All the parts of this tree possess medicinal qualities; but the wood and the peculiar substance afforded by it are the only parts used: the virtues of the wood depend altogether on the peculiar matter it contains. This is spontaneously exuded from the tree, and is called native gum: it concretes in tears, which are semi-pellucid, and very pure; but the greater part of it is obtained by making incisions into the trunk, or, as it is termed, jaggings the tree. This operation is performed in May; and the juice which flows copiously, is concentered by the sun. It is also obtained by sawing the wood into billets, and boring a hole longitudinally through them; so that, when one end of a billet is laid on a fire, the guaiac melting runs through the hole from the opposite end, and is collected in a calabash. Boiling the chips or raspings in salt and water also separates the guaiac, which, as it rises to the surface, may be collected by skimming.

Both the wood and the guaiac are stimulant, diaphoretic, diuretic, and purgative. The wood was introduced into Europe by the Spaniards as a remedy for lues venerea in 1508, and gained much celebrity from curing Van Hutten; but it had long before been used for the same purpose by the natives of St. Domingo. It obtained so much reputation, that the exhibition of mercury was discontinued for a considerable length of time, and even in the eighteenth century its specific powers over this disease were maintained by Boerhaave; but frequent disappointments and more correct observations have shown that it possesses no powers of eradicating the venereal virus; and that it is useful only after a successful mercurial course, for repairing the strength and vigor of the system, "and where a thickened state of the ligament, or of the periosteum, remains, or where there are foul indolent ulcers;" (*Pearson's Observations*, &c. p. 10.) or in suspending the progress of some of the secondary symptoms for a short time, as ulcers of the tonsils, eruptions, and nodes. The decoction of the wood has been found more useful in cutaneous diseases, scrofulous affections of the membranes and ligaments, and in ozena. The guaiac itself is an efficacious remedy in chronic rheumatism and arthritic affections, as well as those diseases for which the decoction of the wood is usually given; and in every respect it may be regarded as the active ingredient of the wood. Its sensible effects are a grateful sense of warmth in the stomach, dryness of the mouth and thirst, with a copious flow of sweat, if the body be kept externally warm, or if the guaiac be united with opium and antimonials: but when the body is freely exposed, instead of producing diaphoresis, it augments considerably the secretion of urine. (*Thomson's London Dispensatory*, 318.)

Lignum vitæ in the stove grows freely in loam and peat. "Cuttings," Sweet observes, "are generally supposed to be difficult to root; but I find ripened cuttings, taken off at a joint, root readily, planted thin in a pot of sand, and plunged under a hand-glass in heat. When the cuttings are rooted, which will be easily perceived by their growing at the top, they should be potted off; when great care must be taken not to break off the young roots in taking the sand from them, as they are very small and easily broken. Pot them off in very small pots, and keep them under a close glass or a few days, till they have struck fresh root, when they must be exposed to the air by degrees." (*Bot. Cult.* 63.)

994. *Zygophyllum*. From ζυγος, a pair, and φυλλον, a leaf, all the leaves grow in pairs. *Morgsana*, which is the name of one species, is the Syrian name of the plant. These are plants of little ornament, generally with fleshy leaves, and flowers of a yellow or whitish yellow color.

History, Use, Propagation, Culture,

995. *Fagonia*. So named by Tournefort, in honor of Mons. Fagon, archiater to Louis XIV, and a great patron of botany. Small prickly plants of no beauty.

996. *Tribulus*. From *treis*, three, and *βολος*, a point, in reference to the points of the capsules. *La Croix du Chevalier*, Fr. The term *Caltrops* is taken from the form of the fruit, which resembles the machines that were formerly cast in the way to obstruct an enemy's cavalry. It is composed of five nuts, united into a subglobular whorl armed with prickles.

T. terrestris is a native of most of the hot and temperate parts of the world: it is common about Kingston in Jamaica, where it is called Turkey blossom, and planted in gardens for the sake of its flowers, which have an agreeable smell. The fowls are observed to feed much on them, which is thought both to fatten them and heighten their flavor. In the south of Europe, it is a common weed in arable land, and is troublesome to cattle by the prickly fruit running into their feet. All the species are pretty, though seldom cultivated.

997. *Dictamnus*. An ancient name of what is now supposed to be the *Origanum Dictamnus*. *Fraxinella*, Fr., in allusion to the remarkable similarity which exists between the leaves of the plant and *Fraxinus*, the ash. The whole plant, especially when gently rubbed, emits an odor like that of lemon-peel, but when bruised it has something of a balsamic scent. This fine scent is strongest in the pedicels of the flowers, which are covered with glands of a rusty red color, exuding a viscid juice or resin, which exhales in vapor, and in a dark place may be seen to take fire. The root is used in medicine, and, it is said, with much success, as an opiate and drastic.

998. *Ruta*. This name is nearly the same in all languages. *Ρορυ*, in Greek; *Ruta*, in Latin; *rux*, in Runic; *rude*, *ruta*, or *rutu*, in Anglo-Saxon; *rutiza*, in Slavonic; in French and English, *rué*, &c. The root of the word is beyond the ingenuity of etymologists. *R. graveolens* was formerly in much repute as a medicinal plant, and also as emblematical of repentance and grace. In Shakspeare and other old authors, it is called herb of grace, as rosemary is called herb of remembrance. The leaves have a powerful unpleasant odor, and a hot, bitter, nauseous taste. In the recent state they will inflame and blister the skin; but much of this is dissipated in drying. Medicinally, rue is stimulant and antispasmodic, and is supposed to possess emmenagogue powers. It was in high estimation as early as the time of Hippocrates, who frequently ordered it in female complaints. In modern practice, it is chiefly used in hysteria and flatulent colic. (*Thomson's London Dispensatory*, 487.)

999. *Crowea*. So named by the president of the Linnean Society, after his friend James Crowe of Norwich, an excellent British botanist, whose collection of willows we believe still exists. This plant continues in flower the greater part of the year. An equal mixture of sandy loam and peat is the best soil for it, and care must be taken not to over water it, or it will look yellow and unhealthy. It likes an airy situation,

- 5876 Leaves conjugate stalked, Leaflets obovate, Stem shrubby
 5877 Leaves conjugate sessile, Leaflets lanceolate oval rough at edge, Stem shrubby
 5878 Leaves with double leaflets stalked, Leaflets cylindrical fleshy smooth, Petals acuminate

- 5879 Spiny, Leaflets lanceolate flat smooth
 5880 Spiny, Leaflets linear convex

- 5881 Leaflets in 4 pairs: the outer larger, Pericarps 10-seeded blunt
 5882 Leaflets in 6 pairs nearly equal, Seeds with four horns
 5883 Leaflets in 8 pairs nearly equal

- 5884 Leafstalk obscurely edged
 5885 Leafstalk scarcely edged at all

- 5886 Leaves supradecomposed, Leaflets oblong terminal obovate, Petals entire
 5887 Leaves supradecomposed, Leaflets all linear, Petals entire
 5888 Leaves supradecomposed oblong, Terminal leaflet obovate, Petals toothed
 5889 Leaves supradecomposed, Lobes oblong cuneate nearly equal, Bractes very small ovate, Petals ciliate
 5890 Leaves pinnate, Leaves lanceolate attenuate at base serrate crenate, Petals entire
 5891 Leaves mostly ternate lanceolate pubescent: lateral very short, Cal. and ovaries villous
 5892 Leaves simple lanceolate smooth, Filaments ciliated, Stem simple herbaceous
 5893 Leaves in middle ternate linear narrowed at the base entire, Calyxes villous
 5894 Leaves pinnatifid, Segments oblong somewhat stalked: the terminal very large, Petals ciliated
 5895 Leaves bipinnate with obovate retuse leaflets, Flowers 4-petalous 8-androus

- 5896 The only species

- 5897 The only species

- 5898 Leaves ovate-lanceolate acuminate serrated at end, Cal. as long as cor. Berries ovate
 5899 Leaves lanceolate entire very obtuse at end, Branches of panicle short angular

- 5900 Flowers hermaphrodite, Leaves pinnate with an odd one, Leaflets opposite sessile, Stalk jointed winged
 5901 Flowers monœcious, Leaves abruptly pinnated, Leaflets alternate stalked, Stalk naked

and Miscellaneous Particulars.

and not to be crowded amongst other plants. Cuttings strike root freely in sand, under a bell-glass. (*Bot. Cult.* 173.)

1000. *Codon*. From *κωδων*, a bell. The corolla of this plant is globular, and formed like a bell in its upper part. A scarce Cape shrub, of which Thunberg speaks in terms of great delight upon finding a solitary individual growing by the side of a precipice in its native country.

1001. *Gomphia*. From *γούμφος*, a club; but the application is not obvious. These are most beautiful tropical bushes, with long spikes of brilliant yellow flowers, and neat serrated shining entire leaves.

1002. *Quassia*. So named by Linnæus, in memory of Quassi, a negro slave of Surinam, who found and discovered to Rolander, a Swede, the wood of *Q. excelsa*, which he had employed with success as a secret remedy in the malignant endemic fevers of Surinam.

Q. amara is a lofty tree with strong branches, white light wood, their bark and leaves not unlike those of the common ash. The flowers are in terminal racemes, of a bright red. The root, wood, bark, and indeed all the parts of this tree are intensely bitter. Linnæus says that the wood of the root is a noble remedy, but that the wood of the small branches, which has since been substituted for it, is good for nothing. The wood of both is now thought to be less intensely bitter than the bark, which is at present regarded as the most powerful medicine. *Quassia* has no sensible odor; its taste is that of a pure bitter, more intense and durable than that of almost any other known substance; it imparts its virtues more completely to watery than spirituous menstrua, and its infusions are not blackened by the addition of martial vitriol. It is said that considerable quantities of this drug are used by the brewers instead of hops.

Q. Simaruba, or mountain damson, as it is called in Jamaica, is a tall tree with alternate branches, and a smooth grey bark, maculated with yellow spots. The leaves are pinnate; the flowers are male and female on the same axillary panicles, yellowish white; the fruit consists of five smooth, ovate, black, one-celled berries, on a common receptacle, and open spontaneously when ripe.

The official part of this tree is the bark of the root; it is inodorous, and has a bitter, but not disagreeable taste. The pieces are of a very fibrous texture, rough, scaly, warty, and of a full yellow color in the inside when fresh. Alcohol and water take up all its active matters by simple maceration, at a temperature of sixty degrees of Fahrenheit better than at a boiling heat; it is tonic, and has been employed with advantage in intermittent fever, obstinate diarrhœa, dysentery, and dyspeptic affections. (*Thomson's London Dispensatory*, 462.)

The different species of *quassia* flower freely in the stove; are of easy culture in loam and peat, and are increased by ripened cuttings taken off at a joint, and not deprived of their leaves, and planted in a pot of sand under a hand-glass.

History, Use, Propagation, Culture,

1003. *Limonia*. The general denomination of the citron in Arabia is *lymonia*, whence limon and lemon, to which fruits this genus is nearly related. *L. monophylla* is a small thorny tree, with a berry the size of a small nutmeg, very like a lime, and called by the Hindoos wild lime. Ripened cuttings of the species root in sand, under a hand-glass plunged in a moist heat.

1004. *Glycosmis*. From *γλυκυσ*, sweet, and *σμη*, smell; all the parts of the plant, leaves, flowers, fruit, having an agreeable perfume. *G. pentaphylla* is an elegant fragrant shrub, very common in most uncultivated lands in Coromandel, but chiefly under large trees, where birds have dropped the seeds. It flowers all the year there. The whole plant, when drying in the shade, diffuses a pleasant permanent scent; the flowers are exquisitely fragrant; birds eat the berries greedily.

G. arborea has also very fragrant flowers.

G. citrifolia is a beautiful stove plant, not, indeed, remarkable for the shewiness of its flowers, but most valuable on account of its fruit, which is about the size of a hazel nut, very juicy and sweet, and produced in profusion in our stoves.

1005. *Murrraya*. So named by Koenig, in honor of John Andrew Murray, knight of the Swedish order of Vasa, professor of medicine and botany at Gottingen, and an editor of Linnæus's *Systema Vegetabilium*. The species are trees of the smallest size, with dotted pinnated leaves and fragrant white flowers, quite like those of an orange.

1006. *Cookia*. Named by Sonnerat in honor of our celebrated Captain Cook. The fruit is much esteemed in China, where it arrives at the size of a pigeon's egg, growing in bunches, and it is called Wampee. It grows well in light loam, and ripened cuttings with their leaves on root in sand in a moist heat.

1007. *Gærtnera*. In memory of Joseph Gærtner, M. D. F. R. S. Acad. Imp. Petrop. Memb., author of a most excellent work on the fruits and seeds of plants, Stuttg. 1788. It is a large climbing woody shrub, cultivated all over the coast of Coromandel, on account of the beauty and fragrance of its flowers. In the stove it requires a good deal of room to flower freely. It is easily increased in sand under a hand-glass. The genus is now referred to the natural order of Malpighiaceæ, among which it is remarkable for its white flowers.

1008. *Monotropa*. From *μονος*, one, and *τροπον*, to turn; its flowers are all turned one way. It is parasitical and without leaves, of a pale uniform hue, having a simple scaly stem; allied in habit to *Orobanche*, to some of the *Orchis* tribe in its peculiarity of scent, which is like that of primrose, or beans in blossom. The root is fibrous, much branched, and somewhat creeping, growing among dead leaves or in half decaying vegetable mould. Sir J. E. Smith says, he could never find it truly parasitical. In Sweden, Linnæus informs us, it is given dry to sheep affected with a cough.

Its natural affinity, which is certainly to the heath, *Pyrola*, and similar plants, is very singular and unexpected.

- 5902 Leaves simple, Spines solitary
 5908 Leaves pinnate, Leaflets oblong lanceolate crenulate, Spines solitary
- 5904 Leaves simple and 3-leaved, Leaflets ovate-oblong acuminate, Peduncles axillary shorter than stalk
- 5905 Leaves pinnate in 2 pairs, Leaflets elliptical entire
 5906 Leaves pinnate in 2 pairs, Leaflets oblong obsolete serrate
- 5907 Leaflets ovate, Peduncles many-fl. corymbose
 5908 Leaflets ovate-acuminate, Pedunc. axill. and solitary
- 5909 Leaves ovate-lanceolate acuminate nearly equal at base
- 5910 Leaves pinnated, Leaflets ovate-lanceolate
- 5911 Large cernuous, Scales close together
 5912 Flowers smooth lateral octandrous
- 5913 The only species
- 5914 The only species

- 5915 Leaves ovate-elliptical ternate and scattered, Corymbs terminal
 5916 Leaves oblong, Corymbs axillary, Bractes linear-lanceolate, Pedunc. and calyx downy with glands
- 5917 Leaves opposite oblong polished beneath glaucous revolute at edge, Branches 2-edged
 β Leaves linear more revolute green beneath
- 5918 Leaves alternate and opposite ovate-lanceolate and branches hairy, Pedunc. axill. 1-flowered

and Miscellaneous Particulars.

1009. *Dionæa*. One of the names of Venus. It is a singular plant in respect of its leaves, which are of an anomalous form, and have a singular motion by which they catch insects, whence the specific name, *muscipula*, a fly-trap. The root is scaly, almost like a bulb, and not prolific in fibres. The leaves have the petiole winged as in the orange; the extreme part, or proper leaf, is the part that operates as a trap. Linnæus affirms, that when the entrapped insect ceases to struggle and is quiet, the leaf opens and permits it to escape. This does not agree with Ellis's account, for he affirms that the lobes never open again, so long as the animal continues there. He thinks it probable, that a sweet liquor discharged by the red glands tempts the insect to its destruction. He adds, that if a straw or a pin be introduced between the lobes, they will grasp it as fast as if it were an insect. The flowers grow in a corymb resembling an umbel. It is rather difficult to preserve. Sweet finds it "thrive best when planted in a pot of Sphagnum with a little mould at the bottom of the pot, and placed in a pan of water." Shepherd, of the Liverpool botanic garden, finds that leaves of *Dionæa* so placed will root and form new plants. In all cases it is necessary that an abundance of fresh cool air should be supplied to the plants.

1010. *Garuga*. *Garugo* is the Telinga name of the plant, which is rare in our stoves, although not of recent introduction.

1011. *Kalmia*. So named by Linnæus in honor of Peter Kalm, professor at Abo in Sweden, author of *Travels in America*. The species are beautiful peat earth shrubs, deserving a place in every American ground. *K. latifolia* is a native of Carolina and other parts of North America, of Pennsylvania, New York, &c. but only in particular places; on rocks, hanging over rivulets, and on the sides of barren hills on the most sterile soil. The noxious qualities of this elegant shrub lessen that esteem which its beauty claims; for though deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better feed, eat the leaves, many die annually. Its blossoms in May, and continues in flower a great part of the summer. (*Catesby*.) The flesh of the American partridge is said to be poisonous in the winter from its feeding upon the buds of this plant. But Wilson denies this statement. The Indians use a decoction of the leaves for purposes of self-destruction. A few drops of the tincture poured upon the body of a large and vigorous rattle-snake, killed the reptile in a short time. An ointment made of the powdered leaves has been used with much success in *tænia capitis*, and some other cutaneous affections. (See *Bigelow's Medical Botany*.)

The wood, being very hard, is very useful in smaller works. The Indians are said to make small dishes, spoons, and other domestic utensils out of the roots: these are large, of a soft texture, and easily wrought when green; but when dry become hard and smooth. (*Curtis*.)

K. angustifolia is also reputed poisonous to sheep and cattle.

History, Use, Propagation, Culture,

1012. *Ledum*. Λένδων was the name applied by the ancients to the plant producing the substance called Ladanium, and now known by the name of *Cistus Ledum*. In foliage the *Ledum* of modern botanists agrees with the plant of the ancients. Pretty American plants, very commonly cultivated for the beauty of their flowers.

1013. *Rhodora*. A name of the same meaning as *Rhododendron*. It is well known in shrubberies as remarkable for its purple flowers appearing on the naked shoots before the leaves come out.

1014. *Rhododendron*. From *ρόδον*, a rose, and *δένδρον*, a tree, because the flowers resemble in color bunches of roses. Some of the species form beautiful and even splendid ornaments to the shrubbery or American ground; and all of them are interesting and deserving of culture.

R. ferrugineum and *hirsutum* abound on the high mountains of Switzerland, Austria, Savoy, Piedmont, Dauphiné, and terminate ligneous vegetation as we ascend, and furnish the shepherds with their only fuel. The grouse are said to eat them; and the white hares sometimes gnaw the bark in hard weather; but animals do not seem to feed on them, except from want of other food; and they are suspected of being in a small degree poisonous. The galls of some small insect are frequent on them.

R. dauricum is almost peculiar to the subalpine tracts of eastern Asia; it appears first at the mouth of the river Jenisea, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but about Baikal it is most abundant, and extends through the deserts of the Mongols to China and Tibet: at the Lena it becomes more rare, and beyond that it is much lower, with a more slender flower and narrower leaves. (*Pallas*.)

R. camtschaticum is an elegant evergreen under shrub; it grows abundantly in the peninsula of Kamtschatka and Behring's island in muddy places on the mountains.

R. caucasicum is a native of the higher rocks of Caucasus, near the perpetual ice, in the highest range of shrubby vegetation, with *Myrtillus* and *Vitis idæa*.

R. chrysanthum is a beautiful evergreen, resembling *R. dauricum*, and like it is a native of the alpine regions of Siberia, where it is a noted remedy for rheumatism. It is cultivated in this country with the

5919 Leaves linear revolute at edge beneath downy

5920 Leaves oblong revolute at edge beneath downy, Flowers about pentandrous

5941 Arborescent, Lvs. coriaceous cuneate-lanc. acute entire with downy scales beneath, Fl.-stalks scurfy rusty

5942 Pedunc. aggregate, Cor. ovate transparent, Lvs. altern. broad lanc. obtuse entire cinereous beneath

5943 Pedunc. aggregate, Cor. globose campanulate, Leaves oval subserrate shining

and Miscellaneous Particulars.

greatest difficulty. The leaves have an austere, astringent, bitterish taste, and are stimulant, narcotic, and diaphoretic. When taken, they first increase the arterial action and the heat of the body, producing diaphoresis; and these effects, according to Dr. Home's observations, are followed by a proportional diminution of excitement, the pulse in one case having been reduced thirty-eight beats. It has not been much used in this country. (*Thomson's London Dispensatory*, 477.)

R. maximum grows on rocks and in barren soils, where it continues flowering great part of the year, and is very ornamental.

R. ponticum grows in wet places in beech and alder coppices, on rocky mountains, but not on high alps.

Rhododendrons are commonly propagated by layers, but some sorts produce seeds, and seeds of others are obtained from America. The seeds "should be sown early in spring, in flat pans or pots of peat soil, and very thinly covered: they may then be set in a close frame, or at the front of a hothouse, till they come up, watering them slightly when dry; as soon as they are high enough to be laid hold of, they must be pricked out in other pots, which should be placed in a shady situation; they may stand in a frame a few days till they have taken fresh root, but they must not remain long, or it will spoil them. The small kinds may be propagated freely by cuttings, taken off in the young wood, and planted in sand, under a bell-glass." (*Bot. Cult.* 815.)

1015. *Epigaea*. From $\epsilon\pi\iota$, upon, and $\gamma\eta$, the earth. The stem grows flat upon the ground, and throws out roots all the length of its branches. A very pretty little American plant with delicate white flowers.

1016. *Andromeda*. Named in allusion to the virgin Andromeda, who, like this plant, was confined in a marsh, and surrounded by monsters of the waters. For an ingenious explanation of this application, see Linnæus's *Flora Laponica*. The species are neat little plants, and some of them considerable shrubs and trees. They all require peat earth, and a moist situation; for those of them which do not grow naturally in bogs are mostly inhabitants of alpine regions, where the air is always more moist than on plains.

A. hypnoides has the appearance of a moss, spreads over great tracts of ground in the Lapland alps, and adorns them with its beautiful red flowers. The *Andromeda* is generally increased by layers, but may be also raised from seeds. "These must be very thinly covered, as they are small, and would rot if covered deep:

History, Use, Propagation, Culture,

when about an inch high they should be planted out thinly in other pots, where they will grow strong, and, when large enough, may be planted in the open ground. Spring is the best time to plant them out as the frost and worms are apt to throw them out of the ground in winter, if planted out in autumn. (*Bot. Cult.* 278.)

1017. *Enkianthus*. From *εγζως*, a pregnant woman, a name given to the plant by Loureiro, because the great colored buds appear as if pregnant with the flowers which afterwards appear. This beautiful genus, as Sweet observes, has generally been considered difficult to propagate: the difficulty is now removed, as ripened cuttings root readily planted in pots of sand, and placed under a hand-glass, without bottom heat. The best soil for it is an equal mixture of sandy loam and peat, and care must be taken not to overwater it when not in a growing state: when it gets pretty large it is one of the most ornamental plants for the greenhouse or conservatory. (*Bot. Cult.* 186.) There are several species confounded under the common name *Enkianthus quinqueflora*.

1018. *Gaultheria*. Named after one Gauthier, a French physician at Quebec. A small evergreen plant, cultivated in the American border for the sake of its ornamental bright scarlet berries. The species may be increased by dividing at the root, by suckers, layers, or from seeds.

1019. *Arbutus*. An ancient name of this plant, said to be traceable to the Celtic *ar boise*, austere bush, in allusion to the roughness of the fruit. In like manner *Unedo* is said by Pliny to have been so called from *unum edo*, I eat one, because, being found disagreeable, no one could eat a second. *L'Arbusier*, Fr., *Landbeere*,

and Miscellaneous Particulars.

Ger., and *Arbuto*, Ital. This genus includes one of the most elegant of hardy shrubs, the *A. unedo*. This evergreen is peculiarly beautiful in October and November, covered at once with blossoms and ripe fruits. It is a native of the south of Europe, and is found also near Killarney in Ireland, where it has probably been brought from Spain or Italy at an early period by the priests. It grows there on limestone rocks, in greater luxuriance than it is often to be met with in the woods of Italy: in both countries the fruit is eaten; and in Spain both a sugar and spirit is extracted from it.

A. uva ursi, *La Busserole*, Fr., *Barrenbeere*, Ger., and *Uva d'orzo*, Ital., is abundant in many parts of the continent, especially the alpine regions. It dyes an ash color; tans leather; the berries are food for grouse and other game, and the leaves are used in medicine. The fresh leaves are inodorous, and have a slightly bitter astringent taste, leaving a sweet sensation in the mouth. When properly dried and powdered, they acquire an odour similar to that of hyson tea; but the taste remains the same, the degree of bitterness only being increased. (*Thomson's London Dispensatory*, 163.)

It is used sometimes in calculous complaints and ulcerations of the urinary organs.

The dwarf species of this genus and those of *Rhododendron* and *Andromeda*, are very fit plants for rock work. *A. alpina* thrives best in peat kept moist and shaded. All the species may be increased by seeds, or by budding and marching on each other: the dwarf kinds root readily by layers.

The *Uva ursi* has been brought into notice in modern times as an efficient remedy in nephritic and even in calculous cases. European practitioners have doubted its powers, but it has found many supporters of respect.

History, Use, Propagation, Culture,

tability in North America. The late professor Barton found the plant of much service in his own case of nephritic paroxysms alternating with gout in the feet. It has also been recommended as a remedy in pulmonary complaints. (See *Bigelow's Med. Botany.*)

1020. *Clethra*. Κληθρα was the name given by the Greeks to the Alder, to which, in its leaves, this bears some resemblance. Pretty upright North American plants, with white flowers. One species is a native of Madeira.

1021. *Mylocaryum*. From μύλον, a mill, and κάρων, a kernel or stone; the four wings of the nut may be easily likened to the four sails of a small mill. A North American plant, with the habit of *Andromeda*, or rather of *Clethra*.

1022. *Pyrola*. A diminution of *Pyrus*, to which, in the leaves, this is thought to be similar. A genus of elegant little plants, mostly evergreens. They grow naturally in the shade, and in rocky or very poor soils; in the garden on sand or gravel shaded; and they are increased by seeds or young cuttings, planted under a hand-glass. All the species are powerfully astringent and tonic, and one or more of the American sorts is said to constitute the chief ingredient in the scorbutic draughts of Whitlaw.

P. uniflora, Sir J. E. Smith says is one of the most curious and elegant of British flowers.

1023. *Chimaphila*. From χίμα, winter, and φίλω, to love; a sort of translation of the English name winter-green. The species may be treated as *Pyrola*, which they much resemble.

1024. *Inocarpus*. From ἰνος, fibre, and καρπος, fruit. The envelope of the nut is composed of tough interwoven fibres. It is a lofty tree, with alternate subcordate leaves, and flowers in racemes succeeded by by nuts called *Ratta* in Otahete. The kernel of these, which is kidney-shaped, and about an inch in diameter, is catch roasted by the inhabitants of the Society and Friendly Isles, the New Hebrides, New Guinea, the Molucca isles, &c. It is sweetish, but less pleasant than the chestnut, harder and less farinaceous. The bark is astringent, and is used in the dysentery. In New Guinea they smear the heads of their arrows with the expressed resinous juice. (*Forst. Escul.*)

1025. *Styrax*. A name altered by the Latins from the Arabic *asthirak*. Pliny says, that the Arabs in his time used the resin to flavor the perfumes of which they are so fond. *S. officinale* is a low tree with slender branches, ovate leaves, flowers in racemes from the sides of the branches, succeeded by ovate globular juice. It less drupes, containing one or two angular nuts. From this tree storax is obtained in Asiatic Turkey. It issues from incisions made in the bark; and as it was formerly the custom to collect and export it in reeds, it was named *Styrax calamita*. It has a fragrant odour, and a pleasant subacidulous, slightly pungent, and

- 5971 Leaves obovate serrate beneath pubescent, Raceme simple bracted
 5972 Leaves cuneate obovate acute upwards finely serrated beneath white with down
 5973 Leaves broad cuneate obovate acute coarsely serrated rough on each side
 5974 Leaves lanceolate obovate serrated smooth, Panicle narrow bracted
 5975 Leaves oval acuminate smooth on each side glaucous beneath, Racemes white with down
 5976 Leaves oblong acuminate serrated smooth, Racemes paniced, Peduncles hairy

5977 Leaves cuneate lanceolate acute, Racemes spiked terminal

- 5978 Stamens ascending, Style declinate, Raceme many-flowered
 5979 Stamens straight, Style declinate long, Peduncle twisted, Raceme many-flowered
 5980 Stamens and styles straight, Flowers racemose spreading
 5981 Raceme 1-sided
 5982 Stamens and styles straight, Flowers racemose closed, Petals rounded obtuse, Peduncle straight
 5983 Peduncle 1-flowered

5984 Peduncles 2-flowered
 5985 Peduncles umbelled

5986 The only species

- 5987 Leaves ovate beneath villous, Racemes simple shorter than the leaf
 5988 Leaves obovate villous beneath, Lower peduncles axillary solitary 1-flowered
 5989 Leaves subsessile oval or obovate beneath powdery, Fl. axill. and term. in threes on short stalks
 5990 Leaves oblong smooth on each side, Peduncles axillary 1-flowered solitary or twin

- 5991 Root creeping, Stems erect with peduncles and calyxes villous, Lower leaves spatulate upper lanceolate
 5992 Erect villous, Flowers tetrapetalous octandrous stalked
 5993 Erect, Flowers tetrapetalous octandrous stalked, Caps. many-valved, Leaves lanceolate
 5994 Erect smooth, Flowers tetrapetalous octandrous sessile
 5995 Flowers tetrapetalous octandrous, Stem erect angul. hairy, Leaves oblong hairy

5996 Leaves opposite ovate, Flowers paniced, Bractes lanceolate

and Miscellaneous Particulars.

aromatic taste; is stimulant, and in some degree expectorant. It was formerly much prescribed in asthma, catarrh, phthisis, and menstrual obstructions; but it is now scarcely ever employed, except as an adjunct on account of its fragrance.

Benzoin is obtained from the *S. Benzoin*, by wounding the bark near the origin of the lower branches. The tree is never wounded under six years of age; and cannot sustain these annual incisions above twelve years. (*Thomson's London Dispensatory*, 525.)

As shrubs this genus affords some plants that may be considered pretty and desirable, on account of their small size and free flowering. They grow best in sandy loam, are commonly propagated by layers, and may also be increased by seeds, which they occasionally ripen.

1026. *Jussiaea*. An obscure and most uninteresting genus of plants, selected, not very happily, to commemorate the family of the Jussieu, which has for more than a century and a half been at the head of botanical science. Antoine de Jussieu, born in 1686, and died in 1758, was professor of botany at the Jardin du Roi, and member of the academy of sciences. He published various papers upon exotic plants, and a discourse upon the progress of botany. He also edited the works of Barrelier. Bernard de Jussieu, his brother, born in 1698, died in 1777, was professor at the same garden, and member of the same academy. He also was author of various papers upon plants, a second edition of Tournefort's History of the Plants growing near Paris, and an arrangement of the plants growing in the garden of Trianon, which was published by his nephew. Joseph de Jussieu, a third brother, born in 1704, and died 1779. He was sent to South America by Louis XV., and remained there for six and thirty years. He made many discoveries, and brought home many new plants. Lastly, Antoine Laurent de Jussieu, their nephew, born in 1748, and still living, as demonstrator of botany at the Jardin du Roi, member of the Institute and of every learned body in Europe. He brought, in his *Genera Plantarum*, published in 1789, to a degree of extraordinary perfection, that system, the outlines of which had been traced by the hand of Tournefort, and partially filled up by his uncle Bernard. That system has now superseded, among men of science, all others, and if as yet inapplicable to merely popular purposes, can never be dispensed with in all philosophical investigations.

1027. *Getonia*. A Malabar plant, the meaning of whose name has not been explained. Cuttings root freely in sand, under a hand-glass, and plunged in heat.

History, Use, Propagation, Culture,

1028. *Quisqualis.* A Latin word, expressive of uncertainty. It was given by Rumphius to a tree of Amboyna, because it was subject to variation. It is a fine climbing genus of easy culture. The best soil for the species is a mixture of loam and peat; and cuttings root freely in sand, under a hand-glass. (*Bot. Cult.* 100.)

1029. *Melastoma.* From *μῆλας*, black, and *στομα*, mouth. Many of the species produce black berries similar to gooseberries, and which stain the mouth black. This is a very numerous genus of shrubs and low trees; the species display great unity of character, and may be considered ornamental. They require but little water in winter, and are easily increased in sand, plunged in a moist heat.

1030. *Petaloma.* From *πέταλον*, a petal, and *λωμα*, an edge. Flowers of which the petals are inserted on the edge of the calyx. A small plant with the leaves, but not flowers, of *Melastoma*.

1031. *Acisanthera.* From *ακίς*, a point, the anthers being pointed. Plants with the habit of *Melastoma*.

5997 Leaves ovate

5998 Leaves subcordate pubescent

5999 Leaves ovate-lanc. entire 3-nerved rough, Fl. terminal subcorymbose

6000 Leaves 3-nerved entire sessile ovate acute villous silky, Racemes brachiata, Stems square

6001 Leaves 3-nerved without a marginal one entire smooth on each side thin, Racemes term. Fls. sessile

6002 Leaves entire 3-nerved ovate-lanc. smooth, Margin and nerves hispid beneath, Fl. terminal

6003 Leaves entire 3-nerved oblong emarginate at base, Raceme erect term. Fl. tetrandrous

6004 Leaves toothletted 5-nerved ovate-lanceolate, Stem hispid

6005 Leaves ovate acuminate toothletted 5-nerved, Cymes axillary

6006 Leaves cordate acumin. 5-nerved serrulate pubescent, Cymes terminal, Sepals roundish, Stamens 5 sterile

6007 Leaves cordate subcrenate beneath rusty with down, Flowers axillary and lateral solitary sessile

6008 Leaves ovate lanceolate acuminate 5-nerved pilose somewhat toothletted, Branches bifid, Panic. term.

6009 Leaves entire 5-nerved subcordate scabrous, Cor. little hairy outside

6010 Leaves 7-nerved ovate lanceolate ovate rough

6011 Leaves 3-nerved without ribs ovate-lanceol. acuminate toothletted, Corymbs term. trichotomous powdery

6012 Leaves 3-nerved obl. lanceol. acute entire hoary beneath, Pedunc. umbelled, Bractes double

6013 Leaves 5-nerved entire ovate acute smooth above beneath hoary, Flowers clustered sessile

6014 Leaves entire 5-nerved ovate-oblong smoothish acuminate smooth at edge

6015 Leaves 5-nerved nearly entire oblong acuminate smooth beneath yellowish, Racemes cymose

6016 Leaves lanceolate ciliated 3-nerved obtuse at base, Stems square, Flowers terminal solitary

6017 Leaves lanceolate ciliated 3-nerved obtuse at base, Stems square, Flowers terminal solitary

6018 Leaves cordate oval entire stalked beneath woolly, Petals obovate, Petals bowed at base

6019 Branches winged, Leaves oval-lanceol. with a long point, Petals obovate pointed, Filam. woolly above

6020 Leaves oblong elliptical 3-nerved ciliated, Calyx setose at end

6021 Stamens 12, Leaves ovate-lanceolate 5-nerved, Stems and globose ovaries very hispid

6022 Peduncles solitary 1-flowered

6023 Leaves 3-nerved ovate crenate opposite

6024 Leaves obovate obtuse, Flowers 5-cleft decandrous

6025 Spikes elongated, Leaves wedge-shaped smooth

6026 Flowers octandrous, Leaves cordate smooth

6027 Flowers dodecandrous, Leaves ovate downy beneath

6028 Flowers 12-androus, Leaves ovate oblong serrulate

6029 Flowers 12-androus clustered, Leaves oblong obtuse serrated pubescent on each side

DIGYNIA.

6030 Leaves ovate roughish

6031 Leaves cordate oblong downy beneath

6032 Leaves oblong obovate obtuse smooth

6033 Leaves lanceolate smooth

6034 Leaves obovate lanceolate pubescent

6035 Leaves oblong lanceolate very villous

6036 Leaves lanceolate acute hairy beneath

6037 Leaves obovate villous coriaceous, Fl. stalked polyandrous polygynous

6038 Leaves elliptical, Flowers polyandrous polygynous

and Miscellaneous Particulars.

1032. *Dais*. A name of unknown application. The plant resembles in its leaves the *Rhus cotinus*, whence its specific name. It may be increased by cuttings of the roots placed in a warm situation.

1033. *Bucida*. From *βυς*, an ox. The form of the fruit when ripe resembles the horn of such an animal. This tree grows in Jamaica in low swampy lands near the coast; it is remarkable for its slender crooked branches, and the tufted disposition of the leaves: it grows to a considerable size, is reckoned an excellent timber tree, and the bark is greatly esteemed by the tanners.

Well ripened cuttings root in sand, plunged in heat, and covered.

1034. *Samyda*. *Σαμυδα* is the Greek name of the birch, to which this genus may be likened in its leaves. The species are rather tardy in growth, but not difficult to root in sand under a hand-glass.

1035. *Royena*. So named by Linnæus, in honor of Adrian Van Royen, who with his son David were successively professors of botany at Leyden. It consists of shrubs of little beauty, which are increased by ripened cuttings in sand under a hand-glass. They are chiefly natives of the Cape of Good Hope.

History, Use, Propagation, Culture.

1036. *Trianthema*. From *τρίεις*, three, and *άνθος*, flower; the flowers growing by threes in the axillæ of the leaves. The species are weeds in their native countries, and of little interest here.

1037. *Scleranthus*. From *σκληρος*, hard, and *άνθος*, a flower; when in seed the envelopes of the flower appear very much indurated. *S. annuus* is common throughout Europe and Siberia on a sandy soil. It flowers about the middle of summer, and sows its seeds very abundantly in autumn, which produce a crop of young plants that generally survive the winter, or, if destroyed, are replaced by another crop arising from those seeds that happen not to vegetate till spring. (*Eng. Bot.*) The Swedes and Germans receive the vapour arising from a decoction of it into their mouths, to cure the tooth-ache. (*Withering*.)

S. perennis in several parts of Europe has its roots attacked by the insect *Coccus Polonicus*, *Lin.* which yields a fine crimson dye, and is said likewise to live on *S. annuus* and some *Potentilla*. Sir J. Smith has "never been able to find this insect on these plants in England." (*Flora Brit. ii.* 283.)

These two species are occasionally found in abundance upon barren heathy wastes.

1038. *Cunonia*. In memory of John Christian Cuno, of Amsterdam, who described his own garden in Dutch verse in 1750. This is a handsome tree, with fine shining green foliage, contrasted by numerous dense elongated branches of small milk-white flowers, and twigs of a red color; having the habit of a tropical rather than of a Cape plant. Its colonial name is *Rood Elze* (red alder), although the tree has not in any point of view the least resemblance to the alder of Europe.

1039. *Hydrangea*. From *ήδωσ*, water, and *αγγειον*, a vessel. The common garden species, *H. hortensis*, is quite a marsh plant, and to be managed well should have a very copious supply of water in summer. A large plant will consume ten or twelve gallons daily, in warm weather.

H. quercifolia is an elegant plant when in leaf; but as it is barely within the limits of ligneous plants, it dies down to the ground on the approach of frost. *H. hortensis* is much valued on account of the great profusion of its very elegant flowers, which are monstrous in the same manner as the *Viburnum opulus*. It has never

6039 Flowers pentandrous monogynous
6040 Flowers about decandrous digynous

6041 Calyx of fruit spreading
6042 Calyx of fruit closed

6043 The only certain species

6044 Cymes naked, Leaves oblong ovate acuminate toothed smooth
6045 Cymes radiate, Leaves cordate toothed
6046 Leaves ovate acuminate toothed beneath white with down, Serratures mucronate

6047 Cymes radiate, Leaves oblong sinuate-lobed toothed
6048 Cymes radiate, Leaves elliptical narrowed at each end toothed smooth

6049 Leaves alternate
6050 Leaves opposite roundish hairy, Stems decumbent

6051 Leaves orbiculate or oval stalked pimpled ciliate cordate at base, Petals round, Sepals mucronate
6052 Leaves oval retuse obsolete serrated stalked, Stem naked, Panicle bearded
6053 Leaves cordate orbicular serrated stalked, Panicle headed
6054 Leaves radical ligulate with cartilaginous teeth, Stem panicled leafy, Cal. hairy with glands
6055 Radical leaves rosed straight glaucous supine crenate, Panicle simple
6056 Leaves radical lingulate with cartilag. teeth, Stem simple racemose leafy, Cal. smooth
6057 Radical leaves aggreg. lanc. obov. with cartilaginous teeth, Stem leafy clammy, Calyxes glandular
6058 Leaves rad. lingulate with a cartilaginous repand edge, Stem racemose leafy, Cal. with gland. hairs
6059 Leaves obl. lanc. hairy toothletted, Stem naked, Peduncles alternate in corymbose heads
6060 Leaves obl. lanc. smooth repand toothed, Stem naked, Peduncles 1-flowered aggregate
6061 Smoothish, Leaves oblong-lanc. acute eroded, Stem naked, Panicle oblong
6062 Leaves roundish toothed with long stalks, Stem naked
6063 Leaves obovate retuse with cartilaginous crenæ, Stem naked panicled
6064 Leaves cordate oval retuse with cartilaginous crenæ, Stem naked panicled
6065 Leaves reniform toothed, Stem naked panicled
6066 Leaves cuneiform very obtuse repand, Stem naked panicled
6067 Very hairy, Lvs. elongate spatulate acutely toothed, Stems divaricate dichotomous, Panic. capillary lax
6068 Leaves roundish toothed hairy, Runners creeping, Two petals long
6069 Leaves rhomboid toothed variegated hairy, Runners very weak, Petals nearly equal
6070 Leaves cuneate obovate somewhat toothed shorter than stalk, Stem panicled
6071 Leaves roundish cuneate crenate in front, Stem naked simple, Flowers clustered racemose

and Miscellaneous Particulars.

been found in a wild state, but is extensively cultivated in the gardens of China and Japan, from whence it was introduced to Kew by Sir Joseph Banks. The flowers are almost always barren; they are naturally of a rose color, but under certain circumstances of culture they become blue. The yellow loam of Hampstead Heath and some other places, and some sorts of peat earth are found to produce this effect; but the cause is not yet ascertained. Dr. Daalen, of Antwerp, finds that turf-ashes, and, still more effectually, those of the Norway spruce, the wood generally used as fuel by him, applied to the roots of Hydrangea, produced the blue color of the petals. (*Neil's Hort. Journ.* 122.) According to Busch, of Petersburg, "the hydrangea will be turned blue by watering the young plant, the summer before, with alum water. Our grey colored earth, under the black moor-earth, has the same effect, being combined with aluminous salt." (*Hort. Trans.* vol. iv. 568.) Sweet recommends a bed of peat, and says, the longer it remains there the bluer will be the flowers.

The hydrangea, to flower freely, must not be allowed more than three or four strong shoots from the same root; it must have abundance of pot room, and plenty of water when in flower. It is a good plan to shift the plants twice or oftener during the early part of the season. If plunged and turned out of the pot into an open border in the end of May, they will flower vigorously, and will even stand the winter around and south of London, and flower yearly, and if well protected in winter very freely and strongly. The flowers are produced from the extremities of the shoots of the current year.

1040. *Chrysosplenium*. From χρυσός, gold, and σπλήν, the spleen; a figurative name applied to this plant, with reference to its medicinal qualities. It is said to be a powerful cathartic. In the Vosges the plants are used copiously as a salad, under the name of *Cresson de Roche*.

1041. *Saxifraga Saxum-frango*, to break the stone; a name contrived in reference to supposed medicinal qualities which are now forgotten.

An elegant genus of alpine plants, which have long been favorites in gardens. Many of the species are

History, Use, Propagation, Culture,

quite easy to cultivate, and although naturally mountaineers, not incapable of breathing the more impure air of towns and vallies. The greater part known are delicate and difficult to rear: they are regardless of cold, but suffer from mild and humid weather during the winter months. Most of the species are perennial, with either fibrous or granular roots, and a few are annual. Of the latter one species, *S. tridactylites*, is common upon very old walls in England, flowering in the beginning of the spring. The parts of fructification are extremely variable in this genus, and have given rise to the construction of many supposed genera, the constituents of which have the recommendation of agreeing with one another pretty well in habit. The limits, however, of these genera are too obscure, and the gradations by which they are united so obvious, that they have not yet been adopted by men of science generally. Without interfering with that question, the old mode of considering Saxifrage has been here adhered to, as being the most popular and the best under-

- 6072 Leaves obovate crenate subsessile, Stem naked, Flowers headed
 6073 Leaves serrate, Stem naked branched, Petals acuminate
 6074 Leaves lanc. mucronate with a cartilaginous ciliated edge, Stem naked few-fl. Cal. obtuse
 6075 Leaves linear perforated dotted aggregate recurved, Stem many-fl.
 6076 Leaves lanc. obtuse hairy, Stem naked 2-flowered
 6077 Leaves ovate opposite imbricated: the upper ciliated
 6078 Cauline leaves lanc. alternate ciliated, Stems procumbent
 6079 Cauline leaves lanc. alternate naked unarmed, Stem erect
 6080 Cauline leaves lin. subul. scattered naked unarmed, Stem decumbent
 6081 Cauline leaves linear alternate ciliated: radical aggregate
 6082 Cauline leaves reniform toothed stalked, Stem panicled
 6083 Cauline leaves reniform lobed, Stem branched, Root granular
 6084 Cauline leaves palmate stalked, Stem very simple 1-fl. bulbiferous
 6085 Cauline leaves palmate: the upper floral ovate, Stem simple about 2-flowered
 6086 Cauline leaves ovate lobed, Stem filiform weak
 6087 Leaves cuneiform 3-parted with trifid linear segments, Stem simple ascending, Petals lanceolate
 6088 Radical leaves reniform 5-lobed many-cleft, Cauline linear, Stem nearly naked branched
 6089 Rad. lvs. reniform pedatifid 7-lobed, Caul. palmate and lin. Stem nearly naked branched, Pet. lin. obov.
 6090 Smooth, Radical leaves 3-lobed, Lobes many-cut; lateral segments falcate, Stem panicled, Cal. colored
 6091 Radic. leaves palm. 5-parted, Cauline linear undivided, Stems ascending many-fl.
 6092 Leaves hairy trifid or 5-fid bearded, Runners procumbent, Stem leafy, Petals obovate rounded
 6093 Leaves reniform palm. hairy, Stem and flower-stalks filiform
 6094 Caul. leaves wedge-shaped trifid alternate, Stem erect branched
 6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Cauline 5-toothed; upper trifid, Pedunc. about 3-fl.
 6096 Leaves palmate 3-parted, Segments subtrifid, Stem branched ascending
 6097 Leaves cuneiform palmate 5-fid ciliated longer than the linear petiole, Runners very short tufted
 6098 Leaves hairy 3 or 5-parted, Lobes elliptical acute, Runners ascending, Petals obovate 3-nerved
 6099 Leaves hairy palmate 5-cleft and trifid, Stem leafy panicled, Petals roundish
 6100 Leaves ciliated cuneate trifid nearly 5-cleft, Pedunc. solitary elongate 1-fl.
 6101 Cauline leaves lin. entire and trifid, Runners procumbent, Stem erect nearly naked
 6102 Radic. leaves aggregate entire and trifid acute linear, Stem viscid nearly racemose, Petals length of cal.
 6103 Radic. leaves aggregate membranous lin. lanceolate entire or trifid, Stem nearly naked about 2-fl.
 6104 Radic. leaves aggr. linear obtuse trifid cut, Stem erect many-fl. Petals twice as long as cal.
 6105 Leaves imbric. cuneate-palmate ciliated, Petals round, Styles spreading, Stigmas flat woolly
 6106 Radical leaves aggregate entire and trifid oblong obtuse, Stem filiform about 2-fl. Pet. as long as calyx
 6107 Leaves cordate acutely lobed toothed, Scape racemose
 6108 Leaves ovate cordate acute shortly lobed toothed, Raceme filiform spiked
 6109 Leaves biternate

- 6110 Leaves cordate about 3-lobed toothed, Scape 2-leaved
 6111 Leaves orbiculate reniform doubly crenate lucid, Scape setaceous lucid
 6112 Leaves reniform repand ciliated, Scape naked

1. *Calyxes not scaly.*

- 6113 Flowers clustered, Stems simple roughish, Leaves linear fleshy
 6114 Flowers corymbose, Stem ascending, Leaves lanc. lin. obsoletely 3-cornered obt. 1-sided, Stam. exerted
 6115 Flowers corymbose, Petals rarely submarginate, Leaves linear fleshy smooth flat
 6116 Flowers corymbose, Branches divaricating, Leaves ovate lanc. smooth at the base cordate amplexicaul.
 6117 Branches spreading, Flowers panicled small, Pan. much branched, Fl.-stalks viscid
 6118 Flowers panicled, Panic. much branched polished, Leaves ovate lanc. half stem-clasping
 6119 Fl. trichotomous panicled, Pedunc. villous viscid, Petals emarginate twice as long as calyx
 6120 Fl. panicled very minute dioecious, Peduncles smooth filiform divaricating, Leaves lin. lanc. rough
 6121 Fl. panicled, Panic. divaricating, Branches few-flowered pubescent viscid, Leaves lin. lanc. obtuse
 6122 Fl. dichotomous, Panic. smooth, Pet. emarg. twice as long as cal. Leaves lanceolate fleshy

*and Miscellaneous Particulars.*

stood. The species are subject to great variation in appearance, and to much diversity of opinion among those who profess to be best acquainted with them. A middle course has here been taken, by which the doubtful kinds have been omitted, and those which are recognized, if not defined, satisfactorily, are alone admitted.

1042. *Tiarella*. From *tiara*, a particular kind of head-dress, a mitre, in allusion to the form of its capsule. Pretty little North American herbaceous plants, related to saxifrage, and easily cultivated in pots of light sandy peat and loam.

1043. *Mitella*. A diminutive of *mitra*, a mitre; so named for the same reason as the last genus, which it altogether resembles in habit and constitution.

1044. *Gypsophila*. From *γυψος*, chalk, and *φίλιον*, to love; most of the species delight in chalky districts.

History, Use, Propagation, Culture,

Some of the species are fine border plants, but the greater part are of little beauty, and only grown in botanic gardens.

1045. *Saponaria*. In allusion to its mucilaginous sap, which is said to be fit for supplying the place of soap, *sapo*. *S. officinalis plena* is considered a border flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which are underground creepers, like those of couch. The leaves form a lather with soap, and take out spots of grease in the same manner. The whole plant is bitter, and was formerly used to cure the itch and the venereal disease.

1046. *Dianthus*. *Διος ωρθος*, the flower of God, or divine flower; so named on account of its pre-eminent beauty. Most of the species of this genus are highly valued, not only for the beauty of their flowers, but also as being evergreens; their foliage during winter being as abundant and vivid as in summer. The fragrance of some of the species is peculiarly grateful, and no plant in this respect surpasses the carnation. *D. barbatus* is an old inhabitant of the flower garden, and was much esteemed in Gerard's time "for its beauty to deck up the bosoms of the beautiful, and garlands and crowns for pleasure." The varieties are numerous, but as the plant has never been treated by florists as a leading flower, they have not been named or improved. A hybrid variety called the Mule, or Fairchild's Sweet-William, is supposed to have been produced from seeds of the

- 6123 Fl. panic. Stem diffuse, Leaves lin. lanc. grassy carinate cæsios
 - 6124 Stems panic. few-fl. Stam. shorter than emarginate petals, Leaves linear smooth
 - 6125 Petals obovate emarginate campan. Stamens shorter than corolla, Leaves linear somewhat fleshy
 - 6126 Stems panicled, Styles longer than emarginate petals, Leaves lin. lanc. smooth
 - 6127 Stem dichotomous panicled much branched, Fl. axill. solitary, Leaves lin. flat as long as fl.-stalks
2. *Calyces supported by 2-4 scarious scales.*
- 6128 Stems numerous erect stiff, Fl. panicled terminal, Leaves linear rigid

6129 Flowers fasciated panicled, Cal. rounded villous yellowish, Leaves ovate lanc. acute or not

- 6130 Fl. panicled, Cal. pyramid. 5-ang. smooth, Bractes membranous acute, Leaves ovate lanc. sessile
- 6131 Stem erect, Branches divaric. with clammy hairs, Fl. on long stalks axill. Leaves lanc. linear
- 6132 Stems erect branched, Fl. panic. and corymbose, Cal. slender glandular purple, Lvs. ovate lanc. 1-nerved
- 6133 Stem dichotomous, Branches divaricating, Fl. axill. Cal. hispid round, Leaves linear spatulate
- 6134 Tufted, Stems 2-leaved, Flowers headed with an involucre, Cal. woolly

§ 1. *Flowers capitate or corymbose, scssile or stalked.*
* *Bractes ovate, blunt.*

- 6135 Scales of calyx ovate pointless longer than tube, Leaves serrulate
 - 6136 Like the last, but the flowers nearly solitary
- ** *Bractes lanceolate, acute, Calyxes villous.*
- 6137 Flowers loosely bundled, Scales lanc. subul. as long as tube, Leaves subulate, Calyxes hairy
 - 6138 Flowers densely bundled, Scales ovate subul. as long as tube, Pet. beard. Lvs. subul. pub. rough upright
 - 6139 Fls. aggreg. Scales long. than cal. striat. rough, Lvs. lin. short. than joints rough, Stem simple rough upw.

*** *Bractes ovate or lanceolate, Calyxes smooth.*

- 6140 Flowers aggregate fasciated, Scales ovate subulate as long as tube, Leaves lanceolate
 - 6141 Flowers aggregate racemose corymbose, Scales ovate lanceolate finally longer than calyx, Lvs. obl. lanc.
 - 6142 Flowers aggregate fasciated, Scales acute ciliated twice as short as tube, Leaves ovate short
 - 6143 Fls. subsess. capitate, Scales imbric. mucron. at end spreading a little short, than tube, Lvs. long narrow
 - 6144 Glaucous, Fls. sess. capitate, Scales broad ovate with a long awn longer than head, Upper lvs. dilat. at base
 - 6145 Dark green, Flowers sessile capitate, Scales ovate very short pointless, Leaves narrow rough
- 2 Flowers panicled fastigate and solitary stalked
- 6146 Fl. aggreg. Involucres and scales scarious rufous oblong awned a little shorter than cal.
 - 6147 Fl. aggreg. sessile and stalked, Scales ovate awned shorter than tube, Leaves linear 3-nerved
 - 6148 Like the last, but flowers aggregate headed sessile 3-5
 - 6149 Flowers aggregate, Claws of petals very long, Scales mucronulate closely imbricated, Leaves subul. fleshy
 - 6150 Flowers aggregate, Claws of pet. as long as cal. Scales mucr. closely imbric. very short, Leaves lanc. obt.
 - 6151 Flowers aggregate, Scales ovate subulate thrice as short as tube, Leaves lin. lanc. narrowed at each end
 - 6152 Flowers aggregate on long stalks, Scales twice as short as tube

§ 2. *Flowers panicled or solitary.*
* *Petals toothed.*

- 6153 Flowers fasciated, Scales ovate lanceolate shorter than tube, Petals acutely toothed, Lvs. lin. lanc. rough
- 6154 Like the last, but the flowers more numerous, and the leaves linear lanc.
- 6155 Stem panicled somewhat hairy, Fl. sol. Scales ovate acute twice as long as cal. Leaves subul.
- 6156 Flowers fasciated twin, Scales awned as long as calyx, Petals crenate, Stem decumbent, Lvs. anc. obt.
- 6157 Flowers somewhat corymbose, Scales furrowed mucron. twice as short as tube, Stems diffuse smoothish
- 6158 Flowers nearly sol. Scales 6 ovate mucron. much shorter than cal. Pet. crenate, Lvs. subul. rough at edge
- 6159 Stem panicled smooth, Flowers solitary, Scales ovate awned as long as tube, Leaves subulate nerved
- 6160 Stem many-fl. smooth, Scales cuspid, spreading shorter than tube, Pet. downy at orifice, Lvs. lin. roughish
- 6161 Stem panicled, Fl. sol. Scales acuminate appressed, Petals acutely toothed, Leaves subul. lanc.
- 6162 Stem branched, Fl. sol. Scales linear leafy, Petals toothed, Leaves lin. lanc.

and Miscellaneous Particulars.

carnation impregnated by a Sweet-William. *D. caryophyllus* is considered the source whence have sprung the numerous varieties of the carnation, and some think those also of the pink. The pink, however, is more probably derived from some of the smaller growing species, as *plumarius*, *deltoides*, *armeria*, *carthusianorum*, &c.

The carnation is rarely found wild in England, but it may be gathered on the south side of the Swiss Alps. It seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favor for its beauty and rich spicy odour. It is the principal florist's flower of Germany and Italy, from which countries the British florists procure their best carnation seed, and also some esteemed varieties.

The varieties of carnation amounted to nearly 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes; flukes, bizarres, and picotees. Flakes have two colors only, and their stripes large, going quite through the leaves; *bizarres*, Fr. (odd, irregular) are variegated in irregular spots and stripes, and with no less than three colours; *picotees*, Fr. (*piquettée*, pricked or spotted) have a white ground, spotted or pounced with scarlet, red, purple, or other colors. Of

History, Use, Propagation, Culture,

each class there are numerous varieties, arranged under the farther subdivisions of scarlet flake, pink flake, purple flake, yellow flake, &c. ; scarlet bizarre, crimson bizarre, &c. ; and purple picotee, yellow picotee, &c.

Picotees are rather smaller flowers than carnations, and are distinguished by the serrated margins of their petals ; the colors are principally yellow and white spotted, and the plants are considered harder than the other sorts. Whatever colors the flower may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis, or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white, *i. e.* one half, or nearly so, which should be perfectly clear and free from spots. Bizarres, or such as contain two colors upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colors are remarkably rich, and very regularly distributed. Scarlet, purple, and pink are the three colors most predominant in the carnation ; the two first are seldom to be met with in the same flower, but the two last are very frequently.

New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping. Established or approved varieties are continued by layering and cuttings, or, as they are commonly called, pipings. The soil in which the carnation thrives best is a rich loam rather sandy than otherwise ; the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom. Carnations grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvass or bunting when the plants are in blossom. Those who are curious in blowing their carnations have a great many nice and curious operations to perform when they come into flower. Such petals as are plain, or run from the proper colors of the variety, are extracted by a particular instrument ; the remaining petals are next arranged so as to form a convex imbricated surface ; the calyx being slit down or tied up as may be necessary to aid this end. Then the flowerstalks are neatly tied to sticks, and the flower supported in a pendant attitude by means of properly formed brass wires.

- 6163 Stem branch. upw. closely dichotom. Fl. sol. Bract. with a spread. leafy point, Lvs. lin. subul. 3-nerv. hairy
 6164 Stem branched, Fl. sol. Scales very short ovate, Petals very broad beardless, Lvs. lin. sub. channelled glauc.

6165 Stem branched or simple, Fl. sol. Scales very short 4 ovate, Pet. broad beardless toothed

6166 Stem dichotomous panicled many-fl. glaucous, Fl. sol. Scales 4 pungent spreading shorter than tube

6167 Fl. sol. subcorymb. Scales ov. lanc. short. than tube, Lvs. lin. lanc. obsol. 3-nerv. smooth, Pet. twice toothed
 6168 Fl. sol. Scales ovate acute very short, Petals emarginate or nearly entire

6169 Stem branched, Fl. sol. Scales ovate acute very short awned, Pet. lanc. narrow, Leaves subul. roughish

6170 Stem few-fl. Fl. sol. Scales very short mucron. spreading, Tube gibbous, Pet. entire, Lvs. caspitose subul.

6171 Stem decumb. branched, Fl. sol. Scales ovate lanc. acute twin, Upper leaves narr. acute: lower oblong obt.

6172 Like the last, but flowers white, Leaves and stem glaucous

6173 Stem branched, Fl. sol. Scales 6 lanc. appressed, Pet. smooth cuneate obovate, Lvs. lin. acum. channelled

6174 Stems tufted few-fl. Fl. sol. Scales ovate acute short, Leaves subul. spreading downy rough

6175 Stem 1-fl. Scales 2 ovate acute short spreading, Cal. contracted in middle, Lvs. lin. chann. roughish at edge

6176 Stem 1-fl. Scales 4 acute short, Petals bearded doubly serrated, Leaves lin. spreading

6177 Stems tufted about 1-fl. Scales roundish short, Pet. crenate downy, Leaves bluntish rough at edge

6178 Stem 1-fl. Outer scales as long as tube: inner much shorter, Pet. crenate, Leaves obl. obtuse

6179 Pedunc. bifid term. Scales lanc. cusp. erect short. than tube, Pet. cut, Lvs. lin. nerved serrul. rough at edge

6180 Stems about 2-fl. Scales 4 ovate acute twice as short as tube, Petals serrate downy, Leaves linear

6181 Stem about 1-fl. Scales obovate mucronate, Pet. beardless many-cut, Leaves subul. entire smooth nerved

** Petals fringed.

6182 Stems ascending about 1-fl. Scales short ovate, Pet. toothed many-cut, Leaves lin. ciliated

6183 Fl. sol. Scales 4 lanc. short, Petals emarginate at the end fringed toothed

6184 Glaucous, Stems 2-3-fl. Teeth blunt, Bractes ovate very short pointed, Leaves lin. rough at edge

6185 Like the last, but the petals bearded at their orifice

6186 Stem pan. few-fl. Fl. sol. Scales ovate acum. Petals equally cut crenate, Leaves glaucous rough at edge

6187 Stems 1-fl. Scales ovate lanceolate acuminate shorter than tube, Pet. beardless, Lvs. subul. rough at edge

6188 Stem branched few-fl. Scales 4 blunt short, Petals beardless dotted, Leaves glaucous linear flaccid

6189 Stems 1-fl. Scales ovate obtuse four times as short as calyxes, Pet. naked, Leaves subul. glauc. ciliated

6190 Stems 1-fl. Scales ovate obtuse, Leaves linear

6191 Stem half-shrubby branched at base 2-fl. Scales 6 lanc. shorter than cal. Leaves subul. rough

6192 Fl. scattered solitary, Scales lanc. lin. spreading a little shorter than tube, Leaves lin. nerved flaccid

6193 Stem panicled few-fl. Fl. sol. Scales subul. straight twice as short as tube, Petals digitate, Lvs. lin. serrul.

6194 Stem panic. many-fl. Fl. fastigiate, Scales short ov. mucron. Pet. beyond the middle pinn. many-cut hairy [at orifice

TRIGYNIA.

6195 Branches divaricating, Leaves ovate, Cal. campanulate, Pet. distant

and Miscellaneous Particulars.

Behind the petals a circle of card paper is sometimes fixed to keep them in position, and the pot in which the plant grows is placed on a particular description of saucer, by which it is surrounded by water, in order to prevent the approach of ground insects, and especially of the carwig. These and a number of other operations will be found described at length in Maddock's Florist's Directory, and in the Encyclopædia of Gardening. (Sec. 6406.)

The pink, as a florist's flower, is of much less antiquity than the carnation: it is scarcely mentioned by Gerard, and Parkinson has given very few varieties. It was chiefly grown as a border flower till within the last fifty years, since which it has been greatly improved and many fine varieties originated. Being one of the hardest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as about Paisley, by the muslin weavers there.

The varieties of pink most cultivated are chiefly those called pheasant's eyes, which seem to have sprung from *D. plumarius*. Cob pinks are a large sort seemingly intermediate between pinks and picotee carnations; red early pinks are smaller plants than cobs, but larger than pheasant's eyes, and seem to have sprung from cobs and *D. armerius* or deltoides. The Paisley growers reckon above three hundred varieties of the pheasant's eyes. To garden pinks in general Wildenow gives the appellation of *D. hortensis*.

The propagation and culture of the pink is the same as that of the carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, and the small side shoots reduced in the autumn in order to throw more strength into those intended to produce flowers the following season. Some cover their pink bed with an awning. Not more than eight or ten flowers are ever allowed to expand on one plant, and these, if they shew a tendency to bursting at the calyx, are to be tied as in carnation culture.

1047. *Cucubalus*. A name signifying a bad subject; an evil weed. According to Miller, the berries of this plant are no less deadly than those of Nightshade.

1048. SILE'NE. L.		CATCHFLY.			<i>Caryophylleæ.</i>		<i>Sp. 107</i> —217.			Eng. bot. 1081

History, Use, Propagation, Culture,

1048. *Silene*. A poetical name, after the God Silenus, who is represented as always drunk and covered with slaver, as the species of this genus usually are with a viscid secretion. This is a large family of small plants, neither remarkable for use, beauty, or as bad weeds. *S. inflata*, the Cucubalus Behen L., may be used as a substitute for asparagus or green pease, the young shoots having the flavor of both. They ought to be gathered

- § 1. *Tufted, Stems scarcely any, Calyx somewhat inflated, Peduncles 1-flowered.*
 6196 Smooth, Stems dense, Leaves lin. lanc. Flowers dioecious, Calyx campanulate
 6197 Stems less dense, Leaves lin. spatulate pubescent, Cal. inflated hairy
- § 2. *Cauliscent, Flowers solitary or panicked, Calyx bladderly inflated.*
 6198 Pubescent, Leaves large ovate-lanc. Fl. in large panicles, Cal. much inflated, Petals fringed
 6199 Hispid, Leaves ovate-lanc. on long stalks wavy, Cal. much inflated, Pet. lacerated crowned
 6200 Stems erect branched pubescent, Leaves 4 whorled lanc. with long points smooth, Fl. pan. Cal. bladderly
 6201 Stems branched, Fl. pan. Cal. bladderly ovate, Pet. bifid naked, Styles very long
 6202 Like the last, but hairy with ovate lanc. leaves
 6203 Like the last, but creeping with smaller nearly spatulate leaves
 6204 Smooth branch. Lvs. lanc. : the lower stalk. Fl. pan. Cal. ovate veiny, Pet. with 2 very short lobes crowned
 6205 Pubescent, Stems very tall branch. Lvs. large lanc. Fl. pan. Cal. ov. netted, Pet. with a claw hairy at base
 6206 Smooth, Stem erect simple rather leafy, Lvs. lin. scarcely ciliat. Fl. in pan. spikes, Claws of pet. not ciliated
 6207 Smooth with very leafy branched procumbent stems, Leaves lanc. Fl. axill. opp. and terminal, Petals bifid
 6208 Nearly smooth, Stems little branched, Leaves obovate serrulate-ciliated, Fl. pan. Pet. obcordate crowned
 6209 Hoary, Stem erect branched, Leaves lanc. : the upper linear, Fl. few term. Petals O
 6210 Stems procumb. diffuse 2-3-chotomous branched, Lvs. small lin. Petals half-bifid with an obcord. crown
 6211 Nearly smooth, Stems wavy branched leafy, Leaves lin. lanceolate, Petals 2-lobed
 6212 Smooth, Stem erect, Leaves acute glaucous, Fl. solitary, Pet. lanceolate with a 2-lobed crown
- § 3. *Cauliscent, Flowers spiked in whorls.* [Fl. small dioecious]
 6213 Leaves erect, with a few branches, which are scarcely pubesc. or leafy, Lower lvs. numerous spatul. fleshy,
 6214 Stem pubesc. branched, Lower leaves large lanc. spatulate : upper lin. long, Fl. panicked with linear petals
 6215 Hoary, Stems assurgent nearly simple, Leaves spatulate lanc. Cal. spherical 10-striped
 6216 Stems erect nearly simple, Lvs. lin. : lower obt. Fl. very numerous and small, Cal. obov. clavate 10-striped
 6217 Half-shrubby smooth, Stems much branched. Lvs. lin. lanc. shortly ciliat. numerous, Cal. infl. clav. 10-striped
 6218 Stem simple, Lvs. lin. lanc. : lower broader stalk. Cal. clavate cylindr. 10-strip. Pet. 2-part. Stam. very long
 6219 Smooth, Stems erect simple very leafy, Lvs. lanc. small, Spike dense, Cal. clavate netted, Stam. very long
 6220 Velvety, Radical leaves cochleate smooth, Cal. tubular 10-striped, Pet. 2-fid, Stamens very long
 6221 Pubescent very viscid, Stem simple thick leafy, Leaves large lin. lanc. wavy, Fl. large nodding
- § 4. *Cauliscent, Calyx conoid, at the bottom retracted, with very long teeth.*
 6222 Pubescent, Leaves linear soft, Cal. short conical
 6223 Stems pubescent, Leaves lanc. lin. nearly smooth, Cal. long conical
 6224 Pubescent, Leaves lanceolate wavy : the lower stalked, Fl. large in loose dichotomous panicles
- § 5. *Cauliscent, Flowers spiked, axillary, not opposite, Calyx with 10 stripes.*
 * *Calyx cylindrical.*
 6225 Hairy, Stems branched, Leaves lanc. acute, Cal. ventricose with very long teeth, Petals small crowned
 6226 Very hairy, Stems much branched, Lower leaves obovate spat. : upper lanc. obtuse, Petals undivided
 6227 Stems branched, Leaves lin. lanc. Spike 1-sided, Cal. cylindrical with 10 ribs, Teeth long, Pet. 3-toothed
 6228 Hairy, Stems branched, Lower lvs. spatulate : upper lanc. obtuse, Cal. teeth short, Pet. obov. crowned
 6229 Hairy, Stems branched, Leaves spatulate, Spike 1-sided few-fl. Cal. very hairy, Pet. obovate crowned
 6230 Hairy, Stem much branched, Leaves lanc. cusp. Spikes twin dense, Pet. small bifid
 6231 Stems simple vill. Leaves pub. : lower spatul. ; upper lanc. Spike 2-ranked few-fl. Pet. obov. retuse crowned
 6232 Pubesc. Stems branch. Lvs. lanc. : lower obt. Spike 1-sid. Cal. vill. with short teeth, Pet. roundish crowned
 6233 Stem branch. hairy below, Lvs. pubesc. with a long fringe at base, Cal. cyl. nearly smooth ribbed and netted
 6234 Like the last, but flowers few distant, Petals smaller
 6235 Hairy, Stem branched leafy, Leaves lin. lanc. Flowers terminal, Cal. cylindr. Pet. bifid
 6236 Hairy, Fl. sessile 1-sided, Cal. cylindr. appressed, Petals small deeply emarginate
- ** *Calyx clavate.*
 6237 Hoary, Stems prostrate branched, Lvs. obovate spatulate ciliated at base, Fl. 1-sided erect, Pet. bifid
 6238 Stems branch. pubesc. Lvs. scabrous cil. at base : lower spatul. ; upper lanc. Fl. sess. nodding, Pet. 2-parted
 6239 Pubescent, Lvs. somewhat fleshy : lower spatulate ; upper lanceolate, Cal. long clavate, Petals 2-fid
 6240 Hairy, Stem erect slender branched, Lvs. lanc. Spikes twin 2-sided, Cal. cylindr. clavate, Pet. bifid
 6241 Pubesc. Stems branch. Lvs. spatul. obt. Spikes twin 1-sided, Cal. bladderly, Pet. 2-parted with ov. lobes
 6242 Velvety, Stem procumb. branch. leafy, Lvs. ov. spatul. fleshy, Bract. very small, Pet. with long claws embog.
 6243 Smth. Stem erect slender branch. Lvs. lin. scarcely ciliat. : low. ov. Fl. on long stks. Pet. 2-part. with lin. lobes
 6244 Smooth, Stems usually simple, Lvs. somewhat fleshy lin. lanc. Cal. ov. ventric. Pet. bifid with 4-lob. append.
 6245 Pubesc. Stems numerous prostrate very leafy at base, Lvs. lin. setaceous ciliated, Recesses of calyx deflexed
 6246 Pubescent branched supine, Leaves ovate lanc. Fl. axillary pendulous, Petals bifid crowned
- § 6. *Cauliscent, Stems upright, Peduncles filiform, Calyx campanulate or cylindrical.*
 6247 Tufted, Stems erect slender branched, Lvs. small linear very narrow, Fl. small, Petals short 4-toothed
 6248 Like the last, but the radical leaves broader, Peduncles long upright
 6249 Root branched, Stems simple leafy, Lvs. lanc. lin. obt. Fl. large panicked, Petals broad 4-cleft, Seed ciliated
 6250 Smooth, Stems erect branched, Leaves ovate lanc. Fl. panicked very small, Petals obcordate

and Miscellaneous Particulars.

when about two inches long, and the more they are blanched the better. Bryant (*Flora Dietetica*) says, its culture would well reward the gardener's trouble. *S. viscosa* is a popular border flower, especially the double variety.

S. quinquevulnera was formerly in culture as a border flower, but is now seldom used for that purpose :

History, Use, Propagation, Culture,

being very low and prolific in flowers, it is well adapted for sowing in pots. S. Armeria is one of the annual border flowers of the seed shops.

1049. *Stellaria*. The parts of the flower are stellate. The species are grassy-looking plants of the casiet.

- 6251 Smooth, Stems erect branched, Lvs. lanc. acute : lower obt. Petals not opening obovdate, Stam. usually 5
 6252 Pubesc. Stem erect much branched slender, Lower lvs. obl. obt. : upper lanc. narrow, Pet. short erect bifid
 6253 Nearly smooth, Stem erect branched somewhat leafy, Leaves lanc. acute ciliated, Fl. small paniced
 6254 Pubescent, Stems branched, Lower leaves ellipt. spatulate : upper lanc. Fl. term. twin, Petals bifid
 6255 Pubescent, Stems erect branch. straight, Low. lvs. lanc. spat. : up. linear, Fl. loosely paniced, Pet. 2-lobed
 6256 Stems branched, Leaves lin. spatulate, Fl. term. Cal. cylindr. clavate, Petals 2-fid
 6257 Smooth, Stems erect branched, Low. lvs. ov. stalked obt. : up. lin. acute, Fl. loosely panic. Cal. ov. clavate
 6258 Viscid pubesc. Stems erect much branched. Lvs. fleshy : low spatul. ; up. ov. Fl. small, Pet. obov. crowned
 6259 Tufted, Stems assurgent, Lvs. lin. acute, Peduncles very long, Cal. long clavate, Petals 2-parted crowned
 6260 Tufted shortly bristly, Stems assurgent, Leaves lin. with bristly teeth, Fl. small, Petals 2-fid crowned
 6261 Smth. Stems erect or assurg. somew. branch. leafy at base, Lvs. lanc. lin. acute : low spat. Pet. 2-part. naked

§ 7. *Cauliscent, Flowers paniced, rarely solitary, Pedicels opposite short, Calyx tubular.*

* *Flowers nodding, Calyx cylindrical.*

- 6262 Smooth viscid, Stems erect, Lvs. somewhat fleshy lin.-lanc. fringed with fine bristles, Pet. very long long crown
 6263 Pubesc. Stems leafy at base, Radical lvs. spatul. : upper lanc. lin. Pet. 2-parted reflexed with a long 2-part
 6264 Like the last, but stems less branched, and less leafy, Leaves linear, Petals often green
 6265 Like the last, but stems flexuose broken down. Petals white above beneath livid green
 6266 Smooth, Leaves lin. lanc. ciliated at base, Fl. pan. erect, Cal. ventricose cylindr. Petals 2-parted
 6267 Hairy soft, Stem branch. leafy, Lvs. large ov. acum. Fl. in large nodding panicles, Pet. with very long claws
 6268 Smooth, Stems erect simple scarcely leafy, Petals 2 parted with filiform lobes [crowned

** *Flowers erect, Calyx clavate.*

- 6269 Velvety glutinous upwards, Stem erect branched leafy, Fl. small loosely paniced, Stamens very long
 6270 Stem short about 2-flowered pubescent, Radic. leaves lanc. lin. acute, Cauline very short, Pet. bifid
 6271 Scarcely pubesc. Root long creeping, Stem erect almost simple, Lvs. lin. grassy acute, Fl. few erect panic.
 6272 Viscid pubesc. Stem procumb. assurgent branch. Fl. large panic. Cal. large clavate, Pet. broad bifid crowned
 6273 Scarcely pubesc. Stem upright branched, Lvs. lin. lanc. Fl. paniced erect, Cal. netted, Pet. small emarginate
 6274 Smoothish viscid, Stem erect, Alternate branches long, Cal. large clavate netted, Petals bifid
 6275 Visc. pubes. Stems erect branch. Lvs. large, Fl. large panic. : every other stripe of cal. veiny, Teeth very long
 6276 Pubes. Stems erect branch. Lvs. lanc. obt. Fl. panic. : every other stripe of cal. veiny, Pet. with broad tooth.
 6277 Subtomentose, Stems branch. Lvs. obov. stalked, Fl. term. erect, Pet. obov. 2-toothed at base [lobes
 6278 Silky, Stems branched, Lvs. with a long fringe at base, Fl. large term. Pet. 2-parted crowned
 6279 Stems much branch. scarcely pubesc. Lower lvs. obov. spatul. Lvs. lin. acute, Cal. clavate striped with red
 6280 Tufted smooth subviscid, Stems branched at base, Lvs. lin. Fl. panic. Cal. netted, Pet. bifid with lanc. lobes

*** *Flowers erect, Calyx long clavate.*

- 6281 Smooth viscid. Stems branch. Lvs. lanc. lin. Cal. very long. clav. nett. Pet. obov. with a tooth on each side
 6282 Viscid pubescent, Stems procumbent, Leaves lin. long, Cal. long tubular, Petals slightly emarg. crenate
 6283 Tufted viscid pubesc. Root woody, Stems low assurgent little branched, Cal. long nett. Petals bifid
 6284 Suffruticose, Stems suberect smooth branched at base, Cal. long cylindr. viscid-vilous, Petals 2-lobed
 6285 Scabrous, Stems bran. Fl. term. in the dichotomics, Cal. long cylin. Pet. 2-part. tooth. on each side at base
 6286 Pubescent, Root woody, Stems diffuse branched, Leaves soft numerous below, Petals half bifid
 6287 Tufted viscid pubescent, Stems woody supine branched, Lvs. lin. acute, Petals with narrow diverging lobes
 6288 Stems erect pub. Lvs. roughish scarcely ciliat. Fl. large pan. Pet. with broad obov. lobes & 2-part. append.
 6289 Very smooth glaucous, Stems branched, Leaves roundish acuminate, Fl. large, Cal. not striped
 6290 Pilose pubesc. Stems much branch. Lower lvs. ovate-spatul. : up. lin. Fl. in large panic. Pet. 2-lob. naked
 6291 Pubesc. viscid. Stems erect branch. Branch. spread. Low. lvs. ov. spatul. Cal. long narrow, Pet. $\frac{1}{2}$ bifid crowned
 6292 Pubescent, Stems assurgent much branched leafy, Leaves linear acute, Cal. clavate, Petals bifid
 6293 Stem simple pubescent, Leaves pubescent : lower large rounded stalked, Petals 2-parted crowned
 6294 Smooth, Stem twiggy, Leaves lin. lanc. radical very long, Cal. very long, Petals 2-parted crowned
 6295 Smooth clammy, Stem assurgent branch. Lvs. lin. lanc. acute : lower very long, Upper bractes with a broad
 6296 Silky, Stems erect branch. Lvs. wavy, Calyxes long clavate, Pet. 2-part. crowned [membranous margin
 6297 Viscid pubescent, Lvs. lanceol. Cal. long tubular, Petals lanceolate crowned, Stamens very long
 6298 Villous viscid, Lvs. lin. lanceol. obt. ciliated, Peduncle 1-fl. spreading in seed, Cal. circularly reflexed at base

§ 8. *Cauliscent, Flowers corymbose, Cal. clavate, 10-striped.*

- 6299 Tufted roughish, Root thick woody branch. Stems simple slender very leafy at base, Lvs. small lin. acute
 6300 Viscid, Stem much branch. pubesc. Lvs. round subciliated : the lower on long stalks, Fl. loosely corymb.

6301 Very smooth glaucous viscid, Leaves ovate-lanc. Fl. in paniced corymbs, Petals obovdate crowned

6302 Smooth, Stems erect branched, Upper leaves lanceolate : lower linear lanc. Umbel dense, Petals obovate

6303 Lower leaves cordate stalked : upper lanc. sessile, Petals twice as long as calyx

6304 Stems diffuse dichotomous rooting at base, Lower lvs. ovate stalked cord. : upper sess. Pet. shorter than cal.

6305 Stems procumbent with a lateral 1-sided hairy line, Leaves lanc. very tender, Fruit deflexed

and Miscellaneous Particulars.

culture. *S. media* is a well known weed, never found but on rich friable soils in a state of culture: the seeds and flower buds are a favorite food of finches and other small birds.

History, Use, Propagation, Culture,

1050. *Arenaria*. From *arena*, sand, in which most of the species are found. They are of most difficult discrimination, and are chiefly diminutive weeds found almost exclusively on sandy soils. The flowers vary

- 6306 Hairy, Lvs. cord. ovate stem-clasping, Stem dichotomous, Fl. solitary, Sepals lanc. ac. longer than petals
 6307 Leaves ovate lanceol. nearly veinless, Pedunc. 1-fl. Sepals lanc. acute twice as short as petals
 6308 Villous viscid, Leaves lin. lanc. Stems dichotomous diffuse, Petals and capsule longer than calyx
 6309 Lvs. lanc. acum. serrulate roughish: the upper broader and shorter, Pedunc. filiform very long, Pet. 2-fid
 6310 Stem erect few-fl. Lvs. linear acute entire smoothish, Pedunc. filiform very long, Petals 2-parted
 6311 Leaves linear smooth at edge, Stems diffuse, Fl. paniced divaricating, Petals the length of calyx
 6312 Glaucous, Leaves lin. lanc. smooth at edge, Floral scarious, Petals twice as long as cal. Stem erect weak
 6313 Leaves ovate-lanceol. entire smooth thick, Sepals ovate-lanceol. much shorter than petals
 6314 Leaves ovate-obl. Pet. deeply divided shorter than calyx, Caps. ovate oblong longer than calyx
 6315 Leaves obl. pubescent, Pedunc. 1-fl. twin, Pet. larger than cal. Caps. obl. nearly twice as long as sepals
 6316 Leaves spatulate, Stem erect bifid viscid, Branches alternate, Petals emarginate
 6317 Leaves linear lanc. obtuse very dense, Pedunc. 1-fl. and umbelled, Pet. scarcely longer than calyx
 6318 Leaves lanc. entire sessile acute, Base and stem pubescent, Fl. axill. solitary
 6319 Glandular pubescent, Stem procumbent, Leaves ovate fleshy, Petals scarcely longer than calyx cut
 6320 Very smooth, Leaves linear-lanc. Pedunc. terminal dichotomous bracted, Pet. broad obovate 2-parted

§ 1. Caps. 3-valved, Leaves linear, with scarious stipules at base.

- 6321 Smooth, Stem erect, Leaves subulate 1-sided, Petals shorter than calyx

[calyx

- 6322 Hispid, Stem erect, Branches divaricating, Lvs. setaceous twice as short as joints, Pet. obt. shorter than
 6323 Stems prostrate hairy, Leaves filiform shorter than the joint, Sepals lanceolate obtuse scarious at edge
 6324 Like the last, but nearly smooth
 6325 Stems prostrate, Leaves half cylindrical fleshy as long as joints, Seeds with a membranous wing
 6326 Pilose subsispid, Leaves filiform longer than joint, Stamens 5, Seeds oboord. compressed, Caps. globose

§ 2. Leaves grassy, linear, lanceolate or rounded, without stipules, Caps. 3-valved.

* Leaves grassy.

- 6327 Stems erect simple. Lvs. subul. filiform rough, Panic. trichotomous pubescent lax, Calyxes very obtuse
 6328 Leaves subulate-filiform serrulate, Stems erect simple, Panicle trichotomous smooth compact
 6329 Leaves lin. setaceous ciliated rough, Stems erect rigid simple, Sepals acute scarcely longer than corolla
 6330 Stems ascending few-fl. pubescent, Lvs. setaceous rigid, Cauline straight, Sepals obtuse striated villous
 6331 Leaves setaceous rigid mucronate striated, Stems paniced few-fl. Sepals lanc. much shorter than corolla

** Leaves subulate or linear.

- 6332 Lvs. subulate rigid spiny: lower fascicled; upper distant, Stems erect firm, Pet. obov. twice as long as cal.
 6333 Erect smooth many-stemmed, Leaves subulate linear erect, Pan. few-fl. Petals conspicuously striated
 6334 Leaves subulate tooth-ciliated, Stems ascending 3-6-fl. roughish, Cal. cylindrical, Sepals 3-nerved hairy

- 6335 Like the last, but stems rigid few-fl. Leaves long straight, Pedunc. and calyx viscid hairy
 6336 Lvs. lin. subul. 3-nerved, Stem paniced, Pedunc. terminal very long twin downy, Pet. obt. emarginate
 6337 Like the last, but stems 2-4-fl. Leaves narrow recurved
 6338 Lvs. subulate broadish flat 3-nerved ciliated, Radical clustered, Stems 1-fl. Pedunc. very long pubescent
 6339 Tufted many-stemmed, Leaves subulate obtuse nerved, Stems paniced elongated
 6340 Erect branched, Leaves linear subulate 3-nerved, Pedunc. twin terminal 1-flowered
 6341 Leaves subulate, Stems paniced, Sepals ovate
 6342 Stems filiform rooting very long diffuse, Flowering branches erect few-fl. Lvs. lin. flat acute fascicled
 6343 Leaves subulate setaceous, Stem branched dichotomous, Sepals subulate striated much longer than petals
 6344 Stem much branched, Leaves lin. recurved, Sepals with a long point and membranous edge
 6345 Radical lvs. clustered recurved subul. 1-sided, Stems tufted simple 3-fl. Sepals and peduncles hairy gland.
 6346 Stem much branched, Fl. paniced fastigiate, Leaves setaceous fascicled 1-sided ciliated at base
 6347 Leaves subulate fascicled setaceous, Stems erect straight simple, Sepals acuminate with 2 lines
 6348 Leaves setaceous fascicled with 2 stripes, Stems suffruticose dichotomous, Pedunc. term. 1-2-flowered
 6349 Lvs. setaceous not ciliated at base, Stems tufted prostrate at base, Pedunc. longer than leaf, Sepals awned

- 6350 Procumbent, Leaves linear obt. Peduncles 2 or 3 1-flowered with 2 bractes at base, Sepals without nerves
 6351 Leaves subulate rigid spiny and flowers whorled, Pedunc. 4-fl. capitate

*** Leaves lanceolate, oval or rounded.

- 6352 Leaves ovate carinate recurved edged imbricated 4 ways, Stems straight downy, Sepals rigid acute keeled
 6353 Tufted villous, Branches ascending, Leaves lanceolate narrow acute rigid nerved
 6354 Like the last, but smaller, with creeping and tufted stems, and imbricated leaves
 6355 Pubescent, Leaves lanc. linear, Barren stems very long procumbent, Pedunc. terminal long 1-flowered
 6356 Leaves ovate acute sessile regular ciliated and smooth, Sepals lanceolate 3-nerved acute green opaque
 6357 Pubescent, Lvs. ovate acute stalked, Stems spreading branched elongated, Sepals acute shorter than cor.
 6358 Leaves oblong acute 3-nerved ciliated imbricated, Stem prostrate, Sepals lanceolate acuminate striped
 6359 Leaves lanc. acute spreading hard rough, Stem simple short, Sepals ovate acuminate striped
 6360 Leaves ovate and obovate blistered rugose more or less nerved and ciliated, Stems procumbent
 6361 Like the last, but leaves pulpy thick and sepals scarcely nerved
 6362 Stem slender branched, Lvs. ovate acute stalked ciliated nerved, Pedunc. long bent down after flowering

and Miscellaneous Particulars.

considerably in the number of their stamens, more generally falling short of than exceeding the regular number.

History, Use, Propagation, Culture,

1051. *Cherleria*. John Henry Cherler was an assistant of John Bauhin in preparing his *Historia Plantarum*. A little obscure weed.

1052. *Brunnicchia*. A catalogue of the books upon natural history was published by one Mr. F. Brunnicchia, a Danish naturalist, in 1793.

1053. *Garidella*. So named by Tournefort, in honor of Pierre Garidel, M. D., physician at Aix in Provence, author of *Histoire des Plantes qui naissent en Provence*, 1719, with many figures. A plant of little curiosity or beauty. Small inconspicuous plants of the easiest management.

1054. *Malpighia*. So named by Plumier in honor of Marcello Malpighi, professor of medicine at Bologna, author of *Anatomie Plantarum*, 1765 and 1769; a celebrated work, the best of its time on the structure of vegetables. The species are handsome evergreen trees and shrubs, some of them fruit-bearing and others climbers. *M. glabra* is grown for its fruit in the West Indies, and the fruit of *M. urens* is also eaten under the name of Barbadoes cherry, but that of both species is much inferior to European cherries. All the species have the under sides of their leaves covered with prickly bristles which when handled run into the fingers. Ripened cuttings root freely in sand under cover.

1055. *Banisteria*. So named by Dr. Houstoun, in memory of the Rev. John Banister, a curious botanist, who lost his life in search after plants in Virginia. The species are chiefly evergreen climbers and twiners; some of them, as *B. fulgens* and *chrysophylla*, have fine shewy foliage as well as beautiful flowers.

- 6363 Tufted creeping, Leaves ovate shining fleshy ciliated, Pedunc. long 1-fl. Flowers cernuous
 6364 Leaves ovate acute fleshy approximated, Fl. solitary on short stalks, Sepals obl. acute as long as cor.
 6365 All over pubescent, Leaves lin. lanceol. Stems prostrate much branched, Seeds very minute

6366 Leaves spreading

6367 Leaves cordate sagittate

6368 Petals sessile spreading, Stamens 10-12

6369 Leaves ovate entire smooth, Peduncles umbelled

6370 Leaves ovate entire smooth, Peduncles 1-flowered

6371 Leaves entire oblong acute smooth shining with 2 glands beneath at the base

6372 Leaves entire oblong lanceolate acute smooth with 2 glands at a distance from the base

6373 Leaves ovate nearly entire with hairs on both sides, Fl.-stalks with a truncate gland at top

6374 Leaves ovate elliptical acuminate entire smooth with 2 glands at base

6375 Leaves oblong acuminate entire smooth, Racemes axillary, Fl. monogynous

6376 Leaves elliptical shining hairy beneath, Fl. axillary corymbose

6377 Leaves obl. ovate with decumbent stiff bristles, Peduncles 1-fl. aggregate

6378 Leaves lin. lanceol. with decumbent bristles on each side, Peduncles umbelled

6379 Leaves obl. obtuse pubescent, Racemes axillary compound

6380 Leaves ovate entire obtuse downy beneath, Racemes terminal

6381 Leaves ovate downy beneath acute, Flowers yellow spiked

6382 Leaves obovate wedge-shaped entire veinless shining, Raceme terminal

6383 Leaves ovate acute entire smooth on each side, Racemes terminal spiked

6384 Leaves oval acuminate shining, Racemes corymbose terminal

6385 Leaves lanceol. toothed-spiny hispid beneath

6386 Leaves subovate toothed-spiny

6387 Leaves orbicular cordate ciliate toothletted smooth, Petioles with 2 glands

6388 Leaves roundish ovate obtuse smooth, Racemes axillary and terminal, Seeds erect

6389 Leaves ovate oblong acutish towards the end obsoletely ciliated beneath shining gold-colored

6390 Leaves ovate-oblong rigid, Racemes terminal

6391 Leaves ovate oblong entire beneath shining, Panicle terminal leafy

6392 Branches 2-edged, Leaves ovate downy beneath, Petioles with 2 glands

6393 Leaves subovate downy beneath, Racemes brachiate, Peduncles umbelled

6394 Leaves downy beneath orbicular cordate, Branches divaricating roundish, Petioles with 2 glands

6395 Leaves subovate, Branches brachiate, Seeds narrower inwards

6396 Leaves simple obovate obtuse pubescent above smooth beneath

6397 Leaves pinnated, Leaflets ovate stalked smooth on each side, Racemes fascicled

PENTAGYNIA.

6398 Leaves pinnated, Leaflets ovate-lanceolate, Fruit oblong with obtuse angles

6399 Leaflets ovate unequal acuminate, Fruit obl. acute-angled

and Miscellaneous Particulars.

All of them root freely in ripened wood in sand under a hand-glass. In most respects they resemble the last genus.

1056. *Hirza*. Named after John Nicholas de la Hire, a French physician, who died in 1727. Plants with the appearance of *Banisteria*.

1057. *Cnestis*. From $\kappa\nu\eta\sigma\omega$, to scratch. The capsules, covered with hairs, excite a troublesome itching. Fine evergreen stove shrubs.

1058. *Averrhoa*. So named in honor of Ebn Elvelid Ebn Rushad, commonly called Averrhoes, of Corduba in Spain, a famous commentator on Aristotle and Avicenna. He also published *Calliget*, or the plants used in food, &c. He died at the beginning of the thirteenth century. The specific names are vernacular appellations. The species are evergreen trees, singular for the fruit growing frequently on the trunk itself, below the leaves: the flowers grow in racemes; the fruit is a five-celled pome. A. Bilimbi is a beautiful tree with a green fleshy oblong fruit the thickness of the finger, filled with a grateful acid juice; the substance and seeds not unlike those of cucumber. They make a syrup of the juice, and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders. A. carambola bears a fruit the size of a hen's egg, with a pulpy subacid juice, used ripe and also pickled green, and employed also in dying, and other economical purposes. The petioles and branches of this tree are said to have a peculiar sensitive quality, of which an account is given by Dr. Bruce in the *Philosophical Transactions*,

History, Use, Propagation, Culture,

Both species form handsome plants in our stoves ; they grow freely, and ripened cuttings root readily in sand under a hand glass.

1059. *Spondias*. One of the Greek names of the plum. The plants of this genus bear fruit like plums, which are also called hog plums in the West Indies. These are deciduous fruit-bearing trees, natives or cultivated in both Indies. *S. Mombin* (the South American name) flowers from the sides of the branches, and is known by its oblong or ovate fruit like a plum, having a luscious thin pulp covering a large fibrous stone. The skin is yellow, purple, or variegated; the pulp is yellow and thin, having a singular but not unpleasant taste, and a sweet smell. The seed scarcely ever ripens, but it is so easily increased by cuttings, that if a branch laden with young fruit be set in the ground, it will grow, and the fruit will soon come to maturity. In St. Domingo they make hedges of the boughs, which flower and bear fruit in a few months. It is also cultivated for the sake of the fruit, though it is not in much esteem in Jamaica.

