and *Victim*, and sometimes made a short Discourse, by Way of Complement; as we find *Homer* makes *Ulysses* do, when he presented the High-Priest with *Iphigenia* to be sacrificed. As any Person came to present his Offering, he washed his Hands in a Place appointed in the Temple for that Purpose. Lastly, when the Offering was made, the Priest that officiated, perfumed the *Victims* with Incense, and sprinkled them with lustral Water; and having washed his Hands, and got up again to the Altar, he prayed to the God to whom he presented the Sacrifice, with a loud Voice, That he would accept of those Offerings, and be pleased with the *Victims* he sacrificed to him for the publick Good, and for such and such Things in particular. In the Close of the Offertory and Prayer, made by the Priest to the Gods, he came down the Steps of the Altar, and from the Hand of one of his Assistants, received the Sacred Paste, called *Mola salsa*, made of Barley or Wheat Flower, mixed with Salt and Water, which he threw upon the Head of the *Victim*, sprinkling a little Wine upon it, which was called *Immolation*. *Servius* says, The Priest scattered little bits of this Paste upon the Head of the *Victim*, the Altar, where the sacred Fire burned, and the Knives, by Way of Consecration. He then took Wine in a Vessel called *Simulacrum*, and having tasted it himself first, and made his Assistants do all the same, to shew that they partook of the Sacrifice, he poured it between the Horns of the *Victim*, pronouncing these Words of the Consecration, *Mactus hoc vino inferis esto*; Let this *Victim* be improved and honoured by this Wine. This done, he pulled off the Hairs from between the Horns, and threw them into the Fire; and commanded the Sacrificer, (who asked him, *Agas* Shall I strike?) To knock down the *Victim* with a Blow on the Head with an Hammer or Ax; upon which, another Assistant, named *Papa*, presently thrust a Knife into his Throat, whilst a third received the Blood, where-with the Priest sprinkled the Altar.

When the *Victim* was slain, they flaid him, if it was not a Burer Offering; (for then they burn'd Skin and all,) took the Fleth off the Head, and adorning it with Garlands and Flowers, fastened it to Pillars of the Temple, as well as the Skins, as Ensigns of Religion, carrying them about in Procession in publick Calamities; not but that the Priests oft wore the Skins, and others went to sleep upon them in the Temples of *Aesculapius* and *Fannus*, that they might receive favourable Responses in their Dreams, or be cured of their Maladies. They then opened the *Victim's* Entrails, and after circumspectly viewing them, to draw Prefages therefrom, according to the Art of the *Aruspices*, they flowered them with Meal, and sprinkled them with Wine, and made a Present of them to the Gods, *reddebant esca Diis*, by throwing them into the Fire in small bits, boiled or parboiled; and hence the Entrails were called *Porrice*. The Entrails being burned, and the other Ceremonies finished, they believed the Gods to be satisfied; and that they could not fail to find their Vows accomplished, which they expressed by the Word *Litare*, *q. d.* All is finished, and well done; whereas *Non Litare*, on the contrary, intimated there was something wanting for the Perfection of the Sacrifice, and that the Gods were not appeased. The Priest afterwards dismissed the People with these Words, *I licet*. Hence it may be observed, that the Sacrifices consisted of four principal Parts, the first called *Libatio*, or the pouring a little Wine upon the *Victim*; the second *Immolation*, when, after they had scattered the Crumbs of salted Paste thereon, they killed it; the third *Redditio*, when they offered the Entrails to the Gods; and the fourth *Litatio*, when the Sacrifice was perfected, and accomplished without any Fault.

**SACRILEGE**, the Crime of profaning sacred Things, or Things devoted to God, or alienating to Laymen, or common Purposes, what was given to Religious Persons, and pious Uses. Our Fore-fathers were very tender in this Case; and therefore, when the Order of the Knights Templars was dissolved, their Lands, &c. were all given to the Knights Hospitallers of *Jerusalem*, for this Reason, *Ne in pios usus ergata, contra donatorum voluntatem, in alios usus distraherentur*.

**SACRISTAN**, a Church Officer, otherwise called *Sexton*. See **SEXTON**.

**SACRISTY**, or *Sentry*, the Place where the Vestels and other Utensils, and the Ornaments of the Church, were anciently reserved, called also in ancient Authors, *Secretarium*. The like with what we call *Vestry*. See **VESTRY**.

**SACROLUMBARIS**, or *Sacro-lumbus*, in Anatomy, a Muscle, that ariseth fleshy from the superior Part of the *Os Sacrum*, posterior Part of the *Ilia*, and from all the Spines and transverse Processes of the *Vertebrae* of the *Loin*. It gives a small Tendon to the posterior Part of each Rib near its Root, where a small Bundle of fleshy

Fibres ariseth and unites with each ascending Tendon, to the third, fourth, fifth, and sixth *Vertebrae* of the Neck. This with the *Serratus Pufficus inferior*, and *Triangularis*, help to contract the Ribs in Expiration. But they are but of small Force, and seem only to accelerate the Motion of the Ribs, which fall down chiefly by their own Gravity, and the Elasticity of the Ligaments, by which they are tied to the *Vertebrae*. See **MUSCLE**.

**SACRUM OS**, in Anatomy, is the lower Extremity of the *Spina Dorsi*, being that whereon we sit. See **OS SACRUM** and **SPINA**. 'Tis doubted whence this Name should arise: Some think 'tis because the Ancients offered it in Sacrifice to the Gods; others, because 'tis very large, and others, because it incloses the Natural Parts. Its Figure is triangular. 'Tis hollow within-side, and by that Means, contributes to the forming of the Cavity at the Bottom of the *Hypogastrium*, called the *Pelvis*. Its Fore-part is smooth, by which Means, the Parts it contains are secured from being wounded: Its Hind-part rough, that the Muscles may fasten the better to it. It has Three different Articulations. The first is with the last of the *Vertebrae* of the *Loin*, and is like that of the other *Vertebrae*. The second, with the *Os Coccygis*, by *Synchondrosi*: The third, with the Bones of the Hips. The *Os Sacrum* is usually divided into five Parts, which are ranked among the Number of *Vertebrae*. The highest is the greatest; the rest growing less as they go lower. These *Vertebrae* are easily separated in Children, by Reason the *Cartilages* which joyn them, are not yet ossified. But in Adults, they are so firm, that they only make one Bone. 'Tis in the *Os Sacrum*, that the Cavity which contains the Spinal Marrow, terminates. See **VERTEBRÆ**. — *Sacra Vena* is a Vein arising from the *Os Sacrum*, and terminating, usually in the *Iliac Vein*; sometimes in the Place where the two *Iliacs* meet with the ascending *Aorta*. — *Arteria Sacra*, is a Branch of the *Aorta Inferius*. See **VEIN**. &c.

**SADDLE**, in the Manage, a Kind of stuffed Seat, laid on the Back of a Horse for the Convenience of the Rider. The Origin of the *Saddle* is not well known. *Gorgop. Beccanus* attributes its Invention to the *Solii*, a People among the ancient *Franks*; and hence, says he, came the *Latin Sello, Saddle*. 'Tis certain, the ancient *Romans* were unacquainted with the Use either of *Saddles* or *Stirrups*: Whence *Galen* observes, in several Places, that the *Roman Cavalry*, in his Time, were subject to several Difinities of the Hips and Legs, for want of having their Feet sustained on Horse-back. And long before him, *Hippocrates* had observed, that the *Scythians*, who were much on Horse-back, were troubled with Defluxions in their Legs, because of their hanging down. The first Time we hear of *Saddles* among the *Romans*, was *Anno. 340*; when *Constantine*, endeavouring to deprive his Brother *Constantine* of the Empire, made Head against his Army, and entering the Squadron where he himself was, threw him off his *Saddle*, as we are informed by the Historian *Zonaras*. Before, they made Use of square Pannels; such as we see in the Statue of *Antoninus* in the Capitol. The Use of *Saddles* was first established in *England*, by a Law of *Henry VII.* whereby the Nobility were obliged to ride on *Saddles*. 'Tis but very lately that the *Irish* have taken to it.

There are various Kinds of *Saddles*; as the *running Saddle*, a very final one, with round Skins. The *Burford Saddle*, which has the Seat and Skirts plain. The *Fad Saddle*, of which there are two Kinds, the one made with Burs before the Seat, the other with Bolsters under the Thighs. The *French Pad-saddle*, the Burs whereof, came all round the Seat. *Portimantus Saddle* furnished with a Cante behind the Seat, to keep a Carriage off the Rider's Back. *War Saddle*, furnished with a Cante, &c. Bolster both behind and before.

*SADDLE-gall'd*, is when a Horse's Back is hurt or fretted with the *Saddle*; 'tis cured by bathing the Part with Urine, or warm Wine. When the Sore is large, 'tis cured by *Aqua Secunda*, strewing over it the Powder of an old Rope or Flax, and consuming the Proud-flesh with *Vitriol* or *Celsorum*.

**SADUCEES**, a Sect among the ancient *Jews*, esteemed as Deists, or Free-Thinkers, rather than real *Jews*; tho' they assidued at all the Ceremonies of the Worship in the Temple. *St. Epiphonius* will have them to have taken their Rise from *Dusibaus*, a *Samaritan* Sectary; and *Yerullianus* is of the same Opinion. *St. Jerom*, and other Writers add, That the *Saducees* came near the *Samaritans* in many Things; particularly in this, that they allowed no Books of Scripture, but the five Books of *Moses*. The Jesuit *Serrarius*, has also embraced this Opinion; as seeming to be supported by the Authority of *Josephus*. But all *Josephus* says, is, That they admitted all that was written, i. e. all the Books of Scripture; intimating by that, they disowned the unwritten Traditions of the *Pharisees*; and, in Effect, *St. Epiphonius* is forced to own, that

that the *Saducees* were *Jews*; inasmuch, as they assisted at the Worship and Sacrifices of the Temple at *Jerusalem*: Whereas the *Samaritans* sacrificed on *Mount Gerizim*. See *SAMARITANA*.

Some Authors ascribe the Original of this Sect, to one *Sadoe*, a Disciple of *Antigonus Sokoas*, who frequently inculcated it on his Scholars, That God is to be served for himself, and not out of View to any Reward to be received from him in the next World, as Slaves serve their Masters merely for Recompence. *Sadoe*, add they, putting a false Interpretation on these Words of his Master, published, That there was no Reward to befall good Actions done in this World. And hence arose the Sect of *Saducees*, thus denominated from their Leader *Sadoe*. St. *Epiphanius*, and some modern Writers after him, take the *Saducees* to have been thus called from the *Hebrew*, *Sadic* Just, or *Sedec* Justice, in Regard of the great Justice they shewed in all their Actions.

'Tis observ'd, *Acti* xxiii. 8. that the *Saducees* say, There is no Resurrection, neither any Angel or Spirit; but that the *Pharisees* believe both the one and the other. These Words, *The one and the other*, seem to insinuate, That Angel and Spirit are one and the same Thing. But as the *Apostles*, observes *Occumicus* on that Passage, don't always use the exactest Terms, one may understand by *Spirit*, all spiritual Substances; as if the *Saducees* had believed that God himself was a Body. This, however, is not *Occumicus's* Opinion. He asks, Why the Scripture says, *The one and the other*, tho' it spoke of Three Things, *Resurrection, Angel, and Spirit*? And he answers, That 'tis either because *Angel and Spirit* are the same thing; or that *one and the other*, which is only properly understood of Two Things, is, perhaps, here spoke of Three: Exact Propriety of Words not being to be required in Books wrote by simple illiterate Fishermen. 'Tis true, in explaining what goes before, he observes, That the *Saducees*, being very ignorant, might possibly disbelieve the Existence of a God, and on that Account, might be represented as denying a Resurrection, &c. But he does not say, that by *Spirit*, they might mean all spiritual Substance. 'Tis probable, all meant by it, is the Immortality of the Soul; it being the Opinion of the *Saducees*, That there is nothing immortal in Man. 'Tis certain, they denied all Resurrection, and allowed of no Happiness but what is enjoyed in this Life; believing, that every Thing told of the other World, had been invented by the *Pharisees*. Hence, also, they denied a Divine Providence, and attributed all Things to Free Will; in which, they opposed the Opinion of the *Pharisees*, who admitted a kind of Destiny or Fatality in all our Actions. See *PHARISEES*.

*SAPHENIA*, in Anatomy, a Vein, which arising over the *Malesius internus*, up along the Leg, and the Inner Part of the Thigh, discharges itself near the Groin, into the *Cranial Ven*. 'Tis this Vein they usually open when they bleed in the Foot. It has its Name probably from *saphis*, *Alasifensis*, as lying plain in Sight.

*SAFE CONDUCT*, a Security given by the Prince under his Great Seal, to a Stranger for his quiet coming in and passing out of the Realm. The *Safe-Conduct* is granted to Enemies, the Passport to Friends. Judges sometimes give *Safe Conduct* to Delinquents, or Prisoners, to enable them to act in their Affairs.

*SAFE GUARD*, *Salvo guardia*, a Protection given by the King to a Person fearing the Violence of some other Person, for seeking his Right by Course of Law.

*SAFE GUARD*, at Sea, is a Rope which saves and secures any Thing: For Instance, that whereby Persons walk securely over the Bolt sprit. The *Safe guard of the Helix*, is a Rope which goes through the Helm, and is fastened to the Buttocks of the Ship. See *REDS*.

*SAFE-PLEDGE*, in Law, a Security given for a Man's Appearance against a Day assigned.

*SAFFRON*, or *Saffron*, a Plant which produces a Flower of the same Name; whence, also, a Drug called *Saffron* or *Crocus* is gathered. See *CROCUS*. The Root which produces the *Saffron*, is a kind of Onion, covered with several bulbous Cartilages. Its Leaves are long, narrow, thick and soft to the Hand. Its Flower, which appears a long Time before the Leaves, is a faint Blue, tinged with a little Yellow at the Extreme towards the Stalk. From the Middle of the Flower arise three reddish Filaments or Chives, which are properly the *Saffron*; the rest of the Flower being of no Use. As soon as the Flower is gathered, they separate the Chives, and lay them on Hurdles, or in large Sieves, or on a little Kiln for that Purpose, with a little Coal-fire underneath to dry them. When dry, the *Saffron* is in its Perfection, and fit for Use. 'Tis observed, that five Pounds of fresh Chives only make one Pound of dry *Saffron*. The good Qualities of *Saffron* are, That its Chives be long and broad, that

they be velvety over with a fine Red, of an agreeable Smell, free of yellow Threads, and very dry. The best *Saffron* in *Europe* is that of *England*. That brought from *Spain* is good for nothing; because of the Oil the *Spaniards* mix with it to keep it. 'Tis used both in Foods and Medicines, to cheer, fortify, and resolve; 'Tis also used by Illuminators, to make a golden yellow Colour. The Word is termed from the *Arabic*, *Zafiran*, which signifies the same Thing.

*SAFFRON* is also a Name given to several Chymical Preparations, from the Resemblance of their Colour to that of *Saffron*, but more usually called *Croci*: Such is *Saffron of Venus*. See *COPPER*.

*SAFFRON of Mori*. See *CROCUS MARTIS*. *Saffron of Gold*. See *AURUM FINISSIMUM*.

*SAGAPENUM*, or *Serapintus*, a Gum whose Smell comes very near that of the *Pine*, whence its Name. It flows by locustion, from the Trunk of a ferulaceous Plant growing in *Perfia*. The best is in bright transparent Tears, of a strong Smell, and the whiter and freer of Dirt, the better. Sometimes 'tis found as white, both within and without Side, as Milk; tho' this is very rare. 'Tis esteemed operative and purgative, proper in the Epilepsy, Asthma and Palsy, and is also used externally to assuage Pains, and resolve Tumors.

*SAGATHEE*, in Commerce, a slight woollen Stuff, being a kind of Serge or Raten; sometimes mixed with a little Silk. 'Tis manufactured chiefly at *Amiens*; tho' we have our Share in *England*. The Word is formed from the *French* *Soyette*, a Diminutive of *Soye*; which see. The *French* Name *Soyette*, is derived from that of the Thread used herein, which is chiefly prepared and spun in *Hainaut*, about *Tarcoing*, &c. and called *Fil de Soyette*.

*SAGE*, *Salvia*, a Medicinal Herb of an agreeable, aromatic Taste; esteemed an excellent Cephalic of the detergent Kind; and on that Score likewise used as a Vulnerary and Diuretic. There are several kinds of *Sage*; those used and cultivated by us are the *Yew-Sage*, or *Sage of Virtue*, the *Red Sage*, and the *Wormwood Sage*. The first has the most agreeable Flower; and on that Score is cut when young and full of Sap, dried, and kept for Tea. The *Dutch* dry and prepare their *Sage* like other Teas, and carry it to the *Indies* as a very precious Thing. They there find a good Market for it; the *Chinese* preferring it to the best of their *Indian* Teas; and for every Pound of *Sage* Tea, giving, in Exchange, Four Pounds of theirs, which they sell again very dear in *Europe*. But the *Wormwood Sage* is esteemed of the most Efficacy in Medicine, and is that alone used in the Shops. It makes an excellent Gargarism, especially if sharpened with a little Acid. Its Decoction is very grateful and cooling, with the Addition of a little Lemon-juice. 'Tis both detergent and absorbent, and as such, finds Place in Diet-drinks, and medicated Alex, intended for Sweetners and Cleaners of the Blood. The School of *Solerism* recommend *Sage* as a Remedy in all Disaffects. Hence the Verbe,

*Cum moritur homo cui salvia crescit in horto?*

*Sage*, when viewed with a Microscope, appears covered all over with little Spiders, which are seen to walk, &c. about. It yields, by Distillation, a very agreeable, aromatic Oil, of some Use in the Shops.

*SAGITTA*, in Astronomy, the *Arrow*, a Constellation of the Northern Hemisphere. See *CONSTELLATION*. The Stars in the Constellation *Sagitta*, in *Tycho's* Catalogue, are Five, and as many in *Ptolemy's*. In Mr. *Flemstead's* Catalogue they are Twenty Three; The Longitudes, Latitudes, &c. whereof are as follow.

SAGITTA, in Botany, signifies the Upper Part of any small Twig, Cyon, or Grait of a Tree.

SAGITTA, in Mathematicks, is the same as the verfed Signe of any Arch, and is fo called by fome Writers, becaufe it is like a Dart, or Arrow, ftanding on the Chord of the Arch. See SINE.

SAGITTA, in Geometry, a Term fome Writers ufe for the *Abfiffa* of a Curve. See ARCUS.

SAGITTAL SUTURE, in Anatomy, the fecond of the genuine Sutures of the *Cranium*. See SUTURE. It reaches the whole Length of the Head; and has its Name from the Latin *Sagitta*, as being ftraight, like an Arrow. 'Tis fometimes alfo called *Rhomboides*.

SAGITTARIUS, in Astronomy, the *Archer*, one of the Signs of the Zodiac; the Ninth in Number. See SIGN.

The Stars in the Confellation *Sagittarius*, in *Protonoy's* Catalogue are Thirty One; in *Tychon's* Sixteen; in the *Britannic* Catalogue Fifty. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

SAGUM, in Antiquity, a military Garment wore by the *Greeks, Romans and Gauls*, in Manner of a Caslock; covering the Thighs, and fuffaining the Sword. 'Twas made of Wool, and fquare. They had one for the Winter, and another lighter for Summer.

SAICK, or Saigue, a *Turkifh* Veffel, very proper for the Carriage of Merchandizes. It has fquare Sails on the Middle-maft; without either Mizzen, Top-gallant, or Shrouds: Only a Main-maft, with a Main-top-maft, both very high; with a Boit-fprit, and a little Mizzen Maft. The Height of the Main-maft makes the Saick be feen at a great Difftance. Their Make renders it impoffible for them to go with a Side-wind; but when they have the Wind behind them, nothing can out-go them. The generality of them carry no Guns.

SAIGNER, in Fortification, a *French* Term, fignifying to bleed or drain. Hence to *faigner* a Moat, is to empty or draw out the Water by Conveyances under Ground, that it may be paffed over the more eafily, after laying Hurdles or Ruffes on the Mud remaining.

SAIL, in Navigation, an Affemblage of feveral Breadths of Canvas, or Cloth of raw Hemp, fewed together by the Lifts, and edg'd around with a Cord; faltened to the Yards and Strays of a Veffel, to make it drive before the Wind which bears thereupon. There are two Kinds of Sails, the one fquare, generally ufed in high bottom'd Veffels: 'Tis has various Naucs, according to the various Mafts 'tis faltened to, as the *Main-fail*, the *Mizzen-fail*, the *Top-fail*, &c. The other are triangular, called *Swaack-fails*, and by fome *Latine-fails*, becaufe chiefly ufed in *Italy*, and in flat-bottom'd Veffels; tho' they are alfo ufed on the Mizzen-Mafts and Strays of other Veffels. They need but few Ropes, and little Wind; but are dangerous, and not to be ufed in foul Weather. There are ordinarily Ten Sails in large Veffels; which Number is increafed at Bottom by the Addition of Bonnets, and at the Sides by *Coff-fails*.

A Veffel is faid to fet *Sail*, to go with full *Sail*, to make all her *Sails*, that is, to open all her *Sails*. To be under *Sail*, that is, ready to fet *Sail*, &c.

SAILS, are alfo the *Vanes* of Windmills, or the Arms or Flights, whereby the Wind has its Effect on Windmills. Thefe are either *Horizontal* or *Perpendicular*. See WINDMILL.

SAILS, in Falconry, the Wings of an Hawk are fo termed.

SAILING, in a general Senfe, is ufed for the Art, or Act of Navigation; or of determining all the Cafes of a Ship's Motion, by Means of *Sea-Charts*. See NAVIGATION. Of this there are Three Kinds, *Plain*, *Mercator's*, and *Circular*.

Plain SAILING, is that performed by Means of Rhumbs drawn on a plain Chart. See PLAIN CHART.

Mercator's SAILING, is that performed by Rhumbs drawn on a *Mercator's Chart*. See MERCATOR'S CHART.

Circular SAILING, is that performed by the Arch of a great Circle; which, of all others, where practicable, is the fhorteft. See CIRCULAR.

Doctrines of PLAIN and MERCATOR'S-SAILING.

Case I. The Longitude and Latitude of Two Places given; To find the Departure, or Miles of Longitude.

In Plain Sailing. 1<sup>o</sup>. If both Places be more Eafterly than the firft Meridian, fubtraft the lefs Longitude from the greater, the Remainder is the Difference of Meridians. If one of the Places be more Eafterly, and the other more Wefterly than the firft Meridian, add the Longitude of the more Eafterly to the Complement of the Longitude of the more Wefterly to a whole Circle; the Sum is the Difference of Meridians. 2<sup>o</sup>. Divide the Difference of Meridians into fo many Parts as there are Degrees in the Difference of Latitude; Or, if the Difference of Latitude be greater than that of the Meridians, into fo many fewer. 3<sup>o</sup>. Reduce the Minutes of Longitude anfwering to one Part, into Miles of the feveral Parallels, in the former Cafe; or into Miles of the Parallel, which is an arithmetically mean Proportional between the Two, in the latter Cafe. 4<sup>o</sup>. The Aggregates of thefe Parts collected into one Sum, exhibit the Departure or Miles of Longitude.

E. g. Suppose the Longitude of the one Place 35<sup>o</sup>, and that of the other 47<sup>o</sup>, the Difference of Meridians is 12<sup>o</sup>. Suppose the Latitude of the firft 4<sup>o</sup>, and that of the latter 8<sup>o</sup>, the Difference will be 4<sup>o</sup>, confequently we have failed from the 4th to the 8th Parallel. Therefore divide 12 by 4, and reduce the Quotient 3<sup>o</sup>, into Miles in the feveral Parallels 4, 5, 6, and 7. (See DEGREE) the feveral Quotients will be 43<sup>o</sup>, 71<sup>o</sup>, 43<sup>o</sup>, 68<sup>o</sup>, 43<sup>o</sup>, 65<sup>o</sup>, 43<sup>o</sup>, 59<sup>o</sup>, the Sum of which is 174, the Departure or Miles of Longitude required.

*In Mercator's Sailing.* The Reduction is much more commodiously performed in *Mercator's Charts*; wherein the Arch intercepted between the Two Meridians, is applied to an Arch of the Meridian intercepted between the Two Parallels; and the Distance it there measure, gives the *Departure*, or *Miles of Longitude* required. See *DEPARTURE* and *LONGITUDE*.

*Case II. The Longitude and Latitude of Two Places, to and from which, a Ship is to sail, being given; To find the Rhumb to be sailed on, and the Distance to be run.*

*In Plain Sailing.* 1. Find the *Departure* by the last Case. 2. From the *Departure*, and Difference of Latitudes, find the *Isochronic Angle* or *Rhumb-line*; which is done by this Proportion: as the Difference of Latitude is to the *Departure*, so is the whole *Sine* to the *Tangent* of the Angle of the *Rhumb-line*. The Distance then, to be run on this *Rhumb*, is to the *Departure*, as the whole *Sine* to the *Sine* of the Angle of the *Rhumb*. See *RHUMB*.

*In Mercator's Sailing.* 1. Apply the Center of the *Mariners Compass* on the Place sailed from, on the *Mercator's Chart*, as *a*, (*Tab. Navigation* Fig. 7.) and so as that the North or South Line thereof be parallel to some of the Meridians. 2. Mark the *Rhumb* of the *Compass*, wherein the Place sailed to, as *b*, is placed. For this is the *Rhumb* to be sailed on. 3. The same *Rhumb* is likewise found by drawing a right Line from *a* to *b*; and with a *Protractor*, finding the Angle the *Rhumb* makes with any Meridian it cuts. 4. The Quantity or Distance *a b* is found by applying the Part *a 1* to *1 K*, *1 a* to *k l*, *2 b* to *l m*.

Note, the *Rhumb* and *Distance* may also be found after the same Manner on a plain *Chart*.

The same may likewise be found by *Loxodromic Tables*; thus, 1. Choose a *Rhumb* at Pleasure, and under the same, in the Tables, find the Longitudes corresponding to the given Latitudes. The Difference whereof, if it coincide with the Difference of the given Longitudes, the *Rhumb* is well chosen; otherwise another must be pitched on, either more or less oblique, 'till the Tabular Difference agree with the given Difference. 2. The *Rhumb* thus found, the Distances answering to the given Latitudes, must be taken from the Tables, and the less subtracted from the greater; the Remainder is the *Distance* sought.

*Case III. The Rhumb and Distance sailed being given; To find the Longitude and Latitude of the Place arrived at.*

*In Plain Sailing.* 1. From the *Data*, find the Difference of Latitude of the Two Places: (by the Proportion delivered under the Article *RHUMB-LINE*.) This Difference added to the Latitude of the Place sailed from, or subtracted from the same, the Sum, or the Remainder, leaves the Latitude of the Place sailed to. 2. From the same, find the *Departure*; and thence the Latitudes of the Place sailed to (as directed under *RHUMB-LINE*.)

*In Mercator's Sailing.* 1. Place the *Mariners Compass* on the *Chart*, with the Center over the Place *a*; and the Meridian, or North or South Line, parallel to the Meridian thereof. 2. From the Point *a*, draw a right Line, as *a b*, for the Ship's Course. Take the Distance by Parts, in Parts of the Meridian *IK*, *KL*, &c. and set it off upon the right Line *ab*; *E. gr.* from *a* to *c*; Then will *c* be the Place the Ship is arrived at; the Longitude and Latitude whereof are given by the *Chart*. See *CHART*.

*By the Loxodromic Tables.* 1. Under the given *Rhumb*, seek the Distance answering to the Latitude of the Place sailed from; and either add it to, or subtract it from the given Distance; as the Latitude of the Place sailed to is greater, or less than that sailed from. 2. Under the same *Rhumb*, ascend or descend further, till you meet with the Distance corrected. 3. The Latitude answering thereto in the first Column, is the Latitude of the Place sailed to. 4. From the second Column of the Table take the Longitude corresponding to the Latitudes of the Places sailed to and from. Their Difference is the Difference of Longitudes of the Places sailed to and from.

*Case IV. The Latitudes of the Places sailed to and from, together with the Rhumb sailed on, being given; To find the Distance and Difference of Latitudes.*

*In Plain Sailing.* From the Difference of Latitude and the *Rhumb* given, find the *Distance*; and from the same *Data*, the *Departure*. See *RHUMB*. This converted in-

to Degrees of a great Circle (See *DEGREES*) exhibits the Difference of Longitudes sought.

*In Mercator's Sailing.* 1. Place the *Compass* on the *Chart*, as in the preceding Case. From the Place sailed from, as *a*, draw the *Rhumb-line* *ab*, sailed in; till it cut the Parallel of the given Latitude. 2. The Point of Intersection will be the Place arrived in. 3. Hence its Longitude is easily found; and the *Distance*, See *RHUMB*.

*By the Tables.* Take both the Longitudes and the Distances answering to the Latitude of the given Places, out of the Tables; then subtract both the Longitudes and the Distances from each other. The first Remainder is the Difference of Longitude, the latter the Difference of the Places.

*Case V. The Latitudes of the Places sailed from, and to, with the Distance given; To find the Rhumb and the Difference of Longitude.*

*In Plain Sailing.* From the Difference of Latitude, and the *Distance*, find the *Rhumb*, and from the same *Data* find the *Departure*; which may be also determined from the *Rhumb* now found, and the Differences of Latitude, or from the *Rhumb* and the *Distance* run. Lastly, from the *Departure* find the Difference of Longitude. See *RHUMB*.

*In Mercator's Sailing.* On the Map draw the Parallel the Ship arrives at, *C D*. Reduce the *Distance* run into Parts proportional to the Degrees of the Map. The *Distance* reduced, being *a 2*; from *a* describe an Arch cutting the Parallel *C D* in *2*: Then will *2* be the Place in the Map; whose Longitude accordingly is easily found.

*By the Tables.* Subtract the given Latitudes from each other; and in the Tables seek the *Rhumb*; under which, the *Distance* run answers to the given Difference of Latitude. Subtract the Longitude under the *Rhumb*, answering to the Latitude of the Place sailed to; and that under the same *Rhumb* against the Latitude of the *Term* sailed to, from each other, the Remainder is the Difference of Longitude sought.

*Case VI. The Difference of Longitude of the Places sailed to and from, with the Latitude of one of the Places, and the Distance run, being given; To find the Rhumb, and the Latitude of the other.*

*In Plain Sailing.* Convert the Difference of Longitudes into Miles of Longitude or the *Departure*; from the given *Departure* and *Distance* run, seek the *Rhumb*: And from the same, and the *Rhumb*, seek the Difference of Latitude; which, and the Latitude of one Place being had, the Latitude of the other readily follows. See *RHUMB*.

*In Mercator's Sailing.* Through the given Place *a* in the Map, draw a right Line *E F* parallel to the Meridian *I H*; and make *F L* equal to the Difference of Longitudes. From *F* draw *L M* parallel to *E F*, which will be the Meridian the Ship is arrived at. Then from *a*, with the Interval of the *Distance* run, *a c*, describe an Arch intersecting the Meridian *M L*; the Place sought will be *c*. If then a *Compass* be placed on the Map, as before directed, the *Rhumb-line* will fall in with *a c*; and consequently the *Rhumb* will be known. Lastly, if through *c* be drawn *N O*, parallel to *A B*; *N A* will be the Latitude of the Place required.

*By the Tables.* Take a *Rhumb* at Pleasure, and under the same in the Tables, find the Longitude, and the *Distance* answering to the given Latitude. Add the given *Distance* to the *Distance* found in the Tables, if the Vessel sailed from the Equator; or subtract it therefrom, if it sailed towards the same. With the same *Sine*, or the *Distance*, enter the Tables; and the Longitudes found against it, subtract or add from that just found. If the Remainder be found the given Difference of Longitudes, the *Rhumb* is well taken. Otherwise, it must be changed for a more or less oblique one, till the same Operation being repeated, the Remainder be found the Difference of Longitudes; then the Latitude in the first Column, corresponding to the *Distance*, will be the Latitude of the other Place.

*Case VII. The Difference of Longitude, and the Latitude of one of the Places, being given, together with the Rhumb; To find the Distance run, and the Latitude of the other Place.*

*In Plain Sailing.* Reduce the Difference of Longitude into Miles of Longitude, or *Departure*, as under the first Case. From the *Departure* and the *Rhumb*, find the *Distance* run. (See *RHUMB*.) And from these, or from the *Rhumb*, and the *Distance* run, find the Difference

ference of Latitude. This done, as the Latitude of the one is already had, that of the other is to be tood.

In *Mercator's Sailing*. Place the Comps on the Chart as before; and by the given Rhumb, draw the Rhumb-line,  $a b$ . Draw a Meridian  $E F$  through the given Place  $a$ ; and with the Interval of the Difference of Longitude  $F L$ , draw another,  $L M$ , for that the Vessel is arrived at. Where this intersects the Rhumb-line, is the Place  $c$  that the Vessel is arrived at. Wherefore, if through  $c$  be drawn  $N O$  parallel to  $A B$ ;  $N A$  will be the Latitude of the Place. The Distance run  $a c$  is easily reduced into Miles by the Scale.

By the Tables. Under the given Rhumb seek the Distance run, and the Difference of Longitude answering to the given Latitude. If the Vessel have sailed towards the Pole, the Difference of Longitude is to be added to the given Difference of Longitude; if towards the Equator, 'tis to be subtracted from the same. In the former Case, descend in the Table, and in the latter, ascend; 'till in the first, the Aggregate, in the latter, the Difference be seen in the Column of Longitude. The Latitude answering hereto in the first Column, is that sought. And from the Distance answering to this Latitude in the first Case, the Tabular Distance is to be subtracted; or in the latter Case, that Distance to be subtracted from the Tabular Distance. What remains, is the Distance run.

From the Solution of these Cases in *Sailing*, 'tis evident, some are more easily performed by the Charts than the Tables; and that the *Mercator's Charts* are preferable to the Plain ones; since in the latter, the Distance is not reduced by the Map, but by a particular Scale for that Purpose.

#### Doctrine of CIRCULAR SAILING.

I. The Latitude and Longitude of the Places sailed to and from, being given; to find the Angle  $M$  (Fig. 8.) which a Ship's Way  $MO$  proceeding in a Circular Course, includes, with the Meridian  $P. M.$  of the Place sailed from.

Since in the Triangle  $PMN$ , we have  $PM$  and  $PN$ , the Complements of the given Latitudes  $HM$ , and  $LN$ , together with the Angle  $MPN$ , measured by the Arch  $HL$ , the Difference of the given Longitudes  $H$  and  $L$ ; the Angle  $PMN$  is found by *Spherical Trigonometry*. See TRIANGLE.

II. The Latitude  $HM$ , and the Longitude  $H$ , of the Place sailed from,  $M$ , with the Distance run, and the Latitude of the Place  $L S$  the Ship in a Circular Voyage arrives at, being given; to find the Longitude of the Place  $L$ , and the Angle  $PLM$  comprehended between the Ship's Way  $M L$ , and the Meridian  $P S$ .

In the Triangle  $PM L$ , we have given  $PM$  the Complement of the Latitude  $HM$ , and  $P L$  the Complement of the Latitude  $L S$ . Wherefore, if the Ship's Way  $M L$  be turned into Degrees of the Equator; we shall find the Angle  $M P L$ , which is measured by the Difference of Longitudes  $H S$ ; and likewise the Angle  $PLM$  by *Spherical Trigonometry*. See SPHERICAL TRIANGLE.

After the like Manner may other Problems be solved; but as 'tis easier and better *Sailing* by Rhumbs, than by Circles, and as this latter Way is but very little in Use; we chuse to pass them over. See GLOBULAR SAILING.

SAILING, in a more confined Sense, is the Art of conducting a Vessel from Place to Place, by the working or handling of her Sails and Rudder; though what is done by Means of this latter, is more properly called *Steering*. See STEERING.

To bring *Sailing* to certain Rules, a late Author computes the Force of the Water, against the Ship's Rudder, Stem or Side; and that of the Wind against her Sails: in order to this, he considers all Fluid Bodies, as the Air or Water, &c. as being composed of little Particles, which, when they act upon, or move against any Surface, do all move parallel one to another, or strike against the Surface after the same Manner. He considers, 1. That the Motion of any Body, with regard to a Surface, on which it is to strike, must be either Perpendicular, Parallel, or Oblique. In the first Case, the Body strikes with all its Force, which will be greater or less, according as the Body moves swifter or slower. In the second Case, the Line of Motion  $a b$ , (Tab. Navigation Fig. 3.) will not affect the Surface at all, because it is no way opposed to it; nor can the moving Body strike upon it, or touch it. In the third, if the Line of Motion,  $A D$ , be oblique to the Surface  $D C$ , so that the Angle of Incidence be  $A D C$ , then the Motion of the Body in the Line  $A D$  may be resolved into Two Directions, *viz.* into  $A E$ , or  $D B$ , and into  $A B$ . But the Direction or Line

of Motion  $A E$  being parallel to the Surface  $D C$ , cannot affect it at all; so that the whole Motion of the Body  $A$  in that oblique Manner of striking on the Surface, will be expounded by the Perpendicular  $A B$ . And if  $D A$  be made the Radius of a Circle, whose Center is at  $D$ ,  $B A$  will be the Line of the Angle of Incidence,  $A D C$ . Hence we deduce, That the Force of a Particle of Air or Water, as  $A$ , striking against the Surface  $D C$ , which may represent, either a Sail or the Rudder of a Ship, in the oblique Direction  $A D$ , will be to the Perpendicular Force there, as  $B A$  is to  $D A$ : that is, as the Line of the Angle of Incidence is to the Radius. And since what is thus true of one Particle, singly considered, will be true of all the Particles of any Fluid Body collectively, it will follow, That the Force of the Air or Water striking perpendicularly upon a Sail or Rudder, to the Force of the same, in any oblique Impingency, will be, as the Square of the Radius, to the Square of the Sine of the Angle of Incidence; and consequently, that all oblique Forces of the Wind against the Sails, or of the Water against the Rudder, will be to one another, as the Squares of the Lines of the Angles of Incidence. If the different Degrees of Velocities be considered, it will be found, that the Forces will then be as the Squares of the Velocities of the moving Air or Water; that is, That a Wind that blows thrice as strong, or moves thrice as swift as another, will have nine Times the Force upon the Sail. And it being also indifferent, whether you consider the Motion of a Solid in a Fluid, whose Particles are at rest; or of those Particles moving all parallel against a Solid that is at rest, the reciprocal Impressions being always the same: If a Solid be moved with different Velocities in the same Fluid Matter (as suppose Water) the different Resistances which it will receive from that Water, will be in the same Proportion, as the Squares of the Velocities of that Body.

Let  $H M$  (Fig. 4) represent a Ship,  $C D$  the Position of the Sail, and  $A B$  the Course of the Wind blowing towards  $B$ . Draw  $B G$  perpendicular to the Sail, and  $G K$  perpendicular to the Line of the Keel produced  $H M K$ . By what is said above, the Sail  $C D$ , will be driven by the Wind  $A B$ , according to the Direction of the Line  $B G$ . So that if she could divide the Water every Way with the same Facility, as she doth with her Head, the Ship would go directly to the Point  $G$ , along the Line  $B G$ . And if  $H K$  represent her direct Course, she would have gone the Length  $B K$ , and Sideways she would have gone the Quantity  $G K$ . But as her Length is much greater than her Breadth, so she will divide the Water, or make her Way in it with more Difficulty with her Side, than with her Head or Stern; on which Account, she will not run Sideways so far as  $K G$ , but fall short of it in Proportion to the said Difficulty of dividing the Water with her Side; 'till at  $s$ , if the Resistance she finds in her passing thro' the Water Sideways, be to that of passing Lengthways, suppose, as ten to one, then will not the Ship get Sideways above a tenth Part of the Line  $G K$ . Wherefore if  $K G$  be found to  $G L$ , in the Ratio of the Resistance of the Side to that of the Stern, and the Line  $B L$ , be drawn; the Ship will go to the Point  $L$ , along the Line  $B L$ , in the same Time as it would have gone to  $G$ , if it could have divided the Water every Way equally. This Part,  $K L$ , is called the *Drift of Leeway* of a Ship, and the Angle  $K B L$  is her Degrees of *Leeway*; as the Angle  $A B K$ , expresses how near the Wind she lies. After this, he proceeds to demonstrate, That the best Position or Situation of a Ship, so as she may make the best *Leeway*, but go to *Windward* as much as is possible, is this: That, let the Sail have what Situation it will, the Ship be always in a Line bisecting the Complement of the Wind's Angle of Incidence upon the Sail; that is, Supposing the Sail in the Position  $B C$  (Fig. 4.) the Wind blowing from  $A$  to  $B$ , and consequently, the Angle of the Wind's Incidence on the Sail  $A B C$ , and its Complement  $C B E$ ; then must the Ship be put into the Position  $B K$ , or move in the Line  $B K$ , bisecting the Angle  $B G E$ . He shews farther, That the Angle which the Sail ought to make with the Wind, *i. e.* the Angle  $A B C$ , ought to be but 24 Degrees; that being the most advantageous Situation to go to *Windward*, the most that is possible. And in order to bring this to bear in Practice, he directs to put Marks to the Sheets, Braces, and Bow lines of the lower Sails, to know when they are in their best Situation; and then, even in the Night, when the Marks of a Brace or of a Sheet shall come to the Cleat, one may be pretty well assured, that the Sail trims well. To this may be added, many curious Things from *Bartoli de V. Percussionis* concerning the different Direction given to a Vessel from the Rudder, when *Sailing* with a Wind, or floating without Sails in a Current; in

the former Cafe, the Head of the Ship always coming to the Rudder, and in the latter always flying off from it.

**SAILORS**, the elder Seamen, who are employed in managing the Sails, the Tackle, Steering, &c.

**SAINTS**, in the *Romish* Church, Holy Persons deceased; and since their Decente, Canonized by the Pope, after several Informations and Ceremonies. See **CANONIZATION**. One of the Points wherein the *Romans Catholics* and *Protestants* differ, is, That the former address, invoke, supplicate Saints, &c. to interceed for them; whereas the latter hold it sufficient to propose their good Examples. The Number of *Saints*, allowed as such, in the *Romish* Church, is prodigious. Father *Papebroch* reckons Seventeen or Eighteen Hundred to have died on the First of *June*, only. Indeed, the Croud of *Saints* wherewith their Martyrologies are stocked, is scandalous, even to the more sober of their own Communion. Father *Mabilion*, in an express Dissertation on the *Worship of unknown Saints*, observes, That Honours are given to *Saints*, who, perhaps, were not *Christians*; and whose Names were never known. Hence, being under a Necessity of giving them Names, they are therefore called *Baptized Saints*. He adds, That they every Day beseech *Saints* to interceed for them with God; when, 'tis much doubted, whether they themselves be in Heaven. Father *Papebroch* was a long Time employed in writing the Lives of the *Saints*. He ranged them each on the Day of the Year wherein they died. For the first Six Months he published Twenty Four Volumes in Folio; and since his Death, in 1714, his Successors have published Two more.

**SAKER**, is a Sort of Cannon; and is either extraordinary, ordinary, or least Size: *Saker* Extraordinary, is Four Inches Diameter at the Bore, 1800 Pound Weight, 10 Foot long; its Load 3 Pounds, 3 Inches and Half Diameter, and something more than 7 Pound and a Quarter Weight; its Level Range is 163 Paces. *Saker* Ordinary, is a Size less, 3 Inches 3 Quarters Bore, 9 Foot long, 1500 Weight; its Charge, 4 Pounds of Powder; Bullets Diameter 3 Inches and a Half, Weight 6 Pounds, its Level Range 160 Paces. *Saker* of the least Size, is 3 Inches and a Half Diameter at the Bore, 1400 Pound Weight, 8 Foot long, its Load near 3 Pounds and a Half; Shot 4 Pounds; 3 Quarters Weight, and 3 Inches and a Quarter Diameter. See **CANNON**.

SAL, in Chymistry, &c.  
 SAL *Armeniac*, or *Ammoniac*,  
 SAL *Tartar*, or *Nitri*,  
 SAL *Tynnelle*,  
 SAL *Tartari*,  
 SAL *Polychrestum*,  
 SAL *Gemma*,

See {  
 SALT.  
 AMMONIAC.  
 SALT-PETRE.  
 FAUNELLE.  
 TARTAR.  
 POLYCHREST.  
 GEMMA.

*SAL Volatile Oleosum*, an Aromatic *Volatile Salt*, first prepared by *Sylvius de la Boe*, and found a very notable Medicine, chiefly as a Cephalic and Cordial. 'Tis made thus: To an Ounce of *Volatile Salt* of *Sal Ammoniac*, distill'd with *Salts* of *Tartar*, and dulcified with Spirit of Wine, put a Dram and Half of some Aromatic Oil, or Essence, drawn from some generous Aromatic Vegetable, as Cinnamon, Cloves, Rosemary, Balm, &c. And when the Spirit and Oil are well stirred and incorporated together; draw off the *Volatile Salt* and Spirit in a Cucurbit. Some, instead of this, mix all the Ingredients together at first, viz. the *Sal Ammoniac*, *Sal Tartari*, Spirit of Wine and Powder of Cinnamon or Cloves, &c. and distill off the *Volatile Spirit* and *Salt* at once; but the former Way is preferred. See **VOLATILE**.

**SALADE**, in War, a light Covering, or Armour for the Head, anciently wore by the light Horse; only differing from the Cask, in that it had no Crest, and was little more than a bare Pot. That of the Foot-men was called *Morion*. *Nicod* derives the Word from *Sala*, which had the same Signification among the *Latin*. Others from *Saladinus*; adding, That it was borrowed from the Orientals: others from the *Italian Celeta*, as if the Head were hid hereby. Others from the *Spanish Celada*, a little Cask, &c.

**SALADINE**, a Tax, imposed in *England* and *France*, in the Year 1188, to raise a Fund for the *Crusade*, undertaken by *Richard I.* of *England*, and *Philip Augustus* of *France*, against *Saladin* Sultan of *Egypt*, then going to besiege *Jerusalem*. The *Saladine-Tax* was thus laid; That every Person who did not enter himself a *Cruiser*, was obliged to pay a Tenth of his yearly Revenue, and the Value of all his Moveables, excepting his wearing Apparel, Books, and Arms. The *Caribussians*, *Bernardines*, and some other Religions, were exempted from it.

**SALAMANDER'S BLOOD**, a Term the Chymists give to Red Vapours, which in Distillation of Spirit of Nitre, towards the latter End do fill the Receiver with Red Clouds; they are the most fixed, and strongest Part of the Spirit; and nothing but Nitre yields a Red Vapour in Distillation.

**SALARY**, *Salarium*, in old Law Books, a Toll, or Duty paid for Salt. Also a Stipend, or Wages for any Service done.

**SALIENT**, in Fortification. There are Two Kinds of Angles; the one *Salians*, which are those that prefer their Point outwards: The other *Re-entring*, which have their Points inward. Instances of both Kinds, we have in *Tenailles*, and Works in Form of Stars. See **ANGLE**. The Word is formed from the *French Saillant*, which signifies the same Thing; of *Sailler*, to project, advance outwards, and that, of the *Latin Salire*, to leap. See **ANGLE**.

**SALIENT**, in Heraldry, is applied to a Lyon, &c. when its Fore-legs are raised in a leaping Posture; standing so as that his right Fore-foot, is in the Dexter chief Point, and his hinder Left Foot, in the Smister base Point of the Escutcheon; by which it is distinguished from *Rampant*. See **RAMPANT**.

**SALIC LAW**, an ancient and fundamental Law of the Kingdom of *France*; supposed to have been made by *Pharamond*, or at least by *Clevis*. *Du Hailan*, after a critical Examination of the *Salic Law*, declares it to have been an Expedient of *Philip the Long*, in 1316, for the Exclusion of the Daughter of *Louis Hutin*, from inheriting the Crown. Father *Daniel*, on the other Hand, maintains, That 'tis quoted by Authors more ancient than *Philip the Long*; and that *Clevis* is the real Author of it. The Style, which is scarce intelligible, and which is in a *Latinized* Dialect, is a Mark of its Antiquity. This Law has not particular Regard to the Kingdom of *France*. It only imports in the general, That in *Salic Land*, no Part of the Inheritance shall fall to any Female; but the whole to the Male Sex. So that 'tis a popular Error to suppose, That the *Salic Law* was established purely on Account of the Succession to the Crown: Since it extends to private Persons as much as those of the Royal Family. Part of it seems to have been borrowed by our *Henry I.* in compiling his Laws, Cap. 89. *Syl hoc feceris secundum legem Salicam morietur*. By *Salic Lands* or *Inheritances* was anciently expressed all Lands by whatever Tenure held, whether Noble or Base, from the Succession whereto, Women were excluded by the *Salic Law*; and admitted to inherit nothing but Moveables, and Purchases, whenever there were any Males. Indeed, *M. Foveau* observes, That there were originally *Salic Lands*, distinguished from all others, and destined for the Military People of the Nation; and to these, 'tis supposed, the Law was originally intruded to be confined. *M. Eccard*, a *Houwerian*, is said to have recovered an ancient M. S. of this famous Law, containing a third Part thereof, much more amply than any yet known, with a very curious Chronology of the same Law, hitherto unknown.

Some, as *Postellus*, will have this Law called *Salic*, *q. d. Gallic*, because peculiar to the *Gauls*. *Ceval* takes the Reason to be, That the Law was only ordained for the Royal *Salles* or Palaces. *Claud. Sciffel* says, 'Twas thus called, because of the *Salt* and the *Prudence* it abounds withal. *Fer. Montanus* says, 'Twas because *Pharamond* was at first called *Salic*. Others, with the *Abbot Ufferg*, derive its Name from *Salicost* his Principal Minister. And others from the frequent Repetition of the Words *Si aliquis*, at the beginning of the Articles. *Guesneard* says, 'Tis called *Salic* for *Salomon*, by Reason *Solomon* set the first Example of it. *Darvion* derives it from the *German* Words, *Salts* and *Lik*, *q. d.* like to Salt. The most probable Opinion is, That the Word is derived from the ancient *Franks*, called *Sali*, *Salici*, and *Salingi*, from the River *Sala*, a River of ancient *Germany*: This is the Sentiment of *Ribonanus* and *Enilius*, who are followed by several others; among the rest, *Menage*, *Pasquier*, *Borel*, and *Juncker*. *Bouteroue* gives another plausible Origin of the Word: He says, it comes from the Word *Selich*, which, in the Old *Teutonic* Language, signified *Salutary*; and that the *French* in this Law imitated the Policy of the ancient *Romans*, who made *Salutary Laws*, which the Magistrates were to have before them when they administered Justice. This he proves from a curious Figure taken out of the *Notitia Imperii*, wherein the Book is represented covered with Gold, with this Inscription; *Leges Salutares*.

**SALII**, in Antiquity, Priests of *Mars*, wherof there were Twelve, instituted by *Numa*. They were painted with Particoloured Garments and high Bonnets, with a Steel Casque, or Breast-plate on the Breast. They had their Name

*Salii* from *Saltare*, to dance; because, after assisting at Sacrifices, they went dancing about the Streets with *Ancylus* or Bucklers in the Left-Hand, and a Rod in the Right, striking musically on one another's Bucklers with their Rods, and singing Hymns in Honour of the Gods. There were Two Companies or Colleges of *Salii*: The ancient established by *Numa*, called *Palatini*; the latter by *Tullius Hostilius*, called *Collini*, and *Agonales*. *Servius*, indeed, tells us, That there were Two Kinds instituted by *Numa*, the *Collini* and *Quirinales*; and Two other Kinds by *Tullius*, the *Pavarii* and *Pelarii*. In Singing, they used a Song called *Saliare Carmen*; and after the Ceremony, were entertained with a Feast: Whence *Saliare Epule*, and *Saliare Dapes*, passed in to a Proverb for good Eating. Their Chief, called *Præful*, and *Mogister Salarum*, was one of their Number. 'Twas he led the Band, and began the Dance; the rest imitating all his Steps and Motions. The whole Company was called *Collegium Salarum*.

See *Pompeius* makes mention of *Salian Mædæ*, *Virgines Saliæres*, hired for the Purpose, and joined with the *Salii*, wearing a Kind of Military Garb, called *Paludamentum*, with high round Bonnets like the *Salii*, and, like them, performing Sacrifice with the *Pontifices* in the Palaces of Kings. *M. Patin* takes it, there is a Figure of one of the *Salii* on a Medal of the *Sevastian* Family; who, besides the Buckler in one Hand, holds the *Castoreus* in the other. But his Look is very grave and sedate; and besides, the buckler he holds, does not seem to be an *Ancylus*, as being quite round, and not indented any where. And again, why should a Priest of *Mars*, the God of War, be represented with a *Castoreus*, the Emblem of Peace? 'Tis probable therefore, this is no Figure of any *Salius*, as *Patin* imagines.

**SALIVA**, *Spittle*, a thin pellucid Humour, separated by the Glands about the Mouth and Fauces; and conveyed by proper *Salivary Ducts* into the Mouth, for several Uses. See **SALIVARY DUCTS**. It consists of a great deal of Water or Phlegm, and a Volatile Salt; some add, a sulphurous Spirit. The *Saliva*, *Boerhaave* observes, is void both of Taste and Smell; does not harden by Heat; is more copious, fluid, sharp, penetrating, and detergent, as a Persion has fasted longer; and is separated from the pure Arterial Blood. The Glands wherein the *Saliva* is separated from the Blood, are the *Parotidæ*; the *Maxillary Glands*; the *Sublingualis*, or those under the Tongue; the *Amygdalæ*, or Almonds of the Ears, and the *Palatine*, or Glands of the Palate: See each under its proper Article. The great Use of the *Saliva*, is in masticating and diluting the Food, and making the first Digestion thereof. The other Uses are to moisten the Tongue, to render its Motion more quick and easy; to lubricate the Throat and *Oesophagus*, in order to facilitate Deglutition, to prevent Thirst, and to assist in the Sensation of Tastes, by dissolving the Salts. Some imagine it to do the Office of a *Menstruum* to mix the oily and aqueous Parts of the Food more intimately, to dissolve the Saline Parts, and to procure a Fermentation in the Stomach. But *Dr. Drake* will not allow it fit for that Purpose. Were the *Saliva*, says he, acrimonious enough for this, 'twould be impossible but it must offend the Stomach; especially, considering the Quantities of it that many swallow, even upon an empty Stomach. See **DIGESTION**.

*M. Galvani*, who has a Medicinal Thesis on the Subject of the *Saliva*, observes, That it takes its Name from the *Sals* it contains; which Salt he will have to be partly a Volatile Acid, and partly Alcalious. He adds, That it contains some Oleaginous Parts, and a little Earth. By being compounded of so many different Kinds of Parts, it becomes a Dissolvent proper for all the different Kinds of Foods whereof we live. Its natural and laudable State, is to be a little more Viscid than common Water, and much less so than Milk. 'Tis preserved in this State by the Application of the Spirits, and of the Particles of Air which infuse into it. According to all Appearance, the *Saliva* is derived from the Blood of the Arteries. Part of the Arterial Blood brought to the *Salivary Glands*, serves to feed them; another Part is returned into the Veins, and continues the Circulation, and a third Part, which is the *Serum*, receiving a sub-acid Quality from them, is converted into *Saliva*. Some Authors have imagined, that the Nervous Juice contributed to the Composition of the *Saliva*; the rather because larger and more numerous Twigs of Nerves are communicated to these Glands, than to most other Parts, which yet have a more exquisite Feeling than these. But *Dr. Nuck* has refuted this Opinion by several Experiments.

Too great an Excretion of *Saliva*, *Boerhaave* observes, disorders the first Digestion; and hence causes Thirst, Dryness, a black Bile, Consumption, Atrophy: On the contrary, if no *Saliva* be discharged into the Mouth, or less than ordinary, it spoils both the Manducation of the

Food, and its Taste, Swallowing, and Digestion; and withal, occasions Thirst.

**SALIVAL**, or *Salivary Ducts*, in Anatomy, certain little Canals lately discovered; whereby the *Saliva* falls into the Mouth. The *Lower Salival Duct* comes from the *Maxillary Glands*, situate under the lower Jaw, and terminates behind the *Dentes Luciferos*. It was first described by our *Dr. Wharton*, in his Treatise of the *Glands*, in 1656. The *Upper Salival Duct* was discovered by *Nicolas Steno*, in 1660. It comes from the *Parotid Glands*; whence perforating the *Buccinator*, it terminates near the third Upper Grinder. *Caspar Bartholinus*, in 1682, discovered another *Salival Duct*, coming from the Glands situate on the Side of the Tongue; tho' *Rivinus*, a Physician of *Leipsic*, had mentioned it before, in a Dissertation printed in 1679. *Ant. Nuck*, Professor at *Leiden*, discovered a fourth *Salival Duct*, arising from a Gland situate in the Orbit of the Eye, between the *Musculus Obducator*, and the Upper Part of the *Os Jugale*. These Ducts are all double, there being one of each Kind on either Side. But 'tis pretended, the Two last are only found in some Brutes, and not in Man.

As the Demand of *Saliva* is greatest in Mastication, Deglutition, Talking, &c. so, *Dr. Drake* observes the Disposition of the *Salivary Ducts*, to favour the Discharge on those Occasions, is very remarkable: Thus the Ducts of the *Parotidæ* pass close over the *Musculi Masseteres*, and thro' the *Buccinators*. The *Salivary Ducts* of the *Maxillary Glands* pass close under the *Amygdalæ*, where the *Sublingual Glands* are placed; by Means whereof, the Intumescence of the *Masseters*, in Chewing, accelerate the Spittle in the *Parotid Salivary Ducts*; as the *Amygdalæ* does in the Action of Deglutition, in drawing the *Hyoides* upwards. The Agitation of the Cheeks and Lips, is sufficient to promote the Discharge from the Glands of the Lips, &c.

**SALIVATION**, in Medicine, a promoting of the Flux of *Saliva*, by Means of Medicines; chiefly *Mercury*. See **MERCURIALS**. The chief Use of *Salivation* is in Diseases adhering to the Glands, and the *Membrana Adiposa*; principally in the Cure of the Venereal Disease. 'Tis sometimes also used in Epidemic Diseases. The Body is prepared for *Salivation* by a copious and continued Use of attenuating, diluting, softening Decoctions; as of Scabious, Pellitory, China, Sarsaparilla, Sassafras, and Santal. *Salivation* is either *Partial* or *Universal*. By the first, only, the Humours of some Part of the Body are to be discharged; as in *Catarris*, *Torbacis*, &c. By the second, the whole Mass of Blood is to be purged. The first is raised by a slow continued Chewing of some tenacious Matter, as Mastich, Wax, Myrrh; especially if other sharp Things be mixed with them, as Pyrethrum or Bartrain, Ginger, or Pepper. Or by drawing in sharp irritating Vapours, as those of Tobacco, Rowley, Thyme, Marjoram, &c. The latter is effected by the Action of such Medicines as create some slight but constant Nausea; as *Scribani* not quite fixed, nor yet quite enstetic; a little common Vitriol, &c. but chiefly such as dissolve all the Parts of the Mass of Blood, turn them into *Lymphæ*, and thus cause a *Pyrosis*. Such is crude Quickilver, Cinabar, a Solution of Quickilver in *Aqua fortis*, White and Red Precipitate, Turbith Minerale, sweet Sublimate of Mercury, &c.

**MERCURIAL SALIVATION**, is now a very usual Method of Cure; especially in Venereal Scrophulous, and Hypochondriac Cases. In Effect, it proves the surest Remedy yet discovered for the *Lues*; tho' the Discovery hereof, as that of most other Remedies, is owing to Chance. *Jac. Corpi*, a Physician of *Boulogne*, having read in *Avicenna* and *Mesue*, Two Arab Authors, that Mercury applied externally, was proper for the *Lepros*, and some Kinds of Pustules, particularly the *Scabies* or the Itch; had a Mind to try it in a Pocky Itch: A *Salivation* was hereupon unexpectedly raised, and the Patient was cured not only of his Itch, but of his Pox. The same Method he afterwards used for the Pox itself; and meeting with great Success therein, others were induced to follow him; and thus did it arrive at its present Height.

There are Two Manners of applying Mercury to raise a *Salivation*: The one *external*, by mixing it up with some Unguent, Plaster, or Perfume, and then rubbing it on the Joints, &c. The other *internal*, where 'tis taken at the Mouth. In each Case the Mercury infuses itself into the Mass of Blood, and mixing with the Venereal Poison, the Two Bodies thus locked together, are drawn, with the Secosity, into the *Salivary Glands*, where they are separated and discharged, as finding the Pores of the Glands proportioned to their Figures, and proper to receive them. But, for the Manner wherein the Mercury acts to raise the *Salivation*, see **MERCURIALS**. *Dr. Quincy*, will have the *internal* to be much the safer and

and better Method. The Mineral Globules, he thinks, given intimately combined with Salts, in the Preparations being inwardly, will, by the Irritation thereof, be easily and fully thrown off by the Secretory Organs, till the Blood is quite discharg'd of its Load: Whereas, in Mercurial Frictions, 'tis possible, some of the heavy Particles may be left lodged in the Interstices of the Fibres, or Cells of the Bones. Add to this, that by computing the Proportion of Mercury in all the Doses necessary to promote a Spitting, internally; and the Weight of the same Mineral used when 'tis done by Unction; the Quantity used in the latter Case, far exceeds that in the former; consequently, the ill Effects apprehended from that dangerous Medicine, must be vastly more sensible in the one Case than the other. The external Application, therefore, is only to be allowed of, where either the Case will bear the Violence of such a Management, or outward Ulcers and Tumours, require a particular Cure by Liniments.

Indeed, a great French Physician, M. Chicaqueau, Chancellor of the University of Montpellier, has lately done some Discredit to the Practice of Salivating in any Manner; And that, in a little Treatise lately published, where he endeavours to prove, That the Salivation it self contributes nothing to the Cure, but is rather prejudicial thereto: That the Salutory Effects of the Mercury are independent of any Evacuation at all; and that it acts purely as a Specific. 'Tis without Reason, therefore, he urges, that Venereal Patients are put to the Torture of a Salivation, since the full Effect of the Medicine is had without carrying Matters to that Extremity. The Salivation is only an Accident to the Cure; which is effectually obtained by a Mercurial Unguent rubbed on the Joints in such Quantities, and at such Intervals, as not to raise any Salivation. He supports the whole by the Experience of Forty or Fifty Cures wrought in one Year, by the New Method. This Method, it seems, has been lately, too, tried in England, and with Success; as appears from a Translation of Chicaqueau's Piece just published with Notes.

SALLET, or *Salade*, a Dish of eatable Herbs ordinarily accompanying Roast-meat, composed chiefly of crude, fresh Herbs, seasoned with Salt, Oil, and Vinegar. Some add Mustard, hard Eggs, and Sugar; others, Pepper, and other Spices, with Orange-Peel, Saffron, &c. Some define *Sallet* more generally, A Composition of Plants and Roots, of several Kinds, to be eaten raw or green, blanched or candied, by themselves, or mixed with others; and even, occasionally, boiled, pickled, or otherwise prepared and disguised, to render them more grateful to the Palate. But this Definition includes *Pot-herbs*, &c. which the Generality of Authors deny to be any proper Salleting, though others stilly maintain it. *Neuage* derives the Word from the Latin, *Salare*, of *Sals*, Salt; others from *Salcedo*. *Du Causse* from *Salgama*; which is used in *Auspinus*, and *Colomella* in the same Sense.

#### Composition of SALLETS.

The principal *Sallet-herbs*, and those which ordinarily make the Basis of our *English Sallets*, are Lettice, Sellery, Endive, Cressis, Radish, and Rape, &c. Along with which, by way of Furniture, or Additionals, are used Purslane, Spinnage, Sorrel, Taragon, Burnet, Corn-Sallet, and Chervil. The different Tastes of Mankind will not allow any certain Mixture of these to be prescribed as most agreeable; but still, in mixing them, the Relish of the several Herbs is to be consider'd: Those, for Instance, which are most hot and biting, as Cressis, Mustard, Sellery, Taragon, Chervil, &c. with those that are more cool and insipid to the Taste; as Turnips, Rape, Spinnage, Lettice, Corn-Sallet, Purslane, &c. by this Means the Herbs may be so judiciously mixed, that the too strong Taste of one Kind may not over power all the rest; and the insipid Kinds be discretely used to moderate and qualify the Heat and Pungency of the others, as the Season of the Year is more hot or cold; so as every *Sallet* may not only be agreeable to the Taste, but also Physic to the Body.

#### Culture of SALLETS.

The Gardeners call *Small herbs*, in *Sallets*, those which should always be cut while in the Seed Leaf; as Cressis, Mustard, Radish, Turnip, Spinnage, and Lettice; all which are raised from Seeds sown in Drills or Lines, from Mid-February to the End of March, under Glasses or Frames, and thence to the Middle of May, upon external Beds, warmly exposed; and during the Summer Heats in more shady Places; and afterwards, in September, &c. as in *March*, &c. and lastly, in the Rigour of the Winter, in hot Beds. If they chance to be frozen in very frosty Weather, putting them in Spring-Water two

Hours, e'er they be used, recovers them. In gathering *Small-herbs*, the best Way is to pull them up by the Roots from the hot Beds. If the Roots be left, and a second Crop of *Salleting* sown on the same Bed, it will not prosper. In sowing second Crops, 'tis also to be observed, that Seeds of the same Kind be not sown in the same Place; but the Ground is to be eased by varying its Barren, putting hot Seeds where cold ones grew before, &c. Another Rule is, that no Plant be placed in the same Spot where the same Kinds have been growing.—*Winter-Sallets* are greatly improved by blanch'd Sellery, which is a hot Herb, of a very rich Flavour; raised from Seed sown in *March*, and *April*, in a well exposed Place, and transplanted, six Weeks after its first Appearance, into Beds, where it remains till the Middle of *June*, and then planted in Trenches 8 or 10 Inches wide, and as many deep, first pruning off the Tops and Roots. As they grow large, they are earthed up within 4 or 5 Inches of the Top, which is repeated several times, till they be fit for Use.—*Endive* blanch'd is much used in *Winter Sallets*, though it have neither Taste nor Flavour; 'tis cultivated much after the same Manner as Sellery.—Of Lettice there are various Kinds, the best are the *Romain*, *Dutch broken*, *Imperial*, and *Silesia-Kinds*, all which cabbage well. They are all commonly sown with other Crops in *March*, for *Summer Sallets*, and in *August*, to be transplanted, or *September*, to stand the Winter, either to be cut for *Winter Sallets*, or to cabbage early next Spring for *Seeds*. See SEEDS. Indeed the *Romain* will scarce bear the Frost.

For the Additional, or Secondary *Sallet-herbs*: *Burnet* is a cool perennial Herb, whose tender Leaves, mixed with other Herbs in Winter, give the agreeable Flavour of a Cucumber: 'Tis propagated by Seed sown in *March*. *Corn Sallet*, raised at the same Time, and in the same Manner, makes a good *Winter Sallet* Furniture; *Purslane*, an insipid, yet cooling Herb, is admired by some in *Summer-Sallets*: 'Tis raised by Seeds sown in *March* in a warm Place. *Sorrel* is chiefly used in the Spring, when the young Leaves are very agreeable. 'Tis raised from Seeds sown in *March*, usually in Rows or Drills. *Spinnage* is a necessary Ingredient in raw *Sallets*, to be cut in the Ear-leaf; but 'tis better for boiled *Sallets* in the Winter and Spring. 'Tis sown in *March*, *April*, and *May*; and again in *August*, in a Place well exposed to the Sun, that the Leaves may be large enough for boiling in the Winter. *Taragon*, of all others, should never be wanting; 'tis a Cordial Herb, though not the most agreeably tasted: Yet a few Leaves, or three or four of the tender Tops, give a *Sallet* a good Relish. 'Tis propagated from Slips, taken from the Root, and planted in *March*.—*Note*, in the Spring, *Dandelion* blanch'd, which is gather'd in almost every plough'd Field, makes an excellent *Sallet* mixed with other Herbs. Some likewise gather *Violet* Flowers, Cowslips, and Blossoms of *Burrage*, as part of the *Sallet* Furniture; others, *Fennel*, and *Parley*. See POT-HERBS.

#### Preparation and Dressing of SALLETS.

The *Sellery* and *Endive*, have their hollow, green Stem, or Stalk, tripp'd of all its outside Leaves, and sliced in the blanch'd Part, cutting the Root into four Parts. The other ingredient Herbs being exquisitely called and cleaned, of all faulty Leaves, &c. are wash'd rather by sprinkling, than lobbing them in Spring-water; laid to drain of all superfluous Moisture, then shook and squeezed together gently, in a coarse Cloth, to dispose them to receive the Seasonings, viz. the Salt, Vinegar, Oil, &c. The Oil nor to be yellow, or high colour'd, but of a pale Olive Green, without either Taste or Smell. See OIL. The Vinegar perfectly clear, neither four nor pall'd. See VINEGAR. The Salt to be the best ordinary Bay-Salt, clean, bright, and dry. Some indeed recommend the Essential Salts and Spirits of Vegetables, or those of the Alcalizate and Fix'd Kind, extracted from the Calcination of Balm, Rosemary, Wurnwood, &c. and affirm, That, without raising the gross *Sallet-herbs* themselves, we might have healing, cooling, generous *Sallets*, wholly out of the *Salt-Setler*. See SALT. *Note*, in the Proportion of the Salt, Pepper, and Vinegar, Regard is to be had to the Season, Constitution, &c. the two first being best for cold, the second for hot Stomachs and Seins. For a moderate *Oxalme*, or *Sallet-Vehicle*, to three Parts of Oil, put one of Vinegar, or Lemon, or Orange Juice, and in the Mixture, steep Slices of Hoefe-radish with a little Salt; occasionally, add a little *Guinea* Pepper, and Mustard, and the Yolks of two Eggs boiled, squeezed, and braised into a Mash therein. Pour the Whole on the Herbs, stirring and mingling them till they be thoroughly imbibed.

SALLY, in Architecture, from the French *Sallie*, is what we more usually call *Projecture*. See PROJECTURE.

SALLY, in the Military Art, the issuing out of the Besieged from their Town or Fort, and falling upon the Besiegers to cut them off, nail their Cannon, hinder the Progress of their Approaches, destroy their Works, &c. To *cut off a Sally*, is to get between those who made it and the Town.

SALON, or *Salon*, in Architecture, a very lofty, spacious Hall, vaulted at Top, and sometimes comprehending two Stories, or Ranges, of Windows: As that at *Blenheim-House*. The *Salon* is a Grand Room in the Middle of a Building, or at the Head of a Gallery, &c. Its Faces, or Sides, are all to have a Symmetry with each other; and as it usually takes up the Height of two Stories, its Ceiling, *Deviser* observes, should be with a moderate Sweep. The *Salon* is a State Room. 'Tis much used in the Palaces in *Italy*; and from thence the Mode came to us. Embassadors, and other Great Visitors, are usually received in the *Salon*: 'Tis frequently built Square, sometimes Oblong, as at *Marily*, and sometimes in other Forms.

SALT, *Sal*, in Chymistry, a simple, acid Substance which enters the Composition of all Bodies, and is held one of the Five Principles, or Elements thereof; only to be extracted by Fire. See PRINCIPLE. *Sal*, M. *Humbert* observes, is an Ingredient in all Animal, Vegetable, and Mineral Bodies, excepting perhaps some Metals, and Stones. In Vegetables and Mineral Bodies, that have undergone a Fermentation, the *Salts* rises first in the Alembic, then the Phlegm: If the Mixture has undergone a Fermentation, the *Salt* rises after the Phlegm.

SALTS are distinguished, with regard to the Manner of extracting them, &c. into *Volatile*, *Fixed*, and *Essential*. *Volatile Salts*, are those light, subtile ones, which rise easily upon Distillation, or are even exhaled by the Nose, and rendered sensible to the Smell. See VOLATILE SALT. *Fixed Salts* are such as, being more Gross and Material, resist and sustain the Fire; and are not raised by it, but remain, after Calcination, or Distillation, in the Earthy Part, at the Bottom. For the Manner of Extracting them, &c. see FIXED SALT. *Essential Salts* are those drawn from Vegetables, without the Use of Fire, as by Crystallization, and other easy, natural Means. See ESSENTIAL SALT. *Volatile Salts* become distinguishable to the Nose, Tongue, and Brain, by their Tenacity and Briskness; *Fixed Salts* by their Bitterness, and Heat in the Mouth. To these may be added an intermediate Kind of *Salt*, under the Title of *Mixed Salts*; which are those resulting from a Mixture of a *Volatile* with *Fixed Salt*.

SALTS are of different Kinds, according to the different Matters wherewith they are found mixed: Some are mixed Bodies themselves, and their Mixture separable by Fire, and Lixivation; such are all *Essential Salts* of Plants, and all *Fossile Salts*, &c. but these are no proper Chymical Principles. There are others which we are sensible are mixed, and whose Mixture we know pretty nearly, though we are not yet able to decompose them: 'Tis these make the Chymical Principle *Salt*; for our Analyses will not render them more Simple, which is the Character of a Principle: And in this Sense *Salt* is defined, *A Matter dissoluble by Water, and unchangeable by Fire*; to which some add, *Of a pungent Taste*.

There are Three Kinds, or Classes, of *Salts*, which come under this Definition; Two whereof are *Volatile*, and the Third *Fixed*. The *Volatile* ones, are *Acid Salts*, and *Urinous Salts*; the *Fixed*, are those drawn by a Lixivium after Calcination, and called *Lixivious Salts*. Nature produces none of these *Salts* simple and unmixed, but we easily extract them by Art, from the Mixtures wherein she has placed them. The Principal Natural *Salts* may be reduced to *Salt-petre*, *Sea-Salt*, and *Vitriol*. Each whereof has its different Kinds; of the various Combination whereof, with different Oily Matters, all the Natural *Salts*, we know of, are compounded. These *Salts* are found, by Chymical Analyses, to consist of Aqueous, Earthy, Oily, or Sulphurous, and Acid Particles. The Acid Matter is the *Pure Salt*, or the *Salt-Principle*, and is the Base of all the rest. This M. *Humbert* observes, is pretty uniform, and nearly the same in all *Salts*, before the particular Determination to form this or that *Salt*, by the particular Admixture of the Sulphur, &c. *Salt-petre*, *Sea-Salt*, &c. therefore are not Principles, but the *Acid Salts* distilled from them are, and the Water wherein these *Salts* swim, and the Earth, or *Fixed Salt*, remaining in the Retort after Distillation, are other Chymical Principles. See PHLEGM, and EARTH.

The Principle *Salt* is held a *Mean* between the *Active* and *Passive* Principles. The pure *Acid*, though accom-

panied with its sulphurous deterring Matter, never becomes sensible but when lodged either in some earthy Matter, or artificially in some simple aqueous Matter. In the first Case, it appears under the Form of a crystallized *Salt*, as *Salt-petre*, &c. See SALT, &c. In the second Case, it appears in the Form of an Acid Spirit, which, according to the Determination of the Sulphur that accompanies it, is either Spirit of Nitre, or Spirit of *Common-Salt*, or Spirit of Vitriol; and what we have here observed of the three Simple, or *Fossile Salts*, may be applied to all other more Compound *Salts* of Plants, Animals, &c. with this Difference, That when, in Form of a *Concrete Salt*, these last always take a greater Quantity of earthy Matter, and when in Form of an Acid Spirit, a greater Quantity of aqueous Matter, than the Simple ones. Whence it follows, that the Acid Spirits of Compound *Salts* are always weaker, lighter, and less penetrating than those of *Fossile Salts*; and after Distillation leave a greater Quantity of earthy Matter behind them.

We don't know precisely what Figures the three *Salt-Principles*, *Acid*, *Urinous*, and *Lixivious*, must have. But to judge by their Effects, one would conclude, the *Acids* to be pointed, only the Points sheathed in some sulphurous Matter. The *Urinous Salts* to be Sponges, containing some of the *Acid*, and some of the fetid Oil of the Animal or Plant: And the *Lixivious Salts* to be Sponges, only containing the Remainder of the *Acid*, which the calcining Fire could not expel.

Acid Spirits may be conceived as pure, and without any Mixture; in which Case all *Acids* will be found of the same Nature: But if we consider them as Distillation gives them, we shall always find them accompanied with some sulphurous Matter, which we cannot separate from them, and which gives the Degree of Activity to the Acid Spirits. 'Tis this sulphurous Matter which characterizes them, and makes all the Difference we find between Acid Spirits. M. *Humbert* ranges all the Kinds of Acid Spirits under Three different Classes, according to the different sulphurous Matters which accompany them. The First Class is of those which contained Animal or Vegetable Sulphur; under which come all *Acids*, distilled from Plants, Fruits, Woods, &c. as also Spirit of Nitre. 'Tis easy to conceive, that the *Acids* of Plants may have retained a Part of the Oil of the Plant, which is their Sulphur; since in reducing these *Acids* into *Salts*, we always find a little Oil therein; which can be nothing else but that of the Plants themselves. And for *Salt-petre*, as this is always drawn from Earths moistened with the Excrements of Animals, or from old Walls, Plaster, &c. full of the sulphurous Matters of the Animals that lived within them, the Soot, &c. 'tis thence, doubtless, *Salt-petre* borrows its Sulphur. See SALT-PETRE. The Second Class is of those which contain a bituminous Sulphur: Under which come the *Acids* of Vitriol, *Common Sulphur*, and *Alom*. For those are all usually drawn from the same Mineral Stone, wherein the bituminous Sulphur, which makes one of the Principal Parts of *Common Sulphur*, predominates. See SULPHUR. The Third Class is of those which contain a more fixed mineral, sulphurous Matter; approaching nearer the Properties of Metallic Sulphur: Under which Class come the *Acids* drawn from several Kinds of *Sea-Salts*, *Rock-Salts*, &c. For the *Rock-Salt*, or *Sol Gemme*, is always found in Places near Metallic Mines; and *Sea-Salt*, in all Appearance, is nothing but *Rock-Salt*, the Quarries whereof have been penetrated by the Sea-Water, which has extracted all the Saltness therefrom. See SEA-SALT.

The sulphurous Matters of the First Class of *Acids* being very light, and taking up a deal of Place, must augment the Bulk of the Points of the *Acids* to which they are joined. And hence these *Acids* become disabled from penetrating very compact Bodies; but their Surface being increased from the same Cause, the Flame will have the greater Hold to drive them: And hence the *Acids* of this Class act more swiftly than any of the rest. The bituminous Sulphur is the least active of all the Sulphurs we know, as being loaded with a great Quantity of earthy Matter, which serves it as a Matrix. Hence it unites more difficultly with Saline Matters than any of the other Sulphurs; so that a less Quantity of it may be conceived to adhere to the *Acids* of this, than of either of the other Classes. Accordingly we find, that the *Acids* of this Class, used alone, scarce dissolve any Metals; but mixed with the others, partake of their Sulphur, and thereby become enabled to dissolve all Metals. The Metallic-Sulphur is of all others the most fixed; that is, its Parts are the smallest, and most compact. See FIXITY. Hence the Points of this Class of *Acids* will not be much swelled by it, and of Consequence will be able to insinuate themselves into the most compact Bodies, or those whose Pores are the smallest. And for the same Reason they will not give much hold to the Flame that agitates them, and will therefore

therefore act with less Violence than those of the First Class of Salts. Acids joined to Fixed Salts, compose Mixed Salts. Thus Spirit of Nitre, with Salt of Tartar, make Salt-petre; and Spirit of Salt, with Salt of Tartar, make a true Common Salt; and Spirit of Vitriol, with Salt of Tartar, a true Vitriol. However, the two ingredients still remain, the one Fixed, the other Volatile: Acids joined with Urinous Salts, compose another Kind of Salts, called Saltes Ammoniacæ, which are always Volatile.

Lixivial and Urinous Salts, are called Alkalies; the first a Fixed Alkali, the second a Volatile Alkali. These Alkalies are usually esteemed Antagonists to the Acid Salts, because their Mixture always occasions a sudden Ebullition. But 'tis more probable this Ebullition is not the Effect of a Combat, but rather a proper Junction and Union of two Matters which had been naturally united together, and only separated by the Fire, and now re-place themselves in the same Parts whence the Flame had tore them off. Hence, the one are compared to Sheaths, and the other to Points fit to be sheathed therein. Now, the Precipitation wherewith the Points of the Acids enter the Pores of the Alkalies, tears asunder their Texture, and reduces them into minute Parts invisible to the Eye; and thus is the Business of Diffusion accounted for. See DISSOLUTION.

Thus far will the mere Doctrine of Alkali and Acid go towards accounting for some of the great Phenomena of Nature. But the Theory is made vastly more complete and adequate, by Sir Isaac Newton's Principle of Attraction, for which we refer the Reader to the Articles ACID, MENSTRUUM, &c. where the Operation of Salts, or Acid Spirits, are perhaps more satisfactorily accounted for.

The Principal Chymical Salts of Use in Medicine are; Salt of Urine, of Lavender, of Viper, of Human Blood, of Wormwood, of Guaiac, of Quinquina, of Tobacco, of Ribwort, of Rosemary, of Calamint, of Sage, of Juniper, of Vitriol, of Amber, of Sassa, &c. most of which, with many others, are explained under the Articles of the respective Drugs, &c. whence they are drawn; To which the Reader may have recourse.

SALT, in the popular Use of the Word, is used for a Kind of Saline Crystallization; or a sharp, pungent, detergent and atringent Substance, used to Season Flesh, Fish, Butter, Hides, and other Things that are to be kept: As also to give a Relish to Meats, &c. This Salt we usually call Common-Salt, in Contradistinction to the Chymical Salt. M. Goughesmei, in an express Dissertation de Salibus, lays it down as a Fundamental, that the first Principles of Common-Salt, Salt-petre, Vitriol, &c. have their Figures unalterably fixed at their first Creation, and are indivisible as to any created Force. That of Common-Salt, he maintains to be a little Cube; that of Salt of Vitriol, a Parallelepiped; that of Salt-petre a Prism, whose Base is an equilateral Triangle, &c. Common-Salt is of three Kinds, viz. Sea-Salt, Fossil, or Rock-Salt, and Salt drawn out of Salt Springs and Wells.

For Sea-Salt, the greatest and best Part is made in France; little in England. Fossil, or Rock-Salts, are chiefly found in Poland, Hungary, and Catalonia. For Salt Fountains, they are considerable in Cyprius, Worcester-shire, Hampshire, Northumberland, Franche Comte, Lorraine, Tivoli, and some other Places.

The Use of Salt is so universal, and the Commerce thereof so very considerable in the Places where Nature has produced the different Salts, and so necessary for those which have not that Advantage; that a Detail of the Preparation, Commerce, &c. of the several Kinds, cannot fail of being acceptable.

#### Manner of Making SEA-SALT.

This Salt is made of Sea Water, thicken'd by frequent Evaporations, and at length Crystallized. Of Sea-Salt there are two Kinds: That which requires the Sun's Rays to give it its Consistence, called, from its brown Colour, Bay-Salt: And that which receives its Consistence from the Heat of a Fire, called White Salt. They use either this or that Manner of Preparation, according to the Disposition of the Coasts, where 'tis made. If the Coasts rise in Downs or Hills of Sand, the Salt is made by Fire, in Copper or Leaden Vessels. If the Coasts be flat, and low; especially, if the Bottom be a little Clayey, the Salt is Crystallized wholly by the Action of the Sun. We have nothing very considerable of either Kind in England. Some indeed we have of the latter, at Shields in Northumberland; and of the former in the Isle of Mey. France is the principal Place for these Salts; more being made there than in all Europe, perhaps in all the World beside, and 'tis hence that we are chiefly furnished therewith. We shall therefore deliver the Method of making it, as it is practised there. The chief Coasts for

Bay Salt are those of Bretagne, Saintonge, and the Pays d'Amis. The chief Sea-Works, in the two latter Places, are Brouage, Maran, and the Isle of Rbe. Those in Bretagne are in the Bay of Brouage, Gueraud, and Cressil: For White-Salt is chiefly made on the Coasts of Normandy. In the Bay of Brouage alone, are computed above Twenty Thousand considerable Salt-Works.

#### Manner of Making BAY-SALT.

Low Marshy Grounds, disposed by Nature for the Reception of the Sea-waters when the Tide swells, and provided with Banks and Sluices to retain the same, are called a Salt-marsh. These Salt-marshes, the Bottoms whereof they ram with a deal of Care, are divided into several square Pits or Basons, some greater, others less, separated by little Dikes 12 or 14 inches broad: And into these Basons, when the Season is at hand, they let in the Sea-water. The Salt Season is from the Middle of May to the End of August; in which Time the Days being long, and the Sun's Rays strongest, the Salt is raised and Crystallized better than in any other Season. Ever they let in the Water, they take Care the Basons be well cleared of what had been left in them during the Winter to keep them in Order. The Water is admitted to the Height of about six Inches, after having first let it rest, and warm two or three Days in huge Reservoirs, without the Works; that it may come in luke-warm. The Water admitted, the Sluices are shut, and the rest of the Work left to the Wind and the Sun.

The Surface of the Water being struck, and agitated by the direct Rays of the Lunnary, thickens, at first imperceptibly, and becomes, at length, cover'd over with a slight Crust, which hardening by the Continuance of the Heat, is wholly converted into Salt. The Water, in this Condition, is so hot, that the Hand can't be put into it without burning it. When the Salt has received its full Coction, they break it with a Pole, upon which it sinks to the Bottom, whence being dragg'd out again, they leave it sometimes in little Heaps, about the Edge of the Pit, to complete the Drying; and at length in greater Heaps, containing several Thousand Maids, which they cover over with Straw, or Rushes, to secure them from the Rain.

Eight, Ten, or at most Fifteen Days, having thus perfected the Crystallization of the Salt, they open the Sluices, when the Tide is rising, for a fresh Stock of Water; and thus they continue alternately, taking in Water, and gathering the Salt, till the Season be over. Rainy Weather is very pernicious to the Work; for Rain Water, mixing in any Quantity with the Sea Water, renders it useless, so that new Water must be called in: The Salt is brown when taken out of the Pits, and is usually thus sold, without farther Preparation. Indeed in some Places they make it into White-Salt by refining. They refine it by boiling it in large flat Caldrons, which not only takes away its Acrimony, but is found to increase the Quantity.

#### Method of Making White SEA-SALT.

The White-Salt of Normandy is not made by refining the Bay-Salt, but has this Colour naturally when taken out of the Pits. To make it, they gather a muddy Sand on the Flats of the Shoar, which the rising Tide has covered and impregnated with its Waters for seven or eight Days. This Sand being removed into Pits for the Purpose, discharges itself by degrees of all its Water, which filtrates through some Straw wherewith the Bottom of the Pit is filled, and trickles into Vessels set on purpose to receive it. Of this Water it is that they make their Salt.

Their Furnaces are of Earth, and their Boilers of Lead: Each Furnace boils four Leads. When the Water wherewith they have filled the Leads begins to boil, they take off the Skins, which arises in abundance, and in Proportion as it diminishes, throw in fresh Water, which they continue to skim, as before. When it thickens, they keep it continually stirring, with a crooked Stick, or Ladle; and when the Grain is form'd, take it off the Fire to purify it.

The Purifying is performed by letting it stand in large Oiler Baskets; where it drains itself of certain Humidities that remained. When dry, it is laid in Heaps, and thence carried into the Magazines. The Commerce of White-Salt brings an immense Profit to France, though more to the King than to the Makers and Sellers: The Duty is one Fourth Part of the Price the Salt is sold at. The English and Dutch, and (when they are at War with France) the Swedes and Danes, take off most of the Salts of the Compté Neuvais; paying for it, communibus Annis, from 20 to 25 Livres the Load. That of Guen

*psade* is preferred, by the *English* and *Irish*, to all the rest, as the best and whitest. Yet that of *Bornese*, though browner and heavier, is mostly used in *France*, as also throughout the *Baltic*; particularly in *Poland*, where, besides the ordinary Uses, it serves in tilling the Ground; being found to warm it, and to prevent little Vermin from gnawing the Grain.

The *English* and *Dutch* have oft strove hard, in Times of War, to do without the *French Salts*; and to that End, have endeavoured to take *Salts* from the *Spanish* and *Portuguese*; but there is a disagreeable Sharpness and Serenity natural to them, which renders them very unfit for the Salting of Flesh, Fish, &c. To remove this, they boil them with Sea-Water, and a little *French Salt*, which they procure by Means of Neutral Nations; which not only softens them, but increases their Quantity by one Third. But it should seem their Refining does not succeed to their Wish, by the Eagerness wherewith they return to the *Salts of Bretagne*, &c. as soon as any Treaty has opened the Commerce.

POSSIBLE, OF ROCK-SALT, call'd also SAL-GEMME.

The *Fossil-Salt* is called *Sal-Gemme*, from a certain Brightness it has, which gives it some Resemblance to Gems. Indeed, it should have something of the Gem in its Nature; if there be nothing exaggerated in the Account Dr. *Ed. Brown*, (who went down into the *Salt-Mines* in *Hungary*) gives us thereof in his Travels. This *Salt* was entirely unknown to the Ancients. *Pliny*, however, gives us some curious Things about *Salts* in *Nat. Hist. Lib. 30.* which we should have transcribed hither, could we believe them as true as they are pretty. We shall here content ourselves with what well warranted Relations we could get of the *Salt-Mines* of *Wilise* in *Poland*; those in the *Upper Hungary*, and those in the Mountains of *Catalonia*, which make a very considerable Article of Commerce in those Three States; *Salt* being transported hence to the several Neighbouring Nations, who can't be conveniently supplied with *Sea-Salt*.

SALT-MINES of Poland, Hungary, &c.

The *Polish-Mines*, in the Village *Wilise*, five Leagues from *Cracow*, were first discovered in 1251. Their Depth and Capacity are surprizing. Within them is found a kind of subterraneous Republick, which has its Polity, Laws, Families, &c. and even publick Roads, and Carriages, Horfes, &c. being kept here to draw the *Salt* to the Mouth of the Quarry, where 'tis taken up by Engines. Their Horfes, when once they are down never see the Light again; but the Men take frequent Occasions of breathing the Village Air. When a Traveller is arrived at the Bottom of this strange Abyss, where so many People are inter'd alive, and where to many are even born, and have never stirred out, he is surprized with a long Series of lofty Vaults, sustained by huge Pillasters cut with the Chisel, and which, being themselves *Rock-Salt*, appear, by the Light of Flamb-aux which are incessantly burning, as so many Crystals, or precious Stones, of various Colours, casting a Lustre, which the Eye has much ado to bear.

The Rocks of *Salt* are hewn in Form of huge Cylinders; the Workmen using Hammers, Pinchers, and Chisels, much as in our Stone Quarries, to separate the several Banks of Stone. As soon as the massive Pieces are got out of the Quarry, they break them into Fragments fit to be thrown into the Mill, where they are ground, and reduced into a coarse Farina or Flower, which serves all the Uses of *Sea-Salt*.

In the *Salt-Mines* of *Wilise*, there are two Kinds of *Sal Gemme*; the one harder and more transparent, and the Crystallization wherof appears more perfect than that of the other: This is the real *Sal Gemme* of the Druggists and Dyers. It cuts like Crystal, and is frequently used for Toys, Chapelets, little Vessels, &c. the other is less compact, and only fit for Kitchen Uses. One of the chief Wonders of the Place is, that through these Mountains of *Salt*, and along the Middle of the Mine, there runs a Rivulet of fresh Water sufficient to supply the Inhabitants.

The *Salt-Mines* in the *Upper Hungary* are every whit as extraordinary. They are found in the Mountains, two Miles from *Eperies*, a City in the County of *Sorex*, on the River *Torbo*. The Depth is 180 Fathoms. The Mineral runs in huge Veins, so that Pieces are sometimes dug not less than an Hundred Thousand Weight; which however, are afterwards reduced into Square Pieces two Foot long, and a Foot thick, for the Convenience of drawing them out of the Mine. When out, they are broke farther, and put to the Mill to be ground. The Colour of the Stone is a firtle brownish, and yet when ground, becomes as

white as if it had been refined. Some of the Stones are found as hard and transparent as Crystal, some White, Yellow, Blue, &c. fit for various Works, whercon they engrave as on precious Stones. The Mine is cold and moist, whence there arises some Difficulty in reducing the *Salt* into Powder. Of the Water drawn out of it and boiled, is made a blackish *Salt*, which fattens Cattle.

The *Salt Mines* of *Catalonia* are found in the Mountains of the Duchy of *Catalonia*, and belong to the Grandees of that Name. 'Tis the Opinion of the Country People, that the *Salt* grows again, and is re-produced, after several Years, in the same Places whence it had been dug. But the Naturalists will scarce allow of such a Re-production. There is no *Dunbr*, however, but it vegetates, or grows sometimes: *M. Lacrozier*, and the Specimens he had of it in his Cabinet, make it plain. The *Salt* is of four Kinds, White, Bay, Red, and Brilliant. The First, is almost like our *Sea-Salt*, only that it is not granulated. The Second, of an Iron and Slate Colour, has most of the Qualities of the White. The Third, of a Converse Role Colour, only differing from the rest by the Mixture of some Bole, or Earth, which gives it this Colour. The Fourth is a *Brilliant-Salt*, yet transparent as Crystal, which is the proper *Sal Gemme* of the Druggists. Of this Kind there is some Blue, others Green, Orange, Red, &c. but they all become white by grinding. These four Kinds of *Salts* are found over each other in distinct Strata or Beds. The Commerce herof is very considerable. The *English*, &c. when Commerce is prohibited with *France*, furnish themselves hence.

*SAL-GEMME* is to be chosen in large, bright, transparent Pieces, easy to break, and dividing into little square Grains. It grows red-hot in the Fire, like Iron, but dissolves easily in Air: Yet the Druggists wash it, to give it the greater Lustre, but they take Care to wipe it dry again speedily.

*SALT* drawn from Saline Fountains and Springs.

Our Method in *England* is thus. Near the Springs, or Place of the Brine, is built a *Saltern*, or Boiling-house, with a Convenience for the Conveyance of the Brine within it. The *Saltern* is usually large enough to contain several huge flat Pans, or Boilers, each furnished with its Grate and Furnace. The Brine being in the Pan, the Fire is kindled; and after Two Hours Time, the Liqueur begins to be ready to granulate, which is known by a thin Skin rising at the top; this they skim off into Brine Tubs, that the Brine that goes with it may not be lost: And whereas all Brines contain, or yield Sand, which is supposed to petrify in boiling; and upon boiling this Sand, if the Liqueur be before hand strained, will arise; and the Pan boiling violently in the Middle, the Sand is cast towards the Corners, where it falls to the Bottom of the Pan, before the *Salt* precipitates; therefore, they rake it to one Corner of the Pan, with a broad Rake, and then take it out with Ladders, and put it into Wooden Vessels, open at one End, placed on Stands. The Sand being removed, that the *Salt* floating in the Liqueur may precipitate, they shut up the Vent-holes, and Door, and let the Fire go out, and in Twelve Hours Time the *Salt* falls to the Bottom, and grows hard; a Liqueur called the *Bitters*, remaining at Top, which being again boiled away, yields more *Salt*. To make the *Salt* precipitate more readily, after the Liqueur is scummed, &c. they frequently use some Beef-Suet, and Wine-Les, of each a like Weight, melting and mixing them together; and putting an Ounce of this Mixture on the End of a Slice, turn it round in the Liqueur till it is spent; then after two Hours, at most, open the Vent-holes and Door, quicken the Fire, and lade away the Liqueur in a good measure, and so is the *Salt* found lying at the Bottom, fit to be removed. 'Tis now raked up to one Side, raked out and put into Cribs, or Sepals, like Hay-racks, with loose Ribs on each Side, so close to one another, that an Half-Crown will scarce go between: Here, after eight Hours draining, it is found an hard granulated *Salt*, and may be taken away; but yet continues dripping three Weeks, and afterwards, if not often moved, will become Rocky: The Liqueur in the Pan, called *Bitters*, is to be all taken out, except a little to keep the Pan from burning; drained from the *Salt*, and cast away, or reserved for *Salt-Petre* Makers, and the Pan immediately filled with fresh Brine, for another Boiling. A Pan of Brine, of moderate Strength, in eight Hours Time will be completely made into *Salt*, with the Expense of about a Bushel and Half of Coals, which will make a Pan of *Salt* from two Bushels and Half to four Bushels of *Salt*, or more, according as the Liqueur is in Strength. This *Salt* they sometimes mould into the Form of Sugar-Loaves, in which State it will keep dry without Fire, and

and that for a long Time. At *Nearwick*, they bake the Leaves twice, or thrice, in an Oven, and keep them in a Stove, or the Chimney-corner.

SALT from Brine raised by the Sun.

In some Parts of *England*, as at *Limington, Port-see*, &c. they use Water raised by the Sun, and then boiled, which they find preferable to the natural Brines of Springs; those being always found either too weak, or too strong. To this End, they have several Ponds, or Cisterns, called *Sun-Ponds*, built with Mud, and well exposed to the Sun, with little Channels, to convey the Brine from them all to a large Shallow Reservoir, called the *Common-Sun-Pan*, not exceeding seven or eight Inches in Height. Here the Liquor is left to mellow, from twelve to twenty-four Hours, or till the Liquor will bear an Hen's Egg new laid; and when it has attained a sufficient Strength, it is from thence derived by Channels into the Cisterns, where the Rain and Sun breed Red Worms, which cleanse and purify the Liquor, which ripens by Age, and is rendered fitter for boiling, which is perform'd after the same Manner as is already described.

Properties of SALT.

The great Property of *Salt* is, that it is incapable of Corruption, and that it even prevails Meats, &c. seasoned therewith, or steeped in Solutions thereof. It endures the Fire, and even comes out purified thereby, as being thereby freed of its Humidity. In very hot Fires it fuses, and is converted into corrosive Waters. It gives Fertility to Lands, and promotes the Fusion of all Metals; yet, we read of Princes, who, as a Mark of their Indignation, sowed Grounds with *Salt* to render them barren. *Plutarch* observes, That the *Egyptians* believed *Salt* to be the Spittle, or Foam, of the Giant *Typhon*, the great Enemy of their Gods: And hence, adds he, they held it in the greatest Horror — *Salt* is found to have two opposite Qualities: By its subtle, penetrating Acidity, it breaks and dissolves the hardest and most compact Minerals and Metals; and by a contrary Property coagulates Liquid Bodies, as Milk, Blood, &c. Some of its Spirits, mixed in a certain Proportion with Water, produce an excessive Heat, yet, when mixed in a less Quantity augment its Coldness, as *Salt-petre* in Snow, &c. Though all *Salts* dissolve by Moisture, yet Water only dissolves, &c. a certain Quantity. However, when impregnated with any *Salt* as much as it can bear, it will still dissolve a Quantity of another *Salt*, whose Particles are of different Figures, proper to infuse into the remaining Vacuities of the Water: Thus, after *Common-Salt* will no longer dissolve in it, Alum will, and after Alum, *Salt-petre*, then *Sal-Armoniac*, &c.

RAY-SALT, } See the preceding Article SALT.  
ROCK-SALT, }

SALT of Tin,		TIN.
SALT of Sulphur,		SULPHUR.
SALT of Tartar,		TARTAR.
VEGETABLE SALT, or Subtile Tartar,		TARTAR.

SALT-PETRE, called also *Nitre*, and by the Chymists *Dragon*, *Cerberus*, and *Salt of Hell*, a Kind of *Salt* either natural or fictitious; of very great Use both in Chymical Preparations, in the Composition of Gun-powder, and in Dying, in the Glass-Manufacture, and in the making of *Aqua Fortis* for the Dissolution of Metals. Its minute Parts, or Crystals, are in Form of Needles; though some will have them Triangular, as those of Alum are Triangular, and those of *Common Salt* Cubical. When perfect they are said to be fistulous, or hollow, like *Capsule*.

Of Natural *Salt-petre* there are two Kinds: The First formed by a natural Crystallization of saline sulphurous Juices distilling in Caverns, or along old Walls. This is what they call *Salt-petre of the Rocks*; the same with the *Aphtarite* of the Ancients.

The Second Kind of Natural *Salt-petre* is furnished by the Water of a dead Lake in the Territory of *Terrasse* in *Egypt*, called the *Nitrium Waters*, exalted and concocted by the Heat of the Sun, much after the Manner of our *Bay-Salt*. This is the *Natron*, or *Anatron* of the Ancients, which our *Druggists* call *Natron*; now little used but in the bleaching of Linens. See NATRUM.

*Artificial*, or *fictitious Salt-petre*, is also principally of two Kinds. The first, called, by some, *Mineral Salt-Petre*, is found in several Places in the Kingdom of *Pegu*, and

about *Agra*, in Villages anciently populous, but now Desert. 'Tis also found in some Places along the Banks of the *Winga*, that famous River, which after watering a good Part of *Mafcozy*, empties itself into the *Caspian* Sea. The Natural *Salt-petre* is drawn from three different Kinds of Mineral Earths, Black, Yellow, and White. The best is that drawn from the Black, as being purest from *Common-Salt*, and needing no purifying after it cometh to us, to fit it for making of Gun-powder; as the rest do. See GUN POWDER.

The Method of Working it is thus: Two flat Pits are dug; one of which they fill up with the Mineral Earth, turning Water upon it for some Time, and then tread it with their Feet into the Confidence of Pap, letting it stand two Days for the Water to imbibe, and extract all the *Salt* therein. They then pass the Water into another Pit, where standing some Time, it shoots and crystallizes into *Salt-Petre*. This they boil once, or twice, as they would have it more or less white and pure, steaming it continually, and filling it out into Pots, holding 25 or 30 Pounds each, and exposing these to the Air in clear Nights; by which Means if there be any Impurity, it sinks to the Bottom: They then break the Pots, and dry the *Salt* in the Sun.

All the *Salt-petre* we now have, *M. Hamburg* observes, is drawn either from Earths moistened, and natured with the Excrements of Animals, or from old Walls, and the Plaster of ruin'd Buildings, which have been filled with sulphurous Matters as well from the Animals which inhabited them, as the Soot penetrating them, and the Air encompassing them. See SALT. However, we usually make a Division of *Salt-petre* into Natural and Fictitious.

The second Kind of *Artificial* or *fictitious Salt-petre*, is that prepared from Nitrous Matters collected in old Buildings, Dove-houses, the Middle of ancient Ruins, &c. by means of *Lixivians*, or Lyes made of Wood Ashes, and sometimes of those of Herbs. Of this there are great Quantities made in *France*, particularly in the Archaet at *Paris*, where there is a Corporation of *Salt-petre* Makers appointed for the Purpose. The *Salt-petre* gained thus, they refine, by boiling it three or four times, and passing it successively through several Lyes.

Some Naturalists pretend, that the Earths, which have already serv'd for *Salt-petre*, may be re-animated, and made fit to serve again, by keeping covered for Twelve or Fourteen Years, and watering them with the Scum, &c. of the *Salt-petre*, and even with Brine.

Good common *Salt-petre* should be well clean'd, white, dry, and as free of *Salt* as possible. The best refined *Salt-Petre*, is that whose Crystals are the longest, largest, and finest.

There are abundance of Chymical Preparations made with *Salt-petre*, as Spirit of *Nitre*. See NITRE: *Aqua Regalis*, *Aqua-fortis*, *Crystall-Mineral*, *Sol-psychroch*, *Butter of Nitre*, &c. each of which see under its proper Article.

The Philosophers generally allow the Air to be impregnated with a Volatile *Nitre*, or *Salt-petre*, which is thence communicated to Plaster, Mortar, &c. 'Tis probable it may derive it from Soot and Smoke, which are actually found to abound with Volatile *Salt* of a Nitrous Nature. Dew and Rain are supposed to fertilize the Ground principally by their bringing down this *Nitre*. See AIR.

*Salt-petre* has a Property of rarifying, or expanding itself to a prodigious Degree. 'Tis hence Gun-powder derives its Force, whereof *Salt-petre* is the Principal Ingredient. 'Tis computed, that when inflamed, it takes up above Ten Thousand Times the Space it possessed before. See GUN-POWDER.

SALTIER, or *Saltor*, in Heraldry, an Ordinary in Form of a *St. Andrew's Cross*; anciently called *Cross of Burgundy*. See CROSS. Its ordinary Breadth, when alone, is one Third of the Escutcheon.

'Tis sometimes bore *chaîné*, and sometimes in *Number*, placed in different Parts of the Field. Sometimes charged, countercharged with the Field, accompanied, engrailed, indented, quarterly-quartered, &c. The *Saltier* was anciently a Piece of the Knight's Harness; being fastened to the Saddle, and serving him for a Stirrup to mount upon; and 'twas hence it had its Name *Saltier* from the *French Sauter*, to leap. It was made of a Silk Cord, or of some other Kind of Cord, covered with some rich Stuff. Others will have it, that the original *Saltier* was a Kind of *Palisade*, serving to fence Parks, Woods, &c. where wild Beasts were inclosed. Tho' *Speelman* says, 'Twas an Instrument for the taking them, thus called, *Quod fit in usu in Saltis*. Lastly, others assure us, That *Saltier* was anciently the Figure of an Engine, which being full of Pins, was used in the Scaling of the Walls

of a besieged Place. Pearl a *Saltier* Ruby, the Coat of Lord *Macclesfield*.

**SALTNESS**, the Quality of something impregnated with Salt. — The *Saltiness* of the Sea, Lakes, &c. is a Thing that has long perplexed the Philosophers to account for. Some take it to be the Effect of the dry, acid, and even saline Exhalations, which the Sun raises from the Earth, and the Winds, and Rains discharge into the Sea. And hence, say they, it is, that the Sea is found more *brackish* near the Surface, than towards the Bottom. Others contend, that the Sun being continually extracting the purest and subtilest Parts from the Water; the coarser Parts remaining, being excited and concocted by this Heat, acquire by little and little, their Degree of *Saltiness*. Others, as Father *Bouhours*, will have it, That the Creator gave the Waters of the Ocean their *Saltiness* at the Beginning, not only to prevent their Corruption, but also to enable them to bear greater Barthen. *Bernier* seems to be nearer the *Marer*, when he ascribes the *Saltiness* of the Ocean, to the *Fossils* or *Mineral Salts* brought into it by the Rivers, and dissolved in the Water.

Dr. *Halley*, in an express Discourse of the *Saltiness* of the Ocean, in the *Philosophical Transactions*, observes, That all the Lakes in the World are *Salt*, some more, some less than the Ocean; which, in this Case, may be esteemed a great Lake it self. And that all the Vapours exhaled by the Sun from Lakes, are perfectly fresh, so that all the saline Particles brought in by the Rivers remain behind, while the fresh evaporate. Hence 'tis evident, their *Saltiness* must be continually augmented. Now if this be the true Reason of the *Saltiness* of Lakes, 'tis probable the *Saltiness* of the Ocean it self arises from the same Cause: Hence we are furnished with a Method of estimating the Age of the World, by observing the Increase of *Saltiness* in the Waters of Lakes; and computing in how long Time the Ocean might, at that Rate, arrive at its present *Saltiness*. See **LAKES**.

The Count *de Marquis* observes, That in *Provence*, the Bottom of the Sea is wholly stony, and nothing but a Continuation of the Mountains of the *Cevennes*; being even found to consist of several *Syrates*, among which, are *Salt* and *Pitcoal*: And hence he derives the *Saltiness* and *Bitterness* of the Sea-Water.

**SALTS**, or *Sarus*, in the Mixture, the Leaps or Vaults of a Horse; from the *French* *Stat*, of the *Latin* *Saltus*, a Leap, Dance, &c. A *Step* and a *Solt* is a high Air, wherein the Horse rising, makes a *Curve* between Two *Salts*, or *Cabriolets*; so as to mount before, and fling back with his hind Feet. Two *Steps* and a *Salt* is a Motion composed of Two *Carvers*, ending with a *Caspiole*.

**SALTUARIUS**, in Antiquity, an Officer, Servant or Slave among the *Romans*, &c. who had the Care and Custody of a Country House, with Lands and Woods, and to whom was to look to the Fruit, the Fences, &c. In *Nebemiah*, cap. ii. v. 8. mention is made of an Officer of this Kind; *Cypus Soltus Regis*, which *Soci* interprets, Keeper of the King's Forest; but he was more; having not only the keeping of a Forest, but of a House with a Forest. *Saltus* being here used as *Horti* for a House of Pleasure; because Gardens are the principal Part. — In the Laws of the *Lombards*, *Saltuarius* is an Officer who has the Guard of the Frontiers.

**SALTUM**, as, *Ordination per SALTUM*. See **ORDINATION**.

**SALTUS**, in Law-Books, a high Wood. See **BOSCU**.

**SALTZ**, or *Sales*, a Pickle made of Salt, dissolved by the Coldness or Moisture of a Cellar.

**SALVAGE-MONEY**, is a Recompence allowed by the Statute and Civil Law, to such Persons as have assisted in saving Merchandizes, Ships, &c. perishing in Wrecks, or by Pirates or Enemies. This usually was a Tenth Part of the Value of the Things saved. See **WARREN**.

**SALVATELLA**, in Anatomy, a famous Branch of the Cephalic Vein, passing over the Metacarpus, between the Ring Finger, and the little Finger. Several Physicians, in Imitation of the *Arabs*, recommend Bleeding in the *Salvatella*, as proper in Tertian and Quartan Agues, and most Hypochondriac Distempers.

**SALVE**, among the *Romanists*, the first Word of a *Latin* Prayer, or Sequence addressed to the Virgin, and sung after Complines; as also upon the Point of executing a Criminal. *Dunsford* says, 'Twas composed by Peter Bishop of *Compostella*. The Custom of Singing the *Salve Regina*, at the Close of the Office, was begun by Order of St. *Dominic*; and first, by the Congregation of *Dominicans* at *Bologna*, about 1237. *Gregory IX.* first appointed it to be general. *S. Bernard* added the Conclusion, *O dulcis! O pia, &c.*

**SALVER**, a flat Dish, usually of Silver or other rich Metal, used to set Glasses on to serve Wines and other Liquors. The *French* call it *Sous-coupe*, under-cup. The *Italians* use to present a *Salver*, with several Kinds of Wines, with this Compliment, *Si non e buona fare lo*.

**SALUTATION**, the Action or Ceremony of Saluting, Greeting, or paying Respect, or Reverence to any one. There is a great Variety in the Forms of *Salutation*: We salute God by Adorations, Prayers, &c. Kings, by Genuflexion, &c. In *England*, &c. we salute one another by uncovering the Head, inclining the Body, &c. The *Orientals* by uncovering their Feet, laying their Hands on the Breast, &c. The Pope makes no Reverence to any Mortal but the Emperor of *Germany*, to whom he stoops a very little, when he admits him to kiss his Mouth. — In the Army, the Officers salute by certain orderly, studied Motions of the Pike, &c. 'Twas held by the Ancients, that the Statue of *Aesculapion*, one of the *Horcles* of the Sun, in a Temple in *Egypt*, saluted that Luminary every Morning at his Rising. The Deceit consisted in this, That the Statue being hollow, when the Warmth of the Morning began to rarify the included Air, it was driven out thro' a narrow Duct in the Mouth: Thus making a gentle Murmur, which the Priests interpreted a Neighing.

At Sea, they salute by a Discharge of Cannon, which is greater or less, with Ball or without, according to the Degree of Respect they would shew. Ships always salute with an odd Number of Guns; Gallies with an even one. A Vessel under the Wind of another, is always obliged to salute first. To salute with Musquets, is to fire One, Two or Three Volleys; which is a Method of *Salutation* that sometimes precedes that of the Cannon; and is chiefly used on Occasion of Passes. After the Cannon, they sometimes also salute with the Voice; which *Salutation* also occasionally obtains where they carry no Guns, or don't care to discharge any. Saluting with the Flag, is performed Two Ways; either by holding it close to the Staff, so as it can't flutter; or by striking it so as it can't be seen at all, which is the most respectful *Salutation*. Saluting with the Sails, is performed by hovering the Top-sails half Way of the Masts. Only those Vessels which carry no Guns, salute with the Sails. When there are several Ships of War together, the Commander alone salutes. Father *Fourrier* has an express Treatise of *Sea-Salutes* and Signals. See **SIGNAL**.

The *Antiquary* *Salutation*, is an Address which the *Romanists* make to the Virgin; containing the Form wherein the Angel saluted her, when he acquainted her with the Mystery of the Incarnation. See **AVE MARY**.

**SAMARITANS**, an ancient Sect among the *Jeus*; still subsisting in some Parts of the *Levant*, under the same Name. Its Origin was in the Time of *Rehoboam*; under whose Reign, a Division was made of the People of *Israel* into Two distinct Kingdoms. One of these Kingdoms, called *Judah*, consisted of such as adhered to *Rehoboam*, and the House of *David*; The other retained the ancient Name of *Israelites*, under the Command of *Jeroboam*. The Capital of their State was *Samarita*; and hence it was they were denominated *Samaritians*. *Solomon*, King of *Affrica*, having conquered *Samarita*, led the whole People Captive into the remotest Parts of his Empire; and filled their Place with Colonies of *Babylonians*, *Catharans*, and other Idolaters. These finding themselves daily destroyed by wild Beasts, desired an *Israelitish* Priest to instruct them in the ancient Laws and Customs of the Land they inhabited. This was granted them; and they thence-forth ceased to be incommoded with any Beasts. However, with the Law of *Moses*, they still retained somewhat of their ancient Idolatry. The *Rabbins* say, They adored the Figure of a Dove on *Mount Gerizim*. See **FATHER SOCIETIES**. Be this as it will, 'tis certain, the modern *Samaritians* are far from all Idolatry. Some of the most learned among the *Jeus* Doctors own, That they observe the Law of *Moses* more rigidly than the *Jeus* themselves. They have a *Hebrew* Copy of the *Pentateuch*, differing in some Respects from that of the *Jeus*; and written in different Characters, commonly called *Samaritan* Characters; which *Origen*, *Jeros*, and other Fathers and Critics, ancient and modern, take to be the primitive Characters of the ancient *Hebrews*; tho' others maintain the contrary. The Point of Preference, as to Purity, Antiquity, &c. of the Two *Pentateuchs*, is also disputed by the modern Critics. See **PENTATEUCH**.

The *Samaritians* are now very few in Number; tho' 'tis not very long, since they pretended to have Priests descended directly from *Abraham*. They were chiefly found at *Gaza*, *Nepolis* (the ancient *Sichem*) *Damascus*, *Cairo*, &c. They had a Temple or Chapel on *Mount Gerizim*, where they performed their Sacrifices. *Josiph Scaliger*, being curious to know their Usages, wrote to the

*Samaritans of Egypt*, and to the High Priest of the whole Sect, who resided at *Nespolis*. They returned Two Answers to *Scaliger*, dated in the Year 998 of the *Hegira* of *Mahomet*. These Answers never came to the Hands of *Scaliger*. They are now in the French King's Library, and have been translated into *Latin* by Father *Morus*, Priest of the Oratory; & printed in the Collection of Letters of that Father in *England*, 1682, under the Title of *Antiquitates Ecclesie Orientalis*. M. *Simon* has inserted a French Translation in the first Edition, of *Ceremonies & Coutumes des Juifs*, by Way of Supplement to *Leos de Madena*. In the First of these Answers, wrote in the Name of the Assembly of *Israël* in *Egypt*, they declare, That they celebrate the Passover every Year, on the Fourteenth Day of the first Month, on Mount *Gerizim*; and that he who then did the Office of High Priest, was called *Eleazar*, Son of *Phineas*, Son of *Aaron*. At present they have no High Priest. In the second Answer, which is in the Name of the High Priest *Eleazar* and the Synagogue of *Shebna*, they declare, That they keep the Sabbath in all the Rigor wherewith 'tis enjoyed in the Book of *Leviticus*; none among them stirring out of Doors, but to the Synagogue. They add, That on that Night they don't lie with their Wives; That they begin the Feast of the Passover, with the Sacrifice appointed for that Purpose in *Exodus*; That they sacrifice no where else but on Mount *Gerizim*; That they observe the Feasts of Harvest, the Expiation, the Tabernacles, &c. They add further, That they never defer Circumcision beyond the eighth Day; never marry their Nieces, as the *Jews* do; have but one Wife; and, in fine, do nothing but what is commended in the Law: Whereas the *Jews* frequently abandon the Law to follow the Inventions of their Rabbins. At the Time when they wrote to *Scaliger*, they reckoned 122 High Priests; affirmed that the *Jews* had no High Priests of the Race of *Phineas*; and, That the *Jews* belied them, in calling them *Cathareans*, whereas they are descended from the Tribe of *Joseph*, by *Ephraim*. The Truth is, The *Jews* impose abundance of Things on the *Samaritans*: They frequently confound them with the *Saducees*, as if they were infected with their Errors. Rabbi *Benjamin*, who lived in the 11th Century, confirms the best Part of what we have observed of the *Samaritans*. He observes, They had Priests of the Tribe of *Aaron*, and now never married with any but those of the same Tribe: That they sacrificed on Mount *Gerizim*, where they had an Altar of Stone raised by the *Israelites* after passing over *Jordan*. He adds, That they are of the Tribe of *Ephraim*; That they change their Habit to go to the Synagogue, and wash e'er they take it.

**SAMARITAN Characters, or Letters.** See LETTER.  
**SAMARITAN Pentateuch.** See PENTATEUCH.  
**SAMARITAN Medals.** In the Cabinets, we find some Medals, usually called *Samaritan Medals*. The Inscriptions and Legends of these are *Hebrew*; but the Character different from the *Hebrew* of our Bibles, which is the square *Hebrew* or *Chaldee*; and 'tis hence, viz. from the Character, not from being struck by the *Samaritans*, that they are denominated *Samaritan*. These Medals have been infinitely canvassed by the Critics, both *Jewish* and *Christian*; particularly Rabbi *Alschov*, R. *Bartenora*, Rabbi *Aarias*, Rabbi *Moses*, Father *Kircher*, *Vilshampans* *Walsrus*, *Cooringius*, *Hottinger*, Father *Morus*, *Walron*, *Harvoun*, *Spanheim*, &c. The learned *Jesuit* *Socinet*, in an express Dissertation on the *Samaritan Medals*, rejects all *Hebrew Medals*, whose Inscriptions are in *Chaldee* Characters, as spurious; and allows of none to be genuine but the *Samaritan*. Of these there are Four Kinds. The first bear expressly the Name of *Simon*, and the Subject for which they were struck, viz. the Deliverance of *Jerusalem*. The Second Kind have not the Name *Simon*, but only the Deliverance of *Sion*, or *Jerusalem*. The Third Kind have neither *Simon*, nor the Deliverance of *Sion*; but only the *Epochas*, first Year, second Year, &c. The Fourth Clasp have neither any Inscriptions, nor any Thing whence one may judge of the Time when they were struck. The Three first Kinds were certainly struck after the Return from the *Babylonish* Captivity, and in the Time of *Simon Maccabean*, after *Jerusalem* had been freed from the Yoke of the *Greeks*. But tho' struck after the Captivity, Father *Socinet* observes, their Character shews it self to be that of the ancient *Hebrew*, which was used before the Captivity, and the Use wherof was lost by the People, during their Sojourn in *Babylon* and *Chaldea*; but restored after their Return, on the same Footing as before. He adds, That the Inscriptions are pure *Hebrew*, such as it was spoke before the Captivity; That the Character, therefore, is the true ancient Character of the *Hebrew*: That it was the Custom to write each Language in its proper Character: That if they had departed from this

Rule, they had doubtless used the New Character they brought with them from *Babylon*: That there could be no other Reason but that of setting all Things on the same Foundation they were on before the Destruction of *Jerusalem*, that could have induced them to use this Character on their Coins. And, lastly, That these Medals were not struck by the *Samaritans*, but by the *Jews*, and in *Jerusalem*. He is very full on all the *æ*. Points, and, in the Proofs drawn from Medals, adds Two others foreign thereto. The first drawn from the Resemblance of the *Greek* Letters, introduced by *Cathars* the *Phoenicians*, with this *Hebrew* Character; which was the same with that of the *Phoenicians*, as the Language of those People was the same with that of the *Hebrews*. The second drawn from several various Readings in the Scriptures, which cannot be well accounted for otherwise, than by supposing, That the Books wrote before the Captivity, were in the same Character with these Medals, and which shew, that 'tis the Conformity which certain Letters have in that Character, that has deceived the *Copists*. From the whole, he concludes, That this Character of the Medals is the true ancient *Hebrew* Character; and, That to judge of the various Readings of the *Hebrew* Text, and the Differences of the ancient *Greek* and *Latin* Translations, either with themselves, or with the *Hebrew* Text, Recourse must be had to this Character.

**SAMBUCUS**, an ancient musical Instrument of the Wind Kind, and resembling a Kind of Flute; probably thus called because made of Elder, which the *Latins* call *Sambucus*. — *Sambucus* was also an ancient Engine of War, used by *Marcellus* in besieging the City of *Syracuse*. 'Twas so big, that *Plutarch*, in the Life of that General, observes, Two Ships were required to carry it.

**SAMIAN EARTH**, an Earth brought from the Isle of *Samos*, in the *Egean* Sea. The best is called by *Dioscorides*, *Collyrium*, because used in the Medicines of that Name: 'Tis white, very light, soft, friable, well-tasted, and a little glutinous on the Tongue. There is another Kind, harder and fouler, called *Aer-Samius*, in Regard little shining Straws are frequently found in it, disposed like little Stars. Each Kind is esteemed very astringent, proper to dry, and draw Wounds.

There is also a *Samian Stone*, taken out of the Mines in the same Island. 'Tis white, and flicks to the Tongue when applied to it. 'Tis astringent and cooling, and is also used by the *Goldsmiths* to burnish their Gold, and give it a greater Lustre.

**SAMOSATENI**, or *Samosatenians*, a Sect of ancient *Antirimitarians*, thus called from their Leader, *Pantius Samosatenus*, Bishop of *Antioch*, under the Emperors *Aurelianus* and *Probus*. He renewed the Heresy of *Arianism*, and had several Sentiments in common with *Apollinarius* &c. tho' he differed from them in the Manner of explaining them. He owned, That the Father, Son, and Holy Ghost were but one God, but denied that the Son and Holy Spirit had any real Substantiality. According to him, they only subsisted in the Father, as the Word of *Mao* subsists in his Understanding. St. *Epiphanius* will have the *Samosatenians* to be real *Jews*, without any Thing more than the Name of *Christians*; adding, That they use the same Arguments against the Mystery of the Trinity that the *Jews* do; pleading against it, with them, on Pretence of maintaining the Unity of the Godhead, tho' they don't observe the Ceremonies of the Law. Their Chieftain was condemned by a Council held at *Antioch*, whereto assisted above Seventy Bishops; and was deposed from his Bishoprick.

**SAMPSEÆI**, or *Sampseæians*, ancient Sectaries, the same, according to St. *Epiphanius*, with the *ELCESAITES*, which see. The *Sampseæians* were not properly either *Jews*, *Christians*, or *Gentiles*. They took their Name from the *Hebrew* *Somes*, *Son*; as if they adored the Sun. They acknowledged one only God; washed themselves often, and were attached, in almost every Thing, to the Religion of the *Jews*. Many among them abstained from eating of Flesh. *Scaliger*, after *Epiphanius*, will have the *Sampseæi* to be the same with the *Esseni*. In effect, the *Elcesaites*, *Sampseæians*, *Massilians*, and *Esseni*, appear to be no more than so many different Names for the same Thing; unless, perhaps, the first added something to the Opinions of the last. See *ESSENI*.

**SAN BENITTO.** See SACCO *Benedictus*.  
**SANCTIFICATION**, the Action of *Sanctifying*, or making a Thing Holy, and separate to God. See SACREN. The reformed Divines define *Sanctification* an Act of God's Grace, whereby a Man is renewed inwardly, his Desires and Affections alienated from the World, and the Man put in a Course of dying to Sin, and living to Righteousness. The *Sanctifying of the Sabbath*, among the *Jews*, is of Divine Right. By *Sanctifying* the Sabbath,

bath, is meant, the spending it in Prayer, Praise, &c. not in worldly Coziness. The first Petition in the Lord's Prayer is, *Hallowed, or sanctified, be thy Name*: By which is meant, Let thy Name be ever accompanied with Blessing and Praise.

**SANCTION**, the Authority given to some judicial Act; or that, whereby it becomes legal and current. The Royal Assent gives the *Sanction* of Statutes, to all Bills in Parliament that have passed each House Thrice. See **PARLIAMENT**. The Word is form'd from the *Latin Sancire*, to establish.

**PRAGMATIC SANCTION**. See **PRAGMATIC SANCTI VIII CHOREA**. See **SANCTI VITI**.

**SANCTUARY**, among the Jews, the holiest and most retired Part of the Temple of *Jerusalem*; wherein was preserved the Ark of the Covenant; and into which No-body was allowed to enter but the High Priest, and that only once a Year, to intercede for the People. The *Sanctuary*, called also *Sanctum Sanctorum*, or Holy of Holies, is supposed to be a Type or Figure of Heaven and of *Jesus Christ* the true High Priest, who is ascended thither to make Intercession for us. Some will have it, That the whole Temple was called the *Sanctuary*; and that the *Sanctum Sanctorum*, where the Ark was kept, was only a little Chapel or Oratory therein. See **TEMPLE**.

*Weight of the Sanctuaries*, to examine it by a just and equal Scale; in Regard among the Jews, 'twas the Custom for the Priests to keep Weights of Stone, to serve as Standards for the regulating of all Weights by; tho' these did not differ from the royal or profane Weights. See **WEIGHT**, **SHERLE**, &c.

**SANCTUARY**, in our ancient Customs, an *Asylum*, or lace privileged by the Prince for the Safeguard of Mens Lives, who were guilty of Capital Crimes. See **ASYLUM**. Till *Henry the VIIIth*, all our Churches and Church-yards were *Sanctuaries*; and protected Traytors, Murderers, &c. if within Forty Days they acknowledged their Fault, and submitted themselves to Banishment; and during that Time, if any Lay-man expelled them, he was excommunicated; if a Clerk, he was made irregular: After Forty Days no Man might relieve them. *St. John's of Beverly*, had an eminent *Sanctuary*, called by the Saxons, A Seat of Peace: So had *St. Martin's le Grand*, in *London*. *Rippon* had the like granted by *Whitfe*, King of the *Mercians*: So had *St. Ebricent* in *Cornewal*, granted by King *Abelbaln*, Anno 936; and *Westminster* the like, granted by *Edward* the Confessor. In *Scotland* they call the *Sanctuary*, *Girtbole*, or *Gritbol*. The Saxons also called it *Prodnoretel*. See **ABJURATION**.

**SANCTUARY**, is also used in the *Romish* Church for the Chancel, or that Part of the Church wherein the Altar is placed, inclosed with a Rail or Balustrade. See **CHANCEL**.

**SANCTUM SANCTORUM**. See **SANCTUARY**. **SAND**, a fine, hard gravelly Earth, of great Use in Building, and many other Arts and Manufactures, as in the making of Glass, in Plumbery, Foundery, &c. There are Three Kinds of Sands, distinguished by the Places whence they are drawn: viz. *Pit-Sand*, *River-Sand*, and *Sea-Sand*. See **EARTH**.

The Use of *Sand* in Building, is as an Ingredient in Mortar: See **MORTAR**. For this Use, *Pit-Sand* is of all others the best; and of *Pit-Sand*, the whitest is always the worst. Of *River-Sand*, that found in the Falls of Waters is best, because most purged. *Sea-Sand* is the worst. *Pit Sand*, as being fat and tough, is most used in Walls and Vaults. *River-Sand* serves for rough casting. All *Sand* is good in its Kind, if when spaced and handled it crackles; and if being put on a white Cloth, it neither stains nor makes it foul. That *Sand* is naught, which, mixed with Water, makes it dirty and muddy, and which has been long in the Air; for such will retain much Earth and rotten Humour. Hence some Maions wash their *Sand* e'er they use it. The *Sand* of *Pozzuolo*, *De Lorne* observes, is the best in the World; especially for Maritime Building. See **PUZZUOL**. Some distinguish a *Male Sand*, which is of a deeper Colour than another Sort in the same Bank or Bed, called *Female Sand*.

The *Sand* whereof Glass is made, is white and gritty, full of little sparkling Grains. See **GLASS**.

The *Sand* used by Founders, is Fossile. 'Tis properly a yellow fat Earth, whereof they make their Moulds, for the Casting of little Works; whence it is they say, *Casting in Sand*. See **FOUNDERY**. The Plumbers also use *Sand* to mould several of their Works, particularly large Sheets. To prepare the *Sand* for these Sheets, they wet it lightly, stir and work it with a Stick, then beat and plane it. See **PLUMBERY**.

**SAND**, in Agriculture, is one of the Three great Kinds of Soil; which are *Sand*, *Clay* and *Earth* or *Loam*. The Properties, &c. whereof see under the Article **SOIL**.

*M. de la Quintine* attributes all the Difference we find in Soils, to the different Quality of *Sands* mixed in them. *Soft Sands*, according to him, make a soft, gentle Earth. *Unctuous Sands*, a stiff Earth. *Coarse Sands* a rough untractable Earth, &c.

**SAND** is also applied to dry, crumbling Earths, which, wanting any *Famess* to bind them together, the Wind easily breaks into Dust, and carries them away. In this Sense it is that Travellers tell us, the Caravans in *Africa* are frequently lost, and buried under Clouds of *Sand*, torn up by Whirl-winds; and sometimes heaped up into Mountains. The Delarts of *Lybia* are niere *Sands*; and hence their Sterility.

A TABLE of SANDS.

Sharp, or Rag *Sand*, composed of small Transparent Pebbles, naturally found upon the Mountains, not Calcinable.

Fine	White.	<i>Srinobans-Moor</i> , in the Road washed up very white Pebble. <i>Flamorough Head</i> , of which the Light-House there is cemented. <i>Calais Sand</i> , burns reddish, but falls not in Water.
	Grey.	<i>Seaw-Banks</i> , near <i>Hartlepool</i> , on the <i>Tees</i> 's Mouth; to <i>Fer-crick</i> in the Gravel-pit there, a Vein of exceeding fine <i>Sand</i> .
	Reddish.	The <i>Pillow Sand</i> in the <i>Baltick</i> , in a Spring at <i>Helsington</i> . <i>Acaine</i> near <i>York</i> , drifted <i>Sand</i> . <i>Hutton-Moor</i> , washed. <i>Throp Fells</i> .
	Brown.	<i>Ouse</i> at <i>York</i> . <i>Nid</i> at <i>Mountain</i> . <i>Dug up</i> at <i>Raveliff</i> near <i>Swath</i> .
	Grieffly.	Wharf at <i>Ickly</i> and <i>Deutets</i> . <i>Air</i> at <i>Carleton</i> in <i>Craven</i> . <i>Eure</i> at <i>Graven</i> .
Coarse	Brown.	<i>Ganton</i> . <i>Santon</i> in <i>Lincolnshire</i> . <i>Brawly-Cannon</i> . <i>Skipwith-Cannon</i> .

Soft or smooth, with flat Particles. From *Lim-* At — in *Yorkshire*. *stone*, with *Mi-* A Vein at *Ofwell*. *co* of Glittering Beacons, in *Lincolnshire*. *Particles*.

Silver-like	Of <i>Westmoreland</i>	<i>Sea-Sand</i> , about the <i>Scilly</i> Islands. In <i>Cleveland</i> , and about <i>Scarborough</i> . <i>Ouse Dust</i> , or <i>Sediment</i> at <i>Raveliff</i> .
		A Vein of <i>Mica</i> in <i>Helsington</i> Gravel-pit. <i>Mica Argentea</i> in <i>Red-Sand</i> Rock, near <i>Rippon</i> , plentifully. <i>Mica Aurea</i> of <i>Cleveland</i> .
Gold-like		

**SANDAL**, in Antiquity, a rich kind of Shoe or Wear for the Feet, made of Gold, Silk, or other precious Stuff, used by the *Roman* and *Greek* Ladies; consisting of a Sole, with a Hollow at one Extreme to embrace the Ankle. *Terence* speaks of this *Sandal*, *Unicum tibi convenitrigori videsse Sandalio caput*: I wish the woud' break your Head with her *Sandal*. *Apollo* was sometimes called *Sandalarius*, the Reason of which Appellation has given great Perplexity to the Critics; some derive it from a Street called *Sandalarius*, because chiefly inhabited by *Sandal*-Makers, wherein that God had a Temple: But others, with more Probability, derive the Name of the Street from that of the God, and take *Apollo* to have been thus called from his effeminate Dress, as if he wore Womens *Sandals*.

The Shoe anciently wore by the Pope, Bishops, Priests, &c. when they officiated, was also called *Sandal*; being such as was supposed to have been wore by *St. Bartholomew*. *Alexis* observes, That there was some Difference between the *Sandals* of Bishops, Priests, and Deacons. Monks were not allowed to wear *Sandals*, except in Travelling, as is observed by *Du Cange*, *Salmajus*, &c. *Sandal*

*Sandal* is also a Shoe worn by several Congregations of reformed Monks. It consists of no more than a mere Leather Sole, fasten'd with Latches or Buckles, all the rest of the Foot being left bare: The Capuchins wear *Sandals*, the Recollects, Socks: The former are of Leather, the latter of Wood.

**SANDARAC**, in Natural History, &c. Some divide this *Sandaracha* into *Natural* and *Falitious*: The *Natural* is found in Gold, Silver, and Copper Mines, and is the same with the red Arsenic: The *Falitious* is only Ceruss exalted by the Fire, and burnt into a kind of Minium. Both the one and the other is a violent Poison. See **REALGAL**, **CERUSS**, &c.

**SANDARAC** of *Sandarach*, in Pharmacy, *Red Arsenic*, called also *Realgal* and *Red Orpiment*; 'tis sometimes also called *Sandaracha Græcorum*, in Opposition to the Gum.

**SANDARACH**, or *Gum-Sandarach*, called also *Sandaracha Arabum*, is a white Gum oozing out of the Trunk, and thick Branches of the great Juniper-Tree, by Incisions made in the Heats of the Summer. The little or common Juniper yields very little *Sandarach*: Its Fruit yields Oils, Waters, Salts, Spirits and Extracts of some Repute in Medicine. The *Gum Sandarach* is an Ingredient in Varnish. See **VARNISH**. 'Tis also reduced into an impalpable Powder, and used to prevent Paper from imbibing Ink. The best is in fine white Tears, free of Dust: The *Engish*, *Swedes*, &c. drive a considerable Trade therewith. Some will have it, that the *Sandarach* of the Juniper is not the right, but only that of *Oxycedron*, which see.

**SAND-BAGS**, in Fortification, are Bags holding about a Cubic Foot of Earth or Sand. They are used for raising Parapets in battle, or to repair what is beaten down; they are also of Use when the Ground is Rocky, and affords no Earth to carry on their Approaches, because they can be easily brought on and off at Pleasure. There are a lesser Sort, which hold half what the former do, and which are placed upon the upper Talus of the Parapet, to cover those who are behind, and who Fire through the Embrasures, or Intervals, that are between them.

**SANDEVER**, the Drops of Glass, or the Scum that arises from the Athes of the Herb *Kali*, used in the Making of Glass. See **GLASS**.

**SANDIX**, a kind of Minium, or rather of red Maltice made of Ceruss calcined and rubified, called also a *Falitious Sandarach*. 'Tis of little Use in Painting, the real Minium or Vermilion, to which it is substituted, making a much better, brighter, and more durable Colour. See **MASTIC**, and **VERMILION**.

**SAND-HEAT**, or *Sand-Barb*, in Chymistry, one of the Chymists Fires, consisting of hot Sand, wherein Herbs, Flowers, &c. are infused in a Cucurbit. See **BALNEUM ARENOSUM**. The *Sand-Heat* is esteemed gentle, digestive, and alterative.

**SANGUIFICATION**, in the Animal Economy, the Action whereby Chyle is converted into Blood. *Sanguification* succeeds to *Chylification*. See **CHYLIFICATION**. Also see **BLOOD** and **CHYLE**.

**SANGUIFICATION** is thus effected. The Chyle having passed the Lacteals of the several Kinds, is delivered into the Blood at the Subclavian; whence the two Humours pass together to the right Ventricle of the Heart, where being yet more intimately mixed, they circulate together through the whole Body; 'till, after several Circulations and Depurations at the several Colatures and Strainers of the Body, they become assimilated, or, as the Chymists call it, *cohabited*, so as only to make one uniform compound Mixture, which appears to be nothing else but Chyle alter'd by the Artifice of Nature, and exalted into Blood. In Effect, it does not appear that any Thing extraneous is mixed with the circulating Liqueur but Chyle, excepting what was before separated from it for particular Occasions; unless perhaps it should receive some Portion of Air in the Lungs, which is a Point long disputed, and yet scarce ascertained. Indeed, that there is a Quantity of Air mixed with the Blood and circulating with it, is granted; but whether this be any more than was at first contained in the Bodies whereof the Chyle was form'd, is much doubted: The principal Arguments for it, are, The Necessity of Respiration, and the florid Colour the Blood receives in the Lungs, and first shews itself in the Pulmonary Vein; but the first is satisfactorily accounted for another Way. See **RESPIRATION**. The latter is chiefly supported by this Experiment, That Blood turning by Venification, and suffered to coagulate, upon drawing up the Boreau, which before was blackish, being now exposed to the Air, acquires a florid Colour, like that we observe in the Blood of the Pulmonary Vein. The Action of *Sanguification* is succeeded by that of *Nutrition*. See **NUTRITION**.

The Antients were in great Perplexity about the Seat of *Sanguification*, or the Place where, and the Instrument whereby it is effected: Whether in the Heart, or the Liver, or the Lungs: But, according to the Doctrine of the Moderns, the Heart, Liver, Vessels, &c. contribute no otherwise to the changing of the Chyle into Blood, than the Sun does to the changing of the Mutt into Wine. See **HEART**, **LIVER**, &c.

The Antients accounted for *Sanguification* from a plaitic Power. In the last Century, when Chymistry was introduced, *Sanguification*, and almost every thing else, was to be effected by a Ferment; and the Physicians of those Times, were very solicitous as to the particular *Officina* where this Ferment was prepared and kept. Some would have it the Liver, others the Spleen, &c. but the very Notion is now exploded.

Of *Sanguification* we may admit two Degrees; the first amounting to no more than a Confusion, or such an intimate Mixture of Parts, as suffices to confound the different coloured Liquors, as that the Whiteness of the Chyle shall be lost or drowned in the Redness of the Blood, so as never more to appear in its own Shape and Colour. This we suppose may be effected by repeated Circulations alone: How many Circulations are necessary thereto, 'tis difficult to determine.

The Second Degree of *Sanguification*, is, when the Parts of the Chyle are so exalted or comminuted and subtilized, as to lose all Tendency to a coagulatory Separation, such as they have in Chyle and Milk. To these two Degrees may be added a third, wherein the Fibres and Filaments of the crude Blood are so broken and blended with the Serum, as not to be again separable from them. This is a *Morbid Sanguification*, such as happens in Fevers, &c. attended with a bloody Sweat, Spots, &c.

All these Degrees of *Sanguification*, Dr. Drake makes no doubt are procured by reiterated Circulations, wherein as well the Intestine, as the Progressive Motion, conspire to the mixing and comminuting of the adventitious Parts. Doubtless they have their stated Period, wherein they are in Perfection; though where precisely to fix it, we do not know.

**SANGUINE**, something abounding in Blood; hence *Sanguine Temperament*, or Constitution, is that where Blood and Heat predominate. *Sanguine* Constitutions require a frequent Use of Phlebotomy. *Sanguine* People are usually observed to be brisk, bold, daring, and even presumptuous: Hence *Sanguine* Hopes, strong, assured, &c. Hopes.

**SANGUINE**, in Heraldry, the Colour usually called *Murrey*, being made of Lake, with a little *Spanish* Brown: It is represented in Engraving, by Hatches like Purple: It is mostly used in the Coats of Knights of the *Bath*; when it is borne by Nobles, it is called *Sordouze*, and in the Coats of Sovereign Princes they call it *Drogout-Tail*.

**SANGUINE-STONE**, *Lapis Sanguinalis*, or *Blood-Stone*, a kind of Jasper brought from *New-Spain*, of a dark brown Colour, marked with Spots of a Blood-red; the *Indians* cut it in Form of a Heart, and use it in Hemorrhages, immoderate Menes, and other Fluxes of Blood. The Patient applies it by grasping it in his Right Hand, having first dip't it in Water 'Tis sometimes also hung on the Part whence the Blood flows. See **JASPER**.

**SANGUIS**, in Medicine, &c. See **BLOOD**. **SANGUIS**, in our antient Customs, a Right, or Power, which the chief Lord of the Fee had to determine in Causes where Blood was shed. *De Murderia & Rapina, de Igne, de Sanguine*, &c. Monast. — *Sanguinem Emere* was an Obligation the Inhabitants of some Manors, as that of *Greenlan*, were under, to buy and redeem their Villain Blood or Tenure, and make themselves Freeman.

**SANGUIS CAPRINUS**, or *Hircinus*, the Blood of the He Goat, either wild or tame, which is prepared, with great Precaution, to be used in Medicine, and supposed to have very extraordinary Qualities. The principal Precautions are these: The Goat is not to exceed four or five Years of Age; 'tis to be fed a considerable Time with Aromatic Herbs, and especially those of the Saxafrage Kind; to be drawn out of the Throat, or the Testicles, by cutting them; but neither what comes first, nor last to be used, the former being too full of Humidity, and the latter too thick; and that the Operation be only performed in *July*, and the Blood put into Earthen Vessels, and dried either in the Sun or the Shade, and, lastly, bottled up to be used occasionally.

Among other Specific Virtues attributed to Goats-blood, the two most considerable ones are, that it cures the

the Pleurisy without bleeding; and that it dissolves the Stone in the Bladder, by taking it in Vehicles proper for those Diseases. To be good, 'tis to be extremely hard and difficult to pulverize.

**SANGUIS-DRACONIS**, in Pharmacy. See **DRA-GONS-BLOOD**.

**SANHEDRIN**, or *Synedrion*, among the Ancient Jews, the Supreme Council, or Court of Judicature of their Republic; wherein were dispatch'd all the great Affairs both of Religion, and Policy. Many of the Learned agree, That it was instituted by *Moses*, and consist'd at first of Seventy Persons, all inspired of the Holy Ghost, who judg'd finally of all Causes and Affairs; and that it subsisted, without Intermission, from *Moses* to *Esdra*: Others will have it, That the Council of Seventy Elders, establish'd by *Moses*, *Numb. xxi*, was Temporary, and did not hold after his Death; adding, That we find no Sign of any such perpetual and infallible Tribunal throughout the whole *Old Testament*. The Jews, however, contend strenuously for the Antiquity of their Great *Sanhedrin*; *M. Sinaar* backs and defends their Proofs, and *M. le Clerc* attacks them. Be the Origine and Establishment of the *Sanhedrin* how it will, 'tis certain it was subsisting in the Time of our Saviour; that it was held at *Jerusalem*; and that the Decision of all the most important Affairs belonged to it. The President of this Assembly was call'd *Nassi*: There were several inferior *Sanhedrim*s in *Palestine*, all depending on the Great *Sanhedrin* at *Jerusalem*. The inferior *Sanhedrim*s consist'd each of Twenty-three Persons; and there was one in each City and Town. Some say, That to have a Right to hold a *Sanhedrin*, 'twas requisite there were One Hundred and Twenty Inhabitants in the Place. Where the Inhabitants came short of the Number of One Hundred and Twenty, they only establish'd Three Judges. Into the great as well as the inferior *Sanhedrim*s were admitted Priests, Levites, and Laymen, of all the Tribes, provided they were of noble Extraction, Rich, Prudent, without any Blemish of Body, and expert in Magick; which last was esteem'd a necessary Qualification, to enable them to obviate and destroy it: Very old People and Eunuchs were excluded. In each *Sanhedrin* there were two Scribes; the one to write down the Suffrages of those who condemn'd; the other to take down the Suffrages of those who acquitted.

*Selden* has a very Learned Work on the Subject of the Jewish *Sanhedrim*s, or *Synedrion*, Printed at *London* in 1635, in three Volumes *Quarto*. The Word is derived from the Greek *Synhedron* a Council, Assembly, or Company of People sitting together, from *syn* cou together, and *hedra* Seat, or *log*, a place.

**SANIES** in Medicine, a thin, serous Matter, issuing out of Wounds and Ulcers. *Galen* compares it to Whey. It differs from *Pus*, which is thicker and whiter: The Greeks call it *ischi* crude Blood.

**SANTALUM**, *Santal*, *Santal*, or *Sansuders*, a hard, heavy, odoriferous, medicinal Wood, brought from the *East-Indies*. There are of three different Colours, Citron, White, and Red. The Trees whence they are taken are all of the same Kind; and 'tis supposed their different Colours only arise from the Difference of Climates where they grow. 'Tis about the Height of the *Europæan* Walnut-tree. Its Leaves resemble those of the *Laurus*, its Flowers Blue, bordering on Black; its Fruit of the size of our Cherry, green at first, but blackening as it ripens, and of a faint Taste. The Citron *Santal* is esteem'd the best. 'Tis brought from *China*, and *Siam*: Is yellow, heavy, and of a good Smell; 'tis used in Medicine, as also in the Perfumers. The *White-Santal* is less odoriferous; 'tis brought from the Isle of *Timor*. The *Red-Santal* has the least Smell of the Three: 'Tis brought from the Island *Tanangorin*, and the Coast of *Coromandel*. The *Santals* are all held to be a little Astringent, to strengthen the Heart and Brain, and to stop Vomiting; and are frequently used in Diet-drinks, and medicated Ales, against Scorbutick Complaints.

**SAP**, or *Sapp*, to *Sap* a Wall, &c. is to dig or open a Hole in the Ground at the Foot of a Wall, &c. to bring it down all at once for want of Support. To *Sap*, according to *Dauviler*, is to undermine a Work with Hammers, Clubs, Pickaxes, Mattocks, &c. *vis*. A Bank, or Hillock, by propping it up, digging underneath it, and then burning the Props, or Stays; or a Rock, by digging a Mine underneath it. To demolish the thick, firm Walls of old Castles, &c. *Sapping* is much the readiest Way. See **SAPPING**.

**SAPHENA**, in Anatomy, a Vein which ariseth over the *Malleolus Internus*, up along the Leg, and the inner Part of the Thigh, discharges it self, near the Groin, into the Crural Vein. 'Tis the Vein they usually open when they bleed in the Foot. It has its Name, probably, from *sappi*, *insensibilis*, as lying plain in Sight,

**SAPHETA**, in Architecture, is the Board over the Top of a Window, placed parallel and opposite to the Window-Board at the Bottom.

**SAPHIC**, in Poetry, a kind of Verse much used by the Greeks, and *Latin*s; denominated from the Iaventric *Sappho*, The *Saphic* Verse consists of Eleven Syllables, or Five Feet, whereof the First, Fourth, and Fifth, are Traces, the Second a Spondee, and the Third a Dactyl, as in

*Longer Vite scelerisq; genus.*

Three Verses of this Kind, clost with an Adonick Verse, consisting of a Dactyl and Spondee, usually make a Strophe. Though we have some Chorus's in the Ancient Tragic Poets, containing a much greater Number of *Saphics* successively. They generally run rough, unless they have a Caesare after the Second Foot.

**SAPIENTAL**, an Epithet applied to certain Books of Scripture, calculated for our Instruction and Improvement in Prudence, or Moral Wisdom; thus call'd, in Contra-distinction to *Historical* and *Prophetical* Books. The *Sapiential* Books are *Proverbs*, *Canticles*, *Ecclesiastes*, *Ecclesiasticus* the *Psalms*, and *Job*; though some reckon this last among the *Historical* Books.

**SAPIENTIE DENTES**, Teeth, thus call'd because they appear not till Persons are grown. See **TEETH**.

**SAPPHIRE**, or *Saphir*, a precious Stone of a beautiful Azure, or Sky-blue Colour. The *Saphir* is transparent, yet exceedingly hard, so as scarce to bear being Engraven. Different Colours constitute different Kinds thereof; the deepest Blues being esteem'd *Males*, and the whitest *Females*. The *Saphirs* of *Pegu* are the most esteem'd. They are found in the same Mines with the Rubies. There are some also brought from the Kingdom of *Caucas*, *Consoor*, and *Ceylon*; from which last Place we should be furnish'd with abundance, if the King of the Island did not prohibit all Commerce thereof with Foreigners. The soft *Water-Saphirs* of *Babonia* and *Silesia* are of some Account, though far inferior to the Oriental ones. Many People value the *Saphir* beyond the Ruby and give it the second Place among precious Stones, viz. that next the Diamond: Others give that Place to the Ruby. Some Authors affirm, That a *Saphir* being heated to a certain Degree, between two Crucibles luted together, loses all its Colour, and becomes perfectly White; so as to deceive even the Jewellers themselves, and make it pass for a Diamond.

The Chymists make several Preparations of *Saphir*; as a Salt, a Tincture, an Essence, a Water, an Oil, &c. and there are two fine Diseases by they pretend themselves able to cure by Remedies compos'd thereof. The *Saphir*'s pernicious attribute still more strange Virtues to it; as, that it grows foul, and loses its Beauty, when wore by a Person that is lecherous, &c. The Rabbin's hold, That *Moses*'s Rod, and the Tables he received on Mount *Sinai*, were of *Saphir*. The Word is derived hence, that in the Hebrew the finest Things are all call'd *Saphirs*; whence, in Scripture, the Throne of God is said to resemble a *Saphir*.

Our Druggists sell two Kinds of *Saphirs* used in the Confession of Hyacinth: The one red, the other blackish. The last, by reason of the deep Tincture they give that Medicine, are very improperly used: The former are little reddish Stones, of the Size of Pins-heads, very hard, and difficult to pulverize.

There is a particular Kind of *Saphir*, call'd, by the *Latin*s, *Oculus Felis*, *Cats-Eye*, remarkable for a fine Diversity of Colours, as well as for its Hardness, which bears a Polish equal with that of the true *Saphir*.

**SAPHIR-RUBIES** are certain precious Stones, between blue and red, which, in effect, are nothing but Rubies, whose Colour is not yet perfectly form'd. See **RUBY**.

**SAPPING**, in War, a Working under Ground, to gain the Decent of a Ditch, Countercarp, &c. and the Attacking of a Place. 'Tis performed by digging a deep Trench, descending by Steps from Top to Bottom, under a Corridor, carrying it as far as the Bottom of the Ditch, when that is dry, or the Surface of the Water when wet. When the Cover'd way is well defended by Musketeers, the Besiegers make their Way down into it by *Sapping*. When they are got near the Foot of the Glacis, the Trench is carried on directly forwards; the Workmen covering themselves with Blinds, Wool packs, Sand-bags, and Mantlets upon Wheels. They also make Epaulements, or Traverses, on each Side to lodge a good Body of Men: The *Sap* is made five or six Fathom from the Salient Angle of the Glacis, where the Men are only covered side-ways, wherefore they lay Planks overhead with Hurdles, and Earth above them. When they have forced the Enemy to quit the Cover'd-way, the Pioneers immediately make a Lodgment, and cover themselves

themselves as well as they can, from the Fire of the opposite Ballion.

**SARABAIT**, a Name anciently given to vagabond Monks. St. Benedic't gives a frightful Idea of these *Sarabaites* in the First Chapter of his Rule. *Cassian* does not speak a whit more favourably of them in his Fourteenth Conference; nor S. *Jerom* in his Letter to *Eustochium*. *Cassian* calls them, *Revenite, quia jugens regularis disciplina reavinit*. The Word *Sarabaitie* is derived from the Hebrew סרסר *Sereh*, to be a Rebel.

**SARABAND**, a Musical Composition in Triple Time; being, in reality, no more than a Minuet, whose Motions are slow, and serious. *Saraband* is also a Dance to the same Measure, usually terminating when the Hand rises, whereby 'tis distinguished from the Courant, which Ends when the Hand that bears Time, falls. The *Saraband* is said to be derived originally from the *Saravants*, as well as the *Chaconne*: It had its Name, according to some Authors, from a Comedian called *Sarabanda*, who first danced it in *France*. Others derive it from the Spanish *Sarao* Ball: 'Tis usually danced to the Sound of the Guitar, or Castanettes.

**SARCASM**, in Rhetorick, a keen, bitter Irony, whereby the Orator scoffs and insults his Adversary. Such was that of the *Jews* to our Saviour: *Thou who destroyest the Temple, and raisest it in three Days, save thy self, Sec.* and again, *He saved others, himself he cannot save*. Or that of *Tamus* to a *Trojan* slain by him in *Virgil*.

*En agras, & quam bello, Trojane, petisti  
Hesperiam metere jacens. Hec premita qui me  
Ferro ausi tentare ferunt: Sic Memia cantus.*

**SARCOCELE**, in Medicine, a fleshy Excrecence, very hard, yet indolent; rising up by little and little about the Testicle, or on the inner Membrane of the *Scrotum*. Sometimes indeed it is painful, in which Case there is Danger of its degenerating into a Cancer: It usually owes its Origine to some external Cause, as a Blow, a Bruise, or Contusion. Such Accidents occasion the nutritious Juices to stop, and to be collected in great Quantities in the relaxed or compressed Pores of those Parts, by which Means is form'd that kind of Flesh called *Sarcocele*. 'Tis a very troublesome and obstinate Disease, and is frequently incurable by any other Means than cutting off the Testicle. The Word is formed from the Greek σαρξ *Caro*, Flesh, and κύμα *Tumor*.

**SARCOCOLLA**, a Gum oozing out of a thorny Tree, either with or without Incisions. Neither Authors nor Merchants are agreed as to the Place where it grows: Some say 'tis in *Persia*, others, in *Arabia Deserta*. It comes either in Grains, or in Tears of different Colours; sometimes White, sometimes Yellow, and sometimes Red, but all equally good, provided they be very dry. Their Taste is bitter, accompanied with somewhat of a disagreeable Sweetness. 'Tis esteemed warm and drying; very good to consolidate and heal Wounds, whence its Name, which is from the Greek σαρξ *Caro*, Flesh, and κόλλα *Glac*. 'Tis sometimes also used in Collyria to stop Defluxions, and take off Specks on the Eye.

**SARCOLOGY**, in Anatomy, a Discourse on the Flesh, or the soft Parts of the Human Body. Anatomy is divided into Two principal Parts; *Othology* and *Sarcology*. The first whereof treats of the Bones and Cartilages; the second of the Flesh and soft Parts. See *FLESH*.

**SARCOMA**, in Medicine, a fleshy Excrecence arising from the proper Nutriment of the Part where it grows, without any Defluxion, or Discharge of Humours from other Parts. If the Flesh be not repress'd and kept under, it frequently produces Pipes like Veins and Arteries, whereby it receives Nourishment, as we see in Wens. It yields a very fetid Sanies, and arises chiefly about the Fundament, the Neck of the Womb, Fractures of the Cranium, &c. The *Latins* call it *Fungus*.

**SARCOMPHALUM**, in Medicine, &c. a fleshy Excrecence of the Navel, from the Greek σαρξ *Caro*, Flesh, and φάλαξ *Navel*.

**SARCOPHAGUS**, or *Sarcophagum*, in Antiquity, a Tomb-stone, wherein the Ancients laid those they had not a mind to burn: The Word, derived from the Greek, literally signifies, one that eats Flesh; because at first, they used a Sort of Stones for the making of Tombs, which quickly consumed the Bodies: The Quarries from whence they dug them were in a City of *Troas*, named *Affum*: They had the Virtue to waste away a Body to nothing, save the Teeth, in Forty Days: This Stone resembled a Reddish Pumice Stone, and had a salish Taste; they made Vessels of it to cure the Gout, into which they put their Feet, not suffering them to continue there too long.

**SARCOTICKS**, in Medicine, Remedies proper to fill up Wounds and Ulcers with new Flesh; the same

as *Incarnatives*. *Sarcoticks* should be deterrive and moderately hot. Such are *Sarcocolla*, *Dragon's-Blood*, *Incense*, &c. The Word is form'd from the Greek σαρξ *Flesh*.

**SARDOIN**, or *Sardonian-Stone*, a precious Stone of a Blood Colour, half transparent; the same with what we otherwise call a *Cornelian*. See *CORNELIAN*. The most beautiful *Sardoin*s, are those brought from about *Babylon*: Those of *Sardinia*, whence they take their Name, are in the second Class. There are others, and those no contemptible ones, found near St. *Maura* in *Albania*; and other, very small ones, about the *Rhine*, in *Boismania*, *Silesia*, &c. To give them the greater Lustre, 'tis usual in setting them, to lay Silver-leaf underneath. The *Sardoin* is most used for Seals, as graving easily, yet taking a fine Polish. The Author of the Book tacitly ascribed to *Albertus Magnus*, attributes several wonderful Virtues to this Stone. See *AGATE*.

**SARDONIAN LAUGHTER**. See *RISUS SARDONIANUS*.

**SARDONYX**, a precious Stone, partaking partly of the *Sardoin*, and partly of the *Agate* or *Oxys*. 'Tis reddish, bordering on White, like the Nail of the Hand. In some, the Red inclines to a Yellow. 'Tis brought from the *East Indies*, *Arabia*, and *Bohemia*. It was anciently much used for fine Vessels. See *AGATE* and *SARDONIAN*.

**SARPLAR OF WOOL**, otherwise called a *P.cket*, is half a Stack. See *SACK*. In *Scotland*, it is called *Str-pliarbe*.

**SARRASIN**, in Fortification, is a Kind of Portcullis; otherwise called an *Herse*, which is hung with a Cord over the Gate of a Town, or Fortress, and let fall in Case of a Surprise.

**SARSAPARILLA**, or *Salsaparilla*, a Medicinal Plant; whose chief Use is in Decoctions and Potions in the Venereal Disease, being esteemed a great Obscurant and Sweetener; and, on that Score, sometimes used as a Tea. Its Root, which is the Part in Use, divides its self into a great Number of Filaments, Six or Seven Foot long; of the Thickness of a Quill. 'Tis Grey without Side, and White within, only mark'd with Two Red Streaks. Its Branches creep on the Earth, or along the Trunks of other Trees, &c. as the Ivy does. To be good, it must be very dry, its Filaments long, easy to cleave; and, in cleaving, must not yield any Dust: When boiled in Water, it must give it a Red Tincture. Some of the Modern Physicians doubt the Medicinal Virtue of this Root, as it does not discover much, either in Taste, Smell or Tincture. There is another Kind, the Filaments of whose Root are thicker, growing in the Island *Maregnan*, on the Coast of *Brasil*. This is not esteemed so good as the former. There is a third Kind brought from *Muscovy*, the Roots whereof are still bigger, but good for nothing but to burn.

**SARTORIUS**, in Anatomy, the *Taylor's Muscle*, a *Muscle* thus called, because serving to throw one Leg across the other. 'Tis also called *Popliteus*. See *POPULITIVUS*.

**SASSAFRAS** or *Sassafras*, a Yellow odoriferous Wood, of a briak aromatic Scent, somewhat resembling *Fennel*. 'Tis the Wood of a Tree growing in *Florida*, whereof there are whole Forests. The Natives call it *Pavanna*, the *Spaniards* and *French* also, *Cinnamon-Wood*; because, at the Conquest of that Country, under *Ferdinand Cortez*, in 1558, they imagined this to have been the true *Cinnamon* Tree. The Wood of *Sassafras*; chiefly its Bark, wherein its principal Virtue is supposed to reside, was formerly sold at an incredible Price, to be used with *Sarsaparilla* and *Equilina*, in the Cure of the Venereal Disease. 'Tis very drying and hot, tho' not quite so much as the *Guaicum*: It is somewhat come into Fashion in Families, as the common Tea, which the Shavings of it make agreeably enough; but the Scandal of being good in Venereal Cases, is a Detriment to it, and prevents a deal of Good being done by it: Indeed, with some, it doth not agree, especially at first, and in a Morning, as it affects the Head, like some Perfumes, and occasions Pains, Drowsiness and Vapours: But Use and drinking it, in the Beginning, in the Afternoon, will, with most Constitutions, wear out these Inconveniencies. 'Tis esteemed in the Gout, Sciatica, and Green Sickness, Chuse that covered with a thick Bark, reddish, and rough, of a sharp Taste, and a strong aromatic Smell.

**SASSE**, in some of our Statutes, is a Kind of *Weir* with Flood-gates, commonly in Navigable Rivers for the damming and loosing the Stream of Water, as Occasion requires, for the better passing of Boats and Barges to and from. This, in the West of *England*, is called a *Lock*; in the River *Lee*, a *Turn-pike*, and in other Places a *Sluice*.

**SATELLIT Guard**, a Person attending on another, either for his Safety, or to be ready to execute his Pleasure. Among the *Eastern* Emperors, *Satellite* Express'd the Dignity or Office of Captain of the Life-Guard. The Term was afterwards us'd for the Vassals of Lords, and afterwards for such as held Fees, called **SERJEANTIES**: Which see.

**SATELLITES**, in Astronomy, certain Secondary Planets, moving round the other Planets, as the *Moon* does round the Earth; thus called, because always found attending them from Rising to Setting, and making the Tour of the Sun together with them. See **PLANET**.

The *Satellites* move round their primary Planets, as their Centres, by the same Laws as those primary ones do round their Centre, the Sun. For the Physical Cause of their Motion, see **GRAVITY**; see also **SYSTEM**.

The Words *Moon* and *Satellit*, are sometimes us'd indifferently; and thus we say, either *Jupiter's Moon*, or *Jupiter's Satellite*: But ordinarily we distinguish, restraining the Term *Moon* to the Earth's *Satellit*; and *Satellit* to the little *Moons* lately discovered about *Jupiter* and *Saturn*. See **MOON**.

The *Satellites* were unknown till our Time, as needing the Assistance of the Telescope to render them visible. We don't know of any *Satellites*, besides those just mentioned; nor is there any great Foundation to hope that more shall be discovered hereafter, as the longest, and the most exquisite Telescopes have already been applied.

**SATELLITES of Jupiter** are Four little Secondary Planets, performing their Revolutions about *Jupiter*, as that Planet does round about the Sun. See **JUPITER**. *Simon Marius*, Mathematician of the Elector of *Brandenburg*, about the End of *November* in 1609, discovered Three little Stars moving round *Jupiter's* Body, and proceeding along with him; and in *January* 1610, found a Fourth. In *January* 1610, *Galileo* observed the same in *Italy*; and the same Year published his Observations; from which it is commenced the Observation of the *Circumpolar* *Satellites*. *Galileo*, in Honour of his Patron, first called them *Astra Medicea*, Medicæan Stars. *Merisius*, the first Discoverer, called that next *Jupiter*, *Mercurius Jovialis*, *Jupiter's Mercury*. The second, *Iovis Jovialis*, *Jupiter's Venus*; the third *Jupiter Jovialis*, and the fourth *Saturnus Jovialis*, *Jupiter's Saturn*.

Indeed, *Anthony Maria Schylaus de Rheira*, a Capuchin of *Calicut*, imagined, That, besides the Four known *Satellites of Jupiter*, he had discovered Five more, the 20th of *December*, Anno 1642, and in Honour of *Urban VIII*, the Pope then reigning, denominated them *Sæcra Urbanæstærona*. But upon *Nanda's* communicating the Observation to *Gessnerus*, who had observed *Jupiter* on the same Day, he soon perceived that the Monk had mistaken Five fixed Stars, in the pouring out of the Water of *Aquarius*, mark'd in *Tychô's* Catalogue 24, 25, 26, 27 and 28, for *Satellites of Jupiter*: Whence 'tis no Wonder they should appear to the Discoverer to move a contrary Way to that of the rest, viz. from West to East. See *Eph. Gessner. ad Gab. Naud. de Novem Stellis. circa Jovis visib.*

#### Phœnomena, Nature, Properties, &c. of Jupiter's SATELLITES

1<sup>o</sup>. The *Satellites of Jupiter* all disappear in a clear Sky, when *Jupiter* interposes between them and the Sun; that is, are eclipsed by him.

Hence it follows, That they are destitute of Light, when the Sun's Rays, which are propagated in right Lines, are intercepted by *Jupiter*: And hence it follows, That they are opaque Bodies like our Moon, and are illuminated by the Sun. And hence, since *Jupiter* does not illumine his *Satellites* when placed behind him; he himself, in that Side opposite to the Sun, is destitute of all Light.

2<sup>o</sup>. When the *Satellites* are interposed between *Jupiter* and the Sun, a round Macula or Spot is observed in *Jupiter's* Disk; which is sometimes found bigger even than the *Satellit* it self.

Hence, since the *Satellites* are opaque Bodies, and are illuminated by the Sun, and must therefore project a Shadow, opposite to the Sun; the round Spots seen in *Jupiter*, are the Shadows of the *Satellites*. Hence also, since the Interfection of the Shadow is a Circle, the Shadow it self is Conical: And hence it follows, That the Figure of the *Satellites*, at least, as to Sense, is Spherical.

3<sup>o</sup>. If, when the Earth is between *Jupiter* and the Sun, any of the *Satellites* happen to be between the same, its Light disappears, and is lost in *Jupiter's* Light. Thus *M. Maraldi* tells us, That on the 26th of *March* 1707, thro' a Telescope of Thirty Four Foot, he observed the

Fourth of *Jupiter's* Moons passing over his Body, in Form of a dark Spot; but it had no sooner got off to the Desk, than it relump'd its usual Brightness. A like Spot he observed on the 4th of *April*, from an Immersion of the third *Satellit*; but, on the 11th of *April*, upon watching an Immersion of the same *Satellit*, he found it appeared wholly, without leaving any Spot at all. The same Phenomenon was also observ'd at other Times by *M. Cassini*: And both *Cassini* and *Maraldi*, have frequently observed very surprizing Changes in the apparent Magnitudes of the *Satellites*, when there was nothing in their Distance, either from Earth, the Sun, or *Jupiter*, to occasion such Variations. E. gr. The fourth *Satellit*, which is frequently the least of all, sometimes appears the biggest; And the third, which is ordinarily the biggest, sometimes only appears equal, and sometimes less, than any of the rest.

Hence, since *Jupiter's* *Satellites* are illumined by the Sun, even when immersed in the Light of *Jupiter*, and yet, notwithstanding this, sometimes appear dark, and sometimes disappear; there must be some Changes in their Atmospheres, to prevent the equable Reflection of the Sun's Rays, from the several Parts of the Atmosphere. To the same Cause 'tis owing that their Shadows are sometimes seen bigger than themselves.

#### Periodical Times of the SATELLITES of Jupiter.

The Periods, or Revolutions of the *Satellites*, are found from their Conjunctions with *Jupiter*, after the same Manner as those of the primary Planets are found from their Oppositions to the Sun. See **PERIOD**, &c.

Note, By this Method *Cassini* determined the Periods of

The First Satellit	1 Day 18 Hours 28 Min. 36 Sec.
Second Satellit	3 13 18 52
Third Satellit	7 3 59 40
Fourth Satellit	16 18 05 06

#### Distances of Jupiter's SATELLITES from Jupiter.

As in the primary Planets, with regard to the Sun, so in the *Satellites*, with regard to their Primaries, the Squares of the Periodical Times, are in a Triplicate Ratio of their Distances therefrom. To determine the Distance by Observation, they measure them with a Micrometer, in Semi-Diameters of *Jupiter*. These Distances, according to *Cassini*, are as follow.

#### The First Satellit distant from Jupiter's Center,

The Second Satellit	5 and two 3ds. Semi-diam.
The Third Satellit	9 Semi-diam.
The Fourth Satellit	14
	25 and one 3d.

Hence, as the Semi-diameter of *Jupiter* is equal to 278 11ths Semi-diameters of the Earth, the Distance of the first *Satellit* from the Centre of *Saturn* is 166 Semi-diameters of the Earth: That of the second 249 and a Half. That of the third 388; and that of the fourth 884.

#### Eclipses of Jupiter's SATELLITES. See ECLIPSE.

**SATELLITES of Saturn**, are Five little Stars revolving about *Saturn*. See **SATURN**. The first was discovered by *M. Huygens*, Anno 1655, *March* the 25th, by means of a Telescope Twelve Foot long. The other Four, at different Times, by *M. Cassini*, viz. Those Two next *Saturn*, in *March* 1684, by Help of *Campani's* Glasses, of One Hundred, and One Hundred and Thirty-six Foot long. The third in *December* 1672, by a Telescope of *Campani's*, of Thirty-five Foot; and the fifth (that of *Huygens* being the fourth) in *October* 1671, by a Telescope of Seventeen Foot.

Most, perhaps all, of the Phenomena observed of *Jupiter's* *Satellites*, are also found exhibited by those of *Saturn*: Thus, they are found sometimes bigger, and sometimes less: The fifth is sometimes, also, found eclipsed, &c. And hence, there is no doubt, but they are of the same Nature, &c. See **SATELLITES of Jupiter**.

#### The Periodical Times of the SATELLITES of Saturn, according to M. Cassini, are as follow.

#### That of the

First Satellit	1 Day 21 Hours 18 Min. 31 Seconds
Second Satellit	2 17 41 27
Third Satellit	4 13 47 16
Fourth Satellit	15 22 41 11
Fifth Satellit	74 7 53 57

The Distances of Saturn's SATELLITES from his Centre, according to the same M. Cassini, are as follow.

First Satellite	4 3 8ths	Semi-diam. of Saturn, or	} Diameter of Saturn's Ring.
Second Satellite	5 3 5ths		
Third Satellite	8		
Fourth Satellite	18		
Fifth Satellite	54		

The great Distance between the fourth and fifth Satellite, gave Occasion to *Huygens* to suspect that there might be some intermediate one; or else, that the fifth might have some other Satellite moving round it, as its Centre.

Dr. *Holley*, in the *Philosophical Transactions*, gives us a Correction of the Theory of the Motion of the fourth or *Huygenian* Satellite. Its true Period he makes 15 Days, 22 Hours, 41 Minutes, 6 Seconds. Its diurnal Motion,  $22^{\circ} 34' 18''$ . Its Distance from the Centre of Saturn, 4 Diam. of the Ring; and its Orbit to be little or nothing distant from that of the Ring, intersecting the Orbit of Saturn under an Angle of  $23 \frac{1}{2}$  Degrees.

SATIR. See SATYR.

SATIRE. See SATYRA.

SATRAPA, or *Satrapes*, in Antiquity, the Governor of a Province among the ancient Persians. King *Darius* usually walked attended by his principal Lords, and *Satrapes*, *Q. Carrus*. The Kingdom was divided into *Satrapies*, or Jurisdictions of *Satrapes*. The Word is originally Persian, signifying, strictly, *Admiral* or *Commander of a Naval Army*, but was afterwards used indifferently for all Governors of Provinces; in which Sense it was borrowed by the *Greeks*, who used *σατραπεία* in the same Signification. We also find the Word used in some ancient *English* Charters of King *Edward*, where the Lords, who sign next after the Dukes, take the Title of *Satrapes* of the King. *Du Cange* takes the Word here to signify *Ministers* of the King.

SATTIN, or *Satten*, a kind of Silken Stuff very smooth, and shining, the Warp whereof is very fine, and stands out; the Wool coarser, and hid underneath: Whence it is; it receives that Gloss, which is its Beauty, and which gives it its Price. There are *Sattins* quite plain, others wrought; some flowered with Gold, or Silk, others striped, &c. All the Changes in the Fashions of *Sattins* are made by adding new Warps or Woofs.

The finest *Sattins* are those of *Florence* and *Genoa*; yet, the *French* will not allow those of *Lyon* any thing inferior thereto. — The *Sattins* of *Bruges* have their Warp of Silk, and their Wool of Thread. *Indian Sattins*, or *Sattins* of *China*, are Silken Stuffs, much like those manufactured in *Europe*. Of these, some are plain, either white, or of other Colours, others worked, either with Gold, or Silk, flowered, damasked, striped, &c. They are most valued, because of their Cleaning, and Bleaching easily, without losing any thing of their Lustre. In other Respects they are inferior to those of *Europe*. *F. le Comptre* observes, That the *Chinese* prepare their *Sattins* in Oil, to give them the greater Lustre; but this makes the Deal liable to rotting to them. *Monsieur* derives the Word from the *Latin Seta*, as who should say, *Setinosa*, or from the *Hebrew Sodin*, signifying the same thing; or from the old *French Sate* and *Satinet*, handsome, genteel.

SATTINET, or SATTINADE, a very slight, thin Satin, chiefly used by the Ladies for *Summer* Nightgowns, &c. and ordinarily striped. The Word is a Diminutive of *Satten*.

SATURANTIA, is sometimes used in the same Sense as *Absorbent*: Which see.

SATURDAY-STOP, a Space of Time, in which of old it was not lawful to take *Salmons*, in the North, viz. From Even-song on *Saturday*, till Sun-rising on *Monday*.

SATURN, in *Astronomy*, one of the primary Planets, being the furthest from the Earth, and the Sun, and that whose Motion is the slowest: Thus characteriz'd  $\text{♄}$ . It shines but with a feeble Light, by reason of its Distance, on which Account, though the biggest of all the Planets, it appears the least. See PLANET.

The Period of Saturn, or the Space of Time where-in he revolves round the Sun, which makes his Year, according to *Kepler*, is 29 Years, 174 Days, 4 Hours, 58 Minutes, 25 Seconds, and 30 Thirds, whence his Diurnal Motion must be 2 Minutes, 0 Seconds, 36 Thirds. The *De la Hire* makes his Diurnal Motion 2 Minutes 1 Second. See REVOLUTION. The Inclination of his Plane to that of the *Ecliptick*, *Kepler* makes  $2^{\circ}$ . *De la Hire*,  $2^{\circ}$ .  $33'$ . See INCLINATION. Its mean Distance from the Sun is 326915 Semi-diameters of the Earth; and from the Earth 210000 of the same: See

DISTANCE. Its smallest Diameter, according to *Huygens*, is 30 Seconds. The Proportion of its Diameter to that of the Earth, as 20 to 1; of its Surface to that of the Earth, as 400 to 1; of its Solidity to that of the Earth, as 1 to 8000. See DIAMETER. Dr. *Holley* observes, in the Preface to his Catalogue of the Southern Stars, That he has found Saturn to have a slower Motion than is assigned him in the Tables: This Irregularity, we may hope, is abundantly rectified in his own Tables now in the Press. 'Tis doubted whether or no Saturn, like the other Planets, revolves on his Axis: It does not appear from any Astronomical Observations that he does; and there is one Circumstance that should seem to argue the contrary, viz. That whereas the Earth, and other Planets, which we know do revolve on their Axes, have their Equatorial Diameter greater than their Polar, nothing like this is observed in Saturn. See EARTH.

The Distance of Saturn from the Sun being ten times greater than that of the Earth from the same, 'tis found, that the apparent Diameter of the Sun seen from him, will not exceed 3 Minutes, which is but little more than twice the Diameter of *Venus*. The Sun's Disk therefore; to an Inhabitant of Saturn, will appear 100 times less than it does to us, and both its Light and Heat be diminished in the same Proportion. See SUN.

The Phases of Saturn are very various and extraordinary, and long perplexed the Astronomers, who could not divide the Meaning of such Irregularity: Thus *Huygens* observed him to be sometimes Spheroidal, sometimes Spherical, Spherico-anated, Elliptico-anated, and Spherico-cuspidated. But *Huygens* plainly shews, That all these monstrous Appearances are owing to the Imperfection of the Telescopes that Author had used. *Huygens*, upon observing him very attentively with much better Glasses, reduced all his Phases to three Principal ones, viz. Round, Brachiated, and Anated. See PHASES.

One Thing Saturn has peculiar to himself, viz. A Ring which surrounds his middle like an Arch, or like the Horizon of a Globe, without touching him any where; the Diameter thereof more than double that of the Planet which it surrounds; The former containing 45 Diameters of the Earth, the latter only 20. When raised enough to be out of the Shadow of the Body of Saturn, it reflects the Light of the Sun very strongly. The Thickness of the Ring, Dr. *Kaill* observes, takes up one half of the Space between its outer or convex Surface, and the Surface of the Planet. This Ring is found to be an opaque, solid, but smooth, and even Body 'Twas *Galilaeus* first discovered that the Figure of Saturn was not round; but 'twas *Huygens* first found that its Inequality was in Form of a Ring; the Discovery of which he published in 1657, in his *Systema Saturnianum*. 'Tis doubted whether or no the Ring revolves round the Planet: Its Use and Design are still a Mystery. For its Phenomena, &c. see RING.

Saturn performs his Course round the Sun, attended with five Satellites, or Secondary Planets; and the Periods, Distances, &c. whereof, see under SATELLITES.

SATURN, in Chymistry, signifies Lead, in regard that Metal is supposed to lie immediately under the Influence of this Planet. See LEAD; Where the several Preparations thereof are described.

SATURN, in Heraldry, the Black Colour in the Coats of Arms of Sovereign Princes; answering to *Diamond* in the Coats of Noblemen; and *Sable* in those of Gentlemen. See SABLE.

SATURNALIA, in Antiquity, Feasts celebrated among the *Romans*, in Honour of the God Saturn: They held three Days, beginning on the 16th, others say, the 17th, and others the 18th Day of *December*. During the Solemnity the Slaves were reputed Masters; they were allowed to lay any thing; and, in fine, were served at Table by the Masters themselves. Every thing run into Debauchery and Dissoluteness, and nothing was heard or seen in the City of *Rome*, but the Din, Riot, and Disorder, of a People wholly abandoned to Joy and Pleasure. *M. Dacier* observes, That the *Saturnalia* were not only celebrated in Honour of Saturn, but also to keep up the Remembrance of the Golden Age, when all the World was on a Level. 'Twas a Piece of Religion not to begin any War, or execute any Criminal during this Feast. The *Saturnalia* were not only held at *Rome*, but also in *Greece*; and were, in reality, much older than *Rome* it self. Some ascribe their Institution to the *Pelagii*, who were cast upon the Island of *Zelus*; others to *Hercules*, and others to *Janus*, *Geropius Becanus* makes *Nash* the Author of them. *Orig. lib.* 4. That Patriarch, he tells us, in the *Ark*, instituted a Feast to be held in the Tenth Month, in Memory of this, That in that Month, the Tops of the Mountains began to appear above the Water; and this he makes the Origin of the *Saturnalia*: But 'tis very

very probable the Year then begun in *Autumn*, and of consequence *December* could not be the Tenth Month. *Vossius* goes still higher, and will have it, that the *Satur*, in Honour of whom this Feast was instituted, was *Adam*.

**SATURNINE**, a Term applied to Persons of dark, sullen, melancholic Complexions; as being supposed under the Predominancy of *Saturn*, or at whose Births *Saturn* was the Ascendant.

**SATURNINIANS**, or *Saturnilians*, a Sect of ancient *Gnosticks*, thus called from their Chief *Saturnus* or *Saturnus*, a Disciple of *Messias*, a famous *Gnostic*. *Saturnus* taught the loose Errors with his Master, in *Syria*. See *MENANDRIANS*.

**SATYR**, in the Heathen Theology, a fabulous Demi-God, who with the *Fauns*, and *Sylvans*, presided over Groves, and Forests, under the Direction of *Pan*. The *Satyrs* were painted half Men, half Goats. The upper Part was Human, excepting for Horns on the Head: The lower Brutal, with the Tail and Legs of a Goat: The Whole cover'd with Hair. The Word is usually derived from *Satibn*, which, in the ancient *Greek*, signified the virile Member; these Deities being supposed much addicted to *Lasciviousness*.

The Poets usually confound the *Satyrs*, *Sylvans*, *Fauns*, and *Panis*: See each under its proper Article. *Nanus* in his *Diogenes*, makes the *Satyrs* the Offspring of *Mercury*, and a Doric Nymph, call'd *Ipsitima*, and gives us the Names of several, viz. *Pemina*, *Typhus*, *Hypoborus*, *Oristes*, *Apeus*, *Phlogysus*, *Lycon*, &c. *Mossan*, in his Book against the Tyrants of *Heracles*, derives the *Satyrs* from *Bacchus*, and a *Naiad*, call'd *Nicoa*.

**SATYRA**, or rather *Satira*, a Satyr: It is a Word that signifies all manner of *Difcourfe*, wherein any Person is reprehended. But a *Satyr* is commonly meant of a Poem, that wittily reproves Men's Vices: *Cassanba* makes a Distinction between the Satyrical Poetry of the *Greeks*, and the *Satyr* of the *Romans*, which was peculiar to themselves only, and this is justified by *Quintilian*, l. 1. c. 10. *Satira quidem tota nostra est*, for which Reason *Horace* calls it, *Græci turanum Carmen*; a sort of Poetry unknown to the *Greeks*: See *Cassanba* on the Word. A *Satyr* ought to be lively, pleasant, moral, and full of Variety, wherein *Juvenal* and *Horace* excelled, though their *Satyrs* ought to be read with Caution.

**SATYRION**, a Root called by this Name, because of its fancied Promotion of Lust: *Dioscorides* distinguisheth this from the *Orebis*, but *Mr. Dale* ranks it under that Tribe. It passeth for a great Cordial and Restorer; but its Shape, resembling an Human Penis, seems to be the only Foundation for the Whimsey of making it a Provoker to *Venery*, and to forward Conception.

**SAVAGES**, or *Savages*, wild, barbarous People, without any fix'd Habitation, Religion, Law or Policy: A great Part of *America* is peopled with *Savages*. Many, some say most, of the *Savages* are *Anthropophagi*. The Word is form'd from the *Italian Salvaggio*, of *Salvatici* or *Silvatici*, which we find used in the barbarous *Latin* for *Silvestris*.

**SAUCISSON**, in Fortification, a kind of Faggot made of thick Branches of Trees, or of the Trunks of Shrubs bound together; the Use whereof is to cover the Men, and to serve as *Epaulements*. It differs from a *Fascine*, which is only made of the small Branches, and by its being bound at both Ends, and in the Middle. Anciently they made it 46 Foot long, and 15 Foot thick; since, 'tis usually 23 Foot long, and 12 thick; bound thrice together with three Bands furnish'd with Iron. The Word is *French*, and signifies literally, a big *Sawage*.

**SAVER-DE-FAULT**, in Law, to excuse a Fault; which is properly when a Man having made Default in Court, comes afterwards, and alleges good Cause why he did it; as Imprisonment at the Time, or the like.

**SAVIOUR**. Order of *St. Saviour*, is a religious Order founded by *St. Bridget*, about the Year 1344, thus called from an Opinion, that Christ himself, the *Saviour of the World*, prescribed the Rules and Constitutions thereof. They are also called, from their Foundress, *Bridgists*. Their Origine was thus: *Wilhelm* Prince of *Noricia*, to whom *St. Bridget* had been married, being dead at *Arres*, in his Return from *Galicia*, the Widow thought of nothing but devoting herself to a religious Life, and accordingly, soon after, built the Monastery of *Hyster* in the Diocese of *Lincopen* in *Sweden*, where she entered herself. By the Constitutions of this Order, 'tis to be principally appointed for Women, who are to pay a particular Honour and Service to the Virgin. The Monks are only to assist them the Spiritual Assistances they may need, to administer them the Sacraments, &c. The Number of Nuns is fixed to Sixty in each Monastery,

and that of Monks to Thirteen, according to the Number of *Apotles*, whereof *St. Paul* makes the Thirteenth. Four of them were to be Deacons, to represent the Four Doctors of the Church, and Eight Converts; the whole Number making Seventy-two, the Number of the Disciples of our Saviour. Setting aside these Circumstances, and the Habit, this Order is under the Rule of *St. Augustinus*. It was approved of by *Urban V.* and several succeeding Popes. In 1603, *Clement VIII.* made some Alterations in it, on account of the double Monasteries which then began to be built in *Flanders*, &c.

**SAVOR**. See *FAST*.

**SAUSAGE**, or *Sausidge*, a Term of some Significance in Commerce. The *Sausidge* is a popular Food prepared of some crude Meat, usually either Pork or Veal shred small, seasoned, and put up in a Skin, in manner of a Pudding. The most citenied Confection of this Kind, is the *Boisgion Sausidge*, which is much thicker than the common one, and is made with moist Success in some Cities in *Italy*, particularly *Boisgion*, *Venice*, &c. whence great Quantities are exported to other Places. 'Tis made of raw Pork, well beaten in a Mortar, with a Quantity of Garlic, Pepper in the Grain, and other Spices. The *Italians* are furnish'd with a great Part of the Skins or Guts for their *Sausidges* from *England*. The Quantities of that Commodity yearly exported, are greater than one would imagine. *Menege* derives the Word from *Salsicia* for *Salsicium*.

**SAUSAGE**, in War, a little long Linnen-Bag, in Form of a Gut, two Inches in Diameter, dipt in Pitch and Tar, and filled with Powder, having a slow Fuse fallen'd thereto, to serve as a Train to set Fire to Mines, Fougades, or Bomb-Chests, being made to reach into the Chamber of the Mine. Two of these *Sausages* are commonly applied to every Mine, to the End, that if one should fail, the other may take Effect. See *MINE*.

**SAUT**, in the Manage. See *SALTS*.

**SAW**, an Instrument serving to cleave, or divide into Pieces, divers kind Matters, as Wood, Stone, Marble, Ivory, &c. The *Saw* is one of the most useful Machines, in the Mechanic Arts, ever invented. The *Table*, which is perhaps founded on some surer Tradition, attributes the Invention thereof to *Kaaris*, who, vying with his Father *Delates*, enrich'd the rising Arts with several Discoveries. 'Tis added, he first contrived it on the Model of the Spine or Backbone of a flat Fish, such as the *Soal*. The *Saw* is made of Steel with Teeth, but those differently filed, and turned, according to the Use it is designed for. There are also *Saws* without Teeth, used in the sawing of Marbles and other Stones.

The best *Saws* are of Steel, ground bright and smooth; those of Iron are only Hammer-hardened: Hence, the first, besides their being stiffer, are likewise found smoother than the last. They are known to be well hammer'd by the stiff bending of the Blade; and well or evenly ground, by bending equally into a Bow. The Edge, wherein the Teeth are, is always thicker than the Back, in regard the Back is to follow the Edge. The Teeth are cut and sharpened by a Triangular File, first fixing the Blade of the *Saw* in a Whetting-block. When filed, the Teeth are to be set, that is, to be turned a-skew, or out of the right Line, to make the wider Kerf or Fissure, that the Back may follow the better: This is done by putting an Instrument, called a *Saw wrist*, between every other two Teeth, and giving it a little Wrench, which turns one of the Teeth a little towards you, and the other a little from you. The Teeth are always set ranker for coarse cheap Stuff, than for hard and fine, in regard the ranker the Tooth is set, the more Stuff is lost in the Kerf; and if the Stuff be hard, the greater the Labour of sawing it.

The Workmen who make the greatest Use of the *Saw*, are, The *Sawyers*, *Carpenters*, *Joiners*, *Ebonists*, *Stone-Cutters*, *Carvers*, *Sculptors*, &c. The *Lapidaries* too have their *Saw*, as well as the Workmen in *Metalick*, but these bear little Resemblance to the common *Saws*. See *LAPIDARY* and *MOZAICK* Work.

But of all Mechanicks, there are none have so many as the *Joiners*, nor so many different Kinds. The chief are as follow. The *Pit-Saw*, a large two-handed *Saw*, used to saw Timber in Pits. 'Tis set rank for coarse Stuff, so as to make a Kerf or Fissure of almost a Quarter of an Inch a but for finer Stuff, finer. The *Whip Saw*, which is likewise two handed, used to saw such large Pieces of Stuff as the *Hand-Saw* will not easily reach.—The *Hand-Saw* is made for a single Man's Use. Of these are various Kinds; as, The *Bow*, or *Frame-Saw*, furnished with Checks; by the twisted Cord and Tongue in the Middle thereof, the upper Ends are occasionally drawn close together, and the lower set the further apart.—The *Tenour-Saw*, which being very thin, has a Back to keep it from bending.—The *Cow-flesh-Saw*, which

which is very small, and its Teeth, usually, not set; its Use is to cut a round, or any other Compa's-Kert: Hence, the Edge is made broad, and the Back thin, that it may have a Compa's to turn in.

The Chirurgians likewise use a Saw, to cut off Bones: 'Tis to be very small, and light, in order to be managed with the more Ease and Freedom. The Blade exceedingly fine, and the Teeth exquisitely sharpened, to make its Way more gently, and yet with more Expedition in Amputations of Legs, Arms, &c.

The Saw is also a Gardener's Instrument, used in the pruning of Trees, &c. 'Tis chiefly applied in the cutting of old, dry, and, consequently, hard Woods, whether Roots or Branches, which might spoil the Pruning-Knife; and big Branches, &c. which the Knife could not well take off at one Stroke. Except on these Occasions, *Quintessence* will have us always use the Knife.

**SAWING**, the Application of the Saw, in the dividing of Timber, &c. into Boards, &c. See **SAW**. There are Wind-mills, and Water-mills, which do the Office of *Sawing Wood*, with infinitely more Expedition and Ease than 'tis done by the Hand: They consist of several parallel Saws, which rise and fall perpendicularly, by means of one of the grand Principles of Motion. But a very few Hands are here needed, viz. only to push along the Timber, which are laid on Rollers, or suspended by Ropes, in Proportion as the *Sawing* advances. These are frequently found abroad, and were lately begun to be introduced in *England*; but the Parliament, in Consideration of this, that they would spoil the Sawyers Trade, and ruin great Numbers of Families, thought fit to prohibit them.

*M. Felibien*, in his Principles of Architecture, &c. mentions a kind of long *Saw*, invented by one *Missa* Inspector of the Marble Quarries in the *Pyreneans*, by means whereof Stones are sawed even in the Rock itself whence they are taken. He adds, That some of them are twenty-three Foot long, but does not describe either their Form or Application: He only says, They are of Iron, without Teeth.

**SAXIFRAGE**, a Medicinal Plant thus called from its supposed Virtue in dissolving the Stone in the Bladder, from the *Latin Saxum*, & *Frango*, I break. Its Leaves are almost round, indented, fat and shining, like those of Ivy. In the Middle of the Leaves rise Stalks, about a Foot high, which, at their Extremities, bear little white Flowers, consisting of five Leaves, disposed in Form of a Rose. Its Seed, which is very small, is inclosed in the *Capsula* of a roundish Pod. Its Root divides itself into several Fibres, at the Bottom whereof are found little reddish Tubercles, like *Coriander* Seed. 'Tis these Grains are commonly called the Seed of the *Saxifrage*, and are used in Medicine. The best manner of using them is to take them infused in White-Wine, or in a Decoction in common Water. Some use the Decoction of the Root itself: 'Tis held a great Diuretick. *Dr. Quincy* observes, That its Lithontriptic Virtue is but little seen in Practice. He adds, That the Simple Water thereof, sold in the Shops, is good for nothing; the Virtue of the Plant, if it have any, consisting in something too gross to rise over the Helm. Some take it to derive its Name from its growing in the Clefts of Rocks, which it seems to pierce through.

**SAXON LANGUAGE**. See **ENGLISH**.  
**SAY**, or *Saye*, in Commerce, a kind of Serge, or a very light, cross'd Stuff, all Wool, much used abroad for Linings, and by the Religious for Shirts; and with us, by the Quakers, for Aprons, for which Purpose 'tis usually green. There are very considerable Manufactures hereof at *Selbury*, near *Colchester*; at *Ypres*, *Houffort*, &c. in *Flanders*, &c. Those made in *England*, are chiefly exported to *Portugal*, and *Leghorn*.

**SAYETTE**. See **SAGATHEE**.  
**SCABELLUM**, in the ancient Architecture, a kind of Pedestal, usually square, sometimes polygonous, very high and slender, commonly terminating in a kind of Sheath or Scabbard, or profiled in manner of a Balluster. Its Use is to bear *Busts*, *Reliefs*, &c.

**SCABIES**, in Medicine. See **ITCH**.  
**SCABIOUS**, a Medicinal Plant, very common in the Fields, and flowers in *July*. It has a great Character amongst many Dispensatory Writers, but seems to grow much out of use to what it has been: It passes for a very great Pectoral, and to do great Things in Asthma's and Pleurisies, and *Etmuller* gives it the Pre-eminence in inward Abscesses. It hath a Place also amongst the *Alexipharmicks*. But hardly any thing is in better Esteem for the Itch, and other cutaneous Foulnesses; whence it has its Name, viz. from *Scabies*, Itch, and upon which Account it is often met with in Decoctions, and sometimes in a Syrup, among such as are called Sweetners. Some call it the *Widow's Flower*.

**SCAFFOLD**, a Timber-Work, raised in manner of an Amphitheatre to place Spectators upon for the commodious viewing of some Shew or Ceremony.—The Word is also used for a little Stage, or Theatre, raised in some publick Place, to execute Criminals upon, either by beheading or breaking upon the Wheel.—Also for an Assemblage of Planks and Boards sustained by Treffels, or by Pieces of Wood fixed in the Wall, whereon Masons, Sculptors, Painters, &c. stand to work in high Places, Wells, Ceilings, &c. *Ménage* derives the Word from the *German Schutzbauwerk*, and *Gaget* derives it from the *Italian Catafalco*, and *Gaget* derives it from the *Italian Catafalco*, which signifies the same thing. *Du Cange*, from *Eckenshaus*, a Word in the corrupt *Latin*, signifying a Tribunal or Pulpit. He adds, That it might come from *Cato*, a Wooden Machine used to carry Earth to fill up Ditches, and carry over the Soldiers to the Attack; whence the *Italians* formed their *Catapulte*, the old *French* their *Chaufant*, and the *English* their *Scaffold*.

**SCALA**, in Anatomy, the Canal or Cochlea of the Ear is divided by a Septum into two Canals called *Scale*; whereof the one, looking towards the Tympanum, is called the *Scala Tympani*; the other, having a Communication with the Vestibulum, is called the *Scala Vestibuli*. See **EAR**.

**SCALA**, in the Ancient Architecture, is what in the Modern we call a *Stair-case*. See **STAIR-CASE**.

**SCALADO**, or *Scalade*, an Assault made on a City, to be surpris'd, by mounting the Walls thereof with Scaling-Ladders. Cities are now no longer taken by *Scalade*, since the Walls have been sunk'd.

**SCALE**, in Musick, a Series of Sounds rising or falling towards Acuteness or Gravity, from any given Pitch of Tune to the greatest Distance that is fit or practicable, through such intermediate Degrees as makes the Succession most agreeable and perfect, and in which we have all the harmonical Intervals most commodiously divided. This *Scale* is otherwise called an *Universal System*, as including all the particular Systems belonging to Musick. See **SYSTEM**.

*Origin and Construction of the SCALE of Musick.*

Every Concord or harmonical Interval, is resolvible into a certain Number of Degrees or Parts; the Octave, for Instance, into three greater Tones, two less Tones, and two Semi-Tones; the greater Sixth, into two greater Tones, one less Tones, and two Semi-Tones; the less Sixth, into two greater Tones, one less Tones, and two Semi-Tones; the Fifth, into two greater Tones, one less Tones, and one Semi-Tones; the Fourth, into one greater Tones, one less Tones, and one Semi-Tones; the greater Third, into one greater Tones, and one less Tones; and the less Third, into one greater Tones, and one less Tones. 'Tis true, there are Variety of other Intervals or Degrees, besides greater Tones, less Tones, and Semi-Tones, into which the ConCORDS may be divided; but these three are preferred to all the rest, and these alone are in Use: For the Reason whereof, see **TONE**. Further, 'Tis not any Order, or Progression, of these Degrees, that will produce Melody: A Number, for Instance, of greater Tones will make no Musick, because no Number of them is equal to any Concord, and the Tune is true of the other Degrees: There is a Necessity, therefore, of mixing the Degrees to make Musick, and the Mixture must be such, as that no Two of the same Kind be ever next each other. A natural and agreeable Order of these Degrees *Mr. Malcolm* gives us in the following Division of the Interval of an Octave; wherein, (as all the lesser ConCORDS are contained in the greater) the Divisions of all the other simple ConCORDS are contained. Under the Series are the Degrees between each Term, and the next. In the first Series, the Progression is by the less Third; in the latter, by the greater Third.

Now, the System of Octave, containing all the Original ConCORDS; and the Compound ConCORDS being only

the Sun of Octave, and some less Concord; 'tis evident, That if we would have the Series of Degrees continued beyond Octave, they are to be continued in the same Order through a Second as through the First Octave, and so on through a Third and Fourth Octave, &c. and such a Series is what we call the *Scale of Musick*. Whereof there are two different Species; according as the less or greater 3d. or the less or greater 6th. are taken in; for both can never stand together in relation to the same Key or Fundamental, so as to make a harmonical Scale. But if, either of these Ways, we ascend from a Fundamental or given Sound, to an Octave, the Succession will be melodious; tho' the Two make two different Species of Melody. Indeed, every Note is Discord with regard to the next; but each of them is Concord to the Fundamental, except the 2d and 7th. In continuing the Series, there are two Ways of compounding the Names of the simple Interval with the Octave. Thus: A greater or lesser Tone or Semi-tone above an Octave, or two Octaves, &c. or to call them by the Number of Degrees from the Fundamental, as 9th, 10th, &c. In the two Scales above, the several Terms of the Scale are expressed by the proportionable Sections of a Line, represented by 1, the Key or Fundamental of the Series: If we would have the Series expressed in the whole Numbers; they will stand as follows; in each whereof, the greatest Number expresses the longest Chord, and the other Numbers the rest in Order: So that if any Number of Chords be in these Proportions of Length, they will express the true Degrees and Intervals of the *Scale of Musick*, as contained in an Octave concinnously divided in the Two different Species abovementioned.

This *Scale* the Ancients called the *Diatonic Scale*, because proceeding by Tones and Semi-tones. See *DIATONIC*. The Moderns call it, simply, *The Scale*, as being the only one now in Use; and sometimes *The natural Scale*, because its Degrees and their Order are the most agreeable and concinnous, and preferable, by the Content both of Sense and Reason, to all other Divisions ever instituted. Those others, are the *Chromatic* and *Enharmonic Scales*, which, with the *Diatonic*, made the *Three Scales or Genera* of Melody of the Ancients. See *GENERAL*: See also *ENHARMONIC* and *CHROMATIC*.

*Office and Use of the SCALE of Musick.*

The Design of the *Scale of Musick*, is, To shew how a Voice may rise and fall, less than any harmonical Interval, and thereby move from the one Extreme of any Interval to the other, in the most agreeable Succession of Sounds. The *Scale* therefore, is a System, exhibiting the whole Principles of Musick; which are either harmonical Intervals (commonly called *Concords*) or *Concinnous Intervals*; the first are the essential Principles, the others, subservient to them, to make the greater Variety. See *CONCORD* and *INTERVAL*. Accordingly, in the *Scale*, we have all the Concords, with their concinnous Degrees, so placed, as to make the most perfect Succession of Sounds from any given Fundamental or Key, which is supposed to be represented by 1. 'Tis not to be supposed, that the Voice is never to move up and down by any other more immediate Distances than those of the concinnous Degrees: For though that be the most usual Movement, yet to move by harmonical Distances, as Concords at once, is not excluded, but is even absolutely necessary. In effect, the Degrees were only invented for Variety sake, and that we might not always move up and down by harmonic Intervals, though those are the most perfect; the others deriving all their Agreeableness from their Subserviency to them. See *DIATHEM*. And that, besides the harmonical and concinnous Intervals, which are the immediate Principles of Musick, and are directly applied in Practice; there are other discord Relations, which happen unavoidably in Musick, in a kind of accidental and indirect Manner: For, in the Succession of the several Notes of the *Scale*, there are to be considered not only the Relations of those that succeed others immediately; but also of those betwixt which other Notes intervene. Now the immediate Succession may be conducted so, as to produce good Melody; and yet among the distant Notes there may be very gross Discords, that would not be allowed

in immediate Succession, much less in Concinnance. Thus in the first Series, or *Scale* above-delivered, though the Progression be melodious, as the Terms refer to one common Fundamental, yet are there several Discords among the mutual Relations of the Terms; e. gr. from 4th to 7th is 32 : 45, and from the greater 2d to the greater 6th is 27 : 40, and from the greater 2d to 4th is 27 : 32; which are all Discords; and the same will happen in the second Series. See *DISCORD*.

From what we have observed here, and under the Article *Key*; it appears, That the *Scale* supposes no determinate Pitch of Tune; but that being assign'd to any Key, it marks out the Tune of all the rest, with relation to it, shews what Notes can be naturally joyn'd to any Key, and thereby teaches the just and natural Limitations of Melody: And when the Song is arriv'd through several Keys, yet 'tis still the same natural *Scale*, only applied to different Fundamentals. If a Series of Sounds be fix'd to the Relations of the *Scale*, 'twill be found exceedingly defective; but this Imperfection is not any Defect in the *Scale*, but follows accidentally from its being confin'd to this Condition, which is foreign to the Nature and Office of the *Scale of Musick*.

This is the Case in musical Instruments; and in this consists their great Deficiency. For, suppose a Series of Sounds, as those of an Organ or Harpsicord, fix'd in the Order of this *Scale*, and the lowest taken at any Pitch of Tune; 'tis evident, 1<sup>o</sup>, that we can proceed from any Note, only by one particular Order of Degrees: Since from every Note of the *Scale* to its Octave, is contain'd a different Order of the Tones and Semi-tones. Hence, 2<sup>o</sup>, we cannot find any Interval required from any Note upwards or downwards; since the Intervals from every Note to every other, are also limited. And hence, 3<sup>o</sup>, a Song may be so contriv'd, that, beginning at a particular Note of the Instrument, all the Intervals, or other Notes, shall be found exactly on the Instrument or in the fix'd Series; yet were the Song, though perfectly *Diatonic*, begun in any other Note, it would not proceed. In effect, 'tis demonstrable, there can be no such thing as a perfect *Scale* fix'd on Instruments, i. e. no such *Scale* as from any Note upwards or downwards, shall contain any harmonical or concinnous Interval required. The only Remedy for this Defect of Instruments whose Notes are fix'd, must be by inserting other Notes and Degrees betwixt those of the *Diatonic* Series. Hence some Authors speak of dividing the Octave into 16, 18, 20, 24, 26, 31, and other Number of Degrees; but 'tis easy to conceive, how hard it must be to perform on such an Instrument. The best on't is, we have a Remedy on easier Terms: For a *Scale* proceeding by Twelve Degrees, that is, Thirteen Notes, including the Extremes, to an Octave, makes our Instruments too perfect, that we have little Reason to complain. This, then, is the present *Scale* for Instruments, viz. Between the Extremes of every Tone of the natural *Scale* is put a Note, which divides it into two unequal Parts, called Semi-tones; whence the whole may be called the *Semitonic Scale*; as containing Twelve Semi-tones betwixt Thirteen Notes, within the Compass of an Octave. And to preserve the *Diatonic* Series distinct, these inserted Notes take either the Name of the natural Note next below, with the Mark # called a *Sharp*; or the Name of the natural Note next above, with this Mark b called a *Flat*. See *FLAT* and *SHARP*: See also *SEMI-TONE*.

*SCALE*, a Mathematical Instrument, consisting of one or more Lines drawn on Wood, Metal or other Matter, divided into equal or unequal Parts, of great Use in laying down Distances in Proportion; or in measuring Distances already laid down.

There are *Scales* of several Kinds, accommodated to the several Uses: The principal are the *Plain Scale*, the *Diatonic Scale*, *Gamm's Scale*, and the *Plotting Scale*.

*Plain Scale*, is made, by dividing a Line, as A B (Tab. Geometry Fig. ) into any Number of equal Parts, e. gr. 5 or 10, and then subdividing one of them, as a b, into 10 less Parts. This done, if one of the larger Divisions represent 10 of any Measure; e. g. 10 Miles, 10 Chains, 10 Poles, 10 Feet or 10 Inches; each of the lesser will represent One Mile, or One Chain, Pole, Foot or Inch. The Use of this *Scale* is very obvious, *exemp. gr.* To lay down a Distance by it of 32 Miles or 32 Poles, &c. I take in my Compasses the Interval of three of the larger Divisions, which contain 30, and two of the smaller,

smaller, for the two odd Ones: This Distance drawn on Paper, will contain 32 by the *Scale*. Again, Were I required to measure any Line by a given *Scale*: Taking the Length of the Line in my Compasses, I apply one Foot in one of the great Divisions of the *Scale*, so as the other may reach over among the lesser; then the Number of great and small Divisions intercepted between the Points, give the Number of Miles, &c. See the Use hereof further illustrated under the Article PLOTTING SCALE.

 GUNTER.  
 PLOTTING SCALE.

SCALE, in Geography and Architecture, a Line divided into equal Parts, placed at the Bottom of a Map or Draught, to serve as a common Measure to all the Parts of the Building, or all the Distances and Places of the Map. In Maps of large Tracts, as Kingdoms and Provinces, &c. the *Scale* usually consists of Miles; whence it becomes denominated a *Scale of Miles*. In more particular Maps, as those of Manors, &c. the *Scale* is usually of Chains sub-divided into Poles or Links. The *Scales* used in Draughts of Buildings, usually consist of Modules, Feet, Inches, Palms, Fathoms or the like. To find the Distance between two Towns, &c. in a Map, the Interval is taken in the Compasses, and set off in the *Scale*, and the Number of Divisions it includes, gives the Distance. See MAP. To find the Height of a Story in a Design, the same Method is used. See DESIGN.

A *Front Scale* in Perspective, is a right Line in the Draught, parallel to the Horizontal Line; divided into equal Parts, representing Feet, Inches, &c. A *Flying Scale* is a right Line in the Draught, tending to the Point of View, and divided into unequal Parts, representing Feet, Inches, &c.

SCALENUM, or *Scaleous Triangle*, in Geometry, a Triangle, whose Sides and Angles are all unequal. See TRIANGLE. A Cylinder, whose Axis is inclined, is also said to be *Scaleous*. The Word is form'd from the Greek *skalaion*, which signifies the same Thing; and which *Hernot* translates *Scalarium*.

SCALENUS, in Anatomy, a Name given to three Pair of Muscles, from their Form; all of them serving to draw the Ribs upwards, in conjunction with the *Serratus superioris politici*, &c.

SCALENUS Primus springs, Flethy, from the transverse Processes of the Second, Third and Fourth Vertebrae of the Neck, where descending laterally, it is inserted into the first Rib, which it helps to draw upwards.

SCALENUS Secundus, arises from the same Processes, as likewise from those of the Fifth Vertebra of the Neck; and is inserted into the Second Rib, and sometimes into the Third.

SCALENUS Tertius, arises from the same Processes with the former, and from those of the Sixth Vertebra of the Neck; and is inserted into the First Rib.

SCALPEL, in Chirurgery, a kind of Knife chiefly used in Dissections; but which may be occasionally used in many other Operations, as in Amputations, and to cut off the Flesh and Membranes that are between the Two Bones of an Arm or Leg, before the Limb be sawed off: There are two Kinds of *Scalpels*; the first cuts on both Sides, and is fixed in an Ebony or Ivory Handle, which being very flat and thin at the Extremity, serves to part the membranous and fibrous Parts in Anatomical Preparations. The other has a Back, that is, it only cuts on one Side; 'tis crooked, and very commodious for stripping the Flesh off the Bones in Embalming, making Skeletons, &c. *Scalptus*, in his *Arsenal*, describes several other Kinds of *Scalpels*; as, A deceitful *Scalpel*, thus called, because it deceives the Patient by hiding its Blade. 'Twas much used by the Ancients, in opening and dilating of Sinews; but as 'tis apt to deceive the Chirurgeon himself, and is besides very slow, 'tis better using a Syringotomus: A *Scalpel*, sharp on both Sides for Setons. A little crooked *Scalpel* for separating the Coherence of the Eye-lids. A sharp, double-cutting *Scalpel*, with a Bone-handle, for the cutting off an *Eglops*. *Scalpels* like *Scalpomachairions*, &c. even the *Scalpomachairion* itself is a kind of *Scalpel*. See SCALPOMACHAIRION.

SCALPER, *Scalprum*, or *Scalping-Iron*, a Surgeon's Instrument used to rasp, and scrape foul, carious Bones.

SCALPTOR ANI, in Anatomy. See LATISSIMUS DORSI.

SCAMILLI IMPARES, in the Ancient Architecture, a Term much contended about among the Critics; though, in effect, it signify no more than certain Benches, Zoco's or Blocks, serving to raise the rest of the Members of an Order, Column, Statue or the like, and prevent their being lost to the Eye, which may chance to be placed below their Level; or below the Projecture of

some of the Ornaments thereof. These *Scamilli* are well represented by the Pedestals of Statues.

SCAMMONY, in Pharmacy, the inspissated Juice of the Root of a Plant of the same Name, growing in the Levant, particularly about Aleppo and St. Juba ad Acre. The Juice flows from an Incision made in the Root; and is afterwards thickened by the Sun, as 'twas pretended, but in reality by the Fire. The Tree is much like an Ivy, its Leaves in Form of Hearts, its Flowers White, and it creeps on the Ground, or mounts on other Trees, Walls, &c. The good, genuine *Scammony of Aleppo*, is to be grey, tender, friable and resinous; the Taste bitter, and the Smell faintish and disagreeable. The *Scammony of Smyrna* and that of the *East Indies* are less valued. The first as being more heavy, hard and black; the latter, though light, friable, &c. is in reality only a Composition of common Resin with some other violent Purgers. *Pomet* shews, that both Kinds are rather Poisons than Remedies. The true *Scammony* is one of the most violent we have: Hence 'tis seldom used without Correcting it by some Preparation. From the Juice is drawn a Resin of more Virtue than the *Scammony* itself. They also make a Syrup of it, which is found a very gentle Purgative. *Scammony* now in Use, must be very different from that of the Ancients, at least in the Preparation; by reason the Ancients gave it in much greater Doses: Hence *Fallopins* conjectures, the modern *Scammony* to be adulterated with Spurge. Some give the Name of *American Scammony* to *Mitchocam*. See MICHOCAM.

SCANDAL, in the Scripture Language, is any thing that may draw us aside, or solicit us to Sin. In which Sense 'tis used indifferently with Offence, and Stumbling-block. *Scandal* is either Active or Passive. An active *Scandal* is a real Induction to Sin; a passive *Scandal* is the Impression an active *Scandal* makes on the Person induced to Sin. In the popular Language, *Scandal* is some Action or Opinion contrary to good Manners, or to the general Sense of a People. The Word is form'd from the Latin, *Scandalum*, which, according to *Popest*, was originally used for a sudden, extemporary Quarrel, *que subito inter aliquos Scandit vel oritur*.

SCANDAL is also a disadvantageous Rumor or Report; or an Action whereby any one is affronted in publick. Hence Stone of *Scandal*, *Lapis Scandali*, or *Viruperi*; a Stone raised in the great Portal of the Capitol in Old Rome; wherein was Engraven the Figure of a Lion upon which the Cessionary or Bankrupt being seated bare-breast'd, cried with a loud Voice, *Cedo locus*, I surrender my Effects; when, squaring his Breach violently, three Times on the Stone, he was acquitted. 'Twas called the Stone of *Scandal*, because thence-forward the Cessionary became intenable, and incapable of giving any Evidence. *Julius Cesar* introduced this Form of Surrender, after abrogating that Article of the Laws of the Twelve Tables, which allow'd the Creditors to dismember their insolvent Debtors, and to take each his Member, or at least to make a Slave of him.

SCANDALUM MAGNATUM, in Law, a special Name for a Scandal or Wrong done to any high Personage of the Land, as Prelates, Dukes, Earls, Barons, &c. as also of the Chancellor, Treasurer, Clerk of the Privy Seal, Steward of the House, Justice of the Bench, or other great Officers of the Realm, by false News or Messages, whereby Debates and Discords between them and the Commons, or any Scandal to their Persons, might arise; and hath given Name to a Writ granted to recover Damages thereupon.

SCANNING, in Poetry, the measuring of a Verse, to see the Number of Feet and Syllables it contains, and whether or no the Quantities, that is the long and short Syllables, be duly observed. The Term is chiefly used with regard to Greek and Latin Verses; the Quantities not being well settled and observed in the Verses of the Modern Languages. See QUANTITY. Hexameters are Scanned one Way, Jambic another, Sapphic another. See HEXAMETER, &c. The Word is form'd from the Latin, *Scandere*, to climb.

SCANTLING, a Measure, Size, or Standard, whereby the Dimensions, &c. of Things are to be determined. The Word is form'd from the French *Echouaillon*, a Pattern or Specimen. See STANDARD.

SCAPHISM, in Antiquity, a kind of Torture or Punishment formerly in Use among the Persians. It consisted in locking the Criminal close up in the Trunk of a Tree bored to the Dimensions of his Body, only with Five holes for his Head, Arms and Legs to come through. In this State he was exposed to the Sun, and the Parts thus appearing anointed with Honey and Milk, to invite the Wasps and Flies. They forced him to eat abundantly, till his Excrements, close pent up in the Wood, rotted his Body.

**Body.** Some Authors observe, that they ordinarily lived Forty Days in this Torment. The Invention is ascribed to *Parisius* Queen of *Perfia*, and Mother of *Antaxares*, *Athenion*, and the young *Cyrus*. 'Tis added, she first ordered it to be practis'd on the Petion who brought the Tidings of the Death of *Cyrus*. The Word is form'd from the *Greek* *σκαφος* of *σκαφος*, I hollow or dig.

**SCAPHOIDES**, in Anatomy, a Bone, called also *Naviculare*, which see. The Word is form'd of the *Greek* *σκαφος*, a Boat or Bark; of *σκαφος*, I hollow; because Boats were originally made of Trunks of Trees hollowed, as are still the Canoes of several Savages; and *σκαφος*, Form.

**SCAPULA**, in Anatomy, called also *Ossiflate* and *Bla. s.*; a large and broad Bone, representing a scalenous Triangle, situate on each Side of the upper and back Part of the *Thorax*: The Substance of the *Scapula* is thin, but solid and firm; its Outside is somewhat Convex, and its Inside Concave; its upper Edge is called *Costa superior*, and its lower, *Costa inferior*; its broad End is called its *Basis*, which, with the two Edges, make the upper and lower Angles. They have each three Processes, of which the first runs all along the Middle of their Outside, and it is called their *Spine*: That End of the *Spine*, which receives the Extremity of the Clavicula, is called *Acrumium*. The second Process is a little lower than the *Acrumium*; it is short and sharp, like a *Crow's* Bill, therefore called *Coracoides*; these two Processes are tied to one another by a strong Ligament, which serves to keep the Head of the *Humerus* in the Cavity of the third Process, which is called *Cervix*. This Process is the Extremity of the *Scapula*, which is opposite to its *Basis*. It has a round Sinus, tipp'd about its Brim, with a Cartilage, which receives the Head of the *Humerus*. The Use of the *Scapula* is to receive the Extremitates of the Clavicula and *Humerus*, for the easier Motion of the Arm, and to give Rise to the *Muscles*, which move the Arm.

**SCAPULAR**, *Scapularis*, in Anatomy, an Epithet given to two Arteries, and as many Veins of the Body. The *Scapularis interna* & *externa*, or the inner and outer *Scapular* Arteries, arise out of the Subclavian, and are spread over the *Scapula*: The *Inner* and *Outer Scapular* Veins discharge themselves into the Axillary, or Vein of the Arm-pits.

**SCAPULARY**, Part of the Habit of several Orders of Religious, wore over the Gowns, as a Badge of peculiar Veneration for the Virgin. It consists of two narrow Breadths or Slips of Cloth, covering the Back and the Breasts, and hanging down to the Feet of the professed Religious, and to the Knees of the Lay-brothers, &c. The common Opinion of the Introduction of the *Scapular* is, That it was first given by the Virgin herself, in an Apparition she made to *B. Stock*, General of the *Carmelites*, in the Thirteenth Century: Which Account of its Origin is asserted, or at least supposed, in several Bulls of the Popes. *M. de Lamoignon*, however, maintains, in an express Treatise on the Subject, That the Apparition was false, and the Sabbath Bull, which approves of the *Scapular*, a Counterfeit. In effect, the *Carmelites* themselves did not begin to wear the *Scapular* till several Years after 'tis pretended the Virgin gave it to *B. Stock*. The Word is deriv'd from *Scapula*, the Shoulder-Blade. There is also a Friery, or Fraternity of the *Scapular*, consisting of Lay-Brothers, who profess a particular Devotion to the Virgin, and who, in Honour of her, wear a little *Scapular*, in manner of a Bracelet, or otherwise, representing the great One. They are obliged to certain Prayers, and to observe certain Rules in their Manner of Life.

**SCAPUS**, in Architecture, the Fust or Shaft of a Column, See *FUST*.

**SCAPUS**; in Botany, the Strait Stalk, or Stem of a Plant, standing upright like a Pillar, or Column.

**SCAR**. See *ESCHAR*.

**SCARIFICATION**, in Chirurgery, an Operation whereby several Incisions are made in the Skin, with an Instrument proper for that Purpose. See *SCARIFICATOR*. *Scarification* is chiefly practis'd in Capping. See *CAPPING*. It acts by stimulating and evacuating. *Salmasius* will have us write *Scarificatio*, not *Scarificatio*, in regard the Word is deriv'd from the *Greek* *σκαρ*. See his Notes on *Solentis*, where he thus corrects the reading of *Plin. Lib. XVII. F. Haridion* lets the old Reading *Scarificatio* stand; though he owns the M.S.S. have it *Scarificatio*; but adds, That *Theop. Priscian* writes *Scarificatio*.

**SCARIFICATOR**, a Chirurgical Instrument used in *Scarification*; which see. The *Scarificator* is made in Form of a Box, wherein are fitted 10, 12, or 15 Lancets, all perfectly in the same Plane; which being, as it were, cock'd, by means of a Spring, are all discharged

at the same Time, by pulling a kind of Trigger, and driven equally within the Skin. 'Till of late, they used little sharp cutting Wheels instead of Lancets. The Use of the *Scarificator* is to evacuate the Blood, and other Humours, spread under the Skin, by making a great Number of Apertures, or Outlets, thence; which being thus all struck at once, gives much less Pain than when struck successively.

**SCARLET**, in Dying, one of the Seven Kinds of good Reds. There are two Kinds of *Scarlets*; the One given with *Scarlet Grain*, particularly called *Scarlet by Grain*, the other with *Cochineal*. See *R.E.P.* See also *COCHINEAL*, &c.

**SCARLET-GRAIN**, a Matter used to dye a *Scarlet* Colour, usually taken for the Grain of a Plant. This imaginary Grain, called by the *Arabs*, *Kermes*, is found on a kind of Holm, growing in great Plenty in the uncultivated Parts of *Provence*, *Langueadoc*, *Spain* and *Peruagal*. That of *Langueadoc*, passes for the best, being big, and of a very bright Red; that of *Spain* is the worst, being very thin, and of a blackish Red; tis to be gathered when ripe, and is only good while new, that is, within the Compass of the Year, after which Time a kind of Insect is found in it, that eats out the Heart thereof. *F. Plumier* has made some particular Discoveries on the Subject of *Scarlet-Grain*. The *Arabic* Term *Kermes*, which signifies little Worms, he observes, agrees perfectly to the Nature of this Drug; which is the Work of a Worm, and not the Grain or Seed of a Tree, as is generally supposed. The Shrub 'tis found on, is the *Hexaculeate Cocco Glanifera*; on the Leaves, and little Shoots whereof, are seen, in the Spring Time, a kind of little Vesicle, which is at first no bigger than a Grain of Millet, and is occasioned by the Puncture of an Insect, which deposits its Eggs therein. In Proportion as it grows, it becomes covered with a kind of Ash-coloured Down, which hides the red Colour underneath. And when 'tis arrived at Maturity, which those who gather them know very well, 'tis taken from the Tree, in Form of a little Gall. The Pod, or Skin, is very light and brittle, covered with a fine membranous Pellicle all around, except at the Place where it grows to the Leaf. A second Skin, under the first, is full of a kind of Dust, partly Red, and partly White. As soon as the Gall is gathered, the Juice or Pulp is expressed from it; 'tis washed in Vinegar to destroy the little Insect within-side, which, without such Precaution, would grow, feed on the Dust, and, at last, be hatch'd, and leave no more than an empty Shell.

The *Scarlet-Grain* is also of considerable Use in Medicine, where 'tis better known under its *Arabic* Name of *Kermes*. See *KERMES*. *Ménage* derives the Word from the *German* *Scarlak*, or the *Hemish* *Scharlak*: Whence the *English* have form'd the *Scarlet*, the *Italians* their *Scarlatto*, and the *French* their *Escarlate*. Others derive it from the *Celtic* *Sparlers*. *Dalechampius* will have it called *Scarlatum*, by Corruption, for *Calceolarium*, a barbarous Word introduced into *Spain*; others fetch it from the *Arabic* *Yaqur late*.

**SCARLETINA FEBRIS**; or *Scarlet-Fever*; the same as *Purple-Fever*. See *PURPLE* and *FEVER*.

**SCARP**, in Fortification, is the Foot of the Rampart-Wall, or the Sloping of the Wall from the Bottom of the Work to the Cordon on the Side of the Moat.

**SCARP**, is a Term in Heraldry, probably derived from the *French* *Escarpe*, signifying the Scarf which Military Commanders wear for Ornament. It is borne something like a Battoon Sinfier, but is broader, and is continued out to the Edges of the Field, whereas the Battoon is cut off at each End. He beareth Argent, a *Scarp* Azure.

**SCAVAGE**, in our ancient Customs, called also *Schewage*, *Schewage*, and *Schewring*, a kind of Toll or Custom, exacted by Mayors, Sheriffs, &c. of Merchants-Strangers, for Wares shewed or offered to Sale within their Liberties. This Custom is prohibited by *Stat. 19. Hen. VII.*

**SCAVANT**, or *Scavant*, a Term purely *French*, signifying Learned; little used in our Language, except in the Phrase *Journal des Scavans*, a Journal of the Works of the Learned, published Monthly at *Paris*, being the first Thing of that Kind, and that whereon all the rest are founded. See *JOURNAL*. *Ménage* derives the Word from *Sapere*, to be Wise, and on that Footing will have it wrote *Scavant*; others from *Scire*, to know, and for that Reason write it *Scavant*. The latter Etymology, and Orthography, are followed by the Academy; though all the ancient M.S.S. have it *Scavant*, *Scavair*, &c.

SCAVENGERS, two Officers chose yearly in each Parish in *London*, and the Suburbs, whose Business it is to hire Persons called *Rakers*, and Carts to cleanse the Streets, and carry away the Dirt and Filth thereof. The Word is derived from the *Dutch Schavens*, to scrape or shave away. The *Germans* call them *Dreck-schwaer*, from one *Simeon* a famed Scavenger of *Munich*. The *Scavengers* are much the same with what were anciently called *Street-sweepers*.

SCENE, in the ancient Drama, in its general Sense, was the Theatre whereon Dramatic Pieces, and other publick Shews, were represented. See THEATRE. In its proper Sense, the ancient Scene was the Decoration of the Theatre. In the Extremity of the Theatre, were three large Gates or Openings, wherein appeared several perspective Decorations, viz. A Palace for Tragedies, Houses and Streets for Comedies, and Forests for Pastorals. These Decorations were all versatile, i. e. either they turn'd on Pivots, as described by *Vitruvius*, or traile, i. e. slid along Grooves, as those in our Theatres; and as this or that Side, or Representation, was turned towards the Spectators, the Scene was called a *Tragic*, a *Comic*, or a *Pastoral Scene*. See STAGE. *Vitruvius* observes, That the Scene was properly a large Face or Front of Building, adorned with Columns and Statues, among which were three large Apertures for perspective Representations. See several curious Remarks on the ancient Scene in *M. Perrault's Notes on Vitruvius*, lib. 5. cap. 6. According to *Rohault*, the Scene, in its proper and original Sense, is a Series of Trees disposed against each other, so as to form a continued Arch, and Shade, *ens*, to defend those underneath it from the Injuries of the Weather: For in such Places it was, that, in ancient Times, e'er Theatres were built, they acted their Plays. Thus also *Cassiodorus* derives the Word Scene, from the dense Shade of the Grove, where, in the Spring Time, the ancient Shepherds used to Sing and Play.

SCENE is also used for the Place thus represented, or that where the Action is conceived to have passed. See ACTION. One of the grand Laws of the Drama, is, To observe the Unity of the Scene, which we more usually call the Unity of Place. See UNITY. In Effect, to keep close to Nature and Probability, the Scene should never be shifted from Place to Place, in the Course of the Play. The Ancients were pretty severe in this Respect, particularly *Terence*: In some of his Plays, the Scene never shifts at all, but the Whole is transacted before the Door of an old Man's House, whither, with inimitable Art, he brings all his Actors, occasionally. The *French* too are very strict in this Respect: But the *English* plead for a Dispensation from the Rule, which they think confines them to too narrow Bounds, and precludes them from that Variety of Adventures and Intrigues, which our *English* Audiences will never be satisfied without. However, the more judicious and accurate of our Writers are very moderate in the Use of this Licence, and take Care not to deviate too far from Probability, by shifting the Scene, between the Acts, much farther than the Persons concerned may be supposed to have passed in the Interval. Hence they seldom carry the Scene out of the same Town: But others, who own no Subjection to the ancient Rules, the outrageous Libertines. With some of these 'tis nothing to skip at once from *Covent-Garden* to *Pernu*. The great *Shakspere* is exceedingly faulty in this Respect, in almost all his Plays.

SCENE is also a Part or Division, of a Dramatick Form, determined by a new Actor's entering. Plays are divided into Acts, and Acts sub-divided into Scenes. See ACT. In most of our printed Plays, a new Scene is never expressed to begin, but when the Place is supposed to be changed by shifting, or drawing, the moveable Scene; but this must be esteemed as an Oversight. On our Stage, the Scene is, properly, the Persons present to, or concern'd in the Action on the Stage at such Time. Whenever, therefore, a new Actor appears, or an old one disappears, the Action is changed into other Hands, and therefore a new Scene then commences.

'Tis one of the Laws of the Stage, That the Scenes be well connected: that is, that one succeed another, in such Manner, as that the Scene is never quite empty till the End of the Act. The Ancients did not allow of above Three Persons on the Stage at the same Time, excepting in the *Comus's*, where the Number was not limited. The Moderns have but little regard to this Restriction.

SCENIC GAMES, or Representations. *Ludi Scenici*, among the Ancients, were Entertainments exhibited on the Scene, or Theatres, including what we now call Plays, of all Kinds, with Dancing, and other Theatrical Performances. The *Romans* were 400. Years without any Scenic Games at all. *Livy* observes, That they were first instituted in the Year of *Rome* 392, under the Consulate of *C. Sulpicius Peticus*, and *C. Licinius Stolon*. But the Critics have observed a Trip here in *Livy*; the Consi-

late of those Persons falling in the Year 389, which therefore, is held the *Era* of the Introduction of *Scenic Games*. For at the Beginning, some Actors were sent for out of *Hetruria*; who, without reciting any Thing, danced about to the Sound of Instruments; so that thus far was no more than a Ball, or rather what the *French* call a *Ballet*. At length they began to recite Verse: thus, by degrees, growing more and more perfect, they were at last represented with a Juteils, and Magnificence, beyond any Thing the World ever saw. See THEATRE. The Fathers, in their Writings, cry out loudly against these Games.

SCENOGRAPHY, in Perspective, a Representation of a Body on a perspective Plane; or, a Description thereof in all its Dimensions; such as it appears to the Eye. See PERSPECTIVE. The *Ischnography* of a Building, &c. represents the Plan, or Ground work of the Building. See ISCHNOGRAPHY. The *Orthography*, the Front, or Upright, thereof. See ORTHOGRAPHY. And the *Scenography*, the whole Building, Front, Side, the Height and all. The Word is formed from the *Greek* *scena* Scene, and *yepeia* Description.

To exhibit the SCENOGRAPHY of any Body.

1<sup>o</sup>. Lay down the Basis, Ground-plan, or Plan of the Body; in the perspective *Ischnography*, according to the Method laid down under the Article PERSPECTIVE. 2<sup>o</sup>. Upon the several Points of the Plan raise the Perspective Heights: Thus will the *Scenography* of the Body be completed; excepting that a proper Shade is to be added. The Method of raising the Heights is as follows.

On any Point given as C, (Tab. Perspect. Fig. 1.) raise a Perspective Altitude, answerable to an Objective Altitude P Q. On the Terrestrial Line raise a Perpendicular P Q, equal to the given objective Altitude. Front P and Q, to any Point as T, draw right Lines P T and Q T. From the given Point C draw a right Line C K, parallel to the Terrestrial Line D E, meeting the right Line Q T in K. In the Point K, upon the Line K C, erect a Perpendicular I K. This I K is the *Scenographic* Altitude required. The Application of this general Method of drawing the *Scenography* of a Body, is not so obvious, in every Case, but that it may be necessary to illustrate it a little by a few Examples.

To exhibit the SCENOGRAPHY of a Cube, viewed by an Angle.

1<sup>o</sup>. As the Basis of a Cube viewed by an Angle, standing on a Geometrical Plane, is a Square viewed by an Angle; Draw a Square, viewed Angular wise, on the Perspective Table, or Plane. 2<sup>o</sup>. Raise the Side H I (Fig. 2.) of the Square perpendicularly on each Point of the Terrestrial Line D E; and to any Point, as V, of the Horizontal Line H R, draw the right Line V I and V H. 3<sup>o</sup>. From the Angles d, b and c, draw c 1, d 2, &c. Parallel to the Terrestrial Line D E. 4<sup>o</sup>. From the Points 1 and 2, raise L 1, and M 2, perpendicular to the same. Lastly, Since H I is the Height to be raised in a, L 1 in c and b, and M 2 in d: In a raise the Line f a perpendicular to f a; in b and c, raise b g and c e perpendicular to b c; and lastly, Raise d h, perpendicular to d 2: And make a f = H I, b g = c e = L 1, and h d = M 2: If then the Parts g h, e f be connected by right Lines, the *Scenography* will be complete.

To exhibit the SCENOGRAPHY of a Hollow Quinquangular Prism.

1<sup>o</sup>. Since the Base of a hollow *Quinquangular Prism*, standing on a Geometrical Plane, is a Pentagon, with a Limb or Breadth of a certain Dimension; find the Appearance of this Pentagon on a Table, or Plane. See PERSPECTIVE. 2<sup>o</sup>. On any Point, as H, of the Terrestrial Line D E (Fig. 3.) raise a perpendicular H I, equal to the objective Altitude; and to any Point, as V, of the Horizontal Line H R, draw the Lines H V and I V. 3<sup>o</sup>. From the several Angles, a, b, d, e, c, of the Perspective *Ischnography*, both the Internal and External ones, draw right Lines, as b 2, d 3, &c. parallel to the Terrestrial Line; and from the Points 1, 2, 3, raise Perpendiculars to the same, as L 1, M 2, N 3, &c. If these, then, be raised in the correspondent Points of the *Ischnography*, as in the preceding Article, the *Scenography* will be complete.

To exhibit the SCENOGRAPHY of a Cylinder.

1<sup>o</sup>. Since the Base of a Cylinder, standing on a Geometrical Plane, is a Circle; seek the Appearance of a Circle. In the Points, a, b, d, f, h, g, e, c, (Fig. 4.) raise the

the apparent Altitudes, as in the preceding Articles. If now their upper Lines be connected by curve Lines, as in the Base, a, b, d, f, c, h, e, c, the *Scenography* of the Circle will be compleat.

'Tis evident that those Lines are to be omitted, both in the Plan and in the Elevation, which are not exposed to the Eye; though they are not to be disregarded, from the Beginning, as being necessary for the finding of other Lines. *E. gr.* In the *Scenography* of the Cube, viewed Angle wise, the Lines b d and d c, (Fig. 2.) in the Base, and the d h in the Elevation, are hid from the Eye, and are therefore omitted in the Description. But since the Point h is not to be found unless the Point d be had in the *Scenography*; nor the Lines g h and d e be drawn without the Height d h; the Appearance of the Point d is as necessary to be determined in the Operation, as the Height h d.

To exhibit the SCENOGRAPHY of a Pyramid, standing on its Base.

Suppose, *e. gr.* it were required to delineate a Quadrangular Pyramid, viewed by an Angle: 1°. Since the Base of such Pyramid is a Square seen by an Angle, draw such a Square, 2°. To find the Vertex of the Pyramid, *i. e.* a Perpendicular let fall from the Vertex to the Base, draw Diagonals mutually intersecting each other in c (Fig. 5.) 3°. On any Point, as H, of the Terrestrial Line D E, raise the Altitude of the Pyramid H I; and drawing the right Lines H V, and I V to each Point of the Horizontal Line H R; produce the Diagonal a b, till it meet the Line V H in b. Lastly, From h draw h i parallel to H I. This being raised on the Point c, will give the Vertex of the Pyramid c d; consequently, the Lines d k, k a, and k b, will be determined at the same Time.—After the like Manner is the *Scenography* of a Cone delineated.

To exhibit the SCENOGRAPHY of a Truncated Pyramid.

Suppose the Truncated, Pyramid Quadrangular; 1°. then, if from the several Angles of the upper Base be conceiv'd Perpendiculars let fall to the lower Base, we shall have a Pentagon, with another inscribed therein, whose Sides are parallel to those of the former. This coincides with a Pentagon, furnished with a Rim or Breadth, &c. and may therefore be delineated in the same manner.— 2°. Raising the Altitude of the Truncated Pyramid (I H, Fig. 6.) determine the *Scenographic* Altitudes, to be raised in the Points a, b, c, d. If now the Points f, g, h, i, k, be connected by right Lines, and the Lines, I k, f m, g n, h o, be drawn, the *Scenography* will be compleat.—By drawing two concentric Circles in a Geometrical Plan, and doing every Thing else, as in this Problem, the *Scenography* of a Truncated Pyramid will be drawn.

To exhibit the SCENOGRAPHY of Walls, Columns, &c. or to raise them on the Pavement.

1°. Suppose a Pavement A F H I (Fig. 7.) represented in a Plan, together with the Bases of the Columns, &c. if there be any. 2°. Upon the Terrestrial Line let off the Thickness of the Wall B A and 1, 3. 3°. Upon A and B, as also upon 3 and 1, raise Perpendiculars A D and B C, as also 3, 6, and 1, 7. 4°. Connect the Points D and 6 with the Principal Point V, by the right Lines D V and 6 V. 5°. Upon I and H raise Perpendiculars H G and E F. Thus will all the Walls be delineated. Now to raise the Pillars, &c. there needs nothing but, from their several Bases (whether Square, or Circular) projected on the Perspective Plan, to raise indefinite Perpendiculars; and on the Fundamental Line, where intersected by the Radius F a passing through the Base, raise the true Altitude A D: for D V, being drawn as before, the *Scenographic* Altitudes will be determined.

To exhibit the SCENOGRAPHY of a Door in a Building.

Suppose a Door required to be delineated in a Wall D E F A (Fig. 7.) 1°. Upon the Fundamental Line let off its Distance A N from the Angle A, together with the Breadths of the Posts N I and L M, and the Breadth of the Gate itself L I. 2°. To the Point of Distance K, from the several Points N, I, L, M, draw right Lines K N, K I, K L, K M, which will determine the Breadth of the Door l i, and the Breadths of the Posts c n and m l. 3°. From A to O, set off the Height of the Gate A O, and from A to P, the Height of the Posts A P, 4°. Join O and P with the Principal Point, by the

right Lines P V and O V. 5°. Then, from n, i, l, m, raise Perpendiculars, the Middle ones whereof are cut by the right Line O V in o, and the Extremes, by the right Line P V in p. Thus will the Door be delineated, with its Posts. If the Door were to have been exhibited in the Wall E F G H, the Method were nearly the same. For, 1°. Upon the Terrestrial Line, set off the Distance of the Door from the Angle, and thence also the Breadth of the Door R T. 2°. From R and T, draw right Lines to the Principal Point V, to have the Breadth r t in the perspective Plan. 3°. From r and t, raise indefinite Perpendiculars to F H. 4°. From A to O, set off the true Height A O. Lastly, From O, to the Principal Point V, draw the right Line O V, intersecting E F in z, and make r r and t t equal to T Z. Thus is the Door r t, t t, drawn, and the Posts are easily added, as before.

To exhibit the SCENOGRAPHY of Windows in a Wall.

When you know how to represent Doors, you'll find no Difficulty in adding Windows; all that is here further required, being to set off the Height of the Window from the Bottom of the Ground. The Whole Operation is as follows. 1°. From 1 to 2, set of the Thickness of the Wall at the Window; from 3 to 4, its Distance from the Angle 3; and from 4 to 5 its Breadth. 2°. From 4 and 5, to the Point of Distance L, draw the right Lines E 5 and L 4, which will give the Perspective Breadth 10, 9 of the Window. 3°. From 10 and 9 raise Lines perpendicular to the Pavement; *i. e.* draw the parallel Lines 6, 3. 4°. From 3 to 11 set off the Distance of the Window from the Pavement 3, 11; and, from 11 to 12, its Height 11, 12. Lastly, From 11 and 12, to the principal Point V, draw Lines V 11 and V 12; which intersecting the Perpendiculars 10, 13, and 9, 14, in 13 and 14, as also in 15 and 16, will exhibit the Appearance of the Window.

From these Examples, which are all no more than Applications of the first grand general Rule, it will be easily perceived what Method to take to delineate any other Thing, and at any Height from the Pavement.

A Mechanical Method of exhibiting the Scenography of any Object; See under the Article DEXTERINO.

SCENOPEGIA, a Feast among the Jews, more usually called, *The Feast of Tabernacles*, instituted after the People of Israel were in Possession of the Land of Canaan, in Memory of their having dwelt under Tents in the Wilderness. 'Twas held for 8 Days successively, commencing on the Fifteenth of September. The last Day was much the most solemn, both on Account of the Conflux of Persons, and of the extraordinary Tokens they gave of their Joy. 'Tis of this Eighth Day, St. John must be understood to speak, when he tells us, our Saviour was at the Feast of Tabernacles, on the last and great Day. When the Holy Scripture says absolutely, *the Feast*, 'tis to be usually understood of the *Scenopia*. The Word is Greek, form'd of *σκηνή* Scene, Tabernacle, Tent; and *πέγυς* PEGY, I fix.

SCEPTER, a Royal Staff, or Battoon, born, on solemn Occasions, by Kings, as a Badge of their Command and Authority. See REGALIA. The Scepter is an Emblem of Royalty of greater Antiquity than the Crown. The Greek Tragic, and other Poets, put Scepters in the Hands of the most ancient Kings they ever introduced. Justin observes, That the Scepter, in its Original, was a *Hasta* or *Spear*: He adds, That in the most remote Antiquity, Men adorned the *Hasta*, or Scepters, as immortal Gods; and, that it was upon this Account, that even, in his Time, they still furnished the Gods with Scepters. *Nephtis's* Scepter is his Trident. See TRIDENT. *Tarquinius*, the Elder, was the first who assumed the Scepter among the Romans. *Le Gendre* tells us, That in the first Race of the French Kings, the Scepter was a Golden Rod, almost always of the same Height with the King who bore it, and crook'd at one End like a Crozier. Frequently, instead of a Scepter, they are seen on Medals with a Palm in their Hand. *Nicod* derives the Word from the Greek *σκηπτός*, which he says, originally signified a Javelin, which the ancient Kings usually bore as a Badge of their Authority, in regard that Instrument was in very great Veneration among the Heathens. But, in Effect, *σκηπτός* does not properly signify a Javelin, but as a Staff, to rest upon, from *σκηπτός*, *Imitor*, I lean.

