $Z z = a a + z a e + e e$ .  $Z \begin{array}{|c|c|} \hline a & e \\ \hline \end{array}$  Multiply  $a + e$  by itself, and the Thing is plain.

$$\begin{array}{r} a + e \\ \hline a a + e e \\ \hline + a e + e a \\ \hline a a + z a e + e e \end{array}$$

Hence it is plain, that the Square of any Line is equal to four times the Square of its Half. For suppose  $Z$  to be bisected, then each Part will be  $a$ ; and multiplying  $a + a$  by itself, the thing will plainly appear.

$$Z \begin{array}{|c|c|} \hline a & a \\ \hline \end{array} \begin{array}{|c|c|} \hline a & a \\ \hline \end{array}$$

$$a a + a a + a a + a a = 4 a a$$

(5.) If a Line be divided into two Parts equally, and into two other Parts unequally, the Rectangle under the unequal Parts, together with the Square of the intermediate Part, will be equal to the Square of half that Line. Let the whole Line be  $z a$ , then each Part will be  $a$ . Let the lesser unequal Part be  $e$ , then the greater unequal Part will be  $z a - e$ ; which multiplied by  $e$ , produces  $z a e - e e$ : To which adding the Square of the Difference or intermediate Part  $a - e$ , which is  $a a - z a e + e e$ , the Sum will be only  $a a$ , the Square of half the Line. (6.) If a Line be bisected, and then another Right Line be added to it, the Rectangle or Product of the whole augmented Line multiplied by the Part added, together with the Square of the half Line, will be equal to the Square of the half Line, and Part added, as one Line.

$$Z \begin{array}{|c|c|} \hline a & a \\ \hline \end{array} \begin{array}{|c|c|} \hline a & a \\ \hline \end{array} \dots \dots$$

Let the first Line be  $z a$ , and the Part added  $e$ , then the whole will be  $z a + e$ , which multiplied by  $e$ , produces  $z a e + e e$ ; and the Square of half the Line  $a a$  being added to it, it will be  $z a e + e e + a a$ , which is equal to the Square of  $a + e$ . (7.) If a Quantity or Line be divided any how into two Parts, the Square of the Whole added to the Square of one of the Parts, shall be equal to two Rectangles contained under the whole Line, and that Part, added to the Square of the other Part.

$$Z \begin{array}{|c|c|} \hline a & e \\ \hline \end{array}$$

Let  $a$  be one Part, and  $e$  the other; the Square of the Whole, and of the lesser Part  $e$  makes  $a a + z a e + z e e$ . then if the Whole  $a + e$  be multiplied by twice  $e$ , it will produce  $z a e + z e e$ ; and if to this be added the Square of the other Part  $a a$ , the Sum will be  $a a + z a e + z e e$ , equal to the former. (8.) If a Line be cut any how into two Parts, the Rectangle under the whole Line and one of the Parts taken four times, and added to the Square of the other Part, is equal to the Square of the Whole, and the other Part added to it, as if it were but one Line.

$$Z \begin{array}{|c|c|} \hline a & e \\ \hline \end{array}$$

Let the whole Line be  $a + e$ , then four times that multiplied by  $e$  (or the Quadruple Rectangle under that and  $e$ ) will be  $4 a e + 4 e e$ ; to which adding the Square of the other Part  $a a$ , the Sum will be  $a a + 4 a e + 4 e e$ . And if you square  $a + e$ , which expresseth the whole Line with  $e$  added to it, the Product will be the former Sum of  $a a + 4 a e + 4 e e$ . (9.) If a Line be bisected, and also cut into two other unequal Parts, the Sum of the Squares of the unequal Parts will be double the Sum of the Squares of the half Line, and of the Difference between the two unequal Parts. Let the whole Line be  $z a$ , and the Difference between the equal and unequal Parts  $b$ ; then the greater unequal Part will be  $a + b$ , and the lesser  $a - b$ : The Sum of the Squares of the unequal Parts will be  $z a a + z b b$ , which is double to the Square of half the Line added to the Square of the Difference. (10.) If a Line be bisected, and then another Line added to it; the Square of the whole increased Line, together with the Square of the Part added, is double the Sum of the Squares of the half Line, and of the half Line and Part added, taken as one Line.

$$Z \begin{array}{|c|c|} \hline a & a \\ \hline \end{array} \begin{array}{|c|c|} \hline a & e \\ \hline \end{array}$$

Let the whole Line be  $z a$ , and the Part added  $e$ ; then the whole increased Line will be  $z a + e$ , and the half Line and Part added will be  $a + e$ ; the Sum of the Squares of  $z a + e$ , and of  $e$ , is  $4 a a + 4 a e + z e e$  which is plainly double to  $a a$ , and  $a a + z a e - e e$  added together.

LINE, in Geography and Astronomy, is used by way of Eminence for the Equator or Equinoctial Line, which, in the Heavens, is a Circle described by the Sun in his Course on the 21st Day of March, and the 21st of September. On the Earth 'tis an imaginary Circle, answering to that in the Heavens. It divides the Earth from East to West into two equal Parts, and is at an equal Distance from the two Poles; so that those who live under the Line, have the Poles always in their Horizon. The Latitudes commence from the Line. The Seamen use to duck their Passengers the first time they cut the Line.

LINE, in the Art of War, is understood of the Disposition of an Army ranged in Order of Battle. An Army usually consists of three Lines; the first is the Front, Van, or Advance Guard; the Main Body forms the second, in which is the General's Post; the third is a Reserved Body or Rear-Guard. 'Tis a Rule to leave 150 Paces distance between the first Line and the second, and twice as much between the second and third, to give room for rallying.

Line is also understood of the Disposition of a Fleet on the Day of Engagement; on which occasion the Vessels are always drawn up in one Line: A Ship of the Line, is a Vessel large enough to be drawn up in the Line, and to have place in a Sea-Fight.

LINE of Demarcation, or *Alexandrian Line*, is a Meridian passing over the Mouth of the River *Niger*, and by the Capes of *Hoamas* and *Malabrigo*. 'Tis so call'd from Pope *Alexander VI.* who to end the Disputes between the Crowns of *Castile* and *Portugal*, about their Boundaries in 1493, drew an imaginary Line on the Globe, which was to terminate the Pretensions of each. By which Partition the *East-Indies* fell to the Lot of the *Portuguese*, and the *West-Indies*, then newly discovered, to the *Castilians*.

LINE of Direction, in Mechanics, is that, according to which a Body endeavours to move. The Term is also used to signify the Line that passes thro' the Center of Gravity of the heavy Body to the Center of the Earth; which must also pass thro' the *Fulcrum* or Support of the heavy Body; without which it would fall.

**LINE**, in Fencing, is thar directly opposite to the Enemy, wherein the Shoulders, the right Arm, and the Sword ought always to be found; and wherein are also to be placed the two Feet at the distance of 18 Inches from each other. In this fence a Man is said to be in his *Line*, to go out of his *Line*, &c.

**LINE**, in Fortification, is sometimes taken for a Ditch bordered with its Parapet, and sometimes for a Row of Gabions, or Sacks of Earth, extended in Length on the Ground, to serve as a Shelter against the Enemies Fire. 'Tis they say, when the Trenches were carried on within thirty Paces of the Glacis, they drew two *Lines*, one on the Right, and the other on the Left, for a Place of Arms. *Line* fundamental is the first *Line* drawn for the Plan of a Place, and which shews its Area. *Line* Capital is that which is drawn from the Angle of the Gorge to the Angle of the Bastion. *Line* Coyne is that which is drawn from the Angle of the Centre to that of the Bastion. *Line* of Defence, is that which represents the Course of the Bullet of any sort of Fire-Arms, more especially of a Musquet-Ball, according to the Situation which it ought to have to defend the Face of the Bastion. *Line* of Defence Fixed, or *Frebant*, is that which is drawn from the Angle of the Curtain to the flank'd Angle of the opposite Bastions, but yet without touching the Face of the Bastion. This must never exceed 800 Feet, which they reckon the Distance at which a Musquet-Ball will do Execution. *Line* of Defence Rasant, is that which being drawn from a certain Point of its Curtain, razeth the Face of the opposite Bastion; this is also called the *Line* of Defence, *Stringent*, or *Hanking*. *Line* of Approach, or *Attack*, signifies the Work which the Besiegers carry on under Cover, to gain the Moat, and the Body of the Place. *Line* of Circumvallation, is a *Line* or Trench cut by the Besiegers within Cannon-Shot of the Place, which rangeth round their Camp, and secures its Quarters against the Relief of the Besieged. *Line* of Contravallation is a Ditch bordered with a Parapet, which serves to cover the Besiegers on the Side of the Place, and to stop the Sallies of the Garrison. *Lines* of Communication are those which run from one Work to another; but the *Line* of Communication, more especially so call'd, is a continued Trench, with which a Circumvallation, or Contravallation, is surrounded, and which maintains a Communication with all its Forts, Redoubts, and Tenaillies. *Line* of the Hope is a right *Line*, which joins the Points of the two nearest Bastions. To *line* a Work, is to strengthen a Rampart with a firm Wall, or to encompass a Parapet or Moat with good Turf, &c.

**LINE** Geometrical, in Perspective, is a right *Line* drawn in any manner on the Geometrical Plane. *Line* Terrestrial, or Horizontal, in Perspective, is a right *Line*, wherein the Geometrical Plane and that of the Picture or Draught intersect one another. *Line* of the Front, in Perspective, is any right *Line* parallel to the Terrestrial *Line*. *Line* Vertical in Perspective, is the common Section of the Vertical and of the Draught. *Line* Visual is the *Line* or Ray imagined to pass from the Object to the Eye. *Line* of Station in Perspective, according to some Writers, is the common Section of the Vertical and Geometrical Planes; others mean by it the perpendicular Height of the Eye above the Geometrical Plane; others a *Line* drawn on that Plane, and perpendicular to the *Line*, expressing the Height of the Eye. *Line* Oblique, in Perspective, is the *Line* of an Object, from whence the Appearance is sought for in the Draught or Picture.

**LINE** of Gravitation of a heavy Body, is a *Line* drawn thro' its Centre of Gravity, and according to which it tends downwards.

**LINE**, Horizontal, in Dialling, is the common Section of the Horizon, and the Dial Plane. *Line* Hourly, or the *Hour-Lines*, are the common Intersections of the Hour-Circles of the Sphere, with the Plane of the Dial. *Line* Substylar, is that *Line* on which the Style or Cock of the Dial is erected, and is the Representation of such an Hour-Circle as is perpendicular to the Plane of that Dial. *Line* Equinoctial, in Dialling, is the common Intersection of the Equinoctial, and the Plane of the Dial.

**LINE** of Measures; so Mr. Oughtred calls the Diameter of the Primitive Circle in the Projection of the Sphere in Plane, or that *Line* in which the Diameter of any Circle to be projected falls. In the Stereographic Projection of the Sphere in Plane, it is that *Line* in which the Plane of a great Circle perpendicular to the Plane of the Projection, and that oblique Circle, which is to be projected, intersects the Plane of the Projection; or it is the common Section of a Plane, passing thro' the Eye-Point, and the Centre of the Primitive; and at right Angles to any oblique Circle which is to be projected, and

in which the Centre and Pole of such Circle will be found.

**LINE** of the swiftest Descent of an heavy Body, is that Curve which a Body would describe in its Descent, if it moved the swiftest possible.

**LINE** of the *Apsides*, in Astronomy, is the *Line* which joins the *Apsides*, or the greater Axis of the Orbit of a Planet. See *Apsides*.

**LINE** FIDUCIAL. See *Fiducial Line*.

**HORIZONTAL LINE**, a *Line* Parallel to the Horizon. See *Horizon*.

**MERIDIAN LINE**. See *Meridian*.

**LINE** of the Nodes, in Astronomy, is the *Line* which joins the Nodes of the Orbit of a Planet, or the common Section of the Plane of the Orbit with the Plane of the Ecliptic. See *Nodes*.

**LINE** of a Projectile. See *Projectile*.

**LINES** on the Plain Scale, are the *Line* of Chords, *Line* of Sines, *Line* of Tangents, *Line* of Secants, *Line* of Semi-Tangents, *Line* of Longitude. The Construction and Application whereof, see under the word *Plain Scale*.

**LINES** on Gunter's Scale, are, the *Line* of Numbers, *Line* of Artificial Sines, *Line* of Artificial Tangents, *Line* of Artificial Versed Sines, *Line* of Artificial Sines of Rhumbs, *Line* of Artificial Tangents of the Meridian *Line*, and *Line* of equal Parts. The Construction and Application whereof, see under the Word *Gunter's Scale*.

**LINES** of the Sector, are, the *Line* of equal Parts, or *Line* of Lines, *Line* of Chords, *Line* of Sines, *Line* of Tangents, *Line* of Secants, *Line* of Polygons, *Line* of Numbers, *Line* of Hours, *Line* of Latitudes, *Line* of Meridians, *Line* of Metals, *Line* of Solids, *Line* of Planes. The Construction and Use whereof, see under the word *Sector*.

**LINES** Converging. See *Converging Lines*.

**LINES** Diverging. See *Diverging Lines*.

**LINES** Proportional, the Manner of constructing them, their Properties, &c. See *Proportional Lines*.

**LINES** Reciprocal. See *Reciprocal*.

**LINEA ALBA**, in Anatomy, is the Concourse of the Tendons of the oblique and transverse Muscles, dividing the Abdomen in two, in the middle. It is called *Linea*, *Linea*, as being strait, and *Alba* from its Colour, which is white. It receives a Twig of a Nerve from the Intercostals in each of its Digitations or Indentings, which are visible to the Eye, in lean Persons especially.

**LINEAMENT**, a fine Stroke or Line observed in the Face, and forming the Delicacy thereof; being that which preserves the Resemblance, and occasions the Relation of Likeness or Unlikeness to any other Face. 'Tis by these that the Physiognomists pretend to judge of the Temper and Manners of People. The word *Lineament* is used by the Painters for the Out-Line of a Face.

**LINEAR PROBLEM**, in Mathematicks, is such an one as may be solved Geometrically by the Intersection of two right Lines; as to measure an inaccessible Height by the means of two unequal Sticks, &c. This is also called a *Simple Problem*, and is capable but of one Solution. *Linear* Numbers are such as have Relation to Length only, as such as represent one Side of a Plane Figure; if the Plane Figure be a Square, the *Linear* Number is called a Root.

**LINE-SEED**, a Grain, that has several useful Properties. It enters the Composition of several Medicines, and yields, by Expression, an Oil that has most of the Qualities of Nut-Oil, and is accordingly sometimes used in lieu thereof in Painting, and to burn. That drawn without the Assistance of Fire, is of much Efficacy in Medicine, and supposed good in the Cure of several Diseases.

**LINGOT**, or INGOT, a Bar or Piece of Gold, Silver, &c. from the Mines, melted down, but not coined or wrought.

*Lingot*, is also a Term in Chymistry, for the Molds they make to cast melted Metals, or the Regulus of Antimony, &c. into.

**LINGUA**, the Tongue, in Anatomy, an oblong Member, whose Form and Situation are sufficiently known, and whose Use is to be the Organ of Taste, and the principal Instrument of Speech and Deglutition. It is fastened to the *Os Hyoides*, the *Larynx*, and to the *Fauces*, by means of a membranous Ligament running along the lower Side of it, about half way, called the *Frenum*. See *Os Hyoides*, &c.

The main Bulk and Body of the Tongue is made up of Muscles, which are covered on the upper Part with a papillar nervous Substance, over which are spread two Membranes. The outer of these Membranes is pretty thick and short, and full of *Papillae*, of a Pyramidal Figure, especially towards the Tip; which *Papillae* stand pointing towards the Root of the Tongue in a bending Posture; which makes their Figure to be Concavo-convex.

These

These *Apices* or *Papille* are so very minute and slender in Men, that they make the Coat appear on the upper Part to be villous; especially as they approach nearer to the Root. The Figure of the *Papille*, in human Tongues, is not so plainly discernible to the naked Eye as not to need the Microscope. In Brutes they are generally larger, stiffer, and more conspicuous, and in some almost cartilaginous, as may be felt in the Tongues of Cows, Oxen, but more sensibly in Lions. On the upper side, at a little distance from the Tip, this Membrane becomes thin, smooth, and glabrous, and, as it were, polished by the lower Parts of the Mouth whereon it slides.

Under this lies a thin soft reticular kind of Coat, punched through with innumerable Holes, and always lined with a thick and white yellowish Mucus. This Membrane is so exceeding tender, and full of Mucus, that it is not to be examined by the naked Eye unless boiled; by which it grows tough, and easily separable from the external Membrane, and from the nervous Part of the Tongue which lies immediately under it. After boiling it appears like a kind of Gawse, between whose Threads innumerable Holes appear, through which the Apices of the papillary Body underneath it are exerted. This Membrane on the upper Side, next the outward, appears white, with a Cast towards yellow, but black on the Side next the Tongue.

Many Authors don't allow this to be a Membrane, and will only have it to be a Mucus hardened by boiling; but since it has so much of the Resemblance of a Membrane, and that Authors agree in allowing two Membranes to the Tongue, Dr. Drake does not scruple to number it among them; since there does not appear to be any other second Membrane: reckoning, with *Malpighi*, the smooth Part under the Tongue, a Part of the outer Membrane.

Immediately under this appears a nervous papillary Body spreading itself to a pretty Thickness over the whole Surface of the Tongue. This Body, on the under Side, is every where level and smooth, except in some few Places, where it is connected to the subjacent muscular Part by some nervous Twigs which it sends into it. *Malpighi* distinguishes the *Papille*, which make the principal Part hereof, into three kinds, from their different Magnitudes and Figures when observed with the Microscope; of which, those seated on the Sides and Tip are very singular, resembling little round Pyramids, with Globes on their Tops like the Horns of Snails. All these *Papille*, which are the immediate Organs of Tasting, send their Apices, or Extremities, through the mucous Membrane, into the pyramidal *Papille* of the outward Membrane, which are hollow to receive them, and seem to be nothing else but a kind of Cases to defend these nervous *Papille* from Injuries which the Salts and Asperities of those Bodies, which we take into our Mouths, might do them.

The rest, and much the greatest Part, of the Body of the Tongue is muscular, consisting of Plans of Fibres in different Directions: The first, or external Plan, consists of fibril Fibres, which cover the Tongue from one Extreme to the other; when these contract, they shorten it. Under this are several other Plans, running from the under to the upper Side, which serve to make it broad and thin. These two kinds of Fibres lie *stratum super stratum*, a Plate of the one, and then a Plate of the other. Authors are not agreed about the Number of Muscles which compose the Tongue, some confounding those of the *Os Hyoides* with those of the Tongue, reckon eight, others nine, others ten, and more Pair. Some number those proper to the Tongue alone six Pair, others five, others four, and some no more than three. Of this last Opinion is our accurate Mr. Cooper, who allows no more than three genuine Pair of Muscles to the Tongue, *viz.* the Pair *Genioglossum*, which pull the Tongue forwards, and put it out of the Mouth; the *Ceratoglossum*, which draws it into the Mouth, or pulls it on one side; and the *Styloglossum*, which draws the Tongue up in the Action of Deglutition. See *Genioglossum*, &c. under their proper Heads.

Before the Muscles, the Tongue is also moved by a Bone situated at its Root, and making as it were its Basis, called *Os Hyoides*, which see.

Down the middle of the Tongue, lengthwise, runs a Seam, call'd *Linea Mediana*, which divides it to the bottom into two equal Parts, but not so effectually, but that the Blood-Vessels of one Side communicate with those of the other. These Vessels are Arteries from the Carotides and Veins called *Ranula*, and are very conspicuous about the *Frenum* under the Tongue, serving to recover the Blood to the external Jugulars. These Veins are frequently opened in the Angina, and are the last Resort of old Women in this Case. The Nerves of the Tongue

come from the fifth, sixth, and ninth Pairs; the two first of which have been call'd *Gustatoric*, and the latter *Motus-vii Linguae*.

Howsoever necessary an Organ the Tongue be in Speech, &c. yet *Jac. Rolandus* has published an Account of a Mouth without a Tongue, which spake perfectly, and perform'd its other natural Functions; the Person he speaks of is *Pet. Dronard*, who losing his Tongue by a Gangreen, could yet speak perfectly, as also taste, swallow, and chew his Food; which last, however, he could only do on that Side he put it into, being unable to turn it to the other Side of his Mouth.

LINIMENT, a Topical Remedy, serving to soften the Asperities of the Skin, and to moisten those Parts that are to be softened, for resolving the Humours that afflict the Patient, and give him Pain. There are various kinds of *Liniments* used according to the various Occasions. The *Liniment* is of a mean Consistence, between an Oil and an Unguent. The word comes from the *Latin Linere*, to anoint gently.

LINSTOCK, is a short Staff of Wood, about three foot long, having at one end a Piece of Iron divided into two Branches, each of which hath a Notch to hold a Piece of Match, and a Screw to fasten it there; the other end of the Staff is also shod with Iron, and pointed, to stick into the Ground. It is used by the Gunners in firing Camen.

LINTEL, in Architecture, the Piece of Timber that lies horizontally over Door-Puffs and Window-Jaums, as well to bear the Thickness of the Wall over it, as bind the Sides of the Walls together.

LINUM CATHARTICUM, Mountain-Flax; this is much used by common People. It is a rough harsh Purge, and powerfully deterges, and evacuates viscid and watery Humours from the most remote Lodgments; which makes them fond of it in Rheumatism; but it is only fit for robust Constitutions.

LINUM INCOMBUSTIBILE, a Mineral Substance, of a whitish Silver Colour, and a woolly Texture; consisting of small Threads or Longitudinal Fibres, endued with the wonderful Property of resisting Fire, and remaining unconsumed in the intensest Heat. This lanuginous Mineral is sometimes call'd *Amanthus* and *Abeles*, which see; sometimes *Salamandra*, or *Salamander's Wool*, from the Candle-Wicks said to be made antiently of it. From a pungent Quality, which *Agricola* says it has on the Tongue without Astringency, it is call'd *Alumen*, having the Epithet of *Plumum* added to it, taken from its downy Filaments, to distinguish it from the other Alums. From its light grey Colour it is call'd *Polia* and *Corsoides*; and from its Likeness to the hoary Fibres of some sorts of Mat-Weed, *Spartapolia*. From the Capacity it has of being spun into Thread, it is call'd *Linum*, with some distinguishing Epithet, taken either from its Quality, as *Linum Abelesinum Firmum*, or *Incombustibile*; or from the Place where it is found, as *Linum Fossile*, *Linum Indicum*, *Creticum*, *Cyprium*, and *Carpesium*, or *Carysimum*. But besides the Places whence it borrows Names, it is also found in Tartary, at *Namur* in the Low Countries, in *Thuringia*, among the Mines in the *Old Noricum* in *Egypt*, in the Mountains of *Arcadia*, at *Potosi* in the Island of *Cosico*, in the Island of *Anglesey* in *Wales*, and in *Aberdeenshire* in *Scotland*.

The Naturalists generally reckon it among the Stones, whence its Appellation of *Lapis Abeles*, &c. but Dr. *Flo* rather judges it a *Terra Lapidina*, or middle Substance, between Stone and Earth. As to its Generation, the same Author takes it to be a Mixture of some Salt, and a pure Earth without Sulphur, coagulated in the Winter, and hardened by the Heats in Summer. The Salt *J. Hesse* says is a liquid Alum, of a milky Substance, inclining to yellow, that sweats out of the Earth, and smells like rotten Cheese.

As to the Art of managing this Mineral, and of spinning and weaving it, &c. the Accounts we have are various. *Signior Castagnata*, Superintendent of some Mines in *Italy*, gives us the Art of reducing it either into a very white Skin, or a very white Paper, either of which resists the most violent Fire.

Mr. *Lloyd* took some of that found in *Anglesey*, and pounding it in a Stone Mortar till it became a downy Substance, sifted it thro' a fine Searc; by which means the earthy Parts were separated from it: the *Linum* remaining. He then brought it to a Paper-Mill, and putting it in Water, in a proper Vessel, stirred it pretty much, ordering the Workmen to proceed on it in their usual manner of making Paper, with their Writing-Paper Mold; only to stir it about constantly before putting their Mold in; considering it as a far more ponderous Substance than what they used, and consequently, if not immediately taken up after it was agitated, it would subside. The

Paper thus made of it proved coarse, and apt to rear, but endured both Ink and Fire very well; the Ink only turning Red with the Violence of the Fire.

M. Paulus Ponceus gives us the Manufacture of the Linnen found in the Province of Chocobutbas in Tartary, from one *Cashear a Turk*, Superintendent of the Mines of that Country, as follows: The lanuginous Mineral, or Amianthus, being first dried in the Sun, is then pounded in a Brass Mortar, and the earthy part separated from the woolly, which is afterwards well washed from Filth; being thus purged, it is spun into Thread like other Wool, and after, wove into Cloth, which, if foul or spotted, they cleanse, he says, by throwing it into the Fire for an hour's time, whence it comes out unshart, as white as Snow: Which very Method, according to the Account given us by *Strabo*, seems to have been used in ordering the *Cretan Amianthus*; with this Addition, that after it was pounded, and the earthy Part separated from the woolly, he says it was combed; and so does *Agricola*.

Signior Campani, after describing four sorts of the Linnen, whereof he had Specimens in his *Museum*; the first finest from *Corfu*, the second from *Sesiri di Ponente*, the third coarser and darker than the rest, and the fourth from the *Pyretians*; and after observing, tho' he kept it three Weeks in a Glass-house Fire, yet found it unaltered, tho' it would not preserve a Strick wrapp'd in it from the Fire: he proceeds to shew the manner of spinning it, and making it into Cloth, which he effected thus: He first laid the Stone in Water, if warm the better, for some time to soak; then opened and divided it with his Hands, that the earthy parts might fall out of it, which are whitish like Chalk, and serve to bind the thready Part together. This makes the Water thick and milky. That Operation he repeated six or seven times with fresh Water, opening and squeezing it again and again, till all the heterogeneous Parts were wash'd out, and then the Flax-like Parts were collected and laid in a Sieve to dry. As to the spinning, he first shews a Method discovered to him, which is thus: Lay the Amianthus, cleans'd as before, between two Cards, such as they call Wooll whiball, where let it be gently carded, and then clapp'd in between the Cards, so that some of it may hang out of the sides; then lay the Cards flat on a Table or Bench; take a small Reel made with a little Hook at the end, and a Part to turn it by, so that it may be easily turned round. This Reel must be wound over with fine Thread; then having a small Vessel of Oil ready, with which the Forefinger and Thumb are constantly to be kept wet, both to preserve the Skin from the corrosive Quality of the Stone, and to render the Filaments thereof more soft and pliant; by continuing to twist about the Thread on the Reel in the Arbestus hanging out of the Cases, some of the latter will be worked up together with it; and by little and little the Thread may, with Care, be woven into a coarse sort of Cloth; and by putting it into the Fire, the Thread and Oil will be burnt away, and the incombustible Cloth remain. But finding this way of uniting the Stone with the Thread very tedious, instead of the Thread he put some Flax on a Distaff, and by taking three or four Filaments of the Abestos, and mixing them with the Flax, he found they might be easily twisted together, and the Thread thus made much more durable and strong; so that there is no need of Carding, which rather breaks the Filaments than does any good: only open and separate the Filaments after washing on a Table, and take them up with the Flax, which is sufficient. As to the making of Paper, he says, in the washing of the Stone there will remain several short Pieces in the bottom of the Water, of which Paper may be made in the common Method. He concludes with the best way of preserving the Cloth, or any thing made of the Linnen, which, by reason of its excessive Dryness, is very apt to break and twist; and it consists in keeping it always well oiled, which is the only Preservative. When the Cloth is put in the Fire, the Oil burns off, and the Cloth comes out white and purified.

This kind of Linnen-Cloth was highly esteem'd by the Antients; tho' then better known and more common than among us, being held equally precious with the richest Pearls; nor is it now of mean Value even in the Country where 'tis most generally made, a *China Cover*, (i. e. a Piece of twenty-three Inches and three quarters long) being worth 80 Tale, i. e. 56 l. 12 s. 4 d. *Pliny* says, he himself had seen Napkins thereof, which being taken foul from the Board, after a Feast, were thrown into the Fire, and by that means were better scoured than if they had been washed in Water, &c. But its principal Use, according to *Pliny*, was for the making of Shrouds for Royal Funerals; to wrap up the Corps, so as the Ashes might be preserved distinct from that of the Wood, &c. which made the Funeral

File; and the Princes of Tartary, according to the Accounts in the *Philosophical Transactions*, till use it at this day in burning their Dead. Some of the Antients are said to have made themselves Clothes of it, particularly the Brachmans among the *Indians*. The Wicks for their perpetual Lamps, according to *Dr. Lister*, were made of it; and we are told that *Sepulchre Canon of Milan* had Thread, Ropes, Nets, and Paper of it. A Handkerchief or Pattern of this Linnen was presented to the Royal Society, a foot long, and half a foot broad. This gave two Proofs of its resisting Fire; tho' in both Experiments it lost above three Drams in its Weight. When taken out red-hot, it did not burn a Piece of white Paper, on which it was laid. *Mr. Villetre* pretends, that his large burning Concave usually vitiates the Abestos.

LIONCELES, in Heraldry, a Term for Lions; when there are more than two of them born in any Coat of Arms, and no Ordinary between them.

LIPOTHYMIA, or LIPOPSYCHIA, in Medicine, is a sudden Diminution or Failure of animal and vital Actions, otherwise called a swooning or Deliquium. In the *Lipothymia* the Pulse is very faint, the Senses both internal and external, and the animal Motions, both voluntary and natural, extremely weakened, and the Respiration scarce visible. The ordinary Causes of the *Lipothymia* are great Losses of Blood, excessive Evacuations, immoderate Exercise, gross hot Air, such as that in the midst of Crowds of People. The word *Lipothymia* comes from the Greek *λοθη*, *deficio*, and *ψυχη*, *Animus*; and *Lipopsychia* from *λοθη*, and *ψυχη*, the Soul.

LIPPITUDO is a Disorder of the Eyes, otherwise call'd *Blear-Eyedness*; consisting in the Oozing out of a thick viscid Humour, which hardening, binds the Eye-lids together. Some, after *Celsus*, give the Name *Lippitudo* to the *Ophthalmia*; which see.

LIPS, *Laba*, the Edge or exterior Part of the Mouth, or that muculous Extremity which fluts and covers the Mouth both above and below. The Lips, besides the common Inreguments, consist of two Parts, the exterior, hard, and muculous; the interior, soft, spongy, and glandulous, covered with a fine Membrane, the *torc* and protuberant Parts of which are red, and called *Prostibia*. Authors generally content themselves with calling the Substance of this Part spongy, but in reality 'tis glandulous, as appears by the scrophulous and cancerous Humours to which it is subject. The Muscles of which the outer Parts of the Lips consist, are either common to them with other Parts, or proper; the common are the third Pair of the Nose, the Subcutaneous, and the Buccinator.

The Lips have six Pair of Muscles belonging to them, and an odd one of these, three are peculiar to the upper and under Lip, the other three and the single one are common to both Lips: The peculiar are the *Atrolien Labiorum Superioris*, *Depressor Labiorum Inferius*, *Atrolien Labiorum Inferius*; the three common Pair are, the *Zygomariacus*, the *Depressor Labiorum*, the *Atrolien Labiorum*; the odd one, *Orbiculairis*, which see.

All these Parts are served with Blood by some Branches of the Carotids, which the Veins carry back to the external Jugulars. Their Nerves come from the 5th, 6th, and 8th Pair of the Head, and some from the *Par Acetabularis*. The Lips have a great share in the Action of Speech, and are of good Use in taking in the Food, &c.

Lips are also used to signify the two Edges of a Wound, and the exterior Parts of a Woman's Privities.

LIQUEFACTION, an Operation, by which a solid Body is reduced into a Liquid; or the Action of Fire or Heat on fat fusible Bodies, which puts their Parts into Motion. The *Liquefaction* of Wax, &c. is performed by a moderate Heat, that of *Sul Tartari* by the mere Moisture of the Air. All Salts liquify. Sand, mix'd with Alkalies, are liquified in the Fire of the Reverberatory to make Glass. In speaking of Metals, instead of *Liquefaction*, we ordinarily use the word *Fusion*, which see.

LIQUID, a Body that has the Property of Fluidity; and besides that, a peculiar Quality of warring other Bodies immersed in it, arising from some Configurations of Particles, which disposes them to adhere to the Surfaces of Bodies contiguous to them. See *Fluid*.

Liquid, among Grammmarians, is a Name applied to certain Consonants opposed to Mutes; L, M, N, and R are *Liquids*.

Liquid is sometimes also used by the Civilians; thus Goods or Effects, that are clear and out of dispute, are said to be *liquid*.

LIQUIDATION, a Reduction and Ascertainment either of some dubious disputable Sum, or of the respective Pretensions which two Persons may have to the same liquid or clear Sum. *Liquidation* is also used for the Order and Method a Dealer endeavours to establish in his

Affairs. *Liquid Debts and Effects* are such as are not only really existing, but such as there can be no Dispute about.

**LIQUORICE.** See *Glycyrrhiza*.

**LIST, or LISTEL,** in Architecture, called also a *Chambre, Filter, and Regler*; is a little square Moulding, disposed in certain Parts of Columns, serving to crown or accompany larger Mouldings, and to separate the Flutings of Columns.

*List* is also used to signify the inclosed Field, or Ground wherein the ancient Knights held their Jousts and Combats. It was so called, as being heron'd round with Pales, Barriers, or Stakes: some of these were double, one for each Cavalier; which kept them apart, so that they could not come nearer each other than a Spear's length. *De Cange* derives the Word from *Listis*, which in the Age of corrupt Latin, was used for the Inclosures of Fields and Cities, as being antiently made with Cords inter-laced; or from *Listis*, quia *Campum claudebant instar Listarum panni*.

*List*, the Border of a Stuff, or that which bounds its Width on each Side. All Stuffs of Silk, Wool, or Cotton have *Listis*. *Listis* contribute to the Goodness of the Stuff, and further serve to shew their Quality; which has given occasion to several Regulations relating to their Mixture, Colour, Work, &c.

**LISTENING,** according to *Robault*, consists in the Extension or Bracing of the Tympanum of the Ear, and putting it into such a Condition, as that it shall be the more affected by any tremulous Motion of the external Air. See *Tympanum*.

**LITANY,** an old Church-Term, signifying the Processions, Prayers, and Supplications, used to appease the Wrath of God, to avert his Judgments, or to procure his Mercies. Ecclesiastic Authors, and the *Roman Order*, by the Word *Litany* mean the People who compose the Procession, and who assist at it. And *De Cange* adds, that the Word antiently signified Procession. *Sonson of Thebesalonicæ*, mentions, that in the ancient *Litanies*, the People went out of the Church, to denote the Fall of *Adam*, and returned into it again, to shew the Return of a pious Soul to God by Repentance. On occasion of a Plague that ravaged *Rome* in the Year 590, *Pope Gregory* appointed a *Litany*, or Procession, consisting of seven Bands, or Companies, who marching from the several Churches of the City, met at *St. Mary Major*. The first Company consisted of the Clergy; the second of Abbots, with their Monks; the third of Abbesses, with their Nuns; the fourth, of Children; the fifth, of Laymen; the sixth, of Widows; and the seventh, of married Women. And from this general Procession, that of *St. Mark*, called the *Grand Litany*, is judged to have taken its Rise.

*Litany*, among us, is a Form of Prayer sung or said in Churches, consisting of several Periods, or Articles; at the End of each whereof, is an Invocation in the same Terms. The Word comes from the Greek *λεηταια*, Supplication. *Peterson* would go further, and derive the *Λιτανει*, or *λεηταια* of the Greeks, from the Celtic *Lit*, Feast, Solemnity.

**LITHARGE;** there are two Kinds of *Litharge*, the one natural, the other artificial. Natural *Litharge* is a Mineral sometimes found in Lead Mines, reddish, scaly, brittle, and somewhat resembling white Lead. This *Litharge* is so exceeding rare, that the Shops sell none but the artificial.

*Artificial Litharge* is of two Kinds, viz. that of Gold, and that of Silver; or rather 'tis the same, with this difference, that the one having undergone a greater Degree of Fire than the other, has occasioned different Colours, and thence different Names. Indeed Naturalists are not over-well agreed what the *Artificial Litharge* is: Some say 'tis a Metallic Scum rais'd on the Surface of Lead, when melted; after having serv'd to purify Gold, Silver, or Copper. Others say 'tis a Metallic Smoak arising from those Metals mix'd with the Lead, used in purifying them; which sticking to the Top of the Chimneys of Furnaces, is there form'd in a kind of Scales. Lastly, others say 'tis the Lead itself used in the refining of those Metals, and especially Copper; which last Opinion appears the most credible; and the rather, on account of the great Quantities of these *Litharges* brought from *Poland, Sweden, and Denmark*; where Copper-Mines are much more frequent than those of Gold and Silver.

*Litharge* are de-ficative, detensive, and cooling; they make the Confidence of several Plaisters. The Potters use them to give a beautiful Gloss to their Ware; and they are also used by Painters, Dyers, Skinners, and Glaziers. When mix'd with Wine, they give it a bright sprightly Colour, but render it extremely unwholesome. The Word is composed of the Greek *λιθος* and *αργυρος*.

**LITHIASIS,** in Physic, signifies the Formation of the Stone, or the Manner in which it grows in the Body. See *Stone*.

**LITHOCOLA,** a Cement used by the Lapidaries to fasten their precious Stones, in order for cutting them. It is composed of Rofin and Brick-Dust. For Diamonds they use melted Lead, putting them into it before it be quite cold. For other *Cements* they mix Marble-Dust with strong Glue; and to fasten their Sparks, add the White of an Egg and Pitch. The Word comes from the Greek *λιθος*, Stone, and *κολληω*, Glue.

**LITHONTRIPICS,** are Medicines proper to dissolve the Stone in the Bladder and Kidneys; of which Kind are the *Lithopermum, Saxifrage, &c.* The Word comes from the Greek *λιθος*, Stone, and *τριβω*, to break or wear.

**LITHOTOMY,** an Operation in Chirurgery, performed upon a human Body in order to extract the Stone out of the Bladder. This is performed three several Ways, viz. by the small Apparatus, the great Apparatus, and the high Apparatus. The first is by cutting thro' the *Perineum* near the Suture, on the left Side, after the Stone, by the Fingers of the Operator, has been brought to that Part. This is called cutting upon the Gripe; but 'tis almost disused, by reason it subjects the Patient to great Hazard and Inconveniences.

In the great Apparatus, which is that ordinarily practised, after the Patient is conveniently placed and bound, the Operator introduces a proper Instrument thro' the urinary Passage into the Bladder, in order to search for the Stone; which being found, that Instrument is withdrawn, and another grooved one introduced the same way; which bulging in the *Perineum*, serves to direct the Knife to the Neck of the Bladder. After the Incision, a third Instrument is thrust into the Aperture, till it join the former, that was last introduced thro' the urinary Passage, at which time that is withdrawn, whilst this remains to guide the Forceps directly into the Bladder, to bring away the Stone. This way is called cutting upon the Staff.

The third Method, called also the High Operation, has been long since described, and strenuously pleaded for by a Chirurgical Writer, *Rosser*; but the Practice is of a late Date among us, and was first attempted by Mr. *Douglas*. Whether, upon the whole, this Method is preferable to the larger Apparatus, remains a Question. Tho' the great Success which Mr. *Chyelden* has found in it, gives Encouragement to hope others may hereafter prove as happy, and at length render the Practice universally advantageous.

The Manner of proceeding herein, is this: After the Bladder is injected with a sufficient Quantity of warm Water, and the Patient conveniently placed, the Operator slowly makes an Incision above the *Os Pubis*, along the *Linea Alba*, till he gets sight of the Bladder, into which he directly plunges his Knife, and afterwards draws out the Stone. The Advantages attending this Method, are, That 'tis perform'd in a very short Time; That the Wound easily heals; That the Dilaceration of Parts, frequent in the other Ways, is prevented; and That there is no danger of the *Incontinentia Urinae*. On the other hand, 'tis thought to be chiefly practicable upon young Persons, and such as are lean; the Wound in old and fat Persons being apt to mortify; moreover, if the Operator be not very cautious, he may easily let out the Intestines.

**LITTER,** a kind of Coach, or Vehicle born upon Shafts, antiently esteemed the most easy and genteel Way of Carriage. *Pliny* calls it the Travellers Chamber. It was much in use among the *Romans*, among whom it was born by Slaves, kept for that purpose; as it still continues to be in the East. The *Roman Litter* made to be born by four Men, was called *Tetraportum*; that born by six, *Hexaportum*; and that born by eight, *Ottaportum*. The Invention of *Litters*, according to *Cicero*, was owing to the Kings of *Bithynia*. In the time of *Tiberius* they were grown very frequent at *Rome*; as appears from *Seneca*; and even Slaves themselves were born in them, tho' never by more than two Persons, whereas Men of Quality had six or eight. *De Cange* derives the Word from *Lestria*, or *Lutaria*, q. d. a Bed for Beasts. Others will rather have it come from *Lestus*, Bed, there being ordinarily a Quilt and a Pillow to a *Litter*; in the same manner as to a Bed.

**LITTORAL SHELLS** are, with the Writers of Natural History, such Sea-Shells as are always found near the Shores, and never far off in the Deep: such as are found in the bottom of the Sea, remote from the Shore, they call *γαστήριον*, and *Pelagus*.

**LITURGY,** a Term signifying all the Ceremonies belonging in general to the Divine Office and Service. In a more restrained Signification, it is used among the *Romanists* to signify the Mass, and among as the Common-Prayer.

Prayer. All who have written on *Liturgies* agree, that in the Primitive Days, Divine Service was exceedingly simple, only clogged with a very few Ceremonies, and confining of but a small Number of Prayers; but by degrees they increased the Number of external Ceremonies, and added new Prayers, to make the Office look more awful and venerable to the People. At length things were carried to such a pitch, that a Regulation became necessary; and it was found proper to put the Service, and the Manner of performing it, into Writing, and this was what they call'd a *Liturgy*. The *Liturgies* have been different at different Times, and in different Countries. We have the *Liturgy* of St. Chrysostom, that of St. Peter, of St. James, the *Liturgy* of St. Basil, the *Armenian Liturgy*, the *Liturgy* of the *Maronites*, of the *Capotes*, the *Roman Liturgy*, the *Galician Liturgy*, the *English Liturgy*, the *Ambrosian Liturgy*, the *Spanish* and *African Liturgies*. The word comes from the *Greek* *λεωργια*. *Service*, *Public Ministry*.

LITUS is the same as *Linimentum*, which see.

LITUUS, among Medalists, is a Staff used by the Augurs, made in form of a Crozier. We frequently see it in Medals, along with other Pontifical Instruments. *Antist. Gelinus* says, it was bigger in the place where it was crooked than elsewhere. Some derive the Word from the *Greek* *λιθον*, something that makes a shrill acute Sound, which was a Property of this Instrument.

LIVER, a large glandulous Viscus, of a red sanguine Colour, situated immediately under the Diaphragm, in the right Hypochondrium, which it almost fills; and thence stretching itself over the right Side of the Stomach towards the left Hypochondrium, reaches behind the *Cartilago Enfermitis*, growing gradually thinner and narrower. Its Use is to purify the Mass of Blood, by making a Secretion of the bilious Humours it contains. Its upper Part is convex, and perfectly smooth or polished, the under concave, and somewhat more uneven, having four large Fissures; one thro' which the Umbilical Ligament passes; a second on the left Side, receiving the *Pylosus* and the beginning of the *Duodenum*; a third on the right Side near the Margin, in which the Gall-Bladder is lodged; and the last in the upper Part, affording a Passage to the *Vena Cava*. Its Figure is somewhat approaching to round, with thin Edges not altogether even, but notched in some Places. Its Magnitude is various in different Subjects, according to the Proportion of the Body, tho' in a Fœtus, or very young Animal, it is always larger, in proportion, than in Adults. In Dogs and other Animals of the Quadruped Kind, it is divided into several distinct Lobes, but in Men it is generally continued; having one small Protuberance, which some account a little Lobe. It is sometimes, however, observed in Men to have been divided into two or three Lobes.

The Liver is connected to several Parts, but especially to the Diaphragm, to which it is fastened by a broad, thin, but strong semicircular Ligament, call'd the *suspensory Ligament*, and derived from the common *Capacula* of the *Porta* and Gall Ducts. The Continuity of this Ligament being interrupted by the Perforation of the *Vena Cava*, has given occasion to some Anatomists to divide it into two. It is likewise by another strong Ligament, which has its Origin from the external Cost of the Liver, or which is all one, from the *Peritoneum*, tied to the *Cartilago Xyphoides*; and by a third, which is formed out of the Umbilical Vessels, which in Adults dry up and become a Ligament, it is connected to the Tendons of the abdominal Muscles in the *Lines alba* at the Navel. These several Ligaments serve to keep it in its due situation: besides which it has some other Connections by the Blood-Vessels.

The Liver has a Motion, though not proper to itself, but depending on that of the Diaphragm, to which being very firmly connected, it must needs obey its Motion, and in Expiration be drawn up, and in Inspiration let down again. It is covered with a thin smooth Membrane, derived from the *Peritoneum*, which may be separated from the Substance of the Liver, tho' not without some danger of Laceration. The Substance of the Liver is vascular and glandulous; which latter Part is very soft and friable, and pretty easily scraped off from the Vessels, to which the Glands every way adhere, as it were in Bunches; which has made the Anatomists call the considerable ones, *The Internal Lobes of the Liver*.

The Glands adhering thus to the Vessels, and constituting those Lobes, are wrapped up together in proper Membranes; whence this Appearance of distinct Lobes. Every one of these Glands, according to *Malpighi*, is composed of six unequal Sides or Faces. They are all cloth'd with their proper Membranes, and have each an excretory Duct, several of which joining together, form little Trunks, which run all along with the Branches of the *Porta*; and these again uniting, form longer Trunks, which are always found full of Bile, and constitute the *Vena Biliaris*; which being distributed all over the Li-

ver, receives, in the foregoing manner, the Bile; which is separated by these Glands, and terminating in the *Meatus Hepaticus*, and that in the *Ductus Communis*, at length discharges the Bile into the *Duodenum*.

Besides this Discharge by the *Porta Biliaris*, which is supposed to be the great one, the Liver also delivers Part of its Bile into the Gall-Bladder, by a Duct, call'd the *Cyst Hepatic Duct*, first discovered by Dr. *Gilston*; by means whereof there is an immediate Communication between the *Vena Biliaris* and the Gall-Bladder; a particular Description of which two last Parts, see under the words *Gall and Bile*.

Besides these Gall-Vessels, which are peculiar to the Liver, it abounds with Blood-Vessels, especially Veins; whereof the *Porta* and *Cava* are disseminated thro' the whole Substance of it. And here it is particularly remarkable of the *Porta*, that after the manner of Arteries it shoots itself from a Trunk into Branches, and being at last lost in Capillaries, delivers the Blood into the *Cava*, by which it is immediately reconveyed to the Heart.

The *Porta* is formed out of the Concurrence of divers Veins, which, meeting together, make one of the most considerable venous Trunks of the Body, as to its Bulk; tho' contrary to the Course of other Veins, it runs not far in a Trunk, but is soon distributed again by Ramifications into the Liver. See *Vena Porta*.

The Blood conveyed into the Liver by the *Porta*, after the manner of the Arteries, is received again, after having been purged of its Bile in the Glands of the Liver into innumerable Veins, which empty themselves into the *Cava*, and are vulgarly, tho' improperly, call'd *Branches of the Cava*; but ought to be esteem'd the proper Blood-Vessels of the Liver, as the Emulgents are of the Kidneys; and which, as all the rest do, except the Pulmonary Vein, empty themselves into the *Cava*; the common Channel by which the Blood returns to the Heart.

The Arteries, which are call'd the *Hepatic*, come from the right Branch of the *Cœliacæ*. Dr. *Gilston* thinks the *Porta* does so much the Office of an Artery, that no more Arteries are necessary than those which furnish Nourishment to the Membranes and Capsula; but Dr. *Drake* thinks they serve for the Nourishment of the whole Part. These Arteries are much bigger in Men than in other Animals. Mr. *Comper* had several Preparations, wherein the Stem of each Hepatic Artery was as large as a Goose-Quill, and the Branches in the Liver every where equal in Magnitude to those of the *Vena Biliaris*, which they accompany. Dr. *Drake* conjectures, that in this Viscus in a human Body, a larger Stream and direct Impetus of arterious Blood is required to drive on the Venous, because of the erect Posture, than in Animals of an horizontal Position of Body. For which reason Horses, &c. though of much larger Size, and having much bigger Livers, have these Arteries much smaller than Men; and not only so, but curled like the Tendrils of a Vine, to break the Impetus, which in that Posture is not so necessary as in the Erect. See *Bile*.

The Liver has its Nerves from the Hepatic Plexus, found on the right Hypochondrium by the Branches of the Intercostal, which wrapping themselves about the Arteries, make a sort of Net-work; and after spreading themselves on the Membrane and Surface, disappear. The Lymphaducts are numerous, tho' not easily discernible in human Subjects, for want of live Dissections; but in other Animals, that may be dissected alive, become very conspicuous, by applying a Ligature to the *Porta* and the biliary Duct. For the Use of the Liver in the Secretion of Bile, see *Bile*.

Plato, and others of the Antients, fix the Principle of Love in the Liver; whence the Latin Proverb, *Cogit amare Jecur*: And in this sense *Horace* frequently uses the word, as when he says, *Si torrens Jecur queris Idoneum*. The Greeks, from its concave Figure, call'd it *σπιγδ*, *waisted*, *suspended*; the Latins call'd it *Jecur*, *q. d. Jecur*, *Car*, as being near the Heart. The French call it *Foye* from *Foyer*, *Focus*, or Fire-place; agreeable to the Doctrine of the Antients, who believ'd the Blood to be boiled and prepared in it. *Erasistratus* at first call'd it *Parenchyma*, i. e. Effusion, or Mass of Blood; and *Hippocrates*, by way of Eminence, frequently calls it the *Hypochondrium*.

LIVERY, properly signifies a Colour, to which a Person has some particular Fancy, and by which he chuses to distinguish himself from others. Liveries are usually taken out of Farcy, or continued in Families by Succession. The ancient Cavaliers, at their Tournaments, distinguished themselves by wearing the Liveries of their Mistresses. Thus People of Quality make their Domesticities wear their Liveries. Father *Mensfrier*, in his Treatise of *Carousals*, has given a very ample Account of the Mixtures of Colours in Liveries. *Dion* tells us, that *Onomasus* was the first who invented green and blue Colours for

for the Troops which in the Circus were to represent Land and Sea Fights. The *Romish Church* has also her several Colours and *Liveries*, white for Confessors and Virgins, and in times of rejoicing; black for the Dead; red for Apostles and Martyrs, blue or violet for Penitents, and green in times of Hope.

Formerly Great Men gave *Liveries* to several who were not of their Family or Servants, to engage them in their Quarrels for that Year; but this was prohibited by the Statute 1 Hen. 4. and no Man, of whatever Condition, was allow'd to give any *Livery* but to his Domestic Officers and Council learned in either Law.

**LIVERY**, in Law, is the Delivery of Possession to those Tenants which held of the King in *Capite*, or Knights Service. In another Signification, *Livery* is the Writ which lies for the Heir to obtain the Possession or Seizin of his Lands at the King's hands.

*Livery of Seizin* is a Delivery of Possession of Lands or Tenements, or Things Corporal (for of Things Incorporeal there can be no *Livery of Seizin*) to him who hath Right, or Probability of Right to them. 'Tis a Ceremony used in the Common Law, in Conveyance of Lands, Tenements, &c. where an Estate in Fee-simple, Fee-tail, or Freehold shall pass; and is a Testimonial of the willing departing of him who makes the *Livery*, from the Thing whereof *Livery* is made, as well as of a willing Acceptance by the other Party of all that whereof the first has divested himself. The common Manner of the Delivery of *Seizin* is thus: If it be in the open Field where is no House nor Building, and if the Estate pass by Deed, one openly reads it, or declares the Effect of it; and after that is sealed, the Vendor takes it in his hand with a Clod of Earth on a Twig or Bough, which he delivers to the Vendee in the name of Possession or Seizin, according to the Effect of the Deed. If there be a House or Building on the Land, this is to be done at the Door of it, none being then left within; and the Ring of the Door is delivered to the Vendee, who enters alone, shuts the Door, and presently opens it again. If it be a House without Land or Ground, the *Livery* is made and Possession given by Delivery of the Ring of the Door and Deed only; and where it is without Deed either of Lands or Tenements, there the Party declares by Word of Mouth before Witnesses the Estate he parts with, and then delivers *Seizin* or Possession as aforesaid, in which Case the Land passes as well as by Deed, by virtue of the *Livery of Seizin*. Antiently, there were a Pair of Gloves, a Ring, Knife, Ear of Wheat, &c. delivered in sign of *Livery* and *Seizin*. See *Investiture*.

**LIVRE**, an Imaginary French Coin, consisting of twenty Sols, each Sol again containing twelve Deniers; which way of computing the Coin has been in use in that Country ever since the Time of *Charlemagne*; before whom they used the Roman *Libra*. The *Livre* is of two kinds, the *Livre Tournois* and *Paris*. The *Livre Tournois*, as above, contains 20 Sols *Tournois*, and each Sol 12 Deniers *Tournois*. The *Livre Paris* is 20 Sols *Paris*, each Sol *Paris* worth 12 Deniers *Paris*, and each Sol *Paris* worth 15 Deniers *Tournois*. So that a *Livre Paris* is equivalent to 15 Sols *Tournois*: the word *Paris* being used in opposition to *Tournois*, by reason of the Rate of Money, which was  $\frac{1}{2}$  more at *Paris* than at *Tours*. One Penny Sterling is equal to 15  $\frac{1}{2}$  Deniers *Tournois*: so that the English Pound Sterling is equal to 15 Livres, 6 Sols, 8 Deniers of French Money, supposing the Exchange to be on the foot of 54 Pence Sterling to a French Crown of 60 Sols *Tournois*; which is the present Par between *England* and *France*.

The Origin of the Word is fetch'd hence, that antiently the Roman *Libra* or Pound was the Standard by which their Money was regulated; twenty Sols being made equal to the *Libra*. By degrees the *Libra* became a Term of Account, so that any Coin just worth 20 Sols was a *Livre* or *Libra*; and since the Time of *Charlemagne* all Contracts have been made on the foot of this Imaginary Coin: Tho' the Sols have frequently chang'd their Weight and Alloy. Since, there have been Pieces of Gold struck of 20 Sols, and under Henry III. in 1175, Species of Silver of like Value: Both the one and the other were call'd *Frances*, and thus the Imaginary Coin became Real.

It appears that the Romans had a kind of Money which they call'd *Libra* or *Libella*; which was the 10th part of their *Denarius*; so call'd because equivalent to an *As*; which, at first, weigh'd a *Libra* or Pound of Copper. *Scaliger* adds, that they used *Libra* as a Term of Account, not as a Coin: *Libra erat Calculi Numerum, non Nummus*. See *Pound*.

**LIXIVIOUS**, in Chymistry, is understood of Salts extracted by a Lixivium or Lotion. *Lixivious Salts* are the fix'd Salts of Plants, &c. extracted by calcining the Plants or reducing them to Ashes; and afterwards making a Lixivium of those Ashes with Water; whence that Name is derived. Mr. *Boyle* observes, that the difference be-

tween *Lixivious* and Urinous Salts consists in this, That the former change the Disposition of Sublimate in common Water into a yellow Colour.

**LIXIVIUM**, a Liquor made by the Infusion of Wood-Ashes, or any burnt Substances; which is more or less pungent and penetrating, as it is more or less impregnated with Salts, and fiery Particles abounding therein. What is left after the Evaporation of such a Liquor, is called a *Lixivial* or *Lixiviate Salt*; such as all those are, which are made by Incineration. *Lixivious* are of notable use not only in Medicine, but also in Bleaching, Sugar-Works, &c. which see.

**LOADSTONE**, see *Magnet*.

**LOAM**, Clay used in Grafting; a kind of Mortar made of Clay and Straw; also a sort of Clay or Plaster used by Chymists to stop up their Vessels with.

**LOBBY**, see *Antechamber*.

**LOBE**, among Anatomists, is used for each of the two Parts whereof the Lungs consist. This Separation into Lobes is of use in dilating the Lungs, in causing them to receive more Air, and in preventing their being too much squeeze'd, when the Back is bent. For this reason it is, that Beasts, which are always inclining towards the Earth, have more Lobes in their Lungs than Men: Even their Liver is divided into Lobes, whereas that of Man is continued.

Lobe is also used for the Tip of the Ear; which is more fat and fleshy than any other part. *Du Laurent* says, that the word Lobe in this last sense comes from the Greek *lobos*, to be ashamed: this part of the Ear being said to blush, when the Person is ashamed.

Lobe is used, likewise, in speaking of Fruits and Grains. Thus the Bean consists of two equal parts, call'd Lobes, which compose the Body thereof, and are encompass'd with the outer Skin. And all other Grains, even the smallest, are divided, like the Bean into two Lobes, or equal Parts; as Dr. *Grew* has shown in his *Anatomy of Plants*.

**LOBULE**, in Anatomy, a little Lobe. Each Lobe of the Lungs is divided into several other Lobes or Lobules, which are fasten'd on each side to the largest Branches of the Trachea. Each Lobule consists of a great number of little round Vesicles, which have, all, a Communication with one another. 'Tis into these Vesicles that the Air enters by the Trachea in Inspiration; still quitting them again in Expiration. The word Lobule is derived from Lobe, whereof it is a Diminutive.

**LOCAL**, something supposed to be tied or annexed to any particular place. Thus, in Law, a thing is said to be Local, i. e. annexed to the Freehold. An Action of Trespass for Battery, &c. is Transitory, not Local; that is, it is not necessary, that the Place where Battery was committed, should be set down as material in the Declaration; or if it be set down, the Defendant cannot traverse it, by saying, he did not commit the Battery in the Place mention'd in the Declaration, and so avoid the Action.

*Local Customs* are those peculiar to some Lordship, or other District, and not agreeable to the General Customs of the Country.

*Local Problem*, in Mathematicks, is such an one, as is capable of an infinite number of different Solutions: as where the Point, that is to solve the Problem, may be indifferently taken within a certain Extent; v. g. any where, in such a Line, within such a Plane Figure, &c. which is called a Geometrical *Local*, and the Problem is said to be a Local or indeterminate one. This *Local Problem* may be either Simple, as when the Point sought is in a right Line; Plane, when the Point sought is in the Circumference of a Circle; Solid, when the Point required is in the Circumference of a Conick Section; or Surfolid, when the Point is in the Perimeter of a Line of the second Gender, as the Geometers call it. See *Local*.

*Local, or Artificial Memory*; see *Memory*.

*Local Colours*, in Painting, are such as are natural and proper for each particular Object in a Picture; and are so called, to distinguish them from the Clair, obscure, which consists wholly of Black and White.

*Local Motion*, see *Motion*.

**LOCATION**, in the Civil Law, an Action by which any thing is lett out, on Rent. The second Title of the 19th Book of the *Digest*, is on the Subject of Location and Conduction. Location and Conduction are relative Terms, and are used as well for the Action of him that lets, as for that of him who takes on that letting. *Tota Locatio* is when the Person who takes, continues on the Premises beyond the Term of his Lease; which by the Civil Law he is allow'd to do, at least for the space of a Year; on the same Terms.

**LOCH**, or *Loboch*, in Pharmacy, is a Composition, of a Consistence between that of a Syrup and that of a soft Electuary, destined for Discharges of the Lungs. The Word is originally *Arabic*; but continues still in use among

among the Apothecaries. The *Latins* call it *Liothra*, and the *Greeks* *ελεγχος*, by reason the manner of taking it is by licking. There are various kinds of *Laches*. See *Elegna*.

**LOCHIA**, or *Laches*, the Evacuations consequent on the Delivery of a Woman in Child-bed. As soon as the *Uterus* is eased of its Load, its Fibres, as also those of the Peritonæum, Muscles of the Abdomen, &c. which had been extremely distended during the last Period of Gestation, begin to contract themselves and their Vessels; particularly the *Uterus*, which by this means expels the Blood amass'd in it. At first, pure Blood is evacuated, and in considerable quantities; afterwards it is diluted, and comes out more sparingly; at length it becomes viscid, pale, &c. These are called the *Laches*.

**LOCK**, a little Instrument used for the shutting of Doors, Chests, &c. The *Lock* is reckon'd the Master-piece in Smithery; a great deal of Art and Delicacy being required in contriving and varying the Wards, Springs, Bolts, &c. and adjusting them to the Places where they are to be us'd, and the various Occasions of using them.

From the various Structure of *Locks*, accommodated to their different Intentions, they acquire various Names. Those placed on outer Doors are called *Street-Locks*; those on Chamber-Doors, *Spring-Locks*; those on Trunks, *Trunk-Locks*, *Pad-Locks*, &c. Of these, the *Spring-Lock* is the most considerable, both for its Frequency and the Curiosity of its Structure. Its principal Parts are, the Main-Plate, the Cover Plate, and the Pin-hole: To the Main-Plate belong the Key-hole, Top-hook, Cross-wards, Bolt, Bolt-toe or Bolt-nab, Drawback Spring, Tumbler, Pin of the Tumbler, and the Staples; to the Cover-Plate belong the Pin, Main-ward, Cross-ward, Step-ward or Day-ward; to the Pin-hole belong the Hook-ward, Main Cross-ward, Shank, the Pot, or Bread, Bow-ward, and Bit. See *Smithery*.

**LOCULAMENTA**, strictly signifies little Pockets; and thence the Term is made use of in Botany, to express those little distinct Cells, or Partitions, within the common *Capsula Seminalis* of any Plant: as those within the Seeds of Poppies, &c.

**LOCUS**, or the Place of any Body, is rightly distinguished into Absolute and Relative; and so ought Space to be accounted. The *Locus Absolutus*, or *Primarius*, of any Body, is that part of the absolute and immovable Space, or extended Capacity to receive all Bodies, which this individual one takes up. *Locus Relativus*, or *Secundarius*, is that apparent and sensible Place, in which a Body is determined to be placed by ourselves, and with relation to other adjoining or contiguous Bodies. The *Locus Apparentis* is a Term in Optics: see *Apparent Place of any Object*. It is also, in Astronomy that Place, in which any Planet or Star appears, when view'd from an Eye at the sensible Horizon.

**LOCUS GEOMETRICUS**, a Line by which an Indeterminate Problem is solved. This, if a right Line suffice for the Construction of the Equation, is called *Locus ad Retinam*; if a Circle, *Locus ad Circulam*; if a Parabola, *Locus ad Parabolam*; if an Ellipsis, *Locus ad Ellipsin*; and so of the rest of the Conic Sections.

The *Loci* of such Equations as are Right Lines or Circles, the Antients call'd *Plain Loci*; and of those that are Parabolas, Hyperbolas, &c. *Solid Loci*. *Wolffius*, and others of the Moderns, divide the *Loci* more commodiously into Orders; according to the Number of Dimensions to which the Indeterminate Quantities rise. Thus it will be a *Locus* of the first Order if the Equation  $x = ay : c$ . A *Locus* of the second or quadrate Order, if  $y^2 = ax$ , or  $y = a\sqrt{x}$ , &c. A *Locus* of the third or cubic Order, if  $y^3 = a^2x$ , or  $y^3 = a \times \sqrt{x^2}$ , &c.

The better to conceive the Nature of the *Locus*, suppose two unknown and variable right Lines AP, PM, (Fig. 3, 4. *Plate Analysis*) making any given Angle APM with each other; the one whereof, as AP, we call  $x$ , having a fixed Origin in the Point A, and extending itself indefinitely along a right Line given in Position; the other PM, which we call  $y$ , continually changing its Position, but always parallel to itself. An Equation only containing these two unknown Quantities  $x$  and  $y$ , mix'd with known ones, which expresses the Relation of every variable Quantity AP ( $x$ ) to its correspondent variable Quantity PM ( $y$ ): the Line passing thro' the Extremities of all the Values of  $y$ , i. e. thro' all the Points M, is called a *Geometrical Locus*, in general, and the *Locus* of that Equation in particular.

All Equations whose *Loci* are of the first Order, may be reduced to some one of the four following Formula's:

$$1. y = \frac{bx}{a}, \quad 2. y = \frac{bx}{a} + c, \quad 3. y = \frac{bx}{a} - c, \quad 4. y = c - \frac{bx}{a}.$$

Where the unknown Quantity  $y$  is sup-

posed always to be freed from Fractions, and the Fraction that multiplies the other unknown Quantity  $x$ , to be reduced to this Expression  $\frac{b}{a}$ ; and all the known Terms to this  $c$ .

The *Locus* of the first Formula being already determined:

To find that of the second,  $y = \frac{bx}{a} + c$ ; in the

Line AP, (Fig. 5.) take  $AB = a$ , and draw  $BE = b$ ,  $AD = c$ , parallel to PM. On the same side AP draw the Line AE of an indefinite length towards E, and the indefinite straight Line DM parallel to AE. I say, the Line DM is the *Locus* of the aforesaid Equation or Formula; for if the Line MP be drawn from any Point M thereof parallel to AQ, the Triangles ABE, APF, will be similar; and therefore

$$AB(a) : BE(b) :: AP(x) : PF = \frac{bx}{a}; \text{ and consequently } PM(y) = PF\left(\frac{bx}{a}\right) + FM(c).$$

To find the *Locus* of the third Form  $y = \frac{bx}{a} - c$  proceed thus. Assume  $AB = a$ , (Fig. 6.) and draw the right Lines  $BE = b$ ,  $AD = c$ , parallel to PM, the one on one side AP, and the other on the other side; and thro' the Points A, E, draw the right Line AE of an indefinite length towards E, and thro' the Point D the Line DM parallel to AE: I say, the indefinite right Line GM shall be the *Locus* sought; for we shall have always

$$PM(y) = PF\left(\frac{bx}{a}\right) - FM(c).$$

Lastly, To find the *Locus* of the fourth Formula  $y = c - \frac{bx}{a}$ ; in AP (Fig. 7.) take  $AB = a$ , and draw  $BE = b$ ,  $AD = c$ , parallel to PM, the one on one side AP, and the other on the other; and thro' the Points A, E, draw the Line AE indefinitely towards E, and thro' the Point D draw the Line DM parallel to AE. I say, DG shall be the *Locus* sought; for if the Line MP be drawn from any Point M thereof parallel to AQ, then we shall have always  $PM(y) = FM(c) - PF\left(\frac{bx}{a}\right)$ .

Hence it appears, that all the *Loci* of the first Degree are straight Lines, which may be easily found, because all their Equations may be reduced to some one of the foregoing Formula's.

All *Loci* of the second Degree are Conic Sections, viz. either the Parabola, the Circle, Ellipsis, or Hyperbola; if an Equation therefore be given, whose *Locus* is of the second Degree, and it be required to draw the Conic Section, which is the *Locus* thereof; first draw a Parabola, Ellipsis, and Hyperbola; so, as that the Equations expressing the Natures thereof, may be as compound as possible: In order to get general Equations or Formula's, by examining the peculiar Properties whereof, we may know which of these Formula's the given Equation ought to have regard to; that is, which of the Conic Sections will be the *Locus* of the proposed Equation. This known, compare all the Terms of the proposed Equation with the Terms of the general Formula of that Conic Section which you have found will be the *Locus* of the given Equation; by which means you will find how to draw the Section which is the *Locus* of the Equation given.

For example, let  $AP(x)$ ,  $PM(y)$ , be unknown and variable straight Lines, (Fig. 8.) and let  $m, n, p, r, t$ , be given right Lines: In the Line AP take  $AB = m$ , and draw  $BE = n$ ,  $AD = r$ , parallel to PM, and thro' the Point A draw  $AE = c$ , and thro' the Point D the indefinite right Line DG parallel to AE. In DG take  $DC = t$ , and with CG as a Diameter, having its Ordinates parallel to PM, and the Line CH =  $p$ , as the Parameter, describe a Parabola CM: then the Portion thereof included in the Angle PAD will be the *Locus* of the following general Formula.

For if from any Point M of that Portion there be drawn the right Line MP, making any Angle APM with MP; the Triangles ABE, APF, shall be similar, therefore

$$AB(m) : AE(c) :: AP(x) : AF \text{ or } DG = \frac{cx}{m}. \text{ And}$$

$$yy - \frac{2n}{m}xy + \frac{nn}{mm}xx - 2rty + \frac{2nr}{m}x + rr = e.$$

$$- \frac{c}{m}p x + p^2.$$

CCCCC A B

AB(m) : BE (n) :: AP(x) : PF =  $\frac{nx}{m}$ . And consequently GM or PM - PF - FG =  $y - \frac{nx}{m} - r$ , and CG or DG - DC =  $\frac{ex}{m} - s$ . But from the Nature of

the Parabola  $\overline{GM}^2 = CG \times CH$ , which Equation will become that of the general Formula, by putting the Literal Values of those Lines.

Again; if thro' the fixed Point A you draw the indefinite right Line A Q (Fig. 9.) parallel to P M, and you take A B = m, and draw B E = n parallel to A P, and thro' the determinate Points A, E, the Line A E = e; and if in A P you take A D = r, and draw the indefinite right Line D G parallel to A E, and take D C = s: this being done, if with the Diameter C G, whose Ordinates are parallel to A P, and Parameter the Line C H = p, you describe a Parabola C M; the Portion of this Parabola contain'd in the Angle B A P, shall be the Locus of this second Equation or Formula,

$$x x - \frac{2n}{m} y x + \frac{nn}{mm} y y - 2 r x + \frac{2nr}{m} y + r r = e.$$

$$- \frac{ep}{m} y + p s.$$

For if the Line M Q be drawn from any Point M, therein, parallel to A P; then will A B(m) : A E (e) : A Q or P M (y) : A F or D G =  $\frac{ey}{m}$ . And A B(m) : BE (n) :

A Q (y) : Q F =  $\frac{ny}{m}$ . And therefore G M or Q M - Q F - F G =  $x - \frac{ny}{m} - r$ ; and C G or D G - D C =  $\frac{ey}{m} - s$ . And so by the common Property of the Parabola, you will have the foregoing second Equation or Formula.

So likewise may be found general Equations or Formulas to the other Conic Sections.

Now if it be required to draw the Parabola, which we find to be the Locus of this proposed Equation  $y y - 2 a y - b x + c c = 0$ ; compare every Term of the first Formula with the Terms of the Equation, because

$y y$  in both is without Fractions; and then will  $\frac{2n}{m} = a$ , because the Rectangle  $x y$  not being in the proposed Equation, the said Rectangle may be esteem'd as multiplied by 0; whence  $n = s$ , and  $m = e$ ; because the Line A E falling in A B, that is, in A P in the Construction of the Formula, the Points B, E, do coincide. Therefore

destroying all the Terms affected with  $\frac{m}{m}$  in the Formula, and substituting  $m$  for  $e$ , we shall get  $y y - 2 r y - p x + r r + p s = 0$ . Again, by comparing the correspondent Terms -  $2 r y$  and -  $2 a y$ , as also -  $p x$  and -  $b x$ , we have  $r = a$ , and  $p = b$ ; and comparing the Terms wherein are neither of the unknown Quantities  $x, y$ , we get  $r r + p s = c c$ , and substituting  $a$  and  $b$  for  $r$  and  $p$ , then will  $s = \frac{cc - a a}{b}$ , which is a negative Expression

when  $a$  is greater than  $c$ , as is here supposed. There is no need of comparing the first Terms  $y y$  and  $y y$ , because they are the very same. Now the Values of  $n, r, p, s$ , being thus found, the sought Locus may be constructed by means of the Construction of the Formula, after the following manner.

Because B E (n) = 0, (Fig. 10.) the Points B, E, do coincide, and the Line A E falls in A P; therefore thro' the fixed Point A draw the Line A D (r) = a parallel to P M, and draw D G parallel to A P, in which take

DC =  $\frac{aa - cc}{b} - s$ ; then with C G, as a Diameter,

whose Ordinates are right Lines parallel to P M, and Parameter the Line C H (p) = b, describe a Parabola; I say the two Portions O M M, R M S, thereof, contain'd in the Angle P A O, form'd by the Line A P, and the Line A O drawn parallel to P M, will be the Locus of the given Equation, as is easily proved. If in a given Equation, whose Locus is a Parabola,  $x x$  is without a Fraction, then the Terms of the second Formula must be compared with those of the given Equation.

Thus much for the Method of Constructing the Loci of Equations, which are Conic Sections. If, now, an Equation whose Locus is a Conic Section be given; and the particular Section wherof it is the Locus, be required:

All the Terms of the given Equation being brought over to one side, so that the other be equal to c, there will be two Cases.

Case 1. When the Rectangle  $x y$  is not in the given Equation. 1. If either  $y y$  or  $x x$  be in the same Equation, the Locus will be a Parabola. 2. If both  $x x$  and  $y y$  are in the Equation with the same Signs, the Locus will be an Ellipsis or a Circle. 3. If  $x x$  and  $y y$  have different Signs, the Locus will be an Hyperbola: or the opposite Sections; regarding their Diameters.

Case 2. When the Rectangle  $x y$  is in the given Equation. 1. If neither of the Squares  $x x$  or  $y y$ , or only one of them, be in the same, the Locus of it will be an Hyperbola between the Asymptotes. 2. If  $y y$  and  $x x$  be therein, having different Signs, the Locus will be an Hyperbola, regarding its Diameters. 3. If both the Squares  $x x$  and  $y y$  are in the Equation, having the same Signs, you must first free the Square  $y y$  from Fractions, and then the Locus will be a Parabola, when the Square of  $\frac{1}{2}$  the Fraction multiplying  $x y$ , is equal to the Fraction multiplying  $x x$ ; an Ellipsis or Circle, when the same is less; and an Hyperbola, or the opposite Sections, regarding their Diameters, when greater.

LOCUSTE, the Beards and pendulous Seeds of Oats, and of the *Gramina Paniculata*; to which the Botanists gave this Name, from their Figure, which something resembles that of a Locust.

LODESMAN, or *Loesman*, a Pilot establish'd for conducting Vessels in and out of Harbours, up and down navigable Rivers. See Pilot.

LODGMENT, in Military Affairs, is sometimes an Incampment made by an Army; but oftener, a Retrenchment dug for a Cover or Shelter, when the Counterfence, or some other Post is gain'd. It is also taken for the Place where the Soldiers quarter among the Burgers, in Huts, Barracks, or Tents. Lodgment of an Attack, is a Work cast up by the Besiegers, during their Approaches in a dangerous Post, where it is absolutely necessary to secure themselves against the Enemies Fire; as in a covert-Way, in a Breach, in the Bottom of the Moat, &c. This Lodgment consists of all the Materials that are capable to make resistance, viz. Barrels, and Gabions of Earth, Pallisades, Wool-packs, Mantelets, Faggots, &c.

LOG, a Sea-Term signifying a piece of Board or Timber 7 or 8 Inches long, and of a triangular figure, on board a Ship; into one end wherof, a convenient quantity of Lead is cast, to make it swim upright in the Water.

*Log-Line* is a little Cord or Line fasten'd to one end of the Log, and wound round a Reel fix'd for that purpose in the Gallery of the Ship. This Line, from the distance of about ten Fathom off the Log, has certain Knots or Divisions, which ought to be at least 50 foot from each other: 'tis the common practice at Sea, not to have them above 42 feet asunder. The Use of the Log and Line is to keep account, and make an estimate of the Ship's Way; which is done by observing the Length of Line unwound in half a Minute's time, told by a Half-Minute Glass; for, so many Knots as run out in that time, so many Miles the Ship sails in an Hour. Thus if there be four Knots veer'd out in half a Minute, the Ship is computed to run four Miles an hour. To heave the Log, as they call it, they let it down into the Water, letting it run till it comes without the Eddy of the Ship's Wake; when one holding the Half-Minute Glass, turns it up just as the first Knot turns off the Reel (tho' some turn the Glass as soon as the Log touches the Water) as soon as the Glass is out, the Reel is stop'd, and the Knots run off are told, and their Parts estimated.

The Log is a very precarious Way of computing, and must always be corrected by Experience and Good Sense, there being a great deal of Uncertainty both in the Heaving of it, in the Course of the Currents, and in the Strength of the Wind, which seldom keeps the same Tenor for two Hours together, which is the Interval between the Times of using the Log in short Voyages, tho' in longer ones they heave it every hour. Yet is this a much more exact Way of Computing than any other in use; much preferable certainly to that of the *Spaniards* and *Portuguese*, who guess at the Ship's Way by the running of the Froth or Water by the Ship's side; or to that of the *Dutch*, who use to heave a Chip over-board, and to number the Paces they walk on the Deck while the Chip swims between any two Marks or Bolt-heads on the side.

*Log-Board* is a Table divided into four or five Columns, whercon are mark'd the reckonings of every Day, from whence they are enter'd into the Log-Book, or Traverse-Book, ruled and column'd just as the Log-Board is: Whence it may be transcrib'd into the Journals, and how much the Ship gains in her Course estimated daily. In the first Column of the Log-Board are shewn the Hours of the Day from 1 to 1. In the second is shewn the Rhumb,

or the Direction of the Vessel with regard to the Points of the Compass. In the third, the Number of Knots run off the Reel each time of heaving the Log. In the fourth, the Wind that blows; and in the fifth, Observations made of the Variation of the Compass, &c.

**LOGARITHMIC, or LOGISTIC CURVE,** a Curve generated by the equable Motion of the Radius of a Circle, thro' equal Arcs of the Circumference; while at the same time a Point in that Radius is supposed to move from the Arc towards the Centre, with a Retardation of Motion in a Geometrick Proportion. As suppose there be a Quadrant of a Circle, B C A, (*Plane Analysis*, Fig. 11.) and any equal Divisions in the Arc, as A F = F f = f f, &c. with five corresponding Radii, as suppose C A, C F, C f, &c. whose Parts or Portions C 1, C a, C n, &c. are geometrically Proportional; then if a Line, as 1, a, a, b, d, C, be drawn thro' those Points, it will be the *Logarithmic* or *Logistic Spiral*.

**LOGARITHMS** (from *λογος* ratio, and *ἀριθμός* numbers) are usually defined *Numerorum Proportionalium equidistantium Comites*; but this Definition Dr. Halley and Stifelius think deficient, and more accurately define them, *The Indices or Exponents of the Ratio's of Numbers*; Ratio being consider'd as a Quantity *in generis*, beginning from the Ratio of Equality, or 1 to 1 = 0; and being affirmative when the Ratio is increasing, and negative when it is decreasing. The Nature and Genius of *Logarithms* will be easily conceiv'd from what follows.

A Series of Quantities increasing or decreasing according to the same Ratio, is call'd a Geometrick Progression; e.g. 1. 2. 4. 8. 16. 32. &c. A Series of Quantities increasing or decreasing according to the same Difference, is call'd an Arithmetick Progression; e.g. 3. 6. 9. 12. 15. 18. 24. Now if underneath the Numbers proceeding in a Geometrick Ratio, be added as many of those proceeding in the Arithmetick one; these last are call'd the *Logarithms* of the first.

Suppose e.g. two Progressions:

Geomet. 1. 2. 4. 8. 16. 32. 64. 128. 256. 512  
Arithmet. 0. 1. 2. 3. 4. 5. 6. 7. 8. 9

*Logarithms.*

○ will be the *Logarithm* of the first Term, viz. 1; 5 of the 6th, 32; 7 the *Logarithm* of the 9th, 128, &c.

**Theor. I.** If the *Logarithm* of Unity be 0, the *Logarithm* of the Factum or Product will be equal to the Sum of the *Logarithms* of the Factors.

*Dem.* For as Unity is to one of the Factors, so is the other Factor to the Product. So that the *Logarithm* of the Product is a fourth equidistant Term to the *Logarithm* of Unity and those of the Factors: but the *Logarithm* of Unity being 0, the Sum of the *Logarithms* of the Factors must be the *Logarithm* of the Factum or Product. q. e. d.

*Corol. 1.* Since the Factors of a Square are equal to each other, i. e. a Square is the Factum or Product of its Root multiplied into itself; the *Logarithm* of the Square will be double the *Logarithm* of the Root.

*Corol. 2.* In the same manner it appears that the *Logarithm* of the Cube is triple, of the Biquadrat, quadruple; of the fifth Power, quintuple; of the sixth, sextuple, &c. of the *Logarithm* of the Root.

*Corol. 3.* Unity, therefore, is to the Exponent of the Power, as the *Logarithm* of the Root to the *Logarithm* of the Power.

*Corol. 4.* So that the *Logarithm* of the Power is had, if the *Logarithm* of the Root be multiplied by its Exponent; and the *Logarithm* of the Root is had, if the *Logarithm* of the Power be divided by its Exponent.

*Schol.* Hence we derive one of the great Uses of *Logarithms*, which is to expedite and facilitate the Business of Multiplication and Extraction of Roots; the former of which is here perform'd by mere Addition, and the latter by Multiplication. Thus 3, the Sum of the *Logarithms* 1 and 2, is the *Logarithm* of 8, the Product of 2 and 4. In like manner 7, the Sum of the *Logarithms* 2 and 5, is the *Logarithm* of 128, the Product of 4 and 32. Again,

5, the *Logarithm* of the Square Root 8, is half the *Logarithm* of 64, the Square Root of 64; and 2, the *Logarithm* of the Cube Root 4, is subtriplicate the *Logarithm* of the Cube 64.

**Theor. II.** If the *Logarithm* of Unity be 0, the *Logarithm* of the Quotient will be equal to the Difference of the *Logarithms* of the Divisor and Dividend.

*Dem.* For as the Divisor is to the Dividend, so is Unity to the Quotient; therefore the *Logarithm* of the Quotient is a fourth equidistant Number to the *Logarithms* of the Divisor, the Dividend, and the *Logarithm* of Unity. The *Logarithm* of Unity therefore being 0, the Difference of the *Logarithm* of the Divisor and that of the Dividend, is the *Logarithm* of the Quotient. q. e. d.

*Schol.* Hence appears another great Advantage of *Logarithms*, viz. their expediting the Business of Division, and performing it by a bare Subtraction. E.g. 2 the Difference between 7 and 5, is the *Logarithm* of the Quotient 4 out of 128 by 32. In like manner, 5 the Difference between 8 and 3, is the *Logarithm* of the Quotient 32, out of 256 by 8.

An Example or two will render the Use of *Logarithms* in Multiplication, Division, &c. obvious.

Num.	Log.	Num.	Log.

Cube 729 3.286272 (0.95424) Cube R.

The Properties of the *Logarithms* hitherto mention'd, and their various Uses, are taken notice of by Stifelius; but come all far short of the Use of *Logarithms* in Trigonometry, first discover'd by the Lord Neper.

To find the *Logarithm* of any Number, and to construe a Canon of *Logarithms* for Natural Numbers.

1. Because 1. 10. 100. 1000. 10000. &c. constitute a Geometrick Progression, their *Logarithms* may be taken at pleasure: To be able, then, to express the *Logarithms* of the intermediate Numbers by Decimal Fractions, take 0.00000000, 1.00000000, 2.00000000, 3.00000000, 4.00000000, &c.

2. 'Tis manifest that for those Numbers which are not contained in the Scale of Geometrick Progression, the just *Logarithms* cannot be had; yet may they be had so near the Truth, that as to Matters of Use they shall be altogether as good as if strictly just. To make this appear, Suppose the *Logarithm* of the Number 9 were required: between 1.00000000 and 10.00000000 find a Mean Proportional, and between their *Logarithms* 0.00000000 and 1.00000000 an Equidistant Mean, which will be the *Logarithm* thereof, that is, of a Number exceeding Three by  $\frac{1}{100000000}$ , and therefore far remote from Nine. Between 3 and 10 therefore find another Mean Proportional, which may come somewhat nearer Nine; and between 10 and this Mean, another still; and so on between the Numbers next above and next underneath Nine, till at last you arrive at 9.00000000, that is,  $\frac{9}{900000000}$ , which not being one Millionth Part from Nine, its *Logarithm* may, without any sensible Error, be taken for that of Nine itself. Seeking then in each Case for the *Logarithm* of the Mean Proportionals, and you will at last have 0.954242, which is exceedingly near the true *Logarithm* of Nine.

3. If in like manner you find Mean Proportionals between 1.00000000 and 3.1622777, and assign convenient *Logarithms* to each, you will at length have the *Logarithm* of the Number 2, and so of the rest.

4. There needs not, however, be so much Pains taken in investigating the *Logarithms* of all Numbers; since those that consist of aliquot Parts being divided, and others mutually multiplying each other, their *Logarithms* are easily found. Thus if the *Logarithm* of the Number 9 be bisected, we shall have the *Logarithm* 0.47712125 of the Number 3.

*Schol.* The Indices or Characteristics of *Logarithms* correspond to the denominative Part of the natural Numbers, as the other Member of the *Logarithm* does to the denominative Part of the Number: i. e. the Index shews the Denomination or Place of the last (or left Hand) Figure of the Number, and consequently of all the rest. Thus 0, affixed to a *Logarithm*, denotes the last Figure of the Number to which the *Logarithm* answers to be nothing distant (i. e. is in) the Place of Units. The Index 1 shews the last Figure of its Number to be distant 1 Place from the Place of Units, i. e. to be in the Place of Tens, and consequently the Number itself to be either 10, or some Number between that and 100, and so of the other Indices. Hence all Numbers, which have the same denominative, but not the same numerative Parts, as all Numbers from 1 to 10, from 10 to 100, &c. will have *Logarithms* whose Indices are the same, but the other Members different. Again, all Numbers which have the same numerative, but not the same denominative Part, will have different Indices; but the rest of the *Logarithm* the same. If a Number be purely decimal, to its *Logarithm* is affixed a negative Index, shewing the Distance of its first significant Figure from the Place of Units. Thus the *Logarithm* of the Decimal .256 is 1.40824, of the Decimal .0256 is 2.40824, &c.

*Schol.* The first Canon of *Logarithms* for natural Numbers, from 1 to 20000, and from 90000 to 100000, was constructed by *Hen. Briggs*, with the Approbation of the Inventor the Lord *Neper*, and the Manner of constructing them shewn. The Chain between 20000 and 90000 was filled up by *Adrian Ulack*. In the common Tables we have only a Canon from 1 to 10000. There are various

other Methods of constructing *Logarithms* by *Dr. Halley*, *Mr. Cotes*, *Dr. Brook*, *Taylor*, &c. which the Reader, who has a Curiosity that way, will find in the *Philosophical Transactions*.

To find the *Logarithm* for a Number greater than any in the Common Canon, but less than 1000000. Cut off four Figures on the left of the given Number, and seek the *Logarithm* in the Table; add as many Units to the Index as there are Figures remaining on the right; subtract the *Logarithm* found from that next following it in the Table: then as the Difference of Numbers in the Canon is to the Tabular Distance of the *Logarithms* answering to them, so are the remaining Figures of the given Number to the *Logarithmic* Difference; which if it be added to the *Logarithm* before found, the Sum will be the *Logarithm* required; as, the *Logarithm* of the Number 92375 is required. Cut off the four Figures 9237, add to the Characteristic of the *Logarithm* corresponding to them, add an Unit; then

From the *Logarithm* of the Numb. 9238 = 3.9655780  
Subtract *Logarithm* Numb. 9237 = 3.9655309

Remains Tabular Difference 471  
10 = 471 = 5

2) 255 1  
Now to the *Logarithm* 3.9655309  
Add the Difference found 471 = 255

The Sum is the *Logarithm* required = 3.9655544

To find the *Logarithm* of a Fraction: Subtract the *Logarithm* of the Numerator from that of the Denominator, and to the Remainder prefix the Sign of Subtraction—Thus (suppose it is required to find the *Logarithm* of the Fraction  $\frac{3}{5}$ ).

*Logarithm* of 7 = 0.8450980  
*Logarithm* of 5 = 0.4771213

*Logarithm* of  $\frac{3}{5}$  = 0.3679767

The Reason of the Rule is, That a Fraction being the Quotient of the Denominator, divided by the Numerator

100, its *Logarithm* must be the Difference of the *Logarithms* of those two; so that the Numerator being subtracted from the Denominator, the Difference becomes negative. *Sofelus* observed, that the *Logarithms* of a proper Fraction must always be negative, if that of Unity be 0; which is evident, a Fraction being less than one.

For an improper Fraction, e. g.  $\frac{3}{2}$ , its Numerator being greater than its Denominator, its *Logarithm* is had, by subtracting the *Logarithm* of the latter from that of the former.

The *Logarithm* of  $\frac{3}{2}$  = 0.9542425  
*Logarithm* of  $\frac{1}{2}$  = 0.6989700

*Logarithm*  $\frac{3}{2}$  = 0.2552725

In the same manner may a *Logarithm* of a mixed Number, as  $3\frac{1}{2}$  be found, it being first reduced into an improper Fraction  $\frac{7}{2}$ .

To find the Number corresponding to a *Logarithm*, greater than any in the Table: First, from the given *Logarithm*, subtract the *Logarithm* of 10, or 100, or 1000, or 10000, till you have a *Logarithm* that will come within the Compass of the Table; find the Number corresponding to this, and multiply it by 10, or 100, or 1000, or 10000, the Product is the Number required.

Suppose, for instance, the Number corresponding to the *Logarithm* 7.7589982 be required; subtract the *Logarithm* of the Number 10000, which is 4.0000000 from 7.7589982, the Remainder is 3.7589982, the Number corresponding to which is 5741  $\frac{1}{2}$ , this multiplied by 10000, the Product is 5741100, the Number required.

To find the Number corresponding to a negative *Logarithm*. To the given negative *Logarithm*, add the last *Logarithm* of the Table, or that of the Number 10000; i. e. subtract the first from the second, and find the Number corresponding to the Remainder; this will be the Numerator of the Fraction, whose Denominator will be 10000; e. g. suppose it be required to find the Fraction corresponding to the negative *Logarithm* 0.3579767, subtract this from 4.1000000

The Remainder is 3.7420233, the Number corresponding to which is 4285  $\frac{1}{2}$ , the Fraction sought therefore is  $\frac{4285\frac{1}{2}}{10000}$ . The Reason of the Rule is, that as a Fraction is the Quotient arising on the Division of the Numerator by the Denominator, Unity will be to the Fraction as the Denominator to the Numerator; but as Unity is to the Fraction corresponding to the given negative *Logarithm*, so is 10000 to the Number corresponding to the Remainder; therefore if 10000 be taken for the Denominator, the Number will be the Numerator of the Fraction required.

To find a fourth Proportional to three given Numbers. Add the *Logarithm* of the second to that of the third, and from the Sum subtract the *Logarithm* of the first, the Remainder is the *Logarithm* of the fourth required. E. g. let the given Number be 4, 68, and 3.

*Logarithm* 68 = 1.8325089  
*Logarithm* 3 = 0.4771213  
 Sum = 2.3096302  
*Logarithm* 4 = 0.6020600

*Logarithm* required 1.7075702

The Number in the Tables corresponding to which is 52. This Problem is of the utmost Use in Trigonometry. See *Trigonometry*.

LOGIC is the Art of Thinking justly; or of making a right Use of our rational Faculties in defining, dividing, and reasoning. The word is derived from *λογος*, *Sermo*, *Discourse*; Thinking being no more than an inward, mental Discourse, wherein the Mind converses with itself. *Logic* is sometimes also call'd *Dialectics*, from *διαλεκτικη*, to reason; and sometimes the *Canonial Art*, as being a Canon or Rule for directing us in our Reasonings. As, in order to think aright, 'tis necessary that we apprehend, judge, discourse, and dispose of methoδικe rightly: hence Apprehension, Judgment, Discourse, and Method become the four fundamental Articles of this Art; and 'tis from our Reflections on those Operations of the Mind, that *Logic* is, or ought to be wholly drawn. My Lord Bacon divides *Logic* into four Branches, according to the Ends proposed in each: for a Man reasons either to find what he seeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence arise so many Arts of Reasoning, viz. the Art of Inquisition or Invention, the Art of Examining or Judgement, the Art of Preserving or of Memory, and the Art of Elocution or Deliver-

ing, which see. *Logic* having been extremely abused, is now in a general Disrepute. The Schools have clogged it with barbarous Terms and Phrases, and have run it out so much into dry usele's Subtilties, that it seems rather intended to exercise the Mind in Wrangling and Disputation, than to assist it in thinking justly. 'Tis true, in its Original, it was rather intended as the Art of Cavilling than of Reasoning; the *Greeks*, among whom it had its Rise, being a People who piqued themselves mightily upon their being able to talk *ex tempore*, and to argue by Turns on either Side the Question. Hence their *Dialectici*, to be always furnished with Arms for such Encounters, invented a Set of Words and Terms, rather than Rules and Reasons, fitted for the Uses of Contention and Dispute. *Logic*, then, was only an Art of Words, which frequently had no Meaning, but served well to hide Ignorance, instead of improving Knowledge, to baffle Reason instead of assisting it, and to confound the Truth instead of clearing it. All that Heap of Words, which we have borrowed from the old *Logic*, is of little Use in Life, and is so far out of the common Usage; that the Mind does not attend to them without Trouble, and finding nothing in them to reward its Attention, soon discharges itself, and loses all Ideas it had conceived of them: But *Logic* disengaged from the Jargon of the Schools, and reduced into a clear and intelligible Method, is the Art of conducting the Reason in the Knowledge of Things, and the Discovery of Truth. From its proper Use we gain several very considerable Advantages; for, (1.) The Consideration of Rules incites the Mind to a closer Attention and Application in Thinking, so that we hereby become assured that we make the best Use of our Faculties. (2.) We hereby more easily and accurately discover and point out the Errors and Defects in our Reasonings; for the common Light of Nature, unassisted by *Logic*, frequently observes an Argumentation faulty, without being able to determine wherein the precise Failure consists. (3.) By these Reflections on the Order and Manner of the Operations of the Mind, we are brought to a more just and compleat Knowledge of the Nature of our own Understanding.

LOGISTA, the Title of a Magistrate at *Athens*, whose Business was to receive and pass the Accounts of Officers upon their laying down their Posts. The *Logistæ* were in Number ten.

LOGISTIC, or *Logarithmic Line*, a Curve so called, from its Properties and Uses in constructing and explaining the Nature of *Logarithms*. If the right Line A X, (*Tab. Analysis*, Fig. 12.) be divided into any Number of equal Parts, and to the Points of those Divisions A P, &c. be drawn Lines continually proportional, the Points N M, &c. form the *Logistic Curve*.

Cor. 1. The Abscissæ A P, A P, &c. are the *Logarithms* of the Semiordinates P M, p m, &c.

Hence if A P = x, A P = y, P M = y, p m = z, and their *Logarithms* x and y = l y and l z, x will be = l y, and z = l z, consequently x : z = l y : l z, that is the Denominators of the Ratio's A N, P M, and A N p m, are to one another as the Abscissæ A P and A P.

Cor. 2. Hence it follows, that there may be infinite other *Logistic Lines* invented, provided x m : z m : l y : l z, that is of the Roots or Powers may be the *Logarithms* of the Semiordinates.

Cor. 3. The *Logistic* will never concur with the Axis except at an infinite Distance, so that A X is its Asymptote.

LOGISTIC, or *Logarithmic Spiral*, a Line, whose Construction is as follows: Divide the Quadrant of a Circle into any Number of equal Parts in the Points P, p, &c. (*Tab. Analysis*, Fig. 11.) and from the Radii C P, C p, C p, &c. cutting off C M, C m, C m, &c. continually proportional, the Points M, m, m, &c. form the *Logistic Spiral*.

Cor. The Arches therefore A P, A P, &c. are the *Logarithms* of the Ordinates C M, C m, &c. whence also it follows, that there may be infinite *Logistic Spirals*.

LOGISTICAL ARITHMETIC, was formerly the Arithmetic of Sexagefimal Fractions, used by Astronomers in their Calculations. It was so called from a *Greek* Treatise of one *Barlaamus Monachus*, who wrote about Sexagefimal Multiplication very accurately, and entitled his Book *Λογιστικη*. This Author, *Vossius* places about the Year 1350, but mistakes the Work for a Treatise of Algebra. Thus also *Shakerly*, in *Tabule Britannicæ*, hath a Table of *Logarithms* adapted to Sexagefimal Fractions, which therefore he calls *Logistical Logarithms*; and the expeditious Arithmetic of them, which is by this means obtained, and by which all the Trouble of Multiplication and Division is saved, he calls *Logistical Arithmetic*, though some by *Logistics* will understand the

first general Rules in Algebra, of Addition, Subtraction, &c.

**LOGOGRIPIHE**, a kind of Symbol or Riddle, proposed to Students for their Solution in order to exercise and improve the Mind. It usually consists in some equivocal Allusion or Metaphor of Words, which, literally taken, signify something different from the thing intended by it; so that it is a kind of Medium between a Rebus and proper Enigma. According to *Krieger*, *Logogriphes* are a kind of Speaking Arms. Thus a Person called *Leonard*, who bore in his Arms a Lion, and Nard or Spikenard, according to that Father, made a *Logogriphic*; *Oeip*, *Egypt*. In another Place however he defines a *Logogriphic* to be an Enigma, which under one Name or Word will bear various Meanings, by adding or retrenching some Part of it. These kind of Enigma's are well known to the *Arabs*, among whom are Authors who treat expressly of them. The Word comes from the Greek *λογος*, *Defensio*, and *γρῆψ*, *Ner*.

**LOHOCH**. See *Loch*.

**LOINS**, in Anatomy, are the lower Part of the Spine of the Back, composed of five Vertebrae, larger than those of the Back, and serving them as a Base, having their Articulations pretty loose, that the Motion of the *Loins* may be more free.

**LOLLARDS**, the Name of a Sect that rose in *Germany* about the beginning of the 12th Century. It took its Name from its Author *Lollard Walter*, who began to dogmatize in 1315. Besides exploding many of the *Romish* Doctrines, he is likewise said to have set aside Baptism as a thing of no effect, and Repentance as not absolutely necessary, &c. *Lollard* was burnt alive at *Cologne* in 1322. In *England* the Followers of *Wickliff* were called, by way of Reproach, *Lollards*, from some Affinity there was between some of their Tenets; others, however, are of Opinion, that the *English Lollards* came from *Germany*. They were solemnly condemned by the Archbishop of *Canterbury* and the Council of *Oxford*. The Monk of *Canterbury* derives the Use of the Word *Lollard* among us from *Lolium*, a *Tare*, as if the *Lollards* were the *Tares* sown in *Christ's Vineyard*. *Achey* says, that the Word *Lollard* signifies praising God, from the *German loben*, to praise, and *Herr, Lord*, because the *Lollards* employ'd themselves in travelling about from Place to Place, singing Psalms and Hymns.

**LONGUS**, *Long*, an Epithet given by the Anatomists to a great Number of Muscles. The second Extensor of the *Carpus* is called the *Longus*, in comparison of the third Extensor, which is called *brevis, fortis*. The *Longus* has its Origin in the bottom of the *Humerus*, and lying along the *Radius*, passes underneath the *Ligamentum Annulare*, and is inserted into the *Carpus*.

The second Muscle of the Flexors of the Neck is also called the *Longus*, and sometimes the *Rectus*. It has its Origin in the lateral Part of the Body of the four upper Vertebrae of the Back, and is inserted into the Body of the four Vertebrae of the Neck, and sometimes into the *Oeciput*; this, in conjunction with the *Scalenus*, bends the Neck.

The third of the six Muscles of the Elbow or Arm, which is the first of its Extensors, is also called the *Longus*, as being the longest of the Extensors. It has its Origin on the upper Side of the *Omoplate*, near the Neck, and descending by the hind Part of the Arm, is inserted into the *Olecranon* by a strong *Aponeurosis*, which is common to it and the second and third Extensor of the Arm.

The second Muscle of the Thumb, which is the first of its Extensors, is also called *Longus*, as being longer than another Extensor of the same Thumb, called *Brevis*. The *Longus* proceeds from the upper and external Part of the Bone of the Elbow, and rising over the *Radius*, is inserted by a forked Tendon into the second Bone of the Thumb, which it extends.

One of the four Muscles of the *Radius* is also called the *Longus*. This is the first of the two Supinators, and has its Origin three or four Fingers breadth above the outer *Apophysis* of the *Humerus*, whence running along the *Radius*, it is inserted into the inner Part of its lower *Apophysis*. It is called *Longus* with regard to the other Supinator, which is called *Brevis*. These two Muscles serve to turn the *Radius*, so as the Palm of the Hand looks upwards; which makes the Supination.

Lastly, the first of the Abductors of the Leg is called the *Longus*, and bears this Title more justly than any of the others, as being the longest Muscle in the whole Body. It is also called *Sartorius*, because it serves to bend the Leg inwards, as the *Tailors* use to have it when at work. See *Sartorius*.

**LONG ACCENT**, in Grammar, &c. shews that the Voice is to stop upon the Vowel, that hath that Mark, and it is expressed thus (-).

**LONG MEASURE**. See *Measure*.

**LONGEVITY**, *Length of Life*. From the different Longevities of Men in the beginning of the World, after the Flood, and in these Ages, *Mr. Derham* draws a good Argument for the Interposition of a Divine Providence. Immediately after the Creation, when the World was to be peopled by one Man and one Woman, the ordinary Age was 900 and upwards. Immediately after the Flood, when there were three Persons to stock the World, their Age was cut shorter, and none of those Patriarchs but *Shem* arrived at 500. In the second Century we find none that reach'd 240, in the third none but *Terah* that came to 200 Years: The World, at least a part of it, by that time being so well peopled, that they had built Cities, and were canton'd out into distant Nations. By degrees, as the Number of People increas'd, their Longevity dwindled; till it came down at length to 70 or 80 Years: and there it stood, and has continued to stand ever since the Time of *Moses*. This is found a good Medium, and by means hereof the World is neither overstock'd, nor kept too thin; but Life and Death keep a pretty equal pace. See *Mortality*.

That the common Age of Man has been the same in all Ages since the World was peopled, is plain both from Sacred and Profane History. To pass by others, *Plato* lived to 81, and was accounted an Old Man; and the Instances of Longevity produced by *Pliny*, l. 7. c. 48. as very extraordinary, may most of 'em be match'd in modern Histories; particularly in *Dr. Plati's Nat. Hist. of Oxf. and Staff.* Among others, he tells of twelve Tenants to the same Person, who made up 1000 Years; to say nothing of *Old Parke*, who lived 152 Years 9 Months; or of *H. Jenkins* of *Yorkshire*, who lived 169 Years; or of the Countess of *Desmond*, or *Mr. Eckleston*, both of *Ireland*, who each exceeded 140 Years. See *Life*.

**LONG-BOAT** is the largest and strongest Boat belonging to a Ship, that can be hoisted a-board of her. Its Use is to bring any Goods, Provision, &c. to or from the Ship, or, on Occasion, to land Men any where, and particularly to weigh the Anchor.

**LONGIMETRY**, the Art of measuring Lengths; both accessible, as Roads, &c. and inaccessible, as Arms of the Sea, &c. Longimetry is a Part of Trigonometry, and a Dependant on Geometry, in the same manner as Altimetry, Planimetry, Stereometry, &c. The Art of Longimetry see under the Names of the Instruments used in it, particularly *Theodolite*, *Chain*, &c.

**LONGISSIMUS DORSI** is a Muscle of the Back; that at its beginning is not to be distinguished from the *Sacro-lumbaris*, arising with it from the hinder Part of the *Os Ilium*, and *Os Sacrum*, and the first Vertebra of the *Loins*; it runs upwards along the whole Tract of the Back, and is connected by Tendons to each transverse Process in its way, and ends sometimes in the first Vertebra of the Back, and sometimes in the first of the Neck; and, as some Authors say, reaches now and then to the *Processus Mamillaris* of the *Os Petrosum*. In conjunction with some others, this helps to keep the Body erect.

**LONGISSIMUS OCULI**, the Name of a Muscle. See *Oblimus Superior*.

**LONGITUDE** of a Place, in Geography, is its Distance from some first Meridian; or an Arc of the Equator intercepted between the Meridian of the Place, and the first Meridian; or the Difference East and West between the Meridians of any two Places, counted on the Equator. To discover an exact Method of finding the Longitude, especially at Sea, is a Problem, that has extremely perplex'd the Mathematicians of these two last Ages; and for the Solution whereof, great Rewards have been publicly offer'd by the *English*, *French*, *Dutch*, and other Nations: this being the only thing wanting to render Navigation perfect. Various are the Attempts that Authors have made for this purpose, and various the Methods they have proposed, but still without Success; all their Schemes being found either false, precarious, impracticable, or in some way or other defective: so that the Palm is still unascertain'd. What they most of 'em aim at, is a Method of determining the Difference of Time between any two Points on the Earth; for every 15 Degrees of the Equator answering to an Hour, i. e. one Degree to 4 Minutes of Time, and one Minute of a Degree to 15 Seconds of Time; the Difference of Time being known and turn'd into Degrees, will give the Longitude, and vice versa. This some have pretended to effect by Clocks, Watches, and other Automata; but always in vain; no Time-keeper, excepting a Pendulum (which cannot be applied at Sea) being sufficiently sure and exact for the purpose.

Others, with more probability, and to better purpose, search for it in the Heavens; for if the exact Times of any Celestial Appearance be known for two Places, the Difference

Difference of those Times gives that of the Longitude of those Places. Now in the *Ephemerides*, we have the Motions of the Planets, and the Times of all the Celestial *Phænomena*, as the Beginning and Ending of Eclipses, Conjunctions of the Moon with other Planets, its Entrance into the Eclipse, &c. accurately calculated for some one Place. Therefore if the Hour and Minute be known wherein any of the same *Phænomena* are observ'd in an unknown Place, the Difference between the Hour and Minute between that Place and that other, to which the Tables are calculated, and consequently the Difference of their Meridians, and their Longitude from each other, are known also. Now the Difficulty, here, does not consist in the exact finding of the Time, which is easily had from the Sun's Altitude or Azimuth; but the Defect lies in the Paucity of proper Appearances capable of being thus observ'd: For all slow Motions (e.g. that of *Saturn*) are at once excluded; as showing but little Difference in a considerable Space of Time; and it being here required that the *Phænomena* be sensibly varied in two Minutes Time, an Error of two Minutes in Time producing another of 30 Miles in the Longitude. Now there are no *Phænomena* in the Heavens that have these Requisites, excepting the several Stages of an Eclipse of the Moon; her Longitude, or Place in the Zodiac; her Distance from the fix'd Stars, or Appulse to them; her Ingress into the Eclipse, or the Points of her Orbit where that cuts the Eclipse; and the Conjunction, Distance and Eclipses of *Jupiter's* Satellites. Of each of these in their Order.

1. The first Method, by the Eclipses of the Moon, is very easy and sufficiently accurate, were there but Eclipses every Night. At the moment wherein we see the beginning or middle of a lunar Eclipse by a Telescope, we have nothing to do but take the Altitude or Azimuth of some fixed Star, from which the Hour and Minute are easily found; or without the Altitude, if the Star be in the Meridian. This Hour and Minute therefore, thus found, and compared with that express'd in the Tables, give the Longitude.

2. The Moon's Place in the Zodiac is a *Phænomenon* more frequent than that of her Eclipses, but then the Observation thereof is difficult, the *Calculus* intricate and perplex'd, by reason of two Parallaxes; so that it's scarce practicable to any tolerable degree of Accuracy. Indeed by waiting till the Moon comes into the Meridian of the Place, and then taking the Altitude of some remarkable Star (the Latitude being supposed to be first known) from this Altitude and the Latitude, we shall be able to find the Time pretty accurately, tho' 'twill be better to do it by some Star in the Meridian. Now the Time being found, 'twill be easy to find what Point of the Eclipse is then in the Meridian or Mid-heaven. Thus we shall have the Moon's Place in the Zodiac corresponding to the Time of our Place. Then in the *Ephemeris* we find what Hour it is in the Meridian of the *Ephemeris*, when the Moon is in that part of the Zodiac: Thus we shall have the Hour and Minute of the two Places for the same Time; the Difference of which will give the Difference of Longitude.

3. In regard there are many times when the Moon cannot be observ'd in the Meridian, there is therefore another still more frequent *Phænomenon* from which the Longitude is sought; viz. the Moon's Appulse and Recess from the fixed Stars: for from thence the Moon's true Place may be investigated for the given Time of Observation. But this Method, by reason of the Parallaxes, and the Solution of oblique spherical Triangles, and the various Cases, is to very difficult and perplex'd, that the Mariners are not able to make use of it; nor is it necessary to trouble the Reader with the Praxis thereof. Those however who are dispos'd to use it, will find very considerable Help from a Harry Zodiac, publish'd under the Direction of Dr. Halley, containing all the Stars to which the Moon's Appulse can be observ'd.

4. To find the Longitude by the Moon's Ingress into the Eclipse; observe the Moment of that Ingress: Then in the *Ephemeris*, see what Hour it is in the Meridian of the *Ephemeris*, when that Ingress happens. The Difference between these Times, gives the Difference of Longitude.

5. The *Phænomena* of *Jupiter's* Satellites are generally preferred to those of the Moon, for finding the Longitude; by reason the former are less liable to Parallaxes, and do, farther, afford a very commodious Observation in every Situation of that Planet above the Horizon. Their Motion is very swift, and must be calculated for every Hour, and for that reason are not found in the common *Ephemerides*, but are had elsewhere. Now to find the Longitude by means of these Satellites, with a good Telescope observe a Conjunction of two of them or of one of them with *Jupiter*, or any other, the like Appea-

rance, and at the same time find the Hour and Minute from the Meridian Altitude of some Star; then consulting Tables of the Satellites, observe the Hour and Minute wherein such Appearance happens in the Meridian of the Place to which the Tables are calculated. The Difference of Time, as before, will give the Longitude.

6. All Methods that depend on the *Phænomena* of the Heavens having this one Defect, that they are not to be observ'd at all times; and being, besides, very difficult of Application at Sea, by reason of the Motion of the Ship; there are some, who, leaving the Moon and the Satellites, have recourse to Clocks and other *Automata*; which, could they be made perfectly just and regular, so as to move with the Sun without either gaining or losing, and without being affected with the Change of Air and of Climates; the Longitude would be had with all the Ease and Accuracy imaginable, nothing more being required but to set the Machine by the Sun at the time of Departure; and when the Longitude of any Place is desired, to find the Hour and Minute from the Heavens, (which is done at Night by the Stars, and in the Day by the Sun) for the Difference between the Time, thus observ'd, and that of the Machine, gives the Longitude: But no such Machine has been yet discover'd. Wherefore Recourse has been still further had to other Methods.

7. Mr. Whiston and Mr. Ditton have propos'd a Method of determining the Longitude by the Flash and Report of great Guns. Sounds, 'tis known, move pretty equally in all their Stages, whatever the ponderous Body be that occasions it, or whatever the Medium that conveys it. If then a Mortar or great Gun be exploded at a Place, whose Longitude is known, the Difference between the Time wherein the Flash (which moves, as it were, instantaneously) is seen, and the Sound, which moves at the rate of four Seconds in a Mile, is heard, will give the Distance of those Places from each other; whence, if their Latitudes be known, the Difference of Longitude will be likewise known. Again, if the Hour and Minute of the Explosion be known, (for the Place where it is made) by observing the Hour and Minute from the Sun or Stars, at the Place whose Longitude is required; the Difference between those Times will give the Difference of Longitude. Again, if the said Mortar be loaden with an Iron Shell full of combustible Matter, and pointed perpendicularly, it will carry the same a Mile high, which will be seen near a hundred Miles; if therefore neither the Sound should be heard, nor the Flash seen, the Distance of any remote Place from the Place of the Mortar may be determin'd from the Altitude of the Shell above the Horizon of the Place unknown: and the Distance and Latitudes known, the Longitude is easily found. According to this Scheme 'twas propos'd to have such Mortars fix'd at proper Distances, and at known Stations, on all the frequented Coasts, Harbours, Capes, &c. and to be exploded at certain Hours for the Observation of Mariners. This Method, tho' good in the Theory, yet is found useless in the Practice; as being extremely troublesome, and yet precarious. It supposes that Sounds may be heard 40, 50, or 60 Miles; of which, 'tis true, we have Instances, but they are very rare; and ordinarily the Report of a Cannon is not heard above half so far; and sometimes much less. It supposes, again, Sound to move always with equal Velocity; whereas, in fact, its Velocity is increased or diminished as it moves with or against the Wind. It supposes, again, the Strength of Powder uniform; and that the same Quantity carries the same Range; the contrary whereof is known to every Gunner. We say nothing of thick cloudy Nights, when no Lights can be seen; nor of stormy Nights, when no Sound can be heard; even at inconsiderable Distances.

8. We have another Method of finding the Longitude, propos'd by the same ingenious Gentleman Mr. Whiston, viz. by the Inclinator or Dipping-Needle. See *Dipping-Needle*.

*Longitude of the Earth*, is its Extent from West to East, according to the Situation of the *Equator*; as the Latitude of the Earth is its Extent in Surface from one Pole to the other.

*Longitude in the Heavens*, is an Arc of the Eclipse, counted from the beginning of *Aries*, to the Place where a Star's Circle of Longitude crosses the Eclipse: so that it is much the same as the Star's Place in the Eclipse, reckoned from the beginning of *Aries*; which to find, see *Place of the Sun or Star*. Longitude of the Sun or Star from the next equinoctial Point, is the Number of Degrees and Minutes they are from the beginning of *Aries* or *Libra*, either before or after them; which can never be more than 180 Degrees. Longitude, in Navigation, is also the Distance of a Ship or Place, East or West, from another.

To find the *Longitude* or Latitude of any Star by the Globe: Bring the Solstitial Coloure to the Brass Meridian, and there fix the Globe; then will the Pole of the Ecliptic be just under 23 deg. 30 min. accounted from the Pole above the Horizon, and on the same Meridian: There screw the Quadrant of Altitude, bring its graduated Edge to the Star, and there stay it; thus the Quadrant will cut the Ecliptic in the Star's *Longitude*, as also its Latitude reckoned on the Quadrant, from the Ecliptic. See *Globe*.

*Longitude of Motion*, is a Term used by Dr. Wallis in his Mechanics, for the Measure of Motion estimated according to the Line of Direction; so that it is the Distance, or Length, which the Center of any moving Body runs thro, as it moves on in a Right Line. And he calls the Measure of any Motion, estimated according to a Right Line or Line of Direction of the *Vis Motrix*, the Altitude of it.

*Velini* also useth this Term of *Longitude* and Altitude in the same Sense in many Places of his Writings, and which an ordinary Reader finds hard to understand for want of this Interpretation. By Altitude also, in his 19th Proposition of *Febrinus*, he means the Thickness of the viscid Matter in the Blood-Vessels; or the greatest Length a viscid Particle is extended into from the side of the Canal to its Axis.

**LONGITUDINAL**, according to the Etymology of the Word, signifies something extended length-wise. Thus in Anatomy it is used to signify some Part or Member running in length, or posited length-wise. The Membranes that compose the Vessels are woven out of two kinds of Fibres, the one *Longitudinal*, and the other Circular, cutting the *Longitudinal* at Right Angles. The *Longitudinal* are tendinous and elastic; the Circular, muscular and motrices, like Sphincters.

**LONGUS COLLI**, a Muscle which arises chiefly fleshy, tho partly tendinous, from the fore-part of the five upper Vertebrae of the Back, and is inserted into the fore-part of every Vertebra of the Neck. Its Use is to bend the Neck forward.

**LONGUS CUBITI**, a Muscle, that, in conjunction with others, extends the *Cubitus*: It ariseth from the inferior Costa of the Scapula, nigh its Neck, and passeth betwixt the two round Muscles. It defends on the back-side of the Humerus, where it joins with the *Brevis* and *Brachialis externus*.

**LONGUS FEMORIS**, in Anatomy. See *Sartorius*.

**LOOF**, or, as they usually pronounce it, *Loof*, is a Term used in Coasting of a Ship: Thus, *Loof up*, is to bid the Steer-man keep nearer to the Wind: To *loof into an Harbour*, is to sail into it close by the Wind: To *spring the Loof*, is when a Ship, that before was going large before the Wind, is brought close by the Wind. When a Ship sails on a Wind, that is, on a Quarter-Wind, they say to the Steer-man, *Keep your Loof: Feet no more! Keep her to! Touch the Wind! Have a care of the Lee-Latch!* All which Words signify much the same thing, and bid the Man at Helm to keep the Ship near the Wind.

*Loof of a Ship*, is that part of her aloft, which lies just before the Chests-Trees; and hence the Guns, which lie here, are called her *Loof-Pieces*.

**LOOKING-GLASS**, a plain Glass, Speculum, or Mirror, which being impervious to the Light, reflects its Rays, and so exhibits the Images of Objects placed before it.

The Theory of *Looking-Glasses*, and the Laws whereby they give the Appearances of Bodies, see under *Mirror*.

The Manner of grinding and preparing the *Looking-Glasses* is as follows: A Plate of Glass is fixed to a horizontal Table, and to another less Table is fixed another Plate, over the hind Part of which is added a Box loaded with Stones and other Weights. Over the first Plate is sprinkled fine Sand and Water in a sufficient Quantity for the Grinding, and the second or less Plate is laid on it, and thus worked this and that way, till each has planed the others Surface. As they begin to grow smoother, finer Sand is used, and at last Powder of Smelt. Being thus fit for polishing, a wooden Paralleloiped, lined with Tripoli Earth, or burnt Tin, tempered with Water, is laid on the Plate, and worked to and again, till the Glass have got a perfect Politure.

'Tis found extremely difficult to bring the Glass to a perfect Plainness. *Hewelius* judges more Art required to bring a Glass to an exact Plane than to a Sphere. For polishing large Plates of Glass, they have a Machine for the purpose.

The Plates being thus polished, a thin blotting Paper is spread on a Table, and sprinkled with fine Chalk; and this done, over the Paper is laid a thin Lamina, or Leaf of Tin, on which is poured Mercury, which is to be equally distributed over the Leaf, with a Hare's Foot or Curton. Over the Leaf is laid a clean Paper, and over that

the Glass-Plate. With the left Hand the Glass Plate is pressed down, and with the right the Paper is gently drawn out; which done, the Plate is covered with a thicker Paper, and loaded with a greater Weight, that the superfluous Mercury may be driven out, and the Tin adhere more closely to the Glass. When it is dried, the Weight is removed, and the *Looking-Glass* is complear.

Some add an Ounce of Mercury to half an Ounce of Marshafite, melted by the Fire; and left the Mercury evaporate in Smoke, pour it into cold Water, and, when cold, squeeze it thro' a Cloth or Leather. Some also add a Quarter of an Ounce of Lead and Tin to the Marshafite, that the Glass may dry the sooner.

**LOOM**, the Weaver's Frame; a Machine whereby several distinct Threads are wove into one Piece. *Looms* are of various Structures, accommodated to the various Kinds of Materials to be wove, and the various Manners of weaving them; viz. for Woollens, Silks, Linnens, Cottons, Cloths of Gold; and other Works, as Tapettry, Ribbands, Stockings, &c. Most of which will be found under their proper Heads.

**LOOP-HOLES**, in the Sea-Language, are *Holes* made in the Comings of the Hatches of Ships, and in their Bulk-heads to fire Muskets thro in a close Fight. And the same are they in the Covert Defences of all Fortifications.

**LORD**, (from a *Saxon* Original, signifying a Bread-Giver, Bountiful or Hospitable) is a Title of Honour variously applied amongst us; being sometimes attributed to those who are noble by Birth or Creation, otherwise call'd *Lords of Parliament*, and Peers of the Realm; sometimes to those so call'd by the Courtesy of *England*, as all Sons of a Duke and Marquis, and the eldest Son of an Earl; sometimes to Persons honourable by Office, as *Lord Chief Justice*, &c. And sometimes to an inferior Person that has Fee, and consequently the Homage of Tenants within his Manor; for by his Tenants he is call'd *Lord*, and in some Places, for distinction sake, *Land-lord*. 'Tis in this last Signification that the word *Lord* is principally used in our Law-Books; where it is divided into *Lord Paramount* and *Lord Mesn*: *Lord Mesn* is he that is Owner of a Manor, and by virtue thereof hath Tenants holding of him in Fee, and by Copy of Court-Roll; and yet holds, himself, of a superior Lord, call'd *Lord Paramount*, or above him. We also read of *Very Lord* and *Very Tenant*: *Very Lord* is he who is immediate Lord to his Tenant; and *Very Tenant*, he who holds immediately of that *Lord*: so that where there is *Lord Paramount*, *Lord Mesn*, and Tenant; the *Lord Paramount* is not *Very Lord* to the Tenant. He is also call'd *Lord in Gros*.

*Lord-High-Admiral of England*, is one of the great Officers of the Crown, whose Trust and Honour is so great, that it has seldom been near, excepting to some of the King's younger Sons or near Kinsmen. To him is, by the King, intrusted the Management of all maritime Affairs, as well in respect of Jurisdiction as Protection. He is that high Officer or Magistrate, to whom is committed the Government of the *British Navy*, with Power to decide all Controversies, and Causes Maritime, as well Civil as Criminal, for which there is a peculiar Court; such as happen either on our own Coasts, or beyond Sea, amongst his Majesty's Subjects; and of such Wrecks and Prizes, as are called *Logon*, *Tesjon*, and *Hesjon*; that is, Goods lying in the Sea floating, or cast on shore, excepting in such Royalties as are granted to other Lords of the Manor, &c. All great Fishes, call'd *Royal Fish*, except Whales and Sturgeon: A Share of Prizes in time of War, and the Goods of Pirates and Felons condemned. The *Lord-High-Admiral* hath under him many Officers of high and low Condition; some at Sea, others at Land; some of a Military, others of a Civil Capacity: some Judicial, others Ministerial. And in his Court all Processes issue in his Name, not the King's, as it does in all other Courts; so that the Dominion and Jurisdiction of the Sea may justly be stiled another Commonwealth, or Kingdom apart, and the *Lord-High-Admiral*, Viceroy of the Maritime Kingdom. He hath under him a Lieutenant, who is Judge of the Admiralty, commonly a Doctor of the Civil Law; the Proceedings in this Court in all Civil Matters, being according to the Civil Law; but in Criminal Matters, they proceed by a Special Commission from the Secretary, according to the Laws of *England*.

*Lord-Privy-Seal*, hath his Office by Patent: before the 30th of *Henry VIII.* they were generally Ecclesiasticks; since which, the Office hath been usually conferr'd on Temporal Peers, above the Degree of Barons. Under the *Privy-Seal* passeth all Charters and Grants of the Crown, and Pardons sign'd by the Sovereign before they have the Great-Seal; as also several other Matters of less Concern, as the Payment of Money, &c. which have

no recourse to the Great-Seal. The *Lord-Privy-Seal* receiving his Warrant from the Signet-Office, issues the *Privy-Seal*, which is an Authority to the Lord Chancellor to pass the Great-Seal, where the nature of the Grant requires the Great-Seal. But *Privy-Seals* for Money begin in the Treasury, from whence the first Warrant issues, counterfig'd by the Lord-Treasurer. On the *Lord-Privy-Seal* are attendant four Clerks, who have two Deputy's, to act for them. The Clerks of the *Privy-Seal* and Signet have no Salaries, but Board-Wages 30*l.* per Annum, and pay Taxes; but they have considerable Fees upon Warrants, for Gift of any Office, Pension, Annuity, Special Livery, Coage d'Elites, Presentations, Pardons, Licences, &c.

*Lord-Seward of the King's Household*, is the principal Officer for the Civil Government of the King's Servants below Stairs; over the Officers of which, he has Jurisdiction. He is constituted by the Delivery of the White Staff, which is esteem'd his Commission. By virtue of his Office, without any other Commission, he judges of all Offences committed within the Court, or the Verge thereof, and gives Judgment according to their several Defaults. To him it belongs at the beginning of the Parliament to attend the King, and to administer the Oaths of Allegiance and Supremacy to all the Members of the House of Commons, and at the end of Parliament to adjust Parliamentary Expences. At the Death of the Sovereign he breaks his Staff over the Hearse, in which the Royal Corps are deposited, and thereby discharge all the Officers under his Power.

