AMERICAN AGRICULTURIST

FOR THE

Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON.

ORANGE JUDD & CO., PUBLISHERS AND PROPRIETORS. Office, 245 BROADWAY.

ESTABLISHED IN 1842. Published also in German at $1.50 a Year.

$1.50 PER ANNUM, IN ADVANCE. SINGLE NUMBER, 15 CENTS. 4 Copies for $5; 10 for $12; 20 or more, $1 each.

Entered according to Act of Congress in December, 1869, by ORANGE JUDD & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

VOLUME XXIX.—No. 1. NEW YORK, JANUARY, 1870. NEW SERIES—No. 276.

[COPYRIGHT SECURED.]

"SEVERE WEATHER."—FROM A PAINTING BY R. ANSDELL.—*Engraved for the American Agriculturist.*

The shepherds of the mountainous regions are liable to have their flocks exposed, both on the coming on of winter and in the spring, to storms of great severity accompanied by rain, snow and cold, and often by driving wind which allows no escape from cold or wet. Even so hardy an animal as the Highland sheep often suffers greatly. Separated from the flock, weighed down by their ice-loaded fleeces, weakened by lack of food, and chilled through and through, it is no wonder that the most vigorous sometimes give up in their struggle with the elements, and die. When the storm breaks away or a lull for a few hours comes, then is exercised the sagacity of that most intelligent of brutes, the shepherd dog. Every old country in the agriculture of which sheep form a prominent feature, has its own race or breed of shepherd dogs. Those used in mountainous regions resemble each other a good deal, because the same arduous duties are required of them. They must be intelligent, kind, hardy and docile, of good size, fleet, well coated, and enduring. The most remarkable instances of intelligence have been manifested by females. We are most familiar with the English and Scotch shepherd dogs. The latter, called the *Colly*, is the breed of the dog in the engraving. These, like other shepherd dogs, are from their birth familiar with sheep. They have the constant companionship of the shepherds and manifest the strongest attachment for their master, generally being entirely indifferent to other men. Their care of the flock is not a cultivated natural impulse, nor second nature, even after centuries of breeding, but simply a business to which they are trained and in which they find unlimited opportunities for the display of their wonderful sagacity, aided by remarkable powers of vision and scent, and probably also of hearing. Untrained they make affectionate, companionable dogs, quick to learn tricks, and to understand language addressed to them.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, outdoor and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for twelve years past, beginning with 1857—that is, Vol. 16 to Vol. 23, inclusive. Any of these volumes sent complete (in numbers) at $1.75 each, postpaid, (or $1.50 if taken at the office). The volumes, neatly bound, are supplied for $2 each, or $2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW YORK, JANUARY, 1870.

It was wise in the Ancients to begin their social year in January. The Jewish year begins in September; the Mohammedan in May; the Ecclesiastical at "Advent," about the first of December; and our National or Civil year on the 4th of July. At no time have farmers, gardeners, professional or business men so much leisure to wind up the affairs of the closing year, and to begin aright the new as at this season, when traffic is, in a measure, suspended, when the ground is frozen, when the hours of light are few, and the evenings are long. We are receiving the income from the harvest in one way or another, or know what to calculate upon, in a measure, at least; weeks must pass before the activity of field work presses us again, and we have time to prepare for a successful year. Success does not come unsought, at least not to farmers following their ordinary avocations. It must be won by well-studied plans, and thorough preparations, judiciously carried out. To plan and prepare is, therefore, the most important work for January. Perhaps we ought to make an exception to this statement in favor of that mental culture for which the winter offers such opportunities. Nothing is so important to a farmer, as a man, as to be well informed,—as a farmer, he may be tolerably successful, without education except in the routine and labor of his profession, but every year makes it harder for those farmers who depend exclusively on native wit and innate shrewdness, and easier for those who study farming, and follow their profession with all the aids they can get, with the printed experience of a thousand neighbors, the best thoughts of men of science, and the best implements and methods they can afford to get and learn, and can carry out to use.

Hints About Work.

We assume that the regular labors of the field are suspended by cold weather; if otherwise, and we occasionally have winter's when, even in Pennsylvania, plowing may be done in every month of the year, no hint from us will be needed to remind farmers that there are some kinds of properly called spring work, which may be done, greatly to the relief of the men and teams in March and April. Now and then, however, times occur when the ground is bare, and stones are loose, and these offer an opportunity not to be lost sight of, to pick up stones and lay them in heaps, or haul them off at once from the fields to where they may be used.

The Work-shop.—The winter affords time to work a good deal at repairing tools, making and mending articles, and if one has a room which may be warmed and lighted, and with a good work-bench, furnished with common carpenters' tools, a soldering iron, a little kit of saddlers' tools, some leather, rivets, etc., it will be found a very attractive place for the boys; and not only would there be a good deal of good work done, but good habits formed, and skill gained, worth a great many dollars more than an expensively fitted up work-shop would cost.

Frost and Snow.—Never delay path-making and road-breaking after every fall of snow. The work is much lighter, and it is better done. Never trust to mild nights, and leave the water standing in pumps or pipes. Sudden changes of weather, with accompanying damage, occur without warning.

Building may often be done by contract in winter cheaper than in warm weather, especially if the contracts be made in the autumn; but builders will give moderate figures for good work, if one can present well-made plans and specifications early in the new year, and give them time to do the finishing after the house is enclosed, and the roof on, when their other work does not press upon them.

Timber.—Cut and haul to the saw-mill. In selecting trees, take such as have nearly stopped growing, but are still sound and healthy. Such wood is quite as good as that which is growing fast, and stiffer. Young timber is elastic, old is stiff; that which has stopped growing, and has many dead limbs, is brash, though good for fuel.

Ice.—Those who have ice-houses should not neglect to fill them whenever sufficient thickness of ice forms to make it possible to handle it economically. At the lowest latitude where ice-houses are found, and where ice is usually gathered, it often happens that good ice can be obtained only for a very few days. Ice one inch thick may be very profitably handled, being dragged out upon a clean platform, running into the water, and from this shoveled into carts. It should be packed by pounding into as solid a mass as possible in the ice-house. An intermixture of a moderate quantity of pure, fresh-fallen snow is an advantage if it be well pounded. When thick ice can be obtained, chip off all the porous snow-ice, and pack only the clearest, filling the crevices with fine ice chipped from the top of each layer. Cut the cakes to fit.

Horses ought to have good cleaning and regular exercise. If there is nothing for them to do, give them a run of an hour or two in a well-fenced lot, one at a time—if there is any danger of their kicking each other—every fair day. Don't scrimp in bedding; you will lose nothing, but gain, in the less amount of food a horse will need if kept warm. Close stables must be well ventilated. Direct the blacksmith to put the best and toughest steel into the caulks, so welded on that they will not tear out. The caulks should be thick, so that they may be sharpened when necessary several times without the necessity of renewing the shoes.

Mares and Colts.—Brood mares are liable to injury from slipping on the ice, and they ought to be kept sharp-shod if used, and kept off from icy paths when exercised or led to water. Similar care must be had for colts in giving them exercise. The winter is a favorable season to break and train young horses. In all exercise for the purpose of training a horse, remember he is an animal of considerable powers of reason, of great natural caution, of excellent memory, and of almost uncontrollable curiosity, and work upon these faculties. The horse is never satisfied with his knowledge of a new and strange thing unless he *smells* and rubs it with his nose. This he must do voluntarily.

Oxen, if used upon snowy or icy roads, must be well shod, and kept sharp.

Cows.—Feed well, so as to keep them in good

condition, and rather gaining than falling off in flesh. Milk to within six weeks of calving before beginning to dry off. Should cows calve during this month, provide warm, well-littered box stalls. Cows with calf should have some grain—corn-meal, bran, or oil-meal. They do better, calve easier, have better calves, and give more and better milk.

Young Cattle.—Give young cattle all the corn-stalks and hay they want to eat, and with good shelter they will thrive. If lousy, wash them with a moderately strong solution of carbolic soap, following the directions accompanying the package.

Beeves should have warm quarters, where they will not be excited or disturbed by occurrences about them, and should be fed, if for the spring market, with all that they will eat of corn and oil-meal mixed, and with roots and hay, to give variety, or with other fattening feed. Quick fattening is the most profitable, and they need very little exercise, if any, so long as they have good appetites.

Sheep which are fed for slaughter need to be sorted, so that the stronger ones shall not get more grain than is their share, or than is good for them. Sheep are easily thrown "off their feed" by over-feeding. Give turnips and oil-cake with corn, and occasionally hemlock boughs, if these can be easily got; all sheep are fond of them, and they are a healthy variation of their diet. Examine all sheep for ticks, lice, and scab, and, if necessary, apply carbolic soap in the form of strong suds, thrown into the parted fleece through a quill in the cork of a bottle; it will keep the vermin in check.

Swine.—The high price of pork will tempt farmers to get their store pigs in condition for slaughter. This is not worth while unless you have abundant provision made for a large stock of young ones. Sows will eat good clover hay and corn-stalks, if sweet, and may be kept in good order on comparatively little feed besides.

Poultry.—Eggs are high. The flesh of poultry brings a fair price except when a glutted market is followed by a thaw at this season. To secure eggs in winter, fowls must have light quarters, where they may spend not only the night but severe days in comfort, protected from both cold and wind. Light barn-cellars or enclosed "hovels," where manure is thrown from the stables, are places which almost every farmer can arrange. Feed well; watch for roup, or any such disease; remove wheezing fowls or those with colds, and give them tonic and stimulating diet. Give fowls soft feed—mashed potatoes with meal or wheat screenings, swelled oats, or cracked corn, well soaked, during the day, mingling it with cayenne pepper now and then, and feeding corn, barley, buckwheat, or other hard feed at evening. Water ought not to freeze in the hen-house except on the severest nights, and the house, roosts and nest-boxes should be kept as clean as in the spring or summer. Dry earth is useful as a deodorizer.

Work in the Horticultural Departments.

As we commence our monthly notes for another year, it is with the accompaniments of a rousing fire within, and the music of sleigh-bells without. It is now the time for fireside horticulture. We do not now allude to window plants, but to the horticulturist himself. Out-door work is, for the most part, "laid by," and now is the time when the cultivator himself needs to have his brain turned over and fertilized. It is necessary to change ideas as well as seed, and many a sound old stock of experience would bear all the better fruit if it could be engrafted with some new notion. Let the journals which were put aside half read, at the season when work was pressing, be brought out for thorough perusal. See if you have the best and latest work on the branch you are most interested in. There are but few books upon horticulture so stupid that a wide-awake man cannot get a good idea from them. There are but few cultivators but have some experiences that are worth learning—and what better way is there in which to learn what is going on in the world than to begin with your neighbor and compare notes with him? So with reading, visiting, and planning, the days which are too rigorous for out-door work, may be made among the most profitable of the year.

Orchard and Nursery.

Animals must be kept out of young orchards. Tight fences and securely closed gates will do much to exclude domestic animals, including man.

Mice and Rabbits are the most troublesome among the wild animals. Tramp down the light snows around the trunks of the trees. Sprinkle blood near the base of each tree, to keep off rabbits. See item in "Basket" on the use of corn-stalks for the purpose.

Cions can be cut if the trees are not frozen; mark, and store in sawdust or moss in a cool cellar.

Pruning.—Though winter pruning is objected to by good authorities, if we had an old orchard that needed treatment, we should go at it in winter when there is plenty of time. Painting over large wounds, or covering them with melted grafting wax will prevent injury from rotting. If trees are properly shaped when young, it will seldom be necessary to do much pruning.

Insects.—One of the worst enemies of the orchardist is the Tent-caterpillar, but it is, fortunately, one of the easiest to keep in check. The eggs may now be seen near the ends of the twigs, glued in a broad band-like cluster. Remove the eggs and there will be no caterpillars, as another crop will not be laid until next summer. A pole pruning implement of some kind is convenient for this.

Manure may be spread upon the orchard. We sometimes see trees manured by a heap placed directly around the trunk, where, if not a positive injury, it is of no use. Spread it evenly over the surface.

Fruit Garden.

Those who have only a limited space must plant their fruits and vegetables as they best can; but where circumstances will admit of it, by all means have a separate garden for small fruits and dwarf and other trees of small growth. It is impossible to grow vegetables properly in the close neighborhood of trees and large shrubs; besides this, the trees and shrubs are likely to suffer for the want of proper nutriment. Select a well-sheltered spot, with good deep soil; drain if necessary, and set it apart as a fruit garden. Strawberries, raspberries, currants, gooseberries, grapes, pears, etc., can be produced in abundant supply. Were small fruits in abundance, there would be fewer discussions of the question, "Why do boys leave the farm?"

A mild spell will allow of the pruning of such grape-vines and gooseberry and currant bushes as were left at the regular autumn pruning.

Kitchen Garden.

At the North we can do but little this month, except when vegetables are forced under glass. In Southern States the hardy vegetables may be sown whenever the soil is in good condition, and the temperature averages about 45°. The beet, carrot, parsnip, parsley, cauliflower, radish, turnip, onion, leek, cress, spinach, cabbage, etc., are hardy.

Seeds.—If the seed be poor in quality, or not true to its kind, it is worse than useless. Look over the stock on hand, and reject all about the identity which there is any doubt. The vitality is easily tried by planting a given number in a box of earth, and keeping in a warm room until they germinate. If three-fourths come up, the seed may be considered good. Decide early what seeds are wanted, and order. Stick to tested kinds for the main crop, and invest in novelties for experiment only.

Manure.—The heaps should be turned over when the steam issues copiously. Cart manure to those points where it will be handy for use.

Hot-beds are to be prepared for. Sashes may need repairs in the way of painting and glazing. In some parts of the South they may be put in operation. The safest rule for all latitudes is to start the hot-bed six weeks before the time at which the plants can be set out with safety.

Straw Mats will be needed to cover the glass of the hot-beds during cool nights. We have frequently given directions for making them.

Cold-Frames.—If the snow covers them while the plants are frozen it need not be removed, but if the weather is mild when the fall takes place, it should be swept off. Give air every mild day, and endeavor to keep the plants as dormant as possible.

Flower Garden and Lawn.

Many plans for the improvement of places will be formed. If one has abundant means, and but little knowledge of such matters, it will be safest for him to employ some landscape-gardener of acknowledged taste to lay out his grounds. The great mass of people are, however, obliged to both plan and execute themselves. To such our advice is, do not attempt too much in the way of adornment at once. Do not copy the plans for expensive places which will be difficult to carry out, and which, if laid out, are not likely to be kept in order. Make a plan of the place as it is, and see what can be done to improve it, and at the same time retain as many of its present features as are desirable. Houses are generally set too near the road, which much restricts the space in front, and this space is generally divided by a path directly from the road to the front door. It is often the case that a side entrance from the road can be so arranged as to avoid breaking up the space directly in front of the house, and thus a lawn of moderate dimensions can be had. A smooth, level lawn is the first thing to be provided for. Make only such paths as are necessary, and if pleasing curves can be given to them, it is better than to have them straight. Shrubs, trees, and flower beds are to be provided for, and for these no definite directions can be given. A common mistake is to so surround the house with trees that distant views are quite shut out. A little judicious cutting away will often open a beautiful landscape to view. All such plans should be made long in advance of the working season, and be well considered in all their relations before the work of laying out is commenced.

Plants in pits, cold-frames, and cellars, should be looked to, and aired when the weather will allow. Plants thus stored will seldom need water, but should they become very dry, give a small quantity.

Rustic Work will afford interesting employment for those who have some taste and mechanical skill. Seats, flower stands, and the like, can be made out of very unpromising material. Cedar, Laurel, the Wild Grape, and others, afford available stuff for the purpose.

Stakes, Labels, and all garden conveniences, should be prepared in advance in abundant supply.

Green-house and Window Plants.

The temperature of the green-house, where plants are expected to grow and flower, should reach 60 or 65° in the daytime, and may sink 10 or 15° lower at night. If plants are only stored for the winter away from frost, then the night temperature may go down to within a few degrees of freezing.

Ventilation is to be given whenever it can be done without injury by cold. Plants in rooms suffer greatly for the want of fresh air, and the success with plants in modern, close-built houses, is much more rare than it used to be in less carefully closed structures. In providing for a change of air, sudden chilling of the plants must be avoided.

Dust is one of the great drawbacks to the health of house plants. The table on which the plants stand may be so arranged that wires or rods, to support a cloth, may be attached to it, and thus provide a dust protector while sweeping is being done. Shower the plants as often as practicable.

Insects.—The Green-fly, or Aphis, and the Red-spider are the principal insects that infest house plants. The first is to be treated to abundant smoking with tobacco, and the other will soon be rid of if the foliage is thoroughly wetted every day.

Water only when the earth shows signs of dryness. More plants are injured by over watering than by too little water.

Bulbs will now be coming forward. Give plenty of light. Cut away the flowers as soon as they fade

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): $1.50 each for less than four copies: Four to nine copies, $1.25 each: Ten to nineteen copies, $1.20 each: Twenty copies and upwards, $1 each. Papers are addressed to each name.

DID IT PAY?

The other day we sent to one gentleman in Ohio: a beautiful $100 *Lady's Gold Watch*, a *Splendid Tea Set* of six pieces, a *Great Dictionary*, and a *Breach-Loading Pocket Rifle*—all as a present in return for 274 subscribers for 1870 which he had gathered in a brief time. Did it *Pay* him? Whether or not it paid us is our look out. We are doing such things all the time, and shall keep on doing so.* Will it pay those who subscribed $1.50 each to have this journal before them all the year? They thought so, and we shall take good care that it DOES.

This journal clashes with nothing else. It is all original and valuable to every person in City, Village and Country—NORTH, SOUTH, EAST and WEST—yes, EVERYWHERE. An intelligent Louisiana gentleman called to see if we could not get up an edition for the far *South*, leaving out some articles and inserting others on Southern topics. But after looking through several back numbers he could not find anything he would omit. We'll try and get in more special information for peculiar Southern crops, and modes of cultivation, as needed.

But the above is only one case. Splendid Premiums are going out daily to all parts of this country, and to other lands. There are in this country **27,107** Post-Offices, and wherever there are people enough for a Post-Office, there are enough to make up a large or small Premium Club—people, too, who would be benefited far more than its cost. It only needs some enterprising person to show and explain the paper, to get the names, and receive the premium free. Suppose YOU do it, reader.

Lack of money is a standard excuse from those asked to subscribe. But the price of one egg or two a week, produced or saved, will pay for the paper. Less than a pound of meat per *month*, or a pound of sugar, saved or economized, will do the same, while the household hints will help to economize many pounds, and will give better and more healthful food at diminished cost. A cheap cigar saved weekly will pay for the paper, while the hints about culture, etc., will secure better crops, by many dollars in value.

Reader, YOU can get a good premium for a little work. Try it. You may not get a large one at first, but you can "break ground" this year, and every copy now introduced will open the way for a great increase next year.

***EXPLANATION.**—Paper, press-work, and mailing, cost about $1 for each subscriber. 20,000 circulation (a very large one) leaves only $5000 for office, editing, engravings, etc., if subscribers average $1.25 each, including clubs. OUR 160,000 to 200,000 circulation leaves us $40,000 to $50,000 for collecting information, engravings, etc, and for *increasing the size of the paper as we have done*. We spend *all* the subscription money *on the paper*, and many thousand dollars more. The large circulation induces good advertisers to pay us enough to give the premiums, and have our profits left. More subscribers give us more advertising money, and thus we can give more premiums, and that gets more subscribers; and so we go on, and every body is benefited. All expenses of getting up and carrying on the Journal, (aside from paper, press-work, and mailing,) are not greater for half a million, than for half a thousand subscribers; so the larger the circulation, the more we can give for the money.

YOU CAN GET:

A Good Watch—Free of Cost—a genuine $40.00 American Waltham Watch, with heavy 3-ounce Hunting-case—a capital time-piece that will last through life, by sending 50 subscribers for the *American Agriculturist* at $1.50 each, or 150 at $1 each. (See No. 64 in Premium list, next page.)

OR—: A Lady's Gold Watch Free—a splendid article of Waltham make, sold usually for **$100** or more, and beautiful as a present to *any* Lady, by sending 110 subscribers at the regular price of $1.50 a year. Others have done so.

OR—: A Great Dictionary Free—the best in the world—containing **1854** great 3-column pages, with many hundred engravings, and giving every word in our language, correctly divided and spelled, with much information, by sending only 18 subscribers at $1.50 each, or 58 at $1 each!

OR—: A Sewing Machine Free—a first-rate one, your choice of three kinds; the best wife-saver, health-saver, money-saver, board-saver—much wanted in *every* house, by sending 60 to 70 subscribers (see table) at $1.50 each; or 240 to 275 at $1 each—easily obtained in most neighborhoods.

Or—: Good Seeds Free—forty varieties of first-rate *garden* seed, enough for almost any garden, (or, **100** kinds of beautiful *flower* seeds) delivered to you free: Only 13 subscribers at $1.50 each, or 37 at $1 each, will bring the seeds.

OR—: Splendid Breeding Sheep Free—either Cotswold or Southdowns, thoroughbred, raised by the best breeders. These sheep will multiply and diffuse their excellent qualities very rapidly, and one or more of them should be introduced into every neighborhood raising sheep: A club of 100 to 210 subscribers will secure one of them free! (See Nos. 13 to 20 in Table of Premiums.)

OR—: The newest and best Potato Free—two pounds of "Bresee's King of the Earlies," which is promised to eclipse even the Early Rose! Two pounds of these will soon multiply to a large stock. Only 5 subscribers will bring you a post-paid 2-lb. parcel of these new potatoes.

OR—: The best Pigs and Poultry Free—the best home-bred, and imported specimens; warranted pure by the reliable breeders who supply them for these premiums. Clubs of subscribers, numbering 22 to 66 names, will secure these animals without charge, and they are *worth* securing! (See No. 21 to 28 in Premium Table.)

Or—: A Washing Machine Free—the best one yet made: Send 21 subscribers at $1.50 each, or 70 at $1 each. Multitudes have secured this.

OR—: A $500 to $700 Shorthorn Bull Free—a superb, thorough-bred animal, from Jas. O. Sheldon's Herd, the finest one in the world—an animal that will soon increase the value of the stock in a neighborhood to the amount of many thousands of dollars. Let the farmers of any neighborhood combine and raise 425 to 580 subscribers, and own the bull in common: Or one person may raise the Club and he will soon derive a fine income from the animal. (See Premiums 1 to 3.)

OR—: An Ayrshire Bull Free—a fine thorough-bred animal raised by Wm. Birnie, which will soon show marked results in the improvement of the stock in a neighborhood: Send 120 to 210 subscribers at $1.50, all of which may be easily gathered.

OR—: The Best Clothes Wringer Free—one of the most valuable Housekeepers' Helps ever invented—one which will repay its cost every few weeks, and keep on doing so—both in saving labor and saving garments: Only 18 subscribers are needed to get this Clothes wringer free!

OR—: A Melodeon Free—one of the best made in the world, one of long-proved excellence—a delightful thing to have in the house, in the school-room, and in the church where an organ can not be afforded: Send 78 or 138 subscribers. (See Nos. 60, 61, in Table of Premiums, next page.)

OR—: A Superb Tea Set Free—six pieces, of splendid pattern, real substantial, durable double silver-plated,—not dressed up silver-washed stuff: Only 66 subscribers will secure this free!

OR—: An Alderney or Devon Bull Free—very fine thorough-bred animals, profitable to the owners, and they will add many times their cost to the value of the stock where they are used. A club of 120 to 365 subscribers will bring one of these animals. (See Nos. 7 to 12 in Premium Table.)

OR—: The Piano that Beats the World—(Steinway's of course.) One Lady secured *Five* of these, worth **$3,250.00**, between Sept., 1868, and July last, by sending subscribers to the *American Agriculturist*. Hundreds of other ladies may easily secure at least one. Hundreds of others may secure the lower-priced but excellent Colibri Piano. (See Nos. 62, 63, in Premium Table.)

OR—: Good Tools Free—not poor-tempered, iron things, but of the very best quality—a whole assortment of more than fifty pieces, just such as are really useful for yourself, and your sons, on the farm, and everywhere else, all in a neat chest, worth at the lowest rate $44.50 (No. 69): Send only 60 subscribers at $1.50 each, or 190 at $1 each!

OR—: Excellent Books Free—those for the Farm, Garden, and Household, your choice out of more than a hundred. A very little time in gathering subscribers will bring you several of these volumes delivered free. (See Nos. 100 to 112.)

OR—: Very Fine Table Furniture Free—Casters, Fruit Baskets, the best plated large and small Spoons, Knives and Forks, etc.,—all of extra make and quality, useful, ornamental, and durable. The Premium Table, Nos. 43 to 55,

will show how few subscribers will secure these valuable articles. Any Lady can get these subscribers almost anywhere! Or Gentlemen, or Boys can get the premiums to give as presents to others.

OR—: A Magnificent Cyclopedia Free—of sixteen great volumes, giving comprehensive descriptions of over **25,000** subjects, including every topic, person, place, and thing, you can think of, past and present—in short, a most complete and extensive Library in itself: All this will be presented in return for 96 subscribers!

OR—: First-rate Farm Implements Free—such as the Buckeye Mowing Machine, the Cylinder Plow, Collins' Cast-Steel Plow, Comstock's Hand Cultivator and Weeder—all very desirable, and easily obtainable. Many got them last year in return for odd hours and evenings spent in gathering subscribers, and thousands may get them this year, very easily, in the same way. (See Nos. 78, 79, 80, 81, in Premium Table.)

OR—: $20 Worth of Nursery Stock Free—whatever you may choose to select from Eastern and Western growers of positive reliability: Send 30 subscribers at $1.50, or 97 at $1 each.

OR—: Valuable Volumes of the American Agriculturist Free—for any year from 1857 to 1869. Each of these contain a great amount of information for the Farm, Garden, and Household. 13 or 16 subscribers secure 3 volumes in numbers, or bound, sent post-paid. (More at same rate—See Nos. 88 to 99 in Premium Table.)

OR—: A Free Pocket Knife—just the one you want, or your Boy, or your Girl wants—not a wrought or cast-iron affair, but a tip-top steel blade and beautiful handle "better than the 'Best!'"—Only 4, 5, or 6 subscribers will secure one of these! (See Nos. 56, 57, 58 in Premium Table.)

OR—: First-rate Family Scales—(Fairbanks' of course,) delicate enough to weigh half an ounce, and large enough to weigh yourself if you don't exceed 240 lbs! "A very handy thing about the house" is such a pair of scales. Only 21 subscribers will secure the scales! (Premium 83.)

OR—: A Free Gold Pen—that will write beautifully for years—a genuine one, in a real coin-silver case for the pocket, with ever-pointed pencil. Only 11 to 14 subscribers needed to get one of these fine pens. (See Nos. 72, 73, in Premium Table.)

OR—: OR—: OR—: A Great Many Other Good Things Free—"too numerous to mention," such as are named in the Premium Table, Nos. 30, 35, 39, and last, not least, No. 85, to light your way! Every thing offered is very good.

SEE "Special Notes" in 3d Column.

For Full Description of all the *above* Premium articles, see our last October paper, or send for free "*Descriptive Sheet.*"

[In the following table is given the price of each article, and the number of subscribers required to get it free, at $1.50 a year, *or* at the lowest club rate of $1 a year. For full descriptions of the articles send for our *Special Sheet.*]

Table of Premiums and Terms, For Volume 29 – 1870.

Open to all—No Competition

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required at $1.50	Number of Subscribers required at $1.
1	*Shorthorn Bull*	$500 00	425	1250
2	*Shorthorn Bull*	$600 00	500	1700
3	*Shorthorn Bull*	$700 00	580	1700

☞ *Every Premium article is new and of the very* **best** *manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-nine Premiums,* **Nos. 29** *to* **33, 56** *to* **59, 70** *to* **74,** *and* **88** *to* **112** *inclusive, will each be delivered* FREE *of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.*

SPECIAL NOTES.

Read and carefully Note the following Items: (*a*) All subscribers sent by one person count, though from one or a dozen different Post-offices. But....(*b*) State with each name or list of names sent, that it is for a premium....(*c*) *Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.* You can have any time, from one to four months, to fill up your list....(*d*) Send the exact money with each list of names, so that there may be no confusion of money accounts....(*e*) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N.B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for....(*f*) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(*g*) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of them is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

Description of Premiums.

Every Premium is described in the October Agriculturist, and also in a **Special Sheet,** *which will be sent* **free** *to every one desiring it. We have room here for the following only:*

No. 84.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequaled. The Blocks are put up in neat boxes, accompanied by a large hand-bill giving various designs of buildings. This is one of the most successful toys ever invented.

Nos. 88 to 93.—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is $1.50 each, at the Office, or $1.75 if sent by mail, as they must be post-paid.——They are profusely Illustrated, the Engravings used in them having alone cost about $35,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from XVI. to XXVIII., inclusive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 94 to 99.—Bound Volumes of the Agriculturist.—These are the same as Nos. 88 to 93 above, but are neatly *bound* in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 100 to 111.—Good Libraries.—In these premiums, we offer a choice of **Books** for the **Farm, Garden,** and **Household.** The person entitled to any one of the premiums 100 to 111 may select any books desired from the list of our book-published monthly, (see another page), to the amount of the premiums, and the books will be forwarded, Post or Express paid. $25 or $50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands.* Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. ☞ Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 112.—General Book Premium. Any one sending 25 or more names may select Books from our published list to the amount of 10 cents for each subscriber sent at $1; or 30 cents for each name sent at $1.20 each; or 60 cents for each name at $1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Dec. 14, 1869, and for the corresponding month last year.

Gold has been as low as 121, but rallied to 123¾ closing at 121½. Breadstuffs have been arriving freely, more so than during any preceding month of the season, and prices have been further depressed, influenced in part, by the decline in gold. At the reduced figures, there has been a restricted business transacted. Export buyers have been purchasing less freely. There has been a moderate home trade movement. Some speculative inquiry has been noted for low grades of Flour, spring and amber winter Wheat, mixed Corn, and Barley. The general market has shown a little more steadiness toward the close, but has been without remarkable animation..... Cotton has been more sought after, and, on the whole, firmer. The available supply here has been quite limited. .....Wool has been in slack request at drooping rates. The auction sale of the 9th inst. was not very successful, though the prices realized were up to a fair average of the open market rates for grades, similar to those offered at auction.....Tobacco has been quite dull, at about former quotations... ..Provisions have been in moderate demand at irregular figures.....Hay has been held with more firmness, since the closing of river and canal navigation, but has been quiet.....Seeds have been quoted stronger in price, but have been slow of sale. .....Hops have attracted less attention, and prices have favored buyers.

There has been a constant decline in the supply of beef cattle since our last report. Instead of an overstocked market, we have a light and lively one. Prices have not advanced from week to week, as many drovers anticipated, and much of the stock was bought too high to allow the owners to realize a large profit. The quality of the stock has much improved for the last two months, and now it presents a fair average. Leaving out a large proportion of Texan stock, the average quality would be called good. The lean Texan cattle are far too plenty, and sell at too low a figure to place the average price high enough to be an indication of the value of good Ohio and Illinois Steers. Butchers still complain of dull trade, and are desirous of buying in small lots only, and of the best. Good fat bullocks sell quickly, at a little advance on last month's prices, while thin, bony Texans fall a little below. Below is the list of prices, average price, and figures at which the largest lots were sold.

There has been quite a quantity of dressed beef and mutton brought from Chicago and sold in our market. The freight on dressed beef is much less than for the same alive, and it sold cheap, the owner getting from 7@9c. per pound by the quarter or side. This fact, together with an abundance of cheap poultry, had its influence on the market price of livestock, so that really the advance is not so much as the diminished supply would indicate. We place the advance at about ½c. per pound, since our last report, on good grades, and none on medium or poor cattle....**Milch Cows.**—The demand has been quite lively in this department, and better prices are paid for fresh cows. The light run of beef enabled city milkmen to sell their dry cows for nearly enough money to purchase fresh ones. The very best of each market sold for $100 each, and upwards, including the calf. Good cows range from $85@$95; medium, $65@$80, and poor ones all the way down to $40 each. ....**Veal Calves** have been less plenty, and prices are fair. Fresh, young calves, if fat, sell quickly; but if poor, and have been kept long from the cow, much less is offered for them. "Hog-dressed" calves have come in quite plenty during the cold weather, and influenced the market somewhat. Fat calves are scarce, and go quickly at 12½c@13c. per pound. Common, 10c@11c. Grass-fed, from 4c.@6c., live weight. "Hog-dressed" sell from 8c.@18c., according to quality and condition... **Sheep.**—We notice but little change in the market. Both sheep and lambs are plenty, and, we ought to add, poor. What our butchers want are large, fat sheep, and we wish our farmers would learn this and send good mutton sheep to market. A sheep that weighs 120@130 pounds will sell a great deal more quickly at 7c.@8c. per pound than one that only weighs 60 pounds will at 4c.; and a difference of $5 or $6 upon a sheep is something. Prices for the past month range from—Extras, 6½c.@7½c.; Medium, 5c.@6c., and poor at 4c. or less per pound....**Swine.**—There has been an advance in price since our last report of about ½c.@¼c. per pound. The trade has been quite lively, and supply good. The quantity of "Western-dressed" has been quite enough for the demand, and sell for from 13c.@13½c. City and "Up-River dressed" bring 13½c.@15c. per lb. Live hogs sell for 10c.@11c. per lb.

Nurserymen and Seedsmen.—A list of the principal dealers in all kinds of horticultural stock will be found in the Horticultural Annual for 1870.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, *paid in advance*, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss.*

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe*, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters thus sent to us are at our risk.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

The "Peach Grub Man."—L. E. K. of St. Joseph, Michigan, says of the "Peach grub man:" "He has been around here selling a private plan for keeping grubs out of peach trees, which seems nothing more nor less than banking up the earth around the collar of the tree ten or twelve inches high in June and leaving it there until freezing weather in the fall. Yet simple as it may appear, it would seem by his subscription list that he has carried off a considerable amount of money from these parts. The dose was administered at various prices, varying from 8 to 20 dollars according to the number of trees owned by the victim. The same plan has long been in use I believe by some of our good cultivators. Now it strikes me that it is bad enough to have our trees injured by the grubs themselves without having them attacked by a human vampire, who has filched the experience of others and then bartered it as his own for gold or greenbacks." L. E. K. evidently takes the papers, and is not to be caught.

Sundry Humbugs.—We are obliged to begin this year with a continuation of the same work that has cost so much time, investigation, and annoyance for many years past, viz., the exposures of the operations of the swindlers who prey upon the simple and unsuspecting, and very often upon intelligent people. Farmers, as a class, are subject to the attacks of these thieving operators, because, being honest themselves and accustomed to deal honestly with each other, they more naturally trust to the representations of others outside their own circle. We have abundant reason to know that the warnings and explanations of the *American Agriculturist* have saved many millions of dollars to its readers, and through them, to a multitude of others. Yet there is so large a class who do not yet read this paper, or come within the influence of those who do, that the swindlers still find their operations remunerative, though greatly less so than they would if this journal could be bought off or frightened off—a thing very often attempted. Unwilling to advertise or give notoriety to these parties, or to give them the credit of pretending to justify their operations, we never publish any accounts of their various law suits *commenced* against us, though they are frequent. We should fear we were not doing our whole duty to our readers if there were not more or less suits pending against us by those whom we have daguerreotyped in these columns. It would be unfortunate should this class ever come to speak well of us. .....To our new readers let us say that the names and Post-Office address of nearly every man having a settled residence in this country, and also of most unmarried young men and women, including multitudes of boys and girls from 10 years old upward, have been obtained by various parties, in one way and another. These names are kept on lists, from which copies are purchased by the swindling operators—often under false pretences, as that they wish to send out specimen copies of news-

papers, or advertisements of good new articles. We have been offered large sums simply to let names be copied from our mail books, ostensibly for legitimate business purposes. (Of course we have never allowed a single name thus to go out, under any circumstances. Even our old business letters, when no longer needed, are so thoroughly "hashed" in a cutting-box that no names can ever be deciphered.) The above explanation will diminish the wonder so often expressed as to "how did the swindlers get my name?" They get it from some one of these "lists" that have been gathered by those who make a business of this very thing.....Several large bundles of recent letters before us refer to parties shown up during the past four months, such as Wogan & Co., Noyes & Co., J. M. Blake & Co., Gumbridge & Co., Kohl & Co., Sayre & Co., Todd & Co., Harris & Co., Andrews, Michelin & Co., etc. Any one receiving circulars from these are referred to our previous numbers.....Wogan & Co., like many others of their ilk, "caught a Tartar" in Mr. Jas. Gayler, special U. S. Mail agent, and editor of *The Mail*, who is doing excellent service in prosecuting the harpies, and interfering with their use of the mails. Large numbers of letters recently sent to Wogan & Co. will go back to the foolish writers through the Dead-letter Office, to which they have been consigned, thanks to Mr. Gayler. Calvin Willis is boarded at the public expense (in State's prison), besides being fined, for sending indecent publications. That boarding-house will have several new patrons soon, if justice be done. .....David M. Clinton's "Great Dollar Sale" at 234 Broadway we vainly hunted for from cellar to attic. The inevitable Todd was found to be getting the letters for that name. That game has been stopped.....W. H. Clement & Co., No. — Canal street, and Porter & Co., Janncey Court, are after the money of those who are inclined to deal in counterfeit money, with their "fac-similes" (*little* photographs) of U. S. Treasury notes, greenbacks and currency, put up in boxes of rubbish.....Lotz & Co., No. — Broadway, and J. P. Waters & Co., on Broadway, are in the same line—the same as Gumbridge, Wogan, Blake, etc .. ..G. W. Harris & Co., have a crafty dodge. They pretend to be "Receivers," trying to settle up the affairs of Wiggins, Bradford & Co., and to have $200 Gold Watches to deliver to those who pay them 5 per cent ($10.00) for expenses. Sundry merchants and others of this city tell us they have had remittances of them, sums of $10 each, from country correspondents, wishing them to get and forward the said $200 watches—a certain proof that the green-horns and trusting people are not all dead yet....."Music Boxes" are offered by sundry parties in Liberty street and elsewhere through circulars. They put in engravings of genuine boxes, and offer them, apparently, for $2 to $5 each; but when they get your money they send you a little mouth organ worth a dime or so, on which you can play as many "tunes" as you know how.....Our space is full, and we must wait until next paper for further reports.

Water Rams.—"W. W." of Howard Co., Md., writes: "I have a spring of excellent water about one hundred yards from my dwelling and thirty feet lower discharging between 30 and 40 gallons per minute and having in a descent of 60 feet a fall of about 10 or 12 feet. Under such circumstances would you advise the use of a Ram for conveying this water to my dwelling? Would it (the Ram) be likely to get out of order?"—In this case a water Ram would be just the thing to keep a cistern filled with water in the attic of the house, and the overflow would make a fountain in the garden. We know a case where a ram has been running steadily 20 years, needing occasional repairs, which rarely required a plumber.

Small Fruits in 1869.—See a full report, by A. S. Fuller, in the Horticultural Annual.

The American Agricultural Annual for 1870 (152 pages, 12mo).—This little volume, like its predecessors, is a farmer's hand-book, which, besides containing a complete Almanac and Calendar of operations for every month, reviews briefly the past year, notices the important inventions respecting agriculture, contains lists of the agricultural and kindred papers of North America, of agricultural books published within the year, of the chartered agricultural schools of the United States, etc. One of the most important and useful features of this Annual is a Farmer's Directory, giving the names and addresses of nearly 1,000 individuals or firms in the United States and Canada, manufacturers or dealers in Agricultural Implements of various sorts, Seeds and Fertilizers, and Breeders of improved stock from Horses to Trout. Besides this, the following subjects are discussed at some length, and many of the articles are beautifully illustrated with *original* engravings: Adobe Houses; Potatoes worth Raising, by D. Hexamer; Care of Hen and Chickens; Root Crops and their Culture, by Joseph Harris; Dry Earth in the Barn; Characteristics of different Breeds of Stock; Progress in Fish Culture; Fish as Farm Stock, by Wm. Clift; English Agricultural Implements; Progress of Invention as affecting the Dairy business; Notes on Veterinary Subjects; Coöperation in Swine Breeding, by Dr. Calvin Cutter; Experience in Steaming Fodder for Cows, by S. M. & D. Wells. Published by Orange Judd & Co., in cloth and paper, price 75 and 50 cents.

Death of B. D. Walsh.—Mr. Walsh has long been known as an active Entomologist and most of the Agricultural journals in the country have been enriched by his contributions. Of late he has been the State Entomologist of Illinois and one of the editors of the American Entomologist both of which places he filled with marked industry and vigor. Mr. W. was an Englishman by birth, but came to this country early in life and settled in Illinois. His death, at the age of 62, was the result of an injury received while walking on a railroad track and occurred on the 18th of Nov. last.

The New Apples and Pears are described and figured in the Horticultural Annual for 1870.

Seed Peas.—One of our large seedsmen has sold all his stock of old seed peas to a dealer in "Pure Java Coffee." This is good news for buyers of seed peas. The drinkers of coffee may draw their own conclusions.

Report of the Department of Agriculture for 1868.—This volume reaches us just as the paper goes to press and we are able to do a little more than to acknowledge its receipt. Upon running it over we find a conspicuous absence of articles spun out against space by obscure penny-a-line writers. Besides, the reports of the Commissioner and his assistants, there are papers upon Grape culture, Culture of the Peanut, the Potato, Osage Hedges, Esparto Grass, Nim of Yucatan, Bee Keeping, Silk Culture and many others. While commending the general appearance of the volume, we must advise the Department or the Printing Bureau to get a new proof reader, as its use of capital letters is against all accepted rules, and a blemish to the work.

Dicentra and Dielytra.—J. L. Mock, Petaluma, Cal. We have stated, we cannot tell how many times, that the word "Dielytra" came into use through a misprint of Diceatra, the botanical name for Bleeding Heart. Florists will probably call it Dielytra until the present generation dies out.

Our Circulation in the SOUTH is rapidly extending, and is now threefold greater in the Gulf States than it was before the war. We shall try to meet the wants of all sections, and we solicit hints and suggestions from the South. An intelligent gentleman from Louisiana called upon us recently, to propose having a special edition of this Journal for the Southern States, prepared by substituting, for a part of the paper, articles designed only for those States, but after looking carefully through several numbers, he could find nothing to be spared, and nothing that would not be useful to that section of the country.

Peaches and Cherries.—F. R. Elliott describes and figures the new ones that have appeared in the Horticultural Annual for 1869.

Special Premium.—The Elegant Picture "Dandelion Time." By Mrs. Lilly M. Spencer.—The name of Mrs. Spencer has become familiar throughout the country. Though of a poetic imagination, and the author of many paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. The publishers of the American Agriculturist have purchased of her the beautiful painting called "Dandelion Time," and having issued it as a chromo, it is now offered by them for sale. But in response to requests from many who desire to secure the picture without paying money for it, we have consented to offer it as a special premium for subscribers.

In this elegant picture, three children, of whom the youngest is a plump, rosy babe, and a huge Newfoundland dog which they have decked with a dandelion wreath, are represented out at play upon the green grass. The scene is full of happy life and cannot fail to delight both old and young. The picture would prove an ornament in any home, and be a most beautiful and acceptable present to make to a friend. It is 13 by 18 inches in size, and mounted on linen will be sent by mail, in a tube with all materials and directions for stretching. Price, post-paid $6.00. We will send it in this form, for 10 subscribers at $1.50 each or 30 at $1 each. The price of this picture in a neat black-walnut frame, gilt band, is $9. For 15 subscribers at $1.50 each, or 45 at $1 each, we will send it in this style by express, carefully boxed, *the receiver to pay express charges.* See advertisement on p. 30.

The Cover.—Aside from the illustrations upon the inside of the paper, we have each month given upon the cover a carefully engraved picture in the center, with neat corner pieces, each month. The engraving presented upon the cover of the present month is interesting on two accounts. It shows the style of plow and team in use in Germany, and it is from an oil painting, executed by a lady over 70 years of age, and sent to this country as a present to her little grandchild.

Good Premiums in abundance, and of real value, are offered by the Publishers, and they are coming to be more and more appreciated. It is quite an easy matter for any one to secure a good article with but a little effort. Look over pages 4 and 5.

Study the Advertising Columns.—We often take up a daily or weekly newspaper and carefully read all the Advertisements through, and never do this without getting some useful information. One learns what business is being done, and how it is done—what is for sale, and by whom. *Our* business columns are of especial value, because of the care taken to exclude all advertisements from parties not believed to be honest. We mean to advertise for no parties who have not both the ability and intention to do all they promise. In order to please advertisers, we repeat the request that those sending orders, or for circulars, etc., to our patrons, will mention *where* the advertisements were seen. We also like to have advertisers thus get some idea of the large number of intelligent and enterprising people they find among our readers.

New Flowers.—Notes on new flowering and ornamental plants, with beautiful engravings, in the Horticultural Annual for 1870.

The Cylinder Plow.—"C. T. M.," Beulah, Miss. The Cylinder Plow so well spoken of in 1861, is still manufactured and is as good as ever, probably much better than it was then.

To Advertisers.—Please send in business notices early. It takes a good deal of time to print our immense edition carefully, with its numerous engravings, which are necessarily worked with slow speed. Please remember that our rules require good evidence of responsibility and reliability from advertisers unknown to the editors personally, or by good reputation. No "Patent Medicines," or advertisements deceptive in form or matter can be received at any price. By living up to this rule we shall make our business columns doubly valuable to the reader, and to the advertisers who are admitted. The fact of their notices appearing here is thus a recommendation. With this fact in view, and our immense circulation, we are glad to know, and to be assured by our oldest patrons, that our terms, high as they may seem, are really the lowest in the country.

Hawk and Owl Traps.—Abe Harrison of York, Ill., writes: "To catch Hawks or Owls, take a pole 20 feet long, to be set a short distance from the house or barn or on the poultry house. Split the top so as to admit the base of a common steel trap, which should be made fast. When both trap and pole are set you may be sure of game of some kind. These birds naturally light on high objects such as dead branches of trees or tops of stacks, and one should use judgment about the place where he puts the traps. An open field, near the chicken yard, is probably best.

Leucothoe racemosa.—Rev. J. H. Brakeley writes: "I noticed in your September number, in an article on the *Leucothoe racemosa*, a request for the common name of this beautiful plant. In visiting Dr. Trowbridge, of Tom's River, N. J., a few weeks since, he pointed out this plant to me as the favorite food of a caterpillar of considerable size, which had destroyed some of their cranberry vines. He called it *Kill-calf*. I recognized it at once as the *Andromeda racemosa* of my early botanical days. The Doctor had observed the moth depositing the eggs, and had noticed that the young larvæ would not attack the cranberry vines until they had first destroyed all the foliage of the *Kill-calf*

Early Rose Potato.—The Most Yet.—Mr. Cornelius Simon, of Bloom, Ohio, says: "I took just one lb. of Early Rose, (four tubers), and cut them in pieces, (about 50), one eye to each piece, and put them in a box to sprout about the 1st of May. Transplanted the sprouts (about 260) between the 1st of June and the 4th of July, in a rich sandy soil in rows two feet apart, putting one sprout every foot in the rows, and produced by actual weight, 751 lbs. of good and large potatoes. The largest potato weighed two lbs. seven oz. From the best hill I got six lbs. four oz. From a piece of ground 16x18 feet, I dug 385 lbs.; at the rate of about 760 bushels per acre.

Money at Six Per Cent.—An Iowa farmer writes us: "I see money quoted in your city as being in good supply at 6 per cent. I want to lift a mortgage on my farm of $1,000, on which I am paying 10 per cent, the current rate here. I send you my note for that amount at 8 per cent, payable in one and two years. I am responsible, having a farm of 160 acres, worth $40 an acre, and no debts but the above."—Money is frequently abundant "*on call*" at 6 per cent, and often lower; but in *all* these cases it must be fully secured by collaterals that can be sold at once for cash, if the loaned money is not promptly returned on any day that it is called for, and small loans seldom lie, on an average, over three or four days. A broker having $50,000 or $100,000 on hand Saturday, will often loan it over Sunday at 3 to 6 per cent if Government Bonds or other securities are left in its place. The best short time (60 to 90 days) double name or endorsed notes, sell at rates to bring double the interest of call loans; while unendorsed notes of men worth their tens and scores of thousands of dollars, running two to six months, are sold at rates that will make them yield 15 to 20 per cent interest. The banks, being limited by law to 7 per cent, lend money on well endorsed notes, of three months or less, to their customers who constantly have balances deposited with them. Our Western friends, who so often send to us to borrow some of this cheap money for them, will thus see that for notes running beyond three months, the rates are quite as dear in New York as anywhere else. People keep their money moving here, and only lend temporary balances at low rates, on call, with cash collaterals as security. Certain Government and State Bonds are taken and held at lower rates of interest, because they always bring cash when wanted, or can be used as collaterals.

Large Yield of Small Grains.—Daniel Witter, Esq., of Denver, Colorado, sends us a statement of T. G. Anderson, the owner of the acre of oats to which the prize of the Colorado Agricultural Society was awarded. Common black oats were sown broadcast, being simply worked in with a 7-toothed cultivator. The ground was not even plowed, and the yield was ninety bushels, sworn to. He sends also a statement of the crop of wheat which did *not* take the premium. Sixty-five and one-half bushels of "Arnautka" wheat were raised upon one acre. This variety is hard and flinty, and not being considered worthy to compete with better kinds, no premium was given for the crop.

Single or Double Lines in Plowing.—L. N. Hager, of Nevada, writes: "This thing of single lines on a farm team is a humbug. I have tried single, double, and side lines, with heads tied together, and have settled down to using double lines altogether except when using four or more mules or horses in one team. The jockey stick on a high spirited horse is a nuisance; and no man can do good harrowing with a single line and a contrary horse on the off-side. As to right or left-handed plows, it is six of one and half a dozen of the other."

More about Chess.—J. K. Hiner, Anderson Co., Kas., positively asserts that when heads of wheat are bent down and covered with hay, or other material having no chess in it, chess will spring from the grain. We have no doubt Mr. H. thinks so, but we do not.

A Horse Saved.—Jas. R. Bruner, Litchfield, Ky., writes: "In looking over the Sept. 'Walks and Talks on the Farm,' I noticed that the writer speaks of a stick in a horse's throat. I read it to my brother, who had a mare which he said had had the sore mouth, or sore tongue, for nearly three weeks, but he knew not what to do for it. I asked him if the description was applicable to his mare, and he said that a portion of it was; so he went this evening and examined as directed by the writer, and found a corn cob, about 1 inch in diameter, and 2⅞ inches in length, fast in her mouth, cross-wise, just behind her teeth, at the root of her tongue. With some difficulty he removed the cob, and she probably will be well in a very short time. He said that he never should have thought of the cause but for this article.

Corn at 50c; Potatoes at 25c.—Levi Clark, St. Joseph, Mo., inquires in regard to the relative economy of using corn or potatoes for fattening hogs—corn being worth 50c. per bushel and potatoes 25c. According to an average of the best analyses we can get, dry corn contains about 12 per cent of water; potatoes 75 per cent. Corn contains 62 per cent of starch, fat, gum and sugar—all digestible and fat-producing; potatoes contain 17 per cent; corn contains about 9 per cent of albuminous, commonly called nutritious substances; potatoes contain about 3 per cent. The ratio of albuminous to fat-producing matter in corn is about 1 to 7; in potatoes about 1 to 6, giving the advantage to the *dry* substance of potatoes over the dry substance of corn. A legal bushel of potatoes in Missouri is 60 pounds. This contains only 15 pounds of dry substance, the rest (75 per cent) is water. A bushel of shelled corn in Missouri is 56 lbs., of which over 49 lbs. is dry substance, nearly 7 lbs. of naturally dry corn being water. At the prices above given, and according to the analyses consulted, one buys for the same money in the shape of corn 3½ lbs. of nutriment and 17½ lbs. of fat-producing matter; in the shape of potatoes, 2½ lbs. of the one and 12½ lbs. of the other. To make them equally economical for feed when corn is worth 50c. per bushel of 56 lbs., potatoes should sell for no more than 17c., and probably less, judging by their analyses. However, the best analytical results are not a perfectly sure guide, though they do not lead us far astray. The digestive powers of different animals vary greatly, and the form in which nutriment is presented is important, and this makes a difference in value which can only be ascertained by patient experimental research. Thus, cooked potatoes present the nutriment in a more digestible form than uncooked corn, and ground corn is more digestible than raw potatoes.

Sign Your Name.—At the commencement of a new volume, when we have many new readers, it is necessary to repeat the request that all letters should contain the writer's signature. No one is under any obligation to notice an anonymous letter, and with our correspondence it is frequently to the disadvantage of the writer if the name is not signed. We do not take up space in the paper to publish answers which are of interest to only one person. We have several inquiries which we should willingly answer by mail had the writer seen fit to give his name; as it is, they must go into the waste basket. Some one in Missouri sent a lot of greenhouse plants for name: the reply interested him alone, but as he withheld his name, we did nothing about them. As we have not space to print nearly all that we should like to, matters of private interest must give place to such as are likely to be useful to a number of readers.

Fruit in Michigan.—S. J. Fowler, Hillsdale, says: "Grape growing has just begun in this vicinity, and it promises entire success. My vines—a dozen varieties—have all made a vigorous growth during the past season. Three-year-old Delawares, Concords, and Hartfords, have borne abundantly, with no signs of any disease about the vines or fruit. Rogers' No. 15 and Dianas grew rampantly, but bore only straggling clusters of good fruit. Rogers' No. 4 yielded compact clusters of excellent grapes. The success of the Iona is yet a little questionable. The fruit is of first quality, and abundant upon old vines, but young vines are not very hardy. The Kittatinny is the choicest blackberry yet raised here.

Hard on the "Farmers' Club."—The talkers at the N. Y. Farmers' Club have been bewailing the loss to the country of a million of bushels of corn, which they imagine to have been due to the advocacy by some of the members of shallow plowing. The deep plowers pitched into the shallow ones, and told them how very wrong and wicked they had been to preach shallow plowing, and cause the loss of so much corn in the Southern States. The American Farmer, Baltimore, Md., irreverently says that the corn was lost by the drouth, and not by shallow plowing, and that "the people who are supposed to have suffered especially by the drought, have not let up their plows the ninety-ninth part of a hair for any influence the Club has had upon them. They know very little, and care much less about the utterances of the notional gentlemen who hold forth at their weekly meeting."

Plum on the Peach.—"J. T. S." Hannibal, Mo. The plum has sometimes been worked on the peach, and on sandy soils the trees have succeeded, but the process is not one that is to be commended as the results are uncertain. We do not advise working any trees on "small pieces of the root." It is generally condemned by good cultivators.

Influence of the Stock upon the Graft.—Mr. H. Conklin, Morristown (no State), grafted two choke pear trees with cions from the Beurré Bosc all from the same tree. One of the grafted trees produces regular Beurré Bosc pears, and the other, fruit of different shape and unfit to eat. The drawings of the two fruits sent are quite unlike.

Cauliflower Seed.—S. N. Blakeley, Glenwood, N. Y. Cauliflower seed requires more care than private growers like to give it, and it is safer to buy of those who make a business of raising it. The seed is sown late, and the partly grown plants are set in a roofed pit or frame, where they are protected until spring, when they are set out, come into flower and produce seed.

Please Speak of the German Edition.—Some of our readers may not know that an edition of this paper has long been printed in the German language. It contains the engravings and principal articles of the English edition, and, in addition, a special Department, edited by Hon. Frederick Münch, a practical cultivator of Missouri. Though this German paper has a far greater circulation than any other similar journal, there are tens of thousands of new comers from Germany who would doubtless be profited by its perusal. The terms are the same as for the English edition, and clubs may contain names for either or both editions.

Notices of Books Received.

German Handwriting, F. Abn. N. Y.: E. Steiger.

Manual of the German Language, by W. Grauert. N. Y.: E. Steiger.

Elements of Astronomy, by Elias Loomis, L.L.D. N. Y.: Harper & Brothers. 8vo., pp. 224. $2.

The Philosophy of Teaching. The Teacher, the Pupil, and the School, by Nathaniel Sands. N. Y.: Harpers.

Handbook of Chemistry for School and Home Use, by W. J. Rolfe and W. J. Gillet. Boston: Woolworth, Ainsworth & Co., who also publish

Handbook of Natural Philosophy. By the same authors.

The Polar World.—A popular description of Man and Nature in the Arctic and Antarctic regions of the Globe. By Dr. G. Hartig, N. Y: Harper & Bros., pp. 486, 8vo; $3.75. This work presents at one view the peculiarities of polar life and condenses in a single volume the observations of many different explorers. The American editor has added a chapter on Alaska and another which embodies Capt. Hall's experience among the Esquimaux. The work is abundantly and beautifully illustrated.

Wild Sports of the World.—A book of Natural History and Adventure. By James Greenwood. N. Y.: Harper & Bros., pp. 474, 12mo; $2.50. This is a capital work for boys for whom stories of wild animals always have a great charm. The author has collected together stories of the great hunters and gives us interesting accounts of the chase of wild animals from the elephant to the fox, and illustrated these with engravings.

Haydn's Dictionary of Dates, Relating to all Ages and Nations, for Universal Reference. Edited by Benjamin Vincent, and revised for the use of American Readers. N. Y.: Harper & Brother, pp. 541, 800; $5. This is a condensed cyclopedia of important events in the world's history and while it is easy to point out many omissions it would be difficult to find a work so useful to both writer and reader.

Life of Daniel Webster, by George Ticknor Curtis, one of his Literary Executors. N. Y.: D. Appleton & Co., pp. 589, 8vo. The Appletons have produced this work in a style worthy of the subject and the author.

Lost in the Jungle.—Narrated for Young People, by Paul du Chaillu. N. Y.: Harper & Bros., pp. 260, 12mo.—$1.75. The celebrated African traveler, Paul du Chaillu, always interests the young people by his lectures and now he has put some of his adventures in a book form for them. It is well illustrated.

Rhetoric.—A Text-Book, designed for use in Schools and Colleges and for Private study. By Rev. E. O. Haven, D. D., L.L.D., N. Y.: Harper & Bros., pp. 381, 12mo. $1.50. The author, who was for some years president of the University of Michigan, has invested his subject with much interest by the use of judiciously selected examples.

Trees, Plants and Flowers—Where and how they grow, a familiar history of the Vegetable Kingdom. Philadelphia: J. B. Lippincott & Co., pp. 140, 12mo. $1.00.

We cannot regard this as a successful attempt to popularize botany.

Washington's Words to Intending English Emigrants to America. With an introduction and Appendix by Elihu Burrit. London: Sampson Low, Son & Marston, pp. 112, 12mo. Mr. Burrit is interested in the International Land and Labor Agency, Birmingham, which is intended to aid the English emigrant, and this little work is published with the view of affording compact information in respect to the various States. The letter of Washington written to Sir John Sinclair in 1796, gives his views of the few States in existence at that early date, and Mr. Burrit gives his own impressions of these and others.

Old Testament Shadows of New Testament Truths.—By Lyman Abbott, author of Jesus of Nazareth, his life and teachings, etc., N.Y.: Harper & Bros., pp. 213. Crown 4to. Beautifully executed in press work, binding, and engraving. The illustrations are from designs by Doré and others.

Odes and Epodes of Horace.—A metrical translation into English with Introduction and commentaries by Lord Lytton, N. Y.: Harper & Bros., pp. 521, 12mo.

Bound to John Company, or the adventures and misadventures of Robert Ainsleigh. Harpers. Paper. 75 cents

Trees and Rabbits.—A. S. Proctor, Peoria Co., Ill., sends the following, which, though not altogether new, is worth repeating at this time: "Cut straight corn-stalks, long enough to reach higher than the rabbits can; stick them into the ground around the tree, and tie the top with twine. The protection is perfect; it never fails. This plan is very expeditious, and costs nothing but a little labor and twine."

Wisconsin Horticultural Society.—The Annual Meeting will be held at Madison, on the first Tuesday in February, and continue for two days. The Secretary, O. S. Willey, sets a good example to other secretaries of such societies. We received his announcement of the meeting in December, and extract from it the following: "First, we don't want any one to say he did not have a timely notice. Second, we want every body to know that there is a Wisconsin State Horticultural Society, and that its members, and all interested in fruit growing, either as a luxury or profession, are invited to be present and participate in its discussions, or at least to add their mite by way of encouragement by their presence. Third, we want any one who has raised any fruit, and still has it on hand, to have this timely notice, that they may have some of their fruit still farther kept, and send or bring such samples as will add a share of interest to the occasion," etc.

Hedging.—An article upon Hedges for the West, by our Iowa contributor is unavoidably put over to another month. It is by a practical hedge-grower and will answer several who have inquiried about hedges.

European Larch.—Most nurseries keep these in moderate supply. Those who have seedlings in quantity should advertise.

The Kittatinny.—This Blackberry seems to do splendidly in Iowa, to judge from a photograph of a cluster sent by B. Larned of Eddysville.

Opium.—G. D. Cramer and others. We have no evidence that opium has yet been made in this country. An extract of the poppy plant, a very different thing, was exhibited as opium. This was subjected to analysis, and found variable, and of poor quality. The opium excitement started in Vermont, and its apparent object was the sale of directions for poppy culture. If any one can furnish us reliable information upon the subject we shall be glad to receive it. Opium is not, as many suppose, to be made by pressing the juice from the poppy and evaporating it. It is the dried milky juice which exudes when the unripe seed-vessel of the poppy is carefully scarified. In India each head only yields about two grains, and we doubt if at the present prices of labor and our uncertain climate it can be made to pay. It is, however, a good field for experiments, and we would like to hear of something more reliable than the newspaper accounts heretofore published.

Fine Grapes.—Wm. Hamilton, Gardener for Wm. Hoyt, Stamford, Conn., has been very successful with his vinery. The cluster he sent us attracted much attention and—we are sorry to say it—proved too much for some fingers.

Peaches.—"W. L. S." Currituck Co., N. C. It is customary to plow the orchard after the fruit is gathered and cultivate it as long as weeds grow. We do not see how it can affect the starting in the spring. A mulch put on after the ground is frozen, might retard the buds somewhat, but not much. The buds being exposed to the influence of spring will be apt to start without much reference to the condition of the soil.

Vines in an Orchard.—J. B. asks if we would advise planting grape vines or raspberries in a peach orchard where the trees are 15 feet apart each way. —Decidedly not. Annual hoed crops may be grown and the breadth given to them diminished until the third year, after which they should be stopped and all the ground given up to the trees. Grape vines will be well established about the time the orchard comes into full bearing, and each will be in the way of the other.

Rabbits, Mice and Trees.—Dr. M'Cannell, Adams Co. O., finds that a mixture of asafœtida and soap, painted upon the bark of trees, will preserve them from the attacks of rabbits and mice. Will the Doctor kindly give us the prescription, as he has forgotten to say what proportions he has found best, or the form in which the asafœtida is used.

Swindling the Nurserymen.—A well-known dealer writes: "Last spring, a man in Ohio issued circulars stating he wished to purchase a certain amount of small fruit stock, as he was going into the berry business. He sent these circulars through the country, asking nurserymen to bid for filling the proposals, reserving to himself the right to accept all or any part of the bid. In time an answer came, stating, 'Your proposal has been accepted for a certain amount of stock, to be forwarded to S——, and to draw on the First National Bank of that place for the amount of bill.' All that any one got was a protest from the bank, with costs. I understand he is doing the same this fall, only in other places." We hope that our friend did not purchase his experience at too high a price. Hereafter, he will ask for references of those who order and are unknown to him.

Smoking Plants.—"F. C. S.," Boston. The length of time a plant should be smoked will depend upon the density of the smoke. In half an hour the lice, if not dead, will generally be so stupefied that they will loose their hold, and may be shaken off.

Dwarf June Berry.—Dr. M'C. This variety came from the West, and we look for information concerning it from that quarter. We, as well as others, have the plant on trial, but it has not yet fruited.

Watering and Manure Water.—"R. J. H." writes: "How is a person who has never had experience to teach him to know what amount a moderate quantity of water is, or what is a moderate quantity of manure water?"—The want of "experience" is just our correspondent's trouble, and which he can, with a little patience, overcome. Dust and mud are the two extreme conditions to which the earth in flower pots can be brought, and both, with rare exceptions, must be avoided. A rapidly growing plant will require an amount of water that would ruin a slow growing or a dormant one. Now, no written rules will instruct one just how much water to give a particular plant. The best way is to experiment. More plants are killed by over-watering than by drying up, and it is better for the health of the plant that the soil should get dryish occasionally. As to manure water, use liquid cow manure, diluted so that the water is slightly colored; apply this once a week, and if the plants seem to do well under it, use it twice a week, making it a little stronger if the plants appear to demand it....Fuchsias, except a few winter-flowering ones, are better stored in the cellar for the winter, as they are generally poor parlor plants.

An Erratic Grass.—Daniel Noble, Shairano Co., Wis., sends specimens of Timothy in which the *palets*, or envelopes of the flower, are developed as small leaves about half an inch long. We have seen the same condition in this grass several times before.

The New York Fruit-Growers' Club.—We were informed by an officer of this Club that it had become mortified at its inability to pay its premiums, and had committed *hari-kari*, and made an announcement to that effect. It seems that it was only cut in two, and like a polyp, its separated parts are struggling into individual existence. Nine men and one woman met at the rooms of the American Institute and made an attempt to organize. As all could not be chairmen at once, this portion—which represents the head, as it contains whatever of brains there was in the concern—adjourned to a more favorable season. The tail end has since shown signs of vitality and has called itself—of all things—the "Horticultural Society of New York." Well, there is something in a *name*. We do not observe that any one ever suspected of horticultural knowledge is identified with the movement—but the name looks well in print.

The "Mexican Everbearing" Strawberry.—The Michigan Farmer quoted us triumphantly as endorsing the claims of this variety to be new. We gave its statement the positive denial it deserved, whereupon it follows with a column, the purport of which is, that our opinion is not worth anything either way. The Farmer mistakes greatly if it thinks to draw us into a controversy with it. Abuse will not help the strawberry nor will it hurt us; and the editor of that paper may feel just as badly as he chooses. The question which interests the public is this—Is the "Mexican Everbearing" Strawberry worth growing? To which we answer, if the old Red Alpine is worth growing, that is, for we are unable to see the difference. The inability to see the difference between the "Mexican" and the Red Alpine may be stupidity or it may be an Eastern prejudice, for both these charges are made against those who think them as alike as two white beans. For ourselves, we consider the Alpine and the "Mexican," be they alike or different, as not worth growing. The fruit is small, soft, pasty, and without the flavor we are accustomed to associate with the strawberry, and have no doubt that nine out of ten who should plant either would be sadly disappointed. There are a few who like a fruit of this kind and they will find it in the so-called "Mexican." The names of some persons whom we highly esteem are quoted as stating that the "Mexican" is a distinct variety. Neither of these have ever grown the two sorts together. We know them well enough to be sure, that should they find upon trial that the "Mexican" is not a new variety, they will frankly say so, and should our experience with the two side by side, show the plants in any respect different, we shall admit that our present opinion is not well founded. Mr. B. Hathaway of Little Prairie Ronde, Mich., publishes in the Michigan Farmer and elsewhere the most positive testimony as to the identity of the two sorts. Mr. H. grew the "Mexican" and an Alpine, which he had cultivated for many years, side by side. He says, "And carefully comparing in size, form, flavor or fruits, and in habit of productiveness, there has been no appreciable difference. Had I not set them myself I could not tell them apart." The testimony of so well-known a fruit grower as Mr. Hathaway is worthy the consideration of the Michigan Farmer. The Farmer says: "Why did not the editors of the *Agriculturist* and the *Rural New Yorker* in the convention respond to the remarks of Mr. Meehan? or why not call the attention of Mr. Elliott or Dr. Warder to the identity of the two varieties? Simply because they dare not!" If that conundrum was not answered by its propounder we should say that the only reason we did not do these things—we can't answer for our friend Bragdon—was the perhaps insufficient one, that at the time we were some 30 miles away....Since the foregoing was in type, we notice that Mr. B. Hathaway has written to the Country Gentleman an article giving his experience with the "Mexican." He states that he has the "Mexican" and the Alpine planted together, and that he will give any one $500 who will at any time of the year pick out the plants of the "Mexican." Here is a chance for the Michigan Farmer.

Norway Spruce Hedge.—"G. H. F.," Montgomery Co., Pa. The Norway Spruce can be kept at any desired size by clipping. Cut a young hedge in October, to secure a strong growth, and when the hedge is once well established, prune the young growth in June, and trim again in October to bring it to the desired shape.

Bark Louse.—A. P. Lark, Millersburgh, Pa., sends a twig covered more thickly than we ever before saw with Harris' Bark Louse. Mr. L. says that the whole tree is covered with them, from root to top, and that they even were on the fruit. On this point we have a letter from D. A. Norris, Greenville, Conn.: "In the spring of 1868 I purchased a house and lot; there were about a dozen pear trees on the lot, and one of them (the Duchesse) was badly infested with scale lice. The former owner of the place had been trying for a number of years to get rid of the pests, but could not succeed, and I decided to cut the tree down. I had some painters at work on my house about the first of June, and I thought I would try an experiment; so I took a paint keg and brush and painted that tree from stem to stern (as a sailor would say), covering the leaf buds and everything else with a thick coat of white paint, lead and oil, such as they were painting the outside of my house with. All of my neighbors (and some of them knew very much more about trees than I did) said I had killed the tree. I told them, 'better dead than lousy.' The tree leaved out very well, though some buds couldn't break the crust of paint. It made a good growth of wood, some of the shoots growing from twenty-four to thirty inches. What is better than that, I could find no lice on them. I thought I would say nothing to you about it until I had tried it another season. I have watched it closely this season, and can find nothing on it that has any resemblance to a louse, and I am well satisfied that I have exterminated them. Some of my neighbors are troubled with them, and they say they 'shall try the paint next season.' The tree which I painted was seven or eight years old, and has never fruited until this year, when it bore one pear. I am in hopes to get a good crop from it next year."—A tree in the condition of Mr. Lark's is fit for no other use than some such heroic experiment as here detailed. If it is killed under the treatment, never mind, as it should be cut down if it cannot be cured. It is likely that linseed oil, without the paint, would do as well. We have no doubt that soap, made thin enough to work, would have answered as well as the paint, if applied early in June, just before the insects hatch. The experiment is interesting as showing how much abuse a tree will stand.

New Vegetables are described by J. J. H. Gregory and others in the Horticultural Annual for 1870.

Treatment of Land for Corn.—"C. H. S." asks the best way to prepare a neglected, white clayey soil for corn. He has little manure. It is poor policy to winter-fallow for corn usually. Heavy clay lands are

however, often benefited by it.—If your white clayey soil has a good sod, it would not be best to disturb it until spring. If the sod is light, plow it this fall, lapping the furrows, and liming. The frost and lime will work through the winter. Haul out manure when the ground is frozen, leave it in as large heaps as you can, and spread with the fork. At corn-planting time, spread the manure, and cross-plow, going perhaps an inch deeper, than you plowed in the fall. This is to bring up any lime that may have worked down to the bottom of the furrow.—Make all the manure you can. Look out for all sorts of wastes of factories, of slaughter-houses (the blood, hair, bristles, entrails—everything), the wastes of tanneries, etc., dead animals, leached ashes,—all sorts of things that you know are good, and that you can have for the hauling or for a low price,—and keep your compost heap growing all winter. You can cut swamp-grass, haul leaves from the woods, and dig muck. Spend as much time making manure this winter as you will in plowing, planting, hoeing, and harvesting the corn, and you will be able to manure the whole ten acres, and your interest will be easily paid if corn is worth half $1.25 per bushel.

Coal Tar Preserving Wooden Drains.—L. M. Hager, of Nevada, is using lumber for making underdrains, as tiles cost him three times as much as the lumber, and writes to know the best method of saturating the lumber with gas tar. We have had no experience in the matter. Should be glad to hear from those who have. Our opinion is, that the use of coal or gas tar for such purposes has been greatly over-rated. It is certainly not a water-proof, or even a water-repellant substance, but mixes quite readily with water. Under not a few conditions coal tar appears to promote decay in wood, etc., rather than to check it. There is a good deal of condensed wisdom in a short article in the *American Agricultural Annual* for 1869 on this subject. And we think a much better application to wooden drains would be roofing pitch, dissolved while warm, in the cheap, light oils (benzine or naptha). This forms a black varnish, a liquid which would penetrate the pores, and is entirely free from pyroligneous acid and other substances which are soluble in or have an attraction for water. The light oil soon evaporates, leaving the pitch. It is very inflammable and must be handled with care. The best way to do it would probably be to make a steam-tight chest, in which the strips could be placed and covered with the black varnish. A partial exhaustion of the air would cause the thorough penetration of the liquid into the pores of the wood. Soaking a day or two would be well, and simple painting with it would doubtless have less, but good, effect.

Clover for Arkansas.—E. G. Collier, Ark. We have no doubt white clover would do very well with you. Sowed in the fall it would grow through the winter and give abundant pasturage in spring, when it would seed itself for the next crop and probably dry up and die during the heats of your summer. The seed is rather expensive, but if it were evenly distributed, a pound to the acre would probably make a good stand the second spring. Red Clover would probably fail; though sown in the early autumn it might make a crop on good land, before the hot weather came on the next year.

What Bull shall I Buy?—Mr. A. Desendorf, Montgomery Co., N. Y., writes in substance as follows: "I have a dairy of common cows and wish to improve them by crossing with either the Ayrshire or Shorthorns. What I want is an increase in the quantity of milk; as I sell the milk to a cheese factory, quality is of minor importance to quantity; from which breed can I get the most milk? I have about 150 acres of cleared land, rich, and much of it underdrained that has kept a dairy for some twenty years or more and which will keep *well* forty milch cows, four horses and one yoke of cattle, and will besides allow of the raising of some young stock. —Upon the same land can I keep more or less than forty Ayrshires, or more or less than forty Shorthorns? The Shorthorns being larger will they consume more food? I make my money out of my cows, and have given them good feed, extra care, and my exclusive attention. Would you then advise me to expend $150 for an Ayrshire, or $300 for a Shorthorn, or would you disapprove of such improvements, and recommend none but native cows for the dairy?"—To answer the last question first; we must most earnestly recommend the use of a thorough-bred bull on all dairy farms. Whether it should be an Ayrshire or a Shorthorn, depends very much on whether the dairyman wishes to turn off some fat cows every year to the butcher, or whether he intends to keep his cows till they are used up, and then sell them for about what they are worth for their hides. If he adopts the latter course, we should recommend the use of an Ayrshire rather than the Shorthorn bull. The Ayrshires have been bred exclusively for milk, and will probably yield a greater quantity for the food consumed than any other breed. On the other hand, if he proposes to sell beef as well as cheese and butter, we would advocate the use of a Shorthorn or Devon bull. Provided in all cases that the bull be *thorough-bred*. To carry out the latter system to the best advantage, we must adopt a higher order of feeding than when the only object is milk. We want cows that will eat a large amount of food. This is of the very first importance. An animal that will not eat freely should be rejected. The Shorthorns are great eaters. If they run to milk they give a large quantity of it. If they have a tendency to fatten, they fatten with great rapidity. The objection to them as dairy cows is, that you are not *sure* whether they will prove to be great milkers or great feeders, or half and half. The remedy is to feed liberally at all times, and if the cows are good milkers they will be very good ones, and if not, they will fatten rapidly, and can be disposed of to good advantage as beef. With a dairy of forty cows, a dozen or so of the best heifer calves should be raised each year, and ten or a dozen cows fattened each winter to be sold in the spring, when the beef commands a very high price. We know no reason why Mr. D. cannot keep as many good Ayrshires on his farm as native cows. But he could not keep to advantage as many Shorthorns. A large Shorthorn cow, if a good one, will eat more food than an Ayrshire. The better either of them are, the more will they eat. If he keeps Shorthorns, on the system proposed, he will not receive as much money from the cheese factory as if he kept Ayrshires or natives. But it is for him to decide whether half a dozen or more fat cows sold every spring to the butcher, will not make up for the deficiency. On the whole, we would say, if he has high-priced land and proposes to adopt high farming, take the Shorthorn bull; but if he proposes to devote his farm and the cows solely to the production of milk, take the Ayrshire.

New York State Poultry Society.—The finest exhibition which had ever been our pleasure to witness was made by this Society last March. Another show was held at the same place, the Empire Skating Rink, New York City. This eclipsed the former in almost every department, and was a triumph for the Society. The great feature of the show was Asiatic fowls, and though we were sorry to miss some of the stock to which the highest honors were awarded last spring, and their progeny, yet the display of Buff and Partridge Cochins, Light and Dark Brahmas, was magnificent, both in numbers and quality. The exhibition was strong in the French class, the Houdans predominating in numbers, and receiving high praises from their breeders for hardiness. Creve Cœurs were in pretty good force also, and showed finely for weight; and there were fine specimens of La Fleche. Dorkings are a very attractive breed to us, especially the Grays, and we wish they were more fashionable. The delicacy which they have sometimes exhibited here is, in great part, due to close breeding, and certainly their good qualities are enough to make it worth while to breed them with an especial view to an improvement in constitution. There were many good coops of both Gray and White. Spanish made a good show also, but the Hamburgh class eclipsed them; and for perfection of feather and beauty of form, the prize birds are certainly models. The class of Poland and other crested breeds was represented by many and good coops, but several of the best lacked beauty in not being fully feathered, especially in the crests. The season was more favorable for a fall display of Games than in March, and there was a good show. It strikes us, however, that there should have been a better show made, and more competition. The abuse of this fowl should not condemn it—and to any one who can keep but one breed of fowls, none offer more attractions than some of the varieties of this thorough-bred race. Perfection of form, beauty of feather, style, hardiness, intelligence and gallantry, are combined with the useful qualities of being the best of all fowls for the table, and second to none as layers, steady setters, and good mothers. They can not well be kept with other fowls, and the cocks must be kept apart. The class of Bantams contained not only some of the most beautiful birds in form and feather in the show, but the variety was great. The Turkeys were of commendable quality, the Bronze ones having, in general, very good size. The winner of the first prize last spring has increased his avoirdupois to 42 pounds. The fine Crested turkey cock, belonging to the Secretary, Mr. Gavit, was greatly admired; and if it be found that he will impress this beautiful peculiarity upon his progeny, we have a right to expect, with confidence, that a new and valuable breed will soon be established. The show of Ducks was confined, so far as we observed, to the "Rouen," (properly, *Roan*,) Aylesbury, Cayuga, Wild Mallard, Crested, and Wood breeds. The first two breeds being shown in large numbers, and of extraordinary size and weight for this country. We are glad to mark rapid improvement in breeding these useful birds, and hope it may continue. The same may be said of Geese. We have never yet bred so fine Toulouse or Bremen geese as we can import. That department of the show devoted to pet animals was well filled with an interesting collection of Ponies and Dogs. There were also Rabbits of several breeds, a variety of Cats, and several Deer; a performing Dog, and other curious and interesting things. Dr. Slack's Troutdale fish ponds were represented by several huge tanks of trout, a number of hatching boxes, with eggs, in which the young trout could be seen, and a model of Ainsworth's breeding race. There were, besides, on exhibition, choice paintings of domestic and wild fowls, and their young, of incubators, of dressed capons, of eggs, of various kinds of folding coops, etc.

The exhibitors were principally from the States of New York, New Jersey, Pennsylvania, and New England, though several fine coops came from Ohio. The season was a favorable one for showing fowls in good condition, and for keeping them in good health, as very few were sick. A severe snow storm, bad traveling, and intensely cold weather caused a very meagre attendance, and the Society must come out with a depleted treasury.

Obituary.—Mr. Richard L. Allen.

A brief note announced that Mr. Allen's death occurred at Stockholm, Sweden, on Sept. 22. He had been traveling with his family in Europe for nearly a year and a half, and was on his way to Russia, intending to pass the winter in Southern Europe, Egypt and Palestine. Mr. Allen was born October, 1803, in Hampden County, Mass., educated at Westfield, in that State, and in early manhood engaged in mercantile pursuits in New York. Relinquishing this, he entered into literary pursuits and the study of law in Baltimore, but was compelled by declining health to return to active life in 1832. Coming into possession of a large tract of woodland on the Niagara River, he zealously engaged in clearing the forest and bringing the soil into cultivation, and also in breeding various kinds of improved stock, of which he was a great admirer, and an excellent judge. In 1842, he became associated with his next eldest brother, Mr. A. B. Allen, in establishing the *American Agriculturist*, and continued a close connection with it as contributor, co-editor, or publisher, for thirteen years, until its final sale to Mr. Judd, who had been its conducting editor for about three years. Mr. Allen was, in this and other ways, one of the earliest and most efficient promoters of agricultural improvement in this country. His "*American Farm Book*," of 325 pages, was, without doubt, the most practical, the best arranged, the most useful, and the most able work of its kind in that day, if indeed it has been excelled up to this time, and its sale has been commensurate with its merits. (A new edition, edited by his brother, Hon. L. F. Allen, and brought up to the present time, has been recently issued.) This was followed by another useful and successful volume on the "Diseases of Domestic Animals." The circulation of the *American Agriculturist* created a demand for improved implements, which could not be supplied by the manufacturing facilities of the time, and to meet this want, the two brothers, on Jan. 1st, 1847, opened an Agricultural Implement Warehouse in Water Street, New York, under the name of A. B. Allen & Co. To this was soon added extensive Agricultural Implement Works in Brooklyn; both establishments are still carried on by R. H. Allen, Esq., a son of the deceased.

Aside from the subject of agriculture, on which he has so ably written, Mr. Allen was a man of various acquirements. His tastes were those of a student and literary man, all his life; though until his gradual withdrawal from more active commercial pursuits, his large and continually increasing business allowed him little time for their indulgence. To a love of history and the belles-lettres, he added also that of science and art; and notwithstanding a faithful attention to his business duties, he found time to keep well up with the best publications of the day. He traveled extensively in his own country before embarking for Europe; and few travelers visit foreign countries better prepared to observe with discrimination, and enjoy with zest and appreciation, whatever is of social, political, economic or historical interest. As a matter of course, he viewed with an intelligent and appreciative eye, everything relating to agriculture and its kindred subjects which fell in his way. Mr. Allen was of an uncommonly amiable disposition, with pleasing, winning manners—erect and noble in person, active and youthful for his years. He was pleasing, intelligent, and instructive in conversation; and in all family and friendly relations, loving and beloved. He was a large owner of real estate at Manitowoc, Wis., and the local press there speak of his acts of unostentatious beneficence, of his liberality to the cause of education, to Churches and Sunday Schools, and for leniency towards worthy debtors. He was, and had been for years, a humble, consistent, and enlightened Christian: and was an elder in the Presbyterian church for some time previous to his death, as his father and more remote ancestors had been before him. In the church, in society, and in business, he has left a void not easily filled.

Bee Notes.—*By M. Quinby.*

Apiary for January.—Probably there was never a time when a really thrifty man, in any business, could find absolutely nothing to do; and probably that bee-keeper remains to be found who can build high the roaring fire, heavily heap the board of good cheer, and abandoning himself to the enjoyment of the summer's garnered fruits, say, "Now, at least, has come a time when my charge demands not even the slightest care." Remember the enemies of bees are abroad, creeping under the snow, making for themselves passages, it may be, into your hives, and may be at this moment taking up their permanent winter residences in the very strongholds of your pets. In cold weather, bees gather into as compact a mass as possible, even the cells of the combs in the interior of the cluster are mostly filled. Now, if the hives are outdoors and the weather very cold, the honey in one locality is soon consumed, and the bees must reach it in other quarters or die. But there is continually arising from a mass of bees considerable moisture. Unless carried off, it accumulates and freezes on the combs, and a bee would die if it moved under such circumstances. Even if the moisture escapes by ventilation, and there is no passage from one part of the hive to another, except around the chilling edges of the combs, the bees will often freeze, even with plenty of honey in the hive. Hence the necessity, especially where movable frames are used, of seeing that there are openings near the middle of the combs. The cross-stick in box-hives generally cause holes to be left in building, which will answer for them. When the weather continues cold for three weeks or more at a time, bees outdoors should be brought in and thoroughly warmed, so that the frost about them will melt and the combs dry. Let it be done in a dark room or in the evening. Frequent warm spells occur in this latitude (Central N. Y.) which generally render this unnecessary. At such time, if the ground is bare or the snow covered with a hard crust, bees may and ought to fly, but if a light snow is on the ground use every means to prevent it. A bee can alight on an icy crust and rise again, but in a soft snow it sinks to die. Careful shading helps keep them back. Straw hives which present a thick mass of non-conducting material are better than wooden ones under such circumstances. Avoid all unnecessary disturbance. If the hives are covered with snow, let them alone. They will do well if properly cared for to begin with. When there is but little snow, sweep away occasionally and clear the air-passages of dead bees. If a warm day loosens the hives, raise them and sweep the bottom boards. Protect from cold winds as much as possible. A warm, south-eastern exposure is best for an apiary. A correspondent placed his hives near together in the fall, and packed straw all about them, allowing it to project about 14 inches in front from between the hives. This would break the force of the wind. This is the month when thousands of weak stocks will freeze to death, victims of costly carelessness. The presence of honey remote from the cluster will not avail them. There should be an inch hole about one-third of the distance from the bottom of the front side of the hive to the top. This will help if the bottom should chance to be closed. Bees flying out might be saved sometimes if there is a short passage to the cluster inside without having to crawl through the frosty space from the bottom up. The presence of mice may be known by their nibblings on the bottom. Trap them; poison might be communicated to the honey. Tall hives for outdoor wintering are better than low, flat ones; they bring bees and honey in the most favorable relative positions—honey above, bees below. The bees can reach the honey by simply crawling up—very different from going from comb to comb; besides, warmth rises from the bees and prevents frost from accumulating over them. It is objected to such hives that they do not afford the requisite space for boxes. Perhaps the best form for the box-hive is a medium between the two extremes, say a foot square in the clear by 14 inches high. Bees in doors must be visited to see that all is right. Keep the trap set for vermin. The room must be dark and dry, and the temperature always a few degrees above the freezing point. Sprinkle lime on the floor, to neutralize any disagreeable odor from dead bees. Bees in this latitude do best housed; farther South a little is gained in their earlier breeding by leaving them out, a matter of much importance in the spring. Winter is the time for preparing hives and boxes for another year. Remember that the longer hives are painted before using, the better.

Bee-Keepers' Convention.—The bee-keepers of the West have been holding conventions, and why should not we? Every interest must organize or fall behind. We need, for the successful prosecution of honey-raising, a rapid communication of all that observation and experience are every day bringing to light. Newspapers help, but they are not sufficient. A thousand points of interest and value would be brought out in a convention which never would find their way to the newspapers. Many observe who but rarely tell what they see though the press; but conventions bring out details. There is nothing like personal intercourse to elicit truth. I would suggest the calling of a convention—say in February or March—to meet at a convenient point, with a view to permanent organization. Let us hear from others.

Patents.—My uncompromising hostility to every sort of patent hive is known. I am glad to see resistance to them anywhere, not because they are always worthless, but because, generally speaking, they have been one unmitigated swindle. But let us have a care lest this hostility to patents blind us to real merit. The old box-hive, I think, is destined to be superseded by movable frames in some form, and new and valuable devices may be invented and patented. But as to the bevel guide for straight combs, about which so much is said, don't be swindled into paying for the right of using it. A friend of mine in St. Lawrence County recently paid $25 for what no man would have troubled him for using before. The same common sense that makes a good farmer or merchant will usually enable a man to steer clear of these humbugs and make bee-keeping a success.

Horse Papers for Farmers. No. 1.

BY A SPECIAL CONTRIBUTOR.

It seems to me that the Horse question needs to be presented to farmers somewhat differently from the manner in which most of the excellent works on the subject set it forth; for, while those who make a special business of horse breeding, and even those who raise one or two colts a year for sale, are most benefited by the instructions contained in these works; they are not suited to all the wants of a farmer who regards a horse only as a part of the outfit of his business, or as a means of recreation,—who never sells a horse and would be glad never to buy one,—raising such as he wants and wearing them out in his own service.

I like to think of this sort of relationship between a farmer and his family, and the horses of the farm. It implies an affectionate fondness for the faithful animals which ensures their kind and considerate treatment, and the cultivation of an interest in them, which is one of the best parts of the education of a farmer's children, and which will do more than anything else to attach them to their homes and to an occupation about which such interests cluster. Oxen—good natured dumb beasts though they are—are not especially lovable, and they always suggest the coming butcher; cows are better, but they are bought and sold without much regard to anything but dollars and cents; while the smaller animals and the poultry usually finish their career within a year or so. A horse on the other hand, which has been raised on the farm and ends his days in his breeder's possession, becomes almost a member of the family, and may follow its fortunes for a quarter of a century—growing up with the children and connecting himself throughout their lives with their most interesting reminiscences of childhood.

Taking this view of the subject, every farmer who is a farmer not alone from necessity, but from choice as well, should endeavor to have one or more horses that are fully identified with his farm *as a home.* He should raise them himself and should never fix a price on them for a dealer, nor regard them so much a part of his commercial stock, as belonging to the permanent fixtures of his establishment.

Shortly after I moved into my present neighborhood, a few years ago, I hired a neighbor to break up a piece of sod for me. His team was a pair of oxen with a horse on the lead. As they swung into my barn-yard from a side road, my attention was immediately attracted by the horse. As I walked towards him with an interested look, his owner jumped down out of the cart and came forward with a pleased air and asked what I thought of him. I eyed him carefully over, wondering how such a horse ever came to lead a pair of oxen, for he seemed to be in the prime of life and had better points than many a thousand-dollar nag that I had seen in the city. His legs were fine and free from puffing, his ears were thin, well-shaped and active, and the whole air of his head was perfect. I followed him into the field and watched his work. He stepped off in a brisk knowing way, without any fuss, but with a perfect business-like gait, tossing his head now and then as though indignant at having to keep pace with oxen. As I was in want of a horse, I watched him more closely than I should otherwise have done, even with his decided attractions, and at length sounded my neighbor to get his opinion of him. He was loud in his praise, and, I began to think, was paving the way for a large price. Finally I asked his age and was referred to his mouth, when I found to my great surprise, that he was a very old horse; too old for buying and selling to be thought of. However, to carry out the joke, I asked, "how much will you take for him?" "There ain't money enough on this farm to buy that horse,—that horse ain't never ben sold and he ain't agoin' to be; my father raised that horse from a colt and he raised his mother before him. He was foalded twenty-eight year ago this month, and when the women folks hitches him up to go to town, it's jest all they can do sometimes to hold him, now. He was got by a runnin' horse that Buckley's father over here used to keep, and them that's got his colts don't want nothin' better. Accordin' to my my notion, if you want blood any where you want it on a farm. That old horse to-day 'll tend a third more corn 'n any other you can bring, an' he won't never set his foot onto a hill all day long."

Only a few days ago as I was riding at a brisk gallop along the road, I saw that same old horse grazing by the road-side. As I drew near he gave a whinny and—head and tail up—wheeled around and invited me for a run, which my rascal was ready for, and I had for a few minutes, hard work to keep him from it. Finally, the veteran, disgusted, gave a snort and trotted off home like a colt. I have seen him going through town (exerting every muscle to its utmost, but over-straining nothing) leading two yoke of oxen before a load of manure, and I have seen him plodding along to meeting on Sunday before a carry-all full of children, with the air of a steady church-goer, who considered even a lively trot improper. In short, he is exactly the sort of horse that every farmer should have—steady, honest, active, cheerful, intelligent, and perfectly good tempered, ready for work week in and week out, as fit for duty now as when he was seven years old, and as reliable for all kinds of service then as now.

This is no ideal animal that I have imagined for the entertainment of my readers; but a real flesh and blood, chestnut horse, with a white stripe in his face, that I see constantly in my neighbor's team. He cost no more to raise and he costs no more to keep, than the veriest club-footed, "lunkhead" that spends half his life on three legs, and I would rather take my chance of getting a full season's work out of him the coming year than out of any other farm-horse that I know. He may die any day, but until he does die he will be "for duty." He will be game to the very end as is the nature of his wiry tribe. He is not only a real horse, but he is of the type that every farmer may have who will go to work in the right way to get it. The whole secret is explained in my neighbor's

statement that "*if we want blood anywhere, we want it on the farm.*" We hear a great deal now about thorough-bred Jerseys and Shorthorns and Southdowns, and our Walking and Talking friend from whom we learn so much every month convinced us that we must at least have thorough-bred boars. I maintain that the king of all the thorough-breds is the thorough-bred horse. I am glad to have pure-bred males for every kind of stock from cattle to chickens, but the one pure-blooded sire on which I depend not only for profit and economy of food and work, but for intelligence and kindly disposition, and friendship as well, is the thorough-bred horse.

In these Horse Papers I shall endeavor to stem the tide that now sets so strongly in favor of fast-trotters (which are well enough in their way), and to call the attention of my readers to the importance of creating a class of *farm* horses which shall combine as many as possible of the most desirable qualities, with speed enough for all practical purposes; using as a means thereto the Thorough-bred "blood" horse, that is the English race-horse. This is beyond comparison the most purely bred domestic animal in the world, having, in this country no less than in England, a clearly recorded pedigree without flaw or defect, running back a hundred and forty years, and possessing more strongly than any other, the power of transmitting his excellent qualities to his progeny.

Then again, as "the master is half of the horse," I shall try to set forth the duties which the ownership of a fine animal imposes on the farmer; and to suggest improvements in our modes of treating the faithful friends who uncomplainingly do so much for us.

Tim Bunker on Trout Brooks and a Hatching House.

It was one evening in November last year, that Mrs. Bunker lifted her gold-bowed spectacles, laid down the last Agriculturist and said: "Timothy, when did you say Dr. Slasher was coming to look at that Trout brook?"

"I expect him here in the morning, Sally, and I want you to do your best on breakfast by seven o'clock. Let it be broiled chickens and Johnny cake in Hookertown style. The Doctor lives by eating, and he'll come hungry."

"Must be an extraordinary man to live in that way!" said Mrs. Bunker dryly.

You see the way I came to send for the Doctor was this. I hold that what is worth doing at all, is worth doing well. Dr. Slasher had been growing trout some two years, had taken them in the egg, hatched them, fed, reared, and sold them and knew just how the thing was done. Besides he was a well-educated physician and had studied into the science of the business. If a wise man builds a house, he goes to an architect, who makes building his study, for a plan. I wanted to make fish ponds, and a hatching house, that would turn out trout as regularly as a hen-house turns out good broilers by the fourth of July. I knew something about growing chickens, but I had only read of fish raising in books. I had got a trout brook and springs, but I did not know certain, whether they would answer for this purpose or not. I had capital enough, but I did not want to lay out three thousand dollars, on my brook, and then find it was in the wrong place. That would be a good deal like building a dry dock on Hookertown creek.

It was a sharp frosty morning when the Doctor knocked at my door. He was a little chunk of a fellow with bushy whiskers, dark hair and snapping eyes, that could look as far into a pine plank as anybody. Mrs. B's coffee and chickens were discussed and we started for the brook.

"Now," says I, "Doctor, what I want to know of you is just this. Will this brook do to raise trout in, and if so, where will you make the ponds and put up the hatching house?"

"I see trout in the brook," said the Doctor, which is a good indication."

"Yes," said I, "we have always caught trout here, but they may be hatched a good ways up stream, where the springs are."

"No," said the doctor, "Here are the spawning beds," pointing to a long streak of coarse gravel in the bed of the brook, and the trout are now crawling over it, and preparing to deposit their eggs, if they have not already done it."

Sure enough, there were a dozen trout or more, stirring up the gravel with their tails, and having a very lively time.

"Thirty-eight degrees," said the Doctor, pulling the thermometer out of the water. "I thought it was colder, for there is ice formed on the edge of the brook a half inch thick. You must have springs not far above here to keep up the temperature?"

"Yes the swamp above here is full of springs, and one is very large, that smokes like a coal-pit in the coldest weather."

"That is good," said the Doctor; "for if this water is not warm enough, the spring can be easily brought into your hatching house. But I think your brook water, if it does not get below 38° in the coldest weather, will do very well. The hatching period of trout eggs in our brooks is about 120 days, which indicates the average temperature of the water at about 36°. In spring water of 50 degrees they will hatch in 40 days, but I notice that the trout do not lay their eggs in springs, but in the streams below where the water is much colder, and I have thought that colder water would give us stronger and better fish."

"The brook never freezes up," I said, "It was once used to carry a saw-mill, and the pond that was made above would never freeze over hard enough to bear a team."

"How is it about flooding in the spring freshets?" asked the doctor.

"The basin above is very narrow and the brook rises in a swamp about a mile above this. Very little water collects in the basin, and I have never seen it raised more than a foot higher than it is now."

"That is worth a heap of money to you," said he. "There are a great many brooks that have such floods that they tear away all dams that you put upon them. It is impossible to use the main stream for this business, and if used at all, the water must be diverted into small ponds, made at great expense for this purpose. Cheap dams with flumes on the main stream will be safe enough here, and but one small side pond for the small trout will be necessary. The old channels of the brook will be better for the trout than anything you can make for them. The bottom is already lined with stone, and they are covered with water plants full of insects. See the water-cresses grow here luxuriantly, and wherever that plant thrives, you can have trout. How is it about your brook in summer? Does it dry up?"

"It always runs a good stream in the dryest weather, though not perhaps more than a quarter as much as you now see."

"You have now," said the Doctor, "at least 1200 gallons per minute, and a 100 would be enough to do a large business. You have a stream good enough for the business. The next thing is the location of the dams, and flumes."

"Why cannot we use these two old dams that served the saw-mill?" I asked.

"How much fall is there between them?"

"At least 15 feet, and 10 or 12 below."

"That will do grandly," said the Doctor. "Use your upper dam to make a reservoir, put two dams between, making three ponds 150 feet long or more. Put your hatching house just before the lower dam, and take your water for it from the pond above. Then make a small, side pond two or three feet higher than the first pond, and feed it from pond No. 2. Make a sluice-way from this small pond into the first for your spawners to go up. Each pond must have its flume and screens above and below, and be so constructed that you can shut off the water at pleasure, and drain the ponds. You want to control the trout while growing, and be able to capture them at your pleasure, to take the eggs or to kill them for market. This is easily done, if you put your flumes so that you can drain your ponds to the bottom."

"And what is the whole going to cost?" I asked the Doctor solemnly, for the thing began to look big.

"Well," said the Doctor, "I will contract to put you up an establishment here with everything in working order for $2500, and that is much less than it would cost on many brooks. But a good part of your work is already done."

"That is a big pile of money;" said I, "to put into an experiment."

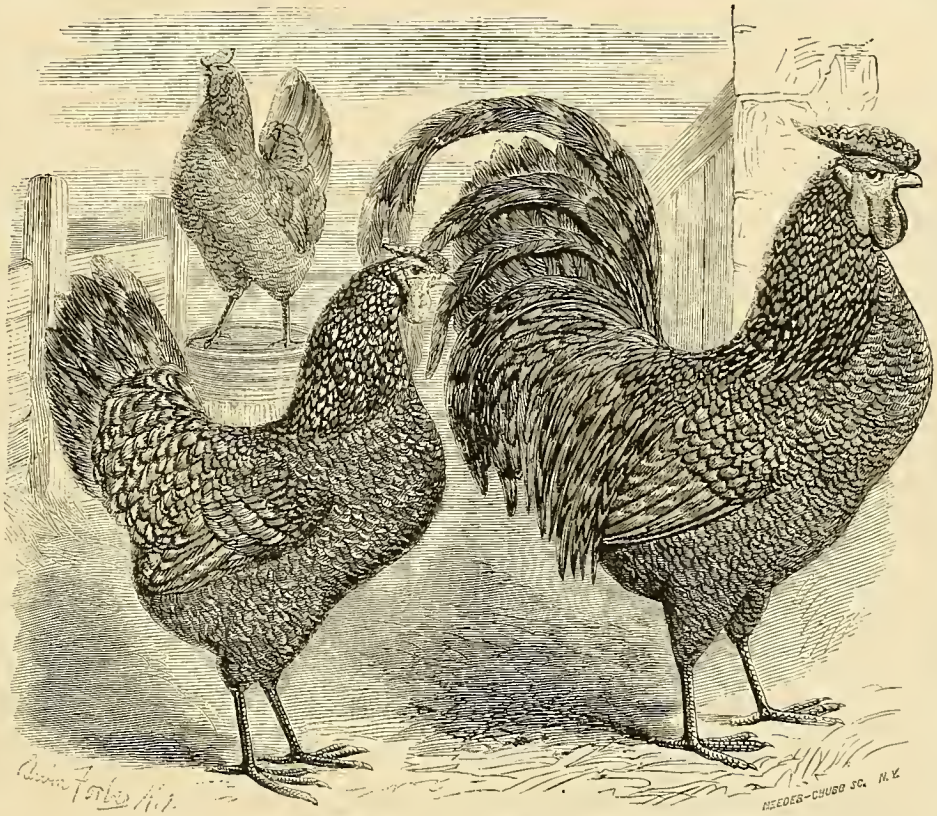
"It is no more an experiment," said the Doctor, "than your raising chickens or pigs. The chickens die more or less every spring, but folks keep on raising them, and I suppose it pays. With right conditions of the water and good attendance I had much rather undertake to raise trout than any domestic animals. They are quite sure not to be hurt by the wet or cold."

I thought over the Doctor's visit through the winter, matured my plans, and in the spring broke ground. I have made five dams and flumes instead of three, and if the trout works succeed as well as they promise I shall put in more. I have visited all the trout-hatching houses I could hear of, and taken advantage of all their improvements, and made some of my own. In all the houses I saw, the hatching boxes were put upon the ground, or but a few inches above it, and the laborious business of examining the eggs and young fish for six hours or more daily had to be attended to on bended knees, or in a stooping posture. This was hard work for nothing. I put the boxes three feet above the floor, which makes this work easy. Coste's boxes, in which the eggs rest upon glass rods, are a great improvement upon gravel. They need no boiling, they are more easily kept clean, the sediment if any remains in the waters falls below the eggs, and they are more rapidly examined and handled. I made the house very thoroughly, laying the walls in cement, and cementing the floor so that neither mouse nor rat can get at the eggs. The water is passed off from the boxes into four-inch tiles beneath the floor, and these are kept grated so that muskrats and other vermin cannot enter the house. How we stocked the ponds, and set the house to hatching eggs, I shall have to tell you in another letter.

Hookertown, Conn., Dec., 15, 1869. Yours to Command, TIMOTHY BUNKER, Esq.

Dominique Fowls.

This is an old-fashioned breed, so to speak, which is probably quite as widely known and has been as well liked as any of the now fashionable ones which are sought after at extraordinary prices, and bred with all the care and skill that man can apply. The Dominique is a breed adapted to all uses, and occupies a position in this country very similar to that which the Dorking does in England, being, however, hardy, and free from that deformity of the Dorking—the fifth toe. The characteristics of the Dominiques may be briefly stated as follows: Good size; aptitude for the table and for market; general excellence as layers, and as winter layers; hardiness, both as fowls and chicks; uniformity of style and plumage. The hens are good setters and mothers. The breed is, besides, remarkable for the degree to which it impresses its character upon the common fowls. There are several breeders in the country who take great pains to maintain it in its perfection, and we are gratified to learn that in Illinois, and perhaps elsewhere at the West, it is held in such esteem that choice breeding birds are held at $40 to $50 a trio.



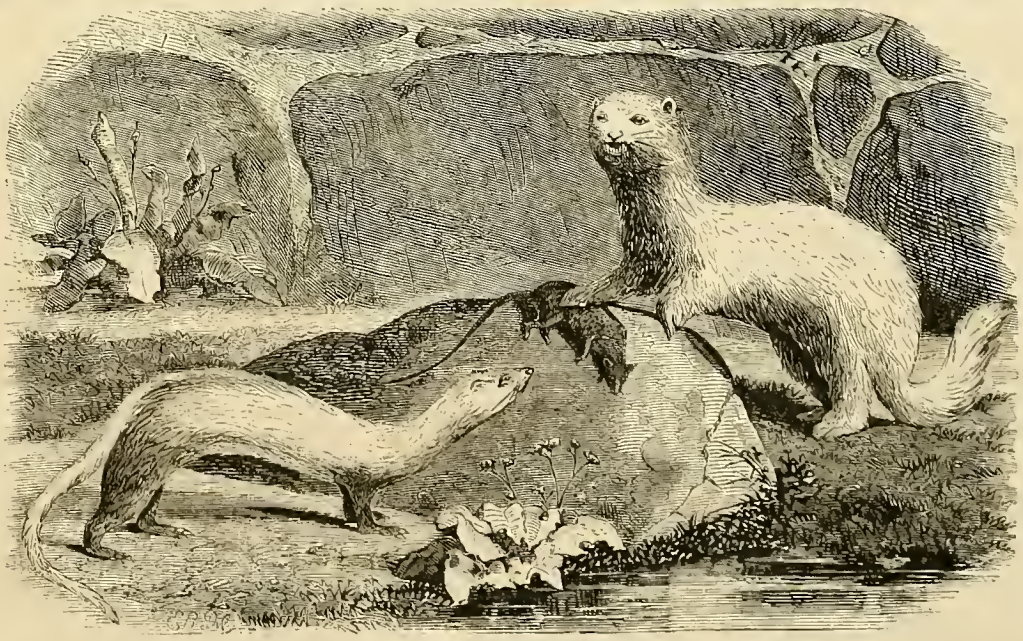
DOMINIQUE FOWLS—PROPERTY OF COL. HENRY HOWLAND, OF CHICAGO.

Both single and rose combs are admissible, but should not be found in the same flocks. The legs are yellow and clean, short and strong. At present the rose-combed variety is the favorite, although in no way superior, unless better bred. The color of the plumage distinguishes the Dominiques from all other fowls with similar characteristics of form. It may be described as bluish-gray — each feather having a light gray ground, barred crosswise with a dark slaty-blue penciling. The cocks have a proud carriage, full neck, and saddle hackle, and full tails, with well-curved sickle feathers. The hens are domestic and active. The cocks should attain a weight of 5 to 7 pounds at eight or nine months old, and at full maturity of 6 to 8 pounds, and hens should weigh 4 to 6 pounds. If bred without regard to size, they run down to 4 pounds for the cocks, and 3 for the hens. This, some otherwise good breeders have allowed, by breeding too close, or too much for brilliancy of color. It deprives the breed of one of its chief recommendations—size and quality as a market fowl—and should not be practiced. We should add that a broad back, and full, deep breast, with short thighs, set wide apart, and well-tucked wings, are essential points. The face should be coral-red, the ear-lobes red, and wattles of medium size, and not too meaty.

The fowls, of which we present portraits, were bred by Col. Henry Howland, of Chicago, and received the first prize at the N. W. Poultry Association last February. Col. H. has none to sell, and this article is not written to advertise anybody's fowls, but to call attention to this excellent, though somewhat neglected breed.

The Ferret.—*Putorius furor*

This little animal, which will be at once recognized as belonging to the family of the Minks and Weasels, is much better known in Europe than in this country. It is a native of the Barbary States in Africa, but we believe sustains itself in Spain and Southern Europe in freedom. In England, however, and wherever the winters are cold, if one escapes and lives a wild life during the summer, it either returns to captivity, which is often voluntarily done, or it perishes. Hence there is no danger, as sometimes apprehended, that ferrets will run wild and become a great nuisance in every cold country. As is well known, they are employed in hunting rats and rabbits, in which exercise they enter their burrows or holes and drive them out. The hunting ferret is invariably muzzled, so that he shall not kill the rabbit, suck its blood, and leave it dead in its burrow. The training of ferrets for the different uses is a task requiring no little skill. A ferret must be a good fighter, or it will be worsted by a rat, and one accustomed to driving rabbits is, it is said, useless for catching rats. Ferrets are kept in close boxes, well supplied with wool to keep them warm, and are fed on bread and milk and meat. They breed readily and acknowledge the care of their breeder by seldom biting him, if properly handled. Sometimes, however, they inflict very severe wounds. It is a practice of European breeders to cross the ferret with the common European Polecat (*Putorius fœtidus*). The progeny is larger, darker colored, and hardier. It is said also that similar crosses may be made with the mink and some other members of the genus. The color of the ferret is very light yellowish, or white with red eyes. Our engraving represents two ferrets of very dis-similar form and size. The smaller one is very highly bred and well trained. The other, a Polecat Ferret, a famous rat-killer. Ferrets are sold by dealers in birds, dogs, and other pets, at prices varying with the training which the animals have received.



THE FERRET.—(*Putorius furor.*)

Walks and Talks on the Farm—No. 73.

First and last, I have written a good deal on the chemistry of manure. For the past week we have been engaged in drawing out manure from the barn-yard, and I can but wish that some one would write an article on the *mechanics* of the manure heap. Chemistry tells us how to make rich manure and how to preserve it, and this is certainly of very great importance. But how to handle the manure with the least labor—how to pile it and turn it, how to load it and draw it to the field, and how to unload it and spread it, are questions of no less importance. At the present price of labor we may make our manure cost us more than it is worth.

The intelligent farmers of the country should direct their thoughts to this subject, and see if some means of lessening the labor cannot be discovered. It will not do to depend on keeping up the fertility of our land by plowing under clover. That day has passed, never, I hope to return. We must keep more stock, and learn how to make a profit in raising and feeding it. The only farmers who have made money the past year have been those who have devoted more or less attention to the production of butter, cheese, pork, beef, or *good* mutton. To raise grain on land worth $100 an acre, to pay $2.00 to $3.00 a day for labor in harvesting and threshing it; to pay high taxes and high prices for every tool and implement and machine that we use, and then to pay high rates for freight, insurance commissions, and profits on middlemen in sending it to New York, and thence to Europe, where it is sold at the same price as grain raised with labor costing not half what we are obliged to pay, is a business that does not afford any particularly bright prospect of large profits. The red winter wheat is less than 50s. a quarter in England ($1.50 per bushel in gold). Not a pound of American wheat should be shipped across the Atlantic. If it were not for our strong disposition to rush into anything that for the moment promised large profits, to the neglect of the steady business of farming, we should seldom be obliged to sell our products at a loss. In the average of the last sixteen years, the United Kingdom of Great Britain and Ireland has imported over 50,000,000 bushels of wheat per annum, and she will continue to want as much for years to come. She has in some way got the impression that the United States can furnish a large amount at low rates. She should be disabused of this idea. We have a population greater than her own, and it is increasing rapidly. We can raise a large amount of wheat, provided it will pay. But to raise it and sell it at a loss is what she should be given to understand we are not willing to do. The remedy is in our own hands. No legislation can help us if we do not help ourselves. When wheat falls below the cost of production, we must either hold it or put it into the pork barrel or convert it into beef, wool, mutton or butter and cheese. Had we been disposed to do this the past autumn, we could have had 50 cents a bushel more for our wheat, to the advantage of all classes, consumers and producers alike.

But what has this to do with drawing out manure? It has a good deal to do with the labor question—and labor affects every operation on the farm. How to render labor more efficient is the first problem which the American farmer has to solve. It worries me to see a man get $2.00 for a day's work, and then spend another day, first and last, in getting his money. He would have been just as well off if he had worked two days at $1.00 a day, and the farmer he worked for would have got twice the benefit. It is a great loss to farmers and to the nation to have men work only eight months in the year. It is a great waste of labor to employ it in raising 10 or 12 bushels of wheat per acre, or 25 or 30 bushels of corn, or 75 or a 100 bushels of potatoes. Our excuse for raising such poor crops is the high price of labor. We waste labor because it is high, and it is high because we waste it.

We must employ less labor in the summer and autumn, and more in spring and winter. In this section, October and November are the busiest months in the year. We have apples to pick, potatoes to dig, corn to husk, and a variety of other things to do before winter sets in. The days are short, the weather uncertain, and much time is necessarily wasted. We must plant less land to corn and potatoes. We should try to raise as many bushels as we now do, or more, but they should be grown on half the number of acres. This can certainly be done. The digging of a poor crop of potatoes this fall has cost more than half what the potatoes would sell for, and so in husking a poor crop of corn.

We must keep more stock, and this will give more work for the winter months. Let all the straw, and especially the corn stalks, be run through a cutting machine. This will add to the labor in the winter, but greatly lessen it when we come to handle the manure. The saving of food may or may not pay for the labor of chaffing the fodder. This is perhaps an open question, but there can be little doubt that we save the labor twice over before the manure gets upon the land. The liquid from an animal is of more value than the solids, and it is with this that the greatest loss usually occurs. Chaffed straw and corn stalks, after the animals have eaten what they will of them, can be thrown from the mangers and used for bedding, and they will absorb much more liquid than when used uncut; and we can keep our animals dry and comfortable on half the litter. The manure will be more valuable, because there is less straw in it, and from having absorbed more liquid (not rain), will decompose more rapidly, and be sooner in proper condition to apply to the land.

Judging from the manner many farmers treat their animals, one would think that the winter was the busiest season of the year. The cow stables are cleaned out about once a week, and the pig-pens when they become so filthy as to be unendurable. How many men did any one ever see carding a cow? I do not know how it is with others, but I have known my men so hurried in winter that they had not time to clean out the cow's manger once a month, or not, in fact, until it became the dirtiest part of the stable. And does not the pig-trough, to say nothing of the pen, often prove that the winter is a very busy season on the farm? How about the gentle sheep? Are their wants properly and promptly attended to? I have known men so much occupied that the sheep were left to do their own foddering.

It not unfrequently happens that men can be had in winter for little more than their board; and it is certainly a very short-sighted economy to put any work off till spring or summer that can be done at this season. Next spring we shall draw out manure when the land is soft and the manure more than three-fourths water. Can we not sometimes draw it out in winter on sleighs or on wide stone boats? It is not only easier to draw, but far easier to load. Manure intended for distant parts of the farm could be drawn out in winter and piled in the field. But when manure is not used in the spring, but is piled in the yard and then applied to the land the next fall, is there nothing we can do in winter that will save labor in the spring and summer? Look at our barn-yards and see. Look at mine; look at yours! The manure from the horse-stable is left near the door; that from the cows is back of the barn; the sheep manure is in the sheds and round the straw-stack—and the pig manure, where is that? The best half of it has soaked through the planks into the ground, and yonder heap of corn-cobs, dirt and straw represents the other half. It will lie there all winter without fermenting, and next spring the man in loading it will spend half his time in removing with his foot the corn-cobs that stick on the tines of the fork. Instead of waiting till spring to mix and pile the manure, why not do this work daily during the winter? The early spring is a comparatively leisure season on many farms, but there is enough to be done without having to do work that might as well or better be done in winter. If such is not the case, your farm is better drained than mine. To relieve the pressure of work in summer, much can be done now and in spring. Whenever we commence to mow *my* machine always wants something done to it, and so with the reaper. And is it not often the case with rakes, hay-racks, scythes, cradles, etc.? If not, you are a far better manager than I am. These, you say, are little matters. I thank you for that excuse. But I cannot accept it. Farm life is made up of such little matters, and he is the successful farmer who keeps ahead of his work and has everything in order.

But, aside from all this, we can lessen our summer's labor materially by sowing less spring crops. We must plow less land and work it better. Let the land lie three years in clover instead of two, or two instead of one, as the case may be. On heavy land, fallow more and plant less corn. At first our aggregate crops may be less, but the *profits* will be greater, and in two or three years our labor will be reduced one half, and the yield per acre will be doubled.

It will not be many years before we have Chinese laborers by the thousand. But in the meantime we can accomplish a great deal more with the same labor than we do now. In fact, the cities are crowded with able-bodied men out of employment. The latter part of November, when thousands of bushels of potatoes were still in the ground, and hundreds of fields of corn unhusked in whole or in part, and when men would not work for less than $1.75, and women for less than $1.25 per day, I was told that when a load of coal was taken to a house in the city, it would not be half an hour before a dozen men and boys wanted the job of carrying it into the cellar. In the country, this winter and next spring labor will be abundant, but in the summer, and especially in the fall, it will be as scarce as ever, unless we change our system of farming. This subject ought to be thoroughly discussed by the agricultural press the present winter. It is possible in this way to bring about a concert of action among farmers. We all feel that we have been paying too much for labor, and there will be an almost universal disposition to stop all kinds of extra work. But while this may lower wages for the time being, it will not permanently cure the evil. We want to employ more rather than less labor on our farms, but it must be distributed more evenly

through the year. The first step is to employ all the men now and in the spring who are willing to work at reasonable rates, and then to reduce, unflinchingly, the area of our plowed land.

"This is much easier said than done," remarks the owner of a farm of 150 acres of naturally good land that he and his son and eight months hired men, with an occasional day-hand, manages to work in such a manner as to secure a tolerable living. In fact, he more than intimates that his style of farming pays better than mine, a remark which, though unpleasantly personal, I would rather let pass than undertake to controvert!

This 150 acres consists of 10 acres of woodland, 20 acres of rather wet permanent pasture, 10 acres of permanent meadow, cutting perhaps three-fourths to one ton of hay per acre, and about ten acres in orchard, garden, etc. On the other hundred acres the crops last year were:

12	acres	corn,	22	bushels	per acre,
3	"	potatoes,	85	"	" "
15	"	of wheat,	13½	"	" "
15	"	of barley,	21	"	" "
5	"	of oats,	58	"	" "

15 acres of clover for hay, and afterwards cut for seed not yet threshed, one bushel per acre.

15 acres two-year-old clover and timothy cut for hay.

20 acres three-year-old clover and timothy, pastured.

There is now 15 acres of wheat on the ground, after barley, and he proposes to sow 15 acres of barley in the spring on the corn and potato ground, to be followed with wheat. The twenty acres of timothy sod are to be plowed in spring and planted with corn. The five acres of oat stubble are to be planted with beans, to be followed with wheat.

He asks how I could better this rotation? I have no particular objection to it, except that it does not keep the land clean and does not produce a single crop, with the exception of the oats, that pays expenses. And unless there is a change, the land will become no richer or cleaner. We must have very cheap labor and high prices for produce before such crops can be profitable. Now, what I would do would be to divide the 20 acres into two fields. Plant one to corn this year and pasture the other, planting it to corn the year following. Put as much labor on the 10 acres in cultivating corn as would have been expended on the twenty. The five acres of oat stubble, instead of planting beans I would summer-fallow for wheat. Although the oats were a fair crop, the thistles were so numerous that only a portion of the field could be bound into sheaves. If planted to beans, a great deal of labor would be required in hoeing, or else the thistles and other weeds would lessen the crop one half, and render it a difficult and unpleasant task to pull the beans. In either case, there is little chance of the crop paying expenses on such land. The fifteen-acre field of two-year-old clover sod I would pasture till the first week in June; then plow up five acres and drill in beans immediately after the plow. The other ten acres I would plow up and summer-fallow, and then sow the whole 15 acres to wheat in the fall. The 15 acres of corn and potato land I would sow to barley, and seed it down heavily with clover, and give up sowing it to wheat next fall. The 15 acres of clover mown for hay and seed I would pasture lightly till July, and then break it up and give it a good "fall-fallowing" and sow it to barley in the spring of 1871, and sow it to wheat afterwards, seeding it down with clover. You would thus have, in 1870,

15 acres wheat, now on the ground, seeded down,
10 acres of corn,
5 acres of beans,
15 acres of barley, seeded down.

In 1871—10 acres summer-fallowed wheat,
5 acres wheat after beans,
15 acres barley after fall-fallow,
10 acres barley in oats after corn, seeded down,
10 acres of corn on old sod.

"But you are making me plow more instead of less." At any rate you will have less corn to hoe and fewer "nubbins" to pack. The summer and fall-fallowing is work that can be done with the teams, and if you do it thoroughly it will make the land clean and mellow, and you may reasonably expect good crops of wheat and barley and splendid crops of clover afterwards. Raise only what potatoes you want for a year or two till your land gets clean and full of clover roots. When it is rich enough to produce 200 bushels per acre, you can plant potatoes with considerable profit.

The increased yield of corn, barley and wheat is only one of the benefits resulting from this thorough working of the land. It will give us splendid crops of clover and rich grass, and this will enable us to keep more and better stock. Many farmers say it does not pay to keep stock, and in point of fact, they are very often in the right. I can hardly see how it pays to keep a wether sheep three years and six months, getting say $7 for the three fleeces, and then selling him for $3. But I think it must be quite as profitable as to keep a steer the same length of time and then sell him for $50. Such a steer will eat as much as eight or ten Merino sheep. But the truth is, we cannot expect to make anything by keeping stock of any kind unless we keep it well; it must be gaining all the time. If we let a machine lie idle all that we lose is the interest on the money which it cost. But an animal cannot be kept idle. It must *eat* every day; and if it gains nothing we lose all the food and the interest on the value of the animal machine besides. But many farmers not only keep them for weeks and months together without their gaining anything, but it not unfrequently happens that the animals actually decrease in weight. It has to live on its own flesh and fat—which is certainly a very expensive food. Even in the case of well-fed pigs, which store up more flesh and fat for the food consumed than any other domestic animal; for every pound of flesh and fat we get in the animal, they eat about five pounds of food. They use four pounds to live on and give us one pound. And when we have got this one pound, how excessively wasteful it is to feed it to the animal and have it worked over again; and yet this is precisely what thousands of farmers are doing to-day with cows, sheep and pigs. No wonder that "keeping stock does not pay." But good stock, fed liberally and with care and judgment, will pay better, all things considered, than any other branch of farming. Good meat brings a good price, and is always in demand. It is the "scallawags" that are hard to dispose of, and always at a loss—a loss to the producer and a loss to the consumer. Those who buy such meat get little besides bones and water. The poor animals have had to live on their own fat and their nutritious juices.

The first step in keeping good stock is to make the land dry and clean. The next is to feed liberally, and this will insure good manure, and that in its turn insures good crops.

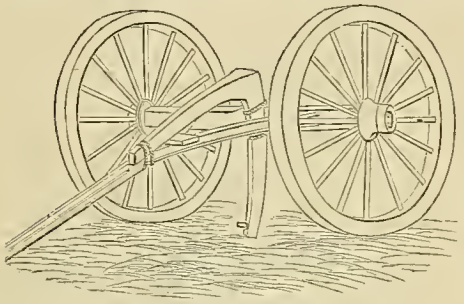
It is all very well to say that a "peck of clover seed to the acre is the cheapest fertilizer," and that by its free use we can dispense with manure. I do not dispute the truth of this proposition. No one thinks more highly of clover than I do. But it only tells half the story. Clover makes good food and good manure too. An animal will take out the food, convert it into valuable products, and leave the manure behind. Our aim should be dry, clean land, more clover and rich grass, more and better stock and more and better manure.

It cannot be too often repeated, however, that the value of manure depends on the food and not on the animals. A raw-boned steer, if it has the same food, will make as rich manure as the best Shorthorn in the Herd-book; and the droppings from a Merino sheep living on clover-hay and oilcake are just as valuable as those from a Cotswold. But this is the point: We cannot feed clover-hay and oil-cake to a Merino with half the profit that we can to a Cotswold. The former is adapted to live on comparatively poor food and grow slowly; the Cotswold has been bred with especial reference to rapid growth on rich food. So when we advocate keeping well-bred stock, in order to make rich manure, we do so for the simple reason that we cannot afford to feed rich food to poor stock, and without rich food we cannot have rich manure.

Use of the Plow in Digging Ditches.

No ditch-digging machine has yet been introduced. There are some for which great claims are put forth, but we must wait before they become common articles upon the farm. Meanwhile ditch digging must go on by spade and mattock, pick and scoop. We may, however, greatly facilitate the operation by employing the labor of horses or oxen with plows. There are several difficulties to be obviated. It is hard to plow a furrow on a sufficiently straight line; this may be accomplished by stretching a cord and turning over a narrow line of sods with a spade, exactly where the ditch should be. The cattle will follow this line of themselves, when they could hardly be driven exactly along a line of stakes. To use the plow economically, one needs a pretty strong force of diggers and pickers, and to have them well scattered throughout the line plowed. Two pairs of oxen make the best team, probably. Two furrows are turned out, 12 inches wide, and 9 inches deep. Then if the sods are cleared away, the plow may lift another furrow-slice out on each side, but probably it will only loosen the dirt and make it easy shoveling. This will stir the soil down some 4 to 6 inches, and when it is cleared out the ditch will be 13 to 15 inches deep, with ridges of earth and stones along both sides. The oxen will not easily be made to walk longer in the furrow, and without very long yokes they will not go one on each side of it. These are sometimes used, but we are informed that another plan is practised in some places with great success. The two yokes of oxen are attached abreast to the pole of a cart, the body being removed. They draw by chains made fast to the axle, and the tongue is supported by a light ash or hickory pole, lashed firmly to the yokes of each pair of oxen. The earth is thrown out from the ditch on each side, and the length of this pole is such that the inside ox of each pair walks on the inner side of the ridge. The plow is attached to the axle-tree. The chain may be fastened to the axle-tree itself, but it is far better to use an oak knee, as shown, which is lashed forward to

the tongue and hangs below. In this consists the chief merit of the whole arrangement, for by it the plow can be drawn at any depth below the surface, provided it be wooded so that the handles do not interfere with the sides of the trench. Any wheelwright will alter the wooding of a plow, or new wood it so that it shall have but one handle, and that directly above the furrow. The plow is fastened to the end of the knee in which a pin is set, by a rather short chain at first, which may be lengthened afterwards. The hight at which the draft for the plow should be is regulated by raising or lowering the knee, which is not only chained by one end to the tongue, but also to the axle, and is made higher or lower by blocks laid across under it, resting upon the spreading fork made by the tongue, where it joins the axletree,



KNEE FOR DITCHING PLOW.

and shoved forward or drawn back, according as one wishes the draft chain higher or lower.

It will be necessary to change plows as the depth increases. There are several plows so arranged that very narrow mould-boards may be attached, and after these, the subsoil plow may be used until little besides "finishing" remains to be done. In stony land men with crowbars and pickaxes must attend and take out stones as fast as they are touched by the plow.

The Geddes Harrow.

Some of the readers of the Agriculturist having found difficulty in making the Geddes harrow, we wrote to the widely-known and justly-honored farmer of Fairmount asking information

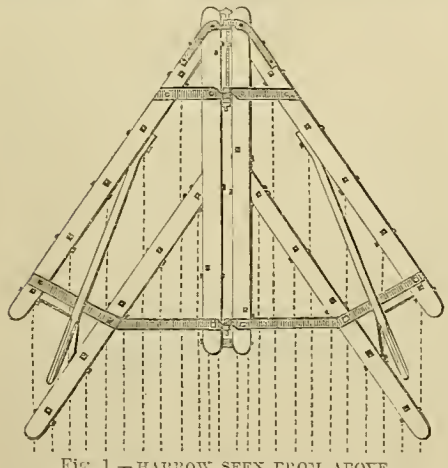


Fig. 1.—HARROW SEEN FROM ABOVE.

as to the best mode of constructing it. He replied promptly and in full, and at his suggestion a harrow was ordered for us with the few improvements which years of use have brought about. This harrow has been drawn and engraved with care, and may well serve as a model for the construction of others.

Figure 1 is a top view, showing the construction; Figure 2 is the harrow seen in perspective; Figure 3 is the harrow folded back, the handles strapped together, in shape for transportation. We find that in this form, unwieldy and heavy as it appears, it may be rolled about, pitched carefully end over end, loaded by one man into a cart or wagon, or drawn with ease

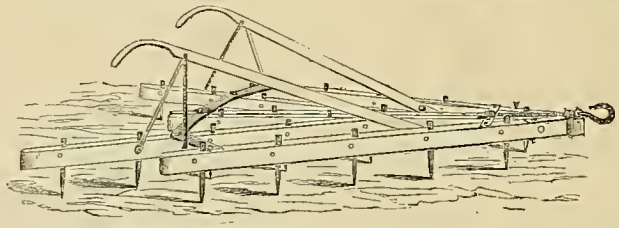

Fig. 2.—PERSPECTIVE VIEW OF HARROW.

upon the ground. This alone is a very strong argument in favor of handles instead of ropes with which to lift the sides and clear the teeth of clods or obstructions without stopping the team.

LETTER FROM HON. GEO. GEDDES.

"The harrow called by my name was invented by me perhaps 35 years ago. The leading ideas in my mind were that the line of draft should pass through the center of the harrow, and that on each side of this line of draft there should be the same number of teeth, and that the teeth should be so placed that each side would have just the same amount of leverage or lateral pressure against the center line. The object of this arrangement was to secure a uniform forward motion without lateral vibration; the teeth also to be so placed that those in the hindermost timber should cut exactly in the center of the spaces made by the foremost row of teeth. To accomplish this, the center of weight, of work or resistance, and the line of draft, must exactly coincide. But there must be no vibration, that is, the harrow must move directly forward without jerking from side to side. If there is any essential lateral vibration, the teeth cannot move with any approach to regularity or accuracy, and cannot harrow the ground evenly. The well-known square (sometimes called Scotch) harrow violates the principles that I aimed to follow accurately in my harrow, for it constantly vibrates, more or less. The best Scotch harrow that I ever saw had so many teeth that if the machine could be made to move directly forward, the marks of the teeth would have been only two inches from center to center, whereas in practice they constantly left spaces on hard land of five inches wide unharrowed. The harrow also had a tendency, on hard land, to move too much in the direction of the length of the timbers, because it had more teeth on one side of the line of draft than on the other.

"All harrows clog up on land having clover roots, stubble, etc., that has not been perfectly plowed under, and it is often necessary to clear away this matter. To do this on new land, that had some roots broken off from the stumps, I have in my early days been compelled to unhitch my horses from a Scotch harrow to clear the forward part of it. In my harrow I tried to overcome this difficulty, so I put a joint exactly in the line of draft, reaching from the hook, by which it was drawn back through the harrow. This joint is open and works on hinges, that allows either half to be turned *up* but not *down*, and laid over on the other half, where every tooth can be cleaned whenever necessary.

"Persons have often tried to make a harrow the two sides of which would fold together, both up and down. This cannot be done without having the center of the harrow liable to be lifted up by the power necessary to draw it.

"The whole object of this longitudinal joint is to enable the user to clean with ease every substance that might get among the teeth and thus obstruct the perfect working of the harrow. It is some advantage to have the center part of the harrow bend down into a dead furrow or other hollow, but the cleaning is the important matter.

"To enable the driver to lift a side of the harrow when in motion, handles similar to such as are used on corn cultivators are now commonly put, one on each half of the harrow. By having these handles it is not necessary to stop the team to clean the harrow.

"To avoid the rising up in the middle when in use, the longitudinal timbers that make the joint should be only one inch apart, with two bolts, one in the rear end of each stick, near the lower side, with large heads projecting, so as to meet when the harrow is level on top. The hinges should be on the top, and the hook to draw by should form a part of the forward hinge.

"You will see that I adopted the idea that an equilateral triangle presented the best form to carry out my views. None of the old engravings show my harrow as it now appears with the handles, which I consider a great improvement. I have no interest in making these harrows as

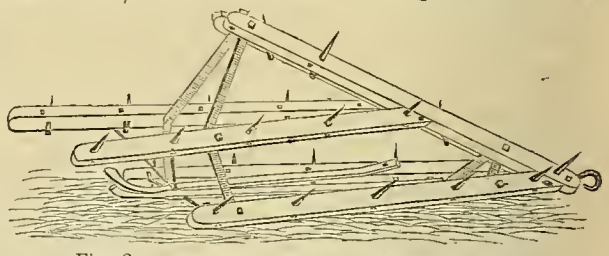

Fig. 3.—HARROW FOLDED FOR TRANSPORTATION.

I took no patent. Occasionally a friend writes to me to get a harrow made for him, in which case I put the order into the hands of a mechanic that lives near me. More than twenty years ago, I was told that a Boston agricultural warehouse had sold 5,000 of these harrows. Many years since I had a request made me to have one constructed for the government of Russia. In short, the harrow has gone into general use."

The wood is 2¾ in. Oak, the middle and outer sticks are 5 feet long, the rear ones 4½ feet; the teeth of $^{7}/_{8}$ in. square iron, 1 foot long, and the hinge-straps 2¾ in. wide, by ½ in. thick.

Action of the Frost on the Soil.

Sandy soils are not as a rule benefited by fall plowing, and by thus being more exposed to the action of the sun and frost than they otherwise would be. This is doubtless because the organic matter which is so important in this class of soils is much more rapidly decomposed and caused to disappear when thus treated. Peaty soils or those in which there is an excess of organic matter are benefited for the same reason, and because the peat becomes less pasty or fibrous, which ever nature it has, and more granular. A very marked example of the effects of frost on some organic substances may be observed in case a crop of buckwheat intended for plowing under be caught by a severe frost. Though the crop on the field might have amounted to several tons, the frost and the decompositions which follow will reduce it to an apparently valueless mass in a very short time. Little besides the stubble

is left, to appearance, and we are assured by a farmer accustomed to plowing under green crops, that not enough of value is left to pay for turning under. This we doubt, but we do believe much besides water is actually lost.

The action of freezing and thawing in clayey and heavy gravelly soils is different; while it destroys a portion of the organic matter in them, which, however, is not of such importance to them as to lighter sandy soils, it comminutes the particles, renders clods friable, and brings a larger portion of the inorganic part into a fit condition to be appropriated by the plant.

The beneficial action of frost is not due to its holding the soil in a frozen state, but to the act of freezing; consequently, thawing is almost as useful as freezing to the soil, and this useful action takes place most in moderate weather. In cold winter weather it is best for the soil to be covered with snow, which is well called "the poor man's manure," for the alternation of freezing and thawing is not altogether arrested by the covering of snow; while, if the ground is bare, the high winds of winter scatter great quantities of the finest particles of the soil.

Field Rollers.

Repeated inquiries have been addressed to the editors of the *Agriculturist* for information about making Field Rollers. There are several ways in which rollers may be and are made by farmers, but, when it is practicable, we think it far better to buy iron ones, of several sections, constructed so as to be loaded as heavily as is desirable. The simplest home made farm roller is a hard-wood log, which ought to be barked, *thoroughly* seasoned under cover, and dry; then smoothed and made cylindrical; then the centres of the ends being found, one-inch iron axles having square points should be driven into holes cut with a chisel, and should be further securely held by iron collars fitting the axles, and having two or three arms several inches long let into the wood, flush and spiked on. The roller should be two feet or more in diameter, and about six feet long. If longer it is harder to turn. It is set in a simple hard-wood frame, and it may be drawn by a chain, like a stone boat, or have a pole attached; in which case the pole must be strongly braced to the frame. After the roller is finished it should be painted, especially on the ends, with hot pine pitch as long as it will absorb it. If treated in this way these rollers are durable and tolerably good. They may be made double, like the one to be described, if sufficient pains be taken to hang them well.

A better form of roller is made of plank. Two or three circular frames of boards are made to nail the planks to. They should be of but three thickness of plank, and it matters not what the thickness of the planks is, as weight is a desirable quality. Figure 1 shows two thickness of plank, and figure 2 the end of the roller after the outside planks are put on. It will be seen that two planks cross each other in the centre of the heads, and that in these square holes are cut for the axle. The heads must be securely nailed. In nailing on the planks which form the surface in making a double roller, the inner heads are set in from the ends to give space for a wider bearing for the axles than the single plank would otherwise afford. Iron axles are used which are made of square bars of iron having their ends made true and rounded by a smith. They are inserted and keyed in place. The dimensions of the roller may vary. The one shown in figure 3 is supposed to be $2\frac{1}{2}$ feet in diameter and 3 feet 11 inches long.

The frame is best made of three-inch hard-wood sticks, in the form shown in figure 4. The rear pieces may be somewhat lighter than the front ones if desirable, but weight is a good thing. They are put together by mortice and tenon and bolted. The center piece is an inch and a quarter oak plank, six or eight inches wide, having pieces bolted to each side for bearings for the journals. The outside journals have their barings under the beams, a piece of wood being bolted on to hold them in place. The beams have holes bored in them and reamed out for oiling. Care must be taken in hanging the rollers that they stand even. A little change in position of the journals will cause them to roll unevenly and draw to one side or the other. The tongue is bolted to the forward beams of the frame as shown, and two boxes are made with slanting sides to fit into the spaces between the beams of the frame, one to go in front and the other behind. These are for holding stones to weight the roller. The weighting should be done when the team is not attached, so that it may be easily equalized. The engraving (figure 4) represents the frame of a roller having the following dimensions: Width of track, 8 feet; width of frame, 9 feet; length of frame, 5 feet 8 inches; distance between inner beams of frame, 2 feet 8 inches.

Fig. 1.

Fig. 2.

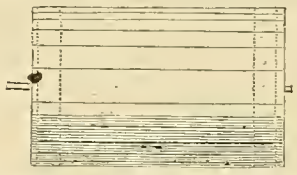

Fig. 3.—ONE-SECTION OF DOUBLE FIELD ROLLER.

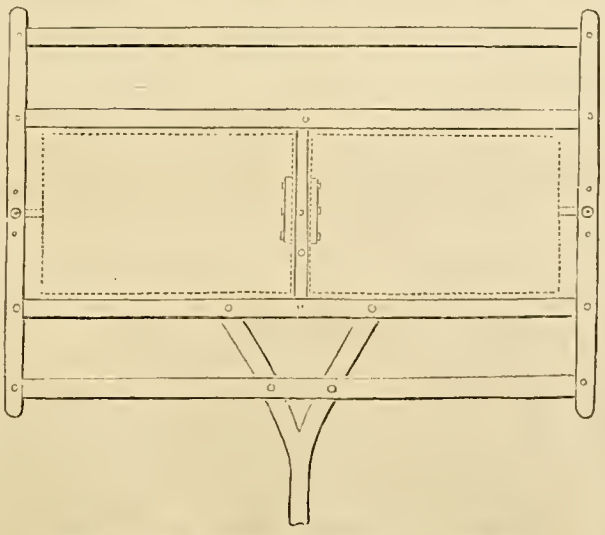

Fig. 4.—FRAME FOR TWO-SECTION FIELD ROLLER.

The place which the roller would occupy in the frame, is indicated by dotted lines; and the space on each side between the frame and ends of the sections is to allow their insertion and removal.

The Cord-Grass or "Spartina."

The materials used in making paper are numerous. We have linen and cotton in the shape of paper rags, but the supply from these sources was long ago found to be inadequate. There have been numerous inventions for using the fibre of basswood and other soft woods, as well as for the cane of the Southern States. Fibres from these sources have more or less helped to supply the great demand for paper stock. Lately, the "Esparto," a curious grass growing on the shores of the Mediterranean, has been largely used in England, and to some extent in this country, as a paper making material. As yet we know but little of its cultivation, but we believe experiments are being made with it in the Southern States. Meanwhile, one of our native grasses has come into notice, the Cord-grass, or "*Spartina cynosuroides.* This, which is shown in the engraving, is abundant along our fresh-water rivers and lakes, especially at the North, and actual experiment has shown it to be a valuable paper stock. In a report to the Commissioner of Agriculture, Mr. Jas. Woodruff, of Quincy, Ill., says: "It is much superior to straw, yielding, when properly treated, a much stronger, longer, and softer fibre, and a much larger percentage of stock. Its cost, delivered at my mill, during the past two years, has been about $5 per ton." Mr. W. says that experts who have worked the two consider the Cord-grass a better material for paper than the "Esparto." There are doubtless many hundreds of acres of otherwise unavailable land that might be devoted to this grass, and the matter is worthy the attention of both paper makers and those who have land adapted to its culture.

CORD-GRASS.

Breeding the Mink.

In response to a call for information in regard to the breeding of the Mink, several letters have been received; the most explicit of which, from D. C. H., North Tunbridge, Vt., is here given:—

"I purchased one female and her litter of five, two males and four females in all, and constructed a building of rough boards, ten by fourteen feet, for a minkery. It had a floor tight enough to prevent the escape of the animals; was properly ventilated, and divided into six apartments, one of which is an ante-room into which to step from the outside and close the

door. Water is supplied by a lead pipe running in at one side, through all the rooms, and out at the other into a trough where small fish are kept, and occasionally given to the minks. They were kept together until December the 18th, when the males were put in an apartment by themselves. On the 10th of March each male was put in with a female, each pair separate, and after a couple of days one of the males was put in with another female, and finally with the third. The other male paid no attention to the female he was with, and I think is disabled.

They were separated about the 1st of April, each female being kept alone and supplied with a suitable box, with warm material for a nest.

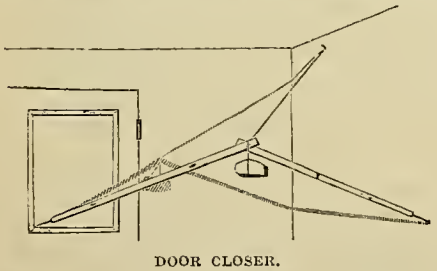
When it was supposed they were about to bring forth their young, they were disturbed as little as possible; anything to excite them at this time, should be avoided, for when irritated, they will sometimes eat their young.

The first female put with the perfect male brought forth seven, one of which disappeared after they began to crawl around out of their nest. The other two females had each a pair, all of which (but the one mentioned) are now alive, fine, fat, sleek fellows, and fully grown. They are very easily kept, being fed once a day upon warm milk with wheat bread crumbs, a quart sufficing now for the whole lot, and once upon fresh meat, care being taken not to overfeed. Any kind of meat and offal that is not too fat will answer. They are very fond of beef liver, chickens' heads and entrails, woodchucks, (being careful not to give them the gall on the liver, which is poisonous,) rats, mice, etc.

They are more easily cared for than one hog, and much more cheaply kept. Nothing was paid out for meat for them, until after the 1st of July, when a contract was made with a butcher to leave a bullock's head once a week. I am confident that the increase of the minkery would have been fully one-third more if both the males had been perfect. I intend to keep them in pairs hereafter. They are not easily handled, but struggle when caught against their will, and exude a thick fetid substance from glands near the vent. They will bite severely, but can be handled safely with thick buckskin gloves."

Shut the Door!

How often is it necessary to repeat the injunction—Keep the Door Shut? It is as desirable for stable doors as for house doors, and though for the house we have a great number of convenient contrivances for keeping the doors



DOOR CLOSER.

shut by weights and springs, for stable, henhouse, and other similar doors, we have never seen anything but the awkward cord and weight, either working over a pulley, or, so to speak, *gate* fashion. Occasion necessitated a door-closer of some kind, and we contrived, from materials at hand, the affair shown in the accompanying sketch, which works so well, that we think it worth imitating.

Two hard-wood sticks, 20 inches to 2 feet long, with sharp awls inserted in one end of each, are fastened together near the other ends with a long screw. A light weight, in proportion to one which would be required to shut a door by the cord and pulley system, is attached to the screw. The awl of one leg of the "shears" is set in a little hole, made in any convenient place, about in the middle of the upper part of the door, and the other leg is similarly placed, either in the wall in which the door is, or in a wall at right angles to it, and against which the door opens. The *shears* are held in place by being fastened by a cord to the wall in a position inclined forward a little. The holes in which the pins are set must be reamed out so that when the door is opened they will not bind. A block must be fastened to the floor to prevent the door opening too wide; but in case it is desirable to have the door swing wide open and back, the apparatus may be attached to the door and to the wall by hooks and eyes screwed in.

Ogden Farm Paper—No. 1.

Having, in Ogden Farm, such an opportunity as does not often come to American farmers, to try the value of improved methods of agriculture, it has occurred to me that many points which its management suggests might be of interest to the readers of the *Agriculturist*.

The essential facts of the case are these: I took, probably, the poorest, the most run-down, the wettest, and the least promising farm in the County, and took it because it had these faults, intending to make it the best, and to make money by the operation. I am fortunate in having an associate in the matter who has an ample capital, and is liberal in the use of it, and who has the sense to know that the *best* way is the best in farming as in everything else. With this much of personal explanation, we will turn to more important matters.

The draining of the farm, its barn, and others of its features have been sufficiently described in these columns, but there is a daily life on every farm that is worth more attention than it usually gets from agricultural writers, or, for that matter, from any one else. The making of plans, and the unmaking of them; the actual execution of some and the total abandoning of others, with the reasons that influence us in each case; the successes and disappointments; the pleasures and the discomforts of farming—these are, after all, what help most in the development of the farmer, and through him, of the farm too. The first question that arose after we got fairly started, came from a half-quizzical friend, and was, "What kind of a farmer are you going to be?" This question might have been answered in many ways. I might have said "Stock farmer," or "Truck farmer," or something of that sort, but as my plans were not definite on that point I said (the only thing I was sure of) that I was going to be a "Book farmer," and having said it, I have stuck to it ever since. I am told that there are men who think that the only things worth knowing are the things that they themselves happen to know, and I am happy to have as high an opinion of the common sense and liberality of mind of these men as they, in their self-sufficiency, have of me and of others who realize the importance of learning from the written experience of others. I yield to no one in appreciating the value of the knowledge and skill that come only with experience and "hard knocks," but I do not believe that these can ever produce their best results without the aid of a knowledge that can be obtained *only* from books; and, acting on this belief, I mean to make Ogden Farm prove or disprove its soundness.

The work of improvement was barely commenced when another friend asked, "What is to be the *solvent?* you are going to make a productive farm; how do you mean to convert its produce into money?" The answer to this question—which should be the vital one with all beginners—was not reached for a long time, not until the whole ground had been conned over and over again, for here, at least, there must be no mistake. It costs so much to prepare for any special industry—and special preparations are usually adapted only to one branch of farming—that it was of the last importance to decide on something that I would be content to adhere to to the end. It was necessary, therefore, to look to the very end, and to consider the circumstances of each future year of the operation. I had this basis to go upon: My land had been exhausted by a long series of robberies that had sapped its very vitality. Henceforth it must take in much more than it should be called upon to give out. Much was to be hoped for from draining and deep cultivation, but in addition to all this the impoverished soil must receive manure from abroad. So, in due time, the question was answered. Butter should be the solvent, because in selling this I should sell absolutely nothing that would be of value to the soil. Its constituents all coming from air and water, the poor, tired soil would have a long ten years' rest from its labors and would be helped to regain its lost force. The details of the plan included *heavy over-stocking* and *fancy prices.* The one should help the improvement of the soil, and the other the money income. The two fundamental themes of the project were these:

1. There is hardly a limit to the productiveness of land. If 50 cows are put upon 50 acres, and kept in good condition by buying food at the outset, their manure will in time make the land rich enough to support them, winter and summer, without buying.

2. *Extra price is all profit.* Given all the appointments of a good dairy, it *costs no more* to make butter worth 75 cents per pound than 50 cents per pound. No more cows are kept, no more and no richer food is consumed, and no extra help has to be hired. In my neighborhood butter *costs* about 30 cents to make; at 50 cents there is a profit of 20 cents, and at 75 cents there is a profit of 45 cents. The 20 cents is earned by the investment of capital and labor; the extra 25 cents by care, skill and neatness.

Therefore, I arranged to keep butter-making cows, and provided for their comfort by building a barn in which it would be easy to keep them in the best condition (by "soiling" in summer and steaming in winter), and to save their manure under cover. The plans of this barn are shown in the *Agriculturist* for October, 1869.

I have said that the farm was to have a ten years' rest. What I mean is this: It is charged with no extra burdens; it has no expensive family to support, only the household of workpeople who are necessary for its improvement; and it has no income to pay (except interest on borrowed capital), as neither my associate nor myself is to receive any compensation during the course of the improvement; all income from the business being invested in improvements on the farm, or in some other manner so as to produce interest until the expiration of ten years,

when the whole concern, farm, stock, implements and investments are to be sold at public auction. This will afford almost the only opportunity possible for determining the extent to which the operation has actually made or lost money. The amount of profit to be divided, or the amount of loss to be made up will be the best test as to whether the work at Ogden Farm has been practical farming or not, for if it does not *pay* it cannot be considered *practical*. It is proper to say here that the land is so situated that it is not likely to acquire a "fancy" value as building sites, and any increase in price from natural causes will be shared by all farmers in the better settled parts of New England.

At the same time we shall, no doubt, make some money from sources that are not open to all farmers. If we did not, we would be eminently unpractical, for we have some opportunities that others have not—offset by some temptations to extravagant expenditure from which others are free; and, in considering the whole question, it becomes necessary to define what is a "practical farmer." I give that name only *to the farmer who makes the utmost of every advantage he has or can get.* A man may rise with the lark and work until dark; may be the best plowman, the best stock-feeder, and the best foreman in the world, and yet, if he lets his manure heap slip through his fingers, or raises corn when he should or could raise roots, or raises grass when he should raise corn, or buys costly tools and leaves them to rust and rot away out of doors, or invests money in bank stocks when he should invest it on his farm, or cultivates wet land which he might drain, or keeps poor stock when he might keep good, or sells in a poor market because he had not informed himself as to a better one, or cultivates two acres to get a crop he might more cheaply raise from one, or does any one of a dozen other things that many farmers do, as a matter of course, he cannot be called a practical farmer. A man who cultivates his farm and does not at the same time cultivate his mind, is a very unpractical farmer, for *his wits*, if well brightened and shrewdly used, are worth, as a source of income, more than all his teams and tools. The only way to be practical is to make every acre, every hour, and every faculty, what we know and all that we can find out, *tell on the final money result*, and on the increased *money-producing* power of the farm. Farming is a *business*, and its success is to be measured by the money it makes—as is the success of any other business.

Ogden Farm was taken in hand September 6th, 1867, when its sixty acres were divided into eight fields, besides the orchards, garden, yards, etc., about the house and barn, these containing some four acres. There was not a field on the whole farm that was not oozing with water for a fortnight after every rain, not one that would produce a ton of fair hay to the acre, not one that would, after deducting the cost of manure and cultivation, pay the interest on its value. The outgoing tenant could not pay his rent, and "Poverty Farm" could not have found another tenant who could afford to pay the taxes. The buildings on the place were not worth $500, and not one of the interior fences would turn an enterprising calf. It was in one sense a most unpromising place, but it was one on which the judicious expenditure of money offered the best results, for the land was "strong," smooth, and free from large stones. Newport, a good market, is only four miles distant by a good road. The beach (from which sand and sea-weed are procured) is only two miles away. If it would pay to improve any farm it would pay to improve this one. So the work was vigorously commenced; the whole place was underdrained with tiles, an excellent large barn was built, the house was remodeled and made comfortable, and other necessary buildings were put up. The interior fences are removed (or soon will be), so as to throw the eight original fields into one, which is divided (by imaginary lines only) into six sections of nine and a quarter acres each. In this manner unnecessary headlands are dispensed with, and short furrows in plowing are avoided.

All this has cost money, and as yet the result bears a trifling proportion to the outlay. But it is too early yet to speak of results, the only point aimed at is to secure the best result at the end of the ten years, and, in that view, what is now most necessary is to put the whole farm on such a footing that its producing power may speedily become as large as possible without calling for an injudicious expenditure of capital. The draining is complete, and it would be difficult to find a heavy soil any where that can be worked sooner after a hard rain, or which better shows the effect of manure; but fully one-half of the land is in other respects unimproved, and only about eight acres of it is in what may be called excellent condition. From the growth of the past season, I have no doubt that this eight acres, devoted exclusively to soiling crops, would fully support twenty cows from May 15 to Oct. 15. When the whole farm is in like condition, (and it was originally all of the same character) it will produce enough to supply fifty cows and four horses with their entire summer and winter food. Nor do I believe this will be the end, for the manure of these animals reapplied to the land on which their food was grown cannot fail to increase its fertility until the produce is only limited by the labor at command, and by the quantity that can stand on the ground—and I know of no instance in farming in which this limit has been attained on any considerable area.

Draining was of the first consideration in the work of improvement, but hardly second to it in importance was the question of Manure, and this gave me much perplexity. As a general rule, it is the wisest course for beginners to follow the custom of their neighbors until some better way can be found; but my neighbors were depending mainly on sea-weed from the shore and stable manure from the city, procured at a fearful cost. The latter was bought at from $6 to $8 per cord (128 cubic feet) in livery stable cellars, whence it was thrown out by their own teamsters, and hauled home, at a snail's pace, by four oxen, not more than a cord in a day. Spread upon the land, it could not cost at average distances less than $10, per cord. At this rate it would cost $5,000 to manure Ogden farm. Sea-weed cost $3 to $4 on the beach, and on the land from $6 to $7. This, too, was too costly, and I resolved to try the effect of special fertilizing. Having seen the good effect of Green Sand Marl on land similar to my own in New Jersey, I procured as an experiment a cargo of 100 tons, costing on the farm about $500.

I cannot say that this has had no effect, and I am not sure that it will not, in time, return its cost; but I am confident that the same money, invested in stable manure, or in sea-weed, would have *paid* much better, on my land, on the old principle of "the nimble sixpence and the slow shilling." Subsequently, I bought butchers' hog-pen manure, costing about the same amount, and it told a very different story, though I am satisfied that the only place from which such manure ought to be procured is one's own barn-cellar or manure-shed, and that our most strenuous efforts should be given to increasing the home supply. Sea-weed I was a slow convert to, and I am not yet sure that it is worth, as a fertilizer, the money and labor that it costs; though its advantage as a covering—as protection against frequent freezing and thawing,—especially where snow is as unreliable as it is here, may make up the account. Indeed, the eagerness with which it is sought, and the lavishness with which it is used, indicate a confidence in its value that only favorable experience could give. I am, this season, covering over half of my twenty acres of clover with it, and shall be able, a year hence—from a comparison of the two lots—to judge of its value; but the seventy cords required will have cost $280 on the beach, and thirty-five days labor of a man and four horses, bringing the total cost to at least $40 per acre, and I am very doubtful whether the benefit will be equivalent. I am sure it would not but for the effect of the larger clover roots on subsequent crops; for after taking $40 per acre from the value of two cuttings of clover, there will be very little money left for the farmer. However, we suspend judgment on this point until the result is before us.

Farmers Should Take Enough Sleep.

Said one of the oldest and most successful farmers in this State, "I do not care to have my men get up before five or half-past five in the morning, and if they go to bed early and can sleep soundly, they will do more work than if they got up at four or half-past four." We do not believe in the eight-hour law, but, nevertheless, are inclined to think that, as a general rule, we work too many hours on the farm. The best man we ever had to dig ditches seldom worked, when digging by the rod, more than nine hours a day. And it is so in chopping wood by the cord; the men who accomplish the most, work the fewest hours. They bring all their brain and muscle into exercise, and make every blow tell. A slow, plodding Dutchman may turn a grindstone or a fanning-mill better than an energetic Yankee, but this kind of work is now mostly done by horse-power, and the farmer needs, above all else, a clear head, with all his faculties of mind and muscle light and active, and under complete control. Much, of course, depends on temperament, but, as a rule, such men need sound sleep and plenty of it. When a boy on the farm, we were told that Napoleon needed only four hours sleep, and the old nonsense of "five hours for a man, six for a woman, and seven for a fool," was often quoted. But the truth is, that Napoleon was enabled, in a great measure, to accomplish what he did from the faculty of sleeping soundly—of sleeping when he slept and working when he worked. We have sat in one of his favorite traveling-carriages, and it was so arranged that he could lie down at full length, and when dashing through the country as fast as eight horses, frequently changed, could carry him, he slept soundly, and when he arrived at his destination was as fresh as if he had risen from a bed of down. Let farmers, and especially farmers' boys, have plenty to eat, nothing to "drink," and all the sleep they can take.

A GROUP OF CALADIUMS.—DRAWN FROM NATURE.—*Engraved for the American Agriculturist.*

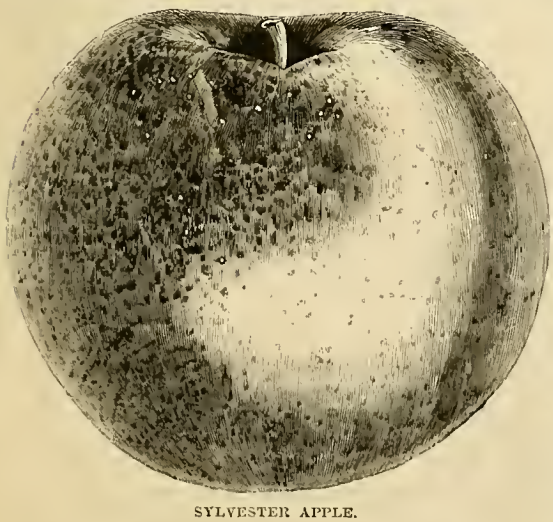
Caladiums as Garden Plants.

The attempts to follow the styles of garden ornamentation which are so successfully carried out in England are with us, for the most part, if not downright failures, at least quite unsatisfactory. Our florists import bedding plants, and with them the glowing descriptions of English dealers; the plants are tried by a few seekers after novelties, and are generally heard of no more. A few, indeed, stand the test to which our hot summers subject them, and we shall in time find a sufficient number of plants suited to our climate, with which we can produce all desirable effects. This list will, however, be quite different from the plants which flourish so finely in the moist summers of England. One after another, the plants which we formerly supposed could be seen only in a hot-house, or at least a green-house, are found to answer admirably when planted in the open ground during summer; our weather seems to remind them of their native tropics, and they flourish accordingly. Those who read of the wonderful beauty of the sub-tropical gardening of Europe need not envy the cultivators across the water. Our own climate allows of the use of a larger number of sub-tropical plants for garden decorations than does theirs. It needs only a few good examples here and there to create a public taste for this style of gardening, and as soon as there is a demand for plants of a tropical habit our florists will not be slow in supplying it. The Caladiums are now attracting attention for decorative purposes out of doors. The great beauty of their leaves, in both form and color, have long made them prized ornaments of the hot-house, but they are now to be more widely known, and we hope to see them before long as popular as their relative, the well-known Calla. The *Caladium*, (or *Colocasia esculentum*,) a very large species with enormous leaves, the bulbs of which are the chief article of food of the natives of the Sandwich Islands, has been more or less cultivated for years. The leaves of this are of a soft, light green, but other species present us with foliage of most brilliant colors and exquisite

markings. A group of the leaves is given in the engraving, where it is difficult to show much more than the form. The imagination must fill up the markings of some with rose, carmine and purple, give a pure white ground, traced with delicate green lines to others, and to a few it must give the metallic lustre of bronze. The florists offer some eighty varieties at prices ranging from 25c. to $4.00 each, according to their rarity and ease of propagation. The lower priced ones, which comprise most of those shown in the engraving, include some of the most desirable sorts. The Caladiums are mostly natives of the tropics of Asia and America; they flourish in good garden soil, but all the better if it is partially shaded. They must not be put out until about the first of June, and when the early frosts come the bulbs must be taken up and kept in a warm place. The derivation of the name Caladium does not appear to be settled, but if the plants become as popular as we think they may, it will present no more obstacles to those who have an aversion to botanical names than do Rhododendron, Magnolia and Geranium.

The Sylvester Apple.

At the State Fair held in Rochester in 1868, we saw an apple which was remarkable for its beauty, and when its originator, Dr. E. Ware Sylvester, of Lyons, N. Y., gave us a specimen to taste, we found that its quality kept the promise made by its exterior. Again, this year, we have been able to try other specimens of the variety, and considering it as deserving a wider popularity than it now enjoys, have had it engraved. The tree is said to be vigorous and an abundant bearer. The size and shape of the fruit are shown in the engraving. The skin is white and of a most delicate waxy appearance, which is lightened by the beautiful markings of crimson that are found upon the specimens, which have been well exposed to the sun. The flesh is white and very tender and juicy; indeed, upon cutting, the juice follows the knife as it does with a well-ripened pear; flavor, a pleasant subacid. Excellent for cooking Sept. and Oct. Dr. Sylvester should feel gratified at having his name attached to so good a fruit.



SYLVESTER APPLE.

The Climbing Fern. (*Lygodium palmatum.*)

The Climbing Fern is so unlike others of our native ferns, that one at first sight would hardly class it with them. Its peculiar form and climbing habit are shown in the reduced engraving, where a fragment is also given of the full size. The light brown stalk is very slender and wiry, and twines closely around small shrubs and other plants, climbing to the hight of two or three feet. Small branches are placed alternately on the main stem; these are forked, and bear at each division what passes for a single leaf, but which, in a botanical description, would be called a *frond* or *frondlet*. Each of these leaf-like bodies is several lobed, the upper ones being very much divided. The small upper ones are the fertile fronds, and upon the under side of them the spore-cases, or what correspond to seed-vessels, are borne. This is among the rare plants of the country, but it is found in several localities, from Massachusetts to as far south as Florida. One of the most abundant localities is at East Windsor Hill, Conn. The striking delicacy and beauty of this fern adapt it to decorative purposes, and it is used in its green state, or pressed and dried, when it is formed into graceful wreaths to surround pictures, attached to white curtains and the like. So popular had it become in Connecticut that there was danger that the locality at East Windsor Hill would become extinct, as large quantities were carried off yearly, until an act was passed by the Legislature forbidding its wanton destruction. The root-stalks are very slender, and the plant does not, as a general thing, bear removal well, though we have known it to be successfully transplanted and to establish itself thoroughly. *Lygodium* comes from the Greek word for flexible, and the specific name *palmatum* is in reference to the manner in which the fronds are lobed, like an outspread hand.

CLIMBING FERN—(*Lygodium palmatum.*)

Propagating the Larch from Seed.

BY D. C. SCOFIELD, ELGIN, ILL.

[Mr. Scofield, who is a warm advocate of tree-planting, considers the European Larch the most valuable tree for timber. He gives the following as his method of treating the seed.—EDS.]

"First. Two prominent difficulties are encountered in this country, which I believe are unknown in Europe; the hot rays of the sun having the double tendency to scald or heat the soil, so that it causes the plant to die at the collar, or as the phrase has it 'damp off,' as well as to scorch the tender plant as it emerges from the earth. These are overcome first, by selecting a light, sandy, dry, though rich soil, for the seed bed; and secondly, by a partial shading the first season, which may be best done by nailing strips of lath one inch apart, and placing them, one foot in hight, over the seed bed, so as to partially obstruct the rays of the sun. Any other material that will render the same amount of shade, will answer.

"Second. The soil where the seed is to be sown should be as clean from weed-seed as possible. The usual time of sowing onion seed, or from middle of April till first of May, is the time to sow Larch. It may be sown in drills, four or six inches apart, or broad-cast, and covered just enough to retain moisture until it germinates. It may be sown as onion or other seed without preparation. Clean culture is indispensable. The shading may be dispensed with after the first season. The seedlings should be transplanted either at one or two years old from the seed-bed. This should be done as soon as the weather and soil will permit, in the spring, in a similar soil to that in which they were grown, and better at one year old than two. Transplant in beds, in rows six

EARLY WYMAN CABBAGE —(See next page.)

inches apart and four inches in the row, and shade, as directed for the seed-bed. The roots should be kept from the atmosphere as much as possible in transplanting. With good seed, a satisfactory success will be realized. This method will apply with equal success in propagating any variety of hardy evergreens.

The Early Wyman Cabbage.

The market of each large city presents peculiar features not to be found elsewhere. In New York an article will sell if it looks well, no matter if its quality is inferior to that which is less showy in appearance. In Boston, people are more particular; they take the pains to learn the names and characters of the best varieties of fruit and vegetables, and are governed more by quality than by external appearance. The gardeners who supply that market have obtained, by careful selection, several varieties or sub-varieties which have a local popularity, and are worthy the attention of growers elsewhere. Boston Market Cauliflower, Boston Market Celery and Boston Market Tomato are all among the best, if not the very best, of their kinds. The popular early cabbage in the Boston market is the Early Wyman—which, for a wonder, is not called "Boston Market." The variety originated with Mr. John Wyman, of Arlington, Mass., and the seed was introduced by Washburn & Co., of Boston. The engraving on page 21 gives the shape of the head. Specimens furnished us last spring by Messrs. B. K. Bliss & Son were of large size, solid for an early variety, and very crisp and tender. It is said to bring a higher price in market than any other variety.

Tree Labels.

A tree label that will not require too much trouble to make it, and that will remain legible for a series of years, has long been a desideratum among fruit-growers. It may be that this

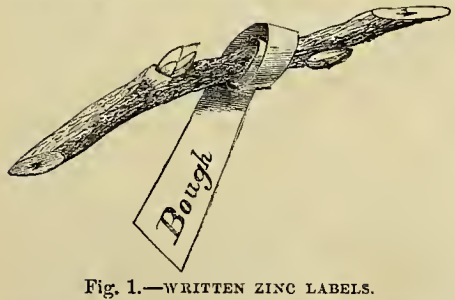


Fig. 1.—WRITTEN ZINC LABELS.

is supplied by the simple zinc label written with a common black-lead pencil. Several gentlemen inform us that they have had labels of this kind remain legible for ten or more years, and that though the writing makes but little show when recently done, in time it becomes more distinct. We suppose that the surface of the zinc just under the writing is protected by the black-lead or plumbago of the

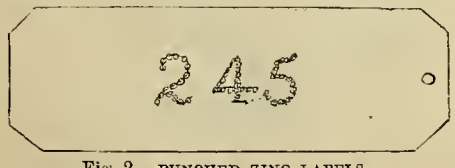

Fig. 2.—PUNCHED ZINC LABELS.

pencil, and that while the rest of the surface is oxidized by the action of the weather this remains intact; or it may be that the carbon—the best black-lead is nearly pure carbon—unites in some way with the zinc. The only objection we see to these labels is the ease with which they may be effaced when the writing is fresh, but a few weeks' exposure fixes it. The Gardeners' Monthly gives a convenient form for the label, which is shown in the engraving. The zinc is cut in the form of an elongated triangle, the point of which, when wrapped around a twig, will hold the label, and at the same time expand as the tree increases in size. Mr. O. D. Case sends us a specimen of the labels he has found to be most serviceable. He uses a tag of zinc, upon which he marks a number, and then with an awl punches holes through the zinc, following the outline of the number, as in the figure; the roughness raised by the punching is filed off. A number of this kind has the advantage that it can be buried in the ground with cuttings and cions without risk of being obliterated, but it of course requires that a record of the numbers and the names they represent should be carefully kept.

Asparagus Culture—The "Colossal."

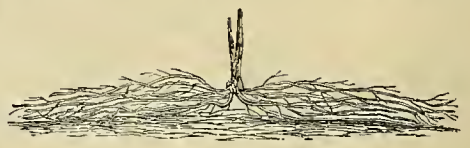
BY PETER HENDERSON, BERGEN CITY, N. J.

When, in 1867, I wrote "Gardening for Profit," I then gave it as my belief that, at that time, we had only one variety of asparagus; and that all the so-called "Giant" and "Mammoth" varieties were merely the results of superior soil or cultivation, which on being propagated by seeds or otherwise and placed in ordinary conditions of culture, would fall back to their original or normal condition; in short, that the *species* had never "broke," as we technically term it.

At least half a dozen different times during the past twenty-five years had various parties claimed to be possessors of varieties of asparagus of increased size and productiveness; these, when fairly tested, we found to be nothing better, nothing different, from what we had been cultivating. This experience necessarily made most of us skeptical to the claims of Conover's "Colossal," and when the question was asked me, as it was done some hundreds of times last season, I invariably replied that all past experience in this matter led me to believe that it was no different from the ordinary sort, and for that reason we had refused to offer the seed for sale until satisfied with full proof of the claim.

I had had several conversations with Mr. Conover on the subject, and although I had no doubt that he honestly believed all he represented, still thought him mistaken, until one day in May he walked into our store with two bunches of asparagus so entirely different in *color*, *texture* and *size* that left me no longer room to doubt, but that these were different varieties. This was one point gained for Mr. Conover and one lost for me, which resulted in an arrangement with him to go over to the farm of Abraham Van Sicleu, of Jamaica, Long Island, and there to inspect an acre of the Oyster Bay Asparagus (the ordinary kind), and an acre of his "Colossal," which Mr. Van Sicleu had planted in the spring 1868, each then one year old from seed. A thorough inspection of the roots of each lot proved that they were of the same age. The soil was next examined, and found to be as near the same as it could well be, yet these two beds of asparagus showed a difference that left me no longer a shadow of a doubt of their being entirely distinct varieties. In the old variety we found no shoot thicker than one inch in diameter and averaging twenty shoots to a hill, while in the Colossal many shoots were found an inch and a half in diameter and averaging thirty-five shoots to a hill—an enormous growth when it is remembered the plant was only three years from the seed.

Mr. Van Sicleu is well known as one of our best Long Island market gardeners, who has made the growing of asparagus a specialty for twenty years, and who has probably in that time sold more asparagus in the markets of New York than any other man. He was exceedingly enthusiastic in praise of this variety, believ-



MANNER OF PLANTING ASPARAGUS.

ing that at a low estimate it would yield a profit of at least one-third greater than the ordinary sort, under the same conditions, besides coming to maturity two years sooner.

Mr. Van Sicleu's method of growing asparagus is simple, and in some respects new to me. To begin, he sows his seeds in his rich sandy loam, in April, in rows one foot apart and two inches in depth, dropping the seed so that they may be distributed evenly about half an inch apart; the plants are cultivated by hoeing between the rows and keeping them clear of weeds by hand picking. In the spring following he sets his plants (now one year old, which in his experience, is preferable to two years old). His mode of planting is somewhat different from the usual practice, but for having a lasting asparagus bed—one that will be as good at the end of twenty years as it is at eight—it is certainly the best. It differs in putting the plants much wider apart than usual, his plants standing six feet between the rows and four feet between the plants, making less than two thousand plants to an acre. In preparing the land to receive the plants, he merely plows to the depth of a foot or so with the ordinary plow; his soft, sandy subsoil rendering the use of the subsoil plow unnecessary, but in soils less favored, the use of the subsoil plow would be of decided advantage. In preparing to plant, he turns out a furrow with a double mould-board plow, so that at its deepest part it is nearly 12 inches deep; a good shovelful of thoroughly rotted manure is then placed in the furrow, at distances of four feet, so spread that it will make a layer of three inches or so; an inch or two of soil is then thrown on the top of the manure and the asparagus planted as shown in the engraving, and so deep that its crown is seven or eight inches under the surface level. The plant is now only partially covered up with the soil, say two or three inches, until it starts to grow, when the furrows are thrown in by the plow so that the whole surface is leveled, which places the crown of the asparagus some seven or eight inches under the surface. This would be, perhaps, two inches too deep in heavy soils, but in the light, soft soil near Jamaica it answers well. The first and second seasons after planting, no asparagus is cut for market, as it weakens the crop, but in the third year a partial crop is taken, although Mr. Van Sicleu does not consider his beds to be at their best until the sixth or seventh year. Their productiveness may be continued for 20 years by his wide system of planting, recourse being had to manuring freely annually, by digging or plowing it in around the roots before the crop has started to grow, or after it is cut. The average clear *profit* annually, taking the wholesale price of 25c. per bunch, Mr. Van Sicleu estimates to be for his section (which is

not early) at $225 per acre for the older sort; the Colossal, he thinks, will run at least one-third higher, or about $350 per acre.

Some growers estimate their profits of asparagus at nearly double these rates, but much depends on location. Asparagus must become in a short time a valuable crop to be raised in the Southern States for our northern markets. A small quantity of the ordinary variety sent me (1st April, 1868,) from Macon, Georgia, sold for $1 per bunch, when the bed from which it was taken had nearly ceased bearing for the season. An acre of the Colossal variety, properly planted in such a latitude, would certainly nett $1,000 profit per acre when in full bearing. It is an article with which the market is never likely to be glutted, for the reason that we must wait a few years for returns. Beginners generally cannot afford to wait, and they grow such crops as mature the season of sowing the seeds; hence, in the great majority of cases, particularly in the vicinity of all large cities, there are often times when many articles sell below a paying price.

Boxes for Starting Plants.

Several devices, patented and otherwise, have been offered for boxes in which such plants as are injured by a disturbance of their roots may be started and afterwards readily and safely removed to the open ground. It is not improbable that it will be found profitable to forward cotton by starting it under glass and transplanting it; at all events a patent has been taken out for an apparatus for the purpose. We gave, some time ago, a box with movable partitions in which melons, cucumbers, etc., could be started in the hot-bed or window and the plants removed at the proper season without disturbing them. A correspondent, "V," Antrim, N. H., says in reference to these boxes:

"I formerly used such a one, but I have lately used *paper boxes*, which I like better. The paper of my boxes, not being entirely decayed, holds the earth firmly in its place until the plant is set out. To make these boxes, cut strips of thick paper about six inches wide and 17 long; paste the ends together, lapping an inch, which will make a circle 16 inches in circumference; then press the sides of the circle together flat, and double once, making a book of four uncut leaves; now, open with the fingers, pinch down the corners properly, and a bottomless box four inches square is the result. Place as many of these as are needed close together in a wooden box, fill with earth, and sow seeds or prick out the plants. After trying boxes of wood, birch-bark, earthenware, etc., etc., I have for two or three years fallen back upon these paper ones as the simplest and best. It is best not to have the box that holds the paper ones so high by two inches as they are, as the paper then does not decay so rapidly as in higher boxes, and holds the earth together better in transplanting.

KEEPING SQUASHES.—"Bunker Hill," Charlestown, Mass., states that he by accident discovered that squashes picked and stored in September will keep much better than those harvested later. He keeps Hubbards and Turbans until June by gathering early and placing them on the shelves of his store, leaving them there until spring. He sums up his account by saying: "Gather the squashes for late keeping between September 1st and 10th, taking only those that grow near the root; put them on the shelves where they are to be kept and keep them dry and cool. Let the remainder of the crop be the first to be used or marketed."

Notes from the Pines. No. 8.

Just now the Frost King, with ice and snow, puts a stop to out-door work and you cannot expect very full notes. One of my favorite plants is the Christmas Rose, (*Helleborus niger*) which in England blooms at the time indicated by its name, but very rarely does so here. I usually take up a clump, and pot it, and by keeping it in a room where there is no fire, have blossoms about Christmas. It is a provokingly slow grower, and this is perhaps one of the reasons, why we so seldom see it in gardens. If left in the ground, and the season is not favorable for a winter blooming, it comes out early in spring.