SCEPTER, *Scoptricus*, in Anatomy, one of the Six new Constellations of the Southern Hemisphere, consisting of 17 Stars; one of the 4th Magnitude, 8 of the 5th, and as many of the 6th.

SCEPTICISM, the Doctrine, and Opinions of the Scepticks; called also *Pyrrhonism*, from the Name of its Author. See PYRRHONISM. The Ancient Scepticks considered

filled in doubting of every Thing, in affirming nothing as all, and in keeping the Judgment in Suspense on every Thing. *Sextus Empiricus* makes *Scepticism* to consist in a Faculty of opposing all Appearances, of making all, even contrary Things, equally probable, and of proceeding first to an  $\epsilon\pi\alpha\lambda\lambda\epsilon\sigma\iota\varsigma$ , Suspense of Mind, and then to an intire Undisturbedness or Tranquillity. Hence these great Maxims of theirs,  $\text{Ὁ μάλιστ' ἴσθ' ἢ οὐδέν. This is no more than that. Πιστεῖν μὴν λυγρῶ. &c. Every Reason has some Reason against it; and Ὁὐδὸν οὐδέν, I determine nothing.$  The proper Character then of *Scepticism* is an  $\alpha\iota\sigma\tau\alpha\lambda\epsilon\iota\alpha$ , Neutrality, or such a Disposition of Mind as does not, upon any Occasion, incline to any thing more than the contrary thing. This Hesitancy of the *Scepticks* is well described by *Aristoteles* in *Enchirid. de Prepar. Evan.* All Things are equally indifferent, uncertain and undetermined; neither our Senses, nor our Opinions give us either Truth or Falshood: Therefore, neither the one, nor the other are to be credited; but all Things to be left on a Level, without having any Opinion, Inclination or Motion of the Mind at all. 'Tis added, that the *Scepticks* carried this Suspense of theirs so far, as to deny, that the thing is either good or evil, just or unjust, true or false; or that any thing is this, more than that. See *SCPTICISM*.

'Tis from this *Acatalepsia* of the *Scepticks*, that *Des Cartes* seems to have borrowed his great Principle of  *doubting of all Things*; as is own'd by many of his Followers. It must be own'd, there is some Difference between the Doubting of the *Scepticks*, and that of the *Cartesians*. In Physical Matters, 'tis true, there does not seem a great deal of Difference; and *Des Cartes*, in that Respect, may, without much Injustice, be denou'd a *Sceptic*: But this may be said in his Favour, That the great *Socrates* was so far a *Sceptic* himself; physical and sensible Things, he held, were all dubious, and, at best, but probable. See *CARTESIANISM*.

The Origin of *Scepticism* is somewhat obscure; *Pyrrho*, who lived under *Alexander the Great*, and made the Tour of *India* in his Retinue, is usually reputed the Author; whence *Pyrrhonians* and *Scepticks* are ordinarily used indifferently. See *PYRRHONIAN*. It must be own'd, however, that the great Dogma of the *Scepticks* had been contemned, and even cultivated before *Pyrrho* by *Democritus*, *Heracitus*, &c. *Sextus Empiricus* lays, expressly, That all that *Pyrrho* did, was to improve, illustrate and enforce the Dogma; and from the Retainers thereto into a Sect. *Democritus's* Philology was near akin to *Scepticism*; for that, upon his observing, that Honey seem'd sweet to some, and bitter to others, he concluded, that 'twas neither sweet nor bitter; and thereupon pronounced  $\text{ἢ μάλιστ', οὐ μᾶλλον, which is pure Scepticism. Yet the same Sextus adds, That Democritus was no Sceptic. Though Plato argue very strenuously against the Acatalepsia of the Scepticks; yet 'tis certain that Dogma received a great Part of its Encouragement from Socrates's School, and Plato's Academy. Nay, 'twas a great Controversy among the Ancients, whether Plato himself were a Sceptic or Dogmatist. Indeed Plato's decisive Way of speaking, in many cases, seems to leave no great room for such a Doubt; but 'tis certain, his Followers of the New Academy founded by *Arcesillus*, gave much into this Way; and *Nihil Sciri*, was held by them, a Principle. *Sextus Empiricus* observes, That *Socrates* himself had a Tincture of *Scepticism*; some even make him the Author of it, from that customary Saying of his, *I know nothing but this, that I know nothing.* If this were the Origin of *Scepticism*, it must be own'd, it was nightly improved afterwards, e'er *Menodorus* said, *I know nothing, not even this, that I know nothing.* The same *Sextus* however adds, That *Plato*, introducing his Master in his *Gymnastic Dialogues*, disputing with the *Sophists*, makes him act the Part of a *Sceptic*. Some have even charged *Job* and *Solomon* with *Scepticism*; from their proposing a great Number of Questions, without deciding any of them. The Philosopher of *Kiel*, who has published a Dissertation on *Scepticism*, fetches its Origin still higher: He will have the Devil the Author thereof, who made our first Parents doubt of the Word of God himself; and drew them in, to the first Profelytes to *Scepticism*.$

*SCPTICKS*, A SECT of Ancient Philosophers, founded by *Pyrrho*, whose distinguishing Tenet was, That all Things are uncertain and incomprehensible; Contraries equally true; that the Mind is never to assent to any thing; but to keep up an absolute Hesitancy or Indifference. See *SCPTICISM*.

*Plato* refutes the great Principle of the *Scepticks* thus: When you say, that all Things are incomprehensible, do you comprehend or conceive that they are thus incomprehensible, or do you not? If you do, then something is comprehensible; if you don't, there is no Reason we should believe you, since you don't comprehend your own Assertion.

The Term *Sceptic*, in its Original Greek  $\text{Σαρκαστικῆς}$ , properly signifies *Considerative*, or, A Man who is ever weighing the Reasons on one Side and the other, without ever deciding between them. 'Tis form'd from the Verb  $\text{σαρκάζω}$ , to consider, weigh, deliberate. *Lactantius* adds, That the Followers of *Pyrrho*, had various Denominations; from their Master, they were called *Pyrrhonians*; from their Dogma *Aporctic*, that is Doubters, of  $\text{ἀπορίαι}$ , to doubt, from their Suspension and Hesitation, *Ephelctic*, of  $\text{ἐπιχρῆ}$  to stay, to keep back; and from their never getting beyond the Search of Truth, *Zetetic*.

*SCÉLOTYRBE*, from  $\text{Σκαλῶ}$ , *Crit*, the Leg, and  $\text{Τύρβη}$ , *Tumultus*, Uproar, significth those Pains in the Legs; that generally attend Scorbuclic Habits; whence it is also frequently used for the Scary itself, and applied to some Medicines contriv'd against such Disorders.

*SCHAR-PENNY*, *Schar-Penny*; and sometimes *Scharn-Penny*. It appears from our old Books, that some customary Tenants were obliged to pen up their Cattle at Night in the Pound or Yard of their Lord, for the Benefit of their Dang or *Seem*, as is the *Saxon* Word. And if they did not do this, they were obliged to pay a small Compensation, which therefore was called by this Name of *Schar-Penny*.

*SCHAT or SEAT*, in Astronomy, a fixed Star of the Second Magnitude in the juncture of the Leg, with the Left Shoulder of *Pegasus*. Some call it *Sat Alphoruz*; and some *Schat Pegasi*. Its Longitude, according to *Mr. Flamsteed*, is  $250^{\circ} 2' 13''$  its Latitude  $31^{\circ} 8' 6''$  North. *SCHEDULE*, or *Cedula*, a Scroll of Paper, or Parchment, annex'd or appended to a Will, Lease, Deed or other Instrument, containing an Inventory of Goods, or some other Matter, omitted in the Body of the Instrument. See *CEDULA*.

*SCHEMATISM*. See *FIGURE*.

*SCHEME*, a Model, Draught, &c. or the Representation of any Geometrical or Astronomical Figure, or Problem by Lines sensible to the Eye: Or of the Celestial Bodies in their proper Places for any Moment. See *DIAGRAM*. The Word is form'd from the Greek  $\text{σχῆμα}$ .

*SCHERIF*. See *CHEERIF*.

*SCHIRE MOTE*, was anciently a solemn Meeting of all the free Tenants and Knights in any County, to do Fealty to the King, and elect an Annual Sheriff. See *SHERIFF*.

*SCHIRRUS*, in Medicine, called also *Schirrose* and *Schirrho*, a hard, indolent Tumor, form'd gradually, in the soft, glandulous Parts of the Body; sometimes internal, and sometimes external. There are two Kinds of *Schirrus's*; the one only beginning, and frequently painful when press'd by the Fingers; the other, confirm'd and senseless. The *Schirrus* arises from a thick, viscid, probably, gritty Matter, detained and indurated in the Vessels and other minute Passages of the Parts affected. There are some *Schirrus's* as hard as Stones; some are even painful in their confirm'd State, and partake of the Nature of a Cancer. The Word is form'd from the Greek  $\text{σχιρρῶς}$ , hardness.

*SCHISM*, a Term, which, in the general, signifies *Division*, or *Separation*; but chiefly used in speaking of Separations happening through Diversity of Opinions among People of the same Religion and Faith: Thus we say, The *Schism* of the Ten Tribes of *Israel*, from the Two Tribes of *Juda* and *Benjamin*. See *SAMARITANS*, The *Schisma* of the *Persians* from the *Turks* and other *Mahometans*. Among Ecclesiastical Authors, the Great *Schisma* of the West, is that which happened in the Times of *Clement VII* and *Urban VI*, which divided the Church for Forty or Fifty Years, and was at length ended by the Election of *Martin V*, at the Council of *Constance*. The *Romanists* number Thirty-four *Schisms* in their Church: They bestow the Name of the *English Schism* on the Reformation of Religion in that Kingdom; those of the Church of *England* again apply the Term *Schisma* to the Separation of the *Nonconformists*, viz. the *Presbyterians* and *Independents*, who are earnest for a further Reformation. Some call the Separation of the Protestants from the Church of *Rome*, a *Passive Schisma*, because that Church cut them off from her Communion. The Word is form'd from the Greek  $\text{σχίσμα}$ , cleft, fissure.

*SCHOENOBATES*, a Name the *Greeks* gave to their Rope-dancers. The *Romans* call them, *Pantamboli*. The *Schoenobates* were Slaves, whose Masters made Money of them, by entertaining the People with their Feats of Activity. *Mercurialis de Arte Gymastica*, Lib. III. gives us five Figures of *Schoenobates* Engraven after ancient Stones. The Word is form'd from the Greek  $\text{σχοινῶν}$ , a Rope; and  $\text{βάτης}$ , I walk.

*SCHOLASTIC*, something belonging to the Schools, or that is taught in the Schools. See *SCHOOL*.

The Title *Scholasticus*, was a long time a Title of Honour. At first it was only given to such as distinguished themselves by their Eloquence, in Declaim-

ing, &c. After *Nero*, 'twas also apply'd to the *Advocati*, and among others, to *Socrates* and *Eusebius*, the Ecclesiastical Historians, who were Advocates at *Constantinople*. *Constantin*. *Hieronymus* also bore it in the twelfth Century, with several others. Afterwards it became restrained to such as had the Government of the Ecclesiastical Schools, established under the first Race of *French* Kings, who intrusted the Clerks of each Church, first in the Humanities, then in Theology and the Liturgy. These were also called *Principes* *Ecclesiastes* and *Theologues*. If the Church were situated in a City, the *Scholasticus* was called the *Chancellor*. *Geubraud* observes, That among the *Greeks*, *Scholasticus* was the Name of an Office or Dignity answering to our *Divine* or *Theologus*. Indeed, he adds, 'twas only properly applied to People of general Learning, and fine Parts, and who were well known to the World in that Character. This *St. Jerome* observes, That *Serapius* was surnam'd *Scholasticus*, by reason of the Delicacy of his Wit. *Walafrid Strabo*, calls the Poet *Prudentius*, *Scholasticus*; *Fortunatus* was called *Scholasticissimus*.

SCHOLASTIC, or SCHOOL Divinity, is that Part of Divinity which clears and discusses Questions, by means of Reason, and Arguments: In which Sense, it stands, in good measure, opposed to positive Divinity, which is founded on the Authority of Fathers, Councils, &c. The School Divinity, like *Plato's* School, has had its three several Ages or Periods: The *Ancient*, the *Mean* and the *New*. The *Ancient* began under *Laufirak*, Archbishop of *Canterbury*, or, more properly, under *Peter Lombard*, the Master of the Sentences, and held about 200 Years; ending under *Albertus Magnus*. 'Twas succeeded by the *Mean School Divinity*, which lasted about 300 Years, to the Time of *Thomas Aquinas*; during which Time, the *Peripatetic* Philosophy was raised to its utmost Reputation. The third Age began under *Dionandus*, who set himself up against *Ynnas*, the Chief of the *mean* Age. From him Peoples Wits began to be more and more subtle; and the *Schools* began to be wholly taken up in frivolous Questions. They disputed, with great Heat, about mere Formalities; and even raised Phantoms on purpose to combat withal. 'Tis now fallen into the last Contempt; and is scarce regarded any where, but in some of the Universities, where they are obliged by their Charters to teach it.

SCHOLIAST, a Commentator, particularly a Person who writes *Scholias*, that is, Notes, Glosses, &c. upon the *Ancient Greek* Authors. See *SCHOLIUM*.

SCHOLIUM, a Note, Annotation, or Remark occasionally made on some Passage, Proposition, &c. 'Tis much used in Geometry, and other Parts of Mathematics; where, after demonstrating a Proposition, 'tis frequent to point out where it might be done some other Way; give some Advice, or Precaution to prevent Mistakes; or add some particular Use or Application thereof. *Wulfius* has given us abundance of curious and useful Arts and Methods, a good part of the *Modern* Philosophy, the Description of Mathematical Instruments, &c. all by way of *Scholias*, to the respective Propositions in his *Elementa Mathematica*. The Word in the *Original Greek*, *σχολιον*, signifies the same Thing.

SCHOOL, a publick Place, wherein the Languages, Humanities or other Sciences are taught. Thus we say, a *Grammar School*, the *School* of Medicine, of *Natural Philosophy*, &c. The Word is also used for a whole Faculty, University, or Sect: as, *Plato's School*: The *School* of *Epicurus*, the *School* of *Paris*, &c. The *School* of the *Liberians* has been famous among the *Ancient* Jews; and 'tis to this we owe the *Massors* and *Masorettes*. See *MASSORETS*. The Word is form'd from the *Latin*, *Schola*, which *Du Cange* derives from *Scolia*, which signifies *Disciplines* and *Corrections*; and adds, That it was anciently, in the general, used for all Places, where several Persons met, either to study, to converse, or do any other Matter. Accordingly, there were the *Scolae Palatinae*, being the several Posts wherein the Emperor's Guards were placed; the *Schola Senatoria*, *Schola Militum*, &c. At length the Term pass'd to Civil Magistrates; and accordingly in the Code, we meet with *Scolae Characteriariorum*, *Agentium*, &c. and even to Ecclesiasticks, as, *Schola Cantuarum*, *Sacerdotum*, &c.

SCHOOL, in Painting, is a Term used to distinguish the different Manners of Places, and Persons: As, the *Roman School*, the *Venetian School*, the *French School*, &c.  *Raphael's School*, *Titian's School*, as *Vinci's School*, &c. meaning their Disciples, Pupils, &c. See *PAINTING*.

SCHOOL of Athens, in Painting, is a celebrated Piece of *Raphael*, now in the *Vatican*. It contains a great Number of Figures, representing Philosophers, Mathematicians, and other Persons, engaged in the Arts and the Sciences. Several Authors have wrote of this Painting, and given different Explanations thereof. *Vasari* will have it to be, The Agreement of Philosophy, and Astronomy, with The-

ology. The Engravers, by the Inscription they add at the Bottom of the Print thereof, shew, That they take it for a Painting of *St. Paul* preaching at Athens. An *Augustin* of *Venice*, takes the Philosopher who is writing, for a *St. Mark*; and he at his Knees, for the Angel *Gabriel*. *M. de Piles* rejects all these Explanations of the *School* of Athens, and especially the last: His Opinion is, That 'tis nothing more than the mere Image or Representation of Philosophy, which *Raphael* here designs under all the Philosophers he has painted. In Behalf of the *Venetian* Engravers it may be said, that they do not pretend to explain the Painting, but have only copied such of the Figures as they thought proper to represent *St. Mark*, *St. Gabriel*, &c.

SCHOOL PHILOSOPHY, Theology, &c. See *SCHOLASTIC*.

SCHOONBIAH, a Sect among the *Mussulmans*. The distinguishing Tenet of those of this Sect is, That the *Sunnas* are not a whit preferable to the *Schais* or *Rasulites*, i. e. the *Orthodox* to the *Heterodox*; but that both the one and the other are equally good *Mussulmans*. The *Schoonbiahs*, therefore, should be properly the *Lai-rustrians* of *Mussulmanish*. Yet are not they regarded by either Party, as much better than *Gentiles* or *Heathens*, as their Name imports. There are abundance among the *Mussulmans*, who give into this Sect, only secretly; *Mahometish*, like all other false Religions, being an avowed Enemy to Toleration.

SCIATICA, in Medicine, the Gout in the Hip. See *GOVY*.

SCIENCE, in Philosophy, a clear and certain Knowledge of any Thing, founded on self-evident Principles, or Demonstration. See *KNOWLEDGE*. In this Sense, Doubting is oppos'd to Science; and Opinion is the middle between the Two. See *OPINION*. The *Strepnicus* profess to deny, that we have any such thing as Science; that is, any clear, certain Notices of any thing, capable of producing absolute Conviction. See *SCIENTISM*. The Word is form'd of the *Latin*, *Scire*, to know.

Divines suppose three Kinds of Science in God: The first, Science of mere Knowledge, whereby God knows himself, and all Things possible. The second, a Science of Vision, whereby he knows all Things he has resolved to do, or to permit, in the same Order wherein he has resolved to do, and to permit them. The third an intermediate Science, whereby he knows what Angels and Men will do, in certain Cases and certain Circumstances, if he resolve to bring them about. 'Tis greatly disputed among the *School Divines*, whether or no there be such an intermediate Science in God; the Reason why some call it so question is, because it does not consist well with their particular Schemes.

SCIENCE, is particularly used for a form'd System of any Branch of Knowledge; comprehending the Doctrine, Reason and Theory, of the Thing, without any immediate Application thereof to any Uses or Offices of Life; in which Sense, the Word is used in Opposition to Art. Indeed, the precise Notion of an Art and Science, and their just, adequate Distinction, are not yet well fixed. See the *PREFACE* to this Work.

As to the Number and Division of the Sciences, *Mr. Lock* fixes them thus: All that can fall within the Compass of human Understanding, is, First, Either the Nature of Things, their Relations, and their Manner of Operation: or, Secondly, That which Man himself ought to do as a voluntary and rational Agent, for the Attainment of any End, especially Happiness; or, Thirdly, the Ways and Means, whereby the Knowledge of both of these are attained and communicated: Whereupon, Science, may be properly divided into these Three Sorts. First, the Knowledge of Things, their Constitutions, Properties and Operations, whether material or immaterial: This, in a little more enlarged Sense of the Word, may be called *Common*, or *Natural Philosophy*. The End of this is bare speculative Truth, and whatsoever can afford the Mind of Man any such, falls under this Branch; whether it be God himself, Angels, Spirits, Bodies, or any of their Affections, as Number, Figure, &c. Secondly, *Reason*, the Skill of right applying our own Powers and Actions for the Attainment of Things good and useful. The most considerable under this Head, is *Etiquets*, which is the seeking out those Rules and Measures of Human Actions, which lead to Happiness, and the Means to practise them. The End of this is not bare Speculation; but Right, and a Conduct suitable thereto. Thirdly, *Reason*, or the Doctrine of Signs: The most usual being Words; it is aptly enough term'd *Logic*: The Business whereof is to consider the Nature of Signs, which the Mind makes use of for the understanding of Things, or conveying its Knowledge to others. Things are represented to the Mind by Ideas; and Mens Ideas are communicated to one another by articulate Sounds or Words. The Consideration then of Ideas or Words, as the great Instruments of Know-

Knowledge, makes no despicable Part of their Contemplation, who would take a View of Human Knowledge in the whole Extent of it. This seems the first, and most general, as well as natural Division of the Objects of our Understanding. For a Man can employ his Thoughts about nothing, but either the Contemplation of Things themselves for the Discovery of Truth; or about the Things in his own Power, which are his Actions, for the Attainment of his own Ends; or the Signs the Mind makes use of, both in the one and the other, and the right ordering of them, for its clearer Information. All which Three; *viz. Things*, as they are in themselves knowable; *Actions*, as they depend on us in order to Happiness, and the right use of *Signs*, in order to Knowledge, being *totò Còlo*, different, they seem to be the Three great Provinces of the Intellectual World, wholly separate and distinct one from another.

**SCIENTIFIC**, something relating to the pure, sublime Sciences; or, that abounds in Science or Knowledge. A Work, a Method, &c. is said to be *Scientific*, when 'tis founded on the pure Reason of Things, &c. conducted wholly on Principles thereof. In which Sense, the Word stands opposed to *Narrative, Arbitrary, Opinionative*, &c.

**SCILLA**, or *Squill*, a Medicinal Plant, of the Onion-kind, but very large; chiefly brought from Spain: Used only in Infusion, and that generally in Vinegar, which it renders Emetic. There are two Kinds, *Male* and *Female*; the Male are whitish, and the Female reddish. Their Infusion, when boiled into the Consistence of a Syrup, with Honey, called *Oximel Spiliticum* in the Shops, retains the same Properties. They wonderfully deterge and fear off the viscid Adhesions in the Bowels, and greatly irritate the Stomach to Ejection. They are also, as all of the Onion Kind are, very Diuretick, and therefore in great Efficacy, with some, in Dropficks: For if their Infusion be mixed with Cinnamon-Water, they will seldom vomit, but work downwards, and very feebly, by Urine: In Asthmas, and all Obstructions, or Infractions of the Lungs, which are to be removed by Detergives and Expectoration, there is scarce any thing more effectual. They are also cited *Alexipharmicki*, and upon that Account have a Place in the *Theriacæ Antidota*.

**SCIOGRAPHY**, the Profile, or Section of a Building, to show the Inside thereof. See SECTION and PROFILE.

**SCIOGRAPHY**, in Astronomy, &c. is a Term some Authors use for the Art of finding the Hour of the Day or Night, by the Shadow of the Sun, Moon, Stars, &c. See DIAT.

**SCIOMANTIA**, or *Sciomaney*, a kind of Divination, otherwise called *Psychomaney*. *Sciomaney*, among the Ancients, was the Art of raising and calling up the Names or Souls of deceased Persons, to intract them in Things to come. The Witch who conjured up the Soul of *Satan*, to furrel *Saul* the Event of the Battle he was about to give, did it by *Sciomaney*. The Word is found in the *Greek*, *viz.* Shadow, used metaphorically for the *Soul*, and *scirtis*, Divination. See DIVINATION.

**SCIOPTICK**, a Sphere or Globe of Wood, with a circular Hole or Perforation wherein a Lens is placed: 'Tis so fitted, that like the Eye of an Animal, it may be turn'd round every Way; to be used in making Experiments of the darken'd Room. See CAMERA OBSCURA.

**SCIRE-FACIAS**, is a judicial Writ, most commonly to call a Man to shew Cause to the Court whence it issues, why Execution of a Judgment passed, should not be made out. This Writ is not granted, until a Year and a Day be elapsed after a Judgment given: *Scire-facias*, upon a Fine, lies not but within the same Time after the Fine levied, otherwise it is the same with the Writ of *Habere facias justitiam*.

**SCLAVONIC**, the Language of the *Slavi*, an Antient People of *Scythia Europæa*; who, about the Year 518, quitting their native Country, ravaged Greece, and established the Kingdoms of *Poland* and *Moravia*, and at last settled in *Byzria*; which thence took the Name of *Sclavonia*. But the Modern *Sclavonia* is much narrower, being only a Province in *Hungary*. The *Sclavonic* is held, after the *Arabic*, the most extensive Language in the World: 'Tis spoke from the *Adriatic* to the *North Sea*; and from the *Caspian* to *Saxony*, by a great Variety of People, all the Descendants of the Ancient *Slavi*, *viz.* the *Poles*, *Muscovites*, *Bulgarians*, *Circassians*, *Bohemians*, *Hungarians*, *Prussians*, *Saxons*, &c. each of whom, however, have their particular Dialect; only the *Sclavonic* is the common Mother of their several Languages, *viz.* the *Polish*, *Russian*, *Hungarian*, &c. By a Latin Chronicle of the *Slavi*, compiled by *Helmold*, a Priest of *Buda*, and *Arnold* Abbot of *Lubeck*, and corrected by *M. Leibnitz*, it appears, that the *Slavi* anciently inhabited the Coasts of the *Baltic Sea*, and were divided

into *Eastern* and *Western*: In the latter whereof, were the *Russians*, *Poles*, *Bohemians*, &c. And in the former, the *Vandals*, *Dan. Maur. Orbini* *Raufser*, Abbot of the Order of *Malta*, in an Italian History of the *Slavi*, intitled, *Il Regno de gli Slavi*, printed in 1601, will have them to be originally of *Finland* in *Scandinavia*. *Laur. Procer*, a *Dalmatian*, in an express Discourse on the Origin of the *Slavi*, maintains them to be originally of *Thracia*, and the same with the *Thracians*, the Posterity of *Thiras*, Seventh Son of *Japhet*. *Theop. Polycarpovna*, in a *Greek, Latin* and *Sclavonic* Dictionary, printed at *Moscow* in 1704, observes, That the Word *Sclavon*, whence *Sclavonic* is form'd, signifies in their Language, *Glorious*.

**SCLEROPHTHALMIA**, a kind of Ophthalmia; wherein the Eye is dry, hard, red and painful; and the Eyebrows likewise; so as not to be opened after Sleep, without great Pain, by reason of their excessive Dryness. See OPHTHALMIA.

**SCLEROTICA**, in Anatomy, &c. one of the common Membranes of the Eye, situate between the Aqueata and the Uvea: 'Tis very firm and opaque behind; but transparent before. In Strictness, 'tis only the hind-part is call'd *Sclerotica*; the fore-part being properly called the *Cornea*; See CORNEA. The *Sclerotica* is a Segment of a larger Spheroid than the *Cornea*. See EXE. The Word is form'd from the *Greek* *viz.* hard.

**SCLEROTICKS**, Medicines, proper to harden and consolidate the Flesh, &c. of Parts they are applied to. Such are *Purlian*, *Jubarb* or *Houle-ock*, *Psyllium*, *Murel* or *Garden-night-shade*, &c.

**SCOLDING**: The Punishment allotted by our Laws for *Scolding* Women, is, To be set in a *Trebuchet*; commonly call'd a *Cocking Stool* (probably from the *French Coquine*, *Queen*, and the *German Stuhl*, *Chair*) placed over some deep Water, into which they are to be let down; and plunged thrice, under Water, to cool their Heat and Choler.

**SCOLOPOMACHAIRION**, in Chirurgery, a Kind of Scalpel, thus call'd, by the *Greeks*, from its resembling a *Woodcock's Bill*. Its Use is to open, and dilate, narrow Wounds of the Breast, Abscesses, &c. *Agnostentis* recommends it for Tapping in Dropficks. 'Tis usually furnished with a little Button at the Point, that it may be used to open Wounds of the Breast, without Danger of wounding the Lungs.

**SCONGES** are small Forts, built for Defence of some Pass, River, or other Place: Sometimes they are made regular of four, five, or six Bâtions; others of smaller Dimensions, fit for Passes, or Rivers, and likewise for the Field: Such are (1.) Triangles with half Bâtions; which may be all of equal Sides, or they may be something unequal. However it be, divide the Sides of the Triangle into three equal Parts, one of these three Parts will set off the Capitals and the Gorges; and the Flanks, being at Right Angles with the Sides, make half of the Gorge. (2.) Square, with half Bâtions; whose Sides may be betwixt 100 and 200 Feet, and let one Third of the Side set off the Capital and the Gorges, but the Flank (which raise at Right Angles to the Side) must be but one half of the Gorge or Capital, that is on the Sixth Part of the Side of the Square. (3.) Square with half Bâtions and Long. (4.) Long Squares. (5.) Star Redoubt of four Points. (6.) Star Redoubt of five or six Points. (7.) Plain Redoubts, which are either small or great. The small are fit for Court of Guards in the Trenches, and may be a Square of 20 Feet to 30. The middle Sorts of Redoubts may have their Sides from 30 to 40 Feet; the great ones from 60 to 80 Feet Square. The Profiles (that is the Thickness and Height of the Breast-works) to be set on these several Works, and the Ditches; are alterable, and uncertain; for sometimes they are used in Approaches, and then the Wideness of the Breast-work, at the Bottom, may be 7 or 8 Feet, inward Height 6, and outward 5 Foot; the Ditch may be 8 or 10 Feet, and sometimes 12; and for the Slopes, to be wrought according to the Nature of the Earth, they may sometimes be made 14 or 20 Feet wide at the Bottom, and the Height of 7, 8, or 9 Feet, and to have 2 or 3 Acres to raise to the Parapet; the Ditch may be 16 or 24 Feet wide, and 5 or 6 deep; and sometimes they may come near the smallest fort of Ramparts, and have a Breast-work Cannon Proof, with a Ditch of 40 or 60 Feet wide, and are thus made to set upon Passes or Rivers to endure. See REDOUBT.

**SCOPER-HOLES** in a Ship, are Holes made through the Sides cloie to the Deck, to carry off the Water that comes from the Pump, or any other Way. These Holes in the Covert Deck, have round Leathers nailed over them, to keep the Sea Water from coming up into the Ship, which are called *Scoper-Leathers*; and the short Nails, with broad Heads, which fasten these Leathers down, are called *Scoper-Nails*.

**SCORBUTUS**, *Scorvy*, in Medicine, a Disease very frequent in the Northern Countries, particularly in fenny, wet, humid Places, open to the North, &c. 'Tis accompanied with a great Variety of Symptoms attacking the several Parts of the Body all at once. Hence *Willis* says, 'tis not any particular Disease, but a Legion of Diseases. The most usual are Bleeding, Coughing, Vomiting, Difficulty of Breathing, Looseness, a Relaxation of the Parts, Swetting, a fetid Smell of the Gums, a falling of the Teeth, sinking Breath, reddish or yellow livid Spots, Pains of the Arms and Legs, Weariness, Faintings, Head-ach, &c. Some distinguish it into *Hot and Cold*; but there is little Foundation for such a Distinction, as the Cause is the same in all, *viz.* according to *Barbette* and *Decker*, a too thick Pituitous Lymph; whence various Symptoms in various Temperaments. *Charleston* observes, That it arises chiefly from sharp, saline Particles, taken in by Inspiration, from Salt and corrupted Meats eaten, from bad Waters drank, from Nitreless, deep Chagrins, &c. He adds, That 'tis contagious. Dr. *Quincy* will have it to consist in such a Constitution, wherein the Blood is unequally Fluid. And hence he observes, 'tis best remedied by Stimuli, Exercise, and such means as promote Sanguification: 'Tis now become so frequent, that there is scarce any Disease appears, but 'tis judged to partake of the *Scorbutus*. The Cure is very difficult; and when the Disease is rooted, next to impossible. It sometimes goes off in a Flux by Stool, sometimes by the Hemorrhoids, and sometimes by Urine; but more often degenerates into a Dropsy, Atrophy, Apoplexy, Epilepsy or Convulsions. A very exact Diet is held of more Effect than the best Medicines; without this, it becomes incurable. Bleeding does not avail; strong Purgatives are hurtful: So is Sugar, and all sugar'd Things, *Mercurius Dulcis* used internally, so as not to Salivate, but only raise a Sweating, is found excellent. *Dobson* undertakes to cure any *Scorbutus* in Twelve Days time, by the Use of this alone; only the Patient to drink nothing all that Time, but a proper Decoction, and to abstain from Acids, and Hog's Flesh. *Charleston* recommends a continued Use of Milk, particularly Milk Emulsions of Sweet Almonds, Decoctions of China, Broths and other Acrid-acids and Analeptics. *Ernsdler* makes the Basis of the Cure of the *Scorbutus* and Hypochondriacal Diseases the same, *viz.* copious Vomiting. Strong Catharticks, he observes, are prejudicial; but gentle ones good; for the Body is to be still kept open. He adds, That Vinegar is hurtful, and yet the Acid Juices of Fruits and Vegetables, wholesome. Accordingly the Use of Lemon Juice is much recommended by *Lifter*. Milk, and all milky Things, while the Stomach is yet able to digest, are excellent. So are Martials. *Ernsdler*, instead of Mercurials, recommends Antimonials. Thus much in the general; for the particular Symptoms, particular Medicines adapted thereto, are to be used; only mixing Antiscorbuticks with them all.

The chief simple Antiscorbuticks are, Horfe-radish, sowre Sorrel, Beeter-but, Scorzonera, Sow-thistle, Zedary, Polydopy, Elecampne, Quinao, Sassafras, Mustard-Seed, Nasturtium Aquaticum, Trifolium Paludosum, Oranges, Lemons, Juniper-Berries, Cream of Tartar, Tartarum Vitriolum, &c.

**SCORE**, in Musick, *Partition*, or the Original Draught of the whole Composition, wherein the several Parts, *viz.* Treble, Second Treble, Bass, &c. are distinctly scored and marked. See **PARTITION**.

**SCORPIO**, in Astronomy, the Eighth Sign of the Zodiac. See **STONE**.

The Stars in *Scorpio*, in *Ptolemy's* Catalogue are 20; in that of *Lycho* 10; in that of *Mr. Flamsteed* 49: The Longitude, Latitudes, Magnitudes, &c. whereof, are as follow;

*Stars in the Constellation SCORPIO.*

Names and Situations of the Stars.	Right Ascension.	Longitude.	Latitude.	Magn.
In the first South Foot	26 43 50	5 26 31 A	6	
Subseq. in the first Foot	27 18 08	4 54 12 A	6

**SCORPION**, an ancient, military Engine, used chiefly in the Defence of Walls, &c. called also *Scorpio*. *Morcellinus* describes the *Scorpio*, as consisting of two Beams bound together by Ropes. From the Middle of the Two, rose a Third Beam; so disposed, as to be pull'd up and let down at Pleasure; and on the Top of this, were fasten'd Iron Hooks, where was hung a Sling, either of Iron or Hemp. Under the Third Beam lay a Piece of Hair-cloth full of Chaff, tied with Cords. To use the Engine, a round Stone was put into the Sling, and Four Persons on each Side, loosening the Beams bound by the Ropes, drew back the erect Beam to the Hook: When, the Engineer standing on an Eminence, giving a Stroke with a Hammer on the Cord to which the Beam was fastned with its Hook, set it at liberty; so that hitting again the soft Hair-cloth, it struck out the Stone with a vast Force. It had its Name *Scorpio*, because when the long Beam or Tillar was erected, it had a sharp Top, in manner of a Sting. The more modern Times have given it the Name *Onager*, Wild Ass, because that Animal, when hunted, flings back Stones.

**SCORIA**, the Rescrement or Drofs of any Metal, remaining after melting, or refining the same. The *Scoria* of Iron, is the Scum taken from that Metal in Forges when its sulphur is melted. See **SCUM**. *Scoria* of Iron, is also the sulphurous Part of the Iron; which uniting with the sulphurous Part of the Charcoal, makes together, those porous Masses, resembling Sponges, frequently seen in the Smiths Forges.

**SCOT** or *Scorb*, from the *Saxon* *Streas*, a Part or Portion; is a certain Custom or common Tallage, according to *Rapin*, made to the Use of the Sheriff or his Bailiffs; but now signifies a customary Contribution laid upon all Subjects, according to their Ability; for whoever are assessed to any Contribution, are generally said to pay *Scot and Lot*.

**SCOTIA**, in Architecture, a Semicircular Cavity or Channel between the Tones, in the Bases of Columns. See **BASE**. The *Scotia* has an Effect just opposite to that of the Quarter round. Our Workmen frequently call it the *Cosmetum*. The *Scotia* is a concave, dark Moulding; whence its Name, *viz.* from *Scotus*, Obscurity, Darkness. 'Tis also called *Frochilus*, partly from its Form. In the *Corinthian* Base, there are Two *Scotias*, the upper whereof is the smaller. According to *Filibien*, the *Cavetto* is a fourth Part of the *Scotia*. See **CAVETTO**.

**SCOTISTS**, a Sect of School Divines and Philosophers, thus called from their Founder, *J. Duns Scotus*, an Irish Cardinal; who maintained the immaculate Conception of the Virgin; or, that she was born without Original Sin; in Opposition to *Thomas Aquinas* and the *Thomists*. See **THOMIST**. As to Philosophy, the *Scotists*

*ripi* were, like the *Thomists*, Peripatetics; only distinguished by this, That in each Being, as many different Qualities as it had, so many different Formalities did they distinguish; all distinct from the Body itself; and making, as it were, so many different Entities: Only those Metaphysical, and, as it were, superadded to the Being. See PERIPATETICS.

SCOTOMY, in Medicine, a Dizziness, or Swimming in the Head, wherein the Animal Spirits are so whirl'd about, that external Objects seem to turn round. See VERTIGO.

SCRATCHES, among Farriers, a Distemper incident to Horses, consisting of dry Scabs, Chops or Rists, that breed between the Heel and the pastern Joint. There are various kinds of *Scratches*, distinguished by various Names, as *Crepences*, *Rust-Tails*, *Moles*, *Kibes*, *Pains*, &c. which are all so many Species of *Scratches*; Engender'd from some dry Humour falling on the Legs, or from the Fumes of his own Dung lying under his Heels, or near them; or for Want of rubbing his Heels, especially after a Journey, from over hard-riding, &c. It begins first, with dry Scabs in the pastern Joint, in several Forms. 'Tis known by the itching, dividing and curling of the Hair on the Spot.

SCRATCH-WORK, in Italian, *Scraffiti*, was a Way of Painting in Fresco, by preparing a Black Ground, on which was laid a white Plaster; which White being taken off with an Iron Bodkin, the Black appear'd through the Holes, and serv'd for Shadows: This kind of Work is lasting; but being very rough, is unpleasant to the Sight.

SCREW, *Cocles*, in Mechanics, one of the Five mechanical Powers; Chiefly used in pressing or squeezing Bodies close, though sometimes also in raising Weights. The Screw is a right Cylinder, as A B, (Tab. Mechanicks Fig. 11.) narrow'd Spiral-wise. 'Tis generated by the equable Motion of a right Line F G, around the Surface of a Cylinder; while, at the same Time, the Point I, descends equally from F towards G. If the furrow'd Surface be convex, the Screw is said to be *Male*; if concave, 'tis *Female*. Where Motion is to be generated, the *Male* and *Female* Screw are always joind; that is, whenever the screw is to be used, as a simple Engine, or mechanical Power. When joind with an Axis in Peritrochio, there is no Occasion for a *Female*; but in that Case, it becomes part of a compound Engine.

#### Doctrine of the Screw.

1<sup>o</sup> If, as the Compass described by the Power in one Turn of the Screw, is to the lateral or Distance between any two immediate Threads or spiral Windings, as B I (measured according to the Length of the Screw) so is the Weight or Resistance to the Power; then the Power and the Resistance will be equivalent one to the other, and, consequently, the Power being a little increased, will move the Resistance.

For 'tis evident, that in one Turn of the Screw, the Weight is so much lifted up, or the Resistance so much removed, or the Thing to be press'd, is squeezed so much closer together, as is the Distance between two immediate Spirals; and in the same Time, the Power to be moved is so much, as is the Compass, describ'd by the said Power in one Turn of the Screw. Wherefore the Velocity of the Weight (or whatsoever answers thereto) will be to the Velocity of the Power, as is the said Distance between the Spirals to the Compass described by the Power, in one Revolution or turning round of the Screw: So that the gaining in Power, is here recompens'd by the Loss in Time.

2<sup>o</sup> As the Distance between two Threads, B I, is less; the Power required to overcome the said Resistance is less; therefore the finer the Thread, the easier the Motion.

3<sup>o</sup> If the *Male* Screw be turned in the *Female*, as itself, a less Power will be required to overcome the Resistance, as the Lever or Scytala, B D (Fig. 12) is the longer.

4<sup>o</sup> The Distance of the Power from the Centre of the Screw, C D; the Distance of two Threads I K, and the Power to be applied in K, being given, to determine the Resistance it will overcome: Or, the Resistance being given to find the Power necessary to overcome it;

Find the Periphery of a Circle describ'd by the Radius C D: Then to the Distance between the two Threads, the Periphery just found, and the given Power: Or, to the Periphery found, the Distance of the two Threads and the given Resistance, find a Fourth proportional. This in the former Case, will be the Resistance that will be overcome by the given Power; and in the latter, the Power necessary to overcome the given Resistance.

E.g. Suppose the Distance between the two Threads, C D, the Distance of the Power from the Centre of the Screw C D, 25, and the Power 30 Pounds; The Periphery of

the Circle to be describ'd by the Power, will be found 157. Therefore, as 3, 157, 30, 1570, the Weight to which the Resistance is equal.

5<sup>o</sup> The Resistance to be overcome by a given Power, being given; to determine the Diameter of the Screw, the Distance of the two Threads I K, and the Length of the Scytala or Handle: The Distance of the Threads, and the Diameter of the Screw may be ascribed at pleasure; if the *Male* be to be turned in the *Female* by a Handle. Then, as the given Power is to the Resistance it is to overcome, so is the Distance of the Threads to a fourth Number, which will be the Periphery to be describ'd by the Handle C D, in a Turn of the Screw. The Semi-diameter of this Periphery, therefore being sought, we have the Length of the Handle C D. But if the *Female* Screw be to be turn'd about the *Male*, without any Handle; then the Periphery and Semi-diameter found, will be very nearly those of the Screw required.

E.g. Suppose the Weight 6000, the Power 100, and the Distance of the Threads 2 Lines; for the Periphery to be pass'd over by the Power, say, A, 100, 6000: 2, 120; The Semi-diameter of which Periphery being; of 120 = 40 Lines will be the Length of the Handle; if any be us'd; otherwise the Side of the *Female* Screw must be 40 Lines.

*Endless* Screw. If a Screw be so fitted as to turn a Wheel D F (Fig. 13) it is called an *Endless*, or *perpetual* Screw; in regard it may be turned for ever, without coming at any End. From the Scheme, 'tis evident enough; that while the Screw turns once round, the Wheel only advances the Distance of one Tooth.

#### Doctrine of the Endless Screw.

1<sup>o</sup> If the Power applied to the Lever, or Handle of an *Endless* Screw A B, be to the Weight, in a Ratio compounded of the Periphery of the Axis of the Wheel E H; to the Periphery describ'd by the Power, by turning the Handle; and of the Revolutions of the Wheel D F, to the Revolutions of the Screw C B; the Power will be equivalent to the Weight.

Hence, 1<sup>o</sup> as the Motion of the Wheel is exceedingly slow; a small Power may raise a vast Weight, by means of an *Endless* Screw: For this Reason, the great Use of the *Endless* Screw, is either where a great Weight is to be raised through a little Space; or, where a very slow, gentle Motion is required. On which Account 'tis very useful in Clocks and Watches.

2<sup>o</sup> The Number of Teeth; the Distance of the Power from the Centre of the Screw A B, the Radius of the Axis H F, and the Power, being given; To find the Weight it will raise;

Multiply the Distance of the Power from the Centre of the Screw A B, into the Number of Teeth: The Product is the Space of the Power pass'd through, in the Time the Weight passes through a Space equal to the Periphery of the Axis. Find a Fourth proportional to the Radius of the Axis; the Space of the Power now found, and the Power. This will be the Weight the Power is able to sustain. Thus, if A B = 3, the Radius of the Axis H F = 1; the Power 100 Pounds; Number of Teeth of the Wheel D F 48; the Weight will be found 14400; whence it appears, that the *Endless* Screw exceeds all others, in increasing the Force of Powers.

*Archimedes's* Screw, or the *Spiral Pump*; a Machine for the Raising of Water, invented by *Archimedes*, its Structure is as follows; A leaden Tube is wound round a Cylinder A B (Tab. Hydraulicks Fig. 1.) after the same Manner as the spiral Thread is drawn in the common Screw above describ'd. This Cylinder is inclined to the Horizon, in an Angle of about 45 Degrees, and the Orifice of the Tube B immersed under Water. If then, the Screw be turned about by the Handle I, against the Water; the Water will rise up the Spiral, and at length be discharged in A.

This Machine, with a very little Force, is able to raise a great Quantity of Water: Whence 'tis found of good Use, in the emptying of Lakes, &c. If the Water be to be raised to any considerable Height, one Screw will not suffice; but the Water drawn up by one, is to be taken by another, and so successively.

SCRIBE, a principal Officer in the Jewish Law, whose Business was to write and interpret Scripture. We find no mention of *Scribes*, in the *Old Testament*, before *Esdra's*; whence some Learned Men have concluded, That the Office was brought from *Chaldea*, and *Affria*, and first established by the Jews after their Return from the *Babylonish* Captivity. The *Scribes* were in great Credit and Esteem among the Jews, and had even the Precedency of the Priests, and Sacrificers: Indeed, there were three Kinds of *Scribes*, whereof those just mention'd, properly call'd *Scribes of the Law*, were the first, and most con-

considerable. The Decisions of these were received with the same Respect as the Law of God itself. The second Kind, properly called *Scribes of the People*, were a Kind of Magistrates, among the *Greeks*, as well as among the *Jews*. The third Kind were publick Notaries, or Secretaries of the Council: These were the least considerable.

**SCRIBER**, *Scribe*, was also an Officer, among the *Romans*, who wrote Decrees, or Acts, and gave out Dispatches. Every Magistrate had his *Scribis* or Secretary, so that there were *Scribe Edilitii*, *Pretorii*, *Questorii*, &c. They were not admitted to the Management of the principal Offices of the Republick, unless they relinquished their Profession. In the Time of the Emperors, they were also called *Notarii*, because they made use of Abbreviations, and short Notes in Writing. See **NOTARY**.

**SCRIBING**, in Joinery, &c. A Term used, when one Side of a Piece of Stuff being to be fitted to the Side of some other Piece, which last is not regular; to make the Two, then, join close together all the Way, they *scribe* it, thus: That is, they lay the Piece of Stuff to be *Scribed* close to the other Piece they intend to *scribe* to, and open their Compasses to the greatest Distance the two Pieces any where stand from each other; then, bearing one of the Legs against the Side to be *Scribed* to, with the other Point they draw a Line on the Stuff to be *Scribed*: Thus have they a Line on the irregular Piece parallel to the Edge of the regular One; and if the Stuff be wrought away exactly to the Line, when the two Pieces are put together, they will seem a Joint.

**SCRIPTUARY**, among the *Jews*. See **CARAITES**.

**SCRIPTURE**, or *Scriptures*. See **BIBLE**.

**SCROBICULUS CORDIS**, the same as **ANTICARDIUM**; which see.

**SCROPHULE**, in Medicine, Scirrhous Tumours, arising usually about the Neck, and sometimes on other glandulous Parts, called also *Stryme*, and popularly the *King's Evil*, or simply, the *Evil*. See **EVIL**. The Word is *Latin*, formed by Diminution, from *Scrophula*, Sow.

**SCROTUM**, or *Scrotum*, in Anatomy, the common Capsula or Membrane, wherein the Testicles are contained; thus called from its resembling a Pouch or Purse of Leather, called by the Ancients *Scrotus*. The *Scrotum* consists of two Membranes; the Exterior whereof is only a Production of the Cuticula or Cutis, which is here very thin, and without any Fat underneath it. The Inner, called *Dartos*, is only an Expansion of the *Panniculus Carnosus*, which, together with the Cutis, is drawn into the Figure of a Purse, externally. 'Tis divided longitudinally into two Parts, right and left, by a Line, called the *Stem* of the *Scrotum*; answering to which inwardly is a Membrane, called the *Sperma*, which divides the Cavity into two Parts, being only a Production of the *Dartos*. 'Tis dividible into Lamellae, and the Testicles are on each Side loosely connected to it by means of their outer proper Tunic. Its Use is to sustain them, prevent their Collision, as also their falling too low, and to promote the *Corrigation* of the *Scrotum*. See **TESTICLE**.

**SCROTUM CORDIS**, the same as **PERICARDIUM**; which see.

**SCROWLS**, in Architecture. See **VOLUTES**.

**SCRUPLE** in Chronology. The *Chaldean Scruple* is the Part of an Hour; called, by the *Hebrews*, *Holakim*. These *Scruples* are much used by the *Jews*, *Arabs*, and other Eastern People.

**SCRUPLES**, in Astronomy. *Scruples* eclipsed are that Part of the Moons Diameter which enters the Shadow, expressed in the same Measure wherein the apparent Diameter of the Moon is expressed. See **DIGIT**.

**SCRUPLES** of half Duration, are an Arch of the Moon's Orbit, which the Moon's Centre describes from the Beginning of the Eclipse to its Middle. See **ECLIPSE**.

**SCRUPLES** of Immersion, or Incidence, are an Arch of the Moon's Orbit, which her Centre describes from the Beginning of the Eclipse, to the Time when its Centre falls into the Shadow. See **IMMERSION**.

**SCRUPLES** of Emerison, are an Arch of the Moon's Orbit, which her Centre describes in the Time from the first Emerison of the Moon's Limb, to the End of the Eclipse. See **EMERISON**.

**SCRUPULUS**, *Scruple*; the least of the Weights used by the Ancients; and amongst the *Romans* was the Twenty-fourth Part of an Ounce. See **OUNCE**.

**SCRUPLE** is still a Weight among us, containing the Third Part of a Dram, or 20 GRAINS. See **GRAIN**. Among Goldsmiths, the *Scruple* is 24 Grains. See **WEIGHT**.

**SCRUTOIR**, *Scrivoy*, from the *French* *Esriture*, a kind of long Cabinet, with a Door or Lid opening downwards, for the Convenience of Writing on, &c.

**SCRUTINY**, in Antiquity, an Examination, or Probation, performed in the last Week of *Leam*, with regard to the Catechumens who were to receive Baptism on *Easter Day*. The *Scrutiny* was practised with a great many Ceremoonies. Exorcisms and Prayers were made over the Heads of the Catechumens. Prayers were given them on the *Sunday*, with the Lord's Prayer, and the Creed; which they were afterwards made to rehearse. The Process was called *Serminius*, *Scrutiny*; because hereby the Hearts of the Catechumens were *serminius*, or searched, that the Priests might understand who were fit to be admitted to Baptism. This Custom was more in Use in the Church of *Rome* than any where else: Though it appears, by some Missals, to have been likewise used, though much later, in the *Gallican Church*. 'Tis supposed to have ceased about the Year 860.

**SCRUTINY** is also used, in the Canon Law, for a Ticket, or little Paper Bollet, wherein, at Elections, the Electors write their Notes privately, so as it may not be known for whom they vote.

Among us, *Scrutiny* is chiefly used for a strict Perusal, and Examination of the several Votes hastily taken at an Election; in order to find out any Irregularities committed therein, by unqualified Voters, &c.

**SCULK**, (amongst Hunters) is a Company; as, *A Skulk of Foxes*.

**SCULPTURE**, the Art of Cutting, or Carving Wood, Stone, or other Matter, to form various Figures for Representations; as also of fashioning Wax, Earth, Plaster, &c. to serve as Models, or Moulds, for the Casting of Metal Figures. *Sculpture*, in its Latitude, includes both the Art of working in Creux, properly called *Engraving*, and of working in Relievo, which is what we strictly call *Sculpture*. See **ENGRAVING**.

The Antiquity of this Art is past Doubt; as the Sacred Writings, the most ancient and authentic Monuments we have of the earliest Ages, mention it in several Places: Witness *Laban's Idols* stolen away by *Rachel*, and the Golden Calf which the *Israelites* set up in the Desert, &c. But 'tis very difficult to fix the Original of the Art, and the first Artists, from profane Authors; what we read thereof, being intermixed with Fables, after the Manner and Taste of those Ages: Some make a Porter of *Sicyon*, named *Dibutades*, the first Sculptor. Others say, The Art had its Origin in the Isle of *Samos*, where one *Iedocus* and *Trochardus*, perform'd Works of this Kind, long before *Dibutades's* Time. 'Tis added, That *Democritus*, Father of *Tarquin the Elder*, first brought it into *Italy* upon his retiring thither; and that by Means of *Euclippus* and *Emphystratus*, Two excellent Workmen herein, who communicated it chiefly to the *Tyrians*; among whom it was afterwards cultivated with great Success. They add, That *Tarquin* sent for *Taurantius*, one of the most eminent among them, to *Rome*, to make a Statue of *Jupiter*, &c. of baked Earth; for the Frontispiece of the Temple of that Deity. About this Time, there were many *Sculptors*, both in *Greece* and *Italy*, who wrought altogether in Earth. Some of the most noted, are, *Calisthenes*, an *Athenian*, who made himself and his Houe famous, by the great Number of Earthen Figures he adomed it withal. *Demophilus* and *Gorfanus*, two Painters, who intich'd the Temple of *Ceres* with great Variety of Painting and Earthen Images. In effect, all the first Statues of the Heathen Deities, were either of Earth or Wood; and 'twas not so much any Futility of the Matter, or Unfitness for the Purpose, as the Riches and Luxury of the People, that first induced them to make them of Marble, and other more precious Stones. Indeed, how rich soever the Matter were, wherein they wrought, yet they still used Earth, to form Models thereof. And to this Day, whether they be for cutting Marble Statues with the Chisel, or for casting them in Metal, they never undertake the one or the other, without first making a perfect Model thereof in Earth. Whence, doubtless, arose the Observation of *Praxiteles*, That the Art of Moulding Earthen Figures, was the natural Mother of that of making Marble and Metal Figures; which last never appeared in Perfection, till about 300 Years after the Building of *Rome*; though the First was at its Height long before.

*Phidias* of *Athen*, who came next, surpass'd all his Predecessors, both in Marble, in Ivory and Metals: And about the same Time, appeared several others, who carried *Sculpture* to the highest Perfection it ever arriv'd at; particularly *Polidoret* at *Sicyon*; then *Myron*; *Lysippus*, who alone was allowed the Honour of casting *Alexander's* Image in Brass, *Praxiteles* and *Scopas*, who made those excellent Figures, now before the Pope's Palace at *Montecavallo*: *Brianis*, *Timoteus* and *Leocares*, who, with *Scopas*, wrought at the famous Tomb of *Manlius* King of *Ceris*; *Celsidorus*, *Cavaecus*, *Dredalus*, *Burbicus*, *Nyceratus*, *Enphemer*, *Theodorus*, *Neocraetes*,

*crates, Phirnachus, Syraceniensis, Antigonus*, who wrote on the Subject of his Art; the famous Authors of the *Isaacus*, viz. *Agasiter, Polyure, and Athanasius*, and infinite others, the Names of some whereof have passed to Posterity; those of others have perished with their Works: For though the Number of Statues in *Asia, Greece, and Italy*, were so immense, that in *Rome* alone, as we are informed, there were more than there were living Persons, yet we have but very few now left, at least very few of the finest. When *Marcus Scævrus* was *Edile*, his Office obliging him to provide what was requisite towards the Publick Rejoycings, he adorned the stately Theatre, which he erected, with 3000 Brazen Statues; and though *L. Mummius*, and *Lucullus*, brought away a great Number out of *Asia and Greece*, yet, there were still above 3000 remaining in *Rhodes*, as many at *Athens*, and more at *Delphi*: but what is most extraordinary, is the Bigness of the Figures, which those ancient Artists had the Courage to undertake. Amongst those *Lucullus* brought to *Rome*, there was one of *Apollo*, 30 Cubits high; the *Colossus* of *Rhodes*, made by *Careas* of *Lydus*, the Disciple of *Lysippus*, far exceeded it; *Nero's* Statue, made by *Neostorus*, after that of *Mercury*, was also of an extraordinary Size, being 110 Feet high: *Sculpture*, however, did not continue above 150 Years, after *Phidias's* Time, till it began insensibly to decline; not, but that there were still some fine Pieces of Workmanship both in *Greece and Italy*, though not performed with so good a Fancy, and such exquisite Beauty.

Besides that the Greek Statues are most esteemed for the Work; there is a special Difference between them, and those of the *Romans*: in that the greatest Part of the first are naked, like those who wrestle, or perform some other bodily Exercise, wherein the Youth of those Times placed all their Glory; whereas, the others are clad or armed, and particularly have the *Legions*, which was the greatest Mark of Honour amongst the *Romans*.

To perform any thing in the Way of *Sculpture*, they begin with making a Model of Earth, or Wax. For Earthen Models, they use but few Instruments: Their Hands and Fingers do almost the Whole. For Waxen Models, to a Pound of Wax they put half a Pound of Colophony; some add Turpentine, melting the Whole with Oil of Olive: Some add a little Vermillion, or other Matter, to give it a Colour. 'Tis wrought and molded with the Fingers, like Earthen Models.

#### SCULPTURE in Wood.

For *Sculpture* in Wood, which we properly call *Carving*, the first Thing required, is, to chuse a Wood proper for the particular Kind of Work. If it be any thing large, and require a deal of Strength and Solidity, the hardest and most durable Wood is to be chosen, as Oak or Chestnut. For smaller Works they use Pear-tree, and Service-tree; but as these Woods are very hard, for little delicate Works they use softer Woods, only close, and of a fine Grain: Such is the Linden-tree, which the Chisell is found to cut more easily, and cleanly, than any other Wood.

As to Statues, we find the Ancients have made them of almost all Kinds of Wood. At *Sicyon* was an Image of *Apollo* in Box; at *Ephesus*, that of *Diana* was in Cedar. As these two Kinds of Wood are very hard, and even held incorruptible, especially Cedar; *Pliny* observes, they were judged particularly expedient for Representations of the Deities. In a Temple, on Mount *Gileadus*, dedicated to *Mercury*, was an Image of that God form'd of the Wood of the Lemon-Tree: Others there were of the Palm-Tree, Olive-Tree, Ebony, and even of the Vine.

For large Works, if it be only single Figures, 'tis better they consist of several Pieces, than of a single one, by reason of the Liableness of the latter to warp; for every large Piece may probably not be dried to the Heart, however it may appear without Side. Observe, that the Wood will not be fit for working, till after it have been cut at least ten Years.

#### SCULPTURE in Marble, and other Stones.

The first Thing they do, is out of a great Block of Marble to saw another of the Size required, which is performed with a smooth Steel Saw without Teeth, casting Water and Sand thereon, from Time to Time: Then they fashion it, by taking off what is superfluous with a fluted Point, and a heavy Mallet; after this, bringing it near the Measures required, they bring it still nearer with another finer Point. They now use a flat cutting

Instrument, having two Notches in its Edge, or three Teeth; then a Chisell to rake off the Scratches the former has left. This last Instrument they use with a deal of Delicacy, giving thereby a Softness, and Tenderness to their Figure; till, at length, taking Rasps of different Degrees of Fineness, by degrees they bring their Work into a Condition for Polishing. To Polish, or make the Parts smooth and sleek, they use Pumice-Stone, and Small; then Tripoli, and when a still greater Lustre is required, a Skin and burnt Straw.

When any considerable Work is undertaken, as a Statue, Basso Relievo, or the like, they always make a Model, before-hand, of Clay; but as this shrinks in drying, and easily cracks and breaks, they only use it to make a Mould of Plaster, or Stucco, wherein they make a Figure of the same Matter, which serves them thenceforth for a Model, and by which they adjust all their Measures and Proportions. To proceed the more regularly, on the Head of the Model they place an immovable Circle, divided into Degrees, with a moveable Ruler, or Index, fastened in the Centre of the Circle, and divided likewise into equal Parts. From the End of the Ruler hangs a Thread with a Plummet, which serves to take all the Points to be transferr'd thence to the Block of Marble, from whose Top hangs another Plummet like that of the Model. Indeed there are some excellent Sculptors who disapprove of this Method, urging, That the smallest Motion of the Model changes their Measures, for which Reason they rather chuse to take all their Measures with the Compasses.

For the Casting of Statues, or Figures, of Metal; and the Moulding of Statues, &c. of Stucco, Plaster, &c. See STATUE.

SCUM, a light Excrement, arising from Liquore when briskly stirred, called *Foam*, or *Froth*: See FROTH. The Word is also used for the Impurities which a Liquor by boiling casts up to the Surface; and also, for those taken from off Metals when intaled; called also *Dross*.

SCUM of Lead is a Kind of Small of various Colours, produced from the Smoak of Lead. See LEAD.

SCUM of Silver is what we commonly call *Litharge* of Silver. See LITHARGE.

SCUM of Nitre, } See { SALT-PETRE.  
SCUM of Salt, } See { SALT.

SCURVY, in Medicine, a Disease called by the Physicians *Scorbutus*. See SCORBUTUS.

*M. Fouquet*, in the Memoirs of the French Academy, gives us a very accurate History of a particular Kind of *Scurvy*, very frequent in *Paris* in the Year 1699. The Symptoms, and Consequences, of this new *Scurvy* were very extraordinary; and soon determined *M. Fouquet* to conclude it somewhat of that cruel Plague wherewith the *Armenians* were so long and so dreadfully harassed; Yet was it a true *Scurvy*, and the Persons attacked with it had all the usual *Scorbutic* Symptoms.

SCUTAGE, in ancient Customs; All Tenants who held from the King by Military Service, were either bound to attend personally in Wars and Expeditions, or, for Default of such Service, to pay a *Scutage*, or Composition in Money, which was levied on every *Scutum Militare*, or Knights Fee, and the proportional Parts for the King's Use; and the Barons, and Knights, who then paid a *Scutage* to the King, had a Power to levy the same Tax on those Tenants who held from them in Military Service. The *Scutage* was at one, two, or three Marks for each Knight's Fee. See ESCUAGE.

SCUTCHEON. See ESCUTCHEON.

SCUTIFORME OS, in Anatomy, the chief Bone of the Knee, called also *Patella*, *Mela*, &c. See PATELLA.

SCUTIFORMIS CARTILAGO, in Anatomy, one of the *Cartilages* of the *Larynx*, the broadest, and biggest of them all: Thus called, because in Form of a Shield, or square Buckler, called by the Greeks *Scutum*, whence 'tis also called by us *Thyriset*. 'Tis also called the *Anterior*, because situate in the fore Parts. 'Tis gibbous without Side, and hollow within: Sometimes double, chiefly in Women, in whom it does not advance so far forward as in Men. The People call it *Adam's Apple*, or, *Pomum Adami*. See POMUM, &c.

SCUTTLES in a Ship, are square Holes cut in the Deck, big enough to let in the Body of a Man; to let People down into any Room below, upon Occasion: They are generally before the Main-mast, before the Knight in the Fore-castle: In the Gun-Room to go down to the Stern-Sheets: In the Round-houfe to go down into the Captain's Cabin, when forced by the Enemy in a Fight aloft. There are also some smaller *Scuttles*, which have Gratings over them, and all of them have Covers

to them, that Men may not tumble in, in the Night. Also, those little Windows, and long Holes, which are cut out in Cabins to let in Light, are called *Scutes*.

**SYCRE GEMOT**, in ancient Customs, a Court held twice every Year (as the Sheriffs Turn is at this Day) by the Bishop of the Diocets, and the *Earl-herman* (in Shires committed to *Escheat*) or Sheriff in those committed to sheriffs, that were immediately under the King. In this Court both the Ecclesiastical and Temporal Laws were given in Charge to the County: At first it was held thrice every Year. *Edward the Confessor*, appointed it to be held twelve Times in the Year. See CONSISTORY.

**SCYTALA**, in Mechanics, a Term some Writers use for a Kind of Radius, or Spoke, standing out from the Axis of a Machine, as a Handle or Lever, to turn it round and work it by. See AXIS in *Perspective*.

**SCYTALA LAGONICA**, in Antiquity, a Stratagem, or Invention, of the *Lacedaemonians*, for the secret writing of Letters to their Correspondents, that if they should chance to be intercepted, no Body might be able to read them. To this End they had two Wooden Rollers, or Cylinders, perfectly alike, and equal; one whereof was kept in the City, the other by the Person to whom the Letter was directed. For the Letter, a Skin of very thin Parchment was wrapped round the Roller, and thereon was the Matter wrote; which done, 'twas taken off, and sent away to the Party, who, upon putting it in the same manner upon his Roller, found the Lines and Words in the very same Disposition, as when they were first wrote: This Expedient they set a very high Value on, though, in Truth, artless, and gross enough: The Moderns have improved vastly on this Method of Writing. See CYPHER.

**SEA**, in Geography, is frequently used for that vast Tract of Water incompassing the whole Earth, more properly called *Ocean*. See OCEAN.

For the Cause of the Saltness of the Sea. See SALTNESS.

**SEA** is more properly used for a particular Part or Division of the *Ocean*, denominated from the Countries it washes, or other Circumstances: As, The *Irish Sea*, The *Mediterranean Sea*, The *Baltic Sea*, The *Red Sea*, &c.

Till the Time of the Emperor *Justinian*, the Sea was common, and open, to all Men: Whence it is, that the *Roman Laws* give an Action against a Person who shall prevent, or molest, another in the free Navigation, or Fishing therein. The Emperor *Leo*, in his 46 Novel, first allowed such as were in Possession of the Lands, the sole Privilege of Fishing before their respective Territories, exclusive of all others: He even gave a particular Commission to certain Persons, to divide the *Thracian Bosphorus* among them. From that Time the Sovereign Princes have been endeavouring to appropriate the Sea, and to withdraw it from the Public Use. The Republic of *Venice* pretends to be so far Mistress in her Gulf, that there is a formal Marriage, every Year, between that Seignory and the *Adriatic*. In these last Ages, the *English* have particularly affected the Empire of the Sea in the Channel, and even that of all the Seas incompassing the Three Kingdoms of *England*, *Scotland*, and *Ireland*, and that as far as the Shores of the neighbouring States. In Consequence of which Pretension it is, that Children born on these Seas are declared natural *Englishmen*, as much as if born on *English* Ground. The *Justice* of this Pretension is strenuously argued between *Grotius* and *Selden*, in the *Mare Liberum*, and *Marrum Clausum*.

SEA-ASTROLABE,	} See	ASTROLABE.
SEA-CHART,		CHART.
SEA-COMPASS,		COMPASS.
SEA-LOTT,		OLERON.
SEA-QUADRANT,		BACK-STAFF.

**SEA-DRAGS**, among Mariners, are such Things as hang over the Ship at Sea, as the Boat, &c. when towed.

**SEA-WATER**. To make *Sea-water* sweet, or fresh, is a Thing long and much wanted, for the Advantage of Navigation and Commerce: A Method of doing which has been invented by *Mr. Hutton*, and the Secret published in the *Philosophical Transactions*. 'Tis perform'd by precipitating the Water with the Oil of *Tartar*, and then distilling it: The Oil of *Tartar* he can draw very cheap, and the Distillation he performs very compendiously, so as to gain 24 French Quarts of fresh Water in a Day; for the Cooling of which, instead of making the Worm pass through a Vessel of Water, as usual, he makes it pass through a Hole in the Ship into the Sea, and enter in again through another. To the Precipitation, and Distillation, he adds a third Operation, viz.

Filtration, to correct intirely the Malignity of the Water. The Filtration is performed by a peculiar Earth, mixed and stirred with the distilled Water, and at length suffered to settle to the Bottom. The Water thus managed, is found perfectly wholesome both to Man and Beast.

*Dr. Lister* observes, That the *Sea-water* is made fresh by the Breath of Plants growing in it. This he does by putting a Quantity of *Sea-weed* in a Vessel of *Sea-water*; and fitting the Hole with a head Beck and Receiver, he distilled daily, from the Plants, a small Quantity of fresh, sweet, potable Water: This he takes to be the most natural, safe, and speedy Way of having fresh Water from the Sea. See WATER.

*Mr. Boyle* relates, from some Experiments he procured to be made of the Gravity of *Sea-water*, in different Climates, that fill, as you approach nearer the Equator, the *Sea-water* is heavier and heavier, as far as within 30 Degrees thereof, after which it continues much at one.

**SEA-YOKE**, when the Sea is so rough, that the Helm cannot be governed by the Hands, the Seamen make a Yoke to steer by; that is, they fix two Blocks to the End of the Helm, and reeve two small Ropes through them, which they call *Falls*; by having some Men at each Tackle, they govern the Helm by Direction: They have other Ways of making *Sea-Yokes*.

**SEAL**, *Sigillum*, a Punction, or Piece of Metal, or other Matter, usually either round or oval; whereon is engraven the Arms, Device, &c. of some Prince, State, Community, Magistrate, or private Person, with a Legend or Inscription: The Impression whereof in Wax serves to make Acts, Instruments, &c. authentic.—The King's *Great-Seal* is that whereby all Patents, Commissions, Warrants, &c. coming from the King, are Sealed. The Keeping hereof is in the Hands of the Lord High-Chancellor, who is hence also denominated Lord Keeper. Indeed, there is some Difference between the Lord Chancellor and Lord Keeper; not in Office, but in the Manner of Creation, the latter being made by the Delivery of the *Great-Seal* to him by the King; but the former having likewise a Patent. See CHANCELLOR.—The King's *Privy-Seal* is a Seal usually first set to Grants that are to pass the *Great-Seal*. See PRIVY-SEAL.

The Use of *Seals* is very ancient. In *Daniel*, cap. xiv. we read that *Darius* set his Seal on the Temple of *Bel*: But *Seals* are still more ancient; for *Jerobab*, in *Kings*, cap. xxi. seals the Orders he sent for *Nabab's* Death with the King's Ring. In Effect, as the ancient *Seals* were all Engraven on the Collets, Stones, &c. of Rings, and as the Original Use of Rings, 'tis asserted, was only to be in a Readiness for the Sealing of Acts, Instruments, &c. *Seals* should be as ancient as Rings themselves, See RING. These Sealing Rings, called *Annuli Signatorii*, *Sigillarii*, *Circographi* or *Circographi*, 'tis said, in ancient Authors, were first invented by the *Lacedaemonians*, who, not content to shut their Chests, Armouries, &c. with Keys, added *Seals* to them: And to this End, at first, made use of Worm-eaten Wood, the Impressions whereof they took on Wax, or soft Earth: But they at length found the Art of Engraving Figures, or Rings, the Impressions of which they took in the same Manner. This, however, must be granted, that even in *Moses's* Time, the Art was known of Engraving, not only on Metals, but also on precious Stones. See ENGRAVING. Indeed, it does not appear that the Ring had any other Use among the Primitive *Jews* besides Ornament: At length they were used to seal Instruments, Contracts, Diplomas, Letters, &c. Instances whereof we have in the Third Book of *Kings* xxi. 8. *Hester* viii. 10. *Xenophon*, *Hellen* lib. l. *Quint. Curt.* lib. vi. *Juss.* lib. xliiii. cap. iii. where we learn, the Keeping of the Emperor's Seal was become a particular Office. *Lucian* adds, That *Alexander* gave his to *Perdiccas*, thereby appointing him his Successor. *Pliny* observes, That in his Time there were no *Seals* used any where but in the *Roman* Empire. At *Rome*, he tells us, they were become of absolute Necessity, inasmuch that a Testament was null without the Testator's Seal, and the *Seals* of Seven Witnesses: But it does not appear that the *Romans* had any such Things as publick *Seals*; nor that their Edicts, and Contracts, were sealed, not even in the Times of the Emperors. In *France*, the Custom anciently was, instead of signing their Instruments, &c. only to seal them, as appears from an Infinity of ancient Charters, which are not signed at all: The Reason whereof was, That in those Days very few People were then able to write; no Body could read and write but Clerks. In *England*, the first sealed Charter we find extant, is that of *Edward* the Confessor, upon his Founding of *Westminster* Abbey: Yet, we read of *Seals* in the MS. History of King *Offa*. Before the Time of *William* the Conqueror, the *English* did not seal with Wax, but only made a Golden Cross on the Parchment, and some-

times an Impression on a Piece of Lead, which hung to the Grant with a Silken String, and was deemed an abundant Authorising of the Grant itself, without either Signing or Witness. The Colour of the Wax where with the King's Grants were sealed, was usually Green, to signify that the Act continued for ever fresh, and of Force. The usual Impression on all Laymens Seals, till the Year 1218, was a Man on Horse back, with a Sword in his Hand; afterwards, they began to Engrave their Coats of Arms on their Seals: Only the Archbishops, and Bishops, by a Decree of Cardinal Otto, who was Legate here in 1237, were to bear in their Seals, their Title, Office, Dignity, and even their proper Names. *Du Clesius* observes, that none below the Dignity of a Knight had any Right to a pendant Seal, called *Authentic*.

The Emperors long sealed all their Acts of Importance with a Golden Seal; and the *Golden Bull of Charles IV.*, for the Election of an Emperor, takes its Name from the Gold Seal hanging to it, which is called *Bull*. See *BULL*. The Pope has two Kinds of Seals: The first used in Apostolical Briefs, and private Letters, &c. called, the *Papal-Ring*. This is a very large Ring, wherein is represented St. Peter, drawing his Nets full of Fishes. The other is used in Bulls, representing St. Peter's Cross on the Right, that of St. Paul on the Left, with a Head between the two: On the Reverse is sometimes the Pope's Name, and Arms: The Impressions of the first Seal are taken in red Wax, those of the second, in Lead.

*Theod. Hopkings*, a German Lawyer, has furnished the World with a very learned and curious Work on the Subject of Seals: It consists of Sixteen Chapters, the 1<sup>st</sup>. whereof treats of the Name Seal, *Sigillum*. 2<sup>d</sup>. Of the Antiquity of the Sealing-Rings, mentioned in Genesis, their Inventors, the Reasons of bearing them, their Kinds, and Differences, Forms, Ornaments, Hieroglyphicks, Ends, Uses, Effects, and Abuses. 3<sup>d</sup>. Of Bulls, in the same Method, and under the same Circumstances. 4<sup>th</sup>. Of different Kinds of Seals, which he divides into public and private, proper and foreign, formed and informed, ordinary and extraordinary, known and unknown, true and false; and, lastly, ratificative, and confirmative, of Authority, Solemnity, Testimony, and Consent. 5<sup>th</sup>. Of such as have a Right to bear Seals. 6<sup>th</sup>. Of the Keeping of Seals. 7<sup>th</sup>. Of Things Seals are put to. 8<sup>th</sup>. Of the Images, Figures, Arms, &c. the Characters, Inscriptions, and of the Places where the Seals are to be set, and the Order to be observed therein. 9<sup>th</sup>. Of the Number and Multitude of Seals, and the Advantage they bring. 10. Of their Use, End, Effects, Force, &c. 11<sup>th</sup>. Of the Proof of the Seals in general and particular, publick and private. 12<sup>th</sup>. Of the Verifying of Seals. 13<sup>th</sup>. Of the Manner of Censuring and Attaching Seals. 14<sup>th</sup>. Of Subscriptions that have any Regard to Seals. 15<sup>th</sup>. Of other Particulars that have any Regard thereto; as the Signature of Emperors, Kings, Chancellors, Secretaries, and Notaries, all in the same Order and Method. The Book was Printed in 1642. at *Nuremberg*, in 4<sup>to</sup>, under the Title of *De Sigillorum Prino & Novo Jure, Tractatus Præfatus*, &c. We have another Work of the like Kind, by *Hemincus*, in Folio, Printed at *Francfort*, and *Leipfic*, in 1709, under the Title, *De Veteribus Germanorum aliorumque Nationum Sigillis, eorumque usu & præstantia Synonyma Historica*.

Engraving of Seals. See ENGRAVING.

L. Keeper of the Great Seal,	} See {	CHANCELLOR.
L. Keeper of the Privy Seal,		PRIVY SEAL.
Hermetical Seal, -----		HERMETICAL.

SEAL is also used for the Wax or Lead, and the Impression affixed to the Thing sealed. The Manufacturers Seal frequently apply'd to their Stuffs, &c. is of Lead. That of Knights enjoy'd to be of hard Wax; that of Commissioners, of soft Wax. Some Seals are fixed on by way of Placard, others hung by Silken Strings. The French seal their Edicts in Green Wax, Arrets in Yellow Wax; Expeditions for *Dauphine* in Red Wax. The Letters of the French Academy are sealed in Blue Wax. See *WAX*.

SEALER, an Officer in Chancery, appointed by the Lord Chancellor, or Keeper of the Great Seal, to seal the Writs and Instruments there made.

SEALING, in Architecture, the fixing a Piece of Wood or Iron in a Wall, with Plaster, Mortar, Cement, Lead, or other solid Bindings. For Staples, Hinges and Joins, Plaster is very proper.

SEAM of Corn; is a Measure of Eight Bushels: Of Glass, the Quantity of 120 Pounds, or 24 Stone, each Five pound Weight; of Wood, an Horse-load.

SEARCHER. See *SIEVE*.

SEARCHER. See *ALPHABET*.

SEAR-CLOTH, or *Cere-clath*, in Chirurgery, an external Remedy somewhat harder than an Unguent, yet softer than an Emplastir; though 'tis frequently used, both for the one and the other. The *Sear-clath* is supposed to have Wax in its Composition, which distinguishes and even denominates it. In effect, when a Liniment or Unguent has Wax in it, it does not differ from a *Sear-clath*. *Sear-claths* are a kind of Substitutes to Friction, for the raising a Salivation. They are usually compounded of resolutive Drugs, as Saffron, Myrrh and Aloes, incorporated with Wax and Gums, as Galbanum, Gum Ammoniac; and Sagapenum. The whole temper'd with Wine. The Word *Sear-clath* is supposed to be a Corruption of *Cere-clath*, and to be derived originally from the Greek *αἰσῶν*, Wax.

SEASONING of Timber. See *TIMBER*.

SEASONINGS, in the *West Indies*, a kind of aguish Distemper, which Foreigners are much subject to at their first coming.

SEASONS, in Cosmography, certain Portions or Quarters of the Year, distinguished by the Signs the Sun enters, or by the meridian Altitudes of the Sun; consequent on which, are different Temperatures of the Air, different Works in Tilling the Ground, &c. The Year is divided into Four Seasons, *Spring, Summer, Autumn, and Winter*. The Beginnings and Endings of each whereof, see under its proper Article. 'Tis to be observed, the Seasons anciently began differently from what they now do: Witness the old Verses,

*Das Clemens Hyemem; das Petrus Ver Catbedratu;*  
*Aquat Urbanus; Autumnat Bartholomæus.*

The Word is form'd on the French, *Saison*, which *Ménage* derives from the Latin, *Statio*, whence the *Italians* have form'd *Stagione*. *Nicod* derives it from *Satio*, *Tempus Sationis*, *Seating Time*.

SEAT, in Medicine. See *ANUS* or *FONDAMENT*.

SEBARAI, or *Sabaræ*, a Name the *Jews* gave to such of their Rabbins or Doctors, as lived and taught some time after the finishing of the *Talmud*. The Word is derived from *שָׁבַר*, *Saber*, I think, whence *שָׁבַר*, *Sbars*, Opinion, Sentiment; and thence *שָׁבַרַי*, *Sbarai*, or *Sabaræ*, Opinionative. The Reason of this Appellation, say the Rabbins, is, That the *Talmud* being finish'd, publish'd and receiv'd in all the Schools and Synagogues, these Doctors had nothing to do, but dispute for and against the *Talmud* and its Decisions. Others say, 'twas because their Sentiments were not received as Laws, or Decisions; as those of the *Mishnah* and *Gemarie* Doctors were; but were held as mere Opinions. Others, as the Author of *Schalschelech Hakkalah*, Chain of Tradition; tell us, That the Persecution, the *Jews* underwent in those Times, not allowing them to teach quietly in their Academies, they only propos'd their Opinion on the Composition of the *Mishnah*. The first and Chief of the *Sabarai*, was *R. Josi*, who began to teach in the Year 787 of the *Æra* of Contracts; which, according to *R. David Genuz*, falls on the Year of the World 4236 5 and who, according to *R. Abraham*, 'was 38 Years President of the Jewish Academy. This *Æra* of Contracts is the same with that of the *Solencides*, the 787<sup>th</sup> Year whereof, falls on the Year of *Christ* 476, which of consequence, is the *Æra* of the Origin of the *Sabarai*; whose Reign did not hold long: *Buxtorf* says, not above 60 Years; but *R. Abraham* and others, not 50. The last of them was *R. Simons*. They were succeeded by the *Gaons* or *Gomims*.

SEBESTUM, or *Sesostent*, in Pharmacy, &c. a Fruit resembling a little Plum; which when ripe, is of a deep red Colour, bordering on Black; very sweet, and the Flesh, or Pulp, glutinous, or sticky. The *Syrims* make a kind of Glac or Birdlime, of the *Sesostent*, called *Glac of Alexandria*. The Fruit is esteem'd pectoral; but is little used in Medicine. The Stone within it is Triangular. It brought its Name from *Arabia*, whence *Pliny* observes it came in his Time into *Italy*.

SEBUÆL, a Seal among the ancient *Samaritans*. *St. Epiphanius* accuses them of changing the Time express'd in the Law, for the Celebration of the great annual Feasts of the *Jews*. *Serrarius* conjectures, That they were thus call'd, from their celebrating the Feast of the Passover on the Seventh Month, call'd by the *Hebrews*, *Saba*, Seventh. *Douglas* rather takes them to have been denominated from *Sebais*, the Leader of a Seal among the *Samaritans*; as the Followers of *Dositheus*, were denominated *Dositheai*; which two Seals, some Jewish Doctors suppose, to have subsisted at the same Time. *Scaliger* derives the Name from the *Hebrew*, *Selmas*, Week; as, who should say, *Hebdomadæ*, because of their celebrating every Second Day of the Seven Weeks, between *Easter* and

and *his fontide*. Yet Scaliger, in his Answer to *Serrerus*, gives a different Explication. In effect, all that has hitherto been advanced on this Point, is mere Conjecture.

**SECANT**, in Geometry, a Line that *cuts* another, or divides it into Two Parts: Thus the Line A M (Tab. Geometry Fig. 12) is a *Secant* of the Circle A E D, &c. as it cuts the Circle B. 'Tis demonstrated by Geometers; 1<sup>o</sup> That if several *Secants* M A, M N, M E, &c. be drawn from the same Point M, that passing through the Centre M A, is the greatest, and the rest are all so much the less, as they are more remote from the Centre. On the contrary, the Portions thereof without the Circle M D, M O, M B, are so much the greater, as they are further from the Centre. The least, is that of M A, which passes through the Centre. 2<sup>o</sup> That if Two *Secants* M A and M E, be drawn from the same Point M; the *Secant* M A, will be to M E as M D to M B. See **TANGENT**.

**SECANT**, in Trigonometry, a right Line, drawn from the Centre of a Circle, which *cutting* the Circumference, proceeds, till it meets with a Tangent, to the same Circle. Thus the Line F C (Tab. Trigonometry Fig. 1.) drawn from the Centre C, till it meet the Tangent E F, is call'd a *Secant*, and particularly the *Secant* of the Arch A E, to which F E is a Tangent. The *Secant* of the Arch A H, which is the Complement of the former Arch to a Quadrant, is call'd the *Co-Secant*, or *Secant* of the Complement.

The *Sine* of an Arch A D, being given; To find the *Secant* thereof F C, the Rule is, As the *Co sine* A D C is to the *Sine* A D, so is the whole *Sine* E C, to the *Secant* C F.

To find the *Logarithm* of the *Secant* of any Arch: The *Sine* of the Complement of the Arch being given; multiply the whole *Sine* of the *Logarithm* by Two, and from the Product subtract the *Logarithm* of the *Sine* Complement, the Remainder is the *Logarithm* of the *Secant*. See **LOGARITHM**.

*Line of SECANTS*. See **SECTOR**.

**SECOND** in Anatomy. See **SECUNDI GENERIS**.

**SECOND** in Geometry, Astronomy, &c. the Sixtieth Part of a Prime or Minute; either in the Division of Circles, or in the Measure of Time, A Degree, or an Hour, are each divided into 60 Minutes, marked thus; A Minute is subdivided into 60 Seconds, marked thus; a Second into 60 Thirds, marked thus, &c. See **DEGREE**. We sometimes say a *Second Minute*, a *Third Minute*, &c. but more usually, simply *Second*, *Third*, &c. A Pendulum Three Feet Three Inches, and two Tenths of an Inch long, vibrates *Seconds*: According to Sir *Isaac Newton's* Reduction of *Huygen's* Three Feet Eight Lines and an Half of Paris Measure, to English Measure. See **PENDULUM**.

**SECOND** in Music, one of the musical Intervals; being only the Distance between any Sound, and the next nearest Sound; whether higher or lower. See **INTERVAL**. As in the Compass of a Tone, there are reckoned Nine sensible, different Sounds, which form whole little Intervals, call'd *Commas*; one night, in strictness, say, there are Eight kinds of Seconds. But as these minute Intervals, though sensible, are not yet so far so, as to contribute much to the Harmony, they usually only distinguish four Sorts. The First call'd, *The diminished Second*, containing Four Commas, and is the Difference, for Instance of a natural *ut*, and an *ut* raised four Commas higher. The Second, call'd *Second Minor*, contains Five Commas, and is made either naturally, as from *mi* to *fa*, or from *si* to *ut*; or accidentally, by means of *b*, as from *ta* to *si*, *b flat*; or from *fa diesis* to *sol*; otherwise call'd a *Major Semitone*, or *imperfect Second*, or *Italian Semitone*. The Third is the *Major Second*, containing the Nine Commas, which compose the Tone. This the *Italians* call *Two or perfect Second*. The Fourth is the *Second Redoubled*, composed of a whole Tone and a minor Semitone.

**SECOND TERMS**, in Algebra, those where the unknown Quantity has a Degree less than it has in the Term where 'tis rais'd to the highest. The Art of throwing these *Second Terms* out of an Equation; that is, of forming a new Equation, where they have no Place, is one of the most ingenious and useful Inventions in all Algebra. See **REDUCTION of EQUATIONS**.

**SECOND CAPTAIN**, is a reform'd Captain, who acts as Lieutenant of a number, into whose Company he is incorporated. See **CAPTAIN**.

**SECOND CAUSE**. See **CAUSE**; and **EFFICIENT**.

**SECOND SIGHT**, an odd Qualification, many of the Inhabitants of the Western Islands of Scotland are said to be possess'd of. We have the Thing so well attested by so many credible Authors (the latest of whom is *Mr Martin*), the ingenious Author of the natural History of these

Islands, and a Member of the *Royal Society*) that, notwithstanding the Quaintness of the Thing, there is scarce Room to call it in Question. The *Second Sight*, is a Faculty of seeing Things to come, or Things doing at a great Distance, represented to the Imagination as if actually visible and present. Thus if a Man be dying, or about to die, his Image shall appear distinctly in its natural Shape, in a Shroud, and with other funeral Apparatus, to a *Second Sight'd Person*, who, perhaps, never saw his Face before: Immediately after which, the Person so seen, certainly dies. This Quality of *Second Sight'dness*, is not hereditary: The Person who has it, cannot exert it at pleasure; nor can he prevent it, or communicate it to another; but it comes on him involuntarily, and exercises itself on him arbitrarily. And often, especially in the younger *Second Seers*, to their great Trouble and Terror. There are a great Number of Circumstances attend these *Visions*, by Observation whereof, the particular Circumstances as to Time, Place, &c. of the Death of the Person, are learnt. The Method of judging of them, or interpreting them, grows into a kind of Art; which is very different in different Persons. *Second Sight'dness*, is held a Discredit among them; so that none will counterfeit it; many conceal and dissemble it.

**SECONDARY** *Circles*, in reference to the *Ecliptick*, or *Circles* of Longitude of the Stars, are such, as passing through the Poles of the *Ecliptick*, are at right Angles to the *Ecliptick* (as the *Meridian* and *Hour Circles* are to the *Equinoctial*). By the Help of these, all Points in the Heavens are referred to the *Ecliptick*; that is, any Star, Planet or other Phenomenon, is understood to be in that Point of the *Ecliptick*, which is cut by the *Secondary Semicircle*, which passes through such Star or Phenomenon. And if two Stars are thus refer'd to the same Point of the *Ecliptick*, they are said to be in Conjunction; if in opposite Points, they are said to be in Opposition: If they are refer'd to two Points at a Quadrant's Distance, they are said to be in a *Quadrant Aspect*; if the Points differ a sixth Part of the *Ecliptick*, they are said to be in a *Sextile Aspect*. And in general, all *Circles* which intersect one of the Six greater *Circles* of the Sphere at Right Angles, may be call'd *Secondary Circles*; as the *Azimuth* or *Vertical Circles* in respect of the *Horizon*, &c.

**SECONDARY** *Fever*, is that which arises after a Crisis, or the Discharge of some morbid Matter, as after the Declension of the small Pox, or Measles; and such a *Fever* is frequently dangerous. See **FEVER**.

**SECONDARY** *Planets*, those moving round other *Planets*, as the Centres of their Motion, and along with them round the Sun. See **PLANET**.

*Saturn*, *Jupiter*, and the *Earth*, are each attended with *Secondary Planets*: *Jupiter* with four, and *Saturn* with five, call'd the *Satellites* of those two *Planets*. See **SATELLITES**. The *Earth* with one call'd the *Moon*. See **MOON**.

The Motion of the *Primary Planet*, is very simple and uniform, as being compounded only of a *Projectile Motion*, forward in a right Line, which is a Tangent to the Orbit, and a Gravitation towards the Sun at the Centre. Add, That being at such vast Distances from each other, the Effects of their mutual Gravitation towards one another are insensible: But the Matter is far otherwise, in respect of the *Secondary Planets*; for every one of these, though it chiefly gravitate towards its respective *Primary One*, as towards its Centre, yet at equal Distances from the Sun, is attracted towards him with equally accelerated Gravity, as the *primary One* is towards him, but at a greater Distance with less, at a nearer Distance with greater; from which double Tendency towards the Sun, and towards its own *Primary Planet*, the Motion of the *Satellites*, or *Secondary Planets*, comes to be mightily compounded, and affected, with many Inequalities: As for Instance, (1.) The *Satellite* shall be continually accelerated in its Motion, from the Time of its Quadrature with the Sun, to the next following Conjunction or Opposition; but contrary-wise from the *Syzygies* to the Quadratures, it shall be retarded, and therefore will not always move swifter in or near the *Syzygies*, and slower near the Quadratures. From whence will follow, (2.) That the Orbits of these *Secondary Planets*, will be of a Figure more Circular in the Quadratures than in the *Syzygies*, where the Swiftness of the Motion will make the Figure of the Orbit more Rectilinear, and therefore the *Satellite* will run farther from its *Primary Planet* at the Quadratures, than at the *Syzygies*, so that the Orbit will be a little elliptical, having the *primary Planet* for its Centre, and the longer Diameter will coincide with the Line of the Quadratures, and the shorter with that of the *Syzygies*. Which Irregularities will arise, if the Sun's Power of perturbing the Motion of the *Satellite* be excluded, and the Orbit be concentric with that of the *Primary*

**Primary Planets.** For if the Orbit be eccentric; it may happen that the *Satellite* shall be farther off from the Primary One in the Syzygies, and so move slower than it does at the Quadratures: And when this is the Case, that the *Satellite's* Orbit is not a Circle concentric to the Primary Orbit, but an Ellipsis, in one of whose Focuses the Primary Orbit is placed, then, the Motion of the *Satellite* will be so disturbed by the Sun, that as it runs into its Orbit, the Apices of the Orbit shall be moved sometimes in *Consequencia*, and sometimes in *Antecedentia* (whereas the Nodes and Apices of the primary Planets are at rest). (3.) When the Plane of the *Satellite's* Orbit is inclined to the Plane of the Primary Orbit, the Line of the Nodes of the Secondary Orbit will be moved in *Antecedentia*, with an Angular Motion, and an unequal Velocity, for it will recede most swiftly, when the Nodes are in Quadrature to the Sun; after which, it will move slower, and at the Time of the Nodes being in the Syzygies, will be perfectly at rest. (4.) The Inclination also of the Plane of the secondary Orbit, to the primary One, will be continually varying, and will be greatest, when the Nodes are in the Syzygies with the Sun, and less (*ceteris paribus*) when they are in the Quadratures; and from the Time of the Nodes being in the Syzygies, to the Quadratures, it will be always decreasing, and from the Time of their being in the Quadratures to the Syzygies, it will be always increasing, and all those Irregularities, whether in any eccentric or concentric Orbit, will always be something greater, when the *Satellite* is in Conjunction with the Sun, than when he is in Opposition to him. See **PLANET**.

**SECONDEINE.** See **SECUNDINE**.

**SECRETARY**, an Officer, who, by Order of his Master, writes Letters, Dispatches, and other Instruments, which he renders Authentic by his Signature. Of these there are several Kinds; as, *Secretary of the King*, or of *State*; *Secretary of the Lord Chancellor*; *Secretary of War*, &c. The King's *Secretaries* were anciently call'd the *King's Clerks* and *Notaries*. As for the Name of *Secretary*, it was at first applied to such as being always near the King's Person, received his Commands, and were call'd *Clerks of the Secret*; whence afterwards form'd, the *Word Secretary*; *Regi a secretis*: And as the great Lords gave to their Clerks the Quality of *Secretaries*; those who attended the King, were call'd, by way of Distinction, *Secretaries of the Commands*; *Regi a Mandatis*. This continued till the Reign of our *Henry VIII.* 1659, when; at a Treaty of Peace between the *French* and *Spaniards*, the former observ'd, that the *Spanish* Ministers, who treated for *Philip II.* call'd themselves *Secretaries of State*. Upon which the *French Secretaries des Commandements*, out of Emulation, assumed the same Title; which thence pass'd into *England*.

**SECRETARIES of State**, Officers attending the King, for the Receipt and Dispatch of Letters, Grants, Petitions, and many of the most important Affairs of the Kingdom, both Foreign and Domestic.

Till the Reign of King *Henry VIII.* there was only one *Secretary of State*; but then Business increasing, that Prince appointed a Second *Secretary*; both of equal Power and Authority, and both titl'd *Principal Secretaries of State*: Before Queen *Elizabeth's* Time, they did not sit at the Council-Board; but that Prince's admitted them to the Places of *Privy Counsellors*; which Honour they have held ever since, and a Council is never, or at least very seldom, held without one of them. On the Union of *England* and *Scotland*, Queen *Anne* added a Third *Secretary*, on account of the great Increase of Business, which, as to *Britain*, is equally and distinctly managed by all the Three, although the latter is frequently call'd *Secretary of State for North Britain*: They have under their Management and Direction, the most considerable Affairs of the Nation, and are oblig'd to a constant Attendance on the King: They receive and dispatch whatever comes to their Hands, be it for the Crown, the Church, the Militia, Private Grants, Pardons, Dispensations, &c. as likewise Petitions to the Sovereign, which, when read, are returned to the *Secretaries* for Answer, all which they dispatch according to the King's Command and Direction. As to Foreign Affairs, they are divided into Two Provinces comprehending all the Kingdoms and Nations which have any Intercourse or Business with *Great Britain*; each *Secretary* receiving all Letters and Addresses from and making all Dispatches to the several Princes and States comprehended in his Province: Which Division still subsists, notwithstanding the Addition of a Third *Secretary*. *Ireland* and the Plantations are under the Direction of the Elder *Secretary*, who has the *Southern Province*. Of these Three *Principal Secretaries*, the Two for *South Britain*, have each Two *Under-Secretaries*, and one chief Clerk; and the other for *North*

*Britain* one *Under-Secretary*, and one chief Clerk, with an uncertain Number of other Clerks and Translators, all wholly depending of them.

THE **SECRETARIES of State** have the Custody of that Seal, properly call'd the *Signet* (See **SIGNET**) and the Direction of the *Signet Office*; wherein are Four Clerks employ'd, who prepare such Things as are to pass the *Signet*, in order to the *Privy* or *Great Seal*. All Grants sign'd by the King are returned hither, which, transcrib'd, are carried to one of the *Principal Secretaries of State*, and seal'd, and then call'd *Signets*, which being directed to the *Lord Privy Seal*, are his Warrant. On the *Secretaries of State*, is likewise dependant another Office, call'd *The Paper Office*, wherein all Public Writings, Papers, Matters of State, &c. are preferred. See **PAPER OFFICE**. All the *Under Secretaries* and Clerks are in the Choice of the *Secretary of State*, without Reserve to any Person; the former of which receives Orders and Directions from them, for writing Dispatches, Foreign and Domestic, which they give to the Chief Clerk, who distributes them to the *Under-Clerks*.

**SECRETARY of an Embassy**, is a Person attending an Ambassador, for the writing of Dispatches relating to the Negotiation. There is a deal of Difference between the *Secretary of the Embassy*, and the *Ambassador's Secretary*; the last is a Domestic or Menial of the Ambassador; the first a Servant or Minister of the Prince. See **EMBASSADOR**.

**SECRETION**, in Medicine, the Act, whereby the several Juices, or Humours in the Animal Body, are separated from the Blood, by means of the Glands.

In the Bodies of Animals, we observe a great Number of Juices of different Natures, viz. the Blood, Lympha, Saliva, Stomach-liquor, intestinal Juices, Pancreatic Juice, the Bile, Urine, &c. Now, the Blood is the general Source of all; and from it they are all Secreted by particular Organs, call'd *Glands*. The Manner, wherein this Secretion is effected, has been greatly enquired into in these last Ages; though not with the greatest Success. The Ancient Physicians, indeed, contented themselves to assert certain particular Virtues or Faculties inherent in the several Viscera; whereby they were determin'd to separate one Liquor rather than another; without troubling themselves much about the Manner wherein it was done. But the Moderns, according to the Genius of their Philosophy, must have this Point clear'd, and the Modus of Secretion rendered intelligible. Hence, as the exceeding Smallness of these Organs prevented any regular Search, they have imagin'd various Manners of explaining them.

Some, full of the Effects they have observed from Fermentations, maintain, that there are Ferments in the several Parts; by Aid whereof, certain Kinds of Particles mix'd in the Blood, are separated therefrom; after the same Manner as we see in Ale, or new Wine, from which, while fermenting, certain Parts are detach'd in form of Scum. But this Opinion has so many Inconveniencies to grapple withal, that 'tis almost universally abandoned. See **FERMENT**.

Others consider the Glands as kinds of Sieves, whose Holes having different Figures, will only let pass certain Particles or Molecules, whose Figures resemble those of the Holes; but the Falsity of this Hypothesis was soon found out; and it was thought sufficient to fix some Proportion between the Diameters of the Pores and of the Molecules that were to pass through them, to account why very subtle Parts should pass through the Glands, through which the Coarser could not pass. Yet this Opinion was not found perfectly satisfactory: For on this Supposition, the most subtle Parts of the Blood must pass in such Quantity through the largest Pores, that there would not be enough left to furnish the little ones with what they needed: And for the same Reason, those Parts whose Pores are biggest, ought to furnish Liquors much fuller of subtle Parts than those whose Pores are smaller, which yet is contrary to Experience. For the Serosity separated in the Kidneys, under the Name of *Urine*, consists of Parts much subtler and smaller than the Bile separated in the Liver: Why then don't this Serosity escape in the Liver? the Pores whereof must be much greater than those of the Kidneys. See **BILE**.

This Inconvenience, many Naturalists being aware of, has made them have recourse to *Inhibition* (if the Word may be allow'd us for want of a better). They maintain, then, That besides the different Diameters of the Pores, 'tis required that the several Parts be already imbued or moisten'd with a Liquor like to that they are to filter. This Opinion is rather the Result of Reason than of Experiment, and the Maintainers hereof, well pleas'd they had something to satisfy their Reason withal, never troubled themselves whether it were true: Till *M. Winslow* fell in to it.

Dr. Keil, whose Theory prevails most in England, accounts for *Secretion*, from the different Diameters of the Vessels, the different Velocity of the Blood, the different Angles the Ducts make with the Arteries, and the different Attraction of the different Parts, under all these different Circumstances. His Theory is at length, under the Article ANIMAL SECRETION. But even in this, there is something Arbitrary and Conjectural. Besides, the Reasoning is carried such a Length; that, in a Thing the Principles whereof are so obscure, the Parts or Organs so imperfectly known, and the whole Process carried on out of Sight, the Mind can scarce safely acquiesce in it.

Monf. Winslow, of the Royal Academy of Sciences, has taken a better Course for the Discovery of this important Action of *Secretion*. He does not take up with conjectural Principles, nor draw a plausible Scheme of Reasoning therefrom through the Dark; but applies himself to Experiment, and investigates, in Nature herself, and the Structure of the Parts, the Manner *Secretion* is perform'd in. From a strict Examination of the several Kinds of Glands, both in Men and other Animals, he finds, with some other Anatomists, that the Glands are only Pelotons or Plexus's of Vessels: but the Vessels proper to the Gland, and which constitute the principal Part thereof, M. Winslow first discovered to be Tubes, furnished, on the Inside, with a kind of Down or Tuft, or rather a very fine, spongy Tissue, which fills the whole Cavity of those Vessels like a Pith or Marrow. This he finds in all Glands, of all Animals: In different Glands, 'tis found of different Colours, and this different Colour is even found in the different Glands of *Fœtus's* themselves.

The Gland, then, is, at least its main Part, a Compound of these downy or spongy Vessels, which, from their Office, we will call *Secretory Vessels* or *Ducts*, and which frequently do, almost of themselves, form what we call a *Gland* or *glandulous Body*: Tho' beside these Vessels, we usually remark Four other Kinds, *viz.* Arteries, Veins, Excretory Ducts and Nerves. The *Secretory Ducts* we distinguish from the *Excretory Ones*; in that the former, by the peculiar Texture of their Down, serve to separate a particular Liqueur; and that the latter only serve to receive the Liqueur thus *Secreted*, and to carry it to the Place 'tis destined for. For a more particular Account of the Structure and Organization of the Glands, See GLAND.

For the Manner wherein the Glands act, in separating the several Liqueurs from the Body, M. Winslow lays it down thus: 'Tis a Thing well known by Physicians and Chymists, that a Piece of brown Paper, which is only an Assemblage of small Filaments drawn close to each other, having once imbibed Oil or Water, will never let any other Liqueur pass through it, but of the same kind with what 'tis impregnated withal. All others it stops. And the like is observed of a Wick of Cotton or other Matter, which having first imbibed its Fill of Oil or Water, and being then dipp'd at one End, in a Vessel full of Oil and Water together; the Wick that had imbibed the Oil, will only raise and distil Oil, and that with Water, only Water. Now, in the *Secretory Ducts* of the Glands, we find a Parallel Structure; an Assemblage or Tissue of fine Threads or Filaments bound close together, much as in brown Paper, or a Cotton-wick; only differently disposed. This Tissue, then, having once imbibed a certain Juice, will not let pass any of the Liqueurs which arrive at the Orifices of these Ducts, but that it had first imbibed. The Cause of this Phenomenon, is doubtless, to be refer'd to the great Principle of Attraction, which is found stronger between the Homogeneous than the Heterogeneous Parts of the same Fluid. But this is an Enquiry that belongs to another *Disc.* See ATTRACTION and REPELSION.

As the Blood, now, is not a Homogeneous Liqueur; but a Compound of an Infinity of different Parts or Molecules, some Oily, others Mucilaginous, Aqueous, Saline, Subtile, Gross, &c. in its Motion along the Arteries of the Gland, it becomes divided into all the little Ramifications thereof; by which Means its Velocity is exceedingly abated, and its Molecules obliged to go off one by one, through the narrow Passage of the Artery into the Vein, and of consequence to pass over the Orifices of the *Secretory Ducts* of the Glands, whose Down is already clogged with a Juice of a certain Nature. Such of the Molecules therefore, as are found of the same Nature with the Juice they meet withal at the Entrance of the *Secretory Duct*, join themselves to them, and enter the Ducts, driven on by others that follow them. Thus they pass, successively, through the whole Vessel, and at length go out of it into the Excretory Duct, while the rest, which are of a different Kind, run over the Orifice of the *Secretory Vessel*, without ever mixing with the Juice thereof, and thus arriving in the Vein, are carried back to the Heart.

All that remains, is, to explain how these Parts should have first imbibed the particular Juices necessary for their respective *Secretions*; How, for Instance, the Bile should

come to be separated in the Liver, for the first Time, preferably to any other Liqueur? To this M. Winslow answers, That having observ'd the Glands of the smallest *Fœtus's* to be colour'd, much as in Adults; it appears highly probable they had been imbued with the Juices they were to filtrate, at the first Formation of the Animal; or at the same time when the solid Parts of the Organ themselves were framed.

SECT, a collective Term, comprehending all such as follow the Doctrines or Opinions of some famous Divine or Philosopher, &c. The Sects of Philosophers among the Ancients, particularly in ancient Greece, were various; as, *Pyrrhonian's*, *Platonists*, *Epicureans*, *Stoicks*, *Peripateticks*, *Academicks*, &c. See each under its proper Article. At present the Sects of Philosophy are chiefly reducible to Three, *viz.* the *Cartesians*, the *Peripateticks*, and the *Newtonians*. In Theology, the *Sects* are much more numerous; yet the Ancients had Legions now extant, as, *Manichees*, *Gnosticks*, *Montanists*, &c. The principal now on Foot, are the *Lutherans*, *Calvinists*, *Anabaptists*, *Arians*, *Scicians*, *Arminians*, &c. The Rise, Progress, and Fate, with the distinguishing Characters and Opinions of each; See under its respective Head.

SECTA, in Law. See SUIT.

SECTIO, or *Operatio Cesarea*. See CESARIAN SECTION.

SECTION, a Part of a Thing divided; or the Division itself: Such, particularly, are the Sub-divisions of Chapters, by others called *Articles*. The Mark of a *Section* is §. The Ancients disregarded the Dividing of their Books into Chapters and *Sections*; that was a Task left for future Editors, and Critics. The Word is form'd from the Latin, *seco*, I cut.

SECTION of a Building, is its *Profile*; or a Delineation of its Heights and Depths rais'd on the Plan; as if the Fabrick were cut alunder, to discover the Inside. See PROFILE.

Horizontal SECTION. See ICHNOGRAPHY.

SECTION, in Geometry, a Side or Surface appearing of a Body, or Figure cut by another; or the Place wherein Lines, Planes, &c. cut each other. The common *Section* of two Planes is always a right Line, being the Line supposed to be drawn by the one Plane in its cutting or entering the other. See PLANE. If a Sphere be cut in any manner, the Plane of the Section will be a Circle, whose Centre is in the Diameter of the Sphere. See SPHERE. The *Sections* of the Cone are Four, *viz.* a Circle, *Spherule*, *Hyperbole* and *Ellipsis*. See each under its proper Article. See also CONE.

Conic SECTIONS. See CONIC SECTION.

SECTIONS SEQUENTES, in Conics, a Term, whose Import may be thus conceiv'd: Suppose Two Right Lines, as A B, C D (Tab. Conicks Fig. 5.) mutually intersecting one another in E, which Point E, is supposed to be the common Centre of the opposite Hyperbolic Sections, F G, H I, and whose common Asymptotes, the proposed Lines A B, C D also are. In this particular Case, the Sections G F and H I, are called *Sections Sequentes*, because they are plac'd following one another in the contiguous Angles of Two intersecting Right Lines: And if the determinate Diameter H G, of one of the *Sections Sequentes* (which is coincident with the supposed indeterminate Diameter of its opposite) be equal to the vertical Tangent K L, applied between the Asymptotes in the Point G, of the Diameter G F, then, Apollonius calls such *Sections*, *Conjugate Sections*.

SECTOR, in Geometry, a Part of a Circle comprehended between two Radii, and the Arch. Thus the mix'd Triangle A C D (Tab. Geometry Fig. 13.) comprehended between the Radii A C and D and the Arch A D, is a *Sector of the Circle*.

'Tis demonstrated by Geometricians, that the *Sector* of a Circle, as A C D, is equal to a Triangle, whose Base is the Arch A D, and its Altitude the Radius A C.

If from the common Centre of Two Concentric Circles, be drawn Two Radii, to the Periphery of the Outer, the Two Arches included between the Radii, will have the same Ratio to the Peripheries; and the Two *Sectors*, the same Ratio to the Areas of their Circles.

To find the Area of a *Sector* D C E, the Radius of the Circle C D, and the Area D E being given: To 100, 314, and the Radius A C, find a Fourth proportional Number; this will be the Semi-periphery. Then to 180°, the given Arch D E, and the Semi-periphery just found, find another fourth Proportional; this will give the Arch A B in the same Measure in which the Radius A C is given. Lastly, multiply the Arch D E into the Semi-radius, the Product is the Area of the *Sector*.

SECTOR is also a Mathematical Instrument, of great Use in finding the Proportion between Quantities of the same Kind, as between Lines and Lines, Surfaces and Surfaces, &c. whence the French call it the *Compass of Proportion*.

The great Advantage of the *Sector* above the common Scales, &c. is, that 'tis made to fit all Radii's and Scales. For, by the Lines of Chords, Sines, &c. on the *Sector*, we have Lines of Chords, Sines, &c. on any Radius betwixt the Length and Breadth of the *Sector* when opened.

The *Sector* is founded on the Fourth Proposition of the 6th Book of *Euclid's*; where 'tis demonstrated, That similar Triangles have their homologous Sides proportional: An Idea of its Foundation may be conceived thus; Let the Lines A, B, A, C (Fig. 14.) represent the Leg of the *Sector*, and A, D, A, E two equal Sections from the Centre. If now the Points C, B and D, E be connected, the Lines C, B and D, E will be Parallel; therefore the Triangles A, D, E, A, C, B Similar, and consequently the Sides A, D, D, E, A, B and B, C proportional: That is, as A, D : D, E : A, B : B, C; whence if A, D be the Half, Third or Fourth Part of A, B; D, E will be a Half, Third or Fourth Part of B, C, and the same holds of all the rest. If, therefore, A, D be the Chord, Sine, or Tangent of any Number of Degrees to the Radius A, B; D, E will be the same to the Radius B, C.

#### Description of the SECTOR.

The *Sector* consists of two equal Rules or Legs of Brass or other Matter, rivetted together, but so as to move easy on the Rivet. See its Figure, Tab. Geometry Fig. 15. On the Faces of the Instrument are placed several Lines; the principal are the Line of equal Parts, Line of Chords, Line of Sines, Line of Tangents, Line of Secants, and Line of Polygons.

The Line of Equal Parts, called also Line of Lines, marked L, is a Line divided into 100 equal Parts; and, where the Length of the Leg will allow it, each is subdivided into Halves, and Quarters. 'Tis found on each Leg, on the same Side; and the Divisions numbered 1, 2, 3, 4, &c. to 10, which is near the Extremity of each Leg. Note, in Practice, 1 is taken for 10, or 100, or 1000, or 10000, &c. as Occasion requires; in which Cases 2 is taken for 20 or 200, or 2000, &c. and so of the rest. The Line of Chords, marked C, on each Leg, is divided after the usual Manner, and numbered 10, 20, 30, &c. to 60. See CHORD. The Line of Sines, denoted on each Leg by the Letter S, is a Line of Natural Sines, numbered 10, 20, 30, &c. to 90. See SINES. Line of Tangents, denoted on each Leg by the Letter T, is a Line of natural Tangents, numbered 10, 20, 30, &c. to 45; besides which, is another little Line of Tangents on each Leg, commencing at 45° and extending to 75° denoted by the Letter t. See TANGENT. Line of Secants, denoted on each Leg by the Letter S, is a Line of natural Secants, numbered 10, 20, 30, &c. to 75, and commencing, not from the Centre of the Instrument, but at Two Inches Distance therefrom. See SECANT. Line of Polygons, denoted by the Letter P on each Leg, is numbered 4, 5, 6, &c. to 12, which falls 3 Inches short of the Centre of the Instrument. See POLYGON.

Beside these Lines, which are essential to the *Sector*; there are others placed near the outward Edges on both Faces, and parallel thereto, which are, in all respects, the same as in Gunter's Scale, and used after the same Manner. Such are the Line of Artificial Sines marked S; The Line of Artificial Tangents; A Line of 12 Inches, mark'd I; and Gunter's Line of Numbers, mark'd N. For the Uses of all which, See Gunter's SCALE. There are sometimes, other Lines placed, to fill the vacant Spaces, as the Lines of Hours, Latitudes and Inclinations of Astronomers, which are used the same as on the common Scales. See SCALE.

The Lines found by the *Sector* are of two Kinds, lateral and parallel. The First are such as are found by the Sides of the *Sector* as A, B, A, C. The latter, such as go across from one Leg to the other, as D, E, C, B. Note, the Order of the Lines in the newer *Sectors*, is different from what it is in the old ones; for the same Line is not now put at the same Distance from the Edge on both Legs; but the Line of Chords, e. g. is intermixt upon the one, and the Line of Tangents on the other. The Advantage hereof is, that when the Instrument is set to a Radius for the Chords, it serves also for the Sines and Tangents without stirring it; for the Parallel betwixt 60 and 60 of the Chords, 90 and 90 of the Sines, and 45 and 45 of the Tangents, are all equal.

#### Use of the Line of Equal Parts on the SECTOR.

1<sup>o</sup> To Divide a given Line into any Number of equal Parts, e. g. Seven: Take the given Line in your Compasses, and setting one Foot in a Division of the Line of equal Parts, that may easily be divided by 7, e. g. 70; whose Seventh Part is 10: Open the *Sector* till the other Foot fall exactly on 70 in the same Line, in the other Leg. In this Disposition, applying one Point of the Compasses to 10 in the same Line; shut them till the other fall in 10 in the same Line of the other Leg. This

Aperture will be the 7th Part of the given Line. Note, if the Line to be divided be too long to be applied to the Legs of the *Sector*, only divide one Half, or one Fourth by 7, and the Double or Quadruple thereof will be the 7th Part of the whole.

2<sup>o</sup> To measure the Lines of the Perimeter of a Polygon, one of which contains a given Number of equal Parts: Take the given Line in your Compasses, and set it over, upon the Line of equal Parts, to the Number of Parts on each Side, expressing its Length. The *Sector* remaining thus, set off the Length of each of the other Lines parallel to the former; and the Numbers each of them falls on will express their Lengths.

3<sup>o</sup> A Right Line being given, and the Number of Parts it contains, e. g. 120, to take from it a left Line, containing any Number of the same Parts, e. g. 25: Taking the given Line in your Compasses, open the *Sector* till the two Feet fall on 120 on each Leg; then, the Distance from 25 to 25 gives the Line required.

4<sup>o</sup> To find a Third Proportional to Two given Lines, and a Fourth to Three. For the First, take the Length of the first given Line in your Compasses, and lay it off on the Line of equal Parts from the Centre, to find the Number where it terminates: Then open the *Sector*, till the Length of the Second Line be included in the Aperture of the Extreme of the first: The *Sector* remaining thus, lay off the Length of the Second Line on one of the Legs, from the Centre; and note the Number where it terminates; the Distance between that Number on the Two Legs, gives the Third Proportional. In the Second Case, take the Second Line in your Compasses, and opening the *Sector*, apply this Extent to the Ends of the First, laid off from the Centre on both Legs. The *Sector* thus open'd, lay off the Third Line from the Centre, and the Extent between the Number whereon it terminates on both Legs, is the Fourth Proportional.

5<sup>o</sup> To divide a Line in any given Proportion, e. g. into Two Parts, which shall be to each other as 40 to 70: Add the Two Numbers together, their Sum is 110. Then, between your Compasses take the Line proposed, which suppose 165, and open the *Sector* till this Distance reach from 110, to 110 on both Legs. The *Sector* thus open'd, take the Extent from 40 to 40, as also from 70 to 70; the first will give 60, the last 105, which will be the Parts proposed, for 40 : 70 :: 60 : 105.

6<sup>o</sup> To open the *Sector*, so as the Two Lines of equal Parts may make a Right Angle: Find Three Numbers that may express the Sides of a Right-angled Triangle, as 3, 4 and 5, or their Equimultiples, as 60, 80 and 100. Take, then, in your Compasses the Distance from the Centre to 100; and open the *Sector*, till, one Point set upon 80, the other fall upon 60 in the other Leg; then do the Two Lines of equal Parts, include a Right Angle.

7<sup>o</sup> To find a Right Line equal to the Circumference of a Circle: The Diameter of a Circle being to the Circumference, nearly as 50 to 157, take the Diameter in your Compasses, and set it over on the Legs of the *Sector*, from 50 to 50. The *Sector* thus open'd, take the Distance from 157 to 157 in your Compasses. This will be your Circumference required.

#### Use of the Line of Chords on the SECTOR.

1<sup>o</sup> To open the *Sector*, so as the two Lines of Chords may make an Angle of any Number of Degrees, e. g. 40: Take the Distance from the Joint to 40, the Number of Degrees proposed, on the Line of Chords; open the *Sector*, till the Distance from 60 to 60, on each Leg, be equal to the fore-said Distance of 40; then does the Line of Chords make the Angle required.

2<sup>o</sup> The *Sector* being opened, to find the Degrees of its Aperture: Take the Extent from 60 to 60, and lay it off on the Line of Chords, from the Centre: The Number, whereon it terminates, shews the Degrees of its Opening—By applying Sight on the Line of Chords, the *Sector* may be used to take Angles, as a Surveying Instrument.

3<sup>o</sup> To make an Angle of any given Number of Degrees, with a given Line: On the given Line describe a Circular Arch, the Centre whereof is the Point whereon the Angle is to be made. Set off the Radius from 60 to 60; and the *Sector* remaining thus, take the Distance of the two Numbers on each Leg, expressing the proposed Degrees, and lay it from the Line upon the Arch described. Lastly, drawing a Line from the Centre, through the End of the Arch, it will make the Angle proposed.

4<sup>o</sup> To find the Degrees a given Angle contains: About the Vertex describe an Arch, and open the *Sector*, till the Distance from 60 to 60 on each Leg, be equal to the Radius of the Circle: Then taking the Chord of the Arch between the Compasses, and carrying it on the Legs of the *Sector*, see what equal Number, on each Leg,

the Points of the Compasses fall on: This is the Quantity of Degrees, the given Angle contains.

5. To take an Arch, of any Quantity, from off the Circumference of a Circle. Open the Sector, till the Distance from 60 to 60 be equal to the Radius of the given Circle: Then take the Extent of the Chord, of the Number of Degrees, on each Leg of the Sector, and lay it off, on the Circumference of the given Circle. By this Use may any regular Polygon be inscribed in a given Circle, as well as by the Line of Polygons.

*Use of the Line of Polygons on the Sector.*

1<sup>o</sup>. To inscribe a regular Polygon, in a given Circle. Take the Semi-diameter of a given Circle, in the Compasses, and adjust it to the Number 6, on the Line of Polygons, on each Leg of the Sector: Then the Sector remaining thus opened, take the Distance of the two equal Numbers, expressing the Number of Sides the Polygon is to have. E. g. The Distance from 5 to 5 for a Pentagon, from 7 to 7 for a Heptagon, &c. These Distances carried about the Circumference of the Circle, will divide it into so many equal Parts.

2<sup>o</sup>. To describe a regular Polygon, e. g. a Pentagon on a given right Line: Take the Length of the Line in the Compasses, and apply it to the Extent of the Number 5, 5, on the Lines of Polygons. The Sector thus opened, upon the same Lines take the Extent, from 6 to 6, this will be the Semi-diameter of the Circle the Polygon is to be inscribed in. If, then, with this Distance, from the Ends of the given Line, you describe two Arches of a Circle, their Intersection will be the Center of the Circle.

3<sup>o</sup>. On a right Line, to describe an Isosceles Triangle: Having the Angles at the Base, double those at the Vertex: Open the Sector, till the Ends of the given Line fall on 10 and 10 on each Leg; Then take the Distance from 6 to 6. This will be the Length of the two equal Sides of the Triangle.

*Use of the Lines of Sines, Tangents, and Secants, on the Sector.*

By the several Lines disposed on the Sector, we have Scaes as to several Radius's; So that having a Length, or Radius given, not exceeding the Length of the Sector when opened; we find the Chord, Sine, or Tangent, &c. thereto. E. g. Suppose the Chord, Sine, or Tangent, of 10 Degrees, to a Radius of 3 Inches, required: Make 3 Inches the Aperture, between 60 and 60, on the Lines of Chords of the two Legs; then will the same Extent reach from 45, to 45 on the Line of Tangents, and from 90 to 90 on the Line of Sines on the other Side; so that to whatever Radius the Line of Chords is set, to the same are all the other set. In this Disposition therefore, if the Aperture between 10 and 10, on the Lines of Chords, be taken with the Compasses, it will give the Chord of 10 Degrees. If the Aperture of 10 and 10 be in like manner taken on the Lines of Sines, it will be the Sine of 10 Degrees. Lastly, If the Aperture of 10 and 10 be in like manner taken on the Lines of Tangents, it gives the Tangent of 10 Degrees.

If the Chord, or Tangent, of 70 Degrees were required; for the Chord, the Aperture of half the Arch, viz. 35, must be taken as before; which Distance, repeated twice, gives the Chord of 70°. To find the Tangent of 70° to the same Radius, the small Line of Tangents must be used, the other only reaching to 45; Making therefore, 3 Inches the Aperture between 45 and 45 on the small Line; the Extent between 70 and 70 Degrees, on the same, will be the Tangent of 70°. to 3 Inches Radius.

To find the Secant of an Arch, make the given Radius the Aperture between 0 and 0 on the Line of Secants: Then will the Aperture of 10 and 10, or 70 and 70, on the said Lines, give the Tangent of 10° or 70°.

If the Converse of any of these Things were required; that is, if the Radius be required, to which a given Line, is the Sine, Tangent, or Secant, 'tis but making the given Line, if a Chord, the Aperture on the Line of Chords, between 10 and 10, and then the Sector will stand at the Radius required; that is, the Aperture between 60 and 60, on the said Line, is the Radius. If the given Line were a Sine, Tangent or Secant, 'tis but making it the Aperture of the given Number of Degrees, then will the Distance of 90 and 90 on the Sines, of 45 and 45 on the Tangents, of 0 and 0 on the Secants, be the Radius.

*Use of the Sector in Trigonometry.*

1<sup>o</sup>. The Base and Perpendicular of a rectangled Triangle being given, to find the Hypotenuse: Suppose the Base A C (Plate Trigonometry, Fig. 2.) 40 Miles, and the Perpendicular A B 30; open the Sector till the two Lines of Lines make a right Angle: Then for the Base, take 40 Parts on the Line of Lines on one Leg; and for the Perpendicular 30 on the same Line on the other Leg: Then the Extent from 40 on the one, to 30 on the other, taken in the Compasses, will be the Length of the Hypotenuse, which Line will be found 50 Miles.

2<sup>o</sup>. The Perpendicular A B of a right-angled Triangle A B C, being given 30, and the Angle B C A 37°, to find the Hypotenuse B C: Take the given Side A B, and set it over, on each Side, upon the Sine of the given Angle A C B; then the Parallel Distance of Radius, or of 90 and 90, will be the Hypotenuse B C; which will measure 50 on the Line of Sines.

3<sup>o</sup>. The Hypotenuse and Base being given, to find the Perpendicular: Open the Sector, till the two Lines of Lines be at right Angles; then lay off the given Base on one of those Lines from the Centre: Take the Hypotenuse in your Compasses, and setting one Foot in the Point of the given Base, let the other fall on the Line of Lines, on the other Leg: The Distance from the Centre to the Point where the Compasses fall, will be the Length of the Perpendicular.

4<sup>o</sup>. The Hypotenuse being given, and the Angle A C B, to find the Perpendicular: Make the given Hypotenuse a Parallel Radius; i. e. make it the Extent from 90 to 90 on the Lines of Sines; then will the Parallel Sine of the Angle A C B be the Length of the Side A B.

5<sup>o</sup>. The Base and Perpendicular A B given, to find the Angle B C A: Lay off the Base A C on both Sides the Sector, from the Centre, and note its Extent: Then take the given Perpendicular, and to it open the Sector, in the Terms of the Base; the Parallel Radius will be the Tangent of B C A.

6<sup>o</sup>. In any right-angled Triangle, two Sides being given, with the included Angle, to find the third Side: Suppose the Side A C 20, the Side B C 30, and the included Angle A C B 110°; Open the Sector, till the two Lines of Lines make an Angle equal to the given Angle, viz. 110°. Lay off the given Sides of the Triangle from the Centre of the Sector, on each of the Lines of Lines; the Extent between their Extremes is the Length of the Side A B sought, viz. 412.

7<sup>o</sup>. The Angles C A B and A C B given, and the Side C B, to find the Base A B: Take the given Side C B, and turn it into the Parallel Sine of its opposite Angle C A B, and the Parallel Sine of the Angle A C B will be the Length of the Base A B.

8<sup>o</sup>. The three Angles of a Triangle being given, to find the Proportions of the Sides: Take the lateral Sines of the several Angles, and measure them in the Line of Lines; the Numbers answering thereto, give the Proportion of the Sides.

9<sup>o</sup>. The three Sides being given, to find the Angle A C B: Lay the Sides A C, C B, along the Line of Sines, from the Centre, and set over the Side A B in their Terms: So is the Sector opened, in these Lines, to the Quantity of the Angle A C B.

10<sup>o</sup>. The Hypotenuse A C (Fig. 3.) of a right-angled Spherical A B C given, e. g. 43°; and the Angle C A B 20°, to find the Side C B. The Rule is: As Radius is to the Sine of the given Hypotenuse 43°, so is the Sine of the given Angle 20° to the Sine of the Perpendicular C B. Take, then, 20° from the Centre, along the Line of Sines, in your Compasses, and set the Extent, from 90 to 90, on the two Legs, and the Parallel Sine of 43°, the given Hypotenuse, will, when measured from the Centre on the Line of Sines, give 130 30' the Side required.

11<sup>o</sup>. The Perpendicular B C, and the Hypotenuse A C given, to find the Base A B: As the Sine Complement of the Perpendicular B C is to Radius, so is the Sine Complement of the Hypotenuse, to the Sine Complement of the Base. — Therefore, make the Radius a Parallel Sine of the given Perpendicular, e. g. 76° 30'; Then the Parallel Sine of the Complement of the Hypotenuse, e. g. 47° measured along the Line of Sines, will be found 49° 25', the Complement of the Base required: Consequently the Base itself will be 40° 35'.

*Particular Uses of the Sector in Geometry, &c.*

1<sup>o</sup>. To make a regular Polygon, whose Area shall be of any given Magnitude: Let the Figure required be a Polygon, whose superficial Area is 125 Feet: Extract the Square Root of  $\frac{1}{2}$  of 125, it will be found 5. Make a Square, whose

whose Side is 5 Feet; and, by the Line of Polygons, as already directed, make the Isosceles Triangle CGD 10, as that CG being the Semi-diameter of a Circle, CD may be the Side of a regular Pentagon inscribed therein, and let fall the Perpendicular GE. Then continuing the Lines EG and EC, make EF equal to the Side of the Square before made: And from the Point F, draw the right Line FH parallel to GC; then a mean Proportional between GE and EF will be equal to half the Side of the Polygon sought, which doubled, will give the whole Side. The Side of the Pentagon thus had, the Pentagon itself may be described, as above directed.

29. *A Circle being given, to find a Square equal thereto.* Divide the Diameter into 14 equal Parts, by the Line of Lines, as above directed: Then will 12.4. of those Parts found by the same Line, be the Side of the Square sought.

30. *A Square being given, to find the Diameter of a Circle equal thereto.* Divide the Side of the Square into 11 equal Parts, by means of the Line of Lines; and continue that Side to 12.4. Parts; this will be the Diameter of the Circle required.

4. *To find the Side of a Square equal to an Ellipsis, whose transverse and conjugate Diameters are given.* Find a mean Proportional between the transverse and conjugate Diameters; which, being divided into 14 equal Parts; 12.4. thereof, will be the Side of the Square required.

5. *To describe an Ellipsis in any given Ratio of its Diameter; the Area whereof shall be equal to a given Square.* Suppose the Proportion of the transverse and conjugate Diameters be required, as 2 to 1; divide the Side of the given Square into 11 equal Parts: Then as 2 is to 1, so is 11 X 14 = 154 to a 4th Number; the Square whereof is the conjugate Diameter sought. Then, as 1 to 2, so is the conjugate Diameter to the transverse. Now,

6. *To describe an Ellipsis, by having the transverse and conjugate Diameters given.* Suppose AB and ED (Fig. 4.) to be the given Diameters; take AC in your Compasses, and to the Extent thereof open the Sector, till the Distance from 90 to 90, on the Lines of Sines, be equal thereto. Then may the Line AC be divided into a Line of Lines, by taking the parallel Extents of the Sine of each Degree, on the Legs of the Sector, in your Compasses, and laying them off from the Centre C. The Line thus divided into Sines, (in the Figure 'tis only done into every 10th Sine) from each raise Perpendiculars both Ways; then, find Points in those Perpendiculars through which the Ellipsis must pass, thus: Take the Extent of the Semi-conjugate Diameter CE, between your Compasses, and open the Sector, till the Aperture of 90 and 90 on the Lines of Sines be equal thereto: Then take the parallel Sines of each Degree of the Line of Sines of the Sector, and lay them off on those Perpendiculars drawn through their Complements in the Line of Sines AC; thus will you have two Points in each Perpendicular, through which the Ellipsis must pass. E.g. The Sector still remaining the same, take the Distance from 80 to 80 on the Lines of Sines, in your Compasses, and setting one Foot in the Point 10, on the Line AC, with the other, make the Points *a* and *b* in the Perpendiculars passing through that Point: Then will *a* and *b* be the two Points in the Perpendicular, through which the Ellipsis must pass. All the other Points, found after the same Manner, being connected, will give the Semi-Ellipsis DA E; and the other Half will be drawn after the same Manner.

#### Use of the Sector in Surveying.

*The Bearings of three Places, as A, B, C, (Fig. 5.) to each other; i. e. The Angles ABC, BCA and CAB, being given: And the Distance of each, from a fourth standing among them; as, D, i. e. BD, DC, and AD being given: To find the Distances of the several Places A, B, C, from each other; i. e. The Lengths of the Sides A B, B C, A C.* Having drawn the Triangle EFG (Fig. 6.) similar to ABC, divide the Side EG in H, so as that EH may be to HG, as AD to DC, after the Manner already directed: And, after the like Manner must EF be divided in I, so as EI may be to IF, as AD to DB. Then continuing the Sides EG, EF, say, as EH - HG is to HG, so is EH + HG to GH, and as EI - IF is to IF, so let EI + IF be to FI, which Proportions are easily wrought by your Line of Lines on the Sector. This done, bisect HK and IM, in the Points L, N, and about the said Points as Centres, with the Distances LH, and LN, describe two Circles intersecting each other, in the Point O; to which, from the Angles EFG, draw the right Line EO, FO, and OG, which will have the same

Proportion to each other, as the Lines AD, BDDC: Now, if the Lines EO, FO, and GO, be equal to the given Lines AD, BD, DC, the Distances EF, FG, and EG, will be the Distances of the Places required. But if EO, OF, OG, be less than AD, DB, DC, continue them, till PO, OR, and OQ be equal to them: Then the Points P, Q, R, being joined, the Distances PR, RQ, and PQ, will be the Distances of the Places sought. Lastly, if the Lines EO, OF, OG, be greater than AD, DB, DC, cut off from them Lines equal to AD, BD, DC, and join the Points of Section by three right Lines; the Lengths of the said three right Lines will be the Distances of the three Places sought. Note, if EH be equal to HG, or EI to IF, the Centres L and N, will be infinitely distant from H and I; that is, in the Points H and I, there must be Perpendiculars raised to the Sides E F, E G, instead of Arcs, till they intersect each other; but if EH be less than HG, the Centre L will fall on the other Side of the Base continued, and the same is to be understood of E I, I F.

*Use of the Sector in the Projection of the Sphere, both Orthographic and Stereographic; See ORTHOGRAPHIC and STEREOGRAPHIC.*

SECULAR, something Temporal, in which Sense the Word is used in Opposition to Ecclesiastical. Thus we say, *Secular Power, Secular Arm, &c.*

SECULAR is also used for a Person who lives at liberty in the World, not shut up in a Monastery, not bound by Vows, nor subjected to the particular Rules of any Religious Community: In which Sense the Word stands in Opposition to Regular. The Regular Clergy is divided into Regular and Secular. The Regulars pretend their State is much more perfect than that of the Seculars. Secular Priests may hold Abbies and Priors both simple and Conventual, though not regularly but only in Commendam. 'Tis a Maxim, in their Canon Law, *Secularis Secularibus, and Secular Benefices* are only to be given to Secular Persons; Regular to Regular. See REGULAR.

SECULAR GARMEN, *Secular Poem*; A Poem sung, or re-heard, at the Secular Games. Of this Kind we have a very fine Piece among the Works of Horace: 'Tis a Saphic Ode, which usually comes at the End of his Epodes. In some Editions, the Twenty-first Ode of the first Book, is called *Carmen Seculare*.

SECULAR GAMES, *Secularis Ludi*: In Antiquity, solemn Games, held among the Romans, once in an Age; or, 10 a Period, deemed the Extent of the longest Life of Man, called by the Greeks *andros*, and the Latins, *Secularium*. They lasted three Days, and as many Nights, during which, Sacrifices were performed, Theatrical Shews exhibited, with Combats, Games, &c. in the Circus. Their Origin, and Institution, is delivered at Length by Val. Maximus: The Occasion thereof was, to stop the Progress of a Plague. The first who had them celebrated at Rome, was *Valerius Publicola*, the first Consul created after the Expulsion of the Kings, in the Year of Rome 245. The Ceremonies to be observed therein were found in one of the Books of the *Sibylls*. At the Time of their Celebration, Heralds were sent to invite all the World to a Feast nobody had ever yet seen, nor was ever to see again.

Authors are not agreed of the Number of Years wherein these Games returned; partly, because the Quantity of an Age or *Seculum* among the Antients is not known; and partly on other Accounts: Some will have it, that they were held once every hundred Years, and that the *Seculum*, or Age, was our Century. This *Varro* and *Livy* seem to express in very plain Terms; yet others will have it, that *Seculum* comprehended 110 Years, and that the *Secular Games* only returned in that Period, that is, at the Beginning of every 110th Year; which Opinion is countenanced by Horace, in his *Secular Poem*, v. 21. Be this as it will, it is certain they sometimes did not stay for the 110th, nor even for the 100th Year, for the Celebration of these Games. Augustus, for Instance, held them in the Year of Rome 736; and Caligula again in the Year of Rome 814, and of Christ 38, *viz.* 64 Years after the former; and Domitian, again, in still less Time, *viz.* in the Year of Christ 87, at which *Facustus* assisted in Quality of *Decemvir*, as he himself tells us, *Annal. Lib. xi. c. ii.* This was the Seventh Time that Rome had seen them from their first Institution. The Emperor Severus exhibited them the Eighth Time 110 Years after those of Domitian: *Zacharius* says, these were the last; but he is mistaken, for in the Year of Rome 1000, Fifty Years after those of Severus, the Emperor Philip had them celebrated with greater Magnificence than had ever been known. We find them represented on Medals.

The *Ludi Seculares* were also called *Ludi Tarentini*, from *Manius Valerius Tarentinus*, who gave Occasion

to their Institution: for having been warned, in a Dream, to dig in the Ground in a Place near the *Campus Martius*, called *Isarentum*, he there found an Altar inscribed to *Dis*, or *Pluto*, and *Proserpine*: Upon which, as had been foretold him in his Dream, three of his Children born Blind, recovered their Sight, and he, in Gratitude, performed Sacrifices, on the same Altar, for three Days and three Nights successively. Some say the Place it self was called *Isarentum*, because the Water of the *Tiber terram terrere*, eat into the Ground in this Place.

SECULAR YEAR, See JUBILEE.

SECULARIZATION, the Action of *Secularizing*, or of converting a regular Person, Place, or Benefice, into a Secular one: Almost all the Cathedral Churches were anciently Regular, i. e. the Canons were to be Religious, but they have been most of them *Secularised*: For the *Secularisation* of a regular Church there is required the Authority of the Pope, that of the Prince, the Bishop of the Place, the Patron, and even the Consent of the People. In France all this must be confirmed by Parliament. Religious, that want to be released from their Vows, obtain Briefs of *Secularisation* from the Pope.

SECUNDA AQUA, among Chymists, &c. is *Aqua Fortis*, which has been already used to dissolve some Metal, &c. See AQUA FORTIS.

SECUNDARY, an Officer who acts as *Second*, or next to the chief Officer: Such are the *Secundaries* of the Fine Office; the *Secundaries* of the Compters, who are next the *Sheriffs of London* in each of the two Compters: *Secundary* of the Office of the Privy Seal; two *Secundaries* of the Pipe; *Secundary* to the Remembrancers, which are two Officers in the *Exchequer*, &c.

SECUNDI GENERIS, in Anatomy, a Distinction among the Lacteal Vessels. There are two Kinds of Lacteals, viz. *Primary*, or those of the first Kind, *Primi Generis*; and *Secundi Generis*, *Secundary*, or of the second Kind. The First carry the Chyle from the Intestines into Glands, dispersed in great Numbers throughout the Mesentery. The Second carry it from these Glands, after its being diluted there with Lympha, into the common Receptacle. See LACTEALS.

SECUNDINE, in Medicine, the several Coats or Membranes wherein the *Fetus* is wrap'd up, in the Mother's Womb, as the Chorion, Amnion, the Placenta, &c. thus call'd, because they come out in the second Place, i. e. after the Child, in Delivery. The Matrons or Midwives call the *Secundine*, the *After-birth*, as being esteem'd a second Burthen, whereof the Mother is freed. Others call it, The *Delivery*, because when this is out, the Woman is reckon'd to be perfectly deliver'd. See FORTIS. The *Secundine* must never be left in the Matrix; 'tis a foreign Body, which wou'd destroy the Mother: 'Tis dangerous even to have a Piece of it left behind. *Hippocrates* observes, That Twins have always the same *Secundine*.

Dr. *Grew*, in his Anatomy of Plants, applies the Term *Secundine* to the Fourth and last Coat or Cover of Seeds; by reason this performs nearly the same Office in Plants, that the Membranes investing the *Fetus* do in Animals. Indeed *Pliny*, *Columella*, *Apuleius*, &c. have us'd *Secundine* in the same Sense.

SECURITATE PACIS, a Writ, which lies for one who is threaten'd with Death, or Danger; against the Person who so threatens him. It is taken out of *Chancery*, directed to the Sheriff. See PEACE.

SECUTOR, in Antiquity, a Kind of Gladiator among the *Romans*. The *Secutores* are those who fought against the *Retiarii*. They were armed with a Sword, and a Buckler, to keep off the Net, or Noose, of their Antagonist, and wore a Cask on the Head. Some confound the *Secutores* with the *Mirmillones*, because both had nearly the same Weapons. The Word is formed from the Verb *Sequi*, to follow; because the *Secutores* use to pursue the *Retiarii*. See RETIARIUM. Secutor was also a Name given to such Gladiators, as took the Place of those killed in the Combat; or, who fought the Conqueror. This Post was taken by LOT— In Ancient Inscriptions we also meet with *Secutor Tribunus*, *Secutor Ducis*, *Secutor Cesaris*, &c. who were Officers attending the Tribunes, and Generals; perhaps like our *Aids de Camp*.

SE-DEFENDENDO, a Plea for him who is charged with the Death of another, saying, He was forced to do what he did, in his own Defence, the other so assaulting him, that had he not done as he did, he must have been in Danger of his own Life. To have this Plea admitted, the Danger must appear inevitable. But though the Party justify its being done *Se-Defendendo*, yet he is driven to procure his Pardon of Court from the Lord Chancellor, and forfeits his Goods to the King.

SEDER OLAM, in Philology, a Hebrew Term, literally signifying, *Order of the World*; being the Title of two Books of Chronology in that Language.

They are both very short, though the one more so than the other; for which Reason the one is called *Seder Olam Rubra*, that is, the great *Seder Olam*; and the other, *Seder Olam Zuta*, i. e. little *Seder Olam*. The first commences at the Creation of the World, and comes down as low as the War of the Pseudo Messiah *Ben Cozzab*, under *Adrian*, 52 Years after the Destruction of the Temple of Jerusalem, and, of Consequence, to the 122d Year of Christ: 'Tis almost all taken from the Scripture, excepting the End, 'Tis the Work of R. *Jos. Son of Hileljetta of Jippers*, who lived in the second Century, about the Year 130, and was Master of the famous R. *Juda Hakkadshoch*, the Compiler of the *Mishna*. The *Seder Olam Zuta* is an Abridgement of the former, brought down as far as *Mar Sura*, who lived 450 Years after the Destruction of the Temple, or 522 Years after Christ. F. *Morin*, continually bent upon diminishing the Antiquity of the Principal Books of the Jews, endeavours to prove it to have been wrote about the Year of Christ 1124, as indeed it is expressed at the Beginning; but R. *Deu. Gauri* has overthrown this Opinion in his *Teshub David*, and shewn, that the Date, in the Beginning, is an interpolation. The two Chronicles were first Printed at Mantua in 1514, *Quarto*; again, at *Basil*, by *Freben*, in 1530, *Octavo*: At Venice in 1545, *Quarto*: At Paris, with a Latin Version of *Genesius*, in Twelve, They have been since Printed at Amsterdam, in 1711.

SEDIMENT, the Settlement, or Dregs, of any Thing; or that gross, heavy Part of a fluid Body, which upon resting, sinks to the Bottom of the Vessel. Some Physicians pretend to discover much of the Nature of the Disease, from the Sediment of the Urine. The Word is formed from the Latin *Sedimentum*, which *Mathew Sylvaticus* derives a *diuturna Sede*. Dr. *Woodward* maintains, That at the Deluge, the whole Terrestrial Globe was dissolved into one uniform Mass, and that the New World arising thence was perfectly Spherical, and without any Inequalities, consisting of several Strata, which the Earthy Sediment gradually produced, as it drained. See DELUGE.

SEDRÁ, the High-Priest of the Sect of *Ali*, among the *Perfians*. The *Sedra* is appointed by the Emperor of *Persia*, who usually confers the Dignity on his nearest Relation. The Jurisdiction of the *Sedra* extends over all Effects destined for pious Purposes, over all Mosques, Hospitals, Colleges, Sepulchres, and Monasteries. He disposes of all Ecclesiastical Employments, and nominates all the Superiors of religious Houses. His Decisions, in Matters of Religion, are all received as so many infallible Oracles: He judges of all Criminal Matters, in his own House, without Appeal, and is, without Contradiction, the second Person in the Empire. He has not, however, any indelible Character, but frequently quits his Post for another purely Secular one: His Authority is balanced by that of the *Moudtebeeb*, or first Divine of the Empire.

SEED, a Matter prepared by Nature, for the Reproduction and Conservation of the Species, both in Men, Animals, and Plants: Some Naturalists add, That even Stones, Minerals, and Metals themselves have each their proper Seed in their Mines, and are produced and perpetuated thereby. See MINERAL, STONE, &c.

SEED, Semen, in the Animal OEconomy, is a white, Liquid Matter, or Humour, the thickest of any in the Body, separated from the Blood in the Testicles, and reserved in proper Vessels, to be the Means of Generation. By Chymical Analysis it is found to consist almost entirely of Oil, and Volatile Salts, blended together by the Mediation of a little Phlegm. Its Activity Dr. *Drake* takes to be derived from the Salts, wherewith it abounds, far more than any other Animal Liqueur. See HUMOUR.

The Parts concerned in the Preparation of the Seed are the Spermatic Arteries, which bring the Blood to be secreted into the Testicles; The Testicles, and Paraglande, where the Secretion it self is chiefly effected; The *Ves. Defrensaria*, which convey the secreted Matter out of the Testicles; and the *Vesicula Seminales*, which receive and preserve it to be emitted in Coition. See each of these Parts described under its proper Article TESTICLE, &c.

The Blood received, in small Quantities, into the Spermatic Arteries, and there, by the particular Structures of the Parts, much diminished of its Velocity, is yet further retarded about the *Corpus Pyramidale*, or *Vasculum*, and its redder, and thicker Parts, carried off by Canals opening into the Veins. Thus rendered paler, and flowier, it is received into the winding Recesses of the Testicles, where, almost stagnating, it assumes an Ash Colour, and is further prepared, thickened, &c. in the *Ductus Highwerianus*, whence, slowly driven into the Epididymide, or *Paraglande*, it is further prepared and elaborated in the Pores and Complications thereof, and, at length, creeps slowly into the

the *Vasa Deferentia*, or *Ejaculatoria*, which consist, at first, of a thick, fungous Matter, very narrow, but growing sensibly wider, and then again narrower; in the winding Meanders whereof it is collected, its Motion abated; further elaborated, and coacted, and at last driven into the *Vesicula Seminales*, in the various Cells and Meatus's whereof it is receiv'd, laid up, fix'd, thicken'd, whiten'd, and rais'd to its last Perfection in which State it is called *Seed*.

It is observ'd, that no Humour in the Body is generated so slowly, meets with so many Means to retard it, or to elaborate, and concert it, when at rest, as the *Seed*. Some imagine that, in its whole retarded Progress, besides what is apparent, there is something still added to it from the minute nervous Vesicles; and something taken away, by the various Lymphatics, and discharg'd thereby into the Venous Vesicles of the *Corpus Pyramidale*, and the little Veins of the *Vesicula Seminales*, and thence into the Humours of the whole Body: *Berberis* takes both the one and the other to be very probable.

The *Seed*, or Humour, thus form'd in the Testicles, *Parastata*, *Vasa Deferentia*, and *Vesicula Seminales*, being, when new, dilated with a little warm Water, and view'd with a good Microscope, is seen to consist of innumerable, little, oblong, living, Eel-like Animalcula floating in the other Part of this Humour. This is always observ'd in the *Seed* of all Men, Quadrupeds, Birds, Fishes, amphibious Animals, and Insects. Upon comparing this with the Bulk, Figure, Place, Change, &c. of the Carina of the Chick described by *Malspighi*, and with the known Law of Nature observ'd in the Generation of Frogs; it appears highly probable, that the Animalcula of the Male *Seed*, contain the Rudiments, or Stamina, of the future Human Body; and the more so, since, whenever the Testicles, or this Humour is wanting, there is always Sterility on the Side of the Male. *M. Leewenboeck*, the first Discoverer of these Animalcula, and many after him, make no Scruple to call them true *Fetus's*, little *Men*; and some have even pretended to discover somewhat of the Human Figure therein. But *Verheyen*, and others after him, deny the Existence of any such Animalcula, maintaining, That 'tis only the intestine Motion of the Parts of the *Seed* kept on Foot by the Warmth thereof, that exhibits this Appearance, which fanciful Persons have improv'd into frisking Animalcula; and urging, in Confirmation hereof, That no sooner is the Warmth gone, than all Appearance of Animals ceases: But this, notwithstanding the Doctrine of the *Animalcula in Semine*, is now generally received. See *ANIMALCULA*.

Some admit of four several Kinds of *Seed*: The *Seed* of the Testicles, that of the *Vesicula Seminales*, that of the *Prostatae*, and that of the Glands of the *Penis*. The two first, which we have described as one and the same Humour, only in different Stages, those Authors take to be different, as not being able to find any strict Communication between the *Deferentia* and the *Vesiculae*; but that Communication is fully shewn, by *Dr. Drake*, & that nothing needs further, to shew the *Seed's* same. The *Liquor* of the *Prostatae*, and that of the Glands of the *Penis* are generally allow'd not to be any true *Seed*, so more than that emitted by Women: Nor is there any good Reason why either of them should be called so, as their Appearance is very different, and as other sufficient Uses are assign'd for them, *viz.* To linc and lubricate the Parts, that the *Seed*, Urine, &c. may pass more freely, and without adhering. See *PROSTATAE*.

The Seminal *Liquor*, however, such as emitted for Use, is a Mixture of several *Liquors*, pour'd at the same Time into the common Canal of the Urethra, either from the Glands that have secreted them, or the Reservoirs that have kept them. *M. Du Verney* observes, That in different Species, the Number and Structure of these Organs is different. In Man, the Principal are the *Vesicula Seminales*, and the *Prostatae*, besides what was discover'd by *Mr. Cooper*, *viz.* A Number of new glandulous Bodies on each Side the Urethra, whose excretory Ducts open into the Urethra, towards the Root of the Yard. *M. du Verney* has found, that the same are likewise in most other Animals, and placed in the same Manner. 'Tis controverted, whether or no the *Liquor* filtrated hereby, be necessary to Generation. *M. de Verney* thinks it is, and his chief Reason is, That in Animals that have been castrated, these Glands, as well as all the other Sources of Generation, are found dried up, and decay'd. *M. Littré* opposes to this, that the *Vesicula Seminales*, and *Prostatae*, having little Cells, where their filtrated *Liquor* is deposited, 'tis easily conceiv'd that their Humours may wait some Time, for an Occasion of being emitted; but that these new *Prostatae*, or Glands, of *Mr. Cooper*, having no such Reservoirs, their *Liquor* must ooze out into the

Cavity of the Urethra, in Proportion, as it is separated, and be destined for some continual, not a momentary or occasional Use. He adds, That as the excretory Ducts of these Glands traverse the spongy Body of the Urethra, for two Inches e'er they penetrate into its Cavity, and that in the sole Moments when the *Liquor* should be discharg'd, to assist in Generation, that spongy Body is extremely dilated, and its Sides in a State of Compression, the *Liquor* must be then less disposed to a Ditchage than ever. See *ERECTION*.

For the Fate of the *Seed* when lodg'd in the Uterus: See *CONCEPTION*, *GENERATION*, &c.

*SEED* in Botany, a Product of a Plant, whereby the Species is propagated. See *PLANT*. The *Seed* is frequently the Fruit of the Plant, as is the Case in most Herbs: See *FRUIT*. Sometimes it is only a Part inclosed in the Fruit, and that in Form, either of Grain, Pippin, Kernel, or Berry. See *GRAIN*, *PIPPIN*, &c.

The *Seed* is the natural Offspring of the Flower, and that for whose Production all the Parts of the Flower are intended; So that when this is once well form'd, these several Parts of the Flower dwindle, and disappear. See *FLOWER*.

'Tis produced from the Farina of the Apices; let fall on the Head of the Pistil, and thence forwarded to an Uterus, at the Bottom thereof, divided into several Cells; where, coming to receive the nutritious Juice of the Plant, it is first soften'd, then swell'd, increased both in Matter and Bulk, and at length comes to its State or Maturity. For more particular Account of the Manner of the Generation of the *Seed*, see *GENERATION*.

That the whole Plant is contained in the *Seed*, is an Opinion as old as *Empedocles*, and is still the prevailing Doctrine among the Generality of Naturalists. Experience, the Microscope, and the Modern Philosophy, give it great Countenance. In effect, by the Use of good Microscopes, we discover, in the *Seed*, several of the Parts of the future Tree, only in Miniature; particularly a little Root, called the *Radicula*, and the Stem called the *Plumule*. See *RADICLE*, and *PLUMULE*.

In *Malspighi's* Life, we have a Debate between him and *Seigneur Trampbetti*, Provost of the Garden at Rome, whether the whole Plant be actually contained in the *Seed*: The affirmative is maintained by *Malspighi*, with cogent Arguments; among which this is one, That in a Kidney Bean e'er sown, the Eye, assist'd with a Microscope, easily discovers Leaves, a Bud, and even the Knots, or Implantations of the Leaves on the Stem. The Stem itself is very conspicuous, and plainly consists of Woody Fibres, and Series of little Urticles. And whereas *Seigneur Trampbetti* had objected, That by Poverty, Transplantation, &c. several Plants degenerate into other, particularly Wheat into Tares, and Tares again into Wheat: In Answer to this, which is one of the strongest Objections against that Opinion, *Malspighi* replies, That he is not fully satisfied as to the Truth of the Objection, for that both himself, and his Friends, making the Experiment, no Metamorphosis of the Wheat succeeded: But granting the Metamorphosis, 'tis the Soil, or the Air, or the Culture, is in the Fault. Now, from a morbid, and monstrous Condition of Nature, there is no inferring her genuine and permanent State. See *DEGENERATION*.

To the same Effect, *Mr. Leewenboeck*, after a nice Observation of an Orange Kernel he had made to germinate in his Pocket, &c. concludes, "Thus we see how small a Particle, no bigger than a coarse Sand, is increas'd, &c." A plain Demonstration, that the Plant, and all that belongs to it, was actually in the *Seed*; *viz.* The Body, Root, &c. *Mr. Derham* adds; That of all the *Seeds* he has view'd, except the Maple, the Plant appears the plainest to the naked Eye in the Nux Vomica.

The Fecundity of Plants, in the Production of *Seeds*, is very surprizing. *M. Desart*, in the Memoirs of the French Academy of Sciences, computes, That an Elm, living 100 Years, ordinarily produces of it self 33000000 Grains; and adds, That had its Crown, or Head, been cut off, it would have put forth as many Branches, within half an Inch of the Place where it was cut, as it had before; and that at whatever Height it were cut off, the Effect would have been still the same. Hence he concludes, That the whole Trunk, from the Ground to the Rise of the Branches, is full of the Principles, or little Embryo's of Branches, which, it is true, cannot all appear at once, but which being conceiv'd, as separated by Circular Rims, half an Inch high, compose so many Sets of Branches, each whereof is ready to appear, and will really appear if the Head be lop'd off just over it. Now these invisible Branches exist as really as those which appear. For whence else should they come? The Trunk

Trunk cannot produce them, as being it self no more than a Packet of Fibres, destitute of all Action: Nor can the Sap, which, like the Blood, is fit to nourish the Parts, but not to form any new ones. The Branches therefore excised before the Tree was lopped, and if they had appeared, would have bore an equal Number of Grains as those which did. These Grains, therefore, they must already contain in little. On this Pointing, the Tree may be said actually to contain in itself 15840000000 Seeds, wherewith to multiply itself as many times: But what shall we say, if each Seed, or Grain of a Tree, contain in itself another Tree, containing the same Number of Seeds? And, if we can never come either at a Seed which does not contain Trees, nor at a Tree which does not contain Seeds? By this Means we shall have an increasing Geometrical Progression, the first Term wherof is 1. the second 15840000000, the third, the Square of 15840000000; the fourth, its Cube, &c. to Infinity.

Several Species of Plants have been always supposed to be destitute of Seeds, in regard, no Observation, no Microscope, no Anatomy, discovered any Thing like them: Such are the *Capillaries*, the several Kinds of *Fuci*, *Scapulars*, *Mosses*, &c. But the happy Industry of the present Age has discover'd the Seeds of some of them; and has left us out of all Doubt, that the rest are not without the same. The Seeds of Fern, and the Capillary-Plants, were first discover'd by *Cestius*; and since, more fully and critically by *M. W. Cole*. The Seeds of some Sea-Plants, were discover'd by the Count de *Marsigli*, and those of others, by *M. Reaumur*, the first mentioned in the History of the French Academy, for the Year 1712, and the latter for the Year 1711. The Seeds of some Kind of *Fuci* have been discover'd by *Mr. Samuel Dooly*; those of Coralloid Shrubs, by *Dr. Janc. Robinson*, as also, those of several Fungi, particularly Truffles, and *Crepitus Lupi*, or *Puff-balls*; and those of some other by *Dr. Lister*. See *MUSCICORNS*. Under which Article, a new Theory of a Propagation of those apparently Seedless Plants is laid down.

SEEDS, in Gardening, and Agriculture. *Mr. Bradley* observes, That the Seeds of Plants, though exceedingly good, will degenerate from the Mother-Plant, if they be sown on the same Ground, whence they were gathered; so that there is a great Necessity for a yearly Change for Seeds of Forest Trees, as *Acorns*, *Mast*, &c. If the Place be too cold to sow them when gathered in August, they may be kept barrelled or potted up, in moist Sand or Earth, *Arctium sopher steratum*, during the Winter, at the End of which they are found fruited, and if gently sown, will be as forward as if sown in Autumn, besides their minding the Vermine to which the Winter Seed is much exposed. The Seed not to be chosen from the most fruitful Trees, so much as from the most solid and fair; nor cover the largest *Acorns*, but the most weighty, clean, and bright. Porous, insipid, mild Sorts of Seeds, to be sown as soon as ripe. Hot, bitter Seeds to be kept a Year before sown. The Shape and Weight of Seeds, direct how they are to be set. Most of them, when they fall, lie on one Side, with the small End towards the Earth, which shows that Posture to be best to set any Stone or Nut in: If they be heavy, sow them the deeper. *Acorns*, *Peaches*, &c. to be sown 2 or 3 Inches deep. See *SEMINARY* and *SEMINATION*.

SEEDS, in Pharmacy, &c. The Seeds used in Medicine, &c. especially those imported from the *Indies*, *Levant*, &c. are severally described under their respective Articles, which see. Among those cultivated at Home, the Principal are the *Four hot*, and the *Four cold Seeds*, as they are called. The first are those of *Annis*, *Fennel*, *Cumin*, and *Caraway*; the latter, those of *Gourd*, *Pumpkin*, *Melon*, and *Cucumber*. The Use of the four cold Seeds is for the making of Emulsions, cool, refreshing Drinks, Puffs for the Hands, and Oils used by the Ladies for the Complection.

SEED of Pearls, - - - - } See { PEARL.  
SEMIN Senticum, or Sautonicum, } See { WORMSEED.

SEEDLINGS, are such Roots of Gilliflowers, as come from Seed sown; also the young tender Shoots of any Plants, that are newly sowed.

SEEING, the Act of perceiving Objects by the Organ of Sight; or the Sense we have of external Objects, by means of the Eye. See *VISION*.

For the Apparatus, or Disposition of the Parts necessary to Seeing; See *EYE*.

For the Manner wherein Seeing is perform'd, and the Laws thereof; See *VISION*.

Our best Anatomists differ greatly as to the Cause why we don't see double with the Eyes. *Galen*, and others after him, ascribe it to a Coalition or Decussation of the

Optic Nerve behind the *Os Sphenoidis*. But whether they decussate or coalesce, or only barely touch one another, is not so well agreed. The *Barbicanus* and *Vesalins*, say expressly, they are united by a perfect Confusion of their Substance: *Dr. Gibson* allows them to be united by the closest Juncture, but not Confusion of their Fibres. *Des Cartes* and others, account for the Effect another Way, viz. by supposing that the *Fibrille* constituting the medullary Part of those Nerves, being spread in the Retina of each Eye, have each of them corresponding Parts in the Brain; so that when any of those *Fibrille* are struck by any Part of an Image, the corresponding Parts of the Brain are affected thereby. Somewhat like which is the Opinion of *Dr. Briggs*; who takes the Optic Nerves of each Eye to consist of homologous Fibres, having their Rise in the *Thalamus nervorum Opticorum*, and thence continued to both the Retinae which are composed of them: And farther, that those *Fibrille* have the same Parallelism, Tension, &c. on both Eyes: Consequently, when an Image is painted on the same corresponding, sympathizing Parts of each Retina, the same Effects are produced, the same Notice carried to the Thalamus, and so imparted to the Soul. Hence that double Vision ensuing upon an Interruption of the Parallelism of the Eyes, as when one Eye is depressed by the Finger, or their Symptom interrupted by Disease. But *Dr. Briggs* maintains, that 'tis but in few Subjects, there is any Decussation; in none, any Juncture more than mere Contact.

Whence it is that we see Objects erect, when, as 'tis certain, the Images thereof are painted invertedly on the Retina, is another Difficulty in the Theory of Seeing. *Des Cartes* accounts for it hence; That the Notice the Soul takes of the Object, does not depend on any Image, nor of any Action coming from the Object, but merely from the Situation of the minute Parts of the Brain; whence the Nerves arise. E.g. the Situation of a Capillament of the Optic Nerve, corresponds to a certain Part of the Brain; which occasions the Soul to see all those Places lying in a right Line therewith. But *Mr. Astley* gives us another Account: The Eye, he observes, is only the Organ, or Instrument: 'Tis the Soul that sees. To enquire, then, how the Soul perceives the Object erect by an inverted Image, is to enquire into the Soul's Faculties. Again, imagine that the Eye receives an Impulse on its lower Part, by a Ray from the upper Part of an Object; must not the visive Faculty be hereby directed to consider this Stroke as coming from the Top rather than the Bottom of the Object, and consequently, be determined to conclude it the Representation of the Top?

SEEING. A Horse is said to *Seel*, when upon his Eye-brows, there grows about the Breadth of a Fanning of white Hairs, mixed with those of his natural Colour, which is a Mark of Old Age: An Horse never Seels till he is Fourteen Years old, and always before he is Sixteen at farthest: The light Sorrel and Black, sooner Seel than any other. Horse-jockeys usually pull out those Hairs with Pinners; but if there be so many, that it cannot be done, without making the Horse look bald and ugly, then they colour their Eye-brows, that they may not appear old.

SEGMENT of a Circle, in Geometry, a Part of a Circle comprehended between an Arch and the Chord thereof. Thus the Portion AFB (Tab. Geometry Fig. 23) comprehended between the Arch AFB, and the Chord AB, is a Segment of the Circle ABED, &c. a Segment of many Degrees. The Term Segment is also applied by Extension, to Ellipses and other Curvilinear Figures. As 'tis evident every Segment of a Circle must either be greater or less than a Semi-circle; the greater Part of the Circle cut off by a Chord, i. e. the Part greater than a Semi-circle, is call'd the greater Segment, as ADEB; and the lesser Part, the Part less than a Semi-circle, the lesser Segment, as AFB, &c. The Angle which the Chord AB, makes with a Tangent LB, is called the Angle of a Segment. Some, indeed, call the Two mixt Angles comprehended between the Two Extremes of the Chord, made with the Arch, Angles of the Segment.

The Height of a Segment FA, and half its Base or Chord BA, being given, to find the Area of the Segment: Find the Diameter of the Circle. (See DIAMETER.) On this describe a Circle, and draw the Base of the Segment A B; draw R, A C, B C; and find the Number of Degrees of the Arch AFB. From the Diameter and its Ratio to the Periphery, find the Periphery itself; and from the Ratio of the Periphery to the Arch ADB, and the Periphery itself, find the Length of the Arch ADB. This done, find the Area of the Sector AFBCA. See *SECTOR*. And that of the Triangle AB. See *TRIANGLE*. Lastly, subtract the Triangle from the Sector, the Remainder is the Area of the Segment.

If the Area of the greater Segment ADEB were required, the Triangle ACB must be added to the Sector ADEB

**ADE B C.** **SEGMENT** of a Sphere, is a part of a Sphere terminated by a Portion of its Surface, and a Plane which cuts it off; passing somewhere out of the Centre: This is more properly called a *Section of a Sphere*. See **SECTION**. The Base of such a *Segment*, 'tis evident, is always a Circle whose Centre is in the Centre of the Sphere. See **SPHERE**.

The solid Content is found, by multiplying the Surface of the whole Sphere by the Altitude of the *Segment*, and then dividing the Product by the Diameter of the Sphere, and to the Quotient adding the Area of the Base of the *Segment*; or, if it be less than a Hemisphere, thus; Take the Altitude of the *Segment* from the Radius of the Sphere, and by the Difference multiply the Area of the Base of the *Segment*; and subtract this Product, from that which will arise by multiplying the Semi-Axis of the Sphere into the convex Surface of the *Segment*; then divide the Remainder by 3, and the Quotient is the Solidity sought. This latter Method supposes the Axis of the Sphere to be given; if not, it may be found thus: Let the Altitude of the *Segment* be called *a*, and its Semi-diameter *s*, then will  $a, s; s: \frac{a}{2}$ ; add  $\frac{a}{2}$  to *a*, and that shall give the Axis sought.

**Line of SEGMENTS.** On *Quarter's Sector* there are usually Two Lines, called *Lanes of Segments*; they are numbered with 5, 6, 7, 8, 9, 10, and lie between the *Lanes of Sines*, and those of *Supplements*. They represent the Diameter of a Circle, so divided into 100 Parts, as that a Right Line drawn through those Parts, and normal to the Diameter, shall cut the Circle into Two *Segments*, of which the greater shall have that Proportion to the whole Circle, as the Parts cut are to 100. See **SECTOR**.

**SEGMENT-LEAVES**; thus Botanists call those Leaves, that are cut and divided into many Shreds or Slices, as Fennel, &c.

**SEGMOIDAL VALVES**, in Anatomy, are little *Folies of the Pulmonary Artery*; thus call'd from their resembling Segments of Circles; but more usually *Semilunar Valves*. See **SEMILUNAR**.

**SEGRIANT**, is the Herald's Word for Griffins, when drawn in a leaping, or salient Posture.

**SEJANT**, is a Term used in Heraldry, when a Lion, or other Beast, is drawn in an Escutcheon, fitting like a Cat, with his Fore-feet freight.

**SEIGNORAGE**, a Right or Due belonging to a *Seignior*, or *Lord*. The Term is particularly used for a Duty belonging to the Prince for the Coining of Money, called also *Coinage*; in the later Latin, *Monetarium*. This Duty is not always the same; but changes according to the Pleasure of the Prince, and the Occasions of State. 'Tis in some measure for the Discharge of this Duty that *Alloy* was invented; that is, the Mixture of other Metals with Gold and Silver.

Under our ancient Kings, for every Pound of Gold brought in the Mass to be Coined, the King's Duty was Five Shillings; one Shilling, and sometimes Eighteen Pence whereof went to the Master of the Mint. Under *Edward the Third*, the *Seignorage* of every Pound Weight of Silver, was Eighteen-penny Weight, which was then equivalent to a Shilling. Under *Henry V.* the King's *Seignorage* for every Pound of Silver was Fifteen-pence. At present, the King claims no *Seignorage* at all, but the Subject has his Money coined at the public Expence; Nor has the King any Advantage therefrom, but what he has by the Alloy. In *France*, under *Philip Augustus*, the *Seignorage* was one Third of the Profit made by the Coining. *St. Louis* fix'd it at one Fifteenth Part of the Value of the Money Coined. King *John* at Three Livres the Mark of Gold. *Charles VII.* by reason of the distressed State of the Finances, rais'd it to Three Fourths of the Value. *Louis XIII.* fix'd it at Six Livres the Mark or Eight Ounces of Gold, and Ten Sols, the Mark of Silver. *Louis XIV.* took away the Right of *Seignorage* in 1679, tho' 'twas re-established in 1689 on the Foot of Seven Livres, Ten Sols the Mark of Gold, and Twelve Sols, Six Deniers the Mark of Silver.

It must be observed, that for the levying of this Duty of *Seignorage*, the just Value of the Money is augmented by the Value of the Duty.

**SEISIN**, in Law, from the *French Seisine*, signifies Possession; so *primaer Seisin* is the first Possession. *Seisin*, according to the common Law, is Two fold; *Seisin in Fact*, and *Seisin in Law*. *Seisin in Fact*, is, when a Corporal Possession is taken. *Seisin in Law*, is, when something is done, which the Law accounteth a *Seisin*; as an Inrolment: and this in Law, is as much as a Right to Lands and Tenements, tho' the Owner be by Wrong Dispossessed of them; and he, who hath had an Hour's Possession quietly taken, hath *Seisin de Droit*, &c. de *Claimo*, whereof, no Man may dispossess him by his own Force or Subtlety, and it is call'd by *Coke*, *Seisin in Law*, or actual *Seisin*.

The Civilians call the one *Civilian Possessionem*, the other *Naturalem*. See **POSSESSION**.

**SEIZE** or **SEASE**, in the Sea Language, is to make fast or bind; particularly to fasten Two Ropes together, with Rope-Yarn. The *Seizing* of a Boat is a Rope tied to a Ring, or little Chain in the Fore-ship of the Boat, by which means it is fasten'd to the Side of the Ship.

**SEIZING**, (in Falcoery) is when an Hawk grips her Prey, or any thing, fast within her Claws.

**SEIZURE**, in Commerce, an Arrest made of some Merchandize, Moveable, or other Matter, either in consequence of some Law, or of some express Order of the King. Contraband Goods, those fraudulently Entered, or landed without Entering at all, or landed at wrong Places, are subject to *Seizure*. See **CONTRABAND**. In *Strawes*, among us, one half goes to the *Straw* or Informer, and the other Half to the King. In *France*, Half the painted Linens, &c. *Seiz'd*, used to be burnt, and the other Half sent Abroad: But in 1715, by an Arret of Council, it was appointed the Whole should be burnt.

**SELENITES**, in Natural History, *Moon-Stone*, said to be a Stone (still found in *China*, which has this remarkable Property, That it increases and decreases, as the Moon waxes and wains. There are some of these *Selenites* preserved in the Palace of *Peking*, valued at an incredible Rate. *Martinus*. The Word is form'd from the *Greek* *Σελήνη* Moon. Some give the same Appellation to *Miscovy-Tals*, from an Opinion, that its Brightness increases and diminishes with the Moon.

**SELENOGRAPHY**, a Branch of Cosmography, which describes the Moon and all the Parts and Appearances thereof; as Geography does those of the Earth: from *Σελήνη* Moon, and *γραφία* Description. Since the Invention of the Telescope, *Selenography* is vastly improved. We have now distinct Names for most of the Regions, Seas, Lakes, Mountains, &c. visible in the Moon's Body. *Hewelius*, a celebrated Astronomer and Bourgeois-master of *Danzwick*, who published the first *Selenography*, named the several Places of the Moon from those of the Earth; *Ricciolus*, from the Names of the celebrated Astronomers and Philosophers. Thus what the one calls *Mons Porphyrites*, the other calls *Aristarchus*. What the one calls *Evus*, *Sinai*, *Atlas*, *Apernius*, &c. the other calls *Copernicus*, *Possidonius*, *Lycus*, *Gassendus*, &c. See **MOON**. At the Royal Observatory at *Paris*, they continue to make *Selenographic* Maps. *M. Cassini* has publish'd a Work call'd *Instructions Seleniques*.

**SELEUCIANS**, a Sect of ancient Hereticks, call'd also *Hermians*. *Selenus* and *Hermias* joining Forces, and dogmatizing together, taught, That God was Corporal; that the Elementary Matter was Coeternal with him; and that the Human Soul was form'd by the Angels, of Fire and Air: They denied that *Jesus Christ* fate at the Right Hand of God; asserting, That he had quitted that Right, and had removed his Throne into the Sun. See **PHILASTRUS**, **S. AUGUSTIN**, &c.

**SELEUCIDES**, in Chronology. The *Æra of the Seleucides*, or the *Syro-Macedonian Æra*, is a Computation of Time, commencing from the Establishment of the *Seleucides*, a Race of Greek Kings, who Reign'd as Successors of *Alexander the Great* in *Syria*; as the *Ptolomys* did in *Egypt*. This *Æra* we find express'd in the Book of *Maccabees*, and on a great Number of Greek Medals struck by the Cities of *Syria*, &c. The Rabbin and Jews call it, The *Æra of Contracts*, because being then subject to the Kings of *Syria*, they were oblig'd to follow their Method of computing in all Contracts. The *Arabs* call it *Tberick Dilkarwan*, *Æra of two Horns*, which some say signifies the *Æra of Alexander the Great*; by reason that Prince bore Two Rams Horns on Medals, in Imitation of *Jupiter Ammon*, whose Son he would needs be. But others understand it much better of the Two Kingdoms of *Syria* and *Egypt*, which were now cloven or divided; and of one single Empire parted into two Monarchies. The grand Point, is to know the Year wherein the Separation was made; or, which is the same Thing, when *Selenus*, one of *Alexander's* Captains, and the first of the *Seleucides*, establish'd his Throne in *Syria*. Without detailing the various Sentiments of various Authors, it may suffice to observe, That, according to the best Accounts, the first Year of this *Æra* falls in the Year 311 before *Christ*, which was 12 Years after *Alexander's* Death. See **EVROGA**.

**SELLA**, in Anatomy, *Sella Equina*, *Sella Turcica*, and *Sella Sphenoides*; A Name given the Four Apophyses of the *Os Sphenoides*, and *Os Cuneiforme* in the Brain, in regard of their forming a Resemblance of a Saddle, which the Latins call *Sella*. See **BRAIN**. They are sometimes also called by the *Greek* Name *Clinoides*. Herein are contain'd the pituitary Glands, and in some Beasts, the *Retæ Mirabile*. See **SPHEREOIDES**.

**SELL**, in Building, is of Two kinds, viz. *Ground-Sell*, which is the lowest Piece of Timber in a Timber Building; and that whereon the whole Superstructure is raised; and *Window-Sell*, called also *Window-Sok*, the bottom Piece in a Window-Frame. See WINDOW.

**SEMIANS**, a Sect of ancient Hereticks, denominated from their Leader, *Semites* or *Semionus*, who condemn'd all Use of Wine, as Evil of itself; persuaded his Followers, that the Vine was a Production of Satan and the Earth; denied the Resurrection of the Dead, and rejected most of the Books of the *Old Testament*. *Jovet*.

**SEMBRADOR**, an Engine, invented by *Don Jof. de Lucarillo*, for the evenly Sowing of Seeds; described in the *Philosophical Transactions*, under the Title of the *Spanish Sembrador*. The Perfection of Agriculture is allowed to consist in setting the Plants in proportionable Spaces, and giving sufficient Depth to the Roots, that they may spread, and receive their necessary Nourishment; yet is very little Care taken in the Practice of this important Part of Husbandry; but all sorts of Grains sown by Handfuls, cast at Random; by which means Four Parts in Five of the Seed are lost. To remedy this Inconvenience, the *Sembrador* or *Sower*, is invented, which being fastened to the Plough, the whole Business of Sowing, Sowing and Harrowing is done at once, the Seeds sown's Trouble saved, and the Grain spread at equal Distances, and equally deep at the bottom of the Furrow. An Experiment hereof was made before the Emperor *Leopold* in the Fields of *Luxemburg* in *Austria*, where the Land usually yields four or five fold; but the Crop from the Ground sowed by this Instrument, was Sixty fold, as appears by a Certificate of the Emperor's Officer, appointed to see the Experiment: *Sign'd Vienna, August 1. 1663.* A Figure of the *Sembrador*, we have in the *Transactions*, by the Earl of *Cochran*.

**SEMIOSIS**, in Medicine. See DIAONIA.

**SEMIOTICA**, that Part of Medicine, which considers the Signs or Indications of Health and Diseases; and enables the Physician to judge what is, was, or will be the State, Degree, Order and Effect of Health or Sickness. See SIGN and INDICATION; see also MEDICINE. The Word is borrow'd from the *Greek* *Σημιωτικη*, of *Σημιω*, Sign.

**SEMENTINE FERLE**, in Antiquity, Feasts held annually among the *Romans*, to obtain of the Gods a plentiful Harvest. They were held in the Temple of *Terra*, or the Earth; where solemn Sacrifices were offered to *Terra* and *Ceres*. The Time of the Celebration was about Seed-Time, usually in the Month of *January*; for *Macrobius* observes, they were moveable Feasts. They had their Name from *Semen*, Seed.

**SEMENTS**, in Botany; *Dr. Greaves* uses the Word for the Apices of the Arise of Plants. See APICES.

**SEMI**, a Word borrow'd from the *Latin*, signifying Half; but only used in Composition with other Words, as in following Examples. The *French*, instead of *Semi*, frequently use *Demi*.

In Music, *Semi* has three several Usages: First, when added to a Note, it expresses a Diminution of Half its Value, as *Semi-Note*, &c. which See. Secondly, when added to the Name of an Interval, it expresses a Diminution, not of Half, but of a minor Half-tone, or four Commas in the whole Composit. Thirdly, it sometimes signifies an Imperfection. Thus *Semicircle* or *Crescenscens*, signifies an imperfect Circle, which is the Mark of imperfect Time, that is, of double Time; whereas the Circle, being a Character of Perfection, marks triple Time.

**SEMI-ARIANS**, a Branch of the Ancient *Arians*; consisting of such as, in Appearance, condemn'd the Errors of that Heretick, but yet acquiesc'd in the Principles thereof; only palliating and hiding them under softer, and more moderate Terms. 'Tis true, they separated from the *Arian* Faction; but yet could never be brought to acknowledge, that the Son was *Homousios*, that is, consubstantial, or of the same Substance with the Father. They would only allow him to be *Homoiosios*, that is, of a Substance like the Father. Though, as to Expression, they only differ'd from the Orthodox by a single Letter; yet were they, in Effect, in the Error of the *Arians*; as they placed the Son in the Rank of Creatures. It did not avail the teaching, that there was no other Creature of the same Class with him; since by denying him consubstantial with God, they effectually precluded him from being truly God. Yet some, even among the Orthodox, use the Word *Homousios*, in speaking of the Son; applying such an Idea to it, as it seems, is consistent with Orthodoxy. See *ARIANS*.

**SEMI-BREVE**, in Music, a Note, or Measure of Time, comprehending the Space of Two Minims, or Four Crotchets, or Half a *Breve*. The *Semi-breve* is accounted one Measure of Time; or the Integer, in Fractions

and Multiples whereof the Time of the other Notes is expressed. Thus the Minim is express'd by  $\frac{1}{2}$ ; a Crotchet by  $\frac{1}{4}$ ; *Et c.* by  $\frac{1}{2}$  of a Measure or *Semi-breve*. A *Breve* by 2; a *Long* by 4, that is, by 4 Measures or *Semi-breves*. The Character of the *Semi-breve* is O.

**SEMI-CIRCLE**, in Geometry, a Figure comprehending the Diameter of a Circle, and Half the Circumference. See CIRCLE. Two *Semi-Circles* can only cut each other in one Point.

*Semi-Circle*, is also an Instrument in Surveying, call'd also *Graephometer*. It consists of a *Semi-circular* Limb, as F I G (Tab. Surveying Fig. 16.) divided into 180. Degrees and sometimes subdivided, Diagonally or otherwise, into Minutes. This Limb is subtended by a Diameter F G, at the Extremities whereof are Erected two Sights. In the Centre of the *Semi-circle*, or the Middle of the Diameter, is fix'd a Box and Needle. On the same Centre is fitted an Axis or moveable Index, carrying two other Sights, as H I. The whole is mounted on a Staff with a Ball and Socket.

In Effect, the *Semi-circle* is nothing else but Half a *Theodolite*; with this only Difference, that whereas the Limb of the *Theodolite*, being an entire Circle, takes in all the 360° successively; in the *Semi-circle*, the Degrees only going from 1 to 180, 'tis usual to have the remaining 180°, or those from 180° to 360°, graduated in another Line on the Limb, within the former.

To take an Angle with a SEMI-CIRCLE.

Place the Instrument in such Manner, as that the Radius C G may hang over one Leg of the Angle, to be measur'd, and the Centre C over the Vertex of the same. The first is done by looking through the Sights F and G at the Extremities of the Diameter, to a Mark fixed up in one Extremity of the Leg: The latter is had by letting fall a Plumbet from the Centre of the Instrument. This done, turn the moveable Index H I on its Centre towards the other Leg of the *Semi-circle*, till through the Sights fix'd on it, you see a Mark in the Extremity of the Leg. Then, the Degree which the Index cuts on the Limb, is the Quantity of the Angle.

For further Uses of the *Semi-circle*, they are the same with those of the *Theodolite*. See THEODOLITE.

**SEMI-CUPUM**, a Half Bath, wherein the Patient is only up to the Navel. See BATH.

**SEMI-DIAMETER**, a Right Line drawn from the Centre of a Circle or Sphere, to its Circumference; the same with what we otherwise call *Radius*. See RADIUS. The Distances, Diameters, &c. of the Heavenly Bodies, are usually estimated by Astronomers in *Semi-diameters* of our Earth. See EARTH; See also SON, PLANET, &c.

To find the *Semi-diameters* of the Primary Planets in *Semi-diameters* of the Earth.

Since the Sun's true *Semi-diameter* is 152 *Semi-diameters* of the Earth; and we have the Ratio of the *Diameters* of the Primary Planets to that of the Sun (See DIAMETER; their *Semi-diameters* are easily found by the Rule of Three: Thus, the *Semi-diameter* of Saturn will be found  $20 \frac{2}{3}$ ; that of his Ring  $45 \frac{2}{3}$ ; that of *Jupiter*  $27 \frac{2}{3}$ ; that of *Mars*  $2 \frac{2}{3}$ ; that of *Venus*  $\frac{1}{2}$ ; and that of *Mercury*  $\frac{1}{3}$ . See PLANET.

**SEMI-COLON**, in Grammar, one of the Points or Steps, used to distinguish the several Members of Sentences from each other. See SENTENCE and POINT. The Mark or Character of the *Semi-colon* is (;) It has its Name, as having a somewhat less Effect than a Colon, or as denoting a shorter Pause. The Use of the *Semi-colon*, the Grammarians generally say, is, To mark a Sense less complex than the Colon, and more complex than the Comma; but this only conveys a very obscure Idea. In effect, the precise Use of the *Semi-colon*, or what it is distinguished from the Colon, is a Thing very little known in the World. Our best Authors seem to use them promiscuously. See COLON.

Mr. *Ward*, we believe, is the first (and he in the present Year 1724) who ever settled the precise Use of the *Semi-colon*. His Observation is, That the *Semi-colon* is properly us'd to distinguish the casual Members of Sentences: Now, by a casual Member of a Sentence, he means, such a one as contains at least two simple Members. See SENTENCE. Wherever, then, a Sentence can be divided into several Members of the same Degree; which are again divisible into other simple Members, the former are to be separated by a *Semi-colon*. For an Instance: If Fortune bear a great Sway over him, who has nicely flated and concerted every Circumstance of an Affair; we must not commit every Thing, without Reserve to Fortune, lest she have too great a hold of us. Again, *Si quis in agro locifera desertis nudicia parat, tantum in Foro adicit*

*Partis uniusculius valeret, non minus in Cæcis, præter Sicut Cæcis, Sicut Abitur impudens, quæ, tum in vi feruente, cæcis uoluit.* An Instance in a more complex Sentence we have, in *Cæcis, Res familiaris primum bene, postea sit, nullaque turpi cæcis; tum quæ plurimum, admodum, sit utique præbet, deinde angustar ratione, diligenti, perfidiosa; Nec huius potius, luxuriosus, quam liberitas, & beneuolentia, ualent.* But though the proper Use of the *Semi-cæsis*, be to distinguish conjoined Members; 'tis not necessary that all the Members divided hereby, be conjoined. For upon dividing a Sentence into great and equal Parts, if any of them be conjoined, all those other Parts of the same Degree are to be distinguished by a *Semi-cæsis*. Thus: Whoever is overtaken with Poverty; the same will find, that Coldness, Contempt, Injuries, &c. are not to be behind. Or thus: *Nihil est, tam male, tam terribile, tum aut fragile, tam fluctabile, quam uoluntas cæcis.* Sometimes also it happens, that Members that are opposite to each other; but relate to the same Verb, are separated by a *Semi-cæsis*: Thus *Cæcis. Ex hoc parte patris, illius perculentis; hinc fides, illius fraudantis; cumque, parat, illius scelus, &c.* Hence likewise may be referred such Sentences, where the whole going before, the Parts follow: as, The Parts of *Absterick* are Four; Invention, Disposition, Elocutio and Pronunciation.

**SEMI-DIAPASON**, in Music, a defective Octave; or an Octave diminished, of a minor *Semi-tone*, or four Commas. See **DIAPASON**.

**SEMI-DIAPANTE**, in Music, a defective Fifth, call'd usually by the *Italians, Quinta quinta*, and by us a *Fifth Fifth*. See **FIFTH**.

**SEMI-DIATRIBASION**, in Music, a defective Fourth, call'd properly, a *false Fourth*. See **FOURTH**.

**SEMI-DOUBLE**, in the *Roman* Beuery, a Term us'd for such Offices and Feasts as are celebrated with less Solemnity than the *double ones*; but yet with more than the single ones. The *Semi-double* Office has double Vespers, and Nine Lessons at *Mattins*; but the Antiphons are not redoubled. 'Tis perform'd on *Sundays*, in the Octaves, and in Feasts mark'd for *Semi-double* in the Calendar.

**SEMI-LUNAR VALVES**, in Anatomy, are little Valves or Membranes of a *Semilunar* Figure, placed in the Orifice of the Pulmonary Artery, to prevent the Relapse of the Blood into the Heart at the time of its Dilatation. See **VALVE**.

**SEMI-ORDINATES**, in Geometry, the Halves of the Ordinates of Applicates. See **ORDINATE**.

**SEMI-PARABOLA**, in Geometry, a Curve defined by the Equation  $ax^2 = by^2$ ; as  $ax^2 = by^2$ ,  $ax^2 = by^2$ . See **PARABOLA**.

In *Semi-parabolas*  $x^2 = ay^2$ ;  $ax^2 = by^2$ ;  $ax^2 = by^2$ ; or the Powers of the *Semi-ordinates*, are as the Powers of the Abscisses one Degree lower; E. g. in Cubical *Semi-parabolas*, the Cubes of the Ordinates  $y^3$  and  $y^4$  are as the Squares of the Abscisses  $x^2$  and  $x^3$ .

**SEMI-PELAGIANS**, a Name anciently, and even at this Day, given to such as retain some Tincture of *Pelagianism*. See **PELAGIAN**. S. *Preßer*, in a Letter to St. *Augustin*, calls them *Reliquies Pelagii*.

Many learned Men, principally among the *Galls*, who cou'd not come into St. *Augustin's* Doctrine of Grace, &c. were accus'd of *Semi-pelagianism*: They were also call'd *Priests of Marcellus*; in regard their Errors had their first Rise in that City. *Cassian*, who had been a Deacon of *Constantinople*, and was afterwards a Priest at *Marcellus*, was the Chief of these *Semi-pelagians*. S. *Preßer*, who was contemporary with him, and who attack'd him very vigorously, tells us, That *Cassian* endeavouring to keep I know not what Medium between the *Pelagians* and the Orthodox, did not agree either with the one or the other. The *Semi-pelagians*, with the Orthodox, allow'd of Original Sin; but deny'd, that Man's free Agency could be so wounded by this Sin, that he could not of himself do something which might induce God to afford his Grace to one more than another. They taught, That the Grace which saves Men, was not given them from the mere Will of God, but according to his eternal Preference, whereby he forelaw who they were that would believe in him. They own'd, that the Vocation or Call to the Gospel, was gratuitous; but added, at the same Time, That it was common to all, inasmuch as God desired all should be saved. As to Election, they held, that it depended on our Perseuerance; God only chusing such to Eternal Life, as should perseuere in the Faith.

**SEMI-PROOF**, an imperfect Proof. The Depositions of a single Evidence only make a *Semi-proof*. See **WITNESS**. The Testament of a Person deceased, is deem'd a *Semi-proof*. In France, in enormous Cases, the *Semi-proof* frequently determines them to try the Torture.

**SEMI-QUARTILE**, is an Aspect of the Planets, when distant from each other 45 Degrees, or one Sign and 15 Half.

**SEMI-QUAVER**, in Music. See **QUAVER**.

**SEMI-QUINILE**, is an Aspect of the Planets, when at the Distance of 36 Degrees from one another. See **ASPECT**. **SEMI-SEXTILE**, or *Semi-sixth*, or *S. S.* an Aspect of two Planets, wherein they are distant from each other, one Twelfth Part of a Circle, or 30 Degrees. See **ASPECT**. The *Semi-sixth* was added to the ancient Aspects by *Kepler*; and, as he says, from Meteorological Observations.

**SEMI-SPINATUS**, in Anatomy. See **TRANSVERSARY DORSI**.

**SEMI-TONE**, in Music, one of the Degrees, or contiguous Intervals, of Concords: See **DEGREE**. There are three Degrees, or lesser Intervals, by which a Sound can move upwards and downwards successively from one Extreme of any Concord to the other, and yet produce true Melody; and, by means whereof, several Voices, and Instruments are capable of the necessary Variety in passing from Concord to Concord, Thrice Degrees, are the greater and lesser Tone, and the *Semi-tone*. The *Ratio* of the First is 8 : 9; that of the Second 9 : 10. See **TONE**. The *Ratio* of the *Semi-tone* is 15 : 16. This Interval is call'd a *Semi-tone*, not that 'tis geometrically the Half of either of the Tones, for 'tis greater; but because it comes somewhat near it. 'Tis also call'd the *Natural Semi-tone*, and the *Greater Semi-tone*, because greater than the Part it leaves behind, or its Complement to a *Tone*, which is 15 : 16 in the *Left Tone*, and 128 : 135 in the *Left*. The *Semi-tone* is the Difference of the greater Third and Fourth, or of a Fifth, and lesser Sixth.

Every *Tone* of the Diatonic Scale is divided into a *Greater* and *Less*, or a *Natural* and *Artificial Semi-tone*. Mr. *Melchior* observes, 'Twas very natural to think of a Division of each *Tone*, where 15 : 16 should be one Part in each Division, in regard this being an unavoidable and necessary Part of the *Natural Scale*, wou'd readily occur as a *fit Degree*, and the more, as 'tis not far from an exact *Half Tone*. In effect, the *Semi-tones* are very near equal, that, in Practice, at least, on most Instruments, they are accounted equal, so that no Distinction is made into *Greater* or *Less*. These *Semi-tones* are call'd *Soft* and *Sharp* Notes, and, with respect to the *Natural ones*, are express'd by Characters call'd *Flats* and *Sharps*. See **FLAT** and **SHARP**. Their Use is to Remedy the Defects of Instruments, which having their Sounds fixed, cannot be always made to answer to the Diatonic Scale: See **SCALE**. By means of these we have a new Kind of Scale, call'd the *Semi-tone Scale*.

**SEMI-TONIC SCALE**, or the Scale of *Semi-tones*: A Scale or System of Music, consisting of 12 Degrees, or 13 Notes, in the *Octave*; being an Improvement on the *Natural* of Diatonic Scale, by inserting between each two Notes thereof, another Note, which divides the Interval or *Space* into two unequal Parts, call'd *Semi-tones*. See **SEMITONE**. The Use of this Scale is for Instruments that have fixed Sounds, as the Organ, Harpsichord, &c. which are exceedingly defective on the Foot of the *Natural*, or *Diatonic*, Scale. For the Degrees of the Scale being unequal, from every Note to its *Octave* there is a different Order of Degrees; so that from any Note we cannot find any Interval in a Series of fix'd Sounds: Which yet is necessary, that all the Notes of a Piece of Music carried through several Keys, may be found in their just *Tone*, or that the same Song may be begun indifferently at any Note, as may be necessary for accommodating some Instruments to others, or to the Human Voice, when they are to accompany each other in Unison.

The *Diatonic Scale*, beginning at the lowest Note, being first settled on an Instrument, and the Notes thereof distinguished by their Names *a. b. c. d. e. f. g.*; the inflected Notes, or *Semi-tones*, are call'd *Fifteenth Notes*, and take the Name or Letter below with a # as *c #* call'd *Sharp*; signifying, that it is a *Semi-tone* higher than the Sound of *c* in the *natural Series*, or this Mark # (call'd a *Flat*) with the Name of the Note above, signifying it to be a *Semi-tone* lower. Now  $\frac{1}{2}$  and  $\frac{1}{3}$  being the two *Semi-tones* the greater *Tone* is divided into; and  $\frac{1}{4}$  and  $\frac{1}{5}$ , the *Semi-tones* the less *Tone* is divided into; the whole *Octave* will stand as in the following Scheme, where the *Ratio's* of each Term to the next, are wrote Fraction wise between them below.

Scale of SEMI-TONES.

$$e. c. \#. d. d. \#. e. f. f. \#. g. g. \#. a. b. b. c. c. \#$$

$$\frac{1}{2} \quad \frac{1}{3} \quad \frac{1}{4} \quad \frac{1}{5} \quad \frac{1}{6} \quad \frac{1}{7} \quad \frac{1}{8} \quad \frac{1}{9} \quad \frac{1}{10} \quad \frac{1}{11} \quad \frac{1}{12}$$

For the Names of the Intervals in this Scale it may be considered, that as the Notes added to the *natural Scale* are not design'd to alter the Species of Melody, but leave it still *Diatonic*, and only correct some Defects arising from something foreign to the Office of the Scale.

of Music, viz. the fixing and limiting the Sounds: We see the Reason why the Names of the Natural Scale are continued; only making a Distinction of each into a Greater and Less. Thus an Interval of one Semi-tone is called a Lesser Second; of two Semi-tones, a Greater Second; of three Semi-tones, a Less Third; of four, a Greater Third, &c.

A second Kind of Semitonic Scale we have from another Division of the Octave into Semi-tones; which is performed by taking an Harmonical Mean between the Extremes of the Greater and Less Tone of the Natural Scale, which divides it into two Semi-tones nearly equal: Thus the Greater Tone 8 : 9 is divided into 16 : 17, and 17 : 18; where 17 is an Arithmetical Division, the Numbers representing the Lengths of Chords; but if they represent the Vibrations, the Lengths of the Chords are reciprocal, viz. As 1 : 16 :: 17 : 9, which puts the Greater Semi-tone  $\frac{17}{9}$ , next the lower Part of the Tone, and the Lesser  $\frac{16}{9}$  next the Upper, which is the Property of the Harmonical Division. After the same Manner the Lesser Tone 9 : 10 is divided into the two Semi-tones 18 : 19 and 19 : 20, and the whole Octave stands thus:

e . c . e . d . d . e . e . f . f . e . g . g . e . a . b . b . c  
 $\frac{17}{9}$   $\frac{17}{18}$   $\frac{17}{18}$   $\frac{16}{9}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$   $\frac{16}{18}$

This Scale, Mr. Salmon tells us, in the *Philosoph. Transact.* he made an Experiment of, before the Royal Society, on Chords, exactly in these Proportions, which yielded a perfect Consonor with other Instruments, touch'd by the best Hands. Mr. Malcain adds, That having calculated the Ratios thereof, for his own Satisfaction; he found more of them false than in the preceding Scale; but their Errors were considerably less, which made Amends.

SEMINAL, in Medicine, &c. Spermatic, or something belonging to the Semen or Seed. See SEED.

SEMINALIS CAPSULA, or Seed-Bag, is the Husk, that contains the Seed of any Plant.

SEMINALES Vesiculae. See VESICULAE Seminales.

SEMINAL Leaves: Much the greatest Part of all Seeds, sown in the Earth, come up, or shoot forth at first with little, plain, soft, and undivided Leaves; which, because they are usually very different from the Leaves of the succeeding Plant in Magnitude, Figure, Surface, and Position, are called *Seminal Leaves*: As the little embryonated Plant, which lies in Miniature in every Seed, is called the *Plantula Seminalis*. See PLANT and LEAF.

SEMINARY, a Place appointed for the Instruction of young Persons, destined for the Sacred Ministry, in the Duties, Ceremonies, and Offices thereof; first instituted, as *Thomasius* tells us, by St. *Augustin*. Of these *Seminaries* there are many abroad, furnish'd with Halls for the Assemblies of the Exercitants, and little Chambers, or Cells, where each Person retires, studies, and prays apart: Such is the *Seminary* of St. *Sulpitius* at Paris. The Council of *Trent* decrees, That Children exceeding 12 Years of Age, be taken, brought up, and instructed in common, to qualify them for the Ecclesiastical State; and that there be a *Seminary* of such belonging to each Cathedral, under the Direction of the Bishop. In France, the Establishment of *Seminaries* is somewhat different from the Decree of the Council. None are taken in but young People ready to study Theology, and are ordained: So that the *Seminaries* are a Kind of Houses of Probation, where the Vocation of Clerks is examined, and they prepared to receive Orders. For the Subsistence of these *Seminaries*, there are several Unions of Benefices, or else the Clergy of the Diocese are obliged to contribute to maintain them. Pope *Pius IV.* having established a *Seminary* at Rome, in Consequence of the Decree of the Council of *Trent*; by Advice of the Cardinals, it was given to the Jesuits, who have made good Use thereof—Among the Canons of St. *Augustine*, *Seminary* is us'd for a Kind of College, or School, where Pensionaries are kept, and instructed in the Classical and other Learning.

The Houses of the Society of *propaganda Fide*, established for the preparing of Ecclesiastics for Missions among Infidels and Hereticks, are also called *Seminaries*: The Principal wherof is that at Rome, called, The *Apostolical College, Apostolical Seminary, Pastoral Seminary, Seminary of the Propaganda*, &c.

SEMINATION, in Natural History, &c. the Act of sowing or shedding Seed; particularly, that of Vegetables. See SEED.

As soon as the Seed is ripe, Dr. *Grew* observes, Nature takes several Methods for its being duly Sown:

Not only by the Opening of the Uterus, but in the Make of the Seed it self. Thus, the Seeds of many Plants, which affect a peculiar Soil or Seat, as *Arum*, Poppy, &c. are heavy and small enough, without further Care, to fall directly down to the Ground. Others, that are large, and light enough to be expell'd to the Wind, are often furnished with one or more Hooks to stay them from straying too far from their proper Place: Thus, the Seeds of *Avena* have a single Hook; those of *Agrimony* and *Grofe-grass*, many; both the former loving a warm Bank, and the last a Hedge for its Support. On the contrary, many Seeds are furnished with Wings, or Feathers; partly with the Help of the Wind to carry them; when ripe; off the Plant, as those of *Ash*, &c. and partly, to enable them to make their Flight more or less abroad, that they may not, by falling together, come up too thick; and, that if one should miss a good Soil or Bed, another may hit. So the Kernels of *Pines* have Wings, though short ones; where, by they don't fly in the Air, but only flutter on the Ground. But those of *Typha*, *Dandelion*, and most of the pappous Kind, have numerous long Feathers, by which they are wafted every Way. Others are sown by being laid in springy elastic Cases, which, when they crack and burst, dart their Seed at convenient Distances: Thus, *Wood-Sorrel* having a running Root, Nature sees fit to sow the Seed at some Distance, the doing of which is effected by a white, starchy, tenacious Cover, which beginning to dry, bursts open on one Side in an Instant, and is violently turn'd inside outwards. The Seed of *Harts-tongue*, and coddled *Arimart*, is flung, or shot away, by means of a Spring, wound, or girt round the Seed-case. When the Spring is become stark and tense enough, it suddenly breaks the Case into two Halves, like linden Cups, and so flings the Seed.

Other notable Means of Semination are observed by other Authors: A Quantity of Fern-Seed, Mr. *Ray* tells us, laid in a Lamp, on a Paper, the *Seminal Vesiculae* are heard to crackle, burst, and, by a Microscope, the Seeds are seen to be projected to a considerable Distance from each other. Dr. *Snope* observes, That the *Gentiana flore Caruleae*, or Spirit Leaf, requiring wet Weather to be sown in, as soon as the least Drop of Rain touches the End of the Seed-Vessels, with a smart Noise, and a sudden Leap, it opens it self, and, with a Spring, scatters its Seed. The Plants of the *Cardamine*-Family, throw their Cods open, and dart out their Seed upon a slight Touch of the Hand. Nay, Mr. *Ray* adds, That the Pods of the *Cardamine Impatiens* not only burst upon the slightest Touch, but even by an Approach of the Hand to touch them, without any real Contact.—

Other Plants sow their Seeds by inviting Birds, by their agreeable Taste and Scent, to feed of them, swallow them, and carry them about; thereby also fertilizing them, by passing through their Bodies. In such Manner are *Nutmegs*, and *Mistletoe*, sown and propagated. See NUTMEG and MISTLETOE.

SEMITA LUMINOSA, is a Name given to a Kind of Lucid Tract in the Heavens, which, a little before the Vernal Equinox, may be seen about Six a Clock at Night, extending from the Western Edge of the Horizon, up towards the Pleiades. The Phenomenon hath been taken Notice of by *Cassini* and *Fatio*, who both evince, That this Light comes diffus'd from both Sides of the Sun: Its Brightness is much the same with that of the *Via Lactea*, or the Tail of a Comet: It is seen plainest with us about the Beginning of *October*, or the latter End of *February*. *Fatio* conjectures, That the Bodies, or rather the Congeries or Aggregate of those Bodies, which occasion a Light, doth conform to the Sun like a Lens, and takes it to have ever been the same; but, *Cassini* thinks it arises from a vast Number of small Planets, which encompass the Sun, and give this Light by Reflexion, esteeming it also not to have existed long before he observ'd it.

SENA, or *Semas*, in Medicine, a purgative Leaf, much us'd in Compositions of that Kind: The Shrub which bears it, is cultivated in several Parts of the Levant, and grows five or six Foot high. It puts forth woody Branches, furnished with Leaves on one Side: Its Flowers are yellow, and yield a Fruit in Manner of a greenish flat Pod, containing several Ledges or Cells of Seeds, resembling Grape-stones. These Pods some Physicians prefer to the Leaves themselves. There is also a Kind of *Sena* cultivated about *Florence*, but 'tis inferior to that of the Levant, as is owned by the *Italians* themselves. Father *Plumier* mentions a Third Kind growing in the *Antilles* Islands. M. *Lemery* distinguishes three Kinds of *Sena* of the Levant. The first brought from *Seydis*, called *Sena of Appalo*, that is *Cassia Sena*, by reason of the Custom paid the Grand Seignior, for the Privilege of

of exporting it. The second comes from *Tripoli*: The third is called *Sena of Mecha*. The best of these Kinds is the first, which *Pomus* directs us to chuse, in narrow Leaves, of a moderate Size, shaped like the End of a Pike, of a pale green Colour, a penetrating Smell, soft to the Touch, &c. The *Sena of Tripoli* holds the second Rank in Goodness. Its Difference from that of *Sevia*, consists in its Colour, which is green; its Smell which is very weak; and in a certain Harshness, or Roughness, which it discovers upon the Touch. Besides these three Kinds of *Sena*, and their Pods; the Druggists sell the Dust found at the Bottom of the Bales; which is a very poor Commodity; and yet much better than what they call the *Small Sena*, which comes with it in the Bales, by way of Package, and which many hold to be a Plant of no Virtue, put in by Chance, or, at best, to increase the Weight.

The best *Sena*, ordinarily found in our Shops, Dr. *Quincy* observes, is that which is sharpest leaved, and which smells freshest. The Brightness of its Colour, and Quickness of its Flavour, are the Indications of its Goodness; for when it has lost its Scent, and grows dusky, it is good for little: This Drug, at first taking, is apt to nauseate the Stomach; and therefore, if a little Cinnamon, or a Dram or two of its distilled Water, be added, it passeth thro' with less Sickness. This is exactly conformable to the Sentiments of *Lindoculus*, who says, That the purgative Quality of this Herb resides in its mucilaginous or gummy Juice; which, the more it is divided, gripes the less in its Operation. *Rulandus* imagined a Sudorific Quality to be in it; and accordingly order'd it in some Compositions of that Intention. This is so ancient in Medicine, that *Schroder* says, *Scrapion* first prescribed it.

SENATE, an Assembly or Council of *Senators*; that is, of the principal Inhabitants of a State, who have a Share in the Government. See SENATOR. As the *Senate of Rome*, of *Carthage*, &c. among the Ancients; the *Senate of Venice*, of *Genoa*, &c. among the Moderns. The *Senate of Ancient Rome*, was, of all others, the most celebrated, during the Splendor of the Republic. The *Roman Senate* exercis'd no contentious Jurisdiction. It appointed Judges, either out of the *Senate*, or among the Knights; but never choos'd to judge any Processes, in a Body. The *Senate* concerted Matters of War; appointed who should command the Armies; sent Governors into the Provinces; took Order, and dispos'd of the Revenues of the Empire. Yet did not the whole Sovereign Power reside in the *Senate*. It cou'd not elect Magistrates, make Laws, nor decide of War and Peace: But in all these Cases they were to consult the People. Under the Emperors, when the *Senate* became dispos'd of most of its other Offices; they began to judge Causes. For Causes of less Consequence they appointed particular Judges; the rest, principally Criminal Causes, they reserv'd for their own Cognizance, to be judg'd by them in a Body, and that frequently in the Emperor's Presence. This was to keep their Heads from State Affairs. *Nero* further committed to the *Senate*, the Judgment of all Appeals: But this did not hold long; nor do we find any Footsteps thereof any where but in the 62d Novel. The *Senate* assembled on certain fixed Days, viz. ordinarily on the Calends, Nones and Ides of each Month. Their extraordinary Meetings were on any other Days; when the Consul, Dictator, or Tribune, thought fit to call them. Their Place of Meeting, was either the Temple of *Concord*, at the Gate of *Capua*, or in the Temple of *Bellona*: The Consul presided at the *Senate*. Till *Augustus's* Time, the *Senate* was always open'd with a Sacrifice. But that Prince, in Lieu thereof, appointed, That each *Senator*, e'er he took his Place, shou'd offer Wine and Incense on the Altar of the God, in whose Temple they were met; and take an Oath, That he would give his Vote according to his Conscience.

*Hollastrucellus*, and other Authors, mention it as a great Defect in the Authority of the *Roman Senate*, That they had none under their Command, to execute their Orders. Hence the least Tribune had it in his Power to obstruct their Decrees; and hence it is, that when they gave their Orders to the Consuls, and Pretors, they did it with a kind of Submission, *Si eis ita videtur*; If they think fit.

SENATOR, a Member of a *Senate*. There were two Orders, or Degrees, among the *Roman Nobility*; that of the *Senators*, and that of the *Knights*: After the Two, came the *People*. The first hundred *Senators* were appointed by *Romulus*, called *Patres*. Upon the Union with the *Sabinos*, *Romulus*, or, as others say, *Tullius*, added a second Hundred, called *Patres majorum Gentium*, to distinguish them from a third Hundred added by the elder *Tarquinius*, and called *Patres minorum Gentium*. The

Number of *Senators* was not fix'd. In the Time of *Gracchus* they were 600; during the Civil Wars, they were reduced to 300. *Julius Cæsar* augmented that Number to 800 or 900; and *Augustus* brought them back again to 600. The Choice of *Senators* belong'd at first to the Kings, then to the Consuls, then to the Censors; who, in their Census or Survey, every five Years, appointed new *Senators* in lieu of those dead or degraded: At length it fell to the Emperors. Though, for a long Time, none were raised to the Dignity of *Senators*, but those most conspicuous for their Prudence, &c. yet some Regard was afterwards had to their Estate, lest the Dignity should become debas'd by Poverty. To hold the Dignity, a yearly Revenue of 800 Thousand Sesterces was required, which amounts to nearly 6000 Pounds of our Money. Half as much was required for the Knights. The *Senators* who sunk below this Revenue, were discarded, and expung'd out of the List by the Censor. The *Senators*; were ordinarily chose from among the Knights, or among such as had bore the Principal Magistratures. At first the Magistrates were taken wholly from among the *Senators*; whence *Tacitus* calls the *Senate*, The *Sennary of all Dignities*: But after the People had been admitted to Magistratures; *Senators* were taken from among such as had discharged those Offices, though, before, Plebeians. The *Senators* carried their Children with them to the *Senate*, to inform them betimes of Affairs of State: Their Children, however, had not Admittance till 17 Years of Age.

Some make a Distinction among the *Senators*. Besides the *Senators* who were allow'd to speak, and were ask'd their Sentiments, there were others, who, without speaking, or being ever asked their Opinion, were only to follow the Opinion of those they thought the most reasonable, and were hence call'd *Pediarii*. *A. Gellius* gives us another Notion of the *Pediarii*, and says, Those were thus call'd, who having never bore the Office of Curule Magistrate, were oblig'd to go to the *Senate* on foot.

The *Senators* alone were allowed to wear the Habit call'd *Laticlavus*; (which See) Had a Right to sit, and be carried in Curule Chairs; to assist at Plays, and Shews, in the *Orchestra*; at Feasts of the Gods, &c. All which Privileges were refer'd to such as *Augustus*, (in the Reform he made of the too numerous *Senate* of *Julius Cæsar*) set aside. They had the Names *Senators*, q. d. *old Men*, given them in Imitation of the *Greeks*, who call'd their *Senate* *γερουσία*. So when the *Athenians* assembled the People to consult about the Affairs of the Public; the Officers summon'd none but such as were Fifty Years Old. The *Agyptians* and *Perfians* followed the same Example, after the *Hebrews*. The *Lacedæmonians*, and *Carthaginians* received none but such as were Sixty Years of Age.

SENATUS CONSULTUM, a Vote or Resolution of the *Roman Senate*, pronounced on some Question, or some Point of Law propos'd to it. The *Senatus consultum* made a Part of the *Roman Law*, when pass'd. They were deposited in the Temple of *Ceres*, under the Custody of the *Ædiles*, and at last carried, by the Censor, to the Temple of *Liberty*, and put up in an Armory call'd *Tabularia*. See LAW.

SENESCHAL, a Name anciently us'd for a *Steward*; form'd from the *Saxon Sein*, House or Place, and *Schale*, Governor. Thus the *Seneschal* of a Baron is his Steward or Bailiff, who holds his Courts, and manages his Demefne Lands: Sub-*Seneschal*, his Under-Steward. High *Seneschal* of *England*, is the High-Steward of *England*: High *Seneschal del Hotel du Roi*, the Steward of the King's Household. The Ancients us'd the Term *Seneschalus* indifferently with that of *Dispenser*, whence we are sure it signifies *Steward*. See STEWARD.

SENSATION, the Action of perceiving external Objects, by Means of the Organs of Sense. See SENSE.

To conceive the Manner wherein *Sensation* is effected: Observe by the way, That all the Organs consist of little Threads, or Nerves; which have their Origin in the Middle of the Brain, are diffus'd thence throughout all the Members which have any Sense, and terminate in the exterior Parts of the Body: That when we are in Health, and awake, one End of these Nerves cannot be agitated, or shaken, without shaking the other; by reason they are always a little stretch'd, as is the Case of a stretch'd Cord, one Part of which cannot be stirr'd without a like Motion of all the rest. Observe, again, That these Nerves may be agitated two ways; either by the End out of the Brain, or that in the Brain. If they be agitated from without, by the Action of Objects, and their Agitation be not communicated as far as the Brain; as frequently happen in

Sleep, when the Nerves are in a State of Relaxation; the Soul does not then receive any new Sensation. But if the Nerves happen to be agitated in the Brain, by the Course of the Animal Spirits, or any other Cause; the Soul perceives something, though the Parts of those Nerves, that are out of the Brain, diffused through the several Parts of the Body, remain at perfect Rest: as likewise is frequently the Case in Sleep. Lastly, observe, by the way, that Experience tells us, we may sometimes feel Pain in Parts of the Body that have been entirely cut off; by reason the Fibres in the Brain corresponding to them, being agitated in the same Manner as if they were really hurt; and the Soul feels a real Pain in those imaginary Parts. All these Things shew evidently, that the Soul resides immediately in that Part of the Brain wherein the Nerves of all the Organs of Sense terminate: we mean, 'tis there it perceives all the Changes that happen with regard to the Objects that cause them, or that have been used to cause them; and, that it only perceives what passes out of this Part, by the Mediation of the Fibres terminating in it. See NERVE, FIBRE, &c.

These Things premised, 'twill not be difficult to explain how Sensation is perform'd; and the Manner whereof may be conceiv'd from what follows. When the Point of a Needle, for Instance, is press'd against the Hand, that Point stirs and separates the Fibres of the Flesh; which Fibres are extended from that Place to the Brain, and when we are awake, are in such a Degree of Tension as that they cannot be stirr'd without shaking those of the Brain. If then, the Motion of the Fibres of the Hand be gentle, that of the Fibres of the Brain will be so too; and if the first be violent enough to break any thing in the Hand, the last will be stronger and more violent in Proportion. In like Manner, if the Hand be held to the Fire; the little Particles of the Wood it throws off in great Numbers, and with a great deal of Violence, striking against these Fibres, and communicating a Part of their Agitation thereto; if the Action be moderate, that of the Extremities of the Fibres of the Brain corresponding to those of the Hand, will be moderate likewise: If it be violent enough to separate any of the Parts of the Hand, as it happens in Burning; the Motion of the Fibres in the Brain will be proportionably more violent. This is what befalls the Body, when Objects strike upon it. We are now to consider how the Mind is affected.

The Mind, we have observ'd, resides principally, if we may be allow'd to say so, in that Part of the Brain where all the Fibres of the Nerves terminate. It attends here, as its Sensory, or Office, to look to the Preservation of all the Parts of the Body; and, of consequence, must be here adverted of all the Changes that happen, and must be able to distinguish between those agreeable to the Constitution of the Body, and those hurtful thereto. Any other, absolute Knowledge, without a Relation to the Body, were useless. Thus, though all the Changes in our Fibres, do, in Reality, consist in Motions, which ordinarily only differ as to more and less; 'tis necessary the Soul should look on them as Changes essentially different; for though in themselves they differ but very little, yet, with regard to Preservation of the Body, they are to be look'd on as essentially different.

The Motion, for Instance, which causes Pain, frequently differs exceedingly little from that which occasions Titillation: 'Tis not necessary there should be an Essential Difference between those two Motions, but 'tis necessary there be an Essential Difference between the Pain and the Tickling those two Motions occasion in the Soul; for the Agitation of the Fibres, which accompanies the Titillation, informs the Soul of the good State of the Body, that it is able to resist the Impression of the Objects, and that it need not apprehend its being hurt: But the Motion, which occasions Pain, being somewhat more violent, is capable of breaking some of the Fibres of the Body; wherefore 'tis necessary the Soul be adverted heretofore by some disagreeable Sensation, that it may provide against it. Thus, though all the Motions which pass in the Body only differ in themselves, as to more or less, yet, when considered, with regard to the Preservation of Life, they may be said to be essentially different: For this Reason it is, that the Soul does not perceive the Shakes, or Motions themselves, which Objects excite in the Fibres of the Flesh: It would be useless to perceive them; and she would never be able, thence, to learn whether the Objects were capable of doing Hurt or Good. But she perceives herself affected with Sensations, which differ essentially, and which shewing precisely the Qualities of the Objects, as they regard the Body, make her perceive, distinctly, whether or no those Objects are capable of hurting it.

In Effect, from a strict Examination of the several Senses, it appears, that sensible Objects act no otherwise upon the Body, for the producing of Sensation, than by exciting a Change in the extreme Surface of the Fibres of the Nerves. The Quality of which Change depends on the Figure, Bulk, Hardness, and Motion of the Object; so that according to all Appearances, the most different Objects, which should agree in these Four Circumstances, would produce the same Sensation. From the various Texture of the Object; the Diversity of the Nerve affected; the different Fabric of the Organ of Sense; the different Place in the Medulla of the Brain, where the Nerve arises; and the different Degree of Motion, wherewith the Action of the Object is applied, arise various Sensations, and Ideas, in the Mind: none of which represent any thing in the Action of the Object, or in the Passion of the Organ. And yet the same Action of the same Object, on the same Organ, always produce the same Sensation or Idea: And the same Ideas necessarily follow the same Disposition of the same sensible Organ, in the same manner as if the Idea perceiv'd, were the natural and necessary Effect of the Action on the Organ. See IDEA.

SENSE, a Faculty of the Soul, whereby it perceives external Objects, by means of some Action or Impression made on certain Parts of the Body, called Organs of Sense, and propagated by them to the Sensory.

Some use the Word Sense in a greater Latitude; and define it a Faculty whereby the Soul perceives Ideas or Images of Objects, either convey'd to it from without, by the Impression of Objects themselves, or excited within by some Effort of the Soul on the Sensory it self: Under this Notion, Sense becomes distinguishable into two Kinds, *External* and *Internal*; corresponding to the two several Manners wherein the Images of the Objects perceiv'd, either are occasion'd, and presented to the Mind, *viz.* immediately from without, or from within; that is, either by what we commonly call the *Five External Senses*, *Hearing, Seeing, &c.* or by the *Internal ones*, *Imagination, Memory, and Attention*; to which some add *Hunger* and *Thirst*. But as these *Internal Senses* are not ordinarily consider'd in the Notion of Senses, nor implied under the Word Senses; but are thus only deominated from Analogy; we shall wave them to be further consider'd, under their respective Articles *IMAGINATION, MEMORY, &c.*

*External Senses*, or, simply, *The Senses*, in their general Signification, are the Means whereby the Soul apprehends, or takes Cognizance of External Objects; the Means we mean, both on the Part of the Mind, and of the Body. The Means, on the Part of the Mind, are always the same; it being one and the same Faculty, whereby we See, Hear, &c. The Means, on the Part of the Body, are different; as different as are the Objects we are concern'd to perceive: For the Being, and Well-being of the Animal, being the End, Nature had in View in giving him any Perception of external Bodies; by this, the Measure and Manner of that Perception is regulated; and we have so many Ways of perceiving, and of perceiving for many Things, as the Relation we bear to external Bodies renders necessary for the Preservation, &c. of our Being. Hence those several Organs of Sense, call'd Eye, Ear, Nose, Palate, and the universal one *Cavities*; each of which is so disposed as to give it some Representation and Report to the Mind, of the State of external Things, the Nearness, Convenience, Hurtfulness, and other Habitudes; and each of them a different one, according to the Degree, and Immediateness, &c. of the Danger, or Convenience. And hence the several Exercises of those Organs, *Hearing, Seeing, Smelling, Tasting, and Feeling*.

For the general Manner wherein our Senses act; or, more properly, the Manner wherein we become Sensible, that is, perceive external Objects; See SENSATION.

For the particular Senses, or, more properly, the particular Manners, wherein we become Sensible, by the particular Organs of Sense; See HEARING, SEEING, SMELLING, &c.

For the several Organs of Sense, ministering to the several Manners of Sensation; See EYE, EAR, NOSE, &c. *Pliny* observes, That of all the Senses, Feeling and Tasting are what Man has in the greatest Perfection: As to Seeing he is excelled by the Eagle, &c. as to Smelling, by the Vulture, &c. and as to Hearing, by the Mole, even when hid under Ground. *Nat. Hist. Lib. 10.* The Senses have been sometimes found greatly sharpened and improved by Diseases. Mr. *Boyle* mentions a Gentleman, who, during a Distemper he had in his Eyes, had his Organs of Sight brought to be so tender, that when he wak'd in the Night, he could, for a while, plainly see and distinguish Colours, and other Objects; and the same Author gives an Instance of another Person, who, after getting half-faddled with Claret, if he wak'd in

the Night, could see, for some Time, to read a moderate Print. In the *Philosoph. Trans.* N<sup>o</sup>. 312. we have an Account of *Den. Frajer*, who continued Deaf and Dumb, from his Birth to the 17th Year of his Age; when, upon recovering from a Fever, he perceived an uneasy Motion in his Brain, after which he began to hear, and, by degrees, to speak. *Grimaldi* affirms, That some Women of *Mogors* were able, by their Eyes alone, to distinguish between Eggs lay'd by black Hens, and those by white ones, *Grimaldi de Lum. & Col.*

**SENSES.** A late excellent Author, gives us a more Just, Extensive, and Philosophical Notion of *Sense*. On his Principle, *Sense* is defined, A Power of Perception; or, A Power of receiving Ideas; If what is absolutely Passive may be properly call'd a Power. On some Occasions, instead of Power, he chuses to call it, A Determination of the Mind, to receive Ideas. See **IDEA**. The Ideas thus perceived, or raised in the Mind, he calls *Sensations*.

**SENSES**, he considers, either as *Natural*, or *Moral*: and the *Natural*, either as *External*, or *Internal*; though the Distribution is chiefly founded on the common Ways of conceiving; for, in Reality, they appear to be all *Natural*, and necessary: Some Reasons, however, for the Distinction, will be shewn under the several Articles thereof.

**External SENSES**, are Powers of perceiving Ideas, upon the Presence of external Objects. On such Occasions, we find the Mind is merely Passive, and has not Power directly to prevent the Perception, or Idea, or to vary it at its Reception; as long as the Body is continued in a State fit to be acted upon by the external Object. When two Perceptions are entirely different from each other, or agree in nothing but the general Idea of Sensation; the Power of receiving those different Perceptions, are call'd *different Senses*. Thus *Seeing* and *Hearing* denote the different Powers of receiving the Ideas of Colours, and Sounds. And though Colours, as well as Sounds, have vast Differences amongst themselves; yet is there a greater Agreement among the most opposite Colours, than between any Colour and a Sound: And hence all Colours are deem'd Perceptions of the same *Sense*. All the several *Senses* seem to have their distinct Organs, except *Feeling*, which is, in some Degree, diffused over the whole Body.

**Internal SENSES**, are Powers, or Determinations of the Mind, to be pleas'd with certain Forms, and Ideas, which occur to our Observation, in Objects perceived by the external *Senses*. Of these there are two different Species, distinguish'd by the different Objects of Pleasure, viz. Pleasurable or Beautiful Forms of natural Things, and Pleasurable or Beautiful Actions, or Characters of rational Agents: Whence the *Internal Senses* become divisible into *Natural* and *Moral*; though what we call the *Internal Natural Sense*, our Author calls simply, and by way of Eminence, the *Internal Sense*.

In reflecting on our external *Senses*, we plainly see, that our Perceptions of Pleasure, or Pain, do not depend directly on our Will. Objects do not please us according as we incline they should: The Presence of some Objects necessarily please us, and the Presence of others as necessarily displeases us; nor can we, by our Will, any otherwise procure Pleasure, or avoid Pain, than by procuring the former Kind of Objects, and avoiding the latter. By the very Frame of our Nature, the one is made the Occasion of Delight, and the other of Dissatisfaction. In Effect, our sensitive Perceptions are pleasant, and painful, immediately, and without any Knowledge of the Cause of this Pleasure and Pain, or of the Manner how they excite it, or are Occasions of it, or without seeing to what farther Advantage, or Detriment, the Use of such Objects might tend. Nor would the most accurate Knowledge of these Things vary either the Pleasure, or the Pain, of the Perception; however it might give a rational Pleasure distinct from the sensible; or might raise a distinct Joy, from Prospect of further Advantage in the Object, or Aversion, from Apprehension of Evil. There is scarce any Object, which our Minds are employ'd about, but is connotated the necessary Occasion of some Pleasure or Pain. Thus we shall find our selves pleas'd with a regular Form, a Piece of Architecture, or Painting, a Composition of Notes, a Theorem, an Action, an Affection, a Character; and we are conscious that this Pleasure naturally arises from the Contemplation of the Idea then present to the Mind, with all its Circumstances, though some of those Ideas have nothing of what we call sensible Perception in them; And in those which have, the Pleasure arises from some Uniformity, Order, Arrangement, Imitation, and not from the simple Ideas of Colour, or Sound, or Mode of Extension separately consider'd.

It seems hence to follow, that when Instruction, Education, or Prejudice, of any Kind, raise any Desire or

Aversion toward an Object; this Desire, or Aversion, is founded on an Opinion of some Perfection, or Deficiency, in those Qualities, for Perception whereof we have the proper *Sense*. Thus, if Beauty be desired by one who has not the *Sense* of Sight; the Desire must be raised by some apprehended Regularity of Figure, Sweetness of Voice, Smoothness, Softness, or some other Quality perceivable by the other *Senses*; without relation to the Ideas of Colour.

The only Pleasure of *Sense*, which our Philosophers seem to consider, is that which accompanies the simple Ideas of Sensation; but there are vastly greater Pleasures in those complex Ideas of Objects, which obtain the Names of *Beautiful* and *Harmonious*. The Power, then, whereby we receive Ideas of Beauty, and Harmony, has all the Characters of a *Sense*. 'Tis no Matter, whether we call these Ideas of Beauty, and Harmony, Perceptions of the external *Senses* of Seeing, and Hearing, or not; we should rather chuse to call these Ideas an *internal Sense*, were it only for the Convenience of distinguishing them from other Sensations of Seeing and Hearing, which Men may have without Perception of Beauty and Harmony. See **PLEASURE**, **BEAUTY**, and **HARMONY**.

**Moral SENSE**, is a Determination of the Mind, to be pleas'd with the Contemplation of those Affections, Actions, or Characters of rational Agents, which we call *Virtuous*.

This *Moral Sense* of Beauty, in Actions, and Affections, may appear strange at first View: Some of our Moralists themselves are offended at it in my Lord *Shaftsbury*, as being accustomed to deduce every Approbation, or Aversion, from rational Views of Interest. Our Gentlemen of good Taste can tell us of a great many *Senses*, Tastes, and Relishes, for Beauty, Harmony, Imitation in Painting and Poetry; and may we not find, too, in Mankind, a Relish for a Beauty in Characters, in Manners? The Truth is, Human Nature does not seem to have been left quite indifferent in the Affairs of Virtue, to form to it self Observations concerning the Advantage or Disadvantage of Actions, and accordingly to regulate its Conduct. The Weakness of our Reason, and the Avocations arising from the Infirmary and Necessities of our Nature, are so great, that very few of Mankind could have found those long Deductions of Reason, which may shew some Actions to be, in the whole, advantageous, and their Contraries pernicious. The Author of Nature has much better furnish'd us for a *Virtuous* Conduct than our Moralists seem to imagine; by almost as quick and powerful Instructions, as we have for the Preservation of our Bodies: He has made Virtue a lovely Form, to excite our Pursuit of it, and has given us strong Affections, to be the Springs of each virtuous Action. See **VIRTUE**.

SENSIBLE Horizon }  
SENSIBLE Point } See { HORIZON.  
POINT.

**SENSITIVE** or **SENSIBLE Soul**, the Soul of Brutes, or that which Man is supposed to have in common with Brutes. See **SOUL**. 'Tis thus call'd, as intimating its utmost Faculty, to be that of Sensation; or, perhaps, because it is supposed to be material, and to come under our *Senses*. My Lord Bacon asserts, That the *Sensible or Brute Soul*, is plainly no more than a Corporeal Substance, attenuated by Heat, and thus render'd Invisible; or a kind of Aura or Vapour partly of an aerial, and partly a fiery Nature; endued with the Softness of Air, to be fit to receive Impressions, and with the Vigor of Fire, to communicate its Action; fed partly with oily Matters, and partly with aqueous ones; inclosed in the Body, and in the more perfect Animals; principally in the Head, moving along the Nerves; and restored and repaired by the Spirituous Blood of the Arteries. *Bac. de Augment. Scient. Lib. IV.*

**SENSITIVE-PLANTS**, a Species of Plants, call'd by the Ancients *Aëthyanthemum*, and by us *Sensitive*, *Living* or *Mimic Plants*, as giving some Tokens of *Sense*. These are such whose Frame and Constitution is so nice and tender, that at the Touch, or least Pressure of one's Hand, they will contract their Leaves and Flowers, as if sensible of the Contact. Botanic Writers mention many Kinds hereof; some of which contract with the Hand or a Stick; others with Heat, others with Cold. The Truth is, many, if not most, Vegetables expand their Flowers, Down, &c. in warm, Sun-shiny Weather, and again close them towards Evening or in Rain, &c. especially at the beginning of Flowering, whilst the Seed is yet young and tender: As is very evident in the Downs of *Dandelion*, &c. and in the Flower of the *Pimpernel*, the opening and shutting whereof are the Country-man's Weather-wiser; whereby, *Gerard* says, he foretells what Weather shall follow

follow next Day; for if the Flowers be close shut up, it betokens Rain and foul Weather; if they be spread abroad, fair Weather. *Ger. Herb. Lib. 2.*

**SENSORY**, or *Sensiferium Communis*, the Seat of the *Common Sense*; or that Part where the sensible Soul is supposed more immediately to reside. The *Sensory* is allow'd to be that Part of the Brain wherein the Nerves from all the Organs of Sense, terminate. This is generally allow'd to be about the Beginning of the *Medulla Oblongata*: *Des Cartes* will have it in the *Corrion*, or Pincal Gland. See **CONARION**. *Sir Isaac Newton* describes the *Sensory* of Animals as the Place to which the sensible Species of Things are carry'd through the Nerves and Brain; that they may be there perceiv'd by their immediate Presence to the Soul. The Organs of Sense, the same great Author observes, are not for enabling the Soul to perceive the Species of Things, in its *Sensory*; but only for conveying them thither. See **SENSE**. The Univerſe, he makes the *Sensory* of the Godhead. See **God**.

**SENTENCE**, in Law, a Judgment pass'd in Court, by the Judge, upon some Process either Civil or Criminal. *Sentences* are either Definitive, Interlocutory, Contradictory, *Uc*, of Absolution, Excommunication, &c. Superior *Uc*s either confirm or annul those of Inferior ones. See **APPEAL**. — *Three conformable Sentences*, *Tres Sententia* Conformes: In the *Revisit* Ecclesiastical Law, 'tis allow'd to Appeal Three Times; so that there must be Three conformable *Sentences* or the *Sentences* of the Judges can take effect. The first Degree of Jurisdiction is the Bishop's Official: From him an Appeal lies to the Metropolitan; and from the Metropolitan in the Primate, or immediately to the Pope. If the Appeal come from the Metropolitan to the Pope, the Pope is oblig'd to delegate Judges in *Parriens*; and then if the Three *Sentences* pass'd in these Three Stages be conformable, there is no further Appeal: but if one of them annul another, new Judges are to be required of the Pope for a Fourth *Sentence*; and thus they sometimes proceed to a Sixth, or Seventh *Sentence*. Such a Number of Jurisdictions, is found infinitely prejudicial to the Public, and vexatious to private Persons.

**SENTENCE**, in Grammar, *Uc*, a Period; or a Set of Words comprehending some perfect Sense, or Sentiment of the Mind. Every *Sentence* comprehends at least Three Words. The Business of *Pointing*, is to distinguish the several Parts and Members of *Sentences*; so as to render the Sense thereof the clearest, aptest and fullest possible. See **PUNCTUATION**.

In every *Sentence* there are two Parts necessarily required; a Noun for the Subject, and a definite Verb: Whatever is found more than these Two, affects one of them, either immediately, or by the Intervention of some other, whereby the first is affected. Again, every *Sentence* is either Simple or Compound. A *Simple Sentence* is that consisting of one single Subject, and one finite Verb: A *Compound Sentence* contains several Subjects and finite Verbs; either expressly or implicitly. A *Simple Sentence* needs no Point or Distinction; only a Period to close it; as, *A good Man loves Virtue for itself*. In a *Simple Sentence*, the several Adjuncts affect either the Subject or the Verb in a different Manner. Thus the Word *good*, expresses the Quality of the Subject, *Virtue* the Object of the Action, and, *for itself*, the End thereof. Now none of these Adjuncts can be separated from the rest of the *Sentence*: For if one be, why should not all the rest? And if all be, the *Sentence* will be miced into almost as many Parts as there are Words. But if several Adjuncts be attributed in the same manner either to the Subject or the Verb; the *Sentence* becomes *Compound*, and is to be divided into Parts.

In every *Compound Sentence*, as many Subjects, or as many finite Verbs as there are, either expressly, or implied, in many Distinctions may there be. Thus, *My Hopes, Fears, Joys, Pains, all center in you*: And thus, *Cicero, Catalus abis, exorsis, evasit, erupit*. The Reason of which *Pointing* is obvious; for as many Subjects or finite Verbs as there are in a *Sentence*, so many Members does it really contain. Whenever, therefore, there occur more Nouns than Verbs, or contrarywise; they are to be conceived as equal. Since, as every Subject requires its Verb; so every Verb requires its Subject, wherewith it may agree: Excepting, perhaps, in some figurative Dictions.

Indeed, there are some other Kinds of *Sentences* which may be rank'd amongst the *Compound* Kind, particularly the absolute *Aliter*, as 'tis call'd: Thus, *Physicians, the Disease once discovered, think the Cure half wrought*: Where the Words *Disease once discovered*, are equivalent to, *when the Cause of the Disease is discovered*. So also in Nouns added by Apposition; as, *The Scars, a hardy People, endured it all*; so also in Vocative Cases, and Interjections; as, *Thy, my Friend, you must allow me*: And, *What, for Heaven's Sake! could he be at?*

The Case is much the same, when several Adjuncts affect either the Subject of the *Sentence*, in the Verb, in

the same Manner; or at least something, whereby one of them is affected: as, *A good, wife, learned Man, is an Ornament to the Commonwealth*: Where the several Adjunctives denoting in many Qualities of the Subject, are to be separated from one another. Again, when I say, *Thy Voice, Contentance, Gesture terrified him*: The several Nominative Cases denote so many Modes of the Verb, which are likewise to be distinguished from each other. The Case is the same in Adverbs; as, *He behav'd himself modestly, prudently, virtuously*. In the first Example, the Adjuncts immediately affect the Subject; in the Third, the Verb, in the following one, another Adjunct; as, *I was a Man laden with Age, Sickness, Wounds*. Now, as many such Adjuncts as there are, so many several Members does the *Sentence* contain; which are to be distinguished from each other, as much as several Subjects, or finite Verbs. And that this is the Case in all *Compound Sentences*, appears hence; that all these Adjuncts, whether they be Verbs or Nouns, &c. will admit of a Conjunction Copulative, whereby they may be join'd together. But where-ever there is a Copulative, or Rooms for it, there a new Member of a *Sentence* begins. For the other Partitions, *Uc*, of *Sentences*; See **COLON**, **SEMICOLON**, **PERIOD**.

**SENTENCE**, is also used in Poetry, &c. for a short, pithy Remark or Reflection, containing some Sentiment of use in the Conduct of Life. As, *Discite Justitiam mori, Et non temere divos*; or, *A teneris affluere vultibus Ue*, &c. *Sentences*, *Father Boffo* observes, render Poems useful; And, besides, add, I know not what Lustre and Spirit, which pleases. But there is no Virtue which is not accompanied with some dangerous Vice. Too many *Sentences* give a Poem too Philosophical an Air; and sink it into a kind of Gravity, that is less fit for the Majesty of a Poem, than the Study of a learned Man, and the Quaintness of a Dogmatist. Such Thoughts not only contain, but inspire, a certain calm Wisdom, which is directly opposite to the Passions: It cools them, both in the Hearers and in the Speaker. Lastly, the Affectation of speaking in *Sentences*, leads a Person to trifling and impertinent Ones; Instances whereof we have, in Abundance, in *Sentences* Tragedies. *Petrarchus* recommends it to Authors, to disguise their *Sentences*, that they mayn't stand glaring above the Thread or Ground of the Discourse. See **ELLIPSES**.

**SENTIMENTS**, in Poetry, and particularly Tragedy, are the Thoughts which the Poet makes his Persons express; whether they relate to Matters of Opinion, Passions, Business or the like. The *Masters* form the Tragic Action, and the *Sentiments* explain it; discovering its Causes, Motives, &c. The *Sentiments* are to the *Manners*, what those are to the *Fable*. See **MANNERS**. In the *Sentiments*, Regard is to be had to Nature and Probability; a Madman, for Instance, must speak as a Madman; a Lover as a Lover; a Hero as a Hero. The *Sentiments*, in great measure, are to sustain the Character. See **CHARACTER**, **DICTION**, &c.

**SENTINEL**, or **SENTRY**, in War, a Soldier taken out of a *Corps de Gard* or Foot, and placed in some Post to watch any Approach of the Enemy, to prevent Surprizes; and to stop such as would pass without Orders, or without discovering who they are. *Sentinel Perdue*, is a *Sentinel* plac'd at some very advanced and dangerous Post, whence 'tis odds he never returns. The *Sentinel's* Word is, *Who is there? Qui va la? Stand, Demourer la*. The Word is Modern: 'Tis not long since they said, *To be on the Scout*, in the same Sense as we now say, *To stand Sentry*, &c. *Mevage* derives the Word a *Sentiuendo*, from perceiving.

**SEPARATION**, in Navigation, the same with what we more usually call *Departure*. See **DEPARTURE**.

**SEPARATION** of Man and Wife. See **MULIER**.

**SEPARATISTS**, a Religious Sect in England, denominated from their setting up a separate Church, in Opposition to that Establish'd by Law. At present, *Separatists*, is rather the Name of a Collection of Sects, than of any particular one; but nearer their Original, there was that Agreement among them, that one Name served them all. Their Division into *Presbyterians, Anabaptists, Independents*, &c. is a Modern Thing. *Hornius* tells us, *Hist. Eccl.* they are such as under *Edward VI. Elizabeth* and *James I.* refused to conform to the Church of England; and who were first call'd *Puritans*, then *Separatists* and *Nonconformists*. The first Leader of the *Separatists*, was *Bolton*; who, upon quitting the Party he had form'd, was succeeded by *Robert Browne*, from whom the *Separatists* were call'd *Brownists*, a Name they long retain'd: tho' *Brown* himself deserted the Sect, and, in Imitation of *Bolton*, abjured his Errors. He was succeeded by *Burrows*, who was hang'd at the Infatigation of the Bishops. Their Fourth Chief was *Johanson*, who set up a Church at *Austerley*; which afterwards divided into several Sects, at the Head of one whereof was *Johanson's* Brother, who Ex-

communicated him, and was reciprocally Excommunicated by him. Soon afterwards, a Fifth, named *Smith*, erected a like Church at *Leysen*, but it dwindled away after his Death: And *Separatist* was brought very low, when *Robinson* appeared, and rais'd its Head. He join'd the Dogma's of *Brown*, and set on foot a good Understanding among them; but was not able to unite the whole Sect. Part of them still adhered to the rigid Opinions of their old Master *Brown*, and part of them followed *Robinson*. The first retained the Old Name of *Separatist*, the latter assumed that of *Semi-Separatist*, and at length degenerated into *Independants*, which is the Name whereby they are now usually call'd, both in New and Old *England*. See INDEPENDANTS.

*Hornius* mentions another Class of *Separatists*, call'd *Semi-Separatist*, that is, *Separatist* and a Half. Some will have these to be a distinct Sect; others, the same with the *Semi-Separatist*: For 'tis added, that the *Semi-Separatist*, under pretence of taking a Medium between the *Brownists* and the Church of *England*, went further even than the *Brownists* themselves, and under the Name of *Separatist* degenerated into *Separatist* and a Half.

SEPIAE OS, Skutellish Bone: This is white and Spongy, and seems almost to be calcined by the Sun. It is rough and absterfiv, and chiefly used in Medicine as a Dentifrice.

SEPTA, in Antiquity, were Inclosures, or Rails, made of Boards; through which they went in, to give their Votes, in the Assemblies of the *Romans*.

SEPTEMBER, the Ninth Month of the Year, reckoning from *January*; and the Seventh, from the *Vernal Equinox*; whence its Name, viz. from *Septimus*, Seventh. The *Roman* Senate would have given this Month the Name of *Tiberius*; but that Emperor oppos'd it. The Emperor *Domitian* gave it his own Name *Germanicus*; the Senate under *Antoninus Pius* gave it that of *Antoninus*. *Commodus* gave it his Name *Herculeus*; and the Emperor *Tacitus*, his own Name, *Tacitus*; but these Appellations have all gone into Disuse.

SEPTEMVIR, in Antiquity. See *EVULO*. The *German* sometimes use the Word *Septemvirate*, for the Seven Electors of the Empire. See ELECTOR.

SEPTENTRIO, in Astronomy, a Northern Constellation, more usually call'd *Ursa minor*, or the little Bear, and by the People, *Charles's Wain*. See URSA MINOR. The Word is form'd from the Latin, *Septem*, as consisting of Seven Stars, and *Trianes* the *Bullocks*, which, in the Ancient Constellation, were yok'd to the Chariot.

SEPTENTRIO, in Cosmography, the same with *North*; thus call'd from the ancient Constellation *Septentrio*, one of whose Stars, is the *Pole Star*. See NORTH, POLAR STAR, &c. Hence also *Septentrional*, something belonging to the *North*; as *Septentrional Signs*; *Septentrional Parallels*, &c. those on the Northern Side of the Equator.