The flowers of *S. Myrobalanus* (the *Myrobalanus* of Dioscorides) was an Egyptian or Arabian tree, which

- 6400 Common petiole compressed
 6401 Common petiole round, Leaves shining acuminate
 6402 Common petiole round with 6 pairs of leaflets which are serrated and ribbed
 6403 Leaves orbicular spatulate powdery obtuse with a point, Fl. paniced, Stem erect branched
 6404 Leaves ovate spatulate obtuse powdery with a point edged with red, Fl. paniced, Stem erect branched
 6405 Leaves opp. rounded ovate, Flowers corymbose
 6406 Leaves obl. spatulate obtuse smooth with a point, Fl. paniced, Stem erect branched
 6407 Leaves semicylindrical scattered, Fl. paniced nodding, Tube curved
 6408 Leaves ovate spatulate obtuse with a point powdery, Fl. paniced, Stem much branched divaricating
 6409 Leaves wedge-shaped fascicled, Stem thickened, Branches fleshy conical
 6410 Leaves obovate acute fleshy, Spike leafy terminal
 6411 Leaves crossing rounded mucronate glaucous, Fl. paniced pendulous
 6412 Leaves half orbicular scurfy dotted flat above, Fl. few small sessile
 6413 Leaves spatulate obtuse naked with a point
 6414 Leaves glaucous narrow tongue-shaped at the end obtuse mucronate, Fl. cymose, Stem leafy
 6415 Leaves oval crenate, Stem spiked
 6416 Leaves oblong nearly round, Flowers fascicled
 6417 Leaves lanceolate acute fleshy, Spike cylindrical terminal leafless
 6418 Leaves peltate crenate, Stem nearly simple, Fl. pendulous, Bractes entire
 6419 Leaves peltate crenate, Stem nearly simple, Flowers erect, Bractes toothed
 6420 Leaves whorled 4
 6421 Leaves amplexicaul. cordate ovate obtuse unequally and deeply serrated
 6422 Leaves amplexicaul. cordate oblong obtusely serrated whitish
 6423 Leaves flattish serrated, Corymb leafy, Stem erect
 6424 Leaves flat ovate acute at each end toothed, Flowers in corymbose fascicles
 6425 Leaves wedge-shaped narrowed at the base sessile, Stems decumbent, Fl. corymbose
 6426 Leaves wedge-shaped rhomboid emarginate stalked, Stems branched, Pan. term. divaricating
 6427 Leaves lanceolate serrated flat, Stem erect, Cyme sessile terminal
 6428 Leaves roundish obovate flat crenate at end with a cartilaginous mucronate edge
 6429 Leaves flat opposite spatulate toothed
 6430 Leaves wedge-shaped concave somewhat toothed aggregate, Branches creeping, Cyme terminal
 6431 Leaves flat cordate toothed stalked, Corymbs terminal
 6432 Leaves whorled obovate entire smooth, Cyme in three divisions
 6433 Leaves flattish angular, Fl. lateral sessile solitary
 6434 Stems branched, Leaves entire: lower spatulate, Stigmas acute
 6435 Leaves flat lanceolate, Stem branched, Flowers paniced, Petals acute awned
 6436 Radical leaves obovate with a long mucronate point, Stem simple, Spike term. long
 6437 Leaves opposite ovate obtuse fleshy, Stem weak, Fl. scattered
 6438 Leaves subulate scattered separate at base: the lower recurved
 6439 Leaves glaucous subulate scattered separate at base, Fl. cymose, Cal. lanceolate
 6440 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme recurved
 6441 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme compact
 6442 Leaves subulate in 7 rows glaucous very close distinct at base
 6443 Leaves subulate scattered separate at base, Fl. in cymes. Petals half as long as lanceolate calyx
 6444 Leaves subulate scattered separate at base glaucous, Fl. in cymes, Petals twice as long as calyx
 6445 Leaves subulate spreading in many rows close, Cal. short obtuse
 6446 Leaves oblong alternate obtuse separate at base, Cyme bifid smooth
 6447 Leaves flat spatulate ovate acute entire pubescent, Corymb hemispherical

and Miscellaneous Particulars.

bore a perfumed fleshy fruit. Jacquin applied the name to this South American plant, which is nearly similar in properties) come out before the leaves make their appearance, and are succeeded by yellow plums the size of a pigeon's egg, which are eaten by children, and considered excellent food for hogs. It grows by large cuttings as freely as the other. *S. dulcis* is a handsome tree; the pulp of the fruit is firmer than that of the others, and tastes like a Reinette apple. It is cultivated in the Society and Friendly islands, especially in Otaheite; the fruit is of a gold color, hangs in little nodding bunches, and is esteemed both tasteful and wholesome: its flavor resembles that of the pine-apple.

1060. *Cotyledon*. From *κωτυλον*, a vessel or cup. Many of the species of this genus have cup-shaped leaves. The species are succulents of little beauty, and of the easiest culture in light earth and lime rubbish, or in sand and loam.

1061. *Sedum*. From *sedere*, to sit: these plants growing upon the bare rock, look as if sitting upon it. The species are low succulents, some of them pretty, others curious; but none of them remarkable in any way.

History, Use, Propagation, Culture,

They seem destined by nature to clothe rocks and dry arid places, after a certain portion of vegetable soil has been generated by lichens and mosses.

Orpine is the French name of two or three species. *S. album* is said to have the same virtues as used to be attributed to the houseleek, *Sempervivum tectorum*: it is pickled by some in the manner of samphire. *S. acre* is considered antiscorbatic; its juice applied to the skin blisters it, taken inwardly it vomits, and applied externally to gangrenes promotes suppuration.

1062. *Penthorum*. From *πεντα*, five, in allusion to the five-marked angles of the capsules. Succulent North American plants of no beauty whatever.

1063. *Grielum*. A small uninteresting Cape plant, with yellow flowers and hoary leaves like southernwood. Derived from *γρίλιος*, old, in allusion to its hoary aspect.

1064. *Biophytum*. *Βίη φυτόν*, plant of life, in allusion to the lively irritable nature of the foliage. This genus, the *Oxalis sensitiva* of Jacquin, has been lately divided by M. De Candolle from *Oxalis*, chiefly on

6448 Petals 8, Leaves scattered: the lower rounded; upper depressed

6449 Leaves scattered rounded obtuse, Stem simple, Fl. in umbels with 4 petals

6450 Leaves linear rounded depressed scattered, Cyne open, Petals 4

6451 Leaves oblong obtuse roundish sessile spreading, Cyne branched

6452 Leaves subovate adnate-sessile gibbous nearly erect alternate, Cyne trifid

6453 Leaves subovate adnate-sessile gibbous nearly erect imbricated six ways

6454 Leaves subovate adnate-sessile gibbous alternate, Cyne branched bifid

6455 Stem erect solitary annual, Leaves ovate sessile gibbous alternate, Cyne recurved

6456 Leaves oblong flattish above and peduncles axillary about 1-fl. pubescent, Petals ovate obtuse

6457 Leaves whorled linear, Stem procumbent paniced, Peduncles villous viscid

6458 Stem erect, Flowers corymbose fastigiate

6459 Leaves scattered oblong-cylindrical obtuse, Stems shrubby much branched, Cymes terminal

6460 The only species

6461 Peduncles simple 1-fl. Leaves tripartite multifid linear downy

6462 Peduncles many-fl. at end

§ 1. *Peduncles many-flowered, Stems suffruticose, Cells of ovary usually 1 seeded.*
6463 Stem erect leafy, Umbel 4-fl. the length of leaves, Leaflets entire ovate obtuse

§ 2. *Cauliscent, Leaves palmate 3-foliolate, Leaflets all sessile, obovate.*
6464 Pedunc. 2-3-fl. somewhat longer than leaf-st. Lvs. 2-lobed obov. ciliated, Styles a little longer than inner
6465 Stem hairy, Umb. 5-6-fl. longer than leaves, Lvs. obovate, Styles longer than both stamens [stamens
β Stem decumbent, Peduncles 2 or 3-flowered

6466 Stem erect, Umbels 2-6-fl. about as long as leaves, Leaf. obov. Styles the length of inner stamens

6467 Stem rooting, Peduncles shorter than leafst. Leaf. obovate, Styles the length of inner stamens

6468 Smoothish, Pedunc. 2-fl. longer than leafst. Leaf. 2-lobed, Styles the length of inner stamens

6469 Stem rooting, Pedunc. 2-fl. the length of leafst. Leaflets obovate, Styles middling

6470 Stem erect, Pedunc. axill. four times as long as leaf at the end corymbose racemose, Leaf. obovate

6471 Stem naked at base, Pedunc. lateral umbell. at end, Leaf. cun. emarg. Styles shorter than outer stamens

§ 3. *Cauliscent, Leaves sessile, 3-leaved, villous, not glandular, Pedunc. axillary, 1-flowered.*

6472 Stem branch. Ped. much long. than lvs. Bractes next cal. Leaf. lin. emarg. Styles long. than inner stam.

6473 Ped. 4 times as long as lvs. Bractes appressed to cal. Leaf. lin. cun. obt. Styles shorter than outer stamens

6474 Stem declined, Branches 1-sided, Leaf. lin.-cuneiform, Peduncles scarcely longer than leaves

6475 Leaf. lin. cun. ret. Ped. much long. than lvs. Bractes remote from cal. Stam. with neither teeth nor glands

6476 Stem much branched, Leaf. lin. cuneate obt. Pedunc. much shorter than lvs. Bractes remote from cal.

6477 Leaf. lin. cuneate, Pedunc. much longer than leaves. Bractes remote from cal. Styles intermediate

6478 Leaf. obl. cuneiform, Pedunc. much longer than leaves, Bractes remote from cal. Styles intermediate

§ 4. *Cauliscent, sparingly leafy, Leaves stalked, 3-5-leaved, Pedunc. axill. 1-flowered.*

6479 Stem short, Leaves on long stalks, Leaf. 3 ovate-rounded, Styles very short

6480 Stem branched, Leaves stalked in fascicled whorls with 3 obovate leaflets, Styles very long

§ 5. *Stemless, Pedunc. 1-2 or many-flowered, Leaves radical, many-leaved, usually 3-leaved.*

6481 Leaf. 3 obovate silky, Umbel longer than leaves, Fl. nodding, Styles intermediate

6482 Leaf. 3 obovate smooth, Umb. 3-9. fl. Styles very short, Fl. nodding

6483 Leaf. 3 obovate 2-lobed smooth, Umb. 2-4-fl. Flowers erect, Styles very short

6484 Leaf. 3 obovate 2-lobed smooth subciliated, Umb. many-fl. Fl. drooping, Styles very short

6485 Petiole flattish, Leaf. 3 obovate pubescent, Umb. 2-fl. Sepals entire, Styles very long

6486 Leaf. 3 obovate smooth subciliated, Umb. 2-5-fl. Sepals 3-toothed at end, Styles very long

6487 Leaf. 3 obovate 2-parted beneath violet, Umbel 2-fl. Styles middling

6488 Smooth, Pedunc. 1-fl. longer than leaf, Leaflets obovate, Root tuberous

6465

and Miscellaneous Particulars.

account of its irritable pinnated foliage, and its stamens being distinct, and five of them only being perfect. It is a very pretty annual, and if well managed so as to acquire, as in China, a stem six or nine inches high, is quite a remarkable object. Cultivated in common earth, and propagated by seeds, which it produces in abundance.

1065. *Oxalis*. The *Oxalis* of the ancients, which was named from *ὄξύς*, sharp, or sour, was a very different plant from this, which is thought to have been the *Oxys* of Pliny. The name employed by Linnæus has, however, been adopted by his followers, although Clusius, Ray, Plumier, Tournefort, Haller, and others, called the genus *Oxys*.

This is a tribe of pretty little plants, of which most of the species flower freely, but all of them are without their leaves half the year. The root is commonly bulbous; in some species only thick and fleshy; in a few branched: the bulbs consist of fleshy scales, sometimes closely imbricate, sometimes loose and diverging. In a few the subterraneous stipe and the terminating fibre of the bulb produce little dog-toothed bulbs, in such

History, Use, Propagation, Culture,

abundance as to fill the whole pot to the very bottom, as in purpurea, cernua, reptatrix. Sometimes the bulb strikes very deep, as in tomentosa; the original bulb near the surface striking a radical fibre downright from its base, which puts out from its side a new bulb, producing the next year's plant, whilst the former perishes. Sometimes fusiform, thick and long fibres spring in a monstrous form from the bulbs, as in glandulosa and some others. Some of the species have a proper stem (*Caulis*), when it bears all the leaves and peduncles alternately, and not in a terminating umbel: this is either branched or quite simple, and that for the most part inconstantly. Others have a stipe; the leaves and flowers being aggregate together at the end of the stalk; this bears none or very few leaves along it, seldom many. In some species the stipe is always subterraneous, as in breviscapa, purpurea, &c.; in others it is always above ground, as in gracilis, versicolor, tenuifolia. Stipes are commonly quite simple; some, however, are branched, the branches terminating in umbels, as in incarnata and polyphylla. Hence the division of the species into caulescent and stipitate. The leaves are not, perhaps, truly sessile in any of the species; they are subsessile in a few, but in most are petioled. They are simple in three species, binate in four, digitate in six, in the rest ternate: almost all of them have an acid

§ 6. *Stemless, Leaves simple.*

- 6489 Leaves ellipt. obtuse, Scape 1-fl. Filam. smooth, Styles middling covered with glandular hairs
 6490 Leaves obovate retuse, Scape 1-fl. Styles very short, Filaments glandular

§ 7. *Stemless, Leaves 2 or 3-leaved, Stalks winged.*

- 6491 Leaf. 2 roundish obovate emarginate wavy at edge, Styles very long and filaments glandular
 6492 Leaf. 2 ellipt. emarg. with a cartilaginous toothletted edge, Filam. glandular
 6493 Leaf. 2 lanceolate with a cartilaginous toothletted edge, Filam. glandular
 6494 Leaf. 2-3 with a cartilaginous scabrous edge, Filam. smooth
 6495 Leaf. 3 obovate emarg. mucronate, Styles and filaments glandular

§ 8. *Stemless, Leaves stalked, 3-leaved, Stalks not winged.*

- 6496 Pubescent, Lateral leaflets obliquely oblong: middle lanceolate, Scapes higher than petioles
 6497 Pubescent, Leaf. obl. obt.: middle cuneate at base, Scapes length of petiole
 6498 Pubescent, Leaf. obl. obt.: middle subcuneate, Scapes longer than petiole
 6499 Pubesc. Leaf. obl. obt. subemarg. Pedunc. longer than petiole with 2 bracts immediately below the cal.
 6500 Pubescent, Leaf. obl. emarg. Pedunc. length of petiole with 2 bracts immediately below the cal.
 6501 Pubescent, Leaf. obl. retuse: middle cuneate, Peduncles twice as long as leaves with 2 bracts in middle
 6502 Subhirsute, Leaf. obov. obl. obt. Pedunc. equal to petiole with 2 bracts in their middle, Styles glandular
 6503 Subhirsute, Leaf. obov. obl. obt. Ped. longer than petioles with 2 bracts below their middle, Styles hairy
 6504 Pubesc. Leaf. obl. lateral ovate: midd. cuneate, Pedunc. twice as long as petiole with 2 bracts in mid.
 6505 Pubesc. Leaf. roundish, Pedunc. as long as pet. with 2 bracts at base, Calyx with clavate hairs at edges
 6506 Pub. Leaf. roundish, Ped. as long as pet. with 2 bracts below mid. Cal. with simple and glan. hairs mixed
 6507 Pub. Leaf. round.: mid. cun. at base, Ped. as long as lvs. or long. with 2 bracts below mid. Styles very short
 β Flowers large, Leaves red beneath
 γ Flowers large, Leaves green on both sides
 6508 Pubesc. Leaf. roundish, Scapes longer than leaf with 2 bracts below the middle
 6509 Smooth, Leaf. roundish dotted, Stipules dilated acuminate, Bracts alternate
 6510 Pub. Leaf. obcor. roundish, Scapes nearly twice as short as pet. with 2 bracts in mid. Styles intermediate
 6511 Pub. Leaf. obcor. roundish, Scapes thrice as short as petiole with 2 bracts in mid. Styles very long
 6512 Densely pubesc. Leaf. obcordate, Scape longer than leaves with 2 bracts above middle, Cal. obtuse
 6513 Woolly, Leaf. obcordate, Ca. acute
 6514 Root toothed creeping, Leaf. obcord. downy, Scape longer than leaves, Petals oval obtuse
 6515 Root toothed creeping, Leaf. obcord. downy, Scape longer than leaves, Pet. obl. unequally emarginate
 6516 Smoothish, Leaflets obcordate, Scape longer than the leaves, Styles very short
 6517 Leaflets obcordate smooth, Pedunc. the length of leaves, Styles very short
 6518 Leaf. obcord. 2-lobed, smooth, Pedunc. longer than leaf, Styles intermediate
 6519 Leaf. obcord. 2-lobed smooth, Pedunc. longer than leaf, Styles very long
 6520 Leaf. cuneate emarg. hairy, Pedunc. the length of petiole, Styles very short, Filam. glandular
 6521 Leaf. lin. emarg. downy, Pedunc. shorter than petiole with 2 bracts at summit, Styles very long
 6522 Leaflets linear subcuneate emarginate, Pedunc. as long as petiole, Style intermediate

§ 9. *Leaves 3 or 5-leaved, glandular at end.*

- 6523 Leaflets 3 linear cuneiform emarginate ciliated with many glands beneath
 6524 Leaflets 3 linear emarginate with 2 glands beneath, Styles and filaments glandular
 6525 Leaflets 3 linear emarginate with 2 calli at end, Styles very short
 6526 Leaflets 3 linear emarginate with many glands beneath, Styles very short, Inner filaments glandular
 6527 Leaflets 3 linear emarginate with 2 glands beneath, Styles intermediate and filaments glandular
 6528 Leaflets 3 linear entire at end and glandular, Styles very long and inner filaments glandular
 6529 Leaflets 5 linear at the end nearly entire with 2 callous glands, Styles intermediate

§ 10. *Leaves palmate or peltate, many-leaved, not glandular at end.*

- 6530 Leaflets 7 lanceolate acutish smooth spotted at base, Petioles compressed, Styles very short
 6531 Leaflets 6-7 smooth linear channelled acute, Styles very short, Filam. glandular
 6532 Leaflets 7 smooth lin. lanc. obtuse, Cal. appressed, Styles very long and filaments glandular
 6533 Leaflets 7-9 smooth lin. emarg. Cal. reflexed at end, Styles intermediate
 6534 Leaflets 9-19 all over downy lanceolate cuneate emarginate

*and Miscellaneous Particulars.*

taste; whence their names of Oxalis or Oxy, wood Sorrel, &c. The partial stem bearing the flower is a peduncle in the caulescent, a scape in the stipitate species.

Many of the species ripen seeds, from which, or from offsets, they are readily propagated, and grown in light sandy soil: care being taken to give the pots little or no water when the plants are in a dormant state. An excellent work has been written on the genus by Jacquin, in which ninety-six species are described. All that were known in Europe at that time, were cultivated in the Imperial gardens of Schönbrunn with great success, under the immediate inspection of Jacquin, by whom the following directions are given for their management. They are best kept in pots which will hold a good many roots. The earth should be so light and sandy as never to become hard, but always to be soft enough not to resist the point of the finger when pressed upon it; when the flowering time is passed, the pots should be placed aside, where they require neither care nor water; but are well protected from mice. In the beginning of August they should be placed in the open air and moderately watered. About the end of that month, or a little later, the leaves should appear. About the middle of September, earlier or later, according to the weather, they should be placed in a very sunny, airy greenhouse,

History, Use, Propagation, Culture,

when they will flower well. Oxalis monophylla and rostrata will not, however, blossom unless placed in a very hot stove.

O. Acetosella, la petite oseille or suvella, Fr., is used as a salad plant, and is more delicate than the Rumex salads : its acid approaches nearly to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic. An infusion of the leaves, or a whey made by boiling the plant in milk, given in ardent fevers, is said to allay inordinate heat, and to quench thirst.

The expressed juice deperated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used whenever vegetable acids are wanted. It is employed to take iron moulds and ink stains out of linen, and is sold under the name of essential salt of lemons. (Withering.) This salt when genuine, which it seldom is, consists of the vegetable alkali and a peculiar acid, and which, according to Bergman, seems more allied to the acid of sugar than that of tartar. What is sold for it in this country, appears sometimes to consist of C. Tart., with the addition of a small quantity of vitriolic acid. For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water. (Curtis, from Newm. Chem. by Lewis.) Twenty pounds of leaves fresh yield six pounds of juice, from which two ounces, two drachms, and one scruple of salt have been obtained. (Lewis.)

1066. Agrostemma. Άγροστέμμα, crown of the field. The beauty of the flowers of the common cockle weed well entitles it to such a distinction. The foreign species are very pretty annuals. A. Githago (git or gith) was the name of certain black and aromatic grains, supposed to have been of Nigella sativa, which were employed by the Romans in cookery. The seeds of the plant Githago are externally similar) is an ornamental weed, and along with corn poppy and blue bottle makes a fine appearance in the fields of the slovenly husbandman, where the soil is dry and gravelly.

- 6535 Hairy, Stem dichotomous, Flowers on long stalks, Leaves linear
³ A slight variety, with longer divisions to the calyx
- 6536 Downy, Stem dichotomous, Peduncles long 1-fl. Cal. campanulate ribbed
- 6537 Downy, Flowers in umbellate heads, Cal. cylindr. clavate ribbed
- 6538 Smooth, Stem dichotomous panicled erect, Flowers terminal solitary
- 6539 Smoothish, Flowers fascicled, Cal. cylindr. clavate ribbed, Petals 2-lobed
- 6540 Stems ascending smoothish, Fl. dichotomous fascicled, Cal. camp. 10-ribbed, Pet. torn with an appendage
- 6541 Smooth, Flowers terminal and axillary 1-3, Cal. rounded clavate ribbed, Petals torn
- 6542 Hairy, Fl. 2-3 fastigiate, Cal. rounded clavate woolly, Petals 4-cleft
- 6543 Stem viscid about the joints, Limb of petals nearly entire, Leaves linear spatulate
- 6544 Smooth, Stems tufted upright, Fl. in dense capitate umbels, Cal. camp. Petals bifid
- 6545 Fl. solitary, Cal. with ten keels, Petals bifid, linear-lanc. subciliated
- 6546 Fl. dichotomous panicled diceious, Petals $\frac{1}{2}$ -bifid, Lobes narrow diverg. Caps. round
- 6547 Fl. dichotomous panicled diceious, Petals $\frac{1}{2}$ -bifid, Lobes broad approximating, Caps. conical
- 6548 Smooth glaucous, Stem erect branched or simple, Leaves lanceolate connate obtuse
- 6549 Hairy pale green viscid, Leaves ovate, Petals length of calyx, Fl. longer than fl.-stalk
- 6550 Hairy viscid diffuse, Leaves lanceolate oblong
- 6551 Stem much branched villous, Leaves ovate-lanc. hispid, Flowers numerous in dichotomous panicles
- 6552 Leaves ovate, Flowers panicled, Cal. villous longer than petals, Caps. scarcely longer than sepals
- 6553 Hairy viscid, Flowers pentandrous, Petals emarginate
- 6554 Hairy subviscid, Flower 4-fid 4-androus, Pet. bifid shorter than calyx
- 6555 Leaves linear lanceolate obtuse ciliated at base, Pet. twice as long as calyx
- 6556 Glutinous hairy, Fl. solitary in the dichotomies, Sepals lanc. acute the length of petals, Leaves lanc.
- 6557 Leaves ellipt. naked or hairy, Pan. dichotomous few-fl. with bractes, Caps. oblong recurved
- 6558 Stems prostrate, Leaves ovate acute subciliated smooth, Flowers terminal subscorimbos
- 6559 Leaves sublinear acuminate smooth, Peduncles glandular, Pet. twice as large as calyx
³ Leaves very narrow and smooth
- 6560 Downy, Leaves lanc.-lin. acute, Flowers very large in dichotomous umbels, Pet. crenate and 2-lobed
- 6561 Leaves cordate ovate, Stem clasping, Peduncles in fruit very long deflexed
- 6562 Hairy viscid, Leaves lanceolate, Fl. diceious, Petals thrice as long as calyx
- 6563 Leaves elliptical scabrous, Pedunc. terminal simple subsolitary, Capsule ovate
- 6564 Leaves oblong spatulate hoary, Sepals hoary scarious at edge, Caps. cylindr. longer than calyx
- 6565 Very smooth, Leaves lanc. linear, Pedunc. very long, Caps. acute shorter than corolla

6566 This is the *Cerastium aquaticum* of English botany

and Miscellaneous Particulars.

A. coronaria and *flos-jovis* are shewy border flowers, the first generally increased by seeds, and the other by cuttings or division of the plant.

1067. *Lychnis*. From *λυχνος*, a lamp, in allusion to the cottony leaves of some species, which have been used as wicks to lamps. *L. chalcidonica*, *Croix de Malthe*, Fr. and Portug., *Croce de Cavaliere*, Ital., and *C. de Jerusalem*, Span., is an old and much esteemed border flower, the double varieties of which require some care in cultivation, to prevent their returning to the single state, and to propagate them by cuttings. *L. fulgens* and *coronata* are also very handsome species. "They do best in a light rich loamy soil, but they must be often taken up and divided, or they dwindle away; the best time of doing this is early in spring. *L. coronata* thrives and flowers abundantly if planted out in the open ground in spring; but it requires to be taken up in autumn and potted, or the severe frosts in winter will kill it, or injure it very much. All may be raised by cuttings planted under hand-glasses, or by seeds, which often ripen in abundance. (*Bot. Cult.* 389.)

L. viscaria and *foscuculi* are more hardy, and grow in common garden soil, and increase abundantly by division; they are both old inhabitants of the flower garden. *L. diurna* and *vespertina* are also border flowers in their double varieties.

1068. *Cerastium*. Derived from *κερας*, a horn, in allusion to the cornute form of the capsule of many species. Most of the annual species, and some of the others, are weeds; a few may be grown in pots or on rock-work, for both of which they seem well adapted. They are very prolific in seeds, and contribute materially to the support of small birds.

1069. *Larrea*. A genus founded by Aug. St. Hilaire, in the second volume of *Mémoires du Muséum*, upon the *Cerastium aquaticum* of Linnæus. He named it after the Abbé de Larbre, who at the age of 80, published a Flora of Auvergne.

History, Use, Propagation, Culture,

1070. *Spergula*. From *spargere*, to scatter, because it scatters its seeds abroad, to the great profit of the farmer in Holland, who obtains from it meadows affording the most delicious butter. *S. arvensis* is a common weed in sandy soils, in Scotland called yarr, and in Norfolk pickpurse. In the Netherlands and in Germany it is sown on corn stubbles, to supply a bite for sheep during winter. It may be sown and reaped in eight weeks, either in autumn or spring. It is said to enrich the milk of cows, so as to make it afford excellent butter; and the mutton fed on it is preferable to that fed on turnips. Hens eat spurry greedily, and it is supposed to make them lay a great number of eggs, whether in hay, or cut green, or pasture. Von Thær observes, it is the most nourishing, in proportion of its bulk, of all forage, and gives the best flavored milk and butter. It has been recommended to be cultivated in England; but it is not likely that such a plant can ever pay the expense of seed and labour in this country, even on the poorest soil; or at all events, as Professor Martyn observes, we have many better plants for such soils.

1071. *Phytolacca*. From *φυλλον*, a plant, and *lacca*, lac; that is to say, a plant whose fruit gives out a fine red color like lac. The English-American name Poke, applied to one species, is a corruption of Pocan, the name by which it was formerly known in Virginia. *P. decandra* has large ramose roots, shoots half an inch in diameter, and five or six feet high; the leaves five inches long, and two and a half inches broad, smooth and of a deep green. It grows vigorously in a good deep soil, and furnishes ample supplies of young shoots, which in America and the West Indies are boiled and eaten as spinach. (*Correa de Serra, in Hort. Trans. iv. 446.*)

- 6567 Leaves whorled, Pedunc. in fruit reflexed, Seeds reniform angular rough
 6568 Leaves whorled, Flowers pentandrous, Seeds depressed winged smooth
 6569 Leaves opposite subulate smooth: upper fascicled, Cal. not nerved
 6570 Leaves opposite subulate blunt naked, Pedunc. solitary very long smooth
 6571 Leaves opposite subulate awned ciliated, Pedunc. very long solitary hairy

DECAGYNIA.

- 6572 Flowers octandrous octogynous
 6573 Flowers decandrous pentagynous
 6574 Flowers dodecandrous octogynous, Leaves ovate obl. with a recurved point
 6575 Flowers decandrous decagynous
 6576 Flowers icosandrous decagynous
 6577 Flowers diceious

and Miscellaneous Particulars.

An ounce of the dried root, infused in a pint of wine, and given to the quantity of two spoonfuls, operates kindly as an emetic, and is preferable to most others, as it hardly alters the taste of the wine. In its medicinal properties, the *Phytolacca* approaches nearer to *Ipecacuanha* than to any other vegetable; but it is slower in its effects, and it remains longer in action, although it may be checked by an opiate. Sometimes its operation produces vertigo and stupor. The powder of the leaves possesses the same virtues as the root, but in a weaker degree. It is one of the plants which have had a temporary reputation for the cure of cancer, and some sensible men have been converts to its efficacy. The fermented berries give out a liquor which yields alcohol by distillation. From half a bushel of the berries, six pints of spirits were obtained, sufficiently strong to take fire and burn with readiness. Two ounces of this given to a dog occasioned nausea and drowsiness, with slight spasmodic motions, but no vomiting. Poultry are fond of the berries, but if eaten in large quantities, they give the flesh a disagreeable flavor. The juice stains paper and linen of a beautiful purple color, but it will not last long; if a method could be found of fixing the dye, it might be very useful. The vignerons in Portugal for many years used the juice of the berries of the elder-bush to give a deep color to the Port wines, to which it was thought to communicate a disagreeable taste when mixed in too great a quantity. Complaint of this practice having been made to government, orders were given that the stems of that plant should be cut down and destroyed before they produced berries: but they forgot to include the *Phytolacca* in the proscription, so that the berries of that plant supply the same purpose in a much worse manner.

CLASS XI. — DODECANDRIA. 12 STAMENS.

This is a small incongruous class, containing no extensive genus of importance except Euphorbia. Some botanists have been of opinion that it ought to be cancelled, but it is probable that Linnæus understood the application of his own principles as well as some of his more pretending followers, and it is certain that if the Linnean plan can be made to act successfully, its artificial arrangement must be rigorously observed. Euphorbia and Reseda, which are usually referred hither, should more properly be referred, the former to Monœcia, and the latter to Polygamia.

Order 1. MONOGYNIA.  12 Stamens. 1 Style.

- 1072. *Asarum*. Cal. 3-4-cleft, superior. Cor. O. Capsule coriaceous, crowned.
- 1073. *Bocconia*. Cal. 2-leaved. Cor. O. Style bifid. Caps. 2-valved, 1-seeded.
- 1074. *Bassia*. Sepals 4. Cor. 8-cleft, with an inflated tube. Stamens 16. Drupe 5-seeded.
- 1075. *Blakea*. Sepals 6, inferior, with a superior entire calyx. Petals 6. Caps. 6-celled, many seeded.
- 1076. *Bejaria*. Cal. 7-cleft. Petals 7. Stamens 14. Berry 7-celled, many-seeded.
- 1077. *Agathophyllum*. Petals 6. Calyx truncate. Drupe 1-seeded.
- 1078. *Rhizophora*. Cal. 4-parted. Cor. 4-parted. Stigmas 2. Seed 1 very long, fleshy at base.
- 1079. *Garcinia*. Sepals 4, inferior. Petals 4. Berry 8-seeded, crowned by the petate stigma.
- 1080. *Grangeria*. Cal. 5-cleft. Petals 5. Stamens 15. Drupe 3-cornered. Nut 3-cornered, bony, 1-seeded.
- 1081. *Halesia*. Cal. 4-toothed, superior. Cor. 4-cleft. Nut quadrangular, 2-seeded.
- 1082. *Decumaria*. Sepals 8-12, superior. Petals 8-12. Caps. 8-celled, many-seeded.
- 1083. *Eurya*. Cal. 5-leaved, with 2 bractes at base. Petals 5. Caps. 5-celled, many-seeded.
- 1084. *Aristolotia*. Sepals 5. Petals 5. Style trifid. Berry 3-celled. Seeds twin.
- 1085. *Canella*. Cal. 3-lobed. Petals 5. Anthers 16, united to an urceolate nectary. Berry 1-celled, 2-4-seeded.
- 1086. *Cratæva*. Petals 4. Cal. 4-cleft. Berry 1-celled, many-seeded.
- 1087. *Triumfetta*. Petals 5. Sepals 5. Capsule hispid, opening in four.
- 1088. *Peganum*. Petals 5. Sepals 5, or O. Capsules 5-celled, 3-valved, many-seeded.
- 1089. *Hudsonia*. Petals 5. Sepals 3, tubular. Stamens 15. Capsules 1-celled, 3-valved, 3-seeded.
- 1090. *Nitraria*. Petals 5, vaulted at end. Cal. 5-cleft. Stamens 15. Drupe 1-seeded.
- 1091. *Portulaca*. Petals 5. Cal. 2-fid. Capsule 1-celled, cut across.
- 1092. *Talinum*. Petals 5. Sepals 2. Capsule 3-6-valved, many-seeded. Leaves without stipules. Seeds not winged.
- 1093. *Anacampseros*. Like *Talinum*, but having stipules and winged seeds.
- 1094. *Lythrum*. Cal. 12-toothed, tubular, unequal at base. Petals 6, inserted in calyx. Caps. 2-celled, many-seeded.
- 1095. *Nesæa*. Like *Lythrum*, but calyx campanulate.
- 1096. *Heimia*. Cal. 12-toothed. Petals 6. Capsule 4-celled.

History, Use, Propagation, Culture,

1072. *Asarum*. An ancient name, said to have been formed from α, privative, and σμα, bandage, because it was not used in garlands of which the ancients were so fond; in that case it should be *Asarum*. The common name, *Asarabacca*, is Latin, qu = the berry of Asarum? Little inconspicuous herbaceous plants. The leaves of *A. europæum* are emetic, cathartic, and diuretic; and, perhaps, as Dr. Cullen has remarked, they form the most useful species of errhine stimulants. A proper dose snuffed up the nose for a few successive evenings at

1097. *Cuphea*. Cal. 6-12-toothed, occasionally gibbous at base. Pet. 6, inserted in calyx, or O. Caps. 1-celled, opening on one side longitudinally along with the calyx.
 1098. *Kleinovia*. Sepals 5. Petals 5. Nect. campanulate, 5-toothed, stamiferous, united to the column of ovary. Ovary stalked. Caps. with 5-angles and 5-cells inflated, cells 1-seeded.

Order 2. DIGYNIA.  12 Stamens. 2 Styles.

1099. *Callicoma*. Flowers in round heads. Calyx 4-5-leaved. Corolla O.
 1100. *Heliocarpus*. Sepals 4. Petals 4. Styles simple. Caps. 2-celled, compressed, radiating on each side longitudinally.
 1101. *Agrimonia*. Cal. 5-toothed, surrounded by another. Petals 5. Grains 2, in the bottom of the calyx.

Order 3. TRIGYNIA.  12 Stamens. 3 Styles.

1102. *Rosca*. Involucre many-leaved spreading. Hermaphrodite flower central, apetalous, surrounded by several fringed petaloid barren flowers.
 1103. *Euphorbia*. Involucre 1-leaved, ventricose, regular. Flowers naked, aggregate. Female floret surrounded by many monandrous male florets.
 1104. *Pedilanthus*. Like *Euphorbia*, but involucre calceiform.
 1105. *Visnea*. Cal. 5-leaved, inferior. Petals 5. Stigmas 3. Nut 2-3-celled, half inferior.

Order 4. TETRAGYNIA.  12 Stamens. 4 Styles.

1106. *Calligonum*. Cal. 5-parted. Corolla O. Filaments about 16, united at base. Ovary superior, 4-cornered. Styles 4. Nut with a many winged crust, 1-celled.

Order 5. PENTAGYNIA.  12 Stamens. 5 Styles.

1107. *Glinus*. Sepals 5. Cor. O. Nectary with bifid bristles. Caps. 5-angular, 5-celled, 5-valved, many-seeded.
 1108. *Blackwellia*. Cal. $\frac{3}{4}$ -superior, persistent, at the base turbinate, many-parted; with villous ciliated segments. Petals 15. Capsule 1-celled, many-seeded.
 1109. *Gastonia*. Cal. entire. Petals 5-6. Stam. 10-12: two opposite each petal. Styles 10-12, very small, united at base. Capsules 10-12-celled.

Order 6. DODECAGYNIA.  12 Stamens. 12 Styles.

1110. *Sempervivum*. Cal. 12-parted. Petals 12. Caps. 12, many-seeded.

MONOGYNIA.

- 6578 Leaves subhastate cordate, Calyx tubular shortly trifid
- 6579 Leaves reniform obtuse twin
- 6580 Leaves reniform mucronate
- 6581 Leaves cordate obtuse smooth stalked

- 6582 Leaves oblong sinuated
- 6583 Leaves cordate somewhat lobed

and Miscellaneous Particulars.

bed time occasions a copious discharge from the nostrils, which continues to flow for several days. (*London Dispensatory*, 185.) The herb was formerly employed to correct the effects of excessive drinking, whence in French it is still called *cabaret*.

1073. *Bocconia*. In memory of Paolo Boccone, M. D., a Sicilian, and Cistercian monk under the name of Sylvius; author of *Icones et Descriptiones rariorum Plantarum Siciliae, Melitae, Galliae, et Italiae*; pub-

History, Use, Propagation, Culture,

lished by Morrison at Oxford, 1764, quarto, and other works. *B. frutescens* is very ornamental in its foliage. The Indian kings, Hernandez tells us, planted it in their gardens, which must have been for its beauty, as it is neither culinary nor medicinal, though the juice is acrid, and used in the West Indies to take off warts.

1074. *Bassia*. So named by Koenig, in honor of Ferdinand Bassi, curator of the botanic garden at Bologna. Tall trees, natives of the hottest parts of the East Indies, with tufted alternate leaves growing only at the end of the shoots. Ripened cuttings root freely in sand.

1075. *Blakea*. So named by Dr. Patrick Browne, after Mr. Martin Blake of Antigua, a great promoter of useful knowledge, and a patron of the doctor's Natural History of Jamaica. This is one of the most beautiful plants of the West Indies. It supports itself for a time by the help of some neighboring shrub or tree, but it grows gradually more robust, and at length acquires a pretty moderate stem, which divides into a thousand weakly declining branches, well supplied with beautiful rosy blossoms on all sides. It cannot display itself to so great advantage in our stoves; but it flowers freely, and thrives well in loam and peat, well supplied with water. Ripe cuttings root in sand in moist heat and covered.

1076. *Bejaria*. So named by Mutis, in honor of Bejar, a Spanish botanist. The original species are natives of New Grenada. That in gardens, which is a native of the southern states of North America, is a beautiful shrub from three to four feet high, with pink flowers of an agreeable scent. It is found upon the banks of swamps and ponds, and requires the protection of a frame or greenhouse.

1077. *Agathophyllum*. From *αγαθος*, good, and *φύλλον*, a leaf. The leaf has a pleasant smell like cloves. In Madagascar, where it is called *Ravendzara*, it forms a large tree with a rufous aromatic bark, and a heavy insipid wood. The leaves are alternate and coriaceous. The dried fruit is very aromatic.

1078. *Rhizophora*. From *ρίζα*, a root, and *φερον*, to bear, in allusion to the numerous roots which are emitted by the seeds, which vegetate among the branches of the tree while yet adhering to their footstalk. This is the common Mangrove, which covers immense tracts of coast within the tropics, rooting and vegetating even as far as low water mark.

1079. *Garcinia*. So named in honor of Laurent Garcin, M. D., F. R. S., who travelled into the East Indies. *Mangostans* is the Malayan name. This tree bears a fruit, which in the East Indies ranks with that of the pine-apple. It rises with a taper stem, sending out many branches, not unlike a fir-tree, with oval leaves, seven or eight inches long. The flower is like that of a single rose; the fruit round, the size of a middling orange; the shell is like that of the pomegranate, the inside of a rose color, divided by thin partitions, as in oranges, in which the seeds are lodged, surrounded by a soft juicy pulp, of a delicious flavor, partaking of the strawberry and the grape, and is esteemed one of the richest fruits in the world. It is a native of the Molucca islands, whence it has been transplanted to Java and Malacca. The head of the tree is in the form of a parabola, so fine and regular, and the leaves so beautiful, that it is looked upon in Batavia as the tree most proper for adorning a garden, and affording an agreeable shade. It was introduced to England in 1789. According to Dr. Garcin, (*Phil. Trans.*) "it is esteemed the most delicious of the East Indian fruits, and a

- 6584 Leaves lanceolate, Peduncles 1-flowered very long horizontal axillary
 6585 Leaves elliptical acute, Peduncles 1-flowered nodding terminal
- 6586 Calyxes two, Leaves with three nerves finely striated across beneath
- 6587 Leaves ovate-lanceolate smooth, Flowers terminal in paniced racemes
- 6588 Leaves stalked alternate obovate obtuse coriaceous entire smooth
- 6589 Leaves acute, Fruit subulate-clavate
- 6590 Leaves ovate, Peduncles 1-flowered
- 6591 Leaves alternate stalked ovate entire smooth veiny
- 6592 Leaves ovate acuminate, Veins hairy beneath, Wings of the fruit equal
 6593 Lvs. obl. ovate obtusely pointed green on both sides very soft beneath, Wings of fruit alternately larger
- 6594 Leaves all ovate, Stem climbing
 6595 Lower leaves rounded : upper ovate-lanceolate, Stem sarmentose
- 6596 Branches at end pubescent, Leaves cuneate oval, Flowers axillary
- 6597 Leaves opposite evergreen ovate shining serrated
- 6598 Leaves oblong obtuse shining, Racemes terminal

and Miscellaneous Particulars.

great deal of it may be eaten without any inconvenience; it is the only fruit which sick people are allowed to eat without scruple. It is given with safety in almost every disorder; and we are told that Dr. Solander, in the last stage of a putrid fever in Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit. The pulp has a most happy mixture of the tart and sweet, and is no less salutary than pleasant. It is propagated by ripe cuttings in sand in moist heat. But the plant rarely survives long after its importation.

1080. *Grangeria*. Named after N. Granger, a traveller in Egypt, Persia, &c. who died at Bassora in 1733. His voyage into Egypt was published in 1745. This is a tree the size of an oak, with alternate ovate entire leaves. The flowers are small, in small terminal and axillary racemes.

1081. *Halesia*. So named by Ellis, in honor of the learned and venerable Stephen Hales, D. D., F. R. S., author of *Vegetable Statics*, 1727. The species are very ornamental shrubs, valuable for blossoming early in the season. The flowers hang in small bunches all along the branches, each bud producing from four to eight or nine; they appear before the leaves, are of a pure snowy whiteness, and last for two or three weeks; they are succeeded by pretty large winged juiceless drupes, hanging likewise in bunches. The leaves of *H. diptera* are six times the size of those of *H. tetraptera*, and the fruit has two large wings and two minute ones. They are propagated by cuttings of the roots.

1082. *Decumaria*. Derived from *decem*, ten, all the parts of fructification answering to the number 10. It is commonly propagated by layers, but will grow by cuttings in sand under a hand-glass.

1083. *Eurya*. A name of Thunberg's, supposed to have been formed from *eu*, broad; its application no one has been able to discover. The *Eurya chinensis* is a little evergreen bush, bearing many whitish flowers on the under side of the branches and hidden by the leaves. It is easily propagated by cuttings.

1084. *Aristotelia*. After the celebrated ancient philosopher and naturalist Aristotle. Maqui is the name of this shrub in Chili. It grows freely in a sheltered situation; but its flowers are of little beauty. They are succeeded by small berries of a purple or black color, slightly acid and eatable: the inhabitants of Chili make a wine from them, which they give in fevers, and for curing the plague. It is increased by layers or ripened cuttings.

1085. *Canella*. A name given by Murray, on account of the resemblance between its wood and the aromatic flavor of *Canella*, Cinnamon. This tree rises very straight, from ten to fifty feet in height. The branches are erect, not spreading, and only at the top of the tree; furnished with petiolated leaves of a dark green color, thick, and shining like those of the laurel, and emitting a similar odor. The flowers, which exhale a powerful aromatic perfume, are small, seldom open, and in bunches. The inner bark of the branches is freed from the cuticle, and dried in the shade. This bark is stimulant, and slightly tonic. It is a useful adjunct to bitters in some cases of dyspepsia and atonic gout; but it is employed chiefly on account of its flavor, and to correct the gripping quality of the resinous cathartics. It is said to prove useful in scurvy (*London Dispensatory*, 207.)

History, Use, Propagation, Culture,

1086. *Cratæva*. In honor of Cræteus, a Greek botanist and contemporary of Hippocrates. C. Tapia, an American name, produces a fruit about the size of an orange, with a mealy pulp and a strong smell of garlic, which is communicated to the animals that feed on it. All the species prefer a rich loamy soil, and may be increased by cuttings in sand under a hand-glass.

1087. *Triumfetta*. So named by Plumier, in memory of Giov. Battista Triumfetti, prefect of the botanic garden at Rome, author of Hortus Romanus, 1681, and other works. T. semitriloba has a tough strong bark which serves for ropes and other conveniences of that kind in the inland parts of the West Indies. The whole plant is mucilaginous and emollient. Cuttings root in sand under a hand-glass. All the species are uninteresting weed-like shrubs of tropical countries.

1088. *Peganum*. *Hyoscyamus* was the Greek name of the rue, which the modern plant resembles. Harmala is the Arabic name (*harmel*) of the species so called. The species are of easy culture and propagation in any light soil.

1089. *Hudsonia*. So named by Linnæus, in honor of William Hudson, apothecary of London, F. R. S., and author of Flora Anglica, 1762 and 1778, octavo. It is a heath-like plant which grows in peat soil, and young cuttings are rooted in sand under a bell-glass. It is extremely rare in gardens.

1090. *Nitraria*. So named by Schreber, who first found it in Siberia near the nitre works, with other saline vegetables. This is a curious thorny shrub, peculiar to the salt deserts of Siberia. Pallas informs us, that the berries, though saltish and insipid, are eaten in the Caspian desert, but in that arid soil they are almost the only luxury. Camels feed on the twigs. Linnæus had the shrub twenty years before it flowered in Sweden;

- 6599 Unarmed, Leaves entire, Flowers gynandrous
 6600 Leaflets ovate acuminate, Petals ovate roundish obtuse with globose ovaries
 6601 Stem twining, Cor. regular, Petals very long wavy, Peduncles capitate-racemose

- 6602 Leaves emarginate at base, Flowers without calyx
 6603 Leaves entire at base undivided
 6604 Leaves half three lobed, Flowers complete
 6605 Leaves subcordate ovate entire serrated rather hairy: the floral ones lanceolate, Branches hairy
 6606 Leaves ovate undivided rarely lobed
 6607 Leaves rhomboid: the upper lanceolate ovate, Flowers complete
 6608 Leaves ovate cordate entire unnequally serrated acuminate downy glandular at base, Fl. complete
 6609 Leaves ovate cordate 7-nerved acuminate serrate hairy, Flowers clustered
 6610 Leaves oblong serrate 5-nerved softly hairy, Fl. terminal clustered

- 6611 Leaves multifid, Stem herbaceous
 6612 Leaves oblong acute, Stem herbaceous

- 6613 Leaves subulate acerose hairy, Calyx erect pubescent

- 6614 Leaves entire obtuse

- 6615 Leaves wedge-shaped fleshy, Fl. sessile, Stem and branches nearly erect
 6616 Leaves wedge-shaped fleshy, Fl. sessile, Branches prostrate
 6617 Much branched prostrate, Leaves wedge-shaped minute fleshy, Fl. on long stalks and sessile
 6618 Leaves subulate alternate hairy at the axilla, Flowers sessile terminal
 6619 Bractes 4, Flowers 4-fid, Joints of the stem hairy
 6620 Leaves elliptical fleshy flat, Joints hairy, Flowers sessile terminal
 6621 Leaves subulate, Cal. hairy, involucre many-leaved, Flowers about 3, Petals retuse
 6622 Axils hairy, Leaves obversely oblong, Involucre 8-leaved

- 6623 Leaves cylindrical fleshy, Corymbs terminal stalked
 6624 Leaves linear oblong ciliated, Flowers solitary
 6625 Leaves flat cham. wedge-shaped emarg. mucronate, Raceme simple with a 3-cornered peduncle
 6626 Leaves flat obovate mucronate, Corymb long, Peduncle 3-cornered
 6627 Leaves ovate flat, Panicle terminal, Peduncle dichotomous
 6628 Leaves lanc. ovate sessile opposite, Panicle branched

- 6629 Leaves ovate difform smooth green, Peduncles round long paniced

- 6630 Leaves ovate acuminate difform green shining cobwebbed, Raceme simple, Peduncles round long
 6631 Leaves ovate acuminate difform shining cobwebbed dark-red, Rac. simple, Pedunc. very long
 6632 Leaves imbricated expanded dark-green cobwebbed rugose above, Threads axillary longer than leaves
 6633 Leaves lanceolate fleshy convex beneath, Scape leafy short 1-flowered

and Miscellaneous Particulars.

and during ten years having in vain tried to make it flower in the garden at Upsal, he at length succeeded by watering the plant with salt water; it flowered, however, at Gottingen without this assistance. Murray expresses a surprise that it has not been used in its native soil for making soda: but perhaps it does not grow in sufficient quantity, or there may be an ample harvest in that salt region of plants that answer the same purpose.

In this country it thrives in sandy loam with a little salt put round it, and is increased by layers, or cuttings in sand under a hand-glass.

1081. *Portulaca*. An ancient name of unknown origin. The species are succulents of the easiest culture. *P. sativa* and *oleracea* were formerly cultivated as potherbs, salads, for garnishings and pickling, though now little used for any of these purposes.

1092. *Talinum*. One of those names invented by Adanson, which probably were the mere creations of that botanist's erratic brain. This is a succulent genus allied in habits to *Portulaca*, and of the easiest culture.

1395. *Anacampseros*. *Ανακαμψερως* was the name of a plant, to which the ancients attributed the quality of restoring the passion of love, for which purpose it was used in philtres and incantations: from *ανακαμπτω*, to return, and *εργος*, love. The species are succulents, and grow freely in a sandy loam mixed with a little lime rubbish, and require but little water. Cuttings root readily, but should be laid to dry a few days before being planted. Leaves taken off close to the plants, and laid to dry a few days, and then planted, will root, and shoot out young plants at their base.

History, Use, Propagation, Culture,

1094. *Lythrum*. From *λυθρον*, black blood, in allusion to the color of the flowers. *L. Salicaria* (willow-like, from *Salix*) although a common British plant, is considered a handsome border flower, and several varieties, differing chiefly in size, are in cultivation. The whole plant is astringent, and has been used in medicine and tanning.

1095. *Nesæa*. Plants formerly referred to *Lythrum*, from which they seem to be satisfactorily distinguished.

1096. *Heimia*. Named by Link, in honor of Dr. Heim, a celebrated Berlin physician. A beautiful stove shrub with fine spikes of yellow flowers.

1097. *Cuphea*. From *κωφός*, curved, in reference to the form of its capsule. Pretty herbaceous or shrubby plants, resembling *Lythrum* in aspect. *C. Melvilla* is a very handsome stove shrub resembling *Bouvardia coccinea*.

1098. *Kleinhofia*. So named by Linneus, after Kleinhoff, formerly director of the botanic garden in Java. The leaves when bruised smell like violets; the flowers appear the greater part of the year, and the tree is seldom without fruit in all its different stages. Cuttings root in sand under a hand-glass.

1099. *Callioma*. From *καλος*, beautiful, and *κωμης*, hair, in allusion to the tufted yellow heads of flowers, for which the plant is remarkable. Ripened cuttings root in sand under a hand-glass.

1100. *Heliocarpus*. From *ἥλιος*, the sun, and *καρπος*, fruit. The valves of its round and elegantly ciliated capsule resemble a little sun surrounded by its rays. Cuttings root in sand under a hand-glass; and Miller found the seeds to vegetate after being kept ten years.

1101. *Agrimonia*. A corruption of the word *Argemone*, by which name the ancients distinguished a plant reputed useful in cataract of the eye, which in Greek was termed *argema*. *A. Eupatoria* was formerly regarded as a remedy of much importance as a tonic and deobstruent; but though still retained in the London *Materia Medica*, is seldom or never prescribed. The root in spring is sweet-scented, and the flowers fresh

- 6634 Leaves opp. cordate lanceolate, Flowers spiked 12-androus
 6635 Leaves opp. lanc. Panicle virgate, Flowers 12-androus 3 together

6659 Leaves lanceolate wavy entire with two glands at base

and Miscellaneous Particulars.

gathered smell like apricots. When the plant is coming into flower it will dye wool a full nankeen color, and gathered in September a darker yellow. It has been used for dressing leather. Sheep and goats eat it, but kine, horses, and swine refuse it.

1102. *Reseda*. From *resedo*, to calm, to appease. The Latins thought it useful as a topical application in external bruises. *R. Luteola*, a diminutive of *lutea*, yellow, is used by dyers, especially in France. (Chaptal's *Chimie appliquée à l'Agriculture*, &c.) It affords a most beautiful yellow dye for cotton, woollen, mohair, silk and linen. Blue cloths are dipped in a decoction of it, in order to become green. The yellow color of the paint called Dutch Pink, is obtained from this plant. The entire plant, when it is about flowering, is pulled up and employed both fresh and dried. Mr. Swayne observes, that it is one of the first plants which grow on the rubbish thrown out of coal pits. It flowers in June and July. The root and bottom leaves are formed from the fallen seeds before winter; and thus it happens in this, as in many other cases, that the wild plant is biennial, whilst the cultivated plant, growing from seeds sown in the spring, is annual. It is an observation of Linnaeus's, that the nodding spike of flowers follows the course of the sun, even when the sky is covered; pointing towards the east in a morning, to the south at noon, westward in the afternoon, and to the north at night.

R. odorata is a well known and universal favorite. The flowers are highly odoriferous, and there are very few to whom this odor is offensive. The plant is in great demand in London for rooms and placing in balconies, and forms for these purposes an extensive article of culture among the florists and market gardeners. The plants are in many cases sown and transplanted into pots, three or four plants to a pot four inches in diameter. To obtain plants for blowing from December to February, a sowing should be made in July in the open ground, and the plants potted in September. The crop for March, April, and May, should be sown not later than the twenty-fifth of August, the plants from this sowing will not suffer by exposure to rain, whilst they are young; they must, however, be protected from early frosts, like the winter crop; they are to

History, Use, Propagation, Culture,

be thinned in November, leaving not more than eight or ten plants in each pot; and at the same time, the pots being sunk about three or four inches in some old tan or coal ashes, should be covered with a frame, which it is best to place fronting the west: for then the lights may be left open in the evening, to catch the sun whenever it sets clear. The third, or spring crop, should be sown in pots, not later than the twenty-fifth of February; these must be placed in a frame, on a gentle heat, and as the heat declines the pots must be let down three or four inches into the dung-bed, which will keep the roots moist, and prevent their leaves turning brown, from the heat of the sun, in April and May. The plants thus obtained, will be in perfection by the end of May, and be ready to succeed those raised by the autumnal sowing. (*Rishon in Hort. Trans. ii. 372.*)

R. odorata frutescens, if left to itself, hardly appears a distinct variety, but trained against a wall or to a stick it, and also the common mignonette, may be made to assume a frutescent character. According to Sabine, the tree mignonette is to be propagated from seeds sown in spring; it may also be increased by cuttings, which will readily strike. The young plants should be put singly into small pots, and brought forward by heat, that of a gentle hot-bed being preferable, but they will grow well without artificial heat. As they advance, they must be tied to a stick; taking care to prevent the growth of the smaller side shoots, by pinching them off, but allowing the leaves of the main stem to remain on for a time to support and strengthen it. When they have attained the height of about ten inches or more, according to the fancy of the cultivator, the shoots must be suffered to extend themselves from the top, but must be occasionally stopped at the ends, to force them to form a bushy head, which by the autumn will be eight or nine inches in diameter, and covered with bloom. Whilst the plants are attaining their proper size, they should be shifted progressively into larger pots, and may ultimately be left in those of about six inches in diameter at top. (*Hort. Trans. iii. 181.*)

Mr. Lándley's theory of the nature of the inflorescence of this genus being remarkable, and only explained in his *Collectanea Botanica*, which is in few hands, it is here transcribed entire. "The usual idea of the flower of *Reseda* has been, that it is furnished with a calyx of a variable number of divisions, with as many petals, producing from their surface certain anomalous appendages, and with an ovary and stamens inserted on a great fleshy body, called nectary by Linnæan botanists, squama by others, and raised to the rank of a distinct organ by M. Mirbel, under the name of Gynophore. To us, however, it has always appeared, that this could by no means be the real structure of the plant, and that by a slight alteration of terms it not only might be much more satisfactorily explained, but its real affinity ascertained with some degree of probability. For even allowing for a moment an analogy between the nectary of this plant and the discus of others, particularly of some *Tiliacæ*, there is still a great difficulty remaining to be overcome in the anomalous structure of the supposed petals, of which we can imagine no probable explanation. We are therefore of opinion, that a much more natural mode of understanding *Reseda* is to consider it as having compound flowers; taking the calyx of authors for an involucre, their petals for neutral florets, and their nectary for the calyx of a fertile

- 6660 Leaves lanceolate wavy hairy
 6661 Leaves linear toothed at base, Styles 4
 6662 Leaves linear entire, Styles 4, Barren florets 2
 6663 Leaves linear entire, Fl. trigynous, Fruit clavate, Stem twiggy
 6664 Leaves lanceolate entire, Fruit stellate
 6665 Nearly related to *R. luteola*, but the leaves are not toothed at base
 6666 Leaves pinnate recurved at end, Styles 4, Involucre 5-parted spreading, Stem half shrubby
 6667 Leaves pinnate, Styles 4, Involucres 6-parted
 6668 Branches above and younger leaves covered with large distinct blisters
 6669 Leaves pinnate wavy, Styles 3 or 4
 6670 Leaves bipinnatifid very rough, Flowers spiked
 6671 Leaves all trifid; segments of the upper leaves linear flat; of the lower lanceol. wavy, Stem quite simple
 6672 Leaves linear simple or trifid, Stem erect branched, Fruit obovate
 6673 Leaves all trifid: the lower pinnate
 6674 Leaves entire and 3-lobed, Involucres 6-parted very large
 6675 Leaves entire and 3-lobed, Involucres shorter than florets
 6676 Leaves entire and 3-lobed, Involucres as long as florets

§ 1. *Stem thick, fleshy, naked, or with a few leaves, Flowers dispersed.*
 * Prickly.

 6683 Prickly naked erect with 9 angles, Prickles solitary flower-bearing, ascending fuscous, Branches pendulous
 6684 Prickly half naked, Angles warted with spines between, The young warts leafy
 6685 Prickly naked with many angles, Prickles solitary subulate
 6686 Prickly naked with many angles, Prickles twin
 6687 Prickly naked with numerous simple erect 10-13-angled stems, Prickles dark
 6688 Prickly half naked, Prickles twin, Angles obliquely warted leafy upwards, Leaves oblong
 6689 Stem round half naked leafy upwards, Leaves lanc. linear, Peduncle 1-fl. at length spiny
 6690 Prickles twin, Stem rounded or angular, Angles obliquely warted, Leaves nearly oblong
 6691 Prickles twin horizontal, Stem rounded simple, Leaves oblong spatulate very large

and Miscellaneous Particulars.

floret in the middle. In support of this opinion, we may observe, firstly, that there is a difference in the time of expansion of the neutral florets, and of the stamens of the fertile one; the former being quite open, in very many capituli, before one anther of the latter has burst in a single flower. Secondly, that there is an evident analogy between the appendages of the neutral florets, and the stamens of the perfect florets; inasmuch as in *Reseda odorata* those of the upper sterile florets are of nearly the same number as the real stamens; because in *Reseda alba*, and some others, in which a union of filaments takes place in the perfect floret, there is a corresponding but more complete union of the sterile appendages; and because occasionally, in *Reseda odorata*, stamens are changed into bodies altogether similar to the sterile appendages, and in *Reseda Phyteuma* the same appearance is always assumed by the perfect stamens after the anthers have performed their functions. Thirdly, that there is an equal analogy between the calyx of the neutral florets, and that of the perfect floret; because both have a peculiar glandular margin; the same form; both produce their stamens from their surface; and because the upper edge of the calyx in sterile florets has the same relation to the axis of each particular head, as that of the perfect floret has to the axis of the whole inflorescence. In *Reseda Phyteuma*, which has the margin of its neutral florets rolled back, the same thing occurs in the perfect floret. Fourthly, that there is no instance of the same analogy existing between the discus and petals of other plants. We may also observe, that in *Reseda Phyteuma*, there is a campanulate tube to the calyx, into the upper edge of which the stamens are inserted.

"To determine the affinity of *Reseda* to other orders, will not be so easy as to explain its structure. One cannot avoid remarking the resemblance between its calyx and the squama of *Amentaceæ* and *Ulmaceæ*. *Ficoideæ*, *Grossulaceæ* and *Cacti*, on account of placentation and structure of seed, may be supposed to have a certain relation to it: as may *Chenopodææ* with regard to inflorescence, absence of petals, and habit. But we are disposed to believe its real place in the system is in the neighbourhood of *Euphorbiaceæ*, where we have placed it in *Flora Scotica*. They agree with it in having the same sort of aggregation of flowers, similar habit, no corolla, and ternary division of ovarium. The insertion of their ovula is the same, as is also the direction of the radicle. They differ, however, firstly, in the presence of albumen; which yet is not entirely absorbed in *Reseda* till the seed is perfectly ripe, and which exists even after that time in the seed of *R. alba*, where it is fleshy as in *Euphorbiaceæ*. Secondly, in their solitary seeds; in which respect *Resedaceæ* may be supposed to bear the same relation to *Euphorbiaceæ* as *Campanulaceæ* do to *Compositæ*; or as some sections of *Rubiaceæ* to the others. In *R. suffruticulosa* the ovules appeared to be reduced to a single row, and the same is said to obtain in *Ochradenus*. Thirdly, in elastic dehiscence of capsule; but as this is not universal in *Euphorbiaceæ*, it is not, strictly speaking, an objection of importance." (*Lindley's Coll. Bot.*)

1103. *Euphorbia*. *Euphorbus* was physician to Juba, king of Mauritania, and first used this plant in medicine. This is a genus of grotesque and curious plants, few of them of either beauty or use, and most of

History, Use, Propagation, Culture,

the annuals poisonous weeds. One species (E. edulis), not yet introduced, is said to be used as a pot-herb in Cochinchina; one (E. punicea) is a very splendid plant, and the E. officinarum, and one or two other species gathered along with it, are used in medicine. They are all milky, mostly herbaceous, several however shrubby, upright for the most part, very few of them creeping; some are leafless, but most of them are leafy. Stems angular or tubercled, or more frequently cylindrical or columnar; unarmed, or in the angular sorts resembling the upright Cactuses, and armed with prickles, which are either solitary or in pairs, placed in a single row on the top of the ridges. Such as have leaves have them simple, most frequently alternate and naked; in some sorts, however, they are opposite, and are then commonly attended with stipules, and in a few they are placed by threes in whorls. Peduncles in the leafless sorts naked, bearing from one to three flowers; in the leafy ones axillary, but more frequently from two to five or more in a terminating umbel; each some-

- 6692 Prickly elliptical obtuse furrowed, Prickles subsolitary, Peduncles 3-flowered
 6693 Warts very large green downy at end, Spines about 4 strong black at end
 6694 Simple rounded obovate with warts woolly at end [than the rest
 6695 Columnar, Warts small numerous with many small spines between, Two spines in each cluster longer

** *Unarmed.*

- 6696 Unarmed globose with many angles
 6697 Unarmed imbricated, Warts with one leaf, Flowers somewhat stalked, Divisions palmate
 6698 Stem closely tessellated with warts upwards thickly branched
 6699 Unarmed imbricated with warts bearing a linear leaf
 6700 Unarmed with round procumbent branches, Warts 4-cornered
 6701 Unarmed imbricated, Warts with a roundish leaflet, Fl. term. solitary sessile with palmate segments
 6702 Unarmed imbricated, Warts with a lanceolate leaflet, Fl. stalked with entire segments
 6703 Unarmed imbricated capitate, Warts rhomboid with lanceolate stalked leaves, Segm. of flower entire
 6704 Unarmed half naked shrubby filiform flaccid, Leaves alternate
 6705 Warts large imbricated hooked at end : the upper having an oval leaflet at length withering
 6706 Unarmed warted, Warts with a deciduous leaf, Pedunc. solitary or 3 terminal 1-flowered
 6707 Unarmed naked leafless branched, Branches square, Fl. solitary terminal
 6708 Unarmed shrubby upright, Head terminal, Leaves lanceolate smooth glaucous
 6709 Unarmed half-naked shrubby filiform erect, Branches spreading regularly clustered

§ 2. *Stem uniform, shrubby, upright, Flowers scattered or aggregate, not in umbels.*

- 6710 Unarmed, Leaves lanceolate clustered entire, Umbel terminal sessile, Invol. connate colored
 6711 Unarmed shrubby upright, Umbel 5-fid term. Invol. oblong, Leaves lanc. smooth
 6712 Unarmed shrubby, Leaves oblong alternate distichous, Bractes persistent
 6713 Unarmed shrubby naked, Branches rounded effuse dependent jointed
 6714 Umbel multifid dichotomous, Invol. subcordate : the first 3-leaved
 6715 Unarmed, Leaves panduriform ovate, Fl. term. suberect, Invol. colored
 6716 Villous, Leaves with long stalks alternate broadly ovate repand-toothed, Stem erect striated
 6717 Leaves opp. minute stalked obovate entire, Two glands on the stem at the base of petioles
 6718 Unarmed shrubby, Leaves ovate entire, Cyme axillary naked
 6719 Leaves opp. subcordate stalked emarginate entire, Stem shrubby
 6720 Stalks whorled longer than the orbicular leaf, Fl. solitary, Stem unarmed naked
 6721 Leaves scattered lanceolate acute smooth, Pedunc. dichotomous, Caps. muricate
 6722 Unarmed shrubby, Leaves scattered lanc. mucron. Fl. solitary term. with a 3-leaved invol. Caps. muricate
 6723 Leaves oval entire wavy edged with white, Caps. smooth, Stem hairy
 6724 Dichotomous, Leaves ovate serrate acute villous, Fl. solitary, Upper dichotomous cymose

§ 3. *Dichotomous, herbaceous, Flowers solitary or aggregate, not umbelled.*

- 6725 Unarmed branched, Leaves subcordate entire shorter than their stalk, Fl. solitary
 6726 Dwarf hairy, Leaves opp. oval toothed, Flowers clustered at the end of branches
 6727 Dichotomous, Leaves serrate oval-obl. smooth, Corymbs terminal, Branches divaricate
 6728 Dichotomous, Leaves ovate obl. acute at each end smooth stalked entire, Capsules smooth
 6729 Dichotomous, Leaves oval obsol. serrated, Pedunc. axill. 3-flowered, Stems diffuse smooth
 6730 Dichotomous diffuse, Lvs. obov. oblique somewhat cord. at base toothletted at end, Pedunc. 1-f. axillary
 6731 Dichotomous, Leaves serrate oblong hairy, Fl. axill. solitary, Branches spreading
 6732 Dichotomous, Leaves ovate hairy stalked entire, Pedunc. axill. 1-f. Caps. smooth
 6733 Dichotomous, Leaves serrate oval oblong, Pedunc. 2-headed axillary, Stem erect
 6734 Dichotomous, Leaves subrenate linear, Fl. fascicled term. Stem erect
 6735 Dichotomous, Leaves serrate oval-obl. Heads axill. clustered subsessile, Stems procumbent
 6736 Dichotomous, Leaves crenulate roundish smooth, Fl. solitary axill. Stems procumbent
 6737 Dichotomous, Leaves entire half cordate, Fl. solitary axillary, Stems procumbent
 6738 Leaves opp. entire lanceolate obtuse, Fl. solitary axillary, Stems procumbent
 6739 Dichotomous, Leaves entire lanceolate, Peduncles axillary 1-f. as long as leaves, Stem erect
 6740 Branches alternate dichotomous channelled filiform, Leaves ovate stalked pubescent

§ 4. *Flowers umbelled with an involucre.*

* *Umbel trifid.*

- 6741 Dichotomous, Invol. ovate, Leaves entire obovate stalked
 6742 Dichotomous, Invol. subcordate mucronate, Leaves lanceol. obtuse
 6743 Dichotomous, Invol. lanceolate, Leaves linear

and *Miscellaneous Particulars.*

times in a many-flowered head, but more often dichotomous, trichotomous, or even tetrachotomous, with single flowers between the divisions at the base and in the forkings; having bractes in number the same with the peduncles, forming a sort of involucre. The juice of every species of Spurge is so acrid that it corrodes and ulcerates the body wherever it is applied; so that it is seldom used internally. Externally it is dropped on warts or corns to remove them, and in the hollow of a decayed tooth, to remove the pain by destroying the nerve, or it is rubbed behind the ears to give relief in the tooth-ache by blistering.

E. officinarum, and also *antiquorum* and *canariensis*, furnish the Euphorbium of the *Materia Medica*. In the lower regions of Mount Atlas, the inhabitants collect the concreted gum resin, which they call *furbium*, in September. It is obtained by making slight incisions in the branches of the plant with a knife, from which a milk-like juice exudes, and forms into tears of an oblong or roundish form. The quantity yielded is so

History, Use, Propagation, Culture,

considerable, that the plants are cut once only in four years; the supply then obtained being sufficient for that space of time for all Europe. The recent juice is so corrosive as to erode the skin wherever it touches; and the people who gather the gum are obliged to tie a cloth over their mouth and nostrils, to protect them from the acrid dust of the withered branches, which induces the most violent sneezing. It is inodorous; and, when first chewed, has little taste, but it soon gives a very acrid burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable. Euphorbium possesses powerful cathartic, emetic, errhine, and rubeifacient properties. It has been given as a hydragogue in dropsies; but, owing to the violence of its effects, its internal use is now exploded: neither as an errhine can it be used alone, for it occasions so

- 6744 Dichotomous, Umbel trifid, Invol. broad obovate, Leaves entire obovate spatulate on long stalks
 6745 Dichotomous, Leaves lanceolate obovate serrate, Invol. cordate, Caps. warted
 6746 Invol. 4-leaved, Stem naked, Leaves oblong emarginate
 6747 Umbel subtrifid, Leaves mucronate, Cauline spatulate lanc. Invol. ovate, Caps. smooth

** Umbel 4 or 5-fid.

- 6748 Umbel 4-fid dichotomous, Leaves opposite entire
 6749 Umbel 4-fid trifid, Invol. ovate acute, Leaves lanc. : lower spatulate
 6750 Umbel 4-fid dichotomous, Invol. obtuse, Leaves altern. lin. cuneate emarginate mucron. Stem diffuse
 6751 Umbel 4-fid bifid, Invol. reniform : the first obcordate
 6752 Umbel 4 or 5-fid twice dichotomous, First invol. oblong : upper rhomboid-roundish, Leaves lin. lanceol.
 6753 Umbel 5-cleft bifid, Invol. ovate, Leaves linear erect
 6754 Umbel 5-cleft simple, Invol. ovate : first 3-leaved, Leaves oblong entire
 6755 Umbel 5-cleft bifid, Upper leaves obovate serrulate mucronate : lower lanc. reflexed
 6756 Umbel 5-cleft bifid, Invol. ovate toothletted, Leaves entire lanc. oblong villous beneath
 6757 Umbel 5-cleft bifid, Invol. subovate toothletted, Leaves lanc. obtuse, Caps. warted hairy
 6758 Umbel 5-cleft bifid, Rays nodding, Invol. ovate entire, Leaves lanc. acute, Caps. warted smooth
 6759 Umbel 5-cleft bifid, Invol. ovate mucronate, Leaves lanc. : the lower involute imbricated downwards
 6760 Umbel 5-cleft dichotomous, Invol. subcordate concave, Leaves lin. lanc. acute smooth spreading
 6761 Umbel 5-cleft bifid, Invol. cordate reniform, Leaves imbricated upwards

- 6762 Branches filiform, Leaves numerous linear oblong retuse, Rib mucronate, Fl. solitary terminal
 6763 Umbel 5-cleft dichotomous, Leaves and invol. linear lanceolate acute
 6764 Umbel 5-cleft dichotomous, Invol. ovate lanceolate mucronate, Lower leaves setaceous
 6765 Umbel 5-cleft dichotomous, Invol. cordate acute, Leaves lin. lanceolate : the upper broadest
 6766 Umbel multifid double, Invol. subcordate, Leaves linear
 6767 Umbel multifid clustered, Invol. subcordate, Leaves numerous close very narrow
 6768 Umbel multifid dichotomous, Invol. half orbicular cordate, Sterile branches many, Lvs. lin. lanc. obtuse
 6769 Umbel 5-cleft bifid, Invol. cordate mucronate, Leaves oblong
 6770 Umbel 5-cleft bifid, Invol. half orbic. cordate submucronate, Leaves linear imbricated backwards
 6771 Umbel 5-cleft bifid dichotomous, Invol. obovate, Leaves cuneiform serrate smooth, Caps. smooth
 6772 Umbel 5-cleft trifid dichotomous, Inv. l. 2-leaved reniform, Leaves alexicaul. cordate serrate
 6773 Umbel multifid bifid, Invol. orbicular, Leaves linear lanc. villous
 6774 Umbel 5-cleft trifid, Invol. oval acuminate colored, Caps. smooth, Leaves glaucous beneath
 6775 Umbel 5-cleft trifid, Invol. ovate, Leaves lanc. serrulate villous, Caps. warted
 6776 Umbel 5-cleft trifid dichotomous, Invol. and leaves oblong obtuse, Divisions of invol. white
 6777 Umbel 4-fid bifid, Invol. obovate, Leaves spatulate lanc. entire reflexed, Stem half shrubby branched
 6778 Umbel 5-cleft trifid dichotomous, Invol. ovate, Leaves lanceolate, Caps. villous
 6779 Naked smooth, Umbel 5-cleft bifid, Leaves sessile lanceolate veiny on each side
 6780 Umbel 5-cleft trifid bifid, Invol. ovate entire, Leaves lanc. hairy subserrulate at end
 6781 Umbel 5-cleft 4-fid dichotomous, Invol. roundish acute, Leaves lanceolate
 6782 Umbel 5-cleft 3-fid dichotomous, Invol. with a hairy keel, Leaves serrate lanceolate, Caps. warted

- 6783 Umbel 5-cleft 3-fid dichotomous, Invol. lanceolate, Leaves lanc. toothed pubescent, Caps. smooth warted
 6784 Umbel multifid bifid, Invol. subcordate 2-horned, Barren branches with 1-shaped leaves
 6785 Umbel 5-fid bifid, Invol. perfoliate cordate acute, Leaves lanc. entire
 6786 Leaves lanc. obtuse, Umbel 5-fid dichotomous, Invol. ovate obtuse 2-horned
 6787 Umbel 5-fid bifid, Leaves spatulate lanc. mucronate coriaceous serrulate, Invol. ovate, Caps. smooth
 6788 Leaves obversely obl. Invol. oblong and ovate serrulate at end, Umbel 5-fid dichotom. Caps. keeled twice
 6789 Leaves linear with long points entire smooth, Umbel 5-fid bifid, Invol. lanceolate, Leaves 2-horned
 6790 Umbel trifid dichotomous, Leaves serrate somewhat hairy : lower spatulate ; upper and invol. spatulate
 6791 Upper branches hairy, Leaves smooth lanceolate, Caps. warted, Invol. cordate
 6792 Umbel sub-5-fid bifid, Caul. leaves and invol. cordate lanceolate obtuse toothletted, Invol. reniform
 6793 Leaves lanceolate, Umbel 5-fid, Invol. oval obtuse, Caps. ramentaceous hairy

*** Umbel 6-many-fid.

- 6794 Umbel multifid dichotomous, Invol. roundish entire, Branches none
 6795 Umbel multifid dichotomous, Invol. subcordate, Branches sterile, Leaves setaceous, Cauline lanceolate
 6796 Umbel multifid bifid, Invol. subtriangular, Leaves sessile erect, Caps. rough
 6797 Umbel 8-fid bifid, Invol. subovate, Leaves spatulate spreading fleshy mucronate rough at edge
 6798 Umbel dichotomous bifid, Invol. roundish mucronate, Leaves obovate imbricate serrulate
 6799 Umbel 5-fid bifid, Invol. cordate roundish entire, Leaves lanceolate mucronate coriaceous

and Miscellaneous Particulars.

much inflammation to produce hæmorrhage from the nostrils, and swells the integuments of the head. When properly diluted, however, with starch or any other inert powder, and cautiously used, it is an effectual and excellent ermine in lethargy, deafness, palsy, amaurosis, and similar cases. (*London Dispensatory*, 298.)

E. Lathyris has seeds about the size and color of caper buds, and in Paris is sometimes substituted for that pickle. Eaten in any quantity they must prove highly deleterious.

E. helioscopia has a peculiarly acrid milky juice, which is often applied by country people to eat off warts ; but should be used with caution where the parts are tender. According to Linnæus, sheep eat it, and are purged by it, and their flesh acquires a bad taste ; but this is not the case with cows.

History, Use, Propagation, Culture,

Many of the stove species of this genus are succulents, and will thrive the better if a little lime rubbish be added to their sandy loam. They are somewhat difficult to strike. Sweet says, "The way I have succeeded best, is to stick them in the tan amongst the pots in a good heat, and not cover them with any glass." (*Bot. Cult.* 55.)

The inflorescence of this genus is not now considered to consist of twelve stamens surrounding an ovary; but almost as in *Reseda*, of a number of monandrous naked male florets surrounding a naked female floret. This manner of understanding *Euphorbia* was first indicated by Jussieu, and afterwards correctly explained by Mr. Brown.

1104. *Pedilanthus*. From *πιδίλον*, a slipper, and *ανθος*, a flower, in allusion to the form of the involucre. A genus resembling *Euphorbia* in properties and appearance.

1105. *Visnea*. This seems to be a blunder of the younger Linnaeus for *Vismea*, which now is the name of a distinct genus, which sec. Ripened cuttings root freely in sand.

- 6800 Umbel multifid 3-fid bifid, Invol. ovate, Leaves lanceolate, Branches barren

 6833 Leaves stem and petals hairy at end
 6834 Leaves ciliated, Offsets short round nearly sessile, Petals 6 fringed

and Miscellaneous Particulars.

1106. *Calligonum*. From *καλος*, beautiful, and *γωνη*, a knee or joint. This plant produces, instead of leaves, curious greenish excrescences disposed in joints, which give it a remarkable appearance.
 1107. *Glinus*. A name employed by Theophrastus to designate a kind of maple. This plant is, however, more like a purslane.
 1108. *Blackwellia*. Named after Elizabeth Blackwell, who published an Herbari in 1735, containing figures of between two and three hundred plants, drawn and engraved by herself. Curious stove plants with pretty foliage, but inconspicuous spikes of whitish green flowers.
 1109. *Gastonia*. Named by Commerson after Gaston de Bourbon, son of Henry IV. In the Isle de Bourbon it is called *Bois d'Eponge*.
 1110. *Sempervivum*. From *semper vivere*, to live for ever, in allusion to the tenacity of life common to plants of the genus. This is a succulent genus, some species of which are ornamental or singular, and others

curious. *S. tectorum*, common on the roofs of buildings, is used by country people as an application to burns, inflammations, and ulcers, alone, in a bruised state, or mixed with cream. Linnaeus informs us, that house-

CLASS XII. — ICOSANDRIA. STAMENS many, perigynous, or inserted into the Calyx.

To gardeners this is one of the most interesting of the Linnean classes, containing a greater proportion than any other of objects which come within their observation and management. It also consists of genera for the most part naturally allied; and comprises not only the most remarkable portion of Ficoideæ, all Cacti, and the chief of the Myrtaceæ, but almost every genus of the beautiful and hardy tribes of Rosaceæ. Its characters are well defined, and depend upon the insertion of a number of distinct stamens, exceeding twenty, into the inner surface of the calyx; modifications of which organ are here found to be of more than ordinary importance in characterising the genera.

The genera are extremely natural, and have been all studied with unusual attention. Some difference of opinion exists among botanists as to the limits which ought to be assigned to them, and great diversity of nomenclature has thence arisen. "But," as has been observed by a modern author, "in a class so strictly natural as this is, greater difficulty is always to be expected in finding characters for genera, than in those of which our knowledge is more imperfect, and whose series of individuals may therefore be considered less complete." In the apple and pear tribe, Pomaceæ, where the greatest difficulty is thought to exist, we adopt Mr. Lindley's arrangement, as published in the Transactions of the Linnean Society, which we find admitted by all botanists of authority.

But if it is difficult to ascertain the definite limits of the genera of Icosandria, it is yet more perplexing to arrive at a satisfactory conclusion respecting the species of which the genera are constituted. Having all been, as long as gardens have existed, the objects of cultivation, it has happened that many individuals have, under the action of domestication, wandered so far from their original types, as to have acquired new characters for themselves, of so peculiar a kind as to have rendered it impossible at the present day to refer them with certainty to the source from which they originally sprung. To remedy this confusion, which has been thus increasing for ages, some persons have thought it necessary to distinguish the species by such artificial characters as they are now found to possess, without reference to any changes the genera may have undergone; but it has been found that no facilities of discrimination have been gained by multiplying distinctions in consideration of differences which are neither permanent or remarkable, nor connected with natural habit, but purely artificial. To others it has appeared proper to endeavour to reduce the aberrant forms which now exist to those from which, upon mature consideration, they may be presumed to have been derived, and to simplify the arrangement and discrimination of the species by confining them within their primitive limits. As we think the latter to be the most simple principles of arrangement, and as they are certainly the most philosophical, we shall here follow those authors who have adopted them.

It is usual in this class to distinguish the orders with two and three styles from that with five: but the different species vary so much in the same genus in this respect, that we have only separated the genera into those with one style, Monogynia; with two, three, or five styles, Di-Pentagynia; and with many styles, Polygynia.

Order 1. MONOGYNIA. Many perigynous Stamens. 1 Style.

§ 1. Ovary inferior.

1111. *Cactus*. Cal. imbricated. Petals numerous, in many rows: the inner the largest. Stigma many-cleft. Berry many-seeded.

1112. *Rhipsalis*. Cal. 3-4-parted, very short. Teeth acuminate, membranous, very fine. Berry 1-celled, pelucid. Seeds 12, in the centre.

1113. *Bartonia*. Cal. 5-cleft. Petals many. Caps. cylindrical, 1-celled at the end with 3-5 lid-like valves. Placentas 3-5, parietal, bearing seeds in a double row.

- 6835 Leaves ciliated, Offsets globose
 6836 Leaves entire, Offsets spreading
 6837 Leaves with entangled hairs, Offsets round
 6838 Leaves rounded clavate clustered, Pedunc. naked 1-fl. Nects. obcordate

and Miscellaneous Particulars.

leek is a preservative to the coverings of houses in Smoland. It may easily be made to cover the whole roof of a building, whether of tiles, thatch, or wood, by sticking the offsets on with a little earth or cow dung.

1114. *Philadelphus*. Cal. 4-5-parted. Petals 4-5. Style 4-cleft. Caps. half-superior, 4-5-celled, many-seeded. Seeds with an arillus.
 1115. *Leptospermum*. Cal. persistent at base, 5-cleft, half-superior. Petals 5, clawed, round, longer than stamens. Stigma capitate. Caps. depressed, 4-5-celled. Seeds angular, slender.
 1116. *Fabricia*. Cal. 5-cleft, half-superior. Petals 5, sessile. Stigma capitate. Capsule many-celled. Seeds winged.
 1117. *Metrosideros*. Cal. 5-cleft, half-superior. Petals 5. Stamens very long, separate. Stigma simple. Caps. 3-4-celled.
 1118. *Psidium*. Cal. 5-cleft. Petals 5. Berry soft, pulpy, many-seeded. Cotyledons leafy, very small. Radicle very large, arcuate. Testa bony.
 1119. *Eugenia*. Cal. 4-5-parted, superior. Petals 4-5. Fruit fleshy, 1-celled, 1-seeded. Cotyledons half-cylindrical. Radicle very small. Testa membranous.
 1120. *Caryophyllus*. Cal. funnel-form. Fruit dry, 1 or 2-celled. Otherwise like *Eugenia*.
 1121. *Myrtus*. Cal. 5-cleft. Petals 5. Berry 2 or 3-celled, many-seeded. Radicle and cotyledons distinct.
 1122. *Calyptanthus*. Cal. truncate, before flowering covered with an hemispherical deciduous lid. Cor. O. Berry 1-celled, 4-seeded.
 1123. *Pimenta*. Cal. 5-fid. Petals 5. Ovary 2-celled. Ovules solitary, appense. Style straight. Stigma somewhat capitate.
 1124. *Olythia*. Cal. 5-cleft. Petals 5. Stigma hooked. Berry 1-celled. Seeds angular. Embryo ferruginate.
 1125. *Stravadium*. Cal. 4-cleft. Petals 4. Fruit 4-cornered, 1-seeded. Flowers in terminal racemes. Leaves alternate.
 1126. *Eucalyptus*. Cal. truncate, covered with an entire deciduous lid. Cor. O. Capsule 4-celled, opening at end, many-seeded.
 1127. *Punica*. Cal. 5-cleft. Petals 5. Berry many-celled, many-seeded. Seeds berried. Placentas parietal.

§ 2. *Ovary superior.*

1128. *Amygdalus*. Cal. 5-cleft. Petals 5. Drupe with a nut perforated on its surface.
 1129. *Prunus*. Cal. 5-cleft. Petals 5. Drupe with a hard smooth nut.
 1130. *Chrysobalanus*. Cal. 5-cleft. Petals 5. Style lateral. Drupe with a 5-furrowed, 5-valved nut.

Order 2. DI-PENTAGYNIA.

Many perigynous Stamens. 2 to 5 Styles.

§ 1. *Ovary inferior*

1131. *Mespilus*. Cal. 5-parted, with leafy divisions. Disk arge, honey-bearing. Styles smooth. Apple turbinate, open, 5-celled, with a bony putamen.
 1132. *Crataegus*. Cal. 5-toothed. Petals spreading, orbicular. Ovary 2-5-celled. Styles smooth. Apple fleshy, oblong, closed by the teeth of the cal., or by the thickened disk. Putamen bony.
 1133. *Pyrus*. Cal. 5-toothed. Petals roundish. Apple closed, 5-celled, with a cartilaginous putamen. Cells 2-seeded. Testa cartilaginous.
 1134. *Cydonia*. Cal. 5-parted, with leafy divisions. Apple closed, many-seeded. Testa mucilaginous.
 1135. *Photinia*. Cal. 5-toothed. Petals reflexed. Ovary half-superior, villous, 2-celled. Styles 2, smooth. Pericarp 2-celled, included in the fleshy calyx. Testa cartilaginous.
 1136. *Raphiolepis*. Cal. with a funnel-shaped deciduous limb. Filaments filiform. Ovary 2-celled. Apple closed by the thickened discus, with a papery putamen. Seeds gibbous.
 1137. *Eriobotrya*. Cal. woolly, bluntly 5-toothed. Petals bearded. Stamens erect, the length of teeth. Styles 5, filiform, included, hairy. Apple closed, 3-5-celled. Chalaza none. Radicle included between the bases of cotyledons.
 1138. *Amelanchier*. Cal. 5-toothed. Petals lanceolate. Ovary 10-celled. Ovules solitary. Apple 3-5-celled, with a cartilaginous putamen.

1139. *Coloneaster*. Flowers polygamous. Cal. turbinate, bluntly 5-toothed. Petals short, erect. Stamens length of teeth. Styles smooth, shorter than stamens. Achenopses parietal, included in calyx.

§ 2. *Ovary superior.*

1140. *Waldsteinia*. Cal. 10-cleft; the alternate segments smaller. Petals 5. Styles clavate, deciduous. Grains 2, obovate.
 1141. *Spiræa*. Cal. spreading, 5-cleft. Petals 5. Caps. 1-celled, 2-valved, opening inwards, 1-3-seeded.
 1142. *Gillenia*. Cal. infundibuliform, 5-toothed. Petals 5. Stamens very short. Capsule 5-celled.
 1143. *Sesuvium*. Cal. 5-parted, colored. Petals O. Caps. ovate, 3-celled, cut round, many-seeded.
 1144. *Aizoon*. Cal. 5-parted. Pet. O. Caps. 5-celled, 5-valved.

Order 3. POLYGYNIA.

Stamens many, perigynous. Styles many.

1145. *Tetragonia*. Cal. 3-5-parted. Petals O. Drupe inferior, with a 3-8-celled nut.
 1146. *Mesembryanthemum*. Cal. 5-cleft. Petals many, linear. Capsule turbinate, fleshy, inferior, many-seeded.
 1147. *Hymenogyne*. Styles about 12, united in a delicate tube. Caps. 1-celled, many-seeded. Otherwise like *Mesembryanthemum*.

History, Use, Propagation, Culture,

1111. *Cactus*. A name under which Theophrastus describes a spiny plant, an article of food, which grew in Sicily. This genus consists of succulent plants, permanent in duration, singular and various in structure; generally without leaves, and having the stem or branches jointed; for the most part armed with spines in bundles, with which, in many species, bristles are intermixed. These bundles of spines are placed on the top of the tubercles in the smaller melon thistle, which is tubercled all over, and produces its flowers between the tubercles. In the great melon thistle the spines are ranged in a single row on the ridge of the ribs. These are of an ovate or globular form. The torch thistle, on the contrary, are slender, rise up high, are jointed and branched; many of them are almost cylindrical, with from five to ten shallow ribs; some, however, are square or three cornered. The structure of the creeping *Cereuses* is the same with these, except that the stems are weak and cannot support themselves; they therefore seek support from trees, and throw out roots from the stem, like ivy. In the Indian figs the branches are jointed, and flattened like the sole of a shoe; the bundles of spines or bristles are scattered over the surface, and the flowers are produced from the edge of the extreme branches. In the *Phyllanthus* the branches are thinner, they are indented along the edge, and the flowers come out singly from the indentures. This seldom has any spines. *Pereskia* has a round stalk with leafy branches; the leaves alternate, flat, and thick; the prickles are large and stiff, and come out in bundles on the stalk and branches, chiefly at the axils; the flowers are produced several together from the axils also. In this and the Indian figs the flowers are pitcher-shaped; in the other species they are subcylindrical and longer; in *Phyllanthus* very long. The fruit in some of the sorts is small, like currants; but in most it is larger, and shaped like a fig, whence their name of Indian fig.

C. melocactus, the great melon thistle or Turk's cap, appears like a large fleshy green melon, with deep ribs, set all over with strong sharp thorns. When it is cut through the middle, the inside is found to be a soft, green, fleshy substance, very full of moisture. The flowers and fruit are produced in circles round the upper part of the cap. Some of those which have been brought to England, have been more than a yard in circumference, and two feet and half high including the cap. But in the West Indies there are plants near twice as large. Linnaeus observes, that this plant resembles a hedge-hog in its form and spines; and on the top has a discoid, convex, villous body, from which the flowers proceed.

1148. *Rosa*. Cal. urceolate, 5-cleft, fleshy, contracted at orifice. Petals 5. Grains bony, hairy, included in the fleshy tube of calyx.
 1149. *Rubus*. Cal. 5-cleft. Petals 5. Berry composed of many cohering fleshy grains. Receptacle nearly dry.
 1150. *Dalibarda*. Cal. 5-cleft. Petals 5. Berry dry. Styles 5, long, deciduous.
 1151. *Fragaria*. Cal. 10-cleft. Pet. 5. Grains inserted upon a fleshy deciduous receptacle.
 1152. *Comarum*. Cal. 10-cleft. Petals 5, less than calyx. Receptacle ovate, spongy, persistent.
 1153. *Potentilla*. Cal. 10-cleft. Petals 5. Grains rugose, roundish, naked, fixed to a small dry receptacle.
 1154. *Tormentilla*. Like *Potentilla*, but cal. 8-cleft. Petals 4.
 1155. *Geum*. Cal. 10-cleft. Sepals unequal. Petals 5. Grains generally with a jointed awn.
 1156. *Kerria*. Cal. 5-cleft. Pet. 5, orbicular. Ovaries 5-8, smooth, globose. Ovules solitary. Styles filiform. Capsules globose.
 1157. *Calycanthus*. Stamens unequal, deciduous; the 12 outer fertile. Grains many.
 1158. *Chimonanthus*. Stamens equal, persistent; the 5 outer fertile, in maturity closing the orifice of the calyx by their united bases.
 1159. *Dryas*. Cal. simple, 8-cleft. Petals 8. Grains with a hairy tail.
 1160. *Coluria*. Like *Sieversia*, but the style jointed with the top of ovarium and deciduous, and the achenia glandular, included in the long turbinate tube of the calyx.
 1161. *Sieversia*. Cal. 10-cleft. Petals 5. Stamens indefinite. Ovaries indefinite, with an ascending ovule. Styles terminal, continuous. Achenia awned with the persistent style. Embryo erect.

MONOGYNIA.

- 6839 Roundish covered with ovate bearded tubercles
 6840 Simple clavate, Tubercles ovate with woolly spines at end, Wool shorter than spines
 6841 Roundish depressed with ten angles
 6842 Proliferous, Warts small cylindrical, Spines fine whitish the lowest like hairs
 6843 Roundish multiplex, Warts cylindrical bearded above furrowed proliferous
 6844 Roundish deeply 16-angled, Angles with a remarkable swelling below each parcel of spines
 6845 Warts large very green downy at end, Spines about 4 strong expanded
 6846 Simple rounded obovate, Warts woolly at end with more than 20 spines
 6847 Columnar, Warts small very numerous with little spines between, 2 in each parcel much longer than rest
 6848 Roundish with about 14 angles
 6849 Roundish with 15 angles, Spines broad recurved numerous
 6850 Oblong with many angles, Angles and spines middle-sized straight
 6851 Oblong with about 20 angles, Rays of spines capillary long
 6852 Depressed spheroidal with about 21 angles, Rays of spines variable the lowest very broad flat deflexed
 6853 Roundish bright green with 14 angles, Ribs straight with long thick white spines

and Miscellaneous Particulars.

C. melocactus, *mammillaris*, and *proliferus*, by many thought to be but one species, grow upon the steep sides of rocks in the hottest parts of America, where they seem to be thrust out of the apertures, having little or no earth to support them: their roots shooting down into the fissures of the rocks to a considerable depth, so that it is troublesome to get the plants up. As they delight in such rocky places, they seldom live long when transplanted into a better soil. In times of great drought the cattle repair to the barren rocks where these plants grow, rip them up with their horns, tear off the outside skin, and greedily devour all the fleshy moist part. The fruit is frequently eaten by the inhabitants of the West Indies. It is about three quarters of an inch in length, of a taper form, drawing to a point at the bottom, but blunt at the top: the taste is an agreeable acid.

C. repandus has a fruit about the size and shape of a Bergamot pear, having many soft spines on the skin; the outside is a pale yellow, the inside very white, full of pulp, having a great number of small black seeds lodged in it. It frequently flowers in July, and in warm seasons will perfect its fruit, which has very little flavor in this country, but is frequently served up at table in the West India islands.

The fruit of *lanuginosus* and *peruvianus* are also occasionally eaten where they are natives.

C. grandiflorus and *flagelliformis* have flowers remarkable for their beauty and sweetness. *C. grandiflorus*, when arrived to a sufficient strength, will produce many exceeding large, beautiful, sweet scented flowers, like most of this kind, of very short duration, scarcely continuing six hours full blown: nor do the flowers ever open again when once closed. They begin to open between seven and eight of the clock in the evening, are fully blown by eleven, and by three or four in the morning they fade, and hang down quite decayed; but during their short continuance, there is scarcely any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot diameter; the inside of which, being of a splendid yellow color, appears like the rays of a bright star; the outside is of a dark brown; the petals being of a pure white add to the lustre; the vast number of recurved stamens surrounding the style in the centre of the flower make a fine appearance: add to all this the fine scent of the flower, which perfumes the air to a considerable distance. There is scarce any plant which deserves a place in the hothouse so much as this, especially as it may be trained against the wall, where it will not take up any room. The usual season of its

History, Use, Propagation, Culture,

flowering is in July, and when the plants are large, many flowers will open the same night, and there will be a succession of them for several nights together. Sometimes six, eight, or ten flowers open at the same time on one plant, making a most magnificent appearance by candle-light: but none of them are succeeded here by any appearance of fruit.