A row of old currant bushes which have long been innocent of shears or knife is about as unsatisfactory a thing as one can spend time over. Here were the old bushes from which it was desirable to get one more crop of fruit, as newly set ones of better varieties would not bear next year. To leave them in their present condition was not to be thought of, as their long stems had fallen over and become interlaced, and long, stout shoots of new wood had pushed their way up through the entangled mass. Some people assert that trees and shrubs should not be pruned at all, as it is "against nature." Nature is a very good thing, but I don't like too much of it, so I went at the unpromising job. Wishing only one more crop of fruit before the bushes were uprooted, almost all the new wood was cut away, and as much of the old as would relieve its crowded condition. As I was at work, a neighbor came along and watched proceedings. I supposed he was indulging in mental criticism upon the work, which, being done with a particular end in view, was against all ordinary rules of pruning. I remarked that he must not laugh at my pruning as I only wished to save the stems that had fruit buds on them. He replied that he did not know that there was any difference between buds. I mentioned it to another that it was strange that a very intelligent farmer had not observed the difference between leaf and flower buds on the currant, cherry, and other trees. Gentleman No. 2, was brought up on a farm, and carries on operations upon a large scale. To my great surprise *he* didn't know any more about buds than gentleman No. 1. Dr. K. laughs at American journals because they do not get beyond the A-B-C of horticulture. Yet here were two persons, intelligent and observing, who were not prepared to go into the a-b-abs. For the benefit of these two, and as many more as need it, I give a drawing of a portion of a branch of a currant bush which will show the difference in the buds more plainly than description. The lower portion of the fragment is two years old, the upper is one year old, or rather of one season's growth. The new wood, as it is called, is drab, and paler in color than the old, and has upon it single scattered buds, which next year would produce leafy shoots only. The lower part or old wood is darker and bears clusters of buds on short spurs, and it is these buds which produce the flowers. The engraving represents a branch of partly old and partly new wood. In currant bushes as usually grown, shoots, entirely of new wood start from near the ground, or below it, and while they will appear the finest and most vigorous, will not fruit the season following that in which they grew. In pruning currant bushes, generally a portion of these new shoots are to be retained to replace the old ones when they have become weakened by several crops.

CURRANT.

It is a misnomer to call the Arbor Vitæ an evergreen. There are some near the house which have put on their dull greenish-brown for winter. I wish they could be exchanged for some of the Hemlocks that grow on the hill over yonder, and I would give both these miserable sticky Balsam firs for one good White Spruce of half the size. Winter is the time for those who intend to plant evergreens to give the matter thought. Those which look best in summer are not always the most desirable for winter. Now is the time, also, to consider where they may best be planted, as the foliage of other trees is now out of the way.

STAKES.—Mr. J. H. Spear, Quincy, Mass., writes, that stakes that have been thoroughly salted, last three or four times as long as others. He uses pine or spruce and salt in brine as if they were meat. Those an inch thick remain in the brine four or five months.

Some of the New Annuals of Last Year.

BY JAMES VICK, ROCHESTER, NEW YORK.

[Mr. Vick, the experienced seedsman and florist prepared a paper upon annual flowers for the Horticultural Annual. A press of other matter crowded this article out and we present a portion of it here.—EDS.]

RHODANTHE MANGLESII MAJOR.—I have seen charming plants of *R. Manglesii* in Europe almost a shower of graceful rosy bells, but never anything more wonderfully beautiful than a bed of this new Rodanthe, in my grounds the present season. It is like *R. Manglesii*, except that the flowers are about twice the size, and the plant far more robust. In Western New York the summer has been wet and cold, something like an English summer, and this may have been the cause of the success.

THE PETUNIA is one of the most useful of our hardy annuals, and its improvement in the past twenty-five years has been quite marked. Only a few years since the Petunia was a poor, white, papery flower. Then small purple flowers were produced. Now we have them of every desirable color, except yellow, and perhaps blue, though some of the purples are very near blue, and both double and single. For making a good showy bed, the single sorts are the best.

There are two classes of Petunias; one of the same habit as the old Petunia, with tough, slender, wiry branches, bearing a mass of flowers, and also giving abundance of seeds. The best variety of this class is the *Countess of Elesmere*, a bright rose, with a white throat. This variety flowers so freely, and is of such a bright rose color, that it makes a bed on the lawn or a border of great beauty. It always comes true from seed. The *Blotched and Striped* of this class is also very desirable—of almost every conceivable style of marking. There are also mixed varieties of almost every color. Plants

of this section make a very long though slender growth. I have measured plants this season which covered with their prostrate branches spaces ranging from 12 to 18 feet in diameter.

The *Grandiflora* section have thick, short, succulent branches, covered with a sticky substance, very large leaves, and enormous flowers, often from four to five inches across. They flower very freely, but not as abundantly as the small flowered ones. They produce but very little seed, and none in the open ground, as a general rule, though perhaps a little could be obtained in a very dry season. To obtain seed of this fine class, the plants must be grown in pots, and kept in the house out of the way of dew and rain, and even when this precaution is taken the product of seed is very light.

Among the best of this section is *Kermesina*, a deep crimson; *Maculata*, mottled, striped and blotched in almost every conceivable manner; *Venosa*, of various colors, but covered with a network of purplish veins; *Rosea*, deep rose, generally with a clear white throat; *Marginata*, which has flowers of various colors, that are curiously margined with green.

In my Petunia house, devoted to saving Petunia seeds from pot plants, this summer I discovered a plant producing flowers that startled and delighted me; they had a pretty, deeply cut fringe. My first impression was that this fringe resembled that of the Fringed Gentian. I give a drawing (Fig. 1,) of this remarkable flower, and hope to prove, next season, that the peculiarity will be reproduced from seed.

Fig. 1.—FRINGED PETUNIA.

DIANTHUS HEDDEWIGII DIADEMATUS fl. pl.—All of which means Double Diadem Pink. This is altogether the most desirable acquisition of the year. It is of the style of *D. Heddewigii*, but more dwarf and compact in habit. The flowers are from two to three inches in diameter and when true, perfectly double; of all tints, from the most delicate to the deepest velvety purple, and of the most gorgeous markings; as the grower wrote me a year since, "Each petal is a marvel of beauty in its drawing." (Fig 2.) Only about one-half the plants produced from seeds are true, or at least give flowers that are equal to the description, but these are so good that no one would mourn over those that fail.

Fig. 2.—DIADEM PINK.

ZINNIA DOUBLE.—Three new Zinnias appeared among the European novelties last season, one claiming to be dwarf in habit, but it was no more dwarf than thousands I have had every season, and had no merit that I could discover. One, represented as quilled, proved curious and very good, though only a few of the plants produced flowers with quilled petals. For many years we have been wishing, working, and waiting for a good *double white Zinnia*. I had grown a good many of a pinkish-white, and of a dirty yellowish-white, but none that satisfied me.

A friend in Europe wrote me that he understood Vilmorin, Andieux & Co., of Paris, had succeeded in producing a good double white flower. In answer to inquiries on this subject, these gentlemen wrote me that they were laboring in this direction, and not without some success, but were not yet prepared so send out anything they had yet produced as a White Zinnia. My efforts have thus far been equally unsuccessful in this direction, yet I hope, in a year or two, not only to exhibit good double Zinnias of snowy whiteness, but those beautifully striped. I had one plant last season producing flowers as clearly and distinctly striped as the best flake Carnation; another with a row of snow-white petals, then a row of crimson, alternating though a little irregularly to the centre. Others with stripes and blotches of red and yellow. I shall watch these changes most anxiously for a year or two. If the striped flower, of which I give a drawing (Fig. 3), reproduces itself from seed next season, I shall feel that its character is pretty well established. I have already obtained everything that can be desired in perfection of form and size of flower, and have every desirable shade of color except blue, which we never expect to see, and white, which I hope to exhibit before long; while I feel quite confident that another year or two will give a collection of fine and well established striped varieties.

Soon after the introduction of the Double Zinnia, I became satisfied that it was destined to become one of our most popular flowers, being hardy, showy, and enduring in its individual flowers, and set to work earnestly to improve its character in every possible way. I am more than satisfied with the results thus far obtained, and await a year or two more of experiment with patient confidence.

CALANDRINIA SPECIOSA ALBA.—A dwarf variety, with pure white flowers in the greatest abundance, and if it kept in bloom during the whole season would be valuable. Unfortunately, the plants acted early in August as though they had fulfilled their mission, stopped blooming, and left me without the white stripe in the ribbon.

Fig. 3.—VICK'S STRIPED DOUBLE ZINNIA.

THE HOUSEHOLD.

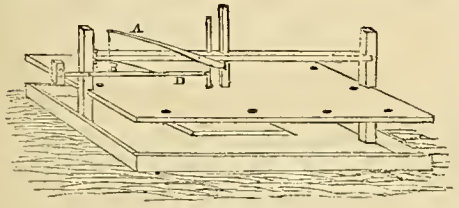
(☞ For other Household Items, see "Basket" pages.)

An Efficient Rat Trap.

BY M. QUINBY.

The engraving represents the best rat trap I ever saw. It is not uncommon for two or three of the vermin to be caught in it at once. I have caught five. The trap is open on every side so that even an old rat, cunning as he is, suspects no danger. When he is fast there is no sight or sound to tell the tale; so that after getting one you can keep right on trapping more in the same place.

The trap consists of a platform of 1½ inch plank, 2 feet square, with a low curb around it; two posts, 14 inches high and 2 inches square, are set inside the curb, midway of opposite sides of the platform; there is a second platform, a trifle smaller than the first, made to drop easily inside the curb; it has several inch holes bored in it so that in falling the enclosed air may easily escape. Notches must also be cut midway of two of its opposite sides to fit the posts which act as guides when the trap springs. The upper platform is raised by a 1×1½ inch standard of hard-wood, mortised into its centre, and passing through a hole cut for it in the cross-piece above. A hook or staple of stiff hoop iron must be screwed to this standard 7 inches from the bottom, to receive the short end of the lever *A*, when the trap is set. Just behind *A* is a rod passing up from the "pan," which is a piece



RAT TRAP.

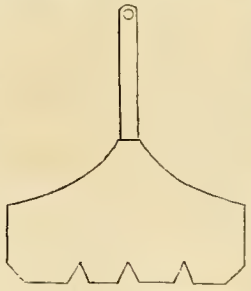
of thin, light wood, 6 inches square, and fitting very loosely in a shallow box cut for it in the lower platform. There should be a quarter-inch hole in two corners of this "pan" through which pass short, upright wires, which are fixed in the bottom but do not reach above the level of the floor. These wires will keep the pan steady when the trap is set. *A* is a lever turning easily and connecting at its extremity by a cord with the lighter lever *B*. The nearer the fulcrums of these levers can be brought to the weights, the easier will the trap spring. Just below *B* is another lever connecting at one end with the upright rod from the "pan" below, playing freely on a wire pivot in the post, and bearing at *C* a weight so adjusted as to balance the weight of the "pan" and rod at the other end.

In the cut the trap is represented as set; the upper platform raised, supported by the short end of the lever *A*, the other being connected with *B*, which in turn is so slightly caught in the notches at *D* that the least disturbance of the "pan" below will detach it and spring the trap. The distance from lower platform to upper when raised is 5 inches

Winter Clothing for Little Ones.

BY FAITH ROCHESTER.

A young child in winter needs garments warm enough to allow of its sitting comfortably on the floor. To be sure it ought not to sit there long at a time. I know it would be an uncomfortable seat for me. I should be cold and should soon get weary in back and limbs. No, baby shall sit mostly in her crib, or in a high chair beside the table. But she will want to creep before warm weather, and I shall wish to have her do so. Creeping soils the clothes, but it strengthens the back, and is a good preparation for walking. Her new garments should reach only to her toes, that they may not be in the way when dear old nurse Nature (who knows better than any one else when these advances should be made) begins to pull the little one upon her feet. She shall have long woolen stockings and home made cloth shoes. These are softer and better than the shoes usually bought for babies who have not learned to walk. It is easy to cut a pattern from a little morocco shoe. Very nice ones can be made of thick broad cloth or cloaking, lined with drilling or strong thin flannel, with the seams laid open and felled down. Her active little legs should not depend too much upon her skirts for warmth. She shall have "knee breeches" such as were invented for her little brother before it was convenient to put drawers on him. I made them of flannel cut in the shape shown in the diagram, with four little gores in the bottom (instead of gathers) and a strong tape fastened to the top, on the end of which was a button to fasten through a hole in the petticoat waist. Being outside the diaper, this strap helps to keep that garment in place. A soft, sleeved, flannel shirt to envelop the arms, chest back and bowels; a warm woolen skirt, with a loose waist buttoned behind, and suspended from the shoulders by easy straps; a lined flannel dress, cut in the pretty style called Gabriella, and a sleeved apron, complete a winter suit for our half year-old baby.



PATTERN FOR BREECHES.

There are mothers who will think this quite too much clothing for a child of that age, especially upon the arms. It is not unusual to see little girls of eight or ten years, who have never in any season worn long-sleeved dresses, a sleeved apron or sack being deemed sufficient protection from cold. Who would think of dressing a boy in that way? What sense is there in such a distinction of dress? Of late, fashion seems to be coming to the rescue, but we cannot put our trust in fashion. We must be guided by common sense. When I see the bare blue arms, and chapped knees, and pale faces of the little ones, I think there is need of mothers who are "strong-minded", in the best sense of the word.

A Codfish Dinner.

An American resident in Rome, a consul we believe, became celebrated for his codfish dinners. He carried one of the staple articles of New England food to the Eternal City, and made famous a dish which some affect to despise. A dinner of codfish cooked by an average Biddy, and one prepared by a good New England housekeeper, present just the difference that is always to be found between things well done and badly done. So simple a thing as codfish can be spoiled. Biddy puts the fish into a pot of boiling water and lets it "wollop" until she thinks it is done. It comes out generally too salt and very tough, is served with potatoes and some greasy paste which she calls "d'hrawn butter". No wonder that such a dinner is not relished. The codfish should first be soaked in cold water, changing the water every few hours until it is fresh enough. It should not be entirely freshened, but left just salt enough to be palatable. It is then put into a kettle, covered with water and brought up to the boiling point, but not *boiled*. Let it simmer gently for 15 or 20 minutes and it is ready to serve. As accompaniment to the fish there are of course potatoes and many add plain boiled beets and carrots, and hard-boiled eggs. We have sometimes seen small bits of salt pork fried crisp and served with some of the pork fat. The proper sauce is butter, which is sometimes simply melted, but more usually made into a sauce with flour and water. This may be made into an egg sauce by adding chopped hard-boiled eggs. The fish, vegetables, etc., are served separately, and each one, being helped to his liking, mixes them upon his plate according to his fancy, the sauce being served last. Mustard, pepper and horse-radish are the condiments most frequently used. In many New England families the regular Saturday dinner is of codfish. What is left is converted into fish balls or minced fish for Sunday morning's breakfast.

Cooking of Game Birds.

A correspondent in Saratoga Co., N. Y., requests us to give some recipes for cooking game birds. This is a difficult matter, as there is so much difference in opinion as to the way in which it should be done. The old directions for a wild duck are for the cook "to run through a warm kitchen with it and serve,"—a way of expressing the idea that the duck should be very rare. Some prefer duck as rare as underdone beef, while at most tables it is served well done. In whatever way it is cooked the duck should be basted frequently in order to preserve its flesh in a juicy condition. Our correspondent asks particularly about woodcock and partridge. The manner in which woodcocks are cooked by epicures is one not likely to be adopted by persons at all squeamish. The birds are plucked without being drawn, and are hung up before the fire to roast, a piece of toast being put beneath them to catch the drippings. They require about 20 minutes, and are basted with butter and served very hot upon the toast. It is considered by "the authorities" as quite the improper thing to remove the entrails of a woodcock, but persons of other tastes cook them differently. Split and broiled quickly, well buttered and served on toast, they are so good that we can forego the delicious morsel of the "trail," as the intestines are called. Partridges, or grouse, and quail, are dry birds, and are cooked in the various ways in which chickens are prepared. If roasted or broiled, the cooking should be done very quickly, and a plenty of butter used for basting. In broiling they are split in the same manner as a spring chicken. Some dip them in melted butter and cover with bread crumbs before broiling, as this, in a measure, prevents them from becoming dry. Either of these birds makes an excellent pie, or they may be stewed with such seasoning as is preferred. A very good way to cook them as well as ducks is to prepare them as for roasting, using stuffing if desired, and place them in a stew-pan with a few slices of pork and a little water, and cook slowly. When the gravy is simmered down and browned, add more water. The birds should be turned occasionally. In this way the birds are kept enveloped in steam, and are much juicier than when cooked in the drying heat of an oven.

Wedding Entertainments.

A correspondent writes: "I would like to inquire with regard to wedding entertainments. What kind of refreshments should be served, if in the forenoon or afternoon. If not taken at the table should the guests stand or sit? Should coffee be served when wine is excluded?"—Among the few sensible decrees of fashion is that which allows the entertainments at weddings to be as simple or as elaborate as the givers are inclined to make them. A glass of wine and a piece of cake are all that are offered in many instances; in others, a table with sandwiches, salads, cakes, etc., as for an evening party, is provided, and this, especially if wines are included, is often a costly affair. A large and increasing number serve no wine, the drinks being lemonade and coffee. The character of the entertainment should depend in a great measure upon the company. If the guests come from a long distance—as is frequently the case in the country, something substantial should be provided in addition to delicacies. Where the wedding takes place early in the day the old English custom of giving a "Wedding breakfast" is a pleasant one, especially if the company is not so large that all cannot be seated at table. At a feast of this kind, cold fowls, tongue, oysters, and other substantials, are given, besides which there are salads, jellies, ice-cream, and the like, with cakes, confectionery and fruit. Coffee, excellent in quality and abundant in supply, is provided. Where it

is not convenient to seat the guests at table, they stand or sit as there may be room. At all events there should be chairs for such elderly people as may be present. Where the majority stand while taking refreshments there is likely to be less of that stiffness and solemnity which frequently attends social gatherings. We do not know that we have given our correspondent a very definite answer. Let her consider what will be the most to the comfort of her guests, and what will comport best with her means, and she cannot go very far wrong.

Washing Fluids.

In December we requested those who had found any fluid or preparation to facilitate washing, to give it for the benefit of our readers. A. D. Reed and others, send us the following: "Put half a pound of unslaked lime and one pound of washing soda in five quarts of water, boil, let it settle, and then drain off. Use a pint of this liquid to every four pailfuls of hot water. Soak the clothes for 20 minutes, rub them lightly, and wring dry; soap well and boil for half an hour; rub again, rinse in clear water, using blueing, wring and hang out to dry." This is really a solution of caustic soda. The washing soda is carbonate of soda and the quicklime is caustic-lime; when the two are boiled together the carbonic acid leaves the soda and goes to the lime, which it converts into carbonate of lime, while the soda is left caustic: i. e., pure soda, dissolved in water. Not having tried this liquid, we are not able to say what effect its continued use would have upon the fabrics.—Mrs. J. S. Sturtevant, Oshkosh, Wis., says: 1¼ pound of washing soda, ¼ pound borax, and dissolve in 4 quarts water by boiling. When the mixture is cold add about one half a teacupful of water of Ammonia (Hartshorn), and bottle for use, taking care to keep the fluid corked from the air. For use take a cupful to a pailful of water. This has for the last six years given perfect satisfaction."

Cleaning Coat Collars.

Mrs. C., Montrose, Md., writes: "For cleaning coat collars and all woolen goods I recommend the Soap-tree Bark (*Quillaya saponaria*) which can be procured at the drug stores. Break a piece about two inches square, into small bits, and pour over it a half pint of boiling water; let it stand an hour or two, then sponge the collar well with the liquor; a second sponging with clear water will clean it nicely. Both washing and rinsing water should be as warm as for flannel. We have by using this bark washed black and blue Empress cloths successfully and have cleaned hair cloth chairs, which had been soiled by contact with the head."

There are several vegetables which are in use in different countries as substitutes for soap. The natives on the North-west coast use a soap root; the Mexicans use one or more vegetables as soap, and the one refered to by Mrs. C., the Soap-tree bark, is largely employed by the Chilians. All these make a lather with water and serve to remove grease without injury to the fabric. The Soap-tree bark has been used to some extent in tooth washes and in preparation for cleansing the hair.

Cooking a Beef Steak.

Mrs. Lucy Lamb says: "The other day a nice looking, tidy, German girl came to work in my kitchen, bringing good recommendations from a family of my acquaintance. When dinner time came I asked her if she could cook the steak: 'O, yes'm,—shall I put grease under it?' Seeing that her ideas of the way of doing it were somewhat different from mine, I got out the gridiron, made ready the coals and proceeded to show her my way. In the first place I cut out the bone and trim off the superfluous fat which would otherwise burn and smoke the meat. If the steak is a good one, it is better not to pound it, as this causes a flow and waste of the juices of the meat, which ought to be preserved. Have the coals abundant and glowing, and the iron hot. Lay the meat upon the bars and place over it a cover made for the purpose. Turn the steak every half minute until it is done. Have the platter *hot* and when ready to take up, scatter daintily over its surface a little pepper and salt. Lay on the hot platter and put bits of butter over it and send to the table immediately. Now this seems a very simple thing, and many readers, perhaps, will say, 'There is no need of telling us how to broil a steak; we know that well enough.' Very true, but there may be a few yet who think the only way is to put the nice loin or porterhouse steak into the frying pan with a generous quantity of 'grease under it,' and let it simmer and stew until it is unfit for a savage, much less for one who values his physical or mental health. It is sometimes difficult to obtain good coals, when the lighter kinds of wood are used, and in such cases I use the frying-pan instead of the gridiron, but never a bit of grease. Have a brisk fire and the pan hot, when the steak is put in; turn often and proceed the same as with the gridiron. Salt should never be added until the meat is done, and the less pepper the better, to my mind."

Chicken Salad.

A lady asks for a recipe for chicken salad. The excellence of the salad depends upon the dressing and the quality of the dressing upon that of the materials composing it. To make a fine dressing there must especially be good oil and a plenty of it. Many have an aversion to olive oil, probably more from the association connected with the name than from any dislike to the taste of the oil itself. When properly incorporated with the other ingredients of the dressing it forms a rich creamy compound in which no trace of oil is visible. We have a number of recipes, but none contain the directions for making the dressing so much in detail as that of Mr. Harrison, which we quote from his book of recipes. The lettuce is not generally to be had in winter nor is it essential. The garnishing with parsley, etc., is merely for ornament, the surface being frequently left without ornamentation.

"Mix one heaping teaspoonful of pure mustard, the yolk of a fresh egg and a teaspoonful of pure white wine or cider vinegar, into a smooth paste, using a silver fork for the purpose. Measure out twelve tablespoonfuls of pure salad oil and one tablespoonful each of vinegar and lemon juice; mix the two latter together and strain them. Add to the egg very slowly, while stirring constantly, two tablespoonfuls of the oil, and when it thickens, one teaspoonful of the mixed vinegar, and thus continue alternately with the oil and vinegar, stirring unceasingly, till all is mixed, and a thick, smooth creamy paste is obtained. Have ready a cold, boiled fowl, remove the skin, bones and fat, and *pull—not cut*—the lean flesh into shreds, the size of large dice; cut into morsels an equal bulk of white, tender, crisp celery, and mix with the meat, a saltspoonful of salt, and one-half the dressing. Cover the bottom of an oval platter with the white centre leaves of well blanched lettuce, and lay the inner green leaves around the border; place the salad upon them, and pour over it the remainder of the dressing. Garnish with a few sprigs of parsley, olives, capers, and slices of hard boiled eggs, neatly arranged around the border. If celery cannot be had, use white cabbage, mixed with a teaspoonful of Extract of Celery."

To Restore Faded Black Lace.—In many a housekeeper's bureau drawers, lie old black lace veils, edgings and head dress, faded and rusty, yet not worn out. By a simple process they can be quickly restored to their pristine beauty. Strain off some black tea from its leaves (having made it too strong to drink), let it cool until milk warm, pour over the lace, and let it stand several hours, then squeeze it very gently, dipping it frequently into the tea, until it shows that the dirt has been extracted. While the lace lies in the tea, boil a little more with a piece of gum arabic, the size of a small "marble," when cool to the hand dip the lace in it for a moment; then clap it in the hands, until nearly dry, carefully pulling out the edges. Pin it over a pillow on which you have spread a newspaper. Let it dry for several hours or even days. Take the pins out, leaving the lace on the paper, remove from the pillow, cover with another paper, and iron with a *coolish* flat-iron. The lace, if not worn out previously, will look as good as new.

Improvement in Farmers' Homes.

There has been a very great change for the better in the homes of all classes of our people within the last thirty years. We think quite a large share of this improvement is found in the strictly rural districts, and is fairly the result of the opportunities and privileges of agricultural life. The average rural parish is the equal of the city parish in intelligence, in good morals, and piety. Social life has not so much show and brilliancy, but quite as much solid happiness. The children coming up in the country have a much better chance of sound health, of a good education, and of a useful career in life. The division of labor, brought about by the introduction of manufactures, has blest the farmer almost as much as any other class. He no longer provides his own clothing or makes his own furniture. He can buy cheaper. The thrifty farmer in the older States has an architect to build his house, and there is taste displayed in the building and in its surroundings. He knows a good deal about fruits and flowers, and what he does not know his wife or daughter does. The flower border is quite up to the town standard. The upholstery may not be quite so attractive, but the floors are carpeted, and the windows have blinds and curtains quite enough for cheerfulness and health. The table is neatly spread, and the chinaware and other appointments come from the same manufactories that furnish city homes. The cookery, especially that part of it furnished by the mistress of the mansion, is above the average in cities. Pianos and melodeons are very common, and the same songs are heard there as in the town, and they are sung about as well. Professional singers do not go to the country for their audiences, but the country comes to them and furnishes a fair share of their appreciative listeners and admirers. There is leisure in the country, time for reading and reflection, plenty of newspapers and magazines, and the village library has its numerous patrons in farmers' homes. Farm life in this age of railroads and steamers is quite different from the life led by our fathers. It moves in the right direction.

Hints on Cooking, Etc.

Pumpkin Pies.—Mrs. S. Hannahs, Portage Co., O., says: "Pare the pumpkin, then grate it, and add sugar and ginger to taste, and milk enough to make it of the proper consistency; then line your pie-tins with crust, put in your pumpkin, and bake in the ordinary way. After trying this once, no one will, I think, wish to go back to the old way of making pies of stewed pumpkin."

Cream Pudding, by Miss M. M. F., Westchester, Mass.: 6 tablespoonfuls of flour, 1 quart milk, 3 eggs, 1 teacupful sugar, salt; take a little of the milk and stir with the flour, to make a batter, and boil the remainder. When the milk boils, add the batter and when sufficiently cooked, take it off and stir in the eggs, beaten. Sift a part of the sugar in the pudding dish, then pour in the pudding, and put the rest of the sugar on top. Flavor to taste, and cover tightly until cold.

Mangles.—Miss E. A. C., Flatrock, Pa. The English mangles take up too much room and require too much power to find favor with our housekeepers. Some small ones have been invented, but their operation so far as we know, has not been such that they have met with any considerable sale. Here is a chance for inventors.

BOYS & GIRLS' COLUMNS.

Rambles in China.—A Fish Story.

BY "CARLETON."

I think of myself as sitting by some one of the thousands of pleasant firesides in the United States amid a group of boys and girls. We toast our toes, tell riddles and stories, and make the room ring with our laughter. As it is my turn to give a story, I shall tell you, my young friends, about what is going on right down beneath our feet in China. I was down there a few months ago. It is a country where old men as well as boys fly kites, walk on stilts, and amuse themselves by making enormous paper dragons, with bodies like snakes, fifty or one hundred feet long, and as large as a flour barrel, with huge claws and great mouths wide open, and goggle eyes flaming with fire. The lanterns that light the streets of the cities are as large, almost, as hogsheads. In that country there are several million people who live in boats, sleeping in drawers built into the sides of the boats. They hatch ducks and chickens in ovens, rear them in flocks,—letting them into the water two or three times a day, just as you are let out of school at recess for a grand frolic. The master calls them back by a whistle, and gives the tardy ones a good drubbing for being behindhand. Possibly some of you could tell me a story about being late in from recess.

The Chinese are ahead of us in some things, especially in catching fish. Years ago, when I was younger than I am now, I loved dearly to go-a-fishing. There was nothing that so set me on tiptoe. I remember the first fish I ever caught, it was a horn-pout, with a mouth split from ear to ear, only I never could find his ears; it was wide enough for him to swallow himself! He had long smellers, and was a tremendous fellow. My alder fish-pole bent almost double as he pulled and tugged at the line, but I got him into the boat at last. Didn't he bounce around? I have seen whales since, but he was bigger than a whale—at least so I thought then.

The fact is, he was a little fellow, and my father took the conceit out of me by saying, he wasn't worth dressing; but I carried him home, and had him go into the frying-pan, and there never was a sweeter morsel than he made. *I* caught him, and that was what made the breakfast one of the best ever cooked. What we accomplish ourselves is of more value to us than what others do for us.

The Chinese are very fond of fish, and hundreds of thousands of people fish for a living.

Let us in imagination think of ourselves as being in China, sailing up the great river Yang-tse, which, you will see by looking at your school atlas, is nearly as large as the Mississippi. It rises in Central Asia, and flows through the heart of the Empire to the sea. You see a great many boats filled with men, women, and children. The boats are their homes. They live in them from childhood to old age—father, mother, grand parents, and children, with pigs, ducks, chickens, cats, and dogs.

Two boats sometimes move side by side, a few rods apart, with a long net or seine between them: after rowing a while, they come together, draw in the net, and take out the fish.

As you sail along the shores, you see a great many contrivances that look like well sweeps. A tall post is driven into the ground just in the edge of the water, and a long pole tilted upon it reaches twenty or thirty feet out into the river. A net attached to the pole drops into the stream. The fisherman sits on the bank in a little hut not much larger than a dog's house, and every few minutes he pulls down his end of the pole, which, of course, raises the other and lifts the net from the water. If he catches three or four fish a day, he is content, for his wants are few, and it does not cost him much to live.

The Chinese catch a great many fish without hook, or line, or net. I don't believe that you can guess how they do it. Try now...."*By driving the fish into a pen?*"

No. I have seen people do that—making a wicker-work fence of stakes and withes, and then splashing the water to frighten the fish; but the Chinese don't do it in that way... "*By a pot?*"

No; you have n't hit it. I used to do that—making a dam across a brook in my father's meadow, and weaving a basket, or pot, as we called it, large at both ends, tapering like a tunnel in the middle, with a hole leading to a box, with sharp spikes pointing in one direction set around the hole. The suckers and trout could go in, but to get out was another matter...."*By spearing them?*"

No; the Chinese do not have such glorious fun as I enjoyed in my boyhood, at night, with a pitch-knot torch flaming in a jack at the bow of a boat. How exciting to see a great pickerel with yellow sides lying motionless in the water! And then to let him have it right back of the gills and draw him in before he could tear himself away! Ah! that was fun.

As you cannot guess, I will tell you. The Chinese fish with birds...."*With birds!*"

I thought that you would open your eyes wide. Yes, with birds about as large as geese. They have sharp bills, are brown in color, and are exceedingly nimble. They are tame sea ravens or cormorants. They live on fish, and have voracious appetites. They will eat their own weight in fish in a few hours. They seem to be always hungry. The more they have, the more they seem to want. Being always hungry, they are exceedingly active. They have sharp eyes, large wings, web feet, and swim very fast. They dive as quick as a flash.

Look at that one swimming in the stream—on the watch for fish. There he goes! In a twinkling he is out of sight. Here he comes with a fish in his mouth, which is struggling to get away, but the raven holds him fast and swims to his master's boat, where he is taken aboard. He cannot swallow the fish because his owner has slipped an iron ring upon the poor creature's throat. He lays the fish down and waits until the ring is taken off, and then he can only have a morsel of fish, just enough to sharpen the appetite, and make him wide awake for more. The owner strokes the bird's head, calls him a good fellow, and throws him into the water for another venture.

Down he goes again. A minute passes. Here he comes! but without a fish. He gets a whipping now. He can have no luncheon until he catches another.

If we go into a city or town anywhere in China, we shall see large fish markets, not little sheds with here and there a table with a few flounders, perch, cat fish, pickerel or trout upon it, and a tubful of eels, as in our own markets; but we shall see great tanks, filled with running water with thousands of live full-grown fish in them. They have been brought in from the breeding ponds in the country, where they were hatched and reared, fed and fattened until fit for the market. It cost but a trifle to rear them, and here they are, lusty fellows, weighing two, three, four, and five pounds. When the people come to market, they select such a fish as they want, the market man catches t in a hand-net, dresses it on the spot, and the customer carries it home for his dinner. "From the tank to the frying pan" is the Chinese proverb about fish.

We may learn something from the Chinese in regard to fish culture. Nearly all the fish eaten in the United States are brought from the sea, or caught in the lakes and rivers. A few men have begun to raise fish for the market, and have found it very profitable. It is easy to do, and there are many boys who live on farms where ponds might be made in which they could rear fish for the market, just as they now raise turkeys, chickens, ducks, geese, pigs, and sheep.

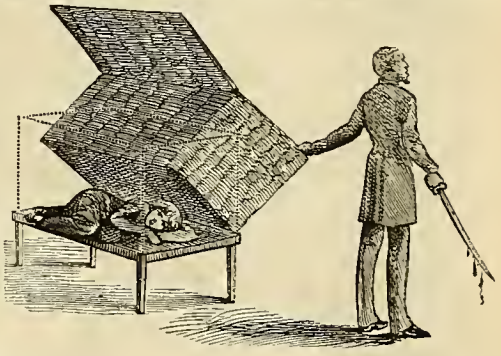
The market men would find it profitable to build tanks, supply them with water, and keep their fish alive until called for by their customers. In warm weather there would be no loss from stale, unsold fish, and then the fish would be a great deal better if cooked immediately after being taken from the tank.

I know that some of my young friends will say this is a "Fish Story." But it is true for all that, if you do not believe it, just go around to the other side of the world and see for yourselves. If you do not get away too soon, however, I shall have more to tell you about that wonderful country and the queer people that live there.

How a Palace is Lighted.—It is said that one of the European palaces burns ten thousand wax candles nightly. The candles are put in their places and connected by a web of gun-cotton, which passes from wick to wick. When one end of this chain of gun-cotton is lighted it flashes instantly from one candle to another, and all in the room are lighted at once. The gun-cotton is prepared with some kind of perfume, and at the time it burns an agreeable odor is diffused in the room. That will do very well for a palace where candles are burned, but in some of the large halls in New York which are lighted by gas, all of the hundreds of burners are lighted by electricity. A fine wire, so small as not to be noticeable, passes from one burner to another, and is so arranged as to give a minute spark at each. By a single movement of a key attached to the electrical apparatus the gas throughout an immense hall is lighted "as quick as a flash."

The Magician's Basket Trick.

Some of the performers of legerdemain show the "Mysterious disappearance of a young lady." A large covered basket is placed upon the stage and a young lady steps from the audience and is blindfolded. The performer opens the basket and tips it towards the spectators that they may see that it is all right inside. The young lady is assisted into the basket and the cover is shut down, the basket being inclined forward the magician stabs it in various places with a small sword; screams are heard, and the lid of the basket is opened when it is found to be empty. The audience usually become greatly excited, and during the confusion the young lady appears among them, and takes her place as if nothing had happened. To do this trick, two young ladies of the same size, and dressed exactly alike, are required, and both are "confederates" of the performer. The basket has two false bottoms. One in the proper place and the other folded up against one of the sides. The young lady is blindfolded as soon as she steps upon the stage in order that her features may not be remembered. When she is in the basket it is tipped forward. She lies upon one false bottom and pulls the one which was folded up against the side down over her. When the basket is tipped forward and opened, it of course appears empty, the second false bottom taking the place of the first, while it screens



THE BASKET TRICK.

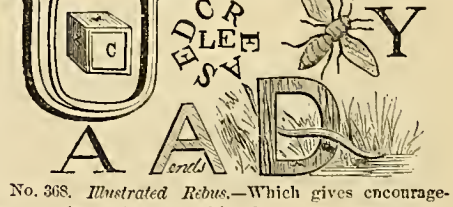
the girl from sight. The engraving shows how she is concealed. The second girl dressed exactly like the first now enters, and while she attracts the attention of the audience, the basket with the stool on which it stands, and girl No. 1, are carried off by assistants.

An Irishman went to live in Scotland for a short time, but didn't like the country. "I was sick all the time I was there," said he, "and if I had lived there till this time I'd been dead a year ago."

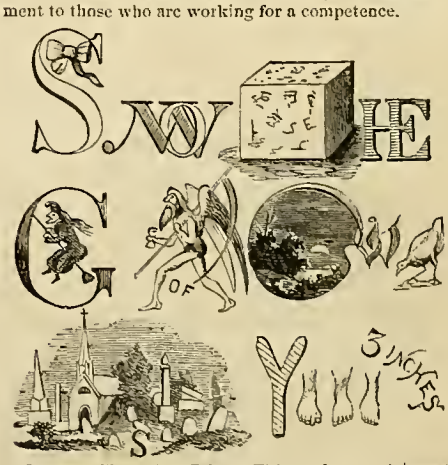
Answers to Problems and Puzzles.

We have either lost or mislaid a list of those who have sent us recent answers, but we hope this will not deter them from sending again. The following are the answers to those which appeared in November and December. No. 363. Take the B's away from Bread and Butter and they will read and utter.... No. 364. A horse, a horse, My kingdom (Mike-in-G-dome) for (4) a horse. (A H o'er sea). .... No. 365. A must dig $42\frac{6}{7}$ yards, and B $57\frac{1}{7}$ yards....No. 366. In some things all, in all things none are blest.—Things in the word some, awl-things in awl, Nun-R-bee-les-tea.

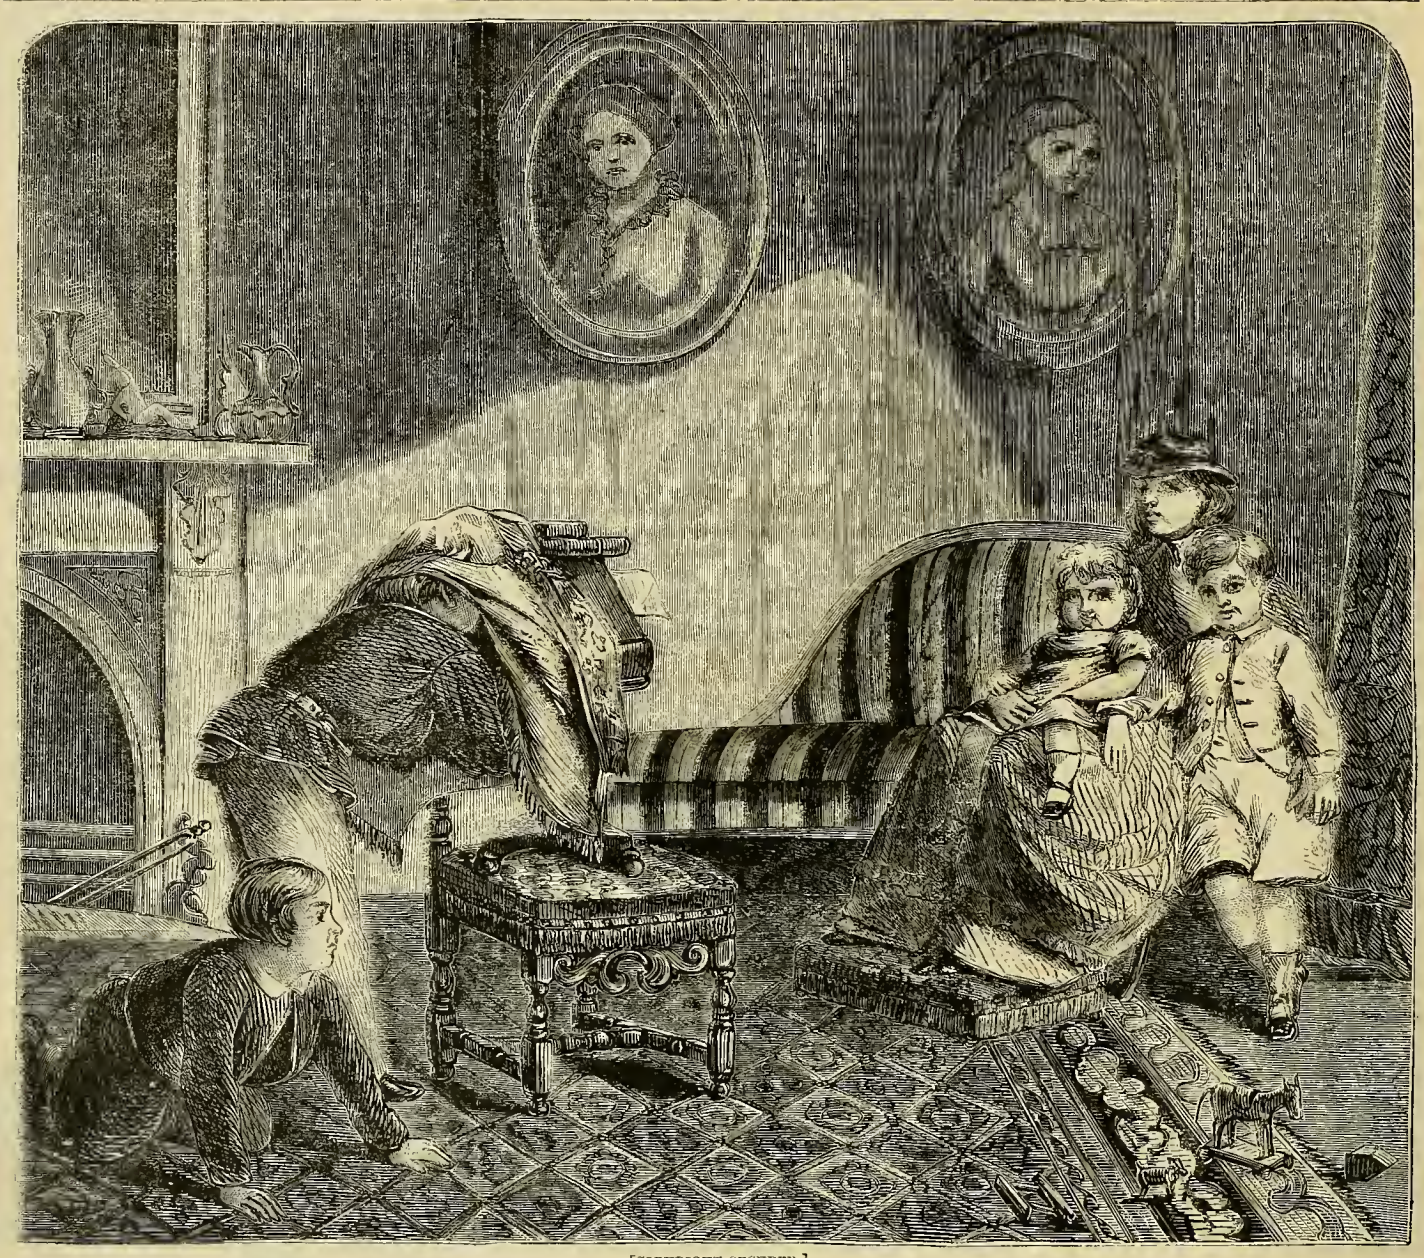
No. 367. *Illustrated Conundrum.* Why is the man in the picture like a great swearer?



No. 368. *Illustrated Rebus.*—Which gives encouragement to those who are working for a competence.



No. 369. *Illustrated Rebus.*—This makes a statement which we do not believe a word of if Shakespeare did say it.



[COPYRIGHT SECURED.]

THE YOUNG PHOTOGRAPHER.—*Drawn and Engraved for the American Agriculturist.*

Master Frank has been to the photographer to have his picture taken. He was much interested in the whole operation. The artist took great trouble to get the active little fellow in the right position, then he pointed a curious machine of wood and brass, which he called a camera, directly at him. The camera had a black cloth under which he hid his head while he was "taking aim," as Frank said, but he was really adjusting the focus, or getting the glass in the right position. When all was ready, Frank was told to look at a particular spot and not move until he had permission. The man took out his watch and Frank sat as quietly as so fidgety a little fellow could. How long the time seemed! He thought of his schoolmates, wondered if he would get a pair of skates on Christmas, counted the panes of glass in the window, and when he thought he could bear it no longer, the operator said "that will do; just a minute." A minute! It seemed to Frank as if a good part of his existence was being passed in that chair, and it was only 60 seconds. Frank was so much interested in his experience at the photographer's that when he went home he must show his sisters how it was done. He has very ingeniously fitted up a camera with the aid of the piano stool, some books and a table cover, and having the girls in position is pretending to arrange his instrument. The girls are doing their part well, for they have just the resigned look that most people put on when they have their pictures taken. Frank is just such a boy as we like, he puts some imagination into his amusement and no doubt gets more fun out of his make-believe camera, with his sisters for sitters, than some boys would from a costly toy.

A little girl was one evening watching an approaching storm, when she saw a bright flash of lightning. "Oh, mamma!" she cried, "see the dark open."

Artificial Duck Hatching in China.

The *Agriculturist* goes all over the world, and we sometimes get very interesting letters from friends who live in far-away places. Most of our Boys and Girls have read about the Chinese, and what numbers of ducks they raise, which they keep in boats. We do not recollect to have before seen an account of the way the Chinese hatch their ducks, but our correspondent, "J. D.," at Foochow, in China, tells how it is done.

"Immense numbers of duck eggs are annually hatched at this and many other places in Southern China. The season for hatching usually closes here in September, after having lasted about six months. Hens eggs can be readily hatched by artificial heat, but the young thus hatched do not thrive without maternal care, and soon die or are sickly. Young ducklings flourish amazingly without the care of a mother duck. In the summer time, in the adjacent country, one sees many companies of juvenile ducks, amounting oftentimes to hundreds in a flock, feeding by the river-side, and on the low rice lands. They are transported from place to place by means of boats. They are easily collected together by their keeper, and are taught to embark or disembark by means of a plank. Some keepers are in the habit of whipping gently the ducklings who are the last in marching into the boat when called. This they learn to be the penalty of being late aboard, and consequently there is considerable strife and hurrying to get on board. Near Canton, five or six years ago, I saw 5,000 ducklings in one pen. Each establishment here for hatching duck eggs, is fitted up with some eighteen or twenty large tub-like vessels. Nets resembling small fish nets, are used, into each of which are put eighty duck eggs, with the date of commencing written upon each egg. The net is then drawn loosely together by a small cord passing through the meshes on the edge. The operator by taking hold of the top of the net-like bag, lifts the eggs and arranges them in the tub, the centre of the bottom being raised a few inches higher than the sides. One set of eighty is arranged around the outside of the bottom, and another set is placed in the middle of the bottom, viz.: the space not occupied by the first set, two sets exactly filling up one layer on the bottom. Another net of eighty eggs is placed on the top of the first set, and a fourth set is put on the top of the second, and so on. Sometimes as many as seven layers of eggs are put in a tub. The tubs being covered with old cotton, are first arranged in one or two rows, a short distance from the floor, those in the same row being as close to each other as possible. Along the sides of these rows, straw mats are used so as to retain the heat which is generated beneath the tubs. The material burned to produce artificial warmth is usually charcoal, placed beneath some of the tubs. The tubs gradually become warm, as do the eggs within them. The operator has no instrument by which to judge of the degree of heat required. Experience is his criterion. Every three days the eggs are examined, and at each time some new sets are added, so at the end of thirty days from the commencement of this artificial incubation, several sets of eggs are ready to hatch. On the third day from the time that new sets are put into the tubs, they are carefully examined by the operator, to see whether any are not likely to hatch. This is ascertained by holding each between the eye and the sun. A skillful operator can generally tell in this way which eggs will produce ducklings and which not. These latter are laid aside for sale, as food, while the former are retained and treated in the way described, for 27 days longer. Each establishment has ducklings for sale, every three days after the first month.

OUR YOUNG FOLKS

FOR 1870.

The following are among the prominent features of OUR YOUNG FOLKS for 1870:—

Mrs. A. D. T. WHITNEY, author of "*A Summer in Leslie Goldthwaite's Life,*" will contribute the leading serial story, entitled

"WE GIRLS: A STORY OF HOME LIFE."

Dr. I. I. HAYES, the distinguished Arctic explorer, will give some graphic sketches of

LIFE AND ADVENTURE IN THE POLAR REGIONS.

Col. T. W. HIGGINSON will furnish a series of valuable articles describing the habits and characteristics of

THE BEAVER, THE ELEPHANT AND OTHER ANIMALS.

"**CARLETON,**" author of "*Winning His Way,*" and "*Our New Way Round the World,*" will contribute several papers of great interest, relating what he saw in China during his recent tour of the globe.

Mrs. PROFESSOR AGASSIZ will continue her instructive and fascinating account of "*The World on which we Live,*" describing the early ages of the earth, and some of the animals that then inhabited it

Mr. T. B. ALDRICH, author of the universally popular "*Story of a Bad Boy,*" will contribute regularly.

Mrs. A. M. DIAZ, author of the inimitable "*William Henry Letters,*" will continue her charming Stories and Sketches.

Mr. JAMES PARTON, whose articles on Voyages and Discoveries have been received with so great favor, will furnish additional articles of the same general character, communicating in an attractive style many interesting and important facts of Geography and History.

Mr. J. T. TROWBRIDGE will continue his remarkable series of papers on curious branches of Industry, Building Steam Engines, etc. He will also describe, from careful observation, the Departments at Washington, showing how the business of our Government is carried on.

Rev. E. E. HALE will furnish articles in his peculiar vein, entitled "Letters to my Nephew," communicating the best practical information with a wealth of illustration and a vigor of style altogether fascinating.

Major TRAVERSE, a very entertaining writer, will furnish articles containing a great deal of curious and valuable knowledge on a wide variety of subjects.

POMPEIAN PAPERS.—A series of remarkably interesting papers on Pompeii will be given, telling how it was buried by an eruption of Vesuvius hundreds of years ago, and how it is now being restored, and what curious things are found among the ruins.

REGULAR OR OCCASIONAL ARTICLES will be contributed by JOHN G. WHITTIER, HARRIET BEECHER STOWE, J. H. A. BONE, LUCY LARCOM, MISS E. STUART PHELPS, NORA PERRY, MRS. THAXTER, ROSE TERRY, GEORGE COOPER, the Author of "Seven Little Sisters," MRS. JANE G. AUSTIN, AUNT FANNY, and other writers whose names are a passport to the affection of all intelligent youthful readers.

The **EVENING LAMP** and **LETTER BOX** Departments will be carefully attended to, and will contain a rich variety of Charades, Enigmas, Puzzles, Rebuses,—and familiar talks by the Editor on the thousand matters of every-day interest to young people.

FULL-PAGE and SMALLER ILLUSTRATIONS, from the best artists, will add to the value and attractiveness of the Magazine.

No effort or expense will be spared to make *OUR YOUNG FOLKS* a worthy and welcome visitor in every school-room and family circle in America.

☞ *Cash Prizes, from $10 to $30,*

Will be given for the best Original Charades, Puzzles, Rebuses, and Compositions.

☞ *Cash Premiums, from $5 to $300,* will be given for the largest Clubs.

CIRCULAR containing full particulars sent *free* to any applicant.

TERMS.—The price of OUR YOUNG FOLKS is $2.00 per year. An extra copy gratis for every five subscriptions. OUR YOUNG FOLKS and Atlantic Monthly, $5.00 per year.

FIELDS, OSGOOD & CO., Publishers,
124 TREMONT STREET, BOSTON.

Amateur Cultivator's Guide

TO THE

KITCHEN AND FLOWER GARDEN.

Twenty-fourth Annual Edition of this popular and useful work, which has met with so much favor in the past, is now ready. It has been re-written and improved, printed with new type, and on fine paper; illustrated with a beautiful lithograph, and many other fine engravings from nature. It contains full description and the culture of over 1,500 leading varieties of Flowers and Vegetables. Also descriptive list of the Novelties, both Flowers and Vegetables, of the present season, to which is added a collection of 200 choice French Hybrid Gladiolus. This work has been prepared regardless of care and expense, and we feel confident that it will compare favorably with any other similar work.

The following testimonials are unsolicited by us, and can be multiplied by hundreds:

From LEVI BARTLETT, Warner, N. H.

"I have received a copy of your superbly gotten-up 'Amateur Cultivator's Guide.' I think it far ahead of anything of the kind ever before issued from the American press. Please accept my warmest thanks for your kindness in forwarding this gem of a book to my address."

From E. S. RAND, JR., Dedham, Mass., author of "Flowers for the Parlor and Garden."

"Accept many thanks for the beautiful copy of your Annual Catalogue. I find much that is new and rare therein. The arrangement, the concise cultural instructions, copious illustrations, and clear typographical execution, all combine to make it a model catalogue. I shall often have occasion to refer to it. It cannot fail to be of great use and interest to all horticulturists."

From J. HOPKINS, M.D., Madison, Wis., Pres't State Hort'l Soc., and Cor. Member of the Royal Hor'l Soc'y of Eng.

"Please accept my thanks for your 'Guide.' I think you ought to call it the 'Garden Companion.' It is at once very usefully and conveniently arranged; a sort of ready-reference book, very ornamentally got up; one of those few books I find fitted for any table; often wanted, and always at hand."

From A. S. FULLER, Hort'l Editor of "The New York Sun."

"There is no use in denying the fact that Washburn's Catalogue is the handsomest thing of the kind ever got up in this country."

This work is published for the benefit of our customers, to which it will be sent free; and will be sent to any address upon receipt of 25 cts. for paper cover, and 50 cts. for tastefully bound in cloth.

WASHBURN & CO.,

Horticultural Hall, Boston, Mass.

FERRE, BATCHELDER & CO.'S ILLUSTRATED CATALOGUE

of Seeds and

VEGETABLE AND FLOWER GARDEN

MANUAL for 1870, will be ready for distribution early in January. It will contain about 100 pages, with numerous illustrations—a complete list of Vegetable and Flower seeds, to which will be added a list of **Summer-Flowering Bulbs, Plants and Small Fruits.** Sent to all applicants **enclosing 10** cents. Our customers supplied without charge. Address

FERRE, BATCHELDER & CO.,

231 Main St., Springfield, Mass.

J. M. THORBURN & CO., 15 John st., New York.

New Tomatoes.

ALGER.—This new variety has the same potato-like foliage as Keyes', but the fruit is larger, of good market size, early and very productive, 15 cts. per package.

GEN. GRANT.—Remarkably solid, round, flat in shape, handsome, and of excellent quality. Received the first premium for the two past years at the Annual Exhibition of the Mass. Hort. Society, 15 cents per package.

CRIMSON CLUSTER.—Early, grows in large clusters bearing handsome fruit, oftentimes elegantly spotted with gold, 15 cents per package.

MAMMOTH CLUSTER.—Very large, round, crimson, 15 cents per package.

BOSTON MARKET.—The result of most careful selection by the Boston market-men for a series of years; large, flat, round, solid; enormously productive, 15 cts. per package.

EARLY ORANGEFIELD.—An English sort, yields its fruit in large clusters. This Tomato is of a peculiarly rich and sweet flavor, and excellent as fruit for dessert, 15 cts. per package.

Also the following excellent varieties at 10 cts. per package. Early York, Dwarf Scotch, Keyes' Early Prolific, Yellow Fig, Maupay's Saperior, Cherry, Large Yellow, Feejee, Cook's Favorite, Lester's Perfected, Large Smooth Red, Tomato De Laye, Tilden, New Mexican, Strawberry, or Ground Cherry.

All of the above are of my own raising, each grown isolated, scattered over three square miles of territory. Catalogues free.

Flower and Vegetable Garden,

AND CATALOGUE OF SEEDS FOR 1870.

The 37th Edition, Revised, enlarged and improved, containing 148 pages, profusely illustrated with more than 100 fine Engravings.

A BEAUTIFUL COLORED PLATE,

and a descriptive list of more than 2,500 varieties of Flower and Vegetable Seeds, embracing every novelty introduced in 1869, with full and plain practical directions for the culture of Flowers and Plants, the arrangement of the Garden, &c. Also a descriptive list of 150 varieties of the best French Gladiolus, including the superb new varieties of 1869, now first offered here, all the fine summer-flowering bulbs, such as Lilies, Tuberoses, Tigridias, &c., together with every Requisite for the garden. A copy mailed to every applicant on the receipt of 25 cents. Our customers supplied free of charge. Address

HOVEY & CO., 53 North Market Street, Boston.

Gregory's Annual Catalogue of Choice Garden and Flower Seeds.

Having in former years introduced to the public the Hubbard Squash, American Turban Squash, Marblehead Mammoth Cabbage, Mexican Sweet Corn, Brown's New Dwarf Marrowfat Pea, Boston Curled Lettuce, and other new and valuable vegetables, with the return of another season I am again prepared to supply the public with Vegetable and Flower seeds of the purest quality. My Annual Catalogue, containing a list not only of all novelties, but also of the standard vegetables of the garden (over one hundred of which are of my own growing) and this season for the first time a carefully selected list of flower seeds will be forwarded *gratis* to all. Sent without request to my customers of last season. All seed purchased of me *I warrant to be fresh and true to name, and that it shall reach the purchaser.* Should it fail in either of these respects I will fill the order over without additional charge.

JAMES J. H. GREGORY, Marblehead, Mass.

Fresh Garden, Flower, Fruit, Herb, Tree, Shrub, and Evergreen

Seeds, with directions for culture, in large or small quantities, prepaid, by mail or otherwise. Twenty-five sorts of either for $1.00, prepaid. Send for Priced List. Seeds on Commission. Agents wanted. Wholesale lists ready. Also Small Fruits, Plants, and Bulbs, &c., by mail, prepaid. B. M. WATSON, Old Colony Nurseries and Seed Warehouse, Plymouth, Mass. Established 1842.

Lilum Auratum and New Coleus.

Seeds of Japan Lily Melpomene, carefully fertilized with L. Auratum. In packets of 25 seeds, $1.00, post-paid. New Coleus, carefully fertilized seeds of the choicest new kinds In packets of 20 seeds, 50 cents, post-paid. We offer the above from our own collection, carefully hybridized, and likely to produce some superb varieties. Address

HOVEY & CO., 53 North Market St., Boston, Mass.

Grafting Grape-vines.

The process of grafting grape-vines is entirely simple, being ordinary cleft-grafting, and can be done by the most common workman who is handy in the use of the knife.

"Grafts carefully inserted, grow with surprising rapidity and vigor, and the method affords a very easy way of replacing an indifferent or worthless variety of grape with a good one. If properly done, the risk of failure is very small."—*American Agriculturist.*

We have issued a circular giving full particulars how and when to graft vines, which will be sent to all applicants.

See advertisement, page 429, of November *American Agriculturist.* Address

HASBROUCK & BUSHNELL,
"IONA," near Peekskill, Westchester Co., New York.

Send 10c. for Catalogues. F. K. PHOENIX.

Marblehead Mammoth Cabbage!

This is the largest cabbage in the world, sometimes weighing over sixty pounds each, and averaging as high as thirty pounds by the acre! It is not only large, but cannot be surpassed for reliability for heading, tenderness, and sweetness. As some cultivators have an impression that this cabbage cannot be fully matured outside of Marblehead, I invite their attention to the following extracts from among the many commendatory letters which I have received.

"Your Marblehead Mammoth Cabbage cannot be excelled. There were heads weighing 50 lbs., and heads of Fottler's Improved Brunswick (from your seed) weighing 40 lbs.—John H. Howlett, Charlestown, Ill."

"I raised from your seed Marblehead Mammoth Cabbages that weighed 50 lbs.—A. H. Mace, Clintonville, N. Y., Nov. 14th, 1869."

"Your Marblehead Mammoth Cabbages were very fine, they all headed well, and weighed 27 to 40, and 47 lbs.—W. Llewellyn, Red Wing, Minn., March 12, 1869."

"Your Marblehead Mammoth Cabbages are wonderful; they grew to the size of an umbrella.—Thomas Flanigan, Palermo, Kansas."

"The Marblehead Mammoth Cabbages were a perfect success. They headed well, and were three times as large as any cabbage I ever raised before.—J. F. Butt, Koscinsco, Miss."

"I have raised your Marblehead Mammoth Cabbage for two years, and it has proved the tenderest and sweetest cabbage I ever saw.—S. S. Groves, Stones Prairie, Ill."

John Van Wormer, Springs' Mills, Mich., raised some weighing 30 lbs. John Humphreys, Titusville, N. Y., 33¾ lbs. M. D. Clark, Elyria, Ohio, 37 lbs. H. A. Terry, Crescent City, Iowa, 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Becancour, C. W., exhibited three cabbages weighing respectively 40, 42½, and 44 lbs. John W. Dean, St. Michael's, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., 36 lbs., when trimmed. E. H. Ellis, Etna Green, Ind., over 30 lbs. A. E. Garrison, Des Moines, Iowa, 30 lbs. James S. Allen, Union Springs, N. Y., 30 lbs., when stripped of loose leaves. Wm. Lee, Jr., Denver, Colorado, has grown heads weighing 45 to 50 lbs., as a penalty for which the miners of the mountains call him the 'Big Cabbage Man." Leonard Choat, Denver, Colorado, raised one which weighed 46 lbs. when trimmed of waste leaves. Collins Eaton, Ogdensburgh, N. Y., 50 lbs. P. Sweeney, Loretto, Pa., 43 lbs. Sam'l B. Ornsbee, Rolling Prairie, Wis., 53 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot weighing from 50 to 60 lbs. A. C. Van Tassal, 59 lbs. trimmed. A. C. Goodwin, Kennedy, N. Y., 45 to 50 lbs. W. H. Spera, Ephrata, Pa., raised fifty heads that averaged over 31 lbs. each. Wm. D. Munson, Burlington, Vt., raised some weighing 46 lbs. Mary B. Sellman, Galesburg, Iowa, 28 to 43 lbs. stripped of loose leaves. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest cabbage ever seen in the country." "Astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled," etc., etc. As the original introducer of the Mammoth Cabbage, I am prepared to supply seed grown from *extra large heads,* at following prices, by mail, post-paid: Per package, 25 cts.; per oz., $1; 4 ozs., $3.50; per lb., $12.

Full instructions for cultivation accompanying the seed.

Trade Price List for Dealers Only,

NOW READY.

25 CTS.—RAISE YOUR OWN LARD KEGS.—25 cts. per package. I have raised for 28 years the Sugar Trough Gourd, and have found them the best lard cans I ever used. They make the cheapest and best vessels for sugar troughs, and are convenient for many household purposes. They hold on an average from 1 to 2 common wooden bucketfuls, and often from 8 to 10 gallons, and I have one that I exhibited at the AGRICULTURIST office that holds over eleven (11) gallons. They are very strong and will last a lifetime, and are as easily grown as the common pumpkin. My Catalogue for 1870 tells how to grow them, and contains a price list and description of 150 varieties of vegetable and flower seeds. Send for it. Address

CURTIS & COBB'S

PERFECTLY RELIABLE SEEDS.

ILLUSTRATED CATALOGUE.

The undersigned would inform their friends and the public that the SEVENTEENTH ANNUAL EDITION of their ILLUSTRATED SEED CATALOGUE, and FLOWER AND KITCHEN GARDEN DIRECTORY, with price of Seeds, Gladiolus Bulbs, Select Small Fruits, &c., &c., will be ready for mailing early in January, and will be sent to all applicants enclosing TWENTY-FIVE CENTS. Old customers supplied without charge; and should any such not receive it in due time, we will thank them to notify us. Our Catalogue has been frequently pronounced one of the best issued, and our endeavor will be to keep it fully up to its present high place amongst its competitors. Please forward orders early to

CURTIS & COBB, Seedsmen and Florists,
348 Washington St., Boston, Mass.

New Cabbage Seed.

The following varieties of cabbage seed I grew this season on my three Seed Farms, all perfectly isolated, scattered over an area of three square miles. You will find them all fresh and true.

	per oz.	4 oz.	*lb.*
Early Jersey Wakefield, (*true*)	$0.75	$2.50	$7.50
Early Winningstadt	0.35	1.25	3.50
Improved American Savoy	0.35	1.25	3.50
Fottler's Improved Brunswick	0.50	1.75	5.00
Stone Mason Drumhead	0.40	1.50	4.00
Premium Flat Dutch	0.35	1.25	3.50
Marblehead Mammoth Drumhead	1.00	3.50	12.00
Early Wyman	1.00, 25c. *per pack'g.*		

The above seeds were *all grown from fully developed heads*, and will be sent by mail, post-paid, on receipt of price. Catalogues free.

JAMES J. H. GREGORY, Marblehead, Mass.

Fresh Garden Seed.

We have reduced the price of Beans, Peas, Sweet Corn, and other Garden Seed, and offer them to clubs and country merchants at the very lowest rates. For instance, Champion of England Peas, of the finest quality, at $6 per bushel, 25 cents per quart, 5 cents per packet, by express; Daniel O'Rourke (eq. early), $4 per bushel, 20 cents per quart, 4 cts. per packet.

Fine valued Gladiolus, from 10 cts. to $3. Good varieties, $8 per 100. Other bulbs for spring planting, very low. Early Rose, and other potatoes, $3.50 per barrel. Norway and Surprise Oats, $3 per bushel; Three bushels, $7.50; Thirty bushels, $65. Catalogues free. Address

WARDWELL & CO., West Dresden, Yates Co., N. Y.

To Market Gardeners.

Your business involves an immense outlay over small areas, and it is of first importance that the seed you plant should be *fully reliable*. My enterprise is of special interest to you, as I am engaged in growing, directly under my own eye, a great variety of vegetable seeds, many of which seedsmen usually import or gather together from growers scattered through the country. Because I grow these seed myself I am enabled to warrant them *fresh and true to name*, and to bind myself to refill the same value gratis, should they not prove so. All seed warranted to reach each purchaser. I also import and procure from first growers, choice varieties that cannot be grown in my locality, giving me thus one of the largest if not *the* largest variety of vegetable seed sold by any dealer in the United States. Give my seed a trial. Catalogues gratis.

JAMES J. H. GREGORY, Marblehead, Mass.

STRAW! STRAW!! STRAW!!!

C. D. Langworthy, of Alfred, writes: "My Norway Oat Straw from one acre is worth as much as an acre of my best meadow hay, my cattle eat it in preference to hay. It seems to be more juicy and tender than ordinary straw." A Connecticut farmer writes: "I was offered 75 cts. per hundred for my Norway Oat Straw, (common oat straw is a drug at 50 cts.), but my cattle like it so well, that I have determined to sell hay in its stead." There is no longer any question, but the straw of this grain is fully as valuable per acre as hay, while its enormous yield of seed is a clear gain. Price $7.50 per bushel, $4 per half bushel, $2.50 per peck, by standard of 32 lbs. to the bushel. Our seed is warranted pure and genuine. Parties are advertising who fill their orders with bogus seed, and farmers are cautioned against these frauds.

Address, D. W. RAMSDELL & CO., 218 Pearl St., New York; or 171 Lake St., Chicago, Ill.

BOSTON MARKET CELERY.

I can supply best seed of the genuine Boston Market Celery, the variety described on page 429 of the Nov. (1869) Agriculturist. Per package, 15 cts.; per ounce, 50 cts.; by mail, post-paid. *Catalogues free.*

BLISS'S SELECT GARDEN SEEDS.

B. K. BLISS & SON,

Nos. 41 Park Row, and 151 Nassau Street, New York

Importers, Growers, and Dealers in Garden, Field, and Flower Seeds, Horticultural Implements, and Garden Requisites.

Would inform their friends and the public that the *Sixteenth Annual Edition* of their **Illustrated Seed Catalogue** and **Guide** to the **Flower and Kitchen Garden**, now in press, will be ready for distribution early in January.

No pains or expense have been spared in preparing this edition, to make it the most complete work of the kind ever published in this country.

It will contain nearly *two hundred* choice engravings of favorite Flowers and Vegetables—a large portion of which are entirely new; also, two beautifully colored lithographs, and a descriptive list of upwards of *two thousand* species and varieties of *Flower* and *Vegetable Seeds*, including all the novelties of the past season, with directions for their culture; also, a list of upwards of One Hundred varieties of Choice Gladiolus—with many other Summer-Flowering Bulbs—and much useful information upon the subject of gardening generally.

A copy will be mailed to all applicants enclosing *Twenty-five cents.* Our regular customers supplied without charge.

Bliss's Gardener's Almanac for 1870,

Also in press, and will be issued the first of January. It will contain about 70 pages of closely printed matter, embracing a *Monthly Calendar of Operations*, and a price list of the leading varieties of *Garden, Field, and Flower Seeds*, with brief directions for their culture. A copy will be mailed to all applicants enclosing a three-cent stamp.

Address B. K. BLISS & SON, P. O. Box 5712, New York.

CONOVER'S
COLOSSAL ASPARAGUS
SEED AND ROOTS.

The experience of the past season fully confirms all that was claimed for this variety when first offered last spring, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties.

Strong, one-year-old Roots mailed, post-paid, $2.00 per fifty; $3.00 per hundred.

SEEDS.—½ oz. packet, 50 cts.; ¼ lb., $3.00.

Address B. K. BLISS & SON,
41 Park Row, and 151 Nassau St.,
P. O. Box, 5,712, New York.

Lilium Auratum.

The Japanese Queen of Lilies.

A large importation from Japan, just received by the subscribers, in fine, healthy condition. Flowering Bulbs mailed to any address at following prices:

No. 1, $1.00 each; $9.00 per doz. No. 2, 75 cents each, or $6.75 per doz. No. 3, 50 cts. each; $4.50 per doz. Prices by the hundred or thousand will be given to dealers upon application. B. K. BLISS & SON,

Nos. 41 Park Row, and 151 Nassau St., New York.

NEW RELIGIOUS WEEKLY.

THE

CHRISTIAN UNION,

An Unsectarian, Independent Journal, devoted to Religion, Morals, Reform, Foreign and Domestic News of the Church and the World, Literature, Science, Art, Agriculture, Trade, Finance, etc., etc.

And containing Household Stories, Choice Poems, Walks with the Children, etc., etc., embracing contributions from *well-known and eminent writers.*

HENRY WARD BEECHER,

whose Powerful Editorials, Literary Reviews, and Lecture-Room Talks, appear regularly in its columns, has undertaken the formation and guidance of the paper.

With Mr. BEECHER as its Editor-in-Chief, aided by some of the best and most notable talent of the land, the paper can not but carry good, Christian food, for heart and soul, to many of its increasing readers. That will be its constant endeavor.

Aiming to be a truly Christian Journal, and a *Complete Family Newspaper*, and having for its purpose the presentation of ESSENTIAL BIBLE TRUTH,

THE CHRISTIAN UNION will advocate, in the spirit of love and liberty, the fellowship and co-operation of Christ's people of every name. Recognizing the right and the necessity of different church organizations as the natural result of the many-mindedness of mankind, it will endeavor to treat all Christian denominations with fairness and love, stating its own opinions with frankness but in kindness, and providing an arena for courteous debate not hedged in by sectarian boundaries. Without undervaluing doctrinal truth, it will chiefly strive to foster and enforce *Christianity as a Life*, rather than a theological system. It is

For Christians of All Denominations.

ITS FORM: SIXTEEN PAGES, LARGE QUARTO, CUT AND STITCHED, so convenient, both for use and preservation, as to be a great and special merit in its favor, apart from its superior literary attractions.

ITS CIRCULATION: SPREADING WITH WONDERFUL RAPIDITY, showing that the paper *supplies a real need* of the Christian public.

ITS PRICE:

Only $2.50 per year.

Subscribe for it! Get others to take it!

A BEAUTIFUL GIFT.

A PICTURE FOR THE HOME CIRCLE.

"DANDELION TIME."

By MRS. LILLY M. SPENCER.

Entered according to Act of Congress, in 1869, by ORANGE JUDD & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New York

The Publishers of the American Agriculturist have purchased of the artist this beautiful painting, and now issue it as a Chromo, believing that it will be gladly secured by thousands as an ornament and source of pleasure in their homes. Mrs. Lilly M. Spencer has already won an honorable name in art. Though of a poetic imagination, and the author of many paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. Her works of this class have been reproduced in colored lithographs and other forms, and through these her name has become a familiar one throughout the country. Finding that pictures of a domestic character with something of the humorous in them were more popular than those to which her natural tastes inclined her, Mrs. S. for some years painted such subjects almost exclusively. Her "Shake Hands," "Jolly Washerwoman," "The Gossips," and others, are known to all lovers of pictures. They are full of life and meaning, and at the same time finished with an accuracy and detail that few artists attempt. Among her latest productions are "War Times at Home," "The Home of the Red, White and Blue," "The Starry Flag," etc.

This Chromo is done in the best style, by Hermann Bencke, whose work equals anything of the kind done in this country. The scene is full of happy life and cannot fail to delight both old and young. The above wood engraving is a miniature representation of it. The picture would prove an ornament in any home, and be a most beautiful and acceptable present to make to a friend. It is 13×18 inches in size, and, mounted on linen, will be sent by mail, in a tube, with all materials and directions for stretching.

PRICE, POST-PAID, $6.00.

If preferred, the picture will be sent by express, mounted on artists' board, all ready for framing, on receipt of the price, $6.00, the purchaser to pay express charges. If ordered in a frame, it will be sent by express, carefully boxed, on receipt of prices, as follows:

In a neat Black-walnut Frame, gilt band - - - - -	$ 9.00.
" " " " wider gilt band - - - -	10.00.
" carved edged " " " - - - - -	11.00.
" beautiful gilt " best quality - - - - -	15.00.

If taken with a frame at the store, 245 Broadway, the charge for boxing, which is 75 cents, will be deducted from these prices. In all cases where sent by express, the purchaser will pay express charges.

A LIBERAL DISCOUNT TO THE TRADE.

ORANGE JUDD & COMPANY, 245 Broadway, New York.

DOWNING'S FRUITS AND FRUIT TREES.

BY A. J. DOWNING.

NEWLY REVISED AND GREATLY ENLARGED

BY CHARLES DOWNING.

Octavo, 1122 Pages.

The original work of the late A. J. Downing appeared in 1845. Some years after it was revised and much enlarged by his brother, Charles Downing, who has again completed the work of a second revision. Charles Downing is upon all hands acknowledged as one of our highest pomological authorities. He writes but seldom, but whatever bears his name is accepted as the judgment of one who is entirely disinterested, as far as the commercial aspects of pomology are concerned. The present edition contains the results of many years' labor and experience which have been devoted to testing the value of fruits and acquiring a knowledge of them that should benefit others.

RECOMMENDATION FROM HON. MARSHALL P. WILDER.

President of the American Pomological Society.

BOSTON, Oct. 4, 1869.

GENTLEMEN:

I have received a copy from Mr. Charles Downing of the second revised edition of the "FRUITS AND FRUIT TREES OF AMERICA." It is the most comprehensive of any similar work, in fact a complete ENCYCLOPEDIA OF AMERICAN POMOLOGY brought down to the present time.

The original edition by his brother, the late Andrew Jackson Downing, popular as it ever has been, is made doubly interesting and useful by this revision, comprising as it does the results of a long life of critical observation.

As a work of reference it has no equal in this country, and deserves a place in the library of every Pomologist in America. MARSHALL P. WILDER.

This elegant and valuable work will be an indispensable requisite to every library, and to all interested in Fruits or Fruit Culture.

Price, Prepaid, $7.50.

ORANGE JUDD & COMPANY, 245 Broadway, New York.

AMERICAN CATTLE:

THEIR HISTORY, BREEDING AND MANAGEMENT.

BY LEWIS F. ALLEN,

Late President of the New York State Agricultural Society, editor "American Shorthorn Herd Book," author "Rural Architecture," etc., etc.

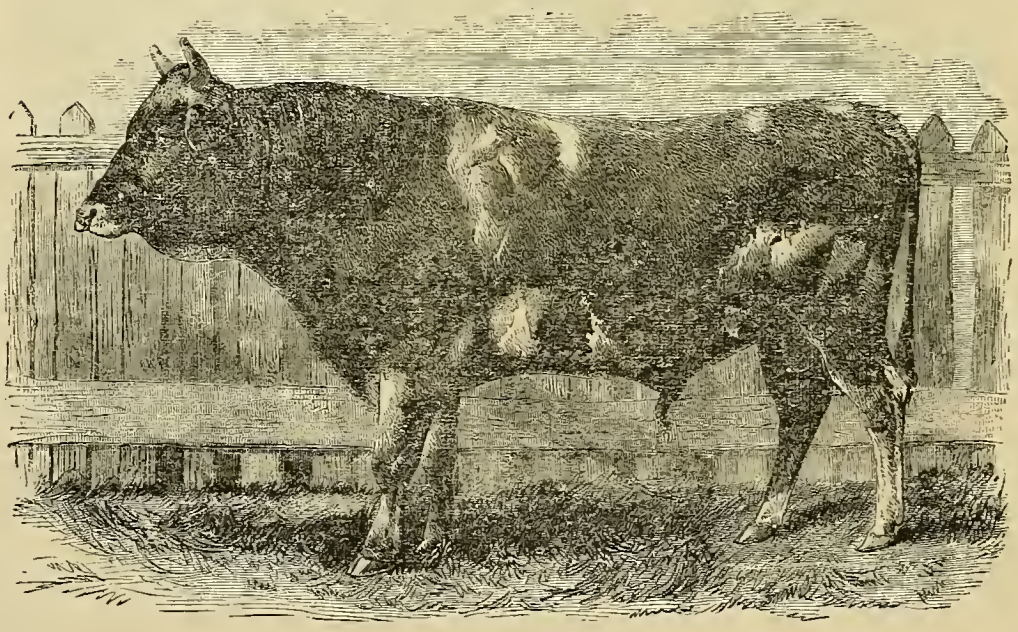
Notices by the Press.

We consider this the most valuable work that has recently been issued from the American press. It embraces all branches of the important subject, and fills a vacancy in our agricultural literature for which work the author by his many years' experience and observation was eminently fitted....It ought to be in the hands of every owner of cattle, and the country, as well as individuals, would soon be much richer for its teachings.

Journal of Agriculture, (St Louis).

This will rank among the standard works of the country, and will be considered indispensable by every breeder of livestock.

Practical Farmer, (Philadelphia).



Notices by the Press.

The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims as a standard authority on the subject. An excellent feature of this volume is its orderly, methodical arrangement, condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves.

N. Y Tribune.

Whatever works the stock farmer may already have, he cannot afford to do without this.

Ohio Farmer.

Considering that there are some ten million milch cows in the United States, and nearly a thousand millions of dollars invested in cattle, the magnitude of this interest demands that the best skilled talent be devoted to the improvement of the various breeds and the investigation of the best method of so caring for the animals as to gain the greatest profit from them. This volume will give the farmer just the instruction which he wants.

N. Y. Independent.

The object of the work, as stated by the author in his preface, "is not only to give a historical account of the Bovine race, to suggest to our farmers and cattle breeders the best methods of their production and management, but to exalt and ennoble its pursuit to the dignity to which it is entitled in the various departments of American agriculture." From the little examination we have been able to give it, we can not recommend it too highly.

Canada Farmer.

His history of cattle in general and of the individual breeds in particular, which occupies the first 180 pages of the volume, is written with much of the grace and charm of an Allison or a Macauley. His description of the leading breeds is illustrated by cuts of a bull, a cow, and a fat ox, of each race. The next one hundred pages are devoted to the subject of Breeding. This is followed by chapters on Beef Cattle, Working Oxen, Milch Cows, Cattle Food, Diseases, etc. The arrangement, illustrations, analytical index, etc., of the work are in the best style of modern book-making.

New England Farmer.

Price, Post-paid, $2.50.

ORANGE JUDD & COMPANY, 245 Broadway, New York.

AGRICULTURAL

Qualitative and Quantitative

CHEMICAL ANALYSIS.

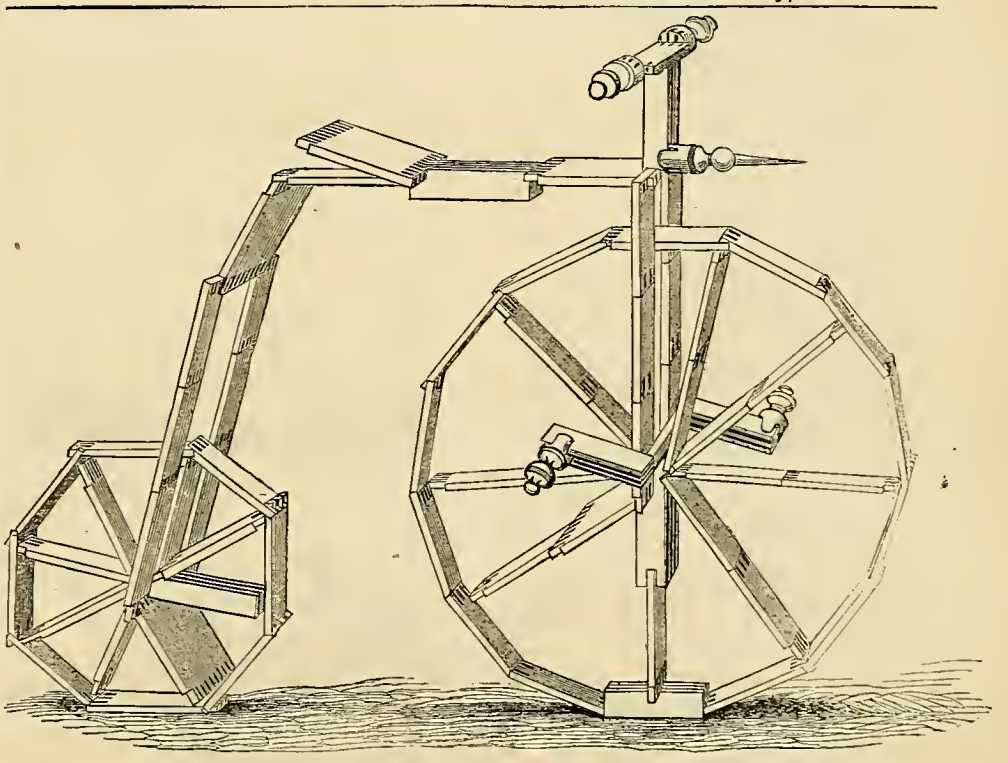
EDITED BY G. C. CALDWELL,

Professor of Agricultural Chemistry in the Cornell University.

Teachers of Agricultural Chemistry have long felt the need of a text book which should serve as a guide to the analysis of soils, manures, and the products of the farm. The present work is very thorough, beginning with the preparation of re-agents and giving the most approved methods of manipulation. Professor Caldwell modestly calls himself the editor, but his book shows that he has not contented himself with editing the works of others, but has given much of his own experience.

PRICE, POST-PAID, $2.00.

ORANGE JUDD & CO.,
245 Broadway, New York.



CRANDALL'S

BUILDING BLOCKS FOR CHILDREN

CAN BE MADE INTO

Churches,	**Factories,**	**Velocipedes,**	**Towers,**
Arches,	**Chairs,**	**Windmills,**	**Boxes,**
Bridges,	**Fences,**	**Tools,**	**Chairs,**
Castles,	**Houses,**	**Sleds,**	**Sheds,**

and other forms in almost endless variety, and when finished, the structure remains firm, so that it can be carried about without falling to pieces. Having given these blocks a practical trial in their own families, the publishers of the *American Agriculturist* were so well pleased with them that they consented to take the general agency for their sale.

The Blocks are put up in neat, strong boxes, and a large sheet giving various designs of buildings, etc., accompanies each box. Price: No. 1, $2.00; No. 3, $1.00.

Orders from the trade will be supplied on liberal terms. Address

ORANGE JUDD & CO.,
245 Broadway, New York.

THE BEST
Family Sewing Machine.

"The Florence Sewing Machine is decided to be the best "on exhibition. It must also be stated incidentally that
"THIS IS BETTER THAN ANY OF ITS CLASS "KNOWN TO THE JUDGES."

EDWARD F. JONES, Binghamton, N. Y.

PATENTS OBTAINED.
AMERICAN AND FOREIGN.

Letter from Hon. D. P. Holloway, former Com. of Patents.
WASHINGTON, D. C., March 30, 1868.

"I cheerfully commend to all persons who may have business in the Patent office the firm of Edson Bros., as gentlemen of prompt business habits, and in every respect worthy of confidence."—D. P. HOLLOWAY.

"I concur in the above."—T. C. THEAKER, late Commissioner of Patents. Send for Circular.

Patents obtained, or no charge. EDSON BROS.,
Patent Lawyers & Solicitors, 459 9th St., Washington, D. C.

THOMAS' PATENT
Smoothing Harrow,

AND BROADCAST WEEDER,

is admirably adapted to harrowing wheat in spring, covering grass seed, pulverizing spread manure, smoothing newly seeded land; and, most of all, OBVIATING THE HAND-HOEING OF CORN, so that one man and team will keep 60 or 70 acres perfectly clean until a foot high. It pays its cost at least five times over, yearly, on every hundred acres. It is eminently useful to MARKET GARDENERS and to NURSERYMEN. Send for a descriptive Circular.

Prices, with 120 wrought iron teeth, $20; with 120 steel teeth, $25; sent by railroad on receipt of price, by
J. J. THOMAS & CO., Geneva, N. Y.

HINKLEY KNITTING MACHINE

For Family use—simple, cheap, reliable. Knits everything, AGENTS WANTED. Circular and sample stocking FREE. Address HINKLEY KNITTING MACHINE CO., Bath, Me., or 176 Broadway, New-York.

Holbrook's Regulator Seed Drill.

A perfect hand-machine for sowing with *regularity and in proper quantity*. Beet, Carrot, Onion, Parsnip, Spinach, Sorghum, Turnips, Peas, Beans, etc. It is very simple, compact, durable, easy to operate, and *shows the seed as it drops*, to prevent any mistake or failure. Price $12.00. Address
F. F. HOLBROOK & SMALL, Boston, Mass.

New Wood-Handle Style of
DOTY'S TREE AND BLACKBERRY PRUNERS.

Save cost in one day's use. Light, yet powerful. Cut limbs inch through. Hook to hold, chisel to cut, and plunger to drive the chisel. They gather fruit. Price $4. Samples, *freight paid*. Great chance for State and local canvassers. Get Circulars of sole proprietor. **WM. M. DOTY, 32 Cortlandt Street, New York.**

BICKFORD KNITTING MACHINE.
OVER 10,000 NOW IN USE.

Read the following unsolicited testimonials in its favor, which are but a few of the many received:

PLATTSBURGH, N. Y., Nov. 3, 1869.
I have one of your Machines, and am perfectly satisfied with it. A. J. BROADWELL.

MEDINA, Ohio, Nov. 1, 1869.
The more I use it the better I like it.
MRS. CROSBY CURTIS.

KINGSTON, C. W., Nov. 1, 1869.
I have a thorough knowledge of all the Machines now made, and select yours as being best adapted to the general wants. JOHN CUNNINGHAM.

EAST HAVERHILL, N. H., Dec. 8, 1868.
I would not take Fifty Dollars for it if I could not get another like it. I am perfectly satisfied with it; it has ten times more than paid for itself since I have had it.
MRS. JOSIE L. BRYANT.

WILMINGTON, Vt., Jan. 7, 1869.
Having made trial of the Lamb Knitting Machine and the Bickford Knitting Machine, to test the comparative excellence of the two, I pronounce without hesitation in favor of the Bickford Machine. It takes up little room, runs with perfect ease, makes a greater variety of work, is much less liable to drop stitches and break yarn, and withal costs only about half the amount of the Lamb Machine.
N. W. WILDER, Pastor M. E. Church.

BICKFORD KNITTING MACHINE.
Prices from $25 to $75.

Send for circulars and price list, or better still, call and examine the Machine. Agents wanted everywhere on liberal terms. Address all orders and letters to The

TO ADVERTISERS.

THE MIRROR AND FARMER,
Published at Manchester, N. H. JOHN B. CLARKE, Editor and Proprietor is an eight-page paper, of forty-eight columns, of size of the New York *Tribune*, and has a larger circulation than any other secular paper in New England, north of Boston. The only Farming paper in the State. Advertisements 10 cents a line, $1.20 an inch of space, for each insertion. No advertisements inserted for less than one dollar.

It circulates in large numbers in all the farming towns, manufacturing villages and cities of New Hampshire, and very largely in Vermont, and some in all the other States. For general advertising, for the price charged (which is the same to all), it has no equal in the Eastern States.

The MIRROR AND AMERICAN,—three editions daily,—is published by the same.

25 CENTS WILL GET THE BEST AGRICULTURAL and FAMILY weekly in AMERICA for two months previous to March 1. Address
NEW ENGLAND HOMESTEAD,
SPRINGFIELD, MASS.
It contains 48 columns, and has a large circulation.
Yearly subscription, $2.50.

TO FARMERS, GARDENERS, FARM LABORERS, and OTHERS.
Deposit your surplus money in the
MUTUAL BENEFIT SAVINGS BANK,
166 Nassau St., New York.
Send for Circular containing valuable information.
CHARLES K. GRAHAM, President.
G. H. BENEDICT, Secretary.

PRACTICAL FLORICULTURE.

A guide to the successful propagation and cultivation of Florists' Plants. By **Peter Henderson,** author of "Gardening for Profit." Beautifully illustrated. Price $1.50.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone.—H. A. DREER, Seedsman and Florist, Phila., Pa.

Full to overflowing with valuable information.
FRANCIS RICHARDSON, Toronto, Canada.

Thoroughly practical, yet readable as a novel. N. Y. Sun.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.
GALVIN & GERAGHTY, Florists, Newport, R. I.

COPELAND'S COUNTRY LIFE.
A COMPENDIUM OF
AGRICULTURAL & HORTICULTURAL
Practical Knowledge.

By ROBERT MORRIS COPELAND.

It contains 926 large Octavo Pages and 250 Engravings, and embraces Descriptions, Hints, Suggestions and Details of great value to those interested in Country Life. The following are some of the matters of which it treats:

DRAINING.
CATTLE.
SHEEP.
SHRUBS.
FRUITS.
FLOWERS.
VEGETABLES.
HOT-HOUSE PLANTS.
GRAPE CULTURE.
ORNAMENTAL TREES.

The **Kitchen Garden** receives particular attention. In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

SENT POST-PAID. - - - - PRICE, $5.00.

Either of the above books sent post-paid on receipt of price by
ORANGE JUDD & CO., 245 Broadway, New York.

We are now prepared to fill orders for our new **LOW-PRICED** double-reed Organ, "No. 55."

The case is solid walnut, paneled, molded, and carved brackets; is finished with two carpeted pedal boards, and Knee Swell, and is more beautiful in design and finish than any now made in the world for the price, and we *guarantee* that the qualities and power of tone will be superior to any we have seen of other makers. The instrument has two full Five-Octave sets of reeds, and contains *six stops*, viz.:

PRINCIPAL BASS,
DIAPASON BASS,
TREMOLO or VOX HUMANA,
PRINCIPAL TREBLE,
DIAPASON TREBLE,
DIVIDED SWELL.

Our Patent *Graduated Swell* is furnished in this, the same as in our higher-priced instruments. The price is fixed at the very moderate sum of $125, and there can be no deviation from these figures.

Orders will be recorded in regular succession, and filled each in its turn.

GEO. A. PRINCE & CO.

S. T. GORDON, Agent, New York.
JAMES BELLAK, Agent, Philadelphia.

Also the principal Music Dealer in each City and Town in the United States and British Provinces.

India Rubber Gloves

For Gardening, Housework, etc., etc. A perfect protection for the hands, making them soft, smooth, and snowy white. Geraldine; A Love Story.

BY MRS. SUMNER HAYDEN.

"HATTIE."

AUTHOR OF "LITTLE GOLDIE," "MIDNIGHT MARRIAGE," ETC., ETC.

CHAPTER I.

UNCLE ABNER.

Our rich Uncle, Abner Ashleigh, desired to go to Europe, and one of his nephews must go with him, for he was too feeble to travel alone, or to trust to the mercies of a hired servant, for, you must understand that our Uncle Abner was worth a half-million of dollars, and it was probable that one of our family would inherit it all at his death.

There were three nephews of us.

Tom Ashleigh, the eldest, who had finished his education, and commenced his ministerial labors.

Dick Ashleigh, the second son, who had but just graduated, and coveted the wealth of Uncle Abner more than all the others. Next in order came myself, Harry Ashleigh, who was still at his books, hoping to get learning enough to gain a comfortable living, for I had no hope of ever inheriting a dollar of Uncle Abner's money.

He had told me twenty times that he wouldn't leave me enough to buy a jack-knife with, because I was so careless of his feelings and his gout.

But the world went merry enough for me without Uncle Abner's money, and I knew that I could earn my own pocket money if I was but faithful to my books.

I was home on vacation when Uncle Abner announced his determination to go to Europe.

"You will never think of going alone, Uncle Abner!" exclaimed my only sister, who had recently married well, and consequently, thought less of Uncle Abner's money.

"Of course, I shan't go alone!" snarled the petulant gentleman, and sent us all out of the room while he waited for Tom, or more respectfully, the Reverend Thomas Ashleigh, pastor of the Wendall street church.

He came, and I went stealthily up stairs, and with my ear close to the register, overheard the following conversation:

"Good morning, my dear Uncle! How do you find yourself this morning? This cold weather coming on will affect your gouty limbs, I fear," said my brother.

"I'm well enough to go to Europe, and all I want of you is to know whether you can leave your business long enough to go with me. No parleying, but answer me. Yes or no," growled Uncle Abner.

"My dear Uncle, I would not listen to such a proposition from any other man in this world. But in view of your uniform kindness to me, and your liberality heretofore, I shall not hesitate one moment, but declare myself ready to forego all thoughts of self-interest, and accompany you wherever you may wish to go."

"Umph! well! You say you wouldn't do this for any other man living?"

"I would not, upon my honor, Uncle! Think of the excellent chance I have, and my liberal salary, all of which I must sacrifice. No, dear Uncle, I would not do this for another living man—"

"Then, by hokey, you shan't do it for me!" snarled my Uncle, leaning back in his chair, and shutting his eyelids closely.

"But, my dear Uncle—"

"Shut up your confounded noise, sir! Can't you see that I am going to sleep?" angrily exclaimed my Uncle.

"But, sir!" persisted Tom.

"Get out! Don't I know what you are all fishing for? If I hadn't half a million of dollars at interest, you'd every one of you see me go to Europe, or to the devil, alone. You know you would, you sneaking cur! You wouldn't one of you offer to go with me! Get out of my sight!"

The Reverend Tom knew full well that to remain would lessen his chances of ever getting a haul out of my Uncle's coffers, so he prudently withdrew.

Uncle Abner's bell rang furiously.

My sister answered the summons.

"Send Dick to me!" he roared.

"Uncle Abner has one of his tantrums to-day," muttered my sister, going for Dick, who at once repaired to the "lion's den."

"Dick, I'm going to Europe. Do you want to go with me?" was the question.

"If I could leave my profession, sir, I should be most happy to accompany you, but the journey, pecuniarily viewed, will subject me to considerable loss—"

"Get out! Just as though you did n't know that I should pay all expenses, and pay you well for your time besides."

"Certainly, my dear Uncle! Certainly! You have always been near and dear to me, and I am willing to make any sacrifice for your pleasure. I will go to Europe with you," replied my brother, Dick.

"Not by a jug-full, if I know myself! No, sir, you toady, if you go to Europe, I don't. Clear out! all that any of you want is my money! I ain't blind! I can see it."

Dick left the room in disgust, and my heart began to thump ominously. If there was one thing I desired more than another, it was to go to Europe, to travel in the land of history of romance, and of song.

Therefore, when Uncle Abner's bell rang again, and he thundered a request for me to be sent to him, I was ready.

"What now?" I asked, entering the room.

"Sit down there, you young scape-grace! I want to talk to you," he said, savagely.

"I don't care to sit down," I replied. "If you have anything to say to me, you'd better say it soon, or I shall be out of hearing."

"Harry, I'm going to Europe, and I've sent for you to ask you if you would like to go with me," he said, more mildly.

I burst into as loud a laugh as I could counterfeit, and after it had a little subsided, exclaimed:

"Well, if that ain't a good one! The idea of my going to Europe with you! Why, you cross old curmudgeon, I would not go to Europe and back with you for all you are worth."

"You wouldn't? I'm worth half a million, young man!" he cried.

"I know that," I answered, moving toward the door.

"Come back here, you young scamp! I'm going to Europe, and you've got to go with me, whether you want to or not," he cried.

"Now, Uncle Abner," I said, gravely, coming into the room, and throwing myself into his favorite chair, put my feet upon the table where he kept his papers and choice books.

"Uncle Abner Ashleigh, I want to go to Europe more than I ever wanted anything in all my life. But I wouldn't travel in your company for all the wealth of the Indies!"

"Why not?" he asked, in a voice quite humanized.

"Because, Uncle Abner," I continued, coolly, pushing a heavy book from the table with my feet, "you are so mortal ugly that I couldn't live to get back! I am morally certain that I should kill you, if you didn't kill me before we had gone a thousand miles from home. No, sir! I won't go to Europe with you."

And having delivered myself of this speech, I arose, and, picking up the book I had displaced, left the room.

After that there was silence in Uncle Abner's room until dinner-time.

Then I was sent for again.

"Harry, my boy, how would you like to have half a million of dollars?" he asked. He spoke pleasantly; but I could detect the tiger in his eyes.

"If I could have half a million of dollars, without degrading myself to get it, I should think it was pretty jolly. But I wouldn't stand your lip, from here to Europe and back again, for a *whole* million!" I answered.

"Come, now, boy, don't be stubborn! Say you'd go with me, and look out for my comfort if I'd promise to make you my heir by will. You would, wouldn't you?"

"No, sir-ee! I wouldn't do it!" I replied.

"Haven't you any respect for your old Uncle?" he asked, changing his tactics.

"No, sir!" I answered, bravely.

I saw that my journey to Europe was as good as made, if only I played my cards well.

The cross old fellow, finding one who would not bow to his half-million, was determined to conquer.

"Don't you love me any, Harry?" he whined.

"Love you, Uncle Abner? How can you expect me to love you, when you have only given me abuse all the days of my life? No, sir! I don't love you any more than I love that brass monkey, on the shelf beside you!"

"Oh, Harry! Ungrateful boy! Think of all the money I have spent on your education, and your clothing, and everything!"

"My good friend, you can't play that on me! All that you have ever done for me don't half pay for the trouble of having you forever snarling about the house. No, sir; it don't! And when you die, I intend to bring my bill in against the estate, at so much a day, damages."

"Damages! Against what?"

"Against my disposition, Uncle Abner. You've fretted, and growled, and snarled about this house, until you have changed me from one of the sweetest-tempered little cherubs that ever went without wings, to a saucy, insolent boy, who has no regard for anything sweet or sacred. And your estate will have to pay damages, sir!"

Uncle Abner looked first angry, then surprised, and he finally burst into a loud laugh, telling me to "clear out, and begin to get my things ready to go to Europe with him."

I went, protesting all the way that he had not money enough to hire me to accompany him across the ocean. The next day he called me to him, and unlike himself, promised to be very quiet and gentle, and not be rude or cross at all, if I would say that I would go with him to Europe. But I held firm until all my preparations were made, and the steamer in which he had planned to go would sail in two days.

My mother and sister begged to be taken along, but the crusty old fellow declared that he'd as soon have a thousand cats along with him as two women.

"No, my dear madam!" he said, in reply to her request to accompany him across the ocean; "I'd as soon have a parcel of cats, as a woman to travel with. You can't go."

And that settled my mother's journey to Europe, for that time.

Declaring to the last that I would not go with him, I bade my mother and brothers and sister a tender farewell, and went with Uncle Abner to the wharf. "I'll go on board and see you safely stowed away in your state-room, Uncle Abner, and I hope you'll have a pleasant journey. Hang it, old fellow! If you wasn't so ungodly in your ugliness I would go with you. I do want to go to Europe," I said, as we entered the large, airy state-room.

The tears actually stood in the old man's eyes.

"I'll leave you all my money if you'll go!" he replied.

"It isn't too late to send a message to your mother, and go now. Say you'll do it, my boy. Remember the half million."

"I don't want your money, Uncle Abner! With my education, when it is finished, I can earn all the money I shall ever need, and you are so confounded cross, you know."

We sat talking together for nearly an hour, when I suddenly started up, exclaiming:

"I must go ashore, if I don't want to be obliged to go to Europe, and I don't. Not with you," I added.

"Well, good-bye, my boy;" and the old fellow wrung my hand at parting.

As I expected, the steamer was well down the harbor.

Returning to the state-room, I found my Uncle in tears.

"What are you crying about? Because the steamer has left the wharf, and I must go to Europe anyhow?" I asked.

"No! We're not moving, Harry?" he cried.

"Yes, we are," I replied.

"Now, praise the Lord! But, Harry, my boy, I'll be as gentle as a lamb with you—"

"You'll have to, or I'll jump overboard!" was my sympathetic reply, as I tumbled into my berth, which looked very inviting.

You may think me perfectly heartless, from my manner of treating my Uncle, but he was one of that sort of people, who, getting an idea into their head, allow it to become the one thought of their lives.

Uncle Abner had entertained the idea that his relatives were all anxious to get his money; and with forever brooding over the thought, had become monomaniacal upon it.

Therefore, it only remained for me to convince him that I cared nothing for his money, to gain his affections, and probably through them his wealth.

He had no nearer kindred than my father's family; and if he left no will, we would share it equally.

There's no use in a person having a rich relative who is presumed to be not long for this world, to say that they give no thought to the money of that relative. The thing would be impossible.

Everybody thinks more or less of his *expectations;* and I had already resolved what disposition I would make of Uncle Abner's property, if ever it came into my hands. I would divide it equally between my two brothers, my sister, and myself. Mother had property enough in her own right.

Uncle Abner was as good as his word. He was as gentle as a woman all the way across the ocean; and our large, pleasant state-room became like a home to me, endeared by pleasant memories.

We reached the "other shore" in safety, and at once commenced the exploration of all the scenes of note.

Probably the most of my readers have seen all that I saw before we reached Paris. So I will not weary them by recapitulation.

CHAPTER II.

THE MASKED BALL.

There was to be a masked ball in the great hall connected with our hotel, and Uncle Abner insisted upon my going. I had never witnessed anything of the kind, and there was enchantment in the very thought of attending a masked ball in costume.

The evening came; and after having seen Uncle Abner nicely in bed, with his favorite foot-warmer, cologne bottle, wine and cigars, with book and bell at his disposal, I arrayed myself in the costume of a German prince, and repaired to the ball-room. There were many persons still earlier than myself; and for a half hour I amused myself with watching the movements of those present, admiring the different costumes, and seeing the new arrivals. Toward midnight I joined in the dance, my first partner being a graceful young girl, with the voice of an angel, in the costume of a German peasant girl.

As we conversed during the intervals of the dance, I observed that her voice was purely American. She must have noticed the same peculiarity, for she said, when we were resting after the dance:

"Your voice tells me that you are an American. I am American, too."

There was such a confiding, innocent ring to her sweet voice, that I was drawn to her in spite of myself.

"Have you been long in Paris?" I asked.

"More than a year. I am at school here; and that large, graceful woman, in the costume of a queen, is my teacher of German. She planned our coming here to-night. In fact, it was Gretchen who first proposed coming. My mamma is terribly strict, so Gretchen says, and she never allows me to go to any place like this. But Gretchen promised to take care of me, and she gained mamma's consent to my passing the night with her, at the lodgings. Then we came here; and here we are, having a splendid time. It is nice, isn't it?"

"Very nice, indeed," I answered, charmed by the frankness of my young countrywoman, and wishing that I could obtain a glimpse of her face, which I felt, instinctively, must be very beautiful, from the purity and sweetness of her voice, her graceful form, and slender hands and feet.

"Have you ever been in a place like this before?" she asked.

"Never!" I replied.

"Quite a coincidence! We are both Americans, and neither of us have ever been at a masked ball before. Perhaps we shall meet in our native land sometime. How shall we know each other there?"

"How shall we, unless you give me your name, and I give you mine?" I replied.

"My name is Geraldine—"

"Mademoiselle is talking too much," exclaimed a soft voice near us; and turning, we beheld the German teacher in the costume of a queen.

"Pardon me, Gretchen! I forgot what you told me, indeed I did," murmured the young girl, bowing me a fare-

well as she moved away with her teacher, who had not honored me with a glance.

An hour later I stood behind a marble pillar near the entrance, thinking whether to go to my rooms, or remain awhile longer at the ball. Two men came and stood near me without observing me. Their first words chained me to the spot. The voice of the first speaker was that of a native Frenchman; the other was purely English.

"Gretchen for me, and you may have the young American, my lord."

"Exactly. But how will you get them into our power?" asked the English voice.

"Gretchen is in the secret! We have met before. But the young American girl must be decoyed. Gretchen will attend to that. All we have to do is to go first to my private room. Gretchen will come in presently with the American. We will have a little supper ready, and you must give the little beauty drugged wine. Gretchen and I will then go our way, and you will have the field clear to enjoy your triumph. Ah, my lord, Paris is one grand city for intrigue in love affairs."

The men moved away, and I stood irresolute. The spirit of old '76 was stirring within me, and that would never allow an Englishman to triumph over an American, even were there nothing in my heart that would protect a weak, innocent girl from the snare of a villain.

I felt that the first thing to be done was to ascertain the locality of the room where Gretchen was to betray her charge into unscrupulous hands.

Fortune favored me, for coming slowly down the hall, I saw the slender, graceful form of Geraldine, accompanied by her teacher.

The two men paused opposite her, and one of them said "No. 72." Gretchen waved her fan, and passed on. I went to No. 72, and found the door unlocked.

On going in I saw a dainty supper laid for four, with wine and champagne.

Quickly hiding behind the rich, heavy window drapery, I was not a moment too soon, for closely following me came the Frenchman and the English lord.

They cast aside their masks, and I saw that both were young and handsome. They had been in the room but a moment when Gretchen entered with the young American girl.

"Throw aside your mask now, Geraldine," said the teacher, taking off her own mask, and turning the most beautiful of blonde faces towards me.

The handsome Frenchman arose, and bowing low before the fair Gretchen, lifted her hand to his lips, and drew her to a seat upon his knee.

"Remove your mask, Geraldine," said the young English lord, approaching the trembling girl, who stood in the centre of the room, with her hands clasped upon her heaving bosom.

"Gretchen!" she cried," take me home, I'm afraid of these men!"

The Frenchman laughed as he kissed the white, bare shoulders of Gretchen, and the Englishman took a step forward, to throw an arm about the waist of the frightened girl, who stood still, unable to move or cry out.

His hand was upon Geraldine's mask, and in a moment it was upon a chair near by, while the beautiful, innocent face of the child lay white and upturned against the breast of her persecuter.

"She has fainted," said Gretchen, coolly. "We will leave her to your tender care, my lord," added the Frenchman; and he and Gretchen left the room together, leaving poor little Geraldine in the arms of her captor, who bent his sensual lips to touch her own pure ones, just as I sprang from my place of concealment, and pressed the cold muzzle of a revolver to his temple, whispering:

"Release this child, or I will blow your brains out, on the instant!"

Like the coward he was, the man let go his clasp about Geraldine's waist, and she rested against my heart.

"What will you do next?" asked the Englisman.

"Blow your brains out, fellow, if you are not obedient," I replied.

"I usually go armed myself, but am unfortunately defenceless to-night, or you would not have found your game so easily won. It's rather small business, anyhow, to take a beauty right out of a fellow's arms, after he has so far won her," muttered the Englishman.

Geraldine was slowly reviving, and in a few moments, she whispered:

"Oh, kind sir, please take me home! Once within my mother's protection, I will never, never wish to go away from her again."

"Calm yourself, my poor girl," I said. "I will take you safely to your mother's arms, I pledge my honor as an American!"

"Are you the gentleman with whom I talked this evening?" she asked.

"I am. You will trust me?"

"I will. Let us go now, please," she replied, clinging to my arm.

I took her mask from her chair beside us, and fastened it with my own hands. Then we went out together, leaving the Englishman sitting at the table as unconcerned as though nothing had happened. As we passed down the ball-room, my companion whispered:

"Take me to the American Hotel, upon the opposite side of this block, if you please."

I promised to do so, and sent a man for a carriage, which was at the entrance in a few minutes.

The ride to her hotel was rather embarrassing for both. Geraldine tried to thank me for the service I had done her, but her voice choked with tears, and I was too apprehensive of another scene, to reply gracefully, although I managed to stammer something in reply.

"What shall I tell my mother?" asked Geraldine, as the carriage stopped before her hotel.

The continuation of GERALDINE; A LOVE STORY, will be found in No. 114 of THE FIRESIDE COMPANION. THE FIRESIDE COMPANION is for sale by all News-dealers, and will be mailed to any address One Year for Three Dollars. Now is the best time to subscribe for THE FIRESIDE COMPANION. AN APPROPRIATE

HOLIDAY GIFT!

What more welcome Gift to a wife, daughter, sweetheart or friend than a Magazine, a monthly reminder of your regards for her entertainment and profit, which are most suitably presented in WOOD'S HOUSEHOLD? Published by

S. S. WOOD, Newburgh, N. Y.

Single copies 10 cents; Yearly $1.00. The Sixth Volume begins with January, 1870. Read what is said of

WOOD'S HOUSEHOLD MAGAZINE,

From Maine to California:

VIRGINIA.—"Each number of this valuable publication is a treat in itself, but to have five all at once before you, furnishes such a feast of reason, and a flow of soul, as can rarely be obtained from other sources. The farmer, the artist, the lover of literature, either light or abstruse, and the housekeeper, whether she be of a romantic or strictly practical turn of mind, will find something that will entertain, amuse and instruct them. We intend filing and binding all the numbers that come to us, and hope the publisher will not fail to send every one, and feel confident that at the end of the year, we will thus have made up a scrap-book, not excelled in variety, taste, spice or reason, by the excellent one compiled by Field."—*The Southwest*, Christianshurgh, Va.

CALIFORNIA.—"It contains nearly as much reading matter as some of the $4 Magazines."—*Times*, Santa Cruz, Cal.

INDIANA.—"To say that it is good, would be 'blue-John,' in comparing its merits to cream."—*Aurora Borealis*, Bowling Green, Ind.

LOUISIANA.—"It speaks to young men, young women, parents, children—the young and the old, and to all, in the most attractive manner."—*Weekly*, Iberville, La.

CONNECTICUT.—"It is presided over with judgment, taste, and with a desire to entertain as well as profit; it does both."—*State Temperance Paper*, West Meriden, Conn.

NORTH CAROLINA.—"It is essentially a home Magazine, and is just the thing that one would most desire to place in the hands of his wife and little ones, or that a man of business would himself take up for the employment of a leisure hour."—*Post*, Wilmington, N. C.

PENNSYLVANIA.—"We have seen no number yet that did not contain information of more value to the reader than the price of it for a year."—*American*, Sunbury, Pa.

IOWA.—"It is filled with spicy, and at the same time, chaste reading, so acceptable to all, that it will eventually become a household necessity."—*Sentinel*, Iowa Falls, Iowa.

TENNESSEE.—"This month'y gem of literature, wit and humor, sparkling and bright as the liquid light, has come to hand."—*American Resume*, Shelbyville, Tenn.

MASSACHUSETTS.—"It is as full of good articles as a Thanksgiving pudding is full of plums."—*Times*, Webster, Mass.

ILLINOIS.—"It has a department for stories, young men, young women, parents, children, temperance, religious, health, scientific, the farm, floral, culinary, and so on to the end of the number."—*Republican*, Princeton, Ill.

OHIO.—"One of the neatest, purest and best household and literary journal in the country."—*Courier*, Columbus, O.

MINNESOTA.—"It will inculcate in your children the best of morals, and enrich their minds with everything that is manly and ennobling."—*Union*, Anoka, Minn.

GEORGIA.—"We receive no work more acceptable than this, or better calculated to give satisfaction to an entire household."—*Clipper*, Warrenton, Ga.

NEW YORK.—"It is replete with splendid stories, first-class biographical sketches, excellent receipts, and, in fact, a host of articles all good and readable."—*City and Country*, Nyack, N. Y.

MISSOURI.—"It is handsomely printed, and is devoted entirely to domestic and literary matters, eschewing the vexed subjects of politics and theology."—*Advertiser*, Fayette, Mo.

MAINE.—"It is filled with a great variety of good reading for the household, well calculated to make people wiser, better and happier."—*Mail*, Waterville, Me.

KANSAS.—"Its pages are never dull with long and dreary disquisitions, but are fresh, lively and wise."—*Republic*, Ottawa, Kansas.

KENTUCKY.—"Young ladies, if you want to read some very interesting stories every month, subscribe for it."—*Democrat*, Flemingsburgh, Ky.

ARKANSAS.—"As an exchange we prize it above all others."—*Free Press*, Madison, Arkansas.

"*At the head of the Magazines of to-day.*"—Norwalk Gazette.

"*Pre-eminent among the Monthlies.*"—Buffalo Com. Advertiser.

Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 33c., best 35c. per lb.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within thirty days, and have the money refunded.

Great American Tea Company,
Nos. **31** and **33** VESEY-ST.,
Post-Office Box, 5,643, New York City.

Farm for Sale.

A chance for the amateur Farmer and Pomologist. 318 acres all enclosed with good fencing and susceptible of cultivation. 200 acres under the best of cultivation. Timber culled out and set to Blue-grass; 3 Orchards in bearing; 250 Apple Trees; 100 St'd and 50 Dwf. Pears; 75 Cherry, 50 Peach Trees, abundance of Grapes and Small-Fruits of all kinds, selected personally from Ellwanger & Barry's Nurseries; ¼ mile Evergreen protection to Orchard, Garden, Stock, &c., 10 to 25 ft. high; Two good dwellings, all the necessary barns and out-houses. Over 50 varieties ornamental trees, shrubs, &c. No roads running through the farm but the main thoroughfare from Indianapolis, west, runs in front of residence; 4½ miles from Covington, the County seat. Within ½ mile of Indianapolis, Bloomington, and Western R. R., running through Covington.

I will sell at the low price of $70 per acre, as I have made arrangements to go into the manufacture of agricultural implements. Address R. D. BROWN,
Covington, Indiana.

To Propagators and Nurserymen.

The valuable property of J. F. DELIOT, Vine-grower, will be sold by Auction, at the Getty House, Yonkers, January 22d.

There are on the place extensive Green-houses, a commodious and well built dwelling, inexhaustible muck beds, and all the applianees necessary for a large and successful business. A rare chanee and well worthy the attention of the trade. Until the 22d, it is offered at private sale.

SING SING, Dec. 14th, 1869.

To Landed Proprietors.

The Advertiser, a man of great practical experience in Draining (having drained several thousand acres), Farming, Breeding and Management of all kinds of first-class stock, erection of farm and other buildings, collection of rents, and other matters of trust, will shortly be disengaged and prepared to undertake any business of the above nature. Apply in the first place stating full particulars, to "Agent," care of T. W. ANDERSON, Esq., 735 Michigan Avenue, Chicago, Ill.

ALL WANTING FARMS.—*Good* soil, *mild* climate, and *healthy*. Thirty-four miles south of Philadelphia. Price $25 per acre. The place is growing *more rapidly* than most any other place in the United States. *Thousands* are settling. Address
CHARLES K. LANDIS, Vineland, N. J.

35 Years! The BEST HOME MAGAZINE in the world. 600 Octavo pages, illustrated. $2.00 in advance. Send for specimen. Address MOTHERS' JOURNAL, Chicago, Ill.

BEST CABINET ORGANS

AT LOWEST PRICES.

That the MASON & HAMLIN CABINET and METROPOLITAN ORGANS are the BEST IN THE WORLD is proved by the almost unanimous opinion of professional musicians, by the award to them of SEVENTY-FIVE GOLD and SILVER MEDALS or other highest premiums, at principal industrial competitions within a few years, including the MEDAL at the PARIS EXPOSITION, and by a sale very much greater than that of any similar instruments. This Company manufacture ONLY FIRST-CLASS INSTRUMENTS, and will not make "cheap organs" at any price, or suffer an inferior instrument to bear their name. Having greatly increased their facilities for manufacture, by the introduction of new machinery and otherwise, they are now making BETTER ORGANS than EVER BEFORE, at increased economy in cost, which, in accordance with their fixed policy of selling always at least remunerative profit, they are now offering at PRICES of INFERIOR WORK. FOUR OCTAVE ORGANS, Plain Walnut Case, $50. FIVE OCTAVE ORGANS, Double Reed, Solid Walnut Case, carved and panneled, with FIVE STOPS (VIOLA, DIAPASON, MELODIA, FLUTE, TREMULANT), $125. Other styles in proportion.

Circulars, with full particulars, including accurate drawings of the different styles of organs, and much information which will be of service to every purchaser of an organ, will be sent free, and postage paid, to any one desiring them.

MASON & HAMLIN ORGAN CO.,
154 Tremont St., Boston; 596 Broadway, New York.

Michigan State Agricultural College.

The term for 1870 will begin on Feb. 23d. The College has just completed a large boarding hall and dormitory.

Instruction is given in the Mathematics, Physical Sciences, higher English branches, and French. The College possesses a farm, stock, orchards, green-house, chemical laboratory, collections on Natural History, &c. Manual labor is required. Expenses are very moderate. Send for Catalogue or information to the President.

T. C. ABBOTT, Lansing, Michigan.

Profitable Employment for the Winter.

A good canvasser can find profitable employment in every town in the United States, canvassing for the sale of Eumelan Grape-vines.

Every family should have from one to one dozen of these vines to produce grapes for their own use, and this variety being highly endorsed by the *American Agriculturist*, the Tribune, and by the Farmers' Club, as well as by all the leading Horticultural Societies, it will be a very easy matter to make sales of the vines, so that any good canvasser can make several dollars per day taking orders for the vines.

☞ See advertisement, page 429, Nov. American Agriculturist. Send for price list and terms to Agents and Clubs.

Address HASBROUCK & BUSHNELL,
Iona, near Peekskill, Westchester Co., N. Y.

PORTABLE, AGRICULTURAL AND STATIONARY

STEAM ENGINES.

EXCELLED BY NONE—EQUALED BY FEW IN MERITS OF EFFICIENCY, ECONOMY AND PERFECTION.

Our PORTABLE ENGINE, mounted on *Locomotive Boiler*, having fire-box and ash-pit entirely surrounded by water space, is set upon legs and timbers; occupies little room; needs no brick-work; is suitable for use in any place where power is required—in *Mills, Shops, Foundries* or *Printing-rooms* or in *Stock Barns*, for grinding, cutting and steaming food for stock.

The AGRICULTURAL ENGINE, supplied with *Locomotive Boiler*, is mounted on wheels, with pole for attaching horses for moving from place to place; is suitable for *Grain Threshing, Corn Shelling, Wood* and *Shingle Sawing*, &c.

The STATIONARY ENGINE is complete, with *Governor, Pump* and *Heater*, with connections fitted.

Circulars, with descriptions and prices, furnished on application to A. N. WOOD & CO.,
Eaton, Madison County, N. Y.

NATIONAL EXHIBITION AT CORDOVA, ARGENTINE REPUBLIC.

All parties desiring information in regard to this Exhibition will please apply to either of the following:

His Excellency Manuel R. Garcia, Argentine Minister, Washington; Edward F. Davison, Argentine Consul General, New York; Belisario Roldan, Special Agent of the Central Committee, at the Consul Generals office, New York, or to the Argentine Consuls at Savannah, Baltimore, Philadelphia, Boston or Portland.

MAPLE SHADE FLOCK.
THOROUGH-BRED COTSWOLDS.

Having purchased of John D. Wing, Esq., his

Entire Flock of Imported Sheep,

I offer for sale a few Choice Ewes, Rams and Lambs. This flock has been gathered from the very best breeders in England and parties ordering can rely upon getting *Pure Thoroughbred Cotswolds*. Address

L. A. CHASE, 245 Broadway, New York.

MASSACHUSETTS AGRICULTURAL COLLEGE, Amherst, Mass. For Circulars or any desired information, address the President, W. S. CLARK.

WALTHAM WATCHES.

Buyers of watches at retail should be on their guard against buying watches represented as "American," and which are usually advertised in connection with the words "Oroide," "Imitation Gold," and other words calculated to attract attention. Nine cases out of ten such watches are spurious, as our genuine movements are seldom, if ever, put into anything but solid gold or silver cases. Large numbers of these worthless watches bear colorable imitations of our trade-marks. To avoid imposition, buyers who do not know responsible jewelers should first procure a descriptive catalogue of the different styles of watches made by the American Watch Company, of Waltham, Mass. The catalogue contains, in addition, much useful information to watch-buyers. Address

ROBBINS & APPLETON, General Agents,
182 BROADWAY, New York.

The Eumelan Grape.

The EUMELAN has been awarded the following first premiums for quality during the present fall:

Penn. Horticultural Society (Philadelphia)....Sept. 13 to 16.
Ohio State Fair (Toledo).....Sept. 13 to 16.
New York State Fair (Elmira).....Sept. 13 to 16.
Geneva Horticultural Society (Geneva, N. Y.)Sept. 25 to 26.
Hammondsport Grape Exhibition.....Sept. 29 to 30.
N. Y. State Grape Growers' Exhibition, (Canandaigua)..... Oct. 5 to 6.
Ohio Grape Growers' Association, (Cleveland)..... Oct. 13 to 14.
Lake Shore Grape Growers' Association, (Erie, Pa.).....Oct. 15 to 16.

These are the strongest commendations of its quality.

The *American Agriculturist* has endorsed it so fully as to offer the vines as special premiums.

This Grape is also fully endorsed by the New York Tribune and by the Farmers' Club.

☞ See advertisement, page 429, Nov. *Am. Agriculturist.*

Profitable employment can be found introducing these vines.

Send for price list and terms to Agents.

Address HASBROUCK & BUSHNELL,

HOW CROPS GROW.

A Treatise on the Chemical Composition, Structure, and Life of the Plant. With numerous illustrations and tables of analyses. By **Prof. Samuel W. Johnson,** of Yale College. Price $2.00.

This book is a guide to the knowledge of agricultural plants, their composition, their structure, and modes of development and growth; of the complex organization of plants, and the uses of the parts, the germination of seeds and the food of plants, obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture.

Another work by the same author is now in press, entitled "How Crops Feed," in which the subject of the Food of the Plant is amplified in all its details, and the atmosphere and the soil are fully discussed in their manifold relations to the Plant.

NEW AMERICAN FARM BOOK.

Originally by **Richard L. Allen.** Revised and greatly enlarged by **Lewis F. Allen.** Price $2.50.

Allen's American Farm Book has been one of the standard farmers' hand books for twenty years; it is still a valuable book, but not up to the tim and as its author, Mr. R. L. Allen, could not give time to its revision, this was undertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Erie county, editor of the American Short-horn Herd-Book. The work is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser, and is called the *New* Americau Farm Book.

PARSONS ON THE ROSE.

A Treatise on the Propagation, Culture, and History of the Rose. Revised and newly electrotyped. Illustrated. By **Samuel B. Parsons.** Price $1.50.

The Rose is the only flower that can be said to have a history. It is popular now and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curious legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has been adopted, and the leading varieties under each class enumerated and briefly described. The chapters on multiplication, cultivation, and training, are very full, and the work is altogether the most complete of any before the public.

Either of the above books sent post-paid on receipt of price by

ORANGE JUDD & CO., 245 Broadway, New York.

[COPYRIGHT SECURED.]

GROUP OF ORNAMENTAL PHEASANTS.—FROM LIFE, BY EDWIN FORBES.—*Engraved for the American Agriculturist.*

We have often wondered that this strikingly beautiful class of poultry is not more frequently bred by our amateur poultry fanciers. The pheasants breed readily in confinement, and are reported quite hardy. The common pheasant of Europe is said to have been originally (hundreds of years ago) brought from Asia. It is a very beautiful bird, though not so brilliant, from contrasts of color, as the golden and silver species which come from China. The Common Pheasant is known in several variations, one of which, the Ring-necked Pheasant, is seen with his mate at the right of the engraving. The cock is a pugnacious fellow, armed with sharp spurs, and weighs about 3½ pounds. His plumage glows with all the colors of the rainbow. Above this pair is a pair of Albinos of the same species. The Silver Pheasant, seen in the foreground, with his hen, of more sober colors, behind him, is gay in his variagated plumage of black and white. This bird is a good deal larger than the common one; the markings are well shown in the engraving, and the head of the cock is adorned by remarkable crimson, velvety caruncules. The Golden Pheasant, seen above the last, is much smaller than the others. The general color of the plumage of the cock is crimson; the crest, which is erectile, is golden yellow, contrasting with the orange colored cape, barred with black. Other colors in the plumage are chestnut brown, black, blue, and green, with glossy iridescences. Pheasants do not sit well in confinement, but drop their eggs about, which are usually set under bantams or Silky fowls. The young are delicate, and require careful attention and a variety of food. No doubt some of the varieties of pheasants might be introduced, and if set at liberty in retired spots, below latitude 41°, become acclimated.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last thirteen volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for thirteen years past, beginning with 1857—that is, Vol. 16 to Vol. 28, inclusive. Any of these volumes sent complete (in numbers) at $1.75 each, post-paid, (or $1.50 if taken at the office). The volumes, neatly bound, are supplied for $2 each, or $2.50 if to be sent by mail. Any single numbers of the past thirteen years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW YORK, FEBRUARY, 1870.

We approach the time, with the passage of this month, when farmers must have their plans made, and know pretty well just what they purpose, and how they will carry it out. The lengthening days make farmers impatient for field work. It is high time that good farm hands were engaged for the summer. The best make the earliest engagements. As there has been quite a dearth of employment for laboring men, both in town and country, we anticipate engagements at lower rates than ruled last year. Money is "tight," in commercial phrase, and farmers have not been so well paid for their products as in the past few years. This should not influence us to decrease our operations; to extend them with discretion, and to employ still more labor, would be better policy. The prosperity of the country depends directly upon large, good crops, of our staple productions. Labor well employed, and manure well applied, will surely pay in the long run. The price of produce is influenced greatly by the European markets, and, of course, by the harvests of the rest of the world. We are at peace, and the irregularities consequent upon a state of war have nearly passed away. Our population is rapidly increasing, land is growing in value, and the prosperity of our country and of the farming interest was never more certain.

Hints About Work.

Wintering Stock too often means feeding animals just enough to bring them through to spring, or to "grass," with life enough to recover in a few weeks from their run down, "spring-poor" condition. No class of stock can be thus treated without loss. They are liable to take diseases, they become the prey to all sorts of vermin, and if the treatment goes a little too far, the crows and dogs pick the bones. Any kind of stock may be wintered well on good upland hay and corn-stalks, or better, corn fodder, which is a good variation or mixture for beef cattle and horses. They eat bright wheat and oat straw, and salt or marsh hay with a relish occasionally. Most horses will keep fat as seals on hay alone, if not worked. They should be fed moderately, three times a day. Cows and young cattle cannot eat too much, and should have all they will eat of coarse fodder. They ought not to be made very fat, and will not become so without grain. Sheep will do well on straw, corn fodder, and hay, swine on clover hay, corn fodder, and a little bran or slops daily, if they have warm quarters.

Beef Stock.—As beeves increase in flesh, their feed should be improved in quality, and varied, so as to tempt the appetite, especially if they are to be marketed soon. If they are to be kept for grazing, they need not be fed highly, but kept gaining.

Cows.—Should any "come in" thus early, give them warm quarters and abundant feed, which may well consist of four or five quarts of bran or middlings, two quarts of oil-meal or corn-meal, and half a bushel of roots for each one, with all the hay she will eat. This will keep up the flow of milk until grass comes. Grain fed to cows with calf is of great service, and it is perfectly safe to let a cow get almost beef fat; if she is a good milker, all will come back in milk and cream.

Horses in steady use need only good feed and grooming, with care that their shoeing is suitable for the season. Those having little work should be exercised, that their legs do not become stiff and "stocky." If they do, hand rubbing is an excellent thing to redness them. They get exercise enough usually by having an hour's run daily.

Brood Mares should have regular exercise also, and their feed may be increased in quantity or quality as their time approaches. Be careful about their slipping upon the ice, and see that they have feed and water regularly, and salt, either always accessible, or given frequently—the former plan is best.

Sheep.—Separate the weakly from those that crowd them, so that each shall get its full share of feed. Feed roots if you have them to all, but especially to fattening sheep, and ewes near yeaning. Remove vermin and scab by carbolic soap.

Early Lambs should be yeaned in very warm quarters, carefully attended during the critical period of the first few days. Should they become chilled and set back, much of the profit is lost.

Breeding Sows require a variety of nourishing feed. Clover hay, milk, boiled potatoes, bran, etc. Do not expose to cold winds or to drifting snow.

Sick and Disabled Animals, of all sorts, should be separated from others of their kind, and placed where they can have extra care, better feed, warm, clean stalls, with plenty of bedding, and where they can be watched and groomed. Never "doctor" by guess work; if you do not know what is the matter, or what to do, do nothing but give good nursing, and trust to nature. If it is inconvenient to provide other accommodations, a sick horse may be placed in a loose box in the cow stables, and a sick cow may be placed among the horses.

Poultry.—It is time for all kinds of poultry to prepare for laying; this they do by accumulating flesh in the first instance, and by the time the hens, ducks, geese and turkeys are in good condition, they will, if good for anything, begin to lay. If we wait until they lay before we begin to feed them well, they will give us few eggs before they want to sit. The arrangements for a large clutch of eggs are made early, probably long before a single one is laid. Give fowls some meat or pounded bones, and oyster shells, and gravel if the ground is covered with snow. Ducks need similar food. Geese should have green feed—cabbage leaves, and turnip sprouts are good for them, and for all poultry. They will eat hay, which is best cut small, and pounded on a block after having been soaked.

Grain Fields, if bare, should be looked to, to see that the water furrows are free, and that the soil is not liable to be washed by spring rains. If the grain is much heaved by the frost, it should be rolled as soon as the frost is out and the ground is settled enough. If clover seeding is intended, the seed may be sowed before rolling. It will probably not start before settled warm weather. Top-dressings of bone-dust, ashes, fish guano, fine, rich compost, Peruvian guano, or good superphosphate, will do much towards resuscitating grain which the winter has used roughly, and may be put on poor spots.

The Wood Lot will still furnish work. Fire-wood cut during the winter should be hauled in and piled under cover of a roof, so that air shall circulate freely through it, if it is desired to have it in per-

fection. Fallen or decaying trees should be cut. Crooked saplings, or those which have given up the effort to push through to the light, should be mercilessly removed. Among the young growth, encourage only timber trees or those best for fuel.

Maple Sugar.—Make preparations betimes, and consult an article detailing the processes on p. 58.

Manure.—Good sledding may well be employed to haul out manure, especially upon plowed ground. Work over manure that is liable to heat, and lay it in compact piles, over which water may be pumped, to check and equalize fermentation.

Seeds, of all kinds, likely to be needed, both for the farm and garden, should be early provided, and tested in pots or boxes, to prevent disappointment.

Work in the Horticultural Departments.

Much is gained in taking advantage of occasional mild spells to advance the spring work. The early part of the winter, contrary to general expectation, afforded several such, and doubtless others will occur in which preparation for planting may be made, odds and ends cleared up, and several days gained which must otherwise have been taken from the busy season. We repeat that it is a great advantage to the purchaser and a convenience to the vender to order trees, seeds, and similar matters, well in advance of the time at which they will be planted and sown. Seedsmen now have their catalogues ready and their stock in store. Most of the hints given in January are timely now.

Orchard and Nursery.

Planting.—The time for setting trees will be governed by the locality. In the Southern States, planting will be done this month, but at the North nothing is gained by planting too early, even if the ground happens to be open for awhile. The cold, drying winds are very injurious to trees that have not yet recovered the use of their roots.

Varieties.—In planting for family use, the selection should comprise varieties from the earliest to the latest. In orchards, for marketing, there should be but few varieties, and those of popular market kinds, known to succeed in the neighborhood. In making a selection, local experience is the only safe guide. Do not buy from the extravagantly colored pictures shown by traveling agents. If unfamiliar with the sorts found to do best, make it a business to go about among those who grow fruit, and learn.

Young Trees, that are vigorous and healthy, are to be preferred to larger ones that have become checked in their growth by being crowded in nursery rows. Some planters prefer trees only one year old from the bud or graft. If trees are frozen in transportation, let them thaw very gradually.

Old Trees, that have become established, may be treated, during a damp, foggy time, to a wash of strong soft-soap, thinned with water enough to work, or a lye of potash. This destroys moss, loosens old scales, and leaves the bark smooth.

Injured Trees, such as have been broken by storms or otherwise, should have the ragged wound pared smooth. Those slightly injured by mice and rabbits will recover if earth be drawn up to cover the wound. If the bark is completely gone, the only way to save the tree is to connect the bark below and above the wound by cions, inserted in the bark so as to span over the injured part.

Grafting should be done only when the swelling of the buds shows that vegetation is starting. Cions may be cut and preserved in moss or sawdust.

Pruning is to be done before growth begins. In pruning neglected trees, the object should be to get an open and well-balanced head. Take care that a bad wound is not made by the falling of the limb when partly sawed off. Pare wounds smooth, and cover them with melted grafting wax or paint, which may be tinted, to be less conspicuous.

Insects.—Those which need particular attention at this time are the Tent-caterpillar and the Canker-worm. The first named is still to be attacked in the eggs, which will be found attached in bands to the twigs, near their ends. The Canker worm issues from the ground in spring, and often in warm days this month. The females are wingless, and can only ascend the trees to deposit their eggs by climbing. Some obstacle must be presented to their ascent. The simplest is a band of stout paper tied around the tree, to which tar is applied. This must be looked to every few days, and be renewed if the surface has become hard. There are a great many contrivances for surrounding trees with a gutter or barrier of oil or other liquid, impassable to insects, some of which are given in back volumes. The success of all these depends upon frequent inspection and care. See back volumes for details.

Manure may be spread upon the surface of the orchard. It should never be put in a heap around the trunks, where it does no good, but harm.

Fruit Garden.

Trees, and there should be only dwarf ones in the fruit garden proper, will need pruning, washing with soap or lye, protection against insects, etc., and such other care as has already been suggested for trees in the orchard.

Grape-Vines may be pruned when not frozen. It frequently happens that, in the pressure of fall work, the vines are left until now. If the coldest of the winter is over, go over those trimmed last fall, and remove the extra buds that were left as a precaution against the severity of the winter.

Blackberries and Raspberries should be set as early as the condition of the soil will allow. The underground shoots, which will form the canes of next season, start very early, and are likely to be injured if the setting is left until late.

Strawberries may be planted in those localities where the frost is out of the ground.

Kitchen Garden.

Manure is the main question, and it will be needed in large quantities, not only to apply to the soil, but for hot-beds. The heaps should be so large that the generated heat will not allow them to freeze. When the heaps become heated, which is shown by the issuing of steam, or may be ascertained by thrusting a stake into them, they should be re-built; water if the interior is dry.

Cold-Frames.—The plants will now bear full exposure during sunny days, but they must be covered in the afternoon, even if the nights are mild, for fear of a sudden change and snow storms.

Hot-beds should be started six weeks in advance of the time for planting in the open air; hence they are now needed only in the warmer States, where Tomatoes, Egg Plants, etc., may be sown. Preparations should be made. The common size of sash is 3×6 feet, glazed with 8×10 glass.

Straw Mats will also be needed to cover the sash, to protect plants from frost or too much sun. The mats should be 7 feet long, and 4½ feet wide, so that two will cover three sashes. We have, in former volumes, given directions for making them. One of the simplest is to stretch five strands of strong twine or "marlin," of the proper length, to form the mat, then lay on straw, with the butt ends towards the edges of the mats, and about an inch in thickness; then put five other strings over the straw, and directly above the first ones, and take a large needle and twine and sew through the straw, taking care that the loop of the stitch catches both the upper and lower strings. The sewing should be done at each pair of strings.

Brush, and Poles for peas and beans. Cut while there is leisure, and before the leaves start.

Potatoes.—A few for very early planting may be kept in a warm room to start the sprouts, and then be planted in a warm place in the garden. A few days may be gained, as they may with

Peas, by a little coaxing. Plant a row or two in a sheltered place, laying a board over the rows at night, and on very cold days. When the peas are up, raise the boards by means of bricks or something else that will keep them clear of the plants. Two boards, nailed together like an eaves-trough, are sometimes used for a cover at night. They may be placed, in the day, near the plants, to break off the wind and reflect the sun's heat.

Parsnips and Salsify.—Dig as soon as the ground is thawed, and before the plants start.

Rhubarb.—Roots may be forced by placing them in earth at the bottom of a barrel in a warm room, or, where there are cold-frames or green-houses, they may be forwarded easily.

Seeds.—Test their vitality as directed last month. Trust to none that are of doubtful identity.

Flower Garden and Lawn.

Plans for new improvements should be completed before the working season begins. We give, on page 64, some suggestions about laying out flower beds, and shall probably have something to say on the subject next month. Whether the place be large or small, a considerable extent of unbroken turf should be secured, unless one's taste for flowers is so strong as to require that all the available land be appropriated to them.

Shrubs should be taken into account in the plan. Many of them are beautiful in foliage all the season, and some of them produce exquisite flowers. Prune established ones if they have become overcrowded and out of shape. Let the trimming conform to the natural habit of the plant, and do not try to make one with naturally curving branches grow upright. Those which flower only on the new wood, like the Rose of Sharon, need to be cut back, to induce a strong new growth, while shrubs upon which the buds for next year's flowering, are ready formed, as the Lilac, need only to be thinned.

Ornamental Trees, if they need pruning, should be treated with the same care as fruit trees. Sometimes it will be necessary to remove lower limbs which are in the way, but, as a general thing, it is better to leave the tree to take its natural form.

Half Hardy Plants, which have been stored for winter in pits or in cellars, will need looking to, to guard against their being started into growth by the warmth of the sun. Give air, and keep as cool as possible, without severe freezing. Plants in cellars, if too dry, will need a little water.

Dahlias, Cannas, and other roots, stored for the winter, should be examined occasionally. They are more apt to suffer from dampness than dryness, and should be removed to a drier place if there are any signs of decay.

Wood-work, such as trellises, garden seats, rustic ornaments, etc., will need painting or oiling.

At the South, where the climate permits it, trees and shrubs may be planted, perennials lifted and divided, lawns made, and other spring work executed.

Green-house and Window Garden.

Air is to be given on mild days—a point much neglected by those who grow window plants.

Dust should be removed from the leaves of window plants by washing or showering.

Insects.—Those which most commonly infest house plants are treated of on page 63.

Bulbs should have the flower stalk cut away as soon as out of flower. If in pots or boxes, the leaves may be kept growing until they can be turned out in the open ground. Bulbs that have flowered in glasses are not worth saving.

Plants in Bloom will need shading during the middle of the day. Bring those about to flower near the glass.

Propagation of bedding and other plants for summer use may now be commenced. Verbenas, Geraniums, Heliotropes, and such plants, are often needed in large quantities, and by beginning early the stock may be multiplied extensively. The temperature of the air of the house should always be lower than that of the cutting bench.

Seeds of annuals, for summer blooming, may be sown in shallow boxes; the seedlings, when large enough to handle, may be pricked out into other boxes. Many of the herbaceous perennials, if started early in this way, will bloom the first year.

AMERICAN AGRICULTURIST.

ORANGE JUDD & CO., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): $1.50 each for less than four copies: Four to nine copies, $1.25 each: Ten to nineteen copies, $1.20 each: Twenty copies and upwards, $1 each. Papers are addressed to each name.

HOW IT IS DONE.

As previously explained, the Publishers of the *American Agriculturist* employ no Agents, and pay no direct commissions on subscriptions. But they prepare a list of choice articles, very valuable for use, or for sale by those not needing them, which they offer to all desiring them, as *rewards* or *Premiums* to those who gather and forward clubs of subscribers. These Premiums are paid out of advertising receipts; *all* the money received from subscriptions, and much more, is expended upon the paper itself. The Premium Articles are purchased at the lowest wholesale cash prices, usually direct from the manufacturers, and by this means, and by favorable advertising arrangements, *large* premiums can be offered. No article is offered which is not believed to be of a superior character, and cheap at the prices named. The list is given in another column, and a full descriptive list is sent to all desiring it. Fully **ten thousand** people have obtained these premiums in the past, and a great number are now receiving them daily. While thousands have written expressing their great satisfaction at their reception, not a dozen persons have ever expressed the slightest disappointment. The Publishers aim to deal honestly, fairly, and liberally with all, and they have every reason to be gratified with the result.....Thousands of illustrations could be given had we room, but the following will suffice as recent examples:

FIVE LADIES obtained 12 subscribers each, received a Sewing Machine, and presented it to a Soldier's widow, who is thus placed in a condition to earn a living for herself and children. This is done in many places.

POSTMASTERS, and their CLERKS in large numbers, are making up many Clubs, and calling largely for almost every article in the whole premium list.

A SCHOOL BOY, (one of many similar cases) in five evenings, gathered 19 subscribers, and now owns the Great Dictionary, with its immense store of information.

TWO FARMERS united their efforts, and in three weeks (using only part of the evenings and stormy days) they secured 150 subscribers in their own and an adjoining neighborhood, and as a reward they own together a Buckeye Mowing Machine, with no cost except freight.

A SCHOOL TEACHER, during a few evenings, made up a Sewing Machine Premium Club, and sold the machine for $55, (equal to his net wages for two months).

MANY GENTLEMEN of various occupations have made up Clubs of 6 to 66 subscribers, and have thus been able to surprise their "better halves" with one or more of the premiums Nos. 40 to 55. (See Table.)

LADIES, IN GREAT NUMBERS, and many MEN, are canvassing for our Premiums *as a business.* They receive the articles and sell them, for they are all very salable, and thus secure larger salaries than they could obtain in any other way—ranging all the way from $30 to $400 a month. The Publishers have letters and figures to show these facts. Any person, of the right tact and enterprise, can do the same. Those who have not the tact can cultivate it, if they have the enterprise.

THE PASTOR OF A SMALL VILLAGE CHURCH, says: ".....I needed a Cyclopedia for my Library, but my small salary would never leave enough to buy it.....I started out Monday morning among my parishioners, and, stating my object to my people, they soon helped me to a list of 96 subscribers, and I am sure I could have got 125 names, if you had required it, for the Cyclopedia. I am grandly paid for my effort, which has really cost nothing, for in gathering the names I made nearly a hundred Parish calls that I ought to have made any way. I shall repay my people in information these books are furnishing me; the reading of your paper in ninety-six families will awaken thought and enterprise, and thus they will be doubly paid. Further, I know of at least $200 lost by the humbug swindlers last year, which your paper would have saved. So here will be another gain. Your premiums are a public benefit."

AN ACADEMY STUDENT, paying his own way, spent vacation in canvassing among his friends, and for the subscribers obtained he selected premiums he could sell; and, as the result, he *cleared* $5.27 for each day of vacation, over all traveling and other expenses.

EIGHT BOYS AND GIRLS obtained 10 subscribers each, and received for the Club a premium Melodeon for their Sunday School Room. Some people who at first thought they "didn't want the paper," subscribed on account of the object aimed at, but they will doubtless find the investment really a double paying one.

A CLERK IN A COUNTRY STORE, says: ".....My friend S—— got an 'American Watch' last year, and it was so good that I thought I would try for one this year. So I opened my list four weeks ago, and as opportunity occurred, without interfering with my regular duties, I have gathered and forwarded 55 subscriptions. I have found plenty of people willing to subscribe if I would take and forward the money. The enclosed list makes up 55 names—or enough for the Watch Premium, No. 56, and five names more towards a Sewing Machine for a widowed Aunt, which I shall get before spring, and I guess before this month closes....."

SEVERAL FARMERS' CLUBS have divided the collection of names among a few active members, five to a dozen each, and secured the valuable premiums Nos. 100 to 111—so that they have the books for general use, besides the paper for the individual subscribers.

IN THE SAME WAY the valuable Live-Stock offered in the premiums are being secured for neighborhood use. One of these breeding animals, introduced in a neighborhood, will soon bring increased value to the stock, to the amount of thousands of dollars.

BUT space fails us to note a hundredth part of what is being done all over the country, and easily done, too. The paper itself *shall* be so valuable as to repay all subscribers. The premiums are all so much extra gain, or pay, to those who simply take the trouble to explain its character and collect and forward names of subscribers.

THIS MONTH

IS A CAPITAL TIME to fill Clubs under way, and start and complete new ones. The supply of Premiums is abundant (except in animals) and almost any one who has enterprise and courage can gather a list of subscribers large enough to get some of the premiums. There is hardly a Post Office in the whole country where there are not still subscribers enough left to form quite a large premium Club. YOU READER, may secure the premiums if you will. **TRY IT.**

SEE "Special Notes" on next Page.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at $1.50 a year, or at the lowest club rate of $1 a year. For full descriptions of the articles send for our *Special Sheet.*]

Table of Premiums and Terms, For Volume 29—(1870).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required at $1.50	at $1.
1	*Shorthorn Bull*	$500 00	425	1250
2	*Shorthorn Bull*	$800 00	500	1500
3	*Shorthorn Bull*	$700 00	580	1700
4	*Ayrshire Bull*	$100 00	120	350

☞ *Every Premium article is New and of the very* **best** *manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-nine Premiums,* **Nos. 29** *to* **33, 56** *to* **59, 70** *to* **74,** *and* **88** *to* **112** *inclusive, will each be delivered* FREE *of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.*

SPECIAL NOTES.

Read and carefully Note the following Items: (*a*) All subscribers sent by one person count, though coming from a dozen different Post-offices. But....(*b*) State with each name or list of names sent, that it is for a premium....(*c*) *Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.* You can have any time, from one to four months, to fill up your list....(*d*) Send the exact money with each list of names, so that there may be no confusion of money accounts....(*e*) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N.B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for....(*f*) Specimen Numbers, Cards, and Show-bills, will be snpplied free as needed by canvassers, but they shonld be nsed carefully and economically, as they are very costly....(*g*) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

Description of Premiums.

Every Premium is described in the October Agriculturist, and also in a **Special Sheet,** *which will be sent* **free** *to every one desiring it. We have room here for the following only:*

No. 84.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasnre daily. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequaled. The Blocks are put up in neat boxes, accompanied by a large hand-bill giving various designs of buildings. This is one of the most successful toys ever invented.

Nos. 88 to 93.—Volumes of the American Agriculturist (Unbound). — These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is $1.50 each, at the Office, or $1.75 if sent by mail, as they must be post-paid.——They are profusely Illustrated, the Engravings used in them having alone cost about $35,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from XVI. to XXVIII., inclusive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 94 to 99.—Bound Volumes of the Agriculturist.—These are the same as Nos. 88 to 93 above, but are neatly *bound* in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 100 to 111.—Good Libraries.—In these premiums, we offer a choice of **Books** for the **Farm, Garden,** and **Household.** The person entitled to any one of the premiums 100 to 111 may select any books desired from the list of our books published monthly, (see another page), to the amount of the premiums, and the books will be forwarded, Post or Express paid. $25 or $50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands.* Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 40 acres than he would off from 50 acres without the mental ability which reading will give him. ☞ Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 112.—General Book Premium. Any one sending 25 or more names may select Books from our published list to the amount of 10 cents for each subscriber sent at $1; or 30 cents for each name sent at $1.20 each; or 60 cents for each name at $1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Jan. 14, 1870, and for the corresponding month last year; also for the year ending Dec. 31.

Gold has been unsettled and lower, having fallen to 119¼, but it subsequently rallied to 123¼, and closed at 121¾....Breadstuffs have been offered freely, and have been depressed in price, on a moderate trade. At the close, holders of Flour, Wheat, Oats, and Barley, manifested unusual eagerness to realize, in view of the liberal supplies available, and prices closed in favor of purchasers....Provisions have been in better supply, and hog products have been much cheaper. The demand has been somewhat brisker, at the reduced figures....Cotton has been less active, and irregular....Wool has been slow of sale, and weak in price....There has been much less movement in Hay, Hops, Seeds, and Tobacco, which have been held with comparative firmness....We give monthly and annual statistics of the breadstuff trade of this port, carefully made up, from our own records.

In summing up the yearly supply of stock coming to the New York market for the year ending Dec. 31st, 1869, we find a large increase in some departments over the receipts given for former years, while in others the supply has not quite equaled that of last year. In the number of beeves there is an increase of 28,152 over the total for 1868, making the weekly average 6,275, or 542 more than the weekly average for 1868. The largest increase is among sheep, where the sum total exceeds that of last year by over 86,000. These figures are a pleasing feature to all interested in the growth of New York City. The markets have been much enlarged, improved, and they are undoubtedly at present second to none in comfort and regularity, care and attention given to the stock, or in the general courtesy to both buyer and seller....

Beef Cattle.—The weather, since our last report, has not been favorable for the beef trade. There have been several rains, followed by close, unseasonably warm days, which depressed the price somewhat. We quote some high figures, but they are only for fancy "Holiday Beef;" the prices of fair to medium grades change but little. The market has not been active since the new year began, but the yards are pretty well cleaned out each day. Butchers will not look at any animal that is not fat, and the price paid for such, over poor ones, is quite marked. Poultry has been abundant and cheap this year, and much of the high priced holiday beef, after hanging on the hooks for a few days, was finally sold at a loss to the butcher. There were many fine bullocks for sale, as is always the case in New York at Christmas time, but there is no space to give them special mention. The display (and the markets are a real show in the holidays) was fully equal to that of former years. We have seen heavier cattle in market, but a drove of fifty head, warranted to run 64 lbs. to the cwt., is pleasant to look at, and such were in market, and sold as high as 22c. per pound. The following is the list of prices, average price, and figures at which the largest lots were sold:

Dec. 20, ranged 11 @22c.	Av. 15c.	Large sales 14 @ 16¼	
do. 27th do. 11½@18c.	do. 14¾c.	do. do. 14 @ 15½	
Jan. 4th do. 10 @18½c.	do. 15c.	do. do. 13 @ 16½	
do. 11th do. 10 @17½c.	do. 14½c.	do. do. 13 @ 16	

By comparing the averages of this month with those for last month, it will be seen that the advance in price is really very little. We place it at about ¼c.@½c. per pound for fair beef. Of course the high price paid for very extra steers is not taken into the calculation....

Milch Cows have been more plentiful, and the market steady. There being a good demand, prices keep about the same. Fresh cows sell quickly for from $80@$100, but they must be good, and not half milked cows, with borrowed calves. A few, very fine, have sold for a few dollars over $100. Medium cows may be bought for from $70@$80, and sell slow at lower prices....

Calves.—The supply is small in this department, and sales rather slow. Butchers prefer in good weather to buy "Hog-dressed," which come in quite freely this season. Live calves sell, if fat, from 12c.@13c. With poor ones, 10c., and lower, per pound. "Hog-dressed," best quality, are worth 14c.@18c. Medium to poor, 8c.@10c. per pound. **Sheep** are in fair demand, and prices a little better. The quality also has improved, and buyers seem a little more ready to take them. Sheep that average over 100 lbs. bring from 7½c.@8c.; those of less weight from 4½c@5½c. and 6c. per pound. Fat sheep always sell quickest and best, and we urge upon farmers to send only such to market.. **Swine.**—The advance noticed in our last report has been more than lost this month. The supply has not been large, but the great number of "Western-dressed" offered,

brought down the price. Fat hogs are now selling for from 10c.@10½c. per lb. City-dressed bring 13c., or a fraction more, and western-dressed 12c.@12½c. per lb.

The Chicago Live-stock Reporter gives the following packing returns of Hogs packed at the various points the present season, compared with the number last season:

At the points indicated above, there appears to have been 601,257 hogs packed to the present time less than the entire number last season. The deficiency will scarcely be made good at the close of the present season.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, *paid in advance*, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss.*

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe*, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters thus sent to us are at our risk.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

Bound Copies of Volume XXVIII (1869) are now ready. Price, $2, at our office; or $2.50 each, if sent by mail. Any of the previous twelve volumes (16 to 28) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

LARGE PAY for LITTLE WORK, is really offered in the Publisher's Premium Table, (page 44), and there is, in all the year, no better time than during February, to gather new and old subscribers, and obtain these premiums. There is no Post-office of a population so small, that there are not enough persons to make up a smaller or larger premium club. These clubs can, if necessary, be gathered from several neighborhoods, and from different Post-offices, if all are forwarded by the same person. In some localities, half a dozen premium clubs, more or less, can be gathered from the same Post-office. A large premium can be obtained by little outlay of time. It has been done thousands of times, and as human wants are about the same everywhere, what has been done in one case, can be done in another. Reader, YOU can get a premium, if you wish.

Good Advertisements, by a large number of dealers, will be found in the proper pages, and they furnish useful information. Looking through these will often suggest new ideas and profitable investments. Those writing for circulars, or sending orders to our advertisers, will confer a double favor by stating in their letters, *where* they saw the advertisement responded to.

Letters and Letters.—Each issue bears witness that we devote several pages of space, and a great amount of time, to answering the questions of our correspondents. We would say to our new subscribers, and remind our old ones, that this is one of the most time-consuming portions of our editorial duties, and inform them that they can save us much time, and insure for themselves a more prompt attention, if they will state their case in brief, and stop when they are done. A letter like this,—"Dear Sir.—Being a great lover of that noble animal, the horse, I presume that you take an interest in him also. This is the first question that I have ever asked you, and I hope your well-known good nature," etc., etc., for two mortal pages, at the very end of which comes the question. A letter like this is laid aside until we have time to study it, and find out what the writer wants. If he had written "Dear Sir.—My horse finds it difficult to open his left eye in the morning. The lids appear to be glued together. What is the remedy?"—his case would have been comprehended at a glance. We have many letters which we can not answer, because life is too short. Twelve to twenty or more questions on a subject would require a treatise, and a book upon the subject should be procured. Where letters are received by the thousand, it will be seen that directness and brevity are desirable. Persons writing should always give their name, though they can use any signature they choose for matter intended for publication. Do not inclose, as is frequently done, 25 or 50 cents "for information,"—we have none to sell upon such terms. Send $5,000, or nothing but a postage stamp, which, by the way, too many forget when they ask an answer by mail.

Our Annuals for 1870, viz., the "Agricultural" and "Horticultural," are beautiful and valuable volumes, which should go into every household. They cost but 50c. each, in fancy paper covers, or 75 in cloth.

Six-and-a-Half Subscribers a Minute!—With the hard times among our western grain growing readers, we hardly expected the circulation of the *American Agriculturist* would hold its own this year. We are agreeably disappointed in the result. Instead of losing old readers, they are renewing generally, and bringing along many of their friends and neighbors. Our largest receipts for any single day in any preceding year were **3,365.** This year we have received **3,944** names in a single day! This, for ten working hours, is equivalent to OVER SIX SUBSCRIBERS A MINUTE!.....We tender our thanks to all the kind friends who have helped to secure this advance in our list of readers. We shall be thankful for a continuance of the same favors. Now is the time to lay in the year's stock of plans, hints, and suggestions for the summer work on the farm, in the Garden, and in the Household, etc. .....It will be seen on another page that the Publishers continue their offers of fine Premiums, which are very desirable, and may be secured by a large number of our friends during this and the succeeding month.

West and South.—A long article from a special Western correspondent came too late for this month. We solicit communications on practical local topics from all our readers at the West and far South.

New York State Poultry Society.—The annual meeting and election of officers of this society was held on the 11th of January, at which time notable changes were made in the administration. Those elected for the current year are T. B. Kingsland, of New York City, *President*, M. C. Weld, of New York, *Corresponding Secretary*, G. H. Leavitt, of Flushing, L. I., *Recording Secretary*, Wm. Simpson, Jr., of West Farms, *Treasurer*. Some changes were also made in the list of Vice-Presidents, and in the Executive Committee. Votes of thanks were passed. A very great degree of harmony appeared to prevail among members at the close of the meeting. All communications with reference to the Society should be addressed to the Corresponding Secretary, Col. M. C. Weld, 245 Broadway, New York City.

Pennsylvania State Poultry Society.—A more satisfactory exhibition than the second annual one of this Society, which closed in Philadelphia on the 25th of Dec., has probably never been held in this country. The number of fowls was not large, but their quality was excellent, Light Brahmas, as usual, being largely represented. The successful exhibitor in this class at the first exhibition again received the highest honors, a result mainly due to the system of feeding he pursues. Dark Brahmas, and Buff and Partridge Cochins were shown, but the display of French fowls was meagre, no Crevecœurs being exhibited. Mrs. Sherlock, of New York, was awarded first premium for Houdans. Fine Hamburgs, of all the varieties, were shown in profusion. There were several coops of cross-bred fowls,—first-class birds for the table. Cross-breeding should receive more attention from breeders than has hitherto been given. The collection of water fowls was of great excellence. A pair of pet Rocky Mountain goats, a cage of different varieties of diminutive African birds, and trout in different stages of growth, attracted much attention. The most extensive collection of fowls was exhibited by the President, Mr. Herstine. They were entered for exhibition only, which is commendable, and worthy of imitation by officers of other societies.

Farm Wages.—M. D. Miller reports from Atchison Co., Kansas, the following average farm wages:

WHEAT.—1865.-3 bush. per week with board, 3½ without.
1867.-2¾ " " " 3¼ "
1869.-6½ " " " 7½ "

CORN.—1865.—5 bush. per week with board, 7½ without.
1867.—8½ " " " 9¾ "
1869.—15 " " " 18 "

Is not the additional allowance for "without board" far too small? Let us have many correct reports.

How to Import Stock.—"J. W. H." Breeders who have trustworthy foreign correspondents, that will select and purchase and ship stock for them, may import with little trouble, provided the animals come consigned to careful parties, who will look after them on landing; otherwise stock importation is troublesome as well as expensive. Mr. W. H. T. Hughes has established a depot at the port of New York, is prepared to learn the wants of American breeders, and import for them, selecting the stock through responsible parties in England and elsewhere, each shipment being accompanied by an especial attendant. The animals we have seen of his importation arrived in fine condition, and were good specimens of their breeds.

Enormous Cattle.—Mr. George Ayrault, of Poughkeepsie, N. Y., has raised and fattened four bullocks, which are now ripe for market, and have been sold to Wm. Laylor, butcher, of Centre Market. They are 6 years old—the lightest one is said to weigh 3,300 pounds. They will be on exhibition the first of February in New York City, and butchered before Washington's birthday. We shall take pains to investigate their merits.

Sundry Humbugs.—If there could be a satisfactory feature in this whole swindling business, it would be found in the fact that so large a part of the efforts of the present operators are aimed at those who are themselves dishonest. For example, many hundreds of thousands of circulars have recently been sent out, offering counterfeit money. Of course no one bites at the tempting bait but those who are willing to circulate the "stuff," and it is no pity that they loose all the money they send; it is only changing genuine money from the pocket of one rogue to that of another. Of this character is the new scheme of the "FOURTH (st.) NATIONAL BANKING COMPANY OF NEW YORK." The operators claiming to be president, cashier, etc., propose to send out a few hundred thousand dollars of their bills, all over the country, and then "fail" about next May. They offer half the profits to those who circulate the bills. They want a deposit of $10 as security from those who order a package of the bills. The "Banking House" we found to be a basement room, with a cheap desk, two rickety chairs, and a boy, who said the "President" and "Cashier" had gone down to Wall street, and "didn't say when they would be back." We believe not many of the letters to this concern have got beyond the "dead letter office." The money *ought* not to be returned to the dishonest senders. [The genuine Fourth National Bank, Nassau St., Cor. Pine, is one of our best city Banks.] . .. The counterfeit money circulars of J. P. Waters & Co., H. Lotz & Co., Porter & Co., Clement & Co., etc., have come to us during January from a great number of our readers, some of whom inquire why these fellows are not stopped. If any one will carefully examine these circulars, they will see that they try to avoid offering counterfeit money. They really send only fac-similes, which are merely little photographs of the currency, worth nothing to pass as money of any kind. The operators are very careful never to get caught with a single dollar of counterfeit money in their hands..... For other names see our last month's humbug column. As fast as these swindling firms are detected, their letters at the Post-office are stopped, and go to Washington. .....Even among the twelve Disciples of our Saviour, there was one Judas,—rather a consolation to christian people, when a supposed good man turns out to be a villain. There are Judases even among our Postmasters, and the counterfeit money swindles have helped bring some of them to light. Several have been detected in trying to obtain counterfeit money for circulation. Of course they were beheaded in short meter. The Post-office Department has an eye on several not yet removed. .....Watson, Graff & Co., Importers, etc., (new names.) and also G. W. Harris & Co., "Bankers and Receivers for the Shareholders," appear to be still stealing simple people's money by pretending to have $200 watches for them from Riverside Enterprises, and Prize Concerts, which will be forwarded on receipt of $10 to $13 cash for ex-

penses. They are nothing else than mean thieves, who steal from the ignorant and foolish, and usually from the poorest class of persons.....The Humbug complained of by "Anonymous," of Lawrence, Kansas, does not belong to the class discussed in these columns.....Costly advertising is that of one Taylor, who offers to send a lottery ticket, *sure* to draw a first-class prize, worth ever so many thousands of dollars, to each of a million or less people who will send him $1, and tell their neighbors who bought their tickets for them. As thirty-one of these offers went to one small Post-office, he proposes to give some $60,000 for advertising his business in a small country place—otherwise he would keep the tickets and draw the money for himself! Whew! How liberal some of these lottery dealers are! Lloyd, Semmes & Co. are nearly as liberal, for they propose to give $10,000 to the fools who remit them $10 for tickets.....To many inquirers. The "Children's Aid Society" of this city, of which Chas. L. Brace, 19 E. 4th street, is Secretary, Wm. A. Booth, 100 Wall street, President, and J. E. Williams, Metropolitan Bank, 108 Broadway, Treasurer, is *not* a humbug, but an efficient, valuable Society, doing a world of good, and worthy of the support of all good people. The circulars of this Society returned to us for inspection, with the above names and addresses on them, are genuine.....Beware of cheap oils, and don't invest your money in "rights" for selling until you know just what and *whom* you are dealing with. We have several ingenious circulars, filled with great pretensions, and making prodigious offers to "agents."....A Salem, Mass., gentleman sent $1 to Nassau street, New York, for a "Parlor Steam Engine," and after long waiting and writing, got a circular stating that the thing had "busted," and was dangerous, and that a book would be sent for the dollar. It finally came—"a mean, low, paper covered book, worth (or *costing*) about 10 cents." The Boston Magazine should be careful *what* and for whom they advertise.....Harris, or any other man, who offers to send for $1 "a Silver Cased Watch, patent lever movement, hunting cased, full jeweled, and warranted a correct time-keeper," is a swindler. So of the "Ladies Watches," etc.....A New York concern offers pay for lists of names of persons afflicted with certain diseases. Pray don't furnish them as a guide for hurling at the unfortunates a lot of circulars of "Patent" or "Quack" medicines. These circulars beget anxieties, and false hopes, and medicine gulping, of ten thousand times more damage to the patients than the medicines will ever be beneficial. One of these "agency" circulars is a fraud—nobody at the place advertised.....To C. M. W., and other inquirers. The "great Doctors" you inquire about, and *all* other advertising Doctors, are humbugs. We don't know of a single advertising doctor in whose hands we would place a cent of money, or entrust the life of a friend, on any account. We don't speak at random. The religious papers publishing their advertisements ought to be sent to purgatory—for a season.

Fresh Manure for Corn.—"Had I better apply fresh livery-stable manure broadcast or in the furrow for corn?"—Spread it over the whole surface and plow it under. If the soil is poor, put a little well rotted manure in the furrow or hill, to give the plants a good start. In the mild climate of Tennessee, by drawing out your stable manure now, and piling it in a heap in the field, covering it with three or four inches of soil, and turning it once or twice, it will ferment rapidly, and be ready to apply to corn in the hill.

A Ton of Manure.—Several have asked what Mr. Henderson, in his "Gardening for Profit," means by a ton of manure. He means 2,000 lbs. He used this term as being more definite than load.

Value of a Yardful of Manure.—Mr. J. Townley, Jr., of Elizabeth, N. J., calculates to have 300 loads of manure in his yard this spring. He feeds 18 head of neat stock, and 3 horses. They eat 100 bushels of "beer grains" in winter, and 50 bushels in summer, per week, besides about 118 bushels of corn-meal in the course of the year. The meal and grains are fed upon hay and corn-stalks, cut up and soaked. He wants to know how much his 300 loads of manure will be worth.—We estimate from the figures given in the tables in the Agricultural Annual for 1868, and repeated in 1869, and from those in Johnson's "How Crops Grow," that the manure made from feeding 3,900 bushels of brewer's grains is worth $590.28; that from the 24½ tons of meal, $18.62; while (allowing only one ton and a half of hay and stalks to each animal,) that from the coarse fodder will be worth $222.05, making in all $830.95, based upon the price of Peruvian guano, when it was $60 gold, per ton. We have not estimated the value of the litter, forming a good part of the bulk of the manure. This would, at a low estimate, add $170 to the value above stated, making $1000 for the 300 loads. If the hay consists largely of clover, it would materially add to this valuation. In adding freely litter of swamp grasses, leaves, dry muck, etc., the bulk will be increased more rapidly than the value per load, but the aggregate increase of value would be very great—thus, instead of 300 loads, worth $1,000, with these 21 head of stock 600 loads, worth $1,500, might easily be made.

Proceedings of the Am. Pomological Society.—With commendable promptness the proceedings of the 12th session of the society, held in Sept. last, came to us early in January, in a well printed volume of about 240 pages. The discussions at the meeting are given, reports of various committees, and the Catalogue of Fruits. Every fruit grower should have these biennial volumes, which he can only obtain by remitting $2 to Thomas P. James, Treasurer, Phila., which will constitute him a member of the society for two years. The payment of $10 makes one a life member.

Geological Report of the Exploration of the Yellowstone and Missouri Rivers, by Dr. F. V. Hayden. This is the geologist's account of a survey made under the direction of Capt. (now Col.) Reynolds, and the U. S. Engineers, and gives the geological features of the mineral resources of a region of which we have hitherto had but an imperfect history. An admirable map accompanies the report, and gives at a glance the geological formations of the different portions of the country. The government explorations have been of great value to the early settlers in the far West, and we always welcome reports like the present as evidences of government money well spent.—We suppose copies may be obtained from members of Congress.

Ferrets.—"F. R. E.," Cleveland, O., writes:—"The article in January number relative to Ferrets should be read by every farmer. My good friend, Professor J. P. Kirtland, keeps a ferret, and has no trouble from mice or rats. He makes a pet of it, as he does of all useful animals which he has around him. He keeps it in a box, takes it out, and gives it a chance to work among the rats from time to time, then plays with it awhile, and puts it away in its nest again. There is only one trouble in keeping ferrets, and that is, they are cross towards children, and disposed to bite; but when provided with a box or pen, and there kept, except when wanted for use, no trouble ensues.

Lilacs.—Mrs. A. C. McCarter. There are two or three varieties of Lilac that are near enough to red to be called so in common language. A poet often calls a flower by any color that suits his rhyme or meter best.

Special Premium.—The Elegant Picture "Dandelion Time." By Mrs. Lilly M. Spencer.—The name of Mrs. Spencer has become familiar throughout the country. Though of a poetic imagination, and the author of many paintings, which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. The publishers of the *American Agriculturist* have purchased of her the beautiful painting called "Dandelion Time," and having issued it as a chromo, it is now offered by them for sale. But in response to requests from many who desire to secure the picture without paying money for it, we have consented to offer it as a special premium for subscribers.

In this elegant picture, are three children, of whom the youngest is a plump, rosy babe, and a huge Newfoundland dog, which they have decked with a dandelion wreath, and are represented out at play upon the green grass. The scene is full of happy life, and cannot fail to delight both old and young. The picture would prove an ornament in any home, and be a most beautiful and acceptable present to make to a friend. It is 13 by 18 inches in size, mounted on linen, and will be sent by mail, in a tube with all materials and directions for stretching. Price, post-paid, $6.00. We will send it in this form,—for 10 subscribers at $1.50 each, or 30 at $1 each. The price of this picture in a neat black-walnut frame, gilt band, is $9. For 15 subscribers at $1.50 each, or 45 at $1 each, we will send it in this style by express, carefully boxed, *the receiver to pay express charges.*

Flower Questions.—Mrs. "W. G. B.," Fort Howard (State?). You do not say whether the Fuchsia dropped its buds in the house or out-doors. If the latter, it probably had too much sun. But few kinds will bloom in winter....Probably your season is not long enough for the Madeira vine, or it may have had too much shade....The Gladiolus formed one new bulb—sometimes they form several. The old one always perishes. The little bulbs, the size of a pen, and smaller, will grow, and in time produce flowering bulbs....The Petunia is probably an exhausted plant. When taken up in the fall, it should have been cut back severely. The best way is to start new plants from cuttings for winter blooming in summer. Old plants seldom do well....The reason some Tuberoses bloomed and some did not, may be owing to the manner in which the bulbs were kept the winter before. If kept too cold, they fail.

Nest Eggs.—C. A. Davis, Berkley, Mass., makes nest eggs from real ones as follows: A sufficiently large opening is made to allow the shell to be emptied of its contents. Plaster of Paris is then mixed with water to the consistency of cream, and the shells filled with the mixture, which hardens in a short time. The result is a nest egg, perfect in shape and color, and still serviceable if the shell gets broken off.

Oats.—E. J. Dobrel, Ill. Oats do well on sod land plowed in the spring. Barley seldom does.

A Green-leaf in Trouble.—"Mary Greenleaf" writes such a pleasant letter that we are sorry not to be able to print it and an answer, which would be, of necessity, much longer than the letter. If she will get Gray's Lessons in Botany, and read them appreciatively, she will understand more about plant structure. We can only say now that we call plants by other names than those she first learned for them, for reasons, to explain which, would require an essay on nomenclature. We acknowledge to being one of the "dreadful reformers," if a desire to be correct makes us one.

Special Premium.—The Eumelan Grape.—This remarkable grape is now attracting much attention, being a beautiful black grape of the first quality, and ripening some time before the Delaware. It has already been planted in many different sections of the country, from the Atlantic to west of the Mississippi and the promises of its success are most flattering. It has proved, generally, vigorous and hardy. The quality of the fruit is, in our judgment, as good as any variety with which we are familiar, except it be the Iona. It has taken the highest premium for quality at many exhibitions this fall. We are convinced that this grape is worthy of general trial, and we shall take much interest in seeing its true merits developed. We have made arrangements with Messrs. Hasbrouck & Bushnell, of Iona, near Peekskill, N. Y., who have the original stock of the vines, and a very superior stock of the young plants, to furnish us a limited number of No. 1, and extra vines *for the purpose of offering them as premiums*, and we give our subscribers the benefit of our large purchase by furnishing the vines as premiums at the lowest rate per thousand. We furnish the *American Agriculturist*, with Eumelan vines, as follows;

1 copy	for one year and	1	No. 1. Eumelan vine	for					$2.50
4 copies	"	"	"	"	4	"	"	"	"	9.00
10	"	"	"	"	10	"	"	"	"	22.00
20	"	"	"	"	20	"	"	"	"	40.00

We will furnish an *Extra quality of Vine*, as follows:

1 copy	for one year and	1	Extra Eumelan vine	for					$3.25
4 copies	"	"	"	"	4	"	"	"	"	12.00
10	"	"	"	"	10	"	"	"	"	29.50
20	"	"	"	"	20	"	"	"	"	55.00

Or we will *give*

One No. 1 Eumelan vine for 4 subscribers at $1.50 each.
Or one Extra " " " 6 " " 1.50 "

These vines will be of really No. 1 and extra quality, and will be sent by mail, postage paid, or boxed, by express, the receiver paying express charges only. Orders received too late for sending this fall will be entered, and the vines forwarded as soon as it is safe in the spring.

"Ex-Squire."—Please send your address.

Kerosene.—The annual report of the N. Y. Fire Marshal for 1869 shows that one-tenth of the fires last year resulted from the use of Kerosene. Ten persons were burned to death, and thirty-five more or less injured. The wonder is that the fires and casualities were so few when we consider the great amount of dangerous kerosene in use. Insist upon having good kerosene, and the dealers will provide it. Pratt's Astral Oil is so good that we have placed it on our premium list.

Weeds.—A. C. Cook, Iowa. We call a plant a weed, without reference to its utility when cultivated. Pine-apples would be weeds if they persisted in growing where we wished to raise cabbages. The fibre of the "weed" sent seems strong—we are unable to give any opinion as to its comparative value.

Twin Steers.—The central engraving upon the cover is from a photograph of a pair of Durham twin steers, owned by Mr. Daniel W. Barnes, of Munson, Geauga Co., O. They are one year old, weigh 2,100 lbs., and took the first premium at the Ohio State Fair.

Cranberries.—"J. C.," Quincy, Ill. Cranberries cannot be raised with success unless the land can be drained, and we doubt the practicability of your plan.

The Eumelan Grape.—The venerable Dr. Kirtland, of Cleveland, O., had a vine of the Eumelan on trial among the first of those sent out. On Nov. 27th last, he wrote as follows: "The experience of the past season with the Eumelan grape has, with me, been very favorable. While many other varieties suffered from mildew, scorching of the foliage, and impairment of the fruit, this variety seemed to escape from any unfavorable impression of the unusual season. Its growth was strong and healthy, and it ripened its *three* bunches of fruit in high perfection by the side of Delaware vines, whose fruit failed to attain maturity. I now consider the Eumelan a variety of much promise."—These vines are offered singly in connection with the *Am. Agriculturist* at the thousand price, and as a premium for a few subscribers.