SEPTIER or SETIER, a French Measure, differing according to the Species of the Things measured. For Liquors, the *Septier* is the same Thing with the *Clopine* or *Half-pint*. See CLOPINE. For dry Measure, the *Septier* is very different, in different Places and different Commodities; as not being any Vesil of Measure, but only an Estimation of several other Measures. At *Paris*, the *Septier* of Wheat consists of Two Mines, the Mine of Two Minots, and the Minot of Three Bushels. See BUSHEL. Twelve *Septiers* make the *Aine*. See MINE. The *Septier* of Oats is double that of Wheat. See MEASURE.

SEPTIZON, in the Ancient Architecture, a Term almost appropriated to a famous Mansoleum, of the Family of the *Antonians*, which *Aur. Victor* tells us, was built in the Tenth Region of the City of *Rome*: being a very large insulated Building, with Seven Stages or Stories of Columns. The Plan was square; and the Upper Stories of Columns, falling back much, render'd the Pile of a Pyramidal Form; terminated a-top, with the Statue of the Emperor *Septimus Severus*, who built it. It had its Name *Septizon*, *Septizonium*, from *Septem* and *Zona*, *g. d.* Seven Zones or Girdles, by reason of its being girt with Seven Rows of Columns. Historians make mention of another *Septizon*, more Ancient than that of *Severus*, built near the *Therme* of *Antoninus*.

SEPTUAGESIMA, the First Sunday in Lent, or the Fourth Sunday before *Quadragesima*; as *Quinquagesima* is the next before *Quadragesima*, then *Sexagesima*, and *Septuagesima*: Being all Days appropriated by the Church to Acts of Penance and Mortification, by Way of Preparation for the Devotion of the *Lent* ensuing. The Laws of King *Canutus* ordained a Vacation from Judicature, from *Septuagesima* to *Quindena Pasche*. See QUINGUAGESIMA. From *Septuagesima* to the Octaves after *Easter*, Marriage is forbidden by the Canon-Law. It takes its Name from its being about 70 Days before *Easter*. Pope *Telphorus* first made it a Feast Day, and appointed Lent to commence from it. See LENT.

SEPTUAGINT, LXX, or the *Seventy*, a Term famous among Divines and Critics, for a Version of the *Old Testament*, out of *Hebrew* into *Greek*, perform'd by Seventy-two Jewish Interpreters, in Obedience to an Order of *Proculus Philadelphus*. The Ancients, till *Jerome's* Time, universally believed, that the *Seventy* were inspired Persons, not mere Translators; grounding their Belief on a fabulous History of this Version, given by *Aristeus*: Who tells us, That the High Priest *Eleazar*, chose Six Doctors out of each Tribe for this Office, which made the Number of *Seventy Two*; and that these being shut up, each in his several Cell, each translated the whole; and without seeing what any of the rest had done, they were all found to agree, to a Letter. The Word is form'd from the Latin, *Septuaginta*, the *Seventy*.

The Chronology of the *Seventy*, is an Account of the Years of the World, very different from what is found in the *Hebrew* Text, and the *Vulgate*; making the World, 1466 Years older than 'tis found in these latter. The Critics are much divided, as to the Point of Preference. *Baronius* prefers the Account of the *Seventy*; And *J. Vossius* makes an Apology for it. The Two latest and most strenuous Advocates, are Father *Peiron*, a *Bernardine*, and Father *le Quen*, a *Dominican*, the first of which defends the Chronology of the *Septuagint*, and the latter that of the *Hebrew* Text.

SEPTUM, in Anatomy, a Term literally signifying an Inclosure or Partition; applied to several Parts of the Body, which serve to separate one Part from another. The *Septum Lucidum*, is a Partition separating the Two upper Ventricles of the Brain; thus call'd, as being Transparent. See BRAIN.

*Septum Medium*, or *Coralis*, is a Separation between the Two Ventricles of the Heart. 'Tis about a Finge thick, fleshy, and of the same Substance with the Heart itself; consisting of muscular Fibres, which assist it in its Motions. Some have imagin'd it to be perforated with a great Number of Holes; but mistakenly. See HEART. *Septum Transversum*, is the Separation of the Two Bellies, or Ventrals, call'd also *Diaphragm*. See DIAPHRAGMA. *Septum Nervium*. See NOSE. *Septum Bulbi*, divides the Balb of the Urethra lengthwise. See URETHRA. *Septum Gallinaginis*. See CAPUT GALLINAGINIS. *Septum Clitoridis*, a membranous Partition running all along between the Two *Corpora Cavernosa*, from the Glans to its Divarication at the *Os pubis*. See CLITORIS. *Septum Auris*. See EAR. *Septum Testinum*. See TESTICLE.

SEPULCHER, a Tomb, or Funeral Monument; or a Place destined for the Interment of the Dead. The Term is chiefly used with regard to the Burying-Places of the Ancients: Those of the Moderns we usually call Tombs. See TOMB. Besides the usual Sepulchers for the Interment, either of the whole Body, or of the Ashes of the Body burnt; the Ancients had a peculiar Kind, call'd *Cenotaphium*; being an empty Sepulcher, made in Honour of some Person, who, perhaps, had no Burial at all; from a Superstitious Opinion, That the Souls of those who wanted Burial, wandered an Hundred Years, e'er they were admitted to pass into the *Elysian* Fields. See BURIAL, FUNERAL, &c. The Pyramids are built to serve as Sepulchers for the Kings of *Egypt*. See PYRAMID. And the *Obeisks* had generally the same Intention. See OBELISK. Sepulchers were held Sacred and Inviolable; and the Care taken thereof, deem'd a Religious Duty, grounded on the Fear of God, and the Belief of the Soul's Immortality. Those who search'd or violated them, were odious to all Nations, and severely punished. The *Egyptians* call'd their Sepulchers, *Eternal Houses*, in Contradistinction to their Houses and Palaces, which they call'd *Imi*; by reason of the short Sojourn we have in the one, in Comparison of the long Stay in the other. The *Eastern* Pilgrimages are all made with Design to visit the Holy Sepulcher, that is, the Tomb of *Jesus Christ*. No Body enters here but bare-footed, and with a World of Ceremonies. The *Turks* exact 24 Crowns of each Pilgrim, whom Devotion carries to the Holy Sepulcher.

St. SEPULCHER, or the Holy Sepulcher, an Order of Regular Canons, anciently instituted in *Jerusalem*, in Honour of the Holy Sepulcher. They ascribe their Institution to *Gosfrey of Boulogne*; who, they say, upon his raking *Jerusalem* in the Year 1099, placed Canons in the Patriarchal Church of the Holy Sepulcher, which, indeed, is true; but then they were not Regulars. In effect, 'twas *Arnold*, who, of Archbishop of the Church of *Jerusalem*, got himself elected Patriarch thereof; that in 1114, first obliged his Canons to live in Community, and to follow the Rule of *St. Augustin*. From the Holy Land, Numbers of these Canons were brought into *Europe*, particularly into *France* by *Louis the Younger*; into *England* by King *Henry*; into *Poland* by *Jaco*, a *Polish* Gentleman; into *Flanders* by the Counts thereof. But the Order was afterwards suppress'd by *Innocent VIII.* and its Effects

added to that of our Lady of *Bethlehem*, which itself ceasing, they were bestowed in 1484, on that of the Knights of *St. John of Jerusalem*. But the Suppression did not take Place in *Poland*, nor in several Provinces of *Germany*, where they still subsist: Their General is in *Poland*. Their Habit, Father *Helgot* observes, was different in different Places.

**St. SEPULCHER**, or the *Holy Sepulcher*, is also the Name of a Military Order, Establish'd in *Palatine*. Most Writers who mention this Order, carry its Institution as far back as the Time of the Apostle *St. James*, Bishop of *Jerusalem*; or at least to that of *Constantine*; pretending that *Godfrey of Boulogne*, and *Baldwin*, were only the Restorers thereof: But 'tis Antiquity is Chimerical. 'Tis not even certain, that 'twas founded so early as *Godfrey of Boulogne*, or his Successor *Baldwin*; though *Fozys* and *de Belloz*, attribute it to this latter. 'Tis certain, there was nothing but Canons in the Church of *St. Sepulcher*, till the Year 1114; and 'tis more than probable, the Knights were only instituted upon the Ruins of the Canons 400 Years after, and that by Pope *Alexander VI.* in order to excite Rich and Noble Persons to visit the Holy Places, by giving them the Title of *Knights of the Holy Sepulcher*, and to this End, instituting an Order under that Name, whereof he took the Quality of Master for himself and his Successors. *Leo X.* and *Clement VII.* granted to the Guardian of the Religions of *St. Francis*, in the Holy Land, the Power of making these Knights; which Power, first granted *Vive voce*, was afterwards confirm'd by Bull of *Pius IV.* In 1558, the Knights of this Order in *Holland*, chose *Philip II.* King of *Spain*, their Master; and afterwards his Son: But the Grand Master of the Order of *Malta* prevail'd on him to resign; and when afterwards the Duke of *Nevers* assumed the same Quality in *France*, the same Grand Master, by his Interest and Credit, procur'd a like Renunciation of him, and a Confirmation of the Union of this Order to that of *Malta*. See *MALTA*.

**SEPULCHRAL**, something belonging to *Sepulchers* or Tombs. See *SEPULCHER*. *Sepulchral* Inscriptions are the surest Monuments we have of Antiquity. See *INSCRIPTION*. *Sepulchral Lamps*, are those said to have been found burning in the Tombs of several Martyrs and others. See *LAMP*. *Sepulchral Columns*, is a Column erected on a Tomb, with an Inscription on its Shaft. See *COLUMN*.

**SEPULCHRAL**, is also the Appellation of a Sect, — *Sepulchral Hereticks*, were thus call'd, from their principal Error, which was, That by the Word *Hell*, whither the Scripture tells us *Jesus Christ* descended after his Death, they understood his *Sepulcher*. They maintained, That *Jesus Christ* only descended into Hell according to the Flesh; that this Hell was nothing else but the Grave where he was laid, and wherein his Soul could not rest. See *PARADISE*.

**SEQUEL**, **SEQUELA**, in Logic, a Consequence drawn from some preceding Proposition: As if I say, *The Human Soul is immaterial; and therefore immortal*: The last Member of the Sentence is a *Sequel* from the first.

**SEQUENCE**, in Gaming, a Series or Set of Cards following in the same Suit or Colour. A *Sequence* of Four Cards, of Five, &c. At *Piquet*, these are call'd *Fourth*, *Fifth*, &c. *Quarts*, *Quints*, &c.

**SEQUESTRATION**, in Common-Law, is the separating of a Thing in Controversy, from the Possession of both Parties, till the Right be determined by Court of Law. 'Tis of two Sorts; *Voluntary*, or *Necessary*: *Voluntary*, is that which is done by Consent of each Party. *Necessary*, is that, which the Judge doth by his Authority, whether the Parties will or not. *Sequestration*, in the Civil Law, is the Act of the Ordinary, disposing of the Goods and Chattles of one Deceased, whose Estate no Man will meddle with. A Widow is particularly said to *Sequester*, when she disclaims having any thing to do with the Estate of her deceased Husband.

Among the *Romanists*, in Questions of Marriage, where the Wife complains of Impotency in the Husband; she is *Sequester'd* into a Convent, or the Hands of Matrons, till the Process be determined.

**SEQUESTRATION** is also used, for the gathering the Fruits of a Benefice void, to the Use of the next Incumbent. In the Time of the Civil Wars, *Sequestration* was used for a Seizing of the Estates of Delinquents, for the Use of the Commonwealth.

**SEQUIN**, or **CECHIN**, a Gold Coin struck at *Venice*, and in several Parts of the Grand Seignior's States, particularly *Cairo*; which last are call'd *Turkish Sequins*, or *Cheeris*. At *Constantinople*, the Ducats struck in several Parts of *Germany*, are call'd *Hungarian Sequins*.

The Value of these *Sequins* is different; those of *Venice* exceeding those of *Turkey* and *Germany*, by one Fifteenth. In the *East-Indies* the Difference is still more

ferible: The *Venetian Sequin* being current for Four *Roupees*, and Six *Pessas*, or *g. s. 4 d. Sterling*, and the *Turkish Sequin*, only for four *Koupees*, or *g. s. 2*. See *DUCAT*. *Ablancourt* derives the Word from *Cosovan* or *Cosacovane*, as supposing the *Sequin* first struck at *Civicum*. *Ménage*, from the *Italian Zecchino*, of *Zecca*, a Town belonging to *Venice*. See *COINS*.

**SERAGLIO**, among the *Levantine*, the Palace of a Prince or Lord. At *Constantinople* they say, The *Seraglio* of the Ambassador of *England*, of *France*, &c. The Word is originally *Persian*, where it has the same Signification. The *Seraglio* is used by way of Excellence for the Palace of the Grand Seignior at *Constantinople*, where he keeps his Court, and where his Concubines are lodg'd, and where the Youth are train'd up for the chief Posts of the Empire. 'Tis a little Triangle about Two Miles round, wholly within the City, at the End of the Promontory *Chrysocheres*, now call'd the *Seraglio Point*. The Buildings run back to the Top of the Hill, from whence are Gardens that reach to the Edge of the Sea. The outward Appearance, *du Lair* tells us, is not beautiful, in regard the Architecture is irregular, being canton'd out into separate Edifices and Apartments, in manner of Pavillions and Domes. No Stranger has ever yet been admitted to the inmost Parts of the *Seraglio*. The old *Seraglio* is the Place where the Emperor's old Mistresses are kept. *Balfaz* observes, that the *Seraglio* at *Constantinople*, is only a Copy of that which *Solomon* anciently built at *Jerusalem*.

**SERAPH**, in the Hierarchy of Angels, a Spirit of the first, or highest Rank. The *Seraphs*, or rather *Seraphims*, make that Class of Angels, suppos'd to be the most inflamed with Divine Love, by their nearer and more immediate Attendance on the Throne; and communicate the Heat to the inferior and remoter Orders: Hence their Name, which is form'd from the Hebrew Root, *שׂרפ*, to burn, inflame. See *HIERARCHY*.

**SERAPHICK**, something belonging to the *Seraphim*; See *SERAPH*. Mr. *Boyle* has a Treatise of *Seraphic Love*; i. e. of the Love of God, *St. Francis*, the Founder of the *Caroliens* and *Franciscans*, is call'd the *Seraphic Father*, in Memory of a Vision he saw on Mount *Averna*, after a Fast of Forty Days, accompanied with many other Severities; when, falling into an Extasy, he saw a *Seraph* glide rapidly from Heaven upon him; which impress'd on him certain Stigmata or Marks, representing the Wounds which the Nails and the Spear made in our Saviour's Body, at his Crucifixion. In the Schools, *St. Bonaventure* is call'd *The Seraphic Doctor*, from his abundant Zeal and Fervour.

**SERENADE**, a kind of Concert given in the Night-Time by a Gallant, at his Mistress's Door, or under her Window. Sometimes it consists wholly of Instrumental Music; sometimes Voices are added; and the Pieces compos'd or play'd on these Occasions, are also call'd *Serenades*. We don't know whence the Word should derive, unless from the *French*, *Serein*, the Dew falling in the Night-Time.

**SERENA GUTTA**, in Medicine, a Disease, the same as *Amaurosis*. See *AMAUROSIS*.

**SERENE**, a Quality or Title of Honour given to certain Princes, and chief Magistrates of Republicks. The King of *England* is still'd, *The most Serene*. The Term is also applied to the Doge of *Venice*. The Pope, and the Sacred College writing to the Emperor, to Kings, or the Doge, give no other Title but that of *Most Serene*. The *Venetians* set the Title of *Serenity* above that of *Highness*. In 1646, *Wicqufort* observes, there was a Clashing between the Courts of *France* and *Vienna*; because the Emperor refused the King of *France* any other Title than that of *Serene*. Bishops anciently, were address'd under the Title of *Serene*. The Kings of *France* of the First and Second Race, speaking of themselves; give no other Quality, but *Nature Serenité*. The Emperor gives no other Title to the King of *England*, nor even to any other King, excepting the King of *France*, The King of *Poland*, and other Kings, give it to the Electors. The Emperor, writing to the Electors or other Princes of the Empire, only uses the Term *Dilection*; but in treating with them, uses *Electoral Serenity* or *Serenity* to the Electors; and *Ducal Serenity* to the other Princes.

**SERGE**, in Commerce, a Woollen cross'd Stuff, manufactured on a Loom with four Treadles, after the Manner of *Ratens*, and other cross'd Stuffs. The Goodness of *Serges* is known by the Crossing, as that of Cloths by the Spinning.

Of *Serges* there are various Kinds, denominated either from the different Qualities thereof, or from the Places where they are wrought. The most considerable is the *Louvain Serge*, now highly valued Abroad, particularly in *France*, where the Manufacture is carried on with good Success, under the Title of *Serges Façon de Londres*.

## Manufacture of London SERGES.

For Wool, the longest is chosen for the Warp; and the shortest for the Woof. E'er either Kind is used, 'tis first scour'd, by putting it in a Copper of Liqueur, somewhat more than luke-warm, compos'd of three Quarters of fair Water, and one of Urine. After having stay'd long enough therein to dissolve, and take off the Grease, &c. 'tis stirred briskly about with a Wooden Peel; taken out of the Liqueur; drain'd, and wash'd in a running Water; dried in the Shade; beaten with Sticks on a Wooden Rack, to drive out the coarser Dust and Filth; and then pick'd clean with the Hands. Thus far prepared, 'tis greas'd with Oil of Olives, and the longest Part, destined for the Warp, combed with large Combs, heated in a little Furnace for the Purpose. To clear off the Oil again, the Wool is put in a Liqueur compos'd of hot Water, with Soap melted therein: Whence being taken out, wrung, and dried, 'tis spun on the Wheel. As to the shorter Wool, intended for the Woof, 'tis only carded on the Knee, with small fine Cards, then spun on the Wheel, without being scour'd of its Oil. Note, The Thread for the Warp is always to be spun much finer, and better twist'd, than that of the Woof.

The Wooll, both for the Warp, and the Woof, being spun, and the Thread divided into Skains; that of the Woof is put on Spools (unless it have been spun upon them) fit for the Cavity or Eye of the Shuttle; and that for the Warp wound on a Kind of Wooden Bobins, to fit it for Warping. When warp'd, 'tis stiffen'd with a Kind of Size, whereof, that made of the Shreds of Parchment is held the best; and when dry, is put on the Loom.

When mounted on the Loom; the Workman raising and falling the Threads (which are pass'd through a Reed) by means of four Steps placed underneath the Loom, which he makes to act transversely, equally, and alternately, one after another, with his Feet, in Proportion as the Threads are raised and lowered, throws the Shuttle across from one Side to the other; and each Time that the Shuttle is thrown, and the Thread of the Woof cross'd between those of the Warp, strikes it with the Teeth the Threads of the Warp pass; and this Stroke he repeats twice, or thrice, or even more, till he judges the Crossing of the Serge sufficiently close: Thus he proceeds, till the Warp is all filled with Woof.

The Serge now taken off the Loom is carried to the Fuller, who fills, or soaks it, in the Trough of his Mill, with a Kind of fair Earth, for the Purpose, first parg'd of all Stones and Filth. After three or four Hours scouring, the Fuller's Earth is washed out in fair Water, brought, by little and little, into the Trough, out of which it is taken when all the Earth is cleared: Then, with a Kind of Iron Pinchers, or Pliers, they pull off all the Knots, Ends, Straws, &c. sticking out on the Surface, on either Side: Then return it into the Fulling Trough, where 'tis work'd with Water somewhat more than luke-warm, with Soap dissolved therein; for near two Hours. 'Tis then wash'd out, till such Time as the Water becomes quite clear, and there be no Signs of Soap left: Then 'tis taken out of the Trough, the Knots, &c. pull'd off, and then put on the Tenter to dry, taking Care, as full as it dries, to stretch it out both in Length and Breadth, till it be brought to its just Dimensions. When well dried, 'tis taken off the Tenter, Diced, Shorn, and Pressed. See DYING, PRESSING, and SHEARING.

SERGEANT, a Term in our Law, applied to sundry Offices. As a *Sergeant at Law*, or of the Coif, is the greatest Degree taken in that Profession; as that of a Doctor is in the Civil Law. As they are the most Learned and Experienced, there is one Court appropriated to plead in by themselves, which is the *Common-Pleas*, where the Common Law of England is most strictly observ'd; but they are not prohibited pleading in other Courts, where the Judges (who most first be *Sergeants*) call them *Brothers*. They are called by the King's Mandate, or Writ, directed to them; commanding them, under a great Penalty, to take upon them that Degree, by a Day assigned. Our of these, one is made the King's *Sergeant* (more may be) to plead for him in all Causes, especially Treason.

The *Sergeants* were anciently call'd *Servientes ad Legem*, and *Servientes Narratores*: Mr. Selden adds, That they were also call'd *Doctores Legis*; though others are of Opinion, that the Judges are, more properly, the *Doctores Legis*, and the *Sergeants*, Bachelors of Law. *Speelman* observes, That however a *Sergeant* may be richer than all the Doctors of the Commons, yet a Doctor is superior in Degree to a *Sergeant*; for the very Name

of a Doctor is *Magisterial*, but that of a *Sergeant* *Ministerial*. Hence the Doctors are seated and cover'd when they plead; but the *Sergeants* stand uncovered at the Bar, excepting for their Coif.

SERGEANT at Arms, is an Officer appointed to attend the Person of a King, An. 7. H. 8. c. 3. To Arrest Traitors, &c. and Persons of Quality offending, and to attend the Lord High-Steward, when he sits in Judgment on any Traitor. There are now Eight at Court, at 100 l. per Ann. Salary each: They are called the King's *Sergeants at Arms*, to distinguish them from others: They are created with great Ceremony; the Person kneeling before the King, his Majesty lays the Mace on his Right Shoulder, and says, *Rise up, Sergeant at Arms, and Esquire, for ever*. They have, besides, a Patent for the Office, which they hold for Life. They have their Attendance in the Presence-Chamber, where the Band of Gentlemen Pensioners wait, and receiving the King at the Door, carry the Maces before him to the Chapel-Door, whilst the Band of Pensioners stand foremost, and make a Lane for the King, as they also do when the King goes to the House of Lords. There are likewise Four others created in the same Manner; One, who attends the Lord Chancellor; a Second, the Lord Treasurer; a Third, the Speaker of the House of Commons, and a Fourth, attending the City of London. They have a considerable Share of the Fees of Honour, and travelling Charges allowed them, when in waiting, viz. Five Shillings per Day, when the Court is within Ten Miles of London, and Ten Shillings when Twenty Miles off London: They are in the Lord Chamberlain's Gift.

SERGEANTY, in War, an inferior Office of Foot, in each Company, arm'd with a Halbard, and appointed to see Discipline kept, to form Ranks, and Files, &c.

SERGEANTY, a Service anciently due to the King for the Tenure or Holding of Lands; and which could not be due to any other Lord. 'Tis divided into *Grand* and *Petty Sergeanty*. *Grand Sergeanty*, is where one holds Land of the King by Service, which he ought to do in his own Person; as to bear the King's Banner, Spear, &c. *Petty Sergeanty* is where a Man holds Land of the King, to yield him yearly some small Thing toward his Wars; as a Sword, Dagger, Bow, Spurs, &c.

*Coke*, on *Littleton*, tells us, That Sir Richard Rockeford held Lands at *Sewton*, by *Sergeanty*; to be *Vauxtraries Regis*, i. e. The King's Fore-footman, when he went into *Gajcoign*, till he had worn out a Pair of Shoos of the Price of Four-Pence. By the Statute, 22 Car. II. all Tenures of any Honours, Manors, Lands, &c. are turn'd into Free and Common Socage; but the Honorary Services of *Grand Sergeanty* are thereby continued.

SERIES, a continued Rank or Succession of Things, in the same Order, and which have some Relation or Connection with each other. — Medals are formed into *Series*, both with Regard to the Metal, and to the Subject. The different Metals of Medals, form three different *Series*, in the Cabinets of the Curious; we mean, as to the Order, and Arrangement, of the several Medals. The *Gold Series*, for Instance, of Imperials, amounts to about 1000 or 1200; that of Silver may amount to 3000; and that of Copper, in all the three Sizes, Great, Mean, and Little, to 6 or 7000. Of these, the *Series* of Middle Copper is the most complete and easily found, as it may be brought down to the Fall of the Empire in the West, and the Time of the *Paleogi* in the East. As to the Antique, the *Series* of Medals are usually formed from the Side called the *Head*. In the First Class, is dispos'd the *Series* of Kings; in the Second, that of Greek and Latin Cities; in the Third, the *Roman Consular Families*; in the Fourth, the Imperial; in the Fifth, the Deities; To which may be added a Sixth *Series*, consisting of Medals of illustrious Persons. There are also *Series* of Modern Medals; That of the Popes only commences from *Martin V.* in 1430. From that Time we have a *Series* of Papal Medals, tolerably complete, to the Number of 5 or 600. One might likewise have a *Series* of Emperors from *Charlemain*; provided one took in the current Coins: But, in Strictness, we commonly commence with *Frederick II.* in 1463. The *Series* of the Kings of France is the most numerous and most considerable of all the Modern Kings.

SERIES, in Algebra, a Rank or Progression of Quantities, increasing or decreasing in some constant Ratio; which, in its Progress, approaching still nearer and nearer some sought Value, is called a *Converging Series*, and if infinitely continued, becomes equal to that Quantity; whence its usual Appellation of *Infinite Series*: Thus  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32}$ , &c. make a *Series*, which always converges, or approaches, to the Value of 1, and infinitely continued, becomes equal thereto. See *INFINITES*.

The Doctrine and Use of *Infinite Series*, one of the greatest Improvements of the present Age, we owe to *Nic. Mercator of Holstein*, who, however, first took it from *Dr. Wallis's Arithmetic of Infinites*. It takes Place principally in the Quadrature of Curves: Where, as we frequently fall upon Quantities, which cannot be expressed by any precise definite Numbers, such as is the Ratio of the Diameter of a Circle to the Circumference, we are glad to express them by a *Series*, which, infinitely continued, is the Value of the Quantity requir'd: An Idea of the Nature, Use, &c. of *Infinite Series*, may be conceived from what follows.

Though Arithmetic furnish us with very adequate and intelligible Expressions for all rational Numbers, yet it is very defective as to irrational Ones; which are infinitely more numerous than the other; there being, for Instance, an Infinity of them between 1 and 2. Were it now required to find a Mean, proportional between 1 and 2, in rational Numbers, which alone are clearly intelligible, (the Root of 2 being certainly a very obscure Idea) we could still approach nearer and nearer to the just Value of the Quantity required, but without ever arriving at it: Thus, if for the mean Proportional between 1 and 2, or the Root of 2, we first put 1, 'tis evident we have not put enough; if we add  $\frac{1}{2}$  we put too much, for the Square of  $1 + \frac{1}{2}$  is greater than 2. If then we take away  $\frac{1}{8}$ , we shall find we have taken away too much, and if we return  $\frac{1}{32}$ , the Whole will be too great: Thus may we proceed, without ever coming at the just Quantity sought. These Numbers thus found, and those found after the same Manner to Infinity, being disposed in their natural Order, make what we call an *Infinite Series*.

Sometimes the *Series* do not proceed by alternate Additions and Subtractions, but by simple Additions, or an Infinity of Subtractions; according to the Position of the first Term. In all these *Infinite Series*, 'tis visible, that as all the Terms are only equal to a finite Magnitude, they must be still decreasing; and 'tis even convenient that they be so, as much as possible, that one may take only a certain Number of the first Terms for the Magnitude sought, and neglect all the rest.

But 'tis not irrational Numbers only, that are expressed in rational Ones, by *Infinite Series*. Rational Numbers themselves may be expressed in the same Manner: 1, for Instance, being equal to the *Series*  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$ , &c. but, there is this Difference between them, that whereas irrational Numbers can only be expressed in rational Numbers, by such *Series*; rational Ones need no such Expression.

Among *Infinite Series*, there are some whose Terms only make a finite Sum, such is the Geometrical Progression  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$ , &c. and in general, all Geometrical, decreasing Progressions: In others, the Terms make an infinite Sum; such is the Harmonical Progression  $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \dots$ , &c. 'Tis not that there are more Terms in the Harmonical, than in the Geometrical Progression, tho' the latter has no Term which is not in the former, and wants several the former has: Such a Difference would only render the two infinite Sums unequal, and that of the Harmonical Progression the greatest; the Cause lies deeper. From the received Notion of infinite Divisibility, it follows, that any finite Thing, *e.g.* A Foot is a Compound both of Finite and Infinite: Finite, as it is a Foot; Infinite, as it contains an Infinity of Parts, into which it is divisible. If these Infinite Parts be conceiv'd, as separated from one another, they will make an *Infinite Series*, and yet their Sum only be a Foot; only, no Terms are to be here put, but such as may, distinct from each other, be Parts of the same Finite Whole: Now this is the Case in the Geometrical, decreasing *Series*  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$ , &c. for 'tis evident, that if you first take  $\frac{1}{2}$  of a Foot, then  $\frac{1}{4}$  of what remains, or  $\frac{1}{8}$  of a Foot, then  $\frac{1}{16}$  of what remains, or  $\frac{1}{32}$  of a Foot; you may proceed to Infinity, still taking new decreasing Halves, all distinct from each other, and which all together only make a Foot. In this Example, we not only take no Parts but what were, in the Whole, distinct from each other; but we take all that were there; whence it comes to pass, that their Sum make the precise Whole again: But were we to follow the Geometrical Progression  $\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \dots$ , &c. that is, at first take  $\frac{1}{3}$  of a Foot, and from what remains  $\frac{1}{9}$  of a Foot, and from what still remains  $\frac{1}{27}$  of a Foot, &c. 'tis true, we should take no Parts but what were distinct from each other in the Foot; but we should not take all the Parts that were there, since we only take the several Thirds, which are less than the Halves; Of Consequence, all these decreasing Thirds, though Infinite in Number, could not make the Whole, and 'tis even demonstrat'd, that they

would only make Half: In like Manner, all the Fourthes decreasing to Infinity, would only make one Third, and all the Hundredths, only the Ninety-ninth Part; so that the Sum of the Terms of an *Infinite Series* decreasing geometrically, is not only always finite, but may even be less than any finite Quantity that can be assign'd. If an Infinite decreasing *Series* express Parts which cannot subdivide in the Whole, distinctly from each other; but such, as to take their Values, we must suppose the same Quantity taken several Times, in the same Whole; then will the Sum of these Parts make more than a Whole, nay, infinitely more; that is, the *Series* will be Infinite, if the same Quantity be taken, an Infinity of Times: Thus, in the Harmonical Progression  $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots$ , &c. if we take  $\frac{1}{2}$  of a Foot, or 6 Inches, then  $\frac{1}{4}$  Inches, 'tis evident we cannot take further  $\frac{1}{2}$  of a Foot, or 3 Inches, without taking 1 Inch more than was left in the Foot. Since then the Whole is already exhausted by the Three first Terms, we can take no more of the following Terms, without taking something already taken: And, since those Terms are infinite in Number, 'tis very possible that the same finite Quantity may be repeated an infinite Number of Times, which will make the Sum of the *Series* infinite. We say possible; for though of two *Infinite Series*, the one may make a finite Sum, and the other an Infinite; 'tis true, that there may be such a *Series*, where the Finites, having exhausted the Whole, the following ones, though infinite in Number, shall only make a finite Sum: And, in Effect, since 'tis demonstrat'd, by Geometrical Progressions, that there are *Series*, whose Sums are less than the Whole, nay, infinitely less; it follows, that there must likewise be *Series* which make infinitely more.

There are two further Remarks necessary to be made on *Series* in general. 1<sup>o</sup>. That there are some, wherein after a certain Number of Terms, all the other Terms, though infinite in Number, become each a Cypher. Now, 'tis evident, that the Sum of these *Series* is finite, and easily found; they having only an Appearance of Infinity. 2<sup>o</sup>. That the same Magnitude may be expressed by different *Series*; and may be expressed both by a *Series*, whose Sum may be found, and by another, whose Sum cannot be found.

Geometry does not labour under the same Difficulty as Arithmetic. It expresses irrational Numbers exactly in Lines, and needs not have Recourse to *Infinite Series*: Thus the Diagonal of a Square, whose Side is 1, is known to be the Root of 2. But, in some other Cases, Geometry itself is under the like Embarrass; there being some Right Lines, which cannot be expressed otherwise than by an *Infinite Series* of smaller Lines, whose Sum cannot be found: Of that Kind are the Right Lines equal to Curves; so that in seeking, for Instance, a Right Line equal to the Circumference of a Circle, we find, that the Diameter being 1, the Line sought will be  $\frac{1}{2}$  Minus,  $\frac{1}{16}$  Plus,  $\frac{1}{64}$  Minus,  $\frac{1}{256}$  Plus,  $\frac{1}{1024}$ , &c.

As to the finding of *Infinite Series*, to express Quantities sought; *Mercator*, the first Inventor of the Method, did it by Division: But Sir I. Newton and M. Leibnitz, have improved the Doctrine very considerably: The first finding his *Series* by the Extraction of Roots, and the Second by another *Series* presuppos'd.

To find a *Series* expressing a Quantity sought, by Division.

Suppose a *Series* required to express the Quotient of *b* divided by  $a + c$ . Divide the Dividend by the Divisor, as in common Arithmetic; continuing the Division till the Quotient shew the Order of the Progression, or the Law, according to which the Terms proceed to Infinity: Still observing the Rules of Subtraction, Multiplication, and Division about the changing of the Signs. The Process carried on, the Quotient will be found  $\frac{b}{a} - \frac{bc}{a^2} + \frac{b^2c^2}{a^3} - \frac{bc^3}{a^4} + \dots$ , &c. in *Infinitum*. These Four or Five Terms

thus found, both the Quotient and Manner of the Division shew, That the Quotient consists of an Infinite *Series* of Terms, whose Numerators are the Powers of *c*, whose Exponents differ from the Number of the Order by Unity, whose Denominators, are the Powers of *a*, and their Denominators equal to the Number of the Order of the Terms. *E.g.* In the Third Term, the Power of *c* is the Second in the Numerator; and the Power of *a* the Third in the Denominator.

Hence, 1<sup>o</sup>. If  $b=c$ ; and  $a=1$ ; substituting this Value for that, we have, in that Quotient  $1 - c + c^2 - c^3 + \dots$ , &c. to Infinity. Wherefore  $\frac{1}{1+c} = 1 - c + c^2 - c^3 + \dots$ , &c. In infinite —

*Ius Major*, has its Stem very straight, smooth, and mark'd with red Spots, like the Skin of a Serpent; whence, probably, as much as from its Virtues, it is, that it takes its Name. Its Root is big, round and white, covered with a thin Skin. The smaller *Serpentary* has its Stalk much like that of the larger, only its Leaves are like those of Ivy; whereas those of the larger are folded in one another, after the Manner of Bastard Rhubarb. Its Root is round and bulbous. The *Serpentary of Virginia*, called also *Viperaria*, *Dittany*, *Snake Root*, and *Conroyvus of Virginia*, has its Leaves green and large, almost in Figure of a Heart; its Fruit round, and its Root, which is of a very strong Aromatick Smell, has, at Bottom, an infinite Number of long thin Filaments, representing a Kind of Beard. 'Twas first brought into Europe from Virginia by the English, where 'tis esteemed a sovereign Antidote against the Bite of the Rattle Snake. We are told by Travellers, That this *Serpentary* does not only cure the Bite of the Rattle Snake, but that that Animal flies the Smell thereof: For which Reason the *Indians*, and other Travellers, always carry it with them on the End of a Staff, to present towards the Snake, when, by Chance, they meet it.

SERPENTINE VERSES, are such as begin and end with the same Word; as,

*Amba florescentes et albiss, Arcades Amba.*

SERPENTINE, in Chymistry, a Worm, or Pipe of Copper, or Pewter, twisted into a Spiral, and ascending from the Bottom of the Alembick to the Capital, and serving as a Refrigeratory in the Distillation of Brandy and other Liquors. See REFRIGERATORY.

SERPENTINE MARBLE, or *Sonne*, a Kind of Marble called by the Ancients *Opibites*, from the Greek *Opis*, *Serpent*, as being speckled like a Serpent's Skin. The Ground is blackish, but covered with green and yellowish Strains, Streaks, &c. exceeding hard, precious and antique. The Scarceness of the *Serpentine* makes, that 'tis only used by Way of Incrustation. The largest Pieces we know of, are some Tables in the Compartments of the Attic of the Pantheon; and Two Columns in the Church St. Lawrence in Lucina at Rome. There is also a soft Kind of *Serpentine* brought from Germany, used to make Vessels of, but not in Building.

SERPIGO, in Medicine, a kind of Herpes, popularly call'd a *Fetter* or *Ring-worm*. It consists of a Number of very small Pustules, rising close to each other, sometimes in a circular Form, with great Pain and Itching. It never comes to Digestion, and is not cur'd without Difficulty. For after it appears to have been quite extinguish'd, it frequently breaks forth again at certain Seasons of the Year. The common People use to anoint it with Ink: But where the Disease is fix'd, some Universals should be first applied. See LICHEN.

SERRATUS, in Anatomy, a Name given to several Muscles, from their Resemblance in Shape, to a *Saw*. Such are the

SERRATUS *Anticus Minor*, which ariseth thin and fleshy from the Second, Third, Fourth, and Fifth superior Ribs, and ascending obliquely, is inserted Flethy into the *Processus Coracoides* of the *Scapula*, which it draws forward. It also helps in Respiration.

SERRATUS *Anticus Major*, comes from the whole Basis of the *Scapula*, and is inserted into the seven true Ribs, and first of the false Ribs, by so many distinct Portions, representing the Teeth of a *Saw*.

SERRATUS *Posticus Superior*, ariseth by a broad and thin Tendon, from the Two inferior Spines of the *Vertebre* of the Neck, and the Three superior of the Back, and growing fleshy, is inserted into the Second, Third, and Fourth Ribs, by so many distinct Indentations. These Two help to draw the Ribs upwards, and bring them to Right Angles with the *Vertebre*; and, consequently, make the Cavity of the *Thorax* wider and shorter.

SERRATUS *Posticus Inferior*, ariseth by a broad and thin Tendon, from the Three inferior Spines of the *Vertebre* of the Back, and from the two Superior of the Loins; its Fibres, ascending obliquely, grow fleshy, and are inserted by four Indentations, into the Four last Ribs.

SERVANT, a Term of Relation, signifying a Person who owes and pays a limited Obedience for a certain Time, to another, in Quality of Master. See SLAVE. The *Roman*, besides their *Slaves*, whom they also call'd *Servi*; had another kind of *Servants*, whom they call'd *Nesii* & *Adisti*, who were such as being in Debt, were delivered up to their Creditors by the Praetor, to work out their Debt; after which they were again at Liberty. The Pope, out of his wonderful Humility, calls himself in his Bulls, *The Servant of the Servants of God*. *Servus Servorum Dei*. The first who used the Appellation, as *Dionysius* tells us, were Pope

SERPENTARY, a Medicinal Plant, called by the Ancients *Pipholochia*, and *Dracunculus*, and now by the People, *Snake Root*, and *Dragon's Warr*. The Ancients were only acquainted with Two Kinds of this Plant; the Great and the Small: But since the Discovery of America, the Botanists have added several others; as, The *Serpentary*, or *Snake Root*, of Virginia, that of Canada, and that of Brazil. They are all supposed to be Alexipharmicks, or Cosmetick-Poisons; and as such are Ingredients in Treacle. The Great *Serpentary*, called by the Ancients *Dracuncu-*

Pope Damasus and Gregory the Great; which last is said to have used it to check, by his Modesty, the Arrogance of John, Patriarch of Constantinople, who took the Title of *Oecumenical*. *Du Cange* adds, That the Title *Servant* has been taken by some Bishops, some Kings, and some Monks.

SERVITUM, in Law. See SERVICE.

SERVITISTS, the Disciples or Followers of *Michael Servet*, the Ring-leader of the *Antitrinitarians* of these last Ages. In Reality, however, *Servet* had not any Disciples; as being burnt, together with his Books, at Geneva, in 1553; But the Name *Servetists* is given to the Modern *Antitrinitarians*, because they have follow'd his Foot-steps. *Sextus Senensis* calls the *Antibaptists*, *Servetists*, and seems to use the Two Terms indifferently. The Truth is, in many Things, the ancient *Antibaptists* of *Switzerland*, &c. chimed in with *Servet*. As the Books that he wrote against the Trinity, are very rare, his real Sentiments are but little known. *M. Simon*, who had a Copy of the first Edition, lays them down at length in his Critical History. Tho' *Servet* uses many of the same Arguments against the Trinity, as the *Arians*, yet he professes himself very far from their Sentiments. He also opposes the *Scotians* in some Things; and declares his Dissent from the Opinions of *Petrus Somofatenus*, though *Sandius* mistakenly charges him with having the same Sentiments. In effect, he does not seem to have had any fix'd regular System of Religion, at least not in the first Edition of his Book against the Trinity, publish'd in 1531, under the Title of *De Trinitatis Erroribus, Libri Septem, per Michaelem Servetum, alias Reves, ab Aragonis Hispanum*. The Year following he publish'd his Dialogues on the Mystery of the Trinity. In the Preface to which last Work, he declares himself dissatisfied therewith. 'Twas on this Account he undertook another on the same Subject, of much greater Extent; which did not appear till the Year 1553, a little before his Death. Those of Geneva having seiz'd the Copies of this Edition, had it burnt; nor were there above Two or Three that escap'd; one of which was kept at *Bosfil*, where the Book was printed, but is now in the Library at *Dublin*. It was lately put to the Press, secretly, in *England*; but being discovered, the Impression was seiz'd, and destroy'd.

SERVICE, SERVITUM, in Law, a Duty which the Tenant, by reason of his Fee, owes to the Lord. See FEE. It is sometimes also call'd *Servage*. Our ancient Law-Books make divers Divisions of *Service*, viz. into *Personal*, *Real* and *Mixed*; *Military*, and *Base*; *Intrinsic* and *Extrinsic*, &c. But since the Statute 24 Car. II. whereby all Tenures are turn'd into free and common Socage, much of that Learning is set aside: Yet may it not be amiss to mention how the several Kinds of *Services* are describ'd in our ancient Law-Books.

*Personal Service*, is that to be perform'd by the *Person*; such is that due from a Slave to his Master.

*Mixed Service*, is that due from the Person, by reason of the Thing, as an Ufu-fruit, &c. Our ancient Law-Books tell us of Lands held of the King, by the Tenant's letting a Part before the King on *New-Year's Day*; others, by furnishing the King with Whores whenever he travelled that Way; others, by bringing the King a Mefs of Portage at his Coronation Feast, &c.

*Real Service*, is either *Urbane* or *Rustic*; which two Kinds differ, not in the Place, but the Thing. The first is that due from a Building or House, in whatever Place situate, whether City or Country, as the keeping a Drain, a Vista or the like. *Rustic Services*, are those due for Grounds where there is no Building; such is the Right of Passage through Ways, &c. There are also *Natural Services*: For Instance, if a Man can't gather the Produce of his Lands without passing through his Neighbour's Grounds, the Neighbour is oblig'd to allow a Passage, as a *Natural Service*. By the *Lex Scribonia*, a *Servitude* can't be acquir'd by Custom and Prescription.

*Military Service* } See { KNIGHTS SERVICE.  
*Base Service* } } VILLENAGE.

*Forinsec*, or *Extrinsic*, or *Regal Service*, was a *Service* which did not belong to the chief Lord, but to the King. 'Twas call'd *Forinsec* and *Extrinsic*, because done *foris*, out of Doors; and *extra Servitium*. We read several Grants in the *Monasticon*, of all Liberties, with the Appurtenances, *Salvo forensi Servitio*.

*Intrinsic Service*, that due to the Chief Lord from his Vassals.

*Frank Service*, a Service done by the Feudatory Tenants, who were call'd *Liberi homines*, and distinct from Vassals: As likewise was their *Service*; for they were not bound to any of those *Services*, as to Plough the Lord's Lands, &c. But only to find a Man and Horse to attend the Lord into the Army or Court. This was sometimes call'd *Liberum Servitium Armorum*.

SERVITES, an Order of Religious, denominated from a peculiar Attachment to the Service of the Virgin. The Order was founded by Seven *Florentine* Merchants, who, about the Year 1233, began to live in Community on Mount *Senar*, Two Leagues from *Florence*. In 1239; they received from the Bishop, the Rule of *St. Augustine*; with a Black Habit, in lieu of a Grey one which they had wore before. In 1251 *Bongio*, one of the Seven, of simple Prior of Mount *Senar*, was named General. The Order was approved of by the Council of the *Lateran*, notwithstanding the Decree it had pass'd to prevent the Multiplication of Religious Orders. And it was again approved by Cardinal *Raynerius*, Legat of *Pope Innocent IV*; who put it under the Protection of the Holy See. The succeeding Popes have granted it a great many Favours, particularly *Alexander IV*, and *Innocent VIII*. It has had some Reform. At present it has Twenty-seven Provinces. 'Tis become famous in *Italy*, by the History of the Council of *Trent*, of *Fran. Paolo*, a *Venetian*, who was a Religious *Servite*. *M. Hermant*, gives this Order the Name of the *Annunciante*, doubtless from this Mistake, that in some Cities of *Italy*, they are call'd *Religious of the Annunciante*, because in those Cities, their Church is dedicated under that Name. *F. Archan Gianni*, derives the Name *Servites*, *Servants* of the Holy Virgin, from hence; That when they appeared for the first Time in the Black Habit given them by the Bishop, the Sacking Children cried out; See the Servants of the Virgin. — There are also Nuns of this Order.

SERVITOR, in our Universities, a Scholar who attends or waits on another for his Maintenance there.

SERVITORS of Bills; are such Servants or Messengers, of the Marshal of the King's Bench, as were sent Abroad with Bills or Writs, to Summon Men to that Court. They are now commonly call'd *Tip-staves*.

SERVITUDE, the Condition of a Servant, or Slave: See SERVICE. Under the Declension of the *Roman* Empire; a new kind of *Servitude*, was introduced, different from that of the ancient *Romans*: It consisted in leaving the Lands of subjugated Nations to the first Owners, upon Condition of certain Rents, and servile Offices, to be paid in Acknowledgement. Hence the Names of *Servi coloni*, *ad scriptum* & *ad licti Glebe*: Some whereof were taxable at the reasonable Discretion of the Lord; others at a certain Rate agreed on; and others were inalienable, who, having no legitimate Children, could not make a Will to above the Value of Five-Pence. The Lord being Heir of all the rest; Others were prohibited marrying, or going to live out of the Lordship. Most of which *Servitudes* still subsist in one Province or other of *France*; though all abolish'd in *England*. Such was the Original of our Tenures, &c. See TENURE.

SERUM, a thin, transparent, watry Liquor, somewhat saltish, which makes a considerable Part in the Mass of Blood. The Blood consists of Two Kinds or Parts; the *Cruor*, or red Part; and the *Serum*, or whiey, limpid Part. See BLOOD. *Mr. Boyle*, and some others, have taken the *Serum* to be more ponderous than the *Cruor*; but *Dr. Jurin*, in the *Philosophical Transactions*, from repeated Experiments, assures us of the contrary. See CRUOR. The *Serum* is, in Reality, the same with the *Lympha*: 'Tis carried by the Arteries throughout the several Parts of the Body; whence it returns partly in the Veins, and partly in the Lymphatick Vessels. See LYMPHA. The Use of the *Serum* is to nourish the Parts of the Body; and to render the Chyle and Blood more Fluid. See NUTRITION. Urine and Sweat, are nothing but *Serum* drained of their Nutritious Parts, by repeated Circulations, and Secreted from the Blood in the Glands of the Kidneys and Skin. The Redundancy, and other Vices in the *Serum*, are the Cause of various Diseases. See DISEASE.

SESAMOIDEA OSSA, in Anatomy, several very small Bones, placed between the Joints of the Fingers, to fortify them; and prevent Dislocations. See FINGER. They have their Name from their Resemblance to a Grain of *Sesamum*, from *Sesamum*, and *os*, *ferm*.

SESQUI, a Latin Particle, signifying a Whole and a Half; which, joined with *Altera*, *Tertia*, *Quarta*, &c. is much used in the *Italian* Music, to express a Kind of *Ratio*'s; particularly, several Species of Triples. The *Ratio* express'd by *Sesqui*, is the Second *Ratio* of Inequality, call'd also *Super-particular Ratio*; and is, when the greater Term contains the less, once, and some certain Part, over: As 3 : 2; where the first Term contains the second once, and Unity over; which is a Quota Part of Two. Now, if this Part remaining, be just Half the less Term, the *Ratio* is call'd *Sesqui-altera*: If the remaining Part be a Third Part of the lesser Term, as 4 : 3, the *Ratio* is call'd *Sesqui-tertia*, or *Sesqui-terza*. If a Fourth Part, as 5 : 4, the *Ratio* is call'd *Sesqui-quarta*, and thus to Infinity, still adding to *Sesqui* the ordinal Number of the smaller Term. In

English,

*Figura*, we may say *Sesqui-altera*, *Sesqui-tertius*, *Sesqui-quartus*, &c.

As to the Kinds of Triples expressed by the Particle *Sesqui*, they are these: The *Greater Perfect Sesqui-altera*, which is a Triple, where the Breve is three Measures, or Minims, and that without having any Point. The *Greatest Imperfect Sesqui-altera*, which is where the Breve, when pointed, contains three Measures, and without any Point, two. The *Less Perfect Sesqui-altera*, which is where the Semi-breve contains three Measures, and that without any Point. The *Less Imperfect Sesqui-altera*, a Triple, mark'd C  $\frac{1}{2}$  where the Semi-breve, with a Point, contains three Measures, and two without. According to *Boetius*, one may likewise call the Triples  $\frac{1}{2}$  and  $\frac{1}{3}$ , *Sesqui-altera*.

The *Sesqui-clave*, is a Kind of Triple, mark'd C  $\frac{3}{8}$ , called by the *Italians* *Nonupla di Croce*, where there are 9 Quavers in every Measure or Bar, in Lieu of 8. The *Double Sesqui-quarta* is a Kind of Triple mark'd C  $\frac{2}{3}$ , called by the *Italians* *Nonupla di Semi-minime*, where there are 9 Crotchets in each Measure, instead of 4.

*Sesqui-altera*, in Geometry, and Arithmetic, is a Ratio between two Lines, two Numbers, &c. where one of them contains the other once, with the Addition of an Half. Thus 6 and 9 are in a *Sesqui-altera Ratio*, since 9 contains 6 once, and 3, which is Half of 6, over: And 20 and 30 are in the same; as 9 contains 20, and half of 20 or 10. See RATIO.

*Sesqui-suplicate Ratio*, is, when of two Terms, the greater contains the less twice, with half another over: As 15 and 6; 50 and 20. See RATIO.

<i>Sesqui-altera</i> ,	} In Music } <i>Sesqui</i> .
<i>Sesqui-clave</i> ,	
<i>Sesqui-quarta</i> ,	
<i>Sesqui-tertius</i> ,	

**SESQUIDITONUS**, in Music, a Concord resulting from the Sounds of two Strings, whose Vibrations, in equal Times, are to each other in the Ratio of 5 to 6. See DITONUS.

**SESQUADRATE**, is an Aspect, or Position, of the Planets, when at the Distance of four Signs and an Half, or 135 Degrees from each other.

**SESQUINTILE**, is an Aspect of the Planets, when 108 Degrees distant from each other.

**SESSION**, in the Schools, each Sitting, or Assembly, of a Council. In quoting Councils, we say, In such a *Session*, such a Canon, &c. *Sessio* of Parliament; is the Session, or Space, from its Meeting to its Prorogation, or Dissolution. See PROROGATION.

**SESSIONS**, a Sitting of Justices in Court, upon Commissions; as the *Sessions of Oyer and Terminer*; *Quarter-Sessions*, called *General Sessions*, or *Open Sessions*, opposite where to are *Especial*, otherwise called *Privy-Sessions*, which are procured upon some special Occasion, for the more speedy Dispatch of Justice. See QUARTER-SESSIONS. *Petit Sessions*, or *Steno Sessions*, are kept by the High-Constable of every Hundred, for the placing of Servants.

**SESTERCE**, *Sesterius*, a Silver Coin, in Use among the *Ancient Romans*, called also *Nomismus*, and sometimes *Nomismus Sesterius*. The *Sesterce* was the Fourth Part of the *Denarius*, and contained Two *As*'s, and an Half; estimated in *English Money*, at One Penny Half-penny Farthing. The *Sesterce* was at first mark'd with L L S, the two L's signifying two *Librae*, and the S Half. But the *Librarii*, afterwards, converting the two L's into an H, expressed the *Sesterce* by H S. The Word *Sesterius* was used by way of Abbreviation for *Semisesterius*, which signifies Two, and a Half of a Third; or, literally, only Half a Third: For in expressing Half of a Third, 'twas understood, that there were Two before. Some Authors make two Kinds of *Sesterces*; the *Less*, called *Sesterius*, in the Masculine Gender; and the *Great one*, called *Sesterium* in the Neuter. The First, that we have already described: The Latter containing a Thousand of the other, or 7 l. 16 s. 3 d. of our Money. Others will have any such Distinction of great and little *Sesterces*, unknown to the *Romans*. *Sesterius*, say they, was an Adjective, and signified *As Sesterius* or two *As*'s and a Half: And when used plurally, as in *Quadragesimo Sesterius*, or *Sesteria*, 'twas only by Way of Abbreviation, and there was always understood *Millia*, Thousands: This last is the more probable Opinion. To be qualified for a *Roman Knight*, an Estate of Four Hundred Thousand *Sesterces* was required; and, for a Senator, Eight Hundred Thousand. Authors mention a Copper *Sesterce*, worth about  $\frac{1}{2}$  of a Penny *English*.

**SESTERCE**, *Sesterius*, was also used in Antiquity, for a Thing, containing Two Wholes and a Half of a Thing: As *As* was taken for any Whole, or Integer. See A S.

**SESTUPLE** **SEXTUPLE**, in Music, a Kind of mix'd Triple-time. M. *Bressart* thinks, 'tis improperly thus called, and ought rather to be called *Binary-Triple*. We only find three Kinds of it in Authors; but one may add two others; the First, the Sestuple of the Semi-breve, or Triple, of 6 for 1, or Six-one. The Second, the Sestuple of Minims, or Triple of 6 for 2, or Six-two. The Third, the Triple of Semi-minim, or Triple of 6 for 4, or Six-four. The Fourth, the Sextuple of the Croma, or Triple of 6 for 8, or Six-eight. The Fifth, the Sextuple of Semi-croma, or Triple of 6 for 16, or Six-sixteen. See TRIPLE.

**SETHIANS**, or **SETHINIANS**, a Branch of the *Ancient Gnosticks*; thus called, because of their pretending to fetch their Origin from *Seth*, the Son of *Adam*, whom they called *Jesus*, and *Christ*; from an Opinion, that *Seth* and *Jesus* were the same Person, who came down from Heaven two several Times. As they had the same Philosophy with the other Gnosticks, they had numerous other Fables in their System. See GNOSTICKS. They pretended to have several Books of the *Ancient Patriarchs*; particularly, Seven of their great Master *Seth*, and one of *Abraham*, full of manifest Falsities; which yet they call *Apocalypse*, or *Revelation*. The Book called the *Little Genesis*, anciently very common in the Churches of the East, was borrow'd from them. From this Book they learn'd the Name of *Seth's* Wife, who, they say, was called *Horea*. Some imagine, they borrow'd a great many of their Fictions from the *Hellenish Jews*.

**SETON**, *Setonum*, in Chirurgery, &c. a Kind of topical Remedy, used, like a Caustery, or an Issue, to divert Fluxions from the Eyes; by making a Wound in the Skin of the Hind Part of the Neck, which is kept suppurating, by Means of a little Skain of Silk, or Cotton, pass'd through it. 'Tis also applied to such as are apt to fall into Epileptic Fits: 'Tis of more Efficacy than a common Issue, but is prescribed with much the same Intention. See ISSUE. The Operation is frequently practised on Horfes, &c. and called, by the *Friars*, *Rowelling*: See ROWEL. *Setons* evacuate with a gentle Pain; shake the nervous Kind; evacuate *Serum*, and give Vent to Repletions.

**SETER**, among Farmers. To *Setter*, is to cut the Dew-Lap of an Ox or Cow, and into the Wound to put Helleboraster, whereby an Issue is made, for all Humours to vent themselves. See ISSUE, and SETON.

**SETTING**, in Astronomy, the Occultation of a Star or Planet; or its sinking below the Horizon. Astronomers make three different Kinds of *Setting* of the Stars: *Cosmical*, *Acronical*, and *Heliacal*. The First, when the Star sets with the Sun: See COSMICAL. The Second, when it sets at the Time the Sun rises: See ACRONICAL. The Third, when it is immersed, and hid, in the Sun's Rays: See HELIACAL.

To find the Times of the *Setting* of the Sun and Stars; See GLOBE.

**SETTING**, in Sea Language. To *set the Ship by the Compass*, is to observe how the Land bears on any Point of the Compass; or, on what Point of the Compass the Sun is: Also, when two Ships sail in Sight of one another, to mark on what Point the Chafed bears, is termed, *Setting the Chafe by the Compass*.

**SEVENTH**, in Music, an Interval, called by the *Greeks* *Heptachordon*; whereof there are four Kinds: The First, The defective *Seventh*, consisting of three Tones, and 3 greater Semi-tones. The Second, called by *Zerlin*, and the *Italians*, *Semi-ditono condispente*, or *Settimo Minore*; is composed Diatonically of seven Degrees, and six Intervals, four whereof are Tones, and the rest greater Semi-tones, as from *de* to *st*; and Chromatically of ten Semi-tones, six whereof are greater, and four less: It takes its Form from the Ratio *Quadrupartiens Quintas*, as 9 to 5. The Third, called by the *Italians*, *Il Divino con Dispentate*, or *Settimo Maggiore*, is composed Diatonically, like the former, of seven Degrees, and six Intervals, six whereof are full Tones, and a single one a greater Semi-tone; so that only one major Semi-tone is wanting of the Octave: As from *ut* to *fi*, and Chromatically of twelve Semi-tones, six whereof are greater, and five less. It takes its Form, or Origin, from the Ratio of 15 to 8. The Fourth, is the redundant *Seventh*, composed of five Tones, a greater Semi-tone, and a lesser; as from *fi* to *la*: So that it only wants a Comma of an Octave; that is, so much as it wants to render its second Semi-tone greater. Hence many confound it with the Octave itself; maintaining, with good Reason, That only the three first *Sevenths* can be of any Use.

**SEVERAL-TAIL**, in Law, is that whereby Land is given, and Entailed severally to two. *R. gr.* Land is given to two Men and their Wives, and the Heirs of their Bodies begotten. The Dooce, here, have joint Estate for their two Lives yet they have *several Inheritance*

tance; for the Issue of the one shall have his Moiety, and that of the other, the other.

**SEVERANCE**, in Law, the *Sixtying*, or *Severing*, two or more that join, or are joynd, in the same Writ. As if two join in a Writ, *De Libertate Probantis*, and the one be afterwards Non-suited; here, *Severance* is permitted, so, notwithstanding the Non-suit of the one, the other may severally proceed. There is also *Severance of the Tenants* in an Issue; when one, two, or more Defendants appear upon the Writ, and not the other. And *Severance in Debt*, where two Executors are named Plaintiffs, and the one refuses to prosecute. *Severance of Caus*; *Severance of Sumsmons*; *Severance in Attaints*, &c.

**SEVERIANS**. There were Two Sects of Hereticks thus call'd: The First, who are as old as the beginning of the Third Century, were a Branch of impure Gnosticks; thus call'd from their Chief, *Severus*. The Second, were a Sect of *Acephali* or *Emulgians*. Their Leader, *Severus*, was preferred to the See of *Antioch* in 513, where he did his utmost to set aside the Council of *Chalcedon*. See *MONOTHELITES*. *Hoffman* calls these last *Severites*.

**SEWER**, in the Household, an Officer who comes to before the Meat of a King or Nobleman, to place and range it on the Table. The Word is form'd from the *French*, *Esfayer*, *Esquire*, Gentleman or Usher.

**SEWERS**, in Building, are Shores or Conduits, or Conveyances for the Guiltage and Filth of a House. Sir *Henry Wotton* advises, that Art imitate Nature in these Iggoble Conveyances, and separate them from Sight, (where there wants a running Water) into the most remote, lowest and thickest part of the Foundation, with secret Vents passing up through the Walls, to the wide Air, like Tunnels; which all the *Italian* Architects commend for the Discharge of noisom Vapours, though elsewhere little practis'd.

**SEX**, something in the Body, which distinguishes Male from Female. See MALE and FEMALE. The Number of Persons, of the two Sexes, are exceedingly well balanc'd; so that every Man may have his Wife, and every Woman her Husband. See MARRIAGE. Hermaphrodites have both the Sexes in one. See HERMAPHRODITE. 'Tis expressly forbid by the Law of *Moses*, to disguise the Sex.

**SEXAGENARY**; something relating to the Number Sixty; Particularly, a Person arriv'd at the Age of Sixty Years. Some Casuists dispense with *Sexagenaries* for not fasting; the *Papian* Law prohibits *Sexagenaries* from Marriage; because, at that Age, the Blood and Humours are frozen. The Word is form'd from the *Latin*, *Sexagenarius*.

**SEXAGENARY TABLES**, are Tables of proportional Parts, shewing the Product of Two *Sexagenaries*, or *Sexagen's*, that are to be multiplied; or the Quotient of Two, to be divided.

**SEXAGESIMA**, the Second *Sunday* before *Lent*, or the next to *Sabbath-Sunday*: So call'd, as being about the Sixtieth Day before *Easter*. *Sexagesima* is that which follows *Septuagesima*, and precedes *Quinquagesima*. See SEPTUAGESIMA.

**SEXAGESIMAL**, or *Sexagenary Arithmetic*, a Method of Computation, proceeding by Sixties: As in the Division of a Degree into 60 Minutes; of the Minute, into 60 Seconds; or the Second, into 60 Thirds, &c.

**SEXAGESIMALS**, are Fractions, whose Denominators proceed in a *Sexagesuple Ratio*; that is, the First Minute = 60, a Second = 3600, a Third, 216000. See DEGREE. Antiently there were no other than *Sexagesimals*, us'd in Astronomical Operations, and they are still retained in many Cases; though Decimal Arithmetick begins to grow in Use now in Astronomical Calculations. In these Fractions, (which some call *Astronomical*) the Denominator is usually omitted, and the Numerator only written down; thus, 4°, 59', 32", 50"', 16''', is to be read, 4 Degrees, 59 Minutes, 32 Seconds of a Degree, or 60th Part of a Minute, 50 Thirds, 16 Fourths, &c. See FRACTIONS.

**SEXTANS**: The *Romans* divid'd their As, which was a Pound of Brass, into 12 Ounces: The Ounce was call'd *Uncia*, from *Unus*; and two Ounces *Sextans*, being the sixth Part of the Pound. *Sextans* was also a Measure, which contain'd two Ounces of Liqueur: Thus, *Sextantes*, *Callise*, *Ante infimise Falerni*.

**SEXTANT**, in Mathematics, is the Sixth Part of a Circle; or an Arch, comprehending 60 Degrees. *Sextant* is particularly us'd for an Astronomical Instrument, made like a Quadrant; excepting, that its Limb only comprehends 60 Degrees: The Use and Application of the *Sextans*, is the same with that of the Quadrant. See QUADRANT. In the Observatories of *Greenwich*, and *Pekin*, are very large and extraordinary *Sextants*. See OBSERVATORY.

**SEXTARIUS**, an ancient *Roman* Measure. See MEASURE.

**SEXTILE**, is the Position, or Aspect, of the Planets, when at 60 Degrees distant; or at the Distance of two Signs from one another. It is marked thus (\*).

**SEXTON**, A Church Officer, thus call'd by Corruption of *Sacristan*, *Sogerfan*, and *Sagifian*. His Office is to take Care of the Vestils, Vettments, &c. belonging to the Church; and to serve and assist the Minister, Church-Wardens, &c. at Church: He is usually choic'd by the Parson only. The Office of *Sexton* of the *Pope's Chapel* is particularly affix'd to the Order of the Hermits of *Saint Augustin*: He is generally a Bishop, though sometimes the *Pope* only gives a Bishoprick, in *partibus*, to him he confers the Post on. He takes the Title of *Prebost* of the *Pope's Sacristy*; has the keeping of the Vestils of Gold and Silver, the Relicks, &c. When the *Pope* says Mass, the *Sexton* always tastes the Bread and Wine first. If it be in Private he says Mass; his Holiness, of two Waters gives him one to eat; and if in Publick, the Cardinal, who assists the *Pope* in Quality of Deacon, of three Waters, gives him two to eat. When the *Pope* dies, he administers to him the Sacraments of Extreme Unction, &c. and enters the Conclave, in Quality of first Conclavist.

**SEXTRY**: See SACRISTY.

**SEXTUS**, *Sextis*, in the Canon Law, is a Collection of Decretals, made by *Pope Boniface* the VIIIth; usually thus call'd from the Title, which is *Liber Sextus*; as if it were a Sixth Book added to the Five Books of Decretals, collected by *Gregory IX*. The *Sextus* is a Collection of *Papal* Constitutions, published after the Collection of *Gregory IX*, containing those of the same *Gregory*, Innocent the IVth, *Alexander* the IVth, *Urban* the IVth, *Clement* the IVth, *Gregory X*, *Nicholas III*, and *Boniface VIII*, by whose Order the Compilation was made. The Persons employ'd in making of it were *Will. de Monteger*, Archbishop of *Ambrois*; and *Berenger* Bishop of *Besiers*, and *Richard* of *Venosa*.

**SGRAFFIT**, in Painting, a Term deriv'd either from the *Italian* *Sgraffiato*, Scratch-work, or the *Greek* *σγραφο*; signifying a Method of Painting in Black and White only, not in Fresco, yet such as will bear the Weather. *Sgraffit* is both the Design, and the Painting, all in one: 'Tis chiefly us'd, to embellish the Fronts of Palaces, and other magnificent Buildings. See SCRATCH-WORK.

**SHACK**, in our Customs, a Liberty of Winter-Pasturage. In the Counties of *Norfolk*, and *Suffolk*, the Lord of the Manor has *Shack*, i. e. A Liberty of feeding his Sheep at Pleasure upon his Tenant's Lands, during the Six Winter Months. In *Norfolk*, *Shack* also extends to the Common for Hogs, in all Mens Grounds, from the End of Harvest, till Seed-time: Whence, to go a-*Shack*, is to feed at large.

**SHADOW**, SHADE, a Plan where the Light is weakened by the Interposition of some opaque Body before the Luminary. The *Shadows* of *Yew*, *Cypress*, and *Wall-nut-tree*, are held dangerous to Men: The *Shadow* of *Ash* is deadly to Serpents; for which Reason Serpents are never found under its Shade. The Doctrine of *Shadows* makes a considerable Article in Opticks, and Geography, and is the Foundation of Dialling.

**SHADOW**, in Opticks, is a Privation of Light, by the Interposition of an opaque Body. But as nothing is seen but by Light; a mere *Shadow* is invisible. When therefore we say, We see a *Shadow*; 'tis partly, that we see Bodies placed in the *Shadow*, and illuminated by Light, reflected from collateral Bodies; and partly, that we see the Confines of the Light. See LIGHT.

If the opaque Body, that projects the *Shadow*, be perpendicular to the Horizon, and the Place 'tis projected on, be Horizontal; the *Shadow* is call'd a *Right Shadow*: Such are the *Shadows* of Men, Trees, Buildings, Mountains, &c. If the opaque Body be placed parallel to the Horizon, the *Shadow* is call'd a *Verfed Shadow*; as the Arms of a Man stretched out, &c.

Laws of the Projection of SHADOWS from Opaque Bodies.

1°. Every opaque Body projects a *Shadow* in the same Direction with its Rays; that is, towards the Part opposite to the Light. Hence, as either the Luminary, or the Body changes Place, the *Shadow* likewise changes.

2°. Every opaque Body projects as many *Shadows*, as there are Luminaries to enlighten it.

3°. As the Light of the Luminary is more intense, the *Shadow* is the deeper. Hence the Intensity of the *Shadow* is measured by the Degrees of Light that Space is deprived of.

4°. If a luminous Sphere be equal to an opaque one it illumines; the *Shadow* thus latter projects, will be a Cylinder; and, of Consequence, will be propagated still equal to itself, to whatever Distance the Luminary is capable of acting: So that, if it be cut in any Place, the Plane of the Section will be a Circle equal to a great Circle of the opaque Sphere.

5°. If the Luminous Sphere be greater than the opaque one; the *Shadow* will be conical. If therefore the *Sha-*

now be cut by a Plane parallel to the Base, the Plane of the Section will be a Circle, and that so much the less, as it is a greater Distance from the Base.

6°. If the Luminous Sphere be less than the opaque one, the Shadow will be a truncated Cone: Consequently, it grows still wider and wider, and therefore, if cut by a Plane parallel to the Section, that Plane will be a Circle so much the greater as 'tis further from the Base.

7°. To find the Length of the Shadow, or the Axis of the Shady Cone, projected by a less opaque Sphere, illuminated by a larger; the Diameters of the Two, as C D, and I N; Tab. Opticks, Fig. 12. and the Distances between their Centers G M being given.

Draw I M parallel to C H; then will I M = C F; and therefore P G will be the Difference of the Semi-Diameters G C and I M. Consequently, as F G, the Difference of the Semi-Diameters is to G M, the Distance of the Centers; so is C F, the Semi-Diameter of the opaque Sphere, to M H, the Distance of the Vertex of the shady Cone, from the Centre of the opaque Sphere. If then, the Ratio of P M to M H be very small; so that M H and P H do not differ very notably, M H may be taken for the Axis of the Shadowy Cone: Otherwise the Part P M must be subtracted from it; which to find, seek the Arch L K: For, this subtracted from a Quadrant, leaves the Arch I Q; which is the Measure of the Angle I M P. Since then, in the Triangle M I P, which is rectangular at P; besides the Angle I M Q, we have the Side I M; the Side M P is easily found by plain Trigonometry.

E. gr. If the Semi-Diameter of the Earth M I = 1; the Semi-Diameter of the Sun, according to Riccioli, will be = 33; and therefore G F = 32; and of Consequence M H = 2287: Since then, M P is found by Calculation to bear a very small Ratio to M H; P H is found to be 2887 Semi-Diameters of the Earth.

Hence, as the Ratio of the Distance of the opaque Body, from the Luminous Body G M; to the Length of the Shadow M H, is constant; if the Distance be diminished, the Length of the Shadow must be diminished likewise. Consequently, the Shadow continually decreases as the opaque Body approaches the Luminary.

8°. To find the Length of the Shadow projected by an opaque Body, T S, Fig. 13, the Altitude of the Luminary; E. gr. of the Sun above the Horizon, vis. the Angle S V T, and that of the Body being given. Since, in the Rectangle Triangle S T V, we have given the Angle V, and the Side T S; the Length of the Shadow T V is had by Trigonometry. See TRIANGLE.

Thus, Suppose the Altitude of the Sun 37° 45', and the Altitude of a Tower 287 Feet; T V will be found 241 Feet.

9°. The Length of the Shadow T V, and the Height of the opaque Body T S, being given; to find the Altitude of the Sun above the Horizon.

Since, in the Rectangle Triangle S T V, the Sides T V and T S, are given; the Angle V is found thus: As the Length of the Shadow T V, is to the Altitude of the opaque Body T S, so is the whole Sine to the Tangent of the Sun's Altitude above the Horizon. Thus, if T S be 30 Foot, and T V 45; T V S will be found 33°. 41'.

10°. If the Altitude of the Luminary, E. gr. The Sun above the Horizon T V S, be 45°, the Length of the Shadow T V is equal to the Height of the opaque Body.

11°. The Lengths of the Shadows T Z and T V of the same opaque Body T S, in different Altitudes of the Luminary, are as the Co-tangents of those Altitudes.

Hence, as the Co-tangent of a greater Angle is less than that of a less Angle; as the Luminary rises higher, the Shadow decreases: Whence it is, that the Meridian Shadows are longer in Winter than in Summer.

120. To measure the Altitude of any Object, E. gr. A Tower A B, (Fig. 14.) by means of its Shadow projected on a Horizontal Plane.

At the Extremity of the Shadow of the Tower C, fix a Stick, and measure the Length of the Shadow A C; Fix another Stick in the Ground of a known Altitude D E, and measure the Length of the Shadow thereof E F. Then, as E F is to A C; so is D E to A B. If, therefore, A C be 45 Yards, and E F 5 Yards; A B will be 327 Yards.

13°. The Shadow of equal opaque Bodies have their Length proportionable to their Distances from the same Luminaries equally high. Hence, as the Opaque approaches to the Luminary; or the Luminary to the Opaque Body, the Length of the Shadow is increased; and as either of them recedes, it is diminished. Hence, from the different Lengths of Shadows of the same opaque Bodies at the same Height of the Sun, Moon, Jupiter, Venus, &c. we may gather their different Distances from the Earth; tho' not accurately enough for Astronomical Purposes. See DISTANCES.

14°. The Right Shadow is to the Height of the opaque Body, as the Co-sine of the Luminary, to the Sine.

15°. The Altitude of the Luminary being the same in both Cases, the opaque Body A C, (Fig. 15.) will be to the *versed Shadow* A D, as the *right Shadow* E B, to its opaque Body D E.

Hence, 1°. The opaque Body is to its *versed Shadow*, as the Co-sine of the Altitude of the Luminary to its Sine; Consequently, the *versed* A D is to its opaque Body A C, as the Sine of the Altitude of the Luminary to its Co-sine. 2°. If D B = A C; then will D B be a mean Proportional between E B, and A D; that is, the Length of the opaque Body is a mean Proportional between its *right Shadow* and *versed Shadow*, under the same Altitude of the Luminary. — 3°. When the Angle C is 45°; the Sine, and Co-sine are equal; and therefore the *versed Shadow* equal to the Length of the opaque Body.

15°. A *right Sine* is to a *versed Sine* of the same opaque Body, under the same Altitude of the Luminary, in a Duplicate Ratio of the Co-sine, to the Sine of the Altitude of the Luminary.

*Right and versed Shadows*, are of considerable Use in Measuring; as by their Means we can commodiously enough measure Altitudes, both accessible and inaccessible, and that too when the Body does not project any Shadow. The *right Shadows*, we use when the Shadow does not exceed the Altitude; and the *versed Shadows*, when the Shadow is greater than the Altitude. On this Footing, is made an Instrument call'd the *Quadrat or Line of Shadows*; by means whereof the Ratios of the *right and versed Shadow* of any Object, at any Altitude, are determin'd. This Instrument is usually added on the Face of the Quadrant. Its Description and Use, see under the Article QUADRANT.

SHADOW, in Geography. The Inhabitants of the Globe are divided, with Respect to their Shadows, into *African*, *Ambrosian*, *Heterosian*, and *Perisic*. The first are such as at a certain Season of the Year have no Shadows at all, while the Sun is in the Meridian. See ASCII. The second are such, whose Meridian Shadow, at one Season of the Year looks to the North, and at another to the South. See AFRICAN. The third are such, whose Shadows constantly tend either to the North or South. See HETEROSIAN. The last are those, whose Shadows, in one and the same Day, successively tend to all the Points. See PERISIC.

SHADOW, in Painting, an Imitation of a real Shadow, effected by gradually heightening, and darkening the Colours of such Figures, as by their Dispositions cannot receive any direct Rays from the Luminary, supposed to enlighten the Piece. The Management of the Shadows and Lights, makes what the Painters call the *Clair obscur*: The Laws whereof see under the Article CLAIR-OBSCUR.

SHADOW, in Perspective. The Appearance of an opaque Body, and a luminous one, whose Rays diverge, (E. gr. as Candle, Lamp, &c.) being given; To find the just Appearance of the Shadow according to the Laws of Perspective: The Method is this. From the Luminous Body, which is here considered as a Point, let fall a Perpendicular to the Perspective Plane or Table; i. e. Find the Appearance of a Point upon which a Perpendicular drawn from the Middle of the Luminary, falls on the Perspective Plane; and from the several Angles, or rais'd Points of the Body let fall perpendicular to the Plane. These Points whereon these Perpendiculars fall, connect by right Lines, with the Point upon which the Perpendicular let fall from the Luminary, falls. And continue the Lines to the Side opposite to the Luminary. Lastly, thro' the rais'd Points, draw Lines thro' the Centre of the Luminary, intersecting the former; the Points of Intersection are the Terms or Bounds of the Shadow.

E. gr. Suppose it required to project the Appearance of the Shadow of a Prism, A B C F E D (Tab. Perspective Fig. 8.) Scenographically delineated: Since A D, B E, and C F, are perpendicular to the Plane, and L M is likewise perpendicular to the same; (for the Luminary is given, if its Altitude L M be given) Draw the right Lines G M and H M, thro' the Points D and E. Thro' the rais'd Points A and B, draw the right Line G L and H L, intersecting the former on G and H. Since the Shadow of the right Line A D terminates in G; and the Shadow of the right Line B E in H; and the Shadows of all the other right Lines conceived in the given Prism are comprehended within these Terms; G D E M will be the Appearance of the Shadow projected by the Prism.

SHAFT, in Building: the Shaft of a Column, is the Body thereof; thus call'd from its Straightness: but by Architects more frequently the Foot. See FOOT. Shaft, is also used for the Spire of a Church Steeple. See SPIRE. And for the Tunnel of a Chimney. See CHIMNEY.

SHAFT of a Mine, is the hollow Entrance into a Mine, which is sunk or dug to come at the Ore. In the Tin-Mines, after this is sunk about a Fathom, they leave a little, long, square Place, which is call'd a *Shanable*.

SHAGREEN. See CHAQUREN.  
SHALLOP or SLOOP, is a small light Vessel, with only a small Main-mast, and Fore-mast, and Lug-Sails, to hale up, and

and let down, on Occasion: They are commonly good Sailors; and are often used as Tenders upon a Man of War.

**SHAMADE.** See **CHAMADE**.  
**SHAMOY,** or **SHAMMY.** See **CHIAMOIS**.  
**SHANKER,** in Medicine, a malignant Ulcer, which gnaws and eats the Flesh; usually occasioned by some Venereal Disorder. See **CARCINOMA**.

**SHARP,** in Music, a kind of artificial Note or Character, (thus form'd  $\sharp$ ) which being prefix'd to a Note, shews that it is to be sung or play'd a Semi-tone, or half a Note higher than the natural Note would have been without. When the Semi-tone takes the Name of the natural Note next above it, 'tis mark'd with a Character call'd a Flat. See **FLAT**. 'Tis different, in the Main, which of the Two be us'd, tho' there are sometimes particular Reasons for the one rather than the other. See **SEMITONE**. The Use of Flats and Sharps, is by way of Remedy to the Deficiencies of the fixed Scales of Instruments. See **SCALE**.

**SHARPING CORN,** is a customary Present of Corn, which at every Christmas, the Farmers, in some Parts of England, make to their Smith, for sharpening their Plough-irons, Harrow tines, &c.

**SHEADING,** is a Riding, Tything, or Division in the Isle of Man; the whole Island being divided into Six *Sheadings*; in every one of which, is a Coroner or chief Constable.

**SHEATHING** of a Ship is the casing that Part of her Hull, which is to be under Water, with something to keep the Worms from eating into her Planks. It is usually done with laying Tar and Hair mix'd together all over the old Plank, and then nailing on this new Boards: But this hinders a Ship's sailing, and therefore late some have been sheathed with mill'd Lead, which is much smoother, and consequently better for sailing, and also more cheap and durable than the other Way. It was first invented by Sir Philip Howard, and Major Watfow.

**SHEERING,** in the Woollen Manufacture, the *Sheer-man's* Craft or Office; or the cutting off, with large *Sheers*, the too long and superfluous Nap, or Shag found on the Surface of Worsted Stuffs, Fustians, Cottons, &c. in order to make them more smooth and even. Stuffs are *Sheer'd* more or fewer Times, according to their Quality and Fineness. See **CLOTH**.

Some use the Phrase *Steering of Hats*, for the passing of Hats made of Wool, over the Flame of a clear Fire made of Straw, or Spray, to take off the long Hairs. Others call this *Flaming* and others *Steeking*. Other Hats, as Castors, Semi castors, &c. are *Sheer'd*, by rubbing them over with Pumice-stone. See **HAT**.

**SHEERING,** is also the Sea Term for the Motion of a Ship, when she is not steer'd steadily; in which case she is said to *Steer* or go *Steering*. When she lies at Anchor, near Port, &c. by reason of the swift running of a Tide Gate, &c. she is said to be in danger of *Steering home her Anchor*, or *Steering a shore*.—*Steer-books*, are large Iron Hooks, used when a Ship designs to Board another.—*Steer-banks*, is a kind of Knot, by which they tie up and fling a Runner when it is too long.

**SHEKEL,** an ancient Hebrew Coin, equal to Four *Attick Drachmas*, or Four *Roman Denarii*; amounting to 2 s. 6 l. Sterling. In the Bible, the *Shekel* is sometimes also render'd *Solidus*, and sometimes *Stater*. The Jewish Doctors are in great doubt of the Weight of the *Shekel*, and 'tis only by Conjecture, and by the Weight of the Modern *Shekel*, that the Ancient one is judg'd equal to Four *Attick Drachmas*. See **BUDEVS**. Father *Saucier*, has described several of these *Shekels*, in his Dissertation on the Hebrew Medals. By the Way he observes, that the Third and Fourth Parts of a *Shekel*, described by *Weserus de Ant. Num. Heb.* are Counterfeits of that Author.

The Hebrew *Shekel*, according to *F. Morfeus*, weighs 268 Grains, and is composed of 20 Oboli, each Obolus weighing 16 Grains of Wheat. This, he says, is the just Weight, as he found by Weighing one in the French King's Cabinet. He adds, that such as come short of this Weight, have been filed or clip'd. Bishop *Cumberland* tells us, he has weigh'd several, and always found them near the Weight of a *Romanus Half-ounce*. Some are of Opinion, that the Hebrews had two Kinds of *Shekels*: The Common, or Profane *Shekel*, call'd *Didrachmas*, and the *Shekel of the Sanctuary*, which last they may have double the former. By this Expedient they think we may get clear of some Difficulties occurring in Scripture, where Things are mentioned as of Incredible Weight; particularly that Passage where 'tis said, That every Time *Ab-salom* cut off his Hair, the Weight whereof used to incommode him; he cut off the Weight of 200 *Shekels*. But *Villafrausius* will not hear of it; nor does Bishop *Cumberland*, *M. Morin*, &c. take the Opinion to have any Foundation. The Profane *Shekel*, or *Shekel of Four Drachmas*, they agree, was the same with the *Sacred Shekel*; and 'twas only

so call'd, because the Standard thereof was kept in the Sanctuary, by the Priests. 'Tis pretended by others, that the Jews had a Gold *Shekel* of the same Weight with the Silver one. The *Shekel* is supposed to have been first struck in the Desert, at the Rate of 100 to the *Attick Mina*, weighing 160 Grains of Wheat, and currant for 10 Geranis or Oboli. But afterwards they were struck of double that Weight. Some will have the *Shekel* the oldest Piece of Money in the World, as being in Use in *Abraham's* Time; but this was not Coin'd, or Stamp'd; nor had any other Value besides its Intrinsic Worth. See **MONEY**. *Xenophon* mentions *Shekels*, as current in *Arabia*: *Du Coze* says the same of *England* and *Germany*. The Word is form'd from a Hebrew Word, signifying to Weigh.

**SHELL,** is what the Miners (especially in Tin Mines) call the *Foss-Country*; by which they mean, an imaginary Surface of the Earth, which, at the Concoction of Waters at the Deluge, was never mov'd; and to the *Shell*, they think, all the Loads or Mineral Veins at first lay even, and parallel; tho' after the Flood, some were elevated, some depressed. And by *Shell-foo*, they mean that hard Surface or Coast of the Earth which lies under the Mould, usually about a Foot deep; for they suppose, that since the Flood, the Earth hath gotten a new Coat of Vegetable Earth, or such as is made by the Corruption of Vegetables and Animals. See **DELUGE** and **STRATA**.

**SHELL,** in Natural History, a hard Crust, serving to cover and inclose a kind of Animals, hence call'd *Testacents*.

Naturalists have been generally mistaken in the Manner of the Formation of *Shells*. The Animal and its *Shell* have been always supposed to arise from the same Egg. But *M. Reaumur* has shewn the Supposition to be false. He has found, by sure Experiments, that the *Shells* of Garden Snails are form'd of a Matter which perspires from their Bodies, and hardens and condenses in the Air. 'Tis certain, that all Animals perspire, and are encompass'd with a kind of Cloud or Atmosphere, which exhales from them, and, in all Probability, assumes pretty nearly their external Figure. Snails have nothing peculiar in this respect; unless that the Atmosphere of their Perspiration, condenses and hardens about them, and forms a visible Cover, whereof the Body is the Mould or Model; whereas that of other Animals is evaporated and lost in Air. This Difference arises from the different Substance perspired; That coming from Snails, is viscous and stony. This is no Supposition; but a Matter of Fact, which *M. Reaumur* has well proved by Experiments.

On this Principle, tho' the *Shell* served the Animal as an universal Bone, yet it does not grow like a Bone, nor like any of the other Parts, by Vegetation; that is, by a Juice circulating within itself; but by an external Addition of Parts laid one over another; as is commonly supposed of Stones. But, to consider the Thing more particularly; it is to be remembered, that the Snail's Head is always at the Aperture of the *Shell*, and its Tail in the Tip or Point of the *Shell*; and that its Body is naturally turn'd into a Spiral Form, the different Folds whereof are in different Planes. This supposed: Take the Snail just hatch'd; As the Matter it perspires petrifies around it, there must be first form'd a little Cover, proportion'd to the Bigness of its Body; And as its Body is yet too little to make a Fold of a Spiral, at least a whole Fold; this Cover will only be the Centre, or, at most, the first Beginning of a little Circle of a Spiral. But the Animal grows; If, then, it ceas'd to perspire, 'tis evident, all that is added to its Body, would remain naked; but as it continues to perspire, it makes itself a Cover in proportion as it needs it. Thus is an entire Fold of a Spiral form'd; and thus is a Second and a Third; and still every new Fold is bigger than the last, in regard the Animal grows in Thickness, at the same Time as it grows in Length. When the Animal ceases to grow, yet it does not cease to perspire; Accordingly, the *Shell* continues to grow thicker, though not longer.

**SHELLS** make a considerable Article in the Cabinets of the Curious: The finest and rarest are these that follow; viz. The *Popul Crown*, which takes its Name from its Form, and which is all streak'd with Red on a White Ground. The *Feather, Pinna*, whose Whiteness, with its Carnation Stains, have an admirable Effect. The *Hebrance*, which, on a Ground as white as Snow, has Spots as black as Jet, much resembling Hebrew Characters. The *Chinese Snail*, which has a Green and Black Embroidery, on a dark Brown Ground. The *Cloth of Gold*, remarkable for an admirable Texture of Yellow, Brown and Black. The *Cloth of Silver*, which does not come behind that of Gold in Beauty. The *Leopard*, which is all speckled. The *Tiger*, whose Spots exceed those of the *Leopard*. The *Hart's-horn*, which has black Stains on a white Ground. The *Porphy*, thus call'd from its Figure; it is embroider'd with Three or Four Colours. The *Dial*: The *Caterpillar*, both denominated from their Forms. The *Nerites*, *White Nautilus*, *Lepasis*, *Apparays*, *Tuba*, *Gales*, &c.

In *Abrucant*, *Gefner* and *Fabius Columna*, we have all that the Ancients have laid on the Subject of *Shells*. In 1622, Dr. *Lifter* publish'd a Natural History of *Shells*, in Folio, full of Cuts, representing the various Kinds of *Shells*. Under the first Class, he ranges the Terrestrial or Land *Shells*; In the Second, the Fresh-water *Shells*, both those call'd *Turbinata*, and those *Bivalvia*. In the Third he disposes all the Sea *Shells*, the *Bivalvia* and *Multivalvia*; and in the Fourth, he divides, into several Classes, the Sea *Shells*, call'd *Turbinata*.

*Shells* are frequently found under the Ground, in Places far remote from the Sea, in Mines, and even in the Tops of Mountains: but how they should come there, is a Thing the Naturalists are greatly divided about. The most usual and easy Opinion is, That those Parts were formerly Sea, or at least have been over-flown thereby; and many even go as high as the grand Deluge. See *DELUGE*. But others take them to be the natural Places of their Birth or Formation; some of them being found no other than raw Clay; others of the same Texture with the Rock where they grow; and others of as absolute a *Shelly* Substance, as any in the Sea. In effect, they may be only so many different Gradations of Nature, which can as well produce *Shells* in Mines, as in the Sea; there being no want of Saline or Earthy Particles for the Purpose: nor is there any great Difference between some Sorts of *Spars*, and Sea *Shells*. See *SPAR*.

Dr. *Lifter* judges, that *Shells* found in Stone-Quarries, were never any Part of an Animal; and gives this Reason for it; That Quarries of different Stone, yield quite different Species of *Shells*; different not only from one another, but from any Thing in Nature besides, which either Sea or Land does yield. See *FOSILS*.

*SHELL-FISH*, a collective Name for all Fishes naturally inclosed in *Shells*. See *TESTACEOUS*. *Zoocrus* observes, That *Shell Animals* have no Diversity of Sex; that they lay no Eggs, as having no Blood; and that if they have any thing that appears analogous to Eggs, 'tis rather something that serves for Nutrition, than for Generation.

*SHERIFF*, or *Sherif*, or *Shire-reeve*, an Officer in each County of *England*, whose Business is to see to the Execution of the King's Orders, and all Writs directed to him out of the King's Courts; To impanel Juries; to bring Causes and Criminals to Trial; to take Care of the Dispatch of Affairs both Civil and Criminal; to collect the Revenues, Impôts, Fines, Confiscations, &c. arising in his County, for which he accounts to the Exchequer; and to attend and assist the itinerant Judges. The *Sheriff* is, as it were, the Soul of the Policy of the County; and the Preserver of the Peace thereof. His Office only lasts one Year. The *Sheriff* was anciently those by the People in the County Court, as Knights now are for Parliament; but he is now nominated by the King. In order to which, the itinerant Judges every Year nominate Six Persons for each County; whereof, the Lord Chancellor, Treasurer, Privy Council, &c. assembled in the Exchequer Chamber, make Choice of Three; out of which Number, the King chooses One. Only the County of *Middlesex* has Two *Sheriffs* chose, as anciently, by the Citizens of *London*: And *Durham*, *Westmoreland*, and *Cumberland*, none.

The *Sheriff* besides his Ministerial Office, of executing Processes and Precepts of the Courts, and making Returns of the Fine; has a judicial Office, whereby he holds Two several Kinds of Courts; the one called the *Sheriff's Turn*, held in divers Places of the County, to enquire of all Offences against Common Law not prohibited by any Statute. The other called the *County Court*, wherein he hears and determines all Civil Causes of the County, under Forty Shillings. See *COURT* and *TURN*.

The Word is formed from the *Saxon*, *Sire Gersa*, Prefect of a Town or County; or rather from *Scyrius*, to divide; the *Sheriff* being denominated from the first Division of the Kingdom into Counties. In *Latin* he is called *Vice-comes*.

*SHIELD*, an ancient Weapon of Defence, made in Manner of a light Buckler, and bore on the Arm to fend off Lances, Darts, &c. The Form of the *Shield* is represented by the Escutcheon in Coats of Arms. See *BUCKLER*.

*SHIELD*, in Heraldry, the Escutcheon or Field whereon the Bearings of an Armory are placed. See *ESCUTCHON*.

*SHILLING*, an *English* Silver Coin, equal to Twelve Pence, or the 20th Part of a Pound; See *POUND* and *PENNY*. 'Tis observ'd, there were no *Shillings* or Twelve-penny-Pieces coin'd in *England* till the Year 1504; and these, *Stow* calls *Greats*, though *Fabius* mentions them under the Name of *Shillings*, 34 *Hu.* VIII. The *Dutch*, *Flemish*, and *German* have likewise their *Shilling*; call'd *Schein*, *Schilling*, *Schelling*, *Scalin*, &c. But these not being of the same Weight or Fineness with the *English* *Shilling*, are not Current on the same Foot. The *English* *Shilling* is worth about Fifteen *French* Sols; those of *Holland* and *Germany* about Seven Sols and a Half, or Six Deniers, Those of

*Flanders* about Six. The *Dutch* *Shillings* are also call'd *Sols de Gros*, because equal to 12 *Grois*. The *Danes* have *Coppee* *Shillings*, worth about 1/2 of a *Faringth* *Staring*. *Frederus* derives the Word from a Corruption of *Soleus*; proving the Derivation by several Texts of Law, and among others by the XXI. Law, *De Annis legitis*. See *COIN*.

*SHINGLES*, in Building, small Pieces of Wood, or quarter'd oaken Boards, saw'd to a certain Scantling; or more usually cleav'd to about an Inch thick at one End, and made like Wedges, Four or Five Inches broad, and Eight or Nine Inches long. They are used in Covering, especially Churches and Steeples, instead of Tiles, or Slates. This Covering is dear; yet where Tiles, &c. are very scarce, and a light Cover required, is preferable to Thatch. If made of good Oak, and cleav'd, not saw'd, and well season'd, they make a sure, light, and durable Covering. The Building is first to be cover'd all over with Boards, and the *Shingles* nail'd thereon. See *COVERING*.

*SHINGLES*, in Medicine, a kind of Herpes, call'd also the *Miliary* Herpes. It consists of innumerable little Pustules breaking out in various Parts of the Body, viz. the Neck, Breast, Loins, Thighs, &c. The Place affected is somewhat inflamed, and the Patient a little Feverish. White Pustules arise and suppurate, and are succeeded by little round Scabs resembling Millet Seeds. It is to be attack'd with Discuritics; and the higher Pustules cut off with Scissars, and a Cerate of Oil and Wax to be applied. *Wifeman* observes, the *Shingles* come near the Nature of a *Pura*, and are therefore to be cured with Mercurial Catharticks.

*SHIP*, a general Name for all great Vessels with Sails, fit for Navigation on the Sea; excepting Gallies, which go with Oars and Smack-Sails. See *GALLEY*. The *Sieur Aubin*, defines a Ship, a Timber-building, consisting of various Parts and Pieces, nail'd and pin'd together with Iron and Wood, in such Form as to be fit to float, and to be conducted by Wind and Sails, from Sea to Sea.

For the most convenient Form of *SHIPS*; or that whereby they shall meet with the least Resistance from the Water; See *VESSEL*.

The Invention of *Ships* is very Ancient, and, at the same time, very uncertain. The Mythologists attribute it to *Dedalus*; and pretend, that the Wings he invented to save himself withal from the Labyrinth of *Crete*, were nothing but Sails, which he first gave to Vessels, and wherewith he eluded the Vigilance and Pursuit of *Minos*. Others gave the Honour to *Janus*; on the Credit of some ancient Greek and *Latin* Coins, on one Side whereof, is represented his double Face, and on the Reverse a *Ship*. Lastly, others, and those who go on the best Grounds, look on *Noah* as the First *Ship-builder*. See *ARK*; See also *NAVIGATION*.

*SHIPS* are usually divided into Three Classes, *Ships* of War, Merchant *Ships*, and an intermediate Kind, half War, half Merchant; being such, as tho' built for Merchandise, yet take Commissions for War. *Ships* of War are again divided into several Orders, call'd *Rates*. See *RATE*. Merchant *Ships* are estimated by their Burthen, that is, by the Number of Tuns they bear, each Tun reckon'd at Two thousand Pounds Weight. The Estimate is made by Gauging the Bottom of the Keel, which is the proper Place of Loading. See *BURTHEN*.

The most celebrated *Ships* of Antiquity are, that of *Proculus Philopater*, which was 280 Cubits long, 38 broad and 48 high. It carried 400 Rowers, 400 Sailors, and 5000 Soldiers. That he made to Sail on the *Nile*, we are told, was Half a Stadium long. Yet these were nothing in Comparison with *Hero's* *Ship*, built under the Direction of *Archimedes*, on the Structure whereof, *Mischion*, as we are told by *Sextus*, wrote a whole Volume. There was Wood enough employ'd in it to make Fifty Gallies. It had all the Variety of Apartments of a Palace; Banqueting Rooms, Galleries, Gardens, Fish-ponds, Equeries, Mills, Baths, a Temple of *Venus*, &c. It was incompar'd with an Iron Rampart, Eight Towers, with Walls and Battions, furnish'd with Machines of War; particularly one, which threw a Stone of 300 Pounds, or a Dart of 12 Cubits, the Space of Half a Mile; with many other Particulars related by *Athenæus*. Among Modern *Ships*, one of the most considerable is a First Rate *Ship* of War, built at *Woodwick* in 1701; The Dimensions whereof, whence those of other Rates may be deducted, are as follow: The Length 110 Foot; Number of Guns 110; Number of Men 1250; Number of Tuns 2300; Draught of Water 22 Foot; the Main-mast in Length 54 Yards, Depth 19; Main-mast in Length 39 Foot; in Diameter 38 Inches; Weight of the Anchor 82 Hundred 1/4 Quarter 14 Pound; Cable in Length 200 Yards; Diameter of the Cable 22 Inches. The Expence of building a common First Rate *Ship*, with Guns, Tackling and Rigging, is computed at 60000 *l.* Sterling. See *NAVY*, *FREIGHT*, *CHARTER-PARTY*, *POLICY of Assurance*, &c.

To give the Reader an Idea of the several Parts and Members of a *Ship*, both Internal and External, with their respective Designations in the Sea Language (the Principal whereof

whereof are explained in the respective Places of this *Dictionary* we here give him Two Draughts; the one, a Section of the Body of a First Rate, to shew its Construction, the Disposition of its Inside, &c. The other, the same Ship entire, with the Sails, Rigging, &c.

**SHIPPER**, or *Saffer*, a Dutch Term, signifying the Master of a Ship. We also use the Word for any common Seaman.

**SHIP-MONEY**, an Imposition anciently charged upon the Ports, Towns, Cities, Boroughs, and Counties of the Realm; by Writs commonly called *Ship-writs*, under the Great Seal of England. This Imposition was revived by King Charles the First, in the Years 1635 and 1636, for the providing and furnishing certain Ships for the King's Service; But by Stat. 17 Car. 1. it was declared to be contrary to the Laws and Statutes of the Realm, Claim of Right, Liberty of the Subject, &c.

**SHIPWRACK**. See WATER.

**SHIRE**, (from the Saxon *Sceir*, or *Seyre*, to divide) is a Part or Portion of the Land, call'd also *County*. See COUNTRY. King Alfred first divided the Land into *Sarapins*, which we now call *Shires*, and those into *Centurias*, which we now call *Hundred's*; see HUNDRED: And those again into *Decanias*, which we call *Tithings*: See TYTHING. The ancient Latin Word for *Shire*, was *Seyra*: The Assistants of the *Shire*, or Assembly of the People of a County, was call'd, by the Saxons, *Sciregoat*.

**SHOAL**, in the Sea Phrase, is the same as *Shallow*, and is used for Flats in the Water: They say, It is good *Shoaling*, when a Ship sailing towards Shore, they find by her Sounding, it grows shallower and shallower by degrees, and not too suddenly; for then the Ship goes in Safety. It is also used for a Company of Fish.

**SHOALS**, is the Miner's Term in the Tin Mines, for such Fragments of Ore, which by RAINS, Currents of Water, &c. are torn off from the Lead or Veins of Ore. They are wash'd down from the Mountains, and by finding of them, they guess where to look for a Load of Ore. Sometimes it is call'd *Squad*, and *Squod*.

**SHOARS**, Props, or Counterforts, set up to support any Thing of Weight, which leans on one Side. See BUTTRESS.

**SHOE**, a Covering of Leather for the Foot: Its Structure, though the Object of a particular Art, is too popular to need explaining: (See CORN-WAIVER). Its History is more obscure. *Bened. Bauouin*, a Shoe-maker, has an express Treatise of the *Antient Shoes*; *De Solea Veterum*: Where the Origine, Matter, Form, &c. thereof, are particularly inquired into.

*Bauouin* maintains, that God, in giving Adam Skins of Beasts to cloath him, did not leave him to go bare-footed; but gave him *Shoes* of the same Matter. That after raw Skins, Men came to make their *Shoes* of Ruffes, Broom, Paper, Linc, Silk, Wood, Iron, Silver, Gold; so different has their Matter been; nor was their Form more stable, with regard either to the Shape, Colour, or Ornaments. They have been square, high, low, long, and quite even, cut, carv'd, &c. *Pliny*, *Lib. 7. c. 56.* tells us, That one *Tibos* of *Baotia* was the first who used *Shoes*. *M. Nilant*, in his Remarks on *Bauouin*, observes, That he quotes *Xenophon* to little Purpose, to shew, that even in his Time they still wore *Shoes* of raw Skins. *Xenophon* relates, That the Ten Thousand Greeks, who had follow'd the young *Cyrus*, wanting *Shoes*, in their Retreat, were forced to cover their Feet with raw Skins, which occasioned them great Inconveniencies. He will not even allow, that the *Shoes* of the Country People, call'd *Carpatine*, and *Perance*, were of crude Skin, without any Preparation. The Patricians among the *Romans*, wore an Ivory Crescent on their *Shoes*. *Heliogabalus* had his *Shoes* covered over with a very white Linnen; in Conformity to the Priests of the Sun, for whom he professed a very high Veneration. This kind of *Shoe* was call'd *Udo*, or *Odo*. *Caligula* wore *Shoes* enrich'd with precious Stones. The *Indians*, like the *Egyptians*, wore *Shoes* made of the Bark of the Papyrus. The *Turks* put off their *Shoes*, and leave them at the Doors of the *Mosques*.

**SHOOTING**, } See { GUNNERY and PRO-  
SHOOTING of Bombs, } JECTILE.  
SHOOTING by the Air, } BOMB.  
WIND-GUN.

**SHOP-LIFTER**, a Person, who cheapening Wares, on Pretence of Buying, takes the Opportunity of stealing them.

**SHORE**, or *Common-Sewer*, a Corruption of *Sewer*. See SEWERS and CLOACA.

**SHORT ACCENT**, in Grammar, a Mark which shews, that the Time of pronouncing, ought to be short; It is wrote thus (´). See ACCENT.

**SHORT-SAILS**, in a Man of War, are the same with the *Fighting Sails*; being the *Fore-sail*, *Main-sail*, and

*Foretop-sail*, which are all that are used in Fight, left the rest should be fired, and spoiled; besides the Trouble of managing them when a Ship gives Chase to another. If the Chase have a Mind to fight, they say, The Chase *strips into her Short-Sails*, i. e. puts out her Colours in the Poop, her Flag at the Main-top, and her Streamers, or Pendants, at the Yard's Arms; Furls her *Sprit-sail*, Pecks her Mizzen, and flings her Main-Yard.

**SHORT-SIGHTEDNESS**, a Fault in the Conformation of the Eye, wherein the Crystallin, &c. being too Convex, the Rays reflected from distant Objects are refracted too much, and made to converge too fast, so as to unite e'er they reach the *Retina*; by which Means the Vision is render'd dim and confus'd. See MYOPIA.

The ordinary Remedy, for *Short-sightedness*, is a Concave Lens, held before the Eye; which making the Rays diverge, or at least, diminishing much of their Convergency, makes Amends for the too great Convexity of the Crystallin. See LENS.

*Dr. Hook* suggests another Remedy. Finding, that many *Short-sighted* Persons are but little helped by Concaves; he recommends a Convex Glass, placed between the Image and the Eye; by Means whereof the Object may be made to appear at any Distance from the Eye, and consequently, all Objects may be thereby made to appear at any required Distance from the Eye; so that the *Short-sighted* Eye shall contemplate the Picture of the Object, in the same Manner, as if the Object it self were in the Place. 'Tis true, the Image will appear inverted; but we have Expedients to remedy this too: For, in Reading, there needs nothing but to hold the Book upside down. To write, the best will be for the Person to learn to read upside down. For distant Objects, the Doctor asserts, from his own Experience, that, with a little Practice in contemplating inverted Objects, one gets as good an Idea of them, as if seen in their natural Posture.

**SHOT**, for Ordnance, are of several Sorts; as *Round-shot*, or Bullets fitted to the Bore of the Piece. *Cross-bar-shot*, Round-shot, with a long Spike of Iron call in it, as if it went through the Middle of it. *Trundle-shot*, being only a Bolt of Iron, 16 or 18 Inches long, sharp-pointed at both Ends, and about an Hand's-breadth from each End, having a round broad Bowl of Lead call upon it, according to the Bore of the Piece. *Langrel-shot*, which runs loose with a Shackle, to be shortened, when put into the Piece, and when it flies out it spreads it self; at each End of the Bar, it hath half a Bullet, either of Lead or Iron. *Chain-shot*, is two Bullets, with a Chain betwixt them; some being contriv'd round, yet so, that they will spread in flying their full Length and Breadth. *Cafe-shot*, is any thing of small Bullets, Nails, old Iron, and the like, to put into the Case, to shoot out of Ordnance.

**SHOT**, for Fowling. The Method of Calling it is as follows. The Lead being melted, stirr'd, and skimr'd, a Quantity of powder'd yellow Orpiment is stirr'd in it; as much as will lie on a Shilling, to 12 or 15 Pounds of Lead. The Whole being well stirr'd, the Orpiment will flame. To judge whether there be Orpiment enough in, a little of the Lead is dropped into a Glass of Water, and if the Drops prove round, and without Tails, there is Orpiment enough, and the Degree of Heat is as it should be. This dose, a Copper Plate, Hollow in the Middle, and Three Inches in Diameter, bored through, with 30 or 40 small Holes, according to the Size of the Shot, is placed on an Iron Frame, over a Tub of Water, four Inches above the Water; The Hollow Part is to be very thio. On this Plate are laid burning Coals, to keep the melted Lead in Fusion. The Lead is now pour'd gently, with a Ladle, in the Middle of the Plate, and it will make its Way through the Holes in the Bottom of the Plate into the Water, in round Drops. Great Care is taken to keep the Lead on the Plate in its proper Degree of Heat: If too cold, it will stop the Holes; and if too hot, the Drops will crack and fly. The Shot, thus made, are dried over a gentle Fire, always stirring them that they do not melt: This done, the greater are separated from the smaller, by passing them through Sieves for that Purpose.

**SHOT-FLAGON**, a Flagon somewhat bigger than ordinary; which in some Counties, particularly *Zerbyshire*, it is the Custom for the Host to serve his Guests in, after they have drank above a Shilling.

**SHOULDER**, among Farriers, *Shoulder-fitter*, is a Disease in a Horse, when the Pitch or Point of the Shoulder is displaced; which makes the Horse halt downright.—*Shoulder flaiting*, or *Shoulder torn*, is a Hurt which befalls a Horse by some dangerous Slip, by which the *Shoulder* is parted from the Breast.

**SHOULDER-BLADE**, a Bone of the *Shoulder*, of a Triangular Figure, covering the Hind-part of the Ribs; call'd by the Anatomists *Scapula* and *Omphalata*. See SCAPULA.

**SHOULDER-BONE**. See HUMERUS.

**SHOULDERING**, in Fortification, is a Retrenchment, oppos'd to the Enemies; or a Work call'd up for a Defence on one Side: whether made of Heaps of Earth call'd up, or of Gabions, and Fascines. A *Shouldering* also is a Square Orillon, sometimes made in the Bastions, on the Flank near the *Shoulder*, to cover the Cannon of a Casement. It is also taken for a Demi-Bastion, or Work, consisting of one Face, and one Flank, which ends in a Point, at the Head of an Horn-work, or Crown-work: Neither is it to be understood only of a small Flank added to the Sides of the Horn-work to defend them, when they are too long; but also of the Redans which are rais'd on a straight Line.

**SHOULDERING-PIECE**, in Building. See **BRACKET**.  
**SHOULDER-WRENCH** is a Strain in the *Shoulder*.  
**SHOWER**, a Cloud resolv'd into Rain, and discharged on a certain Tract of Ground. See **RAIN**.

In Natural History we meet with abundance of Instances of extraordinary and preternatural Showers: As, *Showers of Blood*, mention'd by *Glossolus*, and others; A *Brimstone Shower*, mention'd by *Worantus*; *Showers of Frogs*, mention'd by *Pliny*, and even Dr. *Pilot*; A *Shower of Millet-Seed*, in *Silesia*, mention'd in the *Ephebe*, German. An. 5<sup>o</sup>. *Showers of Albes*, frequent in the *Archipelago*. A *Shower of Wheat*, in *Wiltshire*. A *Shower of Whittings*, mention'd in the *Phislog. Trifolium*. The natural Reasons of many whereof may be seen under the Article **RAIN**.

**SHRINE**, a Case to hold the Relicks of some Saint: See **RELICKS**. The Word is formed from the Latin *Serminus*, a Desk or Cabinet.

**SHROVE-TIDE**, the Time immediately before *Lent*; thus call'd by our Ancestors, because employ'd in *Servings*, that is, in confessing their Sins to the Priest; in order to a more devout keeping the ensuing *Lent* Fast.—*Shrove Tuesday* is the Day next before the first of *Lent*.

**SHROWING of Trees**, the cutting or lopping off the Top-Branche thereof; which is only practis'd to Trees that are not fit for Timber, but designed for Fuel, or some other present Use. Such Trees the Husbandmen find much preferable to Copse; as they need no Fence to secure them, because standing in no Danger of the Brownings and Rubbings of Cattle, which too, have the Benefit of Grazing under them.—For the Time of *Shrowing*, 'tis not to be practis'd till the Trees have stood three or four Years; either at the Beginning of the Spring, or the End of the Fall. The harder sort not to be lopped above once in ten or twelve Years, and that at any Time in the Winter. The pithy and softer Woods are best *shrowed* in the Spring. The Stumps left, should always be cut slope, and smooth, in order to cast the Water off; and prevent its sinking in, and rotting the Tree.

**SHROWDS**, are great Ropes in a Ship, which come from either Sides of all Masts: They are fastned below by Chains to the Ship's Sides, and aloft, over the Head of the Mast; their Pendants, Fore-tackle, and Swifters, being first put under them. They are also fastned there, to prevent their galling the Mast. The Top-mast *Shrowds* are fastned to the Pattucks, by Plates of Iron, and by Dead-Mens-Eyes, and Lammers also, as the others are: The Terms are, *Loose the Shrowds*; that is, Slacken them: *Set taught the Shrowds*; that is, Set them taut: The Bolt-Sprit hath no *Shrowds*.

**SHRUB**, a little low Tree, or Dwarf; or a Woody Plant, of a Size less than a Tree; which, besides its principal Stem, and Branches, frequently, from the same Root, puts forth several other considerable Sets or Stems: Such are *Privet*, *Phillyrea*, &c. Shrubs and Trees put forth in *Autumn*, a kind of Buttons, or Gems, in the Axes of the Leaves: These Buttons are as so many little Eggs, which coming to expand by the Warmth of the following Spring, open into Leaves, and Flowers. By this, together with the Height, some distinguish *Shrubs* from *under Shrubs*; which are low Bushes, that do not put forth any of these Buttons; as *Rosemary*, *Thyme*, &c.

**SHUTTLE**, in the Manufactures, a kind of Instrument used by the Weavers, which, with a Thread it contains either of Wool, Silk, Linc, or other Matter, serves to form the Woof of their Stuff, Linens, Ribbands, &c. by throwing the *Shuttle* alternately from Left to Right, and from Right to Left, a-cross; between the Threads of the Warp, which are stretched out lengthwise on the Loom. In the Middle of the *Shuttle* is a Kind of Cavity, called the *Eye* or *Chamber* of the *Shuttle*, wherein is inclosed the Spool, which is a Part of the Thread destined for the Woof; and is wound on a little Tube of Paper, Rush, or other Matter.

The Ribband-Weaver's *Shuttle* is very different from that of most other Weavers, though it serve for the same Purpose: 'Tis of Box, six or seven Inches long. one broad, and as much deep: Shod with Iron at both Ends, which terminate in Points, and are a little crooked, the one towards the Right, and the other towards the Left, representing the Figure of an  horizontally placed.

**SI**, in Music, a Seventh Note, added within this Sixty Years, by *coe la Mare*, to the Six ancient Notes; invented by *Guido Aretin*, *ut, re, mi, fa, sol, la, si*; by Means whereof, the Embarras of the ancient Gamut is avoided. So busy a Thing is Jealousy, that, for a matter of Thirty Years, that *le Maire* kept preaching to the Musicians of his Time, in Behalf of the new Note; nor a Man would allow it: But he was no sooner dead, than all the World came in to it. See **NOTE**.

**SIBYLS**, **SIBYLLE**, in Antiquity, Virgin Prophetesses, or Maids (supposed to be divinely inspired; and who, in the Height of their Enthusiasm, gave Oracles, and foretold Things to come. See **ORACLES**. The Word is supposed formed of an Assemblage of the Two Greek Words, *Sis*, to agitate, and *bylla*, full, by Reason of the excessive Fury they were agitated withal, when they delivered their Oracles. Authors do not agree about the Number of the *Sibyls*. *Capella* reckons but Two, *viz.* *Euraphie* of *Troy*, called *Sibylla Pitygia*, and *Sinnachia* of *Eritrea*, called, *Sibylla Eritrea*. *Salmus* mentions Three, *viz.* *Cumea*, *Delpheic*, and *Eritrea*. *Ælian* makes their Number Four; and *Varro* increases it to Ten, denominating them from the Places of their Birth; the *Ferfan*, *Lybon*, *Delpheic*, Two *Cumeans*, *Eritrean*, *Saman*, *Helleponic* or *Trejan*, *Ptrygian*, and *Tiburtus*. Of these, the most celebrated are, the *Eritrean*, *Delpheic*, and *Cumean Sibyls*. See **ORACLES**.

The *Sibyllic Oracles*, were held in great Veneration by the more credulous among the Antients; but were much suspected by many of the more knowing. The Books wherein they were written, were kept by the *Romans* with infinite Care, and nothing of Moment undertaken without consulting them. *Tartarin* first committed them to the Custody of Two Patrician Priests, instituted for that Purpose.

**SICILIAN**, in Music, &c. a Kind of gay Sprightly Air, or Dance; somewhat of the Nature of an *Englis* Jig: usually marked with the Characters — or —.

$$\begin{array}{cc} 6 & 12 \\ 8 & 8 \end{array}$$

**SICKNESS**, } See { **DISEASE**.  
*Green-SICKNESS*, } **CHLOROSIS**.  
*Succent* **SICKNESS**, } **SUDOR ANGLICANUS**.  
*Falling-SICKNESS*, } **EPILEPSY**.

**SICUT ALIAS**, a Writ sent out in the Second Place, where the first was not executed. It is thus called from its Beginning, which is in this Form: *Georgius D. G. Sec. Vicecomiti Heref. Salutem. Precipimus tibi (Sicut Alias) precipimus quod non omittas, &c.*

**SIDE**, *Latus*, in Geometry. The *Side* of a *Figure*, is a Line making Part of the Periphery of any Superficial Figure. See **FIGURE**. In Triangles, the *Sides* are also called *Legs*. In a Rectangle Triangle, the Two *Sides*, including the right Angle, are called *Catets*; and the Third the *Hypotenuse*. See **CATHEtus** and **HYPOTHENUSE**.

**SIDE** of a *Polygonal Number*, is the Number of the Terms of the Arithmetical Progression, that are summed up. See **POLYGONAL NUMBER**.

**SIDE** of a *Power*, is what we otherwise call the *Root*, or *Radix*. See **ROOT**.

*Right SIDE*, } See { **LATUS REctum**.  
*Transverse SIDE*, } **LATUS TRANSVERSUM**.

**SIDE-LAYS**, is a Term made Use of by Huntsmen, when Dogs are set in the Way, to be let slip at a Deer, as he passes by.

**SIDERATION**, in Chirurgery, a Mortification of some Part of the Body; called also *Sphacelus* and *Necrosis*; which see.

**SIDERATION**, the blasting or blighting of Trees, Plants, &c. by Eastern Winds, excessive Heat, Draught, or the like. See **BLIGHT**.

**SIDERATION**, is also used for a being suddenly benumb'd, and deprived of the Use of one's Limbs, Senses, &c. which the People call being *Plaster-struck*.

**SIDIERAL YEAR**. See **YEAR**.

**SIDERITES**, a Name some Authors give the Loadstone. See **MAGNET**.

**SIDES** of *Hornworks*, &c. in Fortification, are the Ramparts and Breast-works, which inclose them on the Right and Left from the Gorge to the Head.

**SIDES-MEN**, properly called *Synods-Men*, or *Quest-Men*, Persons, who in larger Parishes are appointed to assist the Church-Wardens, in enquiring into the Manners of inordinate Livers, and in presenting Offenders at Visitation.

**SIEGE**, in War, the Incampment of an Army around a Place, with Design to take it, either in the Way of Distress and Famine; or by making Lines all around it, to prevent any Relief from without; or by main Force, as by digging Trenches, and making formal Attacks. The most celebrated

celebrated Sieges of Antiquity, are those of Troy, Tyre, Alexandria, Numantium, &c. Those of the Moderns are that of Offend, Cadix, Graves, &c. The Word is French, and signifies, literally, *Seas*.

SIERRA, a Spanish Term signifying *Mountain*; applied to Mountains, and Mountainous Countries.

SIEVE, or *Search*, an Instrument serving to separate the Fine from the Coarse Parts of Powders, Liquors, &c. or to cleanse the Pulse from Dust, light Grains, &c. 'Tis made of a Rim of Wood; the Circle, or Space whereof is filled with a Tissue of Silk, Tiffany, Hair, Line, Wire, or even thin Slices of Wood. The Sieves which have large Holes, are usually called *Riddles*; such is the *Cast* or *Line Sieve*, *Garden Sieve*, &c. When Drugs, apt to evaporate, are to be passed thro' the Sieve, 'tis usual to have it covered with a Lid.

SIEUR, a kind of Title of Honour, or Quality among the French; chiefly used among the Lawyers, and in publick Acts and other Writings of that kind: As I plead for the *Seur* Marquis, &c. The Title *Seur* is properly given by a Superior to an Inferior, in his Letters, and other particular Writings: As, Tell the *Seur* such a one, that he proceed, &c. In this Sense, Authors sometimes use it, by Way of Modesty, in speaking of themselves. Thus, at the Heads of Books, we see, *Traduction du Seur d'Abolancours, Oeuvres du Seur d'Esprenoux*, &c.

SIEUR, is also a Term expressing *Seignery* or Lordship: As *Echeyr* or *Seur* of such a Place.

SIGHT, the Exercise, or Action of the Sense of Seeing. See SEEING.

Our Sight, the noblest and most useful of all our Senses, Father Mallebranch shews, deceives us in abundance of Instances; Nay, almost in all: Particularly with Regard to the Magnitude, and Extent of Things; their Figures, Motions, &c. Our Eyes do not shew us any Thing less than a Mite: Half a Mite is nothing, if we believe their Report. A Mite is only a Mathematical Point, with Regard thereto; and we cannot divide it without annihilating it. In effect, our Sight does not represent Extension, such as it is in it self; but only the Relation and Proportion it has to our Body. Hence, as Half a Mite has no Relation to our Bodies, and that it cannot either preserve or destroy, our Sight hides it intirely. Were our Eyes made like Microscopes, or were we our selves as small as Mites, we should judge very differently of the Magnitude of Bodies. It may be added, That our own Eyes are really no other than a kind of natural Spectacles; that their Humours do the same Office as the Lens's in Spectacles; and that, according to the Figure of the Crystallin, and its Distance from the Retina, Objects are seen very differently; insomuch, as we are not sure, that there are any Two Persons in the World, who see them equally big. 'Tis even very rare, that the same Person sees the same Object equally big with both Eyes; as both Eyes are very seldom perfectly alike: on the contrary, we generally see Things bigger with the left than the right Eye; Of which we have some very good Observations in the Journal of the Learned at Rome, for the Year 1669. See VISION.

Short-SIGHT, } See { MYOPIA,  
Second SIGHT, }     { SECOND SIGHT;  
Point of SIGHT, }     { VIEW.

SIGHTS, in Mathematicks, are Two thin Pieces of Brass raised perpendicularly on the Two Extremes of an Alidade or Index of a Theodolite, Circumferentor, or other like Instrument: Each whereof has an Aperture or Slit up the Middle, thro' which the usual Rays pass to the Eye, and distant Objects are seen. Their Use is for the just Direction of the Index to the Line of the Object. See TELESCOPE, CIRCUMFERENTOR, ALIDADE, &c.

Plain SIGHT, } See { SIGHTS.  
Telescopick SIGHTS, }     { TELESCOPICK SIGHTS.

Mr. Flamstead and Dr. Hook, absolutely explode the Use of *Plain Sights* in Astronomical Observations. The Errors in Tycho's Latitudes of the Stars, Mr. Flamstead ascribes wholly to his using *Plain Sights*; and suspects, that Hevelius using the same kind of *Sights*, will fall into the like Errors. Hevelius, on the contrary, in a Paper in the *Philosophical Transactions*, vindicates the Use of *Plain Sights*, and prefers them to *Telescopick* ones. The main Objection he makes to the latter, is, That no Observation can be safely taken with them, without first examining and rectifying them: In which Examination, many and gross Mistakes are liable to be committed. In which he adds, That in Sextants, Octants, Azimuth Quadrants, &c. he does not see how such Examination can be made, at all times, without much Loss of Time.

SIGILLARIA, a solemn Feast held among the ancient Romans; thus called from a Custom which obtained therein,

of sending little Presents from one to another; consisting of Seals, little Gravings, Sculptures, &c. The *Sigillaria* followed immediately after the *Saturalia*, and held Four Days; which, with the Three Days of the *Saturalia*, made a Solemnity of Seven Days. The Institution of the *Sigillaria* is referred by some, to Hercules; who, upon his Return from Spain, after killing Geryon, led his Flocks into Italy, where he built a Bridge over the Tiber, at a Place, where was since the *Pons Sublicus* in Rome. Others ascribe it to the *Polegion*; who conceiving, that by the Words *Heat* and *oil*; the Oracle did not require living Men to be sacrificed to it, but Statues, or Figures of Men by the Fire, and Lights by the Second; began to offer Torches to Saturn, and human Figures to Pluto.

SIGILLATA TERRA, a Kind of Earth or Clay, dug in the Ile of Lemnos, thence also called *Lemnos Earth*; of considerable Use in Painting, and Medicine. 'Tis of different Colours, but most commonly Red; heavy, soft, and friable; held very astringent, and, as such, used in Hemorrhages; as also against the Plague and Poisons. Pliny attributes several other Virtues, which Experience does not justify; nor is it in that Effect it anciently was; yet is still an Ingredient in Treacle. 'Twas anciently found in a Mountain, in the Neighbourhood of the City *Hephestia*; where Diana's Priests went at certain Times, with great Ceremony, to dig it up. After a little Preparation, they made it up into Troches, and seal'd them with Diana's Seal; whence the Appellation of *Sigillata*, &c. 'Tis now brought from Constantinople in little Cakes orbicular, on one Side flat, on the other sealed. See TERRA.

SIGILLUM, a Seal or Signet. See SEAL and SIGNET.  
SIGN, a sensible Mark or Character, denoting something absent, or invisible. See CHARACTER and MARK. Antiently, the Monks, in all Religious Houses, were not allowed to speak; nor to express their Minds otherwise than by Signs, which they learned in their Novitiate. C. Rodericus and Pons have wrote of the ancient Signs and Ciphers used in Speaking and Writing.

SIGN, in Medicine, some Appearance in the Body, distinguishable by the Senses; Whence, by just Reasoning, is inferred the Presence, Nature, Seat, Event, of Health, a Disease, or Death. Those which denote the present Condition of a Body, whether sick or well, dying or the like, are called *Diagnostic Signs*. See DIAGNOSTIC. Those which foretel the future State thereof, are called *Prognostic Signs*. See PROGNOSTIC. That Sign which is proper to the Disease, and inseparable from it, as arising from the Nature thereof, is called a *Pathognomic sign*. See PATHOGNOMIC. As all these are Effects produced by the Cause of the Disease, the Disease it self, and its Symptoms; they usually note the present Condition of the Matter which first produced the Disease, and even of that produced by the Disease. On which Footing, the Signs are all reducible to these Three Classes, *viz.* Signs of the Crudity and Digestion of the Disease; of its Event, whether in Health, a Disease or Death; and of its Secretion and Excretion: Which last Signs are called *Critical ones*. See CAUDITY, DIGESTION, &c. each under its proper Article. See also HEALTH and DISEASE.

SIGN, in Astronomy, a Twelfth Part of the Ecliptic, or Zodiac; or a Portion containing Thirty Degrees thereof. The Zodiac was divided by the Ancients into Twelve Segments, called Signs; commencing from the Point of Interfection of the Ecliptic and Equinoctial: Which Signs they denominated from the Twelve Constellations, which, in Hipparchus's Time, possessed those Segments; But the Constellations have since to changed their Places, by the Precession of the Equinox, that Aries is now got out of the Sign called Aries, into Taurus, Taurus into Gemini, &c.

The Names of the Twelve Signs, and their Order, are as follow; Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces: Each of which, with the Stars thereof, see under its proper Article. The Signs are distinguished with Regard to the Season of the Year when the Sun is in them, into *Vernal, Estival, Autumnal, and Brumal*. The *Vernal*, or *Spring-Signs*, are Aries, Taurus, Gemini: The *Estival*, or *Summer-Signs*, Cancer, Leo, and Virgo: The *Autumnal-Signs*, Libra, Scorpio, and Sagittarius; and the *Brumal*, or *Winter-Signs*, Capricornus, Aquarius, Pisces. The *Vernal* and *Summer-Signs*, are also called *Northern Signs*, and the *Autumnal* and *Brumal Signs*, *Southern Signs*.

For the Motion of the Signs. See PRECESSION of the Equinox.

SIGN MANNA, the setting one's Hand and Seal to a Writing. See SIGNATURE. Among the Saxons, before the Invention of Seals, a + was a common Sign or Signet, prefixed to the Names of most subscribing Witnesses in Charters and other Deeds, as + *Signum Roberti Episcopi Lond.* &c.

SIGNAL, a certain Sign agreed upon for the conveying of Intelligence whether the Voice cannot reach. Signals are given for the beginning of a Battle, or an Attack: Some-

times with Drums and Trumpets. At Sea, Signals are given by Canon or Musket Shot, by Lights, Sails, Flags, &c.

SIGNALS have been in Use in all Ages. The Ancients who had no regular Couriers or Posts, made Use thereof to convey Intelligence of what pass'd at a great Distance. For which Purpose they plac'd Sentinels on the Heights, from Space to Space; some Mention whereof, we find made by Homer himself. *Iliad* 6, v. 553, &c. *Odyss.* 2, v. 261. Those People thus dispos'd; lighted Fires, or Flambeaux in the Night-time. In the *Agamemnon* of *OEdipus*, that Prince at his Departure for *Troy*, promises *Clytemnestra*, that the very Day the City should be taken, he would apprise her of his Victory by Fires lighted Express. He keeps his Word, and Tidings are brought the Princess, that *Troy* is taken, and that *Agamemnon's* Signals are seen. *Frontinus* observes, they were in Use among the *Arabs*; and *Bonaventura Vulcanius*, in his *Scolia* on *Aristotle's* Book de *Mundo*, adds, That while the *Moor*s were Masters of the greatest Part of *Spain*, they built on the Tops of the Mountains, an Infinity of Towers, or Watch-houses, call'd in the *Arabic*, *Atalayes*, a Word the *Spaniards* still retain; whence, by Fires, they could immediately alarm the whole Kingdom. Indeed the Custom was much more Ancient than the *Moor*s in *Spain*. *Q. Curtius* observes, 'twas very frequent among the *Africans*, in the Time of *Alexander*. *Livy* and *Cæsar* both mention it as used among the *Romans*. *Polydore Virgil* shews it of great Antiquity in *England*; and *Boetius* adds, that in several Places in *England*, there are the Remains of huge Poles that have serv'd for this Purpose. See *BRACON*.

SIGNALS at Sea, are Signs made at Sea, by the Admiral or Commander in Chief of a Squadron of Ships, either in the Day or by Night, either for Sailing or Fighting, or for the better Security of the Merchant Ships, under the Conduct of Men of War: These Signals are very Numerous and very Important; all appointed and determin'd by Order of the Lord High Admiral, or Lords of the Admiralty.

#### SIGNALS by Day.

When the Commander in Chief would have them prepare for Sailing, he first looses his Fore-top-sail, and then the whole Fleet are to do the same. When he would have them Unmoor, he looses his Main-top sail, and fires a Gun, which in the Royal Navy is to be answer'd by every Flag-ship. When he would have them Weigh, he looses his Fore-top-sail, and fires a Gun, and sometimes hauls home his Sheets: The Gun is to be answer'd by every Flag-ship, and every Ship to get to Sail as soon as it can. If with the Leeward-side, the Stern-most Ship is to weigh first. When he would have the Weather-moist, and Head-most Ships to Tack first, he hoists the Union-Flag at the Fore-top-mast-head, and fires a Gun, which each Flag-ship answer's; but if he would have the Stern-most, and Leeward most Ships to Tack first, he hoists the Union Flag at the Mizzen-top-mast-head, and fires a Gun; and when he would have all the whole Fleet Tack, he hoists an Union, both on the Fore, and Mizzen-top-mast-heads, and fires a Gun. When in bad Weather, he would have them Wear, and bring to the other Tack, he hoists a Pendant on the Ensign-staff, and fires a Gun: And then the Leeward-most and Stern-most Ships are to Wear first, and bring on the other Tack, and lie by, or go on with an easy Sail, till he comes a-head: Every Flag is to answer with the same Signal. If they are lying by, or Sailing by a Wind, and the Admiral would have them bear up and Sail before the Wind, he hoists his Ensign, and fires a Gun, which the Flags are to answer: And then the Leeward-most Ships are to bear up first, and to give Room for the Weather-most to Wear, and fail before the Wind with an easy Sail, till the Admiral comes a-head. But if it should happen when the Admiral hath Occasion to Wear and Sail before the Wind, that both Jack and Ensign be abroad, he will haul down the Jack, before he fires the Gun to Wear, and keeps it down, till the Fleet is before the Wind. When they are failing before the Wind, and he would have them bring to, with the Star-board Tacks Aboard, he hoists a Red Flag at the Flag-staff, on the Mizzen-top-mast-head, and fires a Gun. But if they are to bring to, with the Larboard Tack, he hoists a Blue Flag at the same Place, and fires a Gun, and every Ship to answer the Gun. When any Ship discovers Land, he is to hoist his Jack and Ensign, and keep it abroad, till the Admiral or Commander in Chief answer him, by hoisting his; or Sight of which, he is to haul down his Ensign. If any discovers Danger, he is to Tack and bear up from it, and to aw Jack abroad from the Main-top-mast Cross-trees, and fire two Guns; but if he should strike or stick fast, then, besides the same Signal with his Jack, he is to keep firing, till he sees all the Fleet observe him, and endeavour to avoid the Danger. When any sees a Ship or Ships more than the Fleet, he is to put abroad his Ensign, and there keep it, till the Admiral's is out, and then to lower it, as often as he sees Ships, and stand in with them, that so the Admiral may know which Way they are,

and how many; but if he be at such a Distance, that the Ensign can't well be discovered, he is then to lay his Head towards the Ship or Ships so desir'd, and to braul up his low Sails, and continue hoisting, and lowering his Top-sails, and making a Weft with his Top-gallant Sails, till he is perceived by the Admiral. When the Admiral would have the Vice-Admiral, or he that commands in the Second Post of the Fleet, to send out Ships to Chase, he hoists a Flag, striped White and Red, on the Flag-staff, at the Fore-top-mast-head, and fires a Gun. But if he would have the Rear-Admiral do so, he then hoists the same Signal on the Flag-staff, at the Mizzen-top-mast-head, and fires a Gun. When the Admiral would have any Ship to Chase to Windward, he makes a Signal for speaking with the Captain, and he hoists a Red Flag in the Mizzen-shrouds, and fires a Gun: But if to Chase to Leeward, a Blue Flag; and the same Signal is made by the Flag, in whose Division that Ship is. When he would have them give over Chase, he hoists a White Flag on his Flag-staff at the Fore-top-mast-head, and fires a Gun: Which Signal is to be made also, by that Flag-ship, which is nearest the Ship that gives Chase, till the chasing Ship sees the Signal. In case of springing a Leak, or any other Disaster, that disables their Ship from keeping Company, they are to haul up their Courses, and fire two Guns. When any Ship would speak with the Admiral, he must spread an *English* Ensign, from the Head of his Main, or Fore, Top-mast, downwards on the Shrouds, lowering his Main, or Fore, Top-sail, and firing Guns, till the Admiral observe him; and if any Ship perceive this, and judgeth the Admiral doeth not, that Ship must make the same Signal, and make the best of his Way to acquaint the Admiral therewith, who will answer by firing one Gun. When the Admiral would have the Fleet to prepare to Anchor, he hoists an Ensign, striped Red, Blue and White on the Ensign-staff, and fires a Gun, and every Flag-ship makes the same Signal. If he would have the Fleet Moor, he hoists his Mizzen-top-sail, with the Clew-lines hauled up, and fires a Gun. If he would have the Fleet cut or slip, he looseth both his Top-sails, and fires two Guns; and then the Leeward Ships are to cut or slip first, to give Room to the Weathermost to come to Sail. So if he would have any particular Ship to cut or slip, and to Chase to Windward, he makes the Signal for speaking with that Ship, hoists a Red Flag in the Mizzen-shrouds, and fires a Gun: But if the Ship is to Chase to Leeward, he hoists a Blue Flag as before. If he would have the Fleet exercise their Small Arms, he hoists a Red Flag on the Ensign-staff, and fires a Gun; but if the great Guns, then he puts up a Pendant over the Red Flag.

#### SIGNALS by Night;

To be observed at an Anchor, weighing Anchor, and Sailing, are as follow. When the Admiral would have the Fleet to Unmoor, and ride short, he hangs out three Lights, one over another in the Main-top-mast Shrouds, over the constant Light in the Main-top, and fires two Guns, which are to be answer'd by Flag-Ships; and each private Ship hangs out a Light in the Mizzen Shrouds. Note, That all Guns, fired for Signals in the Night, must be fired on the same Side, that they may make no Alteration in the Sound. When he would have them Weigh, he hangs a Light in the Main-top-mast Shrouds, and fires a Gun, which is to be answer'd by all the Flags, and every private Ship must hang out a Light in his Mizzen-Shroud. When he would have them Tack, he hoists two Flags on the Ensign Staff, one over another, above the constant Light in his Poop, and fires a Gun, which is to be answer'd by all the Flags; and every private Ship is to hang out a Light extraordinary, which is not to be taken in, till the Admiral takes in his. After the Signal is made, the Leeward-most, and Stern-most Ships must Tack as fast as they can, and the Stern-most Flag-ship, after he is about on the other Tack, is to lead the Fleet, and him they are to follow, to avoid running through one another in the Dark. When he is upon a Wind, and would have the Fleet Veer, and bring to on the other Tack, he hoists up one Light at the Mizzen-peak, and fires three Guns, which is to be answer'd by the Flag-ships, and every private Ship must answer, with one Light at the Mizzen-peak. The Stern-most, and Leeward-most Ships, are to bear up so soon as the Signal is made. When he would have them, in blowing Weather, to lie a Try, Short, or a Hull, or with the Head-gails brac'd to the Mast, he will form Lights of equal Height, and fire five Guns, which are to be answer'd by the Flag-ships, and then every private Ship must show four Lights: And after this, if he would have them to make Sail, he then fires ten Guns, which are to be answer'd by all the Flags, and then the Head-most, and Weather-most Ships, are to make sail first: When the Fleet is failing large, or before the Wind, and the Admiral would have them bring to, and lie by with their Star-board Tacks

Tacks aboard, he puts out four Lights in the Fore-Shrouds, and fires six Guns; but, if with the Lar-board Tacks aboard, he fires eight Guns, which are to be answered by the Flag-ships; and every private Ship must shew four Lights. The Wind-moist Ships must bring to first. Whenever the Admiral alters his Course, he fires one Gun, (without altering his Lights) which is to be answered by all the Flag-ships. If any Ship hath Occasion to lie short, or by, after the Fleet hath made Sail, he is to fire one Gun, and shew three Lights in his Mizzen-shrouds. When any one first discovers Land, or Danger, he is to shew as many Lights as he can, to fire one Gun, and to tack, or bear away, from it: And, if any one happen to spring a Leak, or any be disabled from keeping Company with the Fleet, he hangs out two Lights of equal Height, and fires Guns till he is relieved by some Saip of the Fleet. If any one discovers a Fleet, he is to fire Guns, make false Fires, put one Light out on the Main-top, three on the Poop, to steer after them, and to continue firing of Guns, unless the Admiral call him off, by steering another Course, and fire two or three Guns; for then he must follow the Admiral. When the Admiral Anchors, he fires two Guns, a small Space of Time one from the other, which are to be answered by the Flag-ships; and every private Ship must shew two Lights. When the Admiral would have the Fleet to moor, he puts a Light on each Top-mast-head, and fires a Gun, which is to be answered by the Flag-ships, and every private Ship is to shew one Light. If he would have them lower their Yards and Top-masts, he hoists one Light upon his Ensign-staff, and fires one Gun; which is to be answered by the Flag-ships; and every private Ship must shew one Light. And when he would have them hoist their Yards and Top-masts, he puts out two Lights, one under the other, in the Mizzen-top-mast Shrouds, and fires one Gun; which is to be answered by the Flag-ships; and each private Ship must shew one Light in the Mizzen-shrouds. If any strange Ship be discovered coming into the Fleet, the next Ship is to endeavour to speak with her, and bring her to an Anchor, and not suffer her to pass through the Fleet. And if any one discovers a Fleet, and it blow so hard that he cannot come to give the Admiral Notice timely, he is to hang out a great Number of Lights, and to continue firing Gun after Gun, till the Admiral answers him with one. When the Admiral would have the Fleet to Tack or Slip, he hangs out four Lights, one at each Main-yard-arm, and at each Fore-yard-arm, and fires two Guns, which are to be answered by the Flag-ships, and every private Ship is to shew one Light.

#### SIGNALS used, when a Fleet sails in a Fog.

If the Admiral would have them Weigh, he fires ten Guns; which every Flag-ship is to answer. To make them Tack, he fires four Guns, which are to be answered by the Flag-ships; and then the Leeward-moist, and Stern-moist Ships must tack first, and after they are about, to go with the same Sail they tacked with, and not to lie by, expecting the Admiral to come a-head: And this is to avoid the Danger of running thro' one another in thick Weather.

When the Admiral brings to, and lies with his Head-falls to the Mast; if with the Star-board Tack aboard, he fires six Guns; but if with the Lar-board Tack, he fires eight Guns, which the Flag-ships are to answer. And after this, if he makes Sail, he fires ten Guns, which the Flag-ships must answer, and then the Head-moist, and Weather-moist Ships are to make Sail first. If it grow thick and foggy Weather, the Admiral will continue sailing, with the same Sail set, that he had before it grew foggy, and will fire a Gun every Hour, which the Flag-ships must answer, and the private Ships must answer, by firing of Muskets, beating of Drums, and ringing of Bells. But if he be forced to make either more or less Sail than he had, when the Fog began, he will fire a Gun every half Hour, that the Fleet may discern, whether they come up with the Admiral, or fall a-stern of him; and the Flags, and private Ships are to answer as before. If any one discovers Danger, which he can avoid, by Tacking and Standing from it, he is to make the Signal for Tacking in a Fog; but if he should chance to strike and stick fast; he is to fire Gun after Gun, till he thinks the rest have avoided the Danger. When the Admiral would have the Fleet to Anchor, he fires two Guns, which the Flags are to answer; and after he hath been Half an Hour at an Anchor, he will fire two Guns more, to be answered by the Flags, as before; that all the Fleet may know it.

#### SIGNALS for calling Officers on Board the Admiral.

When the Admiral puts aboard an Union Flag in the Mizzen-shrouds, and fires a Gun, all the Captains are to come aboard him: And if, with the same Signal, there be also a West made with the Ensign, then the Lieutenant

of each Ship is to come on board. If an Ensign be put aboard in the same Place, all the Masters of the Ships of War are to come on board the Admiral. If a Standard on the Flag-staff be hoisted at the Mizzen-top-mast-head, and a Gun fired, then all the Flag-Officers are to come aboard the Admiral. If the Ensign Flag only; then a Standard in the Mizzen-shrouds; and fire a Gun; if the Flag; and Land General Officers; then the Admiral puts aboard a Standard at Mizzen-top-mast-head, and a Pendant at Mizzen-peak, and fires a Gun. If a Red Flag be hoisted in the Mizzen-shrouds, and a Gun fired; then the Captains of his own Squadron are to come aboard the Admiral; and if, with the same Signal, there be also a West with the Ensign, the Lieutenants of each Ship must come aboard. If he hoists a White Flag, as before, then the Vice-Admiral; or he that commands in the Second Post, and all the Captains of his Squadron, are to go on board the Admiral: If a Blue Flag, &c. then the Rear-Admiral, and the Captains of his Squadron, must come on board; and if a West, as before, the Lieutenants. When a Standard is hoisted on the Ensign-staff, and a Gun fired, the Vice and Rear Admirals must come on board the Admiral's Ship. When the Admiral would speak with Captains of his own Division, he will hoist a Pendant on the Mizzen-peak, and fire a Gun; and if with the Lieutenants; a West is made with the Ensign, and the same Signal: For whenever he would speak with the Lieutenants of any particular Ship, he makes the Signal for the Captain, and a West also with the Ensign. When the Admiral would have all the Tenders in the Fleet come under his Stern, and speak with him; he hoists a Flag, Yellow and White, at the Mizzen-peak, and fires a Gun. But if he would speak with any particular Ship's Tender, he makes a Signal for speaking with the Captain she tends upon, and a West with the Jack. If all the Pinnaces and Barges are to come on Board, manned and armed, the Signal is a Pendant on the Flag-staff, hoisted on the Fore-top-mast-head, and a Gun fired; and if he would have them chase any Ship, Vessel, or Boat, in View, he hoists the Pendant, and fires two Guns. The Signal for the Long-boats to come on board him, manned and armed, is the Pendant hoisted on the Flag-staff, and the Mizzen-top-mast-head, and a Gun fired; and if he would have them chase any Ship, Vessel, or Boat, in open View, without coming on board him, he hoists the Pendant, as aforesaid, and fires two Guns. When the Admiral would have all the Boats in the Fleet come on board him, manned and armed, he hoists a Pendant on the Flag-staff, both on the Fore-top-mast, and Mizzen-top-mast-head, and fires one Gun; but if he would have them chase, he hoists his Pendants, as before, and fires two Guns. When the Admiral would speak with the Visqualier, or his Agent, he puts an English Ensign in the Mizzen-top-mast-shrouds; and when with him that hath the Charge of the Gunner's Stores, he will spread an Ensign at his Main-top-fail-yard-arm.

#### SIGNALS for managing a Sea-Fight.

When the Admiral would have the Fleet form a Line of Battle, one Ship a-head of another, he hoists an Union Flag at the Mizzen-peak, and fires a Gun; and every Flag-Ship does the like. But when they are to form a Line of Battle, one a-behind of another, he hoists a Pendant with the Union-Flag, &c. When he would have the Admiral of the White, or he that commands in the second Post, to Tack, and endeavour to gain the Wind of the Enemy, he spreads a White Flag under the Flag at the Main-top-mast-head, and fires a Gun; and when he would have the Vice-Admiral of the Blue do so, he doth the same with the Blue Flag. If he would have the Vice-Admiral of the Red do so, he spreads a Red Flag from the Cap, on the Fore-top-mast-head, downward on the Back-stay: If the Vice-Admiral of the Blue, he spreads a Blue Flag, &c. and fires a Gun. If he would have the Rear Admiral of the Red do so, he hoists a Red Flag at the Flag-staff, at the Mizzen-top-mast-head; if the Rear Admiral of the White, a White Flag; if the Rear-Admiral of the Blue, a Blue Flag, and under it a Pendant of the same Colour, with a Gun. If he be to Leeward of the Fleet, or any Part of it, and he would have them bear down into his Wake or Grain, he hoists a Blue Flag at the Mizzen-peak, and fires a Gun. If he would be to Leeward of the Enemy and his Fleet, or any Part of it be to Leeward of him; in order to bring these Ships into the Line, he beats down with a Blue Flag at the Mizzen-peak, under the Union Flag (which is the Signal for Battle) and fires a Gun; and then those Ships, that are to Leeward of him, must endeavour to get into his Wake or Grain, according to their Station in the Line of Battle. When the Fleet is falling before the Wind, and he would have him, who commands in the Second Post, and the Ship of the Star-board Quarter, to clap by the Wind, and come to the Star-board Tack, he hoists a Red Flag on the Mizzen-top-mast-head: But a Blue one, if he would have Ships of the Lar-

board Quarter, come to the Lar-board Tack, with a Gun. If the Van are to tack first, he spreads the Union Flag at the Flag-staff, on the Fore-top-mast-head, and fires a Gun, if the Red Flag be not Atroad; but if it be, then he lowers the Fore-top Sails a little; and the Union Flag is spread from the Cap of the Fore-top-mast downwards; and every Flag-ship doth the same. If the Rear be to Tack first, he hoists the Union Flag on the Flag-staff, at the Mizzen-top-mast-head, and fires a Gun; which all the Flag-ships are to answer. If all the Flag-ships are to come into his Wake or Grain, he hoists a Red Flag at his Mizzen-peak, and fires a Gun; and all the Flag-ships must do the same. If he would have them commands in the Second Post of his Squadron to make more Sail (though he himself shortens Sail) he hoists a White Flag on the Ensign-staff. But if that Commands in the Third Post be to do so, he hoists a Blue Flag, and fires a Gun, and all the Flag-ships must make the same Signal. Whenever he hoists a Red Flag on the Flag-staff at the Fore-top-mast-head, and fires a Gun; every Ship in the Fleet must use their utmost Endeavour to engage the Enemy, in the Order prescribed them. When he hoists a White Flag at his Mizzen-peak, and fires a Gun; then all the small Frigates of his Squadron, that are not of the Line of Battle, are to come under the Stern. If the Fleet be sailing by a Wind in the Line of Battle; and the Admiral would have them brace their Head-sails to the Mast, he hoists up a Yellow Flag, on the Flag-staff, at the Mizzen-top-mast-head, and fires a Gun; which the Flag-ships are to answer: and then the Ships in the Rear must Brace first. After this, if he would have them fall their Head Sails, and stand on, he hoists a Yellow Flag on the Flag-staff of the Fore-top-mast-head, and fires a Gun, which the Flag-ships must answer, and then the Ships in the Van, must fall first, and stand on. If when this Signal is made, the Red Flag at the Fore-top-mast-head be abroad, he spreads the Yellow Flag under the Red. If the Fleets being near one another, the Admiral would have all the Ships to tack together, the sooner to lie in a Posture to engage the Enemy; he hoists an Union Flag on the Flag-staves at the Fore and Mizzen-top-mast-heads, and fires a Gun; and all the Flag-ships are to do the same. The Fleet being in a Line of Battle, if he would have the Ship that leads the Van, hoist, lower, set, or haul up any of his Sails, he spreads a Yellow Flag, under that at his Main-top-mast-head, and fires a Gun, which Signal the Flag-ships are to answer; and then the Admiral will hoist, lower, set, or haul up the Sail, which he would have the Ship, that leads the Van, do; which is to be answered by the Flag-ships of the Fleet. When the Enemies run, and he would have the whole Fleet follow them, he makes all the Sail be can after them himself, takes down the Signal for the Line of Battle, and fires two Guns out of his Fore-chafe, which the Flag-ships answer, and then every Ship is to endeavour to come up with, and Board the Enemy. When he would have the Chafe given over, he hoists a White Flag at the Fore-top-mast-head, and fires a Gun. If he would have the Red Squadron draw into a Line of Battle, one a-breast of another, he puts abroad a Flag, striped Red and White, on the Flag-staff at the Main, top-mast head, with a Pendant under it; and fires a Gun; if the White or Second Squadron is to do so, the Flag is striped Red, White and Blue: if the Blue or Third Squadron is to do so, the Flag is a Genesie Ensign and Pendant: But if they are to draw into a Line of Battle, one a-head of another, the same Signals are made without a Pendant. If they are to draw into the Line of Battle one a-Stern of another, with a large Wind, and he would have the Leaders go with the Star-board Tacks, a-board by the Wind; he hoists a Red and White Flag at the Mizzen-peak, and fires a Gun: But if they should go with the Lar-board-tacks Aboard, by the Wind, he hoists a Genesie Flag at the same Place; which Signals, like others, must be answered by the Flag-ships.

**SIGNATURE**, *Signez*, a Subscription or putting of one's Name at the Bottom of an Act or Deed, in one's own Hand Writing. Antiently, when very few People could write, they dispensed with the Use of Signatures; and contented themselves with the Party's Seal: See SEAL.—*Signature of the Court of Rome*, is a Supplication answered by the Pope, whereby he grants a Favour, Dispensation, or Collation, to a Benefice, by putting the *Fiat* at the Bottom thereof, in his own Hand; or the *Concessum est* wrote in his Presence. The Signatures, at the Bottom of the Supplication, gives the Name to the whole Instrument. The Signature contains the Clauses, Derogations, and Dispensations, wherewith the Pope grants the Favour, or the Benefice; with a Commission for the Execution thereof, either in *Forma dignum*, or in gracious Form. A Signature of the Pope's own Hand, whereby he answers, *Fiat ut petitur*, is preferred to another, answered by the Prefect, in his Presence, in these Words, *Concessum ut petitur in presensia D. N. Pape*. Sometimes, in Signatures with the *Fiat*, the Pope adds, *Proprio Motu*; which Clause gives them still further Force. See PROVISION. There are three Kinds of Signa-

tures; one in *Forma Gratiæ*, dispatch'd on an Attestation of the Ordinary; another in *Forma dignum Antiqua*, dispatch'd for Canonicates; the third in *Forma dignum Novissima*, which is a Kind of Second Signature, or Executive Letter granted, where upon the Ordinary's failing to execute the first within Thirty Days, the next after Ordinary is enjoy'd to execute it.

**SIGNATURE**, in Printing, a Mark at the Bottom of each Sheet, to facilitate the Gathering and Binding of the Book; and to shew the Order, and Number, of the Quires and Sheets. The Signatures consist of the Capital Letters of the Alphabet; and change in every Quire. If there be more Quires than Letters in the Alphabet; to the Capital Letter, they add a small one of the same sort, i. e. a little *a* after a great *A*, &c. which they repeat, as often as is necessary.

**SIGNATURE** is also used by some Naturalists for the Resemblance a Vegetable or Mineral bears to any Part of the Human Body.

**SIGNET**, one of the King's Seals, used in sealing his private Letters, and in signing all Grants, which pass his Majesty's Hand by Bill. The Signet is always in the Custody of the King's Secretaries: On whom attend Four Clerks of the Signet-Office. See SECRETARY.

**SIGNIFICAVIT**, is a writ which issues out of Chancery, upon a Certificate given by the Ordinary, of a Man that stands obstinately Excommunicate for the Space of Forty Days, for the laying him up in Prison, without Bail, or Mainprize, till he submit himself to the Authority of the Church.

**SIGNIFICATION**, the Sense of a Sign, Word, Phrase, Emblem, &c. or the Thing meant or denoted by the Sign, Word, Figure, &c. We are perfectly at a loss as to the Signification of the Hieroglyphic Characters of the Antients.

**SIGNIFICATION**, in Law, is the Notification of an Act, &c. made to the opposite Party, by a Copy, &c. thereof, given and attested by a proper Officer. Some Significations are to be made to the Person himself; or, at least, at his House: For others, 'tis enough they be made to the Party's Attorney, or Agent.

**SILENCIARCY**, *Silenciaris*, an Officer among the ancient Roman Slaves. The *Silenciaris*, according to some Authors, was a Slave placed over the rest, to prevent any Noise and Din, and keep them silent. *Semeos*, in his Epistles, mentioning the great Care taken to keep the Slaves mute, has given Occasion to *Lipsius*, *Popma*, and some others, to suppose, That the *Silenciaris* was established in his Time: But others, as *Pigeorinus*, think no such Conclusion can be drawn from *Semeos's* Words; nor any Thing, but that they were, even then, very severe in preventing any Noise among the Slaves. As to the Name and Office of the *Silenciaris*, 'twas not established till about the Time of *Salsianus*; who is the first Author that mentions it. — There were also *Silenciaris* established in the Emperor's Court; called *Quiritii Ministri*, and *Silenciaris Palatii*; and honoured with the Title of *Clarissimi*, *Speculabiles*, *Devotissimi*, and in Greek, *Θαυματοκρατες*, &c. Most admirable. There was a great Number of them; but only Thirty ordinarily officiated; who were divided into Three Bands, each whereof had its Decuria. The Council of Chalcedon, call the Body of *Silenciaris*, *Schola devotissimorum Silenciariorum*.

**SILENI**, in Antiquity, Heathen Demi-Gods; the same with the *Satyrs*, which were called *Sileni* when they came to be advanced in Age. Yet was there one principal *Silenus*, elder than any of the rest. *Diod. Siculus* says, He was the Master, or Tutor of *Bacchus*, whom he disciplined nobly, and followed him to the Wars. He quotes an ancient Poet named *Thymetes*, who relates, That the *Silens* assisted *Bacchus* in the War he waged against the *Titans*; adding, That the first *Silenus* reigned in an Island made by the River *Lycus* in *Lybia*. He is represented, as having a long Tail hanging behind; which is likewise an Attribute of all his Posterity. The Poets always mount him on an Ass. *Nanus* makes *Silenus* a Son of *Jellus*; and gives him Three Children; *Agræus*, *Maron*, and *Leucus*. *Serinus*, on *Virgil's* Eclogue, makes *Silenus* the Son of *Mercury*; others, the Son of *Pan*, and a Nymph: Others will have him born of the Drops of the Blood of *Cælus*, Father of *Saturnus*.

*Bochart*, in his *Canana*, will have *Silenus* to take his Name from *שילן*, *Silo*, or *שילן*, *Silan*, the Name of the *Messiah*. He adds, That whatever is attributed to this imaginary God, is all taken from what the Prophets have foretold of the *Jesus Christ*: Thus, whereas 'tis said, The *Messiah* shall be the Instructor of the People; *Silenus* is made Preceptor of *Bacchus*. Because 'tis said, That our Saviour shall bind his Ass to the Vine, and his Colt to the young Vine; *Silenus* is made to ride an Ass. Because our Saviour washed his Garments in Blood, as those who trod the Wine-press; *Silenus* was made to preside over those, who press'd the Vintage. Because, 'tis added, his Eyes were red by Reason of Wine; *Silenus* was made always fuddled. *Bochart* advances all this with a deal

deal of Distrust, as he has Reason; it having no Warrant: He adds, That the Devil invented the Fable of *Silensius*, to turn the Mytheries of our Religion into Ridicule. But it must be a very ignorant Devil, to take *Rubens illi oculi ex vino, & dentes eius ex lacte albescunt*, in the Sense he has done; as if the Words signified any Thing more, in the Propriety of the Hebrew Tongue, than, His Eyes are redder than Wine; His Teeth whiter than Milk. We may add, That no Body, before *Bochar*, neither Christian nor Idolater, ever saw any Thing of *Jesus Christ* in the Fable of *Silensius*.

**SILIQUA**, in Botany, is the Seed-Vessel, Husk, Pod, or Shell of Plants, of the Leguminous Kind. Whence *Siliquosus* Seeds, &c.

**SILK**, a very soft, fine, bright delicate Thread; the Work of an Insect, called the *Silk Worm*. The Antients were but little acquainted with the Use and Manufacture of *Silk*. They took it for the Work of a Kind of Spider, or Beetle, who spun it out of its Entrails, and wound it with its Feet about the little Branches of Trees. This Insect they called *Ser*, from *Seres*, a People in *Seythia*, who kept it; whence, the *Silk* it self they called *Sericum*. But the *Ser* has very little Affinity with our *Silk-Worm*, *Bombyx*: The former living Five Years; but the latter dying annually, envelop'd in a yellowish Cover, or Ball; which, wound out into little Threads, makes what we call *Silk*. 'Twas in the Isle of *Cat*, that the Art of manufacturing *Silk*, was first invented; and *Pamphika*, Daughter of *Platius*, the Inventor. The Discovery was not long unknown to the *Romans*. *Silk* was brought them from *Seres*, where the *Worm* was a Native. But so far were they from profiting by the Discovery, that they could not be induced to believe so fine a Thread should be the Work of a Worm; and therefore formed a Thousand Chimerical Conjectures of their own.

This Temper rendered *Silk* a very scarce Commodity among them for many Ages: 'Twas even sold Weight for Weight against Gold; insomuch, that *Vopiscus* tells us, The Emperor *Aurelianus*, refused the Empress's his Spouse, a Suit of *Silk*, which she solicited of him with much Earnestness; merely for its Deareness. At length, Two Monks, coming from the *Indies* to *Constantinople*, in 555; brought with them great Quantities of *Silk Worms*, with Instructions for the hatching of their Eggs, rearing and feeding the *Worms*, drawing out the *Silk*, spinning and working it. Upon this, Manufactures were set up at *Athens*, *Thebes*, and *Corinth*.

About the Year 1130, Roger King of *Sicily*, established a *Silk Manufactory* at *Palermo*, and another in *Calabria*; managed by Workmen, who were Part of the Plunder brought from *Athens*, *Corinth*, &c. whereof that Prince made a Conquest in his Expedition to the Holy Land. By Degrees, *Messary* adds, the rest of *Italy* and *Spain* learned from the *Sicilians*, and *Calabrians*, the Management of the *Silk Worms*; and the working of the *Silk*: And at length the *French*, by Right of Neighbourhood, a little before the Reign of *Francis I.* began to imitate them. The great Advantage the New Manufacture turned to, made our King *James I.* very earnest for its being introduced into *England*. Accordingly, it was recommended several Times from the Throne, and in the most earnest Terms, to plant Mulberry-Trees, &c. for the Propagation of *Silk Worms*; but, unhappily, without Effect: 'Twas from the various Experiments we meet withal in the *Philosophical Transactions*, and other Places, it appears, That the *Silk Worm* thrives and works as well, in all Respects, in *England*, as in any Part of *Europe*.

The *Silk-worm* is an Insect, not more remarkable for the precious Matter it furnishes for divers Stuffs; than for the many Forms it assumes, before and after its being envelop'd in the rich Cod or Ball it weaves it self. From a Grain, or Seed, which is its first State, it becomes a pretty big *Worm*, of a whitish Colour, bordering on a yellow. When a *Worm*, it flouts its self up in its Cod, and assumes the Form of a kind of greenish Bean, without any Signs of Life or Motion. At length it awakes to become a Butter-Fly; after making it self a Passage out of its *Silken* Sepulcher. And, at last, dying indeed, it prepares it self, by a Grain, or Seed it casts, for a New Life; which the Warmth of the Summer Weather assists it in resumng.

As soon as the *Silk-Worm* is arrived at the Size and Strength necessary for the beginning his Cod; he makes his Web: For 'tis thus they call that slight Tissue, which makes the Beginning, and Ground of this admirable Work. This is his first Day's Employment. On the Second, he forms his Cod, and covers himself almost over with *Silk*. The Third Day, he is quite hid; and the following Days, employs himself in thickening and strengthening his Cod: Always working from one single End, which he never breaks thro' his own Fault; and which is so fine, and so long, that those who have examined it attentively, think they speak within Compass, when they affirm, that each Cod contains *Silk* enough to reach the Length of Six English Miles. In

Ten Days time, the Cod is in its Perfection; and is now to be taken down from the Branches of the Mulberry Tree; where the *Worms* have hung it. But this Point requires a deal of Attention; for there are some *Worms* more lazy than others; and 'tis very dangerous waiting till they make themselves a Passage, which usually happens about the Fifth Day, of the Month.

The first, finest and strongest Cods or Balls, are kept for the Grain; the rest are carefully wound; or, if 'tis desired to keep them all, or if there be more than can be well wound at once; they lay them for some Time in an Oven moderately hot, or else expose them, for several Days successively, to the greatest Heats of the Sun, in order to kill the Bean or Maggot; which, without this Precaution, would not fail to open it self a Way to go and use those New Wings abroad, it has acquired within. Ordinarily, they only wind the more perfect Cods. Those that are double, or too weak, or too coarse, are laid aside; not as altogether useless, but that, being improper for winding, they are referred to be drawn out into Skains. The Cods are of different Colours; the most common are Yellow, Orange-Colour, Habella, and Flesh-Colour.

There are some also of a Sea-green; others of a Sulphur Colour, and others White: But there is no Necessity for separating the Colours and Shades to wind them apart; as all the Colours are to be lost in the future Scouring and Preparing of the *Silk*.

To wind the *Silk* from off the Cods, Two Machines are necessary; the one a Furnace, with its Copper; the other a Reel, or Frame, to draw the *Silk*. The Winder, then, seated near the Furnace, throws into the Copper of Water over the Furnace (first heated and boiled to a certain Degree which Custom alone can teach) a Handful or Two of Cods, which have been first well purged of all their loose furry Substiance. He then stirs the whole very briskly about with Birch-ens Rods, bound and cut like Brushes; and when the Heat, and Agitation have detach'd the Ends of the *Silk* of the Pods, which are apt to catch on the Rods, he draws them forth; and joining Ten or Twelve, or even Fourteen of them together, he forms them into Threads, according to the Bigness required to the Works they are destined for: Eight Ends sufficing for Ribbons; and Velvets, &c. requiring no less than Fourteen. The Ends thus joyned into Two or Three Threads, are first passed into the Holes of the Iron Rods, in the Fore-part of the Reel, then upon the Bobbins, or Pullies, and at last are drawn out to the Reel it self, and there fastened, each to an End of an Arm or Branch of the Reel. Thus disposed, the Workman, giving Motion to the Reel, by turning the Handle; guides his Threads; substitutes new ones, when any of them break, or any of the Cods are wound out; strengthens them where necessary, by adding others; and takes away the Cods wound out, or that, having been pierced, are full of Water. In this Manner, Two Workmen will spin and reel Three Pounds of *Silk* in a Day; which is an overbearing Dispatch than is made by the Spinning Wheel, or Distaff. Indeed, all *Silks* cannot be spun, and reeled after this Manner: Either, by Reason the Cods have been perforated by the *Silk-Worms* themselves, or because they are double, or too weak to bear the Water; or because they are coarse, &c. Of all these together, they make a particular Kind of *Silk* called *Fewers*: Which being carded, or even spun on the Distaff, or the Wheel in the Condition it comes from the Cod, makes a tolerable *Silk*.

As to the Cods, after opening them with Sciffars, and taking out the Beans (which are of some Use for the feeding of Fowl) they are steeped Three or Four Days in Troughs, the Water whereof is changed every Day to prevent their stinking. When they are well softened by this Scouring and cleared of that gummy Matter; the *Worm* had lined the Inside withal, and which renders it impenetrable to the Water, and even to Air it self; they boil them Half an Hour in a Lie of Ashes, very clear and well strained; and after washing them out in the River, and drying them in the Sun, they card and spin them on the Wheel, &c. and thus make another Kind of *Fewers*, somewhat inferior to the former.

The several Preparations which *Silks* undergo, to fit them to be used in the Manufacture of *Silken* Stuffs, are the Spinning, Reeling, Milling, and Dying. The Two first we have already spoke of, as they are concerned in drawing the *Silk* from off the Cods. As to the Spinning and Reeling of Raw *Silks*, already off the Cods, such as they are brought hither from *Italy*, the *Levant*, &c. the first is chiefly performed on the Spinning-wheel; and the latter, either on Hand Reels, or on Reels mounted on Machines, which serve to reel several Skains at the same Time. As to the Milling, they use a Mill composed of several Pieces, which may Mill Two or Three Hundred Bobbins at once, and make them into as many Skains. See SPINNING, REELING, MILLING, and DYING, each under its proper Article.

**RAW SILK**, is that taken from the Cod, without Fire, and wound without boiling; such is most, if not all, that is brought into England from the *Levant*. In the *French Silkworms*, the greatest Part of this *Silk* passes for little better than a Kind of very fine *Fleuret*; yet, when spun, it makes a bright Thread, and serves for the Manufacture of Stuffs of moderate Value, and Lustré: But the *Raw Silks* of the *Levant*, whence most of ours come, are exceeding fine and beautiful. This Difference arises hence, That in *France* the best Cods are spun and wound in boiling Water, and only the Refuse made into *Raw Silk*: Whereas, in the *Levant*, there is no such thing as Spinning or Winding in the Fire; but the *Silks* are all sent in Balls or Masses, as they are drawn from off the Cods: So that they are only distinguished by their Quality of Fine, Middling, and Coarse.

**Boiled SILK**, is that boiled in Water, to facilitate the Spinning and Winding. This is the finest of all the *Silks* manufactured in *France*, and is seldom used, but in the richest Stuffs, as Velvets, Taffetas, Damasks, Brocades, &c. There is also another Kind of *Boiled Silk*, which is prepared by boiling, to be milled; and which cannot receive that Preparation, without being first passed through boiling Water. By the Laws of *France*, 'tis prohibited to mix Raw with *Boiled Silk*; both as such a Practice spoils the Dyeing, and as the raw *Silk* corrupts and cuts the boiled.

**Thrown or Twisted SILKS** are such, as, beside their Spinning and Winding, have had their Milling or *Throwing*. This they have in a different Degree, as they are passed oftener, or less, over the Mill. Properly, however, *Thrown Silks* are those wherein the Threads are pretty thick *thrown*, and are twisted several times.—*Silk Silks* are such as are not twisted, but are prepared, and died, for Tapestry, and other Works, with the Needle. See *THROWSTER*.

**Eggs SILK**: That particularly thus called, is not the Work of the *Silk-Worm*, but comes from a Plant that produces it, in Pods, much like those of the Cotton-Tree. The Matter this Pod contains is extremely white, fine, and moderately bright: It spins easily, and is made into a Kind of *Silk*, that enters the Manufacture of several *Indiano* and *Chinese* Stuffs.

**SPIDER-SILK**. Within a few Years the Secret has been found in *France*, of procuring and preparing *Silk* of the Webs of *Spiders*; and using it in several Manufactures. This Discovery is owing to M. *Bon*, in 1710, who published a Dissertation on the Subject; whence what follows is extracted. See *SPIDER-WEB*.

*Spiders* are usually distinguished, either with regard to their Colour; as, into Black, Brown, Yellow, White, &c. or, with regard to the Number, or Arrangement, of their Eyes; some having 6, others 8, others 10. But with regard to the *Silk-Spider*, M. *Bon* reduces them all to two Kinds, those with long Legs, and those with short; which last, are those which furnish the *Raw Silk*.

The *Silk-Spider* make a *Silk*, every whit as beautiful, strong, and shining, as the *Silk-worm*: It spins it out of the *Arms*, around which are Five Papillæ, or small Nipples, and behind these, two others; all masculous, and furnished with Sphincters. These Nipples serve, as so many wire-drawing-Irons, to form and mould a Liqueur, which, when dried in the Air, after being drawn through them, is to be the *Silk*. Each of these Nipples, M. *Reaumur* observes, consists of a Number of lesser and insensible ones; which one may be convinced of, by pressing a *Spider's* Belly between the Fingers, to oblige the Liqueur to flow into the Nipples; for by this Means, applying the Finger against the *Arms*, several distinct Threads will be drawn out through the several Perforations of the Nipples. The Threads are too fine to be told with any Certainty; but M. *Reaumur* reckons, each larger Nipple may send forth six or seven. Hence we see, how the *Spiders* make their Threads bigger, or smaller: For as, before they begin to Spin, they always apply more or fewer of these six Nipples, against the Body whence the Web is begun; or as they apply each more or less strongly, so as more or fewer of the insensible Nipples come to take; the Thread thus spun, will be a Compound of more or fewer of the single Threads. Indeed, as the Threads come from the *Arms*, all joined together, they appear to be single; but M. *Bon* has distinguished one of the single ones to consist of 15 or 20 distinct Threads.

The Threads are of two Kinds: The First is weak, and only serves for that kind of Web whereinto they catch Flies. The Second is much stronger, and serves to wrap up their Eggs in; which, by this means, are sheltered from the Cold, as well as from Insects, which might otherwise gnaw and spoil them. These Threads they wind very loosely round the Eggs, resembling the Cods or Bags of *Silk-Worms*, that have been prepared and loosened for the Distaff. The *Spider-Bags* are of a Grey Colour when new; but turn blackish when long exposed to the Air: Indeed, one might find other *Spider-Bags* of other Colours, and which would afford a better *Silk*, but their Secrecy would render

the Experiment difficult; for which Reason we confine our selves to the Bags of the commonest *Spiders*, which are the short-legg'd Kind. These always find out some Place secure from the Wind and Rain, to make their Bags; as, hollow Trees, the Corners of Windows, or Vaults, or under the Eaves of Houses. By collecting a Quantity of these Bags, a new *Silk* is made, inferior in nothing to the common *Silk*. It takes all Kinds of Dyes, and may be made into all Kinds of Stuffs. M. *Bon* had Stockings, and Gloves, made of it, which he presented to the Academy; and others to the Royal Society.

For the Manner of preparing the Bags to get the *Silk*, 'tis thus: After having gather'd 12 or 13 Ounces of these Bags, M. *Bon* had them well beaten for some Time, with the Hand, and a Stick, to get out all the Dait: He then washed them, in luke-warm Water, till they left the Water very clear: After this, he laid them to sleep, in a large Vessel, with Soap and Salt-petre, and Gum Arabic. The Whole was left to boil over a gentle Fire, for three Hours. The Bags were next wash'd, in warm Water, to get out the Soap; and, after all, laid to dry some Days, to fit them for Carding; which was perform'd by the common *Silk-Carriers*, but with Cards much finer than ordinary. By this Means, he had a *Silk*, of a very particular Ash-colour, which was easily spun, and the Thread spun from it, both stronger and finer, than that of common *Silk*; which shews, that all sorts of Work may be made of it: Nor is there any Reason to fear, but it will stand any Trials of the Loom, after having paid'd that of the *Stocking-Worms*.

The only Difficulty, now, is in procuring a sufficient Quantity of *Spider's* Bags to make any considerable Work of it: Which M. *Bon* observes, would be no Difficulty at all, had we but the Art of Breeding them as they do *Silk-Worms*. For they multiply much more; every *Spider* laying 6 or 700 Eggs, whereas the *Silk-Worms* don't lay above 100; yet are these last, so tender, &c. that one Half die without making any Bags, or are hinder'd by some little Accident, from making their Bags: Whereas the *Spiders* hatch of themselves, without any Care, in the Months of *August* and *September*, in Fifteen or Sixteen Days after they are laid; the Old *Spiders* that lay them, dying soon after. The young Ones thus bred, live Ten or Twelve Months without eating, and continue in their Bags without growing, till the hot Weather putting their vitid Juices in Motion, forces them to come forth, spin, and run about to seek Food. Were a Way, therefore, found of breeding young *Spiders* in Rooms, they would, doubtless, furnish a much greater quantity of Bags than *Silk-Worms* do. For of Seven or Eight hundred young *Spiders*, which M. *Bon* kept, scarce one died in a Year; whereas of One hundred *Silk-Worms*, not Forty lived to make their Bags. M. *Bon* having order'd all the short-legg'd *Spiders* that could be found in the Months of *August* and *September*, to be brought to him, shut them up in Paper Collins, and Pots; covering the Pots with Papers, which he prick'd full of Pin-holes, as well as the Collins, to give them Air. He fed them with Flies, and found sometime afterwards the greatest part of them had made their Bags. The same Excellent Person found that *Spiders* Bags, with regard to their Weight, afford much more *Silk* than those of the *Silk-Worms*. As a Proof hereof, he observes, That Thirteen Ounces yield near Four Ounces of clear *Silk*; Two Ounces whereof, will make a Pair of Stockings; whereas Stockings of common *Silk* weigh Seven or Eight Ounces: Nor is there any Venom in the *Silk*, or even in the *Spider*, as many have imagined. M. *Bon* has been bit by them several times, without any manner of harm; and as for the *Silk*, 'tis used with very good Success, to stop Bleeding and cure Wounds, the natural Gluten thereof acting as a kind of Balsom. It likewise yields, by Distillation, several Specific Medicines, particularly great Quantities of Spirit, and Volatile Salt, which being prepared after the same Manner as that drawn from the Bags of *Silk-Worms*, in making the *English Drops*, so famous over all Europe; may serve to make other Drops of greater Efficacy, which M. *Bon* calls *Drops of Montpellier*, to be used in all steepey Diseases.

M. *Reaumur* being appointed by the *Royal Academy*, to make a further Enquiry into this New *Silk-work*, has rais'd several Objections and Difficulties against it; which are found in the Memoirs of the *Academy* for the Year 1710: The Sum of what he has urg'd, amounts to this: The Natural Feriency of the *Spiders*, renders them unfit to be bred and kept together, Four or Five thousand being distributed into Cells, 50 in some, 100 or 200 in others; the big Ones kill'd and eat the less, so that in short time, there were scarce left one or two in each Cell: And to this Inclination of mutually eating one another, M. *Reaumur* ascribes the Scarcity of *Spiders*, considering the vast Number of Eggs they lay. But this is not all: He even affirms, That the *Spider's* Bag is inferior to that of the *Silk-worm*, both in Lustré and Strength; and that it produces less Matter to be manufactured. The Thread of the *Spider's* Web only bears a Weight of Two Grains without breaking; that of

the Bag bears 36. The latter, therefore, in all Probability, is Eighteen Times thicker than the former; yet is it weaker than that of the *Silk-worm*, which bears a Weight of Two Drams and a Half. So that Five Threads of the Spider's Bag must be put together to equal one Thread of the *Silk-worm's* Bag. Now, 'tis impossible these should be applied so justly over one another, as not to leave little vacant Spaces between them, whence the Light will not be reflected; And of Consequence, a Thread thus compounded, must fall short of the Lustre of a solid Thread. Add to this, that the Spider's Thread cannot be wound off, as that of the *Silk-worm* may; but must, of necessity, be Carded; by which means being torn in Pieces, its Evenness, which contributes much to its Lustre, is destroy'd. In effect, this want of Lustre was taken Notice of by M. de la Hire, when the Stockings were presented to the *Academy*. Again, Spiders furnish much less *Silk*, than the *Worms*. The largest Bags of these latter, weigh Four Grains; the smaller Three Grains; so that 2304 *Worms*, produce a Pound of *Silk*. The Spider's Bags don't weigh above one Grain; Yet, when clear'd of their Dust and Filth, lose Two thirds of their Weight: The Work of 12 Spiders, therefore, only equal that of one *Silk Worm*; and a Pound of *Silk* will require at least 27648 Spiders. But, as the Bags are wholly the Work of the Females, who spin them to deposit their Eggs in; there must be kept 55296 Spiders, to yield a Pound of *Silk*. Yet will this only hold of the best Spiders; those large ones ordinarily seen in Gardens, &c. scarce yielding a Twelfth Part of the *Silk* of the others. 280 of these, he shews, would not do more than one *Silk-Worm*; and 663552 of them would scarce yield a Pound.

#### Commerce of SILKS.

**French SILKS.** 'Tis only in the most Southern Provinces of France, that *Silk* is cultivated, Mulberry Trees planted, and *Worms* bred. The principal, are those of *Languedoc*, *Dauphine*, *Provence*, *Arignon*, *Savoie*, and *Lyon*. This last Place, indeed, furnishes very few *Silks* of its own Growth; but is the great Staple whence the Merchants of *Paris* and the other Cities are to fetch them: at least, they are obliged to have them pass through *Lyon*, if they bring them from elsewhere, either by Land or Sea. There are computed to enter *Lyon*, *Communions Annis*, 6000 Bales; the Bale valued at 160 Pound Weight: Of which 6000 Bales, there are 1400 from the *Levant*, 1600 from *Sicily*, 1500 from *Italy*, 300 from *Spain*, and 1200 from *Languedoc*, *Provence* and *Dauphine*. At the Time when the Manufactures of *Lyon* were in their Prosperity, there were reckoned 18000 Looms employ'd in the *Silk* Manufacture; but they are so fallen, that even in 1698, there were not reckon'd 4000. The Decay is not less notable at *Tours*. They had formerly 700 Mills for winding and preparing the *Silks*; 8000 Looms to weave them, and 40000 Persons employ'd in the Preparation and Manufacturing thereof; which are now reduced to 70 Mills, 1200 Looms, and 4000 Persons.

**Sicilian SILKS.** The Commerce of the *Silks* of *Sicily*, is very considerable; and the *Florentines*, *Genoese* and *Luciese*, are the People who chiefly make it. Great Quantities are yearly brought thence, especially from *Messina*; part whereof they use in their own Manufactures, and sell the rest to their Neighbours, the *French*, &c. with Profit. The *Italians* have this Advantage, especially the *Genoese*, over other People, That having large Establishments in the Island, they are reputed as Natives, and pay no Duty for the Export. Part of the *Sicilian Silks* are Raw; the rest Spun and Mill'd; of which last Kind, those of *St. Lucia* and *Messina*, are the most valued. The raw, unwrought *Silks* are always sold for ready Money; the others, sometimes, in Exchange for other Goods.

**Italian SILKS.** The *Silks* brought from *Italy* are partly Wrought, and partly Raw, and Unwrought. *Milan*, *Parma*, *Lucca* and *Modena*, furnish none but the latter Kind; *Genoa* most of the former; *Bologna* affords both Kinds.

**Spanish SILKS.** are all Raw, and are Spun, Mill'd, &c. in *England*, according to the several Works they are to be used in.

**SILKS of the Levant,** are all Raw. One Advantage we have in the Commerce of the *Levant*, in *Silks*, wanting in those of *Sicily*, is, That the latter are confined to a particular Season of the Year; whereas the former are bought at all Times. They are brought from *Aleppo*, *Tripoli*, *Seyda*, from the Isle of *Cyprus*, *Condia*, &c. but the principal Place of Commerce, especially for the *Silks* of *Perfia*, is *Smyrna*. The *Silks* are brought hither in Caravans, from the Month of *January* to *September*. The Caravans in *January*, are laden with the finest *Silks*; those of *February* and *March* bring indifferent ones; the rest, the coarsest. They all come from the several Provinces of *Perfia*, chiefly those of *Quilisa* and *Schirvan*, and the City of *Schamackin*, situate near the Edge of the *Caspian* Sea; from which three Places, a *Dutch*

Author assures us, there don't come less than 30000 Bales of *Silk* in a Year. *Ardoul* or *Ardabil*, another City of *Perfia*, not far distant from these *Silk* Countries, is the Place where the *Silks* are laid up, and whence the Caravans set out for *Smyrna*, *Aleppo*, and *Constantinople*; and 'tis this City, with *Schamackin*, that have always been esteem'd the Centre of the *Silk* Trade; which has been several Times attempted to be removed from *Smyrna* and the *Mesopotamian*, in favour of *Archangel* and the *White* Sea, by carrying them across *Moscow*, by the *Volga* and *Dwina*, two Rivers that traverse the principal Provinces of that vast Empire. This new Course of the *Perfia* *Silks* into *Europe*, was first propos'd by *Papal* *Centurio*, a *Genoese*, to *Czar Basil*, under the Pontificate of *Leo X.* The *French* had the same Design in 1626. The *Duke of Holstein*, in 1633, sent Embassadors to the Court of *Perfia* purely with the same View: And in 1668, the *Czar Alexis Michael* attempted the thing himself; but was disappointed by the Rebellion of the *Cossacks*, and the surprize of *Abracan*. In 1688, the Commerce of *Perfia* *Silks* had like to have been removed from *Smyrna* by an Earthquake, which almost overturn'd the whole City: And, doubtless, the Removal had been effected, but for the vigorous Means us'd by the *Turks* to prevent it. *Smyrna*, however, still remains in her ancient Possession; and the several Nations of *Europe* continue every Year to send their Fleets, to fetch away the *Silks*; and Matters are like to remain so, unless the Conquests made by the late *Czar*, along the *Caspian* Sea, enable his Successors, as 'tis certain he himself had such a Thing in View, to put this great Design in Execution.

**Chinese, Japanese and Indian SILKS.** Several Provinces of *China* are so fertile in Mulberry-trees, and their Climate so agreeable to the Nature of *Silk-Worms*, that the Quantity of *Silk* here produced is incredible: The single Province of *Tchikiao* might supply all *China*, and even a great Part of *Europe*, with this Commodity. The *Silks* of this Province are the most esteem'd, though those of *Nanquin* and *Canton* be excellent. The *Silk* Trade is the Principal in *China*, and that which employs the most Hands. But the *European* Merchants, who meddle in it, especially in Work'd *Silks*, are to be careful of the Spinning, &c. the Waste being usually very great, as the *French East-India* Company lately found to their Cost. — *Japan* would not afford fewer *Silks* than *China*; but that the *Japanese*, a barbarous and distrustful People, have interdicted all Commerce with Strangers, especially *European*; excepting with the *Dutch*; who are said to be admitted on certain Terms, related by *Tavernier*, but which we must own we can't credit, so much Horror they raise. Accordingly, the *Dutch* have endeavour'd to vindicate themselves by the Pens of several famous Writers. — The *Silks* of the States of the Great *Mogal*, are brought almost wholly from *Kasem-barar*, a Mediterranean Place, whence they are convey'd by a Canal of Fifteen Leagues into the *Ganges*, by which, they are forwarded Fifteen Leagues further, to the Mouth of the famous River of *Indostan*. The *Silk* of *Kasem-barar* is Yellowish; as are also those of *Perfia* and *Sicily*; there being none, that we know of, naturally White, but that of *Palestine*. The *Indians*, however, whiten it with a Lye made of the Ashes of a Tree, call'd *Adam's Fig-tree*; but as the Tree is pretty scarce, the *European*s are forced to take the greatest Part of their *Silks* in the native Yellow. *Kasem-barar* alone, is computed to furnish every Year Twenty-two thousand Bales of *Silk*, each Bale weighing 100 Pounds. The *Dutch* buy it almost all up; not to bring into *Europe*, no more than they do that of *Japan*; but to exchange it for other rich Merchandizes; particularly Bars of Silver, &c.

**SILLON**, in Fortification, is an Elevation of Earth made in the Middle of the Moat, to fortify it, when too broad: It is otherwise call'd *Enveloppe*, which is the more common Name. See *ENVELOPE*.

**SILVER**, a white Metal, holding the second Place among Metals; being of all others, after Gold, the finest, purest, most ductile, and most precious. See *METAL*.

There are *Silver* Mines in all the Four Quarters of the World. *Europe* has its Share; nor is our own Island quite destitute thereof, tho' it has none of much Value.

The Mines of *Peru*, and some other Parts of *America*, are much the richest, and most abundant. They appear almost inexhaustible: Particularly those of *Potosi*, which continue to be dug with equal Advantage as when first discovered; with this only Difference, That the Veins which were then almost in the Surface of that famous Mountain, are now sunk to prodigious Depths, the Workmen going in to them by a painful Defcent of Four or Five Hundred Steps. Many Millions of *Indians* have perished in them; and prodigious Numbers continue to be destroyed yearly.

The Ores, or Mineral Stones they dig, are not all of the same Quality, Consistence, or Colour; some are white, or ash-coloured, spotted with red, or blue; and call'd *Piara blanca*. Others are black, and call'd *Plomo-ronca*. These last are the richest and the easiest wrought: No *Mercury* being

being here needed; nor any Thing, but to put them in the Fire; Where the Lead evaporating, leaves the *Silver* pure. The *Indians*, who, till the Arrival of the *Spaniards*, knew nothing of the Use of *Mercury*, melted none but of this Kind of Mineral. The *Rosillos*, is another black Mineral distinguished by whetting and rubbing it against Iron, which turns it red. 'Tis very rich, and the Metal it yields, of the best Soet. The *Lovoco* burns like Tale, and looks as if silver'd; tho' it does not yield much. The *Paco* is a yellow red, very soft, and found almost broke in Pieces; 'tis not rich. The *Cabrillo* is green, and half friable. Tho' the *Silver* be visible, yet 'tis exceedingly difficultly drawn from it, by Reason of the Copper wherewith 'tis intermixed. Lastly, the *Stramocin*, which is only found in *Potosi*, and that only in the Mine of *Catenino*, consists of Threads of pure *Silver*, interwove like a *Silver* Galoon, that has been burnt to get out the Silk.

The *Silver-Veins*, of what Quality soever, are usually richer in the Middle than towards the Extremes. But the richest Places are those where the Veins intersect. 'Tis reckoned a great Addition to the Richness of a Mine to be near a River, for the Advantage of Mills to grind Ore. At *Lipes* and *Potosi*, for Instance, the *Caxou* of Ore must yield Ten Marks to defray Expences; whereas, at *Tamou*, there need not above Five.

The most usual Way of separating the *Silver* from the Ore, is by what they call *Pignea*. See *PIGNEA*. Sometimes, however, they use nothing but Fire frequently repeated; or *Aqua Fortis*.

What renders the Working of the Mines exceedingly dangerous, is the Exhalations arising from them; which are even felt on the Out-side; and make an Impression on Animals grazing in the Neighbourhood; but in the In-side, stupify the Miners, none of whom can bear so poisonous an Air above a Day together. Sometimes 'tis so fatal, that it kills on the Spot; and obliges them to stop up the Veins again, whence it exhales. The Mines of *Potosi*, are much the least subject to them; and yet, without the Herb *Panagway*, the Infusion whereof is taken by the Miners, as we do that of Tea, those Mines must be soon abandoned. Tho' the Mines of *Potosi* and *Lipes*, still keep up their Reputation, yet are there several discovered within these few Years, that exceed them much in Richness; Such are the Mines of *Oruro*, Eighty Leagues from *Arica*, and those of *Olchaca*, near *Cusco*, opened in 1712. 'Tis remarkable, that most of the Mines in *America* are found in cold and barren Places.

The Method of separating *Silver* from the Ore, in *Europe*, is the same as that of Gold: That is, by Means of *Quick-Silver*; with this Difference, that for *Silver*, to every Fifty Hundred Weight of Ore, is added One Hundred Weight of Rock-Salt, or some other natural Salt. That curious Operation may be seen at length under the Article *GOLD*.

To separate the *Silver* from the *Mercury*, wherewith 'tis amalgamated; they have a Furnace open a-top; and the Aperture covered with a kind of Capital made of Earth, of a Cylindrical Form; that may be clapp'd on, or taken off at Pleasure. The Mass of *Silver*, and *Quick-Silver*, being laid in the Furnace, the Capital applied, and the Fire lighted underneath; by this Means, the *Quick-Silver* rais'd by the Action of the Fire, in Form of Vapour, is caught in the Capital, and taken thence, to be used in the Second Operation.

The Standard of fine *Silver* is 12 Penny-weights, each consisting of 24 Grains. When 'tis below this, it must be raised to it by Refining; which is usually performed by means of Lead. In order to this, a Coppel is fill'd with a Mixture of Brick-ashes, and Ashes of a Bullock's and other Bones. 'Tis set on the Fire, and heated red hot; in which State the *Silver* and Lead are put in together, in the Proportion of a Pound of Lead to Eight Ounces of *Silver*, and even somewhat more Lead, if the *Silver* be very coarse. As these Two Metals melt together, the Copper, before mixed with the *Silver*, dissipates in Smoke, or goes away with the Scum; and so does the Lead it self; leaving the *Silver* alone in the Coppel, in its proper Degree of Fineness. In this Method of Refining, wherein 6 or 7000 Pounds may be refined at once; the Metal is drawn out of the Coppel Two ways; the one by plunging in it, while still liquid, a thick Bar of Iron, round which, the *Silver* sticks in Form of a Shell, or Crust; repeating this again and again: The other, is by letting the Coppel stand till 'tis cold; in the Bottom whereof, the *Silver* fixes in Form of a Cake.

Besides the Refining of *Silver* with Lead, there is another Manner of doing it with *Salt-Petre*; the Manner whereof, see described under the Article *REFINING*.

But both the one and the other are tedious and troublesome; when performed on large Quantities. This occasioned M. *Hombert* to endeavour to shorten the Operation; which he effected with good Success. His Method is; To calcine the *Silver* with Half its Weight of common Sulphur; and after melting the whole together, to cast a Quan-

tity of Steel Filings upon it, at several Times: Upon this, the Sulphur quits the *Silver*, and joins it self to the Iron, and both are converted into Scorja, which swim on the *Silver*; and the Metal it self is found pure at the Bottom of the Crucible.

The Essay of *Silver* is also made by the Coppel, in the same Manner as the refining by Lead. If the *Silver*, after this Essay, preserve its Weight, 'tis Standard; if it lose, the Grains, or even Penny-weights of its Diminution, are accounted. See *ESSAY*: See also *STANDARD*.

*Silver-Wire*, is *Silver* drawn thro' the Holes of a Wire-drawing-Iron, and by this Means reduced to the Fineness of a Thread or Hair. The Manner of drawing it, see under the Article *GOLD-WIRE*.

*Silver-Leaf*, is that the Gold-beaters have reduced into fine, thin Leaves, to be used by Gilders, &c. See *GOLD-LEAF*.

*Shell-Silver*, is made of the Shreds of *Silver* Leaves, or of the Leaves themselves: Used in Painting and Silvering certain Works. *Shell-Silver* is prepared after the same Manner as *Shell-Gold*. See *GOLD*.

*Silver*, in Chymistry, is called *Luna*, Moon; and several Preparations are made from it: Particularly, a Tincture of *Silver*, by dissolving thin *Silver* Plates, or *Silver* Shot in Spirit of Nitre; and pouring the Dissolution in another Vessel full of Salt-water. By this Means, the *Silver* is immediately precipitated in a very white Powder, which they wash several Times in Spring-Water. This Powder they put in a Matras, and pour rectified Spirit of Wine, and Volatile Salt of Urine upon it. The whole is left to digest in a moderate Heat for fifteen Days; during which, the Spirit of Wine assumes a beautiful Sky-blue Colour, and becomes an Ingredient in several Medicines. This is also called *Potable Silver*, or *Argentum Potabile*. *Silver* is likewise converted into Crystals, by means of the same Spirit of Nitre; and 'tis this is called *Vitriol of Silver*. The *Lapis Infernalis* is nothing but *Silver* dissolved in *Aqua Fortis*, and left to crystallise.

*Quick-Silver*. See *MERCURY*.

*SILVERING*, the Covering of any Work with *Silver*-Leaf. 'Tis usual to *Silver* Metals, Wood, Paper, &c. Which is performed either by Fire, by Oil, or by Glue. Metal-Gilders *silver* by the Fire; Painter-Gilders, all the other Ways. See *GILDING*.

*SILVESTRIS*, a red Grain used to Dye in Scarlet. The Tree that produces it, is peculiar to the Province of *Guatemala* in New Spain. 'Tis not unlike the Tree that produces the Cochineal, only in this, that the Fruit containing the Grain *Silvestris*, is somewhat longer than that of the Cochineal-Tree: When the Fruit of the former is ripe, it opens of it self, and casts out its Seed upon a gentle shaking; and the *Indians* gather it in Earthen Plates set under the Tree for the Purpose. Eight or Ten of these Fruits do not yield above an Ounce of Seed; whereas Four of the Cochineal Fruits, yield an Ounce of Insects. The two Drugs are much like one another, as to the Eye, but prove very different; the Tincture of Cochineal being infinitely more beautiful than that of *Silvestris*: See *COCHINEAL*.

*SIMA*, in Architecture, a Term used by *Wolius*, and some other Writers, for what we otherwise call *Cymatium* or *Simatium*. See *CYMATIUM*.

*SIMATIUM* or *SIMAISE*, in Architecture: See *CYMATIUM*. *Simarium* and *Cymatium*, are generally confounded together; yet, in effect, they ought to be distinguished: the latter being the Genus, and the former the Species. *Simatium* of *Sima*, carnosus, according to *Felslin*, is the last and uppermost Member of grand Corniches, called particularly the great *Doucine* or *Gala recta*; and by the *Greeks*, *Epitrides*. In the Antique Buildings, the *Simatium*, a-top of the Doric Corniche, is generally in Form of a Cavetto, or Semi-Scotia; as we see particularly in the Theatre of *Marcellus*: This, some modern Architects have imitated; but in the *Ionic* Order, the *Simatium* is always a *Doucine*. The *Simatium*, or *Doucine*, then, is distinguished from the other Kinds of *Cymatia*, by its being carnosus.

*SIMELIUM*, a Term purely *Latin*, signifying a little Table, with Ranges of little Cavities therein, for the disposing of Medals in Chronological Order. The Word is but ill wrote: It should rather be *Cymelinum*, as being formed of the Greek *Κυμωλον*, Curiosity, or a Cabinet of precious Things. We more usually say, A Cabinet of Medals, than a *Simelinum*.

*SIMILAR*, in Arithmetic and Geometry. Those Things are said to be *Similar*, or *alike*, which cannot be distinguished by their Com-prehension; that is, either by immediately applying the one to the other, or some other Third to them both. There is nothing, therefore, found in one of the *Similar* Things, but is equally found in the other; that is, if you note all the Things in A, which may be discerned and conceiv'd, without assuming any other; and, in like Manner, note all the Things in B, which may be

be thus conceived: and A be *Similar* to B; all Things in A will be the same with those in B.

Since a Quantity cannot be understood, otherwise, than by assuming some other Quantity to refer it to; *Similar* Things, notwithstanding their *Similitude*, may differ in Quantity: And since, in *Similar* Things, there is nothing wherein they differ, beside the Quantity; Quantity itself is the Internal Difference of *Similar* Things. See *SIMILITUDE*.

*SIMILAR PARTS*, as A, a, have the same Ratio to their Wholes B b; and if the Wholes have the same Ratio to the Parts, the Parts are *Similar*. *Similar Parts* A a, are to each other as their Wholes B b. See *PART*.

*SIMILAR RECTANGLES*, are those which have their Sides about the equal Angles, proportional. See *RECTANGLE*.

Hence 1<sup>o</sup>. All Squares must be *Similar Rectangles*. See *SQUARE*.— 2<sup>o</sup>. All *Similar Rectangles* are, to each other, as the Square of their homologous Sides.

*SIMILAR TRIANGLES*, are such as have all their three Angles respectively equal to each other. See *TRIANGLE*.

Hence 1<sup>o</sup>. All *Similar Triangles* have their Sides about the equal Angles, proportional.— 2<sup>o</sup>. All *Similar Triangles* are, to each other, as the Squares of their homologous Sides.

*SIMILAR POLYGONS* are those, whose Angles are equal, and their Sides proportional.

And the like of other *similar rectilinear Figures*. See *POLYGON*, and *RECTILINEAL Figure*.

Hence, all *Similar Polygons* are, to each other, as the Squares of the homologous Sides.

*SIMILAR ARCS*, are such as are *Similar*, or equal Parts of their respective Circumferences.

*SIMILAR SEGMENTS OF CIRCLES*, are such as contain equal Angles. See *SEGMENT*.

*SIMILAR CON-SECTIONS*, are those whose Diameters make Angles equal to those of their Ordinates; i. e. those which are equilateral and equiangular.

*SIMILAR PLAIN NUMBERS*, are those which may be ranged into *Similar Rectangles*; i. e. into Rectangles, whose Sides are proportional: As 6 multiplied by 2, and 12 by 4; the Product of one whereof is 12, and the other 48, are *Similar Numbers*.

*SIMILAR SOLID NUMBERS*, are those whose little Cubes may be so ranged as to make *Similar* and Rectangular Parallelepipeds.

In all *SIMILAR FIGURES*, the homologous Angles are equal; and the homologous Sides proportional. All regular Figures, and *Similar* irregular ones, are in a duplicate Ratio of their homologous Sides. Circles, and *Similar Figures*, inscribed in them, are, to each other, as the Squares of the Diameter. See *FIGURE*.

*SIMILAR ANGLES*, are also equal Angles. In solid Angles, when the Planes, under which they are contained, are equal both in Number and Magnitude, and are disposed in the same Order; they are *Similar*, and consequently equal. See *ANGLE*.

In *SIMILAR TRIANGLES*, and *Parallelograms*, the Altitudes are proportional to the homologous Sides; and the Bases are cut proportionally by those Sides. See *TRIANGLE*, &c.

*SIMILAR DYSIAST*, a Disease of some simple, solid Part of the Body; as of a Fibre, with regard to its Tension or Flaccidity; of a Membrane; a nervous Canal, &c. See *DISEASE*.

*SIMILAR PARTS*, in Anatomy, those Parts of the Body which, at first Sight, appear to consist of like Parts, or Parts of the same Nature: Of these we usually reckon Ten, viz. The Bones, Cartilages, Ligaments, Membranes, Fibres, Nerves, Arteries, Veins, Flesh, and Skin: Each of which see under its proper Article. Dr. Green, in his Anatomy of Plants, observes, that these have, likewise, their *Similar*, and Organical Parts. See *PARTS*.

*SIMILE*, or *SIMILITUDE*, in Rhetoric, &c. a Comparison of two Things, which, though different in other Respects, yet agree in some one: As, He shall be like a Tree planted by the Water-side, &c. The Difference between a *Simile*, and a *Comparison*, consists in this; That the *Simile* properly belongs to what we call the Quality of the Thing, and the *Comparison* to the Quantity. See *COMPARISON*.

*SIMILITUDE*, in Arithmetic, Geometry, &c. the Relation of two Things *similar* to each other; or which are only distinguishable by Com-prefence. See *SIMILE*. The Notion of *Similitude*, which now makes some Figure in Geometry, &c. is owing to M. Leibnitz; 'Twill be rendered easy by the following Instance. Suppose two Watches perfectly alike; the one belonging to *Carus*, the other to *Gracchus*. If, now, *Carus* pull out his Watch in Prefence of *Gracchus*; the latter will be surprized, and fancy it his own; but he will perceive it different from his own, upon pulling out his own: that is, *Gracchus* distinguisheth *Carus's* Watch from his own, by their Com-prefence; or, by applying the one immediately to the other.

*Enslid*, and after him most other Authors, demonstrated all Things from the sole Principle of Congruity; *Wolffius*, in lieu hereof, substitutes that of *Similitude*; which, he tells us, was communicated to him by M. Leibnitz, and which he finds of very notable Use in Geometry, as serving to demonstrate many Things directly, which are only demonstrable from the Principle of Congruity, by an Analogy.

*SIMONIAICAL* is applied to a Person guilty of *Simony*; or of purchasing a Benefice, or other sacred Matter, with Money. See *SIMONY*. A *Simoniacal* Person convicted, is infamous, and incapable of holding any Benefice.

*SIMONIANIS*, a Sect of ancient Hereticks, the first that ever disturb'd Christianity; if they might be said to do so, who were little more than mere Philosophers, and made Profession of Magic. *Simon Magus*, so often mentioned in the Acts, was their Leader, and died under the Emperor Nero; St. Peter still surviving: So that *Clement Alexandrinus* is mistaken, when he makes *Simon* posterior to *Marcon*. St. Epiphanius says expressly, That the first Heresy was set on foot by *Simon the Magician*, born in a little City of Samaria, who pretended to be the great Virtue and Power of God, sent from Heaven to Earth. Among the *Samaritanians* he made himself pass for God the Father, and among the Jews, for the Son. He push'd up a kind of medly System, out of the Philosophy of *Plato*, the religious Fables of the Heathens, and Christianity: Particularly, from the *Platonists* he borrow'd abundance of Things relating to the Worship of Angels, which he perverted to Uses of Magic; pretending, there was no Salvation, but by the Invocation of Angels, who were, as it were, the Mediators between God and Man: To which superstitious Worship of Angels it is that St. Paul seems to refer in his Epistle to the *Colossians*. The *Gnosticks*, whereof the same *Simon* was the Father, adopted the same Practice of worshipping Angels, and even improved on it. See *GNOSTICKS*.

*SIMONY*, the Crime of trading with sacred Things, particularly of purchasing a Benefice with Money. By the English Canons, Anno 1229, *Simony* is not only committed by an Agreement for Money in Hand, or to be paid yearly; but for any other Profit or Emolument; any Reward, Gift, or Benefit, directly or indirectly; or by Reason of any Promise, Grant, Bond, &c. and this, either in Acceptance of a Living, or in an Exchange or Resignation. The Penalty, by our Laws, is, That the corrupt Patron shall forfeit the next Presentation to the King, and two Years Value of the Living; and the corrupt Incumbent, be for ever disabled to hold the Living.

*Simony* is committed by the Buying or Selling the Sacrament, Baptism, Ordination, Absolution, as well as of the Nomination and Collation to Benefices, a Place in a Monastery, or the like. Some have pretended it to be sufficient, that the Ordination were gratuitous; and that for the rest, the Revenues might be bought and sold as a Temporal Thing; But the Canons of several Councils have condemned this subtle Distinction; since the Revenues are attach'd to an Ecclesiastical Office partly Spiritual. The Casuists distinguish three Kinds of *Simony*. *Neutral Simony*, is that which sticks in the mere Will, and Inclination, without ever breaking forth into Act: As when a Present is made to a Collator, without taking any Notice that we expect a Benefice from him. This Kind of *Simony* is only punishable in *foro Conscientie*. *Conventional Simony* is where there is an express Act, and a formal Bargain, though it never come to an Execution. *Real Simony*, is where the Convention is executed on both Sides, which last is the most criminal of them all. The Penalty of *Simony* is Deposition in a Clerk, and Excommunication in a Layman. 'Tis a Maxim among the Romish Casuists, That there is no *Simony* in the Court of Rome; in regard, tho' the Pope acts there as an absolute Sovereign. They also say, That Resignations, in *favorem*, are not to be admitted but by the Pope, as favouring a little of *Simony*. On these Occasions, however, they swear, That there has been no Deceit, Collusion, or *Simony*, or other illegal Covenant. *Peter Damianus* distinguisheth three Kinds of *Simony*; that of Money, that of the Tongue, and that of Services. *Simony of Money*, or *per minus ab motu*, is where Money is really paid down for a Benefice: He adds, That 'tis likewise committed, by expending Money to live at Court to obtain a Benefice. *Simony of the Tongue*, or *per minus ab lingua*, consists in flattering the Collator, or making one's self agreeable by Complaisance and Commendation. *Simony of Services*, or *per minus ab obsequio*, consists in the doing their good Offices to obtain a Benefice. The Word is borrow'd from *Simon Magus*, who is mention'd in the Acts of the Apostles, as offering to buy the Power of working Miracles with Money.

It was agreed, by all the Justices, *Trin. Oct. Jac. Primi*, That if the Patron presented any Person to a Benefice with

Cate, for Money, that such Presentation, &c. is void, though the Presentee were not privy to it; and the Statute gives Presentation to the King; but this is now repealed.

**SIMPLARY**, *Simplaris*, in Antiquity, a Roman Soldier, who had only single Pay; thus call'd, in Opposition to the *Duplaries*, or such as had double Pay.

**SIMPLE**, something not mixed or compounded; in which Sense it stands in Opposition to *Compound*. The Elements are *Simple Bodies*; from the Composition whereof all mix'd Bodies result. In Geometry we say, the most *Simple* Demonstrations are the best: The *Simplest* Machines are the most esteem'd. In Pharmacy there are *Simple Remedies* and *Compounds*. In Grammar we have *Simple Verbs*, or Primitives; and *Compounds*, which have some Particle added to them. In Jurisprudence we have a *Simple Donation*, in opposition to a mutual or reciprocal one. A *Simple Sale*, in Opposition to that made with a Reservation of the Faculty of Redemption. *Simple Homage*, in Opposition to Liege Homage.

**SIMPLE**, in Music, is chiefly used in Opposition to *Double*; sometimes to a *Consent* of several Parts, or Figures of different Values, &c. *Simple Cadence*, is that where the Notes are all equal through all the Parts. *Simple Concord* are those, wherein we hear at least two Notes in Consonance; as a Third, and a Fifth; and, of consequence, at least three Parts: Which is either done immediately, and call'd the *Harmonical Triad*; or in a more remote Manner; that is, when the Sounds, that are not in the Base, are one or two Octaves higher. This Distance has no ill Effect in the Third; but in the Fifth it has; and, generally speaking, the nearer, or more immediate the Consonds are, the better. We also say, *C Simple*, in Opposition to *c Accented*.—*Simple Counter-point*, is a Harmonical Composition, wherein Note is set against Note; in Opposition to a figurative Counter-point. *Simple Fugue*, or *Simple Imitation*, is, when one Part imitates the Singing of another for some Measures. *Simple Interval*: See INTERVAL. *Simple Triple*: See TRIPLE.

**SIMPLE EQUATION**, in Algebra, is an Equation where the unknown Quantity is only of one Dimension. *E. gr.* if  $x = (a + b) : 2$ . See EQUATION.

**SIMPLE**, in Botany, is a general Name given to all Herbs, and Plants; as having each its particular Virtue, whereby it becomes a *Simple Remedy*. The *Simples* brought from the Levant, and the *East-Indies*, were not known among us till about the Year 1500.

**SIMPLEFYLING**, in Ecclesiastical Matters, is the taking away of a Cure of Souls from a Benefice, and dispensing the Beneficiary from Residence. Several Benefices, which have been *Simplefied*, now require Residence; and, an Infinity of others, which required Residence, have been *Simplefied*. Some use the Word in a more extensive Signification, *viz.* for the shortening a Relation, &c. or retrenching every Thing not precisely necessary: When the Matter of Fact shall be *Simplefied*, and stripp'd of its vain Circumstances, the Court will see, &c.

**SIMPLE QUANTITIES**, are such as have but one Sign, as  $2a$ , and  $-2b$ ; whereas  $a+b$ , and  $-a-c+b$ , are compound Quantities. These are only used in Algebraical Calculations.

**SIMPLUDIARIA**, in Antiquity, a kind of funeral Honours paid to the Deceased's. Some will have the *Simpludiaris* to be Funerals, at which Games were exhibited: Such is the Sentiment of *Psalmus Diaconus*. *Festus* says, They were those, in the Games whereof nothing were seen but Dancers and Leapers, call'd, according to *Scaliger*, *Corvurares*; but who, according to *M. Dacier*, were only a kind of Dancers, who ran along the Walls and Yards of Vessels or Boats, call'd *Corbes*. In other respects, those Two Authors agree as to the kind of Funeral, *viz.* That it was opposite to those call'd *Infideliæ*; wherein, besides the Dancers and Leapers, observ'd in the *Simpludiaris*, there were *Deultores*, or People who vaulted on Horses; or, perhaps, Horse-races, wherein the Cavaliers leap'd from Horse to Horse at speed. The Word is form'd from the *Latin*, *Simplex* and *Ludus*, *Simpludiaris* or *Simpludiaris*, Simple Games.

**SIN**, a Breach, or Transgression of some divine Law or Command. *Plato* defines *Sin* to be something devoid, both of Number and Measure; by way of Contradiction to Virtue, which he makes to consist in musical Numbers, &c. Hence *Suares* observes, That an Action becomes *Sinful*, by its wanting a due Commensuration; for as every thing measured refers to some Rule, from which if it deviate, it becomes incommensurate; and as the Rule of Man's Will is the Law of God; So, &c. *Suares* adds, That all evil Actions are prohibited by some divine Law; and that this is required to the Perfection of the divine Providence. *Simplicius*, and, after him, the Schoolmen assert, That Evil is not any positive Thing, contrary to Good; but a mere Defect and Accident. See EVIL.

**SINS** are distinguish'd into *Original* and *Actual*. The *Reverend* Casuists again distinguish *Actual Sins* into *Mortal*, which are such as make us lose the Grace of God; and *Venial*, which alone are pardon'd, as being only *Sins* of Infirmity, not of Malice. The Divines are not yet agreed, what the *Sin* against the Holy Ghost is. See ORIGINAL SIN.

**SINAPISM**, in Pharmacy, &c. an external Medicine, in form of a Cataplasm; composed chiefly of Mustard-seed, pulveris'd, and mix'd up with the Pulp or Flesh of Eggs, or with Briony, Garlic, Onion, Nasturtium, Euphorbium, Ranunculi or the like. The *Sinapismus* excites a Redness, Heat, itching Tumour, and sometimes a Blister on the Place 'tis applied to. 'Twas anciently in great Request; and still continues in Use for inveterate Distacles of the Head; long, continued Debuxions, &c. The Word is form'd from the *Latin*, *Sinapis*, Mustard-Seed.

**SINCIPIUT**, is the Fore-part of the Head, reaching from the Fore-head to the Coronal Suture. See CRANIUM.

**SINDON**, in Chirurgery, a little round Piece of Linnen or Lint, used in dressing a Wound after trepanning. The first thing done after the Operation of Trepanning, is to pour a few Drops of white Balm on the Dura Mater: then a Spoonful of Mel-Rosatum, being warm'd with a little Balm, Two *Sindons* are dip't in it, the one of linnen Cloth, the other of Lint: The first of them is immediately applied upon the Dura-Mater; and, being greater than the Hole in the Skull, its Circumference is thrust all round between the Cranium and the Membrane: Then the second *Sindon* is applied, and the Hole quite stopp'd with Lint. The next Morning, when the Apparat is taken off, the Brain is never left bare; but as soon as the former *Sindons* are removed, new ones are clapp'd in their Room.

**SINE**, or right *Sine*, in Trigonometry, a right Line drawn from one Extremity of an Arch, perpendicularly upon the Radius drawn from the other Extremity; or, the *Sine* is half the Chord of twice the Arch; thus the Line AD (Tab. Trigonoma. Fig. 6.) which is half the Chord A B, of double the Arch AEB, is the right *Sine*; or, simply, the *Sine* of the Arch A E.

The *Whole SINE*, *Sinus totus*, is the *Sine* of the Quadrant HE, that is, the whole *Sine* is the same with the Radius HC.

The *Verfed SINE*, is a Part ED of the *Whole Sine* or Radius, intercepted between the right *Sine* AD, and the Arch A E.

1° The right *Sine* AD, being perpendicular to the Radius EC; all *Sines* drawn to the same Radius, are parallel to each other. 2° Since the Arch A E is the Measure of the Angle ACE, and A D the Measure of the contiguous Angle ACI; and the Quadrant HE the Measure of the right Angle; A D is also the right *Sine*, and E D the *verfed Sine* of the Angles ACE and ACI; and the *Whole Sine* is the *Sine* of the right Angle. 3° Two Angles contiguous, as ACE and ACI, have the same *Sine*. 4° The *Sines* of obtuse Angles are the same with those of their Complements to Two right Angles. 5° All *Sines* of Similar Arcs have the same Ratio to their Radii.

The *SINE-Complement* or *Co-Sine*, is the *Sine* of an Arch A E, which is the Complement of another Arch A E, to a Quadrant. Thus the *Sine* of the Arch A H, is call'd the *Sine-Complement* of the Arch A E.

In estimating the Quantity of *Sines*, &c. we assume Radius for Unity; and determine the Quantity of the *Sines*, Tangents and Secants in Fractions thereof. From *Prologus* Almagest, we learn, That the Ancients divided the Radius into 60 Parts, which they call'd Degrees, and thence determined the Chords in Minutes, Seconds and Thirds; that is, in Sexagesimal Fractions of the Radius, which they likewise used in the Resolution of Triangles. The *Sines*, or *Half-Chords*, for ought appears, were first used by the *Saracens*. *Regiomontanus*, at first, with the Ancients, divided the Radius into 60 Degrees; and determined the *Sines* of the several Degrees in Decimal Fractions thereof. But he afterwards found 'twould be more commodious to assume Radius for 1; and thus introduced the present Method into Trigonometry. In the common Tables of *Sines* and Tangents, the Radius is conceiv'd, divided into 10000000 Parts; beyond which we never go in determining the Quantity of the *Sines* and Tangents. Hence, as the *Sine* of a Hexagon subtends the Sixth Part of a Circle, and is equal to the Radius; the *Sine* of 30° is 5000000.

1° The *SINE* AD being given; to find the *Sine* Complement.

From the Square of the Radius AC subtract the Square of the *Sine* AD: The Remainder will be the Square of the *Sine-Complement* AG: Whence, the Square Root being extracted, gives the *Sine Complement*. *E. gr.* Supposing AC, 10000000, AG will be found 8660254, the *Sine* of 60°.

2° The SINE AD of the Arch AE being given; to find the Sine of the Half-Arch, or Half of AE.

Find the Chord of the Arch AE (See CHORD): for Half of this is its Sine. Thus, supposing DG and AD, as in the preceding Problem; we shall find the Sine of the Arch Half AE, or the Sine of 15° = 2685190.

3° The SINE DG, of the Arch DE being given; to find the Sine DE, of the double Arch DB, Fig. 7.

Since the Angles at E and G are right Angles; and the Angle B is common to each Triangle BCG and DEB; we shall have BC:CG::BD:DE: wherefore CG being found by the Second Problem, and BD being double of DG; DE is found by the Rule of Proportion.

4° The SINES FG and DE (Fig. 8.) of the Arches FA and D A, whose Difference DE is greater than 45 Minutes, being given; to find any intermediate Sine, as IL.

To the Difference FD of the Arches, whose Sines are given; the Difference of the Arch IF, whose Sine is required, and the Difference of the given Sines DH; find a fourth Proportional: This added to the less given Sine FG; the Aggregate will be the Sine required.

5° To find the SINE of 45 Degree.

Let HI (Fig. 6.) be a Quadrant of the Circle; then will HCI be a right Angle: consequently the Triangle, rectangular; therefore  $HI^2 = HC^2 + CI^2 = 2 HC^2$ ; wherefore, since HC the whole Sine, is 1000000; if from  $2 HC^2$  squared, 20000000000, be extracted the square Root 14142136; we shall have the Chord HI, whose Half 7071068 is the Sine of 45° required.

6° The SINE of a Minute or 60° FG, (Fig. 8.) being given; to find the Sine of one or more Seconds MN.

Since the Arches AM and AF are very small; AMF may be taken for a right Line, without any sensible Error in the Decimal Fractions of the Radius wherein the Sine is expressed; that is, the Arches AM and AF may be taken proportional to their Chords. Wherefore, since MN is parallel to FG; we shall have AF:FG::AM:MN: Therefore AF, FG and AM being given, MN is easily had.

To Construct a Canon of SINES.

The Sines of 30° 15° 45° and 36° (which we have already shewn how to find,) being had; we can thence construct a Canon of all the Sines to every Minute, or even Second. For from the Sine of 36° we find thole of 18° 9° 4° 30' and 2° 15', by the Second Problem: The Sines of 54° 72° 81° 85° 30' and 87° 45', &c. by the first Problem. Again, for the Sine of 45°, find the Sine of 22° 30' 11° 15', &c. From the Sines of 30° and the Sines of 54°, find the Sine of 12°. From the Sine of 12°, find the Sines of 6° 30' 130' 35' 78°, &c. From the Sine of 15°, find the Sine of 7° 30' 30' 45', &c. till you have 120 Sines succeeding each other orderly, at an Interval of 45 Minutes. Between these, find the intermediate Sines by the Fifth Problem: Thus will the Canon be complete.

From the Sine of an Arch given; to find the Tangent and Secant. See TANGENT and SECANT.

To find the Logarithm of a given Sine; See LOGARITHM. Note, the Logarithm of a Sine, is call'd an Artificial Sine.

In every Triangle, the Sides are as the Sines of the opposite Angles. See TRIANGLE.

The Sine BC (Fig. 9.) and the Versed Sine AB, being given in common Measure, set in Parts of the Radius; to find the Arch EFC in Degrees. Find the Semi-diameter AD, (See SEMI-DIAMETER.) Then in the Triangle DBC, besides the Right Angle B, by the Sides AC and DC, we find the Angle ADC, which shews the Number of Degrees in the Arch, the Double whereof is the Arch EC: the use of which Problem is in finding the Segment of a Circle. See SEGMENT.

Line of SINES, a Line on the Sector, Gunter's Scale, &c. the Description and Use whereof see under the Articles SECTOR and GUNTER'S SCALE.

SINE CURES are Ecclesiastical Benefices without Cure of Souls. See BENEFICE, and CURE.

No Church, where there is but one Incumbent, can properly be a Sine-Cure: And though the Church being down, or the Parish being become destitute of Parishioners, the Incumbent may be thereby necessarily acquitted from the actual Performance of publick Duty, yet he is still under an Obligation to do it, whenever a Church shall be built, and there are a competent Number of Inhabitants: And in the mean while, if the Church be Presentative, as most such Churches are, the Incumbent is instituted into the Cure

of Souls; and such Benefices are rather Depopulations than Sine-Cures, and it will be proper for the new Incumbent to read the 59 Articles, and the Liturgy in the Church-yard, &c. and to do what other Incumbents usually do.

But a Rectory, or a Portion of it, may properly be a Sine-Cure, if there be a Vicar endowed, and then it doth not come within the Statute of Pluralities, 21 H. VIII. c. 13; which declareth, That no Parsonage that hath a Vicar endowed, shall be comprehended, &c. so that here no Dispensation is necessary to hold this Sine-Cure with a former Living: Nor need he read the Articles or Divine Service, as required by 13 Eliz. c. 12. which extends only to a Benefice with Cure. — A Sine-Cure Donative wants no Institution and Induction: but one Presentative must have both; especially if it consist in Glebe and Tythes, and not in a Portion of Money: But the Institution must not run in *Coram Animarum*, but in *Reclorum*, five portiones *Reclorum de A B*, &c. — By the above-mention'd Statute 21 H. VIII. not only Prebends and Rectories, with Vicarages endowed, but Deaneries and Archdeacons, are declared to be Benefices without Cure.

SINE-DIE, in Law, when Judgment is given against the Plaintiff; he is then said to be in *miseria corda pro folio clamore suo*: But when for the Defendant, then it is said, *Est inde sine die*, i. e. he is dismissed the Court. — The Phrase is also used in Parliament, for the Adjournment of any Debate, without fixing the Day when it shall come on again, and is looked upon as a genteeler Dimission of the Thing required.

SINEWE, in Anatomy, &c. is what we otherwise call a Nerve. See NERVE.

SINGING, the Action of making divers Inflections of the Voice, agreeable to the Ear, and even answering to the Notes of a Song or Piece of Melody. See SONG.

The first thing done in learning to sing, is to raise a Scale of Notes by Tones and Semi-tones, to an Octave, and descend again by the same Notes; and then to rise and fall by greater Intervals, as a 3d, 4th, and 5th; and to do all this by Notes of different Pitch. Then these Notes are represented by Lines and Spaces, to which the Syllables *fa, sol, la, mi*, are applied, and the Pupils taught to name each Line and Space thereby; whence this Practice is usually call'd *Sol-fa-ing*. The Nature, Reason, Defects, &c. whereof, see under the Article SOL-FADING.

SINGULAR Number, in Grammar, the first manner of declining Nouns, and conjugating Verbs; used when we only speak of a single Person or Thing. See NUMBER.

The Latins, French, English, &c. have no Numbers but the Singular and Plural; the Greeks and Hebrews have likewise a Dual. See PLURAL, DUAL, &c.

SINGULTUS, in Medicine, a convulsive Motion of the Midriff, commonly call'd Hiccough. See HICCOUGH.

SINCAL Quadrant, a Kind of Quadrant furnish'd with an Index, and two Sights, to take Altitudes, &c. by; and, besides, its Side, or Face, covered over with Sines, drawn from each Side, intersecting each other; whereby the Seamen can solve, by Inspection, any Problem in Plain Sailing. See SAILING.

Its Constitution and Use; see under the Article QUADRANT.

SINISTER, something on, or towards the left Hand. Hence *Sinister* is ordinarily used among us for unlucky; tho' in the Holy Rites of Divining, the Romans used it in an opposite Sense. Thus *Avia Sinistra*, or a Bird on the left Hand, was esteem'd a happy Omen: Whence in the Law of the Twelve Tables, *Avi Sinistra populi magister est*. And hence the Greeks, according to *Lipsius*, call the left Hand, *avester*, *bel*.

Some derive the Word *Sinister*, a *Sinenda*; because the Gods, by such Auguries, permit us to proceed in our Designs.

SINISTER, in Heraldry. The *Sinister* Side of an Escutcheon is the left Side. *Sinister chief Point*, is the next middle Chief, on the left Side. *Sinister base Point*, is next the base Point, at the bottom of the Escutcheon. See POINT, ESCUTCHEON, &c.

SINISTER Aspect, among Astrologers, is an Appearance of two Planets, happening according to the Succession of the Signs; as *Saturn* in *Aries*, and *Mars* in the same Degree of *Geminis*. See ASPECT.

SINISTRI, a Sect of ancient Heretics, thus call'd; because they held the left Hand, *Sinistram manum*, in Abhorrence, and made it a Point of Religion, not to receive any thing therewith. What in us, is a Piece of Civility; in them was a Superstition. *Bassaman* observes, that they were likewise call'd *Sabbathians* and *Novatians*. See NOVATIANS, &c.

SI *non omnes*, a Writ of Association, whereby, if all in Commission cannot meet at the Day assign'd, it is permitted, that two or more of them may finish the Business. See ASSOCIATION.

SINOPER, in Natural History. See RUBLE.

SINOPLE or SENOPLE, in Heraldry, the Green Colour in Armouries; thus call'd by the ancient Herald, tho' *Pliny* and *Astare*, by *Celer Præfixus*, or *Sinople*, mean a

brownish Red, such as that of our Ruddle. *Simplic* signifies Love, Youth, Beauty, Rejoicing and Liberty; whence it is, that Letters of Grace, Abolition, Legitimation, &c. are used to be seal'd with Green Wax. See GREEN. *F. Meuserius* derives it from the Greek, *Prasina hupia*, Green Armouries; by corruptly retrenching the first Syllable, *pra*; which is no new Thing among Oriental Words, witness *Solanica* for *Theffalonica*.

SINUOSITY, a Series of Bends and Turns in Arches, or other irregular Figures; sometimes jetting out, and sometimes falling in. Such is the Motion of a Serpent, &c. 'Tis the *Sinuosity* of the Sea Coasts that forms Bays, Ports, Capes, &c. *Du Loir* observes, that the Course of the River *Meander*, creeping in a thousand agreeable *Sinuositys*, served *Desdæus* as a Model to form his Labyrinth. See LABYRINTH.

SINUS, in Chirurgery, a little Bag or Sacculus, form'd by the Side of a Wound, or Ulcer; wherein Pus is collected. See Pus.

*Sinus's* that slope downwards, *Senket* observes, are difficult to heal: Yet that Surgeon undertakes to cure any *Sinus* in a Week, by the Medicaments he describes Page 338, and an agglutinative Bandage. He adds, that he never comes to make an Incision, till he finds that the Pharmacæic Applications are ineffectual; and that for the Dilatation of *Sinus's*, he does not use the deceitful Scalpel; as being more apt to deceive the Operator than the Patient.

SINUS, in Anatomy, a kind of Cavity in certain Bones, and other Parts, the Entrance whereof is very narrow, and the bottom wider and more spacious. See BONE. Of these *Sinus's*, we find several in the several Parts of the Body; particularly in the Basis of the Skull, on the *Ossa parvula*, where the Ancients imagined their Use was to render the Bones more light: In several of the Joints of the Body, they serve to receive the Apophyses of the other Bones. In the Duplicatures of the *Dura Mater*, are several *Sinus's*, which Doctor *Drake* observes to be venous Channels, form'd for the Conveyance of the Blood. Of these, Four only are considerable, viz. the *Sinus Longitudinalis*, which running along the middle of the convex Part of the Brain, sends out a Branch on each Side, between the Brain and Cerebellum, call'd the *Lateral Sinus's*: And the *Torcular Herophili*, form'd out of a Concourse of the *Lateral Sinus's*, and Pinal Gland. They are all form'd of the several Venous Branches, which return the Blood from the Brain and Cerebellum, and deliver their Contents into the Jugular Veins; whereof they are, as it were, the Roots. The Coats of these *Sinus's*, are furnished with strong Fibres, by means whereof, they are dilated by the Influx of the Venal Blood, and again contracted with a reciprocal Motion, like the Pulse of an Artery. See DURA MATER.

SION COLLEGE. See COLLEGE.

SIPHON or SIPHON, in Hydraulicks, a crooked Tube, one Leg or Branch whereof is longer than the other; used in the raising of Fluids, emptying of Vessels, and in various Hydrostatical Experiments. — The Word in the original Greek, *sipos*, signifies, simply, Tube, whence some apply the Term to common Tubes or Pipes; *Wulfius*, particularly describes two Vessels under the Name of *Siphons*; the one Cylindrical in the Middle, and Conical at the two Extremes; the other Globular in the Middle, with two narrow Tubes fitted to it, Axis-wise; both serving to take up a Quantity of Water, &c. and to retain it when up.

But the most useful and celebrated *Siphon* is as follows: A crooked Tube ABC, (Tab. Hydraulicks Fig. 2.) is provided, of such Length, and with such an Angle, as that when the Orifice A, is placed on an horizontal Plane, the Height of AB, may not exceed 30 Foot. (For common Uses, a Foot, or half a Foot high, suffices. If, now, the left Arm AB, be immerg'd in Water, or any other Liquid, and the Air be suck'd out of it by the Aperture C, till the Liquor follow; the Liquor will continue to flow out of the Vessel, through the Tube BC; as long as the Aperture A is under the Surface of the Liquor. Note, instead of sucking out the Air; the Event will be the same, if the *Siphon* be at first filled with the Fluid, and the Aperture C stopp'd with the Finger, till the Aperture A be immerg'd.

The Truth of the Phenomenon is known by abundance of Experiments. Nor is the Reason of part of it far to seek. In sucking, the Air in the Tube is rarified, and the Equilibrium destroyed, consequently the Water must be raised into the lesser Leg AB, by the preponderating Pressure of the Atmosphere.

The *Siphon* being thus filled, the Atmosphere presses equally on each Extremity thereof; so as to sustain an equal Quantity of Water in each Leg: But the Air not being able to sustain all the Water in the longer Leg, unless it exceed 32 Feet in Height; it will be more than able to sustain that in the shorter Leg; with the Excess of Force, therefore, will raise new Water into the shorter Leg; which new Water cannot make its way, but by protruding the first before it. By this means is the Water continually driven out at the longer End, as 'tis continually raised at the shorter.

But *Wulfius*, and some other Authors assert, that the Water continues to flow through the *Siphon*, even when removed under a Receiver, and the Air exhausted from it. The Reason of this, if it be true, is very difficult to account for.

Some will have it, that there is still Air enough left in the evacuated Receiver, to raise the Water to an Inch or two. But as both Mercury and Water are found to fall entirely out of the Torricellian Tube, in *Vacuo*; the Pressure of the thin remaining Air, can never be the Cause of the Ascent, both of Mercury and Water, in the left Leg of the *Siphon*.

Hence, as the Height of the *Siphon* is limited to 32 Foot; for this only Reason, that Air cannot raise Water higher; It does not appear, whether or no we are in the Right in rejecting *Hæro's* Method of carrying Water, by means of a *Siphon*, over the Tops of Mountains, into an opposite Valley. For *Hæro* only orders the Apertures of the *Siphon* to be stopp'd, and Water to be pour'd through a Funnel into the Angle or Meeting of the Legs, till the *Siphon* were full; when, shutting the Aperture in the Angle, and opening the other two, the Water will continue to flow. Now, if there only need Air for the first Rise of the Water into the left Leg, not for the Continuation of the Motion; it were possible to raise the Water much higher than the Height of the Atmosphere would carry it. — The real Cause, therefore, of this extraordinary, tho' well-known Phenomenon; needs some further Disquisition. This is certain, that a *Siphon* once set a running, will persist in its Motion, tho' removed into the most perfect Vacuum our Air-Pumps will make: Or, if the lower Orifice of a full *Siphon* be shut, and the whole be thus placed in a Receiver, with a Constriction for opening the Orifice when the Air is exhausted; the Water will be all emptied out of the Vessel, as if it had been in open Air.

This, too, is remarkable enough, that the Figure of the *Siphon* may be varied at pleasure, (see Fig. 3. &c.) provided only the Orifice C be below the Level of the Surface of the Water to be drawn up; but, still, the further 'tis distant from it, the faster will the Fluid be carried off. And if, in the Course of the Flax, the Orifice A be drawn out of the Fluid; all the Liquor in the *Siphon* will go out at the lower Orifice C: That in the Leg C B, dragging, as it were, that in the shorter Leg A B after it. If a full *Siphon* be so disposed, as that both Orifices A and C be in the same horizontal Line; the Fluid will remain pondant in each Leg; how unequal soever the Length of the Legs may be. Fluids, therefore, in *Siphons*, seem, as it were, to turn one continued Body; so that the heavier Part descending, like a Chain, pulls the lighter after it.

Lastly, it must be observed, that the Water will flow out, even through a *Siphon* that is interrupted, by having the Legs AD and FC joyn'd (Fig. 4.) together by a much bigger Tube full of Air.

The *Siphon Wirtembergicus*, is a very extraordinary Machine of this Kind, performing most of the Things the common *Siphon* will not reach, &c. In this, though the Legs be in the same Level, yet the Water rises up the one, and descends through the other: The Water rises, even tho' the Aperture of the left Leg be only half immerg'd in Water: the *Siphon* has its Effect after continuing dry a long time: either the Apertures being opened, the other remaining shut for a whole Day, and then open'd, the Water flows out as usually. Lastly, The Water rises and falls indifferently through either Leg. — The Project of this *Siphon*, was laid by *Jordanus Polsterer*, and executed at the Expence of Prince *Frederic Charles* Administrator of *Wirtemberg*, by his Mathematician, *Schabackhard*, who made each Branch 20 Feet long, and 18 Feet apart; the Description thereof was published by *Resilius* his Physician, which gave Occasion to *M. Papin* to invent another, that did the same Things, described in the *Philosophical Transactions*; and which *Resilius*, in another Paper in the *Transactions*, ingeniously owns to be the very same with that of *Wirtemberg*. Its Structure will appear from its Figure; which is represented, Tab. Hydraulicks, Fig. 5.

SIRE, a Title of Honour in France; now given to the King only, as a Mark of Sovereignty. In all Places and Requests, Epistles, Discourses, &c. to the King, he is address'd under the Title of *Sire*. Some derive the Word from the Latin, *Heros*, Master: Of which Opinion seems *Wll. Buteus*, who, in speaking to King *Francis I.* always calls him *Heros*, *g. d. Master*, or *Sire*. Others derive the Word from the Greek, *αὐτοῦ, Λαός*; of which Opinion is *Paquier*, who adds, that the ancient *Franks* gave the Title to God, calling him *Beau sire Dieu*. Others derive the Word from the Syrian, and maintain, it was first given to the Merchants who traded to Syria. *Ménage* will have it come from *Seigneur*; whence *Siquet*, then *Seigneur*, and *Sire*.

SIRE was likewise anciently used in the same Sense with *Sieur* and *Seigneur*, and applied to Barons, Gentlemen and Citizens. The *Sire de Joinville* has wrote the History of *St. Louis*.

**SIRIUS**, in Astronomy, the *Dog-Star*; a very bright Star of the first Magnitude in the Mouth of the Constellation *Canis Major*, or the *Great Dog*. See **CANIS**. The *Araab*s call it *Alphere*, *Ejcheere*, *Seers*; the *Greek*s, *Sirius*; and the *Latin*s, *Canis cadens*. Its Longitude, according to Mr. Flamsteed, is  $9^{\circ} 49' 1''$ , its Latitude  $39^{\circ} 32' 8''$  South.

**SISTRUM** or **CISTRUM**, an ANCIENT musical Instrument, used by the Priests of *Isis* and *Osiris*. *Spou* describes it as of an oval Form, in manner of a Racket, with three Sticks traversing it breadth-wise, which playing freely, by the Agitation or Beating of the Instrument, made a kind of Sound, which to the Ancients seem'd melodious. Mr. Malcolms takes the *Sistrum* to have been no better than a kind of a Rattle. *Jer. Boylus* has an express Treatise on the *Sistrum*, intitled, *Isisus de Sistro*. *Osibius* observes, that the *Sistrum* is found represented on several Medals; and also on *Tolimaunt*. *Osiris* on some Medals, is painted with a Dog's Head and a *Sistrum* in his Hand.

**SITE** or **SCITE**, the Situation of a House, &c. and sometimes the Ground-Plot, or the Spot of Earth it stands on.

**SITE**, in Logic, one of the Predicaments, declaring a Subject to be so and so placed. See **PLACE**.

**STOPHYLAX**, in Antiquity, an *Athenian* Magistrate, who had the Intendance of the Corn, and was to take Care that no Body bought more than was necessary for the Provision of his Family. By the *Attic Laws*, particular Persons were prohibited buying more than fifty Measures of Wheat a Man; of those Measures, we mean, called *Metretres*: And the *Stophylax* was to look to the Observation of this Law. 'Twas a Capital Crime to prevaricate in it. There were Fifteen of these *Stophylaxes*, Ten for the City, and Five for the *Piræna*. The Word is form'd from the *Greek*, *στρόφιλον*, Corn, and *φυλάξ*, Keeper.

**SITUS**, in Geometry and Algebra, the Situation of Lines, Surfaces, &c. *Wolffius* gives us some Things in Geometry, which are not deduced from the common Analysis; particularly things depending on the *Situs* of Lines and Figures. In effect, M. *Leibnitz* has invented a particular Kind of Analysis, call'd *Analysis Situs*, and built a peculiar kind of Calculus thereon, call'd *Calculus Situs*.

**SIXAIN**, **SIXTH**, **SEXAGENA**, in War, an Order of Battle wherein Six Battalions have been ranged in a Line, the Second and Fifth are made to advance, to form the Vanguard; the First and Sixth to retire, to form the Rear-guard; the Third and the Fourth remaining on the Spot, to form the Corps, or Body of the Battle. The Word is *French*, where it signifies the same thing.

**SIX Clerks**, Officers in *Chancery* of great Account, next in Degree below the Twelve Masters; whose Business is to enroll Commissions, Pardons, Patents, Warrants, &c. which pass the Great Seal. They were anciently *Clerici*, and forfeited their Places if they married: They are also Attorneys for Parties in Suits depending in the Court of *Chancery*. Under them were formerly 60 Clerks, who, with the Under-Clerks, did the Business of the Office; which Number was afterwards increased to 90. At present the Number is indefinite; an Order having been made, for the reducing them to their ancient Number of 60; by not filling up the Vacancies that may happen by Death, &c. till they are fallen to that Standard.

**SIXTH**, in Music, one of the Simple Original Concords, or Harmonical Intervals. See **CONCORD**. The *Sixth* is of two Kinds; greater and lesser; and hence is esteem'd one of the Imperfect Concords; though each of them arise from a Division of the Octave. See **OCTAVE**. The greater *Sixth* is the Concord resulting from a Mixture of the Sounds of two Strings, that are to each other as 3 to 5. The lesser *Sixth* results from two Strings, which are to each other as 5 to 8. See **SCALE**. The lesser *Sixth* is compos'd Diatonically of Six Degrees, whence its Name; and of Five Intervals, Three whereof are Tones, and Two Semi-tones; Chromatically of Eight Semi-tones; Five whereof are greater, and Three less. It has its Origin from the *Ratio Super-tri-partientis quintas*, as of 8 to 5. The greater is compos'd Diatonically like the less, of Six Degrees and Five Intervals; among which are Four Tones, and a Semi-tone: And Chromatically of Nine Semi-tones; Five whereof are greater, and Four less; of Consequence it has a less Semi-tone more than the former. It has its Origin from the *Ratio Super-bi-partientis tertius*, as of 5 to 3. Anciently the *Sixth* had only one Reply, which was the 13th; but in the modern System, it has several, as the 20th, 27th, &c. all marked indifferently in the thorough Basi, by the Figure 6. And even the *Sixth* itself, both greater and lesser, when used naturally, is not express'd any otherwise than by a Simple *Sixth*. But when 'tis greater or less accidentally, to the 6 is added some other Mark, as may be seen in M. *Broffer*.

Besides the two kinds of *Sixth*'s here described, which are both good Concords; there are two others that are vitious and dissonant. The first is the *Disfective Sixth*, compos'd of two Tones and three Semi-tones, or of Seven Semi-tones, five whereof are greater, and two less. The second is the

*Redundant Sixth*, compos'd of Four Tones, a greater Semi-tone, and a less. Whence some call it *Pentatona*, as comprehending Four Tones. These two being both dissonant, should never be used in Melody, and very rarely in Harmony.

As to the two Consonant *Sixth*'s, they were anciently to be used very sparingly; but at present we make them as often as we please, as we do with Thirds; the *Sixth* being in reality, no other than inverted Thirds; but Care is usually taken, that the first *Sixth* that occurs be less, and the last greater; and that from the greater, we rise to the Octave, and from the less, fall to the Fifth.

**SIZE**, an Instrument used to find the Weight of fine round Pearls withal. See **PEARL**. It consists of five thin Pieces or Leaves, about two Inches long, and half an Inch broad; fastned together at one End by a Rivet. In each of these, are several round Holes drill'd, of different Diameters. Those in the first Leaf serve for weighing Pearls from  $\frac{1}{2}$  a Grain to Seven Grains. Those of the Second, for Pearls from Eight Grains or two Carats, to five Carats, &c. and those of the Fifth, for Pearls from 6 to 8  $\frac{1}{2}$ .

**SKELETON**, in Anatomy, an Assemblage or Arrangement of all the Bones of a dead Animal, disposed in their natural Situation, and kept in that Disposition by means of Wires, &c. *Skeltons* serve to good Purpose, in learning the Osteology. See **OSTEOLOGY**.

For the several Bones a *Skeleton* consists of; See **BONE**.

The Word is form'd from the *Greek* *σκαλον*, I dry.

**SKIFF** or **SQUIFF**, a Shallop, or the less of two Ship-boats. See **BOAT**.

**SKIN**, in Anatomy, a large thick Membrane, spread over the whole Body, serving as the external Organ of Feeling, and as a Cover and Ornament of the Parts underneath. The *Skin* consists of Three Parts; the external one, called the *Cuticle*, *Epidermis*, or *Scarf Skin*. See **CUTICLE**. The middle-most is called the *Corpus Reticulare*, because pierced through with a great Number of Holes, like a Net or Sieve. See **RETICULAR CORPUS**. The innermost, called the *Curtis*, is a Fibrous Substance, wove out of the Extremities of Arteries, Veins, Nerves, Tendons, &c. Whence arise abundance of little Eminences, call'd *Papille Pyramidales*. See **CURTIS** and **PAPILLE**.

It is likewise set with an Infinity of Glands, called *Miliary Glands*, each whereof has its excretory Duct, passing along with the *Pyramidal Papille*, through the Holes of the *Corpus Reticulare*, and terminating at the *Cuticle*. The *Papille* are held by the Moderns to be the Organ of Feeling, and the Excretory Vessels serve to carry off the Matter of Perspiration, which is separated from the Blood in the *Miliary Glands*. See **MILIARY GLANDS**, **PERSPIRATION** and **FEELING**.