*Lord-Lieutenants of Counties*, are Officers of great Distinction, appointed by the King for managing the standing Militia of the Country, and all Military Matters: They are generally of the principal Nobility, and of the best Interest in the County: They are to form the Militia in case of a Rebellion, &c. and march at the Head of them, as the King shall direct. They have the Power of commissioning Colonels, Majors, Captains, and Subaltern Officers; also to present the King with the Names of the Deputy-Lieutenants; who are to be selected from the best Gene in the County, and act in the Absence of the *Lord-Lieutenants*. No Subject is to be charged with an Horseman, unless he has 500*l.* per Annum, or 6000*l.* Personal Estate; nor with a Foot-Soldier, unless he hath 50*l.* yearly, or 600*l.* Personal Estate. Subservient to the *Lord-Lieutenants*, and Deputy-Lieutenants, are the Justices of Peace, who, according to the Order they receive from them, are to issue out Warrants to the High and Petty-Constables, &c. for Military Service, &c.

LOT. See *Scat*.

LOTION, in Pharmacy, a Preparation of Medicines, by washing them in some Liquid, either made very light, so as to take away only the Dregs; or made to penetrate them, in order to clear them of some salt or corrosive Spirit; as the *Lotion* of Antimony, Precipitates, Magisteries, &c. Or else intended to take away some ill Quality, or to communicate some good one.

*Lotion* is also the Name of a Remedy, holding a Medium between a Fomentation and a Bath. There are refreshing and somniferous *Lotions* for feverish Persons, made of Leaves, Flowers and Roots boil'd, wherewith the Feet and Hands of the Patient are wash'd, and after washing, wrapp'd up in Linnen Recp'd in the same Decoction till dry. There are *Lotions* also for the Head and Hair, made of the Ashes of Vine-Twigs.

*Lotion of the Philosophers*, in Chymistry, is a Cohobation which Nature makes of what is rais'd up, and afterwards falls back to the bottom of the Vessel.

*Lotion*, Wash, a Form of Medicine made up of liquid Matters, used for beautifying the Skin, and cleansing it from those Deformities which a distemper'd Blood sometimes throws on it; or rather, which are occasion'd by a preternatural Secretion; for, generally speaking, those Distempers of the Skin, which are accounted Signs of a foul Blood, proceed from the natural Salts thrown off by the cutaneous Glands, which ought to be wash'd away thro' the Kidneys: so that instead of Sweetners, which are usually prescribed on these Occasions, Dr. Quincy thinks the Urinary Discharge should be promoted, or that of the Skin rectified by proper *Lotions*, or Ointments and Frictions.

LOTTERY, a kind of Game at Hazard, wherein several Lots of Merchandize, or Sums of Money, are deposited for the Benefit of the Fortunate. The Design of *Lotteries*, and the Manner of drawing them, are too well known among us to need a Description here. They are very frequent in England and Holland, where they cannot be set on foot without the Permission of the Magistrate. In France too they have had several in favour of their Hospitals. M. le Clerc has compos'd a Treatise of *Lotteries*, wherein is shewn what is laudable, and what blame-

able in 'em: *Gregorio Leti* also publish'd a Book on this Subject of *Lotteries*. And Father Menestrier has done the same in a Treatise publish'd in 1700. He there shews their Origin, and their Use among the Romans. He distinguishes several kinds of *Lotteries*, and takes occasion to speak of Chances, and resolves several Cases of Conscience relating thereto.

LOVE and Hatred: See *Pleasure and Pain*.

LOUIS, or LOUIS D'OR, a French Coin, first struck in 1640. under the Reign of Louis XIII. and which has now a considerable Course: *Louis d'Or* at first were valued at 10 Livres, afterwards at 11, and at length at 12 and 14. In the latter end of Louis XIV. they were risen to 20, and in the beginning of that of Louis XV. to 30 and 36, nay 40 and upwards; with this Difference however, that in the last Coinings, the Weight was augmented in some proportion to the Price, which in the former Reign was never regarded. On one side of the Coin is the King's Head seen, with his Name; and on the other, a Cross composed of 8*l.*s. cantoned with Crowns: The Legend is, *Christus regnat, vincit, imperat*. The Reverse has been frequently changed; at present it bears a Hand of Justice cross'd in a Saiter, with a Scepter.

There are also white *Louis's*, or *Louis d'Argent*; some of 60, of 30, 15, 5, and 4 Sols a-piece, called also *Ecu's*, and among us French *Crowns*, *Half-Crowns*, &c. See *Crown*. On the one side whereof is the King's Head, and on the other the French Arms, with this Legend, *Sic novus Dominus lenediffum*.

St. LOUIS, the Name of a Military Order instituted by Louis XIV. in 1695. Their Collar is of a Flame-colour, and passes from Left to Right. The King is their Grand Master. There are in it 8 Grands-Croix, and 24 Commanders. The Number of Knights is not limited. At the time of their Institution, the King charged his Revenue with a Fund of 300000 Livres, for the Pensions of the Commanders and Knights.

LOW-BELLERS, in our Statute-Books, are Persons who go with Light and a Bell; whereby Birds sitting on the Ground become suspicious, and so are cover'd with a Net and taken.

LOXODROMY, *Rhomb*, the Course of a Ship, or the Line it describes in sailing from any Point towards another, excepting a Cardinal Point; making equal Angles with every Meridian. The word *Loxodromy* is derived from the Greek *loxos*, oblique, and *dromos*, Course; because it cuts the Circles of the Sphere obliquely. See *Rhomb*.

LOXODROMIQUES, the Art or Method of oblique Sailing, by the *Loxodromy* or *Rhomb*. Hence *Loxodromic Triangle*, &c. See *Rhomb*.

LOZENGE or LOZANGE, a kind of Parallelogram or quadrilateral Figure, consisting of four equal and parallel Lines or Sides, whose Angles are not right, but whereof two opposite ones are acute, and the other two obtuse; the Distance between the two obtuse ones being always equal to the Length of one Side. Some Geometricians call the *Lozenge Helmsmum*, and the *Trapezium Helmsmum*. In Geometry it is ordinarily call'd *Rhombus*, and when the Sides are unequal, *Rhomboides*. *Scaliger* derives the word *Lozenge* from *Laurencia*, this Figure resembling in some Respects that of a Laurel-Leaf.

*Lozenge* is also a Term in Heraldry; and 'tis in this Figure that all unmarried Gentlewomen and Widows bear their Coats of Arms; because, as some say, it was the Figure of the Amazonian Shield, or, as others, because it is the ancient Figure of the Spindle. The *Lozenge* differs from the Faulx, in that the latter is narrower in the Middle, and not so sharp at the Ends.

*Lozenge*, a Form of Medicine, made into small Pieces, to be held or chewed in the Mouth, till they are melted or waited.

LUCARIA, the Name of a Feast in use among the Romans. *Senius Pompeius* observes, that the *Lucaria* were celebrated in the Wood, where the Romans, defeated and pursued by the *Gauls*, retired and concealed themselves. It was held in the Month of July, in memory of the Asylum they found in that Wood, which was between the *Tiber* and the Road call'd *Via Salaria*.

The Word, according to *Festus* and *Sex. Pompeius*, comes from *Lucus*, a Grove or Wood. *Farro* derives it from *Luce*, the Ablative of the word *Lux*, Light and Liberty. But former Etymology seems the more natural.

LUCIANIST, or LUCANIST: The Name of a Sect so called from *Lucianus* or *Lucanus*, a Hetic of the second Century. He was a Disciple of *Marcion*, whose Errors he follow'd, and added new ones to 'em. *Epiphanius* says, he abandon'd *Marcion*, teaching that People ought not to marry for fear of enriching the Creator: And yet other Authors mention, that he held this Error

in common with *Marcion* and the other *Gnostics*. He denied the Immortality of the Soul; asserting it to be material.

There was another Sect of *Lucianists*, who appear'd some time after the *Arians*. They taught, that the Father had been a Father always, and that he had the Name even before he had begotten the Son; as having in him the Power or Faculty of Generation: And in this manner accounted for the Sterility of the Son.

**LUCID INTERVALS**, the Fits or Paroxysms of *Mannias*, wherein the Phrenzy leaves them in possession of their Reason. 'Tis said they are capable of making a Will in their *Lucid Intervals*.

**LUCIDA CORONA**, a fix'd Star of the second Magnitude in the Northern Garland. See *Star*.

**LUCIDA LYRA**, a bright Star of the first Magnitude in the Constellation *Lyra*. See *Star*.

**LUCIFERIAN**, the Name of a Sect, who adhered to the Schism of *Lucifer de Cagliari*, in the fourth Century. *St. Augustin* seems to intimate, that they believed the Soul transmitted to the Children by their Fathers. *Theodoret* says, that *Lucifer* was the Author of a new Error. The *Luciferians* increased mightily in *Gaul*, *Spain*, *Egypt*, &c. The Occasion of this Schism was, that *Lucifer* would not allow any Acts he had done to be abolished. There were but few *Luciferian* Bishops, but a great Number of Priests and Deacons. The *Luciferians* bore a very strong Aversion to the *Arians*.

**LUES** properly signifies a Plague or Contagion, tho' according to the modern Use of the Word, especially when joined with *Gallica*, or *Venerica*, it is restrain'd only to the *French Pox*. See *Veneral Disease*.

**LUFF**, a Sea-Term, the same with *Loof*, which see.

**LUMBAGO**, Pains very troublesome about the Loins and the Small of the Back, such as precede Ague-Fits and Fevers. They arise commonly from Fullness and Acrimony; in common with a Disposition to Yawnings, Shuddering, and erratic Pains in other Parts; and go off with Evacuation, generally by Sweat, and other critical Discharges of Fevers.

**LUMBAKES**, an Epithet given to those Branches of the *Arteria Arva*, which carry the Blood to the Muscles of the Loins. The Term is also applied to certain Veins, which bring back the Blood from the *Lvini* into the Trunk of the *Vena Cava*. There is also a Muscle of the Thigh that bears this Name. See *Fibris*.

*Lumbares Glandule*. See *Lactical Veins*.

*Lumbares Vase Et Arterie*, several fo called, while in their Passage thro' the Loins; from *Lumbos*, *Loins*.

**LUMBRICAL**, an Epithet which the Physicians give to four Muscles, that serve to move the Fingers. They are call'd *Lumbricales*, or *Vermiformes*, from the Resemblance they bear to Worms. There is a like Number in the Feet.

*Lumbricales Muscoli*, (called also *Vermicularis*, in regard of the resemblance they bear to Worms by their Smallness and Shape) are Muscles of the Hands, commonly supposed to be nothing but Branches of the Tendons of the *Perforans*, which go to the Inside of the first Bone on each Finger, and are supposed to contribute to the Variety of Motions with the Fingers, by giving a Diversion to the direct Actions of the other Muscles; but simply, they only serve to draw the Fingers towards the Thumb. Mr. *Cruyer* indeed observes, that some of them have distinct Origins; and suspects that the rest may have so too, and therefore makes them distinct Muscles.

There are also *Lumbricales* of the Foot, which arise as in the Hand, one from each Tendon of the *Perforans* or *Profundus*, and go to the Inside of each of the lesser Toes.

**LUNA**, in the Jargon of the Chymists, signifies Silver; from the supposed Influence of that Planet (the Moon) thereupon. The Medicinal Virtues of this Metal, Dr. *Quincy* says, are none at all, until it hath undergone very elaborate Preparations. See *Silver*.

**LUNAR**, something belonging to the Moon. *Lunar Periodical Months* consist of 27 Days and a few Hours; *Lunar Synodical Months* of 29 Days, 12 Hours, and three quarters of an Hour. See *Month*. *Lunar Years* consist of 354 Days, or 12 Synodical Months. In the first Ages the Year accounted by all Nations was *Lunar*; the Variety in Course being more frequent in this Planet, and of consequence more conspicuous, and better known to Men than those of any others. The *Romans* regulated their Year, in part, by the Moon till the time of *Cesar*. See *Year*. The *Jews* too had their *Lunar Months*. Some Rabbits pretend that the *Lunar Month* did not commence till the moment the Moon began to appear, and that there was a Law, which obliged the Person who discovered it, first, to go and inform the Senate thereof. Upon which, the President solemnly pronounced the Month began, and Notice was given of it

to the People by Fires lighted on the Tops of Mountains. But this looks somewhat chimerical.

**LUNATIC**, something affected or governed by the Moon. Hence mad People are called *Lunatics*, it having antiently been an Opinion, that such Persons were much influenced by that Planet. A much sounder Philosophy hath taught us, that there is something in it; but not in the manner the Antients imagined; nor otherwise than what it has in common with other heavenly Bodies, occasioning various Alterations in the Gravity of our Atmosphere, and thereby affecting human Bodies. See *Comet*, *Planet*, &c. See also *Tides*.

**LUNATION**, a Revolution of the Moon, or the Time between one New Moon and another; which is called a *Synodical Month*, consisting of 29 Days, 12 Hours, and three quarters of an Hour. At the end of 19 Years the same *Lunations* always return, on the same Day, but not at the same precise Time of the Day; there being a Difference of one Hour, 27 Minutes, and 53 Seconds. Herein the Antients were mistaken, taking the Use of the Golden Number to be more sure and infallible than it is. It has been found since, that in 312 Years and an half the *Lunations* gained a Day on the beginning of the Month; so that when they came to reform the Calendar, the *Lunations* happened in the Heavens four or five Days sooner than was shewn by the Golden Number. To remedy which, we now make use of the perpetual Cycle of Epacts. We take 19 Epacts, which answer to a Cycle of 19 Years; and when at the end of 300 Years the Moon has gain'd a Day, we take 19 other Epacts: which is also done, when by the Omission of an Intercalary Day, which happens three times in 400 Years, the Calendar is adjusted to the Sun. Care is taken that the Index of the Epacts must never be changed, excepting at the Conclusion of a Century, when there is occasion for it, on account of the Metemorphosis or Proemptions; that is, of the Lunar or Solar Equation. When the Bisextile or Intercalary Day is suppress'd without a Lunar Equation, the next following or lower Index is taken, as was done in 1700. When there is a Lunar Equation without suppressing the Bisextile, the next preceding or higher Index is taken; as will be done in 1400. When there is both an Equation and a Suppression, as in 1800; or neither the one nor the other, as in 2000; the same Index is retain'd. See *Month*, *Moon*, &c.

**LUNE**, or *Lunula*, in Geometry, a Plane, in figure of a Crescent or Half-Moon, terminated by the Circumference of two Circles that intersect each other within.

The Quadrature of the intire Circle was never yet effected, yet the Geometricians have found out the Squares of many of its Parts. The first partial Quadrature was that of the *Lunula*, given by *Hippocrates* of *Sis*, who of a shipwrecked Merchant commenced Geometrician. Let *AEB* (Tab. *Geometry*, Fig. 8.) be a Semicircle, and *GC = GB*; with the Radius *BC* describe a Quadrant *AFB*; and then will *AEBFA* be *Hippocrates's Lune*. And since  $BC^2 = GB^2$ , the Quadrant *AGBC* will be equal to the Semicircle *AEB*; taking away therefore from each the common Segment *AFGA*;  $AEBFA =$  to the Triangle  $ACB = GB^2$ .

**LUNETTES**, in Fortification, are Enveloppes, Counterguards, or Mounts of Earth cast up before the Curtain, about five Fathom in breadth. They are usually made in Ditches full of Water, and serve to the same purpose as False Braies. These *Lunettes* are composed of two Faces, which form a re-entering Angle; and their Platform being only twelve foot wide, is a little raised above the Level of the Water; and hath a Parapet three Fathom thick.

**LUNGS**, a Part in the Human Body, consisting of Vessels and membranous Veicles; and serving for Respiration. The *Lungs* are connected, above, to the Fauces, by means of the *Trachea*; and below, to the *Vertebre* of the *Thorax*; and to the *Sternum* and *Diaphragma* by means of the *Pleura*. They are divided into two great Lobes by the *Mediastinum*, and those again into others lesser; the right sometimes into three or four, by means of some Fissures running from the fore to the back Edge. The great Lobes, when inflated, resemble each of them a Horse's Hoof in Figure, but together they are liker an Ox's inverted.

The Substance of the *Lungs* is membranous, consisting chiefly of innumerable Cells or Veicles; which seem to be nothing but Expansions of the Membranes of the *Bronchia*, to which they hang like Grapes in Clusters; so that by blowing into one of the Branches of the *Bronchia*, those Cells or Veicles belonging to it are blown up; the rest, which do not, remaining still flaccid and unaltered.

These Clusters of Veicles or Cells are called the *Internal Lobules*, by which Name they are distinguished from the lesser Lobes spoken of. They are separated from

one another by Intertices, which receive the Vessels; and are filled up with Membranes propagated from the Lobules, and lying, some parallel, some angular. These Lobules discover and display themselves very exactly, if the larger Trunks of the *Bronchia* be laid open, and the lesser blown into; by which means every Lobule belonging to that Branch will be inflated, and rise very distinctly, and shew its Extent.

The whole Substance of the *Lungs* is covered with a common Membrane, which is divisible into two Coats; the outer thin, smooth, and nervous; the inner somewhat thicker and rougher, consisting mostly of the Extremities of Vessels and Vesicles, through the Impression of which it is pitted, and resembles in some measure a Honey-Comb. Some affirm that in this Coat are abundance of Perforations or Pores, so disposed that they readily imbibe any Humidity from the Cavity of the *Thorax*, but suffer nothing to escape into it: but this seems little more than Fancy.

The Vessels of the *Lungs* are the *Bronchia*, the Pulmonary and Bronchial Arteries and Veins, Nerves and Lymphatics. Of these Vessels some are proper and some common, in respect of the Service they are of to the rest of the Body. The common are the *Bronchia*, the Pulmonary Artery and Vein, the Nerves and Lymphatics; the proper are the Bronchial Artery and Vein. See each in its place.

The *Trachea*, just before it enters the *Lungs*, divides itself into two Branches, sending to each Lobe one; which are again subdivided into innumerable Ramifications, call'd *Bronchia*. The *Bronchia* and their Branches consist of Cartilages like the *Trachea*, only here the Cartilages are perfectly circular, without any membranous hinder Part; of which, having left the *Oesophagus*, they have no need. These circular Cartilages are joined together by the Membranes that invest them, and are capable of being shot out into Length upon Inspiration, and of shrinking up and running into one another in Expiration, when the Cavity of the *Thorax* is lessened. They send their little Ramifications to all the little Vesicles of the *Lungs*. Along with these Air-Vessels run the Branches of the Pulmonary Artery and Vein; sending their Ramifications exactly along with the other; the Artery bringing the Blood from the right Ventricle, and the Vein carrying it back to the left Ventricle of the Heart. Whether the Blood returns by the Vein impregnated with Air in the *Lungs*, is still a Question.

The Bronchial Artery arises from the hind Part of the *Aorta*, a little above the Basis of the Heart, whence, turning off to the right, it embraces the *Trachea*; and after sending off a Branch or two to the *Oesophagus*, pursues the Course of the *Bronchia*, accompanying all their Branches through their whole Progress. This Artery is sometimes single, but oftener there are two of them, and sometimes three, arising at near a Finger's breadth from each other. With these Arteries is a Vein, whose Branches arise from the Ramifications of the capillary Arteries; whether the Blood returns by one or more Trunks, does not appear. These Vessels bring Blood for the Nutriment of the *Bronchia* and Vesicles of the *Lungs*, and carry it back again.

Thro' the *Lungs* are distributed a great Number of Lymphatics, attending generally the Blood-Vessels; and being at length collected, discharge themselves into the Thoracic Duct.

Dr. *Willis*, contrary to the common Opinion, ascribes to the *Lungs* a great Number of Nerves, which come from the Trunk of the *Par Vagus*; and which being distributed thro' the Substance of the *Lungs*, embrace the serious and sanguiferous Vessels. He also asserts, that the *Vesiculae* have muscular Fibres, to enable them to exert a greater contractive Force in Expiration; tho' others deny any such Fibres. *Dietrichboeck* observes, that the Vesicles admit not only of Air, but also of other grosser Matters; and instances two Asthmatic Persons which he opened, the one a Stone-Cutter, the *Vesiculae* of whose *Lungs* were so stuffed with Dust, that, in cutting, his Knife went as if thro' a Heap of Sand; the other a Feather-Drawer, in whom the Vesicles were full of the fine Dust or Down of Feathers. For the Use and Action of the *Lungs*, see *Respiration*, *Voice*, &c.

LUNISOLAR, in Astronomy and Chronology, is understood of something composed of the Revolution of the Sun, and of that of the Moon. Thus we say the Lunisolar Year; which is a Period of Years made by multiplying the Cycle of the Moon, which is 19, by that of the Sun, which is 18, the Product of which is 332; in which Space of Time those two Luminaries return to the same Points.

LUPERCALIA, Feasts instituted in ancient Rome in Honour of the God Pan. The *Lupercalia* were celebrated on the 15th of the Calends of March, that is, on the 15th of February, or, as *Ovid* observes, on the third Day after

the Ides. They are supposed to have been established by *Evander*. On the Morning of this Feast the *Luperci*, or Priests of Pan, run naked thro' the Streets of Rome, stroaking the Women they met on the Hands and Belly with the Skin of a Goat, and promising them Fecundity and happy Deliveries. The Reason of this indecent Custom in celebrating the *Lupercalia*, took its Rise from *Romulus* and *Remus*; for while they were suckling at this Feast a Body of Robbers, taking hold of the Occasion, plundered them of their Flocks. Upon this the two Brothers, and all the Youth that was with them, throwing off their Clothes, to be the more expeditious, pursued the Thieves, and recovered their Prey. This succeeded so well, that thenceforward this Ceremony became a part of the *Lupercalia*. This Feast was abolished in the time of *Augustus*, but afterwards restored, and continued to the Time of the Emperor *Augustinus*. *Baronius* says, it was abolished by the Pope in 496. *Natalis Comes* calls likewise *Lupercalia* the Feasts celebrated in ancient Greece, under the Name of *Lyceae*, which see. The Word comes from *Lupercal*, the Name of a Place under the *Palatine* Mountain, where the Sacrifices were performed.

LUPERCI, the Name given to the Priests of the God Pan. The *Luperci* were the most ancient Order of Priests in Rome; they were divided into two Colleges or Companies, the one called *Fabius*, and the other *Quintilis*. To these *Caesar* added a third, which he call'd *Fulvius*. *Suetonius* mentions the Institution of this new College of *Luperci*, as a thing that render'd *Caesar* more odious than he was; however, it appears from the same Passage of *Suetonius*, that this new Company was not instituted by *Caesar*, nor in Honour of Pan, but by some Friends of *Caesar*, and in Honour of himself.

LUPUS, the Wolf, a Southern Constellation, consisting of 19 Stars. See *Star*.

LUSTRAL, an Epithet applied by the Antients to the Water used in their Ceremonies to sprinkle and purify the People. From them the *Romanists* have borrowed the Holy Water used in their Churches. The Antients call'd *Dies Lustricus*, or *Lustral* Day, that wherein the *Lustrations* were performed for a Child, and its Name given; which was the ninth Day from the Birth of a Boy, and the eighth from that of a Girl. Others performed the Ceremony on the last Day of that Week wherein the Child was born, and others on the fifth Day from its Birth. Over this Feast-Day the Goddesses *Nephthys* was supposed to preside. The Midwives, Nurses, and Domestic handed the Child backwards and forwards around a Fire burning on the Altars of the Gods, after which they sprinkled it with Water. The old Women mixed *Sassa* and Dust with the Water. The whole ended with a sumptuous Entertainment.

LUSTRATION; Expiation, Sacrifices, or Ceremonies, by which the *Romans* purified their Cities, Fields, Armies, or People defiled by any Crime or Impurity. Some of their *Lustrations* were publick, others private. They had a kind of *Lustration*, without Victims, for Children, on the eighth Day for Girls, and on the ninth for Boys. *Lustration* was the same thing with Purification. There were three different Species of it, or it was performed in three different Manners, by Fire and Sulphur, by Water, and by Air; which last was performed by fanning and agitating the Air round the thing to be purified.

LUSTRE, the Brilliant appearing on any thing, particularly Manufactures of Silk, Wooll, and Stuff. *Lustre* is also used for the Composition or Manner of giving that Brilliant. The *Lustre* of Silks, which is their chief Quality, is given them by washing in Soap, then clear Water, and laying them in a cold Alum Bath. The *Lustre* of black Taffeta is given by double-brewed Beer, boiled with Orange or Lemon Juice; that of coloured Taffeta's with Water of Gourds, distilled in an Alembic. Carriers give their *Lustre* several ways, according to the Colour to be illustrated: For Blacks, the first *Lustre* is with Juice of Barberries; the second with Gum Arabic, Ale, Vinegar, and *Handers* Glue boiled together: For colour'd Leathers, they use the White of an Egg beaten in Water; *Morocco's* have their *Lustre* from Juice of Barberries, and Lemon or Orange: For Hats, the *Lustre* is frequently given with simple Water, sometimes a little black Teint is added. The same *Lustre* serves the Skinners, except that in white Furs they never use any black Dye. For very black Furs they sometimes prepare a *Lustre* of Galls, Copperas, Roman Alum, Ox's Marrow, and other Ingredients. The *Lustre* is given to Cloths and Mohairs by pressing them under the Calendar.

LUSTRUM, a Term used by the *Romans* to signify a Space of five Years. *Farro* derives the Word from *lavo*, to wash, because at the beginning of each five Years they paid the Tribute that had been imposed by the Censors; whose Authority, at their first Institution, was continued them for five Years; tho' afterwards it was abridged to

one. This Custom was established by *Servius Tullius* in the Year of Rome 180. Others rather derive the Word from *lustrare*, to make a Review, because once in five Years the Censors reviewed the Army.

*Lustrum* was also a Ceremony or Sacrifice used by the Romans after numbering their People once in five Years.

LUTE, in Chymistry, any sort of Cement or Plaster; us'd either in the Construction of Furnaces, or in fitting to them Vessels of Glass or Earth; that are to resist a very violent Fire. It is frequently made of Potter's Earth, River Sand, Horfes Dung, Powder of broken Pots, *Caput Mortuum* of Vitriol, Drofs of Iron, beaten Glass, Flocks of Wool mix'd with salt Water or Bullock's Blood.

The Lute us'd by *Lemery*, was only two Parts of Sand and one of Clay, tempered together in Water; which does very well for joining the Noises of Retorts and their Receivers in distilling of volatile Spirits, &c. In distilling by the Alembic, or Vesica, or Copper Body, with its Head or Serpentine, a wet Bladder serves very well to lute the Junctures of the Vessels: But for the Distillation of corrosive Spirits, as also to stop the Cracks of Glasses, &c. the following Composition is recommended, viz. Starch boiled, or Fish-Glue dissolved in Spirit of Wine, with Flower of Sulphur, Mastic, and Lime slacked in Milk. *Lutum Sapientia* is the Hermetical Seal, which is made by melting the End of a Glass Matrass by a Lamp, and writing it up with the Pliers. See *Hermetical Sealing*. The Word comes from the Latin *Lutum*, Clay.

LUTE, a Musical Instrument with Strings. It had antiently but five Rows of Strings; but in course of time four, five, or six more have been added. The Lute consists of four principal Parts, the Table, the Body or Belly, which has nine or ten Sides, the Neck, which has nine or ten Stops or Divisions mark'd with Strings, and the Head or Cross, wherein are Screws for raising or lowering the Strings to the proper Tone. In the middle of the Table is a Rose or Passage for the Sound. There is also a Bridge that the Strings are fastened to, and a Piece of Ivory between the Head and the Neck, to which the other Extremity of the Strings are fitted. In playing, the Strings are struck with the right Hand, and with the left the Stops are pressed. We call Temperament of the Lute the proper Alteration that is to be made in the Intervals, both with regard to Consonances and Dissonances, in order to render them more just on the Instrument. Some derive the word from the German *Lauter*, which signifies the same thing, or from *lauten*, *sonare*. *Sealiger* and *Barbar* derive it from the Arabic, *Allaud*. The *Lutes of Daubeigne* are esteem'd the best, on account of the Wood, which is said to have an uncommon Disposition for producing a sweet Sound.

LUTHERANISM, the Sentiments of Dr. *Martin Luther*, with regard to Religion. *Lutheranism* had its Rise in the 16th Century. Its Author was born at *Eisleben* in *Thuringia* in 1483. After his Studies he enter'd himself among the *Augustines*. In 1512, took the Cap of a Doctor in Theology in the University of *Wittenberg*. In 1516, he attack'd the School-Divinity in several Theses. In 1517, *Leo X.* having order'd Indulgences to be dispensed to those who should contribute towards the building of St. Peter's at Rome, he gave a Commission thereof to the *Dominicans*. The *Augustines* thinking they had a Title to it before any body else, *John Saupitz*, their Commissary-General, appointed *Luther* to preach against those Dispensers of Indulgences. *Luther* acquitted himself in a manner that perhaps the Commissary had not imagin'd. From the Preachers of Indulgences he proceeded to Indulgences themselves, and declaim'd very warmly both against the one and the other. At first he only advanc'd ambiguous Propositions, but being engag'd in dispute about them, he maintain'd them openly and without Reserve, insomuch that in 1520 he was solemnly condemn'd and excommunicated by the Pope. But neither the Pope's Thunder, nor the Condemnation of several Universities, could make any Impression of Terror upon him; but he continued preaching, writing and disputing, not against Indulgences only, but several other Corruptions that then prevail'd in the Church. The Character of the Man, the Strength of his Arguments, and the Weakness of his Adversaries Cause, soon procur'd him a Number of Followers. And thus it was that *Lutheranism* was form'd; the Adherents whereto were call'd *Lutherans*, from *Luther*, a Name that has a Greek Turn, and which he assum'd in lieu of his Family-Name, *Louter* or *Lauter*; it being the Custom of those Days for Men of Learning to give themselves Greek Names: witness *Erasmus*, *Melancthon*, *Bucer*, &c. In 1523, *Luther* quitted the Habit of a Religious, and in 1524, married; after having been a happy Instrument of reforming a great part of Germany, under the Protection of George Duke of Saxony. He died at his native Place in 1546.

*Lutheranism* has undergone some Alterations since the time of its Founder. *Luther* reject'd the Epistle of St. James, as inconsistent with the Doctrine of St. Paul in relation to Justification; he also set aside the *Apocalypse*: both which are now receiv'd as Canonical in the *Lutheran* Church. *Luther* first reduc'd the Number of Sacraments to two, viz. Baptism and the Eucharist; but believ'd the Imposition or Consecration: that is, that the Matter of the Bread and Wine remain with the Body and Blood of Christ; and 'tis in this Article that the main Difference between the *Lutheran* and *English* Churches consists. *Luther* maintain'd the Mass to be no Sacrifice; exploded the Adoration of the Host, Auricular Confession, Satisfactory Works, Indulgences, Purgatory, the Worship of Images, &c. which had been introduc'd in the corrupt Times of the *Romish* Church. He also oppos'd the Doctrine of Free Will, maintain'd Predestination, asserted that we are necessitated in all we do, that all our Actions done in a State of Sin, and even the Virtues themselves, of Heathens, are Crimes; that we are only justify'd by the Imputation of the Merits and Satisfaction of Christ. He also oppos'd the Fastings in the *Romish* Church, Monastical Vows, the Celibate of the Clergy, &c.

Some Authors reckon thirty-nine different Sects among the *Lutherans*: viz. the *Consequents*, call'd also *Stricains*; *Antinomians*, *Sansuaveses*, *Inferians*, *Antidaphorists*, *Antiswensfeldians*, *Antoandrians*, *Anticodominists*, *Lays* or of Hands, *Biffacramentals*, *Triffacramentals*, *Moyseans*, *Adaphorists*, *Quadrifacramentals*, *Luthero-Calvinists*, *Amicititer*, *Nedofandrians*, *Consequents* firm and wavering, *Sweidians*, *Onandians*, *Svanozarians*, *Antijancarians*, *Zwinglians simple*, *Zwinglians significative*, *Carlostantians*, *Enargie Tropists*, *Arralonarii spiritual*, *Sweidians*, *Seroticians*, *Davinciks* or *David-Georgians*, *Memmiers*, &c. *Joves* T. 1. p. 475.

LUTHERN, or Dormer, a kind of Window over the Cornice, in the Roof of a Building; standing perpendicularly over the Naked of the Wall; and serving to illumine the Upper-Story. The French Architects distinguish these into various kinds, according to their various Forms; as Square, Semicircular, Bulls Eyes, flat Arches, *Hemis* *Lutherns*, &c. The Word comes from the Latin *Lucerna*, Light or Lantern.

LUXATION, in Chirurgery, a Relaxation of the Tendons or Ligaments, occasioning the Bones to slip out of their Junctures, or at least to remain very loosely in their natural Situation. The proper *Luxation* is when the Bone is entirely out of the Cavity it should move in; which may be done various ways, and there are as many ways of reducing it; according to the particular Formation and Articulation of the Joint: for which, see the Books of Practical Surgery.

LYCANTHROPY, a kind of Phrenzy or Disease, that urges People to run thro the Streets and Fields in the Night; arising from the Bite of a mad Wolf. The Symptoms, &c. are in most respects the same with that of the *Hydrophobia*; which see. The Word comes from the Greek *λύκος*, *Lupus*, and *άνθρωπος*, *Homo*; as who should say, *Man-Wolf*.

LYCEUM, the Name of a celebrated School at *Athenis*, where *Aristotle* explain'd his Philosophy. The Place was compos'd of Portico's, and Trees planted in the Figure of an V. Hence the Philosophy of the *Lycæum* is us'd to signify the Philosophy of *Aristotle*, or the *Peripatetic* Philosophy.

*Suidas* observes, that the Place took its Name from its having been originally a Temple of *Apollo*, or rather a Portico or Gallery built by *Lycus*, Son of *Apollo*; but others mention it to have been built by *Pysistratus* or *Pericles*.

LYGMOS. See *Hiccup*.

LYMPH or LYMPHA, in Anatomy, a thin transparent Humour, something like Water; secreted from the Serum of the Blood in all Parts of the Body, and return'd to the Blood again by proper Ducts of its own; supposed by some to be the immediate Matter of Nutrition. If the *Lymph* be chymically examin'd, it will be found to contain a great deal of volatile, but no fix'd Salt, some Phlegm, some Sulphur, and a little Earth.

The Use of the *Lymph* may be gather'd from the Consideration of the Parts into which it dischargeth itself. That which comes from the Head, Neck, and Arms, is thrown into the Jugular and Subclavian Veins. All the *Lymphatics*, which the Parts in the Cavity in the Thorax send out, empty themselves into the Thoracic Duct; and the *Lymphæ*, from all the rest of the Body, flows to the common Receptacle; so that there can be no doubt, but that its chief Use is to dilute and perfect the Chyle before it mixes with the Blood.

LYMPHATICS, or LYMPHEDUCTS; very small, fine, hollow Vessels, generally arising from the Glands, and conveying back to the Blood a transparent Liquor, call'd *Lymph* or *Lymphæ*. These, tho not so visible as the

other Vessels, because of their Minuteness and Transparency, are however existent in all Parts of the Body; but the Difficulty of finding them, has prevented their being described in many Parts. The *Lymphatics* are contracted at small and unequal Distances, by two opposite semi-lunar Valves, which permit the *Lymph* to pass through them towards the Heart, but shut, like Flood-Gates, upon its returning. They arise in all Parts of the Body, but after what manner, needs no great Dispute; for, without doubt, all the Liquors in the Body, excepting the Chyle, are separated from the Blood in the fine Capillary Vessels, by a different Pipe from the common Channel in which the rest of the Blood moves: but whether this Pipe be long or short, whether it be visible or invisible, it is still a Gland, whilst it suffers some part of the Blood to pass thro it; denying a Passage to the rest. Now the Glands which separate the *Lymph* must be of the smallest kinds, for they are invisible to the finest Microscope; but their excretory Ducts, the *Lymphatic* Vessels, unite with one another, and grow larger, as they approach the Heart: yet they do not open into one common Channel, as the Veins do; for sometimes we find two, or three, or more *Lymphatics*, running by one another; which only communicate by short intermediate Ducts, and which unite, and immediately divide again. In their Progress, they always touch at one or two conglobate or vesicular Glands, into which they discharge themselves of their *Lymph*. Sometimes the whole *Lymphatic* opens at several Places into the Gland, and sometimes it sends in only two or three Branches, whilst the main Trunk passes over, and joins the *Lymphatics* which arise from the opposite sides of the Glands, exporting again their *Lymph* to their common Receptacles. Now the Glands of the Abdomen, which receive the *Lymphatics* from all its Parts, as likewise from the lower Extremities, are the *Glandule Inguinales, Sacre, Binae, Lambare, Mesenterice, and Hepatice*; all which send out new *Lymphatics*, which pour their Contents into the *Receptaculum Chyli*, as those of the Chest, Head and Arms, do into the *Ductus Thoracicus, Jugular, and Subclavian* Veins. These Glands are round and smooth Bodies, about the Bigness of a Hazle Nut, bigger or lesser, according to the number of *Lymphatics* they receive. Their Substance is membranous, and their whole Bulk divided into little Cells, which receive the *Lymph* from the *Lymphatics*; and are therefore improperly call'd *Glands*, because they separate no Liquor from the Blood: It is true, that their exporting *Lymphatics*, communicating with their Arteries, do receive a *Lymph* from them; but this is done without the help of conglobate Glands; as the lactical Veins do with the capillary Arteries of the Guts: the chief Use of their vesicular Bodies seems to be, that the slow-moving *Lymph* may receive a greater Velocity from the elastic Construction of their membranous Cells, as well as from the new *Lymph* immediately derived from the Arteries. See *Gland*.

LYRA, or LYRE, the same with *Cithara*, a Harp; a stringed Instrument much used among the Antients; said to have been invented by *Mercury*, on occasion of his finding a dead Shell-Fish, call'd by the *Greeks* *Chelone*, and the *Latins* *Tessudo*, left, on an foundation of the Nile; of the Shell whereof he form'd his *Lyre*, mounting it with seven Strings, according to *Lucretius*, and adding a kind of *Jugum* to it, to stretch or loosen the Strings. *Bæbius* re-

lates the Opinion of some, who say that *Mercury's Lyre* had but four Strings, in imitation of the Mundane Music of the four Elements. *Diodorus Siculus* says it had but three Strings; in imitation of the three Seasons of the Year; which were all the *Greeks* counted, *viz.* Spring, Summer and Winter. *Nicomachus, Horace, Lucretius*, and others, make it have seven Strings, in imitation of the seven Planets. This three, four, or seven-stringed Instrument *Mercury* gave to *Orpheus*; who being torn to pieces by the *Enchanted*, the *Lyre* was hung up by the *Leucians* in *Apollo's* Temple. Others say, *Pythagoras* found it in some Temple in *Egypt*, and added an eighth String. *Nicomachus* says, that when *Orpheus* was kill'd, his *Lyre* was cast into the Sea, and thrown up at *Antissa* a City of *Lesbos*; where the Fishers finding it, gave it to *Terpsander*; who carried it into *Egypt*, and call'd himself the Inventor. The seven Strings were distonically disposed by Tones and Semi-Tones, and *Pythagoras's* eighth String made up the Octave.

From the *Lyra*, which all agree to be the first Instrument of the stringed kind in *Greece*, arose an infinite Number of others, differing in Shape and Number of Strings; as the *Psalterium, Trigon, Samba, Pelis, Magadis, Barbiton, Tessudo*, (the two last used promiscuously by *Horace* with the *Lyra* and *Cithara*) *Epigonion, Sammicion* and *Pandura*; which were all struck with the Hand or a *Plectrum*.

The *Lyra* among Painters, Statuaries, &c. is an Attribute of *Apollo* and the *Muses*.

*Lyra* is also a Constellation in the Northern Hemisphere, consisting of thirteen Stars. See *Star*.

LYRIC; something sung, or play'd on the Lyre or Harp. The Word is particularly applied to the ancient Odes and Stanza's; which answer to our Airs or Tunes, and may be play'd on Instruments. The Antients were great Admirers of *Lyric* Verse, which Name they gave to such Verses as do not come under either of the two ordinary Kinds of Verse, *viz.* Hexameters and Iambics. These were principally used in Odes, and in the Chorus's of Tragedies. The Characteristic of *Lyric* Poetry, and that which distinguishes it from all others, is Sweetness. As Gravity rules in Heroic Verse, Simplicity in Pastoral, Tenderness and Softness in Elegy, Sharpness and Poignancy in Satire, Mirth in Comedy, the Pathetic in Tragedy, and the Point in Epigram; so in the *Lyric*, the Poet applies himself wholly to sooth the Minds of Men by the Sweetness and Variety of the Verse, and the Delicacy of the Words and Thoughts, the Agreeableness of the Numbers, and the Description of Things most pleasing in their own Nature. See *Ode, Song, &c.*

LYSIARCHA, the Name of an ancient Magistrate or Pontiff of *Lycia*. *Strabo* observes, that the *Lysiarcha* was created in a Council, consisting of the Deputies of twenty-three Cities, that is, of all the Cities in the Province; some of which Cities had three Voices, others two, and others but one. *Cardinal Noris* says, that the *Lysiarcha* presided in Matters of Religion; in effect, the *Lysiarcha* was nearly the same with the *Siarcha* and *Syriarcha*; who, tho they were all the Heads of the Councils or States of those Provinces, yet were they establish'd principally to take care of the Games and Feasts celebrated in honour of the Gods, whose Priests they were inaugurated at the same time that they were created *Lysiarcha, Syriarcha, or Siarcha*.

**M,** A Consonant, and the Twelfth Letter in the English Alphabet. It is pronounced by striking the upper Lip against the lower; in which the Pronunciation of this Letter agrees with that of *b*: the only Difference between the two consisting in a little Motion made in the Nose in the Pronunciation of *M*, and not in *b*: whence it happens that those who have taken Cold, for Ordinarily pronounce *b* the Nose in that case being disabled from making the necessary Motion. See *B*.

*Quintilian* observes, that the *M* sometimes ends Latin Words, but never Greek; the Greeks always changing it in that Case into *N*, for the sake of the better Sound.

*M* is also a Numerical Letter, and among the Antients was used for a Thousand; according to the Verse,

*M Caput est Numeri quem seimus Nulle tenere.*

When a Dash is added a top of it, it signifies a thousand times a thousand;  $\text{M}$ .

The Letter *M* in Astronomical Tables, and other things of that kind, is used for Meridional or Southern.

*M*, in Medicinal Prescription, is frequently used to signify a Manipule, or Handful; and is sometimes also put at the end of a Recipe, for *Misce*, mingle; or *Mixtura*, a Mixture.

*M*, in Law, was the Brand or Stigma of a Person convicted of Murder, and admitted to the Benefit of his Clergy. It was burnt on the Brawn of his left Thumb.

**MACARONIC, or MACARONIAN;** a kind of Burlesque Poetry; consisting of a Jumble of Words of different Languages, with Words of the vulgar Tongue latiniz'd, and Latin Words moderniz'd. For Instance, a bold Fellow, in the Macaronic Style, says;

*Enfilavi omnes Scadones & Regimandis, &c.*

Another Example:

*Ardebat Pistalisfero farianteq; Manantem,  
Et grandem esmentam que insupnam facta Ruelle est;  
Toxinamque alte transstantem Carda Clobero, &c.*

Macarone, among the *Italians*, as has been observed by *Celcius Rhodiginus*, signifies a coarse clownish Man; and because this kind of Poetry, being patch'd up of several Languages, and full of extravagant Words, is not so polite and smooth as those of *Virgil*, &c. the *Italians*, among whom it had its Rise, gave it the Name of *Macaronian* and *Macaronic* Poetry. Others rather chuse to derive it à *Macaribus*, from *Macarons*; a kind of little Cakes made of Meal not bolted, with Eggs and Cheese; accounted a great Dainty among the Country People in *Italy*; which, from their being composed of various Ingredients, occasion'd this kind of Poetry, which consists of Latin, Italian, Spanish, French, English, &c. to be called by their Name.

*Theoph. Fabrijus*, a *Benedictine* Monk of *Mantua*, was the first who invented, or at least cultivated, this kind of Verse: For tho' we have a *Macaroneo Arimontensi* in a very old Letter, beginning, *Est Autor Tibbis Lemens atque Parausius*; yet it seems to have been the Work of *Gasparius Capellus Surinus*, who in the Year 1526 printed six Books of *Macaronic* Poetry, in *Calvinum Gaganense* Region: but as both these came out after the first Edition of *Johannus*, which was publish'd under the Name of *Merlin Cocage*, in 1520; so were they likewise much inferior to him both in the Style, Invention and Episodes wherewith he has enrich'd the History of *Balaus*; which makes the Subject of his Poem. The famous *D. Rabalais* translated the *Macaronic* Style out of the *Italian* Verse into *French* Prose, and on the Model thereof form'd some of the best things in his *Pantagruel*. *Merlin Cocage* met with so much Success in his new Way, that he composed another Book partly in *Macaronic* Style, call'd *Il Clair del tri per uno*; but with very different Success. After this, appear'd in *Italy*, *Macaronica de Synodis, & Condemnatione Diaboli Sanjus Lembi*, a low Performance; and *Macaronis Forza*, an excellent one, by *Stephano* a *Jesuit*. In 1620, *Bajoni* published a *Carnavale Tabula Macaronica*. The last *Italian* who wrote in this way, was *Cesar Ursinus*, to whom we owe *Capricia Macaronica Martiri Stepani Poete Ponzanensis*, printed in 1656. The first who succeeded in the *Macaronic* Style among the *French* was *Antonius de Arca Provençalis de Bragardissima Villa de Saleris*, in two Poems, which he has left us; of *Arca Danjandis*, & *de Guerra Neapolitanis Romana* & *Genuesis*. He was follow'd by another Lawyer, who wrote *Historia Braxijima Caroli V. Imperatoris*, a *Provincialisque Poxyfians triumphantis fugati*. Some time after *Renii Bellun*, among his other *French* Poetics, printed *Dilamen Metrificum de Bello Hispanico, & Rosticorum Pigniamus ad Saldes*, a Piece much valued. This was succeeded by *Casparus Reifro Suisse Lanquenterorum* per *M. J. E. Licliardum Spal-*

*Spereimm Potam*; to which *Stephen Tabouret* return'd an Answer in the same Strain. Lastly, *John Edward de Mexin* enter'd the Lists, and left us *inter verijinata sua Cosmen Arrenaicum de norandum Nuggeralorem Passia insopportabili*. The *Recitas Veritabilis super terribilib; gmentis Fayamaram de Ruelio*, is one of the best Pieces of this kind.

We have but little in *English* in the *Macaronian* Way; nothing scarce, but some little loose Pieces collected in *Cambden's* Remains; which is no Discredit to our Authors: for one may say of such Pieces in general,

*Turpe est Difficile habere Nugas,  
Et Stultus Labor est Ineptiarum.*

The  *Germans and Neiberlanders* have had their *Macaronic* Poets; witness the *Certamen Catholicum cum Calvinisticis*, of one *Martinus Hamenius Frisus*, which contains above twelve hundred Verses, all the Words whereof begin with the Letter *C*.

**MACE**, a Medicinal Bark, the outermost of the three which covers the Nutmeg. It is of astringent and drying Nature, and is used as a Corrector in Cardiac and Cathartic Compositions. See *Nutmeg*.

**MACERATION**, in Pharmacy and Chymistry, is understood of a certain Preparation of Medicines, otherwise express'd by the Word *Digestion*. Others however restrain the Word to that particular kind of Digestion, which is performed in a thick Matter; as when, for instance, having mix'd Roses with Fat to make *Unguent. Rosatum*, the Mixture is expos'd for some Days to the Sun, that the Virtue of the Roses may be the better communicated to the Fat. See *Digestion*.

**MACHINE**, in the general, signifies any thing that serves to augment or regulate moving Powers; or *Machina* may be defined any Body destined to produce Motion, so as to save either Time or Force. There are six principal Machines, to which all the others may be reduced; viz. the Balance, Lever, Wheel, Pulley, Wedge, and Screw. These are call'd *Simple Machines*; and of these all other compound ones consist. For the Doctrine of these, see *Balance, Lever, &c.* See also *Mechanic Powers*.

The Number of compound Machines is now almost infinite; and yet the Antients seem to have out-done the Moderns in this respect. Their Machines of War, Architecture, &c. being described as vastly superior to ours.

*Machine for Building*, is an Assemblage of Pieces of Wood so disposed, as that by means of Ropes and Pulleys, a small Number of Men may raise vast Loads, and lay 'em in their Places; as Cranes, &c. 'Tis hard to conceive what Machines the Antients must have used to raise those immense Stones found in some of the antique Buildings.

*Hydraulic, or Water Machine*, is either used to signify a simple Machine, serving to conduct or raise Water; as a Sluice, Pump, &c. or several of these acting together, to produce some extraordinary Effect; as the Machine of *Marius*; the *Primum Mole* whercof is an Arm of the River *Sene*, which by its Stream turns several large Wheels, which work the Handles, and these with Pistons raise the Water up into the Pumps, and with other Pistons force it up in Pipes against the Ascent of a Hill to a Reservoir in a Stone Tower, 62 Fathom higher than the River; sufficient to supply *Vesailles* with a constant Stream 200 Inches in Diameter.

*Machines of War*: These among the Antients were of three kinds; the first serving to launch Arrows, as the *Scorpion*; Javelins, as the *Catapulta*; Stones, as the *Ballista*; or fiery Darts, as the *Pyroboli*; the second serving to beat down Walls, as the battering Ram and *Terebra*; and the third to shelter those who approach'd the Enemies Wall; as the *Tortoise* or *Testudo*, and the Towers of Wood. The *Machines of War* now in use, consist in Artillery, Bombs, Petards, &c. Tho' it must be observed, that in strictness, a Machine is something that consists more in Art and Invention, than in the Strength and Solidity of the Materials; and for this reason it is that the Inventors of Machines are call'd *Ingenieurs* or *Ingenieurs*. See *Engine*. The Word comes from the Greek, *μηχανη*, Machine, Invention, Art.

*Machine*, in Dramatic Poetry, a Term used, when the Poet brings some Divinity or supernatural Being upon the Stage; to perform some Exploit, or solve some Difficulty out of the reach of Human Power. The *Machines* of the Drama are Gods, Angels, Ghosts, &c. which are so called from the *Machines* or Contrivances by which they are presented upon the Stage, and afterwards removed again. Hence the Use of the Word has also pass'd into the Epic Poem; tho' the Reason of its Name be there wanting: The Word, however, is us'd in the same Sense in both, viz. for the Intervention or Ministry

of some Divinity; but the Occasion of *Machines*, in the one and the other, being somewhat different, the Rules and Laws of managing them are different likewise. The ancient Dramatic Poets never brought any *Machinè* on the Stage, but where there was an absolute Necessity for the Presence of a God; and were generally laugh'd at for suffering themselves to be reduced to such a Necessity. Accordingly *Aristotle* lays it down as an express Law, that the unravelling of the Piece should arise from the Fable itself; and not from any foreign *Machinè*, as in the *Mætes*. *Horace* is something less severe; and contents himself with saying, that the Gods should never appear, unless the *Nodus*, or *Knot*, were worthy of their Presence; *Nec Deus interfit, nisi dignus vindice *Nodus**,—*incidit*. But 'tis quite otherwise in the *Epopæa*; there must be *Machines* every where, and in every Part. *Homer* and *Virgil* do nothing without them. *Persennius*, with his usual Fire, maintains, that the Poets should deal more with the Gods than with Men; that he should every where leave Marks of his prophetic Raptures, and of the Divine Fury that possesses him; that his Thoughts be all full of Fables, that is, of Allegories and Figures: In fine, he will have a Poem distinguished from an History in all its Parts; not so much by the Verses, as by that Poetical Fury which expresses itself wholly by Allegories; and does nothing but by *Machines*, or the Ministry of the Gods. A Poet therefore must leave it to the Historians to say, that a Fleet was dispersed by a Storm, and driven to foreign Shores; and must himself say with *Virgil*, that *Juno* went to seek *Æolus*, and that this God, at her Request, turned the Winds loose against the *Trojans*. He must leave the Historian to write, that a young Prince behaved himself with a great deal of Prudence and Discretion on all Occasions; and must say with *Homer*, that *Minerva* led him as it were by the hand in all his Enterprizes. Let an Historian say, that *Agamemnon*, quarrelling with *Achilles*, has a mind to slay him, tho' mistakingly, that he can take *Troy* without his Assistance. The Poet must say that *Thetis*, piqued at the affront her Son had received, flies up to Heaven to demand Vengeance of *Jupiter*; and that this God, to satisfy her, sends the God *Somnia*, or *Sleep*, to *Agamemnon*, to deceive him, and make him believe that he shall take *Troy* that day. 'Tis thus that the Epic Poets used *Machines* in all Parts of their Works; In the *Iliad*, *Odyssæ*, and *Æneid*, the Propositiō mentions them; the Invocation is address'd to them; and the Narration is full of them: they are the Causes of Actions; they make the *Knots*; and at last they unravel them. This last Circumstance is what *Aristotle* forbids in the Drama; but 'tis what *Homer* and *Virgil* have both practis'd in the *Epopæa*. Thus *Minerva* fights for *Ulysses* against *Penelope's* Lovers, helps him to destroy them; and the next Day herself, makes the Peace between *Ulysses* and the *Ithacians*, which closes the *Odyssæ*.

Further, the Use of *Machines*, in the Epic Poem, is, on some Accounts, entirely opposite to what *Horace* prescribes for the Theatre. In Tragedy that Critic will never have them us'd without an absolute Necessity; whereas in the *Epopæa* they should never be us'd but where they may be well let alone; and where the Action appears as if it did not necessarily require them. How many Gods and *Machines* does *Virgil* employ to raise the Storm that drives *Æneas* into *Carthage*; which yet might easily have happened in the ordinary Course of Nature. *Machines*, in the Epic Poem, therefore are not Contrivances of the Poet, to recover himself after he has made a false Step; nor to solve any Difficulty proper to some Parts of the Poem: but 'tis the Presence of a Divinity, and some supernatural and extraordinary Action which the Poet inserts in most of the Incidents of his Work, to render it more majestic and admirable; and to train his Readers to Piety and Virtue. This Mixture should be so managed, as that the *Machines* may be retrench'd, without retrenching any thing from the Action.

As to the Manner in which the *Machines* are to act; it may be observ'd, that in the old Mythology there are Gods both good, bad, and indifferent; and that our Passions may be convert'd into so many allegorical Divinities: so that every thing, both good and bad in a Poem, may be attributed to these *Machines*, and may be transferr'd by them. They don't however always act in the same manner; sometimes they act without appearing, and by simple Inspirations, which have nothing in them extraordinary or miraculous; as when we say the Devil suggested such a Thought, &c. The second Manner of their acting is entirely miraculous; as when a Divinity presents itself visibly before Men, so as to be known by them; or when they disguise themselves under some human Form without discovering themselves. The third Manner partakes of each of the two, and consists in

Oracles, Dreams, and extraordinary Inspirations; which *Raffa* calls *Demî-Machines*. All these Manners ought to be so managed, as to carry a Verisimilitude; and tho' Verisimilitude be of a vast Extent in *Machines*, as being founded on the Divine Power; yet has it Bounds. *Horace* proposes three kinds of *Machines* for the Stage; the first is a God visibly present among the Actors, which, he says, should never be introduc'd but on a great Occasion. The second contains more incredible and extraordinary *Machines*; as the Metamorphosis of *Progne* into a Swallow, of *Cadmus* into a Serpent; and even these *Machines* he does not absolutely condemn or exclude wholly out of the Poem, but only out of the Scene and the Sight of the Spectators: they are not to be represent'd, but may be recit'd. The third kind of *Machines* is absolutely absurd; and he rejects it entirely: the Instance he gives, is that of a Child taken alive out of the Belly of a Monster that had devoured it. The other two Manners are allow'd indifferently in the *Epopæa*; and without that Distinction of *Horace*, which only suits the Stage; it being in the Drama alone, that a Difference may be made between what passes in the Scene, or the Sight of the Spectators, and what behind the Curtain. See *Actio*.

**MACROCEPHALUS**, from *μακρὸς* *μαγνός*, great, and *κεφαλή*, *Caput*, the Head, is sometimes us'd to signify an Head larger than of a natural Size.

**MACROCOSM**, a Term seldom us'd but in opposition to *Microcosm*. By *Macrocōsm* we mean the World; and by *Microcosm*, which signifies little World, we mean Man. The Word *Macrocōsm* is form'd from the *Greek* *μάκροσ*, Great, and *κόσμος*, World.

**MACULÆ**, in Astronomy, dark Spots, of an irregular changeable Figure; observ'd in the face of the Sun; first taken notice of by *Sabiner* in 1611, and afterwards accurately observ'd by *Galilæus*, *Hecvelius*, *Mr. Flamsteed*, *Cassini*, *Kirch*, &c. Many of these *Maculæ* appear to consist of heterogeneous Parts; whereof the darker and more dense are call'd by *Hævelius*, *Nuclei*, and are incompass'd, as it were, with Atmospheres somewhat rarer and less obscure; but the Figure both of the *Nuclei* and entire *Maculæ* are variable. In 1644, *Hævelius* observ'd a small thin *Macula*, which in two Days time grew to ten times its Bulk; appearing withal much darker, and with a larger *Nucleus*; and such sudden Mutations are frequent. The *Nucleus*, he observ'd, began to fail sensibly e'er the Spot disappeared, and that, e'er it quite vanish'd, broke into four, which in two Days reunited. Some *Maculæ* have lasted 1, 2, 3, 10, 15, 20, 30, seldom 40 Days, tho' *Kirchius* observ'd one in 1681, from April 26 to the 17th of July. The Spots move over the Sun's Disk, with a Motion somewhat smaller near the Limb than near the Centre; that observ'd by *Kirch* was twelve Days visible in the Sun's Disk; for fifteen Days more it lay hid behind it; it being their Rule to return to the Limb whence they departed in 27, sometimes in 28 Days. Lastly, it must be observ'd, that the *Maculæ* contract themselves near the Limb, and in the middle of the Disk appear much larger; those often running into one in the Disk, which in the Limb were separate; that many of them arise in the middle of the Disk, and many disappear in the same; and that none of them are observ'd to deviate from their Path near the Horizon: Whereas *Hævelius* observing *Mercury* in the Sun, near the Horizon, found him too low; being thrust 27 Seconds beneath his former Path. From these Phenomena we collect,

(1.) That since *Mercury's* Depression below his Path arises from his Parallax, the *Maculæ* having no Parallax from the Sun, are nearer him than the Planes; but since they are hid behind the Sun three Days longer than they are in the Hemisphere visible to us, it follows also, that they don't adhere to the Surface of the Sun, but are at some distance from it.

(2.) That since they arise and disappear in the middle of the Sun's Disk, and undergo various Alterations with regard both to Bulk, Figure, and Density, they must be form'd *de novo*, and again diffus'd about the Sun; and are therefore, in all probability, a kind of Solar Clouds form'd out of its Exhalations.

(3.) Since then the Solar Exhalations rise over his Body; and are suspended at a certain Height from it; it appears, from the Laws of Hydrostatics, that the Sun must be incompass'd with some Fluid to drive those Exhalations upwards; which Fluid must be denser, as it is lower; and rarer, as higher, like our Atmosphere: And since the *Maculæ* dissolve and disappear in the very middle of the Sun's Disk, the Matter thereof, i. e. the Solar Exhalations must fall back again to the Sun; whence there must arise Changes in the Sun's Atmosphere, and consequently in the Sun itself.

(4.) Since the Revolution of the *Maeule* round the Sun is very regular; and since their Distance from the Sun is very small, 'tis not properly the *Maeule* that move round the Sun: But 'tis himself, together with his Atmosphere, wherein the *Maeule* swim, that in the space of 27 Days moves round its own Axis; and hence it is that the *Maeule*, being viewed obliquely near the Limb, appear narrow and oblong.

And, Lastly, since the Sun appears with a circular Disk in every Situation; his Figure, as to Sense, must be spherical. Some Authors likewise take notice of *Faculae*, or bright Spots, in the Disk of the Sun, much more lucid than the rest, much larger than the *Maeule*, and very different from them both, as to Figure, Duration, &c. *Hecelius* mentions his seeing a *Facula* in 1634, which took up a third part of the Sun's Diameter; and adds, that the *Maeule* frequently change into *Faculae*; but the *Faculae* seldom or never into *Maeule*. But *Huygens*, and other great Astronomers, reject the Notion of the *Faculae*; having never seen any thing like them (tho' furnish'd with the best Telescopes) excepting little bright Specks in the dim Clouds which frequently encompass the *Maeule*; and which may be owing to the Refraction of the Sun's Rays in the rarer Parts of his Atmosphere. And as to that little Inequality observed in the Circumference of the Sun's Disk, which is usually ascribed to the Windings and Eruptions of the Flames; it seems better accounted for from the tremulous Agitation of the Vapours in our own Atmosphere.

MADDER, the Root of a Plant, much used by Dyers, to make the most solid and rich red Colour; it has its Uses too in Medicine, being found of Service in Obstructions of the Viscera and Cachectic Constitutions; and is generally made up in forms of Decoctions, Diet-Drinks, and medicated Ales.

MADNESS, or MANIA, in Medicine, a kind of Delirium without a Fever, attended with Rage, and a total Deprivation of Reason. *Madness* consisting much in a Delirium, to explain the Nature of the former, *Dr. Quinsy* premises that of the latter thus: As often as the Species of Things, wherewith we have been acquainted, are hurried together, we may be said to dream, and thence in Sleep they are added with other things, and variously compounded, from the manifold Repercussions of the Animal Spirits, which arise from the Cause producing Sleep, and pressing the Nerves, so as to revert the Fluctuations of their Juice. A Delirium is therefore the Dreams of waking Persons, wherein Ideas are excited without Order or Coherence, and the Animal Spirits are drove into irregular Fluctuations. If therefore the Cause inducing a Delirium be of that nature, that it can excite Ideas or Motions of a considerable Impetus, without any manner of Certainty or Order, such a Delirium will be attended with Boldness or Rage, and violent Motions of the Body; that is, a Madness will be produced. Now it is plain, that all the known Causes of this Distemper give a greater Disposition to the Blood for Motion, and render it fluxile, but not consistent, and uniformly thick enough; and therefore that they dispose Persons likewise to continued Fevers, since they occasion the Blood to be thrown out of the Heart with an increased Force, unless some other Cause intervenes, whereby the Efficacies of these are interrupted in disposing the Blood into Febrile Motions; and the Blood is so disposed, as often as it can be rarefied into its minutest Parts; that is, so uniformly rarefied, that it can easily, with any Force by the Motion received from the Heart, go into Parts divisible at the Occurrences of those Orifices, into which it ought to be distributed: for then the Cohesion of the Parts, which can be but very small, will not be any Obstruction to the Increase and Propagation of the Blood's Velocity. But if it happens that the efficient Cause, or the Heart, throws the Blood with a greater Force, or that the Blood can the more easily be propelled in any given Time, it will occasion, at the same time, that some Parts of the Blood be more nearly united, so as to form *Molecules*, consisting of cohering Particles; which *Molecules* will cohere to one another, and not so easily obey the Direction of the Heart's propelling Force. The Blood hereupon cannot be uniformly rarefied, nor enter so easily into the small Orifices of the Vessels, and so soon travel thro' them, and therefore there will no Fever arise; but a Delirium without a Fever, wherein the Heat of the Blood will be greater, and the Pressure in the Brain uncertain; whence uncertain Recursions of the Spirits, inordinate Undulations, confused Vibrations of the Nerves, and a remarkable Energy of Imagination; whence will proceed Auidacity and Passion beyond measure. Some Authors say, that the Brain of a Cat eaten, produces *Madness*. 'Tis a Disease very hard to cure, and is generally found to baffle the Physician.

MADRIER, in the Military Art, a thick Plank armed with Iron Plates, having a Concavity sufficient to receive the Mouth of the Petard when charged, with which it is applied against a Gate, or other Body designed to be broke down. *Madrir* is also the Name of a flat Beam fixed at the bottom of a Moat to support a Wall. Besides which, there are also *Madrices* lined with Tin, and covered with Earth, serving as a Defence against artificial Fires.

MADRIGAL, a Term in the modern Italian, Spanish, and French Poetry, signifying a little amorous Piece, containing a certain Number of loose unequal Verses, not tied either to the scrupulous Regularity of a Sonnet, or the Subtlety of an Epigram; but consisting of some tender, delicate, yet simple Thought, suitably expressed. The *Madrigal*, according to *Mr. le Brun*, is an Epigram without any thing very brisk and sprightly in its Fall or Close: something very tender and gallant is usually the Subject of it; and a certain beautiful, noble, yet chaste, Simplicity, makes its Character.

The *Madrigal* is usually looked on as the shortest of all the little kinds of Poems, and may consist of fewer Verses than either the Sonnet or Rondelay. There is no other Rule regarded in mingling the Rhimes and Verses of different kinds, but the Choice and Convenience of the Author. This Poem, however, really allows of less Licence than any other; whether we regard the Rhyme, the Measures, or the Purity of Expression.

*Ménage* derives the Word from *Mandra*, which, in Latin and Greek, signifies a Company of Cattel; imagining it to have been originally a kind of Pastoral or Shepherd's Song; whence the *Italians* formed their *Madrigale*, and we *Madrigal*. Others rather chuse to derive the Word from *Madrager*, which, in the Spanish signifies to rise in the Morning; the *Madrigal* being formerly sung early in the Morning, by those who had a mind to serenade their Mistresses.

MAGAS, or MAGADE, the Name of a musical Instrument in Use among the Antients. There were two kinds of *Magades*; the one a string Instrument, the Invention whereof is ascribed by some to *Sappho*, and by others to the *Lydians*, and by others to *Timoteus of Miletum*. The other *Magade* was a kind of Flute, which at the same time yielded very high and very low Notes; the former kind was much improved by *Timoteus of Miletum*, who is said to have been impeached of a Crime; for that by increasing the Number of Chords, he spoiled and discredited the antient Music.

MAGAZINE, or Arsenal, is the Place in fortified Towns where all sorts of Stores are kept, and where Carpenters, Wheelwrights, Smiths, &c. are employed in making all things needful to furnish out the Train of Artillery.

S. MAGDALEN. There are several kinds of Nuns, or Religious, who bear this Name; consisting generally of penitent Courtisans: sometimes also call'd *Magdalenites*; as those at Metz established in 1452, those at Paris in 1492; those at Naples, first established in 1324, and endowed by Queen *Sancia*, to serve as a Retreat to public Courtezans, who should quit the Trade, and betake themselves to Repentance; and those of *Rouen* and *Bourdeaux*, which had their Original among those of Paris. In each of these Monasteries there are three kinds of Persons and Congregations, viz. the first is of those who are admitted to make Vows, and these bear the Name of *St. Magdalen*; the Congregation of *St. Marthe* is the second, and is composed of those whom 'tis not judged proper to admit to Vows; the Congregation of *St. Lazarus* is composed of such as are detained there by force. The Religious of *St. Magdalen* at Rome were established by Pope *Leo X.* *Clement VIII.* sented a Revenue on them, and further appointed, that the Effects of all public Prostitutes, dying without Testaments, should fall to them; and that the Testaments of the rest should be invalid; unless they bequeathed a Portion of their Effects, which was to be at least a fifth Part, to them.

MAGI, the Title the Eastern Nations, both antiently and at present, give to their Wife-men or Philosophers. The antient *Magi*, according to *Aristotle* and *Laertius*, were the Authors and Conservators of the *Festian* Philosophy; and the Philosophy principally cultivated among them was Theology and Politics: they being always esteem'd as the Interpreters of all Laws both Divine and Human; on which account they were wonderfully revered by the People. Hence *Cicero* observes, that none were admitted to the Crown of *Persia*, but such as were well instructed in the Discipline of the *Magi*; who taught the  *Persians*; and shew'd Princes how to govern. *Plato*, *Apuleius*, *Lucretius*, and others, agree, that the Philosophy of the *Magi* related principally to the Worship of the Gods; they were the Persons who were to offer Prayers, Supplications, and Sacrifices, as

if the Gods would be heard by them alone. According to *Zenon*, *Suidas*, &c. the Theology or Worship of the Gods, about which the *Magi* were employ'd, was little more than the Diabolical Art of Divination. Hence *magia*, strictly taken, signifies Divination. *Perphyry* defines the *Magi* well, *Circu Divinos Sapientes & in istis munitissimas*; adding, that the word *Magus* implied as much in the *Persian* Tongue. These People, says he, are held in such Veneration among the *Persians*, that *Darius*, the Son of *Hystaspes*, among other things, had this engraven on his Monument, that he was the Master of the *Magi*. Their Descendants, the modern *Magi*, are divided into three Classes; whereof the first and most learned neither eat nor kill Animals, but adhere to the old Institution of abstaining from living Creatures. The *Magi* of the second Class refrain only from tame Animals; nor do the last kill all indifferently; it being the firm and distinguishing Dogma of them all, *quod verum dicitur verum*, that there is a Transmigration of Souls. To intimate the Similitude between Animals and Men; they use to call the latter by the Name of the former; thus their Fellow-Priests they call'd *Lions*, the Priestesses *Lionesses*, the Servants *Crows*, &c. *Philo Judaeus* describes the *Magi* to be diligent Inquirers into Nature, out of the Love they bear to Truth; and who setting themselves apart for these things, contemplate the Divine Virtues the more clearly, and initiate others in the same Mysteries.

The Origin of Magic and the *Magi* is ascribed to *Zoroaster*. *Salmastius* derives the very Name from *Zoroaster*, who, he says, was *farman'd Moe*, whence *Magus*. Others, instead of making him the Author of the *Persian* Philosophy, make him only the Restorer and Improver thereof; alleging that many of the *Persian* Rites, in Use among the *Magi*, were borrowed from the *Zabii* of the *Chaldeans*, who agreed in many things with the *Magi* of the *Persians*; whence some make the Name *Magus* common both to the *Chaldeans* and *Persians*. Thus *Plutarch* mentions, that *Zoroaster* instituted *Magi* among the *Chaldeans*; in imitation whereof the *Persians* had theirs too.

The Learned are in great perplexity about the Origin of the Word. *Plato*, *Xenophon*, *Herodotus*, *Strabo*, &c. search its Origin from the *Persian* Language; in which it signified a Priest, or Person to officiate in Holy Things, as *Druid* among the *Gauls*, *Gymnosophist* among the *Indians*, and *Levite* among the *Hebrews*. Others derive it from the *Greek* *μαγας*, *great*, which being borrow'd of the *Greeks* by the *Persians*, was return'd in the form of *magus*; but *Volius*, with more probability, brings it from the *Hebrew* *מגיד*, *magid*, to mediate; whence is form'd *מגיד*, *Maghim*, in *Latin* *Medatibondi*, q. d. *People addit'd to Meditation*.

MAGIC, a Science that teaches to perform wonderful and surprizing Effects. The Word *Magie* originally carried with it a very innocent, nay laudable, Meaning; being us'd purely to signify the Study of Wisdom; but in regard the ancient *Magi*, or Magicians, engag'd themselves in Astrology, Divination, Sorcery, &c. the Term *Magie* in time became odious, and was only us'd to signify a Science scandalous and unlawful. If any wonder how so vain and deceitful a Science should gain so much Credit and Authority over Mens Minds, *Pliny* gives the Reason of it; 'Tis, says he, because it has possess'd itself of three Sciences of the most Esteem among Men; taking from each, all that is great and marvellous in it. Nobody doubts but it had its first Origin in Medicine, and that it insinuated itself into the Minds of the People under pretence of giving extraordinary Remedies. To these fine Promises it added every thing in Religion that is pompous and splendid, and that appears calculated to blind and captivate Mankind. Lastly, it mingled judiciary Astrology with the rest; persuading People, curious of Futurity, that it saw every thing to come in the Heavens.

*Agrippa* divides *Magie* into three kinds; *Natural* *Magie*, *Celestial* *Magie*, and *Ceremonial* or *Superstitious* *Magie*. *Natural* *Magie* is no more than the Application of natural active Causes to passive Causes; by means whereof many surprizing, but yet natural, Effects are produced.

*Celestial* *Magie* borders very nearly on Judiciary Astrology. It attributes to Spirits a kind of Rule or Dominion over the Planets; and to the Planets a Dominion over Men; and on these Principles builds a ridiculous kind of System.

*Superstitious* *Magie* consists in the Invocation of Devils; its Effects are usually evil and wicked; tho' very strange, and surpassing the Powers of Nature; produced, by virtue of some Compact, either tacit or express, with evil Spirits; but the truth is, these have not all the Power that is usually imagin'd, nor do they produce half those Effects ordinarily ascribed to them.

*Baptista Porta* has written of natural *Magie*, or of Secrets

for performing very extraordinary things by natural Causes. The natural *Magie* of the *Chaldeans* was nothing but the Knowledge of the Powers of Simple and Minerals. The *Magie*, which they call'd *Theurgia*, consist'd wholly in the Knowledge of the Ceremonies, to be observ'd in the Worship of the Gods, in order to be acceptable. By virtue of these Ceremonies they believed they could converse with spiritual Beings, and cure Diseases. *Nicolas* has published an Apology for all the Great Men suspected of *Magie*. *Agrippa* says, that the Words us'd by those in compact with the Devil, to invoke him, and to succeed in what they undertake, are *Dies mihi sequens benedictus aui summa erit emans*. There are an hundred other superstitious Formula's of Words compos'd at pleasure, or gathered from several different Languages, or patch'd from the *Hebrew*, or form'd in imitation of it.

MAGIC LANTHORN, an Optic Machine, by means whereof little painted Images are represented on an opposite Wall of a dark Room, magnified to any Bigness at pleasure.

Construction of the Magic Lanthorn. A B C D (*Tab. Opticks*, fig. 10.) is a common Tin Lanthorn, to which is added a Tube to draw out, F G. In H is fixed a metallic concave Speculum of a Foot diameter at most, or four Inches at least; or, in lieu thereof, near the Extremity of the Tube is plac'd a convex Lens, consisting of a Segment of a small Sphere, its Diameter not exceeding a few Inches. In the Focus of the concave Speculum, or Lens, is plac'd a Lamp L; within the Tube, where it is solder'd to the Side of the Lanthorn, is plac'd a small Lens, convex on both Sides, being a Portion of a small Sphere, having its Focus about the Distance of three Inches. The extreme Part of the Tube F M is square, and has an Aperture quite thro' it; so as to receive an oblong Frame N O, pass'd thro' it; in this Frame are round Holes an Inch or two in Diameter. According to the Bigness of those Holes are drawn Circles on a plain thin Glass; and in these Circles are painted any Figures or Images at pleasure, with transparent Water Colours. These Images fitted into the Frame, and plac'd inverted, at a little distance from the Focus of the Lens I; will be project'd on an opposite white Wall of a dark Room, prodigiously magnified in all their Colours, and so erect Situation.

Theory of the Magic Lanthorn. The Lamp being plac'd in the Focus of the concave Speculum, or any Convex Glass, the Rays will be propagat'd parallel to each other, and the Image will be strongly illumined, and will therefore emit a great Number of Rays into the Lens I. But being suppos'd to be plac'd near the Lens I, the inverted Image of the Picture inverted must be form'd on the opposite Wall, exceedingly magnified after its Refraction thro' the Lens; and it will be still the more magnified as the Lens is a Segment of a less Sphere, and as the Picture is plac'd nearer the Focus of the Lens; in a dark Place therefore the Picture will be represent'd prodigiously large and extremely vivid. See *Lens*.

Another *Magie* Lanthorn. Every thing being managed as in the former, into the sliding Tube F G, insert another Convex Lens K, the Segment of a Sphere somewhat larger than I; now if the Picture be brought nearer I than to the Distance of the Focus, the diverging Rays will be propagat'd as if they proceeded from P; wherefore if the Lens K be so plac'd, as that P is very near its Focus, the Image will be exhibit'd on the Wall exceedingly magnified.

Schol. 1. To heighten the Light, Specula are prefer'd to Lens's; the Focus of a Speculum being nearer than that of the Lens.

2. De *Chales* orders the Diameter of the Lens I to be two, four, or five Digits, and in a subduple Proportion to the other K; i. e. if I be five Digits, K must be 10; and the Diameter of the Speculum, according to the same, is to be two Digits. *Zabini* chuses to have the Diameter of I  $\frac{1}{12}$  of a Foot, and that of K one Foot and  $\frac{1}{2}$ , &c.

3. Little Animals being included in the *Magie* Lanthorn, in the manner observ'd in speaking of the Microscope; or any little transparent Objects fasten'd to a Slice of Talk or Glass, and substituted instead of Images; the *Magie* Lanthorn will become a Microscope.

MAGIC SQUARES, the several Numbers that compose any square Number; (for Instance, 1, 2, 3, 4, 5, &c. 10; 25 inclusive, which compose the square Number 25) being dispos'd after each other in a square Figure of 25 Cells, each in its Cell: if then you change the Order of these Numbers, and dispose them in the Cells, in such manner, as that the five Numbers, which fill any Horizontal Rank of Cells, being added together, shall make the same Sum, with the five Numbers, in any other Rank of Cells, whether horizontal or vertical; and even the same Number with the five in each of the two

Diagonal Ranks, this Disposition of Numbers is called a *Magie Square*, in opposition to the former Disposition, which is called a *Natural Square*. See the Figures adjoining.

Natural Square.

One would imagine that *Magie Squares* had that Name given them, in regard this Property of all their Ranks, which, taken any way, make always the same Sum, appeared extremely surprizing, especially in certain ignorant Ages, when Mathematics passed for *Magie*: But there is a great deal of Reason to suspect, that these Squares merited their Name still further by the superstitious Operations they were employed in, as the Construction of *Talismani*, &c. for according to the childish Philosophy of those Days, which attributed Virtues to Numbers, what Virtues might not be expected from Numbers so wonderful?

However, what was at first the vain Practice of Masters of *Talismani*, and Conjurers, has since become the Subject of a serious Research among the Mathematicians; nor that they imagine it will lead them to any thing of solid Use or Advantage. *Magie Squares* favour too much of their Original to be of any Use. But only as 'tis a kind of Play, where the Difficulty makes the Merit; and as it may chance to produce some new Views of Numbers which Mathematicians will not lose the Occasion of.

*Euclid*, *Mesobopulus*, a Greek Author of no great Antiquity, is the first that appears to have spoke of *Magie Squares*; and by the Age wherein he lived, there is Reason to imagine he did not look on them merely as a Mathematician. However, he has left us some Rules for their Construction. In the Treatise of *Cor. Agrippa*, so much accused of *Magie*, we find the Squares of seven Numbers, viz. from three to nine inclusive, disposed magically; and it must not be supposed that these seven Numbers were preferred to all the others without a very good Reason. In effect, 'tis because their Squares, according to the System of *Agrippa* and his Followers, are planetary. The Square of 3, for Instance, belongs to *Saturn*, that of 4 to *Jupiter*, that of 5 to *Mars*, that of 6 to the *Sun*, that of 7 to *Venus*, that of 8 to *Mercury*, and that of 9 to the *Moon*. *M. Haest* applied himself to the Study of *Magie Squares*, on the Hint he had taken from the Planetary Squares of *Agrippa*; as being unacquainted with the Work of *Mesobopulus*, which is only in Manuscript in the French King's Library; and, without the Assistance of any other Author, found out a new Method for those Squares whose Root is uneven, for instance 25, 49, &c. but could not make any thing of those whose Root is even.

After him came *Mr. Frenicle*, who took the same Subject in hand. A great Algebraist was of opinion, that whereas the sixteen Numbers, which compose the Square, might be disposed 20921289588000 different Ways in a natural Square (as from the Rules of Combination 'tis certain they may) could not be disposed in a *Magie Square* above sixteen different Ways. But *M. Frenicle* shewed, that they might be disposed 878 different Ways; whence it appears how much his Method exceeds the former, which only yielded the 55th Part of *Magie Squares* of that of *Mr. Frenicle*. To this Enquiry he thought fit to add a Difficulty, that had not yet been considered: The *Magie Square* of 7, for instance, being constructed, and its 49 Cells filled, if the two Horizontal Ranks of Cells, and at the same time the two Vertical ones, the most remote from the middle, be retrenched, that is, if the whole Border or Circumference of the Square be taken away; there will remain a Square, whose Root will be 5, and which will only consist of 25 Cells. Now 'tis not at all surprizing that the Square should be no longer *Magie*, in regard the Ranks of the large one were not intended to make the same Sum, excepting when taken entire with all the 7 Numbers that fill their seven Cells; so that being mutilated each of two Cells, and having lost two of their Numbers, it may be well expected that their Remainders will not any longer make the same Sum. But *Mr. Frenicle* would not be satisfied, unless when the Circumference or Border of the *Magie Square* was taken away, and even any Circumference at pleasure, or in fine several Circumferences at once, the remaining Square were still *Magie*: which last Condition, no doubt, made these Squares vastly more magical than ever.

Again, he inverted that Condition, and required that any Circumference taken at pleasure, or even several Circumferences should be inseparable from the Square; that is, it should cease to be *Magie* when they were removed, and yet continue *Magie* after the Removal of any of the rest. *Mr. Frenicle*, however, gives no general Demonstration of his Methods, and frequently seems to have no other Guide but his groping. 'Tis true, his Book was not published by himself, nor did it appear till after his Death, viz. in 1695.

In 1703, *Mr. Poignard*, Canon of *Erffels*, published a Treatise of *Sublime Magie Squares*. Before him there had been no *Magie Squares* made but for Series's of natural Numbers that formed a Square; but *M. Poignard* made two very considerable Improvements: (1.) Instead of taking all the Numbers that fill a Square, for Instance, the 36 successive Numbers, which would fill all the Cells of a natural Square, whose Side is 6, he only takes as many successive Numbers as there are Units in the Side of the Square, which in this Case are 6; and these six Numbers alone he disposes in such manner, in the 36 Cells, that none of them are repeated twice in the same Rank, whether it be horizontal, vertical, or diagonal; whence it follows, that all the Ranks, taken all the Ways possible, must always make the same Sum, which *Mr. Poignard* calls repeated Progression.

(2.) Instead of being confined to take these Numbers according to the Series and Succession of the natural Numbers, that is, in an Arithmetical Progression, he takes them likewise in a Geometrical Progression, and even an Harmonical Progression. But with these two last Progressions the *Magie* must necessarily be different from what it was. In the Squares, filled with Numbers in Geometrical Progression, it consists in this, that the Products of all the Ranks are equal, and in the Harmonical Progression, the Numbers of all the Ranks continually follow that Progression; he makes Squares of each of these three Progressions repeated.

This Book of *M. Poignard* gave occasion to *M. de la Hire* to turn his Thoughts the same way, which he did with good Success, inasmuch that he seems to have well-nigh completed the Theory of *Magie Squares*. He first considers uneven Squares: all his Predecessors on the Subject having found the Construction of even ones by the most difficult; for which Reason *M. de la Hire* reserves those for the last. This Excess of Difficulty may arise partly from hence, that the Numbers are taken in an Arithmetical Progression. Now in that Progression, if the Number of Terms be uneven, that is in the middle has some Properties, which may be of Service; for Instance, being multiplied by the Number of Terms in the Progression, the Product is equal to the Sum of all the Terms.

*M. de la Hire* proposes a general Method for uneven Squares, which has some Similitude with the Theory of compound Motions, so useful and fertile in *Mechanics*. As that consists in decomposing Motions, and resolving them into others more simple, so does *M. de la Hire*'s Method consist in resolving the Square, that is to be constructed, into two simple and primitive Squares. It must be owned, however, 'tis not quite so easy to conceive those two simple and primitive Squares in the compound or perfect Square, as in an oblique Motion to imagine a Parallel and a Perpendicular one.

Suppose a Square of Cells, whose Root is uneven; for Instance 7, and that its 49 Cells are to be filled magically with Numbers, for Instance, the first 7. *M. de la Hire*, on the one side, takes the first seven Numbers, beginning with Unity, and ending with the Root 7, and on the other 7, and all its Multiples to 49 exclusively; and as these only make six Numbers, he adds 0, which makes this an Arithmetical Progression of seven Terms as well as the other. c. 7. 14. 21. 28. 35. 42.

This done, with the first Progression repeated, he fills the Square of the Root 7 magically. In order to this, he writes in the first seven Cells of the first Horizontal Rank the seven Numbers proposed, in what Order he pleases, for that is absolutely indifferent; and 'tis proper to observe here, that those seven Numbers may be ranged in 5040 different Manners in the same Rank. The Order in which they are placed in the first Horizontal Rank, be it what it will, is that which determines their Order in all the rest. For the second Horizontal Rank, he places in its first Cell, either the third, the fourth, the fifth, or the sixth Number from the first Number of the first Rank, and after that writes the six others in the Order as they follow. For the third Horizontal Rank, he observes the same Method with regard to the second, that he observed in the second with regard to the first, and so of the rest. For Instance, suppose the first Horizontal Rank filled with the seven Numbers in their natural Order, 1. 2. 3. 4. 5. 6. 7. the second Horizontal Rank may either commence with 3, with 4, with 5, or with 6; but in this Instance it commences with

1	2	3	4	5	6	7
2	4	5	6	7	1	2
3	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

with 3, the third Rank therefore must commence with 5, the fourth with 7, the fifth with 2, the sixth with 4, and the seventh with 6. The Commencement of the Ranks which follow the first being thus determined, the other Numbers, as we have already observed, must be written down in the Order whereto they stand in the first, going on to 5, 6, and 7, and returning to 1, 2, &c. till every Number in the first Rank be found in every Rank underneath, according to the Order arbitrarily pitched upon at first. By this means, 'tis evident, no Number whatever can be repeated twice in the same Rank, and by consequence that the seven Numbers 1. 2. 3. 4. 5. 6. 7. being in each Rank, they must of Necessity make the same Sum.

It appears, from this Example, that the Arrangement of the Numbers in the first Rank being chosen at pleasure, the other Ranks may be continued in four different Manners; and since the first Rank may have 5040 different Arrangements, there are no less than 20160 different Manners of constructing the Magic Square of seven Numbers repeated.

1	2	3	4	5	6	7
2	3	4	5	6	7	1
3	4	5	6	7	1	2
4	5	6	7	1	2	3
5	6	7	1	2	3	4
6	7	1	2	3	4	5
7	1	2	3	4	5	6

1	2	3	4	5	6	7
7	1	2	3	4	5	6
6	7	1	2	3	4	5
5	6	7	1	2	3	4
4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The Order of the Numbers in the first Rank being determined; if in beginning with the second Rank, the second Number 2, or the last Number 7 should be pitched upon; in one of those Cases one of the Diagonal Ranks would have the same Number constantly repeated; and, in the other Case, the other Diagonal would have it repeated; of consequence therefore, either the one or the other Diagonal would be false, unless the Number repeated seven times should happen to be 4, for four times seven is equal to the Sum of 1. 2. 3. 4. 5. 6. 7. and, in general, in every Square consisting of an uneven Number of Terms, in Arithmetical Progression, one of the Diagonals would be false according to those two Constructions, unless the Term, always repeated in that Diagonal, were the middle Term of the Progression.

'Tis not however at all necessary to take the Terms in an Arithmetical Progression; for, according to this Method, one may construct a Magic Square of any Numbers at pleasure, whether they be according to any certain Progression or not. If they be in an Arithmetical Progression, 'twill be proper, out of the general Method, to except those two Constructions, which produce a continual Repetition of the same Term in one of the two Diagonals; and only take in the Case, wherein that Repetition would prevent the Diagonal from being just. Which Case being absolutely disregarded, when we computed that the Square of 7 might have 20160 different Constructions; 'tis evident, that by taking that Case in, it must have vastly more.

To begin the second Rank with any other Number besides the second and the last, must not however be looked on as an universal Rule. It holds good for the Square of 7, but if the Square of 9, for instance, were to be constructed, and the fourth Figure of the first Horizontal Rank were pitched on for the first of the second, the Consequence would be, that the fifth and eighth Horizontal Ranks would likewise commence with the same Number, which would therefore be repeated three times in the same vertical Rank, and occasion other Repetitions in all the rest. The general Rule therefore must be conceived thus: Let the Number in the first Rank pitched on, for the Commencement of the second, have such an Exponent of its Quota, that is, let the Order of its Place be such, as that if an Unit be taken from it, the Remainder will not be any just Quota Part of the Root of the Square; that is, cannot divide it equally. If, for Example, in the Square of 7, the third Number of the first Horizontal Rank be pitched on for the first of the second, such Construction will be just; because the Exponent of the Place of that Number, viz. 3, subtracting 1, that is 2, cannot divide 7. Thus also might the fourth Number of the same first Rank be chosen, because 4 - 1, viz. 3, cannot divide 7, and for the same Reason the fifth or sixth Number might be taken: But in the Square of 9, the fourth Number of

the first Rank must not be taken, because 4 - 1, viz. 3, does divide 9. The Reason of this Rule will appear very evidently, by considering in what manner the Returns of the same Numbers do or do not happen, taking them always in the same manner in any given Series. And hence it follows, that the fewer Divisions the Root of any Square to be constructed has, the more different Manners of constructing it there are, and that the prime Numbers, that is, those which have no Divisions, as 5. 7. 11. 13. &c. are those whose Squares will admit of the most Variations in proportion to their Quantities.

The Squares constructed, according to this Method, have some particular Property not required in the Problem: For the Numbers that compose any Rank parallel to one of the two Diagonals, are ranged in the same Order with the Numbers that compose the Diagonal, to which they are parallel. And as any Rank parallel to a Diagonal must necessarily be shorter, and have fewer Cells than the Diagonal itself, by adding to it the corresponding Parallel which has the Number of Cells, the other falls short of the Diagonal; the Numbers of those two Parallels, placed, as it were, end to end, still follow the same Order with those of the Diagonal; besides that, their Sums are likewise equal; so that they are magical on another account.

Instead of the Squares, which we have hitherto form'd by Horizontal Ranks, one might also form them by Vertical Ones; the Case is the same in both.

All we have hitherto said regards only the first Primitive Square, whose Numbers, in the proposed Example, were 1. 2. 3. 4. 5. 6. 7; there still remains the second Primitive, whose Numbers are 0. 7. 14. 21. 28. 35. 42. M. de la Hire proceeds in the same manner here as in the former; and this may likewise be constructed in 20160 different Manners, as containing the same Number of Terms with the first. Its Construction being made, and of consequence all its Ranks making the same Sum, 'tis evident, that if we bring the two into one, by adding together the Numbers of the two corresponding Cells of the two Squares, that is, the two Numbers of the first of each, the two Numbers of the second, of the third, &c. and dispose them in the 49 corresponding Cells of a third Square; it will likewise be Magic, in regard its Ranks, formed by the Addition of equal Sums to equal Sums must of necessity be equal among themselves. All that remains in doubt is, whether or no, by the Addition of the corresponding Cells of the two first Squares, all the Cells of the third will be filled in such manner, as that each not only contain one of the Numbers of the Progression from 1 to 49, but also that this Number be different from that of any of the rest, which is the End and Design of the whole Operation.

As to this, it must be observ'd, that if in the Construction of the second Primitive Square, care has been taken in the Commencement of the second Horizontal Rank, to observe an Order with regard to the first, different from what was observ'd in the Construction of the first Square; for instance, if the second Rank of the first Square begun with the third Term of the first Rank, and the second Rank of the second Square commence with the fourth of the first Rank, as in the Example it actually does; each Number of the first Square may be combined once, and only once, by Addition with all the Numbers of the second. And as the Numbers of the first are here 1. 2. 3. 4. 5. 6. 7. and those of the second 0. 7. 14. 21. 28. 35. 42. by combining them in this manner, we have all the Numbers in the Progression from 1 to 49, without having any of 'em repeated; which is the Perfect Magic Square proposed.

The Necessity of constructing the two Primitive Squares in a different manner, does not at all hinder but that each of the 20160 Constructions of the one may be combined with all the 20160 Constructions of the other: of consequence therefore 20160 multiplied by itself, which makes 406425600, is the Number of different Constructions that may be made of the Perfect Square, which here consists of

First Primitive.

1	2	3	4	5	6	7
5	4	5	6	7	1	2
5	6	7	1	2	3	4

11	19	27	35	36	46	3
28	35	42	2	10	18	25

the 49 first Numbers of the Natural Progression. But as we have already observed, that a *Primitive Square* of 7 Numbers repeated may have above 20160 several Constructions, the Number 426455600 mult come vastly short of expressing all the possible Constructions of a perfect *Magic Square* of the 49 first Numbers.

As to the *Even Squares*, he constructs them like the *Uneven* ones, by two *Primitive Squares*; but the Construction of *Primitives* is different in the general, and may be so a great number of ways: and those general Differences admit of a great number of particular Variations, which give as many different Constructions for the same even Square. It scarce seems possible to determine exactly, either how many general Differences there may be between the Construction of the primitive Squares of an even Square and an uneven one; nor how many particular Variations each general Difference may admit of; and of consequence we are still far from being able to determine the Number of different Constructions of all those that may be made by the Primitive Squares.

MAGISTER, *Magister*, a Title frequently found in old Writings. It noted, the Person who bore it had attained some Degree of Eminency in *Scientia aliqua profertim Litteraria*; and in old Times those we now call *Doctors*, were called *Magistri*.

MAGISTRY, a Term in Chymistry signifying a Precipitate of some Dissolution; made by a Salt, or some other Body, which breaks the Force of the Dissolvent. Thus we say, *Magistry of Bismuth*, which is a very fine Powder made by dissolving the Bismuth in Spirit of Nitre, and pouring on it Salt Water, which precipitates the *Magistry* to the bottom. See *Bismuth*. *Magistry of Lead* is a fine Powder, made by dissolving *Saccharum Saturni* in distilled Vinegar, and then precipitating it with Oil of Tartar per Deliquium. The word *Magistry* is also used in speaking of Refins, Reticious Extracts of Scammony, Jalap, Turpeth, &c. which are made by dissolving the Matter in Spirit of Wine, and precipitating it with Water. Mr. Boyle takes the proper Notion of a *Magistry* to consist in a Preparation of a Body, whereby it is wholly, or at least in great measure, by means of some extraneous Additament converted into a Body of a different kind; as when Iron or Copper is turned into Chrysalis of Mars and Venus.

MAGMA, among Chymists, &c. the Dregs or Residuum after Infusion or Distillation.

MAGNA ARTERIA, the name with the *Aorta*, which see.

MAGNA CHARTA, the Great Charter, granted the ninth Year of Henry the Third, and confirmed by Edward the First. The Reason why it is so term'd, is either because of the Excellency of the Laws and Liberties therein contained, or else because there was another Charter, call'd *Charta de Foresta*, establish'd with it, which was the less of the two; or because it contained more than any other Charters; or more than that of King Henry the First; or in regard of the Wars and Troubles in the obtaining of it; or of the great and remarkable Solemnity in the denouncing Excommunications against the Infringers of it. *Halsked* indeed tells us, that King John, to appease the Barons, yielded to Laws or Articles of Government much like to this great Charter; but we have now no antienter Law written than this; which was thought to be so beneficial to the Subject, and a Law of so great Equity, in comparison of those which were formerly in use, that King Henry, for the granting it, had the sixteenth Penny of all the moveable Goods, both of Temporality and Spirituality. Sir Edw. Coke says, it has been above thirty times confirmed. It is recorded, that when Henry III. confirm'd it, he swore on the word and Faith of a King, a Christian, and a Knight, to observe it. See *Charta Magna*.

MAGNES ARSENICAL, in Chymistry, a Mixture of equal Parts of Arsenic, Sulphur, and Antimony melted together over the Fire, and condensed in manner of a Stone. It is a very gentle Caustic, and was first invented by *Angelus Sala*. It has its Name *Magnet*, because being wore during Malignant Difeases, it is suppos'd to preserve the Wearer from Infection by a Magical Power.

MAGNET, or Loadstone, a Mineral Stone, or rather a Metal, or an imperfect Iron; in Weight and Colour resembling Iron Ore, the somewhat harder and more heavy. It is usually found in Iron Mines, and sometimes in very large pieces, half *Magnet*, half Iron. Its Colour is different, according to the different Countries it is brought from. *Norman* observes, that the best are those brought from *China* and *Romag*, which are of an Iron or Sanguine Colour; those of *Arabia* are reddish, those of *Macedonia* blackish; and those of *Hungary*, *Germany*, *England*, &c. the Colour of unwrought Iron. Neither its Figure nor Bulk are determined, but it is found of all Forms and Sizes.

The Antients reckon'd five kinds of *Magnets*, different in Colour and Virtue: the *Ethiopic*, *Magnesian*, *Bastic*,

*Alexandrian*, and *Norsilian*. They also took it to be Male and Female: but the chief Use they made of it was in Medicine; especially for the Cure of Burns, and De-fluxions on the Eyes: the Moderns, more happy, take it to conduct 'em in their Voyages.

The most distinguishing Property of this wonderful Body, are, That it attracts Iron, and that it points to the Poles of the World; and in other Circumstances also dips or inclines to a Point beneath the Horizon, directly under the Pole; and that it communicates these Properties by Touch, to Iron. On which Foundation are built the Mariners Needles; both Horizontal, and Inclinator, or Dipping Needles. See *Needle*.

The Attractive Power of the *Magnet* was known to the Antients, and is mention'd even by *Plato* and *Euripides*; who call it the *Heracleian Stone*; because it commands Iron, which subdues every thing else: But the Knowledge of its Directive Power, whereby it disposes its Poles along the Meridian of every Place, and occasions Needles, Pieces of Iron, &c. touch'd with it, to point nearly North and South, is of a much later date; tho' the exact Time of its Discovery, and the Discoverer himself, are yet in the dark. The first tidings we hear of it, is in 1260, when *Paulus Venetus* is said by some to have first introduced the Mariners Compass; tho' not as an Invention of his own, but as derived from the *Chinese*, who are said to have had the Use of it long before; but others, and with good reason, think that the *Chinese* rather borrow'd it from the *Europeans*. *John de Gota*, a *Neapolitan*, who lived in the 13th Century, is the Person usually suppos'd to have the best Title to the Discovery: And yet *Sir G. W. Beecher* mentions, that he had seen a Book of Astronomy much older, which suppos'd the Use of the Needle; tho' not as applied to the Uses of Navigation, but of Astronomy. And in *Guyot de Provins*, an old French Poet, who wrote about the Year 1180, there is express mention made of the Loadstone and the Compass; and their Use in Navigation obliquely hinted at. See *Compass*.

The Variation of the Needle, or its Declination from the Pole, was first discovered by *Seh. Cabot*, a *Venetian*, in 1500; and the Variation of that Variation by *Mr. Cellbrand*, an *Englishman*, about the Year 1625. Lastly, The Dip or Inclination of the Needle, when at liberty to play vertically, to a Point beneath the Horizon, was first discover'd by another of our Countrymen, *Mr. R. Norman*, about the Year 1576. See *Needle*.

Some of the Phenomena of the Magnet are as follow.

(1.) In every *Magnet* there are two Poles, the one whereof points Northward, the other Southward; and if the *Magnets* be divided into ever so many pieces, the two Poles will be found in each piece. (2.) These Poles in different parts of the Globe, are differently inclined towards a Point under the Horizon. (3.) These Poles, tho' contrary to one another, do help mutually towards the *Magnet's* Attraction and Suspension of Iron. (4.) If two *Magnets* are Spherical, one will turn or conform itself to the other, so as either of them would do to the Earth; and after they have so conformed or turn'd themselves, they endeavour to approach or join each other; but if placed in a contrary Position, they avoid each other. (5.) If a *Magnet* be cut thro' the Axis, the Parts or Segments of the Stone, which before were joined, will now avoid and fly each other. (6.) If the *Magnet* be cut by a Section perpendicular to its Axis, the two Points, which before were conjoined, will become contrary Poles; one in one, the other in the other Segment. (7.) Iron receives Virtue from the *Magnet* by application to it, or barely from an approach near it, tho' it doth not touch it; and the Iron receives this Virtue variously, according to the Parts of the Stone it is made to touch, or made approach to. (8.) If an oblong Piece of Iron be any how applied to the Stone, it receives Virtue from it, only as to its length. (9.) The *Magnet* loathes none of its own Virtue by communicating any to the Iron; and this Virtue it can communicate to the Iron very speedily; tho' the longer the Iron touches or joins the Stone, the longer will its communicated Virtue hold; and a better *Magnet* will communicate more of it, and sooner, than one not so good. (10.) Steel receives Virtue from the *Magnet*, better than Iron. (11.) A Needle touch'd by a *Magnet* will turn its Ends the same way towards the Poles of the World, as the *Magnet* will do it. (12.) Neither Loadstone nor Needles touch'd by it do conform their Poles exactly to those of the World, but have usually some Variation from them: And this Variation is different in divers places, and at divers times in the same place. (13.) A Loadstone will take up much more Iron when arm'd or capp'd than it can alone: And tho' an Iron Ring or Key be suspended by the Loadstone, yet the Magnetic Particles do not hinder that Ring or Key from turning round any way, either to the right or left. (14.) The Force of a Loadstone may be variously increas'd or lessen'd

lessen'd, by the various Application of Iron, or another Loadstone to it. (15.) A strong Magnet at the least distance from a lesser or a weaker, cannot draw to it a piece of Iron adhering actually to such lesser or weaker Stone; but if it come to touch it, it can draw it from the other: But a weaker Magnet, or even a little piece of Iron, can draw away or separate a piece of Iron contiguous to a greater or stronger Loadstone. (16.) In these Northern Parts of the World, the South Pole of a Loadstone will raise up more Iron than the North Pole. (17.) A Plate of Iron only, but no other Body interposed, can impede the Operation of the Loadstone, either as to its Attractive or Directive Quality. Mr. Boyle found it true in Glasses sealed hermetically; and Glafs is a Body, as impervious as most are, to any Effluvia. (18.) The Power or Virtue of a Loadstone may be impaired by lying long in a wrong Position, as also by Rust, Wet, &c. and may be quite destroy'd by Fire. (19.) A piece of Iron Wire well touch'd, will, upon being bent round in a Ring, or coil'd round on a Stick, &c. generally, quite lose its Directive Virtue; but always have it much diminish'd; and yet if the whole length of the Wire were not entirely bent, so that the Ends of it, tho' but for the length of one tenth of an Inch, were left straight, the Virtue will not be destroy'd in those parts; tho' it will in all the rest. This was first observ'd by Grimaldi and de la Hire; and is confirm'd by the Experiments of Mr. Derham; who adds further, that the coiling or bending the Wire as above, would always destroy its Virtue by Day, yet it would not do it in the Evening. (20.) The Sphere of the Activity of Magnets is greater and less at different times: in particular, that preserv'd in the Repository of the Royal Society will keep a Key or other Body suspended to another, sometimes, at the height of 8 or 10 feet; and at others, not above 4 feet. To which we may add, that the Variation of the Magnetical Needle from the Meridian, varies at various Times of the Day; as appears from some new Experiments of Mr. Graham. See Variation. (21.) By twisting a piece of Wire touch'd with a Magnet, its Virtue is exceedingly diminish'd, and sometimes so disorder'd and confus'd, that in some parts it will attract, and at others repel; and even in some places one side of the Wire seems to be attracted, and the other side repell'd by one and the same Pole of the Stone. (22.) A piece of Wire that has been touch'd, being split or cleft into two; the Poles are sometimes chang'd; as in a cleft Magnet; the North becoming the South, and the South the North: And yet sometimes one half of the Wire will retain its former Poles, and the other half have 'em changed. To which it may be added, that laying one or other side of the half uppermost, causes a great Alteration in its Tendency or Aversion to the Poles of the Magnet. (23.) A Wire being touch'd from End to End with the same Pole of the Magnet, the End whereat you begin will always turn contrary to the Pole which touch'd it: If it be again touch'd the same way with the other Pole of the Magnet, it will then be turn'd the contrary way. (24.) If a piece of Wire be touch'd in the middle with only one Pole of the Magnet, without moving it backwards or forwards, in that place will be the Pole of the Wire; and the two Ends will be the other Pole. (25.) If a Magnet be heated red hot; and again cool'd either with its South Pole towards the North in a horizontal Position, or with its South Pole downwards in a perpendicular Position; its Poles will be changed. (26.) Mr. Boyle (to whom we are indebted for the following Magnetical Phenomena) found he could presently change the Poles of a small Fragment of a Loadstone, by applying them to the opposite vigorous ones of a large Magnet. (27.) Hard Iron Tools well temper'd, when heated by a brisk Attrition, as filing, turning, &c. will, while warm, attract thin Filings or Chips of Iron, Steel, &c. but not when cold; tho' there are not wanting some Instances of their retaining the Virtue when quite cold. (28.) The Iron Bars of Windows, &c. which have a long time stood in an erect Position, grow permanently Magnetical; the lower Ends of such Bars being the North Pole, and the upper the Southern. (29.) A Bar of Iron that has not stood long in an erect posture, if it be only held perpendicularly, will become Magnetical; and its lower End the North Pole; as appears from its attracting the South Pole of a Needle: but then this Virtue is transient, and by inverting the Bar, the Poles will shift their places. In order therefore to render the Quality permanent in an Iron Bar, it must continue a long time in a proper Position. But the Fire will produce the Effect in a short time: for as it will immediately deprive a Loadstone of its Attractive Virtue; so, it soon gives a Veracity to a Bar of Iron, if being heated red hot, it be cool'd in an erect posture, or directed North and South. Nays, Tonges and Fire-forks, by being often heated and set to coal again in a posture

nearly erect, have gain'd this Magnetical Property. (30.) Mr. Boyle found, that by heating a piece of English Oker red hot, and placing it to cool in a proper posture, it manifestly acquired a Magnetic Virtue. And an excellent Magnet of the same Ingenious Gentleman's having lain near a Year in an inconvenient posture, had its Virtue surprisingly impair'd; as if it had been by Fire. (31.) A Needle well touch'd, 'tis known, will point North and South: if it have one contrary Touch of the same Stone, it will be deprived of its Faculty; and by another such Touch will have its Poles quite changed. (32.) A Bar of Iron that has gain'd a Veracity by being heated red-hot and cool'd again; North and South, and then hammer'd at the two Ends; its Virtue will be destroy'd by two or three smart Blows on the middle. (33.) By drawing the Back of a Knife, or long piece of Steel, Wire, &c. leisurely over the Pole of a Loadstone; carrying the Motion from the middle of the Stone to the Pole; the Knife or Wire does accordingly attract one End of a Needle: but if the Knife or Wire be pass'd from the said Pole to the middle of the Stone, it will repel that End of the Needle, which in the other Case it attracts. (34.) Either a Magnet or a piece of Iron being laid on a piece of Cork, so as to swim freely in Water; it will be found, that which covers of the two is held in the hand, the other will be drawn to it: so that Iron attracts the Magnet as much as it is attracted by it; Action and Reaction being always equal. In this Experiment, if the Magnet be set afloat, it will direct its two Poles to the Poles of the World. (35.) A Knife, &c. touch'd with a Magnet, acquires a greater or less degree of Virtue, according to the part it is touch'd on. It receives the strongest Touch, when it is drawn leisurely from the Handle towards the Point over one of the Poles; And if the same Knife thus touch'd, and thus in possession of a strong attractive Power, be retouch'd in a contrary Direction, viz. by drawing it from the Point towards the Handle over the same Pole, it immediately loses all its Virtue. Lastly, A Magnet acts with equal force in Vacuo, and in the open Air.

The Doctrine of the Magnet, or the Laws of Magnetism, Mr. Whiston lays down in the following Propositions.

I. The Loadstone has both an attractive and a directive Power united together; whereas Iron touch'd by it has only the former: i. e. the Loadstone not only attracts Needles or Filings of Steel, but directs them to certain different Angles, with respect to its own Surface and Axis; whereas Iron touch'd with it, does little or nothing more than attract them; still suffering them to lie along or stand perpendicular to its Surface and Edges in all places; without any such special Direction.

II. Neither the strongest nor the largest Loadstones give a better directive Touch to Needles, than those of a less Size or Virtue: to which it may be added, that whereas there are two Qualities in all Magnets, an Attractive and a Directive one; neither of 'em depend on, or are any Argument of the Strength of the other.

III. The Attractive Power of Loadstones and of Iron, will greatly increase or diminish the Weight of Needles on the Balance; nay, will overcome that Weight, and sustain other additional Weights too: while the directive Power has much smaller effect. Galvanius indeed, as well as Messemian and Dr. Gilbert, maintain it has none at all; but by a Mistake; for Mr. Whiston found from repeated Trials on large Needles, that after the Touch they weigh'd less than before. One of 484½ Grains lost 2½ Grains by the Touch; and another of 6726 Grains weight, no less than 14 Grains.

IV. 'Tis probable that Iron consists almost wholly of the Attractive Particles; and the Loadstone of the Attractive and Directive together; mix'd probably with other heterogeneous Matter; as having never been purg'd by the Fire, which Iron has: And hence may arise the reason why Iron, after it has been touch'd, will lift up much greater Weights than the Loadstone that touch'd it.

V. The Quantity and Direction of Magnetic Powers, communicated to Needles, is not properly, after such Communication, owing to the Magnet which gave the Touch; but to the Goodness of the Steel that receives it, and to the Strength and Position of the Terrestrial Loadstone, whose Influence alone those Needles are afterwards subject to, and directed by: so that all such Needles, if good, move with the same Strength and Point to the same Angle; what Loadstone soever (provided it be good) they were excited by. Nor does the Touch seem to do much more in Magnetical, than Attrition in Electrical Cases; i. e. it serves to rub off some obstructing Particles that adhere to the Surface of the Steel, and open the Pores of the Bodies touch'd, and so make way for the Entrance and Exit of such Effluvia as occasion or assist the Powers we are speaking of. Hence

he takes occasion to observe, that the directive Power of the Loadstone seems to be mechanical; and to be derived from magnetic Effluvia, circulating continually round it.

VI. The absolute attractive Power of different armed Loadstones, is, *ceteris paribus*, according to the Quantity, not of their Diameters or Solidities, but of the Surfaces of the Loadstones; or in a Duplicate Proportion of their Diameters.

VII. The Power of good Magnets unarmed, not sensibly different in Strength, similar in Figure and Position, but unequal in Magnitude, is sometimes a little greater, sometimes a little less than in the Proportion of their similar Diameters.

VIII. The Loadstone attracts Needles that have been touched, and others that have not been touched with equal Force, at Distances unequal, *viz.* where the Distances are to one another as 5 to 2.

IX. Both Poles of a Loadstone equally attract Needles, till they be, tho' roughly, touched; then it is, and then only, that that one Pole begins to attract one End, and repel the other: tho' the repelling Pole will still attract upon Contact, nay at very small Distances notwithstanding.

X. The attractive Power of Loadstones, in their similar Position to, but different Distances from Magnetic Needles, is in the Squareduplicate Proportion of the Distances of their Surfaces from those Needles reciprocally; or as the mean Proportionals between the Squares and the Cubes of those Distances reciprocally; or as the Square Roots of the fifth Powers of those Distances reciprocally. Thus the Magnetic Power of Attraction, at twice the Distance from the Surface of the Loadstone, is between a fifth and sixth Part of that Power at the first Distance. At thrice the Distance the Power is between the 15th and 16th Part, at four times the Distance the Power is 32 times as small, and at six times the Distance 88 times as small. Where it is to be noted, that the Distances are not taken, as in the Law of Gravity, from the Center; but the Surface: all Experience assuring us, that the Magnetic Power resides chiefly, if not wholly, in the Surfaces of Loadstones and Iron; without any particular Relation to any Center at all. The Proportion here laid down was determined by Mr. *Whiston*, from a great Number of Experiments of Mr. *Hankbee*, Dr. *Brook*, *Taylor*, and himself. The Force they measured by the Chords of those Arcs, by which the Magnet, at several Distances, draws the Needle out of its natural Direction, to which Chords (as he has demonstrated) it is ever proportional. The Numbers in some of their most accurate Trials he gives us in the following Table, setting down half the Chords, or the Sines of half those Arches of Declination, as the true Measures of the Power of Magnetism.

Distance in Inches.	Degrees of Inclination.	Sines of $\frac{1}{2}$ Arcs.	Rat. Squi-dupl.
20	2	175	465
14	4	349	216
12	6	525	170
12	8	697	138
11	10	871	105
10	12	1045	87
9	14	1219	70

XI. An Inclinator, or Dipping-Needle, of six Inches Radius, and of a Prismatic or Cylindric Figure, when it oscillates along the Magnetic Meridian, performs, here, every mean Vibration in about 6<sup>h</sup> or 360<sup>m</sup>; and every small Oscillation in about 5<sup>h</sup>  $\frac{1}{2}$ , or 330<sup>m</sup>; and the same kind of Needle, four Foot long, makes every mean Oscillation in about 24<sup>h</sup>, and every small one in about 22<sup>h</sup>.

XII. The entire Power of Magnetism in this Country, as it affects Needles a Foot long, is to that of Gravity nearly as 1 to 500; and as it affects Needles four Foot long, as 1 to 600.

XIII. The Quantity of Magnetic Power accelerating the same Dipping-Needle, as it oscillates in different vertical Planes, is ever as the Co-sines of the Angles made by those Planes, and the Magnetic Meridian taken on the Horizon.

*Coroll.* Thus if we would estimate the Quantity of Forces in the horizontal and vertical Situations of Needles at London; we shall find that the latter, in Needles a Foot long, is, to the entire Force along the Magnetic Meridian, as 96 to 100; and in Needles four Foot long, as 9667 to 10000; whereas in the former, the entire Force in Needles a Foot long, is as 28 to 100; and in those four Foot

long, as 2560 to 10000. Whence it follows, that the Power by which horizontal Needles are governed in these Parts of the World, is but one quarter of the Power by which the Dipping Needle is moved.

Hence also, since the horizontal Needle is moved only by a Part of the Power which moves the Dipping-Needle; and that it only points to a certain Place in the Horizon, because that Place is the nearest its original Tendency, of any, its Situation will allow it to tend to: When ever the Dipping-Needle stands exactly perpendicular to the Horizon, the horizontal Needle will not respect one Point of the Compass more than another, but will wheel about every way uncertainly.

XIV. The Times of Oscillation and Vibration, both in dipping and horizontal Needles equally good, is as that of their Lengths directly; and the actual Velocity of their Points along their Arcs always equal.

Hence Magnetic Needles are, *ceteris paribus*, still better the longer they are; and that in the same Proportion with their Lengths. See *Needle*.

XV. The Earth, on which we live, includes within it a vast Spherical Magnet, concentric thereto, with its own Poles, Meridians, Equator, and Parallels; and all much of the same general Nature with those of small *Terrellas*, or Spherical Loadstones, in the possession of the Curious among us.

XVI. The Power of a good *Terrella*, or Spherical Loadstone, as it affects a Needle a Foot long, is equal to the Magnetic Power of that internal Loadstone about two and an half, or three Diameters off such Loadstone. From which Consideration the Quantity of Magnetic Attraction, at all Distances from the internal Loadstone, for Needles a Foot long, may be determined; and from the same Consideration it appears, that the Diameter of this internal Loadstone is about 1150 Miles. To which we may add, that, in regard Sir *Isaac Newton* has demonstrated, that the Power of Gravity diminishes within the Earth, and is lesser there than at its Surface nearly, in the proportion of its greater Nearness to the Center; the Magnetic Power at 2900 Miles distance from us, and nearly 1060 from the Earth's Center, which is  $\frac{1}{2}$  of the Power of Gravity here, will be somewhat greater than the Power of Gravity there: Which Limit is worth our Attention, Gravity being stronger than Magnetism on the one Side of it, and weaker on the other; we mean as it affects Needles of one foot Diameter. At that Limit, therefore, at least near the Magnetic Poles, Iron, a Foot long, will be twice as heavy, and fall twice as fast as any other natural Body, *viz.* by the Union of those two equal Powers, Gravity and Magnetism; and of consequence, above that Limit, such an Iron will be less than twice as heavy; below it, more than twice as heavy as any other natural Body.

XVII. The Earth's internal Loadstone is not fixed to our upper Parts, but is moveable with respect thereto, and actually revolves on the Earth's Axis from East to West in a certain long Period of Time; as appears, beyond Contradiction, from the constant Variation of the horizontal Needle Westward; as well as the regular Increase of Inclination of the Dipping-Needle.

The only way to render this Motion, *i. e.* the Variation, possible and intelligible (to use Dr. *Halley's* Words) is to suppose it to turn about the Center of the Globe, having its Center of Gravity fixed and immovable in the same common Center of the Earth. This moveable internal Surface must likewise be loose, and detached from the external Parts of the Globe; which may be reckoned the Shell, and the other the *Nucleus*, or inner Globe, included within it, with a fluid Medium between. Now from the Variations moving Westwards, 'tis plain, that the forefaid *Nucleus* has not precisely attained the same Degree of Velocity with the exterior Parts in their diurnal Revolution; but so nearly equals it, that in 365 Revolves the Difference is scarce sensible; and must probably have arisen from hence, that the Impulse, whereby the diurnal Motion was impressed on the Earth, was given to the external Parts, and thence communicated to the internal.

XVIII. This internal Magnet has one central Pole Northwards, in the nature of the Poles of our common Loadstones; but its Southern Pole appears not to be central, but rather circular; and that at a great Distance from the Southern Pole of the Earth.

XIX. The Northern Magnetic Pole is now situate about the Latitude of 76 Deg.  $\frac{1}{2}$ , *i. e.* 13 Deg.  $\frac{1}{2}$  from the North Pole of the Earth, and about 30 Deg. Eastward from the Meridian of London.

XX. The Southern Magnetic circular Pole has its Center, or central Pole, nearly in the Parallel of 60 Degrees; and in a Meridian passing along the East Coast of *Borneo*, about 117 Degrees Eastward of London: its Radius

dus is also an Arc of a great Circle of about 44 Degrees.

XXI. The respective Motion of the internal *Magnet*, or the Velocity, *v. g.* of its North Pole, appears to be 27 Deg. o Min. in 144 Degrees, *i. e.* one Degree in five Years; so that it makes an entire Revolution in 1920 Years.

Hence as the Number of Degrees in the upper Earth's diurnal Revolution, is to the Number of Days in the Revolution of the internal *Magnet*, *i. e.* as 1 is to 700000, so is the respective Motion of this *Magnet* from East to West to the real Motion of the upper Earth from West to East; or to speak strictly, so is the Difference of their Motions from West to East, to the entire Motion of the upper Earth the same way. This external fixed Earth has therefore communicated almost all its Motion already to the internal *Magnet*, and can communicate no more than this Difference of their Motion, and that only in an infinite Term of Years; or, in other Words, this real internal Motion can never be the 700000th Part swifter than it is at present. This internal Motion therefore began with the Commencement of the diurnal Motion of the upper Earth; and has gone on still faster and faster by the Communication of that Motion thro' the intermediate Fluid. Since therefore Action and Reaction are equal, and tend to contrary Parts, this internal Loadstone, thus accelerated by the upper Part, must have all along retarded that upper Earth, and made the diurnal Rotation still slower and slower. This Acceleration on one Side, and Retardation on the other, must have been very great at the first beginning of the diurnal Motion, when the Difference of their Motion was equal to the entire Motion itself, and must have been diminishing ever since. To which Cause is probably owing that Acceleration of the Moon's Motion with respect to that of the Earth, since the time of the old Astronomers, first taken notice of by Dr. Halley, and embraced by Sir I. Newton. And the same Consideration seems to suggest a Method for determining the Age of the World; for were the Proportions of the Quantity of Matter in the upper Earth to the internal *Magnet*, with the Tenacity of the intermediate Fluid, &c. known, one might go back from the known Difference of their Velocity now, and find those Differences and Quantities of Motion themselves, *a priori*, in all past Ages; or were the Velocity of the first diurnal Rotation of the upper Earth known, we might geometrically determine, *a priori*, how long ago that Rotation began, or how antient our Earth is.

XXII. The Variation of Magnetic Needles from the Azimuth of the Meridians of the internal *Magnet*; is derived from the Difference of the Strength of the several Parts of the internal *Magnet's* Surface; which as it is only to be known by Experience, that Variation cannot be determined beforehand, unless where there are good Accounts how much it had formerly been; it being probable that it returns round, and will be the same in any Year of the next Revolution of the internal *Magnet*, that it has been in the like Year of any former Revolution, or will itself have a Revolution in about 1920 Years.

XXIII. The two fixed Magnetic Poles, in our upper Earth, first introduced by Dr. Halley, as necessary to solve the Irregularity of the Variation of the Horizontal Needle from the Meridians of the moveable internal *Magnet*, seem not to have any just Foundation in Nature; the like Irregularities being found in the common *Terræ* or Spherical Loadstones; and being best accounted for from the Composition of the *Magnets*, which are found to have Parts of different Degrees of Purity, Strength, and Perfection; so that where the Parts are weaker than ordinary, the stronger neighbouring Parts prevail, and draw the Needle that way: not but Dr. Gilbert's Notion of prominent and depressed Parts on *Magnets* may have some room, and be allowed to contribute somewhat to such Variations. See *Needle*.

As to the Causes of Magnetism, or the Manner in which these Phenomena of the *Magnet* are produced, we have yet no Hypothesis that will satisfactorily account for them. *Plutarch* tells us, the *Magnet* attracts Iron, by emitting some spiritual Effluvia, whereby the contiguous Air being opened and driven on either Side, does again drive that contiguous to it; and thus the Action being communicated round, the Iron is thereby protracted: but this is contradicted by the equally vigorous Action of the Loadstone in *Vacuo*, and in the open Air. Others of the Antients ascribe the Action of the *Magnet* to a Soul that animates it; and others to I know not what Sympathy between the Effluvia of the Iron and those of the *Magnet*. The Opinion that principally prevails among the Moderns is that of *Des Cartes*, maintained by *Malebranche*, *Robault*, *Regis*, &c. and even admitted of and confirmed by *Mr. Boyle*, &c. In this 'tis supposed there is continually flowing, from the Poles of

the World, a subtle, impalpable, and invisible Matter; channel'd or striated; which Matter circulating round the Earth, in the Plains of the Meridians, re-enters at the Pole opposite to that from which it issued, and passes again thro' the Poles parallel to its Axis: That the *Magnet* has two Poles answerable to those of the Earth, and that out of these there issues a Matter like that just mentioned: That this Matter, entering in at one of the Poles, gives the Impulse whereby Iron tends to the *Magnet*, and produces what we call Attraction. Now besides the Magnetical Matter re-entering the Poles of the *Magnet*, there is always a certain Quantity thereof circulating round the *Magnet*; composing a kind of Vortex about it. The Space wherein this Matter moves, is the Sphere of Activity of the *Magnet*, within which its attractive Faculty is confined. As to its directive Faculty, or the Inclination of a Needle touched with it to the Poles of the World, and its Dip to a Point beneath the Horizon, it follows from the same Principle; since were the *Magnet* or Needle to have any other Situation, the Magnetical Matter would strike on its Surface in vain; and not being able to get Admission, would, by degrees, change its Situation, till such time as its Pores corresponded to the Course of the Magnetical Matter; which Situation having once acquired, it would cease to move; the Magnetical Matter then ceasing to disturb it. The Form of a *Magnet* therefore is supposed to consist in its being perforated by an infinite Number of parallel Pores; some whereof are disposed to admit the striated Matter from the North Pole of the World, others that of the South; hence the North and South Poles of the *Magnet*.

As to the directive Power of the *Magnet*, *Mr. Whiston*, from the 11, 24, 34, &c. Laws of Magnetism, inclines to think it mechanical; and ascribes it to magnetic Effluvia circulating continually round the Loadstone; of which Circulation, he thinks, there are evident Indications in magnetic Experiments; as *Mr. Boyle* thinks there are of the Magnetism or magnetic Effluvia of the Earth; tho' those Effluvia were never yet rendered sensible as Electric Effluvia begin to be; but the attractive Power *Mr. Whiston* thinks entirely immaterial, as the Power of Gravity is; nor being able to devise any such Motion of a subtle Fluid belonging to the Loadstone, as will account for the attractive Power in the sesquiduplicate Proportion of the Distances reciprocally; tho' if he could, yet would that be no more than to remove the immediate Power of the Supreme Being one Step further; the last Resort of all mechanical Principles whatever being into the immaterial Power and Efficiency of the Deity.

*M. Harjotcher* maintains, that the *Magnet* is no more than a common Stone; full of an infinite Number of hollow Prisms, which, by the diurnal Motion of the Earth, are ranged parallel to each other, and nearly parallel to the Axis of the Earth. These Prisms have their Cavities filled with an extremely subtle Matter; which, by the diurnal Motion of the Earth, is passed from Prism to Prism: thus making a Circulation, and returning into the Prisms where it first began: From these Principles he deduces all the Phenomena of the *Magnet*; and *M. Andry* does the same, from the Doctrine of Alkali and Acid.