Pyles' Seedling.—An apple with this name was sent from Delaware Co., Pa. It appears like a good keeper, but we have many of its season of better quality.

Fruit Garden.—"Ex.," Lunenberg, Mass. Cross plow the piece where clover sod was turned under in the fall, and put on a good dressing of manure and plow again, and it will be in proper condition for small fruits.

Cedar Apples is the name of the fungus found on the Red Cedar, and sent by "Eureka" from Lansing, Iowa. See account in *Agriculturist*, Aug., 1866.

Root Pruning.—"J. A.," Sunderland, Vt. Root pruning is done when vegetation is at rest, either in the autumn or very early in spring. Probably the curculio caused the failure of your cherry crop.

Freezing Seeds.—A correspondent asks us, what is the use of exposing peach and plum seeds to the action of frost. The shells of these seeds are composed of two thick and woody halves or valves; the germ can only force its way out by separating these halves of the stone. When the stones have been allowed to become dry, they cohere with such firmness, that the germinating seed is not able to part them, but if they are exposed to alternate freezing and thawing the halves usually separate with great readiness. Should any escape the action of frost, they are carefully cracked. By covering the seeds with earth, tan or other material, and allowing them to remain exposed through the winter, we imitate that which happens to the seed when the fruit propagates itself in the state of nature.

Peas and Strawberries.—S. Payne, Jacksonville, Fla., tries to make us discontented with our lot by sending peas and strawberries picked at Jacksonville, Fla., Dec. 16. We shall be even with him next June.

Lemon Tree.—S. Reynolds, Kane Co., Ill. Your seedling Lemon will bear sooner and give better fruit if budded. The operation is done the same as on the peach or other fruit, at a time when the bark will lift. You must have buds of an improved kind. If there is any florist near, better send the plant to him to be budded.

Strawberries Mixing.—"B. S. B.," Concord, Pa. Varieties of strawberries "mix" only by the runners of one sort reaching over among and becoming established in the bed of another variety. Two and a half feet apart, as you propose, should be wide enough to prevent mixing if a little care be taken. If neglected, and the runners of both kinds be allowed to root in the intermediate space, there will soon be confusion.

Sanford Corn.—Reports from several correspondents in various parts of the country show that this is an early and productive variety.

Opium.—Mr. James Brittain, Prospect Plains, N. J., writes that he made an experiment in opium culture, following the proper plan of gathering the exudation from the wounded capsules. Judging from a small experiment, he thinks it must bring $20 per lb. to pay. As the wholesale price is $12, Mr. B's first attempt at opium culture does not look encouraging. Let us hear from those who have tried it farther South.

Black Knot.—"J. L. H." The finding of insects in a black knot no more prove them to be the cause of it, than finding rats in a corn-crib prove that they are the origin of the corn. It may be a "philosophical solution," but not in accordance with facts. It is just as well settled that the black knot is caused by a fungus, as that a plum tree grows from a seed. The remedy proposed—cutting them out with a knife when first forming, is the true one. They are usually left too late.

The "Grape Culturist."—We regret to notice that Mr. Husmann finds the support of this journal insufficient to warrant him in continuing it, unless the subscription is largely increased. There should be enough engaged in grape culture to support a journal devoted to their specialty. The journal has been ably conducted, and the price, $1 a year, very low.

Many Apples.—"R.," Centre Co., Pa., informs us that "Henry Garver, of Mifflin Co., Pa., raised this year on a branch 26 inches long, and ¼ of an inch thick, 20 Pennock apples, the aggregate weight of which was (after thorough drying in the house) 7½ pounds."

White Grass.—"J. L. H.," Tuftonborough, N. H., writes that "White-grass" is taking possession of fields and pastures, and asks if salt or ashes will prevent it.—We suppose the grass referred to to be *Holcus lanatus*, the Velvet-grass, which prefers poor soils and is nearly worthless. Enriching the land and encouraging the growth of better grasses will probably drive it out. We should look for no good result from any specific application to destroy the grass, except so far as it acted as a fertilizer; hence ashes would be of much use, and salt but very little.

"The Best Thing in the World."—Many recipes for remedies come to us, with the assurance that they are the "best thing in the world," for this or that disease. It is astonishing, the number of people who have tried everything in the world and found out the best. We very rarely publish any remedies, and these only of the most simple kind. There is altogether enough "dosing" with drugs on the slightest provocation without our encouraging it. When we see the dangerous remedies published by some of our cotemporaries, we pity those who try them. Every intelligent housekeeper has a few things at hand to use in such indispositions as will not yield to good nursing and dieting, as well as in sudden emergencies. Doctoring, as such, had better be left to those who understand it.

Pears.—"B. S. B." The Bloodgood and Bartlett will doubtless suit you for very early and later. Strawberries and raspberries may be cultivated between the rows of trees in a young pear orchard.

Papasiculteur.—A Frenchman calls himself a *Papasiculteur*. He is not a cultivator of Papaws, but only a potato grower. *Papas* is the Spanish for potatoes.

Arbor Vitæ and other Trees.—"A Young Housekeeper." The turning of the foliage of the Arbor Vitæ is not due to any want of pruning or other matter within control. It is the great fault of the tree. This and other evergreens are best transplanted in spring and pruned in autumn. The questions about other trees and shrubs can only be answered on knowing whether the writer lives in Maine or Texas, a bit of information not imparted.

Creaky Boots.—"W. L. D." finds his entrance into church attracts too much attention on account of his creaky boots, and asks us for a remedy. The noise is caused by the rubbing together of two surfaces of leather in the soles. It usually disappears when the boots are somewhat worn. Soak the soles thoroughly with warm water, and while wet apply a liberal coating of oil or grease and dry it in. This will add considerably to the wear of the boots, and cure all but the most inveterate cases of creaking.

Plowing Under Clover on Heavy Land.—Where hay and pasturage are cheap, the practice of plowing under clover to ameliorate and enrich heavy land is undoubtedly a good one. The only question to be considered is, whether the soil cannot be rendered as mellow by the repeated use of the plow and cultivator at a less cost, and destroy the weeds at the same time. The answer depends very much on circumstances.

Not Norway Oats.—The sample of oats sent by John Butler, of New Lisbon (State not given), are not Norway oats, in our opinion.

Steaming Corn for Food.—"P. W. F.," of Phillipsburg, N. J., asks the best and cheapest way to steam corn for a limited number of pigs. The question is rather indefinite. The best, when a barrelful is wanted at a time, is to put the corn (on the ear) into a pork barrel, and cover it with water, putting on a layer of roots to keep the corn down. Then run the flexible nozzle of the steamer into the barrel, nearly to the bottom, and turn on the steam. If there is no steamer on the place, and a less quantity is wanted at a time, it will answer to take a wash boiler, or other large vessel, and fill it with corn (on the ear), that has been soaked in water for 36 hours, pouring in 3 inches of water and standing the vessel on the fire. Cover the top tightly, and boil for half an hour or more; before the water is all evaporated, remove from the fire and cover it closely with a blanket to keep it warm. After a couple of hours, it will have cooked itself by means of its accumulated heat.

Buckthorn and Gophers.—"B H.," Glenroy, Iowa, says that he never knew a Buckthorn hedge to be injured by gophers; also, that insects do not trouble it, and cattle will not browse upon it.

Brewer's Grains for Poultry Feed.—"I. D. R." We have never used them, but think they could do no harm fed with moderation. If the experience of any of our readers bears upon the subject, we would be glad to have it communicated.

Color of Sefton Pigs.—A Rhode Island correspondent asks the color of Sefton swine. They are white and black; sometimes all black, but more often all white—generally white with black or smoky spots.

The Taste of Turnips in Butter. B. H. Baldwin, of Bergen Co., N. J., says: "When cows are fed upon turnips or cabbage, the taste may be prevented in the butter by adding about four tablespoonfuls of a solution of saltpetre (1 oz. to the pint of water) to the cream pot before putting in any cream, and stirring thoroughly each time that cream is added." This is his experience, and we have heard the same from others.

Labor per Acre.—On a farm of 800 acres the late Mr. Hudson, of Norfolk, Eng., paid £2,000 per annum for labor—say $12 per acre, in gold. Here the same labor would cost at least $20 per acre.

The Best Time to Sow Plaster.—This is a question we are frequently asked. We would draw the plaster when the roads are good, or when there is good sleighing. Then sow the plaster on the clover at any time you can most conveniently get on the land—the earlier in the spring the better. But it is better to sow it even as late as May than not at all.

Shall we Sow Barley this Spring?—If you have been in the habit of sowing barley, and your land is well suited for the crop, do not change your system. Barley is as likely to pay as any other crop. But if you have never raised barley, do not rush into its culture simply because it has, for a year or two past, paid better than wheat. Barley requires the best of soil and culture, and few farmers, who have had no experience with the crop, would be likely to succeed the first year.

Boiled Wheat for Cows.—In many sections wheat, at the present time, is the cheapest grain that can be fed to stock. We have found boiled wheat excellent food for milch cows. When wheat costs less than $1.25 per bushel, give the cows from two to four quarts each per day. It will pay. It need not be ground. Put it in a kettle and cover it with water, add a little meal, and boil until it bursts open. If the pigs get a little of the same article it will not hurt them.

Cost of Keeping a Cow.—An English agricultural paper thinks it costs £20 a year to keep a thorough-bred Shorthorn cow in food and attendance.

What to Do with Farrow Cows.—Feed them liberally and they will give rich milk, though, perhaps, not much of it. Let them have three or four quarts of meal a day through the winter and spring, and do not stop giving it them when grass comes. As soon as it dries them up they will be fit for the butcher.

Will it Pay to Use Plaster at $10 per Ton? asks a farmer in Wisconsin. We cannot say. It depends a good deal on the soil. Try a little on clover and on corn, and note the result. On dry upland, the probabilities are that it will pay well, although $10 per ton is a high price.

Seeding Down with Barley.—Of all spring crops, barley is the best to sow clover and grass seeds with. If the land is in as good condition as it should be to insure a good crop of barley, and it is sown as early as it should be, clover will "catch" as well as if sown on winter wheat.

Harrowing Manure.—Where manure has been spread on grass land during the winter, it should be harrowed as early in the spring as possible. A few warm days will soften the upper part of the manure while the ground is still frozen, and it is well to avail ourselves of the opportunity to go over the field with a brush-harrow. We have found Thomas' harrow, which has slanting teeth, a good implement for the purpose. A common harrow, turned upside down, might break the lumps, and do good work. At any rate, if the field is to be pastured, do not neglect to harrow it in some way.

Substitutes for "Muck."—Swamp muck is vegetable matter in a state of slow decomposition. In the swamp the decomposition is exceedingly slow—when dried and mingled with the soil, much more rapid. Any vegetable matter may be used in a manure heap as a substitute for swamp muck or peat. Wood mold is the closest approach to it. The parings of wet meadow land, or any grass sods taken from the fence rows or sides of the road, laid in a heap to decay, resemble it closely, and both these articles may be used when dry in the stables or yards, as absorbents. They will make mud, however, if they get very wet.

Hay and Straw Cutter.—"J. W. B.," Dutchess Co., N. Y., asks, "What hand machine, for cutting hay and straw, do you consider the best, and least liable to get out of order?"—We regard the Copper Strip Feed Cutter as decidedly the best as a hand machine, and know of some large stables in New York City where power cutters are set aside, and two men, in an hour's time, daily, cut all the hay for 100 horses, with a large sized Copper Strip cutter. They are extensively advertised.

Tan-bark Ashes.—"L. H. C.," New Madison, O. "Are ashes made by burning spent tan-bark at the tan-yard of any value as manure on stiff, clayey land?"—Yes; of high value.—"Will it pay to haul it two miles?"—Yes; ten.—"What crops are most benefited?"—Grass, potatoes, tobacco. It must be applied according to the crop—broadcast, in the hill, or upon the hill, just as the plants break the ground.

Rotary Harrows.—A "Subscriber," of Salem, N. C., asks for instructions how to make a Rotary Harrow. The only implements of this kind with which we are acquainted which work well are patented, and upon the patented device their usefulness depends. They possess several advantages over other harrows, in that they drag evenly on side hills, cover grain very well, smooth down the furrows in sod land, make a mellow seed-bed without cross-harrowing, and tear up no sods.

Nutritive Value of Beans.—"X." asks what quantity of small, white, old beans equals one bushel of good corn?—According to Wolff and Kopp's tables, given in Johnson's "How Crops Grow." Field beans contain 25½ per cent of albuminoids, or nutritive substances, and maize contains but 10. On the other hand, maize contains 7 per cent of fat, or oil, and beans but 2 per cent. It is safe to say beans are worth something more than twice as much as corn if judiciously fed.

Boiled Beans, or Bean-Meal.—We know no reason why boiled beans should not be quite as healthy as bean-meal for any kind of stock except sheep.

Good Crops of Potatoes and of Corn.—John Kiernan has charge of the farm and garden of the Sisters of Charity, at Mt. St. Vincent, on the Hudson. He sends us a statement by a civil engineer in regard to his crop of Harison potatoes, which certifies to a yield varying, in different parts of the field, from 400 bushels to 640 bushels per acre. The total yield is not stated. They were planted early in May, in hills 4 feet apart each way, on clean land, in fine condition, cultivated twice, and kept clean of weeds until they stopped growing. The corn crop was planted 4 feet each way, dressed with top manure; four stalks were left to the hill, and 70 bushels of shelled corn were harvested. The land was plowed in the fall and again in the spring.

The Cow "Faney."—In compliance with the request of a correspondent, we publish the following measurements of this animal (pictured in our December number). Length from base of horn to point of rump, 6 feet, 7 inches; length from centre of hip bone to point of rump, 1 foot, 6 inches; height at hip, 3 feet, 10½ inches; height at shoulder, 4 feet; height at belly, from ground, 1 foot, 8 inches; girth around the chest, 5 feet, 2½ inches; girth around the belly, 7 feet, 2 inches; circumference of fore leg below the knee, 5¾ inches.

How to Make it Pay.—"W. L. C.," of Appanoose Co., Iowa, writes that he needs our advice about managing a 40-acre farm to make it pay. (1.) "How shall I arrange the buildings? (2.) What kind and how much grain shall I raise? (3.) What kind and how much live-stock shall I keep to consume the grain, etc., to best advantage?"—1. Put the buildings as near the centre of the farm as you can, having due reference to convenience to the highway, to water, to shelter from prevailing cold winds, etc. Better haul crops down than up hill to the barns. 2 and 3. Keep half as many cows or beef animals as you can cut and cure tons of good hay, and fat as many beeves or twice as many hogs as you can raise acres of corn that will yield twenty bushels or more per acre. Keep grade Shorthorn cattle, and Chester County hogs. Raise, besides, some corn fodder for shoats and cows in summer; some roots, for cows and sheep; potatoes and buckwheat. When your land is in good tilth, raise wheat, taking, at first, your neighbor's advice as to variety. Let your sales be beef, pork, poultry, and wheat, and perhaps wool and lambs. Apply all the manure to corn. Avoid under estimates, and know where the money goes.

Apples for Minnesota.—The State Horticultural Society, at its last annual meeting, *Resolved*, That the following varieties of apples have been found worthy to be recommended for planting in Minnesota.—Duchess of Oldenburgh; Haas; St. Lawrence; Price's Sweet; Famouse; Golden Russet; Red Astrachan; Talman's Sweet; Tetoffsky; Saxton, or Fall Stripe; Perry Russet; Ben Davis, or New York Pippin.

Mixing Soil with Manure.—Heavy loam or clay mixed with manure in a heap, has a tendency to retard fermentation, and may, consequently, be used to advantage with horse or sheep manure, which, when placed in a loose heap by themselves, ferment too rapidly. The clay will also hold the ammonia, and prevent its escape from the heap. On the other hand, sandy loam, or sand mixed with manure, regulates fermentation, and may be used to advantage with hog and cow manure, which is of a sluggish nature. The better way, however, is to mix all these manures together as made.

Exhibition at Cordova.—A fair will be held at Cordova, Argentine Republic, commencing on April 17th. Liberal facilities are offered to exhibitors. Manufacturers and others wishing to show implements, machinery, etc., can obtain circulars by applying to the Argentine Minister at Washington, or to the Consuls of that country at any of the large seaport cities.

Geese Without a Pond.—"I. D. R.," asks if "A small tub say two feet in diameter, and one foot deep will hold sufficient water for a pair of geese during breeding time." The tub specified is too small; give them a tub made by sawing an oil cask in two, or a good big trough, one deep enough for them to bathe in, and they will do well enough. Wild geese and China geese require ponds. The earlier goslings are hatched the better; they should not have water enough to swim in until two or three weeks old, for they get chilled.

Ice-House.—A "Subscriber" writes to know how it will do to enclose an ice-house with three thicknesses of boards, leaving two air spaces, instead of the usual way here of having *one* space, and that filled with sawdust or tan-bark. He thinks it would be more durable, as there would be no moisture in contact with the frame, and it would be less pervious to heat. This plan would not work well, because there would be a constant circulation of air in the air spaces. The aim in making ice-houses and in filling them is, to prevent any circulation of air, and this is best effected by a non-conducting filling, like sawdust, in the air spaces, and straw or wheat chaff under and around the ice.

Shares' Harrow with Steel Teeth.—John D. Parker, Adams Run, S. C., thinks this harrow, from our description of it in the November *Agriculturist*, would be "Useful in their rice fields for breaking up and mellowing the sods after plowing."—If our correspondent buys one we should be glad to hear how it works. The old Shares' harrow worked well, even with cast-iron teeth, and we shall be disappointed if, now that the teeth, or more properly the cutters, are made of steel, it does not prove a most effective implement for preparing and mellowing all kinds of sod land, or for covering peas and other grain when sown broadcast.

Mangy Pigs.—"M.," of Champagne Co., Ohio, inquires what he shall do to prevent his pigs becoming mangy and says: "They are well fed, well bedded, with wheat straw, and the pens are cleaned and bedding changed two and three times a week, and yet some of them will become affected."—Mange is a disease caused by the burrowing and breeding of a minute insect in the skin, like the itch in man, scab in sheep, etc. If pigs which have it or have been exposed to it are washed with Carbolic or Cresylic soap, and their pens and bedding sprinkled with the same, a cure is easily affected. More than one application might be required, and it would be best to wash the animals at an interval of a week.

Farm Wages.—Price of Ag'l Implements.—A farmer of Fulton, Mo., writes: "Some wholesome truths were set forth in the December *Agriculturist* under the heading, 'Farm Wages Must Come Down.' There is a general conviction among farmers that labor must come down. Some of us are already making arrangements to do without hiring so much as usual the coming season unless there is a marked decline. We have to pay high prices for all kinds of agricultural machinery, and are so far from the factories that, if any piece gives way, the freight is as great as its cost, besides the delay and loss in that way. It seems as if the reputation of certain classes of implements and farm machinery were so well established, that if the manufacturers could hit upon some plan to put them into the hands of the farmer at first cost, without employing so many agents whose commissions the farmer has to pay, they would put more money into their own pockets. There are some classes of machinery that it costs more to sell than it does to make. Dealers are satisfied if they get $2 or $3 for ordering a farm wagon that sells for $100, but must have $15 to $25 for selling a reaper and mower, the cost of which, to the farmer, is $150 to $200. If any reliable manufacturer would advertise to ship machines for the actual sum that he receives for his machine, after paying agents for selling, he would sell more machines than he can do on the prevalent system.

To Get Rid of White Birches without plowing or grubbing, cut in winter or spring, and feed close with sheep; or, cut about mid-summer (June 20th) close to the ground and subsequently, as new shoots start once in three or four weeks.

Veterinary Instruction.—H. O. Fairchild, Steuben Co., N. Y., asks: "Will you inform me if there is a Veterinary School of any standing in New York City, or State?"—There is an excellent one, the N. Y. College of Veterinary Surgeons, on Lexington Avenue, N. Y. City. John Busteed, M. D., V. S., is President, and will, we doubt not, cheerfully answer questions in regard to the expense of gaining a thorough veterinary education in this country. This is the only veterinary school in the country so far as we know, which has any standing as an institution of science, or has the confidence of educated physicians and scientific men. It has a moderate endowment, very interesting collections of anatomical subjects, etc., a hospital in which animals of all kinds, not suffering from contagious diseases, are treated. Dr. Busteed is assisted by an able corps of Professors and assistants.

Sore Mouth in Cattle.—A correspondent in Arlington Co., Mo., writes that a disease is there prevalent called Black-tongue, Sore-tongue, and Sore-mouth. Several of his neighbors have lost cattle. The symptoms described are foaming at the mouth, and, inability to eat. Our friends of the Veterinary College advise a weak solution of carbolic acid—say 1 to 5 drops to the ounce of water—washing the mouth every few hours, allowing a little to be swallowed, and following this with mild tonics and food that will not irritate the mouth. Fluid preparations of gentian and iron in small doses, given with the feed, is a good tonic; for food give a warm gruel of oil meal or wheaten flour.

Joint Corn.—A variety of corn has been shown to us which is at least a curiosity, as it produces an ear at each joint. Each of the several stalks we saw had from 8 to 12 ears upon them. It is small in the ear and grain, like pop corn, but if, as is claimed, it will yield 200 bushels to the acre, it will prove valuable.

How to Feed Fowls.—Fowls are not fed for the mere sake of keeping them alive and healthy on the least possible amount of food. We wish to convert the food into flesh, or into eggs. In feeding for quick fattening it is understood that the poultry should be made to eat as much as possible. Our rule for feeding is to throw out the feed twice a day as long as the fowls will run after it and no longer. We are told, and it is our own experience also, that fowls thus fed will eat considerably more than if they can go to a feeding box and help themselves at all times. We want the fowls to eat; the more they eat, within reasonable bounds, the more eggs they will lay, the longer they will lay, and the better condition they will be in. Laying fowls should take exercise. If they can go to a trough and eat at any time they wish, they will take next to none. If they are fed but twice a day, they will hunt insects and wander much more. If fed soft feed such as wheat bran mixed with corn meal or ground oats, they will be hungry again in two hours after feeding, and be off after insects, etc. Give feed, then, only to adult fowls while they will run after it—soft feed morning, whole grain at evening. Keep them supplied with gravel, lime (plastering, or, better, oyster shells), ashes to dust in, and fresh pure water, some meat in winter, and they will be healthy and prolific.

Worms in Horses.—J. W. Bruce of Mass., asks for a cure for "the small intestinal worms in the horse." Give drachm doses of tartar emetic twice a day for two or three days, and follow with a mild purgative, say one of epsom salts, or four or five drachms of aloes.

The Best Way to Make the Best Butter. $50 Prize.

The Proprietors of the Blanchard churn, through their agents, R. H. Allen & Co., place in the hands of the publishers of the *American Agriculturist* the sum of *Fifty Dollars* ($50), to be awarded for the best practical essay on making and packing butter. The conditions are:

The essay should be brief, not exceeding 15 pages of foolscap paper, and thoroughly practical in its whole character. It is intended to be used as a Manual for Butter-making, not only to instruct the novice, but to be useful as a source of valuable hints to experienced butter-makers. It should include the management of the milk from the time it is drawn from the cow, the treatment of milk and cream in the dairy, churning, working, salting, packing, and marketing butter.—Each essay should be accompanied by the name of its author, in a sealed envelope, and must be received at the office of the *American Agriculturist*, (245 Broadway, New York) on or before March 10th, proximo. The essays will be submitted to a committee approved by the Editors, to be hereafter announced, and the prize essay, if deemed of sufficient merit, will be published in the *American Agriculturist*.

Some Facts about Butter.—The butter of commerce and economic use contains according to Way: Fat (margarine and olein), 82.70 per cent; cheesy matter or curd, 2.45 per cent; water, salt, milk, sugar, etc., 14.85 per cent. The fatty portion or true butter varies in its composition, consisting, as it does, of two fats, called margarine, which is a solid fat, and olein, which is an oily or liquid fat. Summer or grass butter contains about 40 per cent of margarine, and 60 of olein; while winter or hay butter contains about 65 per cent of margarine, and 35 of olein. If butter is melted at a temperature of 140° to 180°, the pure butter may be separated from the cheesy matter, water, salt, etc., and will become solid on cooling. If the pure butter stands long enough at a temperature about 70°, or a little higher, the solid and liquid fats will separate. Melted butter may be cooled to 90° before it begins to harden.

Linseed Oil-Cake, Oil-Cake, Oil-Meal.—The seed of Flax, called linseed, is valuable for the oil expressed from it, and which forms the basis of our best common paints. Vast quantities are annually consumed, the seed being partly derived from this country, but chiefly from the East Indies. The seed is ground, then heated, and subjected to enormous pressure, which frees it from its oil, and leaves it in hard, rough cakes, somewhat less than an inch in thickness. This is the linseed oil-cake, or oil-cake of commerce, and most of that made in this country is shipped to England. It is of high nutritive value, and the manure of animals fed upon it is very rich. It is laxative in its action upon the bowels, if used in large quantities, yet may be fed freely without fear of putting sheep or cattle off their feed; on this account it is well to mix it with the feed of both cattle and sheep. For horses, nothing is superior to it as an alterative diet, if fed in small quantities, say a pint three times a day. It gives a smooth coat, and loosens the bowels. Fed to beeves, it should be mixed with Indian meal in the proportion of one part oil-meal to two parts Indian meal. Fed to sheep, the cake is usually broken up into a coarse powder, no lumps being larger than the end of one's finger. The secretion of milk is greatly promoted by it, and if not fed in too large quantities, no foreign flavor or oiliness is imparted to the milk. It should always be fed with bran, corn-meal, or some other provender, about in the proportions above named. Its nutritive value, compared to maize, is as 28 to 10, as shown by analysis.

Hogs Fed on Cattle Droppings.—*Tape Worms.*—Tape worms exist in neat cattle as well as in other animals. They live and grow in the intestines. Joints capable of producing great numbers of eggs which hatch into the minute creatures that finally become tape worms, continually break off or separate from the parent worm, and passing through the intestines are "cast into the draught." Hogs, rats, and other animals which eat filthy food are likely to take them with their food into the stomach, and from this cause comes attacks of the disease in pigs called measles, and hence we have measly pork. This, if eaten raw or not well cooked, will produce tape worm in man and other animals. "A. E. T.," of Missouri, thus writes, describing a practice which should be unequivocally reprobated, no matter how profitable, as dangerous alike to man and beast, for the reason above given:—"The Editor who 'Walks and Talks' once stated that on the whole he did not think it paid to cook for cattle. Has he ever tried the Western practice of feeding corn raw in the car to the cattle, and letting the pigs clean up after them, feeding the shotes nothing else? A full fed steer will thus fatten or winter, it is said, one or two grown hogs. I have never seen a statement of the amount of beef and pork a bushel of corn will thus produce. Will you have the kindness to make the inquiry through the *American Agriculturist*. Objection may be made to the practice as not cleanly; but the hog is as much a crop as the cabbage, and we feed the latter, as well as all other garden truck, on the grossest food." Cabbages do not feed on living food.

Bee Notes.—*By M. Quinby.*

Apiary for February.—Care of Stock.—As a general rule, disturb the bees as little as possible. Raise hives that are out-doors, when a warm day has loosened them, and sweep out the accumulations of dead bees and fragments of comb. Danger from protracted cold is not over. See directions last month. Move such as are to have their locations changed before they mark their present places in the spring, otherwise the bees will return to the old spot and be lost. Give four or even six feet between the hives unless crowded for room. Hives painted of different colors—light colors are best, because cooler—and standing with the alternate ones advanced a foot, will be found serviceable when they must be placed closer than four feet. Let each have its own stand rather than put all on a plank in common; then working at one hive will not disturb all. Be careful to shade the bees after light snows, if the sun comes out bright. A bee-house may now be set up, but I do not think them profitable. They crowd the hives too much. True, you may make artificial swarms, or furnish fertile queens two or three days after natural swarming, but this would hardly balance the disadvantages. As this matter of rearing queens both for the purpose just indicated and for changing native swarms to Italian, is of considerable importance, I will give a practical method.

Rearing Queens.—Premising that you use the movable frame, make a number of small frames, as near four or five inches square as may be, to just fit inside one of your large ones. Fill with clean worker comb—that which has been frozen is the best, because the eggs of the moth will have been thus destroyed—and put the large frame containing these small ones in the middle of some stock with a fertile queen from which you wish to breed. Provide also some small boxes on the plan of a simple movable frame hive, with loose top and rabbeting for the frames, and just the size to accommodate three or four of them. When eggs have been deposited in the combs, set up one of your small boxes with them as a hive in miniature, and confine in it between a pint and quart of bees. They will immediately construct queen-cells, and may then be opened. In this way any number of queens may be provided.

Buying Bees.—The present month is a good time to buy and move bees that are standing out-doors. Sleighing furnishes good transportation. Look out for sufficient honey, and plenty of bees, and be careful that there is no "foul brood,"—bees ought to be seen in at least five layers between the combs. Stop the holes in the top and side of the hive, turn it and cover the open end with muslin or wire-cloth, fastening with carpet tacks. If more than twenty-four hours on the road, something stronger than muslin will be required. Bees ought not to be moved from a cellar or warm room without allowing them to fly for a day in fair weather. If housed, bees are uneasy and begin to spot the combs very much,—set them out for a few hours the first opportunity.

Preparing for Spring.—See that everything is ready for the coming year; hives, boxes, covers, stands, and roofs, are to be made and properly stored. In a little while spring will open and a crowd of other matter will demand attention. Not least among the items to be remembered now is some attention to the

Study of the Subject.—However much you may despise the nonsense found in a good deal that is written upon bee culture, still, there is hardly a thing printed on the subject which a man really interested and in earnest can afford to let go unread. It is rare, indeed, to find a writer uttering such unmixed stupidity as not to give at least some profitable suggestion, while by ignoring the whole for the fault of some, you condemn yourself to a place fifty years behind the times. One of the most profitable books to study is Langstroth's "Hive and Honey Bee," but I would advise a bee keeper to read not only this but all he can find from Huber down; to *test* what he reads by his own observation, and learn how much folly and wisdom can come from the same month. In this way we are made teachable and critical at the same time. Now if this work is to be done, let it be in these days of short sunshine and long leisure. It is brain work that leads the world, and if ever our specialty is to command the respect and attention it deserves, it rests with its advocates not only to exhibit its merits in successful practice, but to urge its claims with clear, well-informed heads. And more than that, if your vision extends no further than your own pocket, be assured that the hand with which, if at all, it must be filled, will blunder if not directed by a disciplined power of thinking.

In-and-in Breeding.—An inquirer asks, "If it is not well to introduce strange colonies of bees into the apiary and thus escape breeding in-and-in."——I am not aware that any course of vigorous experimenting was ever undertaken to test this point, but facts as well as analogy, certainly favor it. It is so generally true of other animals that it can hardly fail to be so of the honey bee. The prominent instance we have—the cross between the native and the Italian, is clearly in favor of the principle. The hybrids thus produced possess superior qualities in a marked degree. I am persuaded that this hybrid will prove more active, hardy and industrious, and more inclined and better fitted to defend itself than either of the races it springs from. As to crosses between stocks with differences less strongly marked, although results are less striking, yet they point, I think, in the same direction. I have known several instances where small apiaries kept at a distance from all other bees for a number of years, have gradually "run out," exhibiting no sufficient cause for their decay. It may have been no other than in-and-in breeding. But if there were no other reason for frequent crossing than the general law, I should strongly recommend it for that. Of course, where no foreign blood is introduced, whatever weaknesses or defects exist in your stock must go on intensifying until its constitution fails.

Do the Workers ever Sting the Drones?—When honey becomes scarce in the latter part of the season, the drones are commonly destroyed; sometimes by crowding or dragging them out of the hive and sometimes by stinging, but neither exclusively or at the same time. But there are certainly occasions when the workers do sting the drones. If a number of the latter were put in a strange hive at night—the hive having a fertile queen—there would be none left in the morning.

Ogden Farm Papers—No. 2.

I have seen enough during the two years of my occupation to convince me that, of all the manures I can get, that which is the surest to produce a good effect on my land is that taken from the cellar of my own barn—where it has never had a ray of sunlight nor a drop of rain to lessen its value. For instance, the strongest manure that is to be purchased in this neighborhood is "Fish Guano," the refuse of the fish-oil works. It contains all of the fish except its oil and its water, (both of which are of no value for manure,) and from its odor and appearance, it is evidently a very strong ammoniacal fertilizer. I have never known it to be used without producing decidedly good results. Last summer I prepared four acres for winter rye. One-half of the piece had not been manured since I took possession of the farm. On this I spread fish guano at the rate of two tons ($36) to the acre. The other half had been well manured in the spring, from the barn-cellar, and had produced a strong growth of corn fodder. The seeding and other treatment was precisely alike on both parts, yet, in earliness of sprouting, in rapidity of growth, and in ability to bear severe changes of the weather, the part manured from the barn is very much better than the other.

The most important question for me to consider is, therefore,—How can I most cheaply fill my barn-cellar?—for, in filling that, I shall be accumulating a "working capital" for future operations. As but little is sold from the farm besides butter and pork, the nutritive elements of the manure will not be lost—as they would be in selling hay and grain. A cord of manure is spread in April; by August the corn fodder that it has produced has been consumed in the stable, and a second (and larger) amount of manure is carted out for winter rye, or for the top-dressing of grass land. By the middle of the following June the rye has been eaten, and the manure made has been again spread upon the land. The manure helps to make the growth, but it *only* helps. The natural fertility

of the land, and the contributions of the atmosphere does much of the work, and each time the manure is applied to the ground it produces larger crops, and these crops produce in their turn more manure, so that we go on with a constantly increasing proportion, and the more frequently we can apply the manure, (and apply it to rapidly growing crops, which are at once consumed,) the more rapidly we can *turn our capital* (making a profit each time) and the faster will our substance grow.

This reasoning points very clearly to the "soiling" of the farm stock—of which, more hereafter—because the most luxuriant vegetation may be grown, and be economically consumed within a short time. Instead of spreading manure over the whole of a pasture field—getting its effect slowly throughout the whole season—we apply it all to a small area, produce abundant crops, feed these out as soon as grown, and return the manure they make at once to the land. In this way it is possible to use the same fertilizing elements twice in a single year. Of course this may happen in pasturing, but not so regularly.

If the production of home-made manure is of vital importance to the success of a farmer, it is of great consequence to him to produce this cheaply, to store it safely, and to apply it economically. These questions all had much consideration in making the original plans for the management of Ogden Farm. According to the recognized value of stable manure in this locality, the solid and liquid excrement of a good common cow, if kept under cover—the cow being fed in the stall the year through,—must be worth $50 a year; and this, added to the value of her milk (say 2,500 quarts, at 5 cents), would make $175, which would more than pay for the cost of food and attendance. Consequently, if a thorough-bred cow, of any race, could be substituted for common cows, so that the calves would have a value, the fertilizing of the farm by the consumption of purchased food would be attended with a profit. This point being settled, the next was to decide on the kind of cows to keep. Should it be Shorthorns for beef, Ayrshires for milk, or Jerseys for butter? The Ayrshires were the first dropped from the list, because, in keeping them, I should have been obliged to run a milk wagon to the city at least once a day, and I might not find a constant market, at full prices, for my whole production, in a place which nearly doubles its population during three months of the year. I was sorry to give them up, for they are handsome animals, and abundant milkers. Shorthorns had the attraction of the possibility of getting high prices for the increase. Mr. Sheldon's sales of American animals in England, at fabulous prices, and the $3,000 a friend had just paid for a yearling bull, made me wonder how it would seem if Ogden Farm and its herd should ever get the reputation that brings such prices; but the temptation had a streak of the gambling element in it. *If* the large prices were realized, it would be smooth sailing, but if the carcasses had to be sold for beef prices, and the cows proved not to be of "milking families," it would be up-hill work to build up a herd of these heavy weights. They would probably be less valuable for milk than the Ayrshires, and New England is not the country to make beef in. I settled on the Jerseys for the following reasons:

1. They are, essentially, *butter* cows. I believe they will make more butter from a given amount of food than any other breed, and I know that the butter is better. It "comes" sooner, requires less working, is less likely to fail in quality from mismanagement in working, and has a much better texture and color than the butter of any other cow. This "reason" is important to all farmers who make butter.

2. I have a good market the year round for good butter, and a "fancy" market from May until October; and, by the help of the express companies, I can follow my customers to their city homes. This argument was a convincing one in my particular case, and its force has been shown by the fact that I receive for my whole production 75 cents in summer, and (after deducting expressage) 65 cents in winter. How good it would be for other farmers, must depend on their ability to deliver their butter to customers who are willing to pay an extra price for extra quality; but it applies more widely than would at first be thought.

3. "Alderney" veal is in demand in Newport in the summer at an extra price, which helps out the disposition of surplus bull calves.

4. The Jerseys are growing in favor as farm cows as well as for family use, and it is safe to count on an extra price of from $50 to $100, or more, for heifer calves.

5. From their long *habit of confinement*—having been for centuries either tied in the stall or tethered in the field, from infancy to old age, and having learned to thrive under the treatment—they are exactly adapted for *soiling* in comparatively limited quarters.

As cows, for butter only, they would pay better than any others, and butter would always be sure of a fair market. To offset their high cost (for it does cost frightfully to fill a dozen stalls with Herd-book Jerseys), I had the chance of a good sale for progeny, also at high prices, and the certainty of a fancy price for butter. So, viewed from every side, the Jerseys are adopted, and I have had every reason to be satisfied with my decision. But it is not to be forgotten that *manure*, and not fancy stock, was the point aimed at. The Jerseys, beautiful animals though they be, are, in the case of Ogden Farm, only a means of fertility. Everything else is incidental to their duty of conveying a large amount of food into the barn-cellar, retaining enough, as it goes, in the form of butter and calves, to pay expenses. The object being *rich land*, as the foundation of all riches, the ability to produce the *largest possible* crops takes the precedence of all else; and if, while the land is being made rich, the cows will barely pay running expenses, the operation will prove a success; of course the chances are that they will do much more than this; and when the farm is able to carry a full stock without buying food, the income will be as large from these cows as it could be from any other form of farm industry by which the condition of the farm could be maintained.

If I had only known early in the autumn that good hay could be bought this winter for $16 per ton! I would have bought a hundred steers, putting up rough sheds to keep them in, and would have cut and steamed (for them and my present stock) 300 tons during the winter, depositing this quantity of hay in my agricultural bank, to be drawn out at a future day at $25, or to be kept on hand as active capital. But then what glorious business farming would be if we could always know how prices would range three months ahead!

I am cutting and steaming about three tons a week now, and I am able to give an *opinion* as to the result, but no definite figures as yet. My apparatus includes a very neat and simple stationary engine, of the Norwalk pattern, (which is managed by a corner of my own eye, and the whole soul of Hinderck, my imported German apprentice, aged fifteen years, of whom the readers of the *Agriculturist* will know better things as he grows older,) a tubular boiler that is just a little too big for its work,—as all steam boilers should be,—a Cummings' Cutter, and (for the present) a steaming chest, with a capacity of only 56 cubic feet.

We cut a week's supply of hay in three hours, and while that work is going on, the whole labor force of the farm is kept on the jump. It is done so quickly that it seems hardly worth while to keep a steam-engine to do it, until we recall the straining, and dragging, and interruptions of our last winter horse-power work, and consider how vastly better, as well as more quickly, the work is now done. We are using, now, about equal parts of two-year-old-hay, which was not very good when it was new, and has not improved in the stack since then, and "cured" oats, cut green, cured in the rain and fog, and both mow-burnt and mouldy. It is altogether an unsavory, smoky lot, and would ordinarily be used for bedding. With this we cut a little corn fodder, the whole being chopped very short, and thoroughly mixed in the operation. Twelve bushels of this chop are thoroughly wetted in a trough, and mixed with ten quarts of wheat bran. Thirteen such troughfuls are packed into the steaming chest, the cover is keyed down, and the steam is turned on at a pressure anywhere from 10 lbs. to 60 lbs. to the square inch, according to the accumulation in the boiler. At the higher pressure, the whole mass is heated up, and *hot* steam forces its way out under the cover of the chest within ten or twelve minutes. With the lower pressure, half an hour or more is required. *Whenever hot steam escapes* (scalding hot), *the whole mass is heated up and will cook itself*, (on the principle of the Norwegian cooking apparatus.) The chest being interlined with sawdust, the heat is retained, and accomplishes its work. Until the whole mass is heated up, the steam will be greatly cooled off. Steam at 60 lbs. pressure must raise the hay to a temperature considerably above that of boiling water. There is no danger of bursting the box, as a very slight leak is sufficient to relieve it, but I am disposed to think that a woolen blanket over the upper opening would be as effective as a stouter cover, if it is close enough to prevent too rapid cooling off.

Almost as soon as the steam is turned on, an odor, as of baked bread, or roasted bran, fills the room, and this odor is, of course, diffused throughout the cut feed, making it palatable. If possible, we keep the chest closed from night until morning,—always for two hours after the steam is turned off. If not opened for even thirty-six hours, the whole contents will be found scalding hot.

And now for the result. I have fed in this way, since about the first of December, all of my mules, horses, colts, oxen, cows, and calves—equal to forty head, full grown. I never saw the best hay eaten up so clean, and I never saw a more thrifty lot of stock. They never get anything else (save grain to the horses) at any time through the day, and if they are not overfed, the only thing left is the *joint* bits of the corn-stalks. Mould and mow-burning are entirely overcome, and I believe that the woody fibre of the old hay, which could not be digest-

ed, if raw, is made, to a large degree, digestable.

As to the *quantity* eaten, I am not yet able to speak, but when I get my new 425 cubic feet steaming closet ready,—at the side of my Fairbanks' scale,—I shall be able to report the actual number of pounds consumed per week, which, with an inventory of the live-stock, will enable any farmer to judge whether I am saving more or less than the 33 per cent that the advocates of steaming claim as the economy of the system. All that I absolutely *know* about it is, that my stock like the food, and flourish on it, and that my manure heap was never so uniform in quality before. There has not been a case of scouring, nor one of tendency to constipation since I commenced steaming. The only verdict I can now give is, that steaming is entirely and easily *practicable*, — whether it is *practical* (whether it pays, that is), our friend, Fairbanks, shall decide for us during the coming month.

Horse Papers for Farmers.—No. 2.

BY A SPECIAL CONTRIBUTOR.

One lucky farmer in a thousand may be able, by good fortune, to buy just such a horse as I would have him own. The other nine hundred and ninety-nine will have to begin at the beginning and breed him; and they should understand at the outset that there is a wrong way to set about it—many wrong ways, and only one right way. It won't do to buy a defective old mare (wind-broken, sprained, blind of one eye, clam-footed, or club-legged,) because she is cheap, and think that she is good to breed from because she is good for nothing else. From such a start no good end can be reached. A good thorough-bred stallion would, no doubt, get from such an animal a colt vastly better than herself, but sooner or later her constitutional defects would be sure to show themselves in the progeny, and half the advantage of the sire would be lost. As a rule, the colt will take his size and constitutional defects from the mare—his spirit and wiry strength from the horse. Hence we see many high-bred, spirited, and intelligent horses hobbling about the country, with the weaknesses of their ill-chosen dams suppressing their usefulness. With sound and healthy mothers, these horses might have been the very best farm horses in the land —as it is, they sometimes turn out among the worst, their extra energy and "blood" having only served to wear out their delicate lungs or limbs. Nor can such inferior be depended on to produce valuable horses with any stallion—if not with the best, surely not with anything less than the best.

It takes fully five years to breed and raise a horse for use, and this fact alone makes it imperative to use every care to make the final result worth the time and money expended.

The mare need not be a beauty, and need not be fast, but she should be roomy in the barrel, wide in the hips, have plenty of lung room, and good bone—not so much a large frame as a firm one. Bony excrescences, and fatty puffings on the legs should be especially avoided. She may be as large as you please, and had better be a good feeder and a stout worker. Of course all improvements on this type—in the way of fine head, bright eyes, thin ears, silky mane and tail, sloping shoulders, high withers, prominent muscle, and broad, flat, "clean" lower legs, big windpipe, and large nostrils, and thin hide and swelling veins, will be well worth seeking, and worth paying an extra price for, as they indicate an infusion of thorough blood, which is an advance in the direction we are working for. But these manifest advantages should not blind us to the great essentials of *a sound constitution and a good frame.* At the same time, there are many defects which cheapen the price of the mare without lessening her value for breeding. If she has had an eye put out by accident (provided the other has not shown a constitutional weakness by going blind in sympathy with it), if she has become knee-sprung from abuse, (not from natural weakness) or has even had a leg broken and reset, her value for breeding may be in no wise impaired. It will usually be cheaper, however, to buy an animal that is able to do good service, and earn her living while she is breeding. To sum up the case in a few words, —If the mare is of good form, is in good bodily health, and is free from *constitutional* defects, she will do to breed from. Defects resulting from accidental causes may be overlooked unless they are a source of present irritation. Defects that have been inherited are quite likely to be transmitted; and those which are still attended by febrile symptoms, and may occasion pain in the part during the period of pregnancy, are hardly less likely to produce a tendency to weakness in the corresponding organ of the young. The mare should not be served by the horse while she is suffering from soreness of any muscle or bone, or of the feet; and she should be so used during pregnancy, that causes of local pain should be avoided. I incline to the opinion that a tender-footed mare, if kept in a soft pasture, or in a stable with a soft clay floor, and never allowed to hurt her feet so that her attention will be called to their defects during her whole pregnancy, may produce a colt with perfectly sound feet. This, however, is only an opinion, and is as unsupported by positive evidence as are most of our ideas of reproduction.

I have assumed that the mare is to be purchased. If she is already owned on the farm, so much will be saved. In either case she should, before meeting the horse, be brought to the most perfect state of health that she is capable of—having enough (but not too severe) work, generous (but not too high) feeding, and thorough grooming. Her bowels should be kept free, and her kidneys active. When she is in the best possible condition for work, and not until then, is she fit for breeding.

So much for the mother of our new horse. Much might be written on the subject, but this is all there is room for here. Those who desire more definite information, as all farmers should, must go to the volumes for it.

Whatever the dam is to be,—whether she comes up to my modest description or not,—*the sire should be invariably of pure blood.* This restricts us, in this country, to the Arab, the Percheron, or Norman, and the Thorough-bred (the English race-horse). I know that I am flying in the face of the Great American Idea, and that letters will be sent to the *Agriculturist* office, asking why I have not included the thorough-bred Morgan, and the famous 2.20 trotters; and I can only meet the issue squarely, and say that the thorough-bred Morgan is a thorough-bred mongrel, and that the fast trotter is an effect, not a cause. The experience of the world—with every class of domestic animals—points directly to the law, that *no certain improvement can be made unless the sire is of pure blood.* My mongrel chickens are superb, but they are from a pure Dorking cock; and my half-bred pigs are very fine, because they are from a pure boar. In like manner may we go over the whole range of farm stock, and see how indispensable it is that the *sire* must be *thorough-bred* if sure results are to be attained.

I am not now considering the breeding of fast trotting horses, but of farm horses—horses of all work. Those who breed trotters have but one aim. They care neither for size, form, fineness, nor constitution, save as these help to spin the wheels of their spider-wagons; consequently they are not tending to the establishment of a fixed type. The Arab, the Norman, and the Race-horse *are* fixed types, of long standing, and with the same power to transmit their characteristics to their offspring that the Herd-Book Shorthorn or Jersey bull have—that is, a power, when coupled with a low bred animal, of impressing its own character on the progeny, and nearly obliterating the character of the dam. A good common mare may or may not have a good colt by a trotting stallion. By a stallion of pure blood she almost invariably will have one strongly marked with the excellences of the pure stock. The underlying principle is thus stated by Stonehenge. "Like produces like, *or the likeness of some ancestor.* The trotting stallion's colt may resemble his dunghill grand-mother. The pure-blooded stallion has had no plebian ancestors; the colt may resemble any of them, and still be good."

The excellences of the Arab and Norman horses are such as to make it wise to breed to a pure stallion of either race; but they are so much less common in this country than the "Thorough-bred" that, as a rule, they are not available to farmers.

Of the Thorough-breds Herbert says: "Of course it is better that the sire, when it is possible, should be of a racing stock that is famous for courage and stoutness, such as any of the stock which trace remotely to Herod, Cade, Regulus, Eclipse, or others of known fame; but thus far it is not essential, or a *sine qua non*, since every blood horse, even if, as Sir John Fenwick said, in the reign of Charles II., he be the meanest hack that ever came out of Barbary, is so infinitely superior, in stoutness and quality, both of bone and sinew, as well as blood, to the best cold-blooded mare that ever went on a shodden hoof,—that he cannot fail to improve her stock, whatever may be his comparative standing among racers. All, therefore, that the breeder has to do in this instance, (raising work horses) is to satisfy himself that the horse is *really thorough-bred.*"

This is not, perhaps, quite all, for some—not many—thorough-breds are vicious, and some have defective feet, or a tendency to go blind—and in these modern times the stock is being permanently injured by the growing custom of short races for very young animals, which results in a weedy, leggy character, that it would not be well to introduce among working horses, though, even then, *blood will tell.*

The best—the very best—sire, is a sound and good-tempered thorough-bred, of the class known as "four-milers,"—that is, horses able to run, within a couple of hours, three heats, of four miles each, at an average rate of, say 1 min. 55 sec. to the mile, carrying 130 to 140 lbs. weight. A horse that has retired safely from the turf after such a career as this, is a treasure to farmers which, in this country, does not always offer. There are probably a dozen or twenty such thorough-breds now standing in the United States, besides many more not much inferior to them. And if any well-to-do farmer really wants to raise an invaluable horse for his own use, it will pay, even at considerable outlay, to send a good mare a long distance in search of one of them.

The Crested Turkey.

Among all domesticated poultry and other birds, so far as we know, except, perhaps, Guinea fowls, geese and swans, we find either natural crests, or a tendency of the feathers about the head to assume extraordinary shapes. Among doves we have frills, hoods, and crests; among fowls, turban-like crests, and mufflers about the throat; among canaries, frills and crests. Peafowls have peculiar crest feathers. Pheasants, beautiful and diverse crests. There is a crested breed of common ducks, and beautiful natural crests upon several wild species. Among the various genera of wild gallinaceous fowls are found beautiful crests of very different forms. The Curassow, for example, a bird of South America, nearly as large as the turkey, has a superb narrow crest, capable of being spread like a fan, with its edge to the front, and depressed, or folded, in like manner. So it does not seem an extraordinary freak of Nature that a turkey should occur with a crest, especially when we consider the varying circumstances under which our domestic turkeys are raised.

In the number of the London *Field* for July 17th, a gobbler was figured, having a crest much like the one represented in the engraving here given. The accompanying memoranda by Mr. W. B. Tegetmeier, gave a brief sketch of other reported crested turkeys. It seems certain that they have repeatedly occurred, and have received so much attention from poultry fanciers as to have become at different times, more or less established as a breed, but now they are, and for many years have been, altogether lost.

The specimen represented in the *Field*, and in possession of Mr. Tegetmeier, was said to have come from Zanzibar, and to have been sent to a Hamburgh dealer in Zoological specimens, by a collector in Africa. It is of the common species native to this country. How it should have occurred in Africa, is strange. Knowing, as we do, the very imperfect knowledge of natural history which zoological dealers usually possess, and the lack of accuracy which characterises their statements concerning their animals, even when truth would serve their purposes better than fiction, we respectfully don't believe a word of its having come from Africa.

Almost simultaneously with the appearance of this interesting bird in the yard of Mr. Tegetmeier, one is found in this country which closely resembles the other in many respects. We noticed it as shown at the exhibition of the Connecticut State Poultry Society, and again at that of the New York State Poultry Society, and as having been purchased by Mr. D. E. Gavit, in whose possession it still remains.

The cock is a medium-sized one, weighing perhaps 18 or 20 pounds; of a blackish bronze color upon the body, fading into gray below, and into brilliant light chestnut bronze on the tail and wing feathers, these being edged with broad bands of black and white. The legs are dark, flesh color; the spurs indicating at least a $1\frac{1}{2}$-year-old bird. The carunculations upon the neck, and the beard, are well developed. The crest is like the Hamburgh bird, "of a dull, uniform gray, the feathers composing it being soft in texture." It is a beautiful appendage, adding a peculiar grace to the bird. It is in a measure erectile at the will of the wearer, and gives the gay fellow quite the air of a Broadway belle, with her extraordinary *chignon*.

CRESTED TURKEY—"VICTOR EMANUEL."

We hope this notice may elicit some positive information from disinterested parties who know by whom and where this bird was bred. From all we can learn, he came from somewhere near Birmingham, Connecticut. The parties who sold him to Mr. Gavit are not disposed to be communicative in regard to his origin. If he lives he will be bred with care, and we hope and expect his progeny, some of them at least, will take after him in this beautiful peculiarity.

Sheep Require Water in Winter.

That sheep will eat snow and get along tolerably well without water, especially when the snow is light and clean, is a good argument in favor of the hardiness of these patient and useful animals; but it proves nothing in regard to the economy of compelling them to do without water. In our cold climate a large amount of food is required to keep up the animal heat, and all the water a sheep drinks has to be raised to the temperature of the body. The heat required for this purpose is derived from the food. Now, it requires twenty-one times as much heat to raise a pint of water when frozen, to the temperature of 40°, as it does a pint of ice-cold water, not frozen. Those who have ever undertaken to melt snow to wash with will readily believe this statement. What would be said of the farmer who should use wood or coal for such a purpose when it could be avoided, and yet wood and coal are far cheaper sources of heat than hay or corn. When we compel a sheep to eat snow, we, in effect, undertake to melt snow by burning straw, hay, and corn in the animal stove. The same remarks will apply to feeding animals on frozen roots. A sheep, weighing say 100 lbs., will eat, in addition to a liberal allowance of hay and grain, 10 lbs. of roots a day, containing nearly or quite 9 lbs. of water. Now, before the carbon in the turnips can produce fat, or furnish material to keep up the heat of the body, it must first raise this frozen water to blood heat. A flock of a hundred sheep will drink nearly two barrels of water a day, and there are few things more important to the economical and successful wintering of sheep than to see that they are constantly or at least frequently and regularly supplied with water. A running stream, brought by pipes into the barn-yard, is doubtless the best, but when this cannot be obtained, the water should be pumped up fresh for the sheep; and not allowed to stand until frozen, and then the surface broken and the ice left to float in the water that the sheep have to drink. We do not know that it would pay to heat water for sheep, but certainly it will not pay to make them eat snow, or drink water with melting ice in it.

Where early lambs are raised, it is important to provide the ewes with a constant supply of fresh water. If from accident or neglect such sheep have been kept without water for a day or two, nothing is more dangerous than to permit them to drink their fill of cold water. We once lost several sheep from this cause, and have since heard of many similar instances. Take the chill off the water and no danger need be apprehended. Suckling ewes require more water than other sheep, and when roots are not fed, it would undoubtedly contribute much to obtaining a good supply of milk for the lambs if the ewes were furnished with warm water, or, better still, warm, cooked food, such as oatmeal and bran mash, or boiled barley, etc.

Walks and Talks on the Farm—No. 74.

The winter months bring me a good many letters asking advice, and giving useful suggestions. I am always glad to receive them. One man gives me his views on the financial problem. He wants more greenbacks. So do I. But I do not feel certain that, if more are issued, any of them will find their way to my pocket. I think he and I have a better chance to make money from attending to our farms than by looking for aid from Washington. Another farmer writes: "Your 'Walks and Talks' are all good, but No. 72 is ahead of anything yet. After reading them I could return to specie payments or withstand a financial crash, and still have *pluck* left. Your remarks did me good, as I am rather deficient in pluck, but am improving by the example of one of the pluckiest of wives."—There are many other farmers who can say the same thing. Nine out of ten owe their success to their wives. The same man says—"I commenced to farm because I had a love for it. I love it still, but would love it still better if I could make more money by it. * * I follow mixed husbandry, and try to do everything well—hire more help than my neighbors, and my farm shows quite a difference. Have more tools, and read more papers than any farmer in town—had rather lend than borrow. Usually board a boy to do chores, but this winter I do them myself, with the help of my eight-year-old son, who takes as much interest in them as any farmer. I always sleep better when *I know* that every animal I own is comfortable. I wish every farmer in America could say the same. It would add millions to our wealth. Have not sold my grain. I had concluded, before reading your remarks on the subject, to convert it into beef, butter, and pork. Pigs are very scarce. I am wintering four sows, and expect to raise pigs from them all. Have bought a thorough-bred Essex to cross with my Chester Whites. I think it will pay. I let them run out in the yard. Pork is bringing 15c. to 16c. per lb. I had some good pigs, but not heavy. They averaged 226 lbs. at eight months old, and thicker pork I never saw."—His grade Essex will do better than that, if he will feed them well until they are three months old, and then let them have the run of a good clover pasture, and a pint or two of corn a day, with the milk and wash from the house.

Here is a letter from a city man, who writes: "Though not a farmer, I am a lover of farming, but am prejudiced against farm life, because it seems to me that living on and working a farm is unfavorable to the development of the intellectual part of our nature." What nonsense! "In town," he continues, "one is thrown in contact with one's own kind, and through the Library and Reading-room, can keep up an acquaintance with the current literature and the history of one's own times, while a farmer could not afford to *buy* all the good periodicals and books." In conclusion, he thinks that "living in a village or town is more favorable to the cultivation of the *thinking* powers than living on a farm."—If he had said the "talking" powers, he would have been nearer the truth. The "current literature of the day" is not the kind of food I should prescribe for strengthening a weak intellect. The *study* of "How Crops Grow" will do more for the "thinking powers" than reading a whole circulating library of light literature. The young farmer who carefully reads Allen's American Farm Book, with a view to practice what he finds applicable to his circumstances, will find more to *think* about than a whole regiment of dry goods clerks can extract from the sale of calico and ribbons. The truth is, however, that a city youth may know more than a farmer's boy, or a farmer's boy more than a city youth. It depends on how they use their time. Both have opportunities for study and improvement, and it will depend entirely on themselves whether they become intelligent men or stupid dolts. As a rule, an intelligent farmer becomes more of a man than an intelligent shopkeeper; on the other hand, a stupid farmer is more stupid than a frivolous city clerk.

Here is another letter, from a man who owns twenty-three acres of poor, undulating, clay loam land, situated less than two miles from the centre of the City of Memphis. He proposes to move on to it, and intends to devote six acres to small fruits, asparagus, celery, and cabbage; the remainder to be planted in corn, potatoes, etc. He wants me to tell him how he can best break it up, enrich it, etc. Stable manure can be had, in large quantities, for ten cents a load.—I would first thoroughly underdrain the land, and, at the same time, draw out a hundred loads of stable manure per acre, and plow it under. Keep the surface mellow and clean by the use of the harrow and cultivator. Then, in the course of a month or six weeks, cross-plow the land. The manure may not be sufficiently rotted to allow neat work, but no matter. Keep working the land, and during the hot weather the manure will decompose very rapidly, and will be thoroughly incorporated with the soil. This will be one great point gained. Another is, that the soil will become very loose and mellow, and if the work is done properly, millions of weeds will spring up after each plowing, and will be destroyed. In short, what I would do in such a case, would be to give up all idea of planting anything the first year, and bend all my energies to getting the land into first-rate condition. With manure at ten cents a load, I would make the land as rich as a hot-bed. Of course I have no idea that my friend will follow this advice. He will be anxious to get the land into crop this spring. With the exception of asparagus and corn, however, he would certainly make more by devoting one year to draining and preparing the land. Twenty acres of land on the borders of a large city, prepared as I have recommended, would make any skillful gardener's fortune. And I would devote every dollar I could spare to drawing out manure while it is worth only ten cents a load. In a few years it will be hard to get at a dollar a load.

Here is another letter, from a young Pennsylvania farmer, who says he "is full of enthusiasm in his vocation, and willing to learn, and believes in thorough cultivation and superthorough manuring."—This is an excellent ground-work for success. He has large quantities of old timber on the farm that is rotting and going to waste, and he wants to know how to make it into ashes, so as to secure the greatest quantity and the best quality. By simply burning the wood he thinks the ashes are burnt up, and a good portion of them lost. This, I think, is a mistake. The value of ashes consists principally of the potash and phosphate they contain, and these are not lost by burning. If the wood cannot be turned to any good account as fuel, I would draw it into piles and set fire to it, and then spread the ashes on the land. Perhaps this wood may be used for burning limestone in a rough way for manure, or perhaps it may be made into charcoal. If this timber lies on low, wet land, that is rough and weedy, I would first dig a ditch through it to get off the surface water, then remove the old wood and logs out of the way, to allow a team and plow, to get through. After plowing three or four furrows place the wood in heaps on the plowed land, and keep on plowing and removing the wood out of the way of the plow and putting it on the heaps. I cleared up a rough piece of land in this way, and made it smooth and level at one operation. All the tough sods, tussocks, and bunches of rushes, etc., we threw on to the heaps of wood and set fire to them. In this way we got quite a large quantity of charred soil, ashes, charcoal, etc., which was spread on the land. We then seeded it down with timothy, and had a splendid crop of grass on land that previously was simply an eyesore and a nuisance.

A Minister in Canada writes: "Is there any amount of ammonia contained in snow, or absorbed by it, so as to make it a real benefit to the crops? I have heard it stated that a heavy covering of snow is as good as a coat of barn-yard manure. Is it so?"—It is so to a certain, but quite limited extent. Snow contains ammonia and nitric acid, and so does the water from rain, dew, and fogs. There is no satisfactory evidence that, on the average, snow contains more ammonia or nitric acid than rain-water. Boussingault, indeed, found twice as much nitric acid in snow as in rain, but the mass of testimony indicates that the *per centage* of ammonia and nitric acid in rain or snow, depends principally on the quantity of water precipitated. The first shower of rain or snow, after a drouth, contains the highest proportion of ammonia and nitric acid. When we have continuous rains or snows, the quantity of ammonia and nitric acid contained in them becomes less and less. Snow has been called "the poor man's manure," and he will be a poor man who depends upon it. Still, the quantity of nitrogen brought to the surface of the earth in a year is equal, on each acre, to about ten pounds of ammonia, or as much as is contained in a ton of ordinary barn-yard or stable manure. The trouble is that for want of underdraining a large proportion of the water from melting snows and heavy rains, instead of soaking into the soil and leaving its ammonia and nitric acid for the use of plants, runs off on the surface, often doing harm rather than good. My impression is, that a well-worked loamy soil absorbs more ammonia from the atmosphere than is brought to it in snow and rain. At any rate this source of ammonia is worthy of the most attention. The snow descends on the poor land as much as on the good. We cannot increase the supply. But the amount absorbed from the atmosphere by the soil is under our control. The more we pulverize a heavy calcareous loam, the more ammonia will it absorb from the atmosphere; and, at the same time, this thorough working of the land will develop the plant-food lying latent in the soil.

A farmer in Canandaigua wants me to tell my "experience with Essex pigs and their grades." I have kept them several years, and the more I know of them the better I like them. But I would not advise him to buy them in hopes of selling to his neighbors. The Essex, you know, are *black*, and in this section

there is not one farmer in ten who can get rid of his prejudice against color. My pigs have been the laughing-stock of the neighborhood. Mr. Chase and I have bought the Maple-shade flock of thorough-bred Cotswolds, and since they arrived here they have attracted much attention. The Deacon came in one morning and remarked, "Now that you have brought such a magnificent flock of sheep into the neighborhood, we will forgive you for bringing in the black hogs." Now, it is not pleasant to pay $50 for a pair of young pigs and have an intelligent farmer like the Deacon make fun of your purchase. If you wish to be on good terms with your neighbors, buy a Chester White or a Jefferson County pig. You may believe, as I do, that an Essex pig will do more to improve the quality and fattening properties of the pigs in the neighborhood than any other breed; but, if the neighbors wont use him, what is the good? You may tell them that the Essex hogs dress as white or whiter than white pigs, that the color is not even skin deep—that it is only the scarf and hair that are black. But it makes no sort of difference. "I hate a black hog anyway,"—said one of the judges on swine at the State Fair, and ninety-nine farmers out of a hundred would approve the sentiment. "Why, then, do you keep black pigs?"—Simply because I know of no white breed that has been kept so long pure. The value of a breed consists, first, in its possessing the form and qualities we desire; and second, in its power of imparting them to common stock. The latter is the rarest and most valuable quality. A pig that possesses the former without the latter is worth no more than what the butcher will pay for him. The handsomest pigs in my yard today are grades. I showed a pen of five pigs, Essex grade, at the State Fair. Col. Weld, of the *Agriculturist*, when he saw them, remarked, "They are spleudid, but they are not thoroughbred."—"How do you know that?" I asked. "They have every mark of the Essex, and resemble each other as closely as two peas."—"They are too good for thorough-breds,"—he replied, and he was right. This fact, however, is not generally understood, and hence the questions most frequently asked are, "How do you like the Essex, or what do you think of the Berkshires, or the Suffolks, or the Yorkshires?"—whereas the question should be, Which breed *gives the best grades?* And this is simply a question of pedigree. The breed that is the most thoroughly established is the best. The only point that needs to be urged on farmers is not to recommend this or that particular breed, but simply to show them the importance of using *some* kind of thorough-bred male—and this in all cases, whether of horses, cattle, sheep, or pigs. If this simple idea could be driven into the minds of all our farmers, it would add millions to the value of our farm stock. I was in the Buffalo cattle yards a few weeks since. There were several thousand pigs in the pens, and every first-class pig in the yards showed more or less Berkshire or Essex blood. I had an experienced butcher with me, who shares the popular antipathy to black pigs, but he was forced to admit that wherever the Essex or Berkshire blood showed itself, "there was the pig he wanted." A great many of the pigs showed Chester White blood. They were good, strong, thrifty pigs, showing plenty of bone and offal, but the quality would not compare with the Berkshire and Essex grades. They would have made good heavy pork if they had been fatted two or three months longer. A visit to these cattle yards would do a farmer good. The contrast in the different lots of animals as they stood side by side in the pens is most striking; and I could not but ask myself over and over again, "Why will farmers raise, and keep for years, and attempt to fatten such miserable animals?"—A good three-months-old calf sells for more than many of the three-year-old steers. There were two four-year-old Ohio Durham steers that sold for more money than a lot of a dozen "scallawags" of the same age. It is so too in the sheep market. I bought a lot of two hundred Michigan Merinos, three and four years old, for $2.40 each, that the dealer said he had spent considerable time in selecting from different flocks. At the same time I offered $8.60 each for a lot of Canada sheep, of only half the age, but the butchers outbid me. Now, I do not say that everybody should keep the mutton breeds of sheep, but I do say that, no matter what breed is kept, we should keep them well, and be constantly improving them; otherwise there is no profit in farming.

——

As long as people will pay as much for light oats as for heavy oats, no one can blame farmers for raising the poorest variety they can find. There can be no doubt that it is easier to raise poor things than good ones. I presume the statements in regard to the large yield of Norway oats are true; and if I intended to raise oats for sale, I would sow the Norway, as it is one of the poorest varieties I am acquainted with. In England and Scotland, where oatmeal is extensively used, the great aim is to get heavy oats, and the price which they will command depends on the quality. For instance, when a bushel of oats, weighing 40 lbs. per bushel, sells for 60 cents, one weighing 41 lbs. brings 62 cents. And every additional pound per bushel adds 2 cents to their market value, while every pound per bushel under 40 lbs. deducts 2 cents from their value. So that a bushel of oats weighing only 25 lbs. would be worth but 30 cents, while a bushel weighing 50 lbs. would be worth 80 cents. Professor S. W. Johnson, in the American Agricultural Annual for 1867, gives the results of Muller's analyses of four samples of oats, the heaviest of which weighed 45.8 lbs. per bushel, and the lightest 28.8 lbs. The latter contained of water, husk, and ash, 31 per cent, and the former not quite 22 per cent, or, in other words, the heavy oats contained over 78 per cent of nutritive matter, and the light oats only 69 per cent. The heavy oats contained 59$^3/_4$ per cent of starch, and the light oats only 51$^1/_2$ per cent. According to this, if a bushel (34 lbs.) of the heavy oats is worth 60 cents, a bushel (34 lbs.) of the light oats is worth only 53 cents. He gives also another experiment in flouring light and heavy rye on a large scale. 100 lbs. of heavy rye gave 10 lbs. more flour and 7 lbs. less bran than the light rye. Millers understand this matter, and will pay, weight for weight, much more for good heavy wheat than for a poor, light sample; but so far as I have observed, the produce dealers make comparatively little difference in the price of oats when sold by weight.

Dr. Miles made some interesting experiments last year, on the Michigan Agricultural College farm, with eight varieties of oats. The results of which are shown in the table just given.

Nos. 1, 2, 3 and 4 were from seed imported by the Department of Agriculture. It will be seen that the two English varieties, Nos. 1 and 2, fall off nearly 13 lbs. in the weight per bushel. It would be interesting to know how much of this is due to soil, culture and climate, and how much to the want of the thorough use of the fanning-mill. I raised about five bushels of the Excelsior oats last year, and I think by running them two or three times through a good fanning-mill, and then through what they call in England a "heaver,"—that is, a fanning-mill with a strong blast and no sieves,—I could get out a bushel that would weigh as much as the sample received from England. In my case the Excelsior were greatly superior, in yield and quality, to the common oats grown in the same field, sown at the same time, and receiving precisely the same treatment. The straw was stiffer and taller, and throughout the season you could see the difference to a row by the dark color, broad leaves, and more luxuriant growth of the Excelsior. I did not try the Somerset. In the Michigan trial it gave by far the largest yield per acre, but it weighed only 31 lbs. per bushel. The Brooks', we believe, is a Michigan variety. The Surprise was sown in an orchard, and the trees injured the crop, "so that the yield does not fairly represent the value of the variety." The weight per bushel indicates a high quality. The Norway makes a very poor show, both in yield and quality. The seed was received from a firm in New York, and contained a quantity of foul seeds, which were picked out by hand. The oats were not sown until the 11th of May, and this late sowing may have had something to do with the poor result. Our seasons are so short that a week or ten days delay in sowing, not unfrequently makes all the difference between a good and poor crop of oats.

There are so few experiments made in this country, that we have to be very thankful to any one who will furnish us any carefully ascertained facts; but it is to be regretted that the above trial was not made on a larger scale, and that all the plots were not of the same size, and on the same land, and sown at the same time. The Department of Agriculture should furnish our Agricultural Colleges with seed enough to make such experiments entirely satisfactory.

Glass-Covered Run for Early Chickens.

It is a great object with breeders of choice fowls to have a few broods, at least, of very early chickens. If these do well, they will probably be the prize-winners at the fall shows, or they will be ready for use, if for market, as broilers, in May and June, when prices are the highest, or the pullets will be laying from September, or earlier, to Christmas, when eggs are scarce and high. To raise early broods with success, the chickens must have no pullbacks, but a steady healthy growth from first to last. It is easy enough to get the eggs hatched, and to rear the chickens until they are a week old, but then commences a series of trials which few early broods live through in common hands. In June, the old hen, left uncooped, will take care of her brood almost without care from us, and with little feed, and the chicks grow and thrive, but in February and March the case is different. At hatching, the greater part of the yelk of the egg fills the stomach of the chicken, and is gradually absorbed as food,

so that the first day it needs no food, the next day but little, and it is only on the third or fourth day that the little things experience real hunger when deprived of food. This period comes sooner in cold than in warm weather, and quicker, too, if they are not properly brooded. It is absolutely necessary to keep chickens warm and dry. They should have clean coops, and a clean, dry, sunny run. These requisites are very conveniently provided by using hot-bed sashes in the manner shown in the accompanying engraving. Three large

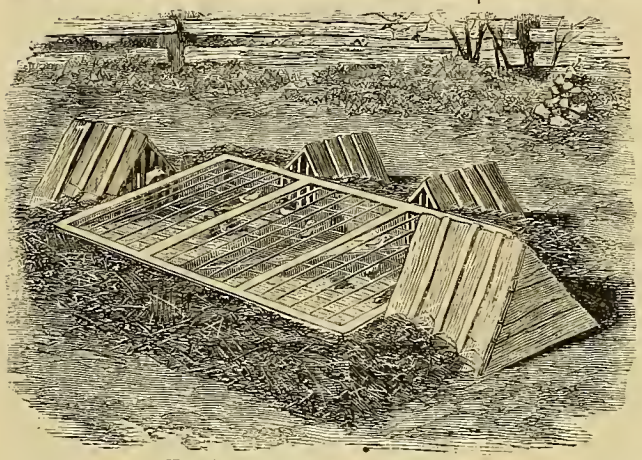

Fig. 1.—CHICKEN-RUN AND COOP.

hot-bed sashes cover a space of about 72 square feet, abundantly sufficient for four clutches. The frame on which the sashes are laid is made of 2 × 3-inch stuff, and supported by stakes driven into the ground at the corners and such other points as may be needed to give firmness, and the frame is nailed through to these posts. The slant given to the sashes need not be more than one foot in the six feet, the rear posts being therefore 18 or 20 inches high, and the front ones 6 or 8. Boards are placed between the coops and at the ends, and earth or litter is banked up and packed firmly against them. If the coops open at the back, it will be found convenient for cleaning them out, and removing the hen if necessary. Ventilation takes place through the openings in the peaks of the coops, which, however, should not be so large that chickens can fly up and get out. The chickens are fed and watered by slipping the sashes up or down, and it might also be convenient to have a pane of glass arranged so as to be removed at each end. A mat should be provided, to give shade in case the place gets too hot, and the sashes may be lifted a little at the upper end, to give freer ventilation. Thus the temperature may be perfectly and easily controlled. We indicate in the engraving two partitions; one crosses the middle of the space, dividing it

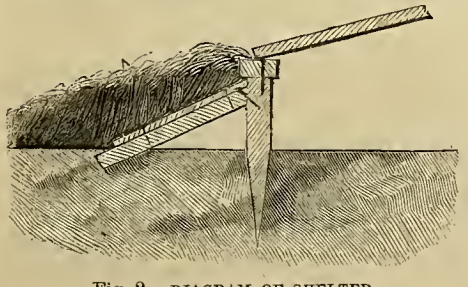

Fig. 2.—DIAGRAM OF SHELTER.

into two equal, square parts; the other divides one of the squares in two equal, triangular parts. This gives the chickens of each coop 18 square feet of space. A warm, shady shelter is easily made by laying a board against the front posts, as shown in the accompanying diagram (fig. 2). This, if covered with warm manure, packed above it, and covered with a layer of earth, will warm through and give a very pleasant place for the chickens to run under in cool weather. When the weather becomes warmer the manure will have lost its heat.

Salt-Muck.—Will it Pay to Dig it?

For shore farmers, who have creeks penetrating their meadows, we have no doubt that salt-muck is one of the cheapest sources of manure. In an analysis made some ten years since by Prof. Johnson of Yale College, it was shown to contain 5.41 per cent. of potential ammonia, standing at the head of all the 33 specimens of peat and muck analyzed for the State Agricultural Society. This sample was taken from a ditch in Stonington, where the tide-water flowed daily, and was probably a fair specimen of what is now found in inexhaustible quantities in the creeks all along our coast. The analysis was made on account of the very noticeable results, which followed its use, both upon grass and corn, in that town. This deposit is made up very largely of decayed marine plants, and the silt brought into the sea from fresh-water streams. River deposits and marine plants are well-known fertilizers. If the kelp and rock weed are so valuable in the fresh state they ought to be still more so when they have been rotted down in the water, and their bulk so much reduced. J. J. Day used it freely upon his meadow at Stonington, and the result was not only remarked upon the corn crop, to which it was applied, but upon the subsequent grain and grass crops. The mud was raised by hand into a scow, and from thence carted upon the land. J. D. Fish, of the same town, has improved upon the method of raising it. He uses a steam derrick rigged like a common mud digger. The mud is dropped from the bucket, immediately into the cart, and is driven off and dumped upon the meadow. After lying a few weeks to dry, the heaps are spread with a shovel. We see no reason why the common mud digger, used to deepen channels, could not be made available for this purpose. It could readily be taken into many of our creeks and the mud be dropped directly into carts, backed a little into the water. It would require of course a good many extra teams, and extra expense for help, but if it is worth only half as much as yard manure, it will pay abundantly. The whole surface dressed with this mud upon Mr. Fish's farm this autumn was a few weeks after its application distinctly marked by the greenness of the aftermath. It is too early of course to tell what the next crop will be, but there is every indication that it will be abundant, and that the muck will pay for digging.

MANURE in a bulky form is less liable to damage; it goes further; is better incorporated with the soil, and it produces more effect than that which is more concentrated.

Clod Crushers.

As a rule, harrows and rollers, used one after the other, are the best clod crushers, but there are many soils which no reasonable amount of rolling and harrowing will bring into good tilth, which a good clod crusher would put in good shape with once going over. Clod crushers for such work, however, like the best rollers, are not home-made articles. The common clod crushers, such as almost any one can make, are, nevertheless, fair substitutes for the roller in subduing land before it is sown with grain, and on some lands may even be used after grain is sown and harrowed. A clod crusher of very simple construction and which can be made in a few minutes is shown in fig. 1, which represents 4 logs, about 10 inches in diameter at the largest end, and eight feet long, fastened together by a chain. This, having quite a large "bight" to hitch to, is run through holes bored about a foot from the ends of each log. The logs are fastened apart by keys put into the links, and should be separated about half their diameters. The keys may be rings or pieces of large wire bent so as not to slip out. Convenient forms are shown in figure 2. They must be made of wire strong enough to stand a heavy strain, so that if the implement runs against a fence, tree or stump, it will not break. The engraving shows sufficient length of chain behind to attach another log if desired. This makes a very good smoothing implement. It may be drawn even,

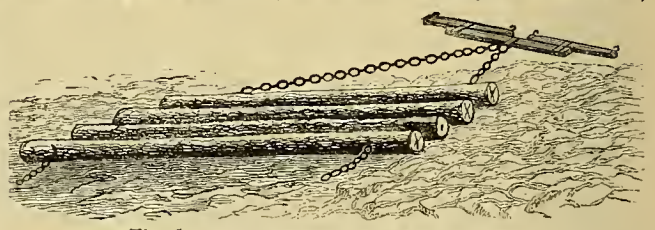

Fig. 1.—CLOD CRUSHER OF CHAINED LOGS.

or the clevis for attaching the horses may be at one side, in which case the earth will be more or less shoved to one side to fill dead furrows, etc. In figure 3, a form of clod crusher is shown which is superior for smoothing

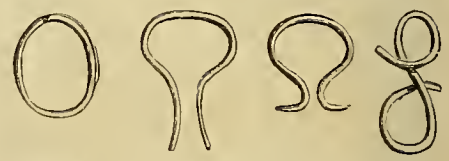

Fig. 2.—WIRE LINKS FOR CLOD CRUSHERS.

rough, irregular land. This also is made of logs about 10 inches in diameter, which are set in a frame, being morticed in, as shown in figure 4. In passing over little knolls and hummocks nearly the whole weight of the affair bears upon

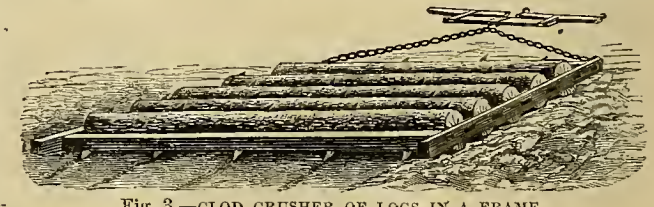

Fig. 3.—CLOD CRUSHER OF LOGS IN A FRAME.

the highest points, and levels them down considerably. This clod crusher may be made either with or without teeth. If employed, they should be inserted at an angle of 45° to the mortice, and may be longer or shorter, according to the work to be done. They should, however, never be long or numerous enough to prevent the logs resting upon the ground. The operation of the teeth is to crowd strawy manure out

of sight if the soil be moderately soft. This implement is drawn by a chain fastened to a clevis on the end of each side beam of the frame. The tool may be reversed by turning it over and hitching to the other end. It is not necessary to sharpen the teeth much; they will wear

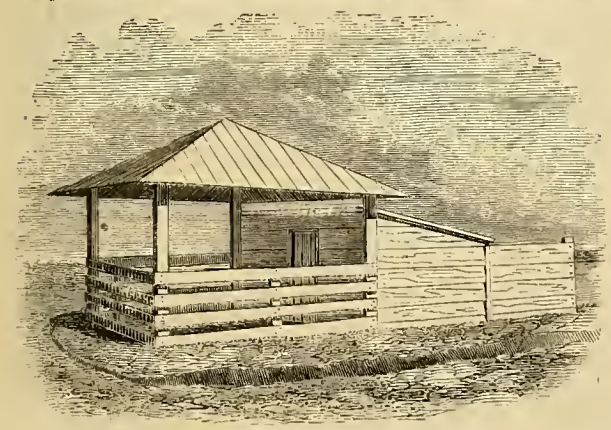
Fig. 4.—SHOWING CONSTRUCTION OF FIG. 3.

rounding very soon. These may be omitted altogether from the rearmost stick, if smooth work not marked by furrows be desired; but in this case the implement could not be so well inverted and used the other side up, for then the smooth log would be at the forward end. The same result is attained by attaching a light log or brush to the back end when in use.

Wet Hog-Yards a Nuisance.

Where hogs are kept on a large scale, say where thirty or forty 300 or 400-pound hogs are fattened every year by one farmer, they are seldom kept in yards, but have the range of an acre or more, with a brook or water-trough, and their manure is made little account of. Farmers who feed fewer swine, and reckon the manure a very important, if not the chief source of profit, confine their hogs, and keep them working over vegetable matter of all kinds. The yards, if not continually supplied with large quantities of fresh litter or weeds, are fitly described by a correspondent of Somerset Co., New Jersey, whose letter we quote as follows:

"Hog-yards, in connection with hog-pens, as most farmers have them, are a nuisance. The hogs root up the bottom of the yard until they get a great hole, and every rain fills it with a slush, into which no one wishes to go to clean out the manure, and it is too offensive to be near the house. My neighbors have tried paving with stone and brick, but the hogs rooted up the pavements. About a year ago, I laid mine



ROOFED HOG-PEN YARD.

with oak plank, on a level with the surface of the ground, so that the water could run off when it rained. The ends of the planks run under the lower boards composing the sides of the yard, so that the hogs cannot root them up; they are not laid on timbers; it is unnecessary. We can now go into our yard and clean out the pen with no more inconvenience than we clean the plank floor of a horse stable. I have no doubt that the reason why farmers make so little manure in their hog-yards is because they are such filthy places to go into, and have no doubt the planks will last in such a situation a lifetime, they being always wet."

This is very well so far as it goes, and it is just about as far as most farmers will go who have to get the manure out of their own hog-pens. We propose a plan for those whose pig-stys are already built, and have the usual inconvenient open yards. It would be best to have the hog-yard sheds open to the south, and accessible to carts at this side. A simple roof, however, something like the hay-barrack roofs of our Dutch neighbors in "Jersey," will answer. A yard 12 or 14 feet square is large enough for half a dozen hogs, and better than if larger. Such an one may be roofed as represented in the engraving. The four corner posts of the yard are 12 feet long, or a little less, and set nearly 3 feet in the ground. There are four rafters mortised upon these posts, meeting in the middle, at a hight to give the desired pitch, and extending 3 feet over the posts, to give wide eaves. Before putting up the rafters, 3 × 4-inch plate-pieces are nailed or pinned near the tops of the posts, all around, and tied by similar pieces mortised into the middle of each side, crossing at right angles. The roof may be of boards, thatch, or shingles, and an old tin roof, taken off from some other building, may be made to turn rain for several years by an occasional coat of some roofing—pitch or paint. A yard so covered will receive rain enough usually to keep it moist; it will not become wet unless water flows into it. Manure will make better and faster than in an open yard; none will be washed away, and little or none will be lost by evaporation, as during the warmest part of the day the yard will be in shade. In dry weather it might need wetting.

Killing Beeves on the Farm.

The slaughter of beeves on the farm is an awkward business at best, unless one has the more essential appliances of a slaughter-house. With plenty of help, and a good pair of blocks and tackle, we can get along very well; but when one man undertakes the job, whether he be on a farm with a roomy barn floor, on one without a building high enough to swing a bullock in, or on the open prairie, with only a tree, or perhaps not even that, he has his hands full. However, the work may be done, and well done, and that without a pulley.—In killing the animal, it is desirable to cut the large blood vessels of the throat as soon after it is struck down as possible, the most rapid bleeding being best for the beef. When it happens on level land that the creature is brought down by the bullet, it is a little difficult to secure the most perfect bleeding, for it is desirable to have the head lie low, and the body incline towards it. This is accomplished by placing the animal on a bank, or by tying a rope to one hind leg, and hoisting the hinder part of the body up as high as is necessary. As this is done before the struggles of the creature are over, the rope should be attached before it is knocked down if possible, or a noose should be made and thrown over the foot afterwards. As soon as dead, the carcass should be skinned. The legs, belly, and pate are skinned as it lies upon its back—most conveniently if ropes can be fastened to each foot, and the legs stretched well apart. This done, the feet are cut off at the knee and hock joints, the paunch is removed, and the carcass strung up. A gambrel is inserted, and with help enough, the beef is easily swung clear of the floor in any common

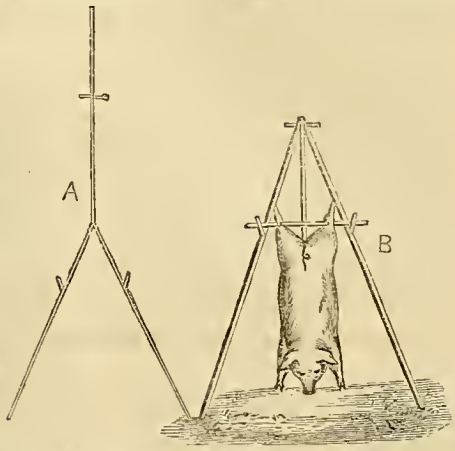


Fig. 1.—TRIPOD FOR HANGING UP HOGS.

barn, or to the limb of a tree, not less than 8 feet high. On the open plain, sometimes a gin is set up, having a block and tackle, and this does very well. We published, some years ago, a plan (see fig. 1) which, while it answers very well for heavy hogs, requires the power of three men to manage it with even a moderate beef animal upon it. This is accomplished as fol-

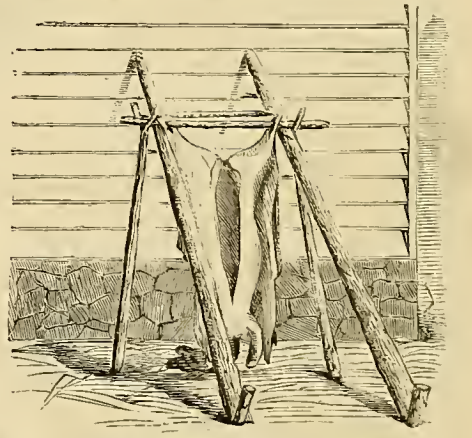

Fig. 2.—SUSPENDING A CARCASS.

lows: Two legs of the tripod, *A*, have pins set in them, upon which the gambrel rests after it is inserted, the tripod lying flat upon the ground, as shown. Then the upper part of the tripod is lifted and the carcass with it a little ways, until the ends of the legs hold in the ground, after which simply carrying up the leg with the pin thrust through it for a handle, elevates the carcass to the desired hight, shown at *B* in the engraving, fig. 1. Mr. S. R. Shegogue having tried this plan, describes for the *Agriculturist* a way by which two men "string up" a good sized bullock. He writes: "Get two strong poles, say 15 feet long each, and place them against a building or tree, as shown in the illustration. Cut four crotched poles and point them at one end; two of these should be 5 feet long, and the other two 7 feet. After killing the

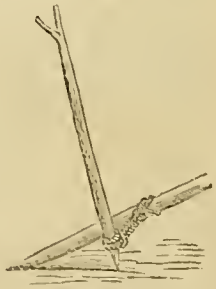

Fig. 3.—LEVER AND SLING.

beef, it is turned on its back, and the legs and as much more as you see fit, are skinned; a long gambrel stick and shorter one are put in place. The long one is laid across the poles, as high up as possible, then the short crotch poles are used,

and the carcass shoved up, one side at a time; then the longer ones are employed until you reach the desired height, leaving the beef suspended as represented. Two men can butcher in this way without much trouble."—When strung up it is comparatively easy to finish skinning, and to remove the vicera, after which the carcass may be allowed to cool, when it can be cut into quarters. A single man will have no difficulty in lifting a beef carcass if he uses a lever and simple sling, as shown in figure 3, to move up the crotched sticks, first on one side and then on the other. The lever being placed at right angles to the long poles.

Care of Young Pigs in Winter.

It seems to be generally admitted that the stock of pigs in the United States is unusually light. At any rate, pork brings a very high price, and this fact, in the face of a tight money market, is pretty conclusive evidence that the supply is not equal to the demand. It is not improbable that farmers will make, or have already made, an unusual effort to raise a large number of pigs next spring, and if we have a good corn crop next year, we may see a marked decline in the pork trade in the winter of 1870–1. But the indications now are that pork will be in demand through the coming summer, and early autumn, and we should make it a point to have our pigs in such high condition that we can avail ourselves of the high prices. Every farmer who has a litter of fall pigs should see to it that they are kept growing rapidly through the present winter, and during next spring and summer. A well-bred fall pig can easily and profitably be made to dress 250 or 300 lbs. at ten months old. But to accomplish this it is absolutely essential that the pigs be provided with comfortable quarters through the winter, and are furnished with a liberal and regular supply of nutritious food. We do not advocate fattening pigs during our northern winters, but we do most earnestly advocate keeping young pigs growing vigorously. So far as our observation extends, half our farmers do little more than keep their young pigs alive during the winter. Whatever food the pigs eat is lost. They do not gain a pound, and they are so stunted that half the summer is past before they get into a thriving condition. No wonder such farmers say "pigs don't pay." Pigs kept warm, dry, and comfortable through the winter, with food enough to keep them nearly fat, will, when spring comes, grow with great rapidity on food but little better than that which is ordinarily given to store pigs at that season; and so all through the summer, the effect of the good food and treatment in the winter will be very decided. With the run of a good clover pasture, and the wash from the house and dairy, with a pint or so of corn a day, these well-wintered pigs will gain rapidly, and will at any time be ready for the butcher. No matter what the price of pork may be, we are satisfied, from experience and observation, that if pigs are kept at all, the only profitable way is to keep them well. They may not always pay, but the liberal feeder has a better chance of getting his money back than the farmer who half starves his pigs. It is true that one of the objects of keeping pigs is, that they may eat food that would otherwise be wasted, and we would not be understood as advocating anything inconsistent with this idea. If possible, however, the "scavengers of the barn-yard" should be full-grown breeding sows. Young, growing pigs, whether intended for breeding purposes or for fattening for the butcher, should never be left entirely to chance food that they can pick up. Let them have the run of the yards in winter, and pick up all the food they can find, but never suffer them to depend on this alone, unless there is abundant evidence that they can find all they need. Farmers should have a pair of platform scales and weigh their pigs occasionally, and they would then ascertain whether their pigs were receiving good treatment and a proper amount of food. We have just weighed some, at four months old, that averaged 80 pounds each. They ought to be so fed through the winter as to gain 25 pounds a month, and, as they get older, and the weather gets warmer, they should gain a pound a day; and when the summer comes, with milk and clover, and a little corn-meal, they should gain $1\frac{1}{2}$ pounds a day; and for the last month or six weeks before killing, they should gain nearly 2 pounds a day. We *know* that this can be done, and we also feel certain that, at the present price of pork and grain, no branch of farming affords a greater profit than liberal feeding of well-bred pigs.

Next to liberal feeding, a dry, warm pen is of the greatest importance. Better have a good pen, so constructed that neither wind, nor rain, nor snow can enter; but, in the absence of such a pen, the farmer is inexcusable who does not contrive some plan for keeping his pigs warm and comfortable. If made of boards, a few laths can be used as battens to stop up the cracks. We have seen pigs shivering in a pen close to a heap of stable litter, where half an hour's labor with a fork would have made the pen comfortable. No matter how the snow and wind are kept out. Anything that will stop up the cracks will answer. With litter or corn-stalks a rail pen may easily be made comfortable.

We repeat—feed the young pigs well this winter, keep them growing rapidly in spring, and then, next summer or autumn, you can avail yourselves of the unusual demand there will probably be for good pork. Neglect the pigs this winter, and the probabilities are that your pigs will not be ready to kill before the price has declined. Recollect that, in any case, whether prices decline or not, liberal feeding is more profitable than a starvation diet for six months, and afterwards a surfeit of corn.

"CAN THE UNITED STATES RAISE ITS OWN WOOL?"—Why not? Have we not land enough; have we not sufficient range of soil and climate? If we can compete with other nations in raising wheat and corn, beef, pork and cheese, why cannot we raise wool enough for home consumption? It requires less labor to raise wool, in proportion to its value, than any other farm product. Peter Henderson cannot afford to raise wheat on his land, but it would be absurd for him to assert, that wheat cannot be raised with profit in the United States. There are farmers on high priced land that cannot afford to keep sheep for wool alone, but they should not assert that it cannot be raised in the United States.

DO PIGS PAY?—A correspondent in N. J. writes: "I have just footed up the proceeds of one brood sow, kept during the past year, and find I have received $406.54, and have the sow still on hand. The pigs were kept and fed in an ordinary manner during the summer on milk, and aside from the poor corn, not more than 100 bushels of ears of good corn were fed." The pigs were sold at from 5 to 11 months old.

Maple Sugar Making.

BY W. T. CHAMBERLAIN, HUDSON, O.

During the last twenty-five years many improvements have been made in the apparatus for, and methods of, making maple sugar. I give those now in use by the best sugar-makers of Northern Ohio.

THE BUCKETS are made of the best "IX" tin. They are straight, (not flaring) and are of three sizes—three buckets fitting together and forming a "nest." The nest occupies only the space of the largest bucket, thus securing convenience in handling, and economy in storing. The three sizes, too, permit the size of the bucket to be adapted to the flowing capacity of the tree. The dimensions are—Largest, circumference 34 inches; depth, 9 in.; capacity, 15 quarts. Medium, circumference $32\frac{1}{2}$ in.; depth, 9 in.; capacity, $13\frac{1}{2}$ quarts. Smallest, circumference 30 in.; depth, 9 inches, capacity, 11 quarts.

Three buckets require eight sheets of 10×14 inch, and two sheets of 10×10-inch tin. The sides of each bucket require two 10×14 sheets and a *piece*. The piece in the largest is $7\frac{1}{2}$ inches wide, and in the medium 6 inches. Both these pieces are made of the seventh sheet of 10×14 tin. The bottoms of these buckets are made of the two 10×10 sheets. The *piece* in the smallest size is $3\frac{1}{2}$ inches wide, and this, with the bottom, is made of the eight sheet of 10×14 tin. Figure 1 shows the smallest of the three buckets; in the other two the piece is much wider. Just below the wire rim an inch hole is punched, so as to hang the bucket on the "spile." The hole is in the middle of the piece above mentioned, as in fig. 1, as the seams strengthen the bucket, and prevent its bending when it hangs full of sap. Such buckets cost now about $40 per hundred. The buckets should be painted outside with yellow ochre, or other durable paint, to protect them from rust. The sap does not rust the inside. The buckets will last thirty years or more. Tin is better than wood, as it is more easily kept clean, does not sour the sap so much, and does not shrink, get leaky, and require hoop-driving every spring, when one is in haste to be tapping. It is also more easily handled, and stored. It is better than earthen-ware, which is heavy to handle, and cracks when the sap freezes.

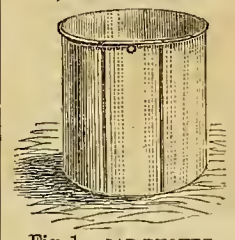

Fig. 1.—SAP BUCKET.

Fig. 2.—SPILE.

Hanging the bucket on the tree is preferable to setting it on the ground. It saves hunting for a block or stone; the bucket is more conveniently emptied, as will be seen hereafter; the wind cannot blow the sap away as it drops, nor blow the bucket away; and, what is of most importance, *the bucket can be covered.*

THE SPILES, fig. 2, are made of beech or maple, turned and bored by machinery. They are better than elder with the pith punched out, because they are not so liable to sour, and are stronger and more durable. They should be $\frac{7}{8}$ of an inch in diameter, 3 or 4 inches long, tapering for an inch of the length, and only $\frac{5}{8}$ of an inch where they enter the tree. Each should have three notches turned around it, about an inch apart, to keep the bucket from sliding off. There should be three notches, so that the bucket may be hung in one or the other of them, and be level, whatever way the tree may lean. The spiles cost about $1.25 per hundred.

The Covers.—The buckets should *always be covered.* This is the greatest single improvement yet made. It keeps out rain, snow, dirt, insects, and prevents the effects of heat and cold. The sap is not so liable to sour during the warm days, nor to freeze in cold nights. Keeping out the rain, however, is the chief thing. Sometimes in a sugar season, four or five inches of water fall, as snow or rain. This, in a "camp" of five hundred trees, would make about twenty-five barrels of water to be boiled away. Nor is the useless labor and expense of boiling this water all. The rain trickles down the trees, carrying with it coloring matter and dirt. Syrup or sugar of the first quality can never be made from sap and rain-water. The covers are made of $^3|_4$-inch lumber, 1 foot wide, and planed on one side.

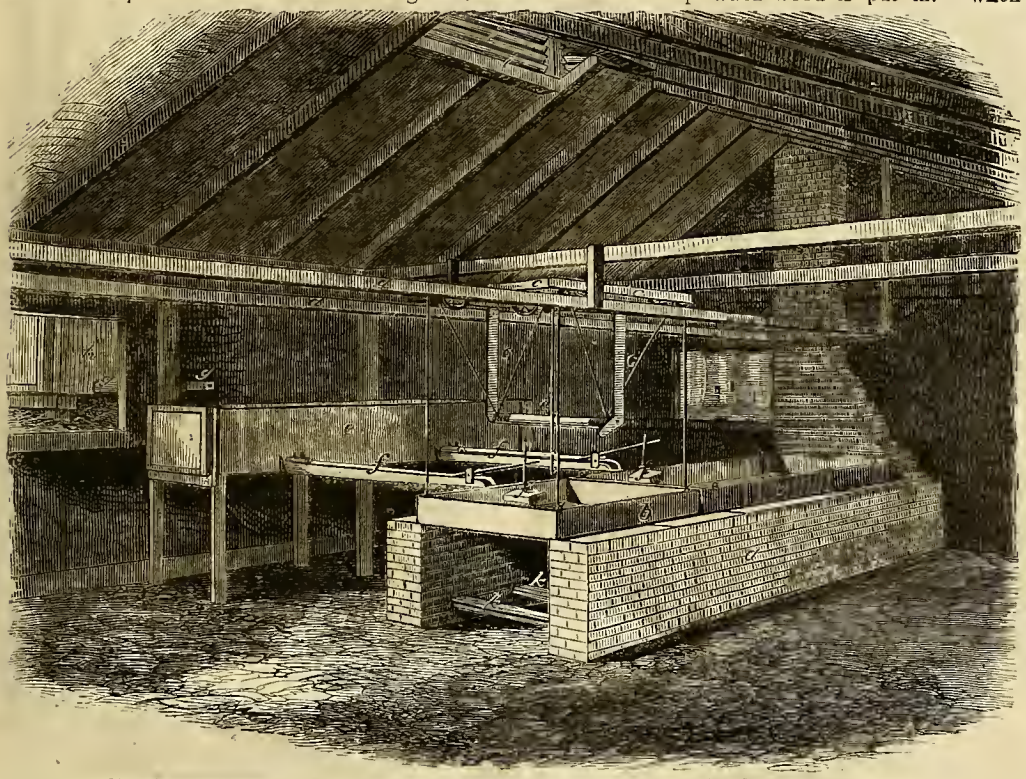

Fig. 3.—Interior of Sugar House, with Arch and Boilers.—(*Scale 8 feet to 1 inch.*)

A, Arch; b, b, Boilers or Pans; c, c, Car, hooked to front pan, ready to lift it; d, d, Track; e, Store-trough; f, f, Conductors, with Self-feeding Attachment; g, g, Conductor from outer Store-trough; h, Outside Store-trough; i, i, Ventilator; k, k, Iron Supports for the wood, best made of rail-road iron, set three feet apart.

The Arch and the Boilers (fig. 3).—Select a dry, level spot, near the center of the sugar orchard or "camp," and, if possible, just at the foot of a small hill, that slopes at least three feet in twenty. Dig below the frost, and lay a good foundation of stone. On this build an "arch" of hard burnt brick, laid in lime-mortar. The wall should be 12 or 16 inches thick as far back as the wood reaches, beyond this then 4 inches less will do. An arch of good brick and mortar, on a good stone foundation, with walls 16 inches thick, will last fifteen years with occasional repairs about the mouth. But if the bricks are laid in mud for mortar, or if the arch is not built upon the rock, it must be rebuilt each year. The wall should be 2 feet high, and, for five hundred trees, 15 feet long. Beyond the point where the wood reaches (five feet from the mouth), the arch should be filled in with dry earth to within five inches of the top. This throws the flame and heat all close to the back pan, as it passes it, and makes this boil about as fast as the front one. The arch has a sheet-iron door (not shown in the engraving, fig. 3), which is closed except when wood is put in.

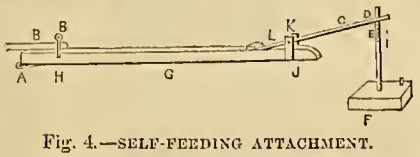

Fig. 4.—Self-feeding Attachment.

The Pans (boilers) are made of heavy Juniata sheet-iron, and are 7 inches deep, $3^1|_2$ feet wide, and usually from 6 to 8 feet long. Two sheets are riveted together lengthwise, and the corners are cut, lapped, and riveted. The edge is strengthened by a thick band of strap-iron, and four strong wire handles are attached near the corners (see *b*, fig. 3). Directly above the pans, and parallel with them, runs the track (*d*, in fig. 3), and on this is the car (*c*, fig. 3), arranged with crank, windlass, ropes and pulleys, to lift the pan from the arch a few inches, and roll it towards the front, away from over the fire, when you wish to take off syrup. Those who would avoid the expense of the car, divide the large front pan into two small ones, the front one $3^1|_2 \times 3$ feet. Then they dip out, with a flat-edged dipper, all the syrup but a pailful, when the pan is easily lifted off by two men, and the syrup poured from one corner. These broad, shallow pans evaporate the sap fully twice as fast as the old kettles used to do, even when they were set in an arch. Kettles belong to the days of wooden plows. Some maple sugar makers use the patent sorghum evaporators instead of pans; but the ordinary pan here described answers perfectly well, and only costs one-third as much, or about $10 for an 8-foot pan.

The Floats and Faucets.—Quite a convenience is the "self-feeder" *f f*, fig. 3, which is shown upon a larger scale in fig. 4. It consists of an ordinary wooden conducting trough (*G*, fig. 4), attached to the store-trough at *A* by a hinge. The sap enters, through the faucet *B*, at the point *H*; *F* is a tin float, resting in the sap or syrup in the pan; *C* is a lever, having the fulcrum at *L*, the weight at *H*, and the power at *D*. This lever and the conductor together form a compound lever, so proportioned that when *D* rises or falls an inch, *H* rises or falls *half an inch.* *I* is a perpendicular (vertical) bar from the float *F*; at *E* are holes for the horizontal pin at *D*, joining it to the lever *C*. When the pin is in the upper hole, there cannot be more, nor much less, than an inch of sap in the boiler. At the second hole there will be about two inches, and so on. The flow of sap is regulated thus: When the pan is empty, the float rests on the bottom of the pan; the bottom of the faucet, near *H*, is half an inch from the conductor, at *H*, and the sap flows freely. As the sap in the pan rises, the float rises with it, and gradually lifts the conductor until the point *H*, presses against the bottom of the faucet and stops the flow of sap. As the sap in the pan boils away, the float sinks, and the sap flows again. The chief advantage of the self-feeder is that you can build a large fire and leave it with safety as long as necessary. The sap or syrup can never burn, and the sap can never overflow the pans. Those who have not the self-feeder, when leaving a large fire, must either fill the pans, or leave the faucets turned so that the sap will flow into each pan about as fast as it will boil away. In the former case, if they are gone too long, their sap will boil to candy, or burn. In the latter case, the sap will overflow. A self-feeder costs about $2.

The Store-troughs (*e*, in fig. 3), are made of long, wide, clear, well-seasoned 2-inch plank—pine or white-wood (poplar), rabbeted and spiked together, and bolted horizontally at top and bottom with six bolts, (two at top, and four at bottom) having nuts to loosen or tighten, as the bottom and ends swell or shrink. Three coats of paint are needed. At least five barrels of storage are required for each hundred trees. The larger trough or troughs should be outside, as it keeps the bulk of the sap coolest. From the outer trough or troughs the sap flows through a wooden or tin conductor to the inner trough. The sap is gathered in barrels, rolled up nearly horizontal skids from the stone-boat sled, and emptied through the bung-hole into the outer trough. The arrangement of skids, troughs, conductors, etc., is best seen in the picture engraving of the camp on the next page.

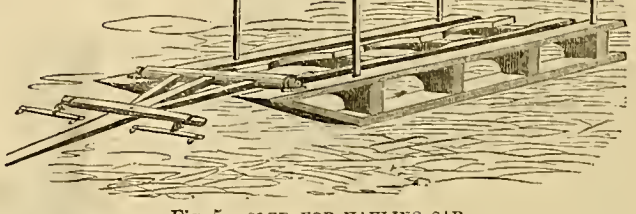

Fig. 5.—Sled for Hauling Sap.

The Wood-shed and Wood.—It saves half the time of boiling to have the wood prepared and housed during the dry weather of the previous September or October. With green or wet wood you may succeed, with a good 15-foot arch, in evaporating a barrel to the hour. But with good dry wood, and far less labor, you can evaporate more than two barrels to the

[COPYRIGHT SECURED.]

A MAPLE SUGAR CAMP.—*Drawn and Engraved for the American Agriculturist.*

hour. It is always best, and sometimes very important, to have the sap boiled rapidly. Once my seven hundred trees yielded seventy-five barrels in twenty-four hours. My wood was not the best; Sunday stopped our boiling, and Monday I had twenty-five barrels of sour sap, which would only make a second-class syrup.

It is best to have three forty-gallon casks for gathering sap, and two twenty-gallon casks for syrup. It is also best to have a stone-boat for drawing the casks in gathering sap. It is shown in fig. 5, and is made much like an ordinary wood-shod farm sled, only the runners and shoes are eight inches wide. It has two boards running parallel with the raves, fitted for holding the casks. There will also be needed a four-gallon funnel, large at the top, and made to fit the barrel, and not shake about; also two or three cone-shaped strainers, made of rather loose white muslin, and held open at the mouth by a hoop or strong wire, one foot in diameter; also two yards of loose muslin to tack tightly across the vats. Other small articles will be needed, such as skimmer (perforated tin, made square, so as to fit the corners of the pans), a dipper with a flat edge, large tongs and shovel, pails for gathering, a lantern, etc. When these things are prepared, you are ready for

TAPPING.—When a decided sugar-day comes, which is indicated by the appearance of a general thaw, late in February, or any time in March, it is time to be busy. Let one man load up two hundred buckets and two hundred covers at a time, in a large wagon or sled-box, and start out for distributing. He should be careful to leave the large buckets at the thriftiest trees. This is one advantage of having buckets of three sizes. Take your half-inch bit, set in a good bit-stock, select a sound side of the tree, where there are no old holes yet unhealed, and bore about two feet from the ground, or as low as you can without having the curve of the roots interfere with the hanging of the bucket. Bore about two inches deep, drive your spile firmly, hang your bucket so that the top of the outer edge shall be on a level with the bottom of the spile hole. This requires some care, but if the spiles are notched as directed, there is no difficulty. If the tree stands plumb, use the middle notch (see fig. 2); if it leans towards you, use the inside notch; if from you, use the outside one. Figure 6 shows both buckets hung right, and fig. 7 shows both buckets hung in the wrong notch. If you have more buckets than trees, you can put two buckets to each large, thrifty tree.

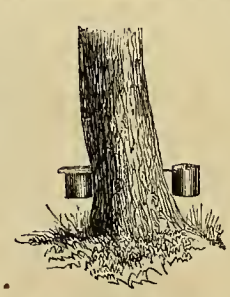

Fig. 6.—HUNG RIGHT.

Fig. 7.—HUNG WRONG.

See that the spile is driven firmly, put the cover on, and go to the next tree. Tapping requires judgment and care. A heedless hand will bore holes in a poor place, and hang half the buckets so that they will waste sap. A good hand will tap thirty trees to the hour where the trees stand thick. Two men, one boring, and the other driving, hanging and covering, will do more than twice as much as one. You must be wide-awake now, for if it is a good day, the trees first tapped will need gathering by the time you have tapped five hundred trees.

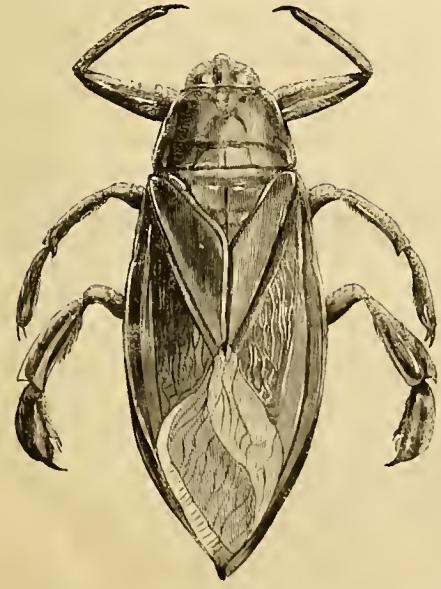
The Mexican Cobæa.—Variegation.

The Mexican Cobæa is a rapidly growing climber, soon covering a trellis or lattice-work with handsome foliage, and later in the season producing large bell-shaped flowers. It is interesting and attractive, and, though a quite old plant, is not very common in gardens, probably from the difficulty of starting it from the seed. It is properly a green-house perennial, but if it is started early enough, it will bloom the first season. Those who sow the seeds in the open ground, at the North, at least, will generally fail, or, if they do succeed in raising plants, they will be too late to bloom, unless in an unusually prolonged season. Those who wish to start the Cobæa from seeds, can do so in a hot-bed, or in a sunny window. The seeds, which are large and flat, should be thrust into the soil edgewise; the plants are to be put out in a rich place when frost is no longer to be feared. It being a perennial, the florists usually keep plants grown from cuttings. The readiest way to obtain it is to procure well-established plants from a green-house. The flowers, which are two inches or more long, appear late in summer, are at first green, and gradually change to a deep violet or purple, and last for a number of days. The large leafy calyx, and the long stamens, bent to one side of the flower, give it a striking air. In these days of variegated leaves, we are prepared to see any old floral friend wearing a "motley coat," and we were not altogether surprised when Mr. Peter Henderson pointed out to us a Cobæa which had taken a fashionable freak, and appeared in dappled leaves. Should the Variegated Cobæa appear as well out of doors as it does in the green-house, it will prove a very acceptable novelty, as its leaf markings are very well defined. The species generally in cultivation is *Cobæa scandens*, a native of Mexico. The genus was named in honor of one Cobo, a Spanish priest.

THE VARIEGATED MEXICAN COBÆA.

The Gigantic Water-bug.

The large Water-bug must have been unusually abundant last summer, as several have been

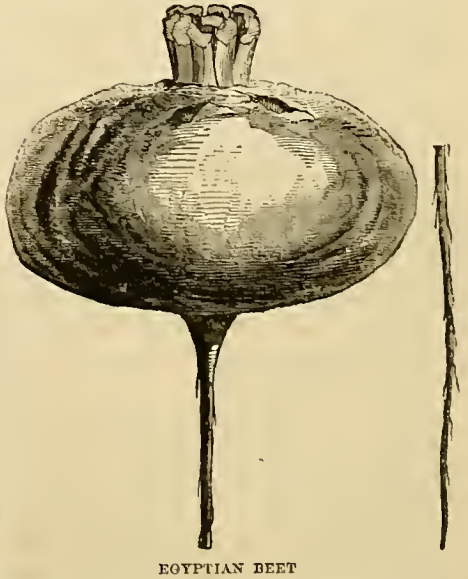


GIGANTIC WATER BUG.

sent us from different parts of the country. Mr. T. C. Grooms, Green Castle, Ind., from whose specimen the engraving was made, thus describes their appearance, in large numbers at his place: "About the middle of August, during a storm, after a rain ceased, large quantities of these bugs were found on the ground. My attention was called to them by the chickens and turkeys making a noise. A neighbor of mine who has a tan-yard, found thousands of them in the yard. The water in the vats was covered with them. By noon the next day after they came, they were all dead."——This Water-bug (*Belostoma grandis*) belongs to the sub-order Hemiptera, which includes the true bugs, plant-lice, fleas, locusts, and other disagreeable insects. There are several allied genera, which, like this, inhabit the water. Most of them swim on their backs, and their legs are admirably adapted for this kind of locomotion. They have a sharp sucker or proboscis, through which they take their food, and which, when not in use, is folded up under the chest. This insect lives on other insects, and is said to be very destructive to young fish; a friend informs us that he has been several times sharply wounded by this water-bug while wading.

The Egyptian Beet.

In beets, deep color and sweetness seem to go together, but it is difficult to associate these two qualities with extreme earliness. The Bassano is a very early variety, but it is not of as fine quality as the Blood Turnip, which is a week or ten days later. Besides earliness and good qualities for the table, a handsome shape, small top, and slender tap-root are desirable. Some think that perfection has been reached in Dewing's Early; others consider Hatch's the best of the early beets, and this year the Egyptian puts in a claim for superiority. The seed was introduced last year by a German seedsman who states that the variety came from Egypt. It is said that the leaves are distinct in character and are very ornamental, as is the plant when the roots are set out the second year for seed. It must be recollected that beets are used in Europe in ornamental planting for the sake of the effects of color produced by their foliage. We have not seen the leaves, but the roots as raised by B. K. Bliss & Son, were of fine shape, and were within of an intensely red color. We give an engraving showing the form.



EGYPTIAN BEET

An Experiment with 25 Varieties of Tomatoes.

BY PETER HENDERSON, BERGEN CITY, N. J.

Last spring we gathered together all the varieties of Tomatoes that could be obtained, with the view of testing their respective merits. By sowing time, we found we had upwards of two dozen varieties, or at least that number of papers, with different names attached. These were carefully sown under glass on March 20th, in a temperature averaging 70°. In three weeks the plants were an inch high, when they were transplanted, at about the distance of an inch apart, into boxes containing three inches depth of soil. Remaining in these boxes for three or four weeks longer, they were again transplanted into cold-frames, this time, six inches apart, and grown carefully by attention to ventilation and watering, until it was safe to plant in the open ground, which, in this district, is the latter part of May. All were planted on the same day, May 26th, and tied up carefully as they grew to stakes placed three feet apart. On the 6th of August they gave the following results, which satisfy us that the difference in earliness of the varieties of different tomatoes can never exceed ten days, even if the very earliest and latest are taken to test. For example, we find that in 8 varieties, all claiming to be earlier than the earliest, 12 lbs. of fruit taken from each did not vary 48 hours in the ripening, though in some cases a single fruit might be a week in advance of the others, as in the case of Keyes' Prolific, but its main crop in weight was rather behind, hence, for market purposes, could not be claimed as early. Our

notes of the varieties, taken on the 6th day of August, are as follows:

BOSTON MARKET.—Scarlet-crimson; large, rather rough, early; foliage drooping, defective.

EARLY YORK.—Evidently the same, or so near it, as not to be distinguished.

LYMAN'S MAMMOTH.—Color, salmon shade of crimson; second early; large, smooth, and productive; differing slightly from the Fegee.

GENERAL GRANT.—Color, scarlet-crimson; smooth, solid, and of medium size, with strong, healthy foliage, which will adapt it for light soils; an excellent variety in all respects; early.

THE COOKS' FAVORITE.—Color, deep red; size, medium, solid and productive; second early.

ROSE.—A European variety, of a pinkish-salmon color, of immense size, some of the fruit weighing 23 oz., but it is ill-shapen, wrinkled, and late, and can only be useful for catsup.

BUCK'S LARGE RED.—A Southern variety, similar to the above, except in color, which is of the usual crimson-scarlet shade.

SIDELL'S NO. 2.—The darkest shade of scarlet we have yet seen in any tomato; also very solid, smooth, and productive; a desirable variety for private use, but too late for market.

NEW YORK MARKET.—Light scarlet-crimson; large, rather rough, but prolific and early.

SIDELL'S MAMMOTH, BOSTON PRIZE, AND MAUPAY'S SUPERIOR, are so like the New York Market, that it is useless to make distinction.

KEYES' PROLIFIC.—Showed the first ripe fruit, but is too small for a market sort.

DWARF PROLIFIC.—A distinct variety of dwarf, strong, upright growth, somewhat resembling the Tree Tomato, but more productive; fruit, medium size; color, rich scarlet, solid, and early; desirable for private use on grounds of limited area, as it can be grown one-half closer than most varieties.

YELLOW PERFECTED.—A large, smooth variety, of a golden-yellow color; desirable in every respect. The yellow varieties, however, do not sell freely in our New York markets.

GOLDEN STRIPED.—This variety is speckled with yellow on a crimson ground, like the "Crimson Cluster;" late and quite rough.

FEGEE IMPROVED.—The improvement is in the greater smoothness of the fruit; but this, like all other varieties not having the crimson-scarlet shade of color, is not desirable as a market fruit; the color is a salmon-violet shade.

VALENCIA CLUSTER.—A sour, rough variety, in no respect worthy of cultivation.

CRIMSON CLUSTER.—This is one of the earliest kinds; of medium size, smooth, and solid; the fruit is borne in large clusters, averaging a dozen or so in each, having the very desirable quality of ripening nearly the whole cluster at once; as an early fruit it is very desirable for market; though, when the market is well supplied, its color might be objectionable, as its crimson-scarlet color is speckled with yellow.

SIMMS' CLUSTER.—Color, crimson-scarlet; smooth, and solid; rather late.

KING OF TOMATOES.—One of the earliest; medium size; smooth, of a rich crimson-scarlet shade; in all respects desirable.

CHARLTON'S EARLY.—Almost identical with the above.

CEDAR HILL.—Very early; medium size; immense bearer, but on heavy soils rather rough.

EARLY YORK.—Early; medium size, smooth, and prolific; hardly solid enough for general use.

BOSTON MARKET.—Evidently the same.

TILDEN.—Crimson-scarlet; smooth; very prolific, but late.

ALGIERS.—A large, late, strong-growing kind, of no special merit.

MICHIGAN No. 1.—A very dark crimson variety; smooth, solid, early, medium size.

RISING SUN.—A large-sized, smooth, solid variety, wonderfully productive, which ripened fruit next to "Keyes' Prolific," a heavier weight of ripe fruit being taken from it on the day of testing than from any other sort. Selecting the four best varieties from the whole, we would place this variety as *first*, "Gen. Grant" as *second*, "Crimson Cluster" as *third*, and "King of Tomatoes" as *fourth*.

These conclusions are arrived at from this experiment, made on our heavy loamy soil of Bergen City, in Hudson Co., N. J.; possibly other varieties might be preferred in different soils or in different latitudes.

In my opinion, the extreme point of earliness in tomatoes has been reached years ago, and now all further improvements must be in point of size, smoothness, and solidity; and that any one laying claim to having varieties a specified number of days or weeks earlier than those we already have, does so without having a knowledge of the subject, or with the desire to impose on the public. The tomato is a plant requiring at all times a certain high temperature to ripen its fruit; and though it may ripen in Georgia in May, in Virginia in June, in Delaware in July, or in New Jersey in August, it requires the same aggregate amount of heat to do the work. The same is true of most fruits and vegetables; we reach a certain point of earliness with a given variety in a given locality, when the temperature tells us we must stop. If improvement in earliness was progressive, we might have reason to expect that the Radish or Lettuce, which matures with us in the open ground here in May, would yet mature in April.

Hedges, or live Fences for the West.

BY OUR SPECIAL IOWA CONTRIBUTOR.

That we upon the timberless prairies must *grow* our fences where we want them, is in my mind a fixed fact. This being settled, the questions arises, *what* shall we use? and *how* manage and cultivate?

The Osage Orange without doubt, stands at the head of hedge plants for this latitude. The idea was formerly entertained that it would not succeed. As an evidence of its success under proper treatment, it may be noticed that our farmers are almost universally putting out more and more of it each succeeding year. Thousands fail *simply because* the conditions of success are not complied with.

Good plants, a thorough preparation of the soil, including drainage, proper setting, cultivation, and future management, are indispensable. It is safe to say that one-third of the plants as they come from the nursery, are unfit to be used. If they have vitality enough to survive the removal, they only drag out a sickly existence, and are finally crowded out by the more vigorous plants and leave the hedge full of gaps, thus ruining its utility and beauty. At the present low price of the plants (about $1 per thousand) it is economy to use none but first class. If others are set at all, they should be carefully assorted, and the first and second class set by themselves.

The next step towards success is the right preparation of the soil. Many in their haste to reach results fail just here. They are impatient to get a start, and do not properly prepare their ground. Sod *may* be prepared to plant the following spring, by breaking in June, two inches deep, and in September plowing deeply, throwing the furrows each way, leaving as deep a ditch as possible on the line of the hedge. This gives the frosts and rains a chance to operate upon the subsoil. In the spring throw the furrows back, not only filling the ditch, but raising a bed above the natural level—more or less as the ground is flat or rolling. If quite flat, a bed 6 feet wide, and 15 inches above the level, is none too high; for bear in mind that the Osage cannot endure wet feet. Having thus prepared the bed, take a small stirring plow and open a furrow for plants. Let a hand follow with the plants in a bucket, keeping the roots covered with *thin mud*, and set them up against the perpendicular side of the furrow, six inches apart, if for an upright hedge—or twelve inches if it is to be slashed. Another hand should follow with a hoe, and draw the earth into the furrow, covering the plants a little deeper than they stood in the nursery.

I like the plan of taking up the plants in the fall, keeping them in some well-protected place till they start in the spring, so that the lifeless ones may be *known*, and rejected. If this is not done the earlier they are set after that the frost is out of the ground, the better. The roots are easily injured and should be handled with care, and kept well moistened. If the hedge plants are bought at a nursery, they will have been trimmed before sending out. If one raises his own plants, he should cut back the top to about 4 inches, leaving the root about 8 inches long.

The plants being in the hedge row, cultivation must follow, and the more the better. Never set a hedge so close to a fence, that it cannot be well cultivated on both sides. A sulky plow may be profitably used for close cultivation, if carefully manipulated; a double shovel for more distant. Mulching is good but thorough cultivation better; but mulching is better than poor cultivation. Protection the first winter in this and more northern latitudes, is absolutely necessary. For this purpose refuse straw or coarse manure are useful. This mulching makes a good substitute for cultivation the second year if properly done, and will in a great measure keep down the weeds, and retain moisture. If the hedge is to be "slashed" (or plashed), no trimming will be necessary; otherwise in August cut off half of this (second) year's growth. Slashing is done the third year in May or June, by cutting each plant half through near the ground, the nearer the better, and laying over one upon another nearly horizontally, leaving one plant uncut and upright as a stake or stay, once in about ten feet. There is a difference of opinion upon the question of slashing, some holding that it injures the vitality of the hedge; but it is very evident that a more impenetrable hedge can be made in this way than in any other. The plan has also the advantage of requiring fewer plants and in consequence a more rapid growth can be obtained, than when closely set. A word for the white or gray Willow as a hedge plant. For sloughs and other places too wet for the Osage, the willow is admirably adapted. Use the willow stakes 5 feet long, drive them down one foot, 8 or 10 inches asunder, and in three years time they will form a barrier against stock. The more usual way of using the willow, though not so good, is to plant cuttings 6 inches long, which are forced into the ground at an angle of about 25 degrees, leaving only one bud

above the surface, and that on the upper side of the cutting; thus securing an upright growth, which is important. They should be set 8 inches apart, as they make a much larger and more rapid growth than the Osage.

The Willow may be cut in the spring, and set at any time before the leaves start, though early setting is to be recommended. It is a good plan to set two or three rows where a wind-break is desired in addition to a fence. There are other hedge plants which are regarded with more or less favor; but with the Osage and Willow we may well rest content. S.

Powesheik County, Iowa, December, 1869.

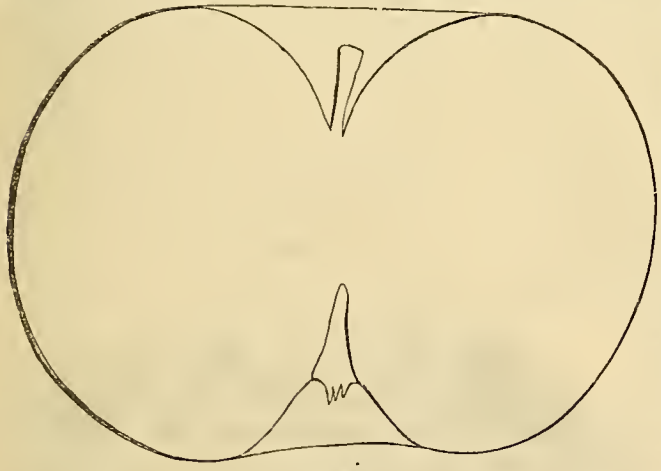
Some New or Little Known Apples.

BY CHARLES DOWNING.

[Mr. Downing has sent us notes and drawings of some apples which have come to his notice since the publication of his great work, and of others which are briefly mentioned there, but for the description of which he has better materials. We give a portion of them.—EDS.]

MONTE BELLO.—I am indebted to A. C. Hammond, of Warsaw, Ill., for specimens of this new and fine apple. Mr. H. writes me that it was raised from seed on the place of Matthew Gray, at Riverside, in Monte Bello Township, Hancock Co., Illinois. It is there considered an apple of great promise, the tree being hardy, rather upright, moderately vigorous, and healthy; an early and annual bearer, very productive, and the fruit always fair and smooth.

Fruit above medium, oblate, regular; Skin pale, yellow, shaded and mottled with light

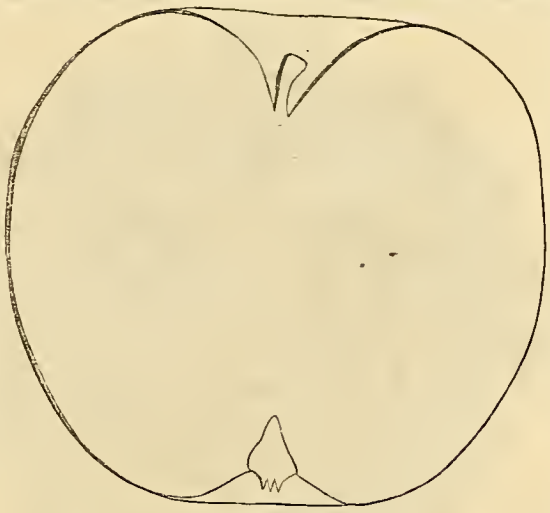


MONTE BELLO.

red, and splashed and striped with dark rich red nearly over the whole surface, and sprinkled with a few light dots; Stalk very short, and small, inserted in a broad cavity, russeted; Calyx closed, or nearly so; Segments short, erect, almost closed; Basin, medium, or rather large, deep, smooth; Flesh very white, fine grained, a little stained next the skin, very tender, juicy, mild, subacid, vinous flavor; Quality very good, or best; Core medium, or small. Ripens from September to December.

IRISH PIPPIN.—Specimens of this fine apple were sent me by Benjamin Borden, of Norristown, Montgomery Co., Pa., and "is said to have originated with Stephen A. Porter, of that town. Tree, a free and upright grower, and forming a handsome head; a very productive and showy fruit, and inclined to bear every year unless the season is unfavorable."

Fruit rather large, roundish, slightly conical; Skin whitish, shaded with light bright red and stripes, and broken splashes of dark red, sprinkled with a few light dots; Stalk very short and small, inserted in a medium cavity, sometimes a little russeted; Calyx closed, segments short; Basin small, corrugated; Flesh white,



IRISH PIPPIN.

fine grained, tender, juicy, with a pleasant, mild, subacid, vinous flavor; Quality very good; Core rather small. Ripens in October and November, and with care, will keep until April.

Window Plants and Frost.

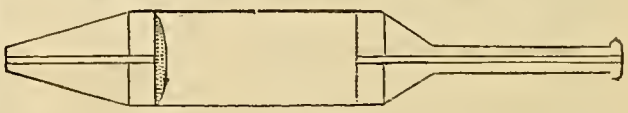
Plants in dwelling rooms are more apt to suffer from a high temperature and a dry atmosphere than from frost; yet it is sometimes the case that there is danger that the plants will freeze during excessively cold nights and precautions must be taken to prevent it. With most of the plants grown in window collections the temperature may go down at night to 35 degrees without injuring them. Moving the plants from the window to the centre of the room will often save them. If it is necessary to take the plants to another room it should not be to one that is much warmer than that in which they have been kept.

A close pantry or closet in the interior of the house is generally frost proof and will serve as a place of refuge. Another method is to make an awning or canopy of some kind over the plants. We have recommended that the table upon which they stand should be so arranged that a moveable framework could be attached to it, to hold a sheet or other covering to keep off the dust, while the room is being swept. A covering of this kind will be found useful in protecting the plants in cold nights, as it will enclose a body of air, which is one of the best nonconductors of heat. A blanket, or a thinner fabric—even newspapers, placed over the plants will often save them. Should the plants become frozen, the effect will vary on different kinds; the more succulent and tender ones are generally totally killed and are past remedy; geraniums and other half woody plants may be injured in their young growth only, and will recover after the damaged part has been cut away. Camellias, carnations and others, are half hardy and are not seriously injured by a moderate freezing. When plants are frozen, never take them to a warm room or use warm water to thaw them, neither will it answer to let them remain where the sun will shine upon them. Remove them to a cold room away from sunlight where the temperature is but little above freezing, and let them thaw out gradually.

BUFFALO CANE.—The *Arundo Donax* is a tall grass, growing some 10 or 12 feet high, and is sometimes cultivated at the North as an ornamental plant. A correspondent at Port Gibson, Miss., writes that it is there called "Buffalo Cane," and that it is successfully used on hill-sides and elsewhere to prevent the land from being washed away. Cattle are fond of the leaves. It grows wild in some parts of Texas.

The Green Fly and Red Spider.

The letters of our correspondents indicate that those plant pests, the Green Fly and Red Spider are, as usual, causing trouble among the house plants. There is not much difficulty in getting rid of them, if they are taken in time, but it is often the case that the growth of the plant is checked and its vitality impaired before the cause of the trouble is discovered. The Green Fly as it is called by florists, also known as plant louse, is an Aphis. There may be several species found in our plant collections, but as far as the cultivator is concerned, they are the same both in their effects and in the means used in destroying them. Those who have but a few window plants which they think enough of to inspect very frequently, need never be troubled with the Green Fly, as its first appearance will be noticed and the insects may be readily removed by means of a brush. A rather limber tooth brush will answer. They may also be removed by the application of an infusion of tobacco, or by the use of soap-suds in which a portion of aloes has been dissolved. Both surfaces of the leaves must be wetted by these preparations, which may be conveniently accomplished by dipping; afterwards they are washed with water. Tobacco smoke is very efficacious in destroying the insects. Florists give their collections a thorough smoking every week or twice a week, and thus prevent the insect from establishing itself. A few shavings are placed on the brick walk of the green-house, lighted, and covered with dampened tobacco stems, such as are thrown out by the cigar makers. Any other means that will cause the tobacco to burn slowly with a great deal of smoke, will answer. The smoking is done just at night, and the house kept shut up tight until morning. A modification of this plan can be practiced upon a few plants or a single one. If there is a small room



SMOKE TUBE.

which can be used for this purpose, the plants may be placed in it, and smoke made by placing a few coals in an iron vessel or large flower-pot, and putting on the tobacco. Care must be taken that the tobacco does not burst into a flame, as this would injure or destroy the plants. A single plant or two may be placed under a tight box, a barrel or any extemporized cover that

will retain the smoke. Where the enclosure is small, the smoke must be generated with the least possible heat. A common tobacco pipe may be used, or the contrivance described by Mr. Quinby for smoking bees will answer for small operations. It consists of a tin cylinder, with a perforated wooden plug at each end; one of these serves as a mouth-piece to blow through, and the other to discharge the smoke. The cylinder is to be nearly filled with smoking tobacco, by removing the mouth-piece, a small live coal dropped in, and the plug replaced. By blowing through the mouth-piece a copious stream of smoke will be driven out at the other end, and may be directed into the enclosure which contains the plant. In smoking plants in a small way we have found that an hour's exposure to the smoke answered as well as a longer time.

The Red Spider is more insidious in its attacks. It is so small as to escape any but an experienced eye, and usually the first warning of its presence is in the blackened and dead leaves of the plant. Its effects are commonly attributed to almost anything but the right cause, and more water, change of soil and other treatment are tried in the belief that something is the matter at the root when the real trouble is upon the leaves. The Red Spider is barely visible to the naked eye, but one who knows what to look for will at once detect it. If a curled or browned leaf is noticed and the underside is found covered with a minute cobwebby film, the Red Spider will be found by close observation. It is more likely to occur in hot and dry rooms than elsewhere. Abundant watering of the leaves will soon dispose of it. Plants which have firm leaves like the Camellia, can be washed with a sponge; those which would be injured by such treatment should be laid upon the side and showered by water from a watering pot with fine holes, taking care that the under surface of the leaves be thoroughly wetted. A repetition of this will in a few days, dispose of the little torment and a regular weekly bath of this kind will not only prevent its lodgment, but add to the health of the plant by removing the dust.

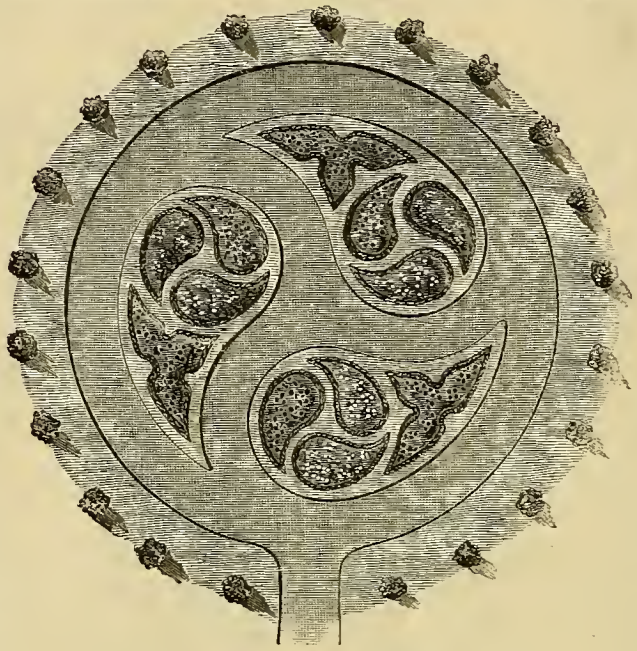


Fig. 1.—GARDEN AT THE TERMINUS OF A WALK.

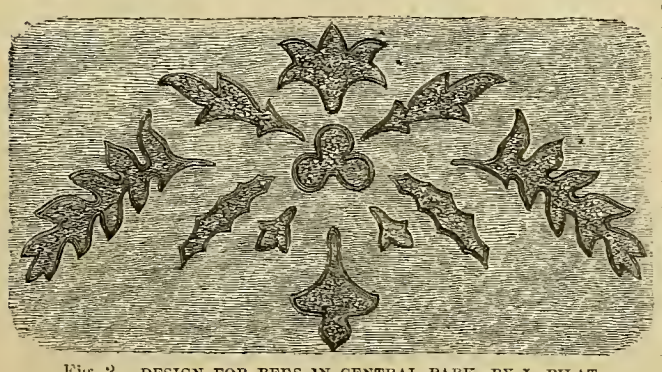

Fig. 2.—DESIGN FOR BEDS IN CENTRAL PARK, BY I. PILAT.

Laying Out a Flower Garden.

A number of letters have come to us this winter asking us to give directions and designs for laying out a flower garden, and it is gratifying to note that our friends are maturing their plans before the working season comes on. It is easy enough to give designs, but the trouble would be that no particular one would suit a half dozen of our readers, as their means and tastes vary as widely as do the shapes and sizes of the portions of land at their disposal. If one is to begin upon a new place without stint as to land or purse, he had better employ a first-class landscape gardener to both furnish the design and lay out the work. But the majority of our readers either do their gardening within the boundaries of a village lot or in the usually too restricted space of the "front yards" to farm-houses, or at best have a moderate-sized country place with an acre or less of ornamental grounds. In laying out a flower garden one has first to consider the territory at command, and then what he wishes to cultivate flowers for. If he wishes to produce effects of color, which can only be done by masses of flowers and bright leaves, where all individuality of the plants themselves is lost, he will pursue a different course from those who wish to grow flowers as flowers—objects to be loved and cared for, and developed into things of individual beauty. Such an one cares not if a plant be new or old, fashionable or unfashionable, if it please him with its own beauty, or through some cherished association. Before describing the mixed flower border, let us consider the case in which flowers are grown for their effects in masses. Plants can be employed for this purpose in two distinct methods: in beds each containing but one kind, or in beds where plants affording distinct contrasts in the colors either of their flowers or of their leaves are grown in successive bands or belts. The first is properly called bedding, and the second, belt or ribbon gardening. A large class of plants adapted to both are known as bedding plants. Where the beds are planted with distinct colors, they must be of such form that each one will hold a proper relation to the other, and the whole group of beds form a pleasing and symmetrical figure. Here are opportunities for a display of taste in designing the forms of the group, and the beds of which it is composed, as well as in the proper choice of plants with which to fill them, in order that a pleasing effect of colors may be obtained. Squares, triangles, and other figures with straight lines, are less tasteful than those with curved outlines. In fig. 1, we give a design by the late Mr. E. A. Baumann, as an example of simple work of this kind. In this design a flower garden is represented at the terminus of a walk. The circular space is graveled; within it are three pear-shaped figures in grass, within which are cut the flower beds. Beds of this kind are set in the grass, as in the above example, or they are placed with very narrow graveled walks between them, and their outlines marked with an edging of box or other material. It will be seen that the fancy may suggest a great number of forms for the beds, or the figure which they compose. Mr. I. Pilat, gardener at Central Park, N. Y., has introduced with good effect, figures suggested by leaves and the parts of flowers. In fig. 2 is given a portion of the beds in the flower garden of the Park. A single oval or other shaped bed planted with one kind of flowers only, or filled with some plant of showy foliage, such as Coleus, is often made in a lawn with excellent effect. From beds of this kind it is but a step to the ribbon style of planting, in which several colors are used. To be effective, ribbon-planted beds should be of considerable size, and the plants selected with reference to similarity of hight and correspondence in time of blooming. Planting of this kind is also used in such groups of beds as those to which we have alluded, but requires nice management to prevent confusion. Ribbon beds may stand alone by themselves, or they may be arranged with a symmetrical relation to one another, as shown in figure 3, another of Mr. Baumann's designs, in which a walk passes quite around a central oval bed, and other beds of various shapes are placed in the lawn at a little distance from the walk. Another way of planting in the ribbon style is to run a narrow bed along each side of a walk and plant it with two or three colors. It will be seen that these styles of flower gardening may be carried out in a single bed in the small lawn of a front yard, or may be extended to ornament the largest grounds. All planting of this kind has its beauty much enhanced when framed by the green of a well kept turf, and is seen to the best advantage when it can be looked upon from a higher level. An enumeration of some of the annual and other plants best suited for use in beds of the kinds we have here described, as well as notes on mixed planting, must be deferred to another month.

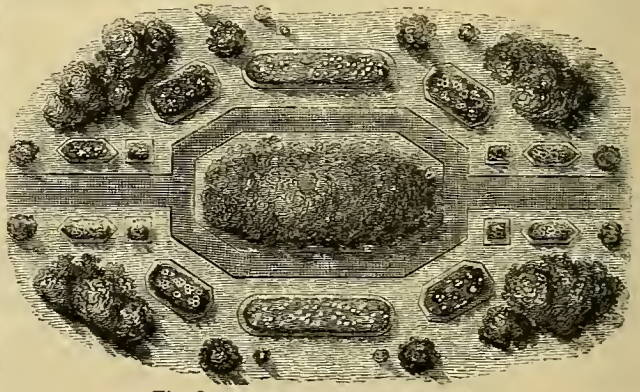

Fig. 3.—DESIGN FOR FLOWER BEDS.

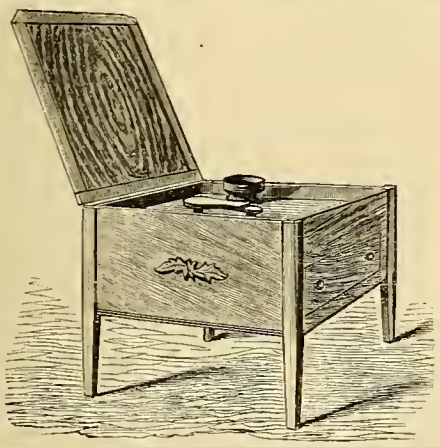
THE HOUSEHOLD.

(☞ *For other Household Items, see "Basket" pages.*)

A Shoe-blacking Stand.

Well blacked shoes are a necessity, but the operation of blacking them is irksome, and the apparatus used is a nuisance in the eyes of the house-



SHOE-BLACKING STAND.

keeper. Hence the blacking and brushes are banished to some out of the way place, to which the one who would use them must follow them. The house-furnishing stores keep neat blacking stands, made like the one shown in the engraving. They are made of black walnut, and when closed no one would suspect their use. Upon lifting the lid we find a place for the brushes, one for the blacking, and a stand upon which to rest the foot while performing the polishing. Probably the majority of our readers do not find it necessary to black the boots in the house, but a stand of this kind, even roughly made, would be found a great convenience in the shed or other place, devoted to this part of the toilet. It would keep the brushes and blacking together, and free from dust, and prove a comfort in affording a foot rest of the proper hight. A person trying to black his boots with his foot in an inconveniently elevated position, shows himself in an attitude, the awkwardness of which is as amusing to others as it is uncomfortable to himself.

Bitter Butter.

Several have written in regard to bitter butter in winter, the communications being called out by an item which appeared in the "Basket" for December. The suggestions are essentially the same in all; we give one from Miss P. E. G., Lancaster Co., Pa., in which she addresses "G. W. S.," the correspondent who complained of bitter butter.

"You keep the milk in the cellar. The *Agriculturist* says, 'keep it at 60°.' Your cellar is probably quite as low as 35° during a part of the winter. Don't the potatoes freeze a little? ours do, without much care. The *Agriculturist* says: 'Keep both milk and cream where they will not absorb kitchen or other odors, especially smoke of wood fires, or of burning grease.' Dear me! What shall we do? Some of us, perhaps, can only afford one fire, and we make a dreadful smoke when we kindle it in the morning, and we fry sausage and mush for breakfast, and we boil pork and cabbage for dinner. What, then, shall we do with our milk? Answer—Make it *sour* before it can get bitter. In our region, the milk is sometimes kept in a cupboard, in the living room, or perhaps upon a table, nicely covered with a white cloth, or on the mantelpiece. This will make much better butter for you than your bitter milk. I have sold butter, in a city, at 65 cents, the milk for which stood in the broad kitchen window (where there was not a great deal of cooking), and was lifted occasionally to the mantel to sour. Don't let one pot be bitter. An experienced farmer's wife told me that one vessel of such milk would give churning a taste.

In the case just mentioned of my own churning, the quantity of milk was so small, that I was not able always to churn in a week, if I recollect right. I will suggest another way.—Try it.—Have standing a vessel of sour milk, or buttermilk, not *bitter* sour milk. When you strain your milk, add to each pot or pan, intended for butter, a little of this sour milk—a skimmer full, perhaps. Your milk will be sour, and see what beautiful cream will rise. I have seen milk managed in this way kept in the winter in a spring-house with unglazed windows. Perhaps you will not have quite so much cream as if you keep your milk in a warm room, but try the experiment. I have further heard of setting milk pots upon the stove, and bringing the milk to a scald before setting it away. This extra heat may cause the milk to sour, and prevent that awful bitterness, of which I speak feelingly. But make your milk sour before it is bitter, unless indeed you can make all the cream rise before it is either sour or bitter. The evening before churning, if you have a coal stove, bring up your cream pot, or pots, and set them near the stove. Do not try to churn cold cream unless your time hangs heavily on your hands, or your name is Job. If you have a thermometer, you can vary your cream to 60°, or perhaps 65°, by stirring in warm water. Be careful of your thermometer, and do not plunge it into water so hot as to break it. After you have done these things, dear Illinois butter-maker, will you not give us in the *Agriculturist* the result of your effort?"

Soothing Syrup—Poisoning Made Easy.

There are mothers who use "Soothing Syrup" in perfect ignorance of its dangerous character. If it were labeled "Syrup of Morphia—Poison," as it should be, but very little of it would be sold. It ought to be very "soothing" indeed, if, as is stated in the California Medical Gazette, it contains very nearly a grain of Morphia to the ounce of syrup, and that the dose for a child three months old is equal to 10 drops of laudanum. It is ascertained that about 100,000 bottles of this stuff are sold annually in San Francisco, and it is also stated that one-third of the babies there die before they reach the age of two years. It seems to us most strange that a mother should give a child a medicine of any kind of the composition of which she was ignorant, unless she received it from the hands of a trusted physician. Years ago when certain worm lozenges were so popular that "children would cry for them," we made an analysis of them and found a good dose of calomel in each. Let secret remedies alone.

Washing Fluids Again.

Since last month's paper was made up, replies to our request for receipes for washing fluids have continued to pour in. It is, indeed, very gratifying to know that so many housekeepers are ready to assist their—what in view of washing-day we may well call—fellow-laborers. Some manufacturers of washing fluids and labor-saving soaps, have sent us samples of their goods, and some correspondents have written to recommend this or that soap or liquid. Those who have such preparations for sale can set forth their merits in the advertising columns, our object being to get some cheap and useful preparation that every one can make. Three-fourths or more of the recipes that have been sent, were the soda solution given last month, and the writers agree in assuring us that it can be used without injury, as the clothes require much less rubbing than when washed without it....Here is another which several have sent, though the proportions of the ingredients vary. Sal Soda and Borax, ¼ lb. each; Gum Camphor, 1 oz.; Alcohol, ½ pint. Dissolve the soda and borax in one gallon of boiling rain-water, pour in two gallons of cold rain-water, add the camphor first dissolved in the alcohol, stir well and bottle for use. Four tablespoonfuls of the preparation are to be mixed with a pint of soft soap, and the clothes boiled in a suds made of this. It is all the better if the clothes are soaked over night, before putting them into the suds. We do not quite see what use the camphor can be in this preparation, though a solution of camphor and alcohol will dissolve some resinous substances that alcohol alone will not dissolve.... One lady adds a tablespoonful of Saleratus to the boiler of suds, which is no improvement over the generally used sal soda....Another uses a mixture of Turpentine and Camphene, 1 pint each, and Ammonia, 4 oz. Three tablespoonfuls to a pint of soft soap, used in the first suds. Camphene, fortunately nearly out of use for burning, is only a very pure kind of spirits of turpentine, and the mixture is really only turpentine and ammonia.

Scouring Knives.—Miss H. M. S. says: Place a quantity of brick-dust on a board, and having the knife perfectly dry, press it down hard and rub it back and forth *crosswise of the blade*, when bright, turn over and scour the other side. Then wipe off with chamois leather. Knives thus treated will retain their brightness much longer, and have a *new* look after years of usage.

Household Talks.

BY AUNT HATTIE.

The fact of it is, I have not had time. Three months ago I sent Peggy away, and have not been suited with any servant since. I said something about Peggy in a previous "talk." She had lived in Ireland with her mistress for thirty years. About two years since Mr. Jackson died, and the farm had to be leased and their effects sold. The family, finding themselves quite reduced in circumstances, sought a home in this land of refuge. They tried to induce their old servant to stay in Ireland, but in vain; she determined to follow them wherever they might go. They went first to Canada, and Peggy had to work in another family for the first time in her life. The family afterwards moved to the States and left her behind. She was unhappy, and finally followed them here. Mrs. Jackson recommended her, for being faithful, excellent with young children, and possessing the rare virtue of never wanting to go out except once on Sunday. She was old, but neat in her appearance, and from her conversation, gave me the impression that she would be quite willing to learn anything, and that she lived only at my service. "Hattie," said the Doctor to me, when I had enumerated her qualifications to him, "you are fixed now, if you are wise; an old servant is what every woman with a family should have, and I hope you will not send her off for any trivial offence. Mark my word, these young girls are never to be trusted with children." I took the Doctor's advice kindly, especially as I felt confident that there was no difficulty in carrying it out to the letter. But, alas for human anticipations. Peggy had not been with me a month before I was tired of her. She could neither cook, bake, nor set a table. She could not, and I could not teach her to, do up Edward's shirts and collars, or any of the children's or my fine clothes, and I had to direct her in all she did. I tried to teach her to make bread, but she simply said she never had baked a loaf in her life, and she thought she was too old to learn now, so I had to bake the bread, pies, and cake, and help to set the table always. I had to cook beefsteaks, chops, and joints; in fact, I considered her incapable of completing anything she undertook. If she minded the baby, she did it faithfully and well—feeding him, tossing him, walking around with him—anything to amuse and keep him quiet; but the rest of the children might have been in Van Dieman's Land for any knowledge she would have been capable of imparting as to their whereabouts. In short, I found her to be the most one-thing-at-a-time person I ever saw. "Peggy," I said to her one day, "when you lived with the mistress in Ireland, what kind of work did you do?"—"Well, ma'am, Mistress Jackson had a large farm, and an illegant stone house, and it was not the likes of me that would be after sweeping her fine carpets and bedrooms, so I jest attended to

feeding the chickens and calves, and washing the dairy pans." Peggy lived with me for two months, when I heard of a situation that I thought might suit her. She went, but only stayed one week; she afterwards lived with a sister of mine, who found her the same faithful, simple-minded, quiet person, but as her work consisted of up-stairs nursery, dining-room, and kitchen, the same difficulty was experienced as with me, and she left there also. For some weeks past Peggy has been living in a large seminary for young ladies, where I fancy she finds work suited to her exactly—washing vegetables and dishes on a large scale, requiring little ingenuity, and hardly any responsibility. The Doctor speaks from experience when he says an old woman for a servant is a good thing. He has living with him now a person who, within my recollection, has always been associated in my mind as old Jane; why so, I do not know, for she does not appear like an old woman, even now; perhaps the title is given to her as significant of her stability, uprightness, and maturity of thought and judgment. She would be a treasure in any family. I might challenge the town for a better bread and pie maker, or a better cook or housekeeper. Jane would be dreadfully mortified if the Doctor should come home to dinner and find it not ready. His candle, which he needs in the evening for attending to the furnace, is always ready. The water pitcher is always full, the kitchen is always clean, the steps are always clean, and her work appears always done, so that she is ever ready and willing to do any thing extra required. Give me such a servant as the Doctor's wife has, and I should have time to do my own sewing, to visit, and to write punctually my Household Talks.

"Any soap-grease to-day, ma'am?" "No, sir; I use my own soap-grease." "Make your own soap?" "No, sir." "How do you use your own soap-grease, then?" "I make it into eggs," I said, smiling. The man looked so astonished and half frightened that I thought it time to explain. "I feed the grease and fat which is unfit for cooking to the chickens."

The baby is cutting its teeth, and is at times so cross that it is difficult to amuse him, and sometimes on this account I am half tempted to regret having sent Peggy away. Although the weather has been quite cold, I take him out every day, sometimes in his little carriage; and when snow is on the ground, I take Willie's sled and fasten a box on the back part, spread over a small Afghan, and give him a delightful little sleigh ride.

This afternoon, while out with baby, I met a German or Holland woman. A good chance to try to get a girl, I thought. "Do you live around here?"—"Yaw; yust in Brighton." "Do you know of a girl to work?"—I shouted, (you always shout when speaking to a foreigner). "Yaw, yaw, a good one; you want one good one?"—"Yes," I said, "a large girl, to do anything—take care of the baby, wash, and iron." "Oh, yaw, she good girl; she wash, she iron, she mind the baby. Oh, she good girl, yaw; she fat." "Is she German?"—"Oh, no, she no German, she Hollands. Oh, she good, she fat." "When can I see her?" I said. "Yaw; I brings her round de day after yesterday." "To-day?"—"No, no to-day; yesterday I goes to wash for Mr. Calver. I can no come, but I prings her the next morning day." "Day after to-morrow?" I shouted. "Yaw, yaw, that is it; the day after to-morrow. I prings her; she clean all up for you; she no Irish; she no German; she Hollands. Oh, she be good; she fat."

When I came into the house I found the sitting-room fire nearly out, a very few coals only alive. To have put a large quantity of coal upon so small a fire would have extinguished it at once, so with the tongs I put on gently six or seven small lumps of coal; in about ten minutes I put on a shovelful, as it was now burning nicely, and I have just put on the usual allowance of coal for a good fire. How often I have had the fire put out by the girls pouring in a large quantity of coal when it was low.

Economical Cooking—Something out of Nothing.

BY FAITH ROCHESTER.

It is a favorite axiom with my father that "You can't get something out of nothing." I have sometimes felt that my experience in household matters almost proved the contrary. Perhaps few readers of the *Agriculturist* know what it is to be *too poor to economize*. It is such poverty as compels Nellie Kay to wear an old silk dress to school this winter. The mothers of her playmates think a good calico frock would be far more suitable, considering her father's circumstances, or suggest to each other that a warm flannel dress would be better and cheaper than anything else. Alas! At Nellie's house there is not a penny to be spared for buying any sort of a new dress, and every possible old dress of her mother's has been made over for her, until there is nothing left but the old silks of better days. They are learning the sad meaning of debt and interest, and are too poor to economize.

Taking health and contentment into account, as well as money, it is the best economy, under ordinary circumstances, to use a liberal diet, consisting largely of fruit and the finer grains. I think people are more likely to eat to excess habitually, after a few scanty and unsatisfactory meals, than when there is little variety in their fare from day to day. The stomach seems to be constantly unsatisfied and takes more than a proper amount in the effort to get what it craves but cannot find. There are lean times in the cupboards of so many homes, that I purpose to reveal a few secrets once taught me by a severe old schoolmaster named Experience.

When the cow has gone dry, and the stock of butter is getting low, and the hens don't lay, and the fresh apples are nearly or quite gone, and (worse than all, perhaps,) the family purse is very, very lean—then what shall a body do? Receipt books are very unsatisfactory at such times.

Most people use lard and even pork-fat for shortening. Some of us do not. Any kind of shortening needs to be carefully used or it will become an abomination. It is not so essential an article in cooking as many imagine. Of all kinds I give the preference to sweet cream. Pie-crust made with lard is whiter, but made with cream it is more wholesome. I have heard of shortening pie-crust with beans, but have never tried it. People *can* keep alive without pies, especially if they can get

Dumplings.—Good crust for various kinds of dumplings may be made of a part of the dough when baking bread. It may be rolled out thin and wrapped around the apples, previously pared, quartered and cored, or cored without quartering, one in each crust. Leave the crust very thin under the apple (or it may be heavy), and when made let them rise a little before going into the oven. Bake slowly. Or, pare, quarter and core fresh apples, and put in the bottom of a dish with a little water (dried apple sauce is better than nothing, if fresh apples are wanting,) and cover with a crust of bread dough. It should rise a little before going into the oven, and then bake slowly. Graham mush is not a bad crust for such a pudding, and boiled rice makes a pretty cover when browned by the baking....Or bake a thin loaf of bread and split it open when done, and spread each half on the split side with canned or stewed fruit, or fresh berries in summer, placing one above the other. It is better, but not necessary, to spread the halves first with butter.

Apple Jonathan differs from the other dumplings chiefly from being made in a pot or kettle. I first made its acquaintance under the name of "Pot apple pie." Invert a plate in the bottom of the pot. Put in sliced or quartered fresh apples. Pour over them maple molasses if you have it, if not, add sugar enough to sweeten well. Add a teacup of water and nutmeg or allspice. Over this around the ridge of the pot put strips of crust, cover tightly and boil over a moderate fire. [This is what is called "Pan-dowdy," in some parts of New England.—Ed.]

Steamed Bread and Butter Pudding.—Place slices of bread and butter in the bottom of a pudding dish, a layer of sliced apples with sugar and nutmeg, another layer of bread and butter, then one of apples, sugar and spice, until the dish is full, having bread and butter at the top, buttered side down. Cook thoroughly in a steamer.

Pudding Sauce.—Cream sweetened and flavored is a favorite dressing, and maple syrup is beyond praise; but when cream is scarce and maple syrup lacking, good sauce may be made after the receipts given in the last volume of the *Agriculturist*, only plainer as one's necessities require....For bread hastily made nothing can surpass

Gems.—They are cheap, easily made, wholesome and palatable. Graham flour and water are stirred together to the consistency of a thick pancake batter, and baked in the iron or tin gem-pans. Everybody should have these bread-pans. Gems, whether of Graham meal, fine flour or corn meal, should be put into a *hot* oven. Success depends on this. Fine flour and sweet milk (skimmed milk is good enough), well beaten together, rather thicker than the Graham batter, makes a very sweet and good kind of warm bread. Corn bread of the best kind can be made without eggs or shortening, or sweetening. Simply scald the meal with boiling water, add a little salt, stir well and bake quickly in the gem-pans. We thought the Graham and white gems must have salt, until we found that its absence was not observed, and then we discarded it, as it seems an unreasonable amount of salt is eaten under the plea of a *little* salt being necessary.

Cake.—This is not one of the necessaries of life, but good cake is seldom refused. There are a few ways of making it quite cheaply and satisfactorily.

Bread Cake of every grade is good if carefully made. The regular receipt as given me by a dear old playmate, reads: "One and a half cup of dough, one cup of sugar, one-half cup of butter, two eggs, one-half teaspoonful of soda. Raisins and spice to suit the taste. Mix with the hands until the dough seems thoroughly worked in, adding a little more flour if the dough is thin. Let it rise half an hour. It rises slowly and but little before going into the oven." This is very nice. We have eaten it with a relish when minus eggs and raisins, and with only a tablespoonful of butter, and a little clove, cinnamon or nutmeg for flavor.

Bachelor's Cake is plain and good. "One and a half cup of sugar, one cup of milk, two tablespoonfuls of butter, two eggs, one teaspoonful cream of tartar, one teaspoonful of soda, three cups of flour." This makes two loaves....A queen among women, once treated me with cake made as follows: One cup of sweet milk, one cup of sugar, two cups of flour prepared with Horsford's powder. The loaf was split and the halves spread with canned strawberries, and one half laid above the other.

Plain Rice Pudding.—Half a pint of rice, one quart of milk, half a pint (or less) of sugar, nutmeg or cinnamon. Bake it slowly two hours. Tapioca may be cooked in the same way, after soaking in warm milk for an hour or two; and Sago, after thoroughly washing and soaking over night, is good in the same fashion. It is possible to dilute the milk one-half and yet have the pudding good, if care is exercised in soaking and cooking.

Soap.—It is convenient sometimes to know how to make soap quickly, when there is little grease and no leach set up. Make a white ley by boiling wood-ashes with water and pouring off the liquid after it has settled. When this ley is boiling, add all the grease (previously tried out—lard or tallow, or drippings) it will "take." Boil it together, trying frequently a little in a saucer, until you find it thickens as you stir it, and it cools. If you cannot make it "come," add a little water to a small quantity in your saucer. If that thickens it, do the same with that in the kettle. If not, try adding ley to a portion, and then to the whole, if that makes the small portion tried "come."

All the above is written for the benefit of those who know what it is to be "in a pinch." I don't envy those who have never had that experience. It quickens the wits and deepens the sympathies, but it is not a good way to live—long at a time,

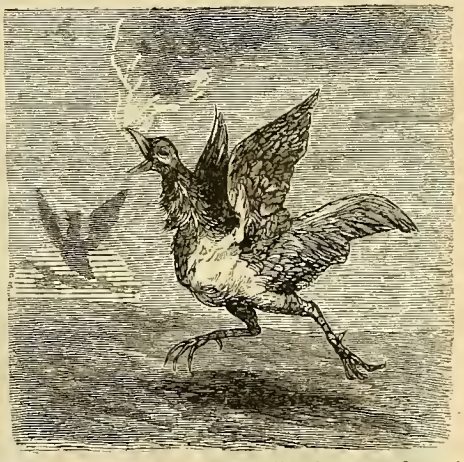
BOYS & GIRLS' COLUMNS.

Rambles in China.—Carleton's "First Story" was so interesting that, no donbt, yon all look for more accounts of the Chinese this month. Carleton has written, according to promise, and has told some funny things about the odd people, which we thought would be all the more interesting, if they were illustrated; so we keep his letter until another month, which will allow the engravers time to make the pictures.

The Doctor's Talks—About Ice.

The boys had come in from skating one cold night, and as they were warming their half-frozen feet, Walter said, "Uncle, show us an experiment."—"You and Arthur are old enough to make experiments for yourselves, and you will learn much more from them than if you merely see them done."—"But," said Arthur, "the curiously shaped glasses, and the acids, and the chemicals you keep all locked up out of our reach, and we can't make any bright lights, great explosions, and what Mother calls horrid smells—but I like them—without these,—come, let us have some beautiful experiments."—"You boys are much like many older people, who think that apparatus makes a chemist. One of our professors used to either blind or deafen the class by his bright lights and noises, or else make the room so unpleasant as to keep us all coughing. There was a great deal of display, and very little instruction. Some of the most interesting phenomena can be shown by the use of very simple means. You are too tired for experiments to-night, but we will prepare for one. In my closet is an empty stone ink-bottle. Get this, fill it with water, cork it, and set it outside on the window-sill. The stronger the bottle the better for our experiment."....

The next morning, after breakfast, the boys were told to go and bring the bottle; they soon came, with long faces. "Uncle," said Walter, "the bottle was not strong enough; the water all turned to ice, and the bottle is broken from top to bottom; why didn't we get a stronger one?"—"Had the bottle been of iron it would have broken just the same, but the experiment has succeeded. The water in freezing expanded, took up more room as ice than it did as water, and in so doing, exercised sufficient force to break a heavy stone bottle."—"Is that all?" asked the boys, who were evidently disappointed, "that is no sort of an experiment, and isn't even worth wasting the ink-bottle for."—"I thought," said Arthur, "that you were going to show us something interesting. Even if ice does take up more room than water so much the worse, as it is always bursting water pipes, and doing other mischief." Arthur is a very pleasant boy, excepting when he is in a dissatisfied mood, and then nothing is better for him than a little ridicule. "How wonderful is it to see such wisdom in youth, and what a pity, Sir Arthur the Little, could not amend the laws of nature. One of his first acts would be to direct that water should contract in freezing, and not expand, as at present. His highness does not want any more skating, or any more fishing." "Stop, Uncle," said the boy, quite over his pet, "what has the expansion of the water to do with skating and fishing?"—"A great deal; and if you are in a teachable mood, we will see. Most substances contract as they cool, and so does water until it gets down to near the freezing point (39°), when it stops contracting and begins to expand. Now, what is the effect upon the pond where you skate in winter, and fish in summer? When cold weather comes, the water at the surface cools, and, as it contracts it becomes heavier, and sinks, and the lighter and warmer water from below takes its place, and this keeps going on until all the water in the pond is cooled down to 39°. After this, the surface water, instead of growing heavier, expands, and becomes lighter, and remains at the surface, and when it becomes cold enough to freeze, it expands still more, and the ice being lighter than the water, remains at the surface, and protects the water below from freezing to any great depth." Walter, who had been attentively thinking over the matter, said—"Now, I see how it would be if Arthur had his way. If the ice were heavier than the water, it would keep on sinking as fast as it froze, and we could not skate until the whole pond was frozen solid."—"Yes, and if it did freeze solid," said Arthur, "all the perch and pickerel would be killed. I think, upon the whole, that I could not better the matter even if I had the power; and the bursting of water pipes and such things by freezing is a small matter compared with the good which comes from this expansion by water in freezing."—"There are many silent agents at work, boys, for our good, which we hardly notice, and one of these is the force exerted by the change of water into ice. When the water cask freezes and bursts the hoops, or the water in the bottle becomes solid and breaks it into fragments, then the force shows itself in such a manner as to strike the attention. But the freezing of the minutest drop exercises irresistible force, and it is by this power that the rocks are being crumbled and powdered into soil. Water finds its way into unseen crevices and pores of the rocks, and then, as it freezes, throws off small particles that make up a good part of the soil upon which the plants grow. The work is very slow, but it is continually going on."—"How much does the water expand in becoming ice?" asked Walter. "This piece is scarcely bigger than the inside of the bottle in which it froze."—"It occupies about one-eleventh more space as ice than it did as water, which is sufficient to cause it to float, but as it is so near the weight of an equal bulk of water, it only shows a small part of its thickness above the surface. Those huge masses of floating ice, called icebergs, which come from the far north, are sometimes two or three hundred feet high above the water. Even then only a small portion of the mass is visible, as only one-seventh projects above the surface. There are other curious things about ice, and snow, which is only a form of ice, but our time has expired for this morning."



No. 370. *Picture Conundrum.*—Why is the unfortunate animal in the right hand picture, like the scene shown in the picture on the left, where the rascally wreckers are enticing a ship to a dangerous shore by means of a false light?

Home Games.—Throwing Light.

"C. L. P.," Cambridge, Mass., sends the following:—This is a game adapted to any number of persons, old or young. One of the party calls to his mind a word, which is used with several different meanings, as for example, the word *Pole*, which means a long, slender piece of wood, the stem of a tree, the pole of a carriage, the May-pole, the bean-pole, a measure of lengths, one of the extremities of the earth's axis, a magnetic pole, a native of Poland, etc., etc. He then begins to *throw light* by describing the word. He says aloud, "I am thinking of something which is found in the woods; it is rather long and slim; it may be seen in the street as part of a carriage; it is an emblem of liberty." As soon as some one thinks he has guessed the word, *he* begins to throw light for his companions, saying it is the name by which some people are called, or people use it in measuring, thus adding any information he can, which the leader confirms or denies, according as it is correct or false. One after another thus guesses the word thought of, and when the story is all told, the word at last is announced, and a new one is selected. This game is entertaining, and at the same time very instructive, not only enabling one to acquire an extensive vocabulary, but also developing in young people a wonderful facility in expressing one's thoughts to advantage.

A young lady just from boarding-school wishing to borrow a friend's thimble, asked for her "Diminutive truncated argentine cone, semiperforated with symmetrical indentations." This is about equal to the definition of net-work, which is given in Johnson's Dictionary as something "reticulated and decussated with interstices between the intersections."

The Prize Poodle.

It is not easy to understand why deer, ponies, cats, and dogs, are invited to show themselves at a poultry exhibition. The N. Y. State Poultry Society gives premiums for all these, besides those for poultry, and in December last they had a great show. There was a band of music, but it had but a poor chance in opposition to the "music of nature," which made itself heard in the greatest crowing, cackling, gobbling, quacking, neighing, mewing, and barking, that I ever heard. The birds were very fine, but I thought the animals with four legs quite as interesting as those with two. You can't pet roosters and ganders, which seem to know one person as well as another, and who have no liking for anything that is not eatable. The deer will become quite friendly, the pony soon learns to know persons, cats show affection after their way, but the dogs! they seem to have more sense than all the rest. I can't say that I petted the Russian blood-hound much, he looked as if such attention would be thrown away on him, but there were a plenty of pleasant little fellows there, and it was curious to see the different expressions, with which they would regard spectators. There was one dog which at first sight looked like a sheep-skin mat rolled up. I was told that this had taken the first prize as a trained dog. It was a Spanish Poodle,

THE TRAINED POODLE "SPORT,"

[COPYRIGHT SECURED.]

THE PIONEER OF THE TRAIN.—DRAWN BY W. M. CARY.—*Engraved for the American Agriculturist.*

with long, white, silky hair, and a countenance expressive of nothing in particular. Presently his owner, Mr. R. W. Dodd, of Brooklyn, came along, and we were soon shown that this was a dog of remarkable accomplishments. Not only could he do all the common tricks "without trying," as the boys say, but had progressed as far as to spell in words of two syllables, and to do sums in simple addition. No, I don't mean "how-wow," by words of two syllables, for he does his spelling in the most quiet manner. The owner has letters of the alphabet, each one on a card; these are laid out in a semicircle, and the dog is told to spell a name—Henry for instance. He walks along with his attention fixed upon the letters until he comes to H, which he takes up and lays by itself, then he starts again to examine the letters and when E is reached he picks that up and puts it by the side of H, and so on until the whole word is spelled out. Cards containing figures instead of letters are then laid down, and the dog is asked, "How much are six times twelve,"—he selects the seven and the two, and places them side by side, and does other simple sums.

You probably think that is a remarkable dog. So I thought, and got his photograph for the engraving.... "How is it done?" Easy enough; how do you spell Constantinople, or solve the problem, 'If an apple and a half cost a cent and a half, how much will two apples cost'? If a young child can do these things why should not an old dog do things which are much easier? "You know that a dog *can't* spell and cypher."—I have told you that I have seen him do both...."But there is something you haven't explained, some trick about it,".... So there is. I am glad you like to know *how* things are done. The dog is trained to go from one letter or figure to another, and at a signal to pick up the proper one. This signal is given so adroitly and the dog's senses are so acute in heeding it, that of the thousands who have seen the dog perform, but few have discovered how it was done. Most people watch the dog, I watched the master. I noticed that he always held a hand behind him, and thinking that hand had something to do with the spelling, I watched it. As the dog came to the right letter the thumb-nail moved against one of the finger-nails and made the slightest possible *click*, loud enough for the sharp ear of the dog to hear, but not loud enough to be noticed by the spectators. So after all, it was the man, and not the dog, who spelled and cyphered, still it was wonderful to see how acute the dog was, and how well he had been trained to do his part. WILL WARREN.

The Pioneer of the Train.

To a great many of our Boys and Girls this picture will need no explanation. They have seen the trains go by, the men on horseback or walking, the children in the huge wagons with the furniture, the old women knitting, the younger ones often on foot, all moving at the slow pace of the patient oxen—where? To the West. Every year finds these trains going farther and farther west, carrying families by the hundreds, and many a little one will read this in States which were not known, by name even, when the writer studied geography. What courage have these people who take all their movables and leave older settlements to go to a new country and make a new home! What days of weary travel, what discomforts with but a wagon, or it may be a tent for a house, what deprivations of food, what sufferings when sick, these brave travelers must experience—can only be told by those who have had a part in them. Generally the guidance of the train falls to one who has had more experience in such matters than the rest. Indeed it would seem that there were some men especially made for the very purpose. The guide or pioneer has a wonderful knowledge of everything about traveling or camping. He will see further and make out an object quicker than most men. If he has been over the country before—years ago it may be—he will remember every feature, and if he travels a route for the first time, he seems to know just where to go to find the best camping places. He appears to never get tired, and never to lose courage. The artist has drawn a fine portrait of one of these hardy characters. Far in advance of the train he has gained the top of a swell in the prairie and casts a long look forward in search of signs of water. Let us hope that the indistinct line which he sees is a belt of Cotton-woods indicating water, and that soon the tired travelers and their animals will reach the long looked for camping place. In the bustle of preparing supper, and in the enjoyment of eating it, the long and tedious road they left behind them will be forgotten. So on the train moves, on, day after day, until the place is reached where the new home is to be.

NEW AND DESIRABLE FLOWERING and Ornamental Foliage Plants for 1870. General Spring Catalogue is now ready of Green-house, Hot-house, and Bedding Plants and Seeds. Catalogues sent to all who enclose stamp. Address OLM BROTHERS, Springfield, Mass.

WALTHAM WATCHES.

CARD TO BUYERS.

We are informed that some Watch Dealers are misrepresenting the quality of our watches in the interest of other watches on which a larger profit is made, we desire to call the attention of buyers to certain facts which should inspire renewed confidence in the superior qualit and unrivaled cheapness of WALTHAM WATCHES. We have an experience of sixteen years, and our advantages are the natural result of the precedence we acquired in the trade and the proportions to which our manufactory has attained, making now twice as many watches as all the other manufacturers in this country combined, and as no industrial law is better established than that which cheapens the cost of an article in proportion to the magnitude of its production, we are enabled to offer our watches at less rates, quality for quality, than any others made in this country.

The conditions which make this cheapness possible are also favorable to the excellence of our watches.

We have the best workers in every department that are available, and with machinery perfect and ample, we make by far the finest grade of watches made in this country, surpassing all other American watch manufacturers by our ability to offer buyers the largest variety from which to select any style that may be required.

Our watches have long been the leading article in their line, and are sold by nearly all respectable jewelers at a moderate profit.

With these facts as a basis the Company confidently appeal to watch buyers to insist on having their preferences for Waltham Watches respected by that small portion of the trade whose hostility to them arises from the fact that they are sold at less profit than any others.

Buyers should also be on their guard against purchasing worthless Swiss Watches, bearing colorable imitations of our trade-marks.

Not satisfied with copying our trade-marks as nearly as they dare, the Swiss manufacturers send large numbers of their refuse to this market marked "Union Watch Co.," "Massasoit Watch Co.," and "Great Western Watch Co.," and other deceptive American names. Any dealer who recommends these watches as genuine American Watches means to cheat if he can, and when represented to be as good as the genuine the object is, of course, to sell them for three or four times their real value.