C. flagelliformis produces a greater number of flowers than the foregoing sort: they come out in May, and sometimes earlier, when the season is warm. The petals are of a fine pink color both within and without; they are not so numerous, and the tube of the flower is longer than that of the other. These flowers keep open three or four days, provided the weather, or the place where the plants stand, be not too warm; and during their continuance they make a fine appearance. This sort has very slender trailing branches, which require a support: they are not jointed, nor do they extend so far as those of the other sort. Fruit sometimes succeeds the flowers, but seldom ripens.

C. triangularis, the strawberry pear, *Poirer de Chardon*, Fr., bears the best flavored fruit of any of the sorts; it is slightly acid, and at the same time sweet, pleasant, and cooling; in Martinique and other West India islands it is much esteemed.

C. opuntia, native of the country of the Opuntiani, whose chief town was Opus, in the vicinity of Phocis, though like the others a native of America, is now found growing wild on the sides of the roads between Rome and Naples and other parts of Italy, and even in the Valais. Gerard says, it was brought from Virginia into England, and Collinson had it from Newfoundland. It was fruited in Scotland in a stove by

- 6854 Erect with deep furrows long with 6 distant angles

 6857 Erect with deep furrows long slightly quadrangular with toothed angles
 6858 Erect with deep furrows long jointed with about 5 angles
 6859 Erect slender with shallow furrows jointed with 9 angles, Joints ovate, Spines as long as wool
 6860 Erect slender with shallow furrows jointed with 9 angles not glaucous, Spines white; a variety of the last
 6861 Erect slender with shallow furrows long with 9 obsolete angles, Spines shorter than wool
 6862 Erect slender with shallow furrows long with 8 compressed wavy angles, Spines longer than wool
 6863 Erect slender with shallow furrows, Branches jointed few bluntly triangular
 6864 Erect slender with shallow furrows, Scarcely ang. Surface covered with variously imbric. lobed divisions
 6865 Erect slender with shallow furrows black with numerous brown spines longer than the wool
 6866 Erect slender with shallow furrows weak cylindrical, Surface covered with netted crossing furrows
 6867 Erect rounded below long elegant with about 9 angles, Spines snow-white weak, Wool very short
 6868 Erect with 18 close obtuse angles with bristly yellowish spines longer than the wool
 6869 Erect with deep furrows oblong with 7 angles
 6870 Creeping triangular rooting
 6871 Decumbent rooting 3-cornered, Spines fascicled divaricating seven two or three lines long
 6872 Creeping rooting 3-cornered with scarcely channelled angles, Spines 5-7 in stellate fascicles
 6873 Creeping rooting with about 5 angles
 6874 Creeping 5-cornered with subulate spines longer than the wool
 6875 Creeping rooting hispid with 10 angles
 6876 Creeping with 3 or 4 angles which are scarcely channelled, Spines 5-7 in stellate parcels
 6877 Erect, Joints broadly ovate-oblong, Spines subulate very long blackish
 6878 Erect, Joints broadly ovate-oblong, Spines subulate long yellow
 6879 Erect, Joints oblong and lanceolate, Spines of various shapes brownish black
 6880 Joints oblong and ovate, Spines of various shapes yellow, Fl. numerous solitary
 6881 Stem rounded, Branches ovate compressed flat, Spines solitary or 3 together subulate strong
 6882 Joints cuneate obovate decumbent, Spines variously shaped yellow
 6883 Erect, Joints obovate roundish glaucous, Stigma 6-lobed
 6884 Creeping prostrate, Joints ovate, Spines even numerous hair-shaped
 6885 Erect, Joints ovate elliptical, Spines even numerous short
 6886 Joints ovate oblong very thick, Spines unequal
- 6887 Jointed proliferous, Joints oval, Warts with a cluster of spines the length of the wool
 6888 Joints ovate oblong unarmed
 6889 Erect, Joints lanceolate-oblong, Clusters of spines fuscous weak with one strong white spine
 6890 Erect, Joints oblong or oval, Spines numerous variable brown; one very long straw-colored
 6891 Jointed proliferous, Joints ovate oblong with strong white spines longer than wool
 6892 Nearly erect, Joints lanceolate with even short spines, Leaves 3 lines long
 6893 Branches oblong with short soft hairs, Spines small
 6894 Branches oblong scarcely spiny
 6895 Joints very long slender compressed, Spines very long slender clustered white
 6896 Joints oblong with numerous stiff spines of which one is very long and white at base
 6897 Joints brittle cylindrical ventricose compressed much divaricating
 6898 Joints brittle compressed short, Spines numerous variable white erect
 6899 Jointed proliferous, Joints lanceolate-glaucous, Spines bristly longer than wool
 6900 Joints brittle linear-lanceolate divaricating, Spines unequal
 6901 Proliferous smooth branched ensiform compressed serrated with a central woody rib
 6902 Branches ensiform compressed obovate with spreading teeth, Spines few setaceous longer than wool

and Miscellaneous Particulars.

Justice, in 1750, and recently by Braddick, near London, in the open air. This active horticulturist, having eaten with pleasure of the prickly pear in Virginia, was desirous of cultivating it here. He recollected that the plant in its wild state delighted in a dry soil, amongst rocks, near the skirts of the sunny sides of the forests; and having heard that it would stand the open air in this country, he planted it in the compost described below, placed in a sheltered situation open to the sun. "The first plant that I turned out has lived in the open ground of this country for six or seven years, during which period it has endured one exceeding hard winter, and several trying springs; and in all, except the two first years, it has never failed to ripen its fruit and seeds, so that it may be now considered decidedly acclimated. The compost used by me for growing the Cactus Opuntia, is the following: one half is carbonate of lime, for which lime-rubbish from old buildings will answer; the remaining half consists of equal portions of London clay and peat-earth, having the acid neutralised by barilla; these are intimately blended and sifted. One square yard of this compost I conceive to be sufficient for one plant, which must be placed in the middle of a small artificial hillock, raised eighteen inches above the surface of the ground, which ground should be rendered perfectly dry, if not naturally so, by under-draining. Neither the leaves, flowers, nor fruit should ever be suffered to touch the ground, but they should as constantly as they are produced be kept from the earth by placing stones, pebbles, flints, or bricks under them, in imitation of artificial rock-work." (*Hort. Trans.* ii. 238.)

C. *Ficus indica* is very common in Jamaica, and on it feed the wild sort of cochineal insect. The fruit is large and of a deep purple color, and when eaten dyes the urine of a bloody color.

History, Use, Propagation, Culture,

C. tuna (tyn the Arabic name for fig) is used as a hedge plant in Spain, South America, and the West Indies. When the island of St. Christopher was to be divided between the English and the French, three rows of the tuna were planted by common consent between the boundaries. (Sloane.) Sir J. E. Smith informs us, that the stamens of the flower are very irritable; and that if a feather be drawn through them, in two or three seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower.

C. cochiniifer is the species on which the cochineal insect chiefly feeds. The insect feeds on other succulent plants besides those of the Cactus genus, but this species is cultivated because least annoying by its prickles. It produces an edible fruit larger than that of C. opuntia. On the top of the fruit there grows a red flower: this when the fruit is ripe, falls down on the top of it, and covers it so that no rain or dew can get the inside. A day or two after, the flower being scorched up by the heat of the sun, the fruit opens wide, and the inside appears full of small red insects. The Indians, when they perceive the fruit open, spread a large linen cloth, and then with sticks shake the plant, to disturb the insect, so that they take wing to be gone, but keep hovering over the plant, till by the heat they fall down dead on the cloth, where the Indians let them remain two or three days till they are dry. The cochineal plants are called by the Spaniards Toona. They are planted in the country about Guatimala, Chiapa, and Guaxaca, in the kingdom of Mexico.

The difference, in point of goodness, observable in the cochineal, is entirely owing to the plant it feeds upon. The prickly pear (C. tuna) so abundant in Jamaica, is covered with the insects, but not having their proper food, they are in general diminutive, and have very little red tincture in their bodies. The delicate red colored juice of the fruit is the natural food of the insect. The exuvia and animal salts of the insect are, from the minuteness of its parts, inseparable from the essential principles of the dye, and must diminish the brilliancy of the color; and this has put some persons upon inspissating the juice of the fruit itself. The ripe fruit is said to check fluxes by its mild restringency; it is also a powerful diuretic, and sometimes imparts a tinge to the urine.

C. pereskia, so called from the generic name of Plumier, who made this species a distinct genus, in memory of N. F. Peiresk of Aix, whose name, as Tournefort says, is his only monument, has fruit about the size of a walnut, having tufts of small leaves on it, and within a whitish mucilaginous pulp.

In our stoves, according to Sweet, "sandy loam, or loam mixed with a little brick rubbish, is the best soil for all the Cacti: the pots should be as small as the plants will allow, and well drained with potherds. They

- 6903 Branched, Joints short oblong truncated
 6904 Leaves elliptical fleshy, Spines about $\frac{1}{2}$ an inch long, Buds little woolly
 6905 Spines numerous variable strong, Leaves lanc. oblong with a strong rib beneath
 6906 Leaves elliptical fleshy, Spines $\frac{1}{2}$ an inch long, Buds very woolly
- 6907 Branches pendulous whorled round smooth naked green
- 6908 Branches pendulous whorled round green the younger covered with bundles of white hairs
 6909 Branches round as thick as a quill, Spines scarcely any
 6910 Pendulous, Branches rounded fascicled, Hairs bundled in six lines
 6911 Jointed erect, Branches round and angular, Young spines in minute inconspicuous parcels
- 6912 Ovary leafy, Seeds naked
 6913 Ovary naked, Seeds winged
- 6914 Leaves somewhat toothed ovate oblong
- 6915 Leaves quite entire
 6916 Leaves ovate acuminate toothletted, Axils of veins hairy, Stigmas 4 linear
 6917 Leaves hairy oblong-ovate acute sharply and angularly toothed
- 6918 Leaves ovate mucronate obsolete 3-nerved, Cal. smooth with colored membranous teeth
 6919 Leaves lin.-lanc. obtuse nerveless, Cal. smooth with membranous naked teeth
 6920 Leaves lanc. lin. acute 3-nerved, Cal. silky villous, with membr. colored naked teeth
 6921 Leaves oblong or oval mucr. pubescent on each side obsolete 3-nerved, Branches villous, Cal. very vill.
 6922 Leaves lanc. oblong hairy oblique reflexed at end
 6923 Leaves oval lanceolate, Young shoots colored, Flowers large, Teeth of calyx colored
 6924 Leaves obovate nerveless, Branches and calyxes hairy with membranous colored teeth
 6925 Leaves ovate lanceolate short three nerved, Fl. sol. sessile, Cal. entire persistent
 6926 Leaves subulate pungent, Branches hairy, Calyxes and teeth villous
 6927 Branches flexuose, Flowers sessile fascicled, Cal. hairy
 6928 Leaves lin.-lanc. pungent, Branches silky, Cal. smooth with membranous colored naked teeth
 6929 Leaves lin.-lanc. pungent, Branches hairy, Cal. smooth with membranous col. pubescent teeth
 6930 Leaves oblanc. densely dotted, Fl. sol. terminal, Sepals deciduous
 6931 Leaves acicular rigid fascicled, Flowers solitary, Teeth of calyx colored
 6932 Leaves linear recurved at end, Cal. smoothish, Teeth leafy lanc. naked, Stamens longer than cor.
- 6933 Leaves lanceolate obovate opp. Teeth of calyx round
 6934 Leaves obovate altern. glaucous, Teeth of calyx triangular

and Miscellaneous Particulars.

require very little water. The best way to flower them is to expose them to the air all the summer, which makes them get plump and throws them into flower-bud. Most of the species are fine flowers. Cuttings, after they are taken off, should be left to dry a few weeks till they are shrivelled, then potted, and they will root immediately. (*Bot. Cult.* 31.)

1112. *Rhipsalis*. From $\rho\epsilon\upsilon\lambda\alpha$, a willow branch, in allusion to the flexible decumbent branches of the genus. Curious, branched, jointed, leafless, prostrate plants. Culture as in Cactus.

1113. *Bartonia*. Named by Pursh, in honor of Dr. B. S. Barton of Philadelphia, an American botanist. Beautiful plants, with alternate pinnatifid rough glaucous leaves, and large white flowers, which open during the night, and spread a most agreeable odor. Very rare, if they yet exist, in collections.

1114. *Philadelphus*. A name used by Athenæus for a tree which is now unknown. Bauhin applied it to this genus. The species are free flowerers, well adapted for the shrubbery. The native country of *P. coronarius* is not known; it is generally referred to the south of Europe, but it has only been found twice in Italy, and then in situations where it might have been planted. The flowers have the appearance and odor of those of the orange, but the odor in near contact is much more powerful. Seeds are seldom produced in this country. The leaves taste like fresh cucumbers. *P. grandiflorus* is a very shewy plant. All the species grow freely in common soil, and are increased by layers.

1115. *Leptospermum*. From $\lambda\epsilon\pi\tau\omicron\varsigma$, slender, and $\sigma\pi\epsilon\rho\mu$, seed, in allusion the extreme tenuity of the seeds. Pretty New Holland plants. *L. scoparium* grows commonly in dry places near the shores in New Zealand, and the underwood in Adventure Bay, Van Dieman's Land, chiefly consists of this shrub. The leaves were used by Captain Cook's ships' crews as tea, whence they named it the tea plant. The leaves have a very agreeable bitter flavor, with a pleasant smell, when fresh; but lose something of both, when dry. If the infusion was made strong, it proved emetic to some, in the same manner as green tea. It was also used with spruce leaves, in equal quantity, to correct their astringency in brewing beer from them; and they rendered the beer exceedingly palatable.

Young cuttings of all the species will root readily in sand, under a bell-glass: the species may also be raised from seeds; but plants from cuttings are best, as they flower young, and the seedlings do not flower till they attain a considerable size. (*Bot. Cult.* 214.)

1116. *Fabricia*. Dedicated by Gærtner to John Christian Fabricius, the famous Entomologist. The species

History, Use, Propagation, Culture,

requiring to grow to a good size before they produce flowers are well adapted for a conservatory: the culture and propagation as in *Leptospermum*.

117. *Metrosideros*. From *urtica*, the heart of a tree, and *sideros*, iron, in allusion to the hardness of the wood. One species (*M. vera*) is called iron wood. The Chinese make their rudders and anchors of it; and among the Japanese it is so scarce and valuable that it is only allowed to be manufactured in the service of their king. The bark is used as a remedy for fluor albus and diarrhoea, being mixed with Pinang, and a small quantity of cloves and nutmegs. This is a genus distinguished at sight by the peculiar character of the shrubs of Australasia, with both sides of the leaf alike. *M. hispida*, *lancoolata*, and *speciosa*, are beautiful plants, but not free flowerers. They are rather difficult to strike. Sweet recommends "ripened wood planted under a bell-glass in sand."

1118. *Psidium*. One of the Greek names of the Pomegranate. In English it is called *Guava*, a corruption of the American name *Guayaba*. Most of the species are cultivated in the tropics for their fruit, which also ripens freely in this country, though it is of little merit. *P. pyriferum* bears fruit the size of a hen's egg, yellowish, with a peculiar smell. The rind is brittle and fleshy; pulp rather firm, full of bony seeds, flesh colored, sweet, aromatic, and pleasant. In the West Indies it is eaten with avidity, not only by the natives, but by Europeans; with those who are not accustomed to it, the Guava is apt to occasion a slight flux; but Jacquin affirms, that when he has been thirsty on a journey he has eaten of it to satiety without suffering any harm. It is eaten raw in the desert, but the seeds are scarcely separable. It is also preserved with sugar. *P. pomiferum* has fruit like a pomegranate, which is seldom eaten, though eatable, and being astringent is counted strengthening for the stomach. *P. Cattleianum* is reckoned one of the best of the Guavas; the fruit is of a fine deep claret color, and the pulp in consistence and flavor bears a considerable resemblance to the strawberry.

All the species are of easy culture in light and rather rich loam, and are increased readily by seeds, layers, or cuttings in sand under a hand-glass.

- 6935 Leaves opposite cordate at base stem-clasping, Branches calyxes and peduncles hispid
 6936 Leaves opposite stalked ovate lanceolate, Panicle brachiate, Pedic. umbelled
 6937 Leaves opposite stalked lin.-lanc. acuminate oblique, Panicle brachiate decomposed
 6938 Leaves opposite ovate netted veiny beneath pubescent, Heads lateral stalked and bracts downy
 6939 Leaves opposite lin.-lanc. naked, Pedunc. axillary umbelled, Bracts lanc. smooth
 6940 Leaves alternate lanceolate 3-nerved, Fl. racemose clustered terminal smooth
 6941 Leaves scattered linear channelled acute rigid, Fl. lateral clustered sessile
 6942 Leaves alternate lin. filiform rigid mucronate channelled rough, Fl. clustered sessile
 6943 Leaves alternate linear-lanceolate, Fl. clustered lateral pubescent
 6944 Leaves alternate lanceolate narrowed at each end mucronate, Fl. lateral clustered sessile smooth
 6945 Leaves alternate lanceolate mucronate, Fl. lateral clustered sessile pubescent
 6946 Leaves scattered lanceolate veiny glandular mucronate, Caps. downy at end
 6947 Leaves ovate-lanceolate acuminate quite smooth, Cymes stalked many-flowered
 6948 Very like *M. lanceolata*, but the blossoms appear more copiously
 6949 Leaves alternate lin.-lanceolate with a long acute point
 6950 Leaves lin.-lanceolate with a long point dotted rough

- 6951 Leaves elliptical pubescent beneath, Peduncles 1-flowered
 6952 Leaves oblong lanceolate pubescent beneath, Peduncles 3-flowered
 6953 Leaves oblong acuminate smooth, Peduncles 1-flowered
 6954 Leaves sessile cordate rounded smooth on each side, Pedunc. 1-fl. clustered
 6955 Leaves oblong acuminate crenulate shining, Peduncles many-fl.
 6956 Leaves ovate oblong acute sub-crenate, pubescent above rugose beneath, Branches reclinate
 6957 Leaves obovate smooth coriaceous, Fruit purple

- 6958 Leaves entire oblong, Peduncles 4-fl. lateral
 6959 Leaves entire lanceolate, Pedunc. 4-fl. terminal
 6960 Leaves entire ovate-lanceolate, Ped. many-fl. axillary shorter than petiole
 6961 Leaves elliptical, Pedunc. trichotomous lateral and terminal, Stamens much longer than petals

- 6962 Leaves entire oblong acuminate obtuse flat, Pedunc. axill. many-fl. the length of petioles
 6963 Leaves entire roundish ovate obtuse, Pedunc. axill. many-fl. trichotomous the length of leaves
 6964 Leaves entire oblong-lanceolate acuminate, Pedunc. axillary many-fl. racemose shorter than leaf
 6965 Leaves entire elliptical acuminate, Pedunc. panic. axill. and terminal, Fruit globose
 6966 Leaves entire lanceolate narrowed at base obtuse veinless, Pedunc. 1-fl. solitary terminal
 6967 Leaves entire ovate-lanceolate, Pedunc. 1-flowered solitary lateral
 6968 Leaves entire oblong acuminate coriaceous not dotted, Pedunc. 1-fl. filiform
 6969 Leaves entire ovate oblong acuminate netted with veins, Pedunc. 1-fl. about 3 in fruit nodding

6970 The only species

- 6971 Flowers solitary, Involucre 2-leaved
 α Leaves ovate longer than the peduncles
 β Leaves ovate with round berries

and Miscellaneous Particulars.

1119. *Eugenia*. In honor of Prince Eugene of Savoy, who was a protector and encourager of botany, and possessed a botanic garden. Some of the species bear edible fruits: that of *E. malaccensis* is ovate, an inch and a half in diameter, flesh smelling like the rose, agreeable to the taste, and wholesome. It is generally cultivated between the tropics. *E. Jambos* bears smaller fruit, edible, but not so much esteemed; it is nevertheless excellent, resembling in appearance and flavor a Brussels apricot, and produced in great abundance in the stove. All the species grow freely in two-thirds loam and one-third peat, and flower abundantly when the plants are of a good size. Ripened cuttings strike root freely in sand under a hand-glass.

1120. *Caryophyllus*. The Arabs, who have been acquainted from all antiquity with the clove, called it *qarunfel*, which the Greeks altered into *Caryophyllon*. *Girolfuer*, Fr. The fruit is thought to bear some resemblance to a nail, and hence is called clove, *clou*, Fr., *Chiode*, Ital., *Clavo*, Span., *Naghet*, Ger. and Dutch. The whole tree is aromatic, and the fruit or clove is considered as one of the hottest and most acrid substances of the aromatic class, and as such is often used, not only internally, but externally, as a stimulant; as in paralytic cases for example, in which the oil of cloves has been administered to advantage: it is also made use of in the tooth-ache, in which it often succeeds in suddenly abating and subduing the pain. A tincture of cloves in rectified spirit is kept in the shops, as well as the essential oil, which latter is perhaps seldom free from sophistication. For culinary purposes, the uses of cloves are innumerable. The Dutch, who had for a long time the monopoly of the spice trade, prevented while they could the tree from being removed from the Moluccas and other islands, where it grows naturally; but the French now cultivate it in Cayenne and St. Domingo. There are a few specimens in the British gardens. It grows freely in loam and peat, and ripened cuttings are not difficult to root in sand, in moist heat under a hand-glass.

1121. *Mirtus*. From *μύρτος*, perfume. *Myrtos* of the Greeks. *Le Myrte*, Fr., *Myrtle*, Ger., *Myrtus*, Dutch, *Mirto*, Ital. and Span., *Myrta*, Portug., *Myrter*, Dan. and *Myrten*, Swed. The common myrtle is a well known popular shrub, which has been in English gardens for an unknown length of time; evidently from

History, Use, Propagation, Culture,

what Gerarde and Evelyn say, before the invention of greenhouses, and probably in that case preserved by covering or housing in rooms. It was a great favorite among the ancients, for its elegance, and its evergreen sweet leaves. It was sacred to Venus, either on this account, or perhaps because it flourishes most in the neighbourhood of the sea. Myrtle-wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens. Both branches and berries were put into wine, and the latter were used in the cookery of the ancients. The myrtle was also one of their medicinal plants. All parts of it are astringent, but it is discarded from modern practice.

M. coriacea, sometimes called wild cinnamon, is a most elegant tree, with a handsome ash-colored straight trunk, and pyramidal head. It grows slowly, and flowers late twice a year. In old trees, the bark becomes white, and hangs down in shreds which have an aromatic quality. The timber is red, very hard, and used in mill-work. The berries, which are the size of peas, and of an agreeable aromatic smell and taste, are used in culinary purposes.

1122. *Calyptranthes*. From *καλυπτρον*, a lid, and *ανθος*, a flower, in allusion to the peculiar manner in which the segments of the calyx, being grown together, fall off.

Zuzýgium, is so called from *ζυζυγος*, coupled, in allusion to the manner in which the branches and leaves are united by pairs. *C. Jambolana*, frequently called the Java plum, bears a black esculent berry. Cuttings of this genus, Sweet observes, "do not strike freely; ripened ones strike best in sand under a bell-glass; but the plants root best from layers." (*Bot. Cult.* 34.)

1123. *Pimenta*. A genus readily distinguishable from *Myrtus* by the structure of its ovarium. It is a handsome tree, common in the hilly parts of the north side of Jamaica. The flowers are without show, and are succeeded by spherical purple berries crowned with a persistent calyx: they are called Jamaica pepper or all-spice, from their taste being thought to resemble a composition of all other spices. The berries are gathered before being ripe, and are carefully dried on mats or terraced floors in the shade. In ten or twelve

- γ Leaves ovate-lanceolate acute
 δ Leaves ovate-lanceolate close together

and Miscellaneous Particulars.

days they become wrinkled, dry, and of a dark brown color, and are then packed in bags or casks for sale. Some kiln-dry them by which the same object is sooner effected. The berries have an agreeable aromatic subastringent taste, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm pungent taste of the cloves; qualities which reside chiefly in the cortical part of the dried berry, and are better extracted by a watery infusion, than by spirit or distillation. They are much used in the kitchen, and also by the druggists to cover the disagreeable taste of other remedies, or to give them warmth. An oil is obtained by distillation which is said to be nearly equal to that of oil of cloves, and sometimes substituted for it.

1124. *Olymthia*. So named from *ολυθιος*, a little fig or berry. A genus separated from *Myrtus* on account of the singular manner in which all the parts of the seed are consolidated. A small stove plant common in collections.

1125. *Stravadium*. The Malabar name of this plant is *Tsjera samstravadi*, from which *Stravadium* has been contrived. A fine tree with racemose flowers, and large, four-cornered, oblong fruit. A delicate stove plant rarely seen.

1126. *Eucalyptus*. From *eu*, well, and *καλυπτω*, to cover as with a lid; a name, therefore, with the same meaning as *Calyptranthes*, No. 1122. This genus consists of the loftiest timber trees of New Holland. Botanists knowing them principally from dried specimens, their respective heights cannot be stated correctly. They are all of the tallest habit, and soon grow beyond the limits of our stoves. In Van Dieman's Island a manufactory has been established for the preparation of extract of tannin from the bark of various species of *Eucalyptus*. A considerable quantity of the substance has been imported into England recently, and it is said to have been found by the tanners to be twice as powerful in its operation as oak-bark.

E. resinifera produces a gum resin something like the Kino of druggists (obtained from a species of *Pterocarpus*), and for all medical purposes full as efficacious.

All the species, Sweet observes, "are fine plants for a large conservatory, as they grow very fast, and are

History, Use, Propagation, Culture.

generally well clothed with beautiful foliage; they will also flower freely, when of a moderate size. The best soil for them is a mixture of loam and peat; and cuttings of them may be struck in sand under a bell-glass; but they are not so free to root, as most of this natural order are. (Bot. Cult. 189.)

1127. *Punica*. This fruit was called by the ancients *Malum Punicum*, Carthaginian apple; because, as Pliny tells us, the tree was first known to grow in the vicinity of Carthage. Hence has the term *Punica* been constructed. *P. nana* has very small fruit and flowers, and is used in the West Indies as a hedge-plant, as *P. Granatum* (from *granum*, grain, on account of the numerous grains of its fruit) is in the south of France and in Italy. The latter, in its wild state, is a thorny bush not unlike our hawthorn: its flowers have a fine appearance, and the fruit is very ornamental. It will produce fruit, trained against a south wall, in many parts of England; and under a glass case, or against a fluted wall, it is probable, the fruit might be as highly flavored as that imported from Genoa and Leghorn. The flowers come out at the ends of the branches, singly, or three and four together; and, therefore, in pruning, care must be had to bring into action only the strongest buds. For this purpose, all the weak shoots should be cut out, and the stronger ones shortened, so as to produce bearing-shoots over the whole tree. The best soil is a rich strong loam.

The double-flowering varieties are to be treated in the same manner, and are highly ornamental.

1128. *Amygdalus*. The Greek name of the almond. The species are fruit-trees, or ornamental trees and shrubs, both much esteemed for the gay color and early appearance of their flowers. *A. Persica*, the peach and nectarine, bears the most exquisitely delicious of European fruits; it is more gratifying to the palate by its mass of juicy pulp than the grape, and more delicate than the melon. Some, however, prefer the grape and melon to the peach and nectarine; but the most delicate of taste consider the latter as surpassed only by the pine-apple. The varieties of peach and nectarine are numerous, and by raising from seed might easily be rendered innumerable. The best varieties have been raised in France, at Montreuil, a village of peach growers for the Paris market. Some good varieties have been raised in England by Mr. Knight, and other members of the Horticultural Society. The peach, to attain its proper flavor, must be protected by glass during the spring and earlier summer months, and exposed to the direct influence of the weather during the ripening process. Ripened under glass, unless very liberal supplies of air are given, the flavor will be very inferior. Mr. Knight considers that the direct rays of the sun (without the intervention of glass) are of great advantage to the proper ripening, and essential to the coloring of the peach.

Linnaeus divides the *A. Persica* into two varieties; that with downy fruit, or the peach, and that with smooth fruit, or the nectarine. There are various instances on record (*Hort. Trans.* vol. i. p. 103.) of both fruits growing on the same tree, even on the same branch; and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions; the *pêches*, or free-stone peaches, the flesh of whose fruit separates readily from the skin and the stone; the *pêches lisses*, or free-stone nectarines, or free-stone smooth peaches; the *pavies*, or cling-stone peaches, whose flesh is firm, and adheres

 7025 Leaves lanceolate doubly serrated

and Miscellaneous Particulars.

both to the skin and stone; and the *brugnons*, or nectarines, or cling-stone smooth peaches. *Knight. (Hort. Trans. iii. 1.)*

The double-blossomed peach is one of the most ornamental of spring-flowering trees; its blossoms appear about three weeks later than those of the common peach.

A. communis and *amara*, and especially the former, are employed as ornamental trees in front of shrubberies, and in suburban gardens. In the south of France, Italy, Spain, and different parts of the Levant, they are cultivated for their fruit. In France they have above a dozen species or varieties, besides a hybrid called the almond-peach. (See *Duhamel.*) The common and bitter almond are only to be distinguished by the taste of the kernels of their fruit. The Jordan almonds, which come from Malaga, are the best sweet almonds brought to England; the bitter come chiefly from Magadore. The bitter cuticle of almonds is taken off by immersion in boiling water. The almond eaten as food is not very digestible, and requires to be well masticated.

Robertson (*Hort. Trans. iii. 382*) and various botanists consider the peach and almond as one species.

Four distinguished and ingenious attempts have been made to class the varieties of peaches and nectarines by the leaf and flower as well as the fruit: the first is by Poiteau, in the *Bon Jardinier*; the next by Count Lelieur, in his *Pomone Française*; the third by Robertson, nurseryman, of Kilkenny, whose arrangement is founded on the glands of the leaves; and the fourth, and most important, by Mr. George Lindley, in the fifth volume of the Horticultural Society's Transactions. The latter writer has, in a peculiarly distinct manner, arranged no fewer than 155 sorts of peaches and nectarines in well defined divisions or sections.

The bitter almond contains less fixed oil, than the sweet almond, and a portion of prussic acid or hydrocyanic acid, upon which its narcotic power is supposed to depend. This variety is said to operate as a poison on dogs and some other animals, but not generally on the human species. The distilled water exerts an action not less deleterious than that of laurel water on the human frame. It produces vertigo, head-ache, tinnitis aurium, dizziness of sight, and vomiting, when taken to the extent of thirty drops only; and a drachm of it has killed a stout dog. When a large doze is taken, death almost instantly follows. In order to counteract its poisonous effects recourse is had to diffusibles, as brandy and ammonia; or three or four spoonfuls of oil of turpentine may be given at intervals of half an hour. The fixed oil, which both varieties of the almond yield by expression in large quantity, is insipid and inodorous when heat has not been employed.

Sweet almonds are used more as food than as medicine, but they afford little nourishment. Heartburn is said to be relieved by eating six or eight of them decorticated. When triturated with water, milky mixtures or emulsions are formed; and they are also used in pharmacy for assisting, by trituration, the combination of substances, such as camphor and the resins with water. Bitter almonds are scarcely ever used medicinally. (*London Dispensatory, 151.*)

A. nana and *pumila* are very ornamental shrubs, both in their double and single varieties.

History, Use, Propagation, Culture,

1129. *Prunus*. The origin of this name is wholly unknown. The Greeks called it *περουν*, and the Latins *prunus*. From this genus have been obtained the principal characters of that section of the natural order Rosaceæ, which is called Amygdalæ or Prunaceæ, and which is curiously and chemically known by the presence of Prussic acid all in the species, and in all their parts.

P. Padus (a name of Theophrastus), the bird-cherry, is an ornamental tree, by its purple bark, leafy bunches of white flowers, and berries successively green, red, and black. It is common in the native woods of Scotland and Sweden, and in both countries the berries are infused in spirits in order to give them an agreeable flavor. The fruit is nauseous to the taste, though greedily eaten by birds. The bark is used by the Finlanders to cure venereal complaints, and also with success by regular practitioners in Stockholm for the same purpose. (*Stockholm Acts*.) The tree is very leafy, and dislikes a wet soil; but bears lopping as copewood. The wood is beautifully veined, and used for cabinet work in France, as is that of *P. virginiana* in America.

P. Lauro-cerasus is one of our most popular evergreens. It was first brought from Constantinople to Holland in 1576; the first we read of in England was one at Highgate, in the garden of Mr. James Cole, a merchant of London, who, as Parkinson informs us, used to cover it in winter with a blanket. In less than half a century afterwards (1688), Ray informs us, the laurel was common in English gardens. It is now as universal in shrubberies as the rose. The kernel-like flavor of the fresh leaves has led to their use in flavoring custards and other culinary preparations; but as these leaves are poisonous, they ought to be used with caution. To brute animals the effect of the distilled water of laurel leaves is almost instant death; and two women in Dublin, and Sir T. Boughton in England, have been poisoned by it.

P. lusitanica is a most beautiful evergreen shrub, nearly as universal as the lauro-cerasus. It was brought to England from Portugal, but does not appear to be a native of that country; probably of Madeira or some other islands possessed by the Portuguese in the sixteenth or seventeenth centuries.

P. Mahaleb (*Mahaleb* the Arabic name) flowers profusely, and disperses an odor resembling that of Clematis for a considerable distance around. Its fruit is round, shining black, and so hard that it has been bored for beads by the catholics. The wood is perfumed and used by the French in cabinet-work, especially in the village of St. Lucie, near Commercy, whence, among the French, the plant has obtained the name of *Bois de St. Lucie*.

P. Cerasus, the cultivated cherry, is by some considered a distinct species, and by others only a variety of *P. avium*, the gean or wild black cherry. Lucullus is said to have first introduced the cultivated cherry to Italy, in 73 A. C. from a town in Pontus in Asia, called Cerasus, whence its specific name, and it was introduced to Britain 120 years afterwards. Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that monarch. But though we have no proof that cherries were in England at the time of the Norman conquest, or for some centuries after it; yet Warton has proved, by a quotation from Lidgate, a poet who wrote about

- 7026 Flowers racemose, Racemes pendulous, Lvs. decid. doubly serrat. somewhat rugose, Petioles with 2 glands
 β Serratures of leaves less, Racemes more erect
 7027 Flowers racemose, Racemes erect, Leaves deciduous doubly toothed smooth, Stalks with 4 glands
 7028 Flowers in loose racemes, Lvs. decid. simply serrated: lower serratures glandular, Rib beard. towards base
 7029 Flowers in lateral racemes, Leaves without glands oblong acuminate entire smooth on each side
 7030 Flowers racemose, Racemes lateral, Leaves evergreen without glands oblong acuminate entire
 7031 Flowers racemose, Leaves evergreen ovate-lanceolate serrated without glands
 7032 Flowers racemose, Leaves evergreen with two glands at back
 7033 Flowers corymbose terminal, Leaves ovate
 7034 Umbels sessile aggregate few-flowered, Cal. acute, Branches virgate round, Leaves narrow lanceolate
 7035 Umbels sessile aggregate few-fl. Sepals lanc. Stipules setaceous compound, Lvs. obl. oval suddenly pointed
 7036 Umbels sessile, Leaves obovate obtuse smooth with glandular serratures
 7037 Umbels somewhat stalked, Leaves ovate-lanceolate smooth folded together
 7038 Leaves obovate acuminate flat serrated, Racemes pubescent
 7039 Flowers racemose, Calyxes serrated, Leaves ovate serrated glandular at base
 7040 Umbel sessile, Leaves ovate-lanceolate pubescent beneath folded together
 7041 Umbel subsessile aggregate many-fl. at length paniced, Leaves obl. lanceolate serrated smooth
 7042 Umbel sessile solitary few-fl. Leaves deciduous ovate acuminate finely serrated, Petioles with 2 glands
 7043 Peduncles solitary, Leaves ovate acuminate smooth, Branches unarmed
 7044 Fl. lateral clustered, Leaves doubly serrated roundish acute
 7045 Peduncles subsolitary, Leaves lanceolate ovate acuminate, Branches not spiny
 7046 Peduncles twin, Leaves ovate villous beneath convolute, Branches spiny
 7047 Peduncles solitary, Leaves elliptical smooth, Fruit pendulous, Branches nearly unarmed
 7048 Umbel sessile clustered few-fl. Cal. obtuse, Branches angular prostrate, Lvs. cun. lanc. glaucous beneath
 7049 Buds clustered 2-fl. Ped. very short, Cal. smooth, Leaves oblong acum. serrulate, Branches spiny
 7050 Pedunc. subsolitary, Leaves ovate-oblong acuminate doubly serrated
 7051 Peduncles solitary, Leaves obovate obl. beneath glaucous serrated entire at base
 7052 Peduncles solitary, Leaves ellipt. lanceolate pubescent beneath, Branches spiny
 7053 Peduncles twin, Leaves ovate cut serrate without glands beneath white, Stem prostrate
 7054 Flowers corymbose, Ped. elongated, Leaves oval oblong eroded membranous smooth
 7055 Umbels sessile aggregate few-fl. Leaves ovate ellipt. acute smooth on each side with 2 glands at base
 7056 Flowers sessile, Leaves subcordate

and Miscellaneous Particulars.

or before 1415, that the hawkers in London were wont to expose cherries for sale in the same manner as is now done early in the season. The tree is now very generally cultivated both as a wall and standard fruit, and has been forced for upwards of two centuries.

The Romans had eight varieties of cherry: in the British gardens are upwards of forty sorts. The French divide their cherries into *griottes*, or tender-fleshed; *bigarreaux*, or hard-fleshed; and *guignes*, or small fruits. The fruit of many varieties is somewhat heart-shaped, hence the very general cognomen; why some sorts are called dukes is not as obvious. The Morello cherry is very distinct from the other varieties, bearing almost exclusively on the preceding year's wood, and the pulp of the fruit having the consistence and flavor of the Morel, whence the name. Cherries are grafted or budded on seedlings from cherry-stones, or better from seedlings of the wild cherry. For dwarfing, they are worked on the bird cherry or perfumed cherry: the latter is preferred in Holland.

Cherry trees are very ornamental in shrubberies and woods, and valuable as encouraging the different species of thrush. The gum of cherry trees is eatable, and equal to that of gum arabic; the wood is hard and tough, and used by the turner and cabinet maker.

Prunus Pseudo-Cerasus, the Chinese cherry, is of recent introduction, and most valuable on account of its bearing an excellent fruit, and producing it abundantly in a forcing-house.

P. avium, the gean, *guigne*, Fr., attains a large size, and its timber is of considerable value: the black corone cherry is supposed to be an improved variety of it, as are the different geans.

P. domestica is generally considered the original of the plum tree, *Prune*, Fr., *Pflaumen*, Ger., and *Prugno*, Ital. Many, however, conjecture that *P. insititia*, spinosa, and domestica, are the same species. There are several sorts of plums found wild in Britain, independently of the sloe, such as the bullace, damson, muscle, and winesour. The plum is said to love a lofty exposure, and to be favorable to the growth of grass under it. The bark dyes yellow, the wood is used in turnery, and the dried fruit or prune is formed into electuaries and gentle purgatives. Prunes were originally brought from Damascus, whence their name of damask, but are now chiefly imported from France.

There are a great many varieties of the plum in France, and in British gardens nearly a hundred sorts. By far the best desert plum is the greengage, *Reine Claude*, Fr., *Regina Claudio*, Ital. It is well known throughout Europe, and perfectly distinct from every other variety. The damson is the best baking plum, and the winesour the best for sweetmeats. Plums are generally grafted or budded on muscle or damson stocks.

Prunus Armeniaca, *Abricot*, Fr., *Abricosenbaum*, Ger., *Albicocco*, Ital., *Albarcoque*, Portug. is a fruit tree next in esteem to the peach. From its trivial name, it is generally supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus; the mountains there, to the top, being covered with it, Thunberg describes it as a very large, spreading, branchy tree in Japan. Grossier says, that it covers the barren mountains to the west of Peking, that the Chinese have a great many varieties of the tree double-

History, Use, Propagation, Culture,

blossomed, which they plant on little mounts for ornament, and dwarfs in pots for their apartments. It appears from Turner's Herbal, that the apricot was cultivated here in 1562; and in Hackluyt's Remembrancer, 1582, it is affirmed, that the apricot was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The fruit seems to have been known in Italy in the time of Dioscorides, under the name of *Præcocia*, probably, as Regnier supposes, from the Arabic, *Berkoch*; whence the Tuscan, *Bacoch* or *Albicocco*, and the English *Apricock*; or, as Professor Martyn observes, a tree when first introduced, might have been called a *præcox*, or early fruit; and gardeners, taking the article *a* for the first syllable of the word, might easily have corrupted it to *apricocks*. The orthography seems to have been finally changed to *apricot* about the end of the last century.

There are fifteen or twenty excellent varieties of apricot, besides the peach apricot, a large fruit supposed to be a hybrid between a peach and an apricot. The trees are generally budded on plum stocks, and always trained against walls. Apricots do not force freely.

1130. *Chrysobalanus*. From χρυσος, gold, and βάλανος, an acorn; in allusion to the size, color, and form of its fruit. *C. Icaco* (the West Indian name) bears flowers and fruit not unlike the plum, which is sold in the markets of the West Indies, and eaten both raw and preserved. Both species grow well in a sandy loam. Large cuttings root best, taken off at a joint, and planted thinly in a pot of sand, without having their leaves injured, and a hand-glass placed over them. (*Bot. Cult.* 39.)

1131. *Mespilus*. In Greek μῆσπιλον, from μῆσος, half, and πῖλος, bullet; the fruit resembling half a bullet or round ball. In French it is called *nefle*, from the Celtic *naff*, which also signifies truncate. *M. Germanica*, bears a turbinate berry, which is eaten raw in a state of incipient decay. It is little cultivated, but one or two trees are generally introduced in shrubberies or in complete orchards. There are one or two varieties besides the wild sort; what is called the Dutch medlar is reckoned the best. It is grafted on seedlings of the

and Miscellaneous Particulars.

wild medlar, or on any other species of the same genus : often on the common thorn. The other species bears fruit similar to *M. germanica*, but more dry.

1132. *Crataegus*. From *αγραία*, force, on account of the extreme hardness of the wood of the original *Crataegus*, which appears to be what is now called *Pyrus aria*, the beam-tree. This is a very ornamental genus of small hardy trees, valuable for the neatness of their foliage, the earliness of their flowers in spring, and the rich colors of their berries in autumn.

C. oxyacantha, *εξορ*, *αξαρία*, sharp-spine, is the best hedge plant in Europe, and also furnishes some highly ornamental varieties, especially the double-blossomed and scarlet-blossomed.

The fruit of *C. odoratissima* is very agreeable. That of the Azarole (*ἀλ ζ'αρὸν* Arabic, according to Castel and John de Souza) is much esteemed in the South of Europe. In this country it rarely arrives at perfection.

1133. *Pyrus*. From the Celtic *peren*, the Anglo-Saxons made *pere*, the English, *pear*, the French, *poire*, and the Latins, *pyrus*, or for the fruit, *pyrum*. From the Celtic word *api*, which also signified a fruit resembling an apple, the Greeks obtained *ἄπιος*, the English, *apple*, the Germans, *apfel*. To this day the French distinguish a tribe of small fruited apples by the name *api*.

P. malus, *Pomme*, Fr., *Apfel*, Ger., and *Pomo*, Ital., is the most popular of British fruits. None can be brought to so high a degree of perfection with so little trouble ; and of no other are there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our islands afford. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland isles, (*Calcd. Hort. Mem.* vol. ii.) as well as in Devonshire and Cornwall ; some sorts are ripe in the beginning of July, and others, which ripen later, will keep till June. Unlike other fruits, those which ripen latest are the best.

The tree attains a great age, is in general very prolific, and the timber is valuable for the turner, millwright

History, Use, Propagation, Culture,

and cabinet maker. The Romans had twenty-two varieties, and there are now several hundreds in Britain and France, and some excellent sorts from America. They are usually divided into dessert, baking, and cyder fruits; the first high flavored, the second such as fall or become mellow in baking or boiling, and the third austere, and generally fruits of small size. Besides this division, apples are classed as pippins or seedlings, pearmain or somewhat pear-shaped fruits, rennets or queens, specked fruits, calvilles or white-skinned fruits, russets or brown fruits, codlings or falling fruits, and burknotts, which grow readily by cuttings. Most sorts of apple form ugly trees as standards, but are otherwise very ornamental in shrubberies from their blossoms. The crabs, and especially the varieties obtained from the Siberian crab, form much the handsomest heads, and have also more brilliant blossoms. The apple may be propagated by layers, and many sorts by cuttings; but the usual mode is by grafting on crab-stocks, and for dwarfing on stocks of the paradise apple.

P. communis, Poirier, Fr., *Birnbaum*, Ger., and *Pero*, Ital., is a fruit-tree next in popularity and value to the apple tree. It is a greatly superior dessert fruit, but not so valuable for culinary purposes and the press. There are fewer good sorts of pears, in proportion to the number of current varieties, than of apples; but a few, as the Jargonelles, Bergamots, Beurrées, Chaumontelles, &c. are most exquisite dessert fruits, and are much easier of digestion than the apple. It arrives in greater perfection in France and the north of Italy than in England. The Chaumontelles of Guernsey are in high repute, as are the St. Germain's and other sorts of Picardy, and the Beurrées of Milan. The Romans had thirty-six varieties, and there are many hundreds in the French and British nurseries, most of them good for little. Professor Van Mons, of Brussels, and M. Duquessie, of Mons, fruited about 8000 seedling pears, from which they obtained nearly 800 sorts worth cultivating. (*Nail's Hort. Tour.*) The varieties are divided into dessert and baking fruits; and also into melting or butter pears, *beurrées*, Fr., breaking pears, *crevers*, Fr., and perry, *poirée*, Fr., fruits. The tree is grafted on seedlings of the same species, and for dwarfing and precocity on the quince. It is a much handsomer upright growing tree than the apple, more durable, and its wood hard and valuable for the turner and millwright; but its blossoms being white, are less showy than those of the apple.

P. domestica, and the other species of service are very ornamental trees; their leaves are mostly white

 7087 Leaves serrated downy beneath, Flowers corymbose
 7088 Leaves lin. lanc. hoary white with down beneath, Fl. axillary solitary subsessile
 7089 Leaves ovate stalked entire silky beneath, Flowers corymbose
 7090 Umbel sessile, Leaves ovate oblong acuminate serrated smooth, Claws shorter than cal. Styles smooth
 7091 Umbel sessile, Leaves oval oblong serrated smooth, Claws longer than cal. Styles woolly at base
 7092 Umbel sessile, Pedunc. pubescent, Styles woolly at base, Leaves ovate acuminate
 7093 Leaves equally serrulate, Pedunc. clustered, Apples like berries, Cal. deciduous
 7094 Leaves cordate cut-serrate angular smooth, Pedunc. corymbose
 7095 Leaves lanc. oblong shining tooth-serrated narrowed at base entire, Pedunc. corymbose
 7096 Leaves roundish ovate cut serrate hoary beneath, Flowers corymbose
 7097 Leaves ovate lanceolate cut-lobed toothed beneath snow-white, Flowers corymbose
 7098 Leaves pubescent beneath pinnated with the last pinna very large pinnatifid and simple
 7099 Leaves half pinnated downy beneath

- 7100 Leaves pinnated villous beneath
 7101 Leaves pinnated smooth on both sides
 7102 Leaves pinnated, Leaflets acute almost equally serrated and common petiole smooth
 7103 Lvs. pinnated, Leaflets acuminate unequally cut serrated and common petiole smooth, Serratures bristly [mucronate
 7104 Leaves oval acutely serrated smooth, Fl. in corymbose heads
 7105 Leaves ovate oblong entire somewhat downy, Peduncle simple downy corymbose
 7106 Leaves oblong cuneate at base unequally and doubly serrated hoary beneath, Fl. corymbose
 7107 Leaves oval serrated, Fl. solitary dioecious, Pet. linear the length of calyx

- 7108 Leaves downy deciduous
 7109 Leaves smooth shining evergreen

- 7110 Leaves smooth deciduous

- 7111 Leaves oblong acute serrulate, Pedicels longer than calyx

- 7112 Leaves oblong lanc. distantly toothed, Pedicels shorter than calyx
 7113 Leaves lanceolate distantly serrated, Panicle hairy

- 7114 Raceme imbricated with persistent foliaceous bractes, Petals roundish
 7115 Leaves ovate lanceolate acuminate at each end, Pet. lanc. Stamens upright shorter than calyx
 7116 Leaves long lanceolate, Stamens spreading longer than the calyx
 7117 Leaves linear lanceolate, Sepals subulate much longer than stamens, Panicle contracted

- 7118 Leaves lanceolate serrated

and Miscellaneous Particulars.

underneath, and they are generally profusely covered with blossoms and fruit. Of *P. domestica* there are two varieties, the pear and apple-shaped, cultivated in some parts of France and near Genoa for their fruits. Those like the medlar and quince are not eaten till in a state of incipient decay. There are but few of the true service in English gardens, but the *P. hybrida* and *pinnatifida* are common, and their fruit, which resembles that of the mountain ash, is sometimes made use of.

P. aucuparia and *Americana* are handsome trees for shrubberies, the former very popular in suburban gardens.

1134. *Cydonia*. So called from being native of the ancient town Cydon in the Island of Crete; or perhaps it may be a corruption of *malus-cotonea*, by which the Latins designate the fruit. *C. vulgaris* is a deformed low tree, sometimes cultivated for its fruit, which is a pome with a persisting calyx like the medlar. It is used as a marmalade for flavoring apple-tarts. It prefers moist loam, and is raised by layers. It is most in use, however, as a stock for the pear. *C. japonica* is a beautiful low bush, remarkable for the brilliancy of its blossoms, which vary from the richest scarlet to the most delicate bluish color. It is hardy, and well adapted for single plants, upon grass, or for forming ornamental hedges in flower gardens.

1135. *Photinia*. So named, we believe, from *φωσ φωτος*, light, in allusion to the lucid surface of the leaves of the species. *P. serrulata* and *arbutifolia* are elegant shrubs, and nearly hardy. The latter succeeds perfectly against a south wall.

1136. *Raphirolepis*. From *ραφίς*, a needle, and *λεπίς*, a scale, in allusion to the numerous, subulate, persistent bractes, which are mixed among the racemes of flowers. Pretty Chinese small shrubs, formerly known under the collective name of *Cratægus indica*.

1137. *Eriobotrya*. From *ερίον*, wool, and *βότρυν*, a bunch of grapes, in allusion to the woolliness of its raceme. This genus is excellently characterized by the structure of its seed, of which the radicle is retracted within the cotyledons, not exerted as in all the other genera of Pomacæ. *E. Japonica* produces an agreeable fruit about the size of a gooseberry, of a fine yellow color, and, according to Sir Joseph Banks, as good as the mango. To ripen it with flavor, it requires the temperature of the stove, and comes into use in March. It may be grafted on any species of the genus, or on the hawthorn.

History, Use, Propagation, Culture,

1138. *Amelanchier*. According to Clusius, *Amelancier* is the old Savoy name of the plant. It has been adopted by Mr. Lindley as the title of a small group of plants nearly related to *Pyrus*, but curiously distinguished by the 10-cells of the ovary.

1139. *Cotoneaster*. Named in allusion to the cottony nature of the fruit and young branches of the most common species. Small inconspicuous bushes, with solitary pink flowers almost hidden among the leaves.

1140. *Waldsteinia*. Named by Willdenow, in honor of Franz de Waldstein, a distinguished German botanist. Named with the aspect of *Potentilla* or rather *Geum*.

1141. *Spiræa*. *Σπειρα*, signifies a cord. *Spireon* is Pliny's name for a plant the blossoms of which are used in garlands. That plant is thought to have been the *Viburnum Lantana*. This genus affords some orna-

- 7119 Leaves roundish elliptical acute pubescent beneath, Sepals smooth, Germen villous
 7120 Leaves oblong elliptical cuspidate smooth, Sepals smooth, Germen pubescent
 7121 Leaves roundish elliptical acute smooth, Petals obovate, Sepals and germen pubescent

- 7122 Leaves ovate rounded at base, Cal. and pedunc. naked
 7123 Leaves elliptical obtuse at each end, Cal. and pedunc. woolly
 7124 Leaves ovate acuminate a little hairy on each side, Cal. and pedunc. naked
 7125 Leaves ovate attenuate at base, Cal. and pedunc. woolly

7126 Leaves radical stalked 5-lobed

7127 Leaves lanceolate entire sessile, Racemes compound

7128 Leaves oblong serrated smooth, Racemes decomposed

- 7129 Leaves ovate elliptical acute at each end smooth coarsely serrated, Racemes spreading paniced
 7130 Leaves lanceolate unequally serrate downy beneath, Flowers doubly racemose
 7131 Leaves linear-lanceolate toothletted smooth, Corymbs lateral
 7132 Leaves obovate entire, Umbels sessile
 7133 Leaves obovate cut-toothed at end, Corymbs stalked
 7134 Leaves ovate lanceolate doubly toothed, Corymbs stalked
 7135 Leaves broad ovate cut-serrate smooth, Corymbs terminal compound leafy
 7136 Leaves obovate acute toothed at end 3-nerved, Corymbs close stalked
 7137 Leaves oblong lanceolate serrated at end and entire, Corymbs stalked
 7138 Leaves roundish bluntly lobed toothed, Umbels stalked
 7139 Leaves obovate obtuse 3-lobed, Umbels lateral sessile
 7140 Leaves obovate obtuse at the end bluntly and unequally 3-nerved, Corymbs axillary sessile
 7141 Leaves ovate 3-lobed serrated, Corymbs stalked
 7142 Leaves pinnated, Leaflets even serrated, Flowers paniced

- 7143 Leaves ovate acute smooth serrated stalked glaucous beneath, Cymes pubescent
 7144 Leaves oblong bluntly and irregularly serrated, Flowers in dense corymbs
 7145 Leaves obovate obtuse forwards doubly serrated smooth, Corymbs terminal compound, Flowers capitate
 7146 Leaves supra-decomposed, Spikes paniced, Flowers diœcium
 7147 Leaves pinnated, Leaflets even serrated, Flowers corymbose

7148 Leaves pinnated downy beneath, The end lobe larger and 3-lobed; the side ones undivided

7149 Leaves pinnated smooth, The end lobe 7-lobed; the lateral 3-lobed, Corymbs proliferous

- 7150 Stipules linear entire, Calyx tubular campanulate
 7151 Stipules leafy ovate cut-toothed, Calyx campanulate

- 7152 Leaves spatulate oblong, Joints of stem tumid, Fl. stalked
 7153 Flowers sessile, Leaves linear oblong flat
 7154 Leaves linear lanc. revolute at edge, Fl. terminal sessile
 7155 Leaves lin. spatulate, Joints of stem equal, Fl. stalked
 7156 Leaves lanc. spatulate, Joints of stem creeping filiform, Fl. stalked

- 7157 Leaves cuneiform ovate, Flowers sessile
 7158 Leaves roundish cuneiform pilose, Fl. sessile, Cal. hairy
 7159 Leaves lanceolate, Flowers sessile apetalous
 7160 Leaves lanceolate, Flowers paniced

and Miscellaneous Particulars.

mental shrubs, free flowerers, and of easy culture; as *S. salicifolia*, *hypericifolia*, *tomentosa*, &c. The herbaceous species, especially *filipendula*, *ulmaria*, and *aruncus*, are also very ornamental.

1142. *Gillenia*. A genus well divided by Mönch from *Spiræa*, from which it differs in so many respects as to make it astonishing that the species should ever have been referred to that genus, even by the most unreasonable advocate of the exploded doctrines of synthetical botany. Pretty North American plants with lobed discolored leaves, and white flowers.

1143. *Scouviom*. Meaning of the name unknown. Inelegant plants with the habit of purslane.

1144. *Aizoon*. From *αἰ*, always, and *ζῶν*, alive, always alive, or evergreen. A name given by the Greeks to the *Sempervivum*. This is an uninteresting genus, only known among the curious.

History, Use, Propagation, Culture,

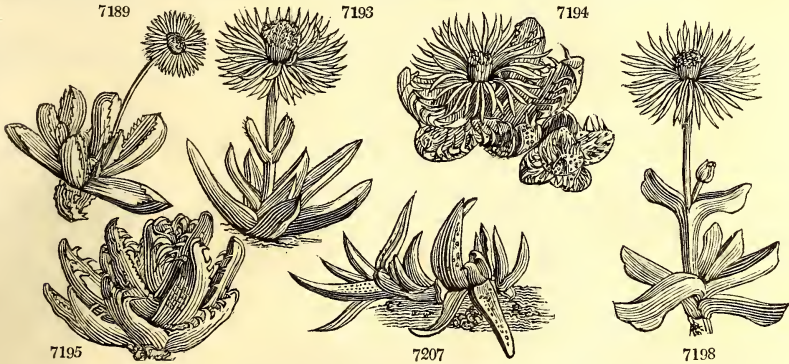

1145. *Tetragonia*. From τετρας, quaternary, and γωνία, an angle, in allusion to the four angles of the bony pericarpium. The species are succulent trailers of no beauty, but possibly all fit to be used, like Chenopodium, as a spinage. *T. expansa* has been so used by Captain Cook when visiting New Zealand, and lately introduced for the same purpose in British gardens; as a summer spinage, it is as valuable as the orache, or perhaps more so. Every gardener knows the plague that attends the frequent sowing of common spinage through the the warm season of the year; without that trouble it is impossible to have it good, and with the utmost care it cannot always be obtained exactly as it ought to be, (particularly when the weather is hot and dry,) from the rapidity with which the young plants run to seed. The New Zealand spinage, if watered, grows freely, and produces leaves of the greatest succulency in the hottest weather. Anderson, one of its earliest cultivators, had only nine plants, from which, he says, "I have been enabled to send in a gathering for the kitchen every other day since the middle of June, so that I consider a bed with about twenty plants quite sufficient to give a daily supply, if required, for a large table."

- 7161 Herbaceous, Leaves ovate rhomboid, Fruit with 4 horns
 7162 Frosted, Leaves ovate sessile, Fruit not horned
 7163 Shrubby, Leaves linear, Fruit winged
 7164 Shrubby frosted, Leaves obovate, Fruit winged
 7165 Procumbent, Leaves sessile lanceolate decumbent, Wings of fruit 8 alternately smaller
 7166 Smooth herbaceous erect, Lower leaves ovate: upper lanceolate smooth, Fl. racemose
 7167 Smooth herbaceous, Leaves ovate stalked, Fruit winged
 7168 Herbaceous, Leaves rhomboid ovate, Fruit ubinate
 7169 Leaves alternate linear revolute at edge with a dorsal line above
 7170 Leaves alternate frosted obovate with winged decumbent stalks

§ 1. *Stem none or very short, Root perennial, Leaves large.*

- 7171 Whitish polished unarmed, Flower with a long tube
 7172 Smooth rather glaucous with branched confluent spots, Ovary exserted
 7173 Smooth green with great confluent branched spots, Ovary included
 7174 Glaucous, Spots branched confluent, Ovary included
 7175 Green, Spots confluent wart-like, Ovary included
 7176 Pyriform glaucous retuse at end, Spots generally distinct green and obsolete
 7177 Very depressed and rather glaucous, Spots nearly distinct, Ovary exserted
 7178 Somewhat hoary and pubescent much depressed
 7179 Nearly globose pale green berry-shaped with little dark scarcely confluent spots
 7180 Glaucous smooth, Ends of the leaves unequally distinct flat above
 7181 Leaves about 4 broadly ovate or parabolic half rounded expanded
 7182 Leaves 6-8 oblong-ovate half round erect
 7183 Green, Leaves unequally half rounded acinaciform obtuse
 7184 Whitish, Leaves equally half rounded very blunt
 7185 Stemless, Leaves rounded very smooth
 7186 Leaves perfect about 4 clavate 3-cornered very thick glaucous with many large dots
 7187 Leaves hoary at the base half rounded and thin upwards gibbous and keeled
 7188 Stemless, Leaves entire half round green marbled at the end keeled 3-cornered
 7189 Stemless, Lvs. glaucous towards the end and the bractes incurved and toothed, Pedunc. length of leaves
 7190 Leaves glaucous, Marginal fringes numerous very deep
 7191 Nearly steml. Lvs. glauc. towards end entire or with large teeth, Bractes entire, Pedun. longer than leaves
 7192 Stemless smooth whitish, Lvs. half round entire at end keeled 3-cornered little thickened with a recurved
 7193 Stemless very smooth white, Leaves thick subulate 3-cornered obtuse with a point [point
 7194 Green stemless, Leaves cordate ovate expanded marbled with white and with a deep fringe
 7195 Stemless glaucous, Leaves deeply tooth-fringed obsoletely dotted with a cartilaginous keel at end
 7196 Stemless green with clear spots, Leaves 3-cornered towards the end with a shortly toothed fringe
 7197 Nearly stemless glaucous, Leaves with 3 rows of toothed fringe and small dots
 7198 Leaves exactly hatchet-shaped, The old stem nearly six inches high and erect
 7199 Leaves keeled 3-cornered green, Scape strong panicled 2-edged
 7200 Leaves erect incurved keeled upwards long glaucous rugose with large dots
 7201 Leaves very glaucous triquetrous compressed at the end with a dilated keel which is often toothletted

- 7202 Leaves obt. dotted with gibbous pustules at the base in the inside, Stem strong short decumbent branch.
 7203 Stemless, Leaves connate dotted half round at the end triquet. reflexed acute, Fl. sessile, Cal. cylin. 6-fid
 7204 Nearly stemless, Leaves hoary glaucous obtuse towards the end with a few spots, Cal. 4-fid
 7205 Nearly stemless, Leaves glaucous very blunt with many dots, Cal. 2-4-fid
 7206 Nearly stemless branched, Leaves subul. elong. dott. very glauc. Bractes 4 crossing shorter than scape
 7207 Stemless, Leaves subulate elongated acute glauc. much dott. Bractes 2 longer than scape
 7208 Like the last, but leaves half cylindr. connate warted outside
 7209 Leaves obl. at the base inside with elevated pustules, Old stem three inches long decumbent
 7210 Leaves papulose iced, the first pisiform, the next half round, Stem much branched corky

and Miscellaneous Particulars.

The seed should be sown in the latter end of March in a pot, which must be placed in a melon-frame; the seedling plants, while small, should be set out singly in small pots, and kept under the shelter of a cold frame, until about the twentieth of May, when the mildness of the season will probably allow of their being planted out, without risk of being killed by frost. The plants must be put out three feet apart in very rich soil. In five or six weeks from the planting, their branches will have grown sufficiently to allow the gathering of the leaves for use. In dry seasons, the plants will probably require a good supply of water. They put forth their branches vigorously as soon as they have taken to the ground, and extend before the end of the season three feet on each side.

1146. *Mesembryanthemum*. From *mesembryanthemum*, the mid-day: on account of the flowers usually expanding at that time: the termination *anthemum*, which signifies flowering, is, to say the least of it, superfluous. The species of this extensive genus are singular, yet beautiful, and some even splendid plants. Their leaves are of odd shapes, and the habits of most of the sorts slovenly and insignificant, though some are grotesque; but the

History, Use, Propagation, Culture,

flowers make ample amends by their profusion, the brilliancy of their colors, and the length of time the species continue in flower. Few are annual, fewer biennial, many are perennial, but most are shrubby,

- 7211 First leaves connate spheroidal, next half round subulate very long recurved green
 7212 Leaves sloping graver-shaped very broad thickest on one edge at the base inside pimpled, Fl. sessile
 7213 Nearly steml. Lvs. tongue-shaped thick; one convex blunt at end, the other with a long keel, Fl. stlkd. frag.
 7214 Leaves obliquely tongue-shaped pale green very soft, the younger ciliated pubesc. hooked inwards at end
 7215 Nearly stemless, Lvs. tongue-shaped sloping 4-inches long, 1-broad cultrate, Pedunc. an inch long
 7216 Nearly stemless, Lvs. distichous tongue-shaped at the edge and end cultrate. Fl. stalked
 7217 Leaves long very green and polished, Pedunc. longer than calyx, Caps. small depressed
 7218 Leaves broad tongue-shaped ascending obtuse green longer than peduncles
 7219 Leaves tongue-shaped ascending 5-6-in. long, 3-11-lines broad, with large pimples at the base inside
 7220 Leaves long tongue-shaped shining thinner, Flowers subsessile, Caps. large depressed

7221 Leaves unequally tongue-shaped thick green partially keeled, Caps. little elevated subsessile

7222 Leaves tongue-shaped obtuse thick often sloping and a little hollowed, Caps. large conical subsessile

7223 Prostrate, Lvs. narr. tongue-shaped obt. recurved depressed variously bent inwards at end, Caps. depressed

7224 Leaves lin. tongue-shaped half cylindr. very soft cruciate. Old stem three inches long

7225 Lvs. bifarious obliquely crossed half round obt. very thick yellowish green incurv. Old stem 6 in. high

7226 Stemless, Lvs. $\frac{1}{2}$ cylin. subul. variously obliquely hooked blunt with broad smooth spots at base, Caps. flat
 [half included]

7227 Lvs. crossing suberect or spreading half round subulate acute soft often pustulate at base, Ovary exerted
 [stalked]

7228 Stemless, Leaves green deformed the upper longest

7229 Leaves linear linguiform half cylindrical very long

7230 Lvs. obliquely cruciate long variously obliquely deformed with one or more obscure teeth, Old stem 3-6-in.

7231 Lvs. $\frac{1}{2}$ cylin. thick soft with two large opp. fleshy teeth beyond the midd. at the end variously and obliquely
 [deformed]

7232 Lvs. very narr. tongue-shap. $\frac{1}{3}$ round towards end oblique with 1 or 2 obsolete teeth, Old stem branch. 6 in.

7233 Nearly stemless, Leaves yellowish green spreading ovate half cylindrical rarely keeled at end

7234 Stem weak two or three inches long, Lvs. obl. $\frac{1}{2}$ -cylindr. upwards 3-cornered yellowish green

7235 Stem weak two or three inches long, Leaves half-cylindr. 3-cornered or subovate very green

7236 Leaves downy hoary or silky smooth

7237 Leaves subulate glaucous at the base above flat, Styles 8

7238 Leaves obsubulate thick obtuse green

7239 Leaves 3-cornered cylindr. subglaucous dotted 3 inches long, The old stem 3 inches closely branched

7240 Lvs. 4 in. long green roundish or cylindr. : the younger polished $\frac{1}{2}$ round very green the old stems 6 in.

7241 Leaves 3-cornered rounded very thick green dotted two inches long [polished]

7242 Leaves 3-cornered blunt with three rows of teeth at end, The old stem branched half shrubby

7243 Leaves half round subulate incurved with clear spots, Spots obsolete not wrinkled

7244 Leaves half round subulate incurved with clear spots, Spots large numerous with a white head

7245 Leaves half round subulate incurved with clear spots, Spots nearly middle sized with a little white point

§ 2. Cluster-leaved. Stem about a foot high decumbent perennial, Leaves in capitata clusters, Flowers polygamous, Calyx 5-leaved.

7246 Lvs. capit. closely clustered $\frac{1}{2}$ cylindr. 3-cornered elong. recurv. somewhat glaucous, Stems roundish white

7247 Lvs. capitata closely clustered long 3-cornered half cylindr. glaucous or green, Stems angular red

7248 Lvs. somewhat clustered long $\frac{1}{2}$ -cylindr 3-cornered minutely wrinkled, Stems prostrate with distant joints

7249 Leaves clust. longish broad erect half cylindr. 3-cornered shining, Joints close, Styles 12

and Miscellaneous Particulars.

especially towards the base. Leaves mostly opposite, seldom alternate, thick, or succulent, of various forms. Flowers solitary, axillary, or extra-axillary, but more frequently terminating. The fruit is some-

History, Use, Propagation, Culture,

times shaped like a fig. Linnæus arranged the species from the color of the flower; Haworth chiefly from the leaves.

7250 Leaves clust. 3-cornered $\frac{1}{2}$ cylindr. very long glaucous incurved, Stems scarcely angular, Joints distant

7251 Leaves in pairs coriuculate incurved $\frac{1}{2}$ cylindr. 3-cornered glaucous, Stems flexuose procumbent

7252 Leaves exactly cylindr. three inches long acute green, Styles 20

7253 Leaves glaucous about a foot long 3-cornered, Angles dilated with a broad furrow, Stem simple

7254 Leaves somewhat glaucous 6-7 inches long 3-cornered, Old stem simple

7255 Leaves green 3-4 inches long 3-cornered, Old stem two inches high simple erect

7256 Leaves dagger-shaped long glittering, Stem shrubby perennial

7257 Leaves glauc. about a span long bluntly 3-cornered channelled or half round, Root large tuberous fleshy

§ 3. *Trailers. Stems prostrate or creeping, angular, Calyx 5-leaved, Flowers polygynous, Leaves connate at base acutely 3-cornered.*

7258 Branches long slender spreading, Lvs. equilateral 3-corn. green hooked a little outwards at end, Fl. 3 or 2

7259 Lvs. equilateral 3-corn. glauc. much dotted straight at end lon. than joints, Edges not serr. Stems firm proc.

7260 Lvs. conn. comp. 3-corn. very green watted often short. than joints, Edges finely tooth. Branches very slen.

7261 Runners $1\frac{1}{2}$ foot long slender rooting, Lvs. clustered compressed 3-corn. bright green not rough at edge

7262 Leaves long equilateral 3-cornered straight roughish at edge, Stem firm procumbent

7263 Leaves compressed 3-cornered large recurved serrulate very rough, Old stems firm decumbent [decum.

7264 Lvs. bright green clust. thick comp. 3-corn. acinacif. dott. lon. than joints with rough edges, Stems short

7265 Lvs. comp. 3-corn. acinacif. glauc. not serrated and scarcely cartilaginous at edge generally lon. than joints

7266 Lvs. comp. 3-corn. greenish rugose the edges with cartilaginous serratures generally shorter than joints

7267 Leaves acinaciform, Edges curled wavy rough

7268 Leaves acinaciform polished glaucous with entire cartilaginous edges

7269 Leaves acinaciform with the edges and keel rough and red

7270 Leaves compressed 3-cornered acinaciform and equilateral, Every edge roughish

7271 Old leaves equilateral 3-cornered green incurved three inches long blistered inside at base, Keel serrulate

7272 Leaves about two inches sharply 3-cornered, the old ones comp. with their keel upwards serrulate burnt

7273 Young lvs. incurved equilateral 3-cornered soft glauc. with a cartilaginous smoothish white edge, Styles 7

7274 Leaves acinaciform or compressed 3-cornered glauc. with a pink smooth cartilag. edge, Stems prostrate

7275 Leaves not equilateral 3-cornered greenish, Stems prostrate, Pedunc. terminal solitary winged, Styles 8

7276 Leaves equilateral 3-cornered greenish, Edges smooth cartilaginous, Stems weak prostrate

7277 Lvs. comp. 3-corn. acinacif. smooth dotted green, in the inside at the base blistered, Keel roughish at edge

7278 Leaves clustered 3-cornered acute glaucous with large rough pellucid dots, Stems filiform very weak

7279 Leaves glaucous dotted 3-cornered incurved smooth

7280 Leaves 3-cornered not dotted smooth very green half cylindrical at base

7281 Leaves clustered expanded obsolete 3-cornered clavate obtuse green with a little point

§ 4. *Perfoliate. Leaves connate sheathing generally three-cornered upwards, usually hooked at end, Calyx 5-leaved.*

7282 Leaves 3-cornered compressed green prickly at end, Stem 2-edged decumbent

7283 Leaves erect white smooth 3-cornered thick sheathing beyond their middle with a cartilaginous edge

7284 Leaves 3-cornered subacinaciform white at edge, Keel dilated

7285 Leaves beaked connate half round subulate recurved dotted green, Stems prostrate branched knotty

7286 Leaves white thick hard dotted usually with about three spines beneath, Branches few

7287 Leaves whitish thick dotted recurved at end usually with one spine beneath, Branches many

7288 Leaves greenish with two spines beneath at the end

7289 Branches simple slender upright hard, Lvs. 3-cornered dotted white with 1-4 teeth at the back upwards

7290 Leaves quite entire very green smooth thick hooked backwards at the end

7291 Leaves acute-angled 3-cornered acum. incurved recurved green rough at edge

7292 Erect, Lvs. usually close recurved smooth green with the angles roughish above, Sheath often sharp

7293 Erect roughish, Lvs. about an inch long spreading straight recurv. at end, Sheaths green smooth, Angles [rough upwards

and Miscellaneous Particulars.

Most of the species are so hardy, that on dry rock-work, in a sheltered part of the garden, they will endure ordinary winters. Every thing, however, depends on keeping them dry. Among the hardy sorts may be reckoned

History, Use, Propagation, Culture,

M. hispidum, striatum, barbatum, crassifolium, glaucum, uncinatum, corniculatum, &c. Hardy, and yet showy sorts, are M. inclaudens, aurantium, perfoliatum, deltoides, barbatum, &c. These will grow and

- 7294 Leaves half an inch long smooth suberect, Keel not serrulate, Stem three feet high and branches erect
- 7295 Lvs. about three lines long horiz. and sheaths smooth, Keel rough at end, Branches very stiff and spread.
- 7296 Lvs. 3 lines long and more spreading thin and sheaths rough at edge, Branches filiform decumbent
- 7297 Lvs. somewhat compressed 3-cornered glauc. about one inch long, Branches many erect, Cal. turbinate

7298 Leaves somewhat compressed 3-cornered glaucous and the branchlets spreading

7299 Leaves distant roundish somewhat glaucous roughish with dots, Sheaths tumid at end

7300 Leaves remote greenish smooth about an inch and half long recurved at end, Sheaths tumid at end

7301 Leaves somewhat glaucous smooth clustered obtuse an inch long with a recurved point

7302 Leaves connate incurve-recurved blunt, Keel roughish at end with a sheathing line at base

§ 5. *Delta-leaved. Leaves more or less deltoid or hatchet formed. Flowers pink.*

- 7303 Leaves subulate 3-cornered dotted with the keel serrated backward
- 7304 Leaves glaucous compressed 3-cornered gladiate, Keel cartilaginous torn, Petals much longer than calyx
- 7305 Lvs. clust. not dotted glauc. shortly falcate gladiate, Angles cartilag. Petals much shorter than calyx
- 7306 Lvs. clust. compressed 3-cornered shortly acinaciform glauc. entire dotted with a cartilaginous edge
- 7307 Leaves distinct clust. equilaterally 3-corn. shortly acinaciform green dotted with a cartilaginous edge
- 7308 Lvs. subdelt. smooth very green with a gibb. entire keel, Pet. not closing: the inner imbricate very short
- 7309 Leaves clustered glaucous long 3-cornered deltoid, The sides not toothed, Keel entire
- 7310 Leaves clust. very glauc. 3-corn. deltoid toothed in three rows, Keel of the bractes and sepals entire
- 7311 Leaves clust. deltoid with the bractes and sepals 3-cornered glaucous toothletted in three rows
- 7312 Leaves 3-corn. acuminate awned green blistered inside at the base, Branches much clustered
- 7313 Leaves obl. ovate acute glaucous 3-corn. with a little white point at end
- 7314 Leaves connate at base oblong ovate half round not pointed, the winter leaves joined almost to the end
- 7315 Leaves acute equilaterally 3-corn. cymbiform grey obsoletely dotted with a downy fringe and recurv. point

§ 6. *Triquetrous. Leaves more or less 3-cornered distinct. Cal. 5-leaved. Styles 5.*

- 7316 Leaves large clustered much compressed 3-corn. incurved very glaucous, Stem woody erect bushy
- 7317 Leaves small much clust. somewhat connate compressed 3-corn. closely incurved, Branches clustered
- 7318 Leaves minute distinctly compressed 3-cornered falcate, Branches numerous filiform
- 7319 Leaves much compressed 3-corn. very glauc. attenuate at each end incurved, Branches much clustered
- 7320 Leaves compressed 3-corn. very glaucous attenuate at each end acinaciform, Stem erect
- 7321 Leaves 3-corn. clust. robust incurved very glaucous, Stem erect much branched
- 7322 Leaves much clustered thick acinaciform falcate with large spots glaucous
- 7323 Lvs. bluntly 3-corn. comp. glauc. incurv. atten. at each end, Pedunc. and branches erect filiform comp.
- 7324 Lvs. clustered falcate inflexed from 3-cornered half round compressed subglaucous smooth
- 7325 Leaves subtriquetrous green shining warty very rough, Sepals ovate acuminate, Petals crenate at end
- 7326 Leaves subtriquetrous glaucouscens warty very rough, Sepals ovate-acuminate, Petals two toothed at end
- 7327 Leaves subtriquetrous very glaucous rough, Sepals and petals distant reflexed, Stamens clust. Bark white
- 7328 Erect woody, Leaves lin. obsoletely 3-corn. smoothish glauc. white imbricated at the ends of old branches
- 7329 Leaves subtriquetrous glauc. roughish attenuated downwards, Stems clust. deflexed, Pet. very numerous
- 7330 Leaves subtriquetrous glauc. attenuated upwards smooth, Keel roughish, Branches distant filiform
- 7331 Leaves small glauc. 3-corn. rough, Branches bushy clust. The young bark brown, Flowers panicle
- 7332 Leaves small often longer than the joints but inwards by pairs glauc. 3-corn. obtuse smooth
- 7333 Leaves much clust. strong incurved-recurved clavate compressed dotted glaucous, Branches bushy
- 7334 Leaves compressed bluntly 3-corn. roughish with dots glaucous, Sepals like spines spreading
- 7335 Leaves subglaucous subtriquetrous rough, Calyxes spiny, Petals deeply emarginate
- 7336 Leaves distinct remote subrecurved triquetrous much comp. dotted glauc. Keel gibbous above middle
- 7337 Leaves distinct distant triquetrous compressed acute subglaucous dotted, Branches twiggy
- 7338 Leaves green, Bractes 4 broadly ovate keeled embracing the calyx, Pet. white at base, Branches fuscous
- 7339 Branches decumbent 2-edged brown, Leaves acinacif. 3-corn. with sides membranous downwards, Dots [large pellucid elevated

and Miscellaneous Particulars.

flower vigorously if planted in a bed in the open air and protected during winter, or if planted in a common pit, and matted over during frost.

History, Use, Propagation, Culture.

M. nodiflorum grows wild in Italy and Egypt, and in the latter country is burnt for potash, which it produces in excellent quality.

- 7340 Leaves glauc. slender roughish, Bractes ovate acute almost surrounding the calyx, Branches very slender [straight]
- 7341 Leaves glaucous, Bractes broad ovate, Branchlets clustered, Stem hoary
- 7342 Leaves glauc. equilateral 3-corn. very rough, Bractes ovate acute embracing the peduncles upwards
- 7343 Leaves 6-12 lines long half erect glauc. with little pellucid rough dots
- 7344 Leaves compressed 3-corn. longish bluish-green with rough pellucid dots, Keel usually onetoothed
- 7345 Low, Leaves green sparkling in the sun and branches very dense, Flower-stems decumbent
- 7346 Lowish, Lvs. glauc. 3-corner. and branches very close, Fl.-stems ascending or erect, Styles obovate twice
- 7347 Leaves green sparkling in the sun and branches close, Flower-stems erect [as short as stamens]
- 7348 Lvs. close compressed 3-cornered very green, Ped. longer than bract, Flowers spreading flat in the sun
- 7349 Leaves compressed 3-cornered glaucous, Branches stout, Pedunc. clavate, Corolla incurved
- 7350 Leaves cylindrical 3-cornered, Petals orange, Styles dark purple
- 7351 Leaves cymbiform pale-green with large dots, Branches few 2-edged hoary
- 7352 Lvs. very glauc. 3-corn. compressed, Sepals obl. ovate, Pet. deep orange imbricated, Styles purple outside
- 7353 Lvs. acutely 3-corn. much compressed glauc. roughish, Sepals ovate cordate, Pet. sulphur, Styles yellow
- 7354 Leaves 3-cornered obtuse expanded glaucous with large spots, Stem much branched woody stiff erect
- 7355 Leaves 3-cornered spreading cymbiform glaucous, Stems branched, Branches filiform nearly erect close
- 7356 Lvs. distinct 3-corn. ovate granular 3 lines long, Flowers yellow opening in the evening, Stems expanded
- 7357 Leaves spreading turgid 3-cornered hoary bluntly dotted at edge, Branches clustered 2-edged decumbent
- § 7. *Slender, Leaves distinct, dotted, rounded, without warts, Flowers opening in the morning, red, orange, or yellow.*
- 7358 Lvs. rounded 3-corn. somewhat compressed obt. glauc. Pedunc. smooth at base, Sepals obt. nearly equal
- 7359 Leaves 3-cornered acute green, Pedunc. and cal. unequal rough, Petals yellow inside
- 7360 Leaves about 3-cornered very green, Pedunc. in fruit clavate, Sepals very unequal, Branches loose
- 7361 Leaves half round subcompressed subulate green smooth longer than joints, Stems erect or procumbent
- 7362 Lvs. 3-corn. compressed glauc. rough, Sepals unequal, Petals changing from yellow to pink, Stems effuse
- 7363 Branches and lvs. cylindrical subul. spiniform erect recurved at end, Pedunc. and keels of bractes rough
- 7364 Lvs. distant expanded at base incurv. half round subul. Branch. firm suberect roughish angul. compressed
- 7365 Lvs. 3-cornered subulate incurved below hooked at end, Branches filiform compressed wavy decumbent
- 7366 Leaves clustered half cylindrical acuminate much recurved at end, Branches filiform nearly erect very close
- 7367 Tufted, Leaves clustered half cylindrical acuminate with filiform very weak creeping stems
- 7368 Leaves rounded 3-cornered dotted distinct, Spines branched
- 7369 Leaves long rounded 3-cornered subulate incurved glaucous edged at base
- 7370 Leaves rounded incurved smooth thickest in middle glaucous, Stem straight branched
- 7371 Flowers terminal 3, Two sepals deeply divided
- 7372 Leaves subulate rounded 3-cornered acute somewhat incurved very glaucous, Bark chestnut-colored
- 7373 Leaves clustered cylindrical obtuse arcuate glaucous smooth
- 7374 Leaves connate at base very close and glaucous 3-cornered cylindrical soapy, Flowers afternoon
- 7375 Leaves clustered 3-cornered half cylindrical mealy obtuse shorter than joint soapy, Sepals very unequal

§ 8. *Warted, Leaves and branches almost always more or less warted, Root biennial or annual.*

- 7376 Leaves large ovate acute wavy frosted with three nerves beneath, Root biennial
- 7377 Leaves large altern. ovate much wavy, as are the stems and cal., bespangled with ice drops, Root annual
- 7378 Leaves oblong pinnatifid pimpled, Petals minute yellow
- 7379 Leaves flat spatulate and stems pimpled, Branches divaricating, Fl. sessile
- 7380 Leaves amplexicaul. spatulate keeled, Pimples conical rough, Petals very minute
- 7381 Leaves opp. and altern. ovate spatulate wavy pimpled, Branches and calyxes angular, Fl. afternoon
- 7382 Leaves altern. lanceolate bluntnish pimpled, Calyxes stalked crystalline
- 7383 Leaves stalked cordate ovate, Stems procumbent spreading, Cal. 4-cleft 2-horned
- 7384 Leaves broad lanceolate flattish smooth ciliated distinct, Stem peduncle and ovaries hairy
- 7385 Leaves opp. lanc. acute subciliate, Pedunc. solitary subterminal very long hairy, Sepals lanceolate
- 7386 Lvs. lin.-lanc. ciliated, Stems branched effuse, Pedunc. bractes and cal. shorter than flower woolly villous
- 7387 Leaves lin.-lanc. scarcely spatulate and calyx ciliated, Sepals linear thick or turgid, Pedunc. scabrous
- 7388 Leaves spatulate flat smooth, Pedunc. very long, Cal. flat at base angular
- 7389 Leaves opp. spatulate blunt rough, Pimples oblong, Sepals oblong blunt contracted in middle

and Miscellaneous Particulars.

- M. crystallinum is a popular hothouse annual, which does well in the open air in the summer season.
- M. umbellatum forms one of the handsomest shrubs of the genus, standing without support with a stout

History, Use, Propagation, Culture,

stem, two or three feet high, with terminating white flowers, which open, when the sun shines, from seven or eight in the morning to two or three in the afternoon, and smell like those of the hawthorn. The fruit of *M. edule* is eaten by the Hottentots and Dutch inhabitants of the Cape, and is called Hottentots' figs.

7390 Leaves linear inflexed channelled blunt rough, Pedunc. and calyx jewelled with crystals

- 7391 Leaves pubescent connate not dotted, Stem hairy [of leaves
 7392 Leaves filiform half round distinct, Pimples ovate, Fl. lateral sessile: the terminal surrounded by a pair
 7393 Leaves amplexicaul. distinct linear flat above pimples longer than joints, Fl. stalked
 7394 Leaves alternate roundish obtuse ciliated at base
 7395 Leaves opp. connate half round, Stipules membranous reflexed torn fringe-like
 7396 Leaves half round papulose distinct, Fl. sessile axill. Cal. 4-cleft
 7397 Leaves alternate lanceolate flat not dotted, Stems lax simple, Cal. 5-cornered
 7398 Leaves flattish lanceolate not dotted spreading distinct opp. and altern. remote
 7399 Leaves lanc. acuminate keeled fleshy bluntly 3-cornered channelled, Pedunc. very thick
 7400 Leaves flattish oblong ovate papulose clustered connate, Cal. 3-leaved 2-horned
 7401 Leaves amplexicaul. glaucous distinct obl. lanc. inflexed concave, Sepals ovate obl. longer than cor.
 7402 Leaves lorate long channelled inflexed blunt very glaucous convex beneath, Sepals obtuse as long as cor.
 7403 Lvs. lorate obl. blunt glauc. livid channelled dotted papulose keeled, Stems branched rounded decumbent
 7404 Leaves lorate acuminate green smooth, Stem very short and thick
 7405 Leaves lanc. elliptical crystalline when dead having only the nerves remaining, Stems procumbent

- 7406 Leaves connate ovate papulose, Branches erect clustered
 7407 Leaves lanc. lin. somewhat channelled convex beneath, Fl. solitary terminal [acute
 7408 Lvs. clustered papulose erect somewhat imbricate subul. half round, Fl. ternate cymose, Sepals digitiform
 7409 Leaves half round not dotted recurved distinct close, Cal. terminal finger-shaped
 7410 Lvs. close flexuose recurved very green half round, Sepals finger-shaped, Stems flexuose shining slender
 7411 Leaves acuminate green, Sepals 2 much elongated
 7412 Leaves close linear subulate half round pale green deeply channelled, Sepals acute
 7413 Leaves close flexuose reflex subulate half round glaucous, Sepals equal 3 membranes on each side
- 7414 Leaves distinct roundish pimples, Stem erect, Branchlets 1-flowered
 7415 Leaves opposite amplexicaul. distichous oblong-lanceolate acute bluntly keeled, Pimples minute
 7416 Leaves lanc. linear keeled not dotted distinct, Flowers stalked, Two sepals very long

- 7417 Lvs. subulate half round acute remote, Fl. term. dichotomous, Sepals very unequal, Branches sometimes
 7418 Branches round granular closely dotted [rush-formed
 7419 Leaves very slender 1-sided effuse, Leaves erect linear very fine
 7420 Branches procumbent knotted at the base, Spines of the leaves very long
 7421 Leaves close half round channelled, Stem and branches erect thick
 7422 Leaves lin. round obtuse narrowed at each end, Old stem strumose at base, Branches effuse
 7423 Branches filiform weak long prostrate, Old roots strumose above, Leaves lin. furrowed longer than joints
 7424 Leaves lin. half round with shining pimples, Stems procumbent filiform
 7425 Leaves half round pimples hairy, Cal. hairy, Stem thick, Branches diffuse knotty
 7426 Leaves half round blunt channelled spreading iced, Branches diffuse weak cinereous
 7427 Beautifully pimples all over, Leaves half round, Branches knotty slender, Fl. small dichotomous
 7428 Stems and leaves cylindrical pimples, Branches dichotomous
 7429 Leaves expanded compressed 3-cornered somewhat hoary soft recurved at end mucronate
 7430 Leaves half round somewhat triquetrous glaucous, Fl. 3-chofomous testaceous, Stem erect shrubby
 7431 Leaves subtriquetrous compressed minutely pimples recurved at end, Old root tuberous large
 7432 Leaves remote obsoletely cylindrical glaucous, Fl. 2 ternate cymose, Bark white

- 7433 Leaves remote subcylindrical glaucous exactly half erect, Fl. ternate, Bark cinereous
 7434 Leaves half round, Pedunc. terminal aggregate clavate cymose
 7435 Leaves remote half cylindrical glaucous exactly horizontal, Fl. ternate
 7436 Leaves half cylindrical subul. subacute incurved sparkling, Sepals and petals obtuse, Cor. funnel-shaped
 7437 Leaves half cylindrical obtuse subrecurved much sparkling, Sepals and petals subacute
 7438 Leaves expanded remote blunt compressed subcylindrical, Stems very rough spotted
 7439 Leaves half round narrowed at each end sparkling incurved erect variously bent, Branches filiform
 7440 Leaves distant cylindrical blunt small shining pimples: one of each pair deflexed, Branches hard suberect
 7441 Leaves graniform expanded bluntly 3-cornered papulose shining, Branches hard rough erect
 7442 Leaves cylindrical blunt spreading short, Branches numerous diffuse filiform
 7443 Leaves expanded very short or globose cylindrical, Branches numerous filiform divaricating decumbent
 7444 Leaves cylindrical 3-cornered obtuse with white dots, Calyx 6-cleft
 7445 Leaves cylindr. very blunt and cal. smooth obconical green pimples sparkling, Stamens longer than styles

- 7446 Leaves close cylindrical blunt with crystalline pimples, Cal. turbinate hairy, Stamens length of styles
 7447 Leaves cylindrical incurved crystalline hoary blunt sparkling, Branches long weak procumbent
 7448 Lvs. subcylindr. incur. pimpl. obt. Cal. hemispheric. pimpl. hairy cluster. Branch. numerous spreading

and Miscellaneous Particulars.

Mr. Haworth's arrangement of the genus, which is the only intelligible one, is here followed. Respecting the general culture of the genus, Sweet observes, "the dwarf kinds require but little water, and to be grown in small pots in a very sandy or gravelly soil. The species should be kept quite dry when in a dormant state;

History, Use, Propagation, Culture,

but when growing freely, and at the flowering season, they require a moderate supply of water. The stronger and more woody kinds may be planted in a richer soil; but the poorer the soil is, the dwarfer they will grow, and the more abundantly they will flower; they also require more water than the dwarf kinds, particularly at the flowering season, but need very little in winter. A good dry frame is sufficient to preserve them through the winter, with the covering of mats in frosty weather. Cuttings of any of them strike root readily, planted in pots of earth, and kept dry till they begin to wither; when they may have a little water, and they will root very soon. (*Bot. Cult.* 224.)

1147. *Hymenogyne*. From *ὑμν*, a membrane, and *γυν*, a woman, or, in botanical language, a style, in allusion to the cohesion of the styles into a membranous tube. An artificial division of *Mesembryanthemum*.

1148. *Rosa*. From *rhos*, signifying red in Armenian, whence *ῥόδον*, Greek, and *rosa*, Latin. The rose has been a favorite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species, from one foot to six or eight, and the colors are red, white, yellow, purple, striped; simple, or in almost numberless shades and mixtures; the flowers are single, semi-double, and double. The odour is universally grateful. It is cultivated in every garden, from that of the most humble cottager upwards; some species, as *R. centifolia*, *damascena*, &c. are also cultivated by commercial gardeners on a large scale for distilling rose water, and for making attar, or essential oil of roses. Six pounds of rose leaves will impregnate by distillation a gallon of water strongly with their odor; but a hundred pounds affords scarcely half an ounce of attar. The rose is also used in medicine. Botanists are not agreed as to the number of

and Miscellaneous Particulars.

original species of this genus: some regard all the European species as originated from one source; others, and especially the moderns, divide them into species, subspecies, and varieties. The most scientific work which has appeared in England on roses is the *Rosarum Monographia* of Mr. Lindley, 1819, in which above a hundred species or subspecies are described, and some of them figured; Miss Lawrence has published ninety plates of A Collection of Roses from Nature, 1810. In France, Guillemeau has published *Histoire Naturelle de la Rose*, 1800; and Redouté and Thory are engaged in a splendid work, in folio, entitled *Les Roses*, containing plates of all the known species and varieties of this flower. Thory has published a separate tract on their culture, entitled *Prodrome de la Monographie du Genre Rosier*, &c. 1820; Pronville, a *Nomenclature Raisonnée*, in 1818; and Vibert, *Observations*, &c., in 1820. A copious and intelligent account of the Scotch roses has been given by Mr. Sabine (*Hort. Trans.* iv. 231.), and some hundreds of new varieties have flowered from seedling plants in the Hammersmith nursery, and will soon be found in the sale catalogues.

Species and varieties. The lists of the London and Paris nurserymen contain upwards of 500 names: that of Calvert and Co., Englishmen, who have established a nursery at Bonne Nouvelle near Rouen, enumerates near 900 sorts. The greater part of these have been raised, within the last thirty years, from seed on the continent, where it ripens better than in this country. A number of varieties have also been raised in Britain, especially of the *R. spinosissima*, or Scotch rose, of which above 300 varieties are procurable in the Glasgow nursery. New varieties are raised in France and Italy annually; Villaresi, royal gardener at Monza, has raised upwards of fifty varieties of *Rosa indica*; not one of which has, as far as we know, reached this

country. Some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. The most remarkable only are here arranged under the species to which they are referable.

A modern invention, of Dutch origin, in the culture of roses, is that of forming standards, by budding on stocks of any of the hardy woody growing sorts, as the dog rose, *R. canina*, or the tree rose, *R. villosa*. They are budded at different distances from the ground, according to taste and the purposes in view, and form, after a few years, handsome round heads, which flower freely, and preserve the variety a longer time than in plants raised from cuttings or layers. They are particularly valuable for shrubberies and lawns, where the culture at the root required by dwarf roses could not be given, and if omitted would occasion the degeneracy of the variety.

New varieties of the rose are obtained from seed; but the usual mode of propagation is by layers. All will grow by cuttings, and some, as the sempervirens, freely; but that mode is seldom resorted to. For preserving delicate varieties, the best mode seems decidedly that of budding on hardier sorts.

No species of rose, wild or cultivated, thrives well in or very near large towns, on account of the smoke and confined air. The yellow and Austrian roses (*R. lutea* and *R. bicolor*) are difficult to flower in any situation, but seldom or never blow in the suburbs of London; even the monthly rose does not thrive so well there as at some miles distance in the country. Roses are generally planted in the front of shrubberies, and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn, either with common edgings, or with edgings of wire, in imitation of basket-work. These last are called baskets of roses; the ground enclosed in the basket-margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike roots

into the ground, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells. Under this treatment, the whole surface of the basket becomes, in two or three years, covered with rose-buds and leaves of one or of various sorts. Where one of the larger free-growing sorts is employed, as the moss, or any of the Provence varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colors of their flowers. By mixing small-flowered with large showy sorts, the beauty of the former is lost without adding to the effect of the latter.