**Nutrition**. M. *Perrault* observes, is sometimes taken in throughout the whole Body of Animals, at the Pores of the *Skin*. The subtle Substances of nutritious Matters applied externally to those Bodies, are found to penetrate them, to mix with the Blood and Juices, and are there assimilated. On this Account, he adds, it is, that Butchers Dogs, Turn/pit-Dogs, &c. are generally very Fat, and even Butchers, Cooks, &c. themselves. M. *Desart* takes it, that Plants receive a great Part of their Food by the external Bark, not all by the Root. See **ROOT**.

**SKIN**, in Commerce, is particularly used for this Membrane stripped off the Animal, to be prepared by the Tanner, Skinner, Carrier, Parchment-Maker, &c. and converted into Leather, &c. See **LEATHER**.

The Use of *Skins* is very ancient; the first Garment in the World being made thereof. The *Danes* and other Northern Nations, have a long Time dress'd in *Skins*.

Morocco's are made of the *Skins* of a kind of Goats. See **MOROCCO**.

Parchment is usually made of Sheep's *Skins*; sometimes of Goat *Skins*. See **PARCHMENT**.

Velum is a kind of Parchment made of the *Skin* of an abortive Calf, or at least of a sucking Calf. See **VELOUM**.

The True Chamois or Shammy, is made of the *Skin* of an Animal of the same Name; though frequently counterfeited with Goats and Sheep's *Skins*. See **CHAMOIS**.

Shagreen is prepared at *Constantinople*, of the hind Part of the *Skin* of a Horse, Male or Afs of the Country, prepared and tanned, and when soft and manageable, stretch'd on a Frame, and expos'd to the Sun. This done, they sprinkle Mustard-Seed on the *Skin*; taking Care to rub it several Times over with the Hand. By means hereof, and the Heat of the Sun, the Grain of the Leather is rais'd up, and there hardned. See **CHAGRIN**.

For the several Preparations of *Skins*; See **TANNING**, **CURRYING**, **CHAMOISING**, &c.

**SKINKER**, a Cup-bearer, or Butler. See **BUTLER**.

**SKIRMISH**, in War, a Combat, in Presence of two Armies, between Persons who advance from the Body for that Purpose, and introduce, or invite to a general, regular Fight. The Word seems form'd from the *French*, *Ejcarmonche*, which signifies the same thing, and which *Nicod* derives from the *Greek*,

*scaps*, which signifies at the same time, both *Light Combat* and *Joy*. *Message* derives it from the *German*, *Schirmen* or *Schermen*, to Fence. *De Cange*, from *Scatenuccia*, a light Engagement, of *Scars* and *Murcia*, a Body of Soldiers hid in Ambush; in regard most *Schirmen* are performed by Persons in Ambuscade.

SKULL, in Anatomy. See CRANIUM.

SKY, the blue Air or Atmosphere. See ATMOSPHERE.

The Azure Colour of the Sky, Sir Isaac Newton attributes to Vapours beginning to condense therein, which have got Consistence enough to reflect the most reflexible Rays, viz. the Violet ones; but not enough to reflect any of the less reflexible ones. See REFLEXIBILITY.

*M. de la Hire* attributes it to our viewing a black Object, viz. The dark Space beyond the Regions of the Atmosphere, thro' a white or lucid one, viz. the Air illumined by the Sun: A Mixture of Black and White always appearing Blue. See BLUE.

This Account is not his; 'tis as old as *Leonardo da Vinci*.

SLAB, the Outside sappy Plank or Board saw'd off from the Sides of a Timber Tree.

SLAUGHTER. See MAN-SLAUGHTER.

SLATE, a blue fossil Stone, very soft when dug out of the Quarry, and on that Account easily cut or saw'd into thin long Squares or Escallops, to serve in Lieu of Tiles for the Covering of Houses. See COVERING. 'Tis sometimes also used to make Tables of; to Pave withal, &c. The Ancients were unacquainted with the Use of Slate, and instead thereof cover'd their Houses with Shingle, as we read in *Pliny*. Besides the Blue Slate, we have in *England* a *Greyish Slate*, call'd also *Horseshoe Stone*, from a *Town* in *Stafford* of that Name, where the greatest Quantities of it are found.

The Blue Slate, is a very light, lasting, and beautiful Covering but chargeable withal, in regard the Roof must be first boarded over, the Slates hung on Tacks, and laid with finer Mortar than Tiles. The Grey Slate is chiefly used in the Covering of Churches, Chappels, Chancels, &c.

'Tis denser than Tiles, but far more durable. The Timber of the Roof needs to be very strong for these Grey Slates, it being almost double the Weight of Tiles. See TILE.

To judge of the Goodness of Slates, *Mr. Colepreff*, in the *Philosophical Transactions*, orders it to be knock'd against any hard Body, to make it yield a Sound: If the Sound be good and clear, the Stone is firm and good; otherwise, 'tis crazy.

Another Method of proving its Goodness, is, by weighing it exactly, then letting it lie 6 or 8 Hours under Water, and wiping it very clean, if it weighs more now than it did before, 'tis of that Kind that soaks in Water, and therefore will not long endure, without rotting the Lath or Timber. Another Method of Trial is, by placing a Slate half a Day perpendicularly in a Vessel of Water, so as to reach a considerable Height above the Level thereof: If the Slate be firm and close, then it will not draw Water, that is, the Water will not have ascended above half an Inch above the Level of that in the Vessel, nor that perhaps any where but at the Edges, the Texture whereof might be loosened by heaving; but a bad Stone will have drawn the Water to the very Top, be it as high as it will. There are Slates in several Places, which the most experienced Slaters, or Coverers, conjecture to have continued on Houses several Hundreds of Years, and are yet as firm as when first put up.

*M. Leibnitz* informs us, in the History of the *French Academy*, that in several Parts of the *Dutchy of Brunswick*, particularly about *Osterode*, &c. there are Horizontal Veins of Slate, wherein are found very exact and finish'd Representations of various Kinds of Fishes and Plants, appearing in their natural Breadth and Length, but without any Thickness. The same Impressions are also frequently found even in a Mixture of Copper and Silver. *M. Leibnitz* accounts for this Appearance, by supposing the Lakes and Meadows of the Places to have been cover'd over with a Kind of Earth, which has buried the Fishes and Plants; or that some very muddy Water, much impregnated with Earth, has covered them up, or carried them away. This Earth he takes to have since hardened into Slate; and length of Time, or some other Cause, to have consumed the delicate Matter of the Fish, &c. Much as the Bodies of Flies or Ants, which are found enclosed in Amber, are quite dissipated, and nothing left but a mere Delication. The Matter of the Fish, or Plant, thus consumed, has left its Form impressed in the Slate, by means of the Cavity remaining therein; which Cavity has been at length filled up with a Metallic Matter. Whether that the Subterranean Fire, in baking the Earth into Slate, has separated the Metal therefrom; or whether a Metallic Vapour penetrating the Slate, has become fix'd in these Cavities.

SLAVE, a Person in the absolute Power of a Master, either by War or Conquest. See SERVANT.

We find no mention of Slaves before the Deluge; but immediately after, viz. in the Case of *Cain*, *Gen. ix. 25*. whence 'tis easily inferred, that Servitude commenced soon

after that Time: For in *Abraham's* Time we find it generally established. Some will have it to have commenced under *Nimrod*, because it was he who first began to make War, and of consequence to make Captives; and to bring such as he took either in his Battles, or Irruptive, into Slavery.

The *Romans* call'd their Slaves *Servi*, from *Servare* to keep, save; as being such as were not killed, but saved, to yield Money either by Sale, or by their Work. Other Authors are of Opinion, that the *Roman* Name *Servi* might come from that of *Servi*; as that of *Slaves* from *Salavi*, a People. Slavery is absolutely abolished in *England*, and *France*, as to Personal Servitude: Our Servants are not Slaves, but only subject to certain determinate Services. The Moment a Slave steps on *English* Ground, he becomes Free.

SLAVES make a very considerable Article of the Traffick in *America*. The *English* South-Sea Company have the sole Privilege of furnishing the *Spanish* West-Indies with Slaves, by Treaty. See NEGRO. *Message* and *Vossius* derive the Word from *Sclavus*, which is the Name of a *Scythian* People, according to the latter, whom *Charlemagne* condemn'd to perpetual Imprisonment, whence the *Italians* have made their *Sclavos*, the *Germans* their *Slaves*, and we *Slaves*: But the former will have it the Name of a People whom the *Italians*, and other Nations, used to buy to make Drudges of; whence the proper Name of a Nation, in Time, became the Name of a State or Condition.

Among the *Romans*, when a Slave was set at Liberty, he changed his Name into a Surname; took the *Nomen* or *Pre-nomen* of his Master; to which he added the *Gnomen* or Nick-name he had been called by when a Slave. See LIBERTY. By the Civil Law, the Power of making Slaves is esteem'd a Right of Nations, and follows as a natural Consequence of War. The *Lothemiomians*, say some, or as others lay, the *Affryians*, first introduced the Practice; which the *Romans* not only approved of, but even invented new Manners of making of Slaves: For Instance, a Man born Free, among them, might sell his Freedom, and become a Slave. This voluntary Slavery was first introduced by a Decree of the Senate, in the Time of the Emperor *Claudian*, and at length abrogated by *Law*. The *Romans* had Power of Life and Death over their Slaves, which no other Nations had; and even this Severity was moderated by the Laws of the Emperors; and by one of *Adrian*, it was made Capital to kill a Slave without a Cause. The Slaves were esteem'd the proper Goods of their Masters, and all they got belong'd to them: But, if the Master were too cruel in his Domestic Corrections, he was oblig'd to sell his Slave at a moderate Price. As Slavery was not abolished by the Gospel, the Custom of having Slaves lasted a long Time in *Christendom*. In the Time of *Leuis the Great*, they were so numerous in *Egypt*, that 'twas found a difficult Matter to quell a Body of them who had made Head against their Masters: Yet *Bartholus*, who lived in 1300, observes, there were none left in his Time.

SLEASY *Holland*, a Kind of *Holland* thus call'd, because made in *Silesia* in *Germany*; and which, from its Slightness, occasions all this, slight, ill-wrought *Holland* to be call'd Sleasy. See HOLLAND.

SLEDGE, a Kind of Machine, or Carriage, without Wheels, for the Conveyance of very weighty Things, as huge Stones, Bells, &c. The *Dutch* have a Kind of Sledge, whereon they can carry a Vessel of any Burthen by Land. It consists of a Plank a Foot and a Half broad, and the Length of the Keel of a moderate Ship, raised a little behind, and hollow in the Middle; so that the Sides go a little a slope, and are furnish'd with Holes to receive Pins, &c. The rest is quite even.

SLEEP, that State wherein the Body appearing perfectly at Rest, external Objects move the Organs of Sense as usually, without exciting the usual Sensations. See WAKING.

SLEEP, according to *Robasut*, consists in a Scarcety of Spirits; which occasions that the Orifices or Pores of the Nerves in the Brain, whereby the Spirits used to flow into the Nerves, being no longer kept open by the Frequency of the Spirits, shut of themselves. For this being supposed, as soon as the Spirits, now in the Nerves, shall be dissipated, the Capillaments of those Nerves, having no Supplement of new Spirits, will become lax, and cohere as if cemented together; and so be unfit to convey any kind of Spirits, will be unable to move, or even sustain the Members: Thus will Sensation, and Motion, be both destroyed. See SENSATION, MUSCULAR MOTION, SPIRITS, &c.

Sleep is broke off unnaturally, when any of the Organs of Sense are so briskly acted on, that the Action is propagated to the Brain: For upon this, the few Spirits remaining in the Brain, are all called together, and unite their Forces to unlock the Pores of the Nerves, &c. But if no Object should thus affect the Organ, yet Sleep would in some Time be broke off naturally; for the Quantity of Spirits generated in Sleep, would at length be so great,

great, that, stretching out the Entrances of the Nerves, they would open themselves a Passage.

With regard to Medicine, *Sleep* is defined, by *Boerhaave*, to be that State of the *Medulla* of the Brain, wherein the Nerves do not receive so copious, nor so forcible an Influx of Spirits from the Brain as is required to enable the Organs of Sense, and voluntary Motion, to perform their Offices.

The immediate Cause hereof appears to be the Scarcity of Animal Spirits, which being spent, and requiring some Time to be recruited, the minute Vessels, before inflated, become flaccid and fall: Or else, 'tis owing to such a Pressure of the thicker Blood against the Cortex of the Brain, as that the *Medulla*, becoming likewise compressed by its Conguity with the Cortex, the Passage of the Spirits is obstructed. The natural Cause of *Sleep* is any Thing that may contribute to these two. — And hence its Effects are understood: For in *Sleep* several Functions are suspended, their Organs and Muscles are at Rest; the Spirits scarce flow through them, therefore there is a less Consumption of them; but the solid *Vitæ* and Fibres of the Nerves are but little chang'd, but an Equilibrium obtains throughout; there is no Difference of Pressure on the Vessels, nor of Velocity in the Humours. The Motion of the Heart, Lungs, Arteries, Viscera, &c. is increased; nor is it chang'd or abated by the Action of the Senses, or of voluntary Motions: The Effects of which are, that the Vital Humours circulate more throngly and equably thro' the Canals, which are now freer, laxer, and opener, as not being compressed by the Muscles. Hence the Blood is driven less forcibly, indeed, into the Lateral Vessels, but more equably; thro' the greater Vessels, both more throngly, and more equably. Thus are the Lateral Fibres sensibly filled, as being less traversed, and at length remain at rest, with the Juices they have collected: Hence the lateral adipose Cells become filled and distended with an Oily Matter. By this means the Circulation, being almost wholly perform'd in the larger Blood Vessels, becomes gradually slower, and at length scarce sensible, if the *Sleep* be too long continued: Thus, in moderate *Sleep*, is the Matter of the Chyle best converted into *Serum*; that, into thinner Humours; and those, into Nourishment. The Attrition of the solid Parts is less considerable; the cutaneous Secretion is increased, and all the rest diminish'd. The Parts wore off are now best supplied, as an equal, continual Repletion, restores the Humours, and repairs the Solids, the preventing and disturbing Causes being then at rest. In the mean Time, that the nutritious Matter is best prepared; there is an Aptitude in the Vessels to receive, and in the Humours to enter, and the Means of Application, and Consolidation, are at Liberty: Hence, a new Production, and Accumulation, of Animal Spirits, in all the Humours, as to Matter, and in the minutest Vessels as to Repletion: The Consequence of which is, an Aptitude for *Waking*, and an In-aptitude for *Sleep*; so that upon the first Occasion the Man awakes. See *NUTRITION*, &c.

Some of the more extraordinary Phenomena of *Sleep*, yet to be accounted for, are; That when the Head is hot, and the Feet cold, *Sleep* is impracticable: That spirituous Liquors first bring on Drunkenness, then *Sleep*: That Peripertition, during the Time of *Sleep*, is twice as great as at other Times: That upon *Sleeping* too long, the Head grows heavy, the Senses dull, the Memory weak, with Coldness, Piteousness, an Indisposition of the Muscles for Motion, and a want of Perspiration. That much *Sleeping* will sustain Life a long Time, without either Meat or Drink: That upon a laudable *Sleep*, there always follows an Expansion of all the Muscles, a repeated Yawning, and the Muscles and Nerves acquire a new Agility: That *Fævus*'s always *sleep*; Children often, Youth more than grown Persons, and they more than old Men; and that People, rising from violent Distempers, *sleep* much more than when perfectly at Health.

**SLIDING**, in Mechanics, called, by some Authors, *Superincensus Rotæ*, is, when the same Point of a Body, moving along a Surface, describes a Line on that Surface: Such is the Motion of a Parallelepiped, protruded along a Plane.

**SLIDING RULE**, a Mathematical Instrument, serving to work Questions in Gauging, Measuring, &c. without the Use of Compasses; merely by the sliding of the Parts of the Instrument one by another, the Lines and Divisions whereof give the Answer, by Inspection. See *RULE*.

This Instrument is variously contrived, and applied by various Authors; particularly *Everard*, *Coggehal*, *Quater*, *Hunt*, and *Partridge*; but the most usual and useful ones, are those of *Everard* and *Coggehal*; the Description, and Uses whereof, are as follow.

*Everard*'s **SLIDING-RULE** is principally used in Gauging. See *GAUGING*.

'Tis ordinarily made of Box, a Foot long, an Inch broad, and  $\frac{1}{2}$  thick. It consists of three Parts: A Rule, on each Side whereof *a b* and *c d*, Tab. Surveying, Fig. 17. is a Groove; and two small Scales, or *Sliding-Pieces*, *m, n*, to

slide in the Grooves, When both these Pieces are drawn out to their full Extent, the Instrument is three Foot long.

On the first broad Face of the Instrument *a b*, are four Lines of Numbers; for the Properties, &c. whereof see *LINE* of NUMBERS. The first mark'd *A*, consisting of two *Radius*'s number'd 1, 2, 3, 4, 5, 6, 7, 8, 9, 13 and then 2, 3, 4, 5, &c. to 10. On this Line are four Brass Centre-Pins, two in each Radius; one in each whereof is mark'd *M B* to signify that the Numbers 'tis set against, 2, 150.40 are the Cubic Inches in a Malt-Bushel; the other two are marked with *A*, to signify that the Numbers they are set against, viz. 282, are the Cubic Inches in an Ale-Gallon. The second and third Lines of Numbers, are on the *Sliding-Pieces*, and are exactly the same with the first. Close to the Figure 7, in the first Radius, is a Dot mark'd *S i*, set directly over 707, denoting 707 to be the Side of a Square inscribed in a Circle, whose Diameter is Unity. Close to 9 is another Dot, mark'd *S e*, set over 886, which is the Side of a Square, equal to the Area of a Circle, whose Diameter is Unity. Another Dot, high *W*, is set over 231, the Number of Cubic Inches in a Wine-Gallon; and another near *C*, is set over 3.14 the Circumference of a Circle, whose Diameter is Unity. The fourth Line of Numbers, mark'd *M D*, to signify Malt Depth, is a broken Line of two Radii's number'd 2, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, 9, 8, 7, &c. the Numbers being set directly against *M B* on the first Radius.

On the second broad Face, mark'd *c d*, are 1<sup>o</sup>. A Line of Numbers of one Radius, number'd 1, 2, 3, and to 10, noted by the Letter *D*. On this are four Centre-Pins, the first, mark'd *W G*, is the Gauge-Point for a Wine-Gallon, i. e. the Diameter of a Cylinder, whose Height is an Inch, and Content 231 Cubic Inches, or a Wine-Gallon, which is 17.15 Inches: The second Centre-pin *A G* stands at the Gauge Point for an Ale-Gallon, which is 18.95 Inches. The third *M S* stands at 86.3 the Side of a Square, whose Content is equal to the Inches in a full Bushel. The fourth *M R*, is the Gauge-point for a Malt-bushel, which is 52.31 Inches. 2<sup>o</sup>. Two Lines of Numbers on the *Sliding-Piece*, which are exactly the same as those on the *Sliding-Piece* on the other Side. Close to the Division 8 is a Dot mark'd *e*, which is set to 795, the Area of a Circle, whose Diameter is Unity; and another mark'd *d*, stands at 785, the Area of a Circle, whose Diameter is Unity. 3<sup>o</sup>. Two Lines of Segments, each number'd 1, 2, 3, to 100; the first, for finding the Ulage of a Cask taken, as the Middle Frustum of a Spheroid, lying with its Axis parallel to the Horizon; and the other, for finding the Ulage of a Cask standing.

Again, on one of the narrow Sides, noted *e*, are 1<sup>o</sup>. A Line of Inches, number'd 1, 2, 3, &c. to 12, each subdivided into 10 equal Parts. 2<sup>o</sup>. A Line, by which, with that of Inches, we find a mean Diameter for a Cask, in the Figure of a Middle Frustum of a Spheroid: 'Tis number'd 1, 2, 3, &c. to 7, and mark'd *Spheroid*. 3<sup>o</sup>. A Line for finding the mean Diameter of a Cask, in the Figure of the Middle Frustum of a Parabolic Spindle, which Gaugers call, the *Second Variety* of Casks; 'Tis number'd 1, 2, 3, &c. and noted *Second Variety*. 4<sup>o</sup>. A Line, by which we find the mean Diameter of a Cask of the *Third Variety*, i. e. of a Cask in the Figure of two Parabolic Conoids, abutting on a common Base; 'tis number'd 1, 2, 3, &c. and noted *Third Variety*.

On the other narrow Face, mark'd *f*, are, 1<sup>o</sup>. A Foot divided into 100 equal Parts, mark'd *F M*. 2<sup>o</sup>. A Line of Inches, like that before-mention'd, noted *I M*. 3<sup>o</sup>. A Line for finding the mean Diameter for the fourth Variety of Casks, which is the Middle Frustum of two Cones, abutting on a common Base. It is number'd 1, 2, 3, &c. and noted *F C*, signifying Frustum of a Cone.

Note, on the Backside of the two *Sliding-Pieces* are a Line of Inches, from 13 to 36, when the two Pieces are put Endwise; and against that, the correspondent Gallons, or Hundred Parts, that any small Tub, or the like open Vessel (from 13 to 36 Inches Diameter) will contain at one Inch deep.

Use of *Everard*'s **SLIDING-RULE**.

1<sup>o</sup>. To multiply one Number by another. Suppose 4 required to be multiplied by 6: Set 1 on the Line of Number *B*, to 4 on the Line *A*; then, against 6 upon *B* is 24, the Product sought upon *A*. Again, to multiply 26 by 68, set 1 on *B* to 26 on *A*; then, against 68 on *B* is 1768 on *A*, the Product sought.

2<sup>o</sup>. To divide one Number by another. Suppose 24 to be divided by 4: Set 4 on *B* to 1 on *A*; then against 24 on *B* is 6 on *A*, which is the Quotient. Again, to divide 952 by 14; set 14 on *A* to 1 on *B*, and against 952 on *A* you have on *B*, 68, which is the Quotient.

3<sup>o</sup>. To work the Rule of Three. If 8 give 20, what will 22 give? Set 8 on *B* to 20 on *A*, then against 22 on *B* stands 55 on *A*; the Number sought.

40. To find a mean Proportional between two Numbers; Suppose between 50 and 72: Set 50 on C to 72 on D; then against 72 on C you have 60 on D, which is the Mean required.

50. To extract the Square Root of a Number. Apply the Lines C and D to one another, so as 10 at the End of D be even with 10 at the End of C; then are these two Lines a Table, shewing the Square Root of any Number less than 1000000 by Inspection: For against any Number on C, the Number answering to it on D, is the Square Root thereof. Note, If the given Number consist of 1, 3, 5, or 7 Places, seek it on the first Radius, on the Line C, and against it is the Root required at D.

60. Either the Diameter, or Circumference of a Circle, being given; to find the other: Set 1 on the Line A against 3, 141 (to which is writ C) on the Line B; and against any Diameter on the Line A, you have the Circumference on B; and contrariwise: thus, The Diameter being 20 Inches, the Circumference will be 62.831 Inches; and the Circumference being 94.237, the Diameter will be 30.

70. The Diameter of a Circle given, to find the Area in Inches, or in Ale or Wine-Gallons. Suppose the Diameter 20 Inches, what is the Area? Set 1 upon D, to 785 (noted 4) on C; then against 20 on D is 314.159 the Area required. Now to find that Circle's Area in Ale-Gallons, set 18.25 (mark'd A G) upon D, to 1 on C; then against the Diameter 20 upon D, is the Number of Ale-Gallons on C, viz. 1.11. The same may serve for Wine-Gallons, regard only had to the proper Gauge-Point.

80. The two Diameters of an Ellipse being given, to find the Area in Ale-Gallons: Suppose the Transverse Diameter 72 Inches, and the Conjugate 50: Set 359.05 the Square of the Gauge-point on B, to one of the Diameters (suppose 50) on A; then against the other Diameter 72 on B, you will have the Area on A, viz. 10.02 Gallons, the Content of this Ellipse at one Inch deep. The like may be done for Wine-Gallons, if instead of 359.05 you use 249.11 the Square of the Gauge-Point for Wine-Gallons.

90. To find the Area of a Triangular Surface in Ale-Gallons: Suppose the Base of the Triangle 260 Inches, and the Perpendicular let fall from the opposite Angle 110 Inches; Set 282 (mark'd A) upon B to 130, half the Base on A: Then against 110 on B is 50.7 Gallons on A.

100. To find the Content of an Oblong in Ale-Gallons: Suppose one Side 130 Inches, and the other 180; set 282 on B to 180 on A; then against 130 upon B is 82.97 Ale-Gallons, the Area required.

110. To find the Content of a regular Polygon in Ale-Gallons, one of the Sides being given: Find the Length of the Perpendicular let fall from the Centre to one of the Sides: This multiplied by half the Sum of the Sides, gives the Area. For an Instance: Suppose a Pentagon, whose Side is 1 Inch; here, the Perpendicular will be found 837, by saying, As the Sine of half the Angle at the Centre, which in this Polygon is 36°, is to half the given Side 5, so is the Sine of the Complement of 36°, viz. 54° to the Perpendicular aforesaid. Whence the Area of a Pentagon, whose Side is Unity, will be found 1.72 Inches, which divided by 282, give 1.0061, the Ale-Gallons in that Polygon.

120. To find the Content of a Cylinder in Ale-Gallons: Suppose the Diameter of the Base of the Cylinder 120 Inches, the Perpendicular Height will be 36 Inches: Set therefore the Gauge-Point (A G) to the Height, 36 on C; then against 120, the Diameter on D, is found 1443.6, the Content in Ale-Gallons.

130. The Bung, and Head-Diameters, of any Cask, together with its Length, being given, to find its Content in Ale, or Wine Gallons.

10. Suppose the Length of a Cask taken, (as the Middle Frustum of a Spheroid which is the first Case or Variety) be 40 Inches, its Head-diameter 24 Inches, and Bung-diameter 32 Inches; subtract the Head-diameter from that of the Bung; the Difference is 8. Look, then, for 8 Inches on the Line of Inches, on the first narrow Pace of the Rule; and against it, on the Line Spheroid stands 5.6 Inches, which added to the Head-Diameter 24, gives 29.6 Inches for that Cask's Mean-Diameter: Set therefore the Gauge-Point for Ale (mark'd A G) on D, to 40 on C; and against 29.6 on D, is 97.45, the Content of the Cask in Ale-Gallons. If the Gauge-Point for Wine (mark'd W G) be used instead of that for Ale; you will have the Vessel's Content in Wine-Gallons.

20. If a Cask, of the same Dimensions as the former be taken (as the Middle Frustum of a parabolic Spindle, which is the Second Variety) see what Inches, and Parts, on the Line mark'd Second Variety, stand against the Difference of the Bung and Head-Diameters, which in this Example is 8; and you will find 5.1 Inches, which added to 24, the Head-Diameter makes 29.1 Inches, the Mean-Diameter of the Cask: Set therefore the Rule, as before, and

against 29.1 Inches, you will have 94.12 Ale-Gallons, for the Content of the Cask.

30. If the Cask taken be the Middle-Frustum of two parabolic Conoids, which is the Third Variety; against 8 Inches, the Difference of the Head and Bung-Diameters, on the Line of Inches, you will find 4.57 Inches on the Line called Third Variety; this added as before to 24, gives 28.57 for the Cask's Mean-Diameter: Proceeding as before, you will find the Content 92.8 Gallons.

40. If the Cask taken be the Frustums of two Cones, which is the Fourth Variety, against 8 Inches on the Line of Inches, you will find on the Line mark'd F C, 4.1 Inches to be added to 24 Inches: The rest, carried on as before, gives the Content of the Cask 87.93 Ale-Gallons.

140. A Cask partly empty, lying with its Axis parallel to the Horizon, to find the Quantity of Liquor therein: Find its whole Content, as above; which suppose 97.455 Gallons; and suppose the Inches, left dry, 8, and the Bung-Diameter 32: Then, as the Bung-Diameter on C is to 100 on the Line of Segments L, so are the dry Inches on C to a fourth Number on the Line of Segments: And as 100 upon B is to the Cask's whole Content on A, so is that fourth Number to the Liquor wanting to fill up the Cask; which, subtracted from the whole Contents of the Cask, gives the Liquor remaining therein. E. Gr. Set 32, the Bung-Diameter on C, to 100 on the Segment Line L; then against 8, the dry Inches on C, stands 17.6 on the Segment Line; Set therefore 100 on B, to the Cask's whole Content on A; and against 17.6 on B, you have 16.5 Gallons on A; subtracting therefore the said Gallons from 97.45, the Vessel's whole Content; the Liquor in the Cask will be 80.95 Gallons.

150. A Cask partly standing upright, or with its Axis perpendicular to the Horizon, to find the Liquor therein. Suppose the Length of the Cask 40 Inches, and 10 of them dry; set 40 Inches, on the Line C, to 100 on the Segment Line S; and against 10, the dry Inches on the Line C, stands 24.2 on H the Segment Line. Set, then, 140 on B, to 97.455, the Cask's whole Content on A; and against 24.2 on B, you will have 23.5 Gallons, which is what is wanting to fill up the Cask: This, therefore, subtracted from the whole Content 97.455, gives 73.955 Gallons, for the Quantity of Liquor remaining in the Cask.

160. To find the Content of any right-angled Parallelepiped (E. gr. a Cistern, Utting-Fat, or the like) in Malt-Bushels. Suppose the Length of the Base 80 Inches, the Breadth 50, and Depth 9 Inches: Set the Breadth 50 on B, to the Depth 9 on C; then against the Length 80 on A, stands 16.8 Bushels on B, the Number required.

Coggeshal's SLIDING-RULE, is principally used in measuring of the Superficies, the Solidity of Timber, &c. See MEASURING, &c.

It consists of two Rulers, each a Foot long, which are framed, or put together, various ways; sometimes they are made to slide by one another, like Glaziers Rules: Sometimes a Groove is made in the Side of a common two-foot Joint-Rule, and a thin Sliding-Piece put in, and Coggeshal's Lines added on that Side: But the most usual and commodious way, is to have one of the Rulers slide along a Groove made along the Middle of the other, as 'tis represented in Table Surveying, Fig. 18.

On the Sliding-Side of the Rule are four Lines of Numbers, three whereof are double, that is, are Lines to two Radius's, and one, a single broken Line of Numbers: The three first, mark'd A, B, C, are figured 1, 2, 3, &c. to 93 then 1, 2, 3, &c. to 10. Their Construction, Use, &c. are the same as those on Everard's Sliding-Rule. The single Line, called the Girt-Line, and noted D, whose Radius is equal to the two Radius's of any of the other Lines, is broke for the easier measuring of Timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. 4 to 5. It is divided into 10 Parts, and each 10th subdivided into 4, and so on to 10, &c.

On the back-side of the Rule, are, 10. A Line of Inch-Measure, from 1 to 12; each Inch being divided and subdivided. 20. A Line of Foot-Measure; consisting of one Foot, divided into 100 equal Parts, and figured 10, 20, 30, &c. The Back-side of the Sliding-Piece is divided into Inches, Halves, &c. and figured from 12 to 24; so that when slid out, there may be a Measure of two Foot.

Use of Coggeshal's SLIDING-RULE, in Measuring Plain Superficies.

1. To measure a Square. Suppose, E. gr. the Sides be each 5 Feet: Set 1 on the Line B, to 5 on the Line A; then against 5 on the Line B, is 25 Feet; the Content of the Square on the Line A.

2. To measure a long Square. Suppose the longest Side 18 Foot, and the shortest 10: Set 1 on the Line B, to 10 on the Line A; then against 18 Foot, on the Line B, is 180 Feet, the Contents on the Line A.

3. To measure a Rhombus. Suppose the Side 12 Feet, and the Length of a Perpendicular let fall from one of the obtuse Angles, to the opposite Side, 9 Feet: Set 1, on the Line B, to 12, the Length of the Side, on the Line A; then against 9, the Length of the Perpendicular on the Line B, is 108 Feet, the Content.

4. To measure a Triangle. Suppose the Base Seven Feet, and the Length of the Perpendicular let fall from the opposite Angle to the Base, 4 Feet: Set 1 on the Line B, to 7 on the Line A; then against half the Perpendicular, which is 2, on the Line B, is 14 on the Line A, for the Content of the Triangle.

5. To find the Content of a Circle, its Diameter being given. Suppose the Diameter 3.5 Feet: Set 11 on the Girt-Line D, to 95 on the Line C; then against 3.5 Feet on D is 9.6 on C, which is the Content of the Circle in Feet.

6. To find the Content of an Oval or Ellipsis. Suppose the longest Diameter 9 Feet, and the shortest 4. Find a mean Proportional between the two, by setting the greater 9 on the Girt-Line, to 9 on the Line C; then, against the less Number 4, on the Line C, is 6; the mean Proportional sought. This done, find the Content of a Circle, whose Diameter is 6 Feet; this, when found, by the last Article, will be equal to the Content of the Ellipsis sought.

Use of Conical's SLIDING-RULE, in the Measuring of Timber.

1. To measure Timber the usual Way. Take the Length in Feet, Half Feet, and, if required, Quarters; Then measure half way back again; there girt the Tree with a small Cord or Line; double this Line twice, very evenly, and measure this fourth Part of the Girt or Perimeter, in Inches, Halves, and Quarters. The Dimensions thus taken, the Timber is to be measured as if Square, and the Fourth of the Girt taken for the Side of the Square, thus: Set 12 on the Girt-Line D, to the Length in Feet on the Line C, then against the Side of the Square, on the Girt-Line D, taken in Inches, you have, on the Line C, the Content of the Tree in Feet.

For an Instance: Suppose the Girt of a Tree, in the Middle, be 60 Inches, and the Length 30 Feet, to find the Content, set 12 on the Girt Line D, and 30 Feet on the Line C; then against 15, one Fourth of 60, on the Girt-Line D, is 45.8 Feet; the Content on the Line C. If the Length should be 9 Inches, and the Quarter of the Girt 35 Inches; here, as the Length is beneath a Foot, measure it on the Line of Foot-measure, and see what decimal Part of a Foot it makes, which you will find .75. Set 12, therefore, on the Girt Line to 75 on the first Radius of the Line C, and against 35 on the Girt Line is 64 Feet on C, for the Content.

2. To measure round Timber the true Way. The former Method, though that generally in Use, is not quite just. To measure Timber accurately, instead of the Point 12 on the Girt Line, use another, viz. 10.635; at which there should be placed a Centre-pin. This 10.635 is the Side of a Square equal to a Circle, whose Diameter is 12 Inches. For an Instance: Suppose the Length 15 Feet, and  $\frac{1}{4}$  of the Girt 42 Inches: Set the Point 10.635 to 15 the Length; then against 42 on the Girt Line is 233 Feet for the Content sought; whereas by the common Way, there arises only 184 Feet. In effect, the common Measure is only to the true Measure, as 11 to 14. See TIMBER.

3. To measure a Cube: Suppose the Sides to be 6 Feet each; set 12 on the Girt Line D, to 6 on C; then against 72 Inches (the Inches in 6 Feet) on the Girt Line, is 216 Feet on C, which is the Content required.

4. To measure unequally-squared Timber; that is, where the Breadth and Depth are not equal. Measure the Length of the Piece, and the Breadth and Depth (at the End) in Inches: Then find a mean Proportional between the Breadth and Depth of the Piece. This mean Proportional is the Side of a Square, equal to the End of the Piece; which found, the Piece may be measur'd as Square Timber. For an Instance: Let the Length of the Piece of Timber be 13 Feet; the Breadth 23 Inches, and the Depth 13 Inches: Set 23 on the Girt Line D, to 23 on C; then against 13 on C is 17.35 on the Girt Line D, for the mean Proportional. Again, setting 12 on the Girt Line D, to 17 Feet, the Length on the Line C; against 17.35 on the Girt Line, is 47 Feet, the Content.

5. To measure taper Timber: The Length being measured in Feet, Note, one third of it; which is found thus: Set 3 on the Line A, to the Length on the Line B; then against 1 on A, is the third Part on B: Then if the Solid be round, measure the Diameter at each End in Inches, and subtract the less Diameter from the greater; add half the difference to the lesser Diameter; the Sum is the Diameter in the middle of the Piece. Then set 13.54 on the Girt to

the Length of the Line C, and against the Diameter in the middle, on the Girt Line, is a Fourth Number on the Line C. Again, set 13.54 on the Girt Line to the third Part of the Length on the Line C; then against half the Difference on the Girt Line, is another fourth Number on the Line C, these two fourth Numbers added together, give the Content: For an Instance; Let the Length be 27 Feet (one Third whereof is 9) the greater Diameter 22 Inches, and the lesser 18; the Sum of the Two will be 40, their Difference 4, and half the Difference 2, which added to the less Diameter, gives 20 Inches for the Diameter in the middle of the Piece. Now set 13.54 on the Girt Line, to 27 on the Line C, and against 20 on D, is 58.9 Feet. Again, set 13.54 of the Girt Line to 9 on the Line C; and against 2 on the Girt Line (represented by 20) is 196 Parts; therefore, by adding 58.9 Feet to 126 Feet, the Sum is 59.076 Feet the Content.

If the Timber be Square, and have the same Dimensions; that is, the Length 27 Feet, the Side of the greater End 22 Inches, and that of the lesser 18 Inches, to find the Content: Set 12 on the Girt Line to 27 the Length on the Line C, and against 20 Inches, the Side of the mean Square on the Girt Line, is 75.4 Feet. Again, set 12 on the Girt Line to 9 Feet, one Third of the Length, on the Line C, and against 2 Inches, half the Difference of the Squares of the Ends on the Girt Line, is 25 Parts of a Foot, both together make 75.65 Feet, the Content of the Solid.

The Girt or Circumference of a Tree, or round Piece of Timber given; to find the Side of a Square within, or the Number of Inches of a Side, whose the round Timber is Squar'd. Set 10 on A to 9 on B, then against the Girt on A, are the Inches for the Side of the Square on the Line B.

SLING, Fundus, a String-Instrument, serving for the casting Stones with the greatest Violence. — Piny, L. 7. C. 56. attributes the Invention of the Sling to the Phœnicians. Vegetius attributes it to the Inhabitants of the Balearic Islands; who were famous in Antiquity, for the dextrous Management thereof. Florus and Strabo say they had three Kinds of Slings; some longer, others shorter, which they used according as their Enemies were nearer or more remote. Diodorus adds, that the first served them for a Head-band, the second for a Girdle, and that the Third they constantly carried with them in the Hand.

SLINGING, is used variously at Sea; but, chiefly for the hoisting up Casks or other heavy Things, with Slings or Contrivances of Ropes, spliced into themselves at either End, with an Eye big enough to hold the Thing to be Slung.

SLIPPING (among Gardeners) is the pulling off a Sprig from a Branch, or a Branch from an Arm of the Tree: and to a Slip may have its Rents double and treble Slipp'd, or its Stalk ragged.

SLOOP, is a floating Vessel of the Shallop-kind. See FLOATING VESSEL.

In our Navy, they are Attenders on the Men of War; and are usually about 60 Ton, and carry about 30 Men. See NAVY.

SLOUGH, a deep and muddy Place; also the cast Skin of a Snake, the Damp of a Coal-pit, and the Scar of a Wound, are so called. The Slough of a Wild Boar is the Bed, Soil, or Mire, wherein he wallows, or in which he lies in the Day-time: Slough (in Hunting) is used for a Company of foule Sorts of Wild-Beasts.

SLUICE, a Frame of Timber, Stone, or other Matter, serving to retain and raise the Water of a River, &c. and, on Occasion, to let it pass: Such is the Sluice of a Mill, which stops and collects the Water of a Rivulet, &c. to let it fall, at length, in the greater Plenty upon the Mill-wheel: such also are those used as Vents or Drains to discharge Water off Land: And such are the Sluices of Flanders, &c. which serve to prevent the Waters of the Sea overflowing the lower Lands, except when there is Occasion to drown them.

Sometimes there is a kind of Canal inclosed between two Gates or Sluices, in artificial Navigations, to save the Water, and render the Passage of Boats equally easy, and safe, upwards and downwards; as in the Sluices of Briare in France, which are a kind of massive Walls, built Parallel to each other at the Distance of 20 or 24 Feet, cloked with strong Gates, at each End, between which is a kind of Canal or Chamber, considerably longer than broad, wherein a Vessel being inclosed, the Water is let out at the first Gate, by which the Vessel is raised 15 or 16 Foot, and pass'd out of this Canal into another much higher. By such means a Boat is convey'd out of the Louvre into the Seine, though the Ground between them be raised above 150 Feet higher than either of those Rivers. — The Word is form'd of the French, *Ecluse*, which *Ménage* derives from the Latin, *Excelsus*, found in the *Solus* Law in the same Sense. But this is to be restrained to the Sluices of Mills, &c. for as to those serving to raise Vessels, they were unknown to the Ancients.

**SMACK**, is a small Vessel with but one Mast. See **MAST**. Sometimes, such are employed as Tenders on a Man of War, and they are also used for Fishing upon the Coasts.

**SMALL-POX**, *Variole*. See **POX** and **VARTOLZ**.

**SMALT**, a kind of Mineral Matter, prepared and purified Abroad, and brought hither, sometimes in Form of a blue Powder, and sometimes in Cakes; chiefly used along with Starch, to give Linens the finer and clearer Galt; and best known by the Name of *Stove-blue*. See **BLUE**.

The Preparation of *Smalt*, as practised in *Hermannsburg*, we have described in the *Philosophical Transactions* by Dr. *Krieg*; Who tells us, that the Matter 'tis made of, is the Mineral Stone, called *Cobalt* or *Cadmia*, which being pulveriz'd, and the lighter Stuff wash'd away, the Remainder is laid on a Furnace, and by a Fire, underneath and aside it, the Flames whereof are reverberated over it, a Matter is separated from it in Form of a Smoak, which sticking to the Walls, makes what we call *Arjenic*. See **ARSENIC**.

When the Cobalt has done smoking, 'tis cool'd, mix'd with Pot-ashes and Powder of white Flint-stones, the Mixture put in Pots, and melted for five or six Hours in a Furnace. By this means, the Matter is form'd into a blue Glass, which being put in cold Water, cracks and grows tender, and is at length powder'd by an Engine, the finest part separated by a Sieve, put into a Mill, and ground in Water, into the finest Powder, which by washing is still further separated from the coarser, then dried in warm Chambers, barrill'd up, and sent away.

**SMARAGD**, a precious Stone of a green Colour, very Beautiful and Brilliant. See **PRECIOUS STONE**.

The Oriental *Smaragd*s are the most in Esteem, as being the hardest, and their Splendor the most vigorous; so as even to tinge the ambient Air with their Greenness. Great Virtues are ascribed to the *Smaragd*. *Cordan* and others say, it resists Plagues, Poisons and Dysenteries; that it refreshes the Spirits, &c.

The Word is form'd from the *Greek*, *σμεραγδος*.

**SMECTYMNUUS**, a Term that made some Figure in the Time of the Civil Wars, and during the *Inter-regnum*. It was form'd of the initial Letters of the Names of Five eminent Presbyterian Ministers of that Time, viz. *Stephen Mayhew*, *Etiennea Colman*, *Thomas Zaing*, *Matthew Newcomen*, and *William Sparke*, who, together, wrote a Book against Episcopacy, in the Year 1641, whence they and their Retainers, were call'd *Smectymnians*.

**SMELL**, Odor, with regard to the Organ, is an Impression made on the Nose, by little Particles continually exhaling from odorous Bodies. See **NOSE**, &c.

*Smell*, with regard to the Object, is the Figure and Disposition of Odorous Effluvia, which sticking on the Organ, excite the Sense of *Smelling*. See **SMELLING**.

With regard to the Soul, *Smell* is the Perception of the Impression of the Object on the Organ, or the Affection in the Soul resulting therefrom. See **SENSE**.

The Chymists teach, that Sulphur is the Principle of all *Smells*, and that these are more or less strong, as the Sulphur in the odorous Body, is more or less dried and exal'd. Sulphur, they say, is the Foundation of Odors, as Salt is of Savors, and Mercury of Colours. See **SMELLING**.

*Smell*, like Taste, consists altogether in the Arrangement, Composition and Figure of the Parts; as appears from the following Experiments of Mr. *Boyle*;

1<sup>o</sup> From a Mixture of Two Bodies, each whereof, is, of itself, void of all *Smell*; a very urinous *Smell* may be drawn: That is, by the Grinding of Quick-lime with Sal-Ammoniac. 2<sup>o</sup> By the Admixture of common Water, which of itself, is void of *Smell*, or inodorous; another inodorous Body may be made to emit a very rank *Smell*. Thus Camphor dissolved in Oil of Vitriol, is inodorous; yet mix'd with Water, immediately exhales a very strong *Smell*. 3<sup>o</sup> Compound Bodies may emit *Smells*, which have no Similitude to the *Smells* of the Simplex they consist of. Thus Oil of Turpentine, mixt with a double Quantity of Oil of Vitriol, and Distill'd; after Distillation, there is no *Smell* but of Sulphur; and what is left behind in the Retort, being again urged by a more violent Fire, yields a *Smell* like Oil of Wax. 4<sup>o</sup> Several *Smells* are only to be drawn by Motion and Agitation. Thus Glass, Stones, &c. which even when heated, yield no *Smell*, yet when rubb'd and agitated in a peculiar Manner, emit a strong *Smell*; particularly Beech-wood in turning, yields a kind of Rosy *Smell*. 5<sup>o</sup> A Body that has a strong *Smell*, by being mix'd with an inodorous one, may cease to have any *Smell* at all: Thus if Aqua-fortis, not well dephlegmated, be pour'd on Salt of Tartar, till it cease to ferment; the Liquor, when evaporated, will yield inodorous Crystals, much resembling Salt of Nitre. Yet when burnt, will yield a most noisom *Smell*. 6<sup>o</sup> From a Mixture of Two Bodies, the one whereof *Smells* extremely ill, and the other not well; a very pleasant aromatic Odor may be gain'd, viz. by a Mixture of Aqua-fortis, or Spirit of Nitre, with an inflammable Spirit of Wine. 7<sup>o</sup> Spirits of Wine, by mixing with an almost inodorous Body, may

gain a very pleasant, aromatic *Smell*. Thus inflammable Spirits of Wine, and Oil of *Dioscoric* Vitriol, mix'd in equal Portions, then digested, and at last distill'd, yield a Spirit of a very fragrant *Smell*. 8<sup>o</sup> A most fragrant Body may degenerate into a fetid one, without the Admixture of any other Body. Thus if the Spirit, mentioned in the former Experiment, be kept in a well closed Receiver, it will soon turn to the Rankness of Garlic. 9<sup>o</sup> From Two Bodies, one whereof is inodorous, and the other fetid; a very pleasant *Smell* may arise, much resembling Musk, viz. by putting Pearls into Spirit of Vitriol: For when dissolved, they yield a very agreeable *Smell*.

**SMELLING**, the Act wherby we perceive *Smells*; (See **SMELL**) or the Act, wherby we become sensible of odorous Bodies, by means of certain Effluvia thereof, which sticking on the Olfactory Organ, and briskly enough to have their Impulse propagated to the Brain, excite a Sensation in the Soul. See **SENSATION**.

The principal Organs of *Smelling*, are the Noftrils, and the Olfactory Nerves; the minute Ramifications of which latter are distributed throughout the whole Concave of the former: Their Description, see under their proper Heads.

*Smelling* is performed by the odorous Effluvia floating in the Air, being drawn into the Noftrils, in Inspiration, and struck with such Force against the Fibrillæ of the Olfactory Nerves which the Figure of the Nose, and the Situation of the little Bones, render opposite thereto, as to shake them, and give them a vibratory Motion; which Action being communicated thence to the common Senfory, occasion an Idea of a sweet, or fetid, or sour, or an aromatic, or a putrid Object, &c.

The Matter in Animals, Vegetables, Fossils, &c. which chiefly affects the Sense of *Smelling*, *Boerhaave* observes, is that subtle Substance inherent in the oily Parts thereof, call'd *Spirits*: For that when this is taken away from the most fragrant Bodies; what remains, has scarce any *Smell* at all; but this pou'd on the most smell-less Bodies, gives them a Fragrance. *Infinit. exp. de Olfac.*

*Willis* observes, That Brutes have, generally, the Sense of *Smelling* in much greater Perfection than Man; as by this, alone, they distinguish the Virtues and Qualities of Bodies unknown before; hunt out their Food at a great Distance, as Hounds, and Birds of Prey, or hid among other Matters, as Ducks, &c. Man having other means of judging of his Food, &c. did not need so much Sagacity in his Noie: Yet have we Instances of a great deal, even in Man.

In the *Histoire des Antilles*, we are assured, there are Negroes who, by the *Smelling*, alone, can distinguish between the Foot-steps of a *Frenchman* and a Negro. 'Tis found that the Laming, wherewith the Upper Part of the Noftrils is fenced, and which serve to receive the Divarications of the olfactory Nerves, are always longer, and folded up together in greater Number, as the Animal has this Sense more accurate. The various Windings and Turnings of these Laminae, detain and fetter the more of the odorous Particles.

**SMELTING**, among Refiners, is the melting of Metal in the Ore in a *Smelting* Furnace; in order to separate the metallic from the earthy Parts. See **METAL**.

**SMINTHEAN**, **SMINTHEUS**, in Antiquity, an Epithet given to *Apollo*, from the *Greek* *εμινθηος*, a *Rat*. — Thus are two different Accounts of the Origin of this Appellation: The first, that in the City of *Chrysa* in *Missa*, was a Priest of *Apollo*, call'd *Crimes*, with whom that God being offended, sent a Herd of Rats to spoil all his Lands. But *Crimes* appeasing the Deity, he came in Person to his Assistance, took his Lodgings with *Crimes's* Shepherd, told him who he was, and destroyed all the Rats with his Arrows: In Memory whereof, *Crimes* built a Temple to his Deliverer, under the Name of *Apollo Smintheus*. — *Clemens Alexandrinus*, in his Exhortation to the *Greeks*, gives us a different Story. The *Creteans*, says he, intending to feed out a Colony, consulted the Oracle of *Apollo* as to the Place; the Answer was, That they should place their Colony where those, born of the Earth, should oppose them. Upon their Arrival in the *Hellepoint*, the Rats, in the Night-time, gnaw'd atunder all the Strings of their Bows: This they deem'd an Accomplishment of the Oracle, and built a City call'd *Sminthis*.

**SMOAK**, a humid Matter, exhaled in Form of Vapour, by the Action of Heat, either external or internal. See **FIRE-SMOAK**. Sir *Isaac Newton* observes, ascends in the Chimney by the Impulse of the Air it floats in: For that Air being rarified by the Fire underneath, has its specific Gravity diminished; thus, being determined to ascend, itself, it carries up the *Smoak* along with it. The Tail of a Comet, that great Author takes to ascend from the Sun after the same manner. See **COMET**.

**SMOAK** of fat unctuous Woods, as Fir, Beech, &c. makes what we call *Lamp-black*. See **BLACK**.

There are various Inventions for preventing and curing *Smoking* Chimneys; as the Occulipes of *Vitrucius*, the Venetians of *Corolan*, the Wind-mills of *Bernard*, the Capitals of *Serlio*, the little Drums of *Padouano*, and several Artifices of *de Lorme*, &c. See **CHIMNEY**.

In the *Philosophical Transactions*, we have the Description of an Engine invented by Monsieur *Dalesne*, which consumes the *Snow* of all Sorts of Wood, and that so rotally as the most curious Eye cannot discover it in the Room, nor the nicest Nose smell it, though the Fire be made in the middle of the Room. It consists of several Iron Hoops, four or five Inches Diameter, which flur into one another; and is placed on a Trestle. A Brand taken out of the Fire smokes instantly; but ceases as soon as returned. The most secret Things, as a Coal steep'd in Cat's-piss, which stinks abominably when taken out of the Fire, yet in it makes not the least ill Scent; no more than Red Herrings broil'd, &c.

**SMOKE Forbings**, were the pentecostal or customary Oblations, offered by the Inhabitants within any Diocese, when they made their Processions to the Cathedral Church; which came by degrees into an annual, standing Rent, called *Smoke-Forbings*.

**SMUGGLING**, a Cant Term for the Running of Goods; or the stealing them abroad without paying Custom. See CUSTOM.

**SMUT**, a Disease in Corn, whereby the Pulp or Meal thereof is damaged, and its natural Taste, Colour, &c. alter'd.

The *Smut* is usually ascribed by the Husbandmen to the excessive Fumels and Rankness of the Soil; to the manuring the Land with rotten Vegetables, as Straw, Hawm and Fern; and to the sowing *Smuty Seed*.

Mr. *Bradley* makes no doubt to call the *Smut* a *Blight*, and to account for it on the same Principle as the Blights befalling other Plants, particularly Fruit Trees, &c. from innumerable little Insects, brought, or at least hatch'd by the eastern Winds, which prey on and devour the native Juices of the Corn, and poison them with a Mixture of their own. See BLIGHT.

An approved Method to prevent the *Smut*, the same Mr. *Bradley* gives us, as follows: The Wheat, for Seed, to be washed in three or four Waters, stirring it well round, and with great force, each time, and skimming off all the light Wheat swimming a-top. This done, 'tis to be steep'd in a Liquor thus prepared: Into a sufficient Quantity of Water, put as much Salt, as, when stirred about, will make an Egg swim; and to this add as much more Salt; stir the whole well, and to the Brine, put two or three pound of Alum beaten fine. In this Mixture, lay the Wheat to steep, at least, thirty or forty Hours. Take it out the Night before 'tis to be sown, and sift some slack'd Lime on it; this dries and fits it for sowing.

Note, many steep their Wheat in Brine, yet have plenty of *smuty Corn*: The Reason is, that they don't either make their Brine strong enough, or don't let the Wheat stay long enough therein. 'Tis a common Notion among them, that steeping it so long, rots the Grain; but Experience shews the contrary.

**SNAKE ROSE**. See SERPENTARIA RADIX.

**SNEEZING**, a convulsive Motion of the Muscles of the Breast used in Expiration; wherein, after suspending the Inspiration begun, the Air is repelled from the Mouth and Nose with a momentary Violence. See RESPIRATION.

The Cause is an Irritation of the Upper Membrane of the Nose, which communicates with the Intra-cerebral Nerve by means of the Twigs that it detaches to it. This Irritation is performed either externally by strong Smells; as Marjoram, Roses, &c. or by Dust floating in the Air, and taken in by Inspiration; or by sharp, pungent Medicines, as Cresses and other Strenuatories, which vilitate the Membrane of the Nose; or internally by the Acrimony of the Lymphs or Mucus, which naturally moistens that Membrane.

The Matters cast forth in *Sneezing*, come primarily from the Nose and Throat, the pituitary Membrane continually exuding a Mucus thither; and, secondarily, from the Breast, the Trachea and the Bronchia of the Lung.

F. *Straada*, in an express Treatise on *Sneezing*, has discovered the Original of the Custom of saluting those who *sneeze*. He shews it to be a Remain of Paganism; tho' he owns 'twas in use among the *Greeks* as well as among the *Romans*. From an Epigram in the Anthology, it appears, that among the Ancients, a Person after *Sneezing*, made a short Prayer to the Gods; as *Esti sicut, Jupiter juve me*.

**SNOW**, a Meteor form'd in the middle Region of the Air, of Vapour raised by the Action of the Sun or subterraneous Fire, there congeal'd, its Parts concompact, its specific Gravity increased, and thus returned to the Earth in form of little Villi or Flakes. See METEOR and VAPOUR.

The *Snow* we receive, may properly enough be ascribed to the Coldness of the Atmosphere through which it falls. When the Atmosphere is warm enough to dissolve the *Snow* before it arrives at us; we call it *Rain*: If it preserve itself undissolved, it makes what we call *Snow*. See RAIN.

The Uses of *Snow* must be very great, if all be true *Barbozin* has said in its behalf, in an express Treatise, *de Nivis usu medico*: He there shews that it fructifies the Earth, (which, indeed, is a very old and general Opinion) preserves from the Plague, cures Fevers, Colicks, Tooth-Aches,

Sore-Eyes, and Pleuritis (for which last Use, his Countrymen of *Denmark* use to keep *Snow-Water* gathered in *March*) He adds, that it contributes to the prolongation of Life; giving Influences of People in the *Alpine* Mountains that live to great Ages; and to the preserving of dead Bodies; Instances whereof, he gives in Persons buried under *Snow* in passing the *Alps*, which are found uncorrupted in the Summer when the *Snow* is melted.

He observes, that in *Norway*, *Snow-water* is not only their sole Drink in the Winter; but *Snow* even serves for Food; People having been known to live several Days, without any other Sustainance.

Indeed the Generality of these medicinal Effects of *Snow*, are not to be ascribed to any specific Virtue in *Snow*; but to other Causes. It fructifies the Ground, for Instance, by guarding the Corn, or other Vegetables, from the intenser Cold of the Air, especially the cold, piercing Winds. And it preserves dead Bodies, by concompacting and binding up the Parts, and thus preventing all such Fermentations or internal Conflicts of their Particles, as would produce Corruption. See COLD.

'Tis a popular Error, that the first *Snow* that falls in the Year, has particular Virtues. In *Italy*, they cool their Wines all the Summer with *Snow-water*.

Dr. *Green*, in a Discourse of the Nature of *Snow*, observes, that many Parts thereof are of a regular Figure, for the most part so many little Rowels or Stars of Six Points, and are perfect and transparent Ice, as any we see on a Pond, &c. Upon each of these Points are other collateral Points, set at the same Angles, as the main Points themselves; Among which there are divers others irregular, which are chiefly broken Points, and Fragments of the regular Ones. Others also by various Winds, seem to have been thaw'd, and froze again into irregular Clusters; so that it seems as if the whole Body of *Snow* were an infinite Mass of Icicles irregularly figured. That is, a Cloud of Vapours being gathered into Drops, the said Drops forthwith descend; upon which Descent, meeting with a freezing Air as they pass through a colder Region, each Drop is immediately froze into an icicle, shooting itself forth into several Points; but these still continuing their Descent, and meeting with some intermitting Gales of warmer Air, or in their continual Waftage to and fro, touching upon each other, some of 'em are a little thaw'd, blunted, and again froze into Clusters, or intangled so as to fall down in what we call Flakes. The Lightness of *Snow*, although it is firm Ice, is owing to the Excess of its Surface, in Comparison to the Matter contained under it; as Gold itself may be extended in Surface, till it will ride upon the least Breath of Air. See ICE and FREEZING.

Signior *Sarvati*, in the *Philosophical Transactions*, mentions a red or bloody *Snow*, which fell on the Mountains *le Langhe*, near *Genoa* on S. *Joseph's* Day. This *Snow* when squeeze'd, yielded a Liquor of the same Colour.

**SNUFF**, a Preparation of Tobacco, made by reducing it into a Powder, fit to be taken at the Nose; in order to purge or clear the Head of Pituita. See TOBACCO.

Ordinarily, Tobacco is only the Basis of *Snuff*; other Matters being added to give it a more agreeable Scent, &c.

The kinds of *Snuff*, and their several Names, are infinite; and new ones are daily invented; so that it would be as impertinent as 'tis impossible, to give a Detail of them. We shall only say, that there are Three grand Sorts; the First granulated; the Second an impalpable Powder; and the Third the Bran or the coarse Part remaining after sifting the second Sort.

**SOAP**, a kind of Paste, sometimes hard and dry, and sometimes soft and liquid; much used in washing, and whitening Linens, and for various other Purposes, by the Dyers, Perfumers, Hatters, Fallers, &c. See DYING, HAT, FULFING, &c.

The principal Soaps of our Manufacture, are the *Soft*, the *Hard*, and the *Best Soap*. The *Soft Soap*, again, is either White or Green: The Process of making each kind, is as follows;

*Method of making the several Kinds of SOAP.*

1<sup>o</sup> *Green, Soft-Soap*. The chief Ingredients used in making of *Green Soap*, are Lyes drawn from Pot-ash and Lime, boil'd up with Tallow and Oil. First, the Lye and Tallow are put into the Copper together, and when melted, the Oil is put to it, and the Copper made to boil; then the Fire is damp'd or stop'd up, while the Ingredients lie in the Copper to knit or incorporate; which done, the Copper is set on boiling, being fed or filled with Lyes as it boils, 'till there be a sufficient Quantity put therein: Then it is boil'd off with all convenient speed, and put to Casks.

2<sup>o</sup> *White Soft Soap*. One sort of *White Soft Soap* is made after the same manner as *Green Soft Soap* is, Oil excepted, which is not used in White. The other sort of *White Soft Soap*, is made from Lyes of Ashes of Lime boil'd up at twice with Tallow. First, a quantity of Lyes and Tallow are put into the Copper together, and kept boiling; being

fed with Lyes as it boils, until it grains, or is boiled enough; then the Lyes are separated or discharged from the tallowish Part, which Part is removed into a Tub, and the Lyes thrown away: This is called the *First half Boil*. Then the Copper is charged again with fresh Tallow and Lyes, and the first half Boil put out of the Tub into the Copper a second Time; where it is kept boiling with fresh Lyes and Tallow, till it comes to Perfection. It is then put out of the Copper into the same sort of Casks as are used in Green soft Soap.

<sup>30</sup> *Hard Soap* is made with Lyes from Ashes and Tallow, and most commonly boil'd at Twice: The First, called a *Half-boiling*, hath the same Operation as the first Half-boil of soft White Soap. Then the Copper is charged with fresh Lyes again, and the first Half-boil put into it, where it is kept boiling, and fed with Lyes as it boils, till it grains, or is boiled enough; then the Lye is discharged from it, and the Soap put into a Frame to cool and harden.

*Note*, There is no certain Time for bringing off a Boiling of any of these Sorts of Soap. It frequently takes up part of two Days.

<sup>40</sup> *Ball-Soap*, commonly used in the North, is made with Lyes from Ashes and Tallow; the Lyes are put into the Copper, and boil'd till the watery Part is quite gone, and there remains nothing in the Copper but a sort of Nitrous Matter (the very Strength or Effence of the Lye) to this the Tallow is put, and the Copper kept boiling and stirring for above half an Hour, in which time the Soap is made; and then it is put out of the Copper into Tubs or Baskets with Sheets in them, and immediately (whilst soft) made into Balls.

*Note*, It requires near Twenty-four Hours to boil away the watery Part of the Lye.

SOAPS, both dry and liquid, are held of some Use in Medicine: The Liquid against Fevers; to be applied by rubbing the Soals of the Patient's Feet therewith: And the Dry, dissolved with Spirit of Wine, in the Cure of cold Humours: Besides its being used in Suppositories, and in the Composition of a kind of Plaster, commonly called *Emplastr de Sapon*.

SOAP Earth, a kind of Earth found in the Levant, and used as a Soap. See EARTH.

The Soap-Earth, Dr. Smith tells us, is only had in two Places near *Durrales*, Six Leagues to the East of *Suyra*. 'Tis, in effect, of itself, a fine Soap, boiling and floating up out of the Earth.

'Tis gathered always before Sun-rise, and in Mornings when there falls no Dew; so that a Stock must be laid up in the Summer Months, to serve all the Year.

In some Places, it comes up an Inch or two above the Surface of the Ground: But the Sun rising on it, makes it fall again. Every Morning there returns a fresh Crop.

SOC, in Law, a Power, Authority, or Privilege to minister Justice, and execute Laws: Also the Shire, Circuit, or Territory wherein such Power is exercised by him indeed with such Jurisdiction.

And hence the Law Latin Word *Socius* for a Seignory or Lordship, infranchised by the King, with Liberty of holding a Court of his *Sock-men* or *Sockengers*, that is, his Tenants, whose Tenure is hence called *Socage*. See SOCAGE.

This kind of Liberty still subsists in several Parts of *England*, under the Name of *Soke* or *Soken*. *Shene* defines *Soc*, to be *Sella de hominibus suis in curia secularium consuetudinem Regni*. *Brady* makes mention of these Liberties: *Soc, Sac, Sol, Tonn, Infangthief and Urfangthief*.

In the Laws of *Henry I.* *Soca* is used as synonymous with Franchise, or a privileged Place, Refuge, Asylum, Sanctuary, &c. From the *Saxon*, *Socca* and *Socent*.

SOCAGE or SOCCAGE, a Tenure, by which Men held their Lands on condition of ploughing those of their respective Lords, with their own Ploughs, and at their own Charges. See SERVICE, VASSAL, TENURE, &c.

This slavish Tenure was afterwards, by the mutual Agreement of Lord and Tenant, turned into the Payment of a certain Sum of Money, which is hence called *Liberum Socagium*, free or common Socage. Whereas the other was *Villanum Socagium*, or base Socage: Inasmuch as those who held Lands by this Tenure, were not only bound to plough their Lords Lands; but took the Oath of Fealty to them, *Sicut de Villanis*. See FEALTY.

Socage was a Tenure of that Extent, that *Litton* tells us, all the Lands in *England*, which were not held by Knight's Service, were held in Socage: So that it seems the Land was divided between the two Tenures, which, as they were of different Natures, so the Defect of the Land was in a different Manner. For the Lands held in Knight's Service, descended to the eldest Son; but those held in *Villanum Socagio*, equally among all the Sons. Yet if there was but one Messuage, the eldest Son was to have it; so, as the rest had the Value of the Messuage equally divided between them.

*Skens* defines Socage, a Tenure of Lands, whereby a Man is infeoffed freely, without Wardship and Marriage, paying to his Lord some final Rent, &c. which is called *Free Socage*, &c.

*Bracton* thus describes it, *Dicit poterit Socagium a Socco & inde tenentur Sockmanni, ex quod deputati sunt ut velent tantum modo ad Culturam, & quorum Custodia & Meritigia ad propinquiores parentes iure sanguinis pertinebant*, &c.

Several Divisions of Socage we meet withal in Law-writers, as Socage *in Capite*, &c. But by Stat. 12. Car. II. all Tenures from and after the 24th of February, 1645, shall be adjudg'd and taken for ever, to be turn'd into free and common Socage.

SOCUS, SOCK, in Antiquity, a kind of high Shoe, reaching above the Ankle, wore by the Actors in the ancient Drama, in representing of Comic Persons. See COMEDY.

The *Soccus* was much lower than the *Cothurnus*; and was the distinguishing Wear of the Comedians; as the *Cothurnus* was of the Tragedians: Hence *Soccus* is frequently used for Comedy itself. Comedy, says *M. Fenelon*, must talk in a humbler Style than Tragedy; the *Sock* is lower than the *Bushin*. See BUSHIN.

SOCIETY, an Assemblage, or Union of several Persons in the same Place, for their mutual Assistance, Security and Interest.

Of Societies we have a great many Kinds, distinguished by the different Ends proposed by them: *Civil Societies*, *Trading Societies*, *Religious Societies*, &c.

*Civil SOCIETY*. See GOVERNMENT.

*SOCIETY*, in Trade, is a Contract or Agreement between two or more Persons, whereby they bind themselves together for a certain Time, and agree to share equally in the Profits or Losses which shall accrue in the Affairs for which the Society or Co-partnership is contracted. See CO-PARTNER.

We have several very considerable Societies of this Kind; as the *Mercantile Adventurers*, the *Turkey, East India, Muscovy, Eastland, Greenland, Spanish, African, South-Sea and Hudson's Bay Companies*. The Initiations, Policies, &c. whereof, see under the Article COMPANY.

By the *Roman Law*, the *Social Contract* needs no other Solemnity, but the sole Consent of Parties, without any Writing at all: But among us, Articles of Co-partnership are required: There is no Contract wherein Probity is more required than in *Society*; inasmuch as the Laws pronounce those Null, that are made contrary to Equity, and with design to deceive.

The *French* distinguish three Kinds of Mercantile Society: *Ordinary Society*, called also *Collective* and *General*; *Society in Commendam* or *Commandary*; and *Anonymous Society*, called also *Momentary* and *Incognite*. The first is, where several Merchants act alike in the Affairs of the Society, and do all under their collective Names, which are public and known to every Body. — *Society in Commendam*, &c. is that between two Persons, one of whom only puts his Money into Stock, without doing any other Office of a Co-partner; the other, who is called the *Complimentary* of the Society, dispatching all the Business under his own Name. This Society is very useful to the State; inasmuch as all kinds of Persons, even Nobles and Men of the Robe, may contract it; and thus make their Money of Service to the Publick: And those who have no Fortune of their own to trade withal, hereby find means of establishing themselves in the World, and of making their Industry and Address serviceable. *Anonymous Society*, is that, where all the Members are employ'd, each particularly, in the common Interest, and each accountable for Profits, &c. to the rest; but without the Publick's being informed thereof; so that the Seller has only an Action against the particular Buyer, no other Name appearing.

'Tis also called *Momentary*, because frequently made on particular Occasions, and ceasing with them; as in the making a Purchase, the selling any Commodity, &c. Of this they distinguish four Kinds: *Society by Participation*, which is usually form'd by Letters from one City to another, where a Merchandise is to be bought or sold. The Second is, when two or three Persons go together to Fair to buy Goods. The Third, when two or three Persons agree to buy up the Whole of some Commodity, in any Country; to sell it again at their own Price. And the Fourth is, when three or four Persons make a Journey together, to buy and sell the same Commodity. Beside Merchants, People of Quality, &c. are admitted into these *Anonymous Societies*.

*Religious SOCIETIES*, are Parties of Persons formed, either to live regularly together; or to promote the Interest of Religion; or to cultivate it in themselves.

Of the first Kind, are all Congregations of Religious; particularly the *Jesuits*, who are called the *Society of Jesus*; though they more usually call themselves the *Company of Jesus*. See JESUITES. — The *Society of the Sorbonns*. See SORBONNS. — The *Society of S. Thomas de Villeneuve*, instituted in 1660, by *F. Ange le Proust*. — The *Society of S. Joseph*, instituted in 1638. — The *Society of Brétagne*, a Reform of Benedictines in 1606. And the *Society of Jesus*, a religious Military Order, instituted by *Pius II*.

Of the second Kind are the *SOCIETY for Reformation of Manners*; and putting in Execution the Laws against Immorality and Prophanities. It was taken foot about 10 Years ago, by five or six private Persons in *London*; but is since exceedingly increased, by Numbers of Members of all Denominations.

tions. A particular Body of the most considerable hereof, bear the Expenses of Profecutions, &c. without any Contribution from the rest: These chiefly apply themselves to the Prosecuting Persons for Swearing, Drunkenness, and Prophaning the Sabbath. Another Body of about 50 Persons, apply themselves to the suppressing Lewdness; and by them above 500 lewd Houses have been actually suppress'd. A third Body consists of Constables. A fourth, of Informers. Besides these, are Eight other regular, mix'd Bodies of Housekeepers, and Officers, who inspect the Behaviour of Constables and other Officers, assist in searching disorderly Houses, &c. seizing Offenders, giving Information, &c.

There are several other Societies of this kind at Bristol, Canterbury, Nottingham, &c.

The SOCIETY for propagating the Gospel in foreign Parts, was instituted by King William, in 1701, for securing a Maintenance for an Orthodox Clergy, and making other Provisions for the Propagation of the Gospel in the Plantations, Colonies, Factories, &c. — To that end, He incorporated the Archbishops, several Bishops, and other of the Nobility, Gentry and Clergy, to the number of 90, into a Body, with Privilege to purchase Two thousand Pounds a Year, Inheritance and Estates for Lives or Years, with other Goods, to any Value. They meet yearly on the third Friday in February, to chuse a President, Vice-President and other Officers; and the third Friday in every Month to transact Business, depute fit Persons to take Subscriptions for the said Uses; and of all Monies so received, to give account to the Lord Chancellor, &c. They have a standing Committee at the Chapter-house, to prepare Matters for the monthly Meeting, which is held at St. Martin's Library.

The SOCIETY for Propagating Christian Knowledge, was begun in 1699 by some Persons of Worth, &c. Its original Design was to propagate Religion in the Plantations, to secure the pious Education of the Poor at Home, and to reclaim those that err in the Fundamentals of Christianity.

In the Year 1701, they had procured considerable Charities, and had transmitted the same to the Plantations, in Libraries, Bibles, Catechisms, &c. with a voluntary Maintenance for several Ministers, to be employ'd in the Plantations. But the Society for Propagating the Gospel in foreign Parts, being then instituted, they were incorporated, by Charter, into the same; and thus discharged, as a particular Society, from the further Pursuit of that Branch of their original Design: Whereupon they wholly turned themselves to the other; and are now very considerable, by great Accrissions from among the Clergy and Laity.

They meet weekly, to concert Measures for raising Charity for Education of poor Children, and setting up Schools for that Purpose; as also for the more regular Disposal of pious Books and Catechisms; for Instruction of the Ignorant, Erroneous, &c. By the Assistance of Members of other religious Societies, they have procured Subscriptions for the Education of above Three thousand Children, who are placed out in Schools about London, and taught Reading, Writing, Psalmody, &c. They have dispersed great Numbers of good Books among the Poor, in the Fleet, Army, &c. and have procured several to be translated into Welsh and other foreign Languages, and dispers'd accordingly. See CHARITY Schools.

Of the third Kind, are divers religious Societies, properly thus called; and their set on foot in London about the Year 1678, by a few young Men, who agreed to meet weekly, for Prayer, Psalmody and spiritual Conference. They are now increased to Forty distinct Bodies, who have set up public Prayers in many Churches where it was not, procured frequent Administrations of the Sacrament; and maintain Lectures on that Subject, in one Church or another almost on every Sunday-evening.

ROYAL SOCIETY. See ROYAL SOCIETY.

SOCIINIANS, a late Sect of Antitrinitarians, who, in these Ages, have revived some of the Errors of Paulus Samosatensis, Photinus and Arius; whence they are also occasionally call'd Arians, Photinians, &c. tho' in many respects different from any of them, See ARIAN, PHOTINIAN, &c.

Sanctus Socius, a Gentleman of Seana, whence they take their Name, was not the first Author of the Sect; for he says himself, in his Letter to Martin Valart, wrote in 1548, that he advances no Dogma but what had been published by others before him, even in Poland, e'er he came to settle there. The Truth is, he may be rather said to have refined, by his Subtilties, on the Notions that already prevailed there in his Time, than to have invented a new System.

In his Life, wrote by a Polish Knight, we read, that he had not applied himself to the Study of Theology and Divinity, nor had studied any thing but Logic; till 35 Years of Age; but had spent the greatest part of his Life at the Court of the Great Duke of Tuscany. Upon his retiring thence, he began to rethink of Religion; and, prepossessed as he was with the Writings of his Uncle Lactus Socius, he form'd a System thereon. Lactus had explained the first Words in the Gospel

of S. John, *In principio erat Verbo*; by these, *In principio Evangelii erat Verbo*; as if the Beginning, there spoke of, were only the beginning of the Gospel.

This Interpretation, never heard of in all Antiquity, is followed by Erasmus, in his Comment on the Fourteen first Verses of that Gospel. He adds, that he who is called *Verbo*, had not been from all Eternity, nor even before the Creation of the World; but that by *Verbo*, must be meant the Man Jesus Christ, God born of the Virgin, under the Emperor Augustus. But this is a Paradox, which all his Followers do not equally come into. However, they all deny, not only the Divinity of Jesus Christ, but the Existence of the Holy Ghost, the Mystery of the Incarnation, Original Sin, and Grace.

Their Sentiments are explain'd at length, in their Catechism printed several Times, under the Title of *Catechismus Ecclesiarum Polonicorum unum Deum Patrem illiusque filium Unigenitum, una cum Sancto Spiritu ex sacra scriptura confitentium*. Still, they are divided on several Articles. Some of them leave Socius, as to what regards the Worship offered to Jesus Christ; not being able to conceive how divine Worship should be given a mere Man.

The Heresy of the Socius spread exceedingly in Poland, Lithuania, Transylvania, and the neighbouring Places. Racov was their chief School; and there all their first Books were published. But they were exterminated out of Poland in 1655; since which time they have chiefly shelter'd in Holland; where, however, their public Meetings have been prohibited: But they find means to conceal themselves under the Name of Arminians and Anabaptists. See UNITARIAN.

SOCLE or ZOCLE, in Architecture, a flat, square Member under the Bases of Pedestals, of Statues, Vases, &c. which it serves as a Foot, or Stand. See PEDestal, STATUE, &c.

The Word is French, form'd from the Italian *Zoccolo*, or the Latin *Soccus*, the Shoe of the ancient Actors. *Vitruvius* calls it *Quadrans*.

A continued SOCLE, is a kind of continued Stand, or Pedestal, without either Base, or Cornice ranging round the whole Building; called by *Vitruvius*, *Stereobata*, and the French, *Soubassement*. See STEREOBATA.

SOCOME, in our Law-Books, &c. a Custom of grinding at the Lord's Mill. There is *Bond Socome*, where the Tenants are bound to it, and *Loose Socome*, where they do it freely, out of Love to the Lord.

SOCRATIC Philosophy, the Doctrines and Opinions, with regard to Morality and Religion, maintained, and taught by *Socrates*. See PHILOSOPHY.

By the Character of *Socrates*, left us by the Ancients, particularly his Scholar *Plato*, *Laertius*, &c. He appears to have been one of the best, and the wisest Persons in all the Heathen World.

To him is ascribed the first introducing of Moral Philosophy; which is what is meant by that popular Saying, *Socrates seipso called Philosophy down from Heaven to Earth*; that is, from the Contemplation of the Heavens and heavenly Bodies, he led Men to consider themselves, their own Passions, Opinions, Faculties, Duties, Actions, &c.

While young, he was exceedingly fond of natural Knowledge, as he witness'd of himself in *Plato*: But in his older Age, he cast aside this part of Philosophy as obscure, uncertain, impracticable, and even useless and impertinent; and applied himself wholly to moral or active Philosophy.

'Twas he, first, who when all the other Philosophers boasted they knew all Things, own'd, ingenuously, he knew nothing; but this, that he knew nothing. Which *Pyrrho*, the Father of the *Sceptic Philosophy*, improv'd on, when he said he knew nothing; not even this, that he knew nothing. Yet in an Answer of the Oracle, it was pronounced; *Ανδρῶν ἀνθρώπων Ζακνάρως σφιστάτω*. That *Socrates* was the Wisest of all Men. See PYRRHONIAN.

He was accused by *Anaxus*, *Melitus* and *Lycon*, three Persons, whose Hatred he had incurred, by his severe Declarations against the Poets, of which Number two of the first were, and the Third an Actor. His Accusation was, That he corrupted the Athenian Youth, and broached new Superstitions. He was condemn'd to drink Cicuta, by 282 Votes, as we are told by *Quintilian*.

After his Death, his Fellow-citizens repented to that degree, that the *Gymnasiums*, Courts of Justice, &c. were all shut up; *Melitus* put to Death, *Anaxus* banish'd, and a Statue erected to *Socrates*. He wrote nothing himself; yet almost all the Sects of Philosophers refer their Origin to his Discipline; particularly the *Platonists*, *Peripateticks*, *Academicks*, *Cynickicks*, *Stoicks*, &c. But the greatest Part of his Philosophy, we have in the Works of *Plato*. See PLATONIC Philosophy; see also ACADEMIC, PERIPATETIC, STOIC, &c.

SODOMY, an unnatural Crime, thus call'd from the City of *Sodom*, which was destroy'd by Fire for the same. See BUOGERY.

The *Levitical* Laws adjudged those guilty of this execrable Evil to the Fire, *Lev. c. 18* and *20*. And the Civil Law assigns the same Punishment. Our Laws make it Felony.

**SOFIT**, in the *East*, is a kind of Alcove, raised half a Foot above the Floor of a Chamber or other Apartment, and citizens'd the Place of State, where Visitors of Distinction are received.

Among the *Turks*, the whole Floor of their State-Rooms is cover'd with a kind of Tapistry, and on the Window-side is raised a *Sofa* or *Sopha*, laid with a kind of Matrafs, cover'd with a Tapistry much richer than the other. On this Tapistry the *Turks* are seated, both Men and Women, like the *Taylor* in *England*, cross-legg'd, leaning against the Wall which is bolster'd with Velvet, Sattin or other Stuff suitable to the Season. Here they eat their Meals, only laying a Skin over the Tapistry, to serve as a Table-cloth, and a round wooden Board over all, cover'd with Plates, &c.

The Embassadors of *France* stood out a long while, and refused to visit the Grand Visier, unless he'd receive them on the *Sofa*: At length he granted them the *Sofa*.

**SOPFITO** or **SOFIT**, in Architecture, any Plafond or Ceiling, form'd of cross Beams, or flying Cornices, the square Compartments or Panels whereof are enrich'd with Sculptures, Painting, or Gilding. Such are those we see in the Basilics and Palaces of *Italy*, in the Apartments at *Luxembourg*, at *Paris*, &c. See **CEILING**.

The Word is *Italian*, and signifies the same with the *Latin*, *Lacunar* and *Laquear*; with this Difference, that *Lacunar* is used for any Ceiling, with square, hollow Panels, called *Lacus*; and *Laquear* for Compartments interlaced with Flat-bands, after the manner of Knots or *Laque*.

**SOPFITO** or **SOFIT**, is particularly used for the under Side or Face of an Architrave; and for that of the Corona or Larmier, which the Ancients called *Lacunar*, and we usually, *Plafond*. See **PLAFOND**.

It is enrich'd with Compartments of Roofs; and in the *Doric* Order has 18 Drops, disposed in three Ranks, Six in each, placed to the Right of the Gutter, at the Bottom of the Triglyphs. See **GUTTER**, **DORIC**, **ARCHITRAVE**, &c.

**SOLF**, &c. See **SOPFIT**.

**SOFTENING**, in Painting, the mixing and diluting of Colours with the Brush or Pencil.

They also say, *soften* Designs in Black and White, made with the Pen, &c. to weaken the Tint. To *soften* a Portrait, according to *Felbiten*, is to change some of the Strokes, and give a greater Degree of Sweetness and softness to the Air thereof, which before had something rough and harsh in it.

**SOIL**, in Agriculture, Gardening, &c. denotes Earth or Ground consider'd, with regard to the Quality of its Mould, for the Production and Growth of Vegetables. See **EARTH**, **MOULD**, **VEGETABLES**, &c.

*M. Bradley* reduces all Soils to three Heads, viz. *Sand*, *Loam* or *Mother-Earth*, and *Clay*. See **SAND**, **LOAM** and **CLAY**.

Gravels and all the open Soils, till we come at Loam, are of the *sandy* Race; and the binding Earths, from Loam down to the Stiffness of Chalk, may be ranged under the *Clay*-kind.

*Loam* or *Mother-Earth*, is the Medium between the Two, and includes all the intermediate Kinds.

Each of these Soils tends alike to Vegetation; and each has its Salts proper thereto; but in different Proportions: A Peck of Clay having twice as much Salts in it as the same Quantity of Loam; and four Times as much as Sand.

Now, 'tis found to be the Salts or Juices of the Soil, not the Earth itself, that Plants are fed and subsisted by. (For in many Experiments of Vegetation, where Plants of Fifteen or Twenty pound Weight have been produced, there has been no sensible Diminution in the Weight of the Earth.) See **VEGETATION**.

Hence, at first Sight, it might seem, that Clay were the most proper, and Sand the least proper Soil to promote the Growth of Plants; which is contrary to Experience. The Reason is, that the Parts of Clay being close wrought together, do not so easily give out their Salts; nor can the tender Fibres of many Plants make their Way through it, in search of their Food. But if its Parts be well open'd, by digging and breaking it into very small Pieces, and those Parts be kept open by a Mixture of some sharp Sand, or other like Matter, that Author adds, we shall see the Effects of its Vignar. Sand, on the other hand, giving its Salts readily, puts forth its Plants very early, and will make them germinate a full Month sooner than Clay; but as it is hasty, 'tis soon spent, The Sun's Warmth calls up all its Salts early in the Spring, and there is but little left for them to subsist long on, if the Heat continue.

Each Kind has its peculiar Plants, which will not grow on the other; but the peculiar Plants of both the other two will grow in Loam, as partaking equally of the Qualities of both. Loam, then, must be allowed the best and most bene-

ficial Soil, where it can be had: And where it cannot, if, by a Mixture of other Earths, we can make a Compost to resemble it; we have more to expect from it, especially in Plantations of durable Trees, than from a Composition of Dung or other forcing Ingredients, which, like Excess of high intemperate Foods and Liquors, though they give a hasty Growth, yet make the Thing short-lived. The Composition of Soil here meant, is equal Quantities of Sand and Clay well mix'd. See **TIME**; see also **HOT-BED**.

Generally, a Mixture of two or three Soils, is better than any simple Soil; especially where the Hot and Dry are mix'd with the Cold and Moist. Clay laid on Sand or Gravel, or Sand on Clay, is the best Mixture. See **MIXTURE**.

But 'tis not the Nature of the Soil alone; but its Depth is also to be regarded, and what Soil is underneath. For the best Soil, if it be not above a Foot deep, and lie on a stiff Clay, or hard cold Stone, is not so fertile as a leaner Soil of greater Depth, or lying on a warm Lime-stone, Sand or Gravel, through which the superfluous Moisture may descend, and not stagnate on the Clay or Stone, to chill the Roots of Plants.

Indeed, regard is to be had to the Climate; for even in *England*, cold, moist Clays are more fruitful in the South than the North.

Some general Rules with respect to Soils, are as follow. 1<sup>o</sup> All Land that moulders to Dust with Frost, with all sorts of warm Lands, black Mould, yellow Clay, (if not too wet) and that turns black after Rain, are good for Corn. 2<sup>o</sup> Lands bringing forth large Trees and Weeds, black-Thorn, Thistles, ring Grass, &c. generally prove fruitful. 3<sup>o</sup> Straw-berries, Betony, Thyme, &c. give Indication to Wood, and Camomile to a Mould disposed for Corn. 4<sup>o</sup> All Land that binds after Frost and Rain, that turns white and full of Worms, that is extremely moist, bears Holly, Yew, Box, Broom, Heath, Moss, &c. is of a cold Temperature. 5<sup>o</sup> Black, Dun and Yellow Sand, and hot, stony Gravel, are generally unfruitful. See **GARDEN**, **ORCHARD**, **BILL**, **PARLIAMENT**, &c.

**SOIT** fait comme il est desire. Be it done as 'tis desired; a Form used when the King gives the Royal Assent to a private Bill prefer'd in Parliament.

**SOKA**, *Soka*, *Soc*, in ancient Customs, the Privilege of Tenants excused from customary Impositions. See **SOC**.

It also denotes the Territory wherein the chief Lord exercised his Liberty of keeping Courts within his own Domains.

Also a Quit-Rent, or Payment made to the Lord by his Tenant, for acting in Quality of a *Soc-man* or Freeholder. See **SOCAGE**.

The Rent-gatherer in the *Soks*, was called *Soke Reeve*.

**SOL**, in Music, the Fifth Note of the Gamut: Ut, Re, Mi, Fa, Sol. See **NOTE** and **GAMUT**; see also **MUSIC**.

**SOL** or **SOL**, Shilling, a French Coin, of Billon, i. e. Copper with a little Silver mix'd; equal to Twelve Deniers or Pence; and the 20th Part of the Livre or Pound. See **SHILLING**; see also **DENIER** and **LIVRE**.

The French Sol is rated at one Tenth Part less than the English Penny. See **COIN**, **PENNY**, &c.

The Word is form'd from the *Latin Solis*, Shilling. *Bodin* is mistaken, when he derives it a *Sole*, by reason of the Sun struck on it.

The Sol was first struck on the Foot of 12 Deniers Tournois, whence it was also called *Douvain*, a Name it still retains, tho' its ancient Value be changed; the Sol having been since augmented by Three Deniers, and struck with a Funchon of a *Floret de Lys*, to make it Current for 15 Deniers. Soon after, the old Sol was coin'd over again, and both Old and New indifferently Current for 15 Deniers. In 1709, the Value of the same Sol was raised to 18 Deniers. Towards the latter End of the Reign of *Louis* the Fourteenth, the Sol of 18 Deniers were again lowered to 15, where they now stand.

The Dutch have also two Kinds of Sol: The one of Silver, called *Sols de gros*, and likewise *Schelling*. See **SCHELLING**. The other of Copper, called also *Stuyver*. See **STUYVER**.

In old Authors we read of Gold Sols, which were different at different Times. In the Time of the *Salic* Law, the Sol was Forty Deniers; and thus it continued till the Time of King *Peppin*, when it was reduced to Twelve. Some have imagined, that the French had anciently Silver Sol.

**SOL**, in Astrology, &c. signifies the Sun. Sol in Aries, &c. See **SUN**.

**SOL**, in the Hermetical Philosophy signifies Sulphur. See **SULPHUR**.

**SOL**, *Son*, in Chymistry, is Gold; thus called from an Opinion, that this Metal is, in a particular Manner, under the Influence of that Luminary. See **GOLD**.

What should have been the principal Inducement of torturing this Metal, with so much Violence to obtain from it some medicinal Virtues, *Dr. Quincy* observes, is not easy to be guess'd; unless it was to keep up the Authority of an ill-deserved Regard, and a Jealousy, that they could not be well

well in the common Opinion for Physicians, who could not do extraordinary Things in their Profession with a Metal, which had such a prodigious Influence on other Accounts. Many, indeed, there have been, who have honestly oppos'd this Artifice; but the contrary Sides have a long Time prevailed, and to such a Degree, that this Metal itself has not only been transformed into all the Shapes imaginable for medicinal Purposes; but even its Name has been transferr'd to do Honour to, and enhance the Price of many other worth-les Preparations, that bore any Resemblance to its sensible Qualities.

Hence many Tinctures of a yellow Colour, are presently the *Golden Tincture* of something or other.

Most, indeed, acknowledge, that Gold in Substance, or reduced into the smallest Particles by the Hammer, as in the Leaf-Gold, is not digestible in the Stomach, so as to be transmitted into the Blood, and be of any Efficacy there. But there are, nevertheless, many, who are confident of its doing extraordinary Matters, if reduced into a Powder, by Amalgamation with Mercury, and by evaporating the Mercury afterwards.

*Zacutus Lusitanus*, is one of the smartest Pleaders on this side the Controversy, against *Musa*, *Picus Mirandola* and *Platerus*; who, besides many Instances of its Efficacy, urges the Authority of *Avicenna*, *Serapion*, *Geber* and many of the *Arabian* Physicians, with those of other Countries, and of later Date. *Quercetan*, *Schroter*, *Zwelfer* and *Ermuller*, with many other more modern, practical Physicians, fell into the same Opinion. But which side soever is in the right, the present Practice rejects all Pretensions to Medicine from it.

**SOL**, in Heraldry, the Gold Colour in the Arms of Sovereign Princes. See METAL.

**SOLAR**, something belonging to the Sun. See SUN.

Thus we say, **SOLAR Fire**, in contradistinction to *Culinary Fire*. See FIRE.

The **SOLAR Year**, which consists of 365 Days, 5 Hours, 49 Minutes; in Opposition to the *Lunar Year*, which only consists of 354 Days. See YEAR.

The **Solar Year**, is either *Tropical*, or *Siderial*.

*Tropical Year*, is that Space of Time, wherein the Sun returns again to the same equinoctial or solstitial Point; which is always equal to 365 Days, 5 Hours, and about 49 Minutes. The *Siderial Year*, is the Space wherein the Sun comes back to any particular, fixed Star; which is about 365 Days, 8 Hours, and 9 Minutes. See SIDERIAL, &c.

**SOLAR System**, the Order and Disposition of the several heavenly Bodies, which revolve round the Sun as the Centre of their Motion, viz. the *Planets*, Primary and Secondary, and the *Comets*. For a Scheme of the Solar System, see SYSTEM.

**SOLAR Eclipse**, is a Privation of the Light of the Sun, by the Interposition of the opaque Body of the Moon. See ECLIPSE.

SOLAR Spot,	} Sec	{	SPOTS.
SOLAR Cycle,			CYCLES.
SOLAR Month,			MONTHS.

**SOLDER**, popularly called *Solder*, a metallic or mineral Composition, used in *Soldering* or joining together other Metals.

*Solders* are made of Gold, Silver, Copper, Tin, Glass of Tin, and Lead; always observing, that in the Composition, there be some of the Metal to be *Solder'd*, mix'd with some higher and finer Metals.

Goldsmiths make four Kinds of *Solder*, viz. *Solder* of Eight; where, to seven Parts of Silver there is one of Brass or Copper. *Solder* of Six, where only a sixth Part is Copper. *Solder* of Four; and *Solder* of Three. 'Tis the Mixture of Copper in the *Solder* that makes raised Plate always come cheaper than flat.

The *Solder* used by Plumbers, is made of two Pounds of Lead to one of Tin. Its Goodness is tried by melting it, and pouring the biggest of a Crown-piece on a Table; for, if good, there will arise little, bright, shining Stars therein. See PLUMBERY.

The *Solder* for Copper is made like that of the Plumbers; only, with Copper and Tin: For very nice Works, instead of Tin, they sometimes use a Quantity of Silver. See COPPER.

*Solder* for Tin, is made of two Thirds of Tin, and one of Lead; but where the Work is any thing delicate, as in Organ-pipes, where the Juncture is scarce discernible, 'tis made of one Part of Tin of Glass, and three Parts of Pewter. See TIN.

The Duke of *Florence's* Nail, anciently so much admired, as being half Iron and half Gold, when as those Two Metals were deem'd irreconcilable; was join'd by a kind of *Solder*, made by *Timmer*, an ingenious Chymist of *Venice*: The Secret whereof, was never discover'd till publish'd by *Timmer*. The *Solder* is nothing but a little Copper or Cyprus Vitriol put between the Gold and the Iron. For, naturally, the great Acidity of the Gold, reduces the Iron into a Scoria

or Ruff, when the Two are applied immediately over one another; but this Difficulty is removed, by the Interposition of a little Copper, be it in the smallest Quantity imaginable.

The Word is form'd from the *Latin*, *Soldare*, to strengthen.

**SOLDERING**, or *Soldering*, among Mechanicks, the joining and fastening together of two Pieces of the same Metal, or of two different Metals, by the Fusion and Application of some metallic Composition on the Extremities of the Metals to be join'd. See SOLDER.

Goldsmiths *Solder* with Gold, Silver and Copper mix'd together: Plumbers with Lead and Tin. See PLUMBERY, &c.

Copper is usually *Solder'd* with Tin; sometimes, according to the Work, with a Mixture of Copper and Silver. In the *Soldering* of all these Metals, they generally use Borax in Powder, and sometimes Rosin. As to Iron, 'tis sufficient that it be heated red-hot; and the two Extremities, in this State, hammer'd together. By this means they become incorporated together. See BRAZING.

**SOLDIER**, a military Man, serving a Prince in War, in Consideration of a certain *Soldo* or daily Pay. See MILITARY.

The *Soldier* is he who takes Pay; the *Vassal* he who serves at his own Expences. See VASSAL and SERVICE.

*Du Cange* observes, that the ancient *Soldiers* were not to be short of Five Foot and a Half; and that this Measure was called *locama*.

The Word is form'd from the *Italian*, *Soldato* of the *Latin* *Soldus* or *Soldius*, the *Soldo* or Pay. *Pasquier* derives it from the old *Gaulish* *Soal* doyer. And *Nicod* from *Solarius*. See SOLDURII.

**SOLDURII**, in Antiquity, a kind of Clients or Retainers to the great Men in *Gaul*, particularly *Aquitania*; mentioned by *Cæsar*.

The *Soldarii* were People, who shared all the good and all the ill Fortune of their Patrons; To whom, if any Disaster happened, they either underwent the very same, or kill'd themselves; and *Cæsar* assures us, that no one had ever been known to refuse the Alternative, *Lib. III. de Bel. Gal. Vigenetius* takes them to have been more than common Soldiers, and even Gentlemen in Pension, or Appointment. *Athenicus* calls them *Zovavovivovvovv*, *q. d.* who die with their Masters.

**SOLECISM**, or *Solecism*, in Grammar, a gross Impropriety in Speech, contrary to the Use of the Language, and the Rules of Grammar, either in respect of Declension, Conjugation or Syntax.

An Actor on the *Roman* Theatre having made a wrong Gesture; the Audience immediately crying out he had committed a *Solecism* with his Hand. Ablanc.

**SOLECISMS**, on some Occasions, are pardonable. *Impetratum est a ratione et peccare sine vitæ causa liceret. Vaugelas* is frequently repeating that of *Quintillius*: *Alind of Latinus, aliud Grammatici loqui. Baltasar Stalberg* has a *Latin* Treatise of the *Solecisms* and Barbarisms falsely attributed to the *New Testament*. See BARBARISM.

The Word is Greek, *σολεκισμὸς*, derived from the *Soli*, a People of *Attica*, who being transplanted to *Gilicia*, lost the Purity of their ancient Tongue, and became ridiculous to the *Athenians* for their Improprieties therein.

**SOLEMN**, something perform'd with much Pomp, Ceremony and Expense.

Thus we say, *Solemn Feasts*, *Solemn Funerals*, *Solemn Games*, &c. See FEAST, GAME, &c.

**SOLEMN**, in Law, signifies something Authentic, or that is cloth'd in all its Formalities. A *Solemn Testament*, in the Civil Law, is to be attested by seven Persons, and seal'd with their Seals.

A *Solemn Marriage*, is that perform'd in one's own Parish Church, after Publication of the Banns, and in Presence of Witnesses.

*SOLE and Debet*. See DEBET and Soler.

**SOLE-TENANT**, in Law, is he or she, who holds only in his or her own Right, without any other Person join'd. See TENANT.

*E. gr.* If a Man and his Wife hold Land for their Lives, the Remainder to their Son; Here, the Man dying, the Lord shall not have Heriot, because he dies not *Sole Tenant*.

**SOLEUS**, in Anatomy, a Muscle call'd also *Gastrocnemius Internus*. See GASTROCNEMIUS.

**SOL-FA-ING**, in Music, the naming and pronouncing of the several Notes of a Song, by the Syllables *Sol, Fa, La, &c.* in learning to sing it. See NOTE.

Of the Seven Notes in the Scale, *ut, re, mi, fa, sol, la, si*; only Four are in Use among us, viz. *fa, sol, la, mi*. Their Office is principally in Singing: that by applying them to every Note of the Scale, it may not only be pronounced more easily; but chiefly, that by them, the Tones and Semi-tones of the natural Scale, may be better mark'd out and distinguish'd.

This Design is obtained by the Four Syllables, *fa, sol, la, mi*; thus, from *fa* to *sol* is a Tone; also from *sol* to *la*, and from *la* to *mi*, without distinguishing the greater or lesser Tone; but from *la* to *fa*, also from *mi* to *fa*, is a Semi-tone.

If, then, these be applied in this Order, *fa, sol, la, fa, sol, la, mi, fa, &c.* They express the Natural Series from *e* 3 and if that be to be repeated to a Second or Third Octave, we see by them how to express all the different Orders of Tones and Semi-tones in the Diatonic Scale; and fill above *mi*, will stand *fa, sol, la*; and below it, the same reversed, *la, sol, fa*; and one *mi* is always distant from another by an Octave; which cannot be said of any of the rest because after *mi* ascending, comes always *fa, sol, la, fa*, which are repeated invertedly, descending.

To conceive the Use of this: it is to be remember'd, that the first Thing in teaching to sing, is to make one raise a Scale of Notes by Tones and Semi-tones to an Octave, and descend again by the same Notes, and then to rise and fall by greater Intervals, at a Leap, as a Third, Fourth and Fifth, &c. And to do all this, by beginning at Notes of different Pitch. Then, these Notes are represented by Lines and Spaces, to which those Syllables are applied, and the Learner taught to name each Line and Space, by its respective Syllable; which makes what we call *Sol-fa-ing*: The Use whereof is, that while they are learning to tune the Degrees and Intervals of Sound, express'd by Notes fit on Lines and Spaces; or learning a Song, to which no Words are applied; they may do it the better, by means of an articulate Sound: but, chiefly, that by knowing the Degrees and Intervals express'd by these Syllables, they may more readily know the true Distance of Notes. See SINGING.

Mr. *Masenius* observes, that the Practice of *Sol-fa-ing*, common as it is, is very useless and insignificant, either as to the Understanding or Practising of Music; yet exceedingly perplexing: The various Application of the several Names, according to the various Signatures of the Clef, are enough to perplex any Learner; There being no less than 72 various Ways of applying the Names *sol, fa, &c.* to the Lines and Spaces of a particular System. See SCALE.

SOLID, in Physics, a Body whose minute Parts are connected together, so, as not to give Way, or slip from each other upon the smallest Impression. See SOLIDITY.

The Word is used in this Sense, in Contradistinction to Fluid. See FLUID and FIRMNESS.

For the Laws of Gravitation of Solids immersed in Fluids Specifically lighter than the Solids - - - } See GRAVITY.

The Laws of Gravitation of Solids immersed in Fluids Specifically heavier - - - }

To find the Specific Gravity of Solids - - - } See SPECIFIC GRAVITY.  
To find the Ratio of the Specific Gravity of Solids to Fluids. }

The Laws of the Resistance of Solids moving in Fluids - - - } See RESISTANCE.  
SOLID of the least Resistance - - }

SOLID, in Geometry, is a Magnitude indued with Three Dimensions; or extended in Length, Breadth and Depth. See DIMENSION.

Hence, as all Bodies have these Three Dimensions, and nothing but Bodies; *Solid* and *Body* are frequently used indifferently. See BODY.

A *Solid* is terminated, or contained under one or more Planes or Surfaces; as a Surface is under one or more Lines. See SURFACE and LINE.

From the Circumstances of the terminating Lines, *Solids* become divided into Regular and Irregular.

Regular SOLIDS, are those terminated by regular and equal Planes. See REGULAR.

Under this Class come the *Tetrahedron, Hexaedron* or *Cube, Octaedron, Dodecaedron* and *Kestredron*. See TETRAEDRON, CUBE, &c. each under its proper Article.

Irregular SOLIDS, are all such as do not come under the Definition of Regular Solids; such are the *Sphere, Cylinder, Cone, Parallelogram, Prism, Pyramid, Parallelepiped, &c.* See SPHERE, CYLINDER, CONE, &c. each under its proper Article.

The Genes, Properties, Ratio's, Contractions, Dimensions, &c. of the several Solids, Regular and Irregular, Spherical, Elliptical, Conical, &c. See under each respective Heads.

*Cubature* or *Cubing* of a SOLID, is the measuring of the Space comprehended under a *Solid*, i. e. the *Solidity* or *Solid Content* thereof. See SOLIDITY.

*Solid Angle*, is that form'd by three or more plain Angles meeting in a Point: Or, more strictly, a *Solid Angle*, as B, (Tab. Geometry, Fig. 10.) is the Inclination of more than two Lines, A B, B C, B F, which concur in the same Point B, and are in the different Planes.

Hence, for *Solid Angles* to be equal, 'tis necessary they be

contained under an equal Number, of equal Planes, disposed in the same manner.

And as *Solid Angles* are only distinguishable by the Planes under which they are contained; and as Planes that equal, are only distinguishable by Comprehension, they are Similar; and consequently Similar *Solid Angles*, are equal, & vice versa. See SIMILAR.

The Sum of all the Plane Angles constituting a *Solid Angle*, is always less than 360°; otherwise they would constitute the Plane of a Circle, and not a *Solid*. See ANGLE.

For the Method of *Cubing* the several Kinds of Solids; See CUBATURE.

SOLID Bastion } See BASTION.  
SOLID Place } See LOECUS.

SOLID Numbers, are those which arise from the Multiplication of a Plain Number, by any other whatsoever. Thus 18 is a *Solid Number*, made of 6 (which is Plain) multiplied by 3; or of 9 multiplied by 2. See NUMBER.

SOLID Problems, in Mathematicks, is one which cannot be Geometrically solved, but by the Interfection of a Circle, and a Conic Section; or by the Interfection of two other Conic Sections, besides the Circle.

Thus, to describe an Isosceles Triangle on a given Right Line, whose Angle at the Base, shall be triple to that at the Vertex, is a *Solid Problem*. See PROBLEM.

SOLIDITY, in Physics, a Property of Matter or Body, whereby it excludes every other Body from the Place itself possess'd.

*Solidity* is a Property common to all Bodies, whether Solid or Fluid. See BODY.

The Idea of *Solidity*, Mr. *Lock* observes, arises from the Resistance we find one Body make to the Entrance of another into its own Place. 'Tis usually call'd *Impenetrability*; but *Solidity* expresses it best; as carrying somewhat more of positive with it than the other, which is negative.

*Solidity*, he adds, seems the most extensive Property of Body; as being that whereby we conceive it to fill Space: 'Tis distinguish'd from meer Space, by this latter not being capable of Resistance or Motion. See SPACE.

'Tis distinguish'd from *Hardness*, which is only a firm Cohesion of the Solid Parts, so as they may not easily change their Situation. See HARDNESS.

The Difficulty of changing Situation, gives no more *Solidity* to the hardest Body than the softest; nor is a Diamond a lot more *Solid* than Water. By this we distinguish the Idea of the Extension of Body, from that of the Extension of Space: That of Body, is the Continuity or Cohesion of solid, separable, moveable Parts; that of Space, the Continuity of unsolid, inseparable, immovable Parts. See EXTENSION.

The *Corrections*, however, will, by all means, deduce *Solidity*, or, as they call it, *Impenetrability*, from the Nature of Extension; and contend, that the Idea of the former, is contain'd in that of the latter; and hence argue against a *Vacuum*. Thus, say they, one Cubic Foot of Extension cannot be added to another, without having two Cubic Feet of Extension; for each has in itself, all that is required to constitute that Magnitude. And hence they conclude, that every Part of Space is Solid, or Impenetrable; inasmuch as of its own Nature it excludes all others. But the Conclusion is false, and the Instance they give follows from this, that the Parts of Space are immovable; not that they are Impenetrable or Solid. See IMPENETRABILITY.

*Solidity*, in Geometry, the QUANTITY of Space contain'd in a Solid Body; call'd also the *Solid Content*, and the *Cube* thereof. See CUBATURE.

The *Solidity* of a Cube, Prism, Cylinder, or Parallelepiped, is had by multiplying its Basis into its Height. See CUBE, PRISM, CYLINDER, &c.

The *Solidity* of a Pyramid or Cone, is had by multiplying either the whole Base into a Third Part of the Height; or the whole Height into a third Part of the Base. See PYRAMID and CONE.

To find the SOLIDITY of any Irregular Body.

Put the Body in a hollow Parallelepiped, and pour Water or Sand upon it, and Note the Height of the Water or Sand A B (Tab. Geometry, Fig. 32.) then, taking out the Body, observe at what Height the Water (or Sand when level'd) stands, as A C. Subtract A C from A B; the Remainder will be B C. Thus is the irregular Body reduced to a Parallelepiped, whose Base is F C G F; and Altitude B C. To find the *Solidity* whereof, see PARALLELEPIPED.

Suppose, *E. gr.* A B 8, A C 5; then will B C be 3; Suppose, again, D B 12, D E 4; then will the *Solidity* of the irregular Body be found 144.

If the Body be such, as that it can't be well laid in such a kind of Channel; *E. gr.* if it be required to measure the *Solidity*

*Solidity* of a Statue, as it stands; is a quadrangular Prism or Parallelepiped is to be framed over it: the rest as before.

To find the *SOLIDITY* of a hollow Body.

If the Body be not comprized in the Number of regular Bodies; its *Solidity* is found as in the preceding Problem, If it be a Parallelepiped, Prism, Cylinder, Sphere, Pyramid or Cone; the *Solidity*, first of the whole Body, including the Cavity, then that of the Cavity, which is supposed to have the same Figure with the Body itself, is to be found, according to the respective Methods delivered under PARALLELEPIPED, PRISM, &c. For the latter being subtracted out of the former, the Remainder is the *Solidity* of the hollow Body required.

*SOLIDITY*, in Architecture, is applied both to the Consistence of the Ground whereon the Foundation of a Building is laid; and to a Massive of Masonry, of extraordinary Thickness, without any Cavity within.

The *Solidity* of the Egyptian Pyramids is inconceivable. See PYRAMID.

*SOLIDS*, in Anatomy, &c. all the continuous and contiguous Parts of the Body are thus call'd, in Opposition to the Fluids or the Parts contained therein. See BONY.

Of the *Solid* kind, are the Bones, Cartilages, Ligaments, Membranes, Fibres, Muscles, Tendons, Arteries, Veins, Nerves, Glands, Lymphducts and Lacrals. See BONE, CARTILAGE, LIGAMENT, &c. under their respective Articles.

Notwithstanding the great Number and Appearance of the *Solids* of the Body; we find from the Microscope, Injections, Vesicatories, Atrophies, &c. that the *Solid* Parts are exceedingly small and inconsiderable, in comparison of the Fluids. Nay, 'tis almost demoustrable, from a Consideration of the Rise and Generation of the Vessels, and the Resolution of the greatest Vessels into their smallest constituent ones, that the whole Mass of *Solids* in the Body, consists merely of Fibres, as their common Elements. See FIBRE.

In effect, the whole Mass of *Solids*, as well as Fluids, a minute Stamen or Animalcule, only excepted, arose from a very subtle fluid Conliquament, not unlike the Nervous Juice; as is shewn by *Malpighi*, in his Treatise de Ovo Incubato. See EGG.

The White of the Egg never nourishes, till, from its natural Thickness, it have been brought, by locution, through innumerable Degrees of Fluidity, to become subtle enough to enter the minute Vesicles of the Stamen or Seed. The first, soft, tender *Solids* arising from this subtle Humor pass through infinite, intermediate Degrees, e'er they arrive at their utmost *Solidity*. See GENERATION.

All the *Solids* therefore in our Bodies (unless any one will be so nice as to except the first Stamen) only differ from the Fluids, out of which they arise, by their Rest, Cohesion and Figure; and a fluid Particle will become fit to form a Part of a *Solid*, as soon as there is a Force sufficient to effect its Cohesion with the other *Solid* Parts. See NUTRITION.

*SOLILOQUY*, a Reasoning or Discourse, which a Man holds with himself. See MONOLOGUE.

*Pepias* says, that *Soliloquy* is properly a Discourse by Way of Answer, to a Question that a Man has proposed to himself.

*Soliloquies* are become mighty common Things on the modern Stage; yet can nothing be more artificial or more unnatural, than an Actor's making long Speeches to himself, to convey his Intentions, &c. to the Audience.

Where such Discoveries are to be made, the Poet should rather take Care to give the Dramatic Persons such Confidants, as may necessarily share their inmost Thoughts; By which means, they will be more naturally convey'd to the Audience. Yet is even this a Shift, an accurate Poet would not be found to have Occasion for. The Use and Abuse of *Soliloquies*, is well delivered by the Duke of Buckingham, in the following Lines:

*Soliloquies had need be very few,  
Extremely short, and spake in Passion too.  
Our Lovers talking to themselves, for words  
Of others, make the Pit their Confidant;  
Nor is the Matter nam'd yet, if thus  
They trust a Friend, only to tell it us.*—

*SOLITARY*, something retired, or in private; remote from the Company, or Commerce of others of the same Species.

A *Solitary COLUMN*, is a Column that stands alone in any public Place, as the Trojan Column. See COLUMN.

A *Solitary WORM*, is a Worm sometimes found in the Intestines, and which is always the only one of the Kind; as being placed in the Pylorus, and extending thence, the whole Length of the Intestines; so that there is no Room for another. See WORM.

*SOLITARIUS*, is also the Title of the Nuns of S. Peter of Alcantara, instituted in 1676, by Cardinal Barberin, when Abbot of Notre Dame de Paris, in that City.

They propose to imitate the severe, penitent Life of St. Peter of Alcantara; keep a continual Silence, never open their Mouths to any Body but themselves; employ their Time wholly in spiritual Exercises, and leave the Temporal Concerns to a Number of Maids, who have a particular Superior in a separate Part of the Monastery. They always go Bare-footed, without Sandals, gird themselves with a thick Cord, and wear no Linnen.

*SOLITARIA*, in Antiquity. See SUOVERTURILLA.  
*SOLLICITOR*, a Person employ'd to follow, and take care of Suits depending in Courts of Law, or Equity; formerly allowed only to Nobility, whose menial Servants they were; but now frequently used to others, to the great Increase of Champarty and Maintenance. See ATTORNEY.  
*SOLLECITOR General*, hath his Office by Patent, during the King's Pleasure.

The Attorney General, and he, had anciently a Right to their Writs of Summons, to sit in the Lords House on special Occasions, till the 13th Car. II. since which, they have almost constantly been chosen Members of the House of Commons. He has the Care and Concern of managing the King's Affairs, and hath Fees for Pleading, besides other Fees arising by Patents, &c. He hath his Attendance on the Privy Council; and the Attorney General, and he, were anciently reckon'd among the Officers of the Exchequer: They have Audience, and come within the Bar in all other Courts.

*SOLSTICE*, in Astronomy, the Time when the Sun is in one of the *Solstitial Points*, that is, when he is at his greatest Distance from the Equator; which is 23 Degrees and a Half; thus called, because he then appears to stand still, and not to change his Place in the Degrees of the Zodiac, any Way: An Appearance owing to the Obliquity of our Sphere, and which those who live under the Equator are Strangers to. See SOLSTICIAL POINTS.

The *Solstices* are Two, in each Year; the *Equinox* or *Summer Solstice*, and the *Hymnal* or *Winter Solstice*.

The *Summer Solstice*, is when the Sun is in the Tropic of Cancer, which is on the 21th of June; when he makes the longest Day. See TROPIC and DAY.

The *Winter Solstice*, is when he enters the first Degree of Capricorn; which is on the 21th of December; when he begins to return towards us, and makes the shortest Day.

This is to be understood, as in our Northern Hemisphere; for in the Southern, the Sun's Entrance into Capricorn, makes the *Summer Solstice*, and that into Cancer, the *Winter Solstice*. See ECLIPTIC, SUMMER, WINTER, &c.

*SOLSTICIAL Points*, are those Points of the Ecliptic, wherein the Sun's Ascent above the Ecliptic, and his Descent below it, are terminated. See POINT.

The first Point, which is in the beginning of the first Degree of Cancer, is called the *Equinox* or *Summer Point*; and the latter, which is in the beginning of the first Point of Capricorn, the *Winter Point*. See SOLSTICE.

The *Solstitial Points* are Diametrically opposite to each other.

*SOLSTICIAL Colours*, is that passing through the *Solstitial Points*. See COLOUR.

*SOLUBLE*, in Medicine, Loose, or apt to go to Stool. See LAXATIVE, STOOL, &c.

*Soluble Tartar*, is a kind of Salt, chymically prepared, by boiling Eight Ounces of Cream of Tartar, with Four of Fixed Salt of Tartar. See TARTAR.

*SOLVENT*, the same with Dissolvent. See DISSOLVENT.

*SOLUTIO Continui*, or *Solutio of Continuity*, a Term used by Physicians, &c. to express a Disease common to the solid Parts of the Body, wherein their natural Cohesion is separated.

If this happen to a simple, similar Part of the Body; 'tis called, simply, *Solutio Continui*.

If on a compound, or organical Part, it acquires a particular Denomination, from the Nature of the Part, the Difference of the Cause, or the Manner of the Application; as, a Wound, Rupture, Fracture, Puncture, Fissure, Contusion, Ulcer, Corrosion, Dilaceration, Exfoliation, Caries, &c. See WOUND, RUPTURE, FRACTURE, &c.

*SOLUTION*, in Algebra and Geometry, is the answering of a Question; or resolving any Problem proposed. See RESOLUTION.

The *Solution* of the Problem of the Quadrature of the Circle, and that of the Duplicate of the Cube, by Right Lines, are held impossible. See QUADRATURE and DUPLICATION.

*SOLUTION of Continuity*, in Chirurgery; See SOLUTIO CONTINUI.

*SOLUTION*, in Physics, the Redolition of a Solid, or firm Body, into a fluid State, by means of some Menstruum. See MENSTRUUM.

*Solution*, is frequently confounded with what we otherwise call *Dissolution*; but there is a Difference. See DISSOLUTION.

*SOLUTION*, in Chymistry, is sometimes used for the Analysis, or Reduction of a natural Body into its chymical Principles. See PRINCIPLE and ANALYSIS.

In this Sense, *Solution* is the same with what we otherwise call *Resolution*. See RESOLUTION.

*SOLUTIVE*. See LAXATIVE.

*SOMNAMBULI*, an Appellation given to People, who walk in their Sleep; more usually called *Noctambuli*. See NOCTAMBULI.

The Word is form'd from the *Latin*, *Somnus*, Sleep, and *Ambulo*, I walk.

*SOMNIFEROUS*. See SOPORIFEROUS.

*SON*, a relative Term, applied to a Male Child, considered in the Relation he bears to his Parents. See FATHER.

The Children of the King of *England*, are called *Sons* and *Daughters of England*. See KING. The Eldest *Son* is born Duke of *Cornwall*, and created Prince of *Wales*. See PRINCE.

The younger *Sons* are called *Cadets*. See CADET.

The King of *France's* Children were anciently call'd *Fils*, and *Filles de France*, *Sons* and *Daughters of France*; and the Grand-children, *Petits Fils*, and *Petites Filles de France*. At present, the Daughters are called *Mes-dames*, and the Grand-daughters, *Mes-dameiselles de France*.

Natural SON } See { BASTARD.  
Adoptive SON }     { ADOPTIVE.

*SON* of *God*, a Term used in various Senses, in the Holy Scriptures; as, 1<sup>o</sup>. For the *Word*, or the Second Person in the Blessed Trinity: who is thus called, with respect to the Manner of his Generation; as being begotten of the Father.

Him, the Orthodox believe to be Co-eternal, and Co-equal with the Father; and to have been with him, the eternal Principle and Source of the Holy Spirit. See TRINITY.

The Term *Son*, is applied to him, both before and after his Incarnation. Thus we say, The *Son* of *God* Created the World; the *Son* of *God* was Incarnate, and lived 33 Years on Earth, &c.

2<sup>o</sup> Several Creatures are also called *Sons of God*; not as being so by Nature and Generation; but on divers other Accounts. Thus the Angels are called *Sons of God* by *Job*; in respect of their Creation, Adoption, &c. And great Men are called *Sons of God* in the *Psalmist*; as being his Lieutenants; or, the Depositories of his Authority. Good Men, and particularly the Elect, are also called *Sons of God*, in various Places of the Sacred Writings.

*SON* of *Man*, is frequently used in Scripture, to signify *Man*; as expressing not only the Nature of *Man*; but his Frailties.

The Expression is very usual among the *Hebrews* and *Chaldeans*. *David*, *Ezekiel*, and *Jesus Christ*, are particularly thus called; the First once, and the Two latter, frequently.

Sometimes, the Word is also used for the Wicked and Reprobate; in contradistinction to those call'd *Sons of God*.

*SONATA*, in Music, a Term called by the *Italians*, *Suonata*, of *Suono*, Sound, as signifying a Piece or Composition of Music, wholly executed by Instruments; and which is, with regard to the several Kinds of Instruments, what the *Cantata* is, with regard to Voices. See CANTATA.

The *Sonata*, then, is properly a grand, free, humorous Composition, diversified with a great Variety of Motions and Expectations, extraordinary and bold Strokes, Figures, &c. And all this purely according to the Fancy of the Composer; who, without confining himself to any general Rules of Counterpoint, or to any fix'd Number or Measure, gives a Loose to his Genius, runs from one Mode, Measure, &c. to another, as he thinks fit.

We have *Cantata's* of 1, 2, 3, 4, 5, 6, 7, and even 8 Parts; but usually they are performed by a single Violin, or with two Violins and a thorough Bass for the Harpsichord, and frequently a more figured Bass for the Bass-Viol, &c.

There are a Thousand different Species of *Sonata's*; but the *Italians* usually reduce them to three Kinds: *Suonate de Chiesa*; that is, *Sonata's* proper for Church-Music, which usually begin with a grave, solemn Motion, suitable to the Dignity and Sanctity of the Place and the Service; after which they strike into a brisker, gay and richer Manner. These are what they properly call *Sonata's*.

The second Kind comprehends the *Suonate da Camera*, or *Sonata's* proper for the Chamber, &c. These are properly Series of several little Pieces, proper for Dancing; only composed to the same Tune. They usually begin with a Prelude or little *Sonata*, serving as an Introduction to all the rest: Afterwards come the *Allenza*, *Pavane*, *Courante*, and other serious Dances; then *Gigue*, *Gavotte*, *Minuets*, *Chacones*, *Passepieds* and other gay Airs: The whole compos'd in the same Tone or Mode.

*SONG*, in Poetry, a little Composition, consisting of simple, easy, natural Verses, for to a Tune, in order to be sung. See SINGING.

Each Stanza of a *Song*, is called a *Couplet*. See STANZA and COUPLET.

The *Song* bears a deal of Resemblance to the *Madrigal*; and more to the *Ode*, which is nothing but a *Song* according to the ancient Rules. See MADRIGAL and ODE.

Its Object is usually either *Wise* or *Love*; whence *M. le Brun* defines a modern *Song*, to be either a soft and amorous, or a brisk and bacchic Thought, express'd in a few Words.

Indeed, this is to restrain it to too narrow Bounds; for we have devout *Songs*, satyrical *Songs*, and panegyrical *Songs*.

But, be the *Song* what it will, the Verses are to be easy, natural, flowing, and to contain a certain Harmony, which neither shocks the Reason nor the Ear; and which unites Poetry and Music agreeably together.

Anciently, the only Way of preserving the Memory of great and noble Actions, was, by recording them in *Songs*; and in *America* there are still People, who keep their whole History in *Songs*. See DRUID.

*SONG*, in Music, is applied in the General, to any single Piece of Music, whether contriv'd for a Voice or Instrument. See MUSIC and COMPOSITION.

A *Song*, Mr. *Malcolm* observes, may be compared to an Oration: For, as in this latter, there is a Subject, viz. some Person or Thing the Discourse is refer'd to, and which is always to be kept in View throughout the whole; so, in every truly regular and melodious *Song*, there is one Note which regulates all the rest; wherein the *Song* begins, and at last ends, and which is, as it were, the principal Matter, or musical Subject, to be regarded in the whole Course of the *Song*. And, as in the Oration, there may be several distinct Parts, which refer to particular Subjects, yet must they have an evident Connection with the principal Subject, which regulates the whole; so in Melody, there may be several sub-principal Subjects, to which the different Parts of the *Song* may belong: But these are, themselves, under the Influence of the principal Subject, and must have a sensible Connection with it. This principal or fundamental Note, is called the *Key of the Song*. See KEY.

*SONNA*, a Book of Mahometan Traditions, wherein all the Orthodox Mussulmans are required to believe. See MANOMETISM.

The Word signifies, in *Arabic*, the same with *Assus* in the *Hebrew*, that is, *Second Law*, or, as the *Jeus* call it, *Oral Law*. See MISCHNA.

The Adherents to the *Sonnas* are called *Sonnites*; and as among the *Jeus*, there is a Sect of *Caraites*, who reject the Traditions as Fables, invented by the Rabbins; there are also Sectaries among the *Mahometans*, called *Sciaites*, who reject the Traditions of the *Sonnites*; as being only founded on the Authority of an apocryphal Book, and not deriv'd to them from their Legislator.

There is the same Enmity between the *Sonnites* and *Sciaites*, as between the rabbinist *Jeus* and the *Caraites*. The *Sciaites* reproach the *Sonnites* with obtruding the Dreams of their Doctors, for the Word of *God*: And the *Sonnites*, in their Turn, treat the *Sciaites* as Hereticks, who refuse to admit the divine Precepts, have corrupted the *Acouras*, &c.

*SONNET* or *Sonetto*, in Poetry, a kind of Composition, contained in Fourteen Verses, viz. two Stanzas or Measures of four Verses each, and two of Three: The Eight first Verses to be all in two Rhimes.

The *Sonnet* is of *Italian* Origin, and *Petrarch* is allowed to be the Father. 'Tis held the most difficult and artful of all poetical Compositions; as requiring the last Accuracy and Exactness. 'Tis to end with some pretty, ingenious Thought: The Close to be particularly Beautiful.

In *Malherb*, and some other Poets, we meet with *Sonnets*, where the two first Stanzas are not in the same Rhime; but they are held irregular; and, in effect, great Part of the Merit of these Pieces, consists in a scrupulous Observation of the Rules.

*Ronsard*, *Malherb*, *Maignard* and *Gombault*, have composed abundance of *Sonnets*; but among two or three Thouland, there are scarce Two or Three to be much admired.

*Pasquier* observes, that *du Bellai* was the First who introduced *Sonnets* into *France*, but *du Bellai* himself says, That *Molin de S. Gelais*, first converted the *Italian Sonnets* into *French*.

*SOOT*, an earthy, volatile Matter, arising from Wood, Coals and other Fuel, along with the Smoke, by the Action of Fire; or, rather, it is the Smoke itself, fixed and gathered on the Sides of the Chimney. See SMOKE and FIRE.

*SOOT*, is found an excellent Manure for Corn Lands, especially where the Soil is cold. See MANURE.

The Dyers make considerable Use of *Soot*, for a kind of Dun Colour; which, viz. his true, has no agreeable Smell; but in Return has the Property of saving Cloaths and other Stuffs, from Moths.

*Soot of Frankincense*, is the smallest and finest Part of the Incense, called *Olivum*, or *Mala Incense*; burnt after the manner of *Rosin* to make Lamp-black.

*Dioscorides* shows how to make a *Sor* of Butter, which has several Uses in Medicine.

The *Sor* found in the Furnaces of Glass-houses, is used by Painters.

SOPHI or SOFI, a Title or Quality given the Emperor of *Perfia*.

The *Sophi's* value themselves, and with some Reason, of their illustrious Extraction; The Race being Second to none in the *East*. They are descended in a right Line from *Houssou*, second Son of *Air*, *Mahower's* Cousin, and *Fatima*, *Mahower's* Daughter. There is no Prince in the World, whose Authority is more absolute than that of the *Sophi* of *Perfia*. His Power is not even limited by any Laws he himself can make; but he suspends, changes, and annuls them at Pleasure.

The Title is said to have taken its Rise from a young Shepherd thus named, who attained to the Crown of *Perfia* in 1370. Others derive *Sophi*, from the *Sophi's* or Sages, anciently called *Alogi*.

*Vossius* gives us a different Account of the Word. *Sophi*, in *Arabic*, he observes, signifies *Wool*, and adds, That it was applied by the *Turks* out of Derision to the Kings of *Perfia*, ever since *Ismael's* Time, because, according to the Scheme of Religion, he is to wear no other Covering on his Head, but an ordinary, red, woollen Stuff; whence the *Perfians* are also called *Kishlousi*, *q. d. Red-heads*. But *Bochart* says, That *Sophi*, in the original *Perfian* Language, signifies One that is pure in his Religion, and who prefers the Service of God in all Things; and derives it from

SOPI'S or SOPLES, a kind of Order of Religious among the *Mahometans* in *Perfia*; thus called, from a kind of coarse Camelot which they wear, called *Sopi*, from the City *Sopi* in *Syria*, where 'tis principally manufactured.

*Scheik Sopi*, who laid the first Foundation of the Grandeur of the Royal House of *Perfia*, was the Founder, or rather the Restorer of this Order. *Ismael*, who conquered *Perfia*, was, himself, a *Sopi*, and valued himself on his being so. He chose all the Guards of his Person from among the Religious of this Order; and would have all the great Lords of his Court *Sopi's*. The King of *Perfia* is still Grand Master of the Order; and the Lords continue to enter into it, tho' it be now fallen into great Contempt.

The vulgar *Sopi's* are now chiefly employ'd as Officers, and Attendants of the Court; and even as Executioners of Justice; and the Emperor last reigning, would not allow them, according to Custom, to gird the Sword on him. This Neglect, into which the *Sopi's* are fallen, has occasioned the late Emperors to disuse the Title of *Sopi* or *Sophi*: However, *M. de la Croix* is mistaken, when he says, That they never bore it. The more eminent of those *Sopi's* are called *Scheik*, *q. d. Reverend*.

SOPHISM, in Logic, a captious, fallacious Reasoning; or an Argument, which with some Subtlety, carries much Appearance of Truth; but little Solidity. See FALLACY.

A *Sophisma* is, properly an Argument false at Bottom, and only invented to amuse and embarrass the Person to whom it is used. See *SOPHIST*.

SOPHISM'S, or *Sophistical Arguments*, among Logicians, are particularly such as are not in Form, or are founded on Equivocals; as, *You have every Thing you have not lost; but you have not lost Horus; Therefore you have Horus*.

SOPHIST, a Person who frames *Sophisms*; that is, uses subtle Arguments, with design to deceive those he would persuade or convince. See *SOPHISM*.

The Term *Sophist*, which is now reproachful, was anciently honourable; and carried a very innocent Idea. *St. Augustin* observes, it signified, simply, a Rhetor or Professor of Eloquence; such as were *Lucian*, *Athenius*, *Libanius*, &c.

*Stridat*, and after him, *Clarens Celsus* in an express Dissertation on the Greek *Sophists*, tell us, That the Word was applied indifferently to all, who excelled in any Art or Science; whether Divines, Lawyers, Physicians, Poets, Orators or Musicians. But this seems to be stretching the Sense of the Word without all Measure. 'Tis possible a Rhetor might have made Verses, &c. but that it was on account of his poetical Talent, that he was denominated *Sophist*, is what we see no Reason to apprehend. However, *Solon* is the first who appears to have ever bore the Appellation; which is given him by *Isocrates*: Afterwards, it was scarce ever given, but to Philosophers and Declaimers.

The Title was in great Credit among the *Latins* in the XIIIth Century, and in the Time of *St. Bernard*; but it began to lose Ground in *Greece*, as early as *Plato's* Time; on account of *Protagoras* and *Gorgias*, who made a sordid Traffic thereof, by selling Eloquence for Money. Hence *Seneca* calls the *Sophists* *Charlatans* or *Empirics*.

*Cicero* says, That the Title *Sophista* was given to such as profess'd Philosophy with too much Ostentation, to make a Trade of it, by running from Town to Town, to retail their deceitful Science. A *Sophist*, therefore, was then, as now, a Rhetor, or Logician, who makes it his Business to ensnare and perplex People, by frivolous Distinctions, vain Reason-

ings and captious Discourses. Nothing has conducted more to the Increasing of the Number of *Sophists*, than the contentious School Philosophy. People are there taught to puzzle and obscure the Truth, by barbarous, unintelligible Terms, as *Antipredicaments*, great and little *Logics*, *Quiddities*, &c.

The Title of *Sophist* was given to *Robustus Maurus*, by way of Eminence. *John Hunton*, an English Scholastic Writer, endeavoured to get, and bear, as a Credit to him, the Title of *Sophist*.

The Word is form'd from the Greek *sopis*, Wife; or rather from *sopis*, impostor, Deceiver.

SOPHISTICATIO, in Chymistry, Alchymy, &c. a Term particularly applied to the Counterfeit Works of fraudulent Alchymists, who use indirect Means of whitening Copper, gilding Silver, and giving other superficial Tinctures; as also of making Augmentations, by divers Mixtures, and other illegal Operations, to delude those, at whose Expence they are employ'd.

Hence the Term is also applied to Merchandizes, and other Goods adulterated, mix'd or alter'd by the Deceit of the Seller.

Musc, at present, is almost all *Sophisticated*, as well as Bezoard, Balm of *Gilead*, *Lapis Lazuli*, and other valuable Drugs. *Cawary Wines* are *Sophisticated* on the Place, before ever they come near our Ports.

SOPORIFIC, *Soporiferous* or *Soporative*, a Medicine that has the Faculty of procuring Sleep. See *SLEEP*.

Such are Opium, Laudanum, &c. See *OPIATE*.

The Word is form'd from the *Latin*, *Sopor*, Sleep; The *Greeks*, in lieu hereof, use the Word *Hypnotic*; which see.

SOPOROUS or sleepy Diseases, are the *Coma* or *Catephora*, *Letargy* and *Coma*, which rather appear to differ as to more or less, than as to Essence.

In this they all agree, That they induce a morbid Sweat. See *COMA*, &c.

SORBONNE, the House or College of the Faculty of Theology, established in the University of *Paris*. See *COLLEGE*.

It was founded in 1252, by *St. Louis*, or rather by *Robert de Sorbon* his Confessor and Almoner; first, Canon of *Canterbury*, and afterwards of the Church of *Paris*. He gave his new House his own Name; which he himself took from the Village of *Sorbon*, or *Sorlan*, near *Sens*, where he was born. The Foundation was laid in 1250: *Queen Blanche*, in the Absence of her Husband, furnishing him with a House before the Palace of *Julian* the Apostate, whereof some of the Remains are still seen. Afterwards, the King gave him all the Houses he had in the same Place, in exchange for some others in another.

The College has been, since, magnificently rebuilt by the Cardinal *de Richelieu*. The Design of its Institution, was for the Use of poor Students in Divinity.

There are Lodgings in it for 36 Doctors, who are said to be of the *Society of the Sorbonne*. Those admitted into it without being Doctors, are said to be of the *Hospitality of the Sorbonne*. Six Repent Doctors hold Lectures every Day, for an Hour and Half each: Three in the Morning, and Three in the Afternoon. See *DOCTOR*.

SORBONNE is also used in the General, for the whole Faculty of Theology at *Paris*: In regard the Assemblies of the whole Body are held in the House of the *Sorbonne*; and that the Bachelors of the other Houses of the Faculty, as the House of *Nauarre*, &c. come here to hold their *Sorbonnique* or *Art*, for being admitted Doctors in Divinity. See *FACULTY*.

SORCERY, the Crime of Witchcraft, or Divination by the Assistance of the Devil. See *MAGIC*, *WITCHCRAFT* and *DIVINATION*.

Some hold *Sorcery* to be properly what the Ancients call *Sorilegium*, or Divination by means of *Sortes* or *Lots*. See *SORTES*.

*My Lord Coke*, 3d *Inst. Fol. 44*. describes a *Sorcerer*, *Qui utitur Sortibus in cantationibus Demoniis*. *Sorcery* is Felony, by *Stat. 1<sup>o</sup> Jac.* In the Mirror, *Sorcery* is said to be a Branch of Heresy; and by *Stat. 12. Cor. II.* it is excepted out of the general Pardons.

*Sorcery* was a Thing formerly very common; at least the Credulity of those Ages made it pass for such; and People suffered frequently for it. In a more knowing and less believing Age, 'tis out of Doors.

In effect, the most probable Opinion is, That the several glaring Instances of *Sorcery* we meet withal, in our old Law-Books and Historians, it well enquired into, would be found, at Bottom, no other than arful Poisonings.

SORITES, in Rhetoric, &c. a kind of Argument, where-in a Number of Propositions are gradually and minutely laid together; and something inferred from the whole: Whence *Cicero* calls it *Syllogismus acervatus*, a Syllogism heaped up or accumulated.

Such was that merry Way *Theophrastus* used of proving, That his little Son, under Ten Years old, commanded the whole World; thus: My Son commands his Mother; his Mother me; I the *Athenians*; the *Athenians* the *Greeks*; the *Greeks*

Greece commands *Europa*: Europe the whole World: Therefore my Son commands the whole World.

This Method of Divining, prevailed much among the Stoicks; especially with *Zeno* and *Chryssippus*. But 'tis very captious and sophistical.

The Word is formed from the Greek *επιδη*, cumulus, Heap. **SORRANCES**, among Farriers, is used to signify two Things, viz. either an ill State or Habit of a Horse's Body, arising from some Part diseas'd; or a Loosening and Solution of the Continuity of the Parts, which according to the various Circumstances thereof, acquires various Names, as *Fracture, Wound, Ulcer, Rupture, Convulsion, Cramp, Excoriation*.

**SORTES**, in Antiquity, *Lot*, a Method of deciding dubious Cases, where there appears no ground for a Preference, by referring the Thing to the Conduct of Chance; as in casting of Dice, drawing of Tickets, &c. See **CHANCE**.

The ancient *Sortes* or *Lots*, were instituted by God himself; and in the Books of the *Old Testament*, we meet with divers standing and perpetual Laws, and divers particular Commands, prescribing and regulating the Use thereof. Thus the Scripture informs us, That the *Lot* fell on St. *Mattias*, when a Successor to *Julias* in the Apostolate was to be chosen. And our Saviour's Garment itself, was cast *Lots* for *Sartius* first *Christi Vestem*.

The *Sortes Præsentine*, were famous among the *Greeks*. The Method of these, was to put an Infinity of Letters, or even whole Words into an Urn; to shake them together, and throw them out; and whatever should chance to be made out in the Arrangement of the Letters, &c. compos'd the Answer of this Oracle.

In what Repute soever, this Method of Divination might, anciently, have been, *M. Dacier* observes, That in *Cicero's* Time its Credit was low; inasmuch that none but the credulous Populace had recourse to it.

In lieu of this, another kind of *Sortes* was introduced into *Greece* and *Italy*, which was to take some celebrated Poet, as *Homer*, or *Æsopides*, or *Virgil*, to open the Book, and whatever first presented itself to the Eye upon opening, was taken for the Ordinance of Heaven. This made what they call'd *Sortes Homæricæ*, and *Sortes Virgilianæ*, which succeeded to the Use of the *Sortes Præsentine*.

This Superstition paid hence into Christianity; and the Christians took their *Sortes* out of the Books of the *Old* and *New Testament*. The first Passage that it presented, upon opening a Book of Scripture, was esteem'd the Answer of God himself.

If the first Passage did not happen to be any Thing to the Purpose for which the *Sortes* were consult'd; another Book was opened, till a Passage were met withal, that might be taken for an Answer. This was call'd *Sortes Sanctiorum*.

St. *Augustin* does not disapprove of this Method of learning Futurity, provided it be not used for worldly Things; and owns he has practis'd it himself.

*Gregory of Tours* adds, That the Custom was, to lay the Bible on the Altar, and to pray the Lord, that he'd discover what was to come to pass.

Instances of the Use of the *Sortes Sanctiorum* are very frequent in History. *Heraculus*, Mr. *Fleury* tells us, in his War against *Cæsar*, to learn where he should take up his Winter Quarters, purify his Army for three Days, and then opened the Gospels, and found the Place appointed for his Winter Quarters, was in *Albania*.

*Gilbert of Nogent*, informs us, That in his Time, that is, about the beginning of the 11th Century, the Custom was at the Consecration of Bishops, to consult the *Sortes Sanctiorum*, to learn the Success, Fate, &c. of their Episcopate.

The Practice is founded on a Supposition, that God presides over the *Sortes*; and on the 33d Verse of the 16th Chapter of *Proverbs*; 'I be *Lot* is cast in the Bottom, and its Decision is from the Almighty.'

In effect, many Divines hold, that the *Lot* is conducted in a particular Manner by Providence; that 'tis an extraordinary Manner wherein God declares his Will by a kind of immediate Revelation. The *Sortes Sanctiorum*, however, were condemn'd by the Council of *Ayde* in 506, at the Time they were beginning to take footing in *France*, &c.

**SORTILEGE**, a kind of Divination by *Sortes* or *Lots*. See **SORTES**.

**SOTERIA**, in Antiquity, Sacrifices offered to the Gods, in Gratitude for their having delivered from Danger. See **SACRIFICE**.

The Term is also applied to poetical Compositions made for the same End. *Orpheus* is the first, who appears to have compos'd *Soteria*.

Our *Latin* Poets give the same Name to Poems in *Latin* Verse, wrote to give Thanks to God or the Saints, for having preserved them on any Occasion: *F. Petrus* being delivered from a dangerous Disease, by the Intercession, as he supposed, of St. *Genevieve*, compos'd that fine Piece in Honour of that Saint, still extant under the Title of *Soteria*.

The Word is form'd from the Greek, *σωρη*, Saviour.

**SOVERAIGN**, the first Being; the Supreme, or the Almighty: A Term, in Strictness, only applicable to God.

*Pajquier* derives it from the *Latin*, *Superior*, the First in any Thing, or he who is superior to the rest.

Whence, in the ancient *French* Customs, we meet with *Sovereign* Master of the Household; *Sovereign* Master of the Forests; *Sovereign* Master of the Treasury: and hence, under *Charles VI.* the Title *Sovereign* is given to Bailiffs and Seneschals, with regard to their Superiority over *Prebends* and *Chateaux*.

**SOVERAIGN**, with regard to Men, is applied to Kings and Princes, who are Supreme and Independent, and hold of no Body but God and their Sword. See **KING**, **PRINCE**, &c.

The Authority of a *Sovereign* is only bounded by the Laws of God, of Nature, and the fundamental Laws of the State.

The Title is also given to such as are invested with certain Rights, which only belong to *Sovereigns*: As the Right of Coining Money; sending Agents to *Diets*, to treat of War and Peace: In which Sense, the Feudatories of the Empire, and the Tributaries of the Grand Signor, are call'd *Sovereigns*.

*Sovereign* is also applied to Judges, who have a Power from a Prince, to decide the Processes of his Subjects without Appeal or in the last Resort. At *Paris* there are five *Sovereign* Companies; the Parliament, the Chamber of Accounts, the Court of Aids, the Grand Council, and the Court of Monies. In *England*, we have but one *Sovereign* Court; the House of Lords.

**SOUL**, a Spirit inclosed in an organ'd Body. See **SPIRIT** and **BODY**.

Many of the ancient Philosophers asserted an *Animæ Mundi*, a *Soul* which moved and animated the Machine of the Universe, and gave Action to all natural Causes. This Doctrine, *Plato* handles very fully in his *Timæus*. See **ANIMA MUNDI**.

Others have given particular *Souls* to all the heavenly Bodies, the Sun, Stars, Earth, &c. to regulate their Motions.

The Philosophers, many of them, allow of two, and others of three kinds of *Souls*.

A *Rational Soul*, which they hold to be Divine, and infused by the Breath of God.

An *Irrational* or *Sensitive Soul*, which Man has in common with Brutes, and which is form'd out of the Elements.

To which some add a *Vegetative Soul*; which we have in common with Plants; and which, as the First is the Principle of Reason and Understanding, or that in us which thinks and understands; and the Second, the Principle of Life; so this Third is the Principle of Growth, Nutrition and Vegetation. See **VEGETATIVE**, &c.

The *Epicureans* took the Substance of the *Soul*, we mean of the rational *Soul*, to be a subtil Air, compos'd of their Atoms, or primitive Corpuscles. See **ATOM**.

The *Stoicks* held it to be a Flame or Portion of heavenly Light.

*Spinoza* and his Followers, allowing of only one kind of Substance, viz. Matter, maintain the *Soul* to be of the same Substance with the Body, viz. Material. See **SUBSTANTIAL**.

The *Cartesians* make Thought the Essence of the *Soul*, and from this Principle, deduce its Immateriality and Immortality. See **THINKING**.

But the Principle is False; nor is there any need to define the *Soul* a Substance that thinks, to prove it Immortal. 'Tis enough, that the *Soul* be capable of Thinking; and that it produce its own Thoughts, without having Thought its Essence. 'Tis no more essential to the *Soul* to Think than to Will: For a Thing I can conceive the *Soul* without, cannot be its Essence.

Again, if Thought be the Essence of the *Soul*; as a Thing cannot produce itself, its own Being, or Essence; the *Soul* does not produce its own Thoughts, nor its own Will: And thus is it brought to the Condition of Brutes, or even of inanimate Bodies without any Action, any Liberty, &c.

If the *Cartesians* only mean this of the Faculty of Thinking; they do wrong even to call this the Essence of the *Soul*. 'Tis no more its Essence, than the Faculty of Willing is. And we conceive something in the *Soul*, prior to both those Faculties.

The *Soul* is a spiritual Substance, proper to inform, or animate a human Body, and by its Union with this Body, to constitute a reasonable Animal or Man. This is its Essence; and this its Definition.

It may be owned, the *Cartesians* prove the Spirituality and Immortality of the *Soul*, from its Thinking, exceedingly well: But they are not to have the Honour of this Proof, as their own Invention. All the great Philosophers used it before them, and use it still. See **IMMORTALITY**.

The Philosophers are not at all agreed, as to the Manner wherein the *Soul* resides in the Body. Some hold it equally diffused throughout every Part thereof. Others say it is

fluences, and acts on every Part of the Body, though it has its principal Residence in some particular Part, call'd the *Sensory*. See *SENSORY*.

This principal Part, *Des Cartes* maintains, is the Pineal Gland of the Brain, where all the Nerves terminate, &c. See *PINEAL Gland*.

*Borry*, a Northern Physician, in a Letter to *Barbolin*, asserts, That in the Brain is found a certain, very subtle, fragrant Juice, which is the principal Seat or Residence of the reasonable Soul; and adds, That the Subtlety and Fineness of the Soul, depends on the Temperament of this Liqueur, rather than on the Structure of the Brain, to which 'tis usually ascribed. This Liqueur, we conceive, must be the same with what we usually call the *Nervous Juice*, or *Animal Spirits*. The Constitution whereof, is, doubtless, of great Importance, with regard to the Faculties of the Soul. See *SPIRIT*.

*Mr. Lock* distinguishes Two principal Faculties for Powers of the rational or human Soul, *viz.* *Perception* and *Will*ing. See *POWER*.

To these, other Philosophers add others; as *Sensation*, *Liberty*, *Memory*, *Imagination* and *Habit*. See *UNDERSTANDING*, *WILL*, *SENSATION*, *LIBERTY*, &c.

The Mystic Divines distinguish Two principal Parts in the Soul: The *Upper-part*, which comprehends the Understanding and the Will; and the *inferior Part*, which comprehends Imagination and Sensation. Thus, say they, *Jesus Christ* was happy on the Cross in his *upper Part*, and suffered in his *lower Part*. The lower Part did not communicate to the Upper, either its Troubles or its Failings; nor the Upper to the Lower, its Peace or Beatitude. From this Distinction, the Quietists take in hand to maintain, That whatever passes through to good Morals, in the lower Part of the Soul, is not contrary to the Purity of the upper Part, inasmuch as the Will has no Share therein.

As to the Soul of Brutes, the *Cartesians*, and some others, deny its Existence, in the common Sense of the Word *Soul*; that is, they strip off all the Properties or Faculties of the Human Soul: And the *Peripateticks*, on the contrary, invest it with the greatest Part of them.

In Man, a particular Agitation of the Fibres of the Brain is accompanied with a Sensation of Heat; and a certain Flux of animal Spirits towards the Heart, and Viscera, is followed by Love or Hatred.

Now the *Peripateticks* maintain, That the Brutes feel the same Heat and the same Passions, on the same Occasions: That they have the same Aversion for what incommodes them, and, in the general, are capable of all the Passions, and all the Sensations we feel.

The *Cartesians* deny they have any Perceptions or Notices at all; that they feel any Pain or Pleasure; or love or hate any thing. The Ground of their Opinion is, That they allow of nothing in Brutes, but what is material, and that they deny Sensations and Passions, to be any Properties of Matter. Some of the *Peripateticks*, on the other hand, maintain Matter, when subtilized, framed, ranged and moved in a certain Manner, to be capable of Sensation and Passion; that Beasts may feel and perceive, by means of the animal Spirits, which are a Matter thus modified; and that the human Soul itself, only becomes capable of Sensation and Passion, by means thereof.

But we must own it very difficult, to reconcile the Idea we have of Matter, with that we have of Thought; to conceive that Matter figured in any manner, whether in a Square, a Sphere, or an Oval, should be Pleasure, Pain, Heat, Colour or Smell; to conceive that Matter, however, agitated, whether in a Circle, a Spiral, Parabola or Ellipsis, should be Love, Hatred or Joy.

The Maintainers of the contrary Opinion, urge that Appearance of Sense, of Fear, Caution, Love for their Young, infinite Sagacity, both for their own Preservation and that of their Species, visible through the whole Brute Creation. And 'tis true, all the Actions of Beasts plainly express an Understanding; for every thing that is regular, expresses it; even a Machine or Watch expresses it: and a Plant much more; the Radicle of the Seed turning downwards, and the Stem upwards, whatever Situation the Seed is found in: the young Plants knitting from Space to Space, to strengthen it; its pushing forth Prickles, &c. to defend it, &c. mark a great Understanding. All the Motions of Plants and Brutes plainly discover an Intelligence; but the Intelligence does not reside in the Matter thereof: 'Tis as distinct from the Beast or Plant, as is that which ranged the Wheels of the Watch, is distinct from the Watch itself.

For, in effect, this Intelligence appears infinitely Great, infinitely Wise, infinitely Powerful; and the same which form'd us in our Mother's Womb, which gives our Growth, &c.

Thus, in Brutes, there is not either Understanding or Soul, in the Sense we generally use the Word: They eat without Pleasure, cry without Pain, grow without knowing it. They fear nothing; know nothing; and if they act in such manner, as shews Understanding; 'tis because God

having made them, to preserve them, has formed their Bodies, so as to avoid whatever might hurt them, mechanically.

Otherwise, it might be said, That there is more Understanding in the vilest Insect, nay, in the smallest Grain, than in the most knowing of Men; for 'tis evident, either of them contains more Parts, and produces more regular Motions and Actions, than we are capable of understanding. Thus does the great *F. Mallebranche*, argue against the *Souls* of Brutes. *Recherche de la Verite*, livo. 6.

*Soul's Debt*, a Legacy anciently bequeathed at their Deaths, by our scrupulously pious Ancestors, to the Parish Priest, to compensate for any Tythes that might have been forgot in their Lives. See *TYTHE*.

*SOUND*, a Perception of the Soul, communicated by means of the Ear; or, the Effect of a Collision of Bodies, and a tremulous Motion consequent therein, communicated thence to the circumambient Fluid, and propagated through it to the Organs of Hearing. See *EAR* and *HEARING*.

To illustrate the Cause of *Sounds*; we observe; first, That a Motion is necessary in the sonorous Body, for the Production of *Sounds*. Secondly, That this Motion exists, first, in the small and insensible Parts of the sonorous Bodies, and is excited in them by their mutual Collision, and Percussion against each other, which produces that tremulous Motion, so observable in Bodies, that have a clear *Sound*, as Bells, musical Chords, &c. Thirdly, That this Motion is communicated to, or produces a like Motion in the Air, or such Parts of it, as are apt to receive and propagate it; inasmuch as no Motion of Bodies, at a Distance, can affect our Senses without the Mediation of other Bodies, which receive those Motions from the Body, and communicate them immediately to the Organ. Lastly, That this Motion must be communicated to those Parts, that are the proper and immediate Instruments of Hearing.

Further, That Motion of a sonorous Body, which is the immediate Cause of *Sounds*, may be owing to two different Causes; either the Percussion between it and other hard Bodies, as in Drums, Bells, Chords, &c. or the beating and dashing of the sonorous Body and the Air, immediately against each other, as in Wind Instruments, as Flutes, Trumpets, &c.

But in both Cases, the Motion, which is the Consequence of the mutual Action, and the Immediate of the sonorous Motion which the Air conveys to the Ear; is an invisible, tremulous or undulating Motion in the small and insensible Parts of the Body.

To explain this; all sensible Bodies are supposed to consist of a Number of small and insensible Parts or Corpuscles, which are of the same Nature in all Bodies, perfectly hard and incompressible. See *CORPUSCLE*.

Of these, are composed others, somewhat greater, but still insensible; and these different, according to the different Figures and Union of their component Parts. These, again, constitute other Masses bigger and more different than the former, and of the various Combinations of these last, are those gross Bodies composed, that are visible, touchable, &c. The first and smallest Parts, we have observed, are absolutely hard; the others are compressible, and united in such manner, that being compress'd by an external Impulse, they have an elastic or restitutive Power, whereby they restore themselves to their natural State. See *ELASTICITY*.

A Shock, then, being made by one Body upon another, the small Particles, by their elastic Principle, move to and again with a very great Velocity, in a tremulous, undulating Manner, somewhat like the visible Motions of grosser Springs; as we easily observe in the Chords of musical Instruments, And this is what we may call the *Sonorous Motion*, which is propagated to the Ear: But observe, that 'tis the insensible Motion of those Particles next the smallest, which is supposed to be the immediate Cause of *Sounds*; and of these, only those next the Surface, communicate with the Air: The Motion of the whole, or of the greater Parts, being no further concerned, than as they contribute to the other.

To apply this Theory; strike a Bell with any hard Body, and you easily perceive a sensible Tremor in the Surface, spreading itself over the whole; and that more sensibly, as the Shock is greater. Upon touching it in any other Part, the Motion and the *Sounds* too, are stopp'd. Now this is apparently a Motion of the small and insensible Parts, changing their Situations, with respect to one another, which being so many, and so closely united, we cannot perceive their Motions separately and distinctly; but only a Trembling, which we reckon to be the Effect of the Confusion of an infinite Number of little Particles, closely joyn'd, and only moving in infinitely little Lines.

*Mr. Ferrault* adds, That this visible Motion of the Parts, contributes no otherwise to *Sound*, than as it causes the invisible Motion of the smaller Parts, which he calls *Particules*, to distinguish them from the sensible ones, which he calls *Parts*, and from the smallest of all, which we call *Corpuscules*.

This he supports from the Instance of a Chord, which being struck, and the *Sound*, and sensible Undulations at Rest again, if you approach the Chord softly with the Finger, you'll find a small tremulous Motion, which is the Remains of the Vibrations of the whole Chord, and the Parts. Now, the Parts vibrate without any *Sound*; but no sooner is the Vibration felt by the Finger, than the *Sound* is heard again; which he ascribes to this, That the Motion of the Parts being insufficient to move the Particles, whose Motion is the first that ceases, requires some Assistance from dashing against the Finger, whereby to become enabled to give the Particles the Motion necessary for the producing of *Sound*. He finishes his Proof, by the Instance of Flutes; which when made of different Matters, as Wood, Metal, &c. whose Parts are very different, but their Particles nearly the same, if their Lengths and Bore be the same; there is very little sensible Difference in their *Sounds*.

The sonorous Body having made its Impression on the contiguous Air, that Impression is propagated, from one Particle to another, according to the Laws of Pneumatics.

A few Particles, for instance, driven from the Surface of the Body, drive the neighbouring Particles into a less Space; and the Medium, as it is thus rarified in one Place, becomes condensed in the other: But the Air thus compress'd in the second Place, is, by its Elasticity, returned back again, both to its former Place, and its former State; and the Air, contiguous to that, is compress'd; and the like obtains, when the Air less compress'd expanding itself, a new Compression is generated. From each Agitation of the Air, therefore, there arises a Motion of the Air, analogous to the Motion of a Wave on the Surface of Water; which we call a *Wave* or *Undulation* of Air. See *UNDULATION*.

In each Wave, the Particles go and return back again, through very short, but equal Spaces; the Motion of each Particle is analogous to the Motion of a vibrating Pendulum, while it performs two Oscillations; and most of the Laws of the Pendulum, with very little Alteration, are applicable thereto. See *PENDULUM*.

*Sounds* are as various, as are the Means that concur to their Production.

The principal Varieties are reducible to the Figure, Constitution, Quantity, &c. of the sonorous Body, the Manner of Percussion, with the Velocity, &c. of the Vibrations consequent thereon; the State and Constitution of the Medium; the Disposition, Distance, &c. of the Organ; the Obstacles between the Organ and the sonorous Object, and the adjacent Bodies: The most notable Distinctions of *Sounds*, arising from the various Degrees and Combinations of the Conditions mentioned, are into *loud* and *low* (or strong or weak) into *grave* and *acute* (or sharp and flat, or high and low) into *long* and *short*. The Management whereof, makes the Office of Music. See *SOUND* in *Music*.

The Velocity of *Sound* is the same, with that of the Waves; which does not differ much, whether it go with the Wind or against it. By the Wind, indeed, a certain Quantity of Air is carried from one Place to another; and the *Sound* is accelerated, while its Waves move through that Part of the Air, if their Direction be the same as that of the Wind. But as *Sound* moves vastly swifter than Wind, the Acceleration it will hereby receive, is inconsiderable. In effect, the most violent Winds we know of, have their Celerity to that of *Sound*, only as 1 to 33; and all the Effect we can perceive from the Wind, is, that it increases and diminishes the Space of the Waves; so that the *Sound* may be heard to a greater Distance than otherwise it would.

That the Air is the ordinary Medium of *Sound*, appears from various Experiments, in rarified and condensed Air.

In an exhausted Receiver, a small Bell may be heard some Distance; but when exhausted, it can scarce be heard at the smallest Distance. If the Air be condensed, the *Sound* will be louder, proportionally to the Condensation, or Quantity of Air crowded in: Of which we have many Instances in Mr. Hauksbee's Experiments; and this does not only succeed in forced Rarefactions, &c. but in such also, as are Natural; as is evident from *Frodo's* Story of his Journey to the Top of Mount *Carpathus* in *Hungary*.

But 'tis not the Air alone, that is capable of the Impressions of *Sound*; but Water also: as it manifests, by striking a Bell under Water, the *Sound* of which may plainly enough be heard, only not so loud, and also a Fourth deeper, by the Ear of some good Judges in musical Notes. Indeed *Alerfense* says, a *Sound* made under Water, is of the same Tone or Note, as if made in Air, and heard under Water.

The Velocity of *Sound* is variously reported by various Authors.

Sir *Isaac Newton* makes its Progress, in a Second of Time, to be 968 Feet; the Honourable Mr. *Francis Roberts* 1300 Feet; Mr. *Boyle* 1200 Feet; Dr. *Walker* 1338 Feet; *Alerfense* 1474 Feet; Mr. *Klamstead* and Dr. *Halley* 1142 Feet; the *Florentine Academy* 1148 Feet; the *French Observers*, *Hij. Acad. Reg.* 1172. The Reason of which Variety, Mr. *Dehamb* ascribes partly to those Gentlemen using Strings

and Plumets instead of regular Pendulums; partly to there not being Distance enough between the sonorous Body and the Place of Observation; and partly, to there being no Regard had to the Winds.

Some of the most considerable Queries, relating to the Laws of *Sounds*, the same Author proposes; and answers several of them accurately, from Experiments made for that Purpose by himself, as follows;

How far a *Sound* moves in a Second of Time? *Sound* moves 1142 Seconds in a Second, which is just an *English Mile* in 9  $\frac{1}{4}$  or 9.25 half Seconds; two Miles in 18  $\frac{1}{2}$ ; three Miles in 27  $\frac{3}{4}$ . &c.

Does the Report of a Gun, discharged with its Mouth towards us, come sooner than when the Muzzle is from the Observer? By repeated Experiments, it appears, there is no Difference in the *Sounds*, from this different Direction.

Do *Sounds* move in the same Time, the same Spaces, in all States of the Atmosphere, and Heights of the Barometer, by Day and by Night, in Summer and in Winter, in snowy and in clear Weather, in this or that Climate? By repeated Experiments, it does not appear there arises any Difference from any of these different Circumstances.

Do the Winds affect the Motion of *Sounds*? By repeated Experiments, it appears, there is some, though a very small Difference in the Velocity of *Sounds*, with or against the Wind; which is also augmented, or diminished, by the Strength or Weakness of the Wind.

Do a great and intense *Sound*, and a small or languid one, move with the same Velocity? It appears that they do.

Does the *Sound* of a Gun move equally swift at all Elevations of the Gun? They do.

Do different Quantities or Strengths of Gun-powder, occasion any Difference, as to the Velocity of the *Sound*? None.

Does *Sound* move in a right Line, the nearest Way; or does it sweep along the Earth's Surface? And is there any Difference in the Time, if the Piece be discharged in an acute and a declive Position? *Sound* moves the nearest Way; and the Velocity appears to be the same in Acclivities and Declivities.

Have all kinds of *Sounds*, as those of Guns, Bells, &c. the same Velocity? And are *Sounds* equally swift in the Beginning of their Motion, and in the End? There appears no Inequality in either of these respects.

For the Reflection of SOUND, } See § ECCHO.  
For the Refraction of SOUND, } See § REFRACTION.

*SOUND*, in Music, the Quality and Distinction of the several Agitations of the Air, consider'd as their Disposition, Measure, &c. may make Music. See *MUSIC*.

*Sound* is the Object of Music, which is nothing but the Art of applying *Sounds*, under such Circumstances of Tone and Tune, as to raise agreeable Sensations.

The principal Affection of *Sounds*, whereby it becomes fitted to have this End; is that, whereby it is distinguished into *Acute* and *Grave*. See *GRAVITY*, &c.

This Difference depends on the Nature of the sonorous Body, the particular Figure and Quantity thereof; and even, in some Cases, on the Part of the Body where it is struck; and is that which constitutes what we call different Tones. See *TONE*.

The Cause of this Difference appears to be no other than the different Velocities of the Vibrations of the sounding Body. In effect, the Tone of a *Sound*, is found, by abundance of Experiments, to depend on the Nature of those Vibrations, whose Differences we can conceive no otherwise, than as having different Velocities: And since 'tis proved, That the small Vibrations of the same Chord, are all performed in equal Time; and that the Tone of a *Sound*, which continues for some Time after the Stroke, is the same from first to last: It follows, that the Tone is necessarily connected with a certain Quantity of Time in making each Vibration, or each Wave; or that a certain Number of Vibrations or Waves, accomplished in a given Time, constitute a certain and determinate Tone.

From this Principle, are all the Phenomena of Tune deduced. See *TUNE*.

From the same Principle, arise what we call *Concords*, &c. which are nothing but the Results of frequent Unions and Coincidences of the Vibrations of two sonorous Bodies, and consequently of the Waves and undulating Motions of the Air, occasioned thereby. See *CONCORD*.

On the contrary, the Result of less frequent Coincidences of those Vibrations, is what we call a *Discord*. See *DISCORD*.

Another considerable Distinction of *Sounds*, with regard to Music, is that, whereby they are denominated *long* and *short*; not with regard to the sonorous Body's retaining a Motion once received, a longer or a less Time, though gradually growing weaker; but to the Continuation of the Impulse of the efficient Cause of the sonorous Body, for a longer or a shorter Time, as in the Notes of a Violin, &c. which are made

made longer or shorter, by Strokes of different Length or Quickness.

This Continuity, is, properly, a Succession of several Sounds, or the Effect of several distinct Strokes, or repeated Impulses on the sonorous Body, so quick, that we judge it one continued Sound; especially if it be continued in the same degree of Strength: And hence arises the Doctrine of *Melody and Time*. See *TIME*.

Sounds, again, are distinguished, with regard to Music, into *Simple and Compound*; and that two Ways:

In the First, a Sound is said to be *Compound*, when a Number of successive Vibrations of the sonorous Body and the Air, come to fall upon the Ear, that we judge them the same continued Sound; as in the Phenomenon of the Circle of Fire, caused by putting the fire'd End of a Stick in a quick, circular Motion; where, supposing the End of the Stick in any Point of the Circle, the Idea we receive of it there, continues till the Impression is renewed by a sudden Return.

A *simple Sound*, then, with regard to this Composition, should be the Effect of a single Vibration, or of so many Vibrations as are necessary to raise in us the Idea of Sound. In the second Sense of Composition, a *simple Sound* is the Product of one Voice, or one Instrument, &c.

A *compound Sound*, consists of the Sounds of several distinct Voices or Instruments all united in the same individual Time and Measure of Duration, that is, all striking the Ear together, whatever their other Differences may be: But in this Sense, again, there is a two-fold Composition; a *Natural and Artificial one*.

The natural Composition, is that proceeding from the manifold Reflexions of the first Sound from adjacent Bodies, where the Reflexions are not so sudden, as to occasion Echo's; but are all in the same Tune with the first Note. See *RESONANCE*.

The artificial Composition, which alone comes under the Musicians Province, is, that Mixture of several Sounds, which being made by Art, the Ingredient Sounds are sensible, and distinguishable from one another. In this Sense, the distinct Sounds of several Voices or Instruments, or several Notes of the same Instrument, are called *Simple Sounds*; in contradistinction to the *Compound ones*, wherein, to answer the End of Music, the Simples must have such an Agreement in all relations, chiefly as to Accents and Gravity, as that the Ear may receive the Mixture with Pleasure. See *COMPOSITION*.

Another Distinction of Sounds, with regard to Music, is that, whereby they are said to be *smooth and even, or rough and harsh, also clear and hoarse*; the Cause of which Differences, depends on the Disposition and State of the sonorous Body, or the Circumstances of the Place; but the Ideas of the Differences must be sought from Observation.

*Smooth and rough Sounds* depend, principally, on the sounding Body; Of these we have a notable Instance in Strings that are uneven, and not of the same Dimension or Constitution throughout.

M. Perrault, to account for *Roughness and Smoothness*, maintains, there is no such thing as a *simple Sound*; but that the Sound of the same Chord or Bell, 'tis a Compound of Sounds of the several Parts of it; so that where the Parts are homogeneous, and the Dimensions, or Figure uniform, there is always such a perfect Mixture and Union of all the Sounds, as makes one uniform and smooth Sound: Contrary Conditions, produce *Harshness*. In effect, a Likeness of Parts and Figure, makes an Uniformity of Vibrations, whereby a great Number of similar and coincident Motions conspire to fortify and improve each other, and unite, for the more effectual producing of the same Effect.

This Account he confirms, from the Phenomena of a Bell, which differs in Tone, according to the Part 'tis struck in; and yet strike it any where, there is a Motion over all the Part. Hence, he considers the Bell as composed of an infinite Number of Rings, which, according to their different Dimensions, have different Tones; as Chords of different Lengths have; and when struck, the Vibrations of the Parts immediately struck, specify the Tone, being supported by a sufficient Number of Consonant Tones in other Parts. This must be allowed, that every Note of a string'd Instrument, is the Effect of several simple Sounds: For there is not only the Sound resulting from the Motion of the String; but that from the Motion of the Parts of the Instrument, which has a considerable Effect in the total Sound, as is evident from hence, that the same String on different Violins, sounds very differently.

But Perrault affirms the same of every String in itself, and without considering the Instrument. Every Part of the String, he says, has its particular Vibrations, different from the gross and sensible Vibrations of the whole; and these are the Causes of different Motions and Sounds in the Particles, which uniting, compose the whole Sound of the String, and make an uniform Composition, wherein the Tone of the particular Part struck, prevails; and all the others mix under a due Subordination with it, so as to make the Composition smooth and agreeable. If the Parts be unevenly, or irregularly constituted, the Sound is harsh; which is the Case in what we call *false Strings*, and

various other Bodies; which, for this Reason, have no certain and distinct Tone; but a Composition of several Tones, which don't unite and mix, so as to have one predominant, to specify the total Tone.

As to *clear and hoarse Sounds*, they depend on Circumstances that are accidental to the sonorous Body: Thus a Voice or Instrument will be hollow and hoarse, if raised within an empty Hog's-head, that yet is clear and bright out of it: The Effect is owing to the Mixture of other and different Sounds, raised by Reflection, which corrupt and change the Species of the primitive Sound.

For Sounds to be fit to obtain the End of Music, they ought to be *smooth and clear*, especially the first; since without this, they cannot have one certain and discernible Tone, capable of being compared to others, in a certain relation of Accents, of which the Ear may judge; and of Consequence can be no Part of the Object of Music. Upon the whole, then, with Mr. Malcolin, we call that a *harmonic or musical Sound*, which being *clear and even*, is agreeable to the Ear, and gives a certain and discernible Tune; (hence called *musical Sound*) which is the Subject of the whole Theory of Harmony. See *HARMONY*.

SOUND, in Geography, a Streight, or Inlet of the Sea, between two Capes or Head-lands. See *STREIGHT*.

The Word is particularly used, by way of Eminence, for that famous Streight, which joins the *German Sea* to the *Baltic*.

It is situate between the Island of *Zeland* and the Coast of *Schonen*. 'Tis about sixteen Leagues long, and generally five broad, excepting against the Castle of *Cronenbourg*, where 'tis but one: So that there is no Passage for Vessels, but under the Cannon of the Fortrefs.

This has given occasion to the *Danes* to settle a Toll on all Vessels, which is one of the best Revenues of the Crown of *Denmark*; and to forbid all Pilots from passing through the great and little Belt, which are two other Inlets into the *Baltic*, though somewhat less commodious than the former. The *Swedish* Vessels are exempted from paying this Toll, by the Treaty of 1698, whereby the *Danes* yielded *South-Gotland* to the *Swedes*. See *TOLL*.

SOUND-BOARD, the principal Part of an Organ, and that which makes the whole Machine play. See *ORGAN*.

The *Sound-board* or *Sommer*, is a Reservoir, into which the Wind drawn in by the Bellows, is conducted by a Port-vent, and hence distributed into the Pipes placed over the Holes of its upper Part. This Wind enters them by Valves, which open by pressing upon the Stops or Keys, after drawing the Registers, which prevent the Air from going into any of the other Pipes, but those 'tis required in.

Organs, whose longest blind Pipes are four Foot, have their *Sound-Board* from five to six Feet. Organs of 16 Feet have two *Sound-Boards*, which communicate the Wind from one to the other, by a Pewter Port-vent.

SOUNDING, in Navigation, the trying of the Depth of the Water, and the Quality of the Bottom, by a Line and Plummet, or other Artifice.

There are two Kinds of Lines occasionally used in *Sounding* the Sea; the *Sounding Line* and the *deep Sea-Line*.

The first, is the thickest and shortest, as not exceeding 20 Fathom in Length; and marked at two, three and four Fathoms, with a Piece of black Leather between the Strands; and at Five, with a Piece of white Leather.

The *Sounding Line* may be used when the Ship is under Sail, which the *deep Sea-Line* cannot. The Plummet is usually in form of a Nine-pin, and weighs 18 Pounds; the End is frequently greas'd, to try whether the Ground be Sandy or Rocky, &c. Near Banks, Shores, &c. they are *Sounding* continually.

Dr. Hook has invented a manner of *Sounding* the Depth of the deepest Sea, without any Line; only by a wooden Globe, lighter than Water, to which, at a little Distance is a piece of Lead or Stone fire'd, by means of a springing Wire in the First, fitted into a Suple in the Second. The whole being let gently down, with the Stone or Lead foremost, as soon as that arrives at the Bottom, it will stop; but the Ball, by the Impetus it has acquired in descending, will be carried a little lower after the Weight is stopp'd; by which means the springing Wire will be enabled to fly back, and disengaging itself, will ascend.

By observing, then, the Time of the Ball's stay under Water by a Watch or Pendulum, and the Help of some Tables; the Depth of the Sea is found.

In some Experiments made in the *Thames* with a maple Globe, 5  $\frac{1}{2}$  Inches in Diameter, and weighing 4 Pound and a Half, lined with Pitch; and a conical Weight 11 Inches long, the Sharp End downwards; at the Depth of 19 Feet, there pass'd six Seconds; and at the Depth of 10 Feet 3  $\frac{1}{2}$  Seconds between the Immersion and Emergence of the Ball. From these Numbers given, the Depths, at any other stays, may be computed by the Rule of Three.

SOUP, a kind of Potage made of Bread, and Broth or the

the Juice of Flesh, or other Matters; usually served at the beginning of a Meal.

*Soup* is esteem'd essential to a French Meal. Occasionally, they improve the Relish by the Addition of Onions or Leeks, or Cabbage or Turnips, &c. The Word is French, form'd from the Italian, *Zuppa* or *Suppa*, of the Latin, *Sops*, Wine boil'd away to a Third Part. Others derive it from the German, *Soupp*, or the Celtic, *Souben*, which signify the same Thing.

**SOURCE.** See **SPRING.**

SOUTH direct Dial, } See { DIAL.  
SOUTHERN Sign, } See { SIGN.

**SOWING.** See **SEMINATION** and **SEMBRADOR.**

**SOWNE**, a Term used in the *Exchequer*; seeming to be a Corruption from the French *Souven*; that is, remembered. For the Statute, 4 H. 5. c. 7. in the Original French, hath *Des Effreits oriens Souven*. And such Effreits and Casualties, as are not to be remembered, run not in Demand, that is, are not Leviable. So now in the *Exchequer*, they say, such Effreits, as the Sheriff by his Industry cannot get, are Effreits that *Souven* not; and Effreits that *Souven*, are such as he may gather. See **ESTREAT.**

**SPACE**, a simple Idea. The Modes, whereof, are Distance, Capacity, Extension, Duration, &c. See **MODE**, **EXTENSION**, **DURATION**, &c.

**SPACE**, in Philosophy, considered barely in Length between any two Bodies; is the same Idea which we have of Distance. See **DISTANCE.**

If it be considered in Length, Breadth and Thickness, it is properly called *Capacity*. See **CAPACITY.**

When considered between the Extremities of Matter, which fills the Capacity of *Space*, with something Solid, Tangible and Moveable, it is then called *EXTENSION*. So that Extension is an Idea belonging to Body only; but *Space*, it is plain, may be considered without it. See **BODY.**

*Space*, therefore, in the general Signification, is the same thing with Distance, considered every Way, whether there be any solid Matter in it or not.

Accordingly, *Space*, is either *Absolute* or *Relative*.

*Absolute Space*, is that considered in its own Nature, without regard to any thing External; which always remains the same; and is infinite and immovable.

*Relative Space*, is that moveable Dimension, or Measure of the former, which our Senses define by its Positions to Bodies within it; and this the Vulgar use for immovable *Space*.

*Relative Space*, in Magnitude and Figure, is always the same with *Absolute*; but it is not necessary it should be so numerically; as if you suppose a Ship to be, indeed, in absolute Rest, then the Places of all Things within her, will be the same Absolutely and Relatively, and nothing will change its Place: But, suppose the Ship under Sail, or in Motion, and she will continually pass through new Parts of absolute *Space*: But all Things on Board, considered relatively, in respect to the Ship, may be, notwithstanding, in the same Place, or have the same Situation and Position, in regard to each another.

Proper and absolute Motion, is defined to be the Application of a Body to different Parts of *Absolute*, that is, of infinite and immovable *Space*. See **PLACE**, **MOTION** and **REST.**

The *Carresians*, who make Extension the Essence of Matter, assert, That the *Space* any Body takes up, is the same thing with the Body itself; and that there is no such Thing as mere *Space*, void of all Matter, in the Universe: But this see disprov'd under the Article **VACUUM.**

**SPACE**, in Geometry, is the Area of any Figure; or that which fills the Intervals or Distance between the Lines that terminate it. See **AREA** and **FIGURE.**

The *Parabolic Space*, is that included in the whole Parabola. See **PARABOLA.**

The *Conchoidal Space*, and the *Ciffoidal Space*, are what are included within the Cavity of the Conchoid and Ciffoid.

By the new Methods now introduced, of applying Algebra to Geometry, 'tis demonstrated, That the *Conchoidal* and *Ciffoidal Spaces*, though infinitely extended, are yet finite Magnitudes. See **CONCHOID** and **CISSOID.**

**SPACE**, in Mechanicks, the Line a moveable Body, consider'd as a Point, is conceived to describe by its Motion. See **MOTION.**

**SPHENOPHARYNGÆUS**, in Anatomy, a Pair of Muscles, called also *Pharyngopharyngæus*, *Cephalopharyngæus*, &c. See **PHARYNGOPHARYNGÆUS.**

**SPAGYRIC**, an Epithet given to Chymistry; which is called the *Spagyric Art*, or *Medicina Spagyrica*; and to Chymical Physicians, who are also called *Spagyristæ*. See **CHYMISTRY.**

*Sphus* derives the Word from the Greek, *σφαις*, to extrude, and *σφραγισσιν*, to collect; which are the two principal Offices of Chymists. *Paracelsus* first introduced the Word.

**SPAH**, a Horse-man in the Ottoman Army, chiefly raised in Asia.

The chief Strength of the Grand Signor's Army consists in the Janizaries, who are the Foot, and the *Spahis*, who are the Horse. See **JANIZARY**, &c.

The Aga or Commander of the *Spahis*, is also called *Spahi Agasi*.

**SPALT**, or **SPELT**, a white, scaly, shining Stone, frequently used to promote the Fusion of Metals. 'Tis found pretty frequently in England and Germany; and sometimes brought from the Levant. The best is in long Scales, very soft, and easily pulveris'd. The English Stone is generally very hard.

**SPAN**, a Measure taken from the Space between the Thumb's End, and the Top of the little Finger, when both are stretch'd out. The *Span* is estimat'd at three Hand-breadth's, or nine Inches. See **MEASURE.**

**SPANISH**, or the **SPANISH Language**. See **LANGUAGE.**

**SPANISH-FLIES**. See **CANTHARIDES.**

**SPANISH-INSPIRATION**, &c. See **INSPIRATION.**

**SPAR**, in Natural History, a shining, stony Substance, frequently found in Caves and Grotto's, in the Clefts of Rocks, Lead-Mines, &c. See **STONE**, **GROTTO**, &c.

Mr. *Beaumont*, in the *Philosophical Transactions*, endeavours to account for the Origin and Growth of *Spar*; which he makes to be a kind of *Rock Plant*.

*Spar*, he observes, may be form'd three Ways; either from Steams alone, or from Steams coagulating Dew, as it falls on the Ground, or Waters issuing from the Joints of Rocks: Or, it may grow from Earths and Clays. To say nothing of the Account we have from *Sweeterland*, viz. That Snow, by long lying and continual Frosts, becomes hardened into *Spar*.

We have Instances of the first Kind in many Grotto's where *Spars* produced from Steams, hang like Icicles; Lead Ore being often found to grow in the same Manner. And as this *Spar* grows downwards; so in many Places, from the Sides of it, issue little Plains of *Spar*, shooting upwards, contrary to the Tendency of the others. An Instance of the second, we have in a certain Place in Italy, where Crystals (which are a sort of *Spar*) are produced in clear Evenings, from a Coagulation of Dew falling on Nitrous Stones. But hereof we have Instances enough near Home. See **STALACTITES.**

For the third Kind of Generation of *Spar*, never before taken Notice of by Naturalists; Mr. *Beaumont* gives us Instances of it in *Mesopotamia* Hills, and other Mines, wherein are Subterranean Vaults or Grotto's. In the Bottoms of some of these, is a Secum incumbent thereon. From this Earth, flows up Spires of various Heights, &c. from the first Budgings out of it, till it is come as high as a Man's Finger; the biggest ordinarily an Inch in Diameter. These Spires have all irregular Ridges and Furrows; and some sooner, some later, begin on the Tops to be congelated into *Spar*; and so gathering a Crust downwards by degrees, are all at last, tum'd into an absolute white *Spar* or Stone. See **PETRIFICATION.**

**SPARADRAP**, in Pharmacy, &c. an ancient Name for a Sear-cloth, or Cere-cloth; or a Cloth smear'd on each Side with a kind of Plaster. See **CERE-CLOTH.**

'Tis prepared by melting a sufficient Quantity of some Plaster or Unguent, and dipping a linen Cloth therein, till such time as it have imbibed its fill. 'Tis then taken out, cool'd and polish'd on a Marble.

There are as many different Kinds of *Sparadraps*, as there are of Plasters for the Cloth to be dip'd in. 'Tis sometimes also called *Tela Gualteriana*.

**SPARRING**, among Cock-fighters, is the fighting a Cock with another to breathe him. In *sparring*, they put Horns on their Spurs, that they may not hurt one another. To *sparris* a Cock, imports in general, to breathe him, to embolden him to Fight.

**SPASMA** or **SPASMUS**, in Medicine, a Greek Term, *σπασμος*, of equal Import with the Latin, *Convulsio*, and the English, *Convulsion*. See **CONVULSION.**

A *Spasmus* happening after the taking of Hellebor, or any other violent Purgative, is mortal.

There are *Spasms*'s peculiar to certain Members, and distinguished by particular Names: That of the Mouth is called *Spasmus Cynicus*; that of the Penis, *Satyrismus*, &c. See **SATYRIASIS**, **CYNICUS**, &c.

*Cardiac* distinguishes two Kinds of *Spasms*'s: The first consisting in a constant Contraction of the Muscles, which renders the Members rigid, and inflexible. The second, is sudden, unatural Motions and Palpitations, frequently intermitting and beginning again.

Accidental *Spasms*, are of little Continuance: There are some arising from *Fistulencies*; from Bites of venomous Beasts, from the Puncture of a Nerve, the Acrimony of the Humours veiling the Stomach, Vapours of the Matrix, excessive Cold, &c.

**SPASMODIC**, something belonging to a *Spasmus*, or *Convulsion*.

vulſion; as a *Spasmodic Medicine, Spasmodic Diſeaſe, &c.* See *SPASMA*.

Hunger, according to *M. Heoquer*, is a *Spasmodic Affection* of the Fibres of the Stomach; unless it arises from the Fibres being too much moiſten'd by the Liquor thereof, ſo as to incapacitate them for their Office. See *HUNGER*.

*SPATULA*, an Inſtrument uſed by Surgeons and Apothecaries; made flat at one end, and round at the other. The Surgeons have little Silver or Steel *Spatulas*, to ſpread their Plaſters and Unguents withal.

The Apothecaries have large ones of Wood, to ſtir their Drugs in diluting, tempering or boiling them. This Word is form'd from the *Latin, Spatula*, of the *Greek spatula*.

*SPAVIN*, a Dilate in a Horſe; being a Swelling or Stiffneſs in the Ham, that cauſes him to halt.

There are two Kinds of *Spavins*, viz. the *Ox-Spavin*, which is a callous Tumour, at the Bottom of the Ham, on the Inſide, hard as a Bone, and very painful. While 'tis yet young, ſome Horſes only halt with it, at the firſt coming out of the Stable.

The *dry Spavin* is more eaſily perceived, by the Horſe's raiſing one of his hind Legs, with a Twitch, higher than the other. Sometimes 'tis found on both Legs. This Kind frequently degenerates into the *Ox-Spavin*, for which there is no Remedy, but to apply the Fire; which, however, is not always ſucceſsful.

The Word is form'd from the *French, Eſpavin*, which ſignifies the ſame thing.

There are two other Kinds of *Spavins*, which have their Seat in the Hoof, viz. the *Blood Spavin*, and *Bone Spavin*; which ſee under their proper Articles.

*SPAWS*, are Springs of Water, ariſing out of Minerals in the Earth, or from Mines of Nitre, Sulphur, Allum, Bitumen, Copperas, &c. See *MINERAL* and *WATER*.

*Spaws* are phyſical Waters, ſome purging by Urine, others by Vomit, and Stool.

That in *Yorkſhire* is the moſt noted of this Kind in *England*. See *BATH*.

*SPAYING*, the Operation of Caſtrating the Females of ſeveral Kinds of Animals, as Sows, Bitches, &c. to prevent any further Conception, and promote their fattening. See *CASTRATION*.

'Tis perform'd, by cutting them in the mid Flank, on the left Side, with a ſharp Knife or Lance, taking out the Birth-Bag and cutting it off, and ſo ſtirching up the Wound, anointing the Sore with Tar, and keeping the Animal warm for two or three Days.

The uſual Way, is to make the Inciſion a ſlope, two Inches and a Half long, that the Fore-finger may be put in towards the Back, to feel for Two Kernels, as big as Acorns on both Sides the Birth, one of which is drawn to the Wound, the String thereof cut, and thus both taken out.

*SPEAKER*, a Member of the Houſe of Commons, elected by a Majority of the Votes thereof, to act as Chair-man, or Preſident, in putting Queſtions, reading Briefs or Bills, keeping Order, reprimanding the Refractory, adjoining the Houſe, &c.

The firſt Thing done upon the firſt Meeting of a Parliament, is to chuſe a *Speaker*; who is to be approved of by the King; and who upon his Admiſſion, begs his Maſteſty, That the Commons, during their Sitting, may have free Acceſs to his Maſteſty; Freedom of Speech in their own Houſe, and Security from Arreſts.

The *Speaker* is not allowed to perſuade or diſſuade, in paſſing of a Bill; but only to make a ſhort and plain Narrative; nor to Vote, unless the Houſe be equally divided. See *PARLIAMENT*.

The Lord Chancellor is uſually *Speaker of the Houſe of Lords*. See *CHANCELLOR*.

The *Speaker of the Convocation*, is called the *Prolocutor*. See *PROLOCUTOR*.

*SPEAKING*, the Art or Act of expreſſing one's Thoughts in articulate Sounds or Words. See *WORD* and *VOICE*; ſee alſo *SPEECH* and *GRAMMAR*.

*Pliny, Aelian, Plutarch* and other Authors, make mention of ſeveral Beasts that have *Spoke*: And *Pliny* himſelf, ſpeaks with Assurance, in his Hiſtory, of an Ox that *Spoke*. *Philopſtrates*, in his Life of *Apollonius*, gives the like Privilege to an Elm, and even to Ships. *Honor* makes *Xanthus*, one of *Achilles's* Horſes, ſpeak; wherein he has been followed by *Oppian*. But theſe are all fabulous: We have much better Authority for a Serpent, and an *Aſ's* ſpeaking. See *LANGUAGE*.

*SPEAKING-Trumpet*. See *TRUMPET*.

*SPECIAL*, ſomething that has a particular Designation; from the *Latin, Species*; in Oppoſition to *general*, of *Genus*. See *SPECIES* and *GENUS*.

The King in his Letters, frequently ſays, of our *Special Grace*, full Power and royal Authority.

*SPECIAL Matter*, in Evidence, in Law. See *GENERAL Iſſue*.

*SPECIAL Verdict*, &c. See *VERDICT*, &c.

*SPECIALTY*, in Law, is moſt commonly taken for a Bond, Bill, or ſuch like Inſtrument. Sometimes it is alſo uſed for *SPECIAL* or particular Acquaintance.

*SPECIES*, an Idea, which relates to ſome other more general one; or is compris'd under a more univerſal Division of a Genus. See *GENUS*.

*Species* is a mere Term of Relation: And the ſame Idea may be a *Species*, when compared to another more general one; and a *Genus*, with regard to a more particular one. Thus *Body* is a *Genus*, with regard to an animate and inanimate *Body*; and a *Species*, with regard to *Subſtance*.

The laſt *Species*, is that which can only be divided into Individuals. See *INDIVIDUAL*.

Animal is a *Species*, with regard to *Body*; and Man is a *Species* with regard to Animal. God deſtroys'd Mankind by the Deluge; but he preſerv'd the *Species*. See *DELUGE*.

*SPECIES*, in Logic, is one of the Five Words, call'd by *Porphyry, Universals*. See *UNIVERSAL*.

The Word is *Latin*, form'd from the ancient Verb, *Specio*, I ſee; as if a *Species* of Things were a Collection of all the Things ſeen at one View.

*SPECIES*, in Rhetoric, is a particular Thing, contained under a more univerſal one.

The Orators alſo call it *Hypothetiſis*, E. gr. Virtue is to be loved, is the *Genus* or *Theſis*. Temperance is to be preſerv'd here, at this Time, is the *Species* or *Hypothetiſis*. See *TERTIUS*.

*SPECIES*, in the ancient Muſic, a Sub-division of one of the *Genera*.

The *Genera* of Muſic were Three, the *Eubarmonic, Chromatic* and *Diatoſic*; the two laſt of which were variously ſub-divided into *Species*; nor was the Firſt without *Species*; though thoſe had not particular Names as the *Species* of the other Two had.

Theſe *Species* were alſo called the *Chromi*, Colours of the *Genera*: The Conſtitution whereof, ſee under the Article *GENERA*.

*SPECIES*, in Opticks, the Image painted on the Retina by the Rays of Light reflected from the ſeveral Points of the Surface of Objects, received in at the Pupilla, and collected, in their Paſſage through the Cryſtallin, &c. See *VISION*.

The Philoſophers have been in great Doubt, whether the *Species* of Objects, which give the Soul an Occaſion of Seeing, are an Effluſion of the Subſtance of the *Body*; or a mere Impreſſion which they make on all ambient Bodies, and which they all refleſt, when in a proper Diſtance and Diſpoſition; or, laſtly, whether they are not ſome other more ſubtle *Body*, as Light, which receives all theſe Impreſſions from Bodies, and is continually ſent and returned from one to other, with the different Figures and Impreſſions it had taken on all Sides: But the Moderns have decided this Point by their Invention of artificial Eyes, wherein the *Species* of Objects are received on a Paper or Linnen-ſloth in the ſame manner as they are received in the natural Eye. See *EYE*.

The Ancients have diſtinguiſhed the *Species*, whereby Objects become viſible, into *Impreſſe* and *Expreſſe*.

*Impreſſ'd Species* are ſuch, as come from without; or are ſent from the Object to the Organ; ſuch are thoſe we have already been ſpeaking of.

*Expreſſ'd Species*, are thoſe, on the contrary, from within; or that are ſent from the Organ to the Object.

*Le Clerc*, in his System of Viſion, by one of thoſe Revolutions very frequent in philoſophical Opinions, has call'd upon the Stage again the *Species expreſſe*, of the ancient Philoſophers. For, according to him, 'tis not by *Species* or Images impreſſ'd on the Optic Nerve, that the Soul ſees Objects; but by Rays, which ſhe herſelf directs to them, and which ſhe uſes as a Blind Man does his Staff, to grupe out Objects.

The Peripatetics account for Viſion, from a kind of *Intentional Species*, thus: Every Object, ſay they, expreſſes a perfect Image of itſelf on the Air next to it. This expreſſes another leſſer one on the Air next to that; and this a Third ſtill leſſ. Thus are the Images continued from the Object to the Cryſtallin, which the Philoſophers hold the principal Organ of Seeing. Theſe they call *Species intentionales*; and to account the better for their Generation, affirm, That Objects exhibit them in the ſame Manner, as Mirrors do a Man's Face.

*SPECIES*, in Theology, the Appearance of the Bread and Wine in the Sacrament, after Conſecration: Or, as the *Romaniſts* call them, the Accidents remaining in the Bread, &c. whereby they become ſenſible to us, after their Subſtance is deſtroys'd.

The *Species* of the Bread, &c. are its Whiteness, Quantity, Figure, Friableness, &c. Of Wine, its Flavour, Quickneſs, ſpecific Gravity, &c.

The Generality of the *Ramiſh* Divines, hold, That the *Species* are abſolute Accidents: And the *Carteſians*, who are bound to deny any ſuch Things as abſolute Accidents, are greatly puzzled to explain the *Species*, without incurring the Cenſure of Hereſy. *F. Moreau* is forced to aſſert, That

the *Species* are mere Delusions and Appearances, which God impresses on our Senses. See *ABSOLUTE Accident*.

*SPECIES*, in Commerce, are the several *Prices* of Gold, Silver, Copper, &c. which having pass'd their full Preparation, and Coinage, are current in Publick. See *COIN*.

*Species decies*, or *cries decies*, are such as the Prince has forbidden to be received in Payment.

*Light Species*, are those that fall short of the Weight prescribed by Law.

*False Species*, are those of different Metal from what they should be, &c.

*SPECIES*, in Algebra, are the Symbols, or Characters, whereby the Quantities are represented. See *CHARACTER*.

*SPECIFIC*, in Philosophy, that which is proper, or peculiar to any thing; that characterizes it, and distinguishes it from every other Thing.

Thus the attracting of Iron is *Specific* to the Load-stone, or a *Specific* Property of the Load-stone.

A just Definition should contain the *Specific Notion* of the Thing defined, or that which *specifies* and distinguishes it from every thing else. See *DEFINITION*.

*SPECIFIC*, in Medicine, a Remedy, whose Virtue and Effect is peculiarly adapted to some certain Disease; is adequate thereto; and exerts its whole Force immediately thereon.

Thus Quinquina, or the Jesuits Bark, is held a *Specific* for intermitting Fevers or Agues; Mercury for the Venereal Disease, &c. See *QUINQUINA*.

Authors make mention of three Kinds of *Specific Medicines*.

1<sup>o</sup> Such as are eminently and particularly friendly to this or that Part, as the Heart, the Lungs, the Brain, the Stomach, &c.

2<sup>o</sup> Such as seem to attract, expell, or evacuate some determinate Humour, by a kind of *Specific Power* they are endowed withal; as Jalap is supposed to purge watery Humors, Rhubarb, Bile, &c.

And, 3<sup>o</sup> Such as remove the Cause of a Disease, by some sudden Property, without our knowing how or why; or the Manner of whose Operations we are entirely ignorant of, and have only learnt their Effects by Experience.

In the Use of these last, there is no Enquiry into the Nature of the Disease; no regard had to the Symptoms or Phenomena: Nor is the Medicine to be at all adapted to the particular Circumstances thereof. All that we regard, is the Name of the Disease, and that of the Remedy: As, immediately upon finding an intermitting Fever, we prescribe the Bark; to assuage Pain, Opium; to expell Poison, some particular Antidote.

A *Specific Medicine*, therefore, stands in Opposition to a *Scientific* or *Methodic* Medicine. See *MEDICINE*.

*SPECIFIC Gravity*, in Hydrostatics, that Gravity, or Weight peculiar to each *Species*, or Kind of natural Body; and whereby it is distinguished from all other Kinds. See *WEIGHT*.

In this Sense, a Body is said to be *Specifically Heavier* than another, when under the same Bulk it contains a greater Weight than that other; and that other, is said to be *Specifically Lighter* than the First. Thus, if there be two equal Spheres, each a Foot in Diameter; only the one Wood, the other Lead: Since the Leaden one is found heavier than the Wooden one, it is said to be *Specifically* or in *Species*, *Heavier*, and the Wooden one *Specifically Lighter*.

This kind of Gravity, some call *relative Gravity*; in opposition to *absolute Gravity*, which increases in Proportion to the Quantity or Mass of the Body. See *GRAVITY*.

#### Laws of the SPECIFIC Gravity and Levity of Bodies.

1. If two Bodies be equal in Bulk, their *Specific Gravities* are, to each other, as their *absolute Gravities*. Thus a Body is said to be twice as heavy, *Specifically*, as another, if it have twice its Gravity under the same Bulk.

Hence, the *Specific Gravities* of equal Bodies, are as their *Densities*. See *DENSITY*.

2. The *Specific Gravities* of Bodies of the same Weight, are in a reciprocal *Ratio* of their Bulks. Hence, the *Masses* of two Bodies of the same Weight, are in a reciprocal *Ratio* of their Bulks.

3. The *Specific Gravities* of two Bodies are, in a *Ratio*, compounded of the direct *Ratio* of the *absolute Gravities*, and the reciprocal one of their Bulks.

Hence, again, the *Specific Gravities* are as the *Densities*.

4. A Body *Specifically* heavier than a Fluid, loses so much of its Weight therein, as is equal to a Quantity of the Fluid of the same Bulk.

For, suppose a Cubic Inch of Lead immersed in Water: a Cubic Inch of Water will, thereby, be expell'd from its Place: But the Weight of this Water was sustained by the Resistance of the ambient Water. Therefore, such a Part of the Weight of the leaden Cube, must be sustained by the Resistance of the ambient Water, as is equal to the Weight of the Water expell'd. The Gravity of the Body immerg'd, therefore, must be diminished by so much.

Hence, 1<sup>o</sup> Since a Fluid *Specifically* heavier, has a greater Weight, in the same Bulk, than a lighter; the same Body will lose a greater Part of its Weight in a Fluid, *Specifically* heavier than in a lighter; and therefore it weighs more in a lighter than a heavier.

2<sup>o</sup> Equal homogeneous Bodies weighing equally in Air, lose their Equilibrium, if one of them be immerg'd in a heavier Fluid; the other in a lighter.

3<sup>o</sup> Since the *Specific Gravities* are as the *absolute Gravities* under the same Bulk; the *Specific Gravity* of the Fluid, will be to the Gravity of the Body immerg'd; as the Part of the Weight lost by the Solid, to the whole Weight.

4<sup>o</sup> Two Solids equal in Bulk, lose the same Weight in the same Fluid; but the Weight of the *Specifically* heavier Body, is greater than that of the *Specifically* lighter; therefore, the *Specifically* lighter, loses a greater Part of its Weight, than the *Specifically* heavier.

5. Since the Bulks of Bodies equal in Weight, are reciprocally as the *Specific Gravities*; the *Specifically* lighter, loses more Weight in the same Fluid than the heavier; wherefore, if they be in *Equilibrium* in one Fluid; they will not be so in another; but the *Specifically* heavier, will preponderate, and that the more as the Fluid is denser.

5. The *Specific Gravities* of Fluids, are as the Weights lost by the same Solid immerg'd in the same.

#### To find the SPECIFIC Gravity of any Fluids.

On one Arm of a Balance suspend a leaden Globe; and to the other, fasten a Weight, which is in *Equilibrium* therewith in the Air. Immerge the Globe successively in the several Fluids, whose *Specific Gravities* are to be determined, and observe the Weight which balances it in each. These several Weights, subtracted, severally, from the first Weight, the Remainders are the Parts of the Weight lost in each Fluid. Whence the *Ratio* of the *Specific Gravity* of the Fluids is seen. See *HYDROSTATICAL Balance*.

Hence, as the *Densities* are as the *Specific Gravities*; we find the *Ratio* of the *Densities* of the Fluids at the same time.

This Problem is of the utmost Use; as by it, the Degree of Purity or Goodness of Fluids, is easily found; a Thing, not only of Service in Natural Philosophy; but also in common Life, and in the Practice of Physic.

At different Seasons of the Year, the *Specific Gravities* of the same Fluids, are found different. *Joan. Cass. Ephem. medius*, in his *Disquisitio Nova de Ponderibus*, &c. gives us Variety of Experiments relating hereto: The principal whereof, to save the Trouble of too frequent Experiments, we shall here subjoin.

Table of SPECIFIC Gravities of several Fluids.

A Cubic Inch Paris Measure.	In Summer		In Winter	
	O.	D. G.	O.	D. G.
Of Mercury	7	1 66	7	2 14
Oil of Vitriol	7	59	7	2 11
Spirit of Vitriol	5	33	5	38
Spirit of Nitre	6	24	6	44
Spirit of Salt	5	49	5	55
Aquafortis	6	23	6	35
Vinegar	5	15	5	21
Distill'd Vinegar	5	11	5	15
Burgundy Wine	4	67	4	75
Spirit of Wine	4	32	4	42
Pale Ale	5	1	5	9
Brown Ale	5	2	5	7
Cows Milk	5	20	5	25
Goats Milk	5	24	5	28
Urine	5	14	5	19
Spirit of Urine	5	45	5	53
Oil of Tartar	7	27	7	43
Oil of Olives	4	55	Is froze in Winter	
Oil of Turpentine	4	39	4	46
Sea Water	6	12	6	18
River Water	5	10	5	13
Spring Water	5	11	5	14
Distill'd Water	5	8	5	11

That the *Specific Gravity* may be found the more accurately; the Weight of the Thread not immerg'd in the Fluid, is to be subtracted from the Weight of the Solid in Air; and the Force necessary to make the Thread subside (if it be *Specifically* lighter) is to be added to the Weight lost: but if the Thread that sustains the Solid be heavier than the Fluid; the whole Weight of the Thread in the Air is to be subtracted from the Weight of the Solid in Air; and the Weight the Thread loses from the Weight lost in the Fluid. Indeed, this Precaution may be spared, if in examining the *Specific Gravity* of several Fluids, Care be taken that the same Thread be immerg'd to the same Depth in each.

6. To determine the *Ratio* which the *Specific Gravity* of a Fluid has to the *Specific Gravity* of a Solid, that is *Specifically* heavier than the Fluid.

Weight any Mass of the Solid in the Fluid, and note the just Weight therein: The *Specific Gravity* of the Fluid will be to that of the Solid, as the Part of the Weight lost by the Solid, is to its whole Weight.

7. The *Specific Gravities* of equally heavy Bodies, are reciprocally as the Quantities of Weight lost in the same Fluid. Hence we find the *Ratio* of the *Specific Gravities* of Solids, by weighing Masses thereof, that are equal in Air, in the same Fluid; and noting the Weights lost by each.

The *Specific Gravities* of various Solids, have been determined by many Authors. *Martin Gualdus*, particularly tried the *Specific Gravities* various Bodies had, especially metallic Ones; which were borrowed thence by *Ouyferré*. In the *Philosophical Transactions*, we have very prolix Tables of *Specific Gravities*, by various Authors.

'Twill be sufficient for us to give those of some of the more usual Bodies, as determined with great Care and Accuracy by *M. Peris*; and publish'd by *F. Alferfens*; and from him by several others.

Table of the *SPECIFIC Gravities* of several Solids.

An Hundred pound Weight of Gold, is equal in bulk to

71 $\frac{1}{2}$ of Mercury	38 $\frac{1}{2}$ of fine Tin
60 $\frac{1}{2}$ of Lead	26 of Lead-stone
54 $\frac{1}{2}$ of Silver	21 of Marble
47 $\frac{1}{2}$ of Copper	14 of Stone
45 of Brats	12 $\frac{1}{2}$ of Sulphur
42 of Iron	5 of Wax
39 of Tin	5 $\frac{1}{2}$ of Water.

8. A Body *Specifically* heavier, descends in a Fluid *Specifically* lighter, with a Force equal to the Excess of its Weight, over that of an equal Quantity of the Fluid.

Hence, 1<sup>o</sup>. The Force which sustains a *Specifically* heavier Body in a Fluid, is equal to the Excess of the absolute Gravity of the Body above that of the Fluid, under the same Bulk; *E. gr.* 47  $\frac{1}{2}$  Pound of Copper loses 5  $\frac{1}{2}$  Pounds of its Weight in Water; therefore a Power of 42 Pounds is able to sustain it.

2<sup>o</sup> Since the Excess of the Weight of a Solid over the Weight of a Fluid *Specifically* heavier, is less than that over the Weight of a *Specifically* lighter Fluid under the same Bulk; it will descend with less Force in a *Specifically* heavier Fluid than in a lighter; and, consequently, will descend more slowly in the former than in the latter.

3<sup>o</sup> A *Specifically* lighter Body, sinks in a heavier Fluid, till the Weight of a Quantity of the Fluid, equal in Bulk, to the Part immersed, is equal to the Weight of the whole Body.

Hence, 1<sup>o</sup>. Since the *Specific Gravities* of Bodies of the same Weight, are reciprocally as their Bulks; and the Bulks of Fluids equal in Weight, are as the Parts of the same Solid immersed therein; the *Specific Gravities* of Fluids are reciprocally as the Parts of the same Body immersed therein.

2<sup>o</sup> A Solid, therefore, immerses deeper in a lighter Fluid than a heavier; and deeper as the Proportion of the *Specific Gravity* of the Solid to that of the Fluid is greater.

3<sup>o</sup> If a Body be of the same *Specific Gravity* with a Fluid; the whole Body will be immersed; and it will remain in any given Place of the Fluid.

4<sup>o</sup> If a *Specifically* lighter Body be wholly immersed in a Fluid; it will be urged by the collateral Columns of the Fluid, to ascend with a Force equal to the Excess of the Weight of the Fluid, Bulk for Bulk, over the Weight of the Solid.

5<sup>o</sup> A Body, therefore, *Specifically* lighter, lying on the Bottom of a Vessel, will not be raised up, unless the heavier Fluid rise above such a Part, as is equal in Bulk to a Quantity of the Fluid of the same Weight with the whole Solid.

10. The *Specific Gravity* of a Solid, is to the *Specific Gravity* of a lighter Fluid, wherein 'tis immersed, as the Bulk of the Part immersed, is to the whole Bulk.

11. The *Specific Gravities* of equal Solids, are as their Parts immersed in the same Fluid.

12. The Weight and Bulk of a *Specifically* lighter Body, and the Weight of the *Specifically* heavier Fluid, being given, to find the Force required, to keep the Solid wholly immersed under the Fluid.

As this Force is equal to the Excess of the Weight of the Fluid, beyond that of an equal Bulk of the Fluid; from the given Bulk of the Solid, and the Weight of a Cubic Foot of Water, find, by the Rule of Three, the Weight of a Bulk of Water, equal to that of the Body. From this, subtract the Weight of the Solid; the Remainder is the Force required. *E. gr.* Suppose the Force necessary to detain a Solid Eight Feet in Bulk, and 100 Pounds in Weight, under Water, required: Since a Cubic Foot of Water is found

to weigh 70 Pound; the Weight of Water under the Bulk of Eight Feet, is 560; whence, 100 Pound, the Weight of the Solid, being subtracted; the Remainder 460 Pound, is the Force necessary to detain the Solid under Water.

Hence, since a *Specifically* lighter Body ascends in a heavier Fluid, with the same Force that would prevent its Ascent; by the present Problem, we can likewise find the Force wherewith a *Specifically* lighter Body ascends in a heavier.

13. The Weight of a Vessel, to be made of a *Specifically* heavier Matter; and that of a *Specifically* lighter Fluid, being given; to determine the Cavity the Vessel must have, to swim on the Fluid.

The Weight of a Cubic Foot of the Fluid being given; the Bulk of the Fluid equal to the Weight of the Vessel, is found by the Rule of Three. If, then, the Cavity be made a little bigger than this, the Vessel will have less Weight under the same Bulk, than the Fluid, and will therefore be *Specifically* lighter than the same, and consequently, will swim. *E. gr.* Suppose it required to make an Iron Ball of 30 Pounds Weight, so as it shall swim upon Water. Since the Weight of a Cubic Foot of Water is 70 Pound, the Quantity of Water equal to 30 Pounds, will be found 728 571; and therefore the Cube of the Diameter of the Sphere 1392174, whence the Cube Root being extracted 1' 1" 1" is the Diameter of a Sphere of Water of 30 Pounds. If, therefore, the Diameter of the Cavity be made a little bigger, *e. gr.* 1  $\frac{1}{2}$  or 2 Feet; so much less of the Ball will be immersed as the Diameter is increased.

14. The Force employ'd to retain a *Specifically* lighter Solid, under a heavier Fluid; and the Weight lost by a heavier Solid in a lighter Fluid; are each added to the Weight of the Fluid, and weigh together with it.

The several Theorems here deliver'd, are not only all demonstrable from the Principles of Mechanics; but are conformable to Experiment. In effect, Experience is here found to answer exactly to Calculation, as is abundantly evident from the Courses of philosophical Experiments, now frequently exhibited; where the Laws of *Specific Gravitation* are well illustrated.

**SPECILLUM**, is an Instrument, wherewith Surgeons scatch Wounds; in manner of a Probe.

**SPECIOUS Arithmetic**, is that conversant in Quantities, design'd by *Species*, that is by the Letters of the Alphabet; in contradistinction to that, where the Quantities are express'd by Numbers, which is call'd *Numerous Arithmetic*. See **ARITHMETIC**; see also **SPECIES**.

*Species Arithmetic*, is what we more usually call *Algebra*. See **ALGEBRA**.

**SPECTACLE**, *Stero*; some extraordinary Object, which draws the View and Attention; and is not beheld without great Emotion.

The Term is chiefly us'd by the Ancients, for theatrical and amphitheatrical Performances: For Comedies, Combats of Gladiators, of Beasts, and even for solemn Processions, as those of the *Circus*, &c.

The People of *Rome* were extremely fond of *Spectacles*; and the *Roman* Historians observe, There was no surer Way of gaining their Affections, and making Parties to introduce Tyranny and Oppression, than by the Use of *Spectacles*.

**SPECTACLES**, an Optic Machine, consisting of two Lens's set in Horn, or other Matter; and applied on the Nose; to assist in Defects of the Organ of Sight. See **LENS**.

Old People and all Presbyter, use *Spectacles* of convex Lens's, to make Amends for the flatness of the Eye, which does not make the Rays converge enough to have them meet in the Retina. See **PRESBYTER**.

Short-sighted People, or Myopes, use concave Lens's, to keep the Rays from converging so fast, through the great Roundness of the Eye, as to make them meet e'er they reach the Retina. See **MYOPE**.

In Spain, and at Venice especially, *Spectacles* are us'd with a different View; All the People of Note and Fashion there, have them continually on their Noses; a Folly, that has its Source in the natural Pride of those People, who value themselves on a profound Wisdom; and affect to stare very near at every Thing; as if their Eyes were weakned, and wore out with Excess of Attention. *Vign. de Marco*.

*F. Chirubin*, a Capuchin, describes a kind of *Spectacle-Telescope*, for the viewing of remote Objects with both Eyes; hence call'd *Binoculi*. Though *F. Rubeira* had mentioned the same before him, in his *Oculus Enoch* and *Elia*. See **TELESCOPE**.

The same Author invented a kind of *Spectacles*, with three or four Glasses, which perform'd extraordinarily.

*Spectacles* were certainly unknown to the Ancients; yet are they not of so late a Date as the Telescope. *Francisco Redi*, in a very learned Treatise on *Spectacles*, will have them to have been invented in the 13th Century, between the Years 1280 and 1311; and adds, that *Alexander Desflina*, a Monk of the Order of *Predicants* of *St. Catherine* at *Pisa*, first communicated the Secret, which was of his own Invention; upon learning, that another Person had it as

well as himself. This History is wrote in the Chronicles of that Convent.

The same Author tells us, That in an old Manuscript still preserv'd in his Library, compos'd in 1299, *Speſtacles* are mentioned as a Thing invented about that Time: And that a famous Jacobin, one *Jourdan de Rivolta*, in a Treatise compos'd in 1305, says, expressly, That 'twas not yet 20 Years, since the Invention of *Speſtacles*. He likewise quotes *Bernard Gardou* in his *Illium Medicinæ*, wrote the same Year, where he speaks of a Collyrium, good to enable an Old Man to read without *Speſtacles*.

*Du Cange*, however, carries the Invention of *Speſtacles* farther back; assuring us, That there is a Greek Poem in Manuscript in the French King's Library, which shews, That *Speſtacles* were in Use in the Year 1150: still, the Dictionary of the Academy *Della Crusca*, under the Word *Occhiale*, inclines to *Reu's* Side; and quotes a Passage from *Jourdan's* Sermons, which says, That *Speſtacles* had not been 20 Years in Use: Now *Sabotius* has observ'd, that those Sermons were made between the Years 1330 and 1336.

**SPECTATOR**, a Person present at a *Speſtacle*.

Among the *Romans*, *Speſtatores*, *Spectatores*, were a kind of Gladiators, who had had their Discharge; and were frequently hired to be present, as *Speſtatores*, at the Combats of Gladiators. *Et*. the People were entertained withal. See **GLADIATOR**.

**SPECULARIA**, the Art of preparing, and making *Specula* or Mirrors: Or, the Laws of Mirrors, their Phenomena, Causes, &c. call'd also *Catoptricks*. See **CATOPTRICKS**.

**SPECULARIS Lapis**, in natural History, is a kind of Stone, clear as Glass, used in several Countries where 'tis found, for Window-lights, &c. 'Tis a kind of Talc, splits easily into thin Laminae or Plates; and is sometimes calcined to make a fine Plaster. See **TALC**.

**SPECULUM**, *Mirror*, in Opticks, any polish'd Body, impervious to the Rays of Light: Such as Water in Wells and deep Rivers, polish'd Metals, and Glasses lined with Mercury, or other opaque Matter, popularly call'd *Looking-Glasses*. See **LOOKING-GLASS**.

The several Kinds and Forms of  
*Specula, plana, concava and convexa*  
The Theory and Phenomena of the  
several Kinds of *Specula* -

See under **MIRROR**.

The Laws and Effect of the *Specula* of various Forms -  
The Theory of concave *Specula* } See particularly } **REFLECTION**.  
under } **BURNING-GLASS**.

**SPECULUM ANI**, an Instrument, wherewith Surgeons dilate the Fundament, examine Sores, extract Bones, or let out any peccant Matter that may be there lodg'd.

**SPECULUM MASTICIS**, is an Instrument used by Surgeons, to examine and dress corrupted Places in the natural Parts of Women. Its Form is the same with that of the *Speculum Ani*.

**SPECULUM ORIS**, is an Instrument serving to examine Disorders in the Mouth.

There are two Kinds: the one common; the other bigger and stronger, fit not only to keep down the Tongue; but also the lower Jaw; while the Mouth is survey'd, to the very Extremity of the Throat, and the necessary Remedies applied.

**SPEECH**, the *Act*, or Art of expressing a Man's Thoughts, by certain Signs invented for that Purpose.

These Signs are principally *Sounds*, made by the Voice and Letters. See **VOICE** and **LETTER**.

**SPEECH**, in Grammar, an Assemblage of several Words ranged in Order. See **LANGUAGE**.

The Grammarians generally make *Eight Parts of Speech*; i. e. Eight kinds of Words used in Discourse, viz. *Nouns, Pronouns, Verb, Participle, Adverb, Conjunction, Preposition and Interjection*; each of which see under its proper Article **ADVERB**, **NOUN**, **PRONOUN**, &c.

*P. Buffier*, one of the last and best Writers of Grammar, only admits of three Parts of Speech, viz. *Nouns, Verb and Modifiers*; which last includes the *Adverb, Conjunction and Preposition*. See **MODIFICATIVE**.

**SPELL**, a kind of Charm, to drive away a Disease, by hanging a Word or Sentence on a Paper about the Neck. See **CHARM** and **PHYLACTERY**.

**SPELL**, in the Sea Language. *To Spell*, is to let go the Sheets and Bowlings of a Sail, and brace the Weather Brace, that the Sail may lie loose in the Wind. *To do a Spell*, is to do any thing by Turns, for a short Time, and then leave it. *To give a Spell*, is to be ready to work in such a one's Room. *Frogg Spell*, is when fresh Men come to work; especially when the Rowers are relieved, with another Gang.

**SPELLING**, that Part of Grammar properly call'd *Orthography*. See **ORTHOGRAPHY**.

*Dr. Jones* gives the following Rules or Maxims of *Spelling*. 1<sup>o</sup>. That all Words were originally writ as *ſpelt*. 2<sup>o</sup>. That in all Words, whose Sounds have been since alter'd (the Origin of the Difficulty of *Spelling*): the Alteration was made for the sake of Ease and Pleasure: And hence, 3<sup>o</sup>. All Words that can be written several Ways, must be *Spelt* according to the hardest, hardest and most unusual Sound.

**SPELTER**, or *Zinck*, a kind of imperfect Metal, which some confound with *Bismuth*, and others with *Spalte*; others making it a female Antimony. See **ZINCK**.

The *Spelter* is a kind of mineral Lead, very hard, white and brilliant; which though not perfectly malleable, yet stretches a little under the Hammer.

'Tis found in greatest Quantity in the Mines of *Goffel* in *Saxony*; and is ordinarily fold in large, square, thick Cakes, whence one would judge it to have been melted as it came out of the Mines, and cast into that Figure.

'Tis used to clear and whiten Tin, in making of Pewter, much as Lead is used to purify Gold and Silver.

Those who imagine that the *Spelter* is put in to increase the Weight, are mistaken; since in melting Five or Six hundred Weight of Tin, they scarce put in a Pound of *Spelter*, and that mix'd with Turmeric. 'Tis also used in the making of Solder, and with Curcuma, in the melting of Copper, to give that Metal a gold Colour; which, however, is not permanent. See **SOLDER**.

The Best is white, in fine Scales, difficult to break, &c. **SPERM** or *Sperma*, the Seed wherof an Animal is form'd. See **SEED**.

The Word is Greek, *σπέρμα*.

**SPERMA-CETI**, in Pharmacy, usually call'd *Permaria*, is a Preparation made from the Brain, and Cerebell of a kind of Animal, call'd by some, the *Male Whale*, and by the *Latins*, *Orca*; only distinguish'd from the common Whale, by its having Teeth, in lieu wherof, the Whale has a kind of Tufts in the Throat. See **WHALE**.

The Ancients were great Strangers to the Nature of this Preparation; insomuch, that *Schroder* seems in doubt, whether to reckon it an animal or mineral Substance.

It had its Name *Sperma Ceti*, Seed or Sperm of a Whale, given it, no doubt, to raise the Value, by a Notion of its Scarcity.

The Method of preparing it, is a Secret in the Hands of a very few: The Process is thus;

The Brain being taken out of the Animal, is melted over a gentle Fire, and put into Moulds, like those wherewith Sugar-Leaves are form'd. When cold and drain'd of its Oil, 'tis taken out and melted over again; and this they continue to do till it be well purified, and become white. 'Tis then cut with a Knife for the Purpose, and reduced into Flakes, such as we have it from the Druggists.

It must be chosen white, clear and transparent, of a rankish Smell, which some fancy to partake of that of the Violet: some sophisticate it with Wax; but the Deceit is discovered, either by the Smell of the Wax, or by the Dullness of the Colour.

Some also sell a Preparation made from the Tail of the Whale, instead of that from the Brain; which last kind turns Yellow, as soon as opened to the Air. In the General, there is no Merchandise that should be kept closer from the Air than *Sperma Ceti*.

'Tis of some Use in Medicine. *Dr. Quincy*, says, 'tis a noble Remedy in many Cases, as the Asthma, &c. though chiefly used in Bruises, inward Hurts, and after Delivery. But 'tis certain, its greatest Property, and that which makes it so much in Vogue, is its softning the Skin, and resolving Tumours of the Breast. Whence it comes to be used by the Ladies in Pastes, Washes, &c.

**SPERMATIC**, in Anatomy, something belonging to the *Sperm* or Seed.

The Ancients made a general Division of the Parts of the Animal Body into *Spermatic* and *Fleshy*.

The *Spermatic* Parts, were those, which by their Colour, &c. bore some Resemblance to Seed, and were supposed to be form'd thereof; such are the Nerves, Membranes, Bones, &c.

The *Fleshy*, were those supposed to be form'd of the Blood, after Conception. But the Moderns, with much better Reason, hold all the Parts to be *Spermatic* in this Sense, and either form'd of the Ovum of the Female, or of the Semen of the Male. See **GENERATION**.

*M. Astruc* mentions *Spermatic Worms* in the human Body. See **WORMS**.

**SPERMATIC VESSELS**, called also *Vasa preparantia*, are certain Vessels appointed for the bringing of the Blood to the Testicles, &c. to be secreted and prepared into Seed; and for the carrying back again the Blood, remaining after the Secretion is effected. See **SEED**.

The *Spermatic Vessels* are two Arteries and two Veins. *Spermatic Arteries* arise from the fore Part of the Trunk of the Aorta, below the Emulgents. Their Structure is very singular, in that, contrary to the Fabric of all other Arteries, which are largest at their Exit from the Trunk, these are smallest at their Origin, and grow bigger in their Progress towards

wards the Testes. By this means, the Blood receives a Check at its first going off for those Parts, which disposes it for the future Changes, &c. it is to pass. The same End is answered in Quadrupeds, by having these Arteries curl'd and contorted in their Passage like a Screw.

The Reason why Nature has taken another Method in Man; Mr. Cowper observes, is, that in that Case, the Abdominal Muscles must have been much larger than they are; by which means, the Intestines would have been frequently let down into the Scrotum; an Inconvenience Quadrupeds are secured from, by the horizontal Position of their Bodies.

The *Spermatic Arteries*, in their Progress, meeting with the *Spermatic Veins*, enter together with them the inner Lamella of the Peritonæum, where, insinuating into the Duplication of the Process, and being clothed therewith, they pass on to within three or four Fingers Breadth of the Testicles, where they divide into Two unequal Branches; the biggest of which, goes to the Testicle, and is distributed therein (See TESTICLE.) And the less in the *Paragata* or *Epididymis*. See PARASTATA.

The *Spermatic Veins* take the same Course with the Arteries; only a little above the Testicles, they split into several Branches, which uniting, form a Plexus, called *Corpus Varicosum Pampiniforme* or *Pyramidale*. The Blood returned by the *Spermatic Veins*, is delivered on the right Side to the Cava, and on the Left, into the emulgent Vein.

**SPERMATOCELE**, in Medicine, a Rupture occasioned by a Contraction of the seminal Vessels, whereby they are let fall into the Scrotum. *Harris*.

**SPHACELUS**, in Medicine, a total Mortification of any Part, occasioned by an Interception of the Blood and Spirits. See MORTIFICATION.

The Word is *Greek*, σφάκελος, form'd, perhaps, of σφάρα, *I kill*.

The *Sphacelus* is distinguished from the Gangrene; which is only a Mortification begun, and, as it were, the Road to a *Sphacelus*, which is the State and Perfection thereof. See GANGRENE.

The *Sphacelus* is distinguished by the Lividness or Blackness of the Part affected; its Softness, Insensibility and cadaverous Smell.

The other Causes of the *Sphacelus*, are close Ligatures, excessive Colds, great Inflammations, Bites of Mad Dogs. 'Tis sometimes, also, called *Necrosis*, and sometimes *Sideratio*. See NECROSIS and SIDERATIO.

A *Sphacelous Foot*, according to *Aquapendente*, ought to be cut off in the mortified Part, near the live Part. When the Foot is off, the dead Flesh left behind, is to be consumed by the Application of an actual Caustery, repeated several Times, till the Patient feel the Heat of the Fire. *Scaliger*.

**SPHERISTERIUM**, in Antiquity, the seventh Part of the ancient Gymnasium; being that wherein the Youth practis'd Tennis-Playing. See GYMNASIUM.

The *Spheristerium* or Tennis-Court, was between the Place, named *Palæstra*, and that where they ran Races, which was between the Portico's and the outer Wall: Though *Virginius* does not make mention of it in the Description he gives of the ancient Gymnasium.

The Exercise here perform'd was called *Spheristica* and *Spheromachia*, which some will have to have differ'd from the modern Tennis; but 'tis not known wherein the Difference consisted.

The *Milesians* were particularly averse to this Exercise; and the *Athenians* as remarkably fond of it.

They frequently gave the Right of Citizens to the *Spheristes*, or Maiters in this Art, by way of Respect.

**SPHENOIDAL SUTURE**, in Anatomy, a Suture thus call'd, from its encompassing the *Os Sphenoides*, which it separates from the *Os frontis*, the *Os petrosum* and *Os occipiti*. See SUTURE.

**SPHENOIDES**, in Anatomy, a Bone of the Head, common to the Cranium and upper Jaw. See CRANIUM, &c.

It is situate in the lower Part of the Skull, whereof it is, as it were, the Basis, and is connected to all the other Members thereof, by the *Sphenoidal Suture*. Its Form, is irregular, and not easy to be described; whence some have call'd it *Multiforme*. It has its Name *Sphenoides* from the *Greek*, σφην, *Cuneus*, Wedge, from the Form of its Insertion into the other Bones of the Skull.

In Adults, 'tis one continued Bone; but in young Children, sometimes consists of Three, and sometimes of Four distinct Pieces.

**SPHENOSTAPHYLINUS**, in Anatomy, a Muscle of the Larynx. It descends from a round, fleshy Origination, near the Root of a Process of the *Os Sphenoides*, and is implanted into the posterior Part of the Uvula, where it joins its Partner. It serves to draw the Uvula upwards and backwards; and hinders the masticated Aliment from passing into the Foramina Narium in Deglutition.

**SPHERE**, in Geometry, a Solid Body contained under one single Surface, and having a Point in the middle, call'd the Centre, whence all the Lines drawn to the Surface, are equal. See SOLID, &c.

The *Sphere* is supposed to be generated by the Revolution of a Semi-circle, as K, (Tab. Geometry Fig. 34.) about its Diameter A B, which is also called the *Axis of the Sphere*, and the extreme Points of the Axis, A and C the *Poles of the Sphere*. See CENTRE, CIRCUMFERENCE, AXIS, POLE, &c.

#### Properties of the SPHERE.

1<sup>o</sup> A *Sphere* is equal to a Pyramid, whose Base is equal to the Surface, and its Height to the Radius of the *Sphere*.

Hence a *Sphere* being esteem'd such a Pyramid, its Cube or Solid Content, is found like that of a Pyramid. See PYRAMID.

2<sup>o</sup> A *Sphere* is to a Cylinder, standing on an equal Basis, and of the same Height, as 2 to 3. Hence, also, may the Cube or Content of the *Sphere* be found. See CYLINDER.

3<sup>o</sup> The Cube of the Diameter of a *Sphere*, is to the Solid Content of the *Sphere*, nearly as 300 to 157: And thus, also, may the Content of the *Sphere* be measured.

4<sup>o</sup> The Surface of a *Sphere* is quadruple that of a Circle described with the Radius of the *Sphere*. For since a *Sphere* is equal to a Pyramid, whose Base is the Surface, and its Altitude, the Radius of the *Sphere*: The Surface of the *Sphere* is had, by dividing its Solidity by a third Part of its Semi-diameter.

If, now, the Diameter of the Circle be 100, the Area will be 7850; consequently, the Solidity 1570000, which divided by a Third of the Semi-diameter, 100; the Quotient is the Surface of the *Sphere* 31400; which is manifestly quadruple the Area of the Circle.

The Diameter of a SPHERE being given, to find its Surface and Solidity.

Find the Periphery of the Circle described by the Radius of the *Sphere*. See PERIPHERY.

Multiply this, found, into the Diameter; the Product is the Surface of the *Sphere*. Multiply the Surface by a sixth Part of the Diameter, the Product is the Solidity of the *Sphere*.

Thus, supposing the Diameter of the *Sphere* 56, the Periphery will be found 175; which multiplied by the Diameter, the Product 9800 is the Surface of the *Sphere*; which multiplied by one sixth Part of the Diameter, gives the Solidity 919057. Or, thus;

Find the Cube of the Diameter 175616; then to 300157, and the Cube found, find a Fourth proportional, 919057. See PROPORTIONAL. This is the Solidity of the *Sphere* required.

For Segments and Sectors of Spheres; see SEGMENT and SECTOR.

Doctrine of the SPHERE } See SPHERICKS.  
Projection of the SPHERE } See PROJECTION.

**SPHERE of Activity** of any Body; is that determinate Space or Extent, all round about it, to which, and no farther, the Effluvia continually emitted from that Body, do reach, and where they operate according to their Nature. See EFFLUVIA.

Thus we see the magnetical Effluvia have certain Bounds and Limits, beyond which they will have no Influence to turn, or attract the Needle: But where-ever a Needle is placed, to as it may be moved by a Load-stone, it may be said to be within the *Sphere* of Activity of the Stone. See MAGNET.

**SPHERE**, in Astronomy, that concave Orb or Expansive, which invests our Globe, and in which the heavenly Bodies, Sun, Stars, Planets and Comets, appear to be fix'd, at equal Distances from the Eye. See HEAVENS.

This is also call'd the *Sphere of the World*; and is the Subject of the *Spherical Astronomy*. See SPHERICAL ASTRONOMY.

This *Sphere*, as it includes the fix'd Stars, whence we also occasionally call it, the *Sphere of the fix'd Stars*, is vastly great. The Diameter of the Earth's Orbit is so small, in respect of the Diameter hereof, that the Centre of the *Sphere* is not sensibly changed by any Alteration of the Spectator's Place in the several Parts of the Orbit: But still, in all the Points of the Earth's Surface, and at all Times, the Inhabitants have the same Appearance of the *Sphere*; that is, the fix'd Stars seem to posside the same Points in the Surface of the *Sphere*. For our Way of judging of the Places, &c. of the Stars, is to conceive right Lines drawn from the Eye or the Centre of the Earth, through the Centres of the Stars, and continued thence, till they cut the foresaid *Sphere*; the Points where these Lines terminate therein, are the apparent Places of those Stars. See PLACE and PARALLAX.

The better to determine the Places of the heavenly Bodies in the *Sphere*; several Circles are imagined to be described in the Surface thereof; hence called *Circles of the Sphere*. See CIRCLE of the Sphere.

Of these, some are said to be *greater*, as the Ecliptic, Meridian, Equator, &c. others *less*, as the Tropicks, Parallels, &c. See GREATER and LESSER.

Of these, again, some are *movable*, or owe their Origin to the Motion of the Earth, &c. such is the Ecliptic, Secularities of the Ecliptic, &c. See each Circle under its proper Head; as EQUATOR, ECLIPTIC, HORIZON, &c.

**SPHERE**, in Geography, &c. a certain Disposition of the Circles on the Surface of the Earth, with regard to one another; which varies in various Parts thereof. See EARTH.

The Circles originally conceived on the Surface of the *Sphere* of the World, are almost all transferred, by Analogy, to the Surface of the Earth; where they are conceived to be drawn directly underneath those in the *Sphere*, or in the same Plane therewith; so that were the Planes of those of the Earth continued to the *Sphere*, they would coincide with the respective Circles thereon.

Thus we have a Horizon, Meridian, Equator, &c. on the Earth.

As the Equator in the Heavens divides the *Sphere* into two equal Parts; the one *North* and the other *South*; so does the Equator on the Surface of the Earth, divide the Globe in the same Manner. See EQUATOR.

And as the Meridians in the Heavens, pass through the Poles of the Horizon; so those on the Earth, &c. See MERIDIAN.

With regard, then, to the Position of some of these Circles in respect of others, we have a *Right*, a *Parallel*, and an *oblique Sphere*.

A *right SPHERE*, is that where the Equator cuts the Horizon of the Place at right Angles: For the particular Phenomena, &c. whereof; see RIGHT SPHERE.

A *parallel SPHERE*, is where the Equator is parallel to the sensible Horizon, and in the Plane of the Rational. See PARALLEL SPHERE.

An *oblique SPHERE*, is where the Equator cuts the Horizon obliquely. See OBLIQUE SPHERE.

*Armillary, or artificial SPHERE*, is an astronomical Instrument, representing the several Circles of the *Sphere*, in their natural Order; serving to give an Idea of the Office and Position of each thereof, and to solve various Problems relating thereto.

'Tis thus called, as consisting of a Number of Falsies or Rings of Brals, or other Matter, called by the *Latins*, *Armille*, from their resembling of Bracelets, or Rings for the Arm.

By this, 'tis distinguished from the *Globe*, which, though it have all the Circles of the *Sphere* on its Surface; yet is not cut into *Armille* or *Rings*, to represent the Circles, simply and alone; but exhibits also the intermediate Spaces, between the Circles. See GLOBE.

*Armillary Spheres*, are of different Kinds, with regard to the Position of the Earth therein; whence they become distinguished into *Ptolemaic* and *Copernican Spheres*. In the first whereof, the Earth is in the Centre; and in the latter near the Circumference, according to the Position that Planet has in those Systems. See SYSTEM.

The *Ptolemaic SPHERE*, is that commonly in Use, and is represented (Tab. Astronomy, Fig. 21.) with the Names of the several Circles, Lines, &c. of the *Sphere*, inscribed thereon. See PTOLEMAIC.

In the Middle, upon the Axis of the *Sphere*, is a Ball, representing the Earth; on whose Surface are the Circles, &c. of the Earth. The *Sphere* is made to revolve about the said Axis, which remains at rest: By which Means, the Sun's Diurnal and Annual Course about the Earth, are represented according to the *Ptolemaic* Hypothesis: And even by Means hereof, all Problems relating to the Phenomena of the Sun and Earth, are solved, as upon the *Cælestial Globe*; and after the same Manner; which see described under the Article GLOBE.

The *Copernican SPHERE*, represented (Fig. 22.) is very different from the *Ptolemaic*, both in its Constitution and Use; and more intricate in both. Indeed the Instrument is in the Hands of few People, and its Use so inconsiderable, except what we have in the other more common Instruments, particularly the *Globe* and *Ptolemaic Sphere*, that we shall be easily excused the not filling up Room, with any Description thereof.

**SPHERICAL Angle**, is the mutual Inclination of Two Planes, whereby a *Sphere* is cut: Thus the Inclination of the two Planes, CAF and CEF (Tab. Trigon. Fig. 9.) forms the *Spherical Angle* ACE. See SPHERE and ANGLE.

The Measure of a *Spherical Angle*, ACE, is an Arch of a great Circle A E, described from the Vertex C, as from a Pole, and intercepted between the Legs CA and CE.

Hence, 1<sup>o</sup> Since the Inclination of the Plane CEF, to the Plane CAF, is every where the same; the Angles in the opposite Intersections G and F, are equal.

2<sup>o</sup> Hence the Measure of a *Spherical Angle* ACE, is described with the Interval of a Quadrant AC or EC, from the Vertex C between the Legs CA, CE.

If a Circle of the *Sphere*, AEBF (Fig. 8.) cut another CEDF, the adjacent Angles, AEC and AED are equal to two Right ones; and the vertical Angles AEC and DEB equal to one another. The former likewise, holds of several Angles form'd on the same Arch CED, at the same Point E.

Hence, any Number of *Spherical Angles*, as AEC, AED, DEB, BEC, &c. made on the same Point E, are equal to four right Angles. See SPHERICAL TRIANGLE.

**SPHERICAL Triangle**, a Triangle comprehended between three Arches of great Circles of a *Sphere*, intersecting each other in the Surface thereof. See TRIANGLE.

#### Properties of the SPHERICAL Triangles.

1. If in two *Spherical Triangles*, (Tab. Trigon. Fig. 10.) ABC and abc  $A=a$ ,  $B=b$  and  $C=c$ : Then will B and the Sides, including the Angles, be respectively equal, the whole Triangles are equal: That is,  $B C=b c$ ,  $B=b$  and  $C=c$ .

Again, if in two *Spherical Triangles*  $A=a$ ,  $C=c$  and  $A C=a c$ ; then will  $B=b$ ,  $A B=a b$  and  $b c=B C$ . Lastly, if in two *Spherical Triangles*  $A B=a b$ ,  $A C=a c$ , and  $B C=b c$ , then will  $A=a$ ;  $B=b$  and  $C=c$ ; the Demonstrations whereof, coincide with those of the like Properties in plain Triangles. The Theorems of the Congruency of rectilinear Triangles, extending to all other curvilinear, circular, parabolic, &c. provided their Sides be Similar. See TRIANGLE.

2. In an equilateral Triangle ABC (Fig. 11.) the Angles at the Base, B and C, are equal; and if in any Triangle, the Angles B and C, at the Base BC, are equal; the Triangle is equilateral.

3. In every *Spherical Triangle*, each Side is less than a Semi-circle: Any two Sides taken together are greater than the Third; and all the three Sides together are less than the Periphery of a great Circle: And a greater Side is always opposed to a greater Angle, and a less Side to a less Angle.

4. If in a *Spherical Triangle* BAC (Fig. 12.) two Legs AB and BC taken together, be equal to a Semi-circle; the Base AC being continued to D; the external Angle BCD will be equal to the internal opposite one BAC.

If the two Legs together, be less than a Semi-circle, the external Angle BCD, will be greater than the internal opposite one A: And if the Legs be greater than a Semi-circle, the external Angle BCD, will be less than the internal opposite one A; and the Converse of all these holds, viz. If the Angle BCD be equal to, greater, or less than A; the Sides AB and BC are equal to, greater, or less than a Semi-circle.

5. If in a *Spherical Triangle* ABC, two Sides AB and BC, be equal to a Semi-circle; the Angles at the Base A and C, are equal to two Right ones: If the Sides be greater than a Semi-circle, the Angles are greater than two Right ones; and if less, less. And, conversely.

6. In every *Spherical Triangle*, each Angle is less than two Right ones; and the Three together, less than Six right Angles, and greater than two.

7. If in a *Spherical Triangle* BAC (Fig. 13.) the Sides AB and AC be Quadrants; the Angles at the Base, B and C, will be right Angles. And, conversely, If the intersected Angle A be a right Angle, BC will be a Quadrant: It A be obtuse, BC will be greater than a Quadrant; and if acute, less. And, conversely.

8. If a *Spherical* rectangular Triangle, the Side BC (Fig. 14.) adjacent to the right Angle B, be a Quadrant; the Angle A will be a right Angle; if BE be greater than a Quadrant, the Angle A will be obtuse; and if BD be less than a Quadrant, the Angle A will be acute. And, conversely.

9. If in a *Spherical* rectangular Triangle, each Leg be either greater or less than a Quadrant; the Hypotenuse will be less than a Quadrant. And, conversely.

10. If in a *Spherical Triangle* ABC (Fig. 15.) rectangular only at B, one Side CB be greater than a Quadrant, and the other Side AB less; the Hypotenuse AC will be greater than a Quadrant. And, conversely.

11. If in a *Spherical* obliquangular Triangle ACB (Fig. 16.) both Angles at the Base, A and B, be either obtuse or acute; the Perpendicular CD let fall from the Third Angle C to the opposite Side AB, falls within the Triangle: if one of them, A, be obtuse; and the other, B, acute; the Perpendicular falls without the Triangle.

12. If in a *Spherical Triangle* ACB, all the Angles A, B and C be acute; the Sides are each less than a Quadrant. Hence, if in an obliquangular *Spherical Triangle*, one Side be greater than a Quadrant, one Angle is obtuse, viz. that opposite to this Side.

13. If in a *Spherical Triangle* ACB, two Angles A and B, be obtuse, and the third C acute; the Sides AC and CB opposite to the obtuse Sides, are greater than a Quadrant; and that opposite to the acute Side AB, less than a Quadrant.

Quadrant. Hence, if the two Sides be less than a Quadrant, the two Angles are acute.

14. If in a *Spherical Triangle*, the several Sides be each greater than a Quadrant; or only two of them greater, and the Third equal to a Quadrant; the several Angles are obtuse.

15. If in an obliquangular *Spherical Triangle*, two Sides be less than a Quadrant, and the Third greater; the Angle opposite to the greatest will be obtuse, and the rest acute.

*Resolution of SPHERICAL TRIANGLES.* See TRIANGLE.

*SPHERICAL GEOMETRY*, the Doctrine of the Sphere; particularly of the Circles described on the Surface thereof, with the Method of projecting the same on a Plane. See SPHERICKS.

*SPHERICAL TRIGONOMETRY*, the Art of resolving *Spherical Triangles*; i. e. from three Parts of a *Spherical Triangle* given, to find the rest. *E. g.* From two Sides of one Angle; to find the other two Angles, and the third Side. See *SPHERICAL TRIANGLE* and TRIGONOMETRY.

*SPHERICAL ASTRONOMY*, that Part of Astronomy which considers the Universe, such as it appears to the Eye. See ASTRONOMY.

Under *Spherical Astronomy*, then, come all the Phenomena and Appearances of the Heavens and heavenly Bodies, such as we perceive them; without any Inquiry into the Reason, the Theory, or the Truth thereof; by which it is distinguished from *Theoretical Astronomy*, which considers the real Structure of the Universe, and the Cause of those Phenomena.

In the *Spherical Astronomy*, the World is conceived to be a concave, *Spherical Surface*, in whose Centre is the Earth, or rather the Eye, about which the visible Frame revolves, with Stars and Planets fix'd in the Circumference thereof. And on this Supposition all the other Phenomena are determined.

The *Theoretical Astronomy* teaches us, from the Laws of Opticks, &c. to correct this Scheme, and reduce the whole to a juster System. See SYSTEM.

*SPHERICITY*, the Quality of a *Sphere*; or that whereby a thing becomes *Spherical*, or round. See SPHERE.

The *Sphericity* of Pebbles, Fruits, Berries, &c. of Drops of Water, Quick-silver, &c. of Bubbles of Air under Water, &c. Dr. Hook takes to arise from the Incoherency of their Particles with those of the ambient Fluid, which prevents their Coalescing; and by pressing on them, and encompassing them all around equally, turns them into a round Form. See DROP.

This, he thinks, appears evidently, from the Manner of making small round Shot of several Sizes, without casting the Lead into any Moulds; from Drops of Rain being form'd, in their fall, into round Hail-stones; and from Drops of Water falling on small Duff, Sand, &c. which strat produce an artificial round Stone; and from the small, round, red-hot Balls, form'd by the Collision or Fusion of Flint and Steel, in striking Fire.

But all these Cases of *Sphericity* seem better accounted for, from the great Principle of Attraction; whereby the Parts of the same Fluid drop, &c. are all naturally ranged as near the Centre as possible, which necessarily induces a *Spherical Figure*; and, perhaps, a repelling Force between the Particles of the Drop, and of the Medium, contribute not a little thereto. See ATTRACTION.

*SPHERICKS*, the *Doctrine of the Sphere*, particularly of the several Circles described on the Surface thereof; with the Method of projecting the same in Plano. See SPHERE.