Buyers who do not know responsible jewelers should send for our descriptive catalogue, which contains much useful information to watch buyers.

No watches retailed by the Company. For all other facts and information, address

ROBBINS & APPLETON, General Agents,
182 BROADWAY, New York.

HOW CROPS GROW.

A Treatise on the Chemical Composition, Structure, and Life of the Plant. With numerous illustrations and tables of analyses. By **Prof. Samuel W. Johnson**, of Yale College. Price $2.00.

This book is a guide to the knowledge of agricultural plants, their composition, their structure, and modes of development and growth; of the complex organization of plants, and the uses of the parts, the germination of seeds and the food of plants, obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture.

Another work by the same author is now in press, entitled "How Crops Feed," in which the subject of the Food of the Plant is amplified in all its details, and the atmosphere and the soil are fully discussed in their manifold relations to the Plant.

PRACTICAL FLORICULTURE.

A guide to the successful propagation and cultivation of Florists' Plants. By **Peter Henderson**, author of "Gardening for Profit." Beautifully illustrated. Price $1.50.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone.—H. A. DREER, Seedsman and Florist, Phila., Pa.

Full to overflowing with valuable information.
FRANCIS RICHARDSON, Toronto, Canada.

Thoroughly practical, yet readable as a novel.—N. Y. Sun.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.
GALVIN & GERAGHTY, Florists, Newport, R. I.

Either of the above books sent post-paid on receipt of price by

ORANGE JUDD & CO., 245 Broadway, New York.

AGRICULTURAL IMPLEMENTS

Garden and Field Rollers,

of all sizes, from $9 to $500.

R. H. ALLEN & CO.,
P. O. Box 376, New York.
189 & 191 Water St.

Norway Oat Premiums.

In accordance with arrangements now completed, in connection with the sale of this seed another year, we are enabled to announce the following grand Premiums for the best crop next year. For the best acre will be awarded a cash premium of

Five Hundred Dollars.

For the best 10 acres, a cash premium of

One Thousand Dollars.

For the best 50 acres, a cash premium of

Twenty-five Hundred Dollars.

Those competing must be prepared to give full particulars of mode of culture, &c., with affidavits, if required. These premiums will be awarded by a committee of impartial and widely-known gentlemen. All who buy seed of us this year, can compete, and some farmer or farmer's son, will certainly get them. Order at once. Price: peck, $2.50; half bushel, $4; per bushel, $7.50, by the standard of 32 lbs. Remit by Post-office Order or Draft.

SUGAR TROUGH GOURD, 25 cts. per package. They grow to average from one to two bucketfuls, and I have one that I exhibited at the Agriculturist office that holds over eleven (11) galls. Send for Catalogue. Address WALDO F. BROWN, Box 75, Oxford, Butler Co., Ohio.

New Tomatoes.

ALGER.—This new variety has the same potato-like foliage as Keyes', but the fruit is larger, of good market size, early and very productive, 15 cts. per package.

GEN. GRANT.—Remarkably solid, round, flat in shape, handsome, and of excellent quality. Received the first premium for the two past years at the Annual Exhibition of the Mass. Hort. Society, 15 cents per package.

CRIMSON CLUSTER.—Early, grows in large clusters bearing handsome fruit, oftentimes elegantly spotted with gold, 15 cents per package.

MAMMOTH CLUSTER.—Very large, round, crimson, 15 cents per package.

BOSTON MARKET.—The result of most careful selection by the Boston market-men for a series of years; large, flat, round, solid; enormously productive, 15 cts. per package.

EARLY ORANGEFIELD.—An English sort, yields its fruit in large clusters. This Tomato is of a peculiarly rich and sweet flavor, and excellent as fruit for dessert, 15 cts. per package.

Also the following excellent varieties at 10 cts. per package. Early York, Dwarf Scotch, Keyes' Early Prolific, Yellow Fig, Maupay's Superior, Cherry, Large Yellow, Feejee, Cook's Favorite, Lester's Perfected, Large Smooth Red, Tomato De Laye, Tilden, New Mexican, Strawberry, or Ground Cherry.

All of the above are of my own raising, each grown isolated, scattered over three square miles of territory. Catalogues free.
JAMES J. H. GREGORY, Marblehead, Mass.

300 BARRELS of Early Rose Potatoes for sale; all *must be sold* before the middle of March. Price—large size, $4, and second size, $3 per bbl.
CHAS. COLLINS, Moorestown, N. J.

THE STORY OF THE BIG CABBAGE that a sheep eat into and did not get out until spring, I doubt, but I have a Gourd that holds over 11 gallons. Read advertisement above.

SECURE A HOME.—The best Fruit and Garden lands for sale, in a mild and healthful climate, 30 miles from Philadelphia. Good Markets and Society. Pure soft water. Price, 30 dollars per acre, payable ¼ cash, balance in 10 years. A rare opportunity. Thousands are settling.
Address R. J. BYRNES, Hammonton, N. J.

"Cabbages, and How to Grow Them."

This is the title of a very thorough treatise that I have written, giving all the minute details so invaluable to the beginner. It treats on selecting and preparing the soil, preparing and applying the manure, the best varieties to raise, (illustrated by fine engravings), the hoeing, cultivating, and the protection of the plants from their insect enemies, how to market, and how to keep over winter, and on other subjects.—Also, my treatise on "ONIONS, WHAT KINDS TO RAISE, AND HOW TO RAISE THEM," and "SQUASHES; HOW TO GROW THEM." Either of these will be sent post-paid, to any address, for 30 cts. I intend that each of these Treatises shall be the most thorough of their kind published, and I believe the public will find them to be decidedly so.

Catalogues of my Garden and Flower Seed sent gratis to any address.
JAMES J. H. GREGORY, Marblehead, Mass.

Twenty-fourth Edition of this popular work, which has met with so much favor in the past, is now ready. It has been re-written and improved, printed with new type, and on fine paper; illustrated with a beautiful Lithograph, and many other fine engravings from nature. It contains full description and the culture of over 1,500 leading varieties of Flowers and Vegetables; also descriptive list of the novelties of the present season; to which is added a collection of 200 choice French Hybrid Gladiolus. This work, we feel confident, will compare favorably with any similar one.

From LEVI BARTLETT, Warner, N. H.

"I have received a copy of your superbly gotten-up Amateur Cultivator's Guide. I think it far ahead of anything of the kind ever before issued from the American press."

Sent to any address upon receipt of 25 cents for paper cover, and 50 cents for tastefully bound in cloth.
WASHBURN & CO., Boston, Mass.

200 Bbls. Early Rose Potatoes, Clinton, Boyden's No. 30, and other varieties of Strawberries; Clarke, and Philadelphia Raspberries. For price list address JOHN CRANE, Union, Union Co., N. J.

SEEDS! SEEDS! SEEDS!

GENERAL GRANT TOMATO.—This new variety is, I think, the *best* Tomato I have ever grown. Fruit, remarkably solid, large, smooth, handsome, and of excellent quality; 15 cents per packet.

LYMAN'S MAMMOTH CLUSTER.—Grows in large clusters like *Orangefield*, but twice the size. The color is a beautiful pinkish-red; packet 15 cents.

CRIMSON CLUSTER.—Early; grows in large clusters; crimson, elegantly striped and spotted with gold; quality excellent; 15 cents per packet. The three varieties will be sent by mail, post-paid, for 50 cents, and my NEW ILLUSTRATED CATALOGUE for 1870, which contains descriptions of 14 of the *best* Tomatoes, and all other vegetables for the garden. Also a select list of 150 choice ANNUALS for the Flower Garden. Be sure and send for a copy. Address
J. F. MENDENHALL, Carmel, Ind.

For the Flower and Vegetable Garden.

Grass Seeds, Field Seeds, Plants, Roses, Dahlias, Verbenas, Gladiolus, Grape-vines, Small Fruits, Asparagus Roots, Early Potatoes, Onion Sets, Books, Implements, &c.

Dreer's Garden Calendar for 1870; containing full descriptive lists of the above (144 pages), *beautifully illustrated with engravings*, will be mailed on receipt of a postage stamp. Address HENRY A. DREER,
714 Chestnut Street, Philadelphia, Pa.

$5.00 Select List, No. 49.

3 varieties of Strawberries, 2 of Raspberries, 1 of Blackberries, 2 of Grape-vines, 2 of Currants, 1 of Gooseberries, all for $5. Send for select lists of Small Fruits, with stamp, to
LOUIS RITZ, Plainville, Hamilton Co., Ohio.

The Sanford Corn a Success.

The experience of the past season fully confirms all that has been said in its favor. Testimonials from nearly every State endorse it as *the best field corn*. In many instances being planted in the same field, and having in all respects the same chance, it has ripened from two to three weeks earlier, and yielded double the amount of other varieties. It has taken highest premium in this (Suffolk) Co., for four successive years. Every Farmer should send for a descriptive circular giving History and Testimonials from reliable Farmers throughout the country. Prices—One Quart, by mail, post-paid, 75 cts.; Two Quarts, $1.25; One Peck, by Express, $2; One Bushel, $5. Address
S. B. FANNING, Jamesport, Long Island, N. Y.

BEAUTIFUL FLOWER SEEDS.

Nos. 41 Park Row, and 151 Nassau St., New York.

Marblehead Mammoth Cabbage!

This is the largest cabbage in the world, sometimes weighing over sixty pounds each, and averaging as high as thirty pounds by the acre! It is not only large, but cannot be surpassed for reliability for heading, tenderness, and sweetness. As some cultivators have an impression that this cabbage cannot be fully matured outside of Marblehead, I invite their attention to the following extracts from among the many commendatory letters which I have received.

"Your Marblehead Mammoth Cabbage cannot be excelled. There were heads weighing 50 lbs., and heads of Fottler's Improved Brunswick (from your seed) weighing 40 lbs.—John H. Howlett, Charlestown, Ill."

"I raised from your seed Marblehead Mammoth Cabbages that weighed 59 lbs.—A. H. Mace, Clintonville, N. Y., Nov. 14th, 1869."

"Your Marblehead Mammoth Cabbages were very fine, they all headed well, and weighed 27 to 40, and 47 lbs.—W. Llewellyn, Red Wing, Minn., March 12, 1869."

"Your Marblehead Mammoth Cabbages are wonderful; they grew to the size of an umbrella.—Thomas Flanigan, Palermo, Kansas."

"The Marblehead Mammoth Cabbages were a perfect success. They headed well, and were three times as large as any cabbage I ever raised before.—J. F. Butt, Koscinsco, Miss."

"I have raised your Marblehead Mammoth Cabbage for two years, and it has proved the tenderest and sweetest cabbage I ever saw.—S. S. Groves, Stones Prairie, Ill."

John Van Wormer, Springs' Mills, Mich., raised some weighing 30 lbs. John Humphreys, Titusville, N. Y., 33½ lbs. M. D. Clark, Elyria, Ohio, 37 lbs. H. A. Terry, Crescent City, Iowa, 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Becancour, C. W., exhibited three cabbages weighing respectively 40, 42½, and 44 lbs. John W. Dean, St. Michael's, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., 33 lbs., when trimmed. E. H. Ellis, Etna Green, Ind., over 30 lbs. A. E. Garrison, Des Moines, Iowa, 30 lbs. James S. Allen, Union Springs, N. Y., 30 lbs., when stripped of loose leaves. Wm. Lee, Jr., Denver, Colorado, has grown heads weighing 45 to 50 lbs., as a penalty for which the miners of the mountains call him the "Big Cabbage Man." Leonard Choat, Denver, Colorado, raised one which weighed 46 lbs. when trimmed of waste leaves. Collins Eaton, Ogdensburgh, N. Y., 50 lbs. P. Sweeney, Loretto, Pa., 43 lbs. Sam'l B. Ornsbee, Rolling Prairie, Wis., 53 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot weighing from 50 to 60 lbs. A. C. Van Tassal, 39 lbs. trimmed. A. C. Goodwin, Kennedy, N. Y., 45 to 50 lbs. W. H. Spera, Emphrata, Pa., raised fifty heads that averaged over 31 lbs. each. Wm. D. Munson, Burlington, Vt., raised some weighing 46 lbs. Mary B. Sellman, Galesburg, Iowa, 28 to 43 lbs. stripped of loose leaves. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest cabbage ever seen in the country." "Astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled," etc., etc. As the original introducer of the Mammoth Cabbage, I am prepared to supply seed grown from *extra large heads*, at following prices, by mail, post-paid: Per package, 25 cts.; per oz., $1; 4 ozs., $3.50; per lb., $12.

Full instructions for cultivation accompanying the seed.

Catalogues free. JAMES J. H. GREGORY,

FERRE, BATCHELDER & CO.'S ILLUSTRATED CATALOGUE of Seeds and VEGETABLE AND FLOWER GARDEN

MANUAL for 1870, will be ready for distribution early in January. It will contain about 100 pages, with numerous illustrations—a complete list of Vegetable and Flower seeds, to which will be added a list of **Summer-Flowering Bulbs, Plants and Small Fruits.** Sent to all applicants **enclosing 10** cents. Our customers supplied without charge. Address

FERRE, BATCHELDER & CO.,
231 Main St., Springfield, Mass.

To Market Gardeners.

Your business involves an immense outlay over small areas, and it is of first importance that the seed you plant should be *fully reliable*. My enterprise is of special interest to you, as I am engaged in growing, directly under my own eye, a great variety of vegetable seeds, many of which seedsmen usually import or gather together from growers scattered through the country. Because I grow these seed myself I am enabled to warrant them *fresh and true to name*, and to bind myself to refill the same value gratis, should they not prove so. All seed warranted to reach each purchaser. I also import and procure from first growers, choice varieties that cannot be grown in my locality, giving me thus one of the largest if not *the* largest variety of vegetable seed sold by any dealer in the United States. Give my seed a trial. Catalogues gratis.

JAMES J. H. GREGORY, Marblehead, Mass.

Evergreen Broom-corn.

I have the genuine. The brush is worth from $5 to $20 per acre more than the old sort. I will send enough to plant an acre *post-paid*, for $1.00, one bushel as freight, $5.00. My Catalogue describes it, and 150 varieties of seed. Early Rose potatoes, Alton Nutmeg Melon, Liberian Cane, Choice Flowers, &c., &c. Send for it. Address

WALDO F. BROWN, Box 75, Oxford, Butler Co., Ohio.

300,000 HORSE-RADISH SETS.—The best in market, at $3.00 per 1,000.

BLISS' SELECT GARDEN SEEDS.

B. K. BLISS & SON,

Nos. 41 Park Row, and 151 Nassau Street, New York. (P. O. Box. No. 5712.)

Importers, Growers, and Dealers in Garden, Field, and Flower Seeds, Horticultural Implements, and Garden Requisites.

Would inform their friends and the public that the *Sixteenth Annual Edition* of their **Illustrated Seed Catalogue** and **Guide** to the **Flower and Kitchen Garden** is now ready for distribution.

No pains or expense have been spared in preparing this edition, to make it the most complete work of the kind ever published in this country.

It contains 120 pages of closely printed matter, and *two hundred* choice engravings of favorite Flowers and Vegetables—a large portion of which are entirely new; also, two beautifully colored lithographs, and a descriptive list of upwards of *two thousand* species and varieties of *Flower* and *Vegetable Seeds*, including all the novelties of the past season, with directions for their culture; also, a list of upwards of *One Hundred varieties of Choice Gladiolus*—with many other Summer-Flowering Bulbs—and much useful information upon the subject of gardening generally.

A copy will be mailed to all applicants enclosing *Twenty-five cents.* Our regular customers supplied without charge. We also publish an edition handsomely bound in cloth at 50 cents per copy.

CUCUMBER, GEN. GRANT.

A superior variety, either for forcing or for culture in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five Packets for $1.00. B. K. BLISS & SON,
P. O. Box 5712,
New York.

Conover's COLOSSAL ASPARAGUS Seed and Roots.

The experience of the past season fully confirms all that was claimed for this variety when first offered last spring, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Strong, one-year-old Roots mailed, post-paid, $2 per fifty; $3.00 per hundred.

SEEDS.—½ oz. packet, 50 cts.
Address B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

SEED POTATOES.

BRESEE'S KING OF THE EARLIES, or No. 4.—Known also as the *Fifty Dollar Potato* (at which price they were sold last spring). The experience of the past season fully confirms all that was claimed for it by the raiser, and we have no hesitation in pronouncing it the *Earliest*, as well as one of the best varieties in cultivation, is ready for marketing one week in advance of the Early Rose. Mr. Bresee has placed his entire stock in our hands, for sale at the following greatly reduced prices.

Two Pounds, by mail, post-paid, for $1.00; by Express, (purchaser paying freight), One Peck, $5.00; One Bushel, $15.00; One Bbl., $40.00.

BRESEE'S PEERLESS, or No. 6.—This is, without exception, the best variety in cultivation, for a general crop. It grows to a large size, of a very showy appearance, is enormously productive, and fully equal to the Peachblow in quality. The stock was sold last spring at $600 per bushel. One lb., by mail, $1.00; by Express, $10.00 per peck.

BRESEE'S PROLIFIC, or No. 2.—4 lbs., by mail, $1.00; by Express, $1.25 per peck; $4.00 per bushel; $9 per Bbl.

CLIMAX.—4 lbs., by mail, $1.00; $1.50 per peck; $4.00 per bushel; $9.00 per Bbl.

EARLY ROSE.—4 lbs., by mail, $1.00; $1.00 per peck; $2.50 per bushel; $5.00 per Bbl.

Not less than $1.00 worth of a variety will be mailed.

Older varieties will be furnished at market prices. Our illustrated *Potato Catalogue*, with full directions for their culture, will be mailed to all applicants enclosing a stamp.

B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

L'HOMME-LEFORT, MASTIC, or COLD GRAFTING WAX.

Used in the Imperial Nurseries and Plantations of Paris.

This preparation is known as the best which can be used in the operation of grafting Trees, Shrubs, and Plants of any description, budding Roses, &c. It requires no previous melting; it is always ready for use; it grows hard in the open air as well as in water; and once hardened is not liquified under a high temperature.

This article is far superior to anything yet produced for the purpose of healing all wounds in Trees, &c., arising from accident or disease. It rapidly causes broken or split branches to unite again; it preserves the graft from moisture and from the intrusion of insects, &c., and is

THE BEST STYPTIC TO PREVENT THE EFFUSION OF SAP AFTER THE PRUNING OF THE GRAPE-VINE.

It is also an indispensable article in many other circumstances, which can only be illustrated by its use. Sold in tin boxes of various sizes, bearing the signature of the inventor. Price 40c., $1.25 and $3.50 per tin. The largest contains 6¾ lbs. Descriptive Circulars furnished to all applicants.

Gregory's Annual Catalogue of Choice Garden and Flower Seeds.

Having in former years introduced to the public the Hubbard Squash, American Turban Squash, Marblehead Mammoth Cabbage, Mexican Sweet Corn, Brown's New Dwarf Marrowfat Pea, Boston Curled Lettuce, and other new and valuable vegetables, with the return of another season I am again prepared to supply the public with Vegetable and Flower seeds of the purest quality. My Annual Catalogue, containing a list not only of all novelties, but also of the standard vegetables of the garden (over one hundred of which are of my own growing) and this season for the first time a carefully selected list of flower seeds will be forwarded *gratis* to all. Sent without request to my customers of last season. All seed purchased of me *I warrant to be fresh and true to name, and that it shall reach the purchaser.* Should it fail in either of these respects I will fill the order over without additional charge.

JAMES J. H. GREGORY, Marblehead, Mass.

Sold in the Public Markets

of the cities of

New York, Boston, Philadelphia, and Brooklyn;

Including the various

Domestic and Wild Animals, Poultry, Game, Fish, Vegetables, Fruits, etc.,

with

MANY CURIOUS INCIDENTS AND ANECDOTES.

BY

THOMAS F. DE VOE,

AUTHOR OF "THE MARKET BOOK," ETC.

ILLUSTRATED.

The object of this volume is to present that which may be found practically useful as well as interesting. It aims at bringing together, in as small compass as possible, and in a form easy of reference, those items of information which many would desire to possess when called upon to cater for the household. In order fully to carry out the practical views here indicated, the work is divided into several headings; all of which, however, harmonize into one connecting form, "*What we Eat*," Domestic, or Tame Animals; Wild Animals, or Animal Game; Poultry; Wild Fowl and Birds, or Bird Game; Fish; Vegetables; Pot and Medicinal Herbs; Fruits and Nuts; Dairy and Household Products, etc.

The author has gleaned what he deems the *useful*, from the daily wants, and the common expressions of almost every home. "What shall we have to-day for dinner?" "What is there in our markets fit to eat?" "What kinds of meats, poultry, game, fish, vegetables, and fruits are in season?" "What names are given to the different joints of meats, and what dishes are they severally and generally used for?" These, and many other similar questions are often discussed, with no one to give answer. For this book it is claimed that it contains a comprehensive reply to all queries of this nature.

In order the more fully to carry out the views the author has entertained in relation to the various articles of food, he has used as illustrations the outlined diagram figures of such animals as are usually portioned out and sold by the public market butchers, with the various names, given with the accompanying engraved cuts of the principal joints. These are intended to assist in their recognition when called for, as well as to aid in rendering perfect the dishes commonly made from them.

After the Butcher's Meats will be found a brief description of other articles of food, with the periods of their season or when considered best; also instructions to guide in judging of and selecting them in the various public market-places.

PRICE, POST-PAID, $2.50.

Grafting Grape-vines.

The process of grafting grape-vines is entirely simple, being ordinary cleft-grafting, and can be done by the most common workman who is handy in the use of the knife.

"Grafts carefully inserted, grow with surprising rapidity and vigor, and the method affords a very easy way of replacing an indifferent or worthless variety of grape with a good one. If properly done, the risk of failure is very small."—*American Agriculturist.*

We have issued a circular giving full particulars how and when to graft vines, which will be sent to all applicants.

See advertisement, page 429, of November *American Agriculturist.* Address

HASBROUCK & BUSHNELL,
"IONA," near Peekskill, Westchester Co., New York.

NEW

American Farm Book.

ORIGINALLY BY

R. L. ALLEN,

Author of "Diseases of Domestic Animals," and formerly editor of the "American Agriculturist."

REVISED AND ENLARGED BY

LEWIS F. ALLEN,

Author of "American Cattle," editor of the "American Shorthorn Herd Book," etc.

NOTICES BY THE PRESS.

Everything connected with the business of farming finds a place in it; soils, manures of every kind, irrigation and draining, grasses, grain and root crops, fruits, cotton, hemp, fences, farm buildings, domestic cattle, sheep, poultry, and the like. The work has been written with great care by men qualified to discuss the subject, and it is really valuable. The chapter on soils should be read carefully by every farmer who desires to make the most of the land he cultivates. The chapter on fruits constitutes an important feature of the work; and there is nothing in it which is not well considered and useful.
Worcester Daily Spy.

Comprehensive and careful, telling, and telling specifically, just what the tillers of the soil need to know, it will prove of great advantage to all who faithfully follow its counsels in the spirit in which they are given.
Congregationalist & Recorder.

It intelligently and quite fully discusses the various operations of farm life, and is invaluable to all engaged in agriculture. *Farmer's Cabinet.*

For the young man of rural tastes, but without a training at the plow-handles, who asks for a general guide and instructor that shall be to agriculture what the map of the world is to geography, it is the best manual in print. For the working farmer, who in summer noonings and by the winter fireside would refresh his convictions and reassure his knowledge by old definitions and well-considered summaries, it is the most convenient hand-book. From its double authorship one might expect some show of patch-work, the original statement of the author of 1846, annotated and qualified by the writer of this year. But this has been wisely avoided. The book is a unit, and shows no disparity of style nor contradiction in statement. Practically it is altogether a recent and timely volume. Only so much of the original Book of the Farm, by R. L. Allen, as time could not change, has been adopted by the reviser. *New York Tribune.*

It is a volume of over five hundred pages, and in its present shape comprises all that can well be condensed into an available volume of its kind.
Hartford Daily Times.

It is almost as comprehensive as a cyclopædia. We can safely recommend it as a valuable and standard work.
Salem Gazette.

It has a very wide range of subjects, taking up nearly all matters that are most important to farmers. Comprising the combined wisdom and experience of two eminent agriculturists, it must prove of great value to the class for whom it is prepared. *New York Observer.*

It is crammed full of just the information that is wanted, which it is a pleasure to recommend. We know of no better encyclopædia of farming.
New York Independent.

In its present revised and enlarged form, it is a work that every practical farmer may consult with advantage, and none can well afford to do without.
Christian Intelligencer.

It is something in favor of this work that it has been before the public for many years. The original work was prepared with extraordinary care, and contained a vast amount of general truth that is as applicable now as it was then; it has therefore been made the basis of the present work, which, to all intents and purposes, is new, since it is adapted to the present improved state of agricultural knowledge. Every department is prepared with conscientious care and with a view of making the work a reliable source of agricultural information.
Chicago Republican.

SENT POST-PAID.....PRICE $2.50.

ORANGE JUDD & CO.,
245 Broadway, New-York.

NEW BOOK FOR HUNTERS.

THE

HUNTER AND TRAPPER,

BY

HALSEY THRASHER,

AN EXPERIENCED HUNTER.

ILLUSTRATED.

This little book will be read with interest by all who would find instruction and entertainment in the narrative of an old hunter's experience. The following, from the author's Preface, will give an idea of the character and design of the work:

"I am a blacksmith by trade, but when I was a boy I became fond of a gun and a trap, and my first success in my shop was to make a steel trap. It was my aim to become an expert trapper, and I tried my hand at catching foxes.

"Many a dollar have I paid to cunning old men to learn the art, and I have succeeded pretty well, too; but why has not some man of experience written a book explaining the art of successfully trapping the different kinds of fur animals? I propose to tell the boys how to do it.

"I have studied the nature and habits of animals of different species, and a plan that was good to capture the otter, the mink, and the beaver, forty years ago, is just as good now as then. The nature of animals doesn't change like the nature of men; we have grown wiser, while they have remained the same. The mode of capturing them when I was a boy, and the way used now, may be put together, and succeed better than either one alone.

"Men are traveling through the country selling recipes at a high price to teach how to dress skins. I propose in this work to teach all these things, so that a man may have them in a neat little volume for reference at any time. I shall also treat upon angling for the trout, the bass, and the pickerel, which I think I understand. I hope to make it all so plain that even the inexperienced will, in some measure, succeed."

CONTENTS.

CHAPTER I.—Deer Hunting.
CHAPTER II.—How to Catch the Fox.
CHAPTER III.—How to Hunt and Catch the Beaver.
CHAPTER IV.—How to Catch the Otter.
CHAPTER V.—How to Catch the Mink.
CHAPTER VI.—How to Hunt and Catch the Muskrat.
CHAPTER VII.—How to Catch the Marten.
CHAPTER VIII.—How to Catch the Fisher.
CHAPTER IX.—How to Catch the Raccoon.
CHAPTER X.—How to Hunt and Trap the Bear.
CHAPTER XI.—How to Hunt and Trap the Wolf.
CHAPTER XII.—How to Trap the Pocket Gopher.
CHAPTER XIII.—Fishing for Trout, Pickerel, and Bass.
CHAPTER XIV.—How to Hunt the Honey Bee.
CHAPTER XV.—Hints About Shot-Guns and Rifles.
CHAPTER XVI.—Traps.
CHAPTER XVII.—Dressing and Tanning Skins and Furs.

PARSONS ON THE ROSE.

A TREATISE ON THE

Propagation, Culture, and History of the Rose.

BY SAMUEL B. PARSONS.

NEW AND REVISED EDITION.

ILLUSTRATED.

The rose is the queen of the floral kingdom, and Mr. Parsons is her prime minister, and this book is his proclamation and greetings to all her courtiers and liege subjects. It is learned in the archæology of the rose, scientific in its classification, and practical in its directions for cultivation. *Christian Advocate.*

We have here a book of more than two hundred pages devoted entirely to this shrub, in which are collected, in small compass, the most important facts concerning it. Some amateurs in floriculture delight in making a specialty of the culture of some favorite flower, and the treatise before us is just the book for an admirer of the rose. *Chicago Republican.*

Everything that relates to the cultivation of this divine flower—as we may call it, for its purity and beauty entitle it to a special celestial creation—is given in this volume, which should be studied by all the millions who appreciate what is most beautiful in the works of nature. All varieties of the plant receive attention, and many illustrations enrich the pages of the book.
(Boston) Evening Traveller.

It is enough to say that it is the most complete treatise on the subject that is accessible to us.
N. Y. Independent.

This volume, in addition to giving the classification of the rose family, shows the methods which are resorted to for cultivating and propagating this favorite flower of all countries. It also contains much curious information respecting its history, and the esteem in which it is held by different nations. In short, it aims to give the reader what is known of the literature, history, and management of the flower in which we all delight.
Prairie Farmer.

CONTENTS:

CHAPTER I.—Botannical Classification.
CHAPTER II.—Garden Classification.
CHAPTER III.—General Culture of the Rose.
CHAPTER IV.—Soil, Situation, and Planting.
CHAPTER V.—Pruning, Training, and Bedding.
CHAPTER VI.—Potting and Forcing.
CHAPTER VII.—Propagation.
CHAPTER VIII.—Multiplication by Seed and Hybridizing.
CHAPTER IX.—Diseases and Insects Attacking the Rose.
CHAPTER X.—Early History of the Rose, and Fables Respecting its Origin.
CHAPTER XI.—Luxurious Use of the Rose.
CHAPTER XII.—The Rose in Ceremonies and Festivals, and in the Adornment of Burial-places.
CHAPTER XIII.—The Rose in the Middle Ages.
CHAPTER XIV.—Perfumes of the Rose.
CHAPTER XV.—Medical Properties of the Rose.
CHAPTER XVI.—General Remarks.

THOS. C. ANDREWS, Moorestown, N. J.

Cahoon's Broadcast Seed Sower,

For Sowing All Kinds of Grain and Grass Seed.

The unprecedented success of this Seeder the past year is without a parallel in the history of Agricultural Implements. It has probably received more First Premiums at State Fairs in the fall of 1869, than was ever awarded any other machine of any name or nature, in one year. Joseph Harris, author of Walks and Talks in *American Agriculturist,* says: "I like the Cahoon Seeder very much indeed."

There is one continuous voice of praise ringing in our ears from all parts of the country.

We warrant the Hand Machine to sow 50 acres of wheat in 10 hours, and the Horse Power Machine to sow 120 acres in the same time, and the work to be done with greater precision and accuracy than it can be done by any other means whatever. No farmer who has an acre of grain to sow yearly can afford to do without one of these Seeders.

Price of Hand Sowers, $10.00; Horse Power, $50.00. Send for Circulars, and name of Agent near your residence.
D. H. GOODELL & CO.,
Sole Manufacturers, Antrim, N. H.

BEST CABINET ORGANS

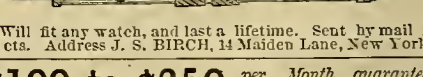
AT LOWEST PRICES.

☞ That the MASON & HAMLIN CABINET and METROPOLITAN ORGANS are the BEST IN THE WORLD is proved by the almost unanimous opinion of professional musicians, by the award to them of SEVENTY-FIVE GOLD and SILVER MEDALS or other highest premiums, at principal industrial competitions within a few years, including the MEDAL at the PARIS EXPOSITION, and by a sale very much greater than that of any similar instruments. This Company manufacture ONLY FIRST-CLASS INSTRUMENTS, and will not make "cheap organs" at any price, or suffer an inferior instrument to bear their name. Having greatly increased their facilities for manufacture, by the introduction of new machinery and otherwise, they are now making BETTER ORGANS than EVER BEFORE, at increased economy in cost, which, in accordance with their fixed policy of selling always at least remunerative profit, they are now offering at PRICES of INFERIOR WORK. FOUR OCTAVE ORGANS, Plain Walnut Case, $50. FIVE OCTAVE ORGANS, Double Reed, Solid Walnut Case, carved and panneled, with FIVE STOPS (VIOLA, DIAPASON, MELODIA, FLUTE, TREMULANT), $125. Other styles in proportion.

Circulars, with full particulars, including accurate drawings of the different styles of organs, and much information which will be of service to every purchaser of an organ, will be sent free, and postage paid, to any one desiring them.

MASON & HAMLIN ORGAN CO.,
154 Tremont St., Boston; 596 Broadway, New York.

THE MAGIC WATCH-KEY.



Will fit any watch, and last a lifetime. Sent by mail for 50 cts. Address J. S. BIRCH, 14 Maiden Lane, New York.

AMERICAN CATTLE:

THEIR

HISTORY, BREEDING,

AND

MANAGEMENT.

By Lewis F. Allen,

Late President New York State Agricultural Society, editor "American Shorthorn Herd Book," author "Rural Architecture," etc., etc.

NOTICES BY THE PRESS.

We consider this the most valuable work that has recently been issued from the American press. It embraces all branches of the important subject, and fills a vacancy in our agricultural literature for which work the author by his many years' experience and observation was eminently fitted.....It ought to be in the hands of every owner of cattle, and the country, as well as individuals, would soon be much richer for its teachings.
Journal of Agriculture (St. Louis).

The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims as a standard authority on the subject. An excellent feature of this volume is its orderly, methodical arrangement, condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves. *N. Y. Tribune.*

This will rank among the standard works of the country, and will be considered indispensable by every breeder of live-stock. *Practical Farmer (Phila).*

We think it is the most complete work upon neat stock that we have seen, embodying as it does a vast amount of research and careful study and observation.
Wiscon Farmer sinr

His history of cattle in general and of the individual breeds in particular, which occupies the first 180 pages of the volume, is written with much of the grace and charm of an Allison or a Macauley. His description of the leading breeds is illustrated by cuts of a bull, a cow, and a fat ox, of each race. The next one hundred pages are devoted to the subject of Breeding. This is followed by chapters on Beef Cattle, Working Oxen, Milch Cows, Cattle Food, Diseases, etc. The arrangement, illustrations, analytical index, etc., of the work are in the best style of modern book-making.
New England Farmer.

The work is one that has long been needed, as it takes the place of the foreign books of like nature to which our farmers have been obliged to refer, and furnishes in a compact and well-arranged volume all they desire upon this important subject. *Maine Farmer.*

Whatever works the stock farmer may already have, he cannot afford to do without this. *Ohio Farmer.*

It is one of the best treatises within our knowledge, and contains information sound and sensible, on every page. *The People, (Concord, N. H.)*

The object of the work, as stated by the author in his preface, "is not only to give a historical account of the Bovine race, to suggest to our farmers and cattle breeders the best methods of their production and management, but to exalt and ennoble its pursuit to the dignity to which it is entitled in the various departments of American agriculture." From the little examination we have been able to give it, we can not recommend it too highly.
Canada Farmer.

Considering that there are some ten million milch cows in the United States, and nearly a thousand millions of dollars invested in cattle, the magnitude of this interest demands that the best skilled talent be devoted to the improvement of the various breeds and the investigation of the best method of so caring for the animals as to gain the greatest profit from them. This volume will give the farmer just the instruction which he wants.
N. Y. Independent.

PRICE, POST-PAID, $2.50.

ORANGE JUDD & CO.,
245 Broadway, New York.

THE PRACTICAL

POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE

MANAGEMENT OF POULTRY,

FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrated.

By L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poulterer who must make the business pay, and the chicken fancier whose taste is for gay plumage, and strange, bright birds. The most valuable portion is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed his aim. The middle parts of Mr. Wright's Manual are taken up with minute directions for making show fowls for Fairs, a nice discussion of the good and bad points of the different breeds, and a brief sketch of such fancy stock as peafowl, pheasants, and water-fowl. Then follows a section on artificial hatching, and another, worth special attention, on large poultry yards....A study of Mr. Wright's book will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutmegs merely, but the family supplies of sugar, shoes, and cloth. *New York Tribune.*

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fowls. *Farmers' Cabinet.*

This is a reprint, with numerous wood engravings, of an English book, the object of which is to convey in plain language a great deal of practical information about the breeding and management of poultry, whether for domestic use, the markets, or exhibition....The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry.
Philadelphia Press.

It is a handsome volume, brought out in the best style, and enriched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business. *United Presbyterian.*

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is embellished with numerous illustrative engravings.
New York Observer.

The author has called to his aid all who were experienced in the subject whereof he writes, and the consequence is a volume of more than ordinary thoroughness and exhaustiveness. *Rochester Democrat.*

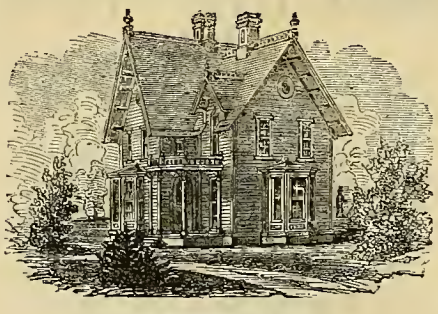
The book is a complete and standard guide to the management of poultry for domestic use, the market, and for exhibition. *Watchman and Reflector.*

PRICE, POST-PAID, $2.00.

ORANGE JUDD & CO.,
245 Broadway, New York.

PRACTICAL STANDARD

BOOKS ON ARCHITECTURE.



JUST PUBLISHED:

WOODWARD'S
NATIONAL ARCHITECT.

Forest Tree Culturist.

A TREATISE

ON THE CULTIVATION OF

AMERICAN FOREST TREES.

WITH

NOTES ON THE MOST VALUABLE SPECIES.

By ANDREW S. FULLER,

Author of the "Grape Culturist."

This is a book of much importance to all in the "Great West," where the scarcity of timber is the one great obstacle to the settlement of our large prairies. With its aid the farmer can in a few years have his own timber lot, from which to obtain a supply for the various uses of his farm.

CONTENTS.

Propagation.	Planting Trees for Shelter.
Time for Sowing Seeds.	Pruning of Forest Trees.
Preserving Seeds.	Pruning Evergreens.
Gathering and Transporting Seeds.	Time to Prune.
Where to obtain Seeds.	Time to cut Timber.
Growing from Cuttings.	Description of Varieties of Deciduous Trees.
Budding, Grafting, etc.	Small Deciduous Trees.
Transplanting.	Evergreen Trees—Varieties.
Transplanting large Trees.	Evergreen Shrubs — Varieties.
Depth to Plant Trees.	

Price, Post-paid, $1.50.

Address **ORANGE JUDD & CO.**

FARM IMPLEMENTS

AND

FARM MACHINERY,

AND THE

Principles of their Construction and Use:

WITH

SIMPLE AND PRACTICAL EXPLANATIONS

OF THE

LAWS OF MOTION AND FORCE

AS APPLIED

ON THE FARM.

With 287 Illustrations.

BY

JOHN J. THOMAS.

The basis of this admirable work was an essay published in 1850, in the Transactions of the N. Y. State Agricultural Society, which was enlarged, and in 1854 published by the Harpers. It has been, and remains, the only work in which the principles of Natural Philosophy, namely, the mechanical powers, and the powers of water, wind, and heat, are systematically discussed as applied to the operations of the farm.

The work has now been most carefully revised by the author. It is much enlarged, and a great part has been re-written, while the illustrations, before abundant, now number two hundred and eighty-seven. A large number of new implements are described, with the heavier farm machinery; and the use of steam, both in cooking and as power on the farm, is clearly discussed.

NOTICES BY THE PRESS.

The great value of this work is the application of natural philosophy to farm labor, in the use of power, and it will supply one of the best text-books in our agricultural schools. Every farmer's son should carefully study this book, and he will be saved much hard labor, accomplish more work, and have less wear and breakage in the implements he uses. The chapter on plowing is of great value to all plowmen, whether old or young, and is worth more than the cost of the book. *Chicago Tribune.*

We welcome this new and re-written edition of an old and very valuable work. The six pages on road-making are worth more than the price of the book to every highway surveyor in Vermont. Farmers need to study the mechanics of Agriculture....This volume is admirably calculated to aid the farmer in determining what he needs and how to supply that want. *Burlington Free Press.*

The volume is one of great value, and should be in every Farmer's Library, for it is full of practical suggestions and useful information. *Salem Observer.*

Mr. Thomas' illustrations are largely drawn from objects with which the farmer is familiar, and any one of ordinary intelligence can readily grasp the whole, following the author step by step, from the inertia of the loaded wagon which snaps the harness traces on a sudden start, to the laws which govern the shape of the working parts of the plow, and the construction of the steam engine, or the radiation of heat causing the phenomena of dew and frost. *Cultivator and Country Gentleman.*

Those who are acquainted with Mr. Thomas' previous works need not to be told that it is written in a clear, concise, practical style, and though eminently scientific, the language is so free from all unnecessary technicalities, and so pleasingly familiar, and at the same time so well illustrated and enlivened by appropriate incident, anecdotes, experiments, etc., as to excite and repay the continued attention of the reader. *Galesburg Free Press.*

The whole work is of a thoroughly practical character, and the application of the principles taught to the farmer's daily work makes its instructions of very great value. There is not an agricultural writer that could be named more respected than Mr. Thomas, or one whose judgment and freedom from personal bias in discussing new implements could be more implicitly relied upon. *Hartford Daily Times.*

PRICE, POST-PAID, $1.50.

WARING'S
BOOKS FOR FARMERS.

DRAINING FOR PROFIT
AND
DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,
Engineer of the Drainage of Central Park, New York.

CONTENTS.

Land to be Drained; How Drains Act; How to Make Drains; How to Take Care of Drains; What Draining Costs. Will It Pay? How to Make Tiles; Reclaiming Salt Marshes; House and Town Drainage.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health. [*Portland (Me.) Press.*

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it. [*Chicago (Ill.) Republican.*

A Book that ought to be in the hands of every Farmer.

SENT POST-PAID, - - - - PRICE, $1.50.

EARTH CLOSETS:

How to Make them and how to Use them.

By GEO. E. WARING, Jr.

It is sufficiently understood, by all who have given the least thought to the subject, that the waste of the most vital elements of the soil's fertility, through our present practice of treating human excrement as a thing that is to be hurried into the sea, or buried in underground vaults, or in some other way put out of sight and out of reach, is full of danger to our future prosperity. Supported as the arguments in this little work are by the most imperative agricultural and sanitary considerations, it is believed that they will commend themselves to the approval of all, in both town and country, who have the well-being of society at heart.

SENT POST-PAID.... PAPER COVERS. PRICE 25cts.

ELEMENTS OF AGRICULTURE.

A BOOK FOR YOUNG FARMERS,

By GEO. E. WARING, Jr.,
Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS.

The Plant; The Soil.; Manures; Mechanical Cultivation; Analysis.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful *practical farmer*, and is full of information, good advice, and sound doctrine.

HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."

ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 33c., best 35c. per lb.

CLUB ORDER.

BRAIDWOOD, Will Co., Ill., Feb. 14th, 1869.

TO THE GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey Street, New York.

Gentlemen:—Business, and a want of opportunity, have for the last eight months prevented me sending, or rather attending to our monthly club, whose orders I sent you regularly for about a year previous. Since that time many indeed have been the solicitations by many of the members, that I should once again commence and send club orders—for, as some declared, they had got *no Tea*, no matter what the price paid, since I quit sending the club orders. I have, therefore, at the urgent request of a few, resolved to send you a small order monthly, and as a beginning send you the following:

2	English Breakfast	John James	at	1.20....2.40
1½	English Breakfast	Jas. Reside	at	1.20....1.80
2	English Breakfast	John Runcie	at	1.20....2.40
2	Uncolored Japan	Wm. Ross	at	1.00....2.00
1	Imperial	Wm. Ross	at	1.25....1.25
1	Young Hyson	Wm. Ross	at	1.25....1.25
1	Oolong	Pat. McGerrity	at	1.00....1.00
2	Imperial	John Larken	at	1.25....2.50
1	Oolong	Wm. Duffie	at	1.00....1.00
4	Young Hyson	Thos. Conners	at	1.25....5.00
6	English Breakfast	Robert Barr	at	1.20....7.20
2	Uncolored Japan	John James	at	1.25....2.50
3	English Breakfast	Geo. Simpson	at	1.20....3.69
2	Imperial	Wm. Brooks	at	1.25....2.50
1	Imperial	Wm. Brooks	at	1.25....1.25
1	English Breakfast	Wm. Brooks	at	1.20....1.20

Address to John James, Braidwood, Will County, Illinois, —per Merchants' Express—to be collected on delivery; and oblige Yours respectfully, JOHN JAMES.

Parties sending club or other orders for less than $30 had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for clubs of less than $30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within thirty days, and have the money refunded.

N. B.—Inhabitants of villages and towns where a large number reside, by *clubbing* together, can reduce the cost of their Teas and Coffees about one-third, (besides the Express charges) by sending directly to "*The Great American Tea Company.*"

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We do not, in any case, authorize the use of our name.

POST-OFFICE orders and Drafts, make payable to the order of "*The Great American Tea Company.*"
Direct letters and orders (as below, no more, no less.)

HORSFORD'S SELF-RAISING BREAD PREPARATION

Makes the most wholesome and best of BREAD, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA and decay of TEETH, and promotes the growth of Muscle and Bone. In "*raising*" the dough it does not, like other yeast, decompose the flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send for pamphlet, supplied gratis. Ask your Grocer for "Horsford's Bread Preparation." WILSON, LOCKWOOD, EVERETT & CO., Wholesale Agents, 201 Fulton-st., New York.

AMERICAN WEEDS
and Useful Plants.

BY WILLIAM DARLINGTON, M. D.
Revised, with additions,
BY PROF. GEORGE THURBER.

An enumeration and description of useful Plants and Weeds, which merit the notice, or require the attention of American Agriculturists.

COPELAND'S COUNTRY LIFE.

A COMPENDIUM OF

AGRICULTURAL & HORTICULTURAL

Practical Knowledge.

By ROBERT MORRIS COPELAND.

It contains 926 large Octavo Pages and 250 Engravings, and embraces Descriptions, Hints, Suggestions and Details of great value to those interested in Country Life. The following are some of the matters of which it treats:

DRAINING.
CATTLE.
SHEEP.
SHRUBS.
FRUITS.
FLOWERS.
VEGETABLES.
HOT-HOUSE PLANTS.
GRAPE CULTURE.
ORNAMENTAL TREES.

The **Kitchen Garden** receives particular attention. In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last thirteen volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for thirteen years past, beginning with 1857—that is, Vol. 16 to Vol. 28, inclusive. Any of these volumes sent complete (in numbers) at $1.75 each, post-paid, (or $1.50 if taken at the office). The volumes, neatly bound, are supplied for $2 each, or $2.50 if to be sent by mail. Any single numbers of the past thirteen years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW YORK, MARCH, 1870.

We believe there never was a season which somebody did not regard as very remarkable, if not altogether without precedent. No one, however, on the seaboard, claims this winter as one of unusual severity. With us, it has been almost like summer for weeks together. We have seen a good deal of plowing done in both January and February, and the ground, up to the time of writing, has been bare of snow, except for a day or two at a time, since before Christmas. This comes, notwithstanding all the "signs." There hardly ever was such a crop of nuts—this betokened a severe winter; the corn husks were thick and abundant—this also indicated a long season of cold. Wild geese went south early; a good many bears, and other wild animals, were killed further south than usual, and there were a score of other "signs" of a hard winter. If it comes, it will be after we go to press. And now, almost everybody prophesies a cold March, and late spring. The fact is, nobody can tell, and he has been wise who has improved the winter to make his fences, clear off the stones, clean up fence rows, dig drains, and lay the tiles, so that whenever spring comes, he can go on with his work without interruption. March is, however, often best adapted for this kind of work, and we have yet to see the farm in America whereon there is not enough of it to do. Bright, sunny days, and a drying surface, are a temptation to begin plowing too early. Wait until the ground is settled, and the water is out of it, on all except sandy or gravelly soils which do not pack when wet.

The month is likely to be one of great changes in temperature; high winds will prevail, more or less, and the farmer's first thoughts should be to protect his stock and stores from exposure. The frost may derange foundations, loose weather-boards may be found, rain finding its way through the roof may make musty hay. All these things need a little closer looking to than was necessary during the winter. At the same time, the roads will probably be very bad, and the provident farmer will get all real necessities, including food and feed, lumber, nails for repairs, etc., beforehand.

Hints About Work.

Clearing up Fence Rows is good work for early spring. There are no leaves and grass to conceal big stones, against which, in summer, one is apt to strike the bush-scythe, hook, and axe, and a man can see much better what he is about. When the brush is cut, and the soil is loosened by the outcoming frost, the ground may be plowed much more easily than in summer.

Setting Fences.—Before the land is in condition to plow, and while yet it is mellow and loose, re-set old fences that have been blown or shoved out of place. The cheapest and best wooden fence a farmer can put up is one of ¾-inch oak strips, nailed to posts, set 6 feet apart, capped and battened.

The use of the Roller is too little known among some pretty good farmers. In the spring, as soon as the ground is free from frost, and firm enough not to poach up under the feet of horses or oxen, all land in grass and grain should be rolled. There are mole hills, and clods, torn up by the tread of animals, and small stones, and tussocks of grass, wheel tracks, and a multitude of things that cause irregularities of surface, which a good roller puts out of the way in once going over. Besides, plants heaved by the freezing and thawing of winter, are packed firmly in the soil.

Pick off the Stones from plowed land, grain fields, and newly seeded grass land, lay them in piles, so that they can be loaded into carts, and drawn off early in the morning, when the ground is stiff. Large stones should be lifted, and have sticks laid under them, when the ground is soft, that they, too, may be moved when it is frozen.

Grass and Grain Fields may be dressed with a few hundred pounds of bone-dust, plaster, and ashes, or all three mixed in about equal parts. Instead of this, any fine, well-rotted compost or manure may be applied, brushed in, and the field rolled. Liquid manure is particularly recommended as a profitable application in the spring.

Seeding with Clover is usually done in March, if possible. The best reason we can suggest for this is, that if a light snow covers the ground, the east can be easily seen. The stand is as good if the seed is sown any time before the May rains.

Plowing.—Plow no water-soaked land. Many a field of heavy soil is damaged for the whole season by being plowed before the water is out of it, and the labor of subsequent tillage is greatly increased.

Weeds.—March is one of the best times to kill certain biennial weeds. They start as early as the grass, and they are easily killed with a hoe. Go through the meadows and lanes, along the fences, and over the grain fields, with as strong a force of men and boys—women and girls, too, if possible—armed with hoes, and cut or pull all such weeds as thistles, mullcins, wild teazles, daisies, wild parsnips and carrots, and many other plants, now easily seen, but which will soon be concealed in the grass. Let docks alone; if cut, they will make half a dozen shoots, which will break off when one tries to pull them; allowed to grow until they are nearly ready to blossom, they may be pulled easily in wet weather, and destroyed, root and top.

Spring Grains cannot be sowed too soon after the ground is fit to plow. Prepare the seed by winnowing out the light stuff, and use only the plumpest grains. Soak in strong pickle, to kill smut. The ground should be in good heart, and mellow.

Peas and Oats will be found a profitable crop for many purposes. It is excellent for soiling, capital for hogs, and the combined yield of grain is greater than either oats or peas alone would reach.

Peas are sowed early; and though they need land in good heart and tilth, they do not need but are damaged by fresh manure.

Potatoes may be planted as soon as the land is warm; but north of Philadelphia, it is not advisable to plant many in March. If cut to single eyes, many sets are likely to be lost in cold, wet weather—larger pieces are best for early planting.

Manure may be hauled while snow lasts, or while the frozen ground permits easy wheeling on plowed land. Work over that which is liable to heat, and mix with litter not needed as bedding.

Swine.—Give breeding sows, soon to farrow,

good, roomy pens, and short straw for nests. Keep a close watch upon them, and if one does not own her young, or treat them motherly, put a small dog in the pen for a few minutes—she will soon own the little ones, and not err again. A sow will usually be in heat the third day after farrowing.

Sheep require extra care now. Scab will cause loss of wool, and they are peculiarly liable to disease. Use carbolic soap for skin diseases and vermin. Ewes, near yeaning, must be watched, and early lambs nursed and raised, if possible. One very early one is worth two late ones. Feed nursing ewes oil-cake and a few raw roots, and cut hemlock boughs for them to browse. Salt regularly, and give them dry places to lie in, and a good range.

Cows coming in must have care. Give them roomy, loose boxes for some days before, and good bedding of straw, cut two or three times. Bring water to them, if the ground is icy, but do not scrimp them. Feed also some raw roots, and oil-meal, perhaps, to keep the bowels moderately loose. All breeding animals should be familiar with their master, and like to be petted and handled.

Beeves and Fattening Sheep may be pushed forward now as the weather grows milder, and either ripened off, or kept steadily gaining a little, according to the stock market, and the price of food.

Working Animals, both oxen and horses, should be gradually accustomed to labor, if they have been standing idle, or it will tell hard upon them, and galled necks and backs will be the result. Should such trouble occur, bind on wet bags at night, and take all pressure off from the wounded parts by pads.

Poultry.—Set some hens early, especially if you breed pure stock, for early chickens that do well make the finest birds, and the prize-takers at the shows. Geese should hatch early; but for ducks and turkeys, the warmer weather of May is more important than the growth they will make.

Swampy Meadows should be burned over before the grass starts; they will then furnish the cows a good bite of grass long before the hill pastures.

Work in the Horticultural Departments.

It is the general impression that the unusually spring-like January is likely to be followed by a late season. Those are fortunate who took advantage of the pleasant days of winter to do such work as usually is attended to in March. Several have written to know what can be done to fruit trees upon which buds have swollen, to preserve them in case the mild weather is followed by severe cold. They are past remedy, and all hope of fruit from trees thus injured must be given up. See that the trees are not neglected on this account. A crop of well-ripened wood will be an important step towards success another year.

Orchard and Nursery.

The article by our Iowa contributor, on page 101, gives such practical hints upon planting, that it is necessary to say but little upon that point. Those who are able to select their trees at the nursery, as he suggests, are fortunate, but the majority of our readers must order from a distance, and take what may be sent them. The roots will usually be small, in proportion to the tops, but if they have been well packed, this difficulty may be met by cutting back the top sufficiently at planting, to compensate for the amount of roots lost in digging.

Shriveling may take place with trees long on the way, and not well packed. Open a trench in sandy soil, lay in the trees, and cover them, tops and all. In a few days, or a week, they will be found to have regained their former plumpness.

Girdled Trees are to be attended to as soon as discovered, as recommended in previous months.

Grafting.—Cherry and plum trees should be grafted earlier than the apple and pear, which are best left until the buds commence to swell.

Pruning may still be done where vegetation is dormant. Cover the wounds with grafting wax.

Fruit Garden.

Grape-Vines.—Plant if the soil is in proper condition. Use no manure. Cut back the vines to three buds, but one of which is to grow into a shoot. Plow old vineyards, and use the hoe near the vines. Layers may be made from last year's wood. Set posts for trellises.

Blackberries.—Set new vines early; leave no old cane; the growth should be all from the buds near the root. Six feet apart, each way, is a good distance, if they are kept within bounds by pinching.

Raspberries.—Set from four to six feet apart, according to the size of the variety. Let no old canes remain on plants now set out. Uncover tender varieties when severe frosts are over.

Currants and *Gooseberries.*—Set early. Prune.

Cuttings of grape, currant, and gooseberry may be put out; pack the earth well against them.

Strawberries.—Set as soon as the frost is well out of the ground, and plants can be obtained. Put the plants in rows, two feet apart, and set them eighteen inches distant in the rows. Remove all decaying leaves at planting, and shorten the roots about one-third. Where pistillate sorts are grown, plant a perfect variety near by to fertilize them.

Kitchen Garden.

Every spring we are obliged, in reply to letters, to say something about plants under glass. By a little pains in this direction, many vegetables may be had several weeks earlier than from seeds sown in the open ground. Those who follow market gardening, make extensive use of glass to forward their crops, and it may be done in the family garden to great advantage, provided one will take the necessary care. If one will not take the trouble, then he had better go on in the old way, and let glass alone. The easiest plan, and one attended with fewest risks, is to start seeds in

Window Boxes, which may be about four inches deep, and of any convenient length and width. Soap, and other boxes may be obtained at the grocer's, which may be cut in two, and answer well. Fill the boxes with light, rich soil, and sow seeds of tomatoes, cabbages, etc., and place in a sunny window—all the better if in the kitchen, where the air is usually moist. Have similar boxes of earth ready to receive the young plants when they are large enough to transplant. Water when needed. The next step is by the use of the

Cold-Frame.—The regular sash is six feet long, and three feet wide, but any other size will answer. Even old window sashes may be made to serve, if the cross-bars have channels cut, to allow the water to run off. The frame to hold the sash is made by setting down stakes, and nailing on boards. It should be eighteen inches high in the rear, and twelve inches in front. The slope should be towards the south, and the bed placed where it is sheltered from cold winds. The soil within the bed must be light, fine, and rich. Expose the glass to full sun during the day, and in the afternoon cover it with mats or board shutters. Work over the soil every few days, and when it has become well warmed, sow the seeds. When the plants are up, the sash must be raised at one end, to air the bed during the day; water must be given as needed.

Hot-beds are like the cold-frames, but with a mass of fermenting manure at the bottom, to give more heat than that supplied by the sun. The old way was to make a heap of manure, three feet high, and place the frame upon it. It is much more economical of manure to place it below the surface. A pit is dug about two feet deep, and of a size corresponding to the number of sashes to be used. A frame is made within the pit by boarding up, and the rear of it is to be eighteen inches, and the front twelve inches above the surface of the ground. Bank up around the outside of the frame. Fill the pit with fermenting stable manure, which will be all the better if mixed, one-third or more of its bulk, with leaves. Put in the manure evenly, and beat it down firmly with the fork. Put six inches of light, rich soil upon the manure, and spread evenly, and put on the sashes. A thermometer should be placed in the soil, and when the heat falls to about 90°, seeds may be sown. When the plants are up, they will need daily care. The glass must be raised in the morning, and closed in the afternoon, and shutters or mats must be put on at night. Neglect in airing at the proper time will burn the plants, and leaving the sashes open too long, when the heat of the sun declines, will chill them—extremes which are to be avoided. Egg-plants, Peppers, Tomatoes, and other plants, of warm countries, are raised in this way. Hot-beds are to be started about six weeks before planting can be safely done in the open air.

Cabbages and *Cauliflower*, that have been wintered in cold-frames, may generally have the sash removed by the first of this month. Those who do not keep fall sown plants over winter, can get a very good start by sowing in the boxes described above, and placing them, at first, in a mild hot-bed. When the plants have made a proper growth, they should be transplanted to other boxes, and when established, the boxes are to be transferred to a cold-frame, and gradually hardened off, by exposure to the air whenever the temperature will allow. Enough plants for a family garden may be grown in window boxes; these should be exposed on mild days.

Cucumbers, *Squashes*, and other plants that do not transplant readily, may be started in hot-beds, cold-frames, or in the house, by the use of small squares of sod, which are placed grass side down, and the seeds are sown in the earth. The bits of sod containing the plants are to be set out at the proper time. See article in "Basket" on "Hay Baskets for Starting Plants" for other contrivances.

Plow or Spade the soil whenever it is dry enough. Use plenty of manure, and work fine and deep.

Asparagus and *Rhubarb Beds* may be forked over if the season permits, working in manure.

Peas.—Sow early sorts as soon as practicable.

Potatoes for the early crop should be placed in a warm room, to induce the sprouts to start. After cutting, allow the surface to dry before planting.

Onions.—Plant Sets, Top, or Button Onions, and Potato Onions, as soon as the ground, which should be rich, is ready. See "Basket" article.

General Planting.—The hardiest vegetables are carrots, beets, spinach, salsify, onions, leeks, and early turnips. The time for sowing them will depend upon locality and season. To these may be added radishes, cress, and lettuce.

Flower Garden and Lawn.

The articles upon "Laying Out a Flower Garden," given last month, and this month, will be found to contain hints which need not be repeated.

Walks should be made permanent, and, if of gravel, must have a good foundation of stone. Asphalt walks, page 100, are worth considering.

Lawns.—Attend to the work of preparation early. Drain, if necessary. Let the soil be deep and fertile, and use a plenty of seed—from two to five bushels to the acre. June grass (Kentucky Blue), or Red-top alone make a good lawn. Various mixtures are sold by seedsmen. Imported lawn mixtures are unsuited to our climate. See last month's notes for other suggestions.

Perennials.—Those which have been in one place for three years or more, should be taken up, divided, and reset in fresh soil.

Green-house and Window Plants.

Now that the heat of the sun increases, more frequent airings can be given, and more care in watering will be required. Many plants that have been dormant will be pushing their growth, and many of those that have been kept for the winter in the cellar may be brought out and started.

Propagation of plants for summer use in the borders, such as Verbenas, Geraniums, and the like, should now go on rapidly. The secret of success is in keeping the air of the house at a lower temperature than that of the cutting bench.

AMERICAN AGRICULTURIST.

ORANGE JUDD & CO., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): $1.50 each for less than four copies: Four to nine copies, $1.25 each: Ten to nineteen copies, $1.20 each: Twenty copies and upwards, $1 each. Papers are addressed to each name.

"IN A NUT-SHELL."

If we recollect rightly, we have previously said something in these columns about giving "*premiums.*" Lest we may have omitted to do so, we will just say here, that the Publishers of the *American Agriculturist* "invented" a custom several years ago which has been widely imitated by others—a strong proof that it is a good custom—viz., that of issuing sundry "tokens"—premiums—to those friends who interest themselves in securing and forwarding subscribers to this paper. The plan has worked admirably. More than *Ten Thousand* persons have received these premiums. The number should exceed twenty-five thousand—or, at least one or more, for every Post-office in the country. *There is just as good a chance for* **15,000** *more, as for the past* **10,000.** THESE PREMIUMS ARE OPEN TO EVERYBODY, AND YOU, READER, MAY GET ONE OF THEM JUST AS WELL AS NOT, DURING THE NEXT FEW WEEKS.

The whole thing is in a "nut-shell." The next column contains a list of *first-rate* articles—not a poor thing among them. The Publishers could not afford to send out anything but the best.

IT IS EASY TO GET THEM! There are plenty of people, everywhere, who could not fail to get more useful, paying information from these columns than the paper would cost them. It wants somebody to tell them about this, and demonstrate it to them, and they will gladly subscribe, especially if some one will receive their subscriptions.

Now, we ask **Every Reader** to try the experiment during this and the next few weeks. The Publishers have an ample supply available, of nearly all the premium articles, and they will respond to all calls for them. Please see that *no one* in your neighborhood is without this paper who can possibly be persuaded to take it. You will be quite likely to secure a fine article from the prize list—something that will be useful. Look over the list, and see what is offered, and if you have not our last October number on hand, send to us promptly, and get a full descriptive list, free. YOU can get one or more of these premium articles, no matter how many premiums have been already taken in your neighborhood. There are everywhere some persons who are not yet subscribers, and almost every one can be induced to take the paper, if it is rightly presented to their notice. Please take hold of this matter, beginning to-day. If you get but two or three names this month, it will open the way, and give you experience for getting a large premium later on, or next year. Try it to-day. The "Special Notes" in the Third Column give some particulars to be read. ☞ "What you **will** to do, you **can** do."

[In the following table is given the price of each article, and the number of subscribers required to get it free, at $1.50 a year, *or* at the lowest club rate of $1 a year. For full descriptions of the articles send for our *Special Sheet.*]

Table of Premiums and Terms, For Volume 29—(1870).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required at $1.50	Number of Subscribers required at $1.

☞ *Every Premium article is New and of the very* **best** *manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-nine Premiums,* **Nos. 29** *to* **33, 56** *to* **59, 70** *to* **74,** *and* **88** *to* **112** *inclusive, will each be delivered* FREE *of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified.*

SPECIAL NOTES.

Read and carefully Note the following Items: (*a*) All subscribers sent by one person count, though coming from a dozen different Post-offices. But.... (*b*) State with each name or list of names sent, that it is for a premium.... (*c*) *Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.* You can have any time, from one to four months, to fill up your list.... (*d*) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (*e*) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N.B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for.... (*f*) Specimen Numbers, Cards, and Show-bills, will be supplied free, as needed by canvassers, but they should be used carefully and economically, as they are very costly.... (*g*) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

Description of Premiums.

Every Premium is described in the October Agriculturist, and also in a **Special Sheet,** *which will be sent* **free** *to every one desiring it. We have room here for the following only:*

Nos. 56, 57, 58, 59—Pocket Knives. —NOW FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl, too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for nothing but a little effort. These knives are made by **Mr. J. P. Swain,** whose work is equal to any done in this country or Europe. No. 56 is a neat, substantial Knife, with three blades and buck-horn handle. No. 57 is a still finer article, with four blades and buck-horn handle. No. 58 is an elegant Knife, with four blades and shell handle. No. 59 is a Ladies' Pocket Knife, a beautiful article, with four blades and shell handle.

Nos. 88 to 93.—Volumes of the American Agriculturist (Unbound). — These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is $1.50 each, at the Office, or $1.75 if sent by mail, as they must be post-paid.——They are profusely Illustrated, the Engravings used in them having alone cost about $35,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from XVI. to XXVIII., inclusive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 94 to 99.—Bound Volumes of the Agriculturist.—These are the same as Nos. 88 to 93 above, but are neatly *bound* in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 100 to 111.—Good Libraries. —In these premiums, we offer a choice of **Books** for the **Farm, Garden,** and **Household.** The person entitled to any one of the premiums 100 to 111 may select any books desired from the list of our books published monthly, (see another page), to the amount of the premiums, and the books will be forwarded, Post or Express paid. $25 or $50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands.* Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. ☞ Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 112.—General Book Premium. Any one sending 25 or more names may select Books from our published list to the amount of 10 cents for each subscriber sent at $1; or 20 cents for each name sent at $1.20 each; or 60 cents for each name at $1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Feb. 15, 1870, and for the corresponding month last year.

Gold has been less active and less buoyant in price, closing at 120¼.....There has been a pretty fair trade reported on low and high grades of Flour, prices of which opened weak, but closed with more steadiness, on reduced offerings. The medium grades have been partially neglected, and have been very irregular.....Wheat has been in quite moderate demand, and heavy, though closing pretty firmly, with less of prime Spring and Amber Winter available.....Corn has been less sought after, and has been depressed.....Rye, Barley and Oats have been lightly dealt in, at lower and variable figures..... Provisions have been offered freely, at easier rates, leading to a livelier business towards the close.....Pork rallied sharply, under extensive speculative purchases, chiefly for forward delivery.....Cotton has been fairly active, but cheaper.....Wool has attracted rather more attention, at steadier prices.....Seeds have been in demand, and held with more confidence.....Hay has been salable and buoyant.....Hops and Tobacco have been quiet, and irregular in prices. The total stock of new Hops here is given at 18,813 bales; of old, at 12,040 bales.

Beef Cattle.—The market, for a month past, has been quite steady, with much uniformity in quality of stock and valuation. The very mild weather for the season, with no snow blockades, has prevented the usual rich range in receipts and prices. The best "tops" have generally sold at rates equivalent to 17c. per lb. for dressed weight, of the fore-quarters; "good" qualities, 16c. Medium and lower grades have varied not more than ½c.@½c. The general quality is about as in former months, except an absence of the poor Texas "hoppers," so abundant last fall. There has been a considerable sprinkling of very poor cattle from the far West, which the owners say have lost them money, as they could only realize 10c.@11c. net—often not that.

The splendid fat cattle of Mr. Ayrault, of Ponghkeepsie, N. Y., have created much interest among the butchers. The particulars of these are given in an item below. **Milch Cows.**—The supply has been quite equal to the demand, with little change in prices. We notice more fresh cows for sale, "with or without their calves," but they are not good enough to command advanced prices. Good cows, if fresh, bring, with their calves, $80@$100. Medium and half-milked, $70@$80, and poor ones a long way down, towards zero..... **Calves.**—The supply of veal calves coming to market, alive, is still quite small, and the price is affected by the large arrivals of "Hog-dressed"—that is, carcasses with the skin on. Prices for live calves, 11½c.@12c.@13c. per lb., live weight, according to quality. Hog-dressed, if fat, sell at 14c.@18c., and if very extra, 19c. per lb..... **Sheep** still keep in plentiful supply, with but little change either in quality or price. Some poor ones sell as low as 4¾c.@5c. per lb., live weight. Fair lots, 6c.@6½c. Prime, 7c.@7½c., with extra at 8c. per lb. .....**Swine.**—A large proportion of the hogs now coming to market pass directly to the slaughterers, and we only hear of them as dressed pork. The market has been somewhat unsettled, and at the close of our report, we notice a decline in price. Within a week, live hogs have declined from 9¾c.@10¼c., to 9c.@10c. per lb. The closing rates for Western-dressed is 11¼@11½c., and for City-dressed, about 1c. per lb. higher.

Stock in Montana.—H. S. Clark writes: This is a wonderful country for stock. They fatten and thrive on the wild bunch grass all the year round, preferring it even now, Jan. 13th to well-cured hay. Stock keep fat and sleek here on the "Back bone of the continent," all the year on bunch grass alone. A fact which seems incredible to many eastern stock-breeders.

The Ayrault Fat Oxen. — George Ayrault, of Ponghkeepsie, N. Y., has the credit of fattening two of the heaviest pair of oxen that have ever been slaughtered in this country; and could we know the weights, we might, in accordance with the claims of the owner, and the butcher (Wm. Lalor, of Centre Market), announce them as the heaviest ever slaughtered. They were raised and fed by Mr. Ayrault, having simply grass in summer, and only grain enough, with some roots, to keep them growing well in winter, until their regular fattening was commenced, more than a year ago. They had meal morning and evening last summer, and lately have been eating twelve to sixteen quarts of dry corn-meal in three feeds, with a peck or so of sugar beets as an appetizer, and all the hay they needed. The lightest one is said to weigh over 3,300 pounds, but it is humiliating to say that we cannot give the weights of the others, because many *bets* depend upon the announcement of the weights of the quarters after hanging one week. These remarkable animals are well represented upon the first page by an engraving from a drawing taken from the living animals by W. M. Cary. The two on the right are mates, and Mr. Ayrault challenges the world to produce another equally heavy pair. Some other remarkably fat cattle, fed by Mr. A., were exhibited with them.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, *paid in advance*, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss.*

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe*, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters thus sent to us are at our risk.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

Bound Copies of Volume XXVIII (1869) are now ready. Price, $2, at our office; or $2.50 each, if sent by mail. Any of the previous twelve volumes (16 to 28) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Good Success is attending the labors of those securing premium clubs. One lady is now sending in the names for her TWELFTH *Premium Steinway Piano*! This is a good month to gather names for new clubs or to complete those under way. See page 98.

The Seasonable Advertisements filling several pages of this paper, are worth looking all through. Early orders to nurserymen, seed-dealers, etc., are likely to be more surely filled in time. All advertisers are pleased to hear from those writing to them, *where* their advertisements are seen.

The New Catalogues.—The Nurserymen, Florists, and Seedsmen have sent us their catalogues in such numbers, that we acknowledge them in a lump. They vary from the simple enumeration of articles for sale, to expensively illustrated treatises. Among several of the seedsmen, it would seem that each tried to excel the other in the elegance and pictorial character of his catalogue. This year one dealer outdoes the rest in putting in his portrait, and we expect, next year, that some rival will give engravings of his wife and babies. One thing we are glad to note, in regard to the catalogues—they show a nearer approach to correctness in nomenclature and spelling than we have been accustomed to see, and they bear witness to the enterprise of our dealers, who spare no pains in procuring novelties, and in presenting them to the public in an attractive form.

Market Gardening and Floriculture.—Mr. Peter Henderson is widely known for his long and successful experience as a gardener and florist, as well as the author of those deservedly popular works, Gardening for Profit and Practical Floriculture. He has been for some time engaged as a regular contributor to the *American Agriculturist*, and will present his experience to the public exclusively through its columns. Mr. H. will find a large circle of appreciative readers, who will be glad to have his teachings come regularly, instead of occasionally.

The N. Y. State Agricultural Society, at its annual meeting on Feb. 9th, elected the following officers: President—Solon D. Humgerford, of Jefferson County; Vice Presidents—Thos. H. Faile, Jr., of New York; Samuel T. Taber, of Queens; Julian Winne, of Albany; Frank D. Curtis, of Saratoga; James Geddes of Onondaga; Wm. M. Ely, of Broome; B. F. Angels, of

Livingstone; Richard Church, of Alleghany; Corresponding Secretary—Thos. L. Harrison of Lawrence. Recording Secretary—John Haven, of New York. Treasurer—Luther Tucker, of Albany. Executive Committee—Wm. Chamberlain, of Dutchess; Robt. J. Swan, of Seneca; Fordham Morris, of New York; Miles Ingoldsbee; W. H. Watson, of Orleans; Edwin Thorne, of Dutchess; Joseph Julian and James W. Wadsworth. The next State Fair is to be held at Utica. A resolution was passed, favoring the repeal of 20 per cent duty on animals imported for breeding purposes. Prof. Law gave an address on the diseases of Cattle.

Maple Sugar Items.—Mr. Chamberlain, author of the articles on Maple Sugar Making in the present and last months' issue says: "In the first sentence of the third paragraph of the article in January, the last clause should read "and two sheets of 12x12 inch tin." Recently a patented metallic sap spout has been brought to my notice, manufactured at Chagrin Falls, Ohio. I think it will prove superior in several respects to the wooden one described in my January article. I shall give 200 of them a careful and exact test through the entire season of 1870, and if they prove as I think they will, shall use them exclusively. I forgot to say, that maple syrup may be canned like fruit, and retain its flavor perfectly any length of time. Fruit cans in plenty are empty in time to can the syrup."

Unanswered Letters.—The large number of letters to Mr. Judd, requiring his personal attention, have recently become so numerous, that he finds it absolutely impossible to give them prompt consideration, and on this account he begs his friends and correspondents to excuse what might seem to be discourtesy or inattention. The hours in a day, and the days in a week are limited, as are human strength and endurance.

Northern Ramie.—Mr. Samuel Miller, of Bluffton, Mo., thinks that one of the Western nettles, *Urtica chamædryoides*, or *U. purpurascens*, will prove valuable as a fiber producing plant. The Ramie is a close relative of the nettle, but will not flourish at the North. Mr. M. sends us some seeds, and says that he will supply with a few seeds those wishing to make a trial of it, who will send a stamped and directed envelope.

The Blanchard Butter Essays.—Competitors should remember to mail their essays previous to the 10th of this month, that they may be received on or before that date. See notice in February, page 50.

Sundry Humbugs.—Our labors in this department are not without some humorous features, as witness: A Vermont woman, whose name we omit now, as her case is "under consideration," tried her prettiest to extract sundry greenbacks from the writer's pocket, by a plaintive story, pretty well told, concerning her loss of a husband in the war, and the crippling of a "dear boy," bearing o-n-r n-a-m-e! Said boy could be restored if his board could be paid for three months ($40), while with the doctor. Could we resist the appeal to save the boy to his mother—a boy with our *own name*, too? Not much. Our "flying detective" sped away to the Green Mountain State on a message of mercy, perchance—perchance not. What a fall to our vanity! The boy wouldn't answer to *our* name—"didn't know nothing about it"—wasn't hurt at all. Oh, dear! A name lost—but our greenbacks are *safe*, Mrs. W!.....Here come two circulars—one from Virginia—one from "out West"—both wanting a little help—just a little—to save a church. The Virginia appeal all right—the other a downright swindling scheme. *Mem. 1st.*—Those sending such circulars must take more care to establish their reliability and identity. *Mem. 2d.*—It don't do to respond to every letter or circular calling for help for churches or other enterprises, when from unknown persons!.....A Michigan swindler advertises, by circulars, a superior six-shooter Revolver for $1.25. Such a thing is not made at any such price. Several correspondents sent the money for them long since, and have written for them time and again, but can get no reply. A look at the man's circular, in which he offers also "bedroom pictures," etc., is enough to condemn him as an unmitigated villain. He that will steal purity and good morals, will not hesitate a moment at stealing money. A similar "Revolver" is advertised at Chicago for $2.....In reply to many inquiries about a variety of "doctors," we say positively, for the fortieth time, that *not one* of the doctors for eyes, ears, private diseases, consumption—and everything else—who advertise themselves, is worthy of a moment's confidence. Write a letter to them, or let them get hold of your case in any way, and it will be "your money or your life"—very often *both*. They are great adepts at working upon people's imaginations when they can get a clue to them. This, and the following, must answer a score or more to whom we can not respond by letter, for want of time. The notorious "*Rev.*" Edward Wilson still finds poor dupes, enough to pay for extensive advertising, and extensive profits on his so-called medicine. Jno. B. Ogden still keeps on confessing the "errors of *his* youth," but don't confess the errors he is leading all those into who send their money to *him* for advice or medicine. Joseph T. Inman is in the same category, with the sanctimonious addition of a "Bible House Station" to his persuasiveness. When the fools all die, these men will seek other business, and professedly "religious papers," advertising their cards, will have less sins going on to the record, for wicked advertising .....Wakefield & Co., (merely a new name,) are practising the same cheat as was described by us last month under Watson, Graff & Co., and Harrison & Co. What a swarm of "Receivers" must have been appointed to settle up Reed & Co.'s Riverside scheme, making it, if possible, a worse swindle in the end than in the beginning.....Of the Spurious Money (fac-simile) dealers, we have said enough in previous articles, in referring to Wogan & Co., Waters & Co., Lotz & Co., Porter & Co., Clement & Co., Noyes & Co., "Fourth *Street* National Bank," etc., etc. Among the new swindling names in this line, we notice Armstrong & Co., F. Porter, etc.....The Cheap Sewing Machine swindle crops out in a new place every month or so. Now we have its "Apex" towering over the top rooms of 208 Broadway—the attic of which (with Nos. 204 and 206) is a pet resort of swindlers, to the great disgust of respectable business establishments in the same building.—After looking into the matter frequently, we advise our readers that they will, in the end, have cause for regret if they send any money to any parties, anywhere, offering good sewing machines for $5, or $10, or $15, whether as special inducements to act as "agents" or not.....The "Barnegat Beach Wrecking Company's Prize Checks," and accompanying "Trivelio" recipes are swindles, and the traveling operators should be arrested wherever they show themselves..... To Georgia Lady: The Parlor Steam-Engine "bust up" some time ago, and carried with it all the dollars sent in. Nothing remains to tell where it *was*, or where it has gone to—so we can't collect that $1.....Meredith, Halstead & Co.'s Great Distribution is a myth.... Several "Music Box" swindlers are at work in different parts of the country. It is now unsafe to buy without first seeing, hearing, and having in your hands, what you are to pay for, unless it is to come from well-known reliable dealers. Thousands of ten cent mouth-reeds have been sent as $3 to $5 music boxes. (See our Jan. No.)... Several correspondents think they get bit by an "Adder," in trying to buy a 75c. adding machine. They think it is a capital instrument to *subtract* people's money, and never *add* anything to their *in*-come. Quite likely. We believe there are good adding machines, and good people selling them, and also, some of both not so good as they might be. ....One of the vilest of the vile scourges of the earth is the one calling himself the "American Purchasing Agency," who offers to supply impure books, pictures, etc. He is only to be reached by letter, but scatters the poison broadcast, corrupting and polluting the youth of our land. Well may a father write us, "with tears in his eyes, and agony in his heart," on finding in his son's room some of the vile articles this satanic being sends out for the lucre it brings him. It behooves parents to look well to what their children receive "sent carefully sealed through the mails," or get from others who do receive them thus. .....A very "Sympathizing Friend" is the Nassau-st-man, who wants all young men, 50,000 he says, who are "ruined by youthful excesses," to send him $3 each for a positive cure. We say, keep your $3 out of this fellow's hands.....Clifford & Rightor, by a great show (on paper) of respectability and large, responsible business, as manufacturer's agents, etc., have succeeded in swindling several people. We can't find them at home in Vesey street..... A batch of other humbugs must wait for next paper.

Circulars Wanted.—Will our readers please send us any circulars issued by any parties at *Hinsdale, New Hampshire?* A variety of business firms advertise at that point, and we would like to get copies of all circulars issued by these various parties during the present, and half a dozen years past. We have many, but desire a complete list, if we have not one already.

Verbenas and Roses in Winter.—The trouble that "C. N., Ridgefield, Ct.," has with these plants is mainly in consequence of keeping too high a temperature in her room; it makes but little difference whether the high temperature is produced by a coal or a wood fire. The plants, in their comparatively dormant condition during the winter season, require a temperature never to exceed 50 degrees on an average. Florists who make a special business of growing these plants never allow their green-houses to get higher than 40 degrees by fire-heat at night when the plants are dormant. The curling up and dropping off of the leaves are attributable to too high a temperature. It is exceedingly difficult to grow Verbenas well in a common sitting-room; at least one-half of the professional florists fail with them in their green-houses, mainly from the same cause, viz.: the high temperature which they are obliged to keep to accommodate other kinds of flowers.

California Grape-Vines.—Here is a horticultural humbug of the worst kind. A chap in Indiana offers California grape-vines, with a certificate from sundry people that "they grow and do better than any other grape that has been tried in this country." We have no doubt that the man sells California vines, but he has no right to try to make people think they will do well in Indiana. Here is where the humbug comes in. Why do these chaps who have wonderful plants for sale, present certificates of sheriffs, merchants, and representatives, but never the name of a horticulturist?

To Get Rid of the Ox-eye Daisy.—"T. B. R.," Alexandria, Va., asks: "Do you know any method (other than repeated cultivation) by which the 'Ox-eye Daisy' may be destroyed? It spreads very rapidly, threatening serious injury to grass fields that many of our people wish to continue in grass. This weed was much introduced during the late war in the hay used by the troops of the general government."—One of the minor results of war is the weeds that it carries in its train. There is probably no way to get rid of this weed except clean culture, and early cutting before it blossoms, so that no mature seeds shall get into the manure.

"Black-leg" in Cattle.—"E. B. C.," La Porte, Col. With reference to black-leg, Dr. Liautard refers us to Professor Gamgee's statement that Black-quarter, which is probably the same thing, has been successfully prevented by proper drainage, by keeping up the condition with oil-cake, and the use of purgatives and setons. The administration of half an ounce to an ounce of nitre in food is of great benefit. Purgatives and stimulants also should be freely administered.

Brewers' Grains Bad for Fowls.—The experience of "J. F. C.," Wrentham, Mass., indicates that brewers' grains fed freely to fowls, induces disease. Are not the fowls which run at large about breweries, healthy?

Hen-plucked Roosters.—"B. F. H.," Natick, Mass., found that his hens plucked off the feathers from the neck of a favorite Black Cochin cock. He applied castor oil to the bare neck, and to the feathers, and it proved a complete remedy.

The Hatching of Eggs can not be expedited by artificial means. It can only be accomplished in the regular time, or a little longer, if at all.

Keeping Eggs.—"H. R. D.," of Belmont, N. Y., has, for forty years, been in the habit of keeping eggs by taking them fresh from the nest and greasing them with good lard or butter, and setting them in a cool, dry place, handling them over once in a while, to keep the yolks from settling down to the shell. With him they keep six or eight months. We have had best, in fact, perfect success, by plunging the fresh eggs, a few at a time, held in a wire ladle, into a kettle of boiling water, and keeping them there long enough to count 10—say five seconds. The water must not stop boiling.

Potato Literature.—There has been a potato excitement and we are now about to have a potato literature. Best's Potato Book has an introduction by Henry Ward Beecher and contains the accounts of the competitors for Mr. Best's prizes for the methods by which they raised the greatest number of potatoes from a given quantity of seed. Price 50 cents....The $100 Prize Essay, which took the premium offered by Mr. Wylie is in press by Orange Judd & Co. Besides the Essay there are other matters of interest to potato growers. An illustrated pamphlet of about 60 pages; price 25 cts.

Roupy Fowls.—Roup is a name which really covers half a dozen diseases, and perhaps more, which, so far as we can judge, have but few common symptoms. Following a cold in the head, a change occurs, the breath smells very bad, and there is an offensive secretion about either the mouth, eyes, or nostrils. The earliest stages of the disease are indicated by a twitching of the head to one side, accompanied by a "quitt,"—then a rattling of the breath, heard best at night. This continues until the disease is well advanced. It may pass into a profuse accumulation of frothy, viscid mucus, filling the beak, gumming up the nostrils, closing the eyes, preventing eating, and destroying the bird by hunger, thirst, and suffocation. It may pass into canker of the mouth and throat, which gradually extends, inflaming and destroying the tissues, or into a diseased condition of the

whole mucous surface of the mouth, eyes, etc., causing a copious watery discharge, which causes inflammation and sores upon the gills and face, where it comes in contact with the skin. There is another disease frequently accompanying roup, though we cannot say that either passes into the other, properly. This generally affects one eye, causing a great swelling of the parts. It is usually followed by a loss of the eye, and frequently the fowl recovers. We have observed this disease—as we suppose, in two forms, which may, indeed, be different diseases. In one form the swelling is fleshy and thick, inclosing more or less watery fluid:—in the other, it is caused by the formation of a dense cheese-curdy growth, of tough nature, and yellowish white color. This growth often takes place in one of the lachrymal ducts, usually just at the entrance of the duct, and we have seen it so large that the entire eye socket was filled with a mass as large as a hickory nut. Instead of forming in the eye, this sometimes grows in the roof of the mouth and extends until it causes the greatest distress, and finally death. Taken early, any of these forms of roup may be surely cured. It is usually sufficient to give stimulating food, and wash the face, eyes, nostrils, month, and throat, thoroughly, with "Chloride of soda" (chlorinated soda—Labarraque's solution), of half its normal strength. We presume "Chloride of Lime"-water or Permanganate of soda, would be equally effective. Delay is fatal; the disease becomes contagious as soon as the fœtid odor is observable, but to what degree is not well known; drinking from the same fountain is always hazardous. Roupy fowls should be isolated at once.

Bee Keeper's Convention.—There will be a Bee keeper's convention in Albany, March 10th, one o'clock P. M., at the State Agricultural Rooms. A general attendance is requested. M. QUINBY.

Olm Bros., of Springfield, Mass., make a specialty of sending green-house and bedding plants by mail, and offer all the novelties. Their recent catalogue presents a new feature—a lithographed design for laying out grounds, which may be used for a large place or a small one, and will afford useful suggestions to those intending to make improvements.

Stables, Out-buildings, and Fences, is the title of a new architectural work which reaches us just as we go to press. The author is Geo. E. Harney, and it is published by Geo. E. Woodward. The illustrations of farm buildings, rustic work, stable fittings, and the like, are numerous, and we doubt not the work will supply a long felt deficiency in our architectural literature. Price, by mail, $10.

Norway Oats.—What Oats to Plant.—Last fall, we asked for the experience of those of the readers of the *American Agriculturist* who had raised the Norway Oat, or had tried it in comparison with other sorts. We have received a number of responses, and proposed to print them this month, but they are crowded out. The writers who have had good seed, with a few exceptions, seem greatly in favor of the Norway. The yield in some instances has been enormous. The straw uniformly extolled for stiffness, length, and leafiness. The best success seems to have been where little seed was drilled in, on good land. The plants, when not crowded, make many stalks. In procuring seed for planting, we surely would try some Norway, even if they failed last year. Other varieties should be tested also, but of the new kinds, these take the lead. They are *not* white, but of various tints of lighter or darker gray, or rather smoke color, never black.

To Save a Poisoned Dog.—"H. H. H." recommends the administration of flour and warm water, as the only effective emetic he has tried, having, by its use, saved a valuable dog which had taken poison.

Winter Butter in Virginia.—"J. F. B." writes from Greenville Co., Va., that he is milking eight very indifferent cows, and averages only 28 pounds of butter per week, from October to February, feeding corn fodder, and a pint of corn-meal, and a quart of ship-stuff, daily, to each cow. It makes him think of the cows he used to milk in Vermont, and he thinks if he had such now, he could do very well at butter making in that milder climate. This is true; and farther South it would be even better, for winter pasturage is often abundant, and might be easily provided. One great need of the South is good neat cattle. Ayrshires and Devons are especially recommended. Buy thorough-bred bulls, and gradually bring the native stock up.

Fumigating Trees.—Who has had any experience in fumigating trees in the open air, either for the purpose of killing insects, or for destroying fungi?—We are induced to make this query by an examination of a very ingenious fumigator, made by Badonio & Fteley, and which was advertised last year in our columns. If out-door fumigation is really useful, this implement will apparently accomplish it.

Winter and Spring Barley.—"C. H. G." There is no difference between them, except that the winter barley has, by being repeatedly sown in the autumn, become hardy and stands the winter.

Gypsum in Tennessee.—W. T. Waters.—As long as plaster costs you $35 per ton, or even $25 per ton, it will probably not pay you to use it as a manure.

Petroleum for Roofs.—"Will not petroleum make roofs more inflammable?"—If the roof catches fire, the petroleum would favor combustion; but a roof treated with petroleum is not as likely to catch fire from sparks. It fills up the pores, and the wood becomes hard, firm, and smooth.

Lime Kilns.—An article on kilns in September 1867, gives some valuable details with engravings.

Forest Trees from Cuttings.—"A. W. W.," Muscotah, Kansas. The only trees likely to succeed from cuttings, except in the hands of an experienced propagator, are the Willows and Cotton-woods. Of these the cuttings are best taken before the sap starts in the spring. The article on Hedging, in February, gives directions for planting them. Other trees are best raised from seed.

Flower Seeds Gratis.—Mr. Chas. D. Copeland, of Lima, Livingston Co. N. Y., writes that he has a considerable surplus seed of "Fancy Pinks" and "Sweet Williams," embracing German, French, Italian, China, and Japan varieties, and he will be happy to send a free paper of the seeds, mixed, to any subscriber of the *American Agriculturist* who will furnish him their address, with a Post-office stamp, for the postage. He will find it a larger job than he has looked for, but he is willing to risk it, and we vary from our general rule not to publish such offers. One of our subscribers formerly offered to send a descriptive circular of a certain breed of animals. After distributing 13,000, at a cost of 10 cents each, he was glad to beg us to withdraw the offer.

Trouble with a Seed Drill.—A subscriber of the *Agriculturist*, in Georgia, writes that he has bought a wheat drill, that it sows dry wheat well, but it will not sow wheat that has been treated with a solution of blue vitriol. Neither would it do so after the wheat had been rolled in ashes to dry it. If the difficulty cannot be overcome, he says the drill is of no use to him. He does not mention the name of the drill. With a "cup" drill, we have never had any difficulty in sowing vitrioled wheat. The only remedy we can think of is to use a stronger solution of vitriol. Turn over the wheat repeatedly, or run it through a fanning-mill until it becomes dry enough to sow. The vitriol will not injure the wheat if kept dry for several weeks before sowing. Ashes or lime should not be mixed with the wheat immediately, as they will neutralize the vitriol. But after the application has destroyed the fungus on the wheat, the ashes or lime would probably do no harm.

Timber in Southern Indiana.—"A Subscriber" has 75 acres of heavy timber two miles from a Railway station, where it is worth $3 per cord. Shall he clear it or not?—No. We think, if he holds on, it will rise in value so as to pay not less than 12 per cent interest per annum for several years, and if the trees are second growth, they are gaining 3 to 8 per cent per annum.

Manuring Corn.—"L. W. G." Barreville, Pa., proposes to plant thin sward land limed, with corn, and intends "to put one handful of dry cow dung without straw on each hill." He is in doubt, whether to mix plaster or lime in considerable quantities with the manure. Of course he should use plaster, for thus, any ready formed ammonia present, and liable to escape would be saved, while lime would drive it off if not immediately buried. Besides the soil has probably lime enough.

Improvements in Field Rollers. Mr. N. G. Jenkins, of Brookside, N. J., suggests some improvements upon the plan of making rollers, described in the January number. His suggestions are excellent, but he, perhaps, does not remember that we describe one that any farmer may make, with only a little help from the smith. "I would make the drums not less than 3 feet in diameter, which gives lighter draught, as well as greater weight. In place of the 1¼ plank in the centre, I would substitute a piece of iron, ⅜ x 4 in., passing through the inner timbers of frame-work, with nuts upon either end; this would allow the drums to run closer together, say not more than 1 inch apart. In place of the journals I substitute a rod of 1-inch round iron, running the entire length of both drums and frame. The rod remaining stationary, I use cast boxes, running through the head of each drum, with flanges on the same, and bolt through the heads. The rod can be drawn out at any time for repairs, or other purposes. I use old tire from wagons, and hoop the drums at each end, and put dowels in the centres of the drums, to keep them in place, and also arrange a seat for the driver over the centre of the roller, which is both easy and convenient."

The Monte-Bello Apple.—Thos. Gregg, Secretary of the Warsaw, Ill., Horticultural Society, writes: "Permit me to thank Mr. Charles Downing for calling attention to so valuable a new apple as the Monte-Bello, noticed in your January number. The sketch given does not, however, do justice to it. It is regarded by the members of the Warsaw Horticultural Society—which has the honor of bringing it into notice—as one of the very handsomest, as it is one of the very best fall apples known; and as the few trees in existence are hardy, and good bearers, it is deemed a great acquisition. It is a remarkable fact in horticultural history that a variety so valuable should have existed in a community for over twenty years almost unknown. Now that our society has brought it to notice, it is exciting much attention, not only abroad, but at home, where its merits should have been recognized before."

Bots in Horses.—A subscriber who believes that "a great many horses are killed by the bot grubs in this section" wishes a remedy. It is a remarkable fact that though every quack horse doctor in the land attributes all sorts of evil and fatal effects to the bot grub, no educated veterinarian believes that they do much harm. The best books on the diseases of the horse say, they do little or no harm; and the man of all others who made the different kinds of bot flies and grubs his especial study (Bracy Clark V. S.) thinks, they do good, rather than harm. One thing is certain—there is only one thing to be done—that is let them alone. They are now nearly full grown and will detatch themselves and quietly pass out in the course of the season.

What is a Ton of Manure?—Peter Henderson says: I must have had over a hundred letters during the past year, asking me how many bushels of manure go to make a ton or how many tons are in a *cord* of manure. These letters still come asking the same questions, exhausting not only my stationary but my patience in answering. One would think that the slightest reflection would show that the condition of the article—wet or dry—solid or light—would so affect the weight, that no comparison between measurement and weight could be given. A little exercise of judgment, will make it apparent, that weight only, is the fair test of value; for if it takes 50 bushels to be a ton, costing $2, it is likely to be of no more value than 25 bushels would be, having the same weight; for the one article would be strawy and loose, the other moist and solid.

Van Buren's Golden Dwarf Peach and Horse Plum.—J. Beachy, Preston Co., W. Va. The Dwarf Peach is worked on the common peach stock, and retains its dwarf character. The Horse Plum is a purple variety, also known as Early Damson, but we cannot tell if it is your common plum.

Eumelan Grape.—Mr. F. R. Elliott, in a recent letter, says: "I notice you are offering the Eumelan Grape among your premiums as compensation for labor in obtaining subscribers. Perhaps no grape of very recent introduction better merits approval. Like the Delaware, it is a sort with which in quality of fruit we may hope to tone up and improve public taste, while realizing a profit in its sale. I have watched the growth of the vines for two years, and they compare favorably in all respects with any and all other varieties. My valued friend, Prof. J. P. Kirtland, fruited it the past season, with, I think, as good or better promise of value, as any other young vine of whatever sort. The question comes to me almost daily, 'What grape do you advise to plant?' and I reply, plant mainly of those you have heretofore known to prove profitable in your section and like soils; but of the new black grapes don't fail to plant some of Eumelan, as a grape of promise. I have known several acres of it planted the past year resulting in uniform and satisfactory growth, giving good cheer to the enterprizing planters, who doubtless congratulate themselves on their foresight."

Cabbage Insect.—"R. B. K." Sprinkling the young plants with ashes and plaster keeps off the "black louse." We suppose the "large white grub" referred to is the larva of the May-bug. No remedy short of digging it out and killing is known for the White-grub.

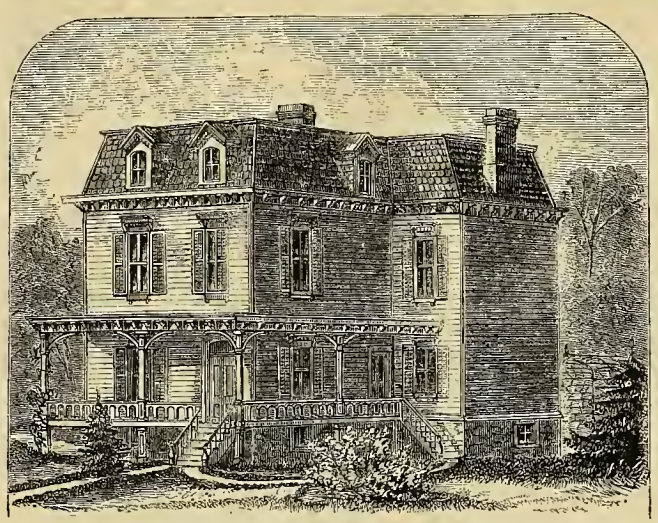

Fig. 1.—FRONT OR SOUTH-EAST ELEVATION.

A Convenient House of Medium Size.

Half-a-dozen houses, alike in plan, and differing a little in size, are now being completed in Flushing, L. I. They are designed to furnish comfortable homes for such as desire a convenient house, at a cost of about $5,000, exclusive of land. They were planned by the senior Publisher of this Journal, who has a fondness for mechanical constructions, as a pastime, especially in the way of house-building. **The Elevations** are seen in figs. 1 and 2. The houses face southward to the street, and fig. 1 shows a view from the south-east. Fig 2 gives the opposite, or north-west view. It will be seen, by fig. 2, that the rear is almost as tastefully finished as is the front. As previously remarked in these pages, people see their own houses from the rear oftener than from the front; and their own taste and self-respect should be consulted, by having the house look well on all sides—not a fine front for show to others, and a cheap look in the rear for their own habitual observation. Besides, few houses are so situated as not to be seen on every side from some point. A few dollars in window caps, etc., make all the difference....The siding (fig. 6) is of 10-inch boards, a full inch thick, and grooved in the middle, to give the appearance of narrow boarding. The lap is 1 inch, which

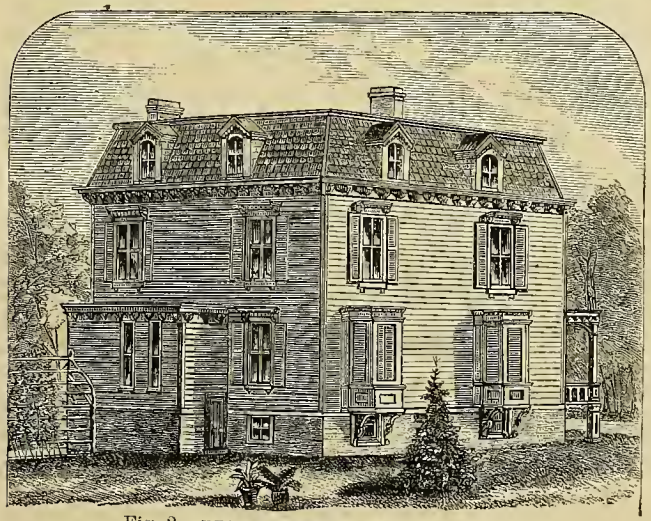

Fig. 2.—REAR OR NORTH-WEST ELEVATION.

prevents the entrance of cold air. This siding is to be greatly commended. The joints are very close, and but half as many as in ordinary clapboarding. These thick boards add greatly to the warmth and solidity of the walls. With such siding, the house is many times stronger than with ordinary clapboards, though the upright timbers be only half as large. The cost is but little greater.....Bricks, laid in mortar, with an open space on each side, fill all the walls, from the cellar to the roof. The Mansard-Roof is covered on the sides with blue slate, laid over a double thickness of felting, and on the top with heavy tin. The Mansard-roof is set more perpendicularly than has been the usual custom. This makes the rooms in the third story very commodious, and it improves the general outside appearance.....**The Cellar** is of brick, nearly five feet out of ground, with large windows. Except in very cold localities, houses are generally set too low. It is more healthful to have the living rooms well above the soil in all cases. The cellar is lighter, and more airy, and, if desired, may be plastered and used for laundry or cooking purposes.

First Story, fig. 3.—Hight to the ceiling, 10½ ft. The *Piazza*, *P*, supported on brick piers, extends around two sides, with banisters, and front and side steps. The *Front Hall*, *A*, is wide. This always gives character to a house: a narrow entrance Hall dwarfs an entire house. A side door, under the stairs, opens on to the side piazza. The *Parlor*, *B*, is ample for all ordinary purposes, and is much improved in convenience, pleasantness, and apparent size, by the Bay-Window. Double windows open down to the piazza floor in front. *Bk* is a bell-pull to the kitchen.—The *Living* and *Dining-Room*, *D*, is of good size, and is also improved materially by the bay-window. These bay-windows also add much to the outside look of the house, as is seen in fig. 2. Closets are marked at *E* and *c*. This room communicates, by doors, directly with the Parlor and Kitchen, and also, through the hall, with the front and side doors, and the cellar under the stairs. *B3h* is a bell-pull to the third story hall (*Q*, fig. 5), to call servants or others from that floor. The *Kitchen*, *C*, is of ample dimensions, with Pantry, *E*, and small pantry, or hall, *F*, opening out upon the rear steps. The great feature of this room is the convenience of water and washing fixtures, which should be in every house, even though the expense be cut off somewhere else. A "Victory" Cooking Range, *r*, with water-back, connects with the 30-gallon Copper Boiler, *b*. The Force-Pump *fp*, in the corner, draws water from the reservoir through tin-lined pipe, for the sink, *s*, and, when required in a dry season, it fills the supply Tank in the third story (fig. 5). A stop-cock, over the sink, also supplies hot water to it. The two stationary wash-tubs, *w w*, are supplied with hot and cold water pipes and stop-cocks, and large waste pipes. This arrangement saves all lifting of tubs and carrying out water, and furnishes hot and cold water always at hand. The ordinary fire keeps 30 gallons always hot. Where there is much washing to be done, it is equivalent to saving half the labor of one woman. The entire cost (excluding the Range, which saves the cost of a cooking stove), but including all pipes, third story tank, etc., is less than $250—involving an annual interest of less than $20. It is worth $100, or more, to every housekeeper, and will save that sum in hired help, in strength, and doctor's bills. Let all house-builders look to procuring boilers, and stationary wash-tubs. Those who have not looked into it can hardly appreciate the great advantage of them. The tubs, tank, and pipes, are placed on the south, or warmest side of the house, and kept away from the walls with double plastering behind them, which prevent winter freezing. *Ventilators* are in every room in both stories.

Second Story. *Fig.* 4.—Hight to ceiling 9 feet. The wide hall gives a convenient bedroom, or store-room, at *L*. The front chamber, *G*, has two closets, *c*, *c*, which are not only convenient, but with the arch thrown over between them, they give the appearance of a bay-window, and brake up the box-like look of any room. This is intended for the family bedroom. On the right side, over the bed, is, *Bk*. a bell to the kitchen; *B3h*, a bell to the 3rd story hall, to call servants in the morning; *Sk*, a speaking tube to the kitchen to talk with, or give orders to the servants or others there, and, *Sfd*, a speaking tube to the front door, opening just over the bell, to speak with any caller at night, without having to dress and go down. These little contrivances cost no great sum, and are a material help in saving woman's steps. They are built into the walls when constructing the house. *Sk* in *H* is a bell-pull to the kitchen. There are two closets *c*, *c*, in this room. The chamber *I*, has a closet, *c*; room for a full-sized bed at *y*, and a wash-sink at *S-hcw*, with stop-cocks over it in pipes carrying hot and cold water. The waste-pipe is large, so that, if preferred, it can be used as a chamber-slop sink. This arrangement saves all carrying of water up and down stairs, and gives constant hot and cold water on the second floor. If desired, a bath-tub can be placed in *I*, by simply connecting it with the hot and cold water pipes, and its waste-pipe with the sink-waste. The house is designed for a large family (8

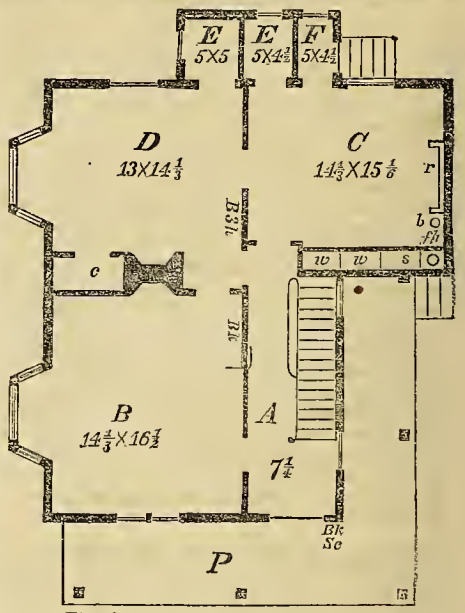

Fig. 3.—FIRST STORY—FLOOR PLAN.

sleeping rooms), but if this room (*I*) is not needed, it can be readily converted into a bath-room, store-room, etc. The stairs to the Third Story are omitted by the engraver. They are directly over the lower flight, the entrance being at the left of the door to *L*, with a half turn in the

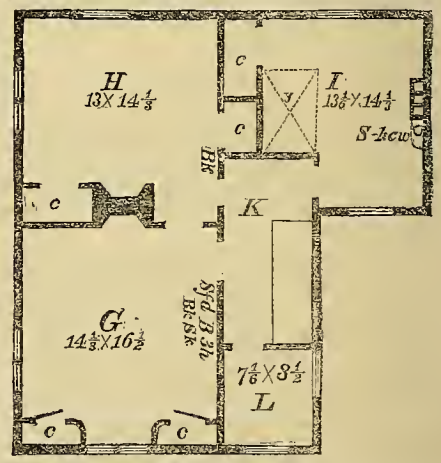

Fig. 4.—SECOND STORY—FLOOR PLAN.

steps. It will be noted in fig. 3, that the Main Hall, *A*, is well lighted by a side window at the foot of the stairs.

Third Story. *Fig.* 5.—Hight to ceiling 8½ feet. This has four finished bedrooms also, as shown on the plan. They are full size to 4 feet high, and the slightly

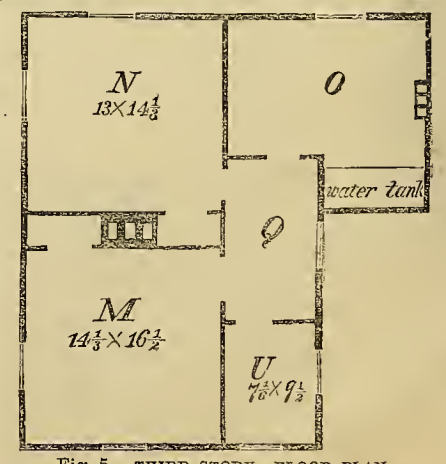

Fig. 5.—THIRD STORY—FLOOR PLAN.

inclining Mansard-roof and dormer windows, render them almost equal to the rooms in the second story. *U*, is nearly large enough for the largest sized bed. The *Water Tank* holding 450 gallons, receives the water directly from the

upper roof, and when full, the surplus water flows down to the large receiver outside the house. The room *O*, is plastered and may be used as sleeping-room, or store-room.

Other Items.—Ample drainage is provided for the cellar, sinks, etc. A Grape Arbor runs back to the privy, which is flat-roofed and enclosed with an L of the arbor and lattice-work screens, so as to effectually hide it from view. The window-caps and cornices are more ornamental than shown in the engravings. The second cornice, at the top of the slate, adds to the beauty of the roof. The mouldings in the first story, (fig. 7,) are a new pattern, designed by S. B. Reed, architect, which secures larger ornamental mouldings with the same cost of timber, than any pattern we have before seen. It is cheap, quickly put up, and does not shrink open. The middle piece is cut from a board less than an inch thick....It will be seen that there is not an inch of waste room in the house, while there is a large amount of room in proportion to the amount of walls. Ten closets or pantries are provided. All doors well grained in walnut; all woodwork, outside and in, 3 coats paint; dining-room and kitchen grained in oak; Parlor in colors; upper rooms white; stair newell, railing, and turned banisters, solid walnut. Gas-pipes to every room, from cellar to attic.

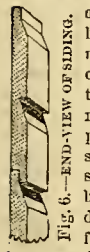

Fig. 6.—END-VIEW OF SIDING.

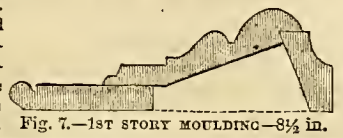

Fig. 7.—1ST STORY MOULDING—8½ in.

Cost.—This will depend upon location, etc.; but with proper economy, it may be built for about $5,000, exclusive of land, everything else included. In this case, all materials are bought of first hands, at lowest wholesale, net cash rates. The work is done by active, expert workmen, by the day, with an efficient superintendent, (Mr. John Donald), with favorable weather, etc., and the cost, all complete, is about as follows: Timber, $250; Lumber of all kinds, $760; Mason-work and material, $970; Carpenter-work, $750; digging Cellar, $15; digging and stoning privy vault, $15; Grading, 35; Painting, $265; sashes and glazing, $110; Blinds, $50; Slate and tin, $280; Plumbing, drains, and Range, $290; Stairs, $120; Stoops and Piazza railing, $165; Arbor and Privy, $60; Fencing, $100; Side-walk, $25; Hardware (nails, locks, etc.), $130; Mouldings, $85; doors, $90; 4 Italian Marble Mantels, $140; Grates and summer-pieces, $60; Gas-pipes, $40; Interest, $110; Carting and Sundries, $185. Total, **$5,100.** Land, $1,000. N. B.—Part of the houses are one foot smaller (6 inches on a room) than the plans here shown, and that is the size here estimated for. The larger size costs about $150 more. With ordinary workmen, and with materials purchased on credit, at retail prices, the cost would run from $500 to $800 more, here. A cheaper style of finish, inside and out, would materially reduce the cost. Among items of cost in these houses, we reckon: best nails at 4½c.; tin roof, 10c. per foot; slating, 14c; gas-pipe, 15c. per foot; timber, 2½c.; siding, planed and grooved, 42 cents per 10-inch board; bricks, $8½ per M; blinds, unpainted, 40c. per foot; parlor moulding, 8½c. per foot; mason work, $4.50 per day; tenders, $1.75; carpenters, $3.00 to $3.25, etc.

Plumbing Specifications.—As a matter of information, not generally understood, we give the specifications for the Plumbing work: "In third story, line Tank (6 ft. long, 3½ ft. wide, 2¾ ft. high), with 4 lb.. per ft., sheet lead; the sides of tank lead to be "tacked": all seams to be heavily soldered, and all inlets and outlets to be flanged over and soldered. Put in 3-inch inlet, with 4-inch overflow, to connect with leader pipes.....In Kitchen, furnish and put up one 30-gallon copper boiler, round, riveted head, Croton pressure, set on Lockwood's stand, properly connected with waterback in range, and a ¾ *aa* lead pipe, with ⅝ sediment brass cock, to connect at the bottom with waste from sink.....By side of Boiler, furnish and put in one cast-iron sink, 30x20, to be supplied with hot and cold water, through ⅝ 2lb. lead pipe, and two brass ⅝ Bibb's cocks. Also, where shown on plans, fit up two wash tubs, with right and left cocks. Waste from wash tubs and sink, through 2-inch lead pipe, properly trapped, to connect with earthen pipe leading to drains. Cold water supply for wash tubs and sink, to come direct from pump; also, run hot water pipe from the boiler up over top of tank, to prevent accident..... Furnish and put in one 2½-inch Douglas suction and force pump, suction to be 1¼-inch 2½ lb. tin-lined lead pipe, leading to within 4 inches of bottom of cistern; the rising main or supply pipe from pump to empty over top of tank, through 1-inch 2½lb. lead pipe, with valve to stop return of water from tank to sink.....Also, where shown on plans, furnish and put in one quarter circle galvanized iron sink, 27x14, supplied with hot and cold water through ⅝ 2½lb. lead pipe, with ⅝ Bibb's cocks. Waste from this sink through 1½ lead pipe, properly trapped, to connect with earthen pipe leading to drain. All pipes to be put up with lead tacks and screws, with all necessary stop-cocks and traps: trap screws to be put in all traps. All to be done in a workmanlike manner, and warranted for one year, damage by frost excepted."

Bitter Butter.—J. G. Caulkins, Dutchess Co., N. Y., says: "When the milk is brought in and strained, set the pans, one at a time, over a kettle half full of boiling water, and let them remain until the milk is *thoroughly scalded*; this is to be repeated the next day, and the milk then set aside in the pantry adjoining the sitting-room or kitchen, and kept comfortably warm until fit to skim; the cream is to be kept in a loosely covered jar, in the same temperature, and well stirred every time fresh cream is added, and churned at least once a week; the butter will be as sweet, and almost as rich as in June or October. If an Orange Carrot be grated fine, a little warm water poured on it, and the juice pressed out, strained, and stirred in the cream before churning, the butter will be of a beautiful golden yellow."

Swelling on Cattle's Jaws.—"W. J. T.," of Florence, Iowa, writes: "I have often noticed a large swelling on the jaws of steers, and sometimes other cattle, which appears very painful, often reaching the size of six or eight inches in diameter, and finally resulting in the death of the animal. Will you tell me the cause of this, and the cure, if there be one?"—Dr. Liautard, of the N. Y. College of Veterinary Surgeons, says: "The swelling on the jaws is probably a disease of the maxillary bone, called *Osteo-Sarcoma*, which is a fibro-plastic degeneration or growth of bone. The causes are generally unknown. At the early stage, the application of blisters or some iodine ointment may prove successful treatment, though, generally, the disease terminates fatally."

To Prevent Dogs Killing Sheep.—In a private letter to an Editor of the *American Agriculturist*, our veteran friend, John Johnston, writes: "If you put a good sounding bell on one of your Cotswold sheep, the dogs will not be so apt to hurt them; but the best thing I ever tried is a little strychnine on a piece of meat—and if the meat is tainted, they find it better. I have often got rid of dogs in this way. Put it around your yards in the evening, and if the dogs come, you will find some dead ones in the morning. I once got two in a morning, and several times one."

Egg-eating Dogs.—"W. C. G." of Boston suggests a specific for Egg-Eating Dogs viz: "Blow an ordinary hen's egg, expelling the entire contents, stop up one end of the shell with wax. Then fill it from the other end with strong spirits of ammonia, or 'Hartshorn.' Seal that end and then put it where the dog can get it. If he crushes it, he will never be desirous of repeating the luxury of egg-eating. After the dog has had one Ammonical feast, a little of the fluid poured into the nest, will remind him of the fact, that, he once was burnt, and also will serve to cleanse the nest from vermin."

Seed Peas.—"J. M. C.," Ohio. Our seed dealers have their peas raised in Canada, and in parts of New England, where the "bug" is not troublesome. It is stated that peas sown in June will be so late that they will escape the attacks of the beetle.

Salting Cabbage Plants.—"G. W. T.," Rahway, N. J., considers salt necessary to the best development of the cabbage, especially in places far from the coast. He finds them more crisp, of better flavor, and to keep better when salt is used, than without. He uses it as follows:—"A few days after setting out the plants, and when they are damp, either after a rain or when the dew is on, I take a small dish of fine salt and walk among the rows, sprinkling a little *pinch* of salt on the centre leaves of each plant; when the leaves begin to grow, I repeat the salting, and when the centre leaves begin to form the head, I apply salt again, scattering it over the leaves; after this I look them over occasionally, and if I find any plants that do not head well or appear diseased, I sprinkle the salt over freely; this will save all such plants. A quart of salt is sufficient for 500 plants in a season, although more can be used with safety."

Field Peas.—"R. C.," of Colorado, writes that he has 300 hogs, and wishes to know "the best variety of pea to sow broadcast, for fattening them the coming season." He would prefer a pea that would give two crops a season, as his land is "hard to keep clean of weeds." We do not know what variety will be best in his climate. We have found the common Canada Creeper as good a variety as any we have grown for feeding hogs. Will some of the Canadian readers of the *Agriculturist* favor us with their experience in raising peas for pigs, the best varieties, etc.?

Spaying cows for milk.—"R. S." Amenia, N. Y. This practice is recommended by those who have tried it as having several important advantages. It secures more milk, of better quality, and the flow is constant. The perils of gestation and calving are avoided. It should not be performed until the cow has reached her full flow of milk—say six years old—and it should take place just before she would naturally come in heat the first or second time after calving. She will continue to give milk, if well fed, in a very gradually diminishing quantity and improving quality, until she becomes fat enough to kill. This will be in from two to five years according to milking and feeding, and her tendency to fatten.

Plum Trees.—M. C. Walton, Penobscot Co., Me., lost two plum trees. The stocks were 4 inches in diameter, and the graft 8 inches. The trouble was caused by grafting on a slow growing and unsuitable stock. With trees of this size we can suggest no remedy. Young trees, if grafted low, might have the junction set below the surface of the ground, and some longitudinal slits made through the bark at the point of union.

Laying Out a Vineyard.—"J. W.," St. Louis Co., Mo., finds laying out a vineyard by the use of a line to be too slow work, and asks if we can suggest a quicker one. By the use of flag stakes, a good plowman will run a very straight furrow. By running furrows in both directions, at the proper distances, the intersections would give the stations for the vines. We cannot say how much quicker this would be than the use of the line, but it would require fewer hands.

Alton Nutmeg Melon.—Wm. Elliot Smith, Alton, Ill., writes that he cultivated fifteen acres of this melon, with very satisfactory results. The vines were well cultivated, bore astonishingly, and the fruit brought good prices. We have no doubt that fine crops of melons have been produced at Alton. The question which interests cultivators is: Is there a distinct variety which originated at Alton?—The drouth prevented our making a fair trial, but we had some good fruit. Others, who received their seeds direct from Alton, say it produced all sorts of melons. Does the Alton Horticultural Society endorse the Alton Nutmeg as a distinct variety?

Yellow-birds.—"M. B.," Williamsbridge, wishes to know how to keep yellow-birds out of his garden, as he finds them very mischievous. A small windmill, so arranged as to make a clatter, might answer. Who has had experience?

Stone Fence Laying.—Thos. Lawson of Missouri asks directions for laying stone fences. It is hardly possible to give directions without knowing the character of the stones, the kind of soil, its liability to be heaved by frost, etc. We have seen old stone fences not less than four feet high, and not more than 16 inches wide at the bottom, perhaps 8 on the top, and laid on the top of the ground at that, which had stood to be gray with mosses and lichens, while other walls 4 feet wide at the bottom, having a base of boulders half sunken in the ground, and laid up in the most careful manner, which after three years was toppling down in spots from the effects of the frost. A light wall will stand on loamy, sandy or gravelly land which has good drainage. As the land contains clay and moisture, the wall should be heavier, and laid with special precautions. An article on this subject in the *Agriculturist* for September 1866, illustrates the different ways of protecting walls from the effects of frost.

Dominique vs. Dorking.—We like the Dorkings greatly, but still consider the characteristic fifth toe a deformity. Our esteemed correspondent, Mr. F. R. Elliott, thinks otherwise, as he writes—"I fail to see the 'deformity' spoken of as being in the 'fifth toe.' To me it is no deformity—only a characteristic of the breed,—as much as the penciling of the feathers is in that of the Dominique,—and when fowls are well bred, that fifth toe is as well separated as the others on the foot. Some years since I bred Dominiques, as well as several other breeds, but never have retained any breed except the colored Dorking over two years, and simply because they have not proved as profitable. My Dorkings give me eggs almost continually, except when moulting. At six months old the male birds dress from five to six pounds each, and the females four to five pounds. They are full, round, and plump for the table, and the flesh is second only to the Game."

Hail.—"J. M.," Goshen, Ind. Hail storms come so suddenly that we know of no precautions that can be taken to save your glass from breakage.

Mixing.—"R. B.," Kinsey, Pa. Potatoes, cabbages, beets, rhubarb, and radishes, will not mix if planted near each other unless you raise seed. Corn shows the mixture the first season. Pumpkins, melons, and cucumbers do not mix with one another; the different varieties of each crop readily, but the mixture does not generally show itself in the fruit until the next generation. Varieties of beans and peas mix more or less, probably by the agency of insects.

Look after the Little Pigs.—Thousands of little pigs are frozen to death every spring. Where the pens are not suitable, it would be better not to have them come until the weather is warmer; but still, much can be done to make an ordinary pen comfortable for the occasion. Batten the sides, or pile a quantity of straw or litter on the outside. Anything that will keep out the cold air will answer. Place some rails or boards across the sleeping apartment three or four feet from the bottom of the pen, and cover them with straw packed in tight. If the pen or sleeping apartment is large, we have found it a great advantage during a cold night to hang, after the sow has made her bed, a couple of horse blankets from the top of the pen around the sow, somewhat after the fashion of curtains on an old-fashioned tent-bedstead. In this way we have saved a litter of pigs in the coldest weather. A few bags of steamed chaff placed around the bed inside the curtains, would be a great help, or, in the absence of these, a pailful of boiling hot water will raise the temperature of the pen several degrees. In a few days, and often in a few hours, if the pigs are strong, the danger is over.

Little Pigs losing their Tails.—"W. O. J."—We think this is caused by a kind of fungus which grows around the tail and "girdles" it. When the tail is girdled all around, there is probably no remedy. But if taken in time, the tails may be saved. Try a little crude petroleum. It may prevent, if not cure, the trouble.

Hen Lice on Horses and Cattle.—Hen lice never stay long upon a human being, hence it is no wonder that people argue that they do not long annoy horses or cattle, if by any means they get upon them. This is a mistake. Cattle, horses, and hogs, kept near chicken roosts which are infested with the little wandering louse, are often greatly annoyed. Dr. Linntard assures us that he has known a horse to be infested with them for one or two months, and that they were present in such numbers that he felt at the time that they must be breeding. He compared them under the microscope with lice from hens, and proved them identical. Hogs will scratch and rub themselves almost raw, if similarly annoyed, but cattle do not seem to mind it much. We think any kind of soap-suds will remove them from other animals, and carbolic soap banishes them for weeks from both the hens and their roosts.

Brush Chopping Machine.—"D. L. H.," Ohioville, N. Y. Tim Bunker is not in the habit of drawing upon his imagination for facts. Parties manufacturing these machines to go by horse or steam power, should put them before the public by advertising. They have a good thing and should let the world know it.

Best Oil for Carriage Wheels.—"F. S. C.," Cambridgeport, Mass.—We have used castor oil, and think it better than any other oil for smooth-running axles. For wagons and carts, tallow is equally good.

Carriage Tops and Curtains kept soft with neats-foot oil, will not crack. Patent leather, should never be used about carriage tops or harnesses in places where it has to be bent.

Black Bass.—"B. H. E.," Pine Plains. The best months to stock ponds with black bass, are October and April, but it can be done at any time when the fish can be caught. They hybernate in holes, and do not take the hook in winter. In hot weather it is difficult to remove them, but with ice and care it can be done.

Oil Barrels for Cider.—"E. R.," Rushville, O., wishes to know if barrels which have contained carbon oil, can be rendered proper to use for cider.

Comparative Value of Raw and Cooked Food.—A correspondent in Illinois, asks for a table showing the comparative value of raw and cooked food. We know of no such table that takes a sufficient account of attending circumstances, to be reliable. So much depends on the condition of the animal itself,—on the conditions under which it is kept,—and the quality of the food before cooking, that it is very difficult to determine to a nicety, just how much benefit is ascribable to the cooking. At the same time,—in the opinion of all practical men who have tested the matter in their own operations,—thorough cooking is held to save from one-quarter to one-third of the food. Grouven,—a German farmer,—steams food for 80 head of cattle. He gives the food at about the temperature of the blood. His brother, Dr. Grouven, says: "Had it been served cold it would take the cattle from half an hour to an hour to raise their food to the temperature of that which was steamed. The food is thus rendered not only easier, but quicker of digestion. Scalding, allows cattle to swallow food quickly, but does not make it more digestible. Steamed food is already half digested, therefore, rapid swallowing is not injurious." Boiling food, lies between the two methods; it has the disadvantages of the one, without the advantages of the other.

Remedies for White Grubs.—A correspondent writes: "A good coat of unrotted manure, plowed in six or eight inches deep, is almost a specific against white grubs in corn or potatoes." We suppose the grubs work in the manure and leave the corn plants alone. Plowing under clover, immediately before planting, often has the same effect. The same writer also says: "I once had a piece of meadow that had been destroyed by grubs. I turned some pigs into the field and they devoured the grubs with a will, and left the meadow in good condition to re-seed."

What to do with Gas Lime.—1st. Haul it upon the land and spread it, breaking the lumps, at any time, when it can lie exposed 6 or 8 weeks. 2d. Compost it in a big flat heap with sods, muck, leaves, or wood mould, where it can be occasionally stirred or worked over with a plow. 3d. Lay it in heaps and shovel it over now and then for two or three months before using it upon or near growing plants.

Stamps upon Notes.—"Many Farmers." The provisions of the law are as follows: Bank Checks, Drafts, or orders on Bankers, or other parties, payable at sight or on demand, *for any amount*, require a 2c. stamp; Bills of Exchange, Drafts, and orders for the payment of money otherwise than at sight, *all* promissory notes, checks, receipts, memorandums, printed or written, showing evidence of an amount of money to be paid on demand, or at a time designated, for one hundred dollars or less, require a 5c. stamp, and for every additional hundred dollars or fractional part thereof, another 5c. stamp.

"Market Gardener," Rockford, Ill., in growing market and seed crops, has much of his land unoccupied from August 1st until June, and wishes to know what he can sow to plow under as a green crop. Buckwheat would answer, as would peas and oats, sowed together, to be turned under in the fall. Rye would do best for those parts which are to be plowed under in spring.

Sledge-hammering Bones.—This is easy to write, but, work at it an hour, and see what a small heap of broken bones you will have for the labor. Bones will decay somewhat in a good hot compost heap, and in overhauling the heap, may be pitched out, and, when dry, will crumble under the sledge. On the same principle they may be put into half a molasses hogshead, covered with hard-wood ashes and pretty well moistened. Those which do not soften after two months, so as to be easily mashed, may be sledged.

Lime and Salt Mixture.—"A. C.," who has mixed 100 bushels of oyster-shell lime with 12 bushels of refuse salt, wants to know how long before the mixture will be fit to use, and what to do with it. —The true lime and salt mixture is made by using a strong brine to slake lime, in which, parts of each undergo chemical changes. In such a mixture as our friend has made, the ingredients remain unchanged, and it is but little, if any, less in value than if made as above. It may be used at once, and applied directly to the soil after plowing, or mingled with muck or other vegetable compost.

Questions About Ashes.—"Subscriber" asks, 1. "Are strong unleached ashes good to put in the hill with potatoes?"—No. Put them on the hill when the plants begin to break the ground. 2. "Are they good to put in the hill with corn?"—Yes. 3. "Are they good manure for cabbages?"—Excellent. 4. "Are they good for sweet potatoes?"—Doubtless. 5. "Are they good to compost with animal manures?"—No; except in small quantities, when plenty of dry muck or soil is employed. From strong nitrogenous manures ashes liberate ammonia. It is a good plan always to mix soil with ashes before using them in contact with seed.

Hen-house Manure is best preserved by being mixed with dry soil and worked over as often as it heats, until it is fine. It must be used with caution, even if mixed with four times its bulk of earth.

Cost of Keeping Sheep.—This depends on the kind of sheep and how they are kept. We recently heard a farmer remark that his sheep last summer cost him nothing. They lived on the summer-fallow, and this, he said, produced more feed than his pastures—which is saying little for his system of fallowing. When pasture costs little or nothing, and when sheep are wintered principally on straw, with say a bushel of grain a day for 100 sheep, most farmers would not estimate the cost of keeping a sheep at over $3.00 a year. But when sheep are pastured on grass, that could be cut with a machine, and a good crop of hay obtained at slight expense, the cost of pasturing a sheep is very considerable. The English farmers estimate that good pasture will keep 5 Long-wooled sheep per acre, which would be equal to about 8 ordinary Merinos. In the winter, a sheep will eat about 3 lbs. of hay per day for each 100 lbs. of live-weight. This would keep them in a fair store condition. If fattening, they will require one lb. of grain or oil-cake per day in addition. On farms where straw is abundant, comparatively little hay is fed, and the cost of wintering is much less. Charles W. Taylor, in an essay, written for the Report of the Department of Agriculture, for 1864, states that he bought 100 grade Southdown and native Cotswold sheep, in November, for $5.00 each. They averaged 100 lbs. each. He fed them for 12 weeks. They then weighed 125 lbs. each, and he sold them to the butcher for $12.50 each. He gives the cost of feeding as follows:

17 tons of hay, @ $10 per ton.....	$170.00
138 bushels of Indian corn @ $1.....	138.00
1,050 bushels Swedes and Mangels @ 10c..	105.00
Three months labor and attendance.....	45.00
	$458.00

This is over 38 cents per week for each sheep. In Mr. Julian Winne's experiment in fattening sheep in winter, the food of the Leicesters cost 44 cents a head per week; that of the Merinos 36 cents—he has fattened sheep for many years and has found it very profitable.

Barley on Mucky Land.—"L. H. R.," Mich., asks if barley will do well on mucky land with a clayey subsoil.—No. It is the worst crop that could be sown on such land. Oats or corn will do far better.

"What is the Cheapest Way of Cutting Hill-side Ditches?"—We really cannot answer this question. It is precisely what we would like to find out. We know of no better way than to get the most skillful man that can be found, mark out one of the ditches, commencing at the outlet or main ditch in the lowest land, and running at right angles up the slope. Let him dig one ditch, you being with him to see that he works faithfully and energetically. In this way you can ascertain how much it is worth a rod to dig the ditches, and can make a bargain with this man and with others for the performance of the work by the rod. This is almost always cheaper than having it done by day work. Let them do *all* the work except laying the tiles. This you had better do yourself, or have it done by a careful man by the day. But let the men who dig the ditches understand that they must make the ditch ready for the tiles. If they do not do the work right, let the man who lays the tiles make the bottom of the ditch smooth and level, and *deduct the cost* from the pay of the ditchers. Let them understand this, and they will soon learn to make the ditch deep enough, and ready for the tiles. Unless the land is very stony, you ought to get a three-foot ditch cut and filled in for 25 cents a rod. But very much depends on the character of the soil. In the spring, when the ground is saturated with water, it is much easier digging than when the ground is dry and hard.

Water Filters.—Samuel Pitchforth, Utah. —No filter will remove sulphate of lime from water impregnated with it. A filter made by putting layers of gravel, sand and gravel in a tight keg with a faucet in the bottom, will remove any "muddiness" and almost any turbidity. It is well to employ a layer or two of charcoal, not smaller than wheat, on each side of the sand layer, so that the filter will be gravel, coal, sand, coal, gravel. This removes organic impurities to a great extent.

Hay or Straw Baskets for Starting Plants.—Numerous devices have been suggested to hold earth in which to start vegetable and flower seeds in window boxes or in hot-beds. These are designed to contain a portion of earth in which the plant grows until it can be removed to the open ground where it is placed without disturbing its roots. We have published a number of these; boxes with loose partitions, paper boxes, shells of turkey's eggs, birch-bark boxes, and hollowed turnips are among those that recur to us now,—not forgetting small squares of sod, the simplest of all for hot-bed use. "Sheet-Anchor," a retired sea captain who is an enthusiast in horticultural matters, sends us the following: "Take a tin quart can, prick a small hole in the bottom and fill with rich earth. Lay three wisps of salt hay, straw, or similar material upon the earth so that they will cross one another, bend the ends of the hay down around the sides of the can, and bind it there with twine or straw. Turn the whole bottom upwards and cut the ends of the hay even, withdraw the can and you have a neat little basket of earth. These baskets are to be placed in a box close together, and when the time for transplanting comes, knock off a side of the box and slide them out."——We should think a smaller can than a quart one would answer. The can must have straight

sides in order to allow the earth to slip out. A preserved fruit-can will answer; the top can be removed by placing the can on a hot stove until the solder is melted.

Peanut Culture.—The Peanut, or Pindar, as it is called in some parts of the country, is now attracting the attention of cultivators in Virginia and other Southern States. In April of last year, we gave an account of a North Carolina planter's method of growing them. Since then, the Department of Agriculture has published its Report for 1868, in which is detailed the method followed in Virginia. As this volume is not in the hands of all those who are making inquiries about peanuts, we will give an abstract containing the essential points. The plant is found to succeed well in Virginia; it is not ascertained how far north it may be cultivated with profit, but it is suggested for trial in the tide-water district of Maryland, and in Delaware, and the southern part of New Jersey. The Virginia peanut is preferred to the Carolina or African, as being larger and heavier. It requires two bushels to plant an acre. Well cured seeds are essential. The soil selected should be friable and light; red or chocolate-colored soils stain the nuts and impair their value. Land that has been in corn, or other hoed crops, except sweet potatoes, is preferred, and if it has not been heavily marled for previous crops, should be dressed with 150 bushels of marl or 50 bushels of lime to the acre. These may be sown broadcast or strewed in the furrow over which the beds are to be raised. It is said that the peanut will not fruit, except on a calcareous soil. Mr. Henry M. Butts, of Southampton Co., Va., makes the peanut crop a part of a rotation. 1st. Peas, the vines of which are plowed under in September. 2d. Peanuts, the land being dressed with lime and superphosphate. 3d. Sweet potatoes, with a liberal supply of stable manure. 4th. Peas, to be followed by peanuts, with lime, as before. Mr. Butts' crops by this course have averaged 100 bushels to the acre, and in 1867 he sold 1,300 bushels of prime nuts from ten acres. The crop ranges from 30 to 100 bushels to the acre, the average being placed at 50 bushels. The ground is plowed in March or April to a depth not exceeding 4 or 5 inches. It is plowed thus shallow, because the nut does not form until the stalks or pedicels reach firm earth; besides the harvesting is much facilitated if the nuts are near the surface. The time for planting is, in Virginia, from the 10th to the 20th of May. The details of planting and cultivation are deferred to another month.

Farming Prospects in California.—A correspondent writes: "Farming in California for fifteen years was, and indeed to a great extent still is, conducted upon a most improvident and lazy system. The farmers were simply grain raisers. They neither made their own bacon, butter, and soap, nor raised their own vegetables, eggs, or fruit. They burnt the straw of their fields as soon as the grain was taken off, and thousands of cattle perished for want of grass in the drought of the winter of 1861-2, which would have been kept alive had the straw of the previous autumn been preserved. These and many other reckless practices characterized the California farming system of the decade between 1857 and 1867, and of course where the farmer was improvident and careless, his home was a cheerless and uncomfortable one. As a class, however, they have lately awakened to the necessity of reform, and to greater independence of the town grocer and trader. The straw is now generally preserved, and if drought does not make it invaluable, the straw rots sufficiently in about three years to constitute a most valuable and much needed fertilizer. Rotation of crops, which was not dreamed of even so lately as five years ago, is now practised by many, though not to the extent, which the exhausted state of the soil of the old farms calls for. Over 150,000 acres of land were taken up last year in the Sacramento and San Joaquin valleys alone; mostly by small farmers or by capitalists in large tracts, for cattle and sheep ranges. The great valley of California (the Sacramento valley) is now being supplied with a railroad—the California and Oregon line—which road will supply the greatest present railroad need of California. Much of the grain of the coast valleys was blighted in May last, and was poor in quality. It sold for but $1.12½ to $1.20 per quintal. The grain of the two valleys named above was, however, full and heavy, and sold for an average of $1.35 per quintal. There are yet many thousands of acres of land in the southern and southeastern counties of the State, and in the upper portion of the Sacramento valley, near to where the California and Oregon Railroad line will pass, which are yet either Government land or which can be purchased from the owners at $2.50 to $5 per acre. Those who settle in California, and bring with them that care of the land, thrift, and economy, which prevail in New England, will do fully as well there as in any State of the Union. Riches in California must be sought by the safe and sure channels of patient industry and economy, and not by unhealthy and rapid means."

Onions—Seeds and Sets.

It is not practicable to publish each year full accounts of every special culture. Those who have asked us to give an article on onion raising, are referred to the *Agriculturist* for April of last year, and to the Onion pamphlet noted in our book list. These give the details of preparing the soil and raising the crop. It is of the first importance to those who undertake the culture of onions, that they secure good seed. It is better to pay a high price for proper seed, than to take that which is inferior for nothing. The onion crop requires too much labor to allow one to run the risk of sowing poor seeds for the sake of saving a few dollars. Our leading dealers are fully impressed with the importance of sending out good onion seed, and that furnished by establishments of good reputation can generally be relied upon. Many correspondents do not seem to understand the difference between seeds and sets, some of them, speaking of sets as "seed onions." The seeds are the produce of the flower; they are by some called "black seed," to distinguish them from sets. When the seeds are sown in suitable soil and climate, bulbs are formed, the top dies away, and we have the ripened bulb—the onion as we usually see it in market. If these onions be put out the following spring, leaves are produced, afterwards a flower stalk appears, which at length bears seed, and the onion completes its career, exteeding over two years. When the seeds are sown in a warm climate, the bulbs have their development arrested quite early by the heat and dryness of summer, and they ripen up when no larger than a hazelnut, and from that down to the size of a large pea. These little, prematurely ripened onions are what are called *sets*, and are harvested and kept with the same care given to large onions. When these little onions, or sets, are put out the following spring, they are not able, like large onions, to throw up a flower stalk and bear seeds, but they go on and grow and gather strength for the effort, forming a large bulb, which, at the end of the season, is like that grown, under favorable circumstances, in one year, from the seed. An onion set, then, is a small onion bulb which has been checked in its development, and when planted will resume its growth. If the sets are too large, or have not been raised under favorable conditions, instead of going on to form bulbs, they will produce flower stems. The large onion crops of the Northern States are raised from seed. The sets are used by market gardeners, who sell their onions mostly in the green state, and by those who wish to get a crop of ripe onions early, as they are a month or more earlier than those from seed. South of New York, even no farther than Philadelphia, it is difficult to raise a crop from seed, and the sets are resorted to. Sets are raised in greater perfection farther South than they are in the onion districts of the Northern States. In the colder localities, they are longer maturing, and are more likely to run to seed. To raise sets, shallow drills, about two inches wide, are made 9 or 10 inches apart, and in these, seed is sown so thickly as to almost cover the ground. When the dying of the leaves indicates the ripening of the bulb, the sets are pulled and stored in an airy room, or loft. They are spread in layers of from 2 to 4 inches thick, and when severe weather comes they are covered with 6 inches of hay and left until spring. The sets are planted early in spring, in rich soil, prepared as for a crop from seed. Rows are marked out from 9 inches to a foot apart, and the bulbs thrust into the ground, right side up, three inches apart. The rows are covered with the foot, and afterwards rolled. The cultivation and weeding is the same as for onions from the seed, but less is required. The price of sets varies with the quantity in the market, and ranges from $5 to $12 per bushel. The sets of the Yellow Danvers onion keep better than those of other varieties. Those of white onions are the most difficult to preserve, and must not be spread over two inches thick when stored.

Bee Notes.—*By M. Quinby.*

Apiary for March. Bees Out-doors.—Raise the hives and clean the stands. Brush dead bees from among the combs and cut out mouldy pieces. Look to the strength of your stocks, unite weak swarms and feed light ones. The best way to feed now is, to open the holes in the top, put thereon honey sealed in the comb, and cover with a close fitting box. Scatter unbolted rye flour in large shallow boxes near the hives before the bees get a taste of pollen from the flowers. Look out for loss of queens—about one in fifty is the average. Immature bees and eggs on the bottom board are the indications of her presence. With movable combs she may be readily found. No matter how strong now, a queenless stock would probably run down by swarming time. If such a hive should be neglected and chance to be diseased, it would undoubtedly be robbed and the fearful pestilence spread broad-cast. In uniting swarms, hives partly or entirely filled with combs are left. If these are clean and in good condition, save them with care. From ten to fifteen pounds of honey are required for the secretion of one of wax, hence, *never melt up good worker comb.* Such, thoroughly frozen in the winter and kept protected from the moth will keep indefinitely, but if the bees are taken out too late to freeze it, fumigate with sulphur occasionally. Put swarms into such hives, taking special care not to break the combs when new and heavy with honey.

Bees In-doors.—Set out on the first warm day—a few at first, as far apart as possible, more in two or three hours, and so on. Place them as nearly as possible on stands occupied by same hives last year. Bees will probably mix some with the utmost care; examine in a day or two, and equalize by causing strong and weak to interchange stands. If cold weather supervenes, the weak ones should be set back till it passes. Don't tempt the bees to rob by leaving refuse honey or comb in their reach.

Preparing the Hives.—A correspondent asks: "Is it necessary to wash the inside of a hive with hickory leaves dipped in salt and water?"—No. Let the hive be clean and rough on the inside as the saw leaves it, and the bees will like it well enough. I have hived thousands of swarms in such hives and rarely had one leave.

Preventing Swarming.—Will Mr. Q. please tell us how to prevent swarming, especially the after swarms?"—Immediately after the issue of the first swarm open the hives, (you must have movable frames for this,) destroy every royal cell but one. If at the end of five days this has not hatched, look over the combs again and destroy every royal cell that may now appear, excepting the one saved at first. But if the oldest of the young queens is allowed to hatch and begin piping before anything is done, the fever of swarming will rise to such a pitch that you cannot allay it, and the old hive may even be left destitute. The best way is to make the first swarm an artificial one before, or soon after queen cells are started. Then, at the end of nine days destroy all cells but one as above. To prevent first swarms, clip the wings of the queen and put a "queen yard" in front of the hive—a shallow box some two feet square, with edges of tin projecting inward, so that no bee can get out and away from the hive without flying. This will of course prevent the escape of the queen, and swarms will return.

Ogden Farm Papers—No. 3.

The new chest for steaming food (425 cubic feet) holds, when well packed, *four full days' rations* for the following stock, (receiving no other food except a little grain to horses and 2 qts. of meal daily to milking cows): 2 mules, 7 horses (partly boarders), 2 colts, 2 oxen, 3 steers and 1 bull, 13 cows, 3 2-year-old heifers, 7 yearlings, 9 calves. The chest is packed through a scuttle from the hay floor, and its contents are removed through a side door opening on the feeding floor gangway. The steam is admitted under a loose false bottom, which allows it to spread under the whole mass. It is necessary to have the steam up when the packing is begun, and occasionally to turn it on until that, which is already in the box, is heated up and softened,—that is, until the steam begins to show itself at the top of the mass. This enables us to pack the chop much more firmly, getting more in the box, than if it were not so softened. At the last steaming I used steam at 90 lbs. pressure, and found it even more satisfactory than at a lower pressure. The heating up was much more rapid (which is not of very much consequence), and the temperature to which the fodder is raised is considerably higher and the cooking more thorough.

My short experience fully justifies the excellent article of Messrs. S. & D. Wells, in your new Agricultural Annual—except in one point. They say that the cooked food is not so well eaten after the second day. I find no difference, even at the end of the fourth day. The scuttle is not taken off at all while there is any hay in the box, and the side door is open only while food is being taken out. Except at these times it is kept constantly closed, and the mass inside is kept much too hot to undergo any fermentation or souring. Even the last bushel of feed removed is too hot to be handled with comfort—and it is eaten as readily as the first,

If it is only a beginning that is to be made this year—go straight for a crop of drilled corn. Never mind about the oats and the clover. If you have got on until now on your ordinary pastures, you can make out for the first two months of one year more, and it is desirable that, as this is an experiment, it be made as convincing as possible. One may question, whether it pays to raise oats for green cutting, (though the question will be answered in the affirmative by any one who will give it a fair trial,—if he can command the necessary labor,) but no one, who has once raised a really good piece of drilled corn, and has marked its influence on his herd, can doubt that it does pay to raise corn for soiling.

I don't advise that any beginner go largely into the business,—probably few would be able to do so without making some change in their plans, which ought not to be made temporarily; —but any farmer can afford to devote half an acre to the trial. This should be manured as soon as possible, not later than the middle of March, the manure being thickly and evenly spread over the surface, and so left until at least one drenching rain has washed its soluble parts into the ground. If the land is in grass, nothing more should be done to it until the middle of May,—especially, should not one blade of its grass be eaten off by pasturing animals;—but if it is fallow land, as soon as it becomes dry enough after one heavy rain has fallen on the manure, it should be thoroughly plowed, but *not too deeply*, and after a few days, rolled or harrowed (or both). It should be plowed and harrowed at least twice more before planting time,—which should not be earlier than May 15, in the latitude of New York, or not until settled warm weather anywhere. The more frequently it is plowed, and the finer the soil is made, the better.

The drills should run north and south rather than east and west, and they should be marked out about 3 feet apart. For seed, get the best "Southern White" corn, (half an acre needs two bushels), and sow it thickly in the rows, occupying a width of two or three inches, and dropping not less than 25 to 30 kernels to the running foot. If this does not use up all of the seed, go over it again. It cannot be too thick in the drill. The thicker it stands, the finer the stalks will be, and the more completely it will be eaten.

As soon as the corn is up, it must be cultivated and hoed clean, and the cultivator should be run through it once a week, as long as there is room for the whiffle-tree between the rows. After that it may be laid by. As this is an experiment, let the crop stand until it begins to tassel out. It will then be about six feet high, and will completely occupy the ground.—Now take the cows from the pasture; tie them in well ventilated stables or in sheds; give them their liberty in the yard, two hours in the morning and two hours in the afternoon, when it does not rain; feeding them, five times a day, as much of the corn as they will eat up clean; and note the effect on the milk, and on the manure heap. If it don't pay, don't try it again; but don't sow the corn broadcast, on poor land, and let the weeds choke it down, for I know that that will *not* pay. Fodder corn, needs rich ground, thorough and frequent cultivation, and ample sun and air;—without these, it will be a failure; with them, it will be the most profitable forage crop that can be grown.

In saying that land for this crop must not be plowed too deeply, I have in mind a notable failure of my own, my last crop of corn (10 acres) having been nearly ruined by too deep plowing. The surface soil for a depth of four or five inches was good enough. After the draining of the field was finished in September, I gave it a very heavy dressing of manure from the cellar, and left it for the autumn rains to work upon. In November the land was broken up by a double team to a depth of eight inches—a subsoil plow following in the furrow. The subsoil that was brought to the top was a cold blue clay that had been water-logged for years, and it was beyond the power of one season's wintering to make it fertile. The consequence was, that the corn came up slowly, ripened slowly, and made less than half a crop, that was got in in bad order on account of its lateness. I am satisfied that if—with the liberal manuring I gave—I had plowed only four inches deep, my crop would have been a good one. That the land will be better in the future for the deep plowing, I have no doubt, but if I had left the deepening till the next time of plowing, I would have saved an important crop, and probably another year's action on the drained subsoil,—helped by the cultivation of the corn, —would have so changed its character that it might have been brought up without harm. When I say "too deeply," I mean bringing up so much of an unprepared subsoil, as to interfere with the growth of the current crop. Many soils cannot be plowed too deeply,—mine can; —and corn will surely suffer from being compelled to germinate and make its early growth in an uncongenial soil. It likes the abundant vegetable matter and the porous condition of the top-soil. It should have a chance to send its roots beyond the reach of drought, which may best be given by the use of a subsoil plow, that loosens the under soil without bringing it up.

Horse Papers for Farmers.—No. 3.

BY A SPECIAL CONTRIBUTOR.

A good breeding mare, brought into good physical condition, and served by a thoroughbred stallion at a cost of from $25 to $100 for the service, is too valuable a piece of property to be allowed to shift for herself and take her chances in a disorderly farm stable;—neither should she be turned to pasture and allowed to pass the summer in the unprofitable labor of kicking away the flies. She is in the best condition for the performance of regular work, and will be far more benefited by it than by lying idle in the stable, or skylarking in the field. Moreover, she needs grooming and grain, which she should work to pay for.

It should be remembered that we are now engaged in carrying out a definite plan which has for its object the production of a superior horse. The mare has been selected with care, and sent (at some expense) to a "four-miler," and the young colt is already susceptible to our attentions and to our neglect. The fœtus can get its development only from the dam. The influence of the sire is secured, and it will make no difference to the foal what becomes of him; the destiny of his progeny lies for the present solely with the mare. In proportion as she is well fed, well groomed, well exercised, well housed, and generally kept in a healthy condition, will the foal thrive and become fitted for a life of usefulness. If she is starved, neglected, allowed to go dirty, or deprived of proper exercise, the foal will have all these disadvantages to overcome after he is born,—and it is doubtful whether he will be able to entirely overcome them, whether he will ever be so perfect an animal as if he had had no drawback before birth.

If it were a question of a future race-horse, possibly the mare would have a groom detailed to her own especial care. She would be fed and watered by the clock, exercised with great care and with unvarying regularity, and made the object of the daily observation of a man skilled in the care of the race. All this would be too troublesome and too costly business for a farmer, and would make the colt too expensive. Fortunately it is not necessary. Such extra care may add the grain of strength and constitution that will enable the future race-horse to win his race "by a neck;" but much less than this will produce an animal good enough for the best service of the farmer. The infallible rule for the case under consideration is to *keep the mare in the best possible condition for work;* for the state of health that this implies is that which will give us the best colt at a moderate cost.

During the first eight months of pregnancy, nothing further will be required than to keep the mare in good condition for summer and autumn work. After this,—usually in the winter and early spring when farmers are too apt to leave their horses idle and to give them only dry hay in their stalls, some extra attention is desirable. Especially is it important to feed from four to eight quarts of grain daily, and to keep the mare in as regular exercise as the weather will allow. After this time (the eighth month) especial care should be taken to avoid too hard work, or to allow any over-exertion. During the last four weeks the mare should be allowed free movement at all times, being allowed a box stall if possible, or being kept in a small enclosure, open only to the south or southeast. It will be especially injurious to keep her tied in an ordinary stall for days together without exercise. It would be better even, to give her *light* work up to the very day of foaling.

In this operation she should be watched without being disturbed or annoyed by over attention. In ninety-nine cases out of a hundred, nature, unaided, will be her best help; but in the case of a false presentation, or of difficult labor from any cause, it may be necessary to call in professional assistance. In such cases, recourse should be had to a regular physician, rather than to the average "cow doctor" of a country neighborhood,—though the two together may be better than either one alone.

After the colt is born, it and its mother should be left entirely to themselves for about six hours or over night. After this the mare should have a thin, warm, bran mash, and this should be repeated daily for a week, unless the season is late enough for grass to be cut for her. For two days after foaling she had better be kept quietly in her box stall. After that time, the foal will be strong enough to take a little exercise, and they may be turned into a small enclosure during the day-time, except in stormy weather. After the colt is a month old,—if the weather has become settled,—they may be kept in good pasture except while the mare is at work, then the colt should be kept in the stall to prevent him from running.

During the first two months the mare should be taken in to suckle him as often as once in three hours, and during the next three months he should not at any time go more than four or five hours without food.

It will be best to wean the colt partly on oats, which he will soon learn to eat from the same box with his mother. And two quarts of oats per day, from weaning time until he is turned out to grass as a yearling, will tell throughout his whole life in his form, size, and vigor.

The Flamingo.

The Flamingo forms one of those wonderful zoölogical links, which both delight and puzzle naturalists. It may be said to be a goose that does not swim, and it is a wader with webbed feet, besides it picks up its food, holding it in the spoon-shaped end of its upper bill. In its instincts, and modes of flight, it much resembles the Wild Goose; in many of its habits, also, it resembles the crane and heron; so it really occupies an intermediate position between the waders and swimmers, besides being exceedingly curious and interesting in other respects. When Europeans first landed upon the West India islands, they found these great red birds arranged in phalanxes along the coast like ranks of red-coated soldiers. They were so tame then, that it was easy to approach them; and many years after, it is said, a sportsman might secrete himself and shoot one after another for some time, before the flock would take the alarm. Now, they are the shyest of all wary things. When they pass over the water, they fly low, but when they approach the land, up they go, away above the reach of shot. On alighting, they do so in shoal water, where they feed, standing erect, if necessary, but easily reaching the bottom with their heads. The legs are very small, and as the birds are heavy, they are able to stand in swift currents of the in-coming and receding tides. When feeding, as described, the heads are long submerged, and of course the birds would be exposed to attacks from their enemies, and especially from man, were it not that sentinels are posted at either end of the long row of feeders, which stand erect, and sound a trumpet-like alarm in case of danger. Then the sentinel leads off and all follow in Indian file, or in two lines, forming an angle, like wild geese, which they always do when on the wing. The motions of these birds are peculiarly graceful, although they are so tall and apparently unwieldy. Their heads and necks are swayed about with a gentle deliberation and ease, which is most striking when they dress their feathers.

The best known species of Flamingo are the American (*Phœnicopterus ruber*), and the European or Mediterranean (*Phœnicopterus antiquorum*). Their size and habits are very similar, the European being somewhat the larger. In color, ours is much the more intense, approaching scarlet; while the European one is of a rosy-white, except upon the wings, where the color is much deeper—sufficiently crimson to give good ground for the generic name, which means crimson-wing. These beautiful birds do not long survive in captivity, and of those from which the drawing for our engraving was made, none are now alive. They were imported by Mr. Charles Ritchie, of New York, from the Zoölogical Gardens at Antwerp, at a cost of $350 per pair. The two larger birds in the engraving are of the European, and the smaller one of the American species. The flesh of the Flamingoes is esteemed, and among the ancients the thick, fat tongues, were regarded as the most delicate of all articles of food.

EUROPEAN AND AMERICAN FLAMINGOES.

The American Panther.

That the American Panther is widely distributed, is shown by the various names it has received. In some localities it is known as the Catamount and "Painter,"—a corruption of Panther. By the Spanish American inhabitants of Mexico and California, it is called Leon (Lion). It is Pagi in Chili, and Puma in Peru. Indeed, it is found from latitude 50° or 60° north, to the extreme point of South America. It is a true cat (*Felis concolor*), and with the exception of one found in Louisiana and farther south, is the largest of our five species. Its weight sometimes reaches 150 pounds, and it measures about seven feet from the nose to the end of the tail. It is covered with short, compact hair of a brownish-yellow on the sides, and of a dirty white on the under part of the body. In color, the panther very closely resembles the common deer, and it is said to change like that with the seasons. The tail is more than half as long as the head and body together, and has a brushy tuft at the end. The young animals are spotted and barred, but the adult ones are without markings, except a black patch on the upper lip, and dusky black upon the interior of the ears. The animal is more abundant in mountainous districts than elsewhere, and is rather shy in its habits, concealing itself among the rocks in the daytime, and prowling about at night. It is very destructive to colts and calves, and has been known to attack the full-grown animals. It climbs trees readily, will lie in wait crouched upon a limb, for deer to pass, and drop suddenly upon them. It is stated that the Panther has been known to attack and kill a man, but we have met with no authenticated account of its having done so unprovoked. It is said to be easily tamed, and in captivity its habits are much like those of a cat. In California and the adjoining parts of Mexico, Panthers are very destructive to domestic animals, and strychnine is extensively used to poison them as well as the wolves. The early Spanish Missionaries had great difficulty in sustaining themselves in Lower California, as the Panther destroyed their domestic animals. The Indians would not kill or disturb the Panther, as they had a superstitious regard for it, for the reason that they depended upon it for a good part of their food. By watching the buzzards, who always soon scent out a concealed carcass, they could discover where the Panther had hidden that portion of his prey which he was unable to devour, and regale themselves upon the fragments.

THE AMERICAN PANTHER.—(*Felis concolor.*)

Walks and Talks on the Farm—No. 75.

Last spring the Commissioner of Agriculture sent me two bushels of "Anautka spring wheat from Russia." I mentioned the fact at our Farmers' Club, and some of the members intimated that they would like to be "connected with the Press," and be in the way of receiving such favors. I told them that if any member of the Club would take the wheat, sow it and report the result, they were welcome to it. But not a man accepted the offer. I like to receive and try new implements, seeds, etc., but so far as the *profit* is concerned, any man shall have it who will supply me with postage stamps.

I have no sort of interest in the matter, but I often think our old, established, agricultural implement manufacturers and seedsmen make a great mistake in not availing themselves of the agricultural papers, to let farmers know where they can get good, thoroughly tried implements and machines. They too often abandon the field to the enterprising advertisers of some new invention—and it is a great evil under the sun. Sometime since, the President of an Agricultural College, who was going to deliver an address, asked me to furnish him a few facts in regard to some of the most striking discoveries in agricultural science and invention. "I do not think of any for the moment," I replied, "and, in fact, I have ceased to look for them." He seemed slightly disgusted. "There is one new thing," said a prominent agricultural gentlemen, "that is destined to accomplish great results, and that is the ——— Ditching Machine. You ought to see it," he said, turning to me, "it is a really capital thing." "Yes," I said, "the inventor came to see me about it." I was digging ditches at the time, and he said "I could save half the expense by using one of his machines." "I think it is a good thing," I replied, "and will make you the following offer: These ditches cost me 25 cents a rod. Now, I will furnish the horses for the machine and will give you 20 cts. a rod for cutting the ditches and making them ready for the tiles." He did not accept the offer.

The truth is, no farmer will ever get rich simply by using machinery. It is not the principal point to aim at. And the same is true of new varieties of seeds and fruit. As a rule, the less we have to do with them the better. Our great object, at the present time, must be to get the land in the best condition to raise large crops and then to find out how to convert them into the best beef, mutton, wool, cheese, butter, and pork, at the least cost.

"But how did your spring wheat turn out?" I got 23 bushels. On one side of this acre of wheat, I had barley that yielded 35 bushels per acre, and on the other side, oats that yielded 75 bushels per acre. Now, I do not say that this is not good spring wheat. I presume it is. And, if I were a spring wheat grower, I would give it a farther trial, on land in better condition. Depend upon it, however, that the one thing which American agriculture wants to day, is not improved varieties of seeds, but improved cultivation of the soil. And it is so with improved breeds of cattle and sheep. Col. Waring proposes to renovate Ogden Farm by putting on it a heavy stock of the best animals. I have no sort of doubt but that he will succeed in his object. He will make large quantities of rich manure, and this in the end will make his land rich enough to support all his stock with little extra food. But in order to do this, he must for some years *purchase food* for his present stock. In his circumstances, I think he has adopted the right course. And there are thousands of farms where the same plan would prove very profitable. But he must get good prices for his stock, butter, etc. And then, again, it should not be forgotton that the first thing he did was to thoroughly underdrain his land. I presume, too, he is taxing all his energies to make it clean. In point of fact, therefore, his practice does not essentially differ from the one I advocate. I urge the necessity of improving the land before you get improved varieties of plants and animals. He puts the animals on at once and buys food for them in order to make manure, and thus bring up the fertility of the land to the self-supporting point. As his land is thoroughly drained, the plan is an excellent one. It is simply buying food to make manure, instead of buying the manure. I knew a nurseryman who drew clover hay to the city and sold it for $10 per ton, and drew back fresh stable manure which cost him $1.00 a ton. Waring knows better than to do this. He feeds his clover hay to Alderney cows, sells the butter for 75 cents a lb., and has manure left worth $10 for every ton of clover hay he feeds out; and I presume he feeds oil-cake besides, the manure from a ton of which is worth $20.

Most farmers cannot adopt this system. We have not capital enough. We must use *time* as a substitute for capital. We must first bring up our land, and then put on improved stock.

How best to do this depends on the soil and location. But in all cases the first thing is to underdrain all land that needs it. The next is to kill the weeds and make the land mellow. These two things must be done no matter what the character of the soil may be. On light, sandy land we can best clean the land by growing hoed crops, such as corn, beans, and roots, that admit the use of the cultivator; on heavy, clay loams it will, at first, generally be best to summer-fallow, or "fall-fallow," or both. Then, never sow a grain crop without seeding it down in the spring with clover. Do anything you like with the clover except to remove it from the farm. Plow it under, or pasture it with sheep, or make it into hay, and return the manure obtained from it to the land. I will not say which is the best plan. It depends on circumstances. With butter at 40 cents a lb., and *good* sheep worth 8 cents per lb., live weight, I think it a pity to plow under clover, because the manure from the sheep eating the clover, is worth as much, within five per cent, as the clover would be if plowed under. And in fact, on wheat land, I would rather have the manure from clover than the clover itself, because the clover gives us too much carbonaceous matter, which produces an excessive growth of straw, and probably retards the ripening of the wheat. Still, this effect would not be produced until the practice of plowing under clover had been continued for some years.

Where a farmer has not sufficient capital to buy manure or to purchase oil-cake, or other food to feed his animals for the purpose of increasing his manure heap in quantity and quality, he must be content with raising comparatively few grain crops. He must aim to get 40 bushels of wheat per acre on ten acres, instead of 20 bushels per acre on 20 acres. And he must aim to get 80 bushels of corn per acre on 5 acres, instead of 40 bushels per acre on 10 acres. In this case he will not have a bushel more to sell than he now has, and will impoverish his land no more. In a recent conversation with Mr. Geddes, the able advocate for plowing under clover, he remarked, "You recommend summer-fallowing; but it will in the end, certainly impoverish the land. I have seen numerous instances where it has had this effect." No doubt about it; and plowing under clover will, theoretically, do the same thing. Practically it does not have this effect, because the land as it becomes impoverished, will gradually cease to grow clover. What I advocate, is the use of fallows to bring up and clean neglected land, especially that of a heavy character. When the land is clean and in good order, I would not summer-fallow. I would grow clover and feed it out to stock. To grow clover and plow it under has the same effect as summer-fallowing. Both processes owe their value mainly to this one effect: They combine in one crop (say wheat) the atmospheric and soil capacities of two seasons of growth, instead of one. If the soil and atmosphere are capable of giving us 15 bushels of wheat every year, fallowing or plowing under a years' growth of clover, should give us 30 bushels per acre every other year. We get no more wheat in the one case than in the other. Where, then, does the profit come in? It costs no more for seed, and little more for harvesting a crop of 30 bushels, than a crop of 15 bushels. And consequently we save the seed and nearly all the labor of one crop. The only advantage which the clover has over the fallow, is, that the roots may go deeper than the wheat, and bring up plant-food from the subsoil which is turned under for the use of the wheat. It may be, too, that the cost of working the land in clover is not as great as in fallowing. On the other hand, fallowing makes the land cleaner and develops more plant-food in the soil.

Now, mark you, I am not advocating fallowing instead of clover. I am only contending that the clover system will impoverish the soil just as much as the fallowing system, provided that the clover is all plowed under, and wheat is raised every other year. And the same is true if we substitute oats, or barley, or corn in the place of wheat.

No one holds clover in greater esteem as a renovating crop than I do. What I contend for is, that we should use it as a renovating plant and for food at the same time. Instead of plowing under clover the first year and sowing the land again to wheat, I would let it lie two years, and either make the crops into hay and draw back the manure, or pasture the field with sheep. Then after two years, I would plow it in the fall and sow it to barley in the spring, and seed down with clover again. Now I pasture for two years more and then plow up and sow to wheat, and seed down again with clover in the spring. In this way we get a crop of grain every three years, and might expect three times as much to the acre as if we sowed a grain crop every year. In other words, we might get as much grain and have the use of the clover for the maintenance of horses, or for the production of mutton, wool, butter and cheese, into the bargain. The amount of plant-food removed from the clover by the animals is of little practical account.

If this system does not make the land rich enough, I would go a step farther. Instead of plowing up the clover the second year, let it lie until the third year, and then plant it to corn or sow it to peas, and let the whole crop be fed out on the farm. If peas are sown, sow wheat in the fall; and if corn, sow it to barley the following spring; and in either case, seed down again with clover. In this way we get for one grain crop sold from the farm, three years' growth of clover, and one years' growth of peas or corn, all of which are returned to the soil. We shall have nearly or quite as much wheat and barley to sell, as if we sowed these crops

more frequently, and we could keep considerable stock besides.

"But will it pay to keep sheep with wool at 40 cents per lb.?" It will pay better to feed the clover to sheep than to plow it under; for the pasture in this case costs you nothing, and now that we have such admirable mowing machines, rakes, and unloading forks, we can put a ton of hay in the barn (if it is a good crop) for less than we can plow under an acre of clover. I have heard farmers recommend plowing under clover for manure, and at the same time undertake to show that we cannot afford to keep stock with hay worth $25 per ton! Can we any better afford to plow it under, seeing that the droppings from the sheep are worth nearly or quite as much as the clover for manure?

I think I could keep good Merino sheep, not bred too much to grease, with profit on my farm. The trouble now, is, that many farmers keep their sheep on a starvation ration. They let the flock take care of itself—pasture them on the highways and fallows in summer, and let them eat at a straw stack in winter. They get one lamb from two ewes, keep their wethers until three years old and then sell them for $1.50 or $2.00. Of course this will not pay. But let a farmer select a flock of strong, healthy, good bodied Merino sheep, and give them good food, and the necessary attention, and they will pay even at present prices of wool and mutton. At any rate, they will pay as well as growing wheat at $1.25 per bushel, and better than cows that only give 90 lbs. of butter a year, or four-year-old steers that do not weigh 1,000 lbs., and sell for 4 cents per lb. Ten Merino wether sheep will eat no more than such a steer, and will bring as much at four years old, and we have two fleeces from each sheep besides. The steer brings in $40 all told. The ten sheep sell for $40, and bring in as much more for wool.

But it will be said that no good farmer will keep such a steer. Neither will any good farmer keep such sheep. His wether sheep at this age, when well fatted, will weigh 140 lbs., and by looking at the market reports, you will see that a poor sheep of 70 lbs. sells for 3 cents per lb., while a fat one of 140 lbs. is worth 9 cts. Ten of the former bring $21; ten of the latter $126!

Nothing is more certain than that the demand for good mutton will continue to increase for many years. We are the greatest beef eaters in the world, but as yet we scarcely know the taste of good mutton. During the past twenty-five years there has been a wonderful improvement in the quality of our beef, but the great bulk of our mutton, so far as my observation extends, is not as good to day, as it was twenty years ago. This will not do. Farmers are now convinced, I think, that they must keep more stock, and they are anxiously considering whether to keep sheep or cows. At present, cows pay better than sheep, but they require more attention. A farmer who has dry land, remote from market, and who has to depend principally on hired help, will probably find sheep more profitable than cows; and this is especially the case on grain growing farms. But there is no profit in keeping either cattle, cows, or sheep, unless they are kept well. Merino sheep will pay if they are kept *steadily improving every day.* They do not require high feeding, but they should at all times have as much food as they can eat. No one will dispute this remark, and yet I question, if there is one Merino flock in a hundred, that is not starved more or less during some periods of every year. Let no such farmer think he will find dairying more profitable than sheep, unless he adopts a more rational and humane system of feeding. Let him not think that he will make more money by keeping Long-wooled mutton sheep. The trouble is not in the breed but in the breeder. Cotswold, Leicester or Southdown sheep are capable of affording as much more profit compared with common Merino sheep, as Shorthorns and Devons are, compared with common cattle. But they must have good care and feed. John Johnston writes me: "I am almost sure that if you would keep 80 or 100 breeding ewes of the Long-wools, you would make a lot of money." This is certainly complimentary, so far; but after all, he is only "*almost* sure." He has still a latent doubt as to how far an agricultural editor will give them the necessary attention. But he should recollect that he himself has written more than almost any other farmer in the United States; and it follows consequently that a man who studies agricultural subjects and writes about them, is not necessarily incapable of attending to his farm and his stock.

A farmer in New England objects to what I said about drawing out manure in winter. He prefers to pile it and let it get thoroughly rotted before applying it to the land. So do I. But labor is so high and so uncertain, that I prefer to draw out manure when we have leisure, whether it is or is not the best time for securing the greatest benefit from its application. On land subject to floods, of course, it would be unwise to spread manure in winter. And on very steep hillsides the rain might wash out much of the goodness of the manure, and carry it off from the land. But, on ordinary, level land, there is less danger from this source than one might imagine who has not looked into the matter. The soil, especially if in grass, will absorb the rain and melting snow, and with it all the soluble matter washed out of the manure. Where land is underdrained, this is certainly the case. And there is no way of applying manure better than in the liquid form. When manure is spread out on grass land in winter, the best portions of it will be washed out and carried into the land distributed through the soil in such a way as to be readily taken up by the roots of the grass. The portion left on the surface will serve as a protection from the cold winds of spring, and the grass will start earlier and grow more vigorously. And it will also act as a mulch in summer.

I said, I preferred to *pile* the manure rather than to draw it out fresh as made during the winter. The reason is, simply because I use a great deal of straw, and when manure is piled, it is reduced more than half in bulk by fermentation, and at the same time its plant-food is rendered more soluble. And when we use so much straw, there is not the slightest danger of losing ammonia by fermentation. The acids produced from the fermenting straw, will hold all the ammonia formed in the heap. This spring, if bone-dust can be obtained at reasonable rates, I propose to pile my sheep manure, which contains a large amount of straw, and mix bone-dust with it. Put a layer of manure, say a foot thick, at the bottom, and then spread bone-dust over it at the rate, say of 50 lbs., to each ton of manure. Then put on another layer of manure, and spread the bone-dust over it, and so on until the heap is finished. If a few loads of muck or soil are put on top, it will be all the better. The bone-dust will greatly accelerate the fermentation of the manure and decompose the straw, and the acids, produced from the decaying straw, will hold the ammonia formed from the organic matter of the bones, and prevent its escape. The bones will be softened and disintegrated, and rendered much more soluble, than if applied directly to the soil. If this work is done in March, and the heap is turned two or three times, the manure will be in capital condition to apply to root crops in May or June. But if not needed for these, it will not injure any crop to which it may be applied. If you want to see cabbage and cauliflowers grow, dig in a liberal allowance of this manure, and sprinkle a teaspoonful of superphosphate in the hole when the plants are set out, and then keep the ground thoroughly cultivated and hoed. Put a little of it in the celery trenches, and mix it with rich surface soil. If your evergreens on the lawn look yellow, fork in a barrowful of it around each one, and if it injures them, let me know. Those forlorn looking currant bushes would be grateful for a few shovelfuls. If you want some good melons, put a wheel-barrowful of this manure, hot from the heap, under each hill; cover it with some rich soil, and sprinkle on it a teaspoonful of superphosphate. Then plants, especially if protected for a week or two with a box covered with glass, will not know that they are in a "farmer's garden;"—they will think they are enjoying the care of some intelligent mechanic or professional man in the village or city, and grow accordingly. If any of the manure is left, spread it on the meadows, or grass land, whenever it is most convenient.

"Why do you speak of a hog as a pig?" writes a critical friend. "You might as well speak of a cow as a calf, or a sheep as a lamb. A pig is simply a young member of the hog family. (See Dictionary.)"—What do the Dictionaries know about pigs? I have no particular fancy for the word hog, and the term is entirely unnecessary. A good farmer never keeps "hogs." He may have breeding sows old enough to be termed hogs, but his fattening stock is sometimes in the pork barrel at an earlier age than the wild hog weans her young.

Sometime since I read a letter in an agricultural paper from a farmer in Tennessee, who had such a fine litter of pigs that he thought their weights ought to be given to the public. They were not quite four years old, and averaged over 250 lbs. each. Those *were* hogs. But as long as my pigs will weigh more than that at eight or nine months, I do not propose to offer them the indignity of speaking of them as hogs. I do not know at what particular period in his history a pig ceases to be a pig and becomes a hog. A sheep is a lamb until it is a year old, even though it weighs 150 lbs. Mr. Sheldon's Shorthorn that weighed 1,200 lbs. before it was a year old, would be called a calf. It is so with pigs. Our modern breeds are larger, or at least heavier, at six months, than many of the old-fashioned "hogs" were, at two years. Since these improvements in the early maturity and fattening qualities of the breeds of swine have taken place, all the English agricultural writers have dropped the term hog. In England, it is "Youatt on the Pig," not "Youatt on the Hog," as the American editor styles the book. Richardson wrote of the pig, not of the hog; and so does Darwin in his recent scientific work on "Animals and Plants under Domestication." I do not think he once uses the word hog, as applied to the domestic pig, in the whole book; and he certainly will be regarded as good authority.

Dr. Johnson, in his Dictionary, gives the following definition: "Swine. A hog; a pig. A creature remarkable for stupidity and nastiness,"

This may have been true in his time. But a modern well-bred pig is one of the cleanest, if not one of the gentlest and most intelligent of our domestic animals. Let his hoggish name cease with his hoggish nature.

I am glad to see that a "Swine Breeder's Association" has been formed in Illinois. It is certainly needed. Our Agricultural Societies pay comparatively little attention to swine. They often appoint judges that do not know a Berkshire from an Essex, and are just as likely to give a prize to a grade as to a thorough-bred.

Cutting up the Fore Quarter of Beef.

There are a great number of beeves killed for the use of those who live in the country, and this is usually done either by country butchers, or by the farmers themselves. The object in cutting up seems to be to get the meat into pieces that can be conveniently salted, boiled, or cut up for frying. Now there are pieces peculiarly adapted to roasting or baking, others fitted for corning, others out of which stakes may be cut; and whether the meat is to be sold in pieces to suit customers, or cut up for family use, it is important that there should be (so to speak) an equitable apportionment of bone to meat, so that we shall not have pieces of bone with little or no meat, and pieces of meat without their share of bone, which, indeed, is often taken out.