There are *Magnets* found in most of the Provinces of China, but the principal Use the Chinese make of them is in Medicine. *Le Compe* describes their manner of cutting them by a Machine, which, he says, is vastly more expeditious than any used among us.

The *Magnet* is also called *Lapis Herculens*, from *Hercules*, a City of *Magnaesia*, a Part of the ancient *Lydia*, where it is supposed to have been first found. Others derive the word *Magnet* from a Shepherd of that Name, who first discovered it with the Iron of his Crook on Mount *Ida*. It is also called *Lapis Nauticus*, by reason of its Use in Navigation; and *Siderites*, from its attracting Iron, which the Greeks call *stereon*.

MAGNETICAL AMPLITUDE, an Arch of the Horizon, contained between the Sun, at his Rising or Setting, and the East and West Point of the Compass: found by observing the Sun at his Rising and Setting by an Amplitude Compass. See *Amplitude*.

MAGNETICAL AZIMUTH. See *Azimuth*.

MAGNETISM, a Term used by some Chymists, to signify a certain Virtue, whereby one thing becomes affected at the same time with another, either in the same or a different manner. This is what they otherwise call *Sympathy*.

MAGNIFY, a Term chiefly used in reference to Microscopes, which are said to magnify Objects, or to make them appear bigger than they really are; but, in reality, Microscopes do not, nor cannot, magnify any Object, but only shew it nearer and more of its Parts than before were taken notice of. See *Microscope*.

**MAGNIFYING-GLASS**, in Optics, a little Sphere, convex Lens, &c. which, in transmitting the Rays of Light, inflects them so, as that the parallel ones become converging, and these which were diverging become parallel; by means whereof, Objects view'd thro' 'em appear larger than when view'd by the naked Eye. See *Lenz*, *Microscope*, &c.

**MAGNITUDE**, any thing that has Parts external to Parts, connected together by some common Term; as i. e. any thing locally extended or continued; or that has several Dimensions. The Origin of all Magnitude is a Point, which tho' void of Parts itself, yet its Flux forms a Line, the Flux of that a Surface, and of that a Body.

M. *Preter* gives the Name *Literal Magnitude* to a Magnitude express'd by Letters; and a *Numerical Magnitude* he calls such a one as is express'd by Numbers; a *Broken Magnitude* is a Fraction; a *Complex Magnitude* is that form'd by Multiplication; an *Incommensurable Magnitude* is a Magnitude that has no proportion to Unity.

Among the Writers of Optics, the *Apparent Magnitude* of a Body is that measured by the Optic or Visual Angle, intercepted between Rays drawn from its Extremes into the Centre of the Pupil of each. And 'tis one of their fundamental Maxims, whatever things are seen under the same or equal Angles, appear equal, and on the contrary.

The *Apparent Magnitudes* of an Object at different Distances, are in a Ratio less than that of their Distances reciprocally.

**MAGOPHONIA**, the Name of a Feast among the ancient *Persians*. The Magus *Smerdis* having usurped the Throne of the *Persians* upon the death of *Cambyses*, 521 Years before J. C. seven of the principal Lords of the Court conspired to drive him out of it. Their Design was executed with good success; *Smerdis* and his Brother, another Magus, call'd *Pisitizbes*, they kill'd. Upon which, the People also rose, and put all the Magi to the sword; inasmuch that there would not one have escap'd, had not the Night come upon 'em. *Darius*, Son of *Hystaspes*, was then elected King. In memory of this Massacre of the Magi, a Feast was instituted, says *Herodotus*, call'd *Magephonia*; from *Magy*, Magus, and *pho*, Murder.

**MAHIM**, or *Moyhim*, in Law, a Corporal Hurt, whereby a Man loseth the Use of any Member, that is or may be of any defence to him in Battle; as the Eye, Hand, Foot, Scalp of the Head, Fore-tooth, or, as some say, any Finger or Toe. *Clavo*, *Brat*, &c. If any one shall of Malice forethought cut out or disable any Limb or Member of any, with Intention in so doing to maim or disgrace him, it is Felony without Benefit of the Clergy; and when the Case is difficult to judge, whether it be a *Mahim* or not, the Judges commonly behold the Party wounded, and sometimes take the Opinion of Chirurgeons. The word comes from the *French Malvaigier*, to mutilate. The Canonists call it *Membris Mutuatio*; and all agree, it consists in the Loss of a Member, or the Use thereof.

**MAHOMETANISM**, the System of Religion broach'd by *Mahomet*, and still adhered to by his Followers. *Mahometanism* is embraced by the *Turks*, *Persians*, and several Nations among the *Africans*, and many among the *East-Indians*. The first and chief Article of the *Mahometan* Creed, is, that there is no other God but God; which they have from the *Alcoran*, where these Words are repeated incessantly: There is no other God but him. Your God is the only God. I am God, and there is no other God but me. This grand Axiom of their Theology seems to have been taken from the *Jews*, who were continually rehearsing those Words of *Deuteronomy*, Hear, Israel, the Lord our God is One. For this reason, the *Mahometans* account all such as own any thing of Number in the Divinity, to be Idolaters; And accordingly, one of the first Lessons they teach their Children, is, That God is neither Male nor Female, and consequently can have no Children.

The second Fundamental Article of *Mahometanism* consists in this, That *Mahomet* was sent from God. By which they exclude all other Religions; under pretence that their Prophet was the last and greatest of all the Prophets that God would ever send; and that as the *Jewish* Religion ceased with the Coming of the *Messiah*, so likewise the Christian Religion was to be abrogated with the Coming of *Mahomet*. Not but that they own *Moses* and *Jesus Christ* to have been great Prophets; but *Mahomet* they hold to be The Prophet, by way of Excellence; and the Paraclete or Comforter spoken of in Scripture.

These are the two Fundamentals of *Mahometanism*; so that when any is to make profession of that Faith, they content themselves with his speaking these words, There is no other God but God, and *Mahomet* is his Envoy or Prophet.

To these Articles the *Mahometans* have added that of Bathing or Purification, in imitation of the *Jews*. And

such an Opinion have they of these Purifications, that 'tis purely on that account they seem to have retain'd the Practice of Circumcision. For they pretend, with the *Jews*, that if the least part of the Body remain unwash'd, the Bathing is of no effect. Hence they find themselves under a necessity of being circumcis'd; that the Part cover'd by the Prepuce may also have its share of the Lotion.

Prayer is also one of the Things to which the *Mahometans* are oblig'd; and they perform it five times a day, to distinguish themselves from the *Jews*, who only do it thrice. Some of their Ceremonies of Prayer they hold to be necessary and of Divine Obligation; others they esteem convenient and prudential. That at Nine a-clock in the Morning they don't esteem necessary; but those that is in the Afternoon are held to be *Jure Divino*. They are oblig'd to observe an infinity of things to be heard: If they speak or smile in Praying, their Prayers are vain: and 'tis the same thing if they weep, unless it be with the Thought of Paradise or Hell. In many of their Prayers they use Beads. They believe with the *Christians* and *Jews* a Resurrection of the Dead. They hold, that e'er that time an *Anti-Mahomet* will come; and that J. C. will descend from Heaven to kill him, and establish *Mahometanism*. To which they add a great many more Chimeras, relating to *Goj* and *Magog*; and the Beast that is to come out of *Mosca*. The Mountains are to fly in the Air like Birds, and at last the Heavens will melt and run upon the Earth. They add however, that some time after, God will renew and re-establish the Earth; that then the Dead will be rais'd, &c. See *Alcoran*.

**MAIDEN**, an old Instrument used in some Countries, particularly in *Scotland*, for the bending of Criminals. The *Maiden* is a broad Piece of Iron, a foot square, sharp on the lower part, and loaded above with Lead, so as scarce to be lifted. At the time of Execution, it is pull'd up to the top of a narrow wooden Frame ten foot high, with a Groove on each side for the *Maiden* to slide in. The Prisoner's Neck being fasten'd to a Bar underneath, on a Sign given, the *Maiden* is let loose, and the Head in an instant separated from the Body.

**MAJESTY**, a Title given to Kings, and which frequently serves as a Name to distinguish them by. The Emperor is call'd, His *Cæsarian* or *Imperial Majesty*; the King of *Spain*, His *Catholic Majesty*; the King of *France*, His *most Christian Majesty*; the King of *Great Britain*, His *Britannic Majesty*, &c. Some have also extended this Title to the Popes. *Pasquier* has observed, that our Forefathers used this Quality exceeding sparingly; and that the frequent Use of the Word which now obtains, had not its beginning before the Reign of their *Henry II.* He induces several Letters of *S. Gregory*, who writing to King *Theobald* and *Theobald*, only compliments them with Excellence. Till the Time of *Charles V.* the King of *Spain* had no Title but that of *Highness*; And before our King *Henry VIII.* the Kings of *England* were only address'd under the Titles of *Grace* and *Highness*. At the Peace of *Münster*, there was a great Contest between the Ministers of the Emperor and those of *France*: The first would not allow the Title of *Serenity* to the King of *France*, and the latter would not give that of *Majesty* to the Emperor. At last 'twas agreed, that whenever the *French* King should write with his own Hand to the Emperor, he should give him the Title of *Imperial Majesty*; and reciprocally when the Emperor should write to the King, he should give him that of *Royal Majesty*.

Under the *Roman* Republic, the Title of *Majesty* belonged to the whole Body of the People and to the Principal Magistrates; so that to diminish or wound the *Majesty* of the Commonwealth, was to be wanting in Respect to the State, or its Ministers. But the Power passing into the hands of a single Person, the Appellation of *Majesty* was transfer'd to the Emperor and the Imperial Family. *Pliny* complements *Trajan* on his being contented with the Title of *Greatness*; and speaks very invidiously on those who affect that of *Majesty*. And yet *Majesty* seems to be the modestest and justest Title that can be attributed to Sovereigns, since it signifies no more, at bottom, than the Royalty or Sovereign Power.

The Word seems composed of the two *Latin* words, *Major*, greater, and *Status*, State.

**MAIL**, a Coat of *Mail*, so call'd from the *French Maille*, a square Figure, or the square Hole of a Net. *Maille* with a double *l* signifies a round Ring of Iron, whence the Play of *Paſſ-Mail*, from *Paſſ*, a Ball, and *Maille*, the round Ring thro' which it is to pass.

**MAILED** implies something speckled, or full of Specks; as the Feathers of Hawks, Partridges, &c. or as the Furs of some wild Beasts are.

**MAIN MORTE**, a Term in some ancient Customs still holding in *Burgundy* and other Countries, signifying a Right

Right which the Lord has, on the Death of the Chief of a Family *Maintenable* (i. e. subject to this Right) of taking the best Moveable in the House; or in default of that, they offer'd him the Right Hand of the Deceased, in token that he could serve him no longer. This Right was not uniform; some People were *Maintenable* in all their Effects Moveable and Hereditary; others in one only.

**MAINOUR**, *Mauour*, or *Meinour*, in Law, signifies the thing that a Thief takes away or steals. Thus, to be taken with the *Mauour*, is to be taken with the Thing stolen about him. If the Defendant were taken with the *Mauour*, and so carried to Court, in ancient Times they would arraign him on the *Mainour*, without any Appeal or Indictment. The word comes from the French *Mainier* or *Mainover*, to hold in the hand.

**MAINPRISE**, in Law, the taking or receiving a Man into friendly Custody, that otherwise is or might be committed to Prison; upon Security given for his forth-coming at a Day assigned. They who thus undertake for any, are call'd *Mainpennors*, because they receive him into their hands; whence also comes the word *Mainpernable*, denoting the Person who may be thus bailed. See *Bail*.

*Mainour* makes a great deal of difference between *Bail* and *Mainprise*: for he that is *mainprised* is already said to be at large after the Day he is set to *Mainprise* till the Day of his Appearance; but 'tis otherwise where a Man is let to *Bail* to four or two Men, by the Lord Justice in Eyre of the Forest, or any other Judge, until a certain Day; for there he is always accounted by the Law to be in their Ward and Custody for the Time; and they may, if they please, keep him in Prison all that time. So that he who is so bailed, shall not be said to be at large, or at his own liberty.

*Mainprise* is also an Undertaking in a Sum certain: *Bail* answers the Condemnation in Civil Causes, and in Criminals, Body for Body.

The Author of the *Mirror of Justice* says, that Pledges are those which bail or redeem any thing but the Body of a Man, and *Mainperners* those that free the Body; Pledges therefore belong properly to real and mix'd Actions, and *Mainperners* to personal. The word *Mainprise* is compounded of the French *Main*, Hand, and *prise*, taken.

**MAINTENANCE**, in Law, is the maintaining or upholding a Cause or Suit between others, either by Word, Writing, Countenance or Deed: Metaphorically taken from the succouring a young Child, that learns to go by one's hand; and used in the evil part in some of our Statutes. When a Man's Act in this kind is esteem'd *Maintenance*, and when not, see *Brooks* and *Kuchin*. There lies a Writ against a Maintainer, call'd a *Writ of Maintenance*.

**MAJOR**, in the Art of War, a Name given to several Officers of different Qualities and Functions.

*Major-General* is he who receives the General's Orders, and delivers them out to the Majors of the Brigades, with whom he concerns what Troops are to mount the Guard, what to go on Parties, what to form Detachments, or to be sent on Convoys, &c. It is his business also to view the Ground to encamp on, and he is next subordinate to the General and Lieutenant-General. See *General*.

*Major of a brigade*, either of Horse or Foot, is he who receives Orders, and the Word, from the Major-General, and gives them to the particular Majors of each Regiment. See *Brigade*.

*Major of a Regiment of Horse*, is the first Captain of the Regiment, and commands in the absence of the *Maitre de Camp*.

*Major of a Regiment*, is an Officer, whose business it is, to convey all Orders to the Regiment, to draw it up, and exercise it; to see it march in good Order, to look to its Quarters, and to rally it, if it happen to be broke in an Engagement, &c. He is the only Officer of a Regiment of Foot, who is allowed to be on horseback in time of Service; but he rides, that he might speedily get from place to place, as occasion serves. See *Regiment*.

There is also in a Garrison an Officer next to the Deputy-Governour, which is call'd the *Town-Major*: He ought to understand Fortification, and hath charge of the Guards, Round, Patrols, and Centinels.

There are also *Aids-Major*, *Drums-Major*, and other Officers; so call'd by reason of some Seniority or Prerogative that they have over the rest.

**MAJOR**, in Law, is a Person who is of Age to manage his own Affairs. By the Civil Law, a Man is not a *Major* till the Age of 25 Years; in England he is *Major* at 21, and in Normandy at 20.

**MAJOR**, in Logic, is understood of the first Proposition of a regular Syllogism. 'Tis call'd *Major*, because it has a more extensive Sense than the *Minor* Proposition, as containing the principal Term. See *Syllogism*.

**MAJOR** and **MINOR**, in Music, are spoken of the Concords which differ from each other by a Semi-tone. There are *Major* and *Minor* Thirds, &c. The *Major* Tone is the Difference between the 5th and 4th, and the *Major* Semi-tone is the Difference between the *Major* 4th and the 3d: The *Major* Tone surpasses the *Minor* by a Comma. See *Concord*.

**MAJOR-DOMO**, an Italian Term, frequently used to signify a Steward.

The Title of *Major-Domo* was formerly given in the Courts of Princes to three different kinds of Officers. 1<sup>st</sup>, To the Officer who took care of what related to the Prince's Table or Eating, otherwise call'd *Eleaser*, *Præfatus Mensæ*, *Archibricinus*, *Dapifer*, and *Præfatus Cœnæ*. 2<sup>dy</sup>, *Major-Domo* was also applied to the Steward of the Household. 3<sup>dy</sup>, The Title of *Major-Domo* was also given to the Chief Minister, to whom the Prince deputed the Administration of all his Affairs, foreign and domestick, relating to War as well as Peace. Instances of *Major-Domo's* in the two first Senses are frequent, both in the English, French, and Norman Affairs.

**MAKE**, in Law, signifies to perform and execute. Thus, to *make his Law*, is to perform that Law to which he had formerly bound himself; i. e. to clear himself of an Action commenc'd against him, by his own Oath and the Oath of his Neighbours. To *make Scrivens*, or *Castom*, is nothing else but to perform.

**MALACIA**, a Disease consisting in a deprav'd Appetite, wherein the Patient covets and longs for some particular kind of Food with extraordinary Exactness, and eats it to Excess. As when a Woman with Child is vehemently desirous of Herrings, or any other usual Dish. Many Authors confound this Affection with another call'd *Pica*, consisting in a Depravation of Appetite, which leads the Patient to covet things unnatural and absurd, as Lime, Coals, &c. The *Malacia* seems to arise from an ill Disposition of the Menstruum in the Stomach; or from some Defect in the Imagination, which determines it to some one thing rather than another. The word seems derived from the Greek *μαλακός*, soft: too lax a Tone of the Stomach being generally the Occasion of Indigestion and unusual Cravings.

**MALANDERS**, a Disease in Horses so called from the Italian *Malandare*, to go ill. It consists in certain Chops, or Chinks, appearing on the inside of the Fore-Legs, just against the bending of the Knee, which void a red, sharp, and biting Water.

**MALE**, the Sex which has the Parts of Generation without-wards, and which has ordinarily the Preheminence over the other.

**MALEBRANCHISM**, the Doctrine or Sentiments of Father *Malebranch*, a Priest of the *Oratory of France*. *Malebranchism* is in a great measure the same with *Cartesianism*. It must be own'd however, that tho' F. *Malebranch* thought the same with *Des Cartes*, yet he does not seem to have follow'd him, but to have met with him. *Malebranchism* is contain'd in the *Recherche de la Verité*; and to give a general Notion of it, we need only repeat what M. *Fontenelle* says of that Work. The *Enquiry after Truth*, says he, is full of God. God is the only Agent, and that too, in the strictest sense. All Power of Acting, all Actions belong immediately to him. Second Causes are no Causes. They are only Occasions that determine the Action of God; Occasional Causes. See *Cause*. F. *Malebranch*, however, does not here lay down his System entire with regard to Religion, or rather the Manner in which he would reconcile Religion to his System of Philosophy. That he reserv'd for his *Christian Conversations*, printed in 1677, where he proves the Existence of a God, the Corruption of Human Nature by Original Sin, the Necessity of a Mediator and of Grace. *Malebranchism*, notwithstanding, appears to many Persons not only ill grounded, but even dangerous and destructive to Religion: and has accordingly been vigorously oppos'd by many zealous French Authors. The first was M. *Foussier*. After him came M. *Arnauld*; and in 1715, (the Year F. *Malebranch* died) F. *de Terville*, a Jesuit, publish'd an ample Confutation (as he imagines) of his whole System. That part which relates to our seeing all things in God, has been answer'd by Mr. *Locke*.

**MALEDICTION**, in Law, a Curse usually annex'd to Donations of Lands, &c. to Churches and Religious Houses; imprecating the most direful Punishments to those who should infringe them.

**MALIGNANT**, in Medicine, a Disease greatly aggravated: The word is generally applied to such Fevers as are Epidemical, or infectious, and are attended with Spots and Eruptions of various kinds. See *Fever*.

**MALLEABLE**, something hard and ductile, and that may be beaten, forg'd and extended under the Hammer without breaking. All Metals are *Malleable*, excepting Quicksilver; but Gold in the greatest degree of all. The Chymists have long sought the Fixation of Mercury, to render it *malleable*. 'Tis a popular Error, that ever

the Art of making Glafs malleable, was known; its Nature is incapable of it. For if it were ductile, its Pores would not be opposite to each other, and of consequence it would not be transparent; so that its principal Quality would be lost. See *Transparency*. This Error is founded on the Credit of ancient Historians.

MALLEOLUS, a Process in the lower part of the Leg just above the Foot. There is one internal, and another external. The internal is an Eminence of the Tibia, the external of the Fibula: the two together form the Ankle.

MALLET, a kind of large Hammer, made of Wood, much used by Artificers who work with the Chiffel, as Sculptors, Masons and Stone-cutters, whose Mallet is ordinarily round; Carpenters, Joiners, &c. who use it square.

MALLEUS, in Anatomy, is understood of one of the Bones of the Ear, from its Resemblance to a Hammer or Mallet; first discovered by *Jac. Carpenfis*. See *Ear*.

MALMSEY, or *Malsosy*, a kind of Wine brought from Greece or Candia; so call'd from *Malsosia*, a City in *Peloponnesus*, which is the ancient *Epilauria*, whence this celebrated Liquor was first brought. That brought from Candia is esteem'd the best. See *Wine*.

*Malmsey* is also the Name of a kind of Muscadine Wine brought from *Provence*.

MALT, a Preparation of Barley, whose Use is well known. The Process of Manner of making it, Sir *R. Morray* describes as follows. Take good Barley newly threshed, &c. put about six English Quarters in a Stone Trough full of Water, where let it steep till the Water be of a bright reddish colour; which will be in about three days, more or less, according to the Moistness or Dryness, Smallness or Bigness of the Grain, the Season of the Year, or the Temperature of the Weather. In Summer, *Malt* never makes well; in Winter it requires longer steeping than in Spring or Autumn. It may be known when it is steep'd enough, by other Marks besides the Colour of the Water; as by the excessive Swelling of the Grain if it be over-steep'd, and by too much Softness; being, when 'tis in a right Temper, like the Barley prepared to make Broth of. When it is sufficiently steep'd, take it out of the Trough, and lay it on heaps, to let the Water drain from it; then after two or three hours turn it over with a Scoop, and lay it in a new heap, about 20 or 24 Inches deep.

This Heap is call'd the *Cowling Heap*, and in the right Management of this lies the principal Skill. In this Heap it may lie 40 hours, more or less, according to the forement'd Qualities of the Grain, &c. before it come to the right Temper of *Malt*; which that it may do equally, is mainly desired. While it lies in this Heap, it must be carefully look'd to, after the first 15 or 16 Hours; for about that time the Grain begins to put forth the Root: which when they have equally and fully done, the *Malt* must within an hour after be turn'd over with a Scoop; otherwise the Grains will begin to put forth the Blade or Spire also, which must by all means be prevented. If all the *Malt* don't come equally, but that which lies in the middle, being warm'd, come the soonest; turn it, so as the outmost may lie inmost, and thus manage it till 'tis all alike. As soon as the *Malt* is sufficiently come, turn it over, and spread it to a depth not exceeding five or six Inches; and by that time it is all spread out, begin and turn it over and over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the Heap deeper by degrees; and continue so to do for the space of 48 hours at least. This frequent turning it over, cools, dries, and deadens the Grain, whereby it becomes mellow, melts easily in Brewing, and separates entirely from the Husk. Then throw up the *Malt* into a Heap, as high as you can; where let it lie till it grow as hot as your Hand can endure it, which usually comes 't' pass in about 30 hours space. This perfects the Sweetness, and Mellowness of the *Malt*. After it is sufficiently heated, throw it abroad to cool, and turn it over again about 6 or 8 hours after, and then lay it on the Kilm with Hair-Cloth or Wire spread under it; where after one Fire, which must last for 24 hours, give it another more slow, and afterwards, if need be, a third: for if the *Malt* be not thoroughly dried, it cannot be well ground, neither will it distill well in the Brewing; but the Ale it makes will be red, bitter, and will not keep. The best Fuel is Peat or Turf; the next, Charcoal. If there be not enough of one kind, burn the best first, for that gives the strongest Impression. Indeed the best and most natural Method of drying it, is in the Sun in the Months of *April* and *May*. This yields the palest, the most wholesome, and the finest Liquor. However this be, take care the *Malt* be not smok'd in the drying. As to the Complexion or Colour of *Malt*, White is account'd the best, because the most natural.

The Manner of preparing Liquors, of *Malt*; see under the word *Brewing*.

*Malt Liquors* have different Names, as well as different Virtues, Properties and Uses, both from the different Manners of preparing the *Malt*, (whence they are distinguish'd into *Pale* and *Brown*) and from the different Manners of preparing or brewing the Liquors themselves; whence they are divided into *Beer* and *Ale*, *Strong* and *Small*, *New* and *Old*.

As to the first Division, *Malt Drinks* are either *Pale* or *Brown*, as the *Malt* is more or less dried on the Kilm; that which is the tenderest dried tinging the Liquor least in brewing, and therefore call'd *Pale*; whereas that higher dried, and as it were roasted, makes it of a higher colour: a Mixture of both these makes an Amber Colour, whence several of these Liquors take their Name. Now 'tis certain the *Pale Malt* has most of the natural Grain in it, and is therefore the most nourishing; but for the same reason, requires a stronger Constitution to digest it. Those who drink much of it, are usually fat and liek in their Bloom; but are usually cut off with sudden Fevers; or if they avoid this, fall early into a disempir'd Old Age. The *Brown* makes a Drink much less viscid, and sicker to pass the several Strainers of the Body; but if very strong, may lead on to the same Inconveniences with the *Pale*; tho' a single Debauch wears off much more easily in the *Brown*. Dr. *Quincey* observes, that the best *Pale Liquors* are those brew'd with hard Waters, as those of Springs and Wells: in regard the Mineral Particles wherewith these Waters are impregnated, help to prevent the Cohesions of those drawn from the Grain, and enable them to pass the proper Secretions the better; as the viscid Particles of the Grain do likewise defend these from doing the mischief they might otherwise occasion. But softer Waters, as Rain and River Waters, seem best suited to draw out the Substance of high-dry'd *Malt*, which retain many fiery Particles in their Contexture, and are therefore best lost in a smooth Vehicle.

As to the Difference in Preparation, it consists chiefly in the Use of Hops, as in *Beer*; or in their Omission, as in *Ale*. Now the Difference made by Hops, is best discovered from the Nature and Qualities of the Hops themselves. These are known to be a subtiler grateful Bitter; in their Composition therefore with this Liquor, they add somewhat of an Alkaline Nature, i. e. Particles that are subtiler, active and rigid. By which means the rosy, viscid Parts of the *Malt* are more divided and subtiliz'd, and are therefore not only render'd more easy of Digestion and Secretion in the Body; but also, while in the Liquor, prevent it from running into such Cohesions as would make it rosy, vapid and sour. Now for want of this, in unhopp'd Drinks, that clammy Sweetness which they retain after working, soon turns them Acid, and unfit for Use; which happens sooner or later, in proportion to the Strength they receive from the *Malt*, and the Communion it has undergone by Fermentation. 'Tis a common Opinion, that Ale is more Diuretic than Beer, that is, unhopp'd Liquors more than that with Hops in it. Which may hold in some particular Constitutions, in regard Ale being more smooth, softening, and relaxing, where Urine is to be promoted by enlarging the Passage, as in thin dry Constitutions, this is the most likely to effect it. But where the promoting of Urine is to be done by attenuating and breaking the Juices, and rendering them more fluid, 'tis certainly best answer'd by those Drinks which are well hopp'd. As to the Dispute, whether or no Hops tend to breed the Stone, 'tis too long to enter upon here. Dr. *Quincey* is of opinion, there is but little reason for the Affirmative side of the Question; and in the general makes no scruple to say, that for one Constitution damaged by Beer, there are Numbers spoil'd by Ale. For this last manifestly fouls the Glands, stuffs the Vessels with Slime and Viscidity, makes the Body unwieldy and corpulent, and paves the way for Cachexies, Jaundice, Asthma's, and at last incurable Dropsies. The Urinary Passages, also, which it is supposed to clear, it will in time fill with Slough and Matter of as ill consequence as Gravel.

Again, the different Strengths of these Liquors makes their Effects different. The stronger they are, the more viscid Parts they carry into the Blood; and though the Spirituous Parts make these imperceptible at first, yet when these are evaporated, which will be in a few hours, the other will be sensibly felt by Pains in the Head, Nauseousness at the Stomach, and Lassitude or Littlefiness to Motion. This, those are the most sensible of, who have experienced the Extremes of drinking these Liquors and Wines; for a Debauch of Wine they find much sooner wear off, and they are much more lively and brisk afterwards, than after fuddling *Malt Liquors*, whose viscid Remains will be long over they are shook off. These Liquors therefore are more wholesome for being small; i. e. of such a Strength as is able to carry a small degree of Warmth into the Stomach, but not so great as to prevent

vent their being proper Diluters of the necessary Food. Indeed in robust People, or those who labour hard, the Viscidities of the Drink may be broke into convenient Nourishment; but in Persons of another Habit and Way of Living, they serve rather to promote Obstructions and ill Humours.

The Age of these Liquors is the last thing by which they are render'd more or less wholesome. Age seems to do nearly the same thing as Hops; for those Liquors which are longest kept, are certainly least viscid: Age breaking the viscid Parts, and by degrees rendering them smaller and finer for Secretion. But this is always determined according to their Strength; in proportion to which they will sooner or later come to their full Perfection as well as Decay. For when Ale or Beer is kept till its Particles are broke and comminuted as far as they are capable, then 'tis they are the best; and beyond this they will be continually on the Decay, till the finer Spirits are entirely escaped, and the Remainder becomes rapid and sour.

We shall only add, that those who mix Wine with their common Drink, are less subject to Coughs, with other Distempers of the Breast, and to Dropsies; yet are they more affected with Gravel and Pains of the Gout. See *Wine*.

**MALTA, Knights of:** An Order of Military Religious, who have bore various Names; as, *Hospitaliers of S. John of Jerusalem, Knights of S. John, Knights of Rhodes, Order of Malta, Religion of Malta, &c.* About the Year 1048, some *Neapolitan* Merchants founded a Church after the *Latin Rite* at *Jerusalem*, giving it the Name of *S. Maria della Latina*. They also founded a Monastery of Religious after the Order of *S. Bennet*, for the Reception of Pilgrims; and afterwards an Hospital near the Monastery, to take care of the Diseased, under the direction of a Master or Rector, to be nominated by the Abbot of *S. Maria della Latina*. Besides which, they also built a Chappel in honour of *S. John Baptist*. In 1099, *Gadfrey of Bullen* having taken *Jerusalem*, endow'd this Hospital with some Demesnes he had in *France*; and others imitating his Liberality, the Revenues of the Hospitals became considerably augmented. Upon this, *Gerard Torn* their Rector, in concert with the Hospitaliers, resolv'd to separate from the Abbot and Religious of *S. Maria*, and to form a distinct Congregation, under the Name and Protection of *S. John Baptist*: And hence it was, that they had the Name of *Hospitaliers, or Brethren of S. John of Jerusalem*. Pope *Paschal II.* by a Bull in the Year 1113, confirm'd the Donations made to this Hospital, which he settled under the protection of the Holy See; ordering that the Rectors, after *Gerard's* death, should be chosen by the *Hospitaliers*. *Raymond de Puy*, *Gerard's* Successor, took the Title of *Master*: He gave a Rule to the *Hospitaliers*, which was approved by *Calixtus II.* in 1120.

Such was the first Rise of the Order of Malta. Now their first Grand Master finding the Revenues of the Hospital vastly exceeded what was necessary for the Entertainment of poor Pilgrims and diseased Persons, resolv'd to employ the Surplus against the Infidels; and with this View offer'd himself to the King of *Jerusalem*. He divided his *Hospitaliers* into three Classes. The first consisted of Nobles, whom he destin'd to the Profession of Arms, for the Defence of the Faith, and the Protection of Pilgrims; the second consisted of Priests or Chaplains, who were to perform the Office; and the third of Servitors, who were not Noble, but were also appointed for the War. He also regulat'd the Manner of admitting Knights Brothers; and had the whole confirm'd by Pope *Innocent*; who gave them for Arms, a White Cross in a Field Argent, which continu'd still the Standard of this Order.

After the Loss of *Jerusalem*, they retired first to *Margat*, then to *Acre*, which they defended very vigorously in 1190. After the entire Loss of the *Holy Land*, they withdrew to *Cyprus*, where *K. Henry of Lusignan*, whom they had follow'd thither, gave 'em the City of *Limiffon*. Here they continu'd 15 Years; when taking the Island of *Rhodes* from the *Saracens* in 1308, they settled there. And now it was that they first took the Name of *Knights, viz. Knights of Rhodes*. *Andronicus*, Emperor of *Constantinople*, granted to their Grand Master *Foulque de Villaret*, the Investiture of this Order; and the Donation was confirm'd by Pope *Clement*. The Year following, with the assistance of *Andalus IV.* Duke of *Savoy*, they defended themselves and their Island against an Army of *Saracens*. In 1480, their Grand Master *d' Aubouffon* made a vigorous Defence against *Mabower II.* and preserved the Island, in spite of a formidable Army which besieged it for the space of three Months. But in 1522, it was attack'd by *Seliman* with an Army of three hundred thousand Men, and taken by him, after having been in the possession of the Knights 213 Years. After this Loss, the Grand Master

and Knights retired first into the Isle of *Corfu*. Sometime after Pope *Clement VII.* gave them *Viterbo*. Lastly, *Charles V.* in 1530, gave them the Island of *Malta*, which they still hold; and hence they come by the Appellation of *Knights of Malta*; tho' their proper Name is that of *Knights of the Order of St. John of Jerusalem*; and this Grand Master, among his other Titles, still retains that of *Master of the Hospital of St. John, and Guardian of the Poor of our Saviour Jesus Christ*.

The Order of *Malta* have no other Dominions besides that of their Island, and some other little Places in the Neighbourhood, the chief whereof are *Gozo* and *Comino*: The Government is both Monarchical and Aristocratical; the Grand Master being the Sovereign, and the Chapter the Senate. It is Monarchical with regard to the Inhabitants of *Malta*, and the Isles adjacent, and even with regard to the Knights in every thing relating to the Statutes and Rule of their Order; and Aristocratical, with regard to the Decision of any important Affairs, which are not to be dispatch'd but by the Grand Master and the Chapter. There are two Councils, the one ordinary, compos'd of the Grand Master, as Chief, and the *Grands Croix*; the other compleat, consisting of the Grand Master, the *Grands-Croix*, and the two Senior Knights of each Language.

The Languages of *Malta* are the several Nations whereof the Order is compos'd. Of these there are eight, viz. *Provence, Auvergne, France, Italy, Aragon, Germany, Castile, and England*. The Pillar (as he is call'd) of the Language of *Provence* is the Grand Commander, he of *Auvergne* the Grand Marshal, he of *France* the Grand Hospitalier, he of *Italy* Grand Admiral, he of *Aragon* Grand Conservator, or Draper, as he was antiently call'd; the Pillar of the Language of *Germany* is Grand Bailiff, and he of *Castile* Grand Chancellor; the Language of *England*, which has been extinct since the Time of the Reformation under King *Henry VIII.* had for its Pillar, or Chief, the *Turolober*, or General of the Infantry. The Language of *Provence* is the first, on account of *Raimond de Puy*, their first Grand Master, who was a *Provincial*.

In each Language there are several Grand Priors and capital Bailiages. To each Language belongs a Hall, where the Knights eat, and hold their ordinary Assemblies. Each Grand Prior has a Number of Commandries. The Commandries are either magistral, by Right, or by Favour; the magistral are those annex'd to the Grand Mastership, whereof there is one in each grand Priory. Commandries by Right are those which come by Right of Seniority; their Seniority is comput'd from the Time of their Admission, but they must first have lived five Years at *Malta*, and have made four Caravanes, or cruizing Voyages on the *Turks* and *Corfairs*. Commandries by Favour, are those which the Grand Master, or the Grand Priors have a Right of conferring; 3 one of these they confer every five Years on whom they please.

The Noble Knights are call'd *Knights by Right*; excepting whom, none can be Bailiffs, Grand Priors, or Grand Masters. The Knights by Favour are those who, not being noble of themselves, are rais'd, on account of some great Exploit, or notable Service, into the Rank of Nobles. The Servitors, or Serving-Brothers, are of two kinds; (1.) The Servitors of War, whose Functions are the same with those of the Knights. (2.) Servitors of Religion, whose whole Business is to sing the Praises of God in the Conventual Church, and to officiate each in his Turn as Almoners on board the Vessels and Gallies of the Order. The Brothers of Obedience are Priests, who, without being oblig'd to go to *Malta*, take the Habit of the Order, make the Vows, and attach themselves to the Service of some of the Churches of the Order, under the Authority of a Grand Prior, or Commander, to whom they pay Obedience. The Knights of Majority are those who, according to the Statutes, are admitted at sixteen Years of Age. The Knights of Minority are those who are admitted from the Time of their Birth; which, however, can't be done without a Dispensation from the Pope. The Chaplains can only be admitted regularly from ten to fifteen Years of Age; after fifteen they must have a Brief from the Pope; till fifteen the Grand Master's Letter is sufficient. These are call'd *Diac'ns*, and must give Proof of their being born of creditable Families.

For the Proofs of Nobility to be made, e'er the Admission of Knights, in the Language of *Germany*, they go back six Generations; in the rest 'tis sufficient to go back to the Great Grandfather on the Father's or Mother's side. All the Knights, after their Profession, are oblig'd to wear a white Cross or Star, with eight Points over the Cloak or Coat on the left Side, which is the proper Habit of the Order, the Golden Cross being only an Ornament.

There are also Female Hospitaliers of the Order of St. John of Jerusalem, sometimes also called *Chevalieresses*, or *Sister-Knights*, of equal Antiquity with the Knights themselves; whose Business was to take care of the Women-Pilgrims, in an Hospital's-part from that of the Men.

**MALTA**, a kind of Cement, formerly in great Use, composed of Pitch, Wax, Plaster, and Grease. Besides this, there was another kind of *Malta* wherewith the Romans plastered and whitened the Insides of their Aqueducts; this was a very fine Cement, consisting of Lime flaked in Wine, incorporated with melted Pitch and fresh Figs. The natural *Malta* is a kind of Bitumen, wherewith the *Assiateks* plaster their Walls. When this *Malta* is once set on fire, Water won't extinguish it, but serves rather to make it burn more fiercely. The first *Malta* was antiently used in the Dedication of Churches.

**MAMME**. See *Breast*.

**MAMMELUKE**, the Name of a Dynasty which reigned a considerable Time in *Egypt*. They were originally *Turkish* and *Circassian* Slaves, bought of the *Tartars* by *Mehmed*, to the Number of a thousand, whom he bred up to Arms, and raised some to the principal Offices of the Empire. They killed Sultan *Moadam* in 1250, being affronted at his concluding a Treaty with his Prisoner St. Louis without their Privity. This *Moadam* was the last Sultan of the *Majoukies*; to whom succeeded the *Mammelukes*, the first of whom was Sultan *Azeddin*, or *Menz Ibec*, the *Turcoman*.

Others say, that the *Mammelukes* were ordinarily chosen from among the Christian Slaves, and that they were the same thing, in great measure, with the *Janiziers* among the *Turks*. They never married. The first arc said to have been brought from *Greece*, and some add, that they first began to be talked of about the Year 869.

The Word comes from *מלך*, *regere, imperare*, the *Arabic* Participle Passive wherof is *מלומה*, *Mamlouh*, which signifies *Subiect*, or one under the Dominion of another. *Scaliger* holds, that the Word is *Arabic*, but that it properly signifies something bought with Money; but others will have it signify any thing acquired, either as Prize or Purchase.

**MAMMIFORMIS**, in Anatomy, a Name given to two Apophyses of the Bone in the back Part of the Skull, so called from their resembling a Breast. See *Mastoides*.

**MAMMILLARIS**, in Anatomy, an Epithet given to two little Protuberances, somewhat resembling the Nipples of the Breast, found under the Fore-Ventricles of the Brain, and supposed to be the Organs of Smelling. They are called *Apophyses Mammillares*. There is also a Muckle called *Mammillaris*, or *Najivoides*, serving to stoop the Head.

**MANAGE**, or *Manege*, a Riding Academy, or Place for riding the Great Horse, and for breaking Horses to the proper Motions and Actions. In a *Manege* is a Place defined for vaulting round a Pillar, a Course or Carrier for running the Rings, and on the Side are Pillars, between which are placed the Horses destined for high Airs. *Manege* is also used for the Exercise itself, either of the Horse or the Rider. The Word is borrowed from the *French* *Manege*, and that from the *Italian* *Maneggio*, or, as some will have it, *à Mains agende*.

**MANCHLE**, a Carcerer; there was antiently an Officer in the Temple called by this Name, now called the Steward; and the Name and Office is retained still in our Colleges in both the Universities.

**MANDAMUS**, a Writ that lieth after the Year and Day, whereas, in the mean Time, the Writ called *Dum clausit extremum* hath not been sent out to the Escheator, for the same purpose to which it should have been sent. *Mandamus* is also a Charge to the Sheriff, to take into the King's hands all the Lands and Tenements of the King's Widow, that, against her Oath formerly given, marrich without the King's Consent.

**MANDARIN**, a Name given by the *Portuguese* to the Nobility of the *Eastern* Countries, whom the *Chinese* call *Quan*, or rather *Coben*, *q. d. se serva*, as he a Minister of a Prince. There are in *China* nine Orders of *Mandarins*; or nine Degrees of Nobility; which have as many different Animals for their Characteristics. The first is distinguished by a Crane, the second by a Lion, the third by an Eagle, the fourth by a Peacock, &c. There are in all thirty-two or thirty-three Thousand *Mandarins* in *China*. There are *Mandarins* of Letters, and *Mandarins* of Arms; both the one and the other of which pass several Examinations. Since the Time that the *Tartars* have rendered themselves Masters of *China*, most of the Tribunals, or Courts of Justice, &c. instead of one *Mandarin* for a President, have two; the one a *Tartar*, the other a *Chinese*. The *Mandarinat* is not hereditary, nor are any raised to it but Men of Letters.

*Mandarin* is also the Name which the *Chinese* give to the

learned Language of the Country; for besides the proper and peculiar Language of each Nation and Province, they have one common to all the learned Men in the Empire; and which is that in *China* which the *Latin* is in *Europe*. This Language they call the *Mandarin*, or the Language of the Court. Their public Officers, as Notaries, Lawyers, Judges, and chief Magistrates, write and speak the *Mandarin*.

**MANDATE**, in the Canon Law, is a Rescript or Edict of the Pope, by which he commands some Ordinary, Collator, or Prefector, to put the Person there nominated in possession of the first Benefice vacant in his Collation. An Apostolical *Mandate* for the Provision of Benefices, is a monitorial and comminatory Letter from the Pope to a Bishop, by which he is enjoined to provide a Substitution for those who have been ordained by him, or his Predecessors, from the Tonfure to Sacred Orders inclusively; and to allow them this Substitution till they be provided of a Benefice; which Practice was occasioned by the Bishop's laying Hands on great Numbers, and afterwards abandoning them to Misery and Want. At first the Popes only gave honorary *Mandates*, which were no more than simple Prayers and Requests, that did not bind the Ordinary; afterwards they gave preceptory *Mandates*, which did not annul the Provisions of the Ordinary; at last they set up executory *Mandates*, by which the Provisions made by the Ordinary, in prejudice of the *Mandate*, were declared null, and the Executor of the *Mandate*, in default of the Ordinary, conferred the Benefice on the Mandatory: but the Pope's Power in issuing these *Mandates* is now very much regulated and restrained.

**MANDERIL**, a kind of wooden Pelley, making a Member of the Turners Leath. Of these there are several kinds, as *Flat Manderils*, which have three or more little Pegs or Points near the Verge, and are used for turning flat Boards on. *Pin Manderils*, which have a long wooden Shank to fit into a round Hole made in the Work to be turned. *Hollow Manderils*, which are hollow of themselves, and used for turning hollow Work. *Screw-Manderils*, for turning Screws, &c. See *Turnery*. See also *Leath*.

**MANDIBULA**, the Jaw. See *Maxilla*. Hence *Mandibulares Musculi*, and *Mandibularii Musculi*. See *Mafferes*.

**MANDIL**, the Name of a Cap or Turban worn by the *Persians*. The *Mandil* is formed, by first wrapping round the Head a Piece of fine white Lincen five or six Ells long; over this they wrap, in the same manner, a Piece of Silk of the same Length, and oftentimes of great Value. To make the *Mandil* genteel, Care must be taken, that in wrapping the Silk, it be so managed, as that the several Colours, found in the several Folds, make a kind of Waves, somewhat like what we see in marbled Paper. This Dress is extremely majestic, but at the same time very heavy. It serves either as a Shelter to the Head from Cold, or as a Screen from the excessive Heat of the Sun; 'tis said the Cutlase won't penetrate it. In rainy Weather they cover it up with a kind of Cash or Hood, made of red Cloth. The Mode of the *Mandil* has been altered of late; during the Time of *Chah Abbas II.* it was round at Top; in the time of *Chah Soliman*, they brought one End of the Silk out of the middle of the *Mandil* over the Head; and, lastly, in the Reign of *Chah Uffcin*, the end of the Silk, in lieu of its being gathered as before, was plaited in manner of a Rose; and this the *Persians* find extremely graceful, and use it to this day.

**MANDRAGORA**, *Mandrake*, a Medicinal Plant, which makes a principal Ingredient in the Unguent, called *Poppem*. There are two kinds of *Mandrake*, Male and Female, each bearing a kind of Apples; those of the Male, as well as the Leaves, Roots, &c. being twice as large as those of the Female; but the Juice of each is a Poison, equally violent. Naturalists tell strange Stories of this Plant, but setting aside its superstitious Virtue, the modern Botanists will scarce warrant any of them, not even that human Figure ordinarily ascribed to its Roots, especially since the Discovery of the Artifice of Charlatan in preparing it, to surprize the Credulity of the People. *Chinese Mandragora* is the Plant *Ginseng*, which see.

**MANDUCATION**, the Action of chewing, a Term seldom used but in speaking of the Eucharist. The Catholics maintain a real *Manducation* of the Body of Christ; the Reformed, on the contrary, take this *Manducation* to be only figurative and by Faith. St. *Augustine* calls it a *Spiritual Manducation*.

**MANEQUIN**, in Painting, is understood of a little Statue, or Model, ordinarily made of Wax, and sometimes of Wood; the Juncures wherof are so contrived, as that it may be put into any Attitude one pleases, and its Draperies and their Folds be disposed at Discretion.

The word *Mamequin* is a Diminutive of Man, and properly signifies a little Man.

**MANES**; a Poetical Term, signifying the Shades or Souls of the Deceased. The Heathens used a world of Ceremonies and Sacrifices to appease the *Manes* of those who died without Burial.

The *Dii Manes* were the Infernal Gods who tormented Men; and to these the Heathens offer'd Sacrifices to assuage their Indignation. The Heathen Theology is a litobfuscate with regard to these Gods *Manes*. Some hold that they were the Souls of the Dead, others that they were the *Genii* of Men; which last Opinion suits best with the Etymology of the Word. The Heathens, 'tis pretty evident, applied all these Ideas to the *Manes*; so that the Word sometimes signified the Ghosts of the Departed, and sometimes the infernal or subterraneous Deities, and in general all Divinities that presided over Tombs. The Invocation of the *Manes* of the Dead, seems to have been a thing very frequent among the *Theffulians*, but was expressly prohibited by the *Romans*.

**MANGANUM**, an Engine of War. See *Ballista*.

**MANIA**, in Medicine, a Disease popularly call'd Madnefs: See *Madnefs*. The Word is *Greek*, *mania*,  *Fury*, *Rage*.

**MANICHEES**; a Set of antient Heretics, so call'd from their Author *Manes* or *Manichee*, a *Persian* by Nation. This Heresy had its first Rise about the Year 277, and spread itself principally in *Arabia*, *Egypt*, and *Africa*. *St. Epiphanius*, who treats of it at length, observes, that the true Name of this Heresiarch was *Cabrius*; and that he chang'd it for *Manes*, which is the *Persian* or *Babylonish* Language signifies *Vessel*. A rich Widow, whose Servant he had been, dying without Issue, left him good store of Wealth; after which, he assumed the Title of Apostle or Envoy of Jesus Christ. He establish'd two Principles, viz. a good one and an evil one. The first, which he call'd *Light*, did nothing but good; and the second, which he call'd *Darkness*, nothing but evil. This Philosophy is very antient, and *Plotinus* treats of it at large in his *Isis* and *Osiris*. Our Souls, according to *Manes*, were made by the good Principle, and our Bodies by the evil one; those two Principles being co-eternal and independent of each other. He borrow'd many things from the antient *Gnostics*; on which account many Authors consider the *Manichees* as a Branch of the *Gnostics*. In truth, their Doctrine was a System of Philosophy, rather than of Religion. They made use of Amulets, in imitation of the *Basilidians*; and are said to have made profession of Astronomy and Astrology. They denied that Jesus Christ assumed a true human Body, and maintain'd it was only imaginary. They pretended that the Law of *Moses* did not come from God, or the good Principle, but from the evil one; and that for this reason it was abrogated. They obtain'd entirely from eating the Flesh of any Animal; following herein the Doctrine of the antient *Pythagoreans*. The rest of their Errors may be seen in *St. Epiphanius* and *St. Augustine*; which last, having been of their Sect, may be presumed to have been thoroughly acquainted with them.

The *Manichees* profess'd to receive the Books of the New Testament; yet, in effect, they only took so much of them as suited with their Opinions: throwing all upon Reason, and quite setting aside all Authority. They formed to themselves a certain Idea of Christianity; and to this adjusted the Writings of the Apostles; pretending that whatever was inconsistent with this Idea, had been foisted into the New Testament by later Writers, who were half *Jews*. On the other hand, they made Fables and Apocryphal Books pass for Apostolical Writings; and even are suspected to have forged several others, the better to maintain their Errors. *St. Epiphanius* gives a Catalogue of several publish'd by *Manes*, and adds Extracts of some of them. He was not contented with the Quality of Apostle of Jesus Christ, but also assumed that of the Paraclete, whom he had promised to send. He left several Disciples, and among others, *Adamas*, *Thomas*, and *Hermes*. These he sent, in his lifetime, into several Provinces to preach his Doctrine. *Manes* having undertaken to cure the King of *Persia's* Son, and not succeeding, was clapt into Prison upon the young Prince's Death; whence he made his escape, but was apprehended soon after, and burnt alive.

Towards the middle of the twelfth Century, the Sect of *Manichees* took a new face, on occasion of one *Constantine*, an *Armenian* and Adherer to it; who took upon him to suppress the reading of all other Books besides the Evangelists and the Epistles of *St. Paul*, which he explain'd in such manner, as to make them contain a new System of *Manicheism*. He entirely discarded all the Writings of his Predecessors, rejected the Chimeras of the *Valentinians* and their thirty *Eons*; the Fable of *Manes*, with regard to the Origin of Rain, which he made to be the Sweat of a young Man in hot Pursuit after a Maid; and other Dreams, but still retain'd the Impurities

of *Basilides*. In this manner he reformed *Manicheism*; inasmuch that his Followers made no scruple of anathematizing *Seythian*, *Bondas*, and even *Manes* himself; *Constantine* being now their great Apostle. After he had seduced an infinite number of People, he was at last stoned by order of the Emperor.

The word *Manichee* comes from the *Latin* *Manichæus*, which antient Authors maintain to have been formed of the two *Greek* Words, *μαίνας*, *Manna*, and *σπας*, *I spread*; intimating that the Doctrine of their Master was a kind of *Manna*, which he spread every where.

**MANICORDION**, a Musical Instrument, in form of a Spinnet: See *Spinnet*. Its Strings are cover'd with pieces of Scarlet Cloth, to deaden, as well as soften, the Sound; whence it is also call'd the *Dumb Spinnet*, and is much used in Nunneries for the Religious to learn to play on; so as not to disturb the Silence of the Dormitory. *Scaliger* makes the *Manicord* more antient than the Spinnet and Harpsichord. *De Gange* derives the word from *Manicord*; from a supposition this Instrument has but one Cord; but he is mistaken, it has fifty, or more.

**MANIFESTO**, an Apology, or public Declaration, in Writing, made by a Prince, shewing his Intentions in any Enterprize, the Motives that induced him to it, and the Reasons on which his Right and Pretensions are founded.

**MANILLE**, or *Manille*, in Commerce, one of the principal Commodities carried by the *Europeans* to the Coasts of *Africa*, to traffic with the *Negroes* in exchange for Slaves; consisting of a large Brass Ring, in form of a Bracelet, either flat or round, plain or engraven; which the Natives use to deck themselves withal, putting them on the Small of the Leg, and the Thick of the Arm above the Elbow. The better sort among 'em wear Silver and Gold *Manilles*; but these are of their own manufacture; most of the Money they receive for their other Merchandizes being melted into *Manilles*.

**MANIPULATION**, a Term used in the Mines, to signify the manner of digging the Silver, &c. out of the Earth. See *Silver*.

**MANIPULE**, *Manipulus*, among the *Romans*, was a little Body of Infantry, which, in the Time of *Romulus*, consisted of an hundred Men; and, in the Times of the Consuls and first *Cæsars*, of two hundred. Each *Manipule* had two Centurions, or Captains, call'd *Manipularii*, to command it; one whereof was Lieutenant to the other. Each Cohort was divided into three *Manipules*, and each *Manipule* into two Centuries.

'Tis true, *Anlus Gellius* quotes an old Author, one *Cicinius*, who lived in the Time of *Hannibal*, (whose Prisoner he was) and who, writing on the Art of War, observes, that, then, each Legion consisted of sixty Centuries, of thirty *Manipules*, and of thirty Cohorts. And again, *Varrus* and *Vegetius* mention it as the least Division in the Army, only consisting of the tenth part of a Century; and *Spartian* adds, that it contain'd no more than ten Men, which shews that the *Manipule* was not always the same thing.

The *Romans* call'd this Company by the Name *Manipule*, or *Manipulus*, as signifying the Handful of Hay which they bore at the End of a Pole, to distinguish themselves by, e'er the Custom was introduced of bearing an Eagle for their Ensign; and hence came the Phrase, an *Handful of Men*. *Vegetius*, *Mastellus*, and *Varrus*, give other Etymologies of the Word. The last derives it from *Manna*, a little Body of Men following the same Standard. According to the former, they were so call'd, because they fought hand in hand, or all together. *Comberninus antem Manipulus vocatur ab eo quod conjunctis Manibus pariter dimicabant*, are their Words.

*Manipule* is also an Ecclesiastical Ornament, wore by the Priests, Deacons and Subdeacons in the *Romish* Church. It consists of a little Fittler in form of a Stole, three or four Inches broad, and made of the same Stuff with the Chasuble; signifying and representing an Handkerchief, which the Priests in the Primitive Church wore on the Arm, to wipe off the Tears they were continually shedding for the Sins of the People. There still remains a Mark of this Usage in a Prayer spoken by those who wear it, *Mereser, Dominus, portare Manipulum Fleus & Doluris*. The *Greeks* and *Maronites* wear two *Manipules*, one on each Arm.

**MANIPULUS**, in Phisic, is used for a Measure of Herbs, viz. an Handful; which is a quantity often used in Prescription amongst Physicians, and is generally marked with M.

**MANNA**, in Pharmacy, a medicinal Drug of great use in the modern Practice. *Manna* is a white Juice, or Liquor, very sweet, Oozing either of it self, or by Incision, from the Branches and Leaves of the *Asthe*, both wild and ordinary, during the Time of the Dog-days. Others will have it to be a Honey of the Air; or a kind of Dew proceeding from a Vapour rais'd from the Earth, and prepared in the Air, condens'd by the Cold, and gathered in the

hot Countries, before Sun-rise, both on Plants and Trees, and even on Rocks, and the Earth itself. But this must be a Mistake; and 'tis much more rational to rank it amongst the Number of Gums, which exuding from the Juice of the Tree, and mixing with it some saline Particles of the Air, is condens'd into those Flakes in which we see it.

The *Italians* gather three kinds of *Manna*. The first *Manna di Corps*, which comes spontaneously from the Branches of the Tree in the Month of *July*. The second *Manna Forzata*, or *Forzatella*, which is not gather'd till *August*, after an Incision of the Tree, when the Flux of the srit has ceas'd. The third, *Manna di Fronda*, which issues of itself, in little Drops, like a kind of Sweat from the nervous part of the Leaves of the *Ash*, and gathers into Grains about the bigness of those of *Wheat*, which are harden'd by the Sun in *August*. The Leaves are frequently found so loaden with these Grains, that they seem cover'd with Snow. *Manna* is a gentle and safe Purg; and is also used in Broths. *Alemarus*, a Physician of *Naples*, has written a Treatise expressly upon it; and *Dorsetius* has seconded it. *Manna*, tho' account'd a kind of Honey, purges the Bile; whereas common Honey increases it. Formerly the *Syrian* was in the most Repute, but now it gives way to the *Calabrian*. *Fuchsius* observes, that the Peasants of Mount *Libanus* eat *Manna* ordinarily as others do Honey. At *Mexico* they are said to have a *Manna* which they eat as we do Cheesc.

*Manna* is brought from several Countries, and in several Forms. Thus we have *Manna of Calabria*, and of *Scily*; *Manna in Grains*, in *Paris*, &c. The most esteem'd, is that in *Tares*; which many take to be facitious, and the Work of the *Jens of Leyborn*, but 'tis certainly natural: And what gives it this Figure, is, that they put Straws and Slips of Wood in the Incisions; along which the *Manna* gliding, is condens'd as it comes out, and assumes this Form.

MANNA, a Term in Scripture, signifying a miraculou kind of Food falling from Heaven, wherewith the *Israelites* were supplied in their Passage thro' the Wilderness. This *Manna* was in form of *Coriander-Seed*; its Colour was like that of *Bacillum*, and its Taste like Honey. They call'd it *Manna*, either from the Hebrew Word *Manna*, a Gift, to intimate its being a Gift from Heaven; or from *Manna*, which signifies to prepare, because the *Manna* came to them ready for eating, and need'd no Preparation but gathering; or from the *Egyptian* word, *Mann*, what is it? This last Etymology seems the more probable, in regard the Scripture takes notice of the Surprise they were under, when they first saw this new Food descend. *Salmafius*, however, does not allow of this Derivation. He says, that the *Arabs* and *Chaldeans* used the word *Mann* to signify a kind of Dew or Honey that fell on the Trees, and was gathered in great abundance on Mount *Libanus*. So that the *Israelites* did not use the Term *Manna* out of Surprise, but because they found this Food fall with the Dew, in the same manner as the Honey, so well known to them under the Name of *Mann*. *Salmafius* adds, that the *Manna* of the *Israelites* was in reality no other than that Honey or Dew condens'd; and that the one and the other were the same with the wild Honey wherewith *St. John* was fed in the Wilderness. So that the Miracle did not consist in the Formation of any new Substance in favour of the *Israelites*; but in the punctual Manner in which it was dispens'd by Providence; so that so vast a Multitude should have wherewithal to satisfy themselves.

MANNER, in Painting, &c. is used to express that particular Character observable in the Works of Painters, Poets, and other Men of Art, by which their Pencil, Hand, or Style, are distinguish'd. Thus the Curious in Paintings know the Manners of the Painters; and distinguish readily between the Manners of *Rubens*, *Titian*, or *Da Vinci*; between the ancient and the new Manner of the same Painter; the *French* and the *Italian Manner*. The Manner is used with respect both to the Invention, the Design, and the Colouring. The Manner of *Michael Angelo*, or *Raphael*, may also be known in their Scholars. Thus we say, such a Piece is of *Raphael's* School, &c.

MANNERS, in Poetry, a Term particularly used in Tragedy, Comedy, and the Epopeia; signifying the Inclinations, Genius, and Humour, which the Poet gives to his Persons, or that which distinguishes his Characters. *Aristotle* defines the Manners to be that which discovers the Inclination of him who speaks, and shews what he will resolve upon, or what reject, before he has actually determin'd: Whence he concludes, that Manners are not always, and in all kinds of Discourses: *Non quolibet Oratio est Morata*. One Instance will make this Definition clear. In the first Book of *Virgil*, *Aeneas* is represented extremely pious, and determin'd to execute the Will of the Gods at all adventures. In the fourth Book, he has a difficult Choice propos'd; being engag'd, on the one hand, out

of a Principle of Love, Gratitude, and Honour, not to quit *Dido*; and having, on the other hand, an express Order from the Gods to depart for *Italy*. Now, before it appears on which side he has determin'd, what he has before said should shew his Will and Inclinations, and which Party he will take. Now those preceding Discourses, which discover his future Resolution, make what we call the Poetical Manners. Those make it pass (doubt he will abandon *Dido*, to obey the Gods: This he does in effect; the Manners therefore are good, and well conducted. Had he disobey'd the Orders of *Jupiter*, to stay with *Dido*, the Manners had been ill; in regard they would have foretold a Resolution contrary to what he was really to take. But had there been nothing to make us foresee any Resolution of *Aeneas* at all, neither that which he actually took, nor the contrary, in that Case there had been no Manners at all.

'Tis the Manners, as we have before observ'd, which distinguish the Characters: And, unless the Manners be well express'd, we shall never be acquainted with the Persons at all; not, consequently, shall we be either terrified with foreseeing their Dangers, nor melted into Pity by seeing their Sufferings. See *Character*.

The Manners then should have four Qualities; they should be Good, Like, Suitable, and Equal. Good is when they are well mark'd or express'd; that is, when the Discourse of the Persons makes us clearly and distinctly see their Inclinations, and what good or evil Resolutions they will take. Like only relates to known and public Persons, whose Characters are in History, with which the poetic Characters must agree; that is, the Poet must not give a Person any Quality contrary to any of those which History has given him. And here it may be observ'd, that the evil Qualities given to Princes and great Men, ought to be omitted by the Poets, if they be contrary to the Character of a Prince, &c. but the Virtues opposite to those known Vices ought not to be impos'd, by making him generous and liberal in the Poem, who was avaricious in the History. The Manners must likewise be suitable; that is, they must be agreeable to the Age, Sex, Rank, Climate and Condition of the Person that has them. *Horne* observes, *Interit multum Divitiae loquatur in Herois*. Again, the Manners must be equal; that is, they must be constant, or consistent through the whole Character; or the Variety or Inequality of the Manners, as in Nature, so in the Drama, must be equal. The Fearful must never be brave, nor the Brave timorous; the Avaricious must never be liberal, nor vice versa. In this part, *Shakespeare's* Manners are admirable. Besides the four Qualities above-mention'd, there is a fifth essential to their Beauty; which is, that they be necessary; that is, that no vicious Quality or Inclination be given to any poetic Person, unless it appear to be absolutely necessary, or requisite to the carrying on of the Action.

MANOMETER, or *Manoscope*, an Instrument to shew or measure the Alterations in the Rarity or Density of the Air; from the Greek *ματρω*, *raritas*, and *μετρον*, *mensura*, &c. The Manometer differs from the *Barometer*, in that the former only measures the Weight of the Atmosphere, or of the Column of the Air over it; but the latter the Density of the Air in which 'tis found: which Density depends not only on the Weight of the Atmosphere, but on the Action of Heat and Cold, &c. Authors, however, generally confound the two together; and Mr *Boyle* himself gives us a very good Manometer of his Contrivance, under the Title of a *Statical Barometer*; and the Structure wherof see under the Word *Barometer*.

MANOR, is deriv'd à *manens*; because the Lord did usually reside there. For its Original: there was anciently a certain Compass of Ground, granted by the King to some Man of Worth, for him and his Heirs to dwell upon, and to exercise some Jurisdiction more or less within that Circuit, as he thought good to grant; but performing, withal, such Services, and paying such yearly Rent, as by this Grant was required. Now, the Lord afterwards, parceling the same to other meaner Men, received Rent and Services from them, and by that means, as he became Tenant to the King, the Inferiours became Tenants to him. Indeed the Word is now taken for Jurisdiction, and Royalty incorporal, rather than for the Land and Suit: For a Man may have a Manor in *Gross*, i. e. the Right and Interest of a Court Baron, with the Perquisites, and another enjoy every Foot of Land belonging to it. A Manor may be compounded of divers things, as of an House, Arable Land, Pasture, Meadow, Wood, Rent, Advowson, Court-Baron, &c. And this ought to be, by long Continuance of Time, beyond Man's Memory. 'Tis held by some, that a Manor cannot now be made, since a Court-Baron cannot be made; and without a Court-Baron, and at least two Suiors, there can be no Manor.

MANSE, is a Parsonage or Vicaridge-House, for the Incumbent to live in; this was originally, and is now, an essential Part of the Endowment of a Parish-Church, together

ther with the Glebe and Tythes. It is sometimes called the *Prebysterium*. See *Prebyster*.

MANSSION, from *mansens*, a Dwelling-House, or Country Habitation; commonly used for the Lord's Chief Dwelling-House within his Fee, otherwise called the *Capital Messuage*, or chief *Manor Place*. *Manſio*, or *Manſus*, were sometimes used in the same Sense with *Hſe*; that is, as much Land as one Plow could till in a Year.

MAN-SLAUGHTER, *Homicide*, or the unlawful killing a Man, without preſented Malice: As when two, who formerly meant no harm to one another, on ſome sudden Occaſion falling out, the one kills the other. It differs from Murder, as not being done with fore-going Malice; and from Chance-Medley, becauſe it hath a preſent intent to kill: It is citem'd Felony, but admitted to the Benefit of the Clergy, for the firſt time. By a Law of King *Canutus*, if a Man is kill'd openly and premeditatedly, the Murderer ſhall be committed to the Relations of the Deceased: But if, on his Tryal, the Fact is proved, but not wilful, the Biſhop is to judge him.

MANSORII MUSCULI. See *Meſſeters*.

MANTELETS, in War, are a kind of moveable Pent-houſes, or Parapets made of Pieces of Timber, ſaw'd into Planks, about three Inches thick, and nailed one over another to the height of almost fix Foot. They are generally caſt with Tin, and ſet upon little Wheels; ſo that in a Siege, they may be driven before the Pioneers, and ſerve as Blinds to ſhelter them from the Enemies (small Shot). There are alſo other forts of *Mantlets*, covered on the top, whereof the Miners make uſe, to approach the Walls of a Town or Caſtle. It appears from *Pegonia*, that theſe were in uſe among the Antients, but they were built lighter, and yet larger than ours, being eight or nine Foot high, as many broad, and ſixteen long: They were defended by a double Covering, the one of Boards, the other of Faggots, with the Ribs of Oxen, and caſt without with Skins ſteep'd in Water, to prevent Fire.

MANTLE, or *Mantle-Tree*, in Architecture, is the lower-part of a Chimney, or that part laid a-croſs the Jambs, and which ſuſtains the Compartment of the Chimney-piece. See *Jamb*.

MANTLE, in Heraldry, is that Appearance of the Folding of Cloth, Flouriſhing or Drapery, that is in any Attainment, drawn about the Coat of Arms: It is ſuppoſed formerly to have been the Representation of a *Mantle* of State in Blazon; it is always laid to be doubled, that is, lined throughout with one of the Furs, as Ermin, Pean, Verry, &c. See *Coar*.

*Mantle* is likewiſe a Term uſed in Falconry; as they ſay, the Hawk *mantles*, that is, ſpreads her Wings after her Legs.

MANUCAPTO, in Law, a Writ that lies for a Man, who, being taken on Suſpicion of Felony, and offering ſufficient Bail for his Appearance, is refus'd to be admitted thereon by the Sheriff, or other having Power to let to Mainpriſe.

MANUDUCTOR, a Name given to an antient Officer in the Church, who, from the middle of the Choir where he was placed, gave the Signal to the Chorifters to ſing, mark'd the Measure, bear Time, and regulated the Muſic. The *Greeks* call'd him *Mefacoras*, becauſe ſeated in the middle of the Choir. But in the *Latin Church*, he was call'd *Manuductor*, from *Manus*, and *ducere*, I lead; becauſe he led and guided the Choir by the Motions and Geſture of the Hand.

MANUFACTURE, a Place where ſeveral Artiſts and Workmen are employ'd in the ſame kind of Work; or make a Commodity of the ſame kind. The Word is alſo popularly uſed for the Work itſelf; and by Extension for the like Work, carried on independently in different parts of a Country. In this ſenſe, we ſay the Woolen *Manufacture*, Silk *Manufacture*, Velvet *Manufacture*, Tapeſtry *Manufacture*, Muſlin *Manufacture*, &c. *Manufacture* of Hats, Stockings, &c. See *Wool*, *Silk*, *Velvet*, *Tapeſtry*, *Muſlin*, &c. The Word comes from the *Latin*, *Manufactus*.

MANUMISSION, an Action by which a Slave is ſet at liberty. Some Authors define *Manumiffion* to be an Act by which a Lord enfranchiſes his Tenants, who till that time had been his Vaſſals, and in a State of Slavery, inconſiſtent with the Holineſs of our Faith.

The *Romans* had ſeveral Ceremonies in uſe in the *Manumiffion* of their Slaves. Their *Manumiffion* was perform'd three ſeveral Ways. Firſt, When, with his Maſter's Conſent, a Slave had his Name enter'd in the *Cenſus*, or Public Register of the Citizens. Secondly, When the Slave was led before the *Prator*, and that Magiſtrate laid his Wand on his Head. Thirdly, When the Maſter gave the Slave his Freedom by his Teſtament. *Servus Tollens* is ſaid to have firſt ſet on foot the firſt Manner, and *P. Valerius Publicola* the ſecond. A particular Account is given of the third in the *Inſtitutes of Juſtinian*. It was not neceſſary, that the *Prator* ſhould be on his Tribunal to perform the

Ceremony of *Manumiffion*. He did it any where indifferently, in his Houſe, in the Street, going to bath, &c. He laid the Rod, call'd *Vindicta*, on the Slave's Head, pronouncing theſe Words, *Dico cum liberam eſſe mere Quiritium; I declare him a Freeman after the manner of the Romans*. This done, he gave the Rod to the Liſtor, who ſtruck the Slave with it on the Head, and afterwards with his Fitt on his Face and Back. And the Notary, or Scribe, enter'd the Name of the new-free'd Man in the Register, with the Reaſons of his *Manumiffion*. The Slave had likewiſe his Head ſhaved, and a Cap given him by his Maſter, as a Token of Freedom. *Tertullian* adds, that he had then a third Name given him. If this were ſo, three Names were not a Token of Nobility, but of Freedom. The Emperor *Conſtantine* order'd the *Manumiffions* at Rome to be perform'd in the Churches. The Word comes from the *Latin* *Manumiffio*, quia *Servus mittebatur extra Manſionem*, ſeu *paſſagium Domini ſui*.

Of *Manumiffion* there have been various Forms in *England*. In the time of the Conqueror, Servants were *manumitted*, by the Maſter's delivering them by the Right Hand to the Vicount in full Court, ſhewing them the Door, giving them a Lance and a Sword, and proclaiming them free. Some were alſo *manumitted* by Charter. There was alſo an implicit *Manumiffion*; as when the Lord made an Obligation for Payment of Money to the Bondman at a certain Day; or ſued him, where he might enter without Suit; and the like.

MANURING of Ground, conſiſts in the Application of a Matter proper for meliorating the Soil, and rendering it more fertile. The Matters uſed for *Manure*, are various in various Countries. The moſt ordinary are Lime and Marl, which ſee under their proper Articles. In ſome parts of *Ireland*, they uſe Sea-Shells, as thoſe of Cockles, Periwinkles, &c. which are found to agree very well with boggy, heathy, clayey, wet or *ſtiff Land*. They ſeem to give it a kind of Ferment, as *Barm* does to Bread, opening and looſening the Clods, and by that means making way for the Roots to penetrate, and the Moiſture to enter into the Fibres of the Roots: This kind of *Manure* continues a long time, e'er its Effects are exhauſted, whereas Lime, &c. ſpend themſelves at once: The Shells being hard, melt away very ſlowly, ſo that the Operation needs not be repeated for 20 or 30 Years. In the Weſt of *England*, they *manure* their Land with a brackiſh Sea-Sand; which Dr. *Bovey* obſerves, quickens Dead-Land: So that what would otherwiſe be the barrenſt part of that Country, is now the richeſt. The Sea-Salt, he obſerves, is too luſty and active of itſelf, and that it does but when mingled with Lime. *Glanbeir* orders the Mixture to be made up and burnt like Bricks, and then apply'd. In ſome Countries they burn the Surface of their heathy Ground, inſtead of *manuring* it; which is but ill Husbandry, inſomuch as it impoveriſhes it; and by deſtroying the Sap of the Earth, and Roots of the Graſs, and other Vegetables, it renders it uſeleſs for ſeveral Years after the third, when it is plow'd. Dr. *Jackson* obſerves, that all the Ground about *Nantwich*, where Salt or Brine is ſpilt, is, when dug up, an excellent *Manure* for grazing Ground; and even Bricks, thoroughly tinged with it, diſſolve and fertilize the Land very conſiderably. Dr. *Beal* ſays, 'tis a common Obſervation of Gardeners and ſkilful Husbandmen, that Froſt and Snow improve and fertilize the Land both more ſpeedily and more effectually than the Influence and Warmth of the Sun. Dr. *Liſter* tells us, that in ſome parts of the *North-Riding* of *Yorkſhire*, the Soil is ſandy, and the People *manure* it with Clay. The Clay, with any other *Manure*, bears nothing but Rye; but with Clay, bears Oats, Barley, &c. This Clay *Manuring*, will, by certain Experience, laſt 45 Years in the Ground e'er it need be repeated. The Bogs in *Ireland* are beſt improv'd by ſandy, or other gravelly *Manures*.

MANUSCRIPT, a Book, or Paper, written with the Hand; in oppoſition to a printed Book, or Paper. A *Manuſcript* is uſually deſign'd by the two Letters MS, and in the *Plural* by MSS, or MMSS. What makes public Libraries valuable, is the Number of antient MSS repoſited in them.

MANWORTH, in old Law-Books, is the Price or Value of a Man's Head: every Man, according to his degree, being rated at a certain Price; according to which, Satisfaction, in old time, was made to his Lord, if any one kill'd him.

MANZEL. See *Caravanſerail*.

MAP, a plain Figure, representing the ſeveral Parts of the Surface of the Earth, according to the Laws of Perſpective: or a Projection of the Surface of the Globe, or a part thereof, in plans. See *Projection*.

Maps are either univerſal, or particular. *Univerſal Maps* are thoſe which exhibit the whole Surface of the Earth, or the two Hemifpheres. *Particular Maps* are thoſe which exhibit ſome particular Region, or part thereof. Each kind

kind are frequently call'd Geographical or Land-Maps, in contra-distinction to Hydrographical or Sea-Maps, representing only the Seas and Sea-Coasts, properly call'd Charts. See *Chart*.

There are three Qualifications required in a Map. First, That all Places have their just Situation with regard to the chief Circles of the Earth, as the Equator, Parallels, Meridians, &c. because on these depend many Properties of Regions, as well as Celestial Phenomena. Secondly, That the Magnitudes of the several Countries have the same Proportion as on the Surface of the Earth. And, Thirdly, That the several Places have the same Distance and Situation with regard to each other, as on the Earth itself.

For the Foundation of Maps, and the Laws of Projection, see *Perspective* and *Projection of the Sphere*: The Application thereof, in the Construction of Maps, is as follows.

*Projection of a Map, the Eye being plac'd in the Axis.* Suppose, v.g. the Northern Hemisphere to be represented with the Eye in a Point of the Axis, v.g. the South-Pole; for the Plane, whereon the Representation is to be made, we take the Plane of the Equator, and from all the Points of the Surface of the Northern Hemisphere, conceive Lines passing thro' the Plane to the Eye; which Points connect'd together, constitute the Map required. Here the Equator will be the Limit of the Projection; the Pole, the Centre. The Meridians will be Right Lines passing from the Pole to the Equator; the Parallels of Latitude, &c. Circles concentric with the Equator; and all the other Circles, and Arches of Circles, as the Horizon, Vertical Circles, &c. Elliptic, &c. conceived in that Hemisphere, will be Ellipses, or Arches of Ellipses. The better to apprehend the Projection of the Circles on the Plane, conceive a radiant Cone, whose Vertex is the Eye, its Base the Circle to be represented, and its Sides the Rays passing between the Circle and the Eye. Suppose this Cone cut by the Plane. 'Tis obvious, that, according to the various Position of the Cone, there will be a different Section, and consequently a different Line or Representation.

For the Application of this Doctrine in Practice. In a Plane, v.g. a Paper, take the middle Point P. (Plate Geography, Fig. 2.) for the Pole, and from this, as a Centre, describe a Circle, of the intended Bigness of your Map, to represent the Equator. There two may be pitch'd on at pleasure, and from these all the other Points and Circles are to be determined. Divide the Equator into 360°, and drawing Right Lines from the Centre to the beginning of each Degree, these will be Meridians; whereof that drawn to the beginning of the first Degree, we suppose the first Meridian.

Now for the Parallels. There are four Quadrants of the Equator; the first, 0, 90; the second, 90, 180; the third, 180, 270; the fourth, 270, 360; which, for the better distinction, we will note with the Letters AB, BC, CD, DE. Taking one of these, v.g. BC, from the several Degrees thereof, as also from 23°, 30', and 66°, 30'. thereof draw occult Right Lines to the Point D, marking where these Lines cut the Semidiameter BPC; and from P, as a Centre, describe Arches passing thro' the several Points in PC. These Arches will be Parallels of Latitude. The Parallel at 23° 30', will be the Tropic of Cancer, and that at 66° 30', the Arctic Circle. The Meridians and Parallels thus described, from a Table of Longitudes and Latitudes, lay down the Places; reckoning the Longitude of each Place on the Equator, commencing at the first Meridian, and proceeding to the Meridian of the Place; and for the Latitude of the Place, chusing a Parallel of the same Latitude: the Point where this Meridian and Parallel intersect, represents the Place: And in the same manner all the other Places may be determin'd till the Map be compleat.

For the Elliptic, half of which comes in this Hemisphere; we have observed, that it makes an Ellipsis; so that the Points thro' which it passes are to be found. The first Point, or that wherein the Elliptic cuts the Equator, is the same with that wherein the first Meridian cuts the Equator, which is therefore distinguish'd by the Sign of Aries; the last Point of this half Ellipsis, or the other Intersection of the Equator and Elliptic, viz. the End of Virgo, will be in the opposite Point of the Equator, viz. at 180°. The middle Point of the Ellipsis is that wherein the Meridian 90 cuts the Tropic of Cancer. Thus we have three Points of the Elliptic determin'd; for the rest, viz. for 1°, and 15° of Taurus, 1° and 15° of Gemini, 1° of Leo, 1° of Virgo, the Declinations of those Points from the Equator must be taken from a Table, and set off in the Map. See *Declination*, &c.

Thus where the Meridian of 15° cuts the Parallel of 5°, that Point will be 15° of Aries. Where the Meridian 27° cuts the Parallel, 11 1/2 will be the first Degree of Taurus, and so of the rest. These Points being all

join'd by a Curve Line, will be a Portion of an Ellipsis representing the Elliptic.

Maps of this Projection have the first Qualification required; but are defective in the second: the Surface being stretch'd further, as it approaches nearer the Equator. For the third, they are still farther out: By this Method may almost the whole Earth be represented in one Map, placing the Eye, v.g. in the Antarctic Pole, and assuming for the Plane of Projection that of some Circle near it, v.g. the Antarctic Circle. Nothing is here required besides the former Projection; but to continue the Meridian, draw Parallels on the other side of the Equator, and complete the Elliptic; but this distorts too much for Practice.

This Projection is of all others the easiest; but that, where the Eye is plac'd in the Plane of the Equator, is prefer'd for use. 'Tis, in effect, of the latter kind that Maps are ordinarily made. The former are added to 'em, in small, by way of Supplement, to represent the intermediate Spaces left between the two Hemispheres. Further, as the Situation of the Elliptic, with regard to the Earth, is continually changing, strictly speaking, it has no Place in the Earth's Surface, but is us'd to be represented according to its Situation some certain Moment; viz. so as the beginning of Aries and Libra may be in the Intersections of the first Meridian and Equator.

The Projection of Maps, with the Eye in the Plane of the Equator. This Method of Projection, tho' more difficult, is yet much juster, more natural and commodious, than the former. To conceive it, we suppose the Surface of the Earth cut in two Hemispheres by the entire Periphery of the first Meridian, each of which Hemispheres we represent in a distinct Map. The Eye is plac'd in the Point of the Equator 90° distant from the first Meridian; and for the transparent Plane, wherein the Representation is to be, we take the Plane of the first Meridian. In this Projection, the Equator is a Right Line, and the Meridian 90° distant from the first, is also a right Line; but the other Meridians, and all the Parallels of the Equator, are Arches of Circles, and the Elliptic an Ellipsis.

The Method is thus. From a Point E, as a Centre, (Fig. 5.) describe a Circle according to the intended Bigness of the Map. This represents the first Meridian, and its opposite; for, drawing the Diameter BD, there arise two Semi-circles, the one whereof BAD is the first Meridian, the other BCD its opposite, or the Meridian of 180°. This Diameter BD represents the Meridian of 90 Degrees, whereof the Point B is the Arctic Pole, and the Point D the Antarctic. The Diameter AC, perpendicular to that BD, is the Equator. Divide the Quadrants AB, BC, CD, DA, each into 90 Degrees; and to find the Arches of the Meridians and Parallels, proceed thus. Divide the Equator into its Degrees, viz. 180. (as being indeed only half the Equator;) thro' these several Divisions, and the two Poles, describe Arches of Circles, representing Meridians, as B 1 D, B 2 D, &c. How to find Centres for describing those Arches, see under the Word Circle. Indeed, the Operation will be both more easy and accurate, if performed by a Canon of Tangents. To describe the Parallels, the Meridian DB must be in like manner divided into 180 Degrees; then thro' each of these Divisions, and the corresponding Divisions of the Quadrants AB, CB, describe Arches of Circles. Thus shall we have Parallels of all Degrees, with Tropics, Polars and Meridians. As for the Elliptic, it may be design'd two ways. For its Situation over the Earth may either be such, as that its intersection with the Equator may be over the Place A, in which Case, the Projection of its Semi-Circles, from the first Degree of Cancer, to the first of Capricorn, will be a straight Line, to be determined by numbering 23° 30' from A towards B, and from the Extreme of that Numeration, drawing a Diameter thro' E; this Line will be half the Elliptic in this Situation, and may be divided, as before, into Degrees, to which the Numbers, Signs, &c. are to be affix'd. But if the Elliptic be so plac'd, as that its Intersection with the Equator is over the Place A, in the first Meridian, its Projection in that Case will be a Segment of an Ellipsis; whereof two of the Points are AC; a third that wherein the Meridian 90 cuts the Tropic of Cancer. The other Points must be determin'd in the manner laid down above, viz. by taking the Declinations and right Ascensions of 15° of Aries, 1° of Taurus, 15° of Gemini, &c. For where the Parallels, according to their several Degrees of Declination, cut the Meridians, taken according to the several right Ascensions, those Points of Intersection are the Points of the 15° of Aries, &c. A curve Line therefore being drawn, these will give the Projection of the Elliptic.

Nothing now remains to complete the Map, but to take the Longitudes and Latitudes of Places from a Table; and to set them off on the Map, as was directed under the former Method. In this Projection the whole Surface of the Earth may

may be represented in one Map; if instead of the Plane of the first Meridian, some other Plane parallel to it, but very near the Eye, be taken; for by this means the entire Parallels and Meridians will be described. But as this distorts the Face of the Earth too much, it is seldom used; and we rather make the two Hemispheres in two distinct Tables. One great Advantage in this Projection, is, that it represents the Longitudes and Latitudes of Places, their Distance from the Pole and from the Equator, almost the same as they are on the Earth. Its Inconveniences are, that it makes the Degrees of the Equator unequal, being the greater as they are nearer the first Meridian D A B, or its opposite B C D; and for this Reason equal Tracts of the Earth are represented unequal; which Defect may be in some measure remedy'd by removing the Eye far from the Earth. Lastly, the Distances of Places, and Situation with regard to each other, cannot be well determined in Maps of this Projection.

*Projection of Maps on the Plane of the Horizon, or wherein any given Place shall be the Centre, or Middle.* Suppose, for instance, 'tis desired to have London the Centre of the Map. Its Latitude we'll suppose to be 51°. 32 Min. The Eye is placed in the Nadir. The transparent Table is the Plane of the Horizon, or some other Plane, if 'tis desired to represent more than a Hemisphere. Take then the Point E (Fig. 4.) for London, and from this, as a Centre, describe the Circle ABCD to represent the Horizon, which you are then to divide into four Quadrants, and each of these into 90 Degrees. Let the Diameter BD be the Meridian, B the Northern Quarter, D the Southern; and the Line of Equinoctial East and West, shews the first Vertical, A the West, C the East, or a Place 90 deg. from the Zenith in the first Vertical. All the Verticals are represented by right Lines drawn from the Centre E to the several Degrees of the Horizon. Divide BD into 180 deg. as in the former Methods; the Point in EB representing 51 deg. 32 min. of the Arch BC, will be the Projection of the North Pole, which note with the Letter P. The Point in ED representing 51 deg. 32 min. of the Arch DC, (reckoning from C towards D) will be the Projection of the Intersection of the Equator and Meridian of London, which note with the Letter Q, and from this, towards P, write the Numbers of the Degrees, 1, 2, 3, &c. As also from Q towards D, and from B towards P, viz. 51, 52, 53, &c.

Then taking the corresponding Points of equal Degrees, viz. 99 and 99, 88 and 88, &c. about those, as Diameters, describe Circles, which will represent Parallels, or Circles of Latitude, with the Equator, Tropics, and Polar Circles. For the Meridians, first describe a Circle thro' the three Points A, P, C. This will represent the Meridian 90 deg. from London. Let its Centre be M in BD (continued to the Point N, which represents the South Pole) PN being the Diameter, thro' M draw a Parallel to AC, viz. FH, continued each Way to K and L. Divide the Circle PHNF into 360 deg. and from the Point P draw right Lines to the several Degrees, cutting KFHL thro' the several Points of Intersection, and the two Poles P, N, as thro' three given Points, describe Circles representing all the Meridians. The Centres for describing the Arches will be in the same KL, as being the same, that are found by the former Intersection; but are to be taken with this Caution, that for the Meridian next BDN towards A, the most remote Centre towards L be taken for the sd, the sd from this, &c. The Circles of Longitude and Latitude thus drawn, insert the Places from a Table as before directed.

*Projection of Maps on the Plane of the Meridian.* This Projection is taught by Ptolemy, and recommended by him as proper for that part of the Earth then known. In the Equator and Parallels are Arches of Circles, and in the Meridians, Arches of Ellipses; the Eye hanging over the Plane of that Meridian which passes over the middle of the inhabited World. But in regard the Description of these Ellipses is somewhat perplexing, and because this Method seems only calculated for a part of the Earth; 'tis not now used.

There is a second Method something a-kin to it, which represents the Circles of Latitude by right Lines, and the Meridians by Arches of Ellipses; as must be the Case, if Lines be conceiv'd to fall from the several Points of each Hemisphere, perpendicularly on the Plane of the first Meridian, and the Eye be supposed at an infinite distance from the Earth; so that all the Rays emitted from the Places of the Earth to it, may be accounted Parallels as well as Perpendiculars to the Plane of the first Meridian.

*Rebillinear Maps,* those wherein both the Meridians and Parallels are represented by right Lines, which by the Laws of Perspective is impossible; in regard there can no such Position be assign'd the Eye and the Plane, as that the Circles both of Longitude and Latitude shall be right

Lines. In the first Method laid down; the Meridians are right Lines, but the Parallels are Circles. In the fifth, the Parallels are right Lines, and the Meridians Ellipses. In all other perspective Methods, both Kinds of Circles are Curve; one Method indeed must be excepted, wherein the Meridians are right Lines, and the Parallels Hypertobola's; as when the Eye is placed in the Centre of the Earth, and the Plane, thro' which it is view'd, is parallel to the first Meridian; but this Method is rather pretty than useful. *Rebillinear Maps* are chiefly used in Navigation, to facilitate the Estimation of the Ship's Way. See CHART.

*Construction of particular or special Maps.*

*Particular Maps of large Tracts, as Europe, Asia, Africa, and America,* are projected after the same Manner as General ones; only let it be observed, that for different Parts, different Methods be chosen. *Africa and America,* for instance, in regard the Equator passes thro' them, cannot be conveniently projected by the first Method, but much better by the second. *Europe and Asia* are most conveniently represented by the third; and the polar Parts, or the frigid Zones, by the first.

To begin then, draw a right Line on your Plane or Paper, for the Meridian of the Place over which the Eye is conceiv'd to hang, and divide it into Degrees, as before, which will be Degrees of Latitude. Then from the Table take the Latitude of the two Parallels, which terminate each Extreme. The Degrees of these Latitudes are to be noted in the Meridian; and thro' them draw Perpendiculars, bounding the Map towards North and South. This done, Meridians and Parallels are to be drawn to the several Degrees, and the Places to be inserted, till the Map is complete.

*Particular Maps of less Extent.* In Maps of smaller Portions of the Earth, the Geographers take another Method. First, a transverse Line is drawn at the bottom of the Plane, to represent the Latitude, wherein the Southernmost part of the County to be exhibited, terminates. In this Line, so many equal Parts are taken, as that Country is extended in Longitude. On the middle of this same Line erect a Perpendicular, having so many Parts as there are Degrees of Latitude between the Northern and Southern Limits of the Country. How big these Parts are to be, may be determin'd by the Proportion of a Degree of a great Circle to a Degree of the Parallel represented by the transverse Line at bottom. See DEGREE. Thro' the other Extreme of this Perpendicular, draw another Perpendicular, or a Parallel to the Line at bottom, in which are to be as many Degrees of Longitude, as in the lower Line, and these, too, equal to those other, unless the Latitudes happen to be remote from each other, or from the Equator. But if the lowest Parallel be at a considerable distance from the Equinoctial, or if the Latitude of the Northern Limit go much beyond that of the Southern; the Parts or Degrees of the upper Line must not be equal to those of the lower, but less, according to the Proportion which a Degree of the more Northern Parallel, has to a Degree of the more Southern: Which see, as before, under the word DEGREE.

After Parts have been thus determin'd, both on the upper and lower Line, for the Degrees of Longitude; right Lines must be drawn thro' the beginning and end of the same Number, which Lines represent Meridians; then, thro' the several Degrees of the Perpendicular erected on the middle of the first transverse Line, draw Lines parallel to that transverse Line. These will represent Parallels of Latitude. Lastly, at the Points wherein the Meridians of Longitude and the Parallels of Latitude concur, insert the Places from a Table, as before directed.

For Maps of Provinces, or small Tracts, as Parishes, Mannors, &c. we use another Method, more sure and accurate than any of the former. In this, the Angles of Position, or the Bearings of the several Places, with regard to one another, are determin'd by proper Instruments, and transfer'd to Paper. This constitutes an Art a-part, call'd *Surveying*. See SURVEYING.

*The Use of Maps is very obvious from their Construction.* The Degrees of the Meridians and Parallels shew the Longitudes and Latitudes of Places, and the Scale of Miles annex'd, their Distances; the Situation of Places, with regard to each other, as well as to the Cardinal Points, appears by Inspection, the top of the Map being always the North, the bottom the South, the right-hand the East, and the left the West; unless the Compass usually annex'd, shew the contrary. See MERCATOR'S CHART, where these Cases are exemplify'd.

MAPPARIUS, an Officer among the Romans, who, in the public Games, as those of the Circus and the Gladiators, gave the Signal for their beginning, by throwing an Handkerchief (*Mappa*) which he had before received from the Emperor, Consul, or other supreme Officer then present.

**MARASMUS**, in Medicine; an extreme Macies or Consumption of the whole Body. A Hectic Fever usually produces a *Marasmus*. The word is Greek, being derived from the Verb *μαρασσω*, to waste. See CONSUMPTION.

**MARAVEDIS**, a little Spanish Copper Coin, worth somewhat more than a French Denier. The Spaniards always count by *Maravedis*, both in Commerce, their Finances, &c. tho' the Coin itself has but little Course among them. 65 *Maravedis* are equivalent to a Real of Silver: so that the Piaster, or Piece of Eight Real, contains 504, and 4 Pistoles of 4 Pieces of Eight, 2016 *Maravedis*. See COIN and MONEY. This Smallness of the Coin produces vast Numbers in the Spanish Accounts and Calculations; so much that a Stranger or Correspondent would think himself indebted several Millions for a Commodity, that costs but a few Pounds. In the Laws of Spain, we meet with several Kinds of *Maravedis*; *Alphonfine Maravedis*, *White Maravedis*, *Maravedis of Good Money*, *Maravedis Combrones*, *Black Maravedis*, *Old Maravedis*. When we find *Maravedis* alone, and without any Addition, it is to be understood of those mentioned above. The rest were different in Value, Fineness of Metal, Time, &c. *Mariana* asserts, that this Coin is older than the *Moor*, that it came from the *Gabrs*, and was worth ten *Denarii* in the time of the Romans.

The Word is *Arabic*, and took its Rise from the *Amoravid* *Moor*, who passing out of *Africa* into *Spain*, imposed their own Name on this Coin, which by Corruption was afterwards changed into *Maravedis*. Mention is made of it in the Decretals, as well as other Latin Writers, under the Name of *Maralutini*.

**MARBLE**, a Kind of Stone, extremely hard, firm and solid, dug out of Pits or Quarries: It takes a beautiful Polish, cuts very hardy, and is much used in Ornaments of fine Buildings, as Columns, Altars, Statues, &c. There are an infinite Number of different Kinds of *Marble*, usually denominated either from their Colour, their Country, or their Defects; some are of one simple Colour, as white or black, others streak'd or variegated with Stains, Clouds, Waves, Veins, &c. All *Marbles* are opaque, excepting the white, which, when cut into thin Slices, becomes transparent. They are also different in Weight and Hardness, and are to be consider'd with regard to their Colour, their Country, their Grain, and their Defects.

Under the Genus of *Marble* are comprehended *Porphyry*, which is the hardest, and which was antiently brought from *Nabata* in *Africa*; the most beautiful is that, whose Red is the most vivid, and the Stains the whitest and the smallest. See PORPHYRY. The *Serpentine*, which is a greenish brown, so call'd, because figur'd with little Stains. It is form'd of a great Number of Grains of Sand condens'd; it is of various Kinds, viz. *Egyptian*, *Italian*, *Violet*, and *Green*. See GRANATE and SERPENTINE. *Jasper*, of which there are various Kinds, the Antient, the Florid, the Black, White, &c. See JASPER. *Alabaster*, of which there are various Kinds, both White and Variegated. They are all soft when taken out of the Quarry, but harden in the Air. *Marbles* again may be consider'd either as Antient or Modern. By Antient we mean those, whose Quarries are lost or inaccessible to us, and whereof we have only some Pieces remaining. The Modern are those, whose Quarries are still open, and out of which Blocks continue to be dug.

*Marbles denominated from their Countries.*

*African Marble* is either of a reddish Brown, streak'd with Veins of White, or of a Carnation, with Veins of Green. *English White Marble* is vein'd with Red. *Marble of Aveney* in France, is of a pale Red, mingled with Violet, Green, and Yellow. *Marble of Brabant* in *Hainault*, is Black, vein'd with White. *Marble of Bresse* in Italy, is Yellow with Spots of White. *Marble Breucelle*, is mingled with little Shades of *Isabella*, Yellow, Pale and Gray. It comes from *Tortosa* in Spain, where it is dug out of an antient Quarry: There is also another Kind of antient *Breucelle* dug near *Adriano*. *Marble of Carrara*, on the Coasts of *Genoa*, is very white, and the fittest of all others for Works of Sculpture. *Marble of Champagne*, resembles the *Breucelle*, being mix'd with blue in round Stains like Partridges Eyes. *Opelino*, or *Opelin Marble*, is of a Sea-green Colour, mix'd with large Waves or Clouds of white or pale green. *Scamozzi* takes this to be the same with that which the Antients call'd *Augustum* & *Tiberium* *Marmor*; because discover'd in *Egypt* in the Times of the Emperors *Augustus* and *Tiberius*. *Marble of Dinan*, near *Liege*, is of a pure black, very beautiful, and very common. *Marble of Guichenot*, near *Dinan*, is of a reddish Brown, with white Spots and Veins. *Marble of Languedoc*, is of a vivid red, with large white Veins or Stains, and is very common; there is some, whose White borders pretty much on the Blue, but this is of less Value. *Lunabelle Marble*, so call'd, because mingled with Spots, gray, black, and white, wreath'd somewhat like Periwinkle-Shells. This is antient, and its Quarry is lost.

*Marble of Marryffe*, in the *Molanae*, has a white Ground with brownish Veins, resembling the Colour of Iron-Rail. This is very common, and extremely hard. *Marble of Lavce*, in *Monna*, has a black Ground, with little narrow Veins of white; there is another Kind of it red, with Veins of a dirty white. *Marble of Naxos* is black, like that of *Dinan*, but less beautiful, as inclining a little to the blue, and travers'd with little Streaks of grey. This is very common, and is frequently used in Paving. *Parian Marble* is Antient, and much celebrated in Authors; it is of a beautiful White: The greatest part of the Grecian Statues were made of it. *Farro* calls it *Lycabites*, because the Workmen dug it out of the Quarry by Lamp-Light. *Marble of Porta Santa*, at *Rome* call'd *Serna*, is mingled with large Clouds and Veins of red, yellow, and grey. *Marble Pistor* has a black Ground, with Clouds and Veins of yellow. It is dug out of the foot of the *Alps* towards *Carrara*. *Marble of Raticce*, in *Hainault*, is of a dirty red, mix'd with blue and white Clouds and Veins: this is pretty common, but is different in Beauty. *Marble of Savy*, is a deep red mix'd with other Colours; each Piece whereof seems cemented on to the rest. *Marble of Sicily* is a brownish red, stain'd with oblong Squares of White and *Isabella*, like striped Taffets's. The Antient has very vivid Colours, and the Modern comes pretty near it. *Marble of Syonan*, in the *Pyreneans*, is ordinarily of a greenish brown, with red Stains; the this is somewhat various in its Colours. *Marble of Thea*, near *Namus* in *Liege*, is a pure black, soft and easy to work, and receives a more beautiful Polish than those of *Naxos* and *Dinan*.

*Marble Bigis Nere*, or black-grey, is antient. White-vein'd *Marble* has large Veins, with grey and blue Stains on a white Ground. It comes from *Carrara*. *White Marble*; that dug out of the *Pyreneans* on the side of *Bayonne*, is inferior to that of *Carrara*, its Grains being larger, and shining, like a kind of Salt. It is something like the antient white *Greek Marble*, whereof their Statues were made, but is not so hard or beautiful. *Antient black and white Marble* is now very rare, its Quarries being entirely lost; it is divided between a pure white and a bright black in Plates. *Blue Turquin Marble*, is mix'd with a dirty kind of white, and comes from the Coast of *Genoa*. *Marble Fior di Peffica*, comes from *Italy*, consists of red and white Stains, somewhat yellowish. *Yellow Marble*, is a kind of yellow *Isabella* without Veins; it is antient, and now very rare. *Black Aric Marble*, is of a pure black, without Stains, and softer than the modern black. This was some of it brought from *Greece*, call'd *Marmor Luculleanum*; but this was not so much prized as that which the *Egyptians* brought from *Athiopia*, approaching to an Iron Colour, and call'd *Basfates*, or *Touch-stone*, because it served them for the Tryal of Metals. *White and black Marble* has a pure black Ground, with some very white Veins. *Marble Oculio di Pevece*, or Peacock's Eye, is mingled with red, white and bluish Clouds, somewhat resembling the Eyes at the end of a Peacock's Tail. *Green Marble antique*, is a Mixture of Grass-green and Black, in Clouds of unequal Forms and Bignesses, and is very rare, the Quarries being lost. The modern *Green*, improperly call'd *Egyptian*, is brought from *Carrara*, on the Coast of *Genoa*; it is a deep Green spotted with Grey.

*Marble denominated from its Defects.*

*Rigid Marble*, that which, being too hard, works with difficulty, and is liable to splinter, as the Black of *Namus*. *Thready Marble*, is that full of Threads or Filaments. *Brittle Marble*, is that which crumbles under the Instrument, as the white *Greek Marble*, that of the *Pyreneans*, &c. *Terra Marble*, that with soft Places in it, which must be filled up with Cement, as that of *Languedoc*.

There are two Defects frequent in *Marbles*, which augment the Difficulty of cutting and polishing them. The one, what they sometimes call Nails, answering to the Knots in Wood; the other, call'd *Emeril*, is a Mixture of Copper or other Metals, making black Stains in the *Marble*. The Knots are common to all *Marbles*, the *Emeril* only in the white.

The Stack whereof they make Statues, Busts, Basso-Reliefs, and other Ornaments of Architecture, is only *Marble palveris'd*, mix'd in a certain Proportion with Plaster; the whole well sifted, work'd up with Water, and used like common Plaster. There is also a kind of artificial *Marble*, made of *Gypsum*, or a transparent Stone, resembling *Marle*; which becomes very hard, receives a tolerable Polish, and may deceive the Eye. There is also a kind of artificial *Marble* form'd by corrosive Tinctures, which penetrating into white *Marble*, to the depth of a Line, imitates the various Colours of other *Marbles*. Polish'd *Mor-ne* is that which, being well rubb'd with Free-stone, and afterwards with Pumice-stone, is at last polish'd with Emery, if the *Marble* be of several Colours, and with Tin, if it be white. In *Italy* they polish with a Piece of Lead and Emery.

There are various Ways of polishing Marble. Some lay three or four Blocks in a Row, and with another, fix'd to a broad Beetle, and a Handle fix'd at oblique Angles, with Sand and Water between, work the upper Stone backwards and forwards on the lower ones, till the Strokes of the Ax are wore off; after which, they polish them with Emery and Putty. Father Krieger shews the Manner of applying Colours on Marble, so as to make them penetrate its whole Substance; inasmuch that if the Marble be slit into several parallel Tables or Planks, the same Image will be found on each, that was painted on the first. Spots of Oil penetrate white Marble, so as they cannot be taken out. The word Marble comes from the Latin *Marmor*, and that from the Greek *μαρμαρος*, so fine.

To marble, is to paint, or dispose Colours in such a manner, as that they may represent Marble. Thus we marble Paper, Wood, &c.

MARbled, something resembling Marble: Thus marbled Paper, &c. is a Paper stain'd with various Clouds and Shades, resembling, in some measure, the various Veins of Marble; the Method whereof, see under PAPER.

MARBLING OF BOOKS, among Binders, the sprinkling over the Cover of a Book with Black, by means of a black Pencil struck gently against the Finger, or on a Stick held for the purpose. *Marbling* is not used, except for Books bound in Calfs; after it is finish'd, the Cover is glazed over with beaten Whites of Eggs, then smooch'd with a polishing Iron. They also marble Books on the Edges, but in this *Marbling* there is no Black us'd; in lieu thereof, red, blue, &c. See BOOK-BINDING.

MARCO, or MARK; a Weight used in several States of Europe, and for several Commodities, especially Gold and Silver in France. The *Marco* is divided into 8 Ounces, or 64 Drachms, or 192 Deniers or Penny-weights, or 160 Elettens, or 500 Mailles, or 640 Felins, or 4608 Grains. In Holland, the *Marco* Weight is also call'd Troy-Weight, and is equal to that of France. When Gold and Silver are sold by the *Marco*, it is divided into 24 Carats, the Carat into 8 Penny-weights, the Penny-weight into 24 Grains, and the Grain into 24 Primes. See CARAT.

MARK is also used among us for a Money of Account; and in some other Countries for a Coin: The English *Mark* is two Thirds of a Pound Sterling, or 13s. 4d. and Matthew Paris observes, it was of the same Value in 1194. The ancient Saxons call'd the *Mark*, *Mancus*, *Mancuse*, and *Mancus*; among them it was equivalent to thirty Pence, i. e. to six Shillings. The *mark-Lubs*, us'd at Hambourg, is also a Money of Account, equal to one Third of the Rixdollar, or to the French *Loire Tournois*. Each *Mark* is divided into sixteen *Sols-Lubs*, *Mark Lubs*, or *Danisch*, is also a Danish Coin, equal to sixteen *Sols Lubs*, or twenty French *Sols*. See SOL. Lastly, *Mark* is a Copper-Coin in Sweden, equal to two Pence Farthing Sterling; it is divided into eight *Ranings*, and each *Ranings* into two *Allovers*. The Swedish *Silver Mark* is a Money of Account, equal to three Copper *Markis*, the same make it a real Coin.

MARCSHITE; a Metallic Mineral, making, as it were, the Seed or first Matter of Metals. On this Principle, there should be as many different *Marscsites* as Metals, which is true in effect; the Name being apply'd to every Mineral Body that has Metallic Particles in its Composition. There are only three Kinds in the Shops, viz. *Marscsite* of Gold, of Silver, and of Copper; the same make the Loadstone *Marscsite* of Iron, Tin of Glass, *Marscsite* of Tin, and Zink or Spelter, that of Lead; but this we leave to the Chymists. *Marscsite* of Gold is in little Balls about the bigness of Nuts, nearly round, heavy, of a brown Colour without. *Marscsite* of Silver is like that of Gold, only less colour'd; within, the Colour differs much, the one having a Gold Colour, and the other a Colour of Silver, both shining and brilliant. The *Marscsite* of Copper is about the bigness of a small Apple, round or oblong, brown without, yellow and crystalline within, brilliant and shining. *Marscsites* are found in Mines of Metal; they contain a great deal of Vitriolic Salt, especially that of Copper. Some only use the word *Marscsite* for *Bismuth*. The Word is originally Arabic.

MARCELLIANISM, the Doctrine and Opinions of the *Marscellians*, a Sect of ancient Heretics; so call'd from *Marscellus* of Ancona, their Leader, who was accus'd of reviving the Errors of *Sabelians*. Some, however, are of opinion, he was Orthodox, and that it was his Enemies the *Asians*, who father'd their Errors upon him. St. Epiphanius observes, that there was a great deal of Dispute with regard to the real Tenets of *Marscellus*; but that as to his Followers, 'tis evident they did not own the three Hypostases: so that *Marscellianism* is no imaginary Heresy.

MARCGRAVE, a kind of Dignity in Germany, answering to our Marquiss. The Word is derived from the German *Marcke* or *Mark*, which signifies a Frontier; the

*Marscellians* being originally Governors of Cities lying on the Frontiers of any State.

MARCH, the third Month of the Year, according to the common way of computing. Among the *Romans* it was the first, and in some Ecclesiastical Computations, that Order is still preserv'd; as particularly in reckoning the Number of Years from the Incarnation of our Saviour, that is, from the 25th of March. In England however, properly speaking, *March* is the first Month in Order; the new Year commencing from the 25th, tho, in compliance to the Customs of our Neighbours, we usually rank it as the third; but in this respect, we speak one way, and write another. Till the Year 1564, the French reckon'd the beginning of their Year from *Easter*; so that there were two Months of *March* in one Year, one of which they call'd *March* before *Easter*, and the other *March* after *Easter*. When *Easter* fell within the Month of *March*, the beginning of the Month was in one Year, and the end in another.

It was *Romulus* who divided the Year into twelve Months; to the first of which he gave the Name of his supposed Father *Mars*. *Ovid*, however, observes, that the People of Italy had the Month of *March* before *Romulus's* Time; but that they placed it very differently, some making it the 5d, some the 4th, some the 3th, and others the 10th Month in the Year. In this Month it was that the *Romans* sacrific'd to *Anna Perenna*, that they began their *Comitia*, that they adjudg'd their public Farms and Leases; that the Women serv'd the Slaves and Servants at Table, as the Men did in the *Saxo-wala*; and that the Vestals renew'd the Sacred Fire. The Month of *March* was under the Protection of *Minerva*, and always consist'd of 31 Days. The Ancients held it an unhappy Month for Marriage, as well as the Month of *May*.

MARCHET; a pecuniary Fine anciently paid by the Tenant to his Lord, for the Marriage of one of the Tenant's Daughters. This Custom obtain'd, with some difference, throughout all England and Wales, as also in Scotland, and still continues to obtain in some places. According to the Custom of the Mannor of *Dinover* in *Carmarthenshire*, every Tenant, at the Marriage of his Daughter, pays ten Shillings to the Lord; which, in the British Language, is call'd *Gwabr-Merched*, i. e. *Maid's-Fee*.

In Scotland, and the North Parts of England, the common Custom was, for the Lord to lie the first Night with the Bride of his Tenant: But this Custom was abrogated by King *Malcolm III.* at the Instance of his Queen; and instead thereof, a *Mark* was paid by the Bridegroom to the Lord. Whence 'tis call'd *Maretha* *Mohelis*.

MARCIONITES, the Name of a very antient and popular Sect in the Church. In the Time of St. *Epiphanius*, they were spread over Italy, Egypt, Palestine, Syria, Arabia, Persia, and other Countries. *Marcion*, their Author, was of Pontus, the Son of a Bishop, and at first made profession of the Christian Life; but having had a criminal Affair with a Maid, was excommunicated by his own Father, who would never admit him again into the Communion of the Church, not even on his Repentance. On this he abandon'd his own Country, and retired to Rome, where he began to broach his Doctrines. He laid down two Principles, the one Good, the other Evil. He deny'd the real Birth, Incarnation and Passion of Jesus Christ, and held them to be all apparent only. He taught two Christs: One, who had been sent by an unknown God for the Salvation of all the World; Another, whom the Creator would one day send to re-establish the Jews. He deny'd the Resurrection of the Body, and allow'd none to be baptized, but those who preserv'd their Continence; but these he granted might be baptized three times. In many things he follow'd the Sentiments of the Heretic *Cerdon*, and reject'd the Law and the Prophets. He pretend'd the Gospel had been corrupted by false Prophets, and allow'd none of the Evangelists but St. *Luke*, whom he alter'd in many places, as well as the Epistles of St. *Paul*; a great many things in which he threw out. In his own Copy of St. *Luke*, he threw out the two first Chapters entire.

MARCITES, a Sect of Heretics in the second Century, who also call'd themselves the *Perseiti*, and made profession of doing every thing with a great deal of Liberty, and without any Fear. This Doctrine they borrow'd from *Simon Magus*, who, however, was not their Chief; for they were call'd *Marcites* from one *Marcus*, who confer'd the Priesthood, and the Administration of the Sacraments, on Women.

MARCOSSIANS, the Name of an antient Sect in Religion, making a Branch of the *Gnostics*. St. *Irenaeus* speaks at large of the Leader of this Sect, *Marcus*, who, it seems, was reputed a great Magician. He relates several things touching the Prayers and Invocation of the antient *Gnostics*, the antient *Jesus Cabala* on the Letters of the Alphabet, and their

their Properties, as well as on the Mysteries of Numbers, which the Jews and Gnostics had borrow'd from the Philosophy of Plato and Pythagoras. Marcus was an Egyptian, and there it was he became acquainted with Magic. To impose more easily on his Followers, he made use of certain Hebrew, or rather Chaldee Words, much used by the Enchanters of those Times. The Marcionites had a great number of Apocryphal Books, which they held for Canonical, and of the same Authority with ours. Out of these they pick'd several idle Fables, touching the Infancy of Jesus Christ, which they put off for true Histories. Many of these Fables are still in use and credit among the Greek Monks.

**MARGARITE.** See PEARL.

**MARK,** in Matters of Commerce and Manufacture; a certain Character struck or impress'd on various Kinds of Commodities, either to shew the Place where they were made, and the Persons who made 'em; or to shew they have been view'd and examin'd by the Officers or Magistrates charged with the Inspection of that Manufacture; or lastly, to shew the Duties imposed thereon have been regularly acquitted. Thus are Cloths, Leather, Cutlery-ware, Paper, Plate, Weights, Measures, &c. mark'd.

**MARK** is also a particular Sign or Character, known only to the Trader who pitches on it; whereby, being fix'd to any Commodity, he recollects the Price it cost him. These Marks, otherwise call'd Numeros, are taken according to the Fancy of those who use them; but, ordinarily, are chosen from among the Letters of the Alphabet, each having a relation to some particular Number of Figures. They are of so much use in Trade, that the Reader will not take it amiss, if we insert a little Table, to serve as a Model for their Construction.

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	100

One Example will give the whole Use of this Table. Suppose, v. g. I would put on a Piece of Stuff, that it cost 37 s. 6 d. per Ell. I put an M for 20 s. an L for 10 s. an H for 7 s. and a G for 6 d. So that the several Letters wrote after each other (observing always to separate Shillings from Pounds and Pence by Points, will make this Mark M.L.H.G equal to 37 s. 6 d. Note, the Mark may be diversified infinitely, by adding other Figures to the Letters in lieu of these.

**ST. MARK,** a Congregation of Regular Canons, founded at Mantua by one Albert Spinola, a Priest, towards the end of the 12th Century. Spinola made a Rule for them, which was approved, corrected and confirmed by several succeeding Popes. About the Year 1450, they were reformed, and followed only the Rule of St. Augustin. This Congregation, which at first consisted of 18 or 20 Houses of Men, and of some for Women, situate in Lombardy and the State of Venice; having flourished for the space of 400 Years, declined by little and little, and was at length reduced to two Convents; and in 1584, that of St. Mark at Mantua, which was the chief, was given with the Convent of Pope Gregory XIII. to the Camaldulens, and so the Congregation became extinct.

**Order of ST. MARK,** an Order of Knighthood in the Republic of Venice, under the Protection of St. Mark the Evangelist. The Arms of this Order are, a Lion winged Gules, with this Device, Pax tibi, Marthe Evangelista. This Order is never conferred but on those who have done signal Services to the Commonwealth.

**MARKET,** from the French *Marché*, i. e. *Emporium* or *Ferum Nominatum*; and signifies the same thing with us, as also the Liberty or Privileges whereby a Town is enabled to keep a Market. *Braithon* observes, that one Market ought to be distant from all others at least six Miles and a half, and a Third of a half. In former times it was customary to have most Fairs and Markets kept on Sundays, and in the Church-yard; so that Matters of Business and Devotion were transacted under one. Which Custom, tho' prohibited by several Kings, was yet held up till the Reign of King Henry the Sixth, when it was effectually suppress'd. In many Places they are still kept in the Church-yard.

**MARLE,** or *Morse*; a kind of fat, soft, fusible Earth, cast on Land to make it more fruitful: There are several Sorts, of several Colours and Qualities. Too much Marle thrown on the Earth, is found to burn it. Marle is also of use in making of Lime, and is burnt like other Stone. The Word comes from the antient Celtic *Marga*, mention'd by *Pliny*. It was afterwards call'd *Margina* and *Margaretta*. *Pliny* teaches the Use of it.

**MARMALADE;** a Confection made of the Juice or Pulp of several Fruits, as Plumbs, Apricocks, Quinces, &c. boiled with Sugar into a Consistence: that made of Quinces is sub-astringent, and grateful to the Stomach.

**MARMORA ARUNDELLIANA,** or the *Oxford Marbles*, are antient Stones, whereon appear a Chronicle of the City of Athens, engraven in Capital Letters in the Island of Paros, one of the Cyclades, 303 Years before Jesus Christ. They took their Name from *Thomas Earl of Arundel*, who procured them out of the East, or from *Henry his Grandson*, who presented them to the University of Oxford. An Account of all their Inscriptions were publish'd in 1676, by *Dr. Prideaux*.

**MARONITES,** a Body of Christians who follow the Syrian Rites, and are subject to the Pope; their principal Habitation being on Mount Libanus. The Learned are divided about their original Father. *Morus* and Cardinal *Enea* take *Marone* for the Name of a Sect, as well as *Nestorian* and *Jacobite*. The *Maronites* themselves pretend, that they are descended from one *Maron*, who lived in the beginning of the fifth Century, and whose Life is written by *Theodore*. The Jesuit *Seebach* is of the same Opinion; he thinks, that they never separated from the Catholic Church; and adds, that what has given occasion to their being judg'd in a Schism, is their Re-union with the *Romish Church*, which some take for a Return to the Catholic Faith. The former Opinion is founded on the Testimonies of *Engebinus*, *James de Vitri*, and several others, who expressly assert the *Maronites* to have been formerly a part of the *Monastelic Jacobites*: According to their Account, *Maron*, whom the *Maronites* qualify for a Saint, was in truth a Heretic. Towards the Year 1182, *Amers*, third Latin Patriarch of Constantinople, united the *Maronites* to that Church. From that time they have used the Mitre, Ring, Crozier, and other of the Latin Episcopalia; but their Service is still performed in the Chaldee Language.

*M. Faustus* has publish'd an Apology for *Maron* and the rest of his Nation. His Opinion is, that they really took their Name from the *Maron* who lived in the 4th Century, and whereof mention is made in *Chrysofom*, *Theodore*, and the Monology of the *Greeks*. He adds, that the Disciples of this *Maron* spread themselves throughout all Syria, that they built several Monasteries, and among others, one that bore the Name of their Leader; That all the Syrians who were not tainted with Heresy, took Refuge among 'em; and that for this reason, the Hereticks of those Times call'd 'em *Maronites*.

The *Maronites* have a Patriarch who resides in the Monastery of *Camnaha* on Mount Libanus, and assumes the Title of Patriarch of *Antioch*. He is elected by the Clergy and the People, according to the antient Custom; but since their Re-union with the Church of Rome, he is obliged to have a Bull of Confirmation from the Pope. He keeps a perpetual Celibate, as well as the rest of the Bishops his Suffragans. For the rest of the Ecclesiastics, they are allow'd to marry before Ordination; and yet the Monastic Life is in great esteem among 'em. Their Monks are of the Order of *St. Anthony*, and live in the most obscure Places in Mountains, far from the Commerce of the World.

As to their Faith, they agree in the main with the rest of the Eastern Church. Their Priests don't say Mass alone, but all say it together, standing round the Altar. They consecrate Bread without Leaven; and the Laity have hitherto communicated in both Kinds, tho' the Practice of communicating in one is introduced by little and little. In Lent they eat nothing, unless it be two or three hours before Sun-rising; Their other Fastings are very numerous. Their Name may either be derived from *Maron* abovemention'd, or from *masa*, the Name of a Monastery, or from *Maronea*, a City of Syria.

**MAROTIC STYLE,** a Term in the French Poetry, signifying a peculiarly gay, merry, yet simple and natural Manner of Writing, introduced by *Morus*, and since imitated by their other Authors, but with most Success by *Vauvenot* and *Fontaine*. The Difference between the *Marotic* and the *Burlesque Style*, is thus assign'd: The *Marotic* makes a choice, the *Burlesque* admits of all. The first is the most simple, but its Simplicity has its Nobleness; and where its own Time won't furnish natural Expressions, it borrows them from former Times. The latter is low and groveling, and borrows false and false Ornaments from the Crowd, which People of Taste despise. The one resigns itself to Nature, but examines first of all whether the Objects she presents be fit for its Paintings, and takes nothing but what carries with it somewhat of Delicacy and Mirth; the other runs headlong into Buffoonery, and affects every thing that is extravagant and grotesque.

**MARQUE,** Letters of, are Letters of Repraisal, granted by a King or Parliament, by which Subjects of one Country are licensed to make Reprisals on those of another; provided Application has been made for Redress to the Government, whereof the Aggressor belongs, three times without Effect. They are so call'd, as being *from*

*venessum in alterius Principis Marebas seu Limites transfennai, sibi que Jus facieat.* See REVERSALS.

**MARQUETRY**, *in-laid Work*; a Work composed of several Pieces of hard, fine Wood of different Colours, fasten'd, in thin Slices, on a Ground, and sometimes enrich'd with other Matters, as Tortoise-shell, Ivory, Tin, and Brass. There is another kind of *Marquetry* made, instead of Wood, of Glasses of various Colours; and a third, where nothing but precious Stones, and the richest Marbles, are us'd: but these are more properly called *Mosaic Work*. See MOSAIC.

The Art of Inlaying is very ancient, and is suppos'd to have pass'd from the East to the West, as one of the Spoils brought by the *Romans* from *Asia*; indeed it was then but a simple thing: nor did it arrive at any tolerable Perfection, till the sixteenth Century, among the *Italians*; it seems however to have arriv'd at its height in the seventeenth Century among the *French*. Till *John of Verme*, a Cotemporary with *Kiphael*, the finest Works of this kind were only black and white, which are what we now call *Mosaic's*; but that Religious, who had a Genius for Painting, stain'd his Woods with Dyes or boiled Oils, which penetrated them. But he went no further, than the representing Buildings and Perspectives, which require no great Variety of Colours. Those who succeeded him, not only improv'd on the Invention of dyeing the Woods, by a Secret which they found of burning them without consuming, which serv'd exceedingly well for the Shadows; but had also the Advantage of a number of fine new Woods of naturally bright Colours, by the Discovery of *America*. With these Assistances the Art is now capable of imitating any thing; whence some call it the *Art of Painting in Wood*.

The Ground whereon the Pieces are to be arranged and glued, is ordinarily of Oak or Fir well dried; and to prevent warping, is compos'd of several Pieces glued together. The Wood to be us'd being reduced into Leaves, of the Thickness of a Line, is either stain'd with some Colour, or made black for Shadows; which some effect, by putting it in Sand extremely heated over the fire, others by sleeping it in Lime-Water and Sublimate, and others in Oil of Sulphur. Thus colour'd, the Contours of the Pieces are form'd, according to the Parts of the Design they are to represent. This last is the most difficult part of *Marquetry*, and that wherein most Patience and Attention are required. The two chief Instruments us'd herein, are the Saw and the Vice; the one, to hold the Matters to be form'd; the other, to take off from the Extremes, according to occasion. The Vice is of Wood, having one of its Chaps fix'd, the other moveable, and is open'd and shut by the Foot, by means of a Cord fasten'd to a Treadle. Its Structure is very ingenious, yet simple enough, and will be easily conceived from the Figure (Tab. *Miscelanea*, fig. 1.) The Leaves to be form'd (for there are frequently three or four of the same Kind form'd together) are put within the Chaps of the Vice, after being glued on the outermost part of the Design, whose Profile they are to follow; then the Workman pressing the Treadle, and thus holding fast the Piece, with his Saw runs over all the Out-lines of the Design. By thus joining and forming three or four Pieces together, they not only gain time, but the Matter is likewise the better enabled to sustain the Effort of the Saw; which, how delicate soever it may be, and how lightly soever the Workman may conduct it, without such a Precaution, would be apt to raise Splinters, to ruin the Beauty of the Work.

When the *Marquetry* is to consist of one single kind of Wood, or of Tortoise-shell, on a Copper or Tin Ground, or vice versa; they only form two Leaves on one another, i. e. a Leaf of Metal, and a Leaf of Wood or Shell: this they call sawing in Counter-parts; for by filling the Vacuities of one of the Leaves by the Pieces coming out of the other, the Metal may serve as a Ground to the Wood, and the Wood to the Metal.

All the Pieces thus form'd with the Saw, and marked, to know 'em again, and the Shadow given in the manner already mention'd, they vaneer or fasten each in its Place on the common Ground; using for that purpose the best *English Glac*. The whole is put in a Press to dry, planed over, and polish'd with the Skin of the Sea-Dog, Wax, and Shave-Grafs, as in simple VANEERING, which see. With this Difference, however, that in *Marquetry* the fine Branches, and several of the more delicate Parts of the Figures, are touch'd up and finish'd with a Graver. 'Tis the Cabinet-Makers, Joiners, and Toy-Men, among us, who work in *Marquetry*; 'tis the Enamellers and Stone-Cutters, who deal in *Mosaic Work*: the Instruments us'd in the former are mostly the same with those us'd by the Ebonists. See EBONY. See also MOSAIC.

**MARQUETTE**; a Right or Due which the Women formerly paid to the King or Lord, to ransom themselves from an infamous Custom, which obliged them to pass

the first Night of their Nuptials with their Lords. This Establishment is attributed to King *Malcolme* or *Malcolme 3* and was suppress'd by *Malcolme III*. Some derive the Word *Marquette* from *Marc*, because the Fee of *Marquette* was half a Silver Marc.

**MARQUISS**, properly signifies a Title given to a Person in possession of a considerable Demefne, erected into a *Marquisate* by Letters Patents; holding a middle Place between the Dignity of a Duke, and that of an Earl or Count. *Marquesses* were antiently Governours of Frontier Cities or Provinces, call'd *Mareber*. See NOBILITY, PEER, &c.

According to some Authors, the Word *Marquis* comes from the *Marcmani*, an antient People who inhabited the *Marche of Brandenburg*. Others derive it from the *German Marc*, Limit; and others from *Marsilia*, which in the *Celtic Language*, signify'd a Wing of Cavalry. *Nicod* derives it from the corrupt Greek *μαρξιας*, Province. *Aleiar* and *Fauheer* bring it from *Marh*, Horse, taking a *Marquis* to be properly an Officer of Horfe. *Mesnage* derives it from *Mare*, Frontiers; and *Selden*, *Krantzius* and *Histomus* do the same. Lastly, *Poissier* teaches the Etymology of *Marquis* from the old *French Marebe*, Limit, or from *Mareber*, to confine; the Guard of the Frontiers being committed to them.