The principal Matters shewn herein, are as follow:

1. If a Sphere be cut in any Manner, the Plane of the Section will be a Circle, whose Centre is in the Diameter of the Sphere.

Hence, 1<sup>o</sup>, The Diameter H I (Tab. Trigon. Fig. 17.) of a Circle, passing through the Centre C, is equal to the Diameter A B of the generating Circle; and the Diameter of a Circle, as F E, that does not pass through the Centre, is equal to some Chord of the generating Circle.

Hence, 2<sup>o</sup>, As the Diameter is the greatest of all Chords; a Circle passing through the Centre, is the *greatest Circle of the Sphere*; and all the rest are *lesser* than the same.

3<sup>o</sup> Hence, also, all *great Circles of the Sphere* are equal to one another.

4<sup>o</sup> Hence, also, if a *great Circle of the Sphere* pass through any given Point of the Sphere, as A; it must also pass through the Point diametrically opposite thereto, as B.

5<sup>o</sup> If Two great Circles mutually intersect each other, the Line of the Section is the Diameter of the Sphere, and therefore two great Circles intersect each other in Points diametrically opposite.

6<sup>o</sup> A *great Circle of the Sphere*, divides it into two equal Parts or Hemispheres.

7. All great Circles of the Sphere, cut each other into two Parts; and, conversely, all Circles that thus cut each other, are *great Circles of the Sphere*.

8. An Arch of a great Circle of the Sphere, intercepted

between another Arch H I I. (Fig. 18.) and its Poles A and B, is a Quadrant.

That intercepted between a *less Circle* D E F, and one of its Poles A, is greater than a Quadrant; and that between the same and the other Pole B, less than a Quadrant; and, conversely.

9. If a *great Circle of the Sphere* pass through the Poles of another, that other passes through the Poles of this. And if a *great Circle* pass through the Poles of another, the Two cut each other at right Angles, and conversely.

10. If a *great Circle*, as A F B D, pass through the Poles A and B of a *less Circle* D E F, it cuts it into equal Parts; and at right Angles.

11. If two great Circles A E B F and C E D F (Fig. 19.) intersect each other in the Poles E and F of another great Circle A C B D; that other will pass through the Poles H and I, I and I of the Circles A E B F and C E D F.

12. If two great Circles A E B F and C E D F, cut each other mutually; the Angle of Obliquity A E C, will be equal to the Distance of the Poles H I.

13. All *Circles of the Sphere*, as G F and L K (Fig. 20.) equally distant from its Centre C, are equal; and the further they are removed from the Centre, the less they are. Hence, since of all parallel Chords, only two, D E and E K, are equally distant from the Centre; of all the Circles parallel to the same great Circle, only two are equal.

14. If the Arches F H and K H, and G I and I L, intercepted between a great Circle I M H and the *less Circle* G N F and L O K; be equal, the Circles are equal.

15. If the Arches F H and G I of the same great Circle A I B H, intercepted between two Circles G N F and I M H, be equal, the Circles are parallel.

16. An Arch of a parallel Circle I G (Fig. 21.) is similar to an Arch of a great Circle A E; if each be intercepted between the same great Circles C A F and C E F.

Hence the Arches A E and I G, have the same Ratio to their Peripheries; and, consequently, contain the same Number of Degrees. And hence the Arch I G is less than the Arch A E.

17. The Arch of a great Circle, is the shortest Line which can be drawn from one Point of the Surface of the Sphere to another: And the Lines between any two Points on the same Surface, are the greater, as the Circles whereof they are Arches, are the less.

Hence, the proper Measure, or Distance of two Places on the Surface of the Sphere, is an Arch of a great Circle intercepted between the same.

*SPHEROID*, in Geometry, a Solid approaching to the Figure of a Sphere, but not exactly round, but oblong; as having one of its Diameters bigger than the other; and generated by the Revolution of a Semi-ellipse about its Axis.

When 'tis generated by the relation of the Semi-ellipse about its greater Axis, 'tis call'd an *Oblong Spheroid*; and when generated by the Revolution of an Ellipse about its less Axis, an *oblate Spheroid*. See OBLATE.

The Contour of a Dome, *Daviler* observes, should be Half a *Spheroid*. Half a Sphere, he says, is too low to have a good Effect below. See DOME.

For the Solid Dimensions of a *Spheroid*, 'tis 3 of its Circumcribing Cylinder: Or it is equal to a Cone, whose Altitude is equal to the greater Axis, and the Diameter of the Base to four Times the less Axis of the generating Ellipsis.

Or a *Spheroid* is to a Sphere described on its greater Axis, as the Square of the less Axis to the Square of the greater: Or 'tis to a Sphere described on the less Axis, as the greater Axis to the less. The Word is form'd from *Sphera*, and *σφα*, Shape.

*SPHINCTER*, in Anatomy, a Term applied to a kind of circular Muscles, or Muscles in Form of Rings, which serve to close and draw up several Orifices in the Body, and prevent the Excretion of the Contents. See MUSCLE.

The Word is form'd from the Greek *σφινκτης*, *Sphincter*, i. e. something that binds and constricts a Thing very closely; these Muscles having an Effect much like that of a Purifying.

*SPHINCTER Ani*, is a circular Muscle, serving to shut the Anus, and keep the Excrements from coming away involuntarily. See ANUS and EXCREMENTS.

'Tis near two Inches broad, and hangs down below the Rectum, near an Inch. It is fasten'd on the Sides to the Bones of the Coccyx, and behind to the Os sacrum: Before, in Men, to the Accelerator Urine, and in Women, to the Vagina Uteri. See RECTUM.

Some would have it Two Muscles, and some Three; but without much Reason.

*SPHINCTER Vesicæ*, is a Muscle consisting of circular Fibres, placed at the Exit of the Bladder, to prevent the perpetual dripping of the Urine. See URINE and BLADDER.

It keeps the Bladder constantly shut; and is only opened, when by the Contraction of the Abdominal Muscles, the Bladder is compress'd, and the Urine forced out.

**SPHINCTER Vaginae**, a constrictory Muscle, serving to hinder the Reflux of the Blood from the *Clitoris*, &c. in Coition. See VAGINA.

**SPHINCTER Gole** } See { **ŒSOPHAGÆUS.**  
**SPHINCTER Labiorum** } } **CONSTRUCTOR.**

**SPHINX**, in Sculpture, &c. a Figure or Representation of a Monster of that Name, famed among the Ancients; now mostly used as an Ornament in Gardens, Terraces, &c.

'Tis represented with the Head and Breasts of a Woman, the Wings of a Bird, the Claws of a Lion, and the rest of the Body like a Dog.

It is supposed to have been engender'd by *Typhon*, and sent by *Jove*, to be revenged on the *Thebans*. Its Office was to propose dark, enigmatical Questions to all Passers-by, and if they did not give the Explication thereof, to devour them.

It made horrible Ravages on Mount *Sphinxus*, and could not by any means be destroyed, till after *Oedipus* had solved the following Riddle; What Animal is it, that in the Morning walks on four Legs; at Noon on Two, and at Night on Three?

Among the *Egyptians*, the *Sphinx* was the Symbol of Religion, by reason of the Obscurity of its Mysteries. And on the same account, the *Romans* placed a *Sphinx* in the *Prætor* or Porch of their Temples.

**SPICA-Nardi**, Spike-nard, a kind of Ear growing even with the Ground, and sometimes in the Ground; used in the Composition of Treacle. See TREACLE.

It likewise should be used in the Compound-Syrup of *Chicory*, in lieu of *Cinnamon*, which the Apothecaries generally put for it, because cheaper.

The Ear or *Spica*, is about the Length and Thickness of a Finger; very light, covered with long, reddish Hairs, of a strong Smell, and a bitterish, sharp Taste. There rise several of these Ears from the same Root. The Stem is small, and the Root the Thickness of a Quill.

The *Spica-Nardi*, is usually reckon'd in the Number of Roots. 'Tis also call'd *Nardus Indicus*; because brought from the *East-Indies*.

'Tis accounted a *Stomachic* and *Nephritic*, proper to strengthen the Stomach, and promote the Discharge of Urine.

There is also another Kind, call'd *Spica-Celtica*, growing in the *Pyreneans*, and the Mountains of *Yrd*.

**SPICA Virginis**, a Star of the first Magnitude in the Constellation *Virgo*. See VIRGO.

Its Place is in the more southerly Hand. Its Longitude, according to *Mr. Flamsteed*, is  $19^{\circ} 31' 22''$ ; its Latitude  $2^{\circ} 1' 59''$  South.

**SPICE**, any kind of aromatic Drug, that has hot and pungent Qualities; such are *Pepper*, *Nutmeg*, *Ginger*, *Cinnamon* and *Cloves*. See PEPPER, NUTMEG, &c.

Some also apply the Word to medicinal Drugs brought from the *East*, as *Senna*, *Cassia*, *Frankincense*, &c. See each under its proper Article, SENNA, CASSIA, &c.

**SPIDERS-Silk**. See SILK.

**SPIKING up the Ordnance**; a Sea Phrase, for the fastening a Quoin with *Spikes* to the Deck, close to the Breach of the Carriages of great Guns; that they may keep close and firm to the Ship's Sides, and not get loose when the Ship rolls, and by that means endanger the breaking out of the Butt-head of a Plank.

**SPINA Ventosa**, in Medicine, &c. an Ulceration, wherein the Bones are eaten by a malignant Tumour, without any Pain of the *Periosteum*, or Membrane that covers the Bone. After which, an indolent Swelling being risen, the Part affected is quite eat out with the Ulcer; whence frequently follows a necessity of Amputation.

**SPINAL Nerve** } See { **MEDULLA Spinalis.**  
**SPINAL NERVEI** } } **NERVE.**

In the History of the *French Academy of Sciences*, for the Year 1714, we have an Instance of a Fœtus born without either Brain, Cerebel, or *Spinal Nerve*, though perfectly well form'd in other respects. It had gone its natural Time; lived two Hours; and even gave Signs of Life, upon sprinkling the Baptismal Water on its Head.

Instances of this Kind, as this is not the only one we meet withal, furnish a terrible Objection against the Existence of the animal Spirits, which should be generated in the Brain, or at least in the Cerebel or *Spinal Nerve*; and which are generally allowed of such absolute Necessity in the Animal Economy. See SPIRIT.

**SPINALIS**, in Anatomy, a Muscle on the Side of the Neck, arising from the Five superior Processes of the Vertebrae of the Thorax, and inferior of the Neck; and in its Ascent, becomes more fleshy, and is lastly inserted into the inferior Part of the Vertebrae of the Neck, laterally. It serves to draw the Neck backwards.

**SPINDLE**, in the Sea Language, is the smallest Part of

a Ship's Capstan, which is berwixt the two Decks; The *Spindle* of the Jeer Capstan hath Whelps to heave the Viol. Also the Axis of the Wheel of a Watch or Clock, is called the *Spindle*, and its Ends the *Peets*. See CLOCK, &c.

**SPINE**, or *SPINA Dorsæ*, in Anatomy, the Series or Assemblage of Vertebrae, or Bones of the Back, which sustain the rest of the Body, and to which are connected the Ribs. See VERTEBRÆ.

The *Spine* is usually divided into four Parts; the Neck, which contains Seven Vertebrae; the Back, Twelve; the Loins Five; and the *Os sacrum*, Four. The *Spine* includes a kind of Medulla, much resembling that of the Brain, hence call'd *Medulla Spinalis*, or *Spinal Marrow*; which see.

It has its Name *Spine*, by reason the hind Part thereof is Edg'd, or *Spiny*. Some call it the *Canalis Sacæ*.

**SPINET**, a Musical Instrument, rank'd in the Second or Third Place among harmonical Instruments. See MUSIC.

It consists of a Chest or Belly, made of the most porous and retinous Wood to be found; and a Table of Firr fasten'd on Rods, call'd *Sound-boards*, which bear on the Sides. On the Table is raised a little Prominence, wherein are placed as many Pins as there are Chords to the Instrument.

The Instrument is played by two Ranges of continued Keys, the foremost Range being in the Order of the Diatonick Scale; and the other Range set backwards in the Order of the Artificial Notes or Semi-tones. See SCALE.

The Keys are so many long, flat Pieces of Wood, which when touch'd and press'd down at one End, make the other raise a Jack, which sounds the Strings by means of the End of a Crow's Quill, wherewith 'tis armed. The 30 first Strings are of Brass, the other more delicate ones of Steel or Iron Wire. They are all stretch'd over Two Bridges glued to the Table.

The Figure of the *Spinet* is a long Square, or Parallelogram a Foot and Half broad; some call it a *Harp Couch'd*, and the Harp, an *Inverted Spinet*.

The *Spinet* is generally tuned by the Ear; which Method of the practical Musicians, is founded on this Supposition, That the Ear is a perfect Judge of an Octave and Fifth. The general Rule, is to begin at a certain Note, as c, taken towards the middle of the Instrument, and tuning all the Octaves up and down, and also the Fifth's, reckoning Seven Semi-tones to each Fifth, by which means the whole is tuned.

Sometimes to the common or fundamental Play of the *Spinet*, is added another similar one in Unison, and a Third in Octave to the first; to make the Harmony the fuller. They are played either separately or together, which is call'd the *double* or *triple Spinet*. Sometimes a Play of Viols is added, by means of a Bow, or a few Wheels parallel to the Keys, which press the Strings, and make the Sounds last as long as the Musician pleases; and heighten and soften them, as they are more or less press'd. The Harpsichord is a kind of *Spinet*, only with another Disposition of the Keys. See HARPSICHOORD.

The Instrument takes its Name from the little Quills Ends, wherewith the Strings are drawn, which are supposed to resemble *Spine*, Thorns.

**SPINNING**, in Commerce, the reducing of Silk, Linc, Hemp, Wool, Hair or other Matters into Thread. See THREAD.

*Spinning*, is either perform'd on the Wheel, or with a Distaff or Spindle, or with other Machines proper for the several kinds of Working. Hemp, Linc, Nettles and other like Plants are to be wet in *Spinning*; Silks, Wools, Cottons, &c. are spun dry, and don't need Water; yet there is a Way of *Spinning* Silk as it comes off the Cafes or Balls, whereto, and even boiling Water is to be used. See SILK; see also WHEEL, DISTAFF, &c.

**SPINOSISM**, the Doctrine of *Spinosæ*; or, Atheism proposed after the Manner of *Spinosæ*. The Retainers whereto, are call'd *Spinosists*.

The great Principle of *Spinosism* is, That there is nothing properly and absolutely existing, but Matter, and the Modifications of Matter; among which are even comprehended, Thought, abstract and general Ideas, Comparisons, Relations, Combinations of Relations, Properties, &c. See MATTER, SUBSTANCE, &c.

*Spinosæ* or *Espinosa*, was a Man well known in *Holland*. He was born a Jew; but did not make Profession of any Religion, either the Jewish or Christian. He compos'd several Books in *Latin*, the most celebrated whercof, is his *Tractatus Theologicus Politicus*, wherein he overturns the Foundation of all Religion: The Book, accordingly, was condemn'd by a publick Decree of the States; though it has since been sold publickly, and even reprinted, both in *Latin* and *French*, in that Country.

*Spinosæ*, here, maintains, That all Religions are only political Engines, calculated for the publick Good; to render the People obedient to Magistrates, and to make them practise Virtue and Morality.

He does not here lay down his Notion of the Deity openly; but contents himself with insinuating it.

In his Conversations, he acted to be more express; and maintained, That God is not, as we imagine him, an infinite, intelligent, happy and perfect Being; nor any thing, but that natural Virtue, or Faculty, which is diffused throughout all Creatures. See NATURE.

There have been abundance of Answers made to this Work of *Spirals*; but all exceedingly weak, except what we have in *Clark's Sermons* at *Boyle's Lecture*.

*Spirals*, in the said Treatise, is very full on the Subject of the Authors of the Scriptures; and endeavours to shew, That the Pentateuch is not the Work of *Moses*; contrary to the common Opinion, both of the *Jews* and *Christians*. He has also his particular Sentiments, as to the Authors of the other Books. This Part of the Treatise has been answered by *M. Huet*, in his *Demonstration Evangelique*; and by *M. Simon*, in his *Hist. Crit. du vieux Test.* See PENTATEUCH.

SPINSTER, in Law, an Addition usually given to all unmarried Women, from the Viscount's Daughter downwards.

Yet *St. Edward Coke* says, *Genofora* is a good Addition for a Gentlewoman; and that if she be named *Spinster* in any Original Writ, Appeal or Indictment, she may abate and quash the same.

*Speelman* says, That anciently, even the Queens used the Distaff and Spindle; whence *Spinster* became a common Appellation for all Women.

SPIRAL, in Geometry, a curve Line, of the circular Kind, which in its Progress, recedes from its Centre; as in winding from the Vertex down to the Base of a Cone. See SPIRE.

'Tis called from its Inventor, *Archimedes's Spire*, or *Helix*; and is thus described:

Divide the Periphery of a Circle A P P A (Tab. Geometry Fig. 39.) into any Number of equal Parts, by a continual Bisection in the Points p. Into the same Number of Parts divide the Radius CA, and make CM equal to one Part, Cn to two Parts, &c. Then will the Points M, n, o, &c. be Points in the *Spiral*, which connected, will give the *Spiral* itself. This now, is called the *first Spiral*, and the Space included between its Centre, and the Point A, the *Spiral Space*.

This first *Spiral* may be continued to a *second Spiral*, by describing another Circle with double the Radius of the First; and the Second may be continued a Third, by a third Circle, &c.

Hence, 1<sup>o</sup>, A P is to the Periphery, as Cn to the Radius. Wherefore, if the Periphery be called p, the Radius A C, AP = x, PM = y; then will CM = y; Consequently as p : n :: x : r - y, we shall have pr - py = x.

2<sup>o</sup> If CM = y; then will r - x = py. Which Equation the *Spiral* has in common with the Quadratrix of *Dionoftrates*, and that of *Leibnizianus*; and therefore r<sup>2</sup> x<sup>2</sup> = p<sup>2</sup> y<sup>2</sup> will serve for infinite *Spirals* and Quadratrices. See QUADRATRIX.

3<sup>o</sup> The Lines M n, M m, &c. are to one another as the Arches of the Circle, intercepted between MA and those Lines: And, when continued, making equal Angles with the first and second *Spiral*, are in arithmetical Proportion.

4<sup>o</sup> Lines drawn from M to the second *Spiral*, are to each other as the said Arches, together with the whole Periphery added on both Sides.

Quadrature of SPIRALS } See { QUADRATURE.  
Logistic SPIRAL } See { LOGISTIC.

SPIRAL, in Architecture, Sculpture, &c. is a Curve that ascends, winding about a Cone or *Spire*; so as all the Points thereof continually approach the Axis: By this it is distinguished from the *Helix*, which winds after the same Manner, around a Cylinder. See HELIX.

Ignorant Architects confound the Two; But the more knowing distinguish them carefully.

The *Spiral Line* is conceived to be thus generated.

If a Right Line as AB, (Tab. Geometry Fig. 40.) having one End fixed at B, be equally moved round, so as with the other End B, to describe the Periphery of a Circle; and at the same Time, a Point be conceived to move forward, equally from B towards A in the Right Line AB, so as that the Point describes that Line, while the Line generates the Circle:

Then will the Point, with its two Motions, describe the curve B, 1, 2, 3, 4, 5, &c. which is called a *Spiral Line*, and the plain Space contained between the *Spiral Line*, and the Right Line BA, is called the *Spiral Space*.

Again, if the Point B be conceived to move twice as slow as the Line AB; so that it shall get but Half way along BA, when that Line shall have formed the Circle; and if then, you imagine a new Revolution to be made of the Line carrying the Point, so that they shall end their Motion, at least, together; there shall be formed a double *Spiral Line*; as in the Figure: From the Manner of which, may be easily drawn these Corollaries.

1. That the Lines B 12, B 11, B 10, &c. making equal Angles with the first and second *Spiral* (as also B 12, B 10, B 8, &c.) are in an arithmetical Proportion.

2. The Lines B 7, B 10, &c. drawn any how to the first *Spiral*, are to one another as the Arches of the Circle intercepted betwixt BA, and those Lines: Because whatever Parts of the Circumference the Point A describes, as suppose 7, the Point B will also have run over 7 Parts of the Line AB.

3. Any Line drawn from B to the second *Spiral*, as B 18, B 22, &c. are to each other, as the aforesaid Arches, together with the whole Periphery added on both Sides: For at the same time that the Point A runs over 12, or the whole Periphery, or perhaps 7 Parts more, shall the Point B have run over 12, and 7 Parts of the Line AB, which is now supposed to be divided into 24 equal Parts.

PROPORTIONAL SPIRALS, are such *Spiral Lines*, as the Rumb Lines on the Terrestrial Globe, which, because they make equal Angles with every Meridian, must also make equal Angles with the Meridians in the Stereographic Projection on the Plane of the Equator; and therefore will be, (as Dr. Halley observes) proportional *Spirals* about the Polar Point. From whence he demonstrates, that the Meridian Line, is a Scale of Log-Tangents of the Half Meridian-Complements of the Latitudes.

SPIRAL SPIRES, in Building, See STAIRS.  
SPIRE, SPIRA, in the ancient Architecture, is sometimes used for the Base of a Column; and sometimes for the *Astragal* or *Tors*. See BASE.

From the *Latin, Spira*, the Folds of a Serpent, which when laid, bears some Resemblance thereto; or from the *Greek, σπῖρα*, the Coils of a Rope.

SPIRIT, in Theology, is used by way of Eminence, for the Third Person in the Holy Trinity; called *The Spirit*, or *The Holy Spirit*. See TRINITY and PERSON.  
The *Macedonians*, &c. deny the Divinity of the *Spirit*. See MACEDONIANS.

The *Arians*, &c. deny his Co-equality with the Father. See ARIANS.

Divines express the Manner wherein the *Spirit* was produced by the active *Spiration* or Breathing of the Father and the Son; whence the Name *Spiritus*, Breath.

Order of the Holy SPIRIT. See Holy GHOST.

SPIRIT, is also used among Divines, for the divine Power and Virtue; and the Communication thereof to Men.

In this Sense, the *Spirit* is said to have gone out on the Face of the Deep, *Genesi*, c. 1. v. 2. And the Prophets to have been possess'd of the *Spirit* of God.

Providence, in this Sense, is that universal *Spirit*, whereby God makes all Nature to act. Thus the Holy Virgin is said to have conceived of the *Spirit*, 1. Cor. vii. 40.

SPIRIT, is also used for any Incorporeal Being, or Intelligence.

In this Sense, God is said to be a *Spirit*: Angels, *Spirits*; and the Devil an *Evil Spirit*. See GOD, ANGEL, DEVIL, &c.

In this Sense, the Human Soul is also call'd *Spirit*, from its thinking and reflecting Powers, which cannot be conceived to reside in any thing Material. See SOUL.

F. *Mallebranch* observes, 'tis extremely difficult to conceive what it is, should make the Communication between the Body and the *Spirit*; for if the *Spirit* have no material Parts, it can't move the Body: But the Argument must be false some how or other; for we believe that God can move Bodies, and yet not attribute any material Parts to him.

Private SPIRIT, is a Term that made a great Figure in the Controversies of the two last Centuries. It signifies the particular View or Notion each Person has of the Dogmata of Faith, and the Truths of Religion, as suggested by his own Thought, and the Persuasion he is under with regard thereto.

The first Reformers denying strenuously any infallible Interpreter of the Scripture, or any settled Judge of Controversies; maintained, that every Person was to interpret and judge of revealed Truths, by his own Light, assisted by the Grace of God; and this was what they call'd *private Spirit* or *Judgment*.

Against this, the Arguments used by the Romanists are, That revealed Truths being one and the same for all Believers; the Rule God has given us for the judging of them, ought to represent them to us uniformly and the same; but the *private Spirit* informs *Little* one way, and *Zuinglius* another. It divides *Oecolampadius*, *Bucer*, *Obseuder*, &c. And the Doctrine it discovers to the *Confessionaires*, is quite different from that it shews the *Anabaptists* and *Mennonites*, in the very same Passage of Scripture.

SPIRIT, in Chymistry, is one of the Principles of natural Bodies, called also *Aireury*. See PRINCIPLE and MERCURY.

The chymical Principle *Spirit*, is a fine, subtle, volatile, penetrating, pungent Liqueur, which arises ordinarily before the Phlegm or Water, and sometimes after it.

The great Properties of this Liqueur are, that it penetrates and opens solid Bodies, cordoes, breaks, dissolves, and even dissolves certain mix'd Bodies; coagulates others, and produces an Infinity of Effects; and those even contrary to one another.

In the general, the Chymists call *Spirits*, all the fine subtle, and not aqueous Particles, raised from Bodies by Heat, and reduced into Liqueurs by Distillation; such are *Spirit of Vitriol*, of *Salt-petre*, of *Salt*, &c.

They also call *Spirits*, those aqueous Liqueurs drawn by Liquidation, when they are impregnated with Salts, or other active Principles, raised, together with them, by the Violence of the Fire.

These, when they excite any Sensation of Heat on the Tongue, are particularly called *Acid*, or *Sharp Spirits*.

When they make any Erosion on the Tongue, they are call'd *Corrosive Spirits*. See *CORROSIVE*.

Such as Taste somewhat like common Salt, are call'd *Saline Spirits*. See *SALT*.

Such as partake of the Taste of common Sulphur, *Sulphurous Spirits*. See *SULPHUR*.

And when this Taste is very strong, *Urinous Spirits*. See *URINOUS*.

Such as take Fire readily, *Inflammable* or *Ardent Spirits*. See *INFLAMMABLE*.

Such where the Acid predominates, though qualified with a little Sulphur, &c. are called *Mix'd Spirits*.

In this Sense, the Chymists are said to draw a *Spirit* from Sulphur, Salt and other Bodies, when they extract the Effence, or the subtlest Part thereof, by Distillation or otherwise. See *DISTILLATION*, &c.

*SPIRITS* is also a general Name among Distillers, for all distill'd Liqueurs that are neither Oil nor Phlegm.

*Spirit of Wine*, is only Brandy rectified once or more Times, by repeated Distillations. See *BRANDY*.

One may likewise make a perfect Rectification of *Brandy* into *Spirit of Wine*, at one single Distillation, by using a chymical Instrument, consisting of several Cucurbites, described by *Glauber*. See *RECTIFICATION*.

*Spirit of Wine* is used in Dying, as a non-colouring Drug, and giving no Colour itself, but serving to prepare the Stuffs to receive the Colours. See *DYING*.

The Consumption of *Spirit of Wine* is very considerable in several other Works and Manufactures, particularly the making of Varnish. See *VARNISH*.

*Spirit of Sulphur*, is a *Spirit* drawn from *Sulphur* melted and inflamed; the most subtle Part whereof, is converted into a Liqueur, by sticking to a Glass Bell suspended over it, whence it falls Drop by Drop, into a Trough, in the Middle whereof, is placed the Stone Pot wherein the Sulphur is burnt. See *SULPHUR*.

This *Spirit* is held Specific for the same Diseases as *Spirit of Vitriol*. See *SPIRIT OF VITRIOL*.

*Spirit of Salt*, a yellow Liqueur drawn, by Chymistry, from Sea Salt. See *SALT*.

The best, is that prepared in *England*. 'Tis much used in Medicine; but has not, perhaps, all the Virtues ascribed to it. The common *Spirit of Salt*, being very corrosive, may be delified, by letting it digest three Days on a gentle Sand heat, with an equal Quantity of *Spirit of Wine* mix'd therewith. See *DULCIFYING*, *FRESH-WATER*, &c.

*Spirit of Vitriol*, is *Vitriol* dried in the Sun, or in Defect thereof, by the Fire, and then distill'd by chymical Operations several Times repeated; first by a reverberatory Fire, and then in *Balneo Marie*. See *VITRIOL*.

'Tis held excellent against the Epilepsy, as well as against burning and malignant Fevers.

The last *Spirit* drawn from *Vitriol*, and which is improperly call'd *Oil of Vitriol*, is used in the Dissolution of Metals and Minerals.

<p><i>Spirit of Tartar</i> <i>Spirit of Sugar</i> <i>Spirit of Turpentine</i> <i>Spirit of Venus</i></p>	}	See	<p>TARTAR. SUGAR. TURPENTINE. VENUS.</p>
--	---	-----	--

*SPIRIT*, in Physics. Sir *Isaac Newton* closes his immortal *Principia*, with observing, That he might "there have added some Things, concerning a most subtle *Spirit* which pervades all, even the densest Bodies, and lies hid therein; by the Force and Action whereof, the Particles attract each other, at very small Distances, and when contiguous, cohere: And electric Bodies act at greater Distances, both attracting and repelling the neighbouring Corpuscles; and Light is emitted, reflected, and inflected and warms Bodies; and all Sensation is excited; and the Members of Animals moved at the Instance of the Will, &c. by Vibrations of this *Spirit*, propagated through the solid Capillaments of the Nerves, from the external Organs of Sense to the Brain, and from the Brain to the Muscles."

But he chafes to postpone them; as not having a sufficient

"Number of Experiments, whereby the Laws of the Action of this *Spirit* might be precisely determined." See *NEWTONIAN PHILOSOPHY*; see also *MEDIUM*, *VACUUM*, &c.

*SPIRITS*, in Medicine, are the most subtle and volatile Parts, or Juices of the Body; by means whereof, all the Functions and Operations thereof are performed.

The *Spirits* are usually distinguished into *Vital* and *Animal*.

The Ancients, indeed, made a four-fold Distinction of *Spirits*; into *Vital*, *Animal*, *Natural* and *Genital*: Whereof, the First they placed in the Heart; the Second in the Brain; the Third in the Stomach and Liver; and the last in the Testicles: But as this Division is founded on a false Hypothesis; 'tis now deserv'dly set aside.

*Vital SPIRITS*, are only the finest, and most agitated Part of the Blood; whereon its Motion, and Heat depend, See *BLOOD*.

*Animal SPIRITS*, are an exceedingly thin, subtle, moveable Fluid, Juice or Humour separated from the Blood in the Cortex of the Brain, hence received into the minute Fibers of the Medulla, and by them discharged into the Nerves, by which it is convey'd through every Part of the Body, to be the Instruments of Sensation, muscular Motion, &c. See *SENSATION*, *MUSCULAR MOTION*, &c.

The *Animal Spirits*, call'd also *Nervous Spirits* and *Nervous Juices*, only differ from the *Vital Spirits*, in that these last are full mix'd and blended with the grosser Parts of the Blood, and circulate along with it: Whereas, the *Animal Spirits* are secreted thence by the Glands whereof the cortical Substance is compos'd; and have a Motion, Circulation, &c. peculiar to themselves. See *CIRCULATION*.

Dr. *Willis* conceives, that the *Animal Spirits* are prepared by a proper Distillation of the subtlest Part of the arterial Blood, brought by the Carotides into the Cortex of the Brain; and shews, that the Blood contained in the Sinus of the Dura Mater, acts in this Distillation in the same Manner as Fire does in the chymical Distillations perform'd by Distillation, where being placed over the Matter to be distill'd, it makes the subtlest Parts thereof descend.

The Existence of the *Animal Spirits* is controverted: But the infinite Use they are of in the Animal Oeconomy, and the exceedingly lame Account we should have of any of the Animal Functions without them, will still keep the greatest Part of the World on their Side. And, in effect, the learned *Boerhaave* had gone a good way towards a Demonstration of their Reality.

The Blood brought to the Brain by the Carotides, and Vertebral Arteries, he shews, is infinitely prepared, secreted elaborated and changed from its natural State, e'er it arrives there, inasmuch as, contrary to the Nature of the rest, instead of cohering by the Fire, it immediately resolves wholly into a thin Vapour, without any Faeces behind. And is thus exceedingly well fitted for the Formation of so extraordinary a Fluid.

He shews, further, That the *Animal Spirits* are not form'd from the Crour, but the Serum of the Blood, which *Malpighi's* History of the Growth of the Fetus in an incubated Egg, shews to be divisible into Parts or Corpuscles, inconceivably smaller than the Crour.

He adds, That the Nature of the Juice is such, as that no Salts or Oils in the Body can contribute any thing to it; and that in all appearance, 'tis only a most subtle, pure Water; which Liqueur is found to resemble these *Spirits* in its extraordinary Miscibility, Mobility, Solidity, Softness, Simplicity and want of Elasticity.

The same Author shews, further, from the Magnitude of the Carotids and Vertebrals, their straight uninterrupted Course, the great Quantity of Blood they bring, the Bulk of the Cortex, &c. that there must be a very great Quantity of this Liqueur; that there is fresh prepared every Moment of Life; and that it is driven, every Moment, by the Action of Heat, &c. from the Brain and Cerebell, to all the Parts of the Body furnish'd with Nerves; which Motion, he shews from the exceeding Fineness, Crookedness, &c. of the Ramifications must be very gentle, equable and constant, one Part continually driving before it another. Upon the whole, 'tis no Wonder it escapes the Notice of our Senses; and that no Ligatures, Wounds, Punctures, Injections or the like, make either it or the Apertures of the Nerves through which it flows, visible: Nor does it avail, what some, who allow the Existence of the *Animal Spirits*, urge against their being any coherent Juice or Liqueur, &c. That we should find it coze out and wet the adjacent Parts, upon cutting a Nerve, as we do in cutting a Lymphatic, &c. that upon binding a Nerve, the upper Part would swell; that the Agitations which Objects make on the Filaments, would deaden, &c. that 'tis impossible a Liqueur should have two opposite Motions at the same Time; and that the Velocity of Sensations, and the Rapidity of the Motions of Man, prove, that the *Animal Spirits* are rather Light than a Liqueur. *Met. de Trev.*

- For the Secretion of the Animal SPIRITS from the Blood, and the Apparatus in order there-  
to - - - - - } See BRAIN and SECRETION.
- For the Course of the Animal SPIRITS, and the Vessels thro' which they are carried - - - } See NERVE and SECRETION.
- For the Office of the Animal SPIRITS in muscular Motion and Sensation - - - - - } See MUSCLE and SENSATION.

SPIRITUALITIES of a Bishop, are such Profits, as arise to him from the Benefit of his Jurisdiction in his Diocese, and not as a Baron of the Parliament. See BISHOP.

Such are those of his Visitations, Inscriptions, Ordinations, Presentation-Money, &c. See VISITATION, &c.

SPIRITUALIZATION, in Chymistry, the Action of extracting Spirits from natural Bodies. See SPIRIT.

Spiritualization, is an Operation that belongs principally to fermented Salts; then to fermented Juices and Liquors; and the Fermentation rendering the Spirits Volatile and Inflammable. See FERMENTATION.

Spirit of Wine, is sometimes *Spiritus vitæ* to that degree, that upon throwing a Quantity into the Air, not a Drop shall fall down; but the whole evaporate and be left.

SPITTLE, See SALIVA and SPUTUM.

SPITTLE-Haust, a Corruption of the Word Hospital.

See HOSPITAL.

SPLANCHNOLOGY, in Anatomy, a Discourse, or Explanation of the Viscera. See VISCERA.

Sarcology is divided into three Parts, *viz.* *Splanchnology, Myology and Angiology.* See SARCLOGY.

*Splanchnology*, is that which treats of the Internal Parts, and particularly the Viscera. The Word is form'd from the Greek *σπλάνχνα* Viscus, *λόγος*, and *ἀνά*, Discourse.

SPLEEN, *Lien*, in Anatomy, a soft, fleshy Viscus, of a darkish Red, or rather Livid, Colour, ordinarily resembling the Figure of a Tongue, though sometimes triangular, and sometimes roundish.

The Spleen is usually single, though sometimes there are Two, and sometimes Three found. 'Tis situate in the Left Hypochondrium, between the spurious Ribs and the Stomach; is somewhat convex on the Side, towards the former, and concave towards the latter. Its ordinary Length is Six Inches; Breadth Three, and Thickness One. It is connected to the Omentum, and by Means of that and the Blood Vessels, to the Stomach and Left Kidney, and sometimes to the Diaphragm.

It is covered with two Tunics; the External derived from the Peritoneum and connected to the Internal only, by the Intervention of the Blood Vessels. The inner consists of Fibres very curiously interwoven. From this, probably, are derived those innumerable Cells or little Bladders, which make up the main Bulk of the Spleen: Though *Malpighi* rather takes them to arise from the Venous Duct. The Cells communicate with each other, and discharge themselves into the Trunk of the Vein. Their Inside, according to *Malpighi*, is furnished with various minute Glands adhering together; Six, Seven or Eight whereof, form a kind of small conglomerate Glands, wherein the Arteries and Veins seem to terminate.

Its Blood-Vessels are the *Splenic Artery*, which furnishes it with Blood, from the Cœliac; and the *Splenic Vein*, which carries it thence, by the Porta, to the Liver. See SPLENIC.

Its Nerves come from the *Plexus Lienaris*, near the Bottom of the Stomach. The Vessels are all, as soon as they enter the Spleen, wrapt up in one common Capsula or Membrane, and plentifully distributed together throughout the Substance of the Spleen. Besides these, are Lymphatics in great Abundance.

The Anastomoses between the Arteries and Veins of the Spleen, are more apparent than in any other Part of the Body. And this Viscus is observed to be furnished with a greater Proportion of Blood than any other Parts. See ANASTOMOSIS.

The Use of the Spleen has been disputed in all Ages; both, as no immediate Use thereof appears from Dissection, and as we find, that Animals from whom it has been cut, live very well without it. All the Effects, *&c.* following the cutting it from a Dog, are, that the Animal grows more Solacious than usual; that it urinates more frequently; is more hungry than ordinary; and for the first Days is troubled with a Vomiting and Nausea. 'Tis added, That 'tis necessary the Part be taken away to make a good Runner.

Hence some have imagined that the Spleen only served to make a Balance in the Weight of the Body; others, that it was only intended for the sake of Symmetry; others, an useless Load, and one of Nature's Redundancies; others a Pit or Common-Shore to discharge the Fœces of the Blood into; others a Fire, by the Heat whereof, the Action of the Ventracles is animated.

Many of the Ancients took it to be the Receptacle of the *Atra Bilis* or Melancholic Humour; for which Reason, some of them call it the *Organ of Laughter*.

Mr. *Casper*, from the great Quantity of Blood, and the apparent Insulations of the Spleen, draws a very natural Conjecture of the Use thereof; at least of the peculiar Mechanism. He takes, then, the Spleen to be only a subordnate Organ, ministering to the Circulation; and thinks, that by this Congress of the Arterial and Venal Blood, an Impetus is communicated to the latter, by which its Progress through the Ramifications of the Porta to the Cava, is promoted, which would otherwise be so broke by the double Ramifications of the Porta, as to want Strength sufficient to carry it to the Heart. See CIRCULATION.

The Action or Effect of the Spleen, according to Dr. *Bowdew*, is to receive the fresh arterial Blood, prepare it in its Glands, and pour it into its Cells; to return what Blood is left from this Action, to the little Veins, and thence to the Splenic Vein; to mix the Humour thus prepared, with the nervous Juice, and to prepare, attenuate, and more intimately unite them together into one Humour.

*Malpighi*, and afterwards Dr. *Keil*, and some others, take the Spleen to be a viscous Assistent to the Liver, in the Secretion, &c. of the Bile. We have observed, that by reason of the Nearness of the Liver and Heart, and the swift Motion of the Blood in the Aorta, a Humour consisting of Particles that combine so slowly as those of the Bile do, could not be prepared but by bringing the Blood round about through the Stomach, Intestines and Omentum, &c. to the Liver, to abate its Velocity.

Now Dr. *Keil* conjectures, that those Part were not sufficient to receive all the Blood necessary to be sent to the Liver; therefore Nature framed the Spleen, into whose Cavities the Blood being poured from a small Artery, moves at least as slowly as any that passes otherwise to the Liver; by which Means the Particles that compose the Bile in the Blood, which passes through the *Ramus Splenicus*, by so long and slow a Circulation, have more Chances for uniting than otherwise they would, had they been carried by the Branches of the Cœliac directly to the Liver; consequently without the Spleen, such a Quantity of Bile as is now concerned, that is, as Nature requires, could not have been secreted by the Liver. See BILE; see also LIVER.

SPLEEN, is also used for a Dicalc; by Physicians more usually called the *Lypochondriac Disease*. See HYPOCHONDRIC and VAPOURS.

SPLENETIC, a Person affected with Opilations and Obstructions of the Spleen.

In *Splenetick* People, the Spleen is swell'd beyond the natural Bulk, or harden'd, so as to shew a Schirrous Tumour thereon. *Splenetick* People are distinguished by a Livid, Lead-coloured Complexion; their Character is to be very prone to Laughter; which is an Expedient Nature is supposed to make use of, to evacuate the too redundant Humour the Spleen is charged withal, whence it is that the Ancients made the Spleen the Organ of Laughter; and hence that popular Saying of a Person laughing heartily, *'Tis he vents his Spleen*.

SPLENIC Vessels, a large Artery, and a Vein of the Spleen. See SPLENIC.

The *Splenic Artery*, is a Trunk of the left Cœliac, serving to bring the Blood from that Artery to the Spleen, to be there secreted, prepared, &c. its Progress is very much contorted; and after its Arrival at the Surface of the Spleen, it is diffused through the Substance thereof in small Branches, which seem to terminate in the Cells.

The *Splenic Vein* is form'd out of the several minute Veins of the Spleen, uniting as they quit the Surface thereof. It carries the Blood secreted, &c. in the Spleen, to the Left Branch of the *Vena Porta*, to be thence convey'd to the Liver, there to be further prepared and converted into Bile.

The *Splenic Vein* and Artery manifestly communicate with each other: For Water being poured into one of them, presently discharges itself by the other. See SPLENIC.

SPLENII, in Anatomy, a Pair of Muscles, called also from their Form *Triangulares*.

They arise from the four upper Spines of the Vertebrae of the Back, and from the two lower of the Neck, and tending obliquely, adhere to the upper transverse Processes of the Vertebrae of the Neck, and are inserted into the upper Part of the Occiput. They pull the Head backwards to one Side. They are call'd *Spleni*, from a supposed Resemblance to an Ox's Spleen.

SPLINT, or SPLINT, among Fattiers, a callous, insensible Excrescence; or kind of hard Gristle, that sometimes sticks to an Horse's Shank-Bone, and generally comes upon the Inside; if there be one opposite thereto on the Outside, it is called a *Pepp'd* or *Pinn'd Splint*, because it doth, as it were, pierce the Bone, and is extremely dangerous.

SPLINTS, in Surgery, Pieces of Wood used in binding up broken Limbs. See FERUVA.

The Word is also used for the Pieces of a fractured Bone. **SPLICE**; at Sea they say, a Cable or Rope is *Spliced*, when the Ends of two Pieces being untwisted, the several Strands are wrought into one another by a Fidd. Also when an Eye is to be made at the End of a Rope, the Ends of the Strands, are, by a Fidd, drawn into the Ends of the other Ropes Strands; and this is call'd a *Splice*.

To *Splice* among Gardeners, is to graft the Top of one Tree into the Stock of another, by cutting them sloping, and fastening them together. See **ENGRAFFING**.

**SPODIUM**, in Pharmacy, a kind of Calc or Ashes, effect'd an excellent Cardiac, and held to have the same Virtues with Coral.

The *Spodium* of the ancient Greeks, was a kind of Ashes found on the Hearths of Furnaces wherein Brass was made; call'd by them *σπιδιον*, *q. d. Cinis*.

That of the Arabian Physicians, as *Avicenna* and others, was made of the burnt Roots of Ruffus and Reeds.

The Moderns make their *Spodium* of Ivory burnt and calcined to a Whiteness. 'Tis sometimes counterfeited, by burning Bullocks or Dogs-bones; but these are of no Value.

The *Anti-Spodium*, which the Ancients substituted for their *Spodium*, was made of Myrtle-Leaves, Galls and some other Ingredients, calcined.

**SPOILS**, whatever is taken from an Enemy in War.

Among the Greeks, the *Spails* were divided in common among the whole Army; only the Generals Quota was the biggest.

By the Military Discipline of the Romans, the *Spails* belong'd to the Republick; particular Persons had no Title to them; and each of the Generals, as valuing themselves on their Probity, always carried them to the Publick Treasury. Sometimes, indeed, the Pillage was distributed by the General among the Soldiery, to encourage them, or to reward them: But this was not done without a world of Prudence and Reserve'dness, otherwise it came under the Crime of *Peculatus*.

The Consuls *Romulus* and *Veturius*, were condemn'd for having sold the *Spails* taken from the *Aegni*. *Livy*, lib. 8.

**SPONDAULES**, in Antiquity, a Player of the Flute, or other Wind Instrument of that Kind, who, during the Offering of Sacrifice, performed some suitable Air in the Priest's Ear to prevent the hearing of any Thing that might distract him, or lessen his Attention. See **SACRIFICE**.

The Word is form'd from the Greek *σπονδαιον*, *Libationis*, and *αυδω*, *Flare*.

**SPONDEE**, **SPONDAEUS**, in the Greek and Latin Profody, a Foot of a Verse consisting of two long Syllables; as *Versutus*. See **FOOT** and **QUANTITY**.

The *Spondees* is a grave Measure: All Greek and Latin Hexameters end with a *Spondees*. See **VERSE** and **MEASURE**.

There are also *Spondees* or *Spondaic Verses*; that is, Verses compos'd wholly of *Spondees*, or at least that end with Two *Spondees*, as,

*Constitit atque oculis Phrygia agmina circumspexit.*

**SPONDYLUS**, a Term anciently used for a Vertebra of the Spine *Dorsæ*. See **VERTEBRA**, &c.

**SPONGE**. See **SPUNGE**.

**SPONGIOSA**, in Anatomy, an Epithet given to several Parts of the Body, from their Texture, which is Porous and Cavernous, like that of the *Spongia*; as

*Corpora Spongiosa Penis*, call'd also *Corpora Cavernosa* and *Nervosa*. See **CAVERNOSA CORPORA**.

*Offa Spongiosa* of the Nose, call'd also *Offa Turbinata*, and *Cribriformis Offa*. See **TURBINATA Offa** and **CRIBRIFORME**.

**SPONTANEOUS**, in the Schools, a Term applied to such Motions of the Body and Mind as we perform of our selves, without any Constraint.

Thus, in Morality, those Actions perform'd from an inward and natural Principle, conformable to the Inclination of Nature, excluding all Constraints, but not excluding Necessity, are call'd *Spontaneous Actions*. See **NECESSITY**.

In Medicine, an Evacuation effect'd without any Application for that purpose, is call'd a *Spontaneous Evacuation*. And a Lassitude or Weariness, not occasion'd by any preceding Fatigue, is call'd a *Spontaneous Weariness*.

The Word is form'd from the Latin Adverb, *Sponte*, of one's own accord.

'Tis held a grievous and dangerous Error, with regard both to Religion and Morality, to hold that human Liberty only consists in a *Spontaneity*: *M. le Clerc* has been very harshly treated, for making *St. Augustin* of this Opinion. See **LIBERTY**.

**SPONTANEOUS Generation**. See **EQUIVOCAL Generation**.

**SPOONING**: In the Sea Language, when a Ship being under Sail, in a Storm at Sea, cannot bear it; but is forced to put right before the Wind; then the Seamen say, she *Spoons*; and when in such a Case, there is Danger left she should bring her Mast by the Board, with her rolling about, or feel under Water, and so founder, they usually set up

the Fore-mast to make her go the steadier, especially if there be Sea-room enough; and this they call *Spooning with the Fore-mast*.

**SPORADES**, in Astronomy, a Name the Ancients gave to such Stars as were not included in any Constellation. See **STAR**.

These, the Moderns more usually call *Informes*. See **INFORMES**.

Many of the *Sporades* of the Ancients have been since form'd into new Constellations, *E. gr.* Of those between *Leo* and *Ursa Major*, *Hevelius* has form'd a Constellation, call'd *Leo Minor*; of those between *Ursa Minor* and *Auriga*, another Constellation call'd *Lynx*; of those under the Tail of *Ursa Major*, another call'd *Canis venaticus*, &c. See **CONSTELLATION**.

**SPORADIC**, in Medicine, an Epithet given to such Diseases as have some special or particular Cause, and are dispersed here and there, regarding particular Constitutions, Ages, or other Circumstances. See **DISEASE**.

*Sporadic* stand in Opposition to *Epidemic* Diseases, which are those arising from a general Cause, and that are common to all Kinds of Persons, of what Complexion and Quality soever. See **EPIDEMIC**.

The Word is form'd from the Greek *σπορας*, dispersed, spread, &c.

**SPORTULA**, in Antiquity, a Dole, or Largess, either of Meat or Money, given by Princes or great Men, to the People, or the Poor.

The *Sportula* was properly the Panier, or Basket wherein the Meat was brought, or wherewith the Poor went to beg it; thence the Word was transferred to the Meat itself; and thence to Money sometimes given in lieu of it.

*Sportula* was frequently used in Opposition to *Reſta cana*, a plentiful Meal; as in *Marshall*,

*Promissio est nobis Sportula reſtae data.*

*St. Cyprian* calls *Sportulantes Fratres*, such Clergymen as then received Gifts for their Maintenance, like our Prebends.

**SPOTS**, in Astronomy, dark Places, observed on the Disks or Faces of the Sun and Moon. See **SUN** and **MOON**.

The *Spots* in the Sun are only visible through a Telescope: Some distinguish them into *Miculae* or dark *Spots*, and *Faculae* or bright *Spots*; but these seem little Foundation for any such Division. See **MACULE** and **FACULAE**.

The *Solar Spots* have not been long observed. They are very changeable, as to Number, Form, &c. are sometimes in a Multitude, and sometimes none at all.

Some imagine they may become so numerous, as to hide the whole Face of the Sun; at least the greatest part of it; And to this, ascribe what *Plutarch* tells us, *viz.* That in the First Year of the Reign of *Augustus*, the Sun's Light was so faint and obscure, that one might look steadily at it with the naked Eye. See **ECLIPSE**.

To which *Kepler* adds, That in 1547, the Sun appeared reddish, as when viewed through a thick Mist; and hence conjectures, That the *Spots* in the Sun are a kind of dark Smoke or Clouds floating on the Surface thereof. Others will have them Stars or Planets transiting the Body of the Sun. But 'tis much more probable they are opaque Bodies, in manner of Crafts, form'd like the Scums on the Surface of Liquors. See **SUN**.

The *Lunar Spots* are fix'd. Some will have them the Shadows of the Mountains, or uneven Places of the Moon's Body; but their Constancy discredit this Opinion. The more general and probable Opinion is, That the *Spots* in the Moon, are Seas, Lakes, Morasses, &c. which absorbing Part of the Sun's Rays reflect the fewer to us; so as to appear in form of dark *Spots*: Whereas the earthy Parts, by reason of their Solidity, reflect all their Light, and thus appear perfectly bright. *M. Herſchel* has another Opinion, and takes the *Spots* in the Moon, many of them at least, for Forests, Groves, &c. the Leaves and Branches whereof, intercept the Rays reflected from the Ground, and send them elsewhere.

The Astronomers reckon about 48 *Spots* on the Moon's Face; to each whereof, they have given Names. The 21<sup>st</sup> is one of the most considerable, and is call'd *Tycho*.

**Planetary Spots**: Astronomers find that the Planets are not without their *Spots*. *Jupiter*, *Mars*, and *Venus*, when viewed through a Telescope, shew several very remarkable ones; and it is by the Motion of these *Spots*, that we conclude the Rotation of the Planets round their Axes, in the same Manner as that of the Sun is deduced from the Motion of his *Maculae*. See **PLANET**, **SUN**, &c.

**SPOUT**, or **Water-SPOUT**, in Natural History, an extraordinary Meteor, or Appearance, at Sea, and sometimes at Land, very dangerous to Ships, &c. oftenest observed in hot, dry Weather; call'd by the Latins, *Typho*, and *Spho*, by the French, *Trompe*, &c. See **MEYTOR**.

Its first Appearance is in form of a deep Cloud, the upper Part whereof is White, and the lower Black. From the lower

lower Part of this Cloud hangs, or rather falls down, ~~that~~ we properly call the *Spout*, in manner of a Conical Tube, biggest at-top. Under this Tube is always a great boiling, and flying up of the Water of the Sea, as in a *Jet d'Eau*. For some Yards above the Surface of the Sea, the Water stands as a Column or Pillar; from the Extremity whereof, it spreads and goes off, as in a kind of Smoak. Frequently, the Cone descends to low, as to touch the Middle of this Column, and continue for some time contiguous to it; though sometimes it only points to it, at some Distance, either in a perpendicular or oblique Line.

Frequently 'tis scarce distinguishable, whether the Cone or the Column appear the first, both appearing all of a sudden against each other. But sometimes the Water boils up from the Sea to a great Height, without any Appearance of a *Spout* pointing to it, either perpendicularly or obliquely. Indeed, generally, the boiling or flying up of the Water, has the Priority, this always preceding its being form'd into a Column.

Generally, the Cone does not appear hollow, till towards the End; when the Sea-water is violently thrown up along its Middle, as Smoak up a Chimney. Soon after this, the *Spout* or Canal breaks and disappears; the boiling up of the Water, and even the Pillar, continuing to the last, and for some time afterwards; sometimes till the *Spout* form itself again and appear anew; which it sometimes does, several times in a Quarter of an Hour.

M. de la Pyrene, from a near Observation of two or three *Spouts* in *Yorkshire*, described in the *Philosophical Transactions*, gathers, that the *Water-Spout*, is nothing but a Gyration of Clouds by contrary Winds, meeting in a Point or Centre; and there, where the greatest Condensation and Gravitation is, falling down into a Pipe or great Tube, somewhat like *Archimedes's* Spiral Screw; and in its working and whirling Motion, absorbing and raising the Water in the same Manner as the Spiral Screw does; and thus destroys Ships, &c.

Thus, *June* the 24th, he observed the Clouds mightily agitated above, and driven together; upon which they became very black, and were hurried round, whence proceeded a most audible whirling Noise, like that ordinarily heard in a Mill. Soon after, issued a long Tube or *Spout*, from the Centre of the congregated Clouds, wherein he observed a spiral Motion, like that of a Screw; by which the Water was raised up. Again, *August* 15, 1687, the Wind blowing at the same Time out of several Quarters, created a great Vortex and Whirling among the Clouds; the Centre whereof, every now and then, dropt down, in Shape of a long, thin, black Pipe, wherein he could distinctly behold a Motion like that of a Screw, continually drawing upwards and screwing up, as it were, where-ever it touch'd. In its Progress it moved slowly over a Grove of Trees, which bent under it like Wands in a circular Motion. Proceeding, it tore off the Thatch from a Barn, bear a huge Oak Tree, broke one of its greatest Branches, and threw it to a great Distance. He adds, That whereas 'tis commonly said, the Water works and rises in a Column, e'er the Tube comes to touch it; this is certainly a Mistake, owing to the Fineness and Transparency of the Tubes, which do most certainly touch the Surface of the Sea, e'er any considerable Motion can be raised therein; but which do not become optick and visible, till after they have imbibed a considerable Quantity of Water.

The Diffolution of *Spouts*, he ascribes to the great Quantity of Water they have glutted; which by its Weight impeding their Motion, whereon their Force, and even Existence, depends, they break and let go their Contents; which used to prove fatal to whatever is found underneath.

A notable Instance hereof, we have in the *Philosophical Transactions*, related by Dr. *Richardson*. A *Spout* in 1718, breaking on *Emost-moor* nigh *Coln* in *Lincolnshire*, the Champagne was immediately overflow'd, a Brook, in a few Minutes, rose Six Feet perpendicularly high; and the Ground whereon the *Spout* fell, which was Sixty-six Feet over, was rose up to the very Rock, which was no less than Seven Feet deep; and a deep Gulf made for above half a Mile; the Earth being raised on either side in vast Heaps.

In *Pliny's* Time, the Seamen used to pour Vinegar into the Sea, to alluage and lay the *Spout*, when it approached them; Our Modern Seamen think to keep it off, by making a Noise with firing and scratching violently on the Deck; or, by discharging great Guns to disperse it.

SPRING, in Natural History, a Fountain or Source of Living Water arising out of the Ground. See WATER.

The Origin of Springs or Fountains, is a Thing much controverted among our latest Naturalists.

Messieurs *Mariotte* and *Perrault* ascribe it to Rains. Their Doctrine is, That the Rain-water penetrates the Earth till such time as it meets a Clayey Soil or Stratum; which proving a sufficient solid Bottom, to sustain and stop their Descent, they glide along it that way to which the Earth declines, till they meet with a Place or Aperture in the Surface of the Earth, through which they may escape, and make the Head of a River. See STRATUM.

Now, that the Rain is sufficient for this Effect, appears

hence; that upon calculating the Quantity of Rain and Snow that falls yearly on the Tract of Ground, that is to furnish; for Instance, the Water of the *Seine*; 'tis found, that River does not take up above one sixth Part of it. Springs ordinarily arise at the Feet of Mountains: The Reason, say they, is, That Mountains collect the moist Waters, and give them the greatest Descent towards the same Side; and that if we sometimes see Springs on high Grounds, and even on the Tops of Mountains; they must be brought from other remoter Places, considerably higher, along on Beds of Clay or clammy Ground, as in their natural Channels. If then, there happen to be a Valley between a Mountain, on whose Top is a Spring, and the Mountain that is to furnish it with Water, the Spring must be look'd on as a Water conducted from a Reservoir of a certain Height through a subterraneous Channel, to make a Jet of an equal or somewhat less Height. See RAIN.

This Theory M. de la Hire has taken under Examination, in its most essential Article, and that where the Authors seem to have been the least disstrifful.

He has endeavour'd to find, by Experiment, whether Rain or Snow-water could penetrate the Earth as low as the clayey Stratum: The Result of his Inquiry, is, That they don't penetrate even 16 Inches deep, in a Quantity sufficient to form the smallest Collection of Water on a Solid Bottom. Nay, this he found when the Earth he made his Experiment on, was quite naked of all Herbs and Plants; but as soon as ever any of these came up, and were grown to any Bulk, so far was the Rain that fell, from being able to gather itself at the Depth of 16 Inches, that it was not sufficient even to feed the Plants, but there was a Necessity for watering them. For the Quantity of Water expended in the ordinary Support of Plants; see VEGETATION.

Dr. *Halley* refers the Origin of Springs moerly to Vapours, rais'd by the Heat of the Sun, or of Subterraneous Fires from the Sea, Lakes, Rivers, &c. These Vapours, thus rais'd, he supposes, are by the Winds, carried over the Low-lands, to the several Mountains and Ridges of Mountains, and are there compell'd, by the Stream of Air, to mount with it to the Tops, where the Atmosphere being very rare and cold, retains but a small Part of them; the rest is condensed into Dew, which presently precipitates, gleeing down by the Crannies of the Stones, and part of it entering the Caverns of the Hills, is gather'd therein, as in an Alembic, which being once full, the Overplus must run down at the lowest Part of the Reservoir, and breaking out by the Side of the Hills, forms single Springs, many of which running down by the Vallies or Guts between the Ridges of the Hills, and at length uniting, form Rivulets, and many of these meeting in a common Channel, form Rivers. See RIVER.

Now, to shew that Vapour is a sufficient Fund, to supply all our Springs, Rivers, &c. The same excellent Author makes an Estimate of the Quantity of Vapour rais'd from the Sun, by the Action of the Sun: The Result of an Experiment he made to that Purpose was, That the Thickness of Water evaporated from the Surface of the Sea, in the Space of Two Hours, in Summer-time, is one Fifty-third Part of an Inch; which for the Ease of Calculation, being only supposed to be  $\frac{2}{3}$ ; the Quantity of  $\frac{2}{3}$  of an Inch will be found exhald in 12 Hours. On this Principle, every Mile square will be found to evaporate, in 12 Hours, 6914 Tuns of Water, and every square Degree, Thirty-three Millions of Tuns. The Area of the *Mediterranean* then being estimated at 160 Square Degrees, it will lose in Vapour, in a Summer's Day 5280 Millions of Tuns.

Yet the Quantity of Vapour thus rais'd, great as it is, is only the Remains of what is rais'd another Way, viz. by the Winds, which sometimes sweep the Water off, faster than the Sun takes it up.

To find now, the Quantity of Water the *Mediterranean* receives, allow the most considerable Rivers it receives, viz. the *Iberus*, *Rhone*, *Tyber*, *Po*, *Danube*, *Neister*, *Zorix*, *Rhenus*, *Tanis* and the *Nile*, each to furnish Ten Times as much Water as the *Thames*; not that any of them are, in reality, so great, but so to allow for the lesser Rivulets: But the *Thames* is found, by Calculation, to evacuate 2030000 Tuns of Water daily. All the Nine Rivers abovementioned, therefore, will only evacuate 1827 Millions of Tuns in a Day, which is little more than a Third of what is rais'd in that Time in Vapour. See VAPOUR.

After all that can be said in Favour, both of Rain and Vapour, it must be owned, they are both still press'd with great Difficulties; and there is still Room to look out for a better Theory.

The Penrenity of divers Springs, always yielding the same Quantity of Water, when the least Rain or Vapour is afforded, as well as when the greatest, is a strong Objection to both. Mr. *Derham* mentions one in his own Parish of *Uppminster*, which he could never perceive by his Eye to be diminish'd in the greatest Droughts, even when all the Ponds in the Country, as well as an adjoining Brook, have been dry for several Months together; nor ever to be increas'd in the moist rainy Seasons, excepting perhaps, for a few Hours, or at most

for a Day, from sudden and violent Rains. Had this *Spring* its Origin from Rain or Vapour, there would be found an Increase and Decrease of its Water, corresponding to those of its Causes; as we actually find in such temporary *Springs*, as have undoubtedly their Rise from Rain and Vapour: Add to this, another considerable Thing in this *Spring*, and Thousands of others, viz. That it breaks out of so inconsiderable a Hillock or Eminence, as can have no more Influence in the Condensation of the Vapours or stopping the Clouds, than the lower Lands about it have. The very highest Ground in the County, he finds is not above 133 Yards above the Level of the Sea; and what is such an inconsiderable Rise of Land, to a Perennial Condensation of Vapours, fit to maintain so inconsiderable a *Spring*? Or the high Lands of the whole County, to the maintaining all its Fountains and Rivulets?

Other Naturalists, therefore, have Recourse to the Sea, and derive the Origin of *Springs* immediately thence; but how the Sea-water should be rais'd up to the Surface of our Earth, and even to the Tops of the Mountains, is a Difficulty they can't agree upon.

Some fancy a kind of hollow, subterranean Rocks to receive the watery Vapours from the Bottom of the Earth, and to act the Part of Alembics, in condensing and converting them into Waters. Others, as *M. de la Hire*, &c. set aside the Necessity of Alembicks, and think it enough that there be large subterranean Reservoirs of Water at the Height of the Sea, whence the Warmth of the Bottom of the Earth, or even the central Fire (if there be such a Thing) may raise Vapours, which pervading not only the Intervals and Fissures of the Strata, but the Bodies of the Strata themselves, at length arrive near the Surface; where, being condensed by the Cold, they glide along on the first Bed of Clay they meet withal, till an Aperture in the Ground lets them out. *M. de la Hire* adds, That the Salts of Stones and Minerals may contribute to the detaining and fixing the Vapours, and the converting them into Water.

But we have a still more natural and easy Way of exhibiting the Rise of the Sea-water into Mountain, &c. by putting a little Heap of Sand, Ashes, or a Load of Bread, or the like, in a Basin of Water: In which Case, the Sand, &c. will represent the dry Land, or an Island; and the Basin of Water the Sea about it. Here, the Water in the Basin will rise to, or near, the Top of the Heap, in the same Manner, and from the same Principle, as the Water of the Sea, Lakes, &c. rise in the Hills. The Principle of Ascend in both, is, doubtless, the same with that of the Ascend of Liquids in Capillary Tubes, or between contiguous Plates, or in a Tube fill'd with Ashes; all which are now generally accounted for from the Doctrine of *Attraction*; see ASCEND, CAPILLARY, ATTRACTION, &c.

**SPRING**, in Cosmography, one of the Seasons of the Year; commencing, in the Northern Parts of the World, on the Day the Sun enters the First Degree of *Aries*, which is about the 10th Day of *March*, and ending when the Sun leaves *Gemini*. See SEASON.

Or, more strictly, and generally, the *Spring* begins on the Day, when the Distance of the Sun's Meridian Altitude from the Zenith, being on the increasing Hand, is at a Medium between the greatest and least. The End of the *Spring* coincides with the Beginning of *Summer*. See SUMMER.

**SPRINGS**, in Physics, a natural Faculty, or Endowment, Bodies have of returning to their first State, after having been violently put out of the same, by compressing, bending them, or the like: This Faculty the Philosophers usually call the *Elastic Force*, or *Elasticity*. See ELASTIC.

Fleas only jump to those excessive Heights, by means of a *Springy* Membrane, easily visible by a Microscope, and whereof we have a curious Figure in *Dr. Hook's* Micrography. By the elastic Force of this *Spring*, they are enabled to leap 200 times the Height of their own Body. See FLEA.

Nature has provided for the regular sowing of the Seeds of several Kinds of Plants, by furnishing them with a *Spring*, which is wound sometimes round the Outside, and sometimes round the Inside of the Case wherein the Seeds are contained. This *Spring*, when stretch'd to a certain Pitch, by the full Growth and Maturity of the Seed, suddenly either breaks in two, as when on the Outside, and tears the Case along with it; or else, by its vehement Effort to unbend itself, as when in the Inside, it bursts the Case into Two Parts like Cups, and disperses the Seed. See SEMINATION.

**SPRING**, is particularly used for a Piece of temper'd Steel put in several Machines to give them Motion, by the Endeavour it makes to unbend itself.

In Watches, 'tis a fine Piece of well-beaten Steel, coil'd up in a cylindrical Case or Frame, which by stretching itself forth, puts the Wheels and the whole Movement in Motion. See WATCH.

The *Spring* of a Lock, Pistol or the like, is a Piece of Steel violently bent, which beats back the Bolt, or strikes down the Cock, when let at Liberty. See LOCK.

**SPRING** of the Air, or its Elastic Force. See AIR and ELASTICITY.

**SPRING** a Mast; so the Sea-men call it, when a Mast is crack'd, but not quite broken in any Part.

**SPRING-TIDE**, is the increasing of a Tide after a dead Neap. See TIDE.

The *Spring-Tides* happen about Three Days before the Full or Change of the Moon; but the Top or Highest of the *Spring-Tides*, is three Days after the Full or Change: then the Water runs highest with the Flood, and lowest with the Ebb, and the *Tides* run more strong and swift, than in the Neaps. See NEAP, FLUX, EBB, &c.

**SPRINGE**, a Snare or Device made of twisted Wire, to catch Birds or small Beasts.

**SPRINGY**, or elastic Bodies, are such, as having had their Figure changed by the Stroke or Percussion of another Body, can recover again their former Figure; which Bodies, that are not Elastic, will not do. Thus if a Piece of Steel be bent any way, it will recover again its former Straightness; but a Piece of Lead will stand bent in any Form. See ELASTIC Bodies.

**SPUNGE** or SPONGE, a kind of Sea-Fungus or Mushroom found adhering to Rocks, Shells, &c. on the Sea-floor. See MUSHROOM.

The Ancients distinguish'd two Kinds, *Male* and *Female*: But the Moderns make only one Kind; which, however, they distinguish with regard to its Texture, into *Coarse* and *Fine*.

The Naturalists have been embarrass'd in all Ages, whether to range *Sponges* in the Animal, Mineral or Vegetable Family. Some would have it a Concretion form'd of the Sea-mud; and others an Animal, from its Motion of Contraction and Dilatation.

The greatest Part of our *Sponges* are brought from the *Mediterranean*, though there are considerable Quantities from *Vicaria*, an Island on the Coast of *Asia*.

The Diving or Fishing for *Sponges* is there reckoned the top Qualification in the Youth, who all get the better Wives as they excel more herein. To this Proof, the Maids refer the Preference among several Suitors; placing themselves on the Brink of the Sea, to be Witnesses of the Address of each; and giving themselves as a Prize to the Conqueror. See DIVING.

The fine or small *Sponges* are the most esteem'd; and usually come to us from *Constantinople*. Their Goodness consists in their being very white, light, and the Holes small and close; the larger and coarser come from the Coasts of *Barbary*, particularly *Tunis* and *Algier*.

The *Spring* is a very useful Matter in the Arts. In Physic it serves to foment Parts inflamed. By Analysis, it yields a deal of volatile, sharp Salts, like other Sea-Plants, taken inwardly it chokes; and is for that Reason cut small, and fried or dipt in Honey, and given to Quadrupeds to kill them, which it seldom fails to do, by swelling and preventing the Passage of the Food into the Intestines.

In *Sponges* are found a kind of Stones call'd *Cybalotrites*, held good for the Worms in young Children, and taken in Powder.

**Pyrotechnical SPUNGES**, are made of the large Mushrooms or fungous Excrecences growing on old Oaks, Ashes, Firs, &c. which being boil'd in common Water, then dried and well beaten, are put in a strong Lye, prepared with Salt-peter, and again dried in an Oven.

These make the black Match or Tinder brought from *Germany*, used to receive and sustain the Fire struck from a Flint and Steel, &c.

**SPUNGE**, in Gunnery, a Rammer or Staff, with a Piece of Sheep or Lamb-skin about its End; to serve for scooping of great Guns when discharged, e'er they be charged with fresh Powder. See CHARGE.

**SPUNGING**, in Gunnery, the clearing a Gun's Inside with a *Spunge*, in order to prevent any Parts of Fire from remaining in her; which would endanger the Life of him, who should load her again. See GUN.

**SPUN-TORN**, among Sailors, the *Torn* of untwisted Ropes, whose Ends are scraped and beaten thin, in order to be let into the Ends of other Ropes, and so made long as Occasion shall require.

**SPUR**, was anciently a Piece of the Armour of a Cavalier, fasten'd to the Tally, that is, the hind of that Part of the complete Armour which cover'd the Legs and Feet.

At present, the *Spur* is a Piece of Iron or other Metal, consisting of two Branches encompassing the Cavalier's Heel, and a Rowel in form of a Star, advancing out behind to prick the Horse.

*Louis le Debonnaire* forbid Ecclesiastics the profane Fashion of wearing *Spurs*.

Anciently the Difference between the Knight and Esquire was, that the Knight wore gilt *Spurs*, whence the Appellation of *Equus Auratus*, and the *Squire* silver'd ones. See KNIGHT and ESQUIRE.

The Word is derived from the *German*, *Sporen* or *Sperren*.  
S U R I O U S .

**SPURIOUS Diseases**, are such as in some Symptoms cannot be brought under any distinct Head, and therefore are call'd by the Name of some, with which they most agree; and hence, also, they are often denominated Bastards, *Notes*; as a *Spurious* or *bastard Pleurisy*, a *bastard Quinsy*, and the like. See **PLEURISY**, &c.

**SPURIOUS Flesh**, among Anatomists, that which is of a Consistence quite different from all the rest; as the *Flesh* of the Lips, Gums, Glans, &c. See **FLESH**, **GUMS**, **GLANS**, &c.

**SPUR-Way**, a Horse-way through a Man's Grounds, through which one may ride, by Right of Custom.

**SPUTUM**, in Medicine, &c. the Spittle, or Excrement voided at the Mouth. See **SALIVA**.

An Examen of the *Sputum*, is of great Consequence in Phtisical Cases; and *Bonnet*, in his *Treatise of Tuberculum*, applies himself in a particular Manner thereto. See **PHTHISIS**.

The *Sputum Sanguinis*, is a very dangerous Symptom in that Disease.

**SPY**, a Person paid to watch the Actions, Motions, &c. of another; particularly as to what passes in so Army.

When a *Spy* is found in a Camp, he is immediately hanged. *Wicqnesfort* says, an Embassador is an Honourable *Spy*, under Protection of the Law of Nations. See **EMBASSADOR**.

**SQUADRON of Ships**, a Division, or Part, of a Fleet, commanded by a Vice or Rear Admiral, or some other Commander or Commodore. See **FLEET**, **ADMIRAL**, &c.

The Number of Ships in the *Squadron* is not fix'd: A small Number of Vessels, if they be in a Body, and have the same Commander, may make a *Squadron*.

If there be a great Number, they are usually divided into Three *Squadrons*. And if the *Squadrons* be numerous, each *Squadron* is divided into Three Divisions.

The Word is form'd from the *Italian Squadrone* of the *Latin*, *Squadra*, us'd by Corruption for *Quadrato*: In regard, at first, the *Squadrons* were always Square, and call'd also by the *Latin*, *Agmina Quadrata*.

**SQUADRON** is also a Body of Horse, whose Number is not fix'd; but is usually from One hundred to Two hundred Men, according to the General's Pleasure, the Strength of the Army, or as Occasion serves.

It usually consists of Three Troops, each of Fifty Men, and it never exceeds Two hundred; because a greater Number can't be advantageously posted, nor have Room to act in narrow Grounds, Woods, Marshes, Desiles, &c. See **TROOP**.

The Eldest Troop takes the Right of the *Squadron*, and the second the Left, the Youngest being in the Centre.

A *Squadron* is always drawn up Three deep, or in Three Ranks, with the Length of an Horse between each Rank.

The Standard is always in the Centre of the first Rank.

**SQUAMMOUS**, in Anatomy, an Epithet given to the *Spurious* or false Sutures of the Skull; because composed of *Squamae* or Scales like those of Fishes, or like Tylos laid fo to reach over one another. See **SUTURE**.

The *Spurious Squammose*, are also call'd *Temporales*, from their terminating the Temples, or *Osse Temporis*.

**SQUARE**, in Geometry, a quadrilateral Figure, both Equilateral and Equiangular. See **FIGURE**, **QUADRILATERAL**, **EQUILATERAL**, &c.

To find the Area of a Square: Seek the Length of one Side; multiply this by itself; the Product is the Area of the Square.

Thus, if the Length of a Side be 345, the Area will be 119025: And if the Side of a Square be 10; the Area will be 100.

Since, then, a Decempeda contains 20 Feet, a Foot 10 Digits, &c. a Square Decempeda contains 100 Square Feet, a Square Foot 100 Square Digits, &c.

The Properties of a Square, are, that its Angles are all Right, and, consequently, its Sides Perpendicular; that it is divided into two equal Parts, by a Diagonal; that the Diagonal of a Square, is incommensurable to the Side. See **DIAGONAL**, &c.

For the Ratio of Squares; they are to each other in a duplicate Ratio of their Sides. E.g. a Square whose Side is double another, is quadruple the Square of the single Side.

SQUARE of the Cube } See POWER.  
SQUARE of the Sides of a Solid }

**SQUARE Number**, the Product of a Number multiplied by itself: Thus 4, the Product of 2 multiplied by 2; or 16 the Product of 4 multiplied by 4, are Square Numbers. See **NUMBER**.

Such Number is call'd a Square Number, because it may be ringed into the Form of a Square, by making the Root, or Factor the Side of the Square. See **ROOT**.

The Difference of Two Square Numbers, whose Roots are not Unity, is an uneven Number, equal to double the Root of the less, increas'd by Unity.

Hence we have an easy Method of constructing Square Numbers for a Number of Roots proceeding in the natural Series;

the double of the Root of the Antecedent increas'd by Unity, being continually to be added to the preceding Square.

Thus, if  $n=1$ ;  $2n+1=3$ : If  $n=2$ ; then will  $2n+1=5$ : If  $n=3$ ; then will  $2n+1=7$ : If  $n=4$ ; then will  $2n+1=9$ , &c. Thus by a continual Addition of the uneven Numbers, arise the Square Numbers.

**SQUARE Root**, a Number consider'd as the Root of a Second Power or Square Number; or a Number by whose Multiplication into itself, a Square Number is generated. See **ROOT**.

Thus the Number 2, being that by whose Multiplication into itself, the Square Number 4 is produced; is, in respect hereof, call'd a Square Root, or the Square Root of 4.

Since, as Unity is to the Square Root, so is the Root to the Square Number; the Root is a mean Proportional between Unity and the Square Number.

A Square Root consisting of 2 Parts, is call'd a Binomial; as  $20+4$ . See **BINOMIAL**.

If it consists of Three, a Trinomial, as  $6+2-1$ . See **TRINOMIAL**.

Now, every Square Number of a Binomial Root, is demonstrated to be compos'd of the Square of the first Part, the Product of double the first into the second, and of the Square of the other Part.

To extract the SQUARE Root out of any given Number; see **EXTRACTION of ROOTS**.

**SQUARE**, is also an Instrument made of Wood or Metal, serving to describe and measure Right Angles withal; such is AEF, (Tab. Geometry Fig. 42.)

It consists of two Rules or Branches fix'd perpendicularly at one of their Extremes. When the two Branches are moveable on a Joint, it is call'd a Bevel. See **BEVEL**.

To examine whether or no a Square be exact, describe a Semi-circle AEF, of any Length, at Pleasure; and therein, from each Extreme of the Diameter A and F, draw Right Lines to a Point taken at Pleasure in the Periphery, as E. To the Sides of the Angle AEF, apply the Square, so as its Vertex may fall on F. If this be possible, that Square is just.

**Geometrical SQUARE**, a Compartment frequently added on the Face of the Quadrant, call'd also Line of Shadows and Squadrat. See **QUADRANT**.

**Magic SQUARES**. See **MAGIC SQUARE**.

**SQUARE Battle**, or *Battalion* of Men, is one that hath an equal Number of Men in Rank and File. See **BATTALION**.

To form any Number of Men into a Square Battle, as suppose 500, extract the nearest Square Root of 500, which is in Integers 22, and that will give the Number of Men for Rank and File. There will be a Remainder of 16 Men, who may be dispos'd of, as the Commander thinks best.

**SQUARE Hollow**, or *hollow SQUARE*, in the Military Art; is a Body of Foot drawn up with an empty Space in the Middle, for the Colours, Drums and Baggage; fixed and cover'd by the Pikes every way, to keep off Horse.

**SQUARING**. See **QUADRATURE**.

**SQUILLITIC**. See **SCILLITIC**.

**SQUILLE**. See **SCILLE**.

**SQUINANCY** or *Esquinancy*, by the *Latin*, &c. call'd *Angina*, and by us, popularly *Quinsy*, a Disease which stops the Freedom of Respiration and Deglutition. See **RESPIRATION**.

The *Squinancy* consists in an Inflammation of the Throat; and particularly of the Muscles of the Larynx or Pharynx, which exactly closing the Chinks thereof, prevent the Air from passing in and out of the Trachea, and the Food from being swallow'd and convey'd into the Stomach.

The *Squinancy* is divided into *true* and *spurious*; the *true Squinancy* is always accompanied with a Fever; the *bastard* or *spurious Squinancy* is free from it.

They are caus'd by a Defluxion of Blood, either pure or bilious, from the Branches of the Carotid Arteries; and there causing a Phlegmon, either a Simple or an Ectypetulous one. See **ANGINA**.

The Word is form'd from the *Greek σκιναν*, to Suffocate.

The *Squinancy* is of all others the most dangerous, when the Tumour is neither perceivable on the inside nor the out. That appearing on the outside is the most curable. In violent *Squinancies*, recourse should be had to Laryngotomy or Brochotomy, which though rarely practis'd, may yet be us'd with Safety. See **LARYNGOTOMY**, &c.

**SQUINTING**. See **STRABISMUS**.

**ST**, an indeclinable Term, chiefly us'd to commend Silence. See **SILENCE**.

The *Romans* had these two Characters wrote over the Doors of their Eating Rooms, as who should say *Sed tace*, or *Silentium tene*.

*Porphyry* observes, the Ancients made a Point of Religion of it, not to speak a single Word in passing in or out of the Doors.

**STABLE Stand**, in the Forest Law, is when a Person is found at his Stand in the Forest, with a Cross-Bow, or Long-Bow, ready to shoot at a Deer, or else standing close by a Tree with Grey-hounds ready to slip: It is one of the Four

Evidences or Presumptions, by which a Man is convicted of intending to steal the King's Deer; the other Three being Back-berand, Bloody-hand, and Dog-draw. See FOREST.

STACK of Wood, among Husbandmen, is a Pile of Wood three Foot long, as many broad, and twelve Foot high.

STACTE, in Pharmacy, a Lixiv Matter drawn from fresh Myrrh, pounded or press'd with a little Water. See MYRRH.

This Lixiv is very Otoriferous, and held mighty precious; making, alone, the Perfume, called by *Dioscorides*, *Sacte*, and which smells finely, though very bitter to the Taste.

We have none of it now, but what is sophisticated; and what the Apothecaries call *Sacte*, is no more than liquid Storax. See STORAX.

STADHOUDER, STADTHOLDER, STADHOLDER, or STATHOLDER, a Governor or Lieutenant of a Province, in the *United Netherlands*; particularly that of *Holland*; where the Word is most used, by reason of the superior Importance of the Government of that Province.

The *Stadholder*, i. e. the *Stadholder of Holland*, is the first Member of the Republic: He is chief of all the Courts of Justice; and may preside therein when he pleases. All Sentences, Judgments, &c. are dispatch'd in his Name. When an Office becomes vacant in any of the Courts, the States propose three Persons to the *Stadholder*, who is to chuse one of them. He can even pardon Criminals, which is a Right of Sovereignty; and has the Choice of Sheriffs, or chief Magistrates in each City; to which end the Council of the City present him two Persons, one of which he appoints.

In several Cities, he has the same Right, with regard to the Burgher-masters and Counsellors; as at *Rotterdam*, *Dort*, &c. He has also a Right to Cashier the Magistrates, and put others in their Room, when he finds it necessary for the public Good; upon giving a Reason for the same.

By Article VI. of the Union of *Utrecht*, the States constitute him Arbitrator of all the Differences that may arise between the States of the several Provinces; or between the Cities and the Members of the States of the Province. To the Dignity of *Stadholder*, is inseparably annex'd, that of Captain and Admiral General of the Province; in which Quality, he names all the Officers, and disposes of all the Military Charges. 'Tis he, takes care of the Execution of the Ordinances of the States; and his Authority gives him a Right to receive and hear Embassadors from foreign Princes, and even to send Embassadors on his own private Affairs.

The Office of *Stadholder* is very Ancient: The Counts not being able to reside in *Holland*, appointed *Stadholders* to command in their Absence, in the several Provinces; besides a Governor General of all the Seventeen Provinces of the *Netherlands*.

*William I.* Prince of *Orange*, was *Stadholder of Holland and Zealand*, at the Time when the *Dutch* shook off the *Spanish* Yoke; which enabled him to contribute greatly to that happy Event.

In 1567, the States thought fit to suppress the Office of *Stadholder*, by Edict; and resolv'd it should never be conferr'd on any Person for the future; but in 1672, *William III.* Prince of *Orange*, afterwards King of *England*, being elected Captain and Admiral General by the States; some Months afterwards, they revok'd the Edict of Suppression in favour of that Prince, who was declared *Hereditary Stadholder*; in an Honour never conferr'd before.

*Messagier* derives the Word from *Stat*, *Statu*, and *holder*, holding, q. d. Lieutenant of the States; but he is mistaken in the Etymology: The Word being compounded of *Stat* or *Stede*, Place, and *holder*, holding, in regard the Governor held the Place of the Counts, and represented them in their Absence.

STADIUM, an ancient *Greek* long Measure, containing 125 Geometrical Paces, or 625 Feet; corresponding to our Furlong. See FURLONG.

Eight of them make a Geometrical or *Italian* Mile; and 20, according to *M. Dacier*, a *French* League; according to others 24 make the *League*.

*Guillette* computes that the *Stadium* was only 600 *Athenian* Feet, which amount to 566 *French* Royal Feet, or 604 *English* Feet; so that the *Stadium* should only have been 113 Geometrical Paces.

It may be observ'd however, That the *Stadium* was different in different Times and Places. See MEASURE.

The Word is form'd from the *Greek*, *stade*, *Stade*; and, 'tis said, on this Occasion, that *Hercules*, after running so far at one Breath, stood still.

The *Greeks* measured all their Distances by *Stadia*, which they call'd *stadia*.

STADIUM was also the Course or Career, wherein the *Greeks* ran their Races. See GYMNASIUM.

*Vitruvius* describes it as an open Space 125 Paces long, terminated at the two Extremes with two Posts, called *Career* and *Meta*.

Along it was an Amphitheatre, where the Spectators were plac'd to see the *Athlete* Exercise, Running, Wrestling, &c.

There were *Stada* likewise, covered over, and encompass'd with Colonnades and Porticoes, serving for the same Exercises in ill Weather. Captive Children us'd to run the *Stadium*. Ablanc.

A more natural Derivation of the Word *Stadium*, from *stade*, or *Stade*, than that popular one mentioned in the last Article, is drawn from the *Athlete* stopping and resting, when at the End of this Course: Whence the Name might be applied to the same Distance, measured in any other Place.

STAFF, an Instrument ordinarily us'd to rest on, in walking.

Cardinal *Bossu* observes, in his Treatise of *Liturgie*, that anciently, those who us'd a *Staff* in the Church to lean on, were oblig'd to lay it by, and to stand alone, firm and upright, while the Gospel was a reading; to testify their respect, by their Posture, and to shew they were ready to obey *Jesus Christ*, and to go wheresoever he should command them.

The *Staff* is also frequently us'd, as a kind of natural Weapon, both of Offence and Defence. The *Lacedaemonians* never wore any Swords in Time of Peace; but contented themselves with a thick, crooked *Staff*, which was peculiar to them. Among the *Romans*, *Mr. St. Evremont* observes, Blows with a *Staff* were the gentlest Correction they gave their Slaves; inasmuch as they received them over their Cloaths.

Among the Masters of Honour and Arms, 'tis held a greater affront to be beaten with a *Staff* than with a Sword; because the Sword is the Instrument of War, the *Staff* the Instrument of Outrage.

Blows with a *Staff* are very severely punished by the *French* Laws: By a Regulation of the Marshals of *France*, in 1653, for Reparations and Satisfactions of Honour, 'tis adjudg'd, That a Person who shall strike another with a *Staff*, shall be imprison'd a whole Year; unless Six Months be moderated, upon paying 3000 Livres, applicable to the nearest Hospital: Beside which, the Offender is to ask Pardon of the Offended on his Knees, &c. ready to receive a like Number of Blows with a *Staff*; which on some Occasions one may oblige him to give; if he have too much Generosity, nor to do it of himself. By another Regulation of the Marshals in 1679, he who strikes with a *Staff*, after receiving Blows with the Fist, in the Heat of a Fray, is condemn'd to Four Years Imprisonment; and to Four, if he even strack first with the Fist.

STAFF, in Music, five Lines, on which, with the intermediate Spaces, the Notes of any Song or Piece of Music are mark'd. See MUSIC.

*Guido Arezzo*, the great Author of the Modern Music, is said to be the first who introduced the *Staff*; marking his Notes, by setting Points (.) up and down them, to denote the Rise and Fall of the Voice; and each Line and Space he mark'd at the beginning of the *Staff* with *Gregory's* Seven Letters, a, b, c, d, e, f, g. See NOTE.

But others will have the Artifice of an older Date; and *Kircher* particularly affirms, That in the *Sejusian* Library at *Messina*, he found an old *Greek* MS. Book of Hymns, above 700 Years old; wherein some Hymns were written on a *Staff* of eight Lines, mark'd at the beginning with Eight *Greek* Letters. The Notes or Points were on the Lines, but no use made of the Spaces. See SCALE, GAMUT, SOLFAING, &c.

STAFF, in Heraldry. See BATTON.

STAFF, in Surveying, a kind of Stand, whereto mount a Theodolite, Circumbrentos, plain Table, or the like, for Use. It consists of Three Legs of Wood, join'd together at one End, whereon the Instrument is plac'd; and made peck'd at the other, to enter the Ground. Its upper End is usually fill'd with a Ball and Socket. See BALL and SOCKET.

STAGE, in the Modern Drama, the Place of Action and Representation; included between the Pit and the Scene.

The *Stage* answers to the *Proscenium* or *Pulpitum* of the ancient Theatre. See THEATRE, PULPITUM, PROSCENIUM.

LOWS of the STAGE, are the Rules and Decors to be observ'd, with regard to the Oeconomy and Conduct of a Dramatic Performance to be exhibited on the *Stage*. These relate, principally, to the Unities, the Disposition of the Acts and Scenes, the Unravelling, &c. See UNITY, ACT, SCENE, CATASTROPHE, &c.

STAGGERS, or Stavers, in the Manage. See STAYERS.

STAIRS, in Building, the Steps whereby we ascend and descend, from one Story of a House to another. See STORY.

The Dimensions of *Stairs* are differently assign'd by different Authors: In this however they agree, that they must not be more than Six, nor less than Four Inches high; nor more than 18, nor less than 12 Inches broad; nor more than 16, nor less than 6 Foot long, each *Stair*. But these Measures have only regard to fine Buildings; ordinary Houses are excepted: Yet even in these, the *Stairs* are not to exceed Eight Inches in Height; nor less than Nine Inches in Breadth; nor Three in Length.

To reduce the Dimensions of *Stairs* to some natural, or at least geometrical Standard, *Vitruvius* borrows the Proportions of the Sides of a rectangle Triangle, which the ancient School express'd by the Numbers 3, 4 and 5. The first for the perpendicular Height; the second for the horizontal Breadth; and the third for the whole Slope or Inclination, from the Edge of one *Stair* to that of another.

But this Rule is fit aside, and with good Reason, by the modern Builders. For, on this Principle, the lower the *Stairs*, the narrower they must be; and *Stairs*, for Instance, Four Inches high (such as we find mentioned in ancient Architects) must be but 5 $\frac{1}{2}$  Inches broad.

One Rule to be regarded in the making of *Stairs*, is, That they be laid according to the Italian Phrase, *Così un tantino alla Scarpa*, i. e. somewhat sloping, or a little highest behind, that the Foot may, as it were, both ascend and descend at once; which, though observed by few, is found a secret and delicate Deception of the Pains in mounting.

*STAIR-CASES*, an Aisle inclosed between Walls, or a Ballustrade, consisting of *Stairs* or Steps, with Landing-places and Rails; serving to make a Communication between the several Stories of a House. See *STAIR*.

The Construction of a complete *Stair-CASE*, is one of the most curious Works in Architecture. The common Rules to be observed therein, are as follow;

1<sup>o</sup> That it have a fall, free Light, to prevent Accidents of Slipping, falling, &c. 2<sup>o</sup> That the Space over Head be large and airy, which the *Italians* call *un bel Spoglio*, good Ventilation, in regard a Man spends much Breath in mounting. 3<sup>o</sup> That the Half-places, or Landing-places, be conveniently distributed for resting in the Way. 4<sup>o</sup> That to prevent Reounters, &c. the *Stair-CASE* be not too narrow; but this last is to be regulated by the Quality of the Building. 5<sup>o</sup> That Care be taken in placing the *Stair-CASE*, so as the *Stairs* may be distributed, without Prejudice to the rest of the Building.

The Kinds of *Stair-CASES* are various: In some, the *Stairs* are straight, others winding; in others both Ways.

Again, of straight *Stairs*, called also *Flyers*, some fly directly forwards, others are Square, others Triangular, others call'd *French Flights*. Of winding *Stairs*, call'd also *Spiral* or *cockle Stairs*, some are Square, some Circular, or some Elliptical.

And these again, are various; some winding round a solid and others an open Newel.

Lastly, of mix'd *Stairs*, some are call'd *Dog-leg's*: Others both wind about a solid Newel, and fly about a square, open Newel.

*Stair-CASES* are of that Importance in Building, that we can't excuse the not giving a more particular Account of each kind.

*STRAIGHT STAIRS*, then, are such as always fly, that is, proceed in a Right Line, and never wind, whence their Denomination. See *FLYERS*.

Of these there are several Kinds; as ——— *Direct Flyers* or *Plain Flyers*, which proceed directly from one Floor to another, without turning either to the Right or Left; seldom used, except for Garret or Cellar *Stairs*. ——— *Square Flyers*, which fly round the Sides of a Square Newel, either solid or open; having at every Corner of the Newel, a square, half Step, taking up  $\frac{1}{2}$  of a Circle. So that they fly from one half Step to another, and the Length of the *Stairs* is perpendicular to the Side of the Newel. ——— *Triangular Flyers*, which fly round by the Sides of a triangular Newel, either solid or open, having at each Corner of the Newel a Trapezial Half-Step, taking up  $\frac{1}{3}$  of a Circle: So they fly from one Half-Step to another; and their Length is Perpendicular to the Side of the Newel. ——— *French Flyers*, which fly, first directly forwards, till they come within the Length of a *Stair* of the Wall; and then have a square half Pace, from which you immediately ascend to another half Pace, from which the *Stairs* fly directly back again, parallel to their first Flight.

*WINDING STAIRS*, are such as always wind, and never fly: Of these there is great Variety; as, ——— *Circular winding Stairs*, whereof there are four Kinds, viz. such as wind about a solid Newel, the fore Edge of each being in a Right Line, pointing to the Centre of the Newel; commonly used in Church Steeples and great old Houses. Such as wind round an open Newel, the Fore-side of each being in a right Line, pointing to the Centre of the Newel, as those in the Monument, London. Such as wind round a solid Newel,

only the Fore-side of each, an Arch of a Circle, either concave or convex, pointing near to the Circumference of the Newel. And such as resemble the last, in all other respects, save that they have an open Newel. Any of these winding *Stairs* take up less Room than any other Kind. In *Stairs* that wind round a solid Newel, Architects make the Diameter of the Newel either  $\frac{1}{2}$  or  $\frac{2}{3}$  of that of the *Stair-case*, according as that is in Bigness. If very small, the Newel is but  $\frac{1}{2}$ , and if large  $\frac{2}{3}$ , &c.

In *Stairs* that wind round an open Newel, *Palladio* orders the Newel to be  $\frac{1}{2}$  the Diameter of the *Stair-case*; though there does not appear any Reason why the Newel here should not be proportion'd to the *Stair-case*, as in the former. As to the Number of *Stairs* in each Revolution; *Palladio* orders, that in a *Stair-case* of 6 or 7 Foot Diameter, the *Stairs* in each Revolution be 12; if the Diameter be 8, the *Stairs* to be 16; if 9 or 10, the *Stairs* to be 20; and if 18, to be 24. ——— *Elliptical winding Stairs*, whereof there are two Kinds; the one winding round a Solid, the other round an open Newel. They are much of the same Nature as circular *Stairs*, excepting that in the one, the Newel is a Circle, and in the other an Ellipsis. ——— *Square winding Stairs*, are such as wind round a square Newel, either Solid or open; the Fore-side of each *Stair* being a right Line, pointing to the Centre of the Newel. ——— *Triangular winding Stairs*, are such as wind round a triangular Newel; the Fore-side of each being a right Line, pointing to the Centre of the Newel. ——— *Calumnated winding Stairs*: *Palladio* mentions a *Stair-case* in *Pompey's* Portico at *Rome*, set on Columns, so, as that the Light they received from above, might distribute itself to all Parts alike. ——— *Double winding Stairs*, *Scamozzi* mentions a *Stair-case* of this Form, made by *Pietro del Borgo*, and *Jean Coffin*, at *Seimberg* in *France*, in the King's Palace. They are so contrived, as that two Persons, the one ascending and the other descending, shall never meet. *Dr Grew* describes a Model of this kind of *Stair-case*, kept in the Museum of the Royal Society. The Foot of one of the *Stair-cases*, he says, is opposite to that of the other, and both make a parallel Aisle, and within the same Cylinder. The Newel in the Middle is hollow, and built with loag Apertures, to convey Light from Candles placed at the Bottom and on the Sides of the Newel, into both Cases. ——— *Quadruple winding Stairs*, *Palladio* mentions a *Stair-case* of this Form, in the Castle of *Chamber* near *Bleyn*. It consists of four *Stair-cases*, carried up together, having each its several Entrance, and going up one over another, in such Manner, as that being in the middle of the Building, the Four serve for four Apartments; so that the People of the one need not go up and down the *Stairs* of the other; yet being open in the Middle, they all see each other pass.

*MIXT STAIRS*, are such as partly fly, and partly wind; whence some call them *Flyers* and *Winders*. Of these there are several Kinds, as, ——— *Dog-leg's Stairs*, which first fly directly forwards, then wind a Semi-circle, and then fly directly backwards, parallel to that. ——— *Square Flyers and Winders*, have a square Newel, either Solid or open, and fly by the Sides of the Newel, winding a Quadrant of a Circle at each Corner. ——— *Solid and open Newel'd Flyers and Winders*, are of two Kinds; the one winds a Quadrant of a Circle about a Solid Newel, then flies by the Side of a square open Newel; then winds again, by the Side of a solid Newel, then flies again, and so alternately. The other flies first, then winds, and then flies again, alternately.

*STALACTITE*, or *STAGONITE*, is a natural History, a sort of loag, sparry Iicles, which hang down from the Tops or Arches of Grotto's, Caves or subterranean Caverns; and from the Roof of the Buildings, and Capitals of the Pillars of such Places, as are built over Therms or Hot Springs, &c. See *STONE* and *SPEAR*.

Of this Kind, are the *Sai Amon*, and *Vitruvium Stalacticum*; the *Minera Ferri-Salatica*, the *Vitruvium Capillare*, the *Amon Capillare*, &c.

The *Stalactine*, which incrustate or line the Tops and Sides of Caves, &c. are manifestly form'd of Exudations or Exhalations of petrifying Juices out of the neighbouring rocky Grounds. Those in the Cave on the Top of *Bredon* Hill, Mr. *Derham* fancies, might be form'd by the Rain soaking through, and carrying with it Impregnations from the Stones; the Hill, there, being all rocky.

*STALE*, the Urine of Cattle. — A *Stale* is also a living Fowl, put in any Place to allure other Fowl, where they may be taken: For want of these, a Lark or any other Bird shot, his Entrails thrust out, and dried in an Oven, in his Feathers, with a Stick thrust through to keep him in a convenient Posture, may serve as well as a live one.

*STALK*, in Botany. See *STEM*.

The *Stalk* is distinguish'd into several Kinds, viz. the *Naked Stalk*; which has no Leaves on: *Crested Stalk*, that has Furrows or Ridges: *Winged Stalk*, which has Leaves on both Sides. *Striped Stalk*, which is of two or more Colours, &c.

*STALKING*, the

**STALKING**, a Term of considerable Import in Fowling; applied to a kind of Screen or Device to hide the Fowler, and amuse the Game, while he gets within Shot.

Of such Devices there are several Kinds, viz. — A *Stalking Hedge*, which is an artificial Hedge, two or three Yards long, and a Yard and half high, made with small Wands, to be light and portable, yet built'd out like a real Hedge, with Stakes to support it, while the Fowler takes his Aim.

*Stalking Horse*, is an old Jade train'd up for the Purpose, which will gently walk up and down as you would have him, in Water, &c. beneath whose Fore-shoulder, the Sportman shelters himself and Gun. When thus got within Shot, he takes Aim from before the Fore-part of the Horse; which is much better than shooting under his Belly.

To supply the Defect of a real *Stalking Horse*, an Artificial one is frequently made, of old Canvas, shaped in form of a Horse, with his Head bent down, as if grazing; stuff'd with any light Matter, and painted. In the Middle it is fix'd to a Staff fixed at the Foot, to stick into the Ground while Aim is taken.

For Change, when the Fowls begin to be used to the *Stalking Horse*, and to know it, some *Stalk* with an Ox, Cow, Deer or the like. Others use a *Stalking Tree*, and others a *Stalking Bush*.

**STAMINA**, in the Animal Body, are those simple, original Parts, which exist first in the Embryo, or even in the Seed; and by whose Distinction, Augmentation and Accretion, by additional Juices, the human Body, at its utmost Bulk is supposed to be form'd. See EMBRYO, BODY, &c.

All that is essential to the Animal, are the *Stamina*, which exist, in *ovo*; the rest being foreign, additional and even accidental.

The *Stamina* seem to coincide with the *Solidis*, which are supprisingly small in Quantity. See SOLID.

The Word is Latin, and signifies *Breads*.

**STAMINA**, in Botany, those fine Threads or Capillaments growing up within the Flowers of Tulips, Lillies and most other Flowers, around the Style or Pistil. See FLOWER and PISTIL.

On the Tops of the *Stamina*, grow those little Capsule or Knots, call'd *Apices*, which M. *Tournefort* makes essential to the *Stamina*; whence M. *Reaumur*, who assures us in the Memoirs of the French Academy, that he could never discover any *Apices* on the Threads of the *Ficus Alerius*, refuses to call them *Stamina*; though he adds, one may suppose that the *Apices* fall assoon as the Threads or *Stamina* begin to be unfolded. See APICES.

In some tubular Flowers, as the *Narcissus*, *Digitalis*, &c. M. *Gessroy* observes the *Stamina* are exceedingly short; and in some Flowers there are no *Stamina* at all, as in the long *Aristolochia*, wherein the *Apices* are immediately fasten'd on the Capsule, which incloses the Fruit. In some other Flowers, as those of Thistles, Lettice, Chicory, &c. the *Apices* are inclosed in the *Stamina*; several of which uniting, form a little Tube in Manner of a Scabbard, in the Inside whereof are the *Apices*, furnished with their *Faring*. The rest of the Cavity being taken up by the Pistil, which is a little Thread placed on the Embryo of the Seed.

M. *Tournefort* takes the Use of the *Stamina* to be, as it were, to many excretory Canals, for discharging the growing Embryo of its redundant Juices; and of these Excrements of the Fruit, he takes that *Farina* or Dust, found in the *Apices*, to be form'd. See FARINA.

But M. *Gessroy*, Mr. *Bradley*, and other late Writers on Plants, as well as some former, assign the *Stamina* a nobler Use.

These Authors, explaining the Generation of Plants, in a Manner, analogous to that of Animals, maintain the Use of the *Stamina* to be to secrete, in their fine capillary Canals, a Juice, which being collected, harden'd and form'd into a *Farina* or Dust, in the Tips or *Apices*, is thence, when the Plant arrives at Maturity, discharged, by the bursting of the *Apices*, upon the Top of the Pistil; whence is a Passage for it to descend into the *Uterus*, where being received, it impregnates and fecundifies the Plant.

On this Principle, it may be said, that the same Flower contains both Sexes, which contribute each their Part to the Generation: That the *Stamina* are the Male-part; and the *Farina*, which is always found as an oily, glutinous Nature, the female Liqueur; and that the Pistil is the Female Part, which conducts the Semen to the *Ova* or Embryo's. See GENERATION of Plants.

**STAMINEOUS Flowers**, among Botanists, are such as are so far imperfect, as to want those colour'd Leaves, we call *Petals*; and which only consist of the *Stylus* and the *Stamina*. See FLOWER.

Such Plants as bear these *Stamineous Flowers*, Mr. *Ray* makes to constitute a large Genus of Plants, which he calls *Herbe flore imperfecto, five apetalis, Stamineae*. And these he divides into such as,

1. Have their Fruit or Seed totally divided from the Flower; which are such Plants as are said to be of

different Sexes: The Reason of which is, that from the same Seed, some Plants shall arise with Flowers, and no Fruit; and others, with Fruit, and no Flowers: As Hops, Hemp, Singing nettles, Spinach, Mercurialis and Phyllo.

2. Such as have their Fruit only a little disjoined from their Flowers; as the *Ambrosia Bardana Minor*, *Ricinus*, and the *Heliotropium Teicocon*.

3. Such as have their Fruit immediately contiguous, or adhering to their Flower: And the Seed of these is either, 1. Triangular; and of this Sort, some are lucid and shining, as the *Lycium*, *Rhabarbarum*, and *Bistorta*, to which also may be added the *Perficaria*: Others are rough and not shining, as the *Helieborus Albus*, *Pegoporum*, *Convolvulus Niger*, and the *Polygonum*. 2. Such as have a roundish Seed, a little flattened or compressed, or of any other Figure but the former Triquetrous or Triangular one; and these have their Flower, or the Calyx of the Flower, adhering to the Bottom or Basis of the Seed or Fruit; as the *Potamogeton*, *Bitum Sylvestre*, *Parietaria*, *Atriplex*, *Blitum Sativum*, *Amaranthus*, *Holococceus*, and the *Saxifraga Aurca*. 3. Such whose Flowers adhere to the Top of the Seed; as the *Beta*, *Amarum*, *Archimilla*. And to these kind of Plants, Mr. *Ray* reduces also the *Kaligeniculatum*, *Sedum Fruticolum*, the *Scoparia* or *Belvidere* of the *Italians*.

**STAMP**. See PRINT.

**STAMPING Mill**, or *Knocking-Mill*, an Engine used in the Tin-works, to bruise the Ore small. See TIN.

**STANCHIONS**, in Building. See PENCINGS.

**STANDARD**, in War, a Banner or Flag, bore as a Signal for the joining together of the several Troops belonging to the same Body. See BANNER.

The *Standard* is used for any Ensign of Honor; and but more usually for that of the General. See FLAG and ENSIGN.

The ancient Kings of France bore St. *Martin's* Hood for their *Standard*. The *Turks* preserve a *Green Standard* bore by *Mahomet*, with a world of Devotion; as believing it to have been brought down by the Angel *Gabriel*. Every time 'tis display'd, all who profess the *Mahometan Faith*, are obliged to take Arms; those who refuse, are to be deem'd as Infidels. *Du Cange* derives the Word from *Standerus* or *Stauterius*, *Standardum* or *Staudale*, Words used in the corrupt Latin, to signify the principal *Standard* of an Army. *Abercrombie* derives it from the German, *Stander*, or the English, *Staud*.

**STANDARD**, in Commerce, the Original of a Weight, Measure or Coin, committed to the keeping of the Magistrate, or deposited in some publick Place, to regulate, adjust, and try the Weights used by particular Persons in Traffick. See MEASURE, WEIGHT, &c.

The Justice of Weights and Measures, is of that Consequence to the Security and good Order of Trade, that there is no civiliz'd Nation but makes it a Part of their Policy to preserve the Equality thereof by means of *Standards*. The *Romans* and *Jews* even seem to have affix'd a kind of religious Worship to these *Standards*, by laying them up in their Temples, as it were under the Eye of their Deities.

The *Standards* of Weights and Measures in England, are appointed by *Magna Charta*, to be kept in the *Exchequer*, by a special Officer, called the *Clerk* or *Comptroller* of the *Markets*.

For Coins; the *Standard* of Gold Coin is 22 Carrats of fine Gold and 2 Carrats of Alloy in the Pound weight Troy; and the *French*, *Spanish* and *Flemish* Gold, are nearly of the same Fineness. The Pound Weight is cut into Forty-four Parts and a Half, each current for 22 Shillings. See GUINEA.

The *Standard* of Silver is 12 Ounces and two Penny-weight of Silver, and 18 Penny-weight of Alloy of Copper. Whether Gold or Silver be above or below *Standard*, is found by assaying. See ASSAY.

**STANDARDS**, or *Standals*, in Husbandry, are Trees, reserved at the falling of Woods, for Growth for Timber.

**STANNARIES**; are the Mines and Works, where Tin is dug and purified; as in *Corwall*, and elsewhere. See TIN.

There are four Courts of the *Stannaries* in *Devonshire*, and as many in *Corwall*; and there are several Laws about, and Liberties granted to these Courts in several Acts of Parliament, as in the Time of *Edward I.* and as abridged by *Edward III.* and in 17 Car. I. c. 15.

**STANZA**, in Poetry, a certain regulated Number of grave Verses, containing some perfect Sense, terminated with a Rest.

The Word is *Italian*, and literally signifies a *Stand* or *Station*, because of the Pause to be made at the end of each *Stanza* or complete Sense.

What the *Coplas* is in Songs, and the *Strophe* in Odes, the *Stanzas* is in the greater and graver Pieces, as Epic Poems, &c. See COPLET and STROPHES.

Indeed the *Italians* scarce write any Poems, but they divide them into *Stanzas*. There are *Stanzas*'s of 4, 6, 8, 10, 12 Verses, and sometimes of an uneven Number of Verses, as

ss 5, 7, &c. but these last are somewhat more difficult to execute, by reason of the three Verses to one Rhime.

The French lay it down as a Rule, That if the first *Stanza* begin with a Masculine or a Feminine Verse, the Second is to begin and end with the same. Every *Stanza* ought not only to contain a perfect Sense, but to be terminated with some lively and ingenious Thought, or some just and pertinent Reflexion.

*Stanzas* were first introduced from the *Italians* into the French Poetry, about the Year 1530, and thence transferr'd into the *English*.

The Use of *Stanzas* in Tragedy or Comedy, is condemn'd by all the best Critics: For though we speak Verse on the Stage, 'tis still presumed we are speaking Prose. *Stanzas* shew a kind of Ingenuity, on the Part of the Poet, which has nothing of Nature in it on the Part of the Actor. Add to this, That *Stanzas* are not fit to express every thing. Wrath, Threatening, &c. fit very ill on a regular *Stanza*: Though Irresolution, Reveries, and every Thing that leads the Actor to think on what he is to resolve, agrees well enough with the unequal Cadence of the *Stanzas*.

STAPES, in Anatomy, a little Bone situate in a Cavity of the *Femur ossalis*; thus call'd from its resembling a *Stirrup*. See EAR.

The *Stapes*, is one of the Four little Bones fastened to the Tympanum of the Ear; first discovered and published, as *Fallopian* tells us, by *John Philab Ingrassia*, a Physician of Sicily. Its Use is in hretching or relaxing the *Membrana Tympani*. See TYMPANUM; see also HEARING and EAR.

STAPLE, primarily, signifies a publick Place or Market, whither Merchants, &c. are obliged to bring their Commodities to be bought by the People; such as the *Groce*, or rather the *Places* along the *Seyne*, for the Wines and Corns at *Paris*; whither the Merchants of other Parts are obliged to bring those Commodities.

*Mence* derives the Word from *Statulus*, which is found in the Ripuary Laws, to signify a Place where Justice is administered. Others derive it from the *German*, *Stapel*, or rather *Stapula*, which *Barbarinus* derives further, from the *German*, *Stapslen*, to pat in a Heap.

STAPLE also signifies a City or Town, where Merchants jointly agree to carry certain Commodities, as Wool, Cloth, Lead, Tin, &c. in order to their being commodiously sold by the Great.

In *England*, *Staples* were settled and appointed, to be constantly kept at *Tark*, *Lincoln*, *Newcastle upon Tyne*, *Norwich*, *Wolstanton*, *Canterbury*, *Chichester*, *Winchester*, *Exeter* and *Bristol*; to which Places Merchants and Traders were to carry Goods to sell in those Parts.

The Staple Commodities of *England*, were chiefly Wool, Leather, Cloth, Tin, Lead, &c. though by *Staple Goods*, is now generally meant, any proper saleable Commodities, not easily subject to perish. See WOOL, &c.

The Principal *Staples* now existing, are *Amsterdam* for all Goods from the *East-Indies*, *Spain*, the *Alexiterranean*, and the *Baltick*: *Huyburg* for those of the *West-Indies*; *Middleburg* for French Wines; *Dort* for *Rhenish* Wines and *English* Cloth; *Vere* in *Zeland* for Scotch Merchandises, &c.

The *Staples* in the *Levants*, call'd by the French, *Echelles* *Scale*, are such Cities where the *English*, *French*, *Dutch*, *Italians*, &c. have Consuls, Factors and Magazines; and whither they send Vessels regularly each Year. The principal of these are *Smyrna*, *Alexandretta*, *Aleppe*, *Seyla*, *Cyprus*, *Sallee*, *Alexandria*, *Cairo*, *Tunis*, *Algiers*, *Tripoli*, the *Mores*, *Candia* and the Islands of the *Archipelago*. See FACTORY.

STAR, in Astronomy, a general Name for all the heavenly Bodies. See HEAVENLY BODY.

The Stars are distinguish'd, from the Phenomena of their Motion, into *Fix'd* and *Erratic*.

Erratic or wandering STARS, are those whose Distances and Places, with regard to each other, are continually changing. These are what we properly call *Planets*. See PLANET.

Though, to the same Class, may likewise be refer'd, what we popularly call *Blazing Stars* or *Comets*. See COMET.

Fix'd STARS, call'd also, by way of Eminence, simply, Stars, are those which continually keep the same Distance, with regard to each other.

#### Concerning the fix'd STARS.

The principal Points that have come under the Consideration of Astronomers, are their *Distance*, *Magnitude*, *Number*, *Nature* and *Motion*.

#### Distance of the fix'd STARS.

The *Fix'd Stars*, are Bodies exceedingly remote from us; so remote, that we have no Distances in the Planetary System to compare to them. See DISTANCE.

Their immense Distance is argu'd hence, That they have so sensible Parallax: that is, that the Diameter of the Earth's Orbit bears no sensible Proportion thereto; but they are seen the very same, in all the Points thereof. Mr. *Helmstedt*, indeed, seems to have discovered a small Parallax: *Sirius*, &c.

He finds to have a Parallax of 20 Seconds. Admitting this, we have Data enough to determine their Distance, a thing hitherto despair'd of.

For thus, the Sun's Parallax being had, and his mean Distance being 34577 Semi-diameters of the Earth, the Distance of *Sirius* from the Earth will be found to be 35477064 Semi-diameters of the Earth. See PARALLAX.

Mr. *Huygens* attempts the Distance of the Stars by another Method, viz. by making the Aperture of a Telescope so small, as that the Sun through it appears no bigger than *Sirius*. In this State he found the Sun's Diameter only  $\frac{1}{100}$  of his Diameter when seen with the naked Eye. Were the Sun's Distance, then, 27664 times as great as it is, it would be seen of the same Diameter with *Sirius*; so that allowing *Sirius* to be equal in Magnitude with the Sun (which is a very reasonable Supposition) the Distance of *Sirius* from the Earth, will be found to be to that of the Sun from the Earth, as 27664 to 1. On which Principle, *Sirius* will be 951005328 Semi-diameters distant from the Earth.

If it be urg'd, that these Methods are too precarious, to conclude any thing from them, yet this we can demonstrate, that the Stars are remoter than *Saturn*; nay, that they are vastly more remote than *Saturn*, as *Saturn* has a great Parallax, and the Stars scarce any at all.

#### Magnitudes of the fix'd STARS.

The Magnitudes of the fix'd Stars, appear to be very different; which Differentiation, not from any diversity in their real Magnitudes, but from their Distances, which are different. From this Difference, the Stars become distributed into Seven several Classes, call'd *Magnitudes*. See MAGNITUDE.

The first Class, or those of the first Magnitude, are those nearest us, and whose Diameters are, therefore, biggest. Next these, are those of the second Magnitude, and so on to the Sixth, which comprehends the smallest Stars visible to the naked Eye. All beyond, are call'd *Telescopical Stars*: Not that all the Stars of each Class appear justly of the same Magnitude; there is a great Latitude in this respect; and those of the first Magnitude, appear almost all different in Lustre and Size. Other Stars there are, of intermediate Magnitudes, which Astronomers cannot refer to this, rather than the next Class, and therefore place them between the Two.

*Ptolemy*, for Instance, which *Ptolemy* makes of the first Magnitude, and *Tycho* of the Second, Mr. *Helmstedt* lays down as between the First and Second.

Thus, instead of Six several Magnitudes, we have really Six times Six.

Some Authors lay it down, that the Stars of the first Magnitude, are seen under an Angle of at least a Minute; but the Earth's Orbit seen from the fix'd Stars, we have observed only subtends an Angle of 20 Seconds; and hence they conclude, That the Diameter of the Stars is vastly greater than that of the Earth's whole Orbit.

Now a Sphere, whose Semi-diameter only equals the Distance between the Sun and Earth, is Ten Millions of times greater than the Sun; consequently, the fix'd Stars must be much more than Ten Millions of times greater than the Sun.

But here is a Mistake; for the Diameters, even of the largest Stars viewed through a Telescope, which magnify, e. gr. 100 Times, subtend no sensible Angle at all, but are mere lucid Points.

The Stars are likewise distinguish'd, with regard to their Situation, into *Asterisms* or *Constellations*, which are nothing but Assemblages of several neighbouring Stars, consider'd as constituting some determinate Figure, as of an Animal, &c. and denominat'd therefrom: A Division as ancient as the Book of *Job*; wherein we find mention of *Orion* and the *Plaiades*, &c. See CONSTELLATION.

Beside the Stars thus distinguish'd into *Magnitudes* and *Constellations*, there are others not reduced to either. Those not reduced into Constellations, are call'd *Informes*, or *unform'd Stars*; of which Kind, several so reputed by the Ancients, have been since form'd into New Constellations by the Modern Astronomers; as *Cor Caroli* by Dr. *Halley*, *Senrum Sobieski*, by *Hewelm*, &c. See INFORMES.

Those not reduced to Classes or Magnitudes, are call'd *Nebulous Stars*, being such as only appear faintly, in Form of little lucid Nebulae or Clouds. See NEBULOUS.

#### Number of the STARS.

The Number of Stars is vastly great, almost infinite; yet have Astronomers long ago, ascertain'd the Number of those visible to the Eye; which are found vastly fewer than one would imagine. *Hipparchus*, 125 Years before the Incarnation, on occasion of a new Star then appearing, made a Catalogue of the Stars, i. e. an Enumeration thereof, with an exact Description of their Magnitudes, Situations, Longitude, Latitude, &c. that it might be known, if any like Change should be made for the future in the Heavens. *Hipparchus*, made the Number of visible Stars 1022. These

were reduced into 48 Constellations, and he laid it down, that if there sometimes appeared more in Winter Nights, 'twas owing to a Deception of the Sense.

*Ptolomy* added Four Stars to *Hipparchus's* Catalogue, and made the Number 1026.

In the Year 1437, *Uleig Beigh*, Grandson of *Tamerlane*, in a New Catalogue he made, only gives 1017.

But in the 17th Century, when Astronomy began to be retrieved, their Number was found to be much greater.

To the 48 Constellations of the Ancients, were added 12 New ones, discovered towards the South Pole, and two towards the North: Besides several others not universally admitted, as the *Flower de Lys*, the *Royal Oak*, &c.

*Tycho Brahe* published a Catalogue of 777 Stars, from his own Observations; which *Kepler*, from *Ptolemy* and others, increased to 1163, *Riccioldi* to 1468, and *Boyer* to 1725: *Dr. Halley* added 373 observ'd by him, within the Antarctic Circle. *Hewelius*, from his own Observations, and those of *Dr. Halley*, made a Catalogue of 1888 Stars: And *Mr. Flamsteed* has since made a Catalogue of no less than 3000 Stars, all from his own most accurate Observations. See CATALOGUE.

Of these 3000, 'tis true, there are many only visible through a Telescope; nor does a good Eye scarce ever see more than an Hundred together in the clearest Heaven: The Appearance of innumerable more, frequent in clear winter Nights, arises from our Sight's being deceived by their Twinkling, and from our viewing them confusedly, and not reducing them to any Order.

Yet for all this, the Stars are really almost infinite. *Riccioldi*, makes no Scruple to affirm, in his new *Almagest*, That a Man who should fly there are above Twenty thousand times Twenty thousand, would fly nothing improbable.

For a good Telescope directed almost to any Point of the Heavens, discovers Numbers that are lost to the naked Sight; particularly in the Milky Way, which is nothing but an Assemblage of Stars, too remote to be singly seen, but so closely disposed, as to give a luminous Appearance to that Part of the Heavens where they are. See GALAXY.

In the single Constellation of the *Pleiades*, instead of 6 or 7 Stars seen by the best Eye, *Dr. Hook*, with a Telescope 12 Foot long, told 78; and with larger Glasses, many more of different Magnitudes. *F. de Rheina*, a Capuchin, affirms, That he has observed above 2000 Stars in the single Constellation of *Orion*.

The same Author found above 188 in the *Pleiades*. And *Huygens* looking at the Star in the Middle of *Orion's* Sword; instead of one, found it to be 12. *Galilei* found 80 in *Orion's* Sword; 21 in the *Nebulous Star* of his Head; and 36 in the *Nebulous Star*, *Procyon*.

#### Changes in the STARS.

The Changes that have happened in the Stars, are very considerable; contrary to the Opinion of the Ancients, who held, that the Heavens and heavenly Bodies, were incapable of any Change, the Matter thereof being Permanent and Eternal, infinitely exceeding the Hardness of Diamonds, and not susceptible of any different Form. And, in Effect, till the Time of *Aristotle*, and even 200 Years afterwards, there had no Change been observed.

The first, was in the Year 125, before the Incarnation; when *Hipparchus* discovering a new Star to appear, was first induced to make a Catalogue of the Stars, that Posterity, as we have observed, might perceive any future Changes of the like Kind.

In the Year 1572, *Tycho Brahe*, observed another new Star in the Constellation *Cassiopeia*, which was, likewise, the Occasion of his making a new Catalogue. Its Magnitude, at first, exceeded that of the biggest of our Stars, *Sirius* and *Lynx*; it even equalled that of *Venus*, when nearest the Earth; and was seen in fair Day-light. It continued Sixteen Months; towards the latter Part whereof, it began to dwindle, and at last totally disappeared, without any Change of Place in all that Time.

*Leucivius* tells us of another Star appearing in the same Constellation, about the Year 905, which resembled that of 1572; and quotes another ancient Observation, whereby it appears, that a new Star was seen about the same Place in 1264.

*Dr. Keill* takes those to have been all the same Star; and does not know but it may make its Appearance a-new 150 Years hence.

*Fabricius* discovered another new Star in the Neck of the *Whale*, which appeared and disappeared several times in the Years 1648 and 1662. Its Course and Motion, are described by *M. Bouilland*.

*Simon Marius* discovered another in *Andromeda's* Girdle; in 1612 and 1613, though *M. Bouilland* says, it had been seen before, in the XVth Century. Another was observed by *Kepler* in *Serpentarius*. Another of the Third Magnitude in the Constellation *Cygnus*, near the Bill, in the Year 1601, which disappeared in 1626, and was observed again by

*Hewelius* in 1639, till the Year 1561, and again in 1666 and 1671, as a Star of the Sixth Magnitude.

'Tis certain, from the ancient Catalogues, that many of the ancient Stars are now invisible. This is particularly notorious in the *Pleiades*, or Seven Stars, whereof only Six are now visible to the Eye; a Thing long ago observed by *Ovid*: Witness the Verse, *Quae Septem dicat, sex tamen esse solent*.

*M. Montanari*, in his Letter to the *Royal Society* in 1670, observes, that there are now wanting in the Heavens, two Stars of the second Magnitude, in the Stern of the Ship *Argo* and its Yard; which had been seen till the Year 1664. When they first disappeared 'tis not known; but he assures us, there was not the least Glimpse of them in 1668. He adds, he has observed many more Changes in the fix'd Stars, even to the Number of an Hundred.

#### Nature of the fix'd STARS.

For the Nature of the fix'd Stars, their immense Distance leaves us greatly at a loss about it. What we can gather see certain from their Phenomena, is as follows;

1<sup>o</sup> That the fix'd Stars are greater than our Earth. This is demonstrable thus: Suppose two Stars C and D (Tab. Astronomy Fig. 31.) the one in the Eastern Horizon, and the other in the Western. As soon as D arrives in C, C will appear in D. But since both move with the same Velocity, while C describes the Arch CHD; the Star C describing an equal Arch CDH, will appear in F: Wherefore, if the Stars C and D be less than the Earth, the Star C will not be seen in the Eastern Horizon, when the other, C, is arrived at the Western: But as this is contrary to Experience, it follows, that the Stars being in L and S, and there seen at the same time by Spectators in A and B, are greater than the Earth AB.

2<sup>o</sup> The fix'd Stars are farther distant from the Earth, than the farthest of the Planets. For we frequently find the fix'd Stars, hid behind *Saturn's* Body; the height of the Planets, See OCCULTATION.

3<sup>o</sup> The fix'd Stars shine with their own Light: For they are much further from the Sun than *Saturn*, and appear much less than *Saturn*; but since, notwithstanding this, they are found to shine much brighter than *Saturn*, 'tis evident they cannot borrow their Light from the same Source as *Saturn* does, viz. the Sun: But since we know of no other luminous Body beside the Sun, whence they might derive their Light; it follows, that they shine with their own native Light.

Hence 1<sup>o</sup>, we deduce, that the fix'd Stars are so many Suns; for they have all the Characters of Suns. See SUN.

2<sup>o</sup> That in all probability, the Stars are not less than our Sun.

3<sup>o</sup> That 'tis highly probable, each Star is the Centre of a System, and has Planets or Earths revolving round it, in the same Manner as round our Sun; i. e. has opaque Bodies illuminated, warm'd and cherish'd by its Light. See SYSTEM.

How immense, then, does the Universe appear! Indeed, it must either be Infinite, or infinitely near it. See UNIVERSE.

*Kepler*, 'tis true, denies that each Star can have its System of Planets as ours has; and takes them all to be fix'd in the same Surface or Sphere; urging, that were there one twice or thrice as remote as the other, it would appear twice or thrice as small, supposing their real Magnitudes equal; whereas there is no Difference in their apparent Magnitudes, justly observed, at all. But to this we oppose, that *Huygens* has not only shewn, that Fires and Flames are seen at such Distances, where other Bodies, comprehended under equal Angles, disappear; but it should likewise seem, that the Optic Theorem about the apparent Diameters of Objects being reciprocally proportional to their Distances from the Eye, does only hold while the Diameter of the Object has some sensible Ratio to its Distance.

4<sup>o</sup> The Stars which appear and disappear by turns, being always found to increase in Magnitude at their first Appearance, and to decrease as they begin to disappear, and being likewise still visible through Telescopes, for some Time after they are lost to the naked Eye (of which we have various Instances in the *Philosophical Transactions*) seem to be no other than Planets performing their Periods about the fix'd Stars, as their respective Suns; unless any Person should rather incline to *Dr. Keill's* Opinion, viz. That the Stars lose their Brightness, and disappear, by their becoming cover'd with Mistle or Spots, such as are frequently found to over-spread the Sun. See SPOTS.

5<sup>o</sup> Those temporary Stars, which, upon their disappearing, have never been found to return again; is probably conjectured to be of the Number of Comets, which make long Excursions from their Suns, or the Centers of the upper planetary Systems, i. e. from the fix'd Stars; returning too seldom to have their Returns perceived. See COMET.

#### Motions of the STARS.

The fix'd Stars have two kinds of Motions; one called the First, common or diurnal Motion, or the Motion of the Pri-

*anus Mobile*: By this they are carried along with the Sphere or Firmament wherein they appear fix'd, round the Earth, from East to West, in the Space of 24 Hours.

The other, call'd the *Second* or *proper Motion*, is that whereby they go backwards from West to East round the Poles of the Ecliptic, with an exceeding Slowness, as not describing above a Degree of their Circle in the Space of 71 or 72 Years, or 551 Seconds in a Year.

Some have imagin'd, I don't know on what Grounds, that when they are got round to the Points, whence they first departed, Nature will have finish'd her Course, and the Stars having perform'd their Career, the Heavens will remain at rest, unless the Being, who first gave them Motion, appoint them to begin another Circuit.

On the footing of this Calculation, the World should last about Thirty thousand Years, according to *Protonny*; 25816 according to *Tycho*; 25920 according to *Riccioli*, and 24800 according to *Cassini*. See *P.A.R.A.C.E.S.S.I.O.N.* of the *Equinox*.

In effect, the Latitudes of the fix'd Stars, we find, by comparing the Observations of the ancient Astronomers with those of the Moderns, continue still the same; but their Longitude is by this Second Motion always increasing.

Thus, e. g. the Longitude of *Cor Leonis*, was found by *Protonny*, A. D. 138, to be  $2^{\circ} 30'$ ; in 1115 'twas observ'd by the *Persians* to be  $1^{\circ} 30'$ ; in 1364, by *Alphonsus*,  $20^{\circ} 40'$ ; in 1586 by the Prince of *Hesse*  $24^{\circ} 11'$ ; in 1601 by *Tycho*  $24^{\circ} 17'$ ; and in 1690 by *Mr. Flamsteed*  $25^{\circ} 31' 20''$ ; whence the proper Motion of the Stars, according to the Order of the Signs in the Circles, parallel to the Ecliptic, is easily infer'd.

'Twas *Hipparchus* first suspected this Motion, upon comparing the Observations of *Tymochorus* and *Aristillus* with his own. *Protonny*, who lived Three Centuries after *Hipparchus*, demonstrat'd the same by undeniable Arguments. See *LONGITUDE*.

Some, 'tis true, have imagin'd a Change in the Latitudes of the Stars; but such an Opinion has little Countenance from Observation. See *LATITUDE*.

*Tycho Brahe* makes the Increase of Longitude in a Century  $1^{\circ} 23' 40'' 12'''$ ; *Flamsteed* and *Riccioli*  $1^{\circ} 23' 20''$ ; *Bullialdus*  $1^{\circ} 24' 54''$ ; *Hovellius*  $1^{\circ} 24' 46'' 50'''$ ; whence, with *Flamsteed*, the Annual Increase of the Longitudes of the fix'd Stars may be well fix'd at  $50''$ .

From these Data, the Increase of the Longitude of a Star for any given Time, is easily had; and hence the Longitude of a Star for any given Year, being given, its Longitude for any other Year, is readily found: E. g. the Longitude of *Sirius* in *Mr. Flamsteed's* Tables for the Year 1690 being  $9^{\circ} 49' 1''$ ; its Longitude for the Year 1724 is found, by multiplying the Interval of Time, viz. 34 Years by  $50''$ , the Product  $1700''$  or  $28' 2''$  added to the given Longitude, will give the Longitude required,  $10^{\circ} 17' 3''$ .

The principal Phenomena of the fix'd STARS, arising from their common and proper Motion, besides their Longitude, are their Altitudes, Right Ascensions, Declinations, Occultations, Culminations, Risings and Settings; which see under their proper Articles, ALTITUDE, ASCENSION, DECLINATION, OCCULTATION, &c.

The several Stars in each Constellation, e. g. in *Taurus*, *Bootes*, *Hercules*, &c. their Longitudes, Latitudes, Magnitudes, Names, Places, &c. as fix'd by *Mr. Flamsteed* in the *Britannic Catalogue*; see under the proper Article of each Constellation, TAURUS, BOOTES, HERCULES, &c.

To learn to know the several fix'd Stars by the Globe; see *GLOBE*.

The Parallax and Distance of the fix'd Stars; see under *PARALLAX* and *DISTANCE*.

STAR, in Fortification, a little Hexagonal Fort, with Six Points, or Salliant and Re-entring Angles flanking one another, and their Faces 90 or 100 Foot long. See *FORT*.

They are frequently made in Lines of Circumvallation, after two or three Redoubts. See *REDOUBT*.

STAR, in Pyrotechny, a Composition of combustible Matters, which being burn'd or thrown aloft into the Air, exhibits the Appearance of a real Star.

Stars are chiefly used as Appendages to Rockets, a Number of them being usually included in a Conical Cap or Cover at the Head of the Rocket, and carried up with it to its utmost Altitude, where the Stars taking Fire, are spread around, and exhibit an agreeable Spectacle. See *ROCKET*.

To make Stars; Mix 3 Pounds of Salt-petre, 11 Ounces of Sulphur, one of Antimony and three of Gunpowder Dust; Or 11 Ounces of Sulphur, 6 of Salt-petre, 5 of Gunpowder Dust, 4 Ounces of Olibanum, one of Maltic, Camphir, Sublimatè of Mercury, and Half a one of Antimony and Orpiment.

Moisten the Mass with Gum-water, and make it into little Balls, of the Size of a Chestnut, which dry either in the Sun or the Oven. These set on fire in the Air, will represent Stars.

STAR, in Heraldry, a Term frequently used, as signifying a Moveable or Charge, frequently borne on the Shield, and the honourable Ordinaries.

It differs from the *Mullet*, or *Spur-rowel*, in that it is not pierced as this last is. See *MULLET*.

It usually consists of five Rays or Spokes. When it has Six or Eight, as among the  *Germans*  and  *Italians* , particular Mention must be made thereof in Blazoning.

On Medals, Stars are Marks of Consecration and Deification, being intended as Symbols of Eternity. *F. Jonbert* says, they sometimes express the Children of Princes reigning; and sometimes the Children dead, and placed in the Rank of Deities. See *DEIFICATION*.

STAR, a Badge of the Honourable Order of the Garter. See *GARTER*.

Order of the STAR, or our *Lady of the STAR*, an Order of Knighthood instituted by King *John of France* in the Year 1352, denominated from a Star they wore on the Stomach.

At first there were but 30 Knights; but the Order in time became depreciated, by the Multitude of Persons admitted, without any Distinction. For which Reason, *Charles VII.* when Grand-maister thereof, quitted it, and gave it the Chevalier *du Guis*, Knight of the Watch at *Paris*, and his Archers, who still wear a Star on their Cassock. But this Account is contradicted by others; who will have the Order instituted by King *Robert* in 1022 in Honour of the Holy Virgin, and to have fallen into Disrepute during the Wars of *Philip de Valois*.

*Justiniani* mentions another Order of the Star, at *Messina* in *Sicily*, call'd also the Order of the *Crescent*. It was instituted in the Year 1268, by *Charles of Anjou*, Brother of *St. Louis*, King of the Two *Sicilies*.

Others will have it instituted in 1464, by *Renatus Duke of Anjou*, who took the Title of King of *Sicily*. At least, it appears from the Arms of this Prince, that he made some Alteration in the Collar of the Order; for instead of *Flower-de-Luces* and Stars, he only bore Two Chains, whence hung a *Crescent*, with the old *French Word Los*, which in the Language of *Reims*, signified *Los* is a *Crescent*.

The Order being dropt into Obscurity, was raised again by the People of *Messina*, under the Name of the *Noble Academy of the Knights of the Star*, reducing the ancient Collar to a single Star placed on a forked Cross, and the Number of Knights to Sixty-two. Their Device was, *Monstrant Regibus Astra Flam.* which they express'd by the Four Initial Letters  $M, A, R, S$  with the Star in the Middle.

STAR, in the Manage. White Stars in the Forehead, are esteem'd good Marks in all Horses, except White and Grey ones: where Nature fails to produce this good Criterion, our Jockies have frequent Recourse to Art.

The Method of making Stars, practis'd among the *Dutch*, is to roast a large Onion in hot Ashes, and when near thoroughly done, to divide it in two, and dip it in scalding hot Walnut Oil. This done, they immediately apply the flat Side thereof to the Place the Star is to be on, and keep it there Half an Hour. After taking it off, they anoint the Scalded Place with Ointment of *Roses*: In a short Time, the Scarf Skin falls off, and White Hair grows up in their Room; but the Middle always continues bare of Hair, which is the certain Characteristic of an Artificial Star.

The Method most used among us, is to shave the Hair from the Place 'tis to be made on; then to apply a little Oil of *Vitriol* with a Feather, or the like, passing it lightly over the bald Place. This eats away the Roots of the former Hair, which will be succeeded by White. The Sore is heal'd up with *Copperas* and green Ointment.

To make a Black Star, on a White or other colour'd Horse; With the Place to be changed, frequently, with Fern Roots and Sage boil'd in *Lye*; and it will breed black Hairs. The same may be done, by beating four Milk, Galls and Rust together, and anointing the Part therewith.

A Red Star is made with an Ounce of *Aqua-fortis*, a pennyworth of *Aqua-vitæ*, and Silver to the Value of Eighteenpence, all heated together in a Glass, and the Place anointed therewith. This immediately turns the Hair to a perfect Red; but it lasts no longer than till the Horse cast his Coat; when it is to be renewed.

STAR-BOARD, is the Right-hand Side of a Ship, as *Starboard* is the Left:

Thus they say, *Starboard the Helm*, or *Helm a Starboard*, when the Man at the Helm should put the Helm to the Right Side of the Ship.

STARCH, a Fecula or Sediment found at the Bottom of Vessels, wherein the waste or refuse Wheat has been steep'd in Water: Of which Fecula, after separating the Bran from it, they form a kind of Loaves, which being dried in the Sun, or on a Furnace, is reduced into little Pieces, and so sold for *Starch*.

The best is white, soft and friable, easily broke into Powder. Such as require very fine *Starch*, don't content themselves, like the *Starch-men*, with the Refuse of Wheat, but use the finest Grain. The Process is as follows;

Method of making STARCH of *Wheat*.

The Grain being well cleaned, is put to ferment in Vessels full of Water, which they expose to the Sun, when in its greatest Heat; changing the Water twice a Day, for the Space of 8 or 12 Days, according to the Season. When the Grain bursts easily under the Finger, they judge it sufficiently fermented. The Fermentation perfected, and the Grain thus soften'd; 'tis put, handful by handful, in a canvas Bag, to separate the Flower from the Husks, which is done by rubbing and beating it on a Plank, laid across the Mouth of the empty Vessel that is to receive the Flower.

As the Vessels are filled with this liquid Flower, there is seen swimming a top, a reddish Water, which is to be carefully scum'd off from time to time, and clean Water put in its Place; which, after stirring the whole together, is all to be strained through a Cloth or Sieve, and what is left behind, put into the Vessel with new Water, and exposed to the Sun for some time; and as the Sediment thickens at the Bottom, they drain off the Water four or five Times, by inclining the Vessel, but without passing it through the Sieve. What remains at bottom, is the *Starch*, which they cut in Pieces to get out, and leave it to dry in the Sun. When dry, 'tis laid up for Use.

To use *Starch*, they take as much as is needed, and steep in Water over Night, changing the Water four or five Times.

The *Starch-men* using the Refuse of *Wheat*, only observe a Part of all these Things in their Process; but their *Starch* falls far short of this.

*Starch* is used along with Snail or Stone-blue, to stiffen and clear Linen. The Powder thereof is also used to whiten and powder the Hair. 'Tis also used by the Dyers to dispose their Stuffs to take Colours the better.

*STAR-Chamber*; was a Chamber at *Westminster*, formerly so called, from its Roof being painted with *Stars*. See CHAMBER.

*Henry* the VIIIth and VIIIth, ordered, by several Statutes, that the Chancellor, assisted by others there named, should have Power to punish Routs, Riots, Forgeries, Embraceries, Perjuries, and such other Misdemeanors, as were not sufficiently provided for by the common Law, and for which the inferior Judges were not proper to give Correction. But this Court, by 17 *Car* 1. c. 10. was entirely dissolv'd, and so continues to this Day.

*STAR-Fort*, in Fortification, is a Work with several Faces, generally composed of from 5 to 8 Points, with Salient and Re-entering Angles flanking one another; every one of its Sides containing from 12 to 25 Barbans.

*STARTING*, among Brewers, is the putting of new Beer or Ale to that which is decayed, to revive it again.

*STATERA Romana*, or *Steclyard*, a Name given to the *Roman Balance*. See STEELYARD.

*STATERA* was also an ancient Silver Coin, weighing four *Attic* Drachms, or Half a *Roman Ounce*. It was worth about two Shillings or two Shillings and Two-pence *Sterling*. See COIN.

*STATE*, or *Estato*, an Empire, Kingdom, Province or Extent of Country under the same Government. See EMPIRE, KINGDOM, &c.

The *State*, or *States* of the King of *England*, include the *British Islands* and the *West India Plantations*, as *Virginia*, *Carolina*, *Mary-land*, &c. to which may be added, the *Dutchies of Brunsvick-Lunenbourg*, *Bremen*, &c.

*STATE* is also used for the Policy or Form of Government of a Nation. Hence, *Ministers of State*; *Reasons of State*, &c. See RATIO STATUS, &c.

Politicians make several *Forms of State*, viz. the *Monarchy*, as that of *England*; *fec* MONARCHY: The *Democracy*, as that of *Rome* and *Athen*; *fec* DEMOCRACY: The *Oligarchie*, as that of *Venice*; *fec* OLIGARCHY: And the *Aristocratic*, as that of *Sparta*; *fec* ARISTOCRACY, &c.

*STATE of a Distaste*. See ACME.

*STATES*, a Term applied to the several Orders, or Classes of a People, assembled to consult of Matters for the publick Good. See ESTATES.

*STATES-General*, the Name of an Assembly, consisting of the Deputies of the Seven United Provinces.

In this Assembly, the Deputies of each Province, what Number ever they be, have only one Voice, and are esteem'd as but one Person; the Votes being given by Provinces. Each Province presides at the Assembly in its Turn, according to the Order settled among them; *Guelterland* presides first, then *Holland*, &c. This Assembly is the Representative of the Sovereignty of the Union, which resides principally in the General Assembly of the *States* themselves of all the Provinces: But as the Assembly ordinarily consists of 7 or 800 Persons, it was resolv'd, after the Departure of the Earl of *Leicester*, in order to avoid Expence, and the Confusion of so numerous a Body, that the Provincial Estates should, for the future, be ordinarily represented by their

Deputies, under the Name of the *States-General*, who were always to reside at the *Hague*, and who alone are now called *States-General*.

Since that new Regulation, there have been two General Assemblies of the *States* of the Provinces; the former held in 1600 at *Berg-op-Zoom*, to confirm the Trace agreed on with the Arch-duke *Albert*, with the greater Solemnity; and the latter in 1651.

*STATES of Holland*, an Assembly consisting of the Deputies of the Councils of each City; wherein resides the Sovereignty of that Province.

Originally, none but the Nobility and the Six principal Cities had Seats or Voices in the *States*. At present there are the Deputies of 18 Cities.

The Nobility have the first Voice. The other Provinces of the Union have likewise their *States*, representing their Sovereignty.

*STATICAL Barscope*. See BAROSCOPE.

*STATICKS, STATICE*, a Branch of Mathematics, which considers *Weights* or *Gravity*, and the Motion of Bodies arising therefrom.

Those who define *Mechanicks*, the Science of Motion, make *Staticks* a Member thereof, viz. that Part which considers the Motion of Bodies arising from Gravity. See GRAVITY.

Others make them two distinct Doctrines; retaining *Mechanicks* to the Doctrine of Motion, and *Weights*, in reference to the Structure and Power of Machines; and *Staticks* to the Doctrine of Motion, consider'd merely as arising from the Weight of Bodies, without any immediate respect to Machines: On which footing, *Staticks* should be the Doctrine or Theory of Motion; and *Mechanicks* the Application thereof to Machines. See MECHANICKS.

For the *Loves of STATICKS* } See { GRAVITY, DESCENT, &c.  
*STATICAL Barometer* } } BAROMETER.

*STATICS, Statice*, in Medicine, a kind of Epilepticks, or Persons seiz'd with Epilepsies. See EPILEPSY.

The *Staticks* differ from the *Catepicks*, in that, these last have no Sense of external Objects, nor remember any thing that passes at the Time of the Paroxysm: Whereas the *Statice* are all the while taken up with some very strong lively Idea, which they remember well enough, out of the Fit. See EPILEPSY.

*STATION*, in Geometry, &c. a Place pitch'd upon to make an Observation, take an Angle, &c.

An inaccessible Height or Distance is only to be taken, by making two *Stations*, from two Places, whose Distances are known. In making Maps of Provinces, &c. *Stations* are fix'd on all the Eminences, &c. of the Country, and Angles taken thence to the several Towns, Villages, &c.

In Surveying, the Instrument is to be adjust'd by the Needle, to answer the Points of the Horizon; at every *Station*, the Distance from the last *Station* to be measured, and an Angle to be taken to the next *Station*; which includes the whole Business of Surveying. See SURVEYING.

In Levelling, the Instrument is *rectified*, that is placed level, at each *Station*, and Observations made forwards and backwards. See LEVELLING.

*STATION*, in Astronomy, the Position or Appearance of a Planet in the same Point of the Zodiac for several Days. See PLANET.

As the Earth, whence we view the Motions of the Planets, is out of the Centre of their Orbits, the Planets appear to proceed irregularly; being sometimes seen to go forwards, that is from West to East, which is call'd their *Direction*; sometimes to go backwards, or from East to West, which is call'd their *Retregredation*. See DIRECTION and RETREGREDATION.

Now between these two States, there must be an intermediate one, wherein the Planet neither appears to go backwards nor forwards, but to stand still and keep the same Place in her Orbit, which is call'd her *Station*. See STATIONARY.

*STATION*, in Church History, is used for the Fasts of the 4th and 6th Day of the Week; that is, those of *Wednesday* and *Friday*, which many among the Ancients observ'd with much Devotion.

These Fasts only held to 3 o'Clock in the Afternoon. See FAST.

*S. Peter of Alexandria*, in his *Canonical Epistle*, *Can.* 15. observes, that it was appointed in conformity with the ancient Tradition, to fast weekly on those Days: On *Wednesday*, in Memory of the Council the Jews took to put our Saviour to Death; and on *Friday*, on account of his Passion; some regard to which is still had by many in the Church of *England*.

*STATION* is also used in the Church of *Rome*, for certain Churches where Indulgences are to be had on certain Days. See INDULGENCE.

'Twas *St. Gregory* that fix'd the *Stations* at *Rome*, i. e. the Churches where the Office was to be perform'd each Day of *Lent*, and on Solemn Feast Days. These *Stations* be mark'd

mark'd down in his *Sacramentary*, as they now stand in the *Roman* Missal; attaching them chiefly to the Patriarchal and Titular Churches: But though the *Stations* were fix'd, the Archdeacon did not fail, at each *Station*, to publish to the People the following *Station*.

*STATION* is also a Ceremony in the *Roman* Church, wherein the Priests or Canons go out of the Choir to sing an Anthem before the Crucifix, or the Image of our Lady. This Ceremony is ascribed to *S. Cyril*.

*STATIONARY*, in Astronomy, the State of a Planet when it seems to remain immovable in the same Point of the Zodiac. See *STATION*.

The Planets having sometimes a progressive and sometimes a retrograde Motion; there will be some Point wherein they appear *Stationary*. Now a Planet will be seen *Stationary*, when the Line that joins the Earth's and Planet's Centre, is constantly directed to the same Point in the Heavens; that is, when it keeps parallel to itself. For all right Lines drawn from any Point of the Earth's Orbit, parallel to one another, do all point to the same Star; the Distance of those Lines being infensible, in comparison of that of the fix'd Stars.

*Saturn* is seen *Stationary*, at the Distance of somewhat more than a Quadrant from the Sun; *Jupiter* at the Distance of 52°, and *Mars* at a much greater Distance. *Saturn* is *Stationary* 8 Days, *Jupiter* 4, *Mars* 2, *Venus* 1; and *Mercury*; though the several *Stations* are not always equal. See *SATURN*, &c.

*STATOCLE*, in Medicine, a Rupture, or Tumour in the Scrotum, consisting of a fatty Substance resembling Suet. See *HEMIA*.

*STATUARY*, a Branch of Sculpture, employ'd in the making of *Statues*. See *STATUE*.

*Statuary* is one of those Arts wherein the Ancients surpass'd the Moderns: indeed 'twas much more popular, and more cultivated among the former than the latter. See *SCULPTURE*.

'Tis disputed between *Statuary* and *Painting*, which of the two is the most difficult and the most artful. See *PAINTING*.

The Invention of *Statuary* was at first very coarse. *Leon Battista Alberti*, who has an express Treatise on *Statues*, imagines that it took its Rise from something casually observed in the Productions of Nature, that, with a little Help, might seem dispos'd to represent the Figure of some Animal. The common Story is, That a Maid, full of the Idea of her Lover, made the first Essay, by the Assistance of her Father's Implements, who was a Potter. This at least, is pretty certain, that Earth is the first Matter *Statuary* was practis'd upon.

*STATUARY* is also used for the Artificer, who makes *Statues*. In this Sense we say, *Phidias* was the greatest *Statuary* among the Ancients, and *Michael Angelo* among the Moderns.

*STATUE*, a Piece of Sculpture in full Relief, representing a human Figure. See *FIGURE*.

*Daviler*, more Scientifically defines *Statue* a Representation in high Relief and Insular, of some Person distinguish'd by his Birth, Merit or great Actions; placed as an Ornament in a fine Building, or expos'd in a publick Place to preserve the Memory thereof.

*Statues* are form'd with the Chisell, of several Matters, as Stone, Marble, Plaster, &c. See *STONE*, *MARBLE*, *CHISEL*, &c.

They are also cast of various Kinds of Metals, particularly Gold, Silver, Brass and Lead.

For the Method of casting *Statues*; see *FOUNDRY* of *Statues*.

*Delator*, the Son of *Eupalamos*, who lived not only before the Siege of *Troy*, but even before the Expedition of the *Argonauts*, among many other notable Contrivances ascribed to him, is said to have been the Inventor of *Statues*. And yet 'tis certain, there were *Statuaries* before him; only he 'twas first found how to give them Action and Motion, and to make them appear as if alive. Before him, they made them with the Feet jointed together, never intending to express any Action. He first loosened the Feet of his, and gave them the Attitudes of People walking and sitting.

The *Phoenicians* are said to have been the first who erected *Statues* to the Gods.

The *Greeks* succeeded in their *Statues* beyond the *Romans*; both the Workmanship and the Fancy of the *Roman Statues* were inferior to the *Grecian*. Indeed we have very few remaining, that have escap'd the Injuries of Time.

In Strictness, the Term *Statue* is only applied to Figures on Foot; the Word being form'd from the *Latin*, *Statua*, the Size of the Body; or from *Stare*, to stand.

*Statues* are usually distinguish'd into four Kinds; the first, are those less than the Life; of which Kind we have several *Statues* of Men, of Kings, and Gods themselves.

The Second, of those equal with the Life; in which Manner it was, that the Ancients, at the publick Expence, us'd to make *Statues* of Persons eminent for Virtue, Learning, or the Services they had done.

The Third, of those that exceed the Life; among which,

those which surpass'd the Life once and a half, were for Kings and Emperors; and those double the Life, for Heroes.

The Fourth Kind, were of those that exceeded the Life twice or thrice, or even more, and were called *Colossal*. See *COLOSSUS*.

Every *Statue* resembling the Person it represents, is called *Statua Iconica*.

*Greek Statues*, is used for a Figure that is Naked and Antique; it being in this Manner the *Greeks* represented their Deities, *Athletes* of the Olympic Games, and Heroes. The Reason of this Nudity, whereby the *Greek Statues* are distinguished, is, that those who exercis'd Wrestling, wherein the *Greek Youth* plac'd their chief Glory, always perform'd naked.

The *Statues* of Heroes were particularly called *Achillean Statues*, by reason of the great Number of Figures of that Prince, in most of the Cities of *Greece*.

*Roman Statues*. This Appellation was given to such as were cloth'd, and which receive various Names from their various Dresses. Those of Emperors with long Gowns over their Armour, were called *Statue Paludate*; those of Captains and Cavaliers, with Coats of Arms, *Decorate*; those of Soldiers, with Cairasses, *Loricata*; those of Senators and Augurs, *Trabeate*; those of Magistrates with long Robes, *Togate*; and those of the People with a plain *Tunica*, *Tunicata*; and lastly, those of Women with long Trains, *Strolate*.

The *Romans* had another Division of *Statues*, into *Divine*, which were those consecrated to the Gods, as *Jupiter*, *Mars*, *Apollo*, &c. *Heroes*, which were those of the Demi-Gods, as *Heracles*, &c. and *Augusti*, which were those of the Emperors; as those two of *Cesar* and *Augustus*, under the Porch of the Capitol.

*Pedestrian Statues*, a *Statue* standing on foot; as that of King *Charles II.* in the *Royal Exchange*, and that of King *James II.* in the *Privy Gardens*.

*Equestrian Statues*, that representing some illustrious Person on Horseback; as that famous one of *Marcus Aurelius* at *Rome*, and those of King *Charles I.* and *II.* at *Charing-Cross* and in *Stocks-Market*, *London*.

*Curule Statues*. Those are thus called, which are represented in Chariots drawn by *Bigs* or *Quadriges*, that is, by two or four Horses; of which Kind there were several in the *Grecus Hippodromus*, &c. or in Cars, as we see on triumphal Arches in antique Medals. See *CURULE*.

*Allegorical Statues*, that which, under a human Figure, or other Symbol, represents something of another Kind, as a Part of the Earth, a Season, Age, Element, Temperament, Hour, &c.

*Hydraulic Statues*, any Figure placed as an Ornament to a Fountain or Grotto; or that does the Office of a *Jet d'Eau*, a Cock, Pipe or the like, by any of its Parts, or by an Attribute it holds. The same is to be understood of any Animal serving for the same Use.

<i>Colossal Statue</i>	} See	{ <i>COLOSSUS</i> , <i>PERSIAN Order</i> , <i>CARYATIDES</i> .
<i>Curule Statue</i>		
<i>Caryatic Statue</i>		

*STATURE*, the Size or Height of a Man; from the *Latin*, *Staturo*, of *Stare*, to stand.

The *Staturo*, or Pitch of Man, is found admirably well adapted to the Circumstances of his Existence. Had Man, observes *Dr. Greer*, been a Dwarf; he could scarce have been a reasonable Creature: For, to that End, he must have had a Joint-head; and then he would not have had Body and Blood to supply his Brain with Spirits; or if he had had a small proportional Head, there would not have been Brain enough for his Business. Again, had Man been a Giant, he could not have been so commodiously supplied with Food: For there would not have been Flesh enough of the best edible Beasts to supply his Turn; or if the Beasts had been made proportionally bigger, there would not have been Grass enough, &c. See *DWARF*, *GIANT*, &c.

'Tis a common Opinion, however, and has been so, ever since *Flower's* Time, that People in the earliest Ages of the World, much surpass'd the Moderns in *Staturo*; and 'tis true, we read of Men, both in sacred and profane History, whose Pitch appears surprising; but then 'tis true, they were esteemed Giants.

The ordinary *Staturo* of Men, *Mr. Derham* observes, is in all probability the same now, as at the beginning; as may be gather'd from the Monuments, Mummies, &c. still remaining. The oldest Monument in the World, is that of *Cheops*, in the first Pyramid of *Egypt*, which *Mr. Greaves* observes, scarce exceeds the Measure of our ordinary Coffins. The Cavity, he says, is only 6,488 Feet long, 2,218 Feet wide, and 2,160 deep: From which Dimensions, and those of several Embalmed Bodies, taken by him in *Egypt*, that accurate Writer concludes, there is no Decay in Nature; but that the Men of this Age are of the same *Staturo* as those 3000 Years ago.

To these we have other and later Instances to add from *Halewell*: The Tombs at *Pisa*, which are some Thousands of Years old, are no longer than ours: So is *Archeban's* in *Malmsey* Church; *Steva's* in *Passy*, of the Year 693, &c.

The like Evidence, we have from the ancient Armour, Shields, Vessels, &c. dug up at this Day, *E. gr.* the Brass Helmet dug up at *Metarum*, fits one of our Men; yet 'tis allowed to have been left there at the Overthrow of *Asdrubal*. Add, that *Augustus* was Five Foot Nine Inches, which was the Measure of our Queen *Elizabeth*; only the Queen exceeded the Emperor by Two Inches, Allowance being made for the Difference between the *Roman* and our Foot.

**STATUS** *de Maneris*, in the ancient Records, all the Tenants and legal Men within the Lands of a Manor, assembled in their Lord's Court, to do their customary Suit, and enjoy their Rights and Privileges.

**STATUTE**, in its general Sense, signifies a Law, Ordinance, Decree, &c. See **LAW**, **DECREE**, &c.

In our Laws and Customs, *Statute* more immediately signifies an Act of Parliament, made by the Three Estates of the Realm; in which Sense, *Statute* is either general or special, public or private, &c. See **PARLIAMENT**.

**STATUTES**, or *Statute Sessions*, called also *Petis Sessions*, are Meetings in every Hundred, to which Constables repair, and others, both Masters and Servants, for deciding Differences between Masters and Servants, rating of Wages, bestowing People in Service who being fit to serve, either refuse to leek or cannot get Masters. See **SESSIONS**.

**STATUTE Merchant**, is a Bond acknowledged before one of the Clerks of the *Statutes Merchant* and Mayor or chief Warden of the City of *London*, or Two Merchants of the said City for that Purpose assigned, or before the Mayor, chief Warden, or Master of other Cities or Towns, or other sufficient Men for that Purpose appointed; sealed with the Seal of the Debtor and of the King, which is of two Pieces, the greater to be kept by the Mayor, chief Warden, &c. and the lesser by the said Clerks. See **BONDS**.

**STATUTE Staple**, is so called, either properly or improperly: Properly, it is a Bond of Record, acknowledged before the Mayor of the Staple, in the Presence of the Two Comptables of the same Staple; for which Seal, the Fee of every Pound, if the Sum exceed not 100 l. is an Half-penny, and if it exceed 100 l. a Farthing; by Virtue of which *Statute Staple*, the Creditor may forthwith have Execution of the Body, Lands and Goods of the Debtor.

Improperly, it is a Bond of Record, founded upon the *Statute 23 H. VIII. c. 6.* of the Nature of a proper *Statute Staple* as to the Force and Execution of it, and acknowledged before one of the chief Justices, and in their Absence, before the Mayor of the Staple, and Recorder of *London*.

**STAVERS**, or **STAGGERS**, among Farriers, a Giddiness in a Horse's Head, which ends in Madness. 'Tis frequently occasion'd, by turning out a Horse to Grass too soon, c't'r well cold; where, by hanging down his Head to feed, ill Vapours and Humours are generated, which oppressing the Brain, are the next Cause of this Disease. Sometimes it comes by over Exercise in hot Weather, which inflames the Blood, &c. and sometimes by noxious Smells in the Stable, excessive Eating, &c. The Signs of it, are Dimness of Sight, Reeling and *Staggering*, watery Eyes, &c. At length, for very Pain, he beats his Head against the Wall, thrusts it into the Litter, rises and lies down with Fury, &c. The Methods of Cure are various; but they all begin with Bleeding.

**STAY**, in the Sea Language, a big, strong Rope, fasten'd to the Top of one Mast, and the Foot of that next before it, towards the Prow, serving to keep it firm, and prevent its falling backwards.

All Masts, Top-masts and Flag-staves, have their *Stays*; except the Spirit-sail and Top-mast. That of the Main-mast, is called the *Main-stay*. The Main-mast, Fore-mast, and those belonging to them, have also *Back-stays*, to prevent their pitching forwards or over-board; as going on either side her. See **BACK-STAY**.

Hence, to *Stay a Ship*, or *bring her on the Stay*, is to manage her Tackle and Sails, so as that she cannot make any Way forwards, which is done in order to her Tacking about.

**STEADY**, is a Word of Command at Sea, for the Man at the Helm to keep the Ship *Steady* in her Course, and not to make Angles (or *Yaw* as they call them) in and out. See **HELM**.

**STEATOMA**; from *stas*, Sevum, Suet; is a Swelling, consisting of a Matter much like Suet, soft, without Pain, and without discolouring the Skin; contained in a Cystis; and easily turned out upon Incision.

**STEEL**, a kind of Iron refined and purified by the Fire, with other Ingredients; which renders it whiter, and its Grain closer and finer. See **IRON**.

*Steel*, of all other Metals, is that susceptible of the greatest

degree of Hardness, when well temper'd; whence its great Use in the making of Tools and Instruments of all Kinds.

The true Method of making *Steel* has been greatly conceal'd, and the Publick long abused by counterfeit ones.

The following Method we have from *Agricola*; and is affirmed by *Kircher* to be that practis'd in the Island of *Ivoa*; a Place famous in all Ages for the Manufacture of good *Steel*, from the Time of the *Romans*, to Ours.

Heat a Quantity of Iron red-hot, cut it into small Pieces, mix it with a sort of Stone that easily melts. This Mixture put by little and little into a Crucible, first fill'd with Charcoal-duff, and heated red-hot; when melted off, three, four or more Pieces of Iron are to be put into the middle of it; there boil them five or six Hours with a strong Fire. The Workman is to stir the melted Matter often, that the Pieces of Iron may soak in the smaller Particles of the melted Iron; which Particles consume, and thin the grosser ones of the Iron Pieces, and are, as it were, a Ferment to them, and make them tender. One of the Pieces is now taken out of the Fire, and put under the great Hammer, to be drawn out into Bars and wrought; and hot as it is, plunged into cold Water. Thus temper'd, 'tis again worked upon the Anvil; then breaking it, 'tis consider'd, whether in any Part it looks like Iron; or whether it be wholly condensed and turned into *Steel*.

**STEEL**, in Medicine. See **CHALYBEAT**.

**STEELYARD**, in Mechanics, a kind of Balance, call'd *Statera Romanus*, or the *Roman Balance*; by means whereof, the Gravity of different Bodies are found by the Use of one single Weight. See **BALANCE**.

#### Construction of the STEELYARD.

It consists of an Iron Beam A B (Tab. Mechanics, Fig. 35.) wherein a Point is assumed at Pleasure, as C, and on this a Perpendicular raised C D. On the left Arm A C, is hung a Scale or Bason to receive the Bodies weigh'd: The Weight I is shifted this and that Way on the Beam, till it be a Counter-balance to one, two, three, four, &c. Pounds placed in the Scale; and the Points are noted wherein I weighs as one, two, three, four, &c. Pounds.

From this Construction of the *Steelyard*, the Manner of using it is apparent. But the Instrument being very liable to Deceit, is therefore not to be contrainced in Commerce.

**Spring STEELYARD**, a kind of portable Balance, serving to weigh any Matter, from about one to forty Pounds.

It is composed of a Brass Tube, into which goes a Rod, and about that is wound a Spring of temper'd Steel in a spiral Form. On this Rod are the Divisions of Pounds and Parts of Pounds, which are made by successively hanging on to a Hook fasten'd to the other End, 1, 2, 3, 4, &c. Pounds. Now the Spring being fasten'd by a Screw, to the bottom of the Rod, the greater Weight is hung on the Hook, the more will the Spring be contracted, and consequently, a greater Part of the Rod will come out of the Tube; the Proportions of which greater Weights are indicated by the Figures appearing against the Extremity of the Tube.

**STEEPLE**, an Appendage, raised on the western End of a Church, to hold the Bells. See **CHURCH** and **BELL**.

*Steeple*s are denominated from their Form, either *Spires* or *Towers*.

The first, are such as ascend continually diminishing either Conically or Pyramidically. The latter are mere Parallelepipeds, and are cover'd atop, Plat-form-like. In each Kind, there is usually a sort of Windows or Apertures to let out the Sounds, and so contriv'd, at the same time, to drive it down.

*Mosini*, in his Treatise of Bells, treats likewise of *Steeple*s. The most remarkable in the World, is that at *Pisa*, which leans all on one Side, and appears every Moment ready to fall; yet without any Danger. This odd Disposition, he observes, is not owing to a Shock of an Earthquake, as is generally imagin'd; but it was contriv'd so at first by the Architects; as is evident from the Ceilings, Windows, Doors, &c. which are all in the Level.

**STEERAGE**, the Art of Steering. See **STEERING**.

The Word is also us'd for a Place in a Ship before the Bulk-head of the great Cabin, where the Steers-man stands and lodges.

**STEERING**, in Navigation, the directing of a Vessel from one Place to another, by means of the Helm and Rudder. See **HELM** and **RUDDER**.

He is held the best *Steers-man*, who uses the least Motion in putting the Helm over to and again, and that keeps the Ship best from making Yaw; that is, from running in and out.

There are three Methods of *Steering*. 1<sup>o</sup> By any Mark on the Land, so as to keep the Ship even by it. 2<sup>o</sup> By the Compass, which is by keeping the Ship's Head on such a Rhumb or Point of the Compass, as best leads to Port. 3<sup>o</sup> To *Steer* as one is bidden or com'd; which in a great Ship is the Duty of him that is taking his Turn at the Helm. See **CONDER**.

For the Theory and Effect of Steering; see SAILING.  
**STEGANOGRAPHY**; the Art of *secret Writing*; or of writing in Cyphers, known only to the Persons corresponding. See **CYPHER**.

One *Aeneas Tafficus*, Two thousand Years ago, as we are told by *Polysius*, had invented 20 different Manners of writing so as no Body but those let into the Secret, could understand any thing of the Matter.

But now-a-days, hardly any thing can be written by this Art, but what may be Decyphered, and the Meaning discovered. And to this Art of Decyphering, that excellent Mathematician, *Dr. Wallis*, hath contributed much.

**STEGNOSIS**, from *στένω, confuso*, I fix, or harden; is an Obstruction of the Pores; whence *Stegnotics* are the same as *Astringents*. See **ASTRINGENT**.

**STENOITICKS**, in Medicine, Remedies proper to close and stop the Orifices of the Vessels, when stretch'd, lacerated, &c. See **STYPTICK**.

Such are Pomgranate Leaves, red Roses, Plantain Leaves, Tormentil Root, &c.

*Stegnotics* are proper in the Hemorrhoids, and other Fluxes of Blood.

The Word is form'd from the Greek *στένω, impedo, confipio*, I hinder, close.

**STELLATE Plants**, such as have their Leaves growing on the Stalks, at certain Distances, in the Form of a Star with Beams; or such Flowers as are Star-like or full of Eyes, resembling Stars, in the Thrum or Pendants. See **PLANT**.

*Mr. Ray* makes this the Tenth Genus of *English Plants*; of this Kind is Cross-Wort, Mollugo, wild Madder, Asperula, or Woodruff, Gallium or Ladies Bed-straw, Asarine or Cleavers, Rubis Tincturum or Dyers Madder.

To which he adds, as akin to this Genus, the Nasturtium Indicum, *Indian Cress*, or yellow Lark-Spar.

**STELLIONATE, STELLIONATUS**, in the Civil Law, a kind of Crime committed by a fraudulent Bargain, where one of the Parties sells a thing for what it is not.

As if I sell an Estate for my own, which belongs to another; or convey a thing as free and pure, which is already engaged to another; or put off Copper for Gold, &c.

*Covis* says, the Word comes from *stellio*, a very subtle kind of Lizard. We find mention hereof in the *Code, lib. 9. Tit. 34*.

The *Romans* frequently used *Stellionatus* to express all Kinds of Crimes that had no proper Names.

**STEM**, in Botany, that Part of a Plant arising out of the Root, and which sustains the Leaves, Flowers and Fruits. See **PLANT**.

In Trees, the *Stem* is called the *Trunk* or *Stock*; in *Latin*, *Caudex* and *Truncus*. See **STOCK**, &c.

In Herbs, 'tis ordinarily call'd the *Stalk*; by the *Latins*, *Canalis* and *Scapus*, when straight like a Column.

When slender, and creeping on the Ground, as that of Nomenclary, some Authors call it *Viticulus*.

In the several Kinds of Corn and Plants of that Kind, 'tis call'd *Calamus*.

The *Stem* of the Plant, according to *Dr. Greve*, is no more than the *Cutis* or Skin which at first covers the two Lobes, and the Plane of the Seed, and which is further dilated as the Plant grows. See **PLUM**, **SKIN**, &c.

**STEM of a Ship**, is that main Piece of Timber which comes bending from the Keel below where it is Scarfed as they call it; that is pieced in, right before the Fore-castle. This *Stem* it is, that guides the Rake of the Ship, and all the Butt-ends of the Planks forwards, are fixed into it. This in the Section of a First Rate Ship, is called the *Main Stem*.

**STENTOROPHONIC Tube**, a speaking Trumpet; thus call'd from *Stentor*, (a Person mentioned in the Fifth Book of the *Iliad*, who could call louder than Fifty Men) and *φωνε, Voice*.

The *Stentorophonic Horn* of *Alexander the Great* is famous; with this he could give Orders to his Army at the Distance of 100 *Stadia*; which is above 12 *English Miles*. See **SPEAKING Trumpet**.

**STEP**. See **PACE** and **STAIR**.

**STEP and Leap**, in the Manage, one of the Seven Aids or artificial Motions of a Horse; consisting, as it were, of three Aids; viz. the Pace or Step which is *terra a terra*; the raising a Carver; and the whole finished with a Salt or Leap.

The *Step*, properly, puts a Horse on the Hand, and gives him a Rise to Leap; like one that runs e'er he leaps, that he may go the higher.

For Leaps of all kinds, the Rider is not to give any Aids or Helps with his Legs; only to hold him well up with the Bridle-hand when he rises before, that he may rise the higher behind; when he begins to rise behind, he is to put the Bridle-hand a little forwards to hold him before, and flay him there on the Hand, as if he hung in the Air; timing the Motion of the Bridle-hand so, as to take him like a Ball on the bound; which is the great Secret in Leaping.

**STERCORARIANS, or STERCORANISTS**, a Name those of the *Romish Church* have anciently given to such as held that the Eucharist was liable to Digestion, and all its Consequences, like other Foods. See **SACRAMENT**.

The Word is form'd from the *Latin*, *Stereus*, *Dung*. *Card. Humber* in his Answer to *Nicet Peflayar*, treats him as a *Stereosus*, merely for holding, that the Eucharist breaks the Fast; which Opinion he imaginal led directly into *Stereosus*.

**STEREOBATA**, in the ancient Architecture, the Basis or Foundation whereon a Wall or other Building is rais'd. See **BASE**.

This answers pretty well to the *continued Sacle* or Basement of the Moderns: Some confound it with the ancient *Stylobata*, or Pedestal; but in effect, the *Stereobata* is that to the *Stylobata*, which the *Stylobata* is to the *Spira* or Base. See **STYLOBATA**.

The Word is form'd from the *Greek*, *στεροβατα*, solid Prop.

**STEREOGRAPHIC Projection of the Sphere**, is that wherein the Eye is supposed to be placed, in the Surface of the Sphere. See **PROJECTION of the Sphere**.

The Method and Practice of this Projection, in all the principal Cases, viz. on the Planes of the Meridian, Equinoctial and Horizon, is as follows;

### 1<sup>o</sup> Stereographic Projection on the Plane of the Meridian.

Let **ZQNE** (Fig. 23.) be the Meridian, **Z** and **N** the Pole, as also the Zenith and Nadir; **EQ** the Equinoctial and Horizon; **ZN** the equinoctial Circle, and prime vertical Circle: **Z 15 N**, **Z 30 N**, **Z 45 N**, &c. are Hour-circles or Meridians, and also Azimuths, because the Pole is in the Zenith; and to describe these Circles, find the Points, **55**, **30**, **45**, **60**, &c. in the Equinoctial, by setting the Half-tangent of their Distance from **Q**; and then their Centres are found by setting their Co-secants, both ways, from their Points of Intersection with the Equator; **30**, **35**, and **40**, &c. are the Northern and Southern Tropics, which are described by setting the Half-tangent of 23 Degrees 30 Minutes from **Q** each Way; so then the Tangent of its Complement, viz. 66 Degrees 30 Minutes, each way from thence on the Colure produced, gives their Centres; by this Method, all Parallels of Declinations may be drawn. Or you might have set the Co-secant of the Parallel from the Centre of the Primitive, which would also have found the same Point for the Centre of the Parallel, whose Radius is equal to the Tangent of its Distance from its Pole. These Parallels in this Projection, are also Almucanters, or Parallels of Altitude; **30**, **45** is the Ecliptick, which must be divided from the Division on the Scale of Half-tangents; but denominated according to the Signs of the Zodiac, reckoning 30 Degrees to each Sign.

### 2<sup>o</sup> Stereographic Projection on the Plane of the Equinoctial.

Let **SC** (Fig. 24.) be the Meridian, and solstitial Colure; **EN** the equinoctial Colure, and Hour-circle of 6; **P** the North Pole; **30**, **35**, the Northern Tropic; **E 30 N** the Northern Half of the Ecliptick (whose Centre is found, by setting off the Secant of 23 Degrees 30 Minutes from **30**) and its Pole is at the Intersection of the Polar Circle and Meridian, being the Place through which all Circles of Longitude must pass; and **EZN** the Horizon of *London*, which is described thus: Set the Half-tangent of the Co-latitude, from **P** to **Z**; then the Tangent of the same, set from **P** to **O**, or its Secant from **Z** to **O**, gives its Centre; and its Pole will be at **b** 38 Degrees 30 Minutes, (in the Half-tangents) distant from **F**, where **b** is at the Zenith. To draw any other Circles in this Projection; 1. For Circles of Longitude, which must all pass through **a**, and the several Degrees of the Ecliptick; set the Tangent of 66 Degrees, 30 Minutes, from **a** downwards, on the Meridian produced; which will find a Point, through which a Perpendicular, drawn to the Meridian, shall contain in it the Centres of all the Circles of Longitude, whose Distances set off to the Radius **P a**, shall be the Tangents of the Degrees of their Distances from the Meridian, **S P C** (which is that belonging to 180 Degrees).

2. All Parallels of Declination are drawn by setting the Half-tangents of their Distances from **P**. 3. All Azimuths, or Vertical Circles must pass through **b a**, the Zenith: Since, therefore, the Zenith is 38 Degrees 30 Minutes distant from **P**, set the Co-secant of that (or the Secant of 51 Degrees 30 Minutes) from **b** on the Meridian extended below, and that shall find the Point **x**, the Centre of the Azimuth of East and West, viz. **E b N**; and the Centres of all the rest are in a Line that is perpendicular to the Meridian, and drawn through **x**. 4. Circles of Altitude or Almucanters, are lesser Circles, whose Poles are not in the Plane of the Projection; thus the Circle **O e**, is a Parallel of Altitude 50 Degrees above the Horizon. 5. All Hour-circles are straight Lines from the Centre to the Limb.

### 3<sup>o</sup> Stereographic Projection on the Plane of the Horizon.

First draw a Circle representing the Horizon, and quarter it with two Diameters; then will **o** be the Zenith of the Place,

12 = 12 the Meridian; 6 = 6 the prime Vertical, or Azimuth of East and West; (Fig. 25.) make  $\alpha P$  = Half-tangent of  $35^{\circ} 20'$  (or Tangent of  $19^{\circ} 15'$ )  $P$  shall be the Pole of the World. Make  $Z E$  = Half-tangent of  $51^{\circ} 30'$  (or Tangent of  $25^{\circ} 45'$ ) and  $E o$  = Secant  $\left\{ \begin{array}{l} \alpha = \text{Tangent} \\ \text{of } 38 \text{ Degrees } 30 \text{ Minutes; then} \end{array} \right.$  shall  $o$  be the Centre of the Equinoctial  $\& E 6$ . In this Projection Azimuths, are all parallel to the primitive Circle: And Azimuths are all right Lines passing through  $\alpha$  the Centre of the Primitive, to the equal Divisions in the Limb. Parallels of Declination are all lesser Circles, and parallel to the Equinoctial, and their Intersections with the Meridian are found, by setting the Half-tangent of their Distance from the Zenith, Southward or Northward, or both Ways from  $\alpha$ . Their Centres are found, by bisecting the Distance between those two Points; for the Middle shall be the Centre of the Parallel. Thus  $\alpha \& =$  Half-tangent of  $20^{\circ} 00'$  = Distance of the Tropick of  $\&$  from the Zenith  $\left\{ \begin{array}{l} \text{to the Southward,} \\ \text{And } \alpha \psi = \text{Half-tangent of } 75^{\circ} = \text{Di-} \\ \text{stance of the Tropick of } \psi \text{ from } \alpha, \\ \text{to the Northward,} \end{array} \right.$

and the Intersection again with the North of the Meridian, is at  $105^{\circ} 30'$  for  $\left\{ \begin{array}{l} \alpha \psi \\ 152^{\circ} 10' \end{array} \right.$  for  $\left\{ \begin{array}{l} \alpha \& \\ 105^{\circ} 30' \end{array} \right.$  to the Northwards or upward from  $\alpha$ . For the Hour-circles make  $\alpha c$  = Tangent of  $51^{\circ} 30'$ , or  $P C$  equal Secant of  $51^{\circ} 30'$ , draw  $G C T$  perpendicular to the produced Meridian: Then, if from  $c$  with the Radius  $\alpha c$ , you set off the Tangents of  $15^{\circ} 30'$ ,  $45^{\circ}$ , &c. both ways, you will have the Centres of the several Hour-circles, 7 and 5, 8 and 4, &c. Note, In all Stereographic Projections, all Diameters are measured on the Scale of Half-tangents; and this is the Ground of all Dialling, or the true Projection of the Hour-Circles of the Sphere on any given Plane. See SPHERICK Geometry, DIALLING, &c.

**STEREOGRAPHY**, the Art of drawing the Forms of Solids upon a Plane. See SOLID.

The Word is form'd from the Greek, στερεο, Solid, and γραφω, I describe.

**STEREOMETRY**, that Part of Geometry, which reaches how to measure Solid Bodies, i. e. to find the Solidity or solid Content of Bodies; as Globes, Cylinders, Cubes, Vessels, Ships, &c. See SOLID and SOLIDITY.

The Methods hereof, see under the respective Bodies, as GLOBE, SPHERE, CYLINDER, &c.

The Word is form'd from the Greek, στερεο, Solid, and μετροω, Measure. See CURVATURE.

**STEREOTOMY**, the Art or Science of cutting Solids, or making Sections thereof; as in Profiles of Architecture, in Walls and other Solids to be cut. See SECTION.

The Word is form'd from στερεο, and τομη, Section.

**STERILITY**, the Quality of something Barren; in opposition to Fecundity. See BARRENNESS and FECUNDITY.

Sterility was held a grievous Affliction by the Wives of the ancient Patriarchs. Nature has annex'd Sterility to all monstrous Productions, that the Creation might not degenerate; Hence the Sterility of Mules, &c. See MONSTER, MULE, &c.

The Sterility of Mercury, says the Alchymists, resembles that of Women who are too cold and moist; and who, by being purged and heated, wou'd be raised from their Sterility, as Mercury is when purged according to the Rules of Art.

The Word is form'd from the Latin Sterilitas, of Sterilis, Barren.

**STERLING**, a Term frequent in the English Commerce. A Pound, Shilling, or Penny Sterling, signifies as much as a Pound, Shilling or Penny of lawful Money of England, as settled by public Authority. See POUND, SHILLING, &c.

Our Antiquaries and Critics are greatly divided, as to the Origin of the Word Sterling. Buchanan fetches it from the Castle of Striveling or Sterling in Scotland, where a small Coin was anciently struck, that in time came to give Name to all the rest.

Cambden and Spelman derive the Word from Easlerling; observing, That in the Reign of King Richard I. Money coin'd in the East Parts of Germany, began to be of especial Request in England, by reason of the Parity thereof, and was called Easlerling Money; as all the Inhabitants of those Parts were called Easlerlings; some of whom, skill'd in Coinage, were soon after sent for over to perfect the English Money, which was thenceforwards denominated from them, Sterling for Easlerling; not, says Cambden from Striveling in Scotland, nor from a Star which some dream to have been coined thereon; for in old Deeds, the English Species are always call'd Nummi Easlerlingi, which implied as much as good and lawful Money, &c.

Sumner, again, derives the Word from the Saxon, Steor, a Role or Standard; intimating, that this, as to Weight and Fineness, was to be the common Standard of all current Money.

In Steor, and some other of our ancient Writers, Easlerling

is used for a certain Coin, amounting nearly to our Silver-penny; and on some Occasions we find the same Word Sterling used in the General for any Piece of Money; it being observable, that, for a good while together, there was no other Coin but Pennies, with which Sterlings or Easlerlings were become synonymous: Much as among the Ancients, the Words Denarius and Nummus were used. See PENNY, DENARIUS, NUMMUS, &c.

**STERN** of a Ship, is all the hindermost Part of her, generally speaking; but properly, it is only the outmost Part of her, abaft. See SHIP, ABAFT, &c.

**STERN**, among Hunters, is the Tail of a Grey-hound or a Wolf.

**STERNOHYOIDEUS**, in Anatomy, a Pair of Muscles arising from the upper and internal Part of the Bone of the Sternum, and part of the Clavicle, and adjoining Part of the first Rib, with a broad Origin; and which running from the Aspera Arteria, Glandulae Thyroidea, and Cartilago Scafoformis, terminates in the Base of the Os Hyoides. It draws the Bone straight upwards.

**STERNOTHYROIDES**, in Anatomy, a Pair of Muscles of the Larynx; arising in the Sternum, or Breast Bone, and terminating in the Cartilago Thyroidea. They serve to draw down that Cartilage.

**STERNUM**, *Breast-bone*, in Anatomy, a Bone that makes the Fore-part of the Breast, and is situated in the middle of the Ribs. See BONE.

In Adults, it consists of one single Piece; but in Infants, of several, according to the Diversity of Age. Kerkringius tells us, he has never seen more than Six. They continue Cartilaginous 'till Seven Years of Age; and are not very Solid afterwards, but Spongyous.

At the lower Extremity of the Sternum, is a Cartilage, called Xiphoides or Isosiformis, because resembling the Point of a Sword. See XIPHOIDES, &c.

The Use of the Sternum is to defend the Heart, and to receive the Extremities of the true Ribs. See RIB.

The Word is form'd from the Latin, Sterno; the Breast being, as it were, couch'd upon it.

**STERNUTATIVE**, or STERNUTATORY, a Medicine proper to occasion Sternutation, or Sneezing.

Sternutatives are of two Kinds, gentle and violent; Of the first Kind, are Betony, Sage, Marjoram, Tobacco, &c.

Of the latter, are Euphorbium, white Hellebore, Pellitory, &c.

Sternutatives have their Effect by their sharp, pungent Parts velleicating the inner Membrane of the Nose, which is exceedingly sensible, and occasioning the Serous Matter contained in the Glands of the Nose, and in several Sinus's situate in the Base of the Cranium, and the Os Frontis, to be expell'd. See NOSE.

**STEW**, a kind of small Fish-pond, the peculiar Service whereof is, to maintain Fish, and keep them in Readiness, for the daily Uses of a Family, &c. See FISH.

The Fish bred in the large Ponds, are drawn and put in here. For two large Ponds of three or four Acres apiece, 'tis advisable to have four Stews, each two Rods wide, and three long. The Stews are usually in Gardens, or at least near the House, to be more handy, and the better look'd to.

The Method of making them, is to carry the Bottom in a continual Decline from one End, with a Mouth to favour the drawing with a Net. See POND.

STEWs or STews, are Places anciently permitted in England, to Women of profus'd Incapacity, for the Proffer of their Bodies to all Comers.

These were under particular Rules, and Laws of Discipline appointed by the Lord of the Manor.

The Word is probably borrowed from the French, Estuet, hot Baths, in regard Wantons are wont to prepare themselves for venereal Acts, by Bathing; and that this is not new, Homer shews in the Eighth Book of his Odyssey.

**STEWARD**, or *Sensheal*, an Officer, whereof there are various Kinds; thus call'd from the Slets, Stend, Place or Room, and Ward, Ward, or Keeper, q. d. a Lieutenant; or Person appointed in Place of another.

Lord High STEWARD of England, is the first and highest Officer of the Crown; as having the Power of what We call a Vice Roy, the *Dames*, &c. *Scatholder*, and the *Sweeth*, *Reichs droffel*, q. d. Vice Rex.

The common Lawyers call him *Magnus Anglie Senshealant*. His Office, as express'd in an ancient Record, was to supervise and regulate the whole Kingdom, both in Time of Peace and War, immediately under the King and after him; an Authority so very great, that it was not judged safe, to trust it any longer in the Hands of any Subject.

The Office was Hereditary and Permanent, till the Time of Henry IV. since whom it has only been made *Pro hoc vice*, occasionally; as to officiate at a Coronation; at the Arraignment and Trial of some Noblemen for Treason, or other great Crime. During his Stewardship, he bears a white Staff in

in his Hand; and the Trial, &c. ended, he breaks his Staff, and with it, his Commission expires.

**LORD STEWARD of the Household**, is an Officer to whom the State of the King's Houſe is committed; to be ruled and guided at his Diſcretion. He has Authority over all Officers and Servants of the King's Houſe, except thoſe of the Chapel, Chamber and Stable; which are under the Lord Chamberlain, Maſter of the Horſe, and Dean of the Chapel. See **CHAMBERLAIN, &c.**

**The Lord Steward**, by Virtue of his Office, judges of all Enormities, as Treafons, Murders, Felons, Bloodſheds, &c. committed in the Court, or within the verge thereof; which is Ten Miles all around the chief Tunnel of the Court (*London*, only, by Charter, excepted).

The ſame Officer miniſters the Oath to the Members of the Houſe of Commons, at the beginning of each Parliament; and at the end of the Parliament, adjusts the parliamentary Expences.

The Badge of his Commiſſion is a white Staff, which he bears in the King's Preſence; but which at other Times is carried by a Footman before-headed.

**STEWARD of a Ship**, is he who receives all the Viſuals from the Purſer; and is to ſee it well ſtowed in the Hold: all Things of that Nature belonging to the Ship's Uſe, are in his Cuſtody: He looks after the Bread, and diſtributes out the ſeveral Meaſures of Viſuals in the Ship. He hath an Apartment for himſelf in the Hold, which is called the *Steward's Room*.

**STIGMATA**, in Antiquity, certain Marks impreſ'd on the Left Shoulder of the Soldiers, when liſted.

**STIGMATA** were alſo a kind of Notes or Abbreviations, conſiſting only of Points diſpoſed various Ways, as in Triangles, Squares, Croſſes, &c.

**STIGMATA**, is alſo a Term introduced by the *Franciſcans*; to expreſs the Marks or Prints of our Saviour's Wounds, impreſ'd by him on the Body of their Seraphic Father, *St. Francis*. See **FRANCISCAN**.

'Twas once Mornine, about the Feſt of the Exaltation, in the Year 1224, that *St. Francis*, being at Prayers on Mount *Averna*, which he had retired to paſs the *Nicholaus Lent*; ſaw a Seraph with Six burning Wings, in other reſpects like a Man; with his Hands and his Feet ſtrech'd upon a Croſs. With two of the Wings he covered his Body, two were raiſed over his Head, and with two he flew ſwiftly down. Five Rays proceeded from the Five Joints of the Perſon crucified, and were directed to the ſame Five Parts of the Body of the Saint.

Upon the Viſion's diſappearing, he ſaw the Marks of the Nails, &c. on his Hands and Feet; the ſame as he had ſeen them in the Image of the Crucifix. His Hands and Feet were found pierced with Nails in the Middle; the Heads of the Nails were plainly ſeen within the Fleſh on one Side, and the Points clench'd on the other. On his right Side, appeared a red Scar, as from a Wound of a Spear, which frequently run with Blood, that flood his Gown, &c.

The good Man, who was told, took a World of Pains to hide the *Stigmata*; but thoſe of his Hands and Feet were ſeen in his Life-time, inſure all his Endeavours, by ſeveral of the Brotherhood, who affirmed it upon Oath, and by ſome Cardinals, ſays *St. Bonaventura*, who attested the Miracle both by Word and Writing, and expreſ'd it in the Hymns, Anthems, &c. compoſed in Honour of *St. Francis*.

After his Death, they were ſeen by Fifty of his Religious, as well as by *St. Clara* and her Nuns, and an infinite Number of Seculars; many of whom felt them with their Hands, to be the more certain.

A ſolemn Feſt was thereupon appointed to be annually celebrated, in Memory of the Miracle, called *The Feſt of the Stigmata of St. Francis*; and a peculiar Maſs or Office compoſed for the ſame.

An Archconfraternity was erected on the ſame Occaſion, by *Frid. Prince*, a *Roman* Chirurgeon in the Year 1594.

**STIGMATA**, in Natural Hiſtory, are Points, or Specks uſually ſeen on the Sides of the Bellies of Inſects; particularly the *Sphondilium*, where they are very apparent.

They are nothing but the Extremities of certain Veſſels ſuſtained to the Sides in each Knot, and ſerving them for Lungs.

**STIBIUM**, an ancient Name for Antimony, now ſeldom uſed. See **ANTIMONY**.

**STILE** and *Stilos*. See **STYLE**.

**STILES**, in Carpentry, &c. are the upright Pieces, which go from the bottom to the top in any Window.

**STILLATITIOUS Oils**; are ſuch as are prepared by Diſtillation, in oppoſition to thoſe got by Inſuſion, Expreſſion, &c. See **OIL** and **DISPILLATION**.

**STILLYARD**, in Commerce. *The Company of the Stillyard* was a Community, or Corporation of foreign Merchants, eſtabliſh'd at *London*; thus call'd, from the Place where they had their Reſidence, called the *Stillyard*, near the Bridge, which was assigned them by Act of Parliament;

and which, in ſome Records, is called *Gutholda Transitorium*; being, as ſome write, a broad Place or *Tier* where much *Steel* had uſed to have been fold.

This Company was created in the Year 1215, under *Henry III.* in favour of the free Cities of *Germany*, who had been affiant to him in his Wars againſt *France*. See **COMMERCE**.

It had render'd itſelf Miſtreſs of all the *Engliſh* Manufactures, particularly thoſe of Cloeth; which it was allowed not only to ſell throughout the Kingdom, but alſo to tranſport Abroad. The Prejudice theſe Privileges did, by which they frequently abuſed the Nation, occaſion'd the Company's being broke, by Sentence of the Judges, under *Edward IV.* But it redreſs'd its Rights, and liſted to the Year 1552, when it was ſuppreſs'd by *Edward VI.* See **HANSE**.

**STIMULATING**, a Property in angular or ſharp Bodies, whereby they cauſe Vibrations and Inflexions of the Fibres of the Nerves, and a greater Derivation of nervous Fluid into the Part affected.

*Stimulants* produce Pain, Heat, Redneſs, &c. They may be reduced to violent penetrating *Depuratives*; gentle *Sinapiſms*, *Veficatories* and *Caulſticks*. See **SINAPISM**, **VEſICATORY**, &c.

**STING**, an Apparatus in the Body of certain Inſects, in manner of a little Spear; ſerving them as a Weapon of Offence.

The *Sting* of a Bee or Waſp, is a curious Piece of Mechanism: It conſiſts of a hollow Tube, at the Root whereof, is a Bag full of ſharp, penetrating Juice, which in *Stinging*, is injected into the Fleſh through the Tube.

Within the Tube, *Mr. Derham* has obſerved, there lie two ſmall ſharp-bearded Spears: In the *Sting* of a Waſp, he told Eight Beards on the Side of each Spear, ſomewhat like the Beards of Fiſh-hooks.

One of theſe Spears in the *Sting* or Sheath, lies with its Point a little before the other; to be ready, as ſhou'd ſeem, to be firſt darted into the Fleſh; which once fix'd, by means of its forward Beard, the other then ſtrikes in too; and ſo they alternately pierce deeper and deeper, their Beards taking more and more hold in the Fleſh; after which, the Sheath or *Sting* follows, to convey the Poiſon into the Wound; which, that it may pierce the better, is drawn into a Point, with a ſmall Slit below that Point, for the two Spears to come out at.

By means of theſe Beards it is, that the Animal is forced to leave its *Sting* behind it, when diſturb'd, or it can have Time to withdraw the Spears into their Scabbard.

**STINK** or **STENCH**, a diſagreeable Smell exhaling from a corrupted or other Body; and which is prejudicial to the Noſe and Brain. See **SMELL**.

A *ſinking* Breath, is uſually the Reſult either of diſeaſed Lungs, or of ſcorbutick Gums, &c.

A *ſinking* Noſe, *ſetter* Noſe, is the Reſult of a deep Ulcer within the Noſe, whence ariſe fetid Scabs, &c. Its Cauſe, according to *Galen*, is a ſharp, putrid Humour falling from the Brain, or the *Proceſſus Mammillares*.

A *ſinking* Noſe is reckoned by the Civilians, one of the legal Cauſes of annulling Marriage.

**STIPEND**, *Stipendium*, among the *Romans*, ſignified the ſame with *Tribute*; and hence *Stipendiarii* were the ſame with *Tribunarii*. See **TRIBUTE**.

**STIPULATION**, in the Civil Law, the Act of *Stipulatio*; that is, of treating and concluding of Clauſes and Conditions to be infered in a Contract. See **TREATY** and **CONTRACT**.

*Stipulations* were anciently performed at *Rome*, with abundance of Ceremonies; the firſt whereof was, that one Party ſhould interrogate, and the other answer, to give his Conſent and oblige himſelf.

By the ancient *Roman* Law, no Body could *Stipulari*, but for himſelf; but as the *Tabelliones* were publick Servants, they were allowed to *Stipulari* for their Maſters; and the Notaries ſucceeding the *Tabelliones*, have inherited the ſame Privilege.

The Word is ſum'd from the *Latin*, *Stipula*, a Straw; becauſe in making a Sale, a Straw was given the Purchaſer, in ſign of a real Delivery.

Which Cuſtom is ſtill retain'd in ſome Parts of *France*, particularly at *Verdun*: The Cuſtom always has been on this Occaſion, for the two Parties to break a Straw between them, and each take his Moiety; which they afterwards join'd again, to recognize their Promiſe.

The *Stipulation* had its Origin in the *Lex Aquilia*, and another Law of the Emperor *Arcadius*.

**STIRROP**, a Reſt or Support for the Horſe-man's Foot; ſerving to keep him firm in his Seat, and enable him to mount. See **SADDLE**.

The great Art of a Cavalier in a Tournament, was to make his Antagoniſt loſe his *Stirrop*.

For Combaring, 'tis a Rule to have the Right Foot *Stirrop* ſomewhat ſhorter than the other.

*Mastolius* observes, that the *Turks* have a knack of poisoning their *Sarapps*, with so fubtile and penetrating a Poison, that it makes its Way through the Boons, and kills the Rider. *F. le Comptre* tells us, that the *Tartars* ride cross-leg'd, and with their *Sarapps* exceedingly short.

*Sarapps* are allowed a modern Invention. *Message* observes, that *St. Jerom* is the first Author who mentions them.

**STOCK**, in Gardening, &c. the Stem or Trunk of a Tree. See **STEM**.

For *Stocks of Fruit-trees*; the best to *Graft* on; are those rais'd of Kernels of Wildings and Crabs of the most thriving Trees.

Though the Fruit always take after the *Graft*; yet the *Stock* has some Influence. A wild *Stock* is always found to enliven a dull *Apple*. See **ENGRAFTING**.

To have a Quantity of *Stocks* to *graft* on; old Trees are to be cut down within two Inches of the Ground, which will cause a multitude of Suckers to rise from the Roots. When these are risen Half a Yard, they are to be covered up with good Earth a Foot thick, and as soon as they have put forth Roots, in Winter are to be conveyed into the Nursery, where, in a Year or two, they will be ready to *Graft*. *Cherry Stocks*, *Plumb Stocks* and *Pear Stocks* may be thus rais'd from Suckers, as well as Stones or Seeds; but those rais'd this latter way are prefer'd. See **FRUIT-TREE**, &c.

**STOCK-FISH** or **STOCKFISCH**, in Commerce, a kind of dried, salted Fish; of a greyish Ash-colour, only the Belly somewhat whiter. See **FISH**.

The Commerce of *Stock-fish* is very considerable in *Holland*, both from the great Consumption thereof in the Country, and from their victualling their Vessels therewith. 'Tis said to take its Name, from being as hard as a *Stock*, or from its needing to be beaten with a *Stick*, to fit it for Eating. See **FISHERY**.

**STOCKING**, that Part of the Cloathing of the Leg and Foot, which immediately covers their Nudity, and screens them from the Rigor of the Cold. Anciently, the only *Stockings* in Use, were made of Cloth or mill'd Stuffs sew'd together; but since the Invention of knitting and weaving *Stockings* of Silk, Wool, Cotton, Thread, &c. the Use of *cloth Stockings*, is quite out of Doors.

The modern *Stockings*, whether Wove or knit, are a kind of Tiffles form'd of an infinite Number of little Knots, call'd *Stitches*, *Loops* or *Meshes*, intermingled in one another.

*Knit Stockings* are wrought with Needles made of polish'd Iron or Brass Wire, which interweave the Threads, and form the Masses the *Stocking* consists of. This Operation is call'd *Knitting*; the Invention whereof it were difficult to fix precisely; though its commonly attributed to the *Scotch*, on this ground, that the first Works of this Kind came from thence. 'Tis added, that it was on this Account, that the Company of *Stocking-knitters* establish'd at *Paris* in 1627, took for their Patron *St. Flavia*; who is said to have been the Son of a King of *Scotland*.

*Wove Stockings*, are ordinarily very fine; they are manufactured on a Frame Machine made of polish'd Iron; the Structure whereof is exceedingly ingenious, but wihal exceedingly complex, so that 'twere very difficult to describe it well, by reason of the Diversity and Number of its Parts; nor is it even conceived, without a deal of Difficulty, when working before the Face.

The *English* and *French* have greatly contended the Honour of the Invention of the *Stocking-loom*; but the Matter of Fact, waving all national Prejudices, seems to be this; That 'twas a *Frenchman* first invented this useful and surprizing Machine; who, finding some Difficulties in procuring an exclusive Privilege, which he required, to settle himself at *Paris*, went over into *England*, where his Machine was admir'd, and the Workman rewarded according to his Merit.

The Invention thus imparted to the *English*; they became so jealous hereof, that for a long Time it was forbid, under Pain of Death, to carry any of the Machines out of the Island, or communicate a Model thereof to Foreigners. But as 'twas a *Frenchman* first enrich'd our Nation with it, so a *Frenchman* first carried it Abroad; and by an extraordinary Effort of Memory and Imagination, made a Loom at *Paris*, on the Idea he had form'd thereof, in a Voyage he made to *England*. This Loom first set up in the Year 1666, has served for the Model of all those since made in *France*, *Holland*, &c.

**STOCKS**, in Ship-Carpentry, a Frame of Timber, and great Poits, made ashore, to build Pinnaces, Ketches, Boats and such small Craft, and sometimes small Frigates upon. See **SHIP** and **VESSEL**.

Hence we say, a Ship is on the *Stocks*, when she is a building.

**STOICISM**, the Doctrines and Opinions of *Zeno's* Followers, call'd *Stoicks*. See **STOICIS**.

**STOICKS**, a Sect of ancient Philosophers, the Followers of *Zeno*; thus call'd from the *Greek*, *στα*, *Portico*, in regard

*Zeno* us'd to teach under a Portico or Piazza. See **PHILOSOPHY**.

The Author of this Sect, *Zeno*, was of *Cittium*, a Town in *Cyprus*, inhabited by a Colony of *Phoenicians*; whence he is supposed to have borrowed many of his Dogmas from the *Phoenician* Philosophy, which many learned Men have since was, itself, borrowed from the *Jewish* or *Mosaic* Philosophy; though it must be allowed, there appear as many Things in the *Stoick* Philosophy, borrowed from *Plato's* and *Socrates's* School, as from that of *Moses*.

*Zeno* making a trading Voyage from *Cittium* to *Athen*, richly laden with *Tyrion Purple*, was Shipwreck'd not far from *Port*; upon which, we are told, consulting the Oracle how he should best spend the rest of his Life, he was answer'd, *ἀζωγῶνται ἄντι τῆς κέρου*. By becoming of like Colour with the Dead; upon which he applied himself to the Study of the ancient Philosophers; became a Hearer of *Crates* the *Cynic*; but *Laertius* tells us, he had too much natural Modesty to give in to the *Cynic* Impudence.

From *Crates*, he had recourse to *Xenocrates*, then to *Polemon*; and at length began to think of instituting a new Sect.

To this Purpose, a *στα*, *Portico*, call'd from the Pictures of *Polignotus* therein, the painted *Portico*, was pitch'd on. Here using to walk and philosophize; he was soon attended by a great Number of Disciples, hence call'd *Stoicks*, *Stoici*.

He became exceedingly reverenc'd at *Athen*, for the Probity and Severity of his Life and Manners, and the Consistency thereof with his Doctrine; inso much that the *Athenians* decreed him, when living, a golden Crown, and us'd in dubious Times to deposite the Keys of the City with him; and after his Death, consecrated an Altar to him.

One of his chief Followers was *Cleanthes*, who was succeeded by *Chryssippus*, and he by *Digenes Babylonius*, *Antipater*, *Panætius* and *Pufflonius*, among the *Greeks*; and by *Cato*, *Varro*, *Cicero*, *Seneca*, the Emperor *Antoninus*, &c. among the *Romans*; and by *Panteanus*, and *Clement Alexandrinus*, among the *Christians*.

The *Stoicks* cultivated *Logicks*, *Physics*, *Metaphysics*, &c. but principally *Ethicks*: The principal of their Dogmas of the former Kinds, are as follows.

That there are certain *καταλόγους*, *Comprehensions*; which others call *ἀνάγκαι*, *common Notices* or innate Ideas or Principles; and *Cicero*, *Ιαχόβατο* *Intellegentia*, *Beginnings* of Understanding; naturally found in the Mind: That God is the seminal Cause of the Universe: That the World is an Animal; which Opinion the *Stoicks* maintain'd in common with the *Platonists*, by reason of God's inhabiting and informing every Part thereof, in quality of an *Animal Minuti*. See **ANIMA**. That Nature is an artificial Fire, tending to Generation: And, that the World is to be destroy'd at last by a Conflagration.

For the Morality of the *Stoicks*; 'twas couch'd much in Paradoxes: as, That a wife Man is void of all Passion or Perturbation of Mind: That Pain is no real Evil; but that a wife Man is happy in the midst of the severest Torment: That a wife Man is always the same, and always joyful; That none but a wife Man is free; all others are Servants; That none but a wife Man is Rich; That none but a wife Man ought to be esteem'd a King, Magistrate, Poet or Philosopher; That all wife Men are great; That all Things are a wife Man's, who is contented with himself; That wife Men are the only Friends, and the only Lovers; That nothing ever happens to a wife Man beyond Expectation; That all Virtues are infensibly connected together; That all good Things are equal, and equally to be desired; and that Goodness admits of no Increase or Diminution. Whether Virtue might be lost or no, was hotly disputed among them; *Chryssippus* held it might, by Drunkenness and Atrabilis; *Cleanthes*, that it could not, by reason of the firm *καταλόγους*, *Comprehensions*.

They own'd but one God; whom, however, they call'd by various Names, as *Mind*, *Fate*, *Jupiter*, &c. by which they did not mean various Things; but various Powers and Relations of the same Things. Providence, they express'd under the Name of *Fate*, which *Chryssippus* defines to be a natural Series or Composition of Things mutually following each other by an immutable Nexus or Tie fix'd from all Eternity. Lastly, they held, That the human Soul surviv'd after Death. See **FATE**, &c.

**STOLE**, **STOLA**, a sacerdotal Ornament, wore by the *Romish* Parish Priests over the Surplice; and by other Priests over the Alb, at celebrating of Mass; in which Case, it goes across the Stomach; and by Deacons over the Left Shoulder, Scarf-wise. When the Priest reads the Gospel for any one, he lays the Bottom of his *Stole* on his Head.

The *Stola* is a broad Swath or Slip of Stuff, hanging from the Neck to the Feet, with Three Crosses thereon.

The Bishops anciently pretended, that the Parish Priests were never to appear before them, but in their *Stoles*. In *Flaniers*

*Spaniards and Italy*, they always preach in *Stoles*. 'Tis supposed to be a Representation of the Extremities of the long Robe wore by the ancient High Priests. The Word is *Greek*, *στωβ*, signifying a long Robe or Vestment.

The *Stole* of the ancient *Romans*, &c. was very different from that now in Use; it being a kind of Robe fitter for Women than Men; tho' 'twas held a Robe of Honour among all Nations. Kings themselves sometimes used it, and sometimes bestowed it as a Reward of Virtue.

*Green of the Stole*, the eldest Gentleman of his Majesty's Bed-chamber; a whole Office and Honour it is, to present and put on his Majesty's first Garment or Shirt every Morning; and to order the Things in the Chamber. See *Bed-Chamber*.

*Order of the Stole*, an Order of Knights instituted by the Kings of *Arragon*; though as to the particular Author, or Time of the Institution, we are in the Dark. The first Time we hear of it, is under *Alphonfus V.* who mounted the Throne in 1416. *Johannus* takes it to have been instituted about the Year 2332.

*Order of the Golden Stole*, a military Order at *Venice*; thus called from a golden *Stole* which the Knights wear over the Left Shoulder, reaching to the Knee, both before and behind, a Palm and a Half broad. None are raised to this Order but the *Patricians* or noble *Venetians*. *Johannus* observes, That the Time of the Institution of this Order is unknown.

*STOMACH*, *Ventricle*, in Anatomy, &c. a hollow, membranous Organ, destined to receive the Food, and convert it into Chyle. See *FOOD*, *DIGESTION*, *CHYLE*, &c.

Its Form is longish, compared by some to a Gourd; by others to a Bag-pipe. 'Tis situate in the Epigastrium, declining a little further to the Left than the Right. Its upper Part is connected to the Diaphragm, the bottom to the Cawl; the right Side to the Duodenum, and the Left to the Spleen.

It has two Orifices, one at each end. The Left Orifice is called *σπυγγη*, from *σπυα*, Mouth; and also *νεφρα*: This is join'd to the Oesophagus, of which it seems to be only a Continuation: By this Orifice, the Aliments enter the Stomach; where being digested, they ascend obliquely to the *Pylorus*, or right Orifice, which is united to the first of the Intestines. See *PYLORUS*.

The *Stomach* consists of four Membranes or Coats; the first and inmost is form'd of short Fibres, which stand perpendicularly upon the Fibres of the next Coat; they are to be seen plainly towards the *Pylorus*: when the *Stomach* is distended with Meat, these Fibres become thick and short. Whilst they endeavour to restore themselves by their natural Elasticity, they contract the Cavity of the *Stomach* for the Attrition and Expulsion of the Aliments. This Coat is much larger than the rest, being full of Plaies and Wrinkles, and chiefly about the *Pylorus*: These Plaies retard the Chyle, that it run not out of the *Stomach* before it be sufficiently digested. In this Coat, there are also a great Number of small Glands which separate a Liguor, which bestrains all the Cavity of the *Stomach*, and helps the Concoction of the Aliments; for which Reason this Coat is call'd the *Tunica Giandulosa*.

The Second is much finer and thinner; it is altogether Nervous; is of an exquisite Sente, and is call'd *Nervosa*.

The Third is Muscular, being made of freight and circular Fibres; the freight run upon the upper Part of the *Stomach*, between its superior and inferior Orifices, and the circular run obliquely from the upper Part of the *Stomach* to the Bottom. Of these, the inermost defends towards the right Side, and the outermost towards the Left; so that by their Action, both Ends of the *Stomach* are drawn towards its Middle, and the whole is equally contracted; by their Contraction and continual Motion, the Attrition and Digestion of the Aliments, is in great measure performed.

The fourth Tunic is common; it comes from the Peritonæum. The *Stomach* sends Veins to the Porze, and Branches to the *Gastroepiplois*, accompanied with others of the *Cœliac*; all lying immediately under the fourth Coat.

The Eighth Pair of Nerves gives two considerable Branches to the *Stomach*, which are spread much about the upper Orifice; by which it is render'd very sensible; whence also, proceeds the great Sympathy betwixt the *Stomach*, Head and Heart; on account whereof, *Van Helmont* thought, that the Soul had its Seat in the upper Orifice of the *Stomach*.

For the Motion of the *STOMACH*; Dr. *Pitt* in the *Philosophical Transactions*, acquaints us, that in dissecting a Dog, he found the peristaltic Motion of the Guts continued through the *Stomach*; the *Pylorus*, which is usually found as high as the Diaphragma, being, in every Undulation, brought below the very bottom of the *Stomach*; so that he could manifestly observe a Constriction in the middle of the *Stomach*, at every Motion downwards, passing it in, in as to be able to compress whatever was contained in its Cavity.

These Motions, he observes, were as regular as any he ever observed in the Guts; and adds, That he has since observed the same in three others; whence one may safely enough conclude it holds of all. See *PERISTALTIC*.

Hence, we easily see the Reason of the quick Distribution of the Nourishment; the Food being no sooner opened by the Drink and Spitale, than it has a free Motion through the *Pylorus* into the Intestines, from this Compression in the middle of the *Stomach*. See *INTESTINES*.

Ruminating Animals have four *Stomachs*; yet 'tis observed that some of these, which have four in *Europe*, have only two in *Africa*, probably by reason the Herbs in *Africa* are more nourishing. See *RUMINANT*.

Birds that live ordinarily of Seeds, cover'd with a tough Rind, have a kind of *Stomach* call'd the *Crop* or *Gizzard*, consisting of four large Muscles without-fide, and a hard callous Membrane within. See *GIZZARD*.

Such as live on Fleish, as Eagles, Vultures, &c. have only one. See *CARNIVOROUS*, *GRANIVOROUS*, &c.

*STOMACHIC*, a Medicine that strengthens the *Stomach*; and promotes the Office of Digestion. See *STOMACH*.

Of this Kind are Wormwood, Rhubarb, Mint, Mastic, Aloes, Pepper, Cinnamon, Atomatick Bitters, &c. good Wine is also a *Stomachic*.

*STOMACHIC*, in Anatomy, is applied to the Arteries, Veins, &c. of the *Stomach*; call'd also *Gastric*. See *GASTRIC*.

The *Stomachic Veins* terminate in the Trunk of the *Vena Porta*, and the *Splenic Vein*.

The *Stomachic Arteries* arise from the *Cœliac*.

The *Stomachic Nerves* come from the *Eighth Pair*.

*STONE*, in Natural History, a hard, solid, mineral Body, neither fusible nor malleable, form'd, in Succession of Time, in the Body of the Earth. See *FOSSIL*.

#### Origin and Formation of STONES.

For the Origin and Formation of *Stones*, M. *Tournefort*, on his Return from the *East*, in the Year 1702, propoed to the *Royal Academy*, a new Theory.

On a curious Survey of the famous Labyrinth of *Crete*, he observed, that several People had Engraven their Names in the living Rock, whereof its Walls are form'd; and, what was very extraordinary, the Letters whereof they consisted, instead of being hollow, as they must have been at first (being all cut with Knife-points) were prominent, and stood out from the Surface of the Rock, like so many *Basso-Relievo's*. See *LABYRINTH*.

This is a Phenomenon no otherwise accountable for, than by supposing the Cavities of the Letters fill'd insensibly, with a Matter issuing from out of the Substance of the Rock; and which even issued in greater Abundance than was necessary for filling the Cavity. Thus is the Wound made by the Knife healed up, much as the Fracture of a broken Bone is consolidated by a Callus, form'd of the extravasated nutritious Juice, which rises above the Surface of the Bone: And this Resemblance is the more just; as the Matter of the Letters was found whitish, and the Rock itself greyish.

Something very like it, is observed in the Barks of Trees, wherein Letters have been cut with the Knife; so that the Poet had Reason to say, That the Characters grow as the Trees themselves grew: *Crescent illos, crescenti amoris*.

M. *Tournefort* supports his Opinion by simular Calus's apparently form'd in several other *Stones*, which re-unite them, after, by Accident, they have been broken.

From these Observations, it follows, that there are *Stones* which grow in the Quarries, and of Consequence that are fed; that the same Juice which nourishes them, serves to rejoin their Parts when broken; just as in the Bones of Animals, and the Branches of Trees, when kept up by Bandages; and in a Word, that they vegetate.

There is, then, no room to doubt but that they are argu'd; or that they draw their nutritious Juice from the Earth. This Juice must be first filtrated and prepared in their Surface; which may be here esteem'd as a kind of Bark, and hence it must be convey'd to all the other Parts.

'Tis highly probable, the Juice which fill'd the Cavities of the Letters, was brought thither from the bottom of its Roots; nor is there any more Difficulty in conceiving this, than in comprehending how the Sap should pass from the Roots of our largest Oaks, to the very Extremities of their highest Branches.

It must be owned, the Heart of these Trees is exceedingly hard; and yet those of *Brassil*, call'd *Iro Wood*, Guaiacum and Ebony, are much harder. Coral is as hard in the Sea as out of it; and Sea Mushrooms, which every Body allows to grow, are true *Stones*, and, so like the common *Stones*, are used in *America* to make Lime of.

None, we believe, ever doubted that Shells grow by means of a nutritious Juice; and yet this Juice is convey'd along

along the narrow Canals of these excessively hard Bodies, as well as through those of Plants, which are much less hard. See SHELL.

Some Stones, then, must be allow'd to vegetate and grow like Plants: But this is not all; probably they are generated in the same Manner; at least there are abundance of Stones, whose Generation is inconceivable, without supposing they came from a kind of Seed, wherein the organical Parts of the Stones are wrapped up in little; as those of the largest Plants are in their Grains.

The Stones, call'd *Caran Annonis*, *Lapis Judaicus*, *Astruc*, those of *Yoklogu* and *Elorence*, the several kinds of Pyrites, Sea Mushrooms, Crystals of the Rock, and an Infinity of other Stones, suppose their several Seeds; as much as Mushrooms, Truffles, and various Kinds of Mosses, whose Seeds were never yet discover'd. See MUSHROOMS, CRYSTAL, CORAL, &c.

How should the *Caran Annonis*, which is constantly in Figure of a Veldate be form'd without a Seed, containing that same Structure in little? Who moulded it so artfully? And where are the Moulds? Far from this, these Kinds of Stones are found in the Earth, like common Flints. Nor were either Moulds or any thing like them, ever discover'd. See *Caran Annonis*.

M. *Tournefort* examines the several Kinds of Stones above-mentioned, and finds them under the same Necessity of Seed. Again, that immense Quantity of Flints, wherewith the *Corn of Arles* is cover'd, is a strong Argument in behalf of this Theory.

The Country there, for 20 Miles round, is full of roundish Flints; which are fill'd out in equal abundance, to whatever Depth you dig. M. *Perris*, who first propos'd the Generation of Stones by means of Seeds (though he took the Word *Seed* in a very different Sense from M. *Tournefort*) first brought this extraordinary Campaign as a Proof thereof. In effect, how could so many similar Flints be form'd? There is no saying they are coeval with the World, without asserting at the same time, That all the Stones in the Earth were produced at once; which were to go directly contrary to the Observations above-mentioned.

Among the Seeds of Stones, M. *Tournefort* observes, there are some, which don't only grow soft by the Juices of the Earth, but even become liquid. These, then, if they penetrate the Pores of certain Bodies, grow hard, petrify and assume the Figure or Impression of the Body: Thus what we call *Pellinaires*, *Conchines*, *Myrralites*, *Offenites*, *Nurmites*, *Echinites*, &c. are real Stones, the liquid Seeds whereof have insinuated into the Cavities of the Shells, call'd *Pellen*, *Concha*, *Myrralus*, *Offra*, *Nantulus*, *Echinus*.

On the contrary, if those liquid Seeds fall on Flints, on Shells, Sand, &c. they include those several Bodies, and fixing between them, form a kind of Cement, which yet grows like other Stones. 'Tis highly probable that such Rocks as are only an Assemblage of imbricated Flints have been form'd by a Number of their liquid Seeds; in like Manner as the Quarries full of Shells; unless the Rocks have envelop'd these Bodies in their Growth.

He adds, that there are Seeds of real Stones enclosed in the Spawn of certain Shell-fish; as well as that hard solid Matter destin'd to the forming their Shells.

There is a particular Kind of Shell-fish, call'd *Pholas*, which is never found any where but in Cavities of Flints, which are always found exactly fitted to receive them. Now, 'tis highly improbable the Fish should come and dig such a Nitch to spawn in; 'tis much more likely, the Stones they are found enclosed in, were at first soft; and that the Matter they are form'd of, was originally found in the Spawn, in like Manner as the Matter which forms the Egg-shell, is really found in the Seed thereof.

From the whole, he concludes, that the Seed of Stones, and even of Metals, is a kind of Dust, which probably falls from them while they are alive, i. e. while they continue to vegetate as above. This Dust may be compared to the Seeds of several Plants, as those of Ferns, Capillaries, Mosses, Truffles, &c. which no Microscope e'er yet discover'd; though their Existence is not at all doubted.

Probably Flints and Pebbles are among Stones, what Truffles are among Plants: Nor is this Opinion new; *Pliny* assures us, That *Theophrastus* and *Marcianus* believed, that Stones produced Stones: And *Gregory Nazianzen* adds, that there were Authors who even believed that Stones made Love, *Ἐστὶ καὶ ἀλόγων γάμος καὶ σαρπυλίου ἔρως*, *Poem. de Virg.*

M. *Geoffroy* accounts for the Origin and Formation of Stones, in a different Manner.

He lays it down as a Principle, that all Stones, without Exception, have been Fluid; or at least a soft Paste, now dried and harden'd; witness the Stones wherein are found foreign Bodies; witness, also, figured Stones, &c.

On this Principle, he examines the Formation of the different Kinds of Stones; and shews, that the Earth alone suffices for the same, independent of all Salts, Sulphurs, &c. The

metallic Particles contain'd in Flints, give them their Colour; but these are only Accidents; for Proof of which, he instances the Saphires and Emeralds of *Auvergne*, which lose all their Colour by a moderate Fire consuming their metallic Parts; but without any Damage to their Transparency; they being hereby render'd mere Crystals.

To view Rock Crystal, indeed, one would not take it for Earth; and yet Earth it must be, not Water congel'd, as the Ancients imagin'd. See CRYSTAL.

Mr. *Geoffroy* conceives two Kinds of little primitive Parts in the Earth: Those of the first Kind, are exceedingly fine; thin Lamellæ, equal to each other, or nearly so. Now, when these meet together, from any Cause whatever, in a sufficient Quantity; the Regularity and Equality of their Figures determines them to range themselves equally and regularly; and thus to form a homogeneous Compound, which is very hard, from the immediate Contact of the Parts, and very transparent, by reason of their regular Disposition which leaves a free Passage to the Rays of Light every Way; and this is Crystal. See CRYSTAL.

The Parts of the second Kind have all kinds of irregular Figures; and must accordingly form Assemblages that are much opaker and less hard. Now Crystal is form'd wholly of Parts of the first Kind; and all other Stones of a Mixture of the two kinds of Parts together: This Mixture is absolutely necessary, in order to unite and bind together the Parts of the second Kind, and give them a Hardness and Consistence, without which they would only make a Sand or Dust. Water, now appears the fittest Vehicle, to carry the Parts of the first Kind. This is seen from several petrifying Springs, which infiltrate the Pipes through which their Waters are convey'd, or even solid Bodies laid in them for some time. The Water does not dissolve those earthy Parts, it only keeps them in Fusion, as it does the Juices wherewith Plants are fed.

This Water, thus charged with earthy Particles of the first Kind, M. *Geoffroy* calls the *Stony* or *Crystalline Juice*, wherewith those Bodies are primarily form'd.

STONES are of various Kinds, with regard to the Places they are produced in: the most ordinary are under Ground; others in the Bodies of Men and other Animals; others seem to be generated by the Sea, as Pumice, &c. and others, the Effect of a petrifying Virtue in certain Waters.

Of these, some serve simply for Magnificence and Ornament; as all those call'd

Precious STONES; which make the Commerce of Lapidaries and Jewellers. See PRECIOUS STONE.

Others, much usefuller, if one might credit all the Virtues attributed to them, are used in Medicine, such as *Beadards*, *Jems Stone*, *Eagles Stone*, &c. See BEZARD, &c.

Others, again, are used in Painting; either to prepare Colours from, by calcining and grinding them, or to be used as Crayons or Pencils for Defigning; of which Number are the *Armenian Stone*, *Black Lead*, *Ruddle*, &c.

Lastly, much the greatest Quantity, and those too of the most immediate and common Use, are those employ'd in Building; such as *Free stone*, *Marble*, *Lime-stone*, *Fire-stone*, &c. each of which see under their proper Articles.

*A Scheme of the several Kinds of STONES from Bishop Wilkins.*

Stones are either *Vulgar*, *Middle-priced*, or *Precious*.  
1. *Vulgar* STONES, or such as are of little Price, are distinguishable by their different Magnitudes, Uses, and Consistence, into the

- Greater Magnitudes of Stone, used either about Buildings, whether of Walls; chiefly being of a softer Consistence, whether Natural or Factitious.
- 1 } *Free Stone*
  - 2 } *Brick*
- Harder Consistence; not easily yielding to the Tool of the Workman, growing either in
- 1 } *Great Masses.*
  - 2 } *Ragg*
  - 3 } *Lesser Masses; whether such as are for their Figure.*
- More knobbed, and unequal; used for the striking of Fire, either the more common, which is less heavy; or the less common, which is more heavy, as having something in it of a metalline Mixture.
- 1 } *Flint.*
  - 2 } *Marchasite, Fire-stone.*
  - 3 } *More round and even.*
  - 4 } *Pebble.*
- Roof, or Pavement, being of a laminated Figure, either Natural or Factitious.
- 1 } *Slate*
  - 2 } *Tile*
- Metals, either for the

- Sharpening, or trying of them  
 6 } *Wool-stone.*  
     } *Touch-stone.*  
 Polishing, or cutting of them; being either of a more  
 spongy and soft, or of a more hard Consistence.  
 7 } Pumice.  
     } Emery.  
 Lesser Magnitudes, either more, less or minute.  
 8 } Sand.  
     } Gravel.

2. *Middle priced STONES*, are either of a

- Shining Politure, or capable of it; whether of a  
 Simple white Colour, and more soft Consistence,  
 1. Alabaſter.  
 Sometimes White, sometimes Black or Green, and some-  
 times variegated with Veins, growing in greater or  
 lesser Masses,  
 2 } Marble, Porphyry,  
     } Agar.  
 Spotted with Red, upon a greenish Colour, or with Spots  
 of Gold-colour upon Blue.  
 3 } Jasper, Heliotrope.  
     } Lazul, Azure Stone.  
 Transparency, either  
 Brittle; whether Natural or Factitious  
 4 } Crystalline  
     } Glass,  
 Fissil into Flakes, either greater or lesser.  
 5 } Selenite, *Majovica* Glass, Iſing Glass, Spar.  
     } Talk.  
 Relation to Metals, attracting Iron, or making of Brass.  
 6 } Lead-stone  
     } Cudmia, Calaminaris;  
 Incombustible Nature.  
 7 Amianus.  
 Strange Original; not being properly Minerals, though  
 usually reckoned amongst them; but either a submarine  
 Plant, or supposed to proceed from a liquid Bitumen.  
 8 } Coraline.  
     } Ambet;

3<sup>o</sup> *Precious STONES*; which see under the Article  
 PRECIOUS Stone.

STONE is also a certain Quantity or Weight of some Com-  
 modities:

A Stone of Beef at London, is the Quantity of Eight  
 Pounds: In *Hersfordshire*, Twelve Pounds; in the *North*,  
 Sixteen Pounds. A Stone of Glass is Five Pounds; of Wax,  
 Eight Pounds.

A Stone of Wool (according to the Statute 11. II. 7.)  
 ought to weigh Fourteen Pounds, yet in some Places it is  
 more, in others less; as in *Gloucestershire*, Fifteen Pounds; in  
*Hersfordshire* Twelve Pounds.

Among Horse-Courſers, a Stone is the Weight of Fourteen  
 Pounds.

*Building STONE*: Of this there are several Kinds; the  
 principal among us, are *Marble*, *Fire-stone*, *Parbeck-stone*,  
*Rox-stone*, *Alabaſter*, *Free-stone*, and *common Stone*; of all  
 which, except the two last, we have spoke under their proper  
 Article; which see.

For *Free-stone*, that dug in the Peninsula of *Portland*, and  
 thence call'd *Portland-stone*, is much used; being softer and  
 whiter than *Parbeck-stone*, and is commonly raised out of  
 the Quarries in bigger Blocks than that. Some also call  
*Rigate* or *Fire-stone*; *Free-stone*.

Mr. Boyle observes, That a competent Knowledge of the  
 Manner of the Sap or Juice found in Stones used in Building,  
 is of the last Importance; the same Stone dug out of the same  
 Quarry at one Season, being found to moulder away in a few  
 Winters, which dug at another Season, will brave the Weather  
 for many Ages; and that there are others, which though dug  
 at the proper Season, yet make but ruinous Buildings, if  
 used at an improper Season.

The same Author adds, That as there are some sort of  
 Stones which will decay in a few Years, there are others will  
 not have attain'd their full Hardness in 30 or 40 Years, or  
 even much more. See PORPHYRY.

For the drawing of STONE out of the Quarry. See  
 QUARRY.

STONE, in Medicine, a Disease call'd also *Calculus*, and  
*Lithiaſis*; and, occasionally, the *Gravel*. See CALCULUS,  
 LITHIASIS and GRAVEL.

It consists of a *ſtony Concretion*, form'd either in the Blad-  
 der or Kidneys; which prevents the Discharge of Urine, and  
 occasions violent Pains. See BLADDER and KIDNEYS.

The Stone is generated, according to some Authors, of the  
 earthy viscid Parts of the Blood, harden'd, in course of Time,  
 by the Heat of the Kidneys; much after the manner as Brick  
 is bak'd in a Furnace.

Dr. Quincy supposes the Stone generated of the harder  
 Parts of the Urine, pent up by the Straightness of the Ducts,  
 and brought into Contact and Cohesion.

*Erasmus* ascribes the Stone, sometimes to the *ſlow* and  
 metallic Particles of our Foods and Drinks, which the Reins,  
 through Weakness and Relaxation thereof, cannot eject; but  
 more usually to the unequal Strength of the Kidneys; Whence  
 it is that we see one Kidney breed Stones, and the  
 other sound.

The Stone in the Bladder, is first form'd in the Pelvis of  
 the Kidneys, whence falling into the Bladder, it becomes  
 augmented by new Lamellæ or Coats. See PELVIS.

The Diagnostic Signs of the Stone in the Kidneys, are,  
 1<sup>o</sup> A fix'd, obtuse Pain in the Region of the Loins, appear-  
 ing like a Weight loading the Reins. As the Stone falls out  
 of the Pelvis into the Ureter, the Pain is exceedingly acute  
 and sticking, which holds till either the Stone be got into the  
 Bladder, or returned again to the Pelvis. 2<sup>o</sup> An inflexibility  
 of the Spina Dorsi, from the Extension and Compression of  
 the Nerves. 3<sup>o</sup> A Swolor of the Thigh and Leg of that  
 Side, from the Consent of Parts. 4<sup>o</sup> A Retraction of the  
 Testicle. 5<sup>o</sup> A very small Quantity of Urine, either thin  
 and limpid, or bloody. But as soon as the Stone is got into  
 the Bladder, the Urine becomes thick, turbid, blackish and  
 in great Quantity.

The Diagnostics of the Stone in the Bladder, are a Sense  
 of Heaviness in the Perineum and inguinal Region, a perpet-  
 ual and troublesome Desire of making Water, which is  
 followed with a sharp Pain, principally in the Glans of the  
 Penis, whence a Prolapsus of the Anus. But the surest Way  
 of finding it, is by the Touch, viz. by thrusting the Finger  
 or Catheter up the Anus.

The Cure of the Stone, is either by a Liquor that will  
 dissolve or break the concrete Stone; so as it may be evacuated  
 Piece-meal; which is call'd a *Lithontriptic*; or by enlarging the  
 Capacities of the Vessels; and by the Operation of Cutting,  
 call'd *Lithotomy*.

We have yet no assured Lithontriptic known, how many  
 however may pretend to it; the most noted, are *Doffey's*  
*Elixir*, *Tipping's* Liquor, and *Rogers's* Powder. See LITHON-  
 TRIPTIC.

The most usual Cure is by Cutting; the various Manners  
 whereof, see under LITHOTOMY.

In some desperate Cases, the Stone has been known to make  
 itself a Way through the Spinal Muscles.

Dr. *Lifter* observes, that Stones are found, not only in the  
 Bladder and Kidneys, but also in the pituitary Ducts,  
 the Breaſt, Liver, Lungs, Ventricle, Intestines and Joints of  
 the Hands and Feet; so which may be added, that in the  
*Philosophical Transactions*; we have likewise Accounts of  
 Stones in the Pineal Gland, the Heart, Gall, Bladder, &c.

The Stone, *Erasmus* says, is not a Disease, but the Pro-  
 duct of a Disease: The Disease, properly, is the *Lithiaſis*,  
 or the Disposition of the Kidneys and Bladder to generate  
 Stones.

Stones are distinguish'd into three Kinds, White, Red  
 and Yellow; which last are the most usual. *Deekers* recom-  
 mends calcin'd Egg-shells as excellent in all Suppressions of  
 Urine: *Hamilton*, Linseed Oil, and Mr. Boyle, the Herb  
*Arsenart*.

STONE-BLUE, a mineral Preparation, properly call'd  
*Smalt*. See SMALT.

STONE-Henge, in Antiquity, a firm'd Pile or Monument,  
 on *Salisbury* Plain, six Miles distant from that City.

It consists of three Ranks of huge rough Stones, ranged  
 one within another, some of them Twenty-eight Feet high,  
 and Seven broad; sustaining others, laid across their Heads,  
 and fasten'd by Mortises; so that the whole must have an-  
 ciently hung together.

Antiquaries are strangely at a loss, as to the Origin, Use,  
 Structure, &c. of this wonderful Fabrick. Most of them  
 allow the Stones to be artificial, and to have been made on  
 the Spot; which is the more probable, as we are pretty well  
 assured the Ancients had the Art of making Stones with Sand  
 and a strong Lime or Cement; and as the Stones are too big  
 for any Land Carriage; and yet are in a Plain, which for  
 some Miles round, scarce affords any Stones at all.

The Legends give us various other Accounts; some will  
 have them brought miraculously by St. Patrick from Ireland;  
 others, &c.

As to its Use, some Antiquaries take it to have been an  
 ancient Temple of the Druids, others of the Romans, de-

dedicated to *Cælus*; in which they are confirm'd by its having been open atop. Others, reading it *Stans Hengijst*, maintain it to have been a Monument erected in Memory of *Hengijst*, the first General of the *Saxons* in *England*: And others, to name no more, will have it a Funeral Monument, raised to that brave *Romano-Briton*, *Ambrosius Aurelius*; to which Opinion, some Circumstances of his Actions, and still remaining Latin Name of the Place (*Mons Ambrosij*) and that very ancient Welsh Proverb, *Mal gwaith Emrys*, Like the Work of *Ambrosius*, give some Countenance.

**STOOL**, in Medicine. A Thing is said to be voided by *Stool*, when it is discharged by the *Anus* or *Fundament*. See *ANUS*.

In the *Philosophical Transactions*, we have Instances of sick Persons voiding stercitious Stones, Balls, &c. by *Stool*. See *EXCREMENT*.

**STOOMING of Wine**; is a putting Bags of Herbs, or other Ingredients into it. See *WINE*.

**STOOPING**, in Falconry, is when an Hawk being upon her Wings, at the Height of her Pitch, bends down violently to take the Fowl.

**STOPS** } in Grammar. See } **POINTS.**  
**STOPPING** } } **PUNCTUATION.**

**STORAX** or **STYRAX**, a resinous odoriferous Gum, brought from *Syria*; whereof there are three Kinds, viz. the *red Storax*, *Storax Calamita*, and *liquid Storax*.

The *red Storax*, call'd also *Jesus Incensif*, is a Gum or Resin oozing out at an Incision made in the Trunk and biggest Branches of a Tree, call'd *Storax*, not unlike our Quince Tree. Its Fruit is of the Size of a Filbert, and contains a white, oily Kernel, of a Smell perfectly like *Storax*.

It must be chosen in a Mass, of a reddish Colour, soft and fat, and of an agreeable Smell, bearing no Resemblance to *liquid Storax*.

That in Cakes, in Bells, &c. is all sophisticated; and only a wretched Composition of *liquid Storax*, and the Impurities of the true *red Storax* and other Drugs. That in Powder is still worse.

*Red Storax* is of some Use in Medicine; and is also used by the Perfumers, and often substituted for Incense.

The *Storax Calamita*, thus call'd from the Rushes or Quills, so Latin, *Calami*, it was anciently brought in, is, in reality, only a Composition of several excellent Drugs, and among the rest, of *red Storax*, whence its Name; though Authors have hitherto taken it for a natural Gum, different from the *red Storax*.

It must be chosen in fine white Tears, very dry, and not bitter; sometimes 'tis in reddish Masses, full of these whitish Tears, only mix'd with a ruddy Substance. These two Kinds are esteem'd excellent Pectorals, Stomachicks and Cephalicks.

*Liquid Storax*, is a kind of stercitious Resin, of a greyish Colour, composed of true *Storax*, common Resin of the Pine, Oil and Wine, beaten with Water, into the Consistence of an Unguent. The Druggists also call it *Stactæ*, to distinguish it, and sell it for the better Price. See *STACTÆ*.

The best is that of *Holland*. 'Tis easily kept in a Cellar, by pouring Water on it from Time to Time. 'Tis an Ingredient in an Unguent which Experience has shewn to be excellent against the *Scorbutus* and *Gangrene*.

**STORGE**, a Greek Term, *Στρυγξ*, frequently used by Naturalists, to signify that Parent Instinct, or natural Affection, which all, or most Animals bear their Young. See *INSTINCT*.

This *Storge* is an admirable Principle implanted by the All-wise Creator throughout the Animal World, for the Preservation thereof; and is govern'd by such Rules as make it best contribute thereto. By means of this, with what Care and Alacrity do they nurse their Young? and what Dangers will they avoid for their Security? Even the most timorous Animals, which at other times fly the Face of Men, Dogs, &c. will, for the sake of their Young, expose themselves.

Thus Hens instead of flying from, will assault such as meddle with their Brood; and Partridges, e'er their Young can fly, will frequently drop down before the Dogs, first or last, then at greater Distances, to dodge and draw them off, from pursuing their Young. With what Concern do others lead about their Young in Places of Safety? and some even admit them for Shelter into their Bowels.

Thus the Opossum, Dr. *Zyffus* observes, has a curious Bag on purpose for the securing and carrying about her Young; and some say, the Teats lie in it. The same Author adds, from *Oppian*, that the Dog-fish upon any Storm or Danger, receives her Young into her Belly, which come out again when the Fright is over. The *Squatina* and *Glaucus* do the like.

With what Tenderness doothers feed and prepare the Food for their Young, teach them to suck, cherish or lull them to Rest, &c. like so many Nurses, deputed by the Creator to take Care of his Creatures? And still in Proportion, as they

grow up and become fit to look to themselves, this *Storge* abates; and at length, when no longer needed, becomes extinct. Mr. *Ray* observes, that young Doves are fed with Meat first eat by the Dam, and fatten a-while in her Prohibe. And *Cassius* observes, that the old Female *Ethiopian* takes no Food but from the Male, after this Manner.

The Returns made by the Young to the Parent Animal, when grown old, are not less considerable. *Pliny* says of Rats, that they nourish their aged Parents with eminent Piety.

St. *Ambrose*, and after him *Olaus Magnus*, observe of the Crane, that when their Parents, through old Age, are bereft of their Feathers, and left half naked, their Offspring stand around them, and cherish them with their own Feathers; that they seek Food for them; and when Nature, as it often happens, repairs their Decays, and restores them to Strength again, they take them up by Tarsus, on their Wings, and habituate their unpractised Limbs to their ancient Art of Flying.

**STOVE**, in Building, a Hot-house or Room. See *FIRE*, *CHIMNEY*, &c.

*Palladius* observes, that the Ancients used to warm their Rooms with certain secret Pipes, which came through the Walls, conveying Heat to several Parts of the House, from one common Furnace. Whether this were a common Custom, says Sir *Henry Wotton*, or a Curiosity, we cannot determine; but it was certainly, both for Profit and Use, far beyond the *German Stoves*.

**STOVE**, among Confessioners, a little Closet well closed on all Sides, wherein are several Stories or Rows of Shelves made of Wires one above another, for the drying of Sweet-meats.

**STOWAGE**, is a Place where Goods are stow'd or laid up; or the Money paid for such a Place.

**STRABISMUS**, an ill Disposition of the Eye, which makes it look a-quint.

This Indisposition consists in a Retraction of the Ball of the Eye, towards one Side; occasion'd by a Convulsion, or a Palsie of one of its Muscles.

Children are apt to acquire it through the Carelessness of their Nurses, in placing them always on the same Side the Light, or of any other remarkable Object that occasions them to turn their Eyes that Way.

To remedy it, Care is to be taken, that the Light, or other sensible Body, be placed on the other side of them; or if a Mask put on them, the Holes whereof are so disposed, as that to see through them, the Child be obliged to turn his Eyes the opposite Way. The Word is form'd from the Greek *στραβισμός*, which signifies the same.

**STRAIGHT**, or, as some chuse to write it, *Streight*, or, as others, *Strait*, in Hydrography, a narrow Sea, or Gut shut up between Lands on either Side, and affording a Passage out of one great Sea into another.

The most celebrated *Streights* in the World, is that of *Gibraltar*, which is about 130 Miles long and 12 broad, joining the *Mediterranean Sea*, with the *Atlantic Ocean*.

The *Streights of Magellan*, discover'd in 1520 by *F. Magellan*. It was used some time, as a Passage out of the North into the South Sea; but since the Year 1616, that the *Streights of le Maire* has been discovered, the former has been disused; both because of its Length, which is full 300 Miles, and because the Navigation thereof is very dangerous, from the Waves of the North and South Seas meeting herein, and clothing.

The *Streight* at the Entrance of the *Baltic*, is call'd the *Sound*. See *SOUND*.

That between *England* and *France*, *Le Pas de Calais*, or the *Channel*. The *Streights of Babinnada*, of *Weigari*, of *Jesso*, of *Anion*, of *Danis* and *Hudon*, &c.

**STRAIGHT** is also used in Geography, for an Isthmus or Neck of Land between two Seas; preventing the Communication thereof. See *ISTHMUS*.

**STRAIN** or *Sprain*, a violent Extension of the Sinews or Tendons of some Muscle. See *TENDON*.

**STRAND** and *Strains*, in ancient Customs, a Freedom from all impositions upon Goods or Vessels by Land or Water.

**STRANDED**, (from the *Saxon Strand*, i. e. a Shore or Bank of the Sea or a great River) is when a Ship is by Tempest or ill Stowage, run on Ground, and so perishes.

**STRANGER**, in Law, has a special Signification, for a Person who is not Privy or Party to an Act: As, a *Stranger* to a Judgment, is he to whom a Judgment does not belong; in which Sense it stands directly contrary to *Party* or *Privy*.

**STRANGURY**, in Medicine, a Distate occasioning a very frequent and involuntary Emission of Urine, in very small Quantities, and, as it were, Drop by Drop; with an intense Pain. See *URINE*.

It arises from the too great Acrimony of the Urine, which vitelicating the Nervous Parts of the Bladder, occasions a continual Inclination to urinate.

New Beer, and other Liquors not well fermented, are used to occasion the *Strangury*.

The extreme Sharpness of the Urine, sometimes produces an Ulcer in the Bladder.

The Word is form'd from the Greek *σπάγγε*, Gutta, Drop, and *ουρη*, Urine.

Some Authors confound the *Strangury*, which the Latins call *Urina Stilloidum*, with the *Urine Incontinentia*.

The Difference between them, consists in this, that in the former, the Urine comes away with Pain, in the latter, without. The former proceeds from the Acrimony of the Urine; and the latter from a Relaxation or Palsy of the Sphincter of the Bladder, which cannot keep the Neck thereof close shut. See URINE.

STRAP, among Surgeons, a Sort of Band to stretch out Members in the setting of broken, or disjoined Bones. See BANDAGE.

STRAPADO, a kind of Military Punishment, wherein the Criminal's Hands being tied behind him, he is hoisted up with a Rope, to the Top of a long Piece of Wood, and let fall again almost to the Ground; so that by the Weight of his Body in the Shock, his Arms are dislocated.

Sometimes he is to undergo three *Strapado's*, or more.

The Word is form'd from the French, *Estrapade*, which signifies the same Thing, and which is supposed to come from the old Verb *Estraper*, to break, extirpate.

STRATA, in Natural History, the several Beds or Layers of different Matter, whereof the Body of the Earth is composed. See EARTH.

The *Strata*, include all the Layers of Earths, Minerals, Metals, Stones, &c. lying under that upper Tegument or *Stratum*, the Turf or Mould. See FOSSIL.