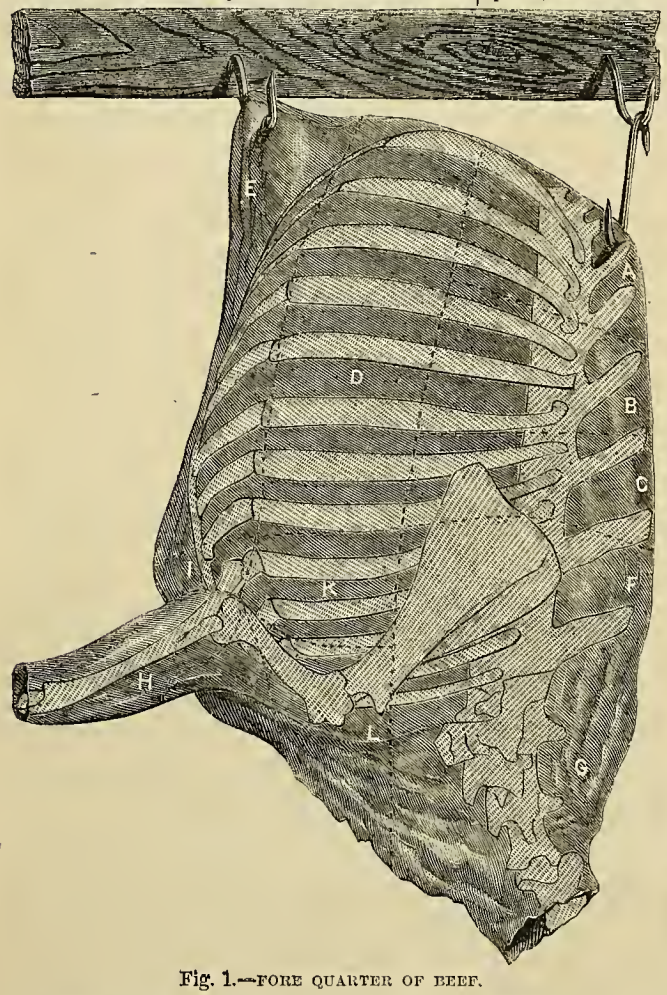

Fig. 1.—FORE QUARTER OF BEEF.

After the beef is slaughtered and dressed, the carcass is cut in two, an ax or cleaver being chiefly used; and it is so cut that the spines of the backbone are left alternately on either side. The sides are handled and transported, whole, or cut in halves, according to the weight and size of the animal. When divided, the cut is made just back of the last rib, as in figure 1.

The fore quarter should be cut about as follows: First, a cut is made from the outside, crossing all the ribs nearly in the middle, and severing the whole quarter in two, apparently, nearly equal parts, as seen in figure 1. This cut may be made to cross the 7th or 8th rib, and then the quarter may be cut across the other way; or, after making the first cut through, each part may be divided at the 7th or 8th rib. The rib roasting pieces are cut from the piece containing the backbone, following the ribs. The choicest piece contains the second and third, or second, third, and fourth ribs, counting from the rear. The dotted lines in the engraving indicate that the first three ribs are cut for one large roasting piece (*A*), the next three for another (*B*), and the seventh and eighth for the next (*C*). The broad, flat piece (*D*), which contains the ends of the ribs is called the plate piece, and with the one cut from it containing the cartilaginous and bony connections between the ribs and the breast-bone, and called the navel piece, is used for corning. The plate piece of a very fat steer is shown in fig. 3, and fig. 4 represents the navel piece from the same animal. Used fresh, these pieces are excellent for stewing, and pretty good for boiling for soup.

After removing the first, second, and third-cut rib roasting pieces from the upper half of the quarter, the rest is cut at right angles to the backbone, into as many pieces as is desirable. Those cuts, containing ribs, are called chuck-rib pieces (*F*, fig. 1), in the vicinity of New York, and we believe New York nomenclature is becoming quite generally accepted. The neck cuts (*G*, fig. 1), are called first, second, and third neck pieces. These are for soup, stewing, or corning, and are also used by the Bologna sausage makers in our large cities. Figure 2 shows the cut made in dividing the rib roasting pieces from the chuck-rib and neck pieces, seen together in figure 1. The leg (*H*, fig. 1), or that part of it which is anatomically the *forearm*, is called the shin, or shin of beef, fig. 5, and is cut off following the dotted line above, but avoiding the brisket, (*I*, fig. 1,) which lies beneath it. The shin is an excellent soup piece, one of the very best, especially for soup stock, and the brisket is generally corned. The piece marked *K*, in figure 1, is the cross-rib, an excellent common piece for almost any purpose. In front of the cross-rib lies the shoulder clod and sticking piece, not separated. This is rather a large piece, and is cut up for corning, soup, or stewing pieces. The thick piece containing the shoulder joint is a favorite soup piece.

Cut in the way here indicated, every piece contains more or less bone, except the sticking piece. The proportion may easily be judged of by the outline of the frame in figure 1. When chuck-rib roasting pieces are cut in the market, the shoulder-blade is usually cut out, and a slice of nice fat laid and skewered in.

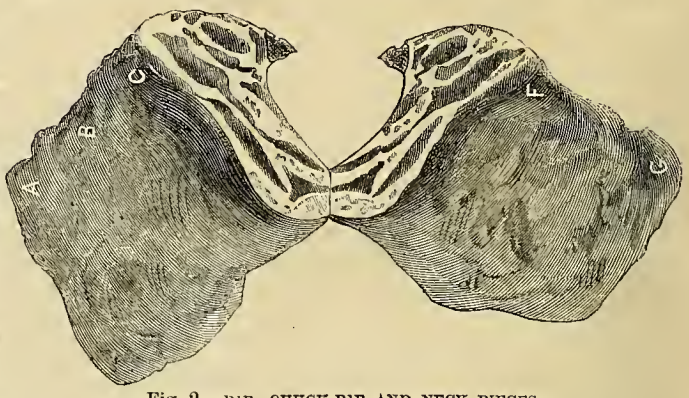

Fig. 2.—RIB, CHUCK-RIB AND NECK PIECES.

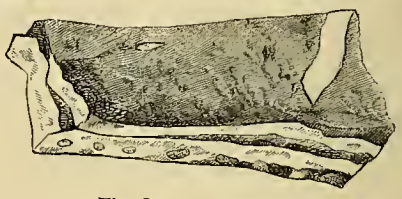

Fig. 3.—PLATE PIECE.

With this description we think no one should have any difficulty in cutting up a fore quarter of beef very neatly. The tools needed are a good knife and steel, a butcher's saw, or a good, fine-toothed cross-cut wood-saw, and a cleaver, or light ax. It should be borne in mind, that following this general system, the pieces may be larger or smaller according to the size of the animal, and the use they are wanted for.

Fig. 4.—NAVEL PIECE.

Fig. 5.—SHIN OF BEEF.

Warm House Walls.

It makes us almost shiver to ride by the flimsy shells erected for dwelling houses nowadays, in many, if not all of the rapidly growing suburbs of New York, and the adjacent cities. The same faulty structure is to be found more or less all over the country. We are building our wooden dwellings with too light foundations, with too cheap walls, and with too thin floors. Thus, while a house is a shelter from the storm, and a sort of wind-break, the cold penetrates, the rain drives in and wets the walls, and the plastering cracks, water freezes on cold nights, the consumption of coal is great, and discomfort and colds in the head prevail. The walls referred to are simply weather-boarded and lath-and-plastered upon studs set 16 inches apart. There are several ways of making them very comfortable. 1st.—They may be filled in with brick laid flat in a cheap poor mortar, and this when 4-inch studs are used, fills the entire

space between the clapboards and the plastering. 2d.—Nearly as efficient a filling is made by laying the bricks upon their edges. This is a good deal cheaper, but they must be more

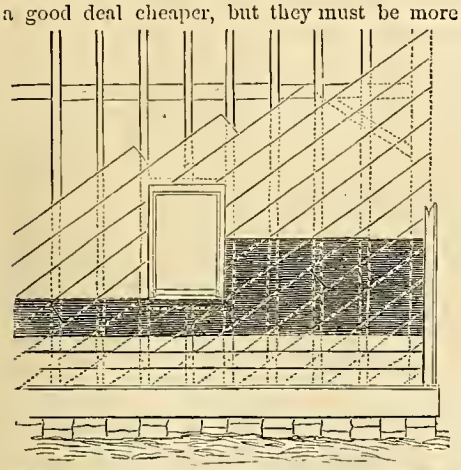

Fig. 1.—DIAGONAL BOARDING AND SHEATHING.

carefully laid, and good mortar used. 3d.—The practice of back-plastering has been for some time in vogue. This consists in tacking laths in the middle between the studs and laying a rough but tight plaster coat upon them. This is cheaper than a brick filling, and more rapidly applied. It has not the same weight, which is useful in settling the house firmly upon its foundation, and in stiffening it against high winds. Still the house is made a good deal stiffer by back-plastering. 4th.—A better plan than either of these is what is called "Diagonal boarding and sheathing." This is represented in fig. 1, and consists of first nailing cheap hemlock boards diagonally upon the studs, and covering them with sheathing-felt or tarred-paper nailed on horizontally, each course lapping an inch upon the one beneath. The boards are not nailed on diagonally to give additional strength and stiffness to the frame from their bracing position, for the frame would be just as stiff if they were nailed horizontally. If in the latter position, however, cracks would often interfere with nailing on the siding. It is of some consequence to have good felt or paper, and the best has a less quantity of tar than roofing-felt. We notice the growing use of felt-sheathing without the diagonal boarding, it being nailed directly on the studs. This is, of course, better than nothing, but not nearly so good as boarding and sheathing. In putting on the boards it is most convenient to give them a slant of 45 degrees, and all on one side have nearly the same slant. The idea of their being useful as bracing the building being a deceptive one, carpenters sometimes put them on to slant upward towards the corners on all sides, which is useless.

There is a style of cheap wall sometimes built which is very comfortable if not handsome.

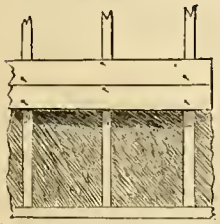

Fig. 2. CONCRETE FILLING.

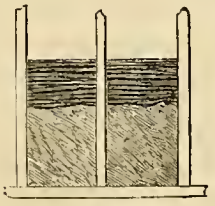

Fig. 3. WATTLED WALL.

The studs are placed three or four feet apart, clapboards nailed on as usual, and the spaces between them filled with coarse concrete, made with a portion of hydraulic cement, boards being nailed on the inside of the studs, as shown in figure 2. When the concrete is stiff enough to stand, the boards are removed, and the surface scratched to receive a coat of plastering. There is an old-fashioned kind of wall which we have known as "Wattled wall," which is made by filling in, between studs set wide apart, with split sticks, cut so as to wedge firmly between the studs. Upon these, coarse mortar is spread, and the outside is finished with a coat of cement floated on smoothly, covering the studs, while inside it is simply plastered. (See fig. 3.)

These two plans are particularly applicable to outbuildings, such as smoke-houses, fowl-houses, hog-houses, and the like, but very warm dwellings might be constructed cheaply on the same principle. In the structure, such buildings are somewhat similar to those in which a wooden frame is filled in with stone or concrete of some kind. These are sometimes built in imitation of European cottages, and if the framing is arranged with some care, may be very ornamental. The style is shown in figure 4.

When the inner plastering is put directly upon stone or brick, or thin concrete walls, moisture is almost sure either to strike through or to deposit upon the inside, hence it is usual to "fur off" for plastering. Any means by which the wall may be made hollow will obviate this difficulty. In laying concrete, half-inch boards may be set perpendicularly, three or four inches

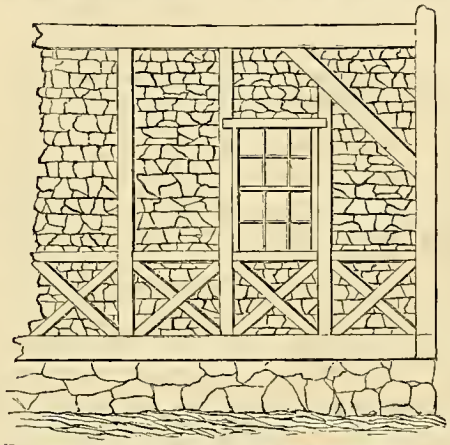

Fig. 4.—EXPOSED FRAME STONE WALL.

apart in the walls, and drawn up as the wall rises. This will entirely obviate any difficulty from moisture on the inside.

Maple Sugar Making.—2d Article.

BY W. I. CHAMBERLAIN, HUDSON, O.

The article in February concluded with the tapping of the trees. If the day has been a good one, many of the buckets at the trees first tapped will be full, and it will be well to commence

GATHERING SAP.—Take the stone-boat sled (fig. 5, Feb.), put on three barrels or casks, a tunnel made to fit the barrel and not rock,—and a tin pail holding sixteen quarts. One pail is better than two, unless the trees are scattered far from where the sled can go. There should be a *strainer* in the tunnel. This should be of the shape shown in figure 2, and made of thin, coarse, white muslin, stitched around a wire hoop at top and bottom. The top wire should fit tightly over the top of the tunnel, and be pressed down over the outside of it about an inch, so as to hold the strainer in place. The bottom wire should be small enough to keep the strainer from touching the sides of the tunnel, else the sap cannot run through rapidly. The strainer should be so short that the bottom of it will not touch the bottom of the tunnel, for this too would obstruct the flow of sap. The strainer is to keep out from the barrels dirt or flies that may have got into the sap, and also to prevent the loose flaky ice often found in sap from clogging the tunnel. The ice may be thrown away, as it is of little value.

Fig. 1.—HOW TO EMPTY SAP.

Select a good road through the grove so as to bring the sled as near each tree as practicable. There is but one right way to empty the sap from the bucket into the pail. If you are not used to the work, probably you will set the pail on the ground, take off the bucket cover and throw it down, take the bucket from the spile with both hands and empty it, hang the bucket, stoop for the cover, and finally stoop again for the pail. If the pail does not stand on level ground, the sap will run over, and if the cover is wet, dirt will stick to it and fall into the pail. The right way is this. Stand facing the tree, with the bucket in line between it and yourself. Hold the pail in your left hand, take the cover with your right hand, and place it up under the left arm above the elbow. Now hold the pail close to the left of the bucket, grasp the rim of it firmly with your right hand, and turn the bucket gently on the spile, as on an axle, until the sap is all out. Then let the bucket back to its place, and put on the cover. (See fig. 1.) The bucket is not removed from the spile, no sap is wasted, no dirt sticks to the cover, your backbone is not bent, and one hand empties the sap far more easily and quickly than both. In gathering, if you find a large bucket only half full, and near to it a small one overflowing, change them. Much sap can be saved by a little care in changing the buckets where necessary.

Fig. 2.

When your barrels are full, and you go to empty them, be careful to drive close to the ends of the skids. These are straight poles, or 3 × 4 scantlings, fastened at the upper end to the store-trough, and at the lower end to a timber at right angles with them, and high enough to bring them just on a level with the top of the sled-rave, as shown last month in the engraving on page 59. The skids should be just long enough to let the barrels roll once and a half over and bring the bung-holes down. Or if the top of the store-trough or vat is low enough, the skids may be so short as merely to let the barrels roll half over. At any rate the skids should not be steep, not more than fifteen degrees, or the barrels will roll too hard for one man to unload easily.

Fig. 3.—DIPPER.

If there is any mud on the barrels remove it

before they are stirred, for if it gets into the sap in emptying, it cannot be strained out. Indeed, if the road is very muddy, it is well to have a tight sled bottom below the barrel rack.

About two feet from the lower end of the store-trough, a strainer-cloth should be tacked tightly to its sides and bottom by strips of lath, and should be stretched across the trough from top to bottom. The lower end of the vat is only half an inch lower than the upper end. This gives the sap a gentle motion through the strainer, permits the fine, heavy dirt to settle, strains out everything at all coarse, and drains the trough after you have stopped putting in sap. The lower store-trough (in the sugar-house) is arranged in the same way, to secure the greatest possible cleanliness.

As soon as the first sled-load of sap is in the upper vat, and has settled for a few minutes, the faucets are opened and it is run down into the boiling-pans, and as soon as it covers the bottom of these, one man should commence boiling. The most careful and capable hand should take this work,—usually the owner of the sugar-works. The wood should be well crossed in the "arch," and not permitted to pack down and keep the air and flame from circulating freely. It may pack down so that no heat shall reach the front pan. One should not be satisfied unless the sap is foaming and tumbling all over the pans. Scum (like suds), will rise and float to the edges and corners, and should be skimmed away often. It may be saved, cooled, skimmed, and settled, and put into a barrel with half its bulk of *rain-water*, and a little vinegar or "mother." In a year it will be quite good vinegar.

If the sap is inclined to boil over, a bit of lard as large as a small pea, will keep it down for two hours, and not injure the flavor of the syrup. Do not split wood in the shed near the arch without closing the door, or the dirt and chips will fly into the boiling sap.

If you have not the self-feeders (fig. 4, Feb. No.) you must use great care not to let the sap boil too low. You go out, perhaps, to help unload, or to change buckets according to the running capacity of the trees, and come back to find the sap boiled to syrup and just ready to burn. Do not, however, keep the pans too full. The less sap there is in a pan, other things being equal, the faster does it evaporate. Not merely a larger *fraction* of the quantity in the pan, but a greater absolute amount,—more gallons.

It is best to "syrup off," often. A barrel of sap makes a gallon of syrup, thick enough to strain, cool, and settle before clarifying, which, when cool, will weigh 10 lbs. When you have enough boiled in for six or eight gallons of syrup, and it is boiled to about an inch deep in each pan, slacken the fire a little, and dip all you can safely, into the front pan, and supply its place with as much cold sap. Boil that in the front pan until it will drop from the edge of the dipper in drops three-quarters of an inch broad. Then, if you have a car (fig. 5, Feb. No.), draw the pan up two inches and roll it to the front, away from the fire, lower one end two inches and dip or pour off the syrup at your leisure, and run it into a twenty-gallon cask through the strainer (fig. 2). If you have no car, slacken the fire a little, and dip off the syrup as low as practicable with a flat-edged two-quart dipper (fig. 3). Have a pail of cold sap at hand, and when you have dipped as low as it is safe to do, turn in the cold sap. Or if you wish all the syrup out, dip out all but a pailful, and then two men can easily lift off the pan, pour out the syrup at one corner, turn in a pail of sap and put the pan in its place again. When the cask is full it should be removed to the dwelling house, put on a bench and left for twelve hours to settle.

It is best to "syrup off" as often as once in ten gallons. The syrup is better, there is less risk of burning, and it boils faster if the pans are only partly full of syrup.

For clarifying, a small sheet-iron pan, similar to those at the sugar-house, is used. It is about 2 ft. long, $1^1|_2$ ft. wide, and 9 in. deep. This is set on top of the cooking stove, and the syrup filled in to the depth of two inches. If proper care has been taken in gathering and boiling, the syrup, after settling in the cask, will draw off as clear, and almost as light colored as strained honey. It is common, however, to clarify it with milk or beaten eggs, or both together. Eggs make lighter-colored syrup, but injure the maple flavor; hence it is best to use milk. A pint of it will clarify ten gallons of syrup. The proper quantity of milk should be stirred into the syrup when it is first put over the stove. As soon as it begins to boil, the milk, with the impurities, will rise to the surface in a thick, dark scum. This should be skimmed off as often as it rises. Boil and skim until a gallon of the hot syrup will weigh $10^1|_4$ lbs. The scales and gallon measure should be at hand, and every mess of syrup should be brought to exactly this weight. In cooling, it shrinks so much that a gallon when cool, weighs 11 lbs., and this is standard weight for maple syrup. If it is thicker it will turn to sugar badly.

If you wish to make sugar, the syrup should boil until it "hairs," that is, drops from the edge of a dipper or spoon, and draws out into hairs three or four inches long. For cakes it should be taken off and stirred until it begins to grain and turn light colored, when it may be poured into tins of any required size and shape. For grained sugar, the stirring must be continued until the sugar is nearly dry, when it may be put in a cask with a perforated bottom to finish drying. It ought to be as dry and white as good "C" coffee sugar. In general, however, it does not pay to make sugar, except a few pounds of small cakes at the first of the season for eating. A limited quantity early in the season will bring from 25 to 35 cts. per lb. Later it will not bring more than 18 cts., and then the syrup, if nice, will buy its weight of "C" coffee sugar, which is better for ordinary cooking purposes. Nice maple syrup is far the best syrup made for buckwheat cakes; and at tea, with hot biscuit, it is better than honey. One does not tire of it so soon as of honey. But it must be of the *best quality*. There is as much difference between syrup made as I have described, and that made from sap and water caught in open wooden buckets or troughs, and boiled in kettles hung between two logs by "sweeps" and chains in the old fashion, as there is between Cauliflower and Cabbage, or Delaware and fox grapes, and people begin to appreciate this difference. Prime maple syrup, made as I have described, now brings in Northern Ohio, from $1.50 to $2 per gallon, according to the time of making. But it must be strictly first quality, and in order to have it thus, three things must be observed:

First.—*The sap must be kept clean*....Second.—*It must be kept cool and sweet until it is boiled*, and in order to have this,....Third.—It must be *gathered as soon as possible* after it runs, and boiled as *rapidly as possible*.

One can guard against sour sap in several ways. When cakes of ice form in the buckets they should not be thrown out (though there is little sweetness in them), for they keep the sap from souring as long as they remain unmelted. It even pays to gather a quantity of this ice to put into the vat if the day is warm. The most of the sap should be kept covered tightly in the *outer vat*. The one in the sugar-house is warmed by heat from the arch, and by steam from the boiling, and the sap will tend to sour. Again, after each "run," the vats, strainers and barrels should be scalded. We usually have two or three days, sometimes a week, of freezing nights and warm days, when the sap runs well. Then it rains or snows or freezes solid for as long a time. The consecutive days of sap weather before the storms and freezing, are termed a *run*. When there are indications that the run is over, barrels, vats, strainers, pails and boilers should be left sweet and clean. The vats and strainers should always be scalded. If the spiles begin to sour they should be brought in and thoroughly boiled out in water in one of the pans. The buckets can be most conveniently scalded by taking a barrel of boiling water on the sled, going through the woods, bringing twenty buckets to the sled, scalding and returning them to the trees bottom side upwards. Two men in three-quarters of a day will scald 500 buckets and spiles, and it pays over and over again for the work. Some seasons the buckets and spiles should be scalded three times, twice during the season, and once at its close. Usually, by the time the buckets need scalding the holes need reaming out, or the trees retapping. The reaming is done with a curved-lipped bit $^9|_{16}$-inch in diameter. If the trees are small and tapped every year it is not wise to bore *a second hole*. Reaming the old one answers the purpose.

Fig. 4.—BUCKET INVERTED.

If the buckets are not sour, it is well to invert them at the last gathering of the run. The bucket is not removed from the spile, but inverted on it, and left inclining from the tree at an angle of about 25 degrees (as in fig. 4). This drains it, and the frost and wind make it sweet and clean. The cover should be laid on a clean root, if placed upon the ground the dirt may freeze to it.

The sap should be gathered as soon as possible after it runs, and boiled soon and rapidly, even if it requires night boiling. Night-boiling is not so bad as it might seem. A bunk is built in one corner of the sugar-house, three feet high, with straw-bed, pillows and buffalo-robe or blankets; and two men divide the night, one boiling while the other sleeps. You will sleep soundly after gathering thirty barrels of sap.

THE PROFITS.—The expense of fitting up a "camp" of 500 trees with buckets, spiles, covers, vats, etc., including a decently good sugar-house and shed, need not much exceed $500, or $1 to the tree. In a favorable year, good trees will yield fifty cents worth of syrup, which is good interest. The buckets and fixtures will last thirty years or more, if cared for. The fuel of the kind I have described answers the purpose well, if housed, and costs little. The work can be performed by the usual force, and comes at a time when not much other profitable work can be done, at least on a dairy farm.

If a man has 500 good maple trees, growing close together, say on six or eight acres, with the other trees mostly cut out, this piece of ground will probably net him more than any other of equal size on his farm. The most impor-

tant directions may be briefly stated again, thus: *First.*—Use tin buckets, hang them on the trees and cover them....*Second.*—Use maple spiles, turned, bored, and notched in three places....*Third.*—Use great care to keep dirt out, and strain, settle, and skim thoroughly....*Fourth.*—Gather often, and keep the sap cool and sweet....*Fifth.*—Scald vats, strainers, buckets and spiles when they show the least signs of souring....*Sixth.*—Use refuse wood, and house it during the dry fall weather....*Seventh.*—Scald, wash and wipe all the vessels, and put up neatly all the fixtures at the close of the season, lock the sugar-house door, and everything will be ready at a minute's notice.

Fish and Muck Compost.

BY AN OLD SEED GROWER.

To prepare fish and muck compost, commence with three shovels of swamp muck, and spread it on the ground in a circle, if for a small heap of a few barrels of fish pomace, or in a long heap for a large quantity; then beat the fish fine and scatter one shovelful over the muck, and so continue alternately until all is mixed, leaving the heap cone-shaped. In about a week the heap will begin to heat, and should be turned and mixed, commencing at one side and making all fine with the back of the shovel. In a week or ten days more, it should be turned again. In three weeks it will be fine and fit for use. It may be kept until wanted to be used, but will require further turning if it continues to heat. The muck should be damp when mixed, or it will not heat sufficiently. Peruvian guano and muck, or earth, should be mixed in the proportion of six to one of guano. It does not heat, but requires the same turning and mixing as fish and muck. A handful of either in the hill is about the quantity generally used, but of the fish compost, more is required than of the guano—as much as can be held in the hand with the palm uppermost and the fingers spread. If thrown into the hole in a heap, it should be spread before being covered, to avoid the danger of destroying the seed, which never should be planted directly upon it.

Cultivation of the Castor Bean.

Numerous correspondents in the Southern States are making inquiries concerning the cultivation of the Castor Bean, and though there are several articles upon the subject in the back volumes, we suppose that to many these are not readily accessible, and we here give a brief synopsis of the matter. The plant, *Ricinus communis*, is a native of India, is a perennial 30 or 40 feet high in subtropical countries, but in cooler latitudes it is cultivated as an annual. It will grow and even perfect a portion of its seed in the latitude of New York and farther north, but it can only be cultivated with profit in the warmer States. In Illinois it is stated that the yield for the past two years has averaged only 9 bushels to the acre, (though it has been more than this in former years), while in Texas it is from 50 to 60 bushels. Land that is capable of producing a good crop of corn, is suited to the cultivation of the Castor Bean; it is thoroughly plowed and harrowed, and marked out with furrows at 6 feet apart. At every tenth row a space is left wide enough to allow of the passage of a cart to collect the crop. To secure a good stand, four seeds are planted at the intersections of the furrows; some scald the seeds, allowing them to remain in the water for twelve hours before planting, and then drop two of the seeds with two that have not been so treated. The scalded ones germinate soonest, and should they be cut down by frost, the others will come up later and thus save replanting. A bushel of seed is sufficient for 18 or 20 acres. The planting should not be done until frosts are probably over. When the plants are well established, all but the strongest one in each hill is removed. The soil is to be kept mellow and clear of weeds by use of the shovel, plow, or other implement, and the crusted surface is broken up after heavy rains. The clusters or spikes of beans ripen unevenly, and they have to be collected every few days. The pods, as they ripen, burst, and throw the seeds out with considerable force, and to avoid waste, the spikes must be gathered as soon as they turn a brown color. They are cut, thrown into the cart, and carried to the curing-house or popping yard. An out-building in which to cure the beans, may be fitted up with shelves and a stove, or a special building may be put up for the purpose. A plan for one was given in May, 1867. Where artificial heat is used, it should not exceed 120°. An open shed with a floor and boards around the sides to prevent the beans from escaping, is also used, and the pods are dried without artificial heat. Whatever place is used as a popping yard, it is necessary to prevent the beans from coming in contact with the damp earth, as well as to keep rains from wetting the spikes. After the beans have all popped out, they are cleaned by being run through a fanning-mill. The beans weigh 46 lbs. to the bushel. As the pressing of the oil is in the hands of a few persons who usually contract directly with the growers for the crop, the price of the beans is not quoted in the Market Reports.

HAULING OUT MANURE.—"W. G. C.," says: Commence dropping the heaps two and a half paces from one side of the land to be manured, and drop the heaps five paces apart, the whole length. Drop the next row five paces from the first, commencing half way between the first two heaps, breaking joints, as it is called, and so continue, until the whole is finished. This takes 160 heaps to the acre. If it is desired to manure pretty heavily, drop five heaps from a one-horse cart, which will take 32 loads to the acre. Six heaps from the cart take 27 loads. Seven heaps 23 loads. Eight heaps 20 loads. An ox-cart or a two-horse wagon will hold one or two heaps more. The quantity required on an acre must always depend upon the quality of the manure, the condition of the land, and the kind of crop to be raised.

SPREADING MANURE.—In spreading manure, care should be taken to scatter it evenly over the land, breaking to pieces all large and hard lumps. This should always be done immediately, or not more than half a day, before plowing, especially if the weather is dry and very windy. The manure should be plowed under, before it dries very much, or loss will accrue.

PLOWING AND HARROWING.—Never plow if it can be avoided, or go on to the ground for any purpose, when it is wet and sticky. Keep the furrows *straight*, and, if possible, reverse them at every plowing, so as to keep the land level. To fill in furrows, back-furrow pretty widely once around, and haul once around very wide; this will generally be sufficient. Harrow soon after plowing and before the lumps, if any, get dried hard; twice over with the teeth down and once with the back of the harrow, will prepare the land for ordinary crops.

Economical Fences.

Fencing, under our present systems of Agriculture, must be endured, and fences must be repaired, made, and well made. In the older parts of the country, especially such as were originally well wooded, fences made of split timber predominate. Where small wood, like red cedar, abounds, the "gun fence" is not uncommon, and may be made to answer a very good purpose. The simple zigzag rail-fence is economical only where timber is most abundant; but, as it is the only easily made wooden fence that will stand upon a bare rock, it is necessary to use it in some places. The favorite post-and-rail-fence is fast going out of fashion, where labor in winter, and timber have a ready market, as they have almost everywhere within 10 miles of a railroad. A bungling, unskillful hand will waste timber wofully in splitting for posts and rails. Holing is slow work for the best farm hands we can hire now-a-days, and whoever trusts the job of sharpening rails to any ordinary hand, will be sure to rue it if he has the fence to set. The waste of timber is most obvious in rail-splitting as compared with sawing. To illustrate this, we give the drawing of one end of an oak log measuring 2 feet in diameter. One half of this is marked to be split into 4 triangular rails about 5 inches deep and 4 wide, and 12 flat rails 7 inches deep and 3 wide, making 24 flat and 8 heart rails out of the stick.

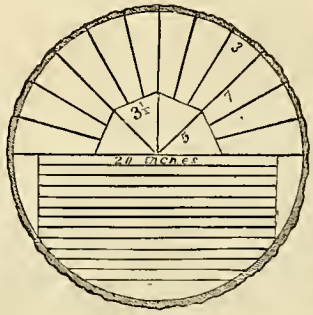

Fig. 1.—TWO-FOOT LOG.

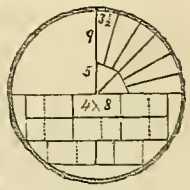

Fig. 2.—28-INCH LOG.

The other half is marked to show how, after taking off the slabs, the whole stick would cut up into not less than 14 20-inch boards, and at least 10 others. These would rip into 70 or more 4-inch, ten 5-inch, and ten 6-inch strips.

The same log, if 13 feet long, split, would afford *rail* material for 125 ft., or about 7½ rods of 4-rail post-and-rail-fence; or, sawed, it would make strips for 130 feet, or 2 feet less than 8 rods of fence made with one 6-inch, one 5-inch, and three 4-inch strips capped and battened, and leaving twenty to twenty-five 4-inch strips over. We have no doubt three-quarter-inch oak strips, well nailed and battened, will last longer than split rails of the same wood or of chestnut.

Posts are another matter; the greater economy of sawing or splitting depends entirely upon the size of the logs. Chestnut sticks, 6 to 10 inches in diameter, will make two good posts each. An 8-inch, half-round post is hardly large enough to hole; but a 10-inch, half-round one may be holed, and makes as good a post as can be desired, for post-and-rail-fence. A 10-inch stick will make four posts for a strip fence, and when looks are not set much by, are as good as if sawed. For a post-and-rail-fence, split posts are almost a necessity; but there is no economy in splitting posts out of large logs.

Figure 2 shows a 28-inch log, marked for splitting into 24 rather thin posts, or for sawing into sixteen 4 × 8 pieces, which will each make 2 posts 5 × 4 at one end and 3 × 4 the other—32 in all.

[COPYRIGHT SECURED.]

THE THRASHING MACHINE OF NEW MEXICO.—FROM A SKETCH BY H. W. ELLIOTT.—*Drawn and Engraved for the American Agriculturist.*

The Thrashing Machine of New Mexico.

Persons accustomed to improved plows, mowing and thrashing machines, and other modern agricultural implements, read of the primitive agriculture of oriental countries, with a feeling of pity for the people who are so far behind the age. But few are aware that we have within our own territory thousands of tillers of the soil whose agricultural implements and operations are as rude as those of the inhabitants of Palestine, where no improvement has been made for centuries. We need not go out of our own dominions to see fields plowed with a crooked stick, wagons built without a particle of iron in their whole structure, grain thrashed by the tread of animals, and ground by rubbing it by hand between two stones. Mr. H. W. Elliott, of Washington, D. C., sends us a sketch made of a thrashing scene in New Mexico, with the following description....."In proceding to thrash, a ring is made, and the earth within smoothed and hardened; then a pile of shock wheat is put into the centre, and from this supply the surface of the ring is covered from four to six inches in depth with the wheat straw. Then the whole household and as many friends and relations as they can call in to help, take places at regular intervals outside of the ring, into which twenty, thirty, or forty sheep are driven, according to its size. The sheep are kept on a constant run by the shouts and exertions of the drivers, who relieve one another at the task of keeping the "machine" in motion.

A floor of wheat is tramped out in about ten or twelve hours of this exercise, then the process of winnowing and cleaning the grain from chaff, sand and dirt, follows, and is carried on in fully as rude a fashion as is the thrashing."

Asphalt Walks.

The "Notes from the Pines" have been crowded out both last month and this. To answer several who have inquired about making walks, we give the following from the writer's last contribution: Some of the neighbors have had asphalt walks laid by those who make it a business, and have, or profess to have, a patent on their composition. Doctor K. has been putting down asphalt walks himself, and I have kept an eye on the experiment. I always thought meanly of the man, who, to the question, "What wine do you prefer?"—replied, "That which other people pay for," but I now think better of him, when I find myself so fond of the experiments which other people pay for. It is very good of the Doctor to try this experiment with the walks and tell how he did it and I felt half guilty the other day when I went, ostensibly to make a friendly call, but really to find out about his *ways* for my own benefit, and for that of those who read the *Agriculturist*. Next to finding out a new or good "wrinkle," the Doctor derives the greatest pleasure from telling some one else how to do it. This is the way he makes his walks: The earth is excavated to the required depth, an edging of bricks placed on end is put down (some use plank), and the earth is rammed hard. Three parts of coal (or gas) tar and one of common pitch, are melted together and boiled for half an hour. The composition is then mixed with dry sand in the same manner as a bed of mortar is mixed, and the material, which is of about the consistency of mortar, is spread upon the path to the depth of about three inches. Boards are laid upon the surface and pounded to make it level; a layer of sand is then strewn on, and the surface rolled. The mixture in a few days, becomes as hard as stone, and thus far the Doctor's paths are as sound as need be, and as good as the patented ones. They are easily kept clean, pleasant to use, and no weeds can grow in them.

The California Pitcher Plant.—(*Darlingtonia Californica.*)

Among the many new plants which have been found by the explorers of the Pacific coast, none is more interesting than the Darlingtonia. It is strikingly curious in its appearance, and in the structure of its leaves and flowers; but beyond all this, a peculiar interest attaches to the plant, as commemorating one whom no botanist mentions without coupling with his name some endearing expression—the late Dr. William Darlington, of West Chester, Pa. Allowing the engraving to save us any extended description of the plant, we will briefly give the history of its discovery, which is interesting, as it shows how long plants may be known to science, before they make their way into collections of living specimens. In 1842, Mr. J. D. Brackenridge, one of the botanists of the U. S. Exploring Expedition under Capt. Wilkes, found, near Shasta Peak, the leaves and remains of a seed-pod of the plant, which were sent home in the collections of the expedition. From these fragments but little could be determined. In 1850, Doct. G. W. Hulse, of New Orleans, in passing over the same locality, came across the plant in flower, and sent dried specimens to Doct. Torrey, who determined it to be a new genus, which he dedicated to Doct. Darlington, and of which he published an account in the Smithsonian Contribution to Knowledge in 1853, accompanied by a plate showing its botanical characters. Every botanist holds it an honor to have a genus bear his name, and Dr. Darlington was delighted, that so rare and curious a plant should be called after him. The West Chester Bank was remarkable for having at one time a botanist in both its President and Cashier. The interior of the banking room was neatly frescoed, and over the door of the President's room was a painting of the *Darlingtonia*, and over that of Mr. Townsend, the Cashier, was one of a *Townsendia*. The Doctor had already had two other plants dedicated to him, which upon further investigation proved not to be good genera, and he was naturally solicitous about the permanence of the present one. We well recollect with what earnestness the old gentleman, then nearly 75, asked, "*Do* you think it will stand?" Some six years ago, Prof. Wm. H. Brewer, then acting as botanist to the California Geological Survey, found the Darlingtonia and sent home an abundance of seeds, which were distributed to various parties. They germinated, in some cases, but the young plants proved to be very shy, and none ever attained any considerable size.

In the spring of 1869, some living plants were sent to Doct. Torrey, which were placed in the hands of several florists, neither of whom succeeded in making them grow. During the past summer, its successful cultivation was announced in England, and the present winter, plants were received from the same person who sent in the spring. Having come by the Pacific Railroad, they arrived in fine condition, and through the kindness of Doct. Torrey, we are in possession of the plant, which enables us to give the engraving, as far as the foliage is concerned, the flowers being taken from the Smithsonian plate. Its resemblance to our common Pitcher plant (*Sarracenia*) will be seen at once, and it is still more like one which grows in the Southern States. The top of each pitcher, which, when full grown, is about 30 inches long, is arched over, with the orifice below; the curious fish-tail-like appendage, which is the leaf proper, gives it a quaint look. Each of the pitchers is twisted about half a turn upon itself. The veining is very distinct; near the top, especially in the older leaves, the pitcher is purplish, with several nearly white dots. The flowers, but one of which is borne upon a stem, are about an inch and a half in diameter, and pale purple.

CALIFORNIA PITCHER PLANT—(*Darlingtonia Californica.*)

Fruit for the North-west.—1st Article.

BY OUR SPECIAL IOWA CONTRIBUTOR.

Ten years ago, when I first came to Iowa from New England, and began at once to set out apple trees, I was laughed at for my verdancy. "Apples won't do nothing in Iowa,"—said my faithless neighbors. "Why not?"—I asked. "Oh, 'cause they won't,"—was the laconic and logical reply. Not being able to comprehend this argument, I continued to set out trees. What is the result? Simply this: that my apple orchard is by far the most valuable and productive piece of land of its size upon my farm, and is already, at eight years of age, furnishing me with an abundance of delicious, healthful fruit. What think Iowa farmers to-day of the practicability of raising their own apples? One can hardly travel half a dozen miles in any direction in early spring, without seeing as many loads of trees direct from the nursery, destined for the farmers' orchards; and the general expression is "We will soon have one of the greatest apple producing States in the Union." It has already been clearly demonstrated, that with reasonable care, apples will succeed admirably throughout the State; and while this article will be devoted mainly to the consideration of apple culture, many of its suggestions will be applicable to the management of other fruits as well. "We do not gather grapes from thorns, or figs from thistles;" why expect to gather apples from trees "shortened-in" by cattle, and "root pruned" by hogs? Why expect results from apple trees so different from anything else? When we give to fruit one-half the attention, and bestow upon it one-half the care we do upon other crops, and *then* fail, it will be time to charge its failure upon the soil and climate; but, until then, let us not make either the scapegoats of our own shiftlessness, or negligence. Success, then, in apple culture, as in everything else, depends upon certain conditions. *These conditions met*, and we are sure to succeed. The climate is right, the soil is right, or at least so nearly so, as to make success attainable in every part of our State; and it is safe to say there is not a county or a township within its borders, in which apples may not be easily and profitably raised.

PLAT FOR AN APPLE ORCHARD.—Any piece of ground that can be drained so as to be suitable for corn, may safely be made use of for an apple orchard; and yet I would prefer oak land, or rolling prairie, if I had it. Not having such, I set my orchard on the level prairies, and have never seen trees do better. The first step in starting an orchard is a suitable

PREPARATION OF THE GROUND to receive the trees. To this end, plow deeply in the fall, and if the land is ridgy, or poor, put under a heavy coat of manure, and the more wood-ashes (if the land is rolling) the better; if level, turn under a heavy coat of horse manure, and set the trees as high as the natural surface; ridging up to them in cultivating, so as to leave a dead furrow for drainage between the rows, at least two feet below the collar of the tree. Trees should be taken from the nursery in the fall, and "heeled-in" thoroughly, in dry, warm soil, ready for early spring setting. Just here, let me caution all to deal with none but reliable nurserymen, who have reputations which they cannot afford to lose. *Leave alone tree peddlers.* If you know it, don't buy a tree whose root has been divided and sub-divided until there is no vitality left in it. *One root for one tree* is evidently the design of nature, and she has kindly provided the means, if properly used, to furnish all creation with whole roots in abundance. Some slow growing varieties, like the Northern Spy, *may* endure this outrage of division; but others of more rapid growth, like the Yellow Bellflower, will not. See to it, that you get trees that have been grafted upon whole roots; and while you are in the nursery looking to this, see to it, also, that you get trees with low-spreading tops, with sound, healthy bark, and a thrifty appearance. See, too, that they are carefully taken up, with a good supply of fibrous roots. A little care

here, will save one or two years' growth of the trees, and a life-long difference in the health, vigor and productiveness of the orchard.

THE BEST AGE AT WHICH TO SET TREES is probably, two or three years, depending somewhat upon their growth in the nursery. Ordinarily I like three-year-old trees best, *if* proper

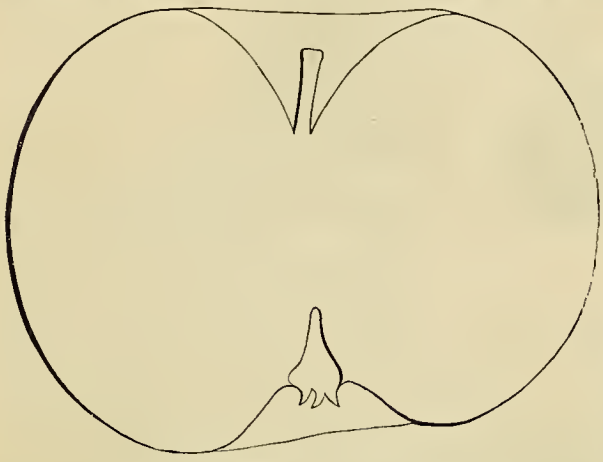

Fig. 1.—MILO.

care is exercised in taking them up, so as to get a sufficiency of roots. Now, having the trees at home, you are prepared to take advantage of time and circumstances in setting. Let the work be done as early as a suitable condition of the soil will admit. One of the manifold advantages of early setting is, that the tree is in a dormant or sleeping state, and is better able to withstand uninjured, the unnatural shock of removal, exposure, and rough handling. Select, if practicable, a cloudy, damp day for setting. Have a bucket of water along, and give the roots a good drenching after they have been put in position, and covered with a few inches of well pulverized soil. Be careful that the roots lie naturally in their places, and that the earth be thoroughly filled in among them; and finally, that the earth at the last filling up be tightly pressed down upon them, covering about two inches deeper than they stood in the nursery.

THE PROPER DISTANCE TO SET TREES.—It is very evident that they should be set much closer

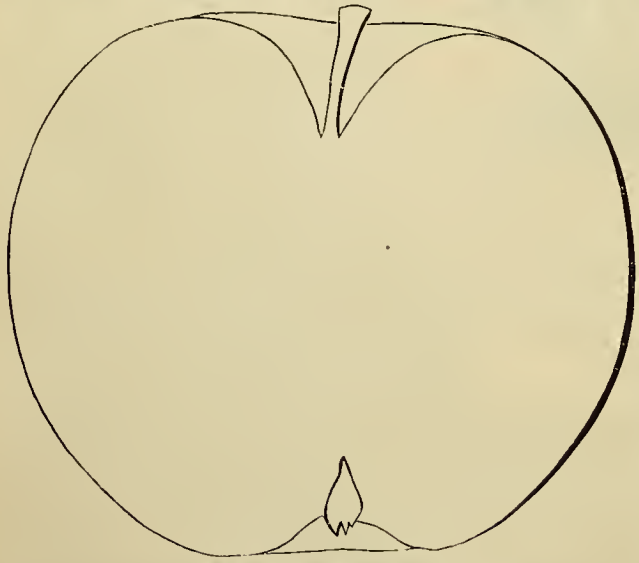

Fig. 2.—LORD SUFFIELD.

here on our prairies than at the East, for the purpose of mutual protection. My own practice is to set from twenty to twenty-five feet apart, depending upon the habit of the tree. Say twenty feet for such varieties as the Northern Spy, and Red June, and twenty-five feet for those with wide-spreading tops like the Yellow Bellflower. By close planting, the trees protect each other, both against wind and sun, both of which are very severe upon newly set trees on our immense stretches of prairie. But in addition to this mutual protection, it is also necessary that the orchard be enclosed on all sides but the south, by some effectual

WIND-BREAKS, at least forty feet from the outside rows. I find for this purpose, the White Willow, and Cotton-wood admirably adapted. Norway Spruce, when it can be had, is still better; but those first named answer a very good purpose. The more protection on the north and west of the orchard, the better. It matters little whether it be hill or grove. If we had hills, or hillsides in the West, as plentifully as our neighbors have in New England, I would by all means recommend them for orchard plats; but not having them, we must resort to artificial means to secure their benefits; one of which has been considered; the other is

DRAINAGE.—It is useless to talk about "fruit in a frog pond." We might as well expect our children to be healthy with wet, cold feet, the year round, as to expect it of our apple, or other fruit trees. Drainage, either natural or artificial, and protection, are *indispensable* requisites of a healthy and productive orchard. By following out the plan ot ridging up, herein indicated, and giving a sufficient outlet to the dead furrows, surface drainage may be secured, which, on level ground, answers a good purpose.

Notes on New or Little Known Apples.

BY CHARLES DOWNING.

MILO.—Syn., The Doctor.—Col. E. C. Frost, of Watkins, N. Y., who kindly sent us specimens of this new apple, says: "It originated with Jonathan Bailey, of Milo, Yates Co., N. Y., and is known as 'The Doctor.' Tree, a very strong, upright grower, both in the nursery and orchard, and a profuse bearer every year; it ripens here in Sept. and the forepart of Oct." As there is already a Doctor apple, the local name, "The Doctor," is likely to lead to confusion, and it is thought best to adopt the name of the town in which it originated.

Fruit medium or above, oblate; skin whitish, shaded, striped, broken splashes of light and dark-rich red, and moderately sprinkled with light dots, a few of which have a brown center; stalk very short and small, inserted in a large, deep cavity, yellowish; calyx half open; segments short, erect, the ends sometimes slightly recurved; basin large, deep, very slightly corrugated; flesh quite white, crisp, tender, juicy, with a pleasant vinous, subacid flavor; quality "very good;" core medium. September and October.

LORD SUFFIELD.—This new English apple is briefly described in the revised edition of the Fruits and Fruit Trees of America; the fruiting of the tree here last summer, allows me to make a more extended description. It is a promising variety for market, and for culinary purposes. Tree vigorous, somewhat spreading, an abundant bearer; fruit large, roundish, slightly conic, obscurely ribbed; skin whitish yellow, with sometimes a shade of red in the sun,

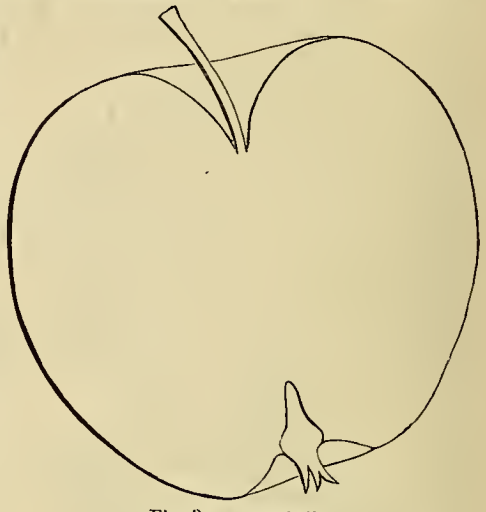

Fig. 3.—SOMERSET.

sprinkled with a few gray dots, and many rather obscure light ones; stalk short and small, inserted in large, uneven cavity; calyx closed; segments short, to a point; basin small, corrugated; flesh white, crisp, juicy, brisk sub-acid; core rather large. Ripens all of September.

SOMERSET.—The origin of this is unknown to me, but it is supposed to have originated in the town of Somerset, Niagara Co., N. Y. Specimens were given me this season, and also a few years previous, by C. L. Hoag, of Lockport, N. Y., who values it highly as an amateur fruit, and for family use. It may be some old variety under another name, but I do not recollect to have seen it elsewhere. It is a delicious eating apple, ripening the last of September and first of October. Tree vigorous and very productive; fruit below medium, roundish, conical; skin whitish yellow, with sometimes a few nettings of russet, and sparsely sprinkled with brown dots; stalk of medium length, slender, often with bracts inserted in a moderate cavity; calyx closed; segments long, narrow, and slightly recurved; basin very small, corrugated; flesh quite white, tender, juicy, with a rich aromatic flavor; quality very good, or best; core rather large.

How to Lay Out a Flower Garden.

SECOND ARTICLE.

In the article last month we gave some simple examples of beds cut in the lawn. This style of gardening can be carried out in a most elaborate manner. In England, in places where expense is not a consideration, the beds are replanted three or four times a year, so that each season, winter included, has its appropriate plants. But few among us will care to attempt this elaborate work. We will not occupy space with plans, giving only two simple ones, to illustrate the principles followed in designing them. Whatever the form of the garden or that of the beds composing it, the two sides must be symmetrical in form, and in planting the colors must be so arranged that a bed of one color will be balanced by another of the same color. It will be seen that these rules are observed in the circular design, fig. 1, where 1 is planted with rose color; 2, 2, 4, 4, and 8, 8, are white; 3, 3, dark lilac; 5, 5, blueish lilac; 6, 6,

yellow; 7, 7, scarlet; 9, 9, purple. The planting here is done with various colored Verbenas, except in 1, where a rose-colored Geranium is used, and in 6 6, where the yellow is a Calceolaria. Moreover, the quieter colors must be towards the center, and the gay and positive ones the farthest from it. In fig. 2 is a design by the late Donald Beaton, for a garden in a front yard, which may have one of the short or one of the long sides towards the house, according to the

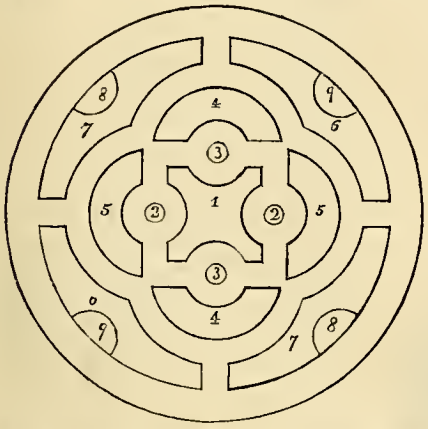

Fig. 1.—CIRCULAR DESIGN OF A FLOWER GARDEN.

nature of the locality. In this plan the beds are edged with box, and the walks laid with light gravel. It admits of being planted in a variety of ways; all the beds may be used for bedding plants, or those upon the side may be for roses and other shrubs, while the smaller ones may be filled with flowers in masses.

To plant even a simple design in the bedding style, requires a large number of plants. Where there is a green-house and a gardener, these can be readily supplied, but if one has to purchase plants, the cost, even at the wholesale price, becomes a serious item. We enumerate some of the principal ones used for garden decoration, remarking that the florists' prices for them are $1.50 to $3.00 per dozen. *Geraniums* or *Pelargoniums*. Among those of the Zonale class we have flowers of the most intense scarlet, salmon color, rose, pink, and white. They

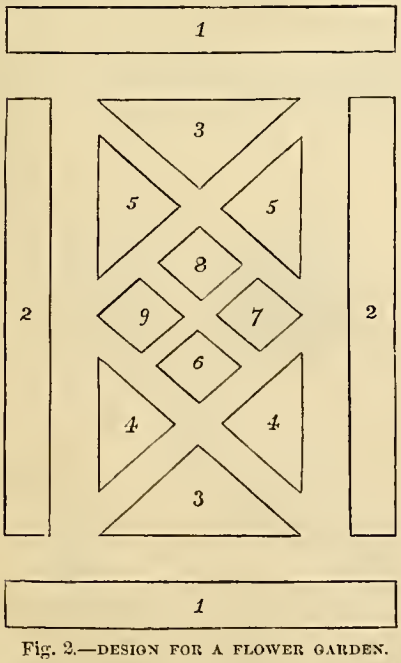

Fig. 2.—DESIGN FOR A FLOWER GARDEN.

flourish well in our climate, and a great show can be made with them. Scarcely any of the beautiful tricolor Geraniums with markings of gold, silver, and crimson, will endure our hot suns. *Verbenas* are among the most popular bedding plants, and give a great range of colors, from white to scarlet, crimson, maroon, and purple. *Petunias*. Only the single sorts should be used for bedding; named sorts may be had of florists, or they may be grown from the seed like annuals. *Lobelias* give us pure white, and the most beautiful of blues. The plants are of low growth, and in ribbon planting should occupy the outside lines. *Shrubby Calceolarias*, though they give crimson and other colors, are valued in bedding for furnishing bright-yellow flowers. These are the leading plants grown for their flowers, besides which we have a number used for the ornamental character of their foliage. Among the most popular and valuable of these are the *Coleuses*. The old *Coleus Verschaffeltii*, with crimson leaves, makes a splendid bed; *C. Veitchii* has a dark chocolate spot in the leaves, and a new set of Golden Coleuses promise to give us a new series of fine shades. *Alternantheras* are low growing plants with small leaves variegated with rose, crimson, and yellow. Among the white or silvery-leaved plants there are *Centaurea candida* and *gymnocarpa*, *Cineraria maritima*, *Gnaphalium lanatum*, and others. These answer admirably to set off almost any of the flowering plants, and are introduced as edgings with fine effect, as well as to separate bright colors in lines of ribbon planting. It is well to dig over the bed several times, at intervals of a few days, in order that the soil may get well warmed through before the plants are set out. The distance apart for the plants will depend upon the habit of growth. Lobelias and small-growing ones should be about 6 inches apart, and the larger ones, such as Geraniums, a foot or more, according to their size.

Rhubarb as a Market Crop.

BY PETER HENDERSON, BERGEN CITY, N. J.

In a recent article on Asparagus, I stated that in consequence of having to wait for returns some years until the crop matured, it followed that the profits when they did come, were much greater than from *annual* vegetables, that were sown from seed and matured the first year. Rhubarb in this respect, is similar to Asparagus. It matures earlier, and is more easily cultivated than Asparagus, as it is a plant that adapts itself to almost any soil, provided it is well drained, artificially or otherwise. The preferable soil for Rhubarb as for most vegetables, is a deep, sandy loam. Whatever the soil, it should be plowed from 10 to 12 inches deep, the subsoil plow following in the wake of the other, stirring to the depth of 10 or 12 inches more; after plowing, harrow deeply and thoroughly.

After the soil is prepared, lines are struck out by the plow 4 feet apart from each side of the field or plot, so that they will intersect at right angles. At these points the plants are set, first mixing with the soil 3 or 4 shovelfuls of well-rotted manure for each plant. The time of planting in the Northern or Western States, may be either in the fall or spring; in the Southern States the fall is preferable.

Rhubarb is usually propagated by division of the old roots; each eye or bud when broken apart with a root attached, forming a plant. But making a plantation of any great extent in this way, is expensive to the beginner, as the plants are rarely to be purchased under $50 per 1,000 eyes, and as about 3,000 plants are required to an acre, quite an outlay is necessary.

This expense may be obviated by increasing the plants by seeds instead of by division of the roots. In the Northern States, the best time to sow the seed is about the first of March, in a cold pit or frame, that is, such a pit or frame as is used for keeping cabbage or lettuce plants in during winter. (See "Gardening for Profit.") The soil best suited is a rich sandy loam, which should be thoroughly pulverized, and the surface made completely level before sowing. One pound of seeds, which will give about one thousand plants, will be sufficient to sow six sashes, or about 100 square feet of surface. After sowing, a soil made *light* with half its bulk of leaf mould from the woods, should be evenly spread over the seed to the depth of one-quarter of an

Fig. 3.—VEGETABLE WORMS—(*See next page.*)

inch, and then nicely patted down with the back of a spade. This is necessary in the sowing of all seeds; for if the soil which covers them is left too loose, the air gets through and dries up the seed, so that they germinate slowly or not at all. Thousands of dollars are annually lost both on the farm and in the garden by the want of this simple precaution. If the surface of the soil in the frames becomes dry, it will be necessary to water, showering freely from a fine rose watering-pot. If the sashes are covered up by mats or shutters so that the soil never becomes frozen, the plants will be large enough, if sown March 1st, to transplant by May 1st, but if not covered up at night they will take three weeks longer. In such sections of the country as are warm enough to begin outdoor operations by the end of February or the beginning of March, there will be no need for sowing under sashes, as sowing in the open air in the manner described, will do equally well.

The plants are fit to be transplanted into the open ground when they are about an inch in hight. The soil to receive them should be enriched and pulverized in the best manner, and the plants set out either in rows 12 inches apart and 3 inches between the plants, or in beds of a convenient width, say 4 feet, and the plants set equidistant, 6 inches each way. By fall they will have grown, if kept clear of weeds, so as to cover all the ground, and may then, in the succeeding spring, be planted out permanently in the manner previously described.

The first season after planting, no stalks should be pulled, as they are yet too young for a crop. But the next year, that is, the third year from the seed, a full return may be expected if proper attention has been given to cultivation.

It is exceedingly difficult to name the annual profits from an acre of Rhubarb in full bearing, as every thing depends upon earliness. Even here in the vicinity of New York, growers vary in their statements from $100 to $500 per acre. The difference of a week in earliness makes a difference of $200 and $300. Here, then, is a chance for many a point in the Southern States,

for if this vegetable will net these profits per acre in the latitude of New York, that from Southern growers, if equally well cultivated, and thrown into our Northern markets three or four weeks earlier, must yield very large returns. We have any quantity of annual vegetables from Southern States, such as cabbage, radishes, onions, lettuce, cucumbers, and tomatoes, but we rarely see a bunch of Southern rhubarb or asparagus. Besides, as these two articles mature their crop in early spring, the low temperature at that season ensures their safe shipment, even if delayed a week in the transit to our Northern markets. The loss in tomatoes, cucumbers, and such articles as become marketable in summer, is often great, from the high temperature at the time of shipment. Most vegetables and fruits would come in better order if they remained in the package 8 days in an average temperature of 50 degrees, than if kept for 3 days in a temperature of 90 degrees. Hence those fruits and vegetables maturing at a low temperature are best fitted to be grown at the South for Northern markets.

Snails, Worms, and Caterpillars.

If the reader of the heading looks for an article upon some pests of the garden, he will be disappointed, as we have reference to the snails, worms, and caterpillars, that are cultivated. On other occasions, we have mentioned striking instances in which animals resembled plants, and have illustrated plants which imitated animals. Some of the seed-pods of the Pea Family bear so striking a likeness to snails, caterpillars, and worms, that at first sight they may be readily mistaken for those animals. The French cultivate a number of plants which are not used so much for food as for garnishing or ornamenting dishes, and in their later works we find included those which furnish pods resembling disagreeable animals we have named. Their use—if it may be called one—is to place upon salads, to surprise those who are at the table. As one of their authors says, "If the surprise is an innocent one, it is certainly not agreeable." As the seeds are now offered by some of our dealers,

Fig. 1.—VEGETABLE SNAIL.

we give figures of the plants, with the remark that they require no special culture. The Vegetable Snail, fig. 1, is *Medicago orbicularis*. Its remarkably twisted pod bears a strong resemblance to a snail shell. The Vegetable Caterpillar, fig. 2, is *Scorpiurus vermiculata*, the pod of which looks much like a hairy caterpillar coiled upon itself. In fig. 3 (on preceding page) we have the Vegetable Worms, the fruit of *Astragalus hamosus*. In the figures, a single fruit is given of the natural size, and a reduced branch of each, showing the habit of the plant.

THE MARSH MARIGOLD.—(*Caltha palustris.*)

Spring Greens—The Marsh Marigold.

A list of all the different plants used as "greens" would be a curious one, as it would include members of widely differing families; some neutral, as far as we know, and some more or less active, but all agreeing in that their leaves and young shoots are tender and not unpalatable. Every now and then we hear of some newly introduced plant, or some old one, which we have grown for other purposes, suggested as a suitable candidate for the pot. Even the leaves of the ornamental Ice-plant and Madeira vine have been made, by some, to serve their turn upon the table. Among our indigenous plants used as greens, none is so generally employed — at least in the Eastern States—as the Marsh Marigold, (*Caltha palustris*), perhaps for the reason that in its localities it grows abundantly, and is readily gathered. In April and May, the wet meadows and the margins of brooks are made gay by the golden buds and flowers of this plant. The leaves are round-heart-shaped, and of a rich green. The flowers, as represented in the engraving, look much like large Buttercups; indeed, the plant belongs in the same family with the Buttercup or Crow-foot. The leaves and tender stems are gathered at or just before flowering time. The plant, when fresh, is considerably acrid, but this quality is removed by cooking. In most localities the plant is known as "Cowslips." It is unfortunate that the early settlers should have applied this name, as the plant has neither resemblance to, nor relationship with, the Cowslip. It is a native of England also, and there it has for hundreds of years been called Marsh Marigold, although it is not a Marigold.

WINTER PEARS.—F. R. Elliott writes:—I regard the neglect to plant and grow more of the winter varieties of pears as a decided error on the part of fruit-growers. It is true, it requires a modicum of knowledge relative to ripening them, over and above that demanded by autumn varieties; but whoever expects to realize paying returns from any business, must understand that business, make it his business, and attend to the business, to which rule fruit-growing is no exception. These remarks are suggested by looking over a basket of winter sorts of pears just received from Ellwanger & Barry, of Rochester, in which Josephine de Malines, Doyenne d'Alençon, and Beurré d'Aremberg, stand prominent for size and quality. Objections are sometimes made by growers to these and some other superior winter pears, on account of the slow growth of tree. Experience proves that such objections, when well understood, are strictly commendations of the variety, as it has been long known by careful observing horticulturists, and recently advocated in Western meetings, that a moderate and slow growth while young, and not too early coming to bearing maturity, are indications of longevity and health in the tree. Columbia, Beurré Duhaume, Beurré Langlier, and others, are as good growers and bearers as market men could wish; but in quality, the fruit for table use will not rank above "good."

[Upon reading the foregoing, we were reminded to look after some Duchesse de Bordeaux sent last fall by Dr. J. S. Houghton, of Philadelphia. Though they were slightly shriveled when put away, from having been exposed at an exhibition, they proved to be of most excellent quality.—ED.]

COAL ASHES FOR FRUIT TREES. — Several have asked whether coal ashes are valuable as an application to fruit trees, and as in various places we have seen small heaps of the ashes

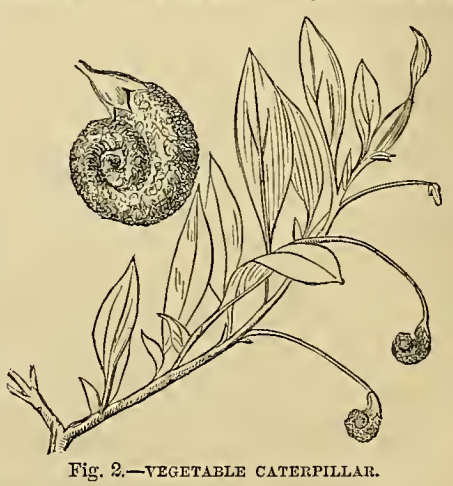

Fig. 2.—VEGETABLE CATERPILLAR.

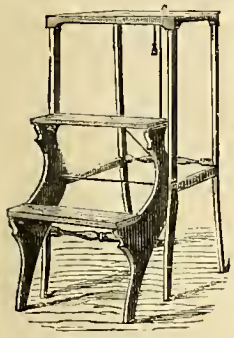
piled against the trunks, we suppose there is an impression that they possess some particular value. Whatever benefit they may be, is due to the small amount of wood ash they contain, which will of course vary with the quantity of wood or charcoal which is used in kindling.

THE HOUSEHOLD.

(☞ *For other Household Items, see "Basket" pages.*)

Library Steps.

Modern furniture at best, is not very strong, and soon becomes worn out even with the most careful usage. Nothing brings a chair into that rickety stage which precedes dissolution, sooner than its frequent use as a substitute for a step ladder. It is the most convenient thing near at hand, if one wishes to take something from a high shelf, reach up to arrange a window curtain, or for any similar purpose. Step ladders are not convenient to keep always at hand, and there is generally more or less trouble in arranging them. The house-furnishing stores sell what are called library steps, like those represented in the engraving. A tall stool has a strong iron rod connecting two of its legs. This rod supports two steps, which are of such a size, that, when not in use, they can be readily turned back, to occupy the space between the legs, and the affair takes up no more room than a stool. Those in the stores are made of black-walnut, with the steps and the top covered with pieces of carpeting. Such a piece of furniture, which any amateur workman can make, will be found very convenient, and save much wear and tear of chairs.



LIBRARY STEPS.

Nice Dishes that all Farmer-Folks can have.

BY MRS. "H. M. R.," MONTOUR CO., PA.

The question, What shall we do for a change? is one which often vexes the housewife, and many times is not so easily answered, especially among a certain class of farmers (and a pretty large class too), who feel that they must make the products of their own farm furnish variety for the table. Among this class, apples are the "stand-by" for fruit, and in nine families out of ten they seldom, if ever, come to the table in but two ways, viz.: between two *lard* crusts, and stewed. I give a few receipes for preparing this esteemed fruit, which, when once tried, will not, I think, be willingly abandoned....Take easy-cooking, tart apples; pare, and with a narrow-bladed knife remove the core; after they are all served in this way, place on a tin plate, the stem or blossom end down, and fill the hole, left by removing the core, with sugar; drop three or four drops of water (flavored with lemon, if you choose) on the sugar in each apple, and set in the oven and bake until done, which will be in about three-fourths of an hour, if your oven is right. Remove to an earthen plate as soon as done, which should be fifteen or twenty minutes before serving. These are excellent with meat dinners, or, eaten alone with cream and sugar, they make a very nice dessert....Some persons consider sweet apples of little use in the kitchen, but when properly prepared, I think they are nearly as good as peaches. Pare, quarter, and core, nice sweet apples, put them in an earthen or new tin dish and set in the steamer and steam until done, which can be told by trying with a fork. Serve, when cold, with cream and sugar. Do not forget to steam and can some before they are all gone, so that you can have them next spring when other fruit is scarce....APPLE PUDDING.—Set as much stale bread in the oven as will make a pint of crumbs. When it is brittle enough to roll, remove, and roll very fine. Take four medium-sized tart apples, pare, quarter, and core, cutting each quarter into four pieces by cutting it in two, both lengthwise and crosswise. Then take one quart and a gill of new milk, the *yolks* of four eggs, one cup of sugar, butter the size of an egg, melted, a little salt, and spice to your taste. Beat the butter, eggs, and sugar together, and stir in with them all the other ingredients. Bake in the same dish in which it goes to the table, unless brought to the table in small dishes. Before removing from the oven, beat the *white* of the eggs with a half cup of sugar to a stiff froth and spread over your pudding, and, when "set," remove from the oven. To be eaten, when nearly cold, with cream....APPLE JONATHAN.—Pare, quarter, and core enough tart apples for two layers over the bottom of a deep, square pie-tin, cutting each quarter in two, sprinkle with a little sugar. Then take one coffee-cupful of sour cream, one of buttermilk, a teaspoonful of saleratus, a pinch of salt, and flour enough to make a batter as stiff as will pour. Stir all well together and pour over the apples, and bake until done. Turn out of the baking tin on to a platter, and serve with cream and sugar.

A Home Letter.

BY FAITH ROCHESTER.

DEAR MARY:—I have been thinking this morning about the inhuman way in which *mothers are overworked.* Did you read a letter from one such woman in the October number of the *Agriculturist?* I hope that was a fictitious letter, [It was not. ED.] but you and I both know real cases just as sad. The thought of them always gives me a heart-ache. There was an excellent reply to that letter in the December number, but I felt, in reading it, that the writer had not been so deeply impressed as I was with the fact that the "overworked farmer's wife" had three little children, "none of them old enough to be of any service." That means, three little ones to hinder the work of a housekeeper. But how about the work of a mother? Preachers and poets tell us that no work is so important. Indeed, everybody is saying so, now that women are supposed to be in danger of forsaking their babies for the ballot-box. If men really believed that the rearing of healthy and noble men and women was of more importance than the improvement of cattle and swine, don't you think they would see to it that mothers had a fair chance to do their work well? But you and I will not blame men for all the misery we see in the lot of woman. To that overworked woman, and to all women, I say, let us all join hands and hearts in earnest efforts to discover just where the mischief lies, and to bring about a better state of things. We shall have to begin our investigations and labors close at home.

Overwork is bad enough in any one—a species of suicide. Its effects are felt by so many others, in the case of a mother, that it is then especially deplorable—yes, sinful. She has no right to make drafts upon the constitutional vigor of her unborn children. Did it ever occur to you what an awful power for good or evil rests with the mothers of the race? If from this hour each child born into the world could have a healthy, good, and wise mother, we should not have to wait long for the millenium. Fathers, however, must bear their share of responsibility for their children's health and characters. Mothers are not independent of circumstances, and farmers should realize that the mothers of their children are entitled to at least as much care and consideration as they give their cows.

Nursing babes suffer when their mothers get very weary. The quality of their food is impaired, and delicate children quickly show that something has gone wrong with them. Nothing in the world tires and worries me so much as to hear the call of my baby when my hands are so engaged that I cannot attend to its needs. Babies should be taught to rely upon themselves a good deal for amusement. It would be foolish to take them or feed them every time they ask it. If they are not suffering real discomfort, they can be easily diverted by a change of position or by a new plaything. Still, they need constant and wise attention. An ignorant nurse will not do at all.

Are you interested in Kindergartens? I am going to find out all I can about Froebel's system of infant education as soon as possible. With little ones already growing around me, there is no time to lose. If farmers need leisure to read agricultural papers and to attend clubs, surely mothers need equal opportunities for informing themselves about their peculiar duties, and the best methods of performing them. It used to be thought that any fool could be a farmer, just as now it seems generally supposed that maternal instinct, such as brute mothers share with us, is sufficient preparation for motherhood. But you know that more than half of all the children born, die before the age of five years. When I look at the diseased and vicious specimens of men and women thrown upon the world, I am convinced that the first three years of a child's life are more important to its character and destiny, than any other three years.

In infancy every touch and tone, and all the scenes of daily life, have such a power upon the opening faculties as they can never have again. Good farmers will not allow some men to have anything to do with their horses and cattle. Should not good mothers be equally careful with their children? When a mother cannot attend to her housework and her children too, the hired labor should be for the kitchen rather than for the nursery, unless she can be sure that the nurse employed is better qualified for the care of children than she is herself. This is sometimes the case. There are different gifts, you know.

Then there are those little questioners, from two years old and upward. Nature keeps them all the time asking, "What is it?" "How?" and "Why?" Some wise and patient friend should be ever near at hand to guide their inquiring minds, and watch over the habits they are forming. Surely, the mother has the first right to this sacred and beautiful office, and to the best assistance her husband can render. Surely, the young women and girls yet to become mothers have a right to such education as shall fit them to answer their children's questions, about the trees, birds, and insects, the clouds and stars, and about the construction of their own bodies, and even the stones and weeds by the wayside. My little boy (not four years old, and not at all precocious, thank Heaven!) often drives me to the dictionary and encyclopedia, and to scientific books, by his most natural questions. It is no easy thing sometimes to fit the answer to his needs, telling him enough to satisfy his present curiosity and keep alive his interest in that line of observation, without burdening or straining his young mind at all. These little ones have no business with the alphabet, but need, instead, intelligent mothers. It is we who need books and lectures. "Bring on your colleges — quick!" I sometimes cry, when Birdie's innocent questions reveal my ignorance to me. Who more needs knowledge than a mother?

Many mothers have all they can possibly do to provide for the common, physical needs of their children. They are so harrassed by the cares of housekeeping that it seems almost impossible to listen to the children's questions or complaints. They need our sympathy as much as do the children, if they fall into a way of scolding and threatening and slapping the little ones. They have no chance to become really acquainted with their children, among whom no two have the same disposition. The little boys and girls soon come to feel that mother does not understand them, and has no time to listen to their questions, experiences, and plans. They go somewhere else to find an intimate friend. Poor children! and poor mother! She needs them as much as they need her.

The very little ones need a mother's care and counsel scarcely more than do the older children. It is not good human economy to use up the mothers in household labor, leaving families of boys and girls motherless at a most critical period of life, or with only a poor broken-down apology for a mother. The boys and girls just going out to mingle with the world, should have at home a wise and sympathizing friend, who knows what sort of an education they are getting from their schools and companions, and from the literature of the day.

Don't point me to our grandmothers, and say, that they had larger families and did even more work than the women of the present day. They

were stronger in health to begin with; but it is a question with me whether we are not suffering the visitation of their sins upon us, in the way of weak constitutions. It is certain that the children of our day are much more difficult to take care of than our grandmothers' were, and our houses are harder to keep, in spite of modern improvements. There are more rooms to take care of, we use more crockery at every meal, and cook a greater variety of food. There is more clothing to make, wash, iron, and mend, for each member of the family. General society makes greater demands upon wives and mothers, and more papers and books come into our houses, wearying us with their cries to be read. I don't think we need feel at all ashamed or discouraged if we are unable to do all that our grandmothers did. Like them, let us teach our sons and daughters to help us. It may not be easy to teach them, but it will pay both them and us. It is a false tenderness that seeks to spare the pretty hands of a child, and dreads to put a portion of our care upon the young shoulders. It should be done with kindness and moderation, and for the sake of their discipline as well as for our relief.

"The farmer needs, above all else, a clear head, with all his faculties of mind, muscle, light and active, and under complete control. Much depends upon temperament, but as a rule such men need sound sleep and plenty of it." Is not the remark just quoted equally applicable to mothers? "Sound sleep and plenty of it!" Some women never know *that* for years and years of their lives. They have no vacations from the confining care of young children, and they go constantly hungering for the sleep they need but cannot get. Much would be gained in the way of rest if the baby never slept in the same bed with both its parents. In warm weather, a crib beside its mother is better; and in very cold weather it should have a good bed by itself. The baby should not sleep upon its mother's arm, as neither can rest soundly or comfortably. It can be taught on the start to take food only once during the night, and may be weaned from night nursing altogether when quite young.

From all our lives, some things get "crowded out" which we would gladly do. It is a nice point to settle what shall be done and what left undone, and it is in deciding this that character shows itself. I say, let us cherish especially those things that tend most to make our families healthy, cheerful, and intelligent. We may cut down a good deal in the way of clothing and pastry, and be the gainers for it. Women owe it to their husbands that they talk these things over frankly, and both should labor together to do that which is for the general welfare. Even in the worst cases, there is generally more thoughtlessness than unkindness on the part of husbands. Mothers spoil their sons from one generation to another, by living before them uncomplaining lives of drudgery and slow suicide. These sons never heard their mothers "complain," and they expect as much from their wives as their own mothers accomplished.

Cause of Sour Bread—Yeast.—"A. M. C.," Cumberland, Md., asks why bread is sour after it is baked, and wishes to know if there is any acid in flour. Flour contains no acid, but is capable of producing acids. When bread is raised slowly, especially if leaven (sour dough) is used, some lactic acid is formed, the chemistry of the production of which we will not now consider. Again, when we add yeast to bread to cause fermentation, some of the flour is decomposed, a small amount of alcohol is formed, and carbonic acid (gas) is set free, which makes the dough light, and causes it to raise. When the bread is baked, this fermentation is stopped, and the expansion of the gas, which was involved in the dough, makes the bread still more porous. If the dough remains too long before it is baked, another kind of fermentation takes place, and acetic acid is produced, which gives the bread a sour taste. A good bread maker shows her skill by putting her bread into the oven before souring has set in. Even the most careful will, especially in warm weather, occasionally have a batch slightly soured. The trouble is then corrected by working in a little soda, thoroughly dissolved in blood-warm water, just before baking. It is best to avoid the necessity for using soda by having quick, fresh yeast, and raising the dough as soon as possible.

A lady correspondent, "M.," says that by using the following yeast she never has sour bread: "To make yeast that will keep; put a handful of hops, in a bag kept for the purpose, into 2 qts. of boiling water; while steeping, wash, peel, and grate 6 medium sized potatoes, take out the hops, put in the potatoes, boil a few minutes, stirring constantly, add ½ teacup salt, ½ teacup white or light brown sugar, let it cool, then add a teacup of potato yeast, if you can get it, if not, brewers' will answer, let it rise until a mass of foam, then stir it down, put it in a large-mouthed jug and keep it corked tight. Observe, if you jug it before it has ceased working, the cork will be thrown out. For a large family, perhaps a larger quantity, than here indicated, will be necessary. I have used yeast made in this manner for several years, and never lost any from souring in the hottest weather. A teacupful will raise two large loaves. The special point in this yeast is that there is no flour used in it."

Household Talks.

BY AUNT HATTIE.

I have been fixing up an old rocking chair that has done nursery service for many years. The cane bottom seat was almost gone, so first with a pair of scissors, I picked out the whole of it from the holes, leaving nothing but the frame. I had previously procured some strong packing twine, which I threaded backwards and forwards after the manner of cording an old-fashioned bedstead, making a very durable seat; then I made a cushion, and a cover for it, and I value it now more than ever.

I notice that my new girl wears away a broom all on one side. There is nothing annoys me so much as to be obliged to use a broom that has been so worn. I should be ashamed to have any one see Libbie's kitchen broom as it is now. I think nothing is so suggestive of extravagance and bad housekeeping as a one-sided broom. There is no necessity of having a broom worn down in this way. When sweeping, hold the broom up, almost perpendicular, and brush rather than sweep, being careful to turn the broom and keep the longest side towards the carpet or floor. A broom kept straight, will last three times as long as one allowed to wear all upon one side.

Mrs. Gilman asks me to write more about making cake. She does not mention her own skill or want of success, but writes: "Some of my neighbors make shocking cake! What is the reason that cake is not only heavy but oily at times?"—I remember that mother used to say, the way to have light cake is to beat the whites of the eggs to a perfect froth, and add them lightly, the last thing. That was very well in those days, when eggs were only 5 to 8 cents per dozen, and we put in nine or ten to an ordinary sized cake, but now, when the farmers get 35, and the grocers 40 cents for them, it is evident that cake must be made light in some other way. I use only one egg to one loaf of cake, but I am careful to obtain good baking powder, or pure cream of tartar, and good soda. I think one great secret of light cake making, is this keeping the ingredients in a state of foam, during the mixing. For instance, beat the sugar, butter, and the yolks of the eggs until they turn white and creamy. Then add milk, if used, and some of the flour, beat and stir one way all the time until the ingredients are mixed, and bake immediately. If cream of tartar and soda are used, mix the former with the flour, and add the soda dissolved in a tablespoonful of warm water, the last thing before the white of the eggs. I imagine that cake is oily, at times, for the reason that the proportions are not properly measured. The sugar in all cases should be as much as, or more than twice the quantity of butter, and the flour should be equal in quantity to the butter and sugar together, thus: 1 part of butter, 2 parts of sugar, and 3 parts of flour. If these rules are observed, and the baking powder is good, you cannot fail to make good cake. I make a very nice cake using only one egg, as follows: Take one small teacupful of butter, warmed, two and a half teacupfuls of sugar, and the yolk of the egg; beat well together, then add one-half teacupful of milk; add gradually, beating one way, three teacupfuls of flour; flavor with very fine strips of citron or candied lemon peel. Finally add three or four teaspoonfuls of baking powder, the white of the egg, and bake in a buttered pan lined with white paper.

I manage my washing in this way. The evening previous to washing-day I put on the boiler and two gallons of soft water, allowing about a quarter of a pound of sal-soda, and a quarter of a pound of soap sliced; let them boil together until the soap and soda are dissolved. I then put the fine white clothes into one tub, and the coarsest ones into another. To the water in the boiler I add enough cold water to make the whole luke warm, and pour it over the clothes, and cover the tubs with a blanket. In the morning I add a pailful of hot water to the fine clothes and rub them well from this. They then go through another rub in fresh water, are next boiled twenty minutes, sudsed, rinsed in blue water and hung up to dry. The coarse clothes receive the same treatment. My colored clothes are washed, rinsed, and starched before hanging out.

In starching my muslins and the shirt bosoms and wristbands, I use boiled starch, being careful to rub in well the starch, that is, after the shirt bosom has been dipped and wrung out as dry as possible, it is well rubbed and patted between the hands. This is a secret known to all good laundry women, and it is almost impossible to prevent the iron from sticking unless this precaution is observed. I cannot make Edward's collars stiff enough with boiled starch, so I always use cold starch for them. Take two teaspoonfuls of starch, and perhaps a half teacupful of water, or a little more. Have the starch thoroughly mixed before dipping in a collar, wring out, and rub and pat with the hand, spread on a clean towel, and when all are done, roll up the towel and iron in about an hour.

Hints on Cooking, Etc.

Cooking Parsnips and Cabbage.—"Lucy Lamb," says: Wash the parsnips, scrape, boil tender, and then slice and brown on a griddle, with butter to prevent sticking. Carrots are good, cooked in the same way....Boil cabbage tender in clear water; drain dry, add salt and a good piece of butter put on in little bits; cut in small squares for convenience in serving. Another method, requiring only half as much time in cooking, is to chop the cabbage fine before cooking; boil in clear water forty or fifty minutes, and serve as above. It is nearly equal to cauliflower.

Raised Cake without Eggs.—By Lucy Lamb.—Eggs are scarce and expensive, and we invent recipes which require few or none. Stir together a coffee-cupful of light sugar, and half a cupful of butter; add a pint of warm water, half a cupful of yeast, and flour enough to make as thick as ordinary fruit cake. Rise over night. When very light, add a little mace, cinnamon, allspice, and nutmeg, and a cup of chopped raisins. Put in the pan, let rise until light; then bake.

Marion's Cake.—Stir to a cream a teacup of butter and two of sugar; then add four eggs beaten to a froth, one small grated nutmeg, and a pint of flour. Stir until just before it is baked. Bake in cups, about 20 minutes.

Corn Cake.—By Mrs. R. E. Griffith, Chester Co., Pa.—1 pint of buttermilk, 1 pint of corn meal, 2 beaten eggs, 1 teaspoonful of soda; beat well together and bake in shallow tin pans. Increase quantities for more than four or five persons.

Cookies.—By Mrs. L. A. G. 1 large cup of butter; 2 cups of sugar; 3 well beaten eggs; ½ a cup of sour cream; 1 level teaspoonful of soda; cinnamon or carraway seeds, and flour enough to roll.

BOYS & GIRLS' COLUMNS.

Street Toys.

If you were to walk down Broadway you would be surprised at the number of men—all of whom look strong and healthy enough to do a good day's work—who are engaged in selling childrens' toys from little stands placed at the street corners, or upon the steps on some building. If you passed by these venders day after day, as I do, you would notice that the stock frequently changes. A dealer will for several days offer figures that tumble heels over head. After a while he will have those which dance at the end of a rubber string, then again, some kind of tops will be for sale, until they in turn will be replaced by a new fashion in toys. I frequently buy these street toys, and if they are sufficiently interesting, tell the Boys and Girls about them. One of the late toys consists of a pasteboard man without any legs, and a pair of pasteboard boots hung by threads to the figure. At first sight, one is puzzled to know what to do with such a toy. At the back of the toy is an elastic band, shown in the engraving, figure 1, by a dotted line. Two fingers are slipped between this elastic and the figure, and one of the boots put upon the end of each finger, and you have a Highlander; the fingers represent the bare legs which are considered necessary to a Highlander when in *full dress;* the knuckles make capital knees, and when by moving the fingers the image is made to walk or dance, the effect is laughable. The figure should be painted to represent the gay colors of the Highland costume, but the one I got was dressed like a jester or clown. There is another toy just now popular—a puzzle. It is a coil of brass wire of the size of figure 2, upon which a ring is placed in such a manner, that two wires of the coil pass through the ring. The puzzle is to get the ring off the coil. It cannot be screwed off by turning the coil, as that is prevented by having the ends of the wires of the coil soldered so as to prevent the ring from going off in that way. I could *show* you in a few seconds how it is done, but to describe it is quite another matter. Let us begin by putting the ring on. Suppose you have a coil of wire and a ring like those shown in the engraving, but both separate. Put the ring over the top of the coil and bring it between two of the turns of the coil; then give it, the ring, a turn or a twist from left to right, and it cannot be taken off without turning the ring back again from right to left. The manner of passing two or more turns of the coil through the ring is easily found out by trying.

Fig. 1.

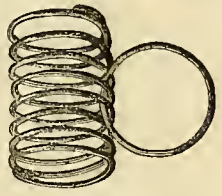


Fig. 2.

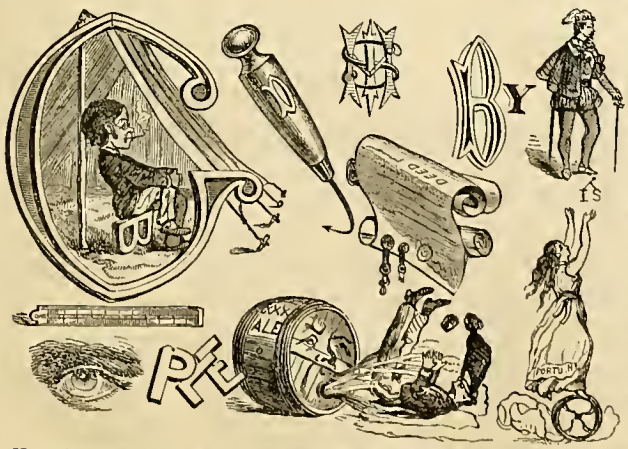
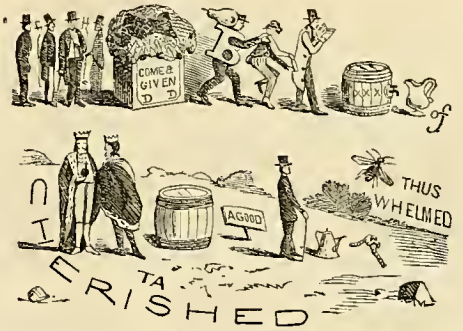
WILL WARREN.



No. 371. *Illustrated Rebus.*—The artist here pictures a maxim which is a little difficult to make out in the picture and not easy to exemplify.

No. 372. *A Problem in Liquid Measure.*—Two men have purchased together an eight gallon keg of vinegar; when they come to divide it they find that they have only two empty vessels, one of which holds 5 and the other 3 gallons. How can they divide the vinegar by the use of these vessels so that they may have 4 gallons apiece?



No. 373. *Illustrated Rebus.*—A pictorial statement of a melancholy fact—intended as a warning, not an example.

No. 374. *Arithmetical Puzzle.*—Two women were going to market with eggs. One asked the other to give her an egg, and then they would each have an equal number; "No," said the other, "give me one of yours and I shall have twice as many as you have. How many had each?

A Letter from a Little Girl.—Ida May, a girl in her fifth year, sends the following account of her cat. "Pussy tom-cat is just the nicest cat I ever saw. He is just now taking a nap on the rocking chair; he hardly ever lies on the carpet, he mostly lies on the lounge or cushioned chair. When he lies on the lounge he puts his head on the pillow like some old man and then I slip my doll in his arms, and that makes fun for us all. If he gets tired sleeping, sometimes he takes a big romp with us and plays hide, and when we hunt him behind the curtains, then he jumps at us and paws us a little. We fetched pussy cat sixty miles, and if we went sixty more, pussy tom-cat would have to go along. Pa says he would n't take ten dollars for my cat."

Don't Forget the Birds.—It is very pleasant to see the birds in the spring, and one, whether he lives in the country or in a town, can have many of them near the house, and receive much pleasure from watching their cunning ways. A little box fastened to a tree with a hole for entrance, is much better than the showy houses some build. It is great fun to see a pair of birds inspecting the "house to let," and when they have taken possession, to observe how industrious they are in gathering materials for their nest. They can be made much more interesting if you scatter feathers, threads raveled from cloth, and such other materials as they use for building; and if you put food in a place near at hand every day, some birds will come regularly to look for it.

Rambles in China.—Street Scenes.

BY "CARLETON."

The people who live down beneath our feet on the other side of the world, have such queer ways of doing things, such strange manners and customs, that I am sure the young people of this country would open their eyes wide, were they to see them; but as you cannot go there just now, let me be eyes for you and tell you how we traveled in China. It is a hot, sultry day, when we set out from the house of a merchant, who deals in teas and silks, to see the old city of Canton. It is one of the oldest in China. No one knows when it was founded, but it was ever so long before Abraham went from the valley of the Euphrates into the land of Canaan. For more than 4,000 years it has been a city. Hundreds of years before Joseph was sold a slave into Egypt, boys and girls were playing in the streets of Canton, or paddling boats on the river, or catching fish in the harbor.

The city is situated on the north bank of the Canton River, which, as you will see by looking at your school atlas, rises among the hills in the southern part of the empire, runs east, and empties into the China sea. It is about as large as the Connecticut. It winds through a lovely country, and as you look towards the west, you see the beautiful White Cloud hills, bordering the valley of the stream. Little villages are nestled on their sunny slopes. The fields are very green, and so are the pastures, for the Chinese save all fertilizers to enrich the soil.

To travel in China, we must either take a coach or a sedan, or else go on foot. I dare say that most of you would prefer a coach rather than to foot it. But the streets are narrow—some of them are not more than six or eight feet wide, and such coaches as you are accustomed to see here in the United States, would get stuck between the houses in about two minutes. But the coaches of Canton are adapted to the streets. They have only one wheel...." *Only one wheel!*"—I thought you would open your eyes wide. Besides, one of the horses pushes while the other pulls; only there are no horses, for two Chinamen are harnessed up instead!

I do not wonder that such a story is rather more than you can swallow, but just look at the picture on the next page and see the coach and the team under full headway.

"*A wheel-barrow!*" Of course it is. You will find no other coach in Canton. It is Paddy's coach, sure enough; and long before an Irishman ever trundled a wheel-barrow through the streets of Cork, centuries before Ireland was known, these wheel-barrows were wheeled through the alleys and lanes of this wonderful old city of China.

I wish you could hear them squeak for about five minutes. The axles are of wood, and the squeaking is terrific. You can hear them all over the city, making a noise as if saying over and over with every turn of the wheel the old Greek word, "*Eu-re-ka, Eu-re-ka, Eu-re-ka,*" which means, "I have found it." And you will wish all the while that they had found a little more of *it*—grease I mean. You have heard a creaking door, or, perhaps, have made your slate pencil give a squeak on your slate now and then; but this "Eu-re-ka" is more excruciating than a score of doors or a hundred slate pencils all going together.

Where there is but one passenger, he rides astride of the coach, and if two are carried, each sets upon a shelf at the side of the vehicle.

Where the street is level, the Chinamen go upon the trot and the two passengers get well bounced and bumped, though they seem to enjoy it. It is a very funny scene—the fellows upon the run, and their pigtails dangling down their backs, or streaming in the wind.

If we do not want to take a coach, we may try a sedan, which is a box, with a seat in it, a leather top to keep out the rain, and curtains in front and at the sides, which we may have up or down just as we please. Two long poles are fastened to the box. Getting in, we are raised from the ground by two men who put the poles on their shoulders, and we go springing up and down with a wave-like motion, which is a great deal more pleasant than teetering on a board. The sedan is also shown in the picture. It is a strange sensation that comes over us, to find ourselves in a sort of hen-coop moving up and down, and carried by men with broad-brimmed bamboo hats, shaped like the cover of a teapot, curving from centre to circumference with a knob on the top. The hat is so large, that, when it rains, it answers for an umbrella. It is much more pleasant to go in a sedan than on a wheel-barrow; but if you want to see all that is strange and curious, it is better to ramble on foot.

We shall have a crowd at our heels, for the Chinese are as curious to see us as we are to see them. We hear them cry "*Fanqui*" "*Fanqui,*" which means that we are foreign devils. They look upon us with contempt. They consider themselves as being far superior to any other people on the face of the earth. We people of the United States are powerful, we have big ships and great guns, steam-engines and locomotives, and telegraphs; we can make iron swim and send messages beneath the sea; we can call the lightning from the skies and make it our servant to carry our thoughts all over the world; we can make the sun take our pictures; we can do many things that they cannot, but we are wicked in their esteem. They think that the inhabitants of the United States are like the English, who have had two wars with the Chinese. The English war ships bombarded their cities; English troops marched into Pekin and pillaged the Imperial Palace, and now China speaks of an Englishman as being "a red-faced foreign devil."

But though they shout "*fanqui,*" they will not harm us. They will grin in our faces, invite us into their shops, and do their best to sell us their goods.

The narrow streets are full of people, and it is all we can do to get along. If we do not keep a sharp lookout, we shall be hustled about, jostled this way and that, and, perhaps, receive a poke in the ribs from somebody, who pays no attention to anybody but himself, and whose only thought is, to get on as fast as possible.

We meet a dozen men staggering along with a block of stone, and all shouting "*Hooto!*" "Get out of the way!" If we did not dodge into a door-way or a side street, they would run us down.

Multitudes of men are carrying baskets, boxes or chests of tea, and bundles, not in their arms or on the top of their heads, but each of the carriers has a stick about six feet long over his shoulder, with cords or ropes at each end, which he ties to the bundle or tea-chest, so that, as we look at them, it seems as if the scales in the shop had somehow found legs and were walking up and down the streets. Only the Chinese do not use scales, but do

[COPYRIGHT SECURED.]

SCENE IN A STREET IN CANTON.—*Drawn and Engraved for the American Agriculturist.*

all their weighing with steelyards; though the instrument is seldom of steel, but usually of wood; or, if for weighing small things, it is made of ivory or bone.

The houses are not very large, or very high—hardly ever more than two stories. They are built usually of pale-blue brick or stone, and in some places of wood. The roofs are all curved. We never see any that are flat or sloping, and they are covered with tiles, such as you may have seen on some of the old houses in New York, or at Albany or Schenectady, brought over from Holland by the Dutch settlers before the Revolutionary war.

The Chinese are very fond of adorning their houses with grotesque figures of dragons, with a head shaped like that of a horse, with great goggle eyes, a mouth wide open, and a tongue like a dart! The body is part horse and part lizard, ending in a long, tapering, arrow-shaped tail. It is covered with scales, and has wings like an eagle's. It has four legs with claws, like a turtle's. It is the Imperial emblem on the flag of the Empire, just as the eagle is the emblem of the United States, or the lion and unicorn that of England, or the elephant that of Siam.

Wherever we look, we see representations of dragons—sitting on the ridge-pole of the houses, on the corners of the roofs, or over the windows. They glare at us from beneath the eaves; open their mouths from above the door-ways; thrust out their tongues at us from the tops of pillars and posts. Every shop-keeper displays a flag or banner of red, green, crimson, blue, yellow, or purple, with a dragon upon it; and so as we look along the narrow streets, we see bright colors everywhere, and dragons everywhere, and men hurrying everywhere, and the sensation is so strange that we can hardly tell whether we are in this world or whether we have been transported to one of the planets! Every house has a lantern hanging over the door, and sometimes there are three or four of them, as large as barrels! They have light rattan or bamboo frames covered with oiled silk, on which we see a great dragon spitting thunderbolts!

The houses have no fireplaces, furnaces, or stoves, and the doors and windows do not shut so closely as in our own houses. In Canton the winters are not very severe, though there are some cold days. If a cold day comes, they put on more clothing. Up among the hills in the interior, and in Northern China, a foot of snow sometimes falls, but even there they have no fireplaces. Fuel is scarce. They gather a few sticks, build a fire on a hearth in the centre of the room; and then at night, all the family—father, mother, and children, roll themselves in their blankets and lie down on the warm bricks.

I am confident that you cannot guess what sort of pillows they have...."*Feathers?*—No...."*Straw?*"—No. Try again...."*Leaves?*"—You have not hit it. They use a wooden block, and think it a great deal better than a bag filled with feathers. Every Chinaman, when he is traveling, carries his wooden pillow with him.

In traveling around the world, I have slept many a night on the soft side of a white oak plank with a piece of the same for a pillow, and one don't mind it much when he gets used to it. If any of you want to know how the Chinese sleep on a cold night, you may easily find out by wrapping yourself in a blanket and lying down on the hearth with a stick of wood for a pillow. One night will satisfy your curiosity. In summer, the Chinese sleep on bamboo couches or rattan settees, which are quite comfortable. They have very nice easy chairs, made of rattan. Their tables and stools are richly carved. They have teacups and bowls almost as thin as egg shells, so delicate, that you must handle them with great care. They have beautiful and costly vases, all covered over with Chinese scenes of men and women in the tea gardens, gathering and drinking tea; of mandarins being carried in sedans, with crimson umbrellas borne before them; with men beating gongs and girls playing on guitars; with pictures of green fields and shady groves, birds of Paradise and peacocks.

The floors in the houses of wealthy Chinamen are of porcelain—red, white, blue, and green—with landscapes painted upon them, each piece being painted before the clay is burned in the kiln, where their tiles are manufactured. The Chinese are far ahead of any other nation in the manufacture of porcelain. Three thousand years ago, they had just such teacups as we see in their houses today. If you were to go to Egypt and dig among the old mummies, which were laid away in the tombs at Thebes when Joseph was ruler of Egypt, you would find such porcelain as is now made in the potteries of China.

The door of a Chinese house is almost always open during the day, and as we look in, we see beautiful silken screens embroidered with delicate floss—the work of the girls and young ladies who have nothing else to do.

Upon the walls are paintings of birds with beautiful plumage, butterflies with gorgeous wings, and flowers of most delicate tints; for, though a Chinese artist in his attempts to paint a landscape, gets men and women, hills and valleys, houses and trees, all mixed up, so that we cannot tell which is which or what is what, because he does not understand the rules of perspective in drawing—yet, he can produce beautiful and brilliant colors, and paint charming pictures of birds and butterflies.

We have hardly got started on our ramble through the old city, but have seen so much that we must stop and think it over. We are apt to read too fast, and too much at once, as well as eat too fast, and the mind as well as the stomach wants time to digest its food. But before we get through our stroll, through the narrow streets, we shall see many things to laugh at, and I dare say, we shall exclaim again and again, what a queer people!

Answers to Problems and Puzzles.

We are always glad to receive rebuses and puzzles from our friends, but the answers should accompany them. No. 370.—A foul proceeding with a beacon fire.—A fowl proceeding with a beak on fire. The following have sent correct answers. C. H. McCartney, W. J. Bishop, Frank M. Hall, J. R. Kaufman, R. A. Baker, Jr., Mary Hilton, Chas. Roberts, Julia A. Green, Clarence Duneter.

(Advertisements on this page $2.50 per Agate Line of Space.)

HERALD OF HEALTH.

The JANUARY number contains:

I. The Two Wives.
By Mrs. Elizabeth Oakes Smith.
(*This is a delightful story to continue during the year.*)

II. The Danger of Blistering.
By Dr. Daveene Pere.

III. The Training of Young Children.
By A Mother.

IV. Generosity and Benevolence.
By Henry Ward Beecher.

V. Physical Growth and Development.
By Archibald Maclaren, Of the Oxford Gymnasium.

VI. Bathing Children.
By Mrs. R. B. Gleason, M. D.

VII. Hygienic Treatment of Dogs.
By Dr. Dio Lewis.

VIII. Industrial Education.
By Mrs. Horace Mann.

IX. Studies in Physiology.
By Prof. T. H. Huxley.

X. New Receipts for Healthful Puddings.

Home Treatment of Cholera Infantum, of Dysentery, of Bad Smelling Feet, of Whooping Cough, of Burns, of Frozen Flesh.

Human Physiology for the people; A man in a Chamber of Ice; Hunger and Thirst; Food; Waste and Supply for the Body; The Erect Position in Man; Mind not the Governor; The Brain; The Blood; The Philosophy of Death.

THE FEBRUARY number contains:

I. The Care of the Eye.
By Rev. C. H. Brougham.

II. An Active Life.
By Rev. Henry Ward Beecher.

III. The Landlord of the Blue Hen.
By Phœbe Cary.

IV. Present Duty of Temperance Men.
By Rev. J. C. Holbrook, D. D.

V. The Prisons of Paris.
By Prof. E. P. Evans.

VI. Spurs and Reins for those who need Them.
By Dr. J. C. Snodgrass.

VII. How to Dress a Baby.
By Mrs. R. B. Gleason, M. D.

VIII. A Successful Experiment with Small Pox.
By Frances Dana Gage.

IX. The Book Worm—Brute Force—Care of School Boys—Systematic Exercise—Mal Growth—Lost Days—Learn to say No—Breaking Bad Habits in the Egg—Death of E. M. Stanton, and of Mrs. Dr. Lozier—Hair Dyes—Horticultural School for Women—Cure for Chronic Diarrhea—Treatment of Felons—Of Chicken Pox—Of Sprains—Of Colds—Feeding the Sick—Food for Infants.

THE MARCH number contains:

I. Fern Grove Gymnasium.
By M. G. Ives Seymour.

II. Take Care of Your Noses.
By Rev. C. H. Brigham.

III. How to Feed Babies.
By Mrs. R. B. Gleason, M. D.

IV. The Treatment of the Sick.

V. Rapid Upward Growth.

VI. Stunted Youth.

VII. One-sided Growth.

VIII. A Pale Skin.

Arrest of the Heart's Action—Evidence that the Blood Circulates—*Blushing*—Why the Veins are Pulseless—A Cut Artery—The Pulse—Our Studies in Physiology—Growth and Physical Development—A Moody Household—A Crafty Woman—Out-door Professions for Women—Work, the Heart does—Keeping Up with the Times—Debt—Cure for Constipation—Insanity—Sleep Alone—Cure for Neuralgia—Hiccough—Delirium tremens—Swimmer's Cramps—Constipation—Cold Feet—Etc., etc., etc.

Each number during the year will be filled with original articles from the best writers, and we shall make a Monthly, which will help every reader to live a higher and a nobler life, both physically and morally.

Every subscriber who sends us $2 for 1870, will be entitled to a splendid **Steel Engraving** of

Alex. von Humboldt—Free.

$2 a year. Samples 20 cts. We send the Herald and the Weekly Tribune, one year, for $3.35; or, the Herald and the American Agriculturist for $3.—See for more complete prospectus December Agriculturist, 1869.

WOOD & HOLBROOK,
15 Laight Street, New York.

United States Watch Company,

MARION, N. J.,
Manufacturers of all the Grades of American
Watches, Pendant Winders and Key Winders,
both nickel and frosted movements.

The finer grades all having three pairs **Conical Pivots, Cap Jeweled,** in **Gold Settings,** and accurately adjusted to *Heat, Cold, and Position*; and all, even in the cheapest grades, have the STRAIGHT-LINE Escapement, with Exposed Pallet Jewels, and Hardened and Tempered Hair Springs; and for our late improvement in STEM-WINDING mechanism, we claim a *STRENGTH, SIMPLICITY,* and *SMOOTHNESS* hitherto unattained in any other manufacture, at home or abroad.

Constantly on hand, full lines, all sizes, in Gold, Silver Diamond Set, and Magic Cases, Minute Repeaters, Independent 1-4, 1-5 Split and Fly-back Seconds, for taking three different times.

SAPOLIO

CLEANS WINDOWS, MARBLE, KNIVES.
POLISHES TIN-WARE, IRON, STEEL, &c.

For Sale Everywhere.

The Novelty Knife

For Ladies and Gentlemen.

Has one ordinary blade, and one new patent blade unequalled for a sewing ripper, eraser, nail trimmer, and many other uses. Is made of best steel. Price by mail, post-paid, plain handle, $1; Ivory, $1.25; Shell, $1.50; Pearl, extra finish, $1.75. For sale at Hardware, Stationery, and Fancy Stores, and Sewing Machine Agencies, and wholesale and retail by A. C. FITCH, Gen. Agent.
27 City Hall Place, New York.

Get the Best.—In nothing will this injunction better apply than in selecting musical instruments, and more especially in purchasing Parlor Organs. It is now a well established fact that the best instruments of this class manufactured, are the American Organs, made by Messrs. S. D. & H. W. Smith, of Boston. These instruments possess every requisite, and, indeed, many excellencies which the organs of other makers do not. Musicians are not at all surprised at their great popularity for they know them to be all and every thing they are claimed to be. Whether for the home circle, the chapel, or the lodge room, there is no organ that unites so many desirable qualities.

CISTERNS PREVENTED from overflowing, and from bursting, by Muss' Patent Automatic Water Leader. Agents wanted. State and County Rights for sale. For particulars inquire of J. MUSS, Box 726, Quincy, Ill., or J. R. MITCHELL, Salem, Columbiana Co., Ohio.

American Vinegar Generator.

New plan, just patented. For full description, &c., send stamp to A. D. STRONG, Ashtabula, Ohio.

Box 155, Pittsburgh, Pa.

MISSOURI LANDS FOR SALE,

On 2 or 10 Years Credit.

Missouri Lands are very fertile and situated in the heart of the Union.

North Missouri contains about 16,000,000 acres as desirable as any in the Mississippi Valley. Through this Garden of Missouri the Hannibal & St. Joseph Railroad extends, and all its lands lie near its track and numerous depots. The climate, so temperate and healthful, and a virgin soil so capable of producing almost every kind of vegetation, invite emigrants to settle on our Prairies. Circulars, giving full and valuable particulars are supplied gratis to all wishing to go themselves, or to circulate to induce their friends to go also.

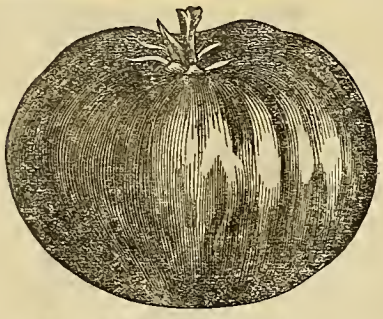
A Sectional Map showing exact location of all our Railroad lands is sold at thirty cents.

Address LAND COMMISSIONER,
Hannibal & St. Joseph R. R. Co., Hannibal, Mo.

FARM & GARDEN Implements.

Rotary Harrows; Monroe's Patent, price $25. Nishwitz Patent Pulverizing Harrow, price $30. Shares' Patent Harrow and Pulverizer, with cast-iron or steel teeth. Send for Circulars of the above, and also for the Copper Strip Feed Cutter to J. R. DECATUR & CO., Manufacturers and Dealers in Seeds, 197 Water Street New York.

SECURE A HOME.—The best Fruit and Garden lands for sale, in a mild and healthful climate, 30 miles from Philadelphia. Good Markets and Society. Pure soft water. Price, 30 dollars per acre, payable ¼ cash, balance in 10 years. A rare opportunity. Thousands are settling.
Address R. J. BYRNES, Haumonton, N. J.



TOMATOES.

The Unrivalled Prize, "Gen. Grant."

This Tomato introduced by us last season, has again proved the best in all respects, taking for the third season the first and second prizes at the Mass. Hort'l Soc. Exhibitions, in competition with all the leading sorts. We have received numerous testimonials from all quarters, but for want of space are obliged to omit publishing them. Price, post-paid, per packet, 25 cents.

EARLY WYMAN CABBAGE.

Introduced by us. The best and most profitable early market-cabbage grown. It heads early, is of large size and first quality, and brings the highest price of any early cabbage brought into the Boston market, selling readily last season by the thousand, at $18 per hundred. It took the first prize at the last and several previous exhibitions of the Mass. Hort. Soc. Per packet, post-paid, 25 cents.

For further descriptions and a beautiful colored Lithograph of above Cabbage, see Jan. No. Agriculturist, page 21, or

Twenty-fourth Edition of this popular work, which has met with so much favor in the past, is now ready. It has been re-written and improved, printed with new type, and on fine paper; illustrated with a beautiful Lithograph, and many other fine engravings from nature. It contains full description and the culture of over 1,500 leading varieties of Flowers and Vegetables; also descriptive list of the novelties of the present season; to which is added a collection of 200 choice French Hybrid Gladiolus. This work, we feel confident, will compare favorably with any similar one.

From LEVI BARTLETT, Warner, N. H.

"I have received a copy of your superbly gotten-up Amateur Cultivator's Guide. I think it far ahead of anything of the kind ever before issued from the American press."

Sent to any address upon receipt of 25 cents for paper cover, and 50 cents for tastefully bound in cloth.

WASHBURN & CO., Boston, Mass.

Three Best Squashes!

The Hubbard is the sweetest, dryest, and richest table squash for winter, the *American* Turban for fall, and the Boston Marrow the best pie squash. Seed sent post-paid to any address, at 10 cents a package; Hubbard and Turban 25 cents an ounce, and Boston Marrow 20 cents an ounce. I take pride in having been the original introducer of the Hubbard squash. My Illustrated Catalogue of Garden and Flower seed sent gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

THE CASABA MELON.

"One of the specimens weighed twelve pounds; and if there is a more sugary, tender-fleshed, and altogether good melon than this, we would like to see it."—*Editors American Agriculturist, Oct., 1868.*

"Every one who ate of them have pronounced them the finest melons they ever tasted; they weighed from ten to sixteen pounds each. They suffered less from drought than any melons on the farm."—J. M. Phillips, Newtown, Md.

"I am especially pleased with the Casaba Melon on my ground; they have borne abundantly, are of very large size, and superior quality."—T. C. Wallace, M. D., Cambridge, N. Y.

"The earlier years of my life, which I spent in Constantinople, Turkey, in the midst of the profuse abundance of melons, which used to overstock the market of that city, we would now and then come across the Casaba. It was a luxury, not solely for its rarity in that market, but for its own size and excellence; though as large as the largest watermelon, it was also of really exquisite flavor. The cause of its rarity was stated to be the fact that it would not grow in excellence except in the province of Casaba, in Asia Minor."—*Extract from a letter from W. D. Dwight, Principal of the West Point School.*

This melon can be grown quite as easily as any of the other varieties of muskmelon.

The seed for sale in sealed packets. 25 cents each, or six for $1; also the following superior varieties:

California Golden Orange,	¼ pkt.,	10 c.;	¼ oz. 20c.;	¼ lb.,	$2.50
Turks-cap, extra,	"	10	"	20	"	1.50
Pineapple,	"	10	"	20	"	1.25
Water melon Mo'nt'n Sweet			"	10	"	1.00

By Mail, at above prices. For other varieties, see Dreer's Garden Calendar for 1870, mailed on receipt of a stamp.

HENRY A DREER, Seed Grower,
714 Chestnut St., Philadelphia, Pa.

American Sage Seed.

True Broad-leaved Sage Seed, grown by the famous Danvers growers who raise Sage by the acre. *Warranted growth of 1869.* Price—10 cts. per package; 35 cts. per oz.; $1 per ¼ lb.; $3.50 per lb. *Sent by mail, post-paid, with full directions for cultivation. Catalogues free.*

JAMES J. H. GREGORY, Marblehead, Mass.

Gregory's Annual Catalogue of Choice Garden and Flower Seeds.

Having in former years introduced to the public the Hubbard Squash, American Turban Squash, Marblehead Mammoth Cabbage, Mexican Sweet Corn, Brown's New Dwarf Marrowfat Pea, Boston Curled Lettuce, and other new and valuable vegetables, with the return of another season I am again prepared to supply the public with Vegetable and Flower seeds of the purest quality. My Annual Catalogue, containing a list not only of all novelties, but also of the standard vegetables of the garden (over one hundred of which are of my own growing) and this season for the first time a carefully selected list of flower seeds will be forwarded *gratis* to all. Sent without request to my customers of last season. All seed purchased of me *I warrant to be fresh and true to name, and that it shall reach the purchaser.* Should it fail in either of these respects I will fill the order over without additional charge.

JAMES J. H. GREGORY, Marblehead, Mass.

JAMES J. H. GREGORY, Marblehead, Mass.

New Tomatoes.

ALGER.—This new variety has the same potato-like foliage as Keyes', but the fruit is larger, of good market size, early and very productive. 15 cts. per package.

GEN. GRANT.—Remarkably solid, round, flat in shape, handsome, and of excellent quality. Received the first premium for the two past years at the Annual Exhibition of the Mass. Hort. Society. 15 cents per package.

CRIMSON CLUSTER.—Early, grows in large clusters bearing handsome fruit, oftentimes elegantly spotted with gold, 15 cents per package.

MAMMOTH CLUSTER.—Very large, round, crimson, 15 cents per package.

BOSTON MARKET.—The result of most careful selection by the Boston market-men for a series of years; large, flat, round, solid; enormously productive, 15 cts. per package.

EARLY ORANGEFIELD.—An English sort, yields its fruit in large clusters. This Tomato is of a peculiarly rich and sweet flavor, and excellent as fruit for dessert, 15 cts. per package.

Also the following excellent varieties at 10 cts. per package. Early York, Dwarf Scotch, Keyes' Early Prolific, Yellow Fig, Maupay's Superior, Cherry, Large Yellow, Feejee, Cook's Favorite, Lester's Perfected, Large Smooth Red, Tomato De Laye, Tilden, New Mexican, Strawberry, or Ground Cherry.

All of the above are of my own raising, each grown isolated, scattered over three square miles of territory. Catalogues free.

JAMES J. H. GREGORY, Marblehead, Mass.

Improve Your Seed.

"The Best is the Cheapest."

SANFORD CORN.

The experience of the past season fully confirms all that has been said in its favor. In many instances, being planted in the same field and having in all respects the same chance, *it has ripened from two to three weeks earlier, and yielded double the amount of other corn.* Testimonials from reliable farmers in nearly every State endorse it as being *the best field corn.* One quart by mail post-paid, 75c. Two quarts, $1.25. One peck, $3. One peck by Express, $2. One bushel, $5. Send for Descriptive Circular. Address

S. B. FANNING, Jamesport, Long Island, N. Y.

BLISS' SELECT GARDEN SEEDS.

B. K. BLISS & SON,

Nos. 41 Park Row, and 151 Nassau Street, New York.

Importers, Growers, and Dealers in Garden, Field, and Flower Seeds, Horticultural Implements, and Garden Requisites.

Would invite attention to the following **COLLECTIONS OF SEEDS** for

THE FLOWER AND KITCHEN GARDEN,

which have been favorably known in every section of the country for the past **Sixteen years.**

Collections of Flower Seeds by Mail.

The following collections contain the most showy varieties in our large assortment, with full directions for culture. Each packet contains a mixture of the different colors and varieties of its species, so that a greater display can be made at a much less price than when ordered in separate packets. Those unacquainted with Flowers, as well as the experienced cultivator, may order without fear of disappointment.

Coll. A—contains twenty choice varieties of Annuals...$1.00

Coll. B—contains twenty choice varieties of Biennials and Perennials..... 1.00

Coll. C—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation..... 1.00

Coll. D—contains five very choice varieties, selected from *Prize Flowers*, of English Pansies, German, Carnation and Picotee Pinks, Verbenas, Truffaut's French Asters, Double Hollyhocks..... 1.00

Any one remitting $3.00 will receive the four assortments postage free.

Coll. E—contains fifteen very select varieties of Greenhouse Seeds.....$3.00

Coll. F—contains one hundred varieties of Annuals, Bienoials and Perennials, including many new and choice varieties..... 5.00

Coll. G—contains fifty varieties of Annuals, Biennials and Perenoials..... 2.50

Coll. H—contains twenty varieties of hardy Annoals, Biennials and Perennials, for sowing in Autumn.1.00

The seeds contained in the above assortments are of our own selection. Purchasers who prefer to make their selection from the Catalogue will be entitled to a discount proportionate to the quantity ordered.

Collections of Kitchen Garden Seeds.

A COMPLETE ASSORTMENT OF VEGETABLE SEEDS FOR ONE YEAR'S SUPPLY, FOR A LARGE OR SMALL GARDEN.

The following Collections are made up in the most liberal manner, care being taken to give a sufficient quantity of all the finest varieties and most useful sorts of Vegetables required in the Kitchen Garden.

Assortment No. 5 contains 55 varieties, $3.50
" No. 6 contains 33 varieties, 2.00
" No. 7 contains 15 varieties, 1.00

The above are prepared expressly for sending *by mail*, and will be sent post-paid upon receipt of prices annexed.

Larger Collections, which can be safely sent by express (freight paid by purchaser,) to any part of the country, as follows:

No. 1, $20.00; No. 2, $15.00; No. 3, $10.00; No. 4, $5.00.

For a list of the contents of each Collection, see *Sixteenth Annual Edition* of our **Illustrated Seed Catalogue** and **Guide to the Flower and Kitchen Garden,** now ready for distribution.

No pains or expense have been spared in preparing this edition, to make it the most complete work of the kind ever published in this country.

It contains 120 pages of closely printed matter, and *two hundred* choice engravings of favorite Flowers and Vegetables—a large portion of which are entirely new; also, two beautifully colored lithographs of **Lilium Auratum** and a **group of Pansies, and a descriptive list of upwards** of *two thousand* species and varieties of *Flower* and *Vegetable Seeds*, including all the novelties of the past season, with directions for their culture; also, a list of upwards of *One Hundred varieties of Choice Gladiolus*—with many other Summer-Flowering Bulbs—and much useful information upon the subject of gardening generally.

A copy will be mailed to all applicants enclosing *Twenty-five cents.* Our regular customers supplied without charge.

Address **B. K. BLISS & SON,**
P. O. Box 5712, New York.

Address B. K. BLISS & SON,
P. O. Box 5,712, New York.

Lilium Auratum.

The Japanese Queen of Lilies.

A large importation from Japan, just received by the subscribers, in fine, healthy condition. Flowering Bulbs mailed to any address at following prices:

No. 1, $1.00 each; $9.00 per doz. No. 2, 75 cents each, or $6.75 per doz. No. 3, 50 cts. each; $4.50 per doz. Prices by the hundred or thousand will be given to dealers upon application. B. K. BLISS & SON,
Nos. 41 Park Row, and 151 Nassau St., New York.

BLISS' IMPROVED

Long Orange Carrot.

This superior variety is the result of a careful selection, for successive years, of the best formed, largest, and deepest-colored roots of the Imported Long Orange Carrot, by which it has attained a perfection hitherto unknown in this useful vegetable, being larger, better flavored, and of a deeper orange color, and more sure to produce a crop. Butter makers will find this variety very useful in giving to their butter a rich, deep yellow color. We unhesitatingly pronounce it the best variety in the market, and one which will not fail to give satisfaction to the purchaser. 1 oz., 20 cts.; 4 oz., 65 cts.; 1 pound, $2, by Mail, post-paid.

Address B. K. BLISS & SON,
P. O. Box 5712, New York.

New Crop Onion Seed.

Grown expressly for us the past season by some of the most successful growers in Wethersfield, Conn., and vicinity, the quality of which cannot be excelled. Mailed post-paid to any address upon receipt of price affixed.

White Globe	50	1.50	5.00

Address B. K. BLISS & SON,
Nos. 41 Park Row & 151 Nassau St., New York.

SEED POTATOES.

BRESEE'S KING OF THE EARLIES, or No. 4.—Known also as the *Fifty Dollar Potato* (at which price they were sold last spring). The experience of the past season fully confirms all that was claimed for it by the raiser, and we have no hesitation in pronouncing it the *Earliest*, as well as one of the best varieties in cultivation, is ready for marketing one week in advance of the Early Rose. Mr. Bresee has placed his entire stock in our hands, for sale at the following greatly reduced prices.

Two Pounds, by mail, post-paid, for $1.00; by Express, (purchaser paying freight), One Peck, $5.00; One Bushel, $15.00; One Bbl., $40.00.

BRESEE'S PEERLESS, or No. 6.—This is, without exception, the best variety in cultivation, for a general crop. It grows to a large size, of a very showy appearance, is enormously productive, and fully equal to the Peachblow in quality. The stock was sold last spring at $600 per bushel. One lb., by mail, $1.00; by Express, $10.00 per peck.

BRESEE'S PROLIFIC, or No. 2.—4 lbs., by mail, $1.00; by Express, $1.25 per peck; $4.00 per bushel; $9 per Bbl.

CLIMAX.—4 lbs., by mail, $1.00; $1.50 per peck; $4.00 per bushel; $9.00 per Bbl.

EARLY ROSE.—4 lbs., by mail, $1.00; $1.00 per peck; $2.50 per bushel; $5.00 per Bbl.

Not less than $1.00 worth of a variety will be mailed.

Older varieties will be furnished at market prices. Our illustrated *Potato Catalogue*, with full directions for their culture, will be mailed to all applicants enclosing a stamp.

B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

L'HOMME-LEFORT, MASTIC, or COLD GRAFTING WAX.

Used in the Imperial Nurseries and Plantations of Paris.

This preparation is known as the best which can be used in the operation of grafting Trees, Shrubs, and Plants of any description, budding Roses, &c. It requires no previous melting; it is always ready for use; it grows hard in the open air as well as in water; and once hardened is not liquified under a high temperature.

This article is far superior to anything yet produced for the purpose of healing all wounds in Trees, &c., arising from accident or disease. It rapidly causes broken or split branches to unite again; it preserves the graft from moisture and from the intrusion of insects, &c., and is

THE BEST STYPTIC TO PREVENT THE EFFUSION OF SAP AFTER THE PRUNING OF THE GRAPE-VINE.

It is also an indispensable article in many other circumstances, which can only be illustrated by its use. Sold in tin boxes of various sizes, bearing the signature of the inventor. Price 40c., $1.25 and $3.50 per tin. The largest contains 6¾ lbs.

Descriptive Circulars furnished to all applicants.

B. K. BLISS & SON, 41 Park Row, New York,
General Agents for the United States.

CUCUMBER, GEN. GRANT.

A superior variety, either for forcing or for culture in the open round. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five Packets for $1.00. B. K. BLISS & SON,
P. O. Box 5712,
New York.

Conover's COLOSSAL ASPARAGUS

Seed and Roots.

The experience of the past season fully confirms all that was claimed for this variety when first offered last spring, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Strong, one-year-old Roots mailed, post-paid, $2 per fifty; $3.00 per hundred.

SEEDS.—½ oz. per pkt. 50 cts.

Address B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

Fresh Pear Seed.

In first-rate condition, just received by the subscribers, 40 cts. per ounce, $1.25 per 4 ounces, $4.00 per pound, $325.00 per 100 pounds.

Address B. K. BLISS & SON,

KANSAS FARMS.

NEOSHO VALLEY LANDS!

1,390,000 ACRES FOR SALE TO

ACTUAL SETTLERS.

UNION PACIFIC RAILROAD COMPANY.

SOUTHERN BRANCH.

The Lands now offered by this Company are situated mainly within twenty miles on each side of the road, extending one hundred and seventy miles along the

NEOSHO VALLEY, the richest, finest, and most inviting valley for settlement in the West. The Lands are admirably adapted to fruit and vine culture, stock raising, and dairy business. They consist of rich bottoms, level, undulating, and rolling prairie, usually convenient to wood and stone, spring, creek, or river water.

Interspersed among cultivated tracts and lying in large bodies together, they present inducements to families, neighborhood settlements, and large colonies, possessed by no other lands in the State. While the lands of similar corporations have been *culled* by the two hundred thousand settlers of the last two years, these have been rigidly reserved intact, and now are open to the actual hard-working settler—the bone and sinew of the nation.

One-third of the labor required at the East in the culture of farms will insure here double the amount of crops. The high rolling prairie is the finest wheat land in the world, and when plowed deeply, stands a drought, and produces corn nearly as well as the best of our bottom-lands. For orchards, grape culture, and small fruit in general, it is far superior, and is least affected by frosts.

BUILDING MATERIAL AND FENCING.—The varieties of timber are Cotton-wood, Hackberry, Locust, Oak, Hickory, and Black-Walnut, situated mostly on the large rivers and creeks, and hid away in ravines, unobservant to the common traveler. Within convenient distance of almost every quarter section, are the finest quarries of limestone, furnishing the best of material for house, barn, fences, etc. Large quantities of pine lumber are imported by way of Leavenworth, and as soon as our road reaches the pineries of the Indian Territory and Texas, it will be brought up the valley of the Neosho.

STOCK RAISING.—The rich native grasses of the prairies and bottoms, with the large area of unoccupied lands in connection with the dry, mild, and open winters, present unequaled advantages for the raising of cattle, sheep, and horses.

One of our correspondents, a Kentuckian, in a letter just received, says: "I examined Labette and Neosho Counties last winter, and I consider the region of your Land Grants to be the very centre of the live-stock trade in this part of the continent. It is a region better adapted to the growth of live-stock, and the making of butter and cheese, than any other in the same latitude. Its limestone soil in time, will be the best Blue Grass land in the world."

DAIRYING.—In such a country, with ranges for stock unrestricted, and pasture limitless, the production of butter and cheese must be profitable. The cheapness with which cattle can be raised and fed, leaves this branch of labor without any drawbacks, and insures handsome returns and liberal profits to all who engage in the dairying business.

FRUIT GROWING is one of the *specialties*, as demonstrated by the Gold Medal awarded to the State of Kansas by the Pennsylvania State Horticultural Society for "A COLLECTION OF FRUITS UNSURPASSED FOR SIZE, BEAUTY, AND FLAVOR." The pear and apple crop of 1869 gives positive assurance of success in this department.

THE CLIMATE AND HEALTH of Kansas are unequaled. These, indeed, are among its chief excellencies, and are recommendations for settlement. The atmosphere is dry and pure, and singularly beneficial to persons predisposed to consumption and bronchial affections. No country in the world furnishes a larger number of days in the year in which out-door work can be done.

COAL AND SALT.—Numerous veins of excellent coal have been opened in the Valley, and in many other parts of the State, varying all the way from 1 to 6 feet in thickness.

SCHOOLS AND CHURCHES.—The Common and Higher Schools of the State are endowed with lands to the value of millions of dollars, a portion of which have been sold and invested, yielding a heavy income. Churches of all denominations are common, and liberally supported and attended.

PRICES OF LAND.—Our lands vary in price, usually from $3 to $8 per acre, and are sold upon the credit of (10) years' time, and on more favorable terms than any other company in the State. It is our purpose to prevent, as far as possible, any speculating in the lands of this Company, and to encourage sales to *actual settlers* alone;

TERMS OF SALE.—One-tenth down at time of purchase. No payment the second year, except the interest. One-tenth every year after until completion of payments, with annual interest. Any one wishing to save the interest can have the privilege of paying up at any time.

THE HEAD LAND OFFICE is located at JUNCTION CITY, to which all immigrants and persons desiring to see the lands of this Company should purchase tickets. Large maps of the road and the lands can be seen, and important information gained, not possessed at any other point, and to all purchasers of lands *free tickets* from this point are given over the Road.

For further information address

ISAAC T. GOODNOW,
Land Commissioner,
Junction City, Kansas.

THE

EUMELAN

GRAPE.

A FEW WORDS TO THE PUBLIC.

We are in receipt of hundreds of letters asking many different questions in reference to the merits of the Eumelan grape; some of the more common of which we desire to answer through the advertising columns of the American Agriculturist, for the benefit of all who read this journal, and are desirous to learn of the worth of this variety which, though new to the public, has been growing and producing fruit for many years.

Ques. Where, when, and with whom did the Eumelan originate? *Ans.* At Fishkill, on the Hudson, about thirty years since, in the grounds of a Mr. Thorne.

Ques. Is the Eumelan an early grape? *Ans.* Yes, the earliest of all the valuable sorts, ripening some days in advance of the Hartford Prolific, and more than two weeks sooner than Delaware.

Ques. Is the Eumelan a hardy variety? *Ans.* One of the most hardy. The vines have withstood the winters of the past 25 years in bleak exposure without protection, and more recently have proved hardy where tried in every Northern State, from Maine to Minnesota. *Ques.* Are the vines vigorous? *Ans.* We have found the Eumelan to be as vigorous as Concord; and such is the report from all who have tested it.

Ques. What is the color of the Eumelan? *Ans.* Black with a peculiar wax-like bluish bloom, making it our handsomest black variety.

Ques. Have Eumelan grapes been grown elsewhere than at Fishkill? *Ans.* Yes; in many places where the vines have been tried, and always possessing the same great superiority over other black varieties that it has been found to possess when grown at Fishkill. *Ques.* Is the stock of vines you are now offering for sale grown from mature wood, or is it grown from green cuttings and immature wood? *Ans.* Our stock of Eumelan vines is grown from well-ripened wood, taken from bearing vines, and the plants we are selling are strong and well rooted, so that we can warrant every one we send out to give satisfaction to the purchaser.

The above and many other inquiries are fully answered in our pamphlet, containing thirty years history of this most valuable grape; also, testimonials from persons in all parts of the country where the vines have been on trial.

We will send the pamphlet free to any person giving us their address.

THE AMERICAN AGRICULTURIST says:

"We are convinced that this grape is worthy of general trial, and we shall take much interest in seeing its true merits developed."

THE RURAL NEW YORKER says:

"The Eumelan promises to deserve a prominent place in American vineyards."

THE NEW YORK TRIBUNE SAYS:

"The Eumelan must be considered, from present evidence, to be a valuable addition to our list of grapes."

ONE WORD FOR THE QUALITY OF OUR VINES.

Palmyra, N. Y., Nov. 11, 1869.

Messrs. Hasbrouck & Bushnell.—Gents: The box of Eumelan vines is received. The One Hundred No. 1 are as fine one-year-old vines as I ever saw. Can't help but give my customers best satisfaction. The second and third class are also very fine. The second class are as good, and, in fact, better, than many first-class one-year-old grape-vines I have received from many other sources.

Truly yours, A. M. PURDY.

ONE WORD FOR THE FRUIT OF THE EUMELAN.

Reading, Mass., Sept. 30, 1869.

Messrs. Hasbrouck & Bushnell:—My Eumelan vine is a vigorous, almost rampant, grower. Leaves, dark, thick, and parchment like, while the wood is hard, and very short jointed. Thus far, I have not one among my fifty or sixty varieties which (all things considered) has pleased me so much as the Eumelan. My vines have been entirely healthy, and the fruit of the Eumelan ripened this year fully one week in advance of the Hartford. In quality, it deserves to be placed *at the head* of the black grapes.

Respectfully yours, REV. WM. H. WILLCOX.

Send for price list of Vines, also terms to Clubs.

Marblehead Mammoth Cabbage!

This is the largest cabbage in the world, sometimes weighing over sixty pounds each, and averaging as high as thirty pounds by the acre! It is not only large, but cannot be surpassed for reliability for heading, tenderness, and sweetness. As some cultivators have an impression that this cabbage cannot be fully matured outside of Marblehead, I invite their attention to the following extracts from among the many commendatory letters which I have received.

"Your Marblehead Mammoth Cabbage cannot be excelled. There were heads weighing 50 lbs., and heads of Fottler's Improved Brunswick (from your seed) weighing 40 lbs.—John H. Howlett, Charlestown, Ill."

"I raised from your seed Marblehead Mammoth Cabbages that weighed 50 lbs.—A. H. Mace, Clintonville, N. Y., Nov. 14th, 1869."

"Your Marblehead Mammoth Cabbages were very fine, they all headed well, and weighed 27 to 40, and 47 lbs.—W. Llewellyn, Red Wing, Minn., March 12, 1869."

"Your Marblehead Mammoth Cabbages are wonderful; they grew to the size of an umbrella.—Thomas Flanigan, Palermo, Kansas."

"The Marblehead Mammoth Cabbages were a perfect success. They headed well, and were three times as large as any cabbage I ever raised before.—J. F. Butt, Kosciusco, Miss."

"I have raised your Marblehead Mammoth Cabbage for two years, and it has proved the tenderest and sweetest cabbage I ever saw.—S. S. Groves, Stones Prairie, Ill."

John Van Wormer, Springs' Mills, Mich., raised some weighing 30 lbs. John Humphreys, Titusville, N. Y., 33½ lbs. M. D. Clark, Elyria, Ohio, 37 lbs. H. A. Terry, Crescent City, Iowa, 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Becancour, C. W., exhibited three cabbages weighing respectively 40, 42½, and 44 lbs. John W. Dean, St. Michael's, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., 33 lbs., when trimmed. E. H. Ellis, Etna Green, Ind., over 30 lbs. A. E. Garrison, Des Moines, Iowa, 30 lbs. James S. Allen, Union Springs, N. Y., 30 lbs., when stripped of loose leaves. Wm. Lee, Jr., Denver, Colorado, has grown heads weighing 45 to 50 lbs., as a penalty for which the miners of the mountains call him the "Big Cabbage Man." Leonard Choat, Denver, Colorado, raised one which weighed 46 lbs. when trimmed of waste leaves. Collins Eaton, Ogdensburgh, N. Y., 50 lbs. P. Sweeney, Loretto, Pa., 43 lbs. Sam'l B. Ornsbee, Rolling Prairie, Wis., 53 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot weighing from 50 to 60 lbs. A. C. Van Tassal, 29 lbs. trimmed. A. C. Goodwin, Kennedy, N. Y., 45 to 50 lbs. W. H. Spera, Euphrata, Pa., raised fifty heads that averaged over 31 lbs. each. Wm. D. Munson, Burlington, Vt., raised some weighing 46 lbs. Mary B. Sellman, Galesburg, Iowa, 28 to 43 lbs. stripped of loose leaves. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest cabbage ever seen in the country." "Astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled," etc., etc. As the original introducer of the Mammoth Cabbage, I am prepared to supply seed grown from *extra large heads*, at following prices, by mail, post-paid: Per package, 25 cts.; per oz., $1; 4 ozs., $3.50; per lb., $12.

Full instructions for cultivation accompanying the seed.

Catalogues free. JAMES J. H. GREGORY,

FERRE, BATCHELDER & CO.'S
ILLUSTRATED CATALOGUE
of Seeds and
VEGETABLE AND FLOWER GARDEN

MANUAL for 1870, will be ready for distribution early in January. It will contain about 100 pages, with numerous illustrations—a complete list of Vegetable and Flower seeds, to which will be added a list of **Summer-Flowering Bulbs, Plants and Small Fruits.** Sent to all applicants **enclosing 10** cents. Our customers supplied without charge. Address

FERRE, BATCHELDER & CO.,
231 Main St., Springfield, Mass.

To Market Gardeners.

Your business involves an immense outlay over small areas, and it is of first importance that the seed you plant should be *fully reliable*. My enterprise is of special interest to you, as I am engaged in growing, directly under my own eye, a great variety of vegetable seeds, many of which seedsmen usually import or gather together from growers scattered through the country. Because I grow these seed myself I am enabled to warrant them *fresh and true to name*, and to bind myself to refill the same value gratis, should they not prove so. All seed warranted to reach each purchaser. I also import and procure from first growers, choice varieties that cannot be grown in my locality, giving me thus one of the largest if not *the* largest variety of vegetable seed sold by any dealer in the United States. Give my seed a trial. Catalogues gratis.

JAMES J. H. GREGORY, Marblehead, Mass.

White Australian Spring Wheat.

This new variety of Wheat lately introduced from Australia, has proved very productive and of most excellent quality. It yielded this past season fifty-one and a half bushels to the acre. This is eighteen and a half bushels more to the acre than the best of several other kinds yielded, which were sown, as a test, on the same field, and treated in all respects in the same way.

I will send a four-pound package of this wheat by mail, and *warrant it to reach its purchaser, for* $1. Such a package, sowed thin, will yield, on good land, with good culture, six to eight bushels. O. DICKINSON, Salem, Oregon.

PURCHASERS WANTED for 1,000,000 Small Fruit Plants and 1,000 barrels of Early Rose Potatoes. Send for prices. JOHN S. COLLINS, Moorestown, N. J.

BEAUTIFUL FLOWER SEEDS.

67th & Darby Road, Philadelphia, Pa.

How to Grow Cabbages.

I have written a work entitled "Cabbages; how to Grow them," which treats on the soil, the manure, the planting, cultivation, marketing, varieties (with several engravings), keeping over winter, hot-bed raising, stamp foot, etc., etc., many minute practical details being given under each head, so invaluable to the beginner. I have written two other works—one entitled, "*Onions; How to Raise them.*" The other, "*Squashes; How to Grow them*;" each characterized by great thoroughness of detail. Either work will be sent post-paid on receipt of 50 cts. My Illustrated Garden and Flower Seed Catalogue sent gratis to all.
JAMES J. H. GREGORY, Marblehead, Mass.

R. CRISWELL, Brooklyn, N. Y.

"GUANO."

Sardy's "Soluble Phospho-Peruvian."
Do. "Ammoniated Soluble Pacific."

Also, Ground Carolina Phosphate and Land Plaster.
The use of the above Soluble Phospho-Peruvian and Ammoniated Soluble Pacific Guanos, is particularly recommended, they being compounds of the richest Pacific Phosphatic Guanos, rendered soluble; the former containing 20 per cent of Peruvian Guano, and the latter highly ammoniated with animal matter—making the most concentrated and profitable fertilizers in use for Cotton, Corn, Wheat, Tobacco, and all other crops.
For prices and full particulars send for pamphlet.
For sale in Bags and Barrels, in quantities to suit, by

Send for Circular. Penningtonville, Chester Co., Pa.

G. H. WARNER HAS TAKEN FIRST PREMIUMS on Houdans, La Fleche, Crevecœurs, Dark Brahmas, Light Brahmas, Partridge Cochins, Silver Gray Dorkings, White Dorkings (rose comb), Silver Sebright Bantams, Rouen and Aylesbury Ducks, either at the New York State Agricultural Fairs, or at the N. Y. S. Poultry Exhibitions, and on most varieties at each show. Also the "*Agriculturist*" First Premium, the N. Y. S. Poultry Society's large Gold Medal on Dark Brahmas, and the Society's First Premium on Houdans, the large Gold Medal, valued at $80 each. The most of my Buff Cochins are stock I bought from Mr. G. H. Leavitt, last August, which included all his fowl—those published in the *Agriculturist*, Sept., 1868, and those that took first and second premiums at the Columbian Society Show, in Dec., 1868; first and second at the Pennsylvania Poultry Exhibition, and first, second, and third, at the N. Y. State Poultry Show in March, 1869.
I am now breeding from 63 *choice* imported fowl, with a few selected from my old stock.

EGG PRICE LIST:

Buff Cochins, Partridge Cochins, Dark Brahmas, La Fleche, Houdans, Crevecœurs, Imported Rouen and Aylesbury Ducks, $6 per dozen. Light Brahmas, Silver Gray Dorkings, and White Dorkings, $2.50 per dozen. Golden and Silver Sebright Bantams, Aylesbury and Rouen Ducks, $3 per dozen. Dorkings, and Black Red Game Bantams (all imported), $6 per dozen.
Young fowl for sale after October. Send stamp for circular.
G. H. WARNER, New York Mills,
Oneida Co., N. Y.

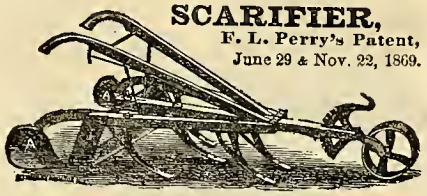
JAS. W. PENFIELD, Cleveland, Ohio.

HOLBROOK'S SWIVEL PLOWS leave no "dead furrows" nor "ridges," turn furrow-slices flat on level land, work equally well on side-hill, save considerable time, pulverize thoroughly, will not clog, and equallze the work of team. Eight sizes, from 1 horse to 4 cattle.
Address F. F. HOLBROOK & SMALL, Boston, Mass.

Cultivators of the Soil cannot
Afford to be without the
SCARIFIER,
F. L. Perry's Patent,
June 29 & Nov. 22, 1869.



It cuts within half an inch of the row, and pulverizes from one to ten inches deep, it will perform THREE TIMES the amount of work, with greater ease, in passing through the soil ONCE than any other Cultivator now in use.
From A. M. PURDY, Palmyra, N. Y.
"The best Cultivator I have ever tried: has paid for itself in ONCE using through my plantation of small fruits. The most complete pulverizer and weed exterminator I have ever followed." Freight paid on orders received before the first of next month, to Boston, Philadelphia, Cincinnati, Chicago, and Milwaukee. Send for Circular and terms to those forming clubs. I offer for the spring trade a well grown stock of Apple and Pear trees, Grape-vines, and Small Fruits. Address
F. L. PERRY, Canandaigua, N. Y.

C.W.Co.

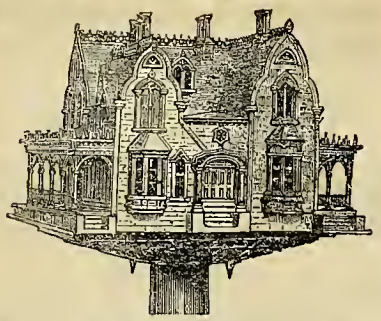
With Slide, Rest, and Fittings. Elegant, durable, cheap and portable. Just the thing for the Artisan or Amateur Turner.
Send for descriptive circular.
S. K. BALDWIN, Laconia, N. H.

NISHWITZ'S PULVERIZING HARROW is indispensable to every farmer who wishes to cultivate his land thoroughly, increase his crops, and economize labor. It is worth ten times its cost to every farmer. *Warranted to please, or money refunded.* Price, with spring seat, $30, at New York, or Cleveland. Send for Illustrated Circular to PEEKSKILL PLOW WORKS, Peekskill, N. Y., or, Cleveland, Ohio.

Farmers and Dealers
Who want any kind of
AGRICULTURAL IMPLEMENTS
or
SEEDS.
or
FERTILIZERS.
should endeavor to learn what are **the best** and what **improvements** have been made recently.
Full details as to these will be given by applying to us.
Among the numerous articles which comprise our stock we call particular attention to our **Improved**
CYLINDER PLOW.
(Figs. 2 and 10,)
made of *cast iron* and of *steel*, of four sizes, from $10 to $30. This is **the best Sod Plow** in use, and will run lighter and do better work than any other.
It appears on the premium list of the *American Agriculturist, Rural New-Yorker*, and other papers.
With this should be used the
COULTER HARROW.
(Page 30,) at $18.)
of Shares's patent,—*the best pulverizing harrow*; made *with chilled cast-iron teeth* or *with steel teeth.*
For cultivating between rows, we recommend the
STEEL HORSE HOE.
(Page 35,)
at $15, or other styles of **Horse Hoes** and **Cultivators,** at various prices.
Our **Specialties** for the Harvesting Season will appear in the **May numbers** of the **Agricultural Press,** but we call attention now to the
Lawn Mower.
(Pages 51 and 52.)
The two smaller sizes at $30 and $35, and the larger machines up to $310; and to the
POTATO DIGGING PLOW.
(Page 57.)
at $15; **the best** Potato Digger in market, and one that will save its cost several times over in a season.
Together with Harvesting Tools properly belongs the
PRINDLE'S STEAMER.
(Page 111,)
from $45 to $115, for cooking potatoes and all kinds of roots, feed, etc., for stock, though useful, also, for a variety of other purposes.
For use in every household, irrespective of season, we offer the
BLANCHARD CHURN.
(Page 134,)
The Best Churn for Family and Dairy purposes now in market, made of five sizes; and to all large Farmers, as a **Motive Power,** the **Lever**
Anti Friction Horse Power
(Pages 64 and 65.)
This is not a "*cheap*" Power, though it is in reality the most economical when its ease of draft, capacity for work, and durability are considered. Price, $175.
It is **the best** on our whole list of Horse-Powers, which contains nearly a dozen different kinds.
Although these are **our Specialties,** and *all of our own manufacture or under our sole control,* yet they are only a few of the articles in our large stock of **Standard** and **Novel Machines** and **Implements** to which we call attention.
We send special Circulars of these and *an Index and Proof-Page Circular* of our **large Illustrated Catalogue,** *on receipt of stamp for return post.*
Our **Seed Catalogue** and **Trade-List,** issued in January, will be sent upon the same terms.
Indeed, **If any article likely to be found in our stock** is wanted by any reader of this advertisement, let him send stamp for information relative to it, and it will be sent immediately.
We recommend to all to *ascertain at once* what they need to do their **Spring work** most *economically* and to *order it* **now,** thus avoiding delay in obtaining goods during the hurry of business as Spring advances.
This is no small item in a Farmer's or Dealer's calculations, and is worthy of consideration.
Address:
R. H. ALLEN & CO
P. O. Box 376, NEW YORK
N. B.—The references to figures and pages in the foregoing are to **our large Catalogue,** the price of which ($1) will be **refunded** to any purchaser who may send us an order from its pages.



METALIC BIRD HOUSE, enameled white, 13 inches high, 14½x10½ base. Manufactured by the

MILLER IRON CO.,

Providence, R. I. Manufacturers of Ornamental Iron Work for Gardens, Lawns, Parks, Cemeteries, etc. Illustrated Catalogue sent free.

COOPER'S STEAM ENGINE WORKS.

To keep pace with the growing demand for our Machinery, we are adding $40,000 worth of new and improved Tools and Buildings to our present large Factories, and will continue to supply the following articles, after the best designs, on terms which will be found to be specially advantageous:

STATIONARY STEAM ENGINES,

For MILLS, FACTORIES, SHOPS, FURNACES, MINING, &c., of every required size, divided into three classes.

1. WITH SINGLE SLIDE VALVE, *Cutting off at two-thirds of Stroke by lap.*

2. WITH CUT-OFF VALVE, arranged so as to close at any part of Stroke and adjustable by hand-lever while engine is in motion.

3. WITH BABCOCK & WILCOX PATENT *Variable Cut-off, automatically adjusted by Governor.*

PORTABLE STEAM ENGINES,

Of 8, 10, 15, 20 and 25 Horse Power, combining all the improvements of the Slide Valve Engine. This is the only portable Engine and Boiler that has a *Combined Heater and Lime Catcher.*

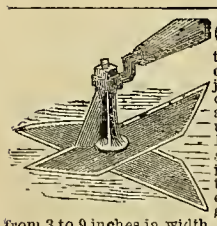
JOHN COOPER & CO.,
Mount Vernon, Ohio.



GREAT LABOR-SAVING Machine for the Million. For the Cotton Planters and all others. Lyman's New Patent Adjustable Weed Annihilator, a year of experience proves it to be by actual test the most practical, useful, cheap and reliable Weed Destroyer known, combining *strength, durability,* great ease in working, doing the work of two or more tools of the ordinary old styles now in use, with much greater ease and rapidity, cutting from 3 to 9 inches in width, with best cutlery steel tempered Knives, with cutting edges each side, and easily sharpened.

A. E. LYMAN & CO., Northampton, Mass.
Send for Circular. A. E. LYMAN, Patentee.

Galvanized Wire Cable Fencing.

Cheaper than wood; more easily erected; not liable to rust; will sustain a man's weight in clambering over it; made of 6 strands of galvanized wire; will not "set" like solid wire, in receiving a blow; will not snap in cold weather, even if strained tight, as the twist of the cable equalizes the contraction and expansion caused by cold and heat; exterior diameter nearly ¼ inch. One hundred pounds of this Cable will make about two-thirds more Fencing, than the same weight of solid wire of same diameter.

A 5-*Bar* or 5-*Cable Fence*, with Straining Brackets, Screws, Nuts, and Staples, for Wood Posts, costs $30 per 100 yards, without the cost of the wooden posts.

A 5-*Bar* or 5-*Cable Fence*, with Iron Posts and Standards, all complete, will cost $68 per 100 yards.

Send for Circular. Liberal discount for $1,000 and over.
Shops, 17 Coates St., Phila. PHILIP S. JUSTICE,
Offices: 42 Cliff St., New York; 14 N. 5th St., Philadelphia.

Steel Blades, adjustable.

30-inch or 2½ ft. Handle.

A. E. LYMAN, Patentee.

A. E. LYMAN & CO.,
Northampton, Mass.

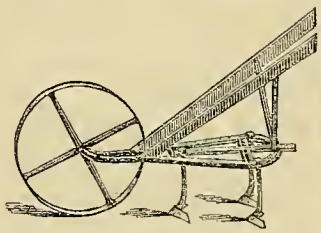
COMSTOCK'S

New Horticultural Implements

COMBINED.

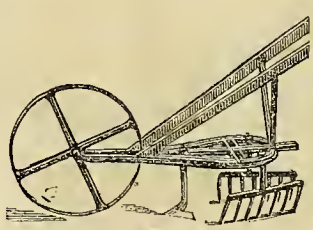
(Patented June 1st, 1869.)

The Best in the World.



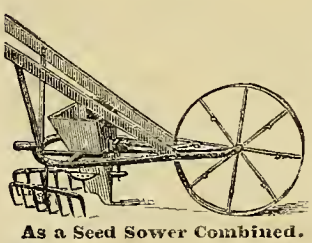
As a Cultivator.

Comstock's Hand Cultivator and Onion Weeder will do the work of SIX MEN with hoes. It is the only implement that *pulls the weeds* and thoroughly pulverizes the soil. As much superior to the hoe for all small drill crops, as the mowers and reapers are to the scythe and cradle. PRICE, $9.00. Boxing, 25 cts.



As a Weeder.

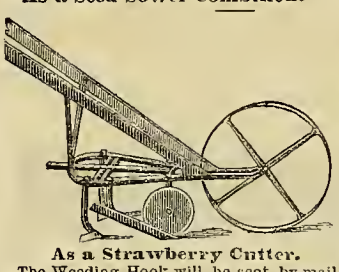
Comstock's Seed Sower.—The neatest and most perfect small seed sower yet invented—sowing Beet, Parsnip, and other difficult seeds with the greatest regularity. Combined with the Cultivator and Weeder, and can be separated in 5 minutes. PRICE, $15. The Seed Sower alone, $10. Boxing, 35 cts.



As a Seed Sower Combined.

Comstock's Strawberry Cutter, for removing Strawberry runners, cultivating between the rows at the same time—with the Cultivator and Weeder combined.

PRICE, $12.00.
Boxing, 25 cts.



As a Strawberry Cutter.

Comstock's Weeding Hook.—A little steel instrument with a hook at each end, one pointed and the other cleft, for hand weeding, and is just the thing for ladies in the Flower Garden.

PRICE, 50 cts.

The Weeding Hook will be sent by mail upon receipt of 65 cts.

The Set Complete, $18.50. Boxing, 35 cts.

The cuts will give a correct idea of the implements, with the exception of the handles, a portion of which it was necessary to cut off for want of space. Descriptive Circulars sent to all applicants. Address

HOW TO MAKE THE FARM PAY

The value of this work is no longer questioned. More than 20,000 farmers, in every State in the Union, have used it the past year, and from all these comes one universal voice of approval. Thousands of dollars have already been made, and hundreds of thousands can yet be made by following its directions; the materials are on every farm without expending a dollar. Every Farmer, Stock Raiser, Gardener and Fruit Culturist can easily double all his profits. Published in English and German. 5,000 copies ordered the first 20 days of 1870. The sale is immense wherever introduced. Farmers and energetic young men wanted in every township to act as agents, on very liberal terms. Send name and address for Circular to ZEIGLER, McCURDY & CO.,
16 South Sixth Street, Philadelphia, Pa.

The DOLLAR Sun.

CHAS. A. DANA, EDITOR.

WATER-PROOF PAPER FOR OUT, AND inside of buildings. C. J. FAY, Camden, N. J.

Differing widely from the usual monthly magazines,

OLD AND NEW,

A MONTHLY MAGAZINE,

EDITED BY REV. EDWARD E. HALE.

January and February numbers now ready.

THE welcome given to the first numbers assures the Proprietors and Editor that their plan for a VIGOROUS, COMPREHENSIVE AND POPULAR Magazine is well founded.

We mean to make the **Stories** in OLD AND NEW attractive alike to its youngest readers and to its oldest readers in their moments of recreation. We mean, also, to discuss the gravest themes, of **SCIENCE,** of **BUSINESS,** of **POLITICS,** and of **RELIGION.** We do not mean that these discussions shall be childish, any more than we mean that our stories shall be dull. Our desire is, not controversy, but to state the highest and best results arrived at in fearless science, in Christian morals, in free government, and in Liberal theology.

The **EXAMINER,** in each number of OLD AND NEW, will contain such reviews of books recently published in all parts of the world as shall guide buyers of books, and put them on their guard against what is worthless.

The January number of the **RECORD OF PROGRESS** was devoted specially to improvements in **Education;** succeeding numbers will touch on the **Homes of the People,** on **Sanitary Improvement,** on **Co-operative Experiments,** and other enterprises for the improvement of the methods of daily life.

The Editor has distinguished assistants. The journal must, of course, be printed in one place; but it does not pretend to be a local organ. There is no State in the Union, and scarcely is there an important city in the Old World, in which we have not active correspondents.

OLD AND NEW is a royal 8vo of 128 pages, handsomely printed.

TERMS.—Yearly subscription, $4; single numbers 35 cts. *Specimen number mailed on receipt of 35 cents.*

H. O. HOUGHTON & CO., Publishers,
135 Washington Street, Boston,

HURD & HOUGHTON,

Hotels, Saloons, Boarding-house Keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 33c., best 35c. per lb.

CLUB ORDER.

BRAIDWOOD, Will Co., Ill., Feb. 14th, 1869.

TO THE GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey Street, New York.

Gentlemen:—Business, and a want of opportunity, have for the last eight months prevented me sending, or rather nttending to our monthly club, whose orders I sent you regularly for about a year previous. Since that time many indeed have been the solicitations by many of the members, that I should once again commence and send club orders—for, as some declared, they had got *no Tea*, no matter what the price paid, since I quit sending the club orders. I have, therefore, at the urgent request of a few, resolved to send you a small order monthly, and as a beginning send you the following:

2	English Breakfast	John James	at 1.20	2.40
1½	English Breakfast	Jas. Reside	at 1.20	1.80
2	English Breakfast	John Runcie	at 1.20	2.40
2	Uncolored Japan	Wm. Ross	at 1.00	2.00
1	Imperial	Wm. Ross	at 1.25	1.25
1	Young Hyson	Wm. Ross	at 1.25	1.25
1	Oolong	Pat. McGerrity	at 1.00	1.00
2	Imperial	John Larken	at 1.25	2.50
1	Oolong	Wm. Duffie	at 1.00	1.00
4	Young Hyson	Thos. Conners	at 1.25	5.00
6	English Breakfast	Robert Barr	at 1.20	7.20
2	Uncolored Japan	John James	at 1.25	2.50
3	English Breakfast	Geo. Simpson	at 1.20	3.60
2	Imperial	Wm. Brooks	at 1.25	2.50
1	Imperial	Wm. Brooks	at 1.25	1.25
1	English Breakfast	Wm. Brooks	at 1.20	1.20

Address to John James, Braidwood, Will County, Illinois, --per Merchants' Express—to be collected on delivery; and oblige Yours respectfully, JOHN JAMES.

Parties sending club or other orders for less than $30 had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for clubs of less than $30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within thirty days, and have the money refunded.

N. B.—Inhabitants of villages and towns where a large number reside, by *clubbing* together, can reduce the cost of their Teas and Coffees about one-third, (besides the Express charges) by sending directly to "*The Great American Tea Company.*"

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We do not, in any case, authorize the use of our name.

POST-OFFICE orders and Drafts, make payable to the order of "*The Great American Tea Company.*"
Direct letters and orders (as below, no more, no less.)

Great American Tea Company,
Nos. **31** and **33** VESEY-ST.,
Post-Office Box, **5,643**, New York City.

PORTABLE, AGRICULTURAL AND STATIONARY

STEAM ENGINES.

EXCELLED BY NONE—EQUALED BY FEW IN MERITS OF EFFICIENCY, ECONOMY AND PERFECTION.

Our PORTABLE ENGINE, mounted on *Locomotive Boiler*, having fire-box and ash-pit entirely surrounded by water space, is set upon legs and timbers; occupies little room; needs no brick-work; is suitable for use in any place where power is required—in *Mills, Shops, Founderies* or *Printing-rooms* or in *Stock Barns*, for grinding, cutting and steaming food for stock.

The AGRICULTURAL ENGINE, supplied with *Locomotive Boiler*, is mounted on wheels, with pole for attaching horses for moving from place to place; is suitable for *Grain Threshing, Corn Shelling, Wood* and *Shingle Sawing, &c.*

The STATIONARY ENGINE is complete, with *Governor, Pump* and *Heater*, with connections fitted.

Circulars, with descriptions and prices, furnished on application to A. N. WOOD & CO.,
Eaton, Madison County, N. Y.

HORSFORD'S SELF-RAISING BREAD PREPARATION

Makes the most wholesome and best of BREAD, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA and decay of TEETH, and promotes the growth of Muscle and Bone. In "*raising*" the dough it does not, like other yeast, decompose the flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send for pamphlet, supplied gratis. Ask your Grocer for "Horsford's Bread Preparation." WILSON, LOCKWOOD, EVERETT & CO., Wholesale Agents, 201 Fulton-st., New York.

New Cabbage Seed.

The following varieties of cabbage seed I grew this season on my three Seed Farms, all perfectly isolated, scattered over an area of three square miles. You will find them all fresh and true.

	per oz.	*4 oz.*	*lb.*
Early Jersey Wakefield, (*true*)	$0.75	$2.50	$7.50
Early Winningstadt	0.35	1.25	3.50
Improved American Savoy	0.35	1.25	3.50
Fottler's Improved Brunswick	0.50	1.75	5.00
Stone Mason Drumhead	0.40	1.50	4.00
Premium Flat Dutch	0.35	1.25	3.50
Marblehead Mammoth Drumhead	1.00	3.50	12.00
Early Wyman	1.00, 25c. *per pack'g.*		

The above seeds were *all grown from fully developed heads*, and will be sent by mail, post-paid, on receipt of price. Catalogues free.

AMERICAN AGRICULTURIST

FOR THE

Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON.

ORANGE JUDD & CO., PUBLISHERS AND PROPRIETORS. Office, 245 BROADWAY.

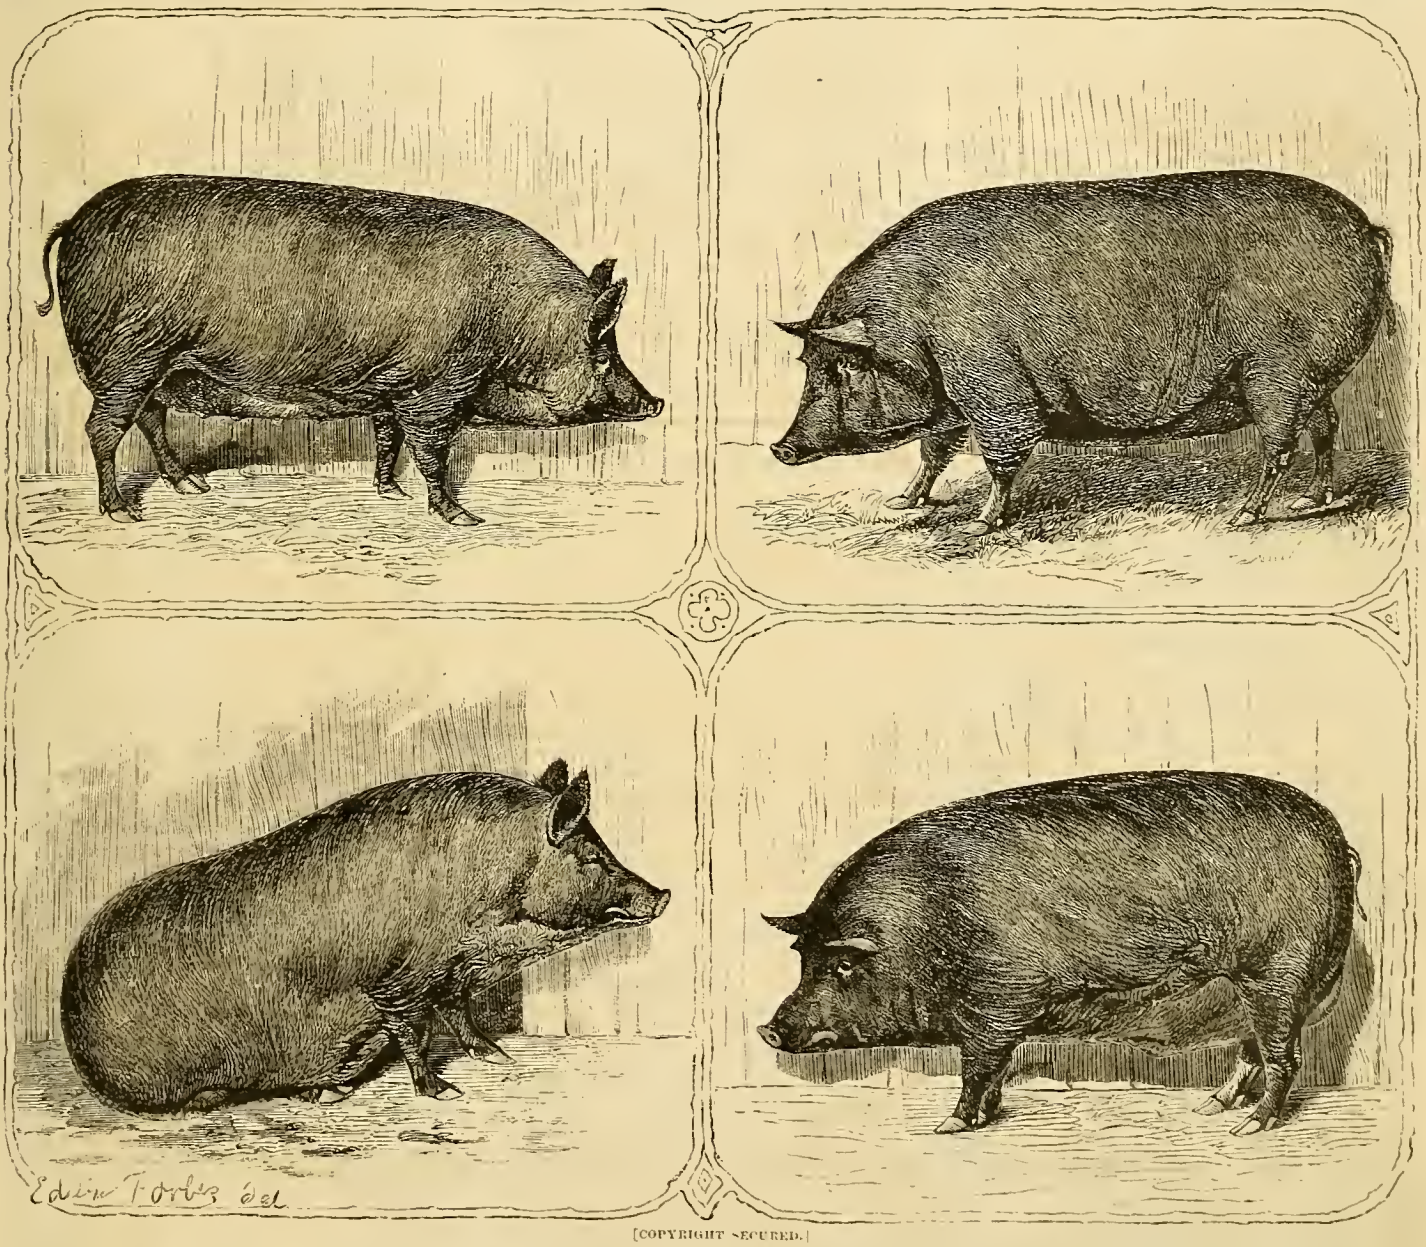
ESTABLISHED IN 1842.

Published also in German at $1.50 a Year.

$1.50 PER ANNUM, IN ADVANCE. SINGLE NUMBER, 15 CENTS. 4 Copies for $5; 10 for $12; 20 or more, $1 each.

Entered according to Act of Congress in March, 1870, by ORANGE JUDD & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

VOLUME XXIX.—No. 4. NEW YORK, APRIL, 1870. NEW SERIES—No. 279.



[COPYRIGHT SECURED.]

ESSEX SWINE.—*Drawn from Photographs and Engraved for the American Agriculturist.*

The Essex are at present attracting much attention from those interested in improving their swine. As there is not space here to enumerate even briefly their claims to consideration, we give a separate article on page 130. The animals above represented are upon the farm of Mr. L. A. Chase, of the *American Agriculturist*, at Northampton, Mass., and are only in breeding condition. The two young sows were bred by Joseph Harris, Esq., ("Walks and Talks,") Moreton Farm, Rochester, N. Y., and the old boar, represented in two positions, is from the herd of Edwin Thorne, Esq., Washington Hollow, N. Y. In contrast with these animals, we give upon the cover an excellent portrait of a wild boar. The influence exercised by man upon the form and character of animals is nowhere more strikingly shown than in the pig. The form and peculiarities which adapt the animal to a wild life in which it has not only to provide its own food, but to protect itself and its young from enemies, are quite different from those required in a state of domestication, where the the animal's whole energies are to be concentrated upon turning vegetable food into pork. By selection and crossings, breeds have been established in which not only aptitude to fatten has become a fixed character, but the amount of bone and useless parts reduced to a minimum. The offal in the Essex is only about ten per cent of the live weight.

For the mere purpose of making pork we would not recommend the pure bred Essex. They are too fine and delicate. Their value consists in their capacity of improving the large breeds, or in fact, any kind of common pigs. For this purpose they must be bred *pure*. What a farmer needs to improve his stock is *thorough-bred* males. And in pigs there is no breed more thoroughly established than the Essex.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last thirteen volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for thirteen years past, beginning with 1857—that is, Vol. 16 to Vol. 28, inclusive. Any of these volumes sent complete (in numbers) at $1.75 each, post-paid, (or $1.50 if taken at the office). The volumes, neatly bound, are supplied for $2 each, or $2.50 if to be sent by mail. Any single numbers of the past thirteen years will be supplied, post-paid, for 15 cents each

AMERICAN AGRICULTURIST.

NEW YORK, APRIL, 1870.

However much winter we may have in March, we are sure to have spring in April. At the time of writing, our summer-like winter is tardily asserting itself, and making spring dates like apples of Sodom—or broken promises. Farmers are likely to have their generalship and management sorely taxed, for a late spring puts one's power of every kind to the test. If a farmer cannot multiply men and teams to suit the tardiness of the season and his own convenience, he must manage his work to accomplish the most possible with the fewest steps of men and teams, and in the shortest time. A late spring does not insure a late June, but we may calculate on rather an early one—no harm will be done whether it comes or not. We are too apt to look over the fence, and plan work by our neighbor's, and take somebody's else estimate of the weather, etc. Men seldom blunder in getting ahead with work. The common failing with American farmers is, that they cannot manage men except as foremen, doing half as much again work as any man they can hire. If such a one makes farming pay, it is by the labor of his hands rather than by "the sweat of his brow," which we are inclined to interpret as meaning *head-work*."—"By the sweat of thy brow thou shalt eat bread." One of the best farmers we know, says, sometimes he fairly longs to do a day's work, but he can't afford the time. Now and then he takes hold just to show the men that he knows exactly how he wants the work done; but his time is worth double or triple what it will cost him to labor in the field. We train our boys to work, that they may know how to do everything well; but they should also be trained to manage hands, and plan work. It requires both to make an accomplished farmer. No farm work can be done without hands, tools, and teams, and it is the farmer's first business to provide these, then to make good use of them.

Farm Hands.—The rate of wages keeps pretty high in spite of the low prices realized for most farm products. Cities are crowded with men who demand a little higher wages than the majority of farmers are willing to pay; but the numbers going to parts of the West and South indicate that the labor market receives bids from every section.

Hints About Work.

Live-stock.—As the weather grows warmer, vermin increase in numbers on live-stock of all kinds. The long coats upon horses, cattle, and sheep, favor their increase, and when once they have a foothold, only vigilance in the thorough application of remedies will rid one's stables. Washing with carbolic soap we have found effectual. Those who have not, must have used the solution too weak. The curry-comb, or card and brush, are efficient also, and do all kinds of animals much good. Spring is a trying season with most stock, and all should have plenty of feed and water, with all the salt they want. Let cattle and horses drink all they will, unless heated, or very thirsty.

Milch Cows.—Feed new milch cows liberally, giving roots with bran or oil-meal. Cows that have not calved should have less of like food.

Calves, to be reared, should be as well fed as those intended for the butcher, unless they be of those breeds like Jerseys, Kerrys, and Brittanys, in which diminutive, or small size, is a point of excellence. We believe in removing calves to be brought up by hand, at once from the cow, and teaching them to drink from the very first. It is much safer to trust them with the cows in the same pastures afterwards. Sour milk will produce scours, and boiled milk, thickened with a little fine wheat flour, will pretty surely check it, if not neglected.

Working Oxen, that have been doing little during the winter, will be liable to have sore necks if the yokes and bows do not fit well. If much is demanded, give extra feed, and groom like horses.

Beeves should have the range of a yard on fine days, after feeding. Give them no chance at the grass until they are turned out into rich, fattening pastures. Oxen well wintered, and not overworked, will do a great amount of labor if well fed, and turned out in June, will fatten rapidly.

Horses.—Groom daily and thoroughly. Have especial care that they are not chilled after work, and that feed and water are not given too soon. At this time, when, in addition to the labor required of them, they are renewing their coats, they are peculiarly sensitive to cold and exposure.

Birds are great company about a house, and a great protection against insects. Court the garden Wren, and set little houses about, at reasonable distances apart, for them. They trouble no fruit, and Bluebirds are equally good as insect killers.

Getting out Manure.—Determine how many loads you will put upon an acre; then, knowing the size of the lot, it is easy to calculate in how many heaps a load should be dumped, and how far apart they should be. With a definite calculation, and the first row of heaps along a straight side accurately laid, the field may be evenly covered.

Plowing.—The land should be dry—no packing of the soil, nor water standing in the furrows, should be seen. The swivel plow is coming greatly into favor, because it leaves no dead furrows. A similar advantage attends back furrowing, but this requires close calculation to come out right. For root crops, no implement is better than the Michigan plow, provided the land can have a good top-dressing, or the crop manured in the drill. In plowing for grain crops, however, the manure should be kept near the well-pulverized surface.

Draining.—Where surface drains will expedite the removal of water from the land, open them with the plow and shovel; and if opportunity offers, when other work will not be hindered, set all the hands that can be spared at underdraining.

Grain Fields.—Pick off stones, top-dress with "hand manures," sow clover seed, and roll if the plants have been heaved by the frost. A good flock of sheep driven over the land has much the same effect as a roller upon grain and grass.

Grass Land.—Permanent meadows need little attention at this season except vigorous letting alone. If there are stones which have worked to the surface, it is a good time to remove them; and where the grass is failing on gravelly knolls, and such places, a sprinkling of gypsum and ashes

will have marked benefit. Newly seeded land will probably be benefited by rolling, after the stones have been picked off, if there are any, and on this the clover will usually do better for a little plaster.

Pastures.—The earliest spring pasturage is in swampy land, where the bogs have been burned over. The young grass, though coarse, is sweet and tender. Keep the herds off from upland pastures until the grass gets a good start. Top-dressings of ashes, leached ashes, plaster, superphosphate, and especially bone-dust, are particularly good for pastures—the earlier applied, the better.

Irrigation of Grass Land receives too little attention. It may be the source of great profit, not the least of which is the production of rank crops of timothy and orchard grass for soiling, much earlier than they would otherwise grow.

Soiling Crops.—These should only be grown upon the richest land, the object being foliage, and not grain, or seed. Oats alone, oats and peas, and spring wheat, are the usual soiling crops put in this month. The ground should be well manured, warm, and mellow, and the seed should be put in as early as it is in this condition.

Barley is an excellent crop; for, though the straw is short, the grain brings a good price usually, and is, besides, excellent for feeding out on the farm to horses, sheep, or poultry. Be careful that the seed is free from oats, and all of one kind. Two-rowed, four-rowed, and six-rowed, are frequently all found mingled in the same lot, much to the dissatisfaction of brewers, and the discredit of the raiser.

Wheat.—There is, doubtless, a marked difference in varieties, but the yield and profits of wheat raising depend more upon the preparation of the soil than upon the kind of wheat. The more thorough the tillage, the better. A finely worked, well enriched, warm soil, early sowed, is what the crop demands. It is far better to drill in the seed than to sow broadcast. It should be soaked in strong brine, and rolled in lime, to kill the smut spores.

Potatoes.—Cut the seed to single eyes, and plant in ground enriched with old, well-rotted manure, or manured last fall. Planted in hills the crop is never quite so large as in drills, but the digging is much more rapid and satisfactory. Plant deep, and when the plants show themselves, turn a ridge over them with a plow, and after a week harrow it flat again. Early Goodrich and Early Rose are the best early varieties, the latter the best and most reliable. The former sometimes of poor quality.

Roots.—Work the soil deeply, and enrich it well, applying fine manure. Sow in drills 24 to 30 inches apart, to admit of doing all the tillage by horse-power. Carrots may be sown closer than above stated, but the labor of cultivation is increased.

Work in the Horticultural Departments.

As we write these notes, early in March, the outlook is more wintry than it has been since December. It is never safe to make predictions concerning the season, but it is proper to be prepared, not only now, but always, for a late spring. It is with this view that we suggest doing many things during the mild spells of winter that are often left until spring. April is always an uncertain month at the North, and it will be useful to look back through the notes for other months for suggestions.

Orchard and Nursery.