In rosaries, commonly, but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctions are better seen. Particular compartments are often devoted to one species, as the Scotch, Chinese, yellow, burnet-leaved, &c. which has an excellent effect; sometimes a piece of rock-work in the centre is covered with the creeping roses, and on other occasions these are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge, standard roses are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds.

Standard roses, however, have certainly the best effect in flower borders, or when completely detached on a lawn: their sameness of form, and that form being compact and lumpish, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity as rose plants, and in their flowers; and, therefore, to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, and here and

there among groups of flowers; or in lines or avenues, along flower walks. In the gardens of the Grand Trianon, they are planted profusely in large masses, like plantations of trees and shrubs, and there much of their individual beauty is lost, and no good general effect produced.

Most species of the rose, in their wild state, grow in sandy and rather poor soil, except such as are natives of woods, where the soil is richer, and comparatively moist. But all the cultivated roses, and especially the double-flowering kinds, require a rich loamy soil, inclining to clay rather than sand; and they require also, like most double flowers, plenty of moisture when in a growing state.

To produce strong flowers, roses require some attention to pruning; old wood should be yearly cut out, and the young shoots thinned and shortened according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw up numerous suckers should be taken up every three or four years, reduced, and replanted; and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil, and replace it by new. The points of the shoots

of the more delicate sorts of roses, are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation, is immediately after the bloom is over; cutting out old exhausted wood, shortening shoots which have flowered to a good bud accompanied with a healthy leaf, but leaving such shoots as are still in a growing state untouched till October. Where very large roses are wanted, all the buds but that on the extreme point of each shoot should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half-rotten stable-dung, or partially rotten leaves.

The earliest flowering rose is the monthly, which, in mild seasons, and planted against a wall, will sometimes flower in the beginning of April; the roses next in succession are the cinnamon, which flowers in May; the damask in the end of May or beginning of June; the blush, York and Lancaster, Provins, and Dutch

History, Use, Propagation, Culture,

hundred-leaved, in June, July, and August. The Virginia and musk roses are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the monthly) is also the latest, and generally continues flowering till interrupted by frost. The earliest sorts may be materially forwarded by being planted against a south wall; and if portable sashes are placed before them, and the wall is either stued and heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The monthly rose being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very

common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots, of every kind, early in spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

The best roses for forcing are the common and moss Provence; the Indian sorts force well, or rather, in stoves, continue in bloom all the year; but the commoner varieties of these not being fragrant, they are in less repute than the European roses. Rose plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots of six or eight inches diameter, in rich loam, and

History, Use, Propagation, Culture,

plunged in an open airy situation; their flower buds pinched off as they appear; and the plants put early into a state of rest, by excluding the sun and rain, but not a free circulation of air.

All the species of roses are very liable to the attacks of insects, especially of the aphides; some, and especially the briar and Scotch rose, are attacked by the *Cynips rosa*, which, by puncturing the bark, occasions the production of rose-galls, and of those mossy tufts often seen on wild roses, which were known formerly under the name of *Bedeguar*, and used in medicine. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvæ of many others, and especially of tipula and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by washing with lime-water or hand picking.

1149. *Rubus*. From the Celtic *rub*, which signifies red. Many of the species are only biennial woody plants, producing suckers or stolones from the roots, which ripen and drop their leaves one year, and resume their

- 7515 Root-shoots climbing, Prickles nearly equal falcate, Leaves evergreen

* Shrubby.

- 7522 Leaves quinate pinnate and ternate green on each side, Stem and petioles prickly, Fl. solitary
 7523 Leaves quinate pinnate and ternate rugose smooth on each side, Stem petioles and pedunc. prickly, Raceme
 7524 Leaves quinate pinnate and ternate white beneath, Leaf. rhomboid lined [terminal
 7525 Leaves three white beneath, Stem prickly, Petioles round
 7526 Lvs. pinnate, Stem round, Leaf. 5-7 obl. plicate serr. white beneath, Pan. cymose, Pet. shorter than calyx
 7527 Branches pet. and ped. downy, Leaf. 3-5 cuneate obovate unequally toothed upwards, Racemes tern. pan.
 7528 Smoothish, Leaf. 10-5-3 lanceolate naked on each side finely serrated, Stem unarmed, Bractes lanceolate
 7529 Leaves 3 naked, Stems and petioles very hispid, Bristles stiff
 7530 Leaves ternate nears naked: the lateral 2-lobed, Stem prickly round
 7531 Stem erect roundish, Prickles many close, Leaf. 5 pubes. beneath, the lateral sessile, Cal. of fl. reflexed
 7532 Stem angular furrowed, Leaf. 5 obtuse shining and even above, hoary beneath, Pan. decomp. hoary

- 7533 Stem with small straight prickles, Leaf. 3 and 5 obl. acum. doubly and finely serr. pubes. beneath, Fl. pan.
 7534 Stems square hoary, Leaf. 3 obov. round. unequally and finely cut-tooth. hoary beneath, Pan. small hoary
 7535 Stem aculeate, Leaf. 3-5 unequal ovate acum. serr. with fine white down beneath, Fl. panicle
 7536 Stem densely prickly and strigose, Leaf. 5 lanc. acum. serrul. smooth, Pedunc. axill. few-flowered
 7537 Lvs. 3-5 cut-serr. downy beneath, Stem petioles and leaves pubes. with recurved prickles, Pan. diffuse
 7538 Stem decum. very prick. Leaf. 3 subcord. ov. doub. acute. cren. smooth prick. beneath, Branches very red
 7539 Differs from R. corylifolius in having the upper shoots and peduncles covered with short hairs
 7540 Differs from the last in having the leaves covered all over beneath with soft hairs
 7541 Unarmed, Branches lvs. beneath and calyxes downy with brown hairs, Lvs. 3-lobed, Fl. sol. on short stalks
 7542 Stem suberect angular prickly smooth, Leaf. 5 cordate ovate cusp. pubes. beneath, Pan. simple
 7543 Stem angl. furrowed, Leaf. 5 orbicular cusp. hoary beneath, Pan. comp. divaricating, Cal. prickly at base
 7544 Stem suberect angular smooth, Leaf. 5 ovate shining pubes. beneath, Panicle prickly
 7545 Leaves 3 obovate downy and soft on each side, Fl. panicle
 7546 Leaves tern. Leaf. roundish ovate acum. mucronate serr. Stem pet. ped. and cal. prickly and glandular

- 7547 Lvs. 5-3 hairy, Leaf. ov. acum. unequally serr. Stem decum. and pet. prickly and gland. Ped. unarm. gland.
 7548 Lvs. 3-5-nate, Leaf. pinn. Stem pet. and ped. with recurved prickles
 7549 Procumbent, Stipules subulate, Lvs. 3-5 digitate, Leaf. ovate obl. smoothish serrate, Pedicels solitary
 7550 Leaves 5 ellipt. acumin. finely serrate villous on each side, Stem and petioles prickly
 7551 Unarmed hispid, Leaf. 3 or pinnate quinate ovate blunt at base white beneath: the odd one cordate
 7552 Lvs. 3-nate smooth unequally serr.: intern. ov.-cuneate at base; lat. rhomb. Stem round proc. and pet. prick.
 7553 Lvs. ternate, Leaf. ovate acute unequally serrate downy beneath, Stem pet. and ped. unarmed
 7554 Leaves simple palmate, Stem unarmed many-leaved many-flowered
 7555 Leaves pinnate about 7 hairy beneath: the upper ternate, Stem ascending with small straight prickles

and Miscellaneous Particulars.

foliage, produce blossom shoots, flower, and fruit, and die the next. The common raspberry and bramble are examples.

R. idaeus is a native fruit, greatly improved by cultivation; it has a grateful subacid taste, and like the strawberry, is one of the few fruits that does not undergo the acetous fermentation in the stomach. There are red and yellow varieties, and one very excellent sort that bears twice a-year, in July and September. The raspberry requires a soft rich moist soil, and if a plant stands singly or a single row is planted by itself, the situation should be gently shaded. Where a plantation is made of several rows together it may be placed in the open garden, as the plants will shade one another to a sufficient degree. Frequent renewal is necessary to prevent the stools getting large and matted when they send up only weak suckers. No more suckers should be left at the stools than are intended to bear the following year, unless young plants are wanted; and if very

History, Use, Propagation, Culture,

large fruit is the object, no suckers should be left at all: on the contrary, when the strongest suckers are wanted, the fruit-bearing shoots should be cut down.

R. occidentalis is a showy plant for large shrubberies. The fruit of *R. cæsius* is blue, edible, and it continues till frost. *R. corylifolius* and *fruticosus* are both common in our hedges; the shoots of the latter are much tougher than those of the former, and are preferred by thatchers for binding their roofs, and by straw-hive and mat makers. The berries, eaten at the moment they are ripe, are cooling and grateful; a little before, they are coarse and astringent; and a little after, disagreeably flavored or putrid. They are sometimes made into pies; but great care is requisite in gathering the fruit, for one berry of the last sort will spoil a whole pie. The double-flowering variety is considered very ornamental.

The fruit of *R. arcticus* and *chamæmorus* is eaten in the north of Scotland and Sweden. In the latter country, Dr. Clarke informs us, it is much prized in soups, sauces, and for making vinegar; and Dr. Clarke was cured of a bilious fever by eating great quantities. The plant is rather difficult to preserve in gardens, but by raising successive generations from the seed it might perhaps be subjected to the same culture as the cranberry. The fruit of *R. pauciflorus*, the Nepal raspberry, is very agreeable.

1150. *Dalibarda.* Denis Dalibard was a French botanist, who published, in 1749, a catalogue of the plants in the neighbourhood of Paris. Small plants, resembling the little species of *Rubus*.

- 7556 Leaves simple cordate somewhat lobed downy beneath, Stem prickly decumbent
 7557 Branches round villous, Lvs. cordate obl. 5-lobed : the middle lobe elongated, Stip. and bracts pectinate
 7558 Leaves 3-5 downy beneath, Stem peduncles and petioles with recurved prickles
 ** *Herbaceous.*
 7559 Leaves tern. naked, Runners creeping herbaceous, Panic. few-flowered
 7560 Leaves tern. naked, Leaf. rhomboid acute cut serrate : the odd one stalked, Flowers about 3
 7561 Stem unarmed 1-flowered, Leaves tern. smooth finely serrate, Pet. obl. entire, Styles approximating
 7562 Leaves ternate, Stem unarmed 1-flowered
 7563 Leaves simple lobed, Stem unarmed 1-flowered
 7564 Leaves simple cordate crenate, Peduncles 1-flowered
 7565 Leaves ternate, Leaf. cuneate serrate-cut, Tube of cal. obconical
 7566 Cal. of fruit reflexed, Pubescence of petioles spreading, of the peduncles appressed
 7567 Leaves simple
 7568 Cal. of fruit erect, Pubescence of pedunc. erect, of petioles much spreading, Leaves downy on each side
 7569 Cal. of fruit reflexed, Pubescence of pedunc. and petioles much spreading
 7570 Large, Leaves broad oval, Pedic. long recurved pendulous, Recept. much excavated globose villous.
 7571 Cal. of fruit spreading, Pubescence of petioles erect, of peduncles appressed, Leaves smoothish above
 7572 Cal. of fruit erect, Pubescence of peduncles and petioles erect, Lvs. smoothish above
 7573 Cal. of fruit erect, Pubescence of peduncles and petioles much spreading, Lvs. villous on each side
 7574 Outer sepals larger than the rest obovate 3-toothed
 7575 Leaves pinn. Petals smaller than calyx
 7576 Leaves tern. Petals larger than calyx

- 7577 Leaves pinnate, Leaf. lin. obl. flat, Petioles long, Branches 1-2-fl.
 7578 Leaves pinnate, Leaf. lin. obl. revolute at edge, Petioles short, Corymbs terminal
 7579 Leaves interruptedly pinnate silky, Leaflets finely serrate, Stem creeping, Pedunc. 1-fl.
 7580 Leaves ternate stalked, Leaf. obovate cut serrate white with down beneath, Sepals ellipt. Pet. orbicordate
 7581 Rad. lvs. quinate cauline tern. Leaf. cuneate obl. serrate, Stipules large adnate entire
 7582 Leaves pinnate white with down beneath, Leaf. serrate, Stem shrubby
 7583 All over silky, Lvs. interruptedly pinn. Fl. dichoto. corymb. Sepals ov. acute, Stem erect nearly simple
 7584 Lvs. interruptedly pinn. with spread. hairs, Leaf. lanc. cut toothed, Stip. cut, Pet. orbord. larger than cal.
 7585 Lvs. bipinnatifid in many pairs downy on each side : segments parallel approximating, Stem decumbent
 7586 Lvs. bipinnatifid in four pairs smooth above downy beneath : segments distant, Stem decumbent
 7587 Leaves pinnate : the outer largest, Runners creeping
 7588 Rad. leaves subpinn. cauline tern. Leaf. lanc. unequally coarsely serrate hairy on each side
 7589 Leaves pinnate alternate, Leaf. 5 ovate crenate, Stem erect
 7590 Leaves pinnate nearly equal, Leaf. oblong subbifid : the outer confluent
 7591 Leaves pinnate, Leaf. roundish toothed equal, Stem erect
 7592 Leaves pinnate upper ternate, Leaf. deeply toothed, Stem erect pubescent
 7593 Leaves pinnate, Leaf. oblong deeply toothed, Stem decumbent dichotomous, Pedun. axill. solitary
 7594 Leaf. 7-5 lanceolate coarsely toothed, Petals orbicordate larger than calyx, Stem erect
 7595 Leaf. 5 cuneiform cut downy beneath, Stem erect
 7596 Radic. leaves 5-nate, Cauline ternate, Stem nearly erect much branched
 7597 Lvs. 5-nate with adpressed hairs : of the branches ternate, Leaf. obl. cuneate deeply toothed, Stem ascend.

and Miscellaneous Particulars.

1151. *Fragaria*. From *fragrans*, in allusion to the perfumed fruit. *Fraisier*, Fr., *Erdbeere*, Ger., and *Tragolo*, Ital. This is a genus of fruit-bearing herbaceous plants, of which there are few in the vegetable kingdom, and none to equal the strawberry in wholesomeness and excellence. This fruit is universally grateful, alone, or with sugar, cream or wine; and has the property, so valuable for acid stomachs, of not undergoing the acetous fermentation. Besides the species or subspecies enumerated, there are upwards of sixty mongrel varieties or different names, some of which, recently produced from seed, are of great excellence. The strawberry is not only a valuable and easily cultivated out-door fruit, but forces well, and with a little trouble in choosing a succession of sorts, they may be had at the dessert every month in the year, though during the three winter months they are without flavor.

In cultivating the strawberry an open situation and rich loamy soil, rather strong, is required for most varieties; and from their large mass of foliage and flowers, they must, till the fruit is set, have copious supplies of water. The row culture is most convenient, and frequent renewal insures vigorous plants and large fruit.

1152. *Comarum*. A name given by the Greeks to the *Arbutus*. The *Comarum* of the moderns produces a fruit not unlike that of the *Arbutus*.

1153. *Potentilla*. In allusion to its supposed *potential* virtues in medicine. These, however, appear to con-

History, Use, Propagation, Culture,

sist of nothing beyond a slight vulnerary quality. *P. fruticosa* and *floribunda* are showy shrubs. *P. anserina* is remarkable for the silvery whiteness of its foliage, which is eaten by geese, as the roots were once by the country people in some places. All the species are pretty, and deserving cultivation.

1154. *Tormentilla*. From *tormina*, the dysentery, which this plant was formerly employed for curing. *T. erecta* was once a plant of some importance in oeconomy and medicine. The roots are still used in most of the Western Isles of Scotland and in the Orkneys for tanning leather, for which they are superior even to oak-bark. They are first boiled in water, and the leather is then steeped in the cold liquor. In the islands of Tirey and Col, the inhabitants have destroyed so much ground by digging them up, that they have been prohibited the use of them. They are also used for dyeing of a red color. And Mr. Young informs us, that many swine are reared with them on the mountains of Killarney.

In the London *Materia Medica* it is employed in intermittents, and as a local application in the form of gargle and lotion, in ulcerations of the tongue and mouth, against spongy gums, and as an application to fetid ill conditioned sores; but it is seldom used. (*London Dispensatory*, 538.)

1155. *Geum*. From *γεωμ*, to taste well. The roots of *G. urbanum* have a mildly astringent aromatic taste, somewhat like that of cloves, whence this plant has the name of *Caryophyllata*. They should be gathered in dry warm situations, for in shady moist places they have little virtue. Gathered in the spring, and put fresh into ale, they give it a pleasant flavor, and prevent its turning sour. Infused in wine, it is esteemed a good

- 7598 Leaf. 5-7 cuneiform cut pilose, Stem erect hairy
 7599 Leaf. 7 sessile seated upon a dilated stipule
 7600 Rad. lvs. 5-7 lin. cuneiform toothed, Petals retuse the length of calyx, Stems filiform decumbent hairy
 7601 Leaves 5-nate obovate toothed pubescent, Pet. obcord. larger than calyx, Stems declinate
 7602 Rad. lvs. 5-nate, Leaf. cuneif. ciliate 5-toothed at end, Caul. 3-nate subsess. Pet. obcord. larger than calyx
 7603 Rad. lvs. 5-nate oblong toothed; upper 3-parted, Cor. larger than calyx, Stem ascending
 7604 Leaves 5-nate with connivent serratures at end, Stems filiform procumbent, Recept. hairy
 7605 Leaves 5-nate with connivent serratures at end, Stems many-fl. decumbent, Recept. hairy, Pet. obovate
 7606 Leaves 5-nate with connivent serratures at end, Stems many-fl. decumbent, Recept. hairy, Pet. roundish
 7607 Leaves 5-nate silky on each side, Leaf. obovate bluntly toothed at end, Pet. length of cal. Recept. woolly
 7608 Leaves subtern. downy with 3 connivent teeth, Stems 1-fl. Recept. woolly
 7609 Leaves 5-nate, Stem creeping, Pedunc. 1-flowered
 7610 Leaves 5-nate obovate coarsely serr. Stip. cut bifid, Pedunc. 1-fl. axill. Stem producing runners
 7611 Rad. lvs. subpinnate: cauline ternate, Leaf. lanc. unequally and coarsely serrated with spreading hairs on
 7612 Leaves ternate, Stem branched erect, Peduncles with a knee at base [each side
 7613 Leaves ternate cut downy beneath, Stem ascending
 7614 Leaves ternate, Stem dichotomous, Pedunc. axillary
 7615 Leaves ternate cuneiform 3-fid at end
 7616 Leaves ternate toothed hairy on both sides, Stem decumbent longer than leaves

- 7617 Stem creeping, Leaves stalked
 7618 Stem nearly erect, Leaves sessile

- 7619 Fl. erect, Awns hooked naked, Caul. lvs. pinn. Leaf. and stipules split, Petals longer than calyx
 7620 Fl. erect, Lvs. pinn. Leaf. nearly equal irregularly cut toothed, Stip. ovate nearly entire, Pet. oval length of
 7621 Fl. erect, Rad. lvs. pinn.: cauline tern. upper simple, Lower stip. cut, Pet. length of calyx [calyx
 7622 Fl. erect, Awns hooked naked, Caul. lvs. tern.: upper lanc. Petals shorter than calyx
 7623 Fl. erect, Awns hooked naked hairy at end, Rad. lvs. lyrate pinnate: terminal pinnate cordate
 7624 Fl. erect, Awns hooked naked, Caul. lvs. tern.: radical lyrate pinnate
 7625 Fl. nodd. Pet. length of cal. Awns hooked naked, Grains hairy, Rad. lvs. lyrate pinn.: cauline ternate
 7626 Fl. nodd. Pet. length of cal. Awns feathery twisted in the middle
 7627 Fl. nodd. Cal. leafy longer than the polypetalous corolla
 7628 Fl. nodd. Pet. longer than cal. Awns hairy twisted at base, Rad. lvs. lyrate pinnate: cauline simple trifid

7629 The only species

- 7630 Leaves oblong downy beneath
 7631 Leaves lanceolate smooth on each side glaucous beneath
 7632 Sepals lanc. Lvs. obl. acute by degrees somewhat rugose smooth and green on each side, Branches very
 [straight and erect

7633 The only species. Fl. small very fragrant pale yellow appearing in the winter

7634 Leaves toothed

and Miscellaneous Particulars.

stomachic; but in water, Haller affirms it to have been attended with bad effects, when given in malignant fevers, producing delirium. Chewed in the mouth, the roots take off from a disagreeable breath.

1156. *Kerria*. So named after Mr. William Ker, a botanical collector, who was sent some years since to China, whence he sent many curious plants. The plant named after him is the common *Corchorus japonica* of the gardens.

1157. *Calycanthus*. From *καλυξ*, and *ανθος*, a flower; the calyx being colored and similar to petals, which are not present in the genus. Small North American shrubs, with chocolate-colored blossoms. The flowers of *C. floridus* have an agreeable scent like those of allspice, and is so called in Carolina.

1158. *Chimonanthus*. From *χιμων*, winter, and *ανθος*, a flower, in allusion to the period of the year when its blossoms are produced. *C. fragrans* is highly odoriferous, and though hardy, deserves a place in the front border of a conservatory, on account of the odor it disperses early in spring.

1159. *Dryas*. A name poetically applied to this little plant, from the resemblance of its leaves to those of the oak, which was sacred to the Dryads. This is a delicate evergreen plant, and with its snow-white blossoms is a great ornament to alpine heights. The stalk and branches are woody and perennial, lying flat upon the ground, and spreading wide about the root in tufts.

It requires some care to preserve it in gardens, and grows better in a shaded bed of peat than in pots.

History, Use, Propagation, Culture,

1160. *Coluria*. From *κολυρος*, deprived of the tail; or, as we usually say in English, bob-tailed. Distinguished by Mr. Brown from *Geum*, principally on account of the deciduous nature of the style or tail of the grains.

CLASS XIII. — POLYANDRIA. STAMENS many, hypogynous, or inserted under the Ovary.

THIS class agrees with the last in having hermaphrodite flowers, with an indefinite number of stamens, which neither cohere in any part of their length, nor are distributed in distinct parcels; but it is distinguished by the stamens being inserted distinctly from the floral envelopes, immediately under the ovary, into what has been called the *receptacle* by Linnæus and his followers; *torus*, by Mr. Salisbury; and *thalamus*, by some other botanists. The class consists of the greater part of several extensive natural orders, such as Ranunculaceæ, Magnoliaceæ, Cistineæ, &c.; and, like the last, is replete with subjects of interest to gardeners and florists. The various kinds of *Clematis* form the most valuable portion of the hardy climbing plants of the verandah. The brilliant varieties of the ranunculus and anemone constitute the most attractive part of the flower garden. *Pæonia*, well known for the richness of its coloring, and the robustness of its constitution, is the ornament of every cottage; and the noble varieties of *Magnolia*, the pride of the North American forest, are the finest exotics of the shrubbery. *Nymphæa* and *Nelumbium* are beautiful genera of aquatic plants. *Annona*, or the custard apple, is one of the most important of the fruit trees of tropical countries; and the celebrated water vine of Sierra Leone is a species of *Tetracera*. Nor must *Sarracenia*, with its curious pitcher-like leaves; *Papaver*, from which opium is extracted; *Cimicifuga*, whence is obtained the antidote to the dangerous bite of the rattle-snake; *Bixa*, or the arnotta tree, from the fruit of which the coloring matter for the red cheese of England is procured; nor *Hepatica*, with its modest beauties, be omitted.

The commencement of M. Decandolle's laborious *Systema Vegetabilium* has included nearly every thing contained in the class, and is followed in the discrimination of the species, as being the best authority which can be taken.

Order 1. MONOGYNIA.

Stamens many, hypogynous. Style 1.

1162. *Capparis*. Cal. 4-leaved, coriaceous, deciduous. Petals 4. Stamens long. Stigma capitate. Berry with a rind, 1-celled, stalked, subglobose, or like a pod.

1163. *Marcgraavia*. Cal. 6-leaved, imbricated. Corolla monopetalous, calyptriformis. Berry many-celled, many-seeded. Style O.

1164. *Actæa*. Cal. 4-leaved, deciduous. Petals 4. Berry 1-celled. Seeds half orbicular.

1165. *Sanguinaria*. Cal. 2-leaved. Petals 8. Pod ovate, 1-celled.

1166. *Podophyllum*. Cal. 3-leaved. Petals 9. Berry 1-celled, crowned with the stigma.

1167. *Cheledonium*. Cal. 2-leaved. Petals 4. Pod 1-celled, linear. Dissepiment O. Seeds several, crested.

1168. *Romeria*. Petals 4. Caps. long, 2-3-4-valved; the valves opening from the vertex to the base. Seeds reniform, scurfy, without a glandular crest.

1169. *Glaucium*. Cal. 2-leaved. Petals 4. Pod 2-celled, linear, 2-3-valved. Seeds several, dotted.

1170. *Papaver*. Cal. 2-leaved. Petals 4. Capsule 1-celled, opening by pores under the persistent stigma.

1171. *Meconopsis*. Petals 4. Style short. Stigmas 4-6, radiating, convex, distinct. Capsule opening with 4-6 valves.

1172. *Argemone*. Cal. 3-leaved. Petals 6. Capsule half valved.

1173. *Sarracenia*. Cal. double, 3-5-leaved. Petals 5. Caps. 5-celled. Style with a clypeate stigma.

1174. *Nymphæa*. Sepals at the base of the discus. Petals and stamens connected with the whole of the discus, which covers the carpella.

1175. *Limncharis*. Sepals 3. Petals 3, very delicate, withering. Plant monocotyledonous.

7635 Stem about 2-flowered, Awns straight naked, Cal. of fruit erect, Lvs. pinnate toothed

7636 Leaves pinnate: the outer leaflet very large round, lower smaller by degrees

7637 Leaves pinnate cut, Runners creeping

and Miscellaneous Particulars.

1161. *Sieversia*. Named by Willdenow, after M. Sievers, a well known Russian botanical collector. Plants resembling *Geum* in habit.

1176. *Nuphar*. Sepals, petals, and stamens inserted at the base of the discus.
 1177. *Euryale*. Sepals, petals, and stamens united with the discus, which covers the carpella.
 1178. *Bixa*. Cal. 5-toothed. Petals 10. Capsule hispid, 2-valved.
 1179. *Prockia*. Cal. 3-leaved, besides two extra leaves at base. Cor. O. Berry 5-angled, many-seeded.
 1180. *Stoanea*. Cal. 1-leaved, 5-9-fid. Cor. O. Anthers united to filaments beneath the end. Caps. echinate, 3-6-celled, 3-6-valved. Seeds 2, with a berried arillus.
 1181. *Apiciba*. Cal. 5-leaved. Petals 5. Caps. echinate, many-celled.
 1182. *Sparmannia*. Cal. 4-leaved. Petals 4. Filaments cohering at base, torulose. Capsule echinate, 5-angled, 5-celled. Cells 2-seeded.
 1183. *Entelea*. Sepals 4-5. Petals 4. Stamens indefinite, uniform. Anthers roundish, incumbent. Stigma denticulate. Caps. roundish, echinate, 6-celled, half 6-valved, many-seeded.
 1184. *Muntingia*. Cal. 5-parted. Petals 5. Berry 5-celled, 1-5-many-seeded.
 1185. *Grewia*. Cal. 5-leaved, coriaceous, colored inside. Petals 5. Scales 5. Ovary usually stalked. Drupe 4-lobed, 4-celled. Nut 1-2-seeded.
 1186. *Tilia*. Cal. 5-parted. Petals 5. Capsule coriaceous, globose, 5-celled, 4-valved, opening at base, 1-seeded.
 1187. *Corchorus*. Cal. 5-leaved, deciduous. Petals 5. Style scarcely any. Stigma 1-3. Capsule pod-shaped, 2-celled, 2-5-valved, many-seeded.
 1188. *Grias*. Cal. 4-cleft. Petals 4. Stigma sessile, cruciate. Drupe with an 8-furrowed nut
 1189. *Calophyllum*. Cal. 4-leaved, colored. Petals 4. Drupe globose.
 1190. *Mammia*. Cal. 2-leaved. Petals 4. Berry very large, 4-seeded.
 1191. *Ochna*. Cal. 5-leaved. Petals 5. Berries 1-seeded, with a large roundish receptacle.
 1192. *Elæocarpus*. Cal. 5-leaved. Petals 5, torn. Anthers 2-valved at end. Drupe with a curly nut.
 1193. *Atangium*. Cal. 6-10-toothed, superior. Petals 6-10, linear. Berry coated, 1-3-seeded.
 1194. *Mentzelia*. Cal. 5-leaved. Petals 5. Capsule inferior, cylindrical, many-seeded.
 1195. *Lagerstromia*. Cal. 6-cleft, campanulate. Petals 6. Stamens many, of which the six outer are thickest. Caps. 4-6-celled, many-seeded.
 1196. *Ægle*. Cal. 1-leaved, 5-lobed. Petals 5, spreading. Style short, thick. Berry coated, turbinate, globose, finally woody, with 12-16 cells.
 1197. *Cistus*. Cal. 5-leaved, with two small leaflets. Petals 5. Caps. 5-celled; the valves bearing the dissepiments in the middle.
 1198. *Helianthemum*. Divisions of the calyx often unequal: the two outer the smallest. Caps. 1-celled, 3-valved, with the dissepiment in the middle of the valves.

Order 2. DI-TRIGYNIA.

Stamens many, hypogynous. Styles 2-3.

1199. *Bauera*. Cal. 7-9-leaved, persistent. Petals 7-9, deciduous. Caps. inflated, 2-celled, many-seeded.
 1200. *Fothergilla*. Cal. truncate, entire. Cor. O. Filaments very long, clavate. Ovary bifid. Caps. 2-celled, 2-horned. Seeds solitary, bony.
 1201. *Curatella*. Cal. 5-leaved. Petals 4. Styles 2. Caps. 2-parted. Cells 2-seeded.
 1202. *Pecunia*. Cal. 5-leaved. Petals 5. Style O. Caps. many-seeded, like a pod.
 1203. *Hibbertia*. Stamens distinct, filiform, equal. Anthers oval, oblong. Ovaries 1-15. Styles filiform, inflexed. Carpella membranous, generally 1-2-seeded.
 1204. *Delphinium*. Cal. O. Petals 5. Nectary bifid, cornute behind. Siliques 3-1.
 1205. *Aconitum*. Cal. O. Petals 5; the upper vaulted. Nectaries 2, hooded, stalked, recurved. Siliques 3-5.
 1206. *Trachytella*. Carpella 1-2, berried, many-seeded; otherwise Tetracera.

Order 3. PENTAGYNIA.

Stamens many, hypogynous. Styles 5.

1207. *Cimicifuga*. Cal. 4-leaved. Cor. with four urceolate nectaries. Caps. 4. Seeds scaly.
 1208. *Aquilegia*. Cal. O. Petals 5. Nectaries 5, horned between the petals. Caps. 5, distinct.

1209. *Nigella*. Cal. O. Petals 5. Nectaries 5, trifold between the corolla.
 1210. *Reaumuria*. Cal. 5-leaved. Petals reflexed, 5. Caps. 5-celled, 5-valved, many-seeded. Seeds woolly.
 1211. *Colbertia*. Ten stamens much longer than the others. Carpella 5, united? Stigma capitate. Seeds several in each cell, reniform, inclosed in a pellucid pulp.
 1212. *Tetracera*. Flowers often dioecious or polygamous. Carpella 3-5, capsular, surrounded by the imbricated sepals. Seeds 1-2, shining, ovate, with an arillus.

Order 4. POLYGYNIA.  Styles many. Stamens many, hypogynous.

1213. *Nelumbium*. Cal. 4-5-leaved. Petals many. Fruit turbinate, in a truncate discus, with several seeded hollows. Nuts ovate, crowned with the persistent style.
 1214. *Dillenia*. Cal. 5-leaved. Petals 5. Capsules many-seeded, connate, replete with pulp.
 1215. *Illicium*. Cal. 6-leaved. Petals 27. Caps. many, placed in a circle, 2-valved, 1-seeded.
 1216. *Liriodendron*. Cal. 3-leaved. Petals 6. Samaras imbricated in a cone. Caps. 1-2-seeded, not opening, 2-tuited.
 1217. *Magnolia*. Cal. 5-leaved. Petals 6-9. Caps. 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous.
 1218. *Michelia*. Cal. 3-leaved. Petals 15. Berries many, 4-seeded.
 1219. *Uvaria*. Cal. 3-leaved. Petals 6. Berries numerous, pendulous, 4-seeded.
 1220. *Annona*. Sepals 3, united at base, concave, cordate, acute. Petals 6, thick; the interior thicker or none. Anthers subsessile, with a dilated angular end. Berry pulpy, many-celled towards the outside.
 1221. *Artobotrys*. Cal. 3-parted. Petals 6. Stamens hypogynous. Ovaries distinct, 2-seeded. Berries 2-seeded. Seeds collateral erect, without arillus.
 1222. *Guatteria*. Sepals 3, united at base, ovate, subcordate, acute. Petals 6, ovate or obovate. Berries dry, coriaceous, ovate or subglobose, stalked, 1-seeded.
 1223. *Asimina*. Cal. 3-parted. Petals 6, spreading, ovate-oblong; the inner smallest. Anthers subsessile. Berries usually 3, sessile. Seeds several.

History, Use, Propagation, Culture,

1162. *Capparis*. From its Arabic name *Kabar*, from which the Greeks made *καππαρις*. *Caprier*, Fr., *Capriolo*, Ital. and *Kapernstrauch*, Ger. This is a genus of low shrubs, some of which produce berries and others pods. *C. spinosa* has the habit of the common bramble; it grows in similar situations in the south of Europe, and especially on rocks and ruins. The chief supply of caper buds is from Sicily; but the plant is cultivated in the neighbourhood of Toulon in orchards, in the intervals between fig and olive trees, and in the neighbourhood of Paris, where it is trained on low walls, and the shoots during winter laid down and covered with soil to protect them from the frost. In this country it is generally treated as a stove plant; though it has stood the winter in the open air in some situations, and by raising from the seed for several generations might probably be naturalized. A plant stood near a century against the wall of the garden of Camden House, Kensington; it produced many flowers annually, though the young shoots were frequently killed to the stump during winter.

As a pickle, the flower buds of the caper are in great esteem throughout Europe. In Italy, the unripe fruit is prepared in the same way as the flower buds; both are highly acrid and burning to the taste. In the isles of the Mediterranean, and near Toulon, the flower buds of the caper are gathered just before they begin to expand, which forms a daily occupation during six months, when the plants are in a flowering state. As the buds are gathered they are thrown into a cask among as much salt and vinegar as is sufficient to cover

1224. *Xylopia*. Cal. 3-5-lobed. Petals 6; the exterior largest. Stamens usually inserted in a globose receptacle. Berries 2-15, on short stalks, compressed, frequently dry and opening. Seeds shining.
1225. *Hepatica*. Invol. 3-leaved, 1-flowered, resembling a calyx, entire. Sepals petaloid, 6-9, arranged in 2 or 3 rows. Ovaries many. Grains without an awn.
1226. *Anemone*. Invol. 3-leaved, distant from the flower, cut. Sepals 5-15, petaloid. Petals O.
1227. *Clematis*. Invol. O, or like a calyx under the flower. Sepals 4-8, colored. Petals O, or shorter than the sepals. Grains terminating in a feathery awn.
1228. *Naravelia*. Petals 6-12, longer than calyx. Grains seated on a thick hollow stalk.
1229. *Thalictrum*. Invol. O. Petals O. Grains dry, not awned, sometimes stalked, sometimes with a longitudinal furrow.
1230. *Adonis*. Sepals 5, appressed. Petals 5-15, with a naked claw. Grains many, 1-seeded, spiked, ovate, pointed with the persistent hardened style.
1231. *Knouttonia*. Sepals 5. Petals 5-15, with a naked claw. Ovaries upon a globose receptacle. Grains 1-seeded, berried, with a deciduous style.
1232. *Picaria*. Sepals 3, deciduous. Petals 9, with a honey-pore at base. Grains obtuse.
1233. *Ranunculus*. Sepals 5, not deciduous. Petals 5, rarely 10, with a honey-scale at base. Grains pointed.
1234. *Trollius*. Sepals colored, 5-10-15, deciduous, petaloid. Capsules many, subcylindrical, many-seeded.
1235. *Isopyrum*. Sepals 5, deciduous. Petals 5, equal, tubular, 2-lipped. Ovaries 2-20. Capsules compressed, membranous, many-seeded. Seeds minute, dotted.
1236. *Eranthis*. Involucre under the flower, cut into many divisions. Sepals 5-8, colored, oblong, deciduous. Petals 6-8, tubular. Capsules stalked. Seeds globose.
1237. *Helleborus*. Sepals 5, persistent, roundish, obtuse, large, usually green. Petals 8-10, tubular, nectariferous. Stigmas orbicular. Capsules coriaceous.
1238. *Coptis*. Sepals 5-6, colored, petaloid, deciduous. Petals small, cucullate. Stamens 20-25. Caps. 6-10, on long stalks, membranous, 4-6-seeded.
1239. *Caltha*. Sepals 5, colored, round. Petals O. Stamens many. Capsule spreading, 1-celled, many-seeded.
1240. *Hydropeltis*. Sepals 3-4. Petals 3-4. Ovaries 6-18. Seeds in a pendulous ovate globose capsule.
1241. *Hydrastis*. Sepals 3, ovate. Petals O. Cariopsides berried, many in a head, terminated by the style, 1-celled, 1-2-seeded.

7648 Leaves ovate-oblong acuminate veiny

and Miscellaneous Particulars.

them, and as the supply of capers is increased more vinegar is added. When the caper season closes, the casks are emptied, and the buds sorted according to their size and color, the smallest and greenest being reckoned the best, and put into small casks of fresh vinegar for commerce. They will in this state keep fit for use for five or six years. It is said to be a common practice to put filings of copper in the first pickle to save vinegar, and give the buds a green color. The best capers are called nonpareilles, and the second best capucines. (*N. Cours complet d'Agr.*; art. *Caprier*.)

Most of the species are very showy when in flower: *C. cynophallophora* has large petals, and stamens upwards of four inches long. Ripe cuttings of all the species grow readily in sand.

1163. *Marcgraavia*. In memory of George Marcgraaf, of Leibstadt, author of a voyage to Brazil in 1648. A sub-parasitical creeping shrub: at first it is radicate like some ferns, but as it advances, the stem becomes shrubby, adhering still by its fibres to the trunk of some tree, to the top of which it frequently runs, at length dividing into several subdivided loose pendulous branches, commonly terminated by flowering umbels. It is frequent in the cool wooded mountains of Jamaica, and, according to Browne, appears in such various forms, that it has been mistaken for different plants in the different stages of its growth. It grows freely in British stoves, and cuttings root in sand under a glass. The genus is remarkable for the transformation of part of the bracteae into fistular bodies, resembling the pitchers of some other plants.

History, Use, Propagation, Culture,

1164. *Actæa*. *Άκρη* was the Greek name of the elder, which this plant resembles in foliage and fruit. Weed-like plants seldom seen in gardens. The berries of *A. spicata* are poisonous, and with alum yield a black dye. The tubers of *A. racemosa* are called snake root, and much used in North America by self-practitioners, and as an antidote against poison and the bite of the rattlesnake.

1165. *Sanguinaria*. From *sanguis*, blood. All parts of the plant on being wounded discharge a blood-colored fluid. This is a singular and very delicate looking plant. It has a tuberous fleshy root with red fibres and a reddish juice: from each bud of the root there springs only a single fig-like glaucous leaf, with a one-flowered scape; the flower has no smell, and is very fugacious. It abounds in the woods of Canada, and in the back settlements, where the Indians stain themselves with its red juice.

1166. *Podophyllum*. From *πους* *ποδος*, a foot, and *φυλλον*, a leaf; in allusion to the long firm stalk on which the leaves are placed. Low neat herbaceous plants, with white flowers hidden by the overshadowing broad leaves.

1167. *Chelidonium*. From *χελιδων*, the swallow, because it was thought to flower with the arrival of that bird, and to perish with its departure. The English word celandine appears to be a corruption of chelidonium. The juice of *C. majus* is of an orange color and very acrimonious. It cures tetters and ringworms. Diluted with milk it consumes white opake spots on the eyes. It destroys warts, and cures the itch. There is no doubt but a medicine of such activity will one day be converted to more important purposes. (*Withering.*) The root, according to Loureiro, is extremely bitter, and greatly esteemed among the natives of Cochín-China, for a variety of uses in medicine.

1168. *Römeria*. Named after J. J. Römer, professor of botany at Landshut, and the collaborator of Schultz in an edition of the Species Plantarum of Willdenow. He died in 1820. A genus intermediate between *Chelidonium*, *Glaucium*, and *Papaver*.

1169. *Glaucium*. All the parts of the species appear covered with a glaucous bloom. Handsome sea-coast plants. *G. luteum* has large and numerous flowers, which, although of short duration, succeed one another in great abundance during most part of the summer, make a fine contrast with the sea-green dew-bespangled leaves, and are a great ornament to our sandy shores. The whole plant abounds in a yellow juice, is fetid, and of a poisonous quality, and said to occasion madness.

1170. *Papaver*. Said by De Theis to have been so called from the Celtic *papa*, which signifies *pop*, or the soft food given to children, in which the seeds were formerly boiled to make the infants sleep. Opium is derived from *opos*, juice; it is supposed to have been the Nephenthes of Homer. *Rheas*, the name of one of the species, is from *ρῆα*, to flow or fall, in allusion to the quickly perishable nature of the flowers. The poppy produces a great quantity of seeds, for which reason Cybele, the mother of the gods, is represented crowned with poppy-heads as a symbol of fecundity.

The species of this genus are all shewy, with large, brilliant, but fugacious flowers. They are all easy of culture in almost any soil; and one species affords that singular medicine opium. *P. Rheas* is one of the commonest weeds among corn on gravelly soils; but in its double and semidouble variegated varieties, it is also one of the handsomest of garden annuals. The capsules, as in *P. somniferum*, contain a milky juice of a narcotic quality: an extract from them has been successfully employed as a sedative; and some foreign practitioners are said to prefer this extract to opium.

P. somniferum, although it is found growing wild in the southern parts of Europe, and even in England, yet there is every reason for thinking that its seed must have been carried to these parts from Asia. It was very early cultivated in Greece, perhaps at first solely for the sake of its seed, which was used as food. It is extensively cultivated in most of the states of Europe in the present age, not only on account of the opium,

- 7649 Berries roundish, Petals length of stamens, Raceme ovate, Leaves 2-3 ternate
 7650 Berries ovate-oblong, Petals shorter than stamens, Raceme ovate, Leaves bi-trinervate

and Miscellaneous Particulars.

for which it is reared in Turkey, Persia, and India, but also on account of the capsules, and of the bland oil obtained from the seeds. All the parts of the poppy contain a white, opaque, narcotic juice; but it abounds more in the capsules: hence these are the only officinal parts of the plant, and for them chiefly is the plant cultivated in this country. They are gathered as they ripen; and as this happens at different times, there are annually three or four gatherings. They are brought to market in bags, each containing about 3000 capsules, and sold to the druggists. The London market is chiefly supplied from Mitcham in Surrey.

The milky juice of the poppy, in its more perfect state, which is the case in warm climates only, is extracted by incisions made in the capsules, and inspissated; and in this state forms the opium of commerce. The mode of obtaining it appears to have been nearly the same in the time of Dioscorides as is at this day adopted. The plants, during their growth, are carefully watered and manured, the watering being more profuse as the period of flowering approaches, and until the capsules are half grown, when it is discontinued, and the collection of the opium commences. At sunset, longitudinal incisions are made upon each half-ripe capsule, passing from below upwards, and not penetrating to the internal cavity. The night dews favor the exudation of the juice, which is collected in the morning by women and children, who scrape it from off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by wooden spatules in the sunshine, until it attains a considerable degree of thickness. It is then formed by the hand into cakes, which are laid in earthen basins to be further exsiccated, when it is covered over with poppy or tobacco leaves. Such is the mode followed in India, and according to Kamper's account, nearly the same is practised in Persia; and when the juice is drawn in a similar manner in this country and inspissated, it has all the characters of pure opium.

Opium is brought to this country in chests from Turkey and India. The Turkey opium is in flat pieces, covered with leaves. East Indian opium is in round masses, covered with the petals of the poppy in successive layers, to the thickness nearly of one-fourth of an inch. Mr. Kerr relates, that at Balar, it is frequently adulterated with cow-dung, the extract of the poppy procured by boiling, and various other substances. In Malava it is mixed with oil of sesamum, which is often one half of the mass; ashes and the dried leaves of the plant are also used. It is also adulterated with the aqueous extract of the capsules, the extracts of *Chelidonium glaucum*, *Lactuca virosa*, and *Glycyrrhiza glabra*, and sometimes with gum arabic, tragacanth, aloes, and many other articles.

Poppy heads or capsules possess anodyne properties; they are chiefly employed, boiled in water, as fomentations to inflamed and ulcerated surfaces; and a syrup, prepared with the inspissated decoction, is used as an anodyne for children, and to allay the tickling cough in chronic catarrh and phthisis.

Opium operates as a powerful and very diffusible stimulus, but its primary operation is followed by narcotic and sedative effects in a degree much greater than could be expected from the previous excitement it induces. It acts directly on the nervous system, and when taken into the stomach destroys irritability, and allays pain in the most distant parts of the body, independent of the circulation, and without inducing any change on the composition of the blood. As the principle, therefore, on which opium acts is the same over all the body, the topical application of it is capable of producing similar effects, only in a diminished degree, to those resulting from it when it is taken into the stomach.

In moderate doses, opium increases the fulness, the force, and the frequency of the pulse, augments the heat of the body, quickens respiration, and invigorates both the corporeal and mental functions, exhilarating even to intoxication; but by degrees these effects are succeeded by languour, lassitude, and sleep; and in many instances headach, sickness, thirst, tremors, and other symptoms of debility such as follow the excessive use

History, Use, Propagation, Culture,

of ardent spirits, supervene. In very large doses the primary excitement is scarcely apparent, but the pulse seems to be at once diminished, drowsiness and stupor immediately come on, and are followed by delirium, sighing, deep and stertorous breathing, cold sweats, convulsions, apoplexy, and death. The appearances on dissection are those which indicate the previous existence of violent inflammation of the stomach and bowels; but notwithstanding the symptoms of apoplexy which an overdose, when it proves fatal, occasions, no particular appearance of an inflammatory state or fullness of the vessels of the brain are perceived.

The Turks call opium *afioni*; and in the *teriakhana*, or opium shops of Constantinople, they take it in graduated doses from ten grains to one hundred grains in a day. It is mixed with rich syrup and the inspissated juices of fruit, to render it more palatable and less intoxicating; and is taken with a spoon, or made up into small lozenges stamped with the words, Mash Allah, literally, "The work of God." The Tartar couriers, who travel great distances, and with astonishing rapidity, take nothing else to support them during their journeys. (*Dallaway's Constantinople*, quarto, 78.) There is, however, some reason for supposing that the Mash Allah, or Maslach of the Turks, contains other narcotics, as those of hemp and of lolium, as well as opium.

The use of opium for the purpose of exhilarating the spirits has long been known in Turkey, Syria, and China; and of late years it has been unfortunately adopted by many, particularly females, in this country. Russell says, that in Syria, when combined with spices and aromatics, he has known it taken to the amount of three drachms in twenty-four hours. Its habitual use cannot be too much reprobated. It impairs the digestive organs, consequently the vigour of the whole body, and destroys also gradually the mental energies. The effects of opium on those addicted to its use, says Russell, are at first obstinate costiveness, succeeded by diarrhoea and flatulence, with the loss of appetite and a sottish appearance. The memories of those who take it soon fail, they become prematurely old, and then sink into the grave, objects of scorn and pity. Mustapha Shatoor, an opium eater in Smyrna, took daily three drachms of crude opium. The visible effects at the time, were the sparkling of his eyes, and great exhilaration of spirits. He found the desire of increasing his dose growing upon him. He seemed twenty years older than he really was; his complexion was very sallow, his legs small, his gums eaten away, and the teeth laid bare to the sockets. He could not rise without first swallowing half a drachm of opium. (*Phil. Trans.* xix. 289.)

When opium has been taken in an overdose, the first thing to be done for counteracting its bad effect, is the exhibition of a powerful emetic; and for this purpose sulphate of zinc, or sulphate of copper dissolved in water, should be immediately swallowed, and the vomiting kept up for a considerable time, and urged by irritation of the fauces. Large draughts of vinegar and water, or other acidulated fluids, should afterwards be frequently taken; and the powers of the habit supported by brandy, coffee, and cordials. The sufferer should be kept awake, and, if possible, in continued gentle motion. Currie recommends the affusion of warm water at 106 degrees or 108 degrees for removing the drowsiness. (*London Dispensatory*, 426.)

Medical men have of late sought to discover the sedative principle of opium, and have found it in the extractive, from which a crystallized salt called morphia is obtained. Some foreign physicians, and Mr.

and Miscellaneous Particulars.

Thomson, the author of *The London Dispensatory*, have found that a quarter of a grain of the acetate of morphia produces the most beneficial effects that can be expected from an anodyne, allaying pain, and procuring sleep without in any degree affecting the central functions. (*London Dispensatory*, 420.)

A variety of *P. somniferum*, known as the black poppy, from the color of its seeds, is cultivated for these to some extent; they are called maw seed, and generally stained of a light blue color.

P. Rhœas (*willotte*, Fr.) and also *somniferum* are cultivated in Flanders and Germany for their seeds, which are bruised for an oil used in cookery as a substitute for that of olives. In Poland and some parts of Russia, the seeds are used as a seasoning to soups, gruels, and porridge.

Professor Martyn, in his edition of *Miller's Dictionary*, has collected a body of facts, which clearly prove that opium may be produced to any extent in Britain, and of equal quality to that procured from abroad; the value of labor in this country, however, does not admit of such a thing. We have seen samples of opium made in the south of England quite equal to that of foreign growth, but we understood that the labor of collecting it was greater than could be afforded for its market price.

P. cambricum is admired for its yellow petals, and orientale and bracteatum are very splendid plants.

1171. *Meconopsis*. From *μικρον*, a poppy, and *opsis*, resemblance. A genus of herbaceous shade-loving plants, just intermediate between *Papaver* and *Argemone*. The flowers are yellow.

1172. *Argemone*. From *argema*, the name by which the cataract of the eye was known, and which was thought to be cured by this plant. *A. mexicana* is a troublesome weed in the West Indies, with a fig-like fruit, armed with prickles, and thence, by the Spaniards, called *Figo del inferno*. The whole plant abounds with a milky glutinous juice, which turns in the air to a fine bright yellow, and when reduced to consistence is not distinguishable from gamboge. In very small doses it is probably of equal efficacy, given in dropsies, jaundice, and cutaneous eruptions. It is esteemed very detersive, and generally used in diseases of the eyes; but the infusion is looked upon as a sudorific and resolutive, which may be used with success on many occasions. The seeds are said to be a much stronger narcotic than opium.

1173. *Sarracenia*. So named by Tournefort in honor of Dr. Sarrazin, a French physician of rank residing in Quebec, who sent this genus to him from Canada: it is called side-saddle flower from the resemblance of the stigma to a woman's pillion. These plants are remarkable for the singular form of the leaves, which are tubular and hold water, and some species have lids or covers, which it is alleged shrink and close over the mouth of the tube in dry weather, so as to prevent the exhalation of the water. In great drought birds and other animals resort to them. They grow in bogs in Carolina and Virginia, and in British gardens thrive very well in pots with turfy peat at the bottom, and the upper part filled with sphagnum, or water-moss, in which the plants must be set, and then placed in pans of water; they succeed best in frames in a shady situation. (*Bot. Cult.* 417.)

1174. *Nymphaea*. The *Nymph*, or Naiad of the streams. The species are beautiful aquatics, especially *N. alba*, which has a large flower filled with petals, so as almost to appear double: it raises itself out of the water and expands about seven o'clock in the morning, and closes again, reposing upon the surface, about

History, Use, Propagation, Culture,

four in the afternoon. The roots have an astringent bitter taste; they are used in Ireland, in the Highlands of Scotland, in the island of Jura, &c. to dye a dark brown or chestnut color. Swine are said to eat it, goats not to be fond of it, kine and horses to refuse it. The flowers, the herb, and the root were formerly used in medicine, but are all now obsolete.

N. lotus resembles our common white species very much in the form of the flower and leaves, but the latter are toothed about the edge. It is native of the hot parts of the East Indies, Africa, and America. It is very common in ponds, lakes, and rivers in Jamaica; and grows in vast quantities in the plains of Lower Egypt near Cairo, during the time they are under water. It flowers there about the middle of September, and ripens towards the end of October. The Arabians call it Nuphar. The ancient Egyptians made a bread of the seed of the Lotus dried and ground.

All the species grow well in large pots of water with a few inches of rich soil at the bottom: they are propagated by dividing the root, and some sorts which produce bulbs are increased by offsets from these. Mr. Kent, of Clapton, who cultivated exotic aquatics to great perfection, found that the bulbous rooted Nymphaeas, if checked in their growth for want of water, from cold, or excessive heat, were apt to form bulbs at the roots and cease growing for the season. Hence the necessity of a regular and powerful moist heat to make them flower freely.

1175. *Limnocharis*. From *λῆμος*, a marsh, and *χαεῖς*, dear, so called because the species are marsh plants. They have beautiful umbels of yellow flowers, and are very easily cultivated in a stove. They are increased by seeds.

1176. *Nuphar*. The Arabic name is *naufar*, according to Forskahl. The species are showy plants closely resembling *Nymphaea*. *N. lutea* is a native of most parts of Europe, and also of America. Linnaeus states, that swine are fond both of the leaves and root; that goats are not fond of it; and that kine, sheep, and horses refuse it: also that crickets are driven out of houses by the smoke in burning it, and that both they and cock-roaches are destroyed by the roots rubbed or bruised with milk. Ray observes, that the flowers smell like brandy.

1177. *Euryale*. From *ευρυαλος*, broad, in allusion to the enormous broad floating leaves of the plant. A noble aquatic, easily cultivated in a good stove.

1178. *Bixa*. The American name of the tree. The drug called Terra Orellana, or Orleansa, Roucon or Arnotto, is prepared from the red pulp which covers the seeds of this plant. By maceration in hot water, the seeds are separated from the pulp, the latter is then made into balls or cakes, which when dry are fit for use. Arnotto of a good quality is of the color of fire, bright within, soft to the touch, and dissolves entirely in water. It is reputed to be cooling and cordial, and is much used by the Spaniards in their chocolate and soups, both to heighten the flavor and to give them an agreeable color. It is esteemed good in bloody fluxes

7684 Leaves peltate at the edge and within the fissure sinuate toothed blistered smooth on each side [end
 7685 Leaves peltate nearly entire not dotted smooth on each side 2-lobed at base, Anthers with appendages at
 7686 Leaves cordate entire, Lobes divaricating acute, Calyx acute 4-leaved longer than the acute petals

7701 The only species

7702 Leaves serrated oblong oblique

and Miscellaneous Particulars.

and disorders of the kidneys. Mixed with lemon-juice and a gum, it makes the crimson paint with which the Indians adorn their persons. It was formerly used by dyers to form the color called aurora; but at present it is not held in much estimation as a dye, though it still maintains its ground with painters. Arnotto is well known to be the drug which is used for dyeing cheese in Gloucestershire, under the name of cheese-coloring. It is used in Holland for coloring their butter. The bark makes good ropes for the common plantation uses in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction.

1179. *Prockia*. A name of unknown meaning. American or Isle of France plants with alternate entire or toothed leaves, and yellow flowers, which are occasionally unisexual.

1180. *Sloanea*. Named by Plumier, in memory of the famous Sir Hans Sloane, Bart., physician to the king, and president to the Royal Society; author of the Natural History of Jamaica, and founder of Chelsea garden and hospital. The leaves are like those of the chesnut; the flowers very large, and the fruit as big as a tennis ball, armed all over with strong spines, and divided regularly into four cells, each containing one small chesnut. It grows freely in our stoves, and ripened cuttings root in sand under a hand-glass.

1181. *Apeiba*. The vernacular name of the plant in Guiana. Tibourbou and Petoumo are vernacular names among the Caribs. The species grow freely in light loamy soil. Cuttings must be well ripened, and the glass they are put under should have a little air given it occasionally, or they will damp off. The best way of flowering it, is to cut a ring round the bark of a large branch, which stagnates it and throws it into flower. (*Bot. Cult.* 20.)

1182. *Sparmannia*. In memory of Anders or Andrew Sparman, a Swede, fellow of the Academy of Sciences at Stockholm, who travelled into China, the Cape of Good Hope, and the islands of the South Sea. His travels were published in London, 1785, quarto, and there are many descriptions by him in the Philosophical and other transactions. It is a beautiful shrub with snowy white petals, and singular nectaries. It grows freely in loam and peat, and cuttings root in sand under a hand-glass.

1183. *Entelea*. From $\epsilon\nu\tau\epsilon\lambda\eta\varsigma$, perfect. So named by Mr. Brown, because all its filaments are fertile; by which character, among others, it is distinguished from *Sparmannia*. A fine New Zealand plant, discovered originally by the botanists with Sir Joseph Banks in Cook's second voyage.

1184. *Muntingia*. Named by Plumier, after Abraham Munting, professor of botany at Groeningen, died in 1682. *Calabura* is an American name. The flowers resemble those of the bramble, and the fruit cherries. It grows in Jamaica on calcareous subalpine hills, flowering in spring; and in St. Domingo in the wet parts of woods, flowering in August and September. In our stoves it grows freely in light loam, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture.

1185. *Grewia*. So named by Linnæus, in honor of Nehemiah Grew, M. D, F. R. S., famous for his work on the Anatomy of Vegetables. The species are shrubs with elm-looking leaves, generally deciduous, and of no great beauty. Cuttings root in sand under a hand-glass in heat. Some of the kinds produce a sort of berry which is esteemed by the natives of the country where they grow.

1186. *Tilia*. A name the meaning of which is unexplained. *Tilleul*, Fr., *Linden*, Ger., and *Tiglio*, Ital. The species are graceful trees with highly odoriferous flowers, all the soft parts abounding in mucilage.

T. intermedia is wild in Sweden, and will in some degree bear the smoke of London. It is a favorite avenue tree in Holland and Germany, and at Evelyn's suggestions (*Sylva*) was a good deal employed in this way in England. He describes some enormous lime trees in Switzerland, Germany, and Hungary, and speaks of its esteem in these countries, and by the Romans. "It is a shameful negligence," he says, "that we are no better provided of nurseries, for a tree so choice and universally acceptable;" for in his time they sent into Holland and Flanders, to our excessive cost, whilst our own woods spontaneously produce them, and though of somewhat a smaller leaf, yet altogether as good, apt to be civilized, and made more florid.

Lime-tree wood is turned into light bowls and dishes, and into boxes for the apothecaries. With the twigs they make baskets and cradles. Formerly the bark was used for writing tablets. Shoemakers make dressers of the plank to cut leather on. The truncheons make a far better coal for gunpowder than that of alder itself, and also scribbles for painters' first draughts. The wood is soft, light, and smooth, close grained, and not subject to the worm. The most elegant use to which it is applied is for carving. Many of Gibbon's beautiful works in lime-tree are dispersed about the kingdom in our churches and palaces; as in the choir of St. Paul's, the Duke of Devonshire's at Chatsworth, Trinity College Library at Cambridge, &c. Evelyn first recommended him to King Charles II. The sap inspissated affords a quantity of sugar. Butcher remarks, that the timber is stronger and lighter than any sort of willow; and makes a proper lining for rooms, and when painted will last long.

In Lincolnshire, in the forest of Dean, and in various parts of the borders of South Wales they make ropes of the bark. This, by maceration, separates into thin rough layers, and is used for making the mats used by gardeners, and called in the north of Europe bast. They form a considerable part of the exports from Russia. This quality in the bark, and a great degree of viscidty in the whole tree, evince its acknowledged affinity to the mallow tribe.

- 7703 Leaves lanc. ovate soft, Cal. very hairy, Pedunc. 3-flowered
 7704 Leaves cordate ovate oblong crenated scabrous, Pedic. axillary 3-flowered, Fruit of 4 pieces
 7705 Leaves ovate obl. acum. smooth nearly entire, Fl. terminal paniced

 7716 Lvs. trunc. at base subcord. oblique dent, serr. pubescent beneath, Pet. emarginate, Fruit globose smooth
 β Leaves thin deeply and rarely cut
 7717 Lvs. cord. subacum. unequal at base serrated snow-white beneath smooth above, Fruit round with 5 ribs
 7718 Lvs. ov. downy beneath, at base either cordate or obliquely or equally truncate, Fruit round with 5 ribs

- 7719 Caps. obl. ventricose, Lowest serratures of leaves setaceous
 7720 Caps. 3-celled 3-valved 3-cornered, Angles bifid scabrous, Leaves obl. Lowest serratures setaceous
 7721 Caps. obl. 3-celled 3-valved 6-furrowed 6-pointed, Leaves cordate, Lowest serratures setaceous
 7722 Caps. prismatical cuneate acutangular 3-toothed, Lvs. ovate with about 1 seta at the base, Petioles hispid
 7723 Caps. roundish depressed rugose, Lowest serratures of leaves setaceous
 7724 Caps. roundish woolly, Leaves ovate obtuse downy equally serrated
 7725 Caps. linear compressed 2-valved, Leaves lanceolate equally serrate

- 7726 Leaves 3 feet long obovate, Flowers growing out of the stem and old branches

- 7727 Leaves oval
 7728 Leaves ovate obtuse

- 7729 Leaves very blunt striated, Peduncles short, Berries 4-seeded

and *Miscellaneous Particulars.*

The honey made from the flowers of the lime tree is reckoned the finest in the world. Near Kowno in Lithuania, there are large forests chiefly of this tree, and probably a distinct variety or species. The honey produced in these forests sells at more than double the price of any other, and is used exclusively in medicine and for mixing with liqueurs. (*Encyc. of Agric. ; Poland and Hungary.*)

1187. *Corchorus*. Κορχορος, the Greek name of a culinary vegetable, supposed to be the same as that now known as *C. olitorius*. *C. olitorius* is sown in great plenty about Aleppo as a pot herb, the Jews boiling the leaves to eat with their meat, whence in French it is called *Mauve-de-Julf*. The other species are weeds.

1188. *Grias*. From γρια, to eat. The fruit is eaten in the West Indies under the name of the Anchovy pear. The uprightness of the growth and the largeness of the leaves give this tree a very elegant appearance. The fruit is about the size of an alligator's egg, and much like it in shape, only a little more acute at one end, and of a brown russet color. It is frequent in many parts of Jamaica, and grows generally in low moist bottoms or shallow water, where the fruit is pickled and eaten in the same manner with the East Indian mango, which it exactly resembles in taste. It grows in a loamy soil, and large cuttings, Sweet observes, succeed best in the same soil under a hand-glass in heat.

1189. *Calophyllum*. From καλος, beautiful, and φυλλον, a leaf, on account of its large beautifully veined leaves. *C. Inophyllum* (*is ivos*, fibre, because the middle nerve of the leaf seems to ramify into a multitude of fibres) is a very large tree, with leaves like a water lily, snow-white fragrant flowers, and fruit like a walnut. The trunk when wounded exudes a viscid yellowish juice, frequently hardening to a gum. It is common in Malabar, in sandy soils, and bears fruit twice a year, in March and September, frequently to the age of three hundred years. An oil is expressed from the nuts to burn in lamps, to assuage pains, and to make ointments. The bark and gum is also used for medical purposes. In Java, &c. they plant this tree about their houses, for the elegance of the shade and the sweetness of the flowers.

C. Calaba (the name among the Caribs) branches from the ground upwards, and is therefore well adapted for tree hedges. It has a green fruit not unlike our cornelian cherry, which is eaten by the natives, and an oil is expressed from it for lamps. Both species grow freely in a light loamy soil, and ripe cuttings are readily struck in sand under a glass and plunged in heat. (*Sweet.*)

1190. *Mammea*. An alteration of its American name, *Mamey*. The name having some resemblance to the Latin word *mamma*, a teat, Linnaeus attributed the derivation to that word, on account of the large fleshy pointed nature of its fruit. *Abricot-sauvage*, Fr. A handsome tree with a spreading elegant head, like those

History, Use, Propagation, Culture.

of *Magnolia grandiflora*, and odoriferous white flowers on peduncles. The fruit is roundish, with a leathery rind, inclosing one thinner, containing a firm bright yellow pulp, having a pleasant singular taste, and a sweet aromatic smell; but the skin and seeds are very bitter and resinous. It is eaten raw alone, or cut in slices with wine or sugar, or preserved in sugar. In Martinico they distil the flowers with spirit, and make a liquor which they call Eau créole.

Some horticulturists are now attempting its culture in our stoves as a fruit tree. It grows freely in sandy loam, and ripened cuttings, with the leaves not shortened, root in sand under a hand-glass in heat. (*Sweet.*)

1191. *Ochna*. The Greek name of the wild pear tree, to which the genus so distinguished by Linnaeus has no kind of resemblance. The species are pretty free-flowering plants, with shining serrated leaves, and long racemes of beautiful yellow flowers. They grow freely in loam and peat, and cuttings root readily in sand under a hand-glass.

1192. *Elæocarpus*. From *ελαιον*, the olive, and *καρπος*, fruit, in allusion to the shape of its fruit. The stones cleaned from the pulp, and set in gold, are formed into necklaces. The species thrive in loam and peat, and cuttings root in sand under a hand-glass.

1193. *Alangium*. So denominated by Lamarck, from a slight alteration of one of its Malabar names, *Alangi*. It grows in light sandy soil, and cuttings root in sand under a hand-glass in moist heat. (*Sweet.*)

1194. *Mentzelia*. Named after Christian Mentzel, a Prussian, physician to the Elector of Brandenburg; he died in 1701. Curious plants related to *Loasa*.

1195. *Lagerstræmia*. So named by Linnaeus from Magnus Lagerstroem, of Gottenburgh, director of the Swedish East India Company, who procured many curiosities from China, and gave them to the public. *L. Regina* is a very handsome shrub: the flowers are in panicles, a span long, pale rose-colored in the morning, growing deeper through the day, and becoming purple in the evening. According to *Sweet*, this species is rather difficult to preserve through the winter; it requires a good heat, and but little water in winter; if it happens to have too much wet, it is a great chance if it survives; in summer it grows very fast, and requires plenty of room and water. Cuttings of both kinds root readily in sand, under a hand-glass. (*Bot. Cult.* 73.)

1196. *Ægle*. *Αγλη* was one of the Hesperides. *Correa de Serra* named the genus *Ægle* from the fruit having some resemblance to the orange. *Sweet* observes, that this plant likes a rich loamy soil. The wood

7730 Stigma capitate, Petals 8-10, Leaves obovate very blunt serrated

7731 Flowers solitary, Leaves ovate acutely toothed, Sepals ovate

7732 Leaves lanceolate ellipt. serrated, Racemes axillary

7733 Leaves obl. lanc. serrated netted, Racemes axillary clustered, Drupes blue

7734 Petals 10, Branches spiny

7735 Stem branched, Peduncles axillary, Petals crenate obtuse

7736 Stem branched, Peduncles axillary solitary, Petals acuminate, Fruit reflexed

7737 Petals crisp, Panicle terminal, Leaves roundish ovate acute smooth

7738 Petals wavy, Panicle terminal, Leaves oblong smooth

7739 Middle leaflet stalked, Fruit with 12 cells

7740 Leaves subsessile connate at base lin. lanc. smooth above downy beneath, Caps. 10-cc

7741 Leaves lin. lanc. sessile 3-nerved villous on each side, Pedunc. cymose 1-sided

7742 Leaves on short stalks ovate lanceolate acum. wavy at edge: the upper hairy, Cymes hirsute

7743 Lvs. sessile obl. obt. hirsute, Pedunc. short 1-fl. or cymose, Caps. small in a large hairy pyramidal calyx

7744 Leaves roundish ovate rugose tomentose hairy stalked, Pedunc. 1-fl. 1-5 together, Calyx villous

7745 Leaves stalked cordate acuminate smooth, Fl. cymose, Pedunc. with long bracts

7746 Leaves stalked cordate ovate acuminate fringed at edge rugose and a little glutinous on each side

7747 Leaves sessile linear oblong acute wavy at edge 3-nerved at base, Sepals villous with long points

7748 Lvs. lanc. acute 3-nerv. hairy reticul. beneath stalked, Stalks sheathing the stem with their connate bases

7749 Leaves sessile linear lanceolate waved crisp 3-nerved rugose pubescent, Fl. sessile umbelled

7750 Leaves stalked ovate blunt rugose downy beneath, Pedunc. long hoary 1-flowered

7751 Leaves stalked ovate lanc. 3-nerved smooth above downy beneath, Petioles dilated and united at base

7752 Lvs. ovate lanc. on short stalks sheathing at base revolute at edge, Pedunc. hirsute leafy 1-flowered

7753 Leaves spatulate toment. rugose 3-nerved sessile subconnate: the upper narrower, Pedunc. 1-flowered

7754 Leaves obl. lanc. acuminate at each end rugose, Stalks short hairy sheathing, Pedunc. short 1-2-3

7755 Leaves spatulate ovate downy hairy narrowed into a short stalk wavy at edge, Pedunc. short 1-flowered

7756 Leaves sessile obl. ellipt. hoary downy about 3-nerved, Fl. 3-8 in terminal umbels, Outer sepals largest

7757 Lvs. conn. obl. lanc. nerv. above smooth and shin. beneath silky, Fl. in corymb. cymes, Ped. and cal. vill.

and Miscellaneous Particulars.

requires to be ripened before the cuttings are taken off; then to be planted in a pot of sand without shortening the leaves, and to be plunged under a hand-glass in heat.

1197. *Cistus*. *Κιστος*, in Greek; derived from *κυστις*, a box, or capsule. The capsules of the genus are remarkable. All these words have been formed from the Anglo Saxon, *cyst*, which signifies a hollow vessel.

The species are for the most part shewy and free-flowering plants; the colors brilliant, and the petals very fugacious. In gardens they are rather difficult to keep in a neat shape, getting naked below, and often dying wholly or in part during severe winters. They succeed best in glass cases, which can be entirely removed in summer, or in a dry soil under a warm wall.

C. villosus has a strong woody stem, the flowers are produced at the ends of the branches, four or five together, almost in form of an umbel, but it rarely happens that more than one is open at the same time. The petals are large, purple, and spread open like a rose; they are but of short duration, generally falling off the same day they expand; but there is a succession of fresh flowers every day for a considerable time in May and June; generally again in September and October, if the autumn be favorable, and even in the winter if the plants be protected from frosts.

C. ledon and *ladaniferus* produce the gum ladanum, but not in such quantities as *C. creticus*. The resin, which is secreted from the leaves and other parts of the shrub, is scraped off by means of a kind of rake, to which numerous leathern thongs are appended instead of teeth. This instrument being drawn backwards and forwards over the plant from time to time, collects the resin. The chief use of this gum in modern practice is in fumigations, its fragrant smell having made it a constant ingredient in such preparations. *C. ladaniferus* is the most popular species for warm situations in ornamental scenery.

"Most of the species," Sweet observes, "will survive through the winter in the open air, if the weather be not too severe; but it is safest to keep some of all the kinds in pots, that they may be sheltered from severe frosts; and they can be turned out in the borders in spring, when they will thrive and flower well. They will succeed in any common soil, or a mixture of loam and peat will suit them very well. They may be increased by layers; or young cuttings, as soon as ripened, taken off at a joint, and planted under a hand-glass, will root readily: they may be also raised from seeds, which are produced in abundance." (*Bot. Cult.* 168.)

History, Use, Propagation, Culture,

1198. *Helianthemum*. From *ἥλιος*, the sun, and *ἄνθος*, flower, in allusion to the bright golden radiance of the blossoms. This is a showy free-flowering genus of little trailing plants, mostly ligneous, and well adapted for rock-work. A number of them answer best kept in pots, and sheltered by frames during winter; but some are quite hardy, and none are more ornamental than the *H. vulgare*, and its varieties with orange, yellow, straw-colored, red, and double flowers. It is one of the handsomest plants in cultivation for rock-work. All the species are of easy culture in light soil, and cuttings root freely under a hand-glass.

1199. *Bauera*. Named after Francis and Ferdinand Bauer, German botanical draughtsmen of the highest

- 7758 Stem nearly smooth, Lvs. sess. lin. revol. at edge brownish green above hoary beneath, Fl. sol. Sep. shining
 7759 Young shoots visc. with downy hairs, Lvs. sess. lin. obl. viscid downy beneath, Fl. in term. umb. Sep. villous
 7760 Branches hoary rough hoary, Lvs. sess. atten. at base green above ash-colored beneath, Ped. shorter than
 7761 Leaves sessile hoary ovate-lanc. Pedunc. panic. hairy, Sepals 3 acute hairy [Leaves, Cal. hairy
 7762 Branches villous, Leaves obov. lanc. hoary, Pedunc. and cal. villous, Sepals 3

 7810 Leaves oblong acute crenate-toothed upwards, green beneath

and Miscellaneous Particulars.

celebrity. Nothing comparable to their works has ever appeared from any other hand. The species is a hardy free-flowering plant, of easy culture in sandy loam and peat, and cuttings root in the same soil under a glass.

120. *Fothergilla*. In memory of John Fothergill, M. D., an eminent physician and patron of botany, who cultivated a variety of the most curious plants in his garden near London. The species are dwarf deciduous shrubs, of easy culture in light soil or peat, and generally increased by layers.

History, Use, Propagation, Culture,

1201. *Curatella*. From *curatus*, worked; a name given by Aublet to the genus, because the leaves, which have a rough surface, are used in Guyana for polishing bows, sabres, and other weapons. A small tree with rough leaves, which grows well in sandy loam; cuttings root in sand under a glass.

1202. *Peonia*. The physician Pæon was the first to use this in medicine. The Greek legend adds, that he used it to cure Pluto of a wound inflicted by Hercules. The species are magnificent flowering plants, especially *P. officinalis* and *moutan*, with their numerous varieties. *P. moutan* and its different varieties are hardy enough to bear our winters in the open air; but they do not flower in such perfection as when planted out in a conservatory, or in a pit where they may be protected from the severe frost under glass: they will thrive well in any rich light soil; and ripened cuttings, slipped off, and planted in the ground, in a shady place, without cover, will root freely. (*Bot. Cult.* 234.)

P. edulis has a more slender stem than the common Peony. The Daurians and Mongols boil the root in

7811 Leaves ovate subrepand toothletted rough

7812 Segments of leaves ovate obl. glaucous beneath

7813 Capsules smooth recurved, Segm. of leaves smooth shining 3-parted with ovate lanceolate lobes

7814 Capsules downy erect, Segm. of leaves glaucous beneath smooth somewhat lobed with blunt obovate lobes

7815 Capsules downy, Segm. of leaves ovate entire smooth

7816 Capsules downy nearly straight, Segments of leaves unequally cut smooth, Lobes ovate-lanceolate

7817 Caps. downy erect, Segm. of leaves 3-parted cut and entire ovate-lanc. flat hairy beneath

7818 Leaves somewhat shining blistered coriaceous glaucous and downy beneath, Ovaries woolly spreading

7819 Caps. downy straight, Segm. of leaves many-parted blunt somewhat wavy glaucous beneath hairy

7820 Caps. downy straight, Segm. of leaves oval-lanc. flat lobed imbricated beneath caesious hairy

7821 Caps. downy arcuate spreading, Segm. of lvs. 3-lobed and pinnatifid decurrent ovate-obl. flat hairy beneath

7822 Caps. pubescent spreading, Segm. of leaves 3-parted oblong blunt hairy beneath

7823 Caps. somewhat pilose nearly erect, Segm. of leaves 3-5-parted villous beneath, Lobes obl. entire

7824 Caps. 5 smooth depressed blunt, Segm. of leaves smooth pinnate, Lobes lanc. acuminat

7825 Caps. pubescent, Segments of leaves smooth many-parted, Lobes linear

7826 Caps. downy spreading, Segm. of leaves smooth many parted, Lobes linear

TRIGYNIA.

7827 Leaves obovate lanc. nearly entire mucronate pubescent beneath, Flowers sessile, Stem twining

7828 Leaves roundish crenate toothed, Fl. stalked opp. to the leaves, Stems procumbent

7829 Leaves obl. acum. smooth with awned serratures, Fl. stalked trigynous

7830 Like *D. grandiflorum*, from which it differs in having a more rigid stem, and a later time for flowering

7831 Stem erect velvety, Lvs. 3-5-part. Lobes pinnatifid, Racemes lax, Spur straight pubesc. shorter than cal.

7832 Stem suberect smth. with spread. branches, Fls. few loosely racem. Ped. long. than bractes, Caps. smooth

7833 Petioles not dilated at base, Lvs. cum. at base 5-7-lob. Lobes cut acute, Raceme lax branch. Calyxes smooth

7834 Stem erect smoothish nearly simple, Branches much covered with fis. Ped. length of bractes, Caps. pubesc.

7835 Stem erect branch. subpub. Lvs. pedate multifid, Ped. very long, Spur incurv. at end horiz. divid. upwards

7836 Stem erect much branch. Lvs. smooth rigid: low. multifid, Branc. and bractes lin. ent. Rac. lax. Pet. stalk.

7837 Leaves palmate many-parted, Lobes linear distant, Pedicels longer than bract, Pet. shorter than calyx

and Miscellaneous Particulars.

their broth, and grind the seeds and put them into their tea. *P. officinalis* was by old authors said to be of two sorts, male and female, the flowers of the former being smaller and lighter colored than those of the latter. These distinctions, however, were not indicative of sexual difference, the pæony being hermaphrodite, but merely of stronger and weaker growing varieties, according to the practice of the age. Now they are laid aside, the varieties reduced to seven or eight, of which a full account is given in the Horticultural Transactions (vol. ii. 273.). Of these, the double red, the most common, when introduced at Antwerp about the end of the sixteenth century, sold for twelve crowns a root. A useful account of the species and varieties has been published by Messrs. Anderson and Sabine, in the transactions of the Linnean Society.

1203. *Hibbertia*. Named after George Hibbert, Esq. who was once a distinguished English collector of plants. Twining or trailing plants of New Holland, with bright yellow flowers.

1204. *Delphinium*. From *δέλφιον*, a dolphin, on account of the resemblance between the nectary of the

History, Use, Propagation, Culture,

plant and the imaginary figures of the dolphin. The species are shewy annuals or perennials, valuable as border flowers. The leaves are generally much divided, and the flowers in terminal spikes, blue, purple, or red; never yellow or any shade of that color.

D. consolida, (from *consolidare*, to unite; it being formerly reputed as a most powerful vulnerary), *Pied d'Alouette*, Fr., *Rittersporn*, Ger., is a shewy annual, with blue, pink, purple, and white flowers, and semi-double and double. *D. Ajacis*, so called because some traces may be perceived in the flower of what may be likened to the letters AIA, is by some considered as only a variety of this species; both are universally grown as border annuals. *D. elatum* is well adapted for shrubberies. All the species are of the easiest culture. The species are extremely difficult to distinguish from each other, and are probably in many cases mere varieties.

1205. Aconitum. So called from growing about Acona, a town of Bithynia. The species are robust flowering plants of some beauty and consequence. The stems rise from two to six feet in height, upright, strong, furnished with many digitate or palmate leaves, and terminated by panicles or loose spikes of blue or yellow flowers.

A. Napellus, from *napus*, a turnip, its grumous roots resembling little turnips, is a well known poisonous plant. Linnæus says, that it is fatal to kine and goats, especially when they come fresh to it, and are not acquainted with the plant; but that it does no injury to horses, who eat it only when dry. He also relates (from the Stockholm Acts) that an ignorant surgeon prescribed the leaves, and on the patient refusing to take them, he took them himself and died. The ancients, who were acquainted with chemical poisons, regarded the Aconite as the most violent of all poisons. Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days.

- 7838 Stem erect branch, Lvs. 5-part. Lobes obl. acumin. Pet. shorter than cal. Caps. netted with color pubescent
 7839 Petioles not dilat. at base, Lvs. cord. 5-7-fid : up. 3-lobed, Lobes cut serr. Ped. bract. cal. and ovaries smooth
 7840 Petioles not dilated at base, Leaves downy 5-lobed, Lobes cuneate at base trifid cut, Spur inflexed
- 7841 Petioles not dilated at base, Lvs. orbicular cord. 5-fid, Lobes cut acute deflexed, Bractes 3, Ovaries smooth
 7842 Petioles sheathing at base, Lvs. many-part. with lin. lobes, Raceme close, Spur straight longer than flower
- 7843 Lvs. somewhat dilated at base, Segm. cuneiform serr. cut in front, Stem upwards and peduncles pubescent
 7844 Petioles not dilated at base, Lvs. flat trifid beyond the middle, Lobes cuneiform trifid at the end acuminate
 7845 Pet. scar. dilat. at base, Lvs. 3-5-part. multif. with lin. lobes, Rac. straight, Pet. beard. at end : low. very vill.
 7846 Pet. scar. dilat. at base, Lvs. 3-7-lob. Lobes obl. ac. cut pinnatifid : up. 3-part. Caps. nett. at keel and edge cil.
 7847 Pet. smth. but scar. sheath. at base, Lvs. 5-par. Lobes 3-5-fid lin. Pet. sh. than cal. Caps. refl. from their base
 7848 Petioles not dilated at base, Leaves concave beyond the middle trifid, Lobes cuneiform cut acuminate at end
 7849 Petio. not dilat. at base, Lvs. 5-lob. with cut lobes, Stem flexu. and petioles hairy, Bractes lin. Caps. smooth
 7850 Petioles sheathing at base, Lvs. many-par. with lin. subul. segm. Fl. pubesc. Spur acute longer than flowers
 7851 Pet. not dilat. at base, Lvs. 3-7-lob. with obl. ac. cut pinnat. lobes, Rac. lax branch. Bractes and ovaries pub.
 7852 Petioles sheathing at base, Lvs. many-parted in lin. lobes, Rac. long, Spur straight blunt longer than pedicel
 7853 Spur very short, Bracteoles inserted at base of pedicel, Petioles hairy, Pedicels twice as long as flower
 7854 Spur scarcely shorter than cal. Bracteoles inserted at base of pedicel, Petioles pubesc. Pedic. scarcely longer
 7855 Spur nearly as long as calyx, Bractes inserted in the middle of pedicel, Petioles hairy [than flower
- 7856 Pan. divaricating, Branches tortuose, Helmet conical half circular, Spur short thick spiral [at end
 7857 Fl. spiked or panic. numerous, Lvs. deeply 3-5-lobed with cuneate trifid lobes, Spur slender straight curv.
 7858 Helmet conical cylindrical. Spur slender spirally twisted, Lip divaricating, Lvs. palm. 3-5-lob. beyond middle
 7859 Veiny smooth, Pan. smoothish with ascend. branches, Bag of hoods very large ventric. Spur thick subinvol.
 7860 Pan. divaricating very smooth, Branches tortuose, Spur thick somewhat spiral, Lobes of leaves rhomboid
 7861 Fls. panic. Sep. and pet. persist. Bag of hoods scarcely any, Spur thick spiral, Lvs. multif. with lin. ac. segm.
 7862 All over densely pubesc. Lvs. very large palmate 3-5-lobed beyond middle pubesc. Helmet conical cylindr.
 7863 Like Anthera, but flowers smoothish variegated with a low subconical helmet [compressed
 7864 Like Lycoctonum, but flowers paniced, Stem peduncles and flowers villous, Ovaries smooth or hairy
 7865 Ovaries 4-5, Helmet conical with a long claw, Rac. lax simple, Lvs. 3-5-parted with trifid toothed lobes
 7866 Pan. lax, Helmet conical elongated abruptly mucronate in front, Spur thick spiral, Ovaries 3-5
- 7867 Pan. lax, Branches 1-4-fl. Spur thick long abruptly kneed, Bags of hoods inflated, Ovaries 3-5 smooth
 7868 Ovaries 3 smooth, Raceme lax corymbose, Ped. smooth, Helmet very convex subconical
 7869 Pan. lax, Helmet exactly conical, Spur very thick blunt very short, Bag of the hoods very large
 7870 Fl. panic. Helmet conical, Spur thick blunt very short. Lvs. deeply lobed with narrow diverging segments
 7871 Stem very short, Low. lvs. few on long stalks 5-part. with palm. segm. Hoods hook. blunt, Ovaries 3 villous
 7872 Ovaries 3 smooth, Raceme cylindrical. long, Leaves divided down to petiole with linear acute furrowed lobes
 7873 Ovaries 3 smooth, Rac. cylindr. long very compact, Pedicels smooth shorter than bractes, Lvs. subpedate
 7874 Stem twining with spreading hairs, Petioles ciliated, Leaves 3-5-parted with pinnatifid lobes, Ovaries 5-7
 7875 Pan. lax, Branches diverging, Helmet exactly conical, Leaves 3-lobed with entire lobes, Ovaries villous

PENTAGYNIA.

7876 Leaves very rough toothed

and Miscellaneous Particulars.

But the root is unquestionably the most powerful part of the plant. Matthiolus relates, that a criminal was put to death by taking one dram of it. Dodonæus gives us an instance, recent in his time, of five persons at Antwerp, who ate the root by mistake, and all died. Dr. Turner also mentions, that some Frenchmen at the same place, eating the shoots of this plant for those of masterwort, all died in the course of two days, except two players, who quickly evacuated all that they had taken by vomit. We have an account, in the Philosophical Transactions, of a man who was poisoned, in the year 1732, by eating some of this plant in a salad, instead of celery. Dr. Willis also, in his work De Anima Brutorum, gives an instance of a man who died in a few hours, by eating the tender leaves of this plant also in a salad. He was seized with all the symptoms of mania. The Aconite, thus invested with terrors, has, however, been so far subdued, as to become a powerful remedy in some of the most troublesome disorders incident to the human frame. Baron Stoerck led the way by administering it in violent pains of the side and joints, in glandulous scirrhi, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose, of an extract, the method of making which he describes.

Willdenow and the Dublin College consider that the plant used by Stoerck was the *A. neomontanum*, in which opinion Mr. Thomson agrees in his London Dispensatory.

All the species are poisonous in a high degree. The limits of the species are extremely obscure, and in a very unsettled state; Decandolle in his Systema, increased the number at that time known, but in his Prodrômus many of the species of the Systema are considered mere varieties. Dr. Reichenbach has, however, multiplied the species prodigiously, but with little reason.

1206. *Trachytella*. From *τραχυτός*, roughness. These are climbing shrubs with racemose white flowers, and hard rough leaves, which are used in China for polishing metals and hard wood.

History, Use, Propagation, Culture,

1207. *Cimicifuga*. From *cimex*, a bug, and *fuga*, to drive away, indicating certain virtues a species is supposed to possess. The *C. serpentaria* is used with success by the native practitioners in North America, for curing the dangerous bite of the rattlesnake. Tall, leafy, herbaceous plants, with the appearance of *Actæa*.

1208. *Aquilegia*. From *aquila*, an eagle; the inverted spurs of the flower have been likened to the talons of a bird of prey. The species are smooth-leaved, handsome-flowered plants. *A. vulgaris* is an old inhabitant of the flower border: the whole plant has been recommended to be used medicinally, but it belongs to a suspicious natural order, and Linnaeus affirms, that children have lost their lives by it. *A. alpina* is the handsomest species.

1209. *Nigella*. From *niger*, black, because of the color of the seeds, which are the part of the plant known in cookery. The species are curious or neat little plants, with fine cut leaves like fennel. *N. damascena* and *sativa* are sown as hardy annual flowers; and on the continent, the leaves and seeds of the latter species and *N. arvensis*, are used in cookery instead of more expensive aromatics. They are also said to be extensively used in the adulteration of pepper.

1210. *Reaumuria*. So named by Hasselquist, in honor of René A. F. de Reaumur, author of several entomological works; *Histoire des Insectes*, &c. He died in 1757. A small caesious plant, bearing an abundance of bright lilac flowers.

1211. *Colbertia*. Named by Mr. Salisbury after the famous Colbert, a patron of the Paris garden, who destroyed with his own hands the vines which had been planted therein in lieu of more curious objects. A fine plant, with leaves like those of *Dillenia speciosa*.

1212. *Tetracera*. From *tetrax*, four, and *keras*, a horn, because of its four capsules recurved like as many horns. Shrubs or small trees, which are often climbers with alternate stalked naked leaves, often rough above. The flowers are panicled or racemose. The leaves are remarkable as an exemplification of that mode of nervation which M. Decandolle calls feather-nerve.

1213. *Nelumbium*. This is called in Ceylon *Netumbo*. Sir James Smith proposed to call the genus by the more classical name of *Cyamus*, but it has been remarked, that it remains to be proved that the holy *kyamos*, was this plant. *N. speciosum* is a native both of the East and West Indies, China, Cochinchina, and Japan,

7877 Monogynous, Racemes very long, Caps. dry dehiscent, Leaves biternate with serrate or cut segments

7878 Ovaries 4 subsessile very vill. Racemes paniced, Lvs. ternate or biternate, Segm. ovate-lanc. cut toothed

7879 Ovaries 2-3 smooth sessile, Racemes paniced, Leaves biternate, Segments cordate at base

7880 Ovaries 12-15 in a roundish head, Racemes dichotomous paniced, Leaves palmate

7881 Spurs incurved, Caps. vill. Stem few or 1-fl. Lvs. covered with viscid down, Styles not longer than stamens

7882 Spurs incurved, Caps. villous, Stem leafy many-fl. Leaves nearly smooth, Styles not longer than stamens

7883 Spurs incurved twice as short as petals, Upper part of the plant and capsules covered with glandular hairs

7884 Spurs straight longer than limb, Stam. as long as petals, Styles long, Petals oval obl. shorter than petals

7885 Spurs straight longer than very blunt limb, Styles scarcely longer than stamens and petals, Sepals acute the length of petals

7886 Spurs straight somewhat incurved at end twice as short as limb of petals, Stem 2-3-fl. leafy, Lvs. finely cut

7887 Spurs straight, Styles and stamens exerted, Sepals acute a little longer than petals, Segm. of leaves 3-parted

7888 Spurs straight as long as limb, Styles and stamens as long as sepals, Sepals the length of petals

7889 Anthers blunt, Caps. 5 smooth 2-cell. united as far as end into an ovate globose one, Fls. in a leafy involucre

7890 Anthers blunt, Flowers in an involucre, Sepals erect conniving

7891 Anthers blunt, Caps. muricate, Stem erect hairy, Flowers naked

7892 Anthers pointed, Styles 5-7 revolute, Capsules and stem smooth, Branches diverging

7893 Anthers pointed, Styles 8-10 erect, Caps. smooth 1-nerved at back, Stem erect smooth, Branches erect

7894 Caps. 5-10 smooth erect, Styles straight

7895 A low shrub, with narrow glaucous leaves

7896 Leaves smooth 10-nerved 1-1½ foot long 6 inches broad

7897 Lvs. oval-obl. blunt or nearly acute smooth roughish above somewhat toothed at end, Pedunc. paniced [pubescent]

POLYGYNIA.

7898 Petals many, Anthers lengthened beyond the cells into a clavate appendage

β Inner petals scarcely smaller than the outer, blunt

7899 Petals many, Anthers lengthened beyond the cells into a linear appendage

and Miscellaneous Particulars.

Persia, and some parts of the Russian empire. Thunberg informs us, that it is considered as a sacred plant in Japan, and pleasing to their deities, and that the images of their idols were often drawn sitting on its large leaves. The long stalks are there eaten among other potherbs. Loureiro relates, that it abounds in muddy marshes in India and China, and is cultivated in large handsome pots in the gardens and houses of the mandarins; that there is a variety with the flower of a pure white, and another with a very beautiful luxuriant flower, having about one hundred large petals, white or rose-colored. Both root and seeds are esulent, sapid and wholesome. In China it is called Lien-wha, and the seeds and slices of the hairy root, with the kernels of apricots and walnuts, and alternate layers of ice, were frequently presented to the British ambassador and his suite at breakfasts given by some of the principal mandarins. The Chinese have always held this plant in such high value, that at length they regarded it as sacred. That character, however, has not limited it to merely ornamental purposes; for the roots are not only served up in summer with ice, but they are also laid up in salt and vinegar for the winter. The seeds are somewhat of the size and form of an acorn, and of a taste more delicate than that of almonds. The ponds are generally covered with it, and exhibit a very beautiful appearance, when it is in flower; and the flowers are no less fragrant than handsome.

Sir George Staunton remarks, that the leaf, besides its common uses, has, from its structure, growing entirely round the stalk, the advantage of defending the flower and fruit arising from its centre from contact with the water, which might injure them. He also remarks, that the stem never fails to ascend in the water from whatever depth, unless in case of a sudden inundation, until it attains the surface, when its leaf expands, rests, and swims upon it, and sometimes rises above it. This plant bears the rigorous cold of the Pekin winter, though it is reared with difficulty in European stoves. It often grows spontaneously in China, and is propagated in the open air with ease both by the seed and root. The Chinese distinguish many varieties of it.

From the root of the Nelumbo, Sir George Staunton says, the Egyptians are supposed to have prepared their Colocasia, but the plant is now no longer found in that country; from which circumstance some naturalists infer, that it never was indigenous there, but cultivated by the inhabitants with extreme care. The ancient Romans made repeated efforts to raise it among them, from seeds brought out of Egypt; and the

History, Use, Propagation, Culture,

modern attempts to cultivate it in Europe, though with the assistance of artificial heat, seldom have succeeded.

Dr. Patrick Browne is of opinion that the ancients confounded two plants under the name of Lotus or Egyptian bean, and that under these titles they described the upper parts of the *Nymphaea Nelumbo*, and the roots of the lesser *Colocasia*, now commonly called *cocos* in Jamaica, *Arum Colocasia*. (*Jam.* 243, 332.)

In our stoves the *Nelumbium* should be grown in a tub or large pot, in a rich loamy soil, and requires a strong heat to flower in perfection. The pot or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over. The plants may be increased by dividing at the root, but it is obtained more readily from seeds, which vegetate freely. (*Bot. Cult.* 83.)

Kent of Clapton says, that the seeds will keep forty years, vegetate freely, and flower the first year. (*Hort. Trans.* iii. 36.)

1214. *Dillenia*. So named by Linnæus, in honor of John James Dillenius, the famous professor of botany at Oxford, author of *Historia Muscorum, Hortus Elthamensis, &c.* The species are beautiful trees, with large leathery leaves, and axillary or terminating flowers often also large. They thrive best in a light loamy soil. Ripened cuttings, not deprived of their leaves, strike root freely, in a pot of sand plunged under a hand-glass in heat. Good seeds sometimes arrive from India, when the sooner they are sown the better; placed in a moderate hot-bed frame, they will succeed well. (*Bot. Cult.* 50.)

1215. *Illicium*. From *illicio*, to attract, on account of its agreeable perfume. *I. floridanum* has very fragrant leaves, and capsules having a strong smell of anise when rubbed. This species, and more especially *anisatum* is powerfully carminative and stomachic. In China it is in frequent use for seasoning dishes, especially such as are sweet. In Japan they place bundles and garlands of the aniseed-tree in their temples before their idols, and on the tombs of their friends. They also use the powdered bark as incense to their idols. A branch put into the decoction of *Tetraodon hispidum* is supposed to increase the virulence of that poison. The bark, finely powdered, is used by the public watchmen to make a chronometer or instrument for measuring the hours, by slowly sparkling at certain intervals in a box, in order to direct when the public bells are to sound.

Ripened cuttings will root in sand, but the plant is most readily increased by layers.