The word *Marquis* is *French*; the *Romans* were unacquainted with it. In the *Notitia Imperii* they are call'd *Comites Limitanei*. *Aleiar* has started a Question, whether a *Marquis* or Count should have the Precedence. To decide it, he goes back to the antient Function of Counts, and observes, that Counts, who are Governours of Provinces, are above *Marquisses*, who are only Governours of Frontiers; and that *Marquisses*, who are Governours of Frontier-Cities, are above Counts, who are Governours of small Towns. He adds, that in consequence of this Distinction, the Book of Fiefs sometimes places *Marquisses* above Counts, and sometimes Counts above *Marquisses*. *Froissart* observes, that the *Marquisat of Juliers* was erected into a County. But now-a-days, neither *Marquisses* nor Counts are any longer Governours; and as they are mere Titles of Honour, the Counts make no scruple of resigning the Precedency. King *Richard* the Second was the first who introduc'd *Marquisses* in *England*; till that time, the Frontiers had been governed by Lords *Marches*. See COUNTY, DUKE, &c.

**MARRIAGE**, a Civil and Religious Contract, by which a Man is join'd and united to a Woman. The Essence of *Marriage* consists in the mutual Consent of the Parties. *Marriage* is part of the Law of Nations, and is in use among all People. The *Romanists* account it a Sacrament. The Woman, with all her moveable Goods, immediately upon *Marriage*, passes wholly in *Patrimonium Viri*, into the Power and Disposal of the Husband. See WIFE, AFFINITY, DECREE, &c. *Seneca*, *Benacina*, and *Bomer*, have wrote on the Subject of *Marriage*.

In *Germany* they have a kind of *Marriage* call'd *Morganatic*, wherein, a Man of Quality contracting with a Woman of inferior Rank, he gives her the left Hand in lieu of the right, and stipulates in the Contract, that the Wife shall continue in her former Rank or Condition, and that the Children born of them, be of the same; so that they become Bastards as to Matters of Inheritance, tho' legitimate in effect: They cannot bear the Name or Arms of the Family. None but Princes, and great Lords of *Germany*, are allow'd this kind of *Marriage*. The Universities of *Leipsic* and *Jena* have declared against the Validity of such Contracts, maintaining that they cannot prejudice the Children, especially when the Emperor's Consent intervenes in the *Marriage*.

The *Turks* have three Kinds of *Marriages*, and three Sorts of Wives; *Legitimate*, *Wives in Keliem*, and *Slaves*. They marry the first, hire the second, and buy the third.

*Duty of MARRIAGE*; a Term us'd in some antient Customs, signifying an Obligation to *Marriage*. To understand this, it must be observ'd, that old Maids, and Widows above sixty, who held Fees in Body, or were charg'd with any Personal or Military Services, were antiently oblig'd to marry, to render those Services to the Lord by their Husbands, or to indemnify the Lord, which they could not do in Person. And this was call'd, *Duty or Service of Marriage*.

The *Roman Laws* speak of second *Marriages* in very hard and odious Terms. *Matre jam secundis Nuptiis junctata, L. 3. C. de sec. Nuptiis*. By these Laws it was enacted, that the Effects of the Husband or Wife deceased should pass over to the Children, if the Survivor should marry a second time. By the *Law Huc Editi Cod. de sec. Nup.* the Survivor, upon *Marrying* a second time, could not give the Person they married, a Portion more than equal to that of each of the Children. In the Primitive Church, the Respect to Chastity was carry'd so high, that a second

Marriage was accounted no more than a lawful Debauch, or a Species of Bigamy. There are some ancient Canons which forbid the Ecclesiastics from being present at second Marriages.

MARRIAGE, in Law, signifies not only the lawful joining of Man and Wife, but also the Right of bestowing

a Ward or a Widow in Marriage, and the Land given in Marriage.

For the Proportions which Marriages bear to Births, and Births to Burials in several Parts of Europe, Mr. Derham gives us the following Table.

Names of Places.	Marriages to Births, as	Births to Burials, as
England in General	1 to 4.63	1.12 to 1
London	1 to 4.	1 to 1.1
Hantsire, from 1569 to 1658	1 to 4.	1.2 to 1
Trocton in Devon. from 1645 to 1664	1 to 3.7.	1.26 to 1
Cranbrook in Kent, 1560 to 1649	1 to 3.9.	1.6 to 1
Synbo in Northamp. for 118 Years	1 to 6	1.6 to 1
Upminster in Essex, for 100 Years	1 to 4.6.	1.8 to 1
Frankfort on the Main in 1695	1 to 3.7	1.2 to 1
Old, Middle, and Lower March, in 1698	1 to 3.7	1.9 to 1
Dominions Elect. of Brandenburg 1698	1 to 3.7	1.5 to 1
Bretlaw in Silesia, from 1687 to 91		1.6 to 1
Paris in 1670, 1671, 1672	1 to 4.7	1.6 to 1

From which Table it appears, that Marriages, one with another, do each produce about four Births, both in England and other Parts of Europe. And by Mr. King's Computation, about 1 in 104 Persons marry; the Number of People in England being estimated at five Millions and a half, whereof about 41000 annually marry.

Major Graunt and Mr. King disagree in the Proportions between Males and Females, the latter making 10 Males to 13 Females in London; in other Cities and Towns, and in the Villages and Hamlets, 100 Males to 99 Females. But Major Graunt, both from the London and Country Bills, computes that there are in England 14 Males to 13 Females; whence he justly infers, that the Christian Religion, prohibiting Polygamy, is more agreeable to the Law of Nature than Mahometism, and others that allow it. This Proportion of Males to Females Mr. Derham thinks pretty just, being agreeable to what he had observed himself. In the 100 Years, for instance, of his own Parish Register of Upminster, tho' the Burials of Males and Females were nearly equal, being 653 Males, and 623 Females in all that time; yet there were baptized 709, and but 675 Females, which is 13 Females to 13.7 Males. From which Inequality it appears, that one Man ought to have but one Wife, and yet that every Woman, without Polygamy, may have a Husband; this Surplusage of Males above Females being spent in the Supplies of War, the Seas, &c. from which the Women are exempt. That this is a Work of Providence, and not of Chance, is well made out by the very Laws of Chance, by Dr. Arbuthnot: Who supposes Thomas to lay against Jobu, that for eighty-two Years running, more Males shall be born than Females; and giving all Allowances in the Computation to Thomas's Side, he makes the Odds against Thomas, that it does not so happen to be near five Millions of Millions of Millions of Millions to one; but for Ages of Ages, according to this World's Age, to be near an infinite Number to one. See BIRTHS and BURIALS.

MARROQUIN, vulgarly MOROCCO, the Skin of a Goat, or some other Animal resembling it, and call'd *Mosen*, frequent in the Levant; dress'd in Sumac or Galls, and colour'd of any Colour at pleasure, much used in Tapistry, Book-Binding, &c. The Name is ordinarily derived from the Kingdom of Morocco, whence 'tis supposed the Manner of preparing them was first borrow'd. We have Morocco Skins brought from the Levant, Barbary, Spain, Flanders, and France; red, black, yellow, blue, &c. The various Manners of preparing Morocco's, both Black and in Colours, are so curious and useful, and withal so little known among us, that the Publick will not be displeas'd to find them here.

Manner of preparing black Morocco's. The Skins having been dress'd in the Hair, are steep'd in clear Water three Days and Nights, stretch'd on a wooden Horse or Leg, like that used by Tanners, beaten with a large Knife for the purpose, and steep'd a-fresh in Water, chang'd daily till they be well come again. In this State they are thrown into a large Vat in the Ground, full of Water, wherein Quick-Lime has been staked, where they lie 15 Days; whence, however, they are taken, and again return'd every Night and Morning: They are then thrown into a fresh Vat of Lime and Water, and shifted Night and Morning, as before, for 15 Days longer; then rins'd in clear Water, and the Hair taken off, on the Leg, with the Knife; return'd into a third Vat, and shifted as before

for about 18 Days; steep'd 12 Hours in a River, taken out, rins'd, put in Pails, where they are pounded with wooden Peelles, changing the Water twice; then laid on the Horse, and the Flesh taken off, return'd into Pails of new Water, taken out, and the Hair-side scraped; return'd into fresh Pails, taken out, and thrown into a Pail of a particular Form, having Holes at bottom: here they are beaten the space of an hour, and fresh Water pour'd on from time to time; stretch'd on the Leg, and scraped on either Side, return'd into Pails of fresh Water; taken out, stretch'd up all around in manner of Bags, leaving out the hind Legs, which serve as a Mouth for the Conveyance of a Mixture mention'd hereafter. The Skins thus wash'd, are put in luke-warm Water, where Dogs Excrement has been dissolved. Here they are stirr'd with long Poles half an hour, left at rest a dozen, taken out, rins'd in fresh Water, and fill'd by a Tunnel with a Preparation of Water and Sumac, mix'd and heated over the Fire till ready to boil; and as they are fill'd, the hind Legs are sew'd up, to stop the Passage. In this State they are let down into the Vessel of Water and Sumac, and kept stirr'd four hours successively, taken out, and heap'd on one another; after a little time, their Sides changed: and thus they continue an hour and half, till drain'd. This done, they are loosen'd, and fill'd a second time with the same Preparation, wash'd up again, and kept stirr'd two hours, piled up and drain'd as before. This is again repeated a third time, with this Difference, that they are now only stirr'd a quarter of an hour; after which, they are left till the morrow morning, when they are taken out, drain'd on a Rack, unfew'd, the Sumac taken out, fold'd in two from Head to Tail, the Hair-side outwards, laid over each other on the Leg, to perfect their Draining, stretch'd out, and dried; then tramp'd under foot by two and two, stretch'd on a wooden Table, what Flesh and Sumac remains scrap'd off, and the Hair-side rubb'd over with Oil, and that again with Water. Having thus received their Oil and Water, they are twist'd in the Hands, then stretch'd and press'd tight on the Table with an Iron Instrument like that of the Curriers, the Flesh-side uppermost; then turn'd, and the Hair-side rubb'd strongly over with a handful of Rushes, to squeeze out as much of the Oil remaining within as possible. The first Course of Black is now laid on the Hair-Side, by means of a Lock of Hair twist'd and steep'd in a kind of black Dye, prepared of four Beer, wherein Pieces of old rusty Iron have been thrown. When half dry by hanging in the Air, they are stretch'd on a Table, and rubb'd over every way with a Paumelle, or wooden Instrument, with Teeth to raise the Grain, over which is put a light Couche of Water, then steek'd, by rubbing them with Rushes prepared for the purpose. Thus steek'd, they have a second Couch of Black, then dried, laid on the Table, rubb'd over with a Paumelle of Cork, to raise the Grain again; and after a light Couche of Water, steek'd over anew, and to raise the Grain a third time, a Paumelle of Wood used. After the Hair-side has thus received all its Preparations, the Flesh-side is pared with a sharp Knife for the purpose; the Hair-side rubb'd strongly over with a woollen Cap, having first given it a Lustre with Barberries, Citron, or Orange. The whole is finish'd, by raising the Grain lightly for the last time with the Paumelle of Cork, which leaves them in a Condition for Sale and Use.

*Manner of preparing red Maroes.* The Skins are steep'd twenty-four hours in a River, taken out, stretch'd on the Leg, beat with the Knife, return'd into the Water for twenty-four hours, re-beaten on the Leg, re-steep'd; thrown into a Fat, and for three Weeks, taken out and return'd every Morning, to dispose them to peel. Being taken out for the last time, they are scraped with the Knife, and when the Hair is quite off, fringed in Pails of fresh Water, where they are rinsed; then the Flesh-side scraped, thrown into the Pails, and thus alternately from the Leg to the Pails, till they leave the Water quite clean: then they are put in lukewarm Water, with the Experiment as before, and after twelve hours, rinsed in clear Water, and scraped on the Leg on both Sides, pounded in Pails, and the Water changed three times; then wrung and stretch'd on the Leg, and pass'd after each other into Water, with Alum dissolved in it. Thus alum'd, they are left to drain till the Morning, then wrung out, pull'd on the Leg, and folded from Head to Tail, the Flesh inwards. In this State they receive their first Dye, by passing them after one another into a red Liquor, prepared with *Laces*, and some other Ingredients, kept secret among the *Marguineers*. This they repeat again and again, till the Skins have got their first Colour. They are then rinsed in clear Water, stretch'd on the Leg, and left to drain twelve Hours; thrown into Water, into which white Galls pulveriz'd have been pass'd thro a Sieve, and stirred incessantly for a day with long Poles, taken out, hung on a Bar a-cross the Water all night, White against Red, and Red against White, and in the Morning the Water stirred up, and the Skins return'd into it for twenty-four Hours.

**MARROW**, a delicate Substance contain'd in the Cavities of the Bones. All the Bones of the Body, which have any considerable Thickness, have either a large Cavity, or are spongy, and full of little Cells; in both the one, and the other, is an oleaginous Substance, call'd *Marrow*, contain'd in proper Vessels or Membranes, which open into one another. In the larger Bones, this fine Oil, by its gentle Heat of the Body, is exhaled thro the Pores of its little Bladders, and enters some narrow Passages, which lead to some fine Canals, excavated in the Substance of the Bone, according to its Length; and from these, other cross Passages (not directly opposite to the former, lest they should weaken the Bone too much in one Place) carry the Marrow fill farther into more longitudinal Canals, placed nearer the Surface of the Bone: All this Contrivance is, that the *Marrow* may supple the Fibres of the Bones, and render them less apt to break. The Antients imagin'd, that *Marrow* serv'd for nourishment to the Bones. But later Observations have found Blood-Vessels in the Bones; so that it appears the Bones are nourish'd in the same manner as the other Parts of the Body. Besides, we find many Bones which grow, and yet have no *Marrow* in them; witness the Horns of Deer, Lobsters Claws, &c. See MEDULLA.

**MARS**, among Chymists, signifies Iron, because imagin'd under the Influence of that Planet. See IRON. Physical Writers prove Iron preferable for all Medicinal Purposes to Steel, which is only a more harden'd, compact Iron, made so by Art; whereby it is rendered more unfit to yield those Principles or Parts in Preparation, which the Physician requires to be drawn out. For the Operation of its Medicinal Properties, see CALVEYREAT.

**MARS**, in Astronomy, one of the five Planets, and of the three superior ones; its Place being between the *Sun* and *Jupiter*: See PLANET, and SYSTEM. Its Character is ♄. Its mean Distance from the Sun is 1524 of those Parts, whereof the Distance of the Sun from the Earth is 1000. Its Eccentricity 141. The Inclination of its Orbit, that is, the Angle form'd by the Place of its Orbit with the Plane of the Ecliptic, 1 Deg. 52 Min. The periodical Time, in which it makes its Revolution round the Sun, 686 Days 23 Hours. Its Revolution about its own Axis is perform'd in 24 Hours 40 Minutes. For the Diameter of *Mars*, see DIAMETER, and SEMIDIAMETER. For its Density, see DENSITY. For the Force of Gravity on its Surface, see GRAVITY. Its Parallax, according to Dr. *Hook* and Mr. *Huyghens*, is scarce 30 Seconds.

In the Achronical Rising of this Planet, that is, when it is in opposition to the Sun, it is found twice as near the Earth as the Sun; which is a Phenomenon that has extremely discredit'd the *Ptolemaic* Hypothesis. Dr. *Hook*, in 1665, observ'd several Spots in *Mars*, which having a Motion, he concluded the Planet to turn round its Centre. In 1666, M. *Cassini* observ'd several Spots in the two Faces or Hemispheres of *Mars*, which, by continuing his different Observations very diligently, he found to move by little from East to West, and to return in the space of 24 Hours 40 Minutes to their former Situation. Whence both the Motion and Period, or natural Day of that Planet, was determin'd. *Mars* always appears with a ruddy,

troubled Light; whence we conclude it is encompass'd with a thick, cloudy Atmosphere, which, by disturbing the Rays of Light in their Passage and Re-passage thro it, occasion that Appearance. *Mars* having his Light from the Sun, and revolving round it, has an Increase and Decrease like the Moon. It may also be observed almost bisected, when in its Quadratures with the Sun, or in his Perigeon, but never concircular or falcated, as the inferior Planets. See PHASES.

This Planet's Distance from the Sun, is to the Distance of the Earth and Sun, as 15 to 1. So that a Man placed in *Mars*, would see the Sun's Diameter less by one third than it appears to us, and consequently the Degree of Light and Heat, which *Mars* receives from the Sun, is less by one third than that received by the Earth: This Proportion, however, will admit of a sensible Variation, on account of the great Eccentricity of this Planet.

The Period or Year of this Planet, as has been already observ'd, is nearly twice as long as ours, and his natural Day, or the Time in which the Sun appears above his Horizon (setting aside the Consideration of Twilight) is almost every where equal to his Night; yet it appears, that in one and the same Place on his Surface, there will be but very little Variety of Seasons, scarce any Difference of Summer and Winter. And the reason is, that the Axis of his Diurnal Rotation is nearly at right Angles with the Place of his Orbit. It will be found, notwithstanding, that Places situate in different Latitudes, that is, at different Distances from his Equator, will have very different Degrees of Heat, on account of the different Inclination of the Sun's Rays to the Horizon; as 'tis with us, when the Sun is in the Equinoxes. From this Consideration, Dr. *Gregory* endeavours to account for the Appearance of the *Polaris* in *Mars*; which are certain Swathes or Fillets seen in this Planet, and posited parallel to his Equator. For, as among us, the same Climate has at different Seasons very unequal Degrees of Heat; but in *Mars* it is otherwise, the same Parallel having always a pretty equable Degree of Heat: It follows, that these Spots may probably be form'd in *Mars*, or his Atmosphere, as Snow and Clouds are in ours, viz. by the constant different Intensions of Heat and Cold in the different Parallels; and so come to be extended in Circles or Belts parallel to his Equator, or the Circle of his Diurnal Revolution. And this same Principle may, perhaps, solve the Phenomenon of *Jupiter's* Belts; that Planet, like *Mars*, having a perpetual Equinox. See JUPITER.

Besides the ruddy Colour of *Mars*, we have another Argument of his being encompass'd with an Atmosphere; and it is this, That when any of the fix'd Stars are seen near his Body, they appear extremely obscured, and almost extinct. If this be the Case, an Eye placed in *Mars* would scarce ever see *Mercury*, unless perhaps in the Sun at the time of Conjunction, when *Mercury* passes over his Disk, as he sometimes appears to us in form of a Spot. A Spectator in *Mars* will see *Venus* about the same Distance from the Sun that *Mercury* appears to us; and the Earth about the same Distance from the Sun, that to us *Venus* appears. And when the Earth is found in Conjunction with, and very near the Sun, he will see in *Mars* what *Cassini* saw on Earth, viz. the Earth appear horned or falcated, and its Attendant the Moon of the same Figure, and at its utmost Distance from the Earth, not above 15 Minutes of a Degree.

**MARS**, among the Astrologers, is held a Masculine Planet. They call it the *little Unfortunate*; it is masculine, nocturnal, hot and dry.

Games of **MARS**, were Combats instituted at Rome in honour of the God *Mars*. They were held twice in the Year; once in the *Circus*, on the 4th of the Ides of *May*; and a second time on the 11th of *August*. These were establish'd, some time after the first, in memory of the Dedication of the Temple of *Mars* on that Day.

These Games consisted in the Courses of Horses, and Combats with wild Beasts. *Germanicus* is said to have kill'd two hundred Lions in the *Circus* on these Occasions.

CRUCIUS MARTIS, is the Rust of Iron; or Iron in an impalpable Powder. The Alchymists sometimes call their Mercury by the Name of *Mars*.

**MARSHAL**: With us there are several Officers of this Name, the Chief whereof is the *Earl-Marshal* of *England*, who is one of the Great Officers of the Crown. He takes Cognizance of all Matters of War and Arms; determines Contracts touching Deeds of Arms out of the Realm upon Land, and Matters concerning War within the Realm, which cannot be determin'd by Common Law, in which he usually proceeds according to the Civil Law. This Office is Hereditary, having been for many Ages in the House of *Norfolk*.

The *Earl-Marshal* had antiently several Courts under him, but hath now only the *Marshalsee*, where he may sit

In Judgment against Criminals offending within the Verge of the Court.

There are other inferior Officers of this Name; as *Marshal of the Justices* in Eyre; *Marshal of the King's Bench*, who has Custody of the Prison, call'd the *King's Bench*, in *Southwark*. *Knight-Marshal*, an Officer in the *Marshalls*, under whom are the *Marshal's Men*, who are properly the King's Bayliffs, and arrest in the Verge of the Court, when a Warrant is back'd by the Board of Green-Cloth. The Court where Causes of this kind, between Man and Man, are tried, is call'd the *Marshalls*, and is under the *Knight-Marshal*. In *Plena* mention is made of a *Marshal of the King's Hall*; a *Marshal of the Exchequer*, to whom the Court commits the Custody of the King's Debtors, &c.

**MARSHAL, or MARECHAL, of France;** the Name of an Officer of the Crown, who commands the Armies. The Dignity of *Marshal* is now for Life, tho at its first Institution it was otherwise. They were then only the King's first Ecuycers under the Constable, but in Time they became the Constables Lieutenants in the Command of the Army, the Constable himself being then become Captain-General. At first they were but two in number, and their Allowance was but 500 Livres per Annum in Time of War, and nothing in Time of Peace. In the Reign of *Francis the First*, their Number was increased to five; since him it has been various: the late King increased it at pleasure; and it is now eleven. Their Office at first was to *marshal* the Army under the Constable, and to command in his Absence. They did then what the *Marshalls de Camp* do now; to which last they have given their Title, and the least considerable Part of their Authority. The first *Marshal* does the Office of Constable in an Assembly of the *Marshalls*.

*Nicod* derives the Word *Marshal* from *Palmarsibus*, Master of the Camp; *Matheus Paris* from *Martis Senfallus*. In the old *Gaulish* Language, *March* signify'd Horse, whence *Marechal* might signify him who commanded the Cavalry. *Ménage* derives it from *Marschalus*, which is composed of *Marek* or *Marak*, Horse, and *Schale*, powerful; or, according to *Clovesius*, Servant: Which makes some imagine, the Title was first given to Farriers, or those who shoe'd and bleed Horses; and that in Succession of Time, it pass'd to those who commanded them. *Pasquier* makes four several Derivations for the four several Kinds of *Marshalls*, viz. *Marshalls of France*, *Marshalls de Camp*, *Marshalls de Lays*, or Quarter-Masters, and Farriers, who are call'd by the Name of *Marshalls*. The third he derives from *Marche* or *Marschir*, to mark, limit; and the last from *Maire*, Master, and *Chal*, Horse.

**MARSHALLING a Coat of Arms,** in Heraldry, signifies the due and proper joining of several Coats of Arms in one and the same Shield or Escutcheon, together with their Ornaments, Parts, and Appurtenances. See *ARMS*.

**MARTIAL,** is sometimes used to express Preparations of Iron, or such as are impregnated therewith; as the *Martial* Regulus of Antimony, &c. See *ANTIMONY*.

**MARTIAL LAW,** is the Law of War, depending upon the King's pleasure, or his Lieutenant in Times of War: For the King, in Time of Peace, never makes any Laws, but by common Consent in Parliament; yet in War he useth absolute Power: But even this Power hath been invested of late Years in the King, or his Generals of the Army, by Act of Parliament, and under particular Restrictions too. See *LAW*.

**MARTINGALE;** a Thong of Leather fasten'd at one end to the Girths under the Belly of a Horse, and at the other end to the Muffroll, to hinder him from rearing.

**MARTLET;** a Term in Heraldry for a Pigeon, with its Feet cras'd, or torn off: It is used for the Difference or Mark of Distinction in an Escutcheon for the fourth Brother, or Family.

**MARTYR,** a Person who suffers Torments, and even Death, in Defence of the Truth of the Gospel. *St. Stephen* is call'd the *Proto-Martyr*, or first Martyr. 197000 Persons are computed to have suffer'd Martyrdom with *St. Irenaeus* at *Lions*, under the Empire of *Severus*. 6666 Soldiers of the *Theban Legion* are said to have been martyr'd in *Gaul*. *Father Papebroch* reckons 16000 *African Martyrs*, and 150000 others under *Dioclesian* alone. Antiently those who were banish'd for the Faith, were call'd *Martyrs*, as well as those who perish'd in the Holy Wars. In the Time of *St. Augustin*, the Title of *Martyrs* was given to Confessors, or those who were tortured for the Faith without losing their Lives. 'Tis *Tertullian's* Thought, in his *Apologetic*; *Plures effusimur, quousq; metimur; Scenam est Saugnis Christianam*.

The Word *Martyr* is *Greek*, *μάρτυρ*, and properly signifies a Witness. Thus it is apply'd, by way of Eminence, to those who suffer in witness of the Truth of the Gospel. In the antient Church, the Acts, Sufferings, and Deaths

of the *Martyrs* were preserv'd with a world of Care; and yet, in spite of this Diligence, we have but very little left of them. *Eusebius* indeed compos'd a Martyrology, but it never reach'd down to us; and those since compil'd, are extremely suspected. See *MARTYROLOGY*. *Mr. Dodwell* endeavours to prove, in a Dissertation expressly for that purpose, That the Number of *Martyrs* who suffer'd under the *Roman Emperors*, was very moderate; alledging, That those we have Accounts of in the Fathers, come in a very small Compass; and that, excepting *Nero* and *Domitian*, the rest of the Emperors made scarce any. *T. Ruanard*, on the contrary, endeavours to prove, That the Catalogue of *Martyrs* is not at all swell'd; That the Carnage was immense under the first Emperors, and especially in that of *Dioclesian*. *F. Papebroch*, in his *Acta Sanctorum*, makes the Number of *Martyrs* infinite. Scarce any Faith or Religion, but pretends to its *Martyrs*. *Mahometans*, *Heathens*, *Idolaters*, &c. See *SAINTS*.

The *ERA of MARTYRS* is an *ERA* follow'd in *Egypt* and *Abyssinia*; and which even the *Mahometans*, since their becoming Masters of *Egypt*, frequently observe. It is fix'd to the beginning of the Persecution of *Dioclesian*, *A. D.* 302 or 303. The *ERA of Martyrs* is also call'd the *ERA of Dioclesian*. See *EPOCHA*.

**MARTYROLOGY,** a Catalogue or List of *Martyrs*. A *Martyrology*, properly speaking, should contain no more than the Name, Place, and Day of Martyrdom of each *Saint*; but the Term is frequently apply'd to the Histories of *Martyrs*. The Custom of collecting *Martyrologies*, is borrow'd from the *Heathens*, who inscrib'd the Names of their Heroes into their *Fassii*, to preserve to Posterity the Memory and Example of their noble Actions. *Baronius* gives *Pope Clement* the Credit of being the first who introduc'd the Custom of collecting the Acts of the *Martyrs*. The *Martyrology of Eusebius of Caesarea* was the most celebrated in the antient Church. It was translated into *Latin* by *St. Jerom*; but the Learned agree, that it is not now extant. That attributed to *Beda* in the 8th Century, is of very doubtful Authority; the Names of several *Saints* being there found, who did not live till after the Time of *Beda*. The 9th Century was very fertile in *Martyrologies*. Then appear'd that of *Florus*, Sub-Deacon of the Church at *Lions*, who, however, only fill'd up the Chasms in *Beda*. This was publish'd about the Year 830. That of *Wandelberin*, Monk of the Diocese of *Treves*, written in *Verse* about the Year 828. That of *Ussard*, a *French Monk*, who wrote by Command of *Charles the Bald*, in 875; which last is the *Martyrology* now ordinarily used in the *Romish Church*. That of *Raban*, which is an Improvement on *Beda* and *Florus*, written about the Year 845. That of *Narker*, Monk of *St. Gal*, written about the Year 894. That of *Adon*, Monk of *Ferrieres*, in the Diocese of *Treves*, afterwards Archbishop of *Vienne*, is a Descendant of the *Roman*, if we may so call it; for *Du Sallier* gives its Genealogy thus: The *Martyrology of St. Jerom* is the great *Roman*, from this was made the little *Roman*, printed by *Rosweyd*. Of this little *Roman*, with that of *Beda* augmented by *Florus*, *Adon* compil'd his in the Year 838. The *Martyrology of Nevelon*, Monk of *Carbie*, written about the Year 1089, is little more than an Abridgment of that of *Adon*. *Father Kircher* makes mention of a *Coptic Martyrology*, preserv'd by the *Maronites* at *Rome*. We have also several Protestant *Martyrologies*, containing the Sufferings of the Reformed under the *Papists*, viz. an *English Martyrology*, by *J. Fox*; with others by *Clark*, *Bray*, &c. The Word comes from the *Greek* *μάρτυρ*, Witness, and *λόγος*, discourse, I speak, or *λεγω*, συλλεγω, I gather.

**MARTYROLOGY,** is also used in the *Romish Church* for a Roll or Register kept in the Vestry, containing the Names of all the *Saints* and *Martyrs*, both of the Universal Church, and of the Particular Ones of that City or Monastery. The Word is also apply'd to the painted or written Catalogues in Churches, containing the Foundations, Obits, Prayers, and Masses, to be said each Day.

**St. MARY;** a Name by which several Orders of Knighthood, several Orders of Religious, and several Feasts, are distinguish'd. As *St. Mary of the TRINITY*, a Military Order. See *TRINITY*. *St. Mary of the Conception*, a Military Order. See *CONCEPTION*. *St. Mary of the Elephant*, a Military Order. See *ELEPHANT*. *St. Mary and Jesus*, a Military Order. See *JESUS*. *St. Mary of Loreto*, a Military Order. See *LORETO*. *St. Mary of Mount Carmel*, a Military Order. See *CARMEI*. *St. Mary of the Teutonic*. See *TEUTONIC*, &c.

**MASBOTHAN, or MASBUTHAN;** The Name of a Sect, or rather of two Sects; as *Eusebius*, or rather *Hegesippus*, whom he cites, makes mention of two different Sects of *Masbetheans*. The first are one of the seven Sects that arose out of *Judaism*, and proved very troublesome to the Church. They were so call'd from *Masbethea*, their Author. The others were one of the seven *Jewish Sects* before the Coming of *Jesus Christ*. For

*Valentin* won't allow the two to be confounded together: the last being a Sect of Jews before, or at least contemporary with Christ; and the former a Sect of Heretics descended from them. *Rafinus* distinguishes them by their Names: The Jewish Sect he calls *Masubebans*; and the Heretics *Masubabans*. The *Masubebans* were a Branch of the *Simonians*.

The Word is derived from the Hebrew *מַסָּבֵב* *Sabeb*, to rest or repose, and signifies idle, easy, indolent People. *Enchiridion* speaks of them, as if they had been so call'd from *Masubebans*, their Chief; but 'tis much more probable that their Name is Hebrew, or at least Chaldaic, signifying the same thing with a *Sedentarian* in our Language, that is, one who makes profession of keeping Sabbath.

**MASCLE**, is a Term in Heraldry for a Bearing of this Figure: Gules a Chevron Ermine between three *Mascles* Argent, by the Name of *Bellgrave*. *Gulim* saith, that *Masle* represents the Mesh of a Net, and is an honourable Bearing. A *Masle* differs from a *Lozenge*, only by being voided.

**MASCULINE**, something belonging to the Male, or the stronger of the two Sexes. See **MALR**.

**MASCULINE**, is more ordinarily used in Grammar to signify the first and noblest of the Genders of Nouns. The *Masculine* Gender is that which belongs to the Male Kind, or something analogous to it, and which Custom has affix'd to a Word. For Men considering themselves, and observing the Difference between the two Sexes, have thought fit to vary the same Adjective Names, by giving them different Terminations, as they are differently apply'd to Men or Women. Thus in *Latin* we say *bonus Equus*, a good Horse, in the *Masculine*; but speaking of a Mare, we change the Termination, not of the Adjective only, but also of the Substantive, and say, *bona Equa*. In *English*, however, we are more strict; for we generally express the Difference of Sex by different Words, not by the varying the Termination of the same, or by varying the Adjective: As *Boar* in the *Masculine*, *Sow* in the *Feminine*; *Boy*, *Girl*; *Brether*, *Sister*; *Brother*, *Sister*; *Man*, *Woman*, &c. Indeed we have about twenty *Feminines* distinguish'd from their *Masculines*, by the Variation of the Termination of the Male into *es*; for instance, *Abbot*, *Abbe's*; *Actor*, *Actress*; *Count*, *Countess*; *Heir*, *Heiress*; *Master*, *Mistress*; &c. And this is all that our Language knows of any thing like the Genders, which are only a different way of expressing the Male and the Female. But the old Languages, and even some of the Moderns, have gone further; for as some Adjectives may have Relations to other Things, besides Men and Women, it has been thought necessary to appropriate to them one or other of the Terminations invented for Men and Women. Hence most other Substantives have been ranged under the Heads of *Masculine* or *Feminine*. This, in some Cases, is done with a shew of Reason, but in others is merely arbitrary; and for that reason is found to vary according to the Languages, and even according to the Words introduced from one Language into another. Thus the Names of Trees are generally *Feminine* in *Latin*, and *Masculine* in the *French*: Farther, the Genders of the same Word are sometimes varied in the same Language. Thus *Alone*, according to *Præfian*, was antiently *Masculine*, but is now become *Feminine*. And *Navoire*, a Ship, in *French*, was antiently *Feminine*, but is now *Masculine*. The modern Tongues have no more than two Genders, viz. the *Masculine* and the *Feminine*; at least, whatever is not *Feminine*, is accounted *Masculine*. See **GENDER**.

The *French*, in their Poetry, have a kind of Rhimes which they call *Masculine*, to distinguish them from others, which they call *Feminine*. The *Masculine* Rhime is that made with a Word which has a strong, open, and accented Pronunciation; as all Words have, excepting those which have an *e* *Feminine* in their last Syllable: for instance, *Amour* and *Jour*, *Mort* and *Sort*, are *Masculine* Rhimes; and *Pere* and *Mere*, *Gloire* and *Messire*, are *Feminine*. Hence Verses ending with a *Masculine* Rhime, are call'd *Masculine* Verses; and those ending with a *Feminine* Rhime, *Feminine* Verses. 'Tis now a Rule establish'd among the *French* Poets, never to use above two *Masculine*, or two *Feminine* Verses successively, except in the looser Kinds of Poetry. *Mars* was the first who introduced this Mixture of *Masculine* and *Feminine* Verses, and *Ronsard* was the first who practis'd it with Success. The *Masculine* Verses should always have a Syllable less than the *Feminine* ones. See **RHIME**.

The Astrologers maintain, that the Signs and Planets are really distinguish'd into *Masculine* and *Feminine*; not on account of any Difference of Sex, in their Bodies, or in their Names; but by reason of their Qualities, which are either active, hot, or cold, accounted *Masculine*; or passive, dry, and moist, which are *Feminine*. On this Principle they call the *Sun*, *Jupiter*, *Saturn*, and *Mars*, *Mas-*

*culine*; and the *Moon* and *Venus*, *Feminine*. *Mercury*, they suppose, partakes of the two. Among the Signs, *Aries*, *Libra*, *Geminus*, *Leo*, *Sagittarius*, *Aquarius*, are *Masculine*; *Cancer*, *Capricornus*, *Taurus*, *Virgo*, *Scorpio*, and *Pisces*, are *Feminine*.

Plants are likewise distinguish'd into *Masculine* and *Feminine*. The *Masculine* are those which have a greater share of Heat and Virtue.

**MASON**, a Person employ'd under the Direction of an Architect, in the raising of a Stone-Building. The chief Business of a *Mason*, is to make the Mortar, raise the Walls from the Foundation to the Top, with the necessary Retreats and Perpendiculars, form the Vaults, and employ the Stones as deliver'd to him. When the Stones are large, the Business of hewing or cutting them belongs to the Stone-Cutters; tho' these are frequently confounded with the *Masons*. The Ornaments of Sculpture are perform'd by Carvers in Stone, or Sculptors. For the Materials whercon *Masons* work, see **STONE**, **MARBLE**, &c. For the Manner of Working, see **MASONRY**, **BUILDING**, &c. For their Works themselves, see **WALL**, &c. The Tools or implements principally used by them, are, the Square, Level, Plumb-Line, Bevel, Compass, Hammer, Chisel, Mallet, Saw, Trowel, &c. which see. Besides the common Instruments used in the Hand, they have likewise Machines for the raising of great Burdens, the conducting of large Stones, &c. The principal of these are the Lever, Wheel, Pully, &c. which see. *Masonry* is sometimes used in a more general and unlimited Sense; so as, besides proper *Masonry*, to include the hewing or sawing of large Stones, to fit them for Building, properly call'd *Stone-Cutting*; and the carving of the Ornaments, on the Members and Mouldings, properly call'd *Sculpture*: which see. *Machina* derives the Word from *Machio*, a Machinist, as being obliged to use Machines in Building. Some derive it from *Machina*. *In Cæsar* from *Maceria*, because the long Fence-Walls that inclose Vineyards, &c. in which *Masons* are supposed to have been first employ'd, were call'd *Maceria*. *Mason est Maceriarum Constructor*. *M. Haet* derives it from *Mas*, an old Word, signifying House; hence *Mason* is a Person who makes *Mas*'s, that is, Houses. In the corrupt *Latin*, a *Mason* was call'd *Majister Comacinus*, which *Lindensbeck* derives from *Comacina*, an Island in *Romania*, where, in the Time of the *Lombards*, the best Architects were found.

**MASONRY**, a Branch of Architecture, consisting, as some define it, in the Art of hewing or squaring Stones, and cutting them level and perpendicular, for the Uses of Building: Tho' in the more limited Sense of the Word, *Masonry* is the Art of assembling and joining Stones together with Mortar. Whence there arise as many different Kinds of *Masonry*, as there are different Forms and Manners of laying or joining the Stones. *Vitrucius* makes mention of seven Kinds of *Masonry* among the Antients; three of hew'd Stone, viz. that in form of a Net, that in *Binding*, and that call'd the *Greek Masonry*: And three of unhew'd Stones, viz. that of an equal Course, that of an unequal Course, and that fill'd up in the middle. The seventh was a Composition of all the rest.

*Net Masonry*, call'd *Reticulation*, from its Resemblance of the Meshes of a Net, consists of Stones squared in their Courses, and so disposed, as that their Joints go obliquely, and the Diagonals are, the one perpendicular, and the other level. This is the most agreeable *Masonry* to the Eye, but it is apt to crack. See **PLATE ARCHITECTURE**, Fig. 1.

*Bound Masonry*, is that wherein the Stones were placed one over another, like Tiles; the Joints of the Beds being level, and the Mortars perpendicular. So that the Joint that mounts and separates two Stones, falls directly over the middle of the Stone below. This is less beautiful than the *Net-Work*, but more solid and durable. See **PLATE ARCH.** Fig. 2.

*Greek Masonry*, according to *Fiermain*, is that where, after we have laid two Stones, each of which makes a Course, another is laid at the end, which makes two Courses; and the same Order observed throughout the Building. This may be call'd *Double Building*, in regard the *Binding* is not only of Stones of the same Course with one another, but likewise of one Course with another Course. See **PLATE ARCH.** Fig. 3.

*Masonry by Equal Courses*, by the Antients call'd *Isodomum*, differs in nothing from the *bound Masonry*, but only in this, that its Stones are not hewn. See **PLATE ARCH.** Fig. 5.

*Masonry by Unequal Courses*, call'd *Pseudisodomum*, is also made of unhew'd Stones, and laid in *bound Work*: But then they are not of the same Thickness, nor is there any Equality observed, excepting in the several Courses; the Courses themselves being unequal to each other. See **PLATE ARCH.** Fig. 4.

*Masonry fill'd up in the Middle*, call'd by the Antients *Emplecten*, is likewise made of unhew'd Stone, and by

Courfes; but the Stones are only fet in order as to the Courfes, the Middle being fill'd up with Stones thrown in at random among the Mortar. See *PLATE ARCH. FIG. 5.*

*Compound Mortar*, is of *Vitruvius's* propofing; fo call'd, as being form'd of all the reft. In this, the Courfes are of heav'd Stone, and the middle Place left void, fill'd up with Mortar and Pebbles thrown in together. After this the Stones of one Courfe are bound to thofe of another Courfe, with Cramp-Irons faften'd with melted Lead. See *PLATE ARCH. FIG. 6.*

All the Kinds of *Masonry* now in ufe may be reduced to thofe five, viz. *Bound Masonry*; that of *brick-Work*, where the Bodies and Projections of the Stones include fquare Spaces or Pannels, &c. fet with Bricks: That of *Milion*, or *Small Work*, where the Courfes are equal, well fquare, and their Edges or Beds rusticated: That where the Courfes are unequal; and that fill'd up in the middle with little Stones and Mortar.

**FREE, or ACCEPTED MASONS**, a very ancient Society, or Body of Men, fo call'd either from fome extraordinary Knowledge of *Masonry* or *Building*, which they are fuppofed to be *Masters* of, or becaufe the first Founders of the Society were Perfons of that Profefion. They are now very confiderable both for Numbers and Character; being found in every Country in *Europe*, and confifting principally of Perfons of Merit and Consideration. As to Antiquity, they lay claim to a Standing of fome thousand Years; and, 'tis faid, can trace up their Origin as early as the Building of *Solomon's Temple*. What the End of their Institution is, feems ftill, in fome meafure, a Secret; tho' fo much of it as is known, appears truly good and laudable, as it tends to promote Friendship, Society, mutual Affiftance, and Good-Fellowfhip. The Brothers of this Family are faid to be poffefs'd of a great Number of Secrets, which have been religiously obferv'd from Age to Age: Be their other Virtues therefore what they will, 'tis plain they are *Masters* of one in a very great degree, viz. Secrecy.

**MASQUE, or MASK**, a Cover for the Face, contriv'd with Apertures for the Eyes and Mouth; wore chiefly by Women of Condition, either to preferve their Complection from the Weather, or out of Modesty, to prevent their being known. *Poppea*, Wife of *Nero*, is faid to be the first In-venter of the *Mafque*; which fhe did to guard her Complection from the Sun and Weather, as being the moft delicate Woman, with regard to her Perfon, that has been known. *Brontome* obferves, that the ordinary Ufe of *Mafques* was not introduced till towards the end of the 16th Century. The Word *Mafque* is alfo ufed to fignify any thing ufed to cover the Eyes, and prevent a Perfon's being known. Thus the Penitents of *Lyon* and *Avignon* hide their Faces with large white Veils, which ferve 'em for *Mafques*.

**MASQUE**, in Architecture, is underftood of certain Pieces of Sculpture, representing fome hideous Form, Grotesque, or Satyr's Faces, &c. ufed to fill up and adorn fome vacant Places, as in Frontes, the Pannels of Doors, Keys of Arches, &c. but particularly in Grotto's.

**MASQUERADE, or MASCARADE**; an Affembly of Perfons mask'd or disguis'd, meeting to dance and divert themselves. This is a very common Practice abroad, efpecially in Carnaval Time. The Word comes from the *Italian Mafcarata*, and that from the *Arabic Mafkara*, which fignifies Raillery, Buffoonery.

**MASS**, in Mechanics, is defined to be the Matter of any Body cohering with it, i. e. moving and gravitating along with it; and is diftinguifh'd from its Bulk, or Volume, which is its Expanfion in Length, Breadth, and Thicknefs. The *Mass* of any Body is rightly eftimated by its Weight. And the *Masses* of two Bodies of the fame Weight are in a reciprocal Ratio of their Volumes. See *MOTION, WEIGHT, MOMENT, &c.*

**MASSALIANS**, certain Sectaries, fo call'd from a *Hebrew* Word fignifying Prayer; it being their diftinguifhing Tcner, that a Man is to be continually in Prayer. The Greeks call'd them *Enchites*, or *Enchites*, which in their Language fignified the fame thing. *St. Epiphanius* diftinguifhes two Kinds of *Massalians*, the Antient and the New. The first, according to him, are neither Jews, Chriftians, nor Samaritans, but pure Gentiles; who owning feveral Gods, yet adore only one, whom they call Almighty. They had Oratories like our Churches, where they ufed to meet, to pray and fing Hymns in honour of God; their Oratories being finely illumined with Lamps and Flambeaux. This Description of *St. Epiphanius* comes to near the Practice of the *Ephesi*, that *Scaliger* thinks the two Sects ought not by any means to be diftinguifh'd. The *Massalians* have gone by the Names of *Enthiafifts*, *Zubites*, *Acceptori*, and fome of them *Martyrians*.

As to the other *Massalians*, who were by Profefion Chriftians, their Rife was not till about the Time of *St. Epiphanius*. Their Doctrine was, that Prayer alone was

fufficient to Salvation. Many Monks, who loved a Life of Lazinefs, and were averfe to Labour, join'd the *Massalians*. See *EUCHITES*.

**MASSATER**, from *masinatus*, *masinatus*, to chew; the Name of a Mufcle, that helps to pull the Jaw upwards in eating: It is thick and fhort, arifing from the *Zygoma*, and from the first Bone of the upper Jaw, and is inferted into the lower Edge of the lower Jaw, from its external Angle to its middle. Its Fibres run in three Directions; thofe from the *Zygoma* obliquely to the middle of the Jaw, and thofe from the first Bone of the upper Jaw crofs the former, and run to the Angle of the lower Jaw; and the Fibres that are in its middle, run perpendicularly from their Origin to their Infertion.

**MASSES**, in Painting, are the large Parts of a Picture, containing the great Lights and Shadows; and thus, when it is almost dark, we fee only the *Maffes* of a Picture, i. e. the Places of the greatest Lights and Shadows.

**MASSIVE**, fomething grofs and folid, in oppofition to Tendernefs and Delicacy. Thus we fay, a Wall, or a Building, is too *massive*, that is, its Walls are too thick, or the Lights and Openings too little in proportion. A *massive* Column is that, which is too fhort for the Order, whole Capital it bears.

**MASSORA**, a Term in the *Jewish* Theology, fignifying a Performance on the Bible by feveral learned Rabbins, to fecure it from any Alterations that might otherwife happen; and to ferve, according to their Expreflion, as a Hedge to the *Law*. *Buxtorf* defines it a Critique on the *Hebrew* Text, contriv'd by the antient *Jewish* Doctors, in which they have number'd the Verfes, Words, and Letters of the Text, and mark'd all the Variations of it. For the Text of the Sacred Books was originally written without any Breaks, or Divifions into Chapters, or Verfes, or even into Words. So that a whole Book, in the antient Manner, was but one continued Word; of which kind we have ftill feveral antient Manuscripts, both *Greek* and *Latin*. In regard the Sacred Writings had undergone an infinite Number of Alterations, whence various Readings had arifen, and the Original was become mangled and disguis'd; the Jews had recourfe to a Rule, which they judg'd infallible, to fix and ascertain the Reading of the *Hebrew* Text; and this Rule they call'd *Massora*, Tradition; as if this Critique were nothing but a Tradition, which they had receiv'd from their Fore-Fathers. According to *Elias Levip*, it was the Jews of a famous School at *Tiberias* who compos'd, or at leaft began the *Massora*, whence they are call'd *Massorettes*. *Aben Ezra* makes them the Authors of the Points and Accents in the *Hebrew* Text, as we now find it, and which ferve for Vowels. The *Arabs* have done the fame thing to their *Alcoran*, that the *Massorettes* have dooe to the Bible: Nor do the Jews deny their having borrow'd this Expedient from the *Arabs*, who first put it in practice in the 7th Century. There is a great and a little *Massora*, printed at *Venice*, and at *Bafil*, with the *Hebrew* Text in a different Character. *Buxtorf* has written a *Massoretic* Comment, which he calls *Tiberias*.

**MASSORETES**, *Jewish* Doctors, Authors of the *Massora*. See *MASSORA*.

**MAST** of a Foreft, the Fruit of a Species of Trees, call'd *Glandiferous*, or *Maft-Bearing*; as *Beech*, *Oak*, *Chestnut*, &c.

**MAST**, a large Tree, or Pole, rais'd in Veffels, for the Cordage and Sails to be faften'd to, in order to their receiving the Wind neceffary for Navigation. In large Veffels, the Number of *Masts* is four: Their Names are, the *Main-Maft*, the *Fore-Maft*, the *Mizen-Maft*, and the *Baltfprit*. To which fome add a fifth, viz. a *Coomer-Mizen*. The *Main-Maft*, or *Master-Maft*, is the chief *Maft* in the Ship; its Place is in the middle of the Veffel, and it bears the ftrongest Cordage, and the largest Sails. The *Fore-Maft* is between the *Main-Maft* and the *Head*. The *Mizen-Maft* is between the *Main-Maft* and the *Stern*. The *Baltfprit* lies upon the *Beak*, in the *Prow* or *Head* of the Ship. The *Coomer-Mizen*, in large Veffels and Gallions, is in the *Stern*.

We alfo ufe the Word *Maft* to fignify thofe Divifions, or additional Pieces in the *Masts*, placed over one another. The *Main-Maft*, and *Mizen-Maft*, have each of them two, viz. the *Main-Maft*, *Main-Top-Maft*, *Main-Gallant-Maft*; the *Fore-Maft*, *Fore-Top-Maft*, *Fore-Top-Gallant-Maft*. The *Mizen-Maft* has one, viz. the *Mizen-Top-Maft*. The Word *Maft* fignifies the fame thing in *French*, *High Dutch*, *Flemish*, and *English*. The *Italians* fay *Mafter*, and the *Spaniards* *Maffel*.

For the Proportion of *Masts*, *Sir H. Manwaring* gives thefe Rules: Whatever the Breadth of a Ship be in Feet, multiply  $\frac{1}{2}$  of that Breadth by 30, the Product is the Length of her *Main-Maft* in Yards. Thus if a Ship be 30 Foot at the *Midfhip-Beam*,  $\frac{1}{2}$  of 30 is 15; therefore that Ship's *Main-Maft* must be 22 Yards, or 72 Feet in Length. Then for its *Bignefs*, he allows an Inch

to every Yard in Length, and therefore this Mast must be 24 Inches thro, or thick. The Fore-Mast of a Ship must be  $\frac{1}{4}$  of the Length of the Main-Mast, that is, in this Case, 19 Yards  $\frac{1}{4}$  thick, or thro it must be near 20 Inches. The Bolt-rip is always the same Length and Biggness with the Fore Mast; and the Mizzen-Mast must be just half the Length of the Main-Mast, and half as thick.

**MASTER**, a Title given to several Officers, and Persons of Authority and Command, and particularly to the Chiefs of the Orders of Knighthood, &c. Thus we say, the Grand Master of Malibis, of St. Lazarus, of the Golden Fleece, of the Free Masons, &c.

The Title *Master, Magister*, was frequent among the Romans: They had their *Master of the People, Magister Populi*, who was the Dictator; *Master of the Cavalry, Magister Equitum*, who held the second Post in an Army after the Dictator. Under the later Emperors there were also *Masters of the Infantry, Magistrum Pedum*. A *Master of the Census, Magister Censu*, who had nothing of the Charge of a Censor or Sub-Censor, as the Name seems to intimate; but was the same with the Commissioner of the Frumentaries, *Præpositus Frumentarium*. *Master of the Militia, Magister Militie*, an Officer in the lower Empire, created, as 'tis urg'd, by Dioclesian, who had the Inspection and Government of all the Forces, with power to punish, &c. somewhat like a Constable of France. At first there were two of these Officers instituted, the one for the Infantry, and the other for the Cavalry. But the two were united into one under Constantine. But as their Power was increased, so was their Number too; and there was one appointed for the Court, another for Thracia, another for the East, and another for Illyria. They were afterwards call'd *Comes*, *Counts*, and *Clarissimi*. Their Power was only a Branch of that of the *Præfessus Prætorii*, who by that means became a Civil Officer. *Master of Arms, Magister Armorum*, was an Officer or Comptroller under the *Master of the Militia*. *Master of the Offices, Magister Officiorum*, had the Superintendance of all the Officers of the Court. He was also call'd *Magister Officii*, *Palatine*, simply *Magister*, and his Post *Magisteris*. This Officer was the same in the Western Empire with the *Caropalanus* in the Eastern. In fine, *Master*, in the Roman History and Laws, is us'd for every Officer, who is the first of his kind, and who has others of the same Species, or that have the same Functions, under him. In Latin, *Magister*, and oftentimes *Procurator*.

**MASTER of the Ceremonies**, is an Officer instituted by King James the First, for the more solemn and honourable Reception of Ambassadors and Strangers of Quality, whom he introduces into the Presence. The Badge of his Office is a Gold Chain and Medal, having on one side an Emblem of Peace, with King James's Motto, and on the Reverse the Emblem of War, with *Deus Et non dicit*: He is always suppos'd to be a Person of good Address, and Master of Languages: He is constantly attending at Court, and hath under him an Assistant *Master*, or Deputy, who holds his Place during the King's pleasure. There is also a third Officer, call'd *Marshal of the Ceremonies*, whose Business it is to receive and distribute the *Master's Orders*, or the Deputies, for the Service; but without their Order he can do nothing. This is in the King's Gift.

**MASTER of the Household**, is an Officer under the Lord-Steward of the Household, and in the King's Gift: His Business is to survey the Accounts of the Household. Antiently the Lord-Steward himself was call'd *Grand Master of the Household*. See **HOUSEHOLD**.

**MASTER of the Horse**, a great Officer of the Crown, to whom is committed the Charge of ordering and disposing all Matters relating to the King's Stables, Races, and Breed of Horses, as he had antiently, of all the Posts in England. He hath a Power of commanding the Equestrics, and all the other Officers and Tradesmen employ'd in the King's Stables; to which he gives, by his Warrant to the Avener, the Oath of Allegiance, &c. for the true and faithful Discharge of their Duty. He has the peculiar Privilege of making use of any Horses, Pages, or Footmen, belonging to the King's Stables; so that his Coaches, Horses, and Attendants, are the King's, and have the King's Arms and Liveries.

**MASTER of the Mint**: This, in the second Year of Henry the Sixth, was the Title of him, who is now call'd *Warden of the Mint*; whose Office it is to receive the Silver and Bullion, which comes to the Mint to be coined, and to take care thereof. See **MINT**.

**MASTER of the Court of Wards and Liveries**, was the chief Officer, and Judge of that Court, who kept the Seal of it, and was nam'd and assign'd by the King. But this Court, and all its Officers, Members, Power, and Appurtenances, is taken away by a Statute made the 12 Car. 2. c. 24.

**MASTER of the Jewel-House**, mention'd in 39 Eliz. c. 7 is an Officer of the King's Household of great Credit, being allowed Diet for himself, and the Clerks of the Office, and a Lodging in the Court. He hath Charge of all the Gold and Silver Plate us'd at the King's Table, or belonging to any Officer of account attending the Court; and of all Plate remaining in the Tower of London, as also of Chains and loose Jewels, not fix'd to any Garment.

**MASTER of the Ordnance**, a great Officer, to whose Care all the King's Ordnance and Artillery is committed. See **ORDNANCE**.

**MASTER of the Faculties**, an Officer under the Archbishop of Canterbury, who grants Licences and Dispensations; he is mention'd in the Statute of laying Impositions at Law, of 22, 23 Car. 2. See **FACTULTY**.

**MASTER of the Revels**, an Officer, whose Office it is to order all things relating to the Performance of Tragedies, Comedies, Masks, Balls, &c. at Court: He hath likewise a Jurisdiction of granting Licences to all who travel to act Plays, Puppet-Shews, or other such like Diversions; which is very beneficial to him, and increaseth the Smallness of the Salary, which is but 10*l. per Annum*, to a very considerable Income. Neither can any new Play be acted at either of the two Houses, till it has pass'd his Perusal and Licence first; and he hath the liberty to castrate any thing, which shall be offensive to Religion or Virtue, and for the latter has his Fee.

**MASTER of the Armoury**, he that has the Care and Oversight of his Majesty's Arms and Armoury.

**MASTER of the Temple**. The Founder of the Order of the Templars, and all his Successors, were call'd *Magistri Templi Magistri*; and ever since the Dissolution of the Order, the Spiritual Guide and Director of the House is call'd by that Name. See **TEMPLE**.

**MASTER of the Ward-Robe**, an Office in the Lord Chamberlain's District, who has the Power of managing all the Royal Robes; as those of the Coronation, St. George's Feast, the Parliament-Robes: as also of the wearing Apparel, Collar of SS's, *George and Garter*, &c. He has the Charge and Custody of all former Kings and Queens Robes, remaining in the Tower; all Hangings, Bedding, &c. for the King's House; the Charge and Delivery of Velvet and Scarlet allow'd for Liveries. He has under him a Clerk of the Robes, and Wardrobe-Keeper, a Yeoman, &c. See **WARDROBE**.

**MASTER of Arts**, the first Degree taken up in foreign Universities, but the second in ours; Candidates not being admitted to it till they have studied in the University seven Years. See **DEGREE**.

**MASTER of a Ship**; an Officer, to whom is committed the Direction of a Merchant-Vessel, who commands it in chief, and is charged with the Merchandizes aboard. In the Mediterranean, the *Master* is frequently call'd *Patron*, and in long Voyages *Captain*. 'Tis the Proprietor of the Vessel that appoints the *Master*; and 'tis the *Master* provides the Equipage, hires the Pilots, Sailors, &c. The *Master* is oblig'd to keep a Register of the Seamen and Officers, the Terms of their Contract, the Receipts and Payments, and in general, every thing relating to his Commission. See **SHIP**.

**MASTER of the Rolls**, has his Office by Patent, which is for Life. In the Absence of the Lord-Chancellor or Keeper, he sits as Judge in the Court of Chancery, and is, by Sir Edward Coke, call'd his *Assham*. At other times he hears Causes in the Rolls Chappel; he is also the first of the Masters in Chancery, and hath their Assitance at the Rolls: but all Hearings before him are appealable to the Lord-Chancellor. He hath also his Writ of Summons to Parliament, and sits next to the Lord Chief Justice of England, on the second Woolpack. He hath the keeping of the Parliament Rolls, and all the Rolls House for his Habitation; as also the Custody of all Charters, Patents, Commissions, Deeds, Recognizances, which being made of Rolls of Parchment, gave rise to the Name. In his Gift are the six Clerks in Chancery, the Examiners, three Clerks of the Petty-bag, and the six Clerks of the Rolls Chappel, where the Rolls are kept. See **ROLLS**.

**MASTERS in Chancery**, are usually chosen out of the Barristers of the Common Law, and sit in Chancery, or at the Rolls, as Assistants to the Lord-Chancellor, and *Master of the Rolls*, during Term-Time: To them is also committed Interlocutory Reports, siting of Accounts, taxing Costs, &c. And sometimes, by way of Reference, they are empower'd to make a final Determination of Causes. They have, time out of mind, had the Honour to sit in the Lords House, tho they have neither Writs, nor Patent to empower them; but as Assistants to the Lord-Chancellor, and Master of the Rolls. They had antiently the Care of inspecting all Writs of Summons, which is now performed by the Clerk of the Petty-bag. When any Message is sent from the Lords to the Commons, it is carry'd

carry'd by the *Mistress in Chancery*. Before them, Affidavits are made, and Deeds and Recognizances acknowledged. See CHANCERY.

**MASTER PIECE**, an exquisite, or extraordinary Work or Performance, in any Art or Science.

**MASTER-PIECE**, or *Chef d'Œuvre*, is particularly used among the French, for a particular Work, which those who aspire to be admitted Master in any Art or Trade, are to perform in presence of the Masters or Jurands of that Company, by way of Specimen of their Capacity. The *Master-Piece* of a Mason is a Defecant bial'd either in the Head or in Talus, corrected by a full Arch. That of a Carpenter, a Rampant Carve of a Stair-Case, the Spiral well adjust'd with the Defecant. That of a Joiner, a Flat-bottom Chest, or a Door-Case, or a Mante-Tree. That of a Tiler, a Luthern well conducted in the *Fauçonné*, with a Ridge. That of a Plumber, a little Cistern a *Cal de Lampe*. That of a Glazier, a Pair of Compartments of Glasses of several Colours, hollow'd, incalstrated, and join'd with Lead of *Chef d'Œuvre*. That of a Paviers, a Rose in a Free-Stone or Flint-Pavement. That of a Cordwainer, a Turn-up Shoe, &c.

**MASTIC**, a clear and sweet resinous Gum, issuing from the Trunk and large Branches of the *Mastic* or *Lentisk* Tree, either without, or with an Incision. It is temperate in Heat, and of a dry, binding Quality, so that it strengthens the Stomach, stays Vomiting, stops Issues of Blood, and tickling Coughs and Catarrhs. It strengthens the Reins, and is a good Cleaner, and is for that reason prescribed in Seminal Weaknesses. The Goldsmiths mix it with Turpentine and black Ivory, and lay it under their Diamonds, to give them a Lustre. The *Mastic* is the Product of *Sida*. The Trees that produce it are cultivated with as much Care as the Vines. It brings in a Revenue of 80000 Ducats per Annum to the Grand Signior. There is also a kind of black *Mastic* brought from Egypt, which serves to sophisticate Camphor. The best *Mastic* is brought from the Isle of *Chio*; it is in larger Tears, and thence more balsamic, than that of the *Lessani*. The *Mastic* produced in *Chio* belongs to the Grand Signior, who takes it of this People in lieu of the Tribute he exacts of the other *Grecian* Islands. It has its Name *Mastic*, from its being continually chew'd by the *Turks*, especially the Women.

**MASTICATION**, in Medicine, the Action of chewing, or of agitating the solid Parts of our Food between the Teeth, by means of the Motion of the Jaws, the Tongue, and the Lips; whereby it is broke into small Pieces, impregnated with Saliva, and so fitted for Deglutition, and a more easy Digestion in the Stomach. See DIGESTION, CHYLIFICATION, DEGLUTITION, &c.

The Mixture of Saliva with the Food, is of absolute necessity; for the Saliva imbibed within the Parts, dissolves the Salts hid in them; and by so doing, prepares the Food for Fermentation in the Stomach: The Food therefore has the Beginning of its Digestion from the Saliva, and its Conclusion from the Ferment in the Stomach. See SALIVA.

**MASTICATORIES**, in Medicine, are such Remedies as are taken in at the Mouth, and chew'd, in order to promote the Evacuation of the salivary Humour; as Tobacco, Ginger, Pepper, Sage, Rosemary, Thyme, Mastic, &c.

**MASTOIDES**, in Anatomy, the same with *Mammillares*. The Word is usually apply'd to such Processes in the Body, as have the Appearance of Breasts or Dugs; arising from a broad Basis, and terminating in an obtuse Top. The Word is sometimes also apply'd to those Muscles which hoop the Head, proceeding from the Neck-Bone, and Breast-Bone, and terminating in the Process *Mammillaris*. The Word comes from the Greek *μασθη*, Nipple, Dug, and *ειδω*, Image, Figure.

**MATCH**, a kind of Cord slightly twisted, and prepared to receive and preserve Fire, for the Uses of Artillery, Mines, Fire-Works, &c. It is made of hempen Tow, spun on the Wheel like Cord, but very slack, and is composed of three Twines or Threads, which are afterwards again cover'd with Tow; so that the Twines don't appear: lastly, it is boil'd in Lees of old Wines; whence its Colour. Since Fuses have been introduced in lieu of Matches, the Consumption of *Match* has been much less considerable than before.

**MATER TENUIS**, or *PIA MATER*. See MENINGES.

**MATER DURA**. See also MENINGES.

**MATERIAL**, denotes something composed of Matter. The *Epicureans*, *Spinosisis*, &c. own none other but *Material* Substances; for SUBSTANCE. Among Causes, some are *material*, others formal: See CAUSE. *Material* Causes having no Understanding or Liberty, must always act in the same Manner, when under the same Circumstances. The Philosophers and Divines dispute, whether or no there be any *material* Forms really distinct from Matter. See FORM.

The *Valentinians* formerly apply'd the Term *Material* to all People, but those of their own Sect; asserting, that their Souls perished with their Bodies. Thus also the *Stoics* maintain'd, that none but the Soul of their Wife-Men survived the Body. See STOICS.

**MATERIALISTS**, the Name of a Sect in the ancient Church; composed of Persons, who, being prepossess'd with that Maxim in the ancient Philosophy (ex *Nihil Nihil fit, out of Nothing Nothing can be made*) had recourse to an Eternal Matter, on which they suppos'd God wrought in the Creation; instead of admitting God alone as the sole Cause of the Existence of all Things. *Tertullian* vigorously opposes the Doctrine of the *Materialists*, in his Treatise against *Hereses*, one of their Number. See MATTER.

**MATERIA SUBTILIS**, a fine subtile Matter, which the *Cartesians* suppose to pervade and penetrate, freely, the Parts of all Bodies, and to fill up all their Pores, so as not to leave the least Vacuity or Interstice between them. This Machine they have recourse to, to support the Doctrine of an absolute *Pneum*, and to make it consistent with the Phenomena of Motion, &c. and accordingly make it act and move just as pleasure, but in vain; for were there any such Matter, in order for it to be able to fill up the Vacuities of other Bodies, it must, itself, be entirely void of any, i. e. be perfectly solid; see SOLIDITY: vastly more solid than Gold, and therefore more ponderous, and resist vastly more. See RESISTANCE. Which is inconsistent with *Pneumata*. See VACUUM and FLENUM.

*Sir I. Newton*, indeed, allows of the Existence of a *subtile Matter*, or Medium, vastly finer than Air, penetrating the closest Bodies, and contributing to the Production of many of the Phenomena of Nature. The Existence of such a Matter he argues from the Experiment of two Thermometers, which being inclosed in Glass Vessels, one of them exhausted of its Air, and both carried from a cold to a warm Place, the Thermometer in *vacuo* grows warm, and rises, almost as soon as that in the Air; and if return'd into the cold Place, both cool and fall about the same. Hence, says he, is not the Heat of the warm Room convey'd thro the Vacuum by the Vibrations of a much subtile Medium than Air, which remain'd in *vacuo*, after the Exhaustion of the Air? And is not this Medium the same with that whereby Light is refracted and reflected, and by whose Vibration, Light communicates Heat to Bodies, and is put into Fits of easy Reflection, and easy Transmision? And do not the Vibrations of that Medium in hot Bodies, contribute to the Intensity and Duration of their Heat? And do not hot Bodies communicate their Heat to contiguous cold ones, by the Vibration of this Medium propagated from them into the cold ones? And is not this Medium more subtile, more elastic and active than Air? Does it not readily pervade all Bodies? And is it not, by its elastic Force, expanded thro all the Heavens? See HEAT, GOLD, &c. Again, Does not the Refraction of Light proceed from the different Density of this Matter in different Places; the Light always receding from the denser Parts of the Medium? See REFRACTION.—Again, Is not this Matter much rarer within the dense Bodies of the Sun, Stars, Planets, &c. than in the empty, celestial Spaces between them? And in passing from them to great Distances, does it not grow denser and denser, and thereby occasion the Gravitation of those Bodies towards one another, and of the Parts to the Bodies; every Body endeavouring to recede from the denser Parts towards the rarer? See GRAVITATION.—Again, Is not Vision performed chiefly by the Vibrations of this Matter, excited in the bottom of the Eye by the Rays of Light, and propagated thro the solid, pellucid, and uniform Pillaments of the Optic Nerves into the Sensory?—Again, Is not animal Motion perform'd by the Vibrations of this Medium, excited in the Brain by the Power of the Will, and propagated thence thro the solid Capillaments of the Nerves into the Muscles, to contract and dilate them? See MEDIUM. *Newt. Optic. lib. 5. in esae.*

**MATHEMATICS**, the Science of Quantity; or a Science that considers Things as computable, or measurable. The Word in its Original, *μαθημα*, signifies *Discipline* or *Learning* in the general, and seems to have been apply'd to the Doctrine of Quantity, either by way of Eminence, or by reason this having the Start of all other Sciences, the rest took their common Name therefrom. See SCIENCE.

For the Origin of MATHEMATICS, *Josephus* dates it before the Flood, and makes the Sons of *Set* Observers of the Course and Order of the Heavenly Bodies; he adds, that to perpetuate their Discoveries, and secure 'em from the Injuries either of a Deluge or a Conflagration, they had them engraven on two Pillars, the one of Stone, the other of Brick; the former of which, he says, was standing in *Syria* in his days.

The first who cultivated MATHEMATICS after the Flood, were the *Affryans* and *Chaldeans*; from whom, the same *Josephus* adds, they were carried by *Abraham* to the *Egyptians*; who proved such notable Proficients, that *Aristotle* makes no scruple to fix the first Rise of *Mathematics* among them. From *Egypt*, 584 Years before Christ, they pass'd into *Greece* thro' the hands of *Thales*, who having learnt Geometry of the *Egyptian* Priests, taught it in his own Country. After *Thales*, comes *Pythagoras*; who, among other Mathematical Arts, paid a peculiar regard to Arithmetic; fetching the greater part of his Philosophy from Numbers: He was the first, as *Laertius* tells us, who abridged Geometry from *Matter*; and to him we owe the Doctrine of *incommensurable* Magnitudes, and the five regular Bodies, besides the first Principles of *Musick* and *Astronomy*. *Pythagoras* was succeeded by *Anaxagoras*, *Democritus*, *Brijo*, *Anthypho*, and *Hippocrates* of *Scio*; who all applied themselves particularly to the *Quadrature* of the Circle, the *Duplication* of the Cube, &c. but the last with most Success: This last is also mention'd by *Proclus* as the first who compiled *Elements* of *Mathematics*.

*Democritus* excelled in *Mathematics* as well as *Physics*; the none of his Works in either kind are extant: the Destruction of which, some Authors lay at *Aristotle's* door. The next in order is *Plato*, who not only improved Geometry, but introduced it into *Physics*, and so laid the Foundation of a solid Philosophy. Out of his School proceeded a Crowd of *Mathematicians*. *Proclus* mentions thirteen of Note; among whom was *Leodanus*, who improved the *Analysis* first invented by *Plato*; *Theocritus*, who wrote *Elements*; and *Archytas*, who has the Credit of being the first who applied *Mathematics* to Use in Life. These were succeeded by *Neoclides* and *Theon*, the last of whom contributed to the *Elements*. *Euclides* excelled in *Astronomy* and *Geometry*, and was the first Founder of a System of *Astronomy*. *Menechmus* invented the *Conic* Sections, and *Theodorus* and *Hermotimus* improved the *Elements*.

For *Aristotle*, his Works are so stored with *Mathematics*, that *Blancinus* compiled a whole Book of them: Out of his School came *Endemus* and *Theophrastus*; the first of which wrote of *Numbers*; *Geometry*, and *indivisible Lines*; the latter a *Mathematical History*. To *Aristeus*, *Hydorus*, and *Hippelides*, we owe the Books of *Solids*; which, with the other Books of *Elements*, were improved, collected and methodized by *Euclid*, who died 384 Years before Christ. An hundred Years after *Euclid*, came *Erasistrater* and *Archimedes*. Concomitory with the latter was *Conon*, a Geometrician and Astronomer. Soon after came *Apollonius Pergus*; whose *Conics* are still extant. To him are likewise ascribed the 14th and 15th Books of *Euclid*, which are said to have been contracted by *Hippelides*. *Hyparchus* and *Meneclaus* wrote on the *Subtenses* in a Circle, the latter also on *Spherical Triangles*; on which Subject, we have a Work of *Theodosius*: And these all, *Meneclaus* excepted, lived before Christ. A.D. 70, *Ptolemy of Alexandria* was born; the Prince of Astronomers, and no mean Geometrician: He was succeeded by the Philosopher *Philadelphus*, of whom we have still extant some *Mathematical Problems*. After him came *Eutocius*, who commented on *Archimedes*, and occasionally mentions the Inventions of *Philo*, *Dioetes*, *Nicomedes*, *Spain*, and *Heron*, on the *Duplication* of the Cube. To *Ctesibius of Alexandria*, we owe our *Pumps*; and *Geminus*, who came soon after, is preferred by *Proclus* to *Euclid* himself.

*Diosphanus of Alexandria* was a great Master of Numbers, and the first Inventor of *Algebra*: For others of the Antients, *Nicomachus* is celebrated for his *Arithmetical*, *Geometrical*, and *Musical Works*; *Serenus* for his Books on the *Section* of the *Cylinder*; *Proclus*, for his Comments on *Euclid*; and *Theon* has the Credit among some, of being Author of the Books of *Elements* ascribed to *Euclid* himself. The last to be named among the Antients, is *Pappus of Alexandria*, who flourish'd A.D. 400, and is celebrated for his Books of *Mathematical Collections* still extant.

See the Progress of each Branch of *Mathematics*, with the Authors who have wrote on it, under the respective Heads; as *GEOMETRY*, *MECHANICS*, *ALGEBRA*, *ASTRONOMY*, &c.

*MATHEMATICS* are distinguish'd with regard to their End, into *Speculative*, which rest in the bare Contemplation of the Properties of Things; and *Practical*, which apply the Knowledge of those Properties to some Uses in Life.

With regard to their Object, *Mathematics* are divided into *pure* or *abstract*; and *mix'd*. *Pure Mathematics* consider Quantity, abstractedly; and without any relation to Matter: *Mix'd Mathematics* consider Quantity as subsisting in material Beings, and as continually interweave.

True *MATHEMATICS* again, either consider Quantity as *discrete*, and so computable, as *Arithmetic*; or as con-

crete, or continued, and so measurable, as *Geometry* and *Trigonometry*. See *ARITHMETIC*, *GEOMETRY*, &c.

Mix'd *MATHEMATICS* are very extensive, and are distinguish'd by various Names, as the Subjects they consider, and the Views wherein they take them, vary; it being sufficient to determine an Art to be a Branch of mix'd *Mathematics*, that pure *Mathematics* are applicable thereto, i. e. that it may be explain'd and demonstrated from the Principles of *Arithmetic* and *Geometry*. Such are, *Mechanics*, which consider Motion, or the Laws of moving Bodies. See *MOTION*.

*Hydrostatics*, consider the Laws of Fluids, or of Bodies gravitating in Fluids. See *FLUIDS*.

*Pneumatics*, the Air, with regard to the Laws and Mensuration thereof. See *AIR*.

*Hydraulics*, the Motion of Fluids: See *FLUIDS*.

*Optics*, direct Light or Vision. See *VISION*.

*Catoptrics*, reflected Vision. See *REFLECTION*.

*Dioptrics*, refracted Vision. See *REFRACTION*.

*Perspectives*, the Images of Objects, in order to delineate or represent them. See *PERSPECTIVE*.

*Astronomy*, the Universe, and the Phenomena of the Heavens. See *HEAVENLY BODIES*.

*Geography*, the Earth, both as in itself, and in its Affections. See *EARTH*.

*Hydrography*, the Sea, principally as navigable. See *NAVIGATION*.

*Chronology*, Time, with regard to the measuring and distinguishing thereof. See *TIME*, *YEAR*, *EPOCHA*, &c.

*Gnomonics*, or *Dialling*; Shadows, in order for determining the Hour of the Day. See *DIAL* and *SHADOW*.

*Pyrotechny*, Artificial Fires, with regard both to Direction, and to the Uses of War. See *FIRMS*, *ROCKETS*, &c.

*Military Architecture*, the Strength of Places, with regard to their Defence against an Enemy. See *FORTIFICATION*.

*Civil Architecture* (now become a Branch of *Mathematics*) Buildings. See *BUILDING*.

*Musick*, Sounds; and their Effects on the Ear. See *SOUND*, *TUNE*, &c.

For the Elements of each, see the respective Heads. For an accurate System of all the Parts above-mention'd (*Musick* alone excepted) orderly digested, and clearly demonstrated, see the excellent *Wolffius's Elementa Mathematico-Universae*.

**MATHURINE**, see **TRINITARIAN**.

**MATINS**, the first part of the daily Service in the *Roman* Church. *Matins* is sometimes held early in the Morning, sometimes at Midnight, and sometimes the Evening before. And infirm People, even in Monasteries, are dispensed from attending *Matins*. The Word comes from the *French Matin*, Morning.

**MATRASS**, or **BOLY HEAD**, a Vessel of Glass used by the Chymists in Distillation, and other Operations. It is made in form of a Bottle, with a very long narrow Neck. The *Matrass* is luted with Earth, when it is to be placed on a very hot Fire. When 'tis required it should be stopp'd very close, they seal it hermetically. The Word comes originally from the Language of the antient Gauls. See **BOLY-HEAD**.

**MATRICE**, see **MATRIX**.

**MATRICE**, in *Dying*, is applied to the five simple Colours, whence all the rest are derived or composed. These are the Black, White, Blue, Red, and Fallow or Root Colour. See **COLOURS**.

**MATRICES**, used by the Letter-Founders, are those little Pieces of Copper or Brass, at one end whereof are engraven, *dent-wife*, or *en creux*, the several Characters used in the Composing of Books. Each Character, *Versale*, and even Point, in a *Discourse*, has its several *Matrices*, and of consequence its several *Punches* to strike it. 'Tis the Engraver on Metal that cut or grave the *Matrices*: See **ENGRAVING**. When any Types are to be cast, the *Matrix* is fillen'd to the End of a Mould, or disposed, as that when the Metal is thrown on it, it may fall into the *Creux* or Cavity of the *Matrix*, and take the Figure and Impression thereof. See **LETTER-FOUNDRY**. See also **TYPE**, and **PRINTING**.

The **MATRICES** used in *Coining*, are Pieces of Steel in form of *Dyes*; whereon are engraven the several Figures, Arms, Characters, Legends, &c. wherewith the Species are to be stamp'd. The Engraving is perform'd with several *Punches*, which being form'd in *reliefs*, or prominent; when struck on the Metal; make an indented Impression, which the *French* call *en creux*; and for which, I don't know we have any precise Name at all: See the Manner hereof under **ENGRAVING on Steel**. See also **COINING**.

**MATRICULA**, a Register kept of the Admission of Officers, and Persons enter'd into any Body or Society, whereof a List is made. Among Ecclesiastical Authors, we find mention made of two Kinds of *Matricula's*: the one

containing a List of the Ecclesiastics; the other of the Poor subfisted at the Expence of the Church. The Word *Marienda* was also applied to a kind of Almshouse, where the Poor were provided for. It had certain Revenues appropriated to it, and was usually built near the Church; whence the Name was also frequently given to the Church itself.

**MATRIX**, or **MATRICES**, any thing serving for the place of Generation of a Body: whether Organical, as the *Matrix* or Womb of Female Animals, for the Production of the Species; or Inorganical, as those of Vegetables, Metals, and Minerals.

**MATRIX**, in *Anatomy*, the *Uterus*, or Womb; or that part of the Female of any Kind, wherein the *Fetus* is conceived and nourished till the Time of its Delivery. In Women, it is situated in the *Pelvis*, or Capacity of the *Pyllogastrum*, between the Urinary Bladder and the *Intestinum Rectum*, and reaches as far as the Flanks. It is surrounded and defended by mighty Bones; before, by the *Os Pubis*; behind, by the *Sacrum*; on each side, by the *Ilium* and *Ileum*. It is in figure somewhat like a flat Flask, or dried Pear. In Women with Child, it expands and receives different Forms, according to the different Times and Circumstances of Gestation. It has several Coats, Arteries, Veins, Nerves, and Ligaments, and is interwoven with several different Kinds of Fibres: Anatomists divide it into the *Fundus* and *Cervix*; a broad Part, and a Neck. It is in Extent, from the Extremity of the one to that of the other, about three Inches in Length; its Breadth at the *Fundus* is about two and a half, and its Thickness two. It has but one Cavity, unless we distinguish between the Cavity of the *Uterus*, and that of its Neck. That of the *Cervix* is very small, scarce sufficient to contain a Garden-Bean. At the Bottom or Neck, towards the *Fundus*, it grows very narrow in Virgins; the Extremity of it is call'd the *Osculum Internum*: In pregnant Women it opens, more especially towards the Time of Delivery. The other and lower Orifice of the Neck, towards the *Vagina*, call'd *Osculum Externum*, is a little prominent, resembling, in some measure, the Glands of the Viole Organ. The Substance of the *Matrix* is membranous and carnosus. It consists of three Tunics; or, according to some, who deny that Name to the middle Substance, of two only. The external Tunic, call'd also the *Communis*, is derived from the *Peritonæum*, and consists of two *Lamellæ*; the exterior of which is pretty smooth, the interior ragged and uneven: This Membrane invests the whole *Matrix*, and connects it to the right Intestine, Bladder, &c. The middle Tunic is very thick, and composed of strong Fibres variously disposed. Some think it contributes to the exclusion of the *Fetus*; tho' others imagine, it serves only to recover the Tone, after any violent Distention. The inner Tunic is nervous. The *Matrix* is connected by its Neck to the *Vagina*; behind, by its outward common Membrane, and before by the fame to the Bladder. Its Sides are tied to other Parts; but the *Fundus* is left loose, that it may expand and dilate more freely. Its Ligaments are four, two of which are called *broad*, and two *round*, from their Figure. The broad Ligaments are membranous, loose, and soft; whence they have been compared by some to the Wings of Bats, and call'd *Alæ Vespertilionum*. The round Ligaments are of a firmer Texture, and consist of a double Membrane, wrapped up in its Arteries, Veins, Nerves, and Lymphaducts. The Blood-Vessels, both in these and the round Ligaments, make a great part of what is call'd their Substance: These, as well as the others, serve to keep the Womb in its right Position; and are very liable to be injured by unskilful Midwives. On each Side of the *Fundus* of the Womb, arises a Duct, which opens into the Womb with a small Orifice, but in its Progress enlarges, and towards the End is contracted again: At the End next the *Ovaria*, which is at liberty, it expands again into a kind of Foliate fringed round; which Expansion *Fallopius*, the first Discoverer, imagined like the End of a Trumpet; whence he call'd the whole Duct, *Tuba*. It consists of a double Membrane. Both Veins and Arteries are very numerous here, especially the latter, which, by various Ramifications and Contortions, make the main Substance of them. Dr. *Wharton* gives them Valves, but the other Anatomists disallow it. See **FALLOPIAN TUBE**, **VERPERILIONUM ALÆ**, &c. &c.

The antient Greeks call'd the *Matrix mères*, from *mères*, *Mother*: Whence, Disorders of the Womb are frequently call'd *Fits of the Mother*. They also call'd it *Uterus*, as being the last of the Entrails, by its Situation. They also call'd it *gonis*, or *Natura*; and *Fulva*, from *fulva*, to *fold* or *envelop*, or *Falva*, a *Door*. *Plato* and *Pythagoras* took it for a distinct Animal within another. *P. Ægineta* observes, that the *Matrix* may be taken away from a Woman, without her Death; and there have been Instances of People, who have lived a long time after the Loss of

the *Matrix*. *Rhisi* and *Parvus* observe, that some Persons have been cured of Dificases, by having the *Matrix* extirpated. In 1669, a Child was produced at the French Academy, which had been conceived out of the *Matrix*, and which nevertheless had grown to the Length of six Inches. See **EMBRYO**, **FOETUS**, &c.

**MATRIX**'s are also used to signify Places proper for the Generation of Vegetables, Minerals, and Metals. Thus the Earth is the *Matrix* wherein Seeds sprout; *Marcasites* are the *Matrix*'s of Metals. See **FOSIL**, **MINERAL**, &c.

**MATRIX** is also used, tho' figuratively, for several Things, wherein there seems to be effected a kind of Generation; and where certain Things seems to acquire a new Being, or at least a new Manner of Being: of this kind are the Moulds wherein the Printers Types or Letters are cast, and those used in striking Money and Medals, call'd also *Coms*. See **MATELICK**.

**MATRON**, among the *Romans*, signify'd a married Woman, and the Mother of a Family. There was, however, some difference between *Matrona* and *Mater-familias*. *Servius* says, that some imagined the Difference to lie in this, That *Matrona* was a Woman who had one Child, and *Mater-familias* she that had several. But others, particularly *Aulus Gellius*, take the Name *Matrona* to belong to a married Woman, whether she had any Children or no; the Hope and Expectation of having them, being enough to warrant the Title of Mother, *Matrona*: and for which reason it is, that Marriage is call'd *Matrimony*. This Opinion is supported by *Aulus Gellius* and *Nonius*.

**MATRONALIA**, Feasts of the Roman Ladies, or rather *Matronæ*, celebrated on the Calends of *March*, in honour of the God *Mars*. No Men living in Celibate, were allow'd to assist at the Feast. The Word comes from the Latin *Matrona*.

**MATROSESSE**, are Soldiers in the Train of Artillery, next below the Gunners; their Duty is to assist the Gunners in traversing, spunging, loading, and firing of Guns, &c. They carry Fire-Locks, and march along with the Store-Waggons.

**MATTADORE**, see **OMBRE**.

**MATTER**, or **BODY**, an extended, solid, divisible, moveable and passive Substance, the first Principle of all natural Things, from the various Arrangements and Combinations whereof, all natural Things are formed. *Aristotle* makes three Principles, *Matter*, *Form*, and *Privation*: Which last the *Cartesians* throw out of the number; and others, the two last. See **PRINCIPLE**.

The Properties of *Matter* we are pretty well acquainted with, and can reason about its Divisibility, Solidity, &c. see **DIVISIBILITY**, &c. But the Essence thereof, or the Subject wherein these Properties reside, or their *Substratum*, is still a Mystery. *Aristotle* speaks very darkly on the Subject, defining *Matter* to be *ne quid, nec quantum, nec quale*, nor any certain or determinate Thing at all; which many of his Followers interpret so, as to believe, that *Matter* does not at all exist. See **BODY**.

The *Cartesians* make the Essence of *Matter* to consist in its Extension; arguing, that since the Properties above-mention'd are all that are essential to *Matter*, some of them must constitute its Essence: and since Extension is conceived prior to all the rest, and is that, without which none of the rest can be conceived, Extension is that which constitutes the Essence of *Matter*. But the Conclusion, here, is unjust; for on this Principle, the Existence of *Matter*, according to Dr. *Clark*, would have the fairest Title to constitute its Essence, the *esse existens* being conceived prior to all Properties, and even to Extension. Since then the Word *Extension* appears to go further, and to be more general than *Matter*; that impenetrable Solidity, which is essential to all *Matter*, and to *Matter* alone, and from which all its Properties manifestly flow, may, with more Propriety, be call'd the Essence of *Matter*. See **ESSENCE**.

Again, if Extension were the Essence of *Matter*, and so *Matter* and Space the same thing; it would follow, that *Matter* is infinite and eternal, that it is a necessary Being, and could neither be created nor annihilated; which is absurd. Besides that, it appears both from the Nature of Gravity, the Motions of Comets, the Vibrations of Pendulums, &c. that Space is not *Matter*: and therefore 'tis not Extension; but solid, impenetrable Extension which has a Power of resisting, that constitutes *Matter*. See **VACUUM** and **EXTENSION**.

Many among the old Philosophers maintain'd the Eternity of *Matter*, out of which they supposed all things to be formed by the hands of Nature; as being unable to conceive how any thing should be formed out of nothing. *Plato* maintain'd, that *Matter* had existed eternally, and concurred with God in the Production of all things, as a passive Principle, or a kind of collateral Cause. See **ETERNITY**.

*Matter* and *Form*, the two simple and original Principles of all things, according to the Antients, compos'd some simple Natures, which they call'd *Elements*; out of the various Combinations whereof, all natural Things were compos'd. See **ELEMENT**.

Dr. Woodward is of an Opinion, not very unlike it; viz. That *Matter* is originally and really very different, being at its first Creation divided into several Ranks, Sets, or Kinds of Corpuscles, differing in Substance, Gravity, Hardness, Flexibility, Figure, Size, &c. from the various Composites and Combinations of which, arise all the Varieties in Bodies, as to Colour, Hardness, Gravity, Tastes, &c. But Sir *Is. Newton* takes all those Differences to result from the various Arrangements of the same *Matter*; which he takes to be homogeneous and uniform in all Bodies. See **CORPUSCLE**.

Besides the Properties of *Matter* hitherto known, Sir *Is. Newton* has discover'd a new one, viz. 'That of Attraction, or that every Particle of *Matter* has an attractive Power, or a Tendency towards every other Particle: which Power is strongest in the Point of Contact, and suddenly decreases, inso-much that it acts no more at the least sensible Distance, and at a greater Distance is converted into a repellent Force, whereby the Parts fly from each other. On this Principle of Attraction, he accounts for the Cohesion of the Particles of Bodies, otherwise inexplicable.' See **COHESION**.

For he takes occasion to observe, 'That all Bodies seem to be compos'd of hard Particles. Even Light itself, and all other the most volatile of Fluids; inso-much as Hardness may be esteem'd a Property of all incompos'd *Matter*: at least the Hardness of *Matter* stands on as good a foot as that of its Impenetrability; all the Bodies we know of, being either hard themselves, or being capable of being harden'd. Now if Compound Bodies be so hard, as we find some of them, and yet are very porous, and consist of Parts which are only laid together; the simple Particles, which are void of Pores, and were never yet divided, must be much harder. Now such hard Particles being heaped together, can scarce touch one another in more than a few Points, and therefore must be separable with much less Force than is requisite to break a solid Particle, whose Parts touch in all the Space, without any Pores or Interstices to weaken their Cohesion: How then should such very hard Particles, only laid together, and touching only in a few Points, stick together, and that so firmly as they do, without the Assistance of something that causes them to be attracted or press'd towards each other?'

The same great Author observes further, 'That the smallest Particles may cohere by the strongest Attractions, and compose bigger Particles of weaker Virtue; and many of these may cohere, and compose bigger Particles, whose Virtue is still weaker, and so on for divers Successions, until the Progression end in the biggest Particles; on which the Operations in Chymistry, and the Colours of natural Bodies, depend; and which, by cohering, compose Bodies of a sensible Magnitude. If the Body is compact, and bends or yields inward to Pressure; without any sliding of its Parts; it is *hard*, and *elastic*; returning to its Figure with a Force arising from the mutual Attraction of its Parts. If the Parts slide upon one another, the Body is *malleable* or *soft*. If they slip easily, and are of a fit Size to be agitated by Heat, and the Heat is big enough to keep them in Agitation, the Body is *fluid*; and if it be apt to stick to things, it is *viscid*. And the Drops of every Fluid affect a round Figure by the mutual Attraction of their Parts, as the Globe of the Earth and Sea affects a round Figure, by the mutual Attraction of its Parts of Gravity.' See **ATTRACTION**.

Again, 'Since Metals dissolved in Acids, attract but a small Quantity of the Acid, their attractive Force reaches but to a small distance. Now, as in Algebra, where affirmative Quantities cease, there negative ones begin; so in Mechanics, where Attraction ceases, there a repellent Virtue must succeed. That there really is such a Virtue, seems to follow, from the Reflections and Inflections of the Rays of Light; the Rays being repelled by Bodies in both these Cases, without the immediate Contact of the reflecting or inflecting Body. The same thing seems also to follow from the Emission of Light; a Ray, as soon as shaken off from a shining Body by the vibrating Motion of the Parts of the Body, and got beyond the reach of Attraction, being driven away with exceeding great Velocity: for that Force, which is sufficient to turn it back in Reflection, may be sufficient to emit it. It seems also to follow from the Production of Air and Vapour. The Particles, when they are shaken off from the Body by Heat or Fermentation, so soon as they are beyond the reach of the Attraction of the Body, receding from it, and also from one another, with

great Strength, and keeping at a distance, so as sometimes to take up above a Million of Times more Space, than they did before in the Form of a dense Body. Which vast Contraction and Expansion seems unaccountable, by feigning the Particles of Air to be springy, and ramous, or rolled up like Hoops, or by any other means than a repulsive Power. The Particles of Fluids, which do not cohere too strongly, and are of such a Smallness, as renders them most susceptible of those Agitations, which keep Liquors in a Flux, are most easily separated and rarefied into Vapour, and in the Language of the Chymists, they are *volatile*; rarefying with an easy Heat, and condensing with Cold. But those which are grosser, and so less susceptible of Agitation, or cohere by a stronger Attraction, are not separated without a stronger Heat, or perhaps not without Fermentation. And these last are the Bodies, which Chymists call *fixed*; and being raised by Fermentation, become true permanent Air; those Particles receding from one another with the greatest Force, and being most difficultly brought together, which upon Contact cohere most strongly. And because the Particles of permanent Air are grosser, and arise from denser Substances, than those of Vapours; thence it is that true Air is more ponderous than Vapour; and that a moist Atmosphere is lighter than a dry one, quantity for quantity. From the same repelling Power it seems to be, that Flies walk upon the Water without wetting their Feet; and that the Object-Glasses of long Telescopes lie upon one another without touching; and that dry Powders are difficultly made to touch one another so as to stick together, unless by melting them, or wetting them with Water, which by exhaling may bring them together; and that two polish'd Marbles, which by immediate Contact stick together, are difficultly brought so close together, as to stick.' See **REPELLING POWER**.

He further observes, 'That all things consider'd, it seems probable God, in the Beginning, form'd *Matter* in solid, massy, hard, impenetrable, moveable Particles, of such Sizes, Figures, and with such other Properties, and in such proportion to Space, as most conduced to the End, for which he form'd them; and that these primitive Particles being Solid, are incomparably harder than any porous Bodies compos'd of them; even so very hard, as never to wear, and break in pieces: no ordinary Power being able to divide, what God himself made one in the first Creation. While the Particles continue entire, they may compose Bodies of one and the same Nature and Texture in all Ages; but should they wear away, or break in pieces, the Nature of Things depending on them, would be changed. Water and Earth, compos'd of old worn Particles and Fragments of Particles, would not be of the same Nature and Texture now, with Water and Earth compos'd of entire Particles in the Beginning. And therefore that Nature may be lasting, the Changes of Corporeal Things are to be placed only in the various Separations, and new Associations and Motions of these permanent Particles; compound Bodies being apt to break, not in the midst of solid Particles, but where those Particles are laid together, and only touch in a few Points.'

It seems farther, 'That these Particles have not only a *Vis Inertia*, accompany'd with such passive Laws of Motion, as naturally result from that Force, but also that they are moved by certain active Principles, such as is that of Gravity, and that which causeth Fermentation, and the Cohesion of Bodies. These Principles are to be consider'd not as occult Qualities, suppos'd to result from the specific Forms of Things, but as general Laws of Nature, by which the Things themselves are form'd; their Truth appearing to us by Phenomena, tho' their Causes are not yet discover'd.' See **PARTICLE**; see also **FERMENTATION**, **FIRMNESS**, **GRAVITATION**, **ELASTICITY**, **HARDNESS**, **FLUIDITY**, **SALT**, **ACID**, &c.

*Hobbes*, *Spinoza*, &c. maintain all the Beings in the Universe to be *material*, and their Differences to arise from their different Modifications, Motions, &c. Thus *Matter* extremely subtle, and in a brisk Motion, they conceive, may think; and so exclude all Spirits out of the World. See **SPIRIT**. Mr. *Berkeley*, on the contrary, argues against the Existence of *Matter*; and endeavours to prove, that it is a mere *Ent Reasonis*; and has no Existence out of the Mind: 'Thus,' says he, 'that neither our Thoughts, Passions, nor Ideas, form'd by the Imagination, exist without the Mind, is evident; nor is it less evident, that the various Sensations or Ideas imprinted on the Sense, however blended or combined together (that is, whatever Objects they compose) cannot exist otherwise, than as in a Mind perceiving them. This no Man can doubt of, that attends to what is meant by the Term *exist*, when applied to sensible Things. Thus I say, the Table I write on exists, i. e. I see and feel it, and if I were out of my Study,

dy, I should say it existed; meaning thereby, that if I were in my former Situation, I should see and feel it as before. Again, I say there was Odour, i. e. I smelt it; it is a Sound, i. e. it was heard; a Colour or Touch, i. e. it was perceived by Sight or Touch. This is the utmost that can be meant by such Expressions; for as to the absolute Existence of any unthinking Being, distinct from its being perceived, 'tis a Chimera. Their *Esse* is in *perceptis*; nor is it possible they should have any Existence out of the Minds that perceive them. Again, what are Hills and Trees, &c. but Things perceived by Sense; and what do we perceive, but our own Ideas or Sensations: and can any one of these, or any Combination of them exist unperceived? What are Light and Colour, Heat and Cold, Extension and Figure, but so many Sensations, Ideas, or Impressions on the Sense? And is it possible, even in Thought, to separate them from Perception? 'Tis next to self-evident, therefore that all the Choir of Heaven, and Furniture of the Earth; in a word, all the Bodies that compose the System of the World, have not any Subistence out of a Mind; their *Esse* is nothing more than their being perceived: and therefore as long as they don't exist in me, i. e. are not perceived by me, nor any other created Spirit; they have no shadow of Existence at all, unless perhaps in the Mind of some Eternal Spirit. It appears therefore, with the Light of an Axiom, that there is not any other Substance but Spirit, &c.' See *Inquiry into Principles of Human Knowledge*. See **EXTERNAL WORLD**.

**MAYER** in *Deed*, and *Mater of Record*, in Law, are thus distinguished: *Mater in Deed* signifies nothing else but a Truth to be proved, tho' not by any Record; and *Mater of Record*, is that which may be proved by some Record: For example, if a Man be sued to an Exigent, during the time he was in the King's Wars, this is *Mater in Deed*, and not *Mater of Record*. And therefore he that will allege this for himself, must come before the *Seire Facias*, before Execution be awarded against him; for after that, nothing will serve but *Mater of Record*; that is, some Error in the Process appearing upon Record.

**MATURANTIA**, in Medicine, &c. Ripeners, or such Things as promote Maturation. See **RIFENERS**.

**MATURATION**, in Pharmacy, a Preparation of Fruits, or other Remedies, gather'd before their Maturity; to fit them to be eaten, or taken.

**MAUNCH**, is the Figure of an ancient Sleeve of a Coat, so called by the Heralds; and is borne in many Gentlemen's Escutcheons: as in the Earl of Huntingdon's, in those of *Ceniors*, &c.

**MAUNDAY THURSDAY**, the *Thursday* before *Easter*, so called from the *French Mande*, i. e. *Sportula*; it being a Custom on that Day to give larger Bounty to certain poor Men, whose Feet the King wash'd.

**MAUSOLEUM**, a magnificent Tomb, or funeral Monument, consisting of Architecture, and Sculpture, with an Epitaph; erected in honour of some Prince, or other illustrious Person: as the *Mausoleum of Artaxius* at Rome. The Word is also used to signify the Decoration of a Tomb, or *Catafalque*, in a funeral Pomp. The Word comes from *Mausolus King of Caria*, to whom *Artemisia*, his Widow, erected a most stately Monument, that has since been number'd among the Wonders of the World, calling it from his Name, *Mausoleum*.

**MAXILLE**, in Anatomy, the *Jaw*, or those Parts of an Animal, wherein the Teeth are set, and which serve for masticating the Food: See **TEETH**. The *Maxille* are two in number, denominated from their Situation, *Superior*, and *Inferior*.

The *MAXILLA Superior*, or Upper Jaw, is immovable in Man, and all other Animals; excepting Parrots and Crocodiles. It consists of eleven Bones, join'd to each other per *Hammium*; five disposed on each side, and one in the middle. Their Names are the *Zygoma*, or *Maxillare*, or *Unguis*, or *Nasi*, or *Palati*, and *Pomer*: See **ZYGOMA**, &c. In this Jaw are Alveoli or Sockets for 16 Teeth.

The *MAXILLA Inferior*, or Lower Jaw, only consists of two Bones, which unite in the middle of the Chin, by the Intervention of a Cartilage, which hardens as the Child grows; and at length, about the Age of seven Years, becoming bony, joins the two Bones into a continued one, resembling the *Greek u*. It consists of two Tables, betwixt which is a spongy Substance, in Children medullous. The fore-part is shallow, just sufficient to afford Sockets for 16 Teeth. It has two Processes, the *Corone* and *Condylodes*, which see; four Holes or *Foramina* for the Passage of Vessels, and five Pair of proper Muscles, viz. the *Crotaphytes* or *Temporal*, the *Masseter*, *Biventer* or *Digastricus*,

*Pterygoides Internus*, and *Pterygoides Externus*. See each in its Place. **CROTAPHYTES**, **MASSETER**, &c.

**MAXILLARIS Glandula**, a considerable Gland of the conglomerate Kind, situate on the Inside, under the lower Jaw-Bone, near the *Musculus Digastricus*. It discharges itself by several Branches of Ducts, which form one Trunk that passes under the *Mylolobisium*, and meets with that of the other Side within the fore Teeth of the lower Jaw, having distinct Orifices, with a *Papilla* on each Side the *Frenum Lingue*. See **GLAND**.

**MAXIMIS** or **MINIMIS**, a Method so called, in use among the Mathematicians, whereby they strive at the greatest or least possible Quantity attainable in any Case: Or thus, If the Semi-ordinates of any Curve continually increase or decrease to some certain Term, which once pass'd, they begin again to increase or decrease, the Method whereby their *Maxima* & *Minima*, i. e. their greatest or least State is determined, is called the Method of *Maximis* & *Minimis*; which, 'tis true, may be used to determine other Quantities that increase or decrease to any certain degree: but then they must always be represented by the Semi-ordinates of Curves.

The Method of *Maximis* & *Minimis*, is best managed by the *Calculus Differentialis*, or Fluxions. The Rule is: Having put the Equation into Fluxions, let the Fluxion of that Quantity (whose extreme Value is sought) be supposed = *c*; by this means all those Members of the Equation, in which it is found, will vanish, and the remaining ones will give the Determination of the *Maximus* or *Minimum* desired. Now the reason of the Rule is, that every *Maximum* or *Minimum* is in its own nature a stable Quantity: To determine therefore any flowing Quantity to a *Maximum* or *Minimum*, is to make it (instead of a flowing) a permanent one; but the Fluxion of a permanent Quantity is equal to nothing. This we shall illustrate by an Example or two.

**Prob. 1.** To determine the greatest or least Applyc in an Algebraic Curve. Since in Curves that have a *Maximum* and a *Minimum*, the Tangent *TM* (*Tab. ANALYSIS* fig. 4.) degenerates at length into *DE*, and becomes parallel to the Axis, and so the Perpendicular *MH* coincides with the greatest or least Applyc *CG*; in the Case of the *Maximum* and *Minimum*, the Sub-tangent *TP* becomes infinite, and the Sub-perpendicular equal to nothing, but  $PH = ydy : dx$ . If then  $ydy : dx = 0$ ; we shall find  $dy = 0$ , and because of  $PT = ydx : dy = \infty$  (the Note of Infinity)  $dx = \infty$ . 'Tis possible for the Tangent *HG* (*fig. 5.*) to be directly against the Semi-ordinate *GC*; in which Case the Sub-tangent *PT* is equal to nothing, and the Sub-perpendicular infinite. But  $PT = ydx : dy = 0$ ; therefore if  $ydx : dy = 0$ , we shall have  $dx = c$ ; or because of  $PH = ydy : dx = \infty$ , we find  $dy = \infty$ . Both  $dx$  and  $dy$  being, in respect of *dy*, Infinitesimals. From the Equation of the Curve therefore we are to find the Value of *dy*, which is to be made equal either to nothing, or to an Infinite, that we may have the Value of the Absciss, to which the greatest Applyc is co-ordinate.

**2.** To cut a right Line *AB* (*fig. 6.*) in such a manner in *D*, that the Rectangle *AD* and *DB* shall be greatest that can possibly be thus contriv'd. Let  $AB = a$ ,  $AD = x$ , then will  $DB = a - x$ ; consequently  $AD \cdot DB = ax - xx$  any *Maximum*, and hence its Differential will be equal to nothing, as being conceived at a Circle, to which

$$ax - xx = yy$$

$$\text{Wherefore } a dx - 2x dx = 2y dy = 0$$

$$a - 2x = 0$$

$$\frac{1}{2} a = x.$$

The Line *AB* therefore is to be cut into two equal Parts; and the Square is the greatest of all Rectangles, whose Altitudes and Bases, taken together, are equal to each other. See **FLUXIONS**.

**MAXIMS**, a kind of Propositions, which, under the Name of *Maxims* and Axioms, have pass'd for Principles of Science; and which being self-evident, have been supposed innate. See **AXIOM**.

For the Reason of the Evidence of *Maxims*: It may be observed, That Knowledge being only the Perception of the Agreement or Disagreement of Ideas; where that Agreement or Disagreement is perceived immediately by itself, without the Intervention or Help of any other Ideas, there our Knowledge is self-evident: which being so, nor only *Maxims*, but an infinite number of other Propositions, partake equally with them in this Self-Evidence. Thus, that a Circle is a Circle, Blue is not Red, are as self-evident Propositions, as those general ones, What is, is; and It is impossible for the same thing to be, and not to be. Nor can the Consideration of these Axioms add any thing to the Evidence or Certainty of our Knowledge of them.

As to the Agreement or Disagreement of Co-existence, the Mind has an immediate Perception of this but in very few. And therefore in this Sort we have very little intuitive Knowledge; tho' in some few Propositions we have. Two Bodies cannot be in the same Place, is a self-evident Proposition: The Idea of fitting a Place equal to the Contents of its Superficies, being annexed to our Idea of Body. As to the Relations of Modes, Mathematicians have framed many Axioms concerning that one Relation of Equality; as that Equals being taken from Equals, the Remainder will be equal, &c. which however received for Axioms, yet have not a clearer Self-evidence than these, That One and One are equal to Two; that if from the five Fingers of one Hand you take two, and from the five Fingers of the other Hand two, the remaining Numbers will be equal. As to real Existence, since that has no Connection with any other of our Ideas, but that of ourselves, and of a first Being; we have not so much as a demonstrative, much less a self-evident Knowledge concerning the real Existence of other Beings. See EXISTENCE.

For the Influence of MAXIMS in the other Parts of our Knowledge: The Rules established in the Schools, That all Reasonings are *ex præconiis & præconsequis*, seem to lay the Foundation of all other Knowledge in these MAXIMS, and to suppose them to be *præconiis*; which implies two Things: viz. That these Axioms are those Truths first known to the Mind; and, That on them the other Parts of our Knowledge depend. But, first, That these Axioms are not the Truths first known to the Mind, is evident from Experience: For who knows not that a Child perceives that a Stranger is not its Mother, long before he knows it impossible for the same Thing to be, and not to be? And how many Truths are there about Numbers, which the Mind is perfectly acquainted with, and fully convinced of, before it ever thought on these general MAXIMS? Hence it follows, That these magnified MAXIMS are not the Principles and Foundations of all our other Knowledge; for if there are a great many other Truths, as self-evident as they, and a great many that we know before them, it is impossible that they should be the Principles, from which we deduce all other Truths. Thus, That One and Two are equal to Three, is as evident, and easier known, than that the Whole is equal to all its Parts. Nor, after the Knowledge of this MAXIM, do we know that One and Two are equal to Three, better, or more certainly, than we did before. For if there be any odds in these Ideas, the Ideas of Whole and Parts are more obscure, or at least more difficult to be settled in the Mind, than those of One, Two, and Three. Either, therefore, all Knowledge does not depend on *Præconiis*, or general MAXIMS, called Principles; or else such as these (That One and One are equal to Two, that Two and Two are Four, &c.) and a great part of Numeration, are MAXIMS. To these, if we add all the self-evident Propositions that may be made about all our distinct Ideas, Principles will be almost infinite; and a great many innate Principles, many Men never come to know all their Lives.

General MAXIMS then may be of use in Disputes, to stop the Mouths of Wranglers; but are of little in the Discovery of unknown Truths. Several general MAXIMS are no more than bare verbal Propositions, and teach us nothing but the Respect and Import of Names one to another; as, The Whole is equal to all its Parts: What real Truth doth this teach us more, than what the Signification of the word *Totum*, or Whole, does of itself import? If rightly consider'd, we may say, that where our Ideas are clear and distinct, there is little or no use at all of MAXIMS, to prove the Agreement or Disagreement of any of them. He that needs any Proof to make him certain, and give his Assent to this Proposition, That Two are equal to Two, or that White is not Black; will also have need of a Proof to make him admit, That what is, is; or, that it is impossible for the same Thing to be, and not to be. But as MAXIMS are of little use, where we have clear and distinct Ideas; so they are of dangerous use, where our Ideas are confused, and where we use Words, that are not annexed to clear and distinct Ideas. LOCKE.

MAY, the fifth Month in the Year, reckoning from the first of January; and the third, in counting the Year to begin with March, as they antiently did. In this Year the Sun enters *Gemini*, and the Plants of the Earth begin to flower. It was called *Maia* by *Romulus*, in respect to the Senators and Nobles of his City, which were named *Majores*; as the following Month was called *Junius*, in honour of the Youth of *Rome*, in honour of *Juniorum*, who served him in the War: Others will have it to have been called thus from *Maia*, the Mother of *Mercury*, to whom they offer'd Sacrifice on that day; *Poppian* derives it from *Maia*, *En quod tunc terra madat*. This Month was under the Protection of *Apollo*, and therein also they kept the Festi-

val of *Bona Dea*, that of *Goblet*, call'd *Lemuria*; and the Ceremony of *Reversorium*, or the Expulsion of the Kings. The Vulgar have a great opinion of *May-Dew* and *Butter*. See *Dew*. The Month of *May* has ever been esteem'd very favourable to Love; and yet the Antients, as well as many of the Moderns, look on it as an unhappy Month for Marriage: The Reason may perhaps be refer'd to the Feast of the *Lemures*, which was held in it. *Ovid* alludes to this in the 5th of his *Figiti*, when he says,

*Nec Fidei tediis tadem, nec Virginis apta  
Tempora; que nuptis, non duntaxat sunt:  
Hæc quoque de Cansâ, si se procerbis tangunt,  
Mense malis Mauo Nubere vulgus erit.*

MAYL, in Falconry, is to plume the Wings of a Hawk.

MAYOR, the Chief Magistrate or Governour in the Cities and most Corporation-Towns of England; chosen annually by his Peers out of the number of the Aldermen. The Mayor of the Place is the King's Lieutenant, and with the Aldermen and Common Council, can make Laws, call'd *By-Laws*, for the Government of the Place. He has the Authority of a kind of Judge, to determine Matters, and to mitigate the Rigour of the Law. The Word comes from the antient *brutis Mira, custodire, to keep*. King *Richard I.* A. D. 1189. first changed the Bayliffs of London into Mayors; by whose Example others were afterwards appointed. See *PORTREVE* and *ALDERMAN*.

MAYOR'S COURT. To the Lord Mayor and City of London belong several Courts of Judicature. The highest and most antient is that call'd *The Husting*, from the Danish *Hind-ting*, i. e. *Domus Judicij*; destined to secure the Laws, Rights, Franchises, and Customs of the City.

The second is a Court of *Request*, or of *Conscience*; so call'd, as meddling with nothing above 40*s.* Value; or rather, because here the Oath of the Creditor himself is accepted.

The third is the Court of the Lord Mayor and Aldermen, where also the Sheriffs sit; two Courts of Sheriffs; and the Courts of the City-Orphans, whereof the Lord Mayor and Aldermen have the Custody.

The Court of Common-Council, consisting of two Houses; the one for the Lord Mayor and Aldermen, and the other for the Commoners: In which Court are made all By-Laws, which bind the Citizens.

Under him is also the Chamberlain's Court, where every thing relating to the Rents and Revenues of the City, as also the Affairs of Servants, &c. are transacted. Lastly, To him belongs the Courts of *Carmer*, and of *Escheator*; another Court for the Confeeration of the River of Thames; another of *Coal-Delivery*, held usually eight Times a year, at the *Old-Bayley*, for the Tryal of Criminals, whereof the Lord Mayor is himself the chief Judge. There are other Courts call'd *Wardmotes*, or Meetings of the Wards; and Courts of *Helmote*, or Assemblies of the several Guilds and Fraternities.

MEAD, a wholesome, agreeable Liqueur, prepared of Honey and Water. One of the best Preparations, is as follows: Into twelve Gallons of Water, slip the Whites of six Eggs; mixing these well together, and to the Mixture adding twenty Pounds of Honey. Let the Liqueur boil an hour, and when boiled, add Cinnamon, Ginger, Cloves, Mace, and a little Rosemary. As soon as 'tis cold, put a Spoonful of Yeast to it, and turn it up, keeping the Vessel fill'd as it works; when it has done working, stop it up close, and when fine, bottle it off for Use.

MEAN, the Middle between two Extremes. See *MIDDLE* and *EXTREME*.

Thus, we say, *Mean Motion* of a Planet; its *mean Distance*, &c. meaning a Motion or Distance, which as far exceeds the least Distance, or Motion, as it is exceeded by the greatest. See *MOTION*, *DISTANCE*, &c.

MEAN, in Logic. See *MEDIUM*.

MEAN Proportion. See *EXTREME PROPORTION*.

MEAN Proportional. See *PROPORTIONAL*.

MEAN Time. See *TIME*.

MEAN Axis, in Optics. See *AXIS*.

MEAN Diameter in Gauging. See *DIAMETER*.

MEAN, in Law, refers either to Time or Dignity. Thus, in the first sense, we say, his Action was *mean* betwixt the Distinction made to him and his Recovery, i. e. in the Interim: In the second we say, there is Lord *Mean*, i. e. *Meane*, or Lord of a Manner, who has Tenants that hold of him, yet himself holds of the King.

MEASLES, or MORRILL, in Medicine, a cutaneous Disease, consisting in a general Appearance of Eruptions, not tending to Suppuration; with a Fever. This Distemper seems to bear a great Affinity to the Small-Pox, the Symptoms being in many respects the same, the Cause nearly the same, and the Regimen and Cure not much different. The Eruptions usually appear about the fourth

Day, like Flea-Bites, over the whole Body; but thicker and redder, and with greater Inflammation, than those of the Small-Pox, and vanish in four or six Days after appearance: being, when at the height, not larger than Pins Heads. The *Measles* is more sickly than dangerous; tho it often inclines to Consumptions, by a Cough which it leaves behind. See **VARIOLÆ**.

**MEASURE**, in Geometry, any certain Quantity assumed as one, or Unity, to which the Ratio of other homogeneous, or similar Quantities is express'd. This Definition is somewhat more agreeable to Practice than that of *Euclid*, who defines *Measure* by a Quantity, which being repeated any number of Times, becomes equal to another: This only answers to the Idea of an Arithmetical *Measure*, or **QUOTA PART**. See **QUOTA PART**.

**MEASURE** of a Number, in Arithmetic, is such a Number as divides another, without leaving any Fraction; thus 9 is a *Measure* of 27. See **NUMBER**.

**MEASURE** of a Line, is any right Line taken at pleasure: The modern Geometricians use a *Decempeda*, or Perch, divided into 10 equal Parts, call'd Feet. The Feet they subdivide into 10 Digits, the Digit into 10 Lines, &c. See **MEASURES**.

This Decimal Division of the *Measure* was first introduced by *Simon Stevinus*, probably from the Example of *Regiomontanus*: The Index or Character of *Decempeda* he made  $\sigma$ , that of Feet 1, of Digits 2, of Lines 3, &c. which, in regard the *Measure* was subdivided in a decuple Ratio, were the Logarithms of the Division. *Bayer*, in lieu of these, express'd the Logarithms by the Roman Characters; v. g. 3 Perches, 4 Feet, 3 Digits, and 2 Lines, he express'd thus;  $\gamma^3, \delta^4, \epsilon^3, \alpha^2$ . This, frequently, most commodious to separate the Integers, or Perches, from the Fractions by a Point; thus instead of  $\gamma^3, \delta^4, \epsilon^3, \alpha^2$ ; to write  $\gamma.4.3.2$ . *F. Neel* observes, that among the *Chinese*, the Decimal Division obtains in their common *Measure*, and even in their Weights. See **DECIMAL, DEGREE, &c.**

**MEASURE** of a Figure, or Plane Surface, is a Square, whose Side is of any determinate Length; among Geometricians 'tis usually a Perch, call'd a *Square Perch*, divided into ten square Feet, and the square Feet into square Digits: Hence square *Measures*. See **SQUARE**.

**MEASURE** of a Solid, is a Cube, whose Sides are of any Length at pleasure. Among Geometricians, a Perch, call'd a Cubic Perch, divided into Cubic Feet, Digits, &c. Hence Cubic *Measures*, or Measures of Capacity. See **CUBE**.

**MEASURE** of an Angle, is an Arch, described from the Vertex, a (*Tab. Geometry, fig. 10.*) in any Place between its Legs; as at *af*. Hence, Angles are distinguish'd by the Ratio of the Arches, described from the Vertex, between the Legs; to the Peripheries. Angles then are distinguish'd by those Arches; and the Arches are only distinguish'd by their Ratio to the Periphery. Thus the Angle *faa* is said to be of so many Degrees, as is the Arch *fad*. See **ANGLE**.

**MEASURE** of Velocity, in Mechanics, is the Space pass'd over by the moving Body in any given Time. To measure a Velocity, therefore, the Space must be divided into as many equal Parts, as the Time is conceived to be divided into. The Quantity of Space answering to such an Article of Time, is the Measure of the Velocity. See **VELOCITY**.

**MEASURE** of the Mass, or Quantity of Matter in Mechanics, is its Weight; it being apparent, that all the Matter which coheres and moves with a Body, gravitates with it; and it being found by Experiment, that the Gravities of homogeneous Bodies, are in proportion to their Bulks; hence, while the Mass continues the same, the Weight will be the same, whatever Figure it put on: its absolute Weight, we mean; for as to its specific Weight, it varies as the Quantity of Surface varies. See **VELOCITY, WEIGHT, GRAVITY, &c.**

**MEASURES**, therefore, are various, according to the various Kinds and Dimensions of the Things measured. Hence arise *Linear* or *Longitudinal Measures* for Lines or Lengths; *Square Measures* for Area's or Superficies; and *Solid* or *Cubic Measures* for Bodies, and their Capacities: All these are very different in different Countries, and in different Ages, and even many of 'em for different Commodities. Whence arise other Divisions of *Domestic* and *Foreign Measures*, *Antient* and *Modern* ones; *Dry* and *Liquid Measures*, &c.

The Business of *Measures* has been so confus'd, and withal so imperfectly deliver'd by our *English* Writers, that the Reader will not be displeas'd with the pains we have here taken to disembroil, and supply it. Under this Head he will find enumerated the various, general, standing *Measures*, *Long*, *Square* and *Cubic*, now or heretofore in use, with their Proportions and Reductions: for Particulars, he must be contented to be refer'd to the particular Heads; as **FOOT, DIGIT, ELL, TUN, GALLON, BUSHEL, PEECE, LEAGUE, FURLONG, &c.**

LONG MEASURES, or Measures of Application.

The *English Standard LONG MEASURE* for Commerce, or that whereby the Quantities of Things are ordinarily estimated in the way of Trade, is the *Yard*; containing three *English Feet*: equal to three *Paris Feet*; 1 Inch,  $\frac{1}{2}$  of an Inch; or  $\frac{1}{3}$  of a *Paris Ell*. Its Divisions are the *Foot*, *Span*, *Palm*, *Inch*, and *Barley-Corn*, which see under their respective Heads: **FOOT, INCH, &c.** Its Multiples are the *Pace*, *Fathom*, *Pole*, *Furlong*, and *Mile*. See **MILE, FURLONG, POLE, &c.** The Proportions these severally bear to each other, will be express'd in a Table for the purpose.

The *French Standard Measure* for Commerce is the *Aune* or *Ell*, containing 5 *Paris Feet*, 7 Inches, 8 Lines; or 1 Yard,  $\frac{2}{3}$  *English*; the *Paris Foot* Royal exceeding the *English* by  $\frac{1}{12}$  Part, as in one of the following Tables. This *Ell* is divided two ways; viz. into *Habes*, *Tards*, *Sabts*, and *Twelfths*; and into *Quarters*, *Half-Quarters*, and *Sixteenths*.

This *Ell* holds throughout the greatest part of *France*; excepting at *Troyes* in *Champagne*; at *Aire* in the *Bayous*; in some parts of *Picardy* and *Burgundy*, where it only contains two Foot, five Inches, one Line; in *Bretagne*, where it contains four Foot, two Inches, eleven Lines; and at *St. Genois* in *Ferry*, where it exceeds the *Paris Ell* by eight Lines. See **ELL**.

But in *Languedoc*, particularly at *Montpellier*, *Toulouse*, in *Provence*, *Guenee*, they measure by the *Canne*, which at *Toulouse* and in *Guenee* contains five *Paris Feet*, five Inches, and six Lines; or one *Paris Ell* and a half. At *Montpellier*, and throughout the *Lower Languedoc*, as also in *Provence* and *Avignon*, and even *Dauphine*, the *Canne* is six Foot and nine Lines; or one *Paris Ell*, two Thirds. See **CANNE**.

*Standard Measure* in *Holland*, *Flanders*, *Sweden*, a good part of *Germany*, many of the *Haut-Towns*, as *Dantzick* and *Hambourg*; and at *Geneva*, *Frankfort*, &c. is likewise the *Ell*: But the *Ell* in all these Places differs from the *Paris Ell*. In *Holland*, it contains one *Paris Foot*, eleven Lines, or four Sevenths of the *Paris Ell*. The *Flanders Ell* contains two Foot, one Inch, five Lines, and half a Line, or seven Twelfths of the *Paris Ell*. The *Ell* of *Germany*, *Brabant*, &c. is equal to that of *Flanders*. See **ELL**.

The *Italian Measure* is the *Braccio*, *Brace*, or *Fathom*; which obtains in the States of *Modena*, *Venice*, *Florence*, *Lucca*, *Milan*, *Mantua*, *Bologna*, &c. but of different Lengths. At *Venice* it contains one *Paris Foot*, eleven Inches, three Lines, or eight Fifteenths of the *Paris Ell*. At *Bologna*, *Modena*, and *Mantua*, the *Brace* is the same as at *Venice*; At *Lucca* it contains one *Paris Foot*, nine Inches, ten Lines, or half a *Paris Ell*. At *Florence* it contains one Foot, nine Inches, four Lines; or forty-nine Hundredths of a *Paris Ell*. At *Milan*, the *brace* for measuring of Silks is one *Paris Foot*, seven Inches, four Lines, or four Ninths of a *Paris Ell*: That for Woollen Cloths is the same with the *Ell* of *Holland*. Lastly, at *Bergamo* the *Brace* is one Foot, seven Inches, six Lines, or five Ninths of a *Paris Ell*. See **BRACE**. The *Measure* at *Naples*, however, is the *Canna*, containing six Foot, ten Inches, and two Lines, or one *Paris Ell*, and fifteen Seventeenths.

The *Spanish Measure*, is the *Vara*, or *Tard*, in some Places call'd the *Barra*; containing seventeen Twenty-fourths of the *Paris Ell*.—But the *Measure* in *Castille* and *Valencia* is the *Pan*, *Espana*, or *Paha*; which is used, together with the *Canna*, at *Genoa*.—In *Aragon*, the *Varra* is equal to a *Paris Ell* and a half, or five Foot, five Inches, six Lines.

—The *Portuguese Measure* is the *Coada*, containing two Foot, eleven Lines, or four Sevenths of the *Paris Ell*; and the *Vara*, 106 whereof make 100 *Paris Ells*.—The *Piedmoise Measure* is the *Ras*, containing one *Paris Foot*, nine Inches, ten Lines, or half a *Paris Ell*.—In *Scilly*, their *Measure* is the *Canna*; the same with that of *Naples*.

Lastly, the *Moscovite Measures* are the *Coft*, equal to one *Paris Foot*, four Inches, two Lines; and the *Arin*, two whereof are equal to three *Cofts*.—The *Turkish*, and *Levant Measure*, the *Picq*, containing two Foot, two Inches, and two Lines; or three Fifths of the *Paris Ell*.—The *Chinese Measure*, the *Che*; ten whereof are equal to three *Paris Ells*.—In *Perfia*, and some part of the *Indies*, the *Guzze*, whereof there are two Kinds; the *Royal Guzze*, call'd also *Guzze Montelzer*, containing two *Paris Foot*, ten Inches, eleven Lines, or four Fifths of the *Paris Ell*; and the *Storer Guzze*, call'd simply *Guzze*, only two Thirds of the former.—At *Goa* and *Ormus*, the *Measure* is the *Varra*, the same with that of the *Portuguese*, having been introduced by them.—In *Pegu*, and some other Parts of the *Indies*, the *Cand* or *Candi*, equal to the *Ell* of *Fouice*.—At *Goa* and other Parts, they use a larger *Cando*, equal to seventeen *Dust* *Ells*; exceeding that of *Babel* and *Belfora* by  $\frac{1}{2}$  per Cent. and the *Varra* by 6 and  $\frac{1}{2}$ .—In *Siam*, they use the *Ken*, short of three *Paris Feet* by one Inch.