Preparing to Plant.—The land should have been prepared last autumn, but many will do it this season. In the hurry to have the soil ready for the trees, do not be tempted to plow while it is wet. It should crumble as the furrow is turned, and be in a condition to produce a good corn crop.

Draining will often be needed, but this can be done after the trees are set.

Planting.—Use no manure about the roots, but surround them with fine surface soil. Spread the roots naturally, and if there are any masses of tangled fibres, separate them. Work the soil well in, among the roots, and, if necessary, use water to wash it into the small cavities. It is supposed that the trees have first had a proper

Pruning before Setting.—See that all roots, mutilated in digging, have a clean cut, and cut back the top one-third or one-half of last year's growth, according to the amount of roots that remain.

Trees in bad order, from delay in transportation, must be treated according to their condition. If shriveled, bury them, tops and all. If they have heated, and the buds started, cut back severely.

Trees that cannot be well planted.—It sometimes happens that the land is not ready, or other work presses so, that the trees, though at hand, cannot be set in a proper manner. Rather than hurry the planting, it is better to set them out in good soil, in nursery rows, and allow them to grow there for one season. They will then be ready for planting in the orchard early in autumn.

Root Grafts.—Set out in rows far enough apart to work with the cultivator, and a foot apart in the row. Bring the soil close in contact with the roots.

Nursery Stock.—Head back before the buds push, as cutting when in leaf will check the growth.

Budded Stocks.—Cut off above the bud those where the budding has been successful. Apples and pears, upon which the buds have failed, may be stock grafted close to the root.

Seeds of apple and pear should be sown early in rich soil, to get a growth before hot weather. Take Peach stones from the seed-beds or heaps, sift the earth from them, and plant in nursery rows.

Fruit Garden

The amateur is much puzzled with descriptions of new varieties of fruits, each claiming to be better than those that are in general cultivation. Among all fruits there are some which, though not the best in all points, have the most desirable quality of being reliable. While we would have all who can afford to do so, to test the new kinds, we advise those about to plant for family use to take for their main dependence the well tested sorts.

Grape-Vines.—The Concord is the most generally known variety. The Eumelan promises to be a favorite. Delaware, Iona, Salem, and others, are excellent where they will succeed. Varieties that have been laid down are to be taken up and tied to the trellis. Plant good one-year-old, or at most, two-year-old vines. It is common to see vines an inch and more in diameter for sale. Such are not worth planting. If it is desired to propagate a variety by layers, open a trench a few inches deep, and lay down a cane of last year's growth. This may be fastened in place by pegs, but it is not to be covered with earth until the shoots have pushed. Cuttings of those varieties that start without artificial heat may be put out.

Strawberries.—Plant as directed last month—the earlier the better. Go over beds that were covered with straw last fall, and part the straw over the plant, but leave it to mulch the soil.

Blackberries.—Set early. See last month. The Kittatinny is the best generally tested variety.

Raspberries.—The tender varieties are to be uncovered. The Black Caps do not sucker, and the fruit is liked by most people. The McCormick (called Mammoth Cluster by some) is one of the best.

Currants.—Set plants in good soil, and give them good care. Proper pruning and culture will make almost any of the varieties acceptable. The Versailles and White Grape are the leading sorts.

Gooseberries.—The Houghton and American Seedling are hardy. Some of the English sorts may be tried in a moist soil by those who are fond of experiments. They will often mildew with the best care.

Kitchen Garden.

In the notes for last month we said all that is necessary about forwarding crops under glass, though we must repeat the necessity of care in giving ventilation to plants in hot-beds and cold-frames. The plants are more likely to suffer from too much heat than from too great cold.

Seed Sowing is to be done according to locality. Garden vegetables are divided into hardy and tender. Onions, leeks, beets, carrots, spinach, cabbage and its relatives, lettuce, parsley, parsnips, peas, radish, cress, salsify and turnip are hardy, and may be sown when the soil can be well worked. Beans, melons, cucumber, squash, tomato, okra, nasturtium and sweet corn are tender, and need the the same conditions of soil and temperature as required by Indian corn.

Seed-Beds are used for all plants that require transplanting, or that it is most convenient to raise in this way. These should be of light and rich soil, placed in a sheltered part of the garden.

Varieties.—We usually give this month a list of a few of the leading sorts as a guide to the inexperienced. There are others equally good with those we name; our object is to save the novice the perplexities which a crowded catalogue presents.

Novelties.—Each year the seedsmen offer new varieties. Some of them prove good, and some inferior to old sorts. It is well to try a few new things every year, if one can afford it.

Asparagus.—Fork over old beds. Make new beds by setting one-year-old plants. See page 20, (January). Conover's Colossal is the leading variety.

Beans.—Early Valentine is the standard bush sort. Black Wax is excellent. Plant in drills, 2 feet apart. Among pole beans, the Giant Wax is best for snaps, and Large Lima for shelling.

Beets.—Bassano is earliest, but Early Blood Turnip is better. Dewing's, Hatch's and Egyptian are new and highly praised. Drills a foot apart.

Broccoli.—White and Purple Cape are good. Treat the same as cabbages.

Cabbage.—Early Wakefield and Little Pixie are good early. Early Wyman, new and large. Winningstadt is best for light soils and medium late. Marblehead Drumhead, Fottler's, Flat Dutch and others are good late. Early, Blue Savoy and Drumhead. Sow in seed-bed or cold-frame. Set plants out from cold-frame, 16 inches apart in rows 2 feet apart, as early as the soil can be worked.

Carrot.—Sow same as beets. Early Horn.

Cauliflower.—Half Early Paris, of which the Boston Market is a strain, is the best for general culture. Treatment, as for cabbage.

Celery.—Dwarf White Solid, Boston Market. Some of the red sorts, such as Incomparable, and Dwarf Crimson, are fine. Sow in seed-bed. Turnip-rooted is for soups and salads.

Corn.—Crosby's Early, Farmer's Club, Mammoth Sweet and Stowell are all good. Mexican, though black, is the sweetest of all.

Cress.—Sow the Curled at intervals of a week.

Cucumbers.—Early Russian, earliest; White Spine, for general crop; Green Prickly, for pickles. General Grant is a new variety, highly commended. Start as directed last month.

Egg-Plant.—Long Purple, earliest; Black Pekin, best. Always sown under glass.

Horse-radish.—Plant sets in manured trenches, and fill up with earth as the plant grows.

Kohl-rabi.—Early White. Sow in rows 2 feet apart.

Leek.—Flag and Musselburgh. Sow the same as onions, or in a seed-bed to transplant.

Lettuce.—Curled Silesia, Curled Simpson, Tennis Ball; many other sorts are in the catalogues. Sow in seed-bed; set out plants from cold-frames a foot apart each way.

Melon.—Ward's Nectar, Skillman's Netted, among the older sorts; Sills' Hybrid and Cassabar, are new and fine. Treat the same as cucumbers.

Onions.—See article on growing from sets, page 91, last month. Seed must be sown on very rich soil in rows 15 inches apart. Early Red, Danvers Yellow, White Portugal. Potato onions are grown from sets.

Parsley.—Curled. Soak the seeds before sowing.

Parsnip.—Sow in 15-inch drills last year's seed. Hollow-Crowned is best.

Peas.—Carter's First Crop, Daniel O'Rourke, Lit-

tle Gem, Champion of England, all good. See catalogues for a host of others. Alpha and Laxton's Supreme are among the novelties.

Peppers.—Squash, for pickling, Sweet Mountain, for stuffing. Monstrous is a new sort. Need to be started under glass.

Potatoes.—We have seen nothing equal to Early Rose for garden culture.

Radish.—Early Scarlet Turnip, Short-top Long Scarlet, Olive Shaped. Sow early and at intervals of 10 days wherever there is room.

Rhubarb.—Manure old beds. See page 103, last month, for directions for sowing and cultivating.

Salsify.—Sow and cultivate the same as beets.

Spinach.—Sow in 18-inch drills. Round-leaved is the most used. The Lettuce-leaved commended. New Zealand is excellent in summer, as is the Perpetual Spinach Beet.

Sweet Potatoes.—The tubers should be put in hotbeds the middle of the month. Cover the manure with 2 inches of good compost, and lay the tubers close together. When the buds start, cover them with an inch of compost. Nansemond, the standard sort, Southern Queen, new and good.

Squash.—Summer Crook-Neck is the best bush variety. Boston Marrow and Hubbard, for late.

Tomato.—Early Smooth Red, General Grant, are well established. Rising Sun and Charter Oak are new and fine. See article on page 61, Feb. Sow under glass or in window boxes, as directed last month.

Turnip.—Flat Dutch, for early. Red and White-top, for late. Of the Ruta-baga sorts, the Sweet German and White French are best for family use.

Flower Garden and Lawn.

In laying out a place the roads and paths should receive the first attention, and then the lawns and flower-beds.

Lawns.—Sufficient information on forming new lawns is given in previous months. Old lawns should be top-dressed with good compost, guano, and bone-dust, a good phosphate, or ashes. Where the grass is taken off, some fertilizer must be used to keep the turf in good condition. Sow seed on thin spots, and roll as soon as the frost is out.

Trees and Shrubs.—Transplant all deciduous ones before they start. Those taken from the woods must be trimmed severely to make them succeed.

Perennials.—Those that have grown three or four years in one spot need to be taken up, divided and set in a new place before growth starts.

Annuals.—Sow hardy sorts as soon as the ground can be worked. Tender ones must be left until later, or sown under glass. The number is so large that we must refer to the catalogues for novelties.

Bedding Plants must not be put out until the soil is well warmed and chilly nights are over.

Roses require a rich, well drained soil. For summer blooming the Tea and China roses are best, but the Remontants, which usually bloom in spring only, are the finest. Get them on their own roots.

Green-house and Window Plants.

The plants should be prepared for turning out of doors by the admission of air every pleasant day. Be prepared to heat up during cold, damp weather.

Water will be needed more frequently than during winter, and window plants often become too dry.

Propagate such bedding plants as will be needed, before the sun gets too warm, and pot off as fast as they strike.

Roses and Carnations are nearly hardy, and must be turned out as soon as the soil can be made ready.

Dahlias may be started and the shoots cut off with a small portion of root and potted.

Tuberoses.—To insure a bloom in the open ground, pot and start late in the month.

Main Grape.—"F. B.," Framingham, Mass.—This has been decided by some of the best pomologists of your State to be nothing but the Concord.

AMERICAN AGRICULTURIST.

"HAND TO MOUTH."

A very large number of people live along from day to day spending all they get, and making little or no provision for the future—as the old adage has it, they "live from hand to mouth." The most successful men and women are those who look *farthest ahead*, and lay out wise plans to-day to be carried out in the future, so that, when the time for action comes, they are all ready to make every stroke tell to the best advantage. This is true in every department of business; in trade, in household affairs, in farm labor—in short, everywhere. The men who invest in good stock, manures, improved implements, fruit trees, etc., with an eye to the future, are those who attain the richest results....And the same is the case with the labors and results of *each* year taken by itself. Those, who in winter lay out all their plans for the year, even to the smallest items, who study the prospective demands for different grains, meats, etc., and when the spring opens are *ready* to make every blow effective, are those who will be the largest gainers, or the least embarrassed, on December 31st. The period for action is at hand, yet there is still some time for planning the work for the whole of the year....So much of an important topic, but here is what we sat down to say:

SPRING WORK is upon us, and now the "hand to mouth" people, after drowsing away the winter months, are just waking up to see what they are going to do. They are running to their neighbors to talk over what they can best do, or how to do it. *Query:* Would it not pay them, to now get the numbers of this Journal from January 1st and read up as fast as they can all the hints and suggestions already given, and study each number carefully as it comes out? It would pay most men to study the advertising pages only. These afford many hints about what is done in the way of improved implements for tillage, improved seeds, fruits, etc., etc.... *We close by just hinting to all our canvassers for premiums that* **NOW,** *THIS MONTH, is a capital time to call upon all these "hand to mouth" people, while they are in a knowledge and* **plan**-*seeking mood, and get them to subscribe for the American Agriculturist. The partially completed lists can be thus filled up, and the premiums received;—they are ready, waiting for you. A multitude of MEN, WOMEN, and CHILDREN, can also start NEW LISTS and quickly complete them, and thus each get, without money investment and without cost, one or more of the fine Premium articles named in the Table.*

☞ This has always been done largely in **APRIL,** and you **READER may do IT this year....TRY** it, beginning **To-day.**

[In the following table is given the price of each article, and the number of subscribers required to get it free, at $1.50 a year, *or* at the lowest club rate of $1 a year. For full descriptions of the articles send for our *Special Sheet.*]

Table of Premiums and Terms, For Volume 29—(1870).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required at $1.50	at $1.

112	*A Choice of Good Books (See Terms below).*		..	...

☞ *Every Premium article is New and of the very* **best** *manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-nine Premiums,* **Nos. 29** *to* **33, 56** *to* **59, 70** *to* **74,** *and* **88** *to* **112** *inclusive, will each be delivered* FREE *of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance specified*

SPECIAL NOTES.

Read and carefully Note the following Items: *(a)* All subscribers sent by one person count, though coming from a dozen different Post-offices. But....*(b)* State with each name or list of names sent, that it is for a premium....*(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.* You can have any time, from one to four months, to fill up your list....*(d)* Send the exact money with each list of names, so that there may be no confusion of money accounts....*(e)* Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N.B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for....*(f)* Specimen Numbers, Cards, and Show-bills, will be supplied free, as needed by canvassers, but they should be used carefully and economically, as they are very costly... *(g)* Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

Description of Premiums.

Every Premium is described in the October Agriculturist, and also in a **Special Sheet,** *which will be sent* **free** *to every one desiring it. We have room here for the following only:*

Nos. 56, 57, 58, 59—Pocket Knives.—NOW FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl, too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for nothing but a little effort. These knives are made by **Mr. J. P. Swain,** whose work is equal to any done in this country or Europe. No. 56 is a neat, substantial Knife, with three blades and buck-horn handle. No. 57 is a still finer article, with four blades and buck-horn handle. No. 58 is an elegant Knife, with four blades and shell handle. No. 59 is a Ladies' Pocket Knife, a beautiful article, with four blades and shell handle.

Nos. 88 to 93.—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is $1.50 each, at the Office, or $1.75 if sent by mail, as they must be post-paid.——They are profusely Illustrated, the Engravings used in them having alone cost about $35,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from XVI. to XXVIII., inclusive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 94 to 99.—Bound Volumes of the Agriculturist.—These are the same as Nos. 88 to 93 above, but are neatly *bound* in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 100 to 111.—Good Libraries.—In these premiums, we offer a choice of **Books** for the **Farm, Garden,** and **Household.** The person entitled to any one of the premiums 100 to 111 may select any books desired from the list of our books published monthly, (see another page), to the amount of the premiums, and the books will be forwarded, Post or Express paid. $25 or $50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands.* Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 40 acres than he would off from 50 acres without the mental ability which reading will give him. ☞ Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 112.—General Book Premium. Any one sending 25 or more names may select Books from our published list to the amount of 10 cents for each subscriber sent at $1; or 30 cents for each name sent at $1.20 each; or 60 cents for each name at $1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending March 14, 1870, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW YORK MARKETS.

Gold has fallen very materially since our last, having been as low, on March 9th, as 110⅛@110¼, but it has since rallied to 114.. . ..Business in most branches has been disturbed by the fluctuations in gold, and values have been more or less unsettled.....Breadstuffs have been moderately active, but generally weak and irregular in price. The export demand has been fair for low grades of Flour, and for spring and amber winter Wheat. There has been more call for Rye, which closes stronger; and for Barley, which, under liberal supplies, leaves off quite heavily. The main business in Oats has been on speculative account, the market closing tamely.....Cotton has been very freely offered at much lower and irregular figures, leading to heavier transactions, largely for export.....There has been more doing in the Provision line, but at depressed and unsettled prices, in most instances.....Wool opened pretty briskly at firmer prices; but closed tamely, under the depression in gold, which discouraged the manufacturing interest.....Hay has been salable and firm... ..Hemp, Hops, and Seeds, have been quiet and irregular.....Tobacco has been in moderate request at former rates.

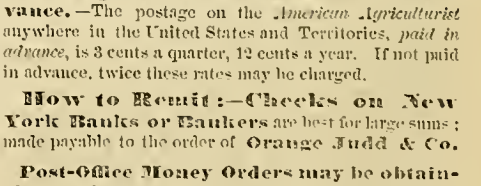
Beef Cattle have been a little more plentiful this month, the quality averaging rather low. The weather has been favorable for trade, and sales of good stock are easily made. Prices have declined somewhat, and varied from week to week for the same quality. The greatest decline is seen among medium and light steers, the "tops" generally holding their own. We place the decline since our last report at fully 1c. per lb net on all grades; and among the light steers at least 1½c. per lb. Since the season of Lent began, trade has dragged a little, and fewer sales are made at high figures. The high prices given below are for the very best bullocks, and the low price for very poor ones. We see but little improvement in the beef stock coming to our market, and prices must decline for medium and poor beef.

Milch Cows.—The supply has been lighter than last month, and we think poorer also. There are by far too many poor cows brought here for sale: $40 and $50 cows are not wanted. A good cow always commands a good price. Prices range a little lower. We quote good cows at $75@$90 each. Medium, $60@$70, and some poor ones even as low as $35.....**Calves.**—There is a little increase in the supply of live calves, and fewer dressed ones. The season of largest supply is close at hand, and prices are good. A good fresh calf, just from the cow, which has not suffered from transportation will sell quickly at 12c.@12½c. ℔ lb., for very extra ones, 13c. has been paid. Prices range from 10c.@12½c., according to quality. Dressed calves range from 16c.@18c. ℔ lb.....**Sheep** have improved a little in quality since our last report, and are fully equal in quantity to the demands of the market. Poor lots drag somewhat, but good sheep go off quickly. Prices range a little higher on prime sheep. The best lots in market sold for 8c.@9c. ℔ lb.; Medium, 6¼c.@7½c. ℔ lb.; and common sheep at 5c.@5¾c. ℔ lb.....**Swine.**—Hogs still go in large numbers direct to the slaughterers, and are sold afterwards as dressed pork. We think sales are made at a little higher figures than last month, but trade is slow. Corn-fed hogs, live-weight, are worth 9¼c.@9¾c.; Still-fed, about 9¼c. per pound lower. Dressed hogs are worth 11¼c.@11¾c. Western dressed, 11c.@11¼c. per pound.



containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, *paid in advance*, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss.*

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe*, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the*

stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

Bound Copies of Volume XXVIII (1869) are now ready. Price, $2, at our office; or $2.50 each, if sent by mail. Any of the previous twelve volumes (16 to 28) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

The Chesapeake and Ohio R. R. Bonds.—Several years ago we became so well satisfied with the reliability, integrity, and good judgment of Messrs. Fisk & Hatch, that we have since then usually referred to them any questions of finance of our own, or coming from our readers, and followed their advice. When we see their names and credit connected with an enterprise, we take it for granted that it is a good thing, and on this ground alone we should have great confidence in the Bonds of the Chesapeake and Ohio Railroad, which they offer through our advertising columns. But, a little study of the road shows it to be one of great importance, and one most promising for financial success. The opening of a through route direct from the magnificent Chesapeake Bay to the Ohio River, at a point to which it is almost always navigable, will supply a main artery through the whole range of the South Middle States, from the Atlantic to the Mississippi River. It is worth while to send to Messrs. Fisk & Hatch and get a descriptive pamphlet, furnished free, and at least become acquainted with the route.

Ohio, Fruit and "Bugs."—The Ohio State Hort. Society memorializes the Legislature, setting forth that the orchard crops of the State are valued at over seven millions of dollars annually, and asks the appointment of a State Entomologist. We hope to hear of the appointment of one. Missouri takes the lead in the war against insects. Illinois has lost her most efficient entomologist. New York has an entomologist whose reports, buried in those of the ponderous Agricultural Society might as well never have been printed, so far as benefiting the public is concerned.

Sundry Humbugs.—The counterfeit, or *Fac-simile*, money operators are increasing in number, or, the old operators are working under many new names. They have to change names often; for as soon as they become known, Mr. Gayler pounces on their letters at the P. O.—Every honest person receiving any of these swindling circulars of any kind, at any time, will do well to send them at once to Mr. James Gayler, Special Agent N. Y. P. O. Dept., or to us. This dodge is as follows: Private, "very confidential" lithographic letters are sent out, saying that the parties have a stock of "exact imitations of United States Treasury Notes, executed by the most skillful engravers, etc.," which they offer to sell in sums of $500 and upwards, for 2 to 3 cents on the dollar, more or less, intimating in many ways, but not exactly saying, that these can be used as currency for their full face. Various statements are made, fictitious newspaper items are enclosed, a great deal said about secrecy, etc., etc. In this way they dupe multitudes of dishonest people to invest with them. When they send *anything* in answer, it is a reduced photograph of unsigned genuine notes, which latter, are, of course, "executed by the most skillful engravers," though the wording of the circulars is not thus understood by those who get them. It is a pretty safe business, for those who get thus swindled are not likely to publicly complain, and thus criminate themselves by making known their attempts to be counterfeit money purchasers. Then, again, when those swindlers do get brought up, a careful examination of their circulars shows that they have really only offered to supply *pictures* of money. This game has been very extensively carried on, but it is a satisfaction to know that none lose money but those willing to use and expecting to pass counterfeits. It is "rogue cheat rogue."—Among the new operators, or new *names*, in this line, are W. M. Martine, 75 Nassau St.; Daily & Co., 73 Nassau St.; I. W. Smith & Co., 39 Nassau St., N. Y.; Wm. Arnold, No. 1 Bond St., N. Y., *alias* James Arnold, Jr., St. Charles Hotel, N. Y., who uses manifold paper, and sends several manufactured newspaper items to give plausibility to his pretension; A. L. Harratt, Box 21, Hudson City, N. J., who locates over the river to dodge Mr. Gayler. Another suppresses his name, but a different hand writing on the book says "address A. J. Hitchcock, 148 Fulton St.;" etc., etc., etc.....A "Grand Presentation Enterprise," ostensibly on Broadway, is one of the new schemes circulated by mail. The operator attempts to make it appear that he is favored by the respectable Commercial Agencies of Messrs. McKillop, Sprague & Co., J. M. Bradstreet & Son, and Dun, Barlow & Co., by saying he was "influenced" by them, etc. He probably got the names from their printed books, or from them for a professedly legitimate object. The whole thing is no more than a lottery, a downright swindle, giving nothing in return for money sent....."Sunlight Oil," is noticed elsewhere (page 145). A correspondent at Marathon, N. Y., describes the operations of a fellow there selling recipes at $5.00 each, for "making Kerosene at 12 cents a gallon." From the descriptions, it is similar to the "Sunlight" affair. ☞ Beware of all these cheap, or manufactured oils. Don't let them try them in one of your buildings. One of these peddlers came into our own town with some "non-explosive, cheap oil, and while exhibiting it, it "went off," and produced a fire that destroyed a whole block of stores, entailing great disaster upon several parties!.....Against low-priced Sewing Machines, for $5, etc., we are again compelled to warn our readers, by the receipt of a fearful lot of complaints, from those who have sent money and can get no response to the original money letter, and others following it; and from others who have learned by experience that these $5 machines are nothing but a bother. Some of those advertising them appear to exist only in un-come-at-able circular and envelope shops..... If people will send money and clubs of subscribers to obscure towns, expecting to get three or four times their money's worth in watches, cheap sewing machines, etc., they must expect to be cheated. It is very easy to get up one taking number of a paper, printed in New York or other large city, date it at some out-of-the-way place, offer immense premiums for clubs, and pocket all the money sent in. A swindler in New Jersey has made a fortune in this way; changing the name of his so-called firm when the former one gets in too bad odor. For special reasons in this case we omit the name for the time being. The same trick is frequently played in this and other cities..... A vile villain calling himself "Mrs. R. S. Godfrey," sends murderous, infanticide circulars of the whining benevolent order, from a Long Island Post Office. We wish all such fellows had but one neck, and we had a rope around it; we should practically disagree with Mr. Greeley for the space of 30 minutes at least..... More humbug "Receivers" for Reed & Co's Swindle *alias* "Riverside," appear under the names of J. J. Dodd & Co., and John W. Ames.....Reinersville, Morgan Co., Ohio, has a "Gift Enterprise" man, who promises a newspaper and throws in a "ticket" for **1** chance in **25,628** for $500 in gold, provided 25,628 tickets are sold, and a few chances at some other prizes. Those who want newspapers will be wise enough, we hope, to send to the proper publishers, and know who is responsible for the money. None but foolish people will invest in *any* Gift enterprise, *alias* lottery.....We are sorry for the boy who lost his 25 cents, sent for a "Mocking bird whistle." It may be a useful investment. The writer lost his first 25 cents by a N. Y. Humbug, and it has, perhaps, saved him many dollars, and waked him up to saving a great many other people from being swindled.....A shrewd Nassau Street Swindler scatters advertisements in South Carolina and elsewhere that a "4-months old, healthy child" will be given to any one who will adopt it, and that $5,000 will be given to the benevolent individual who will take it, with good promises for its care. The swindle comes in just here: those writing about said child must enclose a postage stamp for reply;—and many thousands do send them!

The Weights of the Ayrault Oxen which were withheld from the public in order to give the butchers time to adjust their bets, are given as follows: Live weight, 3,300 lbs., and 3,320 lbs., making 6,620 lbs. for one pair; 3,406 lbs., and 3,440 lbs., making 6,846 lbs. for the other—said to be the heaviest weight ever attained by a pair of oxen bred and fed together.

Hair for Mattrass.—"T. D. P.," Newark, O. The hair for mattrasses is curled by first spinning it to make a hard-twisted rope; it is then boiled or baked, and afterwards the rope is picked to pieces by hand. It then retains the springiness imparted to it by the twisting and heating.

The American Botanist and Florist—By Alphonso Wood, A. M. New York: A. S. Barnes & Co. The work consists of two parts, elementary lessons, of 172 pages, and a descriptive botany, of 392 pages, including index. By the use of analytical tables, signs and abbreviations, the author has condensed descriptions of the native plants of the Atlantic division of the country, as well as the more generally cultivated ones. In doing this the author has shown great industry in reducing the descriptive matter to the briefest possible space. We must admit that we are not admirers of the condensed and meagre descriptions which botanists have of late given us. While, as in the case of the present work, they lead us to the name and botanical family of a plant by the shortest possible route, they fail to tell the young student all he would like to know about it. If some one of the present day would write such popular descriptions as did Dr. Bigelow in his Plants of Boston, botany would find many more students than at present.

Name Your State.—Several letters, some of them containing money, have no mention of the State. The Montgomery Co. Horticultural Society sends us reports of their meetings, but there is nothing in the report that enables us to guess in what State the meetings are held. A good share of the notices of County Fairs have no State mentioned.—Name the State! Name the State!!

Cabbages—How to Grow Them— By James J. H. Gregory, Introducer of the Marblehead Cabbage.—We always supposed that Mr. Gregory's horticultural title was "Introducer of the Hubbard Squash," but this work informs us that he is not only "J. H. S.," but "J. M. C." The work on the cabbage is uniform with that on the squash, and gives details of culture, method of wintering cabbages, varieties, etc. Much of the practice will be found new to many growers of cabbages, especially the recommendation to sow the seed where the cabbages are to stand. If Marblehead were not famous for its squashes it would be renowned for its cabbages, as, thanks to Mr. Gregory's care in seed-growing, the excellent character and wonderful size of some of the local varieties are strictly maintained. Sent by mail by Orange Judd & Co. on receipt of price—30c.

Feeding Jersey Cattle.—Mr. Wm. T. Hughes writes: "In answer to an inquiry as to what he considered the best feed for Jersey cows, Mr. Fowler gives the following answer: 'I recommend the following mixture, it having given the best result in an experience of 50 years in a dairy of Jersey cows: 2 quarts of the best *ground* (not crushed) oats, 4 quarts of bran and 1 peck of cut hay, mixed with 20 lbs. of sliced mangels. Divide into two meals, and feed morning and evening while milking. They should also have as much hay as they can eat up clean. The greatest care should be taken that none is left before them, as no more should be given than they can consume at once. This for winter feeding in stall. I give my dairy cows the oats, bran and cut hay through the summer when they come out of the pasture for milking. When dry, give no forcing foods.'"

Corn Stalks for Mulch.—J. H. W. Husman, in an essay read before the Montgomery Co. (State?) Hort. Soc., says that he has a power machine which cuts and grinds stalks very fine. He finds the ground material admirably suited for a mulch around strawberry plants.

Setting Trees.—"A. B.," West Branch.—Your plan is "Quincunx." Illustrated in March, 1868.

Tree Pedlers.—"S. T.," Orange county, sends us a strong complaint against tree pedlers, which is too long for our columns this month. It is the old story. Pear trees bought of pedlers bore fruit the size of crab-apples, and all alike, and the blackberries and raspberries were wild stock. Years of waiting and poor fruit as a reward. Mr. T. proposes that farmers who wish to purchase, to club together and send one of their number to a reliable nursery and procure the trees. He truly says, that farmers have a hard time of it with tree pedlers, patent fork venders, lightning-rod men, and the like.

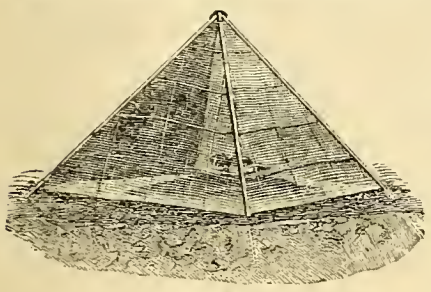
Fruit in Iowa.—A. E. Rich, West Union, says: "I was much interested in the article on fruit from your 'special contributor' in our State. The article is most excellent, but for this, the extreme northerly part of the State, needs a little amending. So far as experiments have been tried, trees set 14 feet apart, north and south, by 20 east and west, have done better than with more room; the object, of course, being self-protection. Your correspondent recommends protection on the north and west. Our prevailing winds are south and west. All old orchards exposed on the prairies in our part of the State lean to the north-east at an angle of from 30° to 45° in consequence of the prevailing south-west winds, and fruit half grown is blown from the trees universally by storms from that direction. The bodies of trees exposed by their inclination to the direct rays of the sun become diseased, the bark cleans off on the side thus exposed, and many valuable orchards are destroyed with us, for the want of a perfect south-west protection."

Barn Itch.—Eben Wight, Dedham, Mass., speaks in the highest terms of Buchan's Cresylic soap for exterminating the "barn itch" and lice on cattle,

Weeds of Maine—By F. Lamson Scribner.—This is a pamphlet of 62 pages, by a young botanist, a student at the Maine Agricultural College. It gives both a popular and brief botanical account of the troublesome weeds of the State, with suggestions as to their extermination. If farmers would become better acquainted with the strategy of their enemies, the weeds, they could operate against them with better chance of success. This little work will prove useful in teaching the proper names as well as the habits of weeds.

The Torrey Botanical Club.—The botanists of New York and vicinity have for some years been associated under the above name. With the present year they commenced the publication of a Monthly Bulletin of matters mainly relating to the local Flora. They desire to be in communication with all who are interested in studying plants within 30 miles of New York City. These and others can procure the Bulletin for a year by enclosing $1 to Wm. H. Leggett, 224 East 10th-st., N. Y.

Another Vine Protector.—If bugs are not kept away from cucumber, melon, and similar vines, it will not be for lack of contrivances to effect it. The latest one we have seen was in the stock of R. H. Allen & Co., and is shown in the engraving. It is made of mosquito net, four triangular pieces of which form the sides; the edges or corners are of two thin strips of wood,



VINE PROTECTOR.

nailed together with the netting enclosed between them. At the top are two small bits of leather, each one of which is tacked to two of the wooden supports in such a manner as to form a hinge. The protector, when not in use, shuts up and occupies a very small space. It is claimed that 24 dozen can be put into a flour barrel. They are easily made, but are sold by the dozen very much cheaper than one can afford to make them.

How to Improve a Meadow.—"S.," Seymour, Conn.—Harrow it thoroughly, sow on some fresh grass seed this spring. Pile or compost your manure, putting in a half bushel of bone-dust to the ton of manure, turn it two or three times, and apply it to the meadow at the rate of 20 tons per acre. Or, if more convenient, use good Peruvian guano or superphosphate of lime, broadcast, at the rate of 400 lbs. to the acre, during rainy weather this spring.

Good Pigs.—Porter Frisbee, Secretary of the Delaware County (N. Y.) Agricultural Society, writes, that at their annual meeting they had a good show of grains, seeds, dressed meats, etc. Five spring pigs were shown—three of them, 10 months old, weighed, dressed, 446, 354 and 332 lbs.; and two pigs, of 9 months old, weighed, dressed, 371 and 338 lbs.

Bark Louse.—D. B. Boyer, Montgomery Co., Pa. Yours is a bad case of the Oyster-shell Bark-louse. The eggs are under the scales, and will hatch in June. If this tree is in an orchard we should cut it down and burn it; and give close attention to the other trees upon which you say it is "starting." We do not commend Mr. Norris' plan of painting trees "from stem to stern," but your tree is good for nothing else but to burn, or devote to some such desperate experiment.

Floral Exhibition at Charleston, S. C.—An exhibition will be held by the Charleston Co. Ag'l and Hort. Soc., from May 1st to 10th, and liberal premiums are offered for the leading classes of flowering plants as well as for baskets, bouquets, strawberries, etc. H. B. Holbeck is Secretary.

Corn vs. Wheat in Virginia.—"H. G.," Augusta county, Va., writes: "My farm is a sandy loam, excellent for corn, but rather too light for a maximum crop of wheat. I can raise from 40 to 60 bushels of corn per acre, while the same land rarely yields over 20 bushels of wheat, and often less. If we attempt to push it beyond this, it falls down and does not fill well; but it brings fine clover." We can see no reason why such land cannot be made to yield 30 or 35 bushels of wheat per acre. Underdrain where needed, make the land clean, so that there shall be no weeds or grass in the wheat—raise more clover and keep more sheep. If this does not give stiffer straw and a well filled ear, try lime.

Grafting the Hickory.—Hickory nuts vary much in their wild state, but the difficulties of propagation have prevented the multiplication of the choicer specimens. Mr. David B. Dickinson, having tried various methods of grafting without success, hit upon the following, which allows him to propagate the hickory with satisfactory results: Early in the Spring he grafts the stock, which should be small, very near the surface, or, if possible, below it. The graft is waxed in the usual manner, and then the earth is heaped around to cover all of the cion except the upper end. Mr. D. has grafted trees now coming into bearing, from which he brings us specimens of the nuts.

How Crops Feed—A Treatise on the Atmosphere and the Soil as Related to the Nutrition of Agricultural Plants, with illustrations; by Samuel W. Johnson, M. A., etc. New York: Orange Judd & Co. Professor Johnson's work, "How Crops Grow," is devoted to the chemical composition of the plant and the changes which take place during its life. Not only has that work received the highest commendations in this country, but it has been republished in England under the editorship of two of the professors of the Royal Agricultural College, and it is being translated into German under the auspices of Liebig. As a companion to "How Crops Grow," we have a work by the same author entitled "How Crops Feed," in which are given the latest researches upon the relations of the atmosphere to plants, and the origin and composition of soils and the offices they perform in the nutrition of crops. It is sufficient to say of the present work that it is marked by the same thoroughness and clearness that characterized its predecessor, and is, like that, the best work upon its subject in the language. As the author says in his preface, "His office has been to digest the cumbrous mass of evidence in which the truths of vegetable nutrition lie buried out of the reach of the ordinary inquirer, and to set them forth in proper order and plain dress for their legitimate and sober uses." Those who would study the principles which underlie all correct agricultural practice can have no better aid than these works will afford them. A third of this series is in preparation, which will treat upon manures and fertilizers. Price, $2, post-paid.

Rosebugs on Grape-Vines.—J. McCoy, West Va.—We know of no better way to treat the rosebug than to shake them off early in the morning, while they are dormant, catch them on a cloth and put them in the fire. The netting you speak of might do for a vine or two, but it would be too expensive on a large scale.

Cropping an Orchard.—"J. B. H.," Rancocas, N. J.—The soil of an orchard 16 years old should be given up to the trees, and instead of taking anything off by planting soiling crops, it would be much better to put fertilizers on to it. We know that it is the custom to mow or otherwise crop the orchard, and we know it is also the custom, in places where the practice prevails, to complain that fruit trees do not do well.

Peaches in Indiana.—W. W. Borden, Clark county, Ind., states: "The night of Feb. 20th killed the entire peach crop in this vicinity. Such is the report from the high lands (the Knobs), by those extensively engaged in peach culture. In the valley the result is about the same. The peach buds were very much swollen, and the lilac buds were bursting. The thermometer indicated 3° below zero."

"Shot Land" in Kentucky.—"J. F. F." writes: "I have about twenty acres of what we call 'Shot land.' If it were all together I would probably put it in some kind of grass, but it is scattered over my farm. The soil consists of pebbles from the size of a large buckshot down to that of a pin's head, nearly round, hard, but it can be cut with a sharp knife, exhibiting a dark iron-ore appearance on the inside. They are in some places very thick on the ground; and the thicker they are, the less the land produces. It appears to be unable to retain ordinary manure."—Probably the best course would be to plow and seed to red clover encouraged by plaster, and calculate to turn under two or three crops of buckwheat, clover, or corn before it would begin to look like good soil or bear other crops.

Inland Fisheries.—It is gratifying to notice the steady progress made in some States in stocking streams and ponds with fine kinds of fish. All the New England States have commissioners who are active in investigating and devising means for multiplying and introducing fish into their streams, lakes and ponds. We have received from the Massachusetts commissioners their report to the Legislature for the year 1869, which is an instructive document to those interested in this subject, as it details both successes and failures. The names of the New England commissioners are given, and we print one for each State for the benefit of persons in other States desirous of inducing their legislatures to take action in fostering inland fisheries: Chas. G. Atkins, Augusta, Me.; W. A. Sanborn, Weirs, N. H.; A. D. Hager, Proctorsville, Vt.; Theo. Lyman, Brookline, Mass.; W. M. Hudson, Hartford, Conn.; Alfred A. Reed, Apponang, R. I.

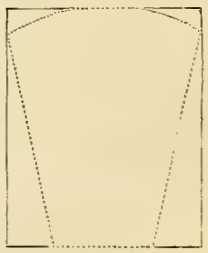
How to Apply Manure.—E. Taylor, Michigan, asks: "What shall we do with our barn-yard manure? George Geddes says plowing it under 10 or 11 inches deep is the poorest way to apply it. This has been our plan ever since I can remember. We sow wheat after corn, then clover two years, and then corn again, and so on *ad infinitum*. Now, what shall we do with the manure?" Do as you have been doing, if it does well, and never mind the agricultural doctors. If the corn does not get the benefit of the manure the wheat will. But *do* you plow 10 or 11 inches deep? Measure and see if the furrow slice is over 8 inches thick. Most people think they plow 2 or 3 inches deeper than they really do.

Plaster on Clover.—"H. G.," Augusta county, Va., writes: "We all use plaster here on clover, and it increases the yield very much—in fact, I think it doubles it in most cases."

Raising Lambs by Hand.—Use the milk of a new milch cow, and let the cow be well fed, so that the milk may be as rich as possible. Put an India-rubber nipple on a glass bottle; and be sure that the bottle is thoroughly cleansed with *boiling* water every day.

Clover for Pigs.—A correspondent writes: "With a good clover pasture, I can easily make a full-bred pig weigh 400 lbs. with 22 bushels of corn."

Button-hole Bouquets.—Some time ago we gave engravings of some button-hole bouquet holders made of glass tube. A writer in a recent number of the Gardeners' Chronicle (Eng.) gives a plan which will be acceptable to those who cannot conveniently procure the tube holders. Some moss is tied to the stems of the flowers and thoroughly wetted; then the stems are surrounded by a piece of oiled silk of the shape and twice the size shown by the dotted lines in the accompanying diagram. This is bound by means of a thread, and will prevent evaporation from the moss.



Allen's Catalogue.—Among the numerous American and foreign illustrated catalogues we have from time to time received, none equals in completeness and fullness of illustration the volume recently issued by R. H. Allen & Co. It embraces tools, vehicles and machines used by the Northern farmer and by the planters of the South, of Cuba and South America, by nurserymen, gardeners and fruit raisers, by brick-makers, carpenters and others; implements for draining, for ice cutting and handling, and a great variety of household articles, dairy implements, apple-parers, etc., etc. It includes scales, pumps and hose, edge tools, bells, and even thorough-bred stock—and almost everything is pictured. The price asked is $1, and this is refunded with the first order. This offer to refund has given rise to some exhibitions of shrewdness almost past credence. For instance, a person in Belmont, Ohio, sends for the book and $1 worth of sundry seeds, saying; "I see you propose to refund the price of the book on receipt of the first order; and, as you propose to pay postage on the book, you may send the *amount of postage* in peas, box the book and seeds and send by express." The order was filled.

Burning Bones.—"A. J. R." Rees Corners, Md.—Bone ashes are useful, certainly; but there is a heavy loss of value in burning them. A bone mill is a pretty heavy affair—Stewart's, one of the best, costs $1,000. Bones may be slowly reduced by being broken with a sledge, and then mixed with fresh wood-ashes kept moist for two or three months. When overhauled the heap should be mixed with earth, and the still hard bones thrown out to be worked over again.

Climbing Fern.—C. C. Schenck informs us that this plant, figured in Jan. last, grows abundantly upon the Cumberland Table-lands in Tennessee. It is known there as "Wild Pea-vine," and the starveling cattle feed upon it in the absence of better food.

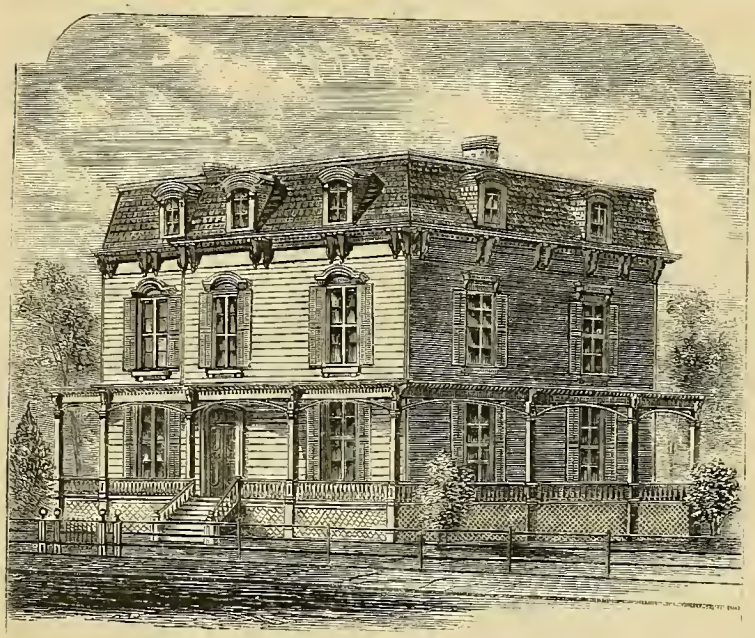


Fig. 1.—FRONT, OR SOUTH-EAST, ELEVATION.

A Convenient Country or Village House,

Having the "Modern Improvements" of Gas, Hot and Cold Water, Bath-room, Water-closet, Warm Air Furnace, Speaking Tubes, Bells, Dumb-waiters, etc.—(all of which, except the Gas, are available in Country Houses generally).—Cost, $7,000 to $8,500.

The demand upon us for hints and suggestions on building and improving houses, is becoming very great. This is hardly to be wondered at, when we remember that there are in this country some Forty Millions of people, all of whom need some kind of shelter in the form of a house. We will try to do more than hitherto, towards supplying practical information. Perhaps the best way to do this is, to take up successive plans and describe them, weaving into the descriptions various suggestions. Some of these plans will furnish exact models for those having no experience in building, and no favorite plans of their own. Usually, however, these descriptions will serve merely as suggestions.....Our Senior Publisher has for several years kept one or more houses in course of erection, not as a source of profit—for they are sold at *cost*—but partly as a matter of pleasant pastime or source of pleasure in exercising a natural mechanical taste, and partly, to gain information that may be useful to our readers, by practical *experience* in working out plans. In March of last year, we published a description of one of his houses costing $12,000. These houses were further improved upon in two others, costing about $13,000 each, having more piazzas, circle head or arched doors and windows in the first story, and one foot larger each way. Last month we described those, alike in plan, but varying a little in size, which cost $5,100 to $5,500. These prices are exclusive of the ground. We now give plans of those costing a little over $8,000. Mr. J. is also thinking over some plans (for testing by actual trial) of houses to cost respectively $1,200 to $1,500 each; about $2,000 each; about $3,000 each; and about $4,000 each.

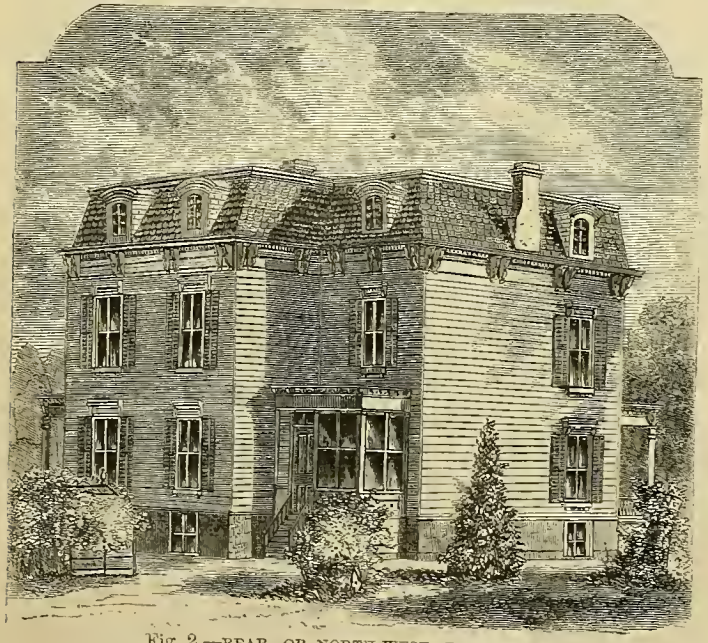

Fig. 2.—REAR, OR NORTH-WEST, ELEVATION.

Fig. 1 shows the **Front,** or South-east. **Elevation;** this stands on a corner, but back from the streets, with the Piazza extending parallel with both the streets.

Fig. 2 shows the **Rear,** or North-west. **Elevation.** For notes on kind of siding, roofing, hight from ground, filling in walls, painting, etc., see notes last month, pages 88-9. Gas Pipes extend to every room and hall, from the basement to the 3d story. Color, very light gray.

Fig. 3. Basement.—Hight in clear, 8½ feet. The walls are of Brick, with hollow in middle, and rise about 4½ feet above the ground surface. *Aa*, the Kitchen, is of ample size, having: *r*, a 9-inch "Victory Range" with water-back, and by its side a pot and shelf closet. *Cc*; a Sink, *v*,—with Suction Pump, *p*, drawing water from outside reservoir through a tin-lined lead pipe; a Pantry, *Cc*, and a Dumb-Waiter, *dw*, to the butler's pantry above: Speaking Tubes, *s,s*, one to dining-room, and one to family chamber (*F*, fig. 5).... ..*Bb* is the Lanndry, having Stationary Wash Trays (or tubs), *t,t,t*, supplied with hot and cold water stop cocks, chain-plugs, and outlet pipes with steuch traps; a Suction and Force pump, *n*, which draws cold water from the reservoir for the wash-trays, and when needed in dry weather, forces water to the Tank (figure 6). The pump is supplied with an air chamber, and a valve to prevent drawing water from the tank, as shiftless "help" would be inclined to do. *Z* is a 40 gallon Copper Boiler, put here instead of in Kitchen, for heating. This is of course connected with the range water-back, and has waste-pipe and stop-cock at the bottom, to draw off any sediment that may collect at the bottom in the course of time, if the water be not absolutely pure. It is of course kept full by a pipe from the tank. *Ee* is a milk or food cellar, plastered and finished off like *Aa*, *Bb*, and *Hh*. *Dd* is a general or vegetable cellar, and *Ff* a coal cellar. *Oo* is a 22-inch "Oriental" Base-burning Furnace, (see advertising columns), with door opening into *Ff*, and man-hole door in *Hh*, for supplying water to vapor pans. A door from the main Hall, *Hh*, opens back into the basement Area and Stairs. A Closet, *c*, is put under the stairs—the rule being to put closets wherever they can be worked in, throughout the house, which all housekeepers will value. The tin pipes conveying warm air to the 2d story, are carried up through the partitions, with iron laths on each side. These are made by cutting strips of sheet-iron 2 inches wide, bending the two edges over to hold the mortar, and nailing them upon the studding. This prevents any possibility of firing the wood-work. Too much care cannot be given to keeping all hot air pipes nearly an inch away from any wood-work, and lining all wood near them with tin, for absolute safety.

Fig. 4. First Story.—Hight in the clear 11 feet. A *Piazza*, 8 feet wide, extends around two sides, and another (Area 12½x6 feet) is enclosed in sash—a cool resort in hot weather.....The *Main Hall*, *H*, is sufficiently wide for a house of this size, and with the double doors on each side gives a very much more spacious look to the whole house, on entering, than if it were only the usual width of 6 feet. The *Vestibule*, *V*, is shut off by glass doors.....The size of the main *Parlor*, *P*, was adopted after much measuring and inquiring among housekeepers of good taste and judgment. The front double windows open down to the floor of the Piazza. The chimney has a statuary or white marble mantle, grate and summer piece. *r*, near a square, here as elsewhere throughout the houses, indicates a register and warm air pipe from furnace. *Bk* is a bell-pull to the kitchen. In this room, as in others, double ventilators, one at the baseboard, and one with cords placed near the ceiling, connect with a flue in the wall. (When heating up a cold room, close the upper and open the lower ventilator, and the warm air rising to the ceiling soon forces the cold air out through the lower ventilator. When desirable to remove the heated, rarified, or impure air from above, the order of opening is reversed.).....*R* is the "*Reception Room*, or Smaller Parlor, or "Living Room," with pantry or closet, *p*, Italian Marble Mantel, and Grate, etc., and warm air register, *r*. *Bk* is a bell to kitchen.....The *Dining-Room*, *D*, has pantries or dish-closets, *p,p*, at the ends, with an arch thrown over, and side brackets or pendants. This is ornamented; it breaks up the box-like look of the room, and has the appearance of a Bay-window. The *Butler's pantry*, *bp*, has an eleptical plated copper basin or wash sink, supplied with hot and cold water cocks with elevated, curved discharge pipe, and waste pipe and trap below. This is convenient for washing silver, and China or other dishes not to be sent below. The Dumb Waiter, *dw*, opens into this pantry, so that food can be brought up from the kitchen and prepared for the table out of sight of the dining-room; and soiled dishes are taken here to be sent down. (The elevator is suspended in the center by weight and cord over a pulley at the ceiling, for which there is room, as the shelves do not need to rise more than 4½ or 5 feet above the floor.) *Sk* is a speaking tube to kitchen; *Sc* one to the family chamber; *Bk*, a bell-pull to kitchen; *Bh*, a bell-pull to 3d story hall to call down servants or others when desired.

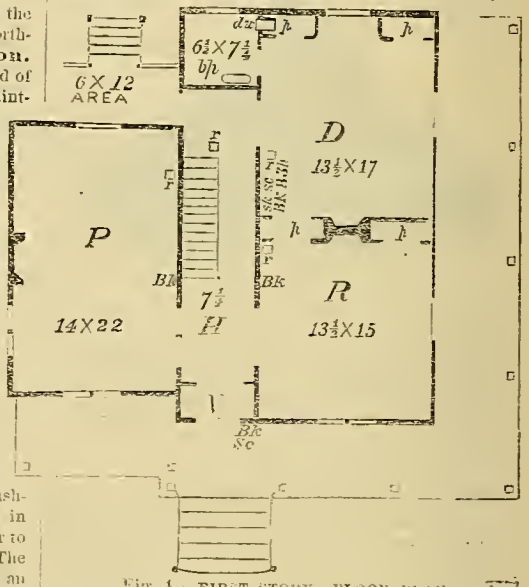

Fig. 4.—FIRST STORY—FLOOR PLAN.

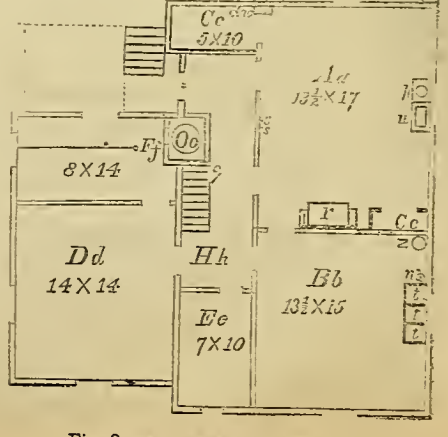

Fig. 3.—BASEMENT—FLOOR PLAN.

Fig. 5. Second Story.—Hight in clear, 9½ feet. The *Family Chamber*, *F*, opens into a dressing-room, or bed-room, *O*, which will take in a full-sized bed by the side of the door. (This room, *O*, may be used as a sewing-room, or a child's room, or a sick-room.) The Marble wash-stands, *w*, *w*, in *F*, and *G*, are placed in arched recesses, with an arched light cornice over the top, which has a pretty appearance. The rounded Marble table extends slightly into the room, and the closet beneath is cased, with a door. Marble pieces against the wall protect it from water. These basins are supplied with plated self-acting supply pipes for hot and cold water, with plated plugs, and stench traps. This arrangement of wash-stands in recesses, devised by Mr. Judd, has several advantages: The wash basins are out of the way, giving much more space in the room; one set of supply and waste pipes answers for two basins; the pipes run down by the chimney and are out of the way of frost, and the arched and corniced recesses are quite ornamental. In this room, *F*, there are, also, *Sk*, a speaking tube to the Kitchen; *Sd*, one to the Dining-room; *Sfd*, one to the front door, opening over the bell-pull (*Sc*, fig. 4), for conversing with callers at night; *Bk*, a bell-pull to Kitchen, and *B3k*, a bell-pull to the 3d Story hall to call servants in the morning, if need be. As remarked last month, these little conveniences, put in at small cost when building, save tens of thousands of steps, and much hallooing through the hall. The Housekeeper, though an invalid in her room, can thus call to other rooms and speak with the occupants through the tubes. So, also, directions may be conveyed to the kitchen and dining-rooms, before dressing in the morning. (A piece of flexible 1-inch rubber tube, attached to the speaking tubes, and extending on to the bed, will enable a sick person to talk with those in the kitchen or dining-room, though unable to rise from the pillow.) The *Chamber*, *G*, has the double closet and arch, above described; bell, *Bk*, to kitchen, register, *r*, etc.... The Chambers *M* and *N*, are convenient bed-rooms, with closets, and a warm-air register, *r*, in *N*.... The *Bath-Room*, *S*, has a wash-stand, and bathing-tub, *b*, both supplied with hot and cold water cocks, waste-pipes, and stench traps; also, a warm-air register, *r*, and gas pipe. The Water-closet, *w*, with patent basins and water arrangements, has a double cover, or seat, on hinges, so that on raising both, the broad-top basin answers for the reception of slops, and also as a urinal. It is supplied with water from the Tank in the hall above. The waste-pipe is iron, 4 inches in diameter, extending down the corner to the cellar, and out through the wall below frost, into the glazed pipe, 6-inch drain, running into the out-door privy vault. The floor under *w*, is cased with lead turned up 4 inches all

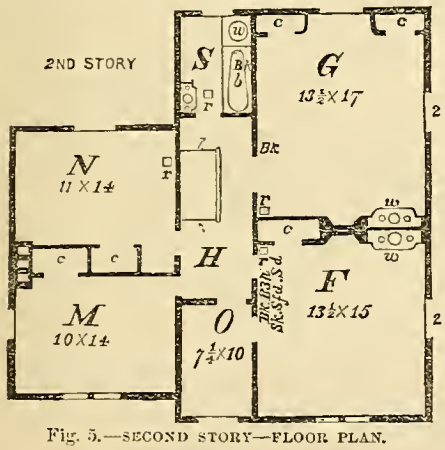

Fig. 5.—SECOND STORY—FLOOR PLAN.

round, to catch any possible drip from the water-closet apparatus. A bell, *Bk*, communicates with the kitchen. The door has sash, with translucent or ground glass, to admit light to the hall, *H*. (Both flights of stairs have a landing and turn, four steps from the top, which eases the ascent, and lowers the floor of the Bath and Tank-rooms two and a half or three feet below the hall floors.)

Fig. 6. Third Story.—Hight, in the clear, 8½ feet. All rooms in this story are finished with white plaster coat. The outer walls rise perpendicularly 3½ feet, and then incline inward with the Mansard roof, which is set more nearly perpendicular than has been the common custom in this country. The third story or attic rooms are thus almost equal, and in some respects superior, to those in the second story. The room *Z* is of ample size for a servant's room, leaving the others for general use. *T* is left undivided, and will answer for a childrens' exercise and play room, and for drying clothes on rainy days, or when too damp to dry them in the laundry. There is a very pleasant outlook from the dormer-windows. (The houses here described stand on ground 70 feet above tide-water.) The tank is 7 feet long, 5 feet wide, and 3 feet deep, giving a capacity of 735 gallons. The water from all the upper roof runs into this, and when it is full the surplus discharges through a 5-inch leader into the general reservoir. If emptied in a dry season, it is refilled by the force pump in the laundry. This, of course, keeps the the boiler (*Z*, fig. 3) always full and gives both hot and cold water to the second story rooms. A safety pipe from the top of the boiler passes up over the top of the tank with a goose-neck, and when the fire is brisk, as in a cold day, some hot water will flow over into it, which alone would prevent freezing, though with a considerable body of water, and with double lath and plastered walls around it, and with the warm air constantly rising up through the open stairways (the walnut railing and banisters

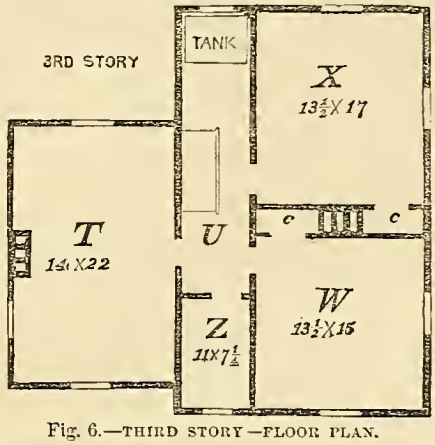

Fig. 6.—THIRD STORY—FLOOR PLAN.

extend into the third story hall) there is no danger of frost. The tank is made with a strong frame, covered inside with matched plank and lined with 4 lbs. per foot sheet-lead, strongly soldered at the joints, and the center of each side supported by plumbers' "tacks," that is, a circular segment of lead attached to the lining and let into the wood. A film soon coats the lead and prevents its solution in the rain-water, though this is of no consequence, as all water for cooking and drinking is drawn through tin lined pipes at *u*, fig. 3. Those, fearful of contact of water with lead, can arrange in the tank a gate or valve worked by a floating ball and lever, so as to turn all the water directly from the roof into the cistern when the tank is full. No spring or well water, which filters through the soil and necessarily dissolves out more or less of mineral salts and organic material, can be so pure as the "heaven-distilled" rain-water from a clean upper roof. We have used none other for many years, and would use no other. When accustomed to it, it is far more agreeable and more salubrious than any compound water drawn through the soil. If the roof be exposed to leaves and dust, a simple filter of washed sand, or sand and charcoal, attached to the cistern will remove these impurities. If many leaves are likely to fall on the roof, a wire netting should be placed over the entrance to the conducting pipe, and the accumulation of leaves be occasionally removed. (The dormer-windows give ready access to the gutters and roof.)

Other Items.—See last month, page 89, for various items, as grape arbor, siding, moulding (used in first and second stories in this house) for painting, etc., etc. There are 16 pantries or closets—an important thing to be provided in any house. One of the upper rooms may be used for a store-room, if desired, as there are in all 9 rooms that may be used as bed chambers....As a matter of due credit and a stimulus to perfection in workmanship, we give the names of the chief artisans of these and the house described last month: General Superintendent, as well as architect, and a hard worker himself, JOHN DONALD; Mason-work, Hendrickson Jarvis, and Geo. W. Lewis (1 house); Painters, Torrington & Brown; Plumber and Gas-fitter, Henry Lewis; Roof-work, and putting up Furnaces, Benj. G. Field; Sash and Blinds, Henry Christie; Stairs, etc., John L. Smith—all of Flushing; Doors, by Little, Fowler & Fleet, of New York City.

COST.—We give the actual cost of these houses, which may be taken as a comparative criterion. (These were built with special economy in purchase of material, and work, as noted last month, but probably timber, etc., will range below the rates of New York and vicinity, and skilled labor averages lower, in most of the country. For ordinary country and village residences of the same size and conveniences, a less expensive style of finish, outside and in, would often be adopted, so that the cost would range all the way from $7,000 to $9,000): Timber, $315; lumber of all kinds, $1,105; mason work and material, $1,547; carpenter work, $1,103; digging cellar, $20; digging and stoning privy vault, $25; grading, $40; cistern, $35; painting, $350; sash and glazing, $130; blinds, $85; roof, slate and tin, including gutters, and window and chimney zinc and tin, $450; plumbing, with marble and wood-work, $490; range, with water-back connection, $60; ontside drains, $50; furnace, with setting, piping, registers, etc., $300; stairs, $260; piazza steps, newels, banisters and railing, $150; arbor, privy, and lattice screens, $80; fencing, $125; sidewalks, $40; hardware, nails, locks, hinges, sash-weights, bells, etc., etc., $288; mouldings, $130; doors, kiln-dried, $140; marble mantels, $200; summer pieces and grates, $80; gas piping, $60; ventilators, $25; cartage, and many sundries, $293: average interest on outlay while building, $180. **Total Cost** of House, exclusive of land, **$8,186.**

House Building Questions.—Numerous recent inquiries about constructing wash-trays, plumbing work, tanks, etc., are necessarily delayed to a future number, for want of room, and to prepare engravings.

Sheep in Colorado.—Mr. Daniel Witter, the United States Assessor at Denver, sends us the following statement made by a gentleman of his acquaintance: "I will furnish some items of a flock of sheep owned by Mr. Crowell, numbering a little over one thousand, of the breed called the Iowa Stock sheep. Their clip last season was within a trifle of 4 lbs. per fleece, average, after washing. Their increase per annum, Mr. Crowell informs me, is 90 per cent, and to-day, of his stock, there are eight hundred fit for the butcher's stall. Many of these sheep when driven here were afflicted with foot-rot, and other diseases that are common in the States, but they rapidly recovered in this climate, and now no sign of disease exists among them. Mr. C. says this soil and climate is a certain and speedy cure for foot-rot. The dry earth and alkali that exist on the surface seem to be the natural remedy. The pure water, excellent climate and nutritious grasses are the great mutton and wool producing secrets. The time is not far distant when the Arkansas valley of Colorado will contain millions of the finest sheep in the world."

Harris on the Pig.—Mr. Joseph Harris, of Rochester, has long been a raiser of thorough-bred pigs, and has experimented largely in crossing these animals on the common swine of the country. Mr. H. now presents, in a neat volume of a little over 200 pages, an excellent manual upon the subject. The various foreign breeds are described and their qualities discussed, as are those breeds which are considered to be purely American. The principles of breeding, the care of young pigs, feeding, fattening, the construction of piggeries, and other pertinent matters are treated with satisfactory fullness. The work is illustrated by numerous engravings of the different breeds, plans of houses, troughs, etc. We have heretofore, in this department of agricultural literature, been mainly dependent upon reprints of foreign works, and we are glad to be able to present a work so well adapted to the wants of the American farmer and breeder. Published at this office. Price, $1.50, post-paid.

Bad Smelling Cisterns.—Mrs. "R. B. J.," Delaware.—The bad odor does not arise from the cement, but from the organic substances washed into the cistern from the roof. The remedy is to clean the cistern and wash it out, and then to have all the water that flows into it filtered. For the present a filter may be prepared thus: Take a keg holding half a barrel or more, put in 6 inches of clean coarse gravel, upon this 4 inches of sand, then several inches of freshly heated charcoal, pounded small, with the *dust* blown out, to be covered with 4 inches of sand and 6 of gravel. The water is poured in at the top and drawn off at the bottom as wanted. A coarse bag, filled (while wet) with hot charcoal broken up somewhat, and suspended over a cistern or well, will often destroy bad odors and flavors in the water.

Improving Hogs.—"P. P.," Kuma, Ill.—You cannot do better than to use a thorough-bred Essex or Berkshire on your large, grade Chester County sows. It will improve the quality of the pork and give more for the food consumed.

Will it Pay to Raise Cattle?—B. L. Tudor, Ontario, asks if it will pay to raise cattle when they sell at from 3c. to 6c. per lb. in gold—oats selling for 30c. per bushel and hay $8 per ton, and other things in proportion, with good pasture in summer?" It will pay better than raising oats and hay and *selling* them at these prices. But be careful to get cattle that will sell at 6c., instead of 3c. per lb.

What are the Best Roots to Raise for Milch Cows?—Parsnips and mangel wurzels. For feeding late in the fall and early winter, nothing is superior to cabbages. But the cows should have bran and meal, and hay, corn-stalks or straw in addition. In this climate we cannot afford to raise root crops and cabbages for cows unless we adopt high breeding.

How to Manage a Farm of Seven Acres.—A subscriber of the *American Agriculturist*, in Pennsylvania, who has hitherto been a mechanic, has bought seven acres of land that have been in grass and not plowed for 20 years. He wants to raise small fruits, to keep two cows, and proposes to raise cabbages, etc., to feed them on. He has had "no experience in working the soil, and has to depend on books and papers for information." We would not discourage him, but he must not expect to obtain large crops the first season. His first aim should be to get the land underdrained, clean and rich. Buy clover hay and bran for the cows. This will make good milk and rich manure. Compost this manure and any other material than can be obtained, with bone-dust. In the meantime break up a portion of the grass land, and plow it and work it two or three times, and next spring put on the manure at the rate of 20 tons per acre, and plow it in and harrow thoroughly. The land will then be ready for anything. For cabbages use about 300 lbs. of superphosphate to the acre. Keep the land constantly stirred, and a good crop may be expected. The probabilities are, however, that the cabbages will be worth more to sell than to feed out. If so, sell them and buy clover hay, bran, oil-cake, etc., for the cows. It must be your constant aim to make rich manure. You can do nothing on a small farm without it. With it, and clean culture, you can do everything.

Sap Spouts.—"M.," Bainbridge, O., says: "We have been interested in Mr. Chamberlain's articles on sugar making, published in the *Agriculturist*, but think him behind the times in using the wooden spout, though I see he is going to try the metalic ones. He can get all the wooden ones he wants among the farmers here, for carrying them off. We use the tin ones here almost exclusively. They are not so liable to sour, the sap all running out. Sap will start quicker and trees keep fresh longer. Many do not cut the trees over, the entire season. Besides, they are not bulky, only 2½ inches in length, and one can carry enough to tap a large bush in a common pail. They have worked their way against strong prejudice, until now nearly all in this section use them."

Essex Pigs.

The Essex is the largest of the small breed of pigs—larger than the small Yorkshire, or Suffolk, or small Berkshire. It is, in fact, what is now known in England as a medium or middle breed. At twelve or fourteen months old, we have had them dress over 400 lbs. They are entirely *black*, but when dressed are as white as the whitest. Their flesh is remarkably firm, and the lard of the best quality. They have small bones, small upright ears, short snout, good cheek and shoulders, square bodies, short legs, and capital hams. They are remarkably compact, and appear much smaller than they really are. They are the quietest and most gentle of all pigs; are good breeders, and mothers. But their crowning excellence is their purity of breed—and, as a consequence, they impress their good qualities with great force on any common sows with which they may be crossed.

They will improve any breed with which they are crossed. We have crossed them with the large Berkshires, with perhaps a slight reduction in size, but with a marked improvement in form, fattening qualities and early maturity. Crossed with a large, coarse, Chester White sow, we get pigs either all black or black-and-white. For large, common pigs to be kept until they are a year or eighteen months old, this cross is admirable. For smaller pigs, with less bone and offal, and that will fat at nine months or a year old, another cross with the Essex is desirable. A third cross would give pigs almost as fine-boned as the pure Essex. Such pigs can be fattened at four or five months old, and afford the choicest and most delicate of fresh pork—an article as yet almost unknown in our general markets, but which, when once known, is sure to command good prices.

From the smallness of offal and exceedingly quiet disposition, the Essex are easy keepers. They are good graziers. We know of no breed superior to them in this respect. With the run of a good clover pasture, well-wintered grade or thorough-bred Essex pigs will keep in fine growing condition all summer, and if allowed in such a pasture, two or three ears of corn each per day, with access to fresh water, will grow very rapidly, and be at all times ready for the butcher. This is the cheapest way of making pork. For the mere purpose of making pork we would not recommend the thorough-bred Essex. They are too fine and delicate. Their great value consists in their capacity of improving any of the large, coarse breeds, or in fact, any kind of common pigs. For this purpose they must be bred *pure*. What a farmer needs to improve his stock is *thorough-bred* males. And in pigs there is no breed more thoroughly established than the Essex. Engravings of some excellent specimens of this breed are given upon the first page of this number.

Tobacco Culture.

There is no crop that can be raised upon the farm with only farm hands and appliances that is more profitable than tobacco. Every year the knowledge of the great profits gained by experienced cultivators leads novices to attempt and fail. Every year there are many farmers who over-estimate their ability to take care of the crop they prepare for and plant, and hence meet with loss. No inexperienced person should attempt to raise a large patch, and whoever raises it should regard the crop second to none, but always attend to it, even if others suffer. A good crop is 2,000 lbs. per acre; this, at 25c. per lb., would bring in $500 per acre. Were $200 per acre sacredly applied to the purchase of manure, and the tobacco cultivated two, and never more than three years on the same ground, and made to take its place in a regular rotation, we have no doubt this exhausting and labor-taxing crop would be a very beneficial one to both farms and purses in sections favorable to its growth.

Tobacco Seed-Beds.—The preparation of the seed-bed should be commenced as early as the frost is out of the ground. A warm spot with a southern exposure, often with a fence or building upon the north, is selected, the soil being a fine, deep, garden loam, rich and mellow. One square rod of seed-bed furnishes, under almost any circumstances, many more than enough plants for an acre. A heavy coating of well rotted hog-pen or other manure is applied and forked under, leaving a rough surface; upon this straw and brush, to the depth of six inches or so, are spread and set on fire, provided the land is not dangerously near some building. This kills the weed-seeds to the depth of about three inches, and leaves a coating of ashes upon the surface, which may then be raked smooth, with a gentle slope to the south. If the nights are frosty and the weather unfavorable, the ground may be left rough awhile, and it is often worth while to apply a dressing of guano or a superphosphate before finishing off the bed. The best way to apply guano is in solution, and barn-yard liquor is equally good. Liquid manure may be put on very strong before or when the seeds are sown, but not after they germinate. As soon as the soil is warm, roll the bed and rake it over. Mix one table-spoonful of seed with a quart of fine sifted soil for each rod, rubbing the whole through the hands, and sifting it, again and again; divide it in two or three parts, and sow each over the whole bed broadcast, and then roll it, or pat it over with a board or a snow shovel. If the weather is warm and dry, water it with a sprinkler. The seeds start slowly and irregularly, and may be encouraged by occasional watering with dilute manure water. The young plants are often attacked by a little black fly, which is driven off by occasionally sifting wood-ashes lightly over them. The best seed for the Northern States is doubtless that of the Connecticut Seed-leaf variety. Before the seeds come up, all weeds that show themselves should be pulled. A bed 4 feet wide and 66 feet long contains one square rod of land. If several acres are to be planted to tobacco, it would be well, perhaps, to calculate that three beds would supply plenty of plants for four or five acres, and sow them at intervals of a week apart, that one or the other might escape unfavorable vicissitudes of weather.

The Relations of Tobacco to the Soil.—The repeated analyses of tobacco, and of the grains of wheat, corn and other crops, demonstrate that in cultivating it for market we remove as much of the constituents of the soil with one good crop, as would be removed by a dozen or fifteen crops of our ordinary grains. As an offset to this fact we have another, viz: The actual amount of manure added to the soil to insure a fine crop of tobacco is not more than twice as much as would be required to produce first-rate crops of wheat or corn; and with this application, good crops of "the weed" are taken year after year. Two things are certain—1st. The manure supplies directly but a portion of the constituents of the tobacco ash; 2d. Those which are lacking are supplied by the soil, which is acted upon by the manure, by water, by the air and by tillage, by all of which, these anti-constituents are brought into an available condition. When the soil ceases to yield those constituents (particularly potash) which ordinary manure does not supply in sufficient quantity, the tobacco crop will inevitably fall off. In some soils this comes after a few years; but by judicious rest and cropping with other plants, and proper manuring, tobacco culture will again be profitable.

What Crops Should Follow Tobacco?—"L. A. C."—Tobacco leaves the land in admirable condition for a crop of wheat, to be followed by grass, which will do well for several years. Almost any of our common crops will do well after tobacco. Roots find potash enough. Potatoes, if planted on good tobacco land, which has not been over-cropped, even two years in succession, will usually indicate no lack of this substance, though peculiarly sensitive to its absence. Ruta-bagas (Swedes) are favored by the amount of the phosphates left as a residuum in old tobacco land, and these, it is well known, are peculiarly advantageous to all the turnip family. It is for the same reason that cabbages are frequently cultivated after tobacco with good success.

Norway and other Oats.—Some time ago we asked for the experience of our readers who had tried the Norway oats. We condense the statements received, but neither color nor qualify them:

Luther Bailey, Jewett, N. Y.—Sowed 1 bushel 6 quarts; harvested 60 bushels, and thinks he can raise 100 bushels.

John Baxter, New Lisbon, N. Y.—Bought of Jones & Clark half a bushel, which cost $8; "found them the most disgracefully, dirty seed ever vended." Sowed on the best land he had, and they turned out to be "Horsemane" oats, which he could have bought for 60c. per bu. at home.

John J. Horton, of White Plains, N. Y.—Sowed late and on inferior land; they grew well, 5 feet high, with heavy heads; were the best he ever raised. After they were ripe they were not lodged by two heavy storms.

Clark L. Horton, Coventryville, N. Y.—Sowed 15 lbs.; harvested 19 bushels by measure (23 by weight), weighed nearly 39 lbs. per bushel; grew to 5 or 6 feet high; land rich. A terrific storm prostrated them.

C. C. Phelps, Vernon, N. Y.—Seed of Heffron; oats stood 5 to 6 feet high; did not lodge; were cut by wire worms; yielded 84 bushels per acre.

Addison Ely, Elizabethtown, Pa.—Seed, from Jones & Clark, very light; sowed on good ground; yield, very poor.

John K. Busteed, Union, N. Y.—Tried Surprise, Norway, White Norway and Swedish, and is greatly in favor of the Surprise for earliness and weight per bushel.

Wm. M. Blakewell, no Post-Office, probably in Pennsylvania—Sowed 1 bushel black oats, which weighed 42 lbs.; sowed on fair land with 175 lbs. of guano; harvested 16 bushels weighing 28 lbs. per bu. The color changed from black to gray-and-white; greatly inferior to common oats.

John T. Bramhall, Falls Church, Va.—Sowed, rather late, 4 quarts clean seed, which weighed 37 lbs. to the bushel; harvested 3¼ bushels weighing 25½ lbs. per bu.; grew tall, and lodged when nearly ripe. Thinks "the Norway a first-class oat, but not all that was claimed for it."

Edward J. Ivy, Hampton, Va.—Bought 1 quart of seed; got 75 qts., and left 5 or 6 in the straw. Says they will yield three times as much as any other oat he ever saw.

James E. Blake, Granville, Ill.—Says he never saw their equal; speaks in high terms of the straw as fodder.

R. F. Brumfield, Kirkmansville, Ky.—Bought 1 quart, which came torn open and one-third gone; sowed on 100 yards of low land: they were hurt by being flooded and by the drought, yet he gathered 3 pecks which he "would not part with for anything in reason."

J. W. Speering, Humboldt, Kan.—Sowed 1 bushel and 2 lbs., and estimates his crop at 100 bushels. Says, "They are far superior to any oats I ever saw."

Wm. Woodford, Fremont, O.—Writes, he sowed half a bushel Norway oats; grew about 6 feet high, and yielded 25 bushels—more than twice as much as common oats.

Philip C. Tussing, Winchester, O.—Sowed 13½ lbs. the 16th of April, and thrashed 30 bushels from the same.

Horace J. Taylor, Claridon, O.—Raised from 1 seed 5,155 seeds on 21 heads; the largest head had 406 seeds, the smallest 134; 4 husks contained 3 seeds each. They stood straight, about 5 feet high; straw very large."

C. J. Dietrich, Grand Rapids, Mich.—"Drilled in, on rather heavy soil, 32 lbs. on just one acre. A tremendous dashing rain packed the ground so hard that not more than half the seed came up; yet from what came up I harvested about 60 bushels of oats, that weighed 40 lbs. to the bushel. Straw, 4 to 5 feet high, large and stiff; none lodged; heads were very long and full. Surprise oats, in the same field, with same treatment, yielded only 40 bushels to the acre, and weighed 40 lbs. to the bushel. The Surprise is much the prettier oat, but the Norway beats them to death in yield."

H. Lorentgen reports that Gen. Israel Garrard, of Frontenac, Minn., drilled 8 acres with 1 bushel and ½ peck to the acre—(land, a black loamy soil, broke two years ago, and had last year a crop of wheat on it). The yield was a little over 960 bushels, making 120 to the acre.

J. E. Davis, South Bend, Ind.—Purchased 2 quarts of Norway oats from Jones & Clark; sowed on light soil; yield, 230 lbs., and 8 or 10 small sheaves of common oats.

Daniel Noble, Bell Plain, Wis.—Sowed 1 bu. on a piece of poor timothy sod, freshly broken up; yield, 94 bu.; weighed 41 lbs. They had been twice broken into by hogs, and badly trampled; grain thick, like barley; one stool had 19 heads with 4,341 grains.

White Norway.—E. M. Angle, Herrick, Pa.—Sends a sample. (We know no such oats.) He says they yield extremely well, from 120 to 150 bushels per acre, and weigh 45 to 50 lbs. per bushel.

White Schonen Oats.—Wm. W. Horner, of Meyers' Mills, Pa., sowed 1 pint of White Schonen oats, imported from Hamburg. Yield 4 bushels. He sowed, also, 1 pint of the Norway oats, and it yielded 2½ bushels.

Ogden Farm Papers—No. 4.

I am now preparing nine acres and a half for corn—being one-sixth of the arable portion of the farm. It will afford an opportunity for comparing the effect of two or three different conditions of preparation of the land. The soil is heavy, and before draining was excessively wet, although lying over the crown of a high ridge with slope enough to make draining easy.

About one-half of the land was seeded down in 1867, and is still in grass; one-third was in corn in '67, in roots (very poor crop) in 1868 and produced, with heavy manuring, a very fine crop of corn fodder in 1869; one-sixth produced a poor crop of hay in 1868 and a very good crop of soiling rye in 1869. Of the grass portion, a small piece that was manured in September was plowed up in October, being a strip about 20 feet wide across the field, with grass, manured at the same time, on each side of it. The manuring is being done at intervals, by strips from one side of the field to the other, and will not be finished before April. The plowing (except the small strip of grass land plowed last fall) will all be done immediately before planting, and the subsequent treatment of the land will be uniform, while its condition when I took the place was about identical. The result will show a comparison between the following conditions:—

1. Grass land, top-dressed early in the fall, and left untouched until May.
2. The same land, plowed in the fall, the manure being turned under with the sod a month after its application—heavy rains having fallen in the meantime.
3. Land that has produced a heavy growth of rye, been twice plowed after harvest, manured in the winter and plowed again in the spring.
4. Land (which before produced corn fodder) in perfect tilth, very heavily manured, plowed during the fall and winter, heavily manured again in March and plowed in May.
5. Grass land manured at various times between September and March.

The most important comparison will be between Nos. 1 and 4. The first will probably have a heavy spring growth to turn under; the last will have had more thorough cultivation and exposure in the rough furrow during a very freezing and thawing winter. It is hardly possible to make any reasonable prophecy of the results, but I shall watch the experiment closely, and report the different results. If other farmers would make similar experiments, the various results in different soils and climates would furnish a foundation from which some valuable conclusions might be drawn.

One of my early ventures was to purchase a thorough-bred stallion, son of the old race-horse "Wagner," and of "Fanny King" (a daughter of imported "Glencoe"). I had three farm mares to breed from, and could hear of but one thorough-bred stallion in the State. To send the three mares to this horse would cost, for service alone, $300. So I bought "Dallas." He combines more fully, than any other horse I have seen since "Hero's" time, the qualities of good temper, good form, good bone and good blood, which are most desirable in a sire. Hoping to secure the patronage of my neighbors, I fixed the price of his service at $25—to insure. I counted without my host; for my neighbors continued to send their mares, at $3 a leap, to a cold-blooded trotter. Dallas has received a few mares from a distance, and a few from the neighborhood. Although at the price fixed I have received less than the cost of keeping him, I feel fully compensated by the two mare colts, now one year old, that I have in my stable, (one mare produced a dead foal) and I think that they are enough finer than my neighbors' colts to convince them of the economy of breeding only to a thorough-bred sire. My own mares are to foal again this spring, and I have laid a foundation for a stock that will be cheap at its cost.

Mr. Edward Curran of Utica, asks whether a Jersey bull would be the best stock getter for the milk and cheese dairies in his section. By no means. The Jersey blood is valuable, mainly, because a large quantity of milk, and a proportional production of *casein*, have, in this breed, been subordinated to the production of cream and butter. A Jersey bull would impart to the stock of a cheese farm, a quality that would be little prized, and would probably lessen the value of the stock for the manufacture of common cheese. If you want a sure annual average of over 200 lbs. of butter from moderate feeding, the nearer you get to having a herd of pure Jerseys, the more likely you will be to secure your object, and the farther you will get from a great flow of milk, and a great yield of cheese.

I have received several letters from readers of the *Agriculturist* asking how they can get my high prices for butter. The question is a difficult one to answer. It depends much on the nearness of a good market, that is, of people who are willing to pay an extra price for extra quality; but it depends still more on the extra quality itself. The cows must be good, the feed must be good and regularly given, and above all, the dairy maid's part of the work must be thorough and untiring from the time the milk is brought into the house until the butter is sent out of it. The essential qualities of good butter are, that it should be worked to a firm, waxy texture; perfectly dry, of good color, and but very slightly salted. It should be put up in neatly printed lumps, and as it goes to market each lump should be surrounded with a piece of damp muslin. The most that can be said as to *flavor* is that there should be no objectionable taste, such as that of turnips or oil-meal.

If any one of these points is more important than another, it is the question of *color*—for most people taste with their eyes rather than with their palates. No butter, no matter how good, will fetch a high price unless it have a high color. In summer there is no difficulty, but *in the winter season butter is white.* I have a herd of pure Jersey cattle, the yellow pigment peculiar to whose organization has been the subject of much study. I have fed them on rowen hay, on turnips, on beets, on corn-meal, on everything, in short, that they would eat that is supposed to contain coloring matter, and I have never yet had in winter (from a dozen cows) a single pat of butter that was *naturally* more yellow than "cream-laid" paper. During the first winter of my operations, Mr. Tyler sent me from Philadelphia a pound-print of peculiarly deep-colored butter, to encourage me. He said its color was due solely to the corn-meal on which the cows were plentifully fed. He sent me the name of the maker and I visited him the next June. He told me, very frankly, that he used annatto the year around, so that his customers should not miss the summer color when he was *obliged* to use it in winter. The manner of coloring is important. I have tried various recipes, including carrot juice in the churn, and I think that nothing equals pure annatto, or rather the solid extract of annatto.

With Jersey cows, and I think with any others, while fed on succulent grass or corn fodder, it is not necessary to color during the summer season, but as soon as the color begins to pale in the autumn, a very little annatto should be added, the quantity being increased at each churning until the artificial has entirely supplanted the natural tint.

Annatto has another effect besides giving the color. It is a strong flavoring substance, and in countries where it grows it is much used in cooking on account of both its aromatic and its chromatic quality. In the dairy, it not only improves the looks of butter and cheese, but imparts a flavor that is a nearer approach to the "sweet vernal grass" taste than it is possible to obtain in any other way. The ordinary annatto of commerce is objectionable on account of its adulterations, but the pure dry extract (annattoine) is in every way desirable.

The use of annatto is very simple and easy. The darker extract being used, (there are two kinds) about $1^1|_2$ grains should be weighed out for each pound of butter to be made. This should be dissolved over night in boiling hot water, and kept in a warm place. In the morning it should be strained into the churn through a piece of fine cambric. The color given to the butter is not precisely that of summer, having a somewhat more reddish cast, but it is very rich, and the product is in every way improved by the application. Even for shipping to distant markets, the extra care above recommended will be amply repaid. There are dozens of buyers in New York City who are seeking for butter of extra quality for their retail trade, who would gladly pay even 50 per cent above the market price if they could be sure of a regular supply, no matter how small; and they will soon scent out a fancy brand.

After experimenting with various patented butter-workers, I have got one up on my own account after a model that I saw in use in Pennsylvania, and I like it better than any of the more complicated devices. It is simply a white oak table, two feet long and three feet wide, made of very heavy stuff, so as to stand firmly, one side being one inch lower than the other, with a groove along the lower edge to lead the buttermilk to one corner, from which it drips into a pail. The butter is laid on this table and worked with a blunt-edged white oak knife 12 inches long and 5 inches wide, with a projection 6 inches long at each end, for handles. The whole is made of $^3|_4$ inch stuff, worked thinner at the edges. The handles are two inches wide with rounded edges. With this apparatus the butter is worked out into a flat mass, wiped dry with a cloth containing a damp sponge, then cut crosswise and wiped again; then rolled together and re-worked—and so on until it is ready to receive the salt, which is worked in with the same implement.

My German dairy woman has taught me one wrinkle that may be new to others. When the butter has been thoroughly worked and is spread out thin upon the table, a knife is drawn through it from end to end at intervals of an inch, and then drawn through crosswise, so as to cut the whole mass into small square sections. It is then rolled together, flattened out and cut again—and again. Every cow hair in the butter that comes in contact with the knife is drawn out by it. I have never seen more than two or three hairs taken from one churning, (and it is a mystery how they came there) but with the ut-

most care that can be given fine hairs will sometimes pass through the strainer, and one of these in a pat of butter might cost a first-rate customer.

Horse Papers for Farmers.—No. 4.

It will be understood, that in the hints for the feeding of the colt from the time of his conception until he is a year old, I have had in view, not the average colt of the breeding farm, but a special animal that is intended for the personal service of the farmer and his family, for probably 20 years; an animal sprung from a noble sire and capable of a far higher development than the average work horse of the country;—not bred for sale, but expected to pay for extra care, extra food, and extra thought, by a long life of willing and efficient service. With such an animal, the question of education is hardly less important than that of food, for we not only want strength and vigor, but the courage and intelligence without which, strength and vigor will lose half their usefulness, and become a source of danger.

The horse that we have under consideration is to be the companion of our children, a helper in our labors, and a willing servant of our "women folks." These relations require that he should be docile, tractable, willing and good tempered, and the preparation for all these is best commenced when he is not more than a month old.

He should, even at this early age, become accustomed to the caresses of old and young. By the time he is six weeks old, a light halter may be put on his head, and after he gets used to this, a leading-strap may be buckled into it, and he may be very gently coaxed to follow a man who leads his mother at the same time. If he is disposed to pull back, he must be taught, then and there, that this is no part of the programme. Don't try to pull him in the opposite direction, but stand as firm as a rock until he gives up pulling and slackens the rein of his own accord. Then fondle him and induce him to step forward if possible. Perfect good temper and indomitable patience at this lesson will be worth more than a year's pounding and "breaking-in," when he is five years old. He has to learn at some time in his life that man is his master, and he will be a better horse all his days if he learns at the same time, that man is his friend. This lesson, once fairly implanted in his mind, will never be lost, unless as a result of inexcusable ill-treatment.

Mr. Charles L. Sharpless, of Philadelphia, breaks his colts to harness at the age of six weeks, and he claims that even if they never have a strap on them again until they are old enough for work, they seem never to forget this early teaching, and to take kindly to the harness from the first. He has a very light harness and a pair of small wheels, with light but strong shafts attached to the axle. Going into the pasture with his apparatus, he takes the colt by the halter and leads him up quietly with his mother, to inspect every part of the gearing.

Each part of the harness is subjected to his examination, and is then put quietly into its place, and loosely buckled. He is allowed to walk around in these until he becomes thoroughly accustomed to them. This part of the operation may require several repeated attempts, as the greatest care must be taken to neither frighten nor disgust the pupil. After he has become perfectly comfortable and "at home" in the harness, the man leading him drags the wheels about with him in the field, until he pays no attention to the shafts striking against his sides. After this, they are gently passed over his back and he is made to walk between them. Then they are passed through the tugs and he is allowed gradually to feel their weight. Then the traces are made fast and he is allowed to draw more and more of the load for himself until he has become a tolerably good harness horse.

In another instance that has come under my notice, a colt that had been taught this much was daily hitched to his drag and left to himself in a small barn-yard, and it was astonishing to see how soon he learned to manage it. In going under an open shed in the yard, the wheel caught against a post, and he turned and looked at it, and experimented with it, until, after several attempts, he backed it out of the way, and came in clear.

Of course his groom, a very careful man, watched him carefully, and took care that he did not become frightened and injure himself, but he soon learned to allow for his cart-wheels in moving about in the yard, as though they were a part of himself. At times he was allowed to amuse himself with a whiffle-tree dangling by the traces against his heels, and again with the loose traces striking against his legs. All this requires very little time and is rather an interesting amusement, than a task, and it insures an education of the young animal which no amount of rough riding and breaking-in could accomplish.

I believe that the coming generation of farmers will make more use of the saddle than their fathers do, and that no family horse will be considered perfectly satisfactory unless he is a tolerable saddle horse. Education for the saddle as well as for the harness, should be commenced with the foal. He should learn to bear the weight of a child on his back, and to carry it about without being alarmed. Both the weight and the sight of the human being in that position are novel, and should not be too suddenly presented. Of course, a colt only six weeks old should have only a very small child placed on its back. The little shaver may be taken in his father's arms and slowly insinuated into his place without danger of a fracas, although the attempt may have to be repeated many times before the colt understands what is wanted. In training, it may be set down as a universal rule, with young animals or with old, that, unless they have been at some time grossly ill-treated, they only need to understand what is wanted of them, to do it at once if within their power.

A colt that has been safely carried through its first year—well bred, well trained, and abundantly fed—starts his second year with a fair chance of making constant progress with even ordinary treatment. All that he now requires, until he is old enough for use, is good pasture in summer, and good hay in winter, although a little grain, (say two quarts of oats a day,) "to keep him going," will tell with good effect on his size and on his muscular development. He will probably be better fitted for work at four years old with it, than at five years old without it, and the saving of a year will more than pay for the extra feed.

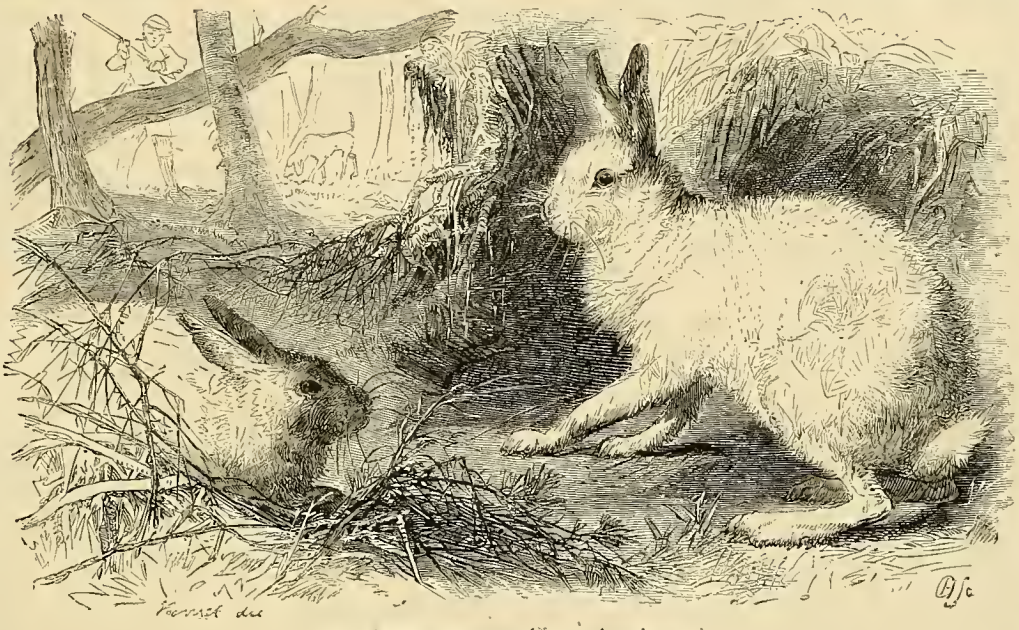
During the whole time of the animal's growth he will be benefited by being made a companion, and it will be all the better if the pasture is near the house, so that he can have daily attention. He will soon learn to come for a piece of bread or sugar, and to stand for a little combing of his mane and tail and the smoothing of his legs and back. It is hardly to be expected that a busy farmer will have much time for exercising a young horse before he is old enough to work, but any attention paid him in the way of leading or driving about (without a vehicle) will help in the final training. However well developed he may be, no horse that is not fully thorough-bred (and brought up in a racing stable, at that,) should be put to work before he is four years old.

Castration is performed with more safety, and more easily, just before weaning than at a later period; but if the colt lacks development in his fore-quarters—has too light a neck, or too low withers—he will improve in these respects if allowed to go "entire" until a year or more old. It would be useless to give here the directions for performing the operation, as it should always be entrusted to a skilled hand, and skilled hands could better instruct me than I them. All that I desire is to urge that castration *be performed.* Once in a thousand times there may be a half-bred horse raised that is worthy to be a stallion, but the chances are very strongly against him, and it would be better in the end that the race of mongrels be not perpetuated. That old rule should be ever before us: "Like produces like, *or the likeness of some ancestor.*" Let us not run the risk of producing the likeness of a cold-blooded ancestor. If we have got one service of a thorough-bred, we can get another when necessary, and my own conviction (based on some experience) is so strong that the sire should be really *thorough-bred*, that I would sooner pay $100 to have a mare, that is fit to breed from at all, served by a "four-miler" than to have her served by a half-bred for nothing; it would *pay* in the end. Any one who will look at the carriage horses belonging to even the richest men in the large cities, or who will go through the city horse markets looking for strictly fine carriage teams, will realize the fact that carelessness of breeding has made the race nearly extinct. He will see plenty of "roadsters," warranted to show a pace that is of no use except for very fast pleasure driving, but he will be lucky if he sees one really fine pair of well framed and stylish carriage horses. If he does, and if the animals are free from all defects and well broken, he will find them held at fabulous prices, even though they may not be able to trot a mile in less than six or seven minutes.

I believe that three-quarter-bred, well matched, well trained and stylish horses—such as may be raised from good, honest, cold-blooded granddams—will find, henceforth, a ready sale at $2,000 and upward per pair at four years old. I also believe that (accidents aside) such animals may be bred with certainty; and that the chances for getting more would be as great as for getting less. This sort of horse breeding would pay much better than the lottery business of breeding for fast trotting—where one horse in a hundred is worth $1,000, and one in a thousand $5,000, and nine-tenths of the balance $150. At the same time, if breeding to thorough-bred stallions became the rule rather than the exception, the average *working power* of all the horses in the country would be doubled by reason of the greater briskness, power, stamina and longevity that "blood" imparts. The question of the influence of blood on fast trotting is a disputed one. If I were to set about the production of this class of animals I would raise only thorough-breds, and develop the trotting action to the utmost in successive generations. Others, who have peculiar views about the "obliquity of the *os calcis*," advocate the mongrel theory. Without stopping to argue the question here, I may confidently assert that for the guidance of *farmers* my rule for breeding is the *safe* one.

The Northern Hare.—*Lepus Americanus.*

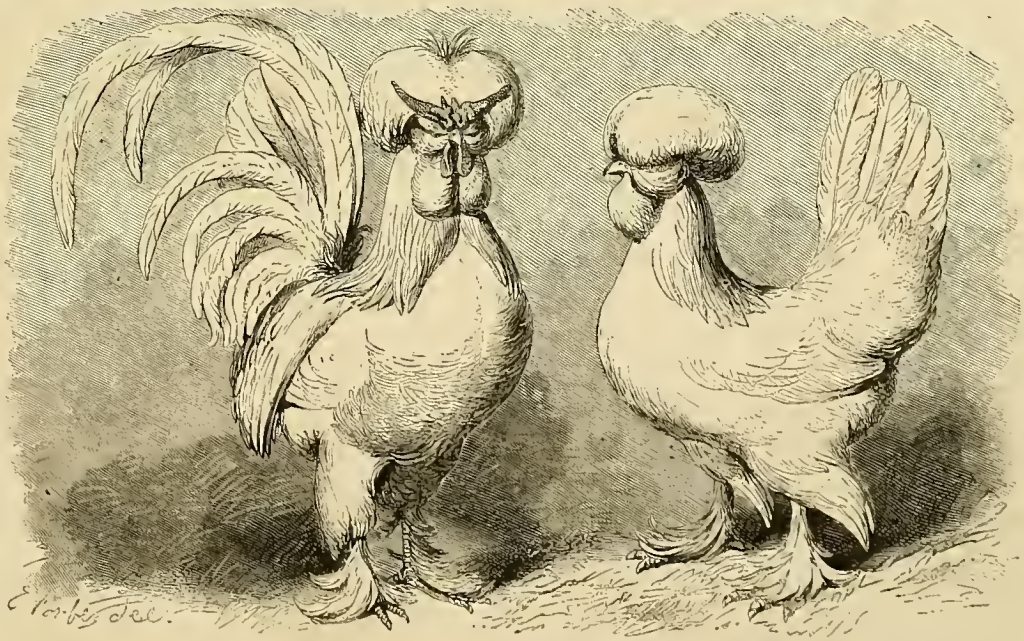
The true rabbits live gregariously, and form burrows, in which they rear their young. None of our rabbits have these habits, and the animals which, in this country, are popularly called rabbits, are strictly hares. We have, in North America, some thirteen species of hares, all of which are solitary in their habits, and instead of burrowing, make forms or nests of grass upon the ground, upon which they sit. The most common, after the Gray or Brown Rabbit, is the Northern Hare, also called White Rabbit. It is found from Virginia to Canada, and as far west as the plains of the Missouri. It is considerably larger than the common rabbit, has ears larger in proportion to the size of the head, and a longer hind foot. The feet are so thickly covered with hair, that the animal makes but little impression upon the snow. In summer, the color of the animal is of a reddish or cinnamon brown above, and white beneath the body; the short tail is sooty brown above, and dull grayish beneath. In winter, the pelage changes to white, but when the hair is parted, lead color and cinnamon color are seen below. The fur, at all seasons, has a rough and shaggy look, on which account the skins are of little value. The animal weighs from three to six and a half pounds. This hare inhabits dense swamps in winter, but in summer finds a retreat on higher ground. It is very seldom seen in the day-time, as it does its foraging during the evening and night. It forms well worn paths or runs, which it is said to follow for years, and many are taken by means of snares or traps, set in these runs. When pursued, it runs, or rather leaps, with great speed, and endeavors to escape the hunter by avoiding the open ground, doubling and turning among the thickest woods and undergrowth. It is much more fierce than the common rabbit, and when captured, bites and scratches with considerable energy. Numbers of this hare are sent to the New York market every winter, but as they are not highly esteemed, they sell for a low price. The flesh is dry and hard, and much inferior to that of the common gray rabbit. It has been stated that the hare was introduced from England into Canada, and from thence spread over a large part of the United States. This is an error, as the European hare differs from ours in many respects. It is larger, with ears longer in proportion to the size of the head, and it does not change its color with the seasons.



THE NORTHERN HARE—(*Lepus Americanus.*)

Sultan Fowls.

The Sultans were introduced from Turkey into England about the year 1854. They are an exceedingly beautiful and attractive breed, closely resembling the Polands in many of their characteristics, yet differing from them essentially in others. Their plumage is of the purest white, and they are abundantly feathered on every part, as shown by our excellent engraving.



A PAIR OF SULTAN FOWLS.

The comb is forked, at least it is in two parts, which, in the case of the cock from which the engraving was taken, so resembled a crescent, that every one was struck with the appropriateness of the combination of crescent and turban for a Turkish fowl. They have full Polish crests, and muffs or beards in both sexes. The body feathers are soft and abundant; the hackle flowing; the sickle feathers well developed; the legs fully feathered to the tips of the toes; the feathers of the hocks having stiff quills and extending back in a line with the thighs, which is called being "vulture hocked." The hens are persistent layers, rarely or never wanting to sit. They lay large, white eggs, and many of them. The breed is reputed to be easily kept, and hardy, easily confined, and useful as well as ornamental. The chickens feather very young, and hence are delicate, as is usually the case with breeds upon which the feathers come before the young bird has built up its frame sufficiently to sustain the draft upon it without becoming too much weakened. Several importations of these fowls have been made within a year or more, and naturally have attracted much attention at the exhibitions where they have been shown. The stock of Sultans in this country is small, but they have proved themselves hardy in our climate, and useful as layers. They are less than medium-sized fowls, but have plump bodies, and, if abundant, would be excellent for the table.

Osier Willow as a Hedge.

We recently saw a successful hedge grown from the Osier willow. It was strengthened at the top and in the middle by interweaving the branches, without severing them from the stock. These living ligatures became stronger every year and added to the stiffness of the fence. It was kept trimmed on the top at the hight of six feet. It turned cattle perfectly in its fourth year, and is constantly growing stronger. It was kept at its required hight by cutting annually a crop of boughs from the top for basket willow. This is a novelty in the way of growing willows, but we do not see why Osiers may not be grown just as well six feet from the ground, as upon its surface. The wands are quite as vigorous, and of as good quality. The double office this willow serves, treated in this way, would induce some, perhaps, to cultivate it, who otherwise would not think of it. The owner of this hedge peeled his wands by hand, and sold them in the market for ten cents a

pound. He remarked that he was not sure it would pay to employ men on purpose to peel willows, but as it furnished occupation for rainy days, he thought it paid. If the willows were worked up into home-made baskets without peeling, it might pay still better than to sell the rods at the present market price. They make a very durable basket, serving all farm purposes quite as well as those of oak or ash. The making of baskets is described and illustrated in the *Am. Agriculturist* for April and June, 1867.

Walks and Talks on the Farm—No. 76.

"I cannot afford to wait for clover and summer fallowing," writes an intelligent New York gentleman, a dear lover of good stock, who has bought an exhausted New England farm, "I must have a portion of it producing good crops right off." Very well. A farmer with plenty of manure can do wonders in a short time. Set a gang of ditchers to work, and put in underdrains where most needed. Have teams and plows enough to do the work rapidly. As soon as the land is drained and plowed, put on a heavy roller. Then sow 500 lbs. of Peruvian guano per acre broadcast, or its equivalent in some other fertilizer. Follow with a Shares' harrow. This will mellow the surface and cover the guano without disturbing the sod. Follow with a forty-toothed harrow and roll again, if needed, working the land until there is three or four inches of fine, mellow surface soil. Then mark off the land in rows as straight as an arrow, and plant corn. Cultivate thoroughly and kill every weed. If the ditchers cannot get through until it is too late to plant corn, drill in beans on the last drained part of the field.

Another good crop to raise on a stock farm is corn fodder. This can be drilled in from time to time as the land can be got ready. Put on half a ton of guano per acre and harrow in, and then mark off the rows three feet apart, and drill in four bushels of corn per acre. Cultivate thoroughly and expect a great crop. By the last of July the Ayrshire cows will take kindly to the succulent corn fodder, and with three or four quarts of meal a day, it will enable each of them to make 10 lbs. of butter a week.

For the pigs, sow a few acres of peas. These will do well on sod land, sown early or late, or a part early and a part late, as most convenient. Sow broadcast and harrow in 500 lbs. of Peruvian guano per acre and 200 lbs. of gypsum. Drill in three bushels of peas per acre, or, sow broadcast, and cover them with a Shares' harrow. Commence to feed the crop green as soon as the pods are formed, and continue to feed out the crop, thrashed, or unthrashed, until the middle of November. Up to this time the bugs do comparatively little damage. The pigs will thrive wonderfully on this crop, and make the richest and best of manure.

I have little faith in any attempt to raise root crops on land not previously well prepared. But as it is necessary to have some mangel wurzel and Swede turnips for the Ayrshire cows and Long-wool sheep next winter and spring, select the cleanest and richest land that can be found that was under cultivation last season. If fall-plowed the chances of success will be doubled. Plow the land two or three times and cultivate, harrow, and roll till it is as mellow as a garden. Sow 400 lbs. of Peruvian guano and 300 lbs. of good superphosphate per acre broadcast and harrow it in. Ridge up the land into ridges 2½ to 3 ft. apart, with a double mold-board plow. Roll down the ridges with a light roller and drill in the seed. Sow the mangel wurzel in May—the earlier the better—and the Swedes as soon afterwards as the land can be thoroughly prepared. Better delay till June rather than sow on rough land. The first point will be to attend to the grass land. This affords the most hopeful chance of getting good returns the first year. But no time is to be lost. Sow 500 lbs. of Peruvian guano per acre on all the grass land and on the clover, with 200 lbs. of gypsum in addition on the latter. If this is sown early enough, so that the spring rains dissolve it and wash it into the soil, great crops of grass may be expected.

"But will it pay?" My friend in New York is a very energetic and successful business man, and he has a real love for farming, and I have no sort of doubt that, taking the New York business and the farm together, they will afford a very handsome profit. Furthermore, I have no doubt that if, after he has drained it, he would cover the whole farm with 500 lbs. of Peruvian guano per acre, or its equivalent, it would pay him better than any other agricultural operation he is likely to engage in. By the time it was on the land the cost would amount to about $25 per acre. If he sells no more grass or hay from the farm than he would sell if he did not use the guano, this twenty-five dollars may very properly be added to the permanent capital invested in the farm. And in this aspect of the case, I have no hesitation in saying it will pay a high rate of interest. His bill for labor will be as much in one case as in the other; and if he uses the guano he will probably double his crops. His grass lands will carry twenty cows instead of ten, and if he raises the corn fodder and roots, he can probably keep thirty cows better than he could otherwise keep a dozen; and, having to keep a herdsman in either case, the cost of labor will not be much increased. "But you think it will not pay?" It will probably not pay *him*. I do not think *his* business would pay me if I lived on my farm and went to New York only once or twice a week. If there is one business above all others that requires constant attention it is farming—and especially stock farming. But my friend is right in saying that he cannot afford to wait to enrich his land by clover and summer fallowing. His land costs too much; he has a large barn and everything requisite to keep a large stock of cattle and sheep. The interest on farm and buildings and the money expended in labor would run on while the dormant matter in the soil was slowly becoming available under the influence of good tillage. The large barn must be filled at once, and the only way to do this is to apply manure with an unsparing hand. If he lived on the farm, I should have no doubt that, by adopting this course and by keeping improved stock and feeding liberally, he could make money. Perhaps he can find a man who will successfully manage the farm under his direction, but the probabilities are that his present profit and pleasure will come from the gratification of his early love for country life.

I had made up my mind to say no more about summer fallowing. But it is evident that the matter is not understood. An intelligent Ohio farmer writes me: "I see that you recommend fallow plowing, what are your reasons? Granting that the *immediate* result is an increased crop, is not the land impoverished? Will not the thorough cultivation of corn or potatoes answer as well?" And a distinguished farmer, of this State, in a recent communication expressed the same idea—that summer fallowing would soon impoverish the land. But if this is the case, the fault is not in the practice of summer fallowing, but in growing too many grain crops and selling them, instead of consuming them on the farm. Take two fields; summer fallow one and sow it to wheat. Plant the other to corn and sow wheat after it in the fall. You get, say 35 bushels of wheat per acre from the summer fallow. From the other field you get, say 30 bushels of shelled corn per acre, and 10 bushels of wheat afterwards. Now, where a farmer is in the habit of selling all his wheat and consuming all his corn on the farm, it is evident that the practice of summer fallowing will impoverish the soil more rapidly than the system of growing corn followed by wheat—and for the simple reason that more wheat is sold from the farm. If no more grain is sold in one case than in the other, the summer fallowing will not impoverish the soil any more than corn growing.

My idea of fallowing is this: The soil and the atmosphere furnish, on good, well cultivated land, plant-food sufficient, say for 15 bushels of wheat per acre, *every year*. It will be sometimes more and sometimes less, according to the season and the character of the soil, but on good, strong limestone land this may be taken as about the average. To grow wheat every year in crops of 15 bushels per acre would impoverish the soil just as much as to summer fallow and get 30 bushels of wheat every other year. It is the same thing in either case. But in summer fallowing we clean the land, and the *profits* from a crop of 30 bushels per acre every other year are much more than from two crops of 15 bushels every year. You know that Mr. Lawes has a field of about thirteen acres that he sows with wheat every year. On the plot that receives no manure of any kind the crop for twenty years averaged 16¼ bushels per acre. It is plowed twice every year, and the wheat is hand-hoed in the spring to keep it clean. A few years ago, in a field adjoining this experimental wheat field, and that is of the same character of land, he made the following experiment. The land after wheat, was fallowed and then sown to wheat; then fallowed the next year and again sown to wheat, and the next year it was sown to wheat after wheat. The following is the result compared with the yield of the continuously unmanured plot in the experimental field that is sown to wheat every year:

1. Year—No. 1—Fallow			No crop.
No. 2—Wheat after wheat	15 bush.	3¼	pecks.
2. Year—No. 1—Wheat after fallow	37 "	—	"
No. 2—Wheat after wheat	13 "	3¼	"
3. Year—No. 1—Fallow after wheat			No crop.
No. 2—Wheat after wheat	15 bush.	3¼	pecks.
4. Year—No. 1—Wheat after fallow	42 "	—	"
No. 2—Wheat after wheat	21 "	0¼	"
5. Year—No. 1—Wheat after wheat	17 "	1½	"
No. 2—Wheat after wheat	17 "	—	

Taking the first four years, we have a total yield from the plot sown every year of 56 bushels 2¼ pecks, and from the two crops alternately fallowed a total yield of 79 bushels. The next year, when wheat was sown after wheat on the land previously fallowed, the yield was almost identical with the yield from the plot that has grown wheat after wheat for so many years.

So far these results do not indicate any exhaustion from the practice of fallowing. On the other hand they tend to show that we can get *more* wheat by sowing it every other year than by cropping it every year in succession. The reason for this may be found in the fact that in a fallow the land is more frequently exposed to the atmosphere by repeated plowings and harrowings; and it should be borne in mind that

the effect of stirring the land is not necessarily in proportion to the total amount of stirring, but is according to the number of times that fresh particles of soil are exposed to the atmosphere. Two plowings and two harrowings in one week, will not do as much good as two plowings and two harrowings, at different times in the course of three or four months. It is for this reason that I object, theoretically, to sowing wheat after barley. We often plow the barley stubble twice, and spend considerable labor in getting the land into good condition; but it is generally all done in the course of ten days or two weeks. We do not get any adequate benefit for this labor. We can kill weeds readily at this season (August), but the stirring of the soil does not develope the latent plant-food to the extent it would if the work was not necessarily done in such a limited period. I say *theoretically*, for in point of fact I *do* sow wheat after barley. I do so because it is very convenient, and because it is more immediately profitable. I am satisfied, however, that *in the end* it would be more profitable to seed down the barley with clover.

We *must* raise larger crops; and to do this we must raise them less frequently. This is the key-note of the coming improved system of American agriculture in all sections where good land is worth less than one hundred dollars per acre. In the neighborhood of large cities, and wherever land commands a high price, we must keep our farms in a high state of fertility by the purchase of manures or cattle foods. Those of us in the interior, where we cannot buy manure, must raise fewer grain crops and more clover. We must aim to raise 40 bushels of wheat, 50 bushels of barley, 80 bushels of oats and 100 bushels of shelled corn, and 5 bushels of clover-seed per acre. That this can be done on good, well-drained land, from the unaided resources of the farm, I have no doubt. It may give us no more grain to sell than at present, but it will enable us to produce much more mutton, wool, beef, cheese, butter and pork than at present.

"But, then, will there be a demand for the meat, wool, etc.?" The present indications are highly favorable. But we must aim to raise *good* meat. The low-priced beef and mutton sold in our markets is as unprofitable to the consumer as it is to the producer. We must feed higher, and to do this to advantage we must have improved stock. There is no profit in farming without good tillage, larger crops, improved stock and higher feeding. The details will be modified by circumstances, but the principles are the same wherever agri-*culture* is practiced.

A farmer in Virginia, who says he finds raising pork at present prices highly profitable, asks what effect the manure from 100 bushels of corn fed to pigs would produce applied to corn—continuing the crop until all the manure is used up. I cannot answer the question. The pigs will take from the food probably not more than five per cent of the most valuable elements of plant-food, and consequently, if the stalks were also returned, the manure from the hundred bushels of corn ought to give 95 bushels more than the same land would produce without manure. It will not give such an increase the first year, and probably not for several years, because the roots of the corn do not come in contact with every part of the soil. In the case of Mr. Lawes' experiments it required, on an average of 12 years, with a moderate supply of ammonia and a liberal supply of minerals, 4.86 lbs. of ammonia to produce one extra bushel of wheat and its proportion of straw. One hundred bushels of corn of 60 lbs. per bushel contain 108 lbs. of nitrogen, equal to a little over 131 lbs. of ammonia. If we calculate that five per cent is retained in the animal, there should be 104¾ lbs. of ammonia in the manure per 100 bushels of corn. This manure applied to an acre of wheat would give us on the average an *increase* of not quite 23 bushels. In the case of wheat we seldom get back in the increase more than one-half the nitrogen applied in the manure—often not over one-third. What becomes of the other half is a question not yet fully determined. Part of it may be thrown off from the leaves of the plant during its growth, and part remain in the soil in such a condition as to be but slightly, if at all, available for the growth of another crop of wheat. But *it may be available for the growth of clover*. In fact, I am inclined to think that the large amount of nitrogen found in a good crop of clover is not obtained so much from the atmosphere as from the accumulated stores of nitrogen in the soil that are unavailable to the wheat plant. The clover takes them up, and and when it is returned to the soil, either directly, as a green manure, or as manure from animals living on clover, this nitrogen, in part, at least, becomes available to the wheat plant. But whether this is so or not, the fact, as Geddes says, is well established that the growth of clover *does* enrich the land.

Some one writes to the *Agriculturist:* "Why does not 'Walks and Talks' stop whining about the high price of labor?" Why, indeed? It does no good. We had better accept high wages as a fact, and look the matter fairly in the face. Farmers cannot control the labor market. And as long as so many railroads and other public works are going on, labor will be high, no matter how low the price of grain may be. But there is one consoling thought—the money is not sent out of the country. The men who get these high wages are enabled to live better. They buy better clothes, and this has a tendency to advance the price of wool, and they will consume more butter, cheese and meat. What farmers want, and what our soils need, is a good price for all animal products. With the exception of wool, we have no reason to complain of the present price of these products, and it would seem as though wool had "touched bottom" and the tendency is upward. Give us good prices for beef, mutton, wool, pork, butter and cheese, and we can rapidly improve our farms. To me the prospect looks less discouraging than it did some months ago. Our population is rapidly increasing. The Southern States have received a large sum of money for their cotton crop, and are spending it wisely in developing their resources. They are sending North for improved implements and improved stock, as well as for pork, cheese, butter and other agricultural products. Then we have a railroad across the continent opening up vast regions marvelously rich in mineral and agricultural wealth. Already the West is beginning to feel the influence of this new outlet for its products. The other day, I received a letter from a farmer in Colorado wishing me to procure him two or three kinds of the best breeds of pigs. I went to the Express office in Rochester to ascertain the cost of sending them. The agent looked on his books, but could find no such place. He then went to a large map hanging in the office, but it did not reach the spot where this enterprising farmer lives, within five hundred miles. The incident only shows what a wonderful age and country we live in. Let a young farmer raise anything that is really valuable; let him be true to himself and honorable in his dealings, and fame and fortune await him.

I do not think wages will be much lower. But we shall discriminate more closely as to the kind of men we employ by the year. Some men are better worth $30 a month than others are worth $20. Good farm men, who are faithful and industrious, and especially those who can take care of stock, will continue to receive good wages. Let the others dig railroads under the sharp eye of a sub-contractor; it will do them good. Our farm men must learn that if they are to receive high wages they must earn them. They must learn to keep things in order and economize time; to do work by machinery; to drive three and four horses instead of two; must ride instead of walk, and then use the strength thus saved in taking extra care in feeding and cleaning their teams. They must learn that the proper management of improved stock is the highest branch of agriculture. For my part I do not want cheap labor. It is the dearest and most provoking of all labor. I want a man who has brains as well as muscle—a man who is quick to think and prompt to act. There is a demand for such men on the farm as well as in other industries, and they will obtain high wages for the reason that they can earn them.

It may be thought that this question of wages does not affect that large class of farmers who, with the aid of their family, do their own work; but this is not the case. High wages affect the price of everything that we have to buy and sell. The sons of farmers will not be content to work at home for poorer fare and poorer wages than they could obtain elsewhere; so that, in point of fact, such farmers need to turn their attention to improved stock and improved farming as much as those who depend principally on hired help. It has been said that high rents and high taxes in England *compelled* the farmers to adopt an improved system of farming. High wages and high taxes will do the same thing here. A farmer cannot pay his taxes and support himself and his family with crops of wheat of 10 bushels per acre, or with cows that do not make over 100 lbs. of butter a year, or with pigs that must be kept 18 months and then be fed an acre of corn each to make them dress 300 lbs. The farmers who do their own work are the very men who should adopt high farming and keep improved stock. They can bestow the necessary care and attention, and it is this which is so difficult to hire. I know a farmer with 75 acres of good land that makes probably $1,000 a year. He is a capital farmer, works early and late, keeps everything in order, gets his crops in at the right time, and suffers scarcely a weed to grow on the farm. He pets his cows, and loves to feed and take care of all his animals. I visit him frequently, and always come away with the feeling that he is cheated out of half his reward from not keeping improved stock. He bestows as much care on a flock of common Merinos as is necessary for a flock of thorough-bred Cotswolds; and Mr. Campbell's Shorthorns and Ayrshires receive no better treatment (though richer food) than his native cows. This good care and treatment pays him vastly better than if he neglected his stock, but if he kept improved animals his profits would be more than doubled.

THE JERUSALEM ARTICHOKE.—Those who wish to try the Jerusalem Artichoke, should plant it as early as the condition of the soil will allow. The land after plowing is marked

out with furrows 3 feet apart, and the small tubers are dropped about 18 inches apart, and covered 3 inches deep. Go over the field in a week or two with a light harrow to kill weeds, and cultivate between the rows until the plants get so large, as to render it unnecessary. It grows readily in dry soil. Those who make trial of it, should take care that the plant does not become established as a weed.

Alsike Clover.

The Alsike clover is still under discussion in the agricultural papers, and the accounts as to its value continue to be variable. Some of our correspondents ask how this differs from other clovers, and others wish our "candid opinion" in regard to it as a forage crop. This clover is also called Swedish, and frequently the "Swedish or Alsike," a doubling of names which it is desirable to avoid. The name Alsike was given to it because it was introduced into Great Britain in 1834, from the Swedish district of Alsike. It grows wild in Sweden, Denmark, and throughout the greater part of Russia, as well as in Southern Europe. Its botanical name is *Trifolium hybridum*. We give an engraving about

ALSIKE CLOVER—(*Trifolium hybridum.*)

one-third less than the natural size, which will show that it is readily distinguishable from the Red Clover (*Trifolium pratense*), by the form of its leaves, as well as by the character of its flowers. The flower head of the Red Clover has leaves just below it, while the separate flowers are sessile, or without individual stems, and they do not turn downwards after blooming. The flowers of the Alsike are white, (the older ones turning pink,) and in this it resembles the White Clover, (*Trifolium repens*), as it does in some other particulars. It is distinguished from the White by its erect (not creeping) stem, and its more wedge-shaped leaflets, which are more distinctly toothed on the margin, and without the notch at the end that gives those of the White Clover a heart-shape. The seeds of the three are readily distinguished. Red Clover seeds are about twice the size of the other two, and have a distinct notch or angle upon one side; they vary in color from lemon-yellow to purple. The seeds of the White and Alsike are nearly of the same size; the White are less regular in shape and vary in color from lemon yellow to light chestnut-brown. The seeds of the Alsike range from pale yellowish-green through olive to blackish-purple. The seeds can be readily distinguished under a magnifier. The seeds ripen late in July. Being much smaller than those of Red Clover, it requires only half the amount of seed to the acre. The present price of seed is from 60 to 75 cents a pound, according to quantity.

An analysis by Dr. Anderson showed the Alsike to contain nearly twice as much nitrogen as the common clover, but more recent analyses, given by Prof. Johnson in "How Crops Grow," do not sustain this conclusion—although it is a *little* richer in nitrogen than the Red Clover, but not so rich in this respect as the White Clover. It is a perennial, of a duration depending upon the character of the soil, but usually short. It goes to seed readily and in permanent meadows or pastures reseeds itself and continues to flourish for many years. The Alsike Clover attracted much attention in England because it was found to flourish on soils that were "clover sick." It has never been claimed by any reliable authority that it would produce as much hay per acre as the Red Clover where the soil was well adapted to the growth of the latter. But it is found very useful on soils where clover sickness prevails. We are not warranted in assuming from this, however, that the Alsike Clover will grow on soils where Red Clover perishes from an excess of moisture. The "clover sickness" of England and the failure of clover on our low, wet, mucky soils are entirely different "diseases." Underdraining will cure the latter, but the former often occurs on the driest and best drained land. As yet "clover sickness" is unknown or exceedingly rare in this country, and so far as this disease (supposed to be caused by a fungus) is concerned, we have no need of Alsike Clover. The only question is in regard to its value on low, wet land where the Red Clover is killed out. It has more fibrous roots, less tap-root than that, and hence may not be as liable to be thrown out by the frost on wet land. It is on this point that we desire information. We are aware that every good quality has been ascribed to the Alsike, but we imagine that its advocates are influenced by a desire to increase the demand for the seed. Where good crops of Red Clover can be grown there is nothing to be gained by sowing the Alsike. It will not yield as much hay per acre, and as the roots do not go so deep it will not stand a drought so well, or bring up from the subsoil as much plant-food as the Red Clover, and will not enrich the land as much

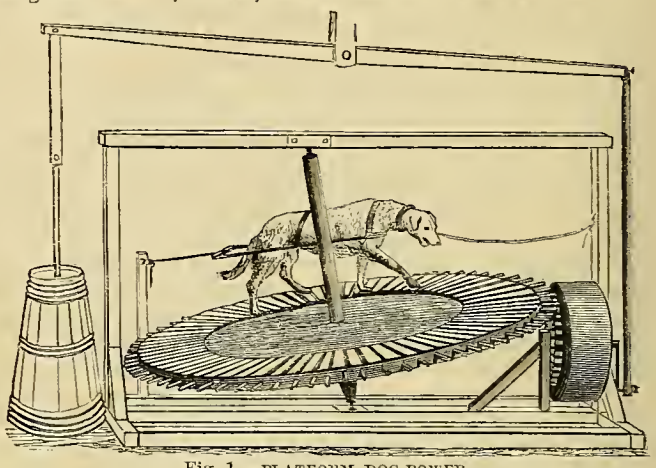


Fig. 1.—PLATFORM DOG-POWER.

Dog and Sheep Power for Churning.

Something has excited the interest of our subscribers in "dog-powers"—that is, in contrivances for utilizing the power of dogs for churning, and, perhaps, other light work—as we judge from the numerous inquiries lately received. This is a good symptom, it shows that there are some people who have waked up to the need of alleviating the drudgery of woman's toil. Where there is much churning to be done, a dog-power is truly a labor-saving device. There are several different kinds, the best, perhaps, is a "tread-power," like the ordinary one, or two-horse tread-powers. These, however, are rather costly, and can only be made by experienced mechanics. There are forms, however, which may easily be made by any one familiar with the use of tools. Two of these we represent in the accompanying engravings. They are worked upon very different principles. The revolving platform, fig. 1, is set at such an angle that, though the weight of the dog operates to favor the turning, it is, after all, by his strength of draft that the machine is effective. The animal must be harnessed in some simple way and attached to some fixed object. The harness figured has no advantage over the simpler one by which the arctic sledge-dogs are attached to the vehicles they draw. This is by means of a broad collar-band, and a small rope or thong passing from it between the legs and held in position by a belly-band. The platform power is made as light as possible, consistent with strength. There is a frame made, supported upon the shaft by means of cross-beams pinned

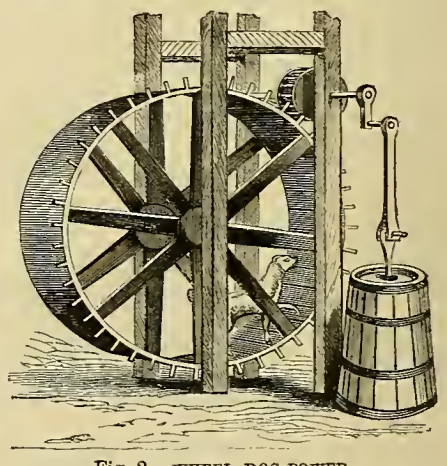

Fig. 2.—WHEEL DOG-POWER.

to it, braces beneath, and a rim in which pins are set to act as cogs, meshing in with flat ones in a drum. The churn may be operated by a crank and walking-beam, as shown, or, if a rotary churn, by a band running upon the drum. A track must be made for the dog by nailing radiating cleats upon the platform. Any arrangement to lessen friction, like friction-wheels, and iron sockets and bearings, will be of essential service. The platforms are usually 7 or 8 feet in diameter. The drum should be a little swelled in the center to prevent the band running off.

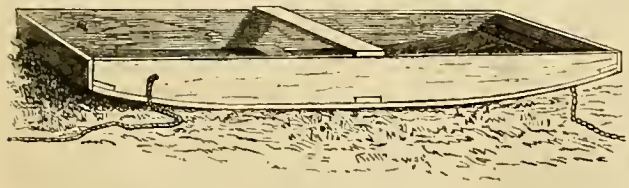
The wheel-power is a little more difficult to make, but has some advantages. It is operated by the weight of the animal, his labor being exerted precisely as in running up hill—as a squirrel runs in his cage. A heavy block is sometimes suspended from the axle to hang down behind the dog, and cross-bars may be nailed to the arms or spokes to prevent his jumping through. The wheel is either made only wide enough for one dog to run in, or wide enough for two to run abreast. Friction rollers, in this case, are also very useful. The wheel is hung in a frame, that will not shake with its motion, which is sometimes quite irregular. It is made with bent rims, fastened to the spokes, and boards are nailed to these.

The greater the diameter, the easier and slower will the wheel turn. Eight feet is about the right size, and the wheel should be banded with common hoop iron nailed on—regular hoops not being neeessary. A three-quarter-inch iron rod makes the bent axle, and this should be keyed fast in the wheel, while the ends should run in metal boxes, which may be oiled.

Dogs, sheep, and goats, are used in these and similar "powers." The last are rather light but active and hardy, and the exercise does them good, especially if they are kept stabled.

A Boat for Getting Out Muck.

Digging muck is work that may be done at almost any season, provided drainage can be got. Where the water of the swamps cannot well be drawn off, the work is usually deferred until very dry weather, which is not necessary, as a little contrivance will make the job an easy one. "S. R.," of Ashtabula Co., Ohio, writes: "We have been drawing out muck upon gravelly ground, hauling it out of the swamps in its wet state by means of a boat, made as follows: Take five one-inch boards, one foot wide, and eleven feet long. The side boards are sloped at the forward ends to five inches, and at the back end to eight inches. Three cross-pieces are put in, the bottom boards are bent to them and nailed. The boat is drawn into the swamp by hand, and drawn out by a team attached to a long chain." We think more cross-pieces would be desirable to give strength, but it is clearly unnecessary, and in fact undesirable, to have



BOAT FOR GETTING OUT MUCK.

the boat water-tight, for the water must have a chance to run out. Five five-inch cross-pieces, and three-quarter-inch oak boards would make a stiff, good bottom, which would wear a long time even if hauled a good ways over anything but a stony or gravelly soil. The engraving shows hand ropes near the stern for hauling the boat backwards, and the chain at the bow.

Three-Story Barns.

Three-story barns, or "three-deckers," as they are sometimes called, when conveniently arranged, are decidedly the most economical, both of material in building, and of labor and

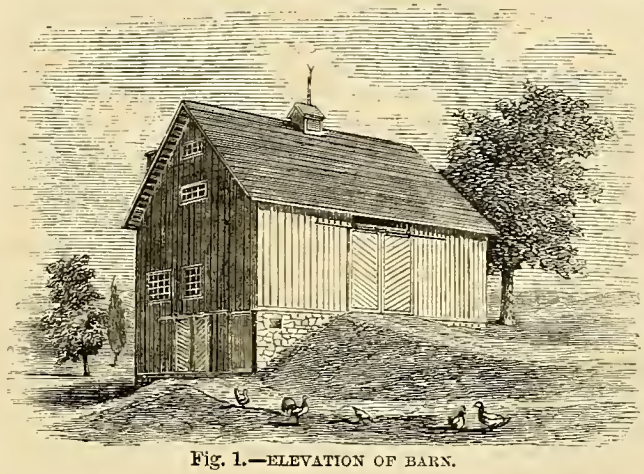


Fig. 1.—ELEVATION OF BARN.

care in management. The accompanying plan has been prepared in response to several requests for a barn-plan to accommodate a small farm, and not to cost more than $1,500 to $2,000.

It is rarely or never worth while to attempt to build a three-story barn upon level ground, but where a descent can be used having a slope of 18 inches in 10 feet for a space of 50 or 80 feet, it will do very well. A bridge, or a walled approach to the barn floor is often dangerous. Access by a self-sustaining sodded earth bank, sloping off gradually to the general surface, is decidedly preferable. A good cellar is seldom to be had without considerable digging, and the wall against the bank must be a substantial one of concrete, or of stone, or brick, well laid in cement, and guarded from the action of water by surface channels and underdrains. The cellar ought to be at least 9 feet high, the floor grouted and cemented water-tight, and should be accessible from the south. Being used for manure, convenience of loading carts requires it to be reasonably high. The feeding or cattle floor is not necessarily so high; 7 feet in the clear is as low as one ever ought to be, and 8 feet is about right. This floor should be accessible from each end, and well lighted. The openings for the manure to be thrown into the cellar, and for the liquid manure to flow through, must be where the liquid will not rot the beams. The floor should be laid of well-seasoned inch-and-a-half plank, merely tacked down at first if not perfectly dry, especially if the barn can stand through one summer before it is used. In this case the floor can be re-laid permanently in autumn, after this extra seasoning, and the seams caulked and pitched. The thrashing floor should be not less than 12 feet wide, the doors opening nearly the full width, and 10 feet high. From the sill to the plate cannot well be less than 14 feet, and the barn should be framed to dispense with the great cross-beams so much in the way of the horse-forks (see figure 5). The side beams, connecting the inner posts with the outer frame, should be level with the top of the great door. We commend a feature which we have long known to work well, namely, laying a corn floor upon the tie-beams of the roof. In this barn such a floor would afford 18 × 40 feet of space for spreading out corn to cure, in the hottest place to be found. Such a loft will hold easily 1,000 bushels of corn in the ear. The corn is lifted in tubs attached to the common horse-fork rigging. The corn sheller is placed here, and the shelled corn run down by a shute.

In building such a barn economically, it is expected of course that the farmer will do a good deal of the labor with his own men and teams, at times when other work does not press. He will dig the cellar and grade the ground for the approach and for the barn-yard. He will haul all the stones, sand, cement, and lime, for the wall, and, perhaps, mix the mortar and lay the walls himself. He will cut and hew the timber, haul to the saw-mill and back again, and assist in the framing and raising. It depends, therefore, a good deal on the part of the country in which the barn is to be built, what timber, as well as what foundation, can be economically used. The barn can be built near New York with bought materials and hired labor, for $2,000.

DESCRIPTION OF THE BARN. — The barn is 30 × 40 feet inside measure, and the plans are drawn to a scale of $^1/_{16}$ of an inch to the foot. Fig. 2 is a plan of the main floor. On the left, space is taken for the shop and the grain room.

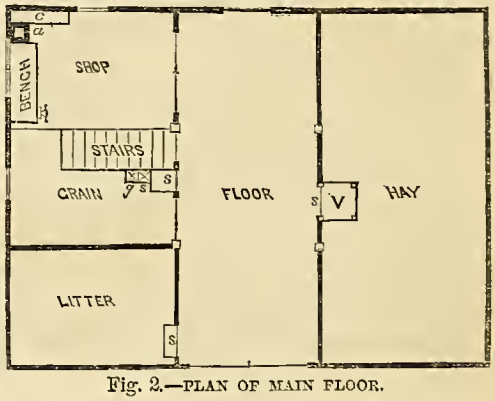

Fig. 2.—PLAN OF MAIN FLOOR.

The former, a room 10 × 14, has a large double window and a single one. The double doors make it possible to run a wagon or carriage into the shop, for painting or other repairs. There is a carpenter's bench and a closet for tools.

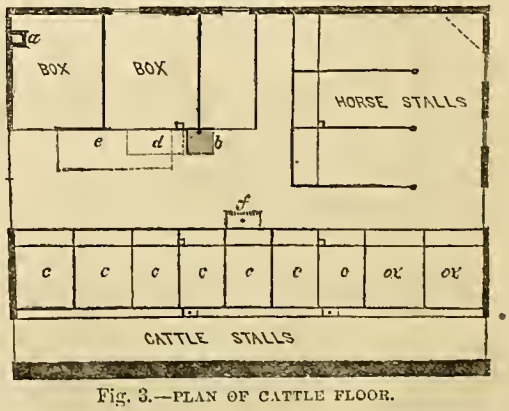

Fig. 3.—PLAN OF CATTLE FLOOR.

The chimney passes through this room, and a fire can be made if necessary. The grain room should be supplied with bins, and there should be two or three shutes for different kinds of grain or meal. These are shown at *g s*, fig. 2,

and are intended to be of canvass, after passing through the floor, so that they may be turned to one side and out of the way. These rooms need not be more than 7 or 7½ feet high. From the thrashing floor, two shutes, or trap doors communicate with the floor below—one near the stairs for cut hay, etc., one near the litter bay, through which bedding may be thrown down at the rear of the cows, while the ventilator is also used as a shute, and through it, long hay is

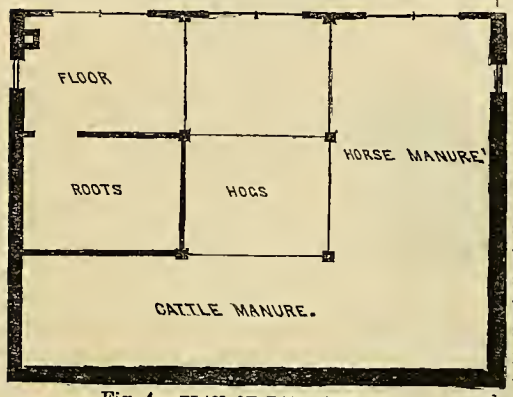

Fig. 4.—PLAN OF BARN-CELLAR.

thrown down, falling in the passage-way between the horse stables and the cow mangers. This ventilator (*V*) is 3 × 3 feet square, and extends from the cattle floor out through the roof of the barn.

The plan of the cattle floor (fig. 3) needs little explanation. The stairs at *e* are hinged and may be turned up and fastened, so that a cart can be driven, or backed under them, to dump a load of green fodder upon the floor, or one of muck to be thrown through the trap door *f* to the pigs. The feed-box *d* is movable. Near the end of the barn, where the horse and ox stalls are, the shed for wagons, carts, tools, etc., is supposed to be placed. At *b* a hydrant and water-trough is placed. One corner of the horse stable may be partitioned off for nice harness, etc., if desired. In the cellar plan, fig. 4, a root cellar is provided, also a floor where steaming apparatus may be set up. Here the "working hogs" are to be kept, and either shut off from the manure, or allowed to range over it, and given the range of the barn-yard besides, if that be desirable. This cellar is accessible to carts or wagons through three 8-foot doors, and it is light-

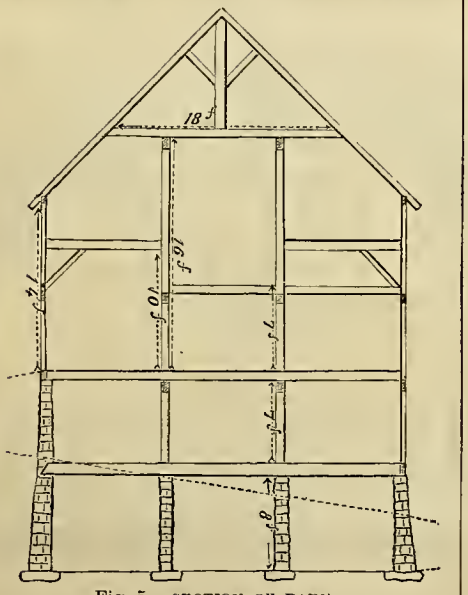

Fig. 5.—SECTION OF BARN.

ed by windows in these doors, and by others in the ends. The ground of the barn-yard slopes towards the cellar, and the water is collected in a tank to be pumped through a hose over the manure whenever it gets too dry, or too hot. Fig. 5 represents a cross-section of the barn, and shows the framing and slope of the ground.

Wooden Shoes for Horses.

Much labor would be saved in gathering the hay crop upon salt marshes and on reclaimed swamps, if horses could be used for mowing, raking, and carting. It often happens that the farmer has several acres of this soft land, where the crop costs all it is worth to gather it. He must mow, rake, and move the grass by hand, or let it rot upon the ground. We recently saw a wooden shoe that completely remedied this difficulty. It was made of stout oak board, one inch in thickness, 10 inches long, and 8 broad, and rounded at the corners. Fig. 1 shows the bottom of the shoe. A cleat is fastened across each end to prevent it from splitting, and to give additional strength to the shoe; this should be fastened either with stout screws 1¾ inches long, or with wrought iron nails driven through and clinched upon the upper side. An iron strap is fastened across the middle of the shoe to receive the shanks of the strap going over the hoof of the horse, which are held in place by screws and nuts. Fig. 2 shows the upper side of the shoe. The horse should be rough shod, and places should be cut into which the toe and heel corks will snugly fit.

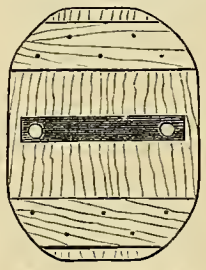

Fig. 1.—UNDER SIDE.

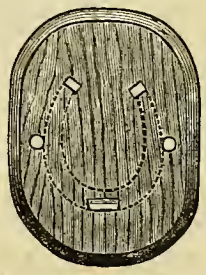

Fig. 2.—TOP OF SHOE.

In fig. 3 the hoof is shown as it stands upon the shoe. An iron strap (fig. 4) is fitted to the hoof, and the shanks pass through the plank and are fastened with a nut and screw. This shoe is so simple in its construction that any one accustomed to the use of carpenters' tools can make the wooden part of it, and a blacksmith can furnish the iron straps and screws. A common monkey-wrench will be needed to put on the nuts, and to tighten them, if they get loose.

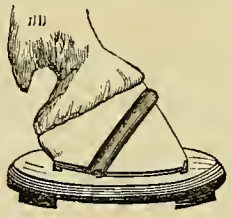

Fig. 3.—SHOE FITTED.

A set of shoes made of good white oak will last a great many years. It will be seen that the shoe enlarges the lower surface of the hoof about four times. It is found in practice that a light horse, weighing, say 900 lbs., shod in this way, can go upon any soft land, where a man could walk, with safety. If the horses are very heavy, or the land very soft, the shoes must be enlarged. These articles had been in use upon the farm where we saw them, some ten years, and so manifest were their advantages that they had been adopted by all the farmers in the neighborhood who had occasion for them. They were in use by all the owners of a large reclaimed salt marsh, and the facility they afforded for gathering the crop, had added very much to the value of the land. To owners of marsh lands these shoes will be invaluable.

Fig. 4.

Hints on Turkey Raising.

The southern part of New London county, Conn., is famous for its turkeys, and the manner of raising them is thus described by "A Native": "Ten or twelve hens with a gobbler is a good stock, and if there is a good range for them, this number may be kept with very little more trouble than a trio. Birds from 2 to 4 years old will bring much stronger chicks than yearlings, and give much better results. But if, from any cause, last year's hens are kept, let them be from the early broods. The late broods should all be sent to market. It is a great point to make the hens all lay near home, and for this purpose it will pay to yard them for a few days when they commence laying. They are thus much more easily protected from foxes, skunks and vermin, and are much more likely to keep together in one flock. When the young ones are large enough to go to the fields, make houses or shelters for them to lay in, and if possible, have them several rods apart, so that at hatching time the turkeys will not be able to hear the peeping of their neighbor's chicks. This will sometimes make a sitting turkey so uneasy that she will abandon her own eggs. If nests are made near one another the hens should be set at the same time, so as to come off together. This is also desirable in case of failure of a part of the eggs to hatch. Two broods may be given to one mother to the number of 18 or 20 and the other hen will very soon begin to lay again. The eggs should be carried in at night, if frost is threatened, and be returned to the nest again in the morning. The heat that they receive from the birds while laying, and the turning that they get is said to have a favorable influence upon them and to make them hatch better. There is a difference of a day or two in the hatching of a fresh and an old egg, although they be of the same clutch. The old bird is inclined to accommodate her movements to the strongest of her family, and the weakest are frequently left behind and lost. When they come off, confine from one to three broods in a pen from 10 to 15 feet square, made by setting up wide boards edgewise, so that the young ones cannot jump out. The old ones will not wander far from the pen, and in about a week the chicks will be able to clear the boards, when they may be safely left to go with the hens. In storms they should be sheltered. Give a little food at first. Indian meal is too fine, and frequently kills them. Get corn cracked at the mill on purpose, and increase its size as the chicks grow. Wheat, buckwheat and oats are good for them when a few weeks old. Feed, also, at first, with some kind of fresh animal food. Chopped liver and beef, boiled eggs and curdled milk are good. The success of the turkey crop depends mainly upon the first month. They should be brought home to the poultry yard every night. For the first three weeks a boy or girl should be employed to watch them, keep away hawks and other enemies, and see to the stragglers. Not a few chicks are lost in the grass and perish because they lose the sound of the mother's voice. One child can watch the broods of a dozen hens, and keep them in the same range—a great deal of trouble later in the season. For, if they begin to feed together they will naturally take the same course every morning, and all the turkeys will be found near together when they are sought at night, if they should fail to come of their own accord. If fed every night they will rarely fail to make their appearance when the cows come for milking. A pasture is the

best range for them when they are young."

NOTES.—There are some things about turkey raising, which it is worth while for a novice to know, not told by our correspondent. Turkeys if well trained become very domestic, and may easily be made to lay, in good-sized boxes placed in sheds or out-buildings, out of the reach of dogs and vermin. The eggs may be removed daily, and this is best if they are carefully handled, because a turkey is often half a day upon her nest long before she becomes broody. If early broods are desired, leave a nest full of eggs (wooden ones) and the hen will soon stop laying and sit. Very tame turkeys are often such persistent sitters that they must be taken off at least every alternate day to feed. Turkey hens are very careful mothers; they rarely or never tread upon a chick, and when the chicks are very young their extreme care is almost distressing. They may, therefore, be cooped; and this is best with all early broods, for otherwise the young suffer for lack of brooding. When turkey hens are cooped with their broods the greatest care is necessary to prevent the coops becoming foul. It is well to shift them daily, or to use an abundance of *dry* earth scattered several times a day over the floor of the coop. We prefer to feed all young birds animal food; hard-boiled egg with curds, mashed together and mingled with bread soaked in milk, is our favorite diet for young turkeys, and they thrive upon it. Cracked wheat and corn follow, and with other grains these soon become the staple food.

The Cultivation of Barley.

We have received many letters asking information about barley, and we conclude that, attracted by the comparatively high prices which have prevailed for a few years past, many who have hitherto paid no attention to this crop are intending to raise it. They had better do so on a small scale at first. Our climate is not as favorable for barley as for oats and wheat. We cannot obtain a good crop unless the soil is dry, clean, and rich. It seldom does well on a recently inverted sod. Its best place in the rotation is after a highly manured and thoroughly cultivated corn crop. The best crops are obtained on a rather heavy calcareous loam, *provided* it has been thoroughly pulverized during the preceding summer and autumn. But as this is seldom the case, the soils that usually give the best medium crops are those of a lighter and warmer character—or sandy loams.

Barley should either be sown very early, or rather late—say the moment the ground is fit to work in the spring, or not until after the heavy spring rains are over. We have had the best success in sowing very early, say the first of April; but good crops are frequently obtained when sown as late as the middle of May. Much depends on the season. If we have heavy rains soon after the barley is sown, and then before the plants cover the ground, dry weather sets in, the surface of the soil becomes baked, and the crop suffers. An early sown crop would suffer less, because it would have got a good start before the drouth set in. A crop sown immediately after the spring rains, as soon as the land is in condition to work, commences to grow rapidly at once, and often does better than a crop sown two weeks earlier—but not as well as a crop sown a month earlier. If the soil is rich and has been plowed the fall previous, sow as early as it will work without clogging.

When barley is grown to sell, the six-rowed, or what is usually called the *four*-rowed (though there is no such thing as a four-rowed barley), is the most profitable—because it brings from ten to fifteen cents a bushel more than the two-rowed. But when barley is grown to feed out on the farm, the two-rowed is altogether the best, especially on strong, rich land. It weighs more per bushel, and if the soil is rich enough, it will yield more per acre. It has another advantage, of being later than the four-rowed, which ripens at the same time as wheat, and we have wheat and barley harvest on us at once. With the two-rowed, we can get through with the wheat by the time the barley is ready.

We usually sow from 2 to 2½ bushels per acre. If the land is very rich and it is sown early and drilled in, less seed is required. Last year we had a better crop from 1¼ bushels of seed per acre, than from 2½ bushels—but the land was in better condition, and sown a week earlier. The yield varies more than that of almost any other crop, depending somewhat on the season, but much more on the condition and previous culture of the soil. We have had over fifty bushels per acre, and in just as good a season, and on land naturally as good we have had only twelve bushels. We again advise our readers *not* to sow barley unless the land is in good condition.

Canada Thistles and Other Weeds.

The fact has been often stated that thistles will succumb to dilligent pulliog or cutting up below the surface. No plant will survive this treatment. Canada thistles may be easily seen soon after the new shoots break through the ground, and before they become self-supporting. These sprouts while yet dependent for their life upon the succulent fleshy roots and underground wandering stems of the parent stock from which

Fig. 1.—THISTLE TONGS CLOSED.

they start, are in the most vulnerable condition possible. A broad blade, like those attached to some horse-hoes, drawn through the ground some three inches below the surface, will, if used several times in the course of one season, completely wipe out this pest, except where stones or other obstacles interfere with thorough working. Plowing is not efficient, because it leaves too much root upon the shoots, and only disturbs and transplants them. The sprout of the Canada thistle is pretty tough, and if evenly held and pulled directly upward, will usually draw out, breaking off several inches below the surface. On page 219, of the *Agriculturist* for 1868, we gave a description of a pair of long-handled wooden tongs for pulling Canada thistles. The accompanying engravings show a pair of iron-jawed pincers or tongs for the same purpose; the notched jaws should be about 8 inches long, narrow, and having a griping surface of about three-quarters of an inch. Any blacksmith can make them. The drawings are sent us by Mr. H. R. Denroche, Alleghany Co., N. Y. The iron pincers are superior to the wooden ones, because they may be pushed into the ground, and so get a better hold of a younger plant.

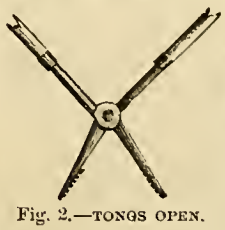

Fig. 2.—TONGS OPEN.

Corn Fodder as a Soiling Crop.

We have made during the past season an experiment in relation to the soiling of cattle, which demonstrates the value of sowed corn for this purpose. We have a small herd of Jersey cattle, and a very poor farm from which to feed them. A piece of rye, sown last fall, gave them an early bite in May, and by the time that had grown too large to be used, the first sowing of oats was ready for the scythe. Early in June it became evident that most of the oats would be too large for profitable feeding before the corn was large enough to cut, and we paid $100 for two acres of clover, (with the privilege of cutting it twice). Commenced feeding from this clover on the 24th day of June. No clover could have been in finer condition than this was, nor have been eaten more greedily. It constituted about one-half of the cows' forage until the 1st of August, being intermitted with oats and a little grass. During this whole time, the cattle were abundantly fed, and were in excellent condition. On the 25th of July we commenced feeding corn fodder, giving it at first but once a day. By the middle of August it was fed exclusively, and a part of the second cut of the purchased clover was re-sold for $20. The calves had all been weaned by the middle of June, and there was nothing in the condition of the herd to prevent a full product of butter at that time. The variations during the summer must, therefore, be ascribed entirely to the difference of food. The following table of the weekly product shows what these variations were:

Week ending	Food.	Butter made, lbs.	Week ending	Food.	Butter made, lbs.
June 5,	Rye	32	Aug. 7,	Corn	57
" 12,	"	29	" 14,	"	58½
" 19,	Oats	35½	" 21,	"	56½
" 26,	Oats & Clover	50½	" 28,	"	60½
July 3,	" "	48½	Sept. 4,	"	62
" 10,	" "	54½	" 11,	"	56
" 17,	" "	49	" 18,	"	54
" 24,	" "	47½	" 25,	"	55
" 31,	Corn & Clover	52½			

This table proves two things:—1. Whereas cows kept on pasture, fall off materially from their June yield, as the season advances, they may not only be kept up to the full quantity by soiling, but by the supplying of a better food their yield may actually be increased. 2. Neither rye, oats, or clover, nor a mixture of these, is so effective in the production of butter as is corn fodder. It is to be borne in mind, that during the latter part of the season, when the yield of butter was largely increased, the cows were much farther from their calving time, and as they were to come in from November to April, their milk should naturally have diminished.

Our corn fodder was planted on very highly manured ground, with a common wheat drill, from which all but three of the teeth had been removed, leaving the rows about three feet apart. The box was so arranged as to discharge about forty kernels to the foot in each row. Two kinds of corn were used—Southern white and Western mixed. The Southern white seemed to be very much the best, and although it has naturally an enormous stalk, the thick planting reduced it to a diameter of from ¼ to ½ inch. The corn grew to a hight of 6 feet, and occupied the ground as thickly as anything could; and the crop would, doubtless, have made (could it have been cured) fully 6 tons to the acre.

HOW TO RAISE PARSNIPS.—Select a rather heavy loam, but clean and rich. Plow it deep and harrow it thoroughly as early as it can be worked; mark off in rows 15 inches apart, and drill in the seed or sow by hand. Use plenty of seed, two or three to the inch, and be sure it

[COPYRIGHT SECURED.]

COLLECTING SEA-FOWLS' EGGS.—FROM A SKETCH BY E. JUMP.—*Drawn and Engraved for the American Agriculturist.*

as *fresh*. Go through the rows with a pronged hoe, or other implement, as soon as they can be distinguished. When large enough, thin the plants to stand 4 or 5 inches apart, and be sure that they stand singly. Keep the land clean by frequent hoeing. We raised last year 1,000 bushels to the acre where the land was very rich, and not 500 upon land not highly manured.

Collecting Sea-Fowls' Eggs.

It is only rarely that the eggs of sea-fowls are found in the markets of the Atlantic coast, but upon the Pacific side they form an important article of trade. The rocky islands along the Pacific are the resort of countless numbers of sea-fowls of various kinds. The bird, which lays the eggs that are valued, is a Murre or Guillemot. It has been supposed that it was identical with the Foolish Guillemot of the Atlantic coasts of this country, and of Europe, but our best authorities consider it different. Its scientific names are much confused; it is the *Uria Brunnichii, U. Troile, Cataractes Californicus*, etc., of various authors. The bird makes no nest, but deposits a single egg upon the bare rock, upon which, like Hans' hen, she "sits standing," or in an upright position. The eggs, which are from the size of a goose egg down to one-fourth that size, are remarkably varied in color, being, for the most part, bluish, with blackish or brown spots, no two of them being marked alike. The bird being very inoffensive and stupid, suffers at the hands of its more wide-awake neighbors, the gulls, which are always on the lookout for a chance to plunder its eggs. Dr. Heermann says: "I one day saw three gulls approach a single Murre sitting on her egg. Two of them feigning an attack in front, the Murre raised herself to repel them with her sharp-pointed bill; instantly, the third, advancing from behind her, flew off with the booty, the first two immediately following to claim their share." The egg gatherers visit the islands at intervals from May until July. The birds, when their eggs are removed, continue to lay during these months. During a "drive," as one of the visits of the egg hunters is called, the islands present a scene of the wildest confusion. The birds fly against the rocks in their fright, or collect upon the ledges in such masses as to kill one another with their struggles. When the drivers take possession, the birds leave the islands and settle upon the water, covering it for a great distance. A few years ago, domestic fowls were very scarce in California, and the great demand for eggs in the cities was mainly supplied from the islands along the coast. The trade in sea-fowls' eggs has reached nearly $200,000 annually.

The Abronias.

Among the pleasing annuals is *Abronia umbellata*. It is a trailing plant, producing numerous clusters of pink flowers, which have the general appearance of those of the Verbena. This, and one with cream-colored flowers, *A. arenaria*, are found in abundance along the

shores of the Pacific, where we have seen them growing in great beauty in the dry, blowing sands. In cultivation, they do best in a light sandy soil. While traveling in New Mexico, the writer had frequent occasion to admire the beautiful *Abronia fragrans*, the clear white flowers and pleasant fragrance of which gave it an attractiveness not often possessed by flowers of that region. The receipt of a package of seeds of this plant from H. A. Terry, Crescent City, Iowa, brought up pleasing recollections and gave gratifying evidence that the plant is in successful cultivation much farther north than we supposed it would be hardy. This is a perennial, and does well with Mr. Terry in a sandy situation. We give an engraving of the Fragrant Abronia, taken from a dried specimen of the wild plant. The stem grows about 18 inches high, and the leaves are fleshy and of a dull green. The flowers are in umbel-like clusters, of a pure white; beneath the cluster is an involucre of several leaves, which are white also. In cultivation the flowers are larger than those represented in the engraving. The resemblance of the flowers to those of the Verbena disappears upon examination. In structure the Abronias are much like those of the Four-o'clock, both belonging to the same family. Abronia is from a Greek word, meaning delicate.

THE FRAGRANT ABRONIA—(*Abronia fragrans.*)

Spring Flowers—The Twin-leaf.

In the woods of the West one of the early spring flowers is the Twin-leaf (*Jeffersonia diphylla*). Its curiously halved leaf readily suggested its common name, as well as its specific botanical one, but we cannot see what induced Dr. Barton to bestow upon it the name of *Jeffersonia*—in honor of Thomas Jefferson. Statesmen and soldiers can be honored sufficiently in other ways, without making plants perpetuate their names in Jeffersonia, Wellingtonia, Napoleona, and the like. The engraving gives the plant of the natural size at the time of flowering, though later in the season the leaves become somewhat larger. The flowers are white, about an inch in diameter, and are borne singly on leafless stems or scapes. The petals are usually 8, with 8 stamens and a single pistil. The pistil ripens into a pear-shaped pod, which splits open at one side to liberate the seeds, as is shown in the detached figure at one side of the engraving. The Twin-leaf considerably resembles the Blood-root (*Sanguinaria*), and appears in flower at about the same time. It, however, belongs to the Barberry family, with the curious May-apple (*Podophyllum*). It is a pleasing plant to have in the garden, it comes so early, and has such a wild wood air; but it has the disadvantage of dropping its petals very early.

THE TWIN-LEAF—(*Jeffersonia diphylla.*)

Fruit for the North-west.—2d Article.

BY OUR SPECIAL IOWA CONTRIBUTOR.

VARIETIES.—Much failure and disappointment have their origin in the selection of varieties unsuited to the climate. We should have well settled ideas of what varieties we want before purchasing; and in no case allow the tree vender to persuade us into buying varieties that have not stood the severest test for hardiness, of which he may happen to have a surplus. Certain varieties will succeed in certain localities, while certain other varieties will not. It is true that a difference of soil, or exposure in the *same County* often affects differently the hardiness and productiveness of the same varieties; but those in the following list, embracing summer, fall, and winter, have been so thoroughly tested, and their value so well established, that it is safe to recommend them for general culture in our State. I therefore offer as suited to Iowa the following

LIST OF APPLES.—*Summer:* Carolina Red June, Red June Sweet, Early Harvest, Benoni, Red Astrachan, Dyer.—*Autumn:* Dutchess of Oldenburgh, St. Lawrence, Fall Orange, Lowell, Famouse, or Snow.—*Winter:* Jonathan, Grimes' Golden, Domine, Ben Davis, Rawles' Janet, Willow Twig, Bailey's Sweet, Talman's Sweet. Every one should be his own judge as to how many of each, or what proportion of each he wants. This will depend upon circumstances which no one so well understands as himself.

PLAN OF THE ORCHARD.—After the trees are well set, there should be a plan of the orchard. This may be drawn on a convenient scale, in a blank book, having each tree numbered, and the variety named. In this book should also be kept a record of every thing of interest pertaining to the orchard; the management of trees; method and time of pruning, with results; productiveness and hardiness of varieties, etc.

CULTIVATION.—I would not thank one to put a plow into my orchard after it has had one year's *proper* cultivation. My practice is, to cultivate the first year as late as the first of August, by throwing furrows towards the trees, *ridging up* one way, and the following spring *early*, seed to clover. Leave a circle around each tree, eight feet in diameter, and keep it well covered, or mulched, with coarse manure, stirring it with a few inches of the surface soil occasionally; and adding to it after the ground freezes every fall. I have found this plan of seeding to clover, and keeping the ground loose and rich around the tree, far better than tearing up the roots, and bruising the trunks and branches by plowing. A heavy mulching in the fall, after the ground has frozen, protects the surface roots, and keeps the tree back in the spring, when it is often injured by starting too early. *Recollect, my friend, not to mow and carry off that clover!* You may turn in small pigs to harvest it, and at the same time cultivate around

the trees; which they will do (when mulched) in search of the worms and other vermin.

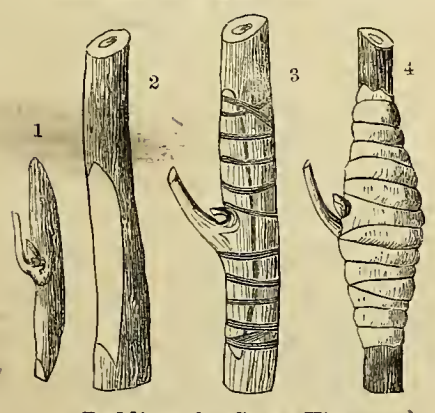
The health, beauty, and productiveness of an orchard depends much upon proper

PRUNING.—If a tree is properly managed in the nursery, and taken up as it should be, it should not be touched with the pruning knife the year it is set. The shock of transplanting is all it can well bear in one year.

Besides, the *natural top* will make a demand for a corresponding amount of roots, of which the tree may have been deprived by removal, and nature will be sure to respond by furnishing all in her power. The second year, in the month of June, use the knife sparingly, by taking off such limbs as will leave the top *low, spreading*, and shapely. Encourage your trees to head low, by trimming from above rather than from below. "Shortening-in" may often be done to advantage, but care should be taken not to cut back more than one-half of the last years' growth. It ought never to be necessary to cut off a large limb; but if by neglect it should be, cut closely to the trunk, and cover the wound well with grafting wax.

DRAWBACKS.—But the end is not yet. Eternal vigilance is the price of apples as well as of liberty. The orchard needs constant care and watching. Gophers, Rabbits, Borers, Bark-lice, Canker-worms, and Caterpillars, all have their time and season, and must be met and vanquished, or we have no apples. The Gopher is easily stopped by opening his hole, and dropping in a piece of sweet apple, or potato, with a little strychnine on it. A wash of cow manure and urine, put on thick twice during the latter part of winter, will keep off rabbits. Keeping the ground clean around the tree is the best safeguard against borers. Caterpillars and worms must be hand picked, and the trees kept healthy and growing, to guard against bark lice or aphis.

All this and much more goes to make up the conditions of success in apple raising. But don't let these difficulties discourage you. Many of them disappear as soon as the trees become well established, and the others are slight indeed compared with the importance of the object sought. Farmers of the North-west, don't let another spring pass without setting out a good-sized orchard, if you have not already done so. This is the advice of one who has tried it, and who believes and knows that we *can* raise apples in Iowa. S., *Powesheik Co., Iowa.*



Budding the Grape-Vine.

The English horticultural journals have had much to say about budding the vine, and have given accounts of the remarkable success that has attended this mode of propagating. It is only recently that we have seen the details of the process described; a recent number of the London Field gives an account, of which we give an abstract and copy its engravings. The operation may be performed upon the main vine, or upon the laterals; the best time is when the wood of the stock is about half ripe. A bud is cut as shown in fig. 1; the stock, fig. 2, has a corresponding cut made to receive the bud; there is a nick at the lower end of the cut which receives the lower end of the piece containing the bud, and holds it in position. The surfaces of the bud and stock are made to fit as evenly as possible, and are bound together by bast matting, as shown in fig. 3. Afterwards, a bandage of cotton-wool, extending an inch below and an inch above the wound, is placed on in such a way as to allow the bud and leaf stalk to be exposed, and is bound on firmly. The cotton is to be kept moist for several weeks. The bud, of course, does not start until the following spring, when it produces fruit as readily as the natural buds of the vine. The practice has thus far, we believe, been confined to grapes under glass, and probably some modifications would be necessary for it to be successful with out-door grapes in our dry atmosphere. A friend who is very successful in inarching the vine, binds up the wound with oiled silk to prevent drying, and over this he winds cotton cloth to protect it from the sun. We think that the same treatment would be worth trying with the process we have just described. It will be seen that the much-talked of budding of the vine is not budding, as generally practised, but only an old method of grafting, in which a cion with a single bud is used.

Crab-Apples.

But a few years ago Crab-apples were grown mainly as ornamental trees, and the rather acerb fruit was sparingly used for preserves. But few varieties were known, and these received but little attention at the hands of pomologists. Now we find that, in the colder parts of the country at least, the crab-apple is becoming a fruit of great importance, and instead of the small, astringent, and quickly perishable fruit, we have varieties fair in size, acceptable in quality, and excellent keepers. The Siberian Crab-apple (*Pyrus prunifolia*), is a distinct species from our common apple, (*Pyrus malus,*) and as its name indicates, is a native of the cold regions of Siberia. It differs from the common apple mainly in having its foliage smooth, except when it is very young, and the styles (parts of the pistil) woolly at the base. The small-fruited or Cherry Crab (usually called *Pyrus baccata*), is only a variety of the Siberian, and has much smaller fruit from which the calyx falls when ripe. The Crab-apple is a very hardy tree, and will endure and perfect its fruit in localities where the ordinary apple fails. We think that there is but little doubt that the improved Crab-apples now attracting attention are natural crosses between the Siberian Crab and the common apple, though Dr. Warder, in the Horticultural Annual for 1870, considers them as sports rather than hybrids. At all events, whether by sporting or through hybridizing, the austere character of the crab is broken down, and it is improved to such a degree as to make it a fruit of the greatest value. In the article above referred to, Dr. Warder gives a very full account of the newer varieties of this fruit. The receipt of a box of specimens from Mr. Charles Andrews, of Marengo, Ill., reminds us to call attention to the claims the improved Crab-apples have to the consideration of those who live where the severity of the winters are an obstacle to fruit culture, as is the case in many parts of the Northwestern States and of Canada.

The Hislop is one of the first of the improved

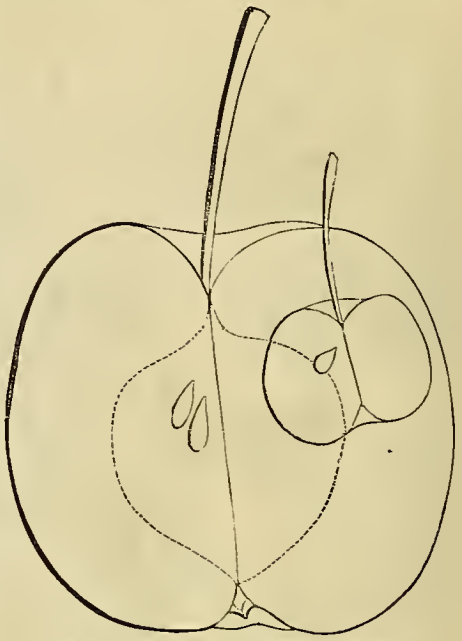


Fig. 1.—HISLOP AND CHERRY CRAB.

varieties that claimed attention, and we give an outline of that and the Cherry Crab, to show the difference in size. The Hislop is, however, fit for cooking purposes only. The specimens sent by Mr. Andrews, were Marengo (fig. 2), a red apple, keeping until late in spring. Chicago, yellow, December to March, and Coral, which is similar in appearance to Chicago, but more acid. These all originated at Marengo, Ill. A set of Crabs has been raised in Minnesota, by Mr. P. A. Jewell, of Lake City. Among them are Summer Rose, July and August; Orange, Sept.; Gen'l Grant, Oct.; Hesper Blush, Oct.;

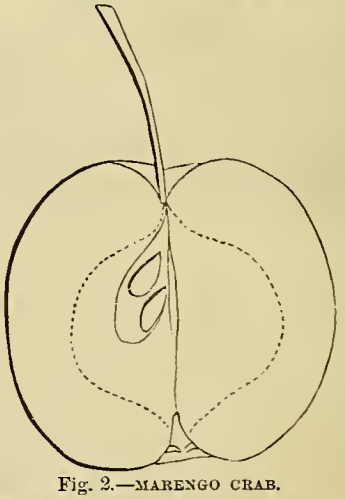

Fig. 2.—MARENGO CRAB.

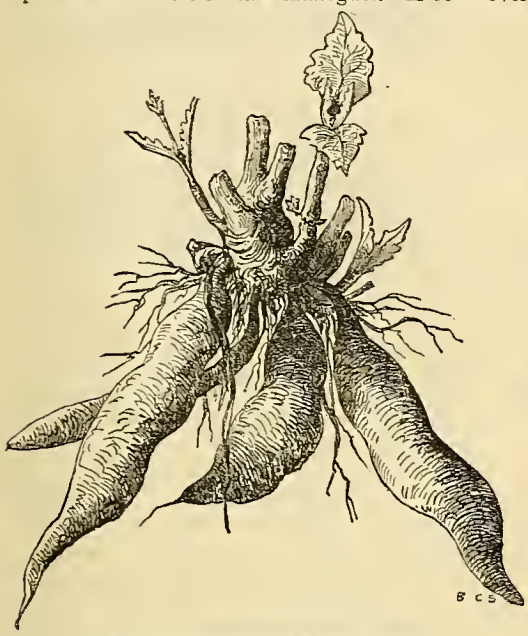
Eureka, fall and winter; Quaker Beauty, winter. There are several Wisconsin seedlings, some of which are known only by numbers. Harger's Winter keeps until April; Tuttle's Sweet is a very large and sweet variety, red, season in September. Last season a fine large sweet crab, the Van Wyck Sweet, was introduced by Mr. A. S. Fuller, which is a chance seedling that originated in the town of Fishkill, N. Y.

Proposed New Vegetable.—*Polymnia edulis*

It is not often that we have a plant that is valuable in both the kitchen and flower garden but here is the *Polymnia edulis*, which claims to

be both ornamental and useful. We have two native Polymnias—which have the common name of Leaf-cup—and very coarse-looking things they are. It is to be hoped that this recent Bolivian introduction is more elegant than its Yankee relatives. The plant has tuberous roots, similar to those of the Dahlia, and it is stated by the Prussian seed growers that the roots are much esteemed as food in their native country. We give an engraving of the root as represented in the Prussian catalogues. A recent French writer says that the roots of this Polymnia resemble those of the Dahlia in both form and taste, and "this, in an alimentary point of view, allows us to appreciate the future of this plant." The seeds are very scarce; but thanks to Messrs. Thorburn & Co., we have a few for trial, and hope that it will prove either handsome to look at or good to eat, if not both. We should add that the Polymnia belongs to the Composite Family, and that the genus was named after Polyhymnia, one of the muses. Our native species do not deserve so poetical a name, but perhaps this South American one will show that Linnæus was, after all, not so far wrong in imposing it.



ROOTS OF THE EDIBLE POLYMNIA.

Opium Culture.

The request that those who had grown poppies and collected opium should give their experience, has brought out several replies, but none so full of details as that of a correspondent "B.," in Wisconsin, who requests that we shall withhold his name and save him the "postage, paper, and time" it would require to answer letters. His experiments in opium raising were made in New York State, in 1848 to 1852, upon one-fourth of an acre. Mr. B. states that he made in all over 27 pounds of opium, specimens of which were sent to several medical colleges; a quantity was sent to New York to have the morphia extracted, and he has the statement of the chemist that the yield was up to the average of that of the best imported opium. The first point to be considered in regard to this as with all other crops is—will it pay? Mr. B. says: "It will pay, and pay well, if attended to rightly. I know that I can take an acre of land and get more money from it than from three acres in any other crop I ever saw. It is not an exhausting crop, but a good one to precede wheat. At $10 or even $8 a pound, it will pay better than corn or wheat. I am not afraid that many will raise poppies or that too much opium will be made. It is too small business to suit the mass of farmers. It is worse than a dairy in requiring close attention to business. The man of small means, with a little land, and who is close, careful, and plucky, will make it pay. A good boy or girl can attend to a quarter of an acre, and have over half a day to spare. The labor of weeding and hoeing is no more than for carrots or onions." Here is the point that all intending to experiment should keep in mind. It is "small business," i. e., full of minor details, the proper observance of which are necessary to success. Good, rich land is required, which should be pulverized and leveled as for an onion bed. Drills are then drawn with a marker so arranged as to make two drills one foot apart, then a space of 18 inches for a walk, then two more drills a foot apart and so on. The seed should be that of the Opium Poppy, *Papaver somniferum*, which is now kept by our large seed dealers. The exceedingly fine seed must be covered very lightly, which is best done by drawing the back of a rake lightly over and along the drill. The plants are to be thinned to six inches apart in the rows and to be kept clean by proper cultivation until they come into flower. After the flowers fall away the work of gathering begins as soon as the capsules or seed vessels are of sufficient size. Some are under the impression that opium is an *extract* of the Poppy plant, made by pressing out the juice and evaporating it; but such is not the case, it is the dried milky juice of the Poppy, which is secreted, probably for the nourishment of the seed, just as the seed vessels are growing, and can only be obtained by scarifying them at the proper time. We will give an account of the process another month.

The Relics of the "Grape Mania."

BY PETER HENDERSON.

Two years ago it became evident that that extended, general culture of the grape was a failure. Hundreds, perhaps thousands, found themselves in possession of glass structures that had been erected for its propagation, looming up as unpleasant reminders of disappointed hopes, of labor wasted and of money lost. None but those engaged in the business can conceive how wide-spread had been the area to which the propagation had extended, or the amount of capital that had been invested in a business which, to the majority of those engaged in it, proved a total loss. Having been long occupied in horticultural pursuits, and being somewhat affected with the grape fever at the time it raged, I was called upon by hundreds for information in regard to the construction of propagating houses, or green-houses best suited for growing vines. These inquiries came from nearly every State in the Union and from all classes of the community; from the man of means, ready to invest his $10,000 or $15,000 in the enterprise, down to the poor farmer or mechanic about to hazard his only hundred or two in a business of which he was entirely ignorant. The only assets of this now bankrupt business are the green-houses which were erected for the propagation of the grape. How to make these assets available is the object of this article.

In all cases where grape propagation was started in the vicinity of a town of 5,000 or more inhabitants, there is no doubt that these green-houses might be made available for growing vegetables or flowers. As the determination, as to which will be the more profitable, depends much upon the location, the directions here given can only be general, and the reader must use his own judgment as to what is likely to best suit his locality. Many vegetables may yet be sown (in April) under the protection of the green-house, so as to gain at least two or three weeks in earliness over those sown in the open ground. These are here named in the order of their importance as market crops in most places: Cabbage, lettuce, tomato, cucumber, melon, Lima bean, egg plant and pepper plant.

Cabbages and lettuce are the only ones named that are what are termed hardy vegetables. These should be sown thinly in shallow boxes filled with soil to the depth of three or four inches, and placed on the bench or table of the green-house or propagating house, but in the coldest part or that part where most ventilation can be given. The seeds should be so sown that the plants when growing will be about half an inch apart each way as nearly as may be. If sown the first week of April, they will make fine plants for setting out in the open ground about the first of May, which will be soon enough for an early crop in most sections of the Northern States. The lettuce plants may either be planted out between the rows of cabbages or by themselves. The distance for the early varieties of cabbage is 2 feet between the rows and 16 or 18 inches between the plants. The lettuce may be planted closer than the cabbage, 14 or 15 inches; or, if planted in a bed by themselves, about 14 inches each way.