1216. *Liriodendron*. From *λεϊριον*, a lily, and *δενδρον*, a tree. The flowers, which may be likened to a lily or tulip, grow upon one of the loftiest trees of the forest. A smooth tree, not less admired for its fiddle-shaped leaves, than its tulip-like flowers, which are produced at the end of the branches; they are composed of six petals, three without and three within, which form a sort of bell-shaped flower, whence the inhabitants of North America gave it the title of tulip. These petals are marked with green, yellow, and red spots, making a fine appearance when the trees are well charged with flowers. When the flowers drop the germ swells, and forms a kind of cone, but it does not ripen in England.

The timber is used in America for canoes, but is unfit for boards or planks, as it contracts and expands more than the wood of any other tree.

The tulip tree is now very common in Europe; in the south of France and Italy, it is frequent in public avenues, and flowers when twenty or thirty feet high, and of six or seven years growth. In Britain it requires a

7900 Leaves elliptic oblong simply serrated, Peduncles 1-flowered

7901 Petals 27-30 purple : outer oblong ; inner lanceolate

7902 Petals 9-12 yellowish ovate roundish

7903 Leaves truncate at end with two broad opposite stipules

7904 Leaves evergreen oval-obl. coriaceous shining above ferruginous beneath, Flowers erect with 9-12 petals

7905 Leaves elliptical blunt glaucous beneath, Flowers with 9-12 contracted petals which are ovate concave

7906 Like the last, but leaves evergreen elliptical acute at each end

7907 Lvs. deciduous obovate abruptly acuminate the younger pubescent, Flowers naked erect with 6-9 petals

7910 Leaves evergreen smooth netted ellipt. acuminate at each end subglaucous, Flowers cernuous

7911 Leaves evergreen elliptical obl. : the old smooth ; younger and branches fuscous downy, Flowers erect

7912 Lvs. deciduous heart-shaped subovate acute, above smooth, beneath somewhat tomentose, Pet. 6-9. obl.

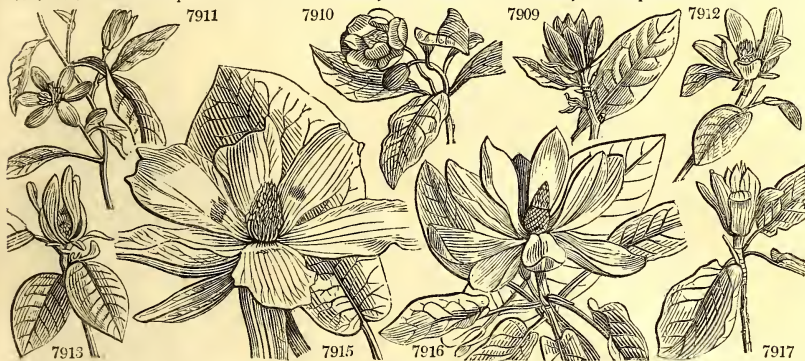

7913 Leaves deciduous oval acuminate pubescent beneath, Petals 6-9

7914 Leaves deciduous lanc. much spreading, younger downy beneath, Petals 9-12, the outer hanging down

7915 Lvs. deciduous very large obl. obov. subuncinate cordate at base, beneath whitish glaucous, Pet. 6-9 ovate

7916 Lvs. decid. smooth spatulate obov. subcord. at base, Auricles blunt close, Sep. 3 much spread, Pet. 9 oblong

7917 Lvs. decid. smth spatul. obov. subcord. at base, of same color on both sides, Auric. spread, Pet. 9 lanc. acum.

and Miscellaneous Particulars.

greater age, though ringing might probably be successfully applied to throwing this and other ornamental trees into a flowering state. There are many fine old trees round London, in the parishes of Fulham, Walham-green, Kew, &c., and a very fine one even so far north as Pitcaithly wells in Fifeshire.

1217. *Magnolia*. In honor of Pierre Magnol, professor of medicine, and prefect of the botanic garden at Montpellier ; author of *Botanicum Monspeliense*, 1676, and other works. The species are chiefly large trees with large leaves, and axillary flowers, also very large and highly odorous.

M. grandiflora is the noblest species ; the leaves, which are persistent, are nine or ten inches long, and not unlike those of a common laurel. The flowers are produced at the ends of the branches : they are very large, and composed of eight or ten petals, narrow at their base, but broad, rounded, and a little waved at their extremities ; they spread open very wide, are of a pure white color, and have an agreeable scent.

The variety *g. elliptica* or Exmouth (having been raised from the seed of an old tree in Sir John Collington's garden of that place) flowers earliest and most freely : it is also the hardiest.

M. glauca is deciduous. In America it is known by the names of *white laurel*, *swamp sassafras*, and *beaver tree*. It has the last name, because the root is eaten as a great dainty by beavers ; and this animal is caught by means of it. Kalm says, these trees may be discovered by the scent of the blossoms at the distance of three quarters of a mile, if the wind be favorable. It is beyond description pleasant to travel in the woods at the flowering season, especially in the evening. They retain their flowers for three weeks, and even longer. The berries also look very handsome when they are ripe, being of a rich red color, and hanging in bunches on slender threads. They cure coughs and other pectoral diseases by putting these berries into brandy, and giving a draught of the liquor every morning. The wood is made use of for joiners' planes. Dillenius remarks, that the flowers never open in a morning, that the calyx falls off at the second opening of the flower, but that the petals dry on, and that the scent resembles that of the lily of the valley, with a mixture of aromatic.

M. conspicua is much valued as a free flowerer, and on account of the early appearance of its white odoriferous blossoms. *Yulan* is the vernacular name in Japan.

M. acuminata bears a fruit about three inches long, like a small cucumber, and is thence called cucumber tree in America.

M. tripetala has leaves twelve or fifteen inches long and five or six inches wide, narrowing to a point at each extremity, and placed at the ends of the branches in a circular manner like an umbrella, whence its name. The flowers are composed of ten, eleven, or twelve large oblong white petals ; the wood is soft and spongy, and the leaves drop off earlier than in the other deciduous sorts.

The different species, Sweet observes, are generally increased by layers or seeds : when the layers are first taken off they should be potted in a mixture of loam and peat, and placed in a close frame till they have taken fresh root. None of the leaves should be taken off or shortened, nor any shoots be cut off ; or their tops shortened, as they will not succeed so well ; for the more branches and leaves are on them, the sooner they will strike fresh root. Most cultivators cut off many of the leaves and shoots of layers, when they are first taken off, thinking the roots will not have so much to nourish, which is the very reason

History, Use, Propagation, Culture,

they often lose great part of their crop; layers of any kind of shrub whatever, when first taken off, should not have a single leaf taken off till they have made fresh root: supposing their tops flag ever so much, as long as there is life it will draw up the sap, and help the plant to root afresh. The Chinese kinds are often inarched or budded on *M. obovata*, which takes readily. (*Bot. Cult.* 306.)

1218. *Michelia*. Named by Linnæus, in honor of Pietro Antonio Micheli, of Florence, author of *Nova Plantarum Genera*, Flor. 1729, fol. A lofty tree, with fragrant flowers, and fruit edible, but not agreeable. In our stoves it grows well in light loam, and cuttings root in sand under a glass and plunged in heat.

1219. *Uvaria*. The fruit grows in bunches like a small bunch of grapes, whence it has been called *Uvaria* from *Uva*. The berries are considered a specific for gonorrhœa, and are used under the name of *cubeba*. These are trees or shrubs with erect or trailing stems, and 1-4-flowered axillary peduncles.

1220. *Anona*. This is called by the Malays, *manoa*, and at Banda, *menona*, which it is presumed that the Europeans have corrupted into *Anona*. As the word signifies in Latin food, it has been adopted by Linnæus in this sense, because of the habitual use made of the fruit by the Americans. The species are for the most part fruit trees, with soft pulpy subacid berries, sometimes as large as an orange, but generally more like a plum.

A. muricata is common in every savannah of Jamaica, flowering in the spring. The large succulent fruit is agreeable to new-comers and over-heated habits; but it is so common, and so much in use among the negroes, that it is now hardly ever used among the better sort of people. The smell and taste of the fruit, flowers, and whole plant, resemble very much those of black currants.

A. tripetala is a large tree with large bright green leaves. The fruit is oblong, scaly on the outside, and of a dark purple color when ripe; the flesh is soft and sweet, and has many brown seeds intermixed with it which are very smooth and shining. It is esteemed by the Peruvians as one of their most delicate sorts.

A. palustris grows wild in soft marshy places in Jamaica, and bears a fine sweet-scented fruit, of no disagreeable flavour; but it is said to be a strong narcotic, and is not eaten on that account. It is called alligator apple. The wood of this tree is so very soft, even after it is dried, that it is frequently used by the country people instead of corks, to stop up their jugs and calabashes; and whence it has now universally obtained the name of cork-wood in Jamaica. (*Browne*.)

To bear fruit in our stoves, these trees require a rich loamy soil, rather moist, and to be trained on a wall or trellis close under the glass. Ringing would also be useful. They are propagated by ripened cuttings, of a good size, with their leaves on, planted in sand, and plunged in heat.

7918 Leaves lanceolate smooth

7919 Leaves lanc. acuminate, Pedunc. lateral solitary 1-flowered

7920 Leaves ovate lanceolate smooth somewhat shining, Pedunc. solitary 1-flowered

7921 Leaves ovate lanceolate not dotted very finely silky beneath, Outer petal downy outside

7922 Leaves lanceolate smooth with pellucid dots, Outer petals smooth

7923 Leaves obl. acute somewhat downy above, silky and rufous beneath, Flowers on short stalks

7924 Leaves obl. lanc. acute smooth somewhat dotted, Outer petals obl. somewhat closed

7925 Leaves ovate obl. coriaceous very smooth, Fl. solitary stalked

7926 Leaves ovate lanc. smooth, Pedunc. opposite the leaves 2-flowered

7927 Leaves obl. lanc. acuminate smooth shining

7928 Leaves oval acuminate cordate covered beneath, as on the branches, with brown down

7929 Leaves ovate acuminate very smooth nearly sessile, Pedunc. axillary 1-flowered

7930 Leaves obl. cuneate acuminate, Branches quite smooth

7931 Leaves cuneate obovate mucronate beneath, as on the branches, rufous with down

7932 Leaves obl. linear long-cuneate, Branches quite smooth

7933 Leaves lanc. acuminate strigose beneath bearded at end

7934 Leaves obl. ovate smooth, Pedunc. 1-fl. solitary

7935 Leaves cordate 3-lobed, Lobes entire

and Miscellaneous Particulars.

1221. *Artabotrys*. This name was suggested by the curious grapple or tendril belonging to the peduncle, by which the growing fruit is conveniently suspended on the nearest support. A beautiful Chinese plant, cultivated as an ornamental covering to walls, as well as on account of the fragrance of the blossom, which diffuses an odor like that proceeding from the finer kinds of ripe fruit. The genus is intermediate, between *Kadsura* and *Guatteria*.

1222. *Guatteria*. Named by the authors of the *Flora Peruviana*, after John Baptist Guatteri, an Italian professor of botany at Parma. *G. virgata* is one of the best timber trees in Jamaica for strength and elasticity; it is imported under the name of lance-wood, and much used by coachmakers for shafts to light carriages.

1223. *Asimina*. A name coined by Adanson, without any meaning. Shrubs with deciduous, oblong, often cuneate leaves, and axillary flowers, which often appear before the leaves. The species are natives of shady woods in the more southern provinces of North America.

1224. *Xylopia*. Named by syncope from *ξύλον πικρόν*, bitter wood, in allusion to the properties of the wood. Fruit-bearing trees, but not in much esteem as such. *X. glabra* is the most useful species. The wood, bark, and berries have an agreeable bitter taste, not unlike that of the orange seed. The wild pigeons feed much upon the latter, and owe that delicate bitterish flavor, so peculiar to them in the season, wholly to this part of their food. Fresh gathered from the tree, they are agreeable to the palate and grateful to the stomach. The bark is also richly impregnated with this juice as well as the wood, and both yield a very agreeable bitter in the mouth while fresh; but that delicacy diminishes greatly after they are dried. The wood is easily wrought, and esteemed a good timber where it is not much exposed to the weather. The bitter quality of this tree is communicated with great facility. A handful of the shavings immersed in water and instantly taken out again, will render it of a very bitter taste. Sugar sent over in hogsheads made of this wood was so bitter that no person would purchase it. Bedsteads and presses made of it, are proof against cockroaches and other insects. Carpenters who work the wood, perceive a bitter taste in their mouths and throats. A decoction of it is said to be of service in cholics, and to create appetite.

1225. *Hepatica*. From *ἥπατις*, of or relating to the liver. The three lobes of the leaves have been compared to the three lobes of the liver. A great favorite of the flower border, both as being evergreen in its foliage, and for its abundant blossoms and great variety of colors and shades.

History, Use, Propagation, Culture,

1226. *Anemone*. From *ανεμος*, wind, because the greater part of the species grow in elevated places much exposed to the wind. The species are shewy flowering plants, and *A. coronaria* and *hortensis* are well known florists' flowers, valued for their hardy nature, and also because they will flower at almost any season, according to the time the roots are kept out of the ground, and the season when they are replanted. The prevailing colors are red, white, and blue, and semidouble flowers are in nearly as much repute as double ones. Many new varieties have been raised from seed; but they are not named by the florists, as in the case of tulips and pinks. The roots of anemones are solid flattened masses like those of ginger, and like them are multiplied by division. A root which has remained in the soil two or three years, if it has room to extend, attains a great breadth, but is still only one root; and hence the mode of sale is by weight, and the roots are divided when planted.

The soil preferred by the anemone is a fresh loam, rather heavy or light. The usual time of planting is the end of October, covering the roots three inches; but to have an early bloom they may be planted in the beginning of September, and to have a bloom every month in the year, plant every month. The finer sorts

- 7936 Leaves ternate with multifid segments and linear mucronate lobes, Sep. 6 oval close
 7937 Leaves 3-parted with cuneate cut-toothed lobes, Invol. sessile obl. entire or cut, Sepals 10-12 oblong
 7938 Leaves cordate roundish bluntly 3-5-lobed toothed, Invol. sessile trifid, Sepals 10-12 oblong
 7939 Leaves ternate with cut-toothed ciliated segments, Invol. on short stalks 5 cut, Sepals 6 round
 7940 Leaves ternate or quinate, Segments cut-toothed at the end, Invol. stalked similar, Sepals 5 obovate
 7941 Lvs. binate with a branch, stalk, Segm. many-part. with lin. lobes, Inv. shortly stalk. multifid, Sep. obl.
 7942 Leaves ternate or quinate, Segm. cut-toothed at end, Invol. stalked similar, Sepals 6 elliptical
 7943 Leaves 3-parted with cuneate cut-toothed lobes, Invol. sessile oblong entire or a little cut, Sep. very acute
 7944 Leaves ternate with trifid acuminate cut-toothed segments, Invol. stalked similar, Sepals 5 elliptical
 7945 Invol. leaves on short stalks thrice cut with linear cut-toothed segments, Sepals 5-6 oval-oblong
 7946 Leaves 3-parted with cut-toothed acuminate lobes, Invol. sessile similar, Sepals 5 elliptical, Fruit hairy
 7947 Leaves 3-parted with cut-toothed oblong lobes, Invol. sessile similar, Sepals 5 elliptical, Fruit smooth
 7948 Leaves all stalked ternate with ovate lanc. acute-toothed segments, Sepals 5 elliptical obtuse
 7949 Leaves ternate with trifid cut-toothed lanc. acute segments, Invol. stalked similar, Sepals 6 elliptical
 7950 Leaves 3-ternate with a branched stalk, Sepals 12-14 oblong obtuse, Leaves of invol. stalked
 7951 Radical lvs. 3-5 cut with subtrifid cut-toothed segments, Invol. stalk. 3-parted toothed, Sep. 5-6 elliptical
 7952 Radical leaves villous palmate 3-5-parted with cut-toothed lobes, Lobes lin. acute, Fl. umbelled
 7953 Flowers umbelled, Floral leaves stalked binate forming a sort of involucre
 7954 Leaves binate with a branched petiole, Segm. pinnated cut serrate, Sepals 6 spreading
 7955 Leaves pinnated with multifid segments, Lobes linear, Flowers pendulous, Sepals 6 erect reflexed at end
 7956 Like the last, but the flower larger and paler, and the lobes of the pinnae broader and awned
 7957 Leaves pinnated with multifid segments, Lobes linear, Flower somewhat nodding, Sepals 6 spreading
 7958 Leaves pinnated very villous with 3-parted segments, Lobes lanc. lin. acum. Fl. erect, Sep. 6 oval lanceol.
 7959 Leaves pinnated with cuneate lanceolate trifid smoothish segments, Fl. erect, Invol. very villous
 7960 Leaves pinnated villous beneath, Segm. pinnatifid, Lobes cut oblong, Fl. subernuous, Sep. 6 spreading
 7961 Leaves pinnate coming after the flowers, Segm. 3-parted, Lobes toothed cut at end, Fl. erect spreading
 7962 Leaves binate rigid smooth, Segm. cuneiform toothed at end

- 7963 Pedunc. 1-fl. longer than leaf, Lvs. binate, Segm. ovate-lanc. acum. serrate, Pet. subpatulate obtuse
 7964 Pedunc. 1-fl. the length of leaf, Leaves binate with obl. lanc. acum. segments, Pet. emarginate at end
 7965 Pedunc. 1-fl. Leaves whorled in fours ternate, Segm. stalked cordate lanc. entire, Petals acute
 7966 Leaves pinnate, Segm. glaucous smooth cuneiform lobed, Lobes entire blunt, Pedunc. trifid
 7967 Fl. paniced, Leaves ternate, Segm. ovate lanc. acum. nearly entire smooth 5-nerved at base
 7968 Leaves pinnated, Segm. ovate lanc. entire, Pedunc. few-fl. longer than leaf, Ovaries about 4, Tails almost
 7969 Pedunc. 1-fl. with an involucre, Leaves ovate subcordate toothed fasciated [naked
 7970 Pedunc. 1-fl. longer than leaf, Leaves tern. decomposed, Segm. ovate acute entire, Sepals much pointed

- 7971 Pedunc. 1-fl. longer than leaf, Leaves entire or ternate decomp. Lobes or segm. entire, Sepals obovate
 7972 Pedunc. 1-fl. Sep. connivent thick reflexed at end acuminate, Lvs. smooth with ent. or 3-lob. ov. acute segm.
 7973 Pedunc. 1-fl. Sep. connivent, Lvs. coriaceous netted 5-nerved smooth with stalked 3-lobed or entire segments
 7974 Pedunc. 1-fl. Sep. acum. wavy at edge thin, Lvs. smooth thin decomposed with stalked ov. or obl. segm.
 7975 Pedunc. 1-fl. shorter than leaf, Leaves entire 3-lobed very acute, Sepals conniving at base spreading at end
 7976 Pedunc. 1-fl. with an involucre under the leaf, Leaves ternate with stalked ternate cut-toothed segments

- 7977 Leaves pinnate with glaucous smooth wedge-shaped 3-lobed segments, Lobes toothed acuminate
 7978 Fl. paniced dicocious, Leaves ternate, Segm. cordate acute coarsely toothed and lobed
 7979 Fl. paniced dicocious, Lvs. tern. Segm. smooth ovate cordate acuminate 3-nerved ent. Pedicels pubescent
 7980 Fl. paniced dicec. Sep. 4. Lvs. tern. Segm. ovate subcord. acute coarsely toothed 3-nerv. Anth. awned at end
 7981 Ped. 3-1-fl. or 3-fid or panic. long. than lvs. Lvs. tern. or pinn. Segm. ovate coarsely toothed, Fl.-buds globose

and Miscellaneous Particulars.

require protection from violent storms and excessive light and heat; but many varieties do exceeding well in borders. A very severe winter will destroy the roots if the surface is not mulched; but the anemone is considerably harder than the ranunculus. Anemone pulsatilla is common in borders. The roots are mostly tuberous, and when taken up should not be long kept out of ground. Like most tuberous plants, they thrive best in a sandy loam.

1327. *Clematis*. From κλημα, a tendril; the climbing habit of this genus is well known. The species are mostly climbing shrubs of rapid growth, free-flowerers, very ornamental, and some are highly odoriferous. *C. florida*, *viticella*, and *flammula* are admired species. The plants formerly called *Atragene*, but now properly united to *Clematis*, are shewy climbers, especially *C. austriaca*, which grows and flowers freely. Any common garden soil will suit them, and they are readily increased by layers; or young cuttings, planted under a common hand-glass, will root freely. Seeds are often ripened in abundance, by which any quantity may be raised; they are best sown in pans, or wide-mouthed pots, and placed in a shady situation, where they will

History, Use, Propagation, Culture,

remain some time before they come up; they may then be potted off, or planted out in the ground, when they will require to be shaded a little if the weather be warm, till they have taken fresh root. (*Bot. Cult.* 281.)

1228. *Naravelia*. An alteration of *naravel*, the name by which the plant is known in Ceylon. A plant with the habit of Clematis, but bearing leaves of only one opposite many-nerved pair, like Lathyrus.

1229. *Thalictrum*. This name is said to be derived from *θαλλω*, to grow green; from the bright color of the young shoots. The species are vigorous growing plants, with ramose roots and smooth finely divided leaves; they grow in any soil and situation, and *T. tuberosum*, *cornuti*, and *aquilegifolium*, are reckoned handsome ornaments in a border or shrubbery.

1230. *Adonis*. The plant which sprang from the blood of Adonis when wounded by the boar. Handsome border flowers, especially *A. vernalis* and *autumnalis*, and of the easiest culture in any common soil.

- 7982 Leaves pinnate with smooth subglaucescous acute cut-toothed 3-lobed segments
 7983 Lvs. pinn. Segm. ovate-lanc. cut-toothed acuminate truncate cordate at base, Pedunc. shorter than leaf

- 8010 Leaves simple 5-lobed serrated
 8011 Stem erect simple angular, Root creeping, Panic. erect racemose few-flowered, Segm. of leaves linear
 8012 Stipules ovate, two at the base of the ramifications of the petiole, Panic. corymb. Fruit 3-cornered
 8013 Stem round upright somewhat furrowed, Root creeping, Panic. erect, Segm. of lvs. lin. very narrow entire
 8014 Stipules O, Fl. loosely corymbose racemose, Fruit 3-cornered pendulous
 8015 Stem round nearly naked, Fl. corymb. Filam. dilated at end, Segm. of lvs. smooth ovate entire or 3-lobed

- 8016 Cal. hispid at base, Pet. flat obl. blunt, Fruit netted in a long lax spike
 8017 Cal. smooth, Pet. conc. conniving scarcely longer than cal. Fruit netted in an ovate head
 8018 Cal. hispid at base, Pet. flat acute longer than cal. Flower large, Fruit in a cylindrical head
 8019 Lower leaves abortive, Upper sessile, Fruit velvety, Pet. 10-12 oblong somewhat toothed
 8020 Cal. smooth distinct at base, Pet. flat obl. twice as long as cal. Fruit smooth in an oblong head
 8021 Rad. leaves on long stalks, Stalks trifid, Fruit smooth, Pet. 8-10 obl. cuneate entire

- 8022 Umb. supradecomound much spreading
 8023 Umb. simple few-flowered

- 8024 Root grumous, Stem leafy, Leaves cordate

and Miscellaneous Particulars.

1231. *Knowltonia*. Named after Thomas Knowlton, once the curator of the botanic garden at Eltham. The species grow freely in loam and peat, and are increased by dividing at the root, and by seeds.

1232. *Ficaria*. So named because the grumous roots bear tubercles like little figs. A common wood plant, remarkable for its shining leaves and bright yellow flowers. The young leaves are sometimes used as greens in Sweden, and the roots were formerly applied in poultices to piles in England, probably from their resemblance to that disease. These roots or tubercles lie near the surface, and are sometimes laid bare by the rains, and in this state have induced the ignorant, under the influence of superstition, to fancy that it rained wheat. The plant is injurious in moist grass lands, but is effectually destroyed by a dressing of coal or wood ashes.

History, Use, Propagation, Culture,

1233. *Ranunculus*. Said to be so called from *rana*, a frog, because the species inhabit humid places frequented by that reptile. *Renoncule*, Fr., *Ranunkel*, Ger., and *Ranuncolo*, Ital. Some of the species are weeds, one or two border flowers, and *R. asiaticus* is one of our most esteemed florists' flowers. Some of the species are tuberous and others bulbous rooted, but the most part are tuberous. *R. sceleratus* is one of the most virulent of our native plants. Bruised and applied to the skin it soon raises a blister, and makes a sore by no means easy to heal. Strolling beggars have been said to use it for that purpose, in order to excite compassion. When chewed, it inflames the tongue; and when taken into the stomach, it produces violent effects. It is suspected to have proved poisonous to sheep.

R. aconitifolius is a handsome plant, with branching stems, deep green leaves, and pure white flowers; the double variety is an old and much admired border flower.

Of *R. asiaticus* the varieties raised from seed are endless. Maddock, in the end of the last century, had nearly eight hundred, all with proper names, and ranged as purple, gray, crimson, red, rosy, orange, yellow, white, olive, coffee, striped, spotted, &c. No plant is more prolific in new varieties from seeds; no two plants, as Maddock observes, producing flowers alike, or the same as the original. Established sorts are propagated by offsets, which generally flower the first year: rare sorts may be multiplied by dividing the crown of the tuber with a sharp penknife into as many parts as there are buds: these will not flower till the second year, but will diminish the risk of losing a very rare variety.

The *ranunculus* prefers a fresh loamy soil, rather than otherwise inclined to clay: it should be well manured; and it is customary, in forming the beds, to place a stratum of well rotted cow-dung six or nine inches below the surface, which both retains moisture and supplies nourishment. The roots may either be planted in November or earlier, in which case, to prevent their being destroyed by the frost, they should be mulched, or they need not be planted till March. The former mode gives much the strongest bloom, as the roots, when kept in air all the winter, are apt to be over dried, and kept in sand they sometimes get mouldy; and in this and similar cases, the progress of vegetation from the planting to the blossoming period, is more rapid than is natural to the species. *Ranunculus* roots will retain their vegetative properties two and sometimes three years; a thing not common among bulbs and tubers, unless preserved dormant in an ice cold room.

R. bulbosus has a solid white bulb about the size of that of the common *Crocus*. The flowers are some-

- 8025 Leaves smooth lin. lanc. : lower stalked, Stem declinate solid rooting at base, Fruit smooth
 8026 Leaves lin. entire smooth, Stem creeping and rooting at every joint
 8027 Leaves lanc. subserrate sessile half stem-clasping, Stem erect smooth
 8028 Rad. leaves stalked oval-obl. Fl. sess. opposite the leaves, Fruit granular scarcely crowned with the style
 8029 Leaves lanc. or lin. entire, Stem erect very smooth, Scales of the petals tubular
 8030 Rad. leaves stalked subcordate ovate-roundish : cauline sessile ovate-lanc. Pedunc. hirsute
 8031 Leaves oval-lanceolate acuminate stem-clasping, Scape and peduncles smooth
 8032 All the leaves radical-stalked ovate toothed, Scapes naked 1-flowered
 8033 Leaves smooth reniform crenate, Floral cut, Stem 2-3-fl. smooth
 8034 Lvs. woolly 3-lobed with trifid toothed cuneate lobes : upper 3-parted with entire lin. lobes, Cal. reflexed
 8035 Leaves cuneiform irregularly cut at the end, Stem smooth branched many-fl. Cal. appressed
 8036 Lower leaves stalked cordate blunt : upper obl. sessile, Stem erect hollow, Fruit granular
 8037 Rad. lvs. stalked oval or subcord. 3-5-tooth. at end, Runners from neck of plant, Scapes naked 1-fl. erect
 8038 Lvs. very smooth many-parted, Lobes obl. Scapes many 1-fl. with appressed hairs, Cal. spreading smooth
 8039 Covered with soft hairs, Rad. lvs. stalk. cord. orbic. somewhat cut-tooth. Stem branched, Cal. appressed
 8040 Lvs. smooth : radic. stalked reniform crenate; caul. in linear lobes, Cal. pubescent shorter than petals
 8041 Leaves smooth : radic. stalked cordate generally 3-parted or lobed, Calyx pubescent shorter than petals
 8042 Lvs. smooth : radic. stalk. cordate-roundish crenate some 3-parted or cut, Cal. smooth longer than petals
 8043 Lvs. smooth : radic. stalk. 3-part. Lobes 3-lob. bluntly cut, Cal. smooth, Fruit very small in an obl. spike
 8044 Lvs. palm. 3-7-parted cut-toothed : upper sessile with lin. lanc. lobes, Stem branch. many-fl. Cal. appressed

β Radic. leaves 5-7-lobed with acuminate lobes, Bractes lin. entire

- 8045 Leaves smooth : radic. stalked 3-parted or pedate; upper linear, Stem erect few-fl. Calyx appressed
 8046 Lvs. silky: first ent. lin. lanc.; rest 3-part. with entire or 3-part. lobes, Stem many-fl. Cal. somewhat reflexed
 8047 Leaves tern. or bitern. Segm. toothed or cut trifid, Stem erect simple or branched, Fruit in a cylindr. spike
 8048 Rad. lvs. stalked villous 3 cut : first ovate toothed or 3-lobed, Stem erect 1-2-fl. Cal. spreading subreflexed
 8049 Leaves pinnate with 3-lobed cut multifid lobes, Stem about 1-fl. Cal. smooth, Pet. 8-10
 8050 Radical leaves stalked palmate 3-parted with trifid blunt thick lobes, Calyx very hirsute
 8051 Leaves smooth : radical stalked 5-fid with entire ovate lobes, Calyx very hirsute twice as short as petals
 8052 Rad. lvs. smooth 3-parted round with trifid blunt segments : cauline sess. linear-lobed, Cal. nearly smooth
 8053 Leaves round 3-lobed, Lobes blunt crenate at end, Stem about 1-fl. Cal. smooth, Pet. orbcd. or 3-lobed
 8054 Stem and petioles cover. with stiff hairs, Lvs. 3-fid with stalk. acutely 3-lob. segm. Cal. reflex. Style smooth
 8055 Rad. lvs. stalked 3-cut with trifid cut segm., of which the middle one is stalked, Stem erect, Cal. reflexed
 8056 Lvs. 3-lob. with blunt cut lobes, of which the mid. is stalk. Cal. refl. Grains with a single row of minute warts
 8057 Stem and petioles with soft hairs at base, Lvs. smooth. trif. with 3-lob. ac. cut segm. Cal. smooth spreading
 8058 Lvs. pinnate 3-fid with cuneate 3-lobed cut segm. Runners creeping, Cal. erect, Grains with an acute point

- 8059 Lvs. 3-5-lob. with lin. divisions, Stem erect and petioles with spreading hairs, Pedunc. furrowed, Cal. hairy
 8060 Lvs. pubesc. or smooth, Lobes cut-tooth. acute : upper lin. Stem many-fl. pubesc. Cal. vill. Grains mucron.

and Miscellaneous Particulars.

times double, but not so frequently as *R. acris*. It is distinguished from the repens, with which it has been confounded by some authors, by its roots, by its never throwing out runners, and by its reflexed calyx; this last character arises from its particular structure, the lower half being thin and almost transparent, and therefore not having a sufficient degree of solidity to support itself upright. It is the second flower which, next to the Dandelion, covers the meadows with dazzling yellow. Like most of the Crow-foots, it possesses the property of inflaming and blistering the skin; particularly the root, which is said to raise blisters with less pain and more safety than Spanish flies; hence these roots have been applied for that purpose, particularly to the joints in cases of the gout. According to Hoffman, beggars make use of them to blister their skins, with a view of exciting compassion. The juice of the herb is said to be more acrid than that of *R. sceleratus*, and if applied to the nostrils, it provokes sneezing. The roots, on being kept, lose their stimulating quality, and are even eatable when boiled. Hogs are fond of them, and frequently dig them up. The herb is too acrid to be eaten unmixed by cattle; accordingly the flowering-stalks are left to perfect the seed in pastures: some of it, however, is consumed, and it is not improbable that this and other pungent plants, mixed with the grasses, may act as a powerful stimulus to some animals, as salt does to others. It abounds in dry pastures, and flowers in May. Besides the name of round-rooted or bulbous Crowfoot, it is called by the common people butter-flower, butter-cups, king-cups, gold-cups; and it is the cuckoo-buds of yellow hue, of Shakspeare. The repens, hirsutus, and acris, however, are all confounded with this under one name by the vulgar.

R. repens is an obnoxious plant in every description of gardening and agriculture. From the great variety of soil and situation in which it is found, it assumes many varieties; by a river's side, or in marshes, it will grow three or four feet high, with a stem nearly as large as the human thumb; in barren gravelly fields it is entirely procumbent, with a stem not larger than a small wheat-straw; but in all states it retains the character of the creeping stem, and it does not lose it in cultivation. Its principal time of flowering is in June, but it may be found in blossom during most of the ensuing summer months in meadows and pastures, under hedges, in shady waste places, church-yards, and gardens. The qualities of this and bulbosus are similar: both blister the skin, and are very acrid in taste. Like the acris and bulbosus, it is sometimes found double, but more rarely.

R. acris is supposed to possess the blistering property in a considerable degree, whence Linnæus gave it the

History, Use, Propagation, Culture,

name of acris. Curtis says, that even pulling up the plant, and carrying it to some little distance, has produced a considerable inflammation in the palm of the hand: that cattle, in general, will not eat it; yet that sometimes, when they are turned hungry into a new field of grass, or have but a small spot to range in, they will feed on it, and hence their mouths have become sore and blistered. According to Linnæus, sheep and goats eat it; but kine, horses, and swine refuse it. When made into hay it loses its acrid quality, but then it seems to be too stalky and hard to afford much nourishment: if it be of any use it must be to correct, by its warmth, the insipidity of the grasses. In many pastures the flowering stems are left standing in vast abundance to disseminate their seeds: before they do that, they might easily be cut down with the scythe, or pulled up by women and children after a shower, which would more effectually destroy the plants; they should be gathered into heaps and burnt. It flowers in June and July, and is confounded vulgarly with the repens and bulbosus, under the name of butter-flower or butter-cups, under a notion that the yellow color of butter is owing to these plants. It is the richness and exuberance of the pasture that communicates this color, and not these flowers, which the cattle seldom or ever touch. It is frequent in gardens with a double flower, among other herbaceous perennials, under the name of yellow bachelor's buttons.

R. aquatilis produces flowers which are sometimes very large, and make a handsome show in ponds and ditches: the curious variety in the floating and immersed leaves, occasioned by the depth and velocity of the stream, adds to the beauty of this common aquatic plant. Dr. Pulteney (*Linn. Trans.* vol. 5. p. 19.) contradicts the assertions of its deleterious qualities, and proves that it is not merely innocuous, but nutritive to cattle, and capable of being converted to useful purposes in agricultural economy. In the neighbourhood of Ringwood, on the borders of the Avon, some of the cottagers support their cows, and even horses, almost wholly by this plant. A man collects a quantity every morning, and brings it in a boat to the edge of the water, from which the cows eat it with great avidity, insomuch that they stint them, and allow only about twenty-five or thirty pounds to each cow daily. One man kept five cows and one horse so much on this plant with the little which the heath afforded, that they had not consumed more than half a ton of hay throughout the whole year, none being used except when the river is frozen over. Hogs also are fed with this plant, and improve so well on it, that it is not necessary to give them any other sustenance till they are put up to fatten. This property of water-crowfoot is the more remarkable, as all the species have been deemed acrimonious, and some of them are, without doubt, highly so. It is probable this species is rendered inert as a poison by growing in the water; although it must be confessed, that in other instances moisture heightens the deleterious property of vegetables, especially in the umbelliferous tribe.

8061 Leaves trifid silky, Lobes broad toothed cut, Stem and petiole with reflexed hairs, Grains hooked
 8062 A small variety of *R. hirsutus*, with a dwarf 1-flowered stem
 8063 Lvs. reniform 3-5-lobed with broad entire blunt lobes, Pet. scarcely longer than cal. Petals 5-12 [bristles
 8064 The submersed lvs. capill. multifid : emerged 3-part. with cuneif. lobes tooth. at end, Grains hispid with stiff
 8065 The submersed lvs. capillary multifid : emerged 3-part. with cuneif. lobes toothed at end, Grains smooth
 8066 All the leaves capillary multifid, Pet. obovate larger than calyx, Grains smooth

8067 Leaves smooth : radical 3-parted ; cauline multifid with lin. lobes, Grains with long prickles on each side
 8068 Lvs. vill. : radic. stalk. ov. 3-part. cut ; floral 3-part. Stem erect dichotom. with spread. hairs, Grains muric.
 8069 Lvs. smooth stalk. bifid, Lobes oval obl. divaricat. : the mid. entire, Sheaths auricled at base, Stem filiform
 8070 Radical leaves round with 5 cut lobes : cauline sessile palmate, Stem pubescent, Cal. subhiskous
 8071 Rad. lvs. trifid beyond midd. with cuneif. trifid lobes, Stem with spread. hairs, Grains hooked with style
 8072 Lvs. smooth stalk. roundish 3-lob. coarsely tooth. Pedunc. opp. lvs. Cal. spreading, Grains muricate cornute
 8073 Lvs. vill. round 3-lob. coarsely tooth. Stems soft decumb. Cal. reflexed as long as pet. Grains tuberculate

8074 Sepals 5-10 spreading, Pet. 10-15 shorter than stamens

8075 Sepals 15 globose, Pet. 5-10 the length of stamens

8076 Sepals 10 spreading, Pet. 10 longer than stamens

8077 Caps. 10-20, Sepals acute, Root slender nearly simple perpendicular

8078 Caps. 1-3, Sepals blunt, Root creeping grumous

8079 Sepals 6-8-oblong

8080 Radical leaves pedate smooth, Scape leafless with 1-2-fl. and bractes
 8081 Radical leaves pedate smooth : cauline subsessile palmate, Sepals roundish ovate green
 8082 Radical leaves palmate downy beneath, Segm. cuneate at base 3-5-lobed at end, Sepals roundish colored
 8083 Radical leaves palmate downy beneath, Segm. obl. undivided serrate at end, Sepals ovate obl. acute green
 8084 Radical leaves very smooth pedate : cauline subsessile palmate, Sepals roundish green
 8085 Stem many-fl. leafy, Leaves pedate very smooth with obl. linear segments
 8086 Stem many-fl. leafy, Leaves 3 cut smooth glaucous beneath, Segments ovate-lanceolate

8087 Leaves trifid with obovate toothed blunt 3-lobed segments, Scape 1-flowered

and Miscellaneous Particulars.

This remark of Dr. Pulteney's is the more important, as in the Swedish experiments the *R. aquatilis* is recorded as the only one rejected by all the species of domestic cattle ; of the common sorts, there is no doubt but that *R. Flammula*, *bulbosus*, *acris*, *sceleratus*, and *arvensis* are acrimonious. Before the introduction of Cantharides they were used as vesicatories, and are said to act with less pain than flies, without any effect on the urinary passages ; but their action is related to be uncertain, and they are accused of frequently leaving ill-conditioned ulcers.

The acrimony, even of the most virulent, is wholly dissipated in drying ; so that in form of hay they appear to be harmless. It is also expelled in decoction ; accordingly, the shepherds of Morlachia boil the *R. sceleratus* and eat it ; and both *R. auricomus* and *repens* are said to be wholly inoffensive, and are ranked by some authors among oleraceous plants.

The Ranunculi give out their acrimony wholly in distillation. The distilled water of *R. sceleratus* is intensely acrimonious ; and when cold deposits crystals, which are scarcely soluble in any menstruum, and are of an inflammable nature.

1234. *Trollius*. A name given to this plant by Conrad Gesner. It is derived from *trol* or *trolen*, an old German word, signifying something round, in allusion to the form of the flowers. The species are showy flowers for the general border, and of the easiest possible culture.

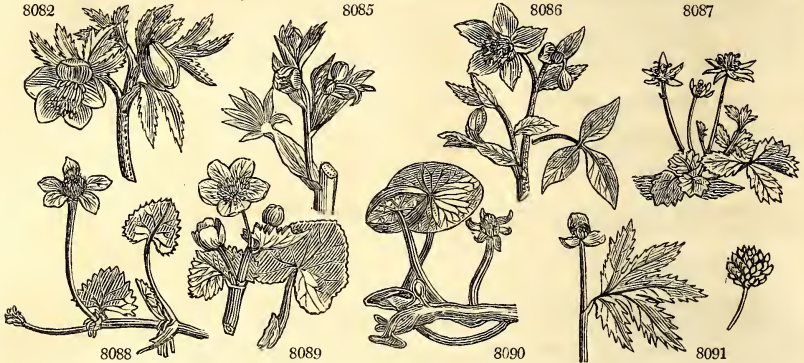

1235. *Isopyrum*. A name given by the Greeks to a plant resembling *Nigella*, the seeds of which had the same taste. These are small herbaceous plants related to *Nigella*, but with the habit of *Thalictrum*.

1236. *Eranthis*. From *ερα*, the earth, and *ανθος*, flower, because the bright yellow blossoms seem to lie upon the earth. A pretty little tuberous rooted plant, valuable for the early period at which it flowers.

1237. *Helleborus*. From *ελεειν*, to cause death, and *ερα*, food. The dangerous qualities of *Hellebore* are well known. Leathery leaved plants, most of which are evergreen, and flower in winter and early in spring. *H. niger* and *foetidus* have long been in use in popular medicine, especially the latter, as a vermifuge and cathartic. They are both admitted in the London *Materia Medica*, but being violent poisons, require caution in their application. *H. foetidus*, from its deep green and finely divided leaves, forms a most ornamental evergreen bush for the shrubbery.

1238. *Coptis*. From *κοπτα*, to cut, in reference to the numerous divisions of the leaves. Small plants, with the habit of *Trientalis*.

History, Use, Propagation, Culture,

1239. *Caltha*. A syncope of *καλαθός*, a goblet, in allusion to the form of the corolla, which may be likened to a golden cup. The flower-buds of *C. palustris*, gathered before they expand, are said to be a good substitute for capers. The juice of the petals boiled with alum dyes paper yellow. The whole plant is acrid, and not eaten by cows, unless in case of extreme hunger.

CLASS XIV. — DIDYNAMIA. 4 STAMENS, of which two are shorter than the others.

This class, which, as its name applies, depends upon the presence of four stamens in the corolla, two of them being longer than the others, is, with the exception of Syngenesia and Gynandria, the most natural and best defined of all Linnæus's great groups, or, as he named them, classes. It is divided into two orders, called Gymnospermia and Angiospermia.

Gymnospermia contains all the genera with what are popularly but erroneously called by the Linnæan school of botany, naked seeds. It answers to the natural order of Labiatae of Jussieu's method, with the exception of some genera which are excluded on account of having only two stamens, and are found in Diandria. Nearly all the class consists of herbaceous plants, those which are called shrubs being for the most part herbaceous plants, whose stems, from the mildness of the climate in which they grow, become perennial. The most remarkable plants are the rosemary, hyssop, balm, thyme, mint, and marjoram, for the kitchen or laboratory; and the various species of *Teucrium*, *Lavandula*, *Phlomis*, and *Dracocephalum*, for the flower garden.

In Angiospermia are included the genera with numerous, or rarely a few, seeds, enclosed in a simple pericarpium. These would be combined in a manner not altogether unnatural, if some of the genera were excluded. For instance, the beautiful *Linnaea*, the emblem of the most highly gifted naturalist the world has ever produced, belongs to the Caprifoliaceæ, and stands alone in point of natural affinity; the same may be said of *Melanthus*. The greater part of Scrophularinæ, all Melampyracæ and Orobanchæ, and nearly the whole of Verbenacæ and Gesneriæ are found here. A considerable portion of Acanthaceæ also occupy a station in this order. Among these are many genera of much beauty, but few of interest as useful plants. Among the ornamental families every one will recognize the Bignonia, with its elegant orange or yellow trumpet flowers, and frequently twining stem; the *Jacaranda*, with its fern-like umbrageous foliage and magnificent diadem of blue; the *Acanthus*, consecrated to sculpture; the noble *Clerodendrum*, the pride of the Japanese; and the modest *Eyebrights* (*Euphrasia*) of our English meadows. In one part of the class we have the *Vervain*, surrounded by its mystic moonlight charms; in another, the *Antirrhinum* tribe, remarkable for the grotesque resemblance of its blossoms to the snouts of animals; and close behind it, imperial *Pedicularis*, proudly rearing her heraldic honours among the snows and deserts of the frozen north. These are succeeded by a long line of forms, principally European, and of various degrees of beauty. Among the useful plants, *Digitalis*, used in medicine, and *Sesamum* as oil seed, are all which can be particularized.

Order 1. GYMNOSPERMIA.

Pericarpium divided into four lobes resembling naked seeds.

- 1242. *Ajuga*. Upper lip of cor. very minute, 2-toothed. Stamens longer than upper lip.
- 1243. *Anisomeles*. Calyx tubular, 10-striated, 5-cleft. Upper lip of corolla small, entire; lower trifid, with the middle segment 2-lobed. Stamens exerted, ascending. Anthers of the short stamens 2-celled, with close cells; of the longer halved or dissimilar. Seeds smooth.
- 1244. *Teucrium*. Upper lip of cor. none, 2-parted beyond the base. Stamens exerted.
- 1245. *Westringia*. Cal. campanulate, 5-toothed. Corolla subrotate, with the upper segment bifid. Two of the anthers barren.
- 1246. *Satureja*. Cal. tubular, striated. Segments of corolla nearly equal. Stamens distant.

8088 Stem creeping, Leaves triangular cordate serrate crenate
 8089 Stem erect, Leaves cordate roundish crenate with round auricles

8090 An aquatic floating plant, covered all over with viscid slime, Roots fibrous

8091 The only species. A small plant with simple stems and a few 3-5-parted leaves

and Miscellaneous Particulars.

1240. *Hydropeltis*. From *υδωε*, water, and *πελτη*, a buckler; that is to say, a water-plant, with a leaf like a round shield. A curious little floater, with the aspect of *Hydrocharis*.

1241. *Hydrastis*. From *υδωε*, water, in reference to the humid places wherein it grows. The root of this plant is yellow, bitter, pungent, and tonic.

1247. *Thymbra*. Cal. subcylindrical, 2-lipped, with a villous furrowed line on each side. Segm. of cor. flat. Style half bifid.

1248. *Hyssopus*. Lower lip of cor. 3-parted, with the intermediate segm. subcrenate. Stamens straight, distant.

1249. *Nepeta*. Cal. dry, striated. Cor. with a longish tube; the middle segments of lower lip crenate. Orifice reflexed at edge. Stamens approximating.

1250. *Elsholtzia*. Cal. tubular, 5-toothed. Upper lip of corolla 4-toothed; lower longer, undivided, somewhat crenulate. Stamens distant.

1251. *Lavandula*. Cal. ovate, somewhat toothed, supported by a bractea. Corolla resupinate. Stamens within the tube.

1252. *Sideritis*. Cal. 5-fid. Cor. ringent or subregular: the upper lip bifid, lower 3-parted. Stamens within the tube. The short stigma wrapping over the other.

1253. *Bystropogon*. Cal. with 5 subulate teeth, closed at the orifice with hairs. Upper lip of cor. bifid; lower trifid. Stamens distant.

1254. *Mentha*. Cor. nearly equal, 4-fid, with the broadest segment emarginate. Stamens erect, distant.

1255. *Perilla*. Cal. with the upper segment very short. Stamens distant. Styles 2, united.

1256. *Hyptis*. Cal. 5-toothed, increasing in size. Corolla ringent: the upper lip bifid; the lower 3-parted, with the intermediate segment shaped like a little bag. Stamens inserted in the swollen part of the tube, and declinate.

1257. *Horminum*. Cal. 2-lipped, awned, smooth in the orifice; when past flower, having its upper teeth crossing each other. Upper lip of corolla 2-lobed; lower 3-lobed, with nearly equal segments. Leaves radical. Scape nearly naked.

1258. *Glechoma*. Cal. 5-fid. Each pair of anthers forming by their union the figure of a cross.

1259. *Lamium*. Upper lip of corolla entire, vaulted; lower 2-lobed; the orifice toothed at the edge on both sides.

1260. *Galeopsis*. Upper lip of corolla somewhat crenate, vaulted; lower 2-toothed above.

1261. *Galeobdolon*. Cal. 5-fid, unequal, awned. Upper lip of corolla vaulted, entire; lower trifid, with acute segments. Anthers smooth.

1262. *Betonica*. Calyx awned. Upper lip of cor. ascending, flattish. Tube cylindrical.

1263. *Stachys*. Upper lip of cor. vaulted; lower reflexed at edges, intermediate larger and emarginate. Stamens after flowering reflexed towards the sides.

1264. *Zietenia*. Cal. 5-parted, with subulate very long equal segments. Segments of lower lip of cor. reflexed; intermediate folded together and emarginate. Stamens after flowering reflexed towards the sides. Grain one.

1265. *Ballota*. Cal. hypocrateriform, 5-toothed, 10-lined. Upper lip of cor. crenate concave. Grains ovate 3-cornered.

1266. *Marrubium*. Cal. hypocrateriform, rigid, 10 lined. Upper lip of cor. bifid, linear, straight.

1267. *Leonurus*. Cal. 5-angled, 5-toothed. Upper lip of cor. villous, flat, entire; lower 3-parted, with the middle segment undivided. Anthers covered, with shining spots.

1268. *Phomis*. Calyx 5-angled, 5-toothed. Helmet compressed, keeled, emarginate. Seeds bearded at end.

1269. *Leucas*. Cal. tubular, 10-striated, 8-10-toothed, with an orifice, either equal or oblique. Corolla ringent. Helmet concave, entire, bearded; lower lip 3-fid, with the middle segment largest. Anthers twin, beardless, with divaricating lobes. Stigma 2-lipped, with the upper segment very short.

1270. *Leonotis*. Differs from the last in having an elongated helmet, and the lower lip small and withering: the middle segment scarcely larger than the others.

1271. *Moluccella*. Cal. campanulate, enlarged, wider than corolla, spiny.

1272. *Clinopodium*. Invol. of many bristles beneath the whorl. Corolla 2-lipped. Upper lip of corolla flat, obovate, straight.

1273. *Pycnanthemum*. involucre of many bractes beneath the little heads. Cal. tubular, striated. Upper lip of corolla nearly entire; lower trifid. Stamens nearly equal.
1274. *Origanum*. Cone 4-cornered, spiked, collecting the calyxes. Upper lip of corolla erect, flat; lower 3-parted, with nearly equal segments.
1275. *Thymus*. Orifice of bilabiate calyx closed with hairs. Upper limb of corolla flat, emarginate.
1276. *Acynos*. Cal. 2-lipped, furrowed, hispid, gibbous at base, villous at orifice. Cor. ringent, inflated at orifice, with the upper lip erect, emarginate; the lower 3-parted, spreading: intermediate segm. concave. All the stamens fertile.
1277. *Calamintha*. Cal. after flowering closed by hairs. Orifice of cor. inflated. Upper lip emarginate; lower 3-parted, with the intermediate segment entire, subemarginate or crenulate.
1278. *Melissa*. Cal. dry, flattish above, with the upper lip somewhat fastigiate. Upper lip of cor. somewhat vaulted, 2-fid: lower less, with middle lobe cordate.
1279. *Dracocephalum*. Cor. inflated at orifice, with the upper lip concave.
1280. *Melittis*. Cal. smooth, campanulate, blunt, oblique at orifice. Upper lip of cor. flat; lower crenate. Anthers cruciate.
1281. *Ocymum*. Cal. with the upper lip orbicular; lower 4-fid. Corolla resupinate, with one lip 4-cleft, the other undivided. Exterior filaments having a process at their base.
1282. *Plectranthus*. Upper lip of cal. largest. Corolla resupinate, ringent, with the tube gibbous upwards, or spurred.
1283. *Trichostema*. Upper lip of cor. falcate, Stamens very long.
1284. *Prostanthera*. Calyx 2-lipped, in fruit closed. Tube striated, lips undivided, blunt. Corolla ringent, with a half bifid helmet: middle segment of lower lip large, 2-lobed. Anthers spurred beneath.
1285. *Scutellaria*. Cal. entire, after flowering closed with a lid. Tube of the corolla elongated.
1286. *Prunella*. Upper lip of calyx dilated. Filaments forked, upon one point bearing their anthers. Stigma bifid.
1287. *Cleonia*. Filaments forked, upon one point bearing their anthers. Stigma bifid.
1288. *Prasium*. Cal. campanulate, 2-lipped. Upper lip of cor. vaulted; lower trifid, with the middle segm. largest cordate. Grains berried.
1289. *Phryma*. Cal. 2-lipped, 5-toothed. Grain only one.

Order 2. ANGIOSPERMIA.

Seeds several, enclosed in an undivided pericarpium.

I. Ovary inferior, or nearly inferior.

1290. *Gesneria*. Cal. 5-fid. Corolla incurved and recurved. Capsule 2-celled.
1291. *Gloxinia*. Cal. 5-leaved. Cor. campanulate, with an oblique limb. Filaments with the rudiment of a fifth inserted upon the receptacle.
1292. *Linnaea*. Cal. double: of the fruit 2-leaved; of the flower 5-parted. Cor. campanulate. Berry dry, 3-celled.

II. Ovary superior, polypetalous.

1293. *Melianthus*. Cal. 5-leaved, with the lower leaflet gibbous. Petals 4, with the nectary below the lowest. Capsule 4-celled.

III. Ovary superior, monopetalous.

A. Filaments 5, the upper only rudimentary.

1294. *Bignonia*. Cal. 5-fid, cup-shaped. Cor. campanulate, 5-fid, ventricose beneath. Pod 2-celled. Seeds with membranous wings.
1295. *Jacaranda*. Cal. 5-toothed. Cor. tubular at base, with a dilated throat, and a 5-lobed unequal limb. Fifth filament sterile, long, villous at end. Stigma with two lips. Capsule large, round, woody, with the edge dividing into two valves.
1296. *Sesamum*. Cal. 5-parted. Cor. campanulate 5-fid, with the lower lobe largest. Stigma lanceolate. Capsule 2-celled, the cells divided in two by the inflexed edges of the valves.
1297. *Pentstemon*. Cal. 5-leaved. Cor. 2-lipped, ventricose. Fifth filament longer than the rest, and bearded at its upper end. Capsule compressed, 2-celled, 2-valved. Seeds numerous, subglobose.
1298. *Chelone*. Cal. 5-parted, with two bractes. Cor. ringent, ventricose. Fifth filament shorter than the others. Caps. 2-celled, 2-valved. Seeds numerous, with a membranous edge.
1299. *Tourretia*. Cal. 2-lipped. Corolla ringent: the upper lip galeate, large; lower 2-toothed, very small. Nectary annular, 4-lobed. Stigma truncate. Capsule 4-celled. Dissepiments with 4 wings. Seeds cordate.
1300. *Martynia*. Cal. 5-fid. Cor. ringent. Capsule woody, coated, with a hooked beak, 4-celled, 2-valved.

B. Filaments 4. Capsule many-seeded, opening with elasticity. Seeds large, flat.

* Calyx bifid.

1301. *Acanthus*. Cal. 4-parted: the two lateral inner segments short; the two outer long, with 3 bractes, of which the middle one is toothed, spiny. Cor. labiate, having the orifice closed with hairs. Lower lip very large, 3-lobed. Anthers villous. Stigma bifid. Caps. ovate, with 1-2-seeded cells.

** Calyx 4-fid.

1302. *Barleria*. Cal. 4-parted. Stamens 2, much smaller than the others. Capsule with 4 angles, 2-celled, 2-valved, elastic, without claws. Seeds 2.

*** Calyx 5-fid.

1303. *Phaylopsis*. Calyx unequal, with a large dorsal segment. Cells of the ovary 2-seeded, with the segments of the dissepiment spontaneously dividing in two. Otherwise like Blechnum.
1304. *Ruellia*. Cal. 5-parted, generally with two bractes. Corolla campanulate, with a 5-lobed limb. Stamens in pairs. Capsule narrowed to each end. Teeth opening elastically. Seeds not many.
1305. *Biechum*. Cal. 5-parted, equal. Cor. funnel-shaped. Capsule about 2-celled, 2-valved: the segments of the crosswise dissepiment finally becoming loose. Seeds many, with hooks.
1306. *Aphelandra*. Cal. 5-parted, unequal. Cal. 2-lipped. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.
1307. *Crossandra*. Cal. 5-parted, unequal. Cor. 1-lipped. Stamens included. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.

**** Calyx multifid.

1308. *Thunbergia*. Cal. double: outer 2-leaved; inner about 12-toothed. Cor. campanulate. Capsule beaked, 2-celled.

C. Filaments 4. Capsule, drupa, or berry few seeded. Seeds erect.

* Calyx bifid.

1309. *Hebenstreitia*. Cal. spathaceous, opening lengthwise beneath. Cor. tubular, unequal, with one upper 4-fid lip. Stamens projecting from the lower cleft of the corolla. Caps. 2-seeded.

** Calyx 4-fid.

1310. *Hosta*. Cal. obsoletely 2-lipped, 4-toothed. Corolla ringent, with the middle segment of the lower lip large, emarginate. Drupe with a 4-celled, 4-seeded nut.
1311. *Gmelina*. Cal. about 4-toothed. Cor. 4-fid, campanulate. Two of the anthers 2-parted, 2-simple. Drupe baccate. Putamen bony, 4-celled. Cells 1-seeded, the lower sterile.
1312. *Lantana*. Flowers capitate. Cal. obsoletely 4-toothed. Limb of corolla 4-fid, with an open orifice. Stigma hooked backwards. Drupes heaped, with a 2-celled smooth nut.
1313. *Aloysia*. Calyx deeply 4-cleft. Corolla tubular, 4-lobed. Stigma emarginate. Stamens 4, perfect. Seeds two.
1314. *Lippia*. Flowers capitate. Cal. 4-toothed, roundish, erect, compressed, membranous. Corolla 4-fid, funnel-shaped. Drupe dry, 1-seeded, thin, covered by the calyx. Nuts two, 1-seeded.
1315. *Melampyrum*. Capsule 2-celled. Seeds 2, gibbous, polished.

*** Calyx 5-fid.

1316. *Selago*. Cal. 5-fid. Tube of corolla filiform. Limb nearly equal. Capsule simple or 2-lobed, each lobe with 1 seed.
1317. *Vitex*. Cal. 5-toothed. Limb of cor. 5-6-fid. Drupe 1-seeded, with a 4-celled nut.
1318. *Cornutia*. Cal. 5-toothed. Stamens longer than corolla. Style very long. Berry 1-seeded.
1319. *Zapania*. Flowers capitate. Cal. 5-toothed. Cor. 6-fid. Stigma peltate, capitate, oblique. Fruit covered, bladdery, enclosing two seeds.
1320. *Priva*. Cal. inflated, 5-toothed. Cor. a little longer than the tube of calyx, contracted at orifice. Drupe covered by the calyx. Nuts two, 2-celled, 2-seeded. Stamens 2-4.
1321. *Spelmannia*. Cal. 5-fid. Limb of cor. 5-fid, the orifice closed by hairs. Stigma hooked. Drupe with a 2-celled warted nut.
1322. *Verbena*. Cal. 5-fid. Cor. funnel-shaped, with an incurved tube, and an unequal 5-fid limb. Stamens 4, fertile. Fruit bladdery, covered, withering. Seeds 4.
1323. *Avicennia*. Cal. 5-parted. Cor. 2-lipped: the upper lip square. Caps. coriaceous, rhomboid, 1-seeded. Seed germinating within the capsule.
1324. *Caldasia*. Cal. tubular, 5-toothed. Cor. hypocrateriform, nearly equal. Filaments inserted in top of tube. Caps. 3-celled, 3-seeded, 3-valved. Seeds elliptical.
1325. *Clerodendrum*. Cal. 5-fid, campanulate. Corolla with a filiform tube and a 5-parted equal limb. Stamens very long, projecting from between the segments of corolla. Drupe 4-seeded, with a 1-celled nut.
1326. *Volkameria*. Cal. 5-fid. Cor. with 1-sided segments. Drupe 2-seeded. Nuts 2-celled, with 1-seeded cells.
1327. *Holmskioldia*. Cal. colored, very large, campanulate, spreading, with a nearly entire limb a little shorter than the ringent corolla.
1328. *Petræa*. Cal. 5-parted, very large, colored. Corolla rotate. Caps. 2-celled, 2-seeded in the bottom of the calyx. Seeds solitary.
1329. *Citharexylum*. Cal. 5-toothed, campanulate. Corolla funnel-shaped, rotate. Segments villous, above equal. Drupe 2-seeded. Nuts 2-celled.
1330. *Durania*. Cal. 5-fid, superior. Drupe 4-seeded, covered by the calyx. Nut 4-2-celled, 2-seeded.
1331. *Petalium*. Cal. 5-parted. Cor. tubular, ringent, with a 5-cleft limb. Filaments hairy at base. Anthers in pairs, forming a cross. Nut corky, with spiny angles. Seeds 2, with an arillus.
1332. *Myoporum*. Cal. 5-parted. Corolla campanulate, with a spreading nearly equal 5-parted limb. Drupe 1-2-seeded, with 2-celled nuts.
1333. *Stenochilus*. Cal. 5-parted. Cor. ringent: the upper lip erect, half 4-cleft: lower undivided, narrow, deflexed. Stamens didynamous, exserted. Ovary 4-celled, with 1-seeded cells. Stigma blunt, undivided. Drupe berried, 4-celled. Seeds solitary.
1334. *Bontia*. Cal. 5-parted. Cor. 2-lipped, with an oblong tube: the lower lip 3-parted, revolute. Drupe ovate, 1-seeded, oblique at end.

D. Filaments 4. Capsule or berry many-seeded. Seeds small, attached to a central receptacle.

* Calyx bifid.

1335. *Orobanche*. Cal. of 2-lobed lateral leaflets. Corolla ringent. Capsule 1-celled, 2-valved, many-seeded. Gland at the base of the ovary.
1336. *Crescentia*. Cal. 2-parted, equal. Corolla gibbous. Berry stalked, 1-celled, many-seeded. Seeds immersed in pulp.
1337. *Castilleija*. Cal. spathaceous; the upper lip bifid, lower none. Cor. 2-lipped: the lower lip very short, trifid, with 2 glands between the segments. Caps. 2-celled.

** Calyx trifid.

1338. *Halleria*. Cal. 3 or 5-leaved. Cor. 4-fid, somewhat inflated. Berry 2-celled, many-seeded.

*** Calyx 4-fid.

1339. *Lathræa*. Cal. 4-fid. A depressed gland at the base of the suture of the ovary. Capsule 1-celled.
1340. *Rhinanthus*. Cal. 4-fid, ventricose. Cor. ringent, with the upper lip generally compressed. Capsule 2-celled, blunt, compressed.
1341. *Bartsia*. Cal. 4-lobed, emarginate, colored. Cor. smaller than the calyx: the upper lip longest. Capsule 2-celled. Seeds angular.
1342. *Euphrasia*. Cal. cylindrical, 4-fid. Corolla 2-lipped: the upper lip bifid; the lower 3-lobed, with bifid lobes. Lower anthers with spiny lobes.

**** Calyx 5-fid.

1343. *Antirrhinum*. Cal. 5-leaved. Cor. not spurred, gibbous at base: the upper lip bifid, reflexed; lower trifid, closed by the prominent palate. Caps. oblique at base, without valves, opening at the end by three pores.
1344. *Linaria*. Cal. 5-parted, with the two lower segments remote. Cor. spurred, ringent: the orifice closed by the prominent palate. Caps. ovate 2-valved, opening at the end into 3-5 segments.
1345. *Anarrhinum*. Cal. 5-leaved. Cor. prominent at base, honey bearing: lower lip flat, without a prominent palate. Caps. 2-celled, many-valved.
1346. *Nemesia*. Cal. 5-parted. Cor. spurred, with a prominent palate. Caps. compressed, truncate, opening lengthwise in the middle, 2-celled, 2-valved. Seeds numerous, linear.
1347. *Mauvandyia*. Cal. 5-parted. Cor. campanulate, unequal. Filaments callous at base. Caps. 2, united, half 5-valved at end.
1348. *Gerardia*. Cal. 5-fid. Cor. 2-lipped, the lower lip 3-parted, with emarginate lobes: the middle 2-parted. Capsule 3-celled, splitting.
1349. *Pedicularis*. Cal. 5-fid. Cor. ringent. Capsule 2-celled, mucronate, oblique. Seeds truncated. Leaves multifid.
1350. *Erinus*. Cal. 5-leaved. Cor. with a 5-fid, equal limb. Lobes emarginate: the upper lip very short, reflexed. Caps. 2-celled.
1351. *Mimulus*. Cal. prismatical, 5-toothed. Cor. ringent, with the upper lip folded back at the sides. Stigma thick. Capsule 2-celled, many-seeded.

1352. *Hornemannia*. Cal. tubular, 5-toothed, plaited. Cor. with the upper lip emarginate : lower 3-lobed. Seeds minute, scurfy.
 1353. *Mazus*. Cal. large, campanulate, spreading. Cor. ringent, with a pimpled throat. Anthers connected. Stigma spatulate. Caps. 2-celled, many-seeded.
 1354. *Isoplexis*. Like *Digitalis*, but corolla campanulate, with the upper segment as long as the lip, and incumbent upon it before expansion.
 1355. *Digitalis*. Cal. 5-parted. Corolla campanulate, ventricose, 5-fid. Capsule ovate 2-celled.
 1356. *Scrophularia*. Cal. 5-fid. Cor. subglobose, resupinate. Caps. 2-celled.
 1357. *Vandellia*. Cal. 4-fid. Cor. ringent. Two outer filaments from the disk of the lip of cor. Anthers united in pairs. Caps. 1-celled, many-seeded.
 1358. *Sibthorpia*. Cal. 5-parted. Cor. 5-parted, equal. Stamens in remote pairs. Caps. orbicular, compressed, 2-celled, with a transverse dissepiment.
 1359. *Limosella*. Cal. 5-fid. Cor. 5-fid, equal. Stamens approximating in pairs. Caps. 1-celled, 2-valved, many-seeded.
 1360. *Browallia*. Cal. 5-toothed. Cor. closed by the prominent orifice. Two of the anthers larger than the others. Caps. 1-celled.
 1361. *Stemodia*. Cal. 5-parted. Cor. 2-lipped. Stamens 4: each filament bifid, and bearing two anthers. Capsule 2-celled.
 1362. *Trevirana*. Cal. 5-leaved. Cor. decinate funnel-shaped. Limb flat, 5-parted, nearly equal. Caps. half 2-celled.
 1363. *Columnea*. Cal. 5-parted, spreading. Corolla ringent : the upper lip 3-parted, with the intermediate segment arched, above the base gibbous. Capsule berried, 1-2-celled.
 1364. *Russelia*. Cal. 5-leaved. Cor. 2-lipped, with a hairy throat : upper lip broader, emarginate, lower trifid, with linear segments. Stigma globose. Caps. 1-celled, 2-valved, many seeded.
 1365. *Dodartia*. Cal. campanulate, angular, 5-toothed. Lower lip of cor. broad, 3-fid. Stigma bifid. Caps. globose, 2-celled, covered by the calyx.

History, Use, Propagation, Culture,

1242. *Ajuga*. Said to be an alteration of *abigo*, to expel or drive away. The Latins attributed emmenagogue qualities to a plant called *ajuga*, which is believed to be our *Teucrium chamæpitys*. Handsome flowering plants. A. reptans is vulgarly reputed vulnerary, cooling, and gently astringent. It is commonly called *bugle*, which appears to be a corruption of *bugula*, a contracted diminutive of *buglossum*, which the plant resembles in medical qualities.
 1243. *Anisomeles*. So named by Mr. Brown, from *α*, privative, *ισος*, equal, and *μειλος*, a member. Tropical downy herbaceous plants. Their leaves are crenate, flowers grow in whorls supported by minute bractæ; the calyxes are glandular, and the corolla of all the species purple.
 1244. *Teucrium*. Teucer, the Trojan prince, is said by Pliny to have been the first to employ this plant

1366. *Lindernia*. Cal. 5-parted. Cor. ringent: upper lip very short. Two lower stamens with a terminal tooth and lateral anther. Capsule 1-celled.
1367. *Herpestis*. Cal. 5-parted, unequal: 2 inner sepals smaller, covered by the others. Cor. tubular, somewhat 2-lipped. Stamens included. Lobes of anthers spreading. Stigma emarginate.
1368. *Capraria*. Cal. 5-parted. Cor. campanulate, 5-fid, acute. Caps. 2-valved, 2-celled, many-seeded.
1369. *Buchnera*. Cal. absolutely 5-toothed. Limb of corolla 5-fid, equal, with cordate lobes. Capsule 2-celled.
1370. *Manulea*. Cal. 5-parted. Cor. funnel-shaped. Limb 5-parted, with subulate segments; the four upper large, connected. Caps. 2-celled, many-seeded.
1371. *Angelonia*. Cal. 5-parted, nearly equal. Cor. irregular, spreading, 2-lipped, with a short tube, and arched orifice: upper lip 2-parted; lower much larger, 3-parted, with the middle segment slipper-shaped at base.
1372. *Schizanthus*. Cor. irregular: the upper lip 5-fid; lower 3-parted. Two filaments sterile. Capsule 2-celled.
1373. *Besleria*. Cal. 5-parted. Cor. tubular, gibbous on each side, with a 5-lobed unequal limb. Berry roundish, 1-celled, many-seeded. Seeds nidulant.
1374. *Tectia*. Cal. 5-parted. Cor. hypocrateriform, 5-fid, blunt. Style short, persistent. Berry 2-celled, many-seeded.
1375. *Brunfelsia*. Cal. 5-toothed, small. Tube of cor. very long, with a flat 5-lobed limb. Capsule berried, 1-celled, many-seeded, with a very large receptacle.
1376. *Celsia*. Cal. 5-parted. Cor. rotate. Filaments bearded. Capsule 2-celled.
1377. *Atonsoa*. Cal. 5-parted. Cor. subrotate, resupinate, 5-fid, with the upper segment largest. Stamens declinate. Filaments smooth. Anthers approximating, similar. Capsule 2-celled.
1378. *Anthocercis*. Cal. 5-fid. Cor. campanulate, regular. Rudiment of a 5th filament. Stigma capitate. Caps. 2-celled, 2-valved, many-seeded. The inflexed edges of valves inserted in the placenta.

***** *Calyx multifid.*

1379. *Cymbaria*. Cal. 10-toothed. Upper lip of cor. bifid, lower trifid. Capsule cordate, 2-celled.

GYMNOSPERMIA.

- 8092 Leaves ovate, Cor. pubescent resupinate
- 8093 Four-cornered pyramidal villous, Radical leaves very large
- 8094 Stem simple, Cauline leaves as long as radical leaves
- 8095 Radical leaves smaller than cauline leaves
- 8096 Stolones creeping
- 8097 Leaves trifid, Fl. axillary solitary shorter than leaf, Stem diffuse
- 8098 Leaves linear toothed forwards, Flowers axillary solitary
- 8099 Leaves stalked subcordate ovate acuminate acutely crenate hairy, Thyrses axillary stalked
- 8100 Bractes filiform, Leaves lanceolate entire downwards
- 8101 Leaves ovate subcordate crenate, Whorls many-fl. Bractes linear, Calyx hairy, Glands inconspicuous
- 8102 Leaves multifid, Flowers lateral solitary
- 8103 Leaves multifid linear, Raceme compound, Pedicels short
- 8104 Leaves multifid, Whorls halved
- 8105 Leaves trifid or 5-fid filiform, Flower stalked solitary opposite, Stem decumbent
- 8106 Leaves lanceolate trifid, Pedunc. axillary 3-flowered
- 8107 Leaves lanceolate entire white beneath, Flowers solitary
- 8108 Leaves entire rhomboid acute villous downy beneath, Flowers solitary
- 8109 Leaves quite entire ovate acute stalked downy beneath, Flowers racemose one-sided
- 8110 Leaves oval toothed forwards, floral entire stalked, Whorls racemose, Stem much branched
- 8111 Leaves ovate toothed forwards, floral entire sessile, Whorls racemose, Stems branched

and Miscellaneous Particulars.

medically. Under-shrubs or herbs of little beauty; but several of them aromatic. The leaves and younger branches of *T. marum* (*Mar*, Arabic, signifying bitter), when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing, but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Cats are very fond of this plant, and where there are few will destroy them.

T. scorodonia (*σκαροδον*, garlic, the smell of which this plant possesses) in Jersey is used as a substitute for hops, and the beer is said sooner to become clear than when hops are made use of. Withering found on trial that it gave too much color to the liquor.

T. scordium, also from *σκαροδον*, garlic, was once in high esteem for destroying worms and for fomentations.

History, Use, Propagation, Culture,

Sheep and goats are said to eat this plant: horses, cows, and swine to refuse it. If cows, compelled by hunger, eat it, their milk gets a garlic flavor.

T. chamædry's, is said to have cured Charles V. of the gout, by a vinous decoction taken for sixty successive days. It is commonly called Germander, which seems to be a corruption of the word Chamædry's, for the French call it *germandrée*, an evident alteration of *gamandrè*, under which name it first appeared in the very rare *Herbier de Mayence*, printed in 1485.

1245. *Westringia*. Named by Sir J. E. Smith, in honor of Dr. John Peter Westring, physician to the king of Sweden, and author of several learned papers on the Lichen tribe. A genus of New Holland plants, chiefly from the colder parts of that country, and having the appearance of our Rosemary.

- 8112 Leaves ovate-oblong villous nearly entire, Flowers axillary solitary sessile
 8113 Leaves ovate serrate smooth, Pedunc. sol. 3-flowered; intermediate sessile, Bractes linear lanceolate
 8114 Leaves lanceolate repand-serrate rectangular at base, Fl. racemose one-sided, Calyx 2-lipped
 8115 Leaves lanceolate crenate rugose, Flower racemose one-sided, Calyx 2-lipped
 8116 Leaves ovate serrate, Raceme spiked round sessile terminal
 8117 Leaves cuncate serrate cut smooth narrowed into the stalk, Flower solitary stalked
 8118 Leaves ovate-lanceolate serrate hoary beneath, Stem erect round terminal, Whorls 6-leaved
 8119 Leaves ovate unequally serrate, Racemes terminal, Bractes shorter than flower-stalk
 8120 Leaves oblong acuminate unequally serrate pubescent, Spikes sessile terminal, Cal. inflated villous
 8121 Leaves cordate oblong obtuse, Stem brachiate dichotomous, Spikes very long terminal sessile spiral
 8122 Leaves cordate toothed acuminate, Racemes lateral nodding
 8123 Leaves cordate subpubescent toothed stalked, Racemes axillary one-sided, Stem erect herbaceous
 8124 Leaves lanceolate crenate tomentose hoary beneath, Racemes terminal, Flower stem brachiate
 8125 Leaves cuneiform lanc. serrated villous, Racemes axillary and terminal, Cor. resupinate
 8126 Leaves ovate rugose cut crenate hoary, Stems erect, Racemes straight one-sided
 8127 Leaves oblong sessile toothed nearly naked, Fl. axillary stalked in pairs, Stem diffuse pubescent
 8128 Leaves cuneiform ovate cut crenate stalked, Fl. ternary, Stems procumbent somewhat hairy
 8129 Leaves elliptical crenate, Fl. lateral solitary, Lip of cor. woolly outside, Leaves various in form
 8130 Leaves ovate cut serrate smooth, Whorls halved, Stems erect smooth
 8131 Leaves ovate crenate: floral entire, Whorls halved racemose, Stem bearded in two rows
 8132 Corymbs terminal, Cal. with acute unarmed teeth, Leaves lanceolate entire downy beneath
 8133 Corymbs terminal, Cal. with acute mucronate teeth, Lvs. linear entire revolute at edge downy beneath
 8134 Heads terminal few-flowered, Leaves stalked ovate blunt downy beneath, Stem procumbent
 8135 Corymbs terminal, Leaves cuneiform orbicular crenate hairy
 8136 Corymbs terminal hairy, Leaves ovate serrate and stems densely woolly at the ends yellow and shining
 8137 Heads roundish stalked, Leaves lanceolate blunt crenate revolute at edge downy, Stem decumbent
 8138 Heads roundish, and leaves, which are linear lanceolate crenate forwards, tomentose yellow at end
 8139 Fl. solitary clustered, Leaves linear revolute crenate, Calyxes woolly
 8140 Heads roundish lax, Leaves lanceolate crenate forwards downy hoary, Stem woolly corymbose
 8141 Heads stalked, Leaves lanceolate crenate tomentose, Stem erect
 8142 Heads roundish, Leaves linear revolute crenate forwards close and stem densely woolly
 8143 Heads terminal sessile, Leaves linear revol. at edge packed in four close rows, Stem procumbent downy
 8144 Spiny, Upper lip of calyx ovate, Corolla resupinate, Peduncles twin
 8145 Leaves entire ovate acute stalked revolute at edge pubescent downy beneath, Fl. racemose

- 8146 Leaves beneath and calyxes silvery, Teeth half as long again as tube
 8147 Leaves beneath and calyxes ash-colored opaque, Teeth half as short as tube

- 8148 Whorls fastigiate, Leaves linear lanceolate rough
 8149 Lvs. acute revolute at edge pubescent, Pedunc. axillary many-fl. Bractes much shorter than calyx
 8150 Whorls roundish hispid, Leaves obovate oblong acuminate veinless dotted hispid
 8151 Pedunc. axillary 3-6-flowered, Bractes shorter than calyx, Leaves ovate hispid veiny beneath
 8152 Pedunc. axillary cymose one-sided, Sepals acuminate mucronate, Leaves lin. lanc. entire mucronate
 8153 Stem erect branched with spreading hairs, Upper leaves hairy acute, Ped. 1-flowered axillary
 8154 Ped. axill. cymose one-sided, Sepals blunt unarmed, Lvs. roundish ovate atten. at base toothed bluntish
 8155 Pedunc. axillary cymose, Leaves lanceolate entire, Stem brachiate
 8156 Flowers spiked, Leaves keeled dotted ciliated
 8157 Fl. axillary 3 subsessile, Bractes linear, Leaves oblong entire attenuate at base smooth hispid beneath

- 8158 Flowers spiked, Bractes heaped linear ciliate
 8159 Flowers whorled, Leaves linear lanceolate entire

- 8160 Fl. whorled racemose 1-sided, Middle lobe of cor. 2-lobed entire, Leaves lanceolate, Teeth of calyx erect
 8161 Fl. whorled racemose 1-sided, Midd. lobe of cor. 2-lobed entire, Lvs. lin. lanc. Teeth of cal. spreading uneq.
 8162 Pedunc. axillary cymose, Cor. resupinate, Middle lobe crenate, Leaves oblong cordate toothed [tooth.
 8163 Spikes whorled cylind. Midd. lobe of cor. crenate, Style shorter than cor. Lvs. subcord. ov. acum. sharply
 8164 Spikes whorl. cylind. Midd. lobe of cor. crenate, Style longer than cor. Lvs. cord.-ov. acum. bluntly tooth.

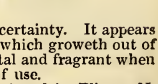

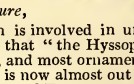

and Miscellaneous Particulars.

1246. *Satureja*. The Arabs call all labiate plants by the collective name of *ss'atar*, according to Bochart. Forskahl says, they call the wild Thyme *ss'atar*. *S. montana* and *hortensis* have been cultivated as culinary aromatics from time immemorial, and much more formerly than now, when almost all European species are superseded by those of the East Indies.

1247. *Thymbra*. A name of uncertain origin. The ancients gave it to a plant analogous to Thyme. Possibly it may have been so called after the name of a place. *Thymbraea*, a town in Lydia, was the spot where the famous battle was fought between Cyrus and Croesus, in which the fate of the latter was decided.

1248. *Hyssopus*. Latinized from the Hebrew name *ezob*. The Arabic name *azzof*, is evidently the same.

History, Use, Propagation, Culture,

Vide John de Souza, p. 106. The plant to which this name was given is involved in uncertainty. It appears to have been one of the smallest plants, whence some have inferred that "the Hyssop which groweth out of the wall" is a kind of moss. H. officinalis, a neat little evergreen tuft, and most oriental and fragrant when in flower, was once in considerable repute as a popular medicine, but is now almost out of use.

1249. *Nepeta*. Said by Linnæus to be derived from *Nepet*, a town of Tuscany, mentioned by Pliny. *N. cataria* is called *catmint*, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure. Ray observes, that plants which he transplanted from the fields into his garden were always destroyed by the cats, unless he protected them with thorns till they had taken good root and came into flower; but that they never meddled with plants raised from seed. Miller has confirmed this by his own experience; having frequently set a plant from another part of the garden within two feet of others which came up from seeds, when the former was torn in pieces and destroyed by the cats, whilst the latter remained unharmed. The true reason of this difference is assigned by Ray; that the cat is fond of it in a languid withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting. Hence the English vulgar saying,

- 8165 Flowers spiked, Whorls somewhat stalked, Leaves stalked cordate tooth-serrated
 8166 Corymbs stalked spiked, Leaves lanceolate rugose tomentose bluntly serrated
 8167 Spike whorled interrupted, Leaves cordate toothed rugose waved crisp stalked hoary
 8168 Cymes stalked many-flowered, Leaves lanceolate oblong cordate naked, Lateral lobes of cor. reflexed
 8169 Cymes stalked many-fl. hairy, Lvs. oblong cordate villous subsessile, Lateral lobes of cor. reflexed
 8170 Cymes stalked many-fl. pilose, Leaves cordate stalked naked subsessile, Lateral lobes of cor. spreading
 8171 Cymes remote stalked 1-sided few-fl. Lvs. cordate blunt crenate glandular beneath: floral all sessile
 8172 Cymes stalk. 1-sid: lower rem. Lvs. cord. blunt cren. rug. downy without glands: floral generally stalked
 8173 Cymes stalked many-flowered, Leaves stalked oblong subcordate crenate downy
 8174 Flowers pinnated, Leaves lanceolate serrate sessile naked
 8175 Cymes stalked, Leaves cordate oblong lanceolate deeply serrate downy
 8176 Leaves cordate oblong serrated, Bractes linear, Whorls 8-12-flowered incurved nearly 1-sided
 8177 Racemes whorled naked, Leaves cordate oblong sessile naked
 8178 Flowers sessile in whorled spikes, Bractes lan. longer than calyx pubesc. Leaves stalked villous beneath
 8179 Cymes stalked racemose, Leaves obl. cordate serrate beneath hoary and rugose with veins
 8180 Leaves cordate oblong crenate stalked, Stem smooth angular, Flowers whorled capitate clustered
 8181 Fl. sessile in whorled spikes, Bractes lin. the length of calyx, Leaves stalked
 8182 Fl. sessile in whorled spikes, Whorls distant capitate, Bractes lan. length of cal. Leaves stalked entire
 8183 Leaves sessile lanceolate in approximated whorls, Bractes ovate with netted veins [at end
 8184 Cymes stalked many-fl. Tube of cor. filiform curved, Leaves ovate cordate blunt stalked serr. pubescent
 8185 Cymes stalked few-fl. racemose, Leaves ovate cordate blunt stalked toothed pubescent
 8186 Spikes term. Bractes obl. acum. nerved with colored lines, Lvs. cord. pubesc. Lateral lobes of cor. reflexed
 8187 Spikes term, Bractes ov. nerved rugose subscarioso, Lvs. obl. cord. villous, Lateral lobes of cor. spreading
 8188 Flowers spiked, Leaves pinnatifid entire
 8189 Flowers spiked, Lateral lobes of cor. spreading, Leaves pinnatifid with lin. nearly equal segments

- 8190 Stems prostrate, Leaves ovate subserrate, Spikes terminal, Calyx scarious at end
 8191 Spikes solitary unilateral erect, Bractes veiny

- 8192 Leaves sessile lin. lanc. revolute at edge, Spike interrupted naked

- 8193 Leaves sessile lin. downy revolute at edge, Spike contracted comose subsessile, Bractes 3-lobed
 8194 Leaves sessile lin. rugose villous revolute at edge, Spike comose, Bractes undivided
 8195 Leaves sessile linear pectinate-pinnate, Spike contracted comose
 8196 Lvs. stalked pinnate, Leaflets cuneate, Spike imbricated
 8197 Lvs. stalked hoary, Leaf. pinnatifid crosswise, Spike simple 4-corn. spiral, Bractes ovate nerved villous
 8198 Lvs. stalked pinnate nearly smooth, Leaf. pinnatifid crosswise, Spike branched interrupted 4-cornered
 8199 Lvs. stalked ovate cordate serrate fleshy, Spike 4-cornered, Calyxes curved

- 8200 Shrubby villous, Lvs. cordate oblong acute stalked, Spikes whorled before flowering nodding
 8201 Shrubby downy, Lvs. ovate lanc. cordate narrowed at end white beneath, Whorls about 8-fl. remote
 8202 Herbaceous without bractes, Cal. larger than cor. spiny, Upper lip trifid
 8203 Herbaceous without bractes villous, Stem diffuse, Segm. of calyx nearly equal spiny
 8204 Herbaceous decumbent without bractes, Leaves spatulate toothed at end, Cal. spiny, Upper lip ovate
 8205 Half-shrubby woolly, Leaves lanc. nearly entire, Fl. in whorled spikes, Bractes cordate acute downy
 8206 Half-shrubby downy, Lvs. lanc. cren. Fl. in whorled spikes, Bractes cord. acum. reticulated with nerves
 8207 Herbac. pilose-hispid, Upper lvs. lanc. amplexicaul. toothletted, Bractes cord. acum. netted hairy at edge
 8208 Half-shrubby downy, Lvs. linear lanceolate nearly entire, Flowers and bractes toothed
 8209 Hirsute, Lvs. lanc. spiny toothed, Bractes round. cord. shorter than cal. with spiny teeth, Whorls distant
 8210 Hirsute, Lvs. lanc. spiny toothed, Bractes cord. acum. longer than cal. with spiny teeth, Whorls close
 8211 Lvs. lanc. smooth entire, Bractes cord. toothed-spiny, Calyxes equal
 8212 Leaves lanc. toothed smooth above, downy beneath, Bractes ovate toothed spiny, Calyxes equal

and Miscellaneous Particulars.

"If you set it
 The cats will eat it;
 If you sow it
 The cats will not know it."

1250 *Elsholtzia*. Named by Willdenow, in memory of a Prussian botanist, John Sigismund Elsholtz, who lived in the middle of the seventeenth century. Inconspicuous hardy herbaceous plants of little merit.

1251. *Lavandula*. From *lavare*, to wash. The use of the distilled water of this plant is well known. The flowers of *L. spica* have an agreeable fragrant odour, and warm bitterish taste. Alcohol extracts their virtues completely, and elevates in distillation all their odorous parts; water acts less completely. The oil, however, on which their virtues depend, is obtained separate in distillation with water; in the proportion, according to Lewis, of one ounce of oil from sixty ounces of the flowers. Lavender is stimulant and tonic. The oil extracted by alcohol enters into several compositions. The dried leaves in powder were used formerly as a sternutatory; but they are now neglected. The flowers are cut in dry weather, when they begin to blow. (*London Dispensatory*, 862.)

1252. *Sideritis*. From *σιδηρος*, iron. A name given by the Greeks to a plant by which were cured all

History, Use, Propagation, Culture,

wounds by sword. The plants of the moderns do not possess any such properties. Their flowers, however, have frequently a ferruginous color.

1253. *Bystropogon.* A name elegantly contrived by L'Heritier, from βυσσ, to close, and πορρω, a beard, in allusion to the throat of the corolla being closed by hairs.

1254. *Mentha.* Μενθω or μινθω, in old Greek. The poets feign that Mintha was a daughter of Cocytus, transformed into the plant which bears her name; an allegorical description of the terrible effects ascribed to their plant by the ancients. *M. viridis* not being so hot to the taste as peppermint, and having a more agreeable flavor than most of the others, is generally preferred for culinary and some medicinal purposes. The leaves or tops are used in spring salads, and eaten dried as sauce with lamb and in soups.

The medical preparations of spearmint are more pleasant than those of peppermint, but perhaps less efficacious. This herb, as do the other sorts, contains much essential oil, but of an odor less agreeable than that of lavender or marjoram: it is therefore less employed as a cephalic; but it acts very powerfully on parts to which it is immediately applied, and therefore considerably on the stomach. It acts especially as an antispasmodic, and therefore relieves pains and cholick arising from spasm. It will also stop vomiting dependent on the same cause; but if it arise from an inflammatory irritation in the stomach itself, or in other parts of the body, it aggravates the disease. The infusion of mint in warm water agrees better with the stomach than the distilled water. The officinal preparations are an essential oil, a conserve, a simple water, and a spirit. The conserve is very grateful, and the distilled waters both simple and spirituous, are generally thought pleasant.

8213 Leaves lanc. toothed blunt pilose, Bractes toothed spiny, Stems hirsute decumbent
 8214 Hirsute, Lvs. obl. cuneate toothed wavy downy beneath, Bractes round with spiny teeth, Whorls distant
 8215 Shrubby downy, Lvs. cord. obl. crenate stalked downy on each side, Upper lip of cor. ovate entire
 8216 Like *hyssopifolia*, but leaves smooth on each side somewhat toothed lanccolate blunt

8217 Panicle dichotomous, Cal. feathery, Leaves ovate subserrate downy beneath
 8218 Panicle dichotomous, Cal. feathery, Leaves ovate entire very white beneath
 8219 Panicle dichotomous, Flowers capitate, Leaves ovate crenate most villous beneath
 8220 Panicle dichotomous, Flowers capitate, Leaves ovate toothed smooth dotted

8221 Spikes oblong, Leaves oblong serrated hairy sessile, Stamens longer than cor.
 8222 Spikes cylindr. interrupted, Leaves ovate-obl. subsessile remotely serrate and calyxes smooth
 8223 Hoary, Spikes oblong interrupted, Leaves roundish rugose crenate sessile

8224 Spikes obl. Leaves sessile oval finely and equally serrate acum. hoary beneath, Stamens as long as cor.
 8225 Spikes obl. Lvs. ovate stalked serr. hoary beneath, Calyxes and peduncles hirsute, Stem much branched
 8226 Leaves stalked subcordate slightly pubescent, Spikes middle sized [somewhat hairy
 8227 Spikes cylindr. interrupted, Lvs. lanc. subsess. cun. at base finely serrated smth. on each side, Teeth of cal.
 8228 Spks. obl. Lvs. obl. comp. blunt serrat. ses. hoary and downy on each side, Cal. and ped. vill. Stem much br.
 8229 Spikes obl. blunt interrupted at base, Lvs. ov.-obl. acute serrat. stalked smooth, Cal. quite smooth at base
 8230 Flowers racemose whorled, Leaves stalked ovate lanc. serrated smooth
 8231 Spikes capitate, Leaves cordate cut-toothed wavy sessile, Stamens length of corolla [hirsute
 8232 Spikes cylindr. interrupt. Lvs. ov. obl. subsess. cuspid. ser. waved complicate hoary on each side, Cal. and ped.
 8233 Spikes cylindr. Lvs. ovate obl. subsess. cuspidate serr. wavy complicate hoary on each side
 8234 Flowers in heads, Lvs. ellipt. blunt serrated smooth stalked, Stamens shorter than corolla

8235 Spikes cylindr. interrupted, Lvs. ovate lanc. stalked finely serr. entire at base, Ped. hirsute, Cal. smooth
 8236 Spikes obl. interrupt. at base, Lvs. obl. lanc. subsess. remotely and finely serrat. entire at base hoary beneath
 8237 Spikes cylindr. contracted, Leaves obl. subcor. subsess. equally serrated hoary beneath, Cal. and ped. hirsute
 8238 Spks. cylindr. interrupt. at base, Lvs. ov. obl. subsess. finely and unequally serr. hoary, Cal. and ped. hirsute
 8239 Spikes cylindr. interrupted, Lvs. ovate-ellipt. rounded at end serrated subsessile hoary beneath

8240 Spks. cylindr. interrupt. at base, Lvs. lin. lanc. nearly entire complicate sess. hoary on each side, Ped. and
 8241 Flowers whorled, Lvs. ovate stalked serrated entire at base smooth, Teeth of calyx hairy
 8242 Fls. whorl. Lvs. ov.-lanc. narrowed at each end, Cal. tubular obl. hairy, Hairs of pedicels spreading, of stems
 8243 Low pubesc. Fl. whorled, Lvs. stalked with resinous dots acute at each end, Stamens exserted [deflexed
 8244 Flowers capitate or whorled, Lvs. stalked ovate, Calyx hairy on each side, Pedicels hispid backwards
 8245 Whorls spiked oblong, Leaves lanceolate entire downy
 8246 Fl. whorled, Lvs. ovate stalked serrate hairy, Cal. hairy, Ped. smooth, Stem erect
 8247 Flowers whorled, Lvs. ovate acutish serrated, Stamens longer than corolla
 8248 Spikes cylindr. interrupted at base, Lvs. ovate stalked serrate beneath hairy, Cal. and peduncle hirsute
 8249 Flowers whorled, Lvs. lanc. subsess. Stem much branched erect, Cal. at base and pedicels very smooth
 8250 Flowers whorled, Lvs. ovate stalked serrate hairy, Cal. and peduncles hirsute, Stem much branched

8251 Flowers whorled, Lvs. ovate, Stem much branched spreading, Calyxes and pedicels smooth at base
 8252 Flowers whorled, Lvs. lanc. serrate stalked hairy, Stam. as long as corolla
 8253 Flowers whorled, Lvs. ov. subsess. cuspidate serr. wavy nearly smooth, Pedunc. and calyx smooth at base
 8254 Flowers whorled, Lvs. ovate, Stem prostrate, Pedicels and cal. downy on each side, Teeth ciliated
 8255 Flowers whorled, Lvs. lanc. nearly entire sessile smooth, Bractes palmate

and Miscellaneous Particulars.

Lewis observes, that mint is said to prevent the coagulation of milk; and hence it has been recommended to be used with milk diets, and even in cataplasms and fomentations for resolving coagulated milk in the breasts: upon experiment, the curd of milk, digested in a strong infusion of mint, could not be perceived to be any otherwise affected than by common water; but milk, in which mint leaves were set to macerate, did not coagulate near so soon as an equal quantity of the same milk kept by itself. Dry mint digested in rectified spirits of wine, gives out a tincture which appears by day-light of a fine dark green, but by candle-light of a bright red color. The fact is, that a small quantity of this tincture is green, either by day-light or candle-light, but a large quantity seems impervious to common day-light; however, when held between the eye and a candle, or between the eye and the sun, it appears red; so that if put into a flat bottle it appears green, but when viewed edgewise red.

For medicinal use spearmint is generally cut just as the flowers appear; but for obtaining the essential oil, the flowering plant is preferred. It should be cut in very dry weather. (*London Dispensatory*, 384.)

M. piperita has a more penetrating smell than any of the other species, and a much stronger taste, pungent and glowing like pepper, sinking as it were into the tongue, and followed by a sensation of coldness. Its stomachic, anti-spasmodic and carminative qualities render it useful in flatulent colics, hysterical affections, retchings, and other dyspeptic symptoms, acting as a cordial, and often producing immediate relief. The official preparations are an essential oil, a simple water, and a spirit. The essence of peppermint is an elegant medicine, and seems to be the rectified oil dissolved in spirits of wine.

“The cultivators of the plant observe, that to keep up its quality, the roots must be transplanted every three

History, Use, Propagation, Culture,

years, otherwise it degenerates into the flavor of spearmint." (*Linnean Transactions*, v. 176.) If the plant be cut in wet weather it changes to black, and is little worth. (*London Dispensary*, 385.)