The *Ken* contains two *Sets*, the *Sek* two *Kebs*, the *Keub* *lois*, the *Ciang*; in *Japan*, the *Iken*; and the *Pan* on some twelve *Niss*, or *Inches*; the *Niss* to be equal to eight of the *Calls* of *Guinea*.  
Grains of *Rice*, i. e. 20 about nine *Lines*.—At *Cum*—

*The Proportions of the Long Measures of several Nations to the English Foot, by Mr. Greaves.*

The English Standard Foot being divided into 1000 equal Parts, the other Measures will have the Proportions to it, which follow.

The English Foot, from the Standard in Guildhall	1000
The Paris Royal Foot, in the Châtelet	1068
The Rhinland Foot, of Suelius.	1033
The Greek Foot	1007 <sup>1/2</sup>
The Roman Foot, on the Monument of Cossutius	967
The Roman Foot, on the Monument of Statilius	972
The Roman Foot, of Villalpanda, taken from the Congius of Vespasian	986
The Venetian Foot	1162
The Ell of Amwerp	1283
The Ell of Amsterdam	1268
The Ell of Leyden	1260
The Canna of Naples	687

The Varrà or Varrè of Almeria, and Gibraltar in Spain	1760
The Braccio of Florence	1913
The Palm of Genoa	815
The Common Braccio of Senna	1242
The Braccio of Senna, for Linnen	1974
The Palm of the Architects at Rome, whereof X make the Canna of the same Architects	732
The Palm of the Braccio of the Merchants and Weavers at Rome; from a Marble in the Capitol, with this Inscription, CVRANTE LV POETO	695 <sup>1/2</sup>
The Large Pique of the Turks at Constantinople	2200
The Small Pique of the Turks at Constantinople, is to the Larger, as 31 to 32.	
The Arsh of Persia	3197
The Dersah or Cubit of the Egyptians	1824

*The Proportions of several Long Measures to each other, by M. Picard.*

The Rhinland or Leyden Foot (12 whereof make the Rhinland Perch) supposed	696
The English Foot	675 <sup>1/2</sup>
The Paris Foot	720
The Amsterdam Foot, from that of Leyden, by Suelius	629
The Danish Foot (100 whereof make the Danish Ell)	701 <sup>1/2</sup>
The Swedish Foot	658 <sup>1/2</sup>
The Brussels Foot	602 <sup>1/2</sup>
The Danzick Foot, from Hevelius's Selenographia	636
The Lyons Foot, by M. Anzout	757 <sup>1/2</sup>
The Bologna Foot, by the same.	843
The Braccio of Florence, by the same, and Fa-thet Merfenne	1290
The Palm of the Architects at Rome, according	

to the Observation of Mess. Picard and Anzout	494 <sup>1/2</sup>
The Roman Foot in the Capitol, examin'd by Mess. Picard and Anzout	653 or 653 <sup>1/2</sup>
The same, from the Greek Foot	652
From the Vineyard Mattei	657
From the Palm	658
From the Pavement of the Pantheon, supposed to contain 10 Roman Feet	653
From a Slip of Marble in the same Pavement, supposed to contain 3 Roman Feet	650
From the Pyramid of Cestius, supposed to contain 3 Roman Feet	652
From the Diameters of the Column in the Arch of Septimius Severus.	653 <sup>1/2</sup>
From a Slip of Porphyry in the Pavement of the Pantheon	653 <sup>1/2</sup>

**SQUARE or SUPERFICIAL MEASURES.**

English SQUARE or SUPERFICIAL MEASURES, are raised from the Yard of 36 Inches, multiplied into itself; and this producing 1296 square Inches in the square Yard, the Divisions of this are Square Feet and Inches; and the

Multiples, Poles, Rods, and Acres; as in the Table. French Square Measures, are regulated by 12 square Lines in the Inch square; 12 Inches in the Foot, 12 Feet in the Perch, and 100 Perches in the Arent, or Acre.

*English Square Measures.*

Inches		Feet		Yards		Poles		Rods		Acres	
144		9		2 <sup>1/2</sup>		16,89		40			
1296		81		30 <sup>1/2</sup>		437,6		160		4

Grecian Square Measures, were the Plethron, Jugerum or Acre; by some said to contain 1444, by others 10000 Ca-

bits; and Aroua, the Half of the Plethron. The Aroua of the Egyptians was the Square of 100 Cubits.

*Roman Square Measures reduced to English.*

The Integer was a Jugerum or Acre, which they divided like the Libra or As: Thus,

	Jugerum contain'd		Engl. Rods. Sq. Poles. Sq. Feet.

*Cubic Measures, or Measures of Capacity for Things Liquid.*

*English Liquid Measures*, were originally raised from Troy-Weight; it being enacted by several Statutes, That eight Pound Troy of Wheat, gather'd from the middle of the Ear, and well dried, should weigh a Gallon, of *Wine-Measure*; the Divisions and Multiples whereof were to form the other Measures: At the same time it was order'd, That there should be but one *Liquid Measure* in the Kingdom: yet Custom has prevailed, and there having been introduced a new Weight, viz. the *Avoirdupois*, we have now a second Standard Gallon adjusted thereto, and therefore exceeding the former, in the proportion of the *Avoirdupois Weight* to *Troy Weight*. From this latter Standard are raised two several Measures, the one for Ale, the other for Beer. The sealed Gallon at *Guildhall*, which is the Standard for Wines, Spirits, Oils, &c. is supposed to contain 231 Cubic Inches; on which Supposition, the other Measures raised therefrom, will contain as in the following Tables; yet, by actual Experiment made in 1688, before the Lord Mayor and the Commissioners of Excise, it was only found to contain 224 Cubic Inches: It was however agreed to continue the common supposed Contents of 231 Cubic Inches; so that all Computations stand on their old footing. Hence, as 12 is to 231, so is 14 $\frac{2}{3}$  to 284; the Cubic Inches in the Ale Gallon: but in effect the Ale Quart contains 703 Cubic Inches; on which Principle, the Ale and Beer Gallon will be 282 Cubic Inches. The several Divisions and Multiples of these Measures, and their Proportions, are exhibited in the Tables underneath.

*French Measures*. At *Paris*, and in a great part of the Kingdom, the Measures, to begin with the smallest, are, the Poffon, which contains six Cubic Inches; two Poffons make the Demi-septier; two Demi-septiers, the Septier or Chopine; two Chopines, a Pint; two Pints, the Quart or Pot; four Quarts, the Gallon, or Septier of Estimation; and thirty-six Septiers, the Muid, which is sub-divided into two Demi-Muids, four Quarter-Muids, and eight Half-Quarter-Muids. See *MUID*, *SEPTIER*, *QUART*, *CHOPINE*, &c. From the Quart are likewise raised the Measures used in other Parts, as the Queue used in *Orleans*, *Blois*, &c. containing a *Paris Muid* and a half, or 420 Pints; the Tun used at *Bayonne* and *Bordeaux*, consisting of four Bariques, and equal to three *Paris Muids*; at *Orleans*, to two: so that the first Tun contains 864 Pints, and the second 576. See *TUN*. The Demi-Queue, used in *Champagne*, 96 Quarts; the Pipe, used in *Amjou* and *Paris*, containing two Barriques, equal to two Demi-Queues of *Orleans*, &c. or a Muid and a half of *Paris*, or 452 Pints. See *PIPE*. The Millerolle used in *Provence*, containing 66 *Paris Pints*; and the Poincon used at *Nantes*, in *Touraine* and the *Blaisois*, equal to half the *Orleans Tun*. The Poincon used at *Paris*, is the same with the Demi-Queue. See *QUEUE*.

*Dutch Liquid Measures*. At *Amsterdam*, their Measures, to begin with the Diminutions, are, Mingles, Mingeables, or Bottles, equal to *French Quarts*, and containing two Pounds, four Ounces, Marc, of an ordinary Liquor. The Mingle is divided into two Pints, four half Pints, eight Muffles, sixteen half Muffles, &c. Seven hundred and seventy Mingles make their Tun. The Viertel, or Verge, consists of five Mingles, and one Sixth of a Mingle. The Wine Viertel is just six Mingles. The Stekan, or Stekamen, contains sixteen Mingles. The Anker contains two Stekans; and four Ankers, the Aem. For Oils they use the Tun, which contains six Aems, or Ams; equal to 1600 *Paris Pints*. See *TUN*.

*Spanish Liquid Measures*, are the Botte, containing between thirty-six and thirty-seven *Dutch Stekans*, holding about a thousand Weight. The Botte consists of thirty Robes, each weighing twenty-eight Pounds. Each Robe is again divided into eight Sommes, and the Somme into

four Quarts. The Pipe consists of eighteen Robes.

*Portuguese Liquid Measures*, are Bottes, Almudes, Cavadas, Quatas; and for Oil, alquiers or Cantars. The *Portuguese Botte*, is somewhat smaller than the *Spanish*; the latter being equal to thirty-six or thirty-seven Stekans, and the former only to twenty-five or twenty-six. The Quatas is one Fourth of the Cavadas. The Cavadas, or Cavado, is the same with the *Dutch Mingle*. Six Cavadas make an Alquier, and two Alquiers one Almude, or Almoud; twenty-six Almudes, a Butte.

*Italian Liquid Measures*. At *Rome* are the Boccale, or Bottle, containing a little more than a *Paris Pint*. Seven Boccals and a half make the Rubbia, and thirteen Rubbia and a half, the Brante; so that the Brante contains ninety-six Boccals.—At *Florence*, the Storo or Stazio, containing three Barilla, and the Baril twenty Fiasco's or Flasks, nearly equal to *Paris Pints*.—At *Vicenza*, they use the Baffice, sixteen whereof make a Brenze; the Brenze contains ninety-six Boccals, or thirteen Rubbias and a half.—At *Venice*, the Amphora, containing two Bottes; the Botte, four Bigotti; the Bigot, or Bigout, four Quarts; the Quart, four Tuschaufferas. The *Venetian Botte* is again divided into Muffaches, seventy-six whereof make the Amphora.—At *Ferrara*, the Mastilly, containing eight Scchys.—In *Syrina*, Scchys; six whereof make the Urna.—In *Calabria*, and the *Pasalle*, Pignatoli's, equal to *French Pints*; thirty-two Pignatoli's make the Storo, or Stazio; and ten Storo's, the Salma.

*German Liquid Measures*. The Feuder is used almost throughout all *Germany*, but with some difference in its Length, as well as its Sub-divisions. The Feuder is supposed the Load of a Waggon with two Horses. Two Feeders and a half make the Reoder; six Ams, the Feoder; twenty Fertels, the Ame; and four Massens, or Masses, the Fertel; so that the Roder contains 1200 Masses, the Feoder 480, the Ame 80, and the Fertel 41.—At *Nuremberg*, the Division of the Feoder, is into twelve Heemers, and the Heemer into sixty-four Masses.—At *Vicenza*, they divide the Feoder into thirty-two Heemers, the Heemer into thirty-two Achtelings, and the Achteling into four Seilins. The Ame, there, is eighty Masses; the Fertel, call'd also Scherwe, four Masses; and the Driolnick twenty-four Heemers.—At *Ambourg*, the Feoder is divided into eight Jex; the Jex into two Muids, or twelve Befons; the Befon into eight Masses, which makes 768 Masses in the Feoder, as in that of *Nuremberg*.—At *Heidelberg*, the Feoder is divided into ten Ams; the Ame into twelve Vertels; and the Vertel into four Masses.—In *Wirtemberg*, the Feoder is divided into six Ams; the Ame into sixteen Yunes; the Yune into ten Masses.

*Liquid Measures on the Coast of Barbary*. At *Tripoli*, &c. they use the Rotolo, or Rotoli; thirty-two whereof make the Matuli.—At *Tunis*, forty-two of the Rotoli of *Tripoli*, make a Matna, or Matsro; and the other Places on the same Coast use nearly the same Measures.—It may be here observed, that most, if not all the *Eastern Nations*, with whom the *Europeans* traffic, have not any such thing as *Measures of Capacity*, whether for Things Liquid or dry; but that they sell every thing, even Liquors, by the Weight. We may, however, rank among the Number of *Liquid Measures*, the Cocoa and Canan of *Siam*. The first are the Cocoa-shells cleared of their Kernel. And since these are not all of the same Capacity, they measure them with *Carris*, or little Shells found in the *Maldives*; which also serve for Money in some States of the *Indies*. Some Cocoa's hold a thousand *Carris*, and some only five hundred. Above the Cocoa's is the Canan, a little Measure used in the same Country, and called by the *Portuguese*, *Choup*; holding about a *Paris Quart*.

Cubic Measures of Capacity for Things Dry.

English Dry or Common Measures, are raised from the Winebejer Gallon; which contains 272½ Solid Inches, to hold of pure Running or Rain-Water, nine Pound, thirteen Ounces. This seems to stand on the foot of the Old Wine Gallon, of 224 Cubic Inches; 12 being to 145½, as 224 to 272½. Yet by an Act of Parliament, made 1697, it is decreed, That a round Bushel, eighteen Inches and a half wide, and eight deep, is a legal Winebejer Bushel. But such a Vessel will only hold 250.42 Cubic Inches; consequently the Gallon will only contain 268½ Cubic Inches. The Divisions and Multiples are as in the Table following.

French Dry Measures, are the Litron, Bushel, Minot, Mine, Sepier, Muid, and Tun. The Litron is divided into two Demi-litrons, and four Quarter-litrons, and contains 36 Cubic Inches of Paris. By Ordinance, the Litron is to be three Inches and a half high; and three Inches, ten Lines broad. The Litron for Salt is larger, and is divided into two Halves, four Quarters, eight Demi-quarters, and sixteen Metretres.—The Bushel is different in different Jurisdictions. At Paris, it is divided into Demi-bushels; each Demi-bushel into two Quarts; the Quart into two Half-quarts; and the Half-quart into two Litrons: so that the Bushel contains sixteen Litrons. By Ordinance, the Paris Bushel is to be eight Inches, two Lines and a half high; and ten Inches broad, or in Diameter, within-side. The Minot consists of three Bushels; the Mine of two Minots, or six Bushels; the Septier of two Mines, or twelve Bushels; and the Muid of twelve Septiers, or a hundred forty-four Bushels. The Bushel for Oats is estimated double that of any other Grain; so that there go twenty-four Bushels to make the Septier, and two hundred eighty-eight to make the Muid. It is divided into four Picotins; the Picotin containing two Quarts, or four Litrons. The Bushel for Salt is divided into two Half-Bushels, four Quarters, eight Half-Quarters, and sixteen Litrons; four Bushels make a Minot, sixteen a Septier, and a hundred ninety-two a Muid. The Bushel for Wood is divided into Halves, Quarters, and Half-Quarters. Eight Bushels make the Minot, sixteen a Mine; twenty Mines, or three hundred and twenty Bushels, the Muid. For Plaster, twelve Bushels make a Sac, and thirty-six Sacs a Muid. For Lime, three Bushels make a Minot, and forty-eight Minots a Muid. See BUSHEL.—The Minot is, by Ordinance, to be eleven Inches, nine Lines high; and fourteen Inches eight Lines in diameter. The Minot is composed of three Bushels, or fifteen Litrons; four Minots make a Septier, and forty eight a Muid.—The Mine is no real Vessel, but an Estimation of several others. At Paris, the Mine contains six Bushels, and twenty-four make the Muid. At Rouen, the Mine is four Bushels; and at Dieppe, eighteen Mines make a Paris Muid. See MUID.—The Septier differs in different Places: At Paris, it contains two Mines, or eight Bushels; and twelve Septiers the Muid. At Rouen, the Septier contains two Mines, or twelve Bushels. Twelve Septiers make a Muid at Rouen, as well as Paris; but twelve of the latter are equal to fourteen of the former. At Toulon, the Septier contains a Mine and half; three of which Mines make the Septier of Paris. See SEPTIER.—The Muid, or Muy, of Paris, consists of

twelve Septiers; and is divided into Mines, Minots, Bushels, &c. That for Oats is double that for other Grain; i. e. contains twice the Number of Bushels. At Orleans, the Muid is divided into Mines; but those Mines only contain two Paris Septiers and a half. See MUID. In some Places they use the Tun in lieu of the Muid; particularly at Nantes, where it contains ten Septiers of sixteen Bushels each, and weighs about three thousand three hundred Pounds. Three of these Tuns make twenty-eight Paris Septiers. At Rochel, &c. the Tun contains forty-two Bushels, and weighs two per Cent. less than that of Nantes. At Breff, it contains twenty Bushels, is equal to ten Paris Septiers, and weighs about two thousand two hundred and forty Pounds. See TUN.

Dutch, Swedish, Polish, Prussian, and Muscovite Dry Measures. In these Places they estimate their Dry Things on the foot of the Last, Less, or Lech, as called, according to the various Pronunciations of the People who use it.—In Holland, the Last is equal to nineteen Paris Septiers, or thirty-eight Bourdeaux Bushels, and weighs about 4560 Pounds; the Last they divide into twenty-seven Mudes, and the Mude into four Schepels.—In Poland, the Last is forty Bourdeaux Bushels, and weighs about 4800 Paris Pounds.—In Prussia, the Last is 135 Paris Septiers.—In Sweden and Majorca, they measure by the Great and Little Last; the first containing twelve Barils, and the second half as many. See LAST.—In Muscovy, they likewise use the Cheffard, which is different in various Places: That of Archangel is equal to three Russian Bushels.

Italian Dry Measures. At Venice, Leghorn, and Lucca, they estimate their dry Things on the foot of the Staro or Staro; the Staro of Leghorn weighs 54 Pounds; 112 Staro's, and seven Eighths, are equal to the Amsterdam Last.—At Lucca, 119 Staro's make the Last of Amsterdam.—The Venetian Staro weighs 128 Paris Pounds; the Staro is divided into four Quarters. 35 Staro's and ½, or 140 Quarters ½, make the Last of Amsterdam.—At Naples, and other Parts, they use the Tomolo, or Tomalo, equal to one Third of the Paris Septier. 36 Tomols and a half, make the Carro; and a Carro and a half, or 54 Tomols, make the Last of Amsterdam.—At Palermo, 16 Tomoli make the Salma; and four Mondili, the Tomolo. Ten Salma's ½, or 171 Tomoli ½, make the Last of Amsterdam.

Flemish Dry Measures. At Antwerp, &c. they measure by the Vertel; thirty-two and a half whereof, make nineteen Paris Septiers.—At Hamburg, the Schepel ½, ninety whereof make nineteen Paris Septiers.

Spanish and Portuguese Dry Measures. At Cadix, Bilbao, and St. Sebastian, they use the Fanega; twenty-three whereof make the Nantes, or Rachel Tun; or nine Paris Septiers and a half: tho' the Billos Fanega is somewhat larger; inasmuch that twenty one Fanegas make a Nantes Tun.—At Seville, &c. they use the Anagros, containing a little more than the Paris Mine; thirty-six Anagros make nineteen Paris Septiers.—At Bayonne, &c. the Conqua; thirty whereof are equal to nine Paris Septiers and a half.—At Lisbon, the Alquier, a very small Measure; 240 whereof make 19 Paris Septiers; 60 the Lisbon Muid.

English Dry or Corn Measures.

Note. The usual MEASURE of Wood for Firing, is the Cord; four Foot high, as many broad, and eight long; divided into two half Cords, call'd Ways, and by the French, Membrer, from the Pieces, stuck upright, to bound them; or Voyes, as being supported half a Waggon Load. See CORD.

The MEASURE for Hefes, is the Hand or Handful; which, by the Statute, contains four Inches. See HAND, &c.

MEASURE is also used to signify the Cadence, and Time observed in Poetry, Dancing, and Music, to render them regular, and agreeable. The different Measures in Poetry, are the different Manners of ordering and combining the Quantities, or the long and short Syllables. Thus Hexameter, Pentameter, Iambic, Sapphic Verses, &c. consist of different Measures. See QUANTITY, VERSE, &c.

In English Verses, the Measures are extremely various and arbitrary, every Poet being at liberty to introduce any new Form he pleases. The most used are, the Heroic, generally consisting of five long, and five short Syllables; Verses of four Feet; and of three Feet, and a Cefure or single Syllable. The Antients, by variety combining and transposing their Quantities, made a vast Variety of different Measures. Of Words, or rather Feet of two Syllables, they form'd a Spondee, consisting of two long Syllables; a Pyrrhic, of two short Syllables; a Triebce, of a long and a short Syllable; an Iambic, of a long and a short Syllable. Of their Feet of three Syllables, they form'd a Mafic, consisting of three long Syllables; a Tribrach, of three short Syllables; a Dactyl, of one long, and two short Syllables; an Anapest, of two short and two long Syllables. The Greek Poets contriv'd 124 different Combinations or Measures, under as many different Names, from Feet of two Syllables to those of six. See SPONDEE, DACTYL, RHIME, FOOT, &c.

MEASURE, in Music, is the Interval, or Space of Time, which the Person, who regulates the Music, takes between the raising and letting fall of his Hand, in order to conduct the Movement sometimes quicker, and sometimes slower, according to the Kind of Music, or the Subject that is sung or play'd. See TIME. The ordinary or common Measure, is one Second, or sixtieth part of a Minute, which is nearly the Space between the Beats of the Pulse or Heart; the Syftole, or Contraction of the Heart, answering to the Elevation of the Hand, and its Diastole, or Dilatation, to the letting it fall. The Measure usually takes up the Space that a Pendulum, of two Foot and a half long, employs in making a Swing or Vibration. See VIBRATION.

The Measure is regulated according to the different Quality or Value of the Notes in the Piece; by which the Time that each Note is to take up, is express'd. The Semi-Breve, for instance, holds one Rise, and one Fall; and this is call'd the whole Measure: the Minim, one Rise, or one Fall; and the Crochet, half a Rise, or half a Fall, there being four Crochets in a full Measure. See NOTE.

Binary, or Double MEASURE, is that wherein the Rise and Fall of the Hand are equal.

Ternary, or Triple MEASURE, is that wherein the Fall is double to the Rise; or where two Minims are play'd during a Fall, and but one in a Rise: To this purpose,

the Number 3 is placed at the beginning of the Lines, when the Measure is intended to be triple; and a C, when the Measure is to be common or double.

This rising and falling of the Hands, was call'd by the Greeks *apne* and *blow*. St. Augustin calls it *Plaufus*, and the Spaniards, *Compafs*. See BEATING OF TIME.

MEASURING. To define Measuring Geometrically, it is the affuming any certain Quantity, and expressing the Proportion of other similar Quantities to the same: To define it popularly, Measuring is the using a certain known Measure, and determining, thereby, the precise Extent, Quantity or Capacity of any thing. See MEASURE.

MEASURING, in the general, makes the practical Part of Geometry; see GEOMETRY: From the various Subjects whereon it is employ'd, it acquires various Names, and constitutes various Arts. Thus

MEASURING of Lines, or Quantities of one Dimension, we call Longimetry; see LONGIMETRY: And when those Lines are not extended parallel to the Horizon, Altimetry: see ALTIMETRY. When the different Altitudes of the two Extremes of the Line are alone regarded, Levelling; see LEVELLING.

MEASURING of Superficies, or Quantities of two Dimensions, is variously denominated, according to its Subjects; when conversant about Lands, 'tis call'd *Geodesia*, or *Surveying*: in other Cases, simply *Measuring*. The Instruments used are the Ten-Foot Rod, Chain, Compafs, Circumferentor, &c. See SUPERFICIES; see also SURVEYING, &c.

MEASURING of Solids, or Quantities of three Dimensions, we call Stereometry; see STEREOMETRY: where 'tis conversant about the Capacities of Vessels, or the Liquors they contain particularly, Gauging. See GAUGING. The Instruments are the Gauging-Rod, Sliding-Rule, &c. See SOLID; see also GAUGING-ROD, SLIDING-RULE, &c.

From the Definition of Measuring, where the Measure is express'd to be similar or homogeneous, i. e. of the same kind with the Thing measured; 'tis evident that in the first Case, or in Quantities of one Dimension, the Measure must be a Line; in the second, a Superficies; and in the third, a Solid. For a Line, e. g. cannot measure a Surface; to measure, being no more than to apply the known Quantity to the unknown, till the two become equal. Now a Surface has Breadth, and a Line has none; but if one Line hath no Breadth, two or a hundred have none: A Line, therefore, can never be applied to often to a Surface, as to be equal to it, i. e. to measure it. And from the like Reasoning it is evident, a Superficies, which has no Depth, cannot be equal to, i. e. cannot measure a Solid, which has. While a Line continues such, it may be measured by any part of itself; but when the Line begins to flow, and to generate a new Dimension, the Measure must keep pace, and flow too; i. e. as the one commences Superficies, the other must do too: Thus we come to have *Square Measures*, and *Cubic Measures*. See SQUARE and CUBE. Hence we see why the Measure of a Circle is an Arch, or part of the Circle; for a right Line can only touch a Circle in one Point, but the Periphery of a Circle consists of infinite Points: The right Line therefore to measure the Circle, must be applied infinite Times, which is impossible. Again, the right Line only touches the Circle,

Circle in a Mathematical Point; which has no Parts or Dimensions, consequently no Magnitude: but a Thing that has no Magnitude or Dimensions, bears no proportion to another that has; and cannot therefore measure it. Hence we see the Reason of the Division of Circles into 360 Parts or Arches, called Degrees. See DEGREE.

MEASURING of Triangles, or from three given Sides or Angles, to determine all the rest, is call'd Trigonometry. See TRIGONOMETRY.

MEASURING of the Air; its Pressure, Spring, &c. is call'd Aerometry or Pneumatics: See AEROMETRY, &c.

MEATUS Cysticus, a Biliary Duct, about the Bigness of a Goose Quill, which at about two Inches distance from the Gall-Bladder, is join'd to the Meatus Hepaticus; and these together form the Ductus Communis. See BILE.

MEATUS Urinaris, or Urinary Passage, in Women, is very short, lined internally with a very thin Membrane; next to which is a Coat of a white Substence. Thro this Coat, from some Laenne in it, pass several Ducts, which convey a limpid glutinous Matter, serving to anoint the Extremity of the Urebra. See URINARY.

MEATUS Auditorius, the Entrance of the Ear; a cartilaginous Substence, irregularly divided with fleshy membranous Interspitions in several Parts of it, not unlike the Bronchia in the Lungs, only its fleshy Fibres are here thicker. The inner Part, or that next the Braia, is bony. It is lined throughout with a thin Membrane, derived from the Skin, which is continued on the Membrana Tympani, where it becomes thicker. See EAR.

From the beginning of the Meatus, almost half-way, arise a great number of small Hairs, at whose Roots issue the Ear-Wax, which is intangled in those Hairs, the better to break the Impetus of the external Air, and prevent its too suddenly rushing in on the Membrana Tympani. See CERUMEN.

MECHANICS, from μηχανη, Engine, is a mix'd Mathematical Science, which considers Motion, its Nature and Laws, with the Effects thereof, in Machines, &c. See MOTION.

That part of Mechanics which considers the Motion of Bodies arising from Gravity, is by some call'd Statics. See GRAVITY, STATICS, RESISTENCE, &c. In distinction from that part which considers the Mechanic Powers, and their Application, properly call'd Mechanic. See MECHANIC POWERS, MACHINE, ENGINE, FRICTION, EQUILIBRIUM, &c.

MECHANIC Powers, are the five simple Machines; to which all others, how complex soever, are reducible, and of the Asssemblage whereof they are all compounded. See POWER and MACHINE.

These Mechanic Powers (as they are call'd) are six, viz. the Balance, Lever, Wheel, Pulley, Wedge, and Screw; which see under their proper Heads: BALANCE, LEVER, &c.

They may, however, be all reduced to one, viz. the Lever. The Principle whereon they depend, is the same in all, and may be conceived from what follows.

The Momentum, Impetus, or Quantity of Motion of any Body, is the Fallum of its Velocity, (or the Space it moves in a given Time, see MOTION) multiplied into its Mass. Hence it follows, that two unequal Bodies will have equal Moments, if the Lines they describe be in a reciprocal Ratio of their Masses. Thus, if two Bodies, fasten'd to the Extremities of a Balance or Lever, be in a reciprocal Ratio of their Distances from the fixed Point; when they move, the Lines they describe will be in a reciprocal Ratio of their Masses. P. 5. If the Body A (Tab. MECHANICS, fig. 6.) be triple the Body B, and each of them be fix'd to the Extremities of a Lever AB, whose Fulcrum, or fix'd Point, is C, as that the Distance of BC be triple the Distance CA; the Lever cannot be inclined on either side: but that the Space BE, pass'd over by the left Body, will be triple the Space AD, pass'd over by the great one. So that their Motions or Moments will be equal, and the two Bodies in Equilibrium. See MOTION. Hence that noble Challenge of Archimedes, datis Viribus, datum Pondus movere; for as the Distance CE may be increased infinitely, the Power or Moment of A may be increased infinitely. So that the whole of Mechanics is reduced to the following Problem.

Any body, as A, with its Velocity C, and also any other Body, as B, being given; to find the Velocity necessary to make the Moment, or Quantity of Motion in B, equal to the Moment of A, the given Body. Since, now the Moment of any Body is equal to the Rectangle under the Velocity, and the Quantity of Matter; as B : A :: C : to a fourth Term, which will be e, the Celerity proper to B, to make its Moment equal to that of A. Wherefore in any Machine or Engine, if the Velocity of the Power be made to the Velocity of the Weight; reciprocally as the Weight is to the Power; then shall the Power always sustain, or if the Power be a little increas'd, move the Weight.

Let, for instance, AB be a Lever, whose Fulcrum is at c, and let it be moved into the Position acb. Here the Velocity of any Point in the Lever, is as the Distance from the Centre. For let the Point A describe the Arch Aa, and the Point B the Arch Bb; then these Arches will be the Spaces described by the two Motions; but since the Motions are both made in the same time, the Spaces will be as the Velocities. But it is plain, the Arches Aa and Bb will be to one another, as their Radii AC and AB, because the Sectors A Ca, and Bcb, are similar; wherefore the Velocities of the Points A and B, are as their Distances from the Centre C. Now if any Powers are applied to the Ends of the Lever A and B, in order to raise its Arms up and down; their Force will be expounded by the Perpendiculars Sa, and bN; which being as the right Sines of the former Arches, bB and aA, will be to one another also as the Radii AC, and cB; wherefore the Velocities of the Powers, are also as their Distances from the Centre. And since the Moment of any Body is as its Weight, or gravitating Force, and its Velocity conjunctly; if different Powers or Weights are applied to the Lever, their Moments will always be as the Weights and their Distances from the Centre conjunctly. Wherefore if to the same Lever, there be two Powers or Weights apply'd reciprocally, proportional to their Distances from the Centre, their Moments will be equal; and if they act contrarily, as in the Case of a Stilliard, the Lever will remain in an horizontal Position, or the Balance will be in Equilibrium. And thus it is easy to conceive how the Weight of one Pound may be made to equal-balance a thousand, &c. Hence also it is plain, that the Force of the Power is not at all increas'd by Engines; only the Velocity of the Weight is either lifting or drawing, is so diminish'd by the Application of the Instrument, as that the Moment of the Weight is not greater than the Force of the Power. Thus, for instance; if any Force can elevate a Pound Weight with a given Velocity, it is impossible by any Engine to effect, that the same Power shall raise two Pound Weight, with the same Velocity: But by an Engine it may be made to raise two Pound Weight, with half the Velocity; or 10000 times the Weight with  $\frac{1}{10000}$  of the former Velocity. See PERPETUAL MOTION.

MECHANICAL Curves, a Term used by Des Cartes for those Curves, which cannot be defined by any Equation; in opposition to Algebraic, which they call Geometric Curves. These Curves, Sir J. Newton, M. Leibnitz, &c. call transcendent Curves; and dissent from Cartes, in excluding them out of Geometry. Leibnitz has even found a new kind of transcendent Equations, whereby these Curves are defined: They are of an indefinite nature; that is, don't continue constantly the same in all Points of the Curves; in opposition to Algebraic Equations, which do. See CURVE.

MECHANICAL Affections, are such Properties in Matter, as result from their Figure, Bulk, and Motion: MECHANICAL Causes are those founded on such Affections; and MECHANICAL Solutions are Accounts of Things on the same Principles.

MECHANICAL Philosophy, is the same with the Corpuscular Philosophy; viz. that which explains the Effects of Nature, and the Operations of Corporal Things, on the Principles of Mechanics; the Figure, Arrangement, Disposition, Motion, Greatness or Smallness of the Parts which compose natural Bodies. See CORPUSCULAR.

The Term MECHANICAL is also applied to a kind of Reasoning, which of late has got a great deal of ground both in Physic and Medicine; so call'd, as being conformable to what is used in the Contrivance, and accounting for the Properties and Operations of Machines. This seems to have been the Result of rightly studying the Powers of a human Mind, and the Ways by which it is only fitted to get acquaintance with material Beings: For considering an Animal Body as a Composition out of the same Matter, from which all other material Beings are formed, and to have all those Properties, which concern a Physician's Regard only, by virtue of its peculiar Make and Constitution; it naturally leads a Person, who trusts to proper Evidences, to consider the several Parts, according to their Figures, Contexture, and Use; either as Wheels, Pulleys, Wedges, Levers, Screws, Chords, Canals, Cisterns, Strainers, and the like; and throughout the whole of such Enquiries, to keep the Mind close in view of the Figures, Magnitudes, and mechanical Powers of every Part or Movement; just in the same manner, as is used, to enquire into the Motions and Properties of any other Machine. For which purpose it is frequently found helpful to decypher, or picture out in Diagrams, whatsoever is under consideration, as it is customary in common Geometrical Demonstrations; and the Knowledge obtained by this Procedure, is call'd Mechanical Knowledge.

The Term **MECHANICAL** is also used in Mathematics, to signify a Construction or Proof of some Problem, not done in an accurate Geometrical Manner, but chiefly and unsuitably, or by the assistance of Instruments, as are most Problems relating to the Duplication of the Cube, and the Quadrature of the Circle.

**MECHOACAN**, **MACADOSHIN**, or **WHITE JALAP** called also *White Rhubarb*, and *American Scammony*; a medicinal Root, taking its Name from a Province of New Spain, from whence it is brought. *Mechocan* was known and used as a Purgative before Jalap, tho' the latter is now in more general Use, as being found more efficacious. Yet *Mechocan* is the sweeter and more gentle of the two, and on that account preferable. The Seat of its Action is chiefly in the extreme Parts, for which reason it is accounted good in arthritic Pains. It has the advantage of needing no Preparation or Corrective; and purging in its own proper Subtilance, such as it grows. *M. Bonidac* found by analysing it, that it contains twelve times as much Salt as *Resin*; but neither the saline nor resinous Extra<sup>ct</sup> purge so freely as the Subtilance, even tho' taken in larger Doses; nor do they yet purge so gently. In the Choice of *Mechocan*, prefer those Pieces which are the brownest within; and whose Subtilance is the closest, and most compact.

**MECONIUM**, in Pharmacy, is the Juice of the Poppy, drawn by Expression, and dried; differing from Opium, in that this last oozes out, after an Incision made in the Heads of the Poppies. The Word comes from the Greek *mecon*, Poppy. See **OPIMUM**.

**MECONIUM** is also a black thick Excrement, gather'd in the Intestines of a Child during the time of Gestation. In Colour and Consistence, it resembles Pulp of *Cassia*. It is also found to resemble *Meconium*, or Juice of Poppy, whence it takes its Name.

**MEDAL**, a small Figure, or Piece of Metal, in form of a Coin, designed to preserve to Posterity the Portrait of some great Man, or the Memory of some illustrious Action.

For the Manner of striking MEDALS, see **COINING**.

Some Authors imagine, that the ancient **MEDALS** were used for Money. *M. Patin* has a Chapter express'd to prove, that they had all a fix'd regular Price in Payments; not excepting even *Meditations*. *F. Joubert* is of the same Opinion. Others, on the contrary, maintain, that we have no real Money of the Antients; and that the *Medals* we now have, never had any Course as Coins. Between these two Extremes, there is a Medium, which appears by much more reasonable than either of them. See **MONEY**.

**MEDALS** are divided into Ancient and Modern; The Ancient are such as were struck between the third and the seventh Centuries: The Modern are those struck within these 500 Years. Among the Ancient, some are Greek, others Roman. The Greek are the most ancient. That People struck *Medals* in all the three Metals with such exquisite Art, as the Romans could never come up to. The Greek *Medals* have a Design, Accuracy, Force, and a Delicacy that expresses even the Muscles and Veins, and it must be own'd, goes infinitely beyond any thing of the Romans. There are also Hebrew *Medals*; *Punic*, *Gothic*, and *Arabic Medals*; which make new Classes in the ancient and modern ones. The Consular *Medals* are certainly the most ancient *Medals* of the Romans: And yet those of Copper and Silver don't go beyond the 484th Year of Rome; nor those of Gold beyond the Year 346. If any are produced of an older Date, they are spurious.

Consular **MEDALS** are so call'd, to distinguish them from the Imperial; not that they were struck by order of the Consuls, but because in those Times the Republic was governed by Consuls. Of these, *Father Joubert* reckons about fifty or sixty of Gold; two hundred and fifty of Copper; and near a thousand of Silver. *Galzarus* has described them in a Chronological Order, according to the *Famili Consulares*. *Uffinus* has disposed them Genealogically, according to the Order of the Roman Families. *M. Patin* has collected an entire Series of them, in the same Order with *Uffinus*; and only computes 1037 Consulars, which relate to 178 Roman Families. *M. Vaillant*, and *M. Morel*, each promised a new Edition of the *Consular Medals*; *M. Vaillant* kept his word, and his Book was printed e'er he died, in 3 Vol. *Folio*.

Among the Imperial **MEDALS**, we distinguish between the Upper and the Lower Empire: The Upper Empire commenced under *Julius Cesar*, and ended about the Year of Jesus Christ 260: The Lower Empire comprehends near 1200 Years, viz. till the taking of *Constantinople*. 'Tis the Custom, however, to account all the Imperial *Medals*, till the Time of the *Paleologi*, among the Antique; and yet we have no Imperial *Medals*, of any considerable Beauty, later than the Time of *Heraclius*, who died in 641.

After the Time of *Pleocis* and *Heraclius*, Italy became a Prey to the Barbarians; so that the Monuments we have remaining of those two Emperors, finish the Set or Series of Imperial *Medals*. To these are added the *Medals* of the Lower Empire, and the Greek Emperors; whereof a Series may be made as low as our time, taking in the Modern ones. *M. Patin* has made an ample Collection of the Imperial *Medals* till the Time of *Heraclius*. The Gothic *Medals* make part of the Imperial ones. They are so call'd, as having been struck in the Times of the Goths, and in the Declension of the Empire; and favouring of the Ignorance and Barbarity of the Age.

As to the Modern, they are such as have been struck in Europe, since the Usurpation of the Goths has been extinct; and Sculpture and Engraving have begun to flourish. The first was that of the famous Reformer *John Hus* in 1415; if any pretend to be more ancient, they are spurious. In France, there were none struck with the Prince's Effigy before the Reign of *Charles VII*. The Study of modern *Medals* is so much more useful, as they afford more light than the ancient, and mark the Times and Circumstances of Events precisely; whereas the Inscriptions of the ancient *Medals* are very short and simple, and generally without any Date. Add to this, that the ancient *Medals* are extremely liable to be counterfeited, by reason of the excessive Price they bear. But in the modern, there is not near that Danger of being imposed upon.

For the rest, *Medals* have been struck in three Kinds of Metals, which make three several Sets or Series in the Cabinets of the Curious. That of Gold is the least numerous, as not consisting of above 1000, or 1200 of the Imperial; that of Silver may contain about 3000 Imperial; and that of Copper, of the three several Sizes, viz. the great, the middle, and the small Copper, consists of 6 or 7000, all Imperial. See **SERIES**.

There are no true Hebrew *Medals*; those which we see of the Heads of *Moses*, and *Jesus Christ*, are spurious and modern. We have a few Shekkels of Copper and Silver, with Hebrew or Samaritan Legends; but none of Gold; tho' there is mention made of one in the King of Denmark's Cabinet. *F. Senelet* has a Dissertation on the Hebrew *Medals*, commonly call'd Samaritan *Medals*; where he distinguishes accurately between the Genuine and Spurious; and shews, that they are true Hebrew Coins struck by the Jews, but on the Model of the Antients; and that they were current before the *Babylonish* Captivity. See **SAMARITAN**.

The Parts of a *Metal*, are the two Sides; one whereof is call'd the Head, the other the Reverse. On each Side is the Area or Field, which makes the middle of the *Metal*; the Rim or Border; and the Exergue, which is beneath the Ground, whereon the Figures represented are placed. On the two Sides are distinguish'd the Type, and the Inscription or Legend. The Types are the Figures represented; the Legend is the Writing, especially that around the *Metal*; tho' in the Greek *Medals*, the Inscription is frequently in the Area. What we find in the Exergue, is frequently no more than some Initial Letters, whose Meaning we are unacquainted withal; tho', sometimes too, they contain Epochs, or Words that may be accounted an Inscription. See **EXERGUE** and **LEGEND**.

'Tis not either the Metal, or the Size, which makes a *Metal* valuable; but the Scarcity of the Head, or of the Reverse, or the Legend. Some *Medals* are common in Gold, which yet are very rare in Copper; and others very rare in Silver, which in Copper and Gold are very common. The Reverse is sometimes common, where the Head is singular; and some Heads are common, whose Reverse are very scarce. There are *Medals* very scarce in some Sets, and yet very common in others. For instance, there is no *Antonia* in the Sets of large Copper, and the middle Copper is forced to supply its place. The *Obvo* is very rare in all the Copper Sets, and yet common in the Silver ones. *Obvs*, of the large Copper, are held at an immense Price; and those of the middle Copper, at 40 or 50 Pistoles. And the *Gordanus* are rated full as high. Singular *Medals* are invaluable. Singular *Medals*, in the popular sense, are such as are not found in the Cabinets of the Curious, and are only met with by chance; but in the stricter sense are such, whereof there is not above one of a Kind extant. The *Obvo* in large Copper is a singular *Metal*. When a *Metal* exceeds the Value of ten or twelve Pistoles, they are worth what the Owner pleases. The *Pescennius Niger*, and *Pertinax*, are very rare in all Metals. The *Didus Julianus* is hardly found any where, but in large Copper. *Carverus*, a Dutchman, and some others, have made Mills express'd to strike *Medals* that never were, as those of *Caere*, *Virgil*, *Priamus*, &c. *M. Vaillant* has collected all the *Medals* struck by the Roman Colonies; *F. Harduin* those of the Greek and Latin Cities. *P. Noris* those

those of Syria. M. Morel has undertaken an Universal History of Medals, and promises Cuts of twenty-five thousand. He has ranged them under four Classes. The first contains the Medals of Kings, Cities, and People; which have neither the Name nor Image of the Roman Emperors. The second contains the *Confular Medals*; the third the *Imperial Medals*; and the fourth, the *Hebrew, Punic, Parthic, French, Spanish, Gothic, and Arabic*. He begins with the *Imperial*, and brings them down as low as *Heraclius*. He places the *Latin*, in order, before the *Greek*. *Ad. Occo*, a German Physician, and Count *Mozzabarba*, have endeavoured to range them in a Chronological Order, but that is impracticable. For in most of the *Imperial Medals*, there is no Mark either of the Consulate, or of the Year of the Reign; and since Gallo, there is none of them that bear the least Footsteps of Chronology. *Greek Medals* are such as have either the Heads of *Greek Emperors*, or *Greek Inscriptions*.

There are false or *spurious Medals*, which are those counterfeited, and put off for Antique, when they are not: *Minted Medals*, which are those that are not entire, or are defaced: *Rehntegrated Medals*, which are those wherein we find the Letters *Reji*, which shew that they have been restor'd by the Emperors: *Dipt Medals*, which are struck of pure Copper, and afterwards silver'd. This is a Contrivance that the Curious have frequent recourse to, in order to complicit their Silver Sets. *Center'd or Plain'd Medals*, which have only a thin Silver Leaf over the Copper, but which are struck so artfully, that the Cheat does not appear, without cutting them: These are the least suspected. *Grain'd or Indented Medals* are those, whose Edges are cut like Teeth, which is a sign of Goodness and Antiquity. They are common among the *Confulars*, but we have none later than *Augustus*. There are several of them, however, among those of the Kings of Syria. *Medals countermark'd*, are those that are cut either on the Side of the Head, or of the Reverse: These Countermarks serve to denote the Change of their Value; and this Kind is much enquir'd for by the Curious. There are also *Cast Medals*, which are not struck, but cast in a Mould; and Medals that have no Reverse.

*Sesliger* derives the Word from the *Arabic Methalis*, a Coin wherein is impress'd the Figure of a human Head. *Menage* and *Vassus* rather derive it from *Matalium*. *Du Cange* observes, that the ancient *Obsols* were call'd *Medallos*, quasi *Medietas Nummi*.

The most noted Medalists, or Authors on Medals, are, *Antonius Augustinus*, *Welfius*, *Lazius*, *Fab. Ursinus*, a learned Antiquary, *Jeanus Vian*, *Habertus*, *Goltzius*, *Oseletus Sepius*, *Occo*, *Trujian*, *Sirmond*, *Fabrant*, *Patin*, *Noris*, *Spanheim*, *Hardouin*, *Morel*, *Joubert*, *Mozzabarba*, *Sejbert*, &c.

**MEDALLION**, a Medal of an extraordinary Bigness. It was ordinarily a kind of Medal, which Princes us'd to present, as a Token of their Esteem; for which reason the *Romans* call'd them *Missilia*. The Medallions were never any current Coin, as the Medals were: They were struck purely to serve as publick Monuments, or to make Presents of. There cannot be any See made of them, even tho' the Metals and Sizes should be join'd promiscuously. The best Cabinets do not contain above four or five hundred; tho' M. Morel promises us Figures of above a thousand. Authors vary about the Time when they first began to be struck. Some Antiquaries will have it under the Empire of *Theodosius*: but this must be a Mistake; for there were some struck even in the Upper Empire: witness a *Novis*, a *Trojan*, and an *Alexander Severus*, still extant. Medallions of Gold are very rare, as also those of large Copper. Medallions are distinguish'd from Medals by the Volume; that is, by the Thickness and Compass; and the Largeness and Relief of the Head. Medallions, in many ancient *Latin* Titles, are call'd *Metalliciones*. The *Italians* call them *Medaglioni*.

**MEDIANA**, the Name of a Vein, or little Vessel, made by the Union of the Cephalic and Basilic, in the Bend of the Elbow. 'Tis not a particular Vein, or a third Vein of the Arm, as some Authors imagine; but merely a Branch of the Basilic; which running into the inner Part of the Elbow, unites with the Cephalic, and forms a common Vein, call'd *Mediana*; and by the *Arabs*, the *Black Vein*. *Columnae Medianae*, in *Ventriculo*, are the two Columns in the middle of a Porch, whose inner Column is larger than those of the rest.

**MEDIANA LINGVA**, a Line or Seam running down the middle of the Tongue, and dividing it into two equal Parts; tho' not so effectually, but that the Blood-Vessels of the one Side communicate with those of the other. See TONGUE.

**MEDIASTINE**, or **MEDIASTINA**, the Name of a Vein of the *Mediastinum*. See VEIN and MEDIASTINUM.

**MEDIASTINUM**, in Anatomy, a double Membrane, form'd by a Duplicate of the *Pleura*; serving to di-

vide the Thorax, longitudinally. It proceeds from the Sternum, and passing straight down thro' the middle of the Thorax to the Vertebræ, divides its Cavity into two. It contains, in its Doublings, the Heart, Vena Cava, the Oesophagus, and the Stomachic Nerves. The Membranes of the *Mediastinum* are finer and thinner than the *Pleura*, and have a little Fat. It receives Branches of Veins and Arteries from the Mamillary, and Diaphragmatic, particularly, one call'd *Mediastina*; its Nerves come from the Stomachic: it has also some Lymphatics, which open into the Thoracic Duct. The *Mediastinum* divides the Thorax into two Parts; to the end that one Lobe of the Lungs may officiate, if the other be hinder'd by a Wound on the other Side. Sometimes there is a Matter contain'd betwixt its Membranes, immediately under the Sternum, which may occasion the tearing of this Place. The *Mediastinum* serves to sustain the *Viscera*, and prevent their falling from one side to the other. See PLEURA, THORAX, &c.

**MEDIASTINUM Cerebri**, is the same as *Septum Transversum*. See SEPTUM TRANSVERSUM, &c.

**MEDIATE**, or **INTERMEDIATE**, a Term of Relation to two Extremes, applied to a third, which is in the middle; as, to a second Cause, which is acted upon by some superior or first Cause, to produce any Effect. Substance is a Genus with regard to Man, but between the two there are other mediate Genus's, as Body and Animal. *Mediate* is us'd in opposition to *immediate*. Thus when we say, that God and Man concur to the Production of Man; God is the mediate Cause, Man the immediate. 'Tis a popular Question in Theology, viz. Whether the Holy Ghost converts a Sinner mediately or immediately.

**MEDICINE**, an Art, ordinarily call'd *Physic*; defined, by *Borbove*, to consist in the Knowledge of those Things, by whose Application, Life is either preserv'd sound and healthy, or when disorder'd, again restor'd to its pristine Healthiness. See HEALTH and DISEASE.

*Galen* defines *Medicine*, the Art of preserving present Health, or of retrieving it when past: *Hippocrates*, the Addition of what is wanting, and the Retrenchment of what is redundant: And lastly, *Hierophilus*, the Knowledge of Things good, indifferent, and ill, with regard to Health.

Physic must have been nearly coeval with the World. The injuries and Vicissitudes of the Air, the Nature and Qualities of Foods, the Violence of external Bodies, and the Actions of Life, and lastly, the Fabric of the Human Compages; must have render'd Diseases almost as old as Mankind: And the Presence of a Disease, as it brings with it a painful Sensation, the Loss of the Use of a Limb, &c. we find, does, by a necessary mechanical Impulse, both in Brutes and Men, compel the Diseas'd to seek for Help, and to apply Remedies, either by mere Experiment, or by Instinct, and spontaneous Appetite. Hence arose the Art of *Medicine*; which, in this sense, has been always, every where, among Mankind. Ancient Historians and Fables tell us, that in a little time, from the Flood, it was so well cultivated by the *Affryans*, *Babylonians*, *Chaldeans*, and *Magi*, that they were able to remove present Diseases, and prevent future ones. Hence it pass'd into *Egypt*, *Lybia Cyrenonica*, and *Groenoe*; and thence into *Greece*, where it flourish'd, principally in the Islands of *Cnidus*, *Rhodus*, *Cos*, and in *Epidaurus*.

The first Foundations of the Art were laid by Chance, natural Instinct, and Events unforeseen: These were improv'd by the Memory of the Success of former Experiments; by writing down the Diseases, their Remedies, and their Event, on Columns, Paintings, and the Walls of their Temples; by exposing the Sick in the Markets and publick Ways, that those who pass'd by, might enquire into the Disease, and communicate a Remedy, if they knew any: and lastly, by Analogy, or Reasoning, from a Comparison of Things already observ'd, with Things present and to come. The Art at length receiv'd a much greater degree of Perfection, by the appointing of Physicians; some for the Care of particular Diseases, and others for Diseases in general; by an accurate Observation of the Disease, and its Symptoms; and by an exact Description of the Remedy, and its Use: immediately, upon which, it got among the Priests, and at length was confin'd to particular Families; descending, by way of Inheritance, from Father to Son: which, again, proved a great Bar to its Progress.

The *Exstipicia*, or inspecting the Entrails of Beasts, us'd by the Priests; and the Custom of Embalming dead Carcases, and even Butchery itself, promoted the Knowledge of the Human Fabric, and of the Causes both of Health, Diseases, and Death. Lastly, the dissecting of live Animals for Philosophical Purposes, distinct Narratives of the Cause, Rise, Increase, Crisis, Declension, End, and Effect of Diseases; and the Knowledge of *Medicine*, their Choice, Preparation, Application, Powers, and

and Events, seem'd to have almost brought the Art to its Perfection.

*Hippocrates*, who was Cotemporary with *Democritus*, and perfectly acquainted with every thing hitherto laid down, and besides, furnish'd with a great number of Observations of his own, collecting into one all that was valuable and useful; compiled a Body of *Greek Medicine*; and was the first who deserv'd the Title of a true Physician: for being a Master of the *quæsiæ*, *Experience*, as well as of Analogy and Reason, and withal well versed in a pure Philosophy; he, first, made *Physic* rational; and laid the Foundation of the dogmatical *Medicine*, which has ever since obtain'd. See DOGMATICAL, THEORETICAL, &c.

What *Hippocrates* had done, continu'd a long time sacred and unalter'd, and was the standing Practice of many Ages; at length *Aretæus* the *Cappadocian* digested it into a more orderly Body: whence, in various Places, at various Times, and by various Hands, particularly the *Alexandrian School*, it was further alter'd and improv'd; till at length it came to the hands of *Claud. Galen*; who collecting the scatter'd Parts, digesting those that were confus'd, and explaining every thing by the rigid Doctrines of the *Peripatetics*, did both a great deal of service, and a great deal of mischief, to the noble Art; he being the first who introduced the Doctrine of the Elements, the Cardinal Qualities, and their Degrees, the four Humours, &c. into *Medicine*: and on these he made the whole Art to depend. See TEMPERAMENT, HUMOUR, QUALITY, GREEK, &c.

After the sixth Century, the Arts were not only extinguish'd, but almost all Memory of them lost, till the ninth; from which, to the thirteenth, *Medicine* was vigorously cultivated by the *Arabs* in *Asia*, *Africa*, and *Spain*: who applying themselves particularly to the Study of the *Materia Medica*, and its Preparations, and to the Operations of Chirurgery, render'd both more just and more copious at the same time. And yet *Galen's* Errors became now more predominant than ever.

At length, however, they were purged out and exploded by two different Means; principally indeed by the Restoration of the pure Discipline of *Hippocrates* in *France*; and then also by the Experiments and Discoveries of Chymists and Anatomists: till at length the immortal *Harvey* overturning, by his Demonstrations, the whole Theory of the Antients, laid a new and certain Basis of the Science. Since his Time, *Medicine* is become free from the Tyranny of any Sect, and is improv'd by the sure Discoveries in Anatomy, Chymistry, Physics, Botany, Mechanics, &c.

Hence it appears, that the Art originally consist'd solely in the faithful Collection of Observations; and that a long time after, they began to enquire, and dispute, and form Theories: the first part has ever continued the same; but the latter always mutable. For the several Sects that have arose among Physicians, see EMPERIC, DOGMATIC, &c.

MEDICINE is divided into five principal Branches. The first considers the Human Body, its Parts and Fabric, its Life and Health, and the Effects following from them; and this is call'd *Physiology*, the *Animal Oeconomy*, or *Doctrine of the Use of the Parts*: and its Objects, now enumerated, are call'd *Res Naturales*, or Things according to Nature. See PHYSIOLOGY, NATURAL THINGS, &c.

The second Branch considers the Diseases of the Human Body, their Differences, Causes, and Effects; and is call'd *Pathology*, as it considers the Diseases; *Ætiology*, as it enquires into their Causes; *Nosology*, when it examines their Differences; and lastly, *Symptomatology*, when it explains their Effects. The Objects of this Part are call'd *Res præter Naturales*, or beyond Nature. See PATHOLOGY, &c.

The third Branch considers the Signs or Symptoms, and how to apply them to Use; so as to judge both in a sound, and a diseas'd Body, what, which, is, will be, the Degree, Order, Effect, of the Health, or the Disease: This is call'd *Semiotica*. Its Objects are Things both Natural, Non-natural, and Præter-natural. See SEMIOTICA.

The fourth Branch considers the Remedies, and their Use, whereby Life may be preserv'd; whence 'tis call'd *Hygiene*. Its Objects are what we strictly call *Non-naturals*. See HYGIENE and NON-NATURALS.

Lastly, The fifth furnishes the *Materia Medica*, its Preparations, and Manner of Exhibition, so as to restore Health, and remove Diseases; and is call'd *Therapeutica*, comprehending the *Dietetica*, *Pharmaceutica*, *Chirurgica*, and *Jetrica*. See DIETETICA, PHARMACEUTICA, CHIRURGICA, and JETRICA.

MEDICINES, or Medicaments, Preparations of any natural Substances, apply'd to a human Body, in order to answer some Intention of Cure. Medicines are distinguish'd, with regard to the Manner of Application, into Internal and External. Internal, are those taken in at the Mouth; External, or Topical, are those apply'd to any particular Part. See TOPICAL, &c.

With regard to the different Manner of their Operation, they are distinguish'd into Evacuants, Astringents, and Alterants, or Specifics. See EVACUANTS, SPECIFICS, ALTERANTS.

A general Idea of the Manner wherein Medicines operate on a human Body, may be conceiv'd from what follows.

A few different sorts of Particles, variously combined, will produce great variety of Fluids; some may have one fort, some two, some three or more. If we suppose only five different sorts of Particles in the Blood, and call them a, b, c, d, e, their several Combinations, without varying the Proportions in which they are mix'd, will be the following: but whether more or less, need not be determin'd.

ab : ac : ad : ae :  
bc : bd : be : ed :  
cc : de : abc : adc :  
abd : abc : ace : aac :  
bdc : bde : bec : dec :  
abed : abce : acde : abde : bcde : abcde :

No Theory of Secrecion has hitherto been able to give any tolerable Account of the Operation of such Medicines, as promote an Evacuation. For if the Humours are equally mix'd with the Blood, that is, if the Blood is in every part of the Body the same, and its Particles are not more apt to form certain Humours, in some certain Parts of the Body, than in others; or if they are not forced, by the Power of some Medicine, to form such Humours: then the Quantities of Humour, separated in equal Times, will always be as the Velocity of the Blood; but the Velocity of the Blood is seldom doubled by any Medicine, and never tripled by the most acute Fever. The Quantity of Humour, however, drawn off by evacuating Medicines, is often twenty times greater than the natural Quantity; and therefore, upon supposition that the Humours are every where equally mix'd with the Blood, the Operation of evacuating Medicines can never be accounted for.

This Thro Argument hath the Strength of a Demonstration, yet there are some who explain the Operation of purgative, and other evacuating Medicines, by a stimulating Faculty; whereby the sluggish Juices are not only forc'd out, but the obstructed Canals open'd, and the Motion of the Blood quicken'd. But such a Power be allow'd, it would remain to be explain'd, why certain Medicines do only stimulate certain Glands? For it is evident, that evacuating Medicines have some other Power, besides the squeezing out stagnant Juices; because when they are all squeez'd out, they still evacuate as much, if they are repeated, as they did before: as is plain, by continuing a Salivation for many days. Secondly, we cannot suppose, that all Bodies have every where, and at all times, Juices stagnating; but these Medicines constantly produce their Effects, more or less, at all times. Thirdly, if the Vessels be supposed to be obstructed, an evacuating Medicine could but double the Quantity that was evacuated, before it was taken. Fourthly, if these Medicines operate only these ways, then in a healthful Body, where there were no Obstructions, they would have no effect at all. Fifthly, if the removing Obstructions were the Cause of a greater Quantity evacuated, then the Evacuation should still continue in a greater degree than before the Obstruction was removed; whereas, in fact, we constantly find it less, as the Medicine works off. Sixthly, tho a Medicine, by stimulating a Vessel, may quicken the Motion of the Fluid in that Vessel; yet it can never increase the Quantity of Fluid running thro it, in equal Spaces of Time; because it quickens the Motion of the Fluid, only by contracting the Vessel: and therefore the faster the Fluid is made to run thro' the Vessel, the less Fluid the Orifice of the Vessel admits; and consequently after the Vessel is contracted by the stimulating Medicine, the Secrecion will be less, instead of being greater. That a Stimulus causes the part, on which it acts, to contract, is matter of fact; and that purgative Medicines do stimulate the Bowels; but it may perhaps be likewise said, they stimulate the Heart and Arteries, and increase their Force, being they not only quicken, but raise the Pulse: so that a greater Quantity of Blood is sent to the Glands of the Guts. This may be granted; but not that it is the principal Action of purgative Medicines; because that, by the same Force, a greater Quantity of Blood is sent to all the other Glands of the Body, whose Fluids are not, however, sensibly increased; and the Glands of the Intestines receive a less Quantity, in proportion, than any others, because they cannot be so much dilated by the greater Force of the Blood, as others, which are not so much stimulated by the Medicine. There are others, who will have evacuating Medicines endued with an attenuating Quality, by which they dissolve all the Cohesions of the Particles of the Blood, and so let the several Humours at liberty, to pass thro' their proper Glands: but if these Medicines have a power universally to dissolve all the Cohesions of the Blood, then every evacuating Medicine would equally and

indifferently increase the Quantity of every Secretion. Mercury would as constantly purge as salivate, and Nitre promote Purification, as well as Urine; but this is repugnant to Experience. If they have a power to dissolve certain Cohesions, and not others; this is but setting certain Particles at liberty to pass thro' their proper Glands, which were not so before; and is a preparing the Humours, in order to increase the Quantity of Secretion. Evacuating Medicines must therefore have a power to affect some Particles, and not others; that is, to repel some, and attract, retain, and alter others: and this is what may be affirm'd to be in all Medicines, and is what a thousand Chymical Experiments demonstrate. The several Humours then being form'd, by the different Cohesion of the Particles of Blood, the Quantity of Humour secreted by any Gland, must be in a Proportion compounded of the Proportion, that the Number of the Particles, cohering in such a manner as is proper to constitute the Humour which passes thro' the Gland, bears to the Mass of Blood; and of the Proportion of the Quantity of Blood, that arrives at the Gland. And hence it follows, that where there is a determinate Quantity of a certain Humour to be separated, the Number of Particles, that are proper to compose the secreted Liquor, must be reciprocally proportional to the Quantity of the Blood that arrives at the Gland: and therefore, if the Quantity of the Secretion is to be increas'd, the Number of Particles is to be increas'd; if the Secretion is to be lessen'd, the Number of Particles, proper for such a Secretion, is to be lessen'd in the same Proportion. Medicines, therefore, which can alter the Cohesions, and Combinations of the Particles, can either increase or diminish the Quantity of any Secretion. Thus, suppose the Humour, which passes thro' the Glands of the Intestines, to be composed of three or four several sorts of Particles; that Medicine, which will easily cohere to those Particles, and cohering, increase their mutual Attractions, so as they unite in greater Numbers at, or before they arrive at the Intestines, than they would have done; if the Medicine had not been given, must necessarily increase the Quantity of Humour, which passes thro' the Glands of the Intestines, if the Quantity of Blood which arrives at the Glands, is not diminish'd in the same Proportion, as the Number of Particles is increas'd. After the same manner do Diuretics, Sudorifics, and Medicines, which promote all other Secretions, operate.

Why increasing the Quantity of some Secretions, should diminish that of others, is not easy to explain on any other foot: for if the Blood be equally mix'd in every part of the Body, with all the Humours which are separated from it; that is, if the Mixture of the Blood is every where alike, so that every Humour bears the same Proportion to the rest of the Arterial Blood, in one part of the Body, that it does in another; and if every Humour has its own proper Gland, thro' which it is separated: then what is separated by one Gland, is not subtracted from another; and consequently doth not diminish the Quantity of Humour, which flows to this other, but doth indeed rather increase the Quantity of this other Secretion: for the more any one Humour is carry'd off, the greater Proportion any other remaining in the Blood, bears to the remaining Blood: And therefore the more any one Secretion is increased, the more all the rest should be increased likewise. But if all the Humours are composed by a Combination of a few different sorts of Particles, then the more apt these Particles are to run into any one sort of Combination, the less all other Combinations must be: and consequently the increasing any one Secretion, must necessarily diminish the Quantity of all others; but most especially of that, which has the most of the same sort of Particles. See SECRETION, HUMOUR, &c.

**MEDICINAL Hours**, are those proper to take Medicines in: Of which there are four in the Day, viz. in the Morning fasting, about an Hour before Dinner, about four Hours after Dinner, and going to Bed; but in acute Cases, the Times are to be govern'd by the Symptoms and Aggravation of the Distemper.

**MEDICAL Waters**. See WATER.

**MEDIETAS Lingue**, an Inquest impannell'd, whereof the one half consists of Natives or Denizens, the other Strangers. It is used in Pleas, wherein the one Party is a Stranger, and the other a Denizen. *Solomon de Starford*, a Jew, in the Time of Edward I. had a Cause tried before the Sheriff of Norwich, by a Jury of *sex probos & legales Homines, & sex legales Indes de Civitate Norwiche*. See JURY.

**MEDITATION**, an Action by which we consider any thing closely, or wherein the Soul is employ'd in the Search of any Truth. In Religion it is used to signify a Consideration of the Mysteries and grand Truths of Faith. The Mystics make a great difference between Meditation and Contemplation. Meditation consists in discursive Acts of the Soul, consisting methodically, and with

attention, the Mysteries of Faith, and the Precepts of Morality: And is perform'd by Reflections and Reasonings, which leave behind them manifest Impressions in the Brain. The pure Contemplative have no need of Meditation, as seeing all things in God at a Glance, and without any Reflection. When a Man therefore has once quitted Meditation, and is arriv'd at Contemplation, he returns no more; and, according to *Avarez*, never resumes the Oar of Meditation, except when the Wind of Contemplation is too weak to fill his Sails. See CONTEMPLATION.

**MEDITERRANEAN**, something inclosed within Land. The Word is particularly used to signify that large Sea, which flows within the Lands of Europe and Africa, by the *Straites of Gibraltar*, and reaches into Asia, as far as the *Euxine Sea*, and the *Palm Meas*. It was antiently call'd the *Grecian Sea*, and the *Great Sea*. It is now call'd out into several Divisions, which bear several Names: To the West of Italy it is call'd the *Ligurian*, or *Tyrranean Sea*; near Venice, the *Adriatic*; towards Greece, *Ionian* and *Aegean*; between the *Hellespont* and the *Bosphorus*, the *White Sea*, as being very safe; and beyond, the *Black Sea*, its Navigation being dangerous. The Arabs call the *Mediterranean Sea*, the *Chamber-Port*, by reason, they say, of its Figure.

**MEDITULLIUM**, is that spongy Substance between the two Plates of the Cranium, and in the Interstices of all laminated Bodies. See CRANIUM.

**MEDIUM**, a Latin Term, signifying Middle or Mean. See MEAN.

**MEDIUM**, in Logic, or **MEDIUM** of a Syllogism, call'd also the *mean* or *middle Term*, and by the *Italians*, *mezzo termine*; is an Argument, Reason, or Consideration, for which we affirm, or deny any thing: Or it is that Cause, why the greater Extreme is attributed to, or deny'd of the less; in the Conclusion. Thus, in the Syllogism, 'E-very good thing is to be desired; but all Virtue is good; therefore all Virtue is to be desired.' The Term Good is the Medium; Virtue the less Extreme, and to be desired the greater. See SYLLOGISM, EXTREME, &c.

'Tis call'd *Medium*, as being a kind of *Mediator* between the Subject and Predicate; or, by reason, the Extremes are disposed to affirm, or deny by means hereof. Some call it *Argumentum tertium*, a third Argument, and others simply *Argumentum*, as being the Cause why we assent to the Conclusion. See ARGUMENT.

*Medians*, or *Media*, are the Things principally sought for, in discoursing; so that the Invention of *Medians* makes the most essential Part of Logic. But the Rules commonly given by Logicians for that purpose, are mere impertinencies. In effect, no such Rules can be given: Nor have we any way of coming at such *Medians* or Reasons, but by a close Attention to clear Ideas. See DISCOURSE, INVENTION, &c.

**MEDIUM**, in Arithmetic, or an *Arithmetical Medium* or *Mean*, call'd in the Schools *Medium Rei*, is that which is equally distant from each Extreme; or, which exceeds the lesser Extreme, as much as it is exceeded by the greater; in respect of Quantity, not of Proportion. Thus, Nine is a *Medium* between Six and Twelve. See ARITHMETICAL PROPORTION.

*Geometrical MEDIUM* or *Mean*, call'd in the Schools *Medium Personae*, is that where the same Ratio is prefer'd between the first and second, and the second and third Terms; or that which exceeds in the same Ratio, or Quota of itself, as it is exceeded. Thus Six is a *geometrical Medium* between Four and Nine. See GEOMETRICAL PROPORTION.

This is the *Medium* which Virtue is suppos'd to observe; whence some call it *Medium quod non*, as having a View to Circumstances, Times, Places, Persons, &c. Distributive Justice observes a *Geometrical Medium*; Commutative Justice, an *Arithmetical* one. See JUSTICE.

The Schoolmen distinguish divers other Kinds of **MEDIUMS**; as

**MEDIUM Participations**, In the Schools, is that said to be compounded of the two Extremes: Thus, Man, who is partly Body, partly Mind, is a *Medium* by *Participation*, of the two Extremes; so, is Warmth the *Medium* of Heat and Cold, &c.

**MEDIUM Negationis** or *Remotionis*, is that, whereof both Extremes are deriv'd; or, it is a Subject, capable of receiving both Extremes, and yet not necessarily possess'd of either. In which latter sense, the Will is a *Mean* with respect to Virtue and Vice; and the Understandings, with respect to Knowledge and Ignorance.

**MEDIUM quod**, or **MEDIUM Sufferii**, is somewhat between the Agent and Patient, which receives the Action of the one, e'er it arrive at the other. In this sense, Air is a *Medium* between the Fire, and the Hand heated thereby. — **MEDIUM quod**, is the Form, or Faculty, whereby

whereby an Agent produces an Effect; in which sense, Heat is said to be the *Medium* or *Means*, whereby Fire acts on the Hand.—*MEDIUM sub quo*, is that which renders the Power to act, complicit, in the general; without determining it to any particular Object: In this sense, Light is the *Medium*, under which the Eye perceives any Colour.—*MEDIUM in quo*, is that, by inspection whereof, a Power is produced in any thing, of knowing or perceiving another: Such, is a Speculum, as it shows an Object; an Image, as it represents the Reality, &c.

*MEDIUM*, in Mechanical Philosophy, is that Space or Region, thro' which a Body passes in its Motion towards any Point. Thus *Aether* is supposed to be the *Medium*, wherein the heavenly Bodies move. See *ÆTHER*. *Air* the *Medium* wherewith the Earth is encompass'd, and Earthy Bodies move. See *AIR*. *Water* the *Medium* in which Fishes live and move. See *WATER*. Thus, *Glass* is also a *Medium* of Light, as it affords it a free Passage: And that Density or Consistence in the Parts of the *Medium*, whereby the Motion of Bodies in it is retarded, is call'd the *Resistance of the Medium*; which, together with the Force of Gravity, is the Cause of the Cessation of Motion of Projectiles. See *RESISTANCE of the Medium*.

*Subtle MEDIUM*. Sir *I. Newton* makes it probable, That beside the particular Aerial *Medium*, wherein we live and breathe, there is another more universal one, which he calls an *Ethereal Medium*; vastly more rare, subtle, elastic, and active, than Air; and by that means freely permeating the Pores and Intertices of all other Media, and diffusing itself thro' the whole Creation: And by the Intervention hereof he thinks it is, that most of the great Phenomena of Nature are effected. This he seems to have recourse to, as the first and most remote Physical Spring; and the Ultimate of all natural Causes. By the Vibrations of this *Medium*, he takes Heat to be propagated from lucid Bodies; and the Intenseness of Heat increas'd and preserv'd in hot Bodies, and from them communicated to cold ones. See *HEAT*. By this *Medium* he takes Light to be reflected, inflected, refracted, and put alternately in Fits of easy Reflection and Transmission; which Effects he elsewhere ascribes to the Power of Attraction: so that this *Medium* appears the Source and Cause of Attraction. See *LIGHT, REFLECTION, REFRACTION, INFLECTION, and ATTRACTION*.

Again, this *Medium* being much rarer within the heavenly Bodies, than in the heavenly Spaces; and growing denser, as it recedes further from them: he proposes as the Cause of the Gravitation of these Bodies towards each other, and of the Parts towards the Bodies. See *GRAVITATION*.

Again, from the Vibrations of this same *Medium*, excited in the bottom of the Eye by the Rays of Light, and thence propagated thro' the Capillaments of the Optic Nerves into the Sensory, he takes Vision to be perform'd; see *VISION*: And so Hearing, from the Vibrations of those some other *Medium*, excited in the Auditory Nerves, by the Tremors of the Air, and propagated thro' the Capillaments of those Nerves into the Sensory: and thus of the other Senses. See *SENSATION, HEARING, &c.*

And, again, he conceives Muscular Motion to be perform'd by the Vibrations of the same *Medium*, excited in the Brain at the Command of the Will, and thence propagated thro' the Capillaments of the Nerves into the Muscles; and thus contracting and dilating them. See *MUSCLE*.

The Elastic Force of this *Medium*, he shows, must be prodigious: Light moves at the rate of 70,000,000 Miles in about seven Minutes, yet the Vibrations and Pulses of this *Medium*, to cause the Fits of easy Reflection and easy Transmission, must be swifter than Light, which yet is 700,000 times swifter than Sound. The Elastic Force of this *Medium*, therefore, in proportion to its Density, must be above 490,000,000,000 times greater than the Elastic Force of the Air, in proportion to its Density: The Velocities and Pulses of Elastic *Media* being in a sub-duplicate Ratio of the Elasticities, and the Rarities of the *Medium*, taken together. And thus may the Vibrations of this *Medium* be conceiv'd as the Cause of Elasticity of Bodies. See *ELASTICITY*.

Further, the Particles of this *Medium* being supposed infinitely small, even smaller than those of Light; if they be likewise supposed, like our Air, to have a repelling Power, whereby they recede from each other, the Smallness of the Particles may exceedingly contribute to the Increase of the repelling Power, and consequently to that of the Elasticity and Rarity of the *Medium*; and so fit it for the free Transmission of Light, and the free Motions of the heavenly Bodies. In this *Medium* may the Planets and Comets roll without any considerable Resistance. If it be 700,000 times more elastic, and as many times rarer, than Air; its Resistance will be above 600,000,000 times less than that of Water: A Resistance that would

make no sensible Alteration in the Motion of the Planets in ten thousand Years. And is not such a *Medium* better disposed for the heavenly Motions, than that of the *Cartesians*, which fills all Space adequately, and without leaving Pores; is vastly denser than Gold; and therefore must resist more? See *PLENUM, &c.* If any ask how a *Medium* can be so rare, let him tell how the Air, in the upper Regions of the Atmosphere, can be above a hundred thousand times rarer than Gold. How an electric Body can, by Friction, emit an Exhalation so rare and subtle, yet so potent, as, the its Exhalation occasions no sensible Alteration in the Weight of the Body; yet it shall be diffus'd thro' a Sphere of two Foot in Diameter, and carry up Leaf-Copper, or Leaf-Gold, at the distance of a Foot from the electric Body. Or how the Effluvia of a Magnet can be so subtle, as to pass a Plate of Glass without any Resistance or Diminution of Force; yet so potent, as to turn a Magnetic Needle beyond the Glass. See *ELECTRICITY*.

That the Heavens are not fill'd with any other, but such a subtle ethereal *Medium*, is evident from Phenomena; whence else those lasting and regular Motions of the Planets and Comets, in all manner of Courses and Directions. And how are such Motions consistent with that Resistance, that must result from that dense, fluid *Medium*, wherewith the *Cartesians* fill the Heavens. The Resistance of fluid *Media* arises partly from the Cohesion of the Parts of the *Medium*, and partly from the *Vis Inertiae*. The first, in a spherical Body, is nearly as the Diameter, or, at most, as the Factum of the Diameter, and the Velocity of the Body. The latter is as the Square of that Factum. Thus are the two Kinds of Resistance distinguish'd in any *Medium*; and being distinguish'd, it will be found that almost all the Resistance of Bodies, moving in ordinary Fluids, arises from the *Vis Inertiae*. That Part which arises from the Tenacity of the *Medium*, may be diminish'd, by dividing the Matter into smaller Parts, and making those more smooth and slippery: But the other will still be proportional to the Density of the Matter, and cannot be diminish'd any other way, but by a Diminution of the same. Thus the Resistance of fluid *Media*, is nearly proportional to their Densities; and thus the Air we breathe, being about 900 times lighter than Water, must resist about 900 times less than Water: As, in effect, the same Author has found it does by Experiments on Pendulums. Bodies moving in Quick-Silver, Water, or Air, don't appear to meet with any other Resistance, but what arises from the Density and Tenacity of those Fluids; which they meet, were their Pores fill'd with a dense and subtle Fluid. See *VACUUM*. Heat, 'tis found, diminishes the Tenacity of Bodies very much; yet does it not decrease the Resistance of Water, sensibly. The Resistance of Water, therefore, arises chiefly from its *Vis Inertiae*; consequently, if the Heavens were as dense as Water, or as Quick-Silver, they would not resist much less: if absolutely dense, without any Vacuum, be the Particles never so subtle and fluid, they would resist much more than Quick-Silver. A solid Globe, in such a *Medium*, would lose above half its Motion, while it moves thrice the Length of its own Diameter; and a Globe not perfectly solid, such as the Planets, would lose more. To make way therefore for the lasting Motions of the Planets and Comets, the Heavens must be empty of all Matter, except, perhaps, from some very fine Effluvia; from the Atmospheres of the Earth, Planets, and Comets; and some such *Ethereal Medium* as we have described. A dense Fluid can serve for no purpose, in the Heavens, but to disturb the Celestial Motions, and to make the Frame of Nature languish; and in the Pores of Bodies, serves only to check the vibrating Motion of their Parts, wherein their Heat and Activity consists. Such a *Medium*, therefore, unless we had some Evidence of its Existence, must be given up; and that given up, the Hypothesis of Light's consisting in a Pressure, falls to the ground. See *LIGHT, PRESSION, CARTESIANISM, &c.*

*MEDIUM Venter*, in Anatomy, the Breast or Thorax. See *THORAX*; see also *VENTER*.

*MEDULLA*, in natural History, &c. See *MARROW*.

*MEDULLA Cerebri* and *Cerebelli*, is the white soft Part of the Brain; and *Cerebellum*, cover'd on the Outside with the Cortical Substance, which is of a more dark or ashy Colour. See the Origin, Structure and Use thereof, under *BRAIN* and *CEREBELLUM*.

*MEDULLA Oblongata*, is the Medullary Part of the Brain and Cerebellum join'd in one; the fore-part of it coming from the Brain, and the hind-part from the Cerebellum. It lies on the Basis of the Skull, and is continu'd thro' the great Foramen thereof into the Hollow of the Vertebræ of the Neck, Back, and Loins: tho' only so much of it retains the Name, as is included within the Skull. After its Exit thence, it is distinguish'd by the Name of the *MEDULLA Spinalis*.

The Substance of the *Medula Oblongata* being only an Aggregate of those of the Brain and Cerebellum, must, like them, be purely fibrous or nervous, and only an Assemblage of minute Tubes for the Conveyance of the Animal Spirits. It arises, as it were, from four Roots; whereof the two largest spring from the Brain, and are call'd *Crua*; the two lesser from the Cerebellum, which Dr. *Willis* calls *Pedunculæ*. See BRAIN, CEREBELLUM.

There are several Parts or Members of the *Medula Oblongata*, particular Descriptions whereof will be found under their proper Heads. In the general it may be observ'd, that, upon inverting it, the first thing that appears upon its Trunk, is a Protuberance somewhat like a Ring, for that reason call'd *Protuberantia Annularis*. Then follow ten Pair of Nerves, which have their Origin here, and are hence sent to the several Parts of the Body. See NERVE. Immediately under the first Pair, or Olfactory, appear two small Arteries, or Branches of the *Carotides*. The second Pair, or Optics, being cut off, appears the *Infundibulum*, which ends in the *Glandula Pituitaria*, and on each Side, the Carotid Arteries enter the Skull in the Lateral Ventricles of the *Medula* are two Prominences on each Side, the one Pair call'd *Corpora Striata*, from the appearance of Stripes, or nervous Fibres, within them; their outer Substance being cortical or glandulous, like the rest of the Surface of the Brain, tho' not so deep. Betwixt the *Corpora Striata* is a broad thin Production of the *Medula*, call'd *Fornix*; and underneath them lie two other Prominences, call'd *Thalami Nervosum Opticorum*. On either side of these is a Plexus of Blood-Vessels, call'd *Plexus Cerebralis*. And under the *Fornix* a narrow Aperture, call'd the *Rima*, which lets into the *Infundibulum*; which is a Passage from the third Ventricle to the *Glandula Pituitaria*, thro' the *Medula* of the Brain; being lined with the *Pia Mater*. Under this, in the *Sinus* call'd *Sella Equina*, or *Turcica*, upon the *Os Cribriforme*, is the *Glandula Pituitaria*; which is surrounded with a Plexus of Vessels, call'd *Reti Mirabile*, only visible in Brutes. On the hind part of the third Ventricle is a small *Foramen*, call'd *Axus*, leading to the fourth Ventricle of the Cerebellum: At the Orifice of this is seated a small Gland, which of his fancied Resemblance to a Pine Apple, is call'd *Conarium*, or *Glandula Pinealis*; where *Des Cartes* and his Followers imagine the Seat of the Soul to be. On the backside of the *Medula Oblongata*, near the Cerebellum, are four Protuberances, whereof the upper and larger are call'd *Nates*; the under and lesser *Testes*. Between these and the *Processus* of the Cerebellum, is the fourth Ventricle, from its Figure call'd *Calamus Scriptorius*. Upon the *Medula Oblongata*, near its Extremity, are four other Prominences, two on each Side; call'd *Corpora Pyramidalia* and *Olivaria*. See PYRAMIDALIA, OLIVARIA, CALAMUS, CONARIUM, RETE, &c.

**MEDULLA Spinalis**, or the *Spinal Marrow*, is a Continuation of the *Medula Oblongata*, or Medullary Part of the Brain, without the Skull. It consists, as the Brain does, of two Parts, a White or Medullary, and a Cerebritious or Glandulous; the former without, and the other within. The Substance of the exterior Part is much the same with that of the *Corpus Callosum*, only somewhat tougher, and more fibrous: which Difference becomes the more apparent, as it descends the lower; by reason of the Stricthness of the Cavity, which growing gradually more narrow, presses the Medullary Fibres closer together, and renders them more compact, and gathers them into more distinct *Fasciculi*, till having descended the whole Tract of the *Spina*, they end in the *Cauda Equina*. It is the Origin of most of the Nerves of the Trunk of the Body: It sends out thirty Pair on each Side to the Limbs, the great Cavities, and other Parts; which are nothing but *Fasciculi* of Medullary Fibres, cover'd with their proper Membranes. See NERVE.

The *Spinal Marrow* is generally said to be cover'd with four Coats: The first, or external one, is a strong nervous Ligament, which ties the *Vertebrae* together, to the Inside of which it firmly adheres. The second is a Production of the *Dura Mater*; it is exceedingly strong, and serves to defend the *Spinal Marrow* from any Hurt from the Flexures of the *Vertebrae*. The third is a Production of the *Arieteides*, and is a thin pellucid Membrane, lying between the *Dura* and *Pia Mater*, or the second and fourth Membranes of the *Medula*. This Membrane gives a Coat to the Nerves, that go out of the *Spina*, which is the inner Membrane of the Nerves, as the *Dura Mater* gives the outer. The fourth Coat is a Continuation of the *Pia Mater*, and is an extremely thin, fine, transparent Membrane; strictly embracing the whole Substance of the *Medula*, dividing it in the middle into two Tracts, and making, as it were, two Columns of it. See SPINE, VERTEBRÆ, &c.

**MEDULLA Ossium**, or Marrow of the Bones, is a soft fatty Substance, placed in the Cavities or Pores of divers Bones; it is inclosed in a Membrane; and is devoid of Sense: it

is red in the greater Cavities, white in the less, and soft and succulent in spongy Bones. See BONE. From this is secreted the Medullary Oil. See MEDULLARY OIL.

**MEDULLARY Oil**, is no more than the finer and more subtil Parts of the *Medula*, or Marrow of the Bones, so call'd. This, Dr. *Havers* observes, passes not into the Bones thro' Ducts, but by small Pores formed into the Vessels or Glandules, which are conglomerated into distinct Lobules, contained in several Membranes investing the whole Marrow; all which Vessels or Bags are propagated from the outward Coat of the Arteries; and by these it passes from one to another, till it arrives at the Sides, or extreme Parts of the Bone. That Part of it, which is supply'd to the Interstices of the Joints, goes into them by Passages, penetrating thro' the Bone into those Cavities, and form'd for that end. The Use of this Oil is either common to all the Bones, whose Temper it preserves, and keeps from being too brittle; or more peculiar for the Joints, where it is very serviceable, (1.) To lubricate the Bones at their Extremities, that they may move more easily and free. (2.) To keep the Ends of the articulated Bones from growing hot with Motion. (3.) To preserve the Joints from wearing by Attrition, and rubbing one against another: And, (4.) To preserve the Ligaments of the Joints from Dryness and Rigidity; and lubricate those Parts, which slide upon the Bones, and keep the Cartilages, which are join'd to them, flexible.

**MEETER**. See METAL.

**MEGALESIA**, is Antiquity, a solemn Feast celebrated among the *Romans* on the 14th of April, in honour of the great Mother of the Gods, that is, *Cybele* or *Rhea*; wherein, were Games or Combats held before the Temple of that Goddess. They were call'd *Megalysia*, from the Greek *μεγας*, Great; *Cybele* being accounted the great Goddess.

**MELA**, a Chirurgion's Instrument, call'd also *Speculum*, and by the *Vulgar*, *Tenta*. Its Use is to probe Ulcers, draw a Stone out of the Yard: Its Form is various, according to the Ulcs it is intended for. See SPECULUM.

**MELANOGOGUES**, are such Medicines as are suppos'd particularly to purge off black Choler; from *μύλας* niger, black; and *εγος*, ducere, to lead; but there is no such Distinction of Choler now regarded, and consequently this Distinction is but little used. See PURGATIVES.

**MELANCHOLY**, in Medicine, the Name of a Disease, which consists in a Delirium, without a Fever, and is usually attended with Fear, Heaviness and Sorrow, without any apparent Occasion. The Antients attributed this Disease to black and cloudy Spirits, arising as Vapours from a redundant black Bile. Some of the Moderns ascribe it to the irregular Motion of the Spirits, and their acid Constitution; and others, who know it better, to too heavy and viscid a Blood, which permits not a Sufficiency of Spirits to be separated in the Brain, to animate and invigorate the Nerves and Muscles: And others to a Dryness of the *Meninges* of the Brain. This Disease is vary'd an infinite number of Ways, according to the Temperament and Ideas of the Person affected with it. It is a Species of Madness, and only differs from a down-right *Mania* in degree. The Word comes from the Greek *μύλας*, niger; and *χολη*, Bile. See MADNESS, DELIRIUM, &c.

**MELCHISADECHIANS**, ancient Sectaries, so call'd, because they rais'd *Melchisedech* above all Creatures, and even above *Jesus Christ*. The Author of this Sect was one *Theodotus*; whence the *Melchisedechians* became more commonly known by the Name of *Theodotians*; all the Difference between those, and the strict *Theodotians*, consisting in that particular Article relating to *Melchisedech*; who, according to them, was the great and supreme Virtue. See THEODOTIANS.

**MELCHITES**, the Name of a Religious Sect in the Levant, who scarce differ from the *Greeks* in any thing relating either to Faith or Worship; but yet speak a different Language. The Word, in the *Syriac*, signifies *Royalists*, and was formerly apply'd to the Catholics by the Heretics, who refus'd to submit to the Decisions of the Council of *Calcedon*: intimating by this Appellation, that they were of the Religion of the Emperor. Those now call'd *Melchites*, are such People, as inhabiting among the *Syrians*, *Coptes*, or *Egyptians*, and other *Levantine* Nations, follow the Opinions of the *Greeks*, tho' no *Greeks* themselves: And 'tis for this reason that *Gabriel Sionita* calls them indifferently by the Name of *Greeks* and *Melchites*. The same Author observes, that they are spread thro' all the *Levants*; that they deny Purgatory; and are declar'd Enemies to the Pope and his Primacy. For the rest, they fall in with the *Greeks*, both as to Articles of Faith and Discipline. They have translated the *Greek* Euchologe, and other Books of that kind, into *Arabic*; and have the Canons of Councils in the same Language. To those of the Council of *Nice*, they have added new Canons, commonly

monly call'd the *Arabic Camari*; which are likewise receiv'd by the *Facilities* and *Morantes*; Tho' most of the Learned look on them as spurious.

**MELICERIS**, is a Tumour inclosed in a *Cystis*, consisting of Matter like Honey; it gathers without Pain, and gives way upon Pressure, but returns again: It is to be cured by warm Discutients.

**MELITTES**, a greyish Stone, which, when pulveriz'd, yields a milky Liqueur, of a Taste somewhat like Honey; whence it takes its Name. It is found in Mines of Metals, and seems to partake pretty much of the Nature of Lead; having a Sweetness somewhat like the *Sal Saturni*, but much fainter. It only differs from the *Galalites*, in that it is milder to the taste. The Antients used it in Inflammations of the Eyes, and to dry Ulcers.

**MELIUS Inquirendo**, is a Writ that lieth for a second Inquiry of what Lands and Tenements a Man died seized; where Partiality is suspected, upon the Writ, call'd, *Diem clausit extremum*.

**MELODY**, in Music, is the agreeable Effect of different Musical Sounds, ranged or disposed in Succession. So that Melody is the Effect only of one single Part, Voice, or Instrument; by which it is distinguish'd from *Harmony*; tho' in common Speech, these two are frequently confounded. Harmony is the agreeable Refuse of the Union of two or more concurring musical Sounds heard in Concourse, *i. e.* at one and the same time; so that Harmony is the Effect of two Parts at least: As therefore a continued Succession of musical Sounds produces Melody, so does a continued Combination of these produce Harmony. See HARMONY and CONCORD; see also Music in PARTS.

Tho' the Term *Melody* be chiefly applicable to the Treble, as the Treble is chiefly distinguish'd by its Air; yet so far as the Bass may be made airy, and to sing well, it may be also properly said to be *Melodius*. See TABLE and BASS.

Of the twelve harmonical Intervals of Musical Sounds, distinguish'd by the Names of *Second lesser*, *Second greater*; *Third lesser*, *Third greater*; *Fourth*; *fifth Fifth*; *Fifth*; *Sixth lesser*, *Sixth greater*; *Seventh lesser*, *Seventh greater*; and *Octave*; all Melody, as well as Harmony, are compos'd: For the Octaves of each of these are but Replications of the same Sounds; and whatever is said of any, or all of these Sounds, is to be understood also of their Octaves. See OCTAVE.

For the Rules of Melody, see COMPOSITION. The Word comes from the Greek *μουσική*, Honey; and *αἴα*, Singing.

**MEMBERS**, in Anatomy, the exterior Parts, arising from the Trunk, or Body of an Animal, like Boughs from the Trunk of a Tree. See BODY. The Physicians divide the Body into three Regions or Venters (the Head, the Breast, and the Lower Ventricle); and their Extremities, which are the *Members*. In Latin they are call'd *Arui*, of *Assare*; because they are Parts attach'd to the Trunk.

Each Member, and Portion of the Body, was anciently devoted to some Divinity. The Head to *Jupiter*, the Breast to *Nephtis*, the Navel to *Mars*, the Ear to *Mercury*, the Forehead to the *Genius*, the Right-Hand to *Faith* or *Fidelity*, the Knees to *Mercy*; the Eye-brows, again, to *Jupiter*, the Eyes to *Cupid*, or, according to others, to *Minerva*; the hind Part of the right Ear to *Neptis*, the Back to *Pluto*, the Reins to *Venus*, the Feet to *Mercury*, the Heels and Soal of the Foot to *Thetys*, and the Fingers to *Minerva*.

**MEMBERS**, in Architecture. See MOULDINGS.

**MEMBER**, in Grammar, is understood of the Parts of a Period or Sentence. See PERIOD and SENTENCE.

**MEMBER'D**, or **MEMBERED**, in Heraldry, is where the Leg or Foot of an Eagle, Griffin, or other Bird, is of a different Colour from the rest of the Body.

**MEMBRANA**, in Anatomy.

MEMBRANA Communis Muscularum.	} See MEMBRANE.
MEMBRANA propria Muscularum.	
MEMBRANA Communis Vascularum.	
MEMBRANA Adiposa.	} See
MEMBRANA Carnosa.	
MEMBRANA Nihiliana.	
MEMBRANA Tympani.	
MEMBRANA Urinaria.	

**MEMBRANE**, in Anatomy, a similar Part of an Animal Body; being a thin, white, flexible, expanded Skin, form'd of several sorts of Fibres interwoven together, and serving to cover or wrap up some certain Parts of the Body. See BODY and PART.

The Membranes of the Body are various; and variously demonstrated: Such are the *Periostrion*, *Pleura*, *Pericardium*, *Peritonaeum*, &c. which see under their proper Articles; **PERIOSTIUM**, &c.

Those Membranes which serve as Integuments, or Covers of Vessels, are call'd *Cuts* or *Tonies*; and those which cover the Brain, are, by a peculiar Name, call'd *Meninges*: See TUNIC and MENINGES.

The Fibres of a Membrane give them an Elasticity, whereby they can contract, and closely grasp the Parts they contain; and their nervous Fibres give them an exquisite Sense, which is the cause of their Contraction: they can therefore scarcely suffer the Sharpness of Medicines, and those are difficultly united, when wounded. In their Texture, there is a number of small Glands, which separate an Humour, fit for moistening the Parts they contain. By reason of the Thickness and Transparency of the Membrane, the Ramifications of the Blood-Vessels are more apparently seen in them, than in any other Part of the Body: here the innumerable Divisions, Windings, and Turnings, serpentine Progressions, and frequent Inosculation, not only of Veins and Arteries together, but also of Veins with Veins, and Arteries with Arteries, make a most agreeable Embroidery, and delicate Network, covering the whole Membrane.

The Use of the Membrane is to cover and wrap up the Parts, and strengthen them; to save them from external Injuries; to preserve the natural Heat; to join one Part to another; to sustain small Vessels, and the Nerves which run thro' their Duplicitures; to stop the returning of the Humours in their Vessels, as the Valves stop the returning of the Blood in the Veins and Heart; of the Chyle in the Thoracic Duct; and of the Lympha in the Lymphatic Vessels.

Anatomists generally assert, that there is a *Membrana Communis Muscularum*, or Membrane common to all the Muscles; being led into that Mistake by the Aponeurosis of several Muscles; whereas, upon stricter Observation, there is no such thing to be found. See MUSCLE. The *Membrana propria Muscularum*, is that which immediately covers all and every one of the Fibres of a Muscle, and is closely tack'd to them. There is another common Membrane, call'd *Membrana Communis Vascularum*; which is a thin Membrane, accompanying almost all the Vessels of the Body. All these Membranes receive Veins, Arteries, and Nerves from the Parts which are nearest to them. The Word comes from the Latin *Membratum*, Parchment.

**MEMBRANOSUS**, in Anatomy, a Muscle of the Leg, so call'd from its large membranous Expansion inclosing all the Muscles of the *Tibia* and the *Tarsus*; whence it is also call'd *Fascia lata*. It hath a sharp fleshy beginning from the fore-part of the Spine of the *Os Ilium*, but soon becomes membranous, and covers almost all the Muscles of the Thigh and Leg, down to the Foot, where it joins with the *Ligamentum Annulare*; and in its Action turns the Leg outwards.

**MEMBERED**: In Heraldry, those Birds, which are either whole-footed, or which have no Talons, are blazon'd by the Term, *Membered*.

**MEMOIRS**, a Term now much in use for Histories, compos'd by Persons who had some Share or Concern in the Transactions they relate, or who were Eye-witnesses of them; answering to what the Latins call'd *Commentarii*. The French are great Dealers in this way of Writing, and have an infinite number of Books of *Memoirs*, containing, for the Generality, the Lives and Actions of the Writers.

**MEMOIRS** are also used for a Journal of the Acts, and Proceedings of a Society; or a Collection of the Matters debated, transacted, &c. therein. Such are the *Memoirs* of the Royal Academy of Sciences, &c. See ACADEMY, &c.

**MEMORY**, a Power, or Faculty of the Mind, whereby it retains or recollects the simple Ideas, or the Images, and Remembrance of Things we have seen, imagin'd, understood, &c. See SOUL; see also POWER, FACULTY, &c.

Of all the Faculties, there is none harder to account for, or that has perplex'd Philosophers more, than the Memory. Some will have it a mere Organ, as the Eye, Ear, &c. Dr. Hook, in an Essay towards a mechanical Account of Memory, makes it consist in a stock of Ideas or Images, form'd occasionally by the Mind, out of the fine Parts of the Brain, and disposed, or laid by in order. *Des Cartes* and his Followers maintain, That the animal Spirit exciting a Motion in the most delicate Fibres of the Brain, leave a kind of Traces or Footsteps, which occasion our Remembrance. Hence it happens, that by passing several times over the same things, the Spirits becoming accustomed to the same Passages, leave them open, and so make their way without any Effort or Labour; and in this consists the Ease wherewith we recollect such Ideas. Thus Wine is found to sharpen the Memory, in regard the Spirits of the Wine put the animal Spirit in Motion, and agitate the Fibres of the Brain the more briskly. See IDEA, BRAIN, TRACE, REMEMBRANCE, &c.

Father *Mallebranche* expresses his Notion of Memory thus: 'It being granted, that all our different Perceptions are owing to Changes happening in the Fibres of the principal Part of the Brain, wherein the Soul more inter-

djustly reflects, the Nature of the *Memory* is obvious: for as the Leaves of a Tree, that have been folded for some time, in a certain manner, preserve a Facility or Disposition to be folded again in the same manner; so the Fibres of the Brain, having once receiv'd certain Impressions by the Course of the animal Spirits, and by the Action of Objects, preserve, for some time, a Facility to receive the same Disposition. Now 'tis in this Facility that *Memory* consists; for we think on the same Things, when the Brain receives the same Dispositions. Further, as the animal Spirits act sometimes more briskly, and sometimes more languidly on the Substance of the Brain; and as sensible Objects make much deeper, and more lasting Impressions, than the Imagination alone; 'tis easy, on this Scheme, to conceive why we don't remember all Things alike: Why a Thing, for instance, seen twice, is represented more vividly to the Mind, than another seen but once: Why Things that have been seen, are usually remembered more distinctly, than those that have been only imagin'd, &c. See HABITUDE.

Old Men are defective in *Memory*, and cannot learn any thing without much difficulty; because they want animal Spirits to make new Traces, and because the Fibres of the Brain are become too hard to receive, or too moist to retain such Impression. For the same reason, those who learn with the greatest Ease, forget the soonest; in regard when the Fibres are soft and flexible, Objects make a slight Impression, which the continual Course of animal Spirits easily wears off: On the contrary, the Fibres of those who learn slowly, being less flexible, and less subject to be shaken, the Traces are more deeply engraven, and last the longer. From all which Observations it follows, that the *Memory* is absolutely dependant on the Body; being impair'd or strengthen'd, according to the Changes that befall the Body; a Fall, the Transports of a Fever, &c. being frequently found to erase or blot out all the Traces, to bear away all the Ideas, and to cause an universal Forgetfulness.

The chief Difficulty that clogs this Doctrine of *Memory*, is to conceive how such an infinite number of Things, as the Head is stor'd withal, should be ranged in so much order in the *Memory*, as that the one should not efface the other: and how in such a prodigious Asssemblage of Traces impress'd on the Brain, the animal Spirits should awake precisely those which the Mind has occasion for. See SPIRITS.

*Seneca* says of himself, that by the mere Effort of his natural *Memory*, he was able to repeat two thousand Words upon once hearing them, each in its order; tho' they had no Dependence or Connexion on each other. After which he mentions a Friend of his, *Portius Latro*, who retain'd in his *Memory* all the Declarations he had ever spok'd, and never had his *Memory* fail him, even in a single Word. He also mentions *Cyrenas*, Ambassador to the *Roman* from King *Pyrhus*, who in one day had so well learnt the Names of his Spectators, that the next he saluted the whole Senate, and all the Populace assembled, each by his Name. *Pliny* says, that *Cyrenas* knew every Soldier in his Army by Name; and *L. Scipio*, all the People of *Rome*. *Charmaidas*, or rather *Carneades*, when required, would repeat any Volume found in the Libraries; as readily as if he were reading. *Dr. Wallis* tells us, that without the assistance of Pen and Ink, or any thing equivalent, he was able in the dark, by mere force of *Memory*, to perform Arithmetical Operations, as Multiplication, Division, Extraction of Roots, &c. to forty Places. Particularly, that in *February* 1674, at the request of a Foreigner (by Night, in Bed) he propos'd to himself a Number of fifty-three Places, and found its square Root to twenty-seven Places; and without ever writing down the Number, dictat'd 'em from his *Memory*, at his next Visit, twenty Days afterwards.

Local or Artificial *MEMORY*, is an Art or Invention, by means whereof, the *Memory* is supposed to be aided, strengthen'd, and enlarg'd. This Art seems to consist in nothing else but a certain Method of coupling or associating Ideas of Things to be remembered; with the Ideas of other Things, already dispos'd orderly in the Mind, or that are before the Eyes. It is of an old standing, having been practis'd by many of the ancient Orators; some whereof are said to have made use of Paintings, Images, and Emblems, on this occasion: Tho' others contented themselves with the Parts, Members, Ornaments, Furniture, and other Circumstances of the Place where they were to speak. *Marcus* tells us, that a young Man of *Cerfeia* pretending to do wonders this way, *Muretus* put him to the Tryal; and upon dictating to him two or three thousand Words, some *Greek*, some *Latin*, some *Barbarous*; all without any relation to each other, and the great-est part without any Meaning at all: the Artist immediately, and without any hesitation, or the least stumbling

or misplacing, repeated them all, from first to last, in the same order wherein they had been dictat'd; and this done, beginning where he ended, he repeated them all backwards, from last to first. Adding, that this was but a slight Essay of his *Memory*; and that he would undertake to repeat thirty-six thousand Words in the same manner.

The truth is, this Art seems better calculated for retaining things without any Coherence or Dependence on one another, as mere Words or Sounds, &c. than for things where Reason or Judgment are any way required.

*Raim. Lully* took so much pains with it, that it now goes by his Name, being call'd *Lully's Art*.

MEMPHITES, or *Lapis MEMPHITICUS*, a sort of Stone mentioned by *Dioscorides*, *Pliny*, and other Natural Historians. 'Tis suppos'd to be found in *Egypte* not far from the City *Gaire*, the ancient *Memphis*; whence its Name. The Property it is fam'd for, is, that being pulveriz'd, and smear'd on any part of the Body to be cut off, it deadens it for, as that the Patient shall perceive no pain from the Operation.

MENANDRIANS, the most ancient Branch of *Gnostics*, thus call'd from *Menander* their Chief, a Disciple of *Simon Magus*, and himself a Magician. See GNOSTICS.

He taught, that no Person could be saved unless he were baptiz'd in his Name: He conferr'd a peculiar sort of Baptism, which would render those who receiv'd it immortal in the next World. *St. Irenaeus* represents him, as pretending to be, That first Virtue hitherto unknown to the World, and to have been sent by the Angels for the Salvation of all Mankind. He took upon him, says *St. Epiphanius*, *Her. 2*. to be greater than his Master; which contradicts *Theodoret*, who makes *Menander* a subordinate Virtue to *Simon Magus*, the great Virtue of all. See SIMONIANS.

MENDICANTS, *q. d. Beggars*; a Term apply'd to several Orders of Religious, who live on Alms, and go a begging from Door to Door.

There are four ancient Orders which pass principally by the Name of the *Four Mendicants*: The *Carmelites*, *Jacobines*, *Cordeliers*, and *Augustines*. See CARMELITES, JACOBINES, &c. each under their proper Articles.

Among the Number of *Mendicants*, are also ranked the *Capuchins*, *Recollets*, *Minims*, and others. See CAPUCHINS, RECOLLECTS, &c.

The *Mendicants* at the time of their first Establishment, could not have any Revenues. The Multitudes of *Mendicants*, are now a kind of Tax on the People.

MENINGES in Anatomy, the Coats, or Membranes wherewith the Brain is inclosed. See BRAIN.

The *Arab* call them *Mobers*; whence we also usually call them in *Latin* the *Pia* and *Dura Mater*. See *PIA* and *DURA MATER*.

There are two of these *Meninges*, the *External* and *Internal*. The external one, being the grosser, is call'd the *Dura*, or *Crasa Meningis* or *Mater*. It lies immediately under the *Cranium*, and covers the whole Substance of the Brain, and the Spinal Marrow, and affords a Coat to the Trunks of the larger Nerves. See NERVE, &c. It is connect'd on the upper part to the *Periosteum* by means of Fibres, and on the other side to the *Pia Mater* by the Branches of the *Sinus's*, and by the Arteries and Nerves. It consists of two lesser Coats or Membranes, which some have taken for two *Dura Mater's*; the exterior, hard: and the inner, more smooth, soft, and moist. It descends double between the two Hemispheres of the Brain, which it divides as deep as the *Corpus Callosum*, and by reason of its Curvature, occasion'd by the Convexity of the Brain in that part, is called *Falx*, from its resemblance to a Sickle. See *FALX*. It likewise infinuates itself between the Brain and *Cerebellum*, and so prevents the Brain from lying too hard on the *Cerebellum*. In the Duplicatures thereof, are several *Cavities* call'd *Sinus's*, which are a sort of venous Canals serving for the reconveyance of the Blood. Of these there are four considerable ones, viz. the *Longitudinales* and *Laterales*. See *SINUS*.

Under the *Dura Mater*, immediately upon the Brain, lies the *Meningis tenuis*, or *Pia Mater*, which is a fine thin Membrane adhering so closely, and insinuating itself into all the Folds and intricate parts of the Brain, that it is scarce to be separated from it. This Membrane covers the whole Brain, *Cerebellum*, and *Medulla Oblongata*, and serves, together with the other, for the Defence of the Brain, and the Support of its Vessels.

Between the two, lies another fine transparent Membrane, call'd *Arachnoidea*; but the best Anatomists take this for no more than the external *Lamina* of the *Pia Mater*. See ARACHNOIDES.

MENIPPEAN, or *Satyra MENIPPEA*, a kind of *Satyra* composed both in *Prose* and *Verse*. See *SATYRA*.

It is thus call'd from *Menippus*, a *Cynic Philosopher*, who delighted in composing *Satyrical Letters*, &c. In imitation of him, *Varro* first wrote *Satyrs* under the Title of *Satyrae Menippeae*.

Among the Moderns, there is a famous Piece under this Title, first published in 1594, against the Chiefs of the League, call'd also the *Catholicon of Spain*. It is esteem'd a Master-piece for the time. See *CATHOLICON*.

**MENISCUS**, in Optics, a Glass, or Lens, concave on one side, and convex on the other; sometimes also call'd *Lunula*. See *LENS* and *OPTIC GLASS*.

In a *Meniscus*, if the Diameter of the Convexity be equal to that of the Concavity, a Ray falling parallel to the Axis, will continue parallel thereto after refraction.

Such a *Meniscus* therefore, will neither collect, nor disperse the Rays; and is therefore of no use in Dioptricks. See *REFRACTION*.

To find the Focus of a *Meniscus*, the Rule is, As the difference of the Semi-diameters of the Convexity and Concavity, is to the Semi-diameter of the Convexity: so is the Diameter of the Concavity, to the distance of the Focus from the *Meniscus*. Hence,

If the Semi-diameter of the Concavity, be triple the Semi-diameter of the Convexity, the distance of the Focus from the *Meniscus* will be equal to the Semi-diameter; and therefore the *Meniscus* will be equivalent to a Lens equally convex on either side. See *CONVEX-LENS*.

Again; If the Semi-diameter of the Concavity be double that of the Convexity; the distance of the Focus will be equal to the Diameter: and therefore the *Meniscus* will be equivalent to a Plano-Convex Lens. See *PLANO-CONVEX*.

If the Semi-diameter of the Concavity be quintuple that of the Convexity, the *Meniscus* will be equivalent to a Sphere. See *SPHERICAL LENS*.

The Semi-diameter therefore of the Convexity being given; that of the Concavity required to remove the Focus to any given distance from the *Meniscus*, is easily found. See *FOCUS*.

**MENNONITES**, a Sect in the United Provinces, in most respects the same with those in other Places called *Anabaptists*. See *ANABAPTIST*.

They had their Rise in 1496, in a Village in *Friesland*; their Founder was one *Mennon*, who undertook to reform the Religion of the ancient Anabaptists, and to throw out all Enthusiasm touching the new Kingdom of Christ, &c.

The *Mennonites* hold, that there is no original Sin; that the first Man was not created just; that in speaking of the Father, Son, and Holy Ghost, we must not use the word *Person*, nor that of *Trinity*; that Jesus Christ did not take his Flesh from the Substance of his Mother, but from the Effence of the Father; or that the Word of the Father became Man; that he brought it from Heaven; or that we don't know whence he had it: And that the Union of the Divine and Human Nature was so effected, as that the Divine was rendered visible, and liable to Death.

The *Mennonites* teach farther, that Christians are not allow'd to swear; to exercise any Civil Magistrature; to use the Sword, nor even for the Punishment of Criminals. They add, that Ministers of the Word are not permitted to receive any Wages for their Work; that they must not baptize little Children; and that the Souls of Men after Death rest in an unknown Place till the Day of Judgment.

The *Mennonites* are said to be divided into Sects, whereof there are two Principal. The *Mennonites of Friesland*, and those of *Flanders*.

The latter exercise a very strict Church-Discipline, and Excommunicate for the slightest Offence; nor do they hold it lawful to have any Society or Communication with those Excommunicated. Those of *Friesland*, on the contrary, receive into their Communion such as are Excommunicated by the others; whence they are call'd *Stereosarii* and *Barbarille*. Their Discipline is very remiss.

They recommend an universal Toleration of Religions very earnestly, and receive all kind of Persons into their Assemblies, provided they be of good Morals, and believe the Scripture to be the Word of God; however divided they may be as to the particular Articles of Faith.

Tho' the *Mennonites* usually pass for a Sect of Anabaptists, yet *M. Her. Scbin*, who has published their History and Apology, maintains that they are not Anabaptists, either in Principle, or by Origin: He owns they baptize none but Adults; but then, neither do they re-baptize any who had received it in their Childhood. They speak with a great deal of Prudence and Reserve as to the extraordinary Operations of the Holy Spirit; and are far from the Fanaticism of the old Anabaptists. No People are more submissive to Magistrates, or carry Passive Obedience farther than they. Far from Rebellion; they condemn even the most just War, &c.

**MENOLOGY** in the Greek Church, is much the same with the *Martyrology*, or *Calendar* in the Latin. See *MARTYROLOGY* and *CALENDAR*.

It is divided into the several Months in the Year; and contains an Abridgment of the Lives of the Saints; with a bare Commemoration of the Names of such whose Lives were never written. The *Greeks* have various *Menologies*, The *Romans* tax them with inferring divers Heretics in their *Menologies* as Saints. *Bailler* treats of them at large.

The Word comes from the Greek *μην* Month, and *λογος*, Discourse.

**MENSALIA**, and **MENSALES**, were such Parsonages, or Livings as were formerly united to the Tables of Religious Houses; and therefore by Canonists call'd *Menfial Benefices*. See *PARSONAGE* and *BENEFICE*.

**MENSES**, *Catamenia* in Medicine, &c. The Monthly Evacuations of Women not with Child, nor giving suck; so call'd from *Menfis*, Month, the Period wherein they return. They are also called *Flowers*, *Courses*, &c.

The *Menses* make one of the most curious and difficult Phenomena in the whole human Body; for the Explanation whereof, many Hypotheses have been framed: tho' the Matter is yet scarcely ascertained.

'Tis generally agreed by all, that the Necessity Women are under for some extraordinary Supply to compensate the Expence, and support them during the time of Gestation, was the final Reason why this Redundance at other times was given them. But this is all they agree in. Some not content with this Occasion alone, will have the *Menstruous Blood* offend in Quality more than in Quantity; which they argue from the Pain it gives many Women in the Evacuation. They add, that its Malignity is so great, that it excoriates the Parts of Men by mere contact; that the Breath of a *menstruous* Woman will give a permanent Stain to Ivory, or a Looking-Glass; that a little of the Blood drop'd on any Vegetable, blights, or renders it sterill; that if a pregnant Woman be defiled with the *Menses* of another Woman, she miscarries; that if a Dog taste them, he runs Mad, and grows Epileptic; All which, with many more Fables of the same kind, tho' related by great Authors, *Dr. Drake* rejects, as too ridiculous to need a Refutation.

Others ascribe this Effect to an imaginary Dominion of the Moon over the Bodies of Women. This was formerly the prevailing Opinion; tho' the smallest Reflection would have shewn them the weakness of it: For had this Purgation been owing to the Influence of the Moon, all Women of the same Age and Temperament, would have found it at the same Periods and Revolutions of the Moon, i. e. at the same time; which all Experience shews to be false.

There are two other Opinions which carry with them a great deal of Probability, and are argued with a great deal of Strength and Reason. In both which, the Quality of the Blood is allow'd to be Innocent; but they still differ about the Reason of its Issue. The former is that of *Dr. Bohn* and *Dr. Friend*, who maintain this Flux to be the result of a *Pletora*, or Plenitude; and to be evacuated only for Relief against the Quantity.

*Dr. Friend*, who has maintain'd the Cause of a *Pletora* with the greatest Strength and Clearness, supposes that this *Pletora* arises from a Coacervation in the Blood-Vessels of a superfluous of Aliment, which he thinks remains over and above what is expended by the ordinary ways; and that Women have this *Pletora*, and not Men, because their Bodies are more humid, and their Vessels, especially the Extremities of them, more tender, and their manner of living generally more unactive than that of Men; and that these things concurring, are the occasion that Women do not perspire sufficiently to carry off the superfluous alimentary Parts, till it be accumulated in such quantity as to distend the Vessels, and force its way thro' the Capillary Arteries of the Uterus. It is supposed to happen to Women more than the Females of other Species, which have the same Parts, because of the erect Posture of the former; and the *Vagina*, and other Canals, being perpendicular to the Horizon; so that the Pressure of the Blood is directed towards their Orifices: Whereas in Brutes, they are parallel to the Horizon, and the Pressure wholly on the Sides of those Vessels. The Discharge, he thinks, happens in this Part rather than in any other, as being more favoured by the Structure of the Vessels; the Arteries being very numerous, and the Veins sinuous and winding, and therefore more apt to retard the Impetus of the Blood, and consequently, in a *Pletoric* Case, to occasion the Rupture of the Extremities of the Vessels, which may last, till by a sufficient discharge the Vessels are cas'd of their Over-load.

This is the Substance of that great Man's Theory, from whence he very Mechanically, and very Philosophically accounts for the Symptoms.

To his Argument, why Women have *Menses* rather than Men, we may add from *Boerhaave*, that in the former, the *Ovary* is wider, and stands farther out, and the *Ovary* farther in; the *Ovary* narrower, and farther

farther apart, and the lowest of them, as well as the lower Eminences of the *Os Pubis* farther outwards than in the latter. Hence in Women, the Latitude or Expansion about these Bones, and the Capacity of the *Pelvis*, is vastly great in proportion to those of Men; and yet in a Woman not pregnant, there is not much to fill this Expanse. Again, the fore-side of the *Thorax* is smoother in Women than in Men, and the Blood-Vessels, Lymphatics, adipose and nervous Vessels, Membranes and Fibres, are much laxer in Women than in Men: whence all their Cavities, Cells, Vessels, &c. are more easily repleted, and the Humours aggregated in them; besides that, they are found to perspire less than Men, and to arrive much sooner at their Maturity, or *Ætate* of Increase. To which he adds the Consideration of the soft pulpy Texture of the *Uterus*, and the vast number of Veins and Arteries it is fill'd withal.

Hence, a healthy Maid, being arrived at her Growth, begins to prepare more Nutrimēt than is required for the support of the Body; which, as there is not to be any farther accretion, must of necessity fill the Vessels, and especially those of the *Uterus*, and Breasts, as being the least compressed. These will be dilated more than the others; whence the lateral *Vasculæ* evacuating their Humour into the Cavity of the *Uterus*, it will be fill'd, and extended: Hence, a Pain, Heat, Heaviness, will be felt about the *Loin*s, *Pelvis*, &c. the Vessels of the *Uterus* at the same time will be so dilated, as to emit Blood into the Cavity of the *Uterus*, its Mouth will be lubricated and loosened, and Blood issue out. As the Quantity of Blood is diminished, the Vessels will be less press'd, and will contract themselves closer, so as again to retain the Blood, and let pass the greater part of the *Serum*; till at length, only the usual *Serum* passes. Again, there are more Humours prepar'd, which are more easily lodged in Vessels once dilated; hence the *Menstrua* go, and return at various Periods in various Persons.

This Hypothesis, however plausible, is opposed by *Dr. Drake*, who maintains that there is no such Repletion, or at least that it is not necessary to *Menstruation*. Arguing, That if the *Menstrua* were owing to a *Pletora* so accumulated, the Symptoms would arise gradually, and the Heaviness, Stiffness, and Inactivity; necessary Symptoms of a *Pletora*, would be felt long before the Period were completed, and Women would begin to be heavy, and indispos'd soon after Evacuation, and the Symptoms increase daily: Which is contrary to all Experience; many Women, who have them regularly and easily, having no warning, nor other Rule to prevent an indecent Surprise, than the measure of the Time; in which, some that have slip'd, have been put to Confusion and Shifts, no ways consistent with the notice a *Pletoric* Body would give. He adds, that even in those who are difficultly purged this way, the Symptoms, tho' very vexatious and tedious, do not make such regular Approaches, as a gradual Accumulation necessarily requires. If we consider what violent Symptoms come on in an Hour, we shall be extremely puzzled to find the mighty Accession of Matter which should in an Hour or a Day's time make such great Alterations. According to the Hypothesis, the last contributes no more than the first, and of Consequence, the Alteration should not be greater in the one than the other; setting aside the bare Erroptio.

This is the substance of what is argued against *Dr. Friend's* Theory; which, it must be own'd, notwithstanding these Objections, is still the most rational and consistent that has yet been advanced.

Those who oppose it, give into the Doctrine of Fermentation, and maintain the Evacuation of Blood, on those parts, to be the Effect of an Effervescence, or Ebullition of the Blood. This Opinion has been maintained by many, particularly *Dr. Charlevoix*, *Bate*, *De Graaf*, and *Drake*. The two first of which suppose a Ferment peculiar to the Women which produces this Flux, and affects that part only, or at least principally. *Dr. Graaf*, less particular in his Notion, only supposes an Effervescence of the Blood rais'd by some ferment, without assigning how it acts, or what it is. The sudden Turgescence of the Blood, occasion'd them all to think, that it arose from something still then extraneous to the Blood, and led them to the Parts principally affected, to seek for an imaginary Ferment, which no Anatomical Enquiry could ever shew, or find any Receptacle for, nor any Reasoning necessarily infer. Again, that Heat which frequently accompanies this Turgescence, led them to think the Cause more than a *Pletora*, and that there was some extraordinary intestine Motion at that time.

*Dr. Drake* improves on the Doctrine of a Ferment; and contends not only that it is necessary there should be a Ferment, but a Receptacle also for this Ferment: Concluding from the Suddenness and Violence of the Symptoms, that a great quantity must be convey'd into the Blood

in a short time, and consequently, that it must have been ready gather'd in some Receptacle, where, while it was lodg'd, its Action was restrained. But he goes farther still, and pretends to ascertain the Place, &c. both of the one and the other, making the Gall-Bladder to be the Receptacle, and the Bile the Ferment. This Liquor he thinks well adapted to raise a Fermentation in the Blood, when discharged into it in a Quantity: And as it is contain'd in a Receptacle that does not admit of a continual Issue, may be there reserved, till in a certain Period of Time, the Bladder becoming tardid and full through the Compression of the incumbent *Viscera*, it emits the Gall: which, by the way of the *Lactæa*, infusing itself into the Blood, may raise that Effervescence which occasions the Aperture of the Uterine Arteries.

To confirm this, he alleges, that Persons of a bilious Constitution, have the *Menstrua* either more plentifully, or more frequently than others; and that Dilemperis manifestly bilious, are attended with Symptoms resembling those of Women labouring under difficult *Menstruation*. If it be objected, that on this foot, Men should have *Menstrua*, as well as Women; he answers, that Men don't abound in Bile so much as Women; the Pores of the former being more open, and carrying off more of the ferrous part of the Blood, which is the Vehicle of all the other Humours; and, consequently, a greater part of each is discharged thro' them than in Women; wherein the Superfluity must either continue to circulate with the Blood, or be gathered in proper Receptacles, which is the Case in the Bile. The same Reason he gives why *Menstruation* should not be in Brutes; the Pores of these being manifestly more open than those of Women, as appears from the Crop of Hair which they bear; for the Vegetation whereof, a large Cavity, and a wider Aperture of the Glands is necessary, than where no such thing is produced. Yet there is some difference between the Males and Females even among these, the latter having their *Menstrua*, tho' not so often, nor in the same Form and Quantity, as Women.

He adds, that the several Phenomena of the *Menstrua*, whether in a natural, a regular, or diseas'd Case, flow naturally and readily from this Hypothesis; and that whatever may be accounted for from a *Pletora*, or from any particular Ferment, may, without any straining, be apply'd to this.

The Root of black Hellebore and Steel, are the principal Remedies for Obstructions of the *Menstrua*; the former, is almost infallible, and in many Cases where the latter is not only ineffectual, but improper; as in *Pletoric* Habitus, for with such, Steel will sometimes raise *Hysterice* Convulsions, Convulsions, and a kind of Uterine *Furo*; whereas Hellebore thins the Blood, and disposes it for a Discharge without making it more impetuous. So that tho' each provoke the *Menstrua*, yet they do it by different ways; Steel by increasing the Blood's Velocity, and giving it a greater Moment against the Uterine Arteries; and Hellebore by dividing it, and rendering it more fluid. See HELLEBORE and CHALYBEAT.

MENSIS  
MENSIS CHYMICUS } Sec { MONTH.  
MENSIS VETITUS } MENSTRUUM.  
MENSTRUUM, or MENSTRUUMS, a Term in Medicine, apply'd to the Blood which flows from Women in their ordinary monthly Purgations. See MENSIS.

The *Menstrual* Blood is the excess, or redundance of the Blood in the Body. It may be defined an Excrement serving for the Generation, as well as Nutriture of the *Fetus* in the Womb, and which at other times is evacuated Monthly.

Of all Animals, there is none besides Women, and perhaps Apes, which have their *Menstrual* Purgations. *Hippocrates* says, that the *Menstrual* Blood gnaws and tears the Earth like Vinegar. *Pliny* and *Colometius* add, that it burns Herbs, kills Plants, tarnishes Looking-Glasses, and that Dogs which taste it, run mad. But this is all fabulous; it being certain that this Blood is the same with that in the Veins and Arteries. By the *Jewish* Law, a Woman was unclean while the *Menstrual* Blood flow'd; and the Man who touch'd her, or the Moveables she had touch'd, were declared unclean. *Levit. Chap. XV.*

MENSTRUUM, or DISSOLVENT, in Chymistry, any Liquor that will dissolve, i. e. separate the Parts of hard Bodies. See DISSOLVENT and DISSOLUTION.

Thus *Aqua Regalis* is a *Menstrum* for Gold; *Aqua Fortis*, and Spirit of Nitre, for most other Metals; Common Water for Salts, &c. See GOLD, SILVER, SALT, &c.

In Pharmacy, it is chiefly defin'd a Body that will extract the Virtues of Ingredients by Infusion, Decoction or the like. See INFUSION, DECOCTION, &c.

The Term *Menstrum* takes its rise from this, that some Chymists pretend the compleat Dissolution of a mix'd Body can't be effected in less than 40 Days, which Period they call a *Philosophical Month*.

*Menstruum* is properly defined a Body, which being applied, or intermixed with another, does so dissolve it, as that all the dissolving Parts float among the Parts dissolved; and so divides it into its minutest Parts, as that the Parts of the Dissolvent are intermixed with those of the Body dissolved. Whence it appears, that every *Menstruum* in dissolving a Body, is likewise dissolved itself; so as with the Body it dissolves, to make up one Body. A Knife therefore divides Bread, but is not on that account a *Menstruum*; as it does not constitute one Body with the Bread: but Water boild with the Bread is a *Menstruum*, with regard to the Bread, as it only makes up one Body therewith. See DISSOLUTION.

The ancient Chymists were very careful in all their Processes, that neither the Degree of Fire, nor the *Menstruum*, might deceive 'em.