The Time when those several *Strata* were hid, was, doubtless, at the Creation; unless, with some great Naturalists, as *Steno*, Dr. *Woodward*, &c. we suppose the Globe of Earth to have been dissolved by the Flood. See DELUGE.

At that Time, says Mr. *Dorham*, whenever it was that the Terraqueous Globe was in a Chaotic State, and the earthy Particles subdivided, then these several Beds were reposit in that commodious Order, wherein they are now found; and that, as is asserted, according to the Laws of Gravity; the lower still heavier than the upper.

But Dr. *Leigh*, in his Natural History of *Lancashire*, speaking of the Coal-pits, denies the *Strata* to lie according to the Laws of Gravitation; observing that the *Strata* there, are first a Bed of Marble, then Free-stone, next Iron-stone, then Coal or Channel Mire, then some other *Strata*, then Coal again, &c.

This determined Mr. *Dorham* to make a nicer Enquiry into the Matter; accordingly, in 1712, he caused divers Places to be bored, laying the several *Strata* by themselves; and afterwards determined very carefully their specific Gravity. The Result was, that in his Yard, the *Strata* were gradually specifically heavier and heavier, the lower and lower they went; but in another Place in his Fields, he could not perceive any Difference in the specific Gravities.

Acquainting the *Royal Society* therewith, their Operator Mr. *Haukebee*, was order'd to try the *Strata* of a Coal-pit, which he did to the Depth of 30 *Strata*; The Thickness and specific Gravity of each whereof, he gives us in a Table in the *Philosophical Transactions*; and from the whole make this Inference, that it evidently appears, the Gravities of the several *Strata* are in no manner of Order; but purely Casual, as if mix'd by Chance. See VEIN and COAL-PIT.

STRATAGEM, a Military Wile; or a Device in War, for the surprizing or deceiving an Enemy.

The Ancients dealt mightily in *Stratagems*; the Moderns wage War more openly, and on the Square.

*Frontinus* has made a Collection of the ancient *Stratagems* of War.

The Word is form'd from the Greek *στρατημα*, I lead an Army. STRATAGEMATRY, in War, &c. the Art of drawing up an Army or any Part of it, in any given Geometrical Figure; and of expressing the Number of Men contain'd in such a Figure, as they stand in Array, either near at Hand, or at any Distance assign'd. *Harris*.

The Word is form'd from the Greek, *στρατη*, Army, *αριθμησις*, Number, and *μετρον*, Measure.

STRATEGUS, in Antiquity, an Office among the *Athenians*, whereof there were two chosen yearly, to command the Troops of the State.

*Plutarch* says, there was one chose from out of each Tribe; but *Pollius* seems to say, they were chose indifferently out of the People. 'Twas the People themselves made the Choice; and that on the last Day of the Year, in a Place call'd *Psycoe*.

The two *Strategi* did not command together; but took their Turns, Day by Day; as we find from *Herodotus* and *Cornelius Nepot*. Some times, indeed, as when a Person was found of Merit vastly superior, and exceedingly fam'd in War, the Command was given to him alone: But it was ever a Rule, never to put any Person in the Office, but who had his Lands in *Attica*, and who had Children, that there

might be some Hoilages, and Securities for his Conduct and Fidelity.

STRATIFICATION, in Chymistry, an Arrangement of different Matters, in several *Strata* or Layers, alternately; call'd by the Latins, *Stratum super Stratum*; and mark'd in Books of Chymistry with S S S.

This Operation is used in calcining of Minerals or Metals with Salts or other Matters. See CALCINATION.

To purify Gold by Cementation, they *Stratify* Lamine, or Plates of Gold in a Crucible, with a dry Paste call'd *Cement*. See GOLD and PURIFICATION.

STRAY. See ESTRAY.

STREAM-Anchor, is a small one, made fast to a *Stream* Cable; for a Ship to ride by in gentle *Streams*, and in fair Weather. See ANCHOR.

STREAM-Works, are certain Works in the Tin-Mines, when the Miners follow the Veins of Metal, by cutting Trenches, &c.

STRENÆ, in Antiquity, Presents made, out of Respect, on New-year's Day; and as a happy Augury for the ensuing Year.

The ancient Lawyers derive the Origin of the Word hence, That these Presents were only given *ovis strenis*, as *Symonides* observ'd; who adds further, That the Use hereof was first introduced by King *Tatinus*, *Romulus's* Colleague, upon his giving, first together the happy Branches, which were the Prefiges of a New Year, in the sacred Grove of the Goddess *Strenia*.

Anciently, a Pound of Gold was given to the Emperors every New-year's Day, by way of *Strenæ*. *Du Gange* observes, that *Strenæ* or *Strenis* was used for a kind of Tribute the People of *Dalmatia* and *Croatia* pay'd to the *Venitians*, or to the Kings of *Hungary*, whom they obey'd voluntarily.

STRENGTH, as it concerns the Animal Oeconomy. The *Strengths* of different Animals of the same Species, or of the same Animal at different Times, are demonstrated to be in a triplicate Proportion of the Quantities of the Mass of their Blood: The whole *Strength* of an Animal, is the Force of all the Muscles taken together; therefore, whatsoever increaseth *Strength*, increaseth the Force of all the Muscles, and of those serving Digestion, as well as others. See MUSCLE.

Yet notwithstanding the Truth of this, the Quantity of Blood may be increased in such Circumstances, as to abate the *Strength*. The Equilibrium between the Blood and Vessels being destroy'd, wonderfully lessens the *Strength*. The sudden Suppression of Perspiration, though it increaseth the Quantity of the Blood, as it must considerably do, by *Santorius's* Calculation, yet it lessens the *Strength*; because the retained Matter, being what ought to be evacuated, so alters the Texture of the Blood, as to make it unfit for muscular Motion. Suppose the increased Quantity to be joined by an extraordinary Viscidity, the Quantity of small separable Parts decreasing, as the Viscidity increaseth, the Quantity of animal Spirits separated in the Brain, will be less; and the Tenacity of the Fibres being in Proportion to the animal Spirits forced into them, they will not be able to counterpoise the great Weight of the Blood, and so the *Strength* will be diminished.

*Bellini* proves, that if the Blood be so vitiated, as to increaseth or diminish *Strength*; it amounts to the same as if the Blood were in a natural State, but its Quantity increased or diminished in the same Proportion: So that the Blood, when vitiated, may so impair the *Strength* of the Muscles, as even to spoil Digestion; and yet in some Cases, it may be so vitiated, as to help Digestion, and increase *Strength*.

M. *de la Hire*, in a Calculation of the *Strength* of a Man in drawing and bearing, shews, that an ordinary Man walking in a horizontal Direction, and with his Body inclining forwards, is only equal to Twenty-seven Pounds; which is much less than one would have imagined.

He adds, That this Force would be much greater, if the Man were to walk backwards; and that 'tis for this Reason, the Watermen fetch their Oars from before, backwards: And though he observes, the Gondoliers of *Venice* fetch them the contrary Way, yet this is, because they chuse to lose the Advantage of *Strength*, to have that of seeing the Place they are going to, in the numerous Turns and Canals they there meet withal.

'Tis known by Experience, that a Horse draws, horizontally, as much as Seven Men; consequently, his *Strength* will be 189 Pounds. A Horse, as to pushing forwards, has a great advantage over a Man, both in the *Strength* of his Muscles, and the Disposition of the whole Body; but the Man has the Advantage over the Horse in ascending. M. *de la Hire* shews, that three Men loaden with 100 Pounds apiece, will ascend a pretty steep Hill with more Ease and Expedition, than a Horse loaden with 300 Pounds.

*Hooke* will furnish us with abundance of Instances of extraordinary *Strength*: *Klamber*, Provost of the great Church of *Moskwa* in 1529, carried a Pipe of Wine out of the Cellar, and laid it in the Cart. — *Moyseus* saw one hold a marble Pillar in his Hand three Foot long, and one in Diameter,

meter, which he toſt'd in the Air, and catch'd again like a Ball. — A little Man of *Montna*, call'd *Rolando*, could break a Cable. — *Ernando Burg* fetch'd up Stairs, an Aſs laden with Wood, and threw both into the Fire. At *Couſtantinople*, in 1581, one lifted a Piece of Wood which Twelve Men could ſcarce raiſe; but lying all along, bore a Stone which Ten Men could not juſt roll on him. — *G. of Franckberg*, Baron of *Minſtebats*, cou'd raiſe a Man off his Seat with his middle Finger, and ſhove a Cannon out of its Place. — *Cardan* ſaw a Man dance with two Men in his Arms, two on his Shoulders and one on his Neck. *Patacona*, Captain of the Cockſicks, could tear an Hoſe-ſhoe; and the ſame is reported of the preſent *Auguſtus* King of *Poland*. — On *Putey* Common, is a Stone with an Inſcription, mentioning a Man, who in that Place outdrew Five Horſes in his own Team. — A gigantic Woman of the *Netherlands*, could lift a Barrel of *Hanſburgh* Beer. Mr. *Carew* had a Tenant that could carry Six Buſhels of Wheat in Meal (of Fifteen Gallons Meaſure) with the Lubber a-top of it. And *J. Rowan* of the ſame County, could carry the Carcaſs of an Ox. See *Hakewill's Apology*, p. 238.

**STRENGTHENERS**, ſuch Medicines as add to the Bulk and Firmneſs of the Solids. See *SOLIDS* and *STRENGTH*. *Strengtheners* differ from *Cordials*, as a Bandage doth from a Fleſh-bruſh: The latter are ſuch as facilitate and drive on the vital Actions; but the former, ſuch as confirm the Stamina, and maintain the Solids in ſuch a Condition, as to exert themſelves into Action on all proper Occaſions, with the greateſt Force and Vigour.

The continual Waſte, which conſtant Motion makes in the Conſtitution, were it not for frequent and proper Supplies, would ſoon wear the Body quite out. The Attritions and Abrasions of the circulating Fluids, would quickly carry away the Caſals in which they circulate, were not ſomehow furniſhed in their Compoſition, which is ſuited to fall into, adhere with, and recruit that which is waſhed off. And thoſe Particles muſt be much more diſpoſed to do, whoſe Adheſions are greateſt, when once they come into Contact; ſuch are thoſe of Bodies we call *Glutinous*, and which eaſily form themſelves into Jellies, and ſuch-like Conſiſtencies; for the Parts of ſuch Bodies are very light, by the over-proportion of their Surfaces to their Solidities, whereby their Motions are both more languid, when in Circulation; and when they ſtop, their Cohereſs will be much the ſtronger, with whatſoever they happen to fall into Contact.

Medicines of this Tribe, are therefore of great Service in Heſticks; where the ſwift Motion of a thin, ſharp Blood, wears away the Subſtance of the Body, inſtead of nouriſhing it; for they not only retard the inordinate Motion; but give ſuch a Weight and Conſiſtence to the Juices, as ſits them alſo for Nourishment. There are likewiſe other Cauſes, which may weaken the Solids, by admitting, or occaſioning them to relax too much. Whatſoever therefore acts as a Stimulus, and criſps and corrugates the Fibres into a more compacted Tone, which moſt auſtere and pointed Bodies do, will remove ſuch Weakneſs, and increaſe Strength: And as alſo, too much Moiſture may contribute to ſuch a Relaxation, what has no other Quality but abſorbing, and drying up ſuch ſuperfluous Humidities, may deſerve, though accidentally, to come under this Denomination.

**STRETCH**: When at Sea, they are going to hoist the Yard, or hale the Sheet; they ſay, *Stretch forward the Sheets*, meaning, that the Part which the Men are to hale by, ſhould be put into their Hands, in order to their Haling.

**STRIE**, in the ancient Architecture, the Liſts, Fillets or Raſs which ſeparate the Trigges or Flatings of Columns. See *LIST* and *FLUTING*.

**STRIE**, among Namaralists, the ſmall Hollows or Chan-nels in the Shells of Cockles, Scallops, &c.

**STRICTOR**, in Anatomy, the ſame as *Sphincter*. See *SPHINCTER*.

**STRIGES**, in the ancient Architecture, are what in the Modern we call *Flatings*. See *FLUTING*.

They are thus call'd, as ſuppoſed to have been originally intended to imitate the Folds or Plaits in Womens Robes; which the *Latins* call *Strigae*.

The Fillets or Spaces between them, were call'd *Striae*.

**STRIKE**, is a Meaſure, containing four Buſhels; two of which make a Quarter. A *Strike* of Flax, is as much as can be heck'd at one Handful.

**STRIKE**, is a Sea Word variously uſed. When a Ship in a Fight, or upon meeting with a Man of War, lets down, or lowers her Top-maſt, at leaſt half-Maſt high; they ſay, *See Strikes*, meaning, the yields or ſubmits, or pays her Devoir to that Man of War, as the paſſes by. When a Ship touches Ground in a Shoal-water, they ſay, *See Strikes*.

When any Top-maſt is to be taken down, they ſay, *Strike the Top-maſt*. And when any Thing is let down or lowered into the Hold, they call it *Striking* down into the Hold.

**STRIKING**. The Punishment appointed by our Laws,

for *Striking* within the King's Court, whereby Blood is drawn, is, that the Criminal ſhall have his Right Hand ſtruck off, in a moſt ſad and ſolemn Manner.

For *Striking* in *Weſtmiſter-Hall*, where the Courts of Juſtice are ſitting, the Punishment is Imprisonment for Life, and Forfeiture of one's Eſtate.

**STRING**, in Muſic. See *CHORD*.

If two *Strings* or Chords of a muſical Instrument only differ in Length; their Tones, that is, the Number of Vibrations they make in the ſame Time, are in an inverted Ratio of their Lengths.

If they only differ in Thickneſs, their Tones are in an inverted Ratio of their Diameters. As to the Tenſion of *Strings*, to meaſure it regularly, they muſt be conceived ſtretch'd or drawn by Weights; and then, *ceteris paribus*, the Tones of two *Strings* are in a direct Ratio of the Square Roots of the Weights which ſtretch them, that is, e. g. the Tone of a *String* ſtretch'd by a Weight 4, is an Octave above the Tone of a *String* ſtretch'd by the Weight 1.

*Stris* are Obſervation of an old ſtanding, that if a Viol or Lute-ſtring be touch'd with the Bow, or Hand, another *String*, on the ſame, or another Instrument, not far from it, if in Unifon to it, or in Octave, or the like, will at the ſame Time tremble of its own accord. See *UNISON*.

But it is now found, that not the whole of that other *String* doth thus tremble; but the ſeveral Parts, ſeverally, according as they are Unifons to the whole, or the Parts of the *String* ſo ſtruck. Thus ſuppoſing  $A$  ———  $B$   $AB$  to be an upper Octave to  $ac$ , and  $A$  ———  $B$  therefore an Unifon to each half of it  $a$  ———  $b$   $1$   $2$  ſtop'd at  $b$ .

If while  $ab$  is open,  $AB$  be ſtruck, the two Halves of this other, that is  $ab$  and  $bc$  will both tremble; but the middle Point will be at reſt; as will be eaſily perceived, by wrapping a bit of Paper lightly about the *String*  $ac$ , and removing it ſucceſſively from one End of the *String* to the other. In like manner, if  $A$   $B$  were an upper Twelfth to  $ac$ , and, conſequently, an Unifon to its three Parts  $a$   $1$ ,  $1$   $2$  and  $2$   $c$ ; if  $ac$  being open,  $A$   $B$  be ſtruck, its three Parts  $a$   $1$ ,  $1$   $2$  and  $2$   $c$  will ſeverally tremble; but the Points  $1$  and  $2$  remain at Reſt.

This, *Dr. Wallis* tells us, was firſt diſcover'd by *Mr. William Noble* of *Merton College*; and after him by *Mr. T. Pigot* of *Wadham College*, without knowing that *Mr. Noble* had obſerved it before. To which we may add, that *M. Senveur*, long afterwards, propoſed it in the *Royal Academy* at *Paris*, as his own Diſcovery, as 'tis like enough it might; but upon his being inform'd, by ſome of the Members then preſent, that *Dr. Wallis* had publiſh'd it before, he immediately reſign'd all the Honour thereof.

**STRING-HALE**, is a sudden twitching or ſtitching up of an Horſe's hinder Leg, much higher than the other, as if he trod on Needles; generally befalling the beſt mettl'd Horſes.

It frequently happens upon taking Cold, after hard Riding, or ſore Labour; eſpecially by waſhing them when too hot, which chills the Blood, and ſo benumbs the Sinews, as to take away the Senſe and Feeling of the Member.

To Cure it, the middle Vein is taken up above and underneath the Thigh; under which is found a *String*, which is to be cut away, and the Part anointed with Butter and Salt.

**STROAKING**, a Method of Cure ſome People have given into, in certain Diſeaſes; conſiſting in a mere Application of the Hand to the Part affected, in the way of Friction or Rubbing.

That Friction has very conſiderable Uſes in many Diſeaſes, is allow'd. See *FRICTION*.

But, aſto the particular Efficacy of the *Stroak* of particular Perſons; we ſee little Foundation for it in Nature. Experience, indeed, affords ſome; to which we don't know what to object.

*Mr. Theoreſy*, in the *Philoſophical Transactions*, gives ſeveral remarkable Inſtances of Cures perform'd by that famous *Stroaker*, *Mr. Greatrix*. *Mr. Theoreſy's* own Brother being ſeiz'd with a violent Pain in his Head and Neck; *Mr. Greatrix* coming accidentally thither, gave immediate Eaſe to his Head, by only *Stroaking* it with his Hand: He then fell to *strok* his Back; whence the Pain immediately fled to his Right Thigh: Then he perſued it with his Hand to the Knee, from thence to the Leg, Ankle, Foot, and at laſt to the great Toe, where it grew more violent; but upon rubbing there, it vaniſh'd.

Another Relation of the ſame Author having a great Pain and Weakneſs in her Knees, which occaſion'd a white Swelling, that had hung on her ſeveral Years, in ſpight of all Means; the ſame *Stroaker* rubbing both her Knees, gave her preſent Eaſe, the Pain ſwimming downwards from his Hand, till he drove it out of the Toes, after which the Swelling ſoon went abſolutely away.

Mr. *Thowley* gives various other like Instances, all among his Acquaintance; and adds, That when Mr. *Greaves* strokes only the Pains, he uses nothing but his Hand; but that for Ulcers, or running Sores, he uses Spittle on his Hand or Fingers. See TOUCHING.

STROPHE, in the Greek and Latin Poetry, a Stanza, or certain Number of Verses including a perfect Sense; succeeded by another, consisting of the same Number and Measure of Verses, in the same Disposition and Rhythmus, call'd the *Antistrophæ*.

What the *Couplet* is in Songs, and the *Stanzas* in Epic Poetry; *Strophe* is in Odes. See COUPLET.

The Word is Greek, *στροφή* of *στρέφω*, I turn; because at the End of the *Strophe*, the same Measures returned again; or rather, as the Term related, principally, to the Music or Dancing, because at first coming in, the Chorus or the Dancers turn'd to the Left, and that Measure ended, they turn'd back again to the Right.

STRUCTURE, in Architecture. See BUILDING.  
STRUMÆ, in Medicine, Tumours arising most usually on the Neck; call'd also *Scrophule*, and, popularly the *Evis*, or *King's Evil*. See EVIL.

The Word is Latin, form'd, as some will have it, a *struendo*; because they grow insensibly, *struunt* as *affurgunt*. The Greeks call them *γαστρίαι*, Sores.

STUC, in Masonry, from the *Italian Stucco*, &c. a Composition of Lime and the Dust of white Marble, pounded together and sifted; whereof Figures and other Ornaments of Sculpture are made.

This is what *Pliny* means by *Marmoratum Opus*; and *Albarium Opus*. See PLAISTER and MOSAIC.

STUFF, in Commerce, a general Name for all Kinds of Works made of Gold, Silver, Silk, Wool, Hair, Cotton or Thread, manufactured on the Loom; of which Number are *Velvets*, *Broadens*, *Mohairs*, *Sattins*, *Taffetas*, *Cloths*, *Serges*, *Ratens*, and various other Kinds; explain'd under their respective Articles of this Dictionary.

STUFF is particularly used, for certain Kinds of light woollen *Stuffs*, used principally for Linings and Womens wear, as *Linfets*, *Ratens*, &c.

STUM, is the Flower of Wine, set a working. See WINE, MUST, &c.

Hence to *Stum*, is to put certain Ingredients into sick and decay'd Wine, in order to revive it, and make it brisk.

STUMBLING, in the Manage, &c. a Vice in a Horse, either natural or accidental.

The *Natural* arises from the Sinews of the fore Legs being somewhat too straight, which cramps the Horse, and prevents his using his Legs with the necessary Freedom and Nimbleness.

The Way to cure him, is to cut him of the Cords, *i. e.* to make a Slit on the Top of his Nose, and with a Corner, to raise up the great Sinews, to cut them asunder, and heal them up again with a proper Salve. The *Accidental* arises from a Splint, Wind-gall, being founder'd, prick'd, stubbed, gravel'd, &c.

STUPIFIERS, in Medicine, the same as Narcoticks and Opiates. See OPIATES.

STUPHA, or STUPE, the same as Fomentation. See FOMENTATION.

STUPOR, a Numbness, occasioned by any accidental Bandage that stops the Motion of the Blood and nervous Fluids, or by a Decay in the Nerves, as in a Palsy, &c.

STYGIAN Liquors, a Term some Chymists apply to acid Spirits, from their Efficacy in destroying or dissolving mixt Bodies. See SPIRIT.

STYLE, a kind of Point, or Bodkin, wherewith the Ancients wrote on Plates of Lead, or on Wax, &c. and which is still used to write on Ivory Leaves, and Paper prepared for that Purpose, &c. See WRITING.

This is the Origin of all the other Significations of the same Word in English.

STYLE, in Chirurgery, is a long Steel Instrument, that goes diminishing towards one End, so as to be of a conical Form.

'Tis used to be thrust in red-hot, in *Cancle*, and to be pull'd out again, immediately: 'Tis put in and drawn out successively, as often as is necessary. In order to do this, 'tis good to have two *Styles*, to be put in alternately. See CANCULA.

STYLE, in Dialling, the Gnomon or Cock of a Dial, rais'd on the Plane thereof, to project a Shadow. See GNOMON.

STYLE, in Botany, the Part rising up the middle of a Flower, and bearing, by its lower Part, on the Seed.

This we more usually call the *Pistil*. See PISTIL.

STYLE, in Matters of Language, is a particular manner of delivering a Man's Thoughts in Writing, agreeably to the Rules of *Syntax*; or, as *F. Buffier* more accurately defines it, the Manner where the Words constructed according to the Laws of *Syntax*, are arranged among themselves, suitably to the Genius of the Language. See LANGUAGE.

This Definition fixes the Notion of *Style* to something

determinate, which before was very vague and arbitrary, whence many Authors, even of Note, confounded it with *Syntax* itself. See SYNTAX.

From the Definition, it appears, that *Style* supposes or includes the *Syntax*; and that *Syntax* does not extend so far as *Style*: For the *Syntax* may be very just, where the *Style* is wretched, were it only in this Example; *God always rewards with great Fidelity, and greater Liberality, the just*: Or this, *There is no Body, who more than I honour you*.

The Regimens and Terminations of each Word, are perfectly just in each of these Phrases: There is no Fault then, in the *Syntax*; but there is something wanting in the Arrangement of the Words, to make them in the Genius of the Language; there is a Fault then, in the *Style*.

Indeed, against what particular Rule of Grammar the Fault is committed, 'tis scarce possible to determine precisely; the Taste and Use of a Language being so exceedingly delicate and precarious. 'Tis true, a Fault in *Style*, is not less a Fault against Grammar, than is a Fault in *Syntax*; Only the former is less precise and palpable than the latter.

A very common Error in Grammarians, *F. Buffier* adds, is to confound two Kinds of *Styles* in one: The *Grammatical Style*; or that directed by the Rules of Grammar; and the *Personal Style*, which depends less on the Grammar, than on the Person that writes; whether with regard to his particular Taste and Genius, or with regard to his Matter, or the Kind or Character of his Work.

There are a great many Differences between the Two; the most essential is, that the one may be diversified an infinite Number of Ways, and the other cannot.

In effect, the *Personal Style* is naturally variable, according to the different Genius's, Humours, and Complexions.

'Tis the Imagination that acts, that conceives, that proposes, and that expresses Things, according to its Character, which is different in all Men, and which is to be varied, according to the particular Kind of the Work.

Hence arises the *Gay*, the *Grave*, the *Florid*, the *Severe*, the *Copious*, the *Concise*, the *Poetical*, the *Epistolary*, the *Burlesque Styles*.

Their *Personal Styles* are all Independent on the *Grammatical*; and we have Authors, who excel in the one, yet are miserably defective in the other. The *Personal Style* is not under the Direction of Grammar; but of the Imagination, or rather of Rhetoric, that Art having to do directly with our Thought, as Grammar with our Words.

This, however, may be said, That Grammar is far from being able to vary the same Words of a Phrase with equal Perfection; and that generally there is but one Way of delivering them in the Taste and Genius of the Language. Thus, the *Grammatical Style*, is invariable in the following Phrase, and proportionably in others. *Death is a Law, which all Men are to undergo*: For you cannot well range the Words otherwise than they here are, without going out of the Bounds of Grammar. Would you say, *a Law is Death, which all Men, &c. or, a Law is Death, which, &c.*

But in the *Personal Style*, where the Imagination comes to be concern'd, this Sentence might be varied infinite Ways, according to the Kind of the Writing, whether Oratorical, Poetical, &c. As, *Death neither spares the Prince nor the Peasant. Death knocks equally at the Monarch's Palace and the Beggar's Hut, &c.*

STYLE, in Oratory and Poetry, is restrain'd wholly to what *F. Buffier* calls the *Personal Style*.

*Language* refers principally to the Matter of the Discourse, *viz.* the Words; *Elocution* to the particular Members or Parts thereof; and *Style*, to the whole Composition.

The Masters of the Art, reduce the Kinds of *Style* to Three, the *Sublime*, the *Low*, and the *Intermediate* or *equable Style*.

The *Sublime*, is that consisting in magnificent Words and Sentences; which, by its noble Boldness, ravishes the Hearers, and extorts Admiration even from the Unwilling. See SUBLIME.

The *low* or *simple Style*, is that ordinarily used in smaller and humbler Works, as Epistles, Dialogues and common Discourse. The chief Virtues hereof are Perseverance, Simplicities, Exactness and Cleanliness; it must be very sparing in the Use of Tropes and Figures, especially the more violent ones, as the *Prophetic*, *Apophthegm*, &c.

The *intermediate, equable Style*, partakes of the Magnificence of the *Sublime*, and the Simplicity of the *Low*. It neither rises to the Majesty of the one in Words or Sentences; nor yet is smartly pointed like the other: But, as *Tully* excellently expresses it, *Est Stylus quidam interjectus, intermedius, et quasi temperatus; nec accumbit inferiori, nec solumine aures superioris, vicinus ambrosiæ, in vestro excellenti utriusque participat*.

The same Author calls it the *Florid* and *Polish'd Style*; it being in this that all the Graces and Beauties of Language are principally to be used.

For the Choice of *Style*, in the General, 'tis the Matter is to determine it. Such *Style*, says *Cicero*, is to be chosen, as expresses great Things magnificently, middle Things moderately, and low Things subtly: But more particularly as there are three Branches of the Duty of an Orator, to teach, to delight, and to move; the *simple Style* is used to teach, the Middle to delight, and the Sublime to move.

Again, the *simple or low Style* is fit for Comedy, the Sublime for Tragedy, and the Middle for History.

*Cæsar*, 'tis true, rather used the *Simple* than the *Intermediate Style*; but then he wrote Commentaries, not a History, as is observed by *Tully*.

Again, the *simple Style* is fit for Bacolicks and Eclogues, the *intermediate Style* for Georgicks, and the *Sublime* for Epicks; which triple Difference we easily discern in *Virgil*, though he sometimes mixes them all in the *Æneid* itself, using the *simple Style* in the Fifth Book, where he describes Games, and the *Intermediate* in the Beginning of the Poem. Care is still to be taken, that the *Style* be not flat and dull, on pretence of being *simple*.

*M. Boileau* observes, that in all Languages a mean Thought express'd in Noble Terms, is better liked than the noblest Thought express'd in mean Terms: The Reason he gives, is, that every Body can't judge of the Force and Justness of a Thought; but scarce any Body but perceives the Meanness of the Words. The latter we find by our Senses, the former by our Reason.

He adds, that the Words in different Languages don't always answer justly to one another; and that a noble Greek Term can't frequently be express'd in another Language, but by a very mean one.

This we see in the Words *Assinus* in *Latin*, *Ass* in *French*, and *Ass* in *English*, which are the meanest imaginable, in those three Languages; yet the Word expressing that Animal, has nothing mean in it, either in *Greek* or *Hebrew*, but is used in the finest and noblest Passages.

Add to this, that Languages are exceedingly capricious on this Head: A Bull, a Heifer, a Goat, a Boar, &c. may be used in the sublimest Passages, without debasing the *Style*; but a Cow, a Sheep, a Hog, a Sow, &c. would be intolerable. Shepherd and Herdsman, are fine Words; Hog-keeper and Cow-ward, which carry the same Idea, vitious to the last Degree.

The chief Faults in *Style*, are, its being *tumid* and *swollen*; or *cold* and *stupid*; or *stiff* or *loose*; or *dry* and *jeune*. A *swollen Style*, is that immediately stuff'd with big Words and Sentences; such are those Verses of the Emperor *Nero*, ridiculed by *Perseus*.

*Torus mimaltonis implerum Corona Bombis*  
*Es rapturn Vitulo capus ablatara superbo*  
*Bosfaris, & lyncem uenas Rexera Corymbis, &c.*

A *cold or sturd Style*, is that which affects certain trifling Ornaments, cold Jells, remote and strain'd Allusions, redundant Descriptions, &c. Such, e. gr. as, *A Centaur's riding himself: More golden than Gold, &c.* Of this Vice, that Passage of *Virgil* seems guilty.

*Num Capri potueri capi? Num incensa cremavis*  
*Troja Viros?*

And that in *Plutarch*, and *Diou Cassius*; *Tomas* no wonder *Diana's Temple* should be burnt the Night *Alexander* was born; as that *Galdefe*, attending at so great a Birth, could not be in the Way to extinguish the Flames. And that in *Plautus*, where a Person is reprehended for exceedingly covetous, that he would invoke *Heaven* and *Earth*, if he saw but a Grain of *Sunak* escape out of his Cottage.

A *loose Style*, is that which wanting Articles, Numbers, &c. fluctuates here and there, not connected or hang together. This is a Fault so frequent, especially in young Writers, that we shall spare giving Instances of it.

A *dry jeune Style*, is that destitute of Ornament, Spirit, &c. The Ancients made a notable Distinction of *Styles*, into *Laconic* and *Asiatic*.

*Asiatic Style*, is that which is very diffusive and prolix; or where abundance of Words are used to express a little Matter: Thus call'd, by the *Greeks*, from the People of *Asia*, who affected such Redundancies, in Opposition to the

*Laconic Style*, which is distinguish'd by its exceeding Conciseness; and by comprehending a deal of Matter under a few Words. See *LAONIC*.

Such, e. gr. is that Answer returned by the *Lacædemonians*, to a long Epistle of an Enemy, threatening to destroy them with Fire and Sword; *Is, si, if, that is, Do if you can: Or, that return'd by the same to King Philip, demanding some extravagant Thing of them, & non, no. Or that of Cleomenes the Spartan General to the Ambassador of Samos; As to what you have said, the first Part I don't remember, the middle I don't understand; the last I don't approve.* Or that

Epistle of *Archidamus* to the *Elai*, who were preparing War against him; *Archidamus to the Elai: 'Tis good to be quiet. Or that of Cæsar to the Roman Senate, after his conquering Pharnaces, King of Pontus: Veni, vici, vici; I came, I saw, I conquer'd.*

*STYLE*, in *Jurisprudence*, the particular Poem, or Manner of Proceeding in each Court or Jurisdiction, agreeably to the Rules and Orders establish'd therein. Thus we say, the *Style* of the Court of *Rome*, of the Court of *Chancery*, of Parliament, of the *Privy Council*. See *CHANCEERY, &c.*

*STYLE*, in Music, the manner of Singing and Composing. The *Style* is, properly, the manner each Person has, either of Composing, or Performing or Teaching; which is very different, both in respect of the different Genus of Countries and Nations, and of the different Matters, Places, Times, Subjects, Expressions, &c.

Thus we say, the *Style* of the *Charissimi*, of *Lully*, of *Lambert*; the *Style* of the *Italians*, the *French*, the *Spaniards, &c.* The *Style* of gay Pieces of Music, is very different from that of serious Pieces: The *Style* of Church Music, very different from Theatrical Music. The *Style* of the *Italian* Compositions, is poignant, florid, expressive; that of the *French* Com, ostions, natural, flowing, tender, &c.

Hence, the various Epithets, given to distinguish these various Characters; as, the ancient and modern *Style*, the *Italian* and *German Style*, the Ecclesiastical and Dramatic *Style*, the gay, grave, majestic, natural, soft, familiar, gallant, low, sublime *Styles, &c.*

The *Style Recitativo* or *Dramatico*, in the *Italian* Music, is a *Style* fit to express the Passions. The *Stylo Ecclesiastico* is full of Majesty, very grave, and fit to inspire Devotion.

*Stylo Musicico*, is a various, rich, florid *Style*, capable of all Kinds of Ornaments, and, of consequence, fit to express various Passions, particularly Admiration, Grief, &c.

*Stylo Madrigalesco*, is a *Style* proper for Love, and the other softer Passions.

*Stylo Hyperbæmatico*, is a *Style* proper to excite Mirth, Joy, Dancing, &c. and, of consequence, full of brisk, gay Motions.

*Stylo Symphonico*, is a *Style* fit for Instrumental Music: But as each Instrument has its particular Effect, there are as many different *symphonical Styles*. The *Style* of Violins, for Instance, is usually Gay; that of Flutes Melancholy and Languishing, and that of Trumpets, Sprightly and Animated.

*Stylo Melismatico*, is a natural, artless *Style*, which any Body, almost, may sing.

*Stylo Phantastico*, is a free, easy, humorous Manner of Composition, far from all Constraint, &c.

*Stylo Choroico*, is the *Style* proper for Dancing; and is divided into as many different Kinds, as there are Dances; as the *Style* of *Sarabands*, of *Minnets*, of *Gavots*, of *Rigadoons, &c.*

*STYLE*, in Chronology, a particular Manner of accounting Time, with regard to the Retrenchment of Ten Days from the Calendar, in the Reformation made thereof under Pope Gregory XIII.

*Style* is either *Old* or *New*.

The *old Style*, is the *Julian* Manner of Computing, which obtains in *England* and some other Protestant States, who refused to admit of the Reformation. See *JULIAN*.

The *new Style* is the *Gregorian* Manner, followed by the Catholics, in consequence of that Reformation. See *GREGORIAN*.

Hence, there arose a Difference of Ten Days, between the *Old Style* and the *New*, the latter being so much before-hand with the former: So that when the Catholics, e. gr. reckon'd the 21st of *May*, we only reckon'd the 11th.

This Difference of Ten Days, was increased in the Year 1707, to 11 Days, by reason that Year was not the *Bissestile* in the *Old Style*, but was, in the *New*: So that the 20th Day of the one, corresponded to the 21st of the other.

There are several Places, however, where the *new Style* has begun to obtain, even among Protestants; and 'tis not unlikely, that the *old Style* may, in Time, dwindle quite away. At the Diet of *Ratisbon* in 1700, it was decreed, by the Body of Protestants of the Empire, that Eleven Days should be retrench'd from the *old Style*, to accommodate it for the future to the *New*. And the same Regulation has since pass'd in *Sweden* and *Denmark*. *England* holds out, almost alone, for the *old Style*. See *CALENDAR*.

*STYLET, STILETTO*, a little, dangerous Pois'd, which is hid in the Hand, and chiefly used in treacherous Assassinations.

The Blade is usually Triangular, and so slender, that the Wound it makes, is almost imperceptible.

The *Styler* is strictly prohibited in all well Policy'd States. *STYLITES*, an Appellation given to a kind of Solitaries, who spend their Life, seated on the Tops of Columns, to be the better dispos'd for Meditation, &c. See *SOLITARY*.

Of these, we find several mention'd in ancient Writers, and even as low as the IXth Century. The Founder of the Order

Order was St. *Simon Stylites*, a famous Anchorite in the 7th Century; who first took up his Abode on a Column Six Cubits high; then on a Second of 12 Cubits; a third of 22; and at last on another of 36, where he lived several Years.

The Extremities of these Columns were only three Foot in Diameter, with a kind of Rail or Ledge about that reach'd almost to the Girdle, somewhat resembling a Pulpit. There was no lying down in it.

The Faucers or devout People of the *East*, imitate this extraordinary kind of Life to this Day. See *Faucher*.

**STYLOIDES**, in Anatomy, an Apophysis of the *Oss frontalis*, thus call'd from its resembling a *Style* or *Stylus*. See *PETROSUM OS*.

**STYLOGLOSSUS**, in Anatomy, a pair of Muscles, running off sharp and fleshy, from the *Processus Styloides*; whence descending obliquely forwards, it is inserted into the Root of the Tongue. It serves to pull the Tongue up in the Action of Deglutition.

**STYLOHYOIDEUS**, in Anatomy, a pair of Muscles springing from the *Processus Styloides*, and inserted into the Basis and Horns of the *Oss Hyoides*; which it draws, laterally, upwards.

**STYLOPHARYNGÆUS**, in Anatomy, a pair of Muscles, arising round and fleshy, from the *Processus Styloides*; and which in its oblique Descent, becomes thicker, and is afterwards expanded on the back Parts of the Fauces. It serves to draw up and dilate the Pharynx.

**STYPTIC**, in Medicine, a Remedy that has the Virtue of stopping Blood, or of binding up the Aperture of a wounded Vessel. See *BLOOD*.

The Service, Nettle, *Solomon's Seal*, &c. are *Stypticks*.

There are various *Styptic Waters* and Powders of surprising Efficacy, in most of which, Vitriol is the principal Ingredient.

The usual *Styptic Water* is made of Colcothar calcined, or Vitriol dissolved with burnt Allum, Sugar-candy, the Urine of a young Man, &c.

Dr. *Casac's Styptic Powder* has been famed; & though Mr. *Cowper*, in the *Philosophical Transactions*, gives us a Number of Instances, wherein it was applied with very little, or ill Success in human Subjects; though he gives us others made in Dogs where it answer'd well.

M. *Tonnarefort* observes, from the Analysis he has made of *Styptic* and Astringent Plants, that Acids and Earths prevail therein; though some of them yield an urinous Spirit. On this Principle, he asserts, That their Salt is analogous to Allum, and that there is somewhat of Sal Ammonic in their Texture, *Chomel* observes, that this does not hold universally.

**STYRAX**, in Medicine. See *SVORAX*.

**SUB**, a Latin Preposition, signifying *under*; frequently used, in Composition, in our Language.

*Sub-Brigadier*, is an Officer in the Cavalry, who commands under the Brigadier; assisting him in the Discharge of his Functions. See *BRIGADIER*.

*Sub-Chantor*, an Officer in the Choir, who officiates in the Absence of the Chantor, &c. See *CHANTOR*.

*Sub-Dean*, a Dignity in certain Chapters beneath the Dean. See *DEAN*.

*Sub-Prior*, a Claustal Officer, who assists the Prior, &c.

*Sub-Deacon*, an inferior Minister, who anciently attended at the Altar, prepared the Sacred Vessels, &c. and was invested with the first of the Holy Orders.

According to the Canons, a Person must be 22 Years of Age, to be promoted to the Order of *Sub-Deacon*.

'Tis disputed among the *Romanists*, whether the *Sub-deaconhood* be a Sacrament or not; in regard *Sub-Deacons* are ordain'd without Imposition of Hands, and that there is no mention made of them in Scripture. Yet *Bellarmin* holds the affirmative Side of the Question. By the Papal Canons, a married Man may be ordain'd *Sub-Deacon*; upon Condition his Wife consent to it, make a Vow of Continence, and shut herself up in a Monastery. See *DEACON*.

**SUBALTERN**, a subordinate Officer, or one who discharges his Post under the Command and Direction of another.

Such are Lieutenants, Sub-lieutenants, Cornets and Ensigns, who serve under the Captain.

We also say *Subaltern Courts*, Jurisdiccions, &c. Such are those of inferior Lords, with regard to the Lord Paramount. Hundred Courts, to County Courts, &c.

For the *Subaltern* Persons in an Epic Poem, *F. Boissu* observes, there is no Necessity to be very strict in preserving every one's Character. See *CHARACTER*.

The Patriarchs, M. *St. Evremont* tells us, had several Wives, who did not all hold the same Rank; but there were several *subalterns* to the principal Wife. Grammar we also say is *subaltern* to Rhetoric. The Word is form'd from the Latin, *sub*, and *alter*, another.

**SURCLAVIAN**, is applied to any thing under the Arm-pit or Shoulder; whether Artery, Nerve, Vein or Muscle.

**SUCCAVICUS**, in Anatomy, is a Muscle that ariseth from the lower Side of the Clavicula, near the Acromion; and descends obliquely to be inserted into the upper Part of the first Rib, near the Sternum.

**SUBCONTRARY** *Position*, in Geometry, is when two similar Triangles are so placed, as to have one common Angle, V. (Tab. Geometry Fig. 44.) at the Vertex, and yet their Base not parallel.

Thus, if the scalenous Cone BVD be so cut by the Plane CA, as that the Angle at C=D; the Cone is then said to be cut *Subcontrarily* to its Base BA.

**SUBCUTANEUS**, in Anatomy, a thin membranous Muscle, running under the Skin, call'd also *Quadratus*. It arises from a pretty broad Origin, from the hind Part of the Neck, and from the Pectoral Muscle below the Clavicula. It adheres firmly to the Panniculus Carnosus; from which it is not separated without Difficulty, and therefore was not anciently distinguish'd from it; and is inserted, obliquely, on each Side, into the lower Jaw-bone near the Skin, Lips, and sometimes the bottom of the Nose; all which Parts it draws downwards and a-way.

A Convulsion herein is call'd a *Spasmus Cynicus*. In some Persons; it reaches to the Ears; and in others not; which is the Reason some Folks have a Faculty of moving the Ears, which others want.

**SUBDUCTION**, in Arithmetick, the same as Subtraction. See *SUBTRACTION*.

**SUBDUPLERATIO**, is when any Number or Quantity is contained in another, Twice; thus THREE is said to be *Subduple* of 6, as 6 is dupe of 3. See *RATIO*.

**SUBJECT**, a Person under the Rule and Dominion of a Sovereign Prince or State.

Of *Subjects*, some are so by Birth, others by Acts of Naturalization. Anciently, the Lords call'd, abusively, those who held Lands or Fees of them, or ow'd them any Homage, *Subjects*.

*SUBJECT* is also used for the Matter of an Art or Science; or that which it considers, or wherein it is employ'd; Thus the human Body is the *Subject* of Medicine; and in this Sense, Anatomists call the Body they are dissecting, and wherein they read Lectures, their *Subject*. See *OBJECT*.

The *Subject* of Logic, is Thinking or Reasoning; but more particularly, in a Syllogism, one of the Terms of a Proposition is call'd the *Subject*, and the other the *Attribute*. See *PROPOSITION*.

In Poetry, the *Subject* is the Matter treated of; the Event related, or set in a fine View, and enrich'd with Ornaments.

*SUBJECT* is also the Substance or Matter to which an Accident is added. See *ACCIDENT*.

'Tis a Maxim, That two Contraries can never subsist in the same *Subject*.

**SUBJUNCTIVE**, in Grammar, the fourth Mood, or Manner of conjugating Verbs; thus call'd, because usually subjoin'd to some other Verb, or at least to some other Particle, as, *I see what you aim at. Though this be true, &c.* See *MOOD*.

The Greek is almost the only Language that properly has any *Subjunctive* Mood, though the French, Spanish and Italian have some Shew thereof. In all other Languages, the same Inflections serve for the Optative and the *Subjunctive* Moods: For which Reason, the *Subjunctive* Mood might be retrench'd from the Latin and those other Grammars; it not being the different Ways of signifying, which may be very much multiplied, but the different Inflections, that constitute the different Moods. See *OPTATIVE, &c.*

**SUBLAPSARY**, in Theology, or *Infralapsary*; a Term applied to such as hold, that God having foreseen the Fall of Adam, and in consequence thereof, the Loss of Mankind; resolv'd to give a Grace sufficient to Salvation to some, and to refuse it to others. See *GRACE*.

*Sublapsary* is used in Opposition to *Infralapsary*. See *INFRA LAPSARY*.

**SUBLIMATE**, a chymical Preparation, the Basis whereof is Mercury, or Quick-silver. See *MERCURY*.

There are two Kinds of *Sublimates*, *Corrosive* and *Sweet*.

*Corrosive Sublimate*, is prepared of Mercury, either crude or revived from Cinnabar, together with Spirit of Nitre, Vitriol lixivated to a Whiteness, and Sea Salt deacidrat; the whole reduced into a white brilliant Mass by *Sublimation*.

*Sweet Sublimate*, is the same with *Corrosive*, only temper'd and sweeten'd by the Addition of *Mercurius Dulcis*, and thus reduced into a white Mass full of hard glittering Pieces, like little Needles, by being pass'd several times over the Fire, and through several Mastrasses.

To take away all its Malignity, it should be dulcified at least Thrice.

*Corrosive Sublimate* is White, and full of shining, crystallin Veins. It cannot act, unless it find some Humidity to act on; and is then a violent Poison, which corrodes and destroys the Parts of the Body with much Violence. Oil of Tartar *per Deliquium*, is held the best Antidote against it.

*Sweet Sublimate*, is thus call'd, in Opposition to the *Corrosive*. 'Tis given internally, in the Cure of several Diseases, particularly Venereal ones. See *VENEREAL*.

**SUBLIMATION**, in Chymistry, an Operation which differs very little from Distillation, excepting, that in Distillation,

tion, only the Fluid Parts of Bodies are raised; but in this, the Solid and Dry; and that the Matter to be distilled may be either Solid or Fluid; but *Sublimation* is concerned only about Solid Substances. See DISTILLATION.

There is also another Difference, namely, that Rarefaction, which is of very great Use in Distillation, has hardly any Room in *Sublimation*; but the Substances which are to be *Sublimed*, being Solid, are incapable of Rarefaction; and so it is only Im; use can raise them.

However, it may not be improper to inquire a little more nicely into the Reason of such a Diversity in the Elevation of Bodies; why some do ascend with a gentle Heat, and others are not to be raised by the most vehement Fire: And such an Enquiry will more properly come in here, because this Heat contains all the Business of Volatility and Fixation. See VOLATILITY and FIXITY.

The Cause of this Elevation, and Ascend in the Particles of Bodies, is to be ascribed to the Fire; not only on the account of Impulse, but of another Property the Fire has; namely, to insinuate itself into all the Interstices of these Bodies, and thereby break the Cohesion of their Parts, so that at last they become divided into very small Parts, if not into the smallest that Art can reduce them into.

Particles thus separated and divided, lose much of their Gravity. For the Gravity of the same Particle decreases in the same Proportion as the Cube of the Diameter is lessened. Suppose, therefore, a Body, whose Diameter is 12: If, then, its Diameter be made less by 1, *viz.* 11, the Gravity of that Body will be only  $9\frac{1}{4}$ , or thereabouts: A Body, therefore, by being divided into very minute Corpuscles, is very easily *sublimed*.

Add, that the Surface of a Body decreases in a very different Manner from Gravity only as the Square of the Diameter is lessened. Where the Gravity decreases, in such a Series, as is express'd by the Numbers 1728, 1331, 1000, the Diminution of the Surface will observe this Proportion, *viz.* 144, 121, 100; and when, upon reducing the Diameter to 6, the Gravity becomes less than 2, the Surface will still amount to 36.

How much this contributes to a quick Ascend, will appear from the *Sublimation* of Camphire, Benzoin and Arsenick; whose Particles, as they cohere but loosely, are, for that Reason, dissolv'd into a larger Surface; upon which account they are the easiest to be *sublimed* of any; nay, these solid Particles, upon account of their Surface, will sooner ascend than some Fluids.

So Flower of Sulphur rises sooner than Oil, not only than that of Violari, but any other, though ever so light.

By this Contrivance of Nature, *viz.* that the Gravity of Bodies decreases in a triplicate, but their Surface in a duplicate Proportion of their Diameters; it comes to pass, that Bodies, which have a very different Gravity, may be raised with the same Force. Thus the Salts of Animals, as of Harts-horn, human Blood, of Vipers, &c. being composed of very minute Corpuscles, as is found by Experience, in distilling them, do easily ascend; because the Surface in them, is not lessened so much as the Gravity is; and the Salts of Vegetables, as of Tartar, Balsam, &c. which are of a more close Texture, by reason of their larger Surfaces, are without much difficulty raised.

The Corpuscles also of Minerals and Metals, though very compact and heavy, do, in some measure, give way to the Fire, and are capable of being *sublimed*. In all these Instances, the Breadth of the Surface, which exposts the Particles more to the Impetus of the Fire, is the Reason why they are raised with as much Ease, as if their Gravity had been lessened, by diminishing their Surface: So that Particles though ever so different in Weight, may be equally raised by the same Degree of Heat, if the Proportion of their Gravity be reciprocal to that of their Surfaces.

SUBLIME, in Discourse, something extraordinary and surprizing, which strikes the Soul, and makes a Work ravish and transport.

This is what Longinus, who has wrote expressly on the Subject, means by *Sublime*. The Definition, indeed, is not his, but M. Wolfen's; for the Author writing his Book after another of *Cicero*, on the same Subject, employ'd almost wholly in shewing what the *Sublime* is, declined defining it, as supposing it well known.

By the Definition, it may appear, that the *Sublime* is a very different Thing from what the Orators call the *sublime Style*. See STYLE.

The *sublime Style* necessarily requires big and magnificent Words; but the *Sublime* may be found in a single Thought, a single Figure, a single Turn of Words. A thing may be in the *sublime Style*, and yet not be *Sublime*, *i. e.* have nothing extraordinary and surprizing.

For Instance: *The Almighty Author of the Universe, with a single Word, created Light.* This, now, is in the *sublime Style*, yet it is not *Sublime*, there being nothing extraordinary in it, which another Person might not easily hit on. But as *God said, Let there be Light, and there was Light*;

so extraordinarily a Turn of Expression, which shews the Obedience of the Creature to the Orders of his Creator, is truly *Sublime*, and has something more than Human.

Longinus makes five Sources of the *Sublime*: The First, a certain Elevation of Mind, which makes us think happily. The Second, in the Pathetic, or that natural Vehemence and Enthusiasm, which strikes and moves us: These Two are owing almost wholly to Nature, and must be born with us; whereas the rest depend, partly, on Art. The Third is, the turning of Figures in a certain Manner, both those of Thought and of Speech. The Fourth, Nobleness of Expression, which consists of two Parts, the Choice of the Words, and the elegant, figurative Diction. The Fifth, which includes all the rest, is the Composition and Arrangement of the Words in all their Magnificence and Dignity. See PASTORAL, &c.

SUBLIMING Pots. See ALUVELLS.

SUBLINGUAL Glands, in Anatomy, two Glands under the Tongue, placed on each Side thereof. See TONGUE.

These with the Spongiosities filtrate a ferrous Humour, of the Nature of Saliva, which they discharge by little Ducts near the Gums, into the Mouth.

SUBMULTIPLE, in Geometry, &c. a *Submultiple Quantity*, is that which is contained in a certain Number of times in another, and which therefore repeated a certain Number of times, becomes equal thereto. Thus 3 is a *Submultiple* of 21.

In which Sense, a *Submultiple* coincides with a *Quota Part*. See QUOTA PART.

*Submultiple Ratio*, is that between the Quantity contain'd, and that containing: Thus the Ratio of 3 to 21 is *Submultiple*. See RATIO.

In both Cases, *Submultiple* is the Reverse of *Multiple*: 21, *e. gr.* being a *Multiple* of 3, and the Ratio of 21 to 3 a *Multiple Ratio*. See MULTIPLE.

SUBMULTIPLE	-	-	-	-	} See RATIO.
SUBMULTIPLE	<i>Subsuperparticular</i>				
SUBMULTIPLE	<i>Subsuperpartiens</i>				

SUBNORMAL, in Geometry, a Line which determines the Point in the Axis of a Curve, where a Normal or Perpendicular, rais'd from the Point of Contact of a Tangent to the Curve, cuts the Axis. See CURVE.

Or, the *Subnormal* is a Line, which determines the Point wherein the Axis is cut by a Line falling perpendicularly on the Tangent in the Point of the Contact.

Thus T M (Plate Conicks, Fig. 19.) being a Tangent to a Curve in M; and M R a Normal or Perpendicular to the Tangent; the Line P R intercepted between the Semiordinate P M and the Normal M R, is call'd the *Subnormal*.

Hence, 1<sup>o</sup>. In a Parabola, as A M, &c. the *Subnormal* P R is to the Semiordinate P M, as P M is to P T, and M R to T M.

2<sup>o</sup> In the Parabola, the *Subnormal* P R is Subduple the Parameter; and, consequently, an invariable Quantity.

SUBORDINATION, a relative Term, expressing the Degree of Superiority or Inferiority, between one thing, and another.

There is a Series of *Subordinations* running throughout all Nature. In the Church, there are several Degrees of *Subordination*, as of Deacons to Priests; Priests to Prelates, &c.

The like are observable in the secular State; In Offices of War, Justice, &c. and even

In the Sciences, Trigonometry is *subordinate* to Geometry; and in the Virtues, Abstinence and Chastity are *subordinate* to Temperance. In Music, some call the plagal Tones, *subordinate Tones*. See TONE.

SUBORNATION, is a secret or under-hand preparing, instructing or bringing in, a false Witness, or corrupting or alluring a Person to do such a false Act.

Hence the *Subornation* of Perjury, mention'd in the Act of General Pardon, 12 Car. II. c. 8. is the alluring to Perjury. See PERJURY.

SUBPOENA, is a Writ, whereby all Persons under the Degree of Peccage, are call'd into Chancery, in such Cases, where the Common Law hath made no Provision, so that the Party can have no Remedy by the ordinary Court of Common Law.

The Peers, in such Cases, are called by the Lord Chancellor's Letter, giving Notice of the Suit intended against them, and requiring them to appear.

There is also a *Subpoena Ad testificandum*, for summoning of Witnesses, as well in Chancery, as in other Courts.

There is also a *Subpoena in the Exchequer*, as well in the Court of Equity there, as in the Office of Pleas.

The Name is taken from the Words in the Writ, which charge the Party summoned to appear at the Day and Place assign'd; *Subpoena coram litonem*.

SUBPOPULATEUS, in Anatomy, See POPULATEUS.

SUBPRETION, the Action of obtaining a Favour from a Superior by Surprise, or by a false Representation.

*Subprepius*

*Subreption* differs from *Obreption*, in that *Obreption* is a false Expression of the Quality of a Thing or Fact, &c. And *Subreption*, a want of Expression; or a fraudulent Reti- cence or Concealment of a Thing, which would have render'd the obtaining of the Favour more difficult.

The Word is form'd from the *Latin*, *sub*, under, and *repto*, I creep.

**SUBREPTITIOUS** or **SURREPTITIOUS**, a Term applied to a Letter, Licence, Patent or other Act, fraudulently obtain'd of a Superior, by concealing some Truth, which had it been known, would have prevented the Concession or Grant.

The Benefit of Letters, Licences, &c. is forfeited, when they are found contrary to the Informations given; they being then reputed *Subreptitious*.

Papal Bulls and Signatures are Null and *Subreptitious*, when the true State of the Benefice, the Manner of the Vacancy, and other necessary Matters, are not justly signified to the Pope.

*Subreptitious* differs from *Obreptions*. See **SURREPTION**. **SUBROGATION**, in the Civil Law, the Action of substituting a Person in the Place, and intitling him to the Right, of another.

In its general Sense, *Subrogation* implies a Succession of any Kind; whether of a Person to a Person, or of a Person to a Thing.

There are two Kinds of *Subrogations*, the one *Conventional*, the other *Legal*.

The *Conventional*, is a Contract, whereby a Creditor transfers his Debt, with all Appurtenances thereof; to the Profit of a third Person.

*Legal Subrogation*, is that which the Law makes in favour of a Person, who discharges an antecedent Creditor; in which Case there is a legal Transilation of all Rights of the ancient Creditor to the Person of the new one.

This the Civilians more usually call *Succession*, as being wholly the Work of the Law, and to distinguish it from the *conventional Subrogation*, which they also call *Cession*. See **CESSION**.

The Word is form'd from the *Latin*, *Subrogatio*, of the Verb *Rogare*, which, among the ancient *Romans*, signified to ask, to interrogate; whence it was, that they call'd the Laws themselves *Rogationes*, in regard the People made them, upon being ask'd by the Magistrates. And as Laws made by the People could not be changed without their Consent, and without being ask'd a-new, if they thought good to have the Law wholly abolish'd, *Lex abrogatur*; if only a Part of it were to be abolish'd, *Lex derogatur*; and if any Clause or Amendment were added to it, *Lex subrogatur*.

The new Magistrates were also *Subrogated* in the Place of the old ones; for during the Time of the Republic, no Magistrate could be, but by Consent of the People, nor, of consequence, but by Law; since whenever the People thought good, was Law. This is what occasion'd *Salmastius* to say, That *Subrogare* and *Substituere per Legem*, were Reciprocal.

**SUBSCAPULARIS**, in Anatomy, a Muscle arising from the Basis and Side of the Scapula; and, spreading itself under the whole Convex, or Under-side of it, is inserted by a Semicircular Tendon, into the Neck of the *Oi Humeri*, and draws it down to the Side of the Trunk.

**SUBSCRIPTION**, the Signature put at the bottom of a Letter, Writing, or Instrument. See **SIGNATURE**.

In Church History, we meet with Instances of *Subscriptions*, wrote in the Blood of *Jesus Christ*. *Nicetas*, in the Life of *Ignatius*, speaking of the *Subscriptions* made at the Council, wherein that Father was deposed, says, *They subscribed*, not with common Ink, but, what strikes a Man with Horror, with a Pen dipp'd in the Blood of *Christ*. The Historian *Theophanes*, tells us, That Pope *Theodore* mix'd the Blood of *Christ* with the Ink, wherein he wrote the Deposition of *Pyrrhus*.

**SUBSCRIPTION**, in the *English* Commerce, is us'd for the Share or Interest, particular Persons take in a publick Stock, or a Trading Company, by writing their Names, and the Shares they require, in the Register thereof. Half the Commerce in *England* is carried on in *Subscriptions*. See **COMPANY**, **BURSE**, **FUND**, &c.

The *French* have likewise adopted the Word *Subscription*, using it in speaking of the Actions of the *India* Company.

A *Subscription* differs from an Action; in that the first is properly only an Action begun, or an Engagement, by making the first Payment, to acquit the rest in the Time limited; and that the other is the whole Action, perform'd in all its Parts. See **ACTION**.

**SUBSCRIPTION**, in the Commerce of Books, particularly signifies an Engagement a Person enters, to take a certain Number of Copies of a Book going to be printed; and the reciprocal Obligation of the Bookseller or Publisher, to deliver the said Copies on certain Terms.

The usual Conditions of these *Subscriptions*, are, on the Part of the Bookseller, to afford the Books cheaper to a Subscriber than to another, by one Third or one Fourth of the

Price; and on the Part of this latter, to advance half the Money in Hand, and to pay the rest on the Delivery of the Copies: An Agreement equally advantageous to the one and the other; as the Bookseller is hereby furnished with Money to carry on Works, which would otherwise be above his Stock; and the Subscriber, as it were, receives Interest for his Money, by the moderate Price the Book stands him in.

*Subscriptions* had their Rise in *England*, and 'tis but very lately that they are got into other Countries. They were first set on Foot, in the middle of the last Century, for the printing of *Walton's Polyglot Bible*, which is the first Book ever printed by Way of *Subscription*.

From *England*, they pass'd a few Years ago into *Holland*, and are just now introduced into *France*. *F. Montfaucon's* Collection of Antiquities, is the first Book there publish'd by *Subscriptions*, which were so very numerous, that great Numbers were refused. The same Method has been since propos'd, for the Publication of *S. Chrysofom* by the *Benedictins*; but not with equal Success.

All the other Books since printed by *Subscription*, are *M. Dacier's* Translation of *Plutarch's* Lives; the Description of *Versailles*, and *F. Daniel's* History of the *French* Militia.

In *England*, they are become exceedingly frequent; and their Frequency has render'd them liable to some Abuses, which begin to discredit them.

**SUBSEQUENT**, something that comes after another, particularly with regard to the Order of Time. When two Festivals happen on the same Day, the principal One is celebrated; and the other transfer'd to the *Subsequent* Day, i. e. to the Morrow.

**SUBSESQUIALTERATE**  
**SUBSUPERPARTICULAR**  
**SUBSUPERPARTIENS** } See **RATIO**.

**SUBSIDY**, in Law, any Aid, Tax or Tribute granted by Authority of Parliament to the King; on pressing Occasions of the State; levied either on Persons, Lands or Goods. See **DUTY**.

Such are the Land Tax, as 'tis call'd; which is usually at the Rate of three or four Shillings in the Pound, for Lands, and of two Shillings and eight Pence for Goods, &c. See **TAX**.

In the List of *English* Duties, or Impositions, are divers Kinds of *Subsidies*: Old *Subsidy*, Additional Imposition to the old *Subsidy*. New *Subsidy*, third *Subsidy*; Two-thirds *Subsidy*. See **DUTY**, **CUSTOM**, &c.

The ancient *Saxon* Kings had no *Subsidies* collected after the Manner of ours; but in lieu thereof, had several *Customs*, whereby they levied Money or personal Service on the People, for the Repairing of Cities, Castles, Bridges, military Expeditions, &c. which they call'd *Burghate*, *Brigbote*, *Herefare*, *Heregeld*, &c.

But upon the Lands becoming oppress'd by the *Danes*, King *Egbertus* in the Year 1007, agreed to pay them yearly 10000 Pounds for Redemption of Peace, which Sum was afterwards increased to 36000 Pounds, and at length to 48000 Pounds, which was call'd *Deneveld*, and was levied on Land; each Hide, or Plough-land, that of the Church only excepted, being call'd 12 Pence. See **DANEGELD**.

Hence the Tribute came to be call'd *Hydegiuma*, a Name that afterwards became common to all Taxes and *Subsidies* imposed on Lands; as those on Cattle, being call'd *Horngeld*. See **HIDAGE**.

Both these the *Normans* sometimes call'd from the *Greek*, *Taxes*, and sometimes from their own Language, *Tailloge*, and sometimes, according to the Custom beyond-Sea, *Subsidia* and *Auxilia*.

After the Conquest, these *Subsidies* seem to have been granted differently from what they now are; as every Ninth Lamb, every Ninth Fleec, every Ninth Sheep, &c. Sometimes the Rate was every Tenth, and sometimes every Fifteenth, &c. See **TENTH**, **FIFTEENTH**, &c. See also **BENEVOLENCE**.

In *France*, the King alone, by his own Authority, imposes *Subsidies* on his People, at his own Discretion. What *Grotius* says, that those who pay *Subsidies* to other Sovereigns, to engage them in their Defence against powerful Enemies, by so doing, acknowledge their own Weakness, and that such an Acknowledgment diminishes somewhat of their Dignity; must be understood of such States as are too weak to defend themselves, and who, in respect hereof, render themselves, in some measure, Tributary; not of such as subsisting by their own Strength, give *Subsidies* to their weaker Neighbours, to prevent their being over-run by others.

Such, e. gr. as the King of *France* is, with regard to *Sweden*, and several other Princes; to whom he generally grants *Subsidies* in the Treaties he concludes with them.

**SUBSTANCE**, in *Physics*, something that we conceive to exist of itself, independently of any created Being, or any particular Mode or Accident.

Thus a Piece of Wax is a *Substance*; because we can conceive it as subsisting of itself, and of its own Nature, without any Dependence on any other created Nature, or without any particular Mode, Form, Colour, &c. See *MODUS*.

*Spinoza* maintains, that there is but one only *Substance* in Nature, whereof all the Creatures are so many different Modifications; and thus he makes the Soul of the same *Substance* with the Body. The whole Universe, according to him, is but one *Substance*; which *Substance*, he holds endow'd with an Infinity of Attributes, in the Number of which are *Thought* and *Extensiveness*. All Bodies are Modifications of this *Substance*, consider'd as extended; and all Spirits Modifications of the same *Substance*, consider'd as Thought. See *BODY* and *THINKING*.

But Mr. *Lock's* Philosophy of *Substances*, is much more Orthodox: Our Ideas of *Substances*, that great Author observes, are only such Combinations of simple Ideas, as are taken to represent distinct Things, subsisting by themselves; in which the confused Idea of *Substance*, is always the Chief. Thus the Combination of the Ideas of a certain Figure, with the Powers of Motion, Thought and Reasoning, joined to *Substance*, make the ordinary Idea of Men; and thus the Mind observing several simple Ideas to go constantly together, which being premeditated to belong to one Thing, are call'd, and united in one Subject, by one Name; which we are apt, afterward, to talk of and consider as one simple Idea. See *IDEA*.

We imagine not these simple Ideas to subsist by themselves; but suppose some *Substratum*, wherein they subsist, which we call *Substance*. See *SUBSTRATUM*.

The Idea of pure *Substance*, is nothing but the supposed, yet unknown Support of these Qualities, which are capable of producing simple Ideas in us. See *QUALITY*.

The Ideas of particular *Substances* are composed out of this obscure and general Idea of Substance, together with such Combinations of simple Ideas, as are observed to exist together, and supposed to flow from the internal Constitution, and unknown Essence of that *Substance*.

Thus we come by the Ideas of Man, Horse, Gold, &c. Thus the sensible Qualities of Iron, or a Diamond, make the complex Idea of those *Substances*, which a Smith, or a Jeweller commonly knows better than a Philosopher. See *DEFINITION*.

The same happens concerning the Operations of the Mind, *viz.* Thinking, Reasoning, &c. which we concluding not to subsist by themselves, nor apprehending how they can belong to Body, or be produc'd by it; we think them the Actions of some other *Substance*, which we call Spirit; of whose *Substance* or Nature we have as clear a Notion, as of that of Body; the one being but the supposed *Substratum* of the simple Ideas we have from without; as the other of those Operations, which we experiment in ourselves within: So that the Idea of *Corporeal Substance* in Matter, is as remote from our Conceptions, as that of *Spiritual Substance*.

Hence we may conclude, that he has the perfect Idea of any particular *Substance*, who has collected most of those simple Ideas which do exist in it; among which, we are to reckon its active Powers and passive Capacities, though not strictly simple Ideas.

*Substances* are generally distinguish'd by secondary Qualities; for our Senses fail us in the Discovery of primary ones, as the Bulk, Figure, Texture, &c. of the minute Parts of Bodies, on which their real Constitutions and Differences depend. See *PARTICLE*.

But secondary Qualities are nothing but Powers, with relation to our Senses.

The Ideas that make our Complex ones of *Corporeal Substances*, are of three Sorts: First, the Ideas of primary Qualities of Things, which are discovered by our Senses; such as Bulk, Figure, Motion, &c. Secondly, the Sensible secondary Qualities, which are nothing but Powers to produce several Ideas in us, by our Senses. Thirdly, the apprehensions we consider in any *Substance*, to cause or receive such Alterations of primary Qualities, as that the *Substance* so alter'd, should produce in us different Ideas from what it did before.

Besides the complex Ideas we have of material *Substances*, by the simple Ideas taken from the Operations of our own Minds which we experiment in ourselves as Thinking, Understanding, Wishing, Knowing, &c. co-existing in the same *Substance*, we are able to frame the complex Idea of a Spirit: And this Idea of an immaterial *Substance*, is as clear, as that we have of a Material.

By joining these with *Substance*, of which we have no distinct Idea, we have the Idea of Spirit: And by putting together the Ideas of coherent, solid Parts, and Power of being mov'd joined with *Substance*, of which likewise we have no positive Idea; we have the Idea of Matter.

Further, there are other Ideas of *Substances*, which may be call'd *Collective*, which are made up of any particular *Substances*; considered as united into one Idea, as a Troop,

Army, &c. which the Mind does by its Power of Composition. These collective Ideas, are but the artificial Draughts of the Mind, bringing Things remote, and independent, into one View, the better to contemplate and discourse of them united into one Conception, and signified by one Name. For there are no Things so remote, which the Mind cannot, by this Art of Composition, bring into one Idea; as is visible, in that signified by the Name *Universe*. See *COMPOSITION*.

*SUBSTANTIAL*, or *SUBSTANCIAL*, in the Schools, something belonging to the Nature of *Substance*.

'Tis generally disput'd, whether or no, there be such Things as *Substantial Forms*, i. e. Forms independent of all Matter; or Forms that are *Substances* themselves. See *FORM*.

*Substantial*, is also us'd in the same Sense with *Essential*; in opposition to *Accidental*; in which relation, it gives room for abundance of Distinguis's. See *ESSENTIAL*.

*SUBSTANTIVE*, in Grammar, a Quality ascribed to a Noun or Name, when the Object it designs, is consider'd, simply, in itself, and without any regard to its Qualities. See *NOUN*.

When the Object is consider'd, as cloath'd with certain Qualities, the Noun is said to be *Adjective*.

For a more palpable Criterion; All Nouns, to which one cannot add the Word *Things*, are *Substantives*; and all those to which *Thing* may be added, are *Adjectives*. See *ADJECTIVE*.

*F. Buffier* observes, 'tis a common Mistake in Grammarians, to define a Noun *Substantive*, to be that which denotes or expresses a *Substance*.

The Mistake arises hence, that finding all *Substances* express'd by *Substantives*, they have call'd all Kinds of Nouns, *Substantives*. But it does not follow, that all Nouns design *Substances*; witness the Nouns *Accident*, *Lightness*, &c. which are far from expressing *Substances*, and yet are true Nouns *Substantives*. Perhaps Grammarians mean nothing here by *Substance*, but the Subject spoke of: If so, the Definition is laudable.

Nouns *Substantives* sometimes, become *Adjectives*; and Nouns *Adjectives* become *Substantives*. In effect, the Nature of the Adjective being to express the Quality of an Object; if that Quality be the Object itself spoke of, then, on the Foot of our Definition, it becomes a *Substantive*. If, I say, a good Prince, the Word good is apparently an Adjective, because it represents the Prince, as cloath'd with the Quality of Goodness. But if I say, The Good ought to be prefer'd to the Bad; 'tis evident, Good is the Subject spoke of, and, consequently, a *Substantive*.

Indeed, Custom does not allow us to use all Adjectives indifferently, as *Substantives*; nor all *Substantives*, as *Adjectives*. The Laws regard'd herein are as follow;

All Nouns either signify an Individual, as *Socrates*, *Alexander*, &c. or a Species, as Man, Horse, &c. or an essential Quality, as Rational, Material; or an accidental one, as Black, White, Good, Fair, &c. or a Dignity, Office, Art, &c. as King, President, Philosopher, &c.

Thus we have four Kinds of Nouns; whereof the 1<sup>o</sup> is very rarely taken adjectively; for as they signify Individuals or particular Beings, they can scarce be applied to any thing but the Thing they properly signify: yet we have sometimes known the Name of *Cato* taken Adjectively; as, *This is to be Cato, indeed*. Nor does *Malherbe* scruple to say in French, *Plus Mars que le Mars de la Thrace*.

2<sup>o</sup> Proper Names are sometimes converted into the Name of Dignities, &c. as *Cesar*, *Augustus*, &c. In which Case, they may be consider'd, in the same Light, as Nouns of the fourth Kind.

3<sup>o</sup> Those of the second Kind, are also sometimes taken Adjectively, as, He is much a Man, &c. The third Kind are Adjectives themselves: For the fourth Kind, all Grammarians rank them among *Substantives*; excepting *F. Buffier*, who will have them to be Adjectives; or, to use his own Term, *Modificatives*. Be this as it will, they are frequently used adjectively; He is more a King, and more a Philosopher than any of his Predecessors.

Now for Adjectives taken *substantively*, 1<sup>o</sup> Participles Passive, are very rarely thus taken; though we sometimes say, *The Lovers are less happy than the Lovers*; *The Tame have the Advantage of the Untame*; *The Beloved made a Sallet*, &c. And, 2<sup>o</sup> Participles Active are taken still more rarely for *Substantives*. We scarce ever, *e. gr.* say the Loving, the Reading; but the Lover, the Reader; yet we say Student, the Protestant, the Tenant, the Applicant, the Opponent, &c.

3<sup>o</sup> For Nouns Adjectives, those applied to Men, are not only used *substantively*, but are even become *Substantives* by Use; whether they be such as regard Religion; as Christian, Pagan, Mahometan, &c. Or Opinion; as Stoic, Peripatetic, Cartesian, &c. Or Country; as the English, French, Indians; Or the Temperament; as the Melancholic, Phlegmatic, Choleric, &c. Under the same Rule, are likewise comprehend-

hended abundance of Adjectives, signifying a Number of People agreeing in some common Attribute; as, the Learned, the Great, the Devout, the Brave, the Diffolute, &c. But Use is here to be regarded; for we don't say the Eloquent, as we say the Learned; but Elegant Writers, &c. 'Tis Custom, and the Ear alone, that are to decide about these Differences.

Again, Adjectives taken *substantively*, for other Things beside Men, are either so used, to signify a Number or Set of Things that have some common Quality; or to express an abstract Quality. In both which, as in those of Men, there are some authorized by Custom, and others form'd every Day on their Model.

With regard to which last, Use, again, and the Ear, are to decide. Here All the Adjectives of Colours, are used *substantively*; as the White, Black, Green, &c. Some of those of Qualities; as the Cold, &c. Those of Time; as the Past, Present, Future: And many of other Matters; as the Agreeable, the Sublime, the Principal, &c. Nor is it only in the Positive, but also in the Comparative and Superlative Degrees, that Adjectives are used *substantively*; as, The better of the two: The best of it, &c.

**SUBSTITUTE**, a Person appointed to officiate for another, in case of Absence, or other legal Impediment.

In the French Law, the *Procurators*, or *Proctors*, are obliged to name two of their Brethren for *Substitutes*, whose Names are wrote after theirs in the List; to receive Significations and Summons made in their Absence.

The Word is form'd from the *Latin*, *sub*, under, and *stituo*, I appoint, establish.

**SUBSTITUTE**, in Medicine, a Drug, or Remedy that may be used in lieu of another; or that supplies the Place of another of like Virtue, which is not to be had; call'd also a *Succedaneum*. See **SUCCEDANEUM**.

The Root of the great Centaureum, and sometimes Monk's Rhubarb, are used as *Substitutes* to Rhabarbar.

**SUBSTITUTION**, in Grammar, the using of one Word for another; or a Mode, State, Manner, Person or Number of a Word for that of another. This the Grammarians otherwise call *Syllepsis*.

**SUBSTITUTION**, in the Civil Law, a Disposition of a Testator, whereby he *Substitutes* one Heir to another, who has only the Use-fruit, and not the Property of the Thing left him.

*Substitution* is a kind of Inheritance, call'd *Fiduciary*, or *Fidei-commisso*, in regard the immediate Inheritor has only the Use or Fruit of the Thing; the Body thereof being substituted and affected to certain Persons, who are likewise to have the Use-fruit in their Times, but never the Property. In some Countries, the *Substitution* is perpetual; in France, it only holds to the fourth Generation.

*Substitution* answers to *Remainder*, in our common Law. See **REMAINDER**.

Among the *Romans*, there were abundance of these *Fiduciary* Heirs; who enjoy'd Inheritances, till they returned them into the Hands of the right Heir; and the Reason why they did not likewise restore the Fruits, or that the Fruits were not deem'd to make a Part of the Inheritance, but only of the Thing, was, that the *Fiduciary* was obliged to run the Risks, and to stand the Charge of the Culture of the Land.

**SUBSTITUTION**, in Algebra, Fractions, &c. is the putting in the Room of any Quantity in an Equation, some other Quantity, which is equal, but express'd after another Manner. See **QUANTITY**.

**SUBTRACTION**, in Arithmetic, the second Rule, or rather Operation, in Arithmetic; whereby we deduct a less Number from a greater, to learn the precise Difference.

Or, more justly, *Subtraction* is the finding of a certain Number from two Homogeneous ones given; which, with one of the given Numbers, is equal to the other. See **ARITHMETIC**.

The Doctrine of *Subtraction* is as follows;

To subtract a less Number from a greater.

1<sup>o</sup> Write the less Number under the greater, in such Manner, as that homogeneous answer to homogeneous Figures, *i.e.* Unites to Unites, Tens to Ten, &c. as we have directed under **ADDITION**. 2<sup>o</sup> Under the two Numbers, draw a Line. 3<sup>o</sup> *Subtract*, severally, Unites from Unites, Tens from Tens, Hundreds from Hundreds; beginning at the right Hand, and proceeding to the Left; and write the several Remainders in their correspondent Places, under the Line. 4<sup>o</sup> If a greater Figure come to be subtracted from a less; borrow an Unite from the next Left-hand Place; this is equivalent to 10, and added to the less Number, the *Subtraction* is to be made from the Sum; Or if a Cypher chance to be in the next Left-hand Place, borrow the Unite from the next further Place. By these Rules, any Number may be subtracted out of another greater. For Example;

If it be required, from  
To Subtract  
9800403459  
4743865263  
The Remainder will be found 5056538196

For, beginning with the right Hand Figure, and taking 3 from 9, there remains 6 Unites, to be wrote underneath the Line: Going then to the next Place, 6 I find, can't be taken from 5; wherefore, from the Place of Hundreds 4, I borrow one, which is equivalent to Ten, in the Place of Tens; and from the Sum of this 10 and 5, *viz.* 15, subtracting 6, I find 9 Tens remaining, to be put down under the Line. Proceeding to the Place of Hundreds, 2 with the 1 borrowed at the last Place, make 3, which subtracted from 4, leave 1. Again, 5 in the Place of Thousands, cannot be subtracted from 3; for which Reason, taking one from 4, in the Place of Hundreds of Thousands, into the empty Place of Tens of Thousands, the Cypher is converted into Ten Tens of Thousands, whence one Ten being borrowed, and added to the 3, and from the Sum 13 Thousand, 8 Thousand being subtracted, we shall have 5 Thousand to enter under the Line: Then subtracting 6 Tens of Thousands from 9, there remain 3. Coming now to take 8 from 4; from the 8 further on the Left, I borrow one, by means whereof, the two Cyphers will be turned each into 9. And after the like Manner, is the rest of the *Subtraction* easily perform'd.

If heterogeneous Numbers be to be subtracted from each other; the Unites borrow'd, are not to be equal to Ten; but to so many as there go of Unites of the less Kind, to constitute an Unite of the Greater. For Example;

l.	s.	d.
45	16	6
27	19	9
<hr/>		
17	16	9

For since 9 Pence cannot be subtracted from 6 Pence; 3 of the 16 Shillings, one is converted into 12 Pence; by which means, for 6 we have 18 Pence; whence 9 being subtracted, there remains 9. In like Manner, as 19 Shillings cannot be subtracted from the remaining 15; one of the 45 Pounds is converted into 20 Shillings, from which, added to the 15, 19 being subtracted, the Remainder is 16 Shillings. Lastly, 27 Pounds subtracted from 44 Pounds, there remains 17.

If a greater Number be required to be subtracted from a less, 'tis evident the Thing is impossible. The less Number, therefore, in that Case, is to be subtracted from the greater; and the Defect to be noted by the negative Character. *E.g.* If I am requir'd to pay 8 Pounds, and am only Master of 3; when the Three are paid, there will still remain 5 behind; which are to be noted, 5.

*Subtraction* is prov'd, by adding the Remainder to the *Subtrahend*, or Number to be subtracted: For if the Sum be equal to the Number whence the other is to be subtracted, the *Subtraction* is justly perform'd: For Example;

	l.	s.	d.	q.
9800403459	156	11	3	$\frac{1}{4}$
4743865263	21	17	2	$\frac{1}{2}$
<hr/>				
5056538196	134	14	0	$\frac{1}{4}$
<hr/>				
9800403459	156	11	3	$\frac{1}{4}$

**SUBTRACTION**, in Algebra, is perform'd by connecting the Quantities with all the Signs of the *Subtrahend* changed; and at the same time uniting such as may be united; as is done in **ADDITION**. Thus +7*a* subtracted from +9*a*, makes +9*a* - 7*a* or 2*a*.

In the *Subtraction* of Compound algebraic Quantities; the Characters of the *Subtrahend*, are to be changed into the contrary ones, *viz.* + into -; and - into +. See **QUANTITY**.

To Subtract Specious Numbers, or Quantities from one another; both those affected with the same, and those with contrary Characters.

1<sup>o</sup> If the Quantities design'd by the same Letter, have the same Signs; and the less be to be subtracted from the greater; the *Subtraction* is perform'd as in common Arithmetic, *e.g.*

5 <i>b</i> + 4 <i>d</i> - <i>f</i>	=	5 <i>b</i> .	+ 4 <i>d</i> .	- $\frac{1}{4}$	
2 <i>b</i> + <i>d</i> - <i>f</i>	=	2 <i>b</i> .	+ 1 <i>d</i> .	- $\frac{1}{4}$	
<hr/>					
3 <i>b</i>	3 <i>d</i> - 0	3	-	3 <i>f</i> .	0

2<sup>o</sup> If a greater Quantity be to be subtracted out of a less; the less must be subtracted out of the greater, and to the Remainder, must be prefix'd the Sign -, if the Quantities be affected with the Sign +; or the Sign +, if they be affected with -.

$$\begin{array}{r} 16a + bb - 9d = 16\text{lib.} + 2\text{lb.} - 9d. \\ 19a + 3b - 11d \quad 19 \quad + 3 \quad - 11 \\ \hline -3a - 1b + 2 \quad -3 \quad - 1 \quad + 2 \end{array}$$

3° If the Quantities have different Signs; the Subtraction is converted into Addition, and to the Aggregate is prefix'd the Sign of the Quantity, whence the Subtraction is to be made: For Example;

$$\begin{array}{r} 8a - 5c + 9d = 8\text{lib.} - 5 + 9d \\ 6a - 8c - 7d = 6 \quad - 8 - 7 \\ \hline 2a + 3c + 16d = 2\text{lib.} + 3 + 16 \end{array}$$

4° If the Quantities be express'd in different Letters; they must be connect'd; only the Characters of the Subtrahend must be changed into the contrary ones: For Example;

$$\begin{array}{r} a + b - c \quad a + d \\ d - e + f \quad c - e - g \\ \hline a + b - c - d + e - f \quad a + d - c + e + g \end{array}$$

SUBTRACTION of Logarithms

SUBTRACTION of Vulgar Fractions

SUBTRACTION of Decimals

See } LOGARITHM.  
} FRACTIONS.  
} DECIMALS.

SUBSTRUCTION, in Building. See FOUNDATION.

SUBSTYLAR Line, in Dialling, a right Line, whereon the Style or Gnomon of a Dial is erected. See GNOMON.

In Polar, Horizontal, Meridional and Northern Dials, the Substylar Line is the Meridian Line, or Line of 12 a Clock; or the Intersection of the Plane, whereon the Dial is delineated, with that of the Meridian. See MERIDIAN.

In Easterly and Westerly Dials, the Substylar Line, is the Line of Six a Clock; or the Intersection of the Plane, whereon the Dial is delineated, with the prime Vertical. See DIAL.

SUB-TANGENT, of a Curve, is the Line that determines the Intersection of the Tangent with the Axis; or, that determines the Point wherein the Tangent cuts the Axis, prolonged. See CURVE.

Thus, in the Curve A M, &c. (Tab. Analyticks, Fig. 10.) the Line T P intercepted between the Semiordinate P M, and the Tangent T M, is the Sub-tangent. And P R is to P M, as P M to P T; and P M to P T, as M R to T M.

'Tis a Rule in all Equations, that if the Value of the Sub-tangent come out positive, the Point of Intersection of the Tangent and Axis, falls on that Side of the Ordinate, where the Vertex of the Curve lies; as in the Parabola and Paraboloides.

If it come out Negative, the Point of Intersection will fall on the contrary Side of the Ordinate, in respect of the Vertex or beginning of the Absciss; as in the Hyperbola, and Hyperboliform Figures.

And, universally, in all Paraboliform, and Hyperboliform Figures, the Sub-tangent is equal to the Exponent of the Power of the Ordinate, multiplied into the Absciss. Thus in the common Parabola, whose Property is  $px = y^2$ . The Sub-tangent is in Length, equal to  $x$ , the Absciss multiplied by 2; the Exponent of the Power of  $y$ , the Square of the Ordinate; that is, it is equal to twice the Absciss; and by the former Rule for Paraboliform Figures, it must be taken above the Ordinate, in the Axis produced.

Thus, also, in one of the cubical Paraboloids, where  $pxx = y^3$ . The Length of the Sub-tangent will be  $\frac{2}{3}$  of the Absciss. Thus in the Figure, you will see that the Sub-tangent in any Curve is a Line, which determines the Intersection of the Tangent in the Axis.

SUBTENSE, in Geometry, a right Line, opposite to an Angle, and presumed to be drawn between the two Extremities of the Arch, which measures that Angle. See ARCH.

The Subtense of the Angle coincides with the Chord of the Arch. See CHORD.

In every re-angled Triangle, the Square of the Subtense of the right Angle, is equal to the Squares of the Subtenses of both the other Angles; by the 4th Prop. of Euclid. This wonderful Property of that Triangle, was first discover'd by Pythagoras, who in the Transport of Joy, hereby occasion'd, sacrificed a Hecatomb. See TRIANGLE.

The Word is form'd from the Latin, *sub*, under, and *tendo*, I stretch.

SUBTERRANEOUS, something under Ground. See FOSSIL.

Naturalists talk much of Subterraneous Fires, as the Cause of Volcanos. See FIRE and VOLCANO.

Subterraneous Winds, as the Cause of Earthquakes. See EARTHQUAKE.

Mr. Boyle gives us an Instance, from the Dissertation de Atmirand. Hungar. Aquis, of a huge Subterraneous Oak

dug out of a Salt Mine in Transylvania, so hard, that it could not easily be wrought on by Iron Tools; which yet, being expos'd to the Air out of the Mine, became so rotten, that in four Days, it was easy to be broken and crumbled between one's Fingers.

Mr. Derham adds, That the Trees turned out of the Earth by the Breaches at West Thorrock and Dogstons, though probably no other than Alder, and interred many Ages ago, in a rotten, oozy Mould, were so exceedingly tough, hard and found at first, that he could make but little Impressions on them with the Strokes of an Ax; yet being expos'd to the Air and Water, soon became so rotten, as to be crumbled between the Fingers.

SUBTILE, in Physicks, intimates a Thing exceedingly small, fine, and delicate; such as the Animal Spirits, &c. the Effluvia of odorous Bodies, &c. are supposed to be. See EFFLUVIA.

One kind of Matter is only more subtle than another, in that being divided into smaller Parts, and those, too, more agitated; on the one hand, it makes less Resistance to other Bodies; and on the other, insinuates itself more easily into their Pores.

The Cartesians suppose a subtilis Matter for their first Element. See CARTESIANISM and ELEMENT.

This they lay down as so exceedingly Fine, that it penetrates the minute Pores of Glass and other solid Bodies; and from this they account for most of the Phenomena of Nature. See VACUUM, PLENUM, SUCTION, &c.

Yet they don't pretend to prove the Existence of this Matter, otherwise than by Consequence. See MATERIA SUBTILIS.

SUBTILE Matter. See MATTER.

SUBTILIZATION, the Act of subtilizing, or rendering any thing smaller and subtiler; particularly, the dissolving or changing a mixt Body into a pure Liqueur, or a fine Powder.

SUBTRIPLE Ratio, is when one Number or Quantity is contain'd in another three times; thus 2 is said to be Subtriple of 6, as 6 is Triple of 2. See RATIO.

SUBURBICARY, an Epithet given to those Provinces of Italy, &c. which compos'd the ancient Diocess or Patriarchate of Rome. See PROVINCE.

The Term is form'd from the Latin, *sub*, under, and *urbis*, City. They were also sometimes call'd Urbicary Provinces.

Authors usually reckon Ten of these Suburbicary Provinces; whereof Italy, from the Po to the Heel made Seven, and the Isles of Sicily, Sardinia, and Corsica, the other Three.

Yet Salmasius will have the Suburbicary Provinces confined to those Four in the Neighbourhood of Rome, to which the Authority of the Prefect of Rome extended; and these he makes the Limits of the Diocess of ancient Rome. See DIOCESE.

F. Sirmond takes the other Extreme, and comprehends all the West under the Name of Suburbicary Provinces. Rufinus, who lived in the Age of the Council of Nice, explains the Power ascribed to the Pope, in the Sixth Canon of that Council, by saying, That he had the Care and Intendance of the Suburbicary Provinces. Hence, the different Sentiments of Authors, with regard to the Suburbicary Provinces; some only considering the Pope as Bishop of Rome; others, as Patriarch of the West, &c.

SUCCEDANEUM, in Pharmacy, a Remedy substituted in the Place of another first prescribed, when the Ingredients are wanting, necessary for the Composition of that other. See SUBSTITUTE.

Substitute and Succedaneum, are of equal Import, unless, with some Authors, we chuse to use Substitute, where a Simple of like Virtue is put for another; and Succedaneum, where a Compound is us'd with the same Intention.

The Word is form'd from the Latin, *Succedo*, to succeed, to come after.

SUCCENTURIATE, in Anatomy. See RENES SUCCENTURIATE.

SUCCENTURIATION, the Act of Substituting. See SUBSTITUTION.

SUCCENTURIATUS, in Anatomy, a Muscle, call'd also Pyramidalis. See PYRAMIDALIS.

SUCCESSION, in Philosophy, an Idea we get, by reflecting on that Train of Ideas constantly following one another in our Minds when awake. See IDEA and MODE.

The Distance between any Parts of this Succession, is what we call Duration. When this Succession of Ideas ceases, we have no Perception of Time or Duration thereof; but the Moment we fall asleep, and that wherein we awake, seem connect'd. See DURATION.

They, who think we get the Idea of Succession from our Observation of Motion by our Senses, will come into Mr. Lock's Sentiment, above, when they consider that Motion produces an Idea of Succession no otherwise, than by producing a continued Train of distinguishable Ideas.

A Man that looks on a Body moving, perceives no Motion, unless that Motion produce a constant Train of successive Ideas. But where-ever a Man is, though all Things be at

at rest about him, if he Thinks, he will be conscious of Succession.

**SUCCESSION**, in Astronomy. The Succession of the Signs, is the Order wherein they follow each other, and according to which, the Sun enters, successively, into one, then into another, call'd, also, *Consequence*. This Order is express'd in the two following Technical Verbes;

*Sunt Ariet, Taurus, Gemini, Cancer, Leo, Virgo, Libraque, Scorpius, Arcivevus, Capri, Amphora, Pisces.*

When a Planet is direct, it is said to go according to the Order and Succession of the Signs, that is, from Ariet to Taurus, &c. when Retrograde, it is said to go contrary to the Succession of the Signs, viz. from Gemini to Taurus, then to Ariet, &c. See SIGN.

**SUCCESSION**, in Law, implies a Right to the Universality of the Effects left by a Defunct.

Of this, there are several Kinds, *ab-intestate, intestate, &c.*

A Succession, *ab-intestate*, is that, a Person has a Right to by being next of Kin, which is, what we call, being next Heir at Law. See AB-INTESTATE.

A testamentary Succession, is that, a Person comes to by Virtue of a Will.

Succession in the direct Line, is that, coming from Ascendants or Descendants. Collateral Succession, is that, coming by Uncles, Aunts, or other Collaterals.

A *patent or absolute* Succession, is a burdensome or vexatious One, which no Body will accept of. There is no real Succession in Benefices; for here, no Body inherits. Successions were anciently divided into Noble and Base.

In Effects, that cannot be divided, as Kingdoms, &c. the Succession falls on a single Head, which is usually the eldest Son of the Deceased, as being supposed an indivisible Representative of his Father. In Effects, that are divided, all the Children represent their Father. 'Twas on this Principle, M. Courtin observes, that each of the Sons of Jacob had his Share assign'd him in the Land of Promise. 'Tis true, Manasseh and Ephraim, the two Sons of Joseph, had likewise their Shares; but this was because a double Portion had been allotted their Father, wherein he was treated as elder Brother, in consideration of the great Services he had done his Father and Brethren.

**SUCCESSOR**, a Person who has a Right to hold the Place another held before him; whether he arrive at it by Election, Collation, Inheritance, or otherwise.

Our Historians tell us, that Queen Elizabeth could never bear to hear of a Successor. The King of the Romans is Pre-emptive Successor to the Empire. The Canonists say, a Coadjutor is a necessary Successor to a Prelate; and a Reignatory to the Reignant.

The Civilians say, a Titular Usu-fructuary, can do nothing to the Prejudice of his Successor.

**SUCCINUM**, in Pharmacy, *Karabe* or *Amber*; a bituminous Juice or Resin, which from a Floor grows hard and brittle. See AMBER.

The Whitest, and most Transparent, is accounted best; it is of no great Use in Medicine, *ser se*, as its Texture seems too compact to open and yield to the natural Elaborations; though some have a great Opinion of it, as a Balsamic, and gave it in Gonorrhoea's particularly.

But it is certain, that what Pharmacy extorts from it, is of wonderful Efficacy, especially in nervous Cases.

**SUCCISA**; a medicinal Herb, call'd also *Morsus Diaboli*, or the Devil's Bit.

'Tis a powerful Sudorific, inasmuch that Sir Theophrastus Mayerne observes, in the Philosophical Transactions, laying a Person sick of a Plague, or other malignant Fever, on a Bed thereof, moderately hot; he shall sweat 'till they take him off; and much more, if he drink of the Decoction or Juice of the Herb. The Succisa is now little used.

**SUCCOTRINE Aloes**. See ALOES.

**SUCCUBUS** or **SUCCUBA**, a Term used to signify a Demon, who assumes the Shape of a Woman, and, as such, lies with a Man.

Some Authors use *Incubus* and *Succubus*, indiscriminately; but they ought to be distinguish'd; *Incubus* being only properly us'd, where the Demon is supposed to be in Form of a Man, and, as such, lies with a Woman. See INCUBUS.

**SUCCULA**, in Mechanicks, a bare Axis, or Cylinder, with Staves in it to move it round, without any Tympanum. See AXIS.

**SUCCUS Pancreaticus** } See { PANCREATIC Juice.  
**Succus Nervus** } { NERVOUS Juice.

**SUCKERS** or Offsets, in Agriculture, Gardening, &c. are young Shoots, that proceed from the Root of a Tree, and are of the same Kind and Nature with the Tree from which they spring; for such as grow from Trees raised by Grafting or Inoculation, follow the Nature of the Stock. See ENGRAFTING.

They sometimes put forth near the Body of the Mother-plant; but other Suckers at more Distance are best; yet the former removed when there is least Sap in the Top, and preserving what Fibrous Roots are upon them, often prosper well. When they are taken up, the Ground is to be well opened, and if they grow from the Body of the Tree, or great Roots, they must be cut off close to the Stem, and set presently. See STOCK.

It forwards much the springing out of Suckers, to bear the Roots of Trees, and sit them in some Places.

**SUCKING-Pump**. See PUMP.

**SUCTION**, the Act of Sucking, or of drawing up a Fluid, as Air, Water, &c. by the Mouth and Lungs. Air is suck'd in by the Muscles of the Thorax, and Abdomen, distending the Cavity of the Lungs and Abdomen, by which means the Air included therein, is rarified, and ceases to be a Counterbalance to the external Air, which, of consequence, is driven in by the Pressure of the Atmosphere through the Mouth and Nostrils. See RESPIRATION.

Air is suck'd through a Pipe, in the same Manner as with the naked Mouth: It being here all one as if the Mouth were extended the Length of the Pipe.

The Suction of heavier Liquors is perform'd after the same Manner, e. g. in lying prone to drink out of a Spring, &c. the Lips are applied close to the Surface of the Water, so as to prevent any Passage of the Air between them; then the Cavity of the Abdomen, &c. being distended as before, the Pressure of Air incumbent on the Surface of the Water without the Circumference of the Mouth, prevailing over that upon the Water within the same, the Fluid is raised, from the same Principle as Water in a Pump. See PUMP.

In sucking a heavy Liquor, as Water, through a Pipe, the longer the Pipe is, the greater Difficulty is found in the Suction; but the Bigness or Diameter of the Pipe, makes no Alteration therein. The Reason of this, arises from the great Principle in Hydrostatics, that Fluids press according to their perpendicular Altitudes. See FLUID.

For, as the external Air raises Columns of the Fluid with greater or less Difficulty, as their Altitudes are less, nor as their Thicknesses are so; if two such Columns be conceived, the one twice as high as the other, and that other twice as thick as this first; though the very same Quantity of Water is to be suck'd through the Pipe, and the Force of the Air to raise it be exactly the same, in both Cases; yet there will be required a greater Distension of the Breast, and a greater Nisus of the Muscles, to raise and suck the former than the latter.

From what we have said, it evidently enough appears, that what we call Suction, is not perform'd by any active Faculty in the Mouth, Lungs, &c. but is perform'd by the mere Impulse and Pressure of the Atmosphere. See AIR.

**SUCULA** or **SUCCULA**, is a Term in Mechanicks, for a bare Axis or Cylinder, with Staves in it, to move it round; but without any Tympanum or Peritrochium.

**SUDAMINA**, little Pimples in the Skin, like Millet Grains, frequent in Youth, especially those of a hot Temperament, and their use much Exercise.

**SUDATORY**, a Name given by the ancient Romans, to their Sweating-houses; sometimes also call'd *Laconica*.

The *Sudatory* was a Species of their *Hypocausta*. See HYPOCAUSTUM.

**SUDOR**, in Medicine, See SWEAT.

*Sudor Anglicanus*, or the English Sweat, is an Epidemic Disease, first perceived in England, in 1485.

'Twas, properly, a sort of Plague; thus call'd, because attended with an extraordinary kind of Sweat.

It made its Return four Times in the Space of 66 Years, viz. in 1506, 1517, 1528 and 1551.

It began with a Sweat, which never ended, but either with the Death of the Patient, or his Recovery. If he survived 24 Hours, he was safe. Few People escaped of it at first; too much Care, and too little, were found equally destructive.

The Patient was to wait, without stirring, either in his Bed, or in his Cloaths, according to the Condition Nature was surpris'd in; without barchening him either with Remedies or with Foods; without cloathing either too much or too little; and, if possible, without either eating or drinking. The Sweat to be kept up, without either promoting it, by any extraordinary Heat, or checking it by the least Cold.

This was what was found by Experience; and which was at length practis'd, with happy Success. The Disease was first felt on the 21st of September, and in the same Day, spread itself all over England; where, after a great Mortality, it stopp'd all at once, towards the End of October.

Its Ravages were so great, that in some Parts, it took off a Third Part of the People, in a very little Time.

At its Return under Henry VIII. in 1516, it was as general, and as dangerous as before, and again disappear'd all at once.

At the third Attack, in 1528, 'twas less fatal; inasmuch that Bellay, Bishop of Bayonne, then Ambassador in England,

England, who Sweat like the rest, tells us, that of Forty thousand Souls, fix'd with it in London, only Two thousand died. In 1534, it pass'd over into Ireland, where it kill'd great Numbers.

**SUDORIFIC**, in Medicine, a Remedy that causes, or promotes Sweat. See SWZAR.

*Sudorifics* only differ from *Diaphoreticks*, in the Degree of their Action; the one promoting sensible Perspiration, the other insensible. See DIAPHORETICKS.

To the Class of *Sudorifics*, belong, 1<sup>o</sup>, all Things that moving violently through the Body, attenuate the Humours, and accelerate their Motion.

2<sup>o</sup> Such Things, as at the same Time diminish the Resistance in the Sudatory Vessels about the Cutis.

To which sume add a third Kind, viz. such as absorb the Acidities of the Blood, and thus set at liberty the Matter of the Sweat.

The first Intention is chiefly effected, by a copious drinking of very hot Waters; by Acids drawn from Vegetables by Fermentation and Distillation; or those of Fossils, attenuated by repeated Distillations, especially if they be drunk mix'd with hot Water; by *Alcalis*, both volatile and fix'd, diluted with hot Water; by all compound *Salts*, dissolved in Water; by *Sopa's*, metallic Crystals, or the attenuated Parts of Metals themselves, as *Silivum Diaphoreticum*, fix'd Sulphur of Tachenus; *Bezoardic Mineral*, *Diaphoretic Mercury*, *Diaphoretic Gold*, &c. by sharp, subtle, acrimonious Aromatics, as *Alystantium*, *Aloetinum*, *Opium*, *Afforgum*, *Ami*, *Astlepis*, *Aristolochia*, *Gum Ammoniac*, *Carabus Benediculus*, *Caryocary*, *Cumamum*, *Camomile*, *Saffron*, *Capillus Veneris*, *Civiva*, *Dittany*, *Eupatorium*, *Gentian*, *Hyssop*, *Lentrol*, *Mint*, *Leek*, *Rosemary*, *Sage*, *Savin*, *Sassafras*, *Scordium*, *Thyme*, *Veronica*, *Nettle*, and other Medicines compounded hereof, as *Treacle*, *Mithridate*, *Diascordium*, *Orvietan*, &c.

The Second is chiefly effected, by cleansing the Skin, by vaporous Lotions, Baths, and Frictions; by relaxing the Cutaneous and Subcutaneous Vessels, which is best done by hot Water sprinkled all over the Body, the Head excepted; by increasing the external Heat about the naked Body, as by the Warmth of a Bed, a Vapour-bath, &c.

The Third is effected by Astringents, as *Corals*, *Crabs-Eyes*, *Diaphoretic Antimony*, *Bezoard*, &c. See each under its proper Article.

**SUET**, a kind of Fat, found in Sheep, Oxen, Hogs, &c. which melted down and clarified, makes what we call Tallow, used in the making of Candles. See FAT and TALLOW.

Anatomists, &c. distinguish four Kinds of Fat in the Body of an Animal. The first, which fixes itself, and after melting, cooks into a very firm Consistence, they call *Suet*.

The second is in greatest Abundance in the lower Belly, and about the Kidneys. The Word is form'd from the *Latin*, *Suadum*, a *Sue*.

*F. le Comptre* mentions a Tree in *China*, that bears *Suet* or Tallow. 'Tis much about the Height of our Cherry Tree: Its Fruit is cover'd with a Rind, which divides into 3 Segments of a Sphere, which when ripe, open in the middle like a Chestnut, and shew Three white Grains, of the Size of our Small-nuts. The Flesh, or Pulp of these Grains, which include a little Stone, has all the Qualities of our *Suet*, the Colour, Smell, Consistence, &c. and accordingly they make Candles of it; after first melting it down with a little Oil of Olives, to make the Paste the softer and more manageable.

**SUFFICIENT**, in the School Theology. *Sufficient Grace*, is a Help or Assistance God gives to Man, to enable him to act and perform his Duty. See GRACE.

'Tis allowed an Article of Faith, that Grace is necessary, and that without Grace, nothing that is Good, or that can any way intire to Heaven, can be done: 'Tis allow'd too, that God does not refuse the necessary Assistances; and 'tis allow'd, that Men, frequently, either does not act, when he should, or acts what he should not.

From these Principles, which are generally admitted by all Sects, however different in other respects, it follows, that there is some Assistance of God which Man resists; some, wherewith Man does not act, wherewith yet he might act; or some, whereby he does Evil, by which he might do well. 'Tis this Assistance that is call'd *Sufficient Grace*; because *sufficiens* to make us act, though we don't act with it.

**SUFFITUS**, or **SUFFUMENTUM**, in Medicine, a thickish Powder, &c. prepared of odoriferous Plants, Gums, &c. which being thrown on Coals, the Vapours or Steam thereof, are received by Smelling. See FUMIGATION.

**SUFFOCATION**, in Medicine, &c. a Loos or Obstruction of Respiration.

*Suffocations* sometimes arise from a too great Abundance of Blood thrown on the Lungs, or the Muscles of the Larynx, and preventing the Ingress of the Air; as is the Case in Squinancies, suffocating Cancers, Peripneumonies, &c. See SQUINANCY, &c.

The Fumes of Wines, or strong Beers, when boiling, cause *Suffocation*, by interrupting the Circulation of the Blood.

And the same may be observed of the Fumes of Lime, wherewith Walls are whitened; and those of Charcoal, Antimony, Sulphur, Vitriol and Spirit of Nitre.

The *Suffocation* under Water, is owing partly to the Passage of the Air being stopp'd up, and partly to the Irruption of the Water into the Breath. See DROWNING.

The *Suffocation of the Womb or Matrix*, is a Disease pretty frequent in Women, call'd also, *Fits of the Mother*.

In this, the Patient imagines a malignant Vapour rising from the Matrix, and so pressing against the Lungs and the Diaphragm, as to prevent the free Motion necessary to Respiration.

Its true Cause, is a Convulsion of the Muscles of the Larynx, which straightens the Wind-pipe, and prevent the Air's passing into the Lungs. Hence it is, that *Hyberic Women* feel Contractions in the Throat, as if one were strangling them with a Cord. See HYBERIC.

In *France*, they dispatch their People that are raving Mad, by suffocating them between two Pillows.

**SUFFRAGAN**, in the Ecclesiastical Polity, a Term applied to a Bishop, with respect to his Arch-Bishop, on whom he depends, and to whom Appeals are made from the Bishop's Official. See BISHOP.

In this Sense, the Archbishop of *Canterbury* has Twenty-one *Suffragans*; and the Archbishop of *York* Four.

The Term was never heard of before the VIIIth Century.

Some distinguish between *Bishop* and *Suffragan* thus: *Dicitur Episcopi qui Archiepiscopo Suffragani & assistere reventur: Et Suffragani dicuntur quia eorum Suffragis cause Ecclesiasticæ indicantur*. *Spelman*. Others say, they are call'd *Suffragans*, because when call'd by the Metropolitan to a Synod, they have a Right of *Suffrage* or of Voting; or because they could not be consecrated without his *Suffrage* and Consent.

**SUFFRAGAN** is also used for a *Chorepiscopus*, or an Assistant-Bishop, or a Conductor, who has a *Tithe*, in *paribus insidivium*, and assists another in the Discharge of his Function, or discharges it himself in the Absence of that other. These some call *Subsidiary Bishops*.

By Statute 36 *Henry VIII.* every Bishop and Archbishop is allowed to appoint, some one, some two, and some three *Bishops-Suffragans*; the Seats or Residences wherof, are fix'd by the same Statute.

The *Suffragan-Bishop* for the Diocese of *Canterbury*, is to be at *Dever* only; for *York*, at *Nottingham* and *Hull*; for *London*, at *Colchester*; for *Winchester*, at *Guisford*, *Southampton*, and in the Isle of *Wight*, &c.

*Des Cange* observes, that the Title *Suffragan* has also been given to such Priests as are subject to the Visitation of the Arch-deacon: And *Suffragans of the Pope*, to the Bishops of such Dioceses, as are immediately subject to the Pope.

**SUFFRAGE**, a Voice or Vote, given in an Assembly, where something is deliberated on, or where a Person is elected to an Office or Benefice. See VOYE.

*Suffrages* are sometimes given by Word of Mouth; and sometimes in Writing, as at Elections lyable to a Scrutiny. See SCRUTINY.

The President of the Assembly usually collects the *Suffrages*.

The Word is form'd from the *Latin*, *Suffragium*, which anciently signified *Silver*, as appears in the VIIIth Novel of *Justinian*: *Ut Judices sine Suffragio fiant*; and the VIth Novel: *Qui emerit presulatum per Suffragium, Episcopatu & Ordine Ecclesiastico exsistat*.

*Suffrages of the Saints*, in the *Romish Church*, are the Prayers and Intercessions they are supposed to make to God, in behalf of the Faithful.

**SUFFERANCE**, in ancient Customs, was a Delay, or Respite of Time the Lord granted his Vassal, for the Performance of Fealty and Homage; so as to secure him from any feudal Seizure. See SERVICE, VASSAL, FEE, &c.

*Sufferance*, say the Authors, is equivalent to Fealty and Homage, while it holds.

The Word is also used for a Delay which the Lord grants his Vassals, to free their Hands of Fees or Inheritances they have acquired, till they have pay'd the Due of Indemnity, &c.

**SUFFRUTEX**, among Botanists, a Name given to a low, woody, perennial Species of Plants, sending out no Leaves from its Root, and beginning to be branched from the very bottom of the Stalk; such as *Lavender*, *Rue*, *Sage*, &c. See PLANT, TREE, &c.

**SUFFUMIGATION**, in Medicine, a Term applied to all Remedies that are received into the Body in form of Fumes, i. e. of Smoak or Perfumes. See SMOAK.

These are composed of different Matters, according to the Nature of the Disease.

*Suffumigations* are intended to soften sharp, serous Humours, to provoke or check the Course of the Menes, to raise a Salivation in venereal Evils, &c.

The Word is form'd from the *Latin*, *suf*, under, and *fumus*, Smoak.

**SUFFUSION**, in Medicine, an overflowing of some Humour, shewing itself in the Skin; particularly that of the Blood or Bile. See **BLUISHING**.

That Redness ordinarily arising from Shame, is only a *Suffusion* of Blood appearing in the Cheeks.

The Jaundice is a *Suffusion* of Bile over the whole Body. See **JAUNDICE**.

**SUFFUSION** is also used for a little Film or Pellicle, form'd in the aqueous Humour of the Eye, before the Pupil; call'd, also, *Cataract*. See **CATARACT**.

**SUGAR**, *Saccharum*, a very sweet, agreeable Juice, express'd from a kind of Canes, growing in great Plenty in the East and West Indies; particularly in *Madaga*, *Brazil* and the *Caribbee* Islands.

'Tis a Question not yet decided among the Botanists, &c. whether the Ancients were acquainted with this Canes, and whether they knew how to express the Juice from the same? What we can gather from the Opinions and Arguments of the one Parry and the other; is, That if they knew the Canes and the Juice, they did not know the Art of Condensing, Hardening and Whiting it, and, of consequence, knew nothing of our *Sugar*.

Some ancient Authors seem to mention *Sugar*, under the Name of *Indian Salt*; but they add, that it ooz'd out of the Canes of itself; and there harden'd like a Gum; and was even friable between the Teeth, like our common Salt; whereas, ours is express'd by a Machine on purpose, and coagulated by the Fire.

Theirs, *Salmastus* tells us, was refreshing and loosening, whereas ours is hot, and excites Thirst. Hence, some have imagin'd, that the ancient and modern *Sugar-Plant* were different: But *Martinius*, on *Dioscorides*, C. 75. makes no doubt they were the same; and others are even of Opinion, that ours has a laxative Virtue, as well as that of the Ancients, and that it purges Pituita.

The Generality of Authors, however, agree, that the ancient *Sugar* was much better than the Modern; as consisting of only the finest and matur'd Parts, which made themselves a Passage, and were condensed in the Air.

The Interpreters of *Avicenna* and *Serapion*, call *Sugar*, *Spodium*; the *Perfians*, *Tabat*, and the *Indians*, *Mandac*.

*Salmastus* assures us, that the *Arabs* have had the Art of making *Sugar*, such as we now have it, above 800 Years. Others produce the following Verses of *P. Terentius Varro Atacinus*, to prove that it was known before *Jesus Christ*.

*Indica non magna nimis Arbore creviscit arunda,*  
*Blivis extensus premior radicibus humor,*  
*Dulcisa cui noqueant succo condendere mella.*

Another Question among Naturalists is, Whether the *Sugar Canes* be originally of the *West Indies*; or whether they have been translated thither from the *East*?

The Learned of these last Ages, have been much divided on the Point: But since the Dissertation of *F. Lobst*, a Dominican Missionary, publish'd in 1722, there is no longer room to doubt, but that the *Sugar-Canes* is as natural to *America* as *India*; all that can be said in favour of the latter, is, That the *Spaniards* and *Portuguese* learnt from the *Oriental*, the Art of expressing its Juice, boiling it, and reducing it into *Sugar*.

#### Culture of the *SUGAR-CANE*.

The Reed or Rush, whence this useful Juice is drawn, resembles those others we see in Morassies, and on the Edges of Lakes; excepting that the Skin of these latter is hard and dry, and their Pulp void of Juice; whereas the Skin of the *Sugar-Reed* is soft, and the spongy Matter or Pith it contains, very juicy, though that in a greater or less Degree, according to the Goodness of the Soil, its Exposure to the Sun, the Season 'tis cut in, and its Age; which four Circumstances contribute equally to its Goodness and its Bulk.

The *Sugar-Cane* usually grows five or six Foot high, and about half an Inch in Diameter; though *F. Lobst* mentions some extraordinary ones in the Isle of *Yabago*, Twenty-four Foot high. The Stem or Stalk is divided by Knots, a Foot and Half apart. At the Top it puts forth a Number of long, green, tufted Leaves, from the Middle whereof, arise the Flower and the Seed. There are likewise Leaves springing out from each Knot; but these usually fall as the Canes rises; and 'tis a Sign, either that the Canes is nought, or that 'tis far from its Maturity, when the Knots are seen beset with Leaves.

The Ground fit for *Sugar-Canes*, is that which is light, soft and spongy; lying on a Declivity, proper to carry off the Water, and well turn'd to the Sun. They usually plant them in Pieces, cut a Foot and Half below from the Top of the Flower. These are ordinarily ripe in Ten Months, though sometimes not till Fifteen; at which Time, they are found quite full of a white, succulent Marrow, whence is express'd

the Liquor whereof *Sugar* is made. When ripe, they are cut, their Leaves cleared off, and they are carried in Bundles to the Mills. The Mills consist of Three wooden Rollers, cover'd with Steel Plates; and have their Motion either from the Water, the Wind, Cattle, or even the Hands of Slaves. See *SUGAR-MILL*.

Two Rules belonging hereto are, That no Canes above four Foot, or under two Foot and a Half long, be sent to the Mills; and, That no Canes be cut than can be conveniently press'd in 24 Hours; in regard they will heat, ferment and grow sour.

The Juice coming out of the Canes, when press'd and broke between the Rollers, runs through a little Canal into the *Sugar-House*; which is near the Mill; where it falls into a Vessel, whence it is convey'd into the first Copper or Cauldron, to receive its first Preparation, only heated by a slow Fire to make it simmer. With the Liquor, is here mix'd a Quantity of Ashes or beaten Lime; the Effect of which Mixture, assisted by the Action of the Fire, is, that the unclean Parts are separated from the rest, and rais'd to the Top, in form of a thick Scum, which is kept constantly scumming off; and serves to feed the Poultry, &c. withal.

#### Preparation of *SUGAR*.

The Juice, in the next Place, is purified in a second Copper; where a brisker Fire makes it boil; and all the Time the casting up of its Scum is promoted by means of a strong Lye, composed of Lime-water and other Ingredients.

This done, 'tis purified and scum'd in a third Boiler, where-in is cast a kind of Lye, that assists in purging it; collects together its Impurities, and makes them rise to the Surface; whence they are taken with a Skimmer.

From the Third, 'tis removed to a Fourth Boiler, where the Juice is further purified by a more violent Fire; and hence to a Fifth; where it takes the Consistence of a Syrup.

In a Sixth Boiler, the Syrup receives its full Coction; and here all the Impurities left from the former Lyes, are taken away by a new Lye, and a Water of Lime and Allom cast into it. In this last Cauldron, there is scarce found one Third of what was in the First; the rest being wasted in Scum.

By thus pressing, successively, a Number of Coppers, the *Sugar Juice* is purified, thicken'd, and readied fit to be converted into any of the Kinds of *Sugar* hereafter mention'd. The Size of the several Coppers always diminishes, from the first to the last; each being furnished with a Furnace, to give a Heat proportionable to the Degree of Coction the Juice has received. In some large *Sugar-Works*, there are also particular Coppers, for the boiling and preparing the Scams.

#### The several Kinds of *SUGAR* made in the *Caribbee* Islands.

*F. Lobst* mentions Seven different kinds of *Sugars* prepared in the *Caribbee*, viz.

Crude <i>SUGAR</i> , or <i>Muscovade</i>	Royal <i>SUGAR</i>
<i>Straiv</i> 's or <i>Brown</i> <i>SUGAR</i>	Candied <i>SUGAR</i>
<i>Earth</i> 's or <i>White</i> <i>SUGAR</i> in Powder	<i>SUGAR</i> of fine Syrup
Refined <i>SUGAR</i> , either in Powder or Loaves.	<i>SUGAR</i> of coarse Syrup
	<i>SUGAR</i> of the Scum.

*Crude* *SUGAR*, or *Muscovade*, is that first drawn from the Juice of the Canes, and whereof all the rest are compos'd.

The Method of making it, is that already described as for *Sugar* in the General.

We need only add, That when taken out of the sixth Copper, 'tis put in a Cooler, where stirring it briskly together, 'tis left stand to settle, till a Crust, of the Thickness of a Crown-piece, be form'd thereon. The Crust form'd, they stir it up again, then put it into Vessels, where it stands to settle; till it be fit to Barrel.

*Straiv*'s or *Brown* *SUGAR*, though whiter and harder, does not differ much from the *crude* *Sugar*. Though 'tis held a Medium between this last and the *Earth*'s *Sugar*; which is the white *Powder* *Sugar*. The Preparation of this *Sugar*, is the same as that of the raw *Sugar*, with this Difference, that to Whiten it, they strain the Liquor through Blankets, as it comes out of the first Copper.

The Invention of *Straiv*'s *Sugar* is owing to the *English*, who are more careful than their Neighbours, in the Preparation hereof; for they not only strain it, but when boil'd, put it in square wooden Forms, of a pyramidal Figure; and when it is square wooden itself well, they cut it in Pieces, dry it in the Sun, and barrel it up.

*Earth*'s *SUGAR*, is that which is whiten'd by means of Earth laid on the Top of the Forms 'tis put in, to purge itself.

The making of this *Sugar*, is begun after the same manner as that of raw *Sugar*; except that they only use the best Canes in it;

that they work with more Care and Nicety; that when the Liqueur is in the first Copper, the Ashes they put in, are little or nothing mix'd with Lime, for fear of reddening it; and that they strain it through a Blanket, from the first to the second Copper.

When it has pass'd all the Six Coppers, 'tis laden out into a Cooler; whence 'tis put into conical Moulds or Forms, the Tops whereof are perforated, but now stopp'd with Linnen or other Stuff; and these ranged evenly before the Furnace. When it has been a Quarter of an Hour in the Forms, 'tis cut with a Sugar-Knife, that is, 'tis stirred briskly this way and that, for Half an Hour.

This serves, not only to promote the forming of the Grain, and the diffusing it equally throughout; but also to determine the unctuous Parts of the Sugar to mount to the Top that they may be scum'd off.

The Forms being left to stand 15 Hours in this State, the Holes at the bottom are then unstopp'd, to give a Passage to the Syrop, and to determine it to take that Way. When enough of these Forms are fill'd, to fill a Stove, which usually contains Five or Six hundred Forms; they visit the Sugar in all the Forms, to examine the Quality thereof, and to see if it quit the Form easily; that it may either have the Earth given it, as the Refiner, who visits it, judges proper; or be melted over again, if it don't prove well.

This done, the Forms are planted, each on its Pot, with the Tip of the Cone downwards; the Top is taken off, and in lieu thereof, they put in some Sugar in Grain, to within an Inch of the Edge; which Space is left for the Earth prepared for it.

The Earths here used, are of various Kinds; the good Qualities of each whereof, are, that they don't tinge the Water, that they let it filtrate easily through, and that they don't imbibe the fatty Part of the Sugar. Ever put in the Forms, 'tis stopp'd in Water 24 Hours; and at length applied, in the Consistence of a Paup.

As soon as the Earth is on the Sugar, all the Windows of the Refining Room are shut, that the Air and Heat may not dry the Earth. When 'tis quite dry, which usually happens in nine or ten Days Time, 'tis taken off; and after cleaning the Surface of the Sugar with Brushes, and raking it up an Inch deep, and again laying it Level as before; they give it a second Earth.

The Whiteness of the Sugar of each Form, is seen from the first Earth; Experience shewing, that a Second or Third Earth don't make the Sugar any thing whiter, but only whitens the Head of the Loaf. When the second Earth is taken off, they clean the Surface of the Sugar with a Brush, and with a Knife loosen the Edge of the Sugar, where it sticks to the Form, that neither the Form nor the Sugar-Loaf be damaged in taking out the latter. The Windows are now open'd, and the Forms left to stand Eight or Ten Days to dry. While the Sugar is draining in its Forms, a Stove is prepared to receive them.

The Stove being sufficiently heated, by Means of the Furnace therein, Loaves are taken out of the Forms one after another; and such as are white from one End to 'other, are carry'd to the Stove, as are, also, the rest, after cutting off what is not white, to be farther refin'd.

When the Loaves are all rang'd in the Stove, a moderate Fire is made for about two Days, during which Time, they visit every Part of the Stove very carefully, to see that every Thing is in good Order, and to repair any Thing that may go amiss.

After these two Days, they shut the Trap-Door a-top of the Building, and increase the Fire. Eight or ten Days and Nights continu'd violent Fire usually suffice to dry a Stove of Sugar.

When they judge it sufficiently done, they open the Trap-Door, and chase a hot dry Day to pound the Sugar, which is perform'd with huge, hard, heavy Wooden Peitles; when pounded, 'tis put up in Barrels, and well trodden down; as 'tis put in, that the Barrels may hold the more.

**SUGAR of the Scum.** This is all made of the Scums of the two last Coppers; those of the former being reserv'd for the making of Rum.

The Scum destin'd to make Sugar, is kept in a Vessel for that Purpose, and boil'd every Morning in a Copper set apart for that Use. With the Scum, is put into the Copper a fourth Part of Water, to retard the boiling, and give Time for its purging: When it begins to boil, the usual Lye is put in, and 'tis carefully scum'd: When almost enough boil'd, Lime and Allom-Water are thrown in; and when 'tis ready to be taken out, they sprinkle it with a little powder'd Allom.

**SUGAR of Syrop.** There are three Kinds of Syrops that run from Sugar. The first from the Barrels of raw Sugar, which is the coarsest of all: The second, from the Forms or Moulds after they are perforated, and e'er they receive their Earth: The third, that coming from the Forms after they have had their Earth; which last is the best.

The coarse Syrop should only be used for Rum; but Sugar being grown dear, Endeavours have been used to make some hereof, and that with tolerable Success. They are first clarify'd with Lime-Water, and, when boil'd, are put up in Barrels, with a Sugar-Cane in the Middle, to make them purify themselves. After twenty Days, a Quantity of coarse Earth is thrown in, to make 'em cast the Remainder of coarse Syrop, and sit 'em to be return'd into raw Sugar. The Dutch and German Refiners, first taught the Islanders how to turn their Syrop into crude Sugar.

The second Syrop is wrought somewhat differently: After the Copper 'tis to be boil'd in is half full, eight or ten Quarts of Lime-Water are cast in: 'Tis then boil'd with a brisk Fire, and carefully scum'd: Some add a Lye, and others none. It requires more Trouble and Attention. This Sugar may be Earth'd alone, or, at least, with the Heads of Loaves, the dry'd Tops, and such other Kinds of Sugars as may not be mix'd with the proper earth'd Sugar, nor yet with the raw Sugar.

For the third Syrop, after boiling and scumming it as the former, they put it instantly into Coolers, the Bottoms whereof are cover'd half an Inch thick with white Sugar, very dry, and well pounded; and the whole is well stir'd, to incorporate the two together. This done, they fire the Surface over with the same pounded Sugar, to the Thickness of one Fifth of an Inch; this assisting the Sugar in forming its Grain. When settled, and the Crust gather'd at the Top, a Hole is made in the Crust five or six Inches Diameter.

By this Aperture, they fill the Cooler with a new Syrop, pour'd gently in, which insensibly raises up the former Crust. When all the Syrops are boil'd, and the Cooler is full, they break all the Crusts; and after mixing them well, put it up in Forms or Moulds.

The rest is perform'd in the same manner as in the earth'd Sugar, from which it only differs in that it falls short of its Lustre and Brilliant; being, in reality, sometimes whiter and finer, tho' of a flatter and duller white.

**Refin'd SUGAR.** Crude Sugar, strain'd Sugar, and the Heads or Tops of Loaves that have not whiten'd well, are the Matter of this Sugar.

In a Refinery are usually two Coppers, the one serving to clarify, the other to boil the clarify'd Liqueur; tho' they sometimes clarify in both, and boil afterwards. For the Operation of Refining, the same Weight of Lime-Water and of Sugar are put in the Copper; and as the Scum is rais'd by the Heat, 'tis taken off, and when it ceases to rise any more, the Syrop is strain'd through a Cloth.

After this, 'tis clarify'd; that is, a Dozen of Eggs is thrown, White, Yolk, Shell and all; after having first broke and beaten them well in Lime-Water. When the fat, and other Impurities of the Sugar, which this Composition gathers together on the Surface of the Syrop, have been scum'd off; a few more Eggs are thrown in, and 'tis scum'd afresh. This they repeat 'till the Sugar is sufficiently clarify'd; which done, 'tis again strain'd through the Cloth.

When taken out of this Copper, 'tis boil'd in the second; which done, 'tis put out into Coolers, the Bottoms whereof are first cover'd half an Inch thick with fine white powder'd Sugar. As soon as 'tis there, 'tis briskly stir'd about, and the Surface strew'd over with powder'd Sugar. The rest is perform'd as in Sugars of fine Syrops, or in earth'd Sugar; only more Care and Exactness is used.

**Royal SUGAR.** The Matter of this Sugar ought to be the finest refined Sugar to be found. This they melt with a weak Chalk-Water; and sometimes, to make it the whiter, and prevent the Lime from reddening it, they use Allom-Water.

This they clarify three Times, and pass as often thro' a close Cloth, using the very best Earth. When prepared with these Precautions, 'tis whiter than Snow, and so transparent, that we see a Finger touching it, even thro' the thickest Part of the Loaf.

**SUGAR-Candy.** This is better made of earth'd Sugar, than refin'd Sugar, in regard the former is sweeter.

The Sugar to be used herein, is first dissolved in a weak Lime-Water, then clarify'd, scum'd, strain'd through a Cloth, and boil'd, and put in Forms or Moulds that are travers'd with little Rods, to retain the Sugar as it Crystallizes. These Forms are suspended in a hot Stove, with a Pot underneath, to receive the Syrop that drops out at the Hole in the Bottom, which is half stopp'd, that the Filtration may be the gentler. When the Forms are full, the Stove is shut up, and the Fire made very vehement.

Upon this the Sugar fastens to the Sticks that cross the Forms, and there hangs in little Splinters of Crystal. When the Sugar is quite dry, the Forms are broke, and the Sugar taken out, *condid.* Red Sugar-Candy they make, by casting into the Vessel, where the Sugar is boiling, a little Juice of the Indian Fig; and if 'tis desir'd to have it perfum'd, they

they call a Drop of some Essence in, when the Sugar is putting into the Forms.

This Method of making Sugar-Candy is that of F. Labar, practis'd in the Caribbees: The Method in Europe, describ'd by Pinner, is some what different.

White Sugar-Candy they make of white refin'd Sugar, boil'd with Water into a thick Syrop, in a large Peel. 'Tis candied in a Stove, whether 'tis carry'd, inclos'd in brass Peels, cross'd with little Rods, about which the Crystals fasten as they are form'd.

The Fire of the Stove is kept equable for fifteen Days; after which, the Sugar is taken out of the Peels to be dry'd. Red or brown Sugar Candy is made like the white, except that they only use brown Sugars and earthen Pots.

Barley SUGAR, is a Sugar boil'd till it be brittle, and then call on a Stove anointed with Oil of sweet Almonds, and form'd into twisted Sticks, about the Length of the Hand, and the Thickness of a Finger.

It should be boil'd up with a Decoction of Barley, whence it takes its Name; but in Lieu thereof, they now generally use common Water, to make the Sugar the finer. To give it the brighter Amber Colour, they sometimes cast Saffron into it. 'Tis found very good for the Cure of Colds and Rheums.

SUGAR of Roses, is white Sugar clarify'd, and boil'd into a Consistence, in Rose-Water; when boil'd, they form it into Lozenges, sometimes into little Hail, of the Size of Peas, by keeping it stirring till it be cold and dry. 'Tis reputed good to loosen and allay Acrimonies, &c. of the Breat.

SUGAR of Saturn? See SATURN.  
SUGAR of Lead? See LEAD.

SUGGESTION, the Art of furnishing one with a Thought, or Design, or of insinuating it artfully into his Mind.

In the Civil Law a Testament is said to be made by Suggestion, when 'tis made by Surprise, and contrary to the Intention of the Testator. See TESTAMENT.

If Suggestion be prov'd, the Testament becomes null. Articles and Legacies of Suggestion are not admissible against a Testament wrote with the Testator's own Hand, which is never suspected.

SUIT, or SUTE, *Seils*, in Law, (from the French *Suite*, a following one another) is used in divers Senses.

As, 1<sup>o</sup>, *Suit in Law*; which is of two Kinds, *Real* and *Personal*: The same with what we call *Real* and *Personal* Actions. See ACTION.

2<sup>o</sup>, *Suit of Court*, or *Suit of Service*; an Attendance which the Tenant owes the Court of his Lord. See SERVICE.

3<sup>o</sup>, *Suit Covenanted*; is when your Ancestor hath covenanted with mine to sue to his Court.

4<sup>o</sup>, *Suit Custom*; when I and my Ancestors owe Suit time out of Mind.

5<sup>o</sup>, *Suit Real*, or *Regal*; when Men come to the Sheriff's Turn or Lect.

6<sup>o</sup>, *Suit* signifies the following one in *Chaise*, as *Pross Suit*.

Lastly, *Suit* signifies a Petition made to the King, or any Great Person.

SULPHUR, in Natural History, a fat unctuous Mineral Substance, fusible and inflammable by Fire, and not dissoluble or miscible in Water. See FOSSIL.

It is particularly call'd *Fossil*, or *Mineral Sulphur*, to distinguish it from the *Sulphur of Metals*, or of the *Philosophers*. See METAL.

*Sulphurs* make a particular Class of Fossils, divided into *Solid* and *Fluid*.

The *Solid Sulphurs* are, *common Sulphur*, or *Sulphur* properly to call'd, *Arsenic* and *Antbar*. See ARSENIC and ANTHRAC.

The *Liquid Sulphurs* are, *Alphaltum*, or *Pisphaltum*, *Bitumen*, *Petroleum*, *Naphtha*, and *Oleum Terræ*, &c. See BITUMEN, PISAPHTALUM, PETROLEUM, NAPHTHA, &c.

SULPHUR, properly so call'd, or *Brimstone*, is of three Kinds, viz. *Vegetal*, *Mineral*, and *Common Sulphur*.

*Sulphur Vegetal* is thus called, as being such as it is taken out of the Mine: It is a kind of greyish argillous Clay, which easily takes Fire, and, in burning, casts a strong sulphurous Smell. Its Colour occasions its being sometimes call'd *Grey Sulphur*.

'Tis chiefly brought from *Sicily*; and is but little used, except in some Galenical Compositions, and to *sulphur* Wine, to make it keep in Carriage.

The best is soft, smooth, triable, and shining, of a Mouse-Colour, and not too full of Smeel.

*Mineral Sulphur*, call'd also *Yellow Sulphur*; is a Kind of hard, carthy Bitumen, of a shining yellow Colour, a strong sinking Smell, easily taking Fire, and dissolving.

'Tis found in great Quantities in the Neighbourhood of Volcanos or burning Mountains, as *Pesuvius*, *Atnas*, &c. yet is

it likewise found in its particular Mines; and we have very good from several Parts of *Italy* and *Switzerland*, tho' the best is that of *Quatro* and *Nicozanos* in *America*.

'Tis from this *Sulphur*, that the *Common Sulphur* used in Gunpowder, and on divers other Occasions, is drawn, by Means of Fire and Whale Oil, which dissolving it, 'tis pour'd into Moulds; and thus form'd into those Cylinders we find it in.

This *Common Sulphur*, is either better or worse, according to the Refinery it comes from. That of *Holland* has a long Time had the Vogue; the second Place has been given to that of *Venice*, and the third to that of *Marseilles*; but the Order seems to have been since chang'd, and that from *Marseilles* is now in the first Place.

It is chosen in large thick Cylinders, of a golden yellow Colour, very brittle, and when broke, appearing all brilliant, as if Crystallized.

Beside the Use of *Sulphur* in the Composition of Gunpowder, whereof it is one of the three Ingredients, and that which makes it take Fire so readily, (See GUNPOWDER) 'tis of some Use in Medicine, and more in Chymistry. 'Tis also used in whitening Silken and Woollen Stuffs; to which End, the Vapour thereof is contriv'd to be receiv'd by them, See BLEACHING.

Its Vapour also whitens red Roses, and even young Rooms, taken out of the Nest, and expos'd thereto, become perfectly white. It has the same Effect on Gold; which is to be restored to its Colour by boiling it in Water with Tartar.

The Chymical Analysis of *Sulphur* is very difficult; its Principles being so volatile, and withal so fast bound together, that they either rise all together, or are dissipated and lost in being separated.

M. *Hamborg*, however, has at length found the Secret of separating the Principles, and of saving them at the same Time. He finds it consists of an Acid Salt, an Earth, an oily, bituminous, and inflammable Matter, and usually a little Metal.

The three first he finds, by a long Series of Operations, are in pretty equal Quantities; but the last, which he finds to be Copper, inconsiderable. The Acid, he adds, is exactly the same with that of Vitriol; the Oil thick and red as Blood, appears to be the inflammable Part, and that which constitutes the Chymical Principle *Sulphur*, but that it retains some heterogeneous Matter in the Operation. The Earth is extremely fix'd, and unalterable by the strongest Fire.

M. *Geoffrey* tried the Recomposition of *Sulphur* on M. *Hamborg's* Principles, and with Success. The pure Acid Salt of *Sulphur*, being mix'd with an equal Quantity of the oily Matter, and earthy Alkali, and a little Oil of Tartar, and the Operation conducted according to the Rules of Art, the Mixture was converted into a pure burning Sulphur.

This done, he attempted the Composition of *Sulphur*, not by recompounding it out of the same Matters it had been resolv'd into, but by using Matters judg'd of the same Nature. Thus, by substituting Oil of Vitriol for the Acid Salt, and Oil of Turpentine for the inflammable Part, he succeeded as before.

Again, he found that fixed Salts, as they are Acids absorb'd in Earth, serve for two Principles at once, and need nothing but an inflammable Oil to make *Sulphur*: And even in Lieu of this Oil, M. *Geoffrey* employ'd, with equal Success, Charcoal, Pit-coal, and other Solids.

Indeed, Mr. *Boyle* and *Glauber* had before made common *Sulphur*, and that by Mixtures, such as M. *Geoffrey* describes; but they were both mistaken as to the Reason thereof; the one concluding, that the *Sulphur* he thus got, had been contain'd in the fix'd Salts, and the other in the Coal; neither of them dream'd, that 'twas the Mixture of the three Principles that produced the Mixt.

Flowers of SULPHUR, are the purest and finest Part of *Sulphur*, gain'd by evaporating *Sulphur*, by Sublimation, or burning it in Pots made for that Purpose; and gathered in the Capital of the Carbacit, where the Vapour Ricks. See FLOWER.

This Preparation, as, indeed, *Sulphur* in most of its Forms, is found excellent for the Lungs. The best Flower of *Sulphur* is that of *Holland*, which is in Cakes, or Pieces, light, soft, friable, and rather white than yellow. If it be in Powder, it must be very fine, of a yellow Colour, that is both whitish and gilt at the same Time.

Instead of this, we have frequently put upon us a vile Mixture of *Sulphur*, exalted by Fire, and mix'd with Starch, or Wheat Flower; and sometimes only *Sulphur*-Dust well sifted.

By adding fix'd Nitre, or Sal Polychrest, to the Flowers of *Sulphur*, we have the white Flowers of *Sulphur*.

*Magistery*, or *Bala*, or *Milk* of SULPHUR, is *Sulphur* dissolved in a sufficient Quantity of Water, with Salt of Tartar; and precipitated by Means of a Spirit of Vinegar, or some other Acid. See MAGISTERY.

'Tis call'd *Milk of Sulphur* from its Whiteness; and *Balm of Sulphur*, or of the *Lungs*, from its excellent Use in Difficulties of the Lungs and Breast. See *BALSAM*, &c.

*Salt of Sulphur*, is a Chymical Preparation, very improperly thus call'd, as being no other than the Sal Poly-chreston, impregnated with Spirit of Sulphur, and reduced to an Acid Salt, by evaporating the Humidity thereof. Some hold it a powerful Febrifuge. See *SALT*.

*Sulphur of Antimony*, is a sulphurous Matter drawn from Antimony by divers Operations. See *ANTIMONY*.

That drawn from the Pieces of the Crocus Metallorum, is by some call'd, *Golden Sulphur*.

*Sulphur Metallorum*, or *Sulphur of Metals*, call'd also, *Sulphur Fixum*, is us'd among the Chymists and Alchymists for a peculiar Matter, which enters the Composition of all Metals. See *METAL*.

Metals are suppos'd to consist of two essential Parts, or Principles; Mercury as the Basis, or Metallic Matter; and Sulphur as the Binder or Cement, which fixes the fluid Mercury into a coherent malleable Mass. See *METAL* and *MERCURY*.

Some of the latest and best Chymists, particularly *Monf. Homberg*, will have this Sulphur to be no other than Fire. See *FIRE*, *GOLD*, *BURNING GLASS*.

*SULTAN*, or *SOLDAN*, a Title, or Appellation given the *Turkish* Emperor.

It had its Rise under *Mahmoud*, Son of *Selveteghin*, the first Emperor of the Dynasty of the *Gaznerides*, towards the Close of the IVth Century of the *Æra of the Hegira*: When that Prince going to *Sogdiana* to reduce *Kalaf*, the Governor of that Province, who affected the Sovereignty; *Kalaf* was no sooner advertis'd of his coming, than he went out before him, deliver'd the Keys of his Fortrefs, and own'd him his *Sultan*, that is, his *Lord* or *Commander*.

The Title pleas'd *Mahmoud* so well, that he assumed it ever afterwards; and from him it pass'd to his Descendants, and to other *Mahometan* Princes.

*Vatier* will have the Word *Turkish*, and to signify *King of Kings*; adding, that it was first given the Princes *Angro-lipes* and *Mahid*, about the Year 1055; others will have it originally *Persian*, alledging, in Proof hereof, an ancient Medal of *Cosroe's*; others derive it from *Soldan quasi solus dominus*; others from the Hebrew שולט, *Schalat*, to rule, reign; from the Hebrew it pass'd into the *Arabic*, and thence to the *Turks*.

In the *Roman* Ceremonial, we find mention made of a *Soldan*, or *Marshal*, who is to attend the Pope when he marches in State.

*SULTANA*, the Wife of a *Sultan*. The Favourite *Sultana* is call'd *Hofski-Sultana*, i. e. private *Sultana*.

The *Sultana* Queen is the Emperor's chief Wife. The old *Sultana*, Mother of the Emperor reigning, is call'd the *Sultana Valida*. *Sultana* is also a *Turkish* Vestel.

*SUM*, in *Mathematics*, signifies the Quantity that arises from the Addition of two or more Magnitudes, Numbers, or Quantities together. See *ADDITION*.

This is sometimes call'd the *Aggregate*; and, in *Algebra*, it is usually denoted by the Letter *Z*, which stands for *Zomma*, or *Suma*; and sometimes by the Letter *S*.

Sense of an Equation, is when the absolute Number being brought over to the other Side, with a contrary Sign, the whole becomes equal to 0: This *Des Cartes* calls the *Sums* of the Equation propos'd. See *EQUATION*.

*SUMAC*, a Drug us'd to die in Green; as also in the Preparation of Black Morocco, and other Leather. See *MOROCCO*.

It consists of the Leaves and young Branches of a Shrub, not unlike the little Service-Tree: The Leaves are longish, pointed, and hairy: The Flowers grow in Clusters, and are red, like our *Roses*. Its Fruit is a Kind of Grape, of a very different Quality; and its Seed almost oval, and inclosed in Capsule of the like Figure.

The Antients us'd them, instead of Salts, to season their Meats withal; whence the *Latins* call the Tree *Rhus Obfcurum*, from its Use in the Dressing of Leather: 'Tis also call'd *Rhus Coriaria*. 'Tis the *Arabs* call it *Sumac*.

*SUMMARY*, an Abridgement, containing the Sum and Substance of a Thing in a few Words.

The *Summary* plac'd at the Head of a Book, a Chapter, a Law, or the like, is very useful to the Reader, to facilitate the Understanding thereof.

A Recapitulation, is to contain a *Summary* of the whole preceding Discourse. See *RECAPITULATION*.

*SUMMATORIUS Calculus*, the Method of summing differential Quantities; that is, from any Differential given, to find the Quantity from whose Differencing the given Differential results.

This Method we more usually call, *The inverse Method of Fluxions*; and *Foreigners*, *Integralis Calculus*. See *CALCULUS INTEGRALIS*, and *FLUXIONS*.

*SUMMER*, one of the Seasons of the Year, commencing in these Northern Regions, on the Day the Sun enters *Cancer*; and ending when he quits *Virgo*. See *SEASON*,

Or, more strictly, and universally, the *Summer* begins on the Day when the Sun's Meridian Distance from the Zenith is the least. It ends on the Day when its Distance is a Mean betwixt the greatest and smallest.

The End of *Summer* coincides with the Beginning of *Winter*. See *WINTER*.

*SUMMER*, in Architecture, is a large Stone, the first that is laid over Columns and Pilasters, in beginning to make a cross Vault; or 'tis the Stone which being laid over a Pedroit or Column, is hollowed, to receive the first Haunce of a Plat-band.

The Word is form'd from the *French*, *Sommier*, which signifies the same Thing.

*SUMMER*, in Carpentry, is a large Piece of Timber, which being supported on two Stone Piers, or Posts, serves as a Lintel to a Door, Window, &c.

There are also *Summers* us'd in various Engines, &c. serving to sustain the Weight, &c.

*SUMMERS*, in Building. See *BRESS-SUMMERS* and *GIRDERS*.

*SUMMET*, the Vertex, or Point of any Body; as of a Triangle, a Pyramid, a Pediment, &c. See *VERTEX*.

The Word is form'd from the *French*, *Somme*, which signifies the same Thing.

*SUMMONER*, or *SUMMONITOR*, an Apparitor, who is to cite Offenders to appear at a certain Time and Place, to answer to the Charge exhibited against them.

*SUMMONS*, in Law, a citing or calling a Person to any Court, to answer any Complaint, or even to give in his Evidence, &c.

This is the same with the *Vocatio in Jus*, or the *Citatio* of the Civilians; Hence our old Word *Suaver*, or *Suammer*.

*Suamons in Terra Peitis*, is that made on the Land which the Party, at whose Suit the *Suamons* is sent out, seeks to have.

*Suamons ad Warrantum dandi*, is a Process, whereby a *Vouchee* is call'd. See *VOUCHEE*.

*SUMMONS*, in War. To *summons* a Place, is to send a *Drum*, or *Trumpet*, to command the Governor to surrender; or, in Defect thereof, to protel to make an Assault, and to lay all in Fire and Blood.

*SUMMUM Bonum*, in *Ethicks*, the chief Good of Human Nature; or that, which, by its Enjoyment, renders truly and completely happy.

The Schools distinguish this chief Good of Man, into that which is simply and adequately so, and beyond which there can be no other; and into a lesser and subordinate one, which is in some measure attainable in this imperfect State.

This last they call *Felicitas Viatorum*; and the former, *Felicitas Compréhensionum*.

*SUMPTER-HORSE*, is an Horse that carries Provisions and Necessaries for a Journey.

*SUMPTUARY* Laws, are Laws made to restrain Excess in Apparel, Furniture, Eating, &c.

Molt Ages and Nations have had their *Sumptuary* Laws; and some retain them still, as the *Venetians*, *French*, &c. 'Tis observ'd, that no Laws are ever worse executed than *Sumptuary* Laws.

The *Sumptuary* Laws of that ancient *Leviticus* Legislator *Zaleucus*, are famous: By these it was ordain'd, That no Woman should go attended with more than one Maid in the Street, except she were drunk: That she should not go out of the City in the Night, unless she went to commit Fornication: That she should not wear any Gold or Embroider'd Apparel, unless she purpos'd to be a common Strumpet. That Men should not wear Rings or Tiffues, except when they went a Whoring, &c.

The *English* have had their Share of *Sumptuary* Laws, tho' all repealed by a Statute 1<sup>o</sup> Jac. I. or obsolete.

Under King *Henry IV.* *Comden* tells us, Pride was got so much into the Foot, that it was proclaim'd, That no Man should wear Shoes above six Inches broad at the Heel. And their other Garments were so short, that it was enact'd, 25 Ed. IV. that no Person under the Condition of a Lord, should, from that Time, wear any Mantle or Gown, unless of such Length, that, standing upright, it should cover his Privy Members and Buttocks.

Among the *Romans*, the *Sumptuary* and *Gibery* Laws were very numerous: By the *Lex Orchia*, the Number of Guests at Feasts was limited, tho' without Limitation of the Charges thereof. By the *Manian* Law, made Twenty-two Years afterwards, it was enact'd, That more than ten *As*'s should not be spent for any ordinary Feast: For the solemn Feasts, as the *Sarmentalia*, &c. an hundred *As*'s were allow'd; Ten of which, *Gellius* informs us, was the Price of a Sheep, and an hundred of an Ox.

By the *Didian* Law, which was prefer'd eighteen Years after, it was decreed, That the former *Sumptuary* Laws should be of Force, not only in *Rome*, but also in *Italy*: And that for every Transgression, not only the Master of the Feast,

Feet, but all the Guests too, should be liable to the Peasantry.

SUN, Sol, in Astronomy, the great Luminary which enlightens the World, and by his Presence, constitutes Day. See DAY.

The SUN is usually reckon'd among the Number of Planets; but that he ought rather to be nam'd among the fix'd Stars, will be shewn in its Place. See STAR and PLANET.

According to the Copernican Hypothesis, which is now generally received, and which has even Demonstration on its Side, the SUN is the Centre of the planetary and cometary System; round which all the Planets and Comets, and our Earth among the rest, revolve, in different Periods, according to their different Distances from the SUN. See this Motion Illustrated and Demonstrated under the Article PLANET.

But the SUN, though thus call'd of that prodigious Motion, whereby the Ancients imagin'd him to revolve daily round our Earth; yet is he not a perfectly quiescent Body.

From the Phenomena of his Macule or Spots, it evidently appears, that he has a Rotation round his Axis; like that of the Earth whereby the natural Day is measured; only slower. Some of these Spots have made their first Appearance near the Edge or Margin of the SUN, and have been seen some time after on the opposite Edge; whence, after a Stay of about 14 Days, they have re-appeared in their first Place, and taken the same Course over again; finishing their entire Circuit in 27 Days time; which is hence deduced to be the Period of the SUN's Rotation round his Axis. This Motion of the Spots, is from East to West, whence we conclude that of the SUN, to which the other is owing, to be from West to East.

For the various Appearances of the Solar Spots, their Cause, &c. see MACULE and SPOTS.

For the annual Motion of the Sun round the Earth; 'Tis easily shewn by Astronomers, That the annual Motion of the Earth will occasion such an Appearance, though it be demonstrated that there is no such Thing.

A Spectator in the SUN, would see the Earth move from West to East, for the same Reason as we see the SUN move from East to West. And all the Phenomena resulting from this annual Motion, in whichever of the Bodies it be, will appear the same from either. Let S, for Instance (Tab. Astronomy, Fig. 39.) represent the SUN, ABCD the Earth's Orbit, which it passes through from West to East, in the Space of a Year.

Now, a Spectator in S, viewing the Earth at A, will refer it to the Point of the Sphere of the Stars,  $\Upsilon$ : When arrived in B, the Spectator will see it, as in the Point  $\delta$ ; when in C, as in the Point  $\epsilon$ , &c. till after its whole Circuit, it will be again seen in  $\Upsilon$ . Thus will the Earth appear to describe the whole Ecliptic, and to pass, successively, from Sign to Sign.

Suppose, now, the Spectator removed from the SUN to the Earth, which imagine in C; the Distance of the fix'd Stars, we have shewn, is so vast, that that of the SUN is but a Point to it. The Spectator, therefore, now situate on the Earth, will see the same Face of the Heavens, the same Stars, &c. as before; the only Difference will be, that as before he imagin'd the Earth in the Heavens, and the SUN in the Centre; he will now suppose the Sun in the Heavens, and the Earth in the Centre.

The Earth, therefore, being in C, the Spectator will see the SUN in  $\Upsilon$ ; and the Spectator being carried along with the Earth, and partaking of his annual Motion, will not perceive either his own Motion, or that of the Earth; but observing the SUN, when the Earth is arrived at D, the SUN will be seen at  $\delta$ . Again, while the Earth proceeds to A, the SUN will seem to have moved through the Signs  $\ominus$ ,  $\odot$ , and  $\text{III}$ : And while the Earth describes the Semi-circle ABC, the SUN will appear to have moved in the concave Surface of the Heavens, through the Six Signs,  $\text{III}$ ,  $\text{II}$ ,  $\text{I}$ ,  $\text{XII}$ ,  $\text{XI}$ ,  $\text{X}$ . So that as Inhabitant of the Earth will see the SUN go through the same Orbit or Circle in the Heavens, and in the same Space of Time, as a Spectator in the SUN would see the Earth describe the same.

Hence arises that apparent Motion of the SUN, whereby he is seen to advance, insensibly, toward the eastern Stars: In-fomuch, that if any Star near the Ecliptic, rise any Time with the SUN; after a few Days, the SUN will be got more to the East of the Star, and the Star will rise and set before him.

For the several Phenomena resulting from the SUN's apparent Motion, or the Earth's real Motion, as the Diversity of Day and Night, of Seasons, &c. See EARTH.

#### Nature, Properties, Figure, &c. of the SUN:

1<sup>o</sup> As the Solar Spots are sometimes found to stay Three Days longer behind the SUN, than they spend in passing over the Hemisphere visible to us; we easily deduce, that they don't adhere to the Surface of the SUN, but are at some Distance therefrom.

2<sup>o</sup> As the Spots frequently rise and vanish, even in the middle of the SUN's Disk; and undergo several Changes, both

with regard to Bulk, and Figure, and Density; it follows, that they frequently rise, *de novo*, about the SUN, and are again dissipated.

3<sup>o</sup> Hence it should follow, that they are form'd out of the Exhalations of the SUN; and are no other than Solar Clouds. See VAPOUR, CLOUD, &c.

4<sup>o</sup> Since, then, Exhalations proceeding from the SUN, rise above him, and stop at a certain Altitude; 'tis evident there is some Fluid encompassing the SUN, to urge the Exhalations to rise; and this Fluid must be denser at bottom, and rarer at top, like our Atmosphere. See ATMOSPHERE.

5<sup>o</sup> Since the Spots frequently dissolve and disappear in the middle of the SUN's Disk; the Matter of the Spots, that is, the Solar Exhalations, fall back again to the SUN; Whence it follows, that there must arise various Alterations in the SUN's Atmosphere, and the SUN himself. See RAIN, HAIL, METEOR, &c.

6<sup>o</sup> Since the Revolution of the Spots round the SUN is found very regular, and the Spots very near the SUN; it follows, That the Spots do not revolve round the SUN; but that the SUN, together with his Atmosphere, wherein the Macule are, move round their common Axis, in an Interval of about 27 Days; and hence it is, that the Spots near the Limb, being viewed obliquely, appear narrow and oblong.

7<sup>o</sup> Since the SUN, in every Situation, appears like a circular Disk; its Figure, as to Sense, must be Spherical; though we shall hereafter shew, That it is really Spheroidal.

Besides the Macule or dark Spots, several Authors make mention of Facule or Spots brighter than the rest of the SUN's Disk; and those generally larger, and very different from the Macule, both in Figure, Duration, &c.

These Facule, Kircher, Scheiner, &c. take to be Eruptions of Flames; and hence take Occasion to represent the Face of the SUN as full of Volcanos, &c. But Huygens, using the best Telescopes, could never find any such Things, though he has sometimes spied certain Places in the Macule themselves, more lucid than the rest. But these do not seem owing to any kindled Matter, which were scarce consistent with their Duration, and their frequent Change into Macule; but to the Refraction of the SUN's Rays through the thinner Exhalations, when as the Groffer, in their Neighbourhood, intercept the same. See FACULE.

8<sup>o</sup> That the Substance of the SUN, is Fire, we thus prove: The SUN shines, and his Rays, collected by concave Mirrors, or convex Lens's, burn, consume, and melt the most solid Bodies, or else convert them into Ashes, or Glass. Wherefore, as the Force of the solar Rays is diminished by their Divergency, in a duplicate Ratio of the Distances reciprocally taken; 'tis evident, their Force and Effect is the same, when collected by a burning Lens or Mirror, as if we were at such Distance from the SUN, where they were equally dense. The SUN's Rays, therefore, in the Neighbourhood of the SUN, produce the same Effects, as might be expected from the most vehement Fire; consequently, the SUN is of a fiery Substance. See FIRE.

Hence it follows, That its Surface is every where Fluid; that being the Condition of Flame. See FLAME.

Indeed, whether the whole Body of the SUN be Fluid, as some think, or Solid, as others; we don't determine: But as there are no other Marks, whereby to distinguish Fire from other Bodies, but Light, Heat, a Power of Burning, Consuming, Melting, Calcining and Vitrifying; we don't see what should hinder, but that the SUN may be a Globe of Fire like ours, involved with Flame.

9<sup>o</sup> Since the Macule are form'd out of the solar Exhalations; it appears, that the SUN is not pure Fire, but that there are Heterogeneous Particles mix'd along with it.

10<sup>o</sup> The Figure of the SUN is a Spheroid, higher under the Equator than about the Poles. This we prove thus: The SUN has a Motion about his own Axis, and therefore the solar Matter will have an Endeavour to recede from the Centres of the Circles wherein it moves; and that, with the greater Force, as the Peripheries of the Circles are greater. But the Equator is the greatest Circle, and the rest, towards the Poles, continually decrease; therefore the solar Matter, though at first in a spherical Form, will endeavour to recede from the Centre of the Equator, further than from the Centres of the Parallels.

Consequently, since the Gravity whereby it is retain'd in its Space, is supposed to be uniform throughout the whole SUN; it will really recede from the Centre, more under the Equator than under any of the Parallels. And hence the SUN's Diameter, drawn through the Equator, will be greater than that passing through the Pole, *i. e.* the SUN's Figure is not perfectly Spherical, but Spheroidal. See SPHEROID.

For the Parallax of the SUN; see PARALLAX.

For the SUN's Distance: As the Determination thereof depends on that of the Parallax; and as the SUN's Parallax is not found without a long, operose Calculus; So, Astronomers don't agree much about either of them.

The mean Distance of the SUN from the Earth, some make 7490 Diameters of the Earth, others 10000, others 12000; others

others 15000 ; but allowing *M. de la Hire's* Parallax of 6", the Sun's mean Distance will be 17188 Diameters of the Earth; and allowing that of *Cassini*, only 14182. See DISTANCE.

The apparent Diameter of the Sun, is not found always the same. *Protony* makes it, when greatest, 33' 20", *Tycho* 32', *Kepler* 31' 4", *Ricciolus* 32' 8", *Cassini* 32' 20", *De la Hire* 32' 45". Its mean, apparent Diameter, according to *Protony*, is 32' 18"; according to *Tycho* 31'; according to *Kepler* 30' 50"; according to *Ricciolus* 31' 40"; according to *Cassini* 31' 40"; according to *De la Hire* 32' 10". Its least Diameter, *Protony* makes 31' 20"; *Tycho* 30'; *Kepler* 30'; *Ricciolus* 31'; *Cassini* 31' 8"; *De la Hire* 31' 38".

The true Diameter of the Sun to that of the Earth, is computed to be, as 10000 to 208. See DIAMETER.

For the Eclipses of the Sun; see ECLIPSE.

Cycle of the Sun. See CYCLE.

Meridian Altitude of the Sun, &c. See MERIDIAN Altitude.

SUNDAY, the First Day of the Week; thus call'd by our Idolatrous Ancestors, because set apart for the Worship of the Sun.

'Tis now also call'd the Lord's Day, because kept a Feast in Memory of our Lord's Resurrection on this Day; and Sabbath Day, because substituted, under the new Law, in the Place of the Sabbath, in the old Law. See SABBATH.

In the Breviary, and other Offices, we meet with *Sundays* of the first and second Class: Those of the first Class, are *Palm, Easter, Ascens and Whit-Sunday*, those of *Quasimodo* and *Quasitrigesimo*; each whereof, see under its proper Article.

Those of the second Class, are the common *Sundays*. Anciently, each *Sunday* in the Year had its particular Name, which was taken from the Invention of the Day; which Custom has only been continued to some few in *Leuz*; as *Reminiscere, Oculi, Letare, Judica*.

It was *Constantine the Great*, that first made a Law for the Observation of *Sunday*; and that, according to *Eusebius*, appointed it should be regularly celebrated throughout the Roman Empire.

Before him, and even in his Time, they observed both the *Jewish Sabbath* and *Sunday*, at the same Time; both to satisfy the Law of *Moses*, and to imitate the Apostles, who used to meet together on the first Day.

Indeed, some are of Opinion, that the *Lord's Day*, mention'd in the *Apocalypse*, is our *Sunday*; which they will have been so early instituted by the Apostles. Be this as it will, 'tis certain, a Regard was had to this Day, even in the earliest Ages of the Church; as appears from the first Apology of *Julius Martyr*, where he describes the Exercise of the Day, not much unlike to ours.

By *Constantine's* Laws, made in 321; it was decreed, That for the future, the *Sunday* should be kept a Day of Rest in all Cities and Towns; but he allowed the Country People to follow their Work. In 438, the Council of *Orleans* prohibited this Country-labour; but in regard there were still abundance of *Jews* in the *Gauls*, and that the People gave into a good many Superstitious Usages, in the Celebration of the New *Sabbath*, like those of the *Jews* in that of the Old; the Council declares, That to believe it unlawful to travel with Horses, Cattle and Carriages, to prepare Foods, or to do any thing relating to the Cleanness and Decency of Houses or Persons, savours more of Judaism than Christianity.

SUNDAY Letter. See DOMINICAL Letter.

SUN-FLORER. See TOURNOLE.

SUOVETAURILIA, or SOLITAURILIA, a Sacrifice among the ancient *Romans*; wherein they offer'd Three Victims, of Three different Kinds, viz. a Bull, a Ram and a Boar.

*Livy* describing it, calls it *Suovetaurilia*, as composed of *Sus, Ovis* and *Taurus*, the Names of the Three Victims sacrificed. *Dion. Halicarnassens* describing the same, calls it *Solitaurilia*, in regard 'twas required, that the Victims were intire, and without any Defect; *Solus*, or *solutus*, in the Language of the *Osci*, signifying Integer.

SUPERBIPARTIENS  
SUPERPARTICULARIS  
SUPERPARTIENS  
SUPERQUADRIPARTIENS  
SUPERTRIARTIENS } See RATIO.

SUPERCARGO, a Person employ'd by the Owners of Ships, to go a Voyage, to oversee the Cargo or Lading, and to dispose of it to their best Advantage, for which Service he is allowed good Provision, because the Trust reposed in him, is very considerable.

SUPERCILLIUM, in Anatomy, the Eye-brow. See EYE.

SUPERCILLIUM, in the ancient Architecture, the uppermost Member of the Cornice, call'd by the Moderns, *Corona*, *Crocca*, or *Larnier*.

*Mr. Evelyn* conceives, it should rather have been call'd *Silicidium, Drip*, to denote its Office of Sheltering the Order from Rain, &c. See CORONA and LARNIER.

SUPERCILLIUM, is also used for a square Member under the upper Toe in some Pedicels. Some Authors confound it with the *Tore* itself.

SUPEREROGATION, in Theology, what a Man does beyond his Duty, or beyond what he is commanded to do.

The *Romanists* stands up strenuously for Works of *Supererogation*; and maintains, that Evangelical Councils are such. By means hereof, a Stock of Merit is laid up; which the Church has the Disposal of, and which she distributes in Indulgences to such as need. See INDULGENCE.

The Reformed Church don't allow of any Work of *Supererogatus*; but hold, with the Apostle, That when we have done our best, we are but unprofitable Servants. See MERIT.

SUPERFETATION, in Medicine, an After-Conception; or a second Generation, happening when the Mother, already pregnant, conceives, of a later Conception; so that she bears at once Two Fetuses of unequal Age and Bulk, and is delivered of them at different Times. See BIRTH, CONCEPTION, FETUS, &c.

We meet with Instances of *Superfetations* of Women, in *Hippocrates, Aristotle, Pliny, An Laurentis*, &c. But they are much more frequent in Hares and Sows.

An Instance of an extraordinary Kind of *Superfetation*, we have in *Bartholin*; who tells us, That a Danish Girl was born big with Child.

*Mewselius*, a German Physician, adds, That in 1672, the Wife of a Physician, in *Yeringa*, was delivered of a Girl big with another; whereof she was delivered in Eight Days Time; and which was Baptiz'd, and died a Day after her Mother.

The Naturalists hold, That Female Rats are frequently born with young Rats in their Wombs.

In the King of *Denmark's* Cabinet, is seen an Egg, in the middle whereof is another Egg perfectly form'd. See Egg.

We meet with something like a *Superfetation* in Plants too; there being a kind of Lemon found to grow inclosed in the Body of another.

In the History of the Royal Academy of Sciences, for the Year 1709, mention is made of a Letter from a very considerable Magistrate, to the Academy, containing a very remarkable Instance of a *Superfetation*; a Butcher's Wife of *Am* being delivered in that Year of Nine Children, each about Two Days after other, all well form'd and alive.

The Word is form'd from the *Latin, Super, over*, and *ferus*, Embryo.

SUPERFICIAL Content. See SUPERFICIES, AREA and MEASURING.

SUPERFICIES, or SURFACE, in Geometry, a Magnitude, considered as having Two Dimensions; or extended in Length and Breadth; but without Thickness or Depth. See DIMENSION.

In Bodies, the *Superficies* is all that presents itself to the Eye. See BODY.

A *Superficies* is chiefly consider'd, as the external Part of a Solid; when we speak of a *Surface* simply, and without any regard to Body, we usually call it *Figure*. See FIGURE.

A *Rectilinear SUPERFICIES*, is that comprehended between Right Lines.

A *Curvilinear SUPERFICIES*, that comprehended between Curve Lines. See CURVE.

A *Plane SUPERFICIES*, is that which has no Inequality, but lies evenly between its boundary Lines. See PLANE.

A *Convex SUPERFICIES*, is the exterior Part of a spherical Body. See CONVEX.

A *Concave Surface*, is the internal Part of an orbicular Body. See CONCAVE.

The Measure or Quantity of a Surface, is call'd the *Area* thereof. See AREA.

The finding of this Measure or Area, is call'd the *Quadrature* thereof. See QUADRATURE.

To Measure the Surfaces of the several Kinds of Bodies, as Spheres, Cubes, Parallelepipeds, Pyramids, Prisms, Cones, &c. See SPHERE, CUBE, PARALLELEPIPED, &c.

Line of SUPERFICIES, a Line usually found on the Sector, and Gunter's Scale. See SCALE.

The Description and Use hereof, see under the Articles SECTOR and GUNTER'S Scale.

SUPERFINE, in the Manufactures, a Term used to express the superlative Fineness of a Stuff.

Thus a Cloth, a Camlet, &c. are said to be *Superfine*, when made of the finest Wool, Silk, &c. or when they are the finest that can be made.

The Term is particularly used among Gold Wire-drawers, for the Gold or Silver-wire, which after being drawn through an infinite Number of Holes, each less and less, is, at length, brought not to be bigger than a Hair. See GOLD-WIRE.

SUPERINCESSUS rotatus } See { SLIDING.  
SUPERINCESSUS volvens } { ROLLING.  
SUPER-

**SUPER-Institation**; is one Institution upon another; as if A be admitted and instituted to a Benefice upon one Title, and B admitted, instituted, &c. by the Presentation of another.

**SUPERINTENDANT**, in the French Customs, an Officer who has the prime Management and Direction of the Finances or Revenues of the French King.

The Term is also used for the first Officer in the Queen's Family, who has the chief Administration of the Household.

They have also a *Superintendant* of the Buildings, answering to the Surveyor of the Works among us.

The Cardinal de Richelieu made himself *Superintendant* of Commerce.

**SUPERINTENDANT**, is also an Ecclesiastical Superior in several Reform'd Churches where Episcopacy is not admitted; particularly among the Lutherans in Germany, and the Calvinists in some other Places.

The *Superintendant* is, in Effect, little else but a Bishop; only his Power is somewhat more restrain'd than that of our Bishops.

He is the chief Pastor, and has the Direction of all the inferior Pastors within his District or Diocese.

In Germany they had formerly *Superintendants General*, who were superior to the ordinary *Superintendants*. These, in reality, were Archbishops; but the Dignity is sunk into Disuse; and, at present, none but the *Superintendant of Wittenberg* assumes the Quality of *Superintendant General*.

**SUPERIOR**, something rais'd above another, or that has a Right to command another.

Thus an Abbot is call'd the *Superior* of an Abbey; and a Prior the *Superior* of a Convent. See ABBOT, &c.

The Canonists hold, that a perpetual *Superiority* forms a Title: But a *Superior* may be continued by those who constituted him such, yet without the *Superiority's* being render'd, by that Means, perpetual. The Church of France allows the *Superiority* of the Pope; nor his *Infallibility*, as all the other *Romish* Churches do.

**SUPERJURARE**: Antiently, when a Criminal endeavour'd, &c. to excuse himself by his own Oath, or by that of one or more Witnesses; and yet the Crime is notorious, that he was convicted by the Oaths of many more Witnesses; this was call'd *Superjurare*.

**SUPERLATIVE**, in Grammar, an Inflection of Nouns Adjectives, serving to augment and heighten their Signification; and to shew the Quality of the Thing to be in the highest Degree. See DEGREE.

In English, the *Superlative* is usually form'd by the Addition of *est*; as Richest, Holiest, &c. Rarely by the Addition of *issimo*, as Generalissimo; more frequently by the prefixing of *magis*, as Most Honourable, Most Amiable, &c.

The French are generally forc'd to form their *Superlatives*, by prefixing of *le plus*, sometimes of *tres*, and sometimes of *fort*.

The Italians and Spaniards have great Advantages over them in this Respect; their Language abounding with magnificent Words to exaggerate Things withal; yet the Hebrews are more poor than the French in this Respect, as having neither *Comparatives* nor *Superlatives*.

They use to express their Degrees by the Particles *jeter* and *meas*, sometimes by the Preposition *min*, and sometimes by re-doubling the Words; which is what we frequently find in the Vulgate.

**SUPERNUMERARY**, something over and above a fix'd Number.

In several of the Offices are *Supernumerary* Clerks, &c. to be ready on extraordinary Occasions, &c.

There are also *Supernumerary* Surveyors of the Excise, to be ready to supply Vacancies when they fall. They have but half Pay.

In Music, the *Supernumerary*, call'd by the Greeks *Prolembanomenos*, is the lowest of the Chords of their System; answering to *a, mi, la*, of the lowest Octave of the Moderns. See PROLEMBANOMENOS and DIAGRAM.

**SUPER-purgation**, in Medicine, an excessive, over-violent Purging. See PURGATION.

A Man who had taken Powder of Diacarthamus inwardly, was sent by it to Stool an hundred times; and was cured of the *Super-purgation* by a Pound of Capon-Broth, an Ounce of Saccharum Rosatum, five Grains of Laudanum, and the Yolk of an Egg.

In lieu of Laudanum, they sometimes use a Drachm and a half of new Treacle. Burnet.

**SUPERSCAPULARIS inferior**; call'd also *Infrascapularis*; a Muscle that helps to draw the Arm backwards. It covers all the Space that is between the Spine, and the Teres minor; and is inserted into the Neck of the Humerus.

**SUPERSCAPULARIS superior**, in Anatomy, a Muscle call'd also *Suprascapularis*. See SUPRASCAPULARIS.

**SUPERSEDEAS**, is a Writ issued in divers Cases, importing, in general, a Command to stay or forbear the

doing of that which ought not to be done, but which, in Appearance of Law, ought to be done; were it not for that Cause, whereon the Writ is granted. Thus, a Man, regularly, is to have Surety of Peace, against him of whom he will swear he is atraid; and the Justice requir'd hereunto can't deny it him; yet, if the Party be formerly bound to the Peace, either in Chancery, or elsewhere, this Writ lies, to stay the Justice from doing that, which otherwise he ought not to deny.

**SUPERSTITION**, an extravagant Devotion, or a Religion ill directed, and ill conducted. See RELIGION.

'Twas a Piece of *Superstition* in the ancient Romans, to observe the Flight of Birds, the Entrails of Victims, &c.

The *Romish* Priests make a fine Penny of the *Superstition* of the People: Moes. Thiers has an express Treatise *des Superstitions Populaires*. Women, he observes, are naturally more inclin'd to *Superstitions* than Impiety. *Plutarch* has endeavour'd to shew, that *Superstition* is worse than Atheism. The Punishment allotted by several Councils for the *Superstitions*, was to fast a Month in Prison.

**SUPERVISOR**, signifies a Surveyor, or Overseer. It was formerly, and is still almost some, a Custom, especially of the better Sort, to make a *Supervisor* of a Will, but it is to little Purpose; as being now to carelessly executed. However, the first Intendment might be good, that he should supervise the Executors, and see the Will truly perform'd.

**SUPINATION**, in Anatomy, the Action of a *Supinator* Muscle; or the Motion whereby it turns the Hand, so, as that the Palm is lifted upwards towards Heaven. See SUPINATOR.

**SUPINATOR**, in Anatomy, two Muscles of the Arm; the one call'd *Supinator longus*, the other *Supinator brevis*.

The first arises by a fleshy Beginning, three or four Fingers Breadth above the external Exuberance of the Humerus. It lies along all the Radius, to whose inferior and external Part it is insert'd by a pretty broad Tendon.

The last comes from the external and upper Part of the Ulna, and passing round the Radius, is insert'd into its upper and fore Part, below the Tendon of the Biceps. These turn the Palm of the Hand upwards.

**SUPINE**, in the Latin Grammar, a Part of the Conjugation of a Verb, of like Effect with the Infinitive Mood. See VERB, MOOD, &c.

There are two kinds of *Supines*, the one in *am*, whose Signification is active, and marks a Motion, as *ans suspirans*; the other in *u*, having a passive Signification, as *horrendus auditu*, &c. The *Supines* have neither Number nor Person.

They have their Name, says *Prætorius*, and after him *Vossius*, quod ad instar *Supinorum* et *otioforum* hominum *otium habent consensu*. Or, according to *Prætorius*, quod *infinitivus a participiis passivis que supina appellantur sunt, quia in infinis loco sua totius conjugationis molem suscipiunt*.

**SUPLANTALIA**, among Physicians, Plasters apply'd to the Soles of the Feet, generally made of Leaven, Mustard, wild Radish, Salt, Soap, Gunpowder, &c.

**SUPPLEMENT** of an Ark in Geometry, or Trigonometry, is the Number of Degrees that it wants of being an intire Semicircle; as Complement signifies what an Ark wants of being a Quadrant. See QUADRANT, COMPLEMENT, &c.

**SUPPLEMENT**, in Matters of Literature, an Appendix to a Book, to supply what is wanting therein. See PARERGON.

*Prætorius* has wrote divers *Supplements*, to restore the Books of several ancient Authors, Part whereof had been lost.

The French also use the Word *Supplement* for a Kind of Tax, or After-payments charg'd on Lands, Offices, &c. that are pretended to have been sold beneath their Value.

**SUPPLICAVIT**, a Writ issuing out of Chancery, for taking the Surety of Peace against a Man. It is directed to the Justices of the Peace, and Sheriff of the County; and is grounded on the Statute 1 *Ed. 3.* which appoints, that certain Persons shall be assign'd by the Lord Chancellor to take Care of the Peace.

**SUPPORTED**, in Heraldry, a Term apply'd to the uppermost Quarters of a Shield, when divided into several Quarters; these seeming, as it were, *supported* or sustain'd by those below. See QUARTER.

The Chief is also said to be *supported* when it is of two Colours, and the upper Colour takes up two Thirds of it. In this Case it is *supported* by the Colour underneath.

**SUPPORTER**, in Heraldry, Figures in an Achievement, plac'd by the Side of the Shield, and seeming to *support*, or hold up the same. See ATTACHEMENT, SHIELD, &c.

The *Supporters* of the English Arms are a Lion and an Unicorn; some of the former Kings had a Leopard and an Unicorn; others Griffons; others Eagles. See ARMS.

The *Supporters* of the French Arms are Angels; which are said to have been first introduc'd by Philip VI; his De-

vice being an Angel over-throwing a Dragon: The Dragon being at that Time the Device of the King of England.

NOTE of the Prince of Monaco, are Anguillin Monks: Those of the Family of the *Ursini*, Bears, in Allusion to their Names.

In England, none below the Degree of a Bannet are allow'd *Supporters*.

Some make a Difference between *Tenant* and *Supporter*: When the Shield is bore by a single Animal, 'tis call'd *Tenant*; when by two, they are call'd *Supporters*. See *TENANT*.

**SUPPOSITION**, in Music, the using of two successive Notes, of the same Value, as to Time; the one whereof being a Discord, *supposes* the other a Concord. See *HARMONY*.

The Harmony, Mr. *Melcolm* observes, is always to be full on the accented Parts of the Bar, or Measure, but on the unaccented, Discords may transiently pass, without any Offence to the Ear. This transient Use of Discords, follow'd by Concoords, makes what we from the French call *Supposition*. See *CONCORD* and *DISCORD*.

There are several Kinds of *Supposition*: The first is, when the Parts proceed gradually from Concord to Discord; and Discord to Concord; the intervening Discord serving only as a Transition to the following Concord.

Another Kind is, when the Parts do not proceed gradually from the Discord to the Concord, but descend to it by the Distance of a Third.

A third Kind, like the second, is, when the rising to the Discord is gradual, but the descending from it to the following Concord, is by the Distance of a fourth.

A fourth Kind, very different from all the rest, is, when the Discord falls on the accented Parts of the Measure, and the Rising to it is by the Distance of a fourth. In which Case 'tis absolutely necessary to follow it immediately, by a gradual Descent into a Concord, that has just been heard before the Harmony; to make the preceding Discord pass without Offence, and only seem a Transition into the Concord.

**SUPPOSITION**, in Arithmetick. See *POSITION*.

**SUPPOSITORY**, in Pharmacy, a solid Medicine thrust up the Fundament, in lieu of a Liquid one, or Clyster, where that would not be so convenient. See *CLYSTER*.

'Tis compos'd of common Honey, mix'd up with either Soap, or Oil, and form'd into Pieces of the Length and Thickness of the little Finger, only Pyramidal.

The *Suppository* was invented for the Convenience of such as have an Aversion to the taking of Clysters; or to be used where the Disease does not allow thereof.

The *Latin* call it *Balanus*, because anciently made in Figure of an Acorn.

To the Composition is sometimes added Powder of Scammony, Euphorbium, Colocynthis, &c.

On some Occasions 'tis made simply of a Cut of Bacon, the Stem of a Leek, or the like Matter, thrust, like a Tent, up the Anus, to irritate the Sphincter Muscle, and oblige it to extrude the Excrements.

**SUPPRESSION**, in the Customs, the Extinction or Annihilation of an Office, Right, Rent, &c.

From the *Latin* *sub* and *premo*, I press under.

**SUPPRESSION**, in Grammar, an Omission of certain Words in a Sentence, which yet are necessary to a full and perfect Construction: As, I come from my Father's; that is, from my Father's House.

*Suppression* is a Figure of Speech very frequent in our Language; chiefly used for Brevity and Elegance. Some Rules relating hereto, are as follow:

1<sup>o</sup>. Whenever a Word comes to be repeated in a Sentence often than once, 'tis to be *suppress'd*: Thus we say, This is my Master's Horse; not, This Horse is my Master's Horse.

2<sup>o</sup>. Words that are necessarily imply'd, may be *suppress'd*.

And 3<sup>o</sup>. All Words that Use and Custom *suppress* in other Languages, are to be *suppress'd* in English; unless there be particular Reasons for the contrary.

**SUPPRESSION**, in Medicine, is apply'd to the Humours that are retain'd in the Body by some Obstruction or Stoppage of the usual Outlets. As, a *Suppression* of Urine, of the Menes, &c. See *URINE*, *MENSES*, &c.

**SUPPURATION**, in Medicine, the Action whereby extravasated Blood, or other Humours, are chang'd, in the Body, into Pus. See *PUS*.

The Change is begun by a Diffusion of the most subtle and spirituous Parts of the Blood: What is left behind, thickens and purifies by little and little; that is, its Sulph and Sulphurs disengage themselves from the grosser Parts wherein they were embarras'd. These Parts thus disengag'd, and acting on one another, bruise and break each other, and thus excite a Fermentation, which increases the Heat of the Part; whereby the Matter is farther digested, and a Pain and Tension produc'd. At length the Blood loses its Colour, and becomes quite white, by the Mixture of its Acid, sulphurous and acrimonious Particles; as we see happens to fulphurous Alkalies, when mix'd with Acids. See *DIGESTION*.

The Word is form'd from the *Latin*, *sub*, under, and *fero*, carry.

**SUPPURATIVE**, a Medicine that promotes *Suppuration*. See *SUPPURATION*.

*Suppuratives* are all hot; by which Means, increasing the Heat of the Part, they resolve the Humour into a Pus. See *DIGESTIVE*.

Such are Mallow, Lilly-Roots, Drachylon, &c. See *COMPUTATION*.

**SUPRALAPSARY**, in Theology, a Person who holds, that God, without any Regard to the good or evil Works of Men, has resolv'd, by an eternal Decree, to save some, and damn others.

Such are also call'd *Antelapsaries*; and are oppos'd to *Sublapsaries* and *Infralapsaries*. See *SUBLAPSARIES*.

According to the *Supralapsaries*, the Object of Predestination is *Homo creatus & lapsus*; and according to the *Sublapsaries*, *Homo creatus & lapsus*.

The *Supralapsaries* seem, in one single absolute Decree, to confound two several ones which ought to be distinguish'd: The one, the Conditional Decree preceding the Fore-sight of the Man's Obedience, or Disobedience to the Grace of God; The other, the Absolute Decree following this Fore-sight. See *DECREE*.

The Predestinants also, admit an Absolute Decree prior to the Fore-sight of Original Sin, in common with the *Sublapsaries*; but distinguish themselves from them, as also from the *Infralapsaries* and *Jansenists*; in that their Absolute Decree includes the offering of sufficient Means of Salvation to the Reprobate; so that, as to the Point of Power, nothing hinders but they might be sav'd. See *GRACE*.

**SUPRASPINATUS**, in Anatomy, a Muscle thus call'd from its fleshy Origination, at the upper End of the Basis of the Scapula, above the Spine, to the upper Part whereof it is connect'd, as also to the superior Rib of the Scapula; whence marching along the upper Intercapulum, or this Part of the Scapula, which it fills, it passes under the Acromion and Articulation of the Humerus. It helps to lift the Arm upwards.

**SUPREMACY**, in the English Customs, the Superiority of the King over the Church of England, whereof he is establish'd Head. See *KING*.

The King's *Supremacy* was first establish'd by King Henry VIII. in 1534, after breaking with the Pope. It is since confirm'd by several Canons, as well as by the Articles of the Church of England; and is pass'd into an Oath, which is requir'd as a necessary Qualification for all Offices and Employments both in Church and State; for Persons to be obtain'd, from the Members of both Houses of Parliament, &c. See *OATH*.

This Right of *Supremacy* chiefly consists in the following Articles, 1. That the Archbishops of either Province cannot summon the Bishop and Clergy to Convocation, nor enact any Canons without the King's express Consent, by 25 H. 8. c. 19. Whereas before that Act, the Convocation was often call'd, and Laws made by it for governing the Church, without any Authority from the Crown. 2. In that there lies now an Appeal from the Archbishop to the King in Chancery; and on such an Appeal, a Commission under the Great Seal is to be directed to certain Persons, whereof commonly half are Laymen, and half Clergymen, which is call'd the Court of Delegates, and which finally determine all Ecclesiastical Causes, by 25 H. 8. c. 19. tho' sometimes a Review is granted. Before this Statute, the Appeal from the Archbishop's Court lay to the People only. 3. The King can grant Commissions for visiting such Places, as are exempt from the Jurisdiction of the Bishops or Archbishops; and Appeal lies from thence to the King in Chancery: Whereas before 25 H. 8. the Pope only could visit them, and receive Appeals from those Courts. 4. Persons in holy Orders, are not, as formerly, exempt from the King's Temporal Laws, any more than Laymen. 5. The Bishops and Clergy do not swear, or pay any Obedience to the Pope; but must take the Oaths of Allegiance and Supremacy to the King.

**SURA**, in Anatomy, the Shin-Bone; the same as *Fibula*. See *FIBULA*.

**SURBATING**, among Farriers, is when the Sole of a Horse's Foot is wore, bruis'd, or spoil'd, by beating the Hoof against the Ground in travelling without Shoes, or going in hot, sandy Lands, or with a Shoe that hurts the Sole, lies too fast to it, &c.

Sometimes, it happens by over-riding a Horse, while young, or his Feet are harden'd; and sometimes by the Hardness of the Ground, and high lifting his Feet.

The Signs hereof, are his halting on both Fore-legs, and going stiffly, and creeping as if half-sounder'd.

In the general, there is nothing better for *Surbated* Feet than Tar melted into the Foot; or Vinegar boil'd with Foot to the Consistence of a Broth, and put into the Foot boiling hot, with Hards over it, and Splints to keep it in.

**SURCHARGE** of the Forest, is when a Commoner puts more Beasts in the Forest than he has a Right to. See FOREST.

**SURCINGLE**, a Girdle, wherewith the Clergy of the Church of *England* usually tie their Cassocks.

**SURCOAT**, a Coat of Arms, to be wore over other Armour. See COAT of Arms.

**SURD**, in Arithmetick, an irrational Number, or Quantity; or a Number, &c. that is incommensurate to Unity. See IRRATIONAL NUMBER.

When any Number or Quantity hath its Root propos'd to be extract'd, and yet is not a true figurate Number of that Kind; that is, if its square Root being demand'd, it is not a true Square; If its Cube Root being requir'd, itself be not a true Cube, &c. then it is impossible to assign, either in whole Numbers or Fractions, any exact Root of such Number propos'd.

And whenever this happens, it is usual in Mathematicks, to mark the requir'd Root of such Numbers or Quantities, by prefixing before it the proper Mark of Radicality, which is  $\sqrt{\quad}$ : thus  $\sqrt{2}$  signifies the Square Root of 2, and

$\sqrt[3]{16}$ , or  $\sqrt{(3) 16}$ , signifies the Cubic Root of 16: Which Roots, because they are impossible to be express'd in Numbers exactly, (for no effable Number, either Integer or Fraction, multiply'd into itself, can ever produce 2; or being multiply'd Cubically, can ever produce 16) are very properly call'd *Surd* Roots.

There is also another Way of Notation now much in Use, whereby Roots are express'd without the Radical Sign, by their Indexes: Thus, as  $x^2$ ,  $x^3$ ,  $x^4$ , &c. signify the Square

Cube, and 5th Power of  $x$ ; so  $x^{\frac{1}{2}}$ ,  $x^{\frac{1}{3}}$ ,  $x^{\frac{1}{4}}$ , signify the Square Root, Cube, &c. of  $x$ .

The Reason of which is plain enough; for since  $\sqrt{x}$  is a Geometrical mean Proportional between 1 and  $x$ , so  $x^{\frac{1}{2}}$  is an Arithmetical mean Proportional between 1 and  $x$ ; and therefore as 2 is the Index of the Square of  $x$ ,  $\frac{1}{2}$  will be the proper Index of its Square Root, &c.

Observe also, that for Convenience, or Brevity's Sake, Quantities or Numbers, which are not *Surds*, are often express'd in the Form of *Surd* Roots. Thus,  $\sqrt{4} \sqrt{2} \sqrt[4]{4}$

$\sqrt[3]{27}$ , &c. signify,  $2 \sqrt[3]{3}$ , &c.

But tho' these *Surd* Roots (when truly such) are inexpressible in Numbers, they are yet capable of Arithmetical Operations, (such as Addition, Subtraction, Multiplication, Division, &c.) which how readily to perform, the Algebraist ought not to be ignorant.

*Surds* are either *Simple*, which are express'd by one single Term; or *Compound*, which are form'd by the Addition or Subtraction of simple *Surds*: As  $\sqrt{5} + \sqrt{12} : \sqrt{5} -$

$\sqrt{2}$ , or  $\sqrt[5]{17} + \sqrt{2} : \sqrt{2}$ : Which last is call'd an universal Root, and signifies the Cubic Root of that Number, which is the Residue of adding 7 to the Square Root of 2.

To reduce rational Quantities to the Form of any *Surd* Roots assign'd; involve the rational Quantity according to the Index of the Power of the *Surd*, and then prefix before it the Radical Sign of the *Surd* propos'd. Thus to reduce  $a=10$ , to the Form of  $\sqrt{15} = b$ , you must square  $a=10$ ; and prefixing the Sign, it will stand thus,  $\sqrt{100} = \sqrt{150}$ , which is the Form of the *Surd* desir'd.

So also, if 3 were to be brought to the Form of  $\sqrt[4]{12}$ , you must raise 3 up to its fourth Power, and then prefixing the Note of Radicality to it, it will be  $\sqrt[4]{81}$ , or  $81^{\frac{1}{4}}$

which is in the same Form with  $\sqrt[4]{12}$ .

And this Way may a simple *Surd* Fraction, whose Radical Sign refers only to one of its Terms, be changed into another, which shall respect both Numerator and Denominator. Thus  $\frac{\sqrt{12}}{25}$  is reduc'd to  $\sqrt{\frac{2}{25}}$  and  $\frac{5}{\sqrt{4}}$ , to

$\sqrt{\frac{125}{4}}$ ; where the Radical Sign affects both Numerator and Denominator.

To reduce simple *Surds*, having different Radical Signs, (which are call'd Heterogeneous *Surds*) to others that may have one common Radical Sign, or which are Homogeneous; divide the Indexes of the Powers by their greatest common Divisor, and set the Quotients under the Dividends; then multiply those Indexes cross-ways by each other's Quotients, and before the Product set the common Radical Sign  $\sqrt{\quad}$ : with its proper Index: Then involve the Powers of the given Roots alternately, according to the Index of each other's Quotient; and before those Products, prefix the common Radical Sign before found.

To Reduce  $\sqrt{a a}$  and  $\sqrt[4]{b b}$

$$2) \sqrt{a a} \quad 2) \sqrt[4]{b b}$$

$$1 \times 2$$

$$\sqrt[4]{b b} \quad \sqrt[4]{a a a a}$$

To reduce *Surds* to the lowest Terms possible: Divide the *Surd* by the greatest Square, Cube, Biquadrate, &c. or any other higher Power, which you can discover is contain'd in it, and will measure it without any Remainder; and then prefix the Root of that Power before the Quotient, or *Surd*, so divided, and this will produce a new *Surd* of the same Value with the former, but in more simple Terms. Thus,  $\sqrt{16 a b}$ , by dividing by 16  $a b$ , and prefixing the Root 4  $a$ , will be reduc'd to thus,  $4 a \sqrt{b}$ , and  $\sqrt{12}$  will be depress'd to  $2 \sqrt{3}$ . Also  $\sqrt[3]{108 y}$  will be brought down to  $b \sqrt[3]{108}$ .

This Reduction is of great Use whenever it can be perform'd: But if no such Square, Cube, Biquadrate, &c. can be found for a Divisor, then you must find out all the Divisors of the Power of the *Surd* propos'd; and then see whether any of them be a Square, Cube, &c. or such a Power as the Radical Sign denotes; and if any such can be found, let that be used in the same Manner as is above said, to free the *Surd* Quantity in Part from the Radical Sign. Thus, if  $\sqrt{288}$  be propos'd; among its Divisors will be found the Squares, 4, 9, 16, 36, and 144; by which, if 288 be divided, there will arise the Quotients 72, 32, 18, 8, and 2; wherefore instead of  $\sqrt{288}$ , you may put  $2 \sqrt{72}$ , or  $3 \sqrt{32}$ , or  $4 \sqrt{18}$ , or  $6 \sqrt{8}$ , or lastly,  $12 \sqrt{2}$ ; and the same may be done in Species. But for the whole Arithmetic of *Surds*, see *Kersey's* Algebra, and others on the same Subject.

**SURETY** of the Peace, (so call'd, because the Party that was in fear, is thereby secur'd) is the acknowledging a Bond to the Prince, taken by a competent Judge of Record, for the keeping the Peace. See PEACE.

This Peace, a Justice of the Peace may command, either as a Minister, when command'd thereto by higher Authority; or as a Judge, when he doth it of his own Power, deriv'd from his Commission.

*Surety of the good bearing*, differs from this; that whereas the Peace is not broken without an Assize, or such like; the *Surety de bono gestu* may be broken by the Number of a Man's Company, or by his or their Weapon, or Harass'd.

**SURFACE**, in Geometry. See SUPERFICIES.

**SURFEIT**, an Indisposition caus'd by Excess in Eating or Drinking, that is, by over-charging the Stomach. It is usually attended with Eruptions, and sometimes with a Fever. See PLENTITUDE.

**SURFEY-WATER**, is a Water distill'd from Poppies, and other Herbs, proper to cure Indigestions.

**SURGE**: The Sailors call a Wave or Billow of the Sea a *Surge*: Also, when they are heaving at the Capitan, if the Cable happen to slip back a little, they say, The Cable surges.

**SURGERY**. See CHIRURGERY.

**SURMOUNTED**, is the Herald's Term for the Bearing of one Ordinary upon another: thus in the adjoining Figure, a Pike is surmounted of a Chevron. *Harris*.

**SURNAMES**, a Name added to the Proper or Baptismal Name, to denominate the Person of such a Family. See NAME.

'Twas the *Romans* first introduced the Use of Hereditary Names; and that on Occasions of their League with the *Sabines*; for the Confirmation whereof, it was agreed, That the *Romans* should prefix *Sabine* Names, and the *Sabines*, *Roman* Names, to their own.

These new Names became Family Names, or *Surnames*, and the old Ones continued personal Names. The former they call'd *Cognomina*, and the latter *Prænomena*. See PRAENOMEN and COGNOMEN.

When they came to be used among the *French* and *English*, they were call'd *Surnames* or *Sir-names*, not because they are the Names of the *Sire* or Father; but, according to *Camden*, because they are super-added to the personal Name; or, rather, with *Du Cange*, because at first, this Family-name was wrote over (*Sur*) the other Name thus: *de Bourbons de Louis*.

In lieu of *Surnames*, the *Hebrews*, to keep up the Memory of their Tribes, used the Name of their Father, with the Addition of *Ben*, Son; as *Melchior Ben-Ahij*, *Ahij-Ben-Cajam*, &c. so the *Greek*, *καθημερον το πατριον*; *Icarus*, the Son of *Deдалος*, *Deдалος* the Son of *Eupalamos*, &c.

So, also, the ancient *Britons*, *Cornwall*, *Cornwall King*, *Credwall's Catling*, that is, *Cornwall* Son of *Credwall*, Son of *Catb*; and in the same Sense, the later *Welsh* use *Ap* for *Mother*, Son,

as, *ap Owen*, *Owen ap Harry*, *Harry ap Rhoſe*; and the *Iriſh*, *Mac*, as *Donald Mac Neal*, *Niel Mac Cou*, &c. and the old *Normans*, *Fitz*, as *John Fitz Robert*, *Robert Fitz Ralph*, &c.

*Sauger*, adds, That the *Arabs* uſed their Father's Name, or *Surname*, without their perſonal Name; as, *Avon-Pace*, *Avon-Zaar*, &c. *q. d.* Son of *Pace*, Son of *Zaar*, &c.; as if *Pace* had a Son at his Circumciſion, call'd *Holy*, he would be call'd *Avon-Pace*, concealing *Holy*; but his Son, however he were nam'd, would be call'd *Avon-Holy*, &c.

The *Romans*, in Time, multiplied their *Surnames*: Beſides the general Name of the Race or Family, call'd, alſo, *Gentilitium*; they took a particular one, to diſtinguiſh the Branch of the Family, call'd *Cognomen*; and ſometimes a Third, on account of ſome perſonal Diſtinction; as that of *Africanus*, by *Scipio*; or *Tergemus* by *Manius*.

Theſe Three different Kinds of *Surnames*, had alſo their different Names, *viz.* *Nomen*, *Cognomen*, *Agnomens*; but theſe laſt were not Hereditary; being, in effect, a kind of *Nick-names*, if that Word be indifferently with reſpect to Good and Evil.

In theſe, too, they have been imitated by later Times: Thus, in our *Engliſh* Hiſtory, we find that *Edgar* was call'd the *Peaceable*; *Edward*, the *Unruly*; *Edmond*, *Iron-ſide*; *Harold*, *Here-foot*; *William*, the *Bayard*; *Henry I.* *Beau-clerk*; *John*, *Lack-law*, &c. But as theſe Names were never bore by the *Scots*, *Camden* thinks it ſtrange, that *Plantagenet* ſhould be accounted the *Sur-name* of the Royal Family of *England*, till *Henry VII.*; or *Lydor* or *Tudor*, that from *Henry VII.* to *King James I.*; or that of *Steward* from *James I.* to *King George*; or, that *Valois* ſhould be eſteem'd the *Sur-name* of the late Family of *French* Kings; or *Boorſen* of the preſent; or *Oldenburg* of the Kings of *Denmark*; or *Hapsburg* of the Emperors. See *PLATAGENET*.

*Dei Cæſar* obſerves, that *Sur-names* were known in *France* before the Year 987; when the Lords began to aſſume the Names of their Domains. *Camden* relates, That they were firſt taken up in *England*, a little before the Conqueſt, under *King Edward the Confeſſor*: But he adds, they were never fully eſtabliſh'd among the common People, till the Time of *King Edward II.* till then they varied with the Father's Name; if the Father, *E. gr.* were call'd *Richard* or *Roger*, the Son was call'd *Richardſon* or *Hoſſon*; but from that Time they were ſettled, ſome ſay, by Act of Parliament.

The oldest *Sur-names*, are thoſe we find in *Domeſday-Book*, moſt of them taken from Places, with the Addition of *de*, as *Godefridus de Marneville*, *Walterus de Vernon*, *Roberts de Oily*, &c.; others from their Fathers, with *Filius*, as *Gulielmus Filius Osborni*; others from their Offices, as *Eudo Dapifer*, *Gulielmus Camerarius*, *Gilbertus Cocus*, &c. But the inferior People are noted, ſimply, by their Chriſtian Names; without any *Sur-names* at all.

In *Sweden*, till the Year 1514, no Body ever took any *Sur-name*; and the common People there, have none to this Day; nor even the native *Iriſh*, *Poles* and *Bohemians*, &c. 'Tis very late that the *Weſt* have had any; and thoſe they have, are generally only form'd, by leaving out the *a* in *ap*, and annexing the *s* to their Father's Name, as in lieu of *Evan ap Rice*, they now ſay, *Evan Price*; for *ap Howell*, *Powell*, &c.

*De Tillet* maintains, That all *Sur-names* were given by way of *Sobriquet*, or *Nick-names*; and adds, That they are all ſignificant and intelligible, to thoſe who underſtand the ancient *Dialects* of the ſeveral Countries. The greateſt Part of our *Sur-names*, and thoſe of greateſt Account, *Camden* ſhews, are local, and borrowed from the Places in *Normandy*, &c. where the reſpective Perſons, who came over with the Conqueror, and firſt bore them, had their Poſſeſſions, or their Birth; ſuch as *Mariner*, *Warren*, *Albigny*, *Percy*, *Dreuxen*, *Taukevil*, *Nevil*, *Tracy*, *Moutfert*, &c. He adds, That there is not a Village in *Normandy*, but gives Name to ſome Family in *England*. Others were taken from Places in *England*, as *Alton*, *Sutton*, *Wotton*, &c.

The *Scots* common People generally took their Father's or Mother's Chriſtian Name, with the Addition of *Son*: Though many were *Sur-named* from their Trade, as *Smith*, *Carpenter*, *Taylor*, *Wagner*, *Feller*, &c. others from their Offices, as *Purvey*, *Shepherd*, *Carter*, *Cook*, *Butler*, &c. others from their Complexion, *vs. Fair*, *ſax*, *Pigot*, *Blunt* or *Blind*; others from Birds, *vs. Wren*, *Finch*, &c. others from Beaſts, as *Lamb*, *Hare*, *Hart*, &c. others from the Winds; others from Saints, &c.

**SURPLUSAGE**, in common Law, ſignifies a Superfluity, or Addition, more than needeth; which ſometimes is the Cauſe that a Will abateth.

It is ſometimes alſo apply'd to Matter of Account, and denotes a greater Diſburſement than the Charge of the Accountant amounteth to.

**SURREBUTTER**, in Law, a ſecond Rebutter, or a Rebutting more than once. See *REBUTTER*.

**SURREJOINDER**, is a ſecond Defence of the Plaintiff's Action, oppoſite to the Defendant's Rejoinder. See *REJOINDER*.

**SURRENDER**, an Inſtrument in Writing, teſtifying, That the particular Tenant of Lands and Tenements for Life or Years, doth ſufficiently conſent and agree, That he, who has the next or immediate Remainder or Reversion thereof, ſhall have the preſent Eſtate of the ſame in Poſſeſſion; and that he yields and gives up the ſame to him; for every *Surrender* ought, forthwith, to give Poſſeſſion of the Things ſurrender'd.

There may alſo be a *Surrender* without Writing, whence, a *Surrender* is divided into that in *Deed*, and that in *Law*.

*Surrender-in-Deed*, is that which is really and ſenſibly perform'd.

*Surrender-in-Law*, is in the Intendment of Law, by way of Conſent, and not Actual. As if a Man have a *Leaſe* of a Farm, and during the Term, he accepts of a new *Leaſe*; this Act is in Law, a *Surrender* of the former.

There is alſo a cuſtomary *Surrender* of the Copy-hold, as may be ſeen in *Coke ſup. Littles*. Sect. 74.

**SURROGATE**, a Perſon ſubſtituted or appointed in Room of another; moſt commonly of a Biſhop, or Biſhop's Chancellor. See *BISHOP*, *SUFFRAGAN*, &c.

**SURSOLED**, or **SURDESOLID**, in Arithmetic, the Fifth Power of a Number, or the Fourth Multiplication of any Number, conſider'd as a Root. See *POWER*.

The Number 2, for Inſtance, conſider'd as a Root, and multiplied by itſelf, produces Four, which is the Square, or ſecond Power of 2; and 4 multiplied by 2, produces 8, the third Power, or the Cube or ſolid Number of 2; 8, again, multiplied by 2, produces 16, the fourth Power, or *Quadrato-quadratum* of 2; and 16 multiplied once more by 2, produces 32, the fifth Power, or *Surſolid*, or *Surdeſolid* Number of 2.

*Surſolid Problem*, is that which cannot be reſolv'd, but by Curves of an higher Kind, than the Conic Sections. See *PROBLEM*.

*E. gr.* To deſcribe a regular Endecagon, or Figure of Eleven Sides in a Circle, it is required to deſcribe an *Hexiſtes* Triangle on a Right Line given, whoſe Angles at the Baſe, ſhall be quintuple to that at the Vertex; which may eaſily be done by the Interſection of a Quadratrix, or any other Curve of the ſecond Gender, as they are by ſome call'd, but not by any lower Curve. See *CURVE*.

**SURVEYING**, the Art or Act of meaſuring Lands; *i. e.* of taking the Dimensions of any Tract of Ground, laying down the ſame in a Map or Draught; and finding the Content or Area thereof. See *MEASURING*, *MAP*, &c.

*Surveying*, call'd alſo *Geodeſia*, is a very ancient Art; 'tis even held to have been the firſt, or primitive Part of Geometry, and that which gave Occaſion to, and laid the Foundation of, all the reſt. See *GEOMETRY*.

*Surveying* conſiſts of Three Parts or Members; the Firſt, is the taking of the neceſſary Meaſures, and making the neceſſary Obſervations on the Ground itſelf; The Second, is the laying down of theſe Meaſures and Obſervations on Paper; and the Third, the finding the Area or Quantity of the Ground thus laid down.

The Firſt is what we properly call *Surveying*. The Second we call *Plotting* or *Protracting*, or *Mapping*: And the Third, *Coſting* up.

The Firſt, again, conſiſts of Two Parts, *viz.* the making of Obſervations for the Angles, and the taking of Meaſures for the Diſtances.

The former of theſe is performed by ſome one or other of the following Inſtruments, *viz.* the *Theodolite*, *Circumferentor*, *Semi-circle*, *Plane Table* or *Compaſs*: The Deſcription and Manner of uſing each whereof, ſee under its reſpective Article, *THeODOLITE*, *CIRCUMFERENTOR*, *PLANE TABLE*, *COMPASS*, &c.

The latter is performed, by means either of the Chain or the Perambulator: The Deſcription and Manner of applying each whereof; ſee under its reſpective Article, *CHAIN* and *PERAMBULATOR*.

The ſecond Branch of *Surveying*, is perform'd by means of the *Protractor* and *Plotting Scale*: The Uſe, &c. whereof; ſee under *PROTRACTOR*, *PLOTTING SCALE*, &c. See alſo *MAP*.

The Third is perform'd, by reducing the ſeveral Diviſions, Incloſures, &c. into *Triangles*, *Squares*, *Trapeziums*, *Parallelograms*, &c. but eſpecially *Triangles*; and finding the Area or Contents of theſe ſeveral Figures, by the Rules deliver'd under the Articles *AREA*, *TRIANGLE*, *SQUARE*, &c.

*SURVEYING CROſS*, is an Inſtrument little known, and leſs uſed in *England*; though in *France*, &c. it ſerves in lieu of a *Theodolite* or the like Inſtrument: It conſiſts of a braſs Circle, or rather a circular Limb, graduated, and again divided into Four equal Parts, by two Right Lines cutting each other at right Angles in the Centre. At each of the Four Extremities of the Lines, and in the Centre are fix'd Sights. The whole is mounted on a Staff.

*SURVEYING Wheel*. See *PERAMBULATOR* or *WAY-WISER*.

**SURVEYOR**, one that hath the Over-ſight and Care of conſiderable Works, Lands, &c.

# TAB. SURVEYING

As, the *Surveyor General of the King's Mowers*; *Surveyor of the King's Exchange*; *Surveyor General of the Works*; *Surveyor of the Highways*, &c.

**SURVEYOR of the Mint**, is an Officer of the Mint, whose Business is to see the Bullion cast out; and that it be not alter'd after the Delivery of it to the Melter. See **MINT** and **COINAGE**.

**SURVEYOR of the Navy**, is an Officer, whose Business is to know the State of all Stores, and see the Wants supplied; to Survey the Hulls, Masts and Yards of Ships; to Audit the Boatwain's and Carpenter's Accounts. See **NAVY**.

**SURVEYOR of the Ordnance**, is an Officer, whose Charge is to Survey all the King's Ordnance, Stores and Provisions of War, in the Custody of the Store-keeper of the Tower of London; to allow all Bills of Debts, to keep Checks on Labourers and Artificers Works, &c. See **ORDNANCE**.

**SURVEYOR** is also used for a Gauger; and also for a Person who measures Lands. See **SURVEYING** and **GAUGING**.

**SURVIVOR**, in Law, signifies the longer Liver of two joint Tenants; or any Two joined in the Right of any Thing.

**SUSPENSION or SUSPENSE**, in Common Law, is a Temporal Stop of a Man's Right.

As, when a Seignior, Rent, &c. by reason of the Unity of Possession thereof, and of the Land out of which they issue, are not in effect for a certain Time, and two dominions; but may be revived; and thus it differs from Extinguishment, which dies for ever. See **EXTINGUISHMENT**.

**SUSPENSION**, in the Common Law, is what we otherwise call the *minor Excommunication*, viz. a Censure inflicted by way of Punishment, on an Ecclesiastic, for some considerable Fault. See **CENSURE** and **EXCOMMUNICATION**.

'Tis of two Kinds, viz. *ab Officio*, and a *Beneficio*. *Suspensio ab Officio*, is that whereby a Minister is, for a Time, declared unfit to execute the Office of a Minister. See **OFFICIO**.

*Suspensio a Beneficio*, is when a Minister is, for a Time, deprived of the Profits of his Benefices. See **BENEFICIO**.

Where the Fault is more Notorious, the two Kinds of *Suspensio* are sometimes joined; and the Person *suspended ab Officio*, and a *Beneficio* likewise. See **DEPRIVATION**, &c.

**SUSPENSION**, the Act of preventing the Effect, or Course of any thing, for a certain Time.

The principal Point urged in the Philosophy of the *Scripturicks* and *Pyrrhonians*, is a *Suspension* of Mind. See **SCRIPTURICKS**, **PYRRHONIANS**, &c.

A *Suspension of Arms*, in War, is a short Truce the contending Parties agree on, for the Burial of their Dead, the waiting for Succours, or the Orders of their Masters, &c.

In Rhetoric, *Suspension* is a keeping the Hearer attentive and doubtful; in expectation of what the Speaker will conclude in: as, *O God! Darkness is now more opposite to Light; Tempests to Calm; Pain to Pleasure; or Death to Life; than Sin to thee*.

**SUSPENSION**, in Mechanics, *Points of Suspension* in a Balance, are those Points in the Axis or Beam wherein the Weights are apply'd; or from which they are *suspended*. See **BALANCE**.

**SUSPENSOR Testiculi**, in Anatomy, a Muscle call'd also *Cremaster*. See **CREMASTER**.

**SUSPIRAL**, a Spring of Water, passing under Ground towards a Conduit or Cistern; also a Breathing-Hole, or Ventiduct. See **VENTIDUCT**.

**SUTE**. See **SUITE**.

**SUTH-DOOR**, in ancient Customs, the South Door of a Church. The *Suth-dore* is mentioned in old Authors, as the usual Place where canonical Purgation was perform'd: that is, when the Fact could not be proved by sufficient Evidence, the Party accused, came to the South Door of the Church; and there, in the Presence of the People, made Oath, that he was Innocent. See **PURGATION**.

This was call'd *Judicium Dei*. 'Tis for this Reason, that Porches are built at the South Doors of Churches. See **PORCH**.

**SUTURE, SUTURA**, in Anatomy, a particular Kind of Junction, or Articulation, of certain Bones in the Animal Body; thus call'd, as resembling a Seam. See **ARTICULATION**.

There are two Kinds of *Sutures*; the one call'd the *true* or genuine *Suture*; wherein the Bones are indented like Saws, and reciprocally receiv'd into each other.

The other, call'd the *false*, or *spurious*, or *squammosus Suture*; wherein the Bones are laid over each other, like the Scales of Fishes.

The Bones of the Cranium are usually join'd by three genuine *Sutures*; the *Coronal*, reaching across from one Temple to the other. See **CORONAL**.

The *Sagittal*, joining the Ossa Parietalia. See **SAGITTAL**. And the *Lambdoidal*; thus call'd from its resembling the Greek  $\Lambda$ , Lambda.

Besides these, is a fourth *Suture*, of the spurious or squamous Kind, suppos'd, tho' falsely, to have no Indentures: It joins the Ossa Temporalia to the Ossa Sphenoides, Occipitalia, &c. and is also call'd the *Temporal Suture*. See **SQUAMMOUS**.

Natural Historians tell us, That in *Persea* 'tis frequent to have People without any *Sutures* at all in the Skull; but the whole one solid Bone; yet without any apparent Inconvenience: And *M. Flebrier*, in his Life of Cardinal *Avennes*, affirms the same of that Cardinal; yet it should seem that great Disorders should arise therefrom; as the Perspiration could be but very imperfectly effect'd; whence Heaviness and Swelling in the Head. See **CRANIUM**.

**SUTURE**, in Chirurgery, a Seam made to close the Lips of a Wound, in order to its healing. See **WOUND**.

The Ancients invented a great Variety of *Sutures*, which they reduced to three Kinds; *Incarnatives*, *Restrictives* and *Conservative*.

*Incarnative SUTURE*, is thus call'd, because, by rejoining the Edges of a Wound, and keeping them together by the means of a Thread run across them with a Needle; they grow together, and incarnate as before. See **INCARNATIVE**.

This, they sub-divided into five Kinds, viz. the *Interrupted*, *Interwoven*, *Pin'd or Feather'd*, *with Claps*, and the *Dry Suture*.

Of these Five, two are perfectly disused, viz. the *feather'd Suture* and the *Suture with Claps*, as being too barbarous, and at the same Time unnecessary. The First was call'd *Pin'd*, when little Pins were made use of; and *feather'd*, when the Barrels of Feathers or Quills.

To perform it, two or three Needles, threaded with a double Thread, were pass'd through the Lips of the Wound, at a Finger's breadth from each other, and a Pin or Feather put in the Stitch; and another Pin or Feather bound with the Ends of the same Thread; that the Feathers might keep the Lips of the Wound close together.

To perform the Second, they had large, crooked Claps, pointed at each End; use of which they thrust into the upper Part of the Wound, the other into the lower, to bring the Lips together.

These *Sutures*, cruel as they were, are yet known to be useful; for in the only Cases where they should seem serviceable, viz. in deep Wounds, where the Contraction of the fleshy Parts keeps the Lips far asunder, and in Wounds of Tendons; they expose the Patient to terrible Convulsions and Shudderings, which are avoided, by diminishing the Dilatation of the Wounds, by moderate Compressions, and waiting till the Fibres relax.

*Retraining Sutures*, were those wherewith they endeavour'd to stop the Flux of Blood from large Wounds, where any considerable Vessels were cut.

To this End they invented several Kinds, in the Number whereof, were the *Shoe-maker's*, *Taylor's*, *Skinner's*; and other Seams; all more impertinent than each other. 'Tis evident, the very Design of such a *Suture* is blameable: For supposing the Wound to exactly few'd up, that no Blood could escape through the Lips thereof; yet will it still flow out of the Vessels; and will thus be forced to make its Way within the Intestines of the Muscles, by which means the Part will swell, rot, and gangrene. Yet the *Skinner's Suture*, *Sutura Pellucida*, is still preserv'd for Wounds of the Intestines: 'Tis thus call'd, because the Skinners use the same, in sewing up the Holes made by the Butchers, in sealing off the Skin.

*Conservative SUTURE*, is that kind of ancient *Suture*, whereby the Lips of large Wounds, wherein there was a Loss of Substance, were prevented from receding too far. But a Bandage, now, suffices.

The *Interwoven SUTURE*, is thus call'd, because the Needles being left sticking in the Wound, the Thread is wound around them; much after the same Manner as the Tailors do the threaded Needles they keep in their Sleeves, &c. This *Suture* is perform'd two Ways; for either the Needles are pass'd across the Wound, or they are stuck on the Sides thereof.

All the *Sutures* hitherto mention'd, are made with Needle and Thread: Beside which, there is another Kind, call'd *dry Sutures*, which are perform'd with Glue or Size; or other proper viscid Matter.

The *dry Suture* is ordinarily made with small Pieces of Leather, or Linnen Cloth, indented like a Saw, so that the Teeth may fall between each other, and the whole Row may be clos'd. The Cloth, before it is cut into this Form, is spread with some proper Emplaster, in order to its firm Adhesion.

The Plasters thus prepar'd, being cut into the proper Form, are apply'd on the firm Flesh, according to the Length of the Wound, reaching from it to the Distance of some Inches; and after they are dry'd, or well fasten'd to the Part, the Lips of the Wound being approach'd, they may conveniently be held together by the *Suture* in that Posture.

This kind of *Suture* is principally us'd to Wounds in the Face, to prevent unsightly Scars: 'Tis likewise convenient when the Fibres of the Muscles are cut a-croß; and where 'tis difficult or impossible to apply a Bandage.

In the other Kinds of *Sutures*, the Stitches ought always to be taken at a Depth proportionable to that of the Wound; Care being had to avoid the Nerves as much as possible. In long Wounds they are best begun at the Ends; but in short ones at the Middle.

**SWABBER**, the Title of an inferior Officer on Board a Man of War, whose Office is to see, that the Ship be kept neat and clean.

In order to this, he is to see her wash'd well once or twice a Week at least; especially about the Gun-Walls and Chains. He ought to burn Pitch, or some such Thing, now and then between Decks, to prevent infection; and to acquaint the Captain of such as are nasty and offensive.

**SWALLOWING**. See DEGLUTITION.

"Some People," (says Dr. *Slovi*, from an Instance of an unhappy Person who had swallow'd great Quantities of Pebbles to ease him of the Wind, and which remaining in his Stomach to the Number of 200, had brought him into a very sad Condition,) "from their seeing Birds lan-  
"guish, unless they swallow Gravel, or small Stones, take  
"up an Opinion, that the swallowing of Stones helps the  
"Stomach to digest its Food; but I have been always  
"against that Practice: For tho' the Stomachs, or Gizzards  
"of Birds (they wanting Teeth to grind their Food) are  
"made very strong, muscular, and defended on the inside  
"with a Coat, by the Help whereof, and these Stones, their  
"Victuals are ground; yet the Stomachs of Men being  
"very different, 'tis not reasonable to think they should be  
"of Use (or even inoffensive) to them.

"I knew, adds he, one Mr. K——, who for many  
"Years swallow'd nine or ten every Day, nearly as large as  
"Wallnuts, and without any apparent Harm, as they al-  
"ways pass'd; but he afterwards dy'd suddenly." —  
A Lady, mention'd by Mr. *Greenhill* in the *Philosophical Transactions*, got a large and painful Tumor in the Umbilicus, with swallow'd Prune-Stones; which, upon the Tumor's breaking of itself, came out in great Quantity: Notwithstanding all imaginable Care she dy'd of it. — A Lad, 16 Years of Age, near *Hall* in *Saxony*, playing with a Knife six Inches and half long, accidentally swallow'd it. The Curiosity of the Cafe led *Wolfgang Christoph Weyson*, Physician of the Elector of *Brandenbourg*, to take Care of him. The Knife was felt to have chang'd its Position several Times, and in a few Months ceas'd to be very troublesome; and in a Year was so much diminish'd, as scarce to be felt from without. At length it was drawn out (exceedingly diminish'd every way) thro' an Abscess which its Point occasion'd, three Fingers Breadth below the Pit of the Stomach, and the Boy was perfectly well. — *Philosophical Transactions*, N<sup>o</sup> 219. Among the Rarities in the Anatomy Hall at *Leysien*, is preserv'd a Knife ten Inches long, swallow'd by a Peasant, and cut out of his Stomach; after which he liv'd Eight Years.

**SWALLOW-tail**, in Fortification, is a single Tenaille, narrower towards the fortify'd Place, than towards the Country. See QUEVEZ d'HERONDE.

**SWALLOW-tail**, in Joinery and Carpentry, a particular Way of fastening together two Pieces of Timber; in as that they can't fall asunder. See DOVE-tail.

**SWAN-herd**. See KING'S SWAN-herd.

**SWANIMOTE**, or SWAINMOTE, (from the *Saxen* *Swain*, *Swain*, Rustic, and *Gemote*, Meeting) a Court touching Matters of the Forest; kept by the Charter of the Forest twice in every Year, before the Verdurers, as Judges. See FOREST.

This Court is as incident to a Forest, as a Court of Piepowder to a Fair. See COURT.

**SWATH**, among Surgeons, a long and broad Band to bind up any diseas'd Member, or Part. See BANDAGE.

**SWEAT**, a Moisture issuing out of the Pores of the Skins of Animals; thro' too much Heat, Exercise, or Weakness; or through the Action of certain Medicines call'd *Sudorifics*.

*Sweat* is either the Consequence of an Acceleration of the Blood's Motion, by Stimuli, or Exercise; or of a Relaxation of the Pores of the Cutis; by means of either whereof, the Matter which before perspir'd insensibly, is now render'd sensible. See PERSPIRATION.

The former is the Case in Natural and Medicinal *Sweats*, and the latter in morbid, fainting, and cold *Sweats*.

The principal Organ of *Sweat* are the milillary Glands; which are spread over the whole Ambit of the Body; and furnish'd, each, with a Vein, Artery, and Nerve, besides an excretory Duct, thro' the Orifice whereof the *Sweat* is cast out under the Cuticle. This Duct is cover'd with a little round Valve, lying immediately under the Cuticle, whereby the *Sweat* is occasionally either retain'd or transmitted. See MILLIARY Gland.

The *Sweat* thus secreted, is various, according to the Variety of the Weather, Soil, Sex, Age, Temperament, Emundatories, Diet, Time of Digestion, &c. as in the Urine. See URINE.

In a sound Body, *Sweat* is scarce ever found, but from a Fault in some of the six Non-naturals: Its immediate Effect is always hurtful; By Accident it sometimes does good.

The Physicians order *Sweats* in cold and inveterate Difeases, as the Palsy, Rheumatism, Sciatica, and many other Difeases. Difeases frequently have their Crises in *Sweats*.

*Sweating* is indicated by the Beginning of a critical *Sweat*, to carry off the Difease; by the Tenuity of the morbid Matter dispers'd thro' all the Vessels, as in the Plague, a venomous Bite, the *French Difease*, e'er yet fix'd; by the particular Temperature of the Patient, and by various Observations to be remov'd in the several Parts of the Body; particularly in subcutaneous Difeases, the Itch, Plica, &c. profusely, &c.

*Matthiolus* tells us, That the *Sweat* of all Quadrupeds, as Horses, Asses, &c. is venomous; and that that of other Beasts is unwholesome. *Tacennius* adds, that the *Sweat* of Horses, particularly, is so acid, that it pierces the strongest and firmest Boots, that are Proof against all Water. Some Naturalists affirm, that Dogs and Cats never sweat, how but soever they be, because they are not found to have any Pores in the Cuticle. See PORE.

*English SWEAT*. See SUDOR ANGLICANUS.

**SWEEP**, among Refiners, the Almond Furnace. See FURNACE.

**SWEEP**: The Seamen call the Mold of a Ship, when she begins to compass in at the Rungheds, the *Sweep* of her, or the *Sweep* of the Futtock.

*Sweeping at Sea*, signifies dragging along the Ground, at the Bottom of the Sea, or Channel, with a Tree-fluk'd Grapple, to find some Hawser or Cable which is slipped from an Anchor.

**SWIMMING**, the Art or Art of sustaining the Body in Water, and of advancing therein by the Motion of the Arms, Legs, &c.

Man alone learns to swim; all other Animals have it naturally.

Among the ancient Greeks and Romans, *Swimming* made so essential a Part of the Discipline of their Youth, that to represent a Man perfectly rude and uneducated, they us'd to say proverbially, he had neither learned to read nor to swim.

In Fishes, 'tis the Tail is the grand Instrument of *Swimming*, not the Fins, as is generally imagin'd: For this Reason Fishes are more strong and muscular in that Part, than in all the rest of the Body; according as we find it in all other Animals; the motive Parts whereof are still the strongest, as the Thighs of Men for walking, the Pectoral Muscles of Birds for Flight, &c. See FLYING, &c.

The Manner wherein Fishes row themselves forwards by the Tail, is well explain'd by *Borelli de Motu Animalium*, Pars 1. cap. 27. The Fins of Fishes only serve to keep the Body well pois'd and ballanc'd, and prevent Vacillation. See FIN.

M. *Tibonius* has publish'd a curious Piece in French, call'd *L'Art de Nager*, the Art of *Swimming*, demonstrated by Figures. Before him, *Everard Digby*, an Englishman, and *Nicholas Wimslow*, had laid down the Rules of this Art: *Tibonius* has done little more than copy from them.

Indeed, had he but read, with all that Application, *Borelli's* Treatise *de Motu Animalium*, he would scarce have maintain'd, as he has done, that Men would swim naturally, like other Animals; were they not prevented by Fear, which magnifies their Danger.

We have abundant Experience against this: Throw any Brute, newly born, into a River, and it swims: Throw an Infant in, e'er yet capable of Fear, and it swims not, but is drown'd.

The Reason is, that the human Machine differs very notably in its Structure and Configuration from that of Brutes; and particularly, which is very extraordinary, in the Situation of its Centre of Gravity. In Man, the Head is exceedingly heavy, with regard to the Weight of the rest of the Body; by reason the Head is furnish'd with a very great Quantity of Brain, and has, besides, a deal of Flesh and Bones, and no Cavities to be fill'd with Air; so that the Head immersing under Water by its own Gravity, the Nose and Ears are soon fill'd: Thus the Strong carrying down the Weak, the Man soon drowns, and is lost.

But in Brutes 'tis otherwise: For the Head having but little Brain, and there being abundance of Sinus's therein; its Weight, with regard to the rest of the Body, is much less considerable; so that they are easily able to keep their Nose up in the Air, and thus respire freely, are out of Danger of drowning, on the Principles of Statics.

In effect, the Art of *Swimming*, which is no otherwise to be acquir'd but by Exercise, consists principally in keeping the Head above Water, so, that the Nose and Mouth being at Liberty, Respiration may be carry'd on: For, as to the Feet and

and Hands, 'tis enough to stir them, and to use them as Oars to conduct the Vessel.

**SWIMMING Bladder**, a Vesicle of Air, inclos'd in the Bodies of Fishes, by means whereof they are enabled to sustain themselves at any Depth of Water. See FISHES.

For the Air in that Bladder being more or less compress'd, according to the Depth the Fish swims at; takes up more or less Space; and consequently the Body of the Fish, Part of whose Bulk this Bladder is, is greater or lesser, according to the several Depths; and yet retains the same absolute Weight. Now the Rule *de Insuperioribus humidis*, is, that a Body heavier than so much Water as is equal in Quantity to the Bulk of it, will necessarily sink; a Body that is lighter, will swim; and a Body of equal Weight, will rest in any Part of the Water.

By this Rule, if the Fish in the middle Region of the Water be of equal Weight with Water, Bulk for Bulk; the Fish will rest there without any natural Tendency upwards or downwards.

And if the Fish be deeper in the Water, its Bulk becoming less by the greater Compression of the Bladder; it will still remain commensurate to the Gravity of the Water in that Part.

If the Fish be higher than the middle Region; the Air dilating itself, and the Bulk of the Fish constantly increasing, but not the Weight; the Fish will rise upwards, and rest a-top of the Water.

'Tis probable the Fish, by some Action, can emit Air out of its Bladder, and take fresh in: Mr. Ray observes, that in most Fishes, there is a manifest Channel leading from the Gall to the swimming Bladder, which doubtless serves for the Conveyance; and that there is a mucus Power in the Coat of the Bladder, whereby the Fish can contract it when it lifts. The same Author adds, in Confirmation of this Doctrine, that 'tis found, if the swimming Bladder of any Fish be prick'd or broke, the Fish immediately sinks to the Bottom, and can neither support nor raise itself. And that in flat Fishes, as Soles, Plaice, &c. which lie always groveling at the Bottom, there is no swimming Bladder at all.

**SWINE-Pox**. See POX.

**SWOONING**, a Kind of Syncope, or Fainting, wherein the Patient loses all his Strength, and his Understanding.

*Swooning* may be occasion'd by any thing that alters, corrupts, or dissipates the Vital Spirits; as, long Watching, violent Pains, great and sudden Evacuations, putrid Vapours arising from Abscesses in the noble Parts. See SYNCOPE.

**SWORD**, an offensive Weapon, wore at the Side, serving either to prick, or cut, or both. See FENCING.

Its Parts are the *Blade*, *Guard*, *Hand* or *Grasp*, and *Pommel*; to which may be added, the *Scabbard*. The Masters of Defence divide the *Sword* into the upper, middle, and lower Part; or the strong, middle, and small or weak Part.

Anciently there were a kind of two-handed *Swords*, call'd *Spada's*, which were to be manag'd with both Hands; which in those Days they could brandish so nimbly, as to cover the whole Body therewith.

The Savages of *Mexico*, when first visit'd by the *Spaniards*, had a kind of Wooden *Swords*, which would do as much Execution as ours. In *Spain*, *Swords* are only allow'd of such a Length, determin'd by Authority. The ancient Cavaliers gave Names to their *Swords*; *Jeyense* was that of *Charlemain*; *Durandal* that of *Orlando*, &c.

**SWORD-Blade Company**. See COMPANY.

**SYCOPHANT**, a Greek Term, originally us'd at *Athens*, for Persons who made it their Business to inform against those who stole Figs, to the Owners; or against those, who, contrary to the Law, which prohibited the Exportation of Figs, yet practis'd the Thing; and deceiv'd the Officers, the Inspectors of the Ports, &c.

At length, the Term became us'd in the general for all Informers, Tale-bearers, Parasites, &c. especially those in the Courts of Princes: And, at last, for a Lye, Impostor, &c.

The Word is form'd from *σύν*, a Fig, and *σύν*, I say.

**SYCOPHANTIC Plants**. See PARASITES.

**SYLLABIC**, in the Greek Grammar. There are two Kinds of Augmentations in the Greek: The first call'd *Syllabic*, which is when the Word is increas'd by a Syllable; and the other *Temporal*, which is when a short Syllable becomes long. See AUGMENTATIVE.

**SYLLABLE**, in Grammar, a Part of a Word, consisting of one or more Letters pronounc'd together. See LETTER.

Or, a Syllable is a complete Sound, utter'd in one Breath, consisting either of a Vowel alone, or of a Vowel and one or more Consonants, not exceeding seven. See VOWEL, CONSONANT, &c.

*Sealiger* defines a *Syllable* to be an Element under one Accent; that is, what can be pronounc'd at once.

*Priscian*, more intelligibly, calls it a Comprehension of several Letters falling under one Accent, and produc'd at one Motion of the Breath: But some Grammarians reject this Definition, as excluding all *Syllables* of one Letter.

Another defines *Syllable* a literal, or articulate Voice, of an individual Sound. See VOICE.

In every Word, therefore, there are as many *Syllables* as there are vocal Sounds; and as many vocal Sounds, as there are simple or compound Vowels; each whereof requires a distinct Motion of the pectoral Muscles: Thus, *a, a, a*, make three *Syllables*, form'd by so many Motions, distinguish'd by small Stops betwixt each Expiration.

In the *Hebrew*, all the *Syllables* begin with Consonants; allowing *Aleph* to be one; nor has any *Syllable* more than a single Vowel. See VOWEL.

From the Number of *Syllables* in Words they become denominat'd *Monosyllables*, *Disyllables*, *Trisyllables*, and *Poly-syllables*, &c. Words of one *Syllable*, two *Syllables*, three *Syllables*, and many *Syllables*. See WORD, MONOSYLLABLE, &c.

The Word is deriv'd from the Greek *σύν*, Assemble.

As 'tis the Number of *Syllables* that makes the Measure of *English Verse*; it were to be wish'd, we had fix'd and settled Rules to determine the precise Number of *Syllables* in each Word: for we have Words very dubious in that respect; And there are even some which have more *Syllables* in Verse, than in Prose. Many of the Words ending in *cious*, give a deal of Embarrass to such as pique themselves on Exactness; as *actions*, *precious*, &c. See FOOT, QUALITY, MEASURE, &c.

**SYLLABUB**, a kind of compound Drink, most affect'd in the Summer Season; ordinarily made of White-Wine and Sugar, into which is squirted new Milk with a Syringe, or Wooden Cow.

Sometimes 'tis made of Canary, in lieu of White Wine; in which Case the Sugar is spar'd, and a little Lemon and Nutmeg us'd in lieu of it.

To prepare it the best Way, the Wine and other Ingredients, excepting the Milk, are mix'd over Night, and the Milk or Cream added in the Morning. The Proportion is, a Pint of Wine to three of Milk. For

*Whipt Syllabub*, to half a Pint of White Wine, or Rhenish, is put a Pint of Cream, with the Whites of three Eggs. This they season with Sugar, and beat with Birchens Rods. The Froth is taken off as it rises, and put into a Pot; where, after standing to settle two or three Hours, 'tis fit to eat.

**SYLLEPSIS**, in Grammar, call'd also *Conceptio*, is a Figure whereby we conceive the Sense otherwise than the Words import; and thus make our Construction, not according to the Words, but to the Sense. See CONCEPTIO.

The *Syllepsis*, says an ingenious Author, is a Figurative Construction, which agrees more with our Ideas, than with the Words; and which expresses more of the Sense or Ideas in the Mind, than the Terms themselves.

Other Authors make it a Disproportion, or Unfuitableness in the Parts of the Discourse.

*Vossius* will have it the Agreement of a Verb, or Adjective, not with that Word next it, but with the most worthy in the Sentence; as *Rex Et Regina beati*.

Some Authors call the *Syllepsis*, *Symbesistis*. See SYNTHESES.

'Tis a Figure of very considerable Use for the well understanding of Authors: Accordingly, *Scioppius* divides it into two Kinds, simple and relative. The simple *Syllepsis* is when the Words of a Discourse either differ in Gender, or Number, or both: The relative *Syllepsis*, is when the Relative is refer'd to an Antecedent, which is not express'd; but which we conceive by the Sense of the whole Period.

**SYLLOGISM**, in Logic, an Argument, or Form of Reasoning, consisting of three Propositions; having this Property, that the Conclusion necessarily follows from the two Premises; so that if the first and second Proposition be granted, the Conclusion must be granted in like Manner; and the whole allow'd Demonstration.

If the Premises be only probable, or contingent, the *Syllogism* is said to be *Dialectical*; if they be certain, *Apodictical*; if false, under an Appearance of Truth, *Sophistical*, or *Paralogistical*. See DIALECTICAL, APDICTICAL, and SOPHISTICAL.

As often as the Mind observes any two Notions to agree to a third; which is done in two Propositions; it immediately concludes that they agree to each other: Or if it find that one of them agrees, and the other disagrees; which is likewise done in two Propositions; it immediately pronounces that they disagree to each other. And such is a *Syllogism*; which, it hence appears, is nothing but an inward Discourse, or Thought, whereby, from any two Propositions granted, a third is necessarily deduc'd. See PROPOSITION.

Hence, as the Greeks call it *Syllogism*, the Latins call it *Collectio*, or *Ratiocinatio*, as being a kind of Computation, which, either by adding or subtracting, gathers either the Sum or the Remainder: For, as if we add two to three, we thence collect five; so, if to this Proposition, *Man is an Animal*, you add this, *every Animal thinks*; you thence deduce this, *therefore Man thinks*.

Of the three Propositions whereof a *Syllogism* consists; the first is by way of Embrace, call'd the *Propositio*, as being propos'd for the Basis of the whole Argument; the second is call'd the *Assumptio*, as being assum'd to assist in inferring

inferring the third: Tho' they are both call'd *Simplicious*, because assum'd for the Sake of the third; and both *Premises*, as being premis'd to it; and for the same Reason both are call'd *Antecedents*, only the first the *Major*, and the latter the *Minor*. See ASSUMPTION, PREMISES, MAJOR, MINOR, &c.

The third is call'd the *Conclusion*, as being the Close of the whole Argumentation; and sometimes *Complexio*, as including the two Notions, before separately compar'd; and *Consequens*, because it follows from the Antecedents; and lastly *Ratio*, because inferr'd from the Premises by Means of the illative Particle *Ergo*, therefore, &c. See CONCLUSION, COMPLEXIO, &c.

As the Conclusion is the principal Part of a *Syllogism*, it thence arises, that tho' both the Proposition and Assumption consist each of its Subject and Attribute; yet the Subject and Attribute of a *Syllogism*, are properly understood of those of the Conclusion. See SUBJECT and ATTRIBUTE.

Again, in the Instance above mention'd, *Animal* being used both as Subject and Attribute, 'tis held a kind of Intermediate between the Two, and frequently call'd *Medium*; in respect to which, both the Subject and Attribute, *Man* and *Thinks*, are call'd *Extremes*, or *Terms*; only the Subject the *greater Extreme*, and the Attribute the *less*. See MEDIUM and EXTREME.

A *Syllogism*, whether Simple or Compound; may either be *Categorical*, as that already instanc'd; wherein both Premises are Positive. See CATEGORICAL.

Or, *Hypothetical*, wherein one or both of the Premises are suppos'd; as, *As if the Sun shines, 'tis Day, but the Sun does shine; therefore 'tis Day*. See HYPOTHETICAL.

Or, *Analogical*, as, *The Base is to the Column; so is Justice to the Commonwealth; but if the Base be withdrawn, the Column is overturn'd; therefore if Justice be taken away, the Commonwealth is over-throw'd*. See ANALOGICAL.

Or *Dilectic*, or *Disjunctive*; as, *Either they mean to Please or to Profit; but they don't aim to Please; therefore they don't aim to Profit*. See DILECTIC.

The most convenient Form of a perfect *Syllogism*, is to have the Medium in the Middle, plac'd between the Subject and the Attribute; as in the Instance above-mention'd.

Of this Form, there are two Figures; the one *Cohærent*, or *Conjunct* and *Affirmative*, founded on this Canon, That what agrees with any thing, likewise agrees with that, wherewith this necessarily agrees.

The other *Incoherens* or *Disjunct* and *Negative*, founded on this Canon, That what agrees with any thing, disagrees with that wherewith this disagrees. Of each of these Figures there are three Modes, *viz. General, Particular and Mix'd*. See MOOD and FIGURE.

A *Syllogism*, wherein one of the Premises is suppress'd; but so as to be understood, is call'd an *Enthyame*; e.g. *Every Animal Thinks, therefore Man Thinks*; wherein the Proposition, *Man is an Animal*, is understood. See ENTHYME.

The Demonstrations of Mathematicians, 'tis observ'd, are only certain Series of Enthyemes; so that every thing in Mathematicks, is concluded by *Syllogism*; only omitting such Premises as occur of their own accord, or as are refer'd to by the Citations. See DEMONSTRATION.

For the Use *Syllogism* is of to Reason, Mr. Lock observs, That of four Things, which Reason is employ'd about, *viz. the finding out of Proofs; the regular Disposition of them, so as their Connexion may appear; the perceiving their Connexion; and the making a right Conclusion; Syllogism* only assists in one, *viz. the shewing the Connexion of the Proofs of any Instance*.

Nor is it of any great Use even here; since the Mind can perceive such Connexion, where it really is; as easily, nay, perhaps, better, without. We for Men reason very strongly, who don't know how to make a *Syllogism*.

Indeed, *Syllogism*, the same Author adds, may serve to discover a Fallacy in a rhetorical Flourish; or, by stripping an Absurdity of the Cover of Wit and good Language, shew it in its natural Deformity. But it only shews the Weakness or Fallacy of such a Discourse, by the artificial Form it is put into, to those who have thoroughly studied Mode, and Figure, and have so examined the many Ways three Propositions may be put together in, as to know which of them does certainly conclude right, and which not, and upon what Grounds they do so.

The Mind is not taught to reason by these Rules: It has a native Faculty, of perceiving the Coherence or Incoherence of its Ideas, and can range them right, without such perplexing Repetitions. Add, that to shew the Weakness of an Argument, there needs no more, than to strip it of the superfluous Ideas, which, blended and confounded with those on which the Inference depends, seems to shew a Connexion where there is none; or at least hinders the Discovery of the Want of it: And then to lay the naked Ideas, on which the Force of the Argumentation depends, in their due Order. In this Position, the Mind taking a View of them, sees what

Connexion they have, and so is able to judge of their Inference, without any need of *Syllogism* at all. Nor must it be omitted, that *Syllogism* is as liable to Fallacies, as the plainer Ways of Argumentation; for which one might appeal to common Observation, which has always esteem'd these artificial Methods of Reasoning, more adapted to catch and entangle the Mind, than to instruct and inform the Understanding. And if it be certain that Fallacy can be couch'd in a *Syllogism*, as no Body will deny but it may; it must be something else, and not a *Syllogism*, that must discover it.

The same Author proceeds to shew, that this Way of Reasoning, discovers no new Proofs, nor makes any Discoveries; but is wholly convertent in the Marshalling and Ranging those we already have: A Man must know, e'er he be able to prove *Syllogistically*; so that the *Syllogism* comes after Knowledge, when we have but little need of it. See REASON.

SYLVA, in Poetry, a poetical Piece; compos'd, as it were, at a Start; in a kind of Rapture or Transport, without much Thought or Meditation.

Such are the *Sylve* of *Stratus*, which, he assures us, were all compos'd after this Manner.

*Quintilian* extends the Use of the Word to any Writing done in haste, and on the Spot.

The Word is *Latin*, and literally signifies *Forest*; whence its chief Use, in our Language is, metaphorically, to express certain Collections of poetical Pieces, of various Kinds, and on various Subjects; as a Forest is an Assemblage of Trees of different Kinds.

SYMBOL, a Sign, Type, Emblem or Representation of any moral Thing, by the Images or Properties of natural Things. See SIGN, TYPE, &c.

Thus we say, the Lion is the *Symbol* of Courage; the Pelican of paternal Love, &c.

*Symbols* were in great Repute among the ancient Hebrews, and especially among the *Egyptians*; and serv'd to cover a great Part of their moral Myologies; being used not only to represent Moral Things by Natural; but even Natural by Natural.

*Symbols* are of various Kinds; as *Types, Figures, Parables, Fables, Allegories, Emblems, Hieroglyphicks, &c.* each whereof see under its respective Article ENIGMA, PARABLE, FABLE, &c.

The Word is form'd from the Greek, *συμβολον*, a Mark, Sign, or Badge, and that from the Verb *συμβάλλω*, *Conjicere*.

The Chinese Letters are most of them *Symbols*, or Significative. See LETTER.

The *Symbols* in Algebra, &c. are various. See CHARACTER.

Medallists apply the Term *Symbol* to certain Marks or Attributes peculiar to certain Persons, or certain Deities. The Thunder-bolt, for Instance, accompanying the Heads of certain Emperors, is a Sign or *Symbol* of the Sovereign Authority, and of a Power equal to that of the Gods. The Trident is the *Symbol* of *Jupiter*; the Peacocks of *Juno*; a Figure seated on an Urn, of a River.

SYMBOL, among Christians, is particularly used for the *Creed*, or the Articles every Christian is to know, and believe. See CREED.

*Henry* observs, That till the Time of St. Gregory, the *Symbol* was never used to be recited in the Office of the Roman Church; in regard that Church, having never been infected with any Heresy, did not need to make any Profession of Faith.

*Suicer* notes, That several Words and Points have been occasionally added to the *Symbols*, upon the rising of new Heresies.

Though it be a common Opinion, that the *Symbol* is the Work of the Apostles; and though, on the fasting of such Opinion, we call it the *Apostles Creed*; yet, *su Pin* observs, there are several very cogent Arguments to render the Opinion highly improbable.