Tomato, egg and pepper plants require nearly the same treatment as cabbage and lettuce, though, if no artificial heat is used in the green-house, the tomatoes should not be sown before the second week of April, and the pepper and egg plants not before the first of May. These, like the cabbage and lettuce plants, are most conveniently handled by being sown in the shallow boxes, with two or three inches of soil. We use soap boxes cut in three; in each box we sow seeds sufficient to produce 1,000 or 1,500 plants. These, when an inch or so high, we replant in the same sized boxes, about 100 in each box, taking care to water and shade for a day or two when the sun is shining. These plants will be ready to set in the open ground from the 20th of May to the 1st of June. Lima beans, cucumbers and melons should also be sown in the green-house in the boxes above recommended, but not sooner than the second week in May; in ten days from time of sowing they will be fit to replant in boxes, say at two or three inches apart, and will have grown sufficiently to be set in the open ground by the first week in June, which will be quite soon enough, as these are plants of tropical origin, and are easily chilled if the weather is not settled and warm. In removing the plants from the boxes to the open ground the roots should be disturbed as little as possible, and planting always done, if practicable, in the cool of the evening. Press the soil firmly about the roots, and if the soil is dry water freely. The same rules apply to all vegetables here named, and all thus treated, by forwarding in the green-house, will give a crop, as already stated, from two to three weeks earlier than if sown in the open ground.

The cultivation of flowers in the green-house is generally supposed to require a large expe-

rience. This is not so; any careful person of good judgment, having access to the works now published, may successfully manage, in twelve months' practice, to make the green-house a steadily profitable business. My experience of over twenty years as a florist has shown me that just as soon as flowers are offered for sale, in any town with a population of ordinary intelligence the demand has a rapid and steady increase. Fortunately flowers are fashionable, and even those ladies who have no strong love for them, purchase them freely for the decoration of their rooms. It is not rare to see ladies of means striving to outdo one another in the abundance and beauty of their floral decorations. The rivalry here becomes just as lively as in bonnets, dresses or carpets, and the florist, like the man of dry goods, reaps the benefit.

How to make the green-houses that have been devoted to the grape business available for the cultivation of flowers, would require too much space here, the varieties being too numerous to allow us to give the necessary details for each. Suffice if to say that they may be made permanently profitable to those who will take the trouble to consult the works on the subject.

Achyranthes Lindenii.

Among the novelties offered by the florists this season is the *Achyranthes* (or *Iresine*) *Lindenii*, one of those plants now so much esteemed for their deeply colored ornamental foliage. The *Achyranthes Verschaffeltii*, introduced some years ago, never became very popular, on account of its unsatisfactory color as well as the difficulty with which it was kept over winter. The present species is from Ecuador, and is claimed to be more robust in habit, and to winter perfectly well in a cold green-house. It will be seen from the engraving which we give of a

ACHYRANTHES LINDENII.

small shoot, that the leaves are very different in form from the older kind. The color is, moreover, richer, it being of an intensely deep red. This, like all such new introductions, has to undergo the test of our hot and dry summers before its value can be ascertained. At the European shows it has been awarded several first prizes as an ornamental plant. As far as can be judged from the small specimens we have seen in the green-house, this new Achyranthes promises to be a valuable bedding plant.

The Ivy-leaved Toad-Flax.

The little Ivy-leaved Toad-Flax, *Linaria Cymbalaria*, is a native of the south of Europe, but has become perfectly naturalized in England, and is entirely hardy with us. Unlike the Toad-Flax we are most familiar with—the trouble-

VARIEGATED IVY-LEAVED TOAD-FLAX.

some weed known as Butter and Eggs and Ranstead Weed—this is a delicate trailer, which has long slender stems, neatly lobed leaves, which are dark green above, and purplish below, and very small lilac flowers. It shows to the best advantage when growing in positions where its branches can hang down, and where it grows wild it prefers crevices in rocks, old walls, and such situations. This habit adapts it for growing in suspended vases or baskets, as well as upon rock work, for which purposes it is quite popular under the names of Kennilworth Ivy, and Coliseum Ivy—though it is hardly necessary to say that it is not an Ivy. When grown in the border it makes a neat little mass; the long leaf-stalks become much entangled, and the plant is more compact and less graceful than when the branches have a chance to trail. Every season brings some novelties in the way of variegated leaves, and this year this well-known old plant is offered with leaves which are blotched with green upon a yellow ground. The engraving represents the variegated plant which differs from the common form only in its blotched leaves. Should the plant hold its variegation, and prove reasonably hardy, it will become very popular.

We are cautious about recommending plants with variegated foliage until they have been tested in out-door culture. Neither the descriptions of the European journals, nor the appearance of the plants in the green-houses, will allow us to judge of their fitness for our gardening. A large number, if not the majority of variegated leaves, become green before the summer is over.

The New Ivy-leaved Pelargoniums.

The Old Ivy-leaved Pelargonium (*Pelargonium peltatum*), or Geranium, as it is most commonly called, is a much neglected plant. When well grown it makes a fine plant for a hanging basket and is handsome for both its foliage and flowers. Within a few years new varieties have appeared which show a marked improvement in the flowers, and some have the now esteemed variegated foliage. *Duke of Edinburgh*, *Silver Gem*, and *L'Elegante*, all have their leaves margined more or less broadly with white. The last named, of which a small bit serves for an illustration, has large clusters of pure white flowers. *Princess Thyra* has flowers of light salmon color, with white center and a crimson spot on the upper petals. *Peltatum elegans* has fine foliage and mauve colored flowers. *Bridal Wreath* has, unlike the other kinds, hairy leaves and white flowers. Besides these, other new kinds are given in the florist's catalogues.

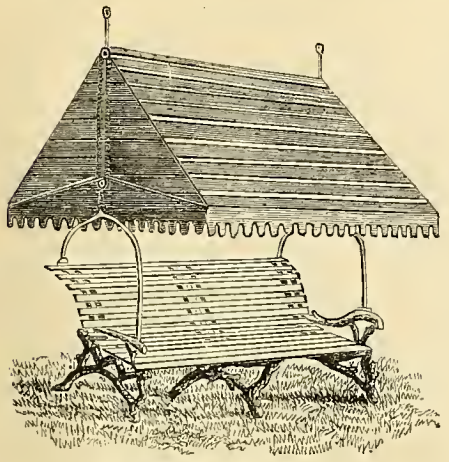
MANURE FOR THE GARDEN.—The letters of our correspondents indicate that there are some who have the impression that success in gardening depends upon the use of some especial manure. Good, well-rotted stable manure, and plenty of it, will grow almost anything in the garden or field. The point where most fail is in not using enough manure. For a large share of garden crops the soil cannot be too rich. This is especially the case with all succulent vegetables, such as cabbage, lettuce and the like. Spent brewers' hops are found to be a useful substitute for stable manure, but few are able to avail themselves of these. Guano is highly valuable, as are hen manure and fish guano. These are best composted with soil before using them. Night soil composted with *dry* earth is odorless, and is a fertilizer almost altogether neglected except in the expensive and uncertain form of poudrette. Earth-closets should be introduced for the sake of the manure, even if they were not advisable upon sanitary accounts. The use of dry earth in the hen-house not only serves to keep the atmosphere wholesome, but it allows the manure to become composted at the same time. Sods laid in a heap

IVY-LEAVED PELARGONIUM—*L'Elegante.*

and allowed to decay, or thrown into a pig pen, and there composted by the animals, make an excellent application, especially to old gardens needing fresh soil. Ashes and plaster, separately or together, may be applied to most crops with benefit. A well made phosphate is a valuable manure, but one should be careful to purchase only of manufacturers of good reputation. Finely ground bones applied directly, or used in compost, are excellent. Gardens which have been long in cultivation, often need lime

THE HOUSEHOLD.

(☞ *For other Household Items, see "Basket" pages.*)



A Shaded Garden Seat.

The engraving of a garden seat with a tent-like roof is from an article of English manufacture, that attracted much attention at the Paris Exposition. We do not know that it is sold in this country, but we introduce it here as a suggestion to the ingenious. A shaded seat of some kind would be found very useful by those who have croquet grounds, as well as by those who wish to enjoy sewing or reading in the open air, and cannot avail themselves of the shade of trees. The top of the one figured is made to incline backwards or forwards, as may be required. It would not take much contrivance to fit up a light awning that would be quite as useful if not so elegant as this. Where the seat is to remain stationary, the awning may be supported by poles driven into the ground.

Scouring Knives, etc.—Mrs. "O. A. H.," writes that for five years she has used water-lime for scouring knives, forks, tins, and the like. She says: "I have a box with a partition and keep the lime in one part and the cloths in the other. I wet a small cloth a little and dip it in the lime, and after the articles are well washed and wiped, I rub them until the spots are removed. Then I take a larger, dry cloth, dip it in the lime, and rub the articles until polished to suit me. Wipe off the dust from the knives and forks with a dry cloth, and they are ready to put away."

"Sun-light Oil"—A Household Humbug.

Most of the "Humbugs" exposed in the column especially devoted to rascality, affect only the pocket. Here is one which, worse than the highwayman, demands both your money *and* your life; and we notice it in the Household Department, as in this case mothers need especial warning. We have several times seen circulars proposing to sell recipes for preparing "Sun-light Oil," which should give a better light and be cheaper than any other illuminating oil. Now we have, from one in Wisconsin, who has invested $2 in the thing, the recipe itself, which reads as follows: "To make one gallon, take 3 quarts of BENZINE, 1 oz. Pulverized Alum, 1½ oz. Alcohol, 2 oz. Cream of Tartar, 2 oz. Sal-soda, 1 pint of Potatoes (cut fine), 2 tablespoonfuls of fine Salt, 2 drachms Oil of Sassafras, 4 drachms Gum Camphor. Dissolve the Alum in the Alcohol as much as possible; then add the Gum Camphor, stir for a few minutes; then add to one pint of the Benzine, stir it well for ten minutes; then add all the other ingredients, except the Benzine, stir well until it foams, then add the remainder of the Benzine; leave it open and exposed to the air; shake it occasionally, and in ten hours time it will be fit for use, although it should stand, if convenient, for 48 hours before using."

If this thing were not so wicked, we should ridicule its absurdity. It is an evident attempt to induce people to believe that, with the various additions and the prescribed mixings, the Benzine can be converted into something safe to be used for illuminating purposes. The Oil of Sassafras and Camphor are added to make the compound smell differently from pure Benzine, they are combustible and so far are not foolish; but the other ingredients, Alum, Soda, Cream of Tartar, Salt, and Potatoes! are all sheer nonsense. They have not the slightest effect in making the Benzine other than Benzine, and the person who proposed to add them is a fool if he did not know it, and a rascal if he did. These recipes are hawked about the country by agents, who by pleading the cheapness of the light doubtless sell a large number. We do not know of any law that exactly meets the case, though by any sensible justice an agent of this kind would be punished as a common nuisance. Recollect that this Sun-light Oil is Benzine, and as far as danger is concerned, nothing but Benzine—unsafe, explosive, deadly. Better that your children should have no other light than tallow dips, or go to bed at dark, than run the risk of sudden death, or what is worse, being maimed for life by this "Sun-light Oil." If you will use it, make your will, insure your life, and ask your minister to get ready a sermon on the "Mysterious Dispensations of Providence."

How to Cook Dried Beef.

BY MRS. "W. A. B.," WINDHAM CO., CONN.

The good qualities of dried beef as an article of food for the family, are not fully appreciated. In point of excellence, it is one of the nicest articles, when properly prepared, that we have in our store-room. It is also one of the most economical articles of food; quite a small quantity of dried beef, shaved very fine, and cooked with a nice gravy, will serve for meat for a family at very small expense. Then it is so convenient to have; always ready; always acceptable. To people who live convenient to market, it is not of so much importance; but to us, who live at a distance from towns, dried beef is one of the necessary articles in our bill of fare. We frequently entertain guests at our table who never have seen dried beef served other than as a relish for bread and butter; shaved and eaten without cooking. There are several methods of cooking it. Some prefer it cooked with a gravy of water, seasoned with butter, thickened with flour, and, perhaps, eggs broken in while cooking. Others cook it with crumbs of sausage, frying the sausage first, then adding the beef with water and thickening with flour. It is also very good cooked with a little sweet milk and sweet cream, the gravy being thickened with flour; allow it to boil once; that is all the cooking it requires. A dish of dried beef, properly cooked, served with toast, baked potatoes, and boiled eggs, is a very nice provision for breakfast or a dinner prepared in haste. We prefer to cure our own beef, as that bought is apt to be too salt. I find that if too salt, it can be remedied by soaking after cutting and before cooking, and adding a little white sugar while cooking, to restore the sweetness lost by soaking. Sugar-cured beef is much nicer than that cured with salt alone. I put mine into a sweet brine, such as is used for pork hams.

A Letter on Washing-day Matters.

BY FAITH ROCHESTER.

Dear Mary! I send you a sketch (fig. 1) of my new clothes pin bag. It is worn fastened about the waist, like an apron, when hanging clothes on the line. The material of mine is slightly worn blue denim, with a binding of light brown calico. When filled with clothes-pins, it is too heavy an apron for tying, so I sewed a buckle on the band, that persons of all sizes might wear it. The same strap serves to hang it up by, when not in use. The back of the pocket, cut like a small rounded apron, is narrower than the front by a few inches. It is fourteen inches deep, and holds, in winter time, besides the clothes-pins, a pair of clean flannel mittens, for use in putting out clothes. My mittens are made of old gray flannel, lined and bound with red. It is easy to cut your own pattern. Measure around your hand just above the thumb. Get the length of the whole hand, and the length from the base of the thumb to the end of the longest finger, also the length of the thumb. Then by the aid of the accompanying diagram (fig. 2), you can cut out a pattern. Be careful and not get the thumb hole too large for the thumb you have made. This is a good way to make mittens for children, and you can make very pretty ones for yourself of fine cloth lined with nice flannel and bound with fur.—Is it possible that you are still doing your washing in the old-fashioned way, without machinery or fluid? A good wringer is a great help. No woman, who can afford even one silk dress, ought to be without a wringer. The clothes and the woman who washes, will both wear longer with a wringer than without it. The price of all washing machines seems very high, and you can hardly induce a hired washerwoman to use one. I think people fail in the use of them, chiefly, from not having the suds strong and *hot*. A good suds, boiling hot, has a wonderful effect in loosening dirt, especially if mixed with good washing fluid. Then you must have sufficient motion to raise or squeeze out the loosened dirt. The especial object of rubbing on the board, I suppose, is, to force the suds between the fibres of the cloth and bring out the dirt. The chief advantage of a machine is that it allows you to use suds too hot for your hands.

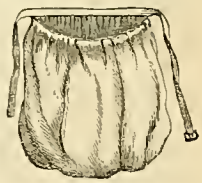


Fig. 1.—CLOTHES-PIN BAG.

My recipe for washing fluid is as follows: one-half pound of sal-soda and a quarter of a pound of borax, dissolved in one gallon of hot, soft water. Allow it to settle, and pour off into a jug for use. A gill of this, mixed with a pint of soft soap, or half a pound of bar soap, previously dissolved in hot water, is sufficient for a moderate washing.

Many housekeepers use unslacked lime instead of borax. This is cheaper, and as good for cleansing, perhaps, but the borax has an excellent effect upon the hands, softening and healing where there is a tendency to chap. It bleaches without injuring the clothes. Those who use the unslacked lime, generally boil the clothes before rubbing. They soak the clothes over night or wet them thoroughly, and soap the spots, before putting them in the boiler, then cover with soft water, add a gill of fluid, heat and boil twenty minutes, the fine clothes first and the coarser ones afterward in the same water. The clothes need very little rubbing after this, and are ready to be rinsed and dried.

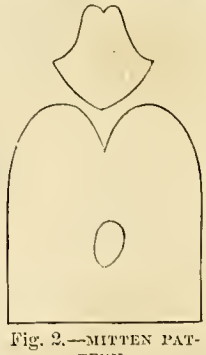

Fig. 2.—MITTEN PATTERN.

With my soda and borax fluid, I do the rubbing before boiling, but there is little or no rubbing to be done by hand if I am careful to have the suds in my machine strong and hot. I use two-thirds of the mixed soap and fluid in the rubbing, and save the remainder to put in the boiling. For the ordinary light washing of a family, I value the help of the fluid more than that of the machine; but for heavy woolen garments, bed quilts, etc., a machine seems almost indispensable. If you try my washing fluid without a machine, mix it with water as hot as the hands can bear, and let the clothes stand in it half an hour before rubbing. They will wash easily and be ready to boil. In using a machine, do not put in too many clothes at once.

You never tried to wash with hard water, I suppose. It is *dreadful*, unless the water is first softened with ley or soda. The usual way is to make white ley, by boiling ashes and water together. It is best to add this to the hard water when cold, and boil all together, skimming it while hot. Too

much ley injures the clothes and hands. I know no exact rule. But people living in a hard water region, should provide themselves with good rain-water cisterns as soon as possible.

A woman should dress for her work. You and I would agree that a washerwoman would look ridiculous, dressed in silk, with lace under-sleeves on her wrists, while working at her tub. I wonder what your ideal would be of a suitable dress for washing day, with its various exercises at the tub, over the stove, hanging out clothes, cleaning the floor, etc. Let me give you mine.

I wish you could go into my kitchen, as baby and I have just been, and see what I shall describe. The dress I saw five minutes ago, was an old one, somewhat faded and patched. It was made of thick goods, cotton and wool, a small plaid. The dress, lined throughout with drilling, was cut in Gabrielle (or basquine) style, a loose, easy fit. It was worn without corsets or whalebones. The waist and arm-holes were sufficiently loose to give the arms entire freedom of movement. The easy coat sleeves and the long sleeves of a warm under garment, were rolled above the elbows (not always necessary with a machine) and a large, gored bib apron was tied on. There was a dimity ruffle sewed in the neck of the dress. A woman without corsets is bad enough, but I have something more dreadful to tell about this washerwoman's dress.

It did not trail—did not even touch the floor—was not so much as of fashionable length for a short dress! Mary, the dress I have the hardihood to describe as suitable for kitchen work, on washing days at least, reached only four inches below the knees! The lower limbs were clothed with warm, lined pantaloons, of the same material as the dress, made very much like your husband's "peg-tops." The shoes were thick balmorals.

I sat on the wood-box, tossing baby for a frolic, and studied this costume, trying to think, without prejudices, how it could be improved or better answer the purposes of health, convenience, economy and comfort. I had seen the same washerwoman at the same tub, in an ankle dress, with and without hoops, and in a gymnasium dress. The ankle dress got drabbled and torn around the bottom, and neither it nor the gymnasium dress protected the ankles properly. This costume has every advantage. You cannot even say it is less beautiful, for one essential element of beauty is fitness. But you can not induce any ordinary Bridget to put it on. No indeed! The "lady in the kitchen" cannot afford to slight the Paris fashions. The last hired washerwoman I had, a pretty colored woman, came with a waterfall on her head, a waist so tight that it was bursting out all around (the unfortunate woman could not afford corsets, and did the best she could for her "figure," under the circumstances by dressing very tightly), and skirt trailing several inches behind. Of course the skirts were wet (her throat was bound up with flannel) and torn from the waist here and there. But I suppose she had an idea that she was fulfilling one of woman's chief duties — to look pretty!

Is it not about time to banish washing—the sloppy, steaming work of washing-day from our homes, and make a public affair of it? A friend writes me, "When Sunday night comes, I always begin to dread the morrow's washing, for our washings are always large, and, do the best I can, I invariably get very tired. A public laundry would be a great blessing."—I think she means a co-operative laundry, for she would hardly be willing to pay for her large washings the prices at most public laundries, that are not co-operative—at the rate of $1, or $1.25 per dozen. The papers have lately been taking notice of some statistics published by the Oneida Community, with reference to their washings. A New Haven paper says, "They find that the week's washing for two hundred and thirty-seven persons costs twenty-nine cents a head. As the average number of pieces washed for each member is eighteen, including heavy articles, this is astonishingly cheap. Why should not the horrors of washing-day in families be abolished by a system of intelligent co-operation? Comfort, health, and cleanliness would all be promoted by it, and a large amount of money and labor saved."

The washing apparatus at that Community is on the largest and best scale of any in this country. The hard work is done by steam. The revolving wringer alone cost $250, and the whole expense of the brick building for the laundry, and of the machinery for washing, wringing, drying and ironing was $6,092. In cities there could be found a sufficient number of families to combine and establish a laundry as good as this. In villages there might be such co-operation as would materially lessen the labors and expenses of family washing, without so great an outlay of money. The expense of the building and apparatus might be divided into shares and each member of the association could own one or more. The apparatus for doing a family washing comfortably at home is seldom less than $25, including machines for washing and wringing. If fifty families should each put in this sum, it would raise a capital of $1,250. What could be done with this sum in the way of establishing a village laundry? The washing might be done at a fixed rate—say seventy-five cents a dozen. After paying the current expenses for soap, fuel, labor, etc., there would remain a surplus of funds (if the concern was properly managed), to be divided at stated periods among the members. In this way the members of the co-operative laundry association, though paying a nominal price of seventy-five cents a dozen for washing and ironing, would really get the work done for considerably less.

My object was not so much to propose a definite plan, as to set women to thinking of some reasonable way of escape from unnecessary drudgery—to give a little push to a ball already set in motion.

How to have a Variety in Food.

BY MRS. "H. C. B."

There are two ways of having variety: one, that of heaping upon one's table a great many kinds of food at one meal, so many that it is impossible to do more than to taste of each one; the other to have but a few kinds at one time, but so varied from meal to meal that the same thing does not appear upon the table very often. The latter seems to me to be the better way on the score of economy, which the larger portion of farmers' wives probably find it necessary to study to a greater or less extent. Besides this, a great jumble of food is injurious to the digestion. I will explain what I mean by the best kind of variety.

Bread, either wheat or rye, should be a constant article of diet, and should be made fresh three times a week. Occasionally raised biscuit, or soda biscuits, can be substituted, or some form of corn bread, or Graham bread, gems, or some kind of muffins. The plain white bread will probably hold its place as the standard kind for a long time to come, and its substitutes should be so judiciously introduced as to make all kinds seem ever fresh and new. Meat ought, also, to be varied, both in its kind and in the manner of cooking it. Beef is acknowledged to be superior to other meats, but it should be cooked in different ways. Roast beef and well-broiled steaks will always stand first in general estimation; but boiled beef, beef stew, and beef soup, help to variety, keep up the appetite for the other kinds, and are more economical than the constant use of such pieces as are needed for good roasts and broils. Many families are in the habit of having a nice piece of roast beef for their Sunday's dinner, and bringing it on cold every day thereafter, until it is vanquished by the force of sheer persistence. Such a piece of beef can be used in many ways. Was it quite rare, to suit the tastes of some members of the family? Then for Monday's dinner cut off some slices of the rare part, lay them on the gridiron over some very hot coals, let them brown upon both sides, and bring them directly to the table with a little butter upon each slice.

The more thoroughly cooked part can be made into several kinds of hash; coarse hash, with or without potatoes; fine hash, with or without potatoes, warmed in the mass or made into small thin cakes, and browned in a little hot lard; fine hash, with potatoes, spread upon a piece of pastry rolled thin, then rolled up tight and baked; or fine hash, without potatoes, put upon toast. A savory stew can also be made of bits of cold beef by the addition of two or three onions, as many tomatoes, or some canned tomato, and a sufficient amount of seasoning. A pie can be made of cold beef, either with common pastry for crust, or layers of mashed potatoes, or boiled rice, alternated with the meat.

A good many farmers' families are out of the reach of a market or a butcher's wagon, and are obliged to subsist, as to meat, the year round upon ham, salt pork, and chickens. The ham is always fried, the pork is always boiled or fried, swimming in grease, and the chickens are cooked in some one way. The ham might be boiled or broiled, or cut in small bits and made into dumplings, the crust for them being like soda biscuit, and steamed or baked. Cold pieces of ham are nice cut in small mouthfuls, and warmed with eggs; they are also very palatable fried in batter, like veal cutlets.

The methods of cooking chickens and pork are numerous, and most housekeepers know them, but fall into the habit of cooking them in some stereotyped way, so that they never seem to have a variety. It is the same with vegetables. The first care is, in the summer and fall, to make provision for winter; this should be plentiful and varied, both in vegetables and fruits. Dried or canned green corn, and canned tomatoes, and the many kinds of sour and sweet pickles, are great additions to the winter dinner table; but my opinion is that they are better appreciated if the same kind does not appear upon the table oftener than once a week. Potatoes seem an essential part of every dinner, and one can make such a rotation of turnips, parsnips, onions, cabbages, beans, corn, beets, etc., according to the nature of the dinner, as never to get tired of any one vegetable.

In the matter of canned fruit, preserves, cakes, pies, and puddings, the same rule for variety should be observed. A housekeeper should not fall into the common error of making year after year the same kind of preserves, the same kind of cake, and the same kind of pies.

It is a good plan to keep a written recipe book, and to add to its contents occasionally such recipes as are known to be good, and then to use them all in their own time, not settling down upon a very few. By canning fruit with but little sugar, the winter routine of pies can be very much relieved. Cherry, raspberry, currant, peach, and blackberry pies, can take their turns with the mince, pumpkin, and apple, usually supposed to be exclusively winter pies, and there is little difference between them and those made of the fresh summer fruits. Apples, which very few farmers are without, are capable of being made into most delicious sauces, jellies, preserves, pies, and puddings; and yet they are often as bad as wasted by being made into miserable, lumpy apple sauce, with the flavor all washed out of them by the admixture of too much water, and into hard, tough, indigestible pies.

Citron and Raisins. — A Maryland Housekeeper asks us to tell her how she can prepare green citron to be used in cakes, and how to make raisins from her grapes. The citron used in cake, etc., is the preserved rind of a fruit like a large lemon. The citron melon cannot be used as a substitute, as it has no aromatic quality. None of our American grapes will make raisins.

English Seed Biscuits.—1 lb of flour, ¼ lb of sugar, ¼ lb of butter, ½ oz. of caraway seeds, 3 eggs. Roll out, cut round, and bake in a moderate oven.

Cinnamon Cakes.—By Mrs. L. A. G. 1 cup of sugar; ¾ of a cup of molasses; 1 cup of butter; 1½ tablespoonfuls of ground cinnamon; 2 level teaspoonfuls of soda, dissolved in 6 large tablespoonfuls of warm water; stir well, and add flour enough to allow to roll quite thin; cut out with a biscuit cutter and bake in a quick oven.

BOYS & GIRLS' COLUMNS.

Under Broadway.

You of course all know that Broadway is the principal street of New York, and some of you have heard of number 245 Broadway. I said, last month, something of the sights to be seen on the street. Indeed, I think that a walk up or down Broadway, on a pleasant day, is more interesting than any show I ever saw. It now appears that to see all the sights of Broadway one must go down underground. In a very quiet way, there has been a company of men at work making a large tunnel or bore directly under the street. It went by the office of the *Agriculturist*, before our friends there, who think they are pretty wide-awake, knew anything about it. Well, I don't wonder, as all the work was done 25 feet under the surface, and the earth loosened in digging was all taken out at the basement of a large marble building, in so quiet a manner that only those in the secret knew anything about it. There the men are at work like moles or gophers, slowly digging a hole 8 feet in diameter. You will wonder what they are doing it for. They are making a big blow gun! I suppose that every boy has blown peas through a tube. This underground channel, which by the way, is all walled with brick or iron, is the tube, and an immense fan driven by a steam engine does the blowing...."*The peas!*"....Oh, they are cars that are blown from one end to the other. The affair is called the Pneumatic Transit. Pneumatic is pronounced *new-matic*, and is from a Greek word meaning air. The company proposes to send parcels, and people, too, I believe, from one point to another, more rapidly than can now be done. A similar thing is successfully at work in London. It is, in fact, a sort of sailing by land with the breeze quite under control. WILL WARREN.

Bees are such remarkable insects that their habits have interested the intelligent and scientific, and it is not strange that they should have given rise to superstitions in the minds of ignorant people. Quite a volume might be filled with the curious legends in various countries about bees. In some parts of England, bees must always be sold; if given away, neither the giver nor the receiver will have luck. Elsewhere it is believed that bees celebrate Christmas Eve by making agreeable music at twelve o'clock at night. If a man and wife quarrel, it is said that bees will leave. In some European countries it is thought necessary to tell the bees if a death occurs in the house; elsewhere the hives are hung with crape when there is a death, and with red if there is a marriage. It is believed that if these things and many others are not observed, the bees will desert their hives. Common schools and general intelligence do away with all such notions as these.

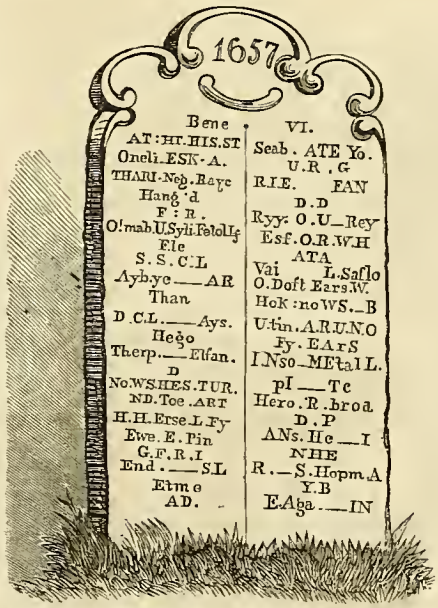
What will Fit Him to be a Farmer?

A boy 15 years old, who is at school, asks us what books we would recommend him to read, to fit him to be a farmer. If our young friend is at a common school we advise him to give his attention in the first place to thoroughly mastering all the studies that are taught there. Do not, in a haste to build your house, forget to lay a good foundation. The great trouble with many men of excellent talents is, that they had not the opportunities for a good elementary education—the foundation—or if they had them, they neglected them for something more attractive. Do not let the desire to be a good farmer, or any thing else, turn your attention from the common school studies. No accomplishments, or picked up bits of science can answer in their place. These being attended to, then we would advise such reading as will teach the laws that govern the common operations of the farm. One of the best books for an intelligent boy is Thomas' Farm Implements, which is full of interest, if he would know the why and wherefore of things. The first principles of Mechanics, or Natural Philosophy, as it is often called, are given, and their application to various kinds of farm work shown. We hope that there are many boys who propose to be farmers and we advise them, and indeed other boys, and the girls too, to learn the laws of motion and gravitation, the properties of air, water, and steam, etc., as they will not only be of great use to them in all mechanical operations, but make them more intelligent men and women.

"Professor," said a student in pursuit of knowledge concerning the habits of animals, "why does a cat, while eating, turn her head first one way and then the other?" "For the reason," replied the Professor, "that she cannot turn it both ways at once."

Do you know any word that contains all the vowels? Unquestionably.

A young man of limited intelligence, who was recovering from a long fit of sickness, being told by his physician that he "might now venture on a little animal food," exclaimed: "No, you don't, doctor; I've suffered enough on your gruel and slops, and you don't get me to touch any of your hay and oats."



No. 375. *A Word Puzzle.*—This is *said* to be an epitaph found in an old English church-yard. It is easy enough when you get fairly started.

No. 376. *Arithmetical Puzzle.*—Suppose the 9 digits (figures 1 to 9), were placed in the form of a square, in what order must they stand so that any three figures in a direct line when added together will make just 15?

No. 377. *Illustrated Rebus.*—The rebus makers should be very excellent men, if they follow all the maxims they illustrate. Here are more words of wisdom.

No. 378. *Arithmetical Problem.*—S. Baird sends us this and No. 376, taken from an arithmetic printed early in the present century. A man driving his geese to market was met by another who said, "Good morrow, with your hundred geese." He replied, "I have not a hundred, but if I had half as many more as I now have, and two geese and a half, I should have a hundred."—How many had he?

No. 365. *Arithmetical Problem.*—A farmer with $100 wants to buy 100 head of stock, is offered cattle at $10, hogs at $3, and sheep at 50 cents. How many will he get of each?

How the Chinese Cultivate and Make Tea.

BY "CARLETON."

I dare say that two-thirds of the many hundreds of thousands of persons who read the *Agriculturist* drink tea at least once a day. They know that it comes from China and Japan, and I doubt not that all will be interested in hearing a short story about the cultivation of the plant, and the preparation of the tea leaves, for that which we call tea is the leaf of an evergreen shrub. We can make tea from any plant. In my boyhood I had to drink catnip and thoroughwort tea when I was sick, and it was so bitter that I had to hold my nose and swallow with all my might; but the teas of China are of another sort. One kind is from the plant called *Thea bohea*, and another, from the *Thea viridis*. There are many varieties. Some thrive best on gravelly soils—while others need a light, loamy soil. Those planted on the hills and among the rocks are generally more mildly flavored than those grown in the meadows.

Think of yourselves as being in China among the tea gardens. You see the full grown shrubs are about seven feet high. If you would know the exact shape of the leaves, examine the grounds in the tea-pot, some evening after supper, and you will find that they are oblong. A full-grown leaf is an inch and a half or two inches in length, but most of the leaves are picked before they are fully matured.

The southern slopes of the hills in the interior of China are covered with tea gardens. You see Chinese men and women wearing blue cotton frocks, and queer bamboo hats, taking young plants from a nursery bed where they have been started, just as we start young apple trees, and transplanting them in rows. They have hoed the ground well over with great clumsy hoes. They thrust a long-bladed knife into the ground with one hand, and thrust the plant into the hole and press the earth around it. They will set out many thousand plants in a day.

They give them close attention, watering them and keeping down all the weeds. You never see tea gardens overrun with pig-weeds, or with witch grass, and chick-weed. They are too good farmers for that. They say that the plant wants all the nourishment it can get from the soil to make it vigorous and the leaves tender, for the tender leaves have a mild flavor; and those which are of mild flavor command the highest price.

We Americans, may take lessons of the Chinese in garden culture and agriculture. They beat us all out in raising vegetables. Everything that can increase the fertility of the soil is preserved, and so their tea gardens and orchards are always in superb condition.

You notice that the plant may be propagated either by sowing the seed or by cuttings or slips. Some of the tea growers sow seeds in a mellow garden bed and when the shrubs are about six inches high, transplant them, cutting off some of the sprouts and using them as slips.

It is a hardy plant and is grown with great ease. In the climate of Central China, which is about like that of Alabama and Mississippi, the blossoms appear in winter, and the flower is very much like that of a wild rose. A tea garden in bloom is a beautiful sight.

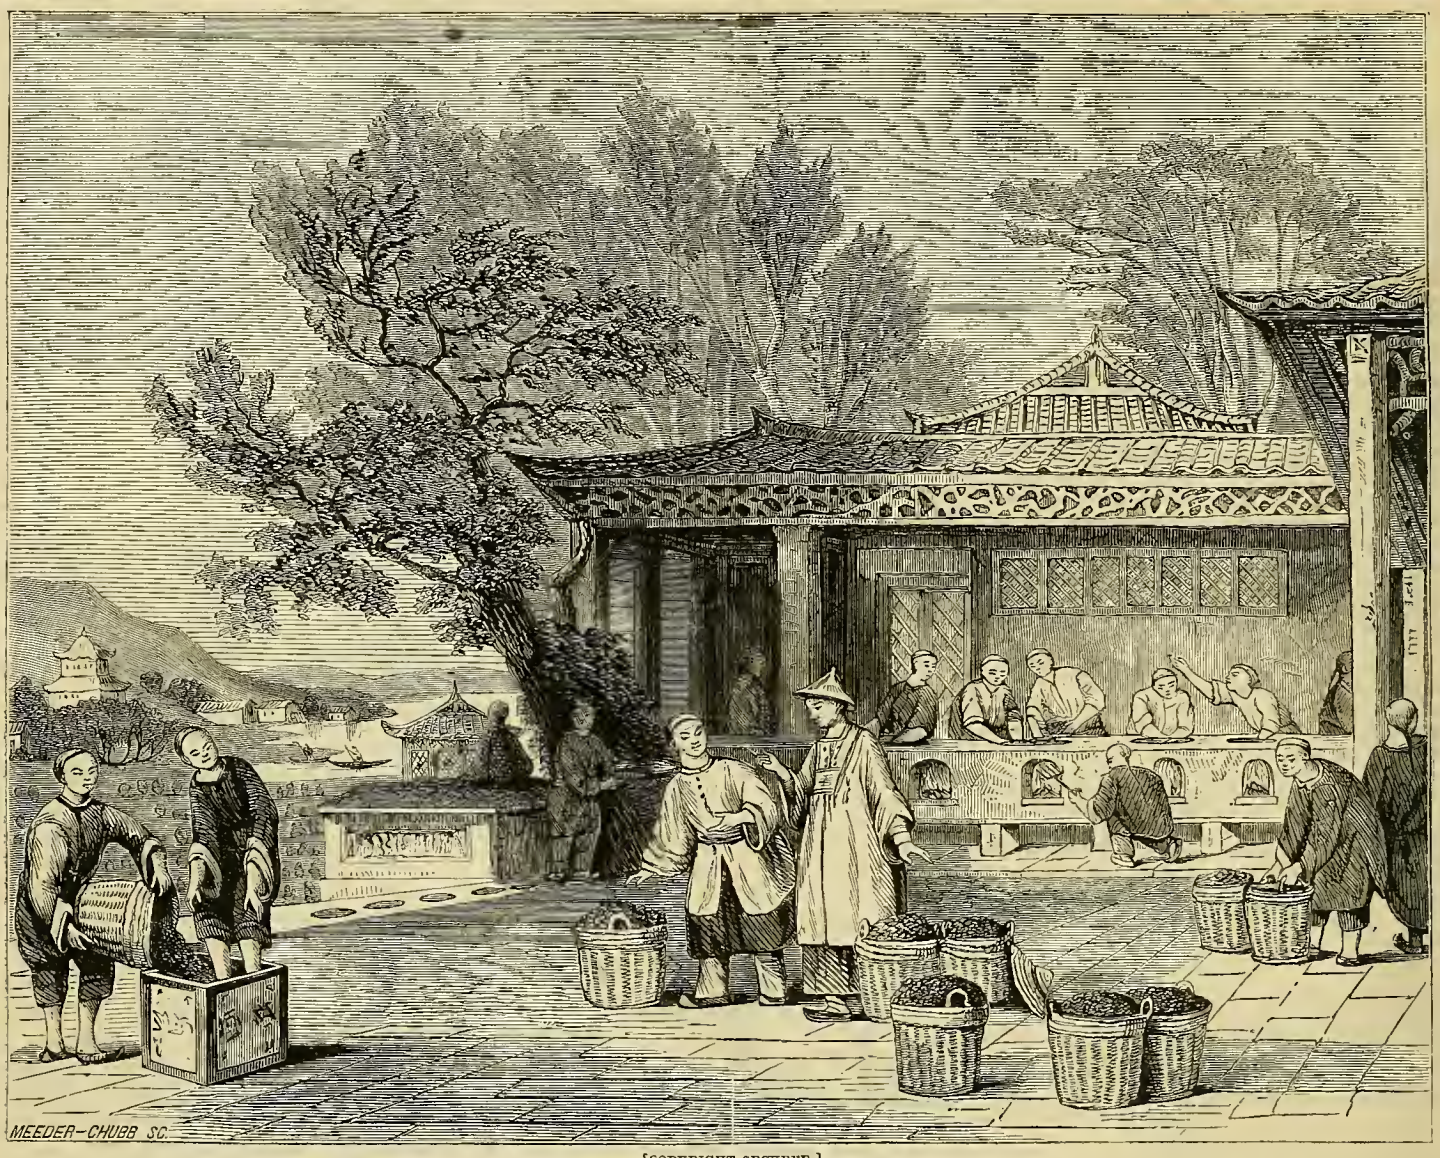
If you were to sail up the Yangtse river in February or March, to the great Poyang Lake, and then glide along its verdant shores, you would behold a charming scene—sunny hill-sides covered with blooming tea gardens,—towns and villages nestled in the corners—white pagodas crowning the hills, hundreds of junks afloat upon the calm waters, and thousands of men, women, and children, at work in the gardens, hoeing the ground, setting out young plants, or picking the leaves.

The first crop is the best. It is gathered with great care—each leaf being carefully picked between the thumb and finger. Only the tenderest leaves growing on the youngest twigs are gathered at the first picking.

A week or two later the next crop is gathered, then the third, and sometimes the fourth. The last pickings make up the poor qualities of tea. A pound of the first picking is worth fifteen or twenty of the last. We never see any of the first quality in our grocery stores. It is nearly all consumed in China by the wealthy classes—the mandarins and rich merchants. A mandarin invited me to dine with him one day, and I drank such tea as I never expect to taste again, unless I visit China once more. It was so mild, pleasant, and delicious, and had such a charming flavor that I did not much wonder that a mandarin could drink sixty cups of it during the day. Common tea was not much better than catnip, after that dinner in the palace of the Governor.

To see the preparation of the tea for market we must step into the building where the leaves are dried. The engraving on the next page shows one of them. You notice a large number of sheet-iron or copper pans, with charcoal fires beneath them. Coolies come trooping in from the gardens with a bamboo pole over their shoulders from which hang baskets filled with tea leaves.

They pour these into the pans; other coolies are stirring the leaves and rolling them in their hands. The fire in the first set of pans is not very hot. They want to get all the moisture out of the leaf, and if they were to dry it too rapidly, it would become brittle. After drying awhile in the first set, they are put into another set, and then into a third, and dried until every particle of moisture is evaporated. If this were not done, the leaves would soon mould in the tea chest. When the drying is completed, the tea is taken out into a basket, ponred into the chest and pressed in by a cooly who tramples it beneath his bare feet!...."*Ugh! the nasty beast!*"....



[COPYRIGHT SECURED.]

DRYING AND PACKING TEA BY THE CHINESE.—*Drawn and Engraved for the American Agriculturist.*

Is that your exclamation? Of course he washed them, but even if he did n't, I dare say the tea is as clean as the champaign that men smack their lips over and pronounce superb; for, if you were to visit France during the vintage season, you would see bare legged men jumping up and down in a tub filled with grapes, crushing the delicious fruit with their feet. Or, if you knew all about the making of molasses and sugar, candy would not be quite so nice as it now is. When the tea chest is full, the lead lining is soldered, the cover nailed down, and the paper with the queer Chinese characters is pasted on, and the "chop" is ready for market. The chests are lined with lead to preserve the tea from gathering moisture while in the stores, or while being exported to foreign countries. The leaves take in moisture easily, and they would soon become as musty as damaged meadow hay, if this precaution were not taken. The atmosphere in China during the summer months is full of moisture,—so full that the people who live in Shanghae have to kindle fires in July and August to dry up the dampness. Clothes mould in the closets. Put your boots aside for twenty-four hours and they will be covered with green fungus, just such as you see in a mouldy cheese. If there are two or three cloudy days in succession, every thing becomes mouldy, musty, and rusty. The books on your parlor table are covered with mould, unless wiped carefully every day.

Because China has such a damp climate the tea plant thrives. The dampness makes the leaves tender. The plant cannot be profitably cultivated in a dry climate.

It would undoubtedly grow well in Georgia, Alabama, Mississippi, and perhaps in Oregon, but so long as there are four hundred million of people in China—most of whom work for a living, and work for very little pay, we shall not be able to make much headway cultivating tea in this country where labor is so dear.

The Chinese are extravagantly fond of tea, and they drink it at all hours of the day and night. The tea saloons are always open. You sit down to a small table in a large hall where there are several hundred pig-tailed men laughing, talking, and drinking their favorite beverage. It is not green tea, but black. They do not often touch the green varieties. You call for a cup of tea, and a little boy, with a little cue, like a pig-tail, sprouting from the crown of his head, brings you two cups and a saucer. You wonder what the second cup with a cover is for. But see! He puts a small quantity of tea, just a pinch, into one cup, pours the boiling water upon it and puts on the cover to keep in all the steam and aroma, lets it stand a minute or two, then drains it into the other cup. It looks very weak and has n't hardly any color. You fear it is as "weak as dish-water." But just taste it. Isn't it delicious? You sip it—a little at a time, and smack your lips every time you swallow. You think of the Indian who wished his neck was half a mile long so that he could taste the whiskey all the way down! You can drink it all day and not get drunk, and as soon as your cup is empty you call for more. You drink it without milk or sugar, for that would spoil it. You notice a large jar beneath the table, and that the boy turns the grounds from your cup into it. When it is full it is taken out-doors and the contents dried in the sun. Then they are taken into the preparing room where they are colored with Prussian blue, Turmeric, Gypsum, and other things, dried in the pans, trampled a second time beneath the heels of a cooly, and sent over for us to drink! Even then it is better for us than whiskey, and no dirtier than many other things that we put into our months. Most of the teas sent to this country are of low cost, and of a poor quality. The Chinese drink the best! They do not make it so strong as we do, and experience no bad effects from its use.

All teas are purchased by sample, and the English and American merchants in China have tasters—young men whose sole business is to judge of the qualities of tea. You enter a tasting room and at the first glance think it a pantry, a china closet, and a grocery store, all in one; there are so many cups, covers, and packages of tea on the shelves. The young man has forty or fifty cups before him, and as many samples of tea. He weighs out a small quantity for each cup, and steeps each parcel so many seconds by the watch, and then tastes of each cup, and so judges of its strength and quality. These tasters get great pay—some of them five and even ten thousand dollars a year in gold. But they mortgage their health and lives. This constant tasting, after awhile, tells upon their nervous system, and the chances are that they will shorten their days. If any young man reading this has a desire to drop every thing and rush off to China to be a tea taster, he had better think twice, for very few tasters are wanted, and the large salary is dearly earned if loss of health and a shortening of life are the accompaniments, for among the best blessings bequeathed by our Heavenly Father is that of good health.

Office of FISK & HATCH,

BANKERS AND DEALERS IN GOVERNMENT SECURITIES.

No. 5 NASSAU STREET, NEW YORK.

February 15th, 1870.

The remarkable success which attended our negotiation of the Loans of the CENTRAL PACIFIC RAILROAD COMPANY and the WESTERN PACIFIC RAILROAD COMPANY, and the popularity and credit which these Loans have maintained in the markets, both in this country and Europe, have shown that the First Mortgage Bonds of wisely-located and honorably-managed Railroads are promptly recognized and readily taken as the most suitable, safe, and advantageous form of investment, yielding a more liberal income than can hereafter be derived from Government Bonds, and available to take their place.

Assured that, in the selection and negotiation of superior Railroad Loans, we are meeting a great public want, and rendering a valuable service—both to the holders of Capital and to those great National works of internal improvement whose intrinsic merit and substantial character entitle them to the use of Capital and the confidence of investors—we now offer with special confidence and satisfaction the

FIRST MORTGAGE BONDS

OF THE

CHESAPEAKE AND OHIO RAILROAD COMPANY.

The Chesapeake and Ohio Railroad, connecting the Atlantic coast and the magnificent harbors of the Chesapeake Bay with the Ohio River at a point of reliable navigation, and thus, with the entire Railroad system and water transportation of the great West and South-west, **forms the additional East and West Trunk Line**, so imperatively demanded for the accommodation of the immense and rapidly growing transportation between the Atlantic seaboard and Europe on the one hand, and the great producing regions of the Ohio and Mississippi Valleys on the other.

The importance of this Road as a new outlet from the West to the sea magnifies it into one of national consequence, and insures to it an extensive through traffic from the day of its completion; while, in the development of the extensive agricultural and mineral resources of Virginia and West-Virginia, it possesses, along its own line, the elements of a large and profitable local business.

Thus the great interests, both general and local, which demand the completion of the CHESAPEAKE AND OHIO RAILROAD to the Ohio River, afford the surest guarantee of its success and value, and **render it the most important and substantial Railroad enterprise now in progress in this Country.**

Its superiority as an East and West route, and the promise of an immense and profitable trade awaiting its completion, have drawn to it the attention and co-operation of prominent Capitalists and Railroad men of this City of sound judgment and known integrity, whose connection with it, together with that of eminent citizens and business men of Virginia and West-Virginia, **insures an energetic, honorable, and successful management.**

The Road is completed and in operation from Richmond to the celebrated White Sulphur Springs of West-Virginia, 227 miles, and there remain but 203 miles (now partially constructed) to be completed, to carry it to the proposed terminus on the Ohio River at, or near, the mouth of the Big Sandy River, 150 miles above Cincinnati, and 350 miles below Pittsburgh.

Lines are now projected or in progress through Ohio and Kentucky to this point, which will connect the **Chesapeake and Ohio with the entire Railroad systems of the West and South-west, and with the Pacific Railroad.**

Its valuable franchise and superior advantages will place the CHESAPEAKE AND OHIO RAILROAD COMPANY among the richest and most powerful and trustworthy corporations of the country **and there exists a present value, in completed road and work done, equal to the entire amount of the mortgage.**

The details of the Loan have been arranged with special reference to the wants of all classes of investors, and combine the various features of convenience, safety, and protection against loss or fraud.

The Bonds are in denominations of

$1,000 $500, and $100.

They will be issued as *Coupon Bonds, payable to Bearer*, and may be held in that form; or

The Bond may be *registered* in the name of the owner, with the coupons remaining payable to bearer attached, the *principal* being then transferable only on the books of the Company, unless reassigned to bearer; or

The coupons may be detached and cancelled, the Bond made a *permanent Registered Bond*, transferable only on the books of the Company, and the interest made payable only to the registered owner or his attorney.

The three classes will be known respectively as:

1st. "Coupon Bonds payable to Bearer."
2d. "Registered Bonds with Coupons attached."
3d. "Registered Bonds with Coupons detached," and should be so designated by Correspondents in specifying the class of Bonds desired.

They have **thirty years** to run from January 15, 1870, with interest at six per cent per annum from November 1, 1869. PRINCIPAL AND INTEREST PAYABLE IN GOLD IN THE CITY OF NEW YORK.

The interest is payable in MAY and NOVEMBER, that it may take the place of that of the earlier issues of Five-Twenties, and suit the convenience of our friends who already hold Central and Western Pacific Bonds, with interest payable in January and July, and who may desire, in making additional investments, to have their interest receivable at different seasons of the year.

The Loan is secured by a mortgage upon the entire Line of Road from Richmond to the Ohio River, with the equipment and all other property and appurtenances connected therewith.

A SINKING FUND OF $100,000 PER ANNUM IS PROVIDED FOR THE REDEMPTION OF THE BONDS, TO TAKE EFFECT ONE YEAR AFTER THE COMPLETION OF THE ROAD.

The mortgage is for $15,000,000, of which $2,000,000 will be reserved and held in trust for the redemption of outstanding Bonds of the *Virginia Central Railroad Company*, now merged in the CHESAPEAKE AND OHIO.

Of the remaining $13,000,000, a sufficient amount will be sold to complete the road to the Ohio river, perfect and improve the portion now in operation, and thoroughly equip the whole for a large and active traffic.

The present price is 90 and accrued interest.

A Loan so amply secured, so carefully guarded, and so certain hereafter to command a prominent place among the favorite securities in the markets, both of this Country and Europe, will be at once appreciated and quickly absorbed.

Very respectfully,

FISK & HATCH,

Bankers.

P. S.—We have issued pamphlets containing full particulars, statistical details, maps, etc., which will be furnished upon application.

☞ We buy and sell Government Bonds, and receive the accounts of Banks, Bankers, Corporations, and others, subject to check at sight, and allow interest on daily balances.

ELGIN WATCHES

MANUFACTURED BY

The Company also call the attention of Watch buyers to the fact that the Elgin Watches now offered have several peculiar improvements over all others and also a new

PATENT DUST EXCLUDER,

so constructed as to enclose the works, and form a protection against dust, enabling the movement to remain in order without cleaning double the time that a watch will ordinarily run without this protection.

The Company feel confident, after having had their Watches three years in market, and selling many thousands of them in all parts of the country, that the

Elgin Watches are the best time keepers now offered to the American public, for either Ladies' or Gentlemens' use, Railway or other uses.

Over Five Hundred Dealers

in various parts of the land have unreservedly endorsed them. They are in use upon numerous lines of Railway, including the **Union Pacific** and **Pennsylvania Central,** and officers of these roads, with other prominent R. R. officials, endorse them as the best Watches for the use of R. R. employees and travelers, yet introduced.

The following are presented as specimens of these testimonials:

UNION PACIFIC R. R., OFFICE OF GEN'L SUP'T, OMAHA, Dec. 16, 1869.

Hon. T. M. AVERY, President National Watch Co., Chicago, Ill.:

Dear Sir:—During the month that I have carried one of your "B. W. Raymond" Watches it has not failed to keep the time with so much accuracy as to leave nothing to desire in this regard. For accuracy, in time-keeping, beauty of movement and finish, your Watches challenge my admiration, and arouse my pride as an American, and I am confident that in all respects they will compete successfully in the markets of the world, with similar manufacturers of older nations. They need only to be known to be appreciated. Yours, most respectfully,

C. G. HAMMOND, Gen'l Sup't.

OFFICE OF THE HUDSON RIVER RAILROAD, Gen'l Sup't, New York, Jan. 17, 1870.

T. M. AVERY, Esq., President National Watch Co.

Dear Sir:—The Watch made by your Company which I have carried the past two months, has kept excellent time. I have carried it frequently on engines, and have been on the road with it almost daily. During this time it has run uniformly with our standard clock.

Truly yours,

J. M. TOUCEY, Gen'l Sup't.

The following dealers also, in various parts of the country, have certified that they consider the Elgin Watches to be all that the Company have advertised them, as better finished, more correct and durable, than any in market of similar price, and that they have great confidence in recommending them to the public on account of their general merit.

IMPORTANT TO FARMERS!

Entered according to Act of Congress, by D. W. RAMSDELL & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New York.

The Norway Seed Oats, Startling Frauds in the sale of Counterfeit Seed, Interesting Facts, Profitable Farming, How to Pay Mortgages, Where to get Genuine Seed, Who Recommends Them.

We have been to considerable expense in putting farmers on their guard against the frauds that were being perpetrated in the sale of Seed Oats, but not until recently did we realize the magnitude of these swindles. H. W. Marshall, of Cincinnati, Ohio, has issued a circular much of the contents of which has been copied from ours, representing that he is our authorized agent for the West, for the sale of the Ramsdell Norway Oats seed. We are informed by reliable parties in Cincinnati, that he has sent out over *Half a Million* of these circulars, and is receiving thousands of orders. He is a swindler, has never had any of our seed, nor any communication with us.

N. P. Boyer & Co., publishers of a country paper somewhere in Penn. issued a circular in a similar manner, claiming to have our seed, but when we exposed the fraud they changed their tactics, and are now advertising that they import seed from Norway. This dodge is so ridiculous, in view of the fact that our seed never came from Norway, and that we are filling orders from that country, that intelligent farmers are not likely to be deceived by it. Samples sent us, which came from them, have been pronounced New Brunswick Oats by hundreds of farmers who examined them. Other parties are selling what they claim to be our seed, at prices varying from $1.50 to $6 per bushel, *all warranted, of course*, and some use our name. Some of these parties are honest, but were themselves deceived in the purchase of seed last year. Out of over twenty samples sent us of Norway Oats, now being advertised, **only two were genuine.** We cannot go through the whole list, but the above facts are sufficient. We have only to request that those who buy of such parties, and are disappointed in their crops, will not condemn our seed, as some did last year.

Facts and figures have already been published, showing by as reliable testimony as can be found in the land, that the Ramsdell Norway Oats will produce from twice to three times as much to the acre, are heavier, and of better quality, stand up better, and are more hardy than any other known oats. They have been awarded forty-five first premiums, at the late State and County fairs, in competition with all the varieties now grown, which is a larger number than was ever awarded to any agricultural improvement in a single year. Among the leading journals that have recommended them, may be mentioned, the American Agriculturist, New-York Tribune, Moore's Rural New-Yorker, Independent, N. Y. Observer, Methodist, Christian Advocate, Western Rural, Prairie Farmer, Advance, Toledo Blade, and others. We can only present a few specimen extracts showing the character of the letters received.

FROM FARMERS.

"The yield is enormous. The additional value of the straw more than pays cost of seed."
C. D. LANGWORTHY, Alfred, N. Y.

"My yield from five acres is 753 bushels. I will beat the world next year."
J. L. DIVINE, Chattanooga, Tenn.

"Yield from 32 pounds seed on one acre, 113½ bushels."
J. BARKER, Spring Mills, N. Y.

"One bushel of your Norways produced as much as five bushels of the Surprise Oats."
ADAM RANKIN, Proprietor of Premium Farm, Ill.

"Yield from 15 lbs. seed, 50 bushels: weight 36 lbs."
GEORGE WILLIAMS, Minn.

"Grew six feet high. I took one bushel to our County Fair, and received first premium. Weight, 52 lbs."
A. WOGALON, Millersburg, Ohio.

"Their spreading qualities are enormous. Yield from 7 lbs. seed, 15 bushels."
G. M. BREWER, N. J.

"Yield 90 bushels per acre. This is the kind of *humbug* I like."
J. H. SCOTT, Warwick, N. Y.

"One bushel of Norways is worth two of other oats to feed out. They have substance, not all chaff."
S. M. WAITE, President Brattleboro (Vt.) Bank.

"I have bought all the improved seed down to the Norways, and it is the only one on which I have not been humbugged. Show me any oats that will beat it in yield or quality, and I will gladly pay $100 for a bushel."
W. R. HIBBARD, L. I., N. Y.

"My yield from 1¼ acres was 100 bushels. Common oats on same ground yielded 30 bushels per acre. Norways were heavier, and stood up while the others lodged badly."
V. C. SAWYER, Ohio.

"I bought 1 bushel of seed of N. P. Boyer & Co., which they advertised as Imported Norway Oats, before I saw your advertisement. I then sent for one peck of yours, and gave each an equal chance. The peck of your seed produced as much lacking 14 lbs. as the bushel of theirs; and yours did not lodge, theirs did."
I. L. DODGE, Pa.

"The Norways yield with me more than double what the Surprise do, and are excellent in quality. The Surprise oats are all hull, and a very deceptive grain. I would not pay half price for them to feed my horses."
M. V. WILSON, Kentucky.

The Norway Oats I bought of you last year have been a perfect God-send to me; I have realized enough to pay off a mortgage on my farm, which was due, and I had no means of paying, and I have seed left for 25 acres, which I shall put in this spring. One more crop will make me independent. The Norways are *King of Oats*.
OSCAR BERRY, Fond du Lac, Wis.

I estimate my clear profit per acre as follows: Increase in yield over ordinary oats, 45 bushels at 60 cts., $27; increased value of straw as feed, $25; total, $52. This is clear gain, from an investment of $10, calling the oats worth same as common oats. It pays better than wheat, or corn. As to quality, they are the best oats I ever saw, and any man who says they are not, shows that he is entirely ignorant about it. Others may try something else, I will stick to the Norways.
CHAS. VAN DEAN, Ohio.

I received 16 lbs. of your oats in the spring of 1869. Sowed on half an acre of ground. Yield, 52 bushels, weighing 40 lbs. to the bushel.
J. GALBREATH, White House, Pa.

Yield from 10¾ lbs., was 33 bushels. The Thrashers offered to thrash such oats at 1 ct. per bushel, the usual price being 3 cts.
O. B. WHEATON, Camillus, N. Y.

The seed I had from you gives great satisfaction. I also had some oats, represented to be Norways, from Boyer & Co., of Pa. They are nothing more than a good quality of common black oats.
JACOB MASON, Rosco, Minn.

I can assure farmers that the *Norway Oats* are no humbug. They yield excellently. My neighbor, who had a part of the seed sent here, has heads from his field 23½ inches long. I can add my name cheerfully to the long list of respectable farmers who endorse them.
REV. J. F. M. LLOYD, Harriettsville, O.

The bushel of oats I bought of you cost me $19.40 landed here. If it had been $100, I would be satisfied. My farm is down on the plains, good bottom land. The yield and growth were simply enormous, being over 120 bushels. They weigh 47 lbs. to the bushel. You have done a great thing for the West in the introduction of these oats, and are deserving of the grateful thanks of every farmer in the country.
C. H. HOWES, Georgetown, Col.

THE PROFITS.

There is a very general understanding among farmers as to supply and probable demand of this seed. No reasonable man, who knows the facts, doubts for a moment but that they will come into general use, just as rapidly as the seed can be had, displacing all others from our soil. If the entire product could be retained in this country, it would require two more crops to supply the seed wanted. But it is rapidly becoming known in other countries. While we have not courted foreign orders, wishing to reserve that market for another year, the few samples sent there last year have produced so well, that orders are daily reaching us from all parts of Europe. Even Norway is looking to us for the seed that bears her name, several important orders having been received from there. Nearly fifteen per cent of the last crop will be exported, and probably not less than ¼ of the next will find ready sales abroad. With these facts before us, we cannot expect a very great reduction in price of seed next year. We have shown that at price of ordinary oats, they are a profitable crop. At $1 per bushel, they will pay handsomely; but at $3 or $4, it is an easy matter for a farmer to pay off mortgages or build a new house from a few acres. Last season a 9-acre lot yielded $4,250 to a New York farmer, a larger sum than he had made in ten years farming. A Wisconsin farmer did still better; and hundreds have made small fortunes. These facts can be fully proven any day by undoubted testimony. While these high prices last, it is a speculation, but *it is safe and sure*. We hope no farmer will buy this seed unless he fully believes he is doing himself a greater favor than he is us. Many have thanked us for urging them to buy last year, and thousands will do so next year.

HOW TO GET SEED.

Our price is $7.50 per bushel; $4 per half bushel; $2.50 per peck. For the convenience of those wishing to experiment, we will send 2 lbs. by mail, post-paid, for $1.

While our seed varies in weight from 36 to 46 lbs. to the bushel, we sell by the standard of 32 lbs. to a bushel, which is enough to seed 1 acre of good ground. Send money with order, by draft, Post Office order, or registered letter. Address either of our Stores as follows:

D. W. RAMSDELL & CO.,
218 Pearl Street, New York.

Large Illustrated Circulars Free.

Marblehead Mammoth Cabbage!

This is the largest cabbage in the world, sometimes weighing over sixty pounds each, and averaging as high as thirty pounds by the acre! It is not only large, but cannot be surpassed for reliability for heading, tenderness, and sweetness. As some cultivators have an impression that this cabbage cannot be fully matured outside of Marblehead, I invite their attention to the following extracts from among the many commendatory letters which I have received.

"Your Marblehead Mammoth Cabbage cannot be excelled. There were heads weighing 50 lbs., and heads of Fottler's Improved Brunswick (from your seed) weighing 40 lbs.—John H. Howlett, Charlestown, Ill."

"I raised from your seed Marblehead Mammoth Cabbages that weighed 50 lbs.—A. H. Mace, Clintonville, N. Y., Nov. 14th, 1869."

"Your Marblehead Mammoth Cabbages were very fine, they all headed well, and weighed 37 to 40, and 47 lbs.—W. Llewellyn, Red Wing, Minn., March 12, 1869."

"Your Marblehead Mammoth Cabbages are wonderful; they grew to the size of an umbrella.—Thomas Flanigan, Palermo, Kansas."

"The Marblehead Mammoth Cabbages were a perfect success. They headed well, and were three times as large as any cabbage I ever raised before.—J. F. Butt, Kosciusko, Miss."

"I have raised your Marblehead Mammoth Cabbage for two years, and it has proved the tenderest and sweetest cabbage I ever saw.—S. S. Groves, Stones Prairie, Ill."

John Van Wormer, Springs' Mills, Mich., raised some weighing 30 lbs. John Humphreys, Titusville, N. Y., 33½ lbs. M. D. Clark, Elyria, Ohio, 37 lbs. H. A. Terry, Crescent City, Iowa, 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Becancour, C. W., exhibited three cabbages weighing respectively 40, 42½, and 44 lbs. John W. Dean, St. Michael's, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., 33 lbs., when trimmed. E. H. Ellis, Etna Green, Ind., over 30 lbs. A. E. Garrison, Des Moines, Iowa, 30 lbs. James S. Allen, Union Springs, N. Y., 30 lbs., when stripped of loose leaves. Wm. Lee, Jr., Denver, Colorado, has grown heads weighing 45 to 50 lbs., as a penalty for which the miners of the mountains call him the "Big Cabbage Man." Leonard Cheat, Denver, Colorado, raised one which weighed 46 lbs. when trimmed of waste leaves. Collins Eaton, Ogdensburgh, N. Y., 50 lbs. P. Sweeney, Loretto, Pa., 43 lbs. Sam'l B. Ornsbee, Rolling Prairie, Wis., 53 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot weighing from 50 to 60 lbs. A. C. Van Tassal, 30 lbs. trimmed. A. C. Goodwin, Kennedy, N. Y., 45 to 50 lbs. W. H. Spera, Euphrata, Pa., raised fifty heads that averaged over 31 lbs. each. Wm. D. Munson, Burlington, Vt., raised some weighing 46 lbs. Mary B. Sellman, Galesburg, Iowa, 28 to 43 lbs. stripped of loose leaves. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest cabbage ever seen in the country." "Astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled," etc., etc. As the original introducer of the Mammoth Cabbage, I am prepared to supply seed grown from *extra large heads*, at following prices, by mail, post-paid: Per package, 25 cts.; per oz., $1; 4 ozs., $3.50; per lb., $12.

Full instructions for cultivation accompanying the seed.

Catalogues free. JAMES J. H. GREGORY,
Marblehead, Mass.

New and Rare Vegetables.

I make the seeds of new and rare vegetables a specialty, besides growing all of the standard sorts. *Catalogues free.*

JAMES J. H. GREGORY, Marblehead, Mass.

BLISS' IMPROVED
Long Orange Carrot.

This superior variety is the result of a careful selection, for successive years, of the best formed, largest, and deepest-colored roots of the Imported Long Orange Carrot, by which it has attained a perfection hitherto unknown in this useful vegetable, being larger, better flavored, and of a deeper orange color, and more sure to produce a crop. Butter makers will find this variety very useful in giving to their butter a rich, deep yellow color. We unhesitatingly pronounce it the best variety in the market, and one which will not fail to give satisfaction to the purchaser. 1 oz., 20 cts.; 4 oz., 65 cts.; 1 pound, $2, by Mail, post-paid.

Address B. K. BLISS & SON,
P. O. Box 5712, New York.

New Crop Onion Seed.

Grown expressly for us the past season by some of the most successful growers in Wethersfield, Conn., and vicinity, the quality of which cannot be excelled. Mailed post-paid to any address upon receipt of price affixed.

	oz.	¼ oz.	pound
Early Red Wethersfield	40	1.25	4.00
Large Red Wethersfield	40	1.25	4.00
Yellow Danvers	40	1.25	5.00
Yellow Dutch	40	1.25	5.00

Importers, Growers, and Dealers in Garden, Field, and Flower Seeds, Horticultural Implements and Garden Requisites,

Would invite attention to the following collection of Seeds to the *Flower and Kitchen Garden*, which have been favorably known in every section of the country for the past sixteen years.

Collections of Flower Seeds by Mail.

The following collections contain the most showy varieties in our large assortment, with full directions for culture. Each packet contains a mixture of the different colors and varieties of its species, so that a greater display can be made at a much less price than when ordered in separate packets. Those unacquainted with Flowers, as well as the experienced cultivator, may order without fear of disappointment.

Coll. A—contains twenty choice varieties of Annuals...$1.00

Coll. B—contains twenty choice varieties of Biennials and Perennials..... 1.00

Coll. C—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation..... 1.00

Coll. D—contains five very choice varieties, selected from *Prize Flowers*, of English Pansies, German, Carnation and Picotee Pinks, Verbenas, Truffaut's French Asters, Double Hollyhocks..... 1.00

Any one remitting $3.00 will receive the four collections postage free.

The seeds contained in the above assortments are of our own selection. Purchasers who prefer to make their selection from the Catalogue will be entitled to a discount proportionate to the quantity ordered.

Collections of Kitchen Garden Seeds
BY MAIL.

A COMPLETE ASSORTMENT OF VEGETABLE SEEDS FOR ONE YEAR'S SUPPLY, FOR A LARGE OR SMALL GARDEN.

The following Collections are made up in the most liberal manner, care being taken to give a sufficient quantity of all the finest varieties and most useful sorts of Vegetables required in the Kitchen Garden.

Assortment No. 5 contains 55 varieties, $3.50
" No. 6 contains 33 varieties, 2.00
" No. 7 contains 15 varieties, 1.00

Larger Collections, which can be safely sent by express (freight paid by purchaser,) to any part of the country, as follows:

No. 1, $20.00; No. 2, $15.00; No. 3, $10.00; No. 4, $5.00.

For a list of the contents of each Collection, see Catalogue.

The *Sixteenth Annual Edition* of their **Illustrated Seed Catalogue and Guide** to the **Flower and Kitchen Garden,** is now ready for distribution.

No pains or expense have been spared in preparing this edition, to make it the most complete work of the kind ever published in this country.

It contains 120 pages of closely printed matter, and *two hundred* choice engravings of favorite Flowers and Vegetables—a large portion of which are entirely new; also, two beautifully colored lithographs of **Lilium Auratum** and a **group of Pansies, and a descriptive list of upwards** of *two thousand* species and varieties of *Flower* and *Vegetable Seeds*, including all the novelties of the past season, with directions for their culture; also, a list of upwards of *One Hundred varieties of Choice Gladiolus*—with many other Summer-Flowering Bulbs—and much useful information upon the subject of gardening generally.

A copy will be mailed to all applicants enclosing *Twenty-five cents.* Our regular customers supplied without charge.

Bliss' Gardener's Almanac mailed to all applicants upon receipt of a 3-cent stamp.

Address B. K. BLISS & SON,
P. O. Box 5,712, New York.

Cabbages worth Growing.

The following embraces the very best varieties in cultivation for a succession. Mailed to any address upon receipt of price.

	pkt.	*oz.*	*¼ lb.*	*pound.*
Early Wyman	25	$2.00	$6.00	$18.00
Early Wakefield	10	75	2.50	8.00

P. O. Box 5,712, New York.

SEED POTATOES.

BRESEE'S KING OF THE EARLIES, or No. 4.—Known also as the *Fifty Dollar Potato* (at which price they were sold last spring). The experience of the past season fully confirms all that was claimed for it by the raiser, and we have no hesitation in pronouncing it the *Earliest*, as well as one of the best varieties in cultivation, is ready for marketing one week in advance of the Early Rose. Mr. Bresee has placed his entire stock in our hands, for sale at the following greatly reduced prices.

Two Pounds, by mail, post-paid, for $1.00; by Express, (purchaser paying freight), One Peck, $5.00; One Bushel, $15.00; One Bbl., $40.00.

BRESEE'S PEERLESS, or No. 6.—This is, without exception, the best variety in cultivation, for a general crop. It grows to a large size, of a very showy appearance, is enormously productive, and fully equal to the Peachblow in quality. The stock was sold last spring at $600 per bushel. One lb., by mail, $1.00; by Express, $10.00 per peck.

BRESEE'S PROLIFIC, or No. 2.—4 lbs., by mail, $1.00; by Express, $1.25 per peck; $4.00 per bushel; $9 per Bbl.

CLIMAX.—4 lbs., by mail, $1.00; $1.50 per peck; $4.00 per bushel; $9.00 per Bbl.

EARLY ROSE.—4 lbs., by mail, $1.00; $1.00 per peck; $2.50 per bushel; $5.00 per Bbl.

Not less than $1.00 worth of a variety will be mailed. Older varieties will be furnished at market prices. Our illustrated *Potato Catalogue*, with full directions for their culture, will be mailed to all applicants enclosing a stamp.

B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

CUCUMBER, GEN. GRANT.

A superior variety, either for forcing or for culture in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five Packets for $1.00. B. K. BLISS & SON,
P. O. Box 5712,
New York.

Conover's COLOSSAL ASPARAGUS
Seed and Roots.

The experience of the past season fully confirms all that was claimed for this variety when first offered last spring, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Strong, one-year-old Roots mailed, post-paid, $2 per fifty; $3.00 per hundred.

SEEDS.—¼ oz. packet, 50 cts.
Address B. K. BLISS & SON,
41 Park Row, & 151 Nassau St., New York.

New Joint Parching Corn.

The most productive variety known, *producing from eight to ten ears on each stalk.* Equal to a yield of from one hundred to two hundred bushels per acre. Although it is, strictly speaking, a variety of parching corn, it is equally adapted to all purposes of common field corn for stock and poultry feeding, etc. It weighs, when shelled, stricken measure, sixty to sixty-two pounds per bushel. It should be planted in drills three feet apart, putting one kernel to every foot. Per packet, of about two hundred kernels, 50 cents; five packets, $2.00. For sale by

B. K. BLISS & SON,
41 Park Row, and 151 Nassau St., New York.

Lilium Auratum.
The Japanese Queen of Lilies.

A large importation from Japan, just received by the subscribers, in fine, healthy condition. Flowering Bulbs mailed to any address at following prices:

No. 1, $1.00 each; $9.00 per doz. No. 2, 75 cents each, or $6.75 per doz. No. 3, 50 cts. each; $4.50 per doz. Prices by the hundred or thousand will be given to dealers upon application. B. K. BLISS & SON,
Nos. 41 Park Row, and 151 Nassau St., New York.

ALSIKE CLOVER.

A fresh supply of the genuine variety just received by the subscribers. 75 cts. per pound, by mail; $7 per peck or $25 per bushel, by Express. B. K. BLISS & SON,
41 Park Row & 151 Nassau St., New York.

TERMS—(cash before insertion):

THE RICHEST FARMING LANDS IN THE WORLD!

1,300,000 ACRES FOR SALE

TO ACTUAL SETTLERS.

NEOSHO VALLEY, KANSAS.

UNION PACIFIC RAILROAD COMPANY.

SOUTHERN BRANCH.

The Lands now offered by this Company are situated mainly within twenty miles on each side of the road, extending one hundred and seventy miles along the NEOSHO VALLEY, the richest, finest, and most invitiog valley for settlement in the West.

One-third of the labor required at the East in the culture of farms will insure here double the amount of crops. For orchards, grape culture, and small fruit in general, it is unequaled.

BUILDING MATERIAL AND FENCING of every variety and in great abundance.

STOCK RAISING.—The rich native grasses of the prairies and bottoms, with the large area of unoccupied lands in connection with the dry, mild, and open winters, present unequaled advantages for the raising of cattle, sheep, and horses.

DAIRYING.—In such a country, with ranges for stock unrestricted, and pasture limitless, the production of butter and cheese must be profitable.

FRUIT GROWING is one of the *specialties*, as demonstrated by the Gold Medal awarded to the State of Kansas by the Pennsylvania State Horticultural Society for "A COLLECTION OF FRUITS UNSURPASSED FOR SIZE, BEAUTY, AND FLAVOR."

THE CLIMATE AND HEALTH of Kansas are unequaled. These, indeed, are among its chief excellencies, and are recommendations for settlement.

PRICES OF LAND.—From $2 to $8 per acre; credit of ten (10) years' time.

TERMS OF SALE.—One-tenth down at time of purchase. No payment the second year. One-tenth every year after, until completion of payments, with annual interest.

THE HEAD LAND OFFICE

is located at JUNCTION CITY. To all purchasers of lands *free tickets* from this point are given over the Road.

The Iona Nurseries.

A Word to Our Agents and Canvassers.

We desire to have Agents and Canvassers for our vines and plants report sales as early in April as convenient, and state at what time they wish to receive them. Additions to their orders should be forwarded as fast as received.

There is yet ample time for the formation of clubs.

☞ Send for our Price-list of vines and terms to Club Agents. Our stock comprises a full assortment of **RASPBERRIES, STRAWBERRIES, BLACKBERRIES, CURRANTS, GOOSEBERRIES, and GRAPES.** Address

HASBROUCK & BUSHNELL,
(Successors to C. W. GRANT,)
"Iona," near Peekskill, Westchester Co., N. Y.

Are You Going to Plant Grape-vines,

Raspberries, Strawberries, Blackberries, Gooseberries or Currants? Send to the **Iona Nurseries**, for Catalogue and price-list. Our vines and plants have been grown with special care to the production of the most valuable roots for planting in gardens, and we can recommend them to be of very superior quality, while our prices are quite as low as those of any first-class dealer. Send us your orders, and we will guarantee entire satisfaction.

Very liberal terms to large planters, agents, and such as will form clubs in their own vicinity. Send for price list and terms to clubs.

HASBROUCK & BUSHNELL,
Iona, near Peekskill, Westchester Co., N. Y.

THE EUMELAN GRAPE.

This grape, although new to the public, has had a history of nearly thirty years, and at Fishkill, its place of origin, proved the most valuable of all the native varieties. During the past several years it has been extensively disseminated for trial in various parts of the United States, and has everywhere maintained its character as a fruit of the best quality, while the vines are vigorous, hardy, and free from mildew.

It is everywhere admitted to be the BEST BLACK GRAPE in the entire collection, being as superior to the Concord, Hartford Prolific, and Ives' Seedling, as these varieties are superior to the common Fox-grapes of the woods.

We have vines of this variety both one and two years old, also a few of extra size for immediate bearing.

Our pamphlet, giving history of the Eumelan, with testimonials from all parts of the country, also containing Price List of Vines, will be sent free on application.

Large Premium Vines are given to Club Agents. Send for Club Agents' terms.

Address HASBROUCK & BUSHNELL,
"Iona," near Peekskill, Westchester Co., N. Y.

Naomi Raspberry.

This promises to become the leading Raspberry of the country. For full description see Catalogue. We offer 10,000 plants this season at the following prices:

Send Post-office Order, Registered Letter, or Draft, if possible.

FRUIT BASKETS.

QUART. PINT. ½ PINT.

GET THE VERY BEST. In nothing does this injunction better apply than in the selection of a basket for marketing small fruits. It is an undeniable fact that no article yet offered for this purpose comes so near perfection as **THE BEECHER VENEER FRUIT BASKET.** These baskets are not only cheap, but combine greater strength, beauty, durability, and capability for ventilation than any other known style, hence for use and convenience are by far the most economical made. *Full measure guaranteed,*—no "short quarts" when the *Beecher Basket* is used. We have the voluntary testimony of many of the largest growers and commission fruit-dealers sustaining our claims for these baskets. In short, they are *the* basket,—try them and prove the correctness of above statements. Light, neat, and strong, crates of various sizes to accompany baskets, on hand, and made to order.
Send for circular and price list to

THE BEECHER BASKET COMPANY,
Westville, Conn.

Cahoon's Broadcast Seed Sower,

For Sowing All Kinds of Grain and Grass Seed.

Our advertisement of this **Seeder**, in the *Agriculturist*, and other papers, has brought us showers of letters and multitudes of orders for which an appreciating public have our sincere thanks. We refer you to our advertisement in March number of this paper, and solicit a continuance of your favors.

D. H. GOODELL & CO., Antrim, N. H.,
Sole Manufacturers.

NEW AND VALUABLE WORKS.

HOW CROPS FEED.

A TREATISE ON THE

ATMOSPHERE AND THE SOIL

AS RELATED TO THE

NUTRITION OF AGRICULTURAL PLANTS.

WITH ILLUSTRATIONS.

BY

SAMUEL W. JOHNSON, M. A.,

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEMISTRY IN THE SHEFFIELD SCIENTIFIC SCHOOL OF YALE COLLEGE; CHEMIST TO THE CONNECTICUT STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

The work entitled "How Crops Grow" has been received with very great favor, not only in America, but in Europe. It has been republished in England under the joint Editorship of Professors Church and Dyer, of the Royal Agricultural College, at Cirencester, and a translation into German is soon to appear, at the instigation of Professor von Liebig. The Author, therefore, puts forth this volume—the companion and complement to the former—with the hope that it also will be welcomed by those who appreciate the scientific aspects of Agriculture, and are persuaded that a true Theory is the surest guide to a successful Practice. In this, as in the preceding volume, the Author's method has been to bring forth all accessible facts, to present their evidence on the topics under discussion, and dispassionately to record their verdict. If this procedure be sometimes tedious, it is always safe, and there is no other mode of treating a subject which can satisfy the earnest inquirer. It is, then, to all the Students of Agriculture, whether on the Farm or in the School, that this volume is specially commended.

CONTENTS.

DIVISION I.

The Atmosphere as Related to Vegetation.

CHAPTER I.—ATMOSPHERIC AIR AS FOOD OF PLANTS.
CHAPTER II.—THE ATMOSPHERE AS PHYSICALLY RELATED TO VEGETATION.

DIVISION II.

The Soil as Related to Vegetable Production.

CHAPTER I.—INTRODUCTORY.
CHAPTER II.—ORIGIN AND FORMATION OF SOILS.
CHAPTER III.—KINDS OF SOILS, THEIR DEFINITION AND CLASSIFICATION.
CHAPTER IV.—PHYSICAL CHARACTERS OF THE SOIL.
CHAPTER V.—THE SOIL AS A SOURCE OF FOOD TO CROPS: INGREDIENTS WHOSE ELEMENTS ARE OF ATMOSPHERIC ORIGIN.
CHAPTER VI.—THE SOIL AS A SOURCE OF FOOD TO CROPS: INGREDIENTS WHOSE ELEMENTS ARE DERIVED FROM ROCKS.

PRICE, POST-PAID, $2.00.

AGENTS WANTED

TO SELL

BULLARD'S

IMPROVED HAY TEDDER.

Important Improvements! See Pamphlet!

It is the *only Machine* for *turning* and *spreading* hay, that is of *light, easy draft* for *one horse.* Takes the hay up *from the bottom*, tosses it lightly into the air, and leaves it in a light, fleecy condition for drying, just as the Farmer wants it. Its use enables the Farmer to *cut*, cure, and *store away* hay in *one day*, and adds 20 per cent to value of crop. A large Farmer says: "*Its use* in a *single season* will *more than* pay *its cost.* The enterprising Farmer *will not, cannot* do *without it*; the longer he puts off buying, the poorer he will be." It is the most popular Harvesting Machine ever offered. Liberal inducements to Agents.

Union Mower and Reaper

Is the height of perfection. Light, easy draft, simple in construction, neat and accurate in workmanship, convenient to operate, perfectly adapted to cut on salt marsh, uneven hill-side or lawn. Those who have used it pronounce it the

Most durable Machine made.

Sulky Hay Rakes—Shares' Coulter Harrow—Betts' Hilling Plow.

Agents wanted to sell any or all of the above. Liberal inducements offered to enterprising men. Illustrated pamphlets and terms to Agents mailed upon application.

DUANE H. NASH, Gen. Agt.,
29 Cortlandt St., New York City.

INVENTORS Who wish to secure **PATENTS** should write to MUNN & CO., **37** Park Row, New York, for **Advice** and **Pamphlet**, 108 pages, **FREE.**

JOHNSTON'S PATENT

SELF-RAKING REAPER.

CHAMPION

OF THE

SWEEPSTAKES

PRIZE.

The most competent and practical Self-Raking Reaper before the American public is that of the "JOHNSTON PATENT;" in fact, it is the only "ORIGINAL DEVICE" that is of practical worth for REELING and RAKING grain. It is the only Reaper that will save the entire crop when badly tangled and lodged.

There is no grain that grows or becomes so tangled and lodged that this Reaper will not cut, clean, and deliver in the most satisfactory manner. (By this we do not mean that it straightens the straw or lays it as compact as when standing); *otherwise we mean all we say.* Its draft is about the same as that of a Light 4-ft. Cut Mower; we make them to cut a 5 or 6 feet swath; 15 acres is an ordinary day's work. A 6 feet cut was used the past summer by a man and an ordinary span of horses, and cut 21 acres between sunrise and sunset; it is simple in its construction, so much so that any boy or ordinary field hand can work it to its full capacity, or it can be worked automatically, as preferred. We manufacture for the States of Minnesota, Wisconsin, Pennsylvania, and New York State east of the Genesee River, except the Counties on the Hudson River; and are prepared to furnish Machines to the farmer or the trade. For other particulars send for Circulars in pamphlet form.

Address C. C. BRADLEY & SON, Syracuse, N. Y.

WISHWITZ'S PULVERIZING HARROW is indispensable to every farmer who wishes to cultivate his land thoroughly, increase his crops, and economize labor. It is worth ten times its cost to every farmer. *Warranted to please, or money refunded.* Price, with spring seat, $30, at New York, or Cleveland. Send for Illustrated Circular to PEEKSKILL PLOW WORKS, Peekskill, N. Y., or, Cleveland, Ohio.

FERTILIZERS.

A 1 Peruvian Guano, per 2,000 pounds, $90, subject to change. E. F. Coe's Superphosphate of Lime, per 2,000 pounds, $56. Pure Ground Bone, per 2,000 pounds, $38.

Any other variety of Fertilizers furnished to order, but we guarantee the above, and will promptly ship a reliable article on receipt of price.

R. H. ALLEN & CO.,
P. O. Box 376, New York.

BLANCHARD CHURN.

(Page 134 of our large catalogue.)

The Best Churn for Family and Dairy purposes now in market, made of five sizes.

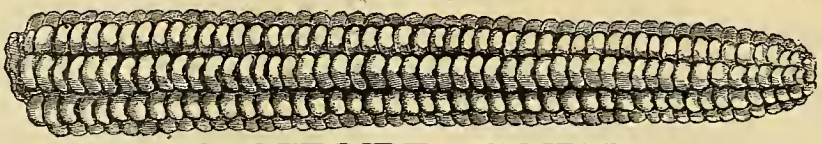
Improve Your Seed, "The Best is the Cheapest."



SANFORD CORN.

The earliest and most productive *field* corn, having yielded the past unfavorable season in many States over 100 Bushels shelled corn per acre. In many instances planted in same field and having in all respects the same chance, *it has ripened from two to three weeks earlier and yielded double the amount of other corn.*

READ THE FOLLOWING TESTIMONIALS:

From E. B. THOMPSON, Wheaton, Ill.

I can truly say that the Sanford Corn has in every way proved itself worthy of the recommendations given it in the *American Agriculturist.* It was planted the 20th of May, and harvested the 1st of Sept. I intend to plant largely of it another season.

From JOHN TAYLOR, Darby Creek, O.

The growth of the Sanford Corn was wonderfully vigorous and beautiful. The time of planting was as late as *the 15th of June*, and it ripened *at least ten days earlier than the common corn of the country.*

From NEWTON ELLIS, Savoy, Ill.

The Sanford Corn received from you was planted on the 15th of May. Two grains in a hill brought forth from four to six stalks, generally two ears to the stalk, and sometimes three. Was well ripened by the 15th of August, and yielded at the rate of 200 Bushels per acre.

From C. H. VAN OLINDA,—originator of the Surprise Oat—Sandwich, Ill.

The Sandford Corn has given perfect satisfaction. All the corn in this vicinity was planted before I planted the Sanford, but it ripened *two or three weeks* before my common corn. It yields with me this season from 65 to 70 Bushels to the acre, while my common corn yields but 25 to 30. I shall plant 25 acres of the Sanford the coming season and *would not take $5 per Bushel for my seed.*

From CLARK WILSON, Ottawa, Kansas.

The Sanford Corn is a success. I planted on the 10th of May and by the *15th of August it was fully matured.* The yield was large. Many ears over 12 inches long and three ears on many of the stalks. The best corn I raised, and gave much the largest yield.

From J. W. STOWELL, Mt. Carmel, Ill.

The Sanford Seed Corn you sent me last spring was not planted until I finished planting my Ill. corn, but it was *fully ripe by Sept. 1st. I can fully recommend it.*

From GEO. WM. WILSON, Auburn, O.

We planted the Sanford Corn on the 22d of May. It was frozen to the ground by the June frost. The constant and drenching rains rendered proper cultivation impossible. Notwithstanding these drawbacks, there was a fair yield of corn, and the large and well filled ears gave conclusive evidence of an enormous yield under more favorable circumstances. From the ordinary varieties we should not have expected a single ripe ear of fair size.

From W. J. YOWELL, Hamburg, Iowa.

I planted the Sanford Corn on the *1st of June, and it was ripe three weeks sooner than the earliest corn I had on my place.* I have given it a strict trial to test it and pronounce it **No. 1.**

From HENRY LONGSTRETH, Limerick Station, Pa.

It affords me much pleasure to inform you that I planted several varieties of corn the past season, and I put the Sanford at the head of them all.

Send stamp for Descriptive Circular. Every farmer should have it. An increase in yield of two Bushels per acre will pay cost of seed. Money may be sent in Registered Letter, by Express, Post-office Money Order (drawn on Riverhead P. O., N. Y.), or Drafts on N. Y. SELECTED SEED (*the small end of every ear rejected*).—Prices: One Quart, by mail, post-paid, 75c.; Two Quarts, $1.25; One Peck, $3.50.—One Peck, by Express, or Freight, $2; ½ Bushel, $3; One Bushel, $5. Address

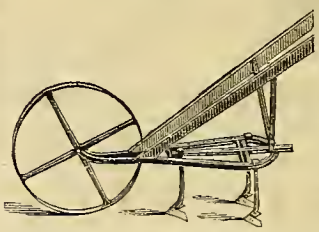
COMSTOCK'S

New Horticultural Implements

COMBINED.

The Best in the World.



As a Cultivator.

Comstock's Hand Cultivator and Onion Weeder will do the work of SIX MEN with hoes. It is the only implement that *pulls the weeds* and thoroughly pulverizes the soil. As much superior to the hoe for all small drill crops, as the mowers and reapers are to the scythe and cradle. PRICE, $9.00. Boxing, 25 cts.

Comstock's Seed Sower.—The neatest and most perfect small seed sower yet invented—sowing Beet, Parsnip, and other difficult seeds with the greatest regularity. Combined with the Cultivator and Weeder, and can be separated in 5 minutes. PRICE, $15. The Seed Sower alone, $10. Boxing, 35 cts.

Comstock's Strawberry Cutter, for removing Strawberry runners, cultivating between the rows at the same time—with the Cultivator and Weeder combined. PRICE, $12.00. Boxing, 25 cts.

Comstock's Weeding Hook.—A little steel instrument with a hook at each end, one pointed and the other cleft, for hand weeding, and is just the thing for ladies in the Flower Garden. PRICE, 50 cts.

The Weeding Hook will be sent by mail upon receipt of 65 cts.

The Set Complete, $18.50. Boxing, 35 cts.

The cuts will give a correct idea of the implements, with the exception of the handles, a portion of which it was necessary to cut off for want of space. Descriptive Circulars sent to all applicants. Address

ARE YOU GOING TO PAINT? See AVERILL PAINT CO'S advertisement on last cover page.

Iowa and Nebraska Lands
FOR SALE.

By ACT OF CONGRESS, the U. S. Government has granted to the **BURLINGTON AND MISSOURI RIVER RAILROAD CO.**, nearly **TWO MILLION ACRES** of choice prairie and timber lands, lying in the south-half of Iowa and south-east part of Nebraska.

Through this healthy and rich region this great railway is now constructed 349 miles, and will be rapidly extended to, or near Fort Kearney, making its entire length about 500 miles on an east and west line.

These lands, mostly prairie, extend 20 miles north and 20 miles south of the railway in alternate sections of 640 acres, and are sold at low prices in one or more tracts of 40 acres each, to suit buyers, on a long credit of 10 years at 6 per cent interest. For the first two years annual interest is required in advance, and then, at the commencement of the third year, only one-ninth of the principal with annual and decreasing interest is payable, as per following example. Say, that 40 acres of land @ $10 per acre = $400, is bought on long credit of ten years, on April 1st, 1870, the payments will be due as follows:

		Interest.	Amount.
April 1, 1870, pay 6 per cent interest on $400		$24 00	$24 00
April 1, 1871, pay 6 per cent interest as before		24 00	24 00
Then one-ninth of principal, as follows:			
April 1, 1872	$44 44	$21 34	$65 78
" 1, 1873	44 45	18 67	63 12
" 1, 1874	44 44	16 00	60 44
" 1, 1875	44 45	13 33	57 78
" 1, 1876	44 44	10 67	55 11
" 1, 1877	44 45	8 00	52 45
" 1, 1878	44 44	5 33	49 77
" 1, 1879	44 45	2 66	47 11
" 1, 1880	44 44	.....	44 44
	$400 00	$144 00	$544 00

If 80 acres are bought at $5 per acre, or if 160 acres are bought at $2.50 per acre, the payments will be due when and for the same amounts as on the above forty acres at $10 per acre.

If payment in full is made at date of purchase, twenty per cent deduction is allowed from the long or Ten years' credit price.

Correspondence is invited, and promptly and cheerfully answered.

Apply to, or address with stamp,

GEO. S. HARRIS,
Land Commissioner B. & M. R. R. Co.,
Burlington, Iowa, or at Plattsmouth, Nebraska.

MISSOURI LANDS FOR SALE,
On 2 or 10 Years' Credit.

Missouri Lands are very fertile and situated in the heart of the Union.

North Missouri contains about 16,000,000 acres as desirable as any in the Mississippi Valley. Through this Garden of Missouri the Hannibal & St. Joseph Railroad extends, and all its lands lie near its track and numerous depots. The climate, so temperate and healthful, and a virgin soil so capable of producing almost every kind of vegetation, invite emigrants to settle on our Prairies. Circulars, giving full and valuable particulars are supplied gratis to all wishing to go themselves, or to circulate to induce their friends to go also.

A Sectional Map showing exact location of all our Railroad lands is sold at thirty cents.

Address LAND COMMISSIONER,
Hannibal & St. Joseph R. R. Co., Hannibal, Mo.

(Advertisements on this page, $2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE

GREAT AMERICAN

TEA COMPANY

Receive their Teas by the Cargo from the best Tea districts of China and Japan, and sell them in quantities to suit customers

AT CARGO PRICES.

NEW CROP TEAS.

We are now receiving several Cargoes of the finest quality of

EARLIEST PICKINGS

of the

NEW CROP TEAS,

ever imported from China and Japan, (some just arrived, and others on the way). They have been selected from the growth of the best Tea Districts, and are very fresh and of the choicest flavor, and cannot fail to give entire satisfaction. We are

NOW FILLING OUR CLUB ORDERS

with the New Crop Teas.

The Company have selected the following kinds from the stock, which are recommended to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS.

OOLONG (Black), 70c., 80c., 90c., best $1 ₱ lb.
MIXED (Green and Black), 70c., 80c., 90c., best $1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., $1, $1.10, best $1.20 per pound.
IMPERIAL (Green), 80c., 90c., $1, $1.10, best $1.25 per pound.
YOUNG HYSON (Green), 80c., 90c., $1, $1.10, best $1.25 per pound.
UNCOLORED JAPAN, 90c., $1, $1.10, best $1.25 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Unground), 30c., 35c., best 40c. per lb. GREEN (Unroasted), 25c., 30c., 33c., best 35c. per lb.

CLUB ORDER.

BRAIDWOOD, Will Co., Ill., Feb. 14th, 1869.

TO THE GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey Street, New York.

Gentlemen:—Business, and a want of opportunity, have for the last eight months prevented me sending, or rather attending to our monthly club, whose orders I sent you regularly for about a year previous. Since that time many indeed have been the solicitations by many of the members, that I should once again commence and send club orders—for, as some declared, they had got *no Tea*, no matter what the price paid, since I quit sending the club orders. I have, therefore, at the urgent request of a few, resolved to send you a small order monthly, and as a beginning send you the following:

2	English Breakfast	John James	at	1.20....2.40
1½	English Breakfast	Jas. Reside	at	1.20....1.80
2	English Breakfast	John Runcie	at	1.20....2.40
2	Uncolored Japan	Wm. Ross	at	1.00....2.00
1	Imperial	Wm. Ross	at	1.25....1.25
1	Young Hyson	Wm. Ross	at	1.25....1.25
1	Oolong	Pat. McGerrity	at	1.00....1.00
2	Imperial	John Larken	at	1.25....2.50
1	Oolong	Wm. Duffie	at	1.00....1.00
4	Young Hyson	Thos. Conners	at	1.25....5.00
6	English Breakfast	Robert Barr	at	1.20....7.20
2	Uncolored Japan	John James	at	1.25....2.50
3	English Breakfast	Geo. Simpson	at	1.20....3.60
2	Imperial	Wm. Brooks	at	1.25....2.50
1	Imperial	Wm. Brooks	at	1.25....1.25
1	English Breakfast	Wm. Brooks	at	1.20....1.20

Address to John James, Braidwood, Will County, Illinois,—per Merchants' Express—to be collected on delivery; and oblige Yours respectfully, JOHN JAMES.

Parties sending club or other orders for less than $30 had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for clubs of less than $30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within thirty days, and have the money refunded.

N. B.—Inhabitants of villages and towns where a large number reside, by *clubbing* together, can reduce the cost of their Teas and Coffees about one-third, (besides the Express charges) by sending directly to "*The Great American Tea Company.*"

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We do not, in any case, authorize the use of our name.

POST-OFFICE orders and Drafts, make payable to the order of "*The Great American Tea Company.*" Direct letters and orders (as below, no more, no less.)

Great American Tea Company,
Nos. **31** and **33** VESEY-ST.,
Post-Office Box, 5,643, New York City.

KNOX

Fruit, Farm & Nurseries.

GRAPES,

Strawberries, Raspberries, Blackberries, Gooseberries, Currants, etc.

Our Vines and Plants are in great demand, and give general satisfaction, because they are grown on the right kind of soil with the greatest care, and so handled as to insure their well doing.

We guarantee our prices to be as low as a GENUINE article of the same QUALITY can be had anywhere.

More failures in Small Fruit culture arise from the planting of inferior stock, because it is low-priced, than from any other cause.

See our DESCRIPTIVE and ILLUSTRATED CATALOGUE and PRICE LIST for spring of 1870, for which send 10 cents.

J. KNOX,
Box 155, Pittsburgh, Pa.

JUCUNDA—Our No. 700 Strawberry,

is greatly the most valuable variety we grow. The New York *Tribune* says that while hundreds of bushels of other kinds were being thrown into the Docks in that city, our berries of this variety were selling on Broadway, for 50 cts. per quart, after a carriage of 400 miles.

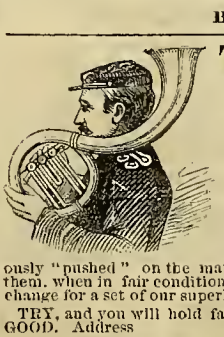
Plant the best and secure the genuine.

We offer plants this season as follows:

50 cts. per doz.; $3 per 100; $5 per 200, by mail. $20 per 1,000; $50 per $3,000; $75 per $5,000; $100 per 8,000.

Our collection of Strawberries includes all desirable kinds, which we offer at low rates. See Price List.

J. KNOX,
Box 155, Pittsburg, Pa.



THE WIDELY-KNOWN SCHREIBER CORNETS AND BAND INSTRUMENTS continue to grow in popular favor. Their peculiarly fine qualities are easily discovered by fair-minded musicians—long use serves but to strengthen the first favorable verdict. The closest tests and scrutiny precede sales. Each set bears its own commendation.

Bands are often encumbered with some of the numerous inferior styles which are vigorously "pushed" on the market. We can arrange to take them, when in fair condition, at a moderate price, in exchange for a set of our superb instruments.

TRY, and you will hold fast, because you will find them GOOD. Address

SCHREIBER CORNET COMPANY,
M. J. PAILLARD & CO., Agents,
680 Broadway, New York.

PLATFORM AND COUNTER

SCALES.

For Farmers, Merchants, Manufacturers, Railroad Companies, Machinists, Druggists, &c., &c., in great variety.

Every Farmer should have a FAIRBANKS' SCALE.

Send for Circular. FAIRBANKS & CO.,
252 Broadway, New York.
246 Baltimore St., Baltimore, Md.
53 Camp St., New Orleans.
FAIRBANKS & EWING, Masonic Hall, Philadelphia.
FAIRBANKS, BROWN & CO., 118 Milk St., Boston.

LARGEST—BEST—CHEAPEST!

MOORE'S RURAL NEW-YORKER

THE GREAT ILLUSTRATED

RURAL, LITERARY, AND FAMILY WEEKLY.

MOORE'S RURAL Excels in CONTENTS, Size, Style, ILLUSTRATIONS, &c. Sixteen Double-Quarto Pages of Five Columns Each. Ably Edited; Beautifully Illustrated; Neatly Printed; and Adapted to both Town and Country. The RURAL is profusely and splendidly Illustrated—the volume just closed containing *Over Eight Hundred Engravings!*

The RURAL employs the Best Talent, and is an acknowledged authority on Practical, Scientific and Literary Subjects. An Exchange truly says of it that "THE RURAL is the most Elegantly Printed, Ably Edited, Widely Circulated and Heartly Welcomed Paper, as a whole, which now finds its way among the People."

MOORE'S RURAL PAYS

All who cultivate Fruits, Flowers, Vegetables, &c., even on a small scale, (in City, Village or Suburb,) while to Farmers, Planters, Horticulturists, Stock Breeders, Wool Growers, Dairymen, Poultry Fanciers, &c., it is INDISPENSABLE. In the FAMILY it is highly regarded, its Literary and Miscellaneous Departments furnishing CHOICE AND ENTERTAINING READING FOR ALL. Remember that it is *not a monthly*, but the **Largest, Cheapest** and **Best Illustrated Weekly in the World!**

Only $3 a Year; in clubs of ten or more, $2.50. Specimens, Premium Lists, Show-bills, &c., sent free. Drafts, Orders, &c., at our risk.

Address D. D. T. MOORE,
41 Park Row, New York.

THOROUGH-BRED PIGS.

CHESTER COUNTY WHITES.

For SALE singly or in pairs (not nearly related), pigs reared by the members of the WORCESTER COUNTY (Mass.) SWINE IMPROVEMENT ASSOCIATION. The swine reared by members of this Association took first premiums for *Boar, Breeding Sow*, and *Litters of Pigs*, at the New England Agricultural Fair, at Portland, Me., 1869, and also at Worcester County Agricultural Fairs for 1867, 1868, 1869. They likewise, had awarded to them a Siver Medal at the N. H. State Agricultural Fair, 1869. Apply to

DR. CALVIN CUTTER, Warren, Mass.,
Agent of said Association.

HORSFORD'S SELF-RAISING BREAD PREPARATION

Makes the most wholesome and best of BREAD, BISCUIT, CAKES, &c. Unlike some other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving itself into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "*raising*" the dough it does not, like other yeast, decompose the flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send for pamphlet, supplied gratis. Ask your Grocer for "Horsford's Bread Preparation." WILSON, LOCKWOOD, EVERETT & CO., Wholesale Agents, 301 Fulton-st., New York.

FULL SIZE.

Snyder's Carpet Hooks

Are the best, cheapest, simplest, most convenient, durable, and **Labor-saving Carpet Fastener** ever invented; enabling you to put down or take up your carpet **in 10 minutes.** Try them **once** and you will **use no other.** Cheaper than tacks. For sale everywhere. Dealers supplied.
JOSEPH SINTON, Ithaca, N. Y., Gen'l Agent.

Just the thing for Canvassers, Agents, and peddlers, as people will have them. Sample and terms for stamp.

A. D. PUTNAM & CO., Produce Commission Merchants, No. 68 Pearl-st, New York. "Quick sales and prompt returns." ☞ Send for our weekly Price Current and Marking Plate.

[COPYRIGHT SECURED.

DEVON CATTLE FROM THE HERD OF HON. E. H. HYDE.—*Drawn and Engraved for the American Agriculturist.*

The above engravings are portraits of animals owned by Hon. E. H. Hyde of Stafford, Conn., and were taken from photographs. The cows were in full milk and the bull in fair working order only. It is impossible to show in any engraving the beauty of this breed which owes so much to its rich, almost cherry-red color and white horns. It is a snug, tightly knit race, very different from any other, showing no indication of intermixture of blood in its origin—and hence by many claimed, with good reason too, to be the original breed of Great Britain. Modern breeders have perhaps introduced a dash of Shorthorn blood to give greater aptitude to fatten and earlier maturity. The Devons are medium-sized cattle, the bulls often rather low in stature; the cows of fair size giving 14 to 20 quarts of rich milk, valuable for both butter and cheese making; the working oxen, both pure Devons and grades, are among the very best in the world, for everything except very slow heavy work. They are spry, intelligent, handy and trusty, fast walkers, and we have known them fair trotters; and they make, when fattened young, the very best beef of our markets. Devons are rather slow in coming to full size and maturity, but they fatten easily, and last in full vigor as cows and oxen until 12 to 18 years old. The cows are docile and quiet, and the steers easily broken. Upon the whole, the Devon probably combines all good points and valuable qualities to a degree not approached by any other breed. These cattle are hardy at the South, and their activity adapts them to pick up a fair living where Shorthorns or Herefords would starve. It is not very unusual to find among the cows deep milkers, giving over 20 quarts of milk, and in quality of the milk takes high rank next to that of the Jerseys.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last thirteen volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for thirteen years past, beginning with 1857—that is, Vol. 16 to Vol. 28, inclusive. Any of these volumes sent complete (in numbers) at $1.75 each, post-paid, (or $1.50 if taken at the office). The volumes, neatly bound, are supplied for $2 each, or $2.50 if to be sent by mail. Any single numbers of the past thirteen years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW YORK, MAY, 1870.

This month brings active work, usually over much, and as every man's most precious property is health, this should not be wantonly jeopardized. The fact is, we continually risk too much and often suffer for it most terribly—as is the experience of almost every family in the land. The laws of health in both man and animals cannot be disregarded or violated without a penalty, and it is much more agreeable to keep one's self, one's family, one's laborers, and one's stock in good health than it is to recover health if lost. Steady, regular, hard work is conducive to health, but it must be sustained by good food and shelter. It is a very important matter to most farmers to know how, and to economise the labor of animals. We are very apt to tax them severely one week and let them stand still another, and this irregularity and its accompanying exposures often cause disease. Turning unused horses and oxen to pasture is a remedy, but this is accompanied by inconviences, unless the animals are not to be used at all. Grooming is a partial cure, and takes the place to a certain degree of both exercise and food. After very hard work for some weeks, horses and oxen need rest and time to recuperate. Liberal feeding is essential, but no severe tax upon the system can be compensated for by food alone. Entire rest is equally important. This should not be continuous, however, but it should be given like the feed at regular intervals and in connection with moderate labor or exercise. Mere fat gained in the stall is of little use before the plow, and it brings a certain delicacy or tendency to disease.

Plan for a crop of corn for cutting and feeding green to milch cows and hogs; for roots, mangels, carrots and parsnips for feed—the last two to be put in this month; for some crops to be sold for cash if you are situated so that this is possible. Some crop may almost always be raised which is nearly as good as money. This in some sections is tobacco, in others fruit, in others broom-corn, in others flaxseed, in others cotton, in others castor-oil beans, etc., etc. As a rule we think some such crop is as advisable as it is usually profitable, if grown understandingly and not in a way, or so largely, as to impoverish the farm. Many food crops may be raised on the same principle, *i. e.* not for feeding out on the place, but for immediate sale.

Hints About Work.

Corn Planting.—Our great cereal demands the farmer's care early and late this month. Manure is to be hauled upon the sward and plowed in, for corn is the best breaking up crop for most farmers. With a heavy dressing of manure, plow pretty deep, especially if it be desirable to deepen the soil. With deep plowing on heavy land it is best to manure in the hill, either with good compost, or with some commercial fertilizer. Corn can hardly be manured too much, as it draws very heavily on the land. When the object in breaking up a sward is to get the land in grass again, corn should not be put on. Potatoes will abstract much less of value to the grain and grass which will follow. Select a variety sure to ripen, getting seed from the North if you do not use that of your own selection. Mark out with care, after giving the ground a thorough, light harrowing to kill weeds, in case the ground has lain more than a day or two after plowing and harrowing, and plant immediately. Corn ground may be plowed, marked and planted the same day. It is not best to plant too early. Seed soaked in warm water and having a little pine tar stirred into the water, will be coated with the tar. If rolled in plaster it is not bad to handle and is much less subject to the attacks of grubs, blackbirds, crows or squirrels.

Broom-Corn.—Put on warm, dry, clean land, rich and in good tilth. If this is very free from weeds plant early; either in hills 3 feet apart, accurately marked each way or in drills 3 to 4 feet apart. Ashes and plaster is a good application in the hill or drill. Test the seed, as, unless it has been carefully gathered and preserved, it will not grow. The seed may be long in coming up, and is always long in getting established and rapidly growing. On weedy land it should be planted late in the month.

Tobacco.—Water the seed-beds with liquid manure, weed carefully, thin if necessary. Work over and haul out manure upon the field; plow as soon as the manure is spread, and harrow as often as weeds start, before time to set out the plants (next month).

Potatoes.—We have little to add to the hints given in April. Garnet Chili and Gleason are prolific sorts for general culture. The White Peachblow is both very good and moderately productive. The Climax, Early Mohawk, and Early Rose are early, prolific and good; Bresee's Prolific late and very prolific. These are among the promising new sorts.

Peas and *Oats* for fodder.—Plow in the peas lightly, and harrow in the oats. The crop may be cut and fed green before corn—if let stand until ripe, it may be thrashed and the seeds separated.

Oats ought to be sowed early if at all—if delayed in sowing, put the land in potatoes, roots, buckwheat or corn sowed in drills for fodder.

Grain Fields and *Grass* may be sometimes weeded to advantage very early in the month. Clover and grass seed sown upon them, and they may be top-dressed with plaster, ashes, superphosphate, etc.

Working Stock.—The farmer's great dependence this month upon his working oxen and horses should lead to their having extra care, shelter, good feed, and grooming. As the heat of the season increases, it is important to give longer resting time at noon, especially to oxen. Bathe yoke and harness galls, or better, wash tender spots, and if possible ease the pressure upon them by pads or otherwise to prevent galling. Oats with barley, or corn-meal, or with barley-meal and Indian meal mixed and fed upon cut hay, is good feed to work upon, and a great deal more labor will be done by well-fed animals, than with others. Everybody knows what a difference it makes with horses, and this is quite as marked with oxen, which are seldom too fat.

Milch Cows.—The greatest care should be exercised, that the milk does not fall off before cows are turned to grass; the employment of corn-meal, wheat or rye bran, cotton-seed oil-meal (if the seed was well hulled), and linseed oil-meal, is to be advised, if the supply of roots has not held out. Bran may be fed very freely; corn meal moderately 2 to 6 quarts a day; oil-meal 3 pints to 2 quarts a day.

Root Crops.—Sugar Beets, Mangel-wurzel Beets, Parsnips, and Carrots should be sown as soon as

the ground is prepared and is warm and mellow. The two former should be sowed on deep rich soil not less than 2 feet apart in field culture and 30 inches to 3 feet is often better, as the same amount of labor will be better rewarded than if the rows were nearer, though perhaps the crop of a given piece of ground might not be so large. We would never sow parsnips with less than 20 inches between the rows, nor field carrots less than 16. Have the ground very mellow, well marked out and sow with a hand-drill, as in garden culture, unless the crop is on a more extensive scale than is common.

Cows.—Before the pastures are ready, cows are very apt to fall off in milk. Rye or wheat sown for feed will be fit to cut this month, and may be mowed as soon as it will give a swath; a small quantity daily will be of great benefit, coloring the butter, and increasing the flow of milk. The stools will start again if not too far advanced when cut.

Calves reared by hand must be watched, lest they become either constipated or loose in the bowels. Skimmed milk may be thickened with scalded Indian meal and rye flour, linseed oilcake, or wheat middlings. The quantity of the mixed meal must be small at first, and may be increased until the calves are turned to grass. A gill of linseed meal with half a pint of fine corn-meal or a little more of middlings a day is enough for a good-sized calf.

Sheep and *lambs.*—We are advocates of early shearing without washing. This necessitates giving the sheep shelter from cold storms—and this should always be done. Wool which starts when there is real necessity for covering, is stronger than that beginiug its growth in hot weather and often when a diseased condition of the skin is caused by sunscalding. Besides, early shorn sheep are well protected when hot weather comes, and if not washed are not almost prostrated by colds which come after this great exposure. A little extra grain or oil-meal tells advantageously after shearing.

Poultry.—Protect young of all kinds both from sun and rain—Turkeys especially need shelter. A simple roof 4 feet wide on the south side of a fence, raised just so high above the ground, that there shall be a shadow of a foot in width at noon, makes a nice warm place for hens and chickens. Provide dusting boxes which shall contain road dust, ashes and sulphur. The dust-bath affords hens and turkeys their only means of *washing* themselves.

Pumpkins.—If the corn is to be only a moderate crop — that is if the land is not heavily manured, and a good sward has not been turned under besides, pumpkins may do very well and will pay. If a very heavy crop of corn is expected, they are likely to be so shaded as not to do well. They do best when placed by themselves on very well manured land. Plant in hills 6 or 8 feet apart. The Cheese Pumpkin is marketable and good, the common yellow best for cattle and hogs.

Roads.—The earlier the roads can be worked after settled weather the better. Where practicable the carriage way should be made and kept hard and smooth by top-dressings of sharp gravel packed hard. Any clay coming to the surface between ruts should be thrown off, and gravel or broken stones should be used to fill holes and soft places. When this cannot be done, employ any means at hand to secure a hard roadway. Frequent scraping and rolling with a heavy roller, obliterating the old wheel tracks will in time make a good road of pretty soft materials, provided it has sunshine.

Work in the Horticultural Departments.

There is so much to be done this month that the horticulturist finds but little time for reading, and our notes must be brief; April and May lap over upon one another so much, so far as work is concerned, that last month's may be referred to with advantage.

Orchard and Nursery.

Planting is to be pushed forward as fast as consistent with good work. Trees may be kept back by heeling them in and shading them.

Grafting.—The more advanced the stock, the greater risk there is of injury to the bark. Several have asked for a recipe for

Grafting Wax.—Take four parts of rosin and one part each of beeswax and tallow and melt together. If too hard, add more tallow, and if too soft, more rosin. Lard may be substituted for the tallow or raw linseed oil, a pint being used in the place of a pound of tallow. The wax is poured into water when melted, and gathered in the hands and worked like candy, after which it is made into convenient rolls. A handy way to use it is to tear up old cotton, old sheets or dresses, into strips about 2 inches wide. Roll them up and put them into the melted wax, and let them remain until thoroughly saturated. Remove, and let them drain. This can be unrolled and torn into convenient bits as wanted.

Young Orchards may have root crops between the rows. When these crops are hoed, cut up the weeds and mellow the surface around the trees. Corn shades the trees too much late in the season, and prevents thorough ripening of the wood.

Mulch.—Covering the surface around the trees with bog hay, coarse manure, or other available litter, will help the trees greatly to resist the drought.

Nursery Trees.—Budded stocks need to have all buds removed, except the inserted one. Rub them off as soon as they start.

Seed-beds.—Success in raising evergreen and most other forest-trees from seed, depends upon shading, proper moisture, and a free circulation of air. A lattice of lath makes a convenient shade.

Insects.—The annual fight must be kept up. Wherever a tent-caterpillar's nest is to be seen, there is a challenge to combat. The insect will get the best of it if it is allowed time. Make it somebody's business to destroy every nest, and let that somebody be yourself, if you wish it done faithfully. Jarring the trees and catching the insects upon a sheet or other convenient receptacle, is the only certain mode of warfare with the curculio yet known. Begin early in the season, and early in the morning. All washes and "invigorators" plague the inventor more than they do the curculio.

Fruit Garden.

Strawberries.—It does not seem to be generally understood that strawberry plants must have a season's growth before they will bear. Plants are best set in the spring, the earlier the better, unless one strikes layers in pots, in which case they may be set at any time. Where the beds have been covered with straw, this is parted over the plants and left on until after fruiting. What weeds make their way through the straw may be pulled. Beds that have not been mulched should be thoroughly hoed over and a mulch put on before the fruit attains much size. Liquid manure and wash from the house will increase the size of the fruit.

Grape-vines.—Upon young vines set this spring but one bud should be allowed to grow. Rub out all but the most vigorous one. Two buds may be allowed to grow upon vines planted last year. Established vines will push buds where they are not wanted; rub off these, and save pruning. When the young shoots are large enough to show the little clusters, which are only buds, and not, as many suppose, grapes, the end of the shoot is pinched off. Some pinch at the leaf above the last or uppermost bunch, and others leave two or even three leaves. This, when done thus early, avoids the check which is given to the vine by the old method of summer pruning after the fruit is set. Layers may be made as directed last month.

Currants.—No fruit is more neglected than this, and none will respond more readily to good treatment. A good dressing of manure and mulching before hot weather comes on, will increase the size and quality of the fruit. The Currant worms, so destructive to the foliage in some localities, are best treated by dusting the leaves with powdered white hellebore.

Insects.—Rose-bugs often destroy the blossoms of the grape-vine. We know of no effective remedy save shaking them from the vine, and catching and killing them. Hand-picking, thoroughly persisted in, will do much to keep in check other insects that prey upon the vine.

Blackberries and *Raspberries* are to be tied to stakes or other supports. A strong wire stretched between posts answers well in garden culture.

Marketing.—Those who send fruit to market should decide in season upon the kind of baskets, crates, or other packages they will need, and procure them in advance. Have them distinctly marked. Berries sent from Southern to Northern markets should not be too ripe when picked.

Kitchen Garden.

A list of the leading varieties as well as some of the promising novelties, was given in last month's notes. In most places the hardy vegetables for the first crop were sown last month.

Succession Crops of these should be put in at intervals if it is desired to prolong the season of peas, salad plants, radishes, etc.

Asparagus is to be cut with a sharp knife, and when marketed it is to be made up into bunches 9 inches long and 4 or 5 inches in diameter. An engraving of a bunching frame was given last May. Beds only two years set should be cut sparingly.

Beans.—Plant bush sorts, and when the soil is well warmed, Limas. If a cold rain comes on, the Limas are apt to rot in the ground. If Limas have been started under glass, put them out when the weather becomes settled.

Beets and *Carrots.*—Run a weeding hoe of some kind between the rows as soon as they can be distinguished. As soon as large enough, weed and thin. A few days' neglect will often be of great injury to carrots.

Cabbages and *Cauliflowers.*—Frequent hoeing is very beneficial to these. If cut-worms attack the plants they must be dug out. Sow seeds for later crops in open ground in a well-prepared seed-bed.

Celery.—Sow seeds in a well prepared seed-bed. They are slow in germinating.

Corn.—Plant as soon as the season will allow. See list of varieties on page 179.

Cucumbers.—If there are cold-frames or hot-beds from which other plants have been removed, they may be profitably devoted to cucumbers. Plants which have been started in-doors or under glass, may be put out when cold nights are over; they will need sheltering for a while at night; two boards nailed together roof-shape will answer. Sow seed in the open ground as soon as it is warm enough. Use plenty of seed to allow for losses. See vine-shield figured last month.

Egg-Plants.—Nothing is gained by putting these out before the weather has become warm and settled. Give them a rich warm spot.

Herbs.—These may be sown in a seed-bed and transplanted, or sown where they are to grow and thinned. In market gardens they are transplanted to the ground from which early cabbages, etc., have been taken. Sage, Thyme, Sweet-Marjoram, and Summer Savory, are the kinds generally grown.

Lettuce.—Transplant as soon as large enough, and sow seed for succession. See article on page 181.

Martynia.—The tender pods are much esteemed for pickles. Sow where they are to grow, or transplant to 3 feet apart each way.

Melons.—Treat the same as directed for cucumbers.

Onions.—Seed in cold localities may yet be sown. When the plants are up sufficiently to allow the rows to be distinguished, run a weeder or hoe through them. Weed as soon as the rows show that it is needed. A moderate dressing of salt is beneficial. Onions from sets and potato-onions are to be kept well cultivated.

Parsley.—Sow in soil as free from weeds as possible, as it is long in starting.

Parsnips.—Hoe and weed as soon as large enough, and thin to about 10 inches.

Potatoes.—Keep the weeds under. A little ashes and plaster at hoeing will help them.

Peas.—Put brush to tall growing sorts after hoe-

ing. If allowed to get tall enough to fall over, they do not climb readily. Sow for a late crop.

Peppers.—Treat the same as Egg-Plant.

Rhubarb.—Plants set this spring should not be gathered from. *Pull*—not cut—the leaves from old plants. They come off readily with a sidewise pull.

Spinach.—Weed and hoe the early planted, and sow for later. For summer spinach, sow the New Zealand when the soil is warm, and the Spinach Beet, early. Both are excellent.

Sweet Potatoes.—The directions for field culture on page 175, will in the main answer for the garden. We prefer to grow them on well manured ridges. Set the plants well down to the first leaf, and should they be injured by frost, they will start anew. If the ridges have not been freshly made, use water in the holes at planting.

Squashes.—Bush kinds started under glass may be set out. Sow in the open ground when warm enough. Make hills for bush sorts 4 feet each way. For Boston Marrow, 8 feet, and for Hubbard, 10 feet. Make the hills rich, and for the running sorts the rest of the soil rich also, as they root at the joints of the vine.

Tomatoes.—Put out when danger of frost is over. In field culture the vines are allowed to fall down. In the garden use a trellis. One is figured on page 182, and others were figured last year.

Winter Cherry, also called Strawberry Tomato, Allekengi, and Ground Cherry, is a relative of the Tomato, with a fruit the size of a small cherry and enveloped in a loose husk. It makes excellent sweetmeats, and the fruit is esteemed by many to eat raw. Sow early, and transplant the same as tomatoes. The vine is low, and does not need a trellis.

Flower-Garden and Lawn.

Lawns.—To have a fine close turf, it is essential that the ground should be rich, the seed thickly sown, and the grass be mown frequently. Weeds for the most part flourish best in a soil too poor for the grass to make a sufficiently strong growth to crowd them out. Frequent mowing not only keeps the turf thick, but it destroys the annual weeds. Good hand mowers may now be had for $25 and $30. It is best to mow often and leave the cut grass to act as a fertilizer. Bone-dust and ashes are excellent as a top-dressing.

Margins around beds or along walks are to be kept neat by the use of an edging knife, which is much like a meat chopping-knife with a long handle. The outline of beds can be preserved by driving down wooden pins an inch square, their heads being below the level of the turf.

Bedding or *Massing.*—Sufficient was said upon the use of bedding plants in articles in February, and March on pages 64 and 102. We repeat our caution not to put out tender things, such as Colens, Heliotropes, etc., until cold storms are over.

Annuals in Ribbon Gardening.—Those who cannot afford the necessary bedding plants, may produce pleasing effects with annuals. These are best sown in a seed-bed and transplanted to the show-bed, taking care to have in reserve, plants to replace any which should not come true to color. No annual is more useful for this purpose than Drummond's Phlox, which can be had from pure white to deep purple. Where different species are used, the hights and times of flowering must be considered. These are given in the Seed Catalogues.

Bulbs.—The principal bulbs to be planted in spring are Lilies, Mexican Tiger-flower, Gladiolus, Jacobean Lilies, Amaryllis, and Tuberoses. All but the Tuberoses may be put out in the border; they should be started in pots in a warm room or under glass.

Roses.—Potted plants of the summer blooming kinds may now be had, and may be turned out without checking their growth. Use tobacco water for plant lice. Where there are but few plants, hand-picking and shaking the plants will be found the best way to treat the rose-slug and rose-bug.

Dahlias.—Put the roots in a warm place to start. A box of earth in a warm room or a vacant hot-bed will do. In lack of these, slightly cover them with earth in a warm corner of the garden, and throw a rug or other cover over them every night.

Evergreens are best moved this month. Success depends upon keeping the roots from drying.

Green-house and Window Plants.

Window plants usually go out of doors altogether, but it is less the custom than formerly to turn everything out of the green-house. It is but little more trouble to properly care for the plants in the house than out of doors, and the liability to injury is much less. By proper shading of the glass and ventilation, plants can be kept in good condition.

Shelter.—Plants out of doors should be sheltered from the winds and in part from the sun. Camellias especially need shade.

Plunging—setting the pot up to the rim in soil—is done to avoid the necessity of frequent watering and for ornamenting the border. Put coal ashes in the bottom of the hole in which the plant is set, to prevent worms from gaining access to the pot.

Fuchsias bloom much better in partial shade than in the sun. In this country they do poorly as bedding plants. Well-grown specimens make a fine show upon a veranda where they have some shade.

Beef Cattle.—There has been quite a variation in the weekly supply of beef, and the total for the month is nearly 2,000 less than for the previous four weeks. This, however, does not affect the prices paid for the same grades. The highest figures seldom reached more than 17½c. for very best tops. A few sold early in April for 18c. per lb., to dress 60 lbs. to the cwt, but these were very fat and large, and would overrun their estimated weight enough to bring the price down to 17½c. per lb. The range of prices has not been so great as for the few months past, and the quality of the beef averaged a little better. As the weather grows warmer, butchers look for what they call "plump" cattle, not large and fat, but such as will cut up well for retail trade; such, if fat, will sell quickly for 17c. to 17½c. per lb., live weight. Below we give the list of prices, average price, and figures at which the largest lots were sold.

do. 11th, do.	13 @17½c.	do. 15½c.	do.	do.	15	@16½

There is a slight advance in prices, as will be seen by the list.....**Milch Cows.**—Calls for good milkers are still plenty, and a really good cow soon finds a buyer. Prices have not changed much from last month. The majority of the common cows sell for from $60@$75, still poorer quality for less. First-rate milkers, if fresh with their calf, sell for $80@$90, and if very extra, $100 will be paid.....**Calves** have increased somewhat in numbers and more come in alive. Trade is quite steady and prices good. We quote ordinary to medium calves at 8@10c.; fair to good at 10@11c., and of very extra, 11½c. per lb., live weight....**Sheep.**—Receipts have been very plenty and quite equal to demand. We do not notice a decline in price, but a tendency to hold off on the part of buyers. Many flocks are kept from day to day seeking buyers, but butchers stand firm, feeling confident that prices must come down a little. A large proportion of sheep came in minus their wool, and they sell a little better sheared than with the wool on. Pelts with the wool on are quoted at from $1.75@$2.00 each, and clipped pelts sell for 22@23 cents each. Prices range for good sheep, from 7¼@8c.; Extras, 8½@8¾c. Majority of sales are from 6@7½c. per lb.....**Swine.**—There has been quite a falling off in the supply, with but little change in prices. Most of the hogs are sold dressed, and we quote only prices of dressed pork. Very heavy and fat hogs sell at 12c., lighter ones, if good, at 12¼@12½c. Prices have been pretty constant during the four weeks ending April 11th, and we notice but little change in this department.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending April 14, 1870, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW YORK MARKETS.

RECEIPTS.	*Flour.*	*Wheat.*	*Corn.*	*Rye.*	*Barley.*	*Oats.*

Gold has fluctuated less violently. It has been again up to 114⅛, but it closes at 112⅝.....Breadstuffs have been fairly active. The export demand has been on an enlarged scale, chiefly for low grades of Flour and Spring and Amber Winter Wheat, at, however, easier prices and more liberal offerings. The home trade inquiry has been moderate. Corn, Rye, and Oats, have been scarce, and quoted higher. Barley has been plenty and depressed.....Provisions have been in more request, prices closing in favor of sellers.....Cotton has been more sought after, and with a reduced supply available, prices have advanced, but close less firmly .....There has been a moderate movement in Wool, at slightly reduced rates. Holders have shown more eagerness to realize. The demand has been mainly for manufacturing purposes.....Hay has been quiet and quoted cheaper towards the close.....Hops and Tobacco have been moderately dealt in, closing steadily at our quotations.... Grass Seeds have been in light supply and good demand at much firmer prices than quoted last month.

CURRENT WHOLESALE PRICES.

2 2 2 2 2 2 2 2 2 2 2 2

2 TWO MONTHS 2

2 2 2 2 2 2 2 2 2 2 2 2

The two months of May and June, this year, are important ones, in several respects. The wintry weather in March, and part of April, has crowded Farm, and Garden, and House work into narrower limits. The labor of three days must often be done in two; but if plans are all well laid, implements and seeds all ready, and the physical strength of both human and animal workers be in good condition, much will be accomplished, and the autumn results will be cheering.

ANOTHER THING, that will **PAY WELL,** can be done during these two months. Our Premium list (previous column) will be open to all until June 30th. So there are two good months, or **52** week days and evenings, in which our friends may fill up their lists already begun, and start and fill up *new* lists, and in return receive most valuable articles, *free of cost.* Many of our largest premiums have, in past years, been secured by persons who did not begin to get subscribers until after May 1st. For example, a lady began May 16, and secured a $650 Steinway Piano before June 30, and took care of her child in the meantime. A farmer, not having the cash to buy a mower, stirred around in May and the forepart of June, and without neglecting his farm work, secured a premium Buckeye Mower in time for haying. He got the subscribers on evenings and rainy days—many of them among evening loungers at the stores.

About one subscriber a day (or evening) during May and June, will secure you premium 21, *or* 24, *or* 25, *or* 36, *or* 38, *or* 43, *or* 53, *or* **64,** *or* 67, *or* 69, *or* 80, *or* 99, *or* 105, etc.,—about a dollar a day! Look at these in the Table.

About one subscriber in two days (or evenings) will secure you premium 26, *or* 27, *or* 28, *or* 34, *or* 40, *or* 46, *or* 51, *or* 66, *or* 77, *or* 79, *or* 83, *or* 98, *or* 101, etc. Look at these in the Table.

About one subscriber in three days (or evenings) will secure you premium 44, *or* 45, *or* 47-8-9, *or* 70, *or* 76, *or* 81, *or* 85, *or* 92, *or* 100, etc. Look at these in the Table.

About one subscriber in four days (or evenings) will secure you premium 31, *or* 32, *or* 54, *or* 72, *or* 73, *or* 82, *or* 90, etc. Look at these in the Table.

All subscribers obtained, give you about $1 each; for the premiums are all valuable, and fully *worth* their price.

Every reader will find it useful to others as well as to himself, or herself, to keep this journal before the people, —every now and then getting some one to subscribe, who will himself be benefited, and a good premium will reward the canvasser. TRY IT, and see what can be done during the next

SPECIAL NOTES.

Read and carefully Note the following Items: (*a*) All subscribers sent by one person count, though coming from a dozen different Post-offices. But....(*b*) State with each name or list of names sent, that it is for a premium....(*c*) *Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.* You can have any time, from one to four months, to fill up your list....(*d*) Send the exact money with each list of names, so that there may be no confusion of money accounts....(*e*) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N.B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for....(*f*) Specimen Numbers, Cards, and Show-bills, will be supplied free, as needed by canvassers, but they should be used carefully and economically, as they are very costly....(*g*) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

Description of Premiums.

Every Premium is described in the October Agriculturist, and also in a **Special Sheet,** *which will be sent* **free** *to every one desiring it. We have room here for the following only:*

Nos. 56, 57, 58, 59—Pocket Knives. —NOW FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl, too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for nothing but a little effort. These knives are made by **Mr. J. P. Swain,** whose work is equal to any done in this country or Europe. No. 56 is a neat, substantial Knife, with three blades and buck-horn handle. No. 57 is a still finer article, with four blades and buck-horn handle. No. 58 is an elegant Knife, with four blades and shell handle. No. 59 is a Ladies' Pocket Knife, a beautiful article, with four blades and shell handle.

Nos. 88 to 93.—Volumes of the American Agriculturist (Unbound). — These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is $1.50 each, at the Office, or $1.75 if sent by mail, as they must be post-paid.——They are profusely Illustrated, the Engravings used in them having alone cost about $35,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from XVI. to XXVIII., inclusive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 94 to 99.—Bound Volumes of the Agriculturist.—These are the same as Nos. 88 to 93 above, but are neatly *bound* in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 100 to 111.—Good Libraries. —In these premiums, we offer a choice of **Books** for the **Farm, Garden,** and **Household.** The person entitled to any one of the premiums 100 to 111 may select any books desired from the list of our books published monthly, (see another page), to the amount of the premiums, and the books will be forwarded, Post or Express paid. $25 or $50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands.* Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The thinking, reasoning, observing man will certainly make more off from 49 acres than he would off from 50 acres without the mental ability which reading will give him. ☞ Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 112.—General Book Premium. Any one sending 25 or more names may select Books from our published list to the amount of 10 cents for each subscriber sent at $1; or 30 cents for each name sent at $1.20 each; or 60 cents for each name at $1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, *paid in advance*, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss.*

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe*, the *Registry fee*, as well as postage, *must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters thus sent to us are at our risk.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

Bound Copies of Volume XXVIII (1869) are now ready. Price, $2, at our office; or $2.50 each, if sent by mail. Any of the previous twelve volumes (16 to 28) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

1,000 Eumelan Vines.—Any subscriber to the *American Agriculturist* may order of us one or more of these remarkable grape-vines before the 15th inst. at the 1,000 price, viz.: No. 1 Vines, $1 each; Extra, $1.75 each. Post-paid by mail, or by express, the receiver paying express charges.

Letters Without Names Signed.—It is useless to send these; we can not give them attention. Here are a lot of *anonymous* inquiries about Kansas lands, White Wire, sundry Doctors, various implements, Dealers, etc., several of which would be answered by letter if we knew just where to direct. If we answered all such questions *in* the paper, it would contain little else; and if we answered all by letter, we could do little else. Better save your time, paper, and postage, than to write anything whatever without giving your *true* name and address. These are not published when the writer desires them withheld.

VALUABLE BOOK—FREE!—The Publishers of this Journal issue, every year, two Volumes, prepared with great labor and care, containing a large amount of valuable information, finely illustrated, in neat illuminated covers. These volumes should be in every household. They also contain very complete Almanacs, with calendar of work to be done each month, on the Farm, in the Garden, etc. One is the **"Agricultural Annual,"** and the other the **"Horticultural Annual,"**—entirely distinct in matter, illustrations, etc. Each volume contains **152** 12mo pages. They are of permanent value, and every one should have each year's issue. There are now Nos. **1, 2, 3,** and **4,** (for 1867, 1868, 1869, and 1870,) of each work.....To make these more widely known, and as a premium, also, the Publishers offer to send any one of these eight volumes, post-paid, to any person who will, during MAY or JUNE, forward a subscriber for the current volume of the *American Agriculturist* (that is, for 1870), at the regular subscription price of $1.50. One copy of any volume of the Annuals desired, will be presented for *each* subscriber thus sent between May 1st and June 30. (Such names will not, of course, be counted in lists for the general premiums described, on page 165.)

Out-of-door Whitewash.—Chas. Stierlin, of Washington, D. C., asks us "to publish in the May issue of the *American Agriculturist* a recipe for a good whitewash for fences and out-buildings, that will not be washed off by a few rain showers."—Here it is. Take good quick-lime, in lumps, slake it with hot water, and while slaking add, to what will make a pallful, a pound of tallow, or any grease free from dirt. It may be rancid, smoked, or otherwise unfit for kitchen use. As soon as the violent slaking is over, stir thoroughly. All the water should be added before the slaking ceases, and the mixture should be very complete. This forms in the whitewash an insoluble lime soap, which, if the whitewash is diluted with cold water, often separates in minute clots. If the mixture be well made, it will be very smooth, and is little affected by rains.

Harris on the Pig.—A slight delay occurred in the issuing of this work, owing to the inability of the author to furnish the final pages, on account of illness. The work is now ready, and will commend itself to all who take an interest in the improvement of swine, as well as in breeding and rearing them in the best and most profitable manner. The advertised table of contents will show how full of information it is.

Every Saturday.—Fields, Osgood & Co. have made a hit with this journal in its new form. It gives the best foreign engravings, and excellent selections from English magazines, at a very popular price. Admirers of Dickens—and that includes almost everybody—will be glad to know that he has begun a new story, which is published in Every Saturday from the author's advanced sheets.

Mark Twain has been engaged to edit an agricultural department in the Galaxy Magazine. Mark is a humorist by profession, but we doubt if he will succeed in doing anything as funny as the reports of what is done at the Farmers' Club in earnest.

The Handy-Book of Husbandry, is the title of a work by Col. George E. Waring, Jr., which E. B. Treat & Co. announce as in preparation, and of which they send us specimen sheets. In accordance with our custom, we defer any extended comments until the complete work is received.

Haying and Harvesting Machines. Mowers and Reapers, Tedders, and Horse-rakes, of the best kinds, must be ordered early, in order to be reasonably sure of getting much use out of them this year. Thousands of farmers are disappointed every year, and some, strange to say, year after year, because they want the best, and order too late.

Pleasant Valley Grape Growers' Association.—At a recent election, C. D. Champlin was chosen President, and H. Gardener, Secretary of this Association. The 11th Annual Fair will be held at Hammondsport, Steuben Co., N. Y., Sept. 25th, 26th and 27th.

Cement for a Manure Pit.—H. F. Goodban, Erie Co., Pa., asks—"Will water-lime answer for laying the wall of a manure pit?" and adds, "I want to make a cheap, durable cement, that will not spoil by freezing."—Hydraulic lime occurs in market in two principal forms—"Water-lime" and "Cement." The cement is ground, and is the superior article. The water-lime, however, is of fair quality, answers for all coarse purposes, and would, we think, make an excellent mortar for such a wall, and for the grouting and cementing of the bottom. If, on trial, the sample is found to make a close, firm mortar, none other need be used, even for the top, which will be exposed to freezing. This portion might be laid in cement. Walls laid early in the season will not be injured by frost if the surfaces be smooth.

Pear Duchesse de Bordeaux.—We have before spoken of the excellence of this winter pear. Messrs. Smith, Clark & Powell, of Syracuse, N. Y., send us a colored plate, which is a very good representation of this large and fine variety.

Plow Deep, but not too deep at one time. F. B. Minch is right. He writes: "I sometimes feel like writing after reading the New York Farmers' Club reports about shallow culture. I have a little over 100 acres under cultivation, and my motto is, 'Plow deep, and manure as you go.' It does best for me. I think that the teaching of the shallow culture theory is productive of much error in the community."

Death of Seth Boyden.—Mr. Seth Boyden died on March 31st, at the advanced age of 82, in the City of Newark. Mr. B. was the pioneer in many of those branches of business to which Newark owes a large share of its prosperity, and by his inventions, contributed much to the wealth of others, though he acquired little himself. It is on account of his labors in horticulture that we notice his demise. He was particularly successful in raising seedling strawberries, several of which maintain a rank among the valuable varieties. The Agriculturist, Green Prolific, and Boyden's No. 30, are among Mr. Boyden's contributions to our list of varieties.

Croquet.—B. Brown. This game is not patented. A particular style may be.

A Suggestion to Farmers' Clubs.—"D. R.," Beverly, Mass., suggests that Farmers' Clubs make their President a member of their State Agricultural Society. This would connect the State with the local organizations, and be a proper acknowledgment of services which are not often required.

Cement for a Cellar Bottom.—We are asked what kind of cement should be used for a cellar floor, and how much surface will be covered by one barrel....There are several good kinds of water cement. In the vicinity of New York, builders give preference to the "Rosedale." If the cellar bottom is firm and level, especially if it be stony or gravelly, the cement need not be more than an inch or an inch and a half thick, if mixed with sharp sand or screened gravel; a barrel will cover about one hundred square feet—what the builders call a "square." If the ground is soft, and a grouting of broken stones is necessary, it takes more. In this case, the floor should be covered with stones of the size of an egg, to the depth of three inches, at least, well pounded down to a level surface. The mortar is spread upon this, and worked down into the grouting, and when set, but still moist, the top coat is applied.

Slugs.—B. Thornton, Tioga Co., Pa. The specimens are common garden slugs. Ducks will destroy them in large numbers. Lime-water, or dusting with dry lime, may be used. Another plan is to lay cabbage or lettuce leaves on the ground; early in the morning the slugs will be found gathered under them.

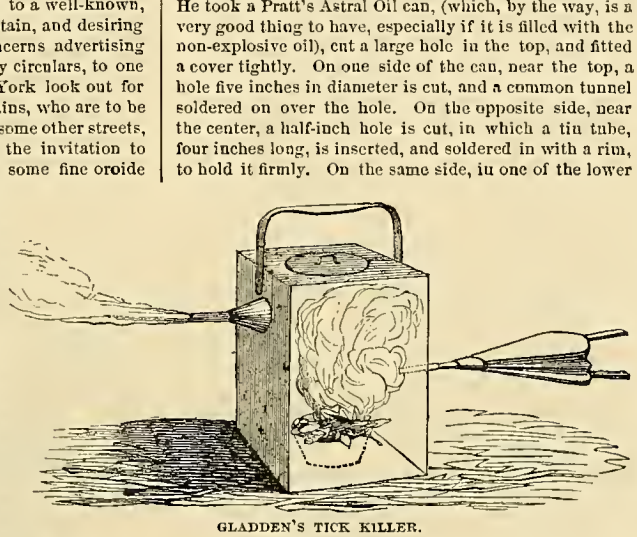
Osiers.—"Subscriber." Osiers are cut when vegetation is at rest. Machines have been invented for peeling them, which the makers should advertise. For home use upon the farm, there is no necessity for peeling.

Sundry Humbugs.—We have quite an assortment of circulars, etc., puffing "electrical apparatus," and various "electrical" appliances for curing all sorts of diseases. There are a few cases where galvanic electricity, properly applied, may be useful, and these are understood and used by all skillful, well educated, regular physicians. But nine-tenths of all the mass of printed stuff—if not ten-tenths,—are sheer humbugs, only useful to work upon the hopes and fears of the people, and get their money. Give all these special electrical doctors a wide berth, and save your money.....Beware of all associations, professing to cure "private diseases," "errors of youth," etc. They are invariably catch-pennies, or catch-dollars, each run by one scheming man, who does a pretty safe business, because his fleeced victims are not likely to expose him. We have had many cases reported to us, where these fellows have drained the last hard-earned or borrowed dollar they could get from their victims, and left them in the end worse off, after having their hopes excited temporarily by the use of stimulants. These operators are chiefly skillful in writing plausible letters, when they can get hold of victims asking, or desiring aid. Let those afflicted apply to some known and reliable physician .....The spurious money operators are as thick as "toads after a shower." In addition to the many before referred to, we have before us the circulars of J. W. Smith & Co., Wm. Andrews, C. L. Wilson, C. J. Crandell, Daily & Co. (multitudinous, and ingenious), Armstrong & Co. (Daily & Co. we suppose); W. M. Martine, an "attorney," who sends printed circulars—but the record is long enough. Most of these so-called firms send the same circulars, names, newspaper slips, etc., and the variety of names assumed is only to mislead the Post-office authorities—a new name being taken as soon as the old ones become known, and their letters are stopped. They now, as a blind, generally put their names and address on a separate card, or write them in a different hand on the back of their documents.....As we expected, Messrs. McKillop, Sprague & Co., pronounce the "Grand Presentation Enterprise" of H. P. Jones, noticed by us last month, "an entire fraud."..... The "Metropolitan Jeweler's Association," of New York, is a humbug, and the statement about crown watches sent here is an entire falsehood.....No sane man will trust a $5 bill to the "Eureka Gift Company," of Saratoga Springs. Better hold up a hat, and wait until a "$40,000 hotel" drops into it from the moon.....To several inquirers. Music Boxes, playing four or five tunes, and costing $12 to $15 each, are sold by some regular dealers. Those advertised by circulars, at $1 to $3 each, are usually swindles. If anything is returned for the money, it is a little hand or reed instrument, to be

blown by the month, and worth 5 to 25 cents each, on which you can play as many tunes as you know how to. .....Beware of Lands at 40 cents per acre, the proprietor of which is ashamed of his own name, and dodges behind a P. O. Box. The "C. O. D. Deeds" will be good for land in the moon, but not on this planet..... We hope every person will treat Michelin & Co. as did the P. M. at a Maryland office, viz., insist on having the watches in hand and examined, before advancing $2 or $1 as an "assurance of sincerity." Haven't "Michelin & Co.," under their (*his*) various *aliases*, got "*assurance* money" enough to quit "business?".....Oroide Watches. There is a composition of metals, cheaply made, much *resembling* gold in appearance, and retaining its color well, and we have seen some very fair watch cases made of it. But we have also seen so much humbug in the same line, that we can but caution our readers in respect to sending money to unknown parties for anything of the kind. It is nonsense to assert that an oroide-case watch can be furnished for $15 or $20, *equal* in neatness, style, and *time*, to a gold watch costing $150 or $200. The case is comparatively a small proportion of the cost of a $200 gold watch—the "works" are the important part. If one wishes an oroide watch, or, indeed, any other kind, the only *safe* way to get it is to have it procured by a dealer of your acquaintance, or send to a well-known, reliable firm having a reputation to sustain, and desiring to sustain it. There are ten bogus concerns advertising watches of various kinds, especially by circulars, to one reliable one.....If you come to New York look out for those sleekly-dressed, extra-polite villains, who are to be met with at any time on Broadway and some other streets, and who will offer you their card with the invitation to "drop into their place *just to look* at some fine oroide watches, jewelry, plated-ware, etc." The "envelope game" is their great hobby just now, and they will skin a man of his last dollar if they once get him into their den. Remember the story of the "spider and the fly," and don't "go and do likewise.".. .. A lady is informed that we cannot undertake to collect prizes drawn in lotteries—not if we get the whole $10,000 as commission. She had better set her lawyers to look after those Kentucky lotteries that won't hand over the money due her. It must have been a mistake on their part, or they would never have let a ticket drawing so large an amount go out of their own hands. *All lotteries* are swindles. .....A subscriber asks about "B. F. Williams, Importer of Watches, etc., 303 Broadway." We find no such name as "Watch Importer" in the City Business Directory, and no such sign at the door or stairway of 303 Broadway.—The same of "A. W. Beecher, 678 Broadway." ... ..Recipes for vinegar, honey, cheap oils, etc. Any person sending $5, or any other sum, for one of these recipes, is likely to lose his money, and time, no matter who advertises them by circular. We have too many of these circulars from various parties, to describe them in detail—nearly all are humbugs!.....Either a sore-head, or a very green man sends, or gets a letter sent, to us all the way from Kansas, asking where he can get some genuine counterfeit money. Others have tried similar tricks. We hope they feel better—to the amount of 3 cents postage and cost of paper and envelopes. *We* get 4 to 6 cents a pound for such documents, when not needed for after-reference.....Still more "Receivers" for Riverside Enterprise. Elmore & Co., 694 Broadway, claims to be one. He figures close—wants $3 for taxes, 15 cents for paper and postage—a humbug, just as is every other so-called "receiver," or agent, of Riverside, or any other gift enterprise. Wm. Badeau, 676 Broadway is just like Elmore, and uses the same letter-head, except the name. R. Smith & Co., No. 2 Amity St., is in the same business, only he asks but $1.50 commission, as 5¼ per cent on a $26 watch. Mr. Gaylor will need to follow these fellows sharply. They change names every week or two, apparently. ....."Recipe" sellers by the score in various towns, from Maine to Texas, are filching people's money. Sambo, in cholera times, said, "the bes' way was to eat nosain at all, and den you no expose yourself," and that is what we advise in regard to all these recipe sellers..... "Dollar watches," or "time indicators," are not worth buying—not by any means—even if the Tribune does advertise them.....To a lot of inquirers: The doctors you ask about, East and West, are humbugs, and so is every doctor who advertises sure cures for all diseases. We *know* this is so, and have said it a great many times. If you don't believe us, why keep on asking us to repeat it? .... In a villainous business is he who advertises himself as Dr. Secley, Albany, N. Y. The P. M. should stop his letters, and we have some of his documents which the District Attorney of that County should attend to..... Several more cheap sewing-machine circulars from sundry quarters. One offers a fine dress with three $5 machines. He hails from the "humbug roost." Let them all alone, or you will surely regret your money gone.....Those $2 pistols or revolvers advertised in Michigan, Chicago, and elsewhere, are a swindle—the money *goes*, but no shooting-iron, or anything else, *comes*.....J. S. Colgate, of the "Eureka Photograph Co.," 1 New Chambers St., New York, has been arrested by Mr. Gaylor for sending vile obscenities through the mails, and is now in jail awaiting the penalty of his disgusting offense.

Orchard Queries.—A number of these must be answered in a lump. A young orchard should be kept clear of weeds; and this is best done by cultivating hoed crops, such as potatoes, melons, and root crops generally, all to be well manured. When the orchard is in bearing, it is best not to cultivate it. Nor is it best to seed it down to carry off each year a heavy crop of hay and expect a crop of fruit besides. Seed the ground to clover and allow the pigs to pasture on it.

Gladden's Tick Killer.—Our friend, Theodore Gladden, of Florence, Mass., has improvised a simple apparatus, which proves very effectual in killing the pests that, in spring, especially, so torment the sheep. He took a Pratt's Astral Oil can, (which, by the way, is a very good thing to have, especially if it is filled with the non-explosive oil), cut a large hole in the top, and fitted a cover tightly. On one side of the can, near the top, a hole five inches in diameter is cut, and a common tunnel soldered on over the hole. On the opposite side, near the center, a half-inch hole is cut, in which a tin tube, four inches long, is inserted, and soldered in with a rim, to hold it firmly. On the same side, in one of the lower



GLADDEN'S TICK KILLER.

corners, a small hole is cut for ventilation, and fitted with a stopper. A few ashes are put in the can, and then an iron dish, or pan, with live coals and some tobacco leaves on top. When the can is well filled with smoke, bring the nose of the tunnel just to the outer ends of the wool, which should be held apart a little, on the sheep,—if too close to the skin, it might be burned; apply a bellows to the tube on the opposite side, and blow away. A few puffs in a place are sufficient; close the wool, and repeat in another place, going carefully over the whole body. When the operation is done, nearly or quite every tick will be dead, and the sheep, if they could, would give you thousands of thanks.

Books Acknowledged.

The Civil War in America, by J. W. Draper, M. D. Vol. 3. Harper and Brothers: $3.50 per volume.

Self Help, with Illustrations of Character, Conduct, and Perseverance, by Samuel Smiles. Harper & Bros.

The Bazaar Book of Decorum. The care of the Person, Manners, Etiquette, and Ceremonials. Harper & Bros.

A German Course, by Geo. F. Comfort, A. M. Harper & Brothers: $2.

Henry Cortland, or What a Farmer Can Do. By A. J. Cline. J. B. Lippincott & Co.: Philadelphia.

Tom Brown's School Days at Rugby, by an Old Boy. Harper & Brothers: Paper, 50 cents. This is a capital book for boys, by Thomas Hughes, M. P., and we are glad to see a cheap edition of it.

The French Echo, or Dialogues to Teach French Conversation, by Jas. H. Norman. A. S. Barnes & Co.: $1.25.

Pamphlets Acknowledged.

Insects of Missouri. The Second Annual Report of C. V. Riley, State Entomologist.

Small Fruit Instructor, by A. M. Purdy, Palmyra, N. Y.

Prospect Park, Brooklyn. Tenth Annual Report of the Commissioners, finely illustrated by photographs.

Best Fowls for Eggs and for the Table.—Alvin Adkins, Washington Co., Ohio. The French breeds of fowls are the only large, quick growing good table fowls which do not incline to sit. Their eggs are large and numerous. The Crevecœur, Houdan, and La Flèche have been bred for several years in this country, and all are highly commended. They are not yet plenty enough to be "cheap," good trios readily selling for $30 in the spring. Leghorns are excellent layers, are hardy, never sit, but though good to eat, are not usually classed as "table fowls."

"Earth-closets and Earth Sewage."—This is the title of a new pamphlet, by Col. Waring, on this very important subject. The whole community is rapidly waking up to the realization that the dry earth system is a success; that it has a wider application and scope than at first could have been anticipated, and that it is to work great changes in some of our domestic arrangements. Our readers know that we have long been advocates of earth-closets, and the quick abolition of the distressing privy, which, outside of the reach of city water-pipes, is universally regarded as a necessary nuisance. The book just issued is one full of instruction. Drawings are given of all sorts of commodes and fixed closets. Systems for the disposal of chamber and kitchen slop water are detailed, and the superiority of the dry earth system, even in cities and towns where water-works exist, is discussed and demonstrated. The pamphlet contains 104 pages, 8vo. It is published by Orange Judd & Co. Price 50 cents.

Stable Manure.—J. R. Williams asks: "Which is worth the most—Horse manure at $1.50 per load, or bone-dust at New York prices?"—The former would be the cheapest at twice, if not at thrice, the price.

How Oils "Explode."—A. S. Canfield, (no State), writes, that he uses a benzine mixture for burning, and says that it cannot be exploded. "We have burned it in pipes, in bottles, in hollow potatoes and have thrown it on the stove."—The expression that an *oil* is explosive conveys a wrong idea. No oil will explode by either of the means above mentioned. An oil may even extinguish a burning match when thrust into it, and yet be highly dangerous to use as a burning fluid. It is the *vapor* of these oils mixed with air that is dangerous, as far as explosion is concerned. Where a partly filled lamp has the portion above the oil filled with a mixture of vapor and air, it may explode. When a lamp is filled while lighted, the mixture of air and vapor in the can or filler, explodes upon coming in contact with the flame; the oil itself does not really explode, though it does serious injury when scattered by the explosion. When Mr. Canfield says, his oil will not explode by heating it or burning it, as above stated, we can believe it—but these are not the conditions under which such oils are dangerous. We repeat that it is positively unsafe to use oils that form an inflammable vapor at a temperature lower than 110 degrees. It is against the laws of the country to sell them, and it is contrary to the teachings of science and the lamentable teachings of experience to use them.

Cyclopædia of Biblical Theological and Ecclesiastical Literature.—Prepared by the Rev. John M'Clintock, DD. and James Strong, DD., vol. III., E. F. G., N. Y.; Harper & Bros. This important work has now reached its third volume and will be completed in three or four more; the death of the Rev. Dr. M'Clintock will not occasion delay in the appearance of the work, as the matter was prepared for the whole before the first volume was put in type. We have had occasion to know something of the thoroughness of the labors of the authors, and have no doubt that it is, as its publishers claim—superior to every former work of the kind ever issued in Europe and America.

Flowering of the California Pitcher Plant.—The specimen of the Darlingtonia referred to in March, p. 101, has since bloomed. This is the first time, so far as we have heard, that this interesting plant has flowered in cultivation.

Tree Seeds.—"G. P. R.," Painesville, O. A note on the Larch on p. 21, (Jan.) gives the precautions to be observed in sowing the evergreen seeds you mentioned. The Honey-Locust seed it is generally best to scald, though it will often grow without this preparation.

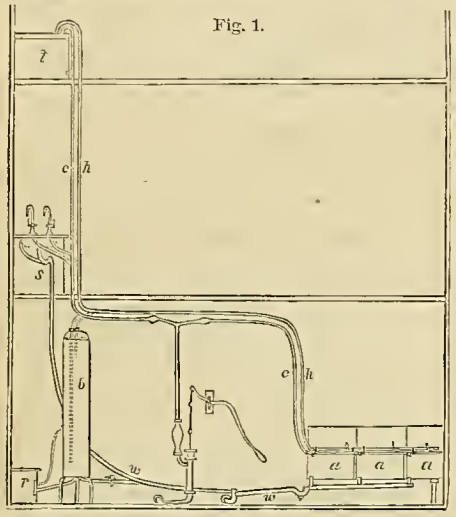
Naphtha for Bark Louse.—A tree infested with the Oyster-shell Bark-louse, is such a hopeless case, that we have publish l some desperate remedies. Ethan Adams, Brecksville, Ohio, had trees thickly covered with bark louse and painted them from "stem to stern" with naphtha." "No harm came of it, but the lice were almost exterminated. The proper time to apply it is, I think, just before the buds start." Please understand, that we give this and other remedies for the trouble, as they are sent to us, without commending them. Those who wish to experiment, should do so cautiously. We shall be glad to learn if naphtha or any other application, will kill the lice and not injure the tree. Fortunately we have no infested trees on which to make the experiment.

Housekeeping Conveniences—Plumbing.

Our previous articles on convenient houses, have called out many inquiries, especially concerning Tanks, Boilers, Stationary Wash-*trays* (often called Stationary Wash-*tubs*), Water-Backs, etc. Many persons living remote from cities are desirous of knowing *how* they are arranged.

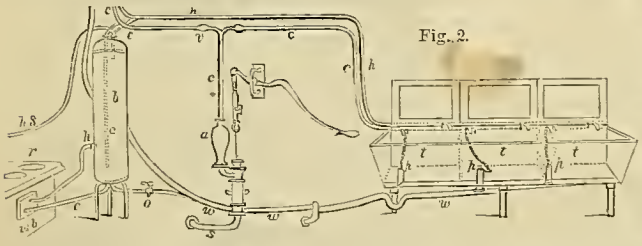
Fig. 1 gives a general view of a 2½-story house with the main apparatus in the first story. This is more frequently placed in the basement, in which case we can imagine the pipes carried up into another story. The tank, *t*, is filled from the roof, or by the pump. The cold water pipe, *c*, conveys the cold water down to near the bottom of the water-tight copper boiler, *b*, and forces the hot water out through the pipe *h*, entering a little way into the top, by which it is carried up to the sink *s*, in the next story, to the stopcocks in the wash-trays, *a*, *a*, *a*, and anywhere else throughout the house, to any point not higher than the tank. The force pump drives the

Fig. 1.



cold water into the trays, if the stopcocks be open; also, on closing these, it is forced into the boiler, and up into the tank when desired. The pressure from the tank keeps this cold water pipe always full for supplying wash-stands (*s*), bath-tubs, water-closets, etc. The waste-pipe, *w*, carries away filthy water from the trays, from the wash-stands, *s*, etc..... **Fig. 2** shows the lower part of the apparatus in a plainer form. The boiler, *b*, is of strong copper, riveted—its strength proportioned to the pressure. For a tank in 2d or 3d story we use what is called "Croton Pressure" strength. From near the bottom of the tank a pipe runs through the chimney back,

Fig. 2.



out shown here, to a *water-back*, *w b*, in the range, *r*, from which another pipe, *h*, runs back to the boiler at a higher point. This water-back is a strong iron box, say 10 to 14 inches long, 6 to 10 inches high, and about 2 inches thick: and it takes the place of the rear fire brick in the fire chamber of the range or cook-stove, so that it is always in direct contact with the fire, and being always full of water does not burn out. With the smallest amount of fire the water is warmed, rises through *h*, while cold water flows in through *c*. In this way the boiler is always kept hot as long as there is any fire. The boiler holds from 30 to 60 gallons, and the body of water will keep warm long after the fire goes out. One holding 35 to 45 gallons is sufficient for a medium house; 30 gallons will do for a small house. The hot-water of course always rises to the top, and is drawn off through the pipe *h*, as wanted. In good plumbing, a waste-pipe leaves the lowest point, with a stopcock, *o*, usually closed, so as to draw off any sediment that may collect in the boiler should this occur, or the water get foul, or it be desirable to empty the whole apparatus. From the hot-water pipe, branches run to any points desired, as *hs*, to a sink in the kitchen; one or more upwards, with side branches to the chambers. This also extends up over the top of the tank (as in fig. 3), and answers as a safety-valve to the boiler. In brisk boiling a little hot-water will sometimes rise over into the tank, and keep it from freezing. Another branch runs along the wall with a stopcock opening into each of

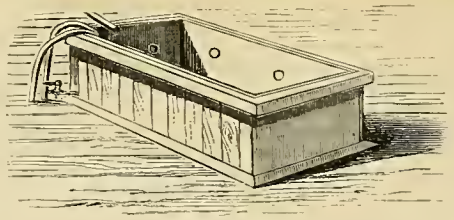


Fig. 3.

the wash-trays, *t*, *t*, *t*. The pump draws the water through the supply pipe *s*, from the cistern, reservoir, or well, and forces it up into the tank, or out at any point where a stopcock is opened; in the right branch a cold water stopcock opens into each of the trays. A valve *v*, in the horizontal pipe above the pump, prevents drawing water from the tank into the trays. It will be seen that by this arrangement, two pipes answer to carry hot and cold water *up* or *down*. The waste-pipes, *w*, *w*, *w*, collect and carry the water out through the wall into a drain. The bend in this, near the first tray, is called a *stench-trap*—the bend always keeping full of water so that no odors can pass back from the drain. These traps should always be provided with a broad screw in the lowest point of the bend, for removing any sand or other obstruction that may chance to settle there.—The wash-trays are made of strong clear pine plank, 1½ or 1¾ inches in thickness, let into each other at the joints, and these well smeared with white-lead ground in oil, before putting the pieces together. The case is divided into two or three compartments as desired. The back and end pieces are perpendicular and the front pieces inclined in at the bottom, so that while the tub is 19 or 20 inches wide at the top, inside measurement, it is only 13 to 14 inches wide at the bottom. Perpendicular depth inside, 14 inches. The top front edge should stand about 33 inches above the floor. The length of the trays may be about 2 feet each. The bottom board is a little inclined to the left, and in the lowest rear corner of each tray is a waste-pipe, *p*, with metallic plug attached to a chain from near the top, so that it can be opened readily. Two trays are convenient for different kinds of suds or clothes, and a third still more so, for rinsing. A wringer can stand upon the right end, or be changed to the division boards. The covers, if neatly fitted, form a good ironing table when shut down. It will be readily seen how great a convenience are these "stationary trays," and how much tugging and lifting they save. Turning a stopcock lets in hot-water as desired. Cold water is pumped directly in, or may be drawn from the tank if the supply be great enough, by omitting the valve *v*; and by lifting the plug, the wash water runs away. We can hardly wonder that when servants are asked to go to a house, the first question usually is "Have you stationary wash-tubs?" which implies boiler, etc., with hot-water for dishes and other purposes always ready for use. This apparatus is supposed to be in a separate wash-room or laundry. The whole may be in the Kitchen. The pump may stand at the edge of the sink with a cold water spout and cock near the air-chamber, *a*. This air-chamber is not necessary, but is desirable as a protection to the pipe and pump, and it makes the pumping easier, and gives a steady stream of water.——All pipes should be kept from the walls, at least by a board, and should be run up by the side of a chimney, or through a closet, and not against the outer wall. It is better also, when practicable, to have the tank, etc., on the warmest side of the building. Lead pipes, where passing through wood-work should fit closely, or be surrounded with cement and broken glass, otherwise rats in attempting to enlarge a passage will sometimes cut through the lead pipe. For size and weight of lead pipe, for apparatus of moderate size, see "Plumbing specifications," on page 89 (March No). For the great utility and profit of such an arrangement, see page 88. Size, arrangement, etc., may be varied to suit taste, means, location of rooms, etc.

Fig. 3 represents the Tank in some upper room, with its top a little below the eaves-trough, from which an inlet pipe is shown. The dark spot, just below it, indicates the over-flow pipe running down to the cistern. The hot and cold water-pipes are shown coming up from below. The short pipe (with stopcock for shutting off the water if ever desired for repairs or otherwise,) lets the water down or up. The extended curved part above, discharges water pumped up, and also answers as a "spring" in the pipe.—The tank is made with 1¼-inch matched plank, built inside a scantling or wall-strip frame, and is lined with sheet lead, well soldered. Two of the "plumber's tacks" are indicated on one side—that is, the lead is let into the wood at these points, the indenture being covered with solder to protect any weakness from the heating in of the lead. These "tacks" prevent the lead from sagging down at the sides, as it will usually do, after long exposure to alternate heat and cold. In building, stronger studding, and closer joists should be carried up under the tank to support the great weight of water. With this provision, it is better to make the tank large,

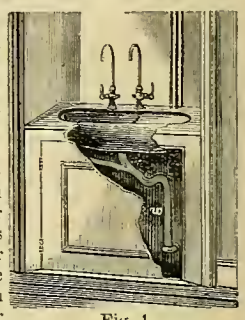

Fig. 4.

and thus save pumping in dry weather. The cost is but a little greater for one of double size. Each cubic foot of contents holds nearly 7½ gallons, or about 4 feet to the barrel; 4×6 feet, 3½ feet deep, will hold about 650 gallons, or 21 barrels. In a house not constructed for the purpose, we made an aperture through the side from the attic floor out over the L, which was half a story lower, and set the middle of a large tank over the heavy beam, supporting the outer end upon the L roof, and covered the outside portion over the roof with double boards, having 4 inches of shavings between, and surrounded the whole with a tin roof extending from the side of the main house over on to the roof of the L. This arrangement has worked well for several years.—It is on the south side, and has never frozen at all. It holds 60 barrels. The tank should always be closely covered, and have a trap-door in the cover to look into the tank. The water comes in from the upper roof only, and when full the surplus runs through a spout on to the L roof and thence to the cistern. The tank is cleaned of any sediment once a year or so. Pipes with branches extend from this to the boiler, to the bath-room, water-closet, wash-sinks, etc. A stopcock in the pipe where it leaves the bottom of the tank, is desirable, both to cut off the water from descending if leakage occur below, and also when cleaning out or washing the tank itself. A metallic strainer is put over the head of the discharge pipe, to stop any leaves or other material entering from the tank, to clog it.

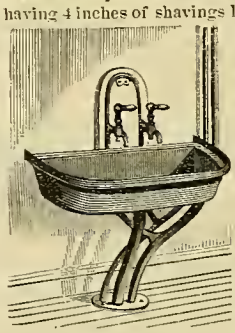

Fig. 5.

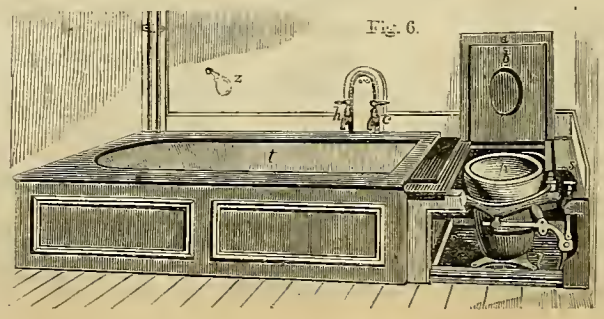
Fig. 4 shows the "Butler's Sink," described last month, page 128, with the front door and casing below partly removed to show the waste-pipe, *w*, from which a branch extends to the strainer placed at the upper edge of the oval sink, to prevent its overflowing, if the stopcocks should by chance be left open. A chain plug in the bottom opens directly into the waste-pipe, *w*.

Fig. 5 shows sink, etc., *S—how*, in room *I*, fig. 4, page 88 (March number), with hot and cold water, and waste-pipes. The two supply pipes are seen in the corner. This is, of course, all cased in neatly, with door in front. The stopcocks are set high enough above the sink to admit a pail under them.

Fig. 6 shows the bath-tub and water-closet described last month, with the casing removed from the latter, in front, to show the internal arrangement... ..*p* is the earthen-ware basin, having a metal basin under it, which is turned down by raising the handle, and this movement also lets cold water into the rim of the porcelain, nearly horizontally, so as to wash it. The large 4-inch waste-pipe below has a stench-trap. The walnut cover, *a*, and seat, *b*, are both on hinges, so that by opening both, the wide porcelain bowl answers for receiving slops, and as a urinal. The hot and cold water pipes are seen in the corner, and the supply stopcocks at *h* and *c*; the bell-pull at *z*; the bathing-tub at *t*, neatly cased in with panels. The French pattern bathing-tub is now generally preferred—about 21 inches deep, 23 inches wide, and

Fig. 6.



4 to 4½ feet long at the top.—Bell hanging, ventilators, dumb-waiters, cornices, brackets, etc., etc., are necessarily deferred to next number for want of space here.

Steaming Feed for Cattle.—Wm. H. Dungan, Ind., asks: "Can you inform me of a good plan to steam corn-meal, etc., for cattle and pigs?" Buy a second-hand boiler of 3 or 4 barrels capacity—tubular boilers are best if strong—have it tested to know what pressure of steam is safe; have it properly set and the valve loaded, then fire up, and carry the steam into the bottom of any *deep* closed chest, hogshead, or tight box. An india-rubber pipe makes the best connection, and a piece of "galvanized" iron gas pipe may be used to carry the steam down into the feed in the box.—The same arrangement serves to boil potatoes, meal, etc., for pigs in a cauldron or tub with water.

Cheese Factories—How Far South? J. M. Brooks of Waterford, Miss., wants to know if a cheese factory will do well in his latitude and to be put in correspondence with a man to run one. We would be glad to see the South producing its own cheese, and will thank any who will inform us of the success or failure of cheese factories south of "Mason and Dixon's line."

Ashes on Wet Land.—E. E. Fagan—no manure does much good on really wet land. You can afford to pay 15c. for ashes, to top-dress grass land, and the middle of May will probably not be too late to apply them. They will benefit the succeeding crops for years. 25 bushels is a fair dressing, and 75 will do no harm.

Peas and Oats—"Constant Reader" asks: "Do they mature at the same time, or would the crops be adapted for soiling only?"—They mature about the same time and may be thrashed.—"If used for soiling, would the crop (green) be as heavy as corn or clover?"—Heavier than clover; not so heavy as corn. "Would barley do as well with the peas as oats, and would it answer to seed the field to clover at the same time?" Barley does not make straw enough—Clover seeding would probably do well. "Is there any crop which will give more pork to the acre than good corn?"—No grain crop and no green crop—possibly some root crop.

Keeping Cabbages.—S. J. Sweet, (who gives no county or State), enquires if it is necessary to cover cabbages when stored in the ground for winter use, with straw or other litter. If he lives where the thermometer falls 10° or 15° below zero, when the ground is not covered by snow, it would be necessary to cover with three or four inches of leaves or straw: for although cabbages will stand a certain amount of freezing, there is a point beyond which they will be injured. It is likely that his failure may be from some other cause, such as storing them too early in the season, or putting them in too hot a place.

Sour Milk for Cows.—W. White, West Stephentown, N. Y. Cows may be easily accustomed to "swill," sour milk, whey, buttermilk, etc., especially if mingled with bran or other ground feed. If such high-flavored things as onions, decaying vegetables, fish, etc., are kept out, no harm will be done, and it will form a nutritious and very valuable article of food. It will have no tendency to dry up cows.

How to Sow and Raise Corn Fodder.—We have recently learned of a method for raising corn fodder, practiced by a successful dairyman in Rockland Co., N. Y., which strikes us as so thoroughly practical that without testing it, we give it to the readers of the *American Agriculturist*. The farmer selects good land which has been a year or more under cultivation, plows and harrows it, marks it out in drills three feet apart. In the drills he drops his corn 14 to 16 kernels to the foot. He uses white Southern for seed—then he spreads cow-dung from his stables (his cows are not bedded and the manure is pure cow dung) upon the corn in the drills, using about 8 full loads to the acre. This is then covered out of sight by crossing the furrows with a Shares' coulter harrow, which leaves the ground smooth. The corn comes up soon, gets ahead of the weeds, may be tilled with a cultivator twice and laid by. It grows 10 to 12 feet high, with the buts scarcely larger than one's finger.

How to Get Good Grass on a Hill-side.—"Novice," who resides near a large city in Tennessee, where manure can be obtained at a mere nominal price, asks: "How can I get a good meadow and pasture on three acres of rather steep hill-side?"—If the land needs plowing, spread on it fifty tons of well rotted manure per acre, and plow it under as deep as the character of the soil will allow. Use the harrow freely, and destroy all weeds that spring up. If the soil can be got into good condition, the grass seed, with or without a grain crop, may be sown at once; but if the land is rough, or the soil hard and cloddy, it will be far better not to sow anything on it until next fall; and, in the meantime, work the land repeatedly, to kill weeds and to pulverize the soil. After the manure is partially decayed, plow the land again, perhaps a little deeper than before, then harrow it and destroy the weeds; and if you want a meadow of the grandest kind, that will last for years, spread on some more manure, say twenty tons per acre, and plow it under in August; then harrow the soil smooth, and sow such grass seed as is suited to the climate. Here, we should sow a peck of timothy seed, 4 quarts red clover, 1 quart white clover, and 2 quarts Kentucky blue grass per acre. If the land is now in grass, and it is not desired to break it up, the principal means of making a good meadow and pasture will consist in top-dressing with rotted manure, and the free use of the harrow. Give up the idea of raising a large crop the first year. Spread twenty tons of well rotted manure per acre on the surface, and harrow it repeatedly; and when this first dressing of manure is washed into the soil, or mixed with it, put on another good dressing, and harrow again *thoroughly*. Then sow some white clover and grass seed, and you may reasonably expect a splendid meadow and pasture. We give this advice on the idea that the land, from its contiguity to a large city, is very valuable, and manure very cheap. In such circumstances, it is almost impossible to manure grass land too highly, provided it is not put on in such large quantities at one time as to smother the grass.

Howard Co., Maryland, Agricultural Association.—The farmers of Howard Co. have recently formed an association of which Anthony M. Johnson is President; D. Lawrence, Clarkesville, is Corresponding Secretary. It meets at Ellicott City.

Crops in Illinois.—N. J. Shephard, Lebanon, writes: The present prospect for wheat is very poor. Some farmers intend to plow some of it up as it is utterly worthless. Unless the spring is a very good one the wheat crop will be a total failure in this section of country. All are very busy preparing for planting corn, of which there will be a very large amount planted this year. A good many have come to the conclusion that raising corn at 50 cents, pays better than raising wheat at 75 cts. or $1.00. Farm hands are receiving from $14 to $18 per month, including board. A majority of farmers have decided not to pay as much for harvest hands as they did last year, on account of the fall in the price of wheat.

Carbolic Soap.—"M. C. K.," Freeport, Iowa, asks if it will injure the skin. That would depend upon its strength.—The soap made for washing and medicinal purposes would not.

Saddle Galls in Horses.—"E. P.," of Canon City, Colorado, writes: "Nearly all horses in this Territory have large 'saddle marks' on their backs, and those that have just come from under the saddle have large sores. In this country two horses are considered necessary for the riding of one herder, and as I have stated, their backs get invariably sore. What is the remedy?"—When the horse comes in, loosen the girths, lift the saddle and replace it for half an hour; then wash off the back and lay a bag wrung out of cold water upon it, binding it on. After an hour or two, apply a lotion of 1 drachm Tincture of Arnica, in ½ pint of water. A hard saddle is better than a padded one. The saddle may often be greased to advantage. Instead of Arnica, salt and water, whiskey, and vinegar and water may be used. Sometimes a sheepskin laid under the saddle is a great relief. Saddle the horse half an hour before mounting.