M. pulegium (from *pulex*, a louse, which animal it was thought to drive away) smells like spearmint, but less fragrant; the taste aromatic and pungent, with a slight flavor of camphor. These qualities reside in a very volatile essential oil, which rises in distillation with water. It was formerly regarded as emmenagogue, expectorant, and diaphoretic, and was in repute for promoting the uterine evacuation, and relieving hysteria, hooping-cough, asthma; but it is now justly considered of no value, and seldom used in regular practice. (*London Dispensary*, 386.)

1255. *Perilla*. A name the meaning of which has not been explained. An annual plant with a strong balmy fragrance.

1256. *Hyptis*. From *hypos*, reversed, because the corolla seems inverted, both as to its form and as to the insertion of stamens. Plants with densely whorled flowers, all natives of the western parts of the world, within, or nearly so, the limits of the tropics.

1257. *Horminum*. From *hormeo*, to excite, in allusion to its stimulant qualities. The Horminum of the ancients was reputed aphrodisiac.

1258. *Glechoma*. Γληχον was a sort of Thyme among the Greeks. Small trailing herbs. The leaves of *G. hederacea* are often deformed with red hairy tumours, which are the galls of the *Cynips Glechomæ*. Before

8256 Leaves ovate serrate, Bractes long leafy

- 8257 Heads stalked in an involucre, Invol. lanc. the length of flowers, Leaves ovate toothed
 8258 Heads stalked in an involucre, Invol. lanc. longer than flowers, Leaves oblong toothed narrowed at base
 8259 Heads opp. few-fl. without bractes, Pedunc. shorter than joints, Leaves cord. doubly serrate; upper oval
 8260 Flowers in spiked 1-sided panicles on a two-parted peduncle, Leaves ovate
 8261 Flowers in stalked capitate cymes, Leaves of invol. 2 longer than calyx in fruit, Leaves oblong
 8262 Leaves ovate subcordate attenuate acutely crenate pubesc. spiked whorled terminal, Cal. 5-toothed
 8263 Flowers capitate, Invol. filiform hispid shorter than calyx of fruit, Lower leaves cordate
 8264 Heads on a short peduncle, Leaves of invol. oblong lanc. Cal. pubescent not closed with hairs

8265 Stem leafy, Leaves ovate oblong crenat Bractes cordate, acuminate, Cal. pungent

- 8266 Smooth, Segment of calyx ovate acute
 8267 Hirsute, Segment of calyx lanceolate cuspidate

- 8268 Leaves cord. unequally finely serr. Orifice of cor. inflated, Lower lip 3-toothed on each side, Cal. colored
 8269 Leaves cord. rugose, Stem smooth, Cal. smooth the length of tube of corolla
 8270 Leaves cord. acute rugose and stems hairy, Whorls many-flowered, Tooth of orifice solitary setaceous
 8271 Leaves cord. concave somewhat hoary, Orifice of cor. inflated, Tube straight with two teeth on each side
 8272 Leaves cord. acuminate, Whorls 10-flowered
 8273 Leaves cord. acuminate serrate stalked, Whorls 20-flowered
 8274 Smooth, Leaves cordate crenate: floral subsessile, Teeth of calyx as long as cor.
 8275 Leaves stalked somewhat toothed: lower cordate; upper ovate
 8276 Leaves stalked cordate blunt toothed; upper close together, Stem naked below
 8277 β Leaves cut-toothed
 8277 Floral leaves sessile amplexicaul cut; radical lobed
 8278 Leaves many-parted

- 8279 Joints of stem equal, All the whorls remote, Leaves lanceolate
 8280 Joints of stem equal, Leaves ovate lanceolate serrate villous, Helmet crenate cut
 8281 Joints of stem thickened upwards, Upper whorls contiguous, Cal. pungent, Cor. little longer than calyx
 8282 Stem hispid, Joints thickened upwards, Cor. thrice as long as calyx, Helmet ventricose

8283 All the leaves ovate, Involucre 4-leaved

- 8284 Spike interrupted, Helmet entire, Middle segm. of lower lip emarg. Cal. smoothish
 8285 Spike oblong, Helmet entire, Middle segm. of lower lip crenate wavy, Cal. hairy, Bractes ciliated
 8286 Spike interrupted, Helmet bifid, Middle segm. of lower lip crenate, Tube downy incurved
 8287 Spike entire, Middle segm. of lower lip entire
 8288 Spike leafy at base, Helmet bifid
 8289 Spike leafy at base, Helmet entire
 8290 Spike leafy interrupted, Calyx villous at edge, Teeth subulate, Helmet orbicordate

and Miscellaneous Particulars.

the use of hops, the leaves were put in ale, and being bitter, aromatic, and having a peculiar and very strong smell, were much used in popular medicine. It is now, however, seldom used.

1259. *Lamium*. *Lamium* is a celebrated marine monster; the flowers of this genus have a considerable resemblance to the grotesque figure of some beast. *L. orvala* is the only species admitted into the garden. The others are mostly ugly weeds. *L. album*, *Ortie blanche*, Fr., *Taube Nessel*, Ger., and *Ortica montana* or *bianca*, Ital., has a disagreeable smell when bruised, and though no cattle whatever will touch it, yet Linnaeus says, the leaves are eaten in Sweden as a pot herb in spring.

1260. *Galeopsis*. From $\gamma\alpha\lambda\eta$, a weasel, and $\psi\iota\varsigma$, appearance. The flower has a grotesque figure, and may be likened to the form of a weasel, or, indeed, of any thing else.

1261. *Galeobdolon*. A word with the same meaning as *Galeopsis*, which see.

1262. *Betonica*. In Celtic botany is called *Bentonic*; wherefore it appears, that Pliny gave too much way to conjecture, when he wrote that *Betonica* or *Vetonica* was so called from the Vetones, a people who dwelt at the foot of the Pyrenees. *B. officinalis* was formerly much used in medicine, but it is discarded from modern practice. When fresh it intoxicates. The leaves when dry excite sneezing. Sheep eat it, but goats refuse it. The roots are bitter and very nauseous; in a small dose they vomit and purge violently. This plant dyes wool of a very fine dark yellow color.

History, Use, Propagation, Culture,

1263. *Stachys*. From *σταχυς*, a spike; the flowers of all the species grow in spikes. They are for the most part strong smelling weeds.
 1264. *Zietenia*. A genus divided by Gleditsch from *Stachys*, on account of the different structure of the corolla, and the single grain. It is a plant with lanceolate entire linear leaves, the lower of which are connate, and purple blossoms.

- 8291 Whorls 6-flowered, Leaves cordate stalked
 8292 Leaves ovate obl. acum. serrated hairy above with soft down beneath, Segm. of cal. linear mucronate
 8293 Whorls spiked 6-fl. Tube of cal. shorter than spread teeth, Helm. of cor. cmarg. Lvs. ov. serr. with soft down
 8294 Small, Stems much branched diffuse, Leaves cordate crenate, Cal. campanulate spiny
 8295 Whorls about 6-flowered, Leaves linear lanceolate $\frac{1}{2}$ stem-clasping sessile
 8296 Whorls 6-flowered, Leaves ovate cordate crenate, Petioles dilated
 8297 Leaves cordate cren. pubescent, Whorls 4-6-flowered, Stem erect smooth simple
 8298 Whorls many-fl. approximated, Bractes filiform, Leaves cordate toothed, Stem decumbent villous
 8299 Hoary, Whorls many-fl. Leaves ovate, Serratures imbricated, Stem woolly
 8300 Whorls many-fl. Calyxes subpungent, Leaves oblong subcordate crenate, Stem woolly
 8301 Whorls many-fl. Leaves woolly oblong, Stems procumbent at base and rooting
 8302 Whorls 10-fl. Calyxes unarmed, Leaves cordate: floral ovate entire sessile, Stem hairy
 8303 Whorls 6-fl. Leaves oblong cordate stalked, Stem hollow
 8304 Whorls 2-fl. Leaves linear naked; lower pinnatifid-toothed
 8305 Like *S. germanica*, but downy not woolly, Leaves narrower, Calyxes long spiny
 8306 Whorls many-fl. Leaves cordate thin, Serratures cartilaginous at end, Lips of cor. flat
 8307 Whorls spiked 6-flowered, Bractes cordate, Leaves cordate stalked blunt crenate toothed
 8308 Leaves ovate crenate pubescent: upper entire, Whorls 6-fl. Cal. hairy with filiform segments
 8309 Whorls spiked, Lvs. oblong attenuated at base serrated hairy: lower blunt, Cal. mucronate spiny
 8310 Erect pubescent, Leaves cord. ov. toothed: above smooth; beneath white with down, Whorls about 6-fl.
 8311 Whorls a little spiked hairy 6-fl. Cal. spiny, Leaves oblong serrate blunt, Helmet bifid
 8312 Hairy, Whorls 30-flowered, Calyx pungent, Stem hairy
 8313 Smooth much branched, Branches spiny, Pedunc. axillary solitary 1-fl. with two bractes
 8314 Hoary, Branches brachiately terminated by a spine, Flowers axillary in threes
 8315 Leaves downy ovate lanceolate: floral shorter than the whorl
 8316 Whorls 6-flowered, Radical leaves oval crenate: upper ovate entire, Cor. twice as long as calyx
 8317 Leaves obliquely cordate rugose crenate blunt hairy, Bractes entire shorter than calyx
 8318 Leaves cordate ellipt. the lower on long stalks, Stems and spinulose calyxes covered with wool
 8319 Whorls 2-flowered, Leaves cordate deeply serrated rugose, Tube of cor. curved
 8320 Whorls 6-flowered, Stems prostrate, Upper lip of cor. bifid spreading reflexed, Lvs. broad cord. crenate
 8321 Hoary, Whorls 6-fl. Leaves linear lanceolate narrowed at base downy rugose serrated, Calyxes pointless
 8322 Whorls 6-fl. Calyxes rather pungent, Lvs. cuneate lanceolate blunt serrate at end sessile, Stem decum.
 8323 Whorls subsipated, Leaves cordate ellipt. crenate rough, Stems ascending
 8324 Whorls 6-fl. Leaves ovate lanc. rugose 3-nerved stalked, Stem erect
 8325 Small, Whorls 6-fl. Leaves blunt nearly naked, Corolla the length of calyx, Stem weak
 8326 Whorls many-fl. spiked, Upper lip bifid, with acute divisions, Leaves broad cordate rugose hairy
 8327 Whorls 8-flowered, Leaves lanceolate cordate crenate rugose, Stem very hairy

8328 Whorls 6-flowered very hairy, Leaves lanceolate entire lined

- 8329 Leaves cordate undivided serrated, Cal. acuminate
 8330 Leaves cordate undivided serrated, Cal. subtruncate
 8331 Leaves palmate toothed, Stem woolly

8332 Leaves whorled halved 2-parted half-spiked

- 8333 Leaves cuneiform 5-toothed plaited, Whorls without involucrem
 8334 Leaves elliptical obtuse crenate downy rugose, Calyxes and bractes lanceolate
 8335 Leaves oblong hoary rugose toothed; the teeth towards the end largest, Cal. with small subulate teeth
 8336 Leaves lanceolate hoary rugose toothed at end, Cal. with setaceous teeth, Stem branched divaricating
 8337 Leaves ovate hoary bluntly toothed rugose, Cal. with subulate teeth, Stem branched at base
 8338 Leaves roundish subcordate crenate rugose, Cal. with straight villous setaceous teeth
 8339 Leaves cordate roundish emarginate crenate, Calyx 10-toothed spiny
 8340 Leaves roundish ovate toothed rugose, Teeth of calyx 10 setaceous hooked
 8341 Leaves cordate crenate downy green above, Teeth of calyx mucronate recurved
 8342 Leaves cordate ovate crenate, Teeth of cal. 10 spreading lanceolate, Bractes subulate
 8343 Leaves roundish cordate unequally crenate, Limb of calyx spreading, Teeth ovate mucronate
 8344 Leaves cordate roundish, crenate somewhat toothed, Teeth of calyx 10 unarmed
 8345 Leaves ovate greenish deeply crenate, Teeth of calyx subulate smooth spreading
 8346 Leaves cordate ovate crenate, Limb of calyx spreading, Teeth ovate mucronate, Bractes oblong
 8347 Hoary, Limb of calyx flat villous, Leaves cordate concave, Stem shrubby
 8348 Limb of calyx longer than tube membranous, Larger angles rounded

and Miscellaneous Particulars.

1965. *Bulicta*. So named on account of its offensive odor, from $\epsilon\alpha\lambda\lambda\omega\varsigma$, to reject.

1966. *Marrubium*. According to Linnaeus is derived from an ancient town of Italy called *Maria-urbs*, situated on the borders of the Fucine lake. *M. vulgare* dried, has an aromatic odor, which, however, is soon lost by keeping, and a bitter taste. Both water and alcohol extract its virtues. It is tonic, diuretic, and laxative; was formerly much used in pulmonary affections, and is still a popular remedy for asthma and obsti-

History, Use, Propagation, Culture,

nate coughs. It loosens the belly when taken in large doses, and was consequently recommended in jaundice, cachexies, menstrual obstructions, and hysteria; but its powers are not found by modern practitioners equal to the account ancients gave of them, and therefore it is very seldom prescribed. (*London Dispensatory*, 379.)

1267. *Leonurus*. From *λεων*, a lion, and *ουρα*, tail. The spikes of flowers were formerly used in medicine, but is now neglected. Tall herbaceous plants with cut leaves and whorls of flowers, of which the corolla is woolly.

1268. *Phlomis*. *Φλομης* was the Greek name of the Mullein, and so called from *φλαξ*, fire, because the thick cottony leaves were used as wicks for lamps. At this day, *P. Lychnitis* is so called, because the dried leaves, which are cottony and russet colored, are used in Spain for wicks. Fine shewy small shrubs or herbaceous plants, with corolla covered with down, and usually of a brownish yellow color.

1269. *Leucas*. A name used by Burmann, neglected by Linnaeus and others, and restored by Mr. Brown; derived from *λευκος*, white, in reference to the usual color of the flowers, which are covered all over with a thick covering of wool.

1270 *Leonotis* From *λεων*, a lion, and *ωτις*, an ear. A fanciful name applied to the fine scarlet-flowering

8349 Leaves cordate 3-lobed or 5-lobed cut toothed wavy, Cor. larger than pungent calyx
 8350 Leaves cuneiform ovate 3-lobed toothed, Cor. larger than pungent calyx, Middle lobe of lower lip acute
 8351 Leaves 3-parted cut, Calyxes villous
 8352 Leaves 3-parted multifid linear somewhat blunt
 8353 Lvs. obl. toothed, Cor. scarcely longer than somewhat pungent calyx, Middle lobe of lower lip roundish
 8354 Leaves about 5-lobed, Lobes blunt toothed at end, Cal. sessile spiny

8355 Leaves oblong blunt rugose and branches downy; floral ovate-lanceolate, Bractes ovate acuminate
 8356 Leaves elliptical blunt woolly rugose, Branches woolly, Bractes obovate twice as short as calyx
 8357 Bractes lanceolate acute pungent, Cal. 5-cornered acuminate, Leaves densely woolly beneath
 8358 Bractes lanceolate blunt unarmed, Cal. truncated pointless, Leaves woolly on each side
 8359 Lvs. downy on each side: rad. cord. sagitt.; cauline obl. Whorls without bractes, Cal. with obl. acute teeth
 8360 Leaves lanceolate downy: floral ovate, Bractes setaceous woolly length of bluntly toothed calyx
 8361 Stem hairy, Lvs. cordate crenate downy beneath, Bractes 3-parted subulate mucronate as long as calyx
 8362 Lvs. ovate obl. serrate hairy beneath, Teeth of calyx lanc. subulate erect, Bractes subul. and stem hairy
 8363 Radical leaves cordate pubescent; floral lanceolate, Bractes linear subulate villous, Stem pubescent
 8364 Radical leaves cordate rough; floral oblong lanceolate, Bractes subulate hispid, Stem smooth
 8365 Leaves alternately pinnate, Leaflets laciniolate, Calyx woolly
 8366 Leaves stalked obl. lanc. serr. at end, rough above downy beneath, Teeth of calyx subulate spreading
 8367 Leaves cordate crenate downy beneath, Bractes ovate-lanceolate mucronate
 8368 Like *P. fruticosa*, but the lower leaves are cordate stalked, Upper ovate

8369 Leaves lanceolate serrate, Heads terminal, Calyxes with 8 teeth
 8370 Leaves obl. toothed pubes. beneath, Whorls many-fl. globose, Cal. incurv. 8-toothed, upper tooth longest
 8371 Leaves ovate serrated hoary, Invol. subulate, Cal. obliquely truncate membranous 9-toothed
 8372 Invol. linear, Cal. 1-lipped oblique, Leaves ovate hairy
 8373 Lvs. lanc. smooth serrated at end, Stem 4-cornered rough, Whorls many-fl. Lip of cor. undivided

8374 Leaves cordate acute serrated somewhat downy, Calyx 7-toothed awned; upper tooth largest
 8375 Leaves lanceolate serrate, Calyxes 10-cornered 10-toothed unarmed
 8376 Leaves small ovate blunt somewhat downy crenate, Cal. 7-toothed awned
 8377 Leaves stalked ovate cordate acuminate cut-toothed, Cal. velvety 10-toothed

8378 Cal. 2-lipp. upper lip lanc. mucron. longest, lower round. 7-tooth. Teeth spiny, Lvs. stalk. ov. deeply tooth.
 8379 Cal. campanulate 5-toothed, Teeth equal pointless, Leaves stalked roundish ovate toothed
 8380 Cal. funnel-shaped 5-toothed: teeth equal mucronate, Leaves sessile wedge-shaped oblong toothed

8381 Heads whorled, Bractes setaceous hispid, Leaves hairy above remotely toothed, Stem simple
 8382 Heads terminal, Bractes setaceous hispid, Leaves smooth above nearly entire

8383 Leaves oblong-ovate acute subserrate hoary, Heads compound, Bractes setaceous, Stamens exserted
 8384 Leaves lanceolate ovate subserrate on short stalks somewhat hoary, Heads sessile, Bractes awned
 8385 Stem much branched rather rough, Leaves linear 3-nerved entire, Heads terminal fascicled

8386 Stem much branched roughish, Lv. lin. lanceolate veiny entire, Heads terminal fascicled corymbose

8387 Leaves concave downy, Spikes naked
 8388 Lower leaves downy, Spikes nodding
 8389 Leaves all smooth, Spikes nodding
 8390 Spikes 4-cornered, Bractes roundish very large
 8391 Spikes aggregate long prismatic upright, Bractes membranous twice as long as calyx

and Miscellaneous Particulars.

plants, known at the Cape by the name of lion's tail. They require a good greenhouse and plenty of air to secure their appearing in perfection. In places badly ventilated their leaves acquire a yellow color, and are apt to fall off.

1271. *Moluccella*. Brought from the Moluccas. Plants remarkable for the enlarged calyx in which the flower is seated.

1272. *Clinopodium*. From $\alpha\lambda\iota\nu\eta$, bed, and $\pi\upsilon\varsigma$, a foot. The tufted close whorls of flowers have been compared to the caster of a bed's foot.

1273. *Pycnanthemum*. From $\pi\upsilon\kappa\nu\omicron\varsigma$, dense, and $\alpha\nu\theta\omicron\varsigma$, a flower. The blossoms are in a close head. A North American genus of plants, some of which, as *P. verticillatum* and *incanum*, are occasionally seen in gardens.

1274. *Origanum*. From $\omicron\omicron\epsilon\omicron\varsigma$, a mountain, and $\gamma\alpha\nu\omicron\varsigma$, joy. These plants, with their pretty spikes of bracted flowers and agreeable perfume, may indeed be called the joy of the places where they grow naturally. *O. vulgare* is an aromatic and ornamental plant, growing wild in thickets and hedges, chiefly in a calcareous soil. The dried leaves used instead of tea, are said to be exceeding grateful; they are also used in fomentations: the essential oil is so acrid, that it may be considered as a caustic, and is much used with that intention by

History, Use, Propagation, Culture,

farriers; a little cotton moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain. The country people use the tops to dye woollen cloth purple. It also dyes linen of a reddish brown color. For this purpose the linen is first macerated in alum water and dried; it is then soaked for two days in a decoction of the bark of the crab-tree; it is then wrung out of this, boiled in a ley of ashes, and then suffered to boil in the decoction. According to the Swedish experiments, goats and sheep eat it, horses are not fond of it, and kine refuse it.

O. onites and marjorana are culinary aromatics; the latter being principally in use under the name of knotted marjoram, from the flower coming in whorls at the joints. O. vulgare and marjorana are both retained in the *Materia Medica* as tonics and stomachics, though scarcely ever used. In quack medicine, the leaves dried and powdered form an ingredient in cephalic snuff. Marjorana is so called from *marjamic* (*māryamyeh*), its Arabic name, according to Förskañl, p. 59.

1275. *Thymus.* From *θυμωσ*, courage, on account of its balsamic smell, which revives the spirits of animals. *T. serpyllum*, from *σέρπω*, to creep, is fragrant, and yields an essential oil that is very heating. It has the same sensible qualities as garden thyme, but the flavor is milder, and rather more grateful. Its essential oil is both smaller in quantity and less acid, and its spirituous extract comes greatly short of the penetrating warmth and pungency of the other. It is a common notion that the flesh of sheep that feed upon aromatic plants, particularly wild thyme, is superior in flavor to other mutton. The truth is, that sheep do not crop

- 8392 Leaves ovate acute serrated, Spikes clustered in umbels
 8393 Spikes on long stalks aggregate, Bractes the length of calyx
 8394 Spikes roundish panicled clustered, Bractes longer than calyx ovate colored
 8395 Spikes oblong aggregate hairy, Leaves cordate downy
 8396 Leaves stalked ovate pubesc. Spikes clustered prismatical, Bractes imbricate ovate smooth ciliated at edge
 8397 Leaves stalked ovate acute subserrate hairy, Spikes prismatical, Bractes dense ovate acute
 8398 Leaves subsessile ovate acute subserrate hairy, Spikes oblong bluntish
 8399 Spikes roundish thin compact stalked, Leaves stalked ellipt. blunt smoothish
 8400 Spikes roundish several clustered stalked, Leaves stalked ellipt. blunt downy

- 8401 Flowers capitate, Stems decumbent, Leaves flat blunt ciliated at base
 8402 Flowers capitate, Stems creeping hairy, Leaves blunt villous
 8403 Leaves ovate smooth with the smell of common balm
 8404 Flowers capitate, Stems procumbent, Leaves cuneate linear ciliated at base
 8405 Erect, Leaves revolute ovate, Flowers in whorled spikes
 8406 Leaves oblong more ciliated than in *T. serpyllum*, Cor. with a more obscure spot in the orifice
 8407 Stem shrubby, Flowers in whorled spikes, Lvs. linear lanc. bluntish flat about 3-nerved ciliated at base
 8408 Erect, Leaves revolute linear-lanc. hairy, Head few-flowered axillary stalked
 8409 Flowers capitate, Stems creeping, Leaves linear nerved and furrowed beneath, Bractes ovate
 8410 Fl. whorled somew. spiked, Ped. 1-fl. Stem shrubby erect, Lvs. ellipt. entire acute smooth shining above
 8411 Flowers in whorled spikes, Cal. woolly with very long setaceous segments
 8412 Flowers in whorled spikes, Spikes oblique, Ped. 1-fl. Lvs. ov. obtuse very entire and calyxes nearly naked
 8413 Flowers in whorled heads, Stems filiform, Leaves roundish flat hairy nerved ciliate at base
 8414 Flowers in whorled spikes, Cal. woolly with setaceous teeth, Lvs. ellipt. entire downy on each side
 8415 Flowers in whorled spikes, Stem erect, Lvs. linear very blunt nerveless revolute at edge ciliated at base
 8416 Pedun. about 3-fl. axillary, Lvs. ovate blunt nerved entire sess. Cor. twice as long as calyx, Stem villous
 8417 Heads laxly imbricated, Bractes broad ovate colored not dotted, Leaves linear entire
 8418 Heads imbricated large, Bractes toothed, Leaves setaceous hairy
 8419 Flowers whorled, Stem half-shrubby erect, Leaves hispid acuminate
 8420 Flowers axillary subsolitary stalked, Leaves cordate acute entire, Stems filiform

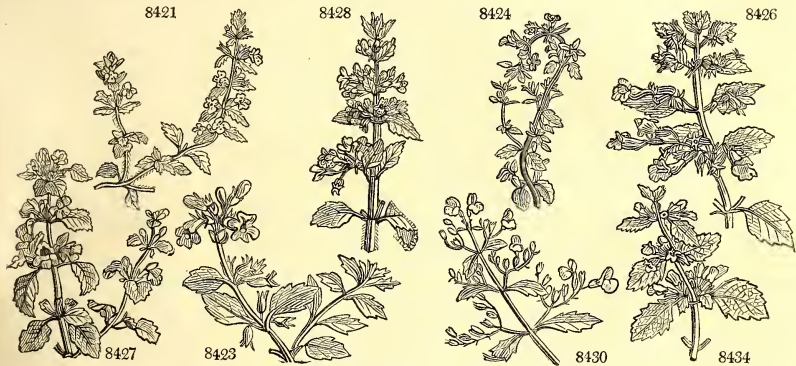

8421 Stem erect branched at base, Leaves ovate acute serrated forwards, Whorls 6-flowered

- 8422 Hirsute villous larger than the last, Stem much branched, Leaves ovate
 8423 Whorls 6-fl. Leaves nearly blunt roundish concave subserrated
 8424 Nearly smooth, Whorls 6-10-fl. Leaves ovate subserrate, Stem ascending
 8425 Fls. whorled, Pedunc. 1-flow. Stem branched spreading, Leaves roundish acute subserrate at end hairy

8426 Pedun. axill. 3-4-fl. Bractes lanc. sessile, Leaves ovate acute finely serrated
 8427 Leaves rhomboid oval obsoletely toothed upwards, Whorls somewhat stalked about 10-fl. shorter than leaf

- 8428 Stem weak, Pedun. axill. many-fl. dichotomous, Lvs. ovate blunt serrated hairy dotted
 8429 Pedunc. axill. many-fl. in dichotomous corymbs, Lvs. ovate blunt subserrate smoothish
 8430 Leaves ovate somewhat toothed glaucous, Pedunc. axill. dichotomous, Segm. of calyx equal
 8431 Racemes terminal, Peduncles solitary very short
 8432 Branches thin twiggy, Leaves downy beneath

8433 Villous, Leaves cordate crenate-toothed, Branches axillary elongated flowering
 8434 Whorls halved subsessile, Bractes oblong stalked, Leaves ovate acute serrated

and Miscellaneous Particulars.

these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favorable to aromatic plants produce a short sweet pasturage best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows. The attachment of bees to this and other aromatic plants is well known.

Few plants are subject to more varieties than wild thyme. In its most natural state, on dry exposed downs, it is small and procumbent; but when it grows among furze or other plants, it runs up with a slender stalk to a foot or more in height. It differs also very much in the smoothness or hairiness of its leaves. The flowers are sometimes larger than ordinary, and of a paler purple color, or even white.

T. vulgaris has the aromatic qualities common to lavender, sage, rosemary, and other *Verticillatae*. It yields a species of camphor in distillation with water. In Spain they infuse it in the pickle with which they preserve their olives. Before the oriental spices were common, it was much used in cookery.

1376. *Acymos*. The Greek name of a balsamic plant, which probably was related to *Thymus*. This genus was included in *Thymus* by Linnæus.

1377. *Calamintha*. From *καλως*, beautiful, and *μινθον*, mint. An ancient Greek name of a plant supposed to chase away serpents.

1378. *Melissa*. This is the Greek name of the bee, from *μελις*, honey, which is sought by bees in these flowers with avidity, as indeed it is in all the plants of the order. The recent plant has the agreeable odor of

History, Use, Propagation, Culture,

lemons, which is lost in drying, and an austere, slightly aromatic taste. In distillation with water, it yields a small portion of a yellow essential oil, on which its odor depends. It is stomachic and diuretic, and was formerly prized as a corroborant in hypochondriacal and nervous affections; but it is now used only in the form of tea, as a grateful diluent in fevers. For medicinal use the herb should be cut before it flowers, as it is then more odorous. (London Dispensatory, 383.)

1279. *Dracocephalum*. From *δρακων*, a dragon, and *κεφαλη*, a head. A name applied in the same sense as *Lamium*, *Galeopsis*, &c. See those genera. Most of the species are plants of ornament, and cultivated as such in the gardens of the curious. *D. canariense* smells of citron, especially when rubbed between the fingers. Sown on a hot-bed early in spring, it may be planted out in the borders like other tender annuals. *D. austriacum* is a handsome plant for a flower border.

- 8435 Smooth, Flowers spiked close, Leaves linear lanceolate serrated
 8436 Flowers spiked remote, Leaves obovate lanceolate toothletted upwards
 8437 Spikes short 4-cornered, Corolla variegated, Leaves oblong toothletted upwards
 8438 Flowers spiked, Leaves ternate oblong
 8439 Fl. somewhat spiked, Lvs. roundish cuneiform sinuate-toothed, Upper lip of cal. undivided mucronate
 8440 Fl. somewhat spiked, Leaves lanceolate remotely mucronate toothed, Bractes lin. lanc. toothed spiny
 8441 Fls. spiked, Lvs. sessile linear mucronate, Cauline 3-5-parted at base, Stem branched somewhat villous
 8442 Flowers spiked, Leaves and bractes lanceolate undivided pointless, Stem nearly simple smooth
 8443 Fls. whorled, Lvs. obl. blunt toothed stalked, Bractes lanc. entire, Upper lip of cal. ellipt. blunt undivided
 8444 Fls. whorled, Rad. lvs. cord. ov. ; cauline sessile roundish wedge-shaped acutely toothed, Teeth of cal. equal
 8445 Flowers whorled, Whorls stalked bifid one-sided, Leaves lanc. cordate acum. serrated smooth
 8446 Flowers whorled, Bractes lanceolate deeply toothed dotted beneath, Lower serratures subclimated
- 8447 Flowers whorled, Bractes oblong ciliated, Cal. striated pubescent, Tube of cor. longer than calyx
 8448 Flowers whorled, Bractes orbicular serrate ciliate
 8449 Stem erect, Leaves linear lanceolate blunt entire at edge rough, Two upper teeth of calyx largest
 8450 Leaves broad-lanceolate finely serrated entire at base, Lower teeth of calyx longest
 8451 Flowers in spiked heads, Leaves roundish pinnatifid crenate downy on each side
 8452 Flowers whorled, Bractes oblong ovate entire, Cor. twice as long as calyx nodding
 8453 Flowers whorled, Bractes oblong entire, Cor. scarcely larger than calyx
- 8454 Leaves opposite ovate toothed, Calyx 3-lobed hairy
- 8455 Cal. 4-lobed smooth, Cor. yellowish white, Segment of lower lip violet in the middle
- 8456 Flowers in paniced fascicles, Stem much branched
 8457 Racemes paniced, Leaves ovate oblong cuneate at base acutely serrated hoary beneath
 8458 Racemes paniced, Leaves ovate cuneate at base bluntly serrated, Veins hairy above rough beneath
 8459 Stamens toothless, every other one bearded at base
 8460 Stem $\frac{1}{2}$ shrubby, Leaves lanceolate ovate subtomentose, Racemes rounded
 8461 Stem shrubby, Leaves ovate serrate, Stamens very long
 8462 Leaves ovate smooth, Calyxes ciliated
 8463 Leaves ovate entire
 8464 Leaves somewhat oblong blunt serrated wavy, Stem hairy, Bractes cordate
 8465 Leaves ovate oblong, Foot-stalks, bractes and calyxes ciliated
 8466 Leaves sublanceolate acuminate subserrate, Racemes rounded, Stem nearly herbaceous
 8467 Leaves ovate-oblong serrated, Bractes cordate reflexed concave, Spikes filiform
 8468 Cor. 4-fid, Racemes leafless nodding at end
 8469 Leaves linear lanceolate serrate [than calyx
 8470 Lvs. broad ovate acum. at each end serr. Bractes shorter than cal. winged at edge, Cor. scarcely longer
 8471 Leaves ovate cordate acute serrated rugose, Recesses closed, Bractes roundish wedge-shaped
 8472 Leaves ovate, Flowers aggregate, Footstalks lateral
 8473 Downy, Lvs. ovate lanceolate crenate stalked, Whorls terminal racemose, Corolla the length of calyx
 8474 Leaves oblong elliptical serrated hoary on long stalks, Stamens twice as long as corolla
 8475 Like *Ocymum polystachyon*, but not having a musky scent as that has

- 8476 Nectary spurred, Racemes compound, Pedunc. 3-parted, Stem shrubby polished
 8477 Nectary gibbous, Racemes leafless, Stem nearly equal
 8478 Nectary gibbous, Racemes compound, Pedunc. 1-flowered whorled, Stem half shrubby nearly smooth
 8479 Cor. falcate, Flower-stalks branched

- 8480 Nectary gibbous, Flowers spiked, Stem herbaceous hairy rufous dotted
 8481 Flowers whorled sessile, Lower lip of calyx 4-parted, Bractes cordate acuminate
 8482 Stem 6-angled, Leaves ternate stalked ovate crenate rugose, Roots tuberous
 8483 Leaves stalked cordate crenate hairy, Bractes nearly equal to flower ovate

and Miscellaneous Particulars.

1280. *Melittis*. A name with the same meaning as *Melissa*.

1281. *Ocymum*. Said by Mathiolus to be derived from $\epsilon\lambda\omega$, to smell, on account of the powerful scent of the plants. *O. gratissimum* is cultivated in China for culinary purposes. *O. Basilicum* ($\beta\alpha\sigma\iota\lambda\iota\kappa\omicron\varsigma$, royal) and *minimum*, are culinary aromatics much used in French cookery. There are several varieties of the *basilicum*, which with some other species were formerly used in medicine, but are now neglected.

1282. *Plectranthus*. From $\pi\lambda\eta\kappa\tau\epsilon\omicron\nu$, a cock's spur, and $\alpha\nu\theta\omicron\varsigma$, a flower, the corolla of the original species of the genus being terminated by a spur-like appendage. Half-shrubby plants with purple flowers, all natives of hot climates.

History, Use, Propagation, Culture,

1283. *Trichostema*. From *θριξ* *τριχος*, hair, and *στημα*, a stamen, because its long slender stamens resemble hairs.

1284. *Prostanthera*. Named in allusion to the spurs of the anthers, the word being derived from *προσθηνη*, an appendage, and *ανθηρα*, the anther. Strong smelling shrubs, natives of New Holland. Flowers either racemose or terminal.

1285. *Scutellaria*. From *scutella*, a small vessel, on account of the figure of the calyx, which is not unlike a cup with its handle. The calyx inverted, presents the figure of a helmet with visor raised.

1286. *Prunella*. A barbarous name softened down by Linnæus from the *Brunella* of some authors, and so called from the German *die Bräunne*, a disorder in the jaws and throat, which this plant is said to cure. Herbaceous plants common by waysides all over Europe.

8484 Stamens very long exerted, Leaves linear
8485 Stamens short included

8486 Leaves lanceolate tooth-serrated smooth, Racemes paniced, Corolla hairy

8487 Leaves cut downy beneath, Spikes rounded 4-cornered
8488 Leaves cordate cut crenate pubescent on each side shorter than footstalk, Spikes short 4-cornered
8489 Leaves subcordate serrate rugose opaque, Spikes 1-sided, Bractes ovate
8490 Leaves cordate cut serrate crenate, Spikes imbricated rounded 4-cornered, Bractes twice as short as fl.
8491 Leaves cordate cut serrate acute smooth, Spikes imbricated rounded 4-cornered, Bractes length of flower
8492 Much branched, Leaves smooth with a scabrous keel, Racemes lateral leafy
8493 Hairy, Leaves ovate rhomboid crenate, Flowers subracemose
8494 Leaves cordate lanceolate crenate, Flowers axillary
8495 Leaves cordate ovate nearly entire, Flowers axillary
8496 Leaves quite entire, lower hastate, upper sagittate, Flowers axillary
8497 Branched very smooth, Leaves stalked linear lanceolate acute entire, Racemes loose leafy, Cal. blunt
8498 Simple densely pubes. Lvs. subsess. obl. or linear blunt entire attenuated at base, Racemes loosish leafy
8499 Branched tall pubescent, Leaves ovate acuminate serrate on short stalks, Racemes usually paniced
8500 Leaves cordate ovate crenate, Flowers solitary axillary, Each lip of cor. trifold
8501 Leaves cordate serrate, Spikes elongated 1-sided, Bractes stalked ovate longer than calyx
8502 Leaves oblong cordate serrate pubes. Spikes elongated 1-sided, Bractes stalked ovate shorter than calyx
8503 Leaves cordate oblong acuminate serrate, Spikes nearly naked
8504 Villous, Leaves cordate blunt and bluntly serrated, Spikes imbricated, Bractes setaceous
8505 Subvillous, Leaves ovate entire all alike, Flowers axillary
8506 Related to *S. albidia* from which it differs in being much less hairy, and in its more slender flower
8507 Lvs. cord. cren. serrate bluntish villous, Spikes long 1-sided hispid, Bractes stalked ovate longer than cal.

8508 Lvs. stalked obl. ovate somew. toothed, Upper lip of cor. trunc. with 3 awns, Stem ascending, Spike round

8509 Leaves broad ovate toothed, Stem much branched, Spikes ovate
8510 Lvs. stalked ovate lanc. toothed at base, Lips of cal. equal: upper truncate with 3 awns, Stem ascending
8511 Leaves sessile lanceolate entire rough, Stem erect
8512 Leaves stalked oblong ovate toothed at base, Upper lip of cor. trifold, Stem ascending
8513 Small, Stem nearly simple villous, Leaves pinnatifid lower oblong, Cor. pale yellow
8514 Leaves entire and sinuated toothed rugose hairy, Upper lip of cor. truncate slightly 3-toothed
8515 Upper leaves linear-lanceolate: lower sinuate toothed somewhat hairy

8516 Bractes laciniate

8517 Leaves ovate oblong serrated
8518 Leaves ovate with a double crenature on each side

8519 Leaves stalked ovate serrated, Spikes terminal long

ANGIOSPERMIA.

8520 Leaves lanceolate ovate serrated somewhat stalked terminal, Pedunc. 3-fl. shorter than leaves
8521 Leaves ovate lanceolate crenate hairy, Peduncles lateral very long bearing corymbs
8522 All vill. Branches rounded, Lvs. opp. obl. ovate cren. Ped. 2-4 axill. 1-fl. aggregate, Cor. clavate cylind.
8523 All pubes. Lvs. opp. ovate ellipt. cord. at base serr. cren. Panicle numer. opp. spread. dist. Ped. corymbose
8524 All pubes. Lvs. oval lanc. velvety above, Panicle leafy, Fl. with a campan. inflated orifice, Limb oblique
8525 Leaves opposite ovate crenulate tomentose, Flowers axillary 2-3 together downy

8526 Leaves oblong cordate crenate rugose, Stem spotted
8527 Leaves hoary ellipt. or oblong crenate, Pedunc. erect longer than flower, Sepals angular acuminate

and Miscellaneous Particulars.

1287. *Cleonia*. An ancient Greek name employed by Theophrastus, *lib. 7. cap. 4.*: the *Cleonæum* of Pliny. This is an annual plant six or eight inches high, and nearly related to *Prunella*, from which some eminent French botanists do not distinguish it.

1288. *Prasium*. The Greek name of the horehound, which this plant resembles in some respects.

1289. *Phryma*. A Linnean name, the meaning of which is unknown.

1290. *Gesneria*. In honor of Conrad Gesner, of Zurich, the famous botanist and natural historian, called the German Pliny. Very fine herbaceous or half-shrubby plants, some of which are remarkable for the brilliancy of their colors.

1291. *Gloxinia*. In memory of Ben. Petr. Gloxin, of Colmar, author of *Observationes Botanicae*, Argent,

History, Use, Propagation, Culture,

1785, quarto. Handsome low herbaceous plants, with fine shewy flowers. The *Gloxinia speciosa* is a favorite in every hothouse, on account of the beauty of its rich purple blossoms.

1292. *Linnaea*. So named by Gronovius, in honor of the celebrated Carl von Linné, the reformer of natural history, and the father of the modern physical sciences. His works are not less numerous than important; it is to be wished that such another man, with equal talent, industry, and judgment, could be found at the present day, to rescue the science of natural history from the confusion to which it is fast approaching.

1293. *Melianthus*. From *μελι*, honey, and *ανθος*, flower. A shrub, native of the Cape of Good Hope, the blossoms of which are a great attraction to bees. Both the known species are common in collections, but seldom flower.

1294. *Bignonia*. In memory of Abbé Bignon, librarian to Louis XIV., born 1662, died in 1743. He was the friend and patron of most of the learned men of his time, and especially of Tournefort, by whom this truly noble genus was named. The species are trees or shrubs, inhabitants of hot climates: the leaves are opposite, pinnate, ternate, or conjugate: the flowers in panicles, large, and handsome, of various colors, red, blue, yellow, or white, and eminently beautiful. The stove sorts grow freely in loam and peat, and young cuttings root in sand under a hand-glass. The hardy species grow in any soil, but will not flower well unless the situation be warm. They are increased by cuttings of the roots, by layers, or by young cuttings on gentle heat under a hand-glass or frame. B. *radicans* is a well known and much admired species, capable of living in the open air in this country against a wall.

1295. *Jacaranda*. The name of the tree in Brazil. Two kinds remarkable for the goodness of their wood, are described by Piso. Those in the gardens are lofty stove plants with fern-like, elegant leaves, and panicles of beautiful blue flowers. They grow with facility, but flower seldom.

8528 The only species

8529 Stipules solitary adhering to stalk, Leaves smooth

8530 Stipules twin distinct, Leaves hoary beneath

8531 Leaves conjugate cirrhose, Leaflets ovate acuminate, Peduncles axillary 1-flowered

8532 Leaves conjugate cirrhose, Leaflets ovate-lanceolate, Pedunc. 2-flowered, Pods linear

8533 Leaves conjugate, Leaflets elliptical entire coriaceous, Pedunc. 5-flowered axillary, Calyx entire

8534 Lvs. conjugate obl. smooth, Racemes term. Branches dichotomous, Corollas very soft and downy outside

8535 Lvs. conjugate cordate ovate, Flowers racemose, Calyx with a double limb

8536 Leaves conjugate cirrhose: lower ternate, Leaflets ovate cord. acuminate, Racem. axill. Stem muricated

8537 Leaves conjugate quite smooth, Tendrils longer than petiole trifid at end hooked

8538 Leaves conjugate cirrhose, Leaflets cordate lanceolate, Lower leaves simple

8539 Leaves conjugate cirrhose, Leaflets cordate ovate downy beneath

8540 Leaves conjugate cirrhose, Leaflets elliptical blunt, Flowers racemose, Pedunc. 3-fl. Calyxes toothed

8541 Leaves conjugate cordate ovate smooth, Lower racemes leafy, Limb of calyx leafy entire

8542 Leaflets 9-lanceolate subserrate dotted beneath, Corollas ventricose bearded in the orifice

8543 Lvs. conjugate cirrhose, Leaf. obl. acute at each end, Corymb trifid term. Ped. petioles and branches rough

8544 Climbing, Lvs. smooth upper conjugate cirrhose obl. ovate acumin. Peduncles corymbose many-flowered

8545 Lower leaves ternate, upper conjugate, Petioles dichotomous cirrhose, Fruit echinate

8546 Leaves ternate smooth, Leaflets ovate acuminate, Stem shrubby erect

8547 Leaves digitate, Leaflets entire obovate

8548 Leaves digitate, Leaflets lanceolate acuminate entire smooth, Flowers terminal solitary

8549 Lvs. pinnate, Leaflets ovate acuminate toothed, Corymb terminal, Tube of cor. thrice as long as calyx

8550 Leaves pinnate, Leaflets ovate acuminate toothed, Panicle terminal, Tube of cor. the length of calyx

8551 Leaves pinnate, Leaflets oblong lanceolate serrate, Raceme simple terminal, Stem erect

8552 Leaves pinnate with an odd one, Leaflets ovate entire pubescent, Corollas bearded half pentandrous

8553 Leaves pinnate with an odd one, Leaflets ovate hirsute, Cal. 1-leaved spathaceous, Cor. hypocrateriform

8554 Leaves pinnate of four pair, Leaflets elliptical generally entire, Racemes compound

8555 Leaves bipinnate, Leaf. roundish ovate cordate acuminate, Fl. pentandrous, Calyx tubular, Cor. 5-fid

8556 Leaves bipinnate, Leaflets oblong obtuse, Panicle terminal, Peduncles with bracts, Pods oblong blunt

8557 Leaves simple linear acuminate, Flowers terminal subumbellate, Stem erect

8558 Leaves bipinnate, Leaflets lanceolate acute, Panicle terminal, Peduncle naked, Pods long emarginate

8559 Leaves bipinnate oblong villous oval oblong mucronate, Panicle large lax branched, Corollas silky

8560 Leaves ovate oblong entire

8561 Leaves ovate lanceolate: lower 3-lobed; upper undivided, Stem erect

8562 Stem smooth, Sterile filament bearded upwards, Leaves lanceolate acuminate all finely serrate

8563 Leaves polished ovate-oblong amplexicaul finely toothletted, lower entire, Flowers paniced

8564 Leaves serrulate lanceolate oblong sessile downy obscurely toothed narrow, Flowers paniced

and Miscellaneous Particulars.

1296. *Sesamum*. From the Arabic word *semsem*. Forskahl, p. 68. These plants were introduced into Jamaica by the Jews, and are now cultivated in most parts of the island. They are called *vango* or oil-plant. The seeds are frequently used in broths by many of the Europeans, but the Jews make them chiefly into cakes. Many of the oriental nations look upon the seed as a hearty wholesome food, and express an oil from them, not unlike, or inferior to, the oil of almonds. It has been also manufactured for salad oil in this country, but without much success.

S. orientale is frequently cultivated in the Levant, and also in Africa, as a pulse: the seeds have been introduced in Carolina by the African negroes. An oil is extracted from the seeds which will keep many years, and not acquire any rancid smell or taste, but in two years become quite mild, so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, it is used as salad oil, and for all the purposes of sweet oil.

The seeds are also used by the negroes for food: they parch them over the fire, then mix them with water, and stew other ingredients with them. A pudding is made with them, in the same manner as with millet or rice.

In Japan, China and Cochin-China, where they have no butter, they use the oil for frying fish, and in dressing other dishes; as a varnish; and medicinally as a resolvent and emollient. Nine pounds of the seed yield upwards of two pounds of neat oil.

1297. *Pentstemon*. From *πεντε*, five, and *στέμον*, a stamen, because of the four perfect and one imperfect stamen of the genus. Beautiful herbaceous plants, deserving a place in every garden.

History, Use, Propagation, Culture,

1298. *Chelone*. *Xελωνη* signifies a tortoise, to the back of which the helmet of the present genus has been fancifully compared. The species are handsome border flowers, of easy culture in loamy soil, or loam and a little peat.

1299. *Tourrettia*. Named in honor of Marc Antoine Louis Claud la Tourrette, to whom some of Rousseau's Letters on Botany are addressed. A singular climbing annual plant, producing its flowers sparingly from the tips of the branches. Seldom preserved long in a garden, as it produces seed very sparingly.

1300. *Martynia*. In honor of John Martyn, F. R. S., professor of botany at Cambridge, author of *Historia Plantarum Rariorum*, and many other works: died in January, 1768. His son is the editor of the last edition of Miller's Dictionary. Handsome tropical annuals, remarkable for the size of their flowers compared with their leaves.

1301. *Acanthus*. From *ακανθα*, a spine: many of the kinds are very spiny. The species are generally large, with a single herbaceous stalk, and great pinnatifid leaves. The flowers are produced in terminating spikes. Some of the species are shrubby and thorny, with undivided leaves, toothed, and having a thorn at the end of the teeth.

A. mollis was formerly used in medicine under the name of *Branca ursina*: the root abounds in mucilage, and may be substituted for those of the marsh mallow. Virgil has two very different plants under the name of *Acanthus*: one a tree, supposed to be the *Mimosa nilotica*, which produces the gum Arabic: the other an

8565 Stem pubescent, Sterile filament bearded from the end to the middle
 8566 Leaves oblong acute subhirsute, Flowers racemose, Leaves of calyx linear very hairy
 8567 Stem smooth long linear entire, Flowers in racemose panicles, Leaves of calyx smooth.
 8568 Stem and lvs. smooth, Lvs. subamplex. ovate obl. ent. Barren flam. naked clav. Sepals roundish acuminate
 8569 Very smooth, Lvs. subamplexicaul. ov. obl. ent. upper roundish, Barren flam. with a short beard at end
 8570 Leaves ovate lanc. subserrulate smooth, Fl. fascicled axillary and terminal, Cor. equal 5-cleft spreading

8571 Leaves stalked lanceolate serrate : upper opposite
 8572 Leaves lanceolate oblique stalked opposite finely serrated at edge
 8573 Smooth much branched, Leaves stalked cordate ovate serrated, Spikes terminal dense
 8574 Leaves opposite connate lanceolate entire, Lower lip of corolla bearded

8575 The only species. Leaves pinnated cut cirrhose

8576 Stem branched, Leaves opposite cordate toothed, Flowers diandrous
 8577 Stem branched, Leaves opposite 5-lobed toothed
 8578 Stem branched, Leaves alternate cordate entire
 8579 Stem simple, Leaves roundish repand, Tube of cor. at base gibbous flattened

8580 Leaves sinuated unarmed
 8581 Leaves sinuated unarmed glabrous shining green
 8582 Leaves pinnated spiny
 8583 Leaves lacinate pinnatifid blistered spiny, Spines white
 8584 Leaves repand spiny-toothed, Stem shrubby prickly

8585 Spines of whorls 6, Leaves ensiform very long rough
 8586 Spines axillary pedate in fours, Leaves quite entire lanceolate ovate
 8587 Spines axillary opposite solitary, Leaves roundish entire
 8588 Unarmed, Leaves lanceolate, Flowers axillary solitary sessile
 8589 Leaves ovate lanceolate rough, Flowers capitate terminal, Bractes ciliate
 8590 Leaves oblong entire, Two lateral leaves of calyx ciliated wider than the rest ; two linear acute
 8591 Unarmed, Leaves lanceolate hairy entire, Fl. aggregate terminal tubular, Bractes very narrow setose
 8592 Unarmed, Leaves ovate silky, Bractes cordate scarious, Corollas very long

8593 Leaves lanceolate on long stalks, Flowers in terminal and axillary heads, Cor. small

8594 Leaves sessile oblong entire acute at each end villous, Fl. 3-subsessile, Stem ascending
 8595 Leaves stalked ovate entire, Peduncles 3-flowered very short, Stem erect
 8596 Subvillous, Stem dwarf branched erect, Leaves ovate concave entire
 8597 Leaves stalked ovate very blunt entire pubescent, Flowers 3 subsessile, Stem erect divaricating
 8598 Lvs. stalked obl. ovate ciliated somewhat toothed, Pedunc. very short about 3-fl. Stem very villous erect
 8599 Leaves stalked oblong blunt attenuated at base somewhat toothed, Pedunc. 3-fl. shorter than leaf
 8600 Leaves entire, Peduncles dichotomous lateral, Calyxes sessile, with the upper segment largest
 8601 Leaves cuneate ovate crenated, Peduncles 3-parted, Stem simple
 8602 Flowers twin sessile
 8603 Leaves stalked entire ovate downy, Pedunc. axillary alternate few-flow. very long

and Miscellaneous Particulars.

herb, supposed to be this plant. Pliny mentions an *Acanthus* which covered part of his lawn, which some conjecture to be a moss, a thing very improbable in a climate and situation where the musci are seldom seen even in winter.

The leaf of *Acanthus mollis* is supposed to have furnished the ancients with the elegant *Acanthus* leaf of their architecture.

1302. *Barleria*. In honor of the Rev. James Barrelier, a Dominican, and M. D. of Paris, who travelled from France into Spain and Italy, and died aged sixty-eight, 1673 ; author of *Icones*, 1714, Paris, folio, a useful work, containing, even at the present day, figures of many things which are to be found nowhere else. The species flower freely and are of easy culture : loam and peat, with a little rotten dung mixed with it, is the best soil for them. Cuttings root freely ; they strike best from the young wood, under a hand-glass, in the same kind of soil as the plants grow in. (*Bol. Cult.* 21.)

1303. *Phaylopsis*. Named by Willdenow, from φαυλος, vile or contemptible, and σψις, aspect. Tropical weeds.

1304. *Ruellia*. In honor of John Ruella, a native of Soissons, the physician of Francis I. He published a work *De Natura Plantarum*, in 1536, and *Commentaries upon Dioscorides*, in 1516. The species are pretty plants, free flowers, and of the easiest culture and propagation.

History, Use, Propagation, Culture,

1305. *Blechnum*. Βλέχων, was the Greek name of a plant resembling Marjoram. This genus has also the flowers in a dense bracteated spike. It has been separated from *Justicia* by Jussieu.

1306. *Aphelandra*. From ἀφελάνης, simple, and άνδρς, a male, on account of the single cell of the anthers.

1307. *Crossandra*. From κροσσός, a fringe, and άνδρς, a man; or, in botanical language, an anther, alluding to the fringed anthers. A fine shewy shrub with large orange flowers.

1308. *Thunbergia*. In honor of Charles Peter Thunberg, M.D., knight of the order of Vasa, professor of botany in the university of Upsal, member of several learned societies; author of *Travels into Europe, Africa and Asia*; *Flor. Japonica*, &c. Handsome climbing flowers with a fragrant odor.

1309. *Hebenstretia*. John Ernest Hebenstreit, was a professor of botany in the university of Leipzig, and published, in 1728, a dissertation upon plants. Small Cape undershrubs, occasionally cultivated for the sake of their neat foliage and simple modest flowers. They require an airy greenhouse, and are easily propagated from cuttings.

1310. *Hosta*. After Dr. Nicholas Thomas Host, the author of the superb *Gramina Austriaca*, in four volumes, folio, and other important works. Smith thinks the genus the same as Linnaeus's *Cornuti* pyramidata.

8604 Leaves stalked ovate acuminate wavy crenate, Fascicles axillary on long stalks
 8605 Leaves ovate somewhat toothletted ciliated at edge on long stalks, Flowers solitary axillary sessile
 8606 Leaves oblong entire, Flowers solitary sessile, Stem procumbent
 8607 Leaves entire ovate subpubescent, Flowers solitary axillary, Stem erect
 8608 Leaves ovate lanceolate entire stalked smooth, Fl. solitary axillary sessile, Branches warted
 8609 Leaves ovate lanceolate acuminate entire, Peduncles long 2-flowered
 8610 Leaves stalked oblong wavy, Heads axillary sessile, Stem erect
 8611 Stem erect hairy, Leaves stalked ovate acuminate repand toothed hairy, Spike whorled

8612 Leaves ovate elliptical somewhat toothed, Spikes 4-cornered, Bractes ovate downy

8613 The only species

8614 The only species

8615 Leaves cordate acuminate somewhat angular at base, Stem climbing

8616 Leaves angular cordate, Inner calyx none, Anthers bearded spurred

8617 Leaves linear toothed, Bractes oval linear hairy

8618 Leaves sessile oblong lanceolate blunt serrated hairy at base, Bractes ciliated

8619 Leaves linear toothed, Spikes smooth

8620 Leaves linear quite entire

8621 Leaves linear toothed, Calyxes 3-valved ciliated

8622 Leaves linear toothed at end, Bractes ovate villous, Stem herbaceous

8623 Leaves lanceolate oblong serrated pilose, Bractes entire ciliated hispid

8624 Leaves cordate somewhat fleshy sessile

8925 Corymbs axillary trichotomous

8626 Spines opposite, Leaves ovate entire

8627 Leaves obovate subtrifid and simple, Prickles nearly straight, those of the stem alternate

8628 Leaves opp. ovate acute hairy, Stem prickly downwards, Heads round, Bractes lanceolate

8629 Leaves 3 or 4-ellipt. rugose above villous beneath, Stem unarmed, Spikes oblong imbricated

8630 Leaves opposite, Stem unarmed, Spikes oblong

8631 Leaves opp. oblong lanc. acute, Stem unarmed, Heads roundish, Bractes ovate-lanceolate and squarrose

8632 Lvs. opp. ov. acute serr. rugose rough hairy ben. Stem nearly unarm. rough, Heads obl. Bractes ovate acute

8633 Leaves opposite, Stem unarmed branched, Flowers in leafless capitate umbels

8634 Leaves opp. or in 3s rhomboid ovate blunt rugose downy, Stem unarmed, Heads squarrose, Bractes ovate

8635 Leaves opposite oval rugose, Stem unarmed, Heads squarrose, Bractes oblong, Pedunc. longer than leaf

8636 Lvs. opp. or in 3s ellipt. rugose, Stem unarmed, Heads squarrose with lanc. bractes, Ped. shorter than leaf

8637 Leaves opp. ovate obl. villous soft, Stem prickly, Spikes hemispherical, Bractes half as short as tube lanc. acute

8638 Lvs. opp. ovate ellipt. rough, Stem prickly, Spikes hemispherical, Bractes half as short as tube lanc. acute

8639 Leaves ovate lanceolate acuminat crenulate, Stem prickly, Head hemispherical, Bractes linear

8640 Leaves ovate subordate softish beneath, Stem prickly, Bractes of heads linear cuneiform

8641 Lvs. ovate rugose crenate blunt downy running down the foot-stalk, Head depressed shorter than leaf

8642 Leaves opposite ovate rough above hoary beneath, Heads conical, Bractes squarrose ovate acute nerved

8643 Leaves narrowed from an ovate base sessile serrate pubescent, Bractes lanceolate concave

8644 Leaves ovate narrowed into the stalk acuminate acutely crenate pubescent, Outer bractes cordate

8645 Leaves linear lanceolate ternate, Stem shrubby

and Miscellaneous Particulars.

A small shrub rising to the height of four feet. Leaves opposite, ovate, acuminate, somewhat toothed, smooth. Flowers blue, in axillary corymbs, which are shorter than the leaves; they are dotted all over with minute white glandular spots.

1311. *Gmelina*. In honor of John George Gmelin, a German naturalist, professor of medicine and botany at Tubingen, who travelled in Siberia and Kamtchatka, by order of the Empress Anne of Russia. His *Flora Sibirica*, in four quarto volumes, is a book of continual reference. These are fine arborescent Indian plants with beautiful flowers, which are seldom produced in this country. They require the utmost heat of the stove.

1312. *Lantana*. One of the ancient names of the *Viburnum*, which this resembles a little in foliage. The species are rapid growers and free-flowerers, and readily increased by cuttings. They form small bushes with pink, yellow, orange, or changeable heads of flowers, and a peculiar aromatic odor.

1313. *Atosia*. Named by Don Antonio Palau, professor of botany at Madrid, and author of an excellent translation of the Linnæus's *Species Plantarum* into Spanish, after her majesty Maria Louisa, queen of Spain, and mother of the reigning king, Ferdinand.

History, Use, Propagation, Culture,

A deciduous under shrub with a most agreeable odor of citrons, and of the easiest culture in any soil. In Jersey and Guernsey, it stands the winter in warm situations.

1314. *Lippia*. Named in honor of Augustine Lippi, a French physician, born in Paris of an Italian family. He accompanied the ill-fated embassy of Lenoir Duroule to the king of Abyssinia, in the beginning of the eighteenth century, and was assassinated along with the ambassador at Sennaar. His merits entitled him to a more interesting genus than this, which consists of obscure weedy shrubs of South America.

1315. *Melampyrum*. From *melas*, black, and *pyros*, wheat. Its grain resembles a grain of wheat, and gives a singularly black color to bread in which it is ground. Smooth narrow-leaved weeds, not uncommon in corn fields and copses. *M. pratense* is considered nutritive, and was formerly cultivated by the Dutch and Flemish in the manner of Spurrey.

1316. *Selago*. This has nothing beyond its name in common with the Selago of the ancients; nor is it possible to imagine what induced Linnæus to apply it to the present plants, which are pretty half-shrubby Cape plants, with beautiful corymbs or spikes of flowers. Hardy greenhouse plants, propagated with facility by cuttings.

1317. *Vitex*. An ancient name applied to some plant of the osier tribe. *V. Agnus Castus* is an autumn shrub, with whorled spikes of blue and white flowers from seven to fifteen inches long. The dried leaves have a powerfully aromatic odor. The seeds, from the time of Dioscorides and Pliny, have been highly celebrated for securing chastity; hence the absurd official name of the shrub, *Agnus castus*; *αγνος*, in Greek, being the same with *castus* in Latin: and hence the Athenian matrons, in the sacred rites of Ceres, used to strew their

8646 Leaves oblong acute serrate rough above pubescent beneath, Heads globose, Bractes obl. lowest longest

8647 Spikes quadrangular, Bractes cordate compact toothletted imbricated

8648 Spikes conical lax, Bractes toothed setaceous colored, Teeth of calyx rough, Corolla closed

8649 Flowers axillary 1-sided, Corollas closed, Leaves lanceolate; floral hastate

8650 Flowers axillary 1-sided, Corollas gaping, All the leaves lanceolate

8651 Leaves linear acute entire reflexed rigid fleshy smooth, Spikes terminal

8652 Leaves linear smooth, Spikes terminal, Branches diffuse

8653 Leaves linear serrate toothed subciliated fleshy, Spikes corymbose

8654 Spikes terminal, Bractes and calyxes keeled rough, Leaves linear smooth reflexed at edge

8655 Leaves sessile linear lanceolate acute entire smooth, Spikes terminal solitary

8656 Spikes corymbose, Leaves linear toothletted

8657 Corymb multiplex, Leaves obovate smooth serrated

8658 Leaves obovate entire shining, Spikes rounded terminal, Stem shrubby

8659 Stem diffuse pubescent upwards, Lvs. lanceolate blunt finely serrate smooth, Spikes terminal subsolitary

8660 Lvs. rounded with a furrow on each side acutifid somewhat toothed smooth fleshy, Spikes term. aggregate

8661 Spikes cone-like ovate terminal, Leaf. lanc. acum. ent. beneath white with down, Branches of pan. dichotom.

8662 Spikes terminal, Leaves filiform fascicled smooth

8663 Leaves filiform fascicled smooth, Panicle compound

8664 Leaves simple ovate

8665 Leaves ternate entire, Panicle whorled, Berry 3-seeded

8666 Leaves digitate 7 or 5 lanceolate nearly entire, Spikes whorled paniced

8667 Leaves digitate 5, Leaflets cut-pinnatifid, Spikes somewhat whorled

8668 Leaves digitate 5, Leaflets stalked oblong entire, Panicle dichotomous, Berry 1-seeded

8669 Leaves quinrate and ternate serrate, Flowers in paniced racemes

8670 Lvs. ternate and quinrate, Leaf. lanc. acum. ent. beneath white with down, Branches of pan. dichotom.

8671 Leaves ternate and quinrate, Leaflets ovate acute entire hoary beneath, Panicle with a straight rachis

8672 Panicle terminal naked elongated

8673 Spikes ovate, Leaves lanceolate serrated plaited, Stem fruticose

8674 Spikes roundish conical, Leaves cuneiform toothed, Stem creeping

8675 Spikes lax, Cal. of fruit reflexed roundish didymous hispid

8676 Spikes filiform very long, Cal. of fruit reflexed hispid, Tube of corolla spiral

8677 The only species

8678 Spikes fascicled, Leaves oblong lanceolate stem-clasping, Stem very tall trichotomous at end

8679 Spikes long acuminate, Leaves hastate

8680 Spikes filiform paniced, Leaves lanceolate coarsely serrated

and Miscellaneous Particulars.

couches with the leaves. Hence also it has had the affected name of *Piper eunuchorum* and *monachorum*. The seeds of the chaste-tree are, however, so far from being thought antiaphrodisiac, that writers of later times have ascribed to them an opposite quality; their aromatic pungency seems to favor this opinion, and Bergius states them to be carminative and emmenagogue. (*Woodville.*)

The fruit of *V. trifolia* is reputed in the eastern countries to be warm, discutient, nervine, cephalic, and emmenagogue; and to be of service in paralysis, weakness, and pains of the limbs. It is in great use among the Indian practitioners, both internally and externally. The plant has a bitter taste, and a strong somewhat aromatic smell.

1318. *Cornutia*. So named after Jacques Cornut, a French physician, who travelled into Canada, and published an account of the plants of that country in 1635. *Cornutia pyramidata* is a shrub with square branches, elliptical ovate entire hoary leaves, and naked pyramidal terminal branches of flowers.

1319. *Zapania*. Named by Scopoli, after Paul Anthony Zappa, an Italian botanist.

1320. *Priva*. A genus of small *Verbena*-like herbaceous plants, with little blue flowers. The derivation of the name is unknown.

1321. *Spielmannia*. In honor of James Reinhold Spielmann, professor of medicine and botany at Strasburg, author of *Prodromus Floræ Argentoratensis*; *Pharmacopœia Generalis*, &c. A shrub of easy culture in any light soil, and cuttings root freely under a glass.

1322. *Verbena*. Said by De Theis, to be derived from *ferfaen*, its name in Celtic. A genus of weedy plants,

History, Use, Propagation, Culture,

with the exception of *Verbena Aubletia* and *Lamberti*. *V. officinalis* was held sacred among the ancients, and used in making leagues by ambassadors, sacrificial rites, incantations, &c.; and by the moderns as an amulet, and for medical purposes: it is now, however, entirely out of use.

1323. *Avicennia*. Named after Abu Vali Ibn Tsin, commonly called Avicennas, a Persian physician, born in 980, died in 1036. His Rules of Medicine were formerly the text-book of physicians, and have occupied the learning and time of many commentators.

1324. *Caldasia*. Named by Willdenow in compliment to Don Josef Caldas, an eminent botanist, native of Popayan, in New Grenada.

1325. *Clerodendrum*. From *κλῆρος*, accident, and *δενδρον*, a tree, in allusion to the various effects in medicine by its various species. *Clerodendrum fortunatum* is useful, *C. calamitosum* and *infortunatum*, dangerous. The species grow freely in light rich soil, composed of half loam, one-fourth of rotten dung, and one-fourth peat. They require a large pot to flower freely, and cuttings root readily under a hand-glass: the younger the shoots the better. The handsomest species are *C. paniculatum* and *C. squamatum*. (*Bot. Cult.* 41.)

C. inermè is hardy enough to live in the open air against a wall, but it must have the protection of a mat in winter.

1326. *Volkameria*. Named after John Christopher Volkamer, a German botanist, who died in 1720. John

- 8681 Spikes filiform, Leaves linear lanceolate subserrate
 8682 Spikes filiform, Leaves lanceolate serrate bluntish subsessile
 8683 Spikes filiform panicled, Leaves ovate serrate acute stalked
 8684 Hoary, Spikes cylindrical upright, Leaves ovate serrate subsessile, Stem erect round
 8685 Spikes solitary stalked, Leaves trifid cut
 8686 Decumbent hirsute, Leaves cut, Flowers spiked, Bracts linear very long squarrose
 8687 Spikes lax solitary, Stem hispid decumbent rooting, Leaves oblong cut-toothed entire at end
 8688 Spikes filiform, Leaves multifid cut, Stems numerous
 8689 Spikes filiform panicled, Leaves multifid cut, Stem subsolitary
 8690 Spikes filiform solitary, Leaves bipinnatifid
 8691 Hirsute, Spikes filiform solitary, Leaves serrate cut, Calyxes twice as long as fruit
- 8692 Leaves oblong blunt downy beneath
- 8693 The only species
- 8694 Leaves subcordate tooth-serrate pubesc. with 2 glands at base, Corymb terminal hemispherical compact
- 8695 Somewhat downy, Leaves cordate toothed, Cal. large 5-cornered viscid, Segm. of cor. on one side
 8696 Leaves subcordate entire, Cor. thrice as long as tube of calyx, Limb bilabiate
 8697 Leaves lanceolate quite entire
 8698 Leaves cordate obscurely angular, Panicles of branches dichotomous smooth
 8699 Leaves 5-lobed toothletted smooth, Panicle brachiate, Axilla woolly
 8700 Leaves lobed and undivided broad ovate entire, Panicle trichotomous
 8701 Leaves elliptical acute entire and calyxes downy, The calyx in fruit thickened colored, Corymbs clustered
 8702 Leaves oblong lanceolate entire, Petioles peduncles and calyx hairy
 8703 Leaves lanc. or lin. lanc. entire quite smooth, Corymbs axill. and term. Cal. 5-toothed and pedunc. smooth
 8704 Leaves ovate entire shining, Petioles peduncles and calyxes smooth
 8705 Leaves whorled long lanceolate entire smooth, Corymbs axillary few-flowered, Corollas very long
 8706 Leaves broad-ovate acuminate serrate subsessile downy beneath, Cal. 5-toothed, Cor. labiate
 8707 Leaves ovate entire toothed and angular, Peduncles axillary about 2-flowered
 8708 Leaves ovate blunt downy beneath ribbed rugose, Corymb trichotomous
- 8709 Leaves oblong acute entire, Spines from the rudiments of petioles
 8710 Leaves obovate entire retuse shining, Peduncles axillary about 1-flowered
 8711 Unarmed, Leaves cordate ovate acute toothed, Racemes 1-sided
- 8712 Leaves stalked cordate crenate smooth
- 8713 Leaves ovate, Flowers thirsoid
- 8714 Branches round, Leaves oblong acuminate entire, Racemes pendulous, Calyxes toothed
 8715 Branches round, Leaves elliptical emarginate blunt entire, Racemes erect, Calyxes somewhat toothed
 8716 Branches square, Leaves obovate pubescent beneath somewhat toothed at end, Racemes nodding
 8717 Branches bluntly 4-cornered, Leaves ovate obl. toothed upwards pubesc. beneath Fl. bracteate pendulous
 8718 Branches square, Leaves ovate acuminate entire, Racemes nodding
- 8719 Calyxes in fruit twisted, Leaves obovate oblong
 8720 Calyxes in fruit erect, Leaves oblong lanceolate acuminate
 8721 Spiny, Leaves 9 lines long 3 lines broad subserrate attenuated at each end, Teeth of cal. short subciliated

and Miscellaneous Particulars.

George Volkamer, his brother, born 1616, died in 1693, wrote many academical dissertations, and a Flora of Nuremberg, which was not published till after his death. The species are ornamental plants with the habit of the last genus.

1327. *Holmskiöldia*. A Theodore Holmskiöld, a Dane, published some obscure works upon Cryptogamous plants. A handsome herbaceous stove plant, remarkable for the large calyxes of a bright red color.

1328. *Petrea*. So called by Houstoun, in honor of Robert James Lord Petre, born in 1710, died in 1742. The famous Peter Collinson, in a letter to Linnæus, speaks of his death as the greatest loss that botany or gardening ever felt in this island. A climbing plant with blue flowers.

1329. *Citharexylum*. From *κίθαρα*, a lyre (hence guitar), and *ξύλον*, wood. This tree produces a wood which in America is very useful for carpenters' work. It is very hard, and has been supposed applicable to making musical instruments, a mistake which arose thus; *C. melanocardium* is called by the French *fidèle*, from its faithfulness or durability in building; the English have corrupted the name to fiddle-wood, as if it were used for making musical instruments, which is a mistake. (Miller.)

Cuttings root in sand under a hand-glass.

1330. *Duranta*. After Castor Durantes, physician to Pope Sixtus V., author of Herbarium, 1584, died in 1590. The species grow and flower freely in loam and peat, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1331. *Petalium*. Πηδαλιον, a Greek word signifying a nail or point. This plant produces a hard and nut-like fruit with four sharp points or horns.

1332. *Myoporium*. From μύω, to shut up, and πορος, a pore; the spots which cover the leaves being, as it were, pores closed with some semi-transparent substance.

1333. *Stenochilus*. From στενος, narrow, and χείλος, a lip; the narrow lip distinguishing this genus from some of its kindred. Very pretty New Holland small shrubs, with fine red flowers.

1334. *Bontia*. James Bont or Bontius was a Dutch physician, born at Batavia, published in 1658, a natural history of the East Indies, in the manner of Piso. A South American plant, with the appearance of a *Daphne*. The leaves are alternate, fleshy, and crenated, and the flowers axillary.

1335. *Orobanchaeae*. So called from οροβός, a vetch, or other leguminous plant, and αργειν, to strangle, in allusion to the well known effect of these parasites in destroying the plants upon which they grow. The species are fleshy herbs of a russet color, fastening themselves to the roots of other plants, and chiefly to Leguminosae. The root is tuberous, imbricated with scales, and sends out fibres into the soil; the stem is without leaves, scaly, and generally simple; the flowers are in terminating spikes. The whole plant is acrid and astringent, and rejected by all animals, excepting the minuter tribes of Cimices and Thripses.

O major adheres to the root of broom, furze, and clover, and is particularly destructive to the latter, especially in Flanders, where in some places it deters the farmer altogether from the culture of clover. It has a large, thick, fleshy, oval, scaly root, sometimes bubous, and sending out fibres which are very brittle. The bulb adheres to the woody roots of furze or broom, and the fleshy root of clover, and the fibres clasp round them.

O. elatior is commonly found adhering to the roots of *Centaurea scabiosa* and *Trifolium pratense*. It does

8722 Leaves truncate, Flowers with a strong smell of musk

8723 Leaves elliptical bluntish mucronate and branches smooth, Sepals lanc. very acute, Orifice of cor. villous

8724 Leaves broadish lanc. acumin. very acute and branches smooth, Sepals ovate lanc. Limb of cor. bearded

8725 Lvs. lin. bluntish sometimes toothed at end with the branches glandular, Peduncles occasionally 2-parted

8726 Leaves lanceolate acute serrated and branches warted with glands

8727 Leaves elliptical acute serrated reflexed and branches viscid with glands

8728 Leaves lanc. toothed at end entire at base, Drupes compressed shorter than calyx, Stem prostrate

8729 Leaves lanceolate at base with recurved teeth, Stems diffuse glandular, Peduncles solitary

8730 Leaves serrate cordate sessile

8731 Leaves lanceolate or elliptical entire sometimes toothed at end, Branches downy, Stem diffuse

8732 Stem silky, Leaves spatulate lanceolate much shorter than flower, Stamens a little protruded

8733 Leaves alternate, Peduncles 1-flowered

8734 Stem simple, Cor. 4-fid inflat. Stam. naked downw. Stigma 2-lobed, Lobes distant, Style pubesc. upwards

8735 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma orbicordate, Style smooth upwards

8736 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma retuse, Style smooth upwards

8737 Stem simple, Corolla tubular, Segm. of lip blunt equal, Stamens fringed on one side at base

8738 Stem nearly simple, Cor. 5-fid, Bractes 3, Calyx tubular half 4-cleft

8739 Stem branched, Cor. 5-fid, Bractes 3, Calyx short deeply 4-cleft

8740 Leaves cuneate lanceolate close together

8741 Leaves ovate subcoriaceous separate, Fruit ovate acuminate

8742 Leaves at end palmate-cut, Flowers sessile

8743 Leaves ovate acuminate serrate, Corollas 2-lipped, Calyx 3-leaved, Stamens exserted

8744 Stem quite simple, Corollas pendulous with the lower lip trifid

8745 Upper lip of corolla emarginate 2-toothed, Middle segment of lower lip very short

8746 Upper lip of corolla compressed shorter, Calyxes villous

8747 Lower lip of cor. longer than upper, Middle segm. blunt longer than lateral, Cal. vill. Lvs. deeply toothed

8748 Leaves alternate linear 2-toothed on each side

8749 Leaves alternate lanceolate entire, Floral oval toothed

8750 Upper leaves alternate serrated, Flowers distant lateral

8751 Leaves linear lanceolate serrated, Segm. of lower lip of corolla blunt

8752 Leaves opposite cordate bluntly serrated

and Miscellaneous Particulars.

not appear among clover till the second year. On the borders of corn-fields it is found on *Centaurea scabiosa* and *nigra*, *Scabiosa arvensis*, &c.

O. minor also adheres to common red clover and to *Hypochaeris radicata*. *O. ramosa* is found on *Galeopsis tetrahit*. Any of the species may be removed to the garden and planted by the whin or broom.

1336. *Crescentia*. In memory of Pietro Crescenti, of Bologna, author of various agricultural works in the thirteenth century. The fruits after the inside has been scooped out, are dried by the natives of the countries where they grow, and serve for containing water or other fluids.

1337. *Castilleja*. Named after one Castillejo, a Spanish botanist and friend of Mutis. Some of the species of this genus which have not yet been introduced, are very beautiful plants, and would amply repay a collector for his trouble in procuring them.

1338. *Halleria*. After the famous Albert Haller, author of *Stirpes Helveticæ*, and other considerable works on botany and medicine. A pretty stove plant, with long branches of red flowers. Surely so eminent an investigator of alpine vegetation as Haller was, should have had an alpine genus consecrated to him.

1339. *Lathræa*. *Æthæos*, concealed. The plant is only found in the most hidden recesses of the grove. A curious humble parasite without leaves, in the room of which it is covered with abundance of white fleshy scales.

1340. *Rhinanthus*. From $\rho\upsilon$, a nose, and $\alpha\nu\theta\eta\varsigma$, a flower; because of its ringent corolla compressed, at the upper lip so as to resemble the snout of some animal.

1341. *Bartsia*. Named by Linnæus, in honor of his beloved friend John Batsch, M. D., of whom he gives an interesting and melancholy account in his *Flora Suecica*. Curious herbaceous plants of very difficult cultivation.

History, Use, Propagation, Culture,

1342. Euphrasia. An abridgment of Euphrosine, the name of a woman, expressing joy or pleasure. This has been so called from the joyful effects of E. officinalis in disorders of the eyes, but it is now thought to be injurious rather than otherwise. Lightfoot states, that the Scotch Highlanders make an infusion of it in milk, and anoint the patient's eyes with a feather dipped in it.

1343. Antirrhinum. From αντι, similar, and ρω, a nose, because the flowers of most of the species bear a perfect resemblance to the snout of some animal. A. majus and its varieties are popular border flowers of the easiest culture in any dry soil; the other species are also pretty little plants.

1344. Linaria. The plant out of flower is very similar to Linum, Flax. The species are for the most part pretty annual plants; and some of them, as L. Cymbalaria, well adapted for growing in pots or for rock-work.

- 8753 Leaves ovate bluntly toothed, Segm. of lower lip of corolla emarginate
 8754 Leaves linear serrated : upper entire, Lateral segments of lower lip of corolla toothletted
 8755 Leaves ovate toothed palmate, Flowers spiked, Cor. tubular, Segm. of lower lip blunt
- 8756 Leaves lanceolate opposite, Flowers racemose, Sepals glandular hairy ovate blunt
- 8757 Leaves linear lanceolate ternate, Flowers racemose, Sepals glandular hairy lanceolate acute
 8758 Leaves lanceolate : upper alternate, Flowers subsessile, Calyxes longer than corolla
 8759 Leaves opposite cordate unequally crenate somewhat lobed hairy, Stems procumbent
 8760 Leaves opposite ovate downy, Stems procumbent
- 8761 Leaves cordate 5-lobed alternate smooth, Stems procumbent
 8762 Small, Leaves reniform repand very hairy alternate, Stems procumbent
 8763 Leaves hastate alternate, Stems procumbent
 8764 Leaves hairy alternate roundish ovate, lower obsoletely toothed : upper subsessile entire, Stem procumb.
 8765 Leaves hastate alternate, Stems spreading, Petioles occasionally producing tendrils
 8766 Leaves hastate alternate, Stem erect much branched, Peduncles stiff
 8767 Leaves ternate ovate blunt 3-nerved rough at edge, Spike terminal, Flowers stalked
 8768 Leaves ternate ovate lanceolate 3-nerved, Spike terminal, Flowers sessile
 8769 Lvs. whorled lanc. 3-nerved, Stems decumbent, Raceme terminal few-flowered, Cor. very large stalked
 8770 Leaves linear lanceolate : lower opposite ; upper alternate, Racemes lax, Helmet erect 2-parted
 8771 Leaves 4 linear lanceolate, Flower-stem erect spiked
 8772 Leaves linear lanceolate : lower ternate, Stem erect spiked
 8773 Root creeping, Leaves linear close : lower 4, Calyx as long as capsule
 8774 Leaves subulate channelled fleshy : lower 3, Stem paniced and corolla quite smooth
 8775 Leaves linear smooth : lower 4, Stem erect paniced, Flowers in capitate spikes
 8776 Leaves linear lanceolate : lower about 4 smooth, Flowers capitate, Calyxes hairy, Stem nearly simple
 8777 Leaves linear scattered : lower opposite, Spur subulate, Flowers subsessile
 8778 Leaves about 4 linear, Stem diffuse, Flowers racemose, Spur straight
 8779 Leaves nearly linear : lower in fours, Calyxes pilose viscid, Fl. racemose, Spur straight, Stem erect
 8780 Leaves nearly linear : lower in fours, Calyxes pilose viscid, Fl. racemose, Spur recurved, Stem erect
 8781 Cauline leaves linear alternate : radical ovate lanceolate 3-5, Flowers corymbose
 8782 Cauline leaves linear alternate : radical lanceolate 4, Cal. villous close to stem
 8783 Leaves 5 linear fleshy, Flowers capitate
 8784 Leaves linear channelled scattered upon the rootshoots in 5s, Calyx hairy, Pedunc. shorter than bractes
 8785 Leaves 4 subulate fleshy, Stems erect, Flowers spiked
 8786 Leaves 4 linear lanceolate glaucous, Stem diffuse, Flowers racemose, Spur straight
 8787 Leaves all opposite villous, Stem simple, Flowers opposite lateral
 8788 Leaves obovate opposite : floral alternate, Stem ascending pubescent, Spur straight
 8789 Leaves mostly alternate lanceolate blunt, Stem much branched diffuse
 8790 Leaves somewhat stem-clasping lanceolate scattered, Bractes longer than calyx, Stem $\frac{1}{2}$ shrubby
 8791 Leaves lanceolate hairy alternate, Flowers spiked : upper sepal very large
 8792 Leaves alternate linear-subulate somewhat fleshy, Stem erect simple, Spike term. stalked
 8793 Leaves lanceolate acuminate, Panicle twiggy flexuose
 8794 Leaves linear alternate, Stem paniced twiggy, Flowers racemose
 8795 Leaves lanceolate linear close, Stem erect, Spikes terminal sessile, Flowers imbricated
- 8796 Leaves alternate linear remote smooth, Flowers racemose, Stem simple, Runners procumbent
 8797 Leaves linear lanceolate alternate, Flowers racemose, Cal. longer than cor. Stem erect
- 8798 Very smooth, Radical leaves obovate lanceolate blunt serrate : cauline divided entire
- 8799 Leaves ovate serrated stalked, Peduncles axillary 1-flowered
 8800 Leaves 4 linear lanceolate acute about 3-nerved smooth, Flowers racemose terminal with bractes
 8801 Leaves oblong serrated, Stem erect herbaceous, Capsules 2-horned spreading

and Miscellaneous Particulars.

L. triphylla is a popular border annual. *L. triornithophora* is remarkable for the form of its flowers, which resemble three little birds seated in the spur.

L. vulgaris is a very shewy plant, but also a bad weed in sandy pastures.

1345. *Anarrhinum*. Named by Desfontaines, from α , privative, and $\rho\nu$, nose, in contradistinction to *Antirrhinum*, because the plants of this genus have not the snout-like flowers of the latter. Plants resembling *Linaria* in habit.

1346. *Nemesia*. A name used by Dioscorides to designate a kind of *Antirrhinum*, to which genus this is nearly related.

History, Use, Propagation, Culture,

1347. *Maurandya*. Named in honor of the lady of Dr. Maurandy, the botanical professor at Carthage. An elegant greenhouse plant, native of Mexico, and flowering for months together in the summer.

1348. *Gerardia*. In honor of John Gerarde, our old English botanist, author of the Herbal, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596. These are handsome North American herbaceous plants, of such very difficult culture, that few persons have seen them in gardens. They deserve any pains which may be necessary to their successful cultivation.

1349. *Pedicularis*; of which the English word *lousewort* is a translation and explanation. The term *lousewort* is applied from a supposition that sheep which feed much on the plant become lousy; probably because the plants grow in very bad pastures, which may occasion the sheep to be in bad condition and to breed vermin. The species have their leaves very much cut, and that in a very regular manner. Their flowers are red, white, or yellow, and the mixture or shades of these three colors sometimes give the corolla the colour of fire. They grow in general at a considerable elevation; namely, more than a thousand toises above the level of the sea.

P. scæptrum Carolinum was so named by Rudbeck, in honor of Charles XII. It abounds in the north of Sweden and Lapland, where it was greatly admired by the traveller Dr. Clarke, who sent seeds of it to the Cambridge botanic garden, but they never came to anything. The flowers grow in long whorled spikes, and

8802 Orifice of corolla pervious
8803 Orifice of corolla closed

8804 Leaves linear pinnatifid, Stem somewhat branching
8805 Stem oppositely much branched, Leaves linear, Flowers axillary opposite subsessile
8806 Branches paniced, Leaves linear, Peduncles axillary opposite longer than flower
8807 Pubescent, Stems nearly simple, Leaves subsessile lanceolate entire or toothed; lower pinnatifid cut
8808 Smooth, Stem paniced, Leaves stalked pinnatifid, Flowers axillary opposite stalked

8809 Stem branched, Lvs. pinnat. Pinnæ pinnatif. cut, Cal. inflated ovate 2-parted crest. Helmet blunt truncate
8810 Low tufted, Stem branch. at base, Lvs. pinnat. Pinnæ acute, cut, Cal. obl. infl. smooth uneq. 5-cléft crested
8811 Stem branched, Leaves pinnatifid toothed, Cal. tubular 2-parted truncate, Helmet 2-toothed
8812 Stem somewhat branched, Leaves pinnated, Pinnæ in 4s acutely pinnatifid, Helmet acute 2-toothed
8813 Stem nearly simple, Leaves lanc. toothed crenate, Cal. 2-fid truncate, Helmet acute
8814 Stem simple, Leaves pinnatifid, Pinnæ repand crenulate, Cal. 5-fid crested, Cor. closed
8815 Stem simple, Lvs. deeply pinnatifid, Pinnæ lanc. pinnatifid toothed, Spike compact leafy
8816 Stem simple, Cauline leaves deeply pinnatifid, Pinnæ lanc. acuminate pinnatifid toothed, Spike leafy
8817 Stem simple, Spike somewhat leafy, Helmet setaceous 2-toothed, Cal. truncate downwards
8818 Stem simple, Leaves deeply pinnatifid, Pinnæ unequally toothed linear-lanc. Calyxes villous 5-cléft
8819 Stem simple, Cauline lvs. deeply pinnatifid, Pinnæ lh. lanc. doubly toothed, Cal. round smooth 5-toothed
8820 Stem simple, Cauline leaves pinnatifid in fours, Pinnæ oblong blunt toothed, Spike capitate, Cal. hairy
8821 Stem simple, Lvs. pinnated, Pinnæ imbricated ovate blunt doubly toothed, Cal. 5-toothed, Helmet blunt
8822 Stem simple, Lvs. pinnated, Pinnæ deeply pinnatifid tooth. Cal. 5-fid somew. crested, Helmet uncinatè
8823 Stem simple, Lvs. pinn. Pinnæ lanc. pinnatifid confluent at end, Spike capitate naked [acum. emargi.
8824 Stem simple, Lvs. pinnate, Pinnæ pinnatifid somewhat toothed, Spike leafy, Helmet two-toothed

8825 Leaves caespitose spatulate deeply serrated smoothish, Peduncles terminal subcorymbose
8826 Smaller branched villous, Leaves bluntly serrated, Flowers racemose
8827 Leaves lanceolate oblong toothed, Segm. of limb entire
8828 Leaves lanceolate smooth serrated at end, Stem herbaceous, Segm. of limb bifid

8829 Leaves lanceolate acuminate smooth sessile, Pedunc. longer than flower
8830 Leaves oblong bluntyish clammy sessile, Peduncles shorter than flower
8831 Procumb. Stem round rooting hairy, Lvs. cord.-ovate toothed 5-nerved, Pedunc. shorter than petioles
8832 Leaves ovate stalked, Stem square winged
8833 Leaves roundish ovate nerved; lower stalked, Stem creeping

8834 Leaves obovate entire at base, Calyxes spreading and peduncles smooth

8835 Raceme lax longer than the few-leaved stem, Calyxes pubescent in fruit increased in size

8836 Segments of cor. acute

8837 Segments of corolla blunt, Raceme comose

and Miscellaneous Particulars.

each represents a lion couchant. All the species are extremely difficult to keep in gardens. According to Sweet, they succeed best in peat soil and moist situations; the more tender species must be grown in pots in the same kind of soil, and should be protected under frames in severe weather: the best way of increasing them is by seed. (*Bot. Cult.* 404.)

1350. *Erinus*. A name under which Dioscorides describes an aquatic plant with a white flower, black seeds, and a milky stem. From the last circumstance it has derived its name; *ερίσιος* signifying a wild fig tree. The plant of the ancients had no resemblance to that called *Erinus* by the moderns. Beautiful little alpine herbaceous plants, well adapted to rock-work in warm damp situations.

1351. *Mimulus*. From *μυμω*, an ape. The flower seeds in front resemble the face of a grinning monkey. The species are showy plants of the easiest culture in almost any soil or situation.

1352. *Hornemannia*. Named after Professor Hornemann, of Copenhagen, an eminent botanist, and the present editor of the *Flora Danica*. Little, inconspicuous, but curious annual plants.

1353. *Martus*. From *μαρτος*, a teat, on account of the little protuberances which close the mouth of the corolla. East Indian herbaceous plants, not unlike some kinds of *Antirrhinum*.

1354. *Isopteris*. From *ισος*, equal, and *πτερίς*, segment, in allusion to the equal-sized divisions of the corolla.

History, Use, Propagation, Culture,

1355. *Digitalis*. Named by Fuchs, from *digitulum*, a thimble, in allusion to the form of the flowers. The species are for the most part showy border flowers of easy culture. *D. purpurea*, found both with purple and white flowers, is one of the most ornamental of native plants in rocky copses, neglected hedges, and by road sides. Its large tall spike attracts not only the botanist and florist, but is even conspicuous enough to be introduced in the painter's landscape of such scenery. It is a violent poison; but also a valuable plant in medicine. The leaves are the parts of the plant used. They should be gathered when the plant is in flower, and those only which are fresh selected. The leafstalks and midrib should be rejected, and the remaining part be dried either in the sunshine, or on a tin-pan or pewter dish before the fire, or the plant be hung up, each leaf separate, in a warm kitchen. Practitioners ought annually to obtain a supply of the recent leaves in the month of July, and dry them themselves; as in the herb-shops they are often so ill dried as to appear black, in which state they are useless. The powder should be kept in closely stopped opaque phials.

Digitalis is directly sedative and diuretic. It weakens the force of all the vital functions; and by a proper exhibition of it, the frequency of the pulse may be diminished any number of pulsations, and regulated at the pleasure of the practitioner; whilst at the same time it admits, to a certain extent, of the employment of such medicines as increase the firmness of the arterial action, and give tone to the habit. When given to the

- 8838 Lvs. obl. rugose crenate, Sepals ovate obl. Segm. of cor. transverse acute, Pedunc. straight as long calyx

- 8852 Lvs. linear lanc. serrated smooth, Raceme 1-sided, Cor. smooth, Segments rounded
- 8853 Segm. of cor. ovate obtuse, Flowers of distinct sexes [flowers
- 8854 Lvs. lanc. toothed smooth, Raceme 1-sided, Cor. smooth : segm. ov. bearded, Lower bractes longer than
- 8855 Lvs. cordate oblong flat crenate not downy, Raceme 1-sided, Cor. smooth, Segm. very blunt
- 8856 Half shrubby, Leaves linear lanc. entire smooth, Corollas ventricose
- 8857 Leaves cordate serrate acute rounded at base, Stem with blunt angles
- 8858 Leaves cordate 3-nerved, Stem with blunt angles
- 8859 Leaves cordate stalked decurrent blunt, Stem with membranous angles, Racemes terminal
- 8860 Lvs. ovate cord. smooth cut serrate with appendages at base, Petioles dilated, Racemes term. compound
- 8861 Lvs. obl. cord. hairy beneath doubly toothed with an appendage at base, Petioles equal, Racemes terminal
- 8862 Leaves cordate doubly serrate pubescent, Panicles terminal trichotomous with leaves between
- 8863 Lvs. obl. lanc. cord. doubly serrated smooth, Panicles racemose terminal 3-chotomous, Stem $\frac{1}{2}$ shrubby
- 8864 Leaves cordate obl. toothed : teeth entire those at base deepest
- 8865 Leaves obl. lanc. deeply cordate finely and doubly serrated smooth, Pan. racem. term. Ped. 3-chotomous
- 8866 Lower lvs. term. cord. cren. toothed; upper entire, Fl. racemose paniced, Bractes ovate lanc. entire at end
- 8867 Leaves cordate 3-nerved pubesc. on each side, Petioles ciliated, Pedunc. and bractes with glandular hairs
- 8868 Leaves lanceolate serrated stalked : cauline in 3s; and the branches opposite
- 8869 Lvs. lanc. narrowed at each end deeply unequally and doubly toothed smooth, Racemes terminal
- 8870 Lvs. somew. fleshy : upper sessile toothed smooth recurved at end, Pan. racem. Pedunc. bifid many-flow.
- 8871 Lvs. cord. doubly toothed : lower teeth bent backwards, Raceme terminal compound, Ped. 2-3-fl. altern.
- 8872 Leaves cordate pubescent doubly serrated, Panic. axillary dichotomous, Bractes ovate serrate
- 8873 Leaves cordate smooth doubly serrated, Panic. axillary dichotomous, Capsules acuminate
- 8874 Leaves smooth : lower ternate pinnate blunt; upper simple, Pedunc. about 3-fl. axillary
- 8875 Leaves interruptedly pinnate cordate unequal, Raceme terminal, Pedunc. axillary twin dichotomous
- 8876 Lvs. obl. cord. lobed at edge naked as long as pet. Rac. term. comp. Branch. and ped. with glandular hairs
- 8877 Lvs. interruptedly pinnate oblong subcordate unequal at base, Panicle terminal, Pedunces dichotomous
- 8878 Leaves pinnated, Leaflets oblong cut toothed, Panicle terminal, Peduncles dichotomous
- 8879 Leaves smooth : lower interruptedly pinnate; upper ternate, Leaflets oblong, Flowers axillary
- 8880 Leaves pinnated, Raceme terminal naked, Peduncles bifid, Calyxes scariosus
- 8881 Lower leaves bipinnate somewhat fleshy very smooth, Racemes bipartite
- 8882 Stems woody at base, Leaves bipinnatifid pubescent, Racemes long, Pedicels short villous
- 8883 Leaves bipinnate, Pinnæ acutely cut toothed, Panicle terminal, Peduncle dichotomous
- 8884 Lvs. smooth : rad. bipinnat. caul. pinnate, Panicle leafy, Ped. dichotomous, Lat. seg. of lower lip emargin.
- 8885 Leaves cordate lined shining, Pedunc. axillary 2-flowered, Stem hexangular

8886 Leaves roundish subsessile

and Miscellaneous Particulars.

full extent of which the system can admit, the pulse intermits, and vertigo, indistinct vision, and nausea, with vomiting or purging, occur; and if, after these indications, the quantity be still increased, or if any considerable portion of the recent herb be inconsiderately swallowed, it produces delirium, hiccough, cold sweats, convulsions, syncope, and death. (*London Dispensatory*, 287.)