In the Emperor's Library, is a Greek MS of the *Symbol of the Apostles*, divided into 12 Articles, with the Names of the respective Apostles, who are said to have compos'd each Article: The First is attributed to St. Peter, and the rest successively to Andrew, James Major, John, Thomas, James Minor, Philip, Bartholomew, Matthew, Simon, Thadæus and Matthias.

But the Testimony of that MS, does not much confirm the Opinion, that each Apostle compos'd an Article of the *Symbol*; yet the Opinion is, at least, as old as St. Leo, who seems to have believed it.

Authors are in doubt, why the Name *Symbol* should be given this Compendium of the Articles of the Christian Faith: Some say, 'tis thus call'd, as being the Mark or Characteristic of a Christian. Others derive it from an Assembly or Conference of the Apostles, where each expressing his Sense of the Faith, and what each had chiefly preach'd, the *Creed* was fram'd, and call'd by the Greek Word *συμβολαιον*, which signifies Collation or Conference. 'Tis added, that St. Cyprian is the first who appears to have used the Word *Symbol* in this Sense.

**SYMBOLICAL Column** } See { COLUMN  
**SYMBOLICAL Philosophy** } See { HERMOLOGYPHIC.

*Clemens Alexandrinus, Enobius, &c.* observe, that the *Ægyptians* had two Ways of designing their *Synbological Mysteries*: One by the Virtues of Animals, Herbs, &c. the other by Geometrical Figures: Thus, the *Sea* and *Moon* were represented, in the first Manner, by the *Beetle* and *Blis*; and in the latter, by their own Figure. Again, the four Elements they represented, after the first Manner, by four Animals which had Qualities corresponding thereto; and after the second Manner by —. See **HERMOLOGYPHIC**.

**SYMMETRY**, the Relation of Equality, in the Height, Length and Breadth of the Parts necessary to compose a beautiful Whole.

*Symmetry*, according to *Vitruvius*, consists in the Union and Conformity of Relation, of the Members of a Work, to their Whole, and of each of the separate Parts to the Beauty of the entire Work; Regard being had to some certain Measure: so that the Body is framed with *Symmetry*, by the Relation the Arm, Elbow, Hand, Fingers, &c. have to each other, and to their Whole.

*Symmetry*, arises from that Proportion, which the *Greeks* call *Analogy*, which is the Relation of Conformity of all the Parts of a Building, and of their Whole, to some certain Measure; whereon depends the Nature of *Symmetry*.

In Architecture, we call *Uniform Symmetry*, that where the Ordinance reigns in the same Manner, throughout the whole Pourtour; and *Respective Symmetry*, that where only the opposite Sides are equal to each other.

The Word is form'd from the *Greek*, *sym*, with, and *metron*, Measure.

**SYMPATHETIC**, something that has a *Sympathy*, or that acts by *Sympathy*. See **SYMPATHY**.

**SYMPATHETIC**, is particularly applied to all Diseases which have two Causes; the one remote, the other near.

In which Sense, the Word is oppos'd to *Idiopathic*. See **IDIOPATHETIC**.

Thus, an Epilepsy is said to be *Sympathetic*, when produced by a remote Cause; i. e. when the Disorder in the Brain, embarras'd, and, as it were, mix'd with Blood, is preceded and produced by some other Disease.

There is a *Sympathetic Palpitation* of the Heart, and an *Idiopathic* one. There is but one *Idiopathic Cause* of the Palpitation; but there are several *Sympathetic ones*. See **PALPITATION**.

Among Chymists and Alchymists, the Term *Sympathetic* is principally applied to a kind of Powder, and a Sort of Ink.

**SYMPATHETIC Inks**, are such as can be made to appear and disappear very suddenly, by the Application of something which seems to work by *Sympathy*. See **INK**.

Of these, we have some very curious Instances and Experiments, given us by *Lemery* and *Mr. Boyle*; to the following Effect.

1° To two or three Parts of unslak'd Lime, put one of yellow Orpiment; powder and mix the Two, adding 15 or 16 times as much Water as there was Orpiment; stop up the Vial with a Cork and Bladder, and set it in warm Embers. Shake the Vial now and then for five Hours, and warily decant the clear Part, or rather filtrate it. In the main Time, burn a Piece of Cork thoroughly, and when well inflamed, quench it in common Water, or rather in Brandy. Being that reduced into a friable Coal, grind it with fair Water, wherein Gum Arabic has been dissolved; and it will make a Liqueur as black as the common Ink.

While these are doing, dissolve in three Times as much distill'd or strong Vinegar, over warm Embers, a Quantity of Red Lead; or of Saccharum Saturni, in Thrice the Quantity of Water, for three or four Hours; or 'till the Liqueur have a sweet Taste. This Liqueur will be as clear as common Water.

The *Inks* thus prepared: Write any thing on Paper with this last Liqueur, dry it, and nothing will appear. Over the Place, write what you please with the Second Liqueur; it will appear as if written with common Ink: When dry, dip a small Piece of Rag or Sponge in the first Liqueur, rub it over the written Place, and the black Writing will vanish; and that wrote with the invisible Ink, appear black and legible.

Again, take a Book four or five Inches thick, and on the first Leaf, write any thing with the last Liqueur: Turn to the other End of the Book, and rub there with a Rag, dip't in the first Liqueur, on that Part, as near as you can guess, opposite to the Writing; and leave also the Rag there, clapping a Paper over it; then nimble shutting the Book, strike five or five smart Strokes thereon with your Hand, and turning the other Side uppermost, clap it into a Press, or lay it under a good Weight, for a Quarter of an Hour, or even half that Time: Then will the Writing done with the invisible Ink be found white and legible.

2° Dissolve white or green Vitriol in Water, and writing

with the Solution, nothing will appear. Boil Galls in Water, and dip a Linnen Rag in the Decoction, and with it rub the Place before writ, and it will appear black and legible. Rub it over again with Spirit of Vitriol, or its Oil, and the Writing will disappear again: Rub it over again with Oil of Tartar per Deliquium; the Letters will appear again, but of a yellow Colour.

**SYMPATHETIC Powder**, a Powder once very much fam'd; supposed to have this wonderful Property, That if spread on a Cloth dip't in the Blood of a Wound, the Wound would be cured, though the Patient were any Number of Miles off.

This Powder, *M. Lemery* tells us, is nothing but *Romans Vitriol*, open'd by the Sun-beams penetrating it, and imperfectly calcining it, in the middle of Summer.

But it is now generally allowed a mere Piece of Charletancy, whatever *Sir. Kenelm Digby* and others before him and after, plead in its Favour.

*Sir Kenelm*, in an express Treatise on the Subject, where he gives Instances of Cures perform'd by it, accounts for the Manner of its Operation thus: The Sun's Rays, says he, attract and draw the Spirits of the Blood, at a great Distance; by which means the Atoms thereof, are driven and dispersed far and near in the Air. Now, the Spirits of Vitriol, incorporated with the Blood, fly along with them, and the Two together form a kind of Train of Corpuscles. On the other Side, there is continually issuing and exhaling from the Wound, abundance of fiery Spirits, which attract the neighbouring Air, and this Air, by a continued Concentration, attracting still, the next Air, at length, meets the Atoms, with the Spirits of the Blood and Vitriol. Thus the Spirits of the Blood finding their Source again, re-enter into their primitive Seat, and being joined with the vitriolic Spirits, the Wound is comforted and healed, imperceptibly.

But to the Confutation of all this fine Reasoning; 'tis found by Experience, that the Powder is so far from this Effect at a great Distance, that 'tis scarce perceived, if dose in the same Room with the Patient. Though 'tis possible, as the Parts of the Vitriol are in continual Motion, if the Cloth be applied just by the Patient, some of the Effluvia thereof, may enter the Wound, and help to stop the Bleeding. See **VITRIOL**.

**SYMPATHY**, an Agreement of Affections and Inclinations; or a Conformity of natural Qualities, Humours, Temperaments, &c. which make two Persons pleas'd and delighted with each other.

The Word is form'd from the *Greek* *sym*, with, and *pathos*, Passion, *q. d.* Com-passion, Fellow-feeling.

*Sympathy* is also used with regard to inanimate Things; intimating some Propension they have to unite, or to act on one another.

In this Sense, Naturalists say, there is a *Sympathy* between the Vine and the Elm; between the Load-Stone and Iron; the two Poles of a Load-Stone, &c.

Several Authors have wrote on the *Sympathies* and Antipathies between Animals; but the greatest Part of what they say is fabulous: Such, *e. gr.* is that Antipathy between Chords made of Sheeps and Wolfis Guts: A Late, they say, being strung with these two Kinds of Chords, they can never be brought into Tune with each other: Such also is that of Eagles Feathers, which mix'd with those of other Birds, devour and consume them. See **ANTIPATHY**.

The Alchymists talk much of the Powder of *Sympathy*. See **SYMPATHETIC Powder**.

**SYMPATHY**, in Medicine, an Indisposition befalling one Part of the Body, thro' the Disorder or Faultiness of another; whether it be thro' the Absence of some Humour, or Vapour sent from elsewhere; or thro' the Want of the Influence of some Matter necessary to its Action. See **CONSENT of Parts**.

For the Force and Effect of *Sympathy*, in the Production of Monsters. See **MONSTER**.

**SYMPHISIS**, in Medicine, one of the Manners of articulating or joining the Bones. See **ARTICULATION**.

*Symphisis* is a natural Union, whereby two separate Bones are render'd contiguous, and become one, so, as neither has any proper, distinct Motion.

Such are most of the Junctures of the Epiphyfes, and many others of Bones which in Children are separate, but with Age grow together; as the Os Ethmoides, the Bones of the Cranium, Os Sacrum, &c. See **BONE**.

The *Symphisis*, or Natural Union of Bones, is of two Kinds; either with a Medium, or without.

The *Symphisis* without Medium, is where two Bones unite, and grow together of themselves without the Intervention of any third Thing: Such are the *Symphisis* of Epiphyfes with the principal Bones; and such those of the lower Jaw. This Union is effected much after the same Manner as that of a Graft and a Tree.

The *Symphisis* with a Medium is of three Kinds, call'd *Synsarcosis*, *Sypharcosis*, and *Synchondrosis*. Each whereof see under its proper Article, **SYNEUROISIS**, &c.

The Word is Greek, *συναγωγη*, and signifies a natural Coherence or Connection.

SYMPHONY, in Music, a Consonance, or Consort of several Sounds agreeable to the Ear; whether they be Vocal or Instrumental, or both; call'd also *Harmony*. See HARMONY and CONSONANCE.

Some Authors restrain *Symphony* to the sole Music of Instruments: In this Sense, say they, the Recitativo's in such an Opera were intolerable, but the *Symphonies* excellent. See *SONO*.

The *Symphony* of the Ancients went no further than to two or more Voices or Instruments set to Union; for they had no such Thing as Music in Parts; as is very well prov'd by M. Perrault; at least, if ever they knew such a Thing, it must be allow'd to have been lost. See SYNAULIA.

'Tis to *Guido Aretime* we owe the Invention of Composition: 'Twas he first join'd in one Harmony several distinct Melodies; and brought it even the Length of four Parts, viz. Bass, Tenor, Counter, and Treble. See HARMONY and MELODY.

The Word is form'd from the Greek *συν*, with, and *συνα*, Sound.

SYMPOSIAC, an Entertainment, or Conversation of Philosophers at a Banquet. See BANQUET.

*Plutarch* has several Treatises which he calls *Symphosiacs*; or, The Banquet of the seven Sages, &c.

The Word is form'd from the Greek, *συνεσιον*, Convivium, Feast.

SYMPTOM, in Medicine, is ordinarily confounded with *Sign*, and defin'd an Appearance, or Conjunction of Appearances, in a Disease, which shew or indicate its Nature and Quality, and whence one may judge of the Event thereof. See *SION*.

In this Sense, a Delirium is held a *Symptom* of a Fever; and Pain, Waking, Drowsiness, Convulsions, Suppression of Urine, Difficulties of Breathing and Swallowing, Coughs, Disgusts, Nauseas, Thirst, Swoonings, Faintings, Loosefness, Costiveness, Dryness and Blackness of the Tongue, are held the principal *Symptoms* of Diseases.

But *Boerhaave* gives us a much more just and accurate Notion of a *Symptom*: Every preternatural Thing, says he, arising from a Disease, as its Cause, in such Manner, however, as that it may be distinguish'd from the Disease itself, and from its next Cause, is call'd a *Symptom* of the Disease. See *DISEASE*.

If it arise, after the same Manner, from the Cause of the Disease, it is call'd a *Symptom* of the Cause. See *CAUSE*.

If it arise from some former *Symptom* as its Cause, it is call'd a *Symptom* of a *Symptom*.

Whatever happens to a Disease, from any other Causes than those mention'd, is more properly call'd an *Epi-genesis*.

Hence it appears, that these former *Symptoms* are really Diseases themselves, very different as to Number, Effect, &c. Tho', after the Ancients, they may be conveniently enough reduc'd to Faults in the *Functions, Excretions, and Retentions*.

Under the first come all Diminutions, Abolitions, Incretions, and Depravations of Animal Actions, particularly with regard to *Hunger and Thirst, Sleeping and Waking*. See *HUNGER, THIRST, &c.*

Under the second come, *Nauseas, Vomiting, Lienteries, Colic Affections, Diarrhoeas, Dysenteries, Bile Passions, &c.*

Under the third, come the *Jandice, Stone, Dropsy, Fever, Icteria, Strangury, Asthma, Catarrh, &c.* Each whereof see under its respective Article, *HUNGER, NAUSEA, LIENTERY, DIARRHOEA, JAUNDICE, DROPSY, STONE, FEVER, &c.*

SYMPTOMATICAL, in Medicine, is a Term often used to denote the Difference between the primary and secondary Causes in Diseases; as, a Fever from Pain is said to be *Symptomatical*, because it arises from Pain only; and therefore the ordinary Means in Fevers are not, in such Cases, to be had recourse to; but to what will remove the Pain; for when that ceases, the Fever will cease, without any direct Means taken for that.

SYNERESIS, in Grammar, a Figure, whereby two Syllables are united in one; as *versus* for *verbum*.

SYNAGOGUE, a particular Assembly of *Jews*, met to perform the Offices of their Religion; also the Place where-in they meet. See *JEW*.

Some Authors take the Use of *Synagogues* to be of no old standing among the *Jews*; and maintain, that 'twas not till after their Return from the *Babylonish* Captivity, that the Opinion first got footing, that the Worship of God was not to be restrain'd to the Temple at *Jerusalem*, that it could not be held any where else. The Consequence of which new Opinion was, that the *Jews* began to build them *Synagogues* in all their Cities.

Others hold, that there were *Synagogues* even in the Time of *David*.

Be this as it will, no Assemblies of the *Jews* appear to

have been call'd *Synagogues* till a little before the Coming of *Jesus Christ*; who is said to have preach'd in the Middle of the *Synagogue*.

There were reckon'd 480 *Synagogues* in the single City of *Jerusalem*.

There are still *Synagogues* subsisting at *London, Anger, Ains, Rotterdam, Avignon, Metz, &c.*

The Word is Greek, *συναγωγη*, Assembly.

SYNALLEPHA, in Grammar, a Contraction, or shortening of a Syllable, in a *Latin* Verse. See *VERSUS*.

It is perform'd various Ways; principally, by the smothering some Vowel or Diphthong at the End of a Word, by Reason of another Vowel or Diphthong at the Beginning of the next; as *Ill' ego*, &c.

SYNAUCHE, in Medicine, a kind of Squinancy, where-in the internal Muscles of the Fauces, or Pharynx, are attack'd. See *SQUINANCY*.

When the external Muscles of the same are seiz'd, it is call'd a *Parasynanche*. See *PARASYNANCIE*.

The Word is form'd from the Greek, *συν*, with, and *αυχη*, to press, suffocate.

SYNARTHROSIS, in Anatomy, a kind of Articulation, or Jointure of the Bones of the Body. See *ARTICULATION*.

The *Synarthrosis* is when the Bones are bound so fast together, that they are render'd immovable with regard to each other.

'Tis divided into three Kinds: The first, *Sutura*; which is sometimes in Form of two Combs or Saws, the Teeth whereof enter within one another; and sometimes in Form of Scales, one Edge lapping over the other. See *SUTURA*.

The second Kind is call'd *Harmonia*; which is when the Bones meet in an even Line, whether it be right or circular. See *HARMONIA*.

The third, call'd a *Gomphosis*, is when one Bone is fixed into another like a Nail or Peg into a Hole. See *GOMPHOSIS*.

To these three Kinds of *Synarthrosis*, some add several others, as *Symphysis, Symensis, and Symenosis*. See *SYMPHYSIS, &c.*

The Word is form'd from the Greek, *συν*, with, and *αρθρον*, Articulus, Joint.

SYNAULIA, in the ancient Music, a Contest of Pipes, performing alternately, without Singing.

Mr. *Maisew*, who doubts whether the Ancients had properly any such Thing as Instrumental Music, that is, Music compos'd wholly for Instruments, without any Singing; yet quotes the Practice of the *Synaulia* from *Athenens*. See *SYMPHONY, HARMONY, MUSIC, &c.*

SYNCATEGOREGMA, in Logic, is us'd for a Word, which signifying little or nothing of itself, yet when joined with others, adds Force thereto; as *all, none, certain, &c.*

SYNCELLUS, an ancient Officer in the Family of the Patriarchs, and other Prelates of the Eastern Church.

The *Syncellus* was an Ecclesiastic, who liv'd with the Patriarch of *Constantinople*, to be a Witness of his Conduct; whence it is, that the *Syncellus* was call'd the *Patriarch's Eye*, because his Business was to observe and watch.

The Word, in the corrupt Greek, signifies a Person who lies in the same Chamber with another.

The other Prelates had also their *Syncelli*, who were Clerks living in the House with them, and even lying in the same Chamber; to be Witnesses of the Purity of their Manners.

At length the Office degenerated into a mere Dignity; and there were made *Syncelli* of Churches. At last it became a Title, and was bestow'd by the Emperor on the Prelates themselves; whom they call'd *Pontifical Syncelli*, and *Syncelli Augustales*.

There were also *Syncelli* in the Western Church, particularly in *France*. The 11th Council of *Paris* speaks with a deal of Indignation of some Bishops who abolish'd the Office of *Syncelli*, and lay alone; and strictly enjoins them that, for the future, to take away all Occasion of Scandal, they make the Office of *Syncelli* inseparable from that of Bishops.

SYNCHONDROSIS, in Anatomy, a kind of Articulation of the Bones of the Body; being a Species of *Symphysis*. See *SYMPHYSIS*.

The *Synchondrosis* signifies the Union of two Bones by Means of a Cartilage; in which Manner the Ribs are join'd to the Sternum, and the Parts of the Os Pubis to one another.

The Word is form'd from the Greek, *συν*, with, and *χονδρον*, Cartilage.

SYNCHRONISM, the being or happening of several Things, at the same Time.

SYNCHRONOS, Word is form'd from the Greek, *συν*, and *χρονος*, Things; &c.

The happening or performing of several Things in equal Times, as, the Vibrations of Pendulums, &c. is properly call'd

call'd *Isochronism*, tho' some Authors confound the two. See **ISOCHRONISM**.

**SYNCOPE**, in Medicine, a deep and sudden Swooning; wherein the Patient continues without any sensible Heat, Motion, Sense, or Respiration; is said with a cold Sweat over the whole Body, and all the Parts turn pale and cold, as if dead.

There are several Causes of *Syncope's*: 1<sup>o</sup>. Too great an Exhaustion of Spirits; as after long Diets, excessive Evacu- ations, violent Exercises, long Bathings, &c.

2<sup>o</sup>. The irregular Motion of the Spirits preventing their due Influx into the Parts; as sometimes happens in Fear, Wrath, and other violent Passions.

3<sup>o</sup>. Immoderate Hæmorrhagies.

4<sup>o</sup>. An ill Constitution of Blood; as in Cacochymies, or in Persons who have taken something that either dissolves or coagulates the Blood.

5<sup>o</sup>. Secret Diseases, as Abscesses, or Polypus of the Heart, Worms, &c.

In very numerous crowded Assemblies, People sometimes fall into *Synopes*, thro' the hot, thick, impure Air they breathe.

Some Women are liable to them upon the Smell of Musk, Civet, &c.

For *Synopes*, give volatile Spirits and Aromatics, *Hew- nius* recommends Treacle Water, and Cinnamon Water; and *Ermuller* the Volatile Salt of Vipers, Spirit of Sal Ammoniac, Oil of Ambar, and sometimes Bleeding.

The Word is form'd from the *Greek*, *σύν*, with, and *κίνησις*, to cut.

**SYNCOPE**, in Grammar, is an Elision, or Retrenchment of one or more Letters, or Syllables from a Word.

As when we say *Virtus* for *Virtutus*; and *manus alta*, *mens*, *repositum*, for *repositum*.

**SYNCOPE**, in Music, signifies the Division of a Note; used when two or more Notes of one Part answer to a single Note of the other Part: as when a Semibreve of the one answers to two or three Crotchets of the other.

A Note is said to be *Syncope'd* when it has a Point added on the Side of it; which increases its Value by one half.

**SYNDESMUS**, in Anatomy, is sometimes us'd for a Ligament. See **LIGAMENT**.

In Grammar, it is us'd for a Conjunction. See **CON- JUNCTION**.

The Word in the original *Greek*, *σύνδυσσις*, signifies a joining together.

**SYNDIC**, in Government and Commerce, an Officer in *France*, intrusted with the Affairs of a City, or other Com- munity; who calls Meetings, makes Representations and So- licitations to the Ministry, Magistracy, &c. according to the Exigency of the Case.

The *Syndic* is appointed to answer and account for the Conduct of the Body; makes and receives Proposals for the Advantage thereof; controuls and corrects the Failings of particular Persons of the Body, or, at least, procures their Correction at a publick Meeting.

In effect, the *Syndic* is, at the same Time, both the Agent and Counselor of the Community.

Almost all the Companies in *Paris*, &c. as the University, Companies of Arts and Trades, &c. have their *Syndics*; and so have most of the Cities of *Provence* and *Languedoc*.

**SYNDICUS** is also us'd for a Person appointed to solicit some common Affair, wherein he himself has a Share; as happens particularly among several Creditors of the same Debtor, who fails, or dies insolvent.

The chief Magistrate of *Geneva* is also call'd *Syndic*. There are four *Syndics* chose every Year, the eldest of which presides in the Council of Twenty-five, which is the chief Council of the City, wherein all Affairs are dispatch'd both Civil and Political: Thus the other three elect cannot all come at the Office till the four Years end; so that the *Syndicate* comes by Turn to sixteen Persons, all chosen out of the Council of Twenty-five.

The Word is form'd from the *Latin*, *Syndicus*, and that from the *Greek*, *σύνδικος*, which signifies the same Thing.

**SYNDROME**, from *σύνδρομος*, Concurfus, a Combina- tion of Diseases.

**SYNECDOCHE**, in Rhetoric, a Figure very frequent among Orators and Poets. See **FIGURE**.

There are three Kinds of *Synecdoches*: By the first, a Part is taken for the Whole; as the *Point* for the *Sword*; the *Roof* for the *House*; the *Sails* for the *Ship*, &c.

By the second, the Whole is us'd for a Part: And by the third, the Matter whereof the Thing is made, is us'd for the Thing itself; as *Steel* for *Sword*, *Silver* for *Money*, &c.

To which may be added another Kind, where the Species is us'd for the Genus, or the Genus for the Species.

The Word is *Greek*, form'd of *σύνδραγμα*, I take toge- ther.

**SYNEDRIN**, or **SYNEDRION**. See **SANHEDRIN**.

**SYNERPHONESIS**, in Grammar, an Union, or Colli-

sion of Vowels, whereby two Syllables are pronounc'd as one. See **SYLLABLE**.

'Tis much the same Thing as *Synapsis*, or *Syneresis*. See **SYNALEPSIS**, &c.

**SYNEUROSI**, in Anatomy, a kind of Articulation, or Joindre of the Bones. See **ARTICULATION**.

The *Syneurosis* is reckon'd a Branch of the *Synapsis*; and is, when the Bones are connect'd together by a Ligament: as is that of the Os Femoris to the Os Iliacum; that of the Patella to the Tibia. See **SYMPHYSIS**.

The Word is form'd from the *Greek*, *σύν*, with, and *νεῦρον*, Nerve.

**SYNOCHA**, and *Synochus*, in Medicine, are Terms bor- rowed from *σύνχωσις*, *synochos*, I support, or hold up; or *σύνχωσις*, *continens*, I containe. The Practice of Authors, with regard to these two Words, is whimsical enough: Lite- rally they both signify the same Thing; yet is the former us'd to signify an intermitting, and the latter a continu'd Fever. See **FEVER**.

**SYNOD**, in Astronomy, a Conjunction, or Concourse of two Stars, or Planets in the same optical Place of the Hea- vens. See **CONJUNCTION**.

**SYNOD**, in Church History, a Council, or Meeting, or Assem- bly of Ecclesiasticks, to consult Matters of Religion. See **COUNCIL**.

Of these there are four Kinds, *viz.* *General*, or *Oecume- nical*, where Bishops, &c. meet from all Nations. See **OECUMENICAL**.

*National*; where those of one Nation only come together, *Provincial*; where they of one only Province meet. And *Diocesan*; where those of but one Diocese meet. See **CONVOCA- TION**.

The Word is form'd from the *Greek*, *συνόδωσις*, Assembly.

**SYNODALS**, or **SYNODIES**, were Pecuniary Rents (commonly of two Shillings) paid to the Bishop, at the Time of the Annual Synod, by every Parochial Priest.

For the Bishops us'd to hold their Diocesan Synods, and to visit all at once; from whence these *Synodals* are ac- counted amongst the Bishop's Procurations at this Time.

**SYNODALES** *Togles*; the urban and rural Deans were at first so call'd, from their informing again, and atreiting the Disorders of the Clergy and People in the Episcopal Synod. But when they sunk in their Authority, in their stead rose *Synodical* Witnesses, who were a Sort of impannell'd Jury, consisting of a Priest, and two or three Laymen for every Parish; though at length two for every Diocese were annually chosen; till at last the Office came to be devolv'd on the Church- Wardens. Some think our Quail-men, who are Assitants to the Church-Wardens, were call'd *Sides men*, *quasi* *Synod- men*. See **SIDES-MEN**.

**SYNODALE** *Instrumentum*; was the solemn Oath that these *Synodical* Witnesses took; as our Church-Wardens now are sworn to make their just Presentments.

**SYNODICAL**, something belonging to a *Synod*.

Thus *Synodical* Letters, are Circular Letters wrote by *Synods* to the absent Prelates and Churches; or even those general ones directed to all the Faithful, to inform them of what had pass'd in the *Synod*.

In the Collection of Councils are abundance of these *Sy- nodical* Letters.

**SYNODICAL** *Month*, is the Period or Interval of Time, wherein the Moon, departing from the Sun at a *Synod* or *Conjunction*, returns to him again. See **MOON**.

*Kepler* found the Quantity of the mean *Synodical* *Month*, 29 Days, 12 Hours, 44 Minutes, 3 Seconds, 11 Thirds. See **MONTH**.

This Period is also call'd a *Lunation*; in Regard, in the Course hereof, the Moon puts on all her Phases or Appear- ances. See **LUNATION**.

**SYNOID'S-MEN**, or *Togles* *Synodales*. See **SIDES-MEN**.

**SYNOESIA**, in Antiquity, a Feast celebrated at *Athens*, in Memory of *Theseus*'s having united all the petty Com- munities of *Attica*, into one single Commonwealth; the Seat whereof was *Athens*; where all the Assemblies were to be held.

The Feast was dedicated to *Minerva*; and, according to the Scholiast of *Trucydidus*, was held in the Month *Meta- gition*.

**SYNONYMOUS**, an Epithet apply'd to a Word or Term that has the same Import, or Signification with another; call'd also *Synonymus*. Some severe Critics condemn all Use of *Synonymous* Terms in the same Period; but this is to condemn all Antiquity. So far is the Use thereof from being vicious, that 'tis frequently necessary; as they contribute both to the Force and Clearness of the Ex- pression. If the first sketch out the Resemblance of the Thing it represents, the *Synonymus* that follows, is, as it were, a second Touch of the Pencil, and finishes the Image.

Indeed they must be us'd with a deal of Discretion and Oe- conomy. The Style must be rais'd and brighten'd, not stuff'd or loaded with *Synonymous* Terms. They must be us'd as Ornaments, and to render the Expression the more forcible, without

without making a Shew of the Riches thereof, or heaping *Synonyma's* on *Synonyma's*.

But, tho' *Synonymous* Words be laudable, *Synonymous* Phrases are inexcusable: The Reason is, that two *Synonymous* Phrases keep the Mind at Rest, and let it flag and languish.

**SYNONYMY**, in Rhetoric, a Figure whereby *Synonyma's*, or *Synonymous* Terms, that is, various Words of the same Signification, are made Use of to amplify the Discourse.

As *abijt, evasit, effugit*, he went off, he escap'd, he run away.

The Word is form'd from the *Greek*, *σύν*, with, and *σύνθεσις*, Name.

**SYNOVIA**, in Medicine, a Term used by some Authors for the nutritious Juice proper to each Part. See **NUTRITION**.

Others use it for the Gout, and other Diseases arising from a Vice in the nutritious Juice.

Others restrain it to the oozing out of the nutritious Juice thro' the wounded Parts.

*Van Halowen* defines it a kind of transparent Mucilage, like Seed, such as issues from the Legs of a Calf upon cutting off the Feet.

**SYNTAGMA**, a disposing, or placing of Things in an orderly Manner.

The Word is *Greek*, *σύνταγμα*.

**SYNTAX**, in Grammar, the Construction or Connection of the Words of a Language into Sentences, or Phrases. See **WORD**, **SENTENCE**, **PHRASE**, &c.

Or, as *F. Buffler* more accurately defines it, *Syntax* is the Manner of constructing one Word with another, with regard to the different Terminations thereof, prescribed by the Rules of Grammar. See **CONSTRUCTION** and **GRAMMAR**.

Some Authors, as *M. Vaugelas*, &c. confound it with *Style*; but there is a real Difference. See **STYLE**.

The Office of *Syntax*, is to consider the natural Suitableness of Words with respect to one another; in order to make them agree in Gender, Number, Person, Mood, &c.

To offend in any of these Points, is call'd to offend against *Syntax*: and such kind of Offence, when gross, is call'd a *Solecismus*; and when more slight, a *Barbarismus*. See **SOLECISM** and **BARBARISM**.

The several Parts of Speech, are, with regard to Language, what Materials are with regard to a Building. How well prepar'dsoever they may be, they will never make a House, unless they be plac'd conformably to the Rules of Architecture. 'Tis the *Syntax*, then, that properly gives the Form to the Language; and 'tis this makes the most essential Part of Grammar.

There are two Kinds of *Syntax*; the one of *Concord*, wherein the Words are to agree in Gender, Number, Case, and Person. See **CONCORD**.

The other, of *Regimen* or *Government*, wherein one Word governs another, and occasions some Variation therein. See **REGIMEN**.

The first, generally speaking, is the same in all Languages, as being the natural Series of what is in Use almost every where, the better to distinguish Discourse. Thus, the Distinction of two Numbers, Singular and Plural, has render'd it necessary to make the Substantive agree with the Adjective in Number; that is, to make the one singular or plural, when the other is so: For, as the Substantive is the Subject confusedly, tho' directly, mark'd by the Adjective; if the Substantive express several, there are several Subjects to be express'd in that Form by the Adjective: And by Consequence it ought to be in the Plural; as *Hominum Dediti*, learned Men: But there being no Termination in the Adjective in *English* to distinguish the Number, it is only imply'd. See **NUMBER**.

The Distinction of Masculine and Feminine Gender, obliges the Languages, which have distinct Terminations, to have a Concordance or Agreement between the Substantive and Adjective, in Gender as well as Number: And for the same Reason, the Verbs are to agree with the Nouns and Pronouns in Number and Person. If at any Time we meet with any thing that seems to contradict these Rules, 'tis by a Figure of Speech, *i. e.* by having some Word understood, or by considering the Thoughts rather than the Words themselves. See **GENDER**.

The *Syntax* of *Government*, on the contrary, is generally arbitrary; and, on that Account, differs in most Languages. One Language, for Instance, forms their *Regimen* by Cases; as the *Latin* and *Greek*: others use *Particles* in lieu thereof; as the *English*, *French*, *Italian*, *Spanish*, &c. See **CASE** and **PARTICLE**.

One or two general Rules, however, may be here noted, which are of Use in all Languages. 1<sup>o</sup>. That there is no Nominative Case, but has a Relation to some Verb, either express'd or understood; since we never speak merely to express what we conceive, but to express what we think

of what we conceive, which is done by the Verb. See **NOMINATIVE**.

2<sup>o</sup>. That there is no Verb but has its Nominative Case either express'd or understood; for the Office of the Verb being to affirm, there must be something to affirm of; which is the Subject or Nominative Case of the Verb; tho' before an Infinitive 'tis an Accusative; as *Scio Petrum esse doctum*. I know *Peter* to be learned. See **VERB**.

3<sup>o</sup>. That there is no Adjective but has a Relation to some Substantive; in regard the Adjective marks confusedly the Substantive, which is the Subject of the Form or Quality distinctly mark'd by the Adjective. See **ADJECTIVE**.

4<sup>o</sup>. That there never comes any Genitive Case but is govern'd by some other Noun. See **GENITIVE**.

5<sup>o</sup>. The Government of Verbs is frequently taken from various Sorts of References, included in the Cases, according to the Caprice of Custom or Usage; which yet does not change the specific Relation of each Case, but only shows that Custom has made Choice of this or that. Thus, the *Latin* say, *Ipseus aliquem & Epistolam alicui*; the *French*, *Service quelqun un & servir a quelque chose*; and in the *Spanish*, the Generality of Verbs governs indifferently a Dative and an Accusative Case.

**SYNTECTOE**, in Medicine, a kind of Colligation of the Solids of the Body; such as frequently happens in Inflammations of the Bowels, Colicquate Fevers, &c. wherein a fatty Uliginous is voided with the Excrements by Stool. See **COLLIQUATION**.

**SYNTHESIS**, the Composition or putting of several Things together; as the making a compound Medicine of several simple Ingredients, &c.

The Word is form'd from the *Greek* *σύν*, with, and *θεσις*, *positio*.

**SYNTHESIS**, in Logic, &c. a Branch of *Method*, opposite to *Analysis*. See **METHOD**.

In the *Synthetic*, or *Synthetic Method*, we pursue the Truth by Reasons drawn from Principles before establish'd or assum'd, and Propositions formerly proved; thus proceeding by a regular Chain, till we come to the Conclusion.

Such is the Method in *Euclid's* Elements, and most Demonstrations of the ancient Mathematicians; which proceed from Definitions and Axioms, to prove Propositions, &c. and from those Propositions proved, to prove others.

This Method we also call *Composition*, in opposition to *Analysis*, which we call *Resolution*. See **COMPOSITION**.

**SYNTHESIS**, in Grammar, See **SYLLEPSIS**.

**SYNTHESIS**, in Chirurgery, an Operation, whereby divided Parts are re-united; as in Wounds, Fractures, &c.

**SYNUSIASTS**, or **SYNOIASTS**, a Sect of Hereticks, who maintain'd, that there was but one single Nature, and one single Substance in *Jesus Christ*.

The *Synusists* denied, that the Word had taken a Body in the Womb of the Virgin; but held, that a Part of the divine Word being detach'd from the rest, was there changed into Flesh and Blood. Thus they taught, that *Jesus Christ* was consubstantial to the Father, not only as to his Divinity, but even as to his Humanity and his Body.

The Word is form'd from the *Greek*, *σύν*, with, and *ἰσῆς*, Substance.

**SYPHILIS**, is a Term used for the *Lus Venerea*. See **VENEREAL**.

Some will have it from *σύν*, *σύν*, with, and *σῆλα*, *Amor*, or *Amicitia*, Love or Friendship; because it proceeds from the infectious Intercourses of Lovers in Coition. Others will have it from the Name of a Shepherd so called, who was remarkably afflicted with it.

However, some Authors of Note use the Term; and *Pracapsorius* a famous *Italian* Physician, gives it for the Title of a fine Poem, which he wrote upon that Dis temper.

**SYPHON**. See **SYPHON**.

**SYRENS**, **SIRENES**, in Antiquity, *Mermaids*, or certain fabulous Beings, represented by *Ovid*, &c. as Sea-monsters, with Womens Faces and Fishes Tails; by others, deck'd with a Plumage of the gayest Colours.

They are supposed to have been the Three Daughters of the River *Achelus*; and call'd *Parthenope*, *Ligea*, and *Leucosia*.

*Hower* only makes mention of Two *Syrens*; but others reckon Five. *Virgil* places them on Rocks, where Vessels are in danger of spitting. *Pliny* makes them inhabit the Promontory of *Minerva*, near the Island *Ceprea*. Others fix them in *Sicily*, near *Cape Pelorus*. *Claudian* says, they inhabited baronous Rocks; that they were charming Monsters; and that Sailors were wreck'd on their Rocks without Regard, and even expir'd in Raptures: *Dulce malum Pelago Siren*.

This Description is, doubtless, founded on a literal Explication of the Fable, that they were Women who inhabited the Shores of *Sicily*, and who, by all the Allurements of Pleasure, stopp'd Passengers, and made them forget their Course. Some Explainers of the ancient Fables, will have been the Number and the Names of the Three *Syrens*, to have been form'd on the Triple Pleasure of the Senses, *Wisdom*,  
Love

Love and Music; which are the three most powerful Means of seducing Men; and hence so many Exhortations to avoid the fatal *Syrus* Song.

Probably 'twas hence, that the *Greeks* fetch'd their Erymology of *Syrus*, viz. from *συσ*, a Chain, as if there was no getting free of their Enticement.

Others, who don't look for so much Mystery in the Fable, maintain, that the *Syrus* were nothing but certain close Places in the Sea, where the Waves whirling furiously around, seize'd and swallow'd up Vessels that approach'd them too near.

Lastly, others allow them to have been certain Shores and Pronatories, where the Winds, by the various Reverberations and Echo's, cause a kind of Harmony, that surprizes and stops Passengers. This probably, might be the Origin of the *Syrus* Song, and of the giving the Name of *Syrus* to these Rocks. The *Sculptors* and *Painters* usually follow *Ovid's* Description; but on some Medals, we find them represented with the upper Parts of Women, and the lower, of Birds.

**SYRINGE**, an Instrument serving to imbibe or suck up a Quantity of any Fluid, and to expel the same with violence.

The *Syringe* is made of a hollow Cylinder, as ABCD (Tab. Hydrostaticks, Fig. 26.) furnished with a little Tube at bottom, EF. In this Cylinder, is an Embolus, K, made or at least cover'd with Leather, or other Matter, that easily takes Moisture; and so filling the Cavity of the Cylinder, as that no Air or Water may pass between the one and the other.

If, then, the little Tube F be put in Water, and the Embolus drawn out, the Water will ascend into the Cavity left by the Embolus: And upon thrusting back the Embolus, it will be violently expell'd again through the Tube EF: And still, the greater Impetus will the Water be expell'd withal, and to the greater Distance, as the Embolus is thrust down with the greater Force, or the greater Velocity.

This Ascend of the Water, the Ancients, who supposed a Plenum, attributed to Nature's Abhorrence of a Vacuum: But the Moderns, more reasonably, as well as more intelligibly, attribute it to the Pressure of the Atmosphere on the Surface of the Fluid. See AIR and VACUUM.

For, by drawing up the Embolus, the Air left in the Cavity of the Cylinder must be exceedingly rarified; so that being no longer a Counter-balance to the Air incumbent on the Surface of the Fluid; that prevails, and forces the Water through the little Tube, up into the Body of the *Syringe*.

In effect, a *Syringe* is only a simple Pump, and the Water ascends in it on the same Principle, as in the common sucking Pump; whence it follows, that Water will not be raised in a *Syringe*, to a Height exceeding 31 Feet. See PUMP and SUCTION.

**SYRNES** are of considerable Use in Medicine and Chirurgery. By them Clysters are administered: Injections of medicinal Waters, &c. made into Wounds, &c. They also serve to inject colour'd Liquors, melted Wax, &c. into the dried Vessels of the Parts of Animals, to shew the Disposition, Texture, Ramifications, &c. thereof. See INJECTION.

The Word is form'd from the *Latin*, *Syrinx*, Pipe.

**SYROP**, in Pharmacy, an agreeable Liqueur, or Composition, of a moderately thick Consistence, extracted from Juices, Tinctures, or Waters of Fruits, Flowers, or Herbs boil'd, and season'd with Sugar, or Honey; and taken either for Health or Pleasure.

There are various Kinds of *Syrops*, denominated from the various Fruits, &c. they are extracted from; as *Syrop* of Violets, of Elder, of Wormwood, of Poppies, &c. *Emetic Syrops*, *Lienteric* and *Antinephritic Syrops*, &c. *Chelegogue*, *Phlegmagogue Syrops*, &c.

The *Syrop* of *Sapor* is a *Syrop*, the Base whereof is Apples, with Juices of Bugles, Annis, Saffron, &c. thus call'd from *Sapor* King of *Perfia*, who overcame the Emperor *Valerian*, suppos'd to be the Inventor thereof.

The Word, *Melange* derives from the *Latin* *Syrupos*, of the *Arab* *Schibarab*, which signifies *Potion*. Others derive it from the *Greek*, *συσ*, I draw, and *σικ*, Juice. *Skinner* thinks the Word might come from the *Greek* *Συρία*, *Syria*, in regard these Kinds of Liquors were much in Use among the *Syrians*, a very delicate People; tho' he thinks it should rather be deriv'd from the *Arabic* *Siraph*, which signifies the same Thing as *Syrop*, or from *Serk* or *Siral*, a *Potion*, or Medicinal Drink.

*D. Herbelot* observes, that the Words *Syrop*, and *Scherbet*, or *Sorbet*, all come from the *Arabic*, *Schibarab*, which signifies any Kind of Drink in the general. See SHERBET.

SYROP of <i>Alkemes</i>	} See	SCARLET.
SYROP of <i>Diacodium</i>		DIACODIUM.
SYROP of <i>Capillaries</i>		CAPILLARIES.
SYROP of <i>Tenuis</i>		CYRON.
SYROP of <i>Sugar</i>		MOLOSSES.
SYROP of <i>Violet</i>		VIOLETS.

**SYSSARCOSIS**, in Anatomy, a particular Species of the Kind of Articulation call'd *Symphysis*. See SYMPHYSIS.

The *Syffarosis* is a natural Union of two Bones, by Means of Flesh or Muscles: Such is that of the Os Hyoides, and Omoplates.

The Word is *Greek*, compounded of *συσ*, with, and *σάρξ*, Flesh.

**SYSTEM**, in the general, a certain Assemblage, or Chain of Principles and Concisions: Or the Whole of any Doctrine, the several Parts whereof are bound together, and follow or depend on each other.

The Word is form'd of the *Greek*, *Συστασις*, Composition.

In this Sense, we say, a *System* of *Philosophy*; a *System* of *Morals*; a *System* of *Fever*, &c. The *Divines* have fram'd abundance of *Systems* of *Grace*: The *Systems* of *intermediate Science*, and *Pre-determination*, are invented to explain that of *Grace*. See GRACE, &c.

Among Physicians, some follow the *System* of *Acids* and *Acid*; others that of the four Qualities, &c. *Dr. Woodward* accounts for most Things on his *System* of the *Bills*.

*Des Cartes's* *System* is held very destructive to Religion. See CARTESIANISM, CAUSE, &c.

*Gassendi* renew'd the ancient *System* of *Atoms*; which was that of *Democritus*, followed by *Epicurus*, *Lucretius*, &c. See CORPUSCULAR.

*Sir Isaac Newton's* Doctrine of Colours; *M. Leibniz's* *Protogea*, and some Discourses of *M. Jussieu*, to the Academy of Sciences, to shew that there are Bodies, whose Parts are not to be destroy'd by any natural Agents; are very favourable to the *System* of *Gassendi*. See ATOM.

Experiments are the Materials of *Systems*: An Infinity are required to build one. See EXPERIMENT.

**SYSTEM**, in Astronomy, an Hypothesis or Supposition of a certain Order, and Arrangement of the several Parts of the Universe; whereby Astronomers explain all the Phenomena, or Appearances of the heavenly Bodies, their Motions, Changes, &c. call'd, also, the *System* of the *World*, and the *Solar System*. See WORLD.

*System* and *Hypothesis*, have the same Signification; unless, perhaps, *Hypothesis* be a more particular *System*; and *System* a more general *Hypothesis*. See HYPOTHESIS.

Some late Authors, indeed, furnish a fresher Distinction: An Hypothesis, say they, is a mere Supposition, or Fiction; founded rather on Imagination, than Reason: A *System* is only built on the firmest Ground, and rais'd by the severest Rules: 'Tis founded on Astronomical Observations, and Physical Causes, and confirm'd by Geometrical Demonstrations.

The most celebrated *Systems* of the *World*, are the *Ptolemaic*, and the *Copernican*; to which may be added, the *Tychonic*: The *Order* of each whereof, is as follows;

*Ptolemaic* *SYSTEM* places the Earth at Rest, in the Centre of the Universe; and makes the Heavens revolve round the same from *East* to *West*, and carry all the heavenly Bodies, Stars and Planets along with them. See PTOLEMAIC.

For the *Order*, *Distances*, &c. of the several Bodies in this System, see *Plate Astronomy*, Fig. 43.

The principal Axioms of this *System*, are *Aristotle*, *Hipparchus*, *Ptolemy*, and many of the old Philosophers, followed by the whole World, for a great Number of Ages; and still adhered to in some of our Universities, and other Places, where free Philosophizing is excluded: But the late Improvements have put it out of all Countenance; and we don't even want Demonstration against it. See EARTH, &c.

*Copernican* *SYSTEM*, places the Sun at rest, nearly in the Centre of the *System*; excepting for a veriginous Motion about his own Axis. See SUN.

Around him, move from *West* to *East*, in several Orbits, first *Mercury*, then *Venus*, the *Earth*, *Mars*, *Jupiter* and *Saturn*. See PLANET.

About the Earth, in a peculiar Orbit, moves the Moon; accompanying the Earth, in its whole Progress round the Sun. See MOON.

And after the same Manner, do four Satellites move round *Jupiter*; and Five round *Saturn*. See SATELLITES.

Atwart the planetary Space do the Comets move round the Sun; only in very excentrick Orbits, probably Parabola's, in one of whose Focus is the Sun. See COMET.

At an immense Distance beyond the Planetary and Cometary Spaces, are the fix'd Stars, which have all a proper Motion from *West* to *East*. See STAR.

The *Solar* or *Planetary System*, is usually confin'd to narrower Bounds: The Stars, by their immense Distance, and the little Relation they appear to bear to us, being reputed no Part thereof. 'Tis highly probable, that each Star, is, itself, a Sun; and the Centre of a particular *System*, surrounded with a Company of Planets, &c. which, in different Periods, and at different Distances, perform their Courses round their respective Sun; and are enlighten'd, warm'd and cherish'd, &c. thereby: Hence we have a very magnificent Idea of the

World, and the Immutability thereof: Hence arises a *System of Systems*. See UNIVERSAL.

The *Planetary System*, here described, is the most ancient in the World. 'Twas the first that we know of, introduced into Greece and Italy by Pythagoras; whence, for many Ages, it was call'd the *Pythagorean System*. It was followed by Plato, Archimedes, &c. but lost under the Reign of the Peripatetic Philosophy; till happily retriev'd about 200 Years ago by Nic. Copernicus; whence its new Appellation, of *Copernican System*. See COPERNICAN.

For the *Occasion of the Copernican System*; see the Scheme thereof, Tab. Astronomy, Fig. 44.

*Tychonic SYSTEM*, in most respects, coincides with the *Copernican*; except in this, that, supposing the Earth to be fix'd, its Orbit is omitted, and in lieu thereof, the Sun's Orbit is drawn round the Earth, and made to intersect the Orbit of Mars; that Mars may be nearer the Earth than the Sun. But as there is not any Reason, or Foundation in Nature, for such a manifest Shift; and as the Author was only led thereto, from a superstitious Persuasion, that to suppose the Sun at Rest, and the Earth to move, is contrary to Scripture; the true *System* is not much prejudic'd hereby. See EARTH.

For the *Order and Occasion of the Tychonic System*; see the Scheme in Tab. Astronomy, Fig. 45.

*SYSTEM*, in Poetry, is a certain Hypothesis, from which the Poet is never to recede; e. g. Having made his Choice either in the Fables of the Heathens, or in Christianity; he must always distinguish between the Two; and never mix such different Ideas in the same Poem. Thus, after invoking *Apollo* and the Muses, he must bid adieu to the Language of Christianity, and not confound the two *Systems*. The Fabulous *Stile*, indeed, is the Gay and more Figurative; but a Pagan God makes but a miserable Figure in a Christian Poem. The *System of Poetry*, *Waller* observes, is, itself, wholly Fabulous and Pagan.

*SYSTEM*, in Music, a compound Interval; or an Interval compos'd, or conceived to be compos'd, of several lesser; such is the *Octave*, &c. See INTERVAL.

The Word is borrow'd from the Ancients, who call a simple Interval, *Diastem*, and a Compound one *System*.

As there is not any Interval in the Nature of Things; so we can conceive any given Interval, as compos'd of, or equal to the Sum of several others. This Division of Intervals, therefore, only relates to Practice; so that a *System* is properly an Interval, which is actually divided in Practice, and where, along with the Extremes, we conceive always some intermediate Terms. The Nature of a *System* will be very plain, by conceiving it an Interval, whose Terms are in Practice, taken either in immediate Succession; or the Sound is made to rise and fall, from the one to the other, by touching some intermediate Degrees; so that the whole is a *System* or Composition of all the Intervals, between one Extreme and the other. *Systems* of the same Magnitude, and consequently of the same Degree of Concord and Discord, may yet differ in respect of their Composition; as containing and being actually divided into more or fewer Intervals: And when they are equal in that respect, the Parts may differ in Magnitude. Lastly, when they consist of the same Parts, or lesser Intervals, they may differ as to the Order and Disposition thereof between the two Extremes.

There are several Distinctions of *Systems*; the most remarkable is, into *Concinnous* and *Inconcinnous*.

*Concinnous Systems*, are those consisting of such Parts, as are fit for Music, and those Parts, placed in such an Order between the Extremes, as that the Succession of Sounds, from one Extreme to the other, may have a good Effect. See CONCINNOUS.

*Inconcinnous Systems*, are those, where the simple Intervals are *Inconcinnous*, or ill dispos'd betwixt the Extremes.

A *System*, again, is either *Particular* or *Universal*. An *universal System*, is that which contains all the particular *Systems* belonging to Music; and makes what the Ancients call the *Diastemata*, and we the *Scale of Music*. See SCALE.

The Ancients also distinguish *Systems* into *Perfect* and *Imperfect*. The *Diastemata*, or double *Octave*, was reckon'd the *perfect System*, because within its Extremes, are contained Examples of all the simple and original Concords, and in all the Variety of Order wherein their concinnous Part ought to be taken; which Variety constitutes what they call the *Species* or *Figures of Concinnousness*.

All the *Systems*, less than the *Diastemata*, were reckon'd *Imperfect*.

The double *Octave* was also call'd the *Systema Maximum*, and *Immutatum*; because they took it to be the greatest Extent or Difference of Time that we could go in making Melody; though some added a Fifth to it, for the greatest *System*: But the *Diastemata*, or simple *Octave*, was reckon'd the most perfect, with respect to the Agreement of its Extremes; so that how many *Octaves* soever were put into the greatest *System*, they were

all to be constituted or sub-divided the same Way as the First: So that when we know how the *Octave* is divided, we know the Nature of the *Diastemata* or *Scale*: The Varieties whereof, constituted the *Genera Musica*, which were sub-divided into Species. See GENERA and SPECIES.

*SYSTOLE*, in Medicine, the Contraction of the Heart and Arteries of an Animal. See HEART and ARTERY.

The *Systole of the Heart* is well accounted for by Dr. Lower, who shews, that the Heart is a true Muscle, the Fibres whereof are acted on like those of other Muscles, by Means of certain Branches of the eight Pair of Nerves infer'd into it, which bring the Animal Spirits from the Brain hither. By a Flux of these Spirits, the Muscular Fibres of the Heart are inflated, and thus shorten'd; the Length of the Heart diminish'd, its Breadth or Thickness increas'd, the Capacity of the Ventricles clos'd, the tendinous Mouths of the Arteries dilated, those of the Veins shut up by means of their Valves, and the contain'd Juices forcibly express'd into the Orifices of the Arteries. See MUSCLE.

And this we call the *Systole*, or Contraction of the Heart; the opposite State to which is call'd the *Diastole*, or Dilatation of the Heart. See DIASTOLE.

Dr. Drake adds to Dr. Lower's Account, that the intercostal Muscles and Diaphragm, contribute to the *Systole*, by opening the Blood a Passage from the right Ventricle of the Heart, to the left thro' the Lungs, to which it could not otherwise pass: By which Means, the Opposition the Blood contain'd in that Ventricle must necessarily have made to its Constriction, is taken off. See CONTRACTION.

Lower and Drake make the *Systole* the natural State or Action of the Heart; and the *Diastole* the violent one: *Boerhaave*, on the contrary, makes the *Systole* the violent, and the *Diastole* the natural State.

*SYXHNDEMEN*, a Term purely Saxon, literally signifying 600 Men, or Men worth 600 Shillings.

In the Time of our Saxons Ancestors, all Men were rank'd into three Classes; the *lowest*, the *middle*, and the *highest*; and were valu'd according to their Class: that if any injury were done, Satisfaction might be made to the Value or Worth of the Man it was done to.

The *lowest* were call'd *Tweyhindemen*, q. d. valued at 200 Shillings; the *middle*, *Syxhndemen*, q. d. valued, at 600 Shillings; and the *highest*, *Tweelfhindemen*, i. e. valued at 1200 Shillings.

*SYZYGY*, in Astronomy, a Term equally us'd for the Conjunction and Opposition of a Planet with the Sun. See CONJUNCTION and OPPOSITION.

The Word is form'd from the Greek, *συνζυγια*, *Conjunctio*.

On the Phenomena and Circumstances of the *Syzygies*, a great Part of the Lunar Theory depends. See MOON.

For, 1<sup>o</sup>. It is shewn in the Physical Astronomy, that the Force which diminishes the Gravity of the Moon in the *Syzygies*, is double that which increase it in the Quadrature: So that in the *Syzygies* the Gravity of the Moon from the Action of the Sun is diminish'd by a Part, which is to the whole Gravity as 1 to 89,36; for in the Quadratures, the Addition of Gravity is to the whole Gravity as 1 to 178,72. See QUADRATURE.

2<sup>o</sup>. In the *Syzygies*, the disturbing Force is directly as the Distance of the Moon from the Earth, and inversely as the Cube of the Distance of the Earth from the Sun. And at the *Syzygies*, the Gravity of the Moon towards the Earth, receding from its Centre, is more diminish'd, than according to the inverse Ratio of the Square of the Distance from that Centre. Hence, in the Motion of the Moon from the *Syzygy* to the Quadrature, the Gravity of the Moon towards the Earth is continually increas'd, and the Moon is continually retarded in its Motion; and in the Motion from the Quadratures to the *Syzygies*, the Moon's Gravity is continually diminish'd, and its Motion in its Orbit accelerated. See GRAVITY.

3<sup>o</sup>. Further, in the *Syzygies* the Moon's Orbit or Circle round the Earth, is more convex than in the Quadratures for which Reason the Moon is less distant from the Earth at the former than the latter. When the Moon is in the *Syzygies*, her Apides go backwards, or are retrograde. See ORBIT, APIDES and RETROGRADATION.

When the Moon is in the *Syzygies*, the Nodes move in Antecedentia fastest; then slower and slower, till they become at rest when the Moon is in the Quadratures. See NODE.

Lastly, When the Nodes are come to the *Syzygies* the Inclination of the Plane of the Orbit is least of all. See INCLINATION.

Add, that these several Irregularities are not equal in each *Syzygy*, but all somewhat greater in the Conjunction than the Opposition. See DISTURBING FORCE, &c.

## T.

**T** A Consonant, and the nineteenth Letter in the Alphabet. See LETTER.

The *T*, in Sound, bears a near Resemblance to the *D*, for which Reason they are often put for each other; and *Quintilian* even rallies those who scrupled to write the one indifferently for the other; as *tu* for *ad*, *tes* for *set*, *tant* for *tant*, &c.

The *T* is one of the five Consonants which the Abbot *de Dangeau* calls *Palatal*, and which are *D-T*, *G-K*, and *N*: The four first whereof have the same Relation to each other, as the Labials *B-P* and *F-V* have. *D*, for Instance, having the same Relation to *T*, that *B* has to *P*, or *V* to *F*. See PALATAL.

The *T*, the same Author observes, is a Letter of a strong Sound; so that a feeble one cannot be pronounc'd before it: Thus to form the Supine of *rego*, the *T* of *sum* changes the *h*, and strengthens it to the Sound of *a c*; so that we say *retulisti*; as in the preterperfect Tense *raxi*, which we pronounce *reksi*.

*T* among the Ancients was used as a Numeral Letter, signifying 160; according to the Verse,

*T* usque centens & Sexaginta tenebit.

When a Dash was added a-top, thus, *T*, it signify'd 160,000. When the Tribunes approv'd of the Decrees of the Senate, they testify'd their Consent by subscribing a *T*.

*T*, in Music, is sometimes used to mark the Tenor. See TENOR.

*T* is also a Mark, or Brand, which by Statute 4 Hen. 7. every Person convicted of any Felony, save Murder, and admitted to the Benefit of the Clergy, shall be mark'd withal, on the Brawn of the left Thumb. See STIGMA.

*T*, or *TAV*, in Heraldry, is a kind of Cross potent, or truncated; found in all the Armories of the Commanders of the Order of St. Anthony. See CROSS.

The *T*, *Ten*, azure, is seen in Arms above 400 Years old: Its Origin, according to some Authors, is taken from the Apocalypse; where the same is a Mark that the Angel impresses on the Foreheads of the Elect. Others take it to represent a Crutch; a Symbol proper enough for this Order, which was sworn to Hospitality. But the Truth, *F. Menestrier* observes, is, that 'tis the Top of a Greek Cross.

The Bishops and Abbots of the Greek Church wear it still; and if it be found on the Habit of St. Anthony, 'tis only to shew that he was an Abbot.

TABACCO. See TOBACCO.

TABBY, in Commerce, a kind of coarse Taffaty, water'd. It is manufactured like the common Taffaty, excepting that 'tis stronger and thicker both in the Wool and Warp. See TAFFATY.

The Watering is given it by means of a Calender, the Rolls whereof are of Iron or Copper, variously engraven, which bearing unequally on the Stuff, render the Surface thereof unequal, so as to reflect the Rays of Light differently. See CALENDER.

TABBING, the passing a Stuff under the Calender, to make a Representation of Waves thereon; as on a Tabby. See CALENDER.

'Tis usual to tabby Mohairs, Ribbons, &c.

Tabbying is perform'd without the Addition of any Water or Dye; and furnishes the modern Philosophers with a strong Proof, that Colours are only Apparances. See COLOUR.

TABELLA, or TABLETTE, in Pharmacy, a solid Electuary, or Composition of several Drugs, made up dry, and form'd into little Squares; more usually call'd *Lozenges*. See LOZENGE.

Powders, Confections, Fruits, Salts, &c. are dissolv'd, in Sugar, and made into *Tabule*; as those of the Juice of Liquorice for Colds, &c.

We have Cordial, Stomachic, Aperitive, Hepatic, &c. *Tablettes*. Jellies and Broths are sometimes reduc'd into *Tablettes*, to be carry'd in the Pocket. There are *Tablettes of Manus Christi*, or Sugar of Rocks pearled. *Tablette Magnanimittatis*, are those taken by feeble old Men, when match'd with young Wives, to assist and bear them out in the Affair of Generation.

TABELLION, TABELLIO, TABULARIUS, in the Roman Law, a kind of Officer often confounded with *Notary*, *Notarius*.

Yet did the two differ in this; that the *Notaries* only drew up, and kept the Minutes of Acts and Instruments on Paper, and in Notes, or Short-hand; whereas the *Tabelliones* deliver'd them enrosg'd on Parchment, in full executory Form. The same put the Seals to Contracts, and render'd them authentic.

The Domestic Clerks of these *Tabelliones*, who, at first, wrote under them, in Procees of Time came to be call'd *Notaries*. See NOTARY.

*Pepinier* observes, that the *Tabelliones* at *Rome* were publick Slaves, appointed for the keeping of Contracts made between private Persons. According to *Loyseau*, a Contract wrote by a *Notary*, was not perfect or obligatory, till the *Tabellio* had wrote it fair; after which the Parties subscrib'd it, i. e. they wrote at Bottom that they approv'd the Contents; for Signatures were not then in Use. See SIGNATURE.

— *Quintus* *Tabellionum* *usum* in *regno* *Anglie* non *habere*, *propter* *quod* *magis* *ad* *Sigilla* *Authentica* *credi* *est* *necessi*, *ut* *ex* *rum* *Copia* *facilius* *habeatur*, *statuimus* *ut* *Sigillum* *habeant* *non* *solum* *Archiepiscopi*, *&* *episcopi* *sed* *etiam* *Officiales*. See SEAL.

TABERNACLE, among the Jews, the Place wherein the Ark of the Covenant was lodg'd; both while they were in Tents, during their Journey from *Aegypt*; and when fix'd in *Jerusalem*, and the Ark kept in the Temple.

*Philo* describes the Jewish *Tabernacle* thus: It was a Building compos'd of 48 Cedar Boards, lined with massive Gold; under each whereof was a Silver Stand, or Foot, and at the Top a Capital of Gold: It was encompass'd with ten Pieces of rich Tapistry, of different Colours, Purple, Scarlet, Hyacinth, &c. The Length of the *Tabernacle* was 30 Cubits; its Breadth 10, *Josephus* lays 12. See ARK.

The Ark was placed in a secret Oratory, in the Middle of this *Tabernacle*; and was gilt both within-side and without; the Top whereof, being a Kind of Lid, was call'd *Propitiatory*, because it appeas'd the Wrath of God.

It was encompass'd with several Veils, stretch'd over it, with Hooks, and Buckles of Gold.

The Word is form'd from the *Latin* *Tabernaculum*, a Tent, *Fest* of *TABERNACLES*. See SCENOPEGIA.

*TABERNACLE* has also been used of late for a sort of temporary Church, or Chapel, contriv'd to serve the immediate Purposes of the Parishioners, &c. while their proper Church is Repairing, Rebuilding, or the like.

TABES, in Medicine, a general Name for Consumptions of all Kinds. See CONSUMPTION, PHTHISIS, ATROPHY, &c.

TABES Dorsalis, is a kind, or rather a Degree of Consumption: proceeding sometimes from an excessive Application to Venery.

The Patient has neither a Fever, nor Loss of Appetite; but a Sensation, as if there were a Number of Pissures running from the Head, down the Spinal Marrow; and when he evacuates, either by Urine, or Stool, there flows a liquid Matter like Semen.

After any violent Exercise his Head is heavy, and his Ears tingle; and as length he dies of a Lippurya, i. e. a Fever, where the external Parts are cold, and the internal burn at the same time. See LIPPURIA.

TABLAURE, in Anatomy, a Division or parting of the Skull into two Tables. See CRANIUM.

TABLATURE, in Music, in the general, is, when, to express the Sounds, or Notes of a Composition, we use Letters of the Alphabet, or Cyphers, or any other Characters, not usual in the modern Music. See SCORE.

But in its stricter Sense, *Tablature* is the Manner of Writing a Piece for a Lute, Theorba, Guitarr, Bass-Viol, or the like; which is done by Writing on several parallel Lines (each whereof represents a String of the Instrument) certain Letters of the Alphabet; whereof, A marks that the String is to be struck open, i. e. without putting the Finger of the left Hand on the Head; B shows, that one of the Fingers is to be put on the first Stop; C on the second; D on the third, &c. See WRITING of Music.

The *Tablature* of the Lute is wrote in Letters of the Alphabet; that of the Harpsichord in the common Notes. See LUTE, HARPSICHOARD, &c.

TABLE, *Tabula*, a Moveable, usually made of Wood, or Stone, supported on Pillars; or the like; for the commodious Reception of Things placed thereon.

*Moses* made a Table in the *Tabernacle* for the laying of the Show-Bread upon; describ'd by *Philo Judæus* as two Cubits long, one broad, and one and half high. Among Christians, the *Table*, or *Lard's Table*, signifies the Sacrament of the Eucharist. See EUCHARIST.

Round TABLE: Knights of the Round Table, a military Order, suppos'd to have been instituted by *Arthur* first King of the *Britans*, in the Year 516. See KNIGHT.

They are said to have been 24 in Number; all pick'd from among the bravest of the Nation.

The Round Table, which gave them their Title, was an Invention of that Prince, to avoid Disputes about the upper and lower End; and to take away all Emulation as to Place.

*Legy* assures us, he has seen the *Table at Winchester*; At least, says he, if we may believe the Keepers thereof, who fill shew it with a deal of Solemnity. He adds, that the Names of a great Number of Knights wrote around it, seem to confirm the Truth of the Tradition.

*Lorrey*, and several other Authors, make no Scruple to relate this *Table*, as Matter of History: but that 'tis *Table* is certain; *F. Papebroch* having shewn, that there was no such Thing as an Order of Knights before the Vth Century.

*Cambden* observes, that the *Table at Winchester* is of a Structure much more modern than the Vth Century. 'Tis added, that *Arthur* himself is no more than a fabulous Prince. In effect, the *Round Table* does not appear to have been any military Order, but rather a kind of Just, or military Exercise, between two Persons, arm'd with Lances. Several Authors say, that *Arthur*, Duke of *Brittany*, renew'd it. See *Matthew Paris*, the *Abbot Jostitiani*, and *F. Helyer*.

*Patius Jevius* says, 'twas under the Empire of *Frederic Barbarossa*, that the Knights of the *Round Table* first began to be talk'd of: Others attribute their Origin to the Factions of the *Guelphs* and *Gibellins*. *K. Edward* built a House call'd the *Round Table*, the Court whereof was 200 Foot in Diameter.

*TABLE*, in *Architecture*, a smooth simple Member, or Ornament, of various Forms; but most usually in that of a long Square.

A *Projecting Table*, is such a one as stands out from the Naked of the Wall, Pedestal, or other Matter it adorns. --- *Raised Table*, is that which is hollow'd in the Dic of a Pedestal, or elsewhere, and which is usually encompass'd with a Moulding. --- *Razed Table*, an Embossment in a Frontispiece, for the putting an Inscription or other Ornament in Sculpture. This is what *M. Perrault* understand by *Abaux* in *Vitruius*. --- *Crown'd Table*, that cover'd with a Cornice, and wherein is cut a Basso Relievo, or a Piece of black Marble inscribed with an Inscription. --- *Rusticated Table*, that which is pick'd, and whose Surface seems rough, as in *Grotto's*, &c.

*PLAIN TABLE*, a Surveying Instrument. See *PLAIN TABLE*.

*TABLE*, in *Perspective*, is a plain Surface, suppos'd to be transparent, and perpendicular to the Horizon. See *PERSPECTIVE*.

'Tis always imagin'd to be plac'd at a certain Distance between the Eye and Objects, for the Objects to be represented thereon by means of visual Rays passing from every Point thereof, thro' the Table to the Eye.

Whence it is also call'd *Perspective Plane*. See *PLANE*.

*TABLE*, in *Anatomy*. The Cranium is said to be compos'd of two *Tables*, or Lamina, i. e. 'tis double; as if it consisted of two Bones, laid one over another. See *CRANIUM*.

*TABLE* of *Pythagoras*, call'd also *Multiplication TABLE*, is a Square, form'd of an hundred lesser Squares, or Cells, containing the Products of the several Digits, or simple Numbers, multiply'd by each other. See *MULTIPLICATION*.

As 'tis absolutely necessary, tho' who learn Arithmetick have the several Multiplications contain'd in this Table, off by Heart; we have thought fit to subjoin it here; with an Example, to shew the Manner of using it.

*TABLE* of *Pythagoras*, or *Multiplication TABLE*.

1	2	3	4	5	6	7	8	9	10
2	4	6	8	10	12	14	16	18	20
3	6	9	12	15	18	21	24	27	30
4	8	12	16	20	24	28	32	36	40
5	10	15	20	25	30	35	40	45	50
6	12	18	24	30	36	42	48	54	60
7	14	21	28	35	42	49	56	63	70
8	16	24	32	40	48	56	64	72	80
9	18	27	36	45	54	63	72	81	90
10	20	30	40	50	60	70	80	90	100

*Example*: Suppose it were requir'd to know the Product of 6 multiply'd by 8: Look for 6 in the first horizontal Column, beginning with 1; then look for 8 in the first perpendicular Column, beginning likewise with 1; the Square or Cell wherein the perpendicular Column from 6, meets with the horizontal one from 8, contains the Product requir'd, viz. 48.

*Laws of the Twelve TABLES*, were the first Set of *Laws*

of the *Romans*; thus call'd, either by reason the *Romans* then wrote with a Style on thin, wooden *Tables*, cover'd with Wax; or rather, because they were engraven on *Tables* or Plates of Copper, to be expos'd in the most noted Part of the public Forum. See *LAW*.

After the Expulsion of the Kings, as the *Romans* were then without any fix'd, certain System of Law; at least had none ample enough to take in the various Cases that might fall between particular Persons; 'twas resolv'd to adopt the best and wisest Laws of the *Greeks*.

One *Hermadorus* was first appointed to Translate them; and the *Decemviri* afterwards compil'd and reduced them into Ten *Tables*. After a world of Care and Application, they were at length enact'd and confirm'd by the Senate, and an Assembly of the People, in the Year of *Rome* 303.

The following Year, they found some Things wanting therein, which they supplied from the Laws of the former Kings of *Rome*, and from certain Customs, which long Use had authoriz'd; these being engraven on Two other *Tables*, made the *Laws of the Twelve Tables*, so famous in the *Roman Jurisprudence*; the Source and Foundation of the Civil or *Roman Law*. See *CIVIL LAW*.

The Laws of the Twelve *Tables*, were also call'd *Decemviral Laws*, from the Officers entrusted with the Composing them. See *DECEMVIR*.

'Tis great Pity, this System of Law should have perished thro' the Injuries of Time: We have, now, nothing of it, but a few Fragments dispersed in divers Authors. *J. Godefroid* has collected them together, and we have them in *Rafinus* and some other Authors. The *Latin* is very old and barbarous, and remarkably obscure.

*New TABLES, Table Nove*, an Edict occasionally publish'd in the *Roman Commonwealth*, for the abolishing all Kinds of Debts, and annulling all Obligations.

It was thus call'd, in regard all antecedent Acts being destroy'd, there were nothing but new ones to take Place.

*TABLE*, among *Jewellers*. A *Table Diamond*, or other precious Stone, is that whose upper Surface is quite flat; and only the Sides cut in Angles: In which Sense, a *Diamond cut Table-wise* is us'd in opposition to a *Diamond cut Facetwise*. See *DIAMOND*.

*TABLE* of *Gloss*. See *CASE* of *Gloss*.

*TABLE* is also an Index or Repertory, put at the Beginning or End of a Book, to direct the Reader to any Passages he may have occasion for. See *INDEX*.

'Tis thus say, *Table of Matters*: *Table of Authors quoted*; *Table of Chapters*, &c. *Tables*, of themselves, sometimes, make large Volumes; as that of *Dnao* on the Civil and Canon Laws. *Tables of the Bible*, are call'd *Concordances*. See *CONCORDANCE*.

*TABLE* Rems. See *BORD* Lends.

*TABLE* of *Houses*, among *Astrologers*, are certain *Tables* ready drawn up for the Assistance of Practitioners in that Art, for the erecting or drawing of Figures or Schemes.

*TABLES*, in *Mathematicks*, are certain Systems of Numbers, calculated to be ready at Hand for the expediting *Astronomical*, *Geometrical*, &c. Operations.

*Astronomical TABLES*, are Computations of the Motions, Places and other Phenomena of the Planets, both Primary and Secondary. See *PLANET*, *SATELLITE* and *MOON*.

The oldest *Astronomical Tables*, are the *Ptolemaic*, found in *Ptolemy's Almagest*; but these no longer agree with the Heavens. See *ALMAGEST*.

In 1522, *Alphonfus XI*, King of *Castile*, undertook the Correcting them, chiefly by the Assistance of *Juaq Heron*, a Jew; and spent 400000 Crowns therein. Thus arose the *Alphonfus Tables*, to which that Prince himself prefix'd a Preface.

But the Deficiency of these was soon perceiv'd by *Purbachius* and *Regiomontanus*; upon which *Regiomontanus*, and after him *Waltherus* and *Wernerus*, applied themselves to celestial Observation, for the further amending them; but Death prevented any Progress therein.

*Copernicus*, in his Books of the Celestial Revolutions, instead of the *Alphonfus Tables*, gives others of his own Calculation from the laxer, and partly from his own, Observations.

From *Copernicus's* Observations, and Theories, *Eraf. Reinholdus* afterwards compil'd the *Prutenic Tables*, which have been printed several Times, and in several Places.

*Tycho de Brahe*, even in his Youth, became sensible of the Deficiency of the *Prutenic Tables*; which was what determin'd him to apply himself with so much Vigour to Celestial Observation. Yet all he did thereby, was to adjust the Motions of the Sun and Moon; though *Longomontanus*, from the same, to the Theories of the several Planets publish'd in his *Astronomia Danica*, added *Tables* of their Motions; now call'd the *Danish Tables*; and *Kepler*, likewise, from the same, in 1627, publish'd the *Rudolphine Tables*, which are now much esteem'd.

These were afterwards, Anno 1650, turned into another Form, by Maria Cunita, whose *Astronomical Tables*, comprehending the Effect of Kepler's Physical Hypothesis, are exceedingly easy, and satisfy all the Phenomena, without any Trouble of Calculation, or any Mention of Logarithm; so that the *Rudolphin Calculus* is here greatly improved.

Mercator made a like Attempt in his *Astronomical Institution*, publish'd in 1676; and the like did J. Bap. Morini, whose *Abridgment of the Rudolphin Tables* was prefix'd to a Latin Version of *Street's Astronomia Carolina*, publish'd in 1705.

Lambertius, indeed, endeavour'd to discredit the *Rudolphin Tables*, and fram'd *perpetual Tables*, as he calls them, of the heavenly Motions; but his Attempt was never much regarded by the Astronomers; and our Country-man Horrox, gave an abundant Check to his Arrogance, in his Defence of the *Keplerian Astronomy*.

Nor was the Authority of the *Rudolphin Tables* impaired by the *Philolaic Tables of Bullialdus*, the *Brianconic Tables of Vincent Wing*, calculated on *Bullialdus's* Hypothesis; or the *Brianconic Tables of Newton*; or the *French ones of the Count de Pogon*, or the *Caroline Tables of Street*, all calculated on *Dr. Ward's* Hypothesis; or the *Neoulmagistic Tables of Riccioli*.

Among these, however, the *Philolaic and Caroline Tables* are esteem'd the best; inasmuch that Mr. Whiston, by the Advice of Mr. Flamsteed (a Person of undoubted Authority in such Cases) thought fit to subjoin the *Caroline Tables* to his *Astronomical Lectures*.

The latest *Tables*, are the *Lutovician*, publish'd in 1702, by M. de la Hire, wholly from his own Observations, and without the Assistance of any Hypothesis; which before the Invention of the Micrometer, Telescope, and the Pendulum Clock, was held impossible.

Another Set of *Tables*, the *Astronomical World* is in daily Expectation of from *Dr. Halley*, Astronomer Royal, &c. There needeth no prepossession of the Public in their Favour: The Author's Name, and the present State of Astronomy, will leave no Doubt on any Body but that they will have the last Degree of Justice and Precision; and such as Posterity itself shall scarce be able to amend. They have been in the Press several Years, and what it is regards their Publication, is not known, unless it be the rendering them more ample.

For TABLES of the *fixed Stars*; see CATALOGUE.

TABLES of *Sines, Tangents, Secours*, &c. used in Trigonometrical Operations, are usually call'd *Canon*. See CANON. See also SINE, TANGENT, &c.

TABLES of *Logarithms, Rhumbs*, &c. used in Geometry, Navigation, &c. See LOGARITHM, RHUMB, SAILING, &c.

*Loxodromick TABLES*, *Tables of Travels*, used in Navigation for the easy and ready Solution of Problems, and Cases therein. See TRAVERSE.

TABLE, in Heraldry. Coats, or Escutcheons, containing nothing but the mere Colour of the Field, and not charged with any Bearing, Figure, Moveable, &c. are call'd *Tables d'Armes*: *Tables of Expectation*, or *Tabule rose*.

TABLET, in Pharmacy. See TABLET.

TABLEING of *Fines*, is the making a Table for every County, where his Majesty's Writs run; containing the Contents of every Fine paid'd each Term. See FINE.

'Tis to be done by the Chirographer of the Fines of the Common Pleas, who every Day of the next Term, after engrossing any such Fine, fixes each of the said *Tablets* in some open Place of the said Court, during its Sitting; and likewise delivers to the Sheriff of each County, a Content of the said *Tables*, made for that respective County, the Term before the Assizes, to be affix'd in some Place in the open Court, while the Justices sit, &c.

TABOR, *Taborin*, a small Drum. See DRUM.

Privilege of the *Tabourets*, in France, is a Privilege some great Ladies enjoy, to sit or have a Stool in the Queen's Presence.

TACAMACHA or TACAMAHACA, a kind of resinous Gum, distilling from the Trunk of a very large Tree, growing in *New Spain*; but, in greatest Abundance, in the Island of *Madagascar*. See GUM.

'Tis not unlike our Poplar Tree, only bigger and taller, its Leaves small and green, its Fruit red, of the Size of our Walnuts, exceedingly Resinous, and containing a Stone like our Peaches.

The Wood of the Tree makes good Timber for Ships, and the Gum it yields, serves for their Caulking; though its chief Use is in Medicine.

There are three Kinds of *Tacamacha*; the *Sublime*, call'd also *Tacamacha* in the Pod; *Tacamacha* in the Mats; and *Tacamacha* in Tears.

The First, is the natural Resin, as it falls of itself, without any Incision made in the Tree: The Good is dry, reddish, transparent, of a bitter Taste and a strong Smell, resembling that of Lavender. The Handers gather it in little Gourd cut in two, and cover'd with a Palm Leaf.

The *Tacamachus* in Tears, and in the Mats, are those which flow from the Tree through Incisions: They must be chosen dry and clear, and their Smell resembling that of the first Kind.

Gum *Tacamacha* is found good for digesting and resolving of Tumors, and assuaging Pains. Burnt upon Coals, 'tis reckon'd good for Hystric Fits in Women, and likewise applied to the Belly in form of a Plaster. Some apply it to the Temples in the same Manner, and to the Nape of the Neck for Pains in the Head, Defluxions of Rheum upon the Throat, and Inflammations of the Eyes, as also in the Tooth-ach. It is of so subtle and penetrating a Nature, that it is greatly used in external Applications, to suppurate and dissipate Tumours; and is accounted effectual, even in those which are Scrophulous.

It is likewise used externally in Arthritical Pains, with Success; in effect, the *Indians* use it for all Kinds of Pains. *Schroder* affirms, That he has seen intolerable Pains in the Leg removed by it.

TACHYGRAPHY, or TACHYGRAPHY, the Art of fast or short writing.

There have been various Kinds of *Tachygraphy* invented: Among the *Romans*, there were certain Notes used, each whereof signified a Word. See NOTE.

The *Rabbins* have a kind of *Tachygraphy* form'd by Abbreviations, which make a kind of Technical Words; wherein each Consonant stands for a whole Word, as *רמב"ם Rambem*, which expresses *Rabbi Moses, Son of Maimon*; *רמ"ן Rashi*, *רא"ב Rashi*, *שבתאי*, *יוראי*. See ABBREVIATION.

In France, &c. the only *Tachygraphy* used is the retrenching of Letters, or even whole Syllables of Words; as in *sem for secunsum, aut for autem, d'us for sed, o for non, Participium for Participium*, &c.

The first Printers imitated these Abbreviations: At present they are almost laid aside, except among Scribes, &c.

In England we have great Variety of Methods of *Tachygraphy*, or Short-hand; more by far, and those too, much better, easier, speedier, and more commodious, than are known in any other Part of the World. Witness *Wilkins's, Swetson's, Wallis's, Webster's* and *Webster's* Short-hands.

The Word is form'd from the Greek, *ταχης*, swift, and *γραφω*, writing.

TACK about, in Navigation, a Term used at Sea when a Ship's Head is brought about, so as to lie the contrary Way.

To effect this, they first make her *stay*; which done, she is laid to be paid. They then let *rise* and *dale*, i. e. let the Le: Tack rise, and hale sit the Sheets, and so trim all the Sails by a Wind as they were before.

TACKLE, or TACKLING, in Navigation, includes all the Ropes or Cordage of a Ship, with their Furniture, whereby the Sails are manag'd. See CORDAGE and ROPE.

TACKLES in a Ship, are small Ropes running in three Parts, having at one End a Pendant, with a Block fasten'd to them, or else a Lannier; and at the other End, a Block and an Hook to hang Goods upon, that are to be heav'd into the Ship, or out of it.

There are several Kinds of these *Tackles*, as the *Boat Tackles*, serving to hoist the Boat, &c. in and out: The *Tackles* belonging to the Masts, serving as *Shrouds* to keep the Masts from swaying: The *Gunner's Tackles*, with which the Ordnance are hoisted in and out: For the *Winding Tackle*, and the *Burnett*. See BURNETT.

TACTICKS, the Art of disposing Forces in Form of Battle, and of performing the military Motions and Evolutions. See EVOLUTION.

The *Greeks* were very skillful in this Part of the military Art, having publick Professors of it, call'd *Tactici*, who taught and instructed their Youth therein. *Aelian* hath a particular Book on this Subject; and there is a great deal of it in *Arrian*, in his History of *Alex. M.* and in *Nicarnus*, and *Leo Imperator*.

*Vossius de Scient. Mathematic.* mentions 24 ancient Authors on the Subject of *Tacticks*.

The Word is form'd from the Greek *τακτι*, Order.

TACTICKS is also used for the Art of inventing and making the Machines of the Ancients for throwing of Darts, Arrows, Stones, Fire-balls, &c. by means of Slings, Bows, and Counter-poises. See MACHINE.

*Vegrius, Hero*, &c. have wrote on these Machines; and we have them describ'd and design'd by *Lepsius*.

TACTILE, or TANGIBLE, in the Schools, something that may fall under the Sense of Feeling. See FEELING.

Tho' *A*'oms be corporeal, yet are they not either *tactile* or visible, by reason of their Smallness. See CORPUSCLE.

The principal *tactile* Qualities are Heat, Cold, Dryness, Hardness, and Humidity. See each under its proper Article, HEAT, COLD, HARDNESS.

TACTION in the Schools } See { FEELING.  
TACTION in Geometry } See { TOUCHING.

**TÆNIA**, or **TENIA**, in Architecture (from the *Greek* *ταenia*, a Bannulet, or little Band, call'd by the *Latins* *Vitta*, *Fascia*, *Zona*, and *Corona*.) a Member of the Doric Architecture, resembling a square Pillar, or Ruler, and serving in lieu of a Cymatium. See **DORIC** and **CYMATIUM**.

*Barbaco* call's it *Liflet*; but *Palladio* uses the old Name *Tænia*. See **LIVLET**.

*Philander* says, there are two Kinds, *viz.* the above-mention'd, which he calls the *lower*; and another, which serves as a Capital to the Triglyphs. *Leon Baptift. Alberti* calls the *Tænia*, *Regule* and *Fasciæ*; and *Daviler*, *Bandelettes*. See each under its proper Article.

**TAFFAREL**, in a Ship, the uppermoſt Part, Frame, or Rail, abait, near the Poop. See **SHIP**.

**TAFFETY**, or **TAFETAS**, in Commerce, a kind of fine, ſmooth Silk Stuff; having, uſually, a remarkable Luſtre. See **SILK** and **STUFF**.

There are *Taffeties* of all Colours; and ſtriped with all Kinds of Stuff, as Gold, Silver, Silk, &c. others chequer'd, others flower'd, others in the *Chineſe* Point, others the *Hungarian*; with various others, to which the Mode, or the Caprice of the Workmen give ſuch whimsical Names, that it would be as difficult, as 'tis uſeleſs, to rehearſe them; beſides that, they ſeldom hold beyond the Year wherein they firſt roſe.

The old Names of *Taffeties*, and which ſtill ſubſiſt, are *Taffeties of Lyons*, of *Spain*, of *England*, of *Florence*, of *Angoulem*, &c.

The chief Conſumption of *Taffeties* is in Summer Drefſes for Women, in Linings, Scarves, Coſts, Window-Curtains, &c.

There are three Things which contribute chiefly to the Perfection of *Taffeties*, *viz.* the Silk, the Water, and the Fire.

The Silk is not only to be of the fineſt Kind, but it muſt be work'd a long time, and very much, e'er it be uſed. The Waters, beſide that it is only to be given very lightly, ſeems only intended to give that fine Luſtre, by a peculiar Property not found in all Waters. Laſtly, the Fire, which is poſſid' under it to dry the Water, has its particular Manner of Application, whereon the Perfection of the Stuff depends very much.

*Ottavio Moy*, of *Lyons*, is held the firſt Author of the Manufacture of gloſſy *Taffeties*; and Tradition tells us the Occaſion of it. *Ottavio*, it ſeems, going backwards in the World, and not able to retrieve himſelf by the Manufacture of *Taffeties*, ſuch as were then made, was one Day muſing on his Miſfortunes, and, in muſing, chanced to chew a few Hairs of Silk which he had in his Mouth. His Reverie being over the Silk he ſpit out, ſeem'd to ſhine, and on that Account engag'd his Attention. He was ſoon led to reflect on the Reaſon; and, after a good deal of Thought, concluded, that the Luſtre of that Silk muſt come, 1<sup>o</sup>. From his having preſid' it between his Teeth. 2<sup>o</sup>. From his having wet it with his Saliva, which had ſomething glutinous in it: And 3<sup>o</sup>. From its having been heated by the natural Warmth of his Mouth. All this he executed upon the next *Taffeties* he made; and immediately acquir'd immenſe Riches to himſelf; and to the City of *Lyons* the Reputation it ſtill maintains, of giving the Gloſs to *Taffeties* better than any other City in the World.

'Twill not, we conceive, be leſs uſeful than curious, to give here the Deſcription of the Engine contriv'd by *Ottavio* to give the Gloſs to *Taffety*; to add the Manner of applying it, and the Compoſition of the Water uſed therein.

The Machine is much like a Silk Loom, except that inſtead of Iron-Points, here are uſed a kind of crooked Needles, to prevent the *Taffety* from ſlipping: At the two Extremities, are two Beams; on one of which is roll'd the *Taffety* to take the Gloſs; and on the other, the ſame *Taffety* as Liſt as it has receiv'd it. The firſt Beam is kept firm by a Weight of about 200 Pounds; and the other turn'd by means of a little Lever paſſing thro' Morroifes at each End. The more the *Taffety* is ſtretch'd, the greater Luſtre it takes; Care, however, is to be uſed it be not over-ſtretch'd.

Beſides this Inſtrument for keeping the Stuff ſtretch'd, there is another to give it the Fire: This is a kind of Carriage, in Form of a long Square, and the Breadth of the *Taffeties*. It moves on Trundles, and carries a Charcoal Fire under the *Taffety*, at the Diſtance of about half a Foot.

The two Machines prepar'd, and the *Taffety* mounted, the Luſtre is given it by rubbing it gently with a Peloton, or Handful of Liſts of fine Cloth, as it rolls from one Beam to 'other; the Fire, at the ſame Time, being carry'd underneath it to dry it. As ſoon as the Piece has its Luſtre, 'tis put on new Beams to be ſtretch'd, a Day or two; and the other this laſt Preparation is repeated, the more it increaſes the Luſtre.

For black *Taffeties*, the Luſtre is given with double Beer, and Orange or Lemon Juice; but this laſt is the leaſt proper,

as being apt to whiten. The Proportion of the two Liqueurs, is a Gallon of Orange Juice to a Pint of Beer, to be boil'd together to the Conſiſtence of a Broth. For colour'd *Taffeties*, they uſe *Geurd-Water*, diſtill'd in an Alembic.

**TAFTOLOGY**. See **TAVTOLOGY**.

**TAIL**, that Part of an Animal which terminates its Body behind.

The *Tail* is different both in Figure and Uſe in the various Species: In Land Animals, it ſerves to rid them of Flies, and is uſually cover'd with Hair, and ſtrengthen'd with Bones: In Fiſhes it is Cartilaginous, and ſerves them as a Helm to ſteer their Courſe withal in ſwimming. See **SWIMMING**.

In Birds it is cover'd with Feathers, and greatly affiſts in all Affairs, and Defences in the Air; as alſo to render their Flight ſteady, by keeping the Body upright in that ſubtile and yielding Medium, by its readily turning and anſwering to every Vacillation of the Body. See **FLYING**.

In Anatomy, **TAIL** is uſed for that Tendon of a Muſcle, which is fix'd to the moveable Part: In Oppoſition to which, the Tendon fix'd to the immovable Part is call'd the *Head*. See **MUSCLE**.

Among Botaniffs, the *Pedicel* is ſometimes call'd the *Tail*. The Way to preſerve *Fruits* in Winter, is to ſeal up their *Tails* or *Pedicels* with Wax. See **PEDICEL**.

*Dove-TAIL*, or *Swallow-TAIL*, among Carpenters, is one of the ſtrongeſt Manners of Joining; wherein, a Piece of Wood that grows larger towards the End, is inſerted into another Piece; ſo that it cannot ſtir out, by Reaſon the Hole in the one, is narrower than the lower End of the other. As in the Figure of a *Dove's Tail*. See **QUEUE d'ARCADE**, and **SWALLOW-TAIL**.

*Peacock's-TAIL*, a Term apply'd to all circular Compartments, which go enlarging from the Centre to the Circumference; imitating, in ſome meaſure, the Feathers of a Peacock's *Tail*.

*Dragon's-TAIL*, *Cauda Draconis*, in Astronomy, the deſcending Node of a Planet; thus characterized  $\psi$ . See **NODE**.

The Astrologers take Care to put it in all their Horoscopes. See **HOROSCOPE**.

*Horſe's-TAIL*, among the *Tartars* and *Chineſe*, is the Enſign or Flag under which they make War. See **ENSIGN**.

Among the *Turks*, it is the Standard bore before the Grand Vizier, the Bathaws, and Sangiacs; in order to which, it is fix'd on the End of a half Pike, with a Gold Button, and is call'd *Tong*.

There are Viziers of one, others of two, others of three *Horſe's Tails*. The *Horſe's Tail* plac'd on a General's Tent, is a Signal of Battle.

For the Original of this Cuſtom, it is related, that in a certain Battle, the Standard being taken by the Enemy, the General of the Army, or, as others ſay, a private Horſeman, cut off the *Tail* of his Horſe, and ſaſtening it to the End of a half Pike, encourag'd the Troops, and gain'd the Victory. In Memory of which noble Action, the Grand Signor appointed that Standard to be bore for the future, as a Symbol of Honour. *Riann*.

*TAIL of a Comet*. When a Comet darts his Rays forwards, or towards that Part of the Heavens, whither his proper Motion ſeems to be carrying him; thoſe Rays are call'd its *Beards*: On the contrary, when its Rays are ſhot behind, towards that Part from whence it appears to move, the Rays are call'd the *Tail of the Comet*.

The various Phenomena whereof, with their Physical Cauſes, ſee under the Article **COMET**.

*TAIL of the Frenches*, in the military Art, is the firſt Work which the Beſiegers make at the Opening of the Trenches, as the Head of the Attack is carry'd on toward the Place. See **TRENCH**.

**TAIL**, or **TAILS**, *Sellura*, in Common Law, ſignifies two ſeveral Things; both grounded upon one Reaſon.

*Fiſh*, it is uſed for that Kind of Fee, which is oppoſite to the Fee-fimple; ſuch Fee being fee mixed, or parted, as it were, that it is not in the Owners free Power to diſpoſe of; but is by the firſt Giver cut, *taille*, and divided from all others, and tied to the iſſue of the Donor. See **SEE**.

This Limitation of *Tails* is either General or Special.

*Tails General*, is that whereby Lands and Tenements are limited to a Man, and to the Heirs of his Body begotten: It is call'd *General*, becauſe how many Wives ſeever the Tenant holding by this Title ſhall have, one after another, in lawful Marriage, his Iſſue by them all have a Poſſibility to inherit one after another.

*Tails Special*, is when Lands or Tenements are limited to a Man and his Wife, and the Heirs of their two Bodies begotten: It is call'd *Special*, becauſe if the Man bury his Wife before Iſſue, and take another; the Iſſue by his ſecond Wife cannot inherit the Land, &c.

Alſo, if the Land be given to a Man and his Wife, and their Son R, for ever; this is *Tails Special*.

*Taille*, after Possibility of Issue, *extinct*; is where Land being given to a Man, and his Wife, and the Heirs of their two Bodies; the one over-lives the other, without Issue between them begotten; upon which the Survivor shall hold the Land for Term of his own Life in quality of Tenant in *Taille*, after the Possibility of Issue, *extinct*; and notwithstanding that he does Waite, he shall never be impeached of it: And when he dies, he in the Reversion shall not have a Writ of Entry, in *Consonabili Casu*, but may enter, and his Entry is lawful.

*Secondly, Tail*, or *Taille* is used for what we vulgarly call a *Talley*, *one Taille de Bois*, for a Cloven Piece of Wood to nick up an Account on. See TALLY.

TALLOIR, in Architecture, a Term some of our Writers, after the French, use for *Abacus*. See ABACUS.

TAINT, in Law, signifies, either, substantively, a Conviction; or, adjectively, a Person convicted of Felony, Treason, &c. See ATTAINT.

TAKE and LEAVE, in the Sea Language. The Sailors say, a Ship can take and leave upon her when she will; when she fails so well that she can come up with another, or out-fail her at Pleasure.

TALBOT, a Sort of Dog, frequent in Coast Armour, noted for its quick Scent, finding out the Tracks, Lodgings, and Forms of Beasts, and pursuing them with open Mouth, and continual Cry, with such Eagerness, that if not taken off by the Huntsmen, they are often spoiled.

TALC, or TALK, in Natural History, a thin, squamous, siffle Stone, easily separable into thin transparent Scales, or Leaves. See STONE.

Anciently, *Talc* was only found in Spain; but since, Mines thereof have been found in *Cyprus*, *Caspadoea*, and since that, in *Arabia* and *Africa*; at present, they dig it in the *Alps* and *Apennines*, several Mountains in *Germany*, and even in *England*, particularly in *Northamptonshire*.

We usually distinguish two Kinds of *Talc*, viz. *White Talc of Venice*, and *Red of Muscovy*.

That from *Venice* is the most esteem'd: 'Tis brought in large shining greenish Stones; but becomes white, and exceedingly transparent when wrought. It appears lustrous to the Touch, tho' there is scarce any Stone dryer; yet in Spight of its Dryness, it pulverizes with Difficulty; nor is it easily calcined.

Its chief Use is as a Screen or Cover for Paintings in Miniature and Craions; to which Purpose thin Slices thereof are used: 'Tis sometimes also used for a Focus; in order to which, by Reason of the Difficulty of pulverizing it, &c. they content themselves to rasp it with the Skin of a Sea-Dog, and to pass the Rasping thro' a Sieve.

*Pliny*, in his Natural History, lib. 26. cap. 22. observes, that the *Romans* built Temples, and Places therewith, and paved the Coliseum of the same.

The *Talc* brought from *Muscovy* is reddish when in the Stone; but it seldom comes to us otherwise than in Leaves, which are very hard, smooth, polish'd, and exceedingly transparent: 'Tis found in Quarries in *Muscovy* and *Perfia*, and is used to make Lanthorns, to cover Paintings, &c.

The Word is *German*, where it signifies the same Thing.

Some Chymists, and other Empiricks, have held, that *Talc* might be used for many more important Purposes; and pretend to draw from it that precious Oil, so much boasted of by the Ancients, particularly the *Arabs*, call'd *Oil of Talc*, which is suppos'd a wonderful Cosmectick, and Preserver of the Complexion: But the Truth is, the Word *Talc*, among them, signify'd no more than an equal Disposition of the Humours, which kept the Body in good Temperament, and perfect Health. Now, as nothing contributes more than Health to the preserving of Beauty, this has given Occasion to the Chymists to search this *Oil of Talc*, which is to maintain the Body in this Disposition, and to engage the Ladies to be at the Expence of the Search.

Some have also pretended, that yellow or ruddy *Talc* contain'd the Seeds of Gold; and that a Menstruum might be drawn from it, to transmute Metals into Gold and Silver, to fix Mercury, &c.; but this is mere Charytancy.

TALENT, *Talentum*, a Weight and a Coin, both very famous among the Ancients; but very different in different Countries. See COIN and WEIGHT.

The Value of the *Talent* is very hard to assign in *English* Money; as being used among all the People throughout the East; and its Value, and the Manner of Computation, different among each. A Difficulty abundantly shew'd by *Budens*, in his learned Treatise de *Affe*.

There were various Kinds of *Talents*, both with regard to Weight, and to Species; the Value of these last still increasing, as the Metal whereof it consist'd was higher: tho' the *Talent* *Wegibus* did all contain the same Number of Pounds and Drachms.

For as the *French* have a Pound *Paris*, and a Pound *Tourain*, each whereof contains alike 20 Sols; yet these compar'd together, the *Paris* Sol contains 25 Sols of the *Tourain*; the *Paris* Sol exceeding that of *Tours* by

one quarter; so all *Talent* Weights were equally 60 *Minae*, and the *Mina* 100 *Drachmae*; but the *Drachma* of one Place exceeding that of another, there hence arose a Difference in the *Talents*. See *MINA*.

The *Attic* *Drachma*, for Instance, was 6 *Attic* *Oboli*, and that of *Aegna* 10 of the same *Oboli*; whence the *Aeginus* *Talent*, computed on the Foot of the *Attic* Weight, was 100 *Minae*; whereas reckon'd on the Foot of its own *Drachma*, it was no more than 60. See *DRACHMA*.

The common *Attic* *Talent* then (the *Talent* Weight we mean) contain'd 60 *Attic* *Minae*, or 62 and half *Attic* Pounds, or 6000 *Attic* *Drachmae*; equal, according to *Dr. Astruc's* Reduction, to 56 Pounds 21 Ounces *English* Troy Weight. Some Authors, as *Priscian*, mention other *Attic* *Talents* of 100 *Minae*; but this is to be understood of ancient *Minae*, as they stood before *Solon*; each only worth 75 *Drachmae*.

The *Syrian* *Talents* contain'd 15 *Attic* *Minae*; That of *Alexandria* 96 *Attic* *Minae*, or 91 Lib. Troy. The *Babylonic*, *Persian* and *Antiochic* *Talents* were the same with the *Aegyptian*.

Among the *Romans*, there were two Kinds of *Talents*, the *little* and the *great* *Talent*: The *little* was the common *Talent*; and whenever they say, simply, *Talent*, they are to be understood of this: The *little* *Talent* was 60 *Minae* or *Roman* Pounds, the *Mina* or Pound estimat'd at 100 *Drachmae* or *Denarii*: It was also estimat'd at 24 great *Sesterces*, which amounted to 60 *Pistates*.

The *great* *Talent* exceeded the less by one third Part. *Budens* computes, that the *little* *Talent* of Silver was worth 75 Pounds Sterling; and the greater 99 l. 6 s. 8 d. Sterling. The greater *Talent* of Silver he makes worth 75 Pounds Sterling; the greater of Gold worth 1215 Lib. Sterling.

*Talent*, as a Species, or Money, among the Hebrews, was a Gold Coin, the same with the *Shekel* of Gold, call'd also *Stater*, and weigh'd only 4 *Drachms*. See *SHEKEL*.

In the Scripture it is also call'd *Solidus*, *Shilling*. The Hebrews reckon'd by these *Talents* as we do by Pounds, &c. Thus a Million of Gold, or Million of *Talents* of Gold, among them, was a Million of *Shekels*, or *Nummi*; the *Nummus* of Gold being the same Weight with the *Shekel*, viz. 4 *Drachms*.

TALES, in Law, a Supply or Addition of Men impannell'd on a Jury of Inquest, and not appearing, or at their Appearance, challeng'd by either Party as not indifferent. See *JURY*.

In such Case, the Judge, upon Motion, grants a Supply to be made by the Sheriff, of one, or more *Tales*, such there present, equal in Reputation to those impannell'd.

This Act of supplying is call'd a *Tales de Circumstantibus*.

He that has had one such *Tales*, either upon Default, or Challenge, may not have another containing so many as the former: For the first *Tales* must be less than the principal Panel, except in a Cause of Appeal; and so every *Tales* less than other, till the Number be made up of such as are unexceptionable.

These, call'd *Tales*, or *Talesmen*, and corruptly *Tallymen*, are, on some Occasions, call'd *Mesiores*.

TALIO, *Lex Talionis*, or *Pana Talionis*, a Retribution, or Punishment, whereby an Evil is return'd perfectly like that committed against us, by another; which is what we usually express by the Words *Eye for Eye*, *Tooth for Tooth*.

The *Pana Talionis* was enjoy'd by the Law of *Moses*, just as 'tis in the Gospel: It was esteem'd a natural Piece of Justice; and yet the *Romans* set it aside; inasmuch as such a Parity or Equality of Punishment could not always be observed. For this Reason, the Praetor allowed such as had suffer'd any Injury, to make an Estimate thereof in Money, that Justice might be done him that way; only reserving to himself the Power of moderating the same.

And this was what was constantly practis'd, and thus the *Pana Talionis*, became quite disus'd.

The *Lex Talionis*, is never observed in the Civil Justice, but with regard to false Witnesses.

TALISMANS, certain Figures engraven, or cut, under several superstitious Observations of the Characters and Dispositions of the Heavens; to which some Astrologers, heremical Philosophers, and other Adepts, attribute marvellous Virtues, particularly that of calling down Celestial Influences.

The Author of a Book, intitled, *Talismans Justifices*, says, a *Talisman* is the Seal, Figure, Character or Image of a heavenly Sign, Constellation or Planet, engraven on a Sympathetic Stone, or on a Metal corresponding to the Star, &c. in order to receive its Influences. The *Talismans* of the *Semotrichians*, so famous of old, were Pieces of Iron, form'd into certain Images, and set in Rings, &c.

They were held Preservatives against all Kinds of Evils; there were other *Talismans* taken from Vegetables, and others from Minerals. In the general, we use to distinguish three

Kinds of *Talisman*. The *Astronomical*, which are known by the Signs, or Constellations of the Heavens engraven thereon, with other Figures, and some unintelligible Characters. The *Magical*, which bear very extraordinary Figures, with superstitious Words and Names of Angels unheard of. And the *Mixt*, which consist of Signs and barbarous Words, but have no superstitious ones, or Names of Angels.

Some Rabbits have maintained, that the Brazen Serpent, rais'd by *Moses* in the *Wilderness*, for the Destruction of the Serpents that annoy'd the *Israelites*, was a *Talisman*.

All the miscellaneous Things wrought by *Apollonius Tyaneus*, are attributed to the Virtue and Influence of *Talismans*: That Wizard is even said to have been the Inventor of *Talismans*.

Some Authors take several *Runic* Medals, at least Medals whose Inscriptions are in *Runic* Characters, for *Talismans*; it being notorious, that the Northern Nations, in their heathen State, were much devoted thereto.

M. Keder, however, has shewn, that the Medals here spoke of are quite othergwise Things than *Talismans*. See *RUNIC*.

The Word is pure *Arabic*; though *Mevage* thinks it may come from the *Greek* *ταλαμα*, Conservation: *Borel* says, 'tis *Persian*, and signifies, literally an engraven Constellation. *Du Cange* derives it a *Talamas hieris*, which are mysterious Characters, or Cyphers used by Sorcerers; thus call'd from *Talamas*, a Fantom, or Illusion.

TALKING. See SPEAKING, SPEECH and VOICE.

TALLAGE, a certain Rate, according to which, Barons and Knights were anciently tax'd by the King towards the Expenses of the State; and inferior Tenants by their Lords, on certain Occasions. See *TAX*.

This kind of *Tallage* of the customary Tenants, was sometimes fix'd, and certain; and sometimes at the Pleasure of the Lord; and was also sometimes compounded for. See *SESSIDY*.

*Tallages* were anciently call'd *Cottings*; which Name is still retain'd in *Ireland*, tho' in a different Signification.

*Tallage*, says *Sir Ed. Coke*, is a general Name including all Taxes. See *TAX*.

TALLY, or TAIL, (from the *French*, *tailleur*, to cut,) a Piece of Wood, whereon retail Traders use to score or mark, by Notches or Incisions, the several Quantities of Goods they deliver out on Credit; to save the Trouble of Writing down so many little Articles in Books. See *TAIL*.

Each Score consists of two Pieces of Wood, or rather of a single Piece cleit length-wise, the Parts whereof falling in with one another, the Things deliver'd are stored on both at the same time; the Seller keeping one, and the Buyer the other. *Tallies* are taken as Evidences in Courts of Justice, as much as Books.

The ancient Way of keeping all Accounts was by *Tallies*; the Debtor still keeping one Part, and the Creditor the other.

There are three Kinds of *Tallies*, mention'd in our Statutes, and long used in the *Exchequer*.

The first, *TALLIES of Loans*; one Part whereof is kept in the *Exchequer*, and the other Part given to particular Persons, in lieu of an Obligation for the Monies they have lent to the Government on Acts of Parliament. See *LOAN*.

This last Part is call'd the *Stock*, and the former the *Counter-stock*, or *Counter-tail*.

The *Tallies* are number'd, bear the Person's Name, and the Sum lent: Thus we say, The *Tallies*, N<sup>o</sup> have been paid, discharge'd; *Tallies* are risen, fallen 4, 5, &c.

The second are, *TALLIES, or TALLIES of Debts*; which are a kind of Acquittances for Debts paid the King.

*E. gr.* the University of *Cambridge* pays yearly 10 Lib. for such Things as are by Charter granted them in Fee-Farm. He that pays this, receives a *Tail*, or *Tally* by his Discharge, with which, or a Note of it, he repairs to the Clerk of the Pipe; and there for the *Tally* receives a full Discharge on Parchment.

The other are, *TALLIES of Rewards*, or Allowance, made to Sheriffs, for such Matters as (to their Charge) they have perform'd in their Office, or such Money as is by Court cast on them in their Accounts, but which they cannot levy.

TALLOW, a Sort of Fat of Animals, melted down, and clarify'd. See *FAT*.

There are scarce any Animals, but a Sort of *Tallow* may be prepar'd from; but those which yield the most, and whereof the most Use is made, are the Horse, Bullock, Sheep, Hog, Goat, Deer, Bear, and Viper. Some of which *Tallow*, or Fats, are only used in Medicine. See *AXUNOIA*.

Most of the rest are used in the making of Soap; the dressing of Leather; but chiefly in the making of Candles. See *SOAP*, *CURLYING*, &c.

For Candles, the best Composition is half Sheeps *Tallow*, and half Cows or Bullocks *Tallow*, without any Mixture of other kinds of Fat, which only serve to turn the Candles yellow, make them run, and spoil the Clearness of their Light. See *CANDLE*.

TALLOW-tree, in *China*, is a Tree growing in great Plenty in that Country, which produces a Substance like our *Tallow*, and serving for the same Purpose.

'Tis about the Height of a Cherry-Tree; its Leaves in Form of a Heart, of a deep, shining, red Colour, and its Bark very smooth. Its Fruit is inclos'd in a kind of Pod, or Cover, like a Chefnut, and consists of three round white Grains, of the Size and Form of a small Nut, each having its peculiar Capsula, and within, a little Stone.

This Stone is encompass'd with a white Pulp, which has all the Properties of true *Tallow*, both as to Consistence, Colour, and even Smell: And accordingly the *Chinese* make their Candles of it; which would, doubtless, be as good as those in *Europe*, if they knew how to purify their *Vegetable Tallow*, as well as we do our *Animal Tallow*.

All the Preparation they give it, is to mix a little Oil with it, to make it softer, and more pliant. 'Tis true their Candles made of it yield a thicker Smoke, and a dimmer Light, than ours; but those Defects are owing, in great measure, to the Wicks, which are not of Cotton, but only a little Rod, or Switch of dry light Wood, cover'd with the Pith of a Rush, wound round it; which being very porous, serves to filtrate the insensible Parts of the *Tallow*, attracted by the burning Stick, which by this Means is kept alive.

TALMUD, or, rather, THALMUD, a Book, wherein the *Jews* have collected what relates to the Explication of their Law.

The *Talmud*, is the Body of the *Hebrew* Law, and of Explications of the Duties impos'd on that People, either in Scripture, or by Tradition, or by Authority of their Doctors, or by Custom, or even by Superstition; and, to speak more plainly still, the Course of Cases of Consistence, or of moral Theology, wherein the Duties are explain'd, and the Doubts clear'd, not by Reasoning, but generally by Authority, by the Custom of the Nation, and by the Decisions of the most approv'd of ancient Doctors.

This *Talmud* consists of two general Parts; the one call'd the *Mishna*, the other the *Gemara*; which second Part is also frequently call'd absolutely the *Talmud*, the general Name of the whole Work. See *MISHNA* and *GEMARA*.

The *Jews* divide their Law into *Written*, which is that contain'd in the Books of *Moses*; and *Unwritten*, which is that convey'd by Tradition. This latter is, in Effect, no other than a Gloss or Interpretation of the former, given by the ancient Rabbits. See *TRADITION* and *RABBIN*.

The *Talmud*, then, contains the Traditions of the *Jews*, their Polity, their Doctrine, and their Ceremonies; which they observe as religiously as the Law of God itself: They would never put it in Writing till they were compell'd to it by the Destruction of *Jerusalem*, and till they saw themselves dispers'd throughout the World.

They had two famous Schools; the one at *Babylon*, and the other at *Jerusalem*: In these they made two several Collections of those Traditions, the first at *Jerusalem*, the latter at *Babylon*; but both call'd *Talmud*, and both exceedingly reverenc'd, especially the *Babylonian*, tho' full of Extravagances.

It was compiled by the *Jews* of *Mesopotamia*, about 500 Years after *Christ*.

The *Talmud* of *Jerusalem* is the least esteem'd. It was compiled by the *Jews* of that City 300 Years after *Christ*.

The *Babylonian Talmud* consists of two Parts, the one the Text, the other the Comment: The Comment, call'd the *Gemara*, contains the Decisions of the *Jewish* Doctors, and their Expositions of the Text. This we find stuffed with Dreams and Chimeras; a deal of Ignorance, and a world of impertinent Disputations: The Style very coarse. On the contrary, the Text, call'd the *Mishna*, is wrote in a pretty pure Style, and the Reasonings generally much more solid.

The *Jews* pretend it was compos'd by *Rabbi Juda*, surname'd the *Satan*; and that God reveal'd to him the Doctrine and the chief Mysteries thereof. But this is only to be understood of the *Mishna*, not of the *Gemara*, the Compilation whereof was not begun till the VIth Century after the Destruction of the second Temple.

*Rabbi Juda* is said to have compos'd the *Mishna* under the Empire of *Antoninus*, in the II'd Century; but they don't all agree about this Antiquity, some carrying it back much further.

'Tis the *Talmud* of *Babylon* that is usually read, and that is the most consult'd among the *Jews*; so that when they say simply the *Talmud*, they always mean this; never quoting the other without the Addition of *Jerusalem*.

*Rabbi Moses*, Son of *Maimon*, has made an Abridgement of the *Talmud*, which *Scaliger* prefers to the *Talmud* itself; as being pars'd of many of the Fables wherewith the other is full. 'Tis a System of the Law and Customs of the *Jews*, both their Civil and their Canon Law, and the best of their Traditions.

About the Year 1236, a Jew of *Rochel*, well vers'd in the Hebrew, becoming Christian, made a Journey to Pope Gregory IX. and discover'd to him a Number of Errors in the *Talmud*: These the Pope sends, in 39 Articles, to the Archbishops of France, with a Letter, appointing them to seize the Books of the Jews, and to burn all such as should contain those Errors; in Consequence of which Order, above 20 Cart Loads of Hebrew Books were burnt. He wrote to the same Effect to the Kings of England, France, Aragon, Castile, &c.

His Successor, Innocent IV. giving Commission to his Legate *Eudes de Chateauxoux*, to examine the *Talmud*, and other Jewish Books more carefully, and to tolerate such Errors as were not contrary to the Christian Religion; the Legate wrote to the Pope, that to tolerate them was to approve them; and the 15th of May, 1248, he condemn'd them Juridically.

TALON, in Architecture, a kind of Astragal; or Moulding consisting of a square Fillet, crowning a Cymatium; frequently found to terminate Ornaments of Joyners-Work, as those of Doors, &c. See Cymatium.

The *Talon* is a Moulding concave at the Bottom, and convex a-top; having an Effect just opposite to the Doucine. See Doucine.

When the concave Part is a-top, 'tis call'd an *Inverted Talon*. The *Talon* is usually call'd by our English Workmen *Ogee*, or *O. G.*; and by Authors an *upright* or *inverted Cymatium*. See Ogee.

The Word is French, and literally signifies *Heel*.

TALPA, in Medicine and Chirurgery, a Tumour thus call'd, of the Oedematous Kind. See Oedematous.

The *Talpa*, and Nates, chiefly arise about the Head, as the Consequence of some Venereal Disorder. See Nates.

The *Talpa* elevates the Skin from the Pericranium; and generally denote a Pouchness in the subjacent Bone of the Skull.

TALUS, in Anatomy, a Bone, call'd also *Astragalus*. See Astragalus.

In its upper Part, it has a Convex Head, which is articulated with the two Facies of the Leg, by Ginglymus, it being divided by a little Sinus, which receives the small Protuberance in the Middle of the Sinus of the Tibia: Without this Articulation, we must always, in going, have trod on the Heel with our Fore-foot, and our Toes with the Hind-foot. See Tibia.

The fore Part of the *Talus*, which is also convex, is receiv'd into the Sinus of the Os Naviculare. See Naviculare.

Below, towards the hind Part of its under Side, it has a pretty large Sinus, which receives the upper and hind Part of the Os Calcis: And towards the fore Part of the same Side it has a Protuberance, which is receiv'd into the upper and fore Part of the same Bone. Betwixt this Sinus, and this Protuberance, there is a Cavity, which answers to another in the Os Calcis; in which is contain'd an oily and mucous Sort of Substance, for moistening the Ligaments, and facilitating the obscure Motion of these Bones when we go.

TALUS, or TALUT, in Architecture, the sensible Inclination or Slope of a Work; as of the Outside of a Wall, when its Thickness is diminish'd by Degrees, as it rises in Height, to make it the firmer. See WALL.

TALUS, in Fortification: The *Talus* of a *Bastion*, or *Rampart*, is the Slope allow'd to such a Work, whether it be of Earth or Stone, the better to support its Weight. See Rampart.

The *Talus exterior* of a Work, is its Steepness on the Side of the Field, which is always made as little as possible, to prevent the Enemies Scaling; unless the Earth be bad, and then it is absolutely necessary to allow a considerable *Talus* for its Parapet.

The *Talus interior* of a Work, is its Steepness on the Inside towards the Place.

TAMARINS, or TAMARINDS, a kind of Medicinal Fruit, of a tart, agreeable Taste; brought from the East Indies, and call'd by some *Indian Dates*, and by others the *Indian Acacia*.

The Tree which yields it, call'd by the *Indians* *Tamarindis*, and the *Portuguese* *Tamarindos*, is not unlike our Ash, or Walnut Tree; its Leaves resemble those of Female Fern; its Flowers are join'd eight or ten together, like those of the Orange Tree.

Its Fruit is in a Pod, the Length of a Finger, and the Thickness of the Thumb; cover'd at first with a green Rind, which afterwards becomes brown, and contains a blackish Pulp, among which are found Seeds resembling Lupines: 'Tis this Pulp alone that is brought to us, and us'd in Medicines.

The *Tamarinds* must be chosen big, of a Jet Colour, a brisk Taste, nor too dry, and such as have not been laid in the Cellar, nor falsify'd with Molasses of Sugar and Vinegar. They are found laxative, cooling, and good to quench

Thirst. In burning Fevers they are prescrib'd to moisten and cool the Mouth.

TAMBAC, or TAMBAQUA, a Mixture of Gold and Copper, which the People of *Siam* hold more beautiful, and set a greater Value on, than Gold itself.

Some Travellers speak of it as a Metal found in its peculiar Mines; but upon what Authority we don't know. The Abbe de Choisy, in his *Journal of Siam*, doubts whether it may't be the Electrum, Amber, of *Solomon*.

The Embassadors of *Siam* brought several Works in *Tambac* to Paris, in the Reign of Louis XIV; which were not found so beautiful as was expected.

TAMBOUR, in Architecture, a Term apply'd to the Corinthian and Composite Capitals; as bearing some Resemblance to a Drum; which the French call *Tambour*. See CAPITAL.

Some chuse to call it the *Vase*, and others the *Campans*, Bell. See VASE, &c.

TAMBOUR is also us'd for a little Box of Timber-Work, cover'd with a Ceiling, within-side the Porch of certain Churches; both to prevent the View of Persons passing by, and to keep off the Wind, &c. by means of folding Doors, &c.

TAMBOUR is also a round Stone, or Course of Stones, several whereof form a Section of the Shaft of a Column, not so high as a Diameter.

TAMPION, TAMKIN or TOMKIN, a kind of Plug or Stopple, serving to close a Vessel; particularly to keep down the Powder in a Fire-Arm, &c.

In charging a Mortar, or the like, over the Powder is usually put a thin round Piece of Wood to keep the Shot, Ball, Shell, or the like from the Gun-powder. This Piece is call'd a *Tampion*, and by means hereof, the Shot is exploded with the greater Vehemence. See CHARGE, &c.

The Word is form'd from the French, *Taupion*, a Bung, Stopple, &c. Some derive it from the English Tap.

TAN, the Bark of the Oak; chopp'd, and ground, by a *Tanning* Mill, into a coarse Powder; to be us'd in the *Tanning* or Dressing of Skins. See BARK and TANNING.

New *Tan* is the most esteem'd; when Old and Stale, it loses a deal of its Effect, which consists in the condensing or closing the Pores of the Skins; so that the longer the Skins are kept in *Tan*, the greater Force and Firmness they acquire.

In effect, not only the Bark, but every Part of the Oak Tree, of what Age or Growth soever, all oaken Coppice, &c. cut in Barking Time, makes good *Tan*; as good at least, as the best Bark.

This, when got, is to be well dried in the Sun, hous'd dry, and kept so. To use it, the greater Wood may be shaved small, or cleft, fir to be cut small by a *Tanning* Engine for the Purpose; which done, 'tis well dried again on a Kiln, and then ground by the Mill.

Where Oak is scarce, Thorns may supply the Defect.

TANGENT, in Geometry, a right Line, which touches a Circle, that is, which meets it in such Manner, as that though infinitely produced, it would never cut the same; that is, never come within the Circumference. See CIRCLE, &c.

Thus the Line AD (Tab. Geometry Fig. 50) is a *Tangent* to the Circle, in D.

'Tis demonstrated in Geometry, 1<sup>o</sup> That if a *Tangent* AD, and a Secant AB, be both drawn from the same Point A; the Square of the *Tangent* will be equal to the Rectangle, under the whole Secant AB, and that Portion thereof AC, which falls without the Circle. See SECANT.

2<sup>o</sup> That if two *Tangents*, as AD AE be drawn to the same Circle from the same Point A, they will be equal to each other.

TANGENT, in Trigonometry. A *Tangent* of an Arch, is a right Line, rais'd perpendicularly on the Extreme of the Diameter, and continu'd to a Point, where it is cut by a Secant, that is by a Line, drawn from the Centre through the Extremity of the Arch whereof it is a *Tangent*.

Or thus; A *Tangent* of an Arch EA (Tab. Trigonometry Fig. 26) is a Part of a *Tangent* of a Circle (that is, of a right Line which touches a Circle without cutting it) intercepted between two right Lines, drawn from the Centre C, through the Extremes of the Arch E and A. See ARC.

Hence, the *Tangent* FE is perpendicular to the Radius EC.

And hence the *Tangent* FE is the *Tangens* of the Circle ACE, as also of that ACI; so that Two adjacent Angles have only the same common *Tangent*.

Co-TANGENT, or TANGENT of a Complement, is the *Tangent* of an Arch which is the Complement of another Arch to a Quadrant. See COMPLEMENT.

Thus, a *Tangent* of the Arch AH, is the Co-tangent of the Arch AE, or the *Tangens* of the Complement of the Arch AE.

To find the Length of the TANGENT of any Arch; The Sine of the Arch being given: Suppose the Arch, AE; [ X x ] the

the given Sine, A D ; and the Tangent required, E F. Since both the Sine and Tangent are perpendicular to the Radius E C, they are parallel to each other. Wherefore, as the Cosine D C is to the Sine A D, so is the whole Sine, to the Tangent E F. See SINE.

Hence, a Canon of Sines being had ; a Canon of Tangents is easily constructed therefrom. See CANON.

*Artificial TANGENTS*, are the Logarithms of the Tangents of Arches. See LOGARITHM.

*Line of TANGENTS*, is a Line usually placed on the Sector and Gunter's Scales; the Description and Uses whereof, see under the Articles SECTOR and GUNTER'S SCALE.

*TANGENT of a Conic Section*, as of a Parabola, or other algebraic Curve, is a right Line, drawn, cutting the Axis. See CURVE, CONIC, &c.

*Method of TANGENTS*, a Method of determining the Quantity of the Tangent of any algebraic Curve; the Equation defining that Curve, being given.

This Method is one of the great Results of the Calculus Differentialis. See DIFFERENTIAL.

Its Use is very great in Geometry; because in determining the Tangents of Curves, we determine at the same Time, the Quadratures of the Curvilinear Spaces; on which account it well deserves to be here particularly insinuated on. See QUADRATURE.

To find the Sub-tangent in any Algebraic Curve.

Let the Semiordinate  $pm$  be infinitely near another  $PM$  (Tab. Analysis Fig. 13) then will  $Pp$  be the Differential of the Abcissa; and letting fall the Perpendicular  $MR = Pp$ ;  $Rm$  will be the Differential of the Semiordinate. Draw, therefore, the Tangent  $TM$ : The infinitely little Arch  $Mm$ , will not differ from a Right Line; and therefore  $MmR$  will be a right-lined, right-angled Triangle, usually call'd the Characteristic Triangle of the Curve, in regard Curvilinear Lines are distinguish'd from each other hereby. See CHARACTERISTIC.

Now, by reason of the Parallelism of the Right Lines  $PM$  and  $pm$ ; the Angle  $mMR = TMP$ . Wherefore the Triangle  $MmR$  is Similar to the Triangle  $TMP$ . Let, therefore  $AP = x$ ,  $PM = y$ , then will  $Pp = MR = dx$ , and  $Rm = dy$ . Consequently,

$$\begin{aligned} Rm : MR :: PM : PT \\ dy : dx :: y : ydx \\ \hline \frac{y}{dx} \end{aligned}$$

If, then, from the given Equation of any Curve, you substitute the Value of  $dx$  to  $ydx$  in  $dy$ , in the general Expression of the Sub-tangent,  $PT$ ; the differential Quantities will vanish, and the Value of the Sub-tangent come out in common Quantities; whence the Tangent itself is easily determined. This we shall illustrate in a few Examples:

1<sup>o</sup> The Equation defining the common Parabola, is,

$$\begin{aligned} ax = y^2 \\ \text{Hence, } \frac{ax = y^2}{dx = 2y dy} \\ \frac{dx = 2y dy}{a} \end{aligned}$$

$$PT = y dx : dy = 2y^2 dy : a dy = 2y^2 : a = 2ax : a = 2x.$$

That is, the Sub-tangent is double the Abcissa.

2<sup>o</sup> The Equation defining a Circle is,

$$\begin{aligned} a^2 - x^2 = y^2 \\ \frac{a^2 - x^2 = y^2}{2ax - 2x dx = 2y dy} \\ \frac{dx = 2y dy}{a^2 - 2x^2} \end{aligned}$$

$$PT = dx : y dy = 2y^2 dy : (a^2 - 2x^2) dy = 2y^2 : (a^2 - 2x^2) = (2ax - 2xx) : (a^2 - 2x^2) = (ax - xx) : (a^2 - 2x^2) \text{ that is, } PC : AP :: PT : AT.$$

Therefore  $AT = (ax - xx) : (a^2 - 2x^2) = (ax - xx - x) : (a^2 - 2x^2 - 2ax + 2xx) : (a^2 - 2x^2) = (a - x) : (a^2 - 2x^2)$  that is,  $PC : PA :: CA : AT$ .

3<sup>o</sup> The Equation defining an Ellipsis, is;

$$\begin{aligned} ay^2 = abx - bx^2 \\ \text{Hence } \frac{2ay dy = ab dx - 2bx dx}{2ay dy : (ab - 2bx) = dx} \end{aligned}$$

$PT = y dx : dy = 2ay^2 : (ab - 2bx) = (2abx - 2bx^2) : (ab - 2bx) = (2ax - 2ax^2) : (a - 2x)$  that is, as the Distance of the Semiordinate from the Centre, is to the Half Axis, so is the Abcissa to the Portion of the Sub-tangent intercepted between the Vertex of the Ellipsis and the Tangent.

Lastly, for all Algebraic Curves, the Equation is,

$$\begin{aligned} ay^m + bx^n + cy^p x^q + dx^r = 0 \\ \frac{may^{m-1} dy - nby^{n-1} dx + fcy^p x^{q-1} dx + rcy^p - 1x^r dy = 0}{dx = may^{m-1} dx - nby^{n-1} dx - may^{m-1} dy - rcy - 1x^r dy} \\ \frac{nbx^n - 1 + fcy^p x^{q-1}}{PT = y dx = \frac{-may^{m-1} dx - rcy^p x^q - 1x^r dx}{dy} : ubx^n - 1 + fcy^p x^{q-1} = 1} \end{aligned}$$

Suppose,  $e.g. y^2 - a x = 0$ ; then, by comparing with the general Formulas;

$$\begin{aligned} ay^m = y^2 & \qquad b x^n = -ax \\ a = 1 \ m = 2 & \qquad b = -a \ n = 1 \\ cy^p x^q = 0 & \qquad f = 0 \\ \hline c = 0 \ r = 0 \ f = 0 \end{aligned}$$

These Values being substituted in the most general Formula of the Sub-tangent; we have the Sub-tangent of the Parabola of the first Kind,  $(-2 \cdot 1 \cdot y^2 - 0 \cdot 0 \cdot y^2 x^0) : (1 - a x - 1 + 0 \cdot 0 \cdot y^2 x^0) = -2y^2 : a = 2y^2 : a$ . Suppose  $y^2 - a x = 0$ , then will

$$\begin{aligned} ay^m = y^2 \ b x^n = -ax \\ a = 1 \ m = 2 \ b = -a \ n = 3 \\ cy^p x^q = -ax \ y \ f = 0 \\ \hline c = -a \ r = 1 \ f = 1 \end{aligned}$$

These Values being substituted in the general Formula of the Sub-tangent; we have the Sub-tangent of the Curve, whose Equation is given,  $PT = (-3 \cdot 1 \cdot y^3 - 1 - a y x) : (3 \cdot -1 \cdot x^2 - 1 + 1 \cdot -a y x^2 - 1) = (-3y^3 + a y x) : (-3x^2 - a y) = (3y^3 - a x y) : (3x^2 + a y)$  Consequently,  $AT = (3y^3 - a x y) : (3x^2 + a y) - x = (3y^3 - a x y) - (3x^2 + a x y) : (3x^2 + a y) = (3a x y - 2 a x y) : 3x^2 + a y$ . The Value of  $y^3 - x^2$ , that is,  $a x y : (3x^2 + a y)$  being substituted from the Equation to the Curve.

In the *Philosophical Transactions*, we have the following Method of drawing Tangents to all Geometrical Curves, without any Labour, or Calculation, by *M. Sluys*.

Suppose a Curve, as  $DQ$  (Fig. 14) whose Points are all referable to any Right Line given, as  $EAB$ , whether the Right Line be the Diameter or not; or whether there be more given Right Lines than one, provided their Powers do but come into the Equation. In all his Equations he puts  $v$  for the Line  $DA$ ,  $y$  for  $BA$ ; and for  $E B$ , and the other given Lines, he puts  $bc$ , &c. that is, always Consistants.

Then, supposing  $DC$  to be drawn touching the Curve in  $D$ , and meeting with  $EB$  produced in  $C$ ; he calls the sought Line  $CA$ , by the Name of  $a$ .

To find which, he gives this general Method: 1. Reject out of the Equation all Members, which have not either  $v$  or  $y$  with them: Then put all those that have  $y$ , on one Side; and all those which have  $v$ , on the other; with these Signs  $+$  or  $-$ ; and the latter, for Distinction and Ease sake, he calls the Right, the former, the Left Side. 2. On the Right Side, let there be prefix'd to each Member, the Exponent of the Power, which  $v$  hath there; or, which is all one, let that Exponent be multiplied into all the Members. 3. Let the same be done also on the Left Side, multiplying each Member there by the Power of the Exponent of  $y$ . Adding this moreover, that one  $v$  multi, in each Member, be always changed into  $a$ . This done, the Equation thus reform'd, will shew the Method of drawing the required Tangent to the Point  $D$ : For, that being given; as also  $y$ ,  $v$ , and the other Quantities express'd by Consistants,  $a$  cannot be unknown. Suppose an Equation  $by - y^2 = v^2$ , in which  $E B$  is called  $b$ ;  $BA = y$ ,  $DA = v$ , and let  $a$ , or  $AC$  be required so as to find the Point  $C$ , from whence  $CD$  being drawn, shall be a true Tangent to that Curve  $QD$  in  $D$ . In this Example, nothing is to be rejected out of the Equation, because  $y$  or  $v$  are in each Member: It is also disposed, as required by the Rule 1; to each Part therefore, there must be prefix'd the Exponent of the Powers of  $y$  or  $v$ , as in Rule 2; and on the Left Side, let one  $y$  be changed into  $a$ , and then the Equation will be in this Form,  $ba - 2y^2 = 2v^2$ , which Equation reduced, gives easily the Value of  $a = \frac{2v^2}{b - 2y} = AC$ . And so the Point  $C$  is found, from whence the Tangent  $DC$  may be drawn.

To determine which Way the Tangent is to be drawn, whether towards  $B$  or  $E$ , he directs to consider the Numerator and Denominator of the Fraction. For, 1. If in both Parts of the Fraction, all the Signs are Affirmative; or if the Affirmative ones are more in Number; then the Tangent is to run towards  $B$ . 2. If the Affirmative Quantities are greater than the Negative in the Numerator; but equal to them in the Denominator; the Right Line drawn through  $D$ , and touching the Curve in that Point, will be parallel to  $AB$ : For in this Case,  $a$  is of an infinite Length. 3. If in both Parts of the Fraction, the Affirmative Quantities are less than the Negative, changing all the Signs, the Tangent must be drawn now also towards  $B$ : For this Case, after the Change, comes to be the same as the First. 4. If the Affirmative Quantities are greater than the Negative in the Denominator; but in the Numerator are less; or vice versa; then changing the Signs in that Part of the Fraction where they are less, the Tangent must be drawn a contrary Way; that

that is, A C must be taken towards E. 5. But whenever the Affirmative and Negative Quantities are equal in the Numerator, let them be how they will in the Denominator,  $a$  will vanish into nothing: And, consequently, the *Tangent* is either A D itself, or EA, or parallel thereto; as will easily be found by the Data. This gives plain Examples of, in reference to the Circle; thus: Let there be a Semicircle, whose Diameter is EB; in which there is given any Point; as D, (Fig. 15,) from which the Perpendicular DA is let fall to the Diameter. Let DA =  $u$ , BA =  $y$ , BE =  $b$ : Then the Equation will be  $by - y^2 = uv$ , and drawing the *Tangent* DC, AC, or  $a = \frac{2uv}{b-2y}$ . Now, if  $b$  be greater than  $2y$ , the *Tangent* must be drawn towards B; if less, towards E; if it be equal to it, it will be parallel to EB, as was said in the first, second and fourth Rules.

Let there be another Semi-circle inverted; as NDD, (Fig. 16.) the Points of whose Periphery, are refer'd to the Right Line BB, parallel and = to the Diameter. Let NB be called  $d$ ; and all Things else as befoe; then the Equation will be  $by - y^2 = dd + uv - 2dv$ ; which being managed according to his Rules, you have  $a = \frac{2uv - 2dv}{b - 2y}$ .

Now since  $v$  here is supposed to be always less than  $d$ ; if  $b$  be greater than  $2y$ , then the *Tangent* must be drawn towards E; if equal, it will be parallel to BB; if less, changing all the Signs, the *Tangent* must be drawn towards B, as by Rules Fourth, Fifth and Third. But there could be no *Tangent* drawn, or at least, EB would be it, if NB had been taken equal to the Diameter. Let there be another Semicircle, whose Diameter N B, (Fig. 17.) is perpendicular to E B, and to which its Points are refer'd. Let N B be called  $b$ , and all Things else as above; the Equation will be  $yy = bv - uv$ , and  $a = \frac{bv - 2uv}{2y}$ . If, now,  $b$  be greater than  $2v$ , the *Tangent* must be drawn towards B, if lesser, towards E, if equal, DA will be the *Tangent*, as by Rules 1, 4 and 5, appears.

*Inverse Method of TANGENTS*, is a Method of finding the Equation, or the Construction, of any Curve; from the *Tangent* or any other Line whose Determination depends on the *Tangent*, given.

This Method is one of the great Results of the New Calculus Integralis. See CALCULUS.

Its Application we shall give in what follows.

The differential Expressions of the *Tangent*, *Sub-tangent*, &c. being delivered under the last Article: If you make the given Value equal to the differential Expression, and either sum up the differential Equation, or, if that can't be, construct it, the Curve required, is had. For Example:

1<sup>o</sup> To find the Curve Line, whose Sub-tangent =  $2yy : a$

Since the *Sub-tangent* of an algebraic Line is =  $y dx$ , we have

$$\begin{aligned} y dx : dy &= 2yy : a \\ ay dx &= 2y^2 dy \\ a dx &= 2y dy \\ a x &= y^2 \end{aligned}$$

The Curve sought, therefore, is a Parabola; whose Construction is shewn under the Article PARABOLA.

2<sup>o</sup> To find the Curve, whose Sub-tangent is a Third Proportional to  $r - u$  and  $y$ .

Since  $r - x : y = y : \frac{y dx}{dy}$

$$\begin{aligned} \text{We have } r - x : y &= dy : dx \\ r dx - x dx &= y dy \\ r x - 2^2 x^2 &= 2^1 y^2 \\ 2 r x - x x &= y^2 \end{aligned}$$

The Curve sought therefore, is a Circle.

3<sup>o</sup> To find the Line where in the Sub-tangent is equal to the Semiordinate.

$$\begin{aligned} \text{Since, } y dx : dy &= y \\ y dx &= y dy \\ dx &= dy \\ x &= y \end{aligned}$$

Hence it appears, that the Line sought, is a right Line, that refers to the Cathetus of an Equilateral Triangle, as to an Axis or the Hypotenuse of an Equilateral, reſtangled Triangle. If  $a$  had been taken for the Arch of a Circle, the sought Line had been a Cycloid. See CYCLOID.

TANGIBLE. See TACTILE.

TANISTRY, or TANISTRU, in our ancient Customs, an Heric presumptive, or second Possessor. See HEIR, &c.

Hence the Law, or Tenure, Tanistry, or Tanistrin, an ancient municipal Law, or Tenure of England, which allotted the Inheritance of Lands, Castles, &c. held by this Tenure, to the oldest and most worthy and capable Person of the Deceased's Name and Blood; without any Regard to Proximity.

This, in reality, was giving it to the strongest; which naturally occasion'd bloody Wars in Families: for which Reason it was abolish'd under K. James I. Sir John Davie's describes it thus; *Quantum aſſum Perſon morali ſeſſe des Aſſum Caſtes, Manor, Terras cu Tenementis ad Naturæ & Tenore de Tanistry; que donqueſ meſius les Caſtes, &c. dont deſcender, & de temps dont Memory ne Couvriſt ou uſe de deſcender Seniori & digniſſimo Viro Sanguinis & Cognominis de ſiel Perſon, &c.* The Word is ſuppos'd form'd from *Tanais*.

TANNING, the preparing of Skins or Hides in a Pit, with Tan and Water, after having first taken off the Hair, by steeping them in Lime Water. See TAN and LEATHER.

Method of TANNING Cows, Calves, and Horses Hides.

The Skin being freed off the Carcaſe, if 'tis intended to be kept, 'tis salted with Sea Salt and Alum, or with a kind of Saltpetre, call'd *Natron*; if 'tis not for keeping, the Salting is sav'd, as being of no use; but to prevent the Hide from corrupting e'er it can be conveniently carry'd to the *Tan-kouſe*.

Whether the Hide have been salted or not, the *Tanner* begins with taking off the Horns, the Ears, and the Tail; after which 'tis thrown into a running Water for about 30 Hours, to wash off the Blood, and other Impurities adhering to the Hide.

This done, 'tis laid over Night in a Lime Pit, already used; whence it is taken, and left to drain three or four Days on the Edge of the Pit.

This first and slightest Preparation over, it is return'd into a strong Lime-Pit for two Days; then taken out for four more; and thus for six Weeks alternately, taken out and put in, twice a Week.

At the six Weeks End, it is put into a fresh Pit, where it continues eight Days, and is taken out for so many; and this alternately for a Year or eighteen Months, according to the Strength of the Leather, or the Weather: for in great Heats, they put in fresh Lime twice a Week; and in Frost they sometimes don't touch them for three Months. Every fresh Lime-Pit they throw them into, is stronger and stronger.

At four, five, or six Weeks end, the *Tanner* scrapes off the Hair, on a Wooden Leg, or Horse, with a kind of Knife for that Purpose. And after a Year or eighteen Months, when the Hair is perfectly gone, he carries it to a River to wash, pares off the Flesh on the Leg, with a kind of curing Knife, and rubs it briskly with a kind of Whe-stone, to take off any Remains of Flesh or Filth on the Side of the Hair.

The Skin is now put into *Tan*; that is, cover'd over with *Tan*, as 'tis stretch'd in the Pit, and Water let in upon it: If the Skin be strong, five Coverings of *Tan* will be requir'd; for weaker, three or four may suffice. When the Skin has not been kept long enough in Lime, or the *Tan*-Pit; upon cleaving it, in the Middle is seen a whitish Streak, call'd the Horn, or Crudity of the Skin; and 'tis this is the Reason why the Soles of Shoes, Boots, &c. stretch so easily, and take Water.

When the Hides are sufficiently *tann'd*, they are taken out of the Pit, to be dry'd, by hanging in the Air: Then the *Tan* is clean'd off them, and they are put in a Place neither too dry, nor too moist; they are well stretch'd over one another, with Weights a-top, to keep them tight and straight; and in this Condition are sold, under the Denomination of *Bend Leather*. This is the Method of *tanning* Bullocks or Oxes Hides.

Cows, Calves, and Horses Skins are *tann'd* much after the same Manner as those of Oxen, except that the former are only kept four Months in the Lime-Pit; and that before they be put in the *Tan*, there is a Preparation requir'd, thus: Cold Water is pour'd into a Wooden Vat or Tub, wherein the Skins are put, which are kept stirring while some other Water is warming in a Kettle; and as soon as that Water is a little more than lukewarm, 'tis pour'd gently into the Vat, and upon this is cast a Basket of *Tan*; during which Time, the Skins are still kept turning, that the Water and *Tan* mayn't burn them.

After an Hour, they are taken out, and cast for a Day in cold Water, then return'd into the former Vat, and the same

same Water they had been in before; and here they are left eight Days; which expir'd, they are put in the *Tan-Pit*, and three Coverings of *Tan* given them, the first of which lasts five Weeks, the 2d six, and the 3d two Months.

The rest of the Process is in all respects the same as that above deliver'd. In some Countries, as in *Champagne*, &c. the *Tanners* give the first Preparation with Barley instead of Lime.

**TANTAMOUNT**, (of the *French tout* and *Mountau*, or *Monteur*.) something that amounts to, or is equivalent to so much.

**TAP**, among Hunters: A Hair is said to *tap*, or beat, when it makes a Noise.

**TAPASSANT**, denotes *lurking* or *squatting*, and is a Term us'd in Hunting; Hence, to *tappy*, is to be hid, as a Deer may be.

**TAPER**, *Tapering*, is understood of a Piece of Timber, or the like, when broad beneath, and sharp towards the Top; as is the Case in Pyramids, Cones, &c. See **PYRAMID**.

To measure *taper* Timber, &c. See **TIMBER**, **SLIDING-RULE**, &c.

**TAPER-BORED**, is apply'd to a Piece of Ordnance, when it is wider at the Mouth than towards the Breech. See **ORDNANCE**.

**TAPER**, a kind of tall waxen Candle, plac'd in a Candlestick, and burnt at Funeral Processions, and in other Church Solemnities. See **CANDLE**.

They are made of different Sizes: In some Places, as *Italy*, &c. they are Cylindrical; but in most other Countries, as *England*, *France*, &c. they are Conical, or *tapers*, whence the Name.

Both Kinds are pierc'd at Bottom, for a Pin in the Candlestick to enter.

The Use of Lights in religious Ceremonies, is of a long standing: The Ancients, we know, us'd Flambeaux in their Sacrifices, and particularly in the Mysteries of *Ceres*; and they had *Tapers* plac'd before the Statues of their Gods.

Some suppose, that it was in Imitation of this Heathen Ceremony, that Lights were first introduc'd into the Christian Church; others take it, that the Christians borrow'd the Practice from the *Jews*: But Recourse need not be had to the one or the other.

Doubleless, as in the first Days of Christianity they had their Meetings in obscure subterraneous Vaults, there was a Necessity for *Tapers*, &c. and there was even Occasion for them after they had the Liberty of building Churches; those being contriv'd in such Manner, as only to receive very little Light, that they might inspire the greater Awe and Respect by the Obscurity.

This Original of *Tapers* in Churches is the most natural; but 'tis now a long Time since the Use of *Tapers*, which Necessary at first introduc'd, is become a mere Ceremony. *S. Pantanus*, who liv'd at the Beginning of the Vth Century, observes, that the Christians of his Days were so fond of *Tapers*, that they even painted them in their Churches. See **LUMINARY**.

#### Manner of making TAPERS.

There are two ways of making *Tapers*: The first with the *Ladle*, the second by *Hand*.

In the first, after the Wicks (which are usually half Cotton half Flax) have been well twist'd, and cut of the due Length; a *Dosen* of them are hung, at equal Distances, around an Iron Hoop, directly over a large Copper Basin full of melted Wax.

Then taking an Iron Ladle-full of the Wax, they pour it gently over the Wicks, a little below the Tups thereof, one after another; so that the Wax running down them, they become quite cover'd therewith, and the Surplus returns into the Basin, under which is a Pan of Coals to keep it in Fusion.

Thus they continue to cast on more and more Wax for ten or twelve times, till the *Tapers* be brought to the requir'd Dimensions. The first Cast only soaks the Wick, the second begins to cover it, and the rest give it the Form and Thickness; in order to which, they take Care that every Cast, after the fourth, be made lower and lower below the Wicks, to make them *taper*.

The *Tapers* thus form'd, are laid, while yet hot, one against another, in a Feather Bed, folded double to preserve them soft; and taken out thence, one after another, to be roll'd on a long smooth Table, with an oblong Instrument of Box, polish'd at Bottom, and furnish'd with a Handle above.

The *Taper* thus roll'd and polish'd, a Piece of its big End is cut off, and a Conical Hole bored therein, with a Boxen Instrument, into which the Pin, or Point of the Candlestick is to be receiv'd.

While the Breech is yet in the Hole, they use to stamp

the Maker's Name, and the Weight of the *Taper*, with a Boxen Ruler, whereon the Characters are cut. The *Taper* is then hang up to dry and harden; after which it is fit for Use.

#### Making of TAPERS by Hand.

The Wicks being dispos'd, as in the former Manner; they begin to soften the Wax by working it in hot Water, in a narrow, deep Copper Vessel. They then take a Quantity of this Wax out with the Hand, and lay it gradually on the Wick, which is fasten'd to a Hook in the Wall by the End opposite to the Wick; so that they begin to form the *Taper* by the big End; and proceed, still lessning the Thickness, to the Neck or Coller.

The rest is perform'd after the same Manner as in *Tapers* made with the Ladle, except that they don't lay them in the Feather-Bed, but roll them on the Table as fast as form'd.

Two Things there are to be observ'd in the two Kinds of *Tapers*: The first, that in the whole Process of *Tapers* with the Ladle, they use Water to moisten the Table, and other Instruments us'd therein, that the Wax may not stick; and that in the other, they use Oil of Olives or Lard for the same End.

*Paschal TAPER*, among the *Romanists*, is a large *Taper*, whereon the Deacon applies five Grains of Frankincense, in Holes made for the Purpose, in Form of a Cross; and which he lights with new Fire in the Ceremony of *Easter* Saturday.

The Pontifical makes Pope *Zosimus* the Author thereof; but *Baronius* will have the Usage more ancient, and quotes a Hymn of *Prudentius* to prove it.

The Pope he supposes to have only establish'd the Use thereof in Parish Churches; which, till that Time, had been restrain'd to the greater Churches. *F. Papebroch* explains the Origin of the *Paschal Torch* more distinctly in his *Conatus Chronico Historicus*, &c. It seems, tho' the Council of *Nice* regulated the Day whereon *Easter* was to be celebrated, it laid it on the Patriarch of *Alexandria* to make a yearly Canon thereof, and to send it to the Pope. As all the other moveable Feasts were to be regulated on that of *Easter*, a Catalogue of them was made every Year, and wrote on a *Taper*, *Cerens*, which was bless'd in the Church with some Solemnity.

This *Taper*, according to the Abbot *Chastelain*, was not a Wax Candle, made to be burnt; it had no Wick; nor was it any thing more than a kind of Column of Wax, made on purpose to write the List of moveable Feasts on, and which would suffice to hold it for the Space of a Year.

For among the Ancients, when any thing was to be wrote to last for ever, they engrav'd it on Marble or Steel; when it was to last a long while, they wrote it on *Aegyptian* Paper; and when it was only to last a short Time, they contented themselves to write it on Wax.

In Process of Time, they came to write the List of moveable Feasts on Paper, but they still fasten'd it to the *Paschal Taper*; which Practice is observ'd to this Day at *Norre Dame* in *Rome*, and throughout the Order of *Cister*.

Such is the Original of the Benediction of the *Paschal Taper*.

**TAPESTRY**, or **TAPISTRY**, a curious Kind of Manufacture, serving to adorn a Chamber, or other Apartment, by hanging, or covering the Walls thereof. See **HANGING**.

Some use *Tapestry* as a general Name for all Kinds of *Hangings*, whether wove, or wrought with the Needle, and whether Silken, Woolen, Linnen, Leather, or Paper; (in which they are countenanc'd by the Etymology of the Word, form'd from the *French Tapisser*, to line, of the *Latin Tapes*, a Cover of a Bed, &c.) But in the common Use of our Language, the Term is now appropriated to a Kind of wove *Hangings*, of Wool and Silk, frequently rais'd, and enrich'd with Gold and Silver, representing Figures of Men, Animals, Landscips, &c.

The Invention of *Tapestry* seems to have come from the *Levants*; and what makes this the more probable is, that formerly the *Workmen* concern'd herein, were call'd, at least in *France*, *Sarrasins*, or *Sarrasinois*.

'Tis suppos'd that the *English* and *Flemish*, who were the first that excell'd therein, might bring the Art with them from some of the *Crossades*, or Expeditions against the *Sarrasens*. See **CRUSADE**.

Be this as it will, 'tis certain that two Nations, particularly the *English*, were the first who set on Foot this noble and rich Manufacture in *Europe*; now one of the finest Ornaments of Palaces, Basilicks, Churches, &c.

Hence, if they be not allow'd the Inventors, they have, at least, the Glory of being the Restorers of so curious and admirable an Art, as gives a kind of Life to Woods and Silks, in no Respect inferior to the Paintings of the best Masters.

'Twas late e'er the *French* apply'd themselves to *Tapisstry*: The first Establishment of that Kind, was under *Henry IV.* in the Year 1607, in the *Fonsbourg, S. Michael.* But this fell with the Death of that Prince. Under *Levis XIV.* the Manufacture was retriev'd by the Care and Address of the great *M. Colbert*, to whom the Establishment of the Gobelins is owing, a Royal *Tapisstry* Manufactory, which has produc'd Works in this Kind, scarce inferior to the finest *English* or *Flemish Tapisstry*, either with regard to the Designs, the Colours, or the Firmness. See *GOBELIN.*

The *Tapisstry-men* distinguish two Kinds of Work, viz. *Tapisstry* of the *high* and *low Warp*; tho' the Difference is rather in the Manner of working, than in the Work itself, which is, in effect, the same in both; only the Looms, and consequently the Warps, are differently situate: Those of the *low Warp* being placed flat, and parallel to the Horizon; and those, on the contrary, of the *high Warp*, erected perpendicularly.

The *English* anciently excell'd all the World in their *Tapisstry* of the *high Warp*; and they still retain their former Reputation, tho' with some little Change: Their *low Warps* are still admir'd; but as for the *high ones*, they are quite laid aside in our Nation. See *COMMERCE, WOOLLEN Manufactory, &c.*

The *French* have three considerable *Tapisstry* Manufactures besides that of the Gobelins; the first at *Aubusson* in *Auvergne*, the second at *Falsetin* in the *Upper Auvergne*, and the third at *Beauvais*: They were all equally estimat'd for the high and the low Warp, but have all laid aside the former, excepting the Gobelins.

There are admirable low Warps in *Flanders*, generally exceeding those of *France*; the chief, and almost only *Flemish* Manufactories, are at *Brussels, Antwerp, Oudenard, Lille, Tourmay, Bruges, and Valenciennes.*

At *Brussels* and *Antwerp* they succeed both in human Figures, in Animals, and Landscips; and that both with regard to the Designs and the Workmanship. At *Oudenard* their Landscips and Animals are good, but their human Figures naught. *Lille*, and the other Cities nam'd, come behind *Oudenard*. The *French* Manufactory of *Falsetin* does tolerably well in Landscips, *Aubusson* in Figures, and *Beauvais* in both.

The usual Widths of *Tapisstries*, are from two Ells to three Ells and half, *Paris* Measure.

The Manufacture of *Tapisstry* of each Kind, is too curious to be here pass'd over, without a short Description. We shall give each under its separate Article.

#### Manufactory of TAPISTRY of the high Warp.

The Loom whereon tis wrought, is placed perpendicularly: It consists of four principal Pieces; two long Planks or Checks of Wood, and two thick Rollers or Beams. The Planks are set upright, and the Beams across them, one a-top, and t'other at Bottom, a Foot's Distance from the Ground. They have each their Trunnions, by which they are suspended on the Planks, and are turn'd with Bars. In each Roller is a Groove, from one End to t'other, capable of containing a long round Piece of Wood, fasten'd therein with Hooks. Its Use is to tye the Ends of the Warp to the Warp, which is a kind of worsted, or twisted Woollen Thread, is wound on the upper Roller; and the Work, as fast as wove, is wound on the lower.

Within-side the Planks, which are seven or eight Foot high, fourteen or fifteen Inches broad, and three or four thick, are Holes pierc'd, from Top to Bottom, in which are put thick Pieces of Iron, with Hooks at one End, serving to sustain the Coat-Flave: These Pieces of Iron have also Holes pierc'd; by putting a Pin in which, the Stave is drawn neater, or set further off; and thus the Coats, or Threads, are stretch'd or loosen'd at Pleasure.

The Coat-Flave is about three Inches Diameter, and runs all the Length of the Loom: On this are fix'd the Coats, or Threads, which make the Threads of the Warp cross each other. It has much the same Effect here, as the Spring-Flave and Treddles have in the common Looms. The Coats are little Threads fasten'd to each Thread of the Warp, with a kind of sliding Knot, which forms a Sort of Math, or Ring. They serve to keep the Warp open, for the Passage of Broaches wound with Silks, Woollens, or other Matters us'd in the Piece of *Tapisstry*.

Lastly, there are a Number of little Sticks, of different Lengths, but all about an Inch Diameter, which the Workman keeps by him in Baskets, to serve to make the Threads of the Warp cross each other, by passing them across: And that the Threads thus cross'd may retain their proper Situation, a Packthread is run among the Threads, above the Stick.

The Loom thus form'd, and mounted with its Warp, the first Thing the Workman does, is to draw, on the Threads of this Warp, the principal Lines and Strokes of the Design to be represented on the Piece of *Tapisstry*, which is

done by applying Cartoons made from the Painting he intends to copy, to the Side that is to be the wrong Side of the Piece; and then with a Black-lead Pencil following and tracing out the Contours thereof on the Thread of the right Side; so that the Strokes appear equally both before and behind. As to the original Design the Work is to be finish'd by, tis hung up behind the Workman, and wound on a long Staff; from which a Piece is unroll'd from Time to Time, as the Work proceeds.

Besides the Loom, &c. here described; there are Three other principal Instruments required for the working the Silk, or Wooll of the Wool within the Threads of the Warp. These are a Brooch, a Reed, and an Iron Needle.

The Brooch is of hard Wood, 7 or 8 Inches long, and two Thirds of an Inch thick, ending in a Point with a little Handle. It serves as a Shuttle, the Silks, Woollens, Gold or Silver to be us'd in the Work, being wound on it. The Reed or Comb is also of Wood, Eight or Nine Inches long, and an Inch thick at the Back; whence it usually grows less and less, to the Extremity of the Teeth, which are more or less apart, according to the greater or less Degree of Fineness of the intended Work. Lastly, the Needle is in Form of the common Needle, only bigger and longer. Its Use is to press close the Wooll and Silks, when there is any Line or Colour that does not fit well.

All Things being prepared for the Work; and the Workman ready to begin, he places himself on the wrong Side the Piece, with his Back towards the Design; so that he works, as it were, blind-fold, seeing nothing of what he does, and being oblig'd to quit his Post, and go to the other Side the Loom, whenever he would view and examine the Piece, to correct it with his Pressing Needle.

To put any Silk, &c. in the Warp, he first turns, and looks at his Design: Then taking a Brooch full of the proper Colour, he places it among the Threads of the Warp, which he brings across t'each other with his Fingers, by means of the Coats or Threads fasten'd to the Staff: This he repeats every time he is to change his Colour.

The Silk or Wooll being plac'd, he beats it with his Reed or Comb; and when he has thus wrought in several Rows over each other, he goes to see the Effect they have; in order to reform the Contours with his Needle, if there be occasion.

As the Work advances, they roll it up on the lower Beam, and unroll as much Warp from the upper Beam, as suffices them to continue the Piece: The like they do of the Design behind them.

When the Pieces are wide, several Workmen may be employ'd at once.

We have but two Things to add: The first, that this *high Warp Tapisstry* goes on much more slowly than the *low Warp*, and takes almost double the Time and Trouble. The second, that all the Difference the Eye can observe between the two Kinds, consists in this, that in the *low Warp* there is a red Fillet, about one Twelfth of an Inch broad, running on each Side, from Top to Bottom; which is wanting in the *high Warp*.

#### Manufactory of TAPISTRY of the low Warp.

The Loom or Frame wherein the low Warp is wrought, is much like that of the Weavers: The principal Parts thereof are two strong Pieces of Wood forming the Sides of the Loom, and bearing a Beam or Roller at each End: They are fasten'd at Bottom with other strong Pieces of Wood in Manner of Trellises; and, to keep them the firmer, are likewise fasten'd to the Floor with a kind of Battresses, which prevent any shaking, tho' there are sometimes four or five Workmen leaning on the fore Beam at once.

The Rollers have each their Trunnions, by which they are sustain'd: They are turn'd by large Iron Pins, three Foot long. Along each Beam runs a Groove, wherein is plac'd the *Wiche*, a Piece of Wood of above two Inches Diameter, and almost the Length of the Roller: This Piece fills the Groove entirely, and is fasten'd therein, from Space to Space, by wooden Pins. To the two Wiches are fasten'd the two Extremities of the Warp, which is wound on the further Roller; and the Work, as it advances, on the neerer.

A cross the two Sides, almost in the Middle of the Loom, passes a wooden Bar, which sustains little Pieces of Wood, not unlike the Beam of a Balance: To these Pieces are fasten'd Strings, which bear certain Spring-Flaves, wherewith the Workmen, by means of two Treddles under the Loom whereon he sets his Feet, gives a Motion to the Coats, and makes the Threads of the Warp rise and fall alternately. Each Loom has more or fewer of these Spring-Flaves, and each Stave more or fewer Coats, as the *Tapisstry* consists of more or fewer Threads. See *LOOM.*

The Design or Painting the *Tapisstry-men* is to follow, is plac'd underneath the Warp; where it is sustain'd from Space to Space with Strings, by which the Design is brought neerer the Warp.

The Loom being mounted, there are two Instruments used in working of it, *viz.* the Reed and the Flute. The Flute does the Office of the Weavers Shuttle: 'Tis made of a hard, polish'd Wood, three or four Lines thick at the Ends, and somewhat more in the Middle, and three or four Inches long. On it are wound the Silks, or other Matters to be used as the Wool of the *Yaspify*. The Comb or Reed is of Wood, or Ivory; it has usually Teeth on both Sides; 'tis about an Inch thick in the Middle, but diminishes each Way to the Extremity of the Teeth: It serves to beat the Threads of the Wool close to each other, as fast as the Workman has pass'd and plac'd them with his Flute among the Threads of the Warp.

The Workman is seated on a Bench before the Loom, with his Breast against the Beam, only a Cushion or Pillow between them; and in this Posture, separating, with his Fingers, the Threads of the Warp, that he may see the Design underneath, and taking a Flute, wound with the proper Colour, he passes it among the Threads; after having rais'd or lower'd them, by means of the Treadles moving the Springshapes and Coats.

Lastly, to press and close the Threads of the Silk or Yarn, &c. thus plac'd, he strikes each Course (*i. e.* what the Flute leaves in its passing and coming back again) with the Reed.

What is very remarkable in the Manufacture of the low Warp, and which is common to it with the high, is, that 'tis all wrought on the wrong Side; so that the Workman cannot see the right Side of his *Yaspify*, till the Piece be finish'd and taken off the Loom.

TAPPING, the Act of piercing a Hole in a Vessel, and applying a Tube or Cannul in the Aperture, for the commodious drawing off the Liquors contain'd therein.

TAPPING, in Agriculture, is the making an Incision in the Bark of a Tree, and letting out the Juice. See BARK.

To Tap a Tree at the Root, is to open it round about the Root.

*Ratray*, the learned *Scot*, affirms, that he has found by Experiment, that the Liqueur which may be drawn from the Birch in the Spring-time, is equal to the whole Weight of the Tree, Branches, Roots and all together.

In the Tapping of Trees, the Juice certainly ascends from the Root, and after it is Concocted and Assimilated in the Branches, &c. descends like a Liquor in an Alembic, to the Orifice or Incision where it issues out.

One of the most effectual Ways of Tapping, so as to obtain the greatest Store of Juice in the shortest Time, is, not only to pierce the Bark, nor yet to cut the Body of the Tree almost to the Pith, with a Chisel (as some have directed) but quite through all the Circles, and the inner Rind itself, on both Sides the Pith; leaving only the Outermost Circle, and the Bark on the North-East Side unpierced.

But this Hole is to be bored sloping upwards, as large as the largest Augre you can get, will make; and that also through and under a large Arm, near the Ground. So will it not need any Stone to keep open the Orifice, nor Tap to direct the Sap into the Receiver.

This Way, the Tree will, in short Time, afford Liquor enough to Brew whisly; and with some of this sweet Sap, one Bushel of Malt, will make as good Ale as Four Bushels of Malt with ordinary Water. Sycamore I take to yield the best brewing Sap, being very sweet and wholesome.

#### To preserve the Sap for Brewing.

Infuse it by a constant Exposure to the Sun in Glasses or other Vessels, till the rest be gather'd and ready; otherwise it will contract an Acidity: when you have enough, put into it as much very thin cut, and hard roasted Rye-bread, as will serve to ferment it; and when it works, take out the Bread, and bottle up the Liquor. A few Cloves in each Vessel that receives the Sap, as it comes from the Tree, will certainly preserve it a Twelve-month. Dr. *Yonge* in the *Philosophical Transactions*.

TAPPING, in Chirurgery. See PARENTHESIS, DROPSY, &c.

TAPPING, in Heraldry. See BEATING.

TAR, a gross, fatty Liquor, issuing from the Trunks of old Pines.

When these Trees are on the Return, and only fit for burning, they cut off the Bark all around towards the Root, and through these Incisions, there continues flowing, for a considerable Time, a blackish Liquor, which is the Tar. When this ceases, 'tis a sure Indication the Pine is quite dead, and only fit for the Fire.

The chief Use of Tar, is for the Coating and Caulking of Ships. See CAULKING, &c.

Of Tar, boil'd to a sufficient Consistence, Pitch is made. See PITCH.

TARANTISMUS, in Medicine, the Distast or Affection of thole bit by the *Tarantula*. See TARANTULA.

Dr. *Cornelio*, in the *Philosophical Transactions* represents this as an imaginary Disease; and tells us, that all those who think themselves seized with it (excepting such as for particular Ends feign themselves so) are most of them young wanton Girls, whom the *Italian* Writers call *Dance di sale*, who falling, from some particular Indisposition, into a melancholy Madnes, persuade themselves, according to the vulgar Prejudice, that they have been stung by a *Tarantula*.

But the Evidence on the other Side the Question, is too strong to be thus overturned; as will appear from the following Article.

TARANTULA, or TARENTULA, in Natural History, a venomous Insect, whose Bite gives Name to a new Disease. See TARANTISMUS.

The *Tarantula* is a kind of Spider, denominated from the City *Tarentum*, in *Apulia*, where it is chiefly found: 'Tis about the Size of an Acorn; and is furnish'd with eight Feet, and as many Eyes; its Colour various; but it is still hairy: From its Mouth arise two Sorts of Horns, or Trunks, made a little hooked, with the Tips exceedingly sharp; thro' which it conveys its Poison.

These Horns, M. *Geoffrey* observes, are in continual Motion, especially when the Animal is seeking for Food; whence he conjectures they may be a kind of moveable Nostrils.

The *Tarantula* is found in several other Parts of *Italy*, and even in the Isle of *Cosica*; but those of *Apulia* alone are dangerous: Even these, when remov'd thence, are said to become harmless: 'Tis added, that even in *Apulia*, none but those found on the Plains are much to be fear'd; the Air being better there, than on the Mountains.

M. *Geoffrey* adds it as an Opinion of some, that the *Tarantula* is never venomous but in the coupling Season; and *Bogliosi*, that 'tis never so, but in the Heat of Summer, particularly in the Dog-Days, when, becoming enrag'd, it flies on all that pass by.

The Bite occasions a Pain, which at first appears much like that felt on the Stinging of a Bee, or an Ant: In a few Hours, the Patient feels a kind of Numbness; and the Part affected becomes mark'd with a little livid Circle, which soon after rises into a very painful Tumour: A little longer, and he falls into a profound Sadness, breathes with much Difficulty, his Pulse grows feeble, his Sight fails; at length he loses all Sense and Motion, and dies, unless reliev'd. But these Symptoms come somewhat differently, according to the Nature of the *Tarantula*, and the Disposition of the Patient. An Aversion for Black and Blue; and, on the contrary, an Affection for White, Red, and Green, are other unaccountable Symptoms of this Disease.

All the Assistance Medicine has been able to discover by Reasoning, consists in some chyrurgical Applications on the Wound, in Cordials and Sudorificks; but these are of little Efficacy: A Thing that avails infinitely more, is, what Reason could never have thought of, Music. See MUSIC.

As soon as the Patient has lost his Sense, and Motion, a Musician tries several Tunes on an Instrument; and when he has hit on that, the Tones and Modulation whereof agree to the Patient, he is immediately seen to make a faint Motion: His Fingers first begin to move in Cadence, then his Arms, then his Legs; by Degrees his whole Body: at length he rises on his Feet, and begins to dance; his Strength and Activity still increasing. Some will continue the Dance for six Hours without Intermission.

After this, he is put to Bed; and when he is judg'd sufficiently retrained of his first Dance, he is call'd out of Bed, by the same Tune, for a Second.

This Exercise is continu'd for several Days, six or seven at most; in which time the Patient finds himself exceedingly fatigu'd, and unable to dance any longer; which is the Characteristic of his being cured: For as long as the Poison acts on him, he would dance, if one pleas'd, without any Discontinuation, till he died of the mere Loss of Strength.

The Patient perceiving himself weary, begins to come to himself; and awakes, as out of a profound Sleep, without any Remembrance of what had pass'd in his Paroxysm, not even of his Dance.

Sometimes the Patient, thus recovering from his first Access, is quite cured; if he be'n't, he finds a melancholy Gloom hanging on him; he shuns the Sight of Men, and seeks Water; and if he be'n't carefully look'd to, throws himself into some River. If he don't die, the Fit returns at that Time Twelvemonth, and he is driven to dancing again. Some have had these Returns regularly for 20 or 30 Years.

Every *Tarantulus*, or Patient in this Disease, has his particular and specific Tune; but, in the general, they are all very brisk, sprightly Tunes. See TUNE.

This Account was given into the Royal Academy of Sciences, by M. *Geoffrey*, at his Return from *Italy*, in 1702; and confirm'd by Letters from F. *Gouje*. The like History

is given us by *Baillou*, in an express Dissertation on the *Tarantula*, published in 1696.

To such extraordinary Facts, 'tis no Wonder a few Fables should be added; as, for Instance, that the Patient is no longer affected than while the Insect lives; and that the *Tarantula* itself dances, all the while, the same Air with the Person bitten.

*Theory of the Effects of the Tarantula's Bite, by*  
*M. Geoffroy.*

The poisonous Juice injected by the *Tarantula*, *M. Geoffroy* conceives, may give the Nerves a Degree of Tension, greater than is natural to them, or than is proportionate to their Functions: And hence arises a Privation of Knowledge and Motion. But, at the same time, this Tension, equal to that of some Strings of an Instrument, puts the Nerves in Unison to certain Tones, and obliges them to shake, after being agitated by the Undulations, and Vibrations of the Air proper to those Tones. And hence this wonderful Cure by Music: The Nerves thus restor'd to their Motion, call back the Spirits thither, which before had abandon'd them. See *UNISON*.

It may be added, with some Probability, and on the same Principles, that the Patient's Aversion for some Colours arises hence, that the Tension of his Nerves, even out of the Paroxysm, being still different from what it is in the natural State, the Vibrations those Colours occasion in the Fibres of the Brain, are contrary to their Disposition, and occasion a kind of Dissonance, which is Pain.

*Theory of the Effects of the Tarantula's Bite, by*  
*Dr. Mead.*

The Malignity of the Poison of the *Tarantula* seems to consist in its great Force and Energy, whereby it immediately raises an extraordinary Fermentation in the whole Arterial Fluid; by which its Texture and Crasis is considerably alter'd: The Consequence of which Alteration, when the Effulvation is over, must necessarily be a Change in the Cohesion of its Parts, by which the Globules, which did before with equal Force press each other, have now a very differing and irregular Nilus, or Action; so that some of them do so firmly cohere together, as to compose Molecules, or small Clusters: Upon this Account, as there is now a greater Number of Globules contain'd in the same Space, than before, and the Impulse of many of these, when united together, differing according to the Conditions of their Cohesion, as to Magnitude, Figure, &c. the Impetus, with which this Fluid is drove towards the Parts, will not only be at some Strokes greater than ordinary, but the Pressure upon the Blood-Vessels must be very unequal, and irregular; and this will be particularly felt in those which are most easily diffused, as those of the Brain, &c.

Upon this the nervous Fluid must necessarily be put into various undulatory Motions, some of which will be like those, which different Objects acting upon the Organs or Passions of the Mind do naturally excite in it; whereupon such Actions must follow in the Body, as are usually the Consequences of the several Species of Sadness, Joy, Despair, or the like Determinations of Thought.

This, in some Degree, is a Coagulation of the Blood, which will the more certainly, when attended with uncommon Heat, as is the Case in those Countries where these Creatures abound, produce such like Effects as these; because the Spirits separated from the Blood thus inflamed, and compounded of hard, fixed and dry Particles, must unavoidably share in this Alteration; that is, whereas their Fluid consists of two Parts, one more active and volatile, the other more viscid and glutinous, which is a kind of Vehicle to the former; their active Part will bear too great a Proportion to the viscid; consequently they must have more than ordinary Volatility and Force, and will therefore, upon the least Occasion imaginable, be irregularly determined to every Part.

Whereupon will follow, Tumblings, Anger or Fear upon a light Cause, extreme Pleasure at what is trivial, as particular Colours, or the like: And on the other hand, Sadness at what is not agreeable to the Sight; nay, Laughter, obscene Talk and Actions, and such like Symptoms as attend Persons bit; because in this Constitution of the nervous Fluid, the most light Occasion will make as real a Reflex and Undulation of it to the Brain, and present as lively Species there, as the strongest Cause and Impression can produce in its natural State and Condition; nay, in such a Confusion, the Spirits cannot but sometimes, without any manifest Cause at all, be hurried towards those Organs, to which at other Times they have been most frequently determined; and every one knows which these are in hot Countries.

The Effects of Music on Persons touch'd with this Poison, confirms the Doctrine above delivered.

For muscular Motion, we know, is no other than a Contraction of the Fibres, from the arterial Fluid's making an

Effervescence with the nervous Juice, which, by the light Vibration and Tremor of the Nerve, is derived into the Muscle.

Thus there is a two-fold Effect and Operation of the Music, that is, upon the Body and the Mind: A brisk Harmony excites lively Species of Joy and Gladness, which are always accompanied with a more frequent and stronger Pulse, or an increased Influx of the Liquor of the Nerves into the Muscles; upon which suitable Actions must immediately follow.

As for the Body, since it was sufficient to put the Muscles into Action, to cause those Tremors of the Nerves by which their Fluid is alternately dropp'd into the moving Fibres, it is all one whether it be done by the Determination of the Will, or the outward Impressions of an Elastic Fluid.

Such is the Air; and that Sounds are the Vibrations of it, is beyond Dispute: These, therefore, rightly modulatur'd, may shake the Nerves as really, as the *Insperium Voluntatis* can do, and consequently, produce the like Effects.

The Benefit of Music arises not only from their dancing to it, and so evacuating, by Sweat, a great Part of the inflammatory Fluid; but besides this, the repeated Percussions of the Air hereby made, by immediate Contact shaking the contractile Fibres of the Membranes of the Body, especially the of the Ear which being continuous to the Brain, communicate their Tremblings to its Membranes and Vessels; by these continued Succussions and Vibrations, the Cohesion of the Parts of the Blood is perfectly broken, and the Coagulation prevented: So that the Heat being removed by Sweating, and the Coagulation by the Contraction of the muscular Fibres, the wounded Person is restor'd to his former Condition.

If any one doubts of this Force in the Air, he may consider, that it is demonstrat'd in Mechanics, that the smallest Percussion of the smallest Body, may overcome the Resistance of any the greatest Weight, which is at rest; and that the languid Tremor of the Air, which is made by the Sound of a Drum, may shake the tallest Edifices.

But besides this, we must allow a great deal to the determinate Force, and particular Modulation of the trembling Percussions; for contractile Bodies may be acted upon by one certain Degree of Motion in the ambient Fluid, though a greater Degree of it differently qualified, may produce nothing at all of the like Effect: This is not only apparent in two common-stringed musical Instruments tuned both to the same Height; but also in the Trick which many have of finding the Tone or Note peculiarly belonging to any Window-Glass, and, by accommodating their Voice exactly to that Tone, and yet making it loud and lasting, make the Vessel, though not touched, first to tremble, and then to burst; which it will not do, if the Voice be too low, or too high. See *SOUND*.

This makes it so difficult Matter to conceive, why different Persons infected with this sort of Venom, do require a different Sort of Music, in order to their Cure; inasmuch as the Nerves and contractile Membranes have different Tensions, and consequently are not in like Manner to be acted upon by the same Vibrations.

TARE, in Commerce, any Defect, Waste or Diminution in the Weight, the Quantity, or the Quality of Goods, The Seller is usually to account to the Buyer for the *Tare* and *Tret*. See *TRET*.

TARE is particularly us'd for an Abatement, or Deduction in the Price of a Commodity, on account of the Weight of Casks, Casks, Bags, Fruits, &c.

The *Tare* is very different, in different Merchandizes; in some, there is none at all allowed.

'Tis a Thing much more regarded in *Holland* than in *England* or elsewhere: A Modern Author, *M. Ricard*, treating of the Commerce of *Amsterdam* observes, that the *Tares* are one of the most considerable Articles a Merchant is to be acquainted withal, if he would trade with Security.

Sometimes, the *Tare* is, as it were, regulated by Custom; but generally, to avoid all Dispute, the Buyer and Seller make a particular Agreement about it. We shall here add, from the fore-mentioned Author, some Instances of *Tares* allowed at *Amsterdam*, referring the Reader for a more ample Account to his *Negocium Amsterdams*, Edit. 1772.

*Spanish* Wools are subject to a kind of double *Tare*: For, First, they deduct the *Tare* mark'd on the Bales; and after that, 24 Pounds *Tare* for every 175 Pound weight, besides the Rebate for prompt Payment. Indeed, for the common Wools, the Seller will seldom allow above 14 per Cent. for the whole *Tare*; for which Reason, the Bargain is to be agreed on before.

TARE of *Roman* Alum is 4 *lib.* per *Sack*.  
of *Frisch*, &c. Butter, 20 per Cent.  
of *crude* Borax, 14 *lib.* per Cent.  
of *Cinnamon* 17 *lib.* the *Burthen*.  
of *Capers* 21 per Cent.  
of *White* Pepper 40 *lib.* per *Barrel*.  
of *Black* Pepper 5 *lib.* &c.

**TARGET**, a *Shield*; thus call'd from the *Latin*, *Targum*, Buck, because originally made of Leather, wrought out of the Back of an Ox's Hide. See *SHIELD* and *BUCKLER*.

**TARGUM**, in the sacred Literature, a Name the Jews give their *Chaldee* Glosses, and Paraphrases on the Scriptures. See *PARAPHRASE*.

As the Jews, during their long Captivity in *Babylon*, had forgot their ancient Language, the *Hebrew*; and now understood nothing but the Language of their Masters, the *Chaldeans*: There was a Necessity of explaining the Prophets in that Language; and to this Necessity, is owing the first beginning of the *Chaldee* Paraphrase to make the Sense of the Text understood. See *CHALDEE*.

Each Doctor made a Paraphrase of some Part thereof in the vulgar Tongue; and as these several Interpretations in Time, became very Voluminous, certain Rabbins undertook to collect them together; and this Collection they call'd the *Targum*.

The Jewish Doctors don't agree about the Antiquity of the *Targum*; for the more modern Jews having blended their own Comments with those of the Ancients; no certain Age or *Æra* can be fix'd for the whole Work.

'Tis commonly believed, that *R. Jonathan*, who lived under the Reign of *Herod the Great*, made the first *Chaldee* Version of the Prophets; and with this Version mix'd the Interpretations of Tradition. *Onkelos*, 'tis certain, translated the Pentateuch almost Word for Word; and without any Paraphrase; and another Version of the Pentateuch is ascrib'd to *Jonathan*, but without much Certainty. See *PENTATEUCH*.

For the *Targum* or Paraphrase on the other Books; we know little of the Authors, no more than of those of the *Targum* of *Jerusalem*, which is another imperfect Paraphrase on the Five Books of *Moses*: So that in Strictness, the *Targum* of *Jonathan* and *Onkelos*, is the only Paraphrase of any Authority. See *PARAPHRASE*.

The Account ascribed to *Sealiger*, is this: The *Hebrew* was translated under the Reign of *Tiberius* into *Chaldee*, by *Jonathan*; the Prophets by *Onkelos*; and the Book of *Moses* into good old *Hierosolymitan*, which was then us'd at *Jerusalem*, much as *Latin* is among us.

'Tis certain, there was a *Targum Hierosolymitanum* still extant: It was wrote in the vulgar Tongue; but that being then greatly corrupted, we have now much ado to understand it.

Those *Targumists* might have seen *Jesus Christ*; 'tis sure they lived long before the taking of *Jerusalem*. See *SCALIGERIANA*.

**TARIF** or **TARIFF**, a Book of Rates; a Table, or Catalogue, drawn, usually, in Alphabetical Order, containing the Names of several Kinds of Merchandise, with the Duties or Customs to be paid for the same, as settled by Authority, and agreed on between the several Princes and States, that hold Commerce together. See *DUTIES*.

**TARNISHING**, a Diminution of the natural Lustre of any Thing, especially a Metal. See *LUSTRE*.

Gold and Silver, when *Tarnish'd*, resume their Brightness, by setting them over the Fire with certain Lics. Copper, Pewter, &c. that are *Tarnish'd*, recover their Lustre with Tripoli and Pot-ashes.

The Breath of Women, under their monthly Purgations, *Artificially* affects, tarnishes all Mirrors, &c. See *MENSTRUUM*.

**TARPAWLING**, of the *Saxon*, *Tare*, and the *Latin*, *Pallium*, Cloak, q. d. a tarred Garment; is a Piece of Canvas, well tarred over, to keep off the Rain from any Place.

The Term is also us'd in Derision for a Person bred at Sea, and educated in the Mariner's Art. See *MARINER*.

**TARPEIAN**, in Antiquity, an Epithet given to a Rock in ancient *Rome*, of surprizing Height; whence, by the Law of the Twelve Tables, those guilty of certain Crimes, were precipitated.

'Twas on this Rock the Capitol was built. See *CAPITOL*.

It took its Name from a Vestal, call'd *Tarpeia*, who betray'd the Capitol, whereof her Father was Governor, to the *Sabines*; on Condition they would give her all they bore on their Left Arms, meaning their Bracelets. But instead of Bracelets, they threw their Bucklers (which were likewise borne on their Left Arm) upon her Head, and crush'd her to Death.

Others ascribe the Delivery of the Capitol to her Father *Sparius Tarpeius*; and add, That he was precipitated down this Rock by *Romulus's* Order; and that this, henceforward, became the Punishment of all Criminals of the like Kind.

The *Tarpeian Games*, were Games instituted by *Romulus*, in Honour of *Jupiter Feretrius*; call'd also *Capitolini Ludii*. See *CAPITOLINI*.

**TARRASS**, or **TERRASS**, a Sort of Plaster, or strong Mortar, chiefly us'd to line Basins, Cisterns, Wells and other Reservoirs of Water. See *MORTAR*, *CISTERN*, &c.

**TARSUS**, in Anatomy, is what we vulgarly call the *Instep*; being the Beginning of the Foot, or the Space between the Ankle and the Body of the Foot which is call'd *Metatarsus*. See *FOOT*.

The *Tarsus* consists of seven Bones: The first whereof is call'd *Astragalus*, and by the *Latins* *Talus*, and *Os Balyste*. See *ASTRAGALUS*.

The second call'd the *Calcus*, or *Calcæ pedis*, or *Calcaneum*; the third *Nasculare*, and by the *Greeks* *Scaphoides*; the fourth, fifth, and sixth are generally call'd *Innominata*, but by *Fallopins*, from their Figure, *Cuneiformis*: Lastly, the 7th, the *Cuboidea*. See each describ'd under its proper Article, *CALX*, *NAVICULARE*, *INNOMINATA*, &c.

**TARSUS** is also a Name given by some Anatomists to the Cartilages which terminate the *Papæbræ* or Eye-lids. See *PALPEBRÆ*.

They are exceedingly thin and fine, which makes them light and flexible.

Their Form is Semicircular: That of the upper Eye-lid, is somewhat longer than that of the under: They serve alike to close the Eyes. See *CILIA*.

**TARTANE**, a kind of Bark us'd for Fishing and Carriage; having neither a rais'd Poop, nor Prow; and also using Oars.

*Tartanes* are common in the *Mediterranean*: They have only a Main-mast, and a Mizzen: Their Sails are triangular. When they put up a square Sail, 'tis call'd a *Sail of Tartane*.

**TARTAR**, in Chymistry, &c. a Kind of Salt, which rises from famous Wines, and sticking to the Top and Sides of the Casks, forms a greyish Crust, which hardens to the Consistence of a Stone. See *SALT*.

*Tartar*, says an ingenious Author, has the Juice of the Grape for its Father, Fermentation for its Mother, and the Cask for its Matrix. See *WINE*, &c.

Its Goodness rather depends on the Number of repeated Fermentations, which a Succession of new Wines in the same Cask for several Years, makes, than on the Soil or Climate where the Wine is produc'd.

*Tartar* is either white, or red, according to the Colour of the Wine it is rais'd from.

That brought from *Germany* is the best, as being taken out of those moorish Tubs, some whereof hold a thousand Pipes of Wine; so that the Salt has Time to come to its Consistence, one of the chief Qualities to be regarded in *Tartar*.

That of *Montpellier* is the next in Order; then that of *Lyon*, *Paris*, &c.

White *Tartar* is prefer'd to red, and is really better: The Marks of good *Tartar* of either Kind, are, its being thick, brittle, brilliant, and very little Earthy.

*Tartar* is of considerable Use among the Dyers; as serving to dispose the Stuffs to take the Colours the better. See *DYING*.

The Chymists make abundance of Preparations from *Tartar*; as *Cream*, or *Crysal* of *Tartar*, which is nothing but *Tartar* powder'd, and reduc'd by means of boiling Water, a straining Bag, and a Cellar, into little Crystals. See *CREAM* of *Tartar*.

Salt of *TARTAR* is made of *Tartar* wash'd, ground, purify'd, and calcin'd in Paper, by a reverberatory Fire; or 'tis made by pulverizing what remains in the Retort after the Distillation of *Tartar*. On the one or the other of these Preparations, they pour a great Quantity of hot Water, to make a Lye of it; this they filtrate, and evaporate the Liquor by a Sand Heat, till the fix'd Salt be found at the Bottom of the Vessel. This is the Alkali, or fix'd Salt of *Tartar*. See *SALT*.

Oil of *TARTAR*, is the Salt of *Tartar* expos'd to the Air for some Days, in an open Vessel, in a moist Place, till it dissolve into an Oil; tho' 'tis improperly so call'd, being no more than a dissolv'd Oil. See *DELIQUIUM*.

Oil of *Tartar per deliquium*, is held the best Remedy against corrosive Sublimate.

*Tartar Vitriolizet*, which some call *Moxifery* of *Tartar*, is Oil of *Tartar* mix'd with rectify'd Spirit of *Vitriol*: Upon mixing the two, there arises a great Ebullition; by means whereof, of Liquids they become Solids.

*Tartar soliatet*, is a Preparation of *Tartar* with dissolv'd Vinegar, which reduces it into white Leaves.

*TARTAR Emetic* } See { *EMETIC*.  
*TARTAR Soluble* } See { *SOLUBLE*.

**TARTARIZING**, a Term us'd by some Writers, for the Act of Refining or Purifying, by means of Salt of *Tartar*. See *TARTAR*.

**TASSEL**, a Sort of pendant Handle, hanging down from a Cushion, or such like Thing: Also a small Ribboon or Silk sew'd to a Book, to be put between the Leaves.

**TASSELS**, in Building, are those Pieces of Boards that lie under the Ends of the Mast-Tree. See *MASTLE*.

**TASSEL**, or **TIERCELEY**, is also us'd in Falconry for a Male Hawk. See *HAWK* and *FALCON*.

**TASSELS** are also a kind of hard Butt, us'd by Cloth-workers in dressing Cloth.

**TASTE**, or *Sensus*, a Sensation, excited in the Soul by means of the Organ of *Taste*; viz. the Papillæ of the Tongue, &c. See SENSATION and TASTING.

Dr. Grew, in a Lecture on the Diversity of *Tastes*, before the Royal Society, distinguishes them into *Simple* and *Compound*.

By the former, he understands such as are Simple Modes of *Taste*, although mingled with others in the same; thus the *Taste* of a Pippin is Acid-dulcis; of Rhabarb, Amara-aftringent, and therefore compounded, in both; but yet in the Pippin the Acid is one simple *Taste*, and the Sweet another; as distinct as the Bitter and Aftringent are in the Rhabarb.

Two Faults, he observes, have here been committed: The first, a defective enumerating of simple *Tastes*, and reckoning them, indistinctly, among such as are compounded.

*Simple Tastes*, of which we usually only reckon six or seven Sorts, are at least sixteen; 1. *Bitter*, as in Wormwood; whose contrary is, 2. *Sweet*, as in Sugar. 3. *Sour*, as in Vinegar; whose contrary is, 4. *Salt*. 5. *Hot*, as in Cloves; to which is opposite, 6. *Cold*, as in Sal Prunella; for we may as properly say a cold *Taste*, as an hot one, since there are some Bodies which do manifestly imprint the Sense of Cold upon the Tongue, tho' not to the Touch. 7. *Aromatick*; to which is contrary, 8. *Nauseous*, or malignant.

He thinks also that *Tastes* may be distinguish'd into such as are, 9. *soft*, which are either Vaprid, as in Water, Starch, Whites of Eggs, &c. or Uctuous, as in Oils, Fat, &c. 10. Or such as are *hard*; of which he reckons four Kinds, as, 11. *Penetrant*, which worketh itself into the Tongue without any Pungency; as is found in the Root and Leaves of wild Cucumber. 12. *Stupefacient*, as in the Root of black Hellebore; which being chew'd, and for some time retain'd upon the Tongue, affects that Organ with a Numbness, or Paralytic Stupor. 13. *Astringent*, as in Galls; and, 14. *Pungent*, as in Spirit of Sal Armoniac; which two last *Tastes* he makes contrary to the Uctuous, as Penetrant and Stupefacient are contrary to the Vaprid one.

The *Compound Tastes* are very numerous; but we have Words to express but six of them, 1. *Astringent*, which is aftringent and bitter, as in the green and soft Stones of Grapes. 2. *Acerb*, properly so call'd, which is aftringent and acid, as in the Juice of unripe Grapes. 3. *Acrid*, which is pungent and hot. 4. *Mutricick*, which is salt and pungent, as in common Salt. 5. *Livorous*, which is Saltness join'd with some Pungency and Heat. 6. *Nitrous*, which is Saltness join'd with Pungency and Cold.

**TASTE**, in a Figurative Sense, is apply'd to the Judgment and Discernment of the Mind.

We talk, and we hear Talk, every Day, of *Taste*, of good *Taste*, and of bad *Taste*; and yet without well understanding what we mean by the Word: In Effect, a good *Taste* seems to be little else but right Reason, which we otherwise express by the Word *Judgment*. See REASON.

To have a *Taste*, is to give Things their real Value, to be touch'd with the Good, to be shock'd with the Ill; not to be dazzled with false Lustræ; but, in spite of all Colours, and of every Thing that might deceive or amuse, to judge soundly.

*Taste* and Judgment then should be the same Thing; and yet 'tis easy to discern a Difference: The Judgment forms its Opinions from Reflection; The Reason, on this Occasion, fetches a kind of Circuit to arrive at its End: It supposes Principles; it draws Consequences; and it judges; but not without a thorough Knowledge of the Case: So that after it has pronounce'd, it is ready to render a Reason of its Decrees. Good *Taste* observes none of these Formalities; e'er it has time to consult, it has taken its Side: As soon as ever an Object is presented it, the Impression is made; the Sentiment form'd; ask no more of it.

As the Ear is wounded with a harsh Sound; as the Smell is sooth'd with an agreeable Odor, before ever the Reason has meddled with those Objects, to judge of them; so the *Taste* opens itself at once, and prevents all Reflection.

They may come afterwards to confirm it, and discover the secret Reasons of its Conduct; but it was not in its Power to wait for them. Frequently, it happens not to know them at all; and what Pains soever it use, cannot discover what it was determin'd to think as it did.

This Conduct is very different from that the Judgment observes in its Decisions; unless we chuse to say that Good *Taste* is, as it were, a first Motion, or a kind of Instinct of right Reason, which hurries us on with Rapidity, and conducts more securely than all the Reasonings the could make. 'Tis a first Glance of the Eye, which discovers us as the Nature and Relations of Things in a Moment.

In Effect, *Taste* and Judgment are one and the same Thing, one and the same Disposition, and Habitude of the Soul, which we call by different Names, according to the different Manners wherein it acts: When it acts by Sensation,

by the first Impression of Objects, we call it *Taste*; and when by Reasoning, after having examin'd the Thing by all the Rules of Art, &c. we call it Judgment; So that one may say, *Taste* is the Judgment of Nature, and Judgment the *Taste* of Reason. See JUDGMENT.

Good *Taste*, as defin'd by Mad. Suedery, and Mad. Dacier, in an express Treatise of the Corruption of *Taste*, is a Harmony between the Mind and Reason; and a Person has more or less of this *Taste*, as that Harmony is more or less just.

One might perhaps improve on this Idea; and say, that Good *Taste* is nothing else but a certain Relation between the Mind, and the Objects presented to it.

A right Reason cannot but be mov'd and affected with Things conformable thereto, and wounded by those contrary: There is, then, a kind of Sympathy which unites them as soon as ever they meet; and their Union, their good Understanding, discover each other. Make a fine Discourse; use only the richest and noblest Expressions; if they contain an unhappy Thought, or an incoherent Reasoning; that Thought, this Reasoning, will immediately be felt by a Person of *Taste*: The Antipathy shews itself by a Movement of Aversion, as sudden, as lively, and as natural, as that which Nature inspires us withal for Toads or Spiders. See BEAUTY.

**TASTING**, the Sense whereby we distinguish Savours; or the Perception the Soul has of external Objects, by means of the Organ of *Taste*. See SENSE and TASTE.

Authors have differ'd much as to the Organs of *Tasting*. *Bouhins*, *Barbodin*, *Veslingius*, &c. place it in the laxer fleshy Parts of the Tongue: Dr. *Wharton* in the Gland at the Root of the Tongue: *Leuridanus*, in the thin Tunic covering the Tongue; others in the Palate, &c. But the great *Malpighi*, and, after him, all the latest Writers, place it in the Papillæ, chiefly lying about the Tip and Sides of the Tongue. See TONGUE.

These Papillæ arise from the Corpus Nervosum that covers the muscular Flesh of the Tongue; whence, passing thro' the Corpus Reticulare, they stand up under the external Membrane of the Tongue, erect, cover'd with Vaginae, or Sheaths of the said Membrane, to defend them from Objects too violent. See PAPILLÆ.

The Vaginae are porous; and stick out so far, that when the Aliment is squeeze'd, they enter within the same, to receive the Object, or the Matter of *Taste*.

These Papillæ, *Borhaave* conjectures, to arise from the ninth Pair of Nerves: And these he asserts, are the only Organ of *Taste*: Those others of the Tongue, Palate, Jaws, &c. he observes, contribute nothing thereto, tho' probably those of the Checks, next the Dentis Molares, may. See PAPILLÆ, PALATE, &c.

The Object of *Tasting*, is any Thing either in Animals, Vegetables, or Minerals, from which Salt or Oil may be extracted. See SALT.

*Tasting*, then, is perform'd by the Objects being attenuated, and mix'd with Saliva, warm'd in the Mouth, and apply'd to the Tongue; where, insinuating into the Pores of the membranous Vaginae of the nervous Papillæ, and penetrating to the Surface of the Papillæ themselves, it affects and moves them; by which Means a Motion is communicated along the Capillament of the Nerve to the common Sensory, and an Idea excited in the Mind, of Salt, Acid, Sweet, Bitter, Hot, Aromatic, Austere, or the like; according to the Figure of the Particles that strike the Papillæ, or the Disposition of the Papillæ to receive the Impulse. See SENSATION.

**TATIANITES**, a Sect of ancient Hereticks; thus call'd from *Tatian*, a Disciple of *Jesus Martyr*.

This *Tatian*, who has the Character of one of the most learned Men of all Antiquity, was perfectly Orthodox during the Life of his Master. He was, like him, a Samaritan, by Nation, not by Religion, as *Ephraïmus* seems to insinuate. They both belong'd to those Greek Colonies spread throughout the Country of the *Samaritanæ*.

*Justin* being dead, *Tatian* gave into the Errors of the *Valentinians*; and form'd a Sect call'd sometimes *Tatianites*, and sometimes *Encratites*. See ENCRATITES.

**TATH**, in old Law, a Privilege which some Lords of a Manor have, of having their Tenants Sheep folded at Night upon their own Ground.

**TAT-100**, q. d. 100-10, a Beat of a Drum, at Night, to advertise the Soldiers to repair to their Quarters in a Garrison, or to their Tents in a Camp. See DRUM.

**TAU**, in our ancient Customs, signifies a Cross: — *Tradendo dicto Comiti Thau elorenæ*. So Mr. *Selden*, in his Notes upon *Edmerti*, p. 152. *Leo Esiquia prædicti Regis Ava hoc opus ægægium Crucis Tauanae consolidavit*. See MON. 3. Tom. pag. 121.

**TAU**, or **TAW**, in Heraldry, an Ordinary, in Figure of a T. suppos'd to represent a Cross potent, the top Part cut off. It is thus call'd from the Name of the *T. tau*. See T.

TAUGHT, *Tight*, in the Sea Language, is the same as setting a Rope tight, or fast.

Thus they say, *Set taught the Shrouds, the Stays, or any other Ropes*, when they are too slack and loose.

TAUNT, a Sea Term: When the Masts of a Ship are too tall for her, the Sailors say, *she is taunt-masted*.

TAURI *liberi Libertas*: In some ancient Charters, *Taurus liber* signifies a common Bull to all Tenants within such a Manor or Liberty, *Cum libertate faldie, liberi Tauri & liberi Apri*, &c.

TAURUS, in Astronomy, the *Bull*; one of the Twelve Signs of the Zodiac, and the second in Order. See SIGN and CONSTELLATION.

The Stars in the Constellation *Taurus*, in *Protony's* Catalogue are 44; in *Tychon's* Catalogue 41; in the *Britannic* Catalogue 135. The Longitudes, Latitudes, Magnitudes, &c. whereof, are as follow:

Stars in the Constellation TAURUS.

TAURUS, in our ancient Customs, signifies a Husband. In leg. H. l. cap. 7. *videtur autem Maris esse, cuiusdamque Taurus aliusferi.*

TAUTOLOGY, in Grammar, a needless Repetition of the same Thing in different Words.

Some People, particularly the Jesuits, write and pronounce it *Tautology*. The Difference arises from the different Pronunciation of the Greek *tautologia* in *tautologia*. The modern Greeks, 'tis true, pronounce the *v* as *f*; and 'tis argued the Ancients did the like: But as Custom is the Standard of a Language, this Plea avails but little with Regard to the *English*.

**TAUTOLOGICAL Echo's**, are such Echo's as repeat the same Sound or Syllable many Times. See **ECHO**.

**TAWING**, call'd also by some *Skimming*, the Art or Manner of preparing or dressing Skins in white; to fit them for Use in divers Manufactures, particularly Gloves, Purfes, &c. See **LEATHER**, &c.

All Kinds of Skins may be *taw'd*; but 'tis chiefly those of Sheep, Lambs, Kids, and Goats, that are used to be dress'd this Way; as being those fittest for Gloves.

*Method of TAWING, or of dressing Skins in white.*

The Wooll or Hair being well got off the Skins, by means of Lime, &c. (as describ'd under the Article **CHAMOIS**) they are laid in a large Vat of Wood or Stone set in the Ground, full of Water, wherein quick Lime has been slak'd; where they continue a Month or six Weeks, as the Weather is more or less hot, or as the Skins are requir'd to be more or less soft and pliant.

While in the Vat, the Water and Lime is chang'd twice, and they are taken out and put in again every Day. When taken out for the last Time, they are laid all Night to soak in a running Water, to get out the greatest Part of the Lime; and, in the Morning, are laid, six together, on the wooden Leg, to get off the Flesh, by scraping them stoutly, one after another, on the Flesh Side, with a cutting two-handed Instrument, call'd a Knife; and while this is in Hand, they cut off the Legs, and other superfluous Parts about the Extremes.

This done, they are laid in a Vat or Pit with a little Water; where being well fill'd with wooden Pelfies for a quarter of an Hour, the Vat is fill'd up with Water, and the Skins rinsed therein.

They are next thrown on a clean Pavement to drain; which done, they are cast into a fresh Pit of Water, where being well rinsed, they are taken out, and laid on the wooden Leg, six at once, with the Hair Side outermost, over which they rub a kind of Whetstone very briskly, to soften, and fit them to receive four or five more Preparations given them on the Leg, both on the Flesh Side and the Hair Side, with the Knife, after the Manner above mention'd.

These over, they are put in a Pit with Water and Wheat Bran, and stirr'd about therein, with wooden Poles, till the Bran is perceiv'd to stick to them; and then they are left: As they rise of themselves to the Top of the Water by a kind of Fermentation, they are plung'd down again to the Bottom; and, at the same Time, Fire is set to the Liqueur, which rises as easily as if it were Brandy, but goes out the Moment the Skins are all cover'd.

This Operation is repeated as often as the Skins rise above Water; and when they rise no more, they are taken out; laid on the wooden Leg, the Flesh Side outermost; and the Knife pass'd over it to scrape off the Bran. The Bran thus clear'd, the Skins are laid in a large Basket, where they are loaden with huge Stones to promote their draining; and when sufficiently drain'd, their Feeding is given them, which is perform'd after the following Manner.

For a hundred large Sheep Skins, and for smaller in Proportion, they take eight Pounds of Alum, and three of Sea Salt, and melt the whole with Water in a Vessel over the Fire; pouring the Dissolution out while yet lukewarm into a kind of Trough, wherein is twenty Pounds of the finest Wheat Flower, with eight Dozen Yolks of Eggs; of all which is form'd a kind of Paste, a little thicker than Childrens Pap; which, when done, is put into another Vessel, to be used in Manner following.

A Quantity of hot Water being pour'd into the Trough wherein the Paste was prepar'd; two Spoonfuls of the Paste is mix'd therewith; in order to which, they use a wooden Spoon, which contains just what is requir'd for a Dozen Skins: And when the whole is well dilu'd, two Dozen of the Skins are plung'd therein: Care being taken, by the Way, that the Water be not too hot, which would spoil the Paste, and burn the Skins.

Having laid some time in the Trough, they are taken out, one after another, with the Hand; and stretch'd out; which is repeated twice: When they have all had their Paste, they are put in Tubs, where they are fill'd afresh with wooden Pelfies.

Then they are put in a Vat, where they remain five or six Days, or more; and are at last taken out in fair Weather, and hung out to dry on Cords or Racks: The quicker they dry the better; for if they be too long a drying, the Salt and Alum within them, are apt to make them rise in a Grain, which is an essential Fault in this Kind of Dressing.

When the Skins are dry, they are put up in Bundles, and just dip't in fair Water; from which being taken out and drain'd, they are thrown into an empty Tub; and, after some Time, are taken out, and trampled under Foot.

They are then drawn over a flat Iron Instrument, the Top whereof is round like a Bardelote, and the Bottom fix'd into a wooden Block; to stretch and open them: When open'd,

they are hung in the Air upon Cords to dry; and when dry, are open'd a second Time by repeating them over the same Instrument.

Lastly, they are laid on a Table, pull'd out, and laid smooth; and are thus in a Condition for Sale and Use.

After the same Manner are dress'd Horfes, Cows, Calves Skins, &c. for the Saddlers, Harness-makers, &c. as also Dogs, Wolves, Bears Skins, &c. excepting that in these the Use of the Paste is omitted, Salt and Alum Water being sufficient.

**TAWNY**, in Heraldry. See **TENNE**.

**TAX**, a Tribute levied on every Town, after a certain Rate; and paid yearly towards the Expences of the Government. See **TRIBUTE** and **IMPOST**.

The ancient *Tax* was what the *Subsidy* now is; excepting that the *Tax* was fix'd to a certain Sum, viz. the *Fifteenth* Part of what the Place was anciently valu'd at, whereas the *Subsidy* is variable according to Occasion; and that the *Tax* was lev'y'd on Cities and Towns, but the *Subsidy* on Persons. See **SUBSIDY**.

Anciently, the *Tax* was impos'd by the King at his Pleasure; but Edward I. bound himself, and his Successors, from that Time forward, not to levy it but by Consent of the Realm. See **FIFTEENTH**; see also **GILD** and **WATER-DEN**.

The Word *Tax* is form'd from the *Greek*  $\tau\alpha\chi\eta$ , Order. See **TAXIS**.

The Rate, &c. of the *Tax* was anciently call'd *Tallege*, from the *French* *taille*, *Tax*. See **TAILLE**.

The People of *France* were Strangers to *Tailles*, or *Taxes*, till the Time of *S. Louis*, when they were first impos'd in Form of Subsidies, necessary for the Support of the War in the Holy Land.

They were then extraordinary Levies, and were rais'd by Capitation; but were afterwards made perpetual under *Charles VII. Philip the Fair*, to raise Money without disturbing the People, call'd the People, as a third Estate, into the general Councils of the Realm. See **ESTATE**.

The Name *Taille* is deriv'd from the Tally of petty Tradesmen; in regard the Country People appointed to collect it, not being able to write, scored down what they receiv'd on Tallies. See **TALLY**.

*Tax* is also the Tribute which Tenants were occasionally to pay their Lord. See **LORD** and **TENANT**.

Most Lords had a Right of *raising* on four Occasions, viz. when the Lord was taken Prisoner in a just War; when he made his eldest Son a Knight; when he marry'd his eldest Daughter to a Gentleman; and when he made the Voyage of the Holy Land. See **CROISADE**.

*Nanda* shews the extravagant Rise of this Kind of *Taxes*: Those, he observes, which under *Charles VI.* only amounted to the Sum of 40000 Livres, were increas'd, under *Charles VII.* to the Sum of 1800000 Livres; under *Louis XI.* to 4740000 Livres; under *Charles VIII.* to 6000000; under *Louis XII.* to 7640000 Livres.

*Taxes* were distinguish'd into *free*, which were those due, in the four Cases, by Freeman, or those who held free Lands; and *servile* and *base*, which were those due from Persons of base Condition.

They were also distinguish'd into *real* and *personal*. The *personal* were impos'd on the Head of the Servant or Man in Main-morte, and so follow'd him where-ever he went.

**TAXERS**, two Officers yearly chosen in *Cambridge*, to see the true Gauge of all Weights and Measures.

The Name took beginning from *Taxing* and *Rating* the Rens of *Horses*, which was anciently the Duty of their Office.

**TAXIS**, in the ancient Architecture, the same with *Ordonnance* in the new, is describ'd by *Vitruvius* to be that which gives every Part of a Building its just Dimensions, with regard to its Use. See **ORDONNANCE**.

**TAYL**, in Heraldry, &c. is particularly us'd for the Tail of an Hart; those of several other Creatures having peculiar and distinct Names.

As that of a Buck, Roe, or any other Deer, is call'd the *Single*; of a Boar, the *Wrest*; of a Fox, the *Byg*; of a Wolf, the *Stern*; and of a Hare and Coney, the *Scot*.

**TCHELMINAR**, or **TCHILMINAR**, or, as we pronounce it, *Chelminar*, one of the most celebrated Ruins in the World. See **RUINS**.

*Tchelminar* is the Remains of a Palace, suppos'd by some to have stood in the Middle of the City *Esfekbar*, built by Queen *Hannai*; others will have it the Palace of the Kings of *Persia* in the ancient *Persopolis*, the Capital of that Kingdom.

The Word in the *Persian* signifies 40 Towers, or 40 Columns. See **CHILMINAR**.

**TEA**, or, as the *Chinese* call it, *TCHA*, the Leaf of a Tree or Shrub, growing in several Provinces of *China*, *Japan*, and *Siam*.

The *Tea* Plant affects Valleys, and the Feet of Mountains, and a stony Soil. Its Seed is usually sown in Places expos'd to the South; and bears three Years after sown. The Root resembles

resembles that of the Peach Tree: The Leaves are green, length at the Point, and pretty narrow, an Inch and half long, and jagged all around. The Flower is much like that of the wild Rose. The Fruit is of different Forms, sometimes round, sometimes long, sometimes triangular, of the ordinary Size of a Bean; containing two or three Peas, of a Mouse Colour, including each a Kernel. These Peas are the Seeds by which the Plant is propagated.

The Tree is of various Heights, from one Foot to an hundred: Some there are which two Men can't fathom, while others scarce exceed the feeblest Shrub in a Garden.

The best Time to gather the Leaves of *Tea*, is while they are yet small, young, and juicy: When gather'd, they are pass'd over the Smoak of boiling Water to moisten them; then they are laid on Copper Plates, which are heated; and thus, the Leaves drying, they curl up in the Manner they are brought to us.

'Tis very rare to find *Tea* perfectly pure; the *Chinese* always mixing other Herbs with it, to increase the Quantity. Indeed, the Price 'tis sold for among them is moderate enough; usually 'tis about Three-Pence a Pound Sterling, never more than Nine-Pence.

The *Chinese* know nothing of *Imperial Tea*, *Flower of Tea*, and many other Names, which in *Europe* serve to distinguish the Goodness, and the Price of this fashionable Commodity; and yet beside the common *Tea*, they distinguish two other Kinds, viz. the *Voui* and *Samilo*, which are reserv'd for People of the first Quality, and sick Folks.

We have three Kinds of *Tea* in *Europe*, viz. *Green Tea*; which is the common *Tea* of the *Chinese*, &c. *F. le Compte* calls it *Bing Tea*, and says 'tis gather'd from the Plant in *Afriq.*

'Tis held very digestive, and a little corrosive: It gives a pale greenish Tincture to Water; and its Leaves are much twisted.

The second is *Zobes Tea*, which is the *Voui Tea*, or *Bau Tea* of the *Chinese*. *F. le Compte* makes this only to differ from the *Green Tea*, by its being gather'd a Month before it, viz. in *March*, while in the Bud; and hence the Smallness of the Leaves, as well as the Depth of the Tincture it gives Water. But 'tis much more probably the *Tea* of some particular Province; the Soil being found to make an Alteration in the Properties of the *Tea*, as much as the Season of gathering it.

'Tis all bought at *Nankin*; and it is but lately that the *Dutch* have introduced it into *Europe*, where it begins to be much in Vogue.

The third is *Red Tea*, or *Tarrar Tea*, or *Homan Tcha*, which tinges the Water with a pale Red, and which is said to be extremely digestive: By means hereof, it is that the *Tarrars* are said to be able to feed on raw Flesh. Its Taste is Earthy; and much the least agreeable of them all; but little known in *England*.

*Tea* is to be chosen Green, of the briskest Smell, as whole as possible; and the greatest Care taken that it hasn't been expos'd to the Air to pall, and evaporate.

The Drink, *Tea*, is made in *China*, and throughout the greatest Part of the East, after the same Manner as in *Europe*; viz. by infusing the Leaves in boiling Water, and drinking the Infusion hot. Indeed, among us, 'tis usual to temper its Bitterness with Sugar, which the Orientals use little or none of.

However, the *Japanese* are said to prepare their *Liquor* a somewhat different Way, viz. by pulverizing it; stirring the Powder in hot Water, and drinking it as we do Coffee.

The *Chinese* are always taking *Tea*, especially at Meals: 'Tis the chief Treat wherewith they regale their Friends. The most moderate take it at least thrice a Day; others, ten times, or more: And yet 'tis computed, the Consumption of *Tea* among the *English* and *Dutch* is as great in Proportion as among the Orientals. In *France*, the Use of *Tea* is much declin'd, and Coffee is now become the prevailing *Liquor*. See *COFFEE*.

As to the Properties of *Tea*, they are strangely controverted: The Eastern Nations are at least as much possess'd with them as the *Europeans*; but 'tis, perhaps, because Imagination bears as great a Sway there as here. The Reason why the Gout and Stone are unknown in *China*, is ascrib'd to the Use of this Plant; which is said further to cure Indigestions of the Stomach, to carry off a Debauch, and to give new Strength for Drinking, to dispel Wind, to cure the Vapours, &c.

*Sin. Paulii*, Physician of the King of *Denmark*, in an express Treatise on this Plant, endeavours to shew, that these Virtues ascrib'd to it in the East, are local, and don't hold with the Inhabitants of *Europe*. He holds, that those past their 40th Year should never use it, as being too delicate: That *Tea* has no other Virtues but those of Betony: And adds, with *Banlin*, that 'tis only a Species of Myrtle found in *Europe* as well as the *Indies*.

But this Opinion is refused by *Pecklin*, in a Treatise of *Tea*, intitled, *Theophilus Bibaculus, sive de Potu Theæ*

*Dialogus*; Where he maintains, That 'tis good to prevent Scorbutic Diseases; that its gentle astringent Virtues strengthens the Tonic Motion of the Inclines, &c. But he blames the Drinking it with Milk; and especially after a full Meal, or after much Wine.

TEAM and THEAME, or TEM and THEME, in our ancient Customs, signifies a Royalty granted by the King's Charter to the Lord of a Manor, for the having, restraining, and judging Bondmen, Neifs, and Villains, with their Children, Goods, and Chattels, in his Court.

TEARS, *Lachryme*, a watry Humour, issuing out at the Corner of the Eye, by the Compression of the Muscles; serving to moisten the Cornea, to express our Grief, and even to alleviate it. See *LACHRYME* and *LACHRYMALIA PUNCTA*.

The Ancients had an Opinion, that the *Tears* of the Living were of use, at least of Pleasure, to the Dead; for which Reason they took great Care to procure them abundance at their Funerals; so much, as to constitute a Profession or Trade of Weepers, to judging those of their own Families insufficient. See *LACHRYMATORY* and *FUNERAL*.

Deer, when at Bay, are commonly said to shed *Tears*: Indeed, they ordinarily do yield a Sort of *Tears*, which issuing into the two Clefts underneath, call'd *Lachrymatories*, are there condens'd into a kind of yellow *Liquor*, or Gum; which diluted in white Wine or *Cardus Water*, is repared a Sovereign Remedy for Fits of the Mether, and the Falling Sickness.

*Virgil* makes the Horse of *Pallas* shed *Tears* at the Funeral Pomp of his Master: This is one of the Passages which the modern Critics censure as a Breach of Probability. See *PROBABILITY*.

TEAZEL, or TEASEL, the *Fallers Tzibile*, a kind of Plant much used by the Fullers, Cloth-workers, and Stocking-Weavers, to card, or draw out the Wool or Nap from the Thread or Ground of several Kinds of Cloths, Stuffs, Stockings, &c. in order to render them closer and warmer. See *FULLING*, &c.

This Plant is cultivated with great Care in several Parts of *France*, particularly *Normandy*; and the Exportation thereof prohibited, by Reason of the vast Use thereof in the Woolen Manufacture. See *CARDUUS*.

The Stem of the Plant is very high; and its Extremity, as also those of its Branches, bear a little round prickly yellowish Ball or Bur, which is the Part used.

The largest Burs, and those most pointed, are esteem'd the best; and are now call'd *Male Teazels*, mostly used in the dressing and preparing of Stockings and Coverlets; the smaller Kind, properly call'd the *Fullers or Drapers*, and sometimes the *Female Teazels*, are us'd in the Preparation of the finer Stuffs, as Cloths, Rataens, &c.

The smallest Kind sometimes, call'd *Linnors Heads*, are us'd to draw out the Nap from the coarser Stuffs, as Bays, &c.

TECHNICAL, something that relates to an Art. See *ART*.

In this Sense we see *Technical Words*, *Technical Verses*, &c. And in this Sense *Dr. Harris* intitles his Dictionary of Arts and Sciences, *Lexicon Technicum*.

The Word is form'd of the *Greek*, τεχνικος, Artificial, of τεχνη, Art.

TECHNICAL, is a Term particularly apply'd to a kind of Verses, wherein are contain'd the Rules or Precepts of any Art; thus directed to help the Memory to retain them.

*Technical Verses* are usual in Chronology, &c. Such, e. g. are those expressing the Order and Measures of the Calends, Nones, &c. See *CALENDS*.

Those expressing the Seasons; See under *AVOUS*.

Those expressing the Order, &c. of the Signs; See under *SIGN*.

*F. Labbe* has compos'd *Latin Verses*, including all the Epochs in Chronology; and *F. Buffier*, after his Example, has put both Chronology and History in *French Verses*; and since, Geography too.

*Technical Verses* are commonly compos'd in *Latin*: They are generally wretched ones, and often barbarous; but 'tis Utility is all aim'd at. To give some Idea hereof, we will here add a few Instances. The Casuists include all the Circumstances which make us share with another in a Theft, or other Crime, in these two *Technical Verses*.

*Justi, Concilians, Confessus, Palpo, Recorsus, Participans, Matus, non Oibans, non Manifestans.*

The first of *Father Buffier's Technical Verses* of the History of *France*, are these:

*Sei Loix en quatre Cents Pharemond Introduit,  
Clovisus Chensels, an Actus oroguis,  
Merovee, avec lui Combattit Arlia;  
Childeric Jar cloiffe, mais en le rasulla.*

**TECHNICAL Words**, are what we otherwise call *Terms of Art*. See **TERM**.

**TE DEUM**, a kind of Hymn, or Song of Thanksgiving, used in the Church, beginning with the Words *Te Deum laudamus, We praise thee, O God*.

'Tis used to be sung in the *Rossich* Church with extraordinary Pomp and Solemnity, upon the gaining a Battle, or other happy Event. The *Te Deum* is usually ascrib'd to St. Ambrose, and St. Augustin.

**TEETH**, *Dentes*, in Anatomy, little hard smooth Bones, set in the Gums, and serving to masticate or chew the Food, to bite, &c. See **FOOD**, **MASTICATION**, &c.

Men, and most terrestrial Animals, as also some Fishes, have two Rows of Teeth, the one in the upper Jaw, and the other in the lower. See **GUM** and **JAW**.

In Men, the ordinary Number of Teeth is 32, sixteen in each Jaw; all fix'd in peculiar Sockets, call'd *Alveoli*; by the Junction or Articulation, call'd *Gomphosis*, and by the Joyners, *Pegging*. See **GOMPHOSIS**.

They are of three Sorts: Those in the fore Part of each Jaw are call'd *Incisors*, *Cutters*; and are four in Number in each Jaw, broad, thin, and flat: Some call them the *Primores*, because they appear the first; others the *Adversis*; and others the *Ridentes*, *Laughers*, because they shew themselves first in Laughing. See **INCISORES**.

Behind these, on each Side of each Jaw, stand two which are a little more prominent, and pointed, call'd *Canini*, by the People *Eyes-Teeth*, because Part of the Nerve which moves the Eyes is inserted into them; whence the Danger of pulling them out. See **CANINI**.

Behind these are five in each Jaw, call'd the *Molares* or *Grinders*, being those which in Men serve chiefly for Mastication. See **MOLARES**.

The *Incisors* have generally only a single Root, or Twang; the *Canini* sometimes two; and the *Molares* three or four, especially the hind ones, which are put to the greatest Stress.

The *Teeth*, according to *Peyer*, are form'd of convolv'd Skins, harden'd and bound together by a viscid Mucus: And if we view the Grinders of Deer, Horses, and Sheep, &c. we shall find great Reason to be of his Mind.

Others speak of their Formation otherwise. The Sockets, Dr. *Quincy* observes, are lin'd with a thin Membrane, upon which are several Vessels, thro' which there passes a thick transparent Humour, that, as it increases, hardens in form of Teeth; and about the seventh or eighth Month after Birth, they begin to pierce the Edge of the Jaw, tear the Periostracum and Gums, which being very sensible, create a violent Pain, and other Symptoms incident to Children in the Time of Dentition. See **DENTITION**.

The *Teeth* begin not to appear all at a Time; but first the *Dentes incisivi* of the upper, and then those of the lower Jaw appear, because the thinnest and sharpest; after them come out the *Canini*, because they are sharper than the *Molares*, but thicker than the *Incisivi*; and last of all the *Molares*, because they are thickest and bluntest.

Of this viscous transparent Liqueur, which is indurated into the Substance of the *Teeth*, there are two Lays, one below the other, divided by the same Membrane which covers all the Cavity of the Jaw: The uppermost Lay forms the *Teeth* which come out first; but about the seventh Year of Age they are thrust out by the *Teeth* made of the undermost Lay, which then begin to sprout; and if these *Teeth* be lost, they never grow again.

If some have been observ'd to shed their *Teeth* twice, they have had three Lays of this viscous Humour, which hardly ever happens.

About the one and twentieth Year, the two last of the *Molares* spring up, and are call'd *Dentes Sæpientie*, because they arise when the Person is at Years of Discretion.

The *Teeth*, M. de la Hire the younger, has found to have all that Part which stands out beyond the Jaw, cover'd with a peculiar Substance quite different from the Bone, which he calls *Email*, or *Polish*.

This *Email*, by some others call'd the *Periostracum*, is compos'd of an Infinity of little Fibres, which grow to the Bone by their Roots, much like Nails or Horns. See **NAIL**.

This Composition is very discernible in a broken Tooth, where the Origin and Situation of the Fibres are apparent. M. de la Hire is perswaded, that the Growth of these Fibres is perform'd much like that of Nails. If by any Accident a little Part of this *Email* be broke off, so that the Bone is left bare, that is, if the very Roots of the Fibres be taken away, the Bone, in that Part, will grow curious, and the *Teeth* inevitably perishes; there being no Bone in the Body that can bear the Air. See **BONE**.

Indeed, in some Persons the *Email* is very much wore and shatter'd, by rubbing them much with *Dentifrices*, &c. so that the Bone appears thro', and yet the *Teeth* keeps sound; but the Reason is, that the Bone is not quite bare, but there is still a thin Lay of the *Email* which preserves it;

but this Lay being thin enough to be transparent, the yellow Bone is seen thro' it.

Sometimes also a *Teeth* breaks, and the Bone is left bare, yet the Person does not find any Pain or aking from it: The Reason is, that the Hole in the Root or Twang of the *Teeth* thro' which a little Branch of a Nerve enters that renders the *Teeth* sensible, being quite stopp'd up by Age, or the like, has pinch'd off the Nerve, and taken away all Communication between the *Teeth* and the Origin of the Nerves, and, by Consequence, all Sensibility.

It also happens in some *Teeth*, that the Fibres are only in little Sheaves or Bundles, whose upper Extremities meet, but not their lower; as is the Case in most of the Grinders, where the Separation of the Bundles is apparent. Here, if the upper Extreme of the Fibres chance to be broken, or wore off, the Separation between two of the Bundles often enlarges itself, so as to admit some hard Particle of the Food, by which Means a little Aperture being made thro' the *Email*, the Bone is laid bare, and the *Teeth* soon rots. This Inconvenience is remedy'd a little by stopping up the Hole with Lead, which prevents the sharp pungent Parts of the Food from penetrating to the Bone, and there occasioning Pain. See **ODONTALGY**.

What we have said is illustrated by the adjoining Figures, where ACPH expresses the Extremity of the Jaw the *Teeth* are set in; AFC and FGH the Roots or Twangs of the *Teeth* includ'd in the Jaw; ADCB and FLHL the *Email*, compos'd of little Fibres ranged aside of each other, which cover all that Part of the *Teeth* without Side the Jaw; I I several Threads join'd at the upper Extremity, but apart at the lower; MM Holes thro' which the Nerves enter the Roots of the *Teeth*; NN a *Teeth* closed up.

The *Teeth*, Mr. *Derham* observes, furnish us with a notable Instance of the Wisdom and Goodness of the Creator: Their peculiar Hardness is very remarkable, considering the tender Substance they are form'd of. See **BONE**.

The Ancients, and even *Riolanus*, among the Moderns, have held them to be incombustible, and the only Part of the Body that was so; on which Account they were placed with great Care in the Urns among the Ashes of the Deceased: But the Opinion is false, there having only been two found in the Tombs of *Wesphalia*, one of which was half calcin'd.

Another popular Error is, that the *Teeth* continue growing for ever, even in old People, to the Hour of their Death. M. de la Hire observes, 'tis only the *Email* or *Polish* that grows, which is a Substance very different from the *Teeth*.

The Form, Disposition, and Order of the *Teeth* are admirable: The foremost weak and far from the Centre, as being only Preparers to the rest; the others being to grind and mince, are accordingly stronger, and placed near the Centre of Motion.

*Galen* puts the Case, that the Order of the *Teeth* should have been inverted, and the Grinders, e. g. put in the Place of the Incisors; and asks, what Use the *Teeth* had then been of, and what Confusion would not there have arose by such a slight Oversight in the Disposal only? Upon which he argues, that if any Person should dispose a Company of 32 Men, the Number of the *Teeth*, in a just Order, we should judge him an intelligent Person: Why then should we not judge the same of the Creator, &c. ? De usu Partium.

Again, their various Forms in various Animals is no less considerable, being all curiously adapted to the peculiar Food and Occasions of the several Species of Animals: Thus in the Rapacious they are fitted for the catching, holding, and tearing the Prey; in Herbaceous for the Gathering and Communion of Vegetables; and in such as have no *Teeth*, as Birds, the Bill supplies the Defect. See **BILL**.

Add, that the temporary Defect of them is no less observable in some: That Children, for Instance, should have none while they are not able to use them, but to hurt themselves, or the Mother; and that at the very Age when they can take in the more substantial Food, and live without the Breast, and begin to need *Teeth* for the Sake of Speech; that then, we say, their *Teeth* should begin to

appear, and gradually grow as they more and more stand in need of them.

Some Persons are born with all their *Teeth*, as *Mareus Curtus Dentatus*, and *Cocius Pampirius Carbo*: Others have only had one continu'd *Tooth*, reaching the whole Length of the Jaw, as *Pyrrhus*, King of *Epirus*, and *Praxias*, Son of the King of *Bithynia*: Others are said to have had two or three Rows on the same Jaw, as *Hercules*.

*Alenrochius*, a German Physician, assures us, that he saw an old Man at *Cleves*, in 1666, aged 120 Years, who had a new Set of *Teeth* two Years before, which cut with great Pain; and he saw an *Engijlman* at the *Hogue*, who cut a new Set of *Teeth* in his 118th Year.

A Danish Physician, named *Hagerus*, maintains in certain Theories, that one may hear with the *Teeth*. See HEARING.

As to Animals, there are some Fishes have *Teeth* on their Tongues, as Trouts; others have them at the Bottom of the Gullet, as the Cod Fish; some, as the great Sea-Dog, call'd *Canis Carcharius*, have three, four, or five Rows of *Teeth* on the same Jaw; the Requiem and Crocodile have each three, and those all Incisors; Vipers and Sea Frogs have two large crooked Canine *Teeth*, which are moveable, and ordinarily lie flat, only rais'd when they would bite. See VIPER, &c.

The Toad and Cattle Fish have no *Teeth*, and yet bite. See BITE.

Artificial TEETH, are those set in lieu of natural ones which are wanting.

They are usually made of Ivory; but in regard Ivory, in a little Time, grows yellow in the Mouth, *Fabriceus* advises them to be made of the Shin-bone of a Ballock, which preserves its Colour.

The Custom of wearing Ivory *Teeth*, and of binding them in with a Gold Wire, is very ancient; *Lucian* and *Martial* speak of it as practis'd among the *Romans*.

*Guillemus* gives as the Composition of a Paste for making artificial *Teeth*, which shall never grow yellow: The Composition is white Wax granulated, and melted with a little Gum Elemi, adding Powder of white Mastick, Coral, and Pearl.

TEETH in the Manage. 'Tis by a Horse's *Teeth*, chiefly, that his Age is known.

The *Teeth* of a Horse are of four Kinds, viz. 24 Jaw *Teeth*, or Grinders at the Bottom of the Mouth, beyond the Bars; 12 on each Side the Canal, ranged 6 above, and as many below: These never fall, nor are they used for the Distinction of Age.

12 Foot-*Teeth*, which come in the fore Part of the Mouth at three Months old, and are usually cast at two Years and half.

4 *Tusks* placed alone in the Bars between the fore *Teeth* and Grinders, one on each Side below, and as many above, Mares seldom have *Tusks*, and when they have, they are small, and are reckon'd an Imperfection.

12 Gatherers growing before in the Place of the Foot-*Teeth* and Grinders, and with which Horses draw their Forster, cut Grass, &c. These are divided into

*Nippers*, which are the two foremost *Teeth* above and below, which a Horse first changes.

*Middle Teeth*, or *Separators*, parting the *Nippers* from the Corner *Teeth*, are the two next the *Nippers*, one on each Side of 'em both above and below, and are those which change next.

*Outward or Corner Teeth*, are those next the *Tusks* above and below, and which are cast last. 'Tis by these that the Horse's Age is known. They shoot forth from the Gum at five Years of Age, and have a Hollow, wherein is a black Speck, resembling a Bean, call'd the *Mark*, which continues till seven or eight Years of Age, and then begins to fill up. See MARK.

TEGUMENT. See INTEGRUMENT.

TEINTS, and Semi-TEINTS, in Painting, the several Colours us'd in a Picture, consider'd as more or less high, or bright, or deep, or thin, or weaken'd, or diminish'd, &c. to give the proper Relievo, or Softness, or Distance, &c. of the several Objects. See COLOURING.

The Word is pure French, where it signifies the same Thing.

TEARS, the third Part of a Pipe, or the Measure of forty-two Gallons. See THREE, MEASURE, &c.

TEKUPHE, in the Jewish Chronology, are the Times wherein the Sun proceeds from one Cardinal Point to the next. See CARDINAL POINT.

The Term is also apply'd to the Moments wherein the Sun enters a Cardinal Point: These four Terms, or *Tekuphe*, are observ'd among the Jews with a World of Ceremony: The Reason, as we are inform'd by *Munster*, is this:

That People have a Notion, that in each *Tekuphe* the Sun has a several Angel appointed to guard and direct it; and that in the very Point wherein the Sun finishes one *Tekuphe*, and enters upon another, before the one Director

has taken Place of the other, the Devils have a Power to exercise all Kinds of Tyranny in the Water.

And hence, they say, that if any body drinks the smallest Quantity of Water at that Time, he'll infallibly have a Dropsy, or some other grievous Distemper.

TELAMONES: The *Romans* call'd by this Name, what the Greeks named *Atraves*; viz. the Figures of Men supporting the Out-jettings of Cornices, &c. in Architecture. See ATRAVES.

A late Author thinks, that the Word *Telescopon*, which in Greek is *τῆλεσκοπία*, a Wretch that bears Misfortunes with Patience, does not disagree with those Statues, which, in Architecture, sustain such Loads.

TELESCOPE, an Optical Instrument, consisting of several Glasses or Lens's, fitted into a Tube; thro' which remote Subjects are seen as if nigh at Hand. See LENS and OPTIC GLASS.

In *Telescopes*, the Lens or Glass turn'd towards the Object, is call'd the *Object Glass*; and that next the Eye, the *Eye-glass*; and if the *Telescope* consists of more than two Lens's, all but that next the Object, are call'd *Eye-glasses*. See OBJECT GLASS, &c.

The Invention of the *Telescope* is one of the noblest, and most useful these Ages have to boast of: By means hereof, the Wonders of the Heavens are discover'd to us, and Astronomy brought to a Degree of Perfection, which former Ages could have no Notion of. See ASTRONOMY.

Indeed, the Discovery is owing rather to Chance, than to Thought; so that 'tis the good Fortune of the Discoverer, not his Skill or Ability, we are indebted to: On this Account it concerns us the less to know, who it was first hit on this admirable Invention. 'Tis certain it must be casual, since the Theory it depends on was not then known.

*Johannes Baptista Porta*, a noble Neapolitan, is asserted by *Wolffius* to be undoubtedly the first that made a *Telescope*; from this Passage in his *Magia Naturalis*, printed in 1549: "If you do but know how to join the two (viz. the Concave and Convex Glasses) rightly together, you will see both remote and near Objects, much larger than they otherwise appear, and withal very distinct. In this Way we have been of good Help to many of our Friends, who either saw remote Things dimly, or near ones confusedly; and have made them see every thing perfectly."

But 'tis certain *Porta* did not understand his own Invention, and therefore neither troubled himself to bring it to greater Perfection, nor ever apply'd it to Celestial Observation. What is more, the Account *Porta* gives of his Concave and Convex Lens's is so dark and indistinct, that *Kepler*, who examin'd it, by particular Command of the Emperor *Rudolphus*, declar'd to that Prince, that it was perfectly unimelligible.

Fifty Years afterwards, a *Telescope*, 12 Inches long, was made and presented to Prince *Maurice* of *Nassau*, by a Spectacle-maker of *Middlebourg*; but Authors are divided about his Name. *Sirrusus*, in a Treatise of the *Telescope*, printed Anno 1618, will have it to be *John Lipperseus*: And *Borel*, in an express Volume on the Invention of the *Telescope*, publish'd in 1655, shews it to be *Zacharias Janssen*, or, as *Wolffius* has it, *Hanssen*.

*Joh. Laurentius*, another Workman of the same Town, passes for a third Inventor; having made one in 1610, on the mere Relation given him of that of *Zachary*.

In 1620, *James Metius*, Brother of *Adrian Metius*, Professor of Mathematics at *Franker*, came with *Drebel* to *Middlebourg*, and there bought *Telescopes* of *Zachary's* Children, who had made them publick; and yet *Haer. Metius* has given his Brother the Honour of the Invention; in which he is mistakenly follow'd by *Des Cartes*.

But none of these Artificers made *Telescopes* of above a Foot and half: *Simon Marius* in *Germany*, and *Galileo* in *Italy*, first made long ones, fit for Celestial Observations.

*Le Ross* relates, that *Galileo* being then at *Venice*, was told of a Sort of Optic Glass made in *Holland*, which brought Objects nearer: Upon which, setting himself to think how it should be, he ground two Pieces of Glass into Form as well as he could, and fitted them to the two Ends of an Organ Pipe, and shew'd, at once, all the Wonders of the Invention to the *Venetian* Nobiles on the Top of the Tower of St. Mark. That Author adds, that from this Time *Galileo* devoted himself wholly to the improving and perfecting of the *Telescope*; and that he thereby almost deserv'd all the Honour usually done him, of being reputed the Inventor of the Instrument, and of its being denominat'd from him *Galileo's Tube*.

*F. Mobilion*, indeed, relates, in his Travels thro' *Italy*, that in a Monastery of his own Order, he saw a Manuscript Copy of the Works of *Commaeus*, written by one *Corradus*, who liv'd in the 13th Century; in the third Page whereof, was seen a Portrait of *Prodomy* viewing the Stars thro' a Tube of four Draws: But that Father does not say that the Tube had Glasses in it. In effect, 'tis more than probable, that such Tubes were then used for no other Purpose but to preserve

preferre and direct the Sight, or to render it more distinct, by singling out the particular Object look'd at, and shutting out all the foreign Rays reflected from others, whose Proximity might have render'd the Image less precise.

This Conjecture is verifi'd by Experience; we having often observ'd, that without a Tube, by only looking thro' the Hand, or even the Fingers, or a Pin-Hole in a Paper, Objects shall appear more clear and distinct than otherwise.

Be this as it will, 'tis certain the Optic Principles, whereon *Telescopes* are founded, are contain'd in *Euclid*, and were well known to the ancient Geometricians; and 'tis for want of Attention thereto, that the World was so long without that admirable Invention; as, no doubt, there are numerous others lying hid in the same Principles, only waiting for Reflection or Accident to bring them forth.

*Telescopes* are of several Kinds, distinguish'd by the Number and Form of their Lenses or Glasses, and denominated from their particular Uses, &c. such are the *Terrestrial* or *Land Telescope*, the *Celestial* or *Astronomical Telescope*: To which may be added, the *Galilean* or *Dutch Telescope*, the *Reflecting Telescope*, and the *Aerial Telescope*.

*Galileo's*, or the *Dutch Telescope*, is a *Telescope* consisting of a Convex Object-glass, and a Concave Eye-glass. See CONCAVE and CONVEX.

This, of all others, is the most ancient Form; being the only Kind made by the Inventors, *Galileo*, &c. or known, before *Huygens*: Whence its Name. Its Construction, Perfections, Imperfections, &c. are deliver'd in what follows.

#### Construction of Galileo's or the Dutch TELESCOPE.

In a Tube prepar'd for the Purpose, (the Structure whereof see under the Article TUBE) at one End is fitted a Convex Object Lens, either a plain Convex, or Convex on both Sides, but a Segment of a very large Sphere: At the other End is fitted an Eye-glass, concave on both Sides, and the Segment of a less Sphere; so to dispos'd, as to be the Distance of the Virtual Focus before the Image of the Convex Lens. See FOCUS.

#### Theory of Galileo's TELESCOPE.

Now, in an Instrument thus fix'd, all People, except *Myopes*, or those short-sighted, must see Objects distinctly, in any erect Situation; and increased in the Ratio of the Distance of the Virtual Focus of the Eye Glass, to the Distance of the Focus of the Object Glass.

But, for *Myopes* to see Objects distinctly thro' such an Instrument, the Eye-glass must be fix'd nearer the Object-glass. The Reason of these Effects will appear from what follows:

For, 1<sup>o</sup> Since 'tis far distant Objects that are to be viewed with a *Telescope*, the Rays proceeding from the same Point of the Object, will fall on the Object-glass, parallel; and, consequently, by their Refraction thro' the Convexity will be thro' Converging on the Eye-glass. But by their Refraction thro' the Concavity hereof, they will be again render'd parallel; and in such Disposition will enter the Eye. See RAY, CONCAVITY, CONVEXITY, and CONVERGING.

But all, excepting *Myopes*, see Objects distinctly by parallel Rays. See VISION and PARALLEL. Therefore the first Point is clear.

2<sup>o</sup> Suppose A (Tab. Optics, Fig. 41.) to be the Focus of the Object-glass; and suppose AC the furthest Ray on the Right Hand of the Object that passes through the Tube: After Refraction, it will become parallel to the Axis BI, and, consequently, after a second Refraction through the concave Lens, will diverge from the virtual Focus. Wherefore, since all the Rays coming from the same Extreme to the Eye placed behind the concave Lens, are parallel to LE; and those from the middle of the Object, parallel to FG (as shown under the former Article) the middle Point of the Object will be seen in the Axis GA; and the right Extreme, on the right Side, viz. in the Line LN, or parallel thereto: that is, the Object will be erect; Which is the second Point.

3<sup>o</sup> Since all Right Lines parallel to LE cut the Axis under the same Angle; the Semi-diameter of the Object will be seen through the *Telescope*, under the Angle EFI; the Rays LE and GI entering the Eye in the same Manner, as if the Pupil were placed in F. If, now, the naked Eye were in A, it would see the Semi-diameter of the Object under the Angle cAb or CAB. But since the Object is (supposed very remote, the Distance AF in respect hereto is nothing, and therefore the naked Eye, even in B, would see the Semi-diameter of the Object under an Angle, equal to A.

The Semi-diameter of the Object, therefore, seen with the naked Eye, is to that seen through the *Telescope* as IM to I E. But 'tis demonstrat'd, that IM : IE :: AB : A B; that is, the Semi-diameter seen with the naked Eye, is to that viewed through the *Telescope*; in the Ratio of the Distance of the Virtual Focus of the Eye-glass FI, to the Distance of the Focus of the Object-glass, AB; Which was the third Point.

Lastly, *Myopes* have their Retina too far from the crystallin Humour; and diverging Rays, concur at a greater Distance than parallel ones; and those that were parallel become diverging by bringing the Eye-glass nearer the Object-glass; by means of such Approach, *Myopes* will see Objects distinctly through a *Telescope*; Which is the fourth Point.

Hence, 1<sup>o</sup> To have the whole Object visible, the Semi-diameter of the Pupil must not be less than the Distance of the Rays LE and GI; and, therefore, the more the Pupil is dilated, the greater Field or Compass will be taken in by the *Telescope*, and vice versa; so that coming out of a dark Place, or shutting the Eye for some time 'er you apply it to the Glass, you will take in a greater Field at first; Glance, than afterwards, when the Pupil is again contracted by the Increase of Light. See PUPIL.

2<sup>o</sup> Since the Distance of the Rays EL and IK is greater, at a greater Distance from the Lens; the Compass taken in by the Eye at one View, will be greater as the Eye is nearer the Concave Lens.

3<sup>o</sup> Since the Focus of a Plano Convex Object Lens, and the Focus of a Plano Concave Eye Lens, is at the Distance of the Diameter; and the Focus of an Object-glass, convex on both Sides, and the virtual Focus of an Eye-glass concave on both Sides, is at the Distance of a Semi-diameter; if the Object-glass be Plano Convex, and the Eye-glass Plano Concave, the *Telescope* will increase the Diameter of the Object, in the Ratio of the Diameter of the Convexity to that of the Concavity: If the Object-glass be Convex on both Sides, and the Eye-glass Concave on both Sides, it will magnify in the Ratio of the Semi-diameter of the Convexity to that of the Concavity; if the Object-glass be Plano Convex, and the Eye-glass Concave on both Sides, the Semi-diameter of the Object will be increased in the Ratio of the Diameter of the Convexity to the Semi-diameter of the Concavity: And, Lastly, if the Object-glass be Convex on both Sides, and the Eye-glass Plano Concave, the Increase will be in the Ratio of the Diameter of the Convexity, to the Semi-diameter of the Convexity.

4<sup>o</sup> Since the Ratio of the Semi-diameters is the same as that of the Diameters; *Telescopes* magnify the Object in the same Manner, whether the Object-glass be Plano Convex, and the Eye-glass Plano Concave, or whether the one be Convex on both Sides, and the other Concave on both.

5<sup>o</sup> Since the Semi-diameter of the Concavity, has a less Ratio to the Diameter of the Convexity, than its Diameter has; a *Telescope* magnifies more, if the Object-glass be Plano Convex, than if it be Convex on both Sides.

6<sup>o</sup> The greater the Diameter of the Object-glass, and the less that of the Eye glass; the less Ratio has the Diameter of the Object viewed with the naked Eye, to its Semi-diameter viewed with a *Telescope*; and, consequently, the more is the Object magnified by the *Telescope*.

7<sup>o</sup> Since the Semi-diameter of the Object is increased in the Ratio of the Angle EFI; and the greater the Angle EFI is, the less Part of the Object does it take in at one View; the *Telescope* exhibits so much a less Part of the Object, as it increases its Diameter more.

And this is the Reason that determined the Mathematicians to look out for another *Telescope*, after having clearly found the Imperfection of the first, discover'd by Chance. Nor were their Endeavours vain; as appears from the Astronomical *Telescope* hereafter to be described.

If the Semi-diameter of the Eye-glass, have too small a Ratio to that of the Object-glass, an Object through the *Telescope*, will not appear sufficiently clear, by reason the great Divergency of the Rays will occasion the several Pencils representing the several Points of the Object on the Retina, to consist of too few Rays. This, too, is found, that equal Object Lens's won't bear the same Eye Lens, if they be differently transparent, or there be a Difference in their Polish. A less transparent Object-glass, or one less accurately ground, requires a more spherical Eye glass, than another more transparent, &c.