All *Mensura*, at the time they act as such, that is, at the time they are dissolving, act as Liquids; whether such *Mensura* be a Liquid or a Solid. Thus, e. g. Silver is a *Menstruum* with regard to Gold; for if you take an Ounce of Silver, melt it at the Fire, and add a Grain of Gold; all the Parts of the Silver will intermix themselves with the Parts of the Gold: so, as that the Gold and Silver, which before were separate, now make one Mass. But Gold and Silver are only *Mensura* as they are dissolved by the Fire; i. e. as they are fluid.

All *Mensura* may be divided into two Classes; the first consists of such as are *fluid*; the second of such as are *solid*: that is, they are either actually divided, or they may be so 'er they act.

*Fluid Mensura* are Water, Dew, Oils, Saline and Acid Spirits, *Alkali*, Salts, &c. and *Solid Mensura*, are such as must be made fluid 'er they will dissolve; such are most Salts, Nitre, Vitriol, &c. See WATER, SALY, VITRIOL, &c.

As to the *Action* of *Mensura*; Sir Isaac Newton accounts for it from the Acids wherein they are impregnated. The Particles of Acids are found to be endued with a strong attractive Force, wherein their Activity consists, and by virtue whereof they dissolve Bodies. See ATTRACTION. These Acids be supposed of a middle Nature between Water, and hard Bodies, and to attract both. By this Attraction they gather together about the Particles of Bodies, whether metallick, stony, or the like, and adhere to them very close, so as scarce to be separated from 'em by Distillation, or Sublimation. Thus strongly attracted, and gather'd together on all sides, they raise, disjoin, and shake asunder the Particles of Bodies, i. e. they dissolve them; and by the attractive Power whereby they rush against the Particles of the Bodies, they move the Fluid, and so excite Heat, shaking some of the Particles to that degree, as to convert 'em into Air, and so generating Bubbles. See ACID.

Dr. Acid gives us the Theory or Foundation of the *Action* of *Mensura*, in the following Propositions.

1<sup>o</sup>. Two Corpuscles may be placed so near each other, without touching, as that the Force wherewith they attract each other, shall easily exceed that of their Gravity.

2<sup>o</sup>. If a Corpuscle placed in a Fluid be every way equally attracted by the ambient Particles, the Corpuscle will not be put in any Motion; but if it be attracted more by some of the Particles than by others, it will then tend towards that Quarter where the Attraction is the strongest: and the Motion thus produced will be correspondent to the Inequality of the Attraction: That is, if the Inequality be great, the Motion will be so; and if little, little.

3<sup>o</sup>. Corpuscles swimming in a Fluid, and attracting each other more than the interposed Particles of the Fluid; those Particles of the Fluid will be driven aside, and the Corpuscles approach each other with a Force equal to the Excess of their mutual Attraction, beyond the Attraction of the Particles of the Fluid.

4<sup>o</sup>. If a Body be placed in a Fluid whose Parts attract the Particles of the Fluid more strongly than those Particles are attracted by one another; and if in the Body there be several Pores pervious to the Particles of that Fluid, the Fluid will presently diffuse itself through the Pores; and if the Connection of the Parts in that Body be not so strong but that it may be exceeded by the Impetus of the Particles rushing together; the immers'd Body will undergo a Diffusion.

Hence, for a *Menstruum* to be fit to dissolve a given Body, there are three things required. 1<sup>o</sup>, That the Parts of the Body attract the Particles of the *Menstruum* more strongly than those are attracted by each other. 2<sup>o</sup>, That the Body have Pores adequate and pervious to the Particles of the *Menstruum*. 3<sup>o</sup>, That the Cohesion of the Parts of the Body be not so strong but that it may be torn asunder by the Impetus of the Particles rushing together. Hence also it follows, that the Par-

ticles which constitute Spirit of Wine, are more strongly attracted by each other, than by those of a saline Body immersed in it.

Hence we see the Reasons of the different Effects of different *Mensura*; why some Bodies, for instance Metals, dissolve in a saline *Menstruum*: Others again, as Resin, in a sulphureous one, &c. particularly why Silver dissolves in *Aqua fortis*, and Gold only in *Aqua Regalis*; all the Varieties whereof are accountable for, from the different Degrees of Cohesion, i. e. of Attraction in the Parts of the Body to be dissolved, the different Diameters and Figures of its Pores, the different Degrees, of Attraction in the *Menstruum*, and the different Diameters and Figures of its Parts. See COHESION.

Suppose, e. g. the Attraction of Gold to that of Silver, to be as A to B; and of Silver to *Aqua fortis* as b to d; but that of *Aqua fortis* to *Aqua Regia*, as d to e; let f signify the Magnitude of Particles in *Aqua fortis*, and r those in *Aqua Regia*; e the Cohesion of Gold, and e the Cohesion of Silver: If the Diameters of the Particles f, are greater than the Diameters of the Pores of Gold, they can never dissolve the Gold, let their attractive Force be ever so strong. But if  $\frac{b}{d}$  be greater than g, then the Silver will yield to the *Menstruum* whose Particles are f, and less than the Pores of the Silver; and if  $\frac{b}{d}$  be less than g, the Silver will never dissolve in the *Menstruum*, the Particles whereof are r, and the attractive Force e. But if  $\frac{a}{b}$  be greater than e, the *Menstruum* made up of the Particles r, and whose attractive Force is e, will be able to penetrate and dissolve the Gold.

How a *Menstruum* may suspend Bodies much heavier than itself, which very often happens, may be conceiv'd by considering, that the Parts of no Fluid can be so easily separated, but they will a little resist, or retard the Descent of any heavy Bodies through them; and that this Resistance is, *ceteris paribus*, still proportionable to the Surface of the descending Bodies: But the Surfaces of Bodies do by no means increase, or decrease, in the same Proportion as their Solidities do; for the Solidity increaseth as the Cube, but the Surface only as the Square of the Diameter. Small Bodies, therefore, will have much larger Surfaces, in proportion to their solid Contents, than larger Bodies will; and consequently when exceedingly diminished, may easily be buoyed up in the Liquor. See DESCENT, RESISTANCE, &c.

*MENSTRUUM PERACIUM*, a Name Mr. Boyle gives to a *Menstruum* he extracted from Bread only, that would prey on Bodies more compact than many hard Minerals, nay even on Glass, and do many things that *Aqua fortis* would not do: With this he drew Tinctures not only from Crude Corals, but also from the *Lapis Hematites* and Granates, nay from Diamonds and Rubies. See DISSOLUTION.

*MENSURATION*, the Act or Art of *Measuring*. See MEASURING.

*MENTAL*, is understood of the Conception, or Operation of the Understanding: Thus a *Mental Prayer* is such a one as is made merely in the Mind, without pronouncing one word of it. A *Mental Reservation*, &c. See RESERVATION.

*MENTUM*, in Anatomy, is the lower Part of the Face, beneath the Mouth; which we otherwise distinguish by the Name of *Chin*.

*MENUET*, or *MINUET*, a kind of Dance, the Steps whereof are extremely quick, and short: It consists of a Coupee, a high Step, and a Balance; it begins with a Beat, and its Measure, or Motion, is Triple.

*MEPHITES*, and *MEPHITICAL Exhalations*, any poisonous and noxious Steams issuing out of the Earth, from what Cause soever. See POISON.

The most remarkable Places of this kind is the *Grotta de Cami* near *Parozoli*, about two Miles from *Naples*, in *Italy*; the Steams of which kill Dogs, or other Animals, when brought within its reach: A very curious Account of which, and the manner of its Efficacy, is given by Dr. Mead in his Essay on Poisons. See GROTTA.

*MERCERS Company*. See COMPANY.

*MERCERS-Chapel School*. See SCHOOL.

*MERCHANTISE*, or *MERCANTILE Profession*, the Function of a Merchant; or the Art, Method, &c. of exercising a Whole-Sale Commerce. See COMMERCE.

The *Mercantile Profession* is esteemed Noble, and independent. In *France*, by two Arrests of Louis XIV. the one of 1669. the other of 1701. the Nobility are allow'd to trade, both by Land and Sea, without derogating from their Nobility: And we have frequent Instances of Merchants established in that Country, in regard of the Utility of their Commerce, and the Manufactures they have set up. In *Bretagne*, even a Retail Trade does not derogate from the Nobility. When the Nobles of the Province are disposed for Commerce, they let their Nobility sleep, that

is, they don't lose it, but only cease to enjoy the Privileges of their Noblesse while their Commerce continues, and reassume it, by giving over Trade, without any Letters or Instrument of Re-Habilitation. In Republicks it is still more valued: but no where more than in *England*, where the younger Sons and Brothers of Peers are frequently bred up to Merchandize. Add to this, that many of the *Italian Princes* are the principal Merchants of their States; and think it no discredit to make their Palaces serve as Warehouses: And that many of the Kings of *Africa*, most of those of the Coast of *Africa* and *Guinea*, traffick with the *Europeans*, sometimes by their Ministers, and sometimes in Person.

The Qualifications requisite for the Profession of a Merchant, are, 1. To keep Books, single or double, viz. Journals, Ledgers, and others. 2. To draw Invoices, Contracts, Charter-Parties, Policies of Assurance, Bills of Exchange, Letters Missive, &c. 3. To know the Relation between the Monies, Weights, and Measures of several Countries. 4. The Places where the several Kinds of Merchandizes are manufactured, in what manner made, what the Materials composed of, and whence; the Preparation the Materials require before they are wrought; and the Merchandizes afterwards. 5. The Lengths and Breadths of Stuffs, as Silks, Wools, Hairs, Lincens, &c. the Regulations of the Place where they are manufactured, and their different Prices at different Seasons. 6. The Dyng, and the Ingredients for the Formation of the different Colours. 7. The Merchandizes that abound, or are more rare in one Country than another; their Kinds and Qualities; and the manner of Trafficking them to the best Advantage, whether by Land, by Sea, or Rivers. 8. The Commodities permitted or prohibited, both for the Import and Export of a State. 9. The Price of Exchange according to the Course of several Places, and what it is that raises or lowers it. 10. The Duties to be paid both at the Import and Export of Wares, according to the Use of the Places, the Tariffs, Regulations, &c. 11. The manner of Packing, Baling, and Tanning Merchandizes, to keep them either in Magazines, or in Voyages, &c. 12. On what Terms a Merchant-Vessel may be Freight, and Assured. 13. The Goodness and Value of every thing requisite for the Construction or Refitting of Vessels, the Prices of Woods, Cordage, Masts, Anchors, Sails, and other Equipage. 14. The Wages ordinarily given Captains, Officers, and Sailors; and the manner of contracting with them. 15. The foreign Languages, which may be reduced to three principal ones, viz. the *Spanish*, used almost through all the *East*, particularly on the Coast of *Africa*, from the *Canaries* to the *Cape of Good Hope*; the *Italian*, used throughout the Coasts of the *Mediterranean*, and many Places of the *Levant*; and the *Turkish* or *German*, used throughout most Countries of the *North*. Lastly, the Consular Jurisprudence, the Laws, Customs, Companies, Colonies, Chambers of Assurance, Consulates in the several Countries; and in the general, all the Ordinances, Regulations, and Policies, relating to Commerce.

**MERCHANT**, a Person who carries on Merchandize, or sustains the Mercantile Profession. See **MERCHANTIZE**.

**MERCHANT-Man**. See **SHIP, VESSEL, CAPTAIN, &c.**  
**MERCHANT-Tailors Company** } See **COMPANY**.  
**MERCHANT-Tailors School** } See **SCHOOL**.

**MERCHANTAGE**, fee Law.  
**MERCATOR'S Chart, or Projection**, is a Sea-Chart, wherein the Parallels are represented by straight Lines; and the Meridians, likewise, by parallel straight Lines, whose Degrees, however, are not equal, but are continually enlarged as they approach nearer the Pole, in the same Proportion as the parallel Circles decrease towards them. See **PROJECTION**.

For the Construction, Use, Advantages, &c. hereof, see **Mercator's GeART**.

**MERCATOR'S Sailing**, is that performed by means of **Mercator's Charts**. See **Mercator's SAILING**.

**MERCURY**,  $\sigma$ , in Astronomy, the smallest of the inferior Planets, and the nearest the Sun. See **PLANET** and **SYSTEM**.

The mean Distance of this Planet from the Sun is to that of our Earth from the Sun as 387 to 1000; its Eccentricity 8 Degrees: The Inclination of its Orbit, that is, the Angle formed by the Plane of its Orbit with the Plane of the Ecliptic, is 6 Degrees 52 Minutes: Its Diameter to that of the Earth as 3 to 4; and therefore the Globe of **Mercury** will be to that of the Earth as 2 to 5. See **ECCENTRICITY, INCLINATION, DIAMETER, DISTANCE, &c.**

According to Sir *I. Newton*, the Heat and Light of the Sun on the Surface of **Mercury** is seven times as intense as on the Surface of our Earth in the middle of Summer; which, as he found by Experiments made for that purpose by a Thermometer, is sufficient to make Water boil. Such a degree of Heat therefore must render **Mercury** un-

inhabitable to Creatures of our Constitution: And if Bodies on its Surface be not inflamed and set on fire, it must be because their Degree of Density is proportionably greater than that of such Bodies with us. See **HEAT**.

The Revolution of **Mercury** round the Sun, or his Year, is performed in 87 Days, 23 Hours; his diurnal Revolution, or the Length of his Day, is not yet determined; nor is it certain whether he has such a Motion round his own Axis, or not. See **PERIOD, REVOLUTION, &c.**

What variety of Weather or Seasons it may be liable to, we are still at a loss; as not knowing the Inclination of his Axis to the Plane of his Orbit: The Force of Gravity on the Surface of **Mercury**, is seven times as strong as on the Surface of the Earth. Its Density, and, consequently, the Gravitation of Bodies towards the Centre, cannot be accurately determined; but no doubt it must exceed that of our Earth, by reason of the Excess of Heat there. See **GRAVITY, DENSITY, &c.**

**Mercury** changes its Phases, like the Moon, according to its several Positions with regard to the Sun and Earth; See **MOON**.

It appears full, in its superior Conjunctions with the Sun, because we can see the whole illuminated Hemisphere: But in its lower Conjunction, we only see the obscure, or unilluminated Hemisphere: In his Approach toward the Sun, his Light is eclipsed or horned. See **PHASES**.

The Situation of this Planet proves evidently, that the Hypothesis of *Ptolemy* is false: For **Mercury** is sometimes observed betwixt the Earth and Sun; and sometimes beyond the Sun. But the Earth is never found between **Mercury** and the Sun; which however must happen, if the Spheres of all the Planets encompass'd the Earth, as a Centre, according to the *Ptolemaic Scheme*. See **PTOLEMAIC SYSTEM**.

The Diameter of the Sun view'd from **Mercury**, would appear three times as big as it appears on our Earth; that Planet being thrice as near him as we are; and therefore the Sun's Disk would appear seven times as large as it appears to us.

Its greatest Distance from the Sun, with regard to us, never exceeds 28 Degrees, whence 'tis seldom visible; being most commonly either lost in the Sun's Light, or when the most remote from the Sun, in the Circumpolarum. The best Observations of this Planet, are those made when it is seen on the Sun's Disk; for in its lower Conjunction, it passes before the Sun like a little Spot, eclipsing a small part of his Body, only observable with a Telescope. The first Observation of this kind, was that of *Gassendi* in 1632. See **TRANSIT**.

To an Inhabitant of **Mercury**, the solar Spots will appear to traverse his Disk sometimes in a right Line from East to West, and sometimes Elliptically. As the other five Planets are above **Mercury**, their Phenomena will be nearly the same there, as with us. Venus and the Earth, when in opposition to the Sun, will shine with full Orbs, and afford a noble Light to that Planet.

**MERCURY**, in Natural History, a fluid, mineral Matter, perfectly resembling Silver in fashion. See **MINERAL**.

**Mercury** is known under a great number of Names: The common Name among the Aorientals was *Hysbargyrus*, *q. d.* Water of Silver. The Moderns commonly call it **Mercury**, from some supposed Relation it bears to the Planet of that Name. In *English* it is popularly call'd *Quick-Silver*, from its Appearance. Many of the Chymists call it *Præter*, from the variety of Forms, Colours, &c. it passes thro' in their Preparations.

Naturalists are divided what Class of Fossils to range **Mercury** under: Some make it a *Metal*; others a *Semi-metal*; and others an imperfect *Metal*. See **FOSIL** and **SEMI-METAL**.

*Berhaave* observes, that it is very improperly call'd a *Metal*, inasmuch as it has not all the Characters of such a Body; nor scarce any thing in common with the other Metals, except Weight and Similarity of Parts: Thus, for Example, it is neither dissolvable by Fire, malleable, nor fix'd: In effect, it seems to constitute a peculiar Class of Fossils: and is rather the Mother, or Bags of all Metals, than a Metal itself. See **METAL**.

Perfect Metals, according to *M. Homburg*, &c. are nothing but pure **Mercury**, whose little Particles are penetrated on all sides, and fill'd with the Matter of Light, which unites and binds them together into a Mass, so that the Parts of fluid **Mercury**, which are supposed to be little solid Globes, in their Metallification are render'd rough and uneven, being pierced on all sides, and having their Pores or Perforations fill'd with the Matter of Light. By such means they lose their first Configuration, and the Politure or Smoothness of their Surfaces, which is one of the principal Causes of the fluidity of **Mercury**.

The Chymists make **Mercury** one of their Hypothetical Principles: Not, as *M. Homburg* observes, that it answers

the Character of a Principle, which is that whose Substance cannot be Analyzed, or reduced into Matters more simple; but because the Analysis has not yet been discovered; Tho' it is possible it may hereafter, there being little doubt but that Mercury is a Compound. This is the more probable, in regard Mercury may be destroy'd, which never happens to simple Bodies. The manner of destroying Mercury, is, first, by changing it into a perfect Metal, by introducing a sufficient quantity of Light within its Substance; and then exposing this Metal to a Burning-Glass, where, in a little time, it evaporates almost wholly into Smoke, leaving nothing behind but a light earthy Dust.

#### The Properties of MERCURY.

The Characters, or Properties of Mercury, are, 1. That of all Bodies it is the heaviest, after Gold; and still the purer it is, the heavier: Nay, some of the Philosophers even hold that Mercury well purged of all its Sulphur, would be heavier than Gold itself. The ordinary Proportion is that of 14 to 19. If any Mercury be found to weigh more than according to this Ratio, it may be safely concluded to have Gold in it. See WEIGHT.

The 2d Character of Mercury, is of all Bodies the most fluid; that is, its Parts separate, and recede from each other by the smallest Force. Consequently, of all Bodies it is that whose parts cohere the least, or are the least tenacious; and therefore of all others the least ductile and malleable. The parts of Water do not divide so readily as those of Quick-Silver; and the parts of Oil much less: There is a certain Tenacity even in the parts of Spirit of Wine which resists separation; but there is scarce any Cohesion at all in the parts of Mercury. See FLUIDITY and FIRMNESS.

The 3d Property of Mercury, which, indeed, depends on the ad, is, That of all Bodies it is divisible into the minutest parts. Thus, being exposed to the Fire, it resolves into a Fume scarce perceivable to the Eye; but in whatever manner it be divided, it still retains its Nature, and is the same Specific Fluid. For the Vapours of distill'd, or volatilized Mercury received in Water, or moist Leather, or the like, become pure Mercury; and if Mercury be mixed with other Bodies, in order to fix it, for it is scarce fixable of itself, it is easily separable from them again by Fire, and reducible into pure Mercury as before. See DIVISIBILITY.

The 4th Character is to be extremely Volatile, being convertible into Fume, even by a Sand-heat. In effect, it does not sustain the Fire long enough either to boil, or ignite. Tho' it must be added, if the Fire be at first very gentle, and increase by easy degrees, it may be retained therein a pretty long time, and be fixed so as at length to become ignited in the Crucible, as we learn from some very tedious Experiments made at Paris. See VOLATILITY.

The Gilders are but too well acquainted with the Vapours of Mercury, which frequently render 'em Epileptic, and Paralytic, and sometimes salivate them; being so penetrating a Nature, as to take away scirrhous Tumours, tho' very apt to reach and destroy the nobler Parts.

The 5th Property is, that it easily enters, and intimately adheres to Gold, less easily to the other Metals, with difficulty to Copper, and not at all to Iron. See AMALGAMATION.

Indeed we have heard much among the Adepts about making an Amalgama with Mercury and Iron; but the Experiment would never succeed with that Noble Chymist, Her. Boerhaave. 'Tis possible there may be some way of binding those two Bodies together; and no doubt an Amalgama might be made, if a large Quantity of Gold were added to the Iron: But then, if the Compound were beaten into a Dust, in Water, the Iron would wash away, and the Gold remain. On this Account it is, that such as have Occasion to handle Quick-Silver, always make choice of Iron-Instruments for that purpose. We have known Women, in a Salivation, to have their Ear-Rings grow white and soft with the Effluvia of the Mercury; and hence the Gilders, to lay Gold on any other Body, dissolve it in hot Mercury, which done, they apply the Solution on the Body to be gilt, suppose Silver; then setting it over the Coals, the Mercury flies away, and leaves the Gold adhering like a Crust to the Silver. Lastly, rubbing the Crust with Lapis Hematites, the Silver is gilt. See GILDING.

The 6th Character is, That of all Fluids, it is the coldest, and the hottest; supposing the Circumstances the same. Boerhaave shews, that Fire is equally diffused through all Bodies; and that there is in reality the same degree thereof in Mercury, as in Spirit of Wine; and yet if you try with your Finger, Mercury in the Cold, is much colder, and, over the same Fire, considerably hotter, than the Spirit. This property depends on the great Weight of Mercury: for the Heat and Cold of all Bodies is *estertis*

*paribus* as their Weights. Now, Mercury being 14 times heavier than Water; if both of them be exposed in a Winter's Night to the same Cold, the Mercury must be so much colder than Water, as it is heavier. So, also, if they be both apply'd to the same degree of Heat, while the Water becomes warm, the Mercury will be hot enough to burn the Hands. See HEAT and COLD.

The 7th Property is, that it is dissoluble by almost all Acids, and unites itself with them; at least with all fufil Acids. Thus it is dissolved in Oil of Vitriol, Spirit of Sulphur per Campanam, Spirit of Nitre, and Aqua regia.

It is prepared with Oil of Vitriol, into *Turbid Mineral*; with Spirit of Sulphur, into *Cinnabar*; with Aqua regia, or Spirit of Sea-Salt or *Sal gemma*, into corrosive Sublimate. See TURBID, CINNABAR, SUBLIMATE, &c.

Only Vinegar does not dissolve it; and hence we are furnished with a Method of detecting the Frauds of Druggists, &c. who make a practice of sophisticating Quick-Silver with Lead. Do but take a Morrar, and pound the Mercury, with Vinegar therein; if the Vinegar grow sweetish, it is a Proof there is a Mixture of Lead: If Copper have been mix'd with it, the Mercury will turn greenish, or bluish; if there be no Adulteration, the Mercury and Vinegar will both remain as before.

The 8th Property is, that it is the most Simple of all Bodies, next after Gold: Accordingly, we find it the same in all its parts, so far as our Observation goes. If a single Grain of Mercury be dissolved in Spirit of Nitre, a proportionable part of the Grain will be distributed into every minute Particle thereof; and by diluting the whole with an Ounce of Aqua Regia, the whole Grain of Mercury will be revived. Had we the Mercury of the Philosophers called also *Vital Mercury*, Mercury of Metals, &c. so much talked of; it is asserted it would be still vastly simpler than Gold: For, from Gold, we can sometimes separate Mercury, and sometimes Sulphur; but from pure Mercury nothing beside itself can be separated.

The 9th Property of Mercury is, not to be in any measure *Sharp*, for it shews no Acrimony in the Taste, nor does it corrode any Body; and if a Carcase were to be buried in Quick-Silver, it would there remain without being any way hurt. The extraordinary Effects, however, it produces in the Body, have given People a Notion of its being Acrid. But the Cause, that when received into the Blood, it acts by its Weight and Velocity; whence it tears and destroys the Vessels, and thus occasions those great Alterations, which lead the Chymists into their Mistakes.

In effect, all its medicinal Operations are to be accounted for from the Properties already enumerated.

#### MINES OF MERCURY.

The Chief Quick-Silver Mines, are those of Hungary, Spain, Frisk, and Peru. The greatest part of our Quick-Silver is brought us from Frisk, where there are abundance of Mines belonging to the Emperor, tho' now mortgaged to the Dutch. It is found under three several Forms. 1. In ruddy Globes or Clods, call'd *Cinnabar*. 2. In hard stony Globes, or a mineral Substance of a saffron, and sometimes a blackish Colour. 3. It is also found pure: For upon opening Holes in the Beds of Stones, &c. there sometimes gushes a Vein or Stream of pure Mercury, call'd *Virgin-Mercury*. This last sort is most valued: *Paracelsus* and *Basil Valentine* prefer it far to any other sort, for Chymical Operations. Dr. Brown assures us in his Travels, that enquiring of one of the Directors of the Quick-Silver Mines, wherein the Difference between this and common Mercury consisted; he was answered, That *Virgin-Mercury*, mix'd, and amalgamated with Gold, render'd the Sulphur of the Gold volatile; but this has been several times try'd without success.

#### Method of procuring or separating MERCURY from the Ore, or Earth.

They first grind the mineral Gleebe into Powder; this done, they pour a great Quantity of Water upon it, stirring and working the whole briskly about till the Water becomes exceeding thick, and turbid. This Water having stood till it be settled, they pour it off, and supply its place with fresh, which they stir, and work as before. This they repeat, and continue to do, till the Water at length comes away perfectly clear; then, all remaining at the bottom of the Vessel, is Mercury, and other metalline Matter.

To this Mercury, &c. they add the *Serria* of Iron, putting the whole in large Iron Retorts, and so distilling it; by which means all the heterogeneous, metalline and stony Part, is separated therefrom; and the Mercury left pure.

As to the Mercury in *Cinnabar*, they don't find it worth while to distil, and get it out; *Cinnabar* selling for a better Price than Mercury itself. See CINNABAR.

The miserable People condemn'd or hir'd to work in those Mines, all die in a little time. They are first affected with Tremors, and proceed to salivate; then their Teeth

drop out, and they are seized with Pains all over, especially in their Bones, which the Mercury penetrates, and thus die.

In Spain, the melting or exhalation of the Mineral is perfected with more Care, and with an Engine contrived for that purpose. As to the earthy Matter wherewith the Mercury is mixed, that of Spain is red, and speckled with black and white; and so hard, that 'tis not to be broken up with Gun-powder. In Hungary 'tis frequently a hard Stone, but ordinarily a reddish Earth. In *Franks* there is a soft Earth where the Virgin Quick-Silver is found, and a hard Stone which yields the common Mercury. The Mine of *Idria*, one of those belonging to *Frudi*, is so rich, that it yields always half Quick-Silver, sometimes two thirds. The Mine of *Juan Cabalosa*, or *Guan Cabalosa* in *Pern*, is still more considerable, the Earth is of a whitish red, like Bricks half burnt; 'tis first broke, then exposed to the Fire, by spreading it on a Lay of common Earth, wherewith the Grate of an Earthen-Furnace is cover'd; under which is lighted a little Fire of an Herb call'd by the *Spaniards*, *Jabo*; which is of that necessity in these Works, that the cutting it is prohibited for the space of 20 Leagues round. In proportion as the Mineral heats, the Mercury rises volatiliz'd into Smoke; which Smoke finding no vent thro' the Capial of the Furnace, which is exactly luted, escapes thro' a Hole made for the purpose, communicating with several Earthen Cucurbites fitted within one another. The Water at the bottom of each Cucurbite condensing it to Smoke, the Quick-Silver precipitates, and is taken up, when the Operation is over. In this Process, there are three things remarkable. The first, That the further the Cucurbites are from the Furnace, the more they are fill'd with Quick-Silver. The second, That at last they all grow fo hot, that they would break, were they not sprinkled from time to time with Water. Thirdly, It is observed that the Workmen employ'd in the Preparation of Mercury, never hold it long, but become paralytic, and die hectic. A Precaution they use, is to hold a piece of Gold in the Mouth, to imbibe the Effluvia, and intercept their Passage into the Body. Dr. *Pepe* tells us of one he saw in the Mines of *Franks*, who in half a Year's time was so impregnated with the Metal, that putting a piece of Brass in his Mouth, or even rubbing it in his Fingers, it would turn white as Silver.

The Method of purifying MERCURY, is, by washing it several times in Vinegar, wherein common Salt has been dissolved; or by passing, and repeating it frequently over a *Chamois* Skin. *Am. Pareus* tells us, that the best way is to make a Dog swallow a Pound at a time, and afterwards to separate it from the Excrements, and wash it in Vinegar.

The Uses of MERCURY are very considerable in Gilding, making Looking-Glasses, in refining Gold, &c. See each under its head, GILDING, REFINING, MIRROR, LOOKING-GLASS, &c.

But especially in Medicine, and particularly for the Cure of the Venereal-Disease, raising Salivations, and on other Occasions. See VENEREAL-DISEASE and SALIVATION. See also MERCURIALS.

The Preparations of MERCURY are very various; this Metal making use of the most considerable Articles in the Chymical Pharmacy. The most common Preparations are,

*Sweet Precipitate of MERCURY*, or *MERCURIUS Dulcis*, is compounded of crude Mercury drove over from Sea-Salt in a Retort, or revived from common Cinnabar, and dissolved in *Aqua fortis*; then a Brine prepared of Spring-Water and Sea-Salt is filter'd thro' a Cap-Paper, and the Solution of Mercury drop'd gradually into this Brine, whence there is a white Powder precipitated, which is to be wash'd from all its Acrimony with some simple distill'd Water, or warm Spring-Water, and the whole dried.

This is the common Precipitate of the Shops, usually call'd *White Precipitate*. Its Operation is mostly by Stool, sometimes by Vomit, and will salivate, if ordered accordingly. It is frequently mix'd with Pomatums for the Itch, and other Foulnesses of the Skin; for which purpose, 'tis necessary to keep the Body laxative, and to take something inwardly to take hold of the Mercurial Principles, and prevent their raising a Salivation, which they may otherwise do. See PRECIPITATE.

*Corrosive Sublimate of MERCURY*, is a Composition of Vitriol calcined to a redacta, common Salt, and purify'd Nitre, with crude Mercury, cleans'd by straining thro' a Leather, all rubb'd together in a Mortar, till the Salts are reduced into Powder, and not the least Globule of Mercury appears. The Mixture is then put into a Matrass, and that set in a Furnace with a Sand-heat, under which a Fire being kept to its greatest height for 12 or 15 Hours, the Mercury will be sublimate, and stick to the Top of the Vessel.

This Sublimate is a violent Escharotic, and eats away

proud Flesh; half a Dram of it dissolved in a Pound of Lime-Water, turns it yellow, which is then call'd *Pbz. gademæ* Water; it is used to wash Ulcers, and tetters, &c. Erasions. See SUBLIMATE.

*See Sublimate of MERCURY*, is a Composition of the preceding corrosive Sublimate with crude Mercury, ground together till no Mercury appear, and then put into a Bolt-head, well stop'd, and set in a Sand-heat, with a gentle Fire, for the Space of two Hours; which Heat is to be then increas'd for three Hours longer, and, lastly, made very strong, for as much more. When this is cold, the Glass is broke, and the Sublimate separated from the light Flowers at top, and the Duit at bottom. This is then powder'd a-fresh, and the Operation repeated in the same manner three times. If it be further repeated a sixth time, it is call'd *Calomel*. See CALOMEL.

*Fixing of MERCURY*. See FIXATION and PHILOSOPHER'S Stone.

MERCURY in Chymistry, or MERCURY of Bodies, is the third of the Principles, or Elements of natural Bodies; call'd also *Spiritus*. See PRINCIPLE.

In this Sense, Mercury is defined the most subtle, light, volatile, penetrating, and active part of all Bodies. See SPIRIT.

MERCURY of Metals, or of the Philosopher, is a pure, fluid Substance in form of common running Mercury, said to be found in all Metals, and capable of being extracted from the same. See METAL.

The Notion of Mercury of Metals, is founded on the common System of the Chymists, That Mercury, or Quick-Silver, is the Basis, or Matter of all Metals; and that Metals are only Mercury fix'd by a certain Sulphur. See SULPHUR, &c.

Mr. *Boyle* assures us, he had a way of drawing a true, running Mercury, or Quick-Silver from Antimony. See ANTIMONY.

MERCURY also serves as a general Title for Books, and Papers of News; so call'd from the Heathen Deity Mercury, supposed the Messenger of the Gods. See JOURNAL.

Thus we have *Mercenarius Galant*, *Manibus Mercenarius*, &c. See GALANT, &c.

In this Sense, Mercury is also figuratively apply'd to Persons who make it their Business to collect News, or to run about and diturbate it.

MERCURY, in Heraldry, is sometimes the Term, or Blazon for the Purple Colour in the Coats of Sovereign Princes. See PURPLE.

MERCURY is sometimes used for the *Torrucellian Experiment*, or *Barometer*. See BAROMETER.

The Mercury is not ordinarily contain'd in a Tube above the distance of 28 or 29 Inches, yet M. *Huygens* has found, that Mercury well purged, and in a close still Place, will be contain'd to the height of 72 Inches; which is a Phenomenon the Philosophers are all at a loss to account for. See TORRUCELLIAN Experiment.

MERCURIAL, something that consists of, or bears relation to Mercury, of one kind or another. See MERCURY.

Thus we say a *Mercenial Person*, to denote a Person of a brisk, volatile Complexion; such Persons being supposed by the Astrologers to be under the more immediate Dominion of the Planet Mercury.

So, also, we say *Mercenial Fumes*, *Mercenial Spirits*, &c. with reference to the Mineral Mercury.

MERCURIAL Phosphorus, see PHOSPHORUS.

MERCURIAL Unguents, *Frillions*, &c. see SALIVATION.

MERCURIAL Medicines, see MERCURIALS.

MERCURIALS, Medicines composed, or prepared of Mercury or Quick-Silver. See MERCURY.

The principal of the Class of *Mercenials*, are *Mercenarius dulcis*, or *white Precipitate of Mercury*; *sweet and corrosive Sublimate of Mercury*; *Calomel*; *Artificial Cinnabar*; *Turbid Mineral*; *Prince's Powder*; *Ætiops Mineral*, &c. See each under its proper Article, *Sublimate of MERCURY*, *Precipitate of MERCURY*, *CINNABAR*, *TURBITH*, *CALOMEL*, &c.

The Medicinal Efficacy of Mercury depends on its extreme Divisibility, and Fineness of its Particles, and on their Gravity or Weight; by means of the first, it finds a Passage into the inmost recesses of the Animal Structure, and, when properly guarded, does not exert itself till it comes in the remotest Scenes of Action; where most other Medicines either don't arrive, or at least not till their Force is rebated. This Property it has in common with Camphor. See CAMPHOR. By the latter, it is enabled to make still more considerable Alterations in the Animal OEconomy, by rendering the Fluids thinner, and breaking open the secretory Passages; but this Effect it has in common with *Chalybeats*. See CHALYBEATS. It may be here added, that the same Property whereby it becomes so powerful a Deobstruent, indicates, that 'tis to be avoided in Hæmics, and all Cases where the Constriction is drawn

low by too profuse Evacuations; in regard *Mercurials* tend to keep up or increase the Excess of Impetus in the Fluids, and that Over-Capacity in the secretory Orifices, wherein the Defect of such a Constitution seems to consist. See HECTIC.

**MERIDIAN**, in Astronomy, a great Circle of the Sphere, passing thro' the Zenith, Nadir, and Poles of the World; and dividing the Sphere into two Hemispheres, the one Eastern, and the other Western. See CIRCLE, and SPHERE.

Or, the *Meridian* is a Vertical Circle, as A Z B N, (Tab. Astronomy, Fig. 6.) passing thro' the Poles of the World, P and Q. See VERTICAL Circle.

It is call'd *Meridian*, from the Latin, *Meridies*, Noon, or Mid-day, by reason when the Sun is in this Circle, it is Noon in that Place.

**MERIDIAN**, in Geography, is a great Circle, as P A Q D, (Tab. Geography, Fig. 7.) passing thro' the Poles of the Earth P and Q, and any given Place, as Z. So that the Plane of the Terrestrial *Meridian*, is in the Plane of the Celestial one.

Hence, 1. As the *Meridian* invests the whole Earth, there are several Places situated under the same *Meridian*. And, 2. As it is Noon-Tide whenever the Centre of the Sun is in the *Meridian* of the Heavens 3 and as the *Meridian* of the Earth is the Plane of the former: it follows, that it is Noon, at the same time, in all Places situate under the same *Meridian*. 3. There are so many *Meridians* on the Earth, as there are Points conceived in the Equator. In effect, the *Meridians* always change, as you change the Longitude of the Place; and may be said to be infinite: Each several Place from East to West having its several *Meridian*. See LONGITUDE.

First **MERIDIAN**, is that from which the rest are accounted, reckoning from West to East. The first *Meridian* is the beginning of Longitude. See LONGITUDE.

The fixing of a first *Meridian* is a matter merely arbitrary; and hence different Persons, Nations, and Ages, have fix'd it differently; whence some confusion has aris'd in Geography. The Rule among the Antients was to make it pass thro' the Place furthest to the West that was known. But the Moderns knowing, that there is no such Place in the Earth as can be esteem'd the most Westerly; the way of computing the Longitudes of Places from one fix'd Point is much laid aside.

*Ptolemy* assum'd the *Meridian* that passes thro' the furthest of the Canary Islands as his first *Meridian*; that being the most Western Place of the World then known. After him, as more Countries were discovered in that Quarter, the first *Meridian* was removed further off. Some fix'd it to the Island of St. Nicholas; *Hondius* to the Isle of St. James; others to the Island *Les Corvo* one of the *Azores*. The latest Geographers, particularly the Dutch, have pitch'd it on the *Pike of Teneriff*; others to the Isle of *Palm*, another of the *Canaries*; and, lastly, the French, by Command of their King, to the Island of *Fero*, another of the *Canaries*.

But, without much regard to any of these Rules, our Geographers, and Map-Makers, frequently assum'd the *Meridian* of the Place where they live, or the Capital of their Country for a first *Meridian*, and thence reckon the Longitudes of their Places.

The Astronomers in their Calculations usually chuse the *Meridians* of the Place where their Observations were made, for their first *Meridian*, as *Ptolemy* at *Alexandria*; *Tycho* Brabe at *Uranibourg*; *Riccioli* at *Bologna*; *Mr. Flamsteed* at the Royal Observatory at *Greenwich*; the French at the Observatory at *Paris*.

In the *Philosophical Transactions*, there is a Suggestion, that *Meridians* vary, in Time. This seems very probable from the old *Meridian-Line* in the Church of St. *Petronius* in *Bononia*, which is found to vary no less than 8 Degrees from the true *Meridian* of the Place at this time; and from that of *Tycho* at *Uranibourg*, which *M. Picart* observes, varies 18' from the modern *Meridian*. If there be any thing of Truth in this Hint, *Dr. Wallis* says, the Change must arise from a change of the Terrestrial Poles (here on Earth, of the Earth's diurnal Motion) not of their pointing to this or that of the fixed Stars: For if the Poles of the diurnal Motion remain fixed to the same Place on the Earth, the *Meridians* which pass through these Poles must remain the same.

But the Notion of the Changes of the *Meridian* is overthrow'n by an Observation of *M. Casselles* of the French Academy of Sciences, who, when in *Egypt*, found that the four sides of a Pyramid built 3000 Years ago, still look'd very exactly to the four Cardinal Points. A Position which can never be look'd on as fortuitous.

**MERIDIAN** of a Globe, or Sphere, is the Brazen Circle, in which the Globe hangs and turns. See GLOBE.

It is divided into four 90's, or 360 Degrees, beginning at the Equinoctial: On it, each way, from the Equinoctial,

is counted the South and North Declination of the Sun or Stars: And on the Terrestrial Globe, the Latitude of Places North or South. There are two Points on this Circle, call'd the *Poles*: and a Diameter continued from thence through the Centre of either Globe, is call'd the *Axis*, of the Earth or Heavens on which they are suppos'd to turn round. See POLE and AXIS.

On the Terrestrial Globes there are usually 36 *Meridians* drawn; one through every tenth Degree of the Equator, or through every tenth Degree of Longitude.

The Uses of this Circle are, to set the Globes to any particular Latitude; to shew the Sun's or a Star's Declination, Right Ascension, greatest Altitude, &c. See GLOBE.

**MERIDIAN Line**, an Arch, or part of the *Meridian* of a Place; terminated, each way, by the Horizon: Or a *Meridian* is the Intersection of the Plane of the *Meridian* of the Place, with the Plane of the Horizon; vulgarly call'd a North and South Line; because its Direction is from one Pole towards the other. See MERIDIAN.

The Use of *Meridian Lines* in Astronomy, Geography, Dialling, &c. is very great; and on its Exactness all depends: Whence infinite Pains have been taken by divers Astronomers to have it to the last Precision. *M. Cassini* has distinguish'd himself by a *Meridian Line* drawn on the Pavement in the Church of St. *Petronia* at *Bologna*, the largest and most accurate in the World. In the Roof of the Church, 1000 Inches above the Pavement, is a little Hole through which the Sun's Image, when in the *Meridian*, falling upon the Line, marks his Progress all the Year. When finished, *M. Cassini*, by a public Writing, inform'd the Mathematicians of *Europe*, of a new Oracle of *Apollo* or the Sun established in a Temple, which might be consulted with entire Confidence as to all Difficulties in Astronomy. See SOLARICE.

To draw a *Meridian Line*.

Knowing the South Quarter pretty nearly, observe the Altitude F E (Tab. Astronomy, Fig. 8.) of some Star on the Eastern side thereof not far from the *Meridian*, H Z R N. Then, keeping the Quadrant firm on its Axis, so as the Plummet may fall on the same Degree, only directing it to the Western side of the *Meridian*, wait till you find the Star has the same Altitude as before, *f. e.* Lastly, bisect the Angle E C E form'd by the Intersection of the two Planes wherein the Quadrant is placed at the time of the two Observations, by the right Line H R. This H R is a *Meridian Line*.

Or thus;

On a Horizontal Plane, from the same Centre C, (Fig. 9.) describe several Arches of Circles BA, b a, &c. And on the same Centre C, erect a Style or Gnomon perpendicular to the Plane ACH, a foot, or half a foot long. About the 21st of June, between the Hours of 9 and 11 in the Morning, and between 1 and 3 after Noon, observe the Points B b, &c. A a, &c. wherein the Shadow of the Style terminates. Bisect the Arches AB, ab, &c. in D, d, &c. If then the same right Line D E bisect all the Arches AB, a b, &c. it will be the *Meridian Line* sought. In regard the Extremity of the Shadow is somewhat hard to determine, 'tis best to have the Style flat a-top, and to drill a little Hole, noting the lucid Spot projected by it on the Arches A B and a b, instead of the Extremity of the Shadow. Otherwise the Circles may be made with yellow, instead of black, &c.

Several Authors have invented particular Instruments and Methods for the describing of *Meridian Lines*, or rather for the determining equal Altitudes of the Sun in the Eastern and Western Parts of the Heavens; as *Mr. Grey*, *Mr. Derham*, &c. in the *Philos. Transf.* But as the former of the Methods above delivered, suffices for Astronomical Observations, and the latter for more ordinary Occasions, we shall forbear to give any Descriptions thereof.

From what has been shewn, it is evident that whenever the Shadow of the Style covers the *Meridian Line*, the Centre of the Sun is in the *Meridian*; and therefore it is then Noon. And hence the Use of a *Meridian Line* in adjusting the Motion of Clocks, &c. to the Sun. Hence, also, if the *Meridian Line* be bisected by a right Line O V, drawn perpendicularly through the Point C; O V will be the Intersection of the *Meridian*, and first Vertical; and, consequently, O will shew the East Point, and V the West. Lastly, if a Style be erected perpendicularly in any other horizontal Plane, and a Signal be given when the Shadow of the Style covers the *Meridian Line* drawn in another Plane, noting the Apex or Extremity of the Shadow projected by the Style, a Line drawn from that Point thro' that wherein the Style is rais'd will be a *Meridian Line*. See MERIDIAN Altitude.

**MERIDIAN Line** on a Dial, is a right Line arising from an Intersection of the *Meridian* of the Place with the Plane of the Dial. See DIAL.

This is the Line of twelve a-clock; and from hence the Division of the Hour-Lines begins.

**MERIDIAN MAGNETICAL**, is a great Circle passing thro' or by the Magnetical-Poles; to which *Meridian* the Compass (if not otherwise hindered) hath respect. See **MAGNET AND COMPASS**.

**MERIDIAN ALTITUDE** of the Sun or Stars, is, their Altitude when in the *Meridian* of the Place where they are observed. See **ALTITUDE**.

The *Meridian Altitude* may be defined an Arch of a great Circle perpendicular to the Horizon, and terminated between the Horizon and the Star then in the *Meridian* of the place. See **SUN, STAR, PLANET, &c.**

To take the *Meridian Altitude* of the Stars.

Astronomers make two principal kinds of Observations of Stars; the one when they are in the *Meridian*, and the other when in Vertical Circles. See **OBSERVATION**.

For *Meridian Observations*; there are two Instruments principally used, the *Quadrant* and *Gnomon*. See **QUADRANT AND GNOMON**.

To take the *Meridian Altitude* with a *Quadrant*; if the Position of the *Meridian* be known, and the Plane of an Astronomical *Quadrant* be placed in the *Meridian* Line by means of the Plumb-Line suspended at the Centre: The *Meridian* Altitudes of the Stars, which are the principal Observations whereon the whole Art of Astronomy is founded, may easily be determined.

The *Meridian Altitude* of a Star may likewise be had by means of a Pendulum-Clock, if the exact time of the Star's Passage by the *Meridian* be known. Now it must be observed, that Stars have the same Altitude for a Minute before and after their Passages by the *Meridian*, if they be not in or near the Zenith: But if they be, their Altitudes must be taken every Minute when they are near the *Meridian*; and then their greatest or least Altitudes will be the *Meridian* Altitudes sought.

As to the manner of Observing, it is found very difficult to place the Vane of the *Quadrant* in the *Meridian* exactly enough to take the *Meridian Altitude* of a Star; for unless there be a convenient Place, and a Wall where the *Quadrant* may be firmly fastened in the Plane of the *Meridian*, which is not easily had, we shall not have the true Position of the *Meridian* proper to observe the Stars.

'Twill be much easier therefore on several Accounts, to use the portable *Quadrant*, by which the Altitude of the Star may be observed a little before its Passage over the *Meridian* every Minute till its greatest or least Altitude be found. Here tho' we have not the true Position of the *Meridian* by this means, yet we have the apparent *Meridian* Altitude of the Star.

Tho' this Method, in the general, be very good, and free of any sensible Error, yet in case a Star passes by the *Meridian* near the Zenith, it proves somewhat defective: For in these kind of Observations, the inconvenient Situation of the Observer; the Variation of the Star's Azimuth several Degrees in a little time; the Alteration of the Instrument, and the difficulty of replacing it vertically, will prevent the Observations from being often than in every four Minutes. But in each Minute, the Altitude varies about fifteen Minutes of a Degree, so that there will be the difference of a Degree in the Star's Altitude between each Observation. In such Cases, therefore, it will be better to have the true Position of the *Meridian*, or the exact time wherein the Star passes the *Meridian*, in order either to place the Instrument in the *Meridian*, or to observe the Altitude of the Star the Moment it passes the *Meridian*. See **ALTITUDE AND QUADRANT**.

To find the *MERIDIAN ALTITUDE* of the Sun, &c. by a *Gnomon*. See **GNOMON**.

**MERIDIONAL** Distance in Navigation, is the same with the Departure; Easting or Westing; or the Difference of Longitude between the *Meridian*, under which the Ship now is, and any other *Meridian* she was under before. See **DEPARTURE**.

**MERIDIONAL** Parts, Miles, or Minutes, in Navigation, are the Parts, by which the *Meridians* in *Mercator's* Chart do increase, as the *Parallels* of Latitude decrease. See **CHART**.

The Co-sine of the Latitude of any Place being equal to the Radius, or Semi-diameter of that Parallel, therefore in the true Sea-Chart, or Nautical Planisphere, this Radius being the Radius of the Equinoctial, or whole Sine of 90 Degrees, the *Meridian* Parts at each Degree of Latitude must increase, as the Secants of the Ark contain'd between that Latitude and the Equinoctial do decrease.

The Tables therefore of *Meridional* Parts in Books of Navigation, are made by a continual addition of Secants, calculated in some Books (as in Sir *Jonas Moore's* Tables) for every Degree and Minute of Latitude; and

these will serve, either to make or graduate a *Mercator's* Chart, or to work the *Mercator's* Sailing.

To use them, you must enter the Table, with the Degree of Latitude at the head, and with the Minute on the next Column towards the Left-hand; and in the Angle of meeting, you will have the *Meridional* Parts.

Having the Latitudes of two Places, to find the *Meridional* Miles, or Minutes between them: consider whether the Places be, one under the Equinoctial, and the other wide thereof; or the one on the one side the Equinoctial, and the other on the other; or whether they both lie on the same side.

If one Place lie under the Equator, the *Meridional* Miles next under the Degree of Latitude of the other Place, is the *Meridional* difference of Latitude, or Latitude enlarged.

If one be in North, and the other in South Latitude; the *Meridional* Minutes corresponding to the two Latitudes added together, give the *Meridional* Minutes between them.

Both Places lying towards the same Pole; subtract the *Meridional* Parts answering to the less Latitude from those of the greater; the remainder gives the *Meridional* Minutes.

**MERIDIANS**, or **MERIDIANS**, a Name which the ancient Romans gave to a kind of Gladiators, who enter'd the Arena about Noon; after the *Phelians*, who fought in the Morning against Beasts, had finish'd. See **GLADIATOR**.

The *Meridians* fought Man with Man, Sword in hand; Hence *Seneca* takes occasion to observe, that the Combats of the Morning were full of Humanity, compared with those which follow'd.

The *Meridians* took their Name from *Merides*, i. e. Noon, the time when they exhibited their Shows.

**MERIT**, in Theology, is used to signify the Moral Goodness of the Actions of Men, and the Reward due to them.

The Romish Schoolmen distinguish two kinds of *Merit* towards God: The one of *Congruity*, and the other of *Condiqny*.

The *Merit* of *Congruity*, is, when there is no just Proportion between the Action, and the Reward; but he who bestows the Reward supplies by his Goodness or Liberality, what was wanting in the Action: Such is the *Merit* of a Son towards his Father; but this is only *Merit* in an improper sense.

The *Merit* of *Condiqny*, is, when there is an absolute Equality, and a just Estimation between the Action and the Reward, as in the Wages of a Workman.

Those of the Reformed Religion disclaim all *Merit* towards God. Even their best Works don't *Merit* any thing at his hands. The Doctrine of *Merits* makes one of the great Articles of Controversy between the Romish and Reformed Churches.

**MERLON**, in Fortification, that part of the Parapet which lies betwixt two Embrasures. See **PARAPET AND EMBRAURE**.

It is from 8 to 9 Foot long on the side of the Cannon, and 6 on the side of the Field; about 6 Foot high, and 18 thick.

The Word comes from *Merula*, or *Merla*, which in the corrupt Latin was used for a Battlement.

**MERMALD**, or **MERMAN**, a Sea-Creature frequently talk'd of, as being supposed half human, and half a Fish. See **MONSTER**.

However Naturalists may doubt of the Reality of *Mermen*, or *Mermans*, yet we have Testimony enough to establish it beyond all contradiction. In the Year 1187, as *Larrey* informs us, such a Monster was fish'd up in the County of *Suffolk*, and kept by the Governour for six Months. It bore so near a Conformity with Man, that nothing seem'd wanting to it besides Speech. One day it took the Opportunity of making its Escape, and plunging into the Sea, was never more heard of. *Hist. d'Angleterre*, P. I. p. 403.

In the Year 1430, after a huge Tempest, which broke down the Dykes in *Holland*, and made way for the Sea into the Meadows, &c. some Girls of the Town of *Edam* in *West-Friesland*, going in a Boat to milk their Cows, perceiv'd a *Mermald* embarras'd in the Mud, with a very little Water. They took it into their Boat, and brought it with them to *Edam*, dress'd it in Women's Apparel, and taught it to spin. It fed like one of them, but could never be brought to speak. Some time afterwards it was brought to *Haverlew*, where it liv'd for some Years, tho' still shewing an Inclination to the Water. *Parvial* relates, that they had given it some Notion of a Deity, and that it made its Reverences very devoutly when ever it pass'd by a Crucifix. *Delices d' Hollande*.

In the Year 1560, near the Island of *Manar*, on the Western Coast of the Island of *Ceylon*, some Fishers brought up at one Draught of a Net, seven *Mermen* and *Moids*; of which, several *Jesus's*, and among the rest,

F. Hen. Henriquez, and Dimas Bojguez, Physician to the Vice-Roy of Goa, were Witnesses. The Physician, who examined them with a great deal of Care, and made Dissections thereof, asserts, that all the Parts, both internal and external, were found perfectly conformable to those of Men. See the *Hist. de la Compagnie de Jesus*, P. II. T. IV. N.º. 276. where the Relation is given at length.

We have another Relation well attested of a *Merman*, near the great Rock call'd *Diamond*, on the Coast of *Martines*. The Persons who saw it, gave in a precise Description of it before a Notary. They affirmed that they saw it wipe its Hand over its Face, and even heard it blow its Nose.

Another Creature of the same Species was caught in the *Baltic* in the Year 1551, and sent as a Present to *Sigismund* King of *Poland*, with whom it liv'd three Days, and was seen by all the Court. Another very young one was taken near *Rocca de Simo*, as related by *Damian Gaes*.

The King of *Portugal* and the Grand Master of the Order of *St. James*, had anciently a Suit at Law to determine which Party these Monsters belonged to.

MESAREUM in Anatomy, the same with *Mesenterium*. See MESENTERY.

MESAREUM is also used in a more restrained Sense for a Part, or Division of the *Mesentery*; being that fastned to the thick Guts. See MESENTERY.

MESARIC Vessels, in the general Sense, are the same with *Mesenteric*. See MESENTERIC.

In common use, *Mesarie* is more frequently applied to the Veins; and *Mesenteric* to the Arteries of the *Mesentery*.

MESENTERY, or MESAREUM, in Anatomy a far membranous Body; thus call'd, because placed in the middle of the Intestines, which it connects to one another. See INTESTINES.

The *Mesentery* is almost of a circular Figure, with a narrow Production, to which the end of the *Colon*, and beginning of the *Rectum*, are tied.

'Tis about four fingers and a half in Diameter: Its Circumference, being full of Plaits and Foldings, is about three Ells in length. The Intestines are tied like a Border on this Circumference of the *Mesentery*: There are three Inches of the Intestines fastned. See INTESTINES.

The *Mesentery* itself is strongly tied to the three first *Vertebrae* of the *Loin*s. It is composed of three *Lamine*s; the inner, upon which the Glands and Fat lie, and the Veins and Arteries run, is its own proper Membrane; and the other two which cover each side of the proper Membrane come from the *Peritonaeum*. Between the two external *Lamine*s of the *Mesentery*, run the Branches of *Arteria Mesenterica*, superior and inferior, which bring the Blood to the Intestines; and the *Vena Mesenterica*, which being Branches of the *Porta*, carry the Blood back to the Liver. Here the large Branches of both Arteries and Veins communicating with one another, march directly to the Guts; where, with the Nerves from the *Plexus Mesentericus*, they divide into an infinite Number of small Branches, which spread themselves extremely finely upon the Coats of the Intestines. The *Vena Lactea*, and Lymphatic Vessels, run likewise upon the *Mesentery*, in which there are also several Vesicular Glands; the biggest of which in the middle of the *Mesentery*, is call'd *Pancreas Aesclii*; these Glands receive the Lympha and Chyle from the Lactal Veins. See PANCREAS AESCLII.

The *Mesentery* has been ordinarily divided into two Parts, the *Mesenterium* and *Mesocolon*. The first appended to the *Intestina Tenua*; and the latter to the *Crassa*: But this is a Division of no great moment.

The Use of the *Mesentery*, is, first, to gather the Intestines into a narrow Compass, that the Coarset of the Chyliferous Vessels towards their common Receptracle may be but short; to cover and protect them and the Blood-Vessels; and to connect and dispose the Intestines, so as to secure them from any Entanglement that might hinder their peristaltic Motion.

The Word comes from the Greek *mesos*, middle, and *enteron*, Intestine, Gut; as being in the middle of the Intestines.

MESENTERIC, or MESARIC, an Epithet given to two Arteries arising from the descending *Aorta*, and proceeding to the *Mesentery*.

There is an Upper, or Superior *Mesenteric*, which goes to the upper part of the *Mesentery*; and a Lower, or Inferior *Mesenteric*, which distributes itself through the lower part. See ARTERY.

We have also a *Mesenteric Vein*, composed of an infinity of Veins proceeding from the *Mesentery*; which, with the *Vena Splenica* arising from the Spleen, form the *Vena Porta*.

Anatomists also reckon a *Mesenteric Nerve* which arises from the Intercostal, and sends several Branches to the *Mesentery*. See NERVE.

MESENTERIC PLEXUS, a PLEXUS, or piece of Net-Work form'd by the Branches or Ramifications of the *Par Vagum*.

The *Plexus Mesentericus Magnus*, or great *Mesenteric Plexus*, is form'd out of the concurrent Branches of several other Plexus's, and sends its nervous Fibres through the whole *Mesentery* along with the *Mesenteric* Vessels, which, with various Circumligation, they accompany to the Intestines. See PLEXUS.

MESN, or MEASNE, a Term in Law signifying him who is Lord of a Manor, and so hath Tenants holding of him; yet he himself holds of a superior Lord. See LORD.

MESN is also a Writ, which lieth where there is Lord *Mesn* and Tenant; and the Tenant is distrained for Services due from the *Mesn* to the superior Lord. The Word is properly derived from *Mesn*, minor man, because his Tenure is derived from another, from whom he holds.

MESOCOLON, in Anatomy, that part of the *Mesentery* continued in the great Guts. See MESENTERY.

The *Mesocolon* lies in the middle of the *Colon*, to which it is join'd. Its lower part sticks to a part of the *Rectum*.

MESOLABE, MESOLABIUM, a Mathematical Instrument invented by the Antients for finding two mean Proportionals Mechanically, which they could not come at Geometrically. See PROPORTIONAL.

It consists of three Parallelograms moving in a Groove to certain Intersections. Its Figure is described by *Leucobius* in his Commentary on *Archimedes*.

MESO-LOGARITHM, a Term used by *Kepler* to signify the Logarithms of the Co-Sines, and Co-Tangents: The former of which my Lord *Nepes* calls *Anti-Logarithms*, and the latter *Differentiales*.

These are also call'd Artificial Sines and Tangents. See LOGARITHM, CO-SINE, CO-TANGENT, ANTI-LOGARITHM, &c.

MESO-PLEURII in Anatomy, the Intercostal Muscles. See INTERCOSTAL.

The Word is derived from *mesos* Medium, Middle; and *πλευρα* Latus, the Side.

MESO-PLEURII is sometimes also used for the intermediate Spaces between the *Costae*, or Ribs. See RIBS.

MESSE, or MASSE, or MISSA, the Office, or public Prayers made in the *Romish* Church, at the Celebration of the *Eucharist*. See EUCHARIST.

The *Romish* Divines define the *Masse*, an Oblation made to God, wherein, by the change of a sensible Object by virtue of a divine Institution, the sovereign Dominion of God over all Things is acknowledged. This they esteem the greatest and most august Ceremony in use in the Church, as being the Sacrifice of the new Law, wherein the Body and Blood of *Jesus Christ* are offered up to God.

They are divided about the Question, Whether or no it be proper or allowable for the same Person to celebrate *Masse* several times in one day; having the Authority of *Pope Leo* in his Letter to *Dionysius* for the Affirmative Side of the Question, and that of several of the Councils for the Negative.

*Nicod*, after *Baronius*, observes that the Word *Masse* comes from the Hebrew *Mosch*, Oblatum; or from *Missa*, *Misseram*; because in the former Times, the Catechumens and Excommunicated were sent out of the Church when the Deacon said *Ita, missa est*, after Sermon, and the reading of the Epistle and Gospel; they not being allow'd to assist at the Consecration. See CATECHUMEN.

*Messe* derives it from *Missa*, dismissing. Others again, derive it from the Latin *Missa*, Envoy; because in the *Masse*, the Prayers of Men on Earth are sent up to Heaven.

There are a vast Variety of *Masses* in the *Romish* Church; the thing acquiring new Titles and Appellations according to the different Rites, Intentions, and Manners in which it is performed, as well as other Circumstances.

Thus they have an *Ambrosian Masse*, celebrated according to the Rite of *St. Ambrose*, particularly used in *Milan*.

The *English Masse* was the Form which antiently obtain'd in *England*.

*Gallican Masse* is the Rite that formerly obtain'd in the Churches of *France*.

*Greek Masse* is that rehearsed according to the *Greek* Rites in the *Greek* Language, and by *Greek* Priests. *Latin Masse* is that used in the *Latin* Church in the *Latin* Tongue, and according to the Rites of the *Latin* Church.

*High Masse*, called also *Grand Masse*, is that sung by the Choristers, and celebrated with the Assistance of a Deacon and Subdeacon.

*Low-Masse* is that wherein the Prayers are all barely rehearsed without any Singing, and performed without much Ceremony, or the Assistance of any Deacon or Subdeacon.

The *Masse of the Beate*, or our Lady, is that offer'd to God by the Means and thro' the Intercession of the Virgin.

The *Bean-Masse* is a *Masse* rehearsed every day, at which

the Ladies and *Beau-Monde* of the Place attend. This is also call'd the perfum'd *Mafs*.

*Common Mafs*, or *Mafs* of the Community in a Monastery, is that celebrated at certain Hours, wherest the whole Body assits.

*Mafs of the Holy Ghost*, is that celebrated at the begining of any Solemnity or Church-Assembly, commencing with an Invocation of the Holy Ghost.

*Holy-day-Mafs*, is that wherein certain Prayers or Lectures are read suitable to the Day.

*Mafs of Judgment*, was that wherein a Person clear'd himself of any Calumny by some Proof agreed upon.

*Mafs* for the Death of our Enemies, was a Form of *Mafs* that obtained a long time in Spain, but was at length abolished as inconsistent with Christian Charity.

*Mafs of the Dead*, or *Requiem*, is that performed at the Request of the Deceased: The Introit whereof begins with *Requiem*. In the 13th Century, it was the Custom of Criminals were carried out to Execution, to make them attend at a *Mafs* of the Dead, rehearsed for the Repose of their Souls.

*Parish Mafs*, or *Great Mafs*, is that which the Parson is obliged to rehearse to his Parishioners on Sundays and Holy-days. *Little Mafs* is that said at private Alms with less Ceremony. The first *Mafs* is that said at Break of Day.

*Mafs of a Saint*, is that wherein God is invoked by the Intercession of some Saint. Thus there are also *Masses* of Apostles, Martyrs, Pontiffs, Virgins, &c.

*Mafs of Scrutiny*, was formerly rehearsed at the Examination of Catechumens, when Enquiry was made as to their Disposition for Baptism.

*Dry Mafs*, is that where there is no Consecration; as those, according to *Durandus*, where the Priest cannot consecrate, by reason of his having said *Mafs* before on the same day; or that used by the Candidates of the Priesthood, in order to their becoming acquainted with the Ceremonies; as *Eckius* will have it.

*Force Mafs*, is an extraordinary *Mafs* besides that of the Day, rehearsed on some extraordinary Occasion.

MESSENGERS, in the English Polity, are Officers chiefly under the Direction of the Secretaries of State; being always ready to be sent with all manner of Dispatches, Foreign and Domestic.

They are also employ'd, with the Secretaries Warrants, to take up Persons for High Treason, or other Offences against the State, which do not so properly fall under the Cognizance of the Common Law, and, perhaps, are not proper to be divulged in the ordinary Course of Justice.

The Prisoners they apprehend are usually kept at their own Houses, for which they are allow'd by the Government 6 s. 8 d. per day. When they are dispatch'd abroad, they have an Allowance for their Journey, as stated, viz. to Paris, 30 l. 10 s. to Holland, 25 l. to Edinburgh, 30 l. to Ireland, 30 l. and so to other Places in proportion. Part of which Money is advanced to them for their Journey.

They wait twenty at a time, monthly, distributed as follows, viz. four at Court, five at one Secretary's Office, five at the other, and two at the third Office for North Britain, three at the Council-Office, and one at the Lord Chamberlain's of the Household. Their Posts, if purchased, are esteem'd worth 300 l. Their Salary is 45 l. per Annum each.

MESSENGERS of the Exchequer: The four Pursuivants in that Court are call'd by this Name. Their Duty and Office is to attend the Lord Treasurer, and to carry his Letters, Precepts, &c. See PURSUIVANT.

MESSENGER of the Press, a Person who by order of the Court searches Printing-Houses, Booksellers Shops, &c. in order to find out, or discover seditious Books, &c.

MESSIAH, a Term signifying Anointed, or Sacred; and in that Sense applied to Kings and Priests: But, by way of Eminence to Jesus Christ, the Saviour promis'd by the Prophets of the Old Law. See CHRIST.

The Jews still wait for the coming of the *Messiah*; being infatuated with the Notion of a temporal *Messiah* that is to be a mighty Conqueror, and to subdue all the World. See PROPHET, &c.

Jesus Christ asserts himself the *Messiah*. In St. John iv. 25. the Samaritan Woman says to Jesus, I know that when the *Messiah* comes (who is call'd the Christ) he will tell us all things. Jesus answered her, I that speak to thee, am he.

There are several Impostors that have endeavour'd to pass for *Messiahs*. J. Lem, a Dutchman, has written a History of false *Messiahs*, De *Falschmessien*. The first he mentions was one *Barcochab*, who appeared under the Empire of *Adrian*. The last is Rabbi *Mardocheai*, who began to be talk'd of in 1682. A little before him, viz. in 1666, appear'd *Sabbethai Sevi*, who was taken by the Turks, and turn'd *Mohometan*.

The Word comes from the Hebrew, *Maschach*, Anointed, of the Verb *Maschach*, to anoint: whence Jesus Christ claims the Title on a manifold Account; 1st, as having been

anointed King of Kings from all Ages. 2dly, As Chief of the Prophets. 3dly, As High-Priest of the Law of Grace; or Priest for ever according to the Order of *Melchisedech*.

The Son of God is variously denominated according to his various Qualities and Attributes. He is call'd the *Word*, as being the Eternal Son of the Father, and Consubstantial with him. *Christus Xpus*, a Greek Term, signifying Anointed, of the same import with the Hebrew *Messiah*; Jesus, i. e. Saviour, of the Hebrew, *Jehoshua*, by reason he saves his People from their Sins. He is call'd *Word*, as being the Son of God; Jesus, as Man; *Christ*, as being Anointed; and *Messiah*, as being both God and Man.

MESSIEURS, a French Title of Honour or Civility, lately introduced into our Language. The Word is the Plural of *Monsieur*, and is equivalent to the English, *Sirs*. See MONSIEUR and SIR.

The Lawyers always begin their Pleasings and Harangues with *Messieurs*; which Word is also frequently repeated in the Course of the Speech; on which occasion it answers to our English Word *Gentlemen*.

The French say, *Messieurs du Parlement*; *du Conseil*; *des Comptes*, &c.

MESSUAGE in Law, a Dwelling-House with some Land assigned for its use, &c.

By this Name may a Garden, Shop, Mill, Chamber, or Cellar be call'd.

In Scotland, *Messuage* is what we call the *Minor-Houses*, viz. Principal Dwelling-House within any Barony. See MANOR.

MESYMNICUM, a Name the Antients gave to a certain part of their Tragedy; or to certain Verses in their Tragedies. See TRAGEDY.

The *Mesymericum* was a kind of Burden, as *Is Psean*; *O Dithyrambe*; *Hymen*, *O Hymenee*, or the like; which when placed at the end of a *Strophe*, was call'd *Ephymnum*; and when inserted in the middle of a *Strophe*, *Mesymericum*. See STROPHE and CHORUS.

METACARPUS, or METACARPUM, in Anatomy, that part of the Hand between the Wrist and the Fingers. See HAND.

The *Metacarpus* consists of four Bones, which answer to the four Fingers; whereof that which sustains the Fore-finger is the biggest and longest. They are all round and long, a little convex towards the back of the Hand, and concave and plain towards the Palm: They are hollow in the middle, and full of Marrow; they reach one another only at their Extremities, leaving Spaces in their middle, in which lie the *Musculi Interossei*. See INTEROSSEI.

In their upper end there is a Sinus, which receives the Bones of the Wrist; their lower Extremity is round, and is received into the Sinus of the first Bones of the Fingers. See FINGER.

The inner part of the *Metacarpus* is call'd the *Palm*, and the outer the back of the Hand. See PALM, &c.

The Word comes from the Greek *meta*, post; and *carpus*, *Manus*. See CARPUS.

METACISM, in Grammar, a Defect in the Pronunciation of the Letter *M*.

*Isidore* says it's a final *m*, followed by a Vowel, as *Isidore* *aurum*, &c.

METACHRONISM, in Chronology, an Error in Computation of Time, either on the side of Defect, or Excess. See CHRONOLOGY and TIME.

METACONDYLII, is used by some Authors for the out-most Bones of the Fingers. See FINGER and CONDYLUS.

METAL, in Natural History, a simple, fossil Body, that fuses, and becomes fluid, by Fire, and by Cold coagulates and hardens into a solid *Masa*, capable of distending under the Hammer. See FOSSIL.

*Metal* is said to be simple, as it may be affirm'd of every the minutest Particle of a *Metal*, e. g. a Grain of Gold, that it is Gold, or has all the Properties of Gold. See GOLD.

*Fusible* by Fire, that is, when expos'd to a great Fire, it dissolves into parts which are easily moveable among themselves, or are in actual motion. See FUSION.

*Fixed*, i. e. bearing the Fire without flying off in Vapours. Tho' it is only to a certain degree that *Metals* are fixed; for by the large Burning-Glasses of Mess. *Tavernier*, *Bayle*, and *Vallerie*, all *Metals* readily evaporate. See FIXITY.

Such is the proper Idea of *Metals*, that is no ways applicable to any other Body in Nature: For a Diamond, or other Stone, tho' a simple Body, is not fusible in the Fire, nor capable of being stretched under the Hammer: See DIAMOND. And Salt, tho' dissolvable by Fire, is not malleable, but breaks under the Hammer. See SALT, &c.

There are indeed certain Woods which yield in some measure

measure to the Hammer; but then they fall to Dust in the Fire: And so of the rest. See MALLEABILITY, &c.

We find but six Metals in all Nature, viz. Gold, Lead, Silver, Copper, Iron, and Tin. See the Nature, Characters, Production, Uses, &c. of each thereof, under its proper Article; GOLD, LEAD, SILVER, COPPER, IRON, and TIN.

To these, a seventh Metal is usually added, viz. Mercury, or Quick-Silver; but improperly, as it has not all the Characters of a Metal, nor scarce any thing in common with the other Metals, except Weight and Similarity of parts. See MERCURY, &c.

Thus, for Example, it is neither dissolvable by Fire, malleable, nor fix'd: In effect, it seems to constitute a peculiar Class of Fossils, and is rather the Mother, or Basis of all Metals, than a Metal itself. However, as it is usually reckoned among them, and as it wants nothing to render it a Metal, but an additional Sulphur to fix and connect its parts together, it may without any great harm be consider'd under that Class.

The common radical Character of Metals is, that of all known Bodies, they are the heaviest. By Dr. Hally's Experiments, the Weight of Gold to that of Glass is determin'd to be as 7 to 1; and the Weight of Tin, the lightest of all Metals, to that of Gold, as 7 to 19; which considerably surpasses the Weight of all Stones, Marbles, Gems, and other the most solid Bodies, as appears from the Tables of specific Gravities. Nor is there any Body in Nature but a Metal, that is one third of the Weight of Gold. See SPECIFIC GRAVITY.

The Royal Society furnish us with various Experiments of this kind. The Weights of the several Metals, and other Solids, they have examined Hydrostatically, by weighing them in Air and in Water; and the Weights of the Fluids by weighing an equal Portion of each. By such Experiments they find, that taking the same Weights of Water and Gold, the Bulk or Magnitude of the former is to the latter as 19635 to 1000; consequently that the Weight of Gold is to Water nearly as 19 to 1.

The Specific Weight of the several Metals by this Means determin'd, stand thus:

Gold	19635	Iron	7852
Quick-Silver	14019	Tin	7311
Lead	11341	Stone	2000
Silver	105135	Water	1000
Copper	8843	Air	7

The Cubic Inch of	} Weights	Ounces.	Drams.	Grains.
Gold		12	4	52
Quick-Silver		8	6	8
Lead		7	3	30
Silver		6	5	28
Copper		5	6	36
Iron		5	1	24
Tin	4	6	17	

As to the Origin and Formation of Metals, various are the Sentiments of Philosophers Ancient and Modern.

Plato will have the Cause of Metals to be a humid Vapour, inclosed in the Bowels of the Earth, which being variously intermix'd with Parts of the Earth, produce various Metals. Platin will have Sulphur to be the Father of Metals; and an oleaginous viscidous Humour the Mother. Lidas endeavours to prove all Metals generated by a subterranean Fire; urging, among other Reasons, that many Metals, when taken out of the Earth, are exceedingly hot. Dr Hamel shews, that Metals don't take their Rise either from any vaporous Exhalation, or from Water, or from Earth; but are generated of Mercury, Sulphur and Salt. He adds, that Metals take their Matter and Weight from the Mercury, and their Tincture and Form from Sulphur.

The same Author owns the first Radiment of a Metal to be a saline Substance swimming in Water, which is by little and little carry'd off. By how much the Terrestrial Parts are more exquisitely mix'd with the aqueous or humid, by so much is the Metal more heavy and firm, as having fewer and smaller Pores. Hence its Ductility; for its Parts being extremely small, dense, and complicated, may be drawn out into a very spacious Surface. On which account it is, that Gold exceeds all other Metals both in Weight and Ductility; hence also its Fixity, its Parts being too close and dense to be exhale'd. The Water defends the Earth from being burnt, and the Earth the Water from flying off; neither forakes the other, but each is bound in an undissolvable Knot. The Moisture gives Ductility, the Earth Solidity. Where the Mixture is less perfect, whether the Earth or the Water prevail, the Metal will neither have so much Weight, as having larger Pores; nor will it bear the Fire so well. For if the Earth prevail, as in Iron, or the Water, as in Lead; Heat will set

the one at liberty from the other; the Moisture evaporates, and the Earth is reduc'd into Scorria's, &c.

Dr Woodward accounts for the Production of Metals found in the Earth, in the following manner.

All Metals now found in the Strata owe their present Condition to the Deluge; when, also he imagines the Strata of Stone, Earth, Marble, &c. were form'd. See DELUGE.

The Metallic and Mineral Matter now found in the perpendicular Intervals or Effluës of the several Strata, whereof the Body of the Earth is compos'd, was, according to him, at the time of the Deluge lodg'd in the Bodies of those Strata, and brought thence, and transmitted into these Intervals since that time; the Intervals themselves not existing, till the Strata were form'd and broke again, to let the Water from the Earth.

Now the Water which, he imagines, is constantly ascending from the Abyss (see ABYSS) towards the Surface of the Earth, continually pervading the Strata, detaches out of their Pores and Interstices such Metallic and Mineral Corpuscles as it finds loose in its way, carrying them along with it to the perpendicular Intervals, where having a freer Passage than before, it descends them, and leaves them in those Intervals. And this he takes to be the way in which all Metals, now found in those Places, were brought thither, and fill'd grow.

Those in the Strata, however, he observes do not, nor cannot grow; but, on the contrary, are continually lessen'd and diminish'd; by so much as has been convey'd into the perpendicular Intervals, and brought forth of the Surface of the Earth by Springs and Exhalations from the Abyss, &c. See FOSSIL.

The same ingenious Author complains of the great Uncertainty and Inconstancy in the Mineral and Metallic Kingdom; neither Colour, Figure, nor Situation in the Earth, being to be depended on, so as to make any positive Judgment from them. A Pyrites or Marchasite, for instance, shall have the Colour and Brightness of Gold and Silver, and yet afford nothing but a little Vitriol and Sulphur; while a Pebble in appearance shall have a Mixture of a valuable Metal in it. 'Tis common too to find the same Metal shot into a great number of different Forms, as well as to find different Kinds of Metal of the same Form. And as to their Place in the Earth, there is the same Uncertainty, being sometimes found in the perpendicular Effluës or Intervals of the Strata, sometimes interspersed in the Bodies of the Strata, and sometimes in both. The same Metals are also plac'd indifferently in all kind of terrestrial Metal, or in Strata of very different natures. They are frequently intermix'd with each other, so that 'tis a rare thing to find any of them pure and simple; but Copper and Iron shall be in the same Mass, Gold and Copper, Silver and Lead, Tin and Lead; nay, sometimes all fix together in the same Lump. See MINERAL.

M. Townesfort is of opinion, that all Metals have their Origin from Seeds, like Plants; that they have Vessels, with Juices circulating in them, &c.

The French Chymists have been very curious in their Inquiries into the Nature and Production of Metals.

M. Geoffroy, from a Mixture of Sulphur with a vitriolic Salt, and an argillous Earth, brought an Iron, which he maintain'd to be a new Production, or a Composition resulting from the Assemblage of certain Principles, which exist'd separately in the Ingredients that form'd the Metal; in a word, that it was an artificial Iron. And observing that there were Parcels of this Metal in the colour'd Ashes of Plants, and of most other inflammable Substances, he concluded that it might be form'd there also by the Union of the same three Principles.

This was oppos'd by M. Lemery the younger, who maintain'd that the Iron contain'd in the Ashes of Plants, was not form'd there by Calcination, but was really existent in the Plants themselves, being rais'd in their Vessels along with the Juices of the Earth; and further, that all the Ingredients whereof M. Geoffroy's artificial Iron were form'd, do really contain Iron in themselves, either in smaller or larger Quantities: Not the Argilla only, where the Iron is easily discover'd by an animated Knife; nor the Oil of Vitriol, which is drawn from a Mineral, the Ground whereof is Iron; but also Linseed Oil, whereof M. Geoffroy's Sulphur was made; and even that of Turpentine, sweet Almonds, &c. relating withal the Operations whereby each of those Oils might be reduc'd to an Earth wherein was Iron.

To this it is answer'd, that in what manner soever Iron be drawn from the several Ingredients separately, there will be still found infinitely less in 'em, than when mix'd, and that of consequence the Mixture produces Iron. That as for Oils, 'tis evident they are not simple Substances, but are compos'd of an Earth, an acid and a sulphurous or inflammable Part; which are the three princi-

cite Principles requir'd for the Formation of Iron: so that, according to all Appearances, 'tis an Assemblage of those Sulphurs, Salts and Earth in the Oil, that the Iron is form'd by Calcination; and therefore that the Means us'd to the Iron in the Ingredients, are the very same with those by which it is compos'd.

Hence it appears, that vegetable Matters contain the Principles of Minerals. But M. Geoffroy goes further: and to support his Doctrine of the Production of Metals, undertakes to prove, that the Principles of Vegetables, and those of Minerals, are essentially the same; and that one may readily, and with ease, decompose Minerals, by separating their Principles, and compound 'em again, by substituting Principles taken from Vegetables in lieu of those taken away.

To clear this Point, he examines and compares the Principles of Mineral and Vegetable Salts. The Principal in the Mineral Class, are Nitre, Sea-Salt, and Vitriol: All which Salts we find in Plants. On the other hand, the essential Salt of the *Parietaria* is wholly nitrous, and melts on the Coals like Salt-Petre. The fix'd Salts of the *Cardus Benedictus*, *Alfimbium*, *Kali*, &c. contain a great deal of Sea-Salt, which crystallizes in Cubes, and precipitates on the Coals. Add, that the greater part of the fix'd Salts of Plants calcin'd to a certain degree, yield a strong Smell of Sulphur, which can proceed from nothing but a vitriolic Salt, rarify'd and volatiliz'd by the Oil of the Plant. By these Salts we may be able to judge of all the other Salts of Plants; for the volatile Salts are nothing else but fix'd Salts disengag'd from the grosser part of their Earth, and join'd with parts of Oil. See SALT.

Further, there is scarce any reason to doubt, that the acid Juices drawn from Vegetables, are of the same nature with the mineral Acids; with this only difference, that the Acids of Plants have been extremely rarify'd by Fermentation, and united so closely with Sulphur, that 'tis not without a great deal of difficulty that they are separated.

Thus, distill'd Vinegar, which we make no scruple of ranking among the vitriolic Acids; does only differ from Spirit of Sulphur, Spirit of Vitriol, or even the Caustic Oil of Vitriol, in that the Acids in the Vinegar are dissolved among a great deal of Phlegm, and strongly united to a great deal of Oil, which yet may be separated. By dissolving Copper in the Acid of Vinegar, separated, as much as possible from its Oil, there are form'd Crystals, like in figure to those of blue Vitriol. From all which it appears, that the Salts of Plants do not differ essentially from those of Minerals.

For Sulphur, the inflammable or sulphureous Principle is the same in Vegetables as in Minerals. And M. Geoffroy even shews, that the Principle of Inflammability in common Sulphur, is the same with that which renders the Fat of Animals, the Oils and Resins of Plants, and the Bitumens of the Earth, inflammable. To which he adds, that this same sulphureous Principle is not only likewise found in metallic Substances, but that 'tis this which gives them their Fusibility, Ductility, and metallic Forms. Thus Antimony, which is a Substance approaching the nearest of any to a Metal, is little else but a burning Sulphur. By exhaling this, it loses its metallic Form, and becomes a kind of grey Ashes, which being melted, instead of Metal becomes Glass. By melting this over again, and adding to it some inflammable Matter, as Tartar, it returns into a Regulus.

As to the Species of METALS, there are four which the Chymists call *imperfect*, because their Principles are not bound so fast together, but that the Force of a common Fire destroys them; these are, Iron, Copper, Lead and Tin; the others, which are Proof against common Fire, are Gold and Silver. In the four first 'tis easy to see the Principle of Inflammability. They become all fusible by the Addition of Salt-Petre, either in a greater or less degree. Iron is that wherein this is the most visible; next, Tin; then Copper and Lead. But the Principle is more conspicuous still, in the Dust or small Filings of the Metals, let fall in the Flame of a Candle, than in the Lump. For Gold and Silver, the sulphureous Principle is not so obvious. No Heat but that of the Sun collected into a Focus, is capable to decompose them. But no doubt they have the same Principles with the other Metals, tho' not so easily seen. In Gold, as well as in the imperfect Metals, the Ground is an Earth capable of Vitrification, as appears by the Glass remaining after the Calcination of Gold in a Burning-Glass; and there is reason to believe, that the greatest part of what is exhal'd in Smoke during the Operation, is the sulphureous Principle mix'd with Salts. As to Silver, there is something in it extremely various. When purify'd with Antimony, it vitrifies in the Sun; but if purify'd with Lead, it leaves nothing behind it but grey Ashes. The Ground of this Metal is doubtless an Earth capable of Vitrification; and what exhales in

Smoke, is apparently a Mixture of Sulphur, Salts, and a little Earth volatilized by the Fire. See SULPHUR.

From all which, and many more Observations of the same kind, M. Geoffroy ventures to draw the following Conclusions. That the Substances whereof Metals are compos'd, don't differ essentially from those which compose Vegetables. That the imperfect Metals are compos'd of a Sulphur, vitriolic Salt, and a vitriolizable Earth. That this sulphureous Principle is more or less strongly join'd with the other Principles; very strongly in Gold and in Silver, less in Antimony, and very little in mineral Sulphur. That the Principle of Inflammability may be separated from metallic Substances, either by culinary Fire, or by the Sun. That the Metal thus despoiled of its Principle, is converted into Ashes. That these Ashes, pursued farther with a violent Fire, vitrify; and that these Ashes, or rather Glasses, by the Application of some inflammable Matter, resume the metallic Form they had lost. That 'tis by this means Linseed-Oil turns Argilla into Iron. That if we knew all the other metallic Earths, they might likewise be immediately converted into Metals, by the Projection of some inflammable Matter. That 'tis the saline and earthy Parts, found in Oil of Vitriol, that furnish the Earth capable of Vitrification, which makes the Base or Ground of Iron, and receives the metallic Form from the sulphureous Principle of the Oil. That the Iron found in the Ashes of Plants, was produced there in the same manner: And, that 'tis a Composition of the vitriolizable Earth of the Plants, the Acid of those Plants, and their oily or inflammable Principle.

The same Author, the better to ascertain the constituent Parts of Metals, made a great number of Experiments on them with the Duke of Orleans's large Burning-Glass; the Result whereof falls in with, and confirms the Doctrine laid down above.

From those Experiments, he says, it appears, That the four Metals which we call *imperfect*, viz. Iron, Copper, Tin and Lead, are compos'd of a Sulphur or oily Substance, capable of Inflammation, and a metallic Earth, capable of Vitrification. That from this Sulphur proceed the Opacity, Brightness and Malleability of a Metal. That this metallic Sulphur does not appear at all different from the Oil or Sulphur of Vegetables, or even Animals; and that it is the same in Mercury as in the four imperfect Metals. That these four Metals have for their Basis an Earth susceptible of Vitrification; that this Earth is different in each of the four Metals, in that it vitrifies differently in each; and that on this Difference in vitrifying, depends the Difference of Metals. See VITRIFICATION.

The excellent *Beerhaave*, after an accurate Survey of the several Metals, their Characters, Properties, Preparations, Uses, &c. draws the following Corollaries concerning the general Nature of Metals.

1. That which distinguishes Metals from all other Bodies, as well as from each other, is their Heaviness: Tho', every Metal has its peculiar Weight; which no Art is able to imitate, and which depends, as *Helmont* and the Chymists express it, on the Atomic Homogeneity of the Parts. Now, the later Philosophers have proved, that all corporeal Magnitude has just so much reality in it, as Weight; and therefore if you have found the Heaviness of any Metal, you have at the same time found its Corporeity. Sir J. Newton treating of Gravity, and *Boysse* of the Pendulum, shew that Weight and Reality are correspondent. See WEIGHT and GRAVITY.

2. The Metals appear to be Simple, yet are really Compounds. Their component Principles, according to the Antients, are Sulphur and Mercury; to which some of the Moderns have added Salt: but 'tis certain Salt is no constituent Part, or Ingredient of Metals, but rather something external adhering to them. All Metals consist of two Parts, or Principles; Mercury as the Basis or Matter; and Sulphur as the Binder or Cement: the first, the Substratum, or metallic Matter; and the second, that which renders it fix'd and malleable. The Mercury, it is to be noted, is the same with our Quicksilver, only desecate, and clear of any heterogeneous Matter; whereas the common Quicksilver is always mix'd. As to the Sulphur, it is not the vulgar fossil Sulphur, but a peculiar sort of Matter specifically denominat'd *Sulphur of Metals*, concluded by some of our latest, and best Chymists, particularly *Mons. Homberg*, to be Fire; which being mix'd with the Mercury, fixes it, and according to the different degrees of its Union and Cohesion therewith, produces different Metals. See MERCURY, SULPHUR, FIRE, &c.

This Doctrine of the Composition of Metals is confirm'd by an Experiment of *Mr. Løyle*, who after having retain'd Mercury a long time in a moderate Fire, took a piece of Gold out of it, which 'twas apparent was not in the Mercury before it was expos'd to the Fire. *Mons. Homberg's* Experiment is to the same effect; from which he concludes,

cludes, that Gold consists of a fulphurous igneous Part, and a heavy mercurial Part fixed thereby; and that upon taking away the fulphurous or fiery Part, the Gold is converted into fluid Mercury. See **MERCURY**.

3. All Metals must first be Mercury, & they be Gold; and the thing superseded to common Mercury, whereby it is prevented from becoming Gold, is a sharp volatile Body, which, when heated, becomes corrosive, and emits Fumes; which are the Properties of the fossil Sulphur.

4. If any Metal, or other Body, could be found that only differ'd from Gold in its wanting Weight, it were impossible ever to make Gold of it; and, on the contrary, if a Body could be had that is as heavy as Gold, all the other Properties, as Colour, Fixity, Ductility, &c. might easily be added. And hence the more knowing among the Alchemists hold the primary Matter of Gold to be Quicksilver; which, say they, is Gold, as heart, as coming nearest to Gold in the point of specific Gravity. Only there is a corrosive Body, i. e. Sulphur, adhering to it, which, if it were separated, you would have Gold; or if it were only inverted, Silver.

And accordingly on such Principles whoever would make Gold out of any other foreign Matter, must remember, that the more his Matter differs from Mercury in Weight, &c. the less Gold it will make. See **PHILOSOPHER'S STONE**.

5. Therefore Metals are transmutable into one another: for if Mercury be the common Matter of all Metals, and if all the difference lie in the fixing Spirit or Sulphur, which, as it is less or more subtle and pure, constitutes this or that Metal; it is no way improbable they should be transmuted by a purer fixing Sulphur, taking place of a corrosive one, and fixing the Matter into a more perfect Metal.

6. The purest Metals result of the purest and most delicate Mercury, and the smallest quantity of the subtlest Sulphur. Hence, Mercury of Gold is heavier than common Mercury, and has always some impure part that is lighter than Gold; and could that be taken away, and the fixing Spirit be added, it would become heavier than Gold.

7. The imperfect Metals consist of impure Mercury and imperfect Sulphur, with some other variable heterogeneous Matter in it: Thus, fused by the Fire, it emits a Fume which whirns Copper, after which the Sulphur exhales yet further. The reality of such a third Matter is evinced hence, that all these baser Metals are resolvable not only into Mercury and Sulphur, but also into *Sovia* or *Sordes*, which are lighter and more earthy than either of the other, and accordingly swim therein.

8. Upon the whole it appears, that in the three nobler Metals, Gold, Mercury, and Silver, it is principally the greater or less proportion of the Sulphur to the Mercury, that determines them to be Gold, Mercury, or Silver: That it is by this Proportion those several Metals are defined and denominated; and that from this difference of Proportion, flow all the specific differences of Colour, Weight, Fixity, Ductility, Volatility, Fusibility, Solubility, Salubrity, &c.

9. That in the other baser Metals, besides this different Proportion of the two Principals, there intervenes another Cause of Diversity, viz. a third Principle, or Matter of an earthy kind, and very distant from either of the rest; which adhering to the pure elemental Sulphur, corrupts and adulterates, and variously modifies it: And from the different Circumstances of this third Principle, consider'd along with those of the Sulphur itself, result the specific differences of the more imperfect Metals as to Weight, Colour, &c.

**Barb METAL**, call'd also **Prince's METAL**, is a kind of factitious Metal, composed of the finest and purest Brass mix'd with Tin, or rather with some Mineral; whereby it becomes more disposed to receive a Polish, Lustre, &c. as also finer to be gilt. See **GILDING**.

'Tis said to have been invented by Prince Rupert, whence its Name.

**Bell METAL**, is a Composition of Copper and Tin melted together. See **BELL**.

The ordinary Proportion is 22 or 25 Pounds of Tin to an hundred Weight of the former. See **BRASS**.

**Line of METALS**. On *Gunter's* Sector, are sometimes two Lines thus call'd, and noted with the Characters of the seven Metals,  $\odot$ ,  $\Delta$ ,  $\square$ ,  $\circ$ ,  $\sigma$ , and  $\Psi$ ; and their Use is to give the proportions between the several Metals as to their Magnitudes and Weights. See their Use under the Word **SECTOR**.

To be laid under **METAL**, in Gunnery, is when the Mouth of a Gun lies lower than her Breach.

**METALS in Heraldry**. There are two Metals used in Heraldry, by way of Colours, viz. *Gold* and *Silver*; the first call'd *Or*, and the second *Argent*. See **OR** and **ARGENT**.

In the common painting of Arms, these Metals are represented by *White* and *Yellow*, which are the natural Colours of those Metals. See **COLORS**.

In Engraving, *Gold* is expressed by dotting the Coat, &c. all over; *Silver*, by leaving it quite blank.

It is a general Rule in Heraldry never to place *Metal* upon *Metal*, nor Colour on Colour: So that if the Field be of one of the Metals, the Bearing must be of some Colour, and vice versa; otherwise the Arms are false: Tho' this Rule admits of some Exceptions.

**METALLIC**, or **METALLINE**, an Adjective applied to something bearing a relation to Metals.

Thus we say, painting in Enamel is only to be performed with metallic Colours, that is, with such as come from Metals, or are made with Metals; no other being able to endure the Fire. See **ENAMEL**.

*L. Romani* has published a *Metallic History* of the Popes: *La France Metallique*, is a Book of Medals mostly imaginary, pretended to be taken from the Cabinets of the Curious, where they never were, by *Jaques de Sic. M. Fizee* has published the *Metallic History* of Holland.

**METALLURGIA**, the Art of Metals, that is of preparing and working Metals, from the Glebe or Mineral, to the Utensil. See **METAL**.

The *Metalurgia* includes what relates to the finding of the Metallic Glebe, or Ore in the Mine; the judging of its kind, Richness, &c. the Proportion of Metal therein; the digging and separating it from the Earth, and other matters; and the purifying and disposing it into a complete, pure, malleable Metal. See **MINZ** and **MINERAL**.

*Eschbaech* divides the *Metalurgia* into four parts. The first teaches how Metals grow in the Mine, how they are discovered, and how procured out of the same. The second how to separate the Metallic from the other Matter of the Ore. The third, how to reduce the separated Matter into simplicity and ductility. The fourth, to work, gilt, polish, and imitate the finer Metals in the coarser.

**METAMORPHOSIS**, the Transformation of a Person, or a Change into another Form. See **TRANSFORMATION**.

The Antients held two kinds of *Metamorphoses*: The one real, the other apparent. The *Metamorphosis of Jupiter* into a Bull, and of *Minerva* into an old Woman, were only apparent. That of *Lycan* into a Wolf, and of *Arachne* into a Spider, were of the number of the real.

Most of the antient *Metamorphoses* include some Allegorical meaning, relating either to Physics or Morality.

*Ovid's Metamorphoses* is a Collection of such Transformations.

Some Authors are of Opinion, that a great part of the antient Philosophy is couched under them; and *Dr. Hooke* has made an attempt to unriddle, and lay open several of them.

The Word comes from the *Greek μετα*, Change, or Removal from one place or state to another; and *μορφη*, Form, Figure.

**METAMORPHISTS**, a Sect of Heretics in the XVIIth Century, whose distinguishing Tenet was, That the Body of Jesus Christ was, upon his Ascension into Heaven, changed, and *Metamorphos'd* into God.

The *Metamorphists* were a Branch of the *Sacramentarians*. See **SACRAMENTARIAN**.

**METAPHORA**, or **METAPHOR**, in Rhetoric, a Figure of Speech whereby a Word is transfer'd from its proper Signification, to another: or, whereby the proper Name of one thing is translated and applied to some other thing; which other thing is more elegantly explained by this translation or foreign Name, than by that which properly belongs to it. As when we say, the Light of the Understanding; to burn with Zeal; to float between Hope and Despair, &c. See **TROPE**.

The *Metaphor* is the most common of all the Figures of Speech; and is that usually meant when we say a thing is spoken figuratively. See **FIGURE**.

The *Metaphor* is a short Simile; an Image being thereby call'd from its proper Subject to give the resemblance of another. See **SIMILE**.

An Allegory is no more than a continued *Metaphor*. See **ALLEGORY**.

The Sources or Places whence *Metaphors* are drawn, are innumerable: They may be fetch'd from Divine Matters; thus *Osée* calls *Plants* our God, *Deus ille noster Placo*. From the Elements; as a *Torrent* of Eloquence. From Plants; as where *Virtue* has taken Root. From Artificial things; as where *Apian* is call'd the *Cymbal* of the World; *Longinus*, a living *Library*; *Pertinax*, *Fortune's Football*, &c.

*Quintilian* distinguishes *Metaphors* into four kinds: The first, when the Word is transfer'd from one Animal to another; as when *Livy* says that *Cato* used to bark at *Scipio*; or, when our Saviour calls *Heralds*, *Fox*. The second, when the Word is transfer'd from one Inanimate to another; as *Bridle*, for *Laws*. The third, when Inanimates are apply'd to Animates; as the *Flower of Youth*. And the last, when Animates are apply'd to Inanimates; as the River *disdain'd* its Bounds.

As the *Metaphor* is intended to set things before the Eyes; it becomes so much the more perfect, as it shows them the more vividly, by representing them in Motion and Action. A *Metaphor* should have nothing in it coarse or shocking; nothing that may raise it above the Simplicity of Nature: Nor should it appear a *Metaphor* to any but those who view it very closely. A *Metaphor* should never be carried too far; for in that Case, it degenerates into Puerility. *Metaphors* should always be follow'd in the same kind; they become unnatural, when different Images are introduced. In all *Metaphorical* Dictions, there should be a kind of Unity, so that the different Words used, may have a kind of Suitableness to each other. Different Ideas are always absurd: As in this Instance; The Church was befieged with a Deluge of Troubles; Where the two Images, *Siege* and *Deluge*, have no relation.

There is nothing young Writers are more faulty in, than the indifcrete use of *Metaphors*. Those who affect the *Mercilesses*, are eternally on the *Metaphorical* strain; nor know any bounds or restraint. They who understand them best, use them with the greatest reserve. Mr. Addison proposes it as a Rule for Writers, to imagine their *Metaphors* actually painted before them, and to view and examine the Justness of their Application and Assemblages: under those Circumstances; throwing every thing out of the Writing, but what might be retained in the Picture. Card. Perron prescribes this general Rule for *Metaphors*; that they must always descend from the Genus to the Species; and never go backwards from the Species to the Genus: Thus we say figuratively, the Bonds of Society; and not the human Cords which tie us together: Bond being a Genus, and Cord a Species.

The Word comes from the Greek *μεταφρασις*, Transflation, or displacing; of *μετα*, trans, and *φρασις*, I bear, or carry. METAPHRASTES, or METAPHRAST, a literal Translator; or a Person who renders an Author into some other Language Word for Word. See TRANSLATION.

A *Metaphrastis* usually signifies something more than a Paraphrastic, or a Translation; in which sense, *Metaphrastis* implies a Translator, Glossographer, and Interpolator, all at once. See PARAPHRASE, &c.

METAPHYSICS, a Branch of Science, about whose Nature and Idea, there is some difference among Authors. See SCIENCE.

Some define it that part of Science which considers Spirits and immaterial Beings; which others chuse to distinguish by the Name of *Pneumatic*. See SPIRIT and PNEUMATICS.

Others, keeping closer to the Etymology of the Word, explain *Metaphysics* by *trans-natural*, or *preternatural*, or even *post-natural* Philosophy. In this sense the Word is form'd of the Preposition *μετα*, trans, beyond, or above; and *φυσικη* Nature, or *φύσις*, Natural.

Others, with more Propriety, conceive *Metaphysics* to be what some others call *Ontology*, or *Ontosophy*, i. e. the Doctrine of *Ente*, or of Being, in the general, i. e. of Being *quatenus* Being, or Being in the Abstract. See ONTOLOGY and ABSTRACTION.

In the same view, some Philosophers call this Science by the Name *Philosophia* or *Scientia generalis*, as being the Foundation, or, as it were, the *Stamen* or Root from whence all the other parts of Philosophy arise, and wherein they all meet; its Object being Being in the Abstract, or general, not restrain'd to this or that Denomination of them; not to Spirit any more than Body: So that the Doctrines of *Metaphysics*, are applicable to all Beings whatever. See ENS.

The Philosophers again, are divided as to the Notion of a Science of *Ente*, in general. Some hold it real, precise, and solid enough to be demonstrat'd; others judge it too obscure, faint, and confus'd to be admitted into Philosophy.

Being, abstracted from every Sort or Species of Being, is certainly a very vague Term; and does not seem to give footing enough for a Science: We do not see how it comes to affect the Mind as an Object. Add, that the common *Metaphysics* cannot demonstrate any part of its Subject, but assumes the whole: There are no Principles, or Axioms whereon to demonstrate *Metaphysics* which contain the Principles of all other Sciences. See MATHEMATICS.

The first who wrote professedly on the Subject of *Metaphysics* is *Aristotle*. Indeed he is the first who uses the Word: *μετα φυσικη*, is the Title of one of his Books, which some of his Commentators will have to signify no more than after the Books of *Physics*. M. du Hamel, taking the Preposition *μετα* in the sense of *post*, is even of Opinion that the Word was coin'd by *Aristotle's* Followers; and that it was utterly unknown to *Aristotle*.

*Aristotle's* *Metaphysics* seem to have been intended for a kind of Natural Theology. F. Molebranche and Mr. Locke have wrote much more clearly and consistently of *Metaphysics*,

than any of the Ancients. See UNITY, MORE, TRUTH, DURATION, &c.

METAPHYSICAL, something belonging to *Metaphysics*. See METAPHYSICS.

The Word is also used to denote something too subtle, abstract, and refined. In this sense we say, such a Reasoning, such a Proof, is too *Metaphysical*, &c.

A *Metaphysical* Case, is an imaginary or chimerical Case, which can scarce ever happen, or not without much difficulty; and which ought not to be laid down as a Rule for common Occasions.

METAPLASM, METAPLASMUS, in Grammar, a Transmutation, or Change made in a Word, by adding, retrenching, or changing a Letter or Syllable thereof.

The Word comes from the Greek *μεταπλασμος*.

METASTASIS, in Medicine, from *μεταστασις*, a transference, I change, or remove; signifies the Removal of a Humour from one part, to another, which is most commonly known in nervous Cases; sometimes also in the greater Humours; the refracted Blood taking up digested Matter from one part, and disposing it upon another. See FLEXION.

METATARSUS, in Anatomy, that part of the human Scleron, containing the middle of the Foot. See FOOT.

The *Metatarsus* consists of five Bones, reaching from the Heel to the Toes; whereof that which sustains the great Toe, is the thickest; and that which sustains the next Toe, the longest. The rest grow, each shorter than the other. They are longer than the Bones of the *Metacarpus*; in other things they are like them, and are articulated to the Toes, as these are to the Fingers. See METACARPUS.

The Word comes from *μετα*, trans, and *ταρσος*, tars, foot.

METATHESIS, *Transposition*, a Grammatical Figure, whereby the Letters of a Word, or the Words of a Sentence, are transposed, or shifted out of their natural Situation. See TRANSPOSITION.

The Word comes from the Greek *μεταθεσις*, *transpositio*.

METEMPSYCH, ancient Heretics, who, in imitation of *Pythagoras*, held the *Metempsychosis* or Transmigration of Souls. See METEMPSYCHOSIS.

METEMPSYCHOSIS, in the ancient Philosophy, the Passage, or Transmigration of the Soul of a Man, after Death, into the Body of some other Animal. See TRANS-MIGRATION.

*Pythagoras* and his Followers held, That after Death Men's Souls pass'd into other Bodies, of this or that kind, according to the manner of Life they had led. If they had been vicious, they were imprison'd in the Bodies of *Haebon*, miserable Beasts, there to do Penance for several Ages; at the Expiration whereof, they return'd afresh to animate Men: If they had lived virtuously, some happier Brute, or even a human Creature, was to be their Lot. See PYTHAGOREANS.

What led *Pythagoras* into this Opinion, was, the Persuasion he had, that the Soul was not of a perishable nature: whence he concluded, that it must remove into some other Body, upon its abandoning this. *Lucretius* treats this Doctrine as a kind of officious Lye, contriv'd to mitigate the Apprehension of Death, by persuading Men that they only changed their Lodging; and ceased to live, to begin a new Life.

*Rambert* denies this Doctrine; and maintains, that the *Metempsychosis* of *Pythagoras* imply'd nothing more than a Similitude of Manners, Desires, and Studies formerly existing in some Person deceased, and now revived in another alive. Thus, when it was said that *Ezoporus* was revived in *Pythagoras*, no more was meant than that the martial Virtue, which had shone in *Ezoporus* at the time of the Trojan War, was now in some measure revived in *Pythagoras*, by reason of the great respect he bore to the *Achives*. For those People wondering how a Philosopher should be so much taken with Men of the Sword, he palliated the Matter, by saying that the Soul of *Ezoporus*, i. e. his Genius, Disposition and Inclination, were revived in him. And this gave occasion to the Report that *Ezoporus's* Soul, who perished in the Trojan War, had transmigrated into *Pythagoras*.

*Lucius* asserts, That what *Plato* speaks of the Migration of a human Soul into a Brute, is intended allegorically; and relates merely to the Manners, Affections, and Habits of its degenerating into a beastly Nature by the Impurities of Vice. *Servanius*, tho' he allows some force to this Interpretation, yet inclines rather to refer the *Metempsychosis* to the Resurrection. See RESURRECTION.

*Pythagoras* is said to have borrowed the Notion of a *Metempsychosis* from the *Egyptians*, others say from the ancient *Brachmans*. It is still retained among the *Bonians* and other Idolaters of India and China; and makes the principal Foundation of their Religion. So extremely are they bigoted to it, that they not only forbear eating any thing that has Life, but many of them even refuse to de-

send themselves from wild Beasts. They burn no Wood, left some little Animalcule should be in it; and are so very charitable, that they will redeem from the hands of Strangers, any Animals that they find ready to be killed. See BRACHMANS, BANIANs, &c.

The Word is Greek, form'd of *μετ*, *ει*, and *μετρον*, *Me-τρον*.

**METEMPTOSIS**, a Term in Mathematics, particularly us'd in Chronology, expressing the solar Equation, necessary to prevent the new Moon from happening a Day too late; as, on the contrary, *Proempsiis* signifies the lunar Equation, necessary to prevent the new Moon from happening a Day too soon. See *PROEMPSIIS*.

The New Moons running a little backwards, that is, coming a Day too soon at the end of 312 Years and a half; by the *Proempsiis*, a Day is added every 300 Years, and another every 1400 Years: On the other hand, by the *Metempsiis*, a Bissextile is suppressed each 154 Years, that is, three times in 400 Years. These Alterations are never made, but at the end of each Century; that Period being very remarkable, and rendering the Practice of the Calendar easy.

There are three Rules for making this Addition, or Suppression of the Bissextile-Day, and by consequence for changing the Index of the Epochs. 1. When there is a *Metempsiis* without a *Proempsiis*, the next following, or lower Index, must be taken. 2. When there is a *Proempsiis* without a *Metempsiis*, the next preceding, or superior Index, is to be taken. 3. When there is both a *Metempsiis* and a *Proempsiis*, or when there is neither the one nor the other, the same Index is preserved. Thus in 1600 we had D; in 1700, by reason of the *Metempsiis*, C was taken; in 1800 there will be both a *Proempsiis* and a *Metempsiis*; so the same Index will be retained. In 1900 there will be a *Metempsiis* again, when B will be taken, which will be preserved in 2000; because there will then be neither the one nor the other. This is as far as we shall need it. *Claudian* has calculated a Cycle of 301800 Years; at the end of which Period, the same Indices return in the same Order. See *EPOCH*.

The Word comes from the Greek *μετ*, *πει*, and *μετρον*, *πει*, I fall.

**METEOR**, in Physiology, a mixed, moveable, crude, inconstant, imperfect Body, or Semblance of a Body, appearing in the Atmosphere, and formed out of the Matter of the common Elements, altered a little, but not transformed.

**METEORS** are of three Kinds: Ignious, or fiery Meteors, consist of a fat sulphurous Smoke set on Fire; such are *Lightning*, *Thunder*, *Ignis Fatuus*, *Draco Volans*, *Falling Stars*, and other fiery Phenomena appearing in the Air. See *THUNDER*, *LIGHTNING*, *IGNIS FATUUS*, &c.

*Aerial* or *Airy* **METEORS**, consist of flatus and spiritous Exhalations; such are *Winds*, *Whirlwinds*, and *Hurricanes*. See *WIND*, *HURRICANS*, &c.

*Aqueous* or *Watery* **METEORS**, are composed of Vapours, or watery Particles variously separated and condensed by Heat and Cold; such are *Clouds*, *Rainbows*, *Hail*, *Snow*, *Rain*, *Dew*, and the like. See *CLOUD*, *RAINEOW*, *HAIL*, *SNOW*, *RAIN*, *DEW*, &c.

The Formation of **METEORS** is explained pretty largely by *Des Cartes*, in a Treatise express. *Aristotle* and *Gassendus* have also handled the same Subject. *Dr. Woodward's* Opinion is, That the Matter of *Meteors* is in great measure of a mineral nature; That the mineral Particles contained in the Strata of the Earth, are raised by the subterraneous Heat, together with the Vapours ascending from the Abyss, and pervading those Strata; especially at such times as the Sun's Heat is sufficient to penetrate the exterior Parts of the Earth, and to make room for their Escape into the Atmosphere. Thus sulphurous, nitrous, and other active and volatile mineral Particles, form various *Meteors*, according to the various Fate they meet with in the Air. See *VAPOUR*, *EXHALATION*, *MINERAL*, *AIR*, &c.

The Greeks call them *μετεωρα*, q. d. *Sublimis*, or high-raised; the Latins, *Impressiones*, as making Signs or Impressions in the Air.

**METEOROLOGY**, the Doctrine of *Meteors*; explaining their Origin, Formation, Kinds, Phenomena, &c. See *METEOR*.

**METEOROSCOPE**, a Name the ancient Mathematicians gave to such Instruments as they used for observing, and determining the Distances, Magnitudes and Places of the heavenly Bodies.

From the Greek *μετρησις*, *high*; and *σκοπος*, *I view, observe*.

**METHEGLIN**, a Liqueur, or Drink prepared of Honey; one of the most pleasant and general Drinks the Northern part of Europe affords; and much used among the ancient Inhabitants. See *DRINK*.

There are divers ways of making it: One of the best whereof follows. Put as much live Honey naturally

running from the Comb, into Spring-Water, as that which the Honey is thoroughly dissolved, an Egg will not sink to the bottom, but be just suspended in it: This Liqueur boil for an Hour, or more, till such time as the Egg swims above the Liqueur about the breadth of a Grout; when very cool, next Morning, it may be barrel'd up; adding to each fifteen Gallons an Ounce of Ginger, as much of Mace and of Cloves, and half as much Cinnamon, all grossly pounded: a Spoonful of Yest may be also added at the Bung-Hole, to promote the working. When it has done working, it may be closely stop'd up, and after it has stood a Month, may be drawn off into Bottles. The Word is *Welsch*, *Meddyglyn*.

**METHOD**, the Art, or Rule of disposing things in such a manner, as they may be easily comprehended; either in order to discover the Truth, which we ourselves are ignorant of; or to prove and demonstrate it to others when known. See *TRUTH* and *ERRORA*.

**METHOD** is twofold. The one of *Resolution*, which is that we generally use in our Enquiry after Truth. See *RESOLUTION*. The other of *Composition*, by which the Truth once found, is taught or imparted to others. See *COMPOSITION*.

In the **METHOD** of Resolution, call'd also by Geometers the *Analytic Method*, we proceed from some general, known Truth, to others which belong to some particular or singular Thing. See *ANALYSIS*.

In the **METHOD** of Composition, call'd also the *Synthetic Method*, we propose some certain, general Truths, from which we deduce particular Truths. See *SYNTHESIS*.

If in the *Method* of Resolution we propose any Maxims; 'tis not immediately in the beginning, and all together; but as they are found necessary in the Disquisition: On the contrary, in the *Method* of Composition, they are proposed all together in the beginning, before there is any absolute need of them.

These two *Methods* differ from each other, as the *Methods* of searching out a Genealogy, either by descending from the Ancestors to their Posterity, or by ascending from the Posterity to the Ancestors: both of them have this in common, That their Progression is from a Thing known, to another unknown. Those Things that are known, in each, are set in the front, or first place; that by them we may be able to arrive at those which are not known. The following Things are required in both, that Error may be avoided.

1. That no Proposition be admitted as true, to which a Man can, with a good Conscience, deny his Assent; or which is not evident. 2. That the Connection of the following Proposition, with the foregoing in every step of the Progression, be likewise evident or necessary. To these may be added two other prudential Maxims, that hold good in each *Method*: As, that we ought to reason on those Things only, of which we have clear and perspicuous Ideas; or of obscure Things only, so far as we know them; and that we should always begin from the simple and easy, and dwell on them a-while, before we proceed to Things compounded, and more difficult.

As to the Laws peculiar to *Resolution*, they are, 1. That we must clearly and perfectly understand the State of the Question proposed. 2. That with some Energy or Effort of the Mind, one or more intermediate Ideas be discovered; which are to be a common Measure or Standard, by whose help the relations between the Ideas to be compared are to be found out. 3. That we cut off all that has no necessary relation to the Truth sought after from the thing which is to be the Subject of our Consideration. 4. That the compounded Question be divided into parts, and those separately consider'd in each Order, as that we begin with those which consist of the more simple Ideas, and never proceed to the more compounded, till we distinctly know the more simple, and by reflection have render'd them obvious to the Understanding. 5. That certain Signs of our Ideas comprehended in obvious and establish'd Figures, or in the fewest Words possible, be imprinted in the Memory, or mark'd on Paper, lest the Mind have any further trouble about them. 6. These things done, that the Ideas (according to the second Law) be then compared with each other, either by reflection alone, or by express Words. 7. If after we have compared all the Ideas, we cannot find out what we seek, we are then, by the third Law, to cut off all the Propositions, which, after a full Examination, we find of no use to the Solution of the Question, and begin a-fresh. If, after this Method has been repeated as often as is necessary, nothing of what we have observed seems to conduce to the Solution of the Question, we ought to give it over as out of our reach.

The *Synthetic Method*, or *Method* of Composition, is only practicable in things, whose Principles we perfectly know; as in Geometry, which is wholly employ'd in the Consideration

deration of abstract Modes; of which our Mind has clear and adequate Ideas: But when the Enquiry is into Substances, as in Physics, we cannot make use of the Method of Composition, their Kinds, and intimate Effences being unknown to us.

This Method has not been by any so justly and accurately observed, as by the Mathematicians, whose Principles are perfectly known: Its Laws therefore will be best drawn from their Practice. Now, as they designed to propose nothing that could be contradicted; they pitch'd on these three Rules: 1. To offer nothing but what was couch'd in Words or Terms perfectly underlind; for which reason they always define the Words they make use of. 2. To build only on evident and clear Principles, such as could not be contradicted by any who understood them; for which reason they first of all propound their Maxims or Axioms, which they demand to be granted them, as being self-evident, and needing no Proof. 3. To prove demonstratively all their Consequences; for which reason they use nothing in their Arguments or Proofs, but Definitions that have been laid down; Axioms that have been granted, and Propositions that have been already proved; which become Principles to things that follow them.

The Word Method comes from the Greek *metodos*, which signifies the same thing: The Schools have a long time disputed, whether Logic be an Art, a Science; or a Method. See LOGIC.

*Gassendus* distributes Method into three Kinds or Branches, viz. *Methodus Inventionis*, Method of Invention, or discovering a Truth unknown. See INVENTION.

*Methodus Judicii*, of Judging, or determining of a Truth, or Proposition propos'd. See JUDGMENT.

And *Methodus Demonstrationis*, or of Demonstration; that is, of exhibiting it to another. See DEMONSTRATION.

METHOD, *Methodus*, is peculiarly used in Mathematics for divers particular Processes. In this sense we say

METHOD of Fluxions. } FLUXIONS.  
METHOD of Maxims & Minimis. } MAXIMIS.  
Etc. } Sec

METHOD of Tangents. } TANGENTS.  
DIFFERENTIAL Method, &c. } DIFFERENTIAL.  
EXPONENTIAL Method, &c. } EXPONENTIAL.

METHODICA Medicina, See MEDICINE and PHYSIC.  
METHODISTS, METHODICI, an Appellation given to those Physicians who adhere to the Doctrine of *Galen*, and the Schools; and who cure with Bleedings, Purges, &c. duly apply'd according to Symptoms, Circumstances, &c. in opposition to *Empirics* and *Chymists*, who use violent Medicines, and pretended Secrets or Nostrums. See EMPIRIC, CHYMISTR, &c.

METOCHE, in the ancient Architecture, a Term used by *Varro* to signify the Space or Interval between the Dentils. See DENTICLE.

*Ealdus* observes, that in an ancient MS. Copy of that Author, the Word *Metatome* is found for *Metroche*. Hence *Daviler* takes occasion to suspect that the common Text of *Vitruvius* is corrupted; and concludes, that it should not be *Metroche*, but *Metatome*, q. d. Section.

METONIC Cycle, in Chronology, the Lunar Cycle, or Period of 19 Years; thus call'd from its Inventor *Meton*, an ancient *Athenian*. See CYCLE and PERIOD.

When the *Metonic* Cycle is completed, the Lunations, or the New and Full Moons return on the same Day of the Month; so that on whatever days the New and Full Moons happens this Year, 19 Years hence they will fall precisely on the very same Day of the Month, as *Meton* and the Primitive Fathers thought. See LUNATION.

For this reason, at the Time of the Council of *Nice*, when the manner of settling the Time for observing *Easter* was established, the Numbers of the *Metonic* Cycle were insert'd in the Calendar in Letters of Gold, on account of their great Use; and the Year of the Cycle for that Year was call'd the *Golden Number* of that Year. See GOLDEN NUMBER.

This is sometimes also call'd the *Lunar Cycle*, or Period. See LUNAR Cycle.

METONYMY, a Figure in Rhetoric, call'd also *Hypallage* and *Transpositionalis*. It consists in a transmutation or change of Names, or putting of one Name for another. See FIGURE.

The *Metonymy* is the most extensive of all the Tropes. See TROPE.

There are four principal Kinds of *Metonymies*: The first, when we put the Inventor for the thing invented; as *Bacchus* for Wine, *Ceres* for Bread. The second, when we put the Containing for the thing contain'd; as a Glass for the Wine within it. The third, when the Effect is put for the Cause; as the Captain for his Soldiers, *Græce* for the Greeks, the Author for his Works. The fourth, when the Sign is put for the thing signified; as the Gown for the Priesthood, &c.

The Word comes from the Greek *metonymia*, and *metonymos*, *Nomen*.

METOPÉ, or METOPÁ, in Architecture, the Interval, or square Space between the Triglyphs, in the Frieze of the Doric Order. See TRIGLYPH and FRIEZE.

The Antients used to adorn these Parts with carved Works, or Paintings, representing the Heads of Oxen, Vessels, Basons, and other Utensils of the Heav'n Sacrifices.

As there is found some difficulty in disposing the Triglyphs and *Metopes* in that just Symmetry which the Doric Order requires; some Architects make it a Rule, never to use this Order but in Temples.

Semi METOPÉ is a Space somewhat less than half a *Metope*, in the Corner of the Doric Frieze.

The Word *Metope*, in the original Greek, signifies the distance between one Aperture or Hole and another, or between one Triglyph and another; the Triglyphs being supposed to be Solives or Joists that fill the Apertures: from *metu* inter, between, and *opu* foramen.

METOPOSCOPY, the Art of discovering the Temperament, Inclinations, and Manners of Persons by Inspecting the Lines in their Faces.

*Metoposcopy* is no more than a Branch of Physiognomy; the latter taking its Conjectures from all parts of the Body: But both the Body, and the Branch are extremely precarious, not to say vain. See PHYSIOGNOMY.

*Circ Spontani*, who has wrote on the Subject of *Metoposcopy*, observes, that there are seven principal Laws consider'd in the Forehead; each of which has its peculiar Planet. The first is the Law of Saturn. The second of Jupiter, &c.

The Word comes from the Greek *metopon*, *Facies*, Face, and *opsis*, *inspicio*, I view.

METRE, or METER, a Term in Poetry; form'd of the Greek *metron*, *mensura*, and signifying Verse, or Measure. See VERSE and MEASURE.

*Metrical Verses* are those consisting of a determinate Number of long and short Syllables; as those of the Greek and Latin. See QUANTITY.

*Capellus* observes, that the Genius of the Hebrew Language is incompatible with *Metrical* Poetry. See HEBREW.

METRICE, among the Antients, was that part of their Music employ'd about the Quantities of Syllables; or which consider'd them as long, or short. See QUANTITY and MUSIC.

METROCOMIA, a Term in the ancient Church History, signifying a Town that had other Towns under its Jurisdiction.

What a *Metropolis* was among Cities, that a *Metrocomia* was among Country-Towns. The ancient *Metrocomies* had each its *Chorepiscopus*, or Rural-Dean, and here was his See or Residence. See METROPOLIS and CHOREPISCOPI.

The Word comes from the Greek *metris*, Mother, and *polis*, Town, Village.

METROPOLIS, the Capital of a Country, or Province; or the principal City, and, as it were, the Mother of all the rest. See CITY.

The Name is also apply'd to Archiepiscopal Churches; and sometimes to the principal Church of a City. See CHURCH.

*Father Monet* gives a compleat List of all the *Metropolies*. See METROPOLITAN.

The Word comes from the Greek *metris*, Mater, Mother; and *polis*, *Urbs*, City; as who should say, the Mother-City, &c.

METROPOLITAN, is indifferently applied to an Archbishop, and to his Cathedral Church. See ARCHBISHOP and CATHEDRAL.

The Roman Empire having been divided into thirteen Dioceses, and 120 Provinces; each Diocese and each Province had its *Metropolis*, or Capital City, where the Proconsul, or the Vicar of the Empire had his Residence. See DIOCESS and PROCONSUL.

By this Civil Division, the Ecclesiastical was afterwards adjust'd; and the Bishop of the Capital City, had the direction of Affairs, and the Pre-eminence over all the Bishops of the Province. His Residence in the *Metropolis*, gave him the Title of *Metropolitan*. This creation of *Metropolitans* is refer'd to the end of the third Century, and was confirm'd by the Council of *Nice*.

Archbishop *Usher* and *de Maras*, however, maintain it to be an Establishment of the Apostles; but in vain: For 'tis next to certain, that the Ecclesiastical Government was regulat'd on the foot of the Civil, and that it was hence the Name and Authority of *Metropolitans* was given to the Bishops of the Capital Cities of the Empire, or the Provinces that compos'd it. This is so true, that in the Contest between the Bishop of *Arles*, and the Bishop of *Vienne*, each of whom laid claim to the *Metropolitanship* of the Province of *Vienne*; the Council of *Turin* appointed, that which e'er of them could prove his City to be the Civil *Metropolis*, should enjoy the Title, and Rights of Ecclesiastical *Metropolitan*.

The Ecclesiastical Government was modell'd on the foot of the Political; yet in *Gaul*, and some other Countries, the distinctions of *Metropolitan* and *Primate* were not observed till very late. As the *Professus Gallicus* resided by turns at *Treves*, *Vienne*, *Arles*, and *Lyon*, he communicated the Rank and Dignity of *Metropolitan* and *Primate* to each of them in their turn; and yet none of the *Gallican* Bishops assumed to themselves the Rights, nor even the Precedence of *Metropolitans*. The *Episcopate* level'd them all; and as to Order, they had no regard, but to the Privileges of Seniority. This Equality lasted till the fifth Century, when the Contest between the Bishops of *Vienne* and *Arles* was set on foot.

M. de *Pis* observes, that in the Provinces of *Africa*, excepting those whereof *Carthage* was the Metropolis, the place where the most aged Bishop resided became the Metropolis. The Reason of which without doubt was this, that neither the Proconsul, nor *Præfectus* ever fix'd their Residence.

The same Author observes, that in *Asia* there were *Metropolitans* merely nominal, that is, which had no Suffragan, nor any Rights of *Metropolitans*. The Bishops of *Nice*, *Chalcedon*, and *Berytus*, had the Precedence of the other Bishops, and the Title of *Metropolitans*, without any other Right or Privilege besides the Honour of the Appellation; they themselves being subject to their *Metropolitans*.

A *Metropolitan* has the Privilege of Ordaining his Suffragans; and Appeals from Sentences pass'd by the Suffragans, are prefer'd to the *Metropolitan*. See *BISHOP* and *PRIMATE*.

The Jesuit *Costel* had began a History of *Metropoles*; but dy'd e'er the second Volume was finish'd.

MEZZANINE, a Term used by some Architects to signify an Entresole. See *ENTRESOLE*.

The Word is borrow'd from the *Italians*, who call *Mezzanini* those little Windows, less in height than breadth, which serve to illuminate an Attic, or Entresole.

MEZZO-TINTO, in Sculpture, a particular manner of Engraving Figures on Copper. See *ENGRAVING*.

*Mezzo-Tinto* is said to have been first invented by Prince *Rupert*; and Mr.  *Evelyn*, in his History of *Chalceography*, gives us a Head perform'd by that Prince in this way.