1356. *Scrophularia*. So named from the roots having a resemblance to *scrophulous* tumours, which they were, by the peculiar mode of induction of the dark ages, therefore supposed to cure. *S. nodosa* has the name of figwort from its knobbed roots : it has a rank smell like elder, and a bitter taste; swine that have the scab are cured by washing them with a decoction of the leaves. Wasps resort greatly to the flowers. Goats eat the plant; but cows, horses, sheep and swine refuse it

The same observations apply to *S. aquatica*, which in French is called *Herbe du Siege*, because at the celebrated siege of Rochelle by Cardinal Richelieu in 1628, the garrison was reduced to the necessity of supporting life upon the roots of the plant.

1357. *Vandellia*. Louis Vandelli, a Portuguese, was professor of botany in the garden of Coimbra. He published in 1788, an essay on the plants of Portugal and Brazil, a work which is little known, on account of its extreme rarity.

History, Use, Propagation, Culture,

1358. *Sibthorpia*. In honor of Humphry Sibthorp, M. D., professor of botany at Oxford, who travelled into Greece, for the purpose of collecting materials for a classical Flora Græca, in which he succeeded even beyond his own hopes. After his death the publication of his materials was confided to Sir James Edward Smith, under whose care the work has reached to five hundred figures in folio, of the most magnificent kind; five hundred more have yet to be published. A little trailing plant.

1359. *Limosella*. From *limus*, mud. The plant grows by the edge of puddles and in muddy places.

1360. *Browallia*. Named by Linnæus, in honor of John Browallius, bishop of Aboo, who defended the sexual system against Siegesbeck, in a book entitled *Examen episcopes, &c.*, Aboo, 1739, octavo. Handsome plants with blue flowers, often cultivated as tender annuals.

1361. *Stemodia*. From *stemon*, a stamen, and *dis*, double. Each of the stamens supports two anthers.

1362. *Trevirana*. Named after Dr. Treviranus, a German botanist. This beautiful plant, which is commonly called *Cyrilla pulchella*, is one of the prettiest of the old inhabitants of the stove.

1363. *Columnnea*. In honor of Fabius Columnea, or Fabio Colonna, of the noble family of Colonna in Italy, born in 1567. He published his *Phytobazanus* in 1592, and his *Ephrasis* in 1606, both works of high reputation in their day. One species, *C. scandens*, is common in hothouses, where it is cultivated for the neatness of its foliage and the beauty of its scarlet blossoms.

- 8887 Leaves reniform subpeltate erenate
 8888 Leaves lanceolate spatulate, Scapes shorter than leaf
 8889 Peduncles 1-flowered
 8890 Peduncles 1 many-flowered
 8891 Leaves opposite and ternate stalked
 8892 Leaves opposite and ternate stem-clasping
 8893 Leaves ternate ovate hairy
 8894 Leaves ovate acute entire subvillous, Sepals entire and corollas pubescent, Upper lip undivided
 8895 Leaves ovate acuminate serrate hairy above, Sepals toothletted and corollas hairy
 8896 Leaves 3 subsessile oblong acutely crenate pubescent, Cor. hairy, Galea dilated reflexed
 8897 Leaves ovate acuminate stalked, Raceme terminal whorled, Peduncles cymose
 8898 Leaves linear smooth entire, Stem nearly naked
 8899 Leaves oblong ovate entire 3-nerved sessile, Pedunc. axillary 1 flowered, Stem proeumbent
 8900 Leaves oblong entire, Peduncles longer than leaf, Stem deelineate
 8901 Very smooth, Leaves cuneate oblong upwards obsolete erenate, Pedunc. nearly as long as leaf
 8902 Stem erect, Leaves lanceolate acute doubly serrated smooth, Flowers whorled
 8903 Leaves ovate serrated alternate, Flowers twin
 8904 Hairy, Leaves alternate rhomboid cuneiform cut serrate, Flowers twin, Sepals linear
 8905 Leaves opposite linear entire, Racemes compound terminal
 8906 Leaves opposite ovate-oblong entire wavy : upper subcordate whorled, Racemes spiked
 8907 Pubescent, Leaves opposite and ternate ovate serrate stalked, Pedunc. axillary shorter than petiole
 8908 Leaves toothed lanceolate 3-nerved
 8909 Leaves opposite ovate jagged, Flowers somewhat umbelled terminal
 8910 Leaves linear toothed villous, Cal. hairy, Branches subfastigiate
 8911 Upper leaves opposite sessile tooth-sinuated, Flowers solitary on long stalks
 8912 Leaves opp. lin. lanc. acute at each end toothletted, Raceme terminal, Stamens exerted
 8913 Leaves lanc. toothed villous, Racemes of flowers remote
 8914 Leaves obovate crenate downy, Stem decumbent
 8915 Leaves obl. serrated hairy, Stem nearly leafless, Flowers alternate remote
 8916 Leaves ovate toothed silky beneath dotted with silver, Flowers axillary stalked
 8917 Leaves wedge-shaped serrated pubescent, Segm. of cor. with very long points
 8918 Leaves opp. stalked oblong blunt tooth-serrated when old smooth, Segm. of cor. rounded

and Miscellaneous Particulars.

1364. *Russelia*. In honor of Alexander Russel, M. D. F. R. S., born in Scotland; died 1768; author of the natural history of Aleppo, London, 1756. His brother Patrick, published a second edition in 1794, and a work on serpents in 1796, folio.

1365. *Dodartia*, by Tournefort, after M. Dodart, member of the academy of sciences at Paris; and an eminent physician. An ugly, leafless, almost flowerless plant, of much rarity and little beauty.

1366. *Lindernia*. Named after Francis Lindern, an obscure Swiss botanist. Pyxidaria is so called from *ρυξος*, the box, which it resembles in foliage.

1367. *Herpestis*. From *ἕρπυστος*, any thing which creeps. An exotic genus of herbs, with opposite leaves and axillary flowers, each of whose stalks bears a pair of bractæe. *Herpestis Monnieria* is a beautiful aquatic.

1368. *Capraria*. So named from *capra*, a goat, the leaves being much liked by that animal.

1369. *Buchnera*. Named after John Godfrey Buchner, a German botanist, who published in 1743, his Observations upon the Plants of Saxony. Small Cape shrubs of little interest or beauty. Their leaves are generally small, and their flowers white.

1370. *Manulca*. Derived from *manus*, the hand. The five divisions of the flower, in some species, from their form and relative position, resemble an open hand. Handsome Cape shrubs of humble growth. They are rare in collections, but deserving of being very generally cultivated.

History, Use, Propagation, Culture,

1371. *Angelonia*. *Angelon* is the name of the plant among the Spanish colonists of Caraccas, where it grows. A very beautiful stove herbaceous plant, with large light-blue flowers.

1372. *Schizanthus*. From *σχίζω*, to cut, and *ανθος*, a flower, in allusion to the numerous divisions of the beautiful purple and yellow flowers. Tender annual plants, with finely cut pale green leaves, and terminal panicles of elegant flowers.

1373. *Besleria*. After Basil Besler, an apothecary at Nuremberg, joint editor with Jungermann, of a sumptuous work entitled *Hortus Eystettensis*, 1613. The garden belonged to Bishop Conrad, of Eichstedt, and the plates were engraved at his expense.

1374. *Tedia*. So named by Persoon, but the meaning is unknown. Pretty herbaceous plants, with bright purple flowers and dark berries.

1375. *Brunfelsia*. In memory of Otho Brunfels, of Mentz, a Carthusian monk, and afterwards a physician, author of *Figures of Plants* in 1530. He died in 1534. The species are handsome tropical shrubs, with neat foliage and shewy white or purple flowers. Cuttings with a little ripened wood strike root freely in heat.

8919 The only species

8920 The only species

8921 Peduncles branched, Leaves ovate

8922 Peduncles simple clustered, Leaves ovate-lanceolate serrated

8923 Peduncles simple solitary, Calyxes serrated, Cor. smooth with a serrulated limb

8924 Leaves obl. ovate rugose crenate decurrent down the petiole, Cal. serrulate colored

8925 Peduncles simple solitary, Calyxes colored serrated, Cor. hairy with an entire limb, Leaves ovate

8926 Leaves opp. obl. finely serrulate smooth

8927 Leaves downy

8928 Leaves ovate-lanceolate narrowed at each end, Tube of cor. curved, Limb wavy

8929 Leaves obovate acuminate longer than petiole, Tube of cor. straight, Limb entire

8930 Leaves and leafstalks deeply stained with purple

8931 Cauline leaves bipinnate

8932 Rad. leaves lyrate: upper oblong, Pedicels longer than bractes, Sepals linear entire

8933 Radical leaves lyrate: upper ovate, Bractes longer than pedicels, Sepals linear oblong entire

8934 Radical leaves lyrate: floral cordate half stem-clasping, Peduncles as long as flower

8935 Radical leaves lyrate: upper oblong, Flowers subsessile the length of bractes, Cal. ovate serrated

8936 Somewhat downy, Leaves lanceolate, Flowers axillary solitary

8637 All over wool, Leaves oval oblong blunt crenate, Stamens bearded with capitate hairs

8938 Leaves ovate lanceolate deeply serrated

8939 Leaves ovate acute cut serrated

8940 Leaves ternate remotely toothletted

8941 Leaves ovate acute serrated, Stem winged at angles

8942 Leaves obovate smooth, Segments of cor. length of tube

8943 Leaves obovate dotted with glands downy

8944 Flowers large yellow spotted

and Miscellaneous Particulars.

1376. *Celsia*. In honor of Olaus Celsius, D. D., surnamed the northern Pliny, professor of the oriental languages in the university of Upsal. His Hierobotanicon, or History of the Plants of Scripture, appeared in 1745. There was also another Swedish botanist called Magnus Nicolaus Celsus, who died in 1679. Besides these moderns, the name is rendered familiar to classical scholars by the recollection of the famous Aurelius Cornelius Celsus, who wrote upon agriculture and medicine, and whose purity of style procured him the name of the Cicero of medicine.

1377. *Alonsoa*. Named by the authors of the Flora Peruviana, after Zanoni Alonso, at the time of the publication of that work, Spanish secretary for the kingdom of Santa Fé, and a great patron of objects connected with natural history. Sir James Smith considers the genus the same as *Hemimeris*.

1378. *Anthocercis*. From *ανθος*, a flower, and *κεραυς*, a ray, the narrow divisions of the corolla spreading in a radiant manner, like the spokes of a wheel.

1379. *Cymbaria*. From *κυμαρον*, a boat, in allusion to the shape of the fruit. A small pubescent hoary plant, native of mountainous rocky places in Siberia.

CLASS XV. — TETRADYNAMIA. STAMENS 6, of which four are longer than the rest.

This class consists, with the exception of *Cleome*, entirely of the natural order *Cruciferae*, and has lately been the subject of the most acute and successful investigation of many botanists of celebrity. Our countryman, Mr. Brown, led the way to the improvements which have been made in the genera, in the second edition of the *Hortus Kewensis*, in which, discarding the uncertain and unnatural characters derived from variations in the floral envelopes, he took a new course, and by indicating with great precision the curious modifications of the seeds and seed-vessels, led the way to an entirely new arrangement of the class. The principles thus developed have been adopted by M. Decandolle, whose learned treatise upon *Cruciferae* is here followed without variation.

The difference between the genera with a long pod (*Siliquosae*), and those with a short one (*Siliculosae*), has given rise to two orders in the Linnean system. But these are not only ambiguous, but interfere so much with a distribution of the genera according to their natural affinities, that they have been rejected here, and the divisions of M. Decandolle, depending upon variation in the relative position of the various parts of the seed, have been substituted.

The plants of this class have always been celebrated for their antiscorbutic qualities. These seem to reside in an acrid, oily, volatile principle, not yet determined by chemists, and varying in the degree of abundance in which it is found in different species. It is particularly abundant in the seeds of mustard and garden rocket, in the roots of the horse radish, and in the foliage of the *Lepidium latifolium*, which, administered inwardly, act powerfully upon the gastric organs, or, applied externally, inflame the skin and operate nearly as severely as blisters. A slighter degree of acrimony is found in the foliage of the scurvy grass, the roots of the garden radish, &c.; and these, therefore, operate more gently, and perhaps more safely, when eaten, scarcely at all when applied outwardly. Whatever the degree of acrimony may be in these plants, they all appear, when eaten, to produce some specific action upon the digestive organs, and thence upon scorbutic humours; for which reason, the horse radish, water-cress, radishes, and even cabbages are eminently antiscorbutic. They are also admitted by physicians as diuretic, sialagogue, and diaphoretic. It is only when the acrid principle is diffused over a considerable quantity of fleshy and watery substance, that cruciferous plants become eatable, as in the leaves and stems of cabbages and sea-kail, and in the roots of radishes and turnips. Even in these plants, the proportion of acrid principle is much diminished by exclusion from light. Plants of this class are also remarkable for containing a larger quantity of azote than most vegetables; for which reason ammonia is generally evolved in their fermentation or putrefaction: to which circumstance it is possible that the two remarkable phenomena are to be attributed, viz.: that cruciferous plants contain a greater portion of nutritive matter than most herbaceous plants; and that they require either a very rich soil manured with animal substances, or at least a situation near the habitations of men. The embryos of all these plants are filled with oil, and the seeds of *Camelina sativa*, *Brassica campestris*, some species of *Rocket*, &c. are cultivated in many parts of Europe for the sake of their expressed oil, which is used either for culinary purposes or for lamps.

Cruciferous plants are chiefly natives of temperate climates, those which are found within the tropics being in all cases mountain plants, and are nearly all cultivable in the open air; they are mostly found in open sandy plains; some on the tops of the highest mountains at the utmost limits of vegetation. Nine hundred species are now described, of which not more than twenty-two are to be found in the works of Hippocrates, Theophrastus, Dioscorides, or Pliny.

A. *Cotyledons four, spirally twisted. Petals 4, cruciate.*

1380. *Schizopetalon*. Petals pinnatifid.

B. *Cotyledons two. Petals 4, cruciate.*

1. *Cotyledons flat, accumbent. Radicle lateral. Seeds compressed. (O=) PLEURORHIZEÆ, Dec.*

* *Siliqua opening; with a linear dissepiment more or less wide than seeds. Seeds oval, compressed; often margined. Cotyledons flat, accumbent, parallel with the dissepiment. ARABIDÆÆ, Dec.*

1381. *Mithola*. Siliqua roundish. Stigmas connivent, thickened or cornute at base. Calyx bisaccate at base.

1382. *Cheiranthus*. Siliqua round or compressed. Stigmas 2-lobed or capitate. Calyx bisaccate at base.

1383. *Nasturtium*. Siliqua roundish, shortened or declinate. Stigma nearly 2-lobed. Calyx equal at base, spreading.

1384. *Leptocarpea*. Siliqua roundish, very slender. Stigmas sessile, 2-lobed. Calyx spreading, equal.

1385. *Notoceras*. Siliqua 4-cornered, 2-edged, the valves elongated at end into a horn or mucro.

1386. *Barbarea*. Siliqua 4-cornered, 2-edged, the valves not elongated at end. Calyx equal at base.

1387. *Braya*. Siliqua oblong, subcylindrical, with flattish valves and a sessile stigma. Seeds few, ovate. Calyx equal at base.

1388. *Parrya*. Siliqua linear with veiny valves. Seeds in two rows, with a loose wrinkled skin. Stigmas approximating. Filaments not toothed.

1389. *Turritis*. Siliqua linear with flat valves. Seeds in two rows in each cell.

1390. *Arabis*. Siliqua linear with flat valves, 1-nerved in the middle. Seeds in one row in each cell.

1391. *Macropodium*. Siliqua pedicellate, linear, with flat valves, 1-nerved in middle.

1392. *Cardamine*. Siliqua linear with flat nerveless valves, often opening with elasticity. Funicles of the hilum slender.

1393. *Pteroneuron*. Siliqua lanceolate with flat nerveless valves, often opening with elasticity: placentas with winged nerves. Funicles dilated.

1394. *Dentaria*. Siliqua lanceolate with flat nerveless valves, often opening with elasticity: placentas not winged. Funicles dilated.

** *Silicle opening lengthwise, with a broad oval membranous dissepiment, and flat or concave valves. Seeds compressed, frequently margined. Cotyledons flat, accumbent, parallel with the dissepiment. ALYSSINÆ, Dec.*

1395. *Lunaria*. Silicle pedicellate, elliptical or lanceolate with flat valves. Funicles long, adhering to the dissepiment. Calyx somewhat bisaccate. Petals nearly entire. Stamens not toothed.

1396. *Ricotia*. Silicle sessile, oblong, when ripe losing its dissepiment and becoming 1-celled: valves flat. Calyx with two prominences at base. Petals emarginate. Stamens not toothed.

1397. *Farsetia*. Silicle sessile, oval or orbicular, with flat valves. Seeds winged. Calyx bisaccate at base. Petals entire.

1398. *Berteroa*. Silicle sessile, elliptical or obovate, with flat or concave valves. Calyx equal at base. Petals 2-parted. The small stamens toothed.

1399. *Aubrietia*. Silicle oblong with convex valves. Seeds not edged. Calyx bisaccate at base. Petals entire. Smaller stamens toothed.

1400. *Vesicaria*. Silicle globose inflated with hemispherical valves. Seeds more than 8. Petals entire.

1401. *Alyssum*. Silicle orbicular or elliptical, with valves flat or convex in centre. Seeds 2-4 in each cell. Calyx equal at base. Petals entire. Some the stamens toothed.
1402. *Clypeola*. Silicle orbicular, 1-celled, 1-seeded, with flat valves. Calyx equal. Petals entire. Stamens toothed.
1403. *Peltaria*. Silicle orbicular, 1-celled, 1-4-seeded, with flat valves. Seeds two in each cell: funicles adhering to the dissepiment.
1404. *Petrocallis*. Silicle sessile, oval, with flattish valves. Seeds two in each cell: funicles adhering to the dissepiment.
1405. *Draba*. Silicle sessile, oval or oblong, with flat or convex valves. Seeds many, not edged. Calyx equal. Petals entire. All the stamens without teeth.
1405. *Erophila*. Silicle oval or oblong, with flat valves. Seeds many, not edged. Calyx equal. Petals 2-parted. Stamens without teeth.
1407. *Cochlearia*. Silicle sessile, ovate-globose or oblong, with ventricose valves. Seeds many, not edged. Petals entire. Stamens without teeth.
- *** Silicle opening, with a very narrow dissepiment, and keeled navicular valves. Seeds oval, sometimes margined. *Cotyledons flat, accumbent, contrary to the dissepiment.* THLASPIDÆ, Dec.
- † Cells of silicle 2-many-seeded.
1408. *Thlaspi*. Silicle emarginate at end, with navicular valves, winged at back. Cells two, many-seeded.
1409. *Capsella*. Silicle triangular, cuneate at base, with navicular valves, not winged. Cells many-seeded.
1410. *Hutchinsia*. Silicle elliptical, with navicular valves, not winged. Cells 2-seeded, rarely many-seeded.
1411. *Teesdalia*. Silicle oval, emarginate at end, with navicular valves and 2-seeded cells. Stamens having a scale inside at their base.
- †† Cells of silicle 1-seeded.
1412. *Iberis*. Two outer petals largest. Silicle compressed, truncate, emarginate.
1413. *Biscutella*. Silicle flat, biscutate, with the cells laterally united to the axis. Style long, persistent. Embryo inverted.
- **** Silicle not opening, with concave indistinct valves, and sometimes with scarcely any trace of a dissepiment. Seeds oval, very few. *Cotyledons flat, accumbent, parallel with dissepiment.* EUCLIDIÆ, Dec.
1414. *Euclidium*. Silicle drupaceous, ovate, with manifest sutures. Style subulate. Cells 1-seeded.
1415. *Ochrodium*. Silicle coriaceous, subglobose. Stigma sessile. Dissepiment thick. Cells 1-seeded.
- ***** Silicle opening lengthwise, with concave valves, bearing internally transverse horizontal dissepiments separating the seeds. Seeds not margined. *Cotyledons flat, accumbent, parallel with the dissepiment.* ANASTATICÆ, Dec.
1416. *Anastatica*. Silicle ventricose, with valves bearing an appendage outside at the end.
- ***** Silique or silicle separating across into 1-2-celled, 1-2-seeded joints. Seeds not edged. *Cotyledons flat, accumbent, parallel with the dissepiment when there is any.* CARKINEÆ, Dec.
1417. *Cakile*. Silicle 2-jointed, compressed: the upper joint ensiform. Seeds solitary in the cells: upper erect; lower pendulous.
1418. *Rapistrum*. Silicle 2-jointed: the upper joint ovate, rugose. Seeds solitary in the cells: upper erect, lower pendulous.
1419. *Chorispora*. Silique roundish, with many equal joints. Seeds all pendulous.
2. *Cotyledons flat, incumbent. Radicle dorsal. Seeds ovate, not margined.* (O||) NOTORHIZÆ, Dec.
- * Silicle 2-celled, opening lengthwise, with concave or keeled valves. Seeds ovate or oblong, not margined. *Cotyledons flat, incumbent, contrary to the dissepiment.* SISYMBRIÆ, Dec.
1420. *Malcomia*. Silique roundish. Stigma simple much pointed.
1421. *Hesperis*. Silique roundish, or about 4-cornered. Stigmas 2, erect, conniving. Calyx bisaccate at base.
1422. *Sisymbrium*. Silique roundish, sessile upon the torus. Stigmas 2, somewhat distinct or connate in a head. Calyx equal at base.
1423. *Alliaria*. Silique roundish, 4-cornered, with prominent nerves. Calyx lax.
1424. *Erysimum*. Silique 4-cornered. Calyx closed.
- ** Silicle with concave valves, and with a dissepiment elliptical in its greatest diameter. Seeds ovate. *Cotyledons flat, incumbent, contrary to dissepiment.* CAMELINEÆ, Dec.
1425. *Camelina*. Silicle obovate or subglobose, with ventricose valves and many-seeded cells. Style filiform.
1426. *Nestia*. Silicle subglobose, with concave valves, 1-celled, 1-seeded, indehiscent.
- *** Silicle with a very narrow dissepiment, and with keeled or very convex valves. Seeds solitary or few in the cells, ovate, not margined. *Cotyledons flat, incumbent, parallel with the dissepiment.* LEPIDINEÆ, Dec.
1427. *Coronopus*. Silicle twin. Valves ventricose or subcarinate, scarcely dehiscent, 1-seeded.
1428. *Lepidium*. Silicle ovate or subcordate, with carinate or rarely ventricose valves, opening with 1-seeded cells.
1429. *Æthionema*. Silicle oval, generally emarginate, with navicular valves, and 1-2-seeded cells. Larger stamens either united or toothed.
- **** Silicle with indistinct or indchiscent keeled valves, 1-celled, 1-seeded, with an obliterated dissepiment. Seeds ovate, oblong. *Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.* ISATIDÆ, Dec.
1430. *Isatis*. Silicle elliptical, flat, 1-celled, 1-seeded, with carinate navicular valves, which are scarcely dehiscent.
1431. *Myagrum*. Silicle compressed, almost cuneate, with two empty hollows at end, and at base 1-celled, 1-seeded.
3. *Cotyledons incumbent, folded together, or plaited lengthwise through their middle, and enwrapping the radicle. Style generally enlarged, with a cell and seed at its base. Seeds generally globose, never margined.* (O > >) ORTHOPLOCEÆ, Dec.
- * Silique with valves opening lengthwise, and a linear dissepiment. *Cotyledons folded together.* BRASSICÆ, Dec.
1432. *Brassica*. Silique roundish. Style small, short, obtuse. Seeds in one row. Calyx closed.
1433. *Sinapis*. Silique roundish, with nerved valves. Style small, short, acute. Seeds in one row. Calyx spreading.
1434. *Moricandia*. Silique 4-cornered, somewhat 2-edged. Seeds in two rows. Calyx bisaccate at base.
1435. *Diplotaxis*. Silique compressed, linear. Seeds in two rows. Calyx equal at base.
1436. *Eruca*. Silique roundish. Style large, ensiform or conical. Seeds in one row. Calyx equal at base.

** *Silicle with concave valves, opening lengthwise, with an elliptical dissepiment. Cotyledons folded together.* VELLEZ, Dec.

- 1437. *Vella*. Larger stamens connate. Style ovate, flat, at the end of a tongue-shaped silicle.
- 1438. *Carrichtera*. Stamens all free. Style ovate, flat, foliaceous.
- 1439. *Succowia*. Stamens all free. Style slender, conical. Valves of the silicle echinate.

*** *Silicle indehiscent, ovate or globose, 1-celled, 1-seeded, with indistinct valves. Seeds globose. Cotyledons folded together.* ZILLEE, Dec.

- 1440. *Zilla*. Silicle 2-celled. Cells 1-seeded.
- 1441. *Calepina*. Silicle 1-celled, 1-seed. Seed pendulous. Outer petals rather the largest.

**** *Silicle or silique dividing across into one or few-seeded joints or cells. Seeds globose. Cotyledons folded together.* RAPHAEL, Dec.

- 1442. *Crambe*. Silicle with two joints, of which the lower is abortive, the upper globose 1-seeded.

History, Use, Propagation, Culture,

1380. *Schizopetalon*. A curious genus of Chilian plants, with pinnatifid petals, whence the name has been formed, from *σχίζω*, to divide. A plant of difficult cultivation. It is raised from seeds, which it produces sparingly, and only in a well-aired cool greenhouse.

1381. *Mathiola*. Named after Peter Andrew Matthioli, an Italian physician, born in 1500, died in 1577. He was first physician to Ferdinand of Austria, and author of a laborious commentary upon Dioscorides. Herbs, or rarely shrubs, nearly all covered with a white stellate soft down. *M. incana*, *annua*, *græca*, and *fenestralis* are popular border flowers, especially the first; the leaves of all the species, and also of *Cheiranthus*, and many other plants of this class, may be used as potherbs or salads.

1382. *Cheiranthus*. So called from the Arabic *kheiry*, the name of a plant with red sweet-scented flowers. Herbs, or occasionally shrubs, with entire or toothed leaves, and flowers of various colors. *C. Cheiri* is a

1443. *Raphanus*. Siliques transversely many-celled or dividing into several joints.
 4. *Cotyledons incumbent, linear, spirally or rather circinate twisted.* (O |||) SPIROLOBEE, Dec.
 1444. *Bunias*. Silicle nucamentaceous, indehiscent, 2-4-celled. Cotyledons twisted spirally.
 1445. *Erucaria*. Siliques lomentaceous, 2-jointed; the lower joint having two cells, the upper being ensiform. Cotyledons replicate, somewhat spiral.
 5. *Cotyledons incumbent, linear, with two legs, or a double plait, that is to say, plaited twice crosswise. Seeds depressed.* (O ||||) DIPLECOLOBEE, Dec.
 1446. *Heliophila*. Siliques elongate or rarely oblong or oval. Dissepiment linear or oval. Valves flat, or in the long siliques somewhat convex. Calyx equal at base.
 1447. *Subularia*. Silicle oval. Dissepiment elliptical. Valves convex. Cells many-seeded. Stigma sessile.
 C. *Cotyledons 2. Petals 4, not cruciate. Thalamus large, hemispherical or elongated. Stamens 4-6.00.*
 1448. *Cleome*. A honey gland at each division of the calyx, except the lowest. Calyx 4-leaved. Petals ascending.

8945 Stem weak cæsious, Petals pinnatifid quickly perishable

8946 Stem shrubby at base erect branched, Leaves lanceolate entire hoary, Pods subcylind. without glands

- 8947 Stem herbaceous erect branched, Leaves lanceolate blunt hoary, Pods subcylindrical without glands
 8948 Stem half shrubby erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands
 8949 Stem herbaceous erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands
 8950 Stem $\frac{1}{2}$ shrubby erect simple, Leaves close obovate downy, Pods downy without glands broadest at base
 8951 Stem somewhat erect herbaceous branch. Lvs. obl. downy; lower sinuated, Pods comp. velvety and gland.
 8952 Stem erect branched, Leaves downy or pubescent toothed or pinnatifid, Pods compressed downy
 β Pods twice as short as α
 8953 Stem erect nearly simple naked, Leaves linear blunt hoary entire, Flowers subsessile, Pods compressed
 8954 Stem $\frac{1}{2}$ shrubby at base branched erect, Leaves downy linear entire or toothed, Fl. subsess. Pods roundish
 8955 Stem suberect branched, Leaves sinuate pinnatifid, Pods with three acute nearly equal points
 8956 Stem suberect branched, Leaves downy lanceolate repand toothed, Fl. sessile, Middle point of pod longest

8957 Leaves lanc. entire, Hairs 2-parted appressed or none, Pods linear, Stigmas with recurved lobes

8958 Lvs. obl. lanc. somew. toothed, Hairs 2-parted or none, Stem decum. branch. Pet obov. Pods erect pointed

8959 Leaves linear entire somewhat silky, Stem half shrubby

8960 Leaves linear-lanceolate acuminate finely serrated downy with 2-parted hairs, Stem shrubby branched

8961 Leaves linear-lanceolate acuminate entire downy with appressed 2-parted hairs, Stem shrubby branched

8962 Leaves lin. lanc. entire roughish, Stem shrubby branched, Pods compressed, Pedic. half as short as calyx

8963 Leaves linear entire rough clustered, Stem shrubby branched, Pods roundish 3 times as long as calyx

8964 Leaves pinnatifid, Segments ovate subcordate repand

8965 Leaves pinnatifid, Segments lanceolate serrate or cut

8966 Leaves pinnated-lobed, lobes confluent toothed smooth, Root fusiform, Petals as long as calyx

8967 Downy, Rad. lvs. toothed backwards, cauline sagittate oblong blunt, Stems erect branched from the base

8968 Radical leaves stalked obovate toothed or lyrate: upper pinnatifid, Lobes linear entire

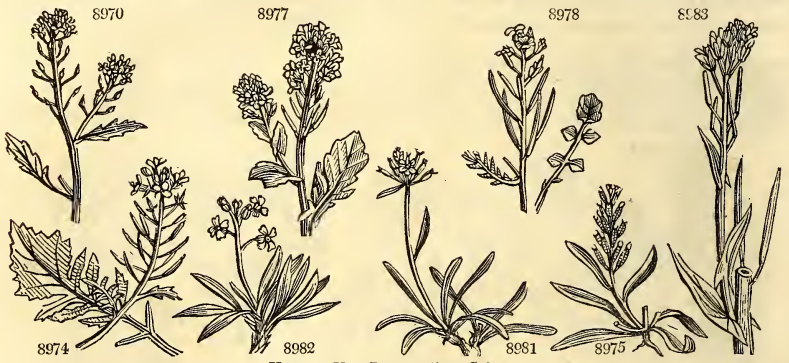

and Miscellaneous Particulars.

popular flower of long standing, admired for its various colors and agreeable odor. Being an acrid and hardy evergreen, it is sometimes sown in pastures, along with parsley, thyme, &c. as a preventative of the rot in sheep.

1383. *Nasturtium*, is said to have been so called from the effect its acrimony produces upon the muscles of the nose; *nasus tortus* signifying a convulsed nose. *Pliny*. *N. officinale* is a well known popular salad, gathered wild in most parts where it is found, and since 1808, cultivated to a considerable extent in the neighbourhood of London. A running stream of clear water is essential to its cultivation; in the bed of this stream the plants are inserted in rows in the direction of the current, and all that is necessary is to take up and replant occasionally, and to keep up the plants free of mud or any accumulation of extraneous matters, and to see that other plants, especially the *Sium nodiflorum*, a poisonous plant resembling the water-cress, do

History, Use, Propagation, Culture,

not find their way into the plantation. Near Rickmansworth, in Hertfordshire, there is a fine stream of water on a chalky bottom, in which one cultivator grows five acres, and sends a supply to London every day in the year, Sundays excepted. There are also large plantations at Uxbridge, Gravesend, and other places.

Some market-gardeners, who can command a small stream of water, grow the water-cress in beds sunk about a foot in a retentive soil, with a very gentle slope from one end to the other. Along the bottom of this bed, which may be of any convenient length and breadth, chalk or gravel is deposited, and the plants are inserted about six inches distance every way. Then, according to the slope and length of the bed, dams are made six inches high across it, at intervals; so that when these dams are full, the water may rise not less than three inches on all the plants included in each. The water, being turned on, will circulate from dam to dam; and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months. A stream of water no larger than what will fill a pipe of an inch bore, will, if not absorbed by the soil, suffice to irrigate in this way an eighth of an acre. As some of the plants are apt to rot off in winter, the plantation should be laid dry two or three times a year, and all weeds and decayed parts removed, and vacancies filled up. Cress grown in this way, however, is far inferior to that grown in a living stream flowing over gravel or chalk.

The water-cress has lately been cultivated in the neighbourhood of Paris, and also near Edinburgh. 1384. *Leptocarpea*. From λεπτος, slender, and καρπον, fruit. A genus distinguished from *Sisymbrium* by its accumbent cotyledons.

- 8969 Radical leaves stalked obovate or lyrate, Cauline amplexicaul pinnatifid, Lobes linear entire
 8970 Leaves obl. lanc. pinnatifid or serrated, Root fibrous, Petals larger than calyx, Silicles ellipsoid
 8971 Leaves obovate cuneate toothed at end, Pods roundish subtergird, Bractes a little shorter than pods
 8972 Lvs. smooth : rad. stalked pinnatifid ; caul. stem-clasping cut serr. Pods roundish, Pedic. bracteate very short
 8973 Lvs. ovate lanc. toothed backwards acuminate at each end smooth, Pods roundish 4 times as long as stalk

8974 The only species. Leaves stalked pinnatifid sublyrate with cut toothed acuminate lobes

- 8975 Pods 2-horned, Petals equal, Leaves entire, Hairs strigose fixed by their middle 2-parted appr. scattered
 8976 Pods 2-horned, Petals unequal, Leaves ent. Hairs strigose fixed by their middle 2-parted very numerous

- 8977 Lower leaves lyrate : terminal lobe roundish ; upper obovate toothed
 8978 Lower leaves lyrate : terminal lobe ovate ; upper pinnatifid with linear oblong entire lobes
 8979 Radical and lower leaves pinnatifid-lyrate : lateral lobes ovate ; terminal cordate entire
 8980 Lower leaves toothed lyrate : lateral lobes dentiform ; terminal very large subcordate, upper ovate

8981 Leaves linear narrowed at base smooth acute

8982 Pods lin.-oblong, Anthers oval, Leaves entire, Peduncles smooth

8983 Rad. leaves toothed hairy : cauline stem-clasping entire smooth, Pods erect 6 times as long as stalk

- 8984 Cauline lvs. cord. stem-clasping rough with 3-parted down, Pedicels shorter than cal. Stigma somew. emarg.
 8985 Leaves many-toothed villous with branched hair lanc. acute : rad. somew. stalked ; caul. cord. stem-clasp.
 8986 Leaves few-toothed hoary with branched hairs : rad. obov. oblong ; cauline cordate sagitt. stem-clasping

- 8987 Lvs. pubesc. with minute stellate down : rad. obl. stalked sinuate toothed ; cauline sagittate lanceol. entire
 8988 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline bluntly cord.-auricled
 8989 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline acutely cord.-auricled
 8990 Lvs. acutely toothed lanc. stem-clasping wavy rough with branching hairs : rad. narrowed into the stalk
 8991 Lvs. somew. toothed rough : rad. ovate or obl. narrowed into the stalk ; cauline lanceol. sagittate cordate
 8992 Lvs. toothed rough with generally branched hairs : radical obov. obl. narr. into the stalk ; caul. ovate lanc.
 8993 Lvs. smooth : radical ovate-oblong somewhat toothed narrowed at base ; cauline sessile ovate serrated

- 8994 Leaves hairy with branched pubescence : radical spatulate bluntly toothed ; cauline ovate acutely toothed
 8995 Leaves rough with scattered bifid down : radical obov. toothed ; cauline obl. nearly entire, Raceme erect
 8996 Leaves somewhat toothed smooth ciliated : radical subsessile oval oblong ; cauline oblong, Raceme erect
 8997 All the lvs. sessile somew. toothed hoary with branched hairs : radical obov. obl. ; cauline obl. Rac. erect
 8998 Leaves hairy somewhat toothed : radical stalked ovate oblong, Stem branched, Pods ascending
 8999 Leaves nearly entire rough with branched hairs : radical and caul. oval narrowed at base, Raceme lax
 9000 Lvs. pubesc. coarsely toothed : rad. spatulate lanc. narrowed into the stalk ; caul. lanc. Pods pubescent
 9001 Leaves oblong acute sessile entire smooth, Stems strigose, Runners creeping, Pods spreading
 9002 Leaves nearly smooth : radical cut ; cauline oblong linear entire, Stem generally branched
 9003 Rad. leaves lyrate pinnatifid smooth or ciliated : cauline linear, Stem hispid at base somewhat branched
 9004 Lvs. vill. with forked down : rad. lyrate pinnat. ; caul. cut toothed, Stem branched hisp. with simple hairs

and Miscellaneous Particulars.

1385. *Notoceras*. From *varos*, the back, and *zegeas*, a horn. The structure of the pod of this genus is intermediate between *Erysimum* and *Capsella*. The species are small annuals, with very minute flowers, which are sometimes apetalous.

1386. *Barbarea*. A name used by Dodoens, because the plant had been called the herb of St. Barbara by some preceding botanists. *B. vulgaris* is sometimes cultivated as a spring salad, but is much less delicate than the common cress, and has nothing in flavor to recommend it. *B. præcox*, the American or Belleisle cress of gardeners, is preferred to the other, and cultivated in a number of gardens.

1387. *Braya*. A curious little plant, with the habit of *Arabis* cerulea. Leaves are linear, racemes terminal, flowers purple. The genus is not completely known ; but it appears to be intermediate between *Silicuosæ* and *Siliculosæ* ; related to *Draba* on one hand, and *Arabis* on the other. It is a native of the Carinthian alps, where it was found by Dr. Hoppe, who named it after Count Bray, a German nobleman.

1388. *Parrya*. Named by Mr. R. Brown, after Captain Edward Parry, the commander of the British expeditions to discover the north-west passage round America. It was found upon Melville island, and once was raised from seeds brought home by some of the officers, but it never flowered, and is now lost.

1389. *Turritis*. From *turris*, a tower ; the leaves and seeds giving the stem a pyramidal form. This genus is principally distinguished from *Arabis* by its seeds being in two rows, and by its habit.

1390. *Arabis*. Native of *Arabia*, according to De Theis ; but this is a forced explanation, and scarcely the true root of the word. Distinguished from all the neighbouring genera by its linear compressed siliques, and flat valves.

History, Use, Propagation, Culture,

1391. *Macropodium.* So named because the pod is elevated above the receptacle upon a stalk; μακρος, long, and πους, a foot or stalk. A genus differing from *Arabis* chiefly in its stalked pod, and its calyx being a little thickened at the base. A little, smooth, erect, simple herb, with ovate, lanceolate, acuminate leaves, and white flowers.

1392. *Cardamine.* From καρδια, the heart, and δυναω, to strengthen, in allusion to its supposed stomachic qualities. The leaves of *C. pratensis* were formerly used in salads. *C. impatiens* is so named from the sudden bursting of the seed pods, being ripe and pressed between the fingers. *C. pratensis* frequently has double flowers. *C. hirsuta* and, it is said, other species, produce young plants from the leaves. All that is necessary is to lay the leaf on a moist grassy surface, or on moss kept moist. The plant propagates itself extensively in this way in moist soils.

1393. *Pteronuron.* From πτερον, a wing, and νευρον, a nerve, in allusion to the winged nerves of the pods, by which it is distinguished from *Dentaria* and *Cardamine*.

- 9005 Lower lvs. stalked lyrate: terminal lobe ovate; upper lanceolate cut, Stem branched weak softly villous
 9006 Leaves all stalked ovate acuminate, coarsely toothed velvety with very fine down, Pedic. and pods spreading
 9007 Lvs. stem-clasping acum. somewhat toothed pubescent, Pedicels length of calyx, Pods 1-sided decurved
 9008 Leaves stem-clasping toothed oblong dilated and cordate at base, Stem furrowed hispid, Pods pendulous
 9009 Cauline leaves linear sessile smooth: lower somewhat toothed; radical obovate, Pods erect
 9010 Cauline leaves sessile oblong lanceolate acuminate somewhat toothed, Pods pendulous falcate [stalk
 9011 Lvs. roughish nearly ent.: rad. obov.; caul. ov. or obl. Rac. nodding, Pods erect 3 times as long as their
 9012 Lvs. smooth nearly entire: rad. obovate; cauline ovate, Raceme erect, Pods 4 times as long as their stalk
 9013 Leaves smooth nearly entire: rad. oblong obovate; cauline few oblong, Raceme nodding, Pods. erect
 9014 Lvs. hoary with stellated down obl. sinuate toothed: rad. stalked; caul. sess. Pods 8 times as long as their
 9015 Leaves stem-clasping shining [stalk

9016 Leaves ovate lanceolate acuminate subserrate, Raceme terminal long

- 9017 Lvs. smooth stalked cordate roundish subsinate toothed, Stem erect, Pods erect twice as long as stalk
 9018 Leaves smooth thickish: radical stalked ovate entire; cauline few entire or 3-lobed, Pods erect
 9019 Leaves smooth membranous stalked: radical undivided; lower cauline 3-fid, upper 5-lobed, Pods erect
 9020 Leaves smooth 3-fid, Segments stalked ovate acuminate toothed, Pods spreading
 9021 Lvs. smoothish 3-fid, Segm. sess. rhomb. roundish tooth. Scape naked, Lower branches root-like creeping
 9022 Leaves above downy trifid, Segments somewhat stalked ovate lanceolate crenate, Stem ascending
 9023 Radical leaves stalked ovate subcordate: cauline pinnatifid with oblong entire lobes, Root granular
 9024 Leaves pinnatifid, Segments of radical roundish; of cauline toothed angular, Stem rooting at base
 9025 Lvs. pinnatifid, Segm. ovate nearly entire: term. round. 3-lobed, Runners creeping, Stem ascend. pubesc.
 9026 Lvs. pinnatifid, Segm. of rad. roundish: of cauline linear or lanc. entire, Style very short, Stigma capitate
 9027 Leaves pinnatifid or lyrate, Lobes oval angular toothed blunt, Stem erect, Petals oblong linear
 9028 Leaves pinnatifid, Segm. of radical roundish mucronate stalked, of the upper oblong subsess. Petals obl.
 9029 Leaves pinnatifid, Lobes sessile obl. linear entire the lowest distant from the stem, Petals oblong linear
 9030 Leaves pinnatifid, Segm. oval oblong somewhat toothed, lowest close to the stem acute stipule-like
 9031 Leaves pinnatifid smooth, Segm. 3-7 roundish toothed angular, Pods erect a little longer than stalk
 9033 Leaves pinnatifid nearly smooth, Segm. stalked ovate toothed lower pinnatifid, Segm. 3-4

9033 Segm. of leaves somewhat stalked roundish tooth-lobed nearly equal

- 9034 Leaves 3 whorled stalked trifid, Segm. oval lanceolate acuminate serrated, Stamens length of petals
 9035 Leaves 1-2 alternately shortly stalked 3-fid, Segm. ovate lanceolate coarsely and unequally serrate lobed
 9036 Leaves many alternate stalked trifid, Segm. broad oval cut toothed, Axillæ without glands
 9037 Leaves many alternate stalked trifid, Segm. ovate-lanceolate remotely toothed, Axillæ with glands
 9038 Caul. lvs. many alternate stalked palmate 5-lobed, Segm. oblong lanceolate acuminate coarsely serrated
 9039 Cauline leaves alternate stalked pinnatifid, Segm. oblong acuminate serrate toothed
 9040 Cauline leaves alternate pinnatifid: upper undivided mostly bearing bulbs in the axillæ

9041 Pods lanceolate narrowed at each end

9042 Pods elliptical blunt at each end

9043 Leaves sub-bipinnatifid, Lobes oblong sinuate angular

- 9044 Stem shrubby erect, Leaves linear with close hairs
 9045 Stem half-shrubby at base erect, Leaves lanceolate downy
 9046 Stems half-shrubby ascending, Leaves oblong obovate stalked and pods hoary with down
 9047 Stems herbaceous erect, Leaves oblong repand, Pods velvety with short down, Stigma capitate

and Miscellaneous Particulars.

1394. *Dentaria*. From *dens*, a tooth; its roots are furnished with projecting angles, which resemble the molar teeth of quadrupeds. Plants with broad palmate or pinnate leaves, and shewy white, yellowish, or purple flowers. The dried root of *D. diphylla* is used instead of mustard by the Americans, under the name of pepper root.

1395. *Lunaria*. Derived from *luna*, the moon, in allusion to the broad round silvery silicles. Large hairy plants, with alternate or opposite cordate leaves, and large lilac flowers.

1396. *Ricotia*. A word, the meaning of which is no where explained. It was probably formed after some obscure botanist. Small weak branched annual plants, with variously lobed foliage, and pale lilac flowers.

1397. *Farsetia*. In memory of Philip Farsetti, a noble Venetian, celebrated for his botanical erudition. A small genus, with hoary entire leaves, and yellow or dirty-white flowers.

History, Use, Propagation, Culture,

1398. *Berteroa*. Named after Charles Joseph Bertero, a pupil of Balbis, and a friend of M. Decandolle, who speaks in high terms of his merits. A genus distinguished from its allies by its bifid petals and peculiar habit.

1399. *Aubrietia*. Named by Adanson, after Aubriet, the famous French botanical draughtsman. A genus very distinct in habit, and sufficiently different from *Berteroa* in its entire petals, and from *Alyssum* in its bisaccate calyx and oblong fruit.

1400. *Vesicaria*. From *vesica*, a blister or bladder. The silicles of this genus are inflated like small bladders. This is a genus which combines species with bisaccate and an equal calyx, with entire and toothed stamens, with edged or not edged seeds, and with a deciduous or persistent calyx. It will, therefore, require division hereafter.

1401. *Alyssum*. From α , privative, and $\lambda\upsilon\sigma\sigma\alpha$, rage; the *Alyssum* passed among the ancients for a plant which possessed the properties of allaying anger. The $\alpha\lambda\upsilon\sigma\sigma\omega\upsilon$ of Dioscorides is referred by Sprengel to *A. alpestre*. The species are shewy plants, of easy culture. *A. saxatile* is very ornamental early in the season.

- 9048 Silicles pubescent somewhat ventricose
 9049 Silicles compressed flat elliptical smooth
 9050 Silicles flat elliptical downy
 9051 Pedicels longer than calyx
 9052 Calyx bisaccate, Leaves oblong entire smooth; lower ciliate subspatulate
 9053 Calyx equal somewhat spreading and leaves velvety oblong entire or sinuate toothed, Stem herbaceous
 9054 Calyx deciduous, Leaves oblong entire or repand wavy hoary with down
 9055 Stems $\frac{1}{2}$ shrubby at base subcorymbose, Leaves lanc. entire downy, Pods obov. orb. 2-seeded, Seeds edged
 9056 Stems $\frac{1}{2}$ shrubby at base panic. Leaves lanc. nearly entire velvety, Pods roundish 2-4-seeded, Seeds edged
 9057 Stems $\frac{1}{2}$ shrubby at base hoary with stellate down, Lvs. obl. spatul. silvery beneath, Pods ovate roundish
 9058 Stems shrubby at base hoary with stellate down, Leaves obl. obov. silvery beneath, Pods elliptical
 9059 Stems shrubby at base hoary with stellate down, Leaves obl. nearly acute whitish beneath, Pods ovate
 9060 Stems $\frac{1}{2}$ shrubby at base twisted diffuse hoary, Leaves hoary sublanceolate, Racemes corymbose
 9061 Stems $\frac{1}{2}$ shrubby at base diffuse hoary, Leaves obovate hoary, Racemes simple, Pods ovate oblong
 9062 Stems diffuse pubescent, Leaves hoary: lower obovate; upper oblong, Racemes simple
 9063 Stem erect, Flowering branches panic. Lvs. lanceol. downy, Pods roundish elliptic. little longer than style
 9064 Stem erect, Leaves lanceolate, Pods hirsute in long racemes twice as long as style
 9065 Stems diffuse, Leaves lanceolate or somewhat linear hairy, Pods roundish rough 6 times as long as style
 9066 Stems diffuse, Leaves linear lanceolate hoary, Cal. persistent, Pods four times as long as style
 9067 Stems diffuse, Leaves linear lanceolate hoary, Pods roundish emarginate smooth
 9068 Stem erect, Leaves velvety oblong sinuated: upper linear, Cal. spreading, Petals bifid
 9069 Stems half shrubby at base procumbent, Leaves lin. lanceol. acute somewhat hoary, Pods oval smooth
 9070 Stems half shrubby at base somewhat erect, Rad. lvs. obl.-lanc. acute silvery: caul. few lin. Pods woolly
 9071 Stems $\frac{1}{2}$ shrubby ascend. Lvs. obl. obt. narrowed at base scaly, Pods roundish smooth twice as long as style
 9072 Stem shrubby, Branches and old peduncles spiny, Leaves obl. linear silvery, Pods round smooth
 9073 Stems diffuse or ascending
 9074 Cauline leaves sagittate stem-clasping, Pods flat smooth
 9075 Leaves sessile 3-5-fid at end cuneate at base
 9076 Scapes naked smooth, Leaves rigid linear lanceolate keeled ciliated, Stamens as long as petals
 9077 Scapes naked smooth, Leaves long linear keeled ciliated, Stamens scarcely as long as calyx
 9078 Scapes naked smooth, Leaves linear keeled rigid ciliated, Style as broad as hairy pod but twice as short
 9079 Scapes naked downy, Leaves lanceolate flat hairy, Hairs branched, Pods oblong, Style very short
 9080 Scapes downy with 2 toothletted leaves, Rad. leaves obl. nearly entire downy, Pods smooth
 9081 Scapes naked or 1-leaved downy, Leaves lanc. hairy nearly entire, Pods lanceol. pubescent
 9082 Scapes 1-leaved pubescent, Leaves ovate obl. with a short starry down, Pedicels downy, Pods oblong
 9083 Stem leafy branched velvety with starry down, Leaves ovate toothed, Pod obl. smooth somewhat twisted
 9084 Stem leafy branched velvety with starry down, Leaves obl. somewhat toothed, Pods obl. pubescent
 9085 Stem branched leafy downy, Leaves ovate toothed downy, Pods ellipt. obl. many-seeded (32-36) velvety
 9086 Stem branched leafy downy, Lvs. ovate toothed subcord. stem-clasping somewhat hairy, Pods smooth few-seeded (12-16)
 9087 Pods elliptical shorter than stalk, Scapes 5-15-flowered

and Miscellaneous Particulars.

1402. *Clypeola*. From *clypeus*, a buckler, in allusion to the form of its silicle. A little annual plant, hoary, with stellate pubescence.
 1403. *Pellaria*. A name with the same meaning and application as the last; *πύλη* signifies in Greek a small buckler.
 1404. *Petrocallis*. From *πέτρας*, a rock, and *καλός*, beautiful, in allusion to the rocky places where it grows, and which it enlivens with its elegant tufts of rose-colored flowers.
 1405. *Draba*. From *δραβή*, acrid, biting, according to Linnaeus. Little annual or perennial plants, found, for the most part, in the cold mountainous countries of Europe; a few are also found in America. Some of the species have silicles, others silicles.
 1406. *Erophila*. A genus divided from *Draba*, on account of its bifid petals; and deriving its name from *ερός*, the spring, and *φιλία*, to love, in allusion to the time of the year when it appears.

History, Use, Propagation, Culture,

1407. *Cochlearia*. From *cochlear*, a spoon. The leaves are hollowed and concave like the bowl of a spoon. The annual species were formerly used as spring salads and antiscorbutics, but are now generally neglected.

C. armoracia, the horse radish, is cultivated as a condiment to roast beef. It is called upon the continent *Cran*, *Cran de Bretagne*, *Raisfort*, *Reeredyck*, &c. &c. Two excellent modes of cultivating it have lately been described in the Horticultural Transactions, by Knight, a nurseryman, and Judd, a gardener. Both agree in trenching the soil to a considerable depth, and putting the manure at the bottom of the trench; but Knight plants the sets on the surface, and calculates on the root that strikes down to the dung for produce. Judd, on the other hand, makes holes quite to the bottom of his trenched soil, and in each drops a set, filling up the hole with wood ashes, rotten tan, or sand, calculating for produce on the shoot made from the set at the bottom of the hole, up through the sand or ashes to the surface. Judd's mode is the most ingenious, and appears the best, but either will do extremely well. A moist soil increases the bitter and alkaline flavor of this and all the Cruciferae.

Common scurvy-grass has powerful medical properties, as antiscorbutic and sialagogue, and stimulating the digestive organs. For ample details respecting its qualities, consult *Wier Cochl. Descr.* lib. 1., Basilea, 1567. *Mællenoroch Cochl. Cur.*, Lipsia, 1674. *Murr. App. Med.* 2. p. 420, &c.

- 9088 Pods lentiform smooth, Rad. leaves obl. toothed hairy ; cauline linear oblong
- 9089 Pods ellipsoid, Rad. leaves obl. crenate ; cauline long lanceolate toothed or cut, Root large fleshy
- 9090 Pods ellipsoid, Rad. lvs. obl. crenate ; cauline lanc. toothed, Teeth cartilaginous, Root fleshy, Sepals erect
- 9091 Pods roundish, Cauline leaves cordate sagittate stem-clasping acuminate entire
- 9092 Pods ovate roundish with netted veins twice as short as stalk, Rad. leaves stalked ovate entire ; caul. obl.
- 9093 Pods ovate globose twice as short as stalk, Rad. leaves stalked cordate ; cauline ovate toothed angular
- 9094 Pods ovate the length of stalk, Rad. leaves stalked reniform entire ; cauline scarcely any
- 9095 Silicles ellipsoid the length of pedicel, Leaves all stalked subdeltoïd
- 9096 Silicles roundish emarginate, Pedicels and petioles radical long, Leaves ovate rounded entire

- 9097 Radical leaves on long stalks cordate repand-toothed ; cauline ovate cordate on short stalks
- 9098 Rad. lvs. somewhat stalked obovate-obl. ; cauline oblong at the base hastate stem-clasp. with acute auricles
- 9099 Leaves oblong toothed, Stems erect, Silicles obovate orbicular shorter than pedicel
- 9100 Lvs. obl. tooth. blunt : lower stalked ; upper sagit. stem-clasp. with acute auricles, Silicles subov. ventricose
- 9101 Lvs. somew. tooth. : rad. stalk. ; caul. cord. stem-clasp. Stem branch. Pet. length of cal. Silicles obcordate
- 9102 Lvs. somew. fleshy ent. : rad. obov. stalk. ; caul. obl. sagitt. stem-clasp. Pet. larg. than cal. Silic. obc. 4-seeded
- 9103 Lvs. nearly entire : rad. ovate stalked ; caul. obl. stem-clasp. Pet. as long as cal. Silic. obcord. 8-12-seeded

9104 Radical leaves pinnatifid, Silicles obcordate

[twice as short as silicle

- 9105 Lvs. somew. fleshy entire : lower stalk. obov. ; caul. ovate obl. somewhat stem-clasp. Stam. petals and style
- 9106 Lvs. somew. fleshy : lower stalk obov. obl. entire ; caul. obl. Stamens petals and style about length of silicle
- 9107 Lvs. pinnated smooth, Pet. twice as long as decid. cal. Silicles acute at each end, Style very short exerted
- 9108 Lvs. pinnated, smooth, Pet. scarcely longer than calyx, Silicles blunt at each end 4-seeded, Stigmas sessile

- 9109 Petals unequal : outer largest
- 9110 Petals equal

- 9111 Shrubby, Lvs. cuneate or spatul. blunt ent. smooth, Flowers corymbose, Silicles truncate subemarg. at end
- 9112 Shrubby, Leaves cuneiform obtuse somewhat toothed at end a little ciliated, Flowers corymbose
- 9113 Shrubby, Leaves linear entire somewhat fleshy rather acute smooth or ciliated, Flowers corymbose
- 9114 Shrubby, Leaves ciliated blunt linear spatulate ; lower somewhat toothed at end, Flowers corymbose
- 9115 Shrubby, Lvs. obl. blunt narrowed at base smooth, Fls. in long racemes, Silic. emarg. with a narrow recess
- 9116 Herbaceous, Lvs. lanc. acute somew. toothed, Fls. corym. becoming racem. Silic. obcord. narrowly emarg.
- 9117 Herbaceous, Lvs. lanc. blunt smooth entire or the rad. somew. toothed, Fls. finally racem. Silic. ovate trun.
- 9118 Herbaceous smooth, Leaves pinnatifid, Racemes corymbose but little elongated after flowering [style
- 9119 Herb. smooth, Lv. lin. tooth. ciliat. at base dilat. at end, Silic. round. Lobes of end acute spread. short. than
- 9120 Herbaceous smooth, Leaves lanc. acuminate : lower serrate ; upper entire, Silicles umb. acutely 2-lobed
- 9121 Herbaceous smooth, Leaves linear entire : radical somewhat toothed, Silicles corymbose 2-toothed
- 9122 Herb. smoothish, Lvs. lin. entire ciliated at base, Silic. corymb. emargin. with blunt lobes as long as styles
- 9123 Herb. smoothish, Leaves ciliat. somew. fleshy : lower spatul. 2-tooth. at end ; upp. lin. Silic. corymb. emarg.
- 9124 Herb. smoothish, Lvs. stalked spat. blunt toothed and ent. ciliat. Corymb somew. umbel. Cal. hairy at back
- 9125 Herbaceous smooth, Lvs. round. spatul. ent. rather fleshy, Silic. corymo. emarg. with a broad blunt recess
- 9126 Half-shrubby at base pub. Lvs. rather fleshy cren. : lower ob. narr. at base ; up. obl. lin. Sil. somew. corymb.

[emarginate

- 9127 Cal. bluntly 2-spurred, Silicles smooth rough with elevated dots in centre, Lobes of end meeting over style
- 9128 Cal. bluntly 2-spurred, Silicles smooth even, Lobes at the end somewhat meeting over the style
- 9129 Cal. acutely 2-spur. Silic. smooth with elevat. rough points on disk, not overhang. style at end, Stem hispid
- 9130 Silicles hispid on each disk, Radical leaves lyrate
- 9131 Silicles smooth even, Radical leaves lyrate

and Miscellaneous Particulars.

- 1408. *Thlaspi*. From *Thlaspi*, to compress. The *Thlaspi*, says Pliny, bears seeds like the lentil, and compressed, whence its name. T. arvense, when rubbed, has the smell of garlic.
- 1409. *Capsella*. A diminutive of *capsula*. This, which is the common shepherd's-purse, has been separated from *Thlaspi* on account of its valves not being winged at back.
- 1410. *Hutchinsia*. Named after Miss Hutchins, to whom Sir James Smith was indebted for many communications of submarine algæ during the progress of his English Botany.
- 1411. *Teesdalia*. Named after Mr. Robert Teesdale, author of a Catalogue of the Plants growing about Castle Howard, in the North Riding of Yorkshire, published in the Transactions of the Linnean Society. Small annual smooth herbs, with revolute leaves, and simple scapes of small white flowers.
- 1412. *Iberis*. From the country called *Iberia*, now Spain. Most of the species grow in such countries. They are generally pretty plants, and some of them are commonly cultivated in gardens as hardy annuals, under the name of Candy-tuft ; a name which was originally applied to the *I. umbellata* only, which was first discovered in Candia, and called *Thlaspi Candia* by Lobel and Dodonæus.
- 1413. *Biscutella*. From *bis scutella*, a double shield, in allusion to the form of its seed-vessel when bursting. Small annual or perennial hispid plants, with small bright yellow flowers. The species are nearly related to each other, and difficult to distinguish.

History, Use, Propagation, Culture,

1414. *Euclidium.* From *eu*, well, and *κλειδω*, to shut up, because of the firmly closed seed vessel.
 1415. *Ochthodium.* So called from *οχθωδης*, warted, in allusion to the surface of the pods.
 1416. *Anastatica.* Derived from *αναστασις*, resurrection. This plant has been so called because it has the curious property of recovering its original form, however dry it may be, upon immersion in water. The common people believe that if you put this in water at the time when a woman first experiences the pains of childbirth, it will expand at the precise moment when the infant is brought into the world. Commonly called Rose of Jericho. It grows in the arid wastes of Arabia and Palestine, where it is called *kaf maryam*, that is to say, Mary's hand.
 1417. *Cakile.* An Arabic word employed by Serapio. Smooth fleshy annual plants, with pinnatifid leaves, and white or purple flowers. They all grow upon the sandy coasts of the northern hemisphere. *C. maritima* is said by Anguillara to be a powerful cathartic.

- 9132 Silicles even ciliated at edge, Radical leaves lyrate
 9133 Silicles even ciliated at edge, Stem erect elongated leafy, Leaves sessile oblong remotely toothed [at base
 9134 Sil. rough on edge and disk with a very fine down, Rad. lvs. obov. cun. acute tooth. Stem somew. nak. hisp.
 9135 Silicles rough on the edge and disk with a very fine down, Leaves lanc. serrate, Stem leafy branched hairy
 9136 Silicles smooth even, Rad. leaves rough with hair oblong narrowed into stalk : cauline linear few entire
- 9137 Silicles smooth even, Leaves rough with hairs, generally radical pinnatifid with 2-3 rem. lobes on each side
 9138 Sil. smth. even, Lvs. rough with hairs : rad. sin.-tooth. nar. at base ; caul. very few cord. at base $\frac{1}{2}$ stem-clasp.
 9139 Silicles smooth rough with elevated dots on the disk, Leaves hairy generally radical oblong
 9140 Silicles smooth rough with elevated dots on disk, Lvs. mostly radical erect linear lanc. hoary nearly entire
- 9141 Silicles scabrous with a persistent subulate style, Cauline leaves stalked lanceolate
- 9142 The only species
- 9143 The only species
- 9144 Upper joint of the silicle ensiform
- 9145 Silicles smooth : upper joint ovate longer than style, Leaves pinnatifid, Lobes toothed cut acute
 9146 Silicles downy : upper joint round rugose shorter than style, Leaves blunt toothed ; radical sublyrate
 9147 Silicles furrowed smooth, Leaves oblong toothed sinuated
- 9148 Silique and leaves smooth : upper lanceolate toothed ; lower pinnatifid
- 9149 Siliques and leaves nearly smooth, Leaves all sinuate pinnatifid
- 9150 Stem branched diff. Lvs. lanc. somew. toothed, Down 2-4-parted, Pedi. shorter than persist. cal. Siliq. rough
 9151 Stem erect simple, Lvs. obl. cut tooth. Down 3-parted, Pedi. shorter than decid. cal. Siliq. smth. about 4-cor.
 9152 Stem branched somew. hairy at base, Lvs. ov. acute toothed angul. and siliq. smooth, Pedi. shorter than cal.
 9153 Stem erect branch. Lvs. obov. ent. Down 2-parted app. Pedi. length of cal. Siliq. round. pub. Style very short
 9154 Stem erect branched, Lvs. ellipt. blunt ent. nar. at base, Down appr. 2-4-parted, Pedicels shorter than cal.
 9155 Stem erect branched, Lvs. lanc. acute : lower toothed sess. Down stel. Pedi. very short, Pods torulose subul.
 9156 Stem erect branched, Lvs. obl. blunt nearly ent. Down tom. stel. Pedicels finally as long as cal. Pods pubesc.
 9157 Stem erect branched, Lower lvs. lyrate stalked blunt, Down app. 2-part. Pedicels length of cal. Pods pubesc.
 9158 Stem compound erect, Leaves lanceolate linear nearly entire hoary, Pedicels length of cal. Pods hoary
- 9159 Pedicels very long spreading stiff as broad as silique which is thickened at each edge, Petals obl. oblique
 9160 Pedicels shorter than cal. Petals obovate oblong, Leaves obovate cut-toothed, Stem hispid
 9161 Pedic. longer than cal. Petals obov. somew. pointed, Lvs. downy : lower lyrate runcinate ; upper lanc. acum.
 9162 Pedicels length of cal. Petals obov. Siliq. erect torose smooth not thickened at edge, Lvs. ovate lanc. toothed
 9163 Pedicels glandular hairy length of cal. Petals obovate, Leaves oblong blunt and stem simple ciliate hispid
 9164 Pedic. scarcely so long as cal. Petals obovate, Leaves somewhat radical somewhat fleshy lanc. Scape simple

and Miscellaneous Particulars.

1418. *Rapistrum* ; that is to say, resembling *Rapa*. A genus very near *Cakile*, from which it differs in having yellow flowers, and leaves not fleshy, and more or less hairy.

1419. *Chorispora*. From *χρησις*, separately, and *σπορα*, seed ; each seed being enclosed separately in the pod. This differs from *Raphanus* in having flat decumbent cotyledons, not folded incumbent ones. Little annual plants.

1420. *Malcomia*. Named after Mr. William Malcolm, an eminent nurseryman in the neighbourhood of London, and a person of some botanical acquirements. *M. maritima* is a common annual, which, sown at different times, or left to sow itself, will be in flower nearly all the year.

1421. *Hesperis*. From *ἑσπερος*, the evening. The flower is more fragrant towards evening than at other periods of the day. *H. matronalis*, in its double varieties, is rather difficult to keep, and requires to be yearly renewed by cuttings. It prefers a strong loamy soil ; and it has been remarked, that it neither thrives in the neighbourhood of London or Paris.

History, Use, Propagation, Culture,

1422. *Sisymbrium*. Σισυμβριον was the name given by the Greeks to some aquatic plant not now recognized. It appears to have had an agreeable smell. Ovid advises that Venus should be propitiated with garlands of myrtle, of roses, and of *Sisymbrium*. *S. officinale* is a celebrated medicinal plant, and esteemed diuretic, detensive, and expectorant, and prescribed in asthma and hoarseness, whence the French call it *Herbe aux chantes*.

1423. *Altaria*. From *allium*, garlic, in allusion to the smell of the leaves of this plant, for the sake of which it was formerly used in salads.

1424. *Erysimum*. From *ερωσω*, to cure, on account of the salutary effects of this plant in medicine. It is even now reckoned a powerful cure for the sore throat. The plant of the ancients appears to have been our garden cress; for Pliny says the Gauls called his *Erysimum velar*, and the garden cress is to this day called *vilhar* in

9165 Leaves runcinate hairy, Stem hairy, Siliques subulate appressed to the rachis
 9166 Leaves lanceolate stalked toothed pubescent
 9167 Leaves smooth glaucous : lower stalked runcinate pinnatifid ; upper linear lanceolate entire
 9168 Leaves lanc. toothed sessile smooth, Stem branched divaricating, Siliques erect roundish smooth [base
 9169 Leaves pinnated, Lobes oval oblong blunt sinuate-toothed with rounded recesses, Stem hispid backward at
 9170 Stem and lvs. smth. : rad. runcin. ; caul. pinnatifid, Lobes and recesses acute, Cal. much spread. Pods rough
 9171 Stem pods and lvs. smooth : rad. runcin. ; cauline cut or pinnatifid, Lobes and recesses acute, Cal. spreading

9172 Stem and leaves smooth runcinate pinnate, Lobes toothed terminal elongated, Cal. and pods spreading erect
 9173 Stem villous somew. hoary, Leaves runcinate pubes. Lobes toothed or ent. acute, Pods nearly erect, Cal. lax

9174 Lower leaves runcin. hispid with toothed lobes : upper pinnated smooth with lin. ent. lobes, Pods spreading
 9175 Lvs. smth. pinnat. with obl. blunt somew. tooth. lobes, Pedic. very sh. Pods muric. rough point, with sh. style
 9176 Leaves bipinnate with oblong linear cut lobes, Pedicels 4 times as long as calyx, Petals smaller than calyx
 9177 Leaves about 3-pinnate hoary with very small blunt lobes, Stem $\frac{1}{2}$ shrubby, Petals larger than calyx
 9178 Lvs. pinnated, Segm. lanc. cut serrated : outer confluent, Petals larger than calyx, Pods shorter than stalk
 9179 Pedic. axillary very short solitary, Pods erect downy, Leaves sinuate pinnatifid, Stem downy backwards
 9180 Pedic. about 3 axill. very short, Pods erect smooth, Lvs. sinuate runcin. Lobes acute toothed lowest largest
 9181 Pedic. very short axill. or naked, Pods and stems erect hispid, Leaves smoothish obl. acutely runcin.-pectin.
 9182 Leaves lyrate pinnatifid smooth, Stem erect leafy, Pedicels thick shorter than calyx
 9183 Rad. leaves lyrate : cauline pinnat. Lobes linear ent. term. largest, Pedic. slender almost shorter than alyx
 9184 Leaves linear entire, Branches and pedicels glandular and hairy, Pods glandular

9185 Leaves cordate, Pods prismatical much longer than pedicel

9186 Leaves ovate roundish, Pods lanceolate the length of their stalk

9187 Pods length of style : when young covered by the persistent calyx, Fl. sessile, Leaves linear entire
 9188 Pods much longer than style when young having a persistent calyx, Fl. subsessile, Leaves linear entire
 9189 Pods thrice as long as style 2-edged naked, Fl. on short stalks, Leaves oblong lanceolate sinuate toothed
 9190 Leaves lanc. toothed pubescent with a 3-parted down, Stem branched, Pods lax, Stigma 2-lobed [of pod
 9191 Lvs. obl. lanc. somew. tooth. pub with 3-part. down, Stem straight round, Length of style great, than breadth
 9192 Lower leaves runcinate toothed : upper lanc. undivided, Fl. branches and pods comp. 4-cor. erect spreading

9193 Lvs. lanc. somew. toothlet. roughish green, Pods erect spread. twice as long as stalk, Stigma small subsessile
 9194 Leaves linear lanc. repand-toothed, subpubes. Pods spreading torulose scarcely thicker than short pedicel
 9195 Lvs. lin. entire and stem cinereous with appressed 2-parted hair, Pods somew. erect, Stigma stalked emarg.
 9196 Lvs. lin. ent. or somew. tooth. somew. hoary with 2-part. hair, Claws long. than cal. Pods erect, Stig. near sess.
 9197 Lower lvs. lanc. toothed : upper somewhat linear entire, Petals roundish obovate, Claws longer than calyx
 9198 Leaves lanceolate toothed narrowed at base, Petals obovate oblong, Pods spreading, Style scarcely any
 9199 Leaves lin. obl. : lower toothed runcin. and stem pubesc. rough, Pods spreading, Style very short and thick
 9200 Leaves membranous smoothed : cauline cordate sagittate stem-clasping oblong ; radical stalked ovate

9201 Rad. lvs. obov. : cauline cordate stem-clasping, all blunt smooth glauc. Sides of square stalk without nerves

9202 Pods cuneate pyriform with 4 ribs and a longish style, Leaves lanceolate nearly entire

9203 Pods roundish pyriform with 4 ribs and a longish style, Leaves repand toothed

9204 Pods globose, Leaves oblong serrate toothed bluntly stem-clasping at base, Stem smooth

9205 The only species

9206 Leaves pinnatifid, Lobes oblong toothed or cut, Pods compressed twin netted

9207 Lvs. pinnatifid, Lobes ent. toothed or pinnatifid, Pods somew. acute compressed with crested rugose valves

and Miscellaneous Particulars.

the Basque tongue, and in other dialects of France *beler* or *veler*. From the seeds of *E. perfoliatum*, a plant not known in this country, oil for lamps is expressed in Japan.

1425. *Camelina* ; that is to say, *chamae-linum*, dwarf flax. *C. sativa* is cultivated in many parts of Europe for the seeds, from which oil is obtained. For the method of its culture see Parmentier, in *Roz. Cours d'Agric.*, v. xi. p. 291. *Bosc. Dict. d'Agr.* 3. p. 45. *Galliz. Bot. Agr.* 3. p. 170.

1426. *Neslia*. A name first employed by M. Desvaux, but not explained by him. A genus allied to *Camelina*, but well distinguished by its one-seeded indehiscent siliques.

1427. *Coronopus*. From *κορωνο*, a crow, and *πους*, a foot. The leaves are deeply cut, and resemble the feet of a bird. *Coronopus Ruellii* was formerly gathered and used as a salad, but has long since been deservedly neglected. *C. nitoticus* is said, by Delile, to be used in Egypt for the same purpose.

History, Use, Propagation, Culture.

1428. *Lepidium*. From *λεπτις*, a scale. The form of the silicles is that of little scales. *L. pisidium* is used by the natives of the Society Islands for the purpose of catching fish by inebriating them. It was used by the English voyagers as a salad, but it was very pungent. *L. oleraceum* is a powerful antiscorbutic, and is found of great service to the crews of ships visiting New Zealand; it resembles lettuce in taste, and acts as a moderate aperient. *L. sativum*, the common garden cress, is a salad-plant known to every one, and which even the cook can cultivate on moistened cloth or wool in a moist heat. Watering with water, impregnated with muriatic acid gas, or electrifying, will facilitate the germination and development of the seeds.

1429. *Æthionema*. So named by Mr. R. Brown, apparently in allusion to some tawny or sunburnt tinge in the stamens. From *αιθια*, to scorch, and *νημα*, a stamen. *Smith*.

1430. *Isatis*. From *ισαζω*, to render blue. The plant was believed to destroy, by its simple application, all roughness and inequalities of the skin. It was formerly called *glastum*, from the Celtic *glas*, blue, whence *Glastonbury* derived its name. The ancient Britons colored themselves with the blue preparation obtained from this plant, whence they received their appellation, *Britho* being the Celtic word for to paint. The Picts were so named by the Romans for the same reason. On account of the brightness of its manufactured colors the Celts called it *gwed* (*guedse*, French, at this day), whence the Anglo-Saxons obtained their name of *waad* or *wad*, and the English the word *woad*. *I. tinctoria* is in occasional cultivation for its leaves, from which a dye, as a substitute for indigo, is obtained. The seeds are sown on well prepared land in good heart; fresh broken old pasture land is preferred; and the great object is to have large leaves; for which purpose, as Miller observes, the culture given by the best gardeners to spinach should be imitated, that of sowing on a very rich well pulverised soil, thinning the plants so as they may not touch each other, keeping them perfectly clear of weeds, and frequently stirring the soil between the plants. The culture applied to the turnip in Northumberland would succeed well with woad. The seeds are sown in July, and the plants, when they come up, weeded and thinned; next July, or earlier, the first crop of leaves may be gathered, and two or three others will be ob-

- 9208 Pods cordate somewhat turgid entire at the end exceeded by the style, Leaves stem-clasping lanc. toothed
- 9209 Pods elliptical twice as long as stalk, Style filiform, Leaves with acute stem-clasping lanceolate auricles
- 9210 Pods ellipt. smooth shorter than stalk, Style filif. Leaves with blunt stem-clasping obl. bluntly toothed auric.
- 9211 Pods ellipt. ent. somew. downy pointed with style, Cal. somew. persistent, Rad. lvs. pinnat. : caul. lin. ent.
- 9212 Pods orbicular winged, Leaves variously divided and cut, Branches not spiny
- 9213 Pods ovate winged emarginate scaly, Cauline leaves sagittate toothed
- 9214 Pods ovate winged emarginate hairy, Cauline leaves sagittate villous nearly entire
- 9215 Pods oblong winged emarginate about 2-horned smooth, Radical leaves pinnatifid with cut lobes
- 9216 Pods orbic. emarg. shorter than stalk, Flowers with 2-4-stamens, Caul. lvs. lin. lanceol. cut-serrate smooth
- 9217 Pods ovate somewhat emarginate, Leaves subulate entire, Stem $\frac{1}{2}$ shrubby
- 9218 Pods ovate emarg. spreading shorter than stalk, Leaves smooth : radical pinnatifid, Fls. diandrous apetal.
- 9219 Pods elliptical slightly emarginate, Leaves pinnatifid, Lobes linear, Joints of stem inflated
- 9220 Pods ellipt. slightly emarg. Lower lvs. stalked pinnatifid with multifid lobes : upper cord. amplexicaul entire
- 9221 Pods oval somewhat emarginate, Leaves pinnatifid with oval entire lobes : terminal large roundish
- 9222 Pods oval somew. emarg. approxim. Lower leaves pinnati. with spread. acute lobes, Stem much branched
- 9223 Pods orbicular emarginate, Flowers diandrous, Leaves all pinnately multifid minutely ciliated
- 9224 Pods oblong obovate emarginate, Stigma exerted, Leaves oval-oblong toothed outwardly or entire
- 9225 Pods ovate acutish, Leaves smooth ellipt.-oblong deeply serrated : upper entire somewhat serrated at end
- 9226 Pods ovate pointed with stigma, Lower lvs. stalked lyrate pinnatifid, Lobes cut toothed : term. very large
- 9227 Pods ovate pointed with the stigma, Leaves ovate lanceolate undivided subserrate, lowest on long stalks
- 9228 Pods ovate pointed with stigma, Leaves smooth somew. fleshy entire, Rad. stalked ovate : caul. sess. sagitt.
- 9229 Pods elliptical pointed with stigma, Stems $\frac{1}{2}$ shrubby, Radical lvs. obov. obl. toothed : cauline linear entire
- 9230 Pods ovate pointed with stigma, Rad. leaves cut or pinnatifid : cauline linear entire, Stem much branched

- 9231 Silicles 2-celled many-seeded obcordate, Valves winged at back and entire, Racemes in fruit lax
- 9232 Silicles 2-celled 2-seeded round emarg. at base and end, Racemes very close, Valves winged at back and ent.
- 9233 Silicles 1-celled 1-seeded not opening emarginate at end, Leaves oval or obovate

- 9234 Silicles round cordate at base with a wide margin pointed with the style
- 9235 Silicles obov. with a broad edge cuneate at base very blunt and emarginate at end, Stem and leaves smooth
- 9236 Silicles oval-oblong blunt at each end with a leafy winged margin 3 times as long as broad
- 9237 Silicles elliptical blunt at each end with a coriaceous winged edge three times as long as broad
- 9238 Silicles obl. cuneate very blunt truncate emarginate narrowed at base, three times as long as broad
- 9239 Silicles cuneate acuminate at base somewhat spatulate at end very blunt three times as long as broad
- 9240 Silicles oblong narrowed at base bluntnish at end four times as long as broad [at end
- 9241 Silicles elongate-cuneate downy four times as long as broad and twice as long as the stalk which is obconical

9242 Silicles lin. blunt vill. with reversed down eight times as long as broad and three times as long as their stalk

9243 The only species

9244 Lvs. covered with glaucous pollen somew. fleshy repand or lobed even in their youngest state quite smooth

and Miscellaneous Particulars.

tained during the season. The end of the second year the plants may be ploughed down, as the third year they will run to seed, and yield but small leaves. The leaves are pressed, and the juice treated as in making indigo (see *Indigofera*) ; but such is the cheapness of the latter article, that no British farmer can afford to raise any sort of substitute.

1431. *Myagrum*. An ancient plant, so named from its properties of catching flies, which the modern plant does not possess ; *μυα*, a fly, *αγρε*, capture.

1432. *Brassica*. The etymology of this word has been explained with great learning and ingenuity by Vossius, Ray, Dalechamp, and others. It comes, however, from the Celtic *brasic*, which signifies a cabbage. This genus affords the well known pot herbs and roots, and also the oil plant rape, extensively cultivated in agriculture. There is scarcely an instance in the vegetable kingdom of a plant that produces varieties so different in appearance and qualities as the *B. oleracea* ; comparing the original plant as it is found on our shores, with wavy sea-green leaves, no appearance of a head, and flowering like wild mustard or charlock, with the red cabbage or cauliflower, the difference is astonishing. A new arrangement of the cultivated species of *Brassica* has been made by Professor Decandolle (*Hort. Trans.* vol. 1., and in his *Reg. Veg.*), whose varieties, or races of *B. oleracea*, are stated above.

The *colza* of the Dutch he makes a distinct species (*B. campestris*), and also the turnip (*B. rapa*) ; the rape (*B. napus*), and the summer rape of the Germans (*B. præcox*).

In Hungary, in the territory of Alba, the *B. elongata* is cultivated for its oil, for which purpose it is said to be better adapted than any other species.

The culture of all the *Brassica* tribe is so universally known that it would be a waste of space in a work of this sort to enlarge on it. They all prefer a loamy soil, well enriched with manure ; and manures of the strongest kind, as nightsoil, offals from the shambles, blood, &c. are not found too powerful for common cabbage or cauliflower. The turnip prefers a lighter soil than the cabbage tribe, but it must be well manured, and if the

History, Use, Propagation, Culture,

manure be well fermented, so much the better for the garden turnip; in the fields, where it is buried in rows or drills, more littery dung will succeed.

The field culture of the turnip is become an important part of the agriculture of light soils; the best mode is by drills, as in Berwickshire and Northumberland, where are produced crops of treble the weight of those grown in the broad-cast manner in Norfolk. In the latter county a crop weighs from five to fifteen tons per acre; in Northumberland from twenty-five to thirty tons; and in Ayrshire as many as sixty tons have been raised on the statute acre. (*Encyc. of Agric.*)

The cabbage has been tried as a field plant; but, though it has been said by Sinclair (*Hortus Gram. Wob.*) to produce more nutritive matter than either turnips or field beet, professional farmers have not found it to answer.

Of all the Brassica tribe it may be observed, that they attain to much the greatest perfection in temperate climates, such as those of Britain and Holland. Without constant and liberal supplies of water, they are small in size, and rigid or stringy in texture. In France and in Italy, and warm climates, it is only the cauliflower and broccoli that attain a large size; and that, in Italy at least, is during the coldest months of the year, and aided by liberal waterings. But in Tarragona the cauliflower is said to reach the enormous weight of 40 lbs.

1433. *Sinâpis*. In Greek *σινάπης*, said to be derived from *nap*, the Celtic designation of all plants resembling the turnip or cabbage. Our English word *mustard*, and the French *moutarde*, are modernizations of *mustum ardens*, hot must; the sweet must of new wine being one of the ingredients of the French mustard for the table. The seeds of all the species are hot, acrid, and will afford an oil by expression, and a powder or meal by drying and grinding, which might serve as the condiment mustard. *S. nigra* is more particularly adapted for the latter purpose, though it is often mixed with the seeds of *S. alba* and *arvensis*, and often with those of the

- 9275 Pods pendulous stalked, Cauline leaves oblong hispid coarsely cut-toothed
- 9276 Pods pendulous sessile, Leaves obovate coarsely toothed hispid
- 9277 Pods sessile nearly erect, Style ensiform, Leaves sessile runcinate lyrate toothed

and Miscellaneous Particulars.

Brassica and Raphanus genera. Both *S. alba* and *nigra* are grown as small salads to be eaten with cress ; they are sown as thick as seeds will lie, in pots or boxes, or in the area of forcing-houses, in the winter season, and forced, or in beds in the open air, and cut as soon as the seed leaf is fully expanded. For flower of mustard, or for the seed for oil or medical purposes, both white and black sorts are sown in the fields in rich well pulverized soil, in March or April, and kept free of weeds. The crop ripens in July and August, and is either threshed immediately or stacked like other grain. It is like other oleiferous seeds, exhausting for the soil, and such seeds as drop and are buried, will retain their vegetative qualities for an unknown length of time ; so that where mustard has once been grown, it will come up occasionally for a century or more afterwards.

If the seeds, Dr. Cullen observes, be taken fresh from the plant and ground, the powder has little pungency, but is very bitter ; by steeping in vinegar, however, the essential oil is cooled, and the powder becomes extremely pungent. In moistening mustard powder for the table, it may be remarked, that it makes the best appearance when rich milk is used ; but the mixture in this case does not keep good for more than two days. The seeds of both the black and white mustard are often used in an entire state medicinally. Half or a quarter of a wine glass of mustard seeds, swallowed fasting, about five in the morning, is the most powerful tonic and strengthener of the digestive organs which is known.

1434. *Moricandia*. Named by Decandolle, after his friend Stephen Moricand, author of the *Flora Veneta*, and an excellent Italian botanist. *M. hesperidiflora* is a favourite food of the camel, notwithstanding its intense acidity.

1435. *Diptolaxis*. From *διπλος*, double, and *ταξις*, arrangement, on account of the double rows of seeds in each cell.

History, Use, Propagation, Culture,

1436. *Eruca*. The meaning of this word is involved in obscurity. According to Isidore, of Seville, a learned Spaniard, who died in 636, and left a book of etymologies, *cruca* is an alteration of *urica*, derived from *uro*, to burn. From *eruca*, the Italians formed *ruchetta*, the French *roquette*, and the English *rocket*. *E. sativa* is very pungent in the foliage, and is used as a salad in the South of Europe for its aphrodisiacal powers :

“ Excitat ad venerem tardos *Eruca* maritos.”

1437. *Vella*. Latinized from *valer*, the Gallic name of the cress. A pretty low shrub, with beautiful yellow flowers appearing in the early spring. It is hardy enough to live through the winter in a dry warm south border.

1438. *Carrichtera*. An unexplained name, first used by Adanson. A small annual plant, with pinnated leaves, and long erect racemes opposite to the leaves. Flowers small, pale yellow.

1439. *Succowia*. In honor of Professor Suckow, a learned botanist of Heidelberg. An annual, with the habit of the last, from which it differs in its subulate style and solitary seeds.

1440. *Zilla*. The Egyptian name of the plant, which is a large glabrous herb, with round white branches and oblong toothed leaves, which are boiled and eaten by the Arabs like those of cabbage.

1441. *Calepina*. A name used by Adanson, the meaning of which is unknown. This plant has been transferred by one author or another to almost every genus of Siliculose, but appears to be really akin to *Crambe* only, from which it differs in its sessile and purely unilocular silicle, in its stamens having no teeth, and in the outer petals being larger than the others.

1442. *Crambe*. One of the names applied by the Greeks to the cabbage, and especially to the marine cabbage. *C. maritima* grows on sandy shores in the west of England, and there the common people have from time immemorial been in the practice of watching when the shoots and leafstalks begin to push up the sand

- 9278 Pods sess. nearly erect, Style roundish 1-2-seed. Lvs. pinnatif. with cut lobes and lin. sinuate toothed segm.
 9279 Pods somewhat stalked erect, Style filif. short without seeds, Upper lvs. entire lower pinnatifid compound
- 9280 Pods sess. erect, Style short somew. filif. Rad. lvs. toothed or lyrate smooth, Stems nearly naked ascending
- 9281 Pods sess. erect, Style short somew. filif. Rad. lvs. runcinate toothed hispid, Stems naked erect
 9282 Pods sess. erect, Style short somew. filif. Rad. lvs. lyrate very blunt smooth, Stems naked decumbent
 9283 Pods sess. erect narrowed at base, Style short conical, Rad. lvs. pinnatifid thickish with entire lobes
- 9284 Lvs. lyrate pinnated with toothed acute lobes, Stem hirsute, Pedicels shorter than deciduous calyx
 9285 Lvs. pinnatifid, Lobes acute nearly entire, Stem hirsute, Calyx persistent somewhat bladderly

 9296 Long filam. forked, Pod nearly blunt, Lvs. stalked toothed: lower cord.; upper ov. and stem nearly smooth
 9297 Long filam. toothed, Pod blunt, Lvs. lyrate rough, Terminal lobe cord. orbicular
 9298 Long filam. scarcely toothed, Pod blunt, Lvs. pinnate-lyrate hairy, Terminal lobe ovate
 9299 Long filam. toothed on one side, Pod mucronate, Lvs. lyrate pinnatifid toothed hoary
 9300 Filam. not toothed, Pod mucronate, Lvs. ov. toothed unequal and somew. auricled at base and stem hispid
- 9301 Pods round torose acuminate scarcely longer than stalk
- 9302 Pods depressed acuminate decumbent longer than the whole plant
 9303 Pods 1-celled jointed striated 3-8-seeded longer than the style, Lvs. simply lyrate
 9304 Pods 1-celled jointed substriated 2-6-seeded longer than the subulate style, Lvs. interruptedly lyrate
 9305 Pods 1-celled jointed striated 2-6-seeded, Style conical shorter than the last joint, Lvs. interruptedly lyrate

and Miscellaneous Particulars.

and gravel, in March and April; when they cut them off under ground, as is done in gathering asparagus, and boil them as greens. About the middle of the last century the plant was first introduced into gardens, grown on deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower pots, earthen pots made on purpose, or any opaque cover. It is now almost as universal in good gardens as asparagus, and like it is forced either by taking up the roots and planting them on a hotbed, or in the border of a forcing house, or by covering or surrounding them with litter in the open garden. Before covering a bed with warm litter, each plant or stool of plants is covered with an earthenware blanching pot, or a wicker case, to keep off the dung from the young shoots, and to ensure their being blanched. No plant is so easily forced; and, unlike asparagus, it yields produce the first spring after raising from seed.

C. tataria is called by the Hungarians *Tatar-Kenyer* or Tartarian bread, and its root, stripped of the bark and sliced, is eaten with oil, vinegar, and salt. The boiled root is sweet, and eaten by children. The young shoots are boiled like those of sea kail, and have an excellent taste, but are stringy, which they would not be if well cultivated, which the plant appears to deserve.

1443. *Raphanus*. From *ραψανος*, quickly, and *ραϊνονομας*, to appear, on account of the rapidity of its germination and arriving at perfection. *R. sativus* is a well known salad root, requiring a deep sandy soil to attain a large size. There are several varieties both of the spindle-shaped and globular rooted kinds, and a very distinct sort known as the black or Spanish radish. In the Horticultural Transactions, sixteen varieties are mentioned besides subvarieties, arranged as spring, summer, turnip, autumn, and winter radishes. They are all of easy culture, and the spring, summer, and turnip sorts force well on hot-beds, or on dung-beds covered with mats.

R. caudatus, or tree radish, is remarkable for the length of its pod, which is greater than the whole height of the plant. The young leaves of *R. Landra* are eaten by the inhabitants of Insubria as salad.

History, Use, Propagation, Culture,

1444. *Bunias*. From *Cyper*, a hill, because the plants grow upon exposed open situations. Linn.
 1445. *Erucaria*. See *Eruca*, No. 1437. Plants with the habit of *Cakile*.
 1446. *Heliophila*. From *ήλιος*, the sun, and *φιλεω*, to love; a plant loving heat. All the species grow upon dry hot plains at the Cape of Good Hope. These are mostly beautiful annual or perennial plants.

9306 Pods 4-cornered : angles crested, Radical leaves runcinate

9307 Pods 4-cornered : angles crested, Leaves all lanceolate

9308 Pods ovate 2-celled not crested somewhat warted

9309 Pod style-bearing, Lvs. pinnated, Lobes linear : of the lower pinnatifid ; of the upper entire

9310 Stigma sessile, Beak longer than pod, Lvs. pinnated thick, Lobes linear

9311 Smooth, Pods rounded narrowed at each end, Leaves linear subulate

9312 Smooth, Pods moniliform, Lower lvs. opp. : upper altern. cord. stem-clasping obl. entire

9313 Smooth, Pods moniliform pendulous, Lvs. pinnated in 3-5-pairs, Lobes linear entire

9314 Hispid, Pods linear, Lvs. hairy either linear entire or trifid at end and cuneate at base

9315 Hispid, Pods linear, Lvs. oval entire or here and there coarsely cut-toothed

9316 Smooth, Pods linear, Leaves pinnated, Lobes and rachis linear entire

9317 Downy, Pods linear spreading, Lvs. pinnated or bipinnated : lobes filiform

9318 Velvety, Pods linear nodding, Lvs. pinnated somewhat fleshy : lobes subfiliform furrowed above

9319 Smooth, Pods linear erect or pendulous, Lvs. fleshy half round

9320 Pods linear compressed velvety, Style thick conical smooth, Leaves oblong

9321 Pods compressed stalked, Leaves linear lanceolate

9322 The only species

9323 Polyandrous hairy, Lvs. 5-7 cuneiform rough, Racemes term. Pods filiform

9324 Flowers dodecandrous, Leaves quinate and ternate

9325 Flowers dodecandrous, Leaves ternate

9326 Flowers gynandrous, Leaves quinate, Stem unarmed

9327 Flowers hexandrous, Leaves 7, Stem unarmed

9328 Flowers hexandrous, Leaves 7-5, Stem spiny

9329 Flowers hexandrous, Leaves quinate viscid, Stem spiny

9330 Prickly hexandrous, Leaves quinate and ternate : floral simple, Stigma dilated

9331 Flowers hexandrous, Leaves ternate and solitary, Leaflets lanc. lin. entire

9332 Unarmed, Lvs. 5 : lower and floral 3 ; upper sessile ovate, Pod smooth as long as its stalk

9333 Flowers hexandrous, Leaves ternate, Leaflets oval-lanceolate

9334 Flowers hexandrous, Leaves ternate lanceolate blunt, Pods fusiform viscid

9335 Flowers hexandrous, Leaves simple ovate-lanceolate stalked

9336 Flowers hexandrous, Leaves simple lanceolate stalked, Stems procumbent

9337 Unarmed pubescent, Leaves 5-7 : floral simple cordate, Pod the length of the stalk

and Miscellaneous Particulars.

1447. *Subularia*. From *subula*, an awl, on account of the form of the leaves. A curious little aquatic, not of common occurrence.

1448. *Cleome*. A name employed by Octavius Horatius, a Latin physician, who lived in the fourth century, to designate a plant resembling *Sinapis*, and growing in humid places. It appears to have had no relation to the modern plant.

CLASS XVI. — MONADELPHIA.

THIS class is distinctly characterized by the filaments being united together throughout the whole or a part of their length; and for the most part consists of plants belonging to the natural orders of Malvaceæ and Geraniaceæ. Of the former, the major part are of little moment, consisting, in a great measure, of weeds or worthless shrubs of various parts of the world. Among them, however, are some plants both of interest and ornament, especially the beautiful *Astrapeæ*, and the various species of *Bombax* and *Hibiscus*. The *Gossypium*, so important as producing the material of cotton, and the *Adansonia* or Baobab tree of Africa, remarkable for its immense size and use as an article of food, are found in this class. The *Geranium*, *Camellia* and *Passion* flower are also genera of much beauty; the latter yielding the well known West Indian fruit called the *Granadilla*. The common *Tamarind*, with which this class commences, would more properly be placed in the next, and the succeeding genera of *Patersonia*, *Tigridia*, *Ferraria*, and *Galaxia*, are in every respect, except the union of their filaments, referable to the third class.

Order 1. TRIANDRIA.

Stamens 3.

1449. *Tamarindus*. Petals 3, ascending. Three filaments longer than the others and fertile. Legumen 1-3-celled, pulpy inside.

1450. *Patersonia*. Cor. tubular. Limb 6-parted, with 3 small segments. Caps. 3-celled, inferior.

1451. *Ferraria*. Spatha 2-leaved. Cal. O. Petals 6, wavy, curled. Filaments united at base. Style 1. Caps. 3-celled, inferior.

1452. *Tigridia*. Spatha 2-leaved. Cal. O. Petals 6, the 3 outer large. Filaments united into a very long tube.

1453. *Galaxia*. Spatha 1-leaved. Cal. O. Corolla monopetalous, 6-cleft, with a long tube. Style 1. Capsule 3-celled, inferior.

Order 2. PENTANDRIA.

Stamens 5.

1454. *Waltheria*. Cal. 5-fid, with a lateral deciduous 3-leaved involucre. Petals 5. Style 1. Stigma pencilled. Caps. 1-celled, 2-valved, 1-seeded.

1455. *Hermannia*. Cal. nearly naked, campanulate, 5-fid. Pet. 5. Stamens 5. Filaments united at base, lanceolate, frequently winged. Styles 5, cohering in one. Caps. 5-celled, 5-valved, many-seeded.