Hence, though it be found by Experience, that a *Telescope* is good, if the Distance of the Focus of the Object-glass be six Inches, and the Diameter of the Plano Concave Eye-glass be one Inch and one Line, or of one equally Concave on both Sides, one Inch and a Half; yet is it by no means expedient to recommend to the Artificer, either this or any particular Combination; but to try several Eye-glasses, both greater and smaller, with the same Object-glass; and take that through which Objects appear most clear and distinct.

*Hewliet* recommends an Object-glass Convex on both Sides, whose Diameter is four *Danville* Feet; and an Eye-glass Concave on both Sides, whose Diameter is 4; Digits or Tenths of a Foot. An Object-glass, equally Convex on both Sides, whose Diameter is five Feet, be observ'd, will require an Eye-glass of 5; Digits; and adds, that the same Eye-glass will also serve an Object-glass of eight or ten Feet.

Hence, as the Distance of the Object-glass and Eye glass is the Difference between the Distance of the virtual Focus of the Eye

Eye-glass, and the Distance of the Focus of the Object-glass; the Length of the Telescope is had by subtracting that from this. That is, the Length of the Telescope is the Difference between the Diameters of the Object-glass and Eye-glass, if that be Plano Convex and this Plano Concave; or the Difference between the Semi-diameters of the Object-glass, and Eye-glass, if that be Convex on both Sides, and this Concave on both; or the Difference between the Semi-diameter of the Object-glass and Eye-glass, if that be Convex on both Sides, and this Concave on both; or the Difference between the Semi-diameter of the Object-glass, and the Diameter of the Eye-glass, if that be Convex on both Sides, and this, Plano Concave; or the Difference between the Diameter of the Object-glass, and the Semi-diameter of the Eye-glass if that be Plano Convex, and this Concave on both Sides.

Thus, e.g. If the Diameter of an Object-glass on both Sides, be four Foot, and that of an Eye-glass Concave on both Sides, be Four and a Half Digits or Tenths of a Foot; the Length of the Telescope will be one Foot eight Digits.

**Astronomical TELESCOPE**, is a Telescope consisting of an Object-glass and an Eye-glass, both Convex. See CONVENTIT.

It has its Name, from its being wholly used in Astronomical Observations.

*Construction of the Astronomical TELESCOPE.*

The Tube being prepared, an Object-glass, either Plano Convex, or Convex on both Sides, but to be a Segment of a large Sphere, is fitted in at one End. At the other End, an Eye-glass Convex on both Sides, which is the Segment of a small Sphere, is fitted into the other End, at the common Distance of the Foci.

*Theory of the Astronomical TELESCOPE.*

Now, an Eye placed near the Focus of the Eye-glass, will see Objects distinctly, but inverted; and magnify'd in the Ratio of the Distances of the Focus of the Eye-glass to the Distance of the Focus of the Object-glass.

For 1<sup>o</sup> Since 'tis very remote Objects are viewed through Telescopes, the Rays from any Point of the Object, fall parallel on the Object-glass; and, consequently, after Refraction, will meet in a Point behind the Glass, which Point is the Focus of the Eye-glass. From this Point they begin to diverge, and fall diverging on the Eye-glass, where being refracted, they enter the Eye parallel.

Hence, as all hut Myopes see distinctly by parallel Rays, a Telescope, thus dispos'd, will exhibit remote Objects distinctly.

Suppose the common Focus of the Lens's in F, (Fig. 42.) and make AB=BF. Since one of the Rays A C, proceeding from the Right Side of the Object, passes thro' A; the Ray CE will be parallel to the Axis A I, and therefore after refraction in the Eye-glass, will fall in with it in its Focus G. Since then, the Eye is placed near it; and all the other Rays proceeding from the same Point of the Object with E G, are refracted parallel thereto; the Point in the Right Side of the Object, will be seen in the Right Line E G.

After the like Manner it appears, that the middle Point of the Object is seen in the Axis G B so that the Object appears Inverted.

3<sup>o</sup> From what has been already shewn, it appears that the Semi-diameter of the Object will be seen through the Telescope, under the Angle E G I, which to the naked Eye placed in A, is seen under the Angle b A C. Suppose, now, I F equal to the Distance of the Focus I G; since the Right Angles at I are equal; E G F=E P I. Therefore drawing F M parallel to A C, we shall have I F M=B A C. The Semi-diameter, therefore, viewed with the naked Eye, is to that viewed through the Telescope, as I M to I E. Draw K E parallel to F M; we shall have I M:I E::I F:I K. But by re. fono the Parallelism of the Lens's; C E=B I=B F+P I=AB+P I; and by reason of the Parallelism of the Right Lines C A, and E K; C E=A K, therefore B I=A K, consequently, A B=I K. And, therefore, I M:I E::I F:A B; that is, the Semi-diameter seen with the naked Eye, is to the Semi-diameter view'd through the Telescope, in the Ratio of the Distance of the Focus of the Eye-Lens I E, to the Distance of the Focus of the Object-glass A B. Q. e. d.

Hence, 1<sup>o</sup>, As the Astronomical Telescope exhibits Objects Inverted; it serves, commodiously enough for observing the Stars (it murthering little, whether they be seen Erect or Inverted) but for Terrestrial Objects, 'tis much less proper, as the Inverting mutually prevents their being known.

2<sup>o</sup> If between the Eye-glass, and its Focus G, be a plain well-polish'd Metal Speculum L N, of the Length of an Inch, and of an Oval Figure, inclined to the Axis under an Angle of 45<sup>o</sup>, the Rays E P and M Q, will be reflected in such Manner, as that concerning in g, they make an Angle P g Q,

equal to P G Q: And therefore the Eye being placed in g, will see the Object of the same Magnitude as before, only in an erect Situation. By the Addition, therefore, of such a Speculum, the Astronomical Telescope, is render'd fit to observe Terrestrial Objects. See MIRROR.

3<sup>o</sup> Since the Focus of a Glass Convex on both Sides, is distant from the Glass itself, a Semi-diameter; and that of a Plano Convex Glass, a Diameter; if the Object-glass be Convex on both Sides, the Telescope will magnify the Semi-diameter of the Object, in the Ratio of the Semi-diameter of the Eye-glass to the Semi-diameter of the Object-glass; but if the Object-glass be a Plano Convex, in the Ratio of the Semi-diameter of the Eye-glass, to that of the Object-glass.

4<sup>o</sup> Wherefore, since the Semi-diameter of the Eye-glass has a greater Ratio to the Semi-diameter of the Object-glass, than to its Diameter; a Telescope magnifies the Semi-diameter of the Object more, if the Object-glass be a Plano Convex, than if Convex on both Sides.

5<sup>o</sup> The Ratio of the Semi-diameter of the Eye-glass, to the Diameter or Semi-diameter of the Object-glass, is the less, as the Eye-glass is a Segment of a less Sphere, and the Object-glass of a greater. A Telescope, therefore, magnifies the Diameter of the Object more, as the Object-glass is a Segment of a greater, and the Eye-glass of a less Sphere. And yet the Ratio of the Semi-diameter of the Eye glass to the Object-glass must not be too small: If it be, it will not refract Rays enough to the Eye from each Point of the Object; nor will it separate those coming from different Points sufficiently: by which means the Vision will be render'd obscure, and confused. To this may be added, what we have shewn, of the Ratio of the Object-glass to the Eye-glass in the Dutch Telescope.

De Chales observes, that an Object Lens of 2 1/2 Feet will require an Eye-glass of 1 1/2 Digit or Tenth of a Foot; and an Object-glass of eight or ten Feet, an Eye-glass of four Digits; in which he is confirm'd by Eustachio de Divinis.

Huygens's great Telescope, wherewith Saturn's true Face, and one of his Satellites were first discovered, consists of an Object-glass of 12 Feet, and an Eye-glass of a little more than Three Digits. Though he frequently used a Telescope 23 Feet long, with two Eye-glasses joined together, each in Diameter 1 1/2 a Digit; so that the Two were equal to One of Three Digits. The same Author observes, that an Object-glass of 30 Feet, requires an Eye-glass of 3 1/2 Digits; and gives us a Table of Proportions, for the Constructing of Astronomical Telescopes; an Abridgment whereof, we shall here give the Reader.

Dist. of Foc. of Obj. Glass	Diam. of Obj. Glass	Dist. of F. of Obj. Glass	Magn. of Obj. Glass	Dist. of Foc. of Obj. Glass	Diam. of Obj. Glass	Dist. of F. of Obj. Glass	Magn. of Obj. Glass
15	2	12	3	72	2	12	3
20	2	16	4	80	2	16	4
25	2	20	5	100	2	20	5
30	2	24	6	120	2	24	6
40	3	30	8	160	3	30	8
50	4	40	12	240	4	40	12
60	5	48	16	320	5	48	16
70	6	56	21	420	6	56	21
80	7	64	28	560	7	64	28
90	8	72	36	720	8	72	36
100	9	80	45	900	9	80	45

If in Two or more Telescopes, the Ratio between the Object and Eye-glass be the same; the Object will be magnified the same in both.

It needs some may conclude, the making of large Telescopes a needless Trouble. But it must be remembered, what we have already laid down: An Eye-glass may be in a less Ratio to a greater Object-glass, than to a smaller: Thus, e.g. in Huygens's Telescope of 25 Feet, the Eye glass is Three Digits. Now, keeping this Proportion, in a Telescope of 50 Feet, the Eye-glass should be Six Digits; but the Table shews, Four and a Half are sufficient. Hence, from the same Table it appears, that a Telescope of 50 Feet magnifies in the Ratio of 1:141; whereas that of 25 Feet, only magnifies in the Ratio of 1:100.

Since the Distance of the Lens's is equal to the Aggregate of the Distance of the Foci of the Object and Eye-glasses; and the Focus of a Glass Convex on each Side is a Semi-diameter's Distance, and that of a Plano Convex, a Diameter's Distance from the Lens; the Length of a Telescope is equal to the Aggregate of the Semi-diameters of the Lens's, if the Object-glass be Convex on both Sides; and to the Sum of the Semi-diameter of the Eye-glass, and of the Diameter of the Object-glass, if the Object-glass be a Plano Convex.

But as the Semi-diameter of the Eye-glass is very small, in respect of that of the Object-glass, the Length of the Telescope is usually estimated from the Distance of the Object-glass, i. e. from its Semi-diameter, if it be a Convex on both Sides; or its Diameter if Plano Convex. Thus, a Telescope

*Telescope* is said to be 12 Feet, if the Semi-diameter of the Object-glass, Convex on both Sides, be 12 Feet, &c.

Since Myopes see near Objects best; for them the Eye-glass is to be remov'd nearest the Object-glass, that the Rays refracted thro' it may be the more diverging.

To take in the larger Field at one View, some use two Eye-glasses; the foremost whereof is a Segment of a larger Sphere than that behind: To this it must be added, that if two Lens's be join'd immediately together, so as one touch the other, the Focus is remov'd to double the Distance which that of one of them would reach to.

To shorten the Astronomical Telescope, i. e. to construct a Telescope so, as that tho' shorter than the common use, it shall magnify as much.

1<sup>o</sup>. Having provided a drawing Tube, fit in an Object Lens E G (Fig. 43.) which is a Segment of a moderate Sphere; let the first Eye-glass B D be Concave on both Sides; and so placed in the Tube, as that the Focus of the Object-glass A may be behind it, but nearer than the Centre of the Concavity G. Then will the Image be thrown in Q, so that G A : G I :: A B : Q I. Lastly, fit in another Object-glass, Convex on both Sides, and a Segment of a lesser Sphere, so as that its Focus may be in Q.

This Telescope will magnify the Diameter of the Object, more than if the Object-glass were to represent its Image at the same Distance E Q; and consequently a shorter Telescope constructed this Way, is equivalent to a longer in the common Way. The Demonstration may be seen in *Wolffius*.

Sir *J. Newton* furnishes us with another Method of constructing the Telescope, in his *Calopteric* or Reflecting Telescope; the Construction whereof see hereafter.

*Land Telescope*, or *Day Telescope*; a Telescope consisting of more than two Lens's, commonly of a Convex Object-glass, and three Convex Eye-glasses: or, a Telescope that exhibits Objects erect, yet different from that of *Galileo*.

It has its Name from its being us'd to view Objects in the Day-time, or on the Earth, or from its being us'd by Day.

#### To construct a Land or Day TELESCOPE.

A Tube being provided, fit in an Object-glass, which is either Convex on both Sides, or Plano Convex, and a Segment of a large Sphere: To this add three Eye-glasses, all Convex on both Sides, and Segments of equal Spheres; disposing them in such Manner, as that the Distance of any two may be the Aggregate of the Distance of their Foci.

#### Theory of a Land TELESCOPE.

Then will an Eye apply'd to the last Lens, at the Distance of its Focus, see Objects very distinctly, erect, and magnify'd in the Ratio of the Distance of the Focus of one Eye-glass L K (Fig. 44.) to the Distance of the Focus of the Object-glass A B.

For, 1<sup>o</sup>. the Rays, from what has been already said, falling on the Object parallel; the Image of the Object will be represented invertedly at the Distance of the principal Focus: Wherefore, since this Image is in the Focus of the first Eye-glass, the Rays after a second Refraction will become parallel, and thus falling on the third Lens, after a third Refraction they exhibit the inverted Image invertedly; that is, a direct Image of the Object. Since then this Image is in the Focus of the third Eye-glass, the Rays after a fourth Refraction will become parallel: And in this Disposition the Eye will receive them, and consequently there will be distinct Vision, and the Object will appear erect.

2<sup>o</sup>. If  $IQ = IK$ , that is, equal to the Distance of the Focus of the Object-glass; the Eye placed in M, will see the Semi-diameter of the Object increas'd in the Ratio of  $LM$  to  $KI$ ; but the Ray A Q, proceeding from the Focus Q of the Object Lens A B, after Refraction becomes parallel to the Axis I L; consequently the first Eye Lens C D joins it to the Axis in M, the Distance of a Semi-diameter.

And since the Focus of the second Eye-glass E F, is also in M; the Ray F H, after Refraction, will be parallel to the Axis N O; and therefore the third Eye-glass will join it at the Axis in P; but the Semi-diameters of the Lens's G H and C D are suppos'd equal; therefore  $PO = LM$ . Wherefore since the right Angles at O and L are equal, as also  $HO = CL$ , the Angle O P H is equal to C M L. The Semi-diameter of the Object, therefore, appears the same in P as in M; and is consequently magnify'd in the Ratio of  $LM$ , or  $PO$  to  $KI$ .

Hence, 3<sup>o</sup>. An Astronomical Telescope is easily converted into a Land Telescope, by using three Eye-glasses for one; and the Land Telescope, on the contrary, into an Astronomical one, by taking away two Eye-glasses; the Faculty of magnifying still remaining the same.

4<sup>o</sup>. Since the Distance of the Eye-glasses is very small, the Length of the Telescope is much the same as if you only us'd one.

3<sup>o</sup>. From the Construction, 'tis evident that the Length of the Telescope is had by adding five times the Semi-diameter of the Eye-glasses to the Diameter of the Object-glass, if a Plano Convex; or its Semi-diameter, if Convex on both Sides.

*Huygens* first observ'd, both in the *Astronomical* and *Land Telescope*, that it contributes considerably to the Perfection of the Instrument, to have a Ring of Wood or Metal, with an Aperture, a little less than the Breadth of the Eye-glass, fix'd in the Place where the Image is found to radiate upon the Lens next the Eye: By Means hereof the Colours, which are apt to disturb the Clearness and Distinctness of the Object, are prevented, and the whole Compar'd taken in at a View, perfectly defin'd.

Some make *Land Telescopes* of three Lens's, which yet represent Objects erect and magnify'd as much as the former. But such Telescopes labour under very great Inconveniences, both as the Objects herein are tinged with false Colours, and as they are distorted about the Margin.

Some again use four Lens's, and even more; but since some Part of the Rays is intercepted in passing every Lens, Objects are hereby exhibited dim and feeble.

*Reflecting*, or *Catoptric*, or *Cata-dioptric* TELESCOPE, is a Telescope, which, instead of Lens's, consists chiefly of Mirrors, and exhibits remote Objects by Reflection, instead of Refraction. See *CATOPTRICKS*, &c.

This Instrument is the Invention of the great Sir *J. Newton*: What determin'd him to apply his Thoughts this Way, was the different Refrangibility, which in his new Doctrine of Light and Colours, he found the Rays of Light were of. In effect, as he found the Ratio between the greatest and least Refractions of the different Rays, to be nearly as 28 to 27, it easily follow'd, that the Rays could never be all refracted parallel from any Lens, but would some of them divergiate more, some less; beside that, the Foci would be disturb'd; the Focus of the most refrangible Rays, being nearer the Lens than that of the least refrangible ones, by a Distance which is the 27th Part of the Distance between the Object-glass, and the Focus of the least refrangible ones. See *RAY* and *REFRANGIBILITY*.

Hence he concluded, that Refraction was too unequal a Principle; and that Lens's, of whatever Figures, whether Spherical, Parabolical, or any of the other conic Sections, and how truly spher ground, would never suffice for the Perfection of Telescopes.

Upon this he had Recourse to another more equable Principle, viz. Reflection; and made a Telescope, consisting of Specula, or Mirrors: The first Hint whereof he owns he took from Dr. *Gregory's* Opticks.

#### Construction of a Reflecting TELESCOPE.

Provide a Tube ABCD, (Fig. 45.) open in AD, and clos'd in BC, well black'd within-side, and of a Length equal to the Distance of the Focus from the Concave Speculum EF. To the Bottom BC, is to be fitted a Concave metallic Speculum *ab*, polish'd to the greatest possible Perfection; or rather, to have the Object's clearer, and more distinct, let it be a Glass Speculum, Concave on its fore Side, and equally Convex on the hind Side; or unless it be of the same Thickness every where, it will reflect the Images of Objects tinged with a spurious Colour, and indistinct. Towards the other End of the Tube is fix'd an Iron Piece H I, to which is cemented a plain metallic Speculum *o*, or, which is better, a triangular Prism of Glass or Crystal G, whose upper Angle G is a right Angle, the two others half right. The Faces or Planes that meet in the Angle G, to be square, and the third a Parallelogram. This Prism is to be so dispos'd, as that a Ray reflected from the Speculum, passing thro' the Middle of the Face G M, may cut it at right Angles; but be inclin'd to the Rectangle M N in an Angle of 45<sup>o</sup>. Its Distance from the Concave Speculum EF, is to be such, as that the Rays *ac* and *ba* reflected from the Concave Speculum, may, after a second Reflection from the Base of the Prism, concur in the Point *e*; that is, the Distance of the Focus *e* from the reflecting Surface of the Prism, and the Distance of that from the Concave Speculum, is to be equal to the Distance of the Focus from the Concave Speculum. In I is placed a Plano Convex Lens, whose Focus is in *e*, that the reflected Rays may enter the Eye parallel. Lastly, this Lens is cover'd with a thin Brass or Lead Plate, having a little round Perforation therein, for the Eye to look thro', by which means all foreign Rays are excluded, which would otherwise occasion Confusion.

In the first Telescope of this Kind which the Inventor made, the Semi-diameter of the Concave Metallic Speculum was 12; Digiti, or Tenths of an Inch; from which, therefore, the Focus was 6; Digiti distant. The Diameter of the Eye-glass was 1 of a Digit; so that it magnify'd the Diameter of the Object in the Ratio of 1 to 38: But he found that Objects were shewn somewhat obscure hereby; on which Account, he afterwards recommended Glass Specula instead

of Metallic ones; adding, that there is nothing more requir'd to the Perfection of this *Telescope*, but that the Art of polishing Glass be brought to greater Perfection; for that some Inequalities which don't hurt Lens's, are found to affect Specula, and prevent Objects being seen distinctly.

The same Author observes, that if the Length of the Instrument be 6 Feet, and consequently the Semi-diameter of the Concave Speculum 12, the Aperture of the Speculum is to be 6 Inches; by which Means the Object will be increas'd in the Ratio of 1 to 200 or 300.

If it be longer, or shorter, the Aperture must be as the Cube of the Quadrato quadratè Root of the Length, and its magnifying Power as its Aperture. The Speculum he orders to be an Inch or two broader than the Aperture.

*Aerial Telescope*, a kind of *Astronomical Telescope*, the Lens's whereof are us'd without a Tube.

In Strictness, however, the *Aerial Telescope*, is rather a particular Manner of mounting and managing long *Telescopes*, for Celestial Observations in the Night Time, whereby the Trouble of long unwieldy Tubes is sav'd, than a particular Kind of *Telescope*. The Convenience we owe to the noble *Huygens*.

Construction of the *Aerial Telescope*.

1<sup>o</sup> A tall Pole or Mast, A B (Fig. 46.) the Length the Tube should be of, is fix'd perpendicularly in the Ground. Before the erecting it, one Side is planed smooth, and upon it two Rulers fix'd parallel to each other, an Inch and Half apart, including a kind of Groove or Channel between them, reaching from top almost to bottom. At the Top of the Pole is fix'd a little Trundle A, moveable on its Axis, and over it is drawn a Cord G, g, double the Length of the Pole, and the Thickness of the little Finger, returning into itself, and furnish'd with a piece of Lead, H, equal in Weight to the Lens and a moveable Arm to be sustain'd thereby.

Then, a wooden Lath, C D, two Foot long, is fram'd so as that it may slide freely in the Channel; and in the Middle thereof, is affix'd a wooden Arm E, standing out a Foot from the Pole, and on its Extremity bearing another, F f, a Foot and Half long, fix'd to it at Right Angles; both of them parallel to the Horizon.

2<sup>o</sup> An Object-glass is included in a hollow Cylinder I K, three Inches long: To this Cylinder is fix'd a Staff, K L, near an Inch thick, and a Foot long, which rests on a brass Ball M, that moves freely in its Cup or Socket underneath: Only, on Occasion, the Ball and Socket are fix'd by a Screw. That the Lens thus equally balanc'd, may be moved with a small Force, a Weight N I of about a Pound, is suspend'd, by a strong Wire N F, by bending which, the common Centre of Gravity of the Weight, the Lens is easily made to coincide with that of the Ball. To the Staff K L, is fix'd a brass Style L, which is bent downwards, till its Point be as much below the Centre of the Staff, as the Centre of the Ball is. To the Point is tied a fine silken Thread L V, which, of Consequence, will be parallel to the Staff K L.

3<sup>o</sup> An Eye-glass O, is included in a short Cylinder; and the Staff P V, fix'd to the same. To this is hang a little Weight S, sufficient to make a Balance. In Q is fix'd a Handle, R, which carries a transverse Axis, to be held in the Observer's Hand, and the Staff P V directed towards the Object-glass, is tied to the Thread L V. The Thread pass'd through a Hole, V, is wound about a little Peg T, fix'd in the middle of the Staff; by the turning whereof, the Length of the Thread is shorten'd or prolong'd at Pleasure.

4<sup>o</sup> That the Observer may be able to hold the Eye-glass steady; he has a Fulcrum or Prop under his Arm, the Structure whereof appears from Inspection of the Figure. Lastly, to keep off the feeble Light flowing from the Air upon the Eye, it is conveniently cover'd with a Circle, Y, perforated in the Middle, fix'd on to a moveable and flexible Arm.

*TELESCOPICAL Stars*, are such as are not visible to the naked Eye; but discoverable only by the Help of a *Telescope*. See *STAR*.

All Stars less than the 6th Magnitude, are *Telescopical* to a moderate Eye.

TELLER, an Officer in the Exchequer, of which there are Four. See *EXCHEQUER*.

Their Business is to receive all Monies due to the Crown, and thereupon to throw down a Bill through a Pipe, into the Tally-Court, where it is received by the Auditor's Clerks, who attend there to write the Words of the said Bill upon a Tally; and then deliver it to be enter'd by the Clerk of the Pells, or his Clerk. See *TALLY* and *PELL*.

The Tally is then split or cloven by the two Deputy Chamberlains, who have their Seals, and whilst the Senior Deputy reads the one Part, the Junior examines the other Part, with the other two Clerks.

Their Places are in the King's Gift, and they have, besides their chief Clerk or Deputy, four other Clerks, for the Dispatch of Business.

TELLUS, *Terra*,  $\delta$ , in Astronomy. See *EARTH*.

TEMPER in a { Physical } Sense, See { TEMPERAMENT }  
 { Musical }  
 { Mechanical }

TEMPERAMENT, TEMPERAMENTUM, TEMPERATURE, in Physics, that Habitude or Disposition of a Body arising from the Proportion of the several prime or elementary Qualities it is compos'd of. See *QUALITY* and *ELEMENT*.

The Notion of *Temperament*, arises from that of Mixture; where different Elements, as Earth, Water, Air and Fire (or, to speak more justly, in the Peripatetic Way, hot, cold, moist and dry) are blended together; by their Opposition, they tend mutually to weaken and inroach on each other; and from the whole, arises a sort of temperate Crisis, or Coalition of them all, in this, or that Proportion; whence, according to the Quality that prevails or predominates, we say a *hot* or *cold*, a *moist* or *dry Temperament*.

It is controverted among the School-men, Whether the *Temperament* properly comprehends all the Four primary Qualities? or, Whether those do not all cease, and a new one, a Fifth, simple Quality, result from the total Alteration made in the other Four, by their mutual Action on each other?

Authors distinguish two Kinds of *Temperaments*, *viz.* *Uniform* and *Difform*: The First, wherein all the Qualities are mix'd in an equal Degree: The Second, where in an unequal one.

The *Uniform Temperament*, can only be one; the *Difform* admits of Eight different Combinations, since either any one, or any two of the Qualities may prevail; whence *hot* and *moist*, *cold* and *moist*, &c. Further, some considering that the Qualities which do prevail, may not be in equal Degree; and the like of those which do not prevail; make several other Combinations or *Temperaments*; and add 12 more to the Number. In effect, as there are infinite Degrees between the highest and lowest Pitch of any one of the Elements, the different *Temperaments* may be said to be Infinite.

TEMPERAMENT, in Medicine, is particularly understood of the natural Habitude and Constitution of the Body of Man; or the Disposition of the Animal Humours. See *CONSTITUTION* and *HUMOUR*.

The Notion of this *Temperament* arises hence, that the Blood flowing in the Veins and Arteries, is not conceived to be a simple Fluid; but a sort of imperfect Mixt, or an Assemblage of several other Fluids. For it does not only consist of the Four simple, or primary Qualities; but of Four other secondary Ingredients compounded thereof, into which it is supposed to be resolv'd, *viz.* *Choler*, *Phlegm*, *Melancholly* and *Blood*, properly so called. See *BLOOD*, *CHOLER*, *BILE*, *PHLEGM*, &c.

Hence, as this, or that Ingredient Humour prevails in a Person, he is said to be of a Choleric, Phlegmatic, Melancholic, Sanguine, &c. *Temperament*: See *SANGUINE*, *MELANCHOLLY*, *CHOLERIC*, &c.

The ancient Physicians brought these Animal *Temperaments* to correspond with the universal *Temperaments* above described: Thus the *Sanguine Temperament* was supposed to coincide with *hot* and *moist*; the *Phlegmatic* with *cold* and *moist*, the *Melancholly* with *dry* and *cold*, &c.

Galen introduced the Doctrine of *Temperaments* into Physic, from the Peripatetic School; and made it, as it were, the Basis of all Medicine. The whole of curing Diseases, consisted in *tempering* the Degrees of the Qualities, Humours, &c. See *GALENICAL*, *DEGREE*, &c.

On the Footing Medicine now stands, the *Temperaments* are much less consider'd. Dr. Sydenham and other Mechanical Writers, pass away the greatest Part of the Galenic Notion, as useless and uncertain; and consider the *Temperaments* as no other but those Diversities in the Blood of different Persons, whereby it becomes more apt to fall into certain Combinations in one Body than another, whether into Choleric, Phlegm, &c. whence, according to them, People are denominat'd *Choleric*, *Phlegmatic*, &c.

The Ancients distinguish'd two Kinds of *Temperaments* in the same Body; the one *ad Pondus*, in Weight; the other, *ad Justitiam*.

The *Temperamentum ad Pondus*, is, where the elementary Qualities are found in equal Quantities, and in equal Proportions; such is supposed to be in the Skin of the Fingers; without which they would want Power of distinguishing Objects, with sufficient Accuracy.

The *Temperamentum ad Justitiam*, is that which contains unequal Portions of those Qualities, but yet in such Proportion as is necessary for the Discharge of the Functions proper to the Part: Such is the *Temperament* in a Bone, which contains more earthy than aqueous Parts, to make it more hard and solid, for its Office of sustaining.

*Galen* observes, that the *Temperaments ad Pondus*, is only imaginary; and that though it were real, it could not subsist above one Moment.

*Dr. Picaeus* looks on the *Temperaments* or Constitutions, as native Diffuses; According to him, any one indued with whatever *Temperament*, hath the Seeds of a real Diffuse within him: A particular *Temperament*, supposing that some Secretions are in greater Proportion than is proper for Life Indefinitely long.

As the Diversities of *Temperaments* are no other than Diversities of Proportions in the Liquids, which may be diversified infinite Ways; so there may be an infinite Number of *Temperaments*; though Authors have only suppos'd Four. The *Sanguin*, which is reckon'd a *Temperament*, *Picaeus* says, is no other than a Plethora. See PLETHORA.

*TEMPERAMENT*, or *tempering*, in Music, a rectifying or mending the false or imperfect Concords, by transferring to them part of the Beauty of the perfect ones. See CONCORD.

The Degrees of the Octave, which may be call'd its Elements, as being the finest Intervals it is resolvible into; are two greater Semitones, two lesser Tones, and three greater Tones. See TONE and OCTAVE.

Now the different Situation of these Elements, with respect to each other, occasions that Intervals or Concords of the same Name, as *Twards*, *Fourths*, &c. don't consist of the same Degree or Elements, tho' there be always the same Number of them; but one Fourth, for Instance, is agreeable and perfect, and another not.

To mend these imperfect Concords, the Musicians have bethought themselves to *temper*, i. e. give them part of the Agreeableness of perfect ones. In order to this, they take a Medium between the two, and thus they call a *Temperament*, which necessarily produces a new Division of the Octave, or which amounts to the same new Elements.

For Instance, whereas naturally its Elements are the greater Semitone, and the greater and lesser Tone; they take a middle Tone form'd of the greater and lesser; and the only Elements now, are the greater Semitone, and this mean Tone, which renders the five Intervals that are Tones equal, and those that are Semitones less unequal to these.

One might also divide each of the five Tones of the Octave into Semitones, which, join'd to the two it naturally has, make twelve: In which Case, the whole Octave would be divided into twelve equal Parts, which would be mean Semitones.

'Tis easy to form various other Kinds of *Temperaments*: All the Difficulty is to find such as are free from two great Inconveniences, i. e. which don't alter either all the Concords too much, or, at least, some of them.

All such Divisions of the Octave are call'd *temper'd*, or *temper'd Systems*. See SYSTEM and SCALE of Music.

**TEMPERATE Zone.** See ZONE.

**TEMPERING**, in the Mechanic Arts, the preparing of Steel and Iron, so as to render them more compact, hard, and firm; or even more soft and pliant; according to the respective Occasions. See IRON and STEEL.

These Metals are *temper'd* by plunging them, while red hot, in some Liquor prepar'd for the Purpose: Sometimes pure Water is us'd for that Purpose; and, in effect, Locksmiths, &c. scarce use any other.

Sometimes a Composition of divers Juices, Liquors, &c. is us'd; which is various, according to the Manner and Experience of the Workman; as Vinegar, Mouse-Ear-Water, the Water oozing from broken Glasses, Soot, Salt, Oil, &c.

To harden and *temper* *English*, *Flawish*, and *Swedish* Steel, you must give them a pretty high Heat, then suddenly quench them in Water to make them hard: But *Spanish* and *Venice* Steel will need but a Blood-red Heat e'er it be quench'd. See HEAT.

If the Steel be too hard, or brittle for an Edge Tool, &c. let it down by rubbing a Piece of Grindstone or Whetstone hard upon the Work, to take off the black Scum: Then brighten, or heat it in the Fire; and as it grows hotter, you will see the Colour change by Degrees, coming first to a Straw, or light goldish Colour, then to a darker Goldish Colour, and at last to a Blue Colour. Chuse such of these Colours as the Work requires, then quench it suddenly in Water.

The light Gold Colour is for Files, cold Chissels, and Punches, that punch Iron and Steel: The dark Goldish Colour for Punches to use on Brass, &c. The Blue Colour gives the *Temper* for Springs, &c.

The *Tempering* of Files and Needles is perform'd in a peculiar Manner. See FILE and NEEDLE.

The Ancients appear to have had some better Method of *Tempering*, than any of the Moderns are acquainted with; witness their Works in Porphyry; a Stone so hard, that none of our Tools make any Impression upon it. See PORPHYRY.

**TEMPEST**, a Storm, or violent Commotion of the Air, with or without Rain, Hail, Snow, &c. See WIND, HURRICANE, WHIRLWIND, WATER-SPOUT, EARTHQUAKE, &c.

**TEMPLARS**, or *Knights-TEMPLARS*, or Knights of the **TEMPLE**, a Religious Military Order, first establish'd at *Jerusalem*, in Favour of Pilgrims travelling to the Holy Land. See KNIGHT.

The Original of this Order, the first Military Order in the World, is this: In 1118, some pious noble Persons devoted themselves to the Service of God, in the Presence of the Patriarch of *Jerusalem*; promising to live in perpetual Chastity, Obedience, and Poverty, after the manner of Canons.

The two principal Persons were *Hugo de Paganis*, and *Geffroy de S. Omer*. *Baldwin II.* then King of *Jerusalem*, gave them an Apartment in his Palace, near the Temple, at *Jerusalem*, not far from the Sepulchre of our Saviour; whence their Denomination *Templers*.

Soon afterwards, the Canons of the Temple gave them a Piece of Ground hard by the said Temple, to build them regular Houses on; and the King, the Lords, the Patriarch, and the Prelates, each gave them somewhat out of their Revenue, for Food and Cloaths. Their first Undertaking, and what they had first in View at their Institution, was to guard the Highways against Robbers, &c. chiefly for the Safety of Pilgrims and Croises. See CROSS.

The principal Articles of their Rule, were: That they should bear the holy Office throughout every Day; or, that when their Military Duties should prevent this, they would supply it by a certain Number of Pater Nosters: That they would abstain from Flesh four Days in the Week; and on *Fridays* from Eggs and Milk-treats: That each Knight might have three Horses, and one Equire; and that they should neither hunt, nor fowl.

Their first Rule was that of *St. Bernard*. Nine Years after their Foundation, a particular Rule was prescrib'd them in the Council of *Troyes*.

In every Nation they had a particular Governor, call'd *Master of the Temple*, or of the *Militia of the Temple*. Their *Grand Master* had his Residence at *Paris*.

The Order of *Templers* was abolish'd at the Beginning of the XIVth Century, under *Clement V.* *Edward II.* of *England*, and *Philip* the Fair of *France*. In 1607 those in *England* were all arrested, and seven burnt alive. And in 1312, the Order was quite suppress'd in the Council of *Vienne*, and so burnt alive.

The Crimes they were charg'd withal, were apostatizing to the *Saracens*, and holding Correspondence with them. Some Authors will have it, these Crimes were only pretended; and that the true Reason of the Suppression of the Order, was the immense Riches they were possess'd of. But tho' this might be some Reason for their Suppression, it could be none for burning them alive: Add to this, that their Effects were given to the Hospitaliers, or Knights of *St. John*. What then did the Kings of *England*, &c. get by their Suppression? And what was it to them, which of those Orders had the Effects?

**TEMPLE**, a publick Building, erected in Honour of some Deity, either true, or false; and wherein the People meet to pay religious Worship to the same. See GOD.

*Clemens Alexandrinus* and *Eusebius*, refer the Origin of Temples to the Sepulchres built for the Dead. *Herodotus* and *Strabo* will have the *Aegyptians* to be the first who built Temples to the Gods. The first, built in *Greece*, is ascrib'd to *Democriton*, by *Apollonius Argæus*. Lib. III.

In Antiquity we meet with many People who would not build any Temples to their Gods, for fear of confining them to too narrow Bounds. They perform'd their Sacrifices in all Places indifferently, from a Persuasion, that the whole World is the Temple of God, and that he requires no other. This was the Doctrine of the *Magi*, follow'd by the *Persians*, the *Scythians*, the *Nimidiensians*, and many other Nations mention'd by *Herodotus*, Lib. I. *Strabo* Lib. XV. and *Cicero* in his 2d Oration against *Verres*.

The *Persians*, who worshipp'd the Sun, believ'd it would wrong his Power, to inclose Him in the Walls of a Temple, who had the whole World for his Habitation: And hence, when *Xerxes* ravag'd *Greece*, the *Magi* exhorted him to destroy all the Temples he met with.

The *Sicyonians* would build no Temple to their Goddess *Coronis*: Nor the *Abenians*, for the like Reason, erect any Statue to *Clemency*, who, they said, was to live in the Hearts of Men, not within Walls.

The *Bithynians* had no Temples, but the Mountains to worship on; nor the ancient *Germans* any other but the Woods.

Even some Philosophers have blamed the Use and Building of Temples, particularly *Digenes*, *Zeno*, and his Followers the *Stoicks*: But, it may be said, That if God have no Need of Temples, Men have Need of Places to meet in for the publick Offices of Religion: Accordingly, Temples may be traced

traced back even into the remotest Antiquity. See *Hoffmannus de Originibus Templorum*.

The *Romans* had several Kinds of *Temples*; whereof those built by the Kings, &c. consecrated by the Augurs, and wherein the Exercise of Religion was regularly perform'd, were call'd, by Way of Eminence, *Temples*, *Temples*.

Those that were not consecrated, were call'd *Aedes*.

The little *Temples*, that were cover'd or roof'd, they call'd *Ædicule*.

Those open, *Sacella*.

Some other Edifices consecrated to particular Mysteries of Religion, they call'd *Fana* and *Delubra*.

All which Kinds of *Temples*, *Vitruvius* tells us, had other particular Denominations, according to the Form and Manner of their Construction; as hereafter related.

Indeed, the *Romans* out-did all Nations in the Point of *Temples*; they not only built *Temples* to their Gods, to their Virtues, to their Diseases, &c. but also to their Emperors, and that in their Life-time; Influences whereof we meet withal in Medals, Inscriptions, and other Monuments. *Horace* compliments *Augustus* hereupon, and sets him above *Hercules*, and all the Heroes of Fable; in that those were only admitted into *Temples* after their Death, whereas *Augustus* had his *Temples* and Altars while living.

*Viventi tibi mactores largimur sacrosque;*  
*Jurandisque iuram per iussum patrum Aras.* Epist. ad Augustum.

**TEMPLE**, in Architecture. The ancient *Temples* were distinguished, with regard to their Construction, into various Kinds; as,

**TEMPLES** of *Antæ*, or simply *Antæ*: These, according to *Vitruvius*, were the most simple of all *Temples*; having only angular Pilasters, call'd *Antæ*, or *Parastatæ*, at the Corners, and two Tuscan Columns on each Side the Doors. See **ANTÆ**.

**Tetrapstyle**-**TEMPLE**, or simply **Tetrapstyle**, was a *Temple* that had four Columns in Front and as many behind; as that of *Fortuna Virilis* at *Rome*. See **TETRASTYLE**.

**Prostyle**-**TEMPLE**, that which had only Columns in its Front, or Fore-side; as that of *Ceres* in *Eleusis*, in *Greece*. See **PROSTYLE**.

**Amphiprostyle**, or **double Prostyle**, that which had Columns both before and behind, and which was also **Tetrapstyle**. See **AMPHIPROSTYLE**.

**Pentapstyle**-**TEMPLE**, that which had four Rows of insulated Columns around, and was **Hexastyle**, i. e. had six Columns in Front; as the *Temple* of Honour at *Rome*. See **PENTASTYLE**.

**Diptere**-**TEMPLE**, that which had eight Rows of Columns around, and was also **Octostyle**: Or had eight Columns in Front; as that of *Diana* at *Ephesus*. See **DIPTERE**.

**Pseudo diptere**, or **impersfect diptere** } See { **Pseudo diptere**.  
**HYPTERE** - - - - - } { **HYPTERE**.  
**MONOPTERE** - - - - - } { **MONOPTERE**.

The Word *Temple* is form'd from the *Latin* *Templum*, which some derive from the *Greek* *temnos*, signifying the same Thing; and others from *temno*, *abscindo*, I cut off, I separate, in regard a *Temple* is a Place separated from common Uses; others derive it from the old *Latin* Word *templare*, to contemplate.

The ancient Augurs gave the Name *Temples* to those Parts of the Heavens, which they mark'd out for the observing of the Flight of Birds. Their Formula was this: *Templa resque sinus*.

**TEMPLES**, among us, are two Inns of Court; thus call'd, because anciently the Dwelling-House of the Knights *Templars*. See **TEMPLAR**.

At the Suppression of that Order, they were purchas'd by some Professors of the Common Law, and converted into *Hospitia*, or Inns. See **INN**.

They are call'd the *Inner* and *Middle Temple*, in relation to *Essex* House, which was also a Part of the House of the *Templars*, and call'd the *Outer Temple*, because situate without *Temple* Bar.

In the *Middle Temple*, during the Time of the *Templars*, the King's Treasure was kept: As was also that of the Kings of *France* in the House of the *Templars* at *Paris*.

The chief Officer was the *Master of the Temple*, who was summon'd to Parliament in 49 Hen. 3. And from him, the chief Minister of the *Temple Church* is still call'd *Master of the Temple*. See **MASTER**.

**TEMPLES**, *Tempora*, in Anatomy, a double Part of the Head, reaching from the Forehead and Eyes, to both Ears. See **HEAD**.

The *Temples* are form'd of two Bones, call'd *Osse Temporis*. See **TEMPORIS**-**OSSE**.  
*Messias* will have the Word deriv'd from the old *Latin*, *Tempra*, whence *Tempora*, and *Temples*. But the Physi-

cians give another Origin. These Parts, they say, were call'd *Tempora*, from their shewing the Age or Time of Man, by the Colour of the Hair, which turns white in this Part before any other; which *Homer* seems to have been aware of, by his calling Men *Policrasphus*, & c. Grey-templed.

**TEMPORAL**, *Temporalis*, a Term frequently us'd for *Secular*; in which Sense it stands in Opposition to *Ecclesiastical*. See **SECULAR**.

Pope *Boniface* wrote to *Philip* the Fair of *France*, that he was subject to him both in *Spirituals* and *Temporals*. At present all the *Doctores* on this Side the *Alps* own the Supremacy of Kings in *Temporals*. See **SUPREMACY**.

**TEMPORALIS**, in Anatomy, a Muscle, which arises by a Semi-circular fleshy Beginning, from a Part of the *Os Frontis*, the lower Part of the *Parietale*, and upper Part of the *Temporale*; from whence going under the *Zygoma*, and gathering together, as in a Centre, it is inserted, by a short and strong Tendon, into the *Processus Coronee* of the lower Jaw, which it pulls upward.

This Muscle is also call'd *Crotaphites*, and is cover'd with a strong tendinous *Fascia*. See **CROTAPHITES**.

**TEMPORALITIES**, the *Temporal* Revenues of an Ecclesiastic; particularly, such Revenues, Lands, Tenements, or Lay-tithes, as have been annexed to *Bishops* Sees by our Kings, or other Persons of high Rank in the Kingdom. See **BISSOP**.

The *Canonists* on the other side the *Alps*, anciently gave the Pope a Power over the *Temporalities* of Kings. Yet Pope *Clement V.* owned frankly, that his Predecessor *Boniface VIII.* had exceeded the just Bounds of his Authority, in meddling with the *Temporalities* of the King of *France*. See **FEVRES**.

**TEMPORIS OS**, *Bone of the Temple*, a Bone on each Side the Head. See **TEMPERES**.

The Figure of the *Os Temporis* is nearly Circular. The fore and upper Parts are very thin, consisting only of one Table. The lower and hind Parts are thick, hard, and uneven.

It is joined to the *Os Sincipitis*, by the Squamous Suture; whence, in that Part, it is call'd *Os Squamososum*. Its lower Part is joined to the *Os Occipitis*, and *Sphenoides*: To which later, as likewise to the Bones of the upper Jaw, it is joined by means of certain *Processes*, and in that Part, is call'd *Os Petrosum*. See **PETROSUM**.

Each of the *Osse Temporum* has two Sinus; the Exterior whereof, is lined with a Cartilage, and receives the *Processus* of the lower Jaw; the Interior receives the lower Part of the *Sinus Laterales* of the *Dura Mater*. Each likewise has four *Processes*; the *Os Jugale*, *Processus Mamillaris*, *Styloides*, and *Os Petrosum*. See each described under its proper Article **JUGALE**, **MAMILLARIS**, &c.

**TEMPTATION**, in Theology, an Induction, or Solicitation to Evil; whether from the World, the Flesh or the Devil.

Among the *Mystic Divines*, *profitable Temptations*, are those Trials the Soul is to pass through, e'er it arrive at the unitive Life, and the Peace within.

When it surmounts that *Dryness* and *Darkness* it falls into, through a Suspension of the Effects of divine Love, and that it revisits the World, and all the Allurements it presents; those *Temptations* are called *Tentations Utiles*, and *Frustruose*.

In our ancient Law Books, *Temptation*, *Tentatio*, is used for a Trial, Proof or Assay. *Tentatio Parisiæ fiat bis*, in *Anno Christi. Ew. I.*

**TENABLE**, in the military Art, something that may be defended, kept and held against Assaults.

The Word is little us'd, but with a Negative: When a Place is open on all Sides, and its Defences all beaten down, it is no longer *Tenable*. When the Enemy has gain'd such an Eminence, This Post is not *Tenable*.

The Word is *French*, form'd from *Tenir*; as that from the *Latin*, *Tenere*, to hold.

**TENAILLE**, in Fortification, a kind of Out-Work, consisting of Two Parallel Sides, with a Front, wherein is a re-entering Angle.

In Strictness, that Angle, and the Faces that compose it, are the *Tenaille*.

The Word is *French*, and signifies, literally, Pincers or Nippers.

The *Tenaille* is of two Kinds: *Simple* and *Double*. *Simple* or *single Tenaille*, is a large Out-work, as **D A B C E** (Tab. Fortification, Fig. 8.) consisting of two Faces or Sides **A B** and **C B**, including a re-entering Angle **B**.

The great Defects of the *Tenaille* are, that it takes up too much Room, and on that Account is advantageous to the Enemy; that its Angle **B** is undefended; the Height of the *Parapet* hindering the facing down into it, so that the Enemy can lodge there under Cover; and that the Sides **A C** and **C D** are not sufficiently defended.

For these Reasons, the *Tenaille* is now excluded out of Fortification by the best Engineers; and never made, but where there wants Time to form a Horn-work.

*Double or Flank'd Tenaille*, is a large Out-work, consisting of two simple *Tenailles*, or two re-entrant Angles FGH and HIK (Fig. 9). This is now, also, excluded out of Fortification for the same Reasons as the former.

*TENAILLE of the Place*, is the Face of the Place, comprehended between the Points of Two neighbouring Bastions; including the Curtain, the two Flanks raised on the Curtain, and the two Sides of the Bastions which face one another. See BASTION, CURTAIN, &c.

So that the *Tenaille* is the same with what is otherwise call'd, the *Face of a Fortress*. See FORTIFIED PLACE.

*TENAILLE of the Ditch*, is a low Work raised before the Curtain, in the Middle of the Foss or Ditch. It is of three Sorts: The First is composed of a Curtain, two Flanks and two Faces. The Rampart of the Curtain, including the Parapet and Tulus, is but five Fathom thick, but the Rampart of the Flanks and Faces Seven.

The Second, which *Vauban* faith, he found to be of very good Defence, is compos'd only of two Faces, made on the Lines of Defence, whose Rampart and Faces are parallel.

The third Sort differs from the Second, only in this, that its Rampart is parallel to the Curtain of the Place.

All three Sorts are good Defences for the Ditch, and lie so low, that they cannot be hurt by the Besiegers Cannon, till they are Masters of the Covert-way, and have planted their Cannon there.

*TENANCY*, a Habitation or House to live in, or a Tenement, or Possession held of another. See TENEMENT.

*TENANT or TENENT*, in Law, one that holds or possesses Lands and Tenements, by any kind of Right, either in Fee, for Life, Years, or at Will. See POSSESSION, TENURE, &c.

The Term *Tenant*, is used in Law with divers Additions: Thus, *Tenant in Dower*, is she that possesses Lands by Virtue of her Dower. See DOWER.

*Tenant per Statute-Mercant*, holds Land by Virtue of a Statute, forfeited to him. See STATUTE-MERCANT.

*Tenant in Frank Marriage*, is he that holds Lands or Tenements by Virtue of a Gift thereof made to him upon Marriage between him and his Wife. See FRANK-MARRIAGE.

*Tenant by Courtesy*, holds for his Life, by reason of a Child begotten by him of his Wife, being an Inheritor and born alive. See COURTESY.

*Tenant by Elegit*, holds by Virtue of the Writ call'd an *Elegit*. See ELEGIT.

*Tenant in Mortgage*, holds by means of a Mortgage. See MORTGAGE.

*Tenant by Verge*, in ancient Demesne, is he who is admitted by the Rod in the Court of an ancient Demesne. See VERGE and DEMESNE.

*Tenant by Copy of Court Roll*, is one admitted *Tenant* of any Lands, &c. within a Manor, which Time out of Mind, have been Demisable according to the Custom of the Manor. See COPYHOLD.

*Tenant paravail*. See PARAVAIL.

*Tenant by Chantry*, is he that holdeth by Possession in Writing or other Deed. See CHANTRY.

*Tenant in Capite or Chief*, holdeth of the King in Right of his Crown. See CAPITE.

*Tenant of the King*, is he that holdeth of the Person of the King.

*Joint Tenants* have equal Right in Lands or Tenements by Virtue of one Title.

*Tenants in common*, have equal Right; but hold by divers Titles. A *Particular Tenant* holds only for this Term. A *Sole Tenant*, is he, who hath no other joined with him; and a *Tenant by Execution*, is he who holds by Virtue of an Execution upon any Statute, Recognizance, &c.

Anciently, there was also *Tenant by Knight-Service*, *Tenant in Burgage*, *Tenant in Socage*, *Tenant in Frank-fee*, *Tenant in Villenage*; and there is still *Tenant in Fee-simple*, *Tenant in Fee tail*, *Tenant upon Suffrage*, &c. See KNIGHTS SERVICE, BURGAGE, SOCAGE, VILLENAGE, FEE-SIMPLE, TAIL, SUFFRANCE, &c.

*TENENT*, in Heraldry, is us'd for something that sustains, or holds up the Shield, or Armory; and is generally synonymous with *Supporter*.

The Difference which some Authors make between them, is, that *Tenants* are single, and *Supporters* double; one placed on each Side the Shield. But the proper Distinction seems to consist in this, that *Tenants* are human Figures, and *Supporters*, Figures of Beasts.

There are various Forms of *Tenants*, as well as of *Supporters*, viz. Angels, Maids, Religious, Savages, Moors, &c.

The first *Tenants*, P. *Mueffier* observes, were Trunks or Branches of Trees; to which the Escutcheons were fasten'd by Straps and Buckles. Afterwards, the Knights were represented as holding their own Scutcheons, which were either tied to their Neck, or else they leant on them.

The Origin of *Tenants* and *Supporters* is refer'd to the ancient Tournament, wherein the Cavaliers had their Arms bore by Servants disguis'd like Savages, Moors, fabulous Deities, Bears, Lions, &c. See SUPPORTER.

*TENAR*, in Anatomy, a Muscle, whose Office is to draw the Thumb from the Fore-finger. See FINGER.

Its Antagonist is call'd *Antitenar*. See ANITENAR.

*TENCH-Fishing*. See TENCH FISHING.

*TENDER*, in a legal Sense, signifies as much, as carefully to offer, or circumspectly to endeavour the Performance of any Thing: Thus, to *Tender Reuts*, is to offer it at the Time and Place, where and when it ought to be paid. To *tender a Person's Law* of Summons, is to offer himself ready to make his Law, whereby to prove that he was not summoned.

*TENDER*, in the Sea Language, is a Vessel, attending on some other larger, and more considerable one.

*TENDING-Penny*. See TITING-PENNY.

*TENDON*, in Anatomy, a hard, white Part of a Muscle, whereby it is fasten'd to the Bone. See MUSCLE.

Most Muscles have, at least, two *Tendons*, one at each Extreme: that fasten'd to the Part toward which the Motion is to be perform'd, is call'd the *Head of the Muscle*; and that fasten'd to the Part drawn towards the other, the *Tail of the Muscle*. See HEAD and TAIL.

The Fibres, whereof the *Tendon* consist, have been supposed to be Nervous; but they are now found to be no other than Productions of the same Fibres, which make the *Belly or Body of the Muscle*. All the Difference between them is, that in the *Belly* of the Muscle they are lax, and at a Distance from each other; whereas in the *Tendon*, they are more closely and firmly connected.

Their Whiteness proceeds wholly from the Blood's being excluded, by the Tightness of their Contexture: In effect, there is the same Difference between them, that there is between a Skein of Thread, and a Cord made of the same Thread.

The Fibres of the *Tendons* undergo no Contraction, or Dilation, as those of the *Belly of the Muscle* do; they act as mere Cords, to draw the Parts towards each other.

The *Suture of a Tendon*, is a very delicate Operation in Chirurgery. It had been abandon'd a long Time, and was not re-establish'd till the last Century by J. *Biancati*. See SUTURE.

The *Puncture of a Tendon* is very dangerous. See PUNCTURE.

Mr. *Cowper* in the *Philosophical Transactions*, gives us an Account of a Cure of the *great Tendon* above the Heel, after an Intire Division, by Stitching.

*TENEbres*, *TENEbRE*, in the *Romish Church*, a Service perform'd on the *Wednesday, Thursday and Friday* before *Easter*, in Commemoration of the Agency of our Saviour in the Garden. See PASSION, &c.

*TENEMENT, TENANCY*, in Law, a House or Lands, depending of a Manor or Lordship; or a Fee or Farm, held of a Superior Lord, and which he may re-call, when the Term or Condition is expired. See LORD and TENANT.

*Frank Tenement*, is any Lands, Houses, Offices or the like, wherein a Man has Estate for Life, or in Fee. — *Base Tenement*, is where a Man holds Lands, &c. at the Will of the Lord.

*Kitebin, Briton, &c.* make *Frank Tenements* and *Base Tenements*, Opposites; so that *Frank Tenement* should be where the Tenant is at liberty to quit it when he pleases.

*TENEMENTARY Lands*, among our Ancestors, were such Lands as the *Saxon* Thanes or Nobles let out to Tenants under arbitrary Rents and Services. See TENANT.

*TENEMENTIS Legatus*, in Law, a Writ which lies in *London* and other Places, where the Custom is to devise *Tenements* by last Will, as well as personal Goods and Chattels; for the Hearing of any Cause relating hereto.

*TENENTIBUS in Assa von Onersandis*, a Writ which lies for him to whom a Dilector has made over Land, whereof he has diffisid'd of another; that he be not disturb'd for the Damages awarded.

*TENESMUS*, in Medicine, a continual Inclination to go to Stool; yet without voiding any Thing, unless, sometimes, a little purulent bloody Sline.

The Cause of the *Tenesmus*, is a sharp, pungent Humour, irritating the Intestinum Rectum and exciting those troublesome Endeavours to evacuate. Those affected with the Stone, are also subject to the *Tenesmus*, from the Communication, or Contact between the Bladder and the Rectum.

The Word is form'd from the *Greek*, *tenere, tenere*, to bend, in regard those attack'd with this Distaste, feel a continual Tenion in the Fundament.

The Cure of a *Tenesmus* depends on proper Evacuacions and Astringents; the former always preceding the latter; such as Bleeding, if Plethoric, gentle Cathartics, especially of the Powder of Rhubarb, &c. An Emetic of the *Indian* Root, *Ipecacuanha*, has been found of great Service in a long standing *Tenesmus*; for the augmenting one Evacuacion, is

the lessening of another, and it becomes so much the more forcible, as they happen to be Contraries.

The Restrings are such as are of use in other Fluxes. See DIARRHEA, DYSENTERY, &c.

TENET, a particular Opinion, Dogma, or Doctrine, professedly held by some Divine, Philosopher, &c. See DOGMA.

The distinguishing Tenets of the several Sects in Religion and Philosophy, see under the Names of the Sects themselves. See also PHILOSOPHER, SECT, &c.

TENMENTALE, or TEMANTALE, in our ancient Customs, originally signifies the Number of Ten Men; which Number, in the Time of the *English Saxons*, was call'd a *Decenary*; and ten Decenaries made what we call a Hundred. See DECENNA and HUNDRED.

These ten Men were bound for each other to preserve the publick Peace; and if any of them was found guilty of a Breach thereof, the other nine were to make Satisfaction, or to bring the Criminal before the King. See FRIEBURG.

The Word was also us'd for a Duty, or Tribute paid to the King, consisting of two Shillings for each Ploughland; which was probably thus call'd, by Reason each Person of the Decenary was bound to see it paid.

TENNY, or TAWNY, in Heraldry, a bright Colour, made of Red and Yellow mix'd; sometimes also call'd *Brusk*, and express'd in Engraving by thwart or diagonal Strokes or Hatches, like Purpure, and mark'd with the Letter T. See PURPURE.

In the Coats of all below the Degree of Nobles, it is call'd *Tenny*; but in those of Nobles, it is call'd *Hyacinth*; and in Princes Coats, the *Dragons Head*.

TENON, in Building, &c. the End of a Piece of Wood, or Metal, diminish'd by one Third of its Thickness, to be receiv'd into a Hole in another Piece, call'd the *Mortise*, for the jointing or fastening the two together. See MORTISE.

Among Joiners, &c. the *Tenon* is made in various Forms, square, Dove tail'd, for double Mortises, &c.

*Vitruvius* calls the *Tenons*, *Cordines*; Dove-tail'd *Tenons* he calls *Subscutes*, or *Securicula*. See DOVE-TAIL.

TENOR, TENOUR, the Purport or Content of a Writing or Instrument in Law, &c. Warrants issu'd by the Confirmation of Sentences, express, that they shall be executed according to their Form and *Tenor*.

It was impossible to retain so long a Speech Word for Word, but the Substance, the *Tenor* is this.

TENOR, in Music, the first mean or middle Part; or that which is the ordinary Pitch or *Tenor* of the Voice, when not either rais'd to the Treble, or lower'd to the Bass. See PART and MUSIC.

The *Tenor* is frequently mark'd on thorough Basses with the Letter T.

The *Tenor* is a Part which almost all grown Persons can sing. But as some have a greater Compass of Voice upwards, others downwards, others are confin'd to a kind of Medium, and others can go equally either higher or lower; hence many Musicians make a Variety of *Tenors*, as a low *Tenor*, a mean *Tenor*, a high *Tenor*, a natural *Tenor*; to which is also added, a *restringing Tenor*, *Violin Tenor*, &c.

The *Bassons* usually distinguish no more than two Kinds of *Tenors*, viz. *Tenore primo*, or P<sup>o</sup> or P<sup>o</sup>, which answers to our upper *Tenor*; and *Tenore secundo*, or 2<sup>o</sup> or II<sup>o</sup>, which is our natural *Tenor*; confounding the others under the Word *Baritone*.

TENOR is also us'd for a Person who sings that Part in Concert; or for an Instrument proper to play it.

TENORE *Ludicromenti mittere*, is a Writ whereby the Record of an Indictment is call'd out of another Court into *Chancery*.

TENSE, *Time*, in Grammar, an Inflexion of Verbs, whereby they are made to signify or distinguish the Circumstance of Time of the Thing they affirm, or attribute. See VERB.

The Affirmations made by Verbs, are different as to Point of Time; since we may affirm a Thing *is*, or *was*, or *will be*: Hence, a Necessity of a Set of Inflexions, to denote those several Times; which Inflexions, our *English* Grammarians call by a barbarous Word *Tenses*, from the *French temps*; most other Languages call them simple *Times*.

There are but three simple *Tenses*, the *Present*; as, *I love*, *Amo*: the *Preter*, or *Preterit*, or *Past*; as, *I have lov'd*, *Amavi*: and the *Future*; as, *I will love*, *Amabo*. See PARSENT, &c.

But in regard, in the *Preter* one may either express the Thing as just done, or past, or indefinitely and barely that it was done: Hence, in most Languages, *twice* two Kinds of *Preterits*; the one *definite*, marking the Thing to be precisely done as, *I have written*, *I have said*: And the other *indefinite* or *aspir*, denoting a Thing done indeterminately; as, *I wrote*, *I went*. See PRETER.

The future *Tense* admits of the same Variety. See FUTURE.

Beside the three simple *Tenses*, others have been invented, call'd *compound Tenses*; expressing the Relation of the simple ones to each other: The first expresses the Relation of the past to the present, and is call'd the *preterimperfect Tense*, because it does not mark the Thing simply, and properly as done, but as imperfect and present with respect to another Thing past; as, *I was at Supper when he enter'd*; *Cum intravit cenabam*.

The second compound Time marks the past doubly, and is therefore call'd the *plusquamperfect Tense*; as, *I had supp'd*, *Cenaveram*.

The third compound *Tense* denotes the Future with respect to the Past; as, *I shall have supp'd*, *Cenavero*.

The several *Tenses* or *Times*, it is to be observ'd, are properly denoted in the *Greek* and *Latin* by particular Inflections; in the *English*, *French*, and other modern Tongues, the auxiliary Verbs *to be* and *to have*, *ere* and *avoir*, are call'd in.

As to the Oriental Languages, they have only two simple *Tenses*, the Past and Future, without any Distinctions of imperfect, more than perfect, &c. which renders those Languages subject to abundance of Ambiguities which others are free from.

TENSION, the State of a Thing bent, or the Effort made to bend it.

Animals only sustain and move themselves by the *Tension* of their Muscles, and Nerves. A Chord or String gives an acuter or a deeper Sound, as it is in a greater or less Degree of *Tension*. See CHORD.

TENSOR, in Anatomy. See EXTENSOR.

TENT, *Tabernacle*, a Pavillion, or portable Lodge, under which to shelter in a Campaign, &c. from the Injuries of the Weather. See TABERNACLE.

Armies encamp under *Tents*: Most of the *Tartars* and *Arabs* are wandering People, that lodge under *Tents*. The *Hebrews* lodg'd forty Years under *Tents* in the Desert; which gave Occasion to the Scenepegy or Feast of *Tabernacles*. See SCENOPEGY.

The Word is form'd from the *Latin tensorium*, of *tendo*, I stretch; in regard *Tents* are usually made of Canvas stretch'd out, and sustain'd by Poles.

TENT, in Chirurgery, is a Roll of Lint, made in a particular Form, put into Wounds whose Suppuration is not perfect; or where there is a Quantity of Matter contain'd in the Tumor, more than what comes out at the first Dressing, &c. See WOUND, &c.

*Tents* are us'd in order to hinder the closing too soon. But several Chirurgical Writers, and particularly the Author of the *Hospital Surgeon*, gives us numerous Instances, wherein the Use, especially of hard *Tents*, has prov'd prejudicial in mortifying the Cure, bringing on Inflammations, Sinsus, Mortifications, &c. in Wounds and Ulcers. To remedy this, he proposes, that the Liniments, &c. be made of a liquid Consistence, either naturally, or by warming them; and that where *Tents* may seem indispensably necessary, as in large Cavities, the Orifice may be enlarg'd, and soft Dressis put in instead of them, which will prevent the Mischiefs commonly attending *Tents*. See ULCER.

TENTATIVE, is sometimes used Adjectively; thus we say, a *Tentative Method*, meaning a kind of unartful or indirect Method, which only proceeds by trying.

*Tentative* is also used Substantively, for an Essay, or Effort, whereby we try our Strength, or found an Affair, &c. to see whether or no it will succeed.

In the *French* Universities, a *Tentative* is the first Thesis or Act, which a Student in the Theology School, holds to shew his Capacity; if he answers well, the Degree of Bachelor is conferr'd on him.

TENTER, call'd also *Yeger* and *Prover*, a Machine used in the Cloth Manufactory, to stretch out the Cloths, Stuffs, &c. or only to make them even, and set them square. See CLOTH.

'Tis usually about Four Feet and a Half high, and for Length, exceeds that of the longest Piece of Cloth.

It consists of several long square Pieces of Wood, plac'd like those which form the Barriers of a Manage, so, however, as that the lower Cross-piece of Wood may be rais'd or lower'd, as is found requisite, to be fix'd at any Height, by means of Pins. Along the Cross-pieces, both the upper and under one, are hooked Nails, call'd *Tenter-hooks*, plac'd from Space to Space.

To put a Piece of Cloth on the *Tenter*: While the Piece is yet quite wet, one End is fasten'd to one of the Ends of the *Tenter*, then 'tis pull'd by Force of Arms towards the other End, to bring it to the Length required: That other End being fasten'd, the upper List is hook'd on to the upper Cross-piece, and the lower List to the lower Cross-piece, which is afterwards lower'd by Force, 'till the Piece have its desired Length. Being thus well stretch'd, both as to Length and Breadth: they brush it with a stiff Hair-brush, and thus let it dry. Then they take it off; and till they wet it again, it will still retain the Width and Breadth the *Tenter* gave it.

**TENTH, Decima.** See **TEN.**

The *Babylonians* and *Egyptians* gave their Kings a *Tenth* of their Revenues: See *Aristotle* in his *Oeconomicks*, lib. 2. *Diodorus Siculus*, lib. 5. and *Strabo*, lib. 15.

Afterwards, the *Romans* exacted of the *Sicilians* a *Tenth* of the Corn they reap'd; and *Appian* tells us, that those who broke up, or till'd any new Grounds, were obliged to carry a *Tenth* of their Produce to the Treasury.

The *Romans* offer'd a *Tenth* of all they took from their Enemies to the Gods, whence the Name of *Jupiter Predator*: The *Gauls* in like Manner, gave a *Tenth* to their God *Mars*, as we learn in the Commentaries of *Cæsar*.

Authors have been strangely perplex'd, to find the Original of a Custom, establish'd among so many People of different Manners and Religion, to give a *Tenth* to their Kings, or their Ministers of Religion. *Grævius* takes it to arise hence, That the Number Ten is the most known and the most common among all Nations; by reason of the Number of Fingers which is Ten. On this Account he thinks it is, that the Commandments of God were reduced to Ten, for People to retain them with greater Ease; that the Philosophers establish'd Ten Categories, &c.

**TENURE**, in Law, the Manner or Condition wherein a Tenant holds Lands or Tenements of his Lord; or the Services perform'd to the Lord, in Consideration of the Use and Occupancy of his Lands. See **TENANT, LORD, &c.**

The Kinds of Service, and consequently of Tenures, are almost infinite. See **SERVICE.**

Those for Lands held of the King, are either *great or petty Sergeanty*, in *Capite, Knights-Service*, &c. See **SERGEANTY, CAPITUM, &c.**

Those held of other Lords were very various, *Base, Frank, &c.* by *Homage*, by *Stocage*, &c. But by Stat. 12 Car. II. all Tenures, both of the King and other Lords, are turn'd into free and common Socage. See **SOCAGE.**

**TERES**, in Anatomy, a Name given two Muscles of the Arms, call'd also *Rotundi*; distinguish'd by *major* and *minor*.

The *Teres, or Rotundus major*, arises from the lower Angle of the Basis of the Scapula, and ascending obliquely upwards, in a round smooth Body, under the Head of the Longus, is inserted with a short flat Tendon into the Neck of the Os Humeri.

The *Teres, or Rotundus minor*, call'd also *Transversarius*, is frequently wanting, or, at least, so confounded with the *Infraspinatus*, that it is lost therein. It arises from the inferior Angle of the Scapula, and ascending obliquely in a round fleshy Body, passes over the upper Head of the Longus, and is inserted by a short flat Tendon below the Os Humeri.

**TERGIFEROUS Plants**, are such as bear their Seeds on the Backsides of their Leaves. See **PLANT and SEED.**

Such are the Capillaries. See **CAPILLARY.**

**TEREBINTHINA**, in Medicine, Natural History, &c. See **TURPENTINE.**

**TERM, Terminus**, the Extreme of any thing, or that which bounds and limits its Extent. See **EXTREME.**

**TERM, in Geometry**, is sometimes us'd for a Point, sometimes for a Line, &c. A Line is the *Term* of a Superficies; and a Superficies of a Solid.

This is what the Schools call *Terminus Quantitatis*.

**TERM, in Law**, signifies a Boundary or Limitation of Time. In this Sense we say, A Lease for Term of Life, For Term of Years, &c.

**TERM, TERMINUS**, in Architecture, is a kind of Statue, or Column adorn'd a-top with the Figure of a Man's, Woman's, or Satyr's Head, as a Capital; and the lower Part ending in a kind of Sheath or Scabbard.

*Terms* are sometimes us'd as Consoles, and sustain Entablatures, and sometimes as Staves to adorn Gardens.

Some write the Word *Terminus*, from *Heruus*, a Name the *Greeks* gave the God *Mercury*; whose Statue, made after this Manner, was placed in several of the Cross-ways in the City of *Athens*, &c.

Others bring the Etymology of the Word from the *Roman* God *Terminus*, the Protector of Land-marks, whose Statue (made without Hands or Feet, that he might not change his Place) was us'd to be planted at the Bounds of Lands to separate them.

Of these *Termini*, the Architects make great Variety, *viz. Angelic, Rustic, Marine, Double, in Bush, &c.*

**Military TERMS**, or *Termini Militariæ*, among the ancient *Greeks*, were the Heads of certain Divinities, placed on square Land-marks of Stone, or on a kind of Sheath, to mark the several *Stadia*, &c. in the Roads. These are what *Plinius* calls *Lares Viales*. See **LARVS.**

They were usually dedicated to *Mercury*, whom the *Greeks* believed to preside over the High-ways. Some of them were represented with four Heads; such as we still see in *Rome*, at the End of the *Fabrician Bridge*, which is hence call'd *Ponsæ de quattuor Capis*.

*Mercury* was thus represented, and also call'd by the *Latins*, *Mercurius Quadriformis*, as being supposed the First, who taught Men the Use of Letters, Music, Wrestling and Geometry. See **HERMES.**

**TERMS** are also us'd for the several Times or Seasons of the Year, wherein the Tribunals, or Courts of Judicature; are open to all who think fit to complain of Wrong, or to seek their own by due Course of Law or Action. See **COURT, DAY, LAW, FASTUS, &c.**

In Contra-distinction to these, the rest of the Year is call'd *Vacation*. See **VACATION.**

Of these Terms there are four in every Year, during which Time Matters of Justice are dispatch'd, *viz. Hilary Term*, which, at *London*, begins the 23d Day of *January*; or if it be *Sunday*, the next Day after, and ends the 12th of *February* following. *Easter Term*, which begins the *Wednesday* Fortnight after *Easter-Day*, and ends the *Monday* next after *Ascension-Day*. *Trinity Term*, beginning the *Friday* next after *Trinity Sunday*, and ending the *Wednesday* Fortnight after. And *Michaelmas Term*, which begins the 23d of *October*, and ends the 28th of *November* following. Each of these Terms have their Returns. See **RETURNS.**

**Oxford TERMS.** *Hilary or Lent Term* begins *January* 14, and ends the *Saturday* before *Palms Sunday*. — *Easter Term* begins the 10th Day after *Easter*, and ends the *Thursday* before *Whitsunday*. *Trinity Term* begins the *Wednesday* after *Trinity Sunday*, and ends after the *Ascension*, sooner or later, as the Vice-Chancellor and Convocation please. *Michaelmas Term* begins *October* the 10th, and ends *December* the 17th.

**Cambridge TERMS.** *Lent Term* begins *January* the 12th, and ends the *Friday* before *Palms Sunday*. *Easter Term* begins the *Wednesday* after *Easter-week*, and ends the *Week* before *Whitsunday*. *Trinity Term* begins the *Wednesday* after *Trinity Sunday*; and ends the *Friday* after the Commencement. *Michaelmas Term* begins *October* the 10th, and ends *December* the 16th.

**Irish and Scotch TERMS.** In *Scotland*, *Candlemas Term* begins *January* the 23d, and ends *February* the 12th. *Whitsunday Term* begins *May* the 25th, and ends *June* the 15th. *Lanmas Term* begins *July* the 20th, and ends *August* the 8th. *Martinsmas Term* begins *November* the 3d, and ends *November* the 29th. — In *Ireland* the Terms are the same as at *London*, except the *Michaelmas Term*, which begins *October* the 12th, and adjourns to *November* the 3d, and thence to the 6th.

**TERM**, in Grammar, a particular Word, Diction, or Expression in a Language. See **WORD.**

The Word *Terminus*, *Terminus*, is borrow'd, metaphorically, by the Grammarians and Philosophers, from the Measures or Surveys of Lands: As a Field is defin'd and distinguish'd by its *Termini*, or Limits, so is the Thing or Matter spoke of by the Word or *Term* it is denoted by.

Some of our Philosophers complain loudly of the great Use, or rather Abuse of vague and general *Terms*, which have no precise, definitive Signification.

To distinguish these, *F. Malebranch* observes, that every thing that is (whether it have actual Existence, or not) and of consequence every thing that is intelligible, is either a Being, or a Mode, or Manner of Being: Where, by Being, is meant whatever is absolute, or which may be conceiv'd alone, and without Relation to any other Thing; and by manner of Being, whatever is relative, or which cannot be conceiv'd alone.

Now, there are two Kinds of Manner of Being; the one consisting in the Relation of the Parts of a Whole, to some Part of the same Whole; the other in the Relation of one thing to another: Of the first Kind is the Roundness of a Piece of Wax; and of the second, the Motion or Situation of that same Wax. If then, every thing that is intelligible, be reducible either to Beings, or Manner of Beings, 'tis evident, every *Terms* which does not signify either of those Things, signifies nothing; and that every *Terms* which does not signify either a Being, or a Manner of Being, is an obscure and confus'd *Terms*.

In Metaphysics, the Use of such *Terms* is sometimes necessary and allowable, as in speaking of the Divine Perfections, &c. But in *Physicks* 'tis always mischievous, and yet nothing more common; *e. g.* when we say, that Bodies tend to their Centre, that they fall by their Weight, that they rise by their Levity, that they move by their Nature, that they change successively their Forms, that they act by their Virtues, Qualities, Faculties, &c. we use *Terms* which signify nothing; and all these Propositions are absolutely false in the Sense most Philosophers understand them.

There is no Centre in the Sense commonly meant; and the *Terms Weight, Force, Nature, Quality*, and the like, don't awaken any Idea either of a Being, or a Manner of Being: They are *Terms* void of Sense, and which Persons of Understanding should always avoid.

*Scientia infensati inenarrabilis verba.*

**TERM**, in the *Arts*, or **TERM of Art**, is a Word, which, besides the literal and popular Meaning which it has, or may have, in common Language, bears a further and peculiar Meaning in some Art or Science. See **ART**.

Or, a *Terms* is a Word which has one or more Meanings beside its Grammatical one; or which has a peculiar Force or Import in the Language of some particular Science, or Art.

A Word then becomes a *Terms*, when its Idea is render'd more complex, consists of more Parts, and includes more special Circumstances on some Occasions than on others.

'Tis this greater Complexness, this Excess of constituent Parts in the Idea, that denominates it a *Terms* in the general.

Further, as the Parts of the Idea signify'd by any Word are arbitrary; and as one may not only add new Parts to those contain'd in the literal Meaning, but also super-add others to them, alter them, excise them, and otherwise modify them, at Pleasure; Hence, the same Word becomes a *Terms* of this, or that Art, or both, as the Inventors and Improvers of those Arts, have thought fit to adopt it for the common Basis of certain Ideas, and to modify and circumstantiate its Meaning to the Use of their respective Arts.

See the Nature and Office of a *Terms* further illustrated in the Preface to this Work. See also the Article **DEFINITION**.

**TERM**, in *Logic*. A Proposition is said to consist of two *Terms*, i. e. two principal and essential Words, the *Subjunct* and the *Attribute*. See **PROPOSITION**.

A Syllogism consists of three *Terms*, the *Major*, *Minor*, and *Conclusion*. A Syllogism containing four *Terms*, is vicious. See **SYLLOGISM**.

**TERMS of an Equation**, in Algebra, are the several Names or Members of which it is compos'd, and such as have the same unknown Letter, but in different Powers and Degrees; for if the same unknown Letter be found in several Members in the same Degree: or Power, they all pass but for one *Terms*. See **EQUATION**.

This in this Equation  $aa + ab = R$ , the three *Terms* are  $aa$ ,  $ab$ , and  $R$ : And in this,  $aa + ab + ac = R + dc$ , the *Terms* are,  $aa$ ,  $ab + ac$ , and  $R + dc$ ; which are but three, because  $ab + ac$ , having  $a$  in the same Dimension in both Parts, is taken but for one *Terms*.

Hence, the *first Terms* in any Equation, must be that where the unknown Root hath the highest Dimensions; and that *Terms* which hath the Root in it: of one Dimension of Power lower, is call'd the *second Terms*; and so on.

**TERMS of Proportion** in Mathematics, are such Numbers, Letters, or Quantities, as are compar'd one with another. See **PROPORTION**.

Thus, if  $4 \cdot 8 :: 6 \cdot 12$  then  $a, b, c, d$ , or  $4, 8, 6, 12$ , are call'd the *Terms*; of which  $a$  is call'd the *first Terms*,  $b$  the *second Terms*, &c.  $a$  and  $c$  are call'd the two *Antecedents*, and  $b$  and  $d$  the two *Consequents*. See **ANTECEDENT** and **CONSEQUENT**.

**TERMS**, or Courses in Medicine, the *Menses* or Woman's monthly Purgations. See **MENSES**.

**TERMINALIA**, in Antiquity, Feasts celebrated by the *Romans*, in Honour of the God *Terminus*. See **FEAST**.

In Reality, the *Terminalia*, or Feast of Land-Marks, was held in Honour of *Jupiter*, consider'd in the Capacity of Conservator of Land-Marks or Bounds. *Dionysius Halicarnassensis* tells us, that it was *Numa Pompilius* who first consecrated Land-Marks to *Jupiter*; and adds, that the same Prince appointed an Anniversary Day, wherein the Country People assembling together on the Bounds of the Lands, should offer Sacrifices in Honour of the tutelary Gods thereof.

The *Terminalia* were held on the 7th, or, as *Servius* will have it, on the 10th of the Calends of *March*. No Animal was to be sacrific'd herein, it being deem'd unlawful to stain the Land-Marks with Blood. They only offer'd Sacrifices of the First-Fruits of the Earth; and this in the open Air, and on the Spot where the Land-Marks were.

*Varro* is of Opinion this Feast took its Name from the End of the Year: But *Festus* is of a different Sentiment, and derives it from the Name of the Deity in whose Honour it was held.

**TERMINATION**, in Grammar, the ending of a Word; or the last Syllables thereof.

'Tis the different *Terminations* of one, and the same Word, on different Occasions, that make the different Cases, Numbers, Tenses and Moods, &c. See **CASE**, **NUMBER**, **TENSE**, &c.

**TERMINISTS**, a Sect or Party among the Calvinists, whose particular Tenets are reducible to Five Points.

1° That there are several Persons, both in and out of the Church, to whom God has fix'd a certain *Terms* before their Death, after which he no longer wills their Salvation, how long soever they live afterwards. 2° That God has fix'd this fatal *Terms* of Grace, by a secret Decree. 3° That this

*Terms* once elapsed, he makes them no further Offer of Repentance or Salvation; but takes away from his Word, all the Power it might have to convert them. 4° That *Pharaoh*, *Saul*, *Judas*, most of the *Jews*, and many of the Gentiles were of this Number. 5° That God still bears with several of these Sort of People, and even confers Benefits on them after the *Terms* expired; but that he does not do it with any Intention they should be converted.

All the other Protestants, and particularly the Lutherans, look on these Articles with Abhorrence, as repugnant to the Goodness of God, as destructive to all Christian Virtue, and as contrary to Scripture, particularly the following Texts; *Ezek. xviii. 23, 30, 31, 32. xxxiii. 11. 1 Tim. ii. 1, 16. 2. Pet. iii. 9. Acts xvii. 30, 31. Mat. xi. 28. Isa. lxxv. 2. Heb. iii. 7, 13. Rom. iv. 5, &c.*

TERRA, in Geography }  
TERRA, in Chymistry } See EARTH.  
TERRA, in natural History }

TERRA Damata } CAPUT MORTUUM.  
TERRA Lemnia } LEMNIAM.  
TERRA Japonica } See JAPON EARTH.  
TERRA Sigillata } SIGILLATA.  
TERRA Merita } TURMERIC.

**TERRA**, a *Terra*, Gallies, and other Vessels, are said to go *Terra*, a *Terra* when they never go far from the Coast. See **COASTING**.

The Phrase is also apply'd in the Manage, to Horses, which neither make Carvers nor Balotades, but run smoothly on the Ground, on a prest'd Gallop; only making little Leaps or Risings something with the fore Feet.

The *Terra*, a *Terra*, is a Series of very low, easy Leaps, which a Horse makes forward, bearing sidewise, and working on two Treads. In this Motion he lifts both Legs at once; and when those are on the Point of descending, they are accompany'd by the hind Legs, with a short and quick Cadence, always bearing and staying on the Haunches, so that the Motions of the hind Quarters are very short and quick.

The *Terms* is also apply'd to Dancers who cut no Capers, nor scarce quit the Ground. Hence it is also figuratively apply'd to Authors, whose Style and Diction is low and creeping.

**TERRACE**, or **TERRAS**, a Bank of Earth, raised in a Garden, Court, &c. above the Level of the Ground.

The *Terras* is an Earth-work usually lined and breast'd with a strong Wall, in Compliance with the natural Inequality of the Ground. Sometimes it is made in Talus, or a slope, and cover'd with Turf. A *Counter-terrace*, is a *Terrace* raised over another, for the joining of the Ground, or the raising a Parterre.

**TERRACE** is also applied to the Roofs of Houses that are flat, and whereon one may walk; as also to Balconies that project. See **ROOF**.

The *Terrace* is properly the Covering of a Building, which is in Plat-form; as that of the Peristyle of the *Louvre*; or that of the Observatory, paved with Flint and Mortar. All the Buildings of the Oriental Nations, are cover'd with *Terrasses*, to take the fresh Air on, and even to lie on. See **PLAT-FORM**.

**TERRA-FIRMA**, in Geography, is sometimes used for a Continent; in Contradistinction to Islands. See **CONTINENT**.

This *Alia*, the *Indies* and *South America* are usually distinguish'd into *Terra-firma's* and Islands. See **ISLAND**.

In our ancient Law-Books, we meet with *Terms* in the Sense of *Land or Ground*; joined with divers Additions; as,

*Terra Normannorum*, the Lands of such *Norman* Noblemen, as were forfeited to the Crown, by the Owners taking Part with the *French King*, against King *Henry III.* — *Terra Frusca*, such Land as has not been lately plough'd. — *Terra Gilliflowera*, Land held by the Tenure of paying a Gilliflower yearly. See **SERVICE**. — *Terra Festiva*, Land fown with Corn, and the Crop still remaining thereon. — *Terra Testamentalis*, Land held free from feudal Services, and divisible by Will. — *Terra culta*, Land that is Till'd and measur'd, in Contradistinction to *Terra inculta*. — *Terra Affirmata*, Land let out to Farm. — *Terra Dominica*, or *Indominata*, Domain Land of a Manor. See **DEMAIN**. — *Terra Hydrata*, was Land subject to the Payment of Hydrage. See **HYDRAGE**. — *Terra Lucrabilis*, Land that may be gain'd from the Sea, or inclosed out of a Waste or Common, to particular Uses. — *Terra Wainabilis*, Tillage Land. — *Terra Warea*, Fallow Land. — *Terra Boscalis*, Wood Land, &c.

*TERRA extendenda*, is a Writ directed to the Escheator, &c. willing him to inquire and find out the true yearly Value of any Land, &c. by the Oath of 12 Men, and certify the Extent into Chancery. See **ESCHEATOR**.

**TERRAGE**, **TERRAGIUM**, anciently signified a Service, in which a Tenant or Vassal was bound to his Lord, to plough and reap the Ground for him. See **PRECARIOUS**.

Others

Others will have it Money paid for digging or breaking the Earth in Fairs and Markets.

*Quæti sunt de Theodosio, Pavagio, Passagio, Logagio, Talagio, Corragio, Prifagio & Terragio.*

**TERRAQUEOUS**, an Epithet given to our Globe or Earth, consider'd as consisting of Land and Water; which, together, constitute one globular Mass. See **GLOSS** and **EARTH**.

The Word, like the Thing, is a Compound of *Terra* and *Aqua*, Earth and Water.

Some Philosophers, particularly Dr. *Burnet* in his *Theory*, tax the Frame and Fashion of the *Terraqueous Globe* as rude, unskillful and disorderly; and conclude it highly absurd to suppose it came thus out of the Hands of the Creator, and therefore have Recourse to a Deluge to make it thus. See **DELUGE**.

But others can perceive a world of Art and Conveniency, even in this apparent Disorder: Mr. *Derham* particularly observes, That the Distribution of Land and Water is admirable; the one being laid over the other so skillfully all the World over, that there is a just Equipoise or Balance of the whole Globe.

Thus the Northern Ocean balances the Southern; and the *American Continent*, is a Counterpoise to the *European, African* and *Asiatic*. See **OCEAN**, &c.

And what some object, that the Waters occupy too great a Part of the Globe, which they imagine would be of more Use were it dry Land; he obviates, by shewing that this would deprive the World of a due Quantity of Vapours and Rain: For if the Cavities which contain the Sea, and other Waters, were deeper; tho' the Quantity of Water were the same, and only the Surface lesser and narrower, the Evaporations would be so much the less, inasmuch as they are made from the Surfaces, and, consequently, are in proportion thereto. See **VAPOUR**, **CLOUD**, **RAIN**, &c. See also **MOUNTAIN**, **VALLEY**, &c.

**TERRÆ-Filius**, q. d. *Sen of the Earth*. A Student in the University of *Oxford*, appointed on certain Occasions to make jesting and Sarcycal Speeches against the Members thereof; to tax them with any growing Corruptions, &c.

**TERRE-Plain**, in Fortification, the Top, Plat-form, or Horizontal Surface of the Rampart, whereon the Cannon are placed, and the Defenders perform their Office. See **RAMPART**.

It is thus call'd, as lying level; having only a little Slope outwardly, to bear the Recoil of the Cannon.

It is terminated by the Parapet on that Side towards the Campaign; and by the inner Talus, on the Side towards the Place. Its Breadth is from 24 to 30 Feet. See **PARAPET**, &c.

**TERRÆ-Tenant**, is he who hath the actual Possession of the Land, otherwise call'd the *Occuparius*. See **TENANT** and **OCCUPATION**.

Thus a Lord of a Manor hath a Freeholder, who letteth out his Freehold to another to be occupied: And this Occupier, having the actual Possession, is called the *Terræ-Tenant*.

**TERRĒLLA**, *μικροτερον*, little Earth; is a Magnet, turn'd of a just spherical Figure, and placed so as that its Poles, Equator, &c. do exactly correspond to those of the World. See **MAGNET**.

'Twas thus first call'd by *Gilbert*, as being a just Representation of the great magnetic Globe we inhabit. See **GLOBE**.

Such a *Terrælla*, if nicely pois'd, and placed in a Meridian like a Globe, it was supposed, would be turn'd round like the Earth in 24 Hours by the Magnetic Particles pervading it; but Experience has shewn this to be a Mistake. See **MAGNETISM**.

**TERRESTRIAL Globe**

**TERRESTRIAL Paradise**

**TERRESTRIAL Line**

} **GLOBE**.

} **PARADISE**.

} **LINE Terrestrial**.

**TERRIER**, or **TERRAR**, in our ancient Customs, a Collection of Acknowledgments of Vassals or Tenants of a Lordship, containing the Rents, Services, &c. they owe their Lord; and serving as a Title, or Claim for demanding and executing the Payments thereof.

At present, by *Terrier* we mean no more than a Book, or Roll, wherein the several Lands, either of a private Person, or of a Town, College, Church, &c. are describ'd. It should contain the Number of Acres, the Site, Boundaries, Tenants Names, &c.

**TERRIER** is also the Lodge or Hole which Foxes, Badgers, Rabbits, &c. dig themselves under Ground; and wherein they save themselves from the Pursuit of the Hunters.

Hence *Terrier* is also used for a kind of little Hound to hunt those Animals, which, like a Ferret, creeps into the Ground, and by that Means affrights and bites them; either tearing them with his Teeth, or else halting them by Force out of their Holes.

**TERRIS Bonis & Casualtis rebabendis post purgationem**, a Writ which lies for a Clerk to recover his Lands, Goods or Chattels formerly seiz'd; after having clear'd himself of a

Felony, upon Suspicion whereof he was convict, and deliver'd to his Ordinary to be purged.

**TERRIS & Casualtis tenens ultra debitum levatum**; a Writ Judicial, for the restoring Lands or Goods to a Debtor, that is detain'd beyond the Quantity of the Debt. See **DISSEISIN**.

**TERRIS Liberandis**, a Writ lying for a Man convicted by Attain, to bring the Record and Proofs before the King, and take a Fine for his Imprisonment, and deliver him Lands and Tenements again, and release him of a Strip and Waite.

**TERRITORY**, *Districus*, the Extent or Compass of Land within the Bounds, or belonging to the Jurisdiction, of any State, City or other Division.

'Tis a Maxim, that the Church has no *Territory*, i. e. it has no Temporal Jurisdiction; so that an Ecclesiastical Judge cannot arrest any Body, nor even a Priest.

Much in this Sense, *Cujas* says, the Church has an Authority, but no *Territory*.

**TERSION**, the Act of wiping or rabbing a Thing. See **ATTRITION**.

The Word comes of *tero*, I wear.

**TERTIAN**, a Fever or Ague intermitting but one Day; so that there are two Fits in three Days. See **FEVER**.

The Method of curing *Tertiens*, as well as other Agues, is by the Curets, either given in Substance or Decoction. This last is best in weak Constitutions, and where the Fits are not so regular; but the Substance more to be depended on as to Certainty in other Cases. See **AGUE**, &c.

**TERTIATE**, in Gunnery: To *Terriate* a great Gun, is to find the Thickness of the Metal at the Touch-hole, the Trunnions, and at the Muzzle; whereby to judge of the Strength of the Piece, and whether it be well fortified or not. See **GUN**, **CANNON**, **ORDNANCE**, &c.

This is usually done with a Pair of Calliper Compasses; and if the Piece be Home-bored, the Diameter less by the Height, divided by 2, is the Thickness at any Place. See **CALLIPER**.

**TERUNCHUS**, in Antiquity, a very small Silver Coin, in use among the *Romans*. See **COIN**.

The Inconvenience of such very small Pieces being soon found, the *Terunchus* became disused; but its Name was still remain'd in reckoning; and thus it became a Money of Account. See **MONEY**.

The *Terunchus* at first, was a Quarter of the *As*, or *Libra*; Hence, as the *As* contained 12 Ounces, the *Terunchus* contained Three; whence the Name, which is form'd of the *Latin*, *tres uncie*.

The *Terunchus* was also a Quarter of the *Denarius*; so that when the *Denarius* was at ten *As*'s, the *Terunchus* was worth Two and a Half, and when the *Denarius* was risen to 16 the *Terunchus* was worth Four. See **DENARIUS**.

**TESSELATED Pavement**, *Pavementum Tessellatum*, a rich Pavement of Mosaic Work, made of curious small square Marbles, Bricks or Tiles, call'd *Tesselle*, from the Form of Dies. See **MOSAIC Work**.

These *Pavements* were much used in the Tents of the *Roman* Generals.

**TESSERA-COENS**, in our ancient Writers, the 40 Days between *Easter* and *Holy Thursday*. See **LENT**.

**TEST**, or *Test Oath*, in our Customs, a Form of Oath, whereby the Doctrine of Transubstantiation, the Sacrifice of the Mass, the Invocation of Saints, &c. are abjured. See **OATH**.

This Oath was first introduced by Authority of Parliament in 1672; and they who refused to take it, were excluded the Privilege of holding any public Offices.

The Word signifies *Proof* or *Trial*, being form'd of the *Latin*, *Testis*, Witness; this Oath being a Mark or Evidence, that the Person is not a *Roman* Catholic.

**TEST**, among Chymists and Refiners, the same as the *Coppel*, *Coppel* or *Coppel*, an Instrument used in the purifying Gold and Silver. See **COUPEL**.

**TESTACEOUS**, in natural History, an Epithet given to a Species of Fish, which are covered with a strong, thick Shell; as Tortoisés, Oysters, Pearl Fish, &c. See **FISH**.

In Strictness, however, *Testaceous* is only applied to such Fish, whose strong and thick Shells are entire and of a Piece; Those which are soft, thin, and consist of several Pieces jointed, as the Lobster, &c. being call'd *Cryustaceous*. See **SHELL**.

In Medicine, all Preparations of Shells, and Substances of the like Kind, are call'd *Testaceous Powers*.

Such are Powders of Crabs Claws and Eyes, Harts-horn, Pearl, &c.

Dr. *Quincy*, and others, suppose the Virtue of all *Testaceous* Medicines to be alike; that they seldom or never enter the Lacteals; but that the chief of their Action is in the first Passages; in which Case, they are of great Use in absorbing Acidities. See **ASSORBENT**.

Hence they become of Use in Fevers, and especially in rectifying the many Distempers in Children, which generally owe their Origin to such Acidities. See *Diseases of CHILDREN*.

**TESTAMENT**, in Law, a solemn and authentic Act, whereby a Person declares his Will, as to the Disposal of his Estate, Effects, Burial, &c. See **WILL**.

A *Testament* has no Effect till after Death; and 'tis always revocable till then. As *Testaments* are Acts, of all others the most subject to Deceits, Surprise, &c. it was necessary to use all kinds of Precautions to prevent the Wills of the Deceased from being eluded; and the Weakness of dying Persons from being abused.

The most ancient *Testaments* among the *Romans*, were made *ex testis*; the Testator declaring his Will in the Presence of Seven Witnesses: These they call'd *Nuncupative Testaments*; but the Danger of trusting the Will of the Dead to the Memory of the Living, soon abolish'd them; and all *Testaments* were order'd to be in Writing. See **NUNCUPATIVE**.

The *French Legislators*, thought *Holographic Testaments*, i. e. *Testaments* wrote wholly with the Testator's Hand, an abundant Security; but the *Roman Law*, more severe, did not admit of *Testaments* without further Solemnity.

The easiest and most favourable, is the 21st Law in the *Code de Testaments*, which permits such as are unwilling to trust the Secret of their *Testaments* to others, to write it with their own Hand, and to close it in the Presence of Seven Witnesses, declaring to them, that it is their *Testament*; after which it is to be Sign'd by all the Seven Witnesses.

Otherwise, to make a *Solemn Testament*, it was required to be attested by Seven Witnesses, and sealed with their Seals.

Yet the *Military Testament* was not subject to so many Formalities: The Soldier was supposed too much employ'd in defending the Laws, to be subject to the Trouble of knowing them. His tumultuary Profession excus'd him from observing all the Rules.

Add, that *Testaments*, wherein Fathers dispos'd of their Estates among their Children, had particular Privileges, and were dispens'd from most of the ordinary Formalities.

The Word is form'd from the *Latin*, *Testamentum*, which the *Latin Lawyers* derive from *Testatio Mentis*.

**TESTATOR**, or **TESTATRIX**, the Person who makes his or her Will and Testament. See **TESTAMENT**.

M. *Gillet*, shews, that a Person incapable of a Legacy, cannot demand any Sum, which the *Testator* in his Testament declares himself indebted to him in; in regard such a Declaration of Debt is presumed a Fraud, against the Intention of the Law.

**TESTA NEVELL**, or **TESA DE NEVIL**, an ancient Record kept by the King's Remembrancers in the *Exchequer*; containing the King's Fees throughout the greatest Part of *England*, with Inquisitions of Lands Escheated, and Sequestrations.

It was denominat'd from its Compiler, *Johann. de Nevil*, one of the Itinerant Justices under *K. Henry III.*

**TESTATUM**, in Law, a *Writ* in personal Actions. If the Defendant cannot be arrested on a *Capias* in the County where the Action is laid, it is return'd *non est inventus* by the Sheriff; this *Writ* shall be sent into any other County, where this Person is thought to have wherewithal to satisfy the Demand.

It is call'd *Testatum*, because the Sheriff has before testifi'd, that the Defendant was not to be found in his Bailiwick.

**TESTE**, a Term commonly us'd in the Close of every *Writ*, where the Date is contain'd, which begins with *Teste magis*, if it be an original *Writ*; or if *Judicial*, *Teste Mattheo Hale, Mil. or Francisco North, Mil.* &c. according to the Court whence it comes.

In some ancient Formula's, we read *Teste Custole Anglie*.

**TESTES**, in Anatomy, two white, soft, oval Bodies serving for Generation; usually call'd, diminutively, *Testicles*. See **TESTICLE**.

**TESTES**, of the Brain, are two little, round, hard Bodies, between the third and fourth Ventricle, near the pineal Gland. See **BRAIN**.

**TESTICLE**, *Testis*, a double Part in an Animal, serving for the Office of Generation. See **GENERATION**.

In Man, and most Animals, they are exterior; in some, as Fowls, interior.

Some have only one, ordinarily they have two, and some have naturally had three; nay, Anatomists assure us they have known four.

The *Testicles* are soft white Bodies, of an oval Figure, and about the Size of a Pidgeon's Egg: They have been thought to be of a glandulous Substance, and, according to the present Doctrine of Glands, they may be allow'd to be so still. See **GLAND**.

They are found of a Convolution of divers Kinds of Vessels, particularly the Spermatic Veins and Arteries; the latter of which bring the Blood whence the Seed is to be secreted in the Meanders of the *Testicles*; and the former return it back again after the Secretion made. See **SEED**.

The rest of the *Testicle* is made up of Seed-Vessels, which, indeed, are but one continu'd Series or Rope, intricately convoluted and wound up as it were into a Bottom, but adhering so loosely, that they are easily drawn out into Length, and in Rats shaken from their close Contexture.

These Spermial Vessels terminate in the Parastate. See **PARASTATA**.

The *Testicles*, with the Parastate, are said to be inclos'd in three proper Coats; the first the *Musculosa*, deriv'd from the Cremaster Muscle; the second the *Elythroides*, or *Vaginalis*, which is a Continuation of the external Lamina of the Peritonium; the third, the *Albuginea*. See each under its proper Article, **MUSCULOSA**, **Elythroides**, &c.

The common Capsula or Membrane including both *Testicles*, is the *Scrotum*; which fee describ'd under the Article **SCROTUM**.

For the Use of the *Testicles*, in preparing and secreting the Seed; See **SEED**.

They are call'd *Testicles*, by Diminution, of *Testes*, Witnesses; as giving Testimony of Virility. They are what we properly call *Generators*, *Genitalia*.

The *Greeks* call them *Didymi* or *Twins*. See **DIDYMI**.

**TESTIMONIAL**, a kind of Certificate, sign'd either by the Master and Fellows of the College where a Person last resid'd; or by three, at least, Reverend Divines, who knew him well for three Years last past; giving an Account of the Virtues, Uniformity, and Learning of the Person. See **CERTIFICATE**.

Such a *Testimonial* is always requir'd before Holy Orders are confer'd; and the Bishop even ordinarily demands one of a Priest before he admits him to a Benefice. See **ORDINATION**, &c.

**TESTIMONIAL** is also a Certificate under the Hand of a Justice of Peace, testifying the Place and Time when and where a Soldier landed, and the Place of his Dwelling, &c. whether he is to pass.

**TESTIMONY**. See **EVIDENCE** and **WITNESS**.

For the Credibility of *human Testimony*; See **CREDIBILITY**.

**TESTUDO**, in Natural History. See **TORTOISE**.

*TESTUDO*, in Antiquity, was particularly us'd among the Poets, &c. for the ancient Lyre; by Reason it was originally made, by its inventor *Mercury*, of the Back or hollow Shell of a *Testudo Aquatica*, or Sea Tortoise, which he accidentally found on the Banks of the River Nile. See **LYRE**.

*Dr. Molyneux* has an express Discourse, in the *Philosophical Transactions*, to shew that the Tortoise-shell was the Basis of the ancient Lyre, and that the whole Instrument had thence the Denomination *Testudo*; which Account lets some Light into an obscure Passage in *Horace*, Ode 3. lib. 4. mistaken by all the Commentators.

*O Testudinis Auree  
Dulcens que strepitans, Pieri, temperas;  
O Mutis quoque piscibus,  
Donatur Cypri, si libeat, sanctorum.*

**TESTUDO**, *Tortoise*, in the military Art of the Ancients, was a Kind of Cover or Screen which the Soldiers, *et c.* a whole Company, made themselves of their Bucklers, by holding them up over their Heads, and standing close to each other.

This Expedient serv'd to shelter them from Darts, Stones, &c. thrown upon them; especially those thrown from above when they went to the Assault.

**TESTUDO** was also a kind of large Wooden Tower which mov'd on several Wheels, and was cover'd with Ballocks Hides newly beat; serving to shelter the Soldiers when they approach'd the Walls to mine them, or to batter them with Rams.

They were call'd *Tortoisets* from the Strength of their Roof, which cover'd the Workmen as the Shell does the Tortoise.

**TESTUDO**, in Medicine, a soft broad Tumour, or gathering of impure Humours between the Scull and the Skin, call'd also *Talpa*, as resembling the Form of a Tortoise or a Mole. See **TALPA**.

**TESTUDO Veliformis quadrabilis**, a Hemispherical Vault, or Ceiling of a Church, &c. wherein four Windows are so contriv'd, as that the rest of the Vault is quadrable, or may be squar'd. See **VAULT**, **QUADRATURE**, &c.

The determining of these Windows, was a Problem propos'd to the great Mathematicians of Europe, particularly the Cultivators of the new *Calculus Differentialis*, in the *Acta Eruditorum Lipsie*, by Sig. *Viciani*, under the fictitious Name of *A. D. Via Lisei pusillo Geomera*, which was the Anagram of *Postremo Galilei Disceptabo*.

It was solv'd by several Persons, particularly M. *Leibnitz*, the very Day he saw it: And he gave it in the *Leipfic Acta* in an Infinity of Manners; as also did M. *Bernoulli*, the *Marquis del Hospital*, Dr. *Wallis*, and Dr. *Gregory*.

**TETANOS**, in Medicine, a Term purely Greek, and signifying a kind of Tonic Spasmus, or Convulsion, wherein the fore and hind Muscles of the Head are render'd rigid and inflexible; so that it can neither bend one Way nor t'other. See CONVULSION.

The Word is form'd from the Greek, *τετανω*, to stretch.

Some Authors also use *Tetanus*, or *Tetanus*, in a more general Sense. When a Convulsion is universal, they denominate it *Tetanus*; which they sub-divide into *Empirosthotonus* and *Ophiothotonus*. See EMPIROSTHOTONOS and EPISTHOTONOS.

**TETRACHORD**, in the ancient Music, a Concord consisting of three Degrees, TONES, or Intervals, or four Sounds or Terms; call'd also by the Ancients *τετραχορδον*, and by the Moderns a *Fourth*. See FOURTH.

This Interval had the Name *Tetrachord* given it with respect to the Lyra, and its Chords or Strings. See CHORD. See also DIATHESSARON.

Ancient Authors make frequent Mention of the Synaphic, or Conjunction; and Dieficula, or Disjunction of *Tetrachords*. To conceive their Meaning, it must be observ'd, that two *Tetrachords* were said to be join'd, when the same Chord was the highest of the first, or lowest Instrument, and the lowest of the second; as was the Case in the two *Tetrachords* that compose the ancient Heptachord or Seventh. But when two *Tetrachords* had no common Chord; but, on the contrary, had each their different ones to begin and end withal, so that between the two there were two Intervals of a TONE, then the *Tetrachords* were said to be disjoin'd; which was the Case in the two *Tetrachords* that compose the Octachord or Octave. See OCTAVE.

The Word is form'd of the Greek, *τετρα*, four times, and *χορδη*, a Chord or String.

**TETRACTYS**, in the ancient Geometry. The *Pythagoric Tetractys* is a Point, a Line, a Surface, and a Solid.

**TETRADIAPASON**, a *Quadruple Diapason*; a Musical Chord, otherwise call'd a quadruple eight or nine and twentieth. See DIAPASON.

**TETRADITES**, in Antiquity, a Name given to several different Sects of Hereticks, out of some particular Respect they bore to the Number four, *τετρα*.

The Sabbathians were call'd *Tetradites*, from their fasting on *Easter-Day*, as on the fourth Day, or *Wednesday*. See SABBATHIAN.

The Manichees, and others, who admitted a Quaternity instead of a Trinity in the Godhead, or four Persons in lieu of three, were also call'd *Tetradites*. See MANICHEE.

The Followers of *Petrus Fullensis* bore the same Appellation of *Tetradites*, by Reason of the Addition they made to the *Trisagion*, to countenance an Error they held, that in our Saviour's Passion, 'twas not any particular Person of the Godhead, *v. gr.* the Son, that suffer'd; but the whole Deity. See TRISAGION.

The Ancients also gave the Name *Tetradites* to Children born under the fourth Moon; and these they believ'd unhappy.

The Word is form'd from the Greek, *τετρας* or *τετρας*, four.

**TETRAEDRON**, **TETRAHEDRON**, in Geometry, one of the five regular or Platonic Bodies, or Solids; comprehended under four equilateral and equal Triangles. See SOLID.

The *Tetraedron* may be conceiv'd as a triangular Pyramid of four equal Faces. See PYRAMID.

Such it that represented (Tab. Geometry, Fig. 59.) See REGULAR BODY.

'Tis demonstrated by Mathematicians, that the Square of the Side of a *Tetraedron*, is to the Square of the Diameter of a Sphere wherein it may be inscrib'd, in a subsubsquare Ratio: Whence it follows, that the Side of a *Tetraedron* is to the Diameter of a Sphere it is inscrib'd in, as  $\sqrt{2}$  to the  $\frac{1}{2}$ , consequently they are incommensurable.

**TETRAGON**, in Geometry, a *Quadrangle*; or a Figure with four Angles. See QUADRANGLE.

Thus a Square, Parallelogram, Rhombus, Trapezium, are *Tetragonal* Figures. See SQUARE, &c.

The Word is form'd from the Greek, *τετρας*, four, and *γωνια*, Angle.

**TETRAGON**, in Astrology, &c. an Aspect of two Planets with Regard to the Earth, when they are distant from each other a fourth Part of a Circle, or  $90^\circ$ ; as AD Tab. Astronomy, Fig. 3.

The *Tetragon* is express'd by the Character,  $\square$ . See ASPECT.

**TETRAGONIAS**, a Name given to a Comet, whose Head is of a Quadrangular Figure, and its Tail or Train long, thick, and uniform; not much different from the Meteor call'd *Trabs*. See COMET and TRABS.

**TETRAGONISM**, a Term some Authors use to express the Quadrature of the Circle. See QUADRATURE.

**TETRAGONUS**, in Anatomy, a Muscle, call'd also *Quadratus Genæ*. See QUADRATUS.

**TETRAGRAMMATON**, a Denomination given by the Greeks to the Name of God, because consisting of four Letters in most Languages. See GON.

**TETRAMETER**, in the ancient Poetry, an Iambic Verse consisting of eight Feet. See IAMBIC.

We meet with none of these but in the Comic Poets, as *Terence*.

The Word is form'd from the Greek, *τετρας*, four, and *μετρον*, Measure, *v. l.* four Measures.

**TETRAPASTUS**, in Mechanicks, a Machine wherein are four Pulleys. See PULLEY.

The Word is form'd from the Greek, *τετρας*, four, and *παστος*.

**TETRAPETALOUS**, in Botany, so Epithet given to Flowers that consist of four *Petals*, or Leaves, plac'd around the Pistil. See PETALA.

Thele, M. *Jussieu* calls *Polypetalous* Flowers. See POLYPETALOUS.

Mr. Ray, who calls them *Tetrapetalous*, makes them constitute a distinct Kind, which he divides into

- 1<sup>o</sup>. Such as have an uniform *Tetrapetalous* Flower, and their Seed-Vessels a little oblongish, which he therefore calls *Siliquose*; as the Keiri or Leucoum Luteum, and the other common Leucoum, the Denaria, the Leucoum Siliquatum, Alysson, Viola Lunaria, Parnochia, Hesperis, Alliaris, Rapa, Napus, Sinapis, Rapistrum, Eraca Spuria, Erisimum, Cardamine, Turrilis, Pileofella Siliquola, and the Raphanus Rusticanus and Aquaticus.

- 2<sup>o</sup>. Such as have their Seed Case or Vessel shorter, which therefore, for Distinction Sake, he calls *Capsulate*, and *Sili-culose*; as the Myrrour, Druha, Leucoum Siliqua subrotunda, Cochlearia, Nasturtium, Lepidium vulgare, Thlaspi, Brasica marina, Glastum, Eruca maritima, &c.

3. Such as have a seeming *Tetrapetalous* Flower, that is, a Monopetalous one, divided deeply into four Partitions; which he particularly calls *Ausmatous*; as the Papaver, Agremony, Veronica, Tithymallus, Planago, Corosolon, Pylidium, Lythymachin Siliquola, Althea spuria, &c.

**TETRAPHARMACUM**, from *τετρας*, *quater*, *four*, and *φαρμακον*, *Medicamentum*, is any Remedy consisting of four Ingredients.

**TETRAPLA**, in Church History, a Bible dispos'd by *Origen* under four Columns, in each whereof was a different Greek Version, *viz.* that of *Aquila*, that of *Symmachus*, that of the *Seventy*, and that of *Theodotian*. See BIBLE.

*Sextus of Steuens* confounds the *Tetrapla* with the *Hexapla*; but the *Tetrapla* is a different Work, compos'd after the *Hexapla*, in Favour of such as could not have the *Hexapla*. See HEXAPLA.

Some Authors are of Opinion, that the Order wherein the four Versions of the *Tetrapla* were rang'd, was different from that wherein we have receiv'd them; and particularly that the Septuagint was in the first Column: But S. *Epiphanius* says expressly to the contrary, and places it in the third. He even gives us *Origen's* Reason for putting it there; which was, says he, that the best Version might be in the Middle, that the others might be the more easily confronted therewith, and corrected from it.

*Zarivinus*, however, in his Annals for the Year 231, takes the Septuagint to have been in the third Place in the *Hexapla*, but the first in the *Tetrapla*; yet *Epiphanius* gives it the same Place in both.

The Word is form'd from the Greek *τετραπλος*, quadruplex, four-fold.

**TETRAPTOTE**, **TETRAPTOYON**, in Grammar, such defective Nouns as have only four Cases; as *Plus*, which wants the Dative and Vocative singular. See CASE, APOTOTE, &c.

**TETRARCH**, **TETRARCHA**, a Prince who holds and governs a fourth Part of a Kingdom; thus call'd from the Greek *τετρας*, fourth, and *αρχη*, Rule, Dominion.

Such, originally, was the Import of the Title *Tetrarch*; but it was afterwards apply'd to any petty King, or Sovereign, and became synonymous with *Embarch*; as appears from the following Consideration: 1<sup>o</sup>. That *Pliny* makes mention of six *Tetrarchies* within the Cities of *Deapolis*.

2<sup>o</sup>. That *Herod's* Kingdom was only divided into three Parts, which yet were call'd *Tetrarchies*, and the Sovereigns thereof, *Luke* iii. 1. *Tetrarchs*. 3<sup>o</sup>. *Josephus*, Antiq. Jud. lib. xiv. c. 23, tells us, that after the Battle of *Philippi*, *Antony* going into *Syria*, constituted *Herod*, *Tetrarch*; and on Medals the same *Herod* is call'd *Embarch*. See EMBARCHA.

**TETRASTICH**, a Stanza, Epigram, or Poem, consisting of four Verses. See DISTICH.

**TETRASTYLE**, in the ancient Architecture, a Building, and particularly a Temple, with four Columns both before and behind, *i. e.* in Front and Rear. See TEMPLE.

The Word is form'd from *τετρας*, four, and *ελα*, Columns.

**TETRASYLLABICAL**, a Word consisting of four Syllables. See **WORD** and **SYLLABLE**.

**TEUTONIC**, something belonging to the *Teutones*, an ancient People of *Germany*, inhabiting chiefly along the Coasts of the *German Ocean*.

The *Teutonic Language* is the ancient Language of *Germany*, the same with the *Celtic*. See **LANGUAGE**, **CELTIC**, &c.

The *Teutonic*, or *German*, is rank'd among the Mother Tongues. See **MOTHER TONGUE**.

It is now distinguish'd into *Upper* and *Lower*.

The *Upper* has two notable Dialects, viz. 1<sup>o</sup>, the *Scandinavian*, *Danish*, or perhaps, *Gothic*; to which belong the Languages spoke in *Denmark*, *Norway*, *Sweden*, and *Ireland*. 2<sup>o</sup>, The *Saxons*; to which belong the several Languages of the *English*, *Scots*, *Frisian*, and those on the North of the *Elbe*. See **ENGLISH**, &c.

To the *Lower* belong the *Low Dutch*, *Flemish*, &c. spoke thro' the *Netherlands*, the more Southerly Parts of *Germany*, &c.

**TEUTONIC Order**, a Military - Religious Order of Knights, establish'd towards the Close of the XIIIth Century; and thus call'd, because consisting principally of *German*. See **KNIGHT** and **ORDER**.

The Origin, &c. of this Order was thus: The Christians under *Guy of Lusignan*, laying Siege to *Aca*, or *Acra*, a City of *Syria*, on the Borders of the Holy Land; at which Siege were present, *Richard King of England*, *Philip Auguste of France*, &c. some *Gerians* of *Bremen* and *Lubeck*, touch'd with Compassion for the Sick and Wounded of the Army, who wanted common Necessaries, set on Foot a kind of Hospital under a Tent, which they made of a Ship's Sail; and here betook themselves to a charitable Attendance of the Sick.

This started a Thought of establishing a third Military Order, in Imitation of the *Templars* and the *Hospitallers*.

The Design was approv'd by the Patriarch of *Jerusalem*, the Archbishops and Bishops of the neighbouring Places, the King of *Jerusalem*, the Masters of the Temple and the Hospital, and the *German Lords* and Prelates then in the Holy Land, &c. And by common Consent, *Froderic*, Duke of *Swabia*, who was then at their Head, sent Embassadors to his Brother, *Henry*, King of the *Romans*, to solicit the Pope to confirm the new Order.

*Calixtus III.* who then govern'd the Church, granted it by a Bull of the 23d of *February*, 1192; and the new Order was call'd, *The Order of Teutonic Knights of the House of St. Mary of Jerusalem*.

The Pope granted them all the Privileges of the *Templars*, and the *Hospitallers* of *St. John*; excepting that they were to be subject to the Patriarchs, and other Prelates, and that they should pay a Tenth of what they possess'd.

The first Master of the Order, *Henry Volp*, elected during the Time of the Siege of *Aca*; after the taking of that City, purchas'd a Garden, wherein he built a Church and an Hospital, which was the first House of the *Teutonic Order*. Such is the Account given by *Peter of Dusbourg*, a Priest of this Order.

*Jacques de Viry* differs a little herefrom; and relates, that the *Teutonic Order* was establish'd at *Jerusalem* before the City of *Aca* was besieg'd.

These two Opinions *Hartshook*, in his Notes on *Dusbourg*, reconciles, by saying, that the Order was first instituted by a private Person, a *German*, at *Jerusalem*; and that it was confirm'd by the Pope, the Emperor, and the Princes at the Siege of *Aca*; and that after the taking that City, it was become of considerable, that it was known all over the World.

If it be true that it was a private Person who first set on Foot the Order, and that those People of *Bremen* and *Lubeck* only join'd with them; as some Authors assert; we don't know the precise Year of its Establishment.

The Order made no great Progress in the three first Grand Masters; but under the fourth, *Hermanus de Salza*, it became very powerful; inso much, that *Courade*, Duke of *Moravia* and *Cujavia*, about the Year 1236, sent an Embassy to him, to solicit his Friendship and Assistance, offering him and his Order, the Provinces of *Culmes* and *Livonia*, with all the Lands they could recover from the Idolatrous *Prussians*, who harass'd him exceedingly with their continual Incurtions, and against whom he intended this new Militia; his own Knights of the Order of *Christ*, or of *Debrin*, instituted for the like Purpose, being found too weak.

*De Salza* accepted the Donation; and *Gregory IX.* confirm'd it; and to aid the Knights in reducing the *Prussians*, *Innocent IV.* publish'd a *Croisade*.

With this Help, in a Year's Time, they subdu'd the Provinces of *Warmia*, *Natangerland*, and *Barthia*; the Inhabitants whereof renounc'd the Worship of Idols; and in the Course

of fifty Years more, they reduc'd all *Prussia*, *Livonia*, *Samogitia*, *Pomerania*, &c.

In 1204, Duke *Albert* had founded the Order of Sword-bearers, *Port-Glatovi*, which now became united to the *Teutonic Knights*, and the Union approv'd by Pope *Gregory IX.* See **PORT-GLATVI**.

*Waldemar III.* King of *Denmark*, fold the Order the Province of *Essein*, the Cities of *Nerus* and *Wessenberg*, and some other Provinces.

A new Union some time afterwards occasion'd great Divisions and Troubles in the Order: It was with the Bishops and Canons of *Prussia* and *Livonia*; who hereupon took the Habit of the *Teutonic Order*; and shar'd the Sovereignty with the Knights, in their respective Dioceses.

The Order, thus Master of all *Prussia*, built the Cities of *Elbing*, *Marientown*, *Ybern*, *Dantzig*, *Koenigsberg*, and some others: The Emperor *Frederic II.* permitted them to add to the Arms of the Order, the Imperial Eagle; and *S. Louis*, in 1250, allow'd them to Quarter the *Flower-de-Luce*.

After the City *Aca*, or *Acra*, had been recover'd by the *Mussels*, the Grand Master of the *Teutonic Order* remov'd his Seat from that City to *Marientown*. As the Order grew in Power, the Knights took more State on them; and, at length, instead of *Friars*, *Brothers*, as at first, would be call'd *Lords*. And tho' the Grand Master *Courade Zaluera*, of *Rosenstein*, oppos'd this Imovation, his Successor *Cantwade Wollera* not only approv'd it, but even procur'd himself to be treated with Honours only render'd to the greatest Princes.

Divisions being got into the Order, the Kings of *Poland* made their Advantage of them: The *Prussians* revolted to them; and after several Wars between the Knights and the *Poles*, the former yielded to King *Casimir* the upper *Prussia*, and did Homage to him for the lower.

Lastly, at the Time of the Reformation, *Albert*, Marquis of *Brandenbourg*, then Grand Master, becoming Lutheran, renounc'd the Dignity of Grand Master, dispos'd the Commanderies, and drove the Knights out of *Prussia*.

Most of the Knights follow'd his Example, and embrac'd the Reformation: The rest transfer'd the Seat of their Order to *Mergentheim*, or *Mariendal* in *Franconia*, which they still retain.

They there elected *Walter of Cronberg* their Grand Master; form'd a Process against *Albert*; and the Emperor put him to the Ban of the Empire. The Order, however, could never recover their Domains; but are now little more than the Shadow of what they formerly were, having only three or four Commanderies, scarce sufficient for the ordinary Subsistence of the Grand Master and his Knights.

The Officers of the *Teutonic Order*, when in its Splendor, were the Grand Master, who resid'd at *Marientown*; under him were the Grand Commander; the Grand Marshal, who had his Residence at *Koenigsberg*; the Grand Hospitalier, who resid'd at *Elbing*; the *Draper*, who took Care to furnish the Habits; the *Treasurer*, who lived at the Court of the Grand Master; and several Commanders, as those of *Thorn*, *Culme*, *Brandenbourg*, *Koenigsberg*, *Elbing*, &c.

They had also their Commanders of particular Castles and Fortresses; Advocates, Proveditors, Intendants of Mills, Provisions, &c.

*Wassibus* in his Annals says, they had 28 Commanders of Cities, 46 of Castles, 81 Hospitallers, 35 Masters of Convents, 40 Stewards, 37 Proveditors, 93 Masters of Mills, 700 Bishops or Knights to take the Field, 162 Brothers of the Choir, or Priests, 6200 Servitors or Domesticks, &c.

**TEXT**, a relative Term, contra-distinguish'd to Commentary. It signifies an original Discourse, exclusive of any Note, or Interpretation.

Infinite Pains have been taken by the Critics to restore, reconcile, settle, explain, &c. the Text of the Bible, and the Classics.

*Mr. Whiston* accounts for all these Misunderstandings between the New and Old Testament, particularly as to the Prophecies in the Old, cited as fulfill'd in the New, to the Corruption of the Text of the Old Testament; and to obviate Objections made against Christianity on that Head, has publish'd an *Essay towards restoring the true Text of the Old Testament*, &c.

This Restoration he is to effect from the *Samaritan Pentateuch*, the *Roman Psalter*, the Apostolical Constitutions, &c. But all our Critics take this Corruption of the Text to be imaginary, and look out for other Ways of solving those Difficulties. See **PROGRESS**.

**TEXT**, is particularly us'd for a certain Passage chose by a Preacher to be the Subject of his Sermon.

Antiently, the Lawyers began all their Pleadings with like Texts of Scripture.

A *Text-book*, in several Universities, is a Classic Author wrote very wide, by the Students, to give Room for an Interpretation dictated by the Master or Regent, to be insert'd in the Inter-lines.

In this Sense, the French say, proverbially, *Glofe d'Orleans plus obscure que le Texte.*

The *Sponiards* give the Name *Text* to a kind of little Poem or Set of Verses, plac'd at the Head of a *Glofe*, and making the Subject thereof; each Verse being explain'd, one after another in the Course of the *Glofe*. See *Gloss*.

In ancient Authors, *Text* is appropriated to the *New Testament*, by way of Eminence: it was written in gold Letters, and carefully preserv'd in the Churches.

*Codex narrato cunctis Grammatæ, Scriptus  
Auctus Evangelicis conservat corpore Textum.*

**TEXTUARIES, TEXTUARI,** a Name given the Stét of the Caraites, among the *Jews*. See *CARAITES*.

*Hotel* those among the *Traditionaries*; and *Sebammai* among the *Textuaries*. See *TRADITIONARY*.

The Civil and Canon Lawyers, sometimes also call a Book containing the bare Text, without any *Glofs* or Commentary, a *Textuary*.

*Textus Rossensis*, is an ancient Manuscript, containing the *Laws of Ethelbert, Flathere, Eadric and Withred Kings of Kent*, collected by *Eardulf*, the venerable Bishop of *Recheber*, about the Year 760. See *LAW*.

**TEXTURE, TEXTURA**, properly denotes the Arrangement and Cohesion of several slender Bodies or Threads, interwove, or intangled among each other; as in the Webs of Spiders, or in Cloths, Stuffs, &c. See *WEB* and *WEAVING*.

The Word is Latin, form'd of *Texo*, I weave.

The Word is also us'd not only of Threads, but for any Union or Cohesion of the constituent Particles of a concrete Body; whether by weaving, booking, knitting, tying, chaining, indenting, inrading, compressing, attracting, or any other way. See *COHESION*, *PARTICLE*, *BODY*, &c.

In this Sense, we say a close, compact *Texture*; a lax, porous *Texture*; a regular, or irregular *Texture*, &c. See *PORE*, *RAREFACTION*, *CONDENSATION*, &c.

A great deal depends on the *Texture* of the Component Parts of a Body; hence most of its particular Properties, its specific Gravity, Colour, &c. See *COLOR*, &c.

**THABORITES, or TABORITES**, a Branch of the ancient *Hussites*. See *HUSSITE*.

The *Hussites*, towards the Close of the XVth Century, dividing into several Parties; one of them retir'd to a little Mountain or Rock, situate in *Bohemia*, 15 Leagues from *Prague*, and there put themselves under the Conduct of *Ziska*: Building themselves a Fort or Castle, which they call'd *Thabor*, either from the general Word *Thabor*, which in the *Sclavonic Language* signifies Castle; or from the Mountain *Thabor*, mention'd in Scripture: And hence they became denominated *Thaborites*.

They carried the Point of the Reformation further than *Hus* has done; reject'd Purgatory, Auricular Confession, the Union at Baptism, Transubstantiation, &c.

They reduced the Seven Sacraments of the *Romanists* to Four, viz. Baptism, the Eucharist, Marriage and Ordination.

They maintain'd a stout War with the Emperor *Steffanund*. Pope *Martin V.* was oblig'd to publish a *Crosside* against them. Nor did this succeed: At length, however, in 1544, their Castle of *Thabor* was taken, and they dispers'd.

**THALAMI Nervorum Opticorum**, in Anatomy, two oblong Prominences, of the lateral Ventricles of the Brain; Medullary without, but a little Cineritious within. See *BRAIN*.

They are thus call'd, because the Optic Nerves rise out of them. See *OPTIC*.

**THANE or THAIN, THANUS**, the Name of an ancient Dignity among the *English*, or *Anglo-Saxons*. See *NOBILITY*.

*Skene* makes *Thane* to be a Dignity equal with that of the Son of an Earl; *Cambden* will have it, that *Thanes* were only dignify'd by some Offices which they bore.

There were two Kinds or Orders of *Thanes*: The *King's Thanes*, and the *Ordinary Thanes*.

The First, were those who attend'd our *English-Saxon Kings* in their Courts; and who held Lands immediately of the King; whence, in *Doomsday-Book*, they are promiscuously call'd *Thani* and *Servientes Regis*.

Soon after the Conquest, the Name was diffus'd; and instead thereof they were call'd the *King's Barons, Barones Regis*. See *BARON*.

As to Dignity, they took Place next after Knights.

Their Origin is refer'd to King *Canutus*, who, taking the chief of the *Danish* Nobility, to the Number of 3000, for his Guard; and arming them with Battle Axes and Sabres with gilt Handles, call'd them *Thing-lieb*, from the Two *Danish* Words *Thing* or *Thing* or *Tin*, Body of Nobility, and *Lieb*, Order of Battle.

The ordinary *Thanes* or *Thani* *Misores*, were the Lords of Manors, who had particular Jurisdiction within their Limits, and over their own Tenants. See *LORD* and *MANOR*.

These, too, changed their Name for that of *Barons*; and hence their Courts are call'd *Courts Baron*, to this Day. See *COURT* and *BARON*.

In old Authors, Charters, &c. we meet with *Thane*, as signifying a *Nobleman*; sometimes, a *Freeman*, and sometimes a *Alouffrate*.

**THANE Lands**, were Lands granted by Charter of the *Saxon Kings* to their *Thanes*.

**THAUMATURGUS, g. d. Worker of Miracles**; an Appellation which the *Romanists* give to several of their Saints. See *SAINTE*.

St. *Gregory Thaumaturgus*, or *Gregory of Nocesarea*, was a Disciple of *Origen*, about the Year 223; and afterwards Bishop of *Cesarea* in *Pourus*; and in that Capacity assist'd at the First Council of *Antioch*, and at that of *Ephesus* against *Pavulus Samosatensis*.

St. *Leo of Catania*, is also usually call'd S. *Leo Thaumaturgus*: He lived in the VIIIth Century; and his Body is still honour'd at *Rome* in the Church of S. *Martin de Tours*.

St. *Francis Paul*, and St. *Francis Xavier*, are the great *Thaumaturgi* of these last Ages. See *MIRACLE*.

The Word is form'd from the *Greek*, *thauma*, wonderful thing, and *ergon*, work.

**THAWING**, the Resolution of Ice into its former fluid State, by the Warmth of the Air, &c. See *ICE*; see also *FREELING*.

**THEANDRIC**, a Term signifying Divine and Human under one; or God-Man; form'd from *Zeus*, God, and *andri*, Man.

S. *Dionysius* Bishop of *Athen*, first us'd the Word *Theandric*, to express the two Kinds of Operations in *Jesus Christ*; the one divine, the other human: The *Monothelites* afterwards abus'd it, to signify the one only Operation which they admitted in *Jesus Christ*; in whom they believed there was a Mixture of the divine and human Nature, whence result'd a third Nature, which was a Compound of the one and the other, whose Operations follow'd the Essence and Qualities of the Mixture, and were neither divine nor human; but both at once, or, in one Word, *Theandric*. See *OPERATION* and *MONOTHELITE*.

The Term *Theandric*, and the Dogma of *Theandric Operations* were examined with great Care and Attention, at the Council of the *Lateran*, held in 649; where Pope *Martin* solidly refuted the Notion of *Theandric Operations*, and shew'd, That the Sense wherein S. *Dionysius* first us'd the Word, was Catholic, and quite remote from that of the *Monothelites*.

**THEANTHROPOS**, a Term sometimes us'd in the Schools, to signify the Person of *Jesus Christ*, who is really *Theanthropos*, i. e. God-Man; from the *Greek*, *Zeus*, Deus, and *anthropos*, Homo, Man.

**THEATER or THEATRE, THEATRUM**, among the Ancients, a Public Edifice, for the exhibiting of Spectacles or Shows to the People. See *SPECTACLE*.

Under the Word *Theater* was comprehended, not only the Eminence whereton the Actors appear'd, and the Action perform'd; but also the whole Area, or Extent of the Place, common to the Actors and Spectators.

In this Sense, the *Theater* was a Building encompass'd with Portico's, and furnish'd with Seats of Stone, dispos'd in a Semi-circle, and ascending by degrees over one another; which encompass'd a Space, call'd the *Orchestra*, in the Front whereof, was the *Proscenium*, or *Palpitium*, whereton the Actors perform'd, and which is what we properly call the *Theater* or *Stage*. See *ORCHESTRA* and *PROSCENIUM*.

On the *Proscenium* stood the *Scena*, a large Front, adorn'd with Orders of Architecture, behind which was the *Postscenium*, or Place where the Actors made themselves ready, retir'd, &c. So that the *Scena*, in its full Extent, comprehended all the Part belonging to the Actors. See *SCENA*, *POSTSCENIUM*, &c.

In the *Greek Theaters*, the Orchestra made a Part of the *Scena*; but in the *Roman Theaters*, none of the Actors ever descend'd into the Orchestra; which was taken up by the Seats of the Senators.

The most celebrated *Theaters* remaining of Antiquity, are the *Theater of Marcellus*, and that of *Pompey*; which are also call'd *Amphitheatres*. See *AMPHITHEATER*.

At *Athen*, are still seen, the Remains of the Temple of *Bacchus*, which was the first *Theater* in the World, and a Master-piece in Architecture. All *Theaters* were consecrated to *Venus* and *Bacchus*.

The Word is form'd from the *Greek*, *θεατρον*, Spectacle, Show, of *αἰσθησις*, *specio*, *videre*, I see.

**THEATER**, among the Moderns, is the Stage, or Place whereton the Drama, or Play is exhibited; answering to the *Scena* of the Ancients. See *DRAMA*.

In its full Latitude, however, the *Theater* includes the whole Play-House; in which Sense, it is a spacious Room, or Hall, part whereof is taken up by the *Scena*, which comprehends the Stage, the Decorations and the Machines; and the rest distributed into a Space, call'd the *Pit*, or *Porterie*, [ E e e ] which

which is cover'd with Seats, Boxes, &c. and terminated with an Elevation of one, or two Galleries, disposed into Benches ascending over one another. See STAGE; for also COMEDY, TRAGEDY, &c.

THEATRE is also used in Architecture, chiefly among the *Italians*, for an Assemblage of several Buildings, which, by a happy Disposition and Elevation, represents an agreeable Scene to the Eye.

Such as are most of the Vineyards at *Rome*; but particularly that of *Monte Drogone*, at *Frezzati*; and in *France*, the new Castle of *St. Germain en Laye*.

ANATOMICAL THEATRE, in a School of Medicine and Chirurgery, is a Hall, with several Rows of Seats, disposed in the Sweep of an Amphitheatre; having a Table, bearing on a Pivot, in the middle; for the Dissection of Bodies.

Such is the *Anatomical Theatre* of the Royal Garden of Plants at *Paris*, &c.

The Theatre at *Oxford* is a beautiful Building, erected by Archbishop *Sheldon*, for the Use of Scholastic Exercises.

THEATINES, a Religious Order of Regular Priests; thus call'd from Don *John Pietro Corassio*, Archbishop of *Cheffin*, in the Kingdom of *Naples*, which was anciently call'd *Theate*.

The same Archbishop was afterwards Pope, by the Name of *Paul IV.* after having been a Companion of *Caetan*, a *Venetian* Gentleman, the first Founder of this Order, at *Rome* in 1524.

The *Theatines* were the first that assum'd the Title of *Regular Clerks*. They have not only no Lands or fix'd Revenues either in common or in particular; but they don't even ask or beg any thing, but wait for what Providence shall send them for their Subsistence.

They employ themselves much in Foreign Missions; and in 1627 enter'd upon *Alingrelia*, where they have an Establishment: They have had the like in *Tartary*, *Circassia*, and *Georgia*, which they have since abandon'd, by Reason of the little Fruit they perceiv'd thereof.

Their first Congregation appear'd at *Rome* in 1524, and was confirm'd the same Year by *Clement VII.* Their Constitutions were drawn up at a General Chapter in 1604, and approv'd by *Clement VIII.* They wear Priests Habit.

THEATINES, are Congregations of Nuns, under the Direction of the *Theatines*.

There are two Kinds of *Theatines*, under the Title of Sisters of the immaculate Conception, who form two different Congregations, the one engag'd by solemn Vows, and the other only by simple Vows. Their common Foundress was *Ursula Benincasa*.

Those who make the simple Vows, are the most ancient; and are call'd simply *Theatines* of the Congregation: They had their Rise at *Naples* in 1583.

The others are call'd *Theatines of the Hermitage*: The whole Business of these is Praying in Retirement; and an austere Solitude, to which they engage themselves by solemn Vows.

The *Theatines* of the first Congregation take Care of the Temporal Concerns of these last. Their Houses stand together, and communicate by a large Hall. Their Foundress drew up their Constitutions, and laid the Foundation of their House at *Naples*; but dy'd ere it was finish'd.

*Gregory* the XVth, who confirm'd the new Institute under the Rule of *S. Augustin*, appointed that they should be under the Direction of the *Theatines*. *Urban VIII.* revok'd this Article by a Brief in 1624, and subjected them to the Nuncio of *Naples*; but *Clement IX.* annull'd this Brief, and submitted them anew to the *Theatines* by a Brief in 1668.

THEBAID, THEBAIS, a famous heroic Poem of *Statius*, the Subject whereof is the Civil War of *Thebes* between the two Brothers *Eteocles* and *Polynices*; or *Thebes* taken by *Thebes*. See HEROIC and POEM.

*Statius* was twelve Years in composing his *Thebaid*, which consists of XII Books: He wrote under *Dominian*.

He is censur'd by the best Critics, as *Bosio*, &c. for a vicious Multiplication of Fables and Actions, for too much Heat and Extravagance, and for going beyond the Bounds of Probability. See FABLE and PROBABILITY.

Several Greek Poets had compos'd *Thebais* before him; the principal were, *Antagoras*, *Antiphones* of *Colophon*, *Menelaus* the *Aegean*, and an anonymous Author mention'd by *Pausanias*, lib. ix.

*Aristotle*, praising *Homer* for the Simplicity of his Fable, oppos'd to him the Ignorance of certain Poets, who imagin'd that the Unity of Fable or Action was abundantly provided for by the Unity of the Hero, and who compos'd *Thebais*, *Herculeis*, &c. in each whereof they collected every thing that had ever happen'd to their principal Person. See FABLE.

THEFT, *Larceny*, *Furtum*, in Law, a felonious taking away another Man's moveable and personal Goods, against the Owner's Will, with an Intent to steal them. See LARCENY.

It is divided into *Theft* or *Larceny*, properly so call'd, and *petit Theft* or *Larceny*; the former whereof is of Goods above the Value of 12 s. and is deem'd Felony: The other, which is of Goods under that Value, is not Felony. See FELONY.

*Theft* from the Person, or in Presence of the Owner, is properly call'd *Robbery*. See ROBBERY.

THEFTHOLE, the receiving Goods from a Thief, to favour and maintain him, the Punishment whereof is Imprisonment, and not Loss of Life or Member. See THEFT.

THELONIUM, TELONIUM, or *Breco effendi quietum de Thelonio*, is a Writ lying for the Citizens of a City, or Burghes of a Town, that have a Charter or Prescription to free them from Toll; against the Officers of any Town or Market, who would constrain them to pay it, contrary to the said Grant or Prescription.

THEME, THEMATA, a Subject or Topic, to write or compose on.

*Theme*, among Astrologers, is the Figure they construct when they draw the *Horoſcope*: It represents the State of the Heavens for a certain Point or Moment requir'd, i. e. the Places of the Stars and Planets for that Moment. See HOROSCOPE.

It consists of 12 Triangles, inclos'd within two Squares, and call'd the *Trochæ Hoſis*.

THENAR, in Anatomy, a Muscle, call'd also *Abductor Pollicis manus*. See ABDUCTOR.

THNETOPSYCHITES, a Sect in the ancient Church, who believ'd the Soul of Man perfectly like that of Brutes; and taught that it dy'd with the Body. See SOUL.

We meet with no Account of these Hereticks any where, but in *J. Damascenus*, *Heret.* 90. unless they be the same with those *Eusebius* speaks of, *Hist. Eccl.* lib. ix. c. 38. who relates, that in *Origen's* Time, there were Hereticks in *Arabia*, who taught that the Soul of Man dy'd with the Body; but that it should rise again with it at the End of the World. He adds, that *Origen* refuted them in a numerous Council, and reclaim'd them from their Errors. *S. Augustin* and *Ishore*, calls them *Arabian Hereticks*.

*Marſhal*, in his Tables, has disfigur'd the Word, for want of understanding it; he writes it *Thebopſychites*, instead of *Thnetopſychites*: He likewise places them in the VIth Century; on what Grounds we can't imagine.

The Word is compos'd of the Greek, *Thnê*, Mortal, and *Psychê*, SOUL.

THEOCATAGNOSTES, a Sect of Hereticks, or rather Blasphemers, who dar'd to find fault with certain Words and Actions of God, and to blame many Things in the Scriptures.

*Marſhal*, in his Tables, places these Hereticks in the VIth Century; for what Reason we know not; *Damascenus* being the only Author that mentions them, but without taking any Notice of the Time of their Appearance.

Add to this, that in *Damascenus's* Treatise of Heresies, we meet with Hereticks that were not so much the Authors of Sects subsisting at any certain Time, as wicked Persons, such as are found in all Times, and all Ages.

The Word is form'd from the Greek, *Theos*, God, and *katagnotos*, I condemn.

THEOCRACY, a State govern'd by the immediate Direction of God alone. See GOVERNMENT.

According to *Josephus*, the ancient Government of the Jews was *Theocratic*; God himself ordering and directing every thing belonging to the Sovereign Authority. See JUDGE.

This *Theocracy* lasted till the Time of *Saul*; when the *Israelites*, weary thereof, desir'd they might have a King like other Nations; and thence-forward the State became Monarchy.

There was also a kind of imaginary *Theocracy* at *Athens*: While the Sons of *Codrus* were disputing the Succession; the *Athenians*, weary'd out with the Miseries of an intestine War, abolish'd the Royalty, and declar'd *Jupiter* the only King of the People of *Athens*.

The Word is form'd from *Theos*, God, and *cracia*, Power, Empire.

THEODOLITE, a Mathematical Instrument, much us'd in Surveying, for the taking of Angles, Distances, Altitudes, &c. See ANGLE, &c.

'Tis made variously; several Persons having their several Ways of contriving it each more simple, and portable, more accurate and expeditious, than other. The following one is not inferior to any we have seen: It consists of a Brass Circle, about a Foot Diameter, cut in Form of Fig. 25. Plate Surveying; having its Limb divided into 360 Degrees, and each Degree sub-divided either diagonally, or otherwise, into Minutes.

Underneath, at cc, are fix'd two little Pillars *bb* (Fig. 26.) which support an Axis, whereon is fix'd a *Teloscope*, consisting of two Glasses, in a square Brass Tube; for the viewing of remote Objects.

On the Centre of the Circle B, moves the Index C, which is a circular Plate, having a Compass in the Middle, whose Meridian Line answers to the Fiducial Line *aa*: at *bb* are fix'd two Pillars to support an Axis, which bears a Telescope like the former, whose Line of Collimation answers to the Fiducial Line *aa*.

At each End of either Telescope, is fix'd a plain Sight for the viewing nearer Objects. See **SIGHT**.

The Ends of the Index *aa* are cut circularly, to fit the Divisions of the Limb B; and when that Limb is diagonally divided, the Fiducial Line at one End of the Index shews the Degrees and Minutes upon the Limb. The whole Instrument is mounted with a Ball and Socket, upon a three-leg'd Staff.

Most Theodolites have no Telescopes, but only four plain Sights, two of them fasten'd on the Limb, and two on the Ends of the Index.

The Use of the Theodolite is abundantly shewn in that of the *Semiverticale*; which is only half a Theodolite. See **SEMICIRCLE**.

And in that of the *plain Table*, which is occasionally made to be us'd as a Theodolite. See **PLAIN TABLE**.

Note, the Index and Compass of the Theodolite, likewise serve for a Circumferentor, and are us'd as such. See **CIRCUMFERENTOR**.

**THEOGONY**, that Branch of the Heathen Theology, which taught the Genealogy of their Gods. See **GEN**.

*Hesiod* gives us the ancient Theogony, in a Poem under that Title. Among the ancient Writers, *Dr. Burnet* observes, Theogony and Cosmogony, signify'd the same Thing. In effect, the Generation of the Gods of the ancient *Pagans*, Fire, Water, and Earth, is apparently no other than that of the primary Elements. See **COSMOGENY**; see also **CHAOS**.

The Word is form'd from *θεός*, God, and *γονή*, Geniture, Seed, Offspring.

**THEOLOGY**, call'd also **Divinity**, a Science which instructs us in the Knowledge of God, and divine Things; or which has God, and the Things he has reveal'd, for its Object. See **GEN** and **DIVINITY**.

Theology is a Doctrine which shews us what we are to think of God, and of the Manner wherein he would be serv'd. It is divided into two Branches, *Natural*, and *Reveal'd* or *Supernatural*.

*Natural Theology*, is the Knowledge we have of God from his Works, by the mere Light of Nature and Reason. See **NATURE** and **REASON**.

*Supernatural Theology*, is that which we learn from Revelation. See **REVELATION**.

*Positive Theology*, is the Knowledge of the holy Scriptures, and of the Signification thereof, agreeable to the Opinions of the Fathers and Councils; without the Assistance of any Argumentation. Some will have it, that this ought to be call'd *expositiva*, not *positive*. See **POSITIVE**.

*Moral Theology*, is that which teaches us the divine Laws relating to our Manners. See **MORAL**.

*Scholastic*, or *School Theology*, is that which proceeds by Reasoning; or that derives the Knowledge of several divine Things from some establish'd Principles of Faith. See **SCHOLASTIC**.

The Ancients had a three-fold Theology; the first *poetic*, *Mystic*, fabulous, which flourish'd among the Poets; and was chiefly employ'd in the Theogony, or Genealogy of the Gods. See **FABLE** and **FABULOUS**; see also **THEOGONY**.

The second, *political*, which was that chiefly embrac'd by the Politicians, Priests, and People, as most suitable and expedient to the Safety, Quiet, and Interest of the State.

The third, *evangelic*, *Natural*, chiefly cultivated by the Philosophers, as most agreeable to Nature.

The Physical or Natural Theology acknowledg'd one only supreme God; to which it added Demons, as Mediators between him and Man. See **DEMON**.

The Word is compounded of *θεός*, God, and *λογία*, Discourse.

**THEOLOGUM**, in the ancient Theater, was a Place, or little Stage, above that wherein the ordinary Acts appear'd.

The *Theologium* was the Place where the Gods appear'd; it also included the Machines wherewith they descended, and from which they spake. See **MACHINE**.

There was a Theologium requir'd for the Representation of the *Axis of Sophocles*, the *Hippolitus of Euripides*, &c. *Scal. Poet. lib. 1. cap. 1.*

The Word is *Latin*, form'd from *θεός*, and *λογία*, Speech, Discourse.

**THEOPASCHITES**, a Sect of Hereticks, in the Vth Century, the Followers of *Petrus Fulgentius*, or *Peter the Fuller*.

Their distinguishing Doctrine was, That the whole Trinity suffer'd in the Passion of *Jesus Christ*. See **PATRI-PASSIANS**.

This Heresy was embrac'd by the *Eutychean Monks of Scythia*; who using their utmost Efforts to make it obtain, rais'd great Disorders toward the Beginning of the following Century.

It was condemn'd at its first Rise, in the Councils of *Rome* and *Constantinople*, held in 483; It was reviv'd in the IXth Century, and again condemn'd in a Council at *Rome*, held in 862 under Pope *Nicholas I.*

*F. Gelen*, in his Notes on *Damascentus*, says, that the same Error had been taught before *Fulgentius*, by *Apollinaris*, whose Disciples were the first that were call'd *Theopaschites*, or *Theopaschites*.

**THEORBO**, **THEORBA**, a Musical Instrument, made in Form of a Lute; except that it has two Necks, or Jugs, the second and longer whereof sustains the four last Rows of Chords, which are to give the deepest Sounds. See **LUTE**.

The Theorbo is an Instrument, which for these last fifty or seventy Years, has succeeded to the Lute, in the playing of thorough Basses: 'Tis said to have been invented in France by the *Sieur Hottemann*, and thence introduc'd into Italy, &c.

The only Difference between the Theorbo and the Lute, is, that the former has eight Bass or thick Strings, twice as long as those of the Lute; which Excess of Length renders their Sound so exceedingly soft, and keeps it up so long a Time, that 'tis no Wonder many prefer it to the Harpsichord itself. At least it has this Advantage, that it is easily remov'd from Place to Place, &c.

All its Strings are usually single; tho' there are some who double the Bass Strings with a little Octave, and the small Strings with an Unison; in which Case, bearing more Resemblance to the Lute than the common Theorbo, the *Italians* call it the *Archibuto* or *Arch-Lute*.

The Word Theorbo is form'd from the *French Theorbe*, of the *Italian Teorba*, which signifies the same Thing, and which some will have the Name of the Inventor.

**THEOREM**, in the Mathematical Method, a Proposition which terminates in Theory, and which considers the Properties of Things already made, or done. See **THEORY** and **PROPOSITION**.

Or, strictly, a Theorem is a Theoretical Proposition, deduc'd from several Definitions compar'd together. Thus, if a Triangle be compar'd with a Parallelogram standing on the same Base, and of the same Altitude; and, partly, from their immediate Definitions, and, partly, from other of their Properties already determin'd, 'tis infer'd, that the Parallelogram is double the Triangle; that Proposition is a Theorem. See **DEFINITION**, &c.

There are two Things to be chiefly regard'd in every Theorem, viz. the Proposition and the Demonstration: In the first is express'd what agrees to some certain Thing under certain Conditions, and what does not. See **PROPOSITION**.

In the latter, the Reasons are laid down, by which the Understanding comes to conceive that it does or does not agree thereto. See **DEMONSTRATION**.

Theorems are of various Kinds: *Universal Theorem*, is that which extends to any Quantity without Restriction, universally; as this, *That the Rectangle of the Sum and Difference of any two Quantities, is equal to the Difference of their Squares*.

*Particular Theorem*, is that which extends only to a particular Quantity.

*Negative*, is that which expresses the Impossibility of any Assertion; as, *That the Sum of two Biquadrate Numbers cannot make a Square*.

*Local Theorem*, is that which relates to a Surface; as, *That Triangles of the same Base and Altitude are equal*. See **LOCAL**.

A *Plane Theorem*, is that which either relates to a Rectilinear Surface, or to one terminated by the Circumference of a Circle; as, *That all Angles in the same Segment are equal*. See **PLANE**.

A *Solid Theorem*, is that which considers a Space terminated by a solid Line; that is, by any of the three Conic Sections; e. g. this, *That if a right Line cut two Asymptotick Parabolas, its two Parts terminated by them shall be equal*. See **SOLID**.

A *Reciprocal Theorem*, is one whose Converse is true; as, *That if a Triangle have two equal Sides, it must have two equal Angles*: The Converse of which is true, *That if it have two equal Angles, it must have two equal Sides*. See **RECIPROCAL**.

**THEORETIC**, **THEORETICAL**, or **THEORIC**, something relating to Theory, or that terminates in Speculation; in which Sense the Word stands in Opposition to *Practical*.

'Tis form'd from the *Greek θεωρητικός*, I see, I contemplate.

The Sciences are ordinarily divided into *Theoretical*, as *Theology*, *Philosophy*, &c. and *Practical*, as *Medicine*, *Law*, &c. See **SCIENCE**.

In ancient Authors, *Theoric Money* was what was rais'd by Way of Tax on the People, to defray the Expences of Theatrical Representations, and other Spectacles.

There were particular Quisitors or Treasurers of the *Theoric Money*. By a Law of *Eubulius*, it was made a capital Crime to pervert the *Theoric Money* to any other Use, even to employ it in the Occasions of War.

**THERORETICKS**, or **THERORETICI**, a peculiar Appellation given to an ancient Sect of Physicians. See **PHYSICIAN**.

The *Theoretic Physicians* were such as apply'd themselves to a careful Study and Consideration of what relates to Health and Diseases; the Principles of the human Body, its Structure and Parts, with their Actions and Uses; whatever befalls it either naturally, or preternaturally; the Differences of Diseases, their Nature, Causes, Signs, Indications, &c. the Textures, Properties, &c. of Plants, and other Medicines, &c. In a Word, the *Theoretic Physicians* were such as went on the Foot of Reason; in Opposition to the *Empirical Physicians*, who went wholly on Experience. See **MEDICINE**.

The Word is form'd from the Greek, *θεωσις*, I see.

**THEORETICAL Astronomy**, is that Part of Astronomy which considers the true Structure and Disposition of the Heavens, and heavenly Bodies; and accounts for their various Phenomena therefrom. See **ASTRONOMY**.

It is thus call'd in Opposition to that Part which considers their apparent Structure, or their Disposition as view'd by the Eye, which is call'd *Spherical Astronomy*. See **SPHERICAL**.

The several Parts of *Theoretical Astronomy*, see under **SYSTEME**, **SUN**, **STAR**, **PLANET**, **EARTH**, **MOON**, **SATELLITE**, **COMET**, &c.

**THEORY**, a Doctrine which terminates in the sole Speculation or Consideration of its Subject, without any View to the Practice, or Application thereof.

To be learn'd in an Art, &c. the *Theory* suffices; To be a Master of it, both the *Theory* and Practice are requir'd.

Machines, many times, promise well in the *Theory*, yet fail in the Practice. See **MACHINE**.

**THEORISTS of the Planets**, &c. are Hypothesists, according to which the Astronomers explain the Reasons of the Phenomena or Appearances thereof. See **HYPOTHESIS**.

**THERAPEUTES**, or **THERAPEUTÆ**, a Greek Term, signifying a Servant wholly employ'd in the Service of God.

The *Greeks* gave the Appellation *Therapentes* to such as apply'd themselves to a contemplative Life, whether it were from the great Concern they had for their Souls, or from the particular Mode and Manner of their Religion; the Word *θεραπεύω*, whence *Therapentes*, signifying the Care a Physician takes of his Patient, and the Service any one renders another.

*Philo*, in his first Book of the contemplative Life, relates, that there were a People spread throughout most of the known World, but particularly throughout *Aegypt*, and about *Alexandria*, who renounc'd their Friends, their Effects, &c. and who, after discharging themselves of all Temporal Concerns, retir'd into solitary Places, where they had each their separate Place, call'd a *Sennee*, or Monastery. See **MONASTERY**.

He adds, that they there resign'd themselves wholly to the Exercises of Prayer and Contemplation, were continually as in the Presence of God, pray'd Mornings and Evenings, eat nothing till after Sun-set, and many of them not above once in three, or even six Days; nor then any thing but a Piece of Bread season'd with Salt, or, at best, with Hyssop.

They carry'd nothing with them into their *Sennee* but the Books of *Moses*, the Prophets, the Psalms, and other like Writings, wherein they sought for Mystical and Allegorical Meanings, from a Persuasion that the Scriptures were only Shadows or Figures, the hidden Meanings whereof were to be unfold'd.

They had also some Books left them by the Founders of their Sect; They met together every seventh Day in a large *Sennee*, to confer together, and partake of the Mysteries.

There are two Points relating to these *Therapentes*, exceedingly controverted among the Critics, viz. 1<sup>o</sup>. Whether they were *Jews* or *Christians*; and 2<sup>o</sup>. If they were the latter, whether they were *Monks* or *Laymen*.

As to the first, *Scaliger de Emend. Temp.* maintains, they were *Essene-Jews*; but *Valesius* on *Eusebius* rejects this Opinion of *Scaliger*, 1<sup>o</sup>. Because *Philo* never calls them *Essenes*, 2<sup>o</sup>. Because there were no *Essenes* but in the Holy Land; whereas the *Therapentes* were spread thro' Greece, and all the barbarous Nations, 3<sup>o</sup>. Because *Josephus*, who gives a very amp<sup>e</sup> Account of the *Essenes*, does not say one Word of the *Therapentes*, or the *Therapentis Iudei*. See **ESSENE**.

And yet *Valesius* takes them to be *Jews*; and *Photius* is of his Opinion: The chief Reasons *Valesius* gives are what *Philo* says, That they read nothing but the Law and the Prophets, 2<sup>o</sup>. That they had some Books of their Founders; And bow can this quadrate with the *Christians*, who were then in their first Rise? 3<sup>o</sup>. That they only pray'd

twice a Day, whereas the *Christians* then pray'd much oftner. 4<sup>o</sup>. That the *Christians* had no *Hymns* or *Psalms* till after the Time of *Antoninus*. Lastly, That the *Christians* could not be spread over the World.

And yet *Eusebius*, lib. II. Hist. Eccl. c. 17. S. *Jerom*, *Socomen*, *Nicephorus*, *Baronius*, *Petavius*, M. *Gozeau*, *Montfaucon*, &c. maintain them to have been *Christians*; urging, that nothing can be more conformable to the Practices of the Church, than the Account given of them by *Philo*; that those Books of their Founders are the Gospels, and other Writings of the Apostles; and that there are Indications even of *Bishops* and other Ministers among them.

M. *Bobier*, President of the Parliament of *Dijon*, refutes this Opinion; supposing it inconsistent in *Philo*, a *Jew*, to write a Book expressly in Praise of the *Christians*.

Yet several Authors, as *Cassim*, F. *Helyot*, &c. maintain, that the *Therapentes* were not only *Christians*, but that they were also *Religious*: And, in effect, M. *Bobier* allows, that if they were *Christians*, they must be confess'd to have been *Monks*. As to his Argument, that *Philo* would never have wrote a Panegyric on the *Christians*, 'tis answer'd, that they were People of his own Nation, *Jews*, as he himself expresses; and that he only look'd on them as a Sect of *Jews*, who, by their extraordinary Virtue, did Honour to his Nation.

But tho' the Christianity of the *Therapentes* appears probable enough; yet their *Monachism* is not made out at all.

**THERAPEUTICE**, **THERAPEUTICKS**, that Part of Medicine which is employ'd in seeking out Remedies against Diseases, and in prescribing and applying them to effect a Cure. See **MEDICINE**.

*Theραπευτικη* teaches the Use of Diet, Pharmacy, Chirurgery, and the *Methodus Medendi*. See **DIEY**, **MEDICINES**, **PRESCRIPTION**, &c.

The Word is form'd from the Greek, *θεραπεύω*, to attend, to cure, &c.

*Theραπευτικη* is also apply'd, figuratively, to the Mind, and to *Dilicourtes* made to correct the Errors and Defects thereof.

Such is the *Theραπευτικη* of *Theodoret*; being a Treatise against the Errors or unwholesome Opinions of the *Greeks*, i. e. the Heathens.

**THERAPHIM**, a Hebrew Term, which has given great Torture to the Critics.

We meet with it 13 or 14 times in Scripture; where 'tis commonly interpreted *Idols*; but the *Rabbins* are not contented to have it simply signify *Idols*, it must be *Idols*, or Images for the Knowledge of Futurity, i. e. *Oracles*.

R. *David de Pomis* observes further, that they were call'd *Theraphim*, from *רָפָא*, *Raphah*, to leave, because they quitted every thing to consult them. He adds, that the *Theraphime* were in human Shape, and that when rais'd upright, they spoke, at certain Hours, and under certain Constellations, by the Influence of the celestial Bodies.

This is a Rabbinical Fable, which he has learnt from *Avenara*.

Others hold, that the *Theraphime* were brazen Instruments which pointed out the Hours and Minutes of future Events, as directed by the Stars. *De Pomis* corrects *Avenara*, saying, that the *Theraphim* being made under a certain Constellation, the Devil made them speak under the same.

R. *Eliezer* tells us the Reason why the *Rabbins* will have the *Theraphim* to speak and render Oracles: 'Tis, says he, because it is written in the Prophet *Zachary*, x. 2. The *Theraphim* speak vain Things.

The first Rabbi adds, that to make the *Theraphim*, they kill'd a firm-born Child, clove his Head, and season'd it with Salt and Oil; that they wrote on a Plate of Gold, the Name of some impure Spirit, laid it under the Tongue of the Dead; placed the Head against the Wall, lighted Lamps before it, pray'd to it; and it talk'd with them.

Be this as it will, *Vossius* observes, that beside the Passage of *Zachary* just quoted, it appears likewise from *Ezekiel* xli. 21. that the *Theraphim* were consulted as Oracles.

*De Pomis* shews, that the *Theraphim* which *Michal* put in *David's* Bed, were not of this Kind, because they were not in the Figure of Men; but R. *Eliezer* is of another Sentiment.

As to the manner of making the *Theraphim*, *Vossius* takes it to be a vain Tradition of the *Rabbins*; though R. *Tanchuma* and *Jonathan*, in his *Targum*, Gen. xxxi. 21. relate it after R. *Eliezer*. The chief Reason of his Disbelief, is, that *Laban*, who had not quite lost all Notion of the true God, as appears from Gen. xxxi. 53. could not be guilty of so great a Cruelty; but *Vossius* does not consider that the Custom might not be less real, for its not having been establish'd so early as *Laban*; and that the *Hebrews* sometimes burnt their Children to *Moloch*.

R. *Kircher* directs us to seek the Origin of the *Theraphim* in *Egypt*; adding, that the Word is *Egyptian*.

Spencer, in his Dissertation on the *Urim* and *Thouminis*, maintains the Word to be *Chaldæe*, and to signify the fame with Seraphim; the *Chaldæans* being frequently known to change the *w* into *r*, that is, the *f* into *r*. He adds, that those Images were borrow'd from the *Americans*, the *Chaldæans* or *Syrians*; and that the Serapis of the *Egyptians* is the same thing with the *Seraphim* of the *Chaldæans*. See *Selden. de Diis Syris*.

**THERJACA**, *Treacle*, in Medicine, a Name the Ancients have given to various Compositions, esteemed good against Poisons; but now generally restrain'd to what, by way of Distinction, we sometimes call *Theriaca Andromachi*. See **ALEXIPHARMACIC**.

This is a Compound of no less than 64 Drugs, prepared, pulveriz'd and reduced, by means of Honey, into a liquid Electuary.

The Basis, or Foundation of the Composition, is Vipers Fleish. *M. Celsus* has wrote a particular History of the Animals, Plants and Minerals, which enter the Composition of this fam'd Remedy.

'Tis found sovereign against the Bites of venomous Beasts, and in the Wind-cholic; and is also used in intermitting Fevers, and in Cases requiring Periphrasies and Diaphoreticks; also in continual Fevers, especially such as are malignant, and where the Pulse is low and tickling; in the Small-pox and Measles; And, as most of the Ingredients thereof, are very hot, for all Diseases, where the natural Heat is weak and languid.

*Andromachus*, *Nero's* Physician, posses for the Inventor of the *Theriaca*; at least, 'twas he gave the first Description thereof in Elegiac Verses; his Son did the same in Prose, and *Democritus* in Iambics.

Anciently, the *Treacle* made at *Venice* had all the Vogue; and many still retain the ancient Prejudice; but 'tis now prepared at *Amstelredam*, at *Paris*, and even at *London*, with as much Advantage as at *Venice*.

There is another vulgar kind of *Theriaca*, call'd *Distefforaw*, because only consisting of four Ingredients.

*Treacle Water* and *Treacle Vinegar* are found good Preservatives against putrid Air, whether by being only snuff'd at, or by rubbing the Wrists, Temples, and Nose therewith.

**THERMÆ**, ancient Buildings, destined for Bathing in. See **BATH**.

Among the noblest Monuments of ancient *Rome* are reckon'd the *Therma* or Baths of *Dioclesian*.

Among us, *Therma* is restrain'd to such Baths as are hot.

The Word is form'd from the *Greek*, *θερμη*, hot.

*Therma*, 'tis commonly argued, owe their Heat to a Collocation, or Effluence of the Minerals in them. Though *Dr. Woodward* ascribes it to the subterraneous Heat, or Fire which communicates with them by some Spiracle or Canal whereby a greater Quantity of Heat is deriv'd thither, than to ordinary Springs. See **MINERAL** and **WATER**.

**THERMOMETER**, **THERMOMETERIUM**, an Instrument shewing, or rather measuring, the Increase and Decrease of the Heat and Cold of the Air. See **HEAT**, **AIR**, &c.

The *Thermometer* and *Thermoscope*, are ordinarily accus'd the same thing; *Waldow*, however, makes a Difference; and shews that what we call *Thermometers*, are, in reality, no more than *Thermoscopes*. See **THERMOSCOPE**.

There are various Kinds of *Thermometers*; the Constructions, Defects, Theories, &c. whereof, are as follow:

#### Construction of a THERMOMETER, depending on the Rarefaction of the Air.

In a Tube B C, (Tab. Pneumsticks Fig. 3.) to which is fasten'd a Glass Ball A B, is put a Quantity of common Water mix'd with Aqua Regis, to prevent its freezing; and the Mixture ting'd with a Solution of Vitriol to give it a Greenness. In filling the Tube, Care is taken that there be so much Air left in the Ball and the Tube, as that when at its greatest Condensation in the middle of Winter, it may just fill the Ball; and yet in its greatest Rarefaction in Summer, may not drive all the Liquor out of the Tube. To the other Extreme of the Tube, is fasten'd another Glass Ball C D, open to the Air at D: On each Side the Tube is applied the Scale E F, divided into any Number of equal Parts.

Now, as the ambient Air becomes warmer, the Air in the Ball and the Top of the Tube, expanding, will drive the Liquor into the lower Ball, and consequently its Surface will descend; on the contrary, as the ambient Air grows colder, that in the Ball becoming condensed, the Liquor will ascend. See **RAREFACTION** and **CONDENSATION**.

#### Construction of the Mercurial THERMOMETER.

In the same Manner, and with the same Caution as before, put a little Quantity of Mercury, not exceeding the Bigness of a Pea, into a Tube B C (Fig. 4.) thus bent with Wrenches, that, taking up the less Height, it may be the more manageable

and less liable to Harm; divide this Tube into any Number of equal Parts to serve for a Scale.

Here the Approaches of the Mercury towards the Ball A will shew the Increases of the Degree of Heat. The Reason is the same, as in the former.

The Defect of both the Instruments consists in this, that they are liable to be acted on by a double Cause: For, not only a Decrease of Heat, but also an Increase of Weight of the Atmosphere, will make the Liquor rise in the one, and the Mercury in the other; and, on the contrary, either an Increase of Heat, or Decrease of Weight of the Atmosphere will make it descend. See **BAROMETER**.

#### Construction of the Florentine or common THERMOMETER.

The *Academists* of *Cimento*, considering the Inconveniences of the *Thermometers* just described; attempted another, that should measure Heat and Cold, by the Rarefaction and Condensation of Spirit of Wine; though that be vastly less than that of Air; and, consequently, the Alterations in the Air like to be much less sensible.

The Structure of their *Thermometer* is this: On some little Pieces of Turmeric is pour'd a Quantity of rectified Spirit of Wine, which hereby receives a red Tincture; this done, the Spirit of Wine is filtrated again, and again through a brown Paper, that the coarser Particles of the Root may be separated therefrom. With the Spirit thus tinged and prepared, they fill a Glass Ball A B (Fig. 5.) with a Tube B C; and that all the Spirit may't descend in Winter into the Ball, 'tis convenient to put the Ball into a Lamp of Snow, mix'd with Salt; Or, if the Instrument be to be made in Summer, into Spring Water, impregnated with Saltpetre; that the condensed Spirit may shew how far it will retire in the extremest Cold.

If it be fill'd at too great a Distance from the Ball, part of it is to be taken out; and that the Tube may't be made longer than needs, 'tis convenient to immerge the Ball, fill'd with its Spirit, in boiling Water; and to mark the furthest Point to which the Spirit then rises.

At this Point the Tube is to be hermetically seal'd, by the Flame of a Lamp; and at the Sides, is to be added a Scale, as in the former *Thermometer*.

Now, Spirit of Wine rarifying and condensing very considerably; as the Heat of the ambient Air increases, the Spirit will dilate, and, consequently, will ascend in the Tube; and as the Heat decreases, the Spirit will descend; and the Degree or Quantity of Ascend and Descend will be seen in the Scale. Yet as the Ratio of yesterdays Heat, to to-days, is not hereby discover'd, this Instrument is not strictly a *Thermometer*, no more than the former.

It is to be here observ'd, 1<sup>o</sup>. That as the natural Gravity of the Liquor makes it tend downwards; so it resists its Ascend out of the Ball into the Tube; and that the more, as it rises higher: For which reason, 'twere best to have the Tube B C Horizontal.

2<sup>o</sup> Since there must of Necessity be some Air left in the void Part of the Tube over the Liquor; that Air, by its Elasticity, will tend downwards, and, of consequence will resist the Rise of the Liquor, and be compress'd by it as it does rise: Its Elasticity, therefore, is thus increased.

3<sup>o</sup> Since 'tis found from Experience, that a less Degree of Heat is communicated more easily to the Spirit of Wine in the Ball, than a greater; the Rarefactions of the Spirit of Wine are not proportionable to their Producing Causes; especially since a greater Degree of Heat finds more Liquor in the Tube than a less does, to which, notwithstanding, the Heat may be more easily communicated, than to that stagnating in the Ball.

On these Accounts, the *Florentine Thermometer*, though that commonly in Use, is far from being an accurate Measure of Heat, &c. to which may be added what *Dr. Halley* observes in the *Philosophical Transactions*, that he has learnt from those who have kept Spirit of Wine long, that it loses Part of its expansive Force, in Course of Time.

Various Methods have been propos'd by various Authors, for finding a fix'd Point, or Degree of Heat and Cold, from which to account the other Degrees, and adjust the Scale; that for Observations made at the same or different Times, in different Places, may be compar'd together.

Some note the Place the Liquor is at in Winter, when Water begins to freeze; and again, that in Summer, when Butter placed near the Ball of the Microscope, melts: The intermediate Space they divide into two equal Parts, the middle Point whereof answers, in their Gradation, to temperate Heat; and each Moiety they sub-divide into ten Degrees: Adding four other equal Degrees on each of the two Extremes. But this Method supposes the same Degree of Heat and Cold, to answer to the freezing of all Water, and the melting of all Butter; as also, that all *Thermometers* receive the same Impressions from the same Degree of Heat; all which are contrary to Experience.

Others advise the Ball of the *Thermometer* to be put in a Quantity of Snow and Salt, and the Point the Liquor is at to be noted. Thence, the *Thermometer* is to be removed into a deep Cave or Cellar, whither no external Air reaches; so that the Liquor receiving the Action of a temperate Air, may shew the Degree of temperate Heat. Lastly, they divide the intermediate Space into 15, or more equal *Parts*, which they continue beyond each Extreme: But this Method is liable to the like Inconveniences as the former.

*Dr. Halley* blames That for a fix'd Degree of Heat, wherein Spirit of Wine begins to boil; but there is Reason for which this, too, of being precarious: Though after him, M. *Amontons* retains the Degree of Heat, answering to boiling Water, for the graduating his mercurial *Thermometer*. But as the different specific Gravities of Water, argue a Difference of Mass and Texture; 'tis highly probable that Heat of all boiling Waters is not the same: So that the Point is yet undetermined.

**THERMOSCOPE**, an Instrument shewing the Changes happening in the Air, with respect to Heat and Cold. See AIR, WEATHER, &c.

The Word *Thermoscope* is generally used indifferently, with that of *Thermometer*. There is some Difference, however, in the literal Import of the two Words; the first signifying an Instrument that shews, or exhibits the Changes of Heat, &c. to the Eye; form'd from *θερμη*, Heat, and *σκοπος*, *views*, I see; and the latter an Instrument that measures those Changes; from *θερμη*, Heat, and *μετρον*, to measure: on which Foundation the *Thermometer* should be a more accurate *Thermoscope*, &c.

This Difference the excellent *Wolffius* taking hold of, describes all the *Thermometers*, in use, as *Thermoscopes*; shewing that none of them properly measure the Changes of Heat, &c. none of them do more than indicate the same. Though their different Heights yesterday and to-day, shew a Difference of Heat; yet since they don't discover the *Ratio* of yesterday's Heat to to-day's, they are not, strictly, *Thermometers*. See **THERMOMETER**.

In the *Alte Erudit. Liff*, we have a Method of graduating the common *Thermometers* so, as that the unequal Divisions thereof shall correspond to equal Degrees of Heat; whereby the *Ratio* of to-day's Heat to yesterday's, will be measured, and consequently, the *Thermoscope* improved into a *Thermometer*.

The Method is that of *Car. Reaumur*, and is described by the *Leipfic* Editors thus: Take a slender Tube about four Palms long, with a Ball fasten'd to the same; pour into it Spirit of Wine, enough just to fill the Ball when surrounded with ice, and not a Drop over. In this State, seal the Orifice of the Tube Hermetically; and provide six Vessels, each capable of containing a Pound of Water, and somewhat over; and into the first, pour 11 Ounces of warm Water, into the second 10 Ounces, into the third 9, &c. This done, immerge the *Thermometer* in the first Vessel, and pour into it one Ounce of hot Water; observing how high the Spirit rises in the Tube, and noting the Point with Unity: then remove the Barometer into the second Vessel, into which is pour'd two Ounces of hot Water, and note the Place the Spirit rises to, with 2. By thus proceeding till the whole Pound of Water is spent, the Instrument will be found divided into 12 Parts, denoting 60 many Terms or Degrees of Heat: So that at 2, the Heat is double that at 1, at 3 triple, &c.

But the Method, though plausible, *Wolffius* shews is deceitful; and is built on false Suppositions: For it takes for granted, that we have one Degree of Heat, by adding one Ounce of hot to 11 of cold Water; two Degrees, by adding two Ounces to 10, &c. It supposes that a single Degree of Heat acts on the Spirit of Wine in the Ball with a single Force, a double with a double Force, &c. Lastly, it supposes, that if the Effect be produced in the *Thermometer* by the Heat of the ambient Air which is here produced by the hot Water, the Air has the same Degree of Heat with the Water.

But none of these Suppositions is true: For, as to the first; allowing the Heat of the hot Water, equally distributed through the Cold; one Degree of Heat will then be distributed through 11 Parts, two through 10, three through 9, &c. Taking, therefore, equal Bulks of the Water, e. g. a twelfth Part of each, the Heat will not be double in one, triple in another, quadruple in another, &c.

The first Supposition, therefore, is erroneous; and so is the Second: For neither is the Heat of the hot Water equally diffused throughout the cold; nor does the Heat of the hot Water act uniformly on the Spirit of Wine; i. e. not with the same Force, all the time of its Action.

For the third Supposition; the Heat of the ambient Air acts not only on the Spirit of Wine in the Ball, but also on that in the Tube; and therefore this, as well as that, will be changed.

**THESEA, THESEA**, in Antiquity, Feasts celebrated by the *Attendants*, in Honour of *Theseus*. See FEAST.

In sight of the important Services that *Herc* had done his Country, in delivering it from a shameful Tribute of 50

many Youths of either Sex, sent yearly to be devour'd by the *Minotaur* in *Crete* (as the Fable has it) or sent as Slaves to *Minos* King of *Crete*, as the Histories have it; from which he freed them, by overcoming *Taurus*, *Minos's* General: He was banish'd for some time; and retired to *Syros*, under the Protection of *Lycomedes*, King of that Island; who slew him out of Jealousy.

The Gods revenged this Treatment *Theseus* received from the *Attendants*, by afflicting them with a Famine, which the Oracle assured them should not cease, till they had avenged his Death.

Upon this, they flew *Lycomedes*, brought *Theseus's* Bones to *Athens*, placed them in a Temple erected to him, and appointed *Theseus* to be held every Eighth Day of each Month; wherein Large Sums were distributed to the People, and the Day spent by the Rich in Feasting and Rejoicing.

**THESIS**, in the Schools, a general Proposition, which a Person advances, and offers to maintain.

The Word is pure Greek, *thesis*, *Position*. In the Colleges, 'tis frequent to have *Placards*, containing a Number of these *Theses*.

There are *Theses* in Theology, in Medicine, in Philosophy, in Law, &c. The maintaining a *Thesis*, is a great Part of the Exercise a Student is to undergo for a Degree. See DEGREE.

**THESIS**, in Logic, &c. every Proposition is divided into a *Thesis* and *Hypothesis*: The *Thesis* contains the Thing affirmed or denied; and the *Hypothesis* the Conditions of the Affirmation or Negation: Thus, in *Euclid*, If a Triangle, and Parallelogram have equal Bases and Altitudes, (is the Hypothesis) the First is half of the Second; the *Thesis*. See HYPOTHESIS.

**THEURGY, THEURGIA**, a Name which the Ancients gave to that Part of Magic, which we sometimes call *white Magic*, or the white Art. See MAGIC.

The Word is form'd from the Greek, *θεω*, God, and *εργον*, Work, &c. the Art of doing divine Things, or Things which God alone can do; or the Power of working extraordinary and supernatural Things by lawful Means, as by Prayer, Invocation of God, &c.

Accordingly, those who have wrote of Magic in the general, divide it into three Parts; the first whereof is call'd *Theurgy*, as operating by divine or celestial Means; the second, *Natural Magic*, perform'd by the Powers of Nature; and the third, *Necromancy*, which proceeds by invoking Demons. See NECROMANCY, &c.

**THIGH**, a Part of the Body of Men, Quadrupeds, and Birds, between the Leg and the Trunk. See LEG, &c.

The several Parts of the *Thigh* have different Names: The fore and upper Part is call'd the *Groin*, or *Loquens*; the Side, the *Haneb*, or *Hip*, *Coxa*, *Coxendix*; the upper hind Part the *Buttock*, *Glamis*; the lower and hind Part the *Ham*, *Poplet*, or *post* and *placo*, because it bends backwards; and the fore Part the *Knee*, *Genus*, of the Greek *γενω*, Angle.

The Bone of the *Thigh* is the largest and strongest in the whole human Body, as being to bear the whole Burthen thereof; whence its Name *femur*, of *fero*, I bear. See FEMUR.

**THINKING, Cogitation**, a general Name for any Act or Operation of the Mind. See MIND and THOUGHT.

*Chauvin*, with the *Cartesians*, will have *Thinking* to consist in a certain native inherent Motion or Agitation of the human Mind, whereof itself is conscious. -- *Native* and *Inherent*, since he conceives it no other than the very Essence of the Mind itself, or, at least, its principal and fundamental Property; -- *An Agitation*, since there is a new Modification or Change made in the Mind, which we scarce know to conceive without Motion; add, that the Origin and Etymology of the Word *Cogitation*, according to *Varro* and *Festus*, implies as much; *cogito* being us'd for *congiro*.

When the Mind turns its View inwards, upon itself, the first Idea that offers, says Mr. *Lock*, is *Thinking*; wherein it observes a great Variety of Modifications, and thereof frames to itself distinct Ideas: Thus the Perception annex'd to any Impression on the Body made by an external Object, is call'd *Sensation*. See SENSATION.

When an Idea recurs without the Presence of the Object, 'tis call'd *Remembrance*. See MEMORY.

When thought after by the Mind, and brought again in View, 'tis call'd *Recollection*. See RECOLLECTION.

When held there long under attentive Consideration, it is *Contemplation*. See CONTEMPLATION.

When Ideas float in the Mind without Regard or Reflection, 'tis call'd a *Revery*: When they are taken express Notice of, and, as it were, register'd in the Memory, it is *Attention*: And when the Mind fixes its View on any one Idea, and considers it on all Sides, it is *Study* and *Intention*. See ATTENTION, STUDY, &c.

These are the most obvious Modes of *Thinking*; but there are several others which we know of; and, doubtless, the Mind is capable of infinite others, whereof we have no Notion at all. See MODE.

The School Philosophers usually divide *Thinking*, with Regard to the Objects it is employ'd about, into *Understanding*, *Intellectus*; and *Willing*, *Volitio*. See *UNDERSTANDING* and *WILLING*.

And hence, those are said to be two Powers or Faculties of the human Mind. See *POWER*.

Intellectual *Thinking* is further sub-divided into divers Kinds: The first, when the Mind merely apprehends or takes Notice of a Thing, call'd *Perception*: The second, when it affirms or denies a Thing, call'd *Judgment*: The third, when it gathers or infers a Thing from others given, call'd *Reasoning*: The fourth, when the Mind disposes its own Thoughts or Ideas in Order, call'd *Method*. See *PERCEPTION*, *JUDGMENT*, *REASONING*, and *METHOD*.

*Volitive Knowledge*, or Volition, admits of infinite different Modifications, or new Determinations. See *VOLITION*.

Some Authors extend the Idea of *Thinking* further; and consider it in God, Angels, Beates, &c. whence a new Division of *Thinking* into *Divine*, *Angelical*, *Human*, and *Animal* or *Sensitive*.

But the first we know little or nothing of. See *GOD* and *ANGEL*.

The third is that we have already been treating of. As to the last, viz. *Animal* or *Sensitive Thinking*, it is defin'd to be an Action of the Soul attending to an external Object, effected by means of the Animal Spirits duely agitated in the Brain, to excite an Idea. See *SPIRITS*; see also *KNOWLEDGE*, &c.

The *Cartesians* maintain, that *Thinking* is essential to the human Soul; and, consequently, that there is no Time when the Soul does not think: But this Doctrine is overturn'd by Mr. *Lock*, who shews, that in Sleep, without Dreaming, there is an entire Cessation of all the Modes of *Thinking*. See *IDEA*.

*I think, cogito*, according to *des Cartes*, is the first, and surest of all Truths; from which alone we draw this Consequence, therefore *I am*, or exist, *sum*.

One might also say, *Cogito, ergo Deus est*; I think, therefore there is a God. See *EXISTENCE*.

Logic is defin'd the Art of *Thinking* justly. See *LOGIC*.

THIRD, *Tertius*, See *NUMBER*, and *NUMERATION*.

THIRD, in Music, a Concord resulting from a Mixture of two Sounds, containing an Interval of two Degrees. See *CONCORD*.

'Tis call'd a *Third*, as containing three Terms, or Sounds between the Extremes. See *INTERVAL*.

The *Third*, in Italian, *Tercia*, in French *Tierce*, in Latin *Tertius*, has no general Name in the Greek: 'Tis the first of the imperfect Concerds; i. e. of such as admit of Majority and Minority, without ceasing to be Concerds.

And hence it is, that it is distinguish'd into two Kinds.

The first, which the *Italians* call *Diatona*, (from the Greek *Diatona*) or *Tercia Maggiore*, and we greater *Third*, is compos'd diatonically of three Terms or Sounds, containing two Degrees or Intervals; one whereof, in the ancient System, is a greater Tone, and the other a lesser Tone; but in the modern temperate System they are both equal, as *ut, re, mi*, or *ut, mi*. See *DEGREE*, *TONE*, *SEMITONE*, &c.

Chromatically it is compos'd of four Semitones; two whereof are greater, and the *third* less: It takes its Form from the Ratio *sesqui-quarta* 4 : 5.

The second *Third*, which the *Italians*, like the *Greeks*, call *Tribenonitono*, or *Semi-diatona*, or *Tercia minore*, and we lesser *Third*, is compos'd, like the former, of three Sounds or Terms, and two Degrees or Intervals: But these Degrees, diatonically, are only a greater Tone, and a Semitone; and chromatically of three Tones, two greater, and one less, as *re, mi, fa*, or *re, fa*: It takes its Form from the Ratio *Sesqui-quinta* 5 : 6.

Both these *Thirds* are of admirable Use in Melody, and make as it were, the Foundation and Life of Harmony. See *MELODY* and *HARMONY*.

They are us'd agreeably both ascending and descending; and that either in running over all the Degrees, as *ut, re, mi, or re, mi, fa*, or in skipping the middle Degree, as *ut, mi, or re, fa*.

But it is to be observ'd, the greater *Third* has somewhat gay and sprightly in rising, and somewhat heavy and melancholic in falling: The lesser *Third*, on the contrary, has somewhat soft and tender in rising, and somewhat brisk in falling.

For the Use of the greater or lesser *Third* in the Series of the Scale. See *SCALE*.

There are two other Kinds of *Thirds* that are dissonant and vicious; the first only compos'd of two greater Semitones, and, by Consequence, of a Semitone less than the lesser *Third*: This they call the defective *Third*.

The second, on the contrary, has a Semitone more than the greater *Third*; and this they call *redundant Third*.

The defective *Third* is very frequent in Italian Songs, especially those compos'd for Instruments; but is not to be

us'd without Necessity, and a deal of Discretion. The redundant *Third* is absolutely forbidden.

THIRD-POINT, or *Tierce-Point*, in Architecture, the Point of Section in the Vertex of an Equilateral Triangle.

ARCHES or VASIS of the *Third Point*, call'd by the *Italians* *de terzo Acute*, are those consisting of two Arches of a Circle, meeting in an Angle at top. See *ARCH*.

THIRD ESTATE. See *ESTATE*.

THIRD ORDER, a Sort of Religious Order, that observes the same Rule, and the same Manner of Life, in Proportion, as some other two Orders instituted before. See *ORDER*.

The *third Orders* are not originally Religious Orders, but Affiliations of secular, and even marry'd Persons, who conform, as far as their Condition will allow them, to the Design, Intention, and Rules of a Religious Order which affiliates and directs them.

The *Premonstratens*, *Carmelites*, *Augustines*, and *Franciscans* dispute among themselves the Honour of having first introduc'd *third Orders*; But the Pretensions of these last appear to be the best founded.

The first contend that the *third Order* of *Premonstratens* began in the Life-time of their Founder, *S. Norbert*, who dy'd in 1134. See *PREMONSTRATENS*.

*F. Diego de Coria Maldonado*, a Spanish Carmelite, who has a particular Treatise on the *third Order* of Carmelites, derives them immediately, as well as the Carmelites themselves, from the Prophet *Elias*; and among the great Men who have made Profession of that *third Order*, reckons the Prophet *Obadiab*, who liv'd 800 Years before Christ; and among the Women, our Saviour's great Grandmother, under the borrow'd Name of *St. Eusebientia*. This *Obadiab*, he says, was Controller-General of the House of *K. Alah*, mention'd in the 1st Book of *Kings*, cap. xviii. and Disciple of the Prophet *Elijah*. After serving that Prince, and his Successors, he retir'd to serve God, and enter'd the Prophetic Order of *Elijah*, but without quitting his House, his Wife, or Children.

The Author adds, that he was not properly of the *third Order*, but of the *secund*, which consisted of marry'd People, and was call'd the Order of *Eanach*, under the Direction of *Elijah*. Such, according to him, is the Foundation of the *third Order* of Carmelites. See *CARMELETTE*.

*F. Helys* shews, that this *third Order* was not begun till the Year 1476, when *Sixtus IV.* gave Permission to the Prior and Provincials of the Carmelites, to give the regular Habit and Rule of their Order, to People of both Sexes, marry'd or unmarried, living at Liberty in the World. *De Coria* reckons *S. Lewis*, King of France in the *third Order* of the Carmelites.

The *third Order* of *Augustines*, if we credit *F. Bruno*, was instituted by *St. Augustin* himself: But the Arguments he produces are so frivolous, that *F. Helys* observes, they are not worth the refuting.

The *third Order* of *Franciscans* was instituted by *S. Francis* in 1221, in Favour of People of both Sexes, who being smitten with the Preachings of that Saint, demand'd of him an easy Manner of living a Christian Life: Upon which he gave them a Rule, the Constitutions whereof are not now extant as wrote by himself, but only as reduc'd and confirm'd by Pope *Nicholas IV.* 68 Years afterwards.

The first Order of this Saint are the Monks call'd *minor Friars*, comprehending the *Cardeliers*, *Casucians*, and *Recollects*; the second comprehends the Nuns of *S. Clare*; and the third several Persons of both Sexes, who live at Liberty, and these are what we call the *third Order*.

Of this Order, which was only establish'd for secular Persons, several of both Sexes, to attain the greater Perfection, have since commenc'd Religious, and form'd various Congregations, under various Names, as *Religious Penitents of the third Order*, &c.

THIRD EARRING, in Husbandry, the Tilling or Ploughing of the Ground a third Time.

THIRD BORROW, in our ancient Law Books, denotes a Contable. See *CONSTABLE*.

THIRD-NIGHT-SHOW-BYND; by the Laws of *S. Edward* the Confessor, a Guest who had lain three Nights in an Inn, was reputed a Domestic, and his Host was answerable for what Offences he should commit.

For one Night he was account'd *Uncouth*, for two Nights *Guest*, and the third *show-bynd*. *Prima Noctis Inognitum, secundanda hospes, tertia Domestica censetur*. *Bracton*, lib. 3. writes it *Hogenn' sva*.

THIRDINGS, the third Part of the Corn or Grain growing on the Ground at the Tenant's Death, due to the Lord for a Heriot, within a certain Manor and Lands belonging to the Chapel of *Trefat*, in *Com. Heref*.

THIRST, a painful Sensation, occasion'd by a preternatural Vellication of the Nerves of the Throat or Fauces, and producing a Desire of Drinking. See *DRAIN*.

*Rehanit* accounts for *Thirst* thus: The Stomach Liqueur, which ordinarily resolves into a thick Vapour, and ascends from the Stomach up into the Throat, to moisten it; being too much warm'd and agitated, either from a Want of some other

other Liqueur to temper and dilute it, or from any other Cause, becoming converted into too thin, subtil, and penetrating a Vapour, is to far from moistening and cooling the Throat, that, on the contrary, it dries and heats it; and hence that Motion in the Nerves, the Sensation whereof we call *Tibris*. See HUNGER.

*Tibris* sometimes also arises from a mere Dryness of the Part; and sometimes from sharp Salts, more immediately visitating the Fibres of the Throat.

There are various Kinds of Liqueurs which quench *Tibris*; some by tempering the Stomach Liqueur, others by diluting, and even dissolving the Salt; and others by moistening and suppling the Fibres.

Acids are peculiarly fitted for that End: See ACID. *Tibris* is sometimes eluded by rolling a leaden Bullet or a Pebble in the Mouth, which occasions an extraordinary Issue of Saliva to moisten the Throat, &c. See SALIVA.

Mr. Boyle mentions a Man who could easily abstain from Drinking for nine Days, and yet his Diet nothing more liquid than usual; the Secretions of Urine, Sweat, &c. being perform'd all the while regularly, and in the same Quantity as usual.

In dropical Cases, where there is not a right Secretion of the Urine by the Renal Glands, and the Vessels and Parts of the Body are loaded with too great a Quantity of ferous Humours, a great Moderation in Drinking might be attended with good Success, provided some Liqueur could be found out to allay that uneasy Sensation: Probably this would be best perform'd by Mucilages acidulated with Spirit of Vitriol or Sulphur, or Gellies with Juice of Lemon, &c. and that a small Quantity of such a Composition now and then us'd, might be of as much real Service in quenching *Tibris*, as Draughts of Liqueurs which increase the Symptoms. See DROPSY.

THISTLE, *Carduus*, a Name common to divers Plants, whose Flowers consist of several little narrow longish Leaves, in Manner of Tubes, rang'd close together like a Head, and whose Leaves are very prickly.

The most known of these Plants are 1<sup>o</sup> *Ceruus Benedictus*. The Apothecaries distil a Water from it, said to be of great Service in pestilential Diseases, the worse Kind of Fevers, and particularly as a Sudorific. The Water is likewise accounted one of the four common Cordial Waters: Its fixt Salt is much of the same Nature as other fixt Salts prepar'd from Wormwood, &c. viz. Anti-emetic, Diuretic, &c. See CARDEUS BENEDICTUS.

2<sup>o</sup> The *humbred-headed* THISTLE, or *Eryngium vulgare*; the Root whereof boil'd in Wine, is us'd with good Success against Retentions of Urine: This is not properly of the *Tibris* Kind.

3<sup>o</sup> Our *Ladies* *Tibris*, *Carduus Albus Maculis notatus vulgaris* CB, the Decoction whereof is recommended against the Dropsy, Jaundice, and Pains of the Kidneys.

The *Fullers* *Tibris*, or *Teasel*; See under the Article TRAZELL.

Order of the THISTLE, or of St. Andrew, is a Military Order in Scotland, instituted, as some say, by Hungus, or Hango, King of the Picts, after a Victory obtain'd over Abellion. See KNIGHT.

The Legend is, that a Cross of St. Andrew (the Patron of that Kingdom) appearing to him at the Time of the Engagement; he blest the happy Augury; took the Figure thereof into his Standard in Honour of his Protector; and instituted an Order of Knights, whose Collar is of Gold interwoven with *Tibris* Flowers.

From the Collar hangs a Medal representing S. Andrew holding his Cross in his Right Hand; with this Motto, *Nemo me impune lacessit*, No Body shall provoke me impune.

Others give a different Account of its Origin, and assure us it was instituted after the Conclusion of a Peace between Charles VII. of France, and the King of Scotland.

The Abbot *Justinian* goes up higher, and will have it to have been instituted by *Acharns* I. King of Scotland, in 803; who, after an Alliance made with *Charlemagn*, took for his Device the *Tibris*, with the Words *Nemo me impune lacessit*, which, in Effect, is that of the Order: He adds, that King James the IVth, renew'd the Order, and took St. Andrew for its Protector.

The Order only consists of twelve Knights, whereof the King is the Chief: They wear a green Ribbon, with a Gold Medal enamell'd; on the one Side whereof is the Image of St. Andrew, and on the Reverse, the Device above mention'd.

Our *Lady of the THISTLE*, was also a Military Order instituted in 1370, by Louis II. Duke of Bourbon.

It consisted of 26 Knights, whereof that Prince and his Successors were the Chiefs: Their Badge was a Sky-blue Girdle; and, on solemn Occasions, a Mantle of the same Colour, with a Gold Collar, interwoven with Flower-de-Luces, among which was the Word *Esperance*, Hope, in Capitals.

They had their Name from a *Tibris* fix'd to an Oval, which hung to the Girdle.

THISTLE-take, a Custom in the Honour of *Haltow*, in the County of *Chester*, whereby, if in driving Beasts over the Common, the Driver permits them to graze, or take but a *Tibris*; he shall pay a Half-penny a Beast to the Lord of the Fee.

At *Fiskerton*, in *Nottinghamshire*, by ancient Custom, if a Native, or Cottager kill'd a Swine above a Year old, he paid the Lord one Penny; which was also call'd *Tibris-take*.

THLIPSIS, is used by some Anatomists, for a pressing together of the Vessels of a human Body.

THOMEANS, THOMEANS, THOMITES, or *Christians* of St. THOMAS, a People of the *East Indies*, who, according to Tradition, receiv'd the Gospel from the Apostle S. Thomas. See CHRISTIAN.

Upon the Arrival of the *Portuguese* at *Calecut*, in their first Voyage to the *Indies*, they met with ancient Christians, who pretended to be defended from those converted by S. Thomas.

The *Thomeans* being inform'd of a new People arriv'd among them, who bore a particular Veneration for the Cross; sent Embassadors to them to make an Alliance with them, and to solicit their Assistance against the Gentile Princes, by whom they were greatly oppress'd.

'Tis certain the *Thomeans* are Indigene, or originally of *India*: They are call'd *Nouareans*; but Custom has affix'd to that Name an Idea of Contempt: Their other Name *Mappuley*, and, in the plural, *Mappuleymar*, is more honourable.

They form a very considerable Clan, or Canton; but are always divided by Factions, inveterate Enmities, &c. The Clan extends through all the Lands from *Calecut* to *Travencor*; not that all the Tract is possess'd wholly by them; Sometimes they have a whole Town to themselves, and sometimes only a certain Quarter in it.

They own themselves Strangers in that Country, and their Tradition is, that they came thither from the Country about the City of *Malabar*, or S. Thomas, by reason they were persecuted by the Prince thereof. But the Time of this Transmigration no Body knows any thing of; for they keep no Monuments.

The *Thomeans* ascribe their Conversion, their Discipline, &c. to S. Thomas: Their Breviary adds, that their Apostle paid's thence into *Cina*.

We shall not here enter into the Dispute, whether the S. Thomas so said in the *Indies*, be the Apostle, or some other Saint of that Name; which latter is the Opinion of several learned Men, and particularly of M. Heur.

But the Progress of the History of this Church is not less difficult to trace than its Origin: Our *European* Books mention the Patriarch of *Alexandria*'s sending Bishops to the *Indies*, particularly S. Pantenus, S. Frument, &c. It may be doubted, whether or no it were to these *Indies* that they were sent: *Baronius*, indeed, maintains it was; but the *Portuguese* Author *de Historia d' Ebiopia*, endeavours to prove it was to *Eriopia* the ancient Missionaries went. All we know for certain is, that the *Thomeans*, for several Ages, were furnish'd with Bishops from the Side of *Babylon*, or *Syria*; and there is a kind of Patriarch at *Babylon* who continues to furnish them.

Whether or no their Apostle ordain'd them any Bishops, (the Order whereof may have been since exting'd thro' want of proper Subjects, as F. Zouche imagines) is a Question: All we can say is, that the *Thomean Church*, at the first Arrival of the *Portuguese*, was wholly govern'd by these foreign Bishops. The Language they use, in *Sacris*, is the *Chaldee*, some say the *Syric*: As to their ordinary Language, 'tis the same with that of their Neighbours.

The *Chaldee* was doubtless brought among them by their Bishops: 'Tis added, that at the Time the East was infected with Nestorianism, Eutychnianism, &c. the Bishops likewise carry'd them those Heresies.

Such a Mixture of Opinions, with a total Interruption of Pastors, sometimes for several Years together, occasion'd that horrible Chaos their Religion was in at the Arrival of the *Portuguese*; for a Specimen whereof we shall add their Manner of celebrating the Eucharist.

Over the Altar was a kind of Tribune or Gallery; and while the Priest was saying the Beginning of the Office below, a Cake of Flower of Rice was frying in Oil or Butter above: When enough, the Cake was let down in a Basket upon the Altar, where the Priest consecrated it. As to the other Species, for Wine, they used a kind of Brandy variously prepar'd in that Country. Nor was their Ordination much more regular; the Archdeacon, who was sometimes more respected than the Bishop himself, frequently ordained Priests.

Their other Abuses were infinite: The *Portuguese*, for these two last Centuries, have labour'd the Reformation of this Church; and have employ'd both the Ecclesiastic and Secular Power therein: To this End they have call'd the *Thomean* Bishops to the Councils at *Goa*, have instructed, charg'd

charg'd them, &c. and have even sent them for Instruction to *Portugal* and *Rome*: But they were still apt to relapse at their Return; so that finding no Good was like to be done with them, they resolv'd to exclude them once for all, and to appoint an *European* Bishop in their Room.

These Proceedings have render'd the *Portuguese* infinitely odious to the *Thomasians*.

The Person who contributed most to the Reform, is *Dons P'ey Alvaro de Mendoza*, Archbishop of Goa, who governing the *Portuguese* Indies for some time, in defect of a Viceroy, took that Occasion to call a Synod in the Village of *Dianper*, where Abundance of Regulations were made, and the *Thomasians* united to the *Roman* Church: He was seconded by the Jesuits.

After the Death of the Archbishop, a great Part of the *Thomasian* Church relaps'd, and thus still continues; partly *Roman*, partly *Thomasian*.

**THOMISM**, or **THOMATISM**, the Doctrine of *S. Thomas Aquinas*, and his Followers the *Thomasists*; chiefly with Regard to Predestination and Grace. See **THOMIST**.

There is some doubt what the true genuine *Thomasism* is: The Dominicans pretend to hold pure *Thomasism*; but there are other Authors who distinguish the *Thomasism* of *S. Thomas*, from that of the Dominicans. See **DOMINICANS**.

Others again make *Thomasism* no other than a kind of *Jansenism* disguis'd; but *Jansenism* we know has been condemn'd by the Pope, which pure *Thomasism* never was. See **JANSENISM**.

In effect, the Writings of *Averroes* and *Lemos*, who were appointed by their Order to lay down and defend before the Holy See the Dogmata of their School, have since been reputed the Rule of pure *Thomasism*.

The Modern School has abandon'd many ancient *Thomasists*, whose Sentiments and Expressions appear'd to *Averroes* and *Lemos* too hard; and the new *Thomasists*, who pass the Bounds mark'd by these two Doct'ors, cannot give their Opinions for the Sentiments of the School of *S. Thomas*, which the Pope has forbid being censur'd.

The *Thomasists* allow'd, is that of *Averroes* and *Lemos*: Those two Authors distinguish four Classes of *Thomasists*: The first, which they reject, deists or takes away Liberty; the second and third don't differ from *Molinists*. See **MOLINISTS**.

The last, which *Averroes* embraces, admits a *Physical Pre-motion*, or *Pre-termination*, which is a Compliment of the active Power, whereby it passes from the first Act to the second; that is, from complex and next Power to Action. See **PRE-TERMINATION**.

This Promotion they hold is offer'd in sufficient Grace: Sufficient Grace is given to all Men; and they have a complex, independent, next Power not to act, and even to reject the most efficacious Grace. See **SUFFICIENT** and **GRACE**.

**THOMISTS**, a Sect of School Divines, who maintain *Thomasism*. See **SCHOOL** and **THOMISM**.

The avow'd Antagonists of the *Thomasists* are the *Scottists*. See **SCOTIST**.

**THORACIC**, in Anatomy, an Epithet given to two Branches of the Axillary Artery, on Account of their conveying the Blood into some Parts of the *Thorax*. See **THORAX**.

The *Thoracic Arteries* are distinguish'd by *upper* and *lower*. There are likewise *Thoracic Veins*, an *upper* and *under*, for the Reconveyance of the Blood from the *Thorax* to the Axillary Vein. See **AXILLARY**.

**THORACIC DUCT**, or **DUCTUS THORACICUS CHYLIFERUS**, is a little Canal arising from, or rather a Continuation of, the Exit or Mouth of the Receptaculum Chyli. See **RECEPTACLE**.

It mounts all along the *Thorax*, whence it takes its Name, and ends in the left Subclavian Vein.

In its Progress thro' the *Thorax*, it is furnish'd with a proper Integument from the Pleura, besides the Membrane it has in common with the Receptaculum: At about one Third of its Way it dearticulates, but soon unites again.

*Dr. Drake* observes, that it has Valves in divers Places of its Tract; *Eustachio* says Glands. Its Use is to carry the Chyle and Lymphs from the Receptaculum into the Subclavian, by which it is forwarded to the Cava, and thence to the Heart. See **CHYLE**.

It is sometimes call'd *Pequetus Duct*, or *Ductus Pequetianus*, from *M. Pequet*, the first Discoverer thereof. See **PEQUET'S DOCT**.

**THORAX**, in Anatomy, that Part of the human Body which forms the Capacity of the Breast, and wherein are included the Heart and Lungs. See **BREAST**.

It is bounded a-top by the Clavicles, and at Bottom by the *Cartilago Xiphoides*, and the Diaphragm.

Its fore Part is call'd the *Sternum*, or *Breast Bone*; its side Parts, the *Costa*, or *Ribs*; its hind Part are the *Spina Dorsi*, and its *Vertebrae*, with the *Omoplate*. See **RIBS**, **STERNUM**, &c.

The *Thorax* is also call'd the *second* or *middle Venter*, and popularly the *Chest*. See **VENTER**.

Beside the Heart and Lungs, the *Thorax* likewise contains the ascending Cava, the Aorta, the pulmonary Vein and Artery, the Trachea, Oesophagus, &c.

'Tis divid'd within-side with a Membrane call'd the *Pleura*, and divided in the Middle by another call'd the *Mediastinum*. See **PLEURA** and **MEDIASTINUM**.

It has its Name from the *Greek*, *θώραξ*, *saire*, to leap; by Reason the Heart, contain'd therein, makes a continual Motion. *Galen* calls it *Cythora*, and says it contains the Parts that excite to love.

**THOROUGH-BASS**, in Music, is that which goes quite through the Composition. See **BASS**.

It is also call'd *Continu'd Bass*. See **CONTINU'D BASS**.

**THOUGHT**, *Sentiment*, a general Name for all the Ideas consequent on the Operations of the Mind, and even for the Operations themselves. See **THINKING**.

As in the Idea of a *Thought*, there is nothing included of what we include in the Idea of an extended Substance; and that whatever belongs to Body, may be deny'd to belong to *Thought*: We may conclude that *Thought* is not a Mode of extended Substance, it being the Nature of a Mode not to be conceiv'd, if the Thing whereof it is the Mode be deny'd it. Hence we infer, that *Thought* not being a Mode of extended Substance, must be the Attribute of some other Substance very different. See **MODE**.

*F. Malebranch*, with the Spirit of a *Cartesian*, denies that a Man who thinks seriously on the Matter, can doubt but the Essence of the Mind consists altogether in *Thought*, as that of Matter does in Extension; and that according to the various Modifications of *Thought*, the Mind sometimes wills, sometimes imagines, &c. as, according to the various Modifications of Extension, Matter is sometimes Water, sometimes Wood, Fire, &c.

By the Way, by *Thought* he does not mean the particular Modifications of the Soul, i. e. such or such a *Thought*, but *Thought* or *Thinking* in the general, consider'd as capable of all Kinds of Modifications or *Thoughts*: As by Extension he does not mean such or such an Extension, as a Square, Oval, or the like, but Extension in the Abstract, consider'd as susceptible of all Kinds of Modifications or Figures.

He adds, that he takes it to be impossible to conceive a Mind which does not think, tho' it be easy to conceive one which does not feel, or imagine, or will; in like Manner as 'tis impossible to conceive a Matter which is not extended, tho' it be easy to conceive one that is neither Earth, nor Metal; nor square, nor round; nor that is even in Motion.

Hence it may be concluded, that as 'tis possible there may be Matter which is neither Earth nor Metal; nor square nor round; nor even in Motion; 'tis also possible, that a Mind may neither perceive Heat nor Cold; nor Joy nor Grief; nor imagine any thing, nor will any thing; so that these Modifications are not essential to it. *Thought* alone, therefore, is the Essence of the Mind, as Extension alone is the Essence of Matter. See **ESSENCE**, **EXTENSION**, **WILL**, &c.

But this Doctrine no longer passes among us. The Followers of *Sir Isaac Newton*, and the new Philosophy, deny Extension to be the Essence of Matter (see **MATTER**); and the Followers of *Mr. Lock* deny *Thought* to be the Essence of the Mind. See **SOUL**.

**THOUSAND**. See **NUMERATION**.

**THOUSAND YEARS REIGN**. See **MILLENNIUM**.

**THRASHING**, or **THRUSHING**, in Agriculture, the Art of beating the Corn out of the Ears. See **CORN**.

*Thrashing* is perform'd two Ways; or rather there are two Ways of separating Corn from the Ear; the first by beating it with a Flail, which is properly what we call *Thrashing*.

Some Authors will not by any means we should call this by the *Roman* Name *trituro* or *trivatio*, but *strogillatio* or *strogillum*, a Scourge or Flail.

The other Manner, still practis'd in several Countries, as we are inform'd by *Liger*, is to make Mules or Horses trample on it backwards and forwards: This is properly what the Ancients call'd *trituro* and *trivatio*.

But they also us'd Oxen therein; witness the *Hebrews*, who sometimes yok'd four Oxen together.

Another Way was with a kind of Sledge made of Boards join'd together, and laden with Stones or Iron, upon which a Man was mounted, and the whole drawn over the Corn by Horses: This Instrument was call'd *Traba* or *Tributus*.

'Tis a Rule among Husbandmen, that the Season for *Thrashing*, is when the Corn has sweated in the Heat, or Mow.

**THRAVE** of Corn, from the *Saxon*, *Threaw*, Bundle, or the *British* *Dressa*, twenty-four, is in most Parts of England twenty-four Sheaves, or four Shocks of six Sheaves to the Shock.

King *Abelstan*, Anno 923, gave by Charter to Sir *Joby* of *Beverley's* Church, four *Thraues* of Corn for every Plough Land in the East Riding of *Yorkshire*.

*Ye son Threbe be Heaven King  
Of Ika Plough of Est Riding.*

[ G 88 ]

SEE PETER-CORN.  
THREE.

**THREE-Legged Staff**, an Instrument consisting of three Wooden Legs, made with Joints, so to shut all together, and to take off in the Middle, for the better Carriage; and usually having on its Top a Ball and Socket, serving to support and adjust Instruments for Astronomy, Surveying, &c. See BALL and SOCKET.

**THRENGUS**, in our ancient Customs. See DRENCHUS. *Quia vero nos transit albus tempore Regis Willielmi Miles in Anglia, sed Threngus; precipit Rex ut de eis Milites fierent ad defendendam terram: fecit autem Lanfrancus Threngos suos Milites, &c.* Somn. Gavelk.

They were Vassals, but not of the lowest Degree of those who held Lands of the chief Lord.

The Name was impos'd by the Conqueror; for when one *Edeyn Sparborough* of Norfolk, and others, were ejected out of their Lands; they complain'd to the Conqueror; insisting, that they were always on his Side, and never oppos'd him: which, upon Enquiry, he found to be true; and therefore he commanded that every one should be restor'd to their Lands, and for ever after be call'd *Drenches*. *Spelm.*

**THRENODY**, **THRENODIA**, a mournful, or Funeral Song. See FUNERAL.

**THROAT**, the Part of an Animal between the Head and the Shoulders, wherein is the Gullet. See GULLET.

Physicians include under the Word *Throat*, all that Hollow or Cavity which may be seen when the Mouth is wide open.

It is sometimes also call'd *Isthmus*; by Reason it is narrow, and bears some Resemblance to those Straights call'd by the Geographers *Isthmi*.

**THROAT**, in Architecture, Fortification, &c. See GORGE and GUEA.

**THRONE**, in the Greek *θρόνος*, a magnificent Seat or Chair; is a Royal Seat, enrich'd with Ornaments of Architecture and Sculpture, made of some precious Matter, rais'd on several Steps, and cover'd with a kind of Canopy.

Such as are in the Rooms of Audience of Kings and other Sovereigns.

**THROWS of Women**, the Pains of Child-Birth. See DELIVERY, &c.

**THROWSTER**, one who throws, i. e. winds or rolls Silk. See SILK.

**THUNDER**, a Noise in the lowest Region of the Air, excited by a sudden kindling of sulphurous Exhalations. See AIR, ATMOSPHERE, EXHALATIONS, &c.

*Seneca, Robault*, and other Authors, both ancient and modern, account for *Thunder*, by supposing two Clouds impending over one another, the upper and rarer whereof becoming condens'd by a fresh Accellion of Air rais'd either by Warmth from the lower Parts of the Atmosphere; or driven upon it by the Wind; immediately falls forcibly down upon the lower, and denser Cloud: By which Fall, the Air interpos'd between the two being compress'd; that next the Extremities of the two Clouds is squac'd out, and leaves Room for the Extremity of the upper Cloud to close tight upon the under: Thus a great Quantity of Air is inclos'd, which at length escaping thro' some winding irregular Vent or Passage, it occasions that Noise we call *Thunder*. See CLOUD, &c.

But this only reaches to the Phenomena of *Thunder* heard without Lightning; and, in effect, we have now a better Solution: *Thunder* is not occasion'd by the falling of Clouds; but by the kindling of sulphurous Exhalations, in the same Manner as the Noise of Aream Fulminans.

There are sulphurous Exhalations, says Sir Isaac Newton, always ascending into the Air when the Earth is dry; there they ferment with the nitrous Acids, and sometimes taking Fire, generate into *Thunder*, Lightning, &c.

That, beside the Vapours rais'd from Water, &c. there are also Exhalations carry'd off from Sulphur, Bitumen, Volatile Salts, &c. is past all doubt; the vast Quantity of sulphurous and bituminous Matter all over the Surface of the Earth, and the Volatile Salts of Plants and Animals, afford such an ample Stock thereof; that 'tis no Wonder the Air should be fill'd with such Particles, rais'd higher or lower, according to their greater or less Degree of Subtility and Activity; and more copiously spread in this or that Quarter, according to the Direction of the Winds, &c. See SUBTILE.

Now, the Effects of *Thunder* are so like those of fir'd Gunpowder, that Dr. Wallis thinks we need not scruple to ascribe them to the same Cause: But the principal Ingredients in Gunpowder we know are Nitre and Sulphur; Charcoal only serving to keep the Parts separate, for the better kindling. See GUNPOWDER.

Hence, if we conceive in the Air a convenient Mixture of nitrous and sulphurous Particles, from the Sources above-mention'd; and those, from some Cause, to take Fire; such Explosion may well follow, and with such Noise and Light, the two Phenomena of *Thunder*; as in the firing of Gunpowder: and being once kindled, it will run from Place to Place, this Way or that, as the Exhalations happen to lead it; as in a Train of Gunpowder.

This Explosion, if high in the Air, and remote from us, will do no Mischief; but if near us, may destroy Trees, Animals, &c. as Gunpowder would do in the like Circumstances.

This Nearness or Farness may be estimated by the Interval of Time between the Flash and the Noise: Dr. Wallis observes, that ordinarily the Difference between the two is about seven Seconds; which, at the Rate of 1142 Feet in a Second of Time, gives the Distance about a Mile and half: But sometimes it comes in a Second or two, which argues the Explosion very near us, and even among us. And in such Cases, the Revd. Doctor assures us, he has more than once foretold the Mischief that befall.

Upon the whole, that there is in Lightening a sulphurous Vapour, appears from the Sulphur which attends it, and from the sultry Heat in the Air which usually precedes it; and that there is a nitrous Vapour along with it, the same Author concludes hence, that we know of no other Body so liable to a sudden and violent Explosion. And as to the kindling of these Materials, we know that a Mixture of Sulphur and Steel Filings, with a little Water, will break forth into actual Flame. Nothing therefore is wanting to the Explosion, but some Chalybeate, or Virriolic Vapour; and among the various Effluvia from the Earth, the Doctor does not doubt, but there must be some of that: But what he leaves as a Probability, we can produce a kind of Proof of.

In History we meet with Instances of its raining Iron in Italy, and Iron Stones in Germany: Joh. Scaliger tells us, he had by him a Piece of Iron rain'd in Savoy. Gordon reports 1200 Stones to have fallen from Heaven, some of them weighing 30, some 40, and one an hundred and twenty Pound, all very hard, and of the Colour of Iron.

The Matter of Fact is so well attested, that Dr. Lister, in the *Philosophical Transactions*, builds a whole Theory of *Thunder* and *Lightening* on it; maintaining, that they both owe their Matter to the Breath or Exhalation of *Pyrites*. See PYRITES.

That Rattling in the Noise of *Thunder*, which maketh it seem as if it pass'd thro' Arches, or were broken variously, is doubtless owing to the Sound being excited among Clouds hanging over one another, and the agitated Air passing between them. See LIGHTENING.

**THUNDER-BOLT**. If what we call *Lightning*, act with extraordinary Violence, and break or shatter any thing; it is call'd a *Thunder-bolt*; which the People, to fit it for such Effects, suppose to be a hard Body, and even a Stone. See LIGHTENING.

But that we need not have recourse to a hard solid Body to account for the Effects commonly attributed to the *Thunder-bolt*, will be evident to any one, who considers those of Pulvis Fulminans, &c. of Gun-powder. See FULMINANS.

The Phenomena of the *Thunder-bolt* are, that it oftener strikes on high Places than on low: That it frequently burns Peoples Cloaths, without touching their Bodies: That it sometimes breaks their Bones, without hurting their Flesh, or their Cloaths; that it has even melted the Sword without touching the Scabbard, &c.

The First is easily accounted for, from the ordinary Height of the Clouds, out of which the Lightening darts: As to the rest, since Exhalations may be very different from one another; some, e. g. coming nearest the Nature of Sulphur, may only yield a very slight lambent Flame, which will only affect such things as take Fire the soonest. And others, on the contrary, so subtle and penetrating, as to come near the Nature of Volatile Salts or Aqua-fortis, which spare soft Bodies, and spend their whole Force on hard ones.

The Chevalier de Louville in the French Academy of Sciences, accounts for some of the Effects of *Thunder* upon a new Principle; as to killing of Animals, without burning or wounding them, 'tis naturally enough ascribed to the Sulphur, which falling near enough the Person, the Fumes thereof stop his Respiration. As to Trees, Buildings, &c. split or beat down, there must be another Cause. M. de Louville, therefore, supposes, that when the *Thunder* is so high, its Flame is dissipated e'er it arrive at the Earth: And that the Air being violently driven along by the impetuous Motion of the Flame, and of consequence exceedingly condensed, becomes a kind of hard Body, capable of producing terrible Effects.

Places struck with *Thunder-bolts*, were held Sacred among the Ancients. Nigidius has a very curious Treatise on the *Thunder-bolt*.

Marcilius Ficinus, and some others, maintain, that Coral dissipates panic Fears, and keeps off *Thunder-bolts* and Hail: Fortunus Licetus has endeavour'd to account for it physically. F. le Brun proves very easily, that those Philosophers are mistaken.

On Medals, the *Thunder-bolt* is sometimes found to accompany the Emperors Heads; as that of Augustus. In which Case, it is a Mark of Sovereignty, and of a Power equal with the Gods.

African informs us, that the *Thunder-bolt* was the principal Divinity of Solencia; adding, that it was adored even in his Time, with various Hymns and Ceremonies. See GON.

THUS. See FRANKINCENSE.

THUMMIM, in the Scripture Learning. See UREM and THUMMIM.

THURSDAY. See WEEK.

Monday THURSDAY. See MAUNDAY Thursday.

THYMUS, in Anatomy, a conglobate Gland, situated in the upper Part of the Thorax, under the Claviculae, where the Cava and Aorta divide into the Subclavian Branches. See GLAND.

This Gland is big in Infants, but as they grow in Age, it grows less; its Arteries and Veins are Branches of the Carotides and Jugulars. It has Nerves from the Par Vagus, and its Lymphatick Vessels discharge themselves into the Ductus Thoracicus.

The learned Dr. *Jysen* supposes the Use of this Gland to be for a Diverticulum to the Chyle in the Thoracick Duct of a Foetus, whose Stomach being always full of the Liquor in which it swims, must keep the Thoracick Duct distended with Chyle; because the Blood which the Fetus receives from the Mother, fills the Veins, and hinders the free Entrance of the Chyle into the Subclavian Veins. See FOETUS.

M. *Chefelinus* observes, that where the *Thymus* in Men is very small, the Thyroid Glands increase proportionably; but in such Brutes as have fallen under his Observation, it is just the contrary; from which he is inclined to believe that they belong to the same Lymphatics, and that either of them encreasing as much as both ought to do, if both encreased, answers the same End as both did; and that the Reason why the *Thymus* encreases rather than the Thyroid Glands in Brutes, is, because the Shape of their Thorax affords convenient Room for it to lodge in; and that in Men, the Reason why the Thyroid Glands encrease to much, is, because there is no Room in that part of the Thorax where the *Thymus* is seated, for a large Gland to be lodg'd.

The *Thymus* is that, which in a Breast of Veal we call the Sweet-Bread.

THYMUS, in Medicine, is used for a kind of Wen, growing on the natural Parts, the Fundament, and several other Places of the Body, with cloven Apertures like those of the Herb *Thyme*, whence its Name. See WEN.

The ordinary Method of curing a *Thymus*, is by Ligature and defecative Lotions, or by Caustic's; and if large, by Incision; taking Care first to secure the greater Vessels by tying them.

THYROARYTENOIDEUS, in Anatomy, a Pair of Muscles, situate under the Cartilago Thyroideus; from the fore and back Part of which, it arises with a very broad Head, and terminates in the Arytenoides, which it constringes, and shuts the Larynx. See ARYTENOIDES.

THYROIDEÆ Glandulae, THYROID GLANDS, are two Glands of the Larynx. See LARYNX.

There are Four pretty large Glands, which serve to moisten the Larynx; two above and two below.

The two latter are call'd *Thyroideae*; situate at the bottom of the Larynx, aside of the Annular Cartilage, and of the first Ring of the Trachea; one on each Side.

They are in form of little Pears; and their Colour a little more reddish, their Substance more solid, more viscous, and resembling more the Flesh of the Mafides, than the other Glands.

They receive Nerves from the Recurrents, Arteries from the Carotides; Veins which pass to the Jugulars, and Lymphaticks, which discharge themselves into the Thoracick Duct.

Their Use is to separate a viscid Moisture, serving to line, and lubricate the Larynx, to facilitate the Motion of its Cartilages, to soften the Acrimony of the Saliva, and to sweeten the Voice.

THYROIDES, in Anatomy, one of the five Cartilages of the Larynx. See LARYNX.

The first, and biggest of the Cartilages of the Larynx is call'd *Thyroides* or *Scutiformis*, by reason of its Figure, which some fancy to resemble a Shield. It is hollow within, and gibbous without side; but more so in Men than in Women. In the middle is a Prominence, call'd *Punctum Adams*. 'Tis usually parted by a Line running along the middle; whence some make two of it; tho' its reality 'tis very rare 'tis found double.

It is near a Square; and at each Angle is a Process: The two uppermost are the longest, and tie it by means of a nervous Ligament to the Os Hyoides: The two lower, and shorter, connect it to the second Cartilage, call'd *Cricoides*.

The Word is form'd from the Greek, *θυρεος*, Buckler, and *ειδος*, Form.

THYRSUS, in Antiquity, the Scepter which the ancient Poets put in the Hand of *Bacchus*, and wherewith they furnish the *Menades* in their *Bacchanalia*. See BACCHANALIA, &c.

The *Thyrus* was originally a Lance, or Spear, wrapt up in Vine-Leaves; wherewith *Bacchus* is said to have arm'd himself and his Soldiers in his *Indian Wars*, to amuse and deceive the unpractis'd *Indians*, and make them suspect no Hostilities.

Hence it was afterwards bore in the Feasts and Sacrifices of that God; and as the Satyrs, who were *Bacchus's* Soldiers, were suppos'd to have fought with it, it became a Custom to represent them therewith. See SATYR, &c.

The Word is form'd from the Greek, *θυρεος*, *Hafusa* from *αδινος* *vestiti*, signifying the same thing.

TIARA or TIBARA, an Ornament or Habit, wherewith the ancient *Perfians* cover'd their Head; and which the *Armenians*, and Kings of *Pontus* still wear on Medals; these last, because descended from the *Perfians*.

The *Latin* Authors call it indifferently, *Tiara* or *Gadavit*. *Strabo* says, the *Tiara* was in form of a Tower: The Scholiast on *Aristophanes's* Comedy, *Αχαρναι*, Act 1. Scene 2. affirms, that it was adorn'd with Peacock's Feathers. Some Moderns, however, take it, the Scholiast is here speaking of the Cask which the ancient *Perfians* wore in War; rather than the Habit which they wore on the Head in the Cities: But they don't seem to have consider'd the Passage in the Poet, to which the Scholiast refers: The Matter there spoke of is Peace, and Embassadors sent to treat of Peace, with Habits of Pomp and Ceremony, *Αχαιοι* *ῥα*, &c. These Ambassadors, these Peacocks, all these Things of Pomp and Ostentation displeas'd me. By these Peacocks, says the Scholiast, he means the *Tiara*, which among the *Perfians* are Ornaments of the Head, whereto are attach'd Peacock's Feathers, &c.

St. *Jerom* on *Dan*, cap. iv. defines the *Tiara* a kind of Cap, *genus Pilositi*, worn by the *Perfians* and *Chaldeans*. In another Place, he adds, 'tis like *Ulysses's* Cap.

The ancient Scholiast, on *Juvenal*, describes the *Tiara* as a Priest's Cap, which descending over the Cheeks, was tied under the Chin; which agrees very well with the Form of that which we see *Mithridates* wear, on Medals. *Servius* on *Virgil*, lib. viii. *Aeneid*. calls the *Tiara*, a *Phrygiac* Cap; and *Statius*, *Thebaid*, lib. viii. gives it the Kings of *Partavia*, who, doubtless, borrow'd it from the *Perfians*.

*Justin* attributes the long Garment and *Tiara* of the *Perfians*, to *Semiramis's* Disguise; whereby she pass'd for *Ninus*.

The Kings of *Perfia* alone, had the Right of wearing the *Tiara* straight and upright: The Priests, and great Lords wore it depress'd, or turn'd down on the Fore-side. *Xenophon* in his *Cyropæd*. says, that the *Tiara* was sometimes encompass'd with the Diadem, at least in Ceremonies; and had frequently the Figure of a Half Moon embroider'd on it: Others are of Opinion, that 'twas the Diadem had the Figure of a Moon, and that it was hence the *Tiara* was call'd *Lunata*; and, lastly, others think that the *Tiara* itself was sometimes in form of a Half Moon. From what we have said, it appears, that there were different Forms of *Tiara's*; and, in effect, *Papalians*, de *Corentis*, shews there were Five different Kinds. See DIADEM.

TIARA is also the Name of the Pope's Triple Crown; and anciently call'd *Regnum*. See CROWN.

The *Tiara*, and Keys are the Badges of the Papal Dignity; the *Tiara* of his Civil Rank, and the Keys of his Jurisdiction: For, as soon as the Pope is dead, his Arms are represented with the *Tiara* alone, without the Keys.

The ancient *Tiara* was a round high Cap, *John XXIII.* first encompass'd it with a Crown. *Boniface VIII.* added a second Crown; and *Benedict* the XIIIth, a Third.

TIBIA, in Anatomy, the bony Part of the Leg, between the Knee and the Ankle. See LEG.

The *Tibia* consists of two Bones, call'd *Fociles*, the one on the Inside the Leg, call'd the *Fibula*, or *little Focil*. See FIBULA.

The other on the Out-side, call'd by the common Name *Tibia*, or the great *Focil*. See the following Article.

TIBIA, is, properly, the inner and bigger Bone of the Leg, call'd also *Focile Major*. See BONE.

The *Tibia* is hard and firm, having a pretty large Cavity in its Middle, to contain the Medulla. See MEDULLA.

It is almost Triangular; its fore, and sharp Edge being call'd the *Spin*; in its upper Extremity, it has two large Sinus's, typ with a soft and fine Cartilage, from its Figure, call'd *Cartilago Lunata*; which runs in between the Extremities of the two Bones, and grows very thin at its Edge; serving to facilitate a small Side-motion in the Knee, like those in the Articulation of the lower Jaw.

The Sinus's receive the two Protuberances of the Femur, or Thigh-bone; and the Production which is between the Sinus's of the *Tibia*, is received into the Sinus, which divides these two Protuberances of the Femur. See FEMUR.

By bending the Knee, we bring the Leg, in walking, in a straight Line forwards; which we could not have done without this Articulation; but like those who have the Misfortune to have a wooden Leg, we must have brought our Foot about in a Semi-circle, in going even upon a Plain, but more evidently upon an Ascent.

On the Side of this upper End, it has a small Knob, which is received into a small Sinus of the *Fibula*, and on its Fore-part, a little below the Patella, it has another into which the Tendons of the Extensors of the Leg, are inserted. See FIBULA.

Its lower Extremity, which is much smaller than its upper, has a remarkable Procefs, which forms the inner Ankle; and a pretty large Sinus, divided in the Middle by a small Protuberance; the Sinus receives the convex Head of the Astragalus, and the Protuberance is received into the Sinus, in the convex Head of the same Bone.

It has another shallow Sinus in the Side of its lower End, which receives the Fibula.

Mr. *Chefelien* gives an Instance of a Boy of Seven Years of Age, where both the Epiphyses at the upper End of the *Tibia*, were so far separated, that not more than Half each *Tibia* was join'd to Half the Epiphysis; which made his Legs wholly useless. This had been occasion'd, by the Nurse's holding him out to Stool by the Heels and Back, when very young; which is among them (as he observes) too common a Practice.

**TIBIALIS** or **TIBIÆUS**, in Anatomy, a Name given two Muscles of the Leg; distinguish'd by *Anticus* and *Posticus*.

The *Tibialis Anticus*, springs from the exterior Procefs of the *Tibia*, and becoming gradually broad and fleshy about the middle of the *Tibia*, down the Fore-part of which it runs, is contracted again, into a slender, smooth Tendon, which passes under the Ligamentum Annulare, and is partly inserted to the Os Cuneiforme Majus, and partly to the Bone of the Metatarsus, that supports the great Toe. Its Office is to draw the Foot up.

*Tibialis Posticus*, is derived from both Bones of the *Tibia*, and from the Ligament that binds them together; and runs with a smooth, strong Tendon through the Sinus on the inner Malleolus, under the Annular Ligament, to the Inside of the Os Naviculare.

Its Office is to draw the Foot inwards. From the Use Sailors make of it in Sailing, it is also call'd the *Neuritic*.

**TICHONIC** System or *Hypothesis*. See **Tychonic**.

**TIDES**, Two periodical Motions of the Waters of the Sea, call'd the *Flux* and *Reflex*; or the *Ebb* and *Flow*. See **SEA**, **FLUX**, **EBB**, &c.

When the Motion of the Water is against the Wind, 'tis call'd a *Windward Tide*; when Wind and Tide go the same Way, *Leeward Tide*: When it runs very strong, 'tis a *Tide-gate*.

To *Tide* it over or up into any Place, is to go in with the *Tide*, either Ebb or Flood, as long as that lasts; then to stay at Anchor all the Time of contrary *Tide*; and thus to set in again with the Return of the first *Tide*.

It is said to *run Tide* and *Half Tide*, when the *Tide* runs three Hours in the Offing, longer than it does by the Shore; but, by *longer*, they don't mean more Hours; but, that if it be high Water a-shore at 12, it will not be so in the Offing till Three. If it Ebb and Flow longer, they say it runs *Half Tide* and *Half-quarter*.

When the Moon is in the First and Third Quarter, *i. e.* when she is New and Full, the *Tides* are High and Swift, and call'd *Spring Tides*; when she is in the second and last Quarter, the *Tides* are lower and slower, and call'd *Neap Tides*. See **NEAP**, &c.

#### Phænomena of the TIDES.

The Sea is observ'd to flow, for certain Hours, from South towards North; in which Motion, or Flux, which lasts about Six Hours, the Sea gradually swells; so that entering the Mouths of Rivers, it drives back the River-waters towards their Heads or Springs. See **RIVER**, &c.

After a continual Flux of Six Hours, the Sea seems to rest for about a Quarter of an Hour; after which it begins to ebb or retire back again from North to South, for Six Hours more; In which Time, the Water sinking, the Rivers resume their natural Course. After a seeming Pause of a Quarter of an Hour, the Sea again begins to flow as before, and thus alternately.

Thus does the Sea ebb twice a-day, and flow as often; but not in the same Hours every Time. The Period of a Flux and Reflex is 12 Hours 50 Minutes, so that the *Tides* return later, and later each Day, by 50 Minutes or  $\frac{1}{2}$  of an Hour, 5 Minutes.

Now, 12 Hours 50 Minutes is a Lunar Day; *i. e.* the Moon passes the Earth's Meridian later and later each Day by 50 Minutes. So that the Sea flows as often as the Moon passes the Meridian, both the Arch above, and that below the Horizon; and Ebbs as often as she passes the Horizon, both the Eastern and Western Point thereof. See **MOON**.

This further Agreement we observe between the Moon and the Sea; that the *Tides*, though constant, are not equal; but are greatest, when the Moon is in Conjunction, or Opposition to the Sun, and least when in Quadrature thereon.

Lastly, those *Tides* are the greatest, which happen in the New and Full Moon, at the Times of the Equinoxes.

Add, that the same Things are observed throughout most of the Coasts of Europe; only that the *Tides* are so much the less, and happen the later, as the Coasts are the more Northernly.

These Phænomena of the *Tides* are admirably accounted for, from the Principle of Gravitation. All we require to

their Solution, is, that the Earth and Moon, and every Particle thereof, mutually gravitate towards each other; the Reasonableness of which Assumption, see under the Article **GRAVITATION**.

Indeed the sagacious *Kepler* long ago, conjectured this to be the Cause of the *Tides*: "If, says he, the Earth ceas'd to attract its Waters towards itself; all the Water of the Ocean would rise and flow into the Moon: The Sphere of the Moon's Attraction extends to our Earth, and draws up the Water." Thus thought *Kepler* in his *Intrad. ad Theor. Mors.* This Surmise, for it was then no more, is now abundantly verified, in the following Theory, deduced by *Dr. Halley*, from the *Newtonian Principles*.

#### Theory of the TIDES.

1<sup>o</sup> As the Surface of the Earth and Sea is naturally globular; if we suppose the Moon A (Tab. Geography Fig. 6.) perpendicularly over some Part of the Surface of the Sea, as E; 'tis evident the Water E, which is now nearest the Moon, will gravitate towards it more than any other Part of the Earth and Sea in the Hemisphere FPH.

The Water in E, therefore, must by this means, be rais'd towards the Moon, *i. e.* it will be lighter than usual, and of consequence will swell in E.

For the same Reason the Water in G being the most remote from the Moon, will gravitate towards the same, rather than any other Part of the Earth or Sea in the Hemisphere FGH.

The Water here, therefore, must approach less towards the Moon, than any other Part of the Globe, *i. e.* it must be rais'd the contrary Way; as being lighter than usual, and will therefore swell in G.

By this means, the Surface of the Ocean must necessarily form itself into a Spheroidal, or Oval Figure, whose longer Diameter is EG; its shorter FH. And thus, the Moon shifting her Position in her Diurnal Motion round the Earth; this Oval of Water must shift with her; by which means are effected those two Floods and Ebbs, observable every 25 Hours.

2<sup>o</sup> Since, in the Conjunctions and Oppositions of the Sun and Moon, the Gravitation of the Water to the Sun competes with its Gravitation towards the Moon; but in the Quadratures, the Water rais'd by the Sun is depress'd by the Moon: Hence it is that the *Tides* are greatest in the Syzygies, and least in the Quadratures.

In effect, there are two *Tides* every natural Day, from the Action of the Sun, as there are in the Lunar Day from that of the Moon; all govern'd by the same Laws: Only those caus'd by the Sun, are much less than those of the Moon; because though the Sun be Ten thousand times bigger than both the Earth and Moon, yet he is so immense a Distance, that the Earth's Semi-diameter bears no Proportion thereto.

Hence, the different *Tides* depending on the particular Actions of the Sun and Moon are not distinguish'd, but confounded. The Lunar *Tide* is somewhat changed by the Action of the Sun; and this Change varies every Day, by reason of the Inequality between the Natural and Lunar Day. See **DAY**.

3<sup>o</sup> Since the greatest *Tides* about the Equinoxes (viz. those happening in the Syzygies) arise from the Sun and Moon being in the Equinoctial; and those about the Solstices, from the Sun and Moon being in the Tropics; for this Reason, those greatest *Tides* about the Equinoxes are greater than those about the Solstices, since the greater the Circle is, wherein the Waters turn, the greater is their Agitation. And if the Moon stood still in the Pole, the Spheroid would become immovable about the Pole, and the high Water be fix'd therein.

4<sup>o</sup> Since the *Tides* are somewhat chang'd by the Libration of the Waters, which use to retain a Motion impress'd on them for some time; for this Reason the highest *Tides* are not precisely in the very Conjunction and Opposition of the Moon, but two or three *Tides* afterwards.

5<sup>o</sup> Since the Sun is somewhat nearer the Earth in Winter than in Summer; hence it is, that the greatest Equinoctial *Tides* are observ'd to be a little before the Vernal Equinox, and a little after the Autumnal one.

6<sup>o</sup> Since the greatest of the two *Tides* happening in every Diurnal Revolution of the Moon, is that wherein the Moon is nearest the Zenith, or Nadir: For this Reason, while the Sun is in the Northern Signs, the greater of the two Diurnal *Tides* in our Climates, is that arising from the Moon above the Horizon; when the Sun is in the Southern Signs, the greatest is that arising from the Moon below the Horizon.

7<sup>o</sup> Such would the *Tides* regularly be, if the Earth were cover'd with Sea very deep; but by Reason of the Shoalness of some Places, and the Narrowness of the Straits in others, by which the *Tides* are propagated, there arises a great Diversity in the Effect, not to be accounted for, without an exact Knowledge of all the Circumstances of the Places; as the Position of the Land, and the Breadth and Depth

Depth of the Channels, &c. for a very flow and imperceptible Motion of the whole Body of Water, where it is (for Example) two Miles deep, will suffice to raise its Surface 10 or 12 Feet in a *Tides-tide*; whereas, if the same Quantity of Water were to be convey'd upon a Channel of 40 Fathom deep, it would require a very great Stream to effect it, in so large Inlets as are the Channel of *England* and the *German Ocean*; whence the *Tide* is found to set strongest in those Places where the Sea grows narrowest, the same Quantity of Water being in that Case to pass thro' a smaller Passage.

This is most evident in the Straits between *Portland* and *C. de la Hague*, in *Normandy*, where the *Tide* runs like a *Sluice*; and would be yet more between *Dover* and *Calais*, if the *Tide* coming about the Island did not check it.

And this Force being once impress'd upon the Water, continues to carry it above the Level of the ordinary Height in the Ocean, particularly where the Water meets a direct Obstacle, as it is in *St. Malo*; and where it enters into a long Channel, which running far into the Land, grows very strait at its Extremity, as it is in the *Severn-Sea* at *Cleppow* and *Bristol*.

This Shoalness of the Sea, and the intercurrent Continents, are the Reason that in the open Ocean, high Water is not at the Time of the Moon's Appulse to the Meridian, but always some Hours after it, as it is observ'd upon all the West Coast of *Europe* and *Africa*, from *Ireland* to the *Cape of Good Hope*; in all which a South-West Moon makes high Water; and the same is reported to be on the West of *America*.

It would be endless to recount all the particular Solutions, which are easy Corollaries from this Doctrine: as, why the Lakes and Seas, such as the *Caspian Sea*, and the *Mediterranean Sea*, the *Black Sea*, and *Baltick*, have no sensible *Tides*: For Lakes having no Communication with the Ocean, can neither increase or diminish their Water, whereby to rise and fall; and Seas that communicate by such narrow Inlets, and are of so immense an Extent, cannot in a few Hours Time receive and empty Water enough to raise or sink their Surface any thing sensibly.

To demonstrate the Excellency of this Doctrine, the Example of the *Tides* in the Port of *Tunking* in *China*, which are so extraordinary, and different from all others we have yet heard of, may suffice. In this Port there is but one Flood and Ebb in 24 Hours; and twice in each Month, viz. when the Moon is near the Equinoctial, there is no *Tide* at all, but the Water is stagnant; but with the Moon's Declination, there begins a *Tide*, which is greatest when she is in the Tropical Signs; only with this Difference, that when the Moon is to the Northward of the Equinoctial, it flows when she is above the Earth, and ebbs when she is under, so as to make high Water at Moon-setting, and low Water at Moon-rising: But, on the contrary, the Moon being to the Southward, makes high Water at rising, and low Water at setting, it ebbs all the Time she is above the Horizon.

The Cause of this odd Appearance is propos'd by *Sir Isaac Newton* to arise from the Concurrence of two *Tides*, the one propagated in six Hours out of the great *Santch-Sea* along the Coast of *China*; the other out of the *Indian Sea* from between the Islands in twelve Hours, along the Coast of *Malacca* and *Comboya*. The one of these *Tides* being produc'd in North Latitude, is, as hath been said, greater when the Moon being to the North of the Equator, is above the Earth, and less when she is under the Earth. The other of them, which is propagated from the *Indian Sea*, being rais'd in South Latitude, is greater, when the Moon declining to the South is above the Earth, and less when she is under the Earth; so that of these *Tides* alternately greater and lesser, there come always successively two of the greater, and two of the lesser together every Day; and the high Water falls always between the Arrival of the two greater Floods; and the low Water between the Times of the Arrival of the two lesser Floods: And the Moon coming to the Equinoctial, and the alternate Floods becoming equal, the *Tide* ceases, and the Water stagnates; but when she has pass'd to the other Side of the Equator, those Floods which in the former Order were the least, now becoming the greatest, that which before was the Time of the high Water, now becomes the low Water, and the converse; so that the whole Appearance of these strange *Tides* is, without any forcing, naturally deduc'd from their Principles, and is a great Argument for the Certainty of the whole Theory.

*TIDE-waiters*, or *TIDE-men*, certain Officers belonging to the Custom-house, appointed to watch or attend on Ships, coming from abroad, to see that nothing be landed till the Custom of the Freight be paid. See CUSTOM, FREIGHT, &c.

They are thus call'd, because they go aboard the Ships at their Arrival in the Mouth of the *Thames*, and come up with the *Tide*.

*TIERCE*, in Heraldry, a Term denoting the Shield to be divided into three equal Parts, of different Colours or Metals.

If the Chief and Base be of the same Colour when divided by a Fesse, they blazon it by expressing the Colour, and mentioning the Fesse; otherwise, they lay it is *Tierce en fasces*, and mention each of the Colours; or *Tierce en pal*, if so divided in Pale.

*TIERCE*, or *TERCE*, is also a Measure of liquid Things, as Wine, Oil, &c. containing the third Part of a Pipe, or 42 Gallons. See MEASURE, GALLON, &c.

*TIERCE*, in Music. See THIRD.

*TIERCE*, *Trees*, a Sequence of three Cards of the same Colour. See SEQUENCE.

*TIERCE*, in Fencing. See GUARD.

*TIERCE* Order. See THIRD Order.

*TIGE*, in Architecture, a French Term for the Shaft or Fust of a Column; comprehended between the Astragal and the Capital. See FUST and COLUMN.

*TILE*. See TYLE.

*TILLER*, or *TILLAR*, in Husbandry, a little young Tree left to grow till it be fellable. See TIMBER.

*TILLER* of a Ship, is a strong Piece of Wood fasten'd to the Rudder. See RUDDER.

The same Name is also given to that which serves for a Helm in a Boat.

*TILLING*, in Gardening and Agriculture, a moving or stirring of the Ground, with the Plough or Spade; which being perform'd on the Top, enters to a certain Depth, and makes the lower and upper Parts change Place; by which means the Goodness of the Earth is kept from being spent in feeding ill Plants. See PLOUGHING, &c.