'Tis pretty different from the common way of Engraving. To perform it, they rake, hatch, or punch the Surface of the Plate all over with a Knife, or Instrument for the purpose; first one way, then a-cross, &c. till the face of the Plate be thus entirely furrow'd with Lines or Furrows close and as it were contiguous to each other; so that if an Impression were then taken from it, it would be one uniform blot or smut.

This done, the Design is drawn, or marked on the same Face: after which, they proceed with Burnishers, Scrapers, &c. to expunge and take out the Dents or Furrows in all the parts where the Lights of the Piece are to be; and that more or less, as the Lights are to be stronger or fainter; leaving those parts black which are to represent the Shadows or Deepnings of the Draught.

MIASMA, from *μασσω, impo*, I infect; is made use of to signify such Particles, or Atoms, as are supposed to arise from distemper'd, putrifying, or poisonous Bodies, and to affect People at a distance. See *CONTAGION*.

MICHAELMAS, the Feast of *St. Michael* the Arch-angel, held on the 29th of September. See *QUARTER-DAY*.

MICROCOSM, a Greek Term literally signifying *Little World*; chiefly understood of *Man*, who is so called by way of Eminency, as being an Epitome of all that is wonderful in the great World, or Macrocosm. See *MACROCOSM*.

The Word is form'd from the Greek *μικρος, parvus*, little; and *κοσμος, Mundus*, World.

MICROGRAPHIA, MICROGRAPHY, a Description of the Parts, and Proportions of Objects, that are so small to be viewed without the Assistance of a Microscope. See *MICROSCOPE*. Dr. *Hook's Micrographia* is in much esteem among the Curious.

The Word is compounded of *μικρος, parvus*, and *γραφω, scribo*, description.

MICROMETER, an Astronomical Machine, which by means of a very fine Screw, serves to measure extremely small Distances in the Heavens; as the apparent Diameters of the Planets, &c. to a great degree of Accuracy. See *DISTANCE*.

The Word comes from the Greek *μικρος, parvus*, and *μετρον, Mensura*; in regard a small Length, e.g. an Inch, is here divided into a vast number of Parts, e.g. in some, 2800; and in others more.

There is some Controversy about the Invention of the *Micrometer*. Mess. *Newton* and *Picard* have the Credit of it in common Fame; as being the first who published it, in the Year 1665. But Mr. *Townley*, in the *Philosophical Transactions*, claims it for one of our own Countrymen,

Mr. *Gafseyne*. He relates, that from some scatter'd Papers and Letters of this Gentleman, he had learn'd, that before our Civil Wars he had invented a *Micrometer*, of as much effect as that since made by M. *Newton*, and had made use of it for some Years, not only in taking the Diameters of the Planets, and Distances upon Land, but in determining other Matters of nice Importance in the Heavens; as the Moon's Distance, &c.

Mons. de la Hire, in a Discourse on the Art of the Inventions of the *Micrometer*, Pendulum Clock, and Telescope, read before the Royal Academy of Sciences, in 1717, makes M. *Huygens* the Inventor of the *Micrometer*. That Author, he observes, in his *Observations on Saturn's Ring*, &c. published in 1659, gives a Method of finding the Diameters of the Planets by means of a Telescope, viz. by putting an Object, which he calls *Vergula*, of a proper Bigness to take in the Distance to be measured, in the Focus of the Convex Object Glass: In this Case, says he, the smallest Object will be seen very distinctly, in that place of the Glass. By such means, he adds, he measured the Diameters of the Planets, as he there delivers them.

This *Micrometer*, M. de la Hire observes, is so very little different from that published by the Marquis de Malasia, in his *Ephemerides*, three Years after, that they ought to be esteem'd the same; and the *Micrometer* of the Marquis differ'd yet less from that published four years after his by *Newton* and *Picard*. Hence M. de la Hire concludes, that 'tis to M. *Huygens* the World is indebted for the Invention of the *Micrometer*: without taking any notice of the Claim of our Countryman, Mr. *Gafseyne*, which is prior by many Years to any of them.

#### Construction and Use of the MICROMETER.

1. *Wolffius* describes a *Micrometer* of a very easy and simple Structure; first contriv'd by *Kirchius*.

In the Focus of a Telescope fit a Brass or Iron Ring A B, (Tab. ASTRONOMY, fig. 11.) with Female Screws diametrically opposite to each other. Into these insert Male Screws C E and F B, of such Length, as that they may be turned in the Tube, so as to touch each other. And with this Instrument very small Spaces in the Heavens may be accurately measured.

For when any Objects, viewed thro' a Tube, appear contiguous to the Screws; if these be turned till they just touch two opposite Points, whose Distance is to be measured, it will be evident how many Threads of the Screw they are apart: To determine how many Seconds answer to each Thread; applying the Tube towards the Heavens, turn the Screws, till they touch two Points, whose Distance is already accurately known; and observe the Number of Threads corresponding to that Interval. Thus, by the Rule of Three, a Table may be made of the Seconds corresponding to the several Threads; by means whereof, without more ado, the Distances of any Points may be determined.

2. The Structure of the *Micrometer* now chiefly in Use, with the Manner of fitting it to a Telescope, and applying it, is as follows:

A B C F (Plate ASTRONOMY, fig. 12.) is a Rectangular Brass Frame; the Side A B being about three Inches long, and the Side B C, as likewise the opposite Side A F, about six Inches; and each of the three Sides about  $\frac{1}{2}$  of an Inch deep. The two opposite Sides of this Frame are screw'd to the Circular Plate, to be mentioned hereafter.

The Screw P, which has exactly forty Threads in an Inch, being turned round, moves the Plate G D E F along two Grooves made near the Tops of the two opposite Sides of the Frame; and the Screw Q having the same number of Threads in an Inch as P, moves the Plate R N M Y along two Grooves, made near the bottom of the said Frame, in the same Direction as the former Plate moves, but with only half the Velocity of that other. These Screws are turned both at once, and so the Plates are moved along the same way, by means of a Handle turning the endless Screw S, whose Threads fall in between the Teeth of the Pinions on the Screws P and Q. And note, that two half Revolutions of the endless Screw S, carry the Screw P exactly once round.

The Screw P turns the Hand a fasten'd thereto, over a hundred equal Divisions, made round the Limb of a circular Plate, to which the above named two opposite Sides of the Frame are screw'd at right Angles. The Teeth of the Pinion on the Screw P, whose Number is 5, take into the Teeth of a Wheel on the back-side of the circular Plate, whose Number is 25. Again, on the Axis of this Wheel is a Pinion of two, which takes into the Teeth of another Wheel, moving about the Center of the circular Plate, on the out-side thereof; having 50 Teeth. This last Wheel moves the lesser Hand b once round the above mention'd circular Plate, in the  $\frac{1}{50}$  part of the Time the Hand a is moving round: For because the Number of Teeth in the Pinion on the Screw P, are 5, and the Number of Teeth of the Wheel this Pinion moves, are 25; therefore the

Screw P moves four times round, in the time that Wheel is moving once round. Further, since there is a Pinion of two which takes into the Teeth of a Wheel, whose Number is 50; therefore this Wheel with 50 Teeth, will move once round in the time that the Wheel of 20 Teeth moves 25 times round; and consequently the Screw P, or Hand A, must move a hundred times round, in the same time as the Wheel of fifty Teeth on the Hand B, has moved once round.

Hence it follows, that if the circular Plate W, which is fasten'd at right Angles to the other circular Plate, be divided into two hundred equal Parts, the Index x, to which the Handle is fasten'd, will move five of those Parts in the same time, in which the Hand a moves one of the hundred Divisions round the Limb of the other circular Plate. Thus by means of an Index, and Plate W, every fifth part of each of the Divisions round the other Plate, may be known.

Further, since each of the Screws P and Q, have exactly forty Threads in an Inch; therefore the upper Plate G D E F, will move one Inch, while the Hand a moves forty times round; the four thousandth Part of an Inch, while the Hand moves over one of the Divisions round the Limb; and the twenty thousandth Part of an Inch, while the Index x moves one Part of the two hundred round the Limb of the circular Plate W: And the under Plate R N M Y will move half an Inch, the two thousandth Part of an Inch, and the ten thousandth Part of an Inch, the same way, in the said respective Times.

Hence, if the under Plate, having a large round Hole therein, be fixed to a Telescope, so that the Frame is moveable, together with the whole Instrument, except the said lower Plate; and the flat smooth Edge H I, of the fixed Plate A B I H, as likewise the flat smooth Edge D E of the moveable Plate G D E I, be perceivable thro' the round Hole in the under Plate, in the Focus of the Object-Glass; then, when the Handle of the Micrometer is turned, the Edge H I of the narrow Plate A B I H fixed to the Frame, and D E of the moveable Plate, will appear thro' the Telescope equally to approach to, or recede from each other.

By these Edges we shall be able to measure the apparent Diameters of the Sun, Moon, &c. the Manner of doing which take as follows:

Suppose in looking at the Moon thro' the Telescope, you have turned the Handle till the two Edges D E and H I, are open'd, so as just to touch or clasp the Moon's Edges; and that there was twenty one Revolutions of the Hand a, to complete that opening. First say, As the focal Length of the Object-Glass, which suppose ten Feet, is to Radius, so is 1 Inch to the Tangent of an Angle subtended by 1 Inch in the Focus of the Object-Glass; which will be found 28 Min. 30 Sec. Again, because there are exactly 40 Threads of the Screws in 1 Inch; say, if 40 Revolutions of the Hand a, give an Angle of  $28^{\circ} 30'$ , what Angle will 21 Revolutions give? The Answer will be, 15 Min. 8 Sec. And such was the Moon's apparent Diameter; and so may the apparent Diameters of any other Objects be taken.

It must be here observed, that the Divisions on the Top of the Plate G D E F, are diagonal Divisions of the Revolutions of the Screws, with diagonal Divisions of Inches against them. Thus as the said Plate slides along, these Diagonals are cut by Divisions made on the Edge of the narrow Plate K L, fixed to the opposite sides of the Frame by means of two Screws. These diagonal Divisions serve for a Register to count the Revolutions of the Screws, and to show how many there are in an Inch, or the parts of an Inch.

Mr. De-han tells us, that his Micrometer is not, as usually, to be put into a Tube, but to measure the Spectres of the Sun on Paper, (of any Radius) or to measure any part of it. By this means he can easily, and very exactly, with the help of a fine Thread, take the Declination of a solar Spot at any time of the Day; and by his half-Seconds Watch, measure the distance of the Spot from the Sun's Eastern or Western Limb.

MICROSCOPE, or ENGYSCOPE, a Dioptrical Instrument, by means whereof very minute Objects are represented exceedingly large, and view'd very distinctly; according to the LAWS of Refraction. See REFRACTION.

Micropes are properly distinguished into simple, or single; and compound, or double.

The Simple are those which consist of a single Lens, or a single Spherule: The Compound consist of several duly combined. See LENS.

As Optics have been improved, other Varieties have been contriv'd, in the sorts of Microscopes: Hence Reflecting-Microscopes, Water-Microscopes, &c. See REFLECTING, &c.

When, and by whom Microscopes were first invented, is not certainly known. Huygens tells us, that one Drebel, a Dutchman, had the first Microscope, in the Year 1621; and that he was reputed the Inventor of it: tho' P. Fontana a

Neapolitan, claims the Invention to himself, but dates it from the same Year. As a Telescope inverted is a Microscope; the Discovery might easily enough have aris'd from thence. See TELESCOPE.

#### Fundations and Theory of Single MICROSCOPES.

If an Object A B (Tab. OPTICS, Fig. 21.) be placed in the Focus of a small convex Lens, or a simple Microscope D E, and the Eye be applied close to the other side of the Microscope, the Object will be seen distinct, in an erect Situation, and magnified in the Ratio of the distance of the Focus to the distance wherein Objects are to be placed to be seen distinctly with the naked Eye.

Now, For the Object A B being placed in the Focus of the convex Lens D E, the Rays issuing from the several Points thereof, after Refraction, will be parallel to each other. See LENS and REFRACTION. Consequently the Eye will see it distinctly, by virtue of what is proved under the Word TELESCOPE.

Further, since one of the Rays A F proceeding from the Point A, after Refraction, becomes parallel to the incident Rays; and therefore, setting aside the thickness of the Lens, is found directly against it; and the same holds of all the other Rays carried to the Eye: the Rays A F, and B F, to which the rest coming from A and B are parallel, will enter the Eye in the same manner as if they enter'd without passing through the Lens; and will therefore appear erect; as if the Lens were away. See VISION.

Lastly, it is manifest that the Object A B will be seen under the same Angle as if view'd by the naked Eye: But since it appears very distinct, whereas to the naked Eye, at the same distance, it would appear extremely confused, 'tis the same thing as if the Object should seem removed to the distance F H, wherein it is viewed with equal distinctness, and under the same Angle. The Diameter of the Object A B, therefore, will be to the apparent Diameter I K, as F C to F H, i. e. as the distance of the Focus of the Lens to the distance wherein an Object is to be placed in order to view it distinctly. See MAGNITUDE and ANGLE.

Huygens takes it for granted, that an Object seen with the naked Eye, is then in its utmost distinctness, when seen at the distance of 8 Digits, or tenths of a Foot; which agrees pretty near with the Observations of others.

#### Lens of Single MICROSCOPE.

1. Simple Microscopes magnify the Diameter of the Object A B in the Ratio of the distance of the Focus F C to an interval of 8 Digits, v. g. If the Semi-diameter of a Lens convex on both sides be half a Digit A B: I K =  $\frac{1}{2}$ : 8 = 1: 16, that is, the Diameter of the Object will be increased in a sedecuple Proportion, or as sixteen to one.

2. Since the distance F H is constant, viz. 8 Digits, by how much the distance of the Focus, F C is smaller, so much the smaller Ratio will it have to F H; consequently the Diameter of the Object will be so much the more magnified.

3. Since in Plano-convex Lens's, the distance of the Focus is equal to the Diameter; and in Lens's convex on both sides, to the Semi-diameter; simple Microscopes will enlarge the Diameter so much the more, as they are Segments of smaller Spheres.

4. If the Diameter of the Convexities of a Plano-convex Lens, and a Lens convex on both sides, be the same, viz. = 1; the Distance of the Focus of the first will be 1; and of the second  $\frac{1}{2}$ . Consequently, the Semi-diameter of the Object A B will be to the apparent one in the first Case as 1 to 8, in the latter as 2 to 8, i. e. as 1 to 16. A Lens, therefore, convex on both sides, magnifies twice as much as a Plano-convex.

As the whole depends on the just and steady situation of Objects with regard to the Lens, various Methods have been contriv'd to that end: Whence we have several different kinds of single Microscopes. The most simple is as follows.

1. A B, Fig. 22. is a little Tube, to one of whose Bases BC, is fitted a plain Glass, to which an Object, viz. a Gnat, Wing of an Insect, Down, or the like, is applied: To the other Base, AD, at a proper distance from the Object is applied a Lens convex on both sides, whose Semi-diameter is about half an Inch. The plain Glass is turn'd to the Sun, or the Light of a Candle, and the Object is seen magnified. And if the Tube be made to draw out, Lens's of different Spheres may be used.

Again, a Lens, convex on both sides, is inclosed in a Cell A C, and a Screw H there fasten'd a cross; thro' the Pedestal C D passes a long Screw, by means whereof, and the female Screw I, a Style or Needle fix'd perpendicular to its extreme, is kept firm at any distance from the Lens. In E is a little Tube, on which, and on the Point G, the various Objects are to be dispos'd: The

Thus there may be Lens's of various Spheres applied.

2. But the *Microscope* which it found to answer the end best, is as follows: A B, Fig. 23. is a round Brass Tube, whose exterior Surface is form'd into a Skrew of a length somewhat less than the distance of the Focus of a Glass convex on both sides, used here for illuminating the Object, and fitted to its Base A C, by a Ring with a Skrew in it D E.

F G is another Brass Tube, somewhat wider than the first, and open each way for an Object to be apply'd to the *Microscope*. To its upper Base G H is fastned a Spring of Steel-Wire, twisted into a spiral I; whereby an Object placed between two round Plates, or Slices K and L, in the manner hereafter mentioned, is by means of the Skrew B C, brought to the *Microscopical* Lens, (or magnifying Glass, whereof there are several) and kept firm in its place. To the Basis H G, which has a female Skrew M, are fitted Cells N, with a male Skrew O, whereon Lens's of various Spheres, guarded by Ferrils, are included. In P is a female Skrew, by which an Ivory Handle P Q is fastned to the *Microscope*.

To the Ivory Slice T are round Holes, in which are fitted little Circles of *Mussey* Glass, for Objects, especially small and pellucid ones, as little Insects, or the Wings, Scales, &c. of larger, to be fastned to.

When live Insects are to be view'd, they are cover'd with the Brass Slice Y, which is put in a little square Brass-bed, perforated with Holes X: And the same Slice, whether alone, or inclosed in the bed, being laid between the round Plates K and L, is brought to the Lens by means of the Screw A B, till the Object may be distinctly view'd.

If other pellucid oblong Objects are to be view'd, as Down, Caticle, &c. instead of the Slice above, is used the Instrumēt mentioned above, for viewing Wings of Flies; whose Structure is manifest from inspection.

There are other Instrumēt in the Apparatus of the *Microscope*, as little Tonges, &c. for taking up small Objects, a Glass-Tube for viewing the Circulation of the Blood in Fishes, &c. which need no description.

What has been said hitherto, is to be understood of *Lenticular Microscopes*; for Spherical ones, their Doctrine will be understood from what follows.

If an Object AB be placed in the Focus of a Glass Spherule F, and the Eye be behind it, *v. g.* in the Focus G; the Object will be seen distinct, in an erect Situation, and magnified, as to its Diameter, in a Ratio of  $\frac{3}{2}$  of the Diameter E I, to the distance at which Objects are to be placed to be seen distinctly with the naked Eye.

The first part of the Proposition is proved in the same manner of Spheres, as of Lens's: As, then, a good Eye sees an Object distinctly at the distance of 8 Digits, a Glass Spherule will enlarge the Diameter of an Object in a Ratio of  $\frac{1}{4}$  of the Diameter to 88 Digits. Suppose then the Diameter of the Spherule E I  $\frac{1}{18}$  of a Digit, CE will be  $\frac{1}{18}$ , and FE  $\frac{1}{18}$ ; and therefore FC  $= \frac{1}{18} + \frac{1}{18} = \frac{1}{9}$ . Consequently, the true Diameter of an Object to its apparent one is in the Ratio of  $\frac{1}{9}$  to 80; *i. e.* as 3 to 520, or 1 to 107 nearly.

Now a Lens convex on both sides, increases the Diameter in a Ratio of the Semi-diameter to the space of 3 Digits; wherefore  $\frac{1}{2}$  having a less Ratio to 8 than  $\frac{1}{4}$ ; of a Lens and a Spherule that have the same Diameter, the former will magnify more than the latter: And pretty much after the same manner it may be shew'd that a Spherule of a less Diameter, magnifies more than another of a large one.

For the Methods of casting little glass Spherules for *Microscopes*; there are various. *Wolffius* describes one as follows: A small piece of very fine Glass, sticking to the wet Point of a Steel-Needle, is to be apply'd to the extreme bluish part of the Flame of a Torch; or, which is better, to the Flame of Spirit of Wine, to prevent its being blacken'd. Being there melted, and run into a little round drop, it is to be removed from the Flame; upon which it instantly ceases to be fluid: folding, then, a thin Plate of Brass, and making a very small smooth perforation, so as not to leave any Roughness on the Surfaces; and further, smoothing them over to prevent any glaring: fit the Spherule between the Plates against the Apertures, and the whole in a Frame, with Objects convenient for Observation.

*Dr. Adams* tells us another Method, thus: Take a piece of fine Window-Glass, and rase it with a Diamond into as many lengths as you think needful, not exceeding an eighth of an Inch in breadth; then holding one of those lengths between the Fore-finger and Thumb of each Hand over a very fine Flame till the Glass begins to soften, draw it out till it be as fine as an Hair, and break it then, applying each of the ends into the purest part of the Flame, you have two Spheres perfectly, which you may make larger or less at pleasure. If they stay long in the Flame,

they'll have Spots; so they must be drawn out immediately after they are turn'd round. As to the Stem, break it off as near the Ball as possible; and lodging the remainder of the Stem between the Plates; by drilling the Hole exactly round, all the Protuberances are buried between the Plates; and the *Microscope* performs to admiration.

After these manners may Spheres be made much smaller than any Lens; so that the best *Microscopes*, or those which magnify the most, are made thereof. For suppose the Diameter of a Spherule to be  $\frac{1}{16}$  of a Digit, the distance of its Focus will be  $\frac{1}{4}$ ; and therefore its real Diameter to its apparent one, as  $\frac{1}{4} + \frac{1}{16}$ ; that is, as  $\frac{5}{16}$  to 8, or as 3 to 512; or lastly, as 1 to 170. Its Surface therefore will be increased in the Proportion of 1 to 28900, and its Bulk in a Ratio of 1 to 4913000.

M. *Leeuwenboeck* and M. *Muffchenbroeck* have succeeded very well in spherical *Microscopes*; and the Apparatus of the latter is much commended: But we forbear any Description thereof; it being easy for any who considers the Structure of those consisting of Lens's, to conceive how those of Spheres may be contriv'd.

*Water Microscopix*. Mr. S. *Gray*, and after him, *Wolffius* and others, have contriv'd *Water-Microscopes*, consisting of Spherules, or Lens's of Water instead of Glass, fitted up somewhat after the manner of those above-mentioned; (as Spherules of Water may be likewise used instead of Glass in any of the common *Microscopes*) But since the distance of the Focus of a Lens or Sphere of Water, is greater than in one of Glass, (the Spheres, whereof they are Segments being the same) *Water-Microscopes* magnify less, and are therefore less esteem'd than those of Glass.

The same Mr. *Gray* first observ'd that a small Drop or Hemisphere of Water held to the Eye by Candle-Light or Moon-Light, without any other Apparatus, magnified the Animalcule contain'd in it, vastly more than any other *Microscope*. The Reason is, that the Rays coming from the interior Surface of the first Hemisphere, are reflected so as to fall under the same Angle on the Surface of the hind Hemisphere, to which the Eye is applied, as if they came from the Focus of the Spherule; whence they are propagated to the Eye in the same manner as if the Objects were placed without the Spherule in its Focus.

Follow Glass Spheres, of the Diameter of about half a Digit, fill'd with Spirit of Wine, are frequently used for *Microscopes*; but they don't magnify near so much.

#### Theory of Compound, or double Microscopes.

Suppose an Object-Glass E D, Fig. 24. the Segment of a very small Sphere, and the Object A B placed without the Focus F.

Suppose an Eye-Glass G H, convex on both sides, and the Segment of a Sphere greater (tho' not too great) than that of D E, and let it be so disposed behind the Object, as that if C E: C L :: C L: C K, the Focus of the Eye-Glass may be in K.

Lastly, suppose L K: L M :: L M: L I.

If then O be the place wherein an Object is seen distinct with the naked Eye; the Eye in this Case being placed in I, will see the Object A B distinctly in an inverted situation, and magnified in a compound Ratio of M K to L H and L C to C O; as is proved from the Laws of Dioptrics.

#### Laws of double Microscopes.

1. The more an Object is magnified by the *Microscope*, the less is its field, *i. e.* the less it takes in at one view.

2. To the same Eye-Glass, may be successively apply'd Object-Glasses of various Spheres; so as that both the entire Objects, but less magnified, and their several parts, much more magnified, may be viewed thro' the same *Microscope*. In which Case, by reason of the different distance of the Image, the Tube L K, in which the Lens's are fitted, should be made to draw out.

For the Proportion of the Object-Glass to the Eye-Glass, some commend the subduplicate Ratio, and some the subtriple. *Dr. Gualt* will have the Semi-diameter of the Convexity of the Object-Glass to be  $\frac{1}{2}$  of a Digit; or at most  $\frac{3}{4}$ ; in the Eye-Glass an entire Digit, or even 1". *Cherubin* makes the Semi-diameter of the Object-Glass  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or  $\frac{3}{4}$  of a Digit; the Semi-diameter of the Eye-Glass  $\frac{1}{2}$ , or  $\frac{3}{4}$  of a Digit.

Since 'tis prov'd, that the distance of the Image L K from the Object-Glass D E will be greater, if another Lens, concave on both sides, be placed before its Focus; it follows, that the Object will be magnified the more if such a Lens be here placed between the Object-Glass D E, and the Eye-Glass G H. Such a *Microscope* is much commended by *Cronde*, who used an Object-Lens, convex on both sides, whose Semi-diameter was two Digits, its Aperture equal to a Mustard-Seed; a Lens concave on both sides  $\frac{1}{2}$ , or at most 16 Digits; and an Eye-Glass convex on both sides, of 6 Digits.

4. Since the Image is projected to the greater distance, the nearer another Lens of a Segment of a larger Sphere, is brought to the Object-Glass; a Microscope may be composed of three Lens's, which will magnify prodigiously.

5. From these Considerations it follows, that the Object will be magnified the more, as the Eye-Glass is the Segment of a smaller Sphere; but the Field of Vision will be the greater, as the same is a Segment of a larger Sphere: If then two Eye-Glasses, the one a Segment of a larger, the other of a smaller Sphere, be so combin'd, as that the Object appearing very near thro' them, i. e. not farther distant than the Focus of the first, be yet distinct; the Object at the same time will be exceedingly magnified, and the Field of Vision much greater than if only one Lens were used: And the Object will be still more magnified, and the Field enlarged, if both the Object and Eye-Glass be double. But in regard an Object appears dim, when view'd through so many Glasses, part of the Rays being reflected in passing through each; the multiplying of Lens's is not advisable: And the best among compound Microscopes, are those which consist of one Object-Glass, and two Eye-Glasses.

For a Microscope of three Lens's, De-Choles comments an Object-Glass of  $\frac{1}{2}$  or  $\frac{3}{4}$  of a Digit; and the first Eye-Glass he makes 2, or 3 Digits; the distance between the Object-Glass and Eye-Glass about 20 Lines. *Comrad* had an excellent Microscope, the Object-Glass whereof was half a Digit, and the two Eye-Glasses (which were placed very near) 4 Digits: But it answer'd best when in lieu of the Object-Glass, he used two Glasses, convex on both sides, their Spheres about a Digit and half, or at most two, and their Convexities touching each other within the Space of half a Line. *Engelmann de Divinis*, instead of an Object-Glass, convex on both sides, used two Plano Convex Lens's, whose Convexities touched. *Grimaldi* did the same; only that the Convexities did not quite touch. *Zabius* made a Binocular Microscope, wherein both Eyes were used.

*Structure or Mechanism of a Double Microscope.*

The Industry and Address of our Country-man, Mr. Marshall, here deserves to be remember'd: The most commodious Double Microscope is of his Contrivance. In this, the Eye-Glasses are placed in the Tube at A and B, Fig. 25. and the Object-Glass at C. The little Pillar D E is turned by means of a Ball E, moveable in the Socket F; and thus the Microscope is accommodated to any Situation. The same Pillar is divided into as many parts, 1, 2, 3, 4, 5, &c. as there are Lens's of different Spheres to be used in viewing different Objects; so that the distance of the Object from the Object-Glass may be found without any trouble. But as it is scarce exactly enough determined this way, the Tube may be brought nearer the Object at discretion, by means of the Screw G H.

The Objects are either laid on the Circle I; or fitted to proper Instruments, having their Points or Stiles passing through the little Tube L M.

Lastly, to illumine the Object, a Lens convex on both sides, N O, is disposed in a convenient Situation. The rest appears from the Figure.

Reflecting Microscope, is that which magnifies by Reflection, as the above-mentioned ones do by Refraction. See REFLECTION.

The Structure of such a Microscope may be conceiv'd thus: Near the Focus of a concave Speculum A B, place a minute Object C, that its Image may be form'd larger than it self in D. To the Speculum join a Lens convex on both sides E F, so as the Image D may be in its Focus.

The Eye will here see the Image inverted, but distinct, and enlarged; consequently the Object will be larger than if viewed through the Lens alone. See MIRROUR.

The Inventor of this Microscope is the great Sir I. Newton; but it is somewhat to be feared lest the Objects appear dim.

Any Telescope is converted into a Microscope, by removing the Object-Glass to a greater distance from the Eye-Glass. And since the distance of the Image is various, according to the distance of the Object from the Focus; and it is magnified the more, as its distance from the Object-Glass is greater; the same Telescope may be successively converted into Microscopes which magnify the Object in different degrees. See TELESCOPE.

MID, or MIDDLE, in Philosophy, and Mathematics. See MEAN and MEDIUM.

MIDDLE LATITUDE, in Navigation, is half the Sum of two given Latitudes. See LATITUDE.

MIDDLE LATITUDE is also us'd for a Method of working the several Cases in Sailing, nearly agreeing with Mercator's way, but without the help of Meridional Parts. See SAILING. See MERIDIONAL PARTS, MERCATOR, &c.

MIDHAVEN, *Medium Celi*, in Astronomy, is that Point of the Ecliptic which culminates, or is in the Meridian. See CULMINATION, &c.

MIDRIF, in Anatomy. See DIAPHRAGM.

MIDSHIP-MEN, are Officers aboard a Ship, whose Station, when they are on Duty, is, some on the Quarter-Deck, others on the Poops, &c. Their Business is to mind the Braces, to look out, and to give about the Word of Command from the Captain, and other superior Officers. They also assist on all occasions both in sailing the Ship, and in flowing and rummaging the Hold.

They are usually Gentlemen, who, having served their time as Volunteers, are now upon their performance.

MIDSUMMER-DAY, is the Festival of St. John the Baptist, held on the 24th Day of June. See QUARTER-DAY.

MIGRATION, or Transmigration, the Passage or Removal of any thing out of one State, or Place into another; particularly of Colonies of People, Birds, &c. into other Countries. See TRANSMIGRATION.

THE MIGRATION of the Souls of Men into other Animals after Death, is the great Doctrine of the Pythagoreans, call'd the *Metempsychosis*. See METEMPSYCHOSIS.

The MIGRATION of Birds, as the Swallow, Quail, Stork, Crane, Fieldfare, Woodcock, Nightingale, and other Birds of Passage, is a very curious Article in Natural History, and furnishes a notable Instance of the powerful Instinct impress'd by the Creator. See INSTINCT.

Mr. Derham observes two things very remarkable therein; the first, That these untaught, unthinking Creatures should know the proper Times for their Passage, when to come, and when to go; as also, that some should come when others go. No doubt, the Temperature of the Air as to heat and cold, and their natural Propensity to breed their Young, are the great Incentives to those Creatures to change their Habitation: But it is an odd Instinct they should at all shift their Habitation; that some certain Place is not to be found in all the Terrestrial-Globe affording 'em convenient Food and Habitation all the Year round.

The second, That they should know what way to steer their Course, and whither to go. What Instinct is it, that moves a poor foolish Bird to venture over vast Tracts of Lands and Sea? If it be said, that by their high Accents up into the Air, they can see across the Seas, yet what should teach or persuade them that that Land is more proper for the purpose than this? That Britain, for instance, should afford them better Accommodation than Egypt? than the Countries? than Spain? or any other of the intermediate Countries? *Physic-Theor.* p. 349.

*Lad de Beauport* remarks, that Birds in their Passage observe a wonderful Order and Polity: They fly in Troops, and steer their Course through huge unknown Regions, without the Compass. *Cosmol. Drom.* It is to be added, that the Birds of Passage are all peculiarly accommodated by the Structure of their Parts for long flights. See PASSAGE.

Naturalists are divided as to the Places where Birds of Passage retire when they leave us. Mr. *Whymby* thinks the Swallows fly into Egypt and Ethiopia. *Ornith. Lib. 2. c. 3.* *Olaus Magnus* says, they lurk in Holes, or under Water; which is confirmed by *Ermuller*, who assures us, that he saw a Bustard of them taken out of a frozen Fish-Pond, all hanging together head to head, feet to feet, &c. in one Cluster. *Dissert. 2. c. 10.* *Olaus* adds, that this is a common thing in the Northern Countries; and that such a Cluster being carried accidentally by some Boys into a Stove, the Swallows, after thawing, began to fly about, but weakly, and for a very little time. A further Confirmation of this Account was given by Dr. *Calan*, a Person very curious in such things, to the Royal Society. Speaking of the way of Fishing in the Northern Parts, by breaking Holes, and drawing their Nets under the ice, he related, that he saw sixteen Swallows so drawn out of the Lake of *Samroth*, and about thirty out of the King's great Pond in *Rosinelen*; and that at *Schleslotten*, near a House of the Earl of *Dobna*, he saw two Swallows just come out of the Waters that could scarce stand; being very wet and weak, with their Wings hanging on the Ground. He added, that he had often observed the Swallows to be weak for some days after their Appearance.

MILDEW. See MILLEDREW.

MILE, in Geography, a long Measure, whereby we use to express the distance between Places. See MEASURE, DISTANCE, &c.

The Mile is of different extent in different Countries. The Geographical or Italian Mile contains a thousand Geometrical Paces, *Mile Paffus*, whence the Term Mile is derived. See PACE, LEAGUE, &c.

*Casimir* has made a curious Reduction of the Miles, or Leagues, of the several Countries in Europe into Roman Feet, which are equal to the *Rhenland* Feet generally used throughout the North. See FOOT.

The Mile of Italy	_____	_____	_____	Feet.
Of England	_____	_____	_____	5000
				5454

	Feet.
The Mile of Scotland: ———	6000
Of Sweden ———	30000
Of Majesty ———	3750
Of Libmania ———	18500
Of Poland ———	19850
Of Germany, the Small ———	20000
The Middle ———	22500
The Largest ———	25000
Of France ———	5250
Of Spain ———	7090
Of Burgandy ———	6600

Of Persia, called also <i>Parafanga</i> ———	18750
Of Egypt ———	25000

MILES, a Latin Term, which, in its general import, signifies Soldier. See SOLDIER and MILITIA.

In our English Laws, and Customs, Miles is peculiarly appropriated to a Knight, called also *Esqet*. See KNIGHT and EQUES.

MILINARY Glands, *Glandule Miliares*, in Anatomy, a great number of small Glands interspersed throughout the Substance of the Cutis, or Skin. See GLAND and CUTIS.

The Milinary Glands are the Organs whereby the Matter of Sweat, and insensible Perspiration, is secreted from the Blood. See PERSPIRATION and SWEAT.

They are interwove with the pyramidal *Papille* of the Skin; and are each served with a Branch of an Artery, Vein, and Nerve; as also with a proper excretory Duct, through which the fluid Matter secreted from the Blood in the Substance of the Gland, is excreted, and sent forth at the Pores, or Perforations of the Cuticle. See PORE and CUTICLE.

MILIARY Fever, is a malignant Fever wherein the Skin is sprinkled over with little purple Spots, or Pustles, in form of Grains of Miles.

It is also call'd a purple Fever, from the colour of the Spots. See PURPLE and FEVER.

MILITANT, a Term understood of the Assembly of Christians, while here on Earth.

The Romanists divide the Church into *Militant*, Patient, and Triumphant: The *Militant* is on Earth; the Patient, or Passive, they place in Purgatory; and the Triumphant in Heaven. See CHURCH.

MILITARY, something belonging to the *Militia*, or Soldierly. Thus,

The MILITARY Art is the Science of War. See WAR.

MILITARY Government is the supreme Government, Direction, Command, and Disposition of all the Military Power of a Nation by Land and Sea. See GOVERNMENT.

The Military Government of England is wholly under the King; and neither one, nor both Houses of Parliament have any Right to levy any Forces, or make any War Offensive or Defensive. See KING, ARMY, MILITIA, GUARDS, &c.

MILITARY Exercises, are the Evolutions, or various manners of Ranging and Exercising Soldiers. See EVOLUTION.

MILITARY Architecture, is the Art of Fortification. See ARCHITECTURE and FORTIFICATION.

MILITARY Execution, is the delivery of a City or Country up to be ravaged and destroy'd by the Soldiers, upon its refusing to pay Contribution-Money. See EXECUTION.

MILITARY Testament among the Romans, was what we call a Nuptiative-Will; or a Testament made only by Word of Mouth, in the Presence of two Witnesses. See TESTAMENT.

This was a Privilege peculiar to the Soldierly, and to them only when in the Campaign; for at other times they were subject to the common Laws.

MILITARY Column among the Romans, was a Column on which was engraven a List of the Troops of an Army; or the Number of Soldiers employ'd in any Expedition. See COLUMN.

MILITARY Order, see ORDER.

MILITARY Law, see LAW.

MILITARY Fever, is a kind of malignant Fever frequent in Armies, by reason of the ill Food, &c. of the Soldiers. See FEVER.

MILITARY Ways, *Via Militares*, are the large Roman Roads, which *Agrippa* procur'd to be made through the Empire, in the time of Augustus, for the more convenient marching of Troops, and conveyance of Carriages. See ROAD.

N. Bevier has wrote the History of the Origin, Progress, and amazing Extent of these Military Roads; which

were paved from the Gates of Rome to the extreme Parts of the Empire. See VIA.

MILITIA, a collective Term, understood of Persons who make Profession of Arms.

The Word comes from the Latin; *Miles*, a Soldier; and *Militia*, from *Mille*, which was anciently wrote *Mile*: For in levying Soldiers at Rome, as each Tribe furnished a Thousand, *Mille* or *Mile*, Men, whoever was of that Number, was called *Miles*. See TRIBE.

MILITIA in its proper, and more restrained sense, is used to signify the Inhabitants, or, as we call them, the *Trained-Bands* of a Town, or Country; who arm themselves, on a short warning, for their own Defence. In which sense, *Militia* is opposed to regular, stated Forces.

The standing *Militia* of England is now computed to be about 200000 Horse and Foot; but may be increased at the pleasure of the King.

For the Direction and Command of these, the King constitutes *Lords Lieutenants* of each County, with Power to Arm, Array, and Form into Companies, Troops, and Regiments, to Conduct, (upon Occasion of Rebellion, and Invasion) and Employ the Men so Arm'd within their respective Counties, and other Places where the King commands; to give Commissions to Colonels, and other Officers; to charge any Person with Horse, Horse-man, Arms, &c. proportionable to his Estate, &c. See Lord LIEUTENANT.

No Person to be charged with a Horse unless he have 500 Pounds yearly Revenue, or 6000 Pounds Personal Estate; nor with a Foot-Soldier, unless he have 50 Pounds yearly, or 600 Pounds Personal Estate.

MILK, *Lact*, a white Juice, or Humour, which Nature prepares in the Breasts of Women, and the Udders of other Animals; for the Nourishment of their Young. See BREASTS.

Milk is thicker, sweeter, and whiter, than the Chyle itself, from which it is derived, and that probably, without much more Artifice or Alteration than the leaving behind some of its aqueous Parts. The Ancients held it form'd from the Blood; but the Moderns are of Opinion, it comes from the pure Chyle convey'd by the Arteries to the Breasts, and without any other Coction filtrated through the Glands whereof they are compos'd, like Urine through the Reins; without undergoing any considerable change.

According to M. Leeuwenboeck's Observations, Milk consists of little Globules swimming in a clear transparent Liqueur, call'd *Serum* or *Whey*.

Milk is a Composition of three different Kinds of Parts, Butirous, Caseous, and Serous. The Butirous Parts are the Cream and Oil that swim a-top. See BUTTER. The Caseous are the gruffer Parts, and those that coagulate, and are made into Cheese. See CHEESE. The Serous are properly a Lympha, and make what we call *Whey*.

Dr. Drake says, that Milk is nothing but Oil and Water united by the Artifice of Nature, perhaps by the Intervention of some peculiar Salts, which, Milk itself, however sweet at first, does, after a little standing, discover to be pretty plentifully therein.

Milk is first found in the Breasts of Women after they have been pregnant about four Months. The Fermentation of the Milk in the Breasts, the first days after a Woman is delivered, occasions a Fever, which takes its Name therefrom.

Aristotle says, there are some Men who have Milk in their Breasts. Cardan tells us he saw one that had enough to suckle a Child.

In the *Philosophical Transactions*, we have an Account of a Wether brought to Milk by the sucking of a Lamb; which Lamb was maintain'd by it all the Summer, till it was weaned.

Milk corrupted in the Stomachs of Children, occasions the several Diseases incident to that Age. *Dubel*, a Danish Physician, who has wrote expressly on this Subject, tells us, an excellent Remedy in such Case, is a Glass of Water with a little Salt dissolved in it: This acts as an Emetic, and throws up the Corruption that occasion'd the Disorder. *Celsus* mentions this Remedy, L. 1. c. 3. See CHILDREN.

*Galen* observes, that in Animals fed with Milk, the greatest part of the Food of the Mother is converted into that Humour.

There are several kinds of Milk, used not only as Food, but as Phycic: As Cows Milk, Asses Milk, Sheeps Milk, and Goats Milk. These are prescribed as proper to alter a sharp thin Blood into a Crasis more soft, balsamic, and nutritive; and in Constitutions where they fit the first Passages, must be very good for that End, as being already prepared into Nutriment, so far as is required for their admission into the Blood. But where the Juices of the Stomach are sharp, these Liqueurs are apt to be turn'd into Card. Whenever Milk, therefore, of what kind soever, is order'd in Consumptions, and as a Restorative, it is with good reason join'd with the tefaceous Powders, and such things as are proper to destroy those Acidities.

*Affes Milk* is said to be a great Beautifier and Preserver of the Skin. *Poppet*, Wife of the Emperor *Nero*, used it for that purpose; having four or five hundred *Affes* constantly in her Retinue, to furnish her every Morning with a fresh Bath.

We have several artificial *Milks*, so call'd from their resemblance of natural ones. *As*,

*MILK of Sulphur*, a Preparation of Flowers of Sulphur, and Salt of Tartar; prescribed by the Physicians, as a Sudorific. See *SULPHUR*.

*Virgin's MILK*, *Lac Virginalis*, composed of Rock Alum, Spring Water, Licharge, and Vinegar; used as a Cosmetic, to drive in Pimples, and check any cutaneous Eruptions, by its cooling, refrigerant Quality.

*MILK of the Moon*, *Lac Lunæ*, is a Name given by the Naturalists to a kind of stifiil Agaric. See *AGARIC*.

*MILK of the Moon*, or of *Silver*, is also the Name of a white, porous, friable, insipid Earth, extracted by sublimation from a Matter frequently found in Silver-Mines: Whence also it has the Name of *Flowers of Silver*. See *SILVER*.

*MILKY WAY*, *Via Lactea*, or *Galaxy*. See *GALAXY*.

*MILL*, in propriety, is a Machine used for *Grinding*: But the Word in its general Signification is used for all Machines whose Action depends on a circular Motion. See *GRINDING*, *MACHINE*, &c.

Of these there are various kinds, which acquire various Names according to the various manners in which the moving Power is apply'd; but they may all be reduced to three heads, *viz.* *Wind-Mills*, *Water-Mills*, and *Hand-Mills*; under which last, are also comprehended those worked by Horses, &c.

*Water-MILLS* are those turned by the force or fall of a River, &c. Of which, again, there are two kinds; those where the force of the Water is apply'd above the Wheel, call'd *Ower-Slot*; and those where it is apply'd below the Wheel, call'd *Under-Slot Mills*. See *WATER-MILL*.

*Wind-MILLS*, are those turned by the force of Wind gathered in their Sails. Of these, some are call'd *Vertical*, others *Horizontal*, according to the position of the Sails; or rather according to the direction of their Motion with regard to the Horizon. See *VERTICAL* and *HORIZONTAL*.

For the best Form of Horizontal Sails, as also for determining the Position of the Axis of Wind-Mills, see *WIND-MILL*.

*Portaine*, or *Hand-MILLS*, are those kept in Motion by the Hand; or whose Mill-Stones are turn'd, or Pistons driven by the force of Horses, or other Beasts.

The Use of Mills and Mill-stones, according to *Pausanias*, was first invented by *Muletas*, Son of *Meleges*, first King of *Sparta*. The *Priest* attributes the Invention of every thing belonging to Bread and Baking, to *Ceres*. *Polydore Virgil* was not able to discover the Author of so useful a Machine. 'Tis doubted whether or no Water-Mills were known to the *Romans*; there being no mention made in the Digest but of Mills turned by Slaves and *Affes*.

*Salmasius*, however, and *Gorkesfrid*, will not allow *Water-Mills* to have been unknown to the ancient *Romans*, though they were not in ordinary use.

*Wind-Mills* are of much more modern Invention: The first Model of these was brought from *Asia* into *Europe*, in the time of the Holy-Wars.

*MILL* is also used, in the general, for all Machines, which being moved by some external Force, serve to give a violent Impression on things apply'd thereto.

*Mills* in this sense, are Machines of vast use in the Manufactures, Arts, and Trades; for the making and preparing divers kinds of Merchandizes. The principal are these which follow.

*Peper-MILL*, a Water-Mill furnish'd with several Hammers, which beat, or pound the Rags or Cloth in a kind of Wooden-Trough: and thus by reducing them to little pieces, turn them into a kind of *Pulp*, by means of Water convey'd into the Troughs by a Pipe for the purpose. See *PAPER*.

*Fulling-MILL*, is a Water-Mill which raises and beats down large wooden Pistons in proper Vessels, call'd *Peels* or *Troughs*; in order to fall, scower, and cleanse Woollen Stuffs. See *FULLING*.

*Linen-MILLS* don't differ much from *Fulling-Mills*. Their Use is to scower Linens, after having been first cleans'd when taken out of the Lixivium, or Lye. See *BLEACHING*.

Some of these go by Water, the generality by Horses. *MILL* in Coinage, is a Machine used to prepare the *Laminae* or Plates of Metal, and to give them the proper thickness, hardness, and consistence before they be struck or stamped. See *COINING*.

This Machine has not been long known among us; but is of some standing in *Germany*. It consists of several Wheels dented like those of Clocks, &c. which move two Cylinders of Steel, between which the Metal is pass'd

to be brought to its proper thickness. It was first turn'd in order with Water, afterwards with Castel, &c.

*MILL*, among the Gold Wire-Drawers, is a little Machine consisting of two Cylinders of Steel, serving to flatten the Gold, or Silver Wire, and reduce it into *Lanams*, or Plates. See *GOLD-WIRE*.

They have also Mills to wind the Gold Wire or Thread on the Silk; composed of several rows of Bobins all turned at the same time. See *DUCTILITY*.

*SUGAR-MILLS*, is a Machine that serves to bruise the Sugar-Canes, and express the Liquor or Juice contain'd therein. See *SUGAR*.

The *Sugar-Mills* are very curious Contrivances. Of these there are four kinds; being turned either by Water, Wind, Men, or Horses.

Those turned by the hand were first in use; but are now laid aside, as being an intolerable Hardship on the poor Negroes, who were doom'd thereto; besides the slowness of their Progress.

Wind-Mills are the most Modern, but they are yet somewhat rare: excepting in *St. Christopher's* and *Barbadoes*, and among the *Portuguese*. These make good dispatch, but have this Inconvenience, that they are not easily stop'd; which proves frequently fatal to the Negroes who feed them.

*Oil-MILLS*, whether turned by Men, Water, Hand, or Horse, serve to bruise or break the Nuts, Olives, and other Fruits and Grains, whose Juice is to be taken by Expression to make Oil. See *OIL*, *OLIVE*, &c.

*Taw*, or *Bark-MILLS*, wrought by Water or Horses, serve to cut certain Barks into a coarce sort of Powder, proper for the Tanning of Hides, &c. See *BARK* and *TANNING*.

*Sawing-MILL* is a Water-Mill, serving to saw several Planks or Boards at the same time. See *SAWING*.

These are frequent in *France*, especially in *Dauphine*. They were lately prohibited in *England*, where they were begun to be introduced, from a view to the Ruin of the Sawyers, which must have ensued.

*Forge-MILLS*, turn'd by Water, serve to raise and let fall one or more huge Hammers, to beat and form the Iron into Bars, Anchors, or other massive Works. See *FORCE*.

*MILLS for Sword-Blades*, are likewise moved by Water. They are frequent at *Vicenne* in *Dauphine*. By working heavy Hammers, they forge those excellent Sword-Blades, call'd *Blades of Vicene*.

*Leather-MILLS*, are used to full, and prepare with Oil, the Skins of Stags, Buffalo's, Elks, Ballocks, &c. to make what they call *Buff-Leather*, for the use of Military-Men.

This is effected by means of several large Pistons rising and falling on the Skins in large Wooden-Troughs, by means of a Wheel without-side, turn'd by the force of the Water. See *BUFF*.

*Gun-Powder MILL*, is that used to pound, and beat together the Ingredients whereof Gun-Powder is composed.

This is done in a kind of Iron or Brass Mortar by means of Iron Peiles wrought by a Wheel without the Mill, turn'd by the Water falling on it. See *GUN-POWDER*.

There are also *Silk-MILLS*, for spinning, throwing, and twisting Silks; which are large round Machines in form of Turrets, five or six Foot high, and six Yards in diameter; which being turn'd either by the force of Water, or that of Men, work at the same time an infinity of Bobins fastned thereto, whereon the Silk had been wound to be here spun, and twist'd. See *SILK* and *THROWSTER*.

There are abundance of Mills of this kind in *France*, especially at *Lyon* and *Tours*, some of which are so disposed, as that three of them will go at the same time, and by the same Wheel wrought by Water, or by strength of Hand. That in the *Hôpital de la Charité* at *Lyon*, is wonderful, a single Man working no less than forty-eight of these Mills. See *MILLING*.

*MILDEW*, *Ruïze*, a Disease happening to Plants, caused by a dewy Moisture, which falling on them, and continuing, for want of the Sun's heat, to draw it up; by its Acrimony corrodes, gnaws, and spoils the inmost Substance of the Plant, and hinders the Circulation of the nutritive Sap; upon which the Leaves begin to fade, and the Blossoms and Fruit are much prejudic'd.

According to *Meß. Cook* and *Mortimer*, *Mildew* is a thick, clammy Vapour exhaled in the Spring and Summer from Plants, Blossoms, and even the Earth itself, in close still Weather, when there is neither Sun enough to draw it on high, nor Wind enough to disperse it. Hanging thus in the lower Regions, when the Evening's Cold comes on, it condenses and falls on the Plants; with its thick clammy Substance stops up their Pores, and thus prevents Perpiration, and hinders the Sap from ascending to nourish its Flowers, Shoots, &c. See *DEW*.

'Tis added, this Dew falling on the top of the Shoot of a Cherry-Tree about Midsummer, has been found to stop the Shoot; so as the Tree has shot forth in other places.

Blights and Mildews are commonly taken for the same thing; yet are they very different. See **BLIGHT**.

On Plants which have smooth Leaves, as the Oak, &c. the Down hangs, and may be seen, tasted, &c. Others, whose Leaves are rougher, imbibe it. When it falls on Wheat, &c. it begets the Stems with a Colour different from the natural one.

These Dew, Mr. *Martiner* takes to be the principal Food of Bees; being sweet, and easily convertible into Honey. See **HONEY**.

**MILLENARIES**, **MILLENARIANS**, a Sect among Christians, chiefly in the primitive Church, who hold that Jesus Christ is to come and reign on Earth for the space of a thousand Years; during which time, the Faithful are to enjoy all manner of temporal Blessings, and at the Expiration of this Term, the Day of Judgment is to take place. See **MILLENNIUM**.

The *Milennaries* are also call'd *Christians* from the Greek  $\mu\iota\lambda\lambda\alpha$ , a mile, a Thousand. See **CITIZENRY**.

This Opinion of the *Milennaries* is very ancient; and may be traced back almost as far as the time of the Apostles. It had its Origin from a Passage in the *Apocalypse* too literally understood, wherein mention is made of Christ's Reign on Earth, &c.

The Opinion of *S. Papias*, says Mr. *Lanoy*, touching the new Kingdom of Jesus Christ on Earth, after the Resurrection, was held for near three Centuries, e'er it was charged as erroneous; as appears from Ecclesiastical History. It was allow'd of, and follow'd by the greatest Men among the Primitive Fathers; as *Irenaeus*, *Justin Martyr*, *Tertullian*, &c. *Dionysius of Alexandria* and *St. Jerom*, oppos'd this imaginary *Milenary* Reign very strongly.

**MILLENNIUM**, a Term literally signifying a thousand Years; chiefly used for the time of our Saviour's second Appearance, and Reign on Earth. See **MILLENARIES**.

Mr. *Whiston*, in several of his Writings, has endeavour'd to support the Notion of the *Milennium*. According to his Computation, it was to have commenced about the Year 1720.

The Word is *Latin*, compounded of *mile*, a Thousand, and *annus*, Year.

**MILLEPEDES**, *Worm-Lice*, little Animals of considerable Use in Medicine. Thus call'd from the great number of their Feet.

*Millepedes* are so much in the Acquaintance of the People, that they seem to be Masters of their medicinal Uses, and take them in many Cases without any other Direction. They are, by all Experience, found to be very Diuretic and Absterive; which makes them not only frequent in Prescriptions for Disorders in the Reins, but also in Obstructions of the Viscera, and particularly in the Jaundice.

They abound with a nitrous Salt, which they seem to derive from the earthy Diet they live on. It is somewhat volatilized by its Digestion and Circulation in the Insect; as such Salt always is more or less, in proportion to the digestive Powers of the Animal, into whose Blood it enters; yet not so much, but that it is brackish and pungent upon the Palate. This makes their detensive Qualities extend further, than the larger Glands, and enables them to scour even the minutest Passages, and keep the Nerves clear from Viscidities, and such things as would clog their Springs; whereby they are good in Palsies, Epilepsies, and all nervous Distempers.

As they open and cleanse away Viscosities, and by their Minutencis and Asperities cut their way through any Obstructions, they are good in Struma's, and all inveterate Tumours or Ulcers.

Remarkable Cures have been performed in each way by a long use of them. They are best taken in Substance; or bruised in white Wine, the Liqueur being taken without settling.

There are several Chymical Preparations of *Millepedes*, as Spirit, volatile Salt, Oil, and Wine of *Millepedes*.

**MILL-REE**, or **MILLE-RAY**, a Portuguese Coin, current for somewhat more than the Spanish Pistole. See **CORN**.

The *Mill-ree* is thus call'd, as consisting of a thousand Rees. See **REES**.

It is also call'd a *St. Stephen*, from the Figure of that Martyr impress'd thereon.

**MILLIARIUM**, among the Romans, was a *Mile*, or League; consisting of a thousand Paces, *mille passus*; whence the Name. See **MILE** and **LEAGUE**.

In the Roman Empire, the *Milliaris*, in all the great Roads, were all mark'd with Stones or Columns, erected for that purpose; commencing from a Column in the heart of the City. See **ROAD**.

Those Columns were hence denominat'd *Military Columns*. See **COLUMN**.

**MILLING**, in the Manufactories, an Operation call'd also *Falling*. See **PULLING**.

**MILLING**, or *Throwing of Silk*, is the last preparation of Silk before dyeing; serving to twill it, more or less according to the Work it is intended for. See **SILK**.

To prepare the Silks for *Milling*, they first put it in boiling Water, inclosed between two linnen Cloths. The Mill is a square Machine, composed of several pieces of Wood mortais'd in each other so as to form a kind of large Cage, in the Centre whereof are two Wheels placed parallel over each other, whose Axis bears on two Posts. When the Machine is Simple, a single Man turns these Wheels by means of a little Cogg in which they catch, and a large Handle.

The Wheels put in motion by the Handle, communicate their Motion to eight Windles, or Reels, or even more, according to the largeness of the Machine; or to the Wings, or Arms whereof the Silk is wound from off two Rows of Bobins placed on each side the Machine, each Row at the height of one of the two Wheels in the Centre. These Bobins have their Motion by means of leathern Thongs, which bear on the little Cylinders of Wood that support them, and turn at length on the two Wheels at the Centre; so that the Silk on each Bobin twills, as it winds, and forms its separate Skain.

The smallest Wheel moves two hundred of these Bobins, over which a single Person is sufficient to inspect, to put new Bobins or Spools in lieu of those discharged of their Silk, and to knot the Ends when they break.

**MILLION**, in Arithmetic, the Number of ten thousand thousand; or a thousand times a thousand. See **NUMERATION**.

The Revenues of Princes are now only computed in Millions. See **REVENUE** and **POLITICAL Arithmetic**.

A *MILLION of Gold*, or *MILLION of Money*, is sometimes understood of a Million of Pounds; and sometimes a Million of Crowns. See **CROWN**, &c.

**MILT**, in Anatomy, is a popular Name for the Spleen. See **SPLEEN**.

**MILT**, in Natural History, the soft Row in Fishes; thus call'd by reason it yields, by expression, a whitish Juice resembling Milk. See **ROW**.

The *Milt* is properly the Seed, or the Spermatic part of the Male Fish. The *Milt* of a Carp is reckon'd a choice Bit. *Leuwenhoeck*, examining the *Milt* of a single Cod-fish with an excellent Microscope, found it to contain more living Animals than there are Men on the Face of the Earth. See **ANIMALCULE**.

**MIME**, **MIMUS**, a Term in the ancient Comedy, signifying a *Buffoon*, or *Mime*, who acted Postures suitable to the Person or Subject he represented.

The Word comes from the Greek  $\mu\iota\mu\omicron$ , Imitator. The same Comedians were also sometimes call'd *Pantomimes*, because of their counterfeiting all manner of Postures and Gestures. See **PANTOMIME**.

**MIMESIS**, *Imitation*, in Rhetoric, &c. a Figure, wherein the Words, Actions, &c. of another Person are imitated. See **MIME** and **PANTOMIME**.

**MIND**, *Mens*, a thinking Being. See **THINKING**.

Philosophers generally allow of three Kinds of *Minds*, viz. *God*, *Angels*, and the human *Soul*. For a thinking Being must either be finite, or infinite: If infinite, it is *God*; and if finite, it is either join'd with a human Body, or not; if the latter, it is an *Angel*; if the former, a *Soul*. See **God**, **ANGEL**, and **SOUL**.

The human *Mind* is properly defined a thinking, rational Substance: By *Thinking*, it is distinguished from Body; and by *Reasoning*, from *God*, and *Angels*, which are supposed to see and know things intuitively, without the help of Deduction, and Discourse. See **DISCOURSE**, **REASONING**, and **KNOWLEDGE**.

**MINE**, in Natural History, a place under ground where Metals, Minerals, or even precious Stones, are found. See **METAL**, **MINERAL**, **PRECIOUS STONE**, &c.

As, therefore, the Matter dug out of Mines is various; the Mines themselves acquire various denominations; as *Gold-Mines*, *Silver-Mines*, *Copper-Mines*, *Iron-Mines*, *Diamond-Mines*, *Salt-Mines*, *Mines of Antimony*, of *Alum*, &c.

For *Gold* and *Silver* **MINES**, the richest and most celebrated are those of *Peru* and *Chili* in *America*. See **GOLD** and **SILVER**. **IRON-MINES** are more abundant in *France* than elsewhere. See **IRON**.

**Copper-MINES** are chiefly in *Sweden* and *Denmark*. See **COPPER**.

**Tin-MINES** abound in *England*. See **TIN**.

**Quicksilver-MINES** in *Hungary* and *Spain*; **Diamond-MINES** in *Colombia*; **Salt-MINES** in *Poland*, &c. See **QUICKSILVER**, **DIAMOND**, **SALT**, &c.

**Metallic MINES** are chiefly found in Mountains; tho the reason thereof does not appear. It is probable, Plains may abound as much therewith, would People dig deep enough. But Plains are commonly cultivated; and beside, the Water will scarce allow 'em to be dug. Add, that the Metallic Vein always

always run either horizontal or oblique; and for that Reason, are easiest found on the sides of Eminences.

The Metallic Veins are commonly encompass'd with a sort of Stone peculiar to the *Mine*, and are accompanied with several Strata of different Matters, as Clay, Gravel, Rock, &c. They who work in *Mines*, know by the Size, and Colour of the Stones, when they approach the Vein. See STRATA and VEIN.

They discover that there is a *Mine* in a Mountain by the Marriages, or Mineral Stones falling from it; by the Mineral Taste of the Waters; by the Quality of the Exhalations rais'd from it; and by the difference between the Earth over the *Mines*, and that of the neighbouring parts in the cold time of Spring and Autumn, the Frost lying on the adjacent Places, when it thaws about the *Mines*. Add, that the Grounds producing but little Grass, and that little, pale and colourless, is an indication of a *Mine*.

Some pretend to discover *Mines* by the false virtue of the Hazel-Tree, out of which they form a forked Stick, call'd *Fergula divinatoria*, which, they say, turns of itself, in their hands, but differently, according to the different nature of the Metals or Minerals underneath. This Artifice made a great noise in France towards the end of the 17th Century; and the *Corpulcular* Philosophy was call'd to account for it. But it is now in little Credit. See VIRGULA DIVINATORIA.

There are some *Mines*, wherein the Metals are found at their first openings very crude and imperfect; which yet, in time, grow ripe and rich. *Alexis Barbé* relates, that in *Pouss*, Stones have frequently been thrown aside, as not containing any thing considerable of Metal; and yet have been found many Years afterwards exceeding full thereof. *Cesalpino* assures us, that Earths which yield no Metal at all, sometimes become very fertile Veins. In an Island of the *Tyrrhene-Sea*, after the Iron *Mines* have been exhausted, they stop 'em up about ten Years, at the end whereof, they find 'em as rich as before.

For the Formation of Mineral and Metallic Matters in Mines, see MINERAL.

*MINE*, in the Art of War, is a subterraneous Canal, or Passage dug under the Wall, or Rampart of a Fortification intended to be blown up by Gun-powder.

The *Mine*, or Passage of a *Mine*, is usually about four foot square; at the end of this is the Chamber of the *Mine*, which is a Cavity about five foot in width and in length, and about six in height; and here the Gun-Powder is bestow'd.

The *Sneige* of the *Mine* is the Train; by which there is always a little Aperture left. See SAUCING.

There are various kinds of *Mines*, which acquire various Names; as Royal *Mines*, Serpentine *Mines*, Forked *Mines*, according as their Passages are straight, oblique, winding, &c.

There are also *Mines* made in the Field, which are call'd *Fougades*. See FUGADE.

*Mines* are either dug within the Body of the Earth, as those made by the Besieged to blow up the Works of the Besiegers, before they make a Lodgment on the Cover'd Way: Or in Eminences and Rising Grounds, as to make a Breach in the Ramparts, &c. Or to blow up Walls: Or, lastly, to tear up Rocks.

*M. Chevalier*, in the Memoirs of the *Royal Academy of Sciences*, has handled the Subject of *Mines* with a great deal of Accuracy. He has calculated the Force of Gun-Powder, the Effort it makes, and the Resistance it meets with in heaving up the Ground. He shews, that a Cubic Foot of Air inclosed in two Cubic Feet of Gun-Powder, is capable of sustaining a Weight of near 30000 Pounds. But observes withal, that this is vastly greater than what it is found by Experience to have; and that in fact, 140 Pounds of Powder don't raise above 30000 Pound of Earth. The Reason of which difference he ascribes to several Causes; as, that the Powder does not take fire all at once, so that its force is divided; that part of the Shock is lost in the Canal or Passage of the *Mine*, and in the Pores of the Bodies inclosing the *Mine*; that the tenacity of the parts of the Earth resist a separation; that it is not enough that the Earth be supported, but that it must be carry'd upwards with a certain Velocity; and that the Weight of the Atmosphere, is a very considerable obstacle, to which no regard is had in the Calculation. See GUN-POWDER.

From a great number of Experiments it appears, 1. That the Effect of a *Mine* is always towards the weakest side; so that the disposition of the Chamber of a *Mine* does not at all contribute to determine this Effect either one way or another, as the Miners mistakenly imagine. 2. That the Quantity of the Powder must be greater or less, in proportion to the greater or less Weight of the Bodies to be rais'd, and to their greater or less Cohesion; and the result of all the Experiments that have been made for determining the different Quantity of Powder to be used for different Bodies, is to allow for each Cubic Fathom

Of loose Earth, 9 or 10 Pounds of Powder.  
Of firm solid Earth, and strong Sand, } 11 or 12  
Of Argil, or fat clayey Earth, } 15 or 16  
Of new Masonry, not very strongly bound, } 15 or 16  
Of old Masonry well bound, } 25 or 30

3. That the Aperture, or Funnel of a *Mine* that has been play'd, if it had been rightly charg'd, is a Cone, the Diameter of whose Base is double the height taken from the Center of the *Mine*. 4. That when the *Mine* has been over-charg'd, its Aperture is nearly cylindrical, the upper Extremity not being much wider than the Chamber at bottom, where the Powder was lodg'd. 5. That, beside the shock of the Powder against the Bodies it takes up, it likewise crushes all the Earth that borders upon it, both underneath and side-ways, which Crush extends itself the further as the Matters make the less Resistance.

To account for all the Effects resulting from these Experiments, and to determine the Quantity of Powder required for the charge of a *Mine*, and the most advantageous Disposition for answering the Intent: Let us conceive, 1. A *Mine*, whereof all the parts wherewith it is encompass'd are incapable of being compress'd, and make an equable Resistance, such as that of a Bomb equally thick throughout, suspended in the Air; where it must be observed, that beside the Resistance of the Body, the Effort of the Powder must likewise surmount the Weight of the ambient Air; in which Case the Body will be beaten into Dust, or at least into very small pieces.

2. Conceive a *Mine* encompass'd wholly by such Bodies as are equally compressible, and that resist every way with equal force. In this Case, the first Effect of the Powder will be to compress all those Bodies equally, and they will not be separated, till by the Violence of their Compression, they are all incapable, any longer, to resist its Effort; so that unless the Powder be in a great Quantity, all its Effect may end in the mere compression of the adjacent Bodies. For this reason, they sometimes block up the Chamber of the *Mine* with large Beams, and sometimes wall it up with Stones, that the adjacent Bodies may resist the more.

Lastly, suppose a *Mine* where all the Bodies that encompass it, are equally compressible, but where there is less Resistance on one side than another; in this Case, there will be a Sphere of Compression, whose Diameter will be so much the greater, as the weak Side resists the more. With regard to which, there are three things to be consider'd.

First, if the Effort of the Powder be very great with regard to the Resistance of the weak Side, the Compression will not reach a little way, that Side being too soft to suddenly for the neighbouring parts to receive their Shock. In which Case, the Aperture or Funnel will be almost cylindrical, the Diameter of the upper Extreme not much exceeding that of the Chamber; and the Earth will be thrown to a great distance, which the Enemy may make an advantage of, by making Lodgments in the Cavity, as was done at the Siege of *Venne*. Secondly, If the *Mine* be under-charg'd, it only makes a simple Compression on the weakest Side, as it hapned at *Croidal Rodrigo*. Thirdly, If the *Mine* be charg'd with a Quantity of Powder between the two Extremes, it will raise a Cone of Earth, the Diameter of whose Base will have a greater or less Ratio to its height from the Centre of the *Mine*, as the Effort of the Powder is greater or less. The most advantageous Effect is when the Diameter of the Base of the Cone is double its height: In which case, the Earth blown up, falls almost all back again into the Aperture of the *Mine*; so that the Enemy cannot make any Lodgment.

To charge a *Mine*, therefore, so as it may have the most advantageous Effect possible, the Weight of the Matter to be carried up must be known, i. e. the Solidity of a right Cone, whose Base is double the height of the Earth over the Centre of the *Mine*, which is easily found from the Rules of Geometry. Having found the Solidity of the Cone in cubic Fathoms, multiply the number of Fathoms by the number of Pounds of Powder necessary for raising the Matter it contains, according to the Proportion already laid down; and if the Cone contains Matters of different Weights, take a mean Weight between 'em all; having always a regard to their degree of Cohesion.

As to the Disposition of *Mines*, we have but one general Rule to lay down; which is, that the Side towards which one would determine the Effect, be the weakest. But this varies according to Occasions and Circumstances.

*Knight of the MINN*, is a Military Honour, antiently confer'd on Persons who had distinguish'd themselves in Engagements in *Mines*.

*MINE Ships*, are Ships fill'd with Gun-Powder, inclosed

in strong Vaults of Brick or Stone, to be fired in the midst of an Enemy's Fleet.

MINE is also a French Measure; See MEASURE.

MINERA, in Medicine and Anatomy, a Term apply'd to those Parts of the Body wherein there are collections and coagulations of Humours made; which hardning, form Obstructions, and produce Diseases. In this sense we say, the *Mæra morbi*, &c.

MINERAL, in Natural History, is sometimes us'd in the general for *Fossil*, and apply'd to any Body, simple, or compound, dug out of a Mine; from which it takes the Denomination. See MINE.

In this sense, the Metals, Sulphurs, fossil Salts, Semi-metals, &c. are *Minerals*. See FOSSIL.

On this Principle, they divide *Minerals* into two Classes; the one *fusible*, and *malleable*; i. e. which melt with Fire, and stretch on the Anvil; which are what we properly call *Metals*. The others want those two Properties; and are what in the strict sense we call *Minerals*.

Some divide *Minerals* into *Simple* and *Compound*: To the first belong *Stones*; *Salts*, as Alum, Nitre, &c. *Inflammable Minerals*, as Sulphur and Bitumen; and *Metals*, as Gold, &c.

Others of the more accurate Writers, restrain the Word *Mineral* to what we otherwise call *Semi-metal*. See SEMI-METAL.

In this sense, a *Mineral* may be defined a compound *Fossil*, wherein there is something discovered, in all respects like Metal, only that it is not malleable; join'd, or compounded with some other *Fossil*, as Salt, Sulphur, Stone, or Earth. Such are *Antimony*, *Cinnabar*, *Bismuth*, *Calaminary*, *Vitriol*, *Fyrites*, *Morassites*, *Cobalt*, *Oker*, the *Magnet*, *Lapis Hematites*, *Armenus*, and *Stellans*. See each under its proper Article, ANTIMONY, CINNABAR, BISMUTH, VITRIOL, CALAMINARY, &c.

Some attribute the Formation of *Minerals* to the Action of the Sun without; some to the central Fire within; and some think the Cold does all by uniting condensing, and congealing certain Juices.

*Der Caries* takes Metals to have been form'd from the beginning of the World; and to have ranged themselves, by the Laws of Gravity, about the Centre. In process of time, he supposes them to have been corroded by the acid Salts, &c. and abundance of the parts thereof carried up along with those Salts by the subterranean Heat, and deposited in divers parts of the Earth.

Monf. *Tournefort* supposes Seeds of *Minerals*, as of Animals, and Vegetables. Every thing, according to him, comes from Eggs, even Stones; and the largest Rocks were originally no more than Grains of Sand. See his System more at length under the Articles METAL and STONE.

Others, as M. *Gouffroy*, contend that Metals, &c. may be the result of a mixture of certain Matters, which had nothing metallic in them. Thus, in the Ashes of all Vegetables we find a ferruginous Matter which the Lead-stone attracts; and yet it will hardly be said that Iron existed in the Plants. We see no signs of Iron in Argilla, work it in what manner you will; and yet add Linseed-Oil, and by Fire you will procure Iron. And the like may be said of divers other Matters.

Hence it is probable, Metals may be form'd by a mere combination of different Ingredients; such like Sulphur, which we all know is made by adding an inflammable Principle to a vitriolic Salt. The Earth may every where abound with those Matters, which are continually circulating through its Pores and Canals, and which meeting with an Earth homogeneous to them, fix thereto; and commence *Minerals*.

The *Minerals*, Metals, and Stones lie in Beds; and have done so ever since the Flood, if not from the Creation; yet 'tis highly probable they have a faculty of growing in their respective Beds; that, as their Beds are robb'd and emptied by Miners, so after a while they recruit again. Thus Vitriol, Mr. *Boyle* thinks, may grow by the help of the Air, and Alum does the same. We are assured (says that Author) by the experienced *Apicula*, that the Earth, or Oil of Alum, being robb'd of its Salts, will, in tract of time, recover it by being exposed to the Air.

As for Metals, there is good reason to believe they grow likewise; from what has been alledged by Mr. *Boyle*, in his Observations about the growth of Metals, and particularly as to the growth of Iron. To the Influences he brings from *Pliny*, *Eulopius*, *Cosulpinus*, and others, we may add, that in the Forest of *Dean* in *Gloucestershire*, the best Iron, and in the greatest Quantities, are found in the old Cinders which they melt over again. This some impute to the Negligence of the former Melters in not exhausting the Ore. But Mr. *Devaux* thinks it rather owing to the new Impregnations of the old Ore, or Cinders from the Air; than to any seminal Principle in the Ore itself.

The Chymists generally take *Minerals* to be nothing else

but imperfect Metals, which not having arriv'd at Maturity, may be perfected by Chymical Operations, and raised to real Metals. This agreeable, but fatal Delusion, has given rise to the Sect of Philo-sophers, who study the Philo-sopher's Stone. See METAL, GOLD, PHILOSOPHER'S STONE, &c.

Crystall Mineral, see CRYSTALL Mineral.

MINERAL-WATERS, are those, which at their springing forth from under Ground, are found impregnated with some Mineral Matter; as Salt, Sulphur, Vitriol, &c. See WATER.

Such are hot Baths, Spas, purging, &c. Springs. See BATH, SPAW, SPRING, &c.

MINIATURE, or MIGNATURE, a delicate kind of Painting, consisting of little Points or Dots, instead of Lines; usually done on Velum, with very thin, simple Water-Colours. See PAINTING.

*Miniature* is distinguished from other kinds of Painting by the smallness and delicacy of its Figures, the weakness of their Colours, and faintness of the Colouring, and in that it requires to be view'd very near.

Those Colours that have the least Body, are the best and most commodious for painting in *Miniatures*; as *Carmine*, *Ultramarine*, fine Lakes, and Green made of the Juices of several kinds of Herbs and Flowers.

Painting in *Miniature* is the nicest and most tedious of all others; being performed wholly with the Point of the Pencil.

There are some Painters who never use any white Colour in *Miniatures*, but make the ground of the Velum serve to raise their Figures; in which Case, the Lights appear bright in proportion to the depth and strength of the Colours of the Figures. Others, before they go to work, give the Velum a light wash with white Lead, well prepared and purified.

When the Colours are laid on flat without dotting, tho' the Figures be small, and the ground either Velum or Paper, it is not call'd *Miniature*, but *Washing*.

The Colours for *Miniature* may be mix'd up with Water of Gum Arabic, or Gum Tragacanth.

The Word comes from the Latin *Minium*, Red Lead, that being a Colour much us'd in this kind of Painting. The French frequently call it *Mignature*, from *Mignon*, fine, pretty, on account of its smallness and delicacy.

MINIM, in Music, a Note, or Character of Time; equal to two Crochets, or half a Semibreve. See TIME, and CHARACTERS of Music.

MINIMA Nature, or MINIMA Naturalia, among Philo-sophers, are the primary Particles, whereof Bodies consist; call'd also *Corpuscles* and *Atoms*. See CORPUSCLE, ATOM, MATTER, &c.

MINIMA and MAXIMA, in the higher Geometry. See MAXIMA and MINIMA.

MINIMENTS, or MUNIMENTS. See MUNIMENTS.

MINIMS, or MINIMI, an Order of Religious, instituted about the Year 1440, by S. *Francois de Paris*.

They have improved on the Humility of the *Monks*, by serving themselves *Minimi*, or *Minimes*, *q. d.* Least, or Smallest. See MINORS.

MINION, a sort of Cannon, or piece of Ordnance, whereof there are two kinds: large and ordinary. See CANNON and ORDNANCE.

The large *Minion*, or one of the largest Size, has its Bore  $3 \frac{1}{2}$  Inch Diameter, and is 1000 Pounds Weight; its Load is  $2 \frac{1}{2}$  Pounds of Powder; its Shot  $2 \frac{1}{2}$  Inches in Diameter, and  $5 \frac{1}{2}$  Pound Weight; its Length is 8 Foot, and its level Range 15 Paces.

The ordinary *Minion* is three Inches Bore, in Diameter, and weighs about 800 or 750 Pounds Weight. It is seven Foot long; its Load  $2 \frac{1}{2}$  Pounds of Powder; its Shot near three Inches Diameter, and weighs 4 Pounds 4 Ounces; and shoots point-blank 120 Paces.

MINISTER, Servant, one that serves God, the Public, or a private Person. See SERVANT.

In the Reformed Church, *Priests*, or those ordain'd to preach, and do the other Functions of the Priesthood, are call'd absolutely and simply *Ministers*.

In this sense, Bishops, &c. are said to be *Ministers* of God; *Ministers* of the Word; of the Gospel, &c. In some Churches they are also called Pastors. See BISHOP, PRIEST, PASTOR, &c.

MINISTERS of the Altar, are properly those who attend, and assist the Priest at the Administration of the Eucharist. Deacon, and Subdeacon are Titles that properly signify *Ministers*; Δακρυ, *Minister*. See DEACON and SUB-DEACON.

Officers of State, &c. are call'd the King's *Ministers*; as administering the Affairs of Justice, Policy, &c. for him. See OFFICERS.

MINISTER of State, is he with whom a Prince entrusts the Administration of his State; or to whom he commits the Care, and Direction of the principal Affairs thereof. See STATE and GOVERNMENT.

*Scimus* is proposed as a Model for Ministers of State. The Grand Vizir is the Prime Minister of the Ottoman Empire, See *VIZIR*.

*Foreign Ministers*, or the Ministers of Foreign Princes, are their Embassadors, Envoys, Agents, or Residents in the Courts of other Princes.

There are two kinds of Foreign Ministers: Ministers of the first Rank, who are also call'd Embassadors, and Envoys in Extraordinary. See *EMBASSADOR* and *ENVOY*.

And Ministers of the second Rank, who are the ordinary Residents. See *RESIDENT*.

Those of the first Rank have a Representative Character, which the others have not; tho' these last are sometimes invest'd with fuller Powers than the former.

MINISTER is also the Title certain Religious Orders give to their Superior. See *SUPERIOR*.

In this sense we say the Minister of the *Mathurins*; the Minister of the *Trinitarians*. See *MATHURIN*, &c.

Among the *Jesuits*, the second Superior, or Deputy of each House is call'd Minister: as being an Assistant to the Superior, or Rector. See *JESUITS*.

The General of the *Cordeliers* Order is call'd the Minister General. See *GENERAL*.

MINISTRY, or MINISTERY, a Profession, Office, or Employment which a Person discharges for the Service of God, the Public, or some particular Person. See *MINISTER*.

In this sense we say, a Bishop must give account to God of his Ministry, &c.

MINISTRY is also used for the Government of a State, by some great Minister under the Sovereign Authority. In this sense we say, the Ministry of the Cardinal de Richelieu, &c.

MINISTRY is also frequently used as a collective Word, signifying the Ministers or Officers of State. Thus we say, the Ministry oppos'd a Thing; meaning, the Ministers oppos'd it.

MINIUM, a Mineral Colour, call'd also *red Lead*, used by Painters, Illuminists, &c. See *LEAD*.

Minium is a preparation of Lead, performed by Fire. There are two ways of making it. The first, of burnt Lead; the second of Ceruss, or white Lead further urged by Fire. See *CERUSS*, &c.

Beside the use of Minium as a Colour; it is also an Ingredient in an Official Composition, call'd *Emplastrum de Minis*, used as a Dedicative and Cicatrice.

Some Authors will have the Minium of the Ancients to be what we now call *Vermilion*. See *VERMILION*.

MINOR, a Latin Term, literally denoting *less*, used in opposition to *major*, greater. See *MAJOR*.

Thus we say St. James *minor*: *Asia minor*: The *Minor Excommunication*, &c.

The four *Minor Orders*, are the four lesser Orders confer'd, in the *Romish Church*, between the *Tonsure* and *Subdeaconate*. These are that of *Poster*, or *Door-Keeper*; that of *Reader*; that of *Exorcist*; and that of *Acolyte*. See *EXORCIST*, *ACOLYTE*, &c.

MINOR, in Law, is used in the like signification, to denote a Person yet under Age, or who by the Laws of the Country, is not yet arriv'd to the Power of Administering his own Affairs, or coming to the Inheritance of an Estate. See *AGE*.

Among us, a Person is a *Minor* till the Age of twenty one: Till this Time his Acts are invalid. See *MAJOR*.

Yet if a Patron, &c. have a Right of Advowson, by the Common Law he may present at the Age of fourteen Years; and may of himself, and without his Father, or Guardian, consent to any Process relating to beneficiary Matters. See *PATRON*.

Hence, in the Canon Law, there is no Title of *Minoribus*; and the reason is, that the several Ages whereat the Common Law declares a Person capable of a Benefice, or of Sacred Orders, are so many Species of Canonical Majorities.

MINOR, in Logic, is the second Proposition of a formal, or regular Syllogism, call'd also the *Assumption*. See *SYLLOGISM*, *PROPOSITION*, and *ASSUMPTION*.

I grant the Major, but deny the *Minor*. See *TERM*.

MINOR, in Music, is apply'd to certain Concords, which yet differ from others of the same Denomination by a half Tone. See *SEMITONE*.

Thus we say, a third *Minor*, or lesser third: A fifth Major, and *Minor*. See *THIRD*, *SIXTH*, &c.

Concords that admit of Major and *Minor*, i. e. greater, and less, are said to be *Imperfect Concords*. See *CONCORD*.

MINORS, or *Friars Minors*, an Appellation which the Cordeliers assume, out of shew of Humility; calling themselves *Fratres Minores*, i. e. *Lesser Brothers*; and sometimes *Minorites*. See *CORDELIERS*.

The Title of *Minors*, however, is not absolutely restrain'd to the Cordeliers, but also given, in the general, to all the Mendicants, or begging Religious, founded by St. Francis d'Assis. See *FRANCISCANS*.

There is also an Order of *Regular Minors* at Naples, established in the Year 1588, and confirm'd by Sixtus V.

MINOT, a French Measure. See *MEASURE*.

MINOTAUR, in Antiquity, a fabulous Monster, much talk'd of by the Poets; feign'd to be half Man, and half Bull.

The *Minotaur* was brought forth by *Pasiphae*, Wife of *Minos King* of Crete. It was shut up in the Labyrinth of that Island; and at last kill'd by *Theseus*. See *Labyrinth*.

Strabo gives the Explication of this Fable. He says, that a Secretary of the Queen *Minos*, named *Taurus*, Bull, had an Intrigue with the King's *Daughter*, *Pasiphae*, in the Chamber of *Daedalus*; and that she was at length deliver'd of Twins, one of which resembled *Minos*, and the other *Taurus*. This occasion'd the Production to be reputed monstrous.

MINOVERY, a Treason committed in the Forest, by something that is a Man's Handy-Work; as an Engine to catch Deer, &c. See *FOREST*.

The Word is form'd of the French *Main-seavoir*, Handy-Work.

MINSTER, antiently signified the Church of a Monastery, or Convent. See *CHURCH*.

The Word is Saxon, *Mynter*.

MINSTREL, an antient Term for a *Singer*, or a Player on any other kind of Musical Instrument.

The Word *Minstrel* in its Original, was used for People who sung and serenaded their Mistresses. Afterwards it became a Name for all kinds of Musicians: and at length pass'd to Buffoons and Country Scrapers.

*Borel* derives the Word from *Manus* and *Hystris*, one who diverts with the Hand; or from *Minor Hystris*, little Buffoon. *De Cange* derives it from *Minstrelles*, a diminutive of *Minister*, by reason the *Minstrels* were antiently ranked among the lower Officers, *Ministers*, or Servants.

MINT, the Place where the King's Coin is form'd. See *COIN*.

Antiently there were *Mints* in most Cities of England. See *MONEY*.

The chief *Mint* at present is in the Tower of London. See *TOWER*.

The Officers of the *Mint* are, 1. The *Warden*, who is the Chief, and is to receive the Bullion, and over-see all the other Officers. 2. The *Master Worker*, who receives the Bullion from the Warden, causes it to be melted, and deliver'd to the *Moniers*, and takes it from them again when coin'd. 3. *Comptroller*, who is to see that the Money be made to the just Assize, and to over-see the Officers. 4. The *Assay-Master*, who weighs the Silver and Gold, and fees whether it be Standard. 5. The *Assayer*, who takes all the Accounts. 6. The *Surveyor of the Mintage*, who is to see the Silver cast out, and that it be not alter'd after it is deliver'd to the Melter, i. e. after the *Assay-Master* has made Trial of it. 7. The *Clerk of the Iron*, who is to see that the Iron be clean, and fit to work with. 8. The *Graver*, who engraves the Dies and Stamps for the Coinage of the Money. 9. The *Melters*, who melt the Bullion before it comes to Coining. 10. The *Blanchers*, who boil and cleanse the Money. 11. The *Pavers*, who keep the Gate of the *Mint*. 12. The *Prossy of the Mint*, who provides for all the *Monyers*, and over-secs them. And, Lastly, the *Moniers*, some of which shear the Money; some forge it; and some stamp or coin it; and some round and mill it. See *COINAGE*.

MINT-Water, the distill'd Water of the Plant of that Name. See *WATER*.

MINTERS, or *Moneyers*. See *MONEYERS* and *MINT*.

MINTING, is sometimes used for the *Coining* of Money. See *COINING*.

MINUSCULE, or MINUSCULES, in Printing, are the small, or running Letters; as contradistinguish'd from *Majoris*, or Capitals. See *LETTER*, *MAJUSCULE*, &c.

MINUTE, in Geography, and Astronomy, is the 60th part of a Degree; which is the 3600th part of a Circle. See *DEGREE*.

Thus we say, the Diameter of the Sun is seen under an Angle of 39 Minutes in Winter; and 31 in Summer. See *DIAMETER* and *SUN*.

In this sense, a *Minute* is also call'd a *Prime*, or *Prime Minute*. See *PRIME*.

The Divisions of Degrees are Fractions, whose Denominators increase in a Sexageuple Ratio; that is, a *Minute* or *Prime* is  $\frac{1}{60}$ ; a *Second*, or second *Minute* is  $\frac{1}{3600}$ , &c. See *SEXAGESIMAL*.

In Astronomical Tables, &c. *Minutes* are expressed by acute Accents, thus, ' 5 Seconds by two, " 3 Thirds by three, &c. See *SECOND*, *THIRD*, &c.

MINUTE, in computation of Time, is used for the 60th part of an Hour. See *HOUR*.

MINUTE, in Architecture, is a 30th Part, or Division of a Module. See *MODULE*.

MINUTE,

**MINUTE**, in speaking of Weights, is the 24th part of a Grain. See **GRAIN**.

**MINUTE** is also used to signify a short Memoir, or Sketch of any thing taken hastily in writing.

In this sense we say, the *Minutes* of the Proceedings of the House of Lords, &c.

The Word comes from the Latin *Minutus*, small. **MIQUELETS**, a kind of four Soldiers, inhabiting the Pyrenean Mountains; arm'd with Pistols under their Belts, a Carbine, and a Dagger.

The *Miquelets* are dangerous People for Travellers to meet. **MIRABOLANS**, or **MIRAZOLANS**, in Pharmacy. See **MYROZOLANS**.

**MIRACLE**, in the popular sense of the Word, is a *Prodigy*, or an extraordinary Event that surprizes us by its Novelty.

In the more Accurate and Philosophical Sense, a *Miracle* is an Effect that does not follow from any of the known Laws of Nature; or which is inconsistent with some known Laws thereof. See **NATURE**.

A *Miracle*, therefore, being a suspension of some Law, can't come from any hand less than his who fix'd that Law. See **GOD**, **LAW**, &c.

*Spinoza* denies that any Power can supersede that of Nature; or that any thing can disturb or interrupt the Order of Things; and accordingly defines a *Miracle* to be a rare Event, happening in consequence of some Laws that are unknown to us. See **SPINOZISM**.

The Divines define a *Miracle* to be an extraordinary and wonderful Effect, above the Power of Nature, wrought by God, to manifest his Power or Providence; or to give Credit to some Messenger sent from himself. Thus Jesus Christ evinc'd the Truth of his Mission, and his Doctrine by *Miracles*; and thus also did *Moses*.

It is still a dispute in the World, how far it may be in the power of the Devil to work *Miracles*; or wherein the specific difference lies between the *Miracles* of *Moses*, and those of *Pharoah's* Magicians; those of Jesus Christ and the Apostles, and those of *Simon Magus* and *Apollonius Tyaneus*: Whether the latter were any more than mere Delusions of the Senses; or whether any supernatural and diabolical Power concurred with them. See **MAGIC**.

The Church of *Rome* abounds in *Miracles*; if we believe their Writers, some of their Monks have wrought more *Miracles* than all the Apostles; and that without any visible Necessity for them.

As full as that Church pretends to be of Saints, it is a Rule with them, that none are ever Canonized till there be good Proof of his having wrought *Miracles*. So that were all those allowed good *Miracles*, and to have happened out of the common Order of Nature, they are so numerous, one would be tempted to think there were no Order or Law of Nature at all. See **SAINT**.

There are those however, who set aside the Authority of all *Miracles*; thinking it unbecoming the Wisdom of God to establish such Laws, as that he should find it frequently necessary to supersede. And as the former, from the avowed Authority of some *Miracles*, fetch an Argument for the Truth of all; pleading those which are allow'd as well as those which are question'd; so these allege the false ones as conclusions against them all.

The *Romans* attribute *Miracles* to their Emperors *Adrian* and *Vespasian*.

St. *Augustine* is a strong Advocate for *Miracles*. He mentions several whereof he was an Eye-Witness, and others whereof he was informed by those that were. In the single City of *Bippes*, he tells us there were seventy *Miracles* wrought in the space of two Years, on the building a Chapel in honour of St. *Stephen*.

The *Miracles* may prove the Superintendency of a voluntary Agent; and that the Universe is not guided by Necessity or Fate; yet that Mind must be weak and inadvertent, which needs them to confirm the Belief of a Wife and Good Deity: Since the Deviation from general Laws, unless upon very extraordinary Occasions, must be a Presumption of Inconstancy and Weakness, rather than of a steady Wisdom and Power; and must weaken the best Arguments we have for the Sagacity and Power of the Universal Mind. *Inquiry into the Original of the Ideas of Beauty*, &c.

**MIRROR**, or **MIRROUR**, or *Speculum*, Body which exhibits the Images of Objects presented thereto, by Reflexion. See **REFLEXION**.

The Use of *Mirrors* is very ancient. Mention is made of a Brazen *Mirror*, or Looking-Glass in *Exodus* xxxviii. 8. where *Moses* is said to have made a Brazen Laver, or Basin, of the Looking-Glasses of the Women continually assembled at the Door of the Tabernacle. 'Tis true, some modern Commentators will not allow the *Mirrors* themselves to have been Bras; but of Glass, only set, or framed in Bras. But the most learned among the Rabbins do all allow, that in those times, the *Mirrors* made use of by the Hebrew Women in dressing their Heads, were of Metal; and that the devout Women

mention'd in this Passage, made Presents to *Moses* of all their *Mirrors* to make the Brazen Laver. See the Jesuit *Sanjezani's* Comment on this Text.

It might likewise be proved, that the Ancient Greeks made use of Brazen *Mirrors*; from divers Passages among the ancient Poets. See **BURNING-MIRROR**.

**MIRROUR**, in Catoptrics, is any polish'd Body impervious to the Rays of Light, and which of consequence reflects it equally. See **LIGHT**.

Thus Water in a deep Well or River, and smooth polite Metals, are rank'd among the number of *Mirrors*.

In this sense, the Doctrine of *Mirrors* makes the Subject of *Catoptrics*. See **CATOPTRICS**.

**MIRROUR**, however, in the more confined Sense of the Word, is peculiarly used to signify a smooth Surface of Glass, tin'd or quick-silver'd on the back-side, which exhibits the Images of Objects opposed thereto.

The Doctrine of *Mirrors* is built on the following general Principles.

1. Light reflected from any *Mirror*, or *Speculum*, makes the Angle of Incidence equal to that of Reflexion; which see demonstrated under the Word **REFLEXION**.

Hence, a Ray of Light, as A B (Tab. **OPTICS**, Fig. 26.) falling perpendicularly on the Surface of a *Speculum*, will be reflected back upon itself: which we find by Experience it actually does.

From the same Point of a *Mirror*, therefore, there can't be several Rays reflected to the same Point; since in that Case, all the Angles of Incidence must be equal to the same Angle of Reflexion C B G, and therefore to each other; which is absurd. Not can the Ray A B be reflected into two or more Points; since, in that Case, all the Angles of Reflexion would be equal to the same Angle of Incidence A B F: which is likewise absurd.

2. From every Point of a *Mirror*, are reflected Rays: thrown on it from every Point of a radiant Object.

Since then Rays coming from different parts of the same Object, and striking on the same Point of the Object, cannot be reflected back to the same Point; the Rays which flow from different Points of the same radiating Object, are again separated after reflexion; so that each Point shows whence it came. See **RADIANT**.

Hence it is, that the Rays reflected from *Mirrors* exhibit the Objects to view. Hence, also, it appears, that rough uneven Bodies must reflect the Light in such manner, as that Rays coming from different Points, will be blended or thrown confusedly together.

**MIRROURS** are either *Plane*, *Concave*, *Convex*, *Cylindrical*, *Conical*, *Parabohcal*, or *Elliptical*.

*Plane Mirrors*, or *Specula*, are those which have a plain or flat Surface. See **PLANE**.

These, by a popular Word, we call *Looking-Glasses*. For the Manner of making plain *Mirrors*, or *Specula*, see **LOOKING-GLASS**.

Laws and Phenomena of Plain *Mirrors*.

I. In a plain *Mirror*, every Point of an Object, as A, (Tab. **OPTICS**, Fig. 27.) is seen in the Intersection of the Center of Incidence, A B, with the reflected Ray C B.

Hence, 1. As all the reflected Rays meet with the Center of Incidence in B; by whatever reflected Rays the Point A be seen, it will still appear in the same Place. Consequently, any number of Persons viewing the same Object in the same *Mirror*; will all see it in the same place behind the *Mirror*. And hence it is, that the same Object has only one Image, and that we don't see it double with both Eyes. See **VISION**.

2. The distance of the Image B, from the Eye C, is compounded of the Ray of Incidence A D, and the reflected Ray C D: And the Object A radiates reflectedly, in the same manner as it would do directly, were it removed into the place of the Image.

II. The Image of a radiant Point, B, appears just so far behind a plain *Mirror*, as the radiant Point is before it.

Hence, 1. If the *Mirror* A G be placed horizontal; the Point A will seem so much below the Horizon, as it is really elevated above it: Consequently, erect Objects will appear as if inverted; and therefore Men standing on their Feet, as if on their Heads. Or if the *Mirror* be fastned to the Ceiling of a Room, parallel to the Horizon, Objects on the Floor will appear above the Ceiling as much as they really are below it; and that upside down.

III. In a plain *Mirror*, the Images are perfectly Similar, and equal to the Objects. And hence their Use as Looking-Glasses.

IV. In a plain *Mirror*, things on the right Hand, appear as on the left; and vice versa.

Hence also, we have a Method of Measuring any inaccessible Altitude by means of a plain *Mirror*.

Thus, the *Mirror* being placed horizontally in C, Fig. 28. retire from it till such time as the Top of the Tree be seen therein.

therein: Measure the height of the Eye DE; the distance of the Station from the Point of Reflexion EC, and the distance of the Foot of the Tree from the same. Then to EC, CB, and ED, find a fourth Proportional AB. This is the Altitude sought.

V. If a plain Mirror be inclined to the Horizon in an Angle of 45 Degrees; an Object perpendicular to it will appear parallel, and an horizontal Object perpendicular.

And hence, the Eye being placed beneath the Mirror, the Earth will appear perpendicularly over it; or if placed over it, the Earth will appear perpendicularly under it. Hence also, a Globe descending down a Plane a little inclined, may, by means of a Mirror, be exhibited as mounting up a Vertical Plain, to the great surprize of such as are unacquainted with Catoptrics.

And hence we have a Method of representing ourselves as if flying.

For a Mirror inclined to the Horizon under an Angle of 45°, we have observed, will represent Vertical Objects as if Horizontal. Consequently, a large Mirror being so disposed; as you advance toward it, you will seem to move horizontally; and nothing will be wanting to the Appearance of flying, but to strike out the Arms and Legs. It must be added, however, that as the Floor is elevated along with you, your Feet will still be seen to walk as along a vertical Plane. To deceive the Eye entirely, therefore, it must be kept from the Feet.

VI. If the Object AB (Fig. 29.) be parallel to the Speculum CD, and be equally distant from it, with the Eye; the reflecting Line C D will be half the length of the Object AB.

And hence, to be able to see the whole Body in a plain Mirror; its height and breadth must be half your height, and breadth. Consequently, the height and breadth of any Object to be seen in a Mirror, being given; we have also the height and breadth of the Mirror wherein the whole Object will appear, at the same distance with the Eye.

Hence also, as the length and breadth of the reflecting part of the Speculum, are subordinate of those of the Object to be reflected; the reflecting part of the Mirror, is to the Surface reflected in a subquadruple Ratio. Consequently, the reflecting Portion being a constant Quantity; if in any place you see the whole Body in a Mirror, you will see it in every other place, whether you approach nearer, or recede farther from it.

VII. If several Mirrors, or several Fragments, or Pieces of a Mirror, be all disposed in the same Plane; they will only exhibit an Object once.

VIII. If two plain Mirrors, as X Y, and Z X, (Fig. 30.) be join'd at an Angle X; the Eye O, placed within that Angle, will see the Image of an Object A placed within the same, as often repeated as there may be Catheti drawn determining the places of the Images, and terminated without the Angle Y X Z.

Hence, as the more Catheti terminated without the Angle, may be drawn as the Angle is more acute; the acuter the Angle, the more numerous the Images. Thus Z Truler found at an Angle of one third of a Circle, the Image was represented twice or thrice, at  $\frac{1}{2}$  thrice, at  $\frac{1}{3}$  five times, at  $\frac{1}{4}$  twelve times.

Further, if the Mirrors be placed upright, and so contracted; or if you retire from them, or approach to them, till the Images reflected by them coincide, or run into one, they will appear most horribly distorted: Thus if they be at an Angle somewhat greater than a right one, you will see it with only one Eye; if the Angle be less than a right one, you will see three Eyes, two Noses, two Mouths, &c. At an Angle still less, the Body will have two Heads. At an Angle somewhat greater than a right one, at the distance of four Feet, the Body will be headless, &c. Again, if the Mirrors be placed the one parallel to the Horizon, the other inclined to it, or declined from it, it is easy to perceive that the Images will be still more Romantic. Thus, one being declined from the Horizon to an Angle of 144 Degrees, and the other inclined to it; a Man sees himself standing with his Head to another's Feet.

Hence it appears how Mirrors may be manag'd in Gardens, &c. to as to convert the Images of those near 'em into Monsters of various kinds: And since glass Mirrors will reflect the Image of a lucid Object twice or thrice; if a Candle, &c. be placed between the Mirrors, it will be multiply'd an infinite number of times.

On these Principles are founded various Catoptric Machines, some of which represent Objects infinitely multiply'd and distorted; others infinitely magnify'd, and set at vast distances. See CATOPTRIC, CISTULA, &c.

CONVEX MIRRORS are those whose Surface is CONVEX. See CONVEX.

Note, by CONVEX Surfaces, Authors generally mean such as are spherically CONVEX. See CONVEXITY.

Manner of preparing or making Convex Specula, or MIRRORS.

There are divers Methods used by divers Artists; particularly as to the Matter, or Composition. One of the best that is known, is given us by *Najans* thus:

Melt one part of Tin, and another of Marc. sic together, and to the melted Mals add two parts of Mercury; as soon as the Mercury begins to evaporate into Smoak (which it presently does) the whole Composit is to be thrown into cold Water, and when well cool'd, the Water decanted off. The Mixture is then to be strain'd through a linen Cloth two or three fold; and what is thus scerned, pour'd into the Cavity of a glass Sphere: this Sphere is to be turn'd gently round its Axis till the whole Surface is cover'd; the rest being reserved for future use.

If the Sphere were of colour'd Glass, the Mirror will be so too.

And in the same manner may Conic, Elliptic, Cylindric, and other Mirrors be made.

How they may be made of Metal, see under CONCAVE MIRROR.

Laws, or Phenomena of CONVEX MIRRORS.

I. In a spherical convex Mirror, the Image of a radiant Point appears between the Centre, and the Tangent; but nearer to the Tangent than the Centre.

Hence, the distance of the Object from the Tangent is greater than that of the Image. And, consequently, the Object is farther distant from the Speculum than the Image.

II. If the Arch BD, (Fig. 31.) intercepted between the Point of Incidence D, and the Cathetus AB; or the Angle C form'd in the Centre of the Mirror by the Cathetus of Incidence AC, and that of Obliquation FC, be double the Angle of Incidence; the Image G will appear on the Surface of the Speculum.

III. If the Arch intercepted between the Point of Incidence, and the Cathetus; or the Angle C form'd in the Centre of the Mirror by the Cathetus of Incidence, and the Cathetus of Obliquation, be more than double the Angle of Incidence; the Image will be without the Mirror.

IV. If the Arch intercepted between the Point of Incidence, and the Cathetus; or the Angle form'd in the Centre of the Mirror, by the Cathetus of Incidence, and that of Obliquation be less than double the Angle of Incidence; the Image will appear within the Speculum.

V. In a convex Mirror, a remoter Point A, (Fig. 32.) is reflected from a Point F, nearer the Eye O, than any nearer Point B is the same Cathetus of Incidence.

Hence, if the Point of the Object A, be reflected from the Point of the Mirror F; and the Point of the Object B from the Point of the Speculum D; all the intermediate Points between A and B will be reflected from the intermediate Points of the Speculum between F and E. Consequently FE will be the Line that reflects A B.

Hence also, a Point of the Cathetus B, seems at a greater distance C b from the Centre C; than a more remote one, A.

VI. A nearer Point B (Fig. 32.) not in the same Cathetus with a remoter, H; is reflected to the Eye O, from a nearer Point of the Speculum, than the remoter H.

Hence, if the Point of an Object A, be reflected from the Point of a Mirror C; and the Point of the Object B, from the Point of the Speculum D, all upon the same Point O: All the intermediate Points between A and B will be reflected from all the intermediate Points between C and D. Consequently, the Image F G, of the Object A B, is contain'd between the Cathetus B E, and A E.

VII. In a spherical convex Mirror, the Image is less than the Object.

And hence the Use of such Mirrors in the Art of Painting, where Objects are to be represented less than the Life.

VIII. In a convex Mirror, the more remote the Object; the less its Image: And again, the smaller the Mirror, the less the Image.

IX. In a convex Mirror, the right hand is turn'd to the left; and the left to the right: And Magnitudes perpendicular to the Mirror, appear topsy turvey.

X. The Image of a right Line perpendicular to the Mirror, is a right Line; but that of a right Line either oblique to the Mirror, or parallel thereto, is convex.

XI. Rays reflected from a convex Mirror, diverge more than if reflected from a plane Mirror.

Hence Light, by being reflected from a spherical Mirror, is weaken'd; and, consequently, the Effects of the reflected Light are weaker than those of the direct. Hence also, Myopes see remote Objects more distinctly in a convex Mirror, than they do directly.

Rays reflected from a convex Mirror of a smaller Sphere, diverge more than if reflected from a larger. Consequent

ly, the Light is more weaken'd, and its Effects are less considerable in the former Case than the latter.

*Concave Mirrors* are those whose Surface is concave. See *CONCAVE*.

Note, by *Concave*, Authors commonly mean *Spherical Concave*.

*The Manner of preparing or making Concave Mirrors.*

First, a Mould is to be provided for casting them. In order to this, take Clay well dry'd, pulverize, and sift it; mix it up with Water, and then strain or filter it; with this, work up Hoefe-Dung and Hair shred small, till the Mass be sufficiently tough; to which, on occasion, may be added Charcoal-Dust, or Brick-Dust, well sifted.

Two coarse Molds are then prepared of a gritty Stone, the one concave, the other convex, which are to be ground on one another with wet Sand between, till such time as the one perfectly fits the other. By this means a perfect spherical Figure is acquir'd.

The Mass prepared before, is now to be extended on the Table by means of a wooden Roller, till it be of Thickness proper for the *Mirror*; and then being strew'd with Brick-Dust to prevent its sticking, it is laid over the convex Mould, and so gets the figure of the *Mirror*. When this is dry, it is cover'd with another Lay of the same Mass; which once dry'd, each Cover, or Segment of the hollow Sphere made of Clay, is taken off. The innermost of the two being laid aside, the stone Mould is anointed with grease prepared from Chalk and Milk, and the outer Cover again put over it.

Lastly, the Joining being cover'd over with the same Clay whereof the Cover is form'd; the whole Mould is bound together with Iron-Wire; and two Holes cut through the Cover, the one for the melted Matter of the *Mirror* to be pour'd thro', the other for the Air to escape at, to prevent the *Mirror*'s being spoil'd with Bubbles.

The Mould thus prepared; eight parts of Copper, one of English Tin, and five of *Marchasite*, are melted together; a little of the mixture is taken out with a Ladle, and if it be too red, when cold, more Tin is put in; if too white, more Copper: The Mass is then pour'd into the Mould before prepared; and so assumes the figure of a *Mirror*.

Some with ten parts of Copper mix four of English Tin, a little Antimony and Sal Armoniac, stirring the Mass about as long as any Fumes arise from it. Others have other Compositions; many of which are described by *Sebastus* and *Zabimus*.

The *Mirror* being thus cast, is cemented to a Wooden Frame, and thus work'd to and fro over the convex Stone-Mould, first with Water and Sand; and, lastly, without Sand, till it be fit for polishing. The Stone-Mould is then cover'd with Paper, and that smear'd over with Tripoly Dust and Calx of Tin; over which the *Mirror* is work'd to and fro till it have got a perfect Polish. And in the same manner are Glass *Mirrors* polish'd, excepting that the convex Surface is there work'd in the concave Mould.

When the *Mirrors* are very large, they are fix'd on a Table, and first ground with a gritty Stone, then with Pumice, then with fine Sand, by means of a Glass cemented to a wooden Frame; and lastly rabb'd with Calx of Tin and Tripoly Dust by a wet Leather.

For concave *Mirrors* of Glass; the Mould is made of Alabaster: The rest, as in Metal *Mirrors*.

*Laws and Phenomena of Concave Mirrors.*

I. If a Ray, as K I, (Fig. 34.) fall on a concave *Mirror* LI, under an Inclination of 60 Degrees, and parallel to the Axis A B; the reflected Ray I B will concur with the Axis A B in the Pole of the Glass B. If the Inclination of the incident Ray be less than 60 Degrees, as that of E, the reflected Ray E F will concur with the Axis at the Distance B F, which is less than a fourth part of the Diameter. And universally, the distance of the Point F, wherein the Ray H E concurs with the Axis, from the Centre G, is to half the Radius C D in the Ratio of the whole Sine, to the Cosine of Inclination.

Hence it is gather'd by Calculation, that in a concave spherical *Mirror*, whose breadth subtends an Angle of 6 Degrees, parallel Rays meet after Reflection in a part of the Axis less than the one thousand four hundred fifty seventh part of the Radius: If the breadth of the concave *Mirror* be 12, 18, 24, 30, or 36 Degrees; the part of the Axis wherein the parallel Rays meet after Reflection is less than  $\frac{1}{252}$ ,  $\frac{1}{126}$ ,  $\frac{1}{84}$ ,  $\frac{1}{63}$ ,  $\frac{1}{54}$  of the Radius.

And on this Principle it is, that *Burning-Glasses* are built.

For since the Rays diffus'd thro' the whole Surface of the concave *Mirror*, after reflection are contracted into a very small compass; the Light and Heat of the parallel Rays must be prodigiously increased thereby, viz. in a duplicate Ratio of the breadth of the *Mirror*, and the Diameter of the Circle wherein all the Rays are collected: And since the Sun's Rays are, as to any purposes on Earth, parallel,

(See *LIGHT*) no wonder concave *Mirrors* should burn with so much violence. See *BURNING-Glass*.

From this same Principle is likewise deduc'd a Method of representing the Images of Objects in a dark Room; which see under *CAMERA Obscura*.

II. A lucid Body being placed in the Focus F, of a concave *Mirror*, H E C; the Rays after reflexion become parallel.

Hence an intense Light may be projected to a vast distance, by a lighted Candle, &c. placed in the Focus of a concave *Mirror*. Hence also, if the parallel Rays be received by another concave *Mirror*, they will again concur in its Focus, and burn.

*Zabimus* mentions an Experiment of this kind made at Vienna, where two concave *Mirrors*, the one six, the other three Foot diameter, being placed about 24 Feet apart, with a Live-Coal in the Focus of the one, and a Match and Tinder in the other, the Rays of the Coal lighted the Candle.

III. If a lucid Body be placed between the Focus F, and the *Mirror* H C B, the Rays after reflexion will diverge from the Axis B G. Whence it follows that Light is weaken'd by reflexion.

IV. If a lucid Body be placed between the Focus F, and the Centre I, the Rays after reflexion will meet in the Axis beyond the Centre.

Hence if a Candle be placed in G, its Image will be in K; if it be placed in K, its Image will be in G; in the intermediate Points between G and K the Section of Light will be a Circle, and that so much the greater, as it is nearer the Point of Concourse.

V. If a luminous Body be placed in the Centre of the *Mirror*, all the Rays will be reflected back upon themselves.

Hence if the Eye be placed in the Centre of a concave *Mirror*, it will see nothing but itself, and that constantly through the whole *Mirror*.

VI. If a Ray falling from the Point of the Cathetus b, (Fig. 35.) on the convex *Mirror* b F, be together with its reflex I F, contained within the Concavity of the *Mirror*; F H will be the Incident Ray from the Point of the Cathetus H and F O its reflex.

Hence, 1. Since the Point of the Cathetus H is the Image of the Point b in the convex *Mirror*; but the Point b the Image of H in the concave; if the Image of an Object reflected by a convex Speculum, be seen by a Reflection made in its Concavity, it will appear like the Object itself.

2. Since the Image of an infinite Cathetus is less in a convex Glass by one fourth of its Diameter; a Portion of the Cathetus less than a fourth part of the Diameter, may appear of any magnitude required in a concave one.

3. A Point therefore distant from a concave Speculum, less than  $\frac{1}{4}$  of the Diameter must appear behind the *Mirror* at any distance, how great soever.

4. Since the Image of any Object how broad soever, is contain'd, in a convex Speculum, between the two Lines of Incidence of its extreme Points; if an Object be placed between the two Lines at a distance less than  $\frac{1}{4}$  of its Diameter, the breadth of the Image, how great soever, may all appear.

4. Since then the Image of an Object included between two Lines, at a distance less than one fourth of the Diameter, may exceed the just height and breadth of the Object; nay, may be made of any magnitude, how big soever: Objects placed between the Focus and *Mirror*, must appear of enormous magnitudes in concave *Mirrors*; the Image being so much the greater in the concave *Mirror*, as it is less in the convex.

5. In a convex *Mirror*, the Image of a remote Object appears nearer the Centre than that of a nearer Object: therefore in a concave *Mirror*, the Image of an Object remote from the *Mirror*, appears at a greater distance than that of a nearer Object, provided the distance of the Object from the Centre be less than a fourth part of the Diameter.

6. In a convex Speculum, the Image of a remote Object is less than that of a near one; therefore in a concave one, the Image of an Object placed between the Focus and the *Mirror*, is nearer the Focus than the Speculum.

7. The Image therefore of an Object receding continually from a concave Speculum, becomes continually greater, provided it don't recede beyond the Focus, where it becomes confus'd; and as it approaches, it grows continually less.

8. In a convex Speculum, if the Sphere, whereof it is a Segment, be smaller, the Image is smaller than in another of a larger Sphere; therefore in a concave, if the Sphere whereof it is a Segment, be smaller, the Image will be larger than in another, whose Sphere is larger; whence concave *Mirrors*, if they be Segments of very small Spheres, will do the Office of Microscopes.

VII. If an Object be placed between a concave *Mirror* and its Focus, its Image will appear behind the *Mirror*, in an erect but inverted Situation.

VIII. If an Object A B, (Fig. 36.) be placed between the Focus and the Centre, its Image E F will appear inverted, and in the open Air, beyond the Centre, the Eye being placed beyond the Centre.

IX. If an Object E F be placed beyond the Centre C, and the Eye likewise beyond the Centre, the Image will appear inverted in the open Air between the Centre and the Focus.

Hence, the inverted Images of Objects placed beyond the Centre, are reflected by a concave *Mirror*, erect, and may be received on a Paper apply'd between the Centre and the Focus, especially if the Room be dark: if the Object E F be further distant from the Centre than is the Focus, the Image will be less than the Object.

On this Principle, concave *Mirrors*, especially those which are Segments of large Spheres, and are capable of reflecting inire Objects, exhibit many pleasing Phenomena. Thus, if a Man flourish a Sword against the *Mirror*, another comes out thereof, and meets him with the same Motions; and the Image of his Head coming out of the *Mirror*, if he strike it with his real Sword, the imaginary Sword will strike his real Head. If he stretch out his Hand, another Hand will be stretch'd out of the *Mirror*, and meet it at a great distance in the open Air, &c.

And on the same Principle are built Catoptric Citizels, which when look'd into, exhibit Images vastly bigger than the Object. See CATOPTIC Citizels.

X. The Image of a right Line perpendicular to a concave *Mirror*, is a right Line; but all oblique or parallel Lines are concave.

*Cylindrical, Conical, Parabolical, and Elliptical MIRRORS*, or *Specula*, are those terminated by a Surface respectively *Cylindrical, Conical, Parabolical, and Spheroidal*. See CYLINDER, CONE, PARABOLA, &c.

To prepare, or make *Cylindrical, Conical, Parabolical, Elliptical, and Hyperbolical MIRRORS*.

For *Cylindrical and Conical Mirrors*, if they are to be of Glass, the Method of preparing 'em is the same as that already laid down for convex *Mirrors*.

If of Metal, they are to be made after the manner of Concave *Mirrors*, only that the clay Moulds there described, require other Wooden ones of the Figure of the *Mirror*.

For *Elliptical, Parabolical, and Hyperbolical Mirrors*, the Mould is to be thus prepared. On a Wooden or Brazen Plane or Table, describe the Figure of an *Ellipse*, A B, (Fig. 37.) a *Parabola*, or an *Hyperbola* C D, (Fig. 38.) after the manner taught under those heads; which done, cut out the Figure from the Plane with all the Accuracy imaginable.

To the Elliptic Figure, fit an Axis, as E F, with two Fulcra to sustain it, &c. and to move it. Lay a Quantity of the Lay above described under it; and turn about the Axis by the Handle, till the Plane A B have turn'd, or impress'd the Elliptic Figure exactly thereon.

The Axis of the Parabolical, or Hyperbolical Figure C D, is to be fix'd at the Vertex in such manner as it may always remain Erect. This is to be turn'd about as above, till it have given its own Figure to the Clay apply'd about it.

The part of the Mould thus form'd, is to be dry'd, and either smear'd over with Fat, or sprinkled with Brick-Dust. Then a convex Mould to be made, by putting a Quantity of the same Clay into the Cavity thus form'd. This latter is call'd the *Mise*, as the former the *Female Mould*.

The Male Mould being well dried, is to be apply'd within the Female; in such manner as only to leave the intended Thickness of the *Mirror* between them. The rest as for concave *Mirrors*.

These *Mirrors* are not made without the utmost difficulty; by reason, be the Moulds ever so just, the Figure of the *Mirror* is apt to be damaged in the Grinding.

*Phænomena, or Properties of Cylindrical MIRRORS.*

I. The Dimensions of Objects corresponding length-wise to the *Mirror*, are not much chang'd; but those corresponding breadth-wise, have their Figures alter'd, and their Dimensions lessen'd so much the more, as they are further from the *Mirror*: Whence arises a very great Distortion.

II. If the Plane of Reflexion cut the cylindrical *Mirror* thro' the Axis, the Reflexion is performed in the same manner, as in a plain *Mirror*; if it cut it parallel to the Base, the Reflexion happens in the same manner as in a spherical *Mirror*; if, lastly, it cut it obliquely, or be oblique to its Base, the Reflexion is the same as in an Elliptic *Mirror*.

Hence, as the Plane of Reflexion never passes through the Axis of the *Mirror*, except when the Eye and Objective-Line are in the same plane; nor parallel to the Base, except when the radiant Point and the Eye are at the same height: The Reflexion in a *Cylindrical Mirror* is usually the same as in an Elliptic one.

III. If a hollow cylindrical *Mirror* be opposed directly to the Sun, instead of a Focus of a Point, the Rays will be reflected into a lucid Line parallel to its Axis, at a distance somewhat less than a fourth part of its Diameter.

Hence arises a Method of Drawing *Anamorphoses*, i. e. wild deformed Figures on a Plane, which appear beautiful and well-proportion'd when view'd in a cylindrical *Mirror*. See ANAMORPHOSIS.

For *Elliptic, Parabolic, Conic, and Pyramidal Mirrors*, we are not much acquainted with their Properties: Only that,

In the First, if a Ray strike on it from one of its Focus's, it is reflected into the other: So that a lighted Candle being placed in one, its Light will be collected in the other.

That the Second, inasmuch as all the Rays they reflect meet in one Point, make the best Burning-Glasses of all others.

And, Lastly, that wild irregular Figures may be so drawn on a Plane, as that the Eye being placed over the Axis of the two last, they shall appear beautiful and well-proportion'd. See ANAMORPHOSIS.

MIS, a Particle prefix'd to divers Terms, particularly Law-Terms; denoting some Fault, or Defect.

As in *Misprison* & *Misdeame*, to scandalize one; *Misdeame*, to reach unto, &c. See MISPRISON, &c.

MISANTHROPY, a general Hatred to Man, and Mankind: In opposition to *Philanthropy*. See PHILANTHROPY.

The Word comes from the Greek *μισος*, Odium, Hatred; and *ανθρωπος*, Homo, Man.

MISADVENTURE, or MISADVENTURE, in Law, is used by *Brown*, &c. in an especial Signification, for the killing a Man partly by Negligence, and partly by Chance: As if a Person, thinking no harm, carelessly throws a Stone, or shoots an Arrow, wherewith he kills another; in this case he commits no Felony, but only loses his Goods, and has a Pardon of course for his Life. See HOMICIDE.

*Misadventure* distinguishes between *Accident* and *Misadventure*. The first he makes to be meer Chance; as if a Man being upon, or near the Water, be taken with some sudden Sickness, and so fall in, and be drown'd; or into the Fire, and be burnt.

*Misadventure*, according to him, is when a Man comes to his Death by some outward Violence, as the Fall of a Tree; the Running of a Cart-Wheel; the Stroke of a Horse, &c.

*Wesl* distinguishes Homicide into casual and mix'd. The first, when a Man is slain by mere Accident, against the mind of the Killer; as if the Ax fly off the Helve, and kill a Man: Which is the same with *Brown's Misadventure*.

MISCONTINUANCE, in Law, the same with *Discontinuance*. See DISCONTINUANCE.

MISDEMEANOUR, an Offence, or Fault, particularly in the Execution of an Office.

*High Crimes* and *MISDEMEANOURS*, are Offences of a heinous nature, next to High Treason.

MISE, a French Term, literally denoting Expence, or Disbursement, wrote in *Latin Misum* or *Misa*; and used in our Law-Books in divers Acceptations.

First, as an honorary Gift, or customary Present, wherewith the People of *Wales* used to salute every new King and Prince of *Wales* at their Entrance upon the Principality. Antiently it was given in Cattle, Wine, Corn, &c. for the Support of the Prince's Family; but when that Dominion was annex'd to the *English Crown*, the Gift was chang'd into Money. The County of *Wint* pays 2000 Marks, &c. for their *Mise*.

The County of *Chester* also pays a *Mise* or Tribute of 5000 Marks at the Change of every Owner of the said Earldom, for the enjoying of the Privileges of that Palatinate. At *Chester* they have a *Mise-Book*, wherein every Town and Village in the County is rated what to pay toward the *Mise*.

*Mises* are also taken for the Profits of Lands; sometimes for Taxes or Tallages; and sometimes for Expences or Costs: As *pro Misis* & *Custariis*, for Costs; and Charges in the Entries of Judgments, &c.

*Mise* is also a Term used in speaking of a Writ of Right. What in other Actions is call'd an *Issue*, in a Writ of Right is call'd a *Mise* or *Me*: so that to join the *Mise* upon the Meer, is as much as to say, to join Issue on the meer Right, i. e. to join upon this Point, whether has the more Right, the Tenant or Demandant. See ISSUE, &c.

Yet even in a Writ of Right, if a Collateral Point be try'd, it is there call'd an *Issue*, not a *Mise*. See RIGHT.

*Mise* is also used as a Participle, for *cast* or *put upon*. Sometimes corruptly for *Messe*, a Messuage or Tenement. In some Manors, a *mease Place* is taken for such a Messuage or Tenement, as yields the Lord a Herriot at the Death of the Tenant.

*MISERERE*, *have mercy*, the Name, and first Word of one of the Penitential Psalms being that commonly given by the Ordinary to such condemn'd Malefactors, as are allow'd the Benefit of the Clergy. Whence it is also call'd the *Psalm of Mercy*. See CLEERGY.

*MISERERE* *me*, is a kind of Colic, or Disorder of the Intestines, wherein the Excrements, instead of passing off the common way, are thrown up by the Mouth. See COLIC.

The *Miserere mei* is the same with what we otherwise call *Poivinus* and *liac Passien*. See *LIAC Passien*.

It takes its Name from the intolerable Pain and Anguish it occasions the Patient; which is such, as claims Pity from the Beholders: *Miserere mei* being a Latin Phrase, which literally signifies, *Have pity on me*.

*MISERICORDIA*, *Mercy*, in Law, is an arbitrary Amerciament or Pardonment imposed on any Person for an Offence. See AMERCIAMENT.

Where the Plaintiff or Defendant in any Action is amerced, the Entry is always *ides in Misericordia*. It is thus call'd, according to *Fischer*, by reason it ought to be but small; and less than the Offence, according to the Tenor of *Magna Charta*.

Hence, if a Man be unreasonably amerced in a Court not of Record, as a Court-Baron, &c. there is a Writ call'd *Moderata Misericordia*, directed to the Lord, or his Bailiff, commanding them to take moderate Amerciaments. See *MODERATA*, &c.

*Misericordia* *lenior sit data, quod lenissima imponitur Misericordia; Graviores enim misilia Fines vocant; Atrocissima, Redemptio*. See FINE and REDEMPTION.

*Misericordia Communis*, is when a Fine is set on the whole County or Hundred.

*MISFEASANCE*, in Law, Misdoings or Trespasses. Whence also *Misfeasor*, a Trespasser. See TRESPASS.

*MISNA*, or *MISHNA*, a part of the Jewish Talmud. See TALMUD.

The *Misna* contains the Text; and the *Gemara*, which is the second part of the Talmud, contains the Commentaries: so that the *Gemara* is, as it were, a Glossary on the *Misna*.

The *Misna* consists of various Traditions of the Jews, and of Explanations of several Passages in Scripture. The Jews maintain, that it was compiled, and reduc'd into a Body, by Rabbi *Juda*, in the second Century, to prevent the Memory of their Traditions from perishing. But the Generality of the Learned scarce allow it of so much Antiquity, and bring in several *C. naries* lower.

It is written in a much purer Style, and is not near so full of Dreams and Visions as the *Gemara*. See *GEMARA*.

*MISNOMER*, a Term in Law, compounded of the French *Mes*, which in Composition signifies *amid*; and *nommer*, to name: It denotes the using of one Name for another; a misnaming or misnaming. See NAME.

*MISPRISION*, a Term in Law, signifying *Neglect*, or *Overfight*.

*MISPRISION of Treason, or Felony*, is a Neglect or light Account shew'd of Treason or Felony by not revealing it, when we know it to be committed; or by letting any Person, &c. on Suspicion of Treason, to go, before he is indicted. See TREASON.

It is the Concealment, or not disclosing of known Treason; for which the Offenders are to suffer Imprisonment during the King's Pleasure, and to lose their Goods, and Profit of their Lands, during their Lives.

*Misprison of Felony* is only fineable by the Justices, before whom the Party is attained; but Justices of the Common Pleas have a power to assess any Amerciaments upon Persons offending by *Misprisions*, Contempts or Neglects, for not doing, or misdoing any thing in or concerning Fines.

*MISPRISION of Clerks*, is a Neglect of Clerks in writing or keeping Records. By the *Misprison* of Clerks, no Process shall be annull'd or discontinu'd. And Justices of Assize shall amend the Defaults of Clerks mis-spelling of a Syllable or Letter in Writing.

*MISSAL*, *MISSALE*, a Mass-Book, containing the several Masses to be used for the several Days, Feasts, &c. See MASS.