Beet Sugar.—S. R. Collins, Cooper Co., Mo. There is not as yet any process by which sugar can be made from the beet as a *domestic* product. The factories where large capital is employed, have hardly reached success. Those who by their inventions did so much to facilitate the production of sorghum syrup, should turn their attention to beet sugar.

A 4-Acre Farm.—"Amateur" wants to keep a horse and cow, and to raise vegetables for a small family on 4 acres of land now in grass.—Devote quarter of an acre to garden, quarter of an acre to small fruits and quarter of an acre to potatoes. Plow and manure all this deeply and well, manuring heavily. Put in oats and peas mixed, on another quarter acre, for green feed before corn is ready. On another sow carrots and parsnips, an eighth of an acre each, having the rows as long as possible, using fine bone and fish manure compost or superphosphate. Have another quarter acre well manured, plowed, cross plowed, and harrowed "all to pieces" for mangels or sugar beets. Heavily manure a full acre for a succession of corn crops, and sow about one-sixth of an acre once a fortnight from about the first of May to the first of August. On part of this land a crop of buckwheat may be sowed and turned under for manure, or corn may be sowed or turned under for the same purpose. Peas might also be sown and taken off in time for the later sowings of corn, and would make excellent fodder, green or dry. The rest of the land might lie in grass the first year and be fed off by tethering the animals, or mowed for hay. Plow the land, which is left by the oats and peas, and put in Swede turnips with superphosphate in the drills; and as fast as corn is cut, plow and sow turnips up to the 10th of August. After that sow wheat, and mow it as often as it will give a good swath. This is an outline, which, if followed, will teach you what you can do. The important thing is manure enough. Feed oil-cake and bran for the sake of the manure.

Spaying Animals, etc.—"B. F. D." asks: "Is there a book that will give me information on the Spaying of Animals?—I wish to apply it to sheep, goats, and cows."—There is an excellent work on "The Castration of Domestic Animals," by Gourdon. It is in French, and can be imported if desired. We know of no English work.

Killing a Dog.—Eben Wight, Dedham, Mass., says: "Having an old and favorite dog that I wished to get rid of in the easiest possible way, and not liking to shoot him or witness the spasmodic effect of strychnine, I laid him on a blanket in a box and pouring in 4 ounces of chloroform, covered him with another blanket, closed the lid of the box, and all was over with him without the slightest struggle."

The Prize Butter Essay.—The prize offered by the proprietors of the Blanchard Churn, through the publishers of the *American Agriculturist*, in our February number resulted in our receiving 82 documents, many of which were not intended to compete for the prize, but were written to convey hints or descriptions of processes believed to be peculiar and valuable. The competing essays, were submitted to the committee named below, who award as follows:—

Messrs. Editors: The essays upon butter making, submitted to us, have been carefully read, re-read and compared, with reference to the offer which requires the essay to be "thoroughly practical in its whole character," and to "include the management of the milk from the time it is drawn from the cow, the treatment of the milk and cream in the dairy, churning, working, salting, packing and marketing." The competition was very close between several of the essays which were of rare excellence; but we agree entirely in awarding the prize to Mrs. M. A. Deane of Farina, Fayette Co., Ill., whom we congratulate as having rendered important service to the butter makers of the country. Very respectfully, MARTHA C. WELD, VINCENT KENYON.

The successful Essay will probably be published in these pages next month.

Minnesota State Horticultural Society.—This association is sending circulars to fruit growers of the State, with a view to ascertain the hardiness of the leading varieties. Every fruit grower in Minnesota should be a member of the Society, and can be such by sending $1, to Wyman Elliott, Treasurer, Minneapolis, which will entitle him to a copy of the Report.

Fruit for Northern Iowa.—A. E. Rich, writes: "Your special Iowa contributor gives a list of apples well suited to the Central and Southern part of Iowa: a better list for Northern Iowa would be, *Summer*, Red Astrachan, Sops of Wine. *Autumn*, Saxton or Fall Stripe, St. Lawrence, Fameuse, Duchess of Oldenburgh. *Winter*, Plumb's Cider, Perry Russett, Ben Davis, Talman Sweet. I agree with your contributor in regard to mulching trees. If a mulch of coarse manure were placed around trees after the ground has frozen, the trees would be almost sure to be girdled by mice before spring. This could be prevented by banking to a hight of 8 or 10 inches with clean earth, the mulch to extend only up to the bank. The borers, that most trouble us, work in the body and main limbs of the trees. Would keeping the ground clean under trees prevent their working in them?—Probably not.

Moles.—"New Subscriber," Washington, D.C. We have in previous numbers published descriptions of several mole traps, any of which will doubtless prove efficient, if thoroughly attended to. The difficulty is that it takes both time and trouble to trap the animals. We have no faith in any other remedy yet proposed. Mr. A. S. Fuller, of Ridgewood, N. J., has offered $100 for the most efficient means of ridding his grounds of moles.

The Glory Pea.—Several inquirers. The seed is kept by most of our Seedsmen, in packets, at 25 cts. and 50 cts. Mr. Saul, of Washington, recommends to sow the seeds where the plants are to flower, waiting until about June 1st, or until the soil is thoroughly warmed.

Horse-tamer's Secret.—A correspondent in Iowa, sends us one of the recipes, for taming "the wildest horses," which are sold about the country. Oil of Cumin is to be rubbed on the horse's nose, Castor is to be put on his food, and 10 drops of Oil of Rhodium on his tongue. "Before applying the above, the following directions should be observed." The "following directions" are to subdue the horse by throwing him on Rarey's plan, by the use of straps, which is apt to tame a horse without the use of Cumin, Castor, or Rhodium. We are informed that "some will tame the wildest horse and drive him through the streets without a bridle, while others can do nothing with the tamest horse."—"All persons found making known this recipe to others, except authorized agents, will be dealt with according to offense." "Jess so!" Please begin with us.

Hand-book of the Sulphur-cure, as applicable to the Vine disease in America. By William J. Flagg. N. Y.: Harper & Brothers. This is a neat little treatise of 100 pages in which the systematic use of sulphur for mildew is enforced, and its manipulation explained. The author does not seem to be aware that the subject has been discussed by "Horticola" and others, in this country. We have no doubt that the thorough application of sulphur will prevent the evil effects of mildew, and this work gives directions for doing it.

Agricultural Colleges and Experiment Farms.—A pamphlet issued by the Trustees of the Agricultural College of Penn., reporting the results at their *three* experimental farms, has been received. The report presents a mass of results through which the inquirer must wade for hours to learn much. Yet there is a good deal of value in it. We have the highest opinion of the good which well managed, experimental farms may be to the community—and can well see that great benefit might be derived by the students at an agricultural college, if they could watch and help conduct the experiments;—but these farms seem to be conducted entirely separate from the college, and without any idea of giving instruction to the pupils, according to the provisions of the Agricultural College Act. This may be all right, and whether it is or not, do let us have well digested statements of the experiments, showing what they were undertaken to prove; and a classification of the results, showing clearly what they teach. If we criticise unfavorably those institutions, which, accepting the bounty of the government, teach agriculture without practical demonstration, what shall we say of Agricultural Colleges "running" farms 150 miles from their students?

"Farming as a Profession, or, How Charles Loring Made it Pay. By T. A. Bland, Editor North-Western Farmer. Loring, Publisher, Boston." Mr. Loring—not Charles, but the publisher,—has already given us two horticultural novels, and now offers this one which proclaims itself as an agricultural one. The other two were by a young man writing as a woman, and one on reading this, might suppose it was by a sentimental school girl, assuming the name of Bland, did not an advertisement at the end of the book state that it is by T. A. Bland, editor of the North-western Farmer. True genius cannot bury itself in the columns of any country paper, so it goes to Boston and finds a publisher to bring it to light. The book comes to us for an editorial review, and it would hardly be handsome to say that a work by one who claims to be an editor is unworthy of notice—whatever we may think. If we ignore the book altogether, we shall do less than justice to our readers, as they will not know of the work, and we do not wish to assume the responsibility of keeping from them the fact that they can buy 87 pages of large-typed and double-leaded wisdom, by T. A. Bland, all for the small sum of 30 cts. Shakespeare and T. A. Bland are two authors who defy criticism—in vain one attempts to analyze either—we can only humbly render them homage by quoting them. T. A. B. is versatile, and treats one subject as well as he does another. His characters love and buy manure, assert woman's rights and broil chickens, scatter money freely and make it rapidly, and oratorize and osculate as no other people could. The characters are all natural born orators, and all make speeches and kiss one another in a manner wonderful to contemplate. Such matter-of-fact topics as agricultural papers, or such profound ones as the future state, are disposed of with equal facility, while the legal profession catches it in a way to make us thankful that we are not a lawyer. But it is in the highly sentimental portions of the work that the author shows his strength. His style we should set down as inimitable—at least, we hope it is, in witness of which we give the following specimens. Charles, the hero—the author says he is, is meditating. "Just behind this bright constellation of home lights, there arose above the horizon of his memory a bright particular star in the graceful and laughing form of Stella Moreland, only daughter of his father's nearest neighbor." The fancy of calling "Stella" a "bright particular star," is so good that it is repeated a few pages further on. "Laughing figure," is decidedly neat, and we suppose Stella was a plump girl who shook all over when she laughed. "Charles went off to college, and on the evening preceding his departure, they [Charles and the "bright particular" aforesaid] held a long and highly confidential (need I say interesting?) interview, which finally terminated in solemn vows of eternal constancy sealed with kisses of undying love." That is what we call rather nice, than otherwise. All this took place "at the gate leading out to the woodland path, which formed the pedestrian link between the homes of the Moreland's and the Loring's." "Pedestrian link," is good—it savors of sausages, some links of which are said to walk off when one whistles as if calling a dog. Charles having gone to college, in time had to return, and the way he behaved in the railroad car must have astonished his fellow passengers. "He opened his portfolio, and taking from it a package of tiny letters, encased in white envelopes, and tied into a bundle by a rose-colored ribbon, he busied himself for the next hour with their contents. Then taking from his breast pocket, just over the heart, a miniature portrait of a fair-haired, blue-eyed girl, he gazed earnestly and long upon it, and finally kissing it, he closed the case," etc. In the way of description, we doubt if anything in any of Beadle's Dime Novels can equal that bit. The "rose-colored ribbon" and the location of that breast pocket are touches of a master-hand. But it was all very funny to do in a railroad car. The meeting between Charles and the original of this "breast pocket over the heart" picture, is just touching, and altogether "Charles Loring Made it Pay." Charles gets a farm by a process which we commend to all needy young men. He gets six thousand dollars of his father and buys a farm—which is much quicker and vastly easier than the stupid old way of working for one. Charles and Stella are married and do wonders at farming and housekeeping, and continue to deliver short orations full of most excellent sentiment. In commending the sentiment of the work we must not forget the wit which is as brilliant as the other is satisfying, and it is so properly pointed out that he must be a dull reader if he does not laugh in the right place. Charles' sister, who does the funny in the book, says: "In view of the probabilities that we ladies are to take charge of the political interests of the country, very soon, it may be well for the gentlemen to become familiar with the details of housekeeping."——"All laughing (as who could help it?) at Lilies' wit, the party," etc. This is intensely witty, but the tremendous joke of the book is in calling a law firm, Quirk & Gammon, and the profundity of the wit here is carefully pointed out by Charles' sister, who thinks the names *apropos* to lawyers. If Charles' sister had read much she would have known that the names of Quirk & Gammon were long ago rendered classic by Dr. Warren, in his admirable novel of Ten Thousand a Year. We have quoted sufficiently to induce all admirers of this style of literature to buy the work and read the whole. It probably has a moral and a purpose, and we suppose that the moral is that of a good old lady who improved every opportunity to teach by precept and example. "My friends," said she, "as I came along I saw a cow a-switching of her tail. How calm and gentle she looked a-switching of her tail, in this wicked world of strife she was peaceful and contented a-switching of her tail, and I said to myself—Go thou and do likewise."

Apiary for May.—*By M. Quinby.*

Look out for moth worms. Destroy as many as possible, and thereby save loss and vexation. Several generations are produced in a few months, so that one, destroyed now, is equivalent to hundreds or thousands in the fall. They may be found in the morning collected on the bottom boards of the hives where they have become chilled. In some places, good stocks will swarm, or may swarm in the latter part of this month. If hives are not ready, they should be made so. When bees swarm, if a good hive is at once presented, they will accept it ninety-nine times in a hundred; but a delay of an hour, leaving the bees to hang in the cluster meanwhile, might issue in the loss of the swarm. He who depends on making hives as they are needed from time to time, will be likely to have "bad luck." Swarms coming just before a wet, cold spell, should be fed. Have a care that light hives do not suffer for want of honey. Swarming in general is not to be expected before the white clover blossoms. Before swarming, the bees build cells for queens, to make sure the succession after the old one has left. These cells may be seen by examining the edges of the combs in a box hive or by taking out the movable frames, where these are used. When these cells begin to be sealed, look out for the swarm at once. Swarms usually issue between the hours of ten and three, but this is more the case with the natives than with the Italians. The latter will issue sometimes earlier or later. They take as much honey with them as they can carry, and usually settle on some tree or bush not far from the hive, where they *may* stay 24 hours, and possibly, not one. If they start for the woods, scatter water or dirt among them. This throws them into confusion, and sometimes will stop them. Those who believe in rattling pans and blowing horns on such occasions, may use them, but for myself, I lack faith. Paint no hives now, but let them be clean and cool. It matters little how the bees are put into them—may be jarred, dipped, or brushed, but brushing is apt to irritate them. Sometimes the branch on which they are can be cut off, laid on a sheet, and the hive set over it. When the bees are in, *shade* the hive. This is of the very first importance. All hives should be kept from the sun in some way. When clover begins to bloom freely, put on as many surplus boxes as the bees will occupy.

Bee Queries Answered.—By M. Quinby. "G. M. H.," Narrows Bridge, Ky., asks, 1st. "What size do you make honey boxes for the frame hive described in your book, 'Mysteries of Bee-keeping?'..... 2d. Which do you use most, the honey board, or the cross-sticks on the top of the frames?..... 3d. Do you confine the frames at the top to keep them from moving, while hiving natural swarms?.....4th. When dividing frame hives, in the division containing the queen, do you put the frames containing the comb all together on one side, or do you mix empty frames with them?"——*Ans.* 1st. Boxes for the hive mentioned should be 5 inches deep, and 6¼ square, or 6¼ by 4¼ inches. The smaller sizes generally sell better.....2d. I find a very thin honey board the least trouble.....3d. When hiving a natural swarm in a frame hive, spread the frames apart each way, as far as possible, and put the bees in at the top, having previously hived them in a half-bushel measure or any convenient box, then restore the frames to their original position.....4th. The frames containing comb should be all put on one side, on account of the brood. The empty frames in the division without a queen are liable to be filled with drone comb, which is undesirable for breeding. To remedy this, surplus boxes should be put inside the hive instead of frames, as described in the book referred to. You should watch the building of new combs that any irregularities may be detected, and the combs straightened.

"A. L. H.," Narrows Bridge, Ky., asks, "Will it pay to obtain and plant basswood trees for the sake of the honey their flowers would yield, and where would be the best place to obtain them?"——*Ans.* Basswood is the most desirable tree for producing honey, but I hardly think it would pay to plant it for that purpose alone, as it would be 15 or 20 years before the yield of honey would amount to anything. I do not know where the trees could be obtained. I would recommend, if disposed to plant anything for honey, that the Antwerp Raspberry be cultivated in large quantities. There would be a gain in fruit, besides the honey, and the returns would begin the second year.

The Duties on Plants and Seeds

BY PETER HENDERSON.

An amendment to the present Tariff bill now pending before Congress, provides that "Plants, Trees, Shrubs, Roots and Seeds," shall be admitted duty free, if wanted for private use only, and not for sale. A more unjust and absurd provision was never made. If a man who uses Pear Trees or Peas may import these free of duty, why may not another who wants cloth for his coat, or leather for his boots, do the same? If this bill pass, it will open the door to easy fraud to hundreds of unscrupulous men, who will not be slow to take advantage of it. What advantage the provision would be to any amateur in horticulture is hard to conceive, for the privilege of importing trees or plants duty free would not be of the least value to those not versed in gardening matters. In what are known as green-house or hot-house plants, with all the care that we florists can bestow upon them, at least one-half of all we import die outright in a week or two after they are unpacked, and the balance are only saved with the greatest care and attention, many of them not recovering for months. With fruit or ornamental trees the experience is not much better, as a large proportion are lost, and those which live take years to make trees as vigorous as might have been purchased here. Moreover, the cost of plants in the leading florists' establishments in London or Paris, is higher than in this country. These facts are so well understood by nurserymen and florists, that few articles are now imported except new varieties. Few amateurs have the knowledge to enable them to judge of what is novel. When the American in London or Paris, sees at an exhibition of flowers some fine grown specimens of a plant, such as he thinks he never saw here, and buys it, he perhaps finds that his

purchase has been discarded years before as unfit for our climate, or is retailing in our markets at 25c. apiece! Just so with fruits; the Jargonelle Pears, or Kean's Seedling Strawberries, upon which he feasts his eyes in European markets, every gardener knows are worthless here. Yet our privileged amateur will buy them and chuckle to himself that he can get them over, duty free.

If I am correct in these statements it is evident that the benefits intended to be conferred upon the community by the proposed bill are far worse than useless, as the seeming advantage of this privilege would induce many to buy who otherwise would not, and this buying in nine cases out of ten, would result in total loss to the purchaser. But if this bill had been so framed as to read that Trees and Plants might be imported duty free, for sale or otherwise, its passage would be a wise and judicious act. For seeds and bulbs we would make no claim, as such are not quickly perishable, and hence the necessity for their admission free of duty is not equal to that for the perishable commodities of trees and plants. It is only on account of their being perishable that we claim that they should be admitted duty free, and thus save us from six to ten days in the transit; for be it known, that on all articles on which duty is to be paid—such is the tangled length of the red tape arrangements of the New York Custom House—that it requires about the same time to get our goods out of it that it takes for them to cross the Atlantic. In consequence of such delays more than half of our importations of new plants are total losses. Was the revenue to the Government derived from the duties on trees and plants of any considerable amount we might with less reason complain, but the amount must be quite insignificant, and that coupled with the fact of the delay (in consequence of this duty being imposed), in passing through the Custom House prevents us in many instances from being able to get alive many of the more rare and delicate plants. So disastrous has been our experience, since the duty was put on, that in importing delicate plants from Europe, we are obliged to order a dozen in the hope of getting one alive to propagate from. We trust our legislators will view this matter fairly; we care nothing about the amount paid for duties, these are trifling; but we bitterly complain of the delay to our perishable goods incident to the collecting of these duties.

Ogden Farm Papers—No. 5.

We have at last had an opportunity to ascertain the quantity of fodder used, by actual weighing. The platform of the Fairbanks scale is a part of the main floor of the barn between the cutting machine and the box in which the feed is mixed. By building temporary sideboards on the platform, we are enabled to weigh 1,000 lbs. of cut-feed at a draft. The chop consisted, on this occasion, of about one-half fine hay from a poor stack that was bought for $12.50 per ton, one-fourth mouldy cured oats of our own growing, and one-fourth corn-stalks kept since harvest, in an out of door stack. The average value of the whole, taking the hay as the basis, was not more than $10 per ton. Of this chop we used 2,840 lbs. It was thoroughly wetted, and well mixed with 342 lbs. of wheat meal, costing 2c. per lb.;—the whole cost of the material was $21.04. To which must be added $3 for fuel and labor (estimated), making the whole cost, say, $24. The stock fed was as follows:—Mules (large), 2; Horses, 7; Colts, 3; Oxen, 2; Steers (coming 3 years old), 3; Bull (coming 3 years old), 1; Cows, 12; 2-year old heifers, 3; Yearlings, 6; Calves, 9. Total, 47. The steamed fodder lasted exactly four days—from Sunday morning until Wednesday night,—equal to 188 days feed for one animal of average size, giving as the cost of keeping each animal for one day, 12¾ cents. In addition to this the horned cattle (old and young) received about an average of one quart of meal per day, apportioned according to their needs. This costs 3c. a day additional for these animals, and raises the average cost of all (including the horse stock) to 15c. per day, or $4.50 per month. We feed, on an average, from Nov. 15 until May 15—when soiling rye should be fit for cutting. This makes the cost for wintering $27 per head. In addition to the above, the mules and colts, and a stallion kept for service, receive a little grain. Just what allowance to make for age and condition, I do not know; I have stated the whole case as it stands, and any farmer who is accustomed to the care of stock can figure the average to suit himself. I draw from the facts the following deductions:—

1. I can raise a Jersey heifer to her first calving (two years old) for $56 for her winter keep, and $14 for summer keep—on hired pasture land; $70 in all—and this *pays*.

2. I can raise a colt to four years old, for $108 for winter keep, and $52 for summer keep—hiring pasture; $160 in all, and if this don't pay it will be because I don't raise the right kind of stock. If I feed grain to young colts I expect them to pay cost and interest, twice over, when the time for selling comes.

3. I can keep a full grown cow—allowing her to eat fifty per cent more than the average of my stock, for $40.50 for winter keep, in addition to the cost of her summer feed, which I estimate as follows:—

Interest on cost of ½ acre of land, say, ($300 per acre) at 6 per cent, and taxes..	$10.00
Cost of seed, $3; cultivation, $5, and harvesting, $2.	10.00
	$20.00
Add for winter keep....	$40.50
Total cost of year's keep	$60.50

If the animal were kept at pasture instead of being soiled, $20 would pay the interest on the value of the land required for her support. If this don't pay (with an average of 200 lbs. of butter), it will be because butter and skimmed milk have gone much below the average value of the past ten years. I have left out of the account the cost of labor,—but I have also left out the item of manure which will more than equal it. It should be understood that my animals are fed three times a day, all that they will eat up clean, and that they are in blooming condition. They are not made to *squeeze* through the winter, but are *kept* as well as they can be.

To make the calculation still more exact, we will estimate the value of the manure made, and of the labor required. Basing the calculation upon J. B. Lawes' table showing the value of manure made by the consumption of different kinds of provender, given in the American Agricultural Annual for 1868, p. 32, adding one-quarter American prices, it is fair to estimate the value of the manure produced by my cut hay, oats, and corn-stalks, at $7.25 for each 2,000 pounds consumed, or $10.28 for 2,840 pounds. By the same computation the manure from 342 lbs. of wheat is worth $1.51;—hay and grain together, $11.79. Deducting from this $6 for the cost of feeding, carding, and stable attendance for four days, we have left $5.79 in our favor. This deducted from $24, leaves $18.21,—and it reduces the total outlay for feed to about 12 cents per day, or $3.60 per month.

The foregoing calculations are based on the use of an inferior quality of forage during a season of very low prices. I have no facts to prove what would be the effect of cutting and steaming when only good hay is used at a cost of $25 per ton. Probably the outlay would be greater, but I believe that the proportional saving from the extra preparation, would be quite as large as it now is. This, however, is an opinion only, and it needs proof to establish it.

Ogden Farm finds encouragement in the following passage in the Hon. George Geddes' Essay on Wheat Culture. "Undrained clay lands are never worn out, for the owner that lacks the energy to free them from stagnant water, never has force enough to exhaust their fertility by cropping. Manure on such land is nearly thrown away. Draining is the first thing to be done; next, thorough cultivation, then manure. Whoever reverses this order throws away his money and his labor."

This would be a good text for every farmer to keep constantly in mind. The *profit* of farming comes entirely from the *surplus* of production beyond the grand total of the cost of interest, labor, seed, manure, and wear and tear. These are nearly fixed quantities. They are at least as great, in the aggregate, with medium crops as with good ones. If 30 bushels of corn to the acre will barely return the outlay, 60 bushels may give a clear profit equal to the value of 30 bushels. There are thousands of farms in the country, whose soil contains enough of the elements of fertility to produce fair crops with the aid of ordinary manuring, (if only these elements were come-at-able,) but which, by reason of their soggy and unpleasant condition, would do less injury to their owners if they were hopelessly barren. In the spring and early summer they are moist and cold,—more like putty than like arable land;—in July and August they are baked to a crust; and when the fall rains come they revert again to their weeping state. Any effort to make good land of such a farm as this without draining, is simply an effort wasted. Neither labor nor manure can do much to drive away the demon of "bad-luck," by which every path of its owner is beset. I have scores of letters from the occupants of such farms,—and I have had for years. I began by advising this and that make-shift, where it was claimed that the expense of draining could not be borne, but I have finally learned to say, point-blank, to any man who is trying to make his way on this kind of a farm: "Either drain it or give it up! You can make more money by working at day's work, on good land, than by fighting year in and year out, against the established laws of Nature. If you can't do better, sell off your stock,—and if necessary, work for a neighbor enough of the time to earn your bare living. Spend the rest of your time and all the money you can raise in draining the *best* field you have got. Don't imagine that your case is to be an exception, but accept the fact, now, that you *can't afford* to farm wet land—either own up that you are only fit for a day laborer, or buckle to and make your land worth cultivating."

There are two great obstacles to the advancement of underdraining, viz: One is, the idea that land which suffers from *drought* does not need draining, when the fact is that land often suffers from drought just *because* it needs draining;—take out the water and let in the air, so that the soil can be put in proper tilth, and it will be able to withstand drought. The other is, the not unnatural notion that the first land to be drained is that which is now the wettest. In my judgment the improvement should be first applied to those fields which are just dry enough to be considered arable, but which, two years out of three, disappoint the farmer's hopes and produce barely enough to repay the cost of cultivation. If such land as this is drained it will pay a profit. If a back swamp lot is drained it may be years before it will do more than pay the expenses of its management. Begin with the very best land that needs draining at all, and *make it produce a profit*, and then take the next best and bring that to a profitable state, and so on until the back swamp comes in its turn. What we want is not so much large crops as

profitable crops. A hundred dollars worth of corn that has *cost* a hundred dollars had better not have been grown. It don't pay to work over large areas for meagre produce. Pile on the steam!—Crowd the production to the most remunerative point!—and *then* extend your operations to the next best field and make that pay a round profit. This is the soundest principle of good farming and in carrying it out we shall have no more efficient aid than is rendered by thorough draining on the best lands that need draining. When this is accepted as the correct principle, we shall see draining extending in all directions. So long as the chief effect of draining is to convert innocent waste lands into fields for unprofitable work, its progress will be but halting, and farmers will continue to cry out against its great cost.—Cost? Why, suppose it costs as much to drain an acre of land as to buy an adjoining acre. This is no argument against it. The one acre, *drained*, would pay a handsome profit—the two acres undrained would pay no profit at all, and had better be left to grow wood. What is wanted, as the foundation of the best improvement, is a conviction in the minds of the farming public that it is better to have good farms than to have large farms. That point being gained, all the rest will come as a matter of course. Let us confine ourselves to such areas as will give us the most money for our farming, and leave the rest of the land to take care of itself.

If I were disposed to modify Mr. Geddes' statement it would be by advising that, after draining, manure and labor go together. In fact, if the land is in grass I would prefer to follow the draining with a liberal winter top-dressing of manure and so stimulate the largest possible growth of grass and roots, in advance of plowing. This would give us something to start on, and the cultivation would be profitable from the start; while if the whole of the first year is to be spent in work, without manure to make crops, both time and money will be lost. Still, I am diffident about questioning the propriety of any statement of so good a farmer as Mr. Geddes has shown himself to be.

This question of labor reminds me of the admonition of the author of "Walks and Talks." He is great on the question of summer-fallowing. I have no doubt he is right so far as general practice is concerned. If land is foul and labor is scarce, it may pay to lose a year in order to gain condition; but I would be sorry to see my land accumulating a year's interest and the cost of a year's cultivation without trying to get my money back in some way;—and I think that Mr. Harris will agree that if the force can be commanded it is best to have the fallow a fallow-crop, rather than a naked surface. A thousand bushels of mangels to the acre will leave the land as clean as even he could desire, and they will be well worth having in the root cellar for early spring feeding.

Tim Bunker on Old Hats—Old Folks.

Mr. Editor: I was down to the city the other day, and I met one of your readers, and he wanted to know how much longer Uncle Jotham Sparrowgrass, Jake Frink, and the rest of the Hookertown people was going to live. He said they had been on the stage some time, and thought they must be getting rather infirm. I had to enlighten him as to the remarkable qualities of the Hookertown climate, and the healthful tendencies of farm life. He seemed to have got his notions of human life from the city, where a man reaches his prime at thirty-five, retires from business at forty with broken health, and is in his grave at fifty. We don't run the human machine in that style, out here, and I guess we get about as much out of life as the fastest man upon your sidewalks. Uncle Jotham has no more doubt that he is just in his prime, than he had thirty years ago when he lived over on the Island. If you should ask him what his age was, he would tell you about seventy. The fact is after a man gets to be sixty out here, he is of no particular age, like a horse in his teens, until he is past eighty, when he begins to brag that he has past four score and grows jealous of everybody that is older than himself:—Jotham's father is still living a hale old man, at the age of ninety, and is as likely to live ten years longer as Jotham himself. I know "Lying like a gravestone" has passed into a proverb, but gravestones are not apt to lie about people's ages, if they do about their virtues. If you go into the burying-ground of Mr. Spooner's meeting house you will find about one-third of all the folks lying there, seventy years and upward. People of eighty and ninety, are not uncommon, and now and then one reaches a hundred. Mr. Spooner preached a sermon a while ago, in which he said that one-third of all the people who had died in the parish for the last ten years, had reached the average age of eighty-two years. He keeps the dates and knows. This is not a very good region for doctors, but it is grand for folks who cultivate the soil.

I met Dea. Stokes on Hookertown street last week in his farm wagon, with an old hat on, seventeen years old. He had just come in with his Wednesday's pail of butter and a big willow basket full of eggs. I dont suppose he has failed to bring butter to market during the season on Wednesdays and Saturdays a dozen times in the last thirty years. It always comes in pound balls, nicely stamped, in a bright tin pail, and during the hottest weather it comes in ice so that it is easily handled. The Deacon is eighty years old, and if he is not as capable of doing business as he ever was, he has not found it out. His boys have all gone out from him long ago, and he runs the Stokes homestead, where his ancestors have lived for six generations, on his own account. He is not a very rich man, but he is vastly more independent on his two hundred-acre farm, than a multitude of city merchants, who have an income of twenty thousand a year. He is altogether the shabbiest part of his establishment, except on Sundays, when he comes to meeting close shaven, and tidily, if not fashionably dressed. The farm buildings are kept painted, for he has learned the economy of white-lead and oil upon clapboards and shingles. The tools, carts, and wagons are kept housed, for he believes in having everything in place. The family carriage is venerable but cleanly, and carries Madam Stokes and her maiden daughter to church with as much regularity as the Deacon himself. But on week-day occasions, the Deacon believes in plain doings, and comes to market in a dress that Madam Stokes criticises to very little purpose, for the Deacon is very sot in his notions. That hat was worn ten years as his Sunday best, and for the last seven years, has borne the brunt of the elements on all occasions when he wanted to be out of doors. There is a dim scattering of thin nap left in patches, but the whole frame-work of the hat is laid bare, and the hatter's art is no longer a mystery. Seth Twiggs came along as the Deacon and I were talking, puffing away at his dirty pipe as usual, and says he:

"Deacon, how long have you had that hat, if it is a fair question?"...."Waal let's see. It was the year my youngest boy Oliver was married, and that's seventeen year ago the 1st of May. I got it to go to the wedding."...."'Bout earnt its freedom hain't it?" inquired Seth...."I guess not," replied the Deacon. "It keeps off the rain and sunshine, dont it?"...."Yes."...."Would a new hat do any more?"...."Perhaps not," said Seth doubtingly...."Waal then, aint it just as good as a new hat?" inquired the Deacon...."But the looks of the thing?" insinuated Seth.

"Waal folks must pay for looks that want 'em. I dont have the looking to do. Ye see, neighbor Twiggs, it makes all the difference in the world whether a man pays for what he wants himself, or for what his neighbors want him to have. The main pint about a hat is to keep off rain and sunshine, and when one has done that for seventeen year, you come to have considerable faith, that it will do it just one year longer. If I thought, getting a new hat every spring would make me any better man, if it would make my work any more profitable, or benefit my neighbors in any way, I should sartinly get one. But I dont see it in that light. Have you ever ciphered on the hat question?"

"No I hain't," said Seth. "What on't?"

"There is a deal of philosophy in it. You see a hat every year would cost, at six dollars a piece, $102, and the interest two-thirds as much more, call it $170, spent for an article that dont promote a man's comfort, or add to a man's respectability. My health is just as good as if I had bought a new hat every quarter, and my bank account is a great deal better. For you see, Seth, if a man begins right with his head, he comes out all right at the foot. Savin' on hats means savin' on everything else. And you see if a man keeps puttin' in to the bank more than he takes out every year, he is pretty sartin' to have somethin' ahead when he gets past labor."

The Deacon drove off leaving Seth very much hefog'd in wreaths of smoke.

Deacon Stokes carries his joke on old hats a little too far, I guess; but there is a good deal of sense in what he says about saving in small things and in being a slave to the opinion of your neighbors. But the Deacon's style of saving, and spending will never do much for our farming interests. He has run the Stokes farm very much as his fathers did before him, but he has not made it more productive. Indeed, it has fallen off very much,—will not carry the stock it would twenty years ago. We want to learn, what the Deacon never has learned—how to spend judiciously as well as to save; how to invest capital in the soil, and make it pay ten per cent. It is not much of a knack to run to the savings-bank with every ten dollars that is made from the sale of crops. Everybody knows that the managers of savings-banks are careful men, and will return your capital with interest. It requires some brain, as well as muscular power, to put capital freely into the bank of earth, and make it enrich the soil, while it enriches you. This is what every good farmer ought to do, and leave the material world, as well as the moral, better for his having lived in it. Old hats generally mean, old clothes, poor fare, a starving soil, and a starved mind. Young America abhors this water-gruel style of living and we must have such husbandry as will give us roast beef for dinner, and a new hat every year, or our sons will follow the Stokeses and emigrate.

Hookertown, Conn., April, 15, 1870 Yours to Command, Timothy Bunker, Esq.

Our Gray Rabbit.—(*Lepus sylvaticus.*)

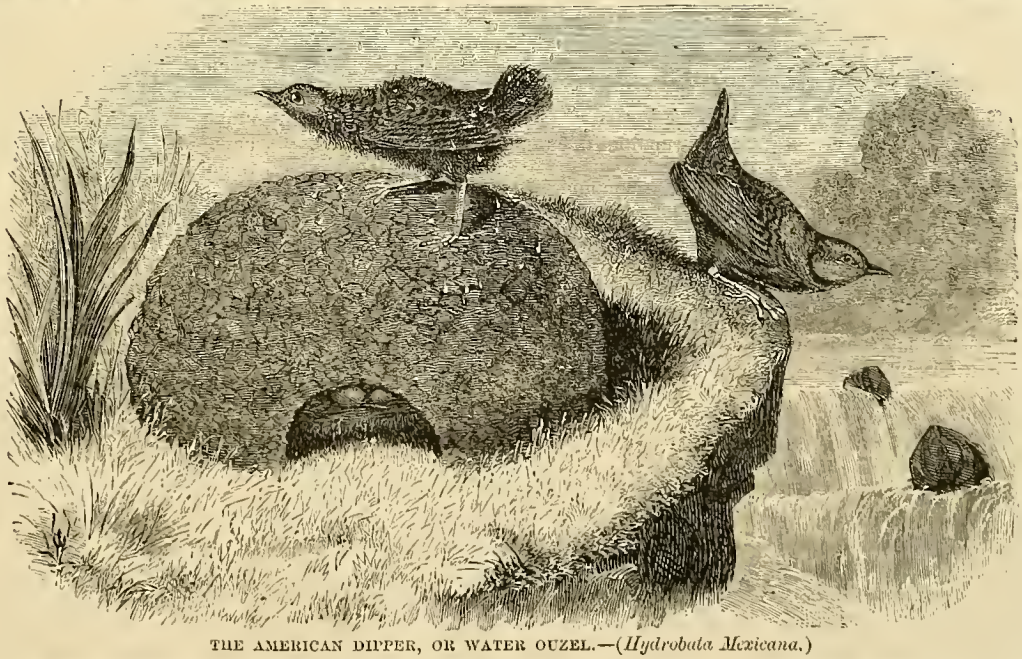
This little animal so closely resembles its consin, the rabbit of Europe (*Lepus cuniculus*), that it passes by its name in this country. Our rabbit is, however, very distinct, particularly in its habits. It does not burrow like its congener, which is the parent of our tame rabbits, but occasionally takes refuge in deserted or occupied burrows, thus often falling a prey to foxes and perhaps other carnivorous animals. The rabbit is about 16 inches long to the tail; it is larger at the West than at the East or South. It is something over two feet long from the nose to the tips of the hind feet, when stretched out. The head is roundish and the ears short. The fur is soft and fine; the skin is rather thin and delicate; the color dark gray, tinted with yellowish-brown above, changing into gray and ash-color upon the sides and rump, and white upon the belly. The tail is very short, dark above and white below. It is very timid, but not suspicious; is easily trapped or shot from its "form," the hollow where it habitually sits, or, started by dogs, and shot upon the jump. The flesh is delicate and good eating, but not particularly rich or "gamey." The rabbit multiplies with such astonishing rapidity that notwithstanding its many enemies it often increases so in numbers as to do farmers, nurserymen and gardeners, great damage. The worst thing it does is to gnaw the bark of young fruit trees near the ground, often girdling them entirely. This is usually done in winter when a lack of other food occurs; and the remedies are to encase the trees with birch bark, sheathing felt, or tarred paper, or to put some offensive substance upon the bark of the tree; sprinkling it with blood is found to prevent their attacks; and it is said that a mixture of assafœtida and soap will have the same effect. The food of this and its related species is exclusively vegetable. Sweet fruit they are very fond of, and box traps are usually baited with sweet apples. Clover and other sweet grasses, cabbages and turnips, grain of all sorts, and many garden vegetables, are their food; their shyness, acute sense of hearing and sight, their instintive tendency to remain still until discovered, and their rapid flight when once started, are their means of defence. So far as we know they never take the offensive except in their occasional fights with one another, or with other species of rabbits or hares, to which they manifest strong repugnance.

THE GRAY RABBIT.—(*Lepus sylvaticus.*)

The American Dipper, or Water Ouzel.

(*Hydrobata Mexicana.*)

The American Dipper is found along the Rocky Mountains, from British America to Mexico. It belongs to the same sub-family as the Thrushes, the Bluebird, and the common Robin, and resembles them in many points of structure, though in habits it is widely different. The bird, the general form of which is shown in the engraving, is lead-colored above, paler beneath, with the head and neck of a clove color, or sooty brown. The Dipper is remarkable for seeking its food under water; it wades or dives into the water, and remains beneath the surface for a considerable time. There is a similar species found in the mountainous countries of Europe, the habits of which have been more closely watched than have those of ours. Observers there state that the bird progresses beneath the water by clinging to the stones at the bottom, by means of its long curved claws, and by the use of its short wings. Its food is mussels and other fresh water mollusks. The European species has the popular reputation of going beneath the water for the purpose of feeding upon the salmon spawn, and is hence regarded as an enemy by the fishermen. An examination of the stomach of the bird has shown no foundation for this belief. The song of the European bird is very powerful and pleasing, but we do not find that observers have noted the song of our species. The nest of the European species is a curiously constructed dome, often placed behind a sheet of falling water or in some locality where it could be found only with great difficulty. The nest of the American Dipper, though it has been diligently sought for, has remained unknown to ornithologists until the past summer, when it was discovered by the naturalists of the U. S. Geological Survey of Colorado and New Mexico. Mr. Henry W. Elliott, of Washington, D. C., who furnishes the sketch for the engraving, says: "While we were in camp near Berthoud's Pass, a member of the party was fortunate enough to discover one of these nests, and to secure it and its builders. I was with him, and made the accompanying sketch. The nest is now in the Smithsonian Museum. It was placed on a rocky shelf mossed and grassed over, just about four or five feet above the stream; it was built of layers of moss, so laid one over the other, as to give it the shape of the crown to an ordinary 'Derby' hat. The moss was kept fresh and growing, from a habit which the bird had of shaking the water over it from its plumage before going in on to the eggs. The eggs were four in number, and of a pale white."



THE AMERICAN DIPPER, OR WATER OUZEL.—(*Hydrobata Mexicana.*)

LARGE ONIONS.—A writer upon onion culture in England says the best way to get large onions, is to tramp and roll beds firmly; the seed is then to be sown on the compact surface and covered with a rich compost the usual depth.

Walks and Talks on the Farm—No. 77.

"How Crops Feed," is certainly a very remarkable book, and the young farmers of America owe Prof. Johnson the profoundest gratitude for his arduous labors in presenting to them in a convenient form all the known facts connected with this intricate subject. We have a concise account of all the important experiments recently made by the German and French investigators, and when we have carefully studied this book we may feel sure that we know all that is known at the present time in regard to the nutrition of agricultural plants.

Prof. Johnson promises us another work on "Cultivation; or the Improvement of the Soil and the Crop by Tillage and Manure." His two works, "How Crops Grow," and "How Crops Feed," contain the *principles* which he will elucidate and apply to practical farming in his next volume. We shall look forward to it with the greatest interest. We know of no man better qualified for the task. Himself a farmer's son, with great practical common sense, and a thorough acquaintance with agricultural literature, he understands precisely what we wish to know, and his accurate scientific learning, united with great caution, and a profound love of truth, will enable him to throw light on many of the questions which none of us at present are able to answer—such, for instance, as: Why gypsum is usually much more beneficial as a manure for clover and Indian corn, than for wheat and timothy? Why clover and the root-crops can get more nitrogen from the soil and the atmosphere, than wheat, barley, and oats? Why thorough tillage increases the productiveness of some land and not of others? Why manure does very little good on land that needs draining? and why such land, *after draining*, is more productive than land that never needed draining? In the present book we get a glimpse of his ideas on these subjects. He gives us the scientific facts, but we want them applied to practical farming so that we can more fully understand their meaning.

On my farm—and it is so on hundreds of thousands of other farms in the United States—the three leading objects are (1) to get the land drained, (2) to make it clean and mellow, and (3) to get available nitrogen for the cereal crops. After the first two objects are accomplished, the measure of productiveness will be determined by the amount of available nitrogen in the soil. How to get available nitrogen, therefore, is my chief and ultimate object in all the operations on the farm. And it is here that science can help me. I know how to get nitrogen, but I want to get it in the cheapest way, and then to be sure that I do not waste it. It would seem from the facts presented by Prof. Johnson, that there is much more danger of the loss of nitrogen than I had supposed.

There is one fact fully established by experiment and experience—that 100 lbs. of available nitrogen per acre, applied in manure, will generally give us a greatly increased yield of grain. I should expect on my farm that on land which without manure, would give me 15 bushels of wheat per acre, such a dressing of manure would give me 35 or 40 bushels. So much for the importance of 100 lbs. of available nitrogen per acre.

Now, I have 100 acres of low, mucky land, bordering on the creek that probably contains, in the depth of one foot, fifteen or twenty thousand lbs. of nitrogen per acre. As long as the land is surcharged with water this nitrogen lies dormant. But drain it and let in the air, and the oxygen decomposes the organic matter, and ammonia and nitric acid are produced. In other words we get *available* nitrogen, and the land becomes capable of producing large crops of corn and grass. And the crops obtained from this low, rich land, will make manure for the poorer upland portions of the farm. This is not new, though it cannot be too often repeated. What is new to me is this:

A soil was analyzed and found to contain to the depth of one foot, at the end of April, 4,652 lbs. of nitrogen per acre. Of this amount, 63 lbs. were in an available condition. A plot of this land, plowed and then allowed to lie vacant, contained of available nitrogen, June 12, 50 lbs. per acre; June 30, 108 lbs.; July 22, 35 lbs.; August 13, 56 lbs., and Sept. 9, only 19 lbs. per acre. It would seem from this and other facts that when land lies fallow there is a large amount of available nitrogen washed out from the soil. And if we place confidence in these results we must conclude that there is a great loss in fallowing land. This is contrary to what I have hitherto believed. But these facts are at any rate worthy of consideration. For my own part I have not much confidence in the ability of a chemist to determine the amount of such small quantities of nitrogen in a soil. In fact, Prof. Johnson himself states that in determining the total amount of nitrogen in an acre of soil, we may attribute a variation of 200 or 300 lbs. to the unavoidable inexactness of the analysis.

There seems to be no reason to doubt that nitric acid is formed from the organic matter in the soil, in considerable quantity. This process of nitrification takes place most rapidly in hot weather, and when the soil is moist. Stirring the soil, by making it loose and porous, and letting in the air, also favors nitrification. Gypsum may also assist in this important process by furnishing oxygen to the decomposing organic matter in the soil. Leaving the question of summer-fallowing in abeyance, one thing is certain: we cannot go wrong in cultivating the soil thoroughly *while the crops are growing*. Our crops certainly need available nitrogen. And it seems equally certain that in soils containing organic matter thorough cultivation will favor the formation of ammonia and nitric acid.

The Deacon and I have a standing quarrel as to the best way of cultivating corn. He prefers to take an old sod, break it up deep with a jointer plow and three horses, harrow at first lengthwise of the furrows, and then diagonally across the furrows. The latter, he thinks an exceedingly important point. The harrows do not pull up the furrows, as they would if drawn directly across them, and yet they break down the soil nearly as well, and leave two or three inches of nice, mellow soil to plant the corn in. If needed, he rolls the land, but this diagonal harrowing is always the last thing before planting. He then marks out the land, 3½ feet apart each way, and drops from four to five kernels in the hill, and is careful to get mellow soil to cover them with, and gives it an affectionate pat with the hoe. When the corn is three or four inches high, he treats each hill to a handful of a mixture of ashes, plaster, and droppings of the hen-house. He then runs the cultivator through the rows both ways, and goes twice in each row, keeping the outside tooth of the cultivator as near to the hill of corn as possible. The Deacon himself likes to take things easy, but his son finishes in this way about 2 acres of corn a day, which is equal to cultivating eight acres once in a row one way. The corn is then hoed, and I do not believe that I enjoy digging an underdrain, or watching the Cotswold lambs playing in the sun, any more than the Deacon does hoeing corn. His face, always a cheerful one, now fairly beams with delight as he runs his sharp, bright hoe round the hill, straightening the plants with his hand, and pulling up with the hoe a little fresh, mellow soil, to smother the weeds. Finally an inch or so of soil is pulled up around the hill and pressed smooth with the back of the hoe.

In two or three weeks the corn is again cultivated once or twice in the row, both ways, and is then hoed again, a little soil being pulled to the plants to smother the small weeds that cannot be reached with the hoe. The pumpkin plants are also treated to a little fresh soil. This finishes the work.

Now, I have no objection to this method of managing the corn crop, provided the cultivator was used earlier and more frequently.

What the Deacon specially objects to in my plan of raising corn is *drilling in the seed*. He thinks that when the seed is carefully planted by hand it is equal to a hoeing. There is probably some truth in this idea. But our seasons are so short and the weather at planting time so precarious, that it seems to me better to plant the corn as soon as the land is plowed, harrowed, etc., without waiting, as must be done when planted in hills, until the whole field is finished. The better plan is to top-dress a clover sod with well-rotted manure in the fall, and let the clover grow until the weather is warm enough to plant. By this time the clover will be six inches high, and it may either be fed off by sheep or turned under. Plow carefully and then harrow thoroughly. A Shares' harrow is much the best. Roll, if need be, and make the soil as mellow as possible. Then drill in the seed in rows 3½ feet apart and let the kernels be 6 or 8 inches apart in the rows; or let the drill drop three kernels in a hill, 18 or 20 inches apart. This latter is the plan I adopt. I cannot say which is best. We mark out the rows before drilling, and try to make the rows as straight as possible. This is very important. Then go over the field with a broadcast plaster sower, and sow two or three bushels of plaster per acre. Just as soon as the rows can be distinguished, start the cultivator, going once in a row at first, and twice in a row the next time, running the cultivator teeth as near to the plants as can be done without smothering them. Then go over the field with the hoe immediately after the cultivator, stopping to do nothing but cut out the weeds, and to straighten up any of the plants that may have fallen over. Keep a cultivator going between the rows as often as once a week for the first six weeks and occasionally afterwards, whenever the surface of the soil gets baked, or would bake if not cultivated. Perhaps it will be necessary to go over the field again with the hoes. I find nothing so good for *the land* as to cultivate and hoe the corn during hot weather in August. It kills every weed. And I do not think it injures the corn, though the Deacon and many other sensible and experienced farmers think it does. If the land was perfectly clear I would not do it.

A farmer in Pennsylvania writes me: "I have a flock of Merino sheep, but I propose to dispose of all of them during the year. My intention then is to select common long-wooled ewes and cross with a thorough-bred Cotswold ram—not with one crossed with a Merino, in which the wool is bettered at the expense of the

carcass, but with a *pure blooded* Cotswold. Wool buyers ask for combing wool, and dressers for a large carcass." I am sorry to see good flocks of Merino sheep sacrificed. I believe those who weed out all the poor ones and keep none but the best—and keep them well—will, in the end, have no cause to regret it. Cotswold wool, whether from grades or thorough-breds, brings a higher price than Merino. I do not think it will be any lower as long as the present tariff continues, but I think Merino wool will be higher. And it would seem that we might retain our flocks of Merinos for future use, and in the meantime raise one or two crops of combing wool by using Cotswold, Lincoln, or Leicester rams with Merino ewes. The long-wooled rams must be *thorough-bred*. It is folly to hope for success with any other. And the *less* thorough-bred the Merino ewes are the more will the lambs take after the ram. I would select large-framed, common, quarter or half-blood Merino ewes, feed them well all summer and autumn, and if it is intended to raise early lambs for the butcher, turn in a long-wooled or Southdown ram the last of September, or first of October. If you have good quarters there is no trouble about raising lambs during the coldest weather in winter. Such lambs ought to bring 18c. to 25c. a pound, live weight, in April or May. A Merino ewe, like an Alderney cow, will give very rich milk, and a good deal of it, for such a small animal, if *well fed* for three or four months before lambing, and three or four months afterwards. When two weeks old the lambs will begin to eat a little bran or fine middlings, and if furnished abundance of nutritive food, will grow with astonishing rapidity.

If it is not intended to sell the lambs early, they need not come before April. The ewes should be well fed during the winter. The grade lambs will be larger and require more food than if they were Merinos. This must be provided for by furnishing abundance of nutritious food for the ewes. I think there is nothing better than, say, one pound of bran and half a pound of beans, oats, or oil-cake per day; and this feed should be continued after the ewes are turned out to grass. We weighed one of our thorough-bred Cotswold lambs the day it was born and it weighed 12½ lbs. That day two weeks, it weighed 25 pounds. Now, it should be understood that when we use a thorough-bred Cotswold ram on common Merino ewes, we get lambs that have nearly all the qualities and characteristics of the Cotswold. And one of these is to grow rapidly. But no animal can grow unless it has food to grow with. Those who talk about improved breeds of animals requiring very little food, talk nonsense. It is true only in this sense: They have little offal, and are gentle and quiet, and *when they have attained their growth* they require less food than a restless animal. But when they are young and growing they require abundance of food. I have some Merino ewes that I put to a thorough-bred Cotswold. I expect lambs that at six months old, will weigh 90 lbs. Now, if I had used a Merino I should have had lambs that, with ordinary treatment, would require *three years* to attain this weight. The grade Cotswolds would grow at the rate of one-half a pound per day; the Merinos, assuming that we had 10 lbs. of wool from the two extra fleeces, would grow only at the rate of one and a half ounces per day. The Merinos eat but little more than enough food to sustain the vital functions, say, 2 lbs. of hay per day or its equivalent; the Cotswold grades eat, say, double the amount of food, or 4 lbs. per day, and being of a quiet disposition they probably require no more food to sustain the vital functions than the Merinos, and consequently the extra food is converted into growth. If 80 per cent of the food which a Merino eats is used to keep up the animal heat and support the vital functions, we have 20 lbs. of food out of the 100 lbs. that is available for the growth of the sheep. The Cotswold grades eat double the amount, say 200 lbs. instead of 100 lbs. Of this 200 lbs., 80 lbs. are required, as before, to sustain the vital functions. The result should be as follows:

	Merinos.	Cotswolds.
Total food consumed	100 lbs.	200 lbs.
Food required to sustain the vital functions	80 lbs.	80 lbs.
Food available for growth of animal.	20 lbs.	120 lbs.

So that, with double the food, the Cotswold grades would be capable of growing *six times* as rapidly as the Merinos.

But give the Cotswold grades no more food than the Merinos and I do not see how they can grow any faster, unless we are to assume that from being of a more quiet disposition they require much less food to sustain the vital functions. If they required 10 per cent less food for this purpose than the Merinos, they would on the same food, grow half as fast again. Thus:

	Merinos.	Cotswolds.
Total food consumed	100 lbs.	100 lbs.
Food required to sustain the vital functions	80 lbs.	70 lbs.
Food available for growth	20 lbs.	30 lbs.

But whether this is the case or not, the advantage of a liberal allowance of food is apparent. In raising Cotswold lambs from Merino ewes, therefore, the chief object should be to induce the ewes to give rich milk, and also to furnish the lambs all the nutritious food they will eat while suckling.

In the experiments at the Michigan Agricultural College, eight lambs from grade Merino ewes, and a thorough-bred Cotswold ram, weighed, when from 5½ to 6½ months old, 78½, 82½, 83½, 83½, 86, 87, 89½, and 97 lbs. each.

Six of these sheep sheared, June 6th, when about 13 months old, 12, 14¼, 13¼, 12¾, 12¾, and 10½ lbs. of wool each. The sheep were thoroughly tagged, but the fleeces were unwashed. Dr. Miles says: "The wool was of good quality, free from gum or dirt, and from the length of fibre, well adapted to the manufacture of delaines, or for combing purposes."

This wool, together with the wool from the Merino and grade Merino sheep, was sent to Boston, and the grade Cotswold wool brought 44 cents per lb., and the Merino 33 cents per lb., both unwashed.

There is, therefore, no reason to doubt our ability to raise combing wool for a year or two, and at the same time retain our present fine wool sheep. We shall get fine wool from the ewes and combing wool and good mutton from the lambs.

A young man who thought of studying law asked Daniel Webster if the profession was not overcrowded. "Yes," he replied, "but there is plenty of room up higher." And it is just so in regard to farming. In the production of poor butter the business is overcrowded, "but there is plenty of room up higher." Poor, common cows are plenty, but where can you buy a really good one? And so of sheep, and cattle. The markets are overrun with inferior animals that sell for less than half price, and are dear at that. And we see the same thing in the grain markets. Those who say there is "no money in farming," are more than half right. A poor farmer and a petty fogging lawyer find the business overcrowded, "but there is plenty of room up higher."

Sweet Potato Culture.

BY MR. B. WILLIAMS, WILLIAMS' FORD, N. J.

[Mr. Williams, who grows sweet potatoes largely, favors us with a very full account of his method of cultivation, from starting the sets to harvesting and storing the crop. It is now too late for his directions for starting the plants to be of any use. We give some timely extracts from the article, reserving his method of harvesting and keeping the crops until later.—EDS.]

With regard to plants, Mr. W. says: "I find sprouts 2 inches long, the best, i. e., 2 inches of white [below the soil of the bed], and 3 inches of green, making 5 inches in all. I plant 4 inches deep, and if cut off even with the ground by frost or cut-worms, they will still come.

"I grow sweet potatoes upon my lightest soil, which is moderately rich naturally, or made so with manure; on such soil I have two plans of field culture, both of which I will give: On soil that is a rich, sandy loam: In the month of April, I sprinkle broadcast over the ground sal-ammoniac and lime, two of the latter to one of the former, in powder, as you would plaster, but in less quantity. Then plow down, taking care not to sprinkle too far ahead of the plow. [In giving Mr. W's method, we must dissent from his sal-ammoniac and lime together, as an expense which cannot be warranted by the results. The lime decomposes the sal-ammoniac, and the ammonia is nearly or quite wasted.—EDS.] After having turned it under, I cover the whole ground with a light coat of plaster, and let it remain until the time I want to plant, which is about the 10th or 15th of May, when I prepare the ground by passing a cultivator over it; then take a plow and mark the ground three feet both ways, straight and true, which makes the hills three feet square—thus giving 4,840 hills to the acre. I have had them to yield a bushel from 20 hills, or 242 bushels of potatoes to the acre; which is not an uncommon yield, when they do well.

"I prepare a compost of horse, sheep, and short barn-yard manure, as soon in the spring as I can, for sweet potatoes require a rotted manure. This mixture after being thoroughly incorporated, is mixed with one-fourth of its bulk of green-sand marl. About a half shovelful of this compost is put where the rows cross each other, and a hill is made with the hoe a foot high, and run to a point. Put one plant in a hill. When the weeds begin to grow, which is about the middle of June, I run the cultivator through both ways. It cleans between the rows and the bottom of the hill thoroughly; I then follow with an iron tooth rake, having teeth about three inches long, to loosen the top of the hill around the plant; then with the hoes, scrape off the weeds on the remainder of the hill. In about three days I run the plow through both ways, follow after with the hoes, and hoe the hill up smooth. The plants by this time have started six or eight inches; in about two weeks, or the first week of July, the vines begin to cover the hill; I then go along with the hoe and lifting the vines with the hand, clean off all the weeds that may show themselves, and leave the hill and vines clean and smooth. In about two weeks, or August 1st, I carefully turn the vines, and plow and hoe, then replace the vines. About the middle of August, I go through again and pull the vines loose, to prevent their taking root. If this is well done, and all the weeds that show themselves are pulled out, they will want nothing more until digging time.

"Another plan of management is as follows:

On my lightest sandy soil I plow the ground shallow about the first week in May; then put on a good coat of equal parts of marl and leached ashes (the ashes I get at the soap factories), which is moderately fine, and spread evenly. Just before I want to plant, I prepare the ground by passing a harrow over it; then take a plow and strike parallel furrows three feet and a half apart. A well-rotted compost of horse, sheep, and barn-yard manure is put in the row and spread along evenly; after which two furrows are thrown upon it, and the plants set fifteen or twenty inches apart in the row. I am careful to prepare only as much ground as will be needed for the first setting, as the plants after being taken from the beds, delight in fresh soil. The earth must be fresh, or the plants will wither and die. After the plants have become well rooted, I run through with a cultivator and level the ground, after which they will begin to thrive finely; while the hot-beds are again ready to be thinned out. Then the plow and hoe are brought into requisition, and the field or patch kept thoroughly cleaned, carefully turning vines during plowing, and afterwards replacing them. I have cultivated sweet potatoes largely after this plan, and with good success; it is not so satisfactorily performed on soil which is a rich sandy loam, where weeds grow and are hard to keep down; I therefore practice both plans."

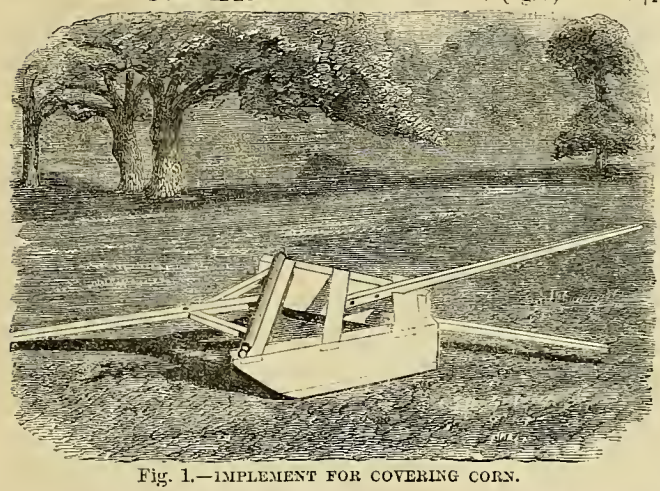


Fig. 1.—IMPLEMENT FOR COVERING CORN.

Planting Indian Corn.

It is very desirable to have corn so planted that it can be worked both ways, and every good farmer prides himself in having his rows straight and true. The distance the hills should be apart is determined by the size of the corn, and the strength of the soil; very small corn ought not to be in hills, but in continuous rows. Hills of ordinary field corn should stand from $3\frac{1}{2}$ to $4\frac{1}{2}$ feet apart each way, and it looks best to have the rows of hills cross exactly at right angles. So important is this, that we think it well to measure the angle at starting when large fields are marked out for corn, and where the fences or other boundaries are not exactly at right angles. This is done thus: establish one true base line, as *A-B*, fig. 2, for the first row upon one side; then measure 30 feet upon it, with a 50-foot tape-line, between two points, *c* and *d*; next take 40 feet upon the tape from the point *c*, and draw part of a circle where you suppose a line, meeting the line *A, B*, at *c*, at right angles, would pass; then move the end of the tape-line to the point *d* and take 50 feet upon it—the point *e*, on the 40-foot circle where the 50-foot circle will cross, establishes a line *c-e*, exactly at right angles to the base line. This is easy and takes less time to do than to tell.

The field is properly marked in two directions by a variety of implements. Three cultivator teeth, set in a joist to which shafts and handles are attached, makes a good marker. Two wheels on a 4-foot axle-tree, with a pole having a chain dragging upon the ground to mark where the wheel must run the next time, is also a convenient implement. If the furrows are made fully and uniformly two inches deep, the corn may be dropped and then covered on smooth land, with a harrow on its back, or with one without teeth, and loaded. We describe a good corn-marker, which makes deep marks, in another article. There are some pretty good corn droppers, but none exactly adapted to planting in rows both ways. The dropping is a rather tedious hand process. It may be somewhat lightened by having a small tin measure, which will hold five or six kernels. A little skill is required to throw the kernels scattering, but it is done rapidly. James Corlis, of Long Branch, N. J., uses a home-made implement for covering corn, of which he sends us a drawing. The runners or scrapers (fig. 1) are of $1\frac{1}{2}$-inch oak plank 10 inches high, and 33 inches long. These are set 34 inches apart in front, and 9 inches at the rear. They are champfered on the outside three-quarters of an inch, and protected by a strip of iron on the inside. There are three cross-pieces of inch stuff. A smoother, 4 feet long, is attached to one runner behind to remove surplus soil, stones, and bits of sod. This smoother is attached by carriage bolts, so as to be set higher or lower. A 6-foot stick for a handle is bolted to the implement as shown. Two horses are used, and it may be loaded or run simply by its own weight, according to the character of the soil. We think it might also be used for covering potatoes.

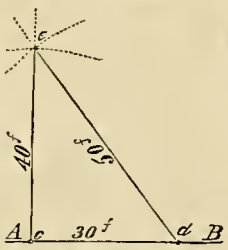

Fig. 2.—RIGHT ANGLE.

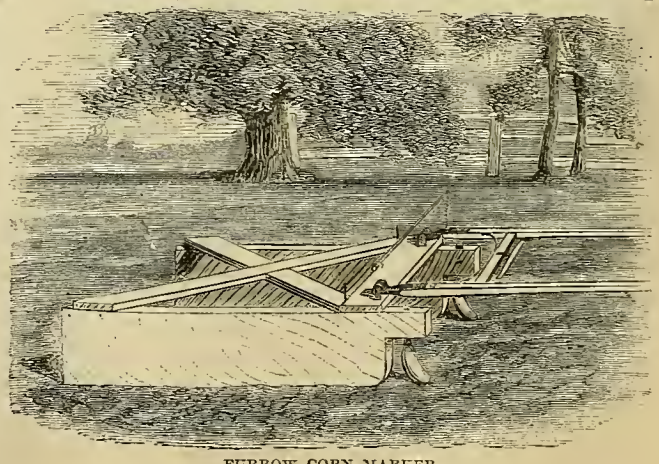
Crows in the Corn Field.

Crows are not the only birds that trouble corn after it is planted, and before it is strong enough to defy them, but they are so active, knowing, and almost insatiable, that we regard it as a mistaken policy to spare the few which may be killed, in order to secure complete protection to our corn fields from their ravages. Mr. C. H. Rue traps crows in a way which we tried last year with complete success. He says he goes upon the principle that a crow will go almost anywhere for an egg. If he cannot find a secluded spot which will answer his purpose, he makes a sort of little bower of brush stuck into the ground, leaving a narrow entrance. In this he makes a rough nest and puts in some hens eggs. The sticks must stand close and meet at the top so a crow cannot get in, except by the entrance; here a steel trap is set, fastened by a cord, covered with tissue paper, and this sprinkled over with earth. We practiced placing an egg for bait just where the crow, when he eats it, will see the others. The first crow that flies over will almost surely be the victim, and as soon as caught, will make the welkin ring with his cries. This will draw a crowd of sympathizers. The bird may be taken out of the trap and fastened to a stake with his wings tied together and left so half a day. He will keep up his cries and not another crow will visit that field that year, if it be not more than 10 or 12 acres in extent. The crow, in case no bones are broken, may then be liberated, if the farmer is tender-hearted, or used upon another field.

CROW TRAP.

A Furrowing Corn Marker.

Most of the corn markers in general use, make too shallow marks, necessitating some other mode of deepening. A sled marker having two or three runners, 8 inches high and 2 inches wide, with their forward ends sawed out so that a cultivator tooth may be set in each, accomplishes all that is desired. The teeth may be set to run two or two and a half inches deep, and the runners following



FURROW CORN MARKER.

pack the earth a little, and prevent the furrows filling up. Such a corn marker may be made in half an hour, and if fastened with strong

nails, is firm enough for use on smooth land. The accompanying engraving shows such a

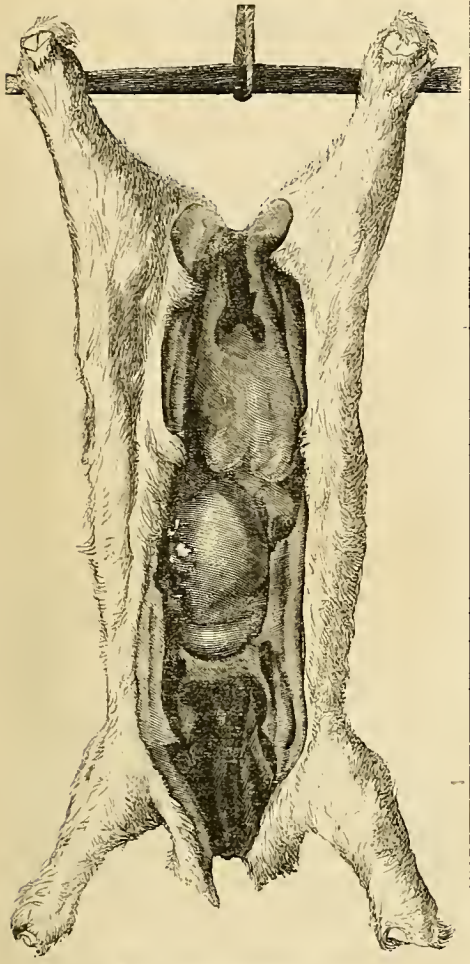


Fig. 1.—HOG-DRESSED VEAL.

marker. The rod and chain attached to the cross-piece is hinged on, and may be turned upon either side. The chain in dragging marks where the next furrow is to be made, or the track of the horse, whichever is preferred.

Veal—The Fatted Calf.

The sale of a well-fatted calf in the vicinity of good markets, usually brings in as much money as it costs to keep a cow through the winter. A good calf sells for the price of one or two tons of hay. The cow should pay for her keeping by her milk the rest of the year. A good many calves come to market on their feet. This is a poor way, for the veal is injured by the confined, heated, hungry and nervous condition the animals are often in. It is far better, and the producer realizes more, besides, for the veal to come to market "hog-dressed," as it is called. A veal so dressed is shown in fig. 1. The calf is killed by cutting its throat, and strung up by one hind leg to bleed. Then the head is skinned and removed; the feet, skinned to the hocks and knees, and removed. The lights and guts are taken out, leaving the heart, liver, kidneys, sweetbreads, etc., in place. After wiping out and hanging up until cool, it is ready for shipment. The skin of the head may be tied over the neck, that of the legs over the ends, and a single cord around the ribs closes the carcass together, and secures cleanliness. Sometimes the head and feet are taken off without skinning, as shown in our engraving, and frequently only a small opening is made in the belly, and all the viscera, except the kidneys, taken out. In this case a stick is inserted to hold the cut open and air the cavity. When veal is required for home consumption or for the neighborhood, the calf is skinned and dressed. After hanging until cold it is cut in two, as shown in figures 2 and 3. When cut up for use the principal divisions are those indicated in fig. 2. The cut dividing the quarters passes just back of the ribs. The hind-quarter is divided into the "Loin," *a*, and the "Leg," *b*, and each of these may be further cut up, or used entire as choice roasting pieces. From the fore-quarter the "Shoulder," *c*, is first removed, cutting beneath the shoulder-blade, and close to the ribs. Then the "Neck," *d*, *d*, and the "Breast," *e*, *e*, are separated, cutting through all the ribs. The shoulder forms an excellent roasting piece when the blade is taken out, and the end is nicely folded down and stuffed. Both the breast and neck are excellent for stews, cutlets, fricassee, etc. Veal cutlets are generally cut from the lower half of the leg, like steaks. This leaves the upper half to roast. The hock and tendinous portion near it, should always be removed in preparing the joint for roasting. The French and Germans take the cutlets from the fore-quarter.

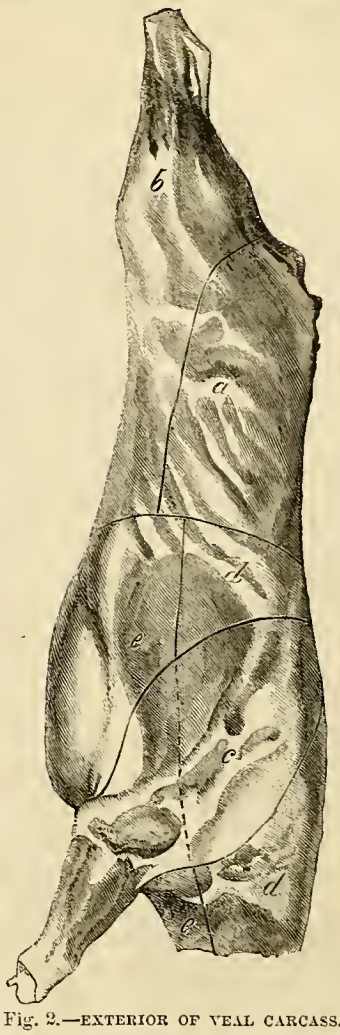

Fig. 2.—EXTERIOR OF VEAL CARCASS.

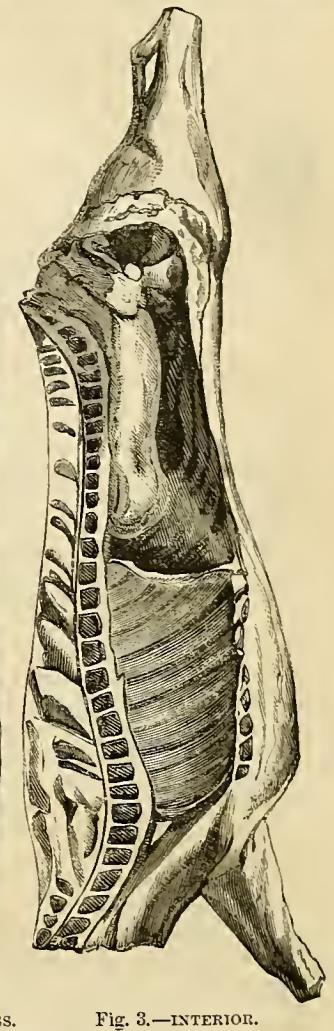

Fig. 3.—INTERIOR.

The Horse Bot and Bot-Fly.

There are not less than three insects, which, in their larva or grub state, are parasitic in the stomach of the horse. The grubs are known as Bots, and the flies, which are the mature propagating insects, are called Bot-flies or Gadflies. They vary in size and general appearance a good deal, in both the mature and grub states. The common one lays its eggs on the hairs of the legs and body, another about the throat, and a third upon the lips. The common Bot-fly is familiar to every one bred or living in the country. It is represented in fig. 1. This is called *Gasterophilus equi*, and is easily distinguished from its congeners by its spotted wings. The insect is tawny, its abdomen covered with woolly, shining hairs; the thorax is black and covered with yellow hairs, and the eyes very dark brown. The wings have several pale, smoky spots in the middle, and towards the tips, as represented. This is the female fly, and the one best known; when ready to deposit an egg she poises herself near the spot selected, as shown in figure 2, protrudes her ovipositer, and then with almost incredible swiftness she darts down and attaches an egg to a hair, as shown in fig. 3. The eggs are slender, and are, so to speak, cut off at the large end on a slant. They adhere very tightly to the hairs, and cannot be removed by ordinary grooming. Some, probably dead ones, remain until the coat is shed in the spring. The writer has practiced washing the parts of the animal on which the eggs are abundant, with strong carbolic soap, and greater numbers than he has ever before observed remain unhatched through the winter. Should this prove, as he suspects, a remedy for the Bots, it will be very gratifying, for so far as our own horses are concerned we are very ready to forego any benefit, real or imaginary, which Mr. Bracey Clark thought might result from their presence in the stomach.

Fig. 1.—BOT-FLY.

Fig. 2.—BOT-FLY.

Fig. 3.—BOT-FLY'S EGG.

Exactly how the eggs hatch, appears to be unknown, but it is certain that very lively little worms come out of them. We think it probable that they hatch and cause a tickling or itching of the skin, which makes the horse lick or gnaw the spot, when they adhere to the tongue or lips and are swallowed. It has also been stated that the licking caused the eggs to hatch, and at the same time removed the worms. Once in the stomach they soon make an attachment and suspend themselves by two hooks, seen in the engraving, fig. 4. This represents the grub or larva, in which condition the insect makes its growth. The little worm soon becomes robust and swollen, and remains much like the form shown, until it reaches the size indicated, never, so far as known, relaxing its hold upon the

Fig. 4.

walls of the stomach, which are somewhat pitted. It is of a tawny color, the body being composed of prominent rings, besides indistinct ones at the head and tail. The large rings are edged with a frill of short, weak spines. It reaches maturity in the spring, and as warm weather comes on it loses its hold, and is voided with the dung. Into this it burrows, penetrating the ground, and immediately assumes the *pupa* condition (fig. 5), contracts in size, and the outer surface becomes a hard shell, within which the final transformations take place. The pupa hatches out into the fly first described.

Fig. 5.

We have seen the stomachs of many horses said to have died from the bots, and have never seen evidence of inflammation or other diseased condition caused by them. A correspondent claims that, in a case which he communicates, bots were so numerous that they stopped up the "neck of the stomach." We can hardly credit it. It is often asserted that the walls of the stomach are *perforated*. That they are pitted, is true—we have never seen anything like perforation. Dr. Liautard, of the N. Y. College of Veterinary Surgeons, informs us that in all his practice he has never met with but one case of death attributable to bots. In this the horse's stomach was perforated, and the animal died of *peritonitis* (inflammation of the bowels). He attributes a case of sudden death reported by one of our correspondents, and by him supposed to be bots, to heart disease. There has never been any cure found for bots. There is no means of making them disengage their hold which will not loosen the horse's hold on life. Milk and molasses with a little ginger in it, is a favorite and excellent prescription. It does the bots no harm, but is good tonic food for the horse.

The Grass Pond Cranberry Bog.

Judging from the letters we receive, our readers are a good deal interested in the cultivation of cranberries. Fortunately, there is no immediate danger of an over-production of this crop. There is comparatively little land adapted to its growth, and the territory, where all the conditions of successful culture are present, is exceedingly limited. The people who have peat, sand, and water, in close proximity and capital enough to develop these resources, have a valuable property. In a trip to the cranberry plantation of Messrs. A. Sampson & I. Hodges, of Providence, R. I., last August, we noticed several points in which the treatment differed from that of the Cape Cod cultivators, which it will be well to add to the observations of Mr. Bunker. The Grass Pond plantation is located in Coventry, R. I., near Green Station, on the railroad. The whole purchase consists of about 700 acres, 400 of which is the basin of a shallow lake now drained. It is only six years ago that the first improvements were made, and these in a small way. Six hundred dollars were laid out in draining and sanding about ten acres. The wild cranberries are found mostly about the edges of the swamp, and the largest crop before the improvements was only 15 barrels. Three years after, 600 barrels were gathered, which sold for $7,200 at the depot. This decided the matter of investing capital in the business, and the improvements have gone on steadily ever since. The stream which runs through the swamp is large enough to carry a saw-mill, and is nearly a mile long. This has been straightened and widened into a canal, which can be used for boating the berries from the plantation to the curing house, thus saving the expense of teams. This canal is the main artery of drainage, and narrow ditches discharge their waters into it at intervals of about 200 feet. Since the drainage, and sanding, the plants have grown wonderfully and are extending themselves rapidly towards the canal, even where there has been no planting. The owners have not strictly followed the books, but have felt their way cautiously to the best methods for their peculiar location.

SANDING VINES UPON THE GRASS is not sound doctrine on Cape Cod, yet it works capitally here. The reason probably is, that the peat here is of quite recent formation, and the surface of the drained pond is too poor to favor the growth of weeds and bushes. At any rate, little else than a poor grass grows. The sand is spread upon the ice in the winter about 3 inches thick, and during the thaws of spring it is sifted down among the roots of the vines, without covering the tops. When the water is drawn off in the summer, the vines start with the greatest luxuriance, and berries generally set the first year upon vines that have heretofore been barren, or nearly so. By far the larger part of the 80 acres now in vines has been improved in this simple way. It costs about $50 to sand an acre 3 inches deep. Labor is about $2 a day, without board. The sand or gravel is found immediately upon the banks of the swamp. The edges of the bog are covered with brush and trees, and this land is treated in the Cape Cod way, that is, skinned, sanded, and planted with vines in the hills. There can be no doubt that sanding upon grass is the best here, upon those parts of the bog where it has been followed, and, under similar conditions, it would probably succeed quite as well elsewhere. The vines start so vigorously after the application of the sand, that they soon choke out the grass and take complete possession of the soil. We saw acres, treated in this way, covered with the most luxuriant growth of vines, and heavily loaded with fruit, say from two to three bushels to the square rod. Two rods were measured last year to ascertain just what the yield was. One gave a barrel, and the other lacked about 4 quarts of a barrel. The standard cranberry barrel of the Cape Cod Association, we believe, is 104 quarts. Capt. Small will probably shake his head at the luxuriance of the vines, and say that this is a bad feature, and skinning and sanding are needed to prevent it. But if the vines are all covered with fruit, the larger they are the better. Of course it remains to be seen how long 3 inches of sand will last. If more is needed, a second coating is easily applied, and it may prove more economical to apply light coatings at intervals, than to give 6 inches at once. The cultivation of cranberries is not so much a science that we can afford to be dogmatic.

A Trap for Musk-rats.

Almost every farmer, with reclaimed land, or with cranberry bogs, suffers from the depredations of musk-rats. Steel traps are good, but the most we can do with them, is to take one rat for each trap in a night, if he does not gnaw his leg off. A better trap is an old barrel. Sink it near the bank of the ditch, where there are evidences of the presence of the animals, to the level of the ground, and half fill it with water. Put in a couple of shingles, or light strips of board, to float on the water. Place sweet apples or carrots cut in small bits in the runs of the musk-rats, and toll them to the barrel. Put several pieces upon the floats, inside. The rats will jump in after their food, and will not be able to get out. Where they are plenty, several musk-rats may be taken in a night by this simple trap. it costs nothing but labor, can be visited at one's convenience, and there is plenty of room in it for a dozen or more of the vermin at once.

THE BARBERRY AS A HEDGE PLANT.—A few years ago we gave the experience of those who had employed the Barberry as a hedge plant and advised its trial; but finding there was such difficulty in obtaining seeds, we have not of late said much about it. This year we notice that the leading seedsmen offer Barberry seed in their catalogues, and those who wish to make a trial of it can readily do so. It is best to first thoroughly soak the seeds and plant as early as practicable, in order that the plants may obtain considerable size before hot weather comes.

Seeds and Seed Sowing.

Moisture, air and a proper degree of temperature are essential to the germination of seeds. The first act of the seed, after being placed in the ground, is to absorb water; the changes which accompany germination cannot take place without it. There must be a certain amount of moisture, but not too much, as this would exclude an equally important agent—air, without the pressure of which, germination cannot take place. The temperature varies with the kind of seed. Many garden seeds will germinate at 10 degrees above the freezing point, while others require still 10 degrees higher, before they will start at all. We do not, however, with tender plants, run the risk of the decay of the seeds by sowing them until the temperature of the ground becomes considerably higher than the lowest point at which they will germinate. Peas may be sown as soon as the frost is out of the ground, but Squashes and Melons require that the soil be above 60 degrees. These are what may be considered the conditions necessary to the germination of the seed—the chemical conditions. The act of germination—the bursting of the seed-coat and the liberation of the embryo plant—is accomplished by these, but this embryo plant has then to encounter mechanical obstacles before it can become fairly established and begin to sustain itself. It should be recollected that the whole growth of the plant, from the time it bursts the seed-coat until its first leaves appear above the surface, is from the nourishment contained within the seed itself. The young plant has to push in two directions, its root end is struggling to get downward while the opposite end is seeking the light. It is evident that not only the depth at which the seed is placed, but the character of the soil above it will have great influence upon the young plant. One great cause of failure with seeds, is too deep planting. Small seeds placed deep may germinate, but the young plant will be unable to reach the surface, the amount of nutriment in so small a seed not supplying sufficient material to allow the plant to grow large enough to reach so great a distance. The young plant perishes and the seedsman is blamed for furnishing poor seeds. The other extreme, sowing too shallow may occur, but we think seldom. The chief trouble here is, that the young plant being so near the surface is liable to become too dry, before the roots are ready to take up moisture. The character of the soil above the seeds is an important point. It will readily be understood that a germinating plant can make much easier progress through a light soil,

than through a heavy one, and it happens with some soils that the surface becomes so baked after a rain, that it is quite impossible for the seeds to overcome the mechanical difficulty. Our market gardeners, in order to be sure of a stand with seeds, the young plants of which are feeble, sow many times more than is necessary in order that the united efforts, so to speak, of a multitute of young plants may be able to throw off the covering. With delicate seeds sown in a seed-bed, the covering should be of a light nature. The soil should be largely of leaf mould. This being light, may allow the seeds to remain too dry, and to prevent this, it is to be packed down by pressure with a board, or patting with a spade after sowing. This packing may seem to be contrary to the statement that the covering should be light, but a soil consisting largely of decayed leaves, or decayed spent hops, is of an elastic character and will not, like a heavy soil, pack so closely as to present an obstacle to the young plants. Flower seeds are often very fine and need more care in regard to the character of the soil and its depth than coarser seeds. Very fine seeds need but a mere sifting of earth over them or no covering at all. With Lobelias and such minute seeds, we have had the best success by strewing them over the level surface of the earth in a pot and then covering the pot with a pane of glass. The object of the glass is to keep the surface from becoming dry. In gardens where the soil dries quickly, it is well to shade the spot where fine seeds are sown. According to our experience, the seed sold by our dealers, is generally good, and we believe that a large majority of the complaints of poor seed arises from burying the seeds too deeply and covering them with too heavy a soil.

Sweet Corn—Varieties and Culture.

Every now and then an article appears in an English journal giving an account of experiments with maize—which is with difficulty grown at all in England, though some cultivators have managed to raise ears for the table. They seem not to be aware that our sweet varieties are quite different from field corn, and a friend of ours sent last spring to Shirley Hibbard, a collection of our best varieties of sweet corn, thinking that so enthusiastic and competent a horticulturist, being put upon the right track, would astonish his friends with a novelty. Mr. H., in a recent letter to the Horticulturist, states his failure, but speaks of the corn as *pop corn!* We can understand the failure to grow the corn, but to call our delicious, sugary varieties "pop corn!" The American Minister should demand his passports at once. We wonder what proportion of our readers enjoy the luxury of sweet corn. Of course everybody has roasting ears, when the field corn will yield them, but as far as our observation goes, the use of sweet corn, cultivated solely for the table, is by no means general. The varieties of sweet corn differ from the common kinds in the greater abundance of sugar; the grain, when ripe, is much shriveled and wrinkled, and of a peculiar horny texture. We have the impression that Roger Williams, in a work published about 1644, mentions that sweet corn was in use among the Indians, but have not the work at hand to confirm it. Many can recollect when there was but one kind of sweet corn, while now the catalogues enumerate some twenty, differing in stature, size of cob, sweetness, color, and earliness. As with common corn, it is easy, by the exercise of a little care, to fix any desirable peculiarity, and at the same time the best sorts will deteriorate if due attention be not given to selecting the seed. Sweet corn is found to be a profitable crop by those farmers who are near enough to large cities to enable them to take the corn to market. It is useful in a rotation, as the necessary cultivation cleans the land and puts it in excellent order for rye or wheat, while a large amount of fodder, more valuable than that from common corn, forms an important part of the returns. The earliest varieties are generally very small, both in the plant and in the ear. The Early Dwarf Sugar and the Early Narragansett, are both excellent for family use. A local New Jersey variety called Tom Thumb, is brought in large quantities to the New York market, and is the largest early variety that we have seen. Crosby's Extra Early Sugar is the variety grown for the Boston market, and, among a half dozen sorts that we grew last season, gave the best satisfaction of any.

Adams' Early, Bates' Extra Early, Early Burlington, and Forty Days, are all said to be good and early, but we have had no experience with them. Of intermediate sorts there are several: Early Eight-Rowed Sugar and Twelve-Rowed Sugar, are commended. Asylum, a variety sent out by the Dexter Asylum, at Providence, R. I., is one of the best. Olcott's Farmer's Club did not please us last year, but it is commended by so many good judges, that we think there must have been some mistake in the seed and shall try again. Red Cob Sweet has a red cob, and large sweet kernels. Mexican Sweet is black and does not look so well upon the table as the white kinds, but one upon tasting it, forgets all prejudices against color, and takes another ear. Mr. Gregory says of it: "The sweetest and tenderest for table uses of all the varieties I am acquainted with." and we quite agree with Mr. Gregory. For latest we have Trimble's Improved and Stowells' Evergreen, both excellent, the last named keeping in eating condition for a long time. All the varieties are not enumerated, but here are enough to enable one to make a selection. Were we restricted to one variety we should, with our present experience, take Crosby's Extra Early. Sweet corn should not be planted until the soil is well warmed, and then be sowed in drills 2½ feet apart for the small sorts, and 4 feet for the larger kinds, thinning to about a foot in the drill. The early dwarf kinds mature sooner if sown on light soil. For the later sorts the ground should be well manured. Compost from the hen-house will be found excellent to give a start. It should be well mixed in the drill before putting in the seed.

How Much Manure to a Cow?

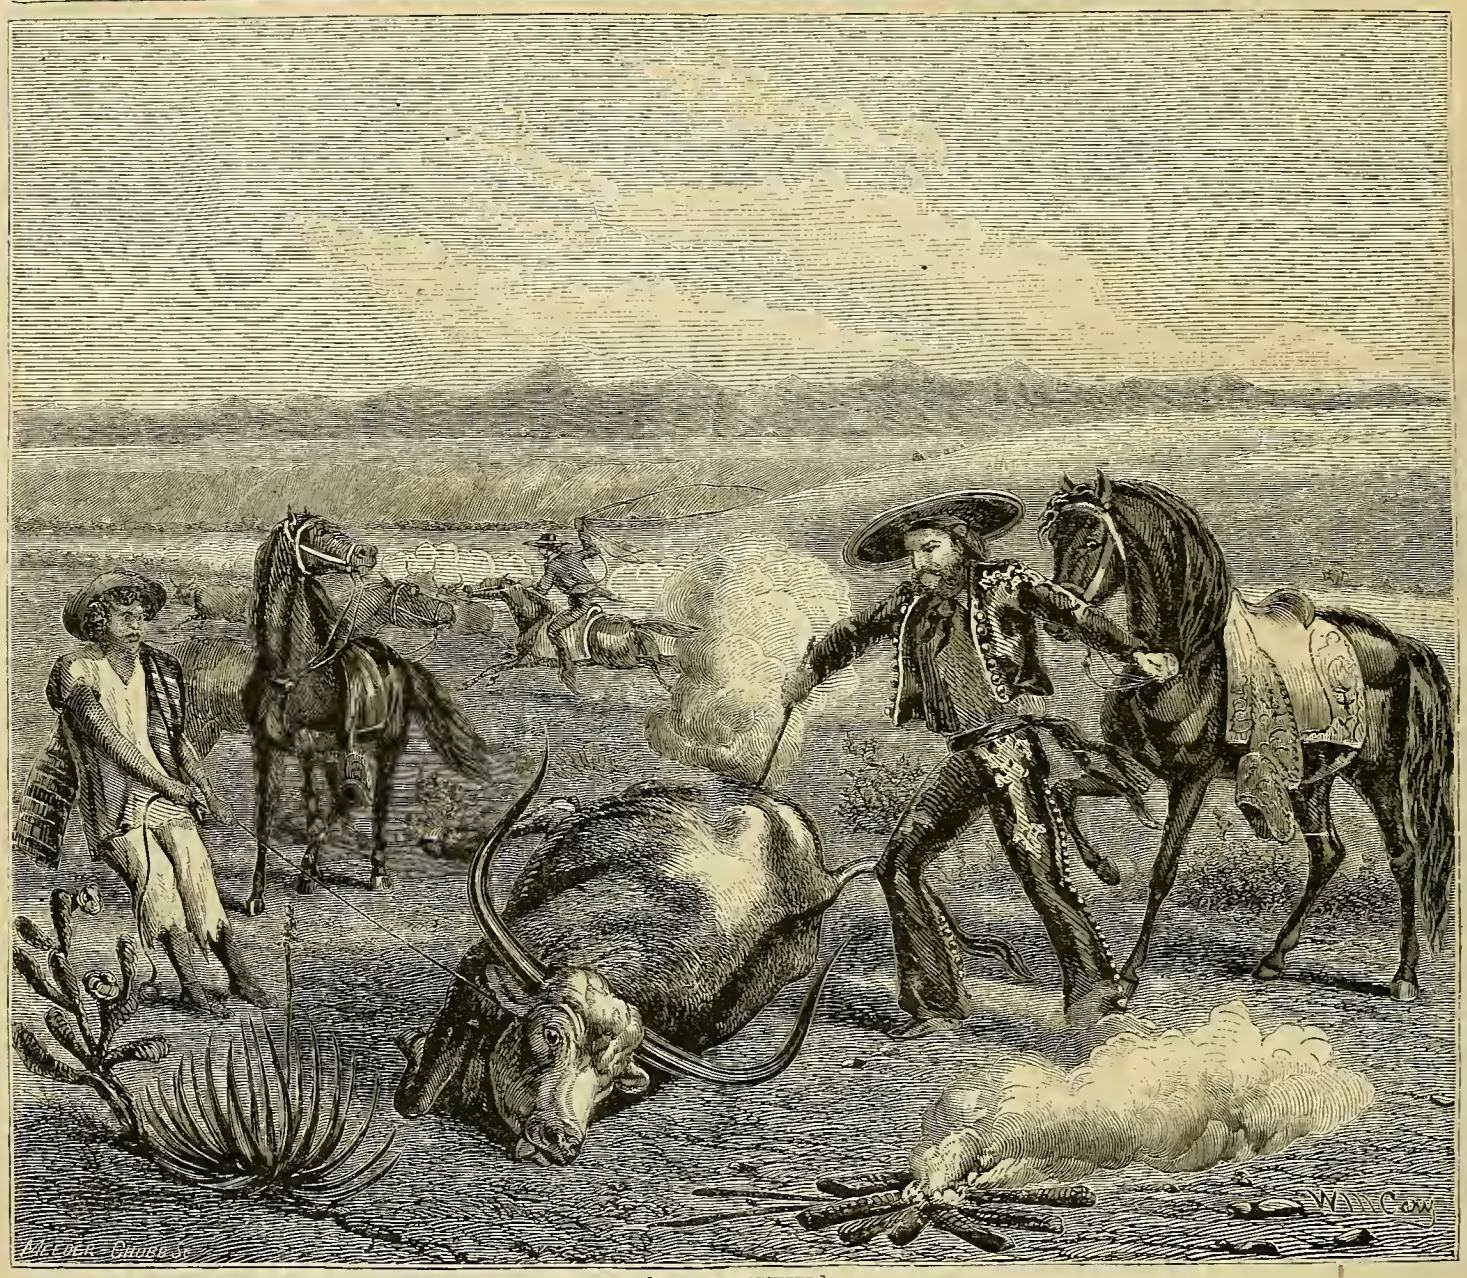
Carefully conducted experiments show that a cow of the average size will void about 60 lbs. of manure in a day, measuring about 1⅛ cubic feet, which is more than three cords, weighing over ten tons, for a year. It is the opinion of many good cultivators that three loads of peat or muck mixed with one load of cow-dung, make a compost quite as effective for top-dressing meadows as the cow-dung itself. If this were done, we should have twelve cords of good compost from the solid excrements of one cow. It is further estimated that the liquid manure is quite as valuable as the solid. If this were carefully saved by peat absorbents, kept under the stable, or in it, it would double the pile, or be equal to twenty-four cords of good compost. If this were spread upon two acres of run-down meadow, producing a ton of hay or less per acre, it would increase the crop probably to three tons to the acre the first year, and the effects of it would be seen in increased crops for five years longer. In those two acres it would make all the difference between profitable and unprofitable farming for five years. This compost, if sold in many good farming districts, would bring $4 per cord or $96. Used on the meadow it would produce much more in successive crops of hay. This estimate shows what may be done under favorable circumstances to increase the home supply of fertilizers. We have found that nothing pays better than labor applied to the compost heap.

The Field Culture of Sage.

BY JAMES J. H. GREGORY, MARBLEHEAD, MASS.

The variety of sage sought after by those who grow it on a large scale, is that known as the "Broad-leaf." An old grower will rarely purchase seed if the purity and freshness of it cannot be guaranteed from a personal knowledge of the raiser. Last season, when home-grown seed was quite scarce, an enterprising farmer in the town of Danvers, Mass., sold his entire crop of 100 lbs. to his neighbors at $10 per lb.; they could readily have bought imported seed at less than half that price. Imported seed usually has more light seed, which is an objection, in addition to those which spring from a probable lack of purity and freshness.

In raising sage, it should be borne in mind that the most valuable portion of the crop is the leaves; the poorer the land and the less the manure, the greater the proportion of leaves to stems. That the interests of both buyer and seller may be equally consulted, rather light soil is selected, which is in good condition, and three or four cords of some compost equal in strength to stable manure, and mechanically fine, is applied to the acre. A heavier dressing would produce a larger crop, but then a larger proportion of this would be stems, for the ranker the crop the coarser the stems. The seed may be planted as late as June, but the quality of the crop is also affected by the length of time it grows; that planted early, and therefore growing the entire season makes more and heavier wood, while that planted later makes proportionally more leaves, and therefore a better article. The ground must be very thoroughly worked, two plowings and harrowings are none too many, and then raked level and fine, as for a root crop; the seed is planted in rows, from 14 to 18 inches apart, and from three-quarters to an inch deep. About five pounds of seed are used for an acre. The seed come slowly: if the season is favorable, the plants will begin to show themselves in two weeks; but if the surface bakes, the best seed may fail to push through, for the seed itself comes up with the leaves, and when the ground bakes hard, it is apt to be broken off, and that is the end of the plant. Keep the crop clear of weeds, which will require considerable care in the earlier stages of growth, but later in the season it will so nearly cover the ground as to shade it, and thus keep it comparatively clean. In the early fall, cut the crop with a large knife or a smooth-edged sickle. Cure it by spreading in the shade in some airy building, on racks or laths, 8 or 10 inches apart, the laths being a couple of inches apart in the racks. These racks, which are excellent for drying all kinds of herbs, are made by using 1¼-inch boards as uprights which are from four to six inches wide; in these, cut notches 1½ inches wide and two or three deep, with a downward slant, securing them firmly to



[COPYRIGHT SECURED.]

BRANDING CATTLE.—FROM A SKETCH BY E. JUMP.—*Drawn and Engraved for the American Agriculturist.*

the floor below and the beams above, having them in rows a little scant, 4 feet apart, and 5 or 6 feet apart in the row. Into the notches, slide slips of an inch or inch-and-quarter stuff, and lay on these laths at distances above given. When the season is closed, all can be readily removed and stored for future use. By using artificial heat, the sage may be dried in two or three days, but this does not make so good an article as that which dries in the course of two or three weeks; the cooler the weather the handsomer the appearance of the crop when dried. A mass of green sage which makes a cord by measure when trod in green, will weigh about 250 lbs. when dry. Two tons, when dry, are considered a good crop per acre. To market the crop, have strong tow bags measuring 7×3 feet, put a hoop in the mouth to keep it open, and secure firmly to a trap-door; fill in the sage and then tread it down as compactly as possible. A bag of these dimensions will hold 150 lbs. of dried sage. The price varies with different seasons, depending of course on the quantity grown, from 8 to 35 cents per lb.; averaging for the past twelve years in the Boston market, 12½ cents. Sage is a very reliable crop when once up, it being not so much affected by drouth as root crops. After a rain it recovers from its check, and starts a fresh growth immediately.

Branding Cattle.

In Mexico, as well as in parts of California and Texas—States that were formerly Spanish-American, cattle raising is an important branch of industry. The cattle are nearly wild, live in immense herds, and have an extensive range. The writer has traveled a whole day to cross the boundaries of a single *hacienda* in Northern Mexico. The proprietorship of cattle as well as horses is established by the presence of the brand of the owner upon the animals. Many are familiar with this method of marking horses and mules, as it is practised upon those belonging to the army. The brand may be the initials of the owner, but it is quite as often some arbitrary sign which, when adopted, is duly recorded in the books of the Alcalde—the town records. The presence of one's mark upon an animal is proof of ownership, and if he can show a brand duly recorded, corresponding with that on the animal, he can take possession of it in spite of any bills of sale that the present holder may show as evidence that he came legally by it. When an animal is sold, the seller puts on the *venta* brand, which is usually the same one reversed, and the purchaser then marks the animal with his own brand. Horses which have changed hands frequently, are singularly scarred, the results of many brandings. Cattle on the large estates are driven up once a year for branding, and the occasion is one of great festivity, as the neighbors come to enjoy the excitement and to lend their aid. It affords the young men a fine opportunity to show their skill in the use of the lasso. The animals are corralled, or driven into an inclosure and let out, a few at a time. The wild beasts set off at full speed and are pursued by the horsemen who capture them with the lasso. The chase is often a long and exciting one, and it often happens that the animal must be caught by both the horns and a hind foot before it is brought to terms. At the time of branding, those having marks which show that they belong to other parties, are separated from the others, and all that are without marks are branded by the use of the hot iron. On large estates the festival lasts for several days, and there is feasting, with music and dancing at night.

The Lungwort.—(*Pulmonaria officinalis.*)

The prevailing taste for plants with unnaturally variegated foliage, has had the good effect of bringing into notice several old-fashioned plants, the natural condition of which is to be speckled or striped. Among these is the Lungwort, so old as to be quite as rare as a new thing. We recently saw it in a florist's collection as *Pulmonaria cærulea variegata*, which, though very good as a name, could not make the plant anything but Lungwort. It is a very pretty, hardy perennial, which flourishes best in sandy soils, and in early spring gives clusters of lively purplish-blue flowers. Its leaves are spotted, as shown in the engraving, with a very pale green. It is a native of Europe, and has its representative in this country in the Virginia Lungwort, which we figured in July, 1867. The name *Pulmonaria*, as well as that of Lungwort, has reference to its former use in diseases of the lungs. It was a notion in olden times, that plants indicated by the shape of their parts or by markings, their uses as remedies. The leaves of this plant, from their spots, bearing some fancied resemblance to the lungs, were considered on this account to be a proper remedy to be used in diseases of those organs.

THE LUNGWORT—(*Pulmonaria officinalis.*)

Young Evergreens from the Woods.

Every spring great numbers of evergreens are offered by those who collect them from the woods, and they are sold, especially the small ones, at very low rates. Those who wish a large number of Arbor Vitæs and Hemlocks for hedges, are tempted by the low prices to buy these young trees; they are set for a hedge, and if a large portion die, as is apt to be the case, the seller is blamed. These seedling trees, which have grown in the shade of the forest, are pulled up, and have lost a share of their roots. If set in a single row for a hedge, they are exposed to the sun and wind in this very unnatural condition, and a large portion of them are likely to die. Trees of this kind should be planted and grown a year before they are permanently placed in the hedge. The Arbor Vitæs, if planted close together, will afford one another mutual shade and protection, and the Hemlocks should be placed closely, and a shelter of some kind be built over them. A platform, covered with evergreen boughs or with brush, should be supported above them; this, while it will give the needed shade, will allow a free circulation of air beneath it. With the best care some of the young trees will die, but those which survive after a season's protection may be planted in the hedge-row another year without fear of loss. A good share of the native evergreens offered by nurserymen is raised from young seedlings from the woods, which have grown a few years in the nursery.

Opium Culture.

In a previous article we gave the substance of a letter from a correspondent in Wisconsin. We have since had other details of Opium culture from him, and also a letter from Dr. E. Lewis, of Topeka, Kansas, who, in 1822, assisted his father who resided in York Co., Pa., in cultivating the poppy, and in gathering opium. This gentleman agrees with "B.," of Wisconsin, in thinking that opium can be profitably produced in this country. We do not wish to get up an Opium excitement, but as there has been much inquiry in regard to the subject, we present such experience as we are able to procure. As our correspondent "B.," is fuller in his details than Dr. L., we follow his article, noting where the two differ in their practice. The seeds of the poppy are very small, and with care in sowing, three or four ounces are sufficient for an acre, but much more is generally used, to be sure of a good stand. "B." says: "The seed will not bear burial. Take great pains in sowing, and cover very lightly, not more than $^1/_8$ to $^1/_4$ of an inch. If covered too deep, you will lose your labor. I sowed plenty of seed and thinned out, leaving the best plants, eating the others as greens, and feeding the pig. Do not be alarmed—they are very nice *when young*, full as good as beets or spinach. The time of sowing will vary in different localities, the point being, to have the capsules mature in the driest time—say from the last of July to the first of September. In Jefferson County, N. Y., I sowed from May 5th to May 20th. The cultivation should be as thorough as that of an onion or ruta-baga field." The Opium Poppy, *Papaver somniferum*, is the one from which the very double garden varieties have sprung. There are two marked varieties, the white, and black-seeded; the white being the most valuable for opium, while the black-seeded is preferred where the plant is cultivated for the purpose of expressing the oil from the seeds. We give an engraving of the Opium Poppy, showing the flower and capsule. The narcotic juice is developed only about flowering time, and our correspondent's remark that the young plant makes a good substitute for spinach, we can readily accept. We have a parallel case in the universally esteemed lettuce, which, when it runs up to flower, produces a milky juice, which, in its medicinal properties, has some resemblance to Opium. Dr. Lewis commenced scarifying the capsules as soon as the petals had fallen. He says: "After a sufficient number of poppy heads have parted with their petals, to justify the profitable commencement, the operator, armed with a sharp pocket knife, should take the head in his hand and give the stalk a twist of once and a fourth around, then apply the knife to the head at its largest circumference, and allow it to gradually untwist itself, thus making a circular

THE OPIUM POPPY—(*Papaver somniferum.*)

incision around the head or pericarp. This may be done once, or if a very large one, twice, to the same head. The milky juice will at once exude, and by the next morning will be ready to be scraped off with a somewhat duller knife and lodged in a common tin cup, belted around the operator by having a handkerchief through the handle." "B.," on the other hand, uses a knife for the purpose, which makes three incisions at once, and also a peculiar knife for collecting the product. He has promised us a set of these implements, and we hope to be able in due time to give engravings of them.

Trellises for Tomato Plants.

Those who grow tomatoes in the garden find that a support of some kind is essential not only

Fig. 1.—TOMATO TRELLIS.

to preserve a neat appearance but to produce the finest fruit. We have already published several trellises and now add another by Mr. E. N. Maxwell, of Louisville, Ky. If the trellis is made against a fence, pieces are got out of $1\frac{1}{4} \times 1\frac{1}{2}$-inch stuff, 6 inches longer than the hight of the fence. A small iron hook is attached to one end of each piece. Holes a trifle smaller than common telegraph wire are bored in the pieces, 6 inches apart, beginning at 4 inches from the hook end, and having the last hole about a foot from the opposite end. Cut telegraph wire into lengths of $3\frac{1}{2}$ inches, and bend them at $1\frac{1}{4}$ inch from one end at an angle a little more acute than a right-angle, and drive the pieces into the holes. The piece, when finished, is shown at *A*, fig. 2. For every two tomato plants there will be required one of these upright pieces, and one additional piece at the end of the row. The slats, which run horizontally, are ripped from an inch board eight feet long, one-quarter or three-eighths of an inch thick; exactly similar to a common lath but twice its length. Cut both ends of the slats slanting, as represented in fig. 1, which gives only one section of the trellis.

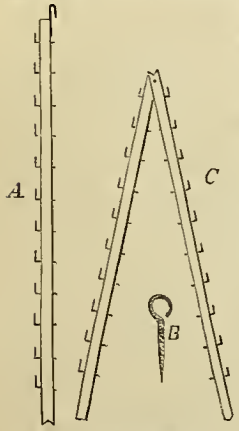


Fig. 2.—SUPPORTS.

Screw into the fence, near its top, on a horizontal line, iron eyes, *B*, fig. 2, measuring the distance between them accurately. Now fasten the hooks on the upper ends of the upright pieces, into these iron eyes, and let the lower ends slightly enter the ground fifteen inches out from the bottom of the fence. Place the slats in position, as seen in figure 1, and with a small hammer drive the iron wire supports tightly upon them, and your trellis is finished.

The tomato vines should be planted directly under the bottom slat, and four feet apart; this will give two vines between two uprights, and one upright between two vines.

As the vines grow up the trellis, weave their tops in and out between the slats, behind one slat, in front of the next, and so on alternately; this will support the vine without any tying. A few of the upper slats might be farther than 6 inches apart, for economy's sake, but it will not answer to have the lower ones any wider.

In the fall, after frost destroys the quality of the fruit, drive the iron fastenings loose by striking them behind the trellis, draw out the slats horizontally, letting the vines fall to the ground, unhook the upright pieces and your entire trellis may be placed under cover for the winter, ready to be put together again the following summer with but a very few minutes' work.

A trellis may be made without the support of a fence. Two upright pieces, *C*, fig. 2, seven feet long, are prepared with wires as before described, and fastened together at the top ends by a small iron bolt. The lower ends are spread three or four feet apart; these uprights are secured in position by being tied to cedar stakes, driven firmly into the ground; I prefer wire to twine for tying. These supports are placed at the same distance apart as those against a fence, and similar slats are used. Plant vines along both sides of the trellis four feet apart, as before.

My vines were planted in rich soil last summer, and grew eight feet high, trained in this way, covering the entire trellis, and were loaded with delicious fruit nearly to their tops.

The slats running east and west warped badly, but those on the trellis running north and south remained perfectly free from this defect.

Entrance Gates.

There is perhaps no one contrivance so generally in use that is so unsatisfactory as a gate, be it large or small. We find this the most frequently out of order, of any of the surround-

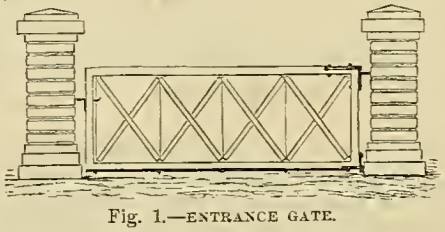

Fig. 1.—ENTRANCE GATE.

ings of a house, whether it be the gate leading to a modest cottage, or the one that closes the approach to an expensive mansion. The trouble about gates must be largely felt by our readers, if we can judge from the number of requests we have for plans of gates. We mentioned the matter to Mr. Geo. E. Woodward, the well-

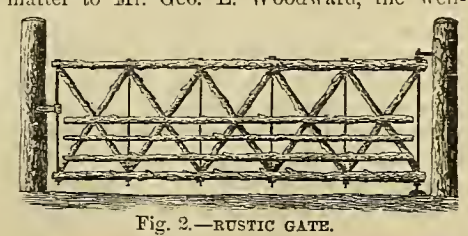

Fig. 2.—RUSTIC GATE.

known architect, and he referred us to a gate in his work upon Country Homes, as the one he had found in his experience to be the most easily built, and the most durable. With Mr. W.'s permission we copy some of his engravings to illustrate the principle, which is that upon which railroad bridges and span-roofs are built. Figure 1 shows the simplest form of a gate of

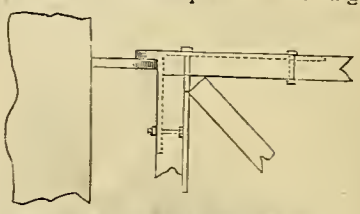

Fig. 3.—UPPER HINGE-CORNER.

this kind. Within a simple frame there are eight braces crossing each other, and five iron rods, the heads of which are let into the upper rail of the gate, and the lower ends are furnished with a screw and nut by means of which they may be fastened. The braces are halved together where they cross each other; they are not tenoned into the frames of the gate, but are

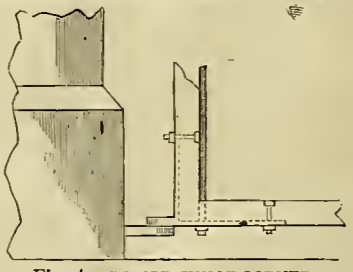

Fig. 4.—LOWER HINGE-CORNER.

held in position by tightening the nuts. The ends of the braces that bear against the rods have a groove in each to admit the end. The principle of construction here shown being adhered to, a gate of this kind may be ornamented in various ways, as illustrated in the work referred to. One of these is in the rustic gate, figure 2, where the whole is made of cedar sticks and iron rods. Three other rails, besides the upper and lower ones, are fastened to the braces by means of carriage bolts. In this gate the iron rod at one end is made to answer as a very simple and permanent hinge. It is prolonged at each end beyond the portion upon which the nut is screwed; the upper end moves in a strong iron eye screwed into the gate post, while the lower end is stepped into a stone placed to receive it. The hinges to the gate, in figure 1, are strong and very simple, and are shown more plainly in figures 3, 4, and 5. Figure 5 gives a perspective view of the hinge; figure 3 shows the upper hinge corner in section; the rod which holds this end of the gate passes through the upper plates of the hinge, which is further secured to the gate by means of carriage bolts. In figure 4 we have a section of the lower corner, where the iron rod passes through the lower plate of the hinge, and is there fastened by the nut. The hinge may, if desired, be countersunk, to present less iron work to view.

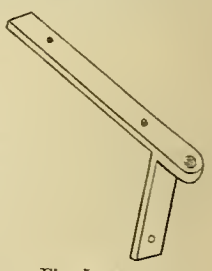

Fig. 5—HINGE.

Lettuce Growing in New York City.

BY PETER HENDERSON.

The passenger in the horse-cars going from 60th Street to Harlem, on New York Island, any day from June to October, may see little patches of vegetation of different shades of green, ranged in uniform and regular lines.

These are the "salad patches" cultivated mainly by German market gardeners; they range from two acres down to a quarter of an acre in area. It seems a wonder that the cultivation of such a small plot of earth should give the cultivator a living; but a living it does give, in nearly all cases, and some have quite a respectable surplus for a "rainy day." The manner of growing the lettuce for the first or early crop, is the same as that practised by the market gardeners of New Jersey or Long Island, namely, using plants from seed sown in fall, that have been wintered over under sashes, and planted out as early as the ground is fit to work, which in these warm nooks (in most cases at the base of rocky elevations), is often as early as the first week in March. In some particularly favored spots the lettuce is planted out in the first week of October, and if it remains unscathed during winter, comes in, in such fine condition for market in May, as to well repay the risk. The variety used for this purpose is the "Brown Dutch." In any section of the country where the thermometer never falls further than 10° above zero, lettuce sown the first week in September and planted out the first week of October in sheltered spots in dry soils, will be almost certain to "winter over," and give a crop in spring earlier than if treated by any other method. The wonder is that it is not more extensively done at such points as Charleston and Savannah, where, as far as I can judge, there is nothing to hinder it from being had in a marketable condition at any time, by ranging the sowings and plantings, from the middle of February to the middle of April. To return to the New York City growers; the varieties grown under glass and first planted out in spring, are usually the "Butter" and "Curled Silesia." As soon as the crop is planted out, sowings are made for a succession; this time, of "Curled India" and "Butter," the Silesia being unfitted for the warm weather at which this sowing would mature. The crop planted out in March matures by the end of May or first of June, and as soon as it is cut off, the ground is plowed or dug over, and the plants sown in March are planted. Another sowing is made for plants to succeed these again, and so on during the entire season, the rule being to sow seed at each time of planting. Four crops of lettuce are usually taken from June to October, or nearly a crop each month. The plants are set about a foot apart each way, and will average one cent per head, so that the four crops give a return of nearly $2,000 per acre. This seems like an immense return for an acre, but though the net profits are respectable, there are some serious disadvantages attending the cultivation. Few or none of these men are owners of the land, nor in hardly any instance have they a lease. They are tenants at will, and pay a yearly rental of, in some instances, $250 per acre. Many of your country readers may think that an extra cipher has been added to the amount, but they must recollect that the value of some of these "salad patches," as they are called, is $8,000 per city lot, or over $100,000 per acre, so that the paltry rental of $250 per acre hardly pays the *interest* of the amount of taxes. The following figures were given me by one of the best and largest growers, whose patch was two acres:

Rent	$ 400.
Manure	250.
Labor of 3 men for 6 months	750.
Horse keep and incidentals	450.
	$1,850.
Four crops lettuce, estimated at	$4,000.
Expenditures	1,850.
Annual profits for 2 acres	$2,150.

A pretty good profit, but deservedly earned, for to attain this result, the grower works early and late. It must not be supposed that 5 acres could be cultivated by one man with the above profit. The loss from inadequate hired labor, and the difficulties of selling large quantities of a quickly perishable crop, would be likely to make the attempt to increase largely the area cultivated a failure. Besides, lettuce is only used to a limited extent in the summer and fall months, and if grown in the quantities that it is in spring, could not be sold, yet in all large cities it is used more or less, at all seasons, and commands for limited quantities, usually a higher price than in spring, the season of its greatest consumption. No doubt the system of our New York City lettuce growers might be successfully and profitably followed in the neighborhood of many other cities and large towns.

Starting a Yellow Locust Plantation.

The first thing in starting a plantation of Locust trees is the selection of the site. Experience suggests a rather dry gravelly or sandy loam. The trees would grow more rapidly on bottom lands or black, rich soils, but they would also be much more liable to the attacks of their enemy, the borer. Some years ago, the Illinois Central Railroad Company made extensive plantations on the waste land bordering their track. The locusts grew finely for the first two or three years, and then the borers attacked them with great fierceness, and now hardly a vestige of the great plantations remains. On the light lands of Long and Shelter Islands, the tree thrives wonderfully well. Its favorite localities are steep hill-sides and well-drained soils. It would be likely to do well on many old fields and worn out pastures, which are now unprofitable for grass. An additional inducement to plant such fields is the fact, that the tree is a renovator of the soil and friendly to the growth of the grasses. We recently saw a plantation upon a light sandy soil, once nearly worthless, where there was grass enough to have made two tons to the acre.

The Treatment of the Seed and Seed-bed is a matter of great importance. The soil should be well prepared and made sufficiently rich with compost to grow good corn. Mark off the rows 3 feet apart and sow the seed, and cover them about the same depth as onion seed. The seed should be prepared by soaking in hot water. Pour 4 quarts of boiling water to a pound of seed, and let them stand in a warm room for twenty-four hours. If any of the seeds are not swollen, separate from the rest, and pour hot water upon them, and repeat the process of scalding and assorting until all the seeds are swelled. Keep the ground clean with cultivator and hoe the first year and subsequently; the seed will not all sprout the first year, but will keep coming for many years. Sprouts will start both from seed and from the roots for a dozen years or more. If the seed-bed or nursery is properly cared for, it will furnish any desired number of plants. A tree so easily propagated, and so valuable both for timber and as a renovator of the soil, ought to have the immediate attention of the owners of exhausted lands. There are thousands of acres in all the older States where this tree would flourish. If it did not pay dividends to the present owners, it would at least be a safe investment for their heirs. Timber is all the while growing scarcer, and the next generation must have posts for their fences, and treenails for their ships at whatever cost.

CONNECTICUT.

The Terraced Propagating Pot.

BY PETER HENDERSON.

A few weeks ago I received from Benjamin W. Putnam, of Jamaica Plains, Mass., five different styles of flower pots, which he calls "self-watering." Among the patterns sent there is only one of special value, the Terraced Propagating Pot. As represented in figure 1, it has a base about 12 inches in diameter, with three terraces of 2 or 3 inches wide, the top one being about 4 inches in diameter. In the center is a reservoir for holding the water, this widens at the base, as shown in the section, fig. 2. The water in the reservoir filters through the sides of the pot, keeping the sand on the terraces always saturated. Cuttings of the young shoots of the great majority of plants placed in the sand, will root, to a certainty, in from two to four weeks.

Fig. 1.—TERRACE POT.

To such as have tried the "saucer system" of propagation (described in February, 1864), the principle here will easily be understood, as it is only an ingenious modification of that, which has the advantage of doing away with the necessity of pouring water directly on the cuttings, as all that is needed to be done in this case is to keep the reservoir filled with water, and the sand will be kept in a uniform condition of moisture by filtration.

I know some practical gardeners may say that there is nothing new in this, as we have used the same principle, in a rough way, in propagating, for many years, by placing a smaller flower pot inside of a larger one, and keeping the inside one filled with water, and planting the cuttings in sand in the space between the pots. That was an awkward and clumsy contrivance compared with Mr. Putnam's design.

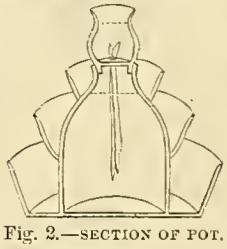

Fig. 2.—SECTION OF POT.

In the one received by us about the middle of February, we placed cuttings of Roses, Geraniums, Pelargoniums, Heliotropes, Fuchsias, Carnations, and Verbenas, filled the reservoir with water, and placed the pot exposed to the sun, in one of our green-houses where an average temperature of 70° is kept. In three weeks every cutting, without a single exception, was rooted, and the little propagating house, for so it may be called, had more attractions for our amateur visitors than any other thing in the establishment. It must not be supposed that the atmosphere of a green-house is necessary to propagate with the terrace pot, it will do just as well placed in the window of the dwelling-house, where there is plenty of light and the necessary heat; all that is needed to observe for success is that the cuttings used are the young green shoots, and that the reservoir is full of water, so that the sand is kept thoroughly moist.

Whenever the cuttings show roots, no matter how small they are, they should be taken from the propagating pot and placed in flower pots of two or three inches in diameter, and kept well watered and shaded from the sun for two or three days after potting. So convinced am I of the certainty of success from this mode of propagating that in cases of rare or valuable

cuttings I would use it in preference to our regular propagating beds, though of course it could not be applicable by florists on a large scale.

THE VARIEGATED GRASSY CALAMUS.—(*Acorus gramineus.*)

The Grassy Calamus.

Almost every one is acquainted with the Sweet Flag or Calamus of our swamps, and which is prized by many for the pungent aroma of its creeping root-stocks. The Grassy Calamus from China, is very much like a miniature reproduction of the one with which we are familiar. It has similar long and narrow, two-edged leaves. The flowers, as in the common one, are minute and densely crowded into a spike (or *spadix*) which issues from the edge of a flattened stem that is quite like the leaves in appearance. The species in its natural state has the leaves entirely green; but a striped variety has been introduced from Japan within a few years, and is now not rare. The engraving represents the plant somewhat under the real size, and shows the manner the clusters of leaves are given off. The clumps all have a tendency to assume a curved or cresent-like form. The plant is generally grown in greenhouses, and is a useful one to place in rustic baskets and vases, as it endures the dry atmosphere of the dwelling. It is, however, quite hardy, as we have had it in the open ground for several winters without any protection.

EXPERIENCE WITH A WILLOW HEDGE.—Mr. Geo. M. Chase, Freeborn, Minn., writes: "In the spring of 1868 I built a few rods of willow fence, which has succeeded so well, I think others should try it. First I dug a ditch 18 inches deep, and 1 foot wide at the bottom. Then I cut the willow into pieces 5 feet long, taking care not to wound them more than was necessary. They were placed in the ditch 4 inches apart, and nailed to a board 4 inches from the top, using clinch nails. The soil was thrown back and pressed gently against each piece. Digging a ditch to set the fence in, has two advantages: first it gives you a chance to build a straight fence out of material more or less crooked, and secondly it loosens the soil, giving the roots a better chance to start and furnish the nourishment now so much needed. It was quite dry for nearly three weeks after the fence was built, but I saved the life of nearly every piece by mulching with coarse manure. This makes a picket fence 3½ feet high, which nothing has ever attempted to pass, and it grows better every year. In this soil a man can dig the ditch, prepare his trees, and put up 5 rods per day. The necessity of resorting to some plan to secure cheap and durable fencing, is almost imperative in this sparsely timbered country. I ought to have said that the willow (White Holland is the kind I used) never sprouts from the roots, no matter how close you plow or how many roots you may cut off."

SILLS' HYBRID MELON.—Mr. Gregory, of Marblehead, Mass., exhibited this variety at Boston last fall. It is small, white, and netted. The flesh is of a deep salmon color, of fine texture, rich, sweet, and good flavored. Mr. G. thinks it too sweet to suit some tastes. The one we tested was certainly sweet enough.

LAYING OUT A VINEYARD OR ORCHARD.—Mr. W. W. Smith, of Napa Co., California, gives the following method of laying out a plot for planting with vines or trees which would seem to be easy of execution: "Set two flag stakes as if about to lay out the ground with a horse and plow. Then take a wheel-barrow and fasten a stake of the proper hight to the center of the box or bed, and just behind the wheel. Get the three stakes exactly in a line and start across the field, pushing the wheel-barrow before you and keeping your eyes steadily upon the stakes. After a little practice one can, in this way, strike out a row almost as 'straight as a line,' and the wheel makes a mark sufficiently plain. By running across in both directions, the intersections of the marks, or 'checks,' will indicate the proper stations for the vines or trees. By putting stakes in the 'cheeks' before commencing to dig the holes, a person can, with a little care, set his vineyard or orchard in perfectly straight rows."

VALLOTA PURPUREA.

An Easily Grown Bulb—The Vallota.

The Vallota is a plant so easily managed, and withal, so showy, that we wonder we so seldom see it employed as a garden ornament. There seems no reason why it should not be as common among the spring bulbs as the Gladiolus. Perhaps it is because the books put it down as a green-house plant that so few are to be found in gardens. Seeing some bulbs in the collection of B. K. Bliss & Son, we were reminded to say a word in behalf of the Vallota. It is from the Cape of Good Hope, and has been in cultivation for a century. Its leaves do not die down, as do those of many bulbs, hence, after the flowering season, it cannot be packed away like a Gladiolus, but must be kept at rest in earth, though dry. The leaves, which are nearly flat, spread in a fan-like manner, and are of a dark, rich green. The flower-stalk is a foot or 18 inches high, and bears in August a cluster of brilliant, scarlet lily-like flowers, of the shape shown in the engraving. The plant may be turned out in the open ground after frosts are over, and in autumn be taken up and potted, and kept in a green-house or dry cellar. The bulbs produce an abundance of offsets by means of which the plant may be readily multiplied. Recently, botanists have placed this in the genus Amaryllis, and it is found in some works as *Amaryllis speciosa.* It is, however, best known by the florists and dealers as *Vallota purpurea*—though *purpurea* is a misnomer, as the flowers are scarlet. At all events, Vallota will serve for the popular name.

THE HOUSEHOLD.

(☞ *For other Household Items, see "Basket" pages.*)

An Aquarium.

A properly managed aquarium is not only a pleasing household ornament, but it is capable of affording no small amount of instruction. Some years ago, when the aquarium was a new thing, we gave considerable space to the subject. The excitement soon subsided, but all interest in the matter has not died out, as we have several letters asking how to start and manage an aquarium. The aquarium is a vessel of water containing plants and animals, and is in fact a miniature lake. A globe or other vessel containing fish, the water in which is daily changed, is not an aquarium proper. In the aquarium there is plant life as well as animal life, and the main condition of success consists in keeping the plants and animals properly balanced. The plants as they grow in the water, give off oxygen, a proper amount of which is necessary to the life of the fish or other animals that may be there. Reciprocally the fish, etc., give off carbonic acid, which is needed for the growth of plants. Too many plants are only objectionable, as they diminish the room needed by the fish; but an overstocking with fish will soon prove fatal. The first thing to be considered is the vessel, or tank, as it is generally called. A very pleasing aquarium may be made by using a large glass jar, holding a gallon or more. Such jars as confectionary is kept in (fig. 1) answer well, and they are to be preferred without bands or hoops. Large glass covers, such as are used by confectioners to cover up cake, make a good tank. They have to be supported in an inverted position by means of a base, which has a hole for the reception of the knob upon the glass as in fig. 2. Vessels with curved surfaces have the objection that they distort the objects within when viewed through the sides. Regular tanks (fig. 3) are made with metallic bottom and frame with the sides formed of glass; these are sold by the manufacturers at prices varying from $6 to $20, according to size and finish. The flat, glass sides allow the interior to be distinctly seen. An aquarium may be made with a wooden frame, black walnut being the wood usually preferred. The glass is fastened in with a cement of rosin and beeswax applied hot. The bottom of the tank and all the parts of the wood-work that come in contact with the water should be covered with the same cement, spread on while hot. Four parts of rosin and one of beeswax, with a small proportion of tallow, are used for the cement. Enough tallow is used to give toughness to the cement, so that it will not break readily when cold. The quantity is best found by experiment, probably a fourth as much as there is of wax will answer. Those who do not care to procure a tank of the regular style, can find sufficient to interest and amuse them in an aquarium made in a jar. An inch or so of clean gravel from which all fine particles have been washed, is to be put into the bottom of the jar or tank, and then the vessel is nearly filled with river or rain-water. The plants are next in order, and it is a little difficult to indicate which are most desirable, as there are few that are known by common names. Almost any plant which naturally grows quite under water in ponds or slow streams, will answer. One of the best is the Tape-grass, or Eel-grass, figured in August last, and those who will take the trouble to search the ponds, will find a number of others well suited to the purpose. The plants, being washed clean, are made into convenient bunches, to the lower end of each of which a small stone is tied to sink it, and as many plants as are desirable are anchored in the tank. It is best to allow the aquarium to remain thus for several days, before any animals are added, exposed to the light, at a window that has the sun for a part of the day. For animals, very small fish, water newts, snails, mussels, and tadpoles, are the principal ones. If the vessel is quite small, care must be taken in introducing fish, as they consume oxygen much more rapidly than newts, snails and less active animals. We shall speak of the management of the aquarium in another article.

Fig. 1.—JAR.

Fig. 2.—GLASS COVER.

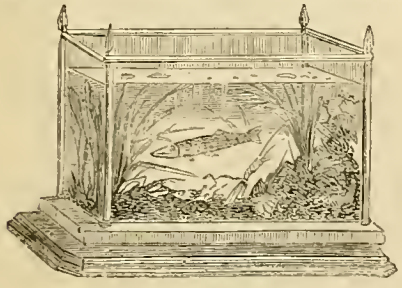

Fig. 3.—SQUARE TANK.

How I brought Water into the House.

I live in one of those farm houses built about fifty years ago, which are only remarkable for having no modern conveniences. No gas, no bells, no soft water, no sinks, no drains, no furnace. It is true, there *is* a sink; but I turn it out of doors every summer, preferring to have the refuse water wheeled away to having a cholera bog near the house, which stands on a level space, and the water cannot be easily carried away by surface drains.

Men do not always know that they suffer from sink drains and neglected ventilation, for they are abroad in the breezy fields and acquire a stock of hardy health, which does not succumb to malarial exhalations; but women, who are obliged by their duties to keep in the house, often breathe an atmosphere of sickening odor from sink and cellar, and drift into consumption, fever, or paralysis. A farmer's wife usually rises at about half-past four o'clock in the summer, and six in the winter. Therefore, at half-past two she has worked ten hours and has a *possibility* of feeling weary, and before she goes to her chamber for an hour's rest, she remembers that the water for the chambers is to be carried up. It is work that she will not, if she can avoid it, allow her daughters to do, as she knows by experience the strain on back and arms; so she toils painfully up the stairs with a bucket of water, knowing it must be brought wearily down again, wishing, perhaps, as I have done for years, that she *could* have water brought into her second story. After wishing for it many years, I decided that I could and would bring it in. Perhaps others will do better than I have, if they will plan instead of regretting. Our house formerly had no gutters at at the eaves, but a few years since it was slated and a gutter added with a conductor, which delivers the water to a hogshead at the side of our south door. Above that south door is a large window, which lights a closet or bathing-room. As the small room adjoining was deficient in ventilation (for none of our windows can be opened at the top), several years ago I broke out the upper right-hand pane of glass in the closet, knowing it would be so difficult to re-set it that I should have constant ventilation. Why not bring a water pipe from the gutter above through that open sash, as well as air from without? My plans were soon laid. I could place a barrel with faucet upon a high stand by the window, curtaining off a space that no fastidious taste be offended. I would have a water pipe introduced into the gutter about 18 inches long with one elbow, bringing the water near the window, indeed quite close to the open sash, and at the lower end of this pipe there should be a rim sufficiently large to allow me to attach a section of hose which could either deliver water into my barrel or into the hogshead below, as I might choose.

At the left-hand corner outside the window I attached 20 feet of hose to deliver the refuse water into a small reservoir on wheels, which will be daily wheeled away. The house being covered on the south side by a luxuriant Virginia Creeper, the hose passes behind the net-work of branches, and is therefore not conspicuous, and will not be seen at all in summer. I have no doubt there are many country houses which might have similar or better arrangements, if women will once think for themselves, instead of waiting for others to plan for them.

W.

An Unpatented Clothes-Horse.

Many of the contrivances to hold clothes while they are drying or airing, are patented. We give one invented by Mr. Chas. F. Diebert, Schuylkill Co., Pa., that is not patented, and which is so simple that it can be readily made. The engraving

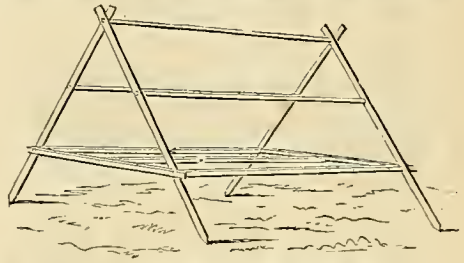

Fig. 1.—CLOTHES-HORSE EXTENDED.

shows a perspective view of the horse, which is 5 feet long and 4½ feet high. It requires in its construction neither nails nor screws, the whole being fastened together by wooden pins through the ends of the bars, which project through holes in the uprights. The bars are 1 inch square, but rounded at the ends which go through the uprights, which are ¾ inch by 2 inches. The end view is given in fig. 2; perpendicular dotted lines show the manner in which the clothes hang, and it will be seen that those upon one bar will not come in contact with those upon another. The cross-pieces at the ends are attached by one of their ends to one of the horizontal bars, and hook upon another bar by means of a notch near the opposite end. By unhooking the cross-pieces, as shown by the dotted lines, and removing the lower center bar, the horse can be folded up and occupy but a small space.

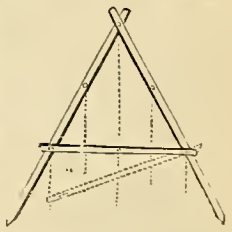

Fig. 2.—END VIEW.

Gardens, Flowers, and Children.

BY FAITH ROCHESTER.

I cannot imagine a country home without flowers. No crop on a farm "pays" better than a well-kept and properly used flower-garden. Of course I do not refer to dollars and cents, though, to be sure, everything which has a soothing or enlivening effect upon the spirits, and which tends to keep the body in health, contributes to our material prosperity—saving time, wages for hired labor, and doctor's bills.

Every mother needs a flower garden for herself and children. Rightly used, it is a great help in family government, in the same way that singing is an aid in the discipline of a school. The less of visible government anywhere the better. It is the wiser way, in most cases, to manage children so as to avoid the necessity for prohibitions and punishments. In spite of all our management there will be need enough for serious correction with ordinary children, so let us ward off the necessity whenever we can.

We must "Beware of entrance to a quarrel, but being in, bear it." When a child is losing all patience with work or play, and is in danger of some

word or deed of desperate naughtiness that could not be allowed to go unpunished—quick! *divert* it somehow, but with such skill that it will not suspect your motive. Appear not to observe the rising storm of temper, but say you wonder what the hens are all cackling so for, and suggest a search for eggs, or make some exclamation to draw attention to the team passing in the street. In this kind of family government a flower garden is a great help. Very little children may have their own beds. Our Birdie, when three years old, had a deal of daily comfort in his garden. It was small, and he scratched in all sorts of seeds with his little hands, sometimes two or three kinds in the same hill. Corn, squashes and pinks, cucumbers, beans and petunias, came up side by side, and much crowded; but we forebore criticism and joined in his admiration. Some of his flowers blossomed, and he had a few pods of beans, and two or three little wagon-loads of ears of corn—enough for quite a pretty job of husking. During the winter his little bags of seed-corn and his squash seeds which he saved last fall, were carefully treasured, and often exhibited. This spring he will have a larger garden and he is now old enough to plant and tend it more reasonably. I would not wonder if he should raise something to sell this year. The little things *must* have something to do. How tired we sometimes get of that oft-repeated question, "What shall I do?" If we cannot direct their industry, of course they will get "into mischief."

Gardening, after the plowing and spading are done, is easier than ordinary housework. There are so many things demanding a thought and a care at the same moment in housework—the oven, two or three kettles, the condition of the fire or fires, the baby, the cat, and perhaps company. Compared with this, gardening is very simple business. The sunshine may be hot, but the cook-stove is not less so. The odor of flowers and of freshly stirred earth is preferable to the smell of boiling cabbage any day, and no one but a starving man can like to hear the sputtering of meat better than the song of birds. Women who get pretty tired with in-door labor, would often find real rest in cultivating flowers. Gardening would be a great benefit to most young ladies, especially if carried on in connection with the study of botany. Pretty girls, who shun the sunshine, have no idea what a suicidal policy they are pursuing. Their beauty will fade and wither, and leave them prematurely old, unless they take exercise in the fresh air and sunshine, and give the hours of night to sleep. It is a good idea to wear gloves in gardening. Those of buckskin or old kid are better than cotton or woolen gloves. Some people will laugh and say "A cat in gloves will catch no mice," but we know that soft hands are more comfortable than hard and rough ones, and they are better fitted for sewing, piano-playing, care of children, and nursing the sick. With gloves, the hands need suffer no injury in gardening.

I think we need some kind of advanced classes in botany, and kindred studies in all our towns, for persons who cannot conveniently attend school. Most people do not realize what a *useful* study botany is. They fancy that it is merely an ornamental branch. There is health for the body, discipline for the mind, and culture for the heart in botany rightly pursued. It calls us out into the fields and woods, and there we may find, besides the sweet wild flowers, a cure for headache, cold feet, and "the blues." So much judgment is necessary in analyzing specimens that botany is one of the best of studies for cultivating the most practical mental faculties. And it is such a delight! It warms and softens the heart, and I, at least, will reckon it among my "means of grace"—I say it reverently.

Do you know that little children can be as deeply interested in examining and learning about a plant or a flower, as in listening to any of the foolish stories people generally amuse them with? It is just as easy for them to learn the names of the different parts—stamens, pistils, petals, etc.—as to learn "Hinty minty cuty corn," if you are interested yourself in what you teach, and do not try to instruct them too much. At first only call their attention, and let them come to the observation of a flower as to a *pleasure*, and not to a lesson. I don't want to be misunderstood: "Mother Goose" is well enough in her place. Nonsense will not hurt any one, unless it crowds out sense. But *this* does hurt children, and most of us have suffered from it,—to have their natural questioning, about things all around them, checked or unsatisfied. The faculties of observation seem to develop first, or *try* to develop, but they have such a poor chance!

"Don't ask so many questions"—the child is told, and when it does ask, "I don't know,"—is the usual reply. The fact that it fails at the time to get the knowledge it seeks is not half so bad as the danger that it will gradually learn to feel no interest in natural objects about it, and go through life having eyes yet seeing not.

I once belonged to a Floral Society, which seems to me now, even more than it did then, a very useful association. The working members were all women, and at times they numbered nearly three hundred. In the spring time there were often as many as one hundred present at the weekly afternoon meetings. At other times the number present was quite small. The members were from all ranks of society, and from all religious denominations in the town—old and young together. Among them were some who had had much experience in the cultivation of flowers. This was the object of the society—mutual assistance in floriculture and improvement in botany, and the ornamentation of the town as far as possible with flowers and shrubbery. Seeds and plants were brought in and given away by those who had them to spare, and other seeds were procured from seedsmen and distributed at the meetings. There was always some talk about the proper manner of cultivating different plants. This society usually had charge of the decoration of halls for festivals and fairs.

One winter, a plain, elderly woman, who had lately come among us, offered to give us a course of lectures on botany. These were just what we needed. She used the black-board freely to illustrate her lectures, and we were at liberty to ask questions at any time. She asked no reward, and we only gave her a vote of thanks and a life-membership; but it seemed to me that, for some of us, in whom she had awakened a hearty interest in botany (and I gratefully counted myself one of these) she had done incalculable service. It did me good to know that this woman began her own scientific studies, which extended over a wide range, after she was married and a mother. She used to leave her housekeeping and her little ones long enough on certain days of the week to go and hear the lectures given to the children of the public schools.

"Home is woman's sphere," we are told, until we get rather tired of hearing it. It is a hard saying for women who have no homes, but in a general sense, it is very true. What bothers me most is the bigness of the sphere and the incapacity of most of us women to fill it. We ought to help each other more, and it was of this I was thinking when I began writing about the Floral Society. A friend wrote me lately: "Our meetings have been very interesting during the winter. The talks have been more about house-keeping." So they might be, and more about the care and education of children, the prevention of disease by attention to the laws of health, and other useful topics of general interest. It seems better to have a Floral Society than a House-keeper's Club, or Mother's Meeting, because it is more likely to call in the young girls, and there is no general subject to rally around more agreeable than flowers. The social nature of such a society is one of its best features. Home may be woman's "sphere," but it should not be her grave, socially and intellectually. I think the pleasures of home are more keenly enjoyed and its duties more cheerfully performed by those who are not tied down to them constantly. Most women "love to *go*" (as we country folks say), and tea parties and fashionable calls are far less profitable than societies for mutual improvement. No Farmers' Club should exclude women, but they usually meet in the evening, when many women could not so conveniently leave home, and they cannot devote sufficient time to the interests that are peculiarly woman's.

I cannot see that the progress of the race depends more upon any human agency than upon the women who train the children and keep bright the altar-fires of Home—not only mothers, but all good daughters and sisters, and the dear "old maids." The message I have for all these "home missionaries" to-day is—in the great work we have intrusted to us, let us bring to our aid, in every possible way, the sweet and holy influence of flowers.

A Comforting Use of Flowers.

Miss F. Hudson writes: "A friend lost a little child. When my mother heard of it, her sympathetic feeling urged immediate action. The universal desire to assist or relieve the mourning family, which is always felt when such tidings reach one, was always hers. So she went to our beautiful cemetery and gave directions for a pile of evergreen boughs to be placed in the yard where the little one was to be laid. While this order was being executed, she procured several baskets of exquisite flowers and returned to the yard where the grave was already excavated. Under her direction it was then completely lined with Spruce and Hemlock boughs, the heap of earth taken from the grave was also covered with them. Then, with the assistance of a friend, mother arranged flowers amid all the green, literally lining the grave with flowers. They were secured in their places either singly, or in tiny bunches by hair-pins. The effect of the arrangement was most beautiful, but its comparative effect still more so, when one saw and felt the difference between a bed of sweetest flowers, and the bare open grave. The earth used in the burial service being but a symbol, certainly the single lump softly dropped by our pastor fulfilled its purpose better than the ordinary unerring spadeful."

Hints on Cooking, Etc.

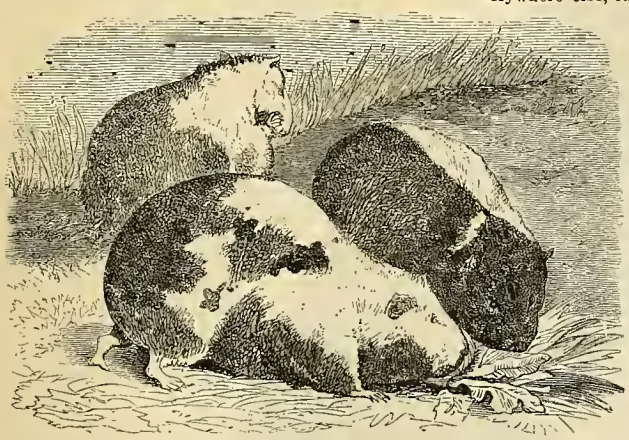
German Mustard.—Wm. Logier, Iowa, sends the following as his method of preparing mustard: "To half a pound of ground mustard add two ounces of sugar, and moisten with boiling vinegar; stir for half an hour with a wooden spoon, and set it aside, well covered, for an hour. Finally, add as much vinegar as may be necessary to thin it. Keep it well covered in a stone or glass jar." The mustard as sold in New York has some aromatic addition.—Who has another recipe?

An Excellent Rice Pudding.—By Mrs. W. Two qts. of milk, one cup each of rice and sugar, a teaspoonful of salt. Wash the rice and add it to the milk cold, and bake. The secret of having it nice consists in its being taken out of the oven before the milk is all dried away. It should be creamy in consistency, and when cool it is better than a pudding made with eggs, as there is no watery whey. Essence of lemon or raisins are an improvement.

Cream Pie.—By Mrs. R. J. R., Minneapolis, Minn. ½ cup of flour and 1 pint of milk boiled together, add the yolks of 2 eggs; ½ cup of sugar (white or coffee) and lemon to flavor the milk, and flour while boiling. Let all boil a few minutes. Make the crust and bake it, then put in the above mixture. Beat the whites of the eggs to a stiff froth, add enough white sugar to sweeten, and put this over the pie and bake to a light brown. This is enough for two pies.

Tea Stains on Table Linen.—Mrs. W. says: Japan teas stain table cloths more indelibly than other black teas, and for a long time it seemed impossible to take the stains out, but I find a weak solution of Chloride of lime will remove them. The solution must not be strong, and must be carefully strained; the cloth must not remain in the lime-water but a short time, and then must be thoroughly rinsed. The preparation sold as Javelle water would answer the same purpose.

BOYS & GIRLS' COLUMNS.



Guinea Pigs.

Most boys and girls have a liking for pets. Some keep birds, others have rabbits, and now and then we see one who keeps Guinea Pigs for pets. We do not think that they are as interesting as some other animals, but they are quite harmless, and very young children can take care of them without danger of being scratched or bitten. One funny thing about the Guinea Pig is, that it is not a pig and did not come from Guinea. It is much nearer a rat than a pig, and has been called by some one "a rat without a tail." It was not brought from Guinea, which is in Africa, but from some place in South America. The tame ones are variously marked with white, black, and brownish patches. They are easily raised if kept in a box where they will not get too cold or be damp. They like all kinds of vegetables, and they very seldom drink. While the Guinea Pigs are very tame, they are also very stupid, and do not seem to have much fun themselves or make much for others. They multiply rapidly, having six or eight young at a time. Whatever pet a boy or girl keeps, it should be attended to regularly. We have no right to place an animal in confinement, where it is prevented from seeking its own food, and then neglect to provide for its wants.

Rambles in China—"Pig Tails."

BY "CARLETON."

There is always something new and strange to be seen in China. It may be old to the Chinese, but it is new to us. While among that strange people, I was always seeing something queer or ludicrous. As I walked the streets, my eyes were always wide open; I was on the broad grin, and am pretty sure that if my young friends had been there, they would have stared and grinned with me. I was interested and amused very much by the traveling barbers, who went along the streets with their shops on their backs.

The Chinese shave not only their faces, but their heads as well, leaving only a tuft of hair upon the crown, which is allowed to grow long and is braided into a tail. They think a great deal of their tails.

It is curious to learn how they came to wear them. Several hundred years ago the inhabitants of China wore their hair as we do, but there was war between China and Tartary, and the Chinese got the worst of it and were conquered. When the first Tartar king of the present dynasty came to the throne, he determined to humble the pride of the Chinese. He began in 1644, by ordering every body to shave off all the hair, except a tuft on the crown; that being the way he wore his own hair. There were a great many proud and high-spirited gentlemen in China who would not obey the command, and the result was, they had their heads chopped off. It was quite the fashion in those days to cut off heads. King Charles I. of England lost his in 1649—not because he would not shave, but because he conspired against the liberties of the people. It is rather an uncomfortable thing for a man to lose his head. The Chinese thought so, and concluded to shave and braid their hair into a pig-tail, although it was an act of degradation. They felt it keenly, but as the years rolled on, they forgot the humiliation and began to like the fashion. When a thing is in fashion—no matter how uncomfortable it may be—even if it is as ugly as the great bundles of horse-hair and the chignons and braids which the ladies wear now in our country, there is nothing humiliating about it; but there are not many young ladies, or old ones either, who would like to be seen in the streets or at Church wearing their hair as was the fashion three or four years ago. A fashionable bonnet of 1865 would be frightful now.

As soon as the pig-tails became fashionable, the young gentlemen of China tried to get up the longest, neatest, and glossiest tails possible. They cultivated them just as young gentlemen in the United States, and almost everywhere else, cultivate their whiskers and monstache, greasing, combing, brushing, and fingering them all the time; and just as young ladies, and old ones too, exercise their ingenuity and skill in frizzling, puffing, plaiting, crimping, and braiding. The Chinese take as much comfort in dressing their hair as we do, only their style is somewhat different from ours. The barbers are all licensed by government, and if one starts a shop without a permit, he will have it unceremoniously kicked over by a policeman and find himself in prison. The outfit of a barber's shop is not very extensive. He has a wash-stand made of bamboo sticks with a bowl in the top. Above the bowl, and attached to the upright stick, is a small dish filled with hot water heated by a lamp, and there is also a soap box. The barber carries around a stool upon which the customer takes his seat. Beneath the seat are two or three small drawers, in which he carries his razor and towels. If New York had as many barbers in proportion to its population as there are in Canton, there would be seven or eight thousand of them! They seem to be always employed. They get very small pay for a shave, but as the people shave every day, they earn a living, notwithstanding there are so many of them in the business. They save all the hair, some of which is used for medicine! "*For Medicine!*" No wonder you open your eyes wide. The Chinese use all sorts of things in medicine. They pound up dogs' skulls into fine powder, mix in pieces of dry snake skin, parings of nails and human hair. They use all of these things and a great many more in medicine. The hair of the Chinese is always straight. I never saw a Chinaman with curly hair; but curly hair they think is an excellent medicine, and if a negro goes to China, he must look sharp, or the barbers will shave off all his hair to sell to the doctors! The hair which is not wanted for medicine is used for fertilizing the ground. They save everything that can give fertility to the soil, and as men are constantly going through the streets carrying buckets filled with the sweepings of the streets and the collections from out-houses, the air is filled with bad smells. The Chinese do not mind it, however, and the barber goes on with his shaving,—the people keep on eating at the street restaurants without thinking of their noses. After the barber shaves his customer, the pig-tail is attended to. The old braid is shaken out, the hair combed and oiled, and rebraided. The Chinese take great pride in having a long tail. To be in fashion, it must dangle almost to the ground, and if their own hair is not long enough, they do as the ladies of this country are in the habit of doing, braid in other hair, and then a skein of fine black silk at the end, as if it was the snapper to a whip. Instead of being a sign of disgrace as in former years, the pig-tail is now not only fashionable, but it is a mark of honor and distinction. They will consider it an insult if you speak disrespectfully of their cue, or if you handle it in a familiar manner. When they are about their work, they coil it upon the crown of their head; but when they are in the parlor or dining-room, it would be an unpardonable breach of politeness were they to appear with it coiled upon the head. They are as particular about letting it dangle down the back as a lady in this country is about putting on her gloves before going into company. It would show a want of respect not only for himself, but for you, were a Chinaman to keep his cue coiled upon his crown in your company. In China no man wears a beard until he is sixty years old. Custom does not permit it. It is very fortunate for some young gentlemen who are growing a few stray hairs on their upper lip, and who often look into the glass to see how they are getting on, and are constantly feeling of them, as if trying to make them grow faster, that they live in this country, for in China no man wears a moustache until he is a grandfather! The Chinese have no use for wigs. An amusing story is told of an Englishman who was bald-headed, and was shaved by a Chinese barber. The Englishman was accustomed to wear a wig, but he had it for the moment in his hat. The barber shaved him. When the barber's back was turned, he placed it on his head, and the Chinaman, upon turning around and discovering such a growth of hair on a head he had just shaved, thought he had the "Old *Harry*" for a customer! He ran as fast as he could to get away, from one who the next moment might have him in his clutches and carry him off to the place where, as the Chinese believe, men who have not done just right in this world, are pounded to pieces in morters, or are compelled to clasp red hot iron pillars, or are hung up by their tails to poles, or are obliged to sit down on stools filled with sharp nails. The Englishman had a hearty laugh, but the barber and all the people trembled with fear and kept out of his way.

In a town in England was a barber whose sign read, Theobald, Hair-Dresser. Some mischievous fellow painted out the O, and the astonished barber found himself The bald Hair-Dresser.

What did a blind wood-sawer take to restore his sight? He took his horse and *saw*.

"Mister," said Bob to the showman, "won't that Boa Constrictor bite me?"—"No, my little boy, he allers swallers his wittles whole."

A large number of illustrated rebuses, charades, connundrums and mathematical puzzles, have been sent to us by correspondents. The limited space afforded by the columns especially belonging to the boys and girls, will forbid the early appearance of some that may be accepted.

No. 379. *Illustrated Rebus.*—Contains very good advice.

No. 380. *Illustrated Rebus.*—Equally true with the preceding.

Answers to Problems and Puzzles.

The problem in Liquid measure, No. 372, in March, has called out an unusual number of answers, the most of which were correct. Some accomplished the division in an unnecessarily roundabout way, and others required the use of another vessel. The correct answer was given last month. We must repeat that we cannot publish a problem unless an answer is furnished. Some are going about which are mere catches and have no answer.

No. 375. This is a clever subdivision of words. It is a very old epitaph upon a woman who sold earthen ware, beginning: "Beneath this stone lies Katharine Gray,
Changed from a busy life to lifeless clay."

No. 376. One way that the 9 digits may be placed is:

8 1 6
3 5 7
4 9 2

No. 377. Fools only contend against a force that cannot be overcome. Fools on L Y, C on 10-Dey-G A in stay, 4 ee-T-hat-can, knot-B over Come.

No. 378. The man had 65 geese.

No. 379. 5 cattle at $10=$50. 1 Hog $3, and 94 sheep at 50 cts.=$47 All amounting to $100.

The following have sent correct answers, Where a

[COPYRIGHT SECURED.]

FAIRY MARAUDERS.—From a Painting by J. F. Gookins, of Chicago.—*Drawn and Engraved for the American Agriculturist.*

figure is placed after a name, it indicates that the answer to that number was correct and the others not:

C. D. Hawkins, J. T. McLain, E. R. Miller, H. Hunter, C. N. Sears, Chas. F. Tolhurst, Jas. N. B. Clemmons (374), J. N. Shedenhelm, Robt. J. Wilson, B. H. Roberts, C. A. McCartny, Fred. Rush, Irene Ellison, A. F. Mum, S. W. Hanke, M. B. Kanth, J. C. Scanlan, Charles E. & Fred. S. Bronson, Chas. M. Walker, Sam'l Ewing, M. G. Keeney, Julia E. Kyle, G. L. Sypher, J. W. Miles, Jr., A. H. Hood, C. S. Wakefield (374), Minnie Allen (374), J. Siebenthaler, G. F. Mumma, L. E. Shriver, M. Butler, A. McMore, E. Tallman, E. Dollenmayer, J. W. Walker, M. Prosper Phillips, Eli Keith, L. C. Cowles, J. C. Slater, T. J. Laurie, F. H. Rohn, O. Woolston, "D. A. P.," E. F. Warner, J. Twininga, Jr., E. Cabot, Geo. M. Hemingway, J. N. Wilson, A. L. Hemingway, E. H. Scott, J. W. Cherry, Mrs. S. Littlefield, Maria Hayworth, P. H. Fetherman, C. F. Deibert, N. H. Haynes, W. T. Walters, R. L. Condon, Chas. B. McClure, W. A. Jacobs, C. A. Wilson, P. H. Mattes, "Dan.," "T. H. J.," L. P. Burt, F. Donbrana.

Some of the older boys and girls will be interested in the article on the aquarium given on page 185. Those who can refer to back volumes will find in April and May, 1867, something interesting about tadpoles or polliwogs.

The Fairy Marauders.

In a beautiful garden, where sweet Honeysuckles twined, where the Fuchsia hung its gorgeous pendants and hundreds of other flowers added their color and fragrance to make it just such a place as you would like to live in were you a humming-bird, a pair of humming-birds had built their nest. Such a cunning nest it was; all soft within, with the finest down, and without all covered with mosses so deftly put on that it would readily be taken for a knot upon a branch. The eggs were laid, and beautiful little eggs they were, not bigger than beans, and the humming-birds were happy. Mistress Humming-bird was sitting upon the nest one night, thinking what she should name the little ones when they should be hatched; while Mr. Humming-bird sat upon a twig near by admiring his wife as the bright moonlight made the feathers on her breast look brighter than jewels. A little noise below, a slight shaking of a rose leaf, and their long dreaded enemies were upon them—"The Fairies!" they both chirped at once, and instantly the peaceful scene was one of strife and confusion. There were the dreaded fairies, Fern-seed, Pea-blossom, and others, all out on a midnight raid. How stealthily the enemy approached and how valiantly the birds fought to protect their nest! These little imps with long boots made of the flowers of Honeysuckles and helmets of Columbine, what pranks they played and how the garden rung with tiny shouts and screams!—Oh dear, what a pity there are no fairies. Children all love to read about them, and older people too like to let their fancy run upon them. One of the most charming poems ever written is all about a fairy, and the artists paint beautiful pictures of fairies all from their imagination. The above picture is from an elegant painting in which the artist has made a little rogue so cunning and bright, that we cannot help liking him, though he is a marauder. The one at the nest looks like a mean fellow—he is letting the other do all the fighting, while he secures the plunder. The outline figures used to fill in around the oval, are worth examining; they are drawn by another artist, who seems to have thought that the fairies deserved punishment for their attacks upon the humming-birds, and has represented them in various difficulties. The hornet has taken upon itself to battle in the cause of the humming-bird, and we think that the little elf is in danger of a stinging rebuke, to say the least. Down below, a party of evil-doers are put into a leaf of a pitcher plant for safe keeping, while on the other side, a big spider is securing more fairies as prisoners of war.

ELGIN WATCHES

MANUFACTURED BY

The National Watch Company.

All the Grades of the Elgin Watches

INCLUDING THE

"LADY ELGIN,"

READY FOR

SPRING TRADE.

The Company also call the attention of Watch buyers to the fact that the Elgin Watches now offered have several peculiar improvements over all others and also a new

PATENT DUST EXCLUDER

so constructed as to enclose the works, and form a protection against dust, enabling the movement to remain in order without cleaning double the time that a watch will ordinarily run without this protection.

The Company feel confident, after having had their Watches three years in market, and selling many thousands of them in all parts of the country, that the

Elgin Watches are the best time keepers now offered to the American public, for either Ladies' or Gentlemens' use, Railway or other uses.

Over Five Hundred Dealers

in various parts of the land have unreservedly endorsed them. They are in use upon numerous lines of Railway, including the **Union Pacific** and **Pennsylvania Central**, and officers of these roads, with other prominent R. R officials, endorse them as the best Watches for the use of R. R. employees and travelers, yet introduced.

The following are presented as specimens of these testimonials:

UNION PACIFIC R. R., OFFICE OF GEN'L SUP'T, OMAHA, Dec 16, 1869.

Hon. T. M. AVERY President National Watch Co., Chicago, Ill.:

Dear Sir:—During the month that I have carried one of your "B. W. Raymond" Watches it has not failed to keep the time with so much accuracy as to leave nothing to desire in this regard. For accuracy, in time-keeping, beauty of movement and finish your Watches challenge my admiration, and aronse my pride as an American, and I am confident that in all respects they will compete successfully in the markets of the world, with similar manufacturers of older nations. They need only to be known to be appreciated. Yours, most respectfully,

C. G. HAMMOND, Gen'l Sup't.

OFFICE OF THE HUDSON RIVER RAILROAD, Gen'l Sup't, New York, Jan. 17, 1870.

T. M. AVERY, Esq., President National Watch Co.

Dear Sir:—The Watch made by your Company which I have carried the past two months, has kept excellent time. I have carried it frequently on engines, and have been on the road with it almost daily. During this time it has run uniformly with our standard clock.

Truly yours,

J. M. TOUCEY, Gen'l Sup't.

The following dealers also in various parts of the country, have certified that they consider the Elgin Watches to be all that the Company have advertised them, as better finished, more correct and durable, than any in market of similar price, and that they have great confidence in recommending them to the public on account of their general merit.

ARE YOU

GOING TO PAINT?

IF SO, USE THE

AVERILL CHEMICAL PAINT.

Purest White

AND ALL THE FASHIONABLE SHADES.

"Ready for use—requires no oil, thinning or driers,"

And Sold only by the Gallon.

MORE RECOMMENDS.

Extract from the Christian Union, March 26, 1870.

"The fine residence of P. P. Clark, Esq., Morristown, N. J., just finished with the Averill Chemical Paint, is conceded to be one of the finest specimens of beauty and harmony of colors to be seen in this country."

St. Augustine, Fla., Feb., 1870.

"We painted the St. Augustine Hotel with your paint and find it all you claim for it. It is the best paint we have ever seen." PALMER & VAIL, Proprietors,

Bridgeport, Ct., March 1st, 1870.

The first house upon which I had your Paint applied is looking finely to-day. One painted at the same time with Lead had deteriorated so much that, last fall, I had it repainted with your Paint; and I have furthermore issued orders to have all the buildings I am erecting painted with your Paint, knowing it to be the cheapest and the best Paint made. P. T. BARNUM, Esq.

Recommends from all sections of the country, comprising the owners of many of the finest villas and residences in the land, can be obtained, with sample Card and Price List, free of charge, by addressing,

AVERILL CHEMICAL PAINT CO.,
32 Burling Slip, New York;
or, 182 Superior st., Cleveland, Ohio;
or, 19 Dearborn st., Chicago, Ill.;
or, 75 Haverhill st., Boston, Mass.;
or, 86 Poydras st, New Orleans, La.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations into the market. We must caution the public against them.

THE PATENT LEAD-ENCASED BLOCK-TIN PIPE is a safe Pipe for Drinking Water. It is stronger than Lead Pipe of twice the weight, and costs about the same per foot. It has all the advantages of the Lead pipe without the danger of being poisoned by Lead water. It is flexible, durable, and easily soldered. The use of this Pipe is recommended by Physicians, Chemists, and Water Commissioners. Water drawn through it is as pure as if drawn through Silver. It is introduced into many Public Schools, Hospitals, and most of the new first-class buildings. It gives perfect satisfaction wherever used. To give the cost per foot we should know the head or pressure of water, and bore of Pipe. Send for Circular. Address THE COLWELLS, SHAW & WILLARD MANUFACTURING COMPANY, No. 213 Center Street, between Canal and Grand Sts., New York.

From THE RURAL NEW-YORKER, July 18, 1868.

"Having examined this pipe we are satisfied that it possesses great value and utility, and therefore voluntarily commend it to all who use water conveyed through pipes."

ENOCH MORGAN'S SONS'

THE NOVELTY KNIFE

For Ladies and Gentlemen.

Has one ordinary blade, and one new patent blade unequalled for a sewing ripper, eraser, nail trimmer, and many other uses. Is made of best steel. Price by mail, post-paid, plain handle, $1; Ivory, $1.25; Shell, $1.50, Pearl, extra finish, $1.75. For sale at wholesale and retail by A. C. FITCH, Gen. Agent, 37 Chatham St., New York.

DOWNING'S FRUITS AND FRUIT TREES OF AMERICA.

By **A. J. Downing.** Newly Revised and Greatly Enlarged by **Chas. Downing.** 8vo., 1122 pages. Price $7.50.

The original work of the late A. J. Downing appeared in 1845. Some years after it was revised and much enlarged by his brother, Charles Downing, who has again completed the work of a second revision. Charles Downing is upon all hands acknowledged as one of our highest pomological authorities. He writes but seldom, but whatever bears his name is accepted as the judgment of one who is entirely disinterested, as far as the commercial aspects of pomology are concerned. The present edition contains the results of many years' labor and experience which have been devoted to testing the value of fruits and acquiring a knowledge of them that should benefit others. When we compare this edition with the modest one which first appeared, we can see to what extent the subject has grown. If only a small proportion of the new varieties that have been added prove valuable, we shall have reason to be proud of our progress. This elegant and valuable work will be an indispensable requisite to every library, and to all interested in Fruits or Fruit Culture.

AGRICULTURAL QUALITATIVE AND QUANTITATIVE CHEMICAL ANALYSIS.

After E. Wolff, Fresenius, Krocker, and others. Edited by **Prof. G. C. Caldwell,** of Cornell University. Price $2.00.

In this work Professor Caldwell has brought together the processes of analysis which apply especially to soils, fertilizers, animals and plants, and their products. He has tested the methods of the best foreign authorities, and presented them in a compact hand-book. Such a work has long been needed by all who teach agricultural chemistry, and by analytical chemists generally. Professor Caldwell modestly calls himself the editor, but his book shows that he has not contented himself with editing the works of others, but has given much of his own experience

HOW CROPS GROW.

A Treatise on the Chemical Composition, Structure, and Life of the Plant. With numerous illustrations and tables of analyses. By **Prof. Samuel W. Johnson,** of Yale College. Price $2.00.

This book is a guide to the knowledge of agricultural plants, their composition, their structure, and modes of development and growth; of the complex organization of plants, and the uses of the parts, the germination of seeds and the food of plants, obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture.

AMERICAN CATTLE:

Their History, Breeding, and Management. Illustrated By **Lewis F. Allen.** Price $2.50.

This book will be considered indispensable by every breeder of live-stock. The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims as a standard authority on the subject. An excellent feature of the volume is its orderly, methodical arrangement, condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves.

NEW AMERICAN FARM BOOK.

Originally by **Richard L. Allen.** Revised and greatly enlarged by **Lewis F. Allen.** Price $2.50.

Allen's American Farm Book has been one of the standard farmers' hand-books for twenty years; it is still a valuable book, but not up to the times: and as its author, Mr. R. L. Allen, could not give time to its revision, this was undertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Erie county, editor of the American Shorthorn Herd-Book. The work is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser, and is called the *New* American Farm Book.

PRACTICAL FLORICULTURE.

A guide to the successful propagation and cultivation of Florists' Plants. By **Peter Henderson,** author of "Gardening for Profit." Beautifully illustrated. Price $1.50.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone.—H. A. DREER, Seedsman, Phila., Pa.

Full to overflowing with valuable information.

FRANCIS RICHARDSON, Toronto, Canada.

Thoroughly practical, yet readable as a novel.—N. Y. Sun.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.

GALVIN & GERAOUTY, Florists, Newport, R. I.

Either of the above books sent post-paid on receipt of price by

ORANGE JUDD & CO., 245 Broadway, New York.

ADDITIONAL IMPROVEMENTS FOR 1870.

THE AMERICAN FRUIT-PRESERVING POWDER.

(Title Copyrighted, and Preserving Powder Patented in United States, March, 1861, and August, 1867. Also, Patented in England, France, Belgium, South America, &c., &c.)

This Preserving Powder is a combination of powerful antiseptics, and warranted to be in every particular, as healthful as common table salt, and will effectually prevent fermentation and subsequent decay in all kinds of Fruit, Juices and Syrups of Fruits, Cider, &c. And preserve them in as good and healthful condition as the best "Canned or preserved" fruits, &c., without the trouble and expense of hermetically sealing or air-tighting the jars or cans. And with or without the use of Sugar.

It admits of keeping the fruit, &c., in large glass, or earthen or stoneware jars of any size, from one quart to six gallons, by simply tying an oiled cloth or paper, or moistened bladder over the top, and when opened the fruit, &c., may be used as wanted from time to time, without danger of fermentation being occasioned by weeks of full exposure to the air.

For Tomatoes and Vegetables such as green Beans, Peas, Asparagus, Corn, &c., (which all know are so difficult and uncertain to keep in the air-tighting method,) the preserving Powder will reliably keep them in glass or stoneware jars not larger than two (2) gallons, by simply corking and sealing with common bottle wax; when opened they will keep for a few weeks, giving ample time to use from large jars.

For fruits preserved with spices it prevents the spices from turning them dark color, and will keep them from becoming strong and unpleasant in taste.

For vinegar pickles it strengthens the vinegar and prevents their becoming soft.

We will compare the cost of jars in the air-tighting method with those used with this preserving powder.

For family use air-tight jars should not be larger than one quart; therefore, to preserve 12 quarts of fruit requires one dozen jars, which cost from $2.50 to $3.00, according to quantity purchased.

For 12 quarts of fruit with the preserving powder, we will use one three-gallon stone jar, which will cost from 62½c. to 75c., according to quantity purchased. Therefore it is manifest that the best jars necessary with the preserving powder will cost just one-fourth as much as patent air-tight jars, independent of their being so much more durable. But the preserving powder encourages still greater saving by admitting the use of imperfect jars that could not be used in other methods.

In confirmation we add a few testimonials in a condensed form, from families of the highest respectability, the originals of which may be seen at our office.

From MRS. REV. DR. CAMP, Bethseda Rectory, Saratoga Springs, N. Y.

Gents:—We used the American Preserving Powder last season, according to directions, in preserving strawberries and whortleberries, and to-day they are as good as new. I regard the Powder as a great saving of sugar, trouble, and money, and hope next season to use it more largely.
December 29, 1869. Respectfully, MRS. M. T. CAMP.

From D. T. STANTON, Warren C. H., Warren Co., Pa.

Gents:—The American Preserving Powder has given general satisfaction on all fruits it has been tried upon. I think there will be a large demand for it here next season.
December 29, 1869. Yours, etc., D. T. STANTON.

From N. H. M. POLLOCK, North Star, Alleghany Co., Pa.

Gents:—I used extensively your American Preserving Powder the past season with perfect success. I used it largely for corn. I could always save tomatoes, peaches, etc., well enough in tin cans sealed with wax, but corn would never save until I used the Powder. My corn is just as sweet and nice to-day as it was when cut off the cob in August. We used it in blackberries, tomatoes, peaches, apple-sauce, pears, and quinces, but, for want of confidence in the Powder, we sealed with wax all but a few jars of each to test its preserving qualities. The result is most satisfactory, and I shall use it the coming season, and am glad to be able to recommend it to every lover of good fruit. Yours, etc.,
December 27, 1869. N. H. M. POLLOCK.

From MARY A. WOODBRIDGE, Newburg, Cuyahoga Co., O.

Gents:—I used the American Preserving Powder last season with tomatoes only. I put them in stone jars, covering with oiled silk. Upon opening the jars we use them as wanted, and find them far superior to canned tomatoes; indeed, they are so fresh that I think, if they were cooked and used at the same time with others just picked from the vines, it would be impossible to distinguish between them.
Dec. 21, 1869. Respectfully, MARY A. WOODBRIDGE.

From GEO. MCKENZIE, Bangor, Van Buren Co., Mich.

Gents:—The half dozen packages of Preserving Powder I purchased of you the past season we used in putting up blackberries and peaches. We put up 76 pounds of blackberries with one package of the Powder; and, seeing our mistake, I wrote to you to know if they would keep, when you promptly stated in reply that you thought they would go up before winter. But, sirs, they have not, at this date (January 10, 1870), nor shown the least signs of fermentation. They were put up in large jars, without sugar, with paper tied over the mouth of the jars. We also put up a dozen large jars of peaches, without sugar and without air-tighting, and I will here state, for the benefit of our Western fruit-growers, they have given no signs of fermentation, and hold their flavor better than any canned fruit I ever saw.
Jan. 10, 1870. Truly yours, GEO. MCKENZIE.

From MRS. E. M. PEYOR, Milwaukee, Wis.

Gents:—We have used and distributed the half dozen packages of American Preserving Powder among our neighbors, and all like it. It is truly wonderful, and a great blessing to housekeepers, as it saves much labor and expense. Go on in this way and the blessings of thousands will rest on you. Respectfully, MRS. E. M. PEYOR.
September 30, 1869.

From NELSON GRIFFITH, Corunna, De Kalb Co., Ind.

Gents:—We used the American Preserving Powder on peaches, gooseberries, and blackberries, and it has proved itself to do all that you claim for it. Yours truly,
December 23, 1869. NELSON GRIFFITH.

From H. M. WOOD, M.D., Salem, Marion Co., Ill.

Gents:—I take pleasure in giving you our testimony in favor of your American Preserving Powder. We used it the past season in currants, gooseberries, raspberries, cherries, peaches, tomatoes, and green peas, with perfect success in all. Our neighbors who have tasted them agree with us in saying they are the best they ever ate. Mrs. Wood says she will not do without the American Preserving Powder if it can possibly be procured. Most respectfully,
January 17, 1870. H. M. WOOD, M.D.

From HON. JAMES RICE, Osceola, Clarke Co., Iowa.

Gents:—We used the Fruit Preserving Powder received from you last fall, in putting up grapes and some other late fruits, and have found it to be a perfect success. The fruit is in a perfect state of preservation. We put it up in large stoneware jars, and are using it with convenience. It is certainly an article of great merit. Yours truly,
January 6, 1870. JAMES RICE.

From EDWARD HIGBEE, Esq., Lancaster, Schuyler Co., Mo.

Gents:—I find the American Preserving Powder to be all that you guarantee it to be. All the fruits that I have put up with it have kept perfectly sweet and fresh. Yours truly,
December 21, 1869. EDWARD HIGBEE.

From W. WILLARD & SON, Macon, Macon Co., Mo.

Gents:—As far as introduced with us, the American Preserving Powder has given universal satisfaction, although we found prejudice strong at first. Our own family used the Powder with the best results, and another year we can guarantee the Powder. Very truly yours,
December 26, 1869. W. WILLARD & SON.

From W. H. CRAIG, Milan, Sullivan Co., Mo.

Gents:—My wife used the American Preserving Powder the past season, and finds it all you claim for it. Yes, more, for not only did it preserve the fruit without making the jars air-tight, but it preserved their flavor and color better. I think it the best preparation of the age, and would be glad to be the means of extending its sale in this part of the country. Very respectfully,
December 27, 1869. W. H. CRAIG.

From MRS. M. E. MARTIN, Milton, Sussex Co., Del.

Gents:—I used the American Fruit Preserving Powder the past season to preserve peaches, blackberries, and tomatoes, and so far they are in the best possible condition. There have been no signs of fermentation, while the flavor of the fruit is perfectly preserved. I can say they are in every respect equal to your recommendation. Yours truly,
January 16, 1870. MRS. M. E. MARTIN.

From C. G. BOYNTON, Felton, Kent Co., Del.

Gents:—We used a portion of the American Preserving Powder received last summer in preserving peaches, etc., and are prepared to recommend it and fully endorse all that has been said of their preserving qualities. We have peaches now just as nice and fresh as when preserved.
Yours respectfully, C. G. BOYNTON.
December 30, 1869.

From P. W. CUSTEED, Seaford, Sussex Co., Del.

Gents:—We used the American Preserving Powder last season in pears, peaches, strawberries, and currants. The fruit was put into ordinary stone jars without any attempt to make them air-tight, and as far as I can judge they are now as good as when first put up. I can conscientiously recommend the Powder as a labor-saving and effectual preparation. Yours, etc., P. W. CUSTEED.
December 31, 1869.

From M. A. F. KENT, Rutland, Anne Rundel Co., Md.

Gents:—I was so unfortunate as to lose the directions for using the American Preserving Powder last season, and could not use it only in putting up my grapes, which I have not the least fault to find with, as they are keeping nicely. I shall recommend the Powder highly.
Jan. 3, 1870. Respectfully, M. A. F. KENT.

From CHAS. H. MARTIN, West Friendship, Howard Co., Md.

Gents:—We are highly pleased with the American Preserving Powder, having put up peaches, pears, and tomatoes with it with the best success, and can safely recommend it to the public as a reliable and economical mode of preserving fruit, etc. Yours truly,
Jan. 1, 1870. CHAS. H. MARTIN.

From S. H. WILSON, Upper Falls, Baltimore Co., Md.

Gents:—All the fruit I put up with your American Preserving Powder last season appears to be keeping well. The peaches were of excellent flavor. I will recommend your Powder to my friends. Respectfully,
Dec. 20, 1869. S. H. WILSON.

From JOHN PRETLOW, SR., Franklin Depot, Southampton Co., Va.

Gents:—I used your American Preserving Powder the past season in whortleberries and peaches, which are now in a good state of preservation. I have, and can recommend the use of the Powder to others.
Jan. 1, 1870. Very respectfully, JOHN PRETLOW, SR.