The *Missal* was first compil'd by Pope *Zachary*, and afterwards reduc'd into better Order by Pope *Gregory* the Great, who call'd it the *Book of Sacraments*.

Each Diocese, and each Order of Religious, have their particular *Missal*, accommodated to the Feast of the Province, or of the Order.

*MISSELTOE*, *MISLETOE*, or *MISTLETOE*, in Natural History, a Plant of the Parasite Kind; growing, not on the Ground, but on other Trees, as the Oak, Apple-Tree, Pear-Tree, Plum-Tree, Acacia Americana, Beech, Chestnut, &c. See PARASITE.

*Mistletoe*, by Physicians, &c. call'd *Viscum*, grows to the height of about two Feet. It consists of several Stems, which are usually cover'd with a greenish, sometimes a yellowish Bark, about the Thickness of the Finger, hard, woody, and divided by Knots; from which spring the Leaves, which grow by two and two opposite to each other, oblong, thick, of a greenish, or yellowish Colour, vein'd their whole Length, and rounded at the End. Its Flowers grow by three and three, Trefoil-wise, at the Extremes of the Branches: each Flower is a yellow Calyx, one third of an Inch in Diameter, divided into four Parts. The Fruit likewise grows by three and three, at the Extremes of the Branches. They are a kind of oval Berries, not unlike little Pearls, fill'd with a starchy Seed in form of a Heart; cover'd with a fine silver'd Membrane, and enclos'd with a viscid, glutinous Humour, of a whitish Colour, wherein the Seed naturally buds or germinates, and puts forth two Eyes. From this Juice it is, that the Latins denominate the Plant *Viscum*. The Fruit grows on different Branches from the Flowers.

That uncommon Soil, wherein the *Mistletoe* grows, has occasion'd abundance of fabulous Notions both as to its Production and Virtues.

Pliny and most Naturalists relate, that Thrushes being exceedingly fond of the Berries of the *Mistletoe*; they swallow 'em, and cast 'em out again on the Branches of Trees where they use to perch; and by this means give Occasion to a new Production of *Mistletoe*. By cracking the Berries with their Bills, or Claws, they are supposed to let out the Viscous Juice, which facilitates their Sticking: And hence that Proverb, *Turdus sibi causat Malum*; the *Viscum* being sometimes used as Bird-Lime.

Mr. *Bradley* endeavours to refute the popular Opinion of the Antients, that the Seeds of the *Mistletoe* could not vegetate. Their endeavouring to propagate it in the Earth without success, he takes to have led them into the Error: And asserts, that it may be propagated by Seed on any Tree whatever. The Method too is very easy. About Christmas, when the Berries are full ripe, you need only apply them on the smooth Bark of any Tree; the viscid Juices they are encompass'd withal, will make them stick; and, provided the Birds do not devour the Seed, you may, without any further Trouble, expect a young Plant the following Year.

Others rather chuse to account for the Propagation of *Mistletoe* from the System hereafter advanced for that of *Mushrooms*. See MUSHROOM.

For the Virtues of *Mistletoe*, it seems of the most Efficacy in the Epilepsy; against which some will have it a Specific. Dr. *Casareus* has wrote expressly to prove it such. It is also prescribed in Apoplexies, Lethargies, and Vertigos; and wore about the Necks of Children to prevent Convulsions, and ease the cutting of their Teeth.

The best is the *Mistletoe of the Oak*; tho' it is not this which is commonly used, but that of the Apple or Pear-Tree. Mr. *Bradley* observes, that there is no Variety in this Plant, but that the Leaves, Flowers, Fruit, &c. are all alike on whatever kind of Tree it grows: But others pretend to distinguish that of the Oak by several particulars.

The Virtues ascribed to the *Mistletoe*, may perhaps be the Remains of the Religious Honour paid it by the antient Gauls; among whom the Druids, assembled constantly on the first Day of the Year, went in quest thereof with Hymns, and other Ceremonies and Rejoycings, distributing it again among the People, as a Thing sacred, after having first consecrated it, crying *Au gay l'An neuf*, to proclaim the new Year. See DAVIDS.

The Cry is still kept up at *Pearcy*, where they add *Plantae*, to wish a plentiful new Year.

Mr. *Perrault* observes, that the *Mistletoe* is full of a poisonous Juice, which weakens the Tree whereon it grows; and that the Fruit has always a disagreeable Taste while it sticks on it.

*MISSEN-Mast* of a Ship, is a *Mast*, or round long piece of Timber, standing in the sternmost part. See MAST.

Some great Ships require two *Misfens*.

Next the Main-Mast, is the *Main-Misfen*; and that next the Poop, is call'd the *Boventure-Misfen*. When at Sea they use the Word *Misfen* alone, they always mean the *Sail*, and not the *Mast*.

To change the *Misfen*, is to bring the *Misfen-Tard* over to the other side the *Mast*. To peck the *Misfen*, is to put the *Misfen* right up and down the *Mast*. To spell the *Misfen*, &c.

*MISSION*, a Term in Theology used to signify a Power or Commission to preach the Gospel. See GOSPEL.

Jesus Christ gave his Disciples their Mission in these Words, *Go, and teach all Nations, &c.*

The Romanists reproach the Protestants, that their Ministers have no Mission; as not being authorized in the Exercise of their Ministry, either by an uninterrupted Succession from the Apostles, or by Miracles; or by any extraordinary Proof of a Vocation.

The Anabaptists deny any other Mission necessary for the Ministry than the Talents necessary to discharge it.

Mission is also used for divers Establishments of People zealous for the Glory of God, and the Salvation of Souls, who go and preach the Gospel in remote Countries, and among Infidels. See MISSIONARY.

There are Missions in the East, as well as the West-Indies.

Among the Romanists, the Religious Orders of St. Dominic, St. Francis, St. Augustin, and the Jesuits, have Missions in the Levant, America, &c.

The Jesuits have Missions in China, and all other parts of the Globe, where they have been able to penetrate.

The Medicants abound in Missions.

Mission is also the Name of a Congregation of Priests, and Laymen, instituted by Vincent de Paul, and confirmed in 1626 by Pope Urban VIII. under the Title of Priests of the Congregation of the Mission.

These profess to make it their whole Business to assist the poor People in the Country; and to this purpose oblige themselves never to preach, or administer any of the Sacraments in any Town where there is an Archbishop, Bishop, or Provincial residing.

They are settled in most Provinces of France, Italy, Germany, and in Poland.

At Paris they have a Seminary which they call the Foreign Mission, where Youth are bred up and qualify'd for foreign Missions.

MISSIONARY, an Ecclesiastic who devotes himself and his Labours to some Mission, either for the Instruction of the Orthodox, the Conviction of Heretics, or the Conversion of Infidels.

MISSIVE, something sent to another. The Word is form'd from the Latin *Mitto*, I send.

In this sense we say *Missive Letters*, or Letters *Missive*, i. e. Letters sent from one to another. See LETTER.

In property, Letters *Missive* are Letters of Business; but not Business of great concern; in contradistinction from Letters of Gallantry, Letters on Points of Learning, Dispatches, &c.

MIST, a Meteor, call'd also *Fog*. See FOG.

MISY, in Natural History, see CHALCITIS.

MITE, a small Coin, formerly current; equal to about one third part of a Farthing. See MONEY and COIN.

MITE is also a small Weight used by the Moneyers. It is equal to the twentieth part of a Grain, and is divided into 24 *Dans*. See WEIGHT.

MITHRIDATE, in Pharmacy, an Antidote, or Composition serving either as a Remedy or a Preservative against Poisons.

*Mithridate* is one of the capital Medicines in the Apothecaries Shops; being composed of a vast Number of Drugs, as *Opium*, *Myrrh*, *Agaric*, *Saffron*, *Ginger*, *Cinnamon*, *Spikenard*, *Frankincense*, *Cajor*, *Pepper*, *Genian*, &c.

It is accounted a Cordial, Opiate, Sudorific and Alexipharmic.

*Mithridate* says it is more effectual against Poisons than *Vener-Triacle*; tho' easier to be made. See POISON.

It takes its Name from its Inventor, *Mithridate* King of *Pennis*, who is said to have so fortify'd his Body against Poisons with Antidotes and Preservatives, that when he had a mind to dispatch himself, he could not have any Poison that would have effect.

The Receipt of it was found in his Cabinet, written with his own Hand, and was carried to *Rome* by *Pempey*. It was translated into Verse by *Damascentus*, a famous Physician, and was afterwards translated by *Galen*, from whom we have it: Tho' there is room to imagine it has undergone considerable Alterations since the time of its Royal Prescriber.

MITRALES *Faldae*, MITRAL *Valve*, in Anatomy, two Valves in the Heart; thus call'd from their resembling a Mitre. See VALVE and HEART.

They are placed at the Orifice of the Pulmonary Vein, in the left Ventricle of the Heart. Their Office is to close the Orifice thereof, and prevent the return of the Blood through the Pulmonary Vein into the Lungs again. See PULMONARY VEIN, CIRCULATION, &c.

MITRE, a Pontifical Ornament, worn on the Head by Bishops, and certain Abbots, on Solemn Occasions. See BISHOP, ABBOT, &c.

The Mitre is a round Cap, pointed, and cleft a-top with two Funnels hanging down the Shoulders.

The Abbots wear the Mitre turned in Profile; and bear the Crozier inwards, to shew that they have no spiritual Jurisdiction without their own Cloisters.

The Pope has granted to some Canons of Cathedrals the Privilege of wearing the Mitre. The Counts of *Lyon* are said to have assist'd at Church in Mitre.

In Germany, several great Families bear the Mitre for their Crest; to shew that they are Advocates, or Feudatories of ancient Abbots, or Officers of Bishops, &c.

The Pope has four Mitres, which are more or less rich according to the Solemnity of the Feast-Days they are to be worn on.

The Mitre was originally the Women's Head-Dress, as the Hat was that of the Men. This appears from *Servius*, who reproaches the *Trojan*, or *Pbrygians*, that were dress'd like Women, and wore Mitres;

*Et Tunice Manicas, Et habent redimicula Mitre.*

The Cardinals antiently wore Mitres, before the Hat which was first granted them by the Council of *Lyon* in 1245.

Authors make no mention of the Mitre as an Episcopical Ornament before the Year 1000.

The Word comes from the Latin *Mitra*, of the Greek *μῆτρα*.

MITRE, in Architecture, is the Work-men's Term for an Angle, that is just 45 Degrees; or half a right one.

If the Angle be a quarter of a right Angle, they call it a Half Mitre.

To describe such Angles, they have an Instrument call'd the Mitre Square; with this they strike Mitre-Lines on their Quarters, or Battens; And for dispatch, have a Mitre-Box, as they call it, which is made of two pieces of Wood, each about an Inch thick, one nailed upright on the Edge of the other; the upper piece hath the Mitre-Lines struck upon it on both sides, and a Kerf to direct the Saw in cutting the Mitre Joints readily, by only applying the Piece into this Box.

MITRED Abbot, see ABBOT.

MITTIMUS, in Law, a Writ, by which Records are transfer'd from one Court to another; sometimes immediately, as out of the King's Bench into the Exchequer; and sometimes by a *Certiorari* into the Chancery, and from thence by a *Writimus* into another Court.

The Word is also used for a Precept directed by a Justice of Peace to a Gaoler, for the receiving and safe keeping a Felon, or other Offender, by him committed to the Goal.

MIXT, or MIXT Body, in Philosophy, is that which is compounded of divers Elements, or Principles; in contradistinction to those which the Chymists suppose to be Elementary, or consisting of one Principle only; as they take Sulphur, Salt, &c. to be. See ELEMENT.

The Schoolmen define a Mixt Body to be a Whole, resulting from several Ingredients, slic'd, or new modified by the Mixture. On which Principle, the several Ingredients don't actually exist in the Mixt, but are all changed, so as to conspire to a new Body of a different Form, from the Forms of the Ingredients. But the modern Philosophers rarely conceive the Term in so much strictness.

The Business of Chymistry, we say, is to resolve Mixt Bodies into their Principles, or component Parts. See PRINCIPLE, CHYMISTRY, &c.

The School-Philosophers distinguish Mixt Bodies into Perfect and Imperfect. Perfect Mixts are the Clafs of Vital or Animated Bodies, where the Elements or Ingredients they are composed of, are changed or transformed by a perfect Mixture. Such are Plants, Beasts, and Men.

Imperfect Mixts are inanimate Bodies, the Forms whereof remain still the same as of the Ingredients that constitute them: Such are Meteors, Minerals, Metals, &c.

MIXT Figure, in Geometry, is that which consists partly of right Lines, and partly of curve Lines. See FIGURE.

MIXT Number, in Arithmetic, that which is partly an Integer, and partly a Fraction; as 4 +  $\frac{1}{2}$ . See FRACTION.

MIXT Action, in Law, is an Action of two different Natures; being partly real, and partly personal. See ACTION, real, personal.

A Mixt Action is that which lies both for the Thing detained; and against the Person of the Detainer.

Or a Mixt Action is that which seeks both the Recovery of a thing we are unjustly deprived of; and Damages, or a Penalty for the unjust detention thereof. Such are Actions of *Waste*, and *Quare Impedit*; Actions for Tithes on the Statute 2 & 3 *Edw. 6. c. 6.*

MIXT Tides, are those of Cheese, Milk, &c. and of the Young of Beasts. See TIDES.

MIXT Mode, according to Mr. Lock, is a Combination of several simple Ideas of different Kinds. See IDEA and MODE.

Thus, Beauty, as it consists in a certain Composition of Colour, Figure, Proportion, &c. of different Parts, causing Delight to the Beholder, is a Mixt Mode. Such also is Theft, Murder, &c. See MODE.

The Mind, that Author observes, being once furnished with simple Ideas, can put them together in several Compositions, without examining whether they exist in Na-

ture together. And hence it is that these Ideas are call'd Notions; as if they had their Original and constant Existence more in the Thoughts of Men, than in the Reality of Things; and that to form such Ideas, it sufficed that the Mind put the Parts of them together; and that they were consistent in the Understanding, without considering whether they had any real Being.

There are three ways whereby we get these complex Ideas of *Mixt Modes*. First, By Experience and Observation of Things themselves; Thus by seeing two Men wrestle, we get the Idea of Wrestling. Secondly, By Invention, or voluntary putting together of several simple Ideas in our own Mind: So he that first invented Printing, had an Idea of it first in his Mind before ever it existed. Thirdly, By explaining the Names of Actions we never saw, or Notices we cannot see; and by enumerating all those Ideas which go to the making them up.

Thus the *mixt Mode* which the Word *Lie* stands for, is made up of these simple Ideas; First, Articulate Sounds. Secondly, Certain Ideas in the Mind of the Speaker. Thirdly, Those Words, the Signs of these Ideas; Fourthly, Those Signs put together by Affirmation, or Negation, otherwise than the Ideas they stand for are in the Mind of the Speaker, since the Language was made.

Complex Ideas are usually got by the Explication of those Terms that stand for them. For since they consist of simple Ideas combined, they may by Words standing for those simple Ideas be represented to the Mind of one who understands those Words, tho' that Combination of simple Ideas was never offer'd to his Mind by the real Existence of Things.

*MIXT Ratio, or Proportion*, is when the Sum of the Antecedent and Consequent is compared with the difference between Antecedent and Consequent; as if  $\frac{3}{4} + \frac{12}{16} = \frac{28}{16}$

$\frac{a \times b}{c} = \frac{d \times e}{f}$ . See *RATIO*.

*MIXTION*, the Act of *Mixing*; or the Union and Coalescence of divers Corpuscles into one Body. See *MIXT*.

The *Peripatetics*, who hold an Alteration essential to *Mixtion*, define it the Union of several alter'd Ingredients, or Mixcibles.

*Mixtion* makes a considerable Operation in the Chymical and Galenical Pharmacy.

*MIXTURE*, in a Philosophical sense, is an Assemblage, or Union of several Bodies of different Properties, in the same Mass.

To determine the Ratio of the Ingredients of a *Mixture*, is that celebrated Problem proposed by *Hiero King of Syracuse* to *Archimedes*, on occasion of a Crown of Gold wherein the Workman had fraudulently mix'd Silver; the Solution whereof was matter of so much Transport to that divine Mechanic.

It may be determined thus:

Weight the *Mixture*, immerse it in some Fluid; and find the Weight it loses therein. (See *SPECIFIC GRAVITY*.) Then find what Weight any determinate Quantity of either Ingredient loses in the same Fluid: And by the Rule of Three find what Weight each ought to lose therein, were its Weight equal to that of the *Mixture*. Subtract the less Loss from the greater, which will give the Excess where-with the Loss of the lighter exceeds that of the heavier. Then subtract the Weight lost by the heavier, from that lost by the whole *Mixture*, to find the Excess of the Weight lost by the *Mixture* beyond that lost by the heavier.

*MIXTURE*, in Matters of Drapery, the Union, or rather Confusion of several Wools of different Colours, not yet spun.

Hence a *Mixt*, or mix'd Stuff, is that whose Wool and Warp are of Wools of different Colours dy'd and mix'd before they were spun.

*MOAT*, in Fortification, call'd also *Foss* and *Ditch*, a hollow Space or Ditch dug round a Town, or Fortrefs to be defended, on the outside the Wall or Rampart. See *RAMPART*.

The Length and Breadth of the *Moat* often depends on the nature of the Soil; ascending as it is Marshy or Rocky.

A *Dry Moat* is that which is destitute of Water, and ought to be deeper than one which is full of Water.

A *Lined Moat* is that whose Scarp and Counterescarp are cased with a Wall of Mason's Work lying a slope.

A *Flat-bottom'd Moat* is that which hath no sloping, its Corners being somewhat rounded.

The Brink of the *Moat* next the Rampart is any Fortification call'd the *Scarp*, and the opposite one the *Counterescarp*. See *SCARP* and *COUNTERSCARP*.

*MOATAZALITES*, a Religious Sect among the *Turks*.

There are two Opinions among the *Turkish Divines* concerning God. The first admit Metaphysical Forms, or Attributes; as that God has a Wisdom by which he is Wise; a Power by which he is Powerful; an Eternity by which he is Eternal, &c.

The Second allow God to be Wife, Powerful, Eternal; but will not allow any Form in God, for fear of admitting a multiplicity.

Those who follow this latter Opinion are call'd *Moatazites*: They who follow the former, *Sephalites*.

*MOBILE*, Moveable; any thing susceptible of Motion, or that is dispos'd to be moved either by itself, or by some other prior *Mobile*, or Mover.

*Primum Mobile* in the ancient Astronomy, was a ninth Heaven, or Sphere, imagin'd above those of the Planets and fixed Stars. See *SPHERE*.

This was supposed to be the first Mover, and to carry all the lower Spheres round along with it; by its Rapidity communicating to 'em a Motion whereby they revolved in twenty-four Hours. But the diurnal Revolution of the Planets is now accounted for without the Assistance of any such *Primum Mobile*.

*Perpetuum Mobile*, see *PERPETUAL Motion*.

*MOBILIA Bona*, in the Civil Law, are what in Common Law, &c. we call *Movables*, or *Movable Goods*. See *MOVABLES*.

*MOBILITY*, in the Schools, &c. an Aptitude, or Facility to be moved.

The *Mobility* of Mercury is owing to the smallness and sphericity of its Particles; and is that which renders its Fixation so difficult. See *MERCURY* and *FIXATION*.

The Hypothesis of the *Mobility* of the Earth is the most plausible; and is that commonly admitted, by the latter Astronomers. See *EARTH*.

Pope Paul V. appointed Commissioners to examine the Opinion of *Copernicus* touching the *Mobility* of the Earth. The Result of their Enquiry, was, a Prohibition to assert, nor that the *Mobility* was possible, but that it was actually true. That is, they allow'd the *Mobility* of the Earth to be held as an Hypothesis which gives an easy and sensible Solution of the Phenomena of the heavenly Motions; but forbade the *Mobility* of the Earth to be maintain'd as a Truth, or a real effective thing; by reason they conceiv'd it contrary to Scripture.

*MODAL*, in Logic, &c. a Term apply'd to Propositions containing certain Conditions, or Restrictions. See *CONDITIONAL*.

*MODY*, or *MOOD*, in Philosophy, a Manner of Being; or a Quality, or Attribute of a Substance, or Subject, which we conceive as necessarily depending on the Subject, and incapable of subsisting without it. See *SUBSTANCE*.

*Mr. Lock* defines *Modes* to be those Ideas (he should have said Things) which don't imply any supposition of subsisting by themselves, but are consider'd as mere dependences and affections of Substances.

Our Ideas of things may be reduced to two Kinds: The one of Things which we conceive separately, and by themselves, call'd *Substances*; and the other of Things which we conceive as existing in others, in such manner as that we cannot allow them existence without 'em; and these we call *Modes*, or *Accidents*. See *ACCIDENT*.

Thus, when we reflect on Wax, and Roundness; we consider the Wax as a thing which may subsist without the Roundness; Wax therefore we denominate a *Substance*: on the contrary, we consider *Roundness* so dependant on the Wax, that it can't subsist without it, there being no conceiving of Roundness distinct and separate from a round Body: This therefore we call a *Mode*, or *Accident*. See *IDEA*.

It is the Characteristic, then, of a true *Mode*, to have such a relation to some Subject, as not to be clearly and distinctly conceivable without conceiving the Subject, whereof it is a *Mode*, at the same time: When, on the other hand, the conception of the Subject does not at all infer or require that of the *Mode*. See *SUBSTANCE*.

Thus, what gives us to know that Thought is not a *Mode* of extended Substance, or Matter, is, that Extension, and the other Properties of Matter may be divided from Thought, without ceasing to conceive Thought all the while. See *THINKING*, *EXTENSION*, &c.

We always consider Things as clothed with certain *Modes*; except when we reflect on the Abstract, or General: And it is the Variety of *Modes*, and Relations, that occasions the great Variety of Denominations of the same thing. It is the various *Modes* of Matter, e.g. that make all the Diversity of Bodies, or corporeal Beings in Nature. See *RELATION*, *MATTER*, &c.

There are various Divisions and Kinds of *Modes*: One of the most common, is into *Internal* and *External*.

*Internal Modes* are those inherent in the Substance, as Roundness in the Bowl; Flattness in the Nose; Crookedness in the Finger, &c.

These, we have observ'd, cannot exist, nor even be conceiv'd without the Subject, as being only Circumstances thereof, or even, according to some, only the Subject itself consider'd, not simply, but as such. Thus the Roundness of the Bowl, is only the Bowl itself consider'd as round, &c.

*External Modes* are those extraneous to the Subject; as when we say a thing is desir'd, lov'd, bebel'd, &c. These coincide with what we call *Relations*.

Add, that there are *Modes* which are likewise Substances, as Apparel, Hair, &c. which may subsist without the Subject.

Mr. Lock divides *Modes* into *Simple* and *Compound*.

*Simple Modes* are Combinations of simple Ideas of the same Kind, or even of the same simple Ideas divers times repeated; as a Dozen, a Score, &c. which are only the Ideas of so many distinct Units put together.

*Mixed Modes* are Combinations of simple Ideas of several Kinds; as in *Beauty*, which consists in a certain Composition of Colour, Figure, &c. *Thrift*, which is the conceal'd Change of the Possession of any thing without consent of the Proprietor, &c.

With regard to *Simple Modes*; that Author observes, that the Modifications of any simple Idea are as perfectly different and distinct Ideas in the Mind as those the most remote and inconsistent. Thus two is as distinct from three, as Blindness from Heat. With this View he examines the *Simple Modes of Space*.

*Space* is a simple Idea, which we get both by Sight and Touch: When we consider it barely in Length between two Bodies, it is call'd *Distance*: When in Length, Breadth, and Thickness, it may be call'd *Capacity*: When consider'd between the Extremities of Matter, which fills the Capacity of Space with something solid, tangible, and moveable, it is call'd *Extension*; and thus Extension will be an Idea belonging to Body: But Space may be conceived without it. Each different Distance is a different Modification of Space; and each Idea of any different Space, is a simple *Mode* of this Idea. Such are an Inch, Foot, Yard, &c. which are the Ideas of certain fixed Lengths, which Men settle in their Minds for the Use, and by the Custom of Measuring. When these Ideas are made familiar to Men's Thoughts, they can in their Minds repeat them as often as they will, without joining to them the Idea of Body, and frame to themselves the Ideas of Feet, Yards, and Fathoms, beyond the utmost Bounds of all Bodies, and by adding these still to one another, enlarge their Idea of Space, as much as they please.

From this Power of repeating any Idea of Distance, without being ever able to come to an end, we come by the Idea of Infinity. See *EXTENSION, DISTANCE, MEASURE, &c.*

Another *Mode*, or Modification of Space, is taken from the relation of the Parts of the Termination of Extension, or circumscrib'd Space amongst themselves; and this is what we call *Figure*. This, the Touch discovers in sensible Bodies, whose Extremities come within our reach; and the Eye takes, both from Bodies and Colours whose Boundaries are within its view; where, observing how the Extremities terminate, either in straight Lines, which meet at discernible Angles; or in crooked Lines, wherein no Angles can be perceived; by considering these as they relate to one another in all parts of the Extremities of any Body or Space, it has the Idea we call *Figure*: Which affords to the Mind infinite Variety. See *FIGURE*.

Another *Mode* belonging to this Head, is that of *Place*. Our Idea of Place is nothing but the relative Position of any thing, with reference to its distance from some fixed and certain Points: Whence we say, that a thing has, or has not changed Place, when its distance either is, or is not alter'd with respect to those Bodies, with which we have occasion to compare it. That this is so, we may easily gather from hence; that we can have no Idea of the Place of the Universe: tho we can of all its Parts. See *PLACE*.

Another *Mode* of Space, is the Idea which we get from the fleeting, and perpetually perishing Parts of Succession, which we call *Duration*. The *Simple Modes* of it are any different Lengths of it, whereof we have distinct Ideas, as Hours, Days, Years, &c. Time, and Eternity. The Idea of Succession is got by reflecting on that train of Ideas, which constantly follow one another in our Minds, as long as we are awake. See *SUCCESSION*.

The distance between any Parts of this Succession is what we call *Duration*: And the Continuation of the Existence of ourselves, or any thing else commensurate to the Succession of any Ideas in our Minds, is what we call our own Duration, or that of another thing co-existing with our thinking.

A Man having once got this Idea of Duration, can apply it to things which exist, while he doth not think: And thus we measure the time of our Sleep, as well as that wherein we are awake. See *DURATION*.

In regard to some other *Simple Modes*, Mr. Lock observes, That the Mind has several distinct Ideas of Sliding, Rolling, Walking, Creeping, &c. which are all but the different Modifications of Motion. Swift and Slow are two different Ideas of Motion, the Measures whereof are made

out of the Distances of Time and Space put together. The like Variety we have in Sounds; every articulate Word is a different Modification of Sound, as are all Notes of different length put together, which make that complex Idea call'd Time. See *TIME*.

The *Modes* of Colours might be also very various; some of which we take notice of as the different Degrees, or as they are termed, Shades of the same Colour. But since we seldom make Assemblages of Colours without taking in Figure also, as in Painting, &c. those which are taken notice of, do most commonly belong to mix'd *Modes*, as Beauty, Rainbow, &c. All compounded Tastes and Smells are also *Modes* made up of the simple Ideas of those Senses.

As to the *Modes of Thinking*; when the Mind turns its view inward upon itself, Thinking is the first Idea that occurs, wherein it observes a great Variety of Modifications; and therefore frames to itself distinct Ideas.

Thus the Perception annex'd to any Impression on the Body made by an external Object, is call'd *Sensation*. Where an Idea recurs without the presence of the Object, it is call'd *Remembrance*. When fought after by the Mind, and brought again in view, it is call'd *Recollection*. When held there long under attentive Considerations, it is call'd *Contemplation*. When Ideas float in the Mind without regard or reflection, it is call'd in French, *Reverie*. When the Ideas are taken notice of, and, as it were, register'd in the Memory, it is *Attention*. When the Mind fixes its view on any one Idea, and considers it on all sides, it is *Intention and Study*.

Of these various *Modes* of Thinking, the Mind forms as distinct Ideas, as it does of White and Red, a Square, or a Circle.

For *Mix'd Modes*, there are three ways whereby we get the complex Ideas thereof. 1. By Experience and Observation of things themselves; thus by seeing two Men wrestle, we get the Idea of Wrestling. 2. By Invention, or voluntary putting together of several simple Ideas in our own Minds; so he that first invented Printing, had an Idea of it first in his Mind, before ever it existed. 3. By explaining the Names of Actions we never saw, or Notions we cannot see; and by enumerating all those Ideas, which go to the making them up: Thus the mix'd *Mode* which the Word *Lie* stands for, is made up of these simple Ideas: (1.) Articulate Sounds. (2.) Certain Ideas in the Mind of the Speaker. (3.) Those Words, the Signs of these Ideas. (4.) Those Signs put together by Affirmation, or Negation, otherwise than the Ideas they stand for are in the Mind of the Speaker.

*Mix'd Modes* have their Unity from an Act of the Mind, combining those several simple Ideas together, and considering them as one complex one: The Mark of this Union is one Name given to that Combination. Men seldom reckon any number of Ideas to make one complex one, but such Collections, as there he names for. Thus the Killing of an old Man is as fit to be united in one complex Idea, as that of a Father; yet there being no Name for it, it is not taken for a particular complex Idea; nor a distinct Species of Action from that of Killing any other Man: Those Collections of Ideas have Names generally affixed, which are of frequent use in Conversation; in which Cases Men endeavour to communicate their Thoughts to one another, with all possible dispatch. Those others, which they have seldom occasion to mention, they lay not together, nor give them Names.

This gives the Reason, why there are Words in every Language, which cannot be rendered by any one single Word of another. For the Fashions and Customs of one Nation make several Combinations of Ideas familiar in one, which another had never any occasion to make. Such were, *ὄργανα*, among the *Greeks*; and *Proscriptio* among the *Romans*. This also occasions the constant Change of Languages; because the Change of Custom and Opinion brings with it new Combinations of Ideas, which, to avoid long Descriptions, have new Names annex'd to them, and so they become new Species of *Mix'd Modes*.

Of all our simple Ideas, those which have had most mix'd *Modes* made out of them, are Thinking, and Motion, (which comprehend in them all Action) and Power, from whence these Actions are conceived to flow. For Actions being the great Business of Mankind, it is no wonder that the several *Modes* of Thinking and Motion, should be taken notice of; and the Ideas of them observed, and laid up in Memory, and have Names assigned them. For without such complex Ideas with Names to them, Men could not easily hold any Communication about them.

Of this kind are the *Modes* of Actions distinguish'd by their Causes, Means, Objects, Ends, Instruments, Time, Place, and other Circumstances; as also of the Powers fitted for those Actions. Thus Boldness is the Power to do or speak what we intend, without Fear or Disorder; which Power of doing any thing, when it hath been acquir'd by frequent doing the same thing, is that Idea we call *Ha-*

but; and when forward and ready upon every Occasion, to break into Action, we call it *Disposition*: Thus Tenderness is a Disposition or Aptness to be angry. Power being the Source of all Action, the Substances, wherein those Powers are, when they exert this Power, are call'd *Causes*: And the Substances thereupon produced, or the simple Ideas introduced into any Subject, *Effects*. The Efficacy whereby the new Substance or Idea is produced, is call'd in the Subject exerting that Power, *Atom*; in the Subject wherein any simple Idea is changed, or produced, *Passion*. Which Efficacy in intellectual Agents, we can conceive to be nothing else, but *Modes* of Thinking and Willing: In corporeal Agents, nothing else but Modifications or Motions.

Whatever sort of Action, besides these, produces any Effect, we have no Notion or Idea of: And, therefore, many Words which seem to express some Action, signify nothing of the Action, but barely the Effect, with some Circumstances of the Subject wrought on, or Cause operating: Thus Creation, and Annihilation, contain in them no Idea of the Action, or Manner whereby they are produced, but barely of the Cause, and the Thing done. And when a Country-man says, the Cold freezes Water, though the word, Freezing, seem to import some Action, yet it truly signifies nothing but the Effect, viz. that the Water that was before fluid, is become hard and consistent; without intimating any Idea of the Action whereby it is done.

In *Mixed Modes*, it is the Name that seems to preserve their Essences, and to give them their lasting Duration. The Collection of Ideas is made by the Mind; but the Name is, as it were, the Knot which ties them fast together: Hence we seldom take any other for distinct Species of *mixed Modes*, but such as are set out by Names. We must observe, that the Names of *mixed Modes* always signify the real Essences of their Species; which being nothing but the abstract complex Ideas, and not refer'd to the real Existence of Things, there is no supposition of anything more signified by any Name of a *mixed Mode*, but barely that complex Idea, the Mind itself has form'd; which when the Mind has form'd, is all it would express by it, and is that on which all the Properties of the Species depend, and from which alone they flow; and so, in these, the real and nominal Essence is the same.

This also shews the Reason, why the Names of *mixed Modes* are commonly got, before the Ideas they stand for are perfectly known; because there being no Species of these ordinarily taken notice of, but such as have Names, and those Species being complex Ideas made arbitrarily by the Mind, it is convenient, if not necessary, to know the Names, before we learn the complex Ideas; unless a Man will fill his Head with a company of abstract complex Ideas, which others having no Names for, he has nothing to do with, but to lay by, and forget again. In the beginning of Languages, it was necessary to have the Idea, before one gave it the Name; and so it is still, where a new complex Idea is to be made, and a Name given it. In simple Ideas, and Substances, it is otherwise; which being such Ideas, as have real Existence and Union in Nature, the Ideas or Names are got, one before the other, as it happens.

The Schoolmen make numerous other Divisions of *Modes*; as into *Immediate* and *Mediate*: *Essential* and *Non-Essential*: *Positive* and *Privative*: Of *Spirit* and of *Body*: Of *Thinking*, and of *Having*.

*Immediate Modes* are those immediately attributed to their Subjects or Substances.

*Mediate Modes* are those attributed to Subjects by the intervention of some other *Mode*.

Thus, e. g. Motion is an immediate *Mode* of the Body; Knowledge of the Mind, &c.

But Swiftness and Slowness are not immediately attributable to the Body; but only to the Body in respect of the Motion.

*Essential, or Inseparable Modes*, are Attributes without which the Substance cannot exist; as Wisdom, Goodness, Power, &c. in God; Figure, Place, Quantity, Extension, &c. of Body. See ATTRIBUTE.

*Non-Essential, or Separable Modes*, are Attributes affecting created Substances, and remaining assist'd thereto so long as it is necessary; such are Coldness, of Water; Hardness, of Stone; Whiteness, of Milk, &c.

*Positive Modes*, are those which give something real, positive, and absolute to their Substances. Thus Roundness is a positive *Mode* of a Globe, &c.

*Privative Modes* are attributed to Subjects, when the Mind perceiving some Attributes wanting therein, frames a Word, which at first sight seems to note something positive, but which in reality only notes the want of some Property, or *Mode*. Thus a Privation of Light is attributed to a blind Man, &c.

*Modes of Spirit* are two, viz. Cognition, or Knowledge; and Willing. See KNOWLEDGE and WILLING.

*Modes of Body* are three, viz. Figure, Rest, and Motion. See FIGURE, REST, and MOTION.

*Modes of Thinking* are the same with Essential Attributes or Modes. See ESSENTIAL MODE.

*Modes of Having*, are those whereby any thing may be had by another.

*Artifice* enumerates seven of these: A thing, for instance, may be had either by the *Mode* of Quality, as Knowledge; by that of Magnitude, as Circumference; by the *Mode* of Part, as the Hand, &c.

*Mode* is also used in Logic, for the Modification of a Proposition; or that which renders it *Modal* and *Conditional*. See CONDITIONAL.

*Mode* in Grammar, } See MODE:  
*Mode* in Logic, }

*Mode* in Music, is defined by some Authors, the particular Manner of constituting the Octave; or the melodious Constitution of the Octave, as it consists of seven Essential, or Natural Notes besides the Key, or Fundamental. See OCTAVE.

A *Mode*, then, is not any single Note, or Sound; but the particular Order of the concinnous Degrees of an Octave: The fundamental Note whereof may, in another sense, be call'd the Key, as it signifies that principal Note which regulates the rest.

The proper difference between a *Mode* and a Key, consists in this, that an Octave with all its natural and concinnous Degrees, is call'd a *Mode*, with respect to the Constitution, or the manner and way of dividing it; and with respect to the place of it in the Scale of Music, that is, the Degree or Pitch of Tune, it is call'd a Key: that is, an Octave of Sounds may be rais'd in the same Order, and Kind of Degrees which makes the same *Mode*, and yet be begun higher or lower; that is, be taken at different Degrees with respect to the whole, which makes different Keys: and from the same Definition it follows, that the same Key may be found with different *Modes*; that is, the Extremes of two Octaves may be in the same Degree of Tune, and the Division of 'em different. See KEY.

Now it may be further observed, that of the natural Notes of every *Mode*, or Octave, three go under the Name of the essential Notes in a peculiar manner, viz. the Fundamental, the Third, and Fifth; their Octaves being reckon'd the same, and mark'd with the same Letters in the Scale: the rest are particularly call'd Depend-nt. Again, the Fundamental is also call'd the final; the Fifth the Dominant; and the Third, as being between the other two, the Mediant. See KEY.

The Doctrine of the Antients with regard to *Modes*, which they sometimes also call Tones, is somewhat obscure; there being an unaccountable Difference among their Authors as to the Definitions, Divisions, and Names of their *Modes*. They agree indeed, that a *Mode* is a certain System or Constitution of Sounds; and that an Octave, with all its intermediate Sounds, is such a Constitution: but the specific differences of Tones, some place in the manner of Division, or Order of its concinnous parts; and others merely in the different Tension of the Whole, i. e. as the whole Notes are acuter or graver, or stand higher or lower in the Scale of Music.

*Boetius* is very dark on this head; and defines a *Mode* to be, as it were, an intire Body of Modulation, consisting of a Conjunction of Consonances, as the Diapason.

*Prosemy* makes the *Modes* the same with the Species of the Diapason; but at the same time speaks of their being at some distance from each other. Some contend for thirteen, some for fifteen *Modes*, which they placed at a Semitone's distance from each other; but it is plain, those under-deritod the differences to be only in their place or distance from each other; and that there is one certain harmonious Species of Octave apply'd to all, viz. that Order which proceeds from the *Proflambasmenos* of the *Systema Immutatum*, or the A of the modern System. *Prosemy* argues, that if this be all, they may be infinite, tho' they must be limited for Use and Practice. But, indeed, much the greater part define them by the Species *Diapason*; and therefore only make seven *Modes*; but as to their Use, we are left intirely in the dark.

If the *Modes* be something but the seven Species of Octaves, the Use of 'em can only be, that the *Proflambasmenos* of any *Mode* being made the principal Note of any Song, there may be different Species of Melody answering to those different Constitutions. But then we are not to conceive that the *Proflambasmenos*, or Fundamental of any *Mode* is fixed to any particular Chord of the System, e. g. the Phrygian to g; so that we must always begin there, when we would have a piece of Melody of that Species. When we say in general, that such a *Mode* begins in g, it is no more than to signify the Species of Octave as g, they appear in a certain fix'd System; but we may begin in any Chord of the System, and make it the *Prosemy* of any *Mode*, by

by adding new Chords, or altering the tuning of the old. If this were the true nature, and use of the Tones, most of these *Modes* must be imperfect, and incapable of good Melody, as wanting some of those which we reckon the essential and natural Notes of a true *Mode*. Again, if the essential difference of the *Modes* consist only in the Gravity or Acuteness of the whole Octave, then we may suppose one Species or conscious Division of the Octave, which being apply'd to all the Chords of the System, makes them true Fundamentals for a certain Series of successive Notes, by changing, as above, the Tone of certain Chords in some case, or by adding new Chords to the System. But that must have been a simple kind of Melody, produced by admitting only one conscious Series, and that too wanting some useful and necessary Chords.

Musick was considerably improved in the XIII Century, by Guido *Arezzino*; who, among other Innovations, reformed the Doctrine of *Modes*. It is true, they were first defined by the Species of the Octave, in *Ptolemy's* manner, and their number was fix'd to seven; but afterwards taking occasion to consider the Harmonical and Arithmetical Divisions of the Octave, whereby it resolves into a 4th above a 5th, or a 5th above a 4th, they hence constituted 12 *Modes*, making of each Octave two different *Modes*, according to this different Division; but because there are two of them that cannot be divided both ways, there are but 12 *Modes*. Of these, such as were divided harmonically, that is, with the 5th lowest (which were fix'd) were call'd *Authentic*; and the other six which had the 5th highest, were call'd *Plagal Modes*. See the Scheme annex'd.

To these *Modes*, they gave the Names of the ancient Greek Tones, as *Dorian*, *Phrygian*, *Lydian*: But the several Authors differ in the Application and Order of these Names. So that we are still in great measure at a loss what they meant by those distinctions, and what their real use was. The best Account we can give is this; They consider'd that an Octave which wants a 4th or 5th, is imperfect; & being between the Concoords next to Octave, the Song ought to touch those Chords most frequently and remarkably; and because their Concord is different, which makes the Melody different, they established by this two *Modes* in every natural Octave that had a true 4th and 5th: Then, if the Song was carried as far as this Octave above, it was call'd a *perfect Mode*; if less, as to the 4th or 5th, it was imperfect; if it moved both above and below, it was call'd a *mix'd Mode*. Thus it is some Authors speak about these *Modes*. Others, considering how indispensable a Chord the 5th is in every *Mode*, they took for the Final, or Key-Note in the Arithmetically divided Octaves, not the lowest Chord of that Octave, but that very 4th. The only difference then in this Method between the *Authentic* and *Plagal Modes* is, that the *Authentic* goes above its Final to the Octave; the other ascends a 5th, and descends a 4th; which will indeed be attended with different Effects, but the *Mode* is essentially the same, having the same Final to which all the Notes refer. We see now to consider wherein the *Modes* of one Species, as *Authentic*, or *Plagal*, differ among themselves. This must either be by standing higher or lower in the Scale, i. e. by the different Tension of the whole Octave, or rather by the different Subdivision of the Octave into its conscious Degrees; there can be no other. We are to consider then, whether these Differences are sufficient to produce such very different Effects as are ascribed to the several *Modes*; for instance, that the one produces Mirth, another Sadness, a third is proper for Religion, a fourth for Love, &c. That these Effects are owing merely to the Constitution of the Octave, scarce any body will affirm. The differences in the Constitution will, indeed, have some influence, but it will be so little, as that by the various Combinations of other Causes, one of these *Modes* may be used to different purposes. The greatest difference is that of those Octaves which have the 5th, or 5d ♯, making what on other occasions we call the *Sharp* and *Flat Key*.

However, if the *Modes* depend upon the Species of Octaves, how can they be more than seven? And as to the distinction between *Authentic* and *Plagal*, we have already observed, that it is imaginary with respect to any essential Difference constituted thereby in the Kind of the Melody; for the carrying the Song above or below the Final, may have different Effects, yet this is to be ascribed to other Causes besides the Constitution of the Octaves. It is particularly observable, that those Authors who give us Examples in actual Composition of their twelve *Modes*, frequently take in the Artificial Notes ♯ and ♭, to perfect the Melody of their Key; and by this means depart from the Constitution of the Octave, as it stands fix'd in

the natural System. There is nothing certain or consistent therefore in their way of speaking; but the *Modes* are all really reducible to two, viz. the Sharp and Flat; the other differences respecting only the Place of the Scale where the Fundamental is taken.

The ancient *Modes*, besides their general Division into *Authentic* and *Plagal*, had also their respective Names from the several Greek Provinces where they are supposed to have been invented. Originally, indeed, there were but three, viz. *Doric*, *Lydian*, and *Phrygian*; which were particularly call'd *Tones*, because at a *Tone's* distance from one another. The rest were added afterwards, and were some of them named from the relations they bore to the former, particularly the *Hypo-Doric*, as being below the *Doric*.

The *Doric Mode* was a mixture of Gravity and Mirth, invented by *Thamus* of *Thrace*. See *Doric*.

The *Phrygian Mode* was adapted to the kindling of Rage; invented by *Marytas* the *Phrygian*. See *Phrygian*.

The *Lydian Mode* was proper for Funeral Songs; invented, according to *Pliny*, by *Asopius*. See *Lydian*.

The *Myxolidian* was invented by *Sappho*. The *Aeolic*, *Ionic*, and *Hypo-Doric* were invented by *Phileteus*.

The *Hypo-Lydian* by *Polymnesticus*. Besides these *Modes* of *Tone*, old Authors have also introduced *Modes* of *Time*, or *Measures* of *Notes*.

These at first were distinguished into *Greater* and *Less*, and each of these again into *Perfect* and *Imperfect*. But afterwards they reduced all into four *Modes*, which included the whole Business of *Times*. As those *Modes* are now disused, they are hardly worth the reciting.

The common *Mode* now in use, is much more Simple and Natural than any of those; the Proportion, which in theirs varied, being in ours fix'd, viz. 2 : 1. A Large equal to two Long; 3 a Long to two Breves; 3 a Breve to two Semi-breves, &c. proceeding in the same Proportion to the last or lowest Notes. And if on some Occasions the Proportion of 3 : 1 betwixt two successive Notes is required, it is easily express'd by annexing a Point (·). See *Time*, *Note*, &c.

The Antients had likewise their *Modi Melopoeiae*, of which *Aristides* names these, *Dithyrambic*, *Comic*, and *Tragic*, call'd *Modes* from their expressing the several Motions and Affections of the Mind. See *Melopoeia*.

**MODEL**, an Original, or Pattern propos'd for any one to copy or imitate.

St. Paul's Church is said to be built on the *Model* of St. Peter's at Rome.

**MODEL** is particularly us'd in Building for an Artificial Pattern, made of Wood, Stone, Plaster, or other Matter, with all its Parts and Proportions; in order for the better Conducting and Executing of some great Work, and to give an Idea of the Effect it will have in Large.

In all large Buildings, it is much the surest way to make a *Model* in *Relievo*; and not to trust to a bare Design, or Draught. See *DESIGN*.

There are also *Models* for the Building of Ships, &c. for extraordinary Stair-Cases, &c.

**MODEL**, in Painting and Sculpture, is any thing propos'd to be imitated.

Hence in the Academies they give the Term *Model* to a naked Man, dispos'd in several Postures, to give an Opportunity for the Scholars to design him in various Views and Attitudes.

The Sculptors have little *Models* of Clay or Wax to assist them in their Designs of others that are larger in Marble, &c. and to judge of the Attitude and Correctness of a Figure. See *FIGURE*.

The Sculptors likewise give the Name *Model* to certain Figures of Clay or Wax, which are but just fashion'd, to serve by way of Guide for the making of larger, whether of Marble, or other Matter. See *STATUE*.

**MODERATOR**, in the Schools, the Person who presides at a Dispute, or at a public Assembly. See *PRESIDENT*.

Such a Doctor was the *Moderator*, the President at such a Disputation; in such an Assembly, &c.

**MODERN**, something new, or of our Time; in opposition to any thing Antique, or Antient.

**MODERN Authors**, according to *Nancla*, are all those that have wrote since Boetius. The *Modern Philosophy* commences with *Galileus*. The *Modern Astronomy* with *Copernicus*. See *PHILOSOPHY* and *ASTRONOMY*.

**MODERN Medals** are all those that have been struck within these 300 Years. See *MEDAL*.

**MODERN** in Architecture, is improperly apply'd to the present, or Italian Manner of Building; as being according to the Rules of the *Antique*. See *ANTIQUE*. Nor is the Term less abused, when attributed to Architecture purely Gothic. See *GOTHIC*.

*Modern Architecture*, in strictness, is only applicable to that which partakes partly of the *Antique*, retaining some-

What of its Delicacy and Solidity; and partly of the Gothic, whence it borrows Members and Ornaments, without Proportion or Judgment. See ARCHITECTURE.

MODIFICATION, or MODI; in Philosophy, that which modifies a thing; that is, gives it this or that manner of Being. See MODI.

Quantity and Quality are Accidents that make the Modifications of all Bodies. See QUANTITY and QUALITY.

According to Spinoza's System, all the Beings that compose the Universe, are only so many different Modifications of one and the same Substance. 'Tis the different Arrangement and Situation of their Parts, that make all the difference between them. See SPINOZISM.

MODIFICATIVE, something that modifies, or gives a thing a certain Manner of being.

Father Buffier establishes a new Part of Speech, which he calls *Modificative*. Nouns, and Verbs, he observes, are susceptible of divers Circumstances or Modifications: In the Phrase *Zest aiti*, we have a Noun and Verb without any Modification; but in that, *Zest without Discretion aiti ravalis*, the Noun and the Verb are each attended with a Modification or Circumstance.

This last Kind of Words, which serve to modify Nouns and Verbs, since it has no general Name in the common Grammars, he chuses to call *Modificatives*. It includes what Grammarians commonly call *Adverbs, Conjunctions, and Prepositions*. See CONJUNCTIONS, PREPOSITIONS, &c.

MODILLIONS, in Architecture, Ornaments in the Cornish of the Ionic, Corinthian, and Composite Columns. See CORNISH.

The *Modillions* are little Consoles or Brackets under the Soffit of the Cornish, seeming to support the Lamicr, tho' in reality they are no more than Ornaments. See CONSOLE.

They ought always to be placed over the middle of the Column. They are particularly affected in the Corinthian Order, where they are usually enrich'd with Sculpture.

The *Modillon* is usually in form of an S inverted, and fixed to the Soffit of the Cornish. See CORNISH.

The Proportions of *Modillions* must be so adjusted, as to produce a Regularity in the Parts of the Soffits.

The *Inter-Modillions*, i. e. the Distances between them, depend on the Inter-Columns, which oblige the *Modillions* to be made of a certain Length and Breadth, in order to make the Intervals perfect Squares, which are always found to have better effect than Parallelograms. To this it must be added, that in adjusting the *Modillions*, Care should be taken that they have such a Proportion, as that when the Orders are placed over one another, there be the same Number in the upper Order as in the lower, and that they fall perpendicularly over each other.

*Modillions* are also used under the Cornishes of Pediments; tho' Vitruvius observes that they were not allow'd of in his time, in regard *Modillions* were intended to represent the Ends of Rafters, which could not be suppos'd to be used in a Pediment. See PEDIMENT.

Some will have the *Modillions* of a Pediment to represent Furlins; and those at the Eaves to represent Rafters. Daviler rather takes them for a kind of inverted Consoles or Corbels.

The *Modillon* is sometimes also call'd *Mutule*, the Use has introduc'd a little difference between the Idea of a *Modillon* and a *Mutule*; the *Mutule* being peculiar to the Doric Order; and the *Modillions* to the higher Orders. See MUTULE.

The Word comes from the *Italian Modigliane*, a little Measure.

MODIOLUS, a Chirurgion's Instrument, the same with *Aspersion* and *Trepandum*. See TREPANDUM.

MODIUS, in Antiquity, a Kind of Bushel, or Measure in Use among the Romans for several Sorts of Grain. See MEASURE.

It contain'd about nine *English Quarts*.

MODUS & FORMA, in Law, a Phrase used in Processes and Pleadings, whereby the Defendant absolutely denies the thing charg'd on him by the Plaintiff, *Modo & Forma declarata*.

The Civilians in the like sense say, *Negus allegata prout allegatur, esse vera*.

MODULATION, in Music, is the Art of keeping in, or changing the Mode or Key. See MODI.

Under this Term is comprehended the regular Progression of the several Parts thro' the Sounds that are in the Harmony of any particular Key, as well as the proceeding naturally and regularly from one Key to another.

The Rules of *Modulation* in the first sense belong to Harmony and Melody. See HARMONY and MELODY.

We shall here only add a word with regard to the Rules of *Modulation* in the latter sense.

As every Piece must have a principal Key; and since the Variety so necessary in Music to please and entertain, forbids the being confined to one Key; and that therefore it is not only allowable, but necessary, to modulate into,

and make Cadences on several other Keys, having a Relation and Connection with the principal Key: It must be consider'd what it is that constitutes a Connection between the Harmony of one Key and that of another, that it may be hence determin'd into what Keys the Harmony may be conducted with Propriety. See KEY.

As to the Manner in which the *Modulation* from one Key to another is to be perform'd, so that the Transition may be easy and natural; 'tis not easy to fix any precise Rules: for tho' it is chiefly perform'd by the help of the 7th g of the Key, into which the Harmony is to be changed, whether it be flat or sharp; yet the Manner of doing it is so various and extensive, as no Rules can easily circumscribe. A general Notion of it may be conceiv'd under the following Terms.

The 7th g in either sharp or flat Key, is the 3d g to the 5th f of the Key, by which the Cadence in the Key is chiefly perform'd; and by being only a Semi-tone under the Key, is thereby the most proper Note to lead into it, which it does in the most natural manner imaginable. Inasmuch that the 7th g is never heard in any of the Parts, but the Ear expects the Key should succeed it; for whether it be used as a 3d, or as a 5th, it always affects us with so imperfect a Sensation, that we naturally expect something more perfect to follow, which cannot be express'd and smoothly accomplish'd, than by the small Interval of a Semi-tone, to pass into the perfect Harmony of the Key. Hence it is, that the Transition into one Key is best effected, by introducing its 7th g, which so naturally leads to it.

MODULE, in Architecture, a certain Measure, or Measure taken at pleasure, for regulating the Proportions of Columns, and the Symmetry or Distribution of the whole Building. See COLUMN.

Architects usually chuse the Semi-diameter of the bottom of the Column for their *Module*; and this they subdivide into Parts, or Minutes.

*Vignola* divides his *Module*, which is a Semi-diameter, into twelve Parts in the Tuscan and Doric, and into eighteen for the other Orders.

The *Module* of *Palladio*, *Scamozzi*, *M. Cambray*, *Desgoulers*, *Le Clerc*, &c. which is also equal to the Semi-diameter, is divided into thirty Parts or Minutes in all the Orders. See MINUTE.

Some divide the whole height of the Column into 20 Parts for the Doric, 24 for the Ionic, 25 for the Roman, &c. and one of these Parts they make a *Module*, to regulate the rest of the Building by.

There are two Ways of determining the Measures, or Proportions of Buildings; the first by a fix'd Standard Measure, which is usually the Diameter of the lower part of the Column, call'd a *Module*, subdivided into 50th Parts, call'd *Minutes*. In the second, there are no Minutes, nor any certain and stated Division of the *Module*; but it is divided occasionally into as many Parts as are judg'd necessary. Thus, the height of the Attic Base, which is half the *Module*, is divided either into three, to have the height of the Plinth; or into four, for that of the greater Torus; or into six, for that of the lesser. Both these Manners have been practis'd by the ancient, as well as the modern Architects: But the second, which was that chiefly used among the Antients, is in my Opinion preferable. *Ferrault*.

As *Vitruius*, in the Doric Order, has lessen'd his *Module*, which in the other Orders is the Diameter of the lower part of the Column; and has reduc'd that great *Module* to a mean one, which is the Semi-diameter: I here reduce the *Module* to a third part for the same reason, viz. to determine the several Measures without a Fraction. For in the Doric Order, beside that the height of the Base, as in the other Orders, is determin'd by one of these mean *Modules*; the same *Module* gives likewise the heights of the Capital, Architrave, Triglyphs, and Metopes. But our little *Module*, taken from the third of the Diameter of the lower part of the Column, has Uses much more extensive; for, by this the heights of Pedestals, of Columns, and Entablatures, in all the Orders, are determin'd without a Fraction.

As then the great *Module*, or Diameter of the Column, has 60 Minutes; and the mean *Module*, or half the Diameter, 30 Minutes; our little *Module* has 20. *Id.*

MODUS Decimandi, is when Land, a Sum of Money, or a yearly Pension, belongs to the Parson, either by Composition or Custom, in Satisfaction for Tithes in Kind.

MOHAIR, MOVAIRE, or MOIRS, a kind of Stuff, ordinarily of Silk, both West and Warp; having its Grain very close.

There are two kinds of *Mohairs*, the one smooth and plain; the other water'd like *Tabbys*: The Difference between the two only consists in this, that the latter is calander'd, the other not.

There are also *Mohairs* both plain, and water'd, the Wool whereof is Woolen, Cotton, or Thread.

MOIDORE, MOXBORE, or MOXDA, a Gold Coin, struck and current in *Portugal*. See COIN.

The *Misere* is properly their *Pistole*; and is equivalent to two *Millie-Rees*. See *PISTOLE*, &c.

There are also *Doppie-Misere*, or double *Pistoles*, and *Demi-Pistoles*.

**MOIETY**, a French Word, *Moitie*; signifying the *half* of any thing.

**MOINEAU**, in Fortification, is a flat Bastion raised in the middle of a Curtain when it is too long, and the Bastions of the Angles too remote to be able to defend one another. See *BASTION*.

Here *Musquetiers* are placed, to fire each way.

**MOLA**, in Medicine, see *MOLLE*.

The Word is *Latin*, and literally signifies a *Mill-stone*.

**MOLA**, in Anatomy, a Bone of the Knee, call'd also *Patella*, *Retiole*, &c. See *PATELLA*.

**MOLARES**, in Anatomy, the *Grinders*, an Epithet given to the large Teeth; as serving, like *Mill-stones*, to grind the Food. See *TEETH*.

The Number of *Molares* is not always the same. Some Persons have twenty; and others only sixteen, viz. four, or five on each side of either Jaw. They are very large, hard, and strong; being fastned into their *Alveoli* or Sockets by several Roots.

**MOLASSES**, *MOLASSES*, or *MELASSES*, that gross, yet fluid Matter, remaining of Sugar, after refining, and which no boiling will bring to a consistence more solid than that of Syrup; hence also call'd *Syrup of Sugar*. See *SUGAR* and *REFINING*.

Properly, *Molasses* are only the Sediment of one kind of Sugar call'd *Chyvre*, or brown Sugar, which is the Refuse of other Sugars not to be whiten'd, or reduced into Loaves.

*Molasses* are much used in *Holland* among poor People, for the Preparation of Tobacco, and instead of Sugar.

There is also a kind of Brandy, or Spirit made of it; but exceedingly unwholesome, and therefore much disapproved. See *BRANDY*.

**MOLE**, *MOLA*, or *MOLA Carnis*, in Medicine, a misshapen Mass of hard Flesh, sometimes generated in the Wombs of Women, instead of a *Fetus*; call'd also a *false Conception*.

The *Mole* is the Chans of an Embryo; and would have grown to an Infant, had not the Process of Conception been disturbed. Tho' it be without regular Bones, Viscera, &c. yet the Lineaments frequently are not in far effaced, but that there are some Remains of a Child; sometimes a Hand, and sometimes a Foot, have been spied; but commonly the *Secundines*.

It is rare that more than one *Mole* is excluded; though *Sennerius* observes that there are Instances of two, three, or even more. He adds, that tho' they usually come alone, yet they have been known to come with a *Fetus*, sometimes before it, and sometimes after it. See *CONCEPTION*.

The *Mole* is distinguished from an Embryo, in that it has no Placenta whereby to receive its Nourishment from the Mother. Instead of that, it grows immediately to the Womb; and is nourish'd thence. It has a kind of Vegetative Life, and continues growing in bulk till the time of exclusion. Sometimes it has been born in the Womb for two or three Years.

This Production is supposed to arise from some Defect or Indisposition of the Ovary, or Egg; or, perhaps, from the Male Seed's wanting force to penetrate it sufficiently in order to open, and expand the Parts. Or the Effect may be accounted for, by supposing an Ovary to drop into the Womb, without being impregnated by the Seed of the Male: In all which cases, the Egg continuing to grow, and yet wanting something necessary to organize and form it into an Embryo, becomes a shapeless Lump. See *EMBRYO*.

Authors are divided whether or no the Women ever bring forth *Moles* without any intercourse with Men. Some say there are *Moles* which derive their Origin from the Menstruous Blood detain'd, coagulated, and harden'd; through which the Blood and Spirits have made themselves Passages, &c. See *MENSES*.

The *Mole* is distinguished from a true Conception, by its tremulous palpitating Motion; by its rolling from side to side; and by the Belly's swelling equally every way. Tho' the Breasts swell as in case of a just Embryo; but the Humour generated therein is not true Milk, but a crude Matter, form'd of the suppressed Menes.

To bring the *Mole* out of the Womb, Bleeding and violent Purgings are used, and at last strong Emmenagogues. If these fail, recourse is to be had to manual Operation.

The *Latins* give it the Name *Mola*, which literally signifies *Mill-stone*, from its resemblance thereto in Form and Hardness.

**MOLE**, *Moler*, a Peer, or Massive Work of Masonry, consisting of large Stones thrown into the Sea, in manner of a Bank, with design to shut up a Port, and defend the

Vessels in it from the Impetuosity of the Waves, and to prevent the Passage of any Vessel without leave. Thus we say the *Mole* of the Harbour of *Messina*. See *PILL*.

The Word *Mole* is sometimes also used to signify the Harbour itself. See *HARBOUR*.

Among the *Romans*, *Mole*, *Moles*, was also used for a kind of Manufactory built in manner of a Round Tower on a square Base, insulate, incampal'd with Columns, and cover'd with a Dome. See *MAUSOLEUM*.

The *Mole* of the Emperor *Adrian*, now the Castle of St. Angelo, was the greatest, and most stately of all the *Moles*. It was crown'd with a Brazen Pine-Apple, wherein was a golden Urn containing the Ashes of the Emperor.

**MOLECULE**, *MOLECULA*, in Physics, a little Mass, or part of any thing. See *MASS*, &c.

Thus we say the Air, by Respiration, insinuating itself into the Veins and Arteries, endeavours by its elastic Power to divide and break the *Molecules* of the Blood, which on their side resist such division.

**MOLINE**, in Heraldry. A *Cross-MOLINE* is that which turns round both ways at all its Extremities, tho' not so wide or sharp as that said to be *Anchor'd*. See *CROSS*.

In *Upton*, the Points are all cut off, which makes it very different from the *Cross Anchor'd*. See *FER de MOULIN*.

**MOLINISTS**, a Sect among the *Romanists*, who follow the Doctrine and Sentiments of the Jesuit *Malina*, relating to sufficient and efficacious Grace. See *GRACE*, &c.

Their great Antagonists are the *Jansenists*. See *JANSENISTS*.

**MOLINOSISTS**, a Sect among the *Romanists*, who adhere to the Doctrine of *Molina*.

They are likewise call'd *Quietists*. See *QUIETISTS*.

**MOLMUTIN**, or *MOLMUTIAN LAW*, the Laws of *Dumalis Molmutius*, XVIII King of the Britons, who began his Reign 440 Years before the Incarnation. See *LAW*.

He was the first who published any Laws in this Land; and they continued famous therein till the time of *William the Conqueror*.

**MOLLOSSUS**, in the *Greek* and *Latin* Poetry, the Name of a Foot consisting of three long Syllables: As *Ander*, *cantabans*, *Virtutum*. See *FOOT*.

It takes its Name either from a Dance in use among the People call'd *Moloss*, or *Epirotes*; or from the Temple of *Jupiter Molossus*, where Odes were sung, in which this Foot had a Share; or because the March of the *Moloss* when they went to the Combat, was composed of this Foot, or had their Cadence.

**MOLTA**, or *MOLYORA*, a Duty, or Toll paid by Vassals to the Lord for grinding their Corn at his Mill.

**MOLTING**, or *MOLTING*, the falling off or change of Hair, Feathers, Skin, Horns, Voice, and other Dispositions of the Body of Animals, happening in some, annually, in others at certain Stages of their Life.

The generality of Beasts *Molt* in the Spring.

The *Molting* of a Deer is the quitting of his Horns in February or March; the *Molting* of a Serpent is the putting off his Skin. See *EXUVIÆ*.

**MOMENT**, in Time, is the most minute, and insensible Division of Time; or what we otherwise call an *Instant*. See *TIME*.

**MOMENTS**, in the new Doctrine of Infinites, are the infinite small Parts of Quantity. See *INFINITÆ*.

*Moments* are the same with what we otherwise call *Infinitesimals*, *Differentialis*, and *Fluxions*; being the *Momentary* Increments, or Decrements of Quantity consider'd as in a continual Flux. See *DIFFERENTIALIS* and *FLUXION*.

*Moments* are the generative Principles of Magnitude: They have no determined Magnitude of their own; but are only inceptive thereof. See *INCEPTIVE*.

Hence, as it is the same thing in lieu of these *Moments*, the Velocities of their Increases and Decreases be made use of, or the finite Quantities proportionable to such Velocities; the Method of Proceeding which considers the Motions, Changes, or Fluxions of Quantities, is denominated by Sir *I. Newton* the Method of *Fluxions*. See *FLUXIONS*.

*Leibnitz*, and most of the Foreigners, considering these infinitely small parts or *Infinitesimals* as the differences of two Quantities; and thereby endeavouring to find the differences of Quantities, i.e. some *Moment* or Quantity infinitely small, which being taken an infinite Number of Times, shall equal a given Quantity, call these *Moments Differentialis*; and the Method of Proceedure, the *Differentialis Calculus*. See *CALCULUS Differentialis*.

**MOMENT**, in Mechanics, is the same with *Impetus*, or Quantity of Motion in any moving Body; and sometimes it is used simply for the Motion itself. See *IMPETUS*.

*Moment* is frequently defined by the *Vis insita*, or the Power by which moving Bodies continually change Place. See *VIS*.

In comparing the Motions of Bodies, the Ratio of their *Moments* is always compounded of the Quantity of Matter, and the Celerity of the moving Body; so that the *Moment* of any such Body may be consider'd as a Rectangle under the Quantity of Matter, and the Celerity. And since it is certain that all equal Rectangles have their sides reciprocally proportionable; therefore if the *Moments* of any moving Bodies are equal, the Quantity of Matter in one to that of the other will be reciprocally as the Celerity of the latter to the Celerity of the former; and, on the contrary, if the Quantities of Matter are reciprocally proportionable to the Celerities, the *Moments*, or Quantities in each, will be equal.

The *Moment* also of any moving Body may be consider'd as the Aggregate or Sum of all the *Moments* of the Parts of that Body; and therefore where the Magnitudes and Number of Particles are the same, and where they are moved with the same Celerity, there will be the same *Moments* of the Wholes. See MOTION.

MONARCHY, a large State govern'd by one; or a State where the Supreme Power is lodged in the hands of a single Person. See GOVERNMENT.

The most ancient *Monarchy* was that of the *Assyrians*, which was founded soon after the Deluge.

We usually reckon four Grand or Universal *Monarchies*, the *Assyrian*, *Persian*, *Grecian*, and *Roman*. But St. Augustine makes them but two, viz. those of *Babylon* and *Rome*. There is no necessity to make the *Medic*, *Persian* and *Greek* succeed to the whole Power of the *Assyrians*, to multiply the number of the *Monarchies*. It was the same Empire still, and the several Changes that happen'd in it, did not constitute different *Monarchies*. Thus the *Roman* Empire was successively govern'd by Princes of different Nations, yet without any new *Monarchy* being formed thereby. *Rome* therefore may be said to have immediately succeeded *Babylon* in the Empire of the World. See EMPIRE.

Of *Monarchies* some are Absolute and Despotick, where the Will of the Monarch is uncontrollable; as *France*, &c. others limited, where the Prince's Authority is restrained by Laws, and part of the supreme Power lodged in other hands; as in *England*. Some again are Hereditary, where Succession devolves immediately from Father to Son; and others Eleotive, where, on the Death of the *Monarch*, his Successor is appointed by Election, as *Poland*.

The Word comes from the *Greek* μοναρχος, one who governs alone; form'd of μονο *solus*, and αρχο *Imperium*, Government.

According to *Hobbes*, *Monarchy*, as well as Aristocracy, derives all its Authority from the People, who transfer all their Right, viz. the supreme Power, by a Plurality of Suffrages, &c. to some one Person call'd a *Monarch*; so that whatever the People could have done before this Translation, may be now rightfully done by him, to whom the Translation is made. This done, the People are no longer to be look'd on as a Person, but a dissolv'd Multitude; in regard they were only one by virtue of the supreme Power, which they have now transferred to another.

Nor can the *Monarch*, says he, oblige himself by any Covenants to any Person, for the Authority he has received; in regard he receives the Power from the People, which, as soon as that is done, ceases to be a Person; and the Person ceasing, the Obligation to the Person ceases of course. The People therefore are oblig'd to pay Obedience to the *Monarch*, by virtue of those Covenants, whereby they mutually oblige themselves to what the People, as a Person, injoins to be done.

He argues further, that as a *Monarch* cannot be oblig'd by any Covenants; so neither can he do any injury to his Subjects: an injury being nothing else but a Breach of Covenant; and where there is no Covenant, there can be no Breach. De Civ. cap. 8.

MONASTERY, a Convent, or House built for the Reception of Religious, whether it be *Abbey*, *Prory*, *Nunnery*, or the like. See ABBEY, PRIORY, &c.

*Monastery* is in a more immediate sense apply'd to the Houses of Mendicant Friars, and Nuns. The rest are more properly call'd *Convents*. See CONVENT.

MONASTIC, something belonging to the *Monks*, or the *Monach's* Life. See MONK.

The *Monastic* Profession is a kind of civil Death, which has the same Effects with the natural Death. The Council of Trent, &c. fix sixteen Years for the Age at which a Person may be admitted into the *Monastical* Life.

St. Antony is the Person who in the fourth Century first instituted the *Monastical* Life; as St. Pascoe, in the same Century, is said to have first set on foot the *Cœnobic* Life, i. e. Regular Communities of Religious. See COENOBITE.

In a short time, the Deserts of *Egypt* became inhabited with a Set of Solitaries, who took upon them the *Monastical*

Profession. See SOLITARY. St. Basil carry'd the *Monach's* Humour into the *East*, where he compos'd a Rule, which afterwards obtain'd thro' a great part of the *West*. In the eleventh Century, the *Monastical* Discipline was grown very remiss. St. Odo first began to retrieve it in the *Monastery* of *Cluny*.

This *Monastery*, by the Conditions of its Erection, was put under the immediate Protection of the Holy See; with a Prohibition to all Powers, both Secular and Ecclesiastical, to disturb the Monks in the Possession of their Effects, or the Election of their Abbot. In virtue hereof, they pleas'd an Exemption from the Jurisdiction of the Bishop; and extended this Privilege to all the Houses dependent on *Cluny*. This made the first Congregation of several Houses under one Chief immediately subject to the Pope, so as to constitute one Body, or, as they now call it, one *Religious* Order. Till then, each *Monastery* was independent of other, and subject to the Bishop. See ORDER, ABBOT, RELIGIOUS, &c.

MONETAGIUM, MONETAGE, was entirely the Right, or Privilege of Coining Money. See MINT, COINING, &c.

MONK, was entirely a Person who retir'd from the World, to give himself up wholly to God, and to live in Solitude, and Abstinence. See RELIGIOUS.

Such were the *Hermites* and *Anchoretites*, who withdrew into Deserts, and lived remote from all Commerce of Mankind. See HERMITE and ANCHORITE.

The Word is deriv'd from the *Latin* Monachus, and that from the *Greek* μοναχος, which signifies alone; by reason the ancient *Monks* liv'd in Solitude, as the true *Monks* still do.

Some Writers, as Father *Helyot*, *Dissert. Prelim.* trace the Original of *Monks* up as early as the time of the *Therapeute*, and maintain that there had been an uninterrupted Succession of *Monks* from the *Therapeute* to St. Antony. Others, on the contrary, are contented with going back as far as St. Paul, the first Hermit. See THERAPEUTE.

The *Monks*, at least the ancient ones, were distinguish'd into *Solitary* and *Cœnobites*.

The *Solitary* are those who live alone, in Places remote from all Towns, or Habitations of Men, as do still some of the *Hermites*. See SOLITARY.

The *Cœnobites* are those who live in Community with several others in the same House, and under the same Superior. See COENOBITE.

Those Houses again were of two kinds, viz. *Monasteries* and *Lauri*. See MONASTERY and LAURUS.

Those we call *Monks* now-a-days, are *Cœnobites*, who live together in a Convent or *Monastery*, who make Vows of living according to a certain Rule establish'd by the Founder, and wear a Habit which distinguishes their Order.

Those that are endow'd, or have a fix'd Revenue, are properly call'd *Monks*, as the *Chartreux*, *Benedictines*, *Bernardines*, &c. The *Mendicants*, or those that beg, as the *Carthusians*, and *Franciscans*, are properly call'd *Religious*, tho' the Names are frequently confounded. See RELIGIOUS.

The first *Monks* were those of St. Antony's; of St. Basil, call'd in the *East* *Calogers*, from καλός γέρων, Good old Man; and those of St. Jerome; the *Hermites* of St. Augustine, and afterwards those of St. Benedict and St. Bernard; at length came those of St. Francis, St. Dominic, with a Legion of others; which see under their proper Heads. BENEDICTINES, &c.

*Monks* are distinguish'd by the Colour of their Habits into *Black*, *White*, *Grey*, &c.

Among the *Monks*, some are call'd *Monks* of the *Choir*, others *Professed Monks*, and others *Lay Monks*; which last are destin'd for the Service of the Convent, and have neither Clericature nor Literature. See LAY.

*Cloister'd Monks*, are those who actually reside in the House, in opposition to *Extra-Monks*, who have Benefices depending on the *Monastery*. They are distinguish'd further into *Reform'd*, whom the Civil and Ecclesiastical Authority have made Masters of ancient Convents, and put it in their power to retrieve the ancient Discipline, which had been relax'd; and *Antient*, who enter the Convent, to live in it according to its Establishment at the time when they make their Vows, without obliging themselves to any new Reform.

Antiently, the *Monks* were all Laymen, and were only distinguish'd from the rest by a particular Habit, and an extraordinary Devotion. Not only the *Monks* were prohibited the Priesthood; but even Priests were expressly prohibited from becoming *Monks*, as appears from the Letters of St. Gregory. Pope *Syriscus* was the first who call'd them to the Clericature, on occasion of some great Scarcity of Priests, that the Church was then suppos'd to labour under. And since that time, the Priesthood has been usually united to the *Monastical* Profession. See FATHER, &c.

MONKS *Rubard*, see RUBARD.

MONKS *Seam*, among Sailors, is, when the Selves ges of Sails are laid a little over one another, and sewed on both sides.

MONETARIUS, a Name Antiquaries and Medalists give to those who struck the ancient Coins, or Monies.

All the old *Roman*, &c. Coins, have the Name of the *Monetarius*, either written at length, or at least the initial Letters of it.

MONEY, or *Monny*, *Moneta*, a Piece of Metal mark'd for Coin, with the Arms of a Prince, or State, who make it circulate or pass, at a common rate, for things of different Value; to facilitate the Business of Commerce. See COMMERCE.

*Pandus* the Lawyer, defines *Money* a thing stamp'd with a public Coin, and deriving its Use and Value from its Impression rather than its Substance. *ff. de Contr. Emp.*

Monf. *Lezard* defines it a piece of Matter to which public Authority has affixed a certain Value and Weight to serve as a Medium in Commerce.

The *Art* of the Invention of *Money* is not easy to be settled. There is no room to doubt but that in the earliest Ages, the ordinary way of Traffic among Men was by trucking or exchanging Commodity for Commodity. Thus in *Homer*, *Glauca's* golden Armour was valued at one hundred Cows; and *Dumedeus's* Armour at ten. See EXCHANGE.

But in course of time, it was found necessary in the way of commutative Justice, to have some common Measure or Standard, according to which all other things should be estimated. This, as the *Jews* gather from *Josephus*, was first invented by *Cou*: The first tidings we hear of it, is in the time of *Abraham*, who paid 400 Shekels for a Burying-Place.

The *Greeks* refer the Invention of *Money* to *Hermiodus*, Wife of King *Midas*: And the *Latins* to *Janus*.

This being a common Measure for reducing Wares to a Balance, it was call'd by the *Greeks* *Nomisma*; not from King *Namus*, but from *Namus*, as being established by Law. By the *Latins* it was call'd *Pecunia*; either because the Wealth of those Days consisted in their Cattel; or, as *Pliny* will have it, because their first Coin was stamp'd with the Figure of a Cow. They also call'd it *Moneta*, & *monetas*, as *Sandus* observes, because when the *Romans* were at a want of *Money*, *Juno* admonish'd them to use Justice, and there should be no want of *Money*. The Effect whereof when they had found, she was sur-named *Juno Moneta*, and *Money* was coin'd in her Temple. In process of time, *Money* herself was made a Goddess, and inscribed by the Name of *Dea Pecunia*, in the Figure of a Woman holding a Balance in one hand, and a *Cornucopia* in the other.

On the first *Money* now stands, it may be divided into *Real*, or *Effective*; and *Imaginary*, or *Money of Account*.

Under *Real Money* come all Coins or Species, of Gold, Silver, Copper, &c. which have course in Commerce, and do really exist: Such as *Guineas*, *Crowns*, *Pistoles*, *Louis's*, *Pieces of Eight*, *Ducats*, &c. Which see under their proper heads; as also under *Coin*.

*Imaginary Money*, or *Money of Account*, is that which has never exist'd, or at least which does not exist in real Species, but has been invented and retained to facilitate the Strating of Accounts, by keeping them still on a fixed footing, not to be changed like current Coins, which the Authority of the Sovereign raises or lowers according to the Exigencies of State. Of this kind are *Pounds*, *Livres*, *Maravedies*, &c.

This *Money of Account*, *M. Biffart* observes, is a Sum of *Money*, or a certain number of Species which may change in Substance and Quantity, but never in Quality. Thus fifty Pounds consist of fifty Pieces call'd Pounds, which are not real, but may be paid in several real Species, as in *Guineas*, *Crowns*, *Shillings*, &c. which are changeable, as *Guineas*, &c. which are sometimes higher, sometimes lower.

*Real Money*, as the *Civilians* observe, has three essential Qualities, *viz.* Matter, Form, and Weight or Value.

For *Matter*, Copper is that thought to have been first coin'd; afterwards Silver, and, lastly, Gold; as being the most beautiful, scarce, cleanly, divisible, and pure of all Metals.

The Degrees of Goodness are express'd in Gold by Carats; and in Silver by Penny-weights. See CHARACTERS, &c.

For there are several reasons for not coining 'em pure, and without alloy, *viz.* the great Loss and Expence in refining them, the necessity of hardening them to make 'em more durable, and the scarcity of Gold and Silver in most Countries. See ALLOY.

Among the ancient *Greeks*, Iron Rings, or, as some say, Iron Plates, were used for *Money*. Among the *Lacedaemonians* Iron Rings quench'd with Vinegar, that they might not serve for any other use. *Strabo* observes, that there was anciently stamp'd *Money* of Leather; *Carium forma publica impressum*. And the same thing was put in practice by *Frederic II.* at the Siege of *Milaz*; to say nothing of an

old Tradition among ourselves, that in the confused times of the Barons Wars, the like was done in *England*: But the *Hollanders*, we know, coin'd great Quantities of Paper-board in the Year 1574. *Nama Populini* made *Money* of Wood and Leather. Nor does it appear that the *Romans* were much acquainted with the Art of striking *Money* in Metal in the Time of their Kings. The first Silver *Money* they coin'd was in the Year of Rome 484; and their first Gold *Money* in 546. See COINING.

As to the Form of *Money*, it has been more various than that the Matter.

Under the Form are comprehended the Weight, Figure, Impression, and Value.

For the Impression, the *Jews*, tho they detested Images, yet stamp'd on one side their Shekel, the golden For which had the *Manna*; and on the other, *Aaron's* Rod. The *Dardans*, two Cocks fighting. *Alexander* his Horse *Incubalus*. The *Athenians* an Owl, or an Ox; whence the Proverb on bribed Lawyers, *Est in Lingua*. They of *Aegina*, a Snail; whence that other saying, *Virtutum & Sapientiam vincunt rejidines*. For the *Romans*, as they impress'd the Image and Inscription of the Consul on their Coins while the Common-wealth flourish'd, and afterwards that of the Emperor on one side; so they always varied the Reverse upon new Events or Exploits. Some think that the great Ounce Medals both of Brass and Gold were struck chiefly to do honour, and preserve the Memories of great Men; but it is pretty plain they were current as well as the smaller. See MEDAL and MEDALLION.

This Practice of stamping the Prince's Image on Coins, has obtain'd among all civiliz'd Nations; the *Turks* and other *Mahometans* alone excepted, who, in detestation of Images, inscribe only the Prince's Name, with the Year of the transmigration of their Prophet.

As to the Figure, it is either round, as in *England*; multi-angular or irregular, as in *Spain*; square, as in some parts of the *Indies*; or nearly globular, as in most of the rest.

After the Arrival of the *Romans* in this Island, the *Britons* imitated them, coining both Gold and Silver with the Images of their Kings stamp'd on 'em. When the *Romans* had subdued the Kings of the *Britons*, they also impress'd their Coins, and brought in their own; which were current here from the time of *Claudius* to that of *Valentinian* the Younger, about the space of 500 Years.

*Mr. Camden* observes, that the most ancient *English* Coin he had known was that of *Ethelbert* King of *Kent*, the first Christian King in the Island; in whose time all *Money* Accounts began to pass by the Names of *Pounds*, *Shillings*, *Pence*, and *Manchees*.

*Pence* seems borrow'd from the *Latin* *Pecunia*, or rather from *Pendo*, on account of its just Weight, which was about three Pence of our *Money*. These were coarsely stamp'd with the King's Image on the one side, and either the Mier-Master's, or the City's where it was coin'd, on the other. Five of these Pence made their Scilling, probably so call'd from *Sealing*, which the *Romans* used for the fourth part of an Ounce. Forty of these Scillings made their Pound, and 400 of these Pounds were a Legacy, or a Portion for a King's Daughter; as appears by the last Will of King *Alfred*. See PENNY, &c.

By these Names they translated all Sums of *Money* in their old *English* Testament; Talents by *Fundes*; *Judas's* thirty pieces of Silver by thirty Scillings; Tribute *Money*, by *Peining*; the Mite by *Forthing*.

But it must be observed, they had no other real *Money*, but Pence only; the rest being imaginary *Money*, *i. e.* Names of Numbers, or Weights. Thirty of these Pence made a *Mancus*, which some take to be the same with a Mark; *Manca*, as appears by an old MS. was *quinta pars Unice*. See MANCUS.

These *Mancaes* or *Mancaes's*, were reckon'd both in Gold and Silver. For in the Year 680, we read that *Ina* King of the *West-Saxons*, oblig'd the *Kentishmen* to buy their Peace at the price of thirty thousand *Mancaes's* of Gold. In the Notes on King *Cannin's* Laws, we find this distinction, that *Mancaes* was as much as a Mark of Silver; and *Manca* a square piece of Gold, valued at thirty Pence.

The *Danes* introduced a way of reckoning *Money* by Ores, mentioned in *Dooms-Day Book*; but whether they were a several Coin, or a certain Sum, does not plainly appear. This, however, may be gathered from the *Abby-Book* of *Barton*, that twenty Ores were equivalent to two Marks. They had also a Gold Coin call'd *Bizantines*, or *Belans*, as being coin'd at *Constantinople*, then call'd *Bizantium*. The value of which Coin is not only now lost, but was so entirely forgot even in the time of King *Edward* the Third; that whereas the Bishop of *Norwich* was fin'd a *Bizantine* of Gold to be paid the Abbot of *St. Edmund's* Bury, for infringing his Liberties (as it had been enacted by Parliament in the time of the Conqueror) no Man then living could tell how much it was; so it was refer'd to the King to rate how much he should pay. Which is the

more unaccountable, because but an hundred Years before, two hundred thousand Relants were exacted by the *Soldan* for the Ransom of St. Lewis of France's which were then valued at one hundred thousand Livres.

The Coining of Money be a special Prerogative of the King, yet the ancient *Saxon* Princes communicated it to their Subjects; in former times in every good Town there was at least one Coiner; but at *London* eight, at *Canterbury* four for the King, two for the Arch-bishop, one for the Abbot at *Winchester*, six at *Rocheſter*, at *Hasting* two, &c. See MINT.

The *Norman* Kings continu'd the same Custom of Coining only Pence, with the Prince's Image on one ſide, and on the other the Name of the City where it was coin'd, with a Croſs fo deeply impreſs'd, that it might be eaſily parted, and broken into two Halves, which fo broken, they call'd Half-pence; or into four Parts, which they call'd Farthings, or Farthings. See FARTHING.

In the time of King *Richard* the Firſt, Money coin'd in the Eaſt Parts of *Germany*, came in ſpecial requeſt in *England*, on account of its Purity, and was call'd *Eaſterling Money*, as all the Inhabitants of thoſe Parts were call'd *Eaſterlings*. And ſhortly after, ſome of theſe People ſkil'd in Coining were ſent for hither, to bring the Coin to Perfection; ſince ſince has been call'd *Sterling* for *Eaſterling*. See STERLING.

King *Edward* the Firſt, who firſt adjust'd the Measure of an Ell by the Length of his Arm, herein imitating *Charles* the Great, was the firſt alſo who eſtabliſh'd a certain Standard for the Coin, which is expreſs'd to this effect by *Greg. Reckley*, Mayor of *London*, and Mint-Maſter. A Pound of Money containeth twelve Ounces: In a Pound there ought to be eleven Ounces, two *Eaſterlings*, and one Farthing; the reſt Alloy. The ſaid Pound ought to weigh twenty Shillings and three Pence in Account and Weight. The Ounce ought to weigh twenty Pence, and a Penny twenty four Grains and a half. Note, that eleven Ounces two Pence *Sterling* ought to be of pure Silver, call'd *Leaf Silver*, and the Mintre muſt add of other Weight ſeventeen Pence Half-penny Farthing, if the Silver be to pure.

About the Year 1320. the States of *Europe* firſt began to coin Gold, and among the reſt, our King *Edward* the Third. The firſt Pieces he coin'd were call'd *Florences*, as being coin'd by *Florentines*; afterwards he coin'd Nobles; then *Rose-Nobles*, current at fix Shillings and eight Pence; Half-Nobles, call'd *Half-Penny*, at three Shillings and four Pence of Gold; and Quarters at twenty Pence, call'd *Farthings of Gold*. The ſucceeding Kings coin'd *Rose-Nobles*, and double *Rose-Nobles*, great Sovereigns, and half *Henry Nobles*, Angels, and Shillings.

King *James* the Firſt coin'd *Unites*, double Crowns, *Britannic Crowns*. Then the Crowns, Half Crowns, &c.

There are various Kinds of falſe or baſe Money, viz. either that ſtruck by an unqualify'd Perſon, and of unſuitable Metals; or that which has loſt of its Weight, either by being clipped on the Corners, or filed on the Edges, or laſtly, by having ſome of its Surface peel'd off; if Gold, by *Agua Regalis*; if Silver, by *Agua Fortis*. Another Kind of baſe Money is that made by Pieces of Iron, Copper, or other Metal, cover'd on each ſide with a thin Plate or Leaf of Gold or Silver, neatly ſoder'd and join'd around the Edges, and ſtruck, like other Coin, with Figures, Legends, &c. only to be diſtinguiſh'd from them by the Bulk, and Weight, and Sound.

The Word Money comes from the old *Anglo-Saxon* *Mancet*, and that from *Mania* a *Mundo*, as before obſerv'd. From the ſame *Mania* the  *Germans* have borrow'd their *Manro*, the  *French* *Monnaie*, the  *Spaniards* *Monedas*, and the  *Italians* *Moneta*.

#### MONEYS of Account, or Manners of reckoning MONEY in Europe and Aſia.

We here confine ourſelves to the Moneys of Account of thoſe two Parts of the World: *America* having none; the reſpective Moneys of Account of the  *Europeans*, who have there made Settlements, being eſtabliſh'd with 'em. As to *Africa*, the Cities of *Barbery* and *Egypt*, whither the  *Europeans* traffick, reckon ſuch after the ſame manner as in the  *Levant*, and in the Dominions of the Grand Signior: For the reſt, throughout that vaſt Extent of Coaſts, where we trade for *Negroes*, *Gold-Duſt*, *Elephants Teeth*, *Wax*, *Leathers*, &c. either the miſerable Inhabitants do not know what Money of Account is; or if they have any, 'tis only what Strangers, ſettled among them, have introduc'd. The *Mosque*, however, and the *Price*, which are Manners of accounting among theſe  *Barbarians*, will be deliver'd in their place.

*English* MONEY of Account is the Pound, Shilling, and Penny *Sterling*: The Pound containeth 20 Shillings, and the Shilling 12 Pence. See POUND, &c. See alſo COIN, and STERLING.

*French* MONEY of Account, was antiently the *Paris*, *Tournois*, and the *Ecu*, or *Crown*: but ſince the Ordinance of 1657, they only reckon by *Livres*, i. e. Pounds; *Sols*, i. e. Shillings; and *Deniers* *Tournois*, i. e. Pence. The *Livre*, 20 *Sols*, or  $\frac{1}{2}$  of the *Ecu*, or *Crown*; the *Sol*, 12 *Deniers*. See LIVRE, DENIER, &c.

The *Maille*, *Obole*, or *Half-penny* *Tournois*, is alſo now a Money of Account, tho' antiently a real Coin. The *Maille* is divided into two *Pites*, and each *Pite* into two *Semi-pites*; all *Moneys* of Account. To which muſt be added the *Fraoc*, of the ſame Value with the *Livre*, viz. 20 *Sols* *Tournois*; and the *Blanc*, 3 *Deniers* *Tournois*; and the *Carolus*, Ten: All three antiently real Coins. See FRANC, &c.

*Dutch* and *Hemiſh* MONEYS of Account. In *Holland*, *Zeland*, *Brabant*, and *Cologne*, they uſe the *Pandt*, or *Livro de Gros*; *Schelling*, or *Sol de Gros*; and *Penning*, or *Deniers Gros*. The *Pandt*, containing 20 *Schelling*; and the *Schelling*, 12 *Penning*. The *Pandt* equal to 7 *Livres*, 4 *Sols* *French*, or 10 *Shillings*  $\frac{1}{2}$  *Sterling*. They alſo account by *Florins* or *Goulders*, *Patards* and *Penning*: The *Florin* is equal to  $\frac{1}{2}$  of the *Pound*, or 20 *Patards*; and the *Patard*, 12 *Penning*. The *Merchants* uſe each Method of Accounting indifferently.

*Spaniſh* MONEY of Account, is the *Pefo*, *Ducat* of *Silver* and *Vellon*, *Rial* of *Vellon*, and *Corrados* and *Maravedis* of *Silver* and *Vellon*. The *Pefo* is to the *Ducat* as 12 to 10. The *Ducat* of *Silver* containeth 12 *Rials* of *Silver*; and that of *Vellon*, 12 *Rials* of *Vellon*; which makes a difference of near one half. The *Silver Rial* being current for 7 *Shillings* *Sterling*, and that of *Vellon* only at 3  $\frac{1}{2}$  *Sterling*. 32 *Maravedis* make the *Rial* of *Vellon*, and 63 that of *Silver*. The *Maravedis* is divided into 4 *Comeros*.

*German* and *Sax*'s MONEYS of Account. In *Switzerland*, and many of the chief Cities of *Germany*, particularly *Frankfurt*, they account by *Florins* (but on a footing different from that of *Holland*) by *Creux*'s or *Croixers*, and *Penning*. The *Florin* equal to 3 *Shillings* *Sterling*, and divided into 60 *Creux* or *Kreuz*, and the *Creux* into 8 *Penning*. In others, as *Nuremberg*, &c. they account by *Rixdollars*, *Florins*, and *Creux*. The *Rixdollar* equal to 4  $\frac{1}{2}$  *Sterling*, divided into 100 *Creux*, and the *Creux* into 8 *Penning*. In others, as *Hamburg*, *Berlin*, &c. by *Rixdollars*, *Marks* *Labs*, *Schellings* *Labs*, and *Deniers* *Labs*. The *Rixdollar* and *Dollar* on the foot of the *French* *Crown*, or 4  $\frac{1}{2}$  *Sterling*, divided into 3 *Marks*, and the *Mark* into 16 *Schellings*, and the *Schelling* into 12 *Penning*. At *Hamburg* they alſo uſe the *Livre*, *Schelling*, and *Denier de Gros*. At *Amburg* and *Balzamon*, they account by *Tallers* and *Creux*'s; the *Taller* equal to 4  $\frac{1}{2}$  *Sterling*, divided into 90 *Creux*'s. At *Namberg*, by *Rixdollars* *Gros* and *Penning*; the *Rixdollar* equal to 4  $\frac{1}{2}$  *Sterling*, divided into 36 *Gros*, and the *Gros* into 12 *Penning*. At *Strasburg* by *Florins*, *Creux*, and *Penning*. The *Florin* equal to 1  $\frac{1}{2}$  *Sterling*, divided into 60 *Creux*, and the *Creux* into 8 *Penning*.

*Italian* MONEYS of Account. In *Italy*, the Moneys of Account are various, almoſt as the Cities of Commerce. At *Rome*, they account by *Pounds*, *Shillings*, and *Pence* of *Gold* & *Stamps*. At *Venice*, by *Ducats*, and *Gros de Banco*. The *Ducat* divided into 24 *Gros*, each *Gros* equal to 2 Pence  $\frac{1}{2}$  *Sterling*. And by *Ducats* *Curant*, call'd alſo *Sequins*, equal to 9  $\frac{1}{2}$  *Sterling*; and by *Pounds*, *Shillings*, and *Pence*. At *Lucca* and *Bergamo*, they uſe the four laſt; and only the three laſt at *Buſſogna*, *Mantua*, and *Sroy*: In *Genova*, beſides *Pounds*, *Shillings*, and *Pence*, they account alſo by *Florins*, containing 5 *Solds*, or 6 Pence  $\frac{1}{2}$  *Sterling*. At *Leghorn* and *Genoa*, beſides *Pounds*, *Shillings*, and *Pence*, they account by *Piaſtres*, equal to 4  $\frac{1}{2}$  *Sterling*. At *Nova*, their Moneys of Account are *Crowns*, *Shillings*, and *Pence* of *Gold de Nova*. At *Ravennat*, *Pounds*, *Florins*, and *Gros*. At *Ancona*, *Crowns*, *Shillings*, and *Pence*. At *Naples*, *Ducats*, *Tarins*, and *Grains*, equal to one *Shilling* *Sterling*, divided into 20 *Grains*.

*Sicilian* and *Malteſe* MONEYS of Account. At *Meſſina*, *Palerme*, and throughout *Sicily*, they account by *Pounds*, *Ounces*, *Tarins*, *Grains*, and *Piccoli*'s; which are ſumm'd by 50, 20, and 6; the Ounce being 30 *Tarins*, the *Tarin* 20 *Grains*, and the *Grain* 6 *Piccoli*'s. At *Malta*, they account by *Pounds*, *Ounces*, *Carlins*, and *Grains*. The Ounce 30 *Tarins*, or 60 *Carlins*, or 600 *Grains*; the *Carlin* equal to 6  $\frac{1}{2}$  *Sterling*.

*Polish* MONEYS of Account. Throughout *Poland*, moſt of the Dominions of the King of *Pruffia*, and *Dantzic*, they account by *Rixdollars*, *Roops*, and *Grochs*. The *Rixdollar* equal to 4  $\frac{1}{2}$  *Pence* *Sterling*, and divided into 32 *Roops*; and again, in the *Pruffian* *Territories*, into 24 *Grochs*: In *Poland*, into 90 *Grochs*. Sometimes they uſe the *Florin*, *Groch*, and *Penny*.

*Swediſh*, *Daniſh*, and *Muscovite* MONEYS of Account. In *Sweden*, they account by *Dalles*, equal to 32 *Sols* *Labs*, or 3 *Shil-*

3 Shillings Sterling. In Denmark, by Rixdollars, Hors, and Schellings; the Rixdollar divided into 4 Hors, and the Hor into 4 Schellings. In *Mexico*, they account by Roubles, Altins, and Grils or Grives. The Rouble equal to 100 Copecs, or 2 Rixdollars, or 3 Shillings Sterling; divided into 10 Grils; 3 Altins; 5 the Gril, or 10 Copecs; the Copec at 13 Pence 2 Sterling.

*Turkish MONIES of Account.* The *Turks*, both in *Europe*, *Asia*, and *Africa*, account by Bourles or Purles; either of Silver or Gold (the last only used in the Seraglio) with half Purles of Gold, call'd also Rizars. The Purle of Silver equal to 1500 French Livres, or 112 l. 10 s. Sterling. The half Purle in proportion. The Purle of Gold 15000 Sequins, equal to 30000 French Crowns, or 6750 Pounds Sterling; seldom used but for Presents to Favourites: So that a Purle, simply, signifies a Purle of Silver, or 1500 Livres. They are call'd Purles, because all the Money in the Treasury of the Seraglio is kept in Leather Bags or Purles, of those Contents. The Merchants also use Dutch Dalters, call'd Altins or Abocquets, with Meidens and Afpres. The Daltler equal to 35 Meidens, and the Meidien to 3 Afpres; the Afpre to 2 Penny Sterling.

*Persian MONIES of Account.* In *Persia*, they account by the *Toman* (call'd also *Man*, and *Turmein*) and the *Dinar-bibi*. The *Toman* is composed of 50 Abaff's, or 100 Mamoud's, or 100 Chapes, or 10000 Dinars; which accounting the Abaff on the foot of 18 French Sols, or the Dinar on that of a Denier, amounts to 3 l. 12 s. 6 d. Sterling the *Toman*. They also account by Larins, especially at *Ormus*, and on the Coast of the *Persian Gulph*. The Larin equivalent to 11 Pence Sterling; and on that footing used also in *Arabia*, and a great part of the *East Indies*.

*Chinese MONIES of Account,* are the *Pic*, *Piccol*, and *Tael*; which tho' in effect Weights, do likewise serve as *Monies of Account*; obtaining in *Touquin* as well as *China*. The *Pic* is divided into an hundred *Cati's*, some say 125. The *Cati* into 16 *Tael's*; each *Tael* equal to 1 Ounce 3 Drachms. See *Chinese COINS*. The *Piccol* contains 66 *Cati's*; and the *Tael* equivalent to 6 s. 8 d. Sterling.

*Japaneze MONIES of Account,* are the *Schuites*, *Cockkens*, *Oebans* or *Oubans*, and *Tael's*. Two hundred *Schuites* are equal to five hundred Dutch Livres, or Pounds; the *Cockken* equal to ten *Low-Country Livres*; 1000 *Oebans* make 45000 *Tael's*.

*Mogul MONIES of Account.* At *Serim*, *Agra*, and the rest of the *Estates of the Great Akbar*, they use *Lacres*, *Aeres*, or *Lectes*; implying a hundred thousand: Thus a *Lacre* of *Roupias* is a hundred thousand *Roupias*; the *Lacre* being nearly on the footing of the *Ton* of Gold in *Holland*, and the *Million* of *France*.

*MONIES of Account of other Islands and Coasts of India.* Throughout *Malabar*, and at *Gaz*, they use *Tanga's*, *Vintins*, and *Pardo's* *Xeraphin*. The *Tanga* is of two kinds, viz. of good, and bad Alloy. Hence their Custom is to count by good or bad Money. The *Tanga* of good Alloy is 2 better than the bad; so that 4 *Tanga's* of good being allow'd the *Pardo's* *Xeraphin*, there will be required 5 of the bad; 4 *Vintins* good make a *Tanga* likewise good; 15 *Baracos* a *Vintin*. The good *Baraco* is equal to a *Portuguese Rey*, a *French Denier*, or 2 of a *Penny Sterling*. In the *Island of Java*, they use the *Santa*, *Sapacou*, *Pardo's*, and *Cati's*; which last *Money*, together with the *Lecth*, or *Lacre*, is much used throughout all the *East-Indies*. The *Santa* is 200 *Caxas*, or little *Pieces* of that *Country* hung on a *String*; and is equal to 2 of a *Penny Sterling*. Five *Santa's* make the *Sapacou*. The *Pardo* equal to 2 s. 8 d. Sterling. The *Cati* contains 20 *Tael's*; the *Tael* 6 s. 8 d. Sterling.

There are *Islands*, *Cities*, and *States of the East-Indies*, whose *Monies of Account* are not here express'd; partly because reducible to some of those above-mentioned; and partly because we find no certain consistent account of 'em in any of the *Authors*, or *Memoirs* herein consulted.

*African MONIES of Account.* From *Cape Verd*, to the *Cape of Good Hope*, all *Exchanges* and *Valuations* of *Merchandises* are made on the foot of the *Macoute* and *Piece*; which tho' no *Monies of Account*, for those *Barbarians* having no real Money, need no imaginary ones to value them by, yet serve in lieu thereof. At *Loango de Borie*, and other Places on the Coast of *Angola*, the *Estimations* are made by *Macoutes*; and at *Malmbo*, and *Calindo*, on the same Coast, the *Negroes* reckon by *Pieces*. Among the first, the *Macoute* is equivalent to ten: Ten *Macoutes* make an hundred; which likewise leaves us a kind of imaginary Money. To estimate any Purchase, Exchange, &c. they fix on the one side the number of *Macoutes* required, e. g. for a *Negro*; on the other for how many *Macoutes* they agree to receive each kind of *Merchandise* required for the *Negro*; so that there are several *Bargains* made for one. Suppose, v. g. the *Slave* be fix'd at 3500; this amounts to 350 *Macoutes*. To make up this number

of *Macoutes* in *Merchandises*, they fix the *Price* of each in *Macoutes*. Two *Hemph Knives*, e. g. are accounted one *Macoute*; a *Copper-Baton* three *Pounds Weight*, three; a *Barrel of Gun-Powder*, two, &c. For the *Piece*, it serves in like manner to estimate the *Value* of *Goods Duties*, &c. on either side. Thus the *Natives* require ten *Pieces* for a *Slave*; and the *Europeans* put, v. g. a *Fulco* at 1 *Piece*; a *piece* of *Salampoures bloc*, at 4 *Pieces*, &c.

*MONIES of Account among the Antients.*  
*Grecian MONIES of Account.* The *Grecians* reckon'd their *Sums of Money* by *Drachms*, *Minae*, and *Talents*. The *Drachma* equal to 7 1/2 d. Sterling; 100 *Drachms* made the *Mina*, equal to 3 l. 4 s. 7 d. Sterling; 60 *Minae* made the *Talent*, equal to 195 l. 15 s. Sterling: Hence 100 *Talents* amounted to 19575 l. Sterling.

The *Mina* and *Talentum* indeed, were different in different *Provinces*: Their *Proportions* in *Attic* *Drachms* are as follow. The *Syrian* *Mina* contain'd 25 *Attic* *Drachms*; the *Prolemaic* 53; the *Attic* and *Euboean* 100; the *Babylonic* 116; the greater *Attic* and *Tyrian* 133 1/2; the *Aeginean* and *Rhodian* 160 1/2.

The *Syrian* *Talcent* contain'd 15 *Attic* *Minae*; the *Prolemaic* 20; the *Attic* and *Euboean* 60; the *Babylonic* 70; the greater *Attic* and *Tyrian* 80; the *Aeginean* and *Rhodian* 100.

*Roman MONIES of Account,* were the *Scelerii* *Nunmi*, *Scleritia*, and *Decies Scleritium*. The *Scleritia* equal to 1 d. 3 s. Sterling. One thousand of these made the *Scleritium*, equal to 8 l. 1 s. 5 d. 2 s. Sterling. One thousand of these *Scleritia* made the *Decies Scleritium* (the *Adverb Centies* being always understood) equal to 8075 l. 18 s. 4 d. Sterling. The *Decies Scleritium* they also call'd *Decies Centia* *millia* *Nummum*. *Centies Scleritium*, or *Centies* *H S* are equal 80729 l. 3 s. 4 d. *Millies H S* to 80729 l. 13 s. 4 d. *Millies Centies H S* 888020 l. 16 s. 8 d.

*MONYERS, MONEYERS, or MONIERS,* Officers of the *Mint*, who work, and coin *Gold* and *Silver Money*; and answer all the *Waite*, and *Charges*. See *MINT* and *COINING*.

*MONEYERS* are also taken for *Bankers*; or those who make a *Trade* of turning, and returning *Money*. See *BANKER*.

*MONITORY Letters,* are *Letters* of *Admonition*, or *Warning*, sent from an *Ecclesiastical Judge* upon *Information* of *Scandals* and *Abuses* within *Cognizance* of his *Court*.

*MONOCHORD,* a musical Instrument wherewith to try the *Variety* and *Proportion* of musical Sounds. See *TUNE*.

It is compos'd of a *Rule*, divided and subdivided into divers *Parts*, whereon there is a *String* pretty well stretch'd upon two *Bridges*, at each *Extreme* thereof. In the middle between both is a *moveable Bridge*, by whose means, in applying it to the different *Divisions* of the *Line*, you find that the *Sounds* are in the same *Proportion* to one another, as the *Divisions* of the *Line* cut by the *Bridge* were.

The *Monochord* is also call'd the *Harmonical Canon*, or *Cronical Rule*; because serving to measure the *Degrees* of *Gravity*, and *Acuteness* of *Sounds*. See *GRAVITY*, &c.

There are also *Monochords* with 48 fix'd *Bridges*; the *Use* of all which may be supply'd by one single *moveable Bridge*; which are placed in the middle, by only shifting it under new *Chords* or *Strings*, always representing the entire *Sound*, or the open *Note*.

*Pythagoras* is held to have been the *Inventor* of the *Monochord*. *Ptolemy* examined his *Harmonical Intervals* with the *Monochord*. See *CANON*.

When the *Chord* was divided into equal parts, so that the *Terms* were as 1 and 1, they call'd them *Unisons*; if they were as 2 to 1, *Octaves*, or *Diapasons*; when they were as 8 to 5, *Fifths*, or *Diapentes*; if they were as 4 to 3, they call'd them *Fourth's*, or *Diateserons*; if the *Terms* were as 5 to 4, *Ditons*, or a *Third Major*; if as 6 to 5, a *Demi-Diton*, or a *Third Minor*; lastly, if as 24 to 25, *Semi-ditons* or *Diese*. See *UNISON*, *OCTAVE*, *DIAPASON*, *DIAPENTE*, *DIATESERON*, &c.

The *Monochord* being thus divided, was properly what they call'd a *System*, of which there were many kinds, according to the different *Divisions* of the *Monochord*. See *SYSTEM*.

*Dr. Wallis* has taught the *Division* of the *Monochord* in the *Philosophical Transactions*; but that Instrument is now disused, the modern Music not requiring such *Division*.

*MONOCHORD*, is also used for any musical Instrument, consisting of only one *Chord*, or *String*. See *CHORD*.

The *Trumpet Marine* is a *Monochord*. See *TRUMPET*.

The *Word* is *Greek*, form'd of *monos* *solus*, single, and *χρῶμα* *Chord*.

*MONOCHROMA*, a *Picture* all of one *Colour*. See *CAMIEUX*, *CLAIR* *OSCUR*, &c.

The Word is compounded of the Greek *μονος*, single; and *φωνη*, Colour.

**MONODY**, **ΜΟΝΟΔΙΑ**, in the ancient Poetry, a kind of mournful Song, or Ditty, sung by a Person all alone; to utter his Grief.

The Word is compounded of *μονος* & *διδασκαλος*; and *διδασκαλος*, Song.

**MONOGAMY**, the State or Condition of those who have only married once. See **MARRIAGE**, **BIGAMY**, &c.

The Word is compounded of *μονος* & *γαμος*, and *γαμος* Marriage.

**MONOGRAM**, or **ΜΟΝΟΓΡΑΜΜΟΝ**, a Cypher, or Character composed of one or more Letters interwoven; being a kind of Abbreviation of a Name; antiently much used as a Badge, Seal, Arms, &c. See **SEAL**, **CYPHER**, &c.

Under the Eastern Empire, it is usual to find M I K, which are the Monogram of *Maria, Iesai, Constantine*.

The use of Monograms is of an antient standing, as appears from *Plutarch*; and from some Greek Medals of the time of *Philip of Macedon, Alexander his Son*, &c.

The Roman *Laborum* bore the Monogram of *Jesus Christ*, consisting of two Letters, a P placed perpendicular over the middle of a X, as we find it in several Medals of the time of *Constantine*; those being the two first Letters of the Word *ΧΡΙΣΤΟΣ*, *Christ*. See **Lazarum**.

The Kings formerly marked their Coins with their Monogram: Of this we have instances in *Charlemain's* Coins. That Prince also used the Monogram for his Signature. *Eginard* gives us this reason for it, viz. that *Charlemain* could not write; and that having attempted in vain to learn in his grown Age, he was reduced to the necessity of Signing with a Monogram.

The Antients used Monograms as Notes or Abbreviations of Inscriptions; for the understanding whereof we have express Treatises of *Valerius Probus, Paulus Diaconus*, &c. See **CHARACTER**.

**MONOLOGUE**, a Dramatic Scene, wherein a Person appears alone on the Stage, and speaks to himself. See **SOLILOQUY**.

The Word *Monologue* is derived from the Greek *μονος* & *λογος*, and *λογος*, Discourse, Speech.

**MONOMACHIA**, a *Duel*, or single Combat of Man against Man. See **DUEL**.

*Monomachia* was antiently allow'd by Law for the Trial or Proof of Crimes. It was even permitted in pecuniary Causes, as appears by antient Records. It is now forbid both by the Civil and Canon Laws. See **COMBAT**.

*Alain* has wrote a Treatise de *Monomachia*.

The Word comes from the Greek *μονος* & *μαχη*, and *μαχη* Combate.

**MONOME**, in Algebra, a Quantity that has but one Denomination, or Name; as *α, β, γ, δ, ε, ζ, η, θ, ι, κ, λ, μ, ν, ξ, ο, π, ρ, σ, τ, υ, φ, χ, ψ, ω*. See **QUANTITY**.

The *Monome* may be either Rational, or Irrational. See **RATIONAL**, &c.

**MONOPETALOUS**, in Botany, a Term apply'd to Flowers which have only one undivided Petalum, or Leaf. See **FLOWER**, **PETALA**, &c.

**MONOPHYTES**, a general Name given to all those Sectaries in the *Levanti* who only own one Nature in *Jesus Christ*.

The *Monophytes* however, properly so call'd, are the Followers of *Secutus*, and *Petrus Eschensis*.

The Word comes from the Greek *μονος* & *φυσις*, and *φυσις* Nature.

**MONOPOLY**, an unlawful kind of Traffick, when one or more Persons make themselves sole Masters of any Commodity, with design to enhance its price; those who have occasion for it being obliged to purchase it at their hands, and on their own terms.

There are two kinds of *Monopolies*: The one, when a Merchant buys up, for instance, all the Corn of a Province, to retail it at an advanced Rate to the People.

The other when a Letter, or Patent is procured from the Prince, prohibiting any other Person to sell any Commodity besides the Patentee.

The Word is pure Greek, form'd of *μονος* & *πωλησις*, signifying to sell alone.

Among the *Romans*, the Term was so odious, that *Tiberius*, as *Suetonius* relates, having occasion to make use of it, begn'd leave of the Senate for it, as being borrow'd from the *Greeks*.

**MONOPTERE**, a kind of Temple among the Antients, round, and without Walls; having a Dome supported with Columns. See **TEMPLE**.

**MONOPTOTE**, **ΜΟΝΟΠΤΟΝ**, in Grammar, a Noun which has only one Case. See **CASE**.

**MONOPYRENEOUS** *Fruits*, are such as only contain one Kernel, or Seed. See **FRUIT**.

**MONORHYME**, a Poetical Composition, all the Verses whereof end with the same Ryme.

*Monorymes* are said to have been invented by the old French Poet *Leonin*, who address'd some Latin Verses of

this kind to Pope *Alexander III*. Whence they are also call'd *Leonine Verses*. See **LEONINE**.

They are but little used in *English*; more in *French*.

The Word comes from the Greek *μονος* & *ρυμος*, and *ρυμος* Ryme. See **RHYME**.

**MONOSTICH**, **ΜΟΝΟΣΤΙΧΟΝ**, an Epigram consisting of one single Verse.

**MONOSYLLABLE**, a Word of a single Syllable; or, consisting of one, or more Letters pronounced all together. See **WORD** and **SYLLABLE**.

The French Language abounds in *Monosyllables* more than any other. This renders it the more perplexing to Foreigners, and yet the Beauty of the Language seems to consist in it. One of the best and smoothest Lines in *Malherbe* consists of twelve *Monosyllables*; speaking of *Calista*, he says,

*Et moi je ne voy rien quand je ne la vois pas.*

In this the Genius of the *English* Tongue differs much from the *French*, an uninterrupted Series of *Monosyllables* having always an ill Effect. This Mr. *Pope* both intimates and exemplifies in the same Verse.

*And ten low Words oft creep in one dull Line.*

*Pasquier* cites an Elegy of forty two Verses, consisting wholly of *Monosyllables*.

**MONOTHELITES**, an antient Sect, who sprung out of the *Eutybianis*; thus call'd, as only allowing of one Will in *Jesus Christ*; as the Word *Monothelisme* in the *Greek* imports.

The Opinion of the *Monothelites* had its Rise in 537, and had the Emperor *Heraclius* for an Adherent. It was the same with that of the *Severian Aephabis*.

They allow'd of two Wills in *Christ*, consider'd with regard to the two Natures; but reduc'd them to one, by reason of the Union of the two Natures: Thinking it absurd there should be two free Wills in one and the same Person.

They were condemn'd by the sixth General Council, as being suppos'd to destroy the Perfection of the Humanity of *Jesus Christ*, in depriving it of Will and Operation. That Council declared their Belief of two Wills, and two Operations, without Division, or without changing the one for the other, without either distinguishing or confounding them: the Human Will being subject to the Divine.

**MONOTONIA**, **ΜΟΝΟΤΟΝΙΑ**, a Want of Variation, or Inflection of the Voice, or a Fault in Pronunciation, where a long Series of Words are deliver'd with one unvaried Tone. See **PRONUNCIATION**.

This is one of the principal Faults of our *English* Orators. *Monotonia* is oppos'd to Chanting or Singing.

**MONSEIGNEUR**, in the Plural **MESSEIGNEURS**, a Title of Honour and Respect used by the *French* in writing to Persons of superior Rank or Quality. See **SEIGNEUR**.

The Word is a Compound of *mon*, *my*, and *Seigneur*, Lord.

Dukes, Peers, Archbishops, Bishops, and Presidents of the *Parliaments*, are complemented with the Title of *Monseigneur*. In the Requests presented to the Sovereign Courts, they use the Term *Nostreigneur*.

**MONSIEUR**, absolutely used, is a Quality now given to the Dauphin of *France*.

This Custom was unknown till the time of *Louis XIV*. Till then, the Dauphin was call'd *Monsieur le Dauphin*.

**MONSIEUR**, in the Plural **MESSEIGNEURS**, a Term, or Title of Civility, used by the *French*, in speaking to their Equals, or those a little below them; answering to *Mr*, or *Sir*, among the *English*. See **SIR**.

The Superfixions of all Letters begin, *A Monsieur, Monsieur* such a one.

The Word is a Compound of *mon*, and *Sieur*, *Sir*. See **SIEUR**.

*Borel* derives the Word from the Greek *κυριος*, Lord, or *Sire*, q. d. *monseigneur*. *Pasquier* derives *Sieur*, and *Monsieur*, from the Latin *Senior*, Elder. The *Italians* say *signor*, and the *Spaniards* *senor*, in the same Sense, and from the same Origin.

The use of the Word was formerly more extensive. They apply'd it to the People of many Ages before them: Thus, *Monsieur St. Augustine, Monsieur St. Ambrose*; and the vulgar still say *Monsieur St. Paul, Monsieur St. James*, &c.

The *Romans*, during the flourishing times of their Liberty, were unacquainted with that term of Parade and Flattery, which they afterwards made use of under the Name of *Domine*. In speaking, or writing to each other, they only gave them their proper Names; which Practice lasted even after *Cesar* had brought the Republic under his Command. But after the *Roman* Emperors were once well seated in the Throne, the Courtiers, and Minions who

who by Flattery sought to procure Favours from them, studied new Honours. *Suetonius* observes, that a Comedian on the Theatre having call'd *Augustus, Dominus, Lord*; the Spectators all stared at him! So that the Emperor forbade, for the future, that Quality to be attributed to him. *Calpurnia* was the first who expressly commanded himself to be call'd *Dominus, Martial*, entirely devoted to Tyranny, calls *Desautin, Dominum* strange *nostrum*. In time, the Title was also apply'd to the People; and of *Dominus*, at length was form'd *Dom*. See *Dom*.

**MONSIEUR**, absolutely used, is a Title or Quality affixed to the second Son of France, or the King's Brother.

In a Letter of *Philip de Valois*, that Prince speaking of his Predecessor, calls him *Monsieur le Roy, Monsieur le King*. At present, no body calls the King *Monsieur*, but the Children of France.

**MONSOON**, a regular, or periodical Wind, in the East-India, blowing constantly the same way, during six Months of the Year, and the contrary way the remaining six. See *WIND*.

In the Indian Ocean, the Winds are partly general, and blow all the Year round the same way, as in the *Antipodical Ocean*; and partly periodical, i. e. half the Year blow one way, and the other half near on the opposite Points. And those Points and Times of shifting differ in different Parts of this Ocean. *Halley*.

These latter, or periodical Winds, are what we call *Monsoons*.

*Monsoons* then are a Species of what we otherwise call *Trade-Winds*. See *TRADE WIND*.

They take the Denomination *Monsoon* from an Antient Pilot, that first cross'd the Indian Sea by means hereof. Others derive the Name from a Portuguese Word signifying *Motion*, or Change of Wind, and Sea.

*Lucretius* and *Apollonius* make mention of annual Winds which arise every Year, *Etesia Flava*, which seem to be the same with what in the East-Indies we now call *Monsoons*.

**MONSTER**, a natural Birth, or Production of a living thing, degenerating from the proper and usual Disposition of Parts, in the Species it belongs to. As when there are too many Members, or too few; or some of 'em are extravagantly out of Proportion.

*Aristotle* defines a *Monster* to be a Defect of Nature, when acting towards some end, it cannot attain to it, by reason some of its Principles are corrupted.

*Monsters* do not propagate their kind; for which reason some rank Mules among the Number of *Monsters*; as also *Hermaphrodites*. See *MULE* and *HERMAPHRODITE*.

The Word comes from the Latin *Monstrum*, of *Monstrandum*, showing.

*Da Cange* mentions an Inventory of the Church d'*Eoreux* with this Article, *Item unum Monstrum cum Officio Sancti Petri in Basil*, & *Oraculus in Jumentate*.

Females, which bring forth Twins, are most liable to produce *Monsters*. The reason, probably, is owing to this; that tho' the Twins are cover'd with one common Chorion, yet they have each their separate Amnios, which, by their contiguity may chance to grow together, and so occasion a confusion, or blending of the Parts. Hence so many double Creatures. See *DOUBLE*.

*F. Mallarbane* accounts for the Production of *Monsters* in the Animal World, thus:

The Creator has established such a Communication between the several parts of his Creation, that we are not only naturally led to imitate one another, i. e. have a disposition to do the same things, and assume the same manners with those with whom we converse; but also have certain natural Dispositions which incline us to Compassion, as well as Imitation. These things most Men feel, and are sensible of; and, therefore, need not be proved. The Animal Spirits then are not only naturally carried into the respective parts of the Body to perform the same Actions, and the same Motions which we see others do, but also to receive in some manner their Wounds, and take part in their Sufferings.

Experience tells us, that when we look attentively on any Person severely beaten, or that has a large Wound, Ulcer, or the like; the Spirit immediately flows into those parts of our Body which answer to those we see suffer in the other; unless their Course be stopp'd from some other Principle. This Flux of Spirit is very sensible in Persons of a delicate Constitution, who frequently shudder, and find a kind of trembling in the Body on these Occasions; and this Compassion in Bodies, produces Compassion in the Mind.

Now it must be here observed, that the view of a Wound, &c. produces a Wound in the Person who views it, by so much the greater and more sensible, as the Person is more weak and delicate; the Spirit making a stronger Impression on the Fibres of a delicate Body, than in those of a robust one. Thus strong, vigorous Men, &c. see an Execution without much concern, while Women, &c.

are struck with Pity and Horror. As to Children still in their Mother's Womb, the Fibres of their Flesh being incomparably finer than those in Women, the Course of the Animal Spirits must necessarily produce much greater Alterations.

This thing being laid down, *Monsters* are easily accounted for. Suppose, e. g. a Child born a Fool, and with all its Legs and Arms broke in the same manner as those of Criminals in some Countries are; which case we chuse to instance in, because we are told from Paris that such a *Monster* was actually born there, and liv'd in one of their Hospitals twenty Years: The Cause of this Accident, according to the Principles laid down, was, that the Mother seeing a Criminal executed, every Stroke given to the poor Man, strook forcibly the Imagination of the Mother; and by a kind of Counter-stroke, the tender and delicate Brain of the Child. Now, tho' the Fibres of the Woman's Brain were strangely shaken by the violent flux of the Animal Spirits on this occasion, yet they had strength and consistence enough to prevent an entire disorder and overturning; whereas the Fibres of the Child's Brain being unable to bear the shock of those Spirits, were instantly dissipated; and that Ravage was great enough to deprive him of Reason all his Life time.

Again, the view of the Execution frightening the Woman, the violent Course of the Animal Spirits was directed forcibly from the Brain to all those Parts of the Body corresponding to the suffering parts of the Criminal; and the same thing must happen in the Child. But in regard the Bones of the Mother were strong enough to resist the Impulse of those Spirits, they were not damaged. And yet the rapid Course of these Spirits could easily overpower, and break the tender and delicate Fibres of the Bones of the Child; the Bones being the last parts of the Body that are form'd, and having a very slender consistence while the Child is yet in the Womb.

To which it may be here added, that had the Mother determined the Course of these Spirits towards some other part of her Body, by tickling or scratching herself vehemently, the Child would not, in all probability, have had its Bones broken; but the part answering that, to which the Motion of the Spirit was determined, would have been the Sufferer.

Hence appears the reason, why Women in the time of Gestation, seeing Persons, &c. mark'd in such a manner in the Face, imprints the same Mark on the same parts of the Child: And why, upon rubbing some hidden part of the Body, when startled at the Sight of any thing, or agitated with any extraordinary Passion, the Mark or Impression is fix'd on that hidden part rather than on the Face of the Child. From the Principles here laid down, may most, if not all, the Phenomena of *Monsters* be easily accounted for.

There are also *Monsters* in the Vegetable World: Such, e. g. are what some Botanists call *Mules*. See *MULE*, *GENERATION*, &c.

Flourish give the Denomination *Monsters* to what we otherwise call *Double Flowers*.

**MONSTRANS de Droit**, a Writ issuing out of Chancery to be restored to Lands or Tenements that are mine in Right, tho' on some occasion found in Possession of one largely dead.

**MONSTRAYERUNT**, a Writ which lies for a Tenant who holds freely by Charter in ancient Demesne, upon his being distrained for the payment of any Toll or Imposition contrary to the Liberty he does, or ought to enjoy.

**MONSTRUM** was antiently used for the Box wherein Relicks were kept. See *MONSTER*.

**MONS Peneis**, see *VENERIS Mons*.

**MONTANISTS**, antient Heretics, so call'd from their Leader *Montanus*, who acted the Prophet, and had his Prophetical es.

They were also called *Phrygians, Cataphrygians*, and *Quintilians*. See *PHRYGIAN*, *CATAFRYGIAN*, and *QUINTILIAN*.

**MONTH, MENES**, the twelfth part of a Year. See *YEAR*: Time, we have observ'd, is Duration mark'd out for certain uses; and measured by the Motions of the Heavenly Bodies. See *TIME* and *DURATION*.

Hence result divers kinds of Years, and Months, according to the particular Luminary by whose Revolutions they are determined, and the particular purposes they are destined for; as *Solar Months, Lunar Months, Civil Months, Astronomical Months*, &c.

*Solar Months* is the Space of Time wherein the Sun moveth thro' one entire Sign of the Ecliptic. See *SUN*.

Hence, if regard be had to the Sun's true Motion, the *Solar Months* will be unequal; since the Sun is longer in passing thro' the Winter Signs, than those of the Summer.

But as he constantly travels thro' all the Twelve in 365 Days, 5 Hours, and 49 Minutes, the Quantity of a mean *Month* will be had by dividing that Number by 12. On

this Principle, the Quantity of a Solar Month will be found 30 Days, 10 Hours, 29 Minutes, 5 Seconds.

Lunar MONTHS are either *Synodical*, *Periodical*, or *Illuminative*.

Lunar *Synodical* MONTH, call'd also, absolutely, Lunar MONTH, and *Lunation*, is the Space of Time between two Conjunctions of the Moon with the Sun; or between two New Moons. See *SYNOICAL MONTH* and *LUNATION*.