1456. *Melochia*. Cal. 5-fid, naked, or with 1-3 bractææ. Petals 5, spreading. Stam. 5, monadelphous at base. Styles 5. Caps. 5-celled. Seeds 1-2 in each cell.

1457. *Methania*. Cal. 5-parted, persistent, with a 3-leaved involucre on one side. Pet. 5. Stam. 10, alternately sterile: the fertile ones bearing from 1-2 anthers each.

1458. *Ochroma*. Cal. double, outer 3-leaved. Petals 5. Anthers anfractuose. Capsule 5-celled, many-seeded. Seeds involved in wool.

1459. *Passiflora*. Cal. 5-parted, colored. Petals 5 or O, inserted in the calyx. Crown of many filiform rays. Fruit stalked, fleshy.

1460. *Erodium*. Cal. 5-leaved. Petals 5. Scales 5, alternate, with filaments and honey glands at the base of the stamens. Cocci 5, 1-seeded, awned, at the base of a rostrate receptacle.

Order 3. HEPTANDRIA.

Stamens 7.

1461. *Pelargonium*. Cal. 5-parted, the upper segment ending in a nectariferous tube running down the peduncle. Cor. 5-petalous, irregular.

Order 4. OCTANDRIA.

Stamens 8.

1462. *Aitonia*. Cal. 4-parted. Cor. 4 petals. Style 1. Berry dry, quadrangular, 1-celled, many-seeded.

Order 5. DECANDRIA.

Stamens 10.

1463. *Geranium*. Cal. 5-leaved. Petals 5, regular. Glands 5, honey-bearing, united to the base of the longer filaments. Cocci 5, 1-seeded, awned, at the base of a beaked receptacle.

Order 6. DODECANDRIA.

Stamens 12.

1464. *Brownea*. Cal. tubular, bifid. Cor. double: outer 5-fid; inner of 5 petals. Legumen 1-celled.

1465. *Monsonia*. Sepals 5. Pet. 5. Stamens 15, united; their cup 5-fid. Style 5-fid. Cocci 5, 1-seeded awned, at the base of a beaked receptacle.

1466. *Helicteres*. Cal. tubular, obliquely 5-fid. Petals 5. Germs on a long stalk. Style about 5-fid. Caps. 5, 1-celled, many-seeded, spirally twisted.

1467. *Dombeya*. Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are sterile. Style 5-fid. Caps. 5, united, 1-celled, 1-many-seeded.

1468. *Pentapetes*. Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are barren. Style obsolete 5-toothed. Caps. 5-celled, many-seeded, with contrary disseminations.

1469. *Astrapeæ*. Flowers umbellate, with an involucre. Involucre many-leaved, unequal. Cal. simple, 5-leaved, with 1 bract. Petals 5, convolute-closed. Stamens 25, united into a tube bearing the corolla: 5-sterile.

1470. *Pterospermum*. Cal. simple, 5-parted. Petals 5. Stamens 20, of which 5 are sterile. Style cylindrical, Stigma thickish, Caps. woody, 5-celled. Seeds winged.

Order 7. POLYANDRIA.

Stamens indefinite in number.

1471. *Malope*. Cal. double, outer 3-leaved. Capsules heaped without order, 1-seeded.
 1472. *Malva*. Cal. double, outer 3-leaved. Capsules many, 1-seeded.
 1473. *Kitaibelia*. Cal. double, outer 7-9-fid. Caps. clustered in a 5-lobed head, 1-seeded.
 1474. *Althæa*. Cal. double, outer 6-9-fid. Capsules many, 1-seeded.
 1475. *Lavatera*. Cal. double, outer 3-fid. Capsules many, 1-seeded.
 1476. *Malachra*. Common calyx 3-leaved, many-flowered, large. Caps. 5, 1-seeded.
 1477. *Urena*. Cal. double, outer 5-fid. Capsule 5-celled, 5-partible, with close 1-seeded cells.
 1478. *Pavonia*. Cal. double, outer many-leaved. Stigmas 10. Capsules 5, 2-valved, 1-seeded.
 1479. *Achania*. Cal. double, outer many-leaved. Cor. convolute, closed. Stigmas 10. Berry 5 celled, 5-seeded.
 1480. *Hibiscus*. Cal. double, outer many-leaved. Stigmas 5. Capsule 5-celled, many-seeded.
 1481. *Gossypium*. Cal. double, outer 3-fid. Caps. 5-celled. Seeds enwrapped in wool.
 1482. *Redoutea*. Cal. 5-parted, surrounded by a 10-12-leaved involucre. Stigmas 3. Capsules 3-celled, 3-valved, many-seeded, with three placentas alternate with the valves, and bearing on each side woolly seeds.
 1483. *Palavia*. Cal. naked, 5-fid. Capsules many, 1-seeded, united in a head without order.
 1484. *Cristaria*. Cal. naked, 5-fid. Fruit orbicular, depressed, covered with a skin, and consisting of several carpella, 2-winged in the centre, and many-seeded.
 1485. *Anoda*. Cal. naked, 5-fid. Lobes acuminate, much spreading in fruit. Caps. hemispherical beneath, depressed and stellate above, many-celled, with 1-celled, 1-seeded divisions.
 1486. *Periptera*. Cal. naked, 5-fid. Petals erect, spirally twisted in the tube, at length distinct. Capsule stellate, many-celled, with 1-seeded cells.
 1487. *Sida*. Cal. simple, angular. Style many-parted. Capsules several, 1 or 3-seeded.
 1488. *Lagunæa*. Cal. simple, 5-fid. Style 5-fid. Capsule 5-celled, with contrary dissepiments.
 1489. *Ruizia*. Cal. double, outer 3-leaved. Styles 10. Caps. 10, 1-celled, 2-seeded, closely cohering.
 1490. *Carolinea*. Cal. simple, subtruncate. Filaments branched. Style very long. Stigmas 6. Caps. woody, 1-celled, many-seeded.
 1491. *Adansonia*. Cal. simple, deciduous. Style very long. Stigmas many. Caps. woody, 10-celled, many-seeded, with a farinaceous pulp.
 1492. *Bombax*. Cal. 5-fid. Stamens 5, or many. Caps. woody, 5-celled, 5-valved. Seeds woolly. Receptacle 5-cornered.
 1493. *Myrodia*. Cal. naked, tubular, 4-5-toothed, bursting laterally. Petals oblong, linear. Stamens with a long column. Anthers 10-15. Capsule drupaceous, 2-3-celled, with 1-seeded cells.
 1494. *Gordonia*. Cal. simple. Style 5-cornered, with a 5-fid stigma. Caps. 5-celled. Seeds twin, with a leafy wing.
 1495. *Stuartia*. Cal. simple, rotate. Petals 5. Styles 5, united or distinct. Caps. 5-celled, 5-valved. Seeds solitary or twin.
 1496. *Camellia*. Cal. imbricated, many-leaved, the inner leaflets largest.
 1497. *Barringtonia*. Cal. 2-leaved, superior. Petals 4. Drupe dry, large, quadrangular, with a 4-celled ut.
 1498. *Gustavia*. Cal. 4-6-fid. Petals 4-6. Berry dry, 4-5-celled.
 1499. *Careya*. Cal. superior, 4-fid. Petals 4. Berry many-seeded. Seeds nestling in pulp.

History, Use, Propagation, Culture,

1449. *Tamarindus*. Latinized from the Arabic name *Tamer-hindy*, or Indian date. This tree is a native of the East and West Indies, of Arabia, and Egypt. It is a large beautiful spreading tree. The leaves are abruptly pinnate, composed of sixteen or eighteen pairs of sessile leaflets, half an inch only in length, and one sixth of an inch broad, of a bright green color, downy, oblong, entire, and obtuse: the flowers are in loose bunches of five or six, which come out from the sides of the branches: the calyx is of a straw yellow color, and deciduous: the petals also yellowish, and beautifully variegated with red veins; ovate, concave, acute, indented, and plaited at the edge; and the filaments purplish, bearing incumbent brownish anthers: the pods are thick, compressed, and of a dull brown color when ripe: those from the West Indies from two to five inches long, with two, three, or four seeds: those from the East Indies are twice as long, and contain five, six, or seven seeds: the seeds in both are flat, angular, shining, and lodged in a dark pulpy matter.

In the West Indies, the pods are gathered in June, July, and August, when fully ripe; and the fruit being freed from the shelly fragments, is placed in layers in a cask, and boiling syrup poured over it, till the cask is filled; the syrup pervades every part quite down to the bottom; and when cool the cask is headed for sale. (*Long's Jamaica*, iii. 729.) The East India tamarinds are darker colored and drier, and are said to be preserved without sugar. Tamarinds are inodorous, and have an agreeable acid sweetish taste. The acid taste chiefly depends on the citric acid, the quantity of that being greater than of the other. The pulp is refrigerant, and gently laxative. The simple infusion of the pulp in warm water, or a whey made by boiling it in milk, forms a very grateful refrigerant beverage, which is advantageously used in febrile diseases. The dose of the simple fruit required to act upon the bowels is so large, that it is seldom given alone as a purgative, but is generally combined with cassia or manna, the action of which it augments, or with such of the neutral purgative salts as are not decomposed by it; which is the case with those that have potass for their base, and are therefore incompatible in mixtures with this fruit. (*Thompson's London Dispensatory*, 534.)

The plants thrive in loam and peat, and root under a glass in sand. They form handsome objects, but in our stoves are seldom allowed sufficient room to flower. Miller says, he had several plants twenty years old, and upwards, of fifteen feet high, which never had shewed blossoms.

TRIANDRIA.

9338 The only species

9339 Stigma deflexed, Scape and spathes silky, Leaves ensiform straight striated

9340 Stigma deflexed, Scape and spathes smooth shining, Keel of leaves woolly at base

9341 Stem branched, Leaves equitant ensiform equal wavy ; inner twice as narrow as the outer

9342 Stem simple, Leaves equitant ensiform ; lower narrow

9343 Stem simple wavy, Leaves ensiform nerved, Petals flat ; inner small panduriform

9344 Almost stemless, Leaves oblong, Spathe 1-valved 1-flowered

9345 Almost stemless, Leaves linear filiform dilated at base, Spathe 1-valved 1-flowered

PENTANDRIA.

9346 Leaves oval plicate acutely and unequally toothed downy, Heads stalked

9347 Leaves oval plicate bluntly toothed downy, Heads sessile

9348 Leaves lanceolate oblong blunt plicate toothed downy, Heads sessile

9349 Leaves ovate mucronate serrate and stem quite smooth, Heads stalked, Calyxes ciliated

9350 Leaves ovate downy plicate crenate, Lower stipules ovate ; upper broad lanceolate, Cal. angular

9351 Lvs. downy hairy ovate subcord. rugose denticulate, Stipules ovate acute, Cal. in fl. cylind. finally inflated

9352 Leaves oval unequally crenate subpubescent, Stipules ovate acute often cut, Stem glandular pubescent

9353 Leaves whitish downy round ovate crenate, Stipules lanceolate subulate, Cal. campanulate spreading

9354 Leaves hispid-villose roundish-ovate blunt toothed, Stipules subovate acuminate, Cal. angular

9355 Leaves downy hispid rugose oblong blunt entire subsessile, Stipules long lanceolate subulate, Fls. naked

9356 Lvs. downy hispid somewhat rugose obl. very blunt a little toothed at end with short stalks, Stip. lanc. subul.

and Miscellaneous Particulars.

1450. *Patersonia*. Named after Colonel William Paterson, a gentleman whose remarks on the Cape of Good Hope, New Holland, and Norfolk Island, have been of much service to botany. Handsome plants, which grow readily in loam and peat, and are increased like other herbaceous vegetables.

1451. *Ferraria*. Named after Jean Baptiste Ferrari, an Italian botanist, author of a work on the culture of flowers, published in 1633, &c. According to Sweet, "a mixture of sandy loam and peat is the best soil for the species, and they should be kept without water, after they have done growing, till they begin to grow again, when they may be planted in fresh pots and regularly watered: they are increased by offsets from the bulbs, or by seeds." (*Bot. Cult.* 192.)

1452. *Tigridia*. In allusion to the spotted flowers, which are marked something like the skin of a tiger. Splendid plants, and tolerably hardy. They do best when planted in the soil and protected by a frame or hand-glass; but will also thrive in sheltered borders, provided they are protected from the winter's frost. They ripen seeds, from which, or from offsets, they may be readily increased.

1463. *Galaxia*. Thunberg, the author of the name, has not explained its meaning. Like other plants of the bulbous kind, these should be kept dry after flowering and seeding. At the return of the growing season, they should be fresh potted, and kept in a cool part of the greenhouse till they are well rooted, when they may be put into a warmer situation and regularly watered. They seed freely.

1454. *Waltheria*. In memory of Augustin Frider. Walther, professor of medicine at Leipzig; author of *Hortus Proprius*, 1735. The species grow in any light rich soil, and are readily propagated. They are of no importance.

1455. *Hermannia*. In memory of Paul Hermann, who practised physic in Ceylon, and at the Cape of Good Hope, and was afterwards professor of botany at Leyden. He was born in 1640, at Halle, in Saxony, and died in 1695. The species are low shrubs, for the most part, with wrinkled leaves and yellow flowers, which they produce in abundance. They grow freely in any light rich soil, and are readily increased in the same soil.

History, Use, Propagation, Culture,

1456. *Melochia*. According to Forskahl, it is an alteration of the Arabic name *melochieh*, or *melokkieh*. Light rich soil suits all the species, and they strike readily in moist heat.

1457. *Melhania*. A plant which grows upon Mount *Melham*, in Arabia. Pretty plants, which grow in sandy loam, and root in sand under cover. Sweet observes, that "they are very apt to become covered with insects."

1458. *Ochroma*. From *oxeos*, yellow, the flowers being of that color, according to Schreber. *O. Lagopus* is a very large tree, with divaricating branches, and leaves more than a foot long. The wood is white, tender, and so light, that it is used instead of corks to nets. The capsules contain a very soft fine rufous down, in which the seeds are involved, and which down is said to be used in the manufacture of English beavers. (*Desportes Plantes de S. Domingue*, iii. 16.)

1459. *Passiflora*. This genus has been so named, on account of its being supposed to represent, in the appendages of its flower, the passion of Jesus Christ. A beautiful genus of climbers, partly herbaceous, but chiefly suffrutescent or woody; and all of them exotics and very ornamental. Some species are odoriferous; others bear edible fruits, fleshy juicy berries of considerable size, though not rich in flavor. Of late, a number of hybrid sorts have been raised, some of which, as *P. cæruleo-racemosa*, are considered more beautiful than almost any of the natural species.

P. maliformis, the sweet calabash of the West Indies, produces large flowers, red, white, and blue, but of short duration. They are succeeded by fruit, roundish, the size of a large apple, yellow when ripe, having a thicker rind than any of the other sorts; inclosing a sweetish pulp, in which are lodged many oblong black seeds, of a brownish color, a little rough to the touch. It grows naturally in the West Indies, where the inhabitants call it *Granadilla*. The fruit is served up there in desserts. It has borne fruit in the garden of the Bishop of Durham in Oxfordshire, and at Vere's, Kensington Gore. (*Hort. Trans.* iii. 101.)

P. quadrangularis, the *Granadilla* vine of the French, has leaves five or six inches long, and luxuriant four-

 9395 Leaves 3-lobed peltate, Petioles with 4 glands, Flowers terminal racemose
 9396 Leaves obl. ovate subcord. entire veiny, Petioles with 6 glands, Stipules roundish ovate, Invol. 3-leaved

and Miscellaneous Particulars.

cornered ligneous stems. The flowers are red within, and white outside; they are odoriferous, and generally the plant is covered with fruits and flowers at the same time, which makes a fine appearance. The fruit, Sabine describes (*Hort. Trans.* iii. 100.) as very large, of an oblong shape, about six inches in diameter, from the stalk to the eye, and fifteen inches in circumference. It is externally of a greenish-yellow when ripe, soft and leathery to the touch, and quite smooth; the rind is very thick, and contains a succulent pulp of a purple color (which is the edible part), mixed with the seeds in a sort of sack, from which it is readily separated. Wine and sugar are commonly added to it when used. The flavor is sweet and slightly acid, and it is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places, as at Lord Harewood's, Farley Hall, &c. (*Hort. Trans.* iv. 60.)

P. laurifolia, the water lemon, *Pomme de Liane*, Fr., has a suffrutescent stem, with divaricating filiform branches, oval smooth leaves, and very long tendrils. Flowers red and violet, sweet-scented; the fruit about the size of a hen's egg, but rather more elongated, and tapering equally at both ends; when ripe, it is yellow and dotted over with white spots; it contains a whitish watery pulp, which, in the West Indies, is usually sucked through a small hole made in the rind; the rind is tough, soft, and thin; the juice has a peculiar aromatic flavor, is delicately acid, and allays thirst agreeably. It is grown in our stoves, but has not yet been cultivated for its fruit.

P. normalis has berries about the size of small grapes. The root has been extolled as a counterpoison and diuretic.

P. Murucuja produces fruit of an oblong oval form, about the size of a large olive, and flesh-colored when ripe. Both the syrup and decoction of the plant are much used in the leeward parts of Jamaica, where it is frequent; and they are said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use: they are commonly infused in, or pounded and

History, Use, Propagation, Culture,

mixed immediately with wine or spirits; and the composition is generally thought a very effectual and easy narcotic.

P. incarnata, the May apple, has a perennial root, herbaceous shoots, and sweet-scented flowers, variegated with purple. The fruit is about the size of an apple, orange-colored, with a sweetish yellow pulp, but it requires the heat of the stove to bring it forward.

P. cerulea is the tallest and most ligneous of the species. The stem will grow almost as large as a man's arm, and the shoots will often grow the length of fifteen feet in one summer. The leaves are the most elegant of the genus. The flowers are blue outside, and purple and white within: they have a faint scent, and continue but for one day. The fruit is egg-shaped, of the size and color of the Mogul plum, the yellow skin of which encloses a sweetish disagreeable pulp and black seeds.

Besides the species thus enumerated, some varieties have been procured by cross impregnation, which are very remarkable for their beauty, and for having acquired the hardihood of their parent. The most valuable of these artificial productions, is the *P. ceruleo-racemosa*, raised by Mr. Milne, of Fulham, from seed of *P. racemosa* impregnated by *P. cerulea*, and figured in the Transactions of the Horticultural Society, vol. 3. tab. 3., and the *P. alato-cerulea*, obtained by Mr. J. H. Masters of Canterbury, between *P. alata* of the West Indies, and *P. cerulea*.

All the species grow and flower freely in a mixture of loam, and light rich earth or peat, with plenty of room. Most of them fruit in the stove, but the *P. cerulea* seldom fruits in the greenhouse. They are all easily increased either by seeds or very young cuttings, in a close moist heat.

As fruit-bearing plants the Passifloras are thus treated:—"Having procured plants with good roots, plant such as are intended to fruit in a border in the stove, and train them to a trellis near the glass; they will in general produce fruit the second year. The seedlings of the *P. incarnata*, will produce fruit the first year. All the species will fruit even in large pots; but Sabine says, the "best method is to plant them in an angle of the bark-bed, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of

 9406 Lvs. round. shortly and bluntly 3-lobed dott. downy ben. Petiol. without glands, Pet. twice as short as cal.
 9407 Lvs. round. subcord. blunt obsoletely 3-lobed smooth dott. Petioles without glands, Ped. twice as long as cal.
 9408 Lvs. cord. 3-lobed blunt smooth, Petioles without glands, Pedunc. axill. twin, Pet. twice as narrow as cal.
 9409 Lower leaves 3-lobed acuminate ; upper undivided lanceolate, Petioles with 2 glands, Flowers apetalous
 9410 Leaves roundish cordate, Petioles with 2 glands, Flowers solitary long-stalked, Cal. keeled, Stam. 1-sided
 9411 Leaves ovate entire 3-nerved veiny, Petioles with 2 glands, Flowers apetalous, Involucrum O.
 9412 Lvs. 3-lobed smooth, Lobes lanc. ; middle one longest, Petioles with 2 glands, Fl. apetal. Stem corky at base
 9413 Leaves subcordate 3-lobed, Lobes rounded with 2 glands, Pedunc. axillary solitary, Flower apetalous
 9414 Lvs. 3-lobed smooth, Lobes oblong ; lat. very short, Petioles with 2 glands, Fl. apetal. Stem corky at base
 9415 Lvs. peltate deeply 3-lobed smooth, Lobes lin. lanc. divaricating, Petioles with 2 glands, Flow. apetalous
 9416 Leaves peltate half 3-lobed smooth, Lobes ovate blunt, Petioles with 2 glands, Fl. apetalous
 9417 Leaves peltate cordate 3-lobed, Lobes equal oblong blunt, Petioles with 4 glands, Petals length of calyx
 9418 Leaves discolored peltate
 9419 Leaves 3-lobed downy with a reflexed tooth on each side at the base
 9420 Leaves 3-lobed vill. ; lower smooth above, Lobes obl. entire ; intermediate longest, Petioles with 2 glands
 9421 Leaves 2-lobed glandular beneath, Lobes oblong erect, Peduncles twin
 9422 Leaves palmate about 5-parted subserrulate, Involucres 3-leaved entire, Rays a little shorter than corolla
 9423 Leaves 3-lobed cordate hairy, Involucres multifid capillary
 9424 Leaves and stems all fringed with red hairs
 9425 Leaves 3-lobed cordate smooth ciliated serrated, Involucres multifid capillary
 9426 Downy, Leaves cordate 3-lobed, Peduncles twice as short as petiole, Corona much shorter than corolla
 9427 Lvs. rounded trunc. at base slightly 3-5-lobed, Lobes blunt, Petioles without glands, Pet. shorter than cal.
 9428 Stem square, Leaves 3-lobed : lobes nearly equal serrated, Pedunc. long 1-flowered
 9429 Leaves 3-lobed serrated smooth, Invol. glandular serrulate caducous, Ovary naked
 9430 Lvs. 3-lobed serr. Lobes obl. acute, Petioles with 2 glands, Inv. 3-leaved, Threads of corona longer than cor.
 9431 Lvs. palmate 5-parted entire, Petioles gland. Invol. 3-leaved entire, Threads of corona shorter than corolla

- 9432 Leaves palmate 5-parted serr. Petioles gland. Invol. 3-leaved serrate, Threads of corona longer than cor.
 9433 Leaves palmate 7-parted serrated, Petioles glandular, Invol. 3-fid entire
 9434 Leaves 7-pedate serrated, Petioles glandular, Invol. 3-leaved serrated
 9435 Upper leaves quinate pedate obovate somewhat cut ; lower ternate linear-lanceolate or simple

and Miscellaneous Particulars.

the cavity formed by this division, should be laid some brick-rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung. Herein the roots will strike freely, and will even spread through the partition into the pit, growing into the fresh tan. Such roots may be trimmed and reduced whenever the tan is changed; but should the plant have been some time in its station, it will be as well to leave part of the old tan in the bottom of the pit, in which the protruded roots may remain undisturbed. They do not require the full heat of the pine stove, for they flourish best in a temperature of from sixty-five to seventy degrees; but they do not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots, as they advance, must be trained near to and under the inclined glass of the stove: the flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time; but if it does not set well, it will be advisable to impregnate the stigmas by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin, for these do not bear fruit so abundantly as those which are less vigorous; but the fruiting branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting. The crop will begin to come in in August, and will continue until January; but the earlier produce is the best. When the crop is all off, which will be early in January, the heat must be reduced to about fifty degrees, so as to check or stop the growth; this being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about two or three feet of each) of the old branches should be retained; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better, and in greater quantity, from the older wood than from that of two years' standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season." (*Hort. Trans.* iii. and iv.)

History, Use, Propagation, Culture,

1460. *Erodium*. From *erodios*, a heron, because the fruit resembles the head and breast of that bird. The species are hardy plants, of common treatment, and no great beauty.

1461. *Pelargonium*. So called from *πελαργος*, a stork, in allusion to the beak of the fruit, which resembles the bill of that bird; as well as to preserve an analogy with the *Geranium* or Crane's-bill. It was detached by the late learned botanist Mons. L'Heritier, along with *Erodium*, from the Linnean genus *Geranium*; and distinguished by its seven fertile stamens, irregular flower, tubular nectary, and spiral-leaved awns, or beaks to the capsule.

"This vast and favorite genus, for which we are almost entirely indebted to the Cape of Good Hope, consists of a number of well marked species. But that number is greatly augmented in almost every book, by the admission of spurious hybrid species or varieties, which continually start up from seed, wherever many of the primary ones are cultivated, and are for a while propagated by cuttings, and even by seed. Sooner or later,

- 9436 Stemless, Peduncles many-fl. Lvs. smoothish pinnat. Segm. pinnatifid, Petals retuse twice as long as calyx
 9437 Stemless, Peduncles many-fl. Lvs. downy gland. pinnat. Segm. pinnatif. Petals acute twice as long as calyx
 9438 Stem smooth. branch. Ped. many-fl. Lvs. smooth. bipinnatif. Lobes lin. Pet. blunt long. than long-point. cal.
 9439 Stem branched diffuse downy, Lvs. thick pinnatif. cut, Lobes linear, Pedunc. many-fl. Bracts ovate scariose
 9440 Stem prostrate, Leaves bipinnate with linear acute lobes, Stipules and bracts ovate scariose, Ped. many-fl.
 9441 Stem ascend. and lvs. somew. villous pinnated, Seg blunt pinnatif. tooth. Ped. many-fl. Pet. length of calyx
 9442 Stem prostrate or diffuse hairy, Leaves pinnated, Segm. sess. pinnatifid cut, Pedunc. many-fl. Pet. unequal
 ♂ Caulescent diffuse, Segments pinnated with linear lobes
 9443 Nearly stemless, Leaves pinnate with ovate pinnatifid segments, Petals equal larger than calyx
 ♂ Plant of larger size
 9444 Stem procumbent, Leaves pinnated with stalked ovate unequally serrated segm. Pedunc. downy glandular
 9445 Stem erect nearly smooth, Leaves 3-cut, Segments cut-toothed, Pedunc. many-fl. Calyx striated nerved
 9446 Stem erect somewhat diffuse, Leaves smooth subcordate; upper 5-parted with cut toothed lobes
 9447 Stem erect branch. shrubby at base, Lvs. 3-lobed or 5-parted very blunt, Stipules and bracts scariose ovate
 9448 Stem erect soft, Pedunc. many-fl. Leaves cordate blunt bluntly toothed undivided or 3-lobed
 9449 Stem branched hairy, Leaves cordate undivided or 3-lobed blunt toothed, Petals length of calyx
 9450 Stem $\frac{1}{2}$ shrubby and leaves nearly smooth; lower cord. undivided toothed, Lobes cuneate 3-toothed at end
 9451 Stem erect and leaves smooth oblong lobed crenate fleshy, Awns feathery from middle to end
 9452 Caulescent diffuse smooth, Leaves cordate ovate cut-crenate pubescent, Awns beardless
 9453 Stemless, Leaves cordate crenate blunt smoothish, Pedunc. 1-fl. Petals larger than calyx
 9454 Caulescent diffuse smoothish, Leaves cordate roundish 3-lobed unequally crenate, Awns bearded
 9455 Stems diffuse, Leaves opposite 3-cut: segm. lateral cut-toothed divaricating, Peduncles many-flowered

HEPTANDRIA.

§ 1. HOAREA. Sweet. *Petals 5, rarely 2 or 4 obl. lin., 2 upper parallel, with long claws abruptly reflexed in the middle. Stamens in a long tube, length of lower petals, bearing 5 or rarely 2-4 anthers, the others sterile, straight or incurved at end, the 3 lower shorter than the fertile ones. Stemless herbs, with tuberous turnip-like roots, and radical stalked leaves.*

* *Leaves oblong, entire or lobed. Lobes entire or scarcely toothed.*

- 9456 Stemless, Leaves lanceolate entire acute smooth; older pinnatifid linear, Umb. comp. Fl. tetrandrous
 9457 Stemless, Leaves lanceolate entire acute smooth, Umb. comp. 4-fl. Fl. tetrandrous, Petals linear
 9458 Leaves oval or oval-oblong blunt flat or involute at edge entire hairy, Petals linear wavy twisted
 9459 Stemless, Leaves ellipt. lanc. or obl. ent. hairy revol. at edge, Fl. pentandr. Pet. lin. spatul. wavy reflexed
 9460 Stemless, Leaves ovate acute entire subciliated, Umb. compound, Fl. pentandrous, Petals linear spatulate
 9461 Stemless, Leaves ovate toothed smooth, Umb. compound, Fl. diandrous, Pet. linear; 3 lower shortest
 9462 Stemless, Leaves oval obl. entire acute at each end smooth ciliated, Umb. simple, Flowers pentandrous
 9463 Stemless, Lvs. obl. subspatul. blunt smooth, Umb. comp. Fl. pentandrous, Petals lin. blunt subrevolute
 9464 Stemless, Leaves elliptical spatulate entire smooth, Umb. compound, Fl. pentandrous, Petals cuneiform
 9465 Stemless, Lvs. ellipt. ovate acute at each end smooth, Umb. subcomp. Fl. pentandrous, Pet. lanc. cuneate
 9466 Stemless, Leaves lin. lanc. entire ciliated, Umb. simple, Flowers pentandrous, Petals wavy nearly equal
 9467 Stemless, Leaves linear lanceolate repand, Umbel nearly simple, Flowers pentandrous, Petals linear
 9468 Stemless, Lvs. smooth: lower ovate ent.; upper pinnatif. Petals reflexed; lower ones much the smallest

** *Leaves sagittate, cordate, 3-lobed, or with an appendage at base.*

- 9469 Stemless, Leaves cordate blunt nerved entire, generally with two ears at base, Leaves of invol. revolute
 9470 Stemless, Lvs. obl. lanc. acum. at each end hairy ciliat. at edge, generally ent. somet. with 2 obl. lin. append.
 9471 Stemless, Leaves entire and cut-lobed at end, Scape flexuose, Umbel compound
 9472 Stemless, Leaves ciliated 3-cut: segm. ovate blunt, Umbel compound
 9473 Stemless, Leaves smooth 3-cut: segm. blunt lobed nerved glauc. beneath, Scapes hispid, Umbel compound
 9474 Stemless, Leaves smooth 3-cut: segm. blunt crenated, Scapes and petioles downy
 9475 Stemless, Leaves smooth 3-cut: segm. lobed cut recurved, Two upper filaments and stigmas reflexed
 9476 Stemless, Leaves cut-lobed downy, Umb. simple close, Three lower petals much the smallest

and Miscellaneous Particulars.

however, they for the most part vanish, even before the eyes of those who witnessed their origin."

(Smith.)
 The greater part of the species being of the easiest cultivation, and many bearing the confined air of a sitting room better than most plants, it has happened that they have become objects of universal cultivation and attention; of which, indeed, they are in many cases deserving, for their neatness and beauty alone. There is, however, an uniformity in their form, coloring, and foliage, for which the liveliest colors will scarcely compensate. The popular taste for the Pelargonium tribe, or for Geraniums, as they are commonly called, has been much aided by several splendid publications both in this country and abroad; and especially by the Geraniaceæ of Mr. Sweet, in which it is proposed to figure not only all the species formed by the hand of nature, but the multitudes of hybrid creations produced by the assistance of modern ingenuity. It is very doubtful whether any permanent advantage is derived from the obtaining such of these productions as are truly

History, Use, Propagation, Culture,

hybrid; but it is quite certain, that to admit them into works of science, is replete with the greatest inconvenience, and can lead to no useful end. In the arrangement here adopted, all those kinds which are manifestly or avowedly artificial productions, are therefore placed at the end of the legitimate species in alphabetical order, an order much more commensurate with their importance, than an arrangement upon scientific principles.

*** *Leaves pinnatifid. Segments cut or multifid.*

- 9477 Stemless, Leaves hairy bipinnated, Lobes linear somewhat blunt, Upper petals reflexed; lower connivent

 9486 Stemless, Lvs. pinnated hairy: segm. cut multifid, Umbel simple 4-6-fl. Petals linear
 9487 Stemless, Lvs. pinnated: segm. lanc. linear, Umbel compound
 9488 Stemless, Lvs. lanc. linear entire and pinnatifid, Umb. compound
 9489 Stemless, Lvs. hairy ciliated obovate or lanc. entire or pinnatifid, Stipules adhering to petiole
 9490 Nearly stemless, Lvs. hairy pinnated: segm. oval-obl. blunt subpinnatifid or toothed, Petals lin. blunt
 9491 Stemless, Lvs. hispid entire or 3 cut, Umbel compound, Flowers dioecious [at end
 9492 Stemless, Lvs. downy: some obl. and entire; others pinnated, Upper sepal erect, Barren filam. incurved

§ 2. DIMACRIA. Lindl. *Petals 5, unequal, two upper connivent spreading at end. Stamens shorter than sepals, 5 fertile, two lowermost twice as long as the rest, upper very short; 5 sterile, very small, nearly equal. Stemless herbs, with a tuberous turnip-like root; leaves stalked pinnatifid.*

* *Leaves pinnated, with an odd segment. Segments entire.*

- 9493 Stemless, Lvs. pinnated villous: segm. ovate in 2 or 4 pairs, Petals nearly entire flat
 9494 Stemless, Lvs. pinnated hairy: segm. elliptical in many pairs, Petals wavy twisted at base
 9495 Stemless, Lvs. pinnated smooth: segm. of 1 or 2 pairs obovate or oblong
 9496 Stemless, Lvs. pinnated smooth: segm. of 2 or 3 pair obovate: the terminal ones confluent

** *Leaves pinnate, with an odd one. Segments lobed or multifid.*

- 9497 Nearly stemless, Leaves smooth pinnated: segments lobed blunt, Upper petals obcordate
 9498 Stemless, Lvs. smooth bipinnated, Lobes trifid linear blunt, Scape simple

§ 3. CYNOSBATA. Dec. *Petals oval, nearly equal, almost twice as long as calyx. Stamens 10 erect, the 5 alternate ones bearing the anthers. Stems shrubby, erect.*

- 9499 Stem shrubby at base, Lvs. cordate 5-lobed hairy zoned, Lobes acutely toothed at end
 9500 Stem shrubby branched, Lvs. cordate 3-lobed toothed hairy: middle lobe 3-lobed, Pedunc. 2-flowered

§ 4. PERISTERA. Dec. *Petals nearly equal, as long as calyx, or a little larger. Stamens 10, 5 longer, nearly equal, or one only occasionally abortive, 5 alternate, very short, sterile, tooth like. Herbs with stems, and with the appearance of Erodium or Geranium.*

- 9501 Stems many diffuse, Lvs. cordate rounded many-parted, Lobes trifid, Lobelets linear blunt
 9502 Caulescent procumbent, Lvs. cord. somewhat lobed crenate-toothed, Pedunc. 2-flowered
 9503 Stems many procumbent, Lvs. cord. usually 3-parted or 5-lobed toothed, Pedunc. 3-5-flowered
 9504 Much branched procumbent, Leaves ellipt. blunt hoary toothed, Pedunc. 2-flowered, Anthers 5
 9505 Diffuse procumbent, Lvs. cordate somewhat lobed villous beneath, Peduncles many-flowered
 9506 Diffuse procumbent, Lvs. cordate ovate villous 3-lobed toothed: upper sinuated, Umbel many-flowered

§ 5. OTIDIA. Lindl. *Petals oblong-linear, nearly equal, about twice as long as calyx, the two upper awicled at the base on the upper side. Stamens 10, erect, 5 fertile, 2 upper spatulate or subulate, 3 lower shorter. Stems shrubby, fleshy. Leaves alternate pinnated, fleshy. Flowers whitish.*

- 9507 Stem shrubby fleshy, Umb. many-flowered loosely paniced, Lvs. pinnated smooth, Petals somew. toothed
 9508 Stem shrubby fleshy branched, Lvs. fleshy pinnated: lobes lin. round channelled entire or 3-toothed at end
 9509 Stem shrubby fleshy warted, Lvs. fleshy pinnated: segm. cut pinnatifid subtrifid at end [at base
 9510 Stem shrubby fleshy, Lvs. fleshy bipinnated: lobes dilated and cut at end, Pedunc. panic. Upper pet. crisp
 9511 Stem shrubby fleshy, Branches hairy, Lvs. pinnat: segm. stalked subalternate wedge-shaped toothed at end
 9512 Stem fleshy thick suffruticose at base, Lvs. smooth thick sinuate-pinnat: segm. obl. blunt cut toothed at end

§ 6. POLYACTIUM. Dec. *Petals nearly equal, revolute. Petals 5, nearly equal, obovate. Stamens 10, 5 fertile: the four lower long, subulate; upper broad, spatulate, reflexed at end; the fertile ones shorter, incurved at end. Petals with a very large dark brown spot which is scarcely edged with yellow.*

- 9513 Subcaulesc. Lower lvs. pinnat. hairy: segm. pinnati; lobes obl. blunt cut-toothed; upper smoothish bipinn.

§ 7. ISOPETALUM. Sweet. *Upper sepal ending in a honey pore and not in a tube. Petals 5, equal. Stamens 10, united in a very short cup, 5-6 fertile, spreading incurved at end; sterile unequal, subulate incurved. Shrub with a fleshy stem.*

- 9514 Stem thick fleshy branched naked, Lvs. cord. subpeltate rugose pubesc. netted with downy veins beneath

and Miscellaneous Particulars.

The bulbous or fleshy stemmed species are generally very rare in collections, and are far more interesting than the common or vulgar kinds. They are distinguished by so peculiar a habit and constitution, that there can be little doubt of the propriety of separating them into one or more distinct genera, as has been done already by the authors quoted above; especially as the characters upon which they are founded, are generally more certain than those by which *Erodium* and *Geranium* are defined. Here, however, they are placed as

History, Use, Propagation, Culture,

sectional names, so as to present a double arrangement, in which the purposes of combination and analysis are both combined.

As the cultivation of Pelargonium generally is of the easiest kind, so is that of the bulbous rooted species of the most difficult nature. They require plenty of air and light, not to be over-watered, and a great deal of

- § 8. *CAMPYLIA*. Lindl. *Petals 5, unequal, two upper larger, with an awicled claw. Stamens 10, hairy or pubescent, 5 fertile, erect, 5 alternate sterile, of which the two upper are longer and hooked back. Herbs at the base a little shrubby, branched. Leaves stalked, ovate or oblong, toothed or cut.*
 * *Petals with an appendage to the claw : 5 stamens fertile, erect ; 5 sterile, of which the two uppermost are hooked backwards.* TRUE *CAMPYLIA*.
 9515 Stem suffruticose erect, Lvs. ovate round blunt hoary silky toothed, Upper petals roundish : lower oblong
 9516 Stem suffruticose erect, Lvs. ellipt. roundish blunt crenate silky, Upper pet. obovate sharply emarginate
 9517 Stem suffruticose erect, Lvs. roundish ovate blunt doubly toothed silky, Upper petals round dark purple
 9518 Stem herbaceous ascending, Lvs. obl. lanc. blunt toothed hoary, Pedunc. 1-3-fl. Upper petals obovate
 9519 Stem suffruticose ascending, Lvs. lin. lanc. cut-toothed at end hoary beneath, Upper petals obov. oblong
 9520 Stem suffruticose, Lvs. ovate plaited serrated downy, 3 upper petals very broad ovate
 9521 Stem suffruticose ascending, Lvs. ovate unequally toothed or cut, Stipules carinate, Upper pet. oval wavy
 ** *Upper petals warty above the claw. Tube of stamens very short, 5 fertile recurved, spreading, 5 sterile straight.* *PHYMATANTHUS*. Lindl.
 9522 Stem suffruticose erect, Lvs. lanc. villous cut-toothed trifid, Upper petals blistered at base
- § 9. *MYRRHIDIUM*. Dec. *Petals 4, or rarely 5, the two upper very large, obovate, cuneate, usually marked with branching lines, the two or three lower much smaller, oblong-linear. Stamens 10, with their tube and filaments straight, generally with 5 anthers, and 5 alternately barren, rarely 7 fertile. Biennial or perennial herbs rarely shrubby. Stems round. Leaves pinnate or ternate, often multifid.*
 * *Anthers 5. Petals 4.*
 9523 Stem suffruticose, Lvs. 3-parted, Lobes toothed at end blunt : lower obovate ; middle ovate often trifid
 9524 Stem herbaceous strigose ascending, Lvs. hispid on each side rigid pinnate, Lobes cut-toothed
 9525 Stem herbaceous biennial somewhat downy, Lvs. bipinnate smooth, Lobes linear subpinnatifid
 ** *Anthers 5. Petals 5.*
 9526 Stem herbaceous hairy suberect, Lvs. bipinnatifid, Segm. lanc. blunt toothed at end
 *** *Anthers 7. Petals 4.*
 9527 Stem herbaceous biennial hairy erect, Lvs. pinnated hairy beneath smooth above, Lobes toothed
 9528 Stem herbaceous hairy, Lvs. bipinnate, Lobes linear smoothish, Pedunc. 1-fl.
 9529 Stem herbaceous procumbent smooth, Lvs. subbipinnatifid toothed, Pedunc. many-fl. capitate
- § 10. *SEYMOURIA*. Sweet. *Petals 2, distinct at base, abruptly reflexed in the middle. Stamens 5, nearly equal, in a long straight tube, all fertile.*
 9530 Lvs. roundish cordate bluntish entire ciliated shining on the upper side
 9531 Leaves ovate entire acute smooth, Umb. simple, Flowers pentandrous
- § 11. *JENKINSONIA*. Sweet. *Petals 5, the two upper much larger than the rest, emarginate at end, striated with colored lines, the 3 lower much smaller. Stamens 10, ascending, spreading at end, hairy at base, 7 fertile, of which the three upper are shorter, the three sterile shortened, subulate, of equal length. Stems shrubby. Flowers large.*
 9532 Lvs. bipinnatifid hairy, Stem procumb. hairy, Flowers heptandrous, Petals 4
 9533 Stem shrubby flexuose, Lvs. pubescent palmate 5-fid, Lobes cuneate 3-toothed at end
- § 12. *CHORISMA*. Lindl. *Petals 4, rarely 5, the two upper with long claws largest, two lower much smaller. Stamens declinate, in a very long tube, jointed in middle, connate, 7 fertile, of which the two lower are loose ; the 3 sterile shortened, subulate of equal length.*
 9534 Branches 4-cornered fleshy, Leaves cordate bluntly lobed somewhat toothed
- § 13. *PELARGONIUM*. Lindl. *Petals 5, unequal, the two upper approximating. Stamens 10, unequal, 7 fertile, 3 sterile, subulate.*
 * *Petals whole colored, the two upper shorter and narrower. Stamens short, erect, the two lowest very short with nearly sessile anthers. Stem shrubby, fleshy.* *CICONIUM*, Sweet.
 9535 Leaves very smooth obovate crenate somewhat fleshy, Pedunc. few-fl. Petals linear
 9536 Leaves roundish obsoletely lobed crenate smooth zoned, Petals linear breadth of sepals
 9537 Leaves roundish obsoletely lobed crenate : younger somewhat zoned, Pedunc. 4-fl. Petals linear
 9538 Leaves roundish obsoletely lobed crenate smooth zoned, Petals linear narrower than sepals
 9539 Leaves roundish obsoletely lobed crenate smooth not spotted, Petals linear cuneiform
 9540 Leaves cordate-orbicular obsoletely lobed toothed zoned upwards, Pedunc. many-fl. Petals cuneate
- 9541 Leaves reniform 5-lobed crenate zoned, Stipules cordate obl. acute ciliated, Umbels many-fl. crowded
 9542 Leaves round reniform scarcely divided crenate viscid, Petals obovate cuneate
 9543 Leaves cordate orbicular cut-lobed toothed pubescent on each side, Petals obl. cuneate
 9544 Leaves roundish reniform obsoletely lobed somewhat zoned complicate crisp downy on each side
 ** *Petals nearly equal in size.*
 § A. *Stems herbaceous. Leaves cordate, palmate, lobed. Petals small.*
 9545 Stem diffuse, Lvs. cord. ov. obsoletely lobed bluntly toothed ciliated, Pet. equal to the cal. and one another

and Miscellaneous Particulars.

attention at all periods. If well managed, they flower beautifully, and are incomparably superior in all points to the commoner races. They are no where in this country managed with so much success as by Sweet, who seems to hold the reins of nature in his hands in a more steady manner than any cultivator of the age.

History, Use, Propagation, Culture,

The most common free-growing kinds will thrive well in any rich light soil, or a mixture of loam and decayed leaves will suit them very well; the dwarfer woody kinds, as *P. tricolor*, *elegans*, *Blattarium*, *ovale*,

9546 Stem diffuse, Lvs. cord. somewhat lobed bluntly crenate villous beneath, Pet. larger than calyx

- 9547 Stem fleshy very short, Branches herbaceous long diffuse, Lvs. roundish cordate very soft
 9548 Branches spreading soft with down, Lvs. roundish cordate about 3-lobed bluntly toothed very soft
 9549 Stems square very smooth, Lvs. cordate roundish cut toothed, Pedunc. about 2-fl.
 9550 Stems 3-cornered 2-edged smooth, Lvs. cordate roundish obsoletely lobed toothed, Umb. many-fl.
 9551 Stem hispid, Lvs. reniform 3-5-lobed blunt toothed at end smoothish, Pedunc. long 2-4-fl.
 9552 Stem villous, Lvs. cordate 5-lobed palmate villous, Pedunc. few-fl. Stigma sessile
 9553 Stem erect, Lvs. bipinnatifid lacinate smooth, Involucres and calyxes blunt

§ B. *Stem half shrubby. Leaves pinnate. Lobes multifid.*

- 9554 Leaves cinereous velvety palmately 3-cut, Lobes linear trifid, Calyxes somewhat hispid
 9555 Leaves 3-cut dark-green, Lobes distant 3-parted lacinated, Petals linear flaccid
 9556 Stem fleshy naked erect, Leaves hairy bipinnate decomposed, Lobes linear subulate
 9557 Leaves 3-parted fleshy cut-toothed glaucous, Segments subsessile cuneiform, Honey spur very long
 9558 Leaves cuneiform trifid toothed, Petioles and stipules persistent spiny, Umb. comp. few-fl.

§ C. *Stem half-shrubby, fleshy. Leaves trifid or pinnate, fleshy, Petals yellowish brown.*

- 9559 Stem with tumid articulations, Leaves pinnate of 1 or 2 pairs with an odd one blunt cuneate cut-toothed
 § D. *Nearly stemless. Root fasciated, tuberous. Leaves decomposed, lacinated. Petals yellowish brown.*
 9560 Leaves decomposed lacinate hairy, Segm. linear, Umb. many-fl.
 9561 Leaves hairy pinnate, Segm. bipinnate; divisions ovate toothed somewhat acute
 9562 Leaves smooth ciliated fleshy 5-7-lobed toothed reflexed at end, Umb. many-fl. Fls. on very long stalks
 9563 Leaves hairy pinnate, Segm. bipinnatifid; divisions linear acute
 9564 Leaves ternate oblong blunt wavy hairy on each side and revolute at end, Petals 2-parted multifid
 9565 Leaves cordate downy beneath bluntly 3-5-lobed sinuate-toothed, Scape divided
 9566 Leaves decomposed smooth, Leaflets cut, Segments channelled linear, Calyx reflexed

§ E. *Stem short, or somewhat fleshy. Leaves divided, cut or toothed. Petals scarlet or crimson.*

- 9567 Leaves hairy pinnate, Segments lacinate pinnatifid decurrent, Lobes linear lanceolate
 9568 Leaves 3-parted, Segm. sessile cuneate cut toothed, Middle lobe larger pinnatifid
 9569 Leaves cord. 3-lobed, Segm. toothed: lateral bifid; middle 3-lobed, Stipules cord. acum. somew. toothed

§ F. *Stem half shrubby. Leaves lobed, hairy. Petals with a broad purple spot in the middle.*

- 9570 Leaves hispid 3-parted, Segm. multifid, Lobes linear-lanceolate serrated
 9571 Leaves cordate 3-fid wavy hairy blunt toothed: lateral segments 3-lobed; upper 5-lobed

§ G. *Stem fleshy, half shrubby. Leaves oblong, or often cordate, somewhat cut. Stipules lanceolate, spreading, acute. Roots tuberous, fasciated.*

- 9572 Leaves 3-parted hairy, Lateral segments smaller lobed toothed; term. long cut-toothed, Pet. spreading
 9573 Leaves oblong lobed pinnatifid, Petioles united at base, Umb. many-flowered
 9574 Leaves cord. obl. subreniculate toothed downy, Scape branched, Umb. many-fl. Involucres leafy
 9575 Leaves ovate cordate somewhat lobed crenate villous beneath, Stipules persistent spiny
 9576 Leaves reniform obacuminate toothed silky on each side, Bractes 4 times shorter than pedicel
 9577 Leaves reniform obacuminate toothed silky on each side, Bractes twice as short as pedicels
 9578 Leaves cordate cut-lobed wavy bluntly toothed downy, Honey-tube 4 times as long as calyx
 9579 Leaves reniform crenate-toothed downy beneath, Stipules persistent dilated at base

§ H. *Stem shrubby, fleshy. Leaves peltate, or cordate 5-lobed, fleshy. Honey-tube as long as stalk. Stipules broad ovate.*

- 9580 Branches fleshy round, Leaves cordate 5-lobed somewhat toothed fleshy smooth, Umb. many-fl.
 9581 Branches fleshy angular, Leaves peltate 5-lobed entire fleshy, Umb. few-fl.

*** *Two upper petals broader, shorter, very blunt.*

- 9582 Stem weak prostrate, Branches petioles and peduncles softly hairy, Leaves oval acute toothed hoary
 9583 Leaves elliptical roundish finely serrate blunt rigid smooth, Petals all obovate

**** *Two upper petals longer and broader. Stems shrubby.*

§ A. *Leaves smooth, or nearly smooth, more or less glaucous.*

1. *Petals white, the upper generally lined with red, or spotted.*

- 9584 Very smooth and glaucous, Leaves lanceolate entire acuminate, Peduncles 1-2-fl.
 9585 Smooth glaucous, Leaves lanceolate entire or 3-parted; lower toothed, Pedunc. about 1-fl. panicled
 9586 Very smooth somewhat glaucous, Leaves ovate acute glaucous somewhat cut remotely serrate
 9587 Very smooth, Leaves deeply 3-parted, Segm. acinaciform cut serrate, Peduncles 3-flowered
 9588 Very smooth glaucous, Leaves 3-parted, Segm. trifid cuneate; divisions linear lanc. Pedunc. about 2-fl.
 9689 Smooth glauc. Lvs. 5-lobed palmati. cord. at base, Lobes toothed tow. the end, Pet. 3 times as long as cal.
 9590 Smooth glaucous, Leaves 3-5-lobed palmate-parted, Segments trifid toothed, Stipules ovate cordate acute

2. *Petals rosy or violet, upper generally striped with purple.*

- 9591 Smooth glaucous, Leaves long-stalked cordate reniform 3-5-fid toothed, Petals lanceolate-cuneate
 9592 Smooth glaucous, Leaves on long stalks cordate roundish 5-fid toothed zoned above
 9593 Smooth glaucous, Leaves cord. 5-lobed toothed glaucous beneath: younger zoned above; upper 5-parted

and Miscellaneous Particulars.

&c. thrive best in an equal mixture of sandy loam and peat, and require their pots to be well drained; the succulent kinds like a light sandy loam, and require scarcely any water when not in vigorous growth; the

History, Use, Propagation, Culture,

tuberous rooted kinds thrive best in very sandy loam and peat, and require no water after they have flowered, till they begin to grow afresh. Cuttings of the shrubby kinds strike root freely under hand-glasses in the same

§ B. *Flowers white, or scarcely rose-colored; two upper petals deep-red, lined. Leaves ovate, cordate, or reniform toothed, undivided.*

9594 Lvs. ovate cut serr. the younger scabrous backwards; adult nearly smooth, Stipules ovate acuminate
 9595 Leaves ovate unequally serrate smoothish, Stipules ovate-lanceolate, Peduncles 2-4-flowered
 9596 Umb. many-fl. Leaves ovate acute concave rigid somew. lobed uneq. tooth. truncate at base many-nerved

§ C. *Petals white, narrow. Leaves cordate, soft with down. Stipules spreading much.*

9597 Stem shrubby fleshy, Branches peduncles and leaves hirsute, Leaves cordate hastate 5-lobed very soft
 9598 Stem shrubby fleshy, Branches and pedunc. subhispid, Lvs. cord. hastate 5-lobed rough, Umb. many-fl.

§ D. *Leaves cordate, flat, toothed. Lower petals linear; upper purple, lined.*

9599 Branches leaves and pedunc. hairy, Leaves cordate roundish angular toothed, Umbels panicked many-fl.
 9600 Lvs. cord. acute toothed flat hoary beneath and downy, Branches and ped. pilose, Lower pet. subulate-lin.
 9601 Leaves cordate acutely crenulate quite smooth, Stipules linear reflexed, Umbels many-flowered
 9602 Leaves roundish ovate truncate subcordate at base cut-toothed wavy beneath hoary pubescent

§ E. *Leaves cordate, or cuneate, toothed, undivided, or lobed. Lobes blunt, not divided down to the middle. Flowers purple. Lower petals oblong or obovate.*

1. *Leaves undivided, cucullate.*

9603 Leaves reniform cucullate toothed pubescent, Branches and peduncles softly hispid, Lower petals oblong
 9604 Leaves roundish truncate reniform with acute cartilaginous teeth many-nerved subpubescent
 9605 Leaves roundish ovate subcord. concave somewhat angular serr. pubesc. Honey-tube the length of calyx
 9606 Leaves cun. at base entire at end palmately 5-lobed toothed many-nerved rather villous, Stip. cordate ovate
 9607 Leaves truncate at base subcucul. roundish bluntly 5-lobed toothed pubesc. Stipules cord. ovate acuminate
 9608 Leaves reniform blunt cucullate toothletted hairy on each side, Umbels many-flowered
 9609 Leaves cord. roundish somewhat lobed tooth-crenate wavy at edge, Stipules cord. acute somew. toothed

2. *Leaves lobed, flattish.*

9610 Leaves cordate bluntly 3-lobed wavy villous soft, Pedunc. about 2-flowered
 9611 Leaves truncate at base subcuneate 3-fid flat hairy, Lobes divaricating serrated at end, Lower petals lin.
 9612 Leaves cordate 3-lobed roughish blunt toothed, Stipules broad cordate, Stem erect
 9613 Leaves cordate lobed wavy softly villous toothed, Stipules broad cordate, Stems diffuse
 9614 Lvs. subcord. acute slightly 5-lobed serrated, Umb. 5-fl. subcapitate, Ped. scarcely longer than involucrem

3. *Leaves lobed. Lobes acutely cut at end.*

9615 Lvs. deeply 3-lobed, Lobes round. blunt unequally toothletted. Veins ben. and cal. roughish, Stipules cord.
 9616 Leaves cuneate at base trifid, Lobes acute: middle longer subserrate with a midrib muricated beneath
 9617 Leaves cuneate at base trifid rough, Lobes lanc. loosely serrated, Pedun. 1-4-flowered
 9618 Leaves cuneiform distichous rough plaited truncate at end cut-toothed, Peduncles 2-flowered short
 9619 Leaves distichous roundish fleshy subcuneate at base trifid wavy plaited rough toothed, Pedun. about 2-fl.
 9620 Leaves truncate cord. 3-lobed toothed hoary, Stipules scarcely any, Peduncles 3-4-flowered
 9621 Lower lvs. deeply 3-lobed beneath pustular, Lateral lobes spreading unequally and acutely toothed
 9622 Leaves deeply 3-lobed, Lobes spreading unequally and acutely toothed at end beneath and at edge rough
 9623 Leaves 3-parted cucullate rough, Lobes cuneiform cut-serrate at end: the middle one trifid

§ F. *Leaves divided beyond the middle. Lobes toothed, cut, or pinnatifid. Flowers purplish or pale.*

9624 Leaves cord. pinnatifid with rounded recesses, Lobes blunt crenate, Branches and petioles hispid
 9625 Leaves palmately 7-lobed, Lobes oblong blunt toothed revolute at edge, Umb. many-fl. capitate
 9626 Leaves cord. hastate 5-angled toothed viscid smoothish, Umb. 2-4-fl. Honey tube a little longer than calyx
 9627 Leaves palmatifid downy hispid, Lobes narrow pinnatifid revolute at edge, Segm. linear, Umb. few-fl.
 9628 Leaves palmated rough, Lobes narrow pinnatifid cut toothed, Umb. panicked many-fl.
 9629 Leaves palmated roughish cuneate at base, Lobes lanc. remotely toothed, Umb. few-fl.
 9630 Leaves somewhat palmated rough, Lobes 5-7-oblong blunt crisply toothletted at edge, Umb. 5-fl. in heads
 9631 Leaves palmated viscid smooth, Lobes linear pinnatifid repand toothed flattish, Umb. few-fl.
 9632 Leaves rough palmate 5-lobed, Lobes oblong serrated: middle 3-lobed, Umbels few-fl. compound

‡ *Uncertain species.*

9633 Stem fleshy branched arboreous, Lvs. cord. peltate pubesc. variably glauc. Petioles villous without stipules
 9634 Leaves reniform distichous slightly 3-lobed blunt unequally toothed wavy
 9635 Leaves slightly trifid unequally and acutely toothed wavy hairy, Peduncles 2-4-fl.
 9636 Leaves roundish ovate blunt subtrifid folded together wavy toothed hairy beneath, Sepals erect
 9637 Leaves slightly 3-lobed flat blunt; Lobes divaricating unequally and finely toothed, Pedunc. 3-fl.
 9638 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Branches petioles and peduncles villous
 9639 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Honey tube twice as short as reflexed calyx
 9640 Leaves ellipt. blunt: floral obsoletely subtrifid unequally toothed somew. cuneate and entire at the base
 9641 Leaves flat very smooth half round 7-lobed serrated slightly cordate at base, Pedunc. 2-5-flowered

and Miscellaneous Particulars.

kind of soil, or in pots, without being covered by glass, and placed in a shady situation. Many of the kinds may also be increased by pieces of their roots, or from seeds. The tuberous-rooted kinds may be propagated

DECANDRIA.

- 9643 Stem erect diffuse branched, Peduncles longer than petiole, Leaves 5-parted, Lobes oblong cut-toothed
 9644 Stem erect diffuse branched, Ped. longer than petiole, Leaves opp. 5-parted, Lobes trifid, Lobelets linear
 9645 Stem diffuse, Leaves hoary beneath 7-part. Lobes multifid linear, Pedunc. elongated, Calyxes silky villous
 9646 Stem diffuse, Leaves hoary beneath 5-parted, Lobes obl. cut-toothed, Ped. very long and cal. gland. hairy
 9647 Stem very short, Radical leaves on long stalks silky on each side 5-7-parted, Lobes 3-fid, Lobelets linear
 9648 Stem very short, Rad. leaves stalked glaucous pubescent 5-parted, Lobes cuneiform trifid, Pedunc. radical
 9649 Stem shrubby, Leaves smooth palmate 5-cut, Segments bipinnatifid, Peduncles opposite erect hairy
 9650 Stem suffruticose at base dichot. at end, Lvs. smooth 5-parted, Lobes toothed at end, Cal. globose inflated.
 9651 Root subglobose, Stem naked from base to the branches, Leaves 5-parted, Lobes lin. pinnately cut serrate
 9652 Stem villous dichotomous, Leaves 5-7-parted, Lobes pinnately cut, Calyxes ciliate villous
 9653 Stem 4-cornered, Lower leaves 5-lobed; upper 3-lobed, Lobes oblong acuminate serrate, Pet. emarginate
 9654 Stem angular, Rad. leaves 7-lobed; cauline 5-lobed, Lobes oblong acuminate toothed, Petals emarginate
 9655 Stem erect somewhat angular, Leaves opposite 5-lobed, Lobes cuneate ovate lobed-toothed, Stip. connate
 9656 Stem round, Leaves 5-lobed, Lobes oval acuminate cut-toothed, Stipules connate bifid
 9657 Stem round, Lower leaves 5-lobed; upper 3-lobed, Lobes ovate acute cut toothed, Stipules distinct
 9658 Stem round, Leaves altern. 5-7-lobed cut-toothed; upper sessile, Petals reflexed toothed at end
 9659 Stem round, Leaves 5-lobed cut-toothed; upper sessile, Petals spreading entire, Filaments hairy at base
 9660 Like the last, but with dark fuscous petals
 9661 Like Phaxum, but the petals are rose-colored and emarginate
 9662 Stem round simple, Lvs. 5-lobed, Lobes ovate coarsely toothed: lower on long stalks altern.; upp. sess. opp.
 9663 Stem round erect smooth, Lvs. about 7-lobed, Lobes obl. cut serr. Ped. corymbos. Pet. somev. emarginate
 9664 Stem round erect downy, Lvs. about 7-lobed, Lobes linear obl. cut serrate, Ped. somev. corymb. Pet. entire
 9665 Stem round erect smooth, Leaves palmate subpeltate 5-7-lobed, Lobes oblong coarsely cut, Ped. very long

and Miscellaneous Particulars.

sand, under a bell-glass, plunged in heat. The cuttings must not be put in very close together, and the glass must be wiped frequently, as they are apt to damp off." (Bot. Cult. 129.)

History, Use, Propagation, Culture,

interest, and in others, being extremely shewy border-flowers. The *G. Lancastrænsis* is the most elegant, and *G. sanguineum* the most ornamental of our British kinds. *G. anemonifolium*, a Cape species, is singularly beautiful, on account of its fine caulescent stem, loaded with large fern-like glossy leaves of the most delicate green, and its fine red rich blossoms broader than half a crown.

1464. *Brownæa*. Named after Dr. Patrick Browne, an English physician, who published a Natural History of Jamaica, in 1756, illustrated with figures from the pencil of Ehret. A splendid genus, as yet rare in British gardens. Loamy soil best suits rooted plants; and ripened cuttings root in sand in close moist heat.

1465. *Monsonia*. In memory of Lady Ann Monson, a lady of eminent botanical acquirements, who resided for many years in the East Indies, and is said to have assisted in compiling *Benca's Introduction to Botany*. The species are curious and beautiful plants: they grow well in turfy loam and rotten leaves, and are increased by cuttings of the shoots or roots.

- 9666 Stem somew. angul. erect dichotomous pubesc. backw. Lvs. 3-5-part. cut-toothed : radic. on very long stalks
 9667 Stem angular diffuse pubesc. backw. Lvs. palmate 5-part. : lobes 3-lobed cut serrate, Ped. and cal. vill. viscid
 9668 Stem decumbent villous with spreading hairs, Leaves 5-7-lobed : lobes cut-toothed, Ped. very long hairy
 9669 Stem ascending smoothish, Leaves peltate 7-parted : lobes cut, Peduncles and calyx villous
 9670 Stem naked at base erect smooth, Caul. lvs. opposite 3-5-part. : lobes cut acute, Ped. 3 times as long as leaf
 9671 Stems decumbent branched, Petioles and peduncles hispid, Leaves 3-5-parted : lobes linear blunt trifid
 9672 Stems decumbent, Petioles pedunc. and calyx smoothish, Caul. lvs. opp. 3-5-parted : lobes trifid toothed
 9673 Stem prostrate compressed, Lvs. opp. 5-lobed : lobes oblong unequally toothed, Ped. elong. and cal. hairy
 9674 Stem erect branched, Leaves reniform 7-lobed : segm. oblong obtuse trifid ; lobes 3-toothed
 9675 Stem more flaccid and nearly naked, Grains nearly smooth. Otherwise like the last
 9676 Leaves ren. : rad. 9-lobed ; caul. 7-lobed : lobes 3-fid, Pet. bifid length of pointless cal. Fruit smooth rugose
 9677 Leaves subreniform 7-lobed : lobes 3-fid, Petals emarg. length of pointless cal. Fruit downy not rugose
 9678 Radic. lvs. reniform 7-lobed ; caul. roundish trunc. at base 5-lobed : lobes trifid, Pet. length of awned cal.
 9679 Leaves 5-parted : lobes multifid linear, Petals emarginate length of awned calyx, Fruit smooth
 9680 Leaves 5-parted : lobes trifid linear, Petals emarginate length of awned calyx, Fruit hairy
 9681 Lvs. 5-lob. beyond middle : lobes cut 3-5-fid, Ped. clustered at end, Petals emargin. length of awned calyx
 9682 Lvs. 5-lobed : lobes cuneate ovate cut-tooth. Hair of stem spread. hispid, Pet. emarg. length of awned calyx
 9683 Lvs. 5-lob. : upp. 3-lob. : lobes obl. coarsely and irreg. tooth. Hair of stem spread. hisp. Pet. shorter than cal.
 9684 Very smooth, Leaves rounded 5-lobed, Calyx pyramidal angular transversely wrinkled, Fruit muricate
 9685 Leaves 3-5-parted : lobes trifid pinnatifid, Petals entire twice as long as the angular awned calyx
 9686 Like the last, but the petals only a little longer than calyx
 9687 Stem prostrate nodose, Leaves opposite deeply 5-lobed

9688 Stamens length of cor. Pedunc. aggregate, Branches smooth

DODECANDRIA.

- 9689 Leaves palmate 5-parted, Segm. finely bipinnatifid, Petioles and calyxes smooth
 9690 Leaves palmate 5-parted, Segm. 3-parted pinnatifid ; beneath calyxes and petioles hairy
 9691 Leaves cordate 5-7-fid : lobes blunt serrated ; beneath petioles and calyxes somewhat hairy
 9692 Leaves ovate oblong subcordate crenate wavy, Stipules rigid, Pedunc. 1-fl. with 2 bractes
 9693 Leaves ovate mucronate entire, some subsessile, some on long stalks
 9694 Decandrous, Leaves cordate finely serrate downy beneath, Peduncles 2-flowered, Calyxes sub-bilabiate
 9695 Decandrous, Leaves cordate crenate velvety with down on each side, Flowers subterminal few corymbose
 9696 Decandrous, Leaves cordate ovate tooth-serrate acuminate rough, Flowers axillary
 9697 Leaves cordate acuminate serrate downy green, Peduncles axillary few-flowered, Fruit-stalk very long
 9698 Leaves cordate lanceolate crenulate downy beneath rusty, Fl. terminal subracemose

- 9699 Young leaves downy, adult smoothish cordate 7-nerved crenate, Corymb bifid
 9700 Leaves downy beneath smooth above ovate oblong 7-nerved subcordate-peltate toothed

- 9701 Leaves hastate lanceolate serrate
 9702 Leaves ovate serrated

9703 Leaves roundish cordate acuminate very large, Stipules large persistent ovate wavy

- 9704 Leaves oblong acuminate coarsely somewhat toothed at end, Pedicels scarcely longer than petiole
 9705 Leaves cordate blunt toothed
 9706 Leaves oblong acuminate entire cordate at base sagittate on one side

and Miscellaneous Particulars.

1466. *Helicteres*. Derived from $\epsilon\lambda\iota\kappa\tau\epsilon\rho\varsigma$, a screw, in allusion to the manner in which the fruit is twisted. Free-flowering plants of easy culture, and increased in sand closely covered. They have little or no merit.

1467. *Dombeya*. Named after Joseph Dombey, a famous French botanist, who travelled in Peru with Ruiz and Pavon, in 1777. Ripened cuttings root in sand in moist heat.

1468. *Pentapetes*. One of the names given by the Greeks to the Cinquefoil ; but having no reference to the present genus, except that the calyx and capsules are in five. The species are of easy culture in any rich light soil, and are readily increased by cuttings in sand.

1469. *Astrapæa*. So called from $\alpha\sigma\tau\rho\alpha\pi\eta$, lightning, in allusion to the splendid colors of the flowers. A noble genus, remarkable for the large heads of flowers, and the great dilated stipules at the base of the leaves.

1470. *Pterospermum*. From $\pi\tau\epsilon\rho\alpha$, a wing, and $\sigma\pi\epsilon\rho\mu\alpha$, a seed. Light soil suits the plants, and cuttings with their leaves on root in sand covered close.

History, Use, Propagation, Culture,

1471. *Malope*. A name given by the Greeks to the Tree Mallow.
 1472. *Malva*. Altered by the Latins from the Greek word, *μαλαχη*, soft, in allusion to the soft mucilaginous qualities of the species. Some of the species are shewy plants, and *M. capensis* is valued in small greenhouses as flowering all the year. *M. sylvestris*, *Mauve*, Fr., has still a place in the *Materia Medica*, on account of its

POLYANDRIA.

- 9707 Leaves ovate crenate, Stipules oblong-linear
 9708 Leaves 3-nerved trifid toothed smooth : lobes acuminate
- 9709 Leaves oblong or ovate acute serrate, Flowers axillary clustered
 9710 Leaves ovate acute crenate serrate hairy, Fl. axillary subsolitary
 9711 Leaves ovate-lanceolate doubly toothed obsoletely 3-lobed beneath rough, Peduncles axillary 2-flowered
 9712 Leaves ovate crenate-serrate beneath velvety, Fl. axillary clustered
 9713 Leaves ovate acute coarsely toothed pubescent ; upper cuneate at base, Fl. axillary and terminal spiked
 9714 Leaves ovate acuminate serrate rough, Fl. axillary and terminal spiked
 9715 Leaves ovate or subcordate rough above downy beneath, Flowers in ovate spikes
 9716 Leaves cordate crenate blunt and branches downy, Flowers lateral heaped
 9717 Leaves subcordate acute toothed downy beneath, Fl. sessile, Lobes of calyx ovate
 9718 Leaves cordate acuminate serrated rough ; lower lobed, Pedunc. axillary, Flowers in heads
 9719 Leaves cordate blunt smooth, Flowers sessile heaped
 9720 Dwarfs, Leaves ovate toothed : adult smoothish ; younger hairy, Fl. axillary solitary on short stalks
 9721 Leaves reniform broadly crenate and branches leprous, Stems prostrate
 9722 Leaves cordate roundish 5-angled crenate villous, Pedicels longer than petiole
 9723 Leaves half orbicular crenate ; upper rhomboid, Stem erect hairy
 9724 Lower leaves 3-lobed entire ; upper multifid, Segm. trifid toothed at end
 9725 Leaves 3-parted, Segm. trifid ciliated toothed at end, Cor. less than calyx
 9726 Leaves 3-parted, Segm. trifid linear blunt, Cor. 3 times as large as calyx
 9727 Leaves many-parted : lobes trifid linear, Stem decumbent, Hairs stellated
 9728 Lower leaves angular ; upper 5-parted cut, Stems and calyxes velvety
 9729 Lower leaves reniform cut ; cauline many-parted, Segments linear, Stems and calyxes hairy
- 9730 Leaves palmated : lobes lanceolate toothed, Hairs simple, Pedicels longer than leaf
 9731 Stem erect, Leaves 5-lobed blunt, Pedicels and petioles smoothish or downy on the upper side
 9732 Stem erect, Leaves 5-7-lobed acute, Pedicels and petioles hairy
 9733 Stem prostrate, Leaves cord. orbic. bluntly 5-lobed, Pedicels in fruit drooping and petioles downy
- 9734 Stem diffuse, Lvs. cord. orbicular 7-lobed soft : lobes acute, Fls. aggreg. stalked, Leaves of involucre bristly
 9735 Stem erect, Leaves cordate roundish about 5-lobed crenate smooth, Fl. axillary sessile clustered
 9736 Stem spreading, Leaves roundish bluntly angular crenate smoothish, Fl. axillary sessile clustered
 9737 Stem erect, Leaves cordate roundish bluntly angular, Fls. axill. clustered sess. Cal. rough somew. inflated
 9738 Stem erect, Leaves angular toothed crisp smooth, Flowers axillary sessile
 9739 Pedicels 1-flowered aggregate shorter than leaf, Invol. ovate acuminate, Leaves 5-lobed hairy rugose
 9740 Pedicels 1-flowered solitary or twin longer than petiole, Invol. linear, Leaves cut crenate smooth rigid
 9741 Pedicels 1-fl. solitary or twin longer than petiole, Inv. ov. lanc. Lvs. 5-lobed or 3-lobed cren. toothed glutin.
 9742 Pedicels 1-fl. solitary longer than petiole, Invol. obl. linear, Lvs. sub-three-lobed acute unequally toothed
 9743 Pedicels 1-flowered solitary length of leaves, Leaves subsessile cuneiform trifid entire
 9744 Pedicels solitary longer than petiole, Leaves lobate plaited toothed roughish, Branches divaricating
 9745 Pedicels solitary longer than petiole, Invol. lanceolate, Leaves oblong very blunt 3-lobed toothed
 9746 Pedicels solitary 1-fl. twice as long as petiole, Invol. ovate acute very large, Leaves cordate crenate hairy
 9747 Pedicels solitary 1-fl. length of petiole, Invol. lanc. Leaves cordate 5-lobed toothed, Branches glutinous
 9748 Pedicels solitary 1-fl. length of petiole, Invol. nearly linear, Leaves ovate about 3-lobed toothed hairy
 9749 Pedicels solitary 1 or 2-fl. shorter than petiole, Leaves cordate about 5-lobed blunt rough with stellat. hair
 9750 Pedicels solitary 1-3-fl. length of petiole, Invol. obl. linear, Leaves sinuate lobed serrate rugose hairy
 9751 Pedicels 1-2-fl. solitary longer than petiole, Invol. linear, Leaves 5-lobed blunt rugose very rough
 9752 Leaves angular acute cordate villous, Petals obovate shorter than calyx, Pedunc. panicled
 9753 Leaves ovate 3-lobed toothed downy, Pedunc. axillary racemose few-flowered
 9754 Leaves angular 5-lobed ; middle lobe largest, Pedunc. axillary racemose, Flowers 1-sided
 9755 Leaves palmate, Spikes axillary 1-sided, Fruit toothletted
 9756 Leaves 7-lobed rugose, Spikes axillary 1-sided, Fruit smooth
 9757 Leaves 5-lobed : lobes pinnatifid sinuate toothed, Pedunc. corymbose capitate, Fruit with two beaks
 9758 Leaves subpeltate 5-lobed blunt, Pedunc. axillary umbelled, Invol. obovate stipitate deciduous
 9759 Leaves 5 angular downy, Pedunc. axillary bifid few-flowered, Invol. oblong small
 9760 Leaves 3-parted hoary, Segm. toothed at end ; middle trifid, Pedunc. axillary 1-flowered
 9761 Leaves lanceolate toothed downy, Pedunc. axillary 2 few-fl. Invol. setaceous deciduous
 9762 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit villous
 9763 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit smooth, Petals entire
 9764 Leaves ovate cut toothed lobed, Pedicels longer than petiole, Fruit villous, Petals entire

and Miscellaneous Particulars.

demulcent properties ; but it is greatly inferior to Althæa, and therefore little used. Malva was an excellent vegetable among the Romans, but what species is uncertain. A tree of the mallow kind is said, by Prosper Alpinus, to afford food to the Egyptians ; and the Chinese use some sort of mallow as food.

All the species are of the easiest culture and propagation.

History, Use, Propagation, Culture,

1473. *Kitabelia*. Named after Dr. Paul Kitabel, professor of botany at Pest, in Hungary, and author, in conjunction with Count Waldstein, of a noble work upon the plants of that country. A tall mallow-like plant with vine-like leaves, and white flowers.

1474. *Althea*. From *al. thea*, to cure. The salutary effects of the mucilaginous root, are well known in medicine. *Guimauve*, Fr. A. officinalis has long been in repute as a demulcent. Its roots are sometimes used as an emollient suppurative cataplasm; and a decoction of the leaves forms a useful fomentation in external abrasions, and in cutaneous eruptions, accompanied with a sharp ichorous discharge.

A. rosea is the parent of nearly twenty splendid varieties of border flowers, which seed readily, and the offspring generally resembles the parent variety. All the species are of the easiest culture in common garden soil.

1475. *Lavatera*. In memory of two Lavaters, physicians of Zurich, neither the physiognomist, but two friends of Tournefort. The species resemble those of Malva, in general appearance and culture: much the handsomest is *L. arborea*, which is a magnificent plant in shrubberies, or in the back of wide borders.

9765 Leaves 5-lobed acute toothed

- 9766 Leaves soft on each side cordate or ovate toothed undivided or 3-lobed, Pedunc. axillary many-fl.
 9767 Leaves pubescent : lower 5-7-parted ; upper trifid, Peduncles many-fl. longer than leaf
 9768 Leaves downy hoary beneath : lower palmate ; upper 3-parted : lobes narrow coarsely toothed
 9769 Leaves cordate rough with hairs smooth above : lower blunt ; upper 5-lobed, Stem hispid
 9770 Leaves smooth cordate roundish lobed toothed, Pedicels axillary clustered 1-flowered
 9771 Leaves roundish cordate 5-angled crenate, Pedicels 1-fl. much shorter than petiole
 9772 Stem upright hairy, Leaves cordate 5-7-angled crenate rugose, Flowers axillary sessile
 9773 Stem erect hispid, Leaves roundish cordate, Invol. as long as calyx
 9774 Stem upright smoothish, Leaves rounded lobed crenulate serrate, Flowers solitary subsessile
 9775 Stem subflexuose hispid, Leaves cordate about 7-lobed blunt on long stalks, Flowers axillary solitary
 9776 Stem erect hairy, Leaves palmate 7-lobed beyond the middle : lobes oblong blunt irregularly toothed

- 9777 Leaves 7-angled downy plicate, Pedicels axillary 1-fl. clustered much shorter than petiole
 9778 Leaves 7-angled acute crenate plaited downy, Racemes terminal
 9779 Leaves soft hoary 5-lobed ; upper 3-lobed : middle lobe elongated ; upper oblong undivided
 9780 Leaves downy on each side acutely 5-lobed ; upper 3-lobed, Flowers solitary on short stalks
 9781 Stem hispid, Leaves hoary 5-lobed ; upper 3-lobed or undivided, Flowers subsessile
 9782 Stem and leaves downy subcordate sub-three-lobed round crenate, Pedicels aggregate, Calyxes acuminate
 9783 Leaves 7-angular downy plaited, Racemes terminal
 9784 Stem rough, Leaves 5-lobed downy beneath, Pedunc. axillary aggregate, Petals emarginate
 9785 Stem and leaves downy roundish bluntly angular crenate, Pedicels axillary solitary
 9786 Leaves somewhat downy : lower angular ; upper 3-lobed : middle lobe longer than the rest
 9787 Stem herbaceous hispid, Leaves 5-lobed acute, Pedicels axillary 1-flowered aggregate
 9788 Stem rough, Leaves somewhat downy : lower round cordate ; upper 3-lobed, Pedicels solitary 1-fl.
 9789 Stem herbaceous, Leaves smoothish roundish cordate ; upper angular, Pedicels solitary

- 9790 Leaves cordate roundish bluntly angular toothletted, Invol. stalked 3-leaved 7-flowered, Stem rough
 9791 Leaves cordate palmate 5-lobed, Heads stalked 5-leaved 10-flowered, Stem with scattered hairs
 9792 Leaves palmate-lobed, Heads stalked 5-leaved many-flowered, Invol. acuminate, Calyxes and stems hairy

- 9793 Leaves roundish very bluntly 3-lobed velvety on each side 7-nerved 1-glanded, Cal. oblong lanceolate
 9794 Lower leaves 3-lobed ; upper lanceolate panduriform beneath hoary netted with one gland
 9795 Leaves trifid downy pale beneath with 3 glands : lobes angular toothletted blunt
 9796 Leaves broad ovate cut lobed with narrow recesses : lobes acute coarsely and unequally toothed

- 9797 Leaves broadly obovate truncate crenate at end, Pedic. axillary 1-fl. longer than leaf
 9798 Leaves ovate acuminate subcordate doubly toothed, Pedicels axillary 1-fl.
 9799 Leaves ovate subcordate 3-pointed somewhat toothed and branches covered with viscid hairs
 9800 Leaves cordate 3-lobed serrate, Pedicels axillary 1-fl. ascending, Involucre 3-leaved
 9801 Leaves 5-angular : lobes toothed acuminate, Pedic. axillary 1-fl. much shorter than petiole
 9802 Leaves 7-angular acuminate toothed hairy, Fl. axillary subsessile clustered
 9803 Lower leaves roundish cord. crenate others 3-5-lob. Pedicels axillary 1-fl. Inv. 10-leaved setaceous ciliated

- 9804 Leaves cordate 3-5-lobed acuminate roughish, Leaflets of invol. erect
 9805 Leaves cordate about 3-lobed acuminate soft downy, Leaf. of invol. somewhat spreading
 9806 Leaves cordate crenate blunt or acuminate, Branches and petioles hairy

- 9807 Leaves ovate acuminate serrate downy beneath, Invol. and cal. downy
 9808 Leaves ovate toothed somewhat 3-lobed hoary with down beneath
 9809 Leaves lanceolate oblong entire white with scales beneath

and Miscellaneous Particulars.

1476. *Malachra*. A name under which Pliny speaks of a tree from the north of Persia, producing a certain gum. It had no reference to the plant called *Malachra* by the moderns. Sow in light rich soil, and transplant as with other stove annuals.

1477. *Urena*, the vernacular name in Malabar. The species are of easy culture, seed freely, or may be propagated by cuttings in sand under a hand-glass.

1478. *Pavonia*. In honor of Don José Pavon, the companion of Dombey, in his voyage to Peru, and one of the authors of *Flora Peruviana*. The species are free-growers, and seed readily : they are also increased by cuttings in sand under a hand-glass.

1479. *Achania*. From *αχαιος*, closed ; so called because the corolla does not open out as in most Malvaceous plants, but remains always rolled together.

1480. *Hibiscus*. One of the Greek names of the mallow. The species are for the most part showy plants, and not difficult of culture. All of them abound in mucilage, like many of the same natural family, and the

History, Use, Propagation, Culture,

bark of the ligneous sorts may be manufactured into mats or cordage. Of *H. tiliaceus*, in the island of Otaheite, they make matting of the bark, as fine as our coarse cloth; also ropes and lines, from the size of an inch to that of a small packthread; and fishing nets. (*Hawks. Voy.* ii. 217.) Forster informs us, they also suck this bark for food, when the bread-fruit fails them; and in New Caledonia, the inhabitants frequently subsist on it, though it is an insipid food, affording very little nourishment.

H. Rosa-sinensis is extremely common in the gardens of China, and the East Indies; but its native country is unknown. Loureiro, however, affirms, that it is spontaneous as well as cultivated both in China and Cochín-China; and that it is so common in the latter, that they have entire hedges of it to their gardens. It has been long known from its appearance on Chinese screens and paper hangings. The variety with double flowers is most frequently cultivated, both in the East and in European hothouses: the plant is, indeed, rarely seen with single flowers. (*Smith, spicil.*)

H. syriacus is one of our most beautiful hardy shrubs, the more valuable as it is a free-flowerer, will grow in common garden soil, and propagates freely by seeds, layers, and even by cuttings.

H. Sabdariffa (the Turkish name) in the West Indies is called Red Sorrel. The calyxes and capsules, freed

- 9810 Leaves ovate acuminate bluntly serrate hoary on each side, Pedicels axillary 1-fl.
 9811 Leaves 3-lobed hastate acuminate serrate smooth on each side, Pedicels jointed in the middle
 9812 Leaves roundish cordate acuminate (*Thespesia* Dec.)
 9813 Leaves roundish cordate acuminate crenate hoary beneath, Invol. 10-toothed
 9814 Leaves roundish cordate entire hoary beneath, Pedunc. very short 1-flowered
 9815 Leaves cordate 3-pointed smooth dotted beneath, Pedicels solitary 1-fl. longer than petiole
 9816 Leaves cordate acutely serrate, Branches somewhat hairy
 9817 Leaves cordate ovate-lanceolate acuminate toothed, Pedicels twice as long as petiole
 9818 Leaves roundish cordate acuminate finely toothed hairy beneath, Pedicels thick villous
 9819 Leaves ovate acuminate smooth entire at base coarsely toothed at end, Pedicels length of leaf
- 9820 Leaves ovate acuminate serrate; lower subcordate 3-pointed, Pedicels jointed at end
 9821 Leaves ovate or roundish undivided serrated rough, Pedic. longer than leaf, Cor. reflexed
 9822 Leaves cuneiform about 5-toothed hairy, Pedicels longer than leaf, Invol. 8-10-leaved hispid
 9823 Leaves cordate angular 5-lobed acuminate toothed downy, Pedicels nearly as long as leaf
- 9824 Leaves cuneiform ovate 3-lobed toothed, Pedic. scarcely longer than petiole, Invol. 6-7-leaved
- 9825 Leaves cordate 5-lobed hairy: lobes acuminate subrepand, Inv. 6-7-leaved setaceous [undivided
 9826 Stem and petiol. prickly, Pedic. short unarmed very hairy, Lvs. 3-5-lobed blunt toothed; upper obl. lanc.
 9827 Stem prickly, Leaves palmate 5-lobed; upper 3-lobed: lobes blunt unequally toothed narrowed at base
 9828 Leaves toothed: lower ovate undivided; upper 3-lobed cuneate at base, Flowers subsess. Invol. 12-toothed
 9829 Leaves palmate 5-parted: lobes lanceolate acuminate subserrate at end, Pedicels jointed under the end
 9830 Stem hairy, Leaves on long stalks ovate about 3-lobed serrate membranous smoothish, Pedic. very short
 9831 Stem prickly, Leaves linear lanceolate acuminate usually lobed prickly-serrate, Inv. 10-leaved
 9832 Stem prickly, Leaves palmate 5-parted with 1 gland beneath, Fl. subsess. Cal. covered with glandul. hairs
 9833 Stem rough with recurved prickles, Stipules 3-cord. Leaves palmate 5-lobed, Pedicels length of petiole
 9834 Stem rough with recurved prickles, Stipules lanc. Leaves 5-7-parted with lanc. acuminate serrated lobes
 9835 Leaves smoothish palmate: lobes 5-7-acuminate coarsely toothed, Inv. hispid 4-6-leaved, Fls. declinate
 9836 Stem rough, Leaves rough roundish truncate at base; upper palmate-lobed: lobes dilat. crenate upwards
 9837 Stem petioles and calyx muricate, Leaves ovate at base trifid; lower 5-fid: lobes acuminate serrate
 9838 Leaves palmated: lobes lanceolate serrate, Petioles muricate, Fl. subsessile solitary, Inv. 7-fid
 9839 Leaves subpeltate cordate 7-angular acuminate serrate, Stem hispid, Pedicels longer than petiole
 9840 Leaves 3-5-lobed blunt crenate hairy, Pedic. twice as long as leaf. Inv. many-leaved, Cor. campanulate
 9841 Leaves cord. 5-lobed blunt toothed, Petioles longer than fl. Inv. 10-leaved decidu. Cal. bursting lengthwise
 9842 Stem strigose, Leaves 3-lobed angular cordate toothed downy, Peduncle longer than petiole
 9843 Leaves cord. angular sparingly toothed nearly smooth, Branches velvety, Caps. turbinate truncate hispid
 9844 Stem prickly, Leaves smoothish coarsely toothed without glands, Leaves of the invol. with a tooth inside
 9845 Leaves cordate unequally toothed beneath hoary: lower about 5-lobed; upper acum. Pedic. 1-fl. very short
 9846 Stem somew. prickly, Leaves smoothish toothed 5-angular acuminate, Fls. cernuous, Caps. 5-winged hairy
 9847 Leaves acuminate unequally toothed subvillous: lower undivided cordate; upper ovate-cordate 3-lobed
 9848 Leaves cordate oblong toothed bluish angular slightly 3-lobed smooth, Pedicels longer than petiole
 9849 Lvs. toothed: lower undivided; upper 5-fid: lobes oblong nearly equal blunt, Cal. inflat. membran. nerved
 9850 Lvs. toothed: lower undivided; upper 3-parted: lobes lanc. middle one very long, Cal. infl. membr. nerved
 9851 Leaves toothed: lower leaves 3-lobed; upper 5-parted blunt, Stem hispid
 9852 Leaves hairy 5-lobed: lobes linear oblong coarsely toothed, Cal. very villous longer than involucreum

and Miscellaneous Particulars.

from the seeds, make very agreeable tarts; and a decoction of them, sweetened and fermented, is commonly called sorrel cool drink. It is a small diluting liquor, much used in our sugar colonies, and reckoned very refreshing in those sultry climates. (*Braune's Jam.*) The bark of this species, and also of *H. cannabinus*, is full of strong fibres, which the inhabitants of the Malabar coast prepare and make into cordage; and it seems as if it might be wrought into fine strong thread of any size.

The leaves of *H. surattensis* are gratefully acid, and eaten in salads. The mucilage of the root of *H. manihot* is used in Japan for giving consistence to paper.

H. Abelmoschus, from the Arabic *Ab-el-Mosch*, grain or seed of musk, has large seeds of a very musky odor, and are frequently used as a substitute for animal musk in scenting powders and pomatums. In Arabia and Egypt they are ground and mixed with coffee, to render it more agreeable to the head and stomach.

H. esculentus, the Okro of the West Indies, is cultivated there, and in some parts of France, for the pods, which are gathered green and used in soups, or pickled like capers. They are full of a nutritive mucilage, and buttered and spiced make a very rich dish.

History, Use, Propagation, Culture.

1481. *Gossypium*. Pliny says, that in Upper Egypt, on the borders of Arabia, grew a shrub called *gossypion* or *zylon*. Its fruit enclosed a sort of soft white wool, of which the garments of the Egyptian priests were manufactured. Golius remarks, that *goz*, which expresses in Arabia, a silky substance, may be the root of the word. An important genus, as furnishing the down used in the cotton manufacture. This down is found lining the capsules which contain the seeds. There are several species cultivated for this purpose in different parts of the world. *G. herbaceum* is the only species cultivated in Europe, especially in the Levant, and in Malta, Sicily, and Naples: it is also grown in many parts of Asia.

G. hirsutum is occasionally grown in the West Indies; but *G. barbādense* is the prevailing species there. In the East Indies and China, *G. herbaceum* and arboreum are cultivated, and some other species, especially that which produces the nankeen-colored down, not yet introduced to Europe. An oil is obtained from the seeds of all the species, while those of the *G. herbaceum* are eaten in the Levant, and esteemed wholesome and nutritive.

In the Levant, the herbaceous cotton is sown in well prepared land in Mareh, in lines at three feet distance, and the patches of seeds two feet apart in the lines. The plants are thinned out to two or three in a place, and the earth is stirred by a one-horse plough, or by manual labor with hoes, and irrigated once or twice a week by directing the water along the furrows between the rows. The flowering season is generally over about the middle of September, and then the ends of the shoots are pinched off to determine the sap to the capsules. The capsules are collected by hand as they ripen, a tedious process, which lasts till the end of November. The cotton and the seeds are then separated by manual labor, and the former packed in bales or bags for sale. The seeds are bruised for oil or eaten, and a portion kept for sowing.

The Barbadoes cotton plant is sown in the West Indies in rows, about five feet asunder, at the end of September, or the beginning of October; at first but slightly covered, but after it is grown up, the root is well moulded. The soil should not be stiff nor shallow, as this plant has a tap-root. The ground is hoed frequently, and kept very clean about the young plants, until they rise to a moderate height. It grows from four to six feet high, and produces two crops annually; the first in eight months from the time of sowing the seed; the second, within four months after the first; and the produce of each plant is reckoned about one pound weight. The branches are pruned or trimmed after the first gathering; and if the growth is over luxuriant,

- 9843 Leaves 5-lobed 1-glandular beneath : lobes round mucronate, Invol. serrate, Stem smooth
 9854 Leaves 5-lobed palmate : lobes lanceolate blunt mucronate with 1 gland beneath, Invol. nearly entire
 9855 Lower leaves 5-lobed palmate ; upper 3-lobed with 1 gland beneath, Inv. tern. Cal. with 3 glands at base
 9856 Upper leaves undivided cordate ; lower 3-5-lobed with 1 gland beneath, Branches and petioles hirsute
 9857 Upper leaves 3-lobed ; lower 5-lobed with 1 gland beneath, Branches and petioles spotted with black
 9858 Upper leaves 3-lobed ; lower 5-lobed with 3 glands beneath, Stem smoothish

9859 Leaves ciliated elliptical entire rarely trifid

9860 Smoothish prostrate, Peduncles nearly as long as petiole

9861 Leaves very casious, Stem very short

9862 Lower leaves cordate acuminate 5-angled somewhat toothed blunt ; upper hastate acuminate

9863 Leaves all crenate : lower roundish cordate blunt 5-angled ; upper round hastate acuminate

9864 Lower leaves triangular hastate crenate ; upper ovate lanc. nearly entire, Ped. sol. axill. length of leaves

9865 Lower leaves cord. about 5-lobed hastate : upper hastate, Petals erect spatulate somewhat toothed at end

1. Capsules 5-12, 1-seeded, not bladderly.

* Flower-stalks not longer than the leafstalk. Leaves oblong or ovate

9866 Leaves linear entire much longer than the diameter of the flower, Racemes terminal

9867 Leaves linear-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axill. subsidiary

9868 Leaves ovate-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axillary solitary

9869 Leaves oblong ovate subcordate blunt tooth, Pedicels as long as petiole

9870 Leaves ovate-lanceolate acuminate toothed smooth, Branches round downy, Rac. very short bracteolate

9871 Leaves ovate-oblong doubly serrate, Pedunc. axillary very short about 4-flowered, Branches flattened

9872 Leaves rhomboid narrowed at base serrate-toothed forwards beneath downy, Pedicels shorter than petiole

9873 Lvs. ellipt. subov. blunt toothed at end, Pedic. axill. solitary very short, Stipules ciliated longer than flow.

9874 Lower lvs. roundish ov. ; upp. obl. toothed cun. and nearly ent. at base, Pedic. axill. many shorter than pet.

** Flower stalks elongated, distinctly jointed. Leaves oblong or ovate

9875 Lvs. ovate lanc. acumin. toothed hoary beneath, Branches compr. dotted, Pedic. thrice as long as petiole

9876 Leaves lanceolate toothed smooth, Pedic. axillary 1-fl. length of leaf

9877 Leaves oblong-lanceolate toothed cuneate at base hoary beneath, Pedic. axillary 1fl. shorter than leaf

9878 Leaves somewhat rhomboid retuse crenate towards the end hoary beneath, Pedic. longer than petiole

9879 Leaves ovate blunt serrated downy shining, Pedic. axillary solitary much longer than petiole

*** Flower-stalks elongated. Leaves cordate at base, toothed, not lobed.

9880 Leaves ovate cordate blunt toothed, Pedicels solitary 1-flowered longer than petiole

and Miscellaneous Particulars.

this should be done sooner. When great part of the pods are expanded, the wool is picked, and afterwards cleared from the seeds by a machine called a gin, composed of two or three smooth wooden rollers of about one inch diameter, ranged horizontally, close and parallel to each other, in a frame ; at each extremity they are toothed or channelled longitudinally, corresponding one with the other ; and the central roller being moved with a treadle or foot-lath, resembling that of a knife-grinder, makes the other two revolve in contrary directions. The cotton is laid in small quantities at a time upon these rollers, whilst they are in motion, and readily passing between them, drops into a sack placed underneath to receive it, leaving the seeds, which are too large to pass with it, behind. The cotton thus separated from the seeds, is afterwards hand-picked and cleansed thoroughly from any little particles of the pods or other substances which may be adhering to it. It is then stowed in large bags, where it is well trod down, that it may be close and compact ; and the better to answer this purpose, some water is every now and then sprinkled upon the outside of the bag ; the marketable weight of which is usually three hundred pounds. An acre may be expected to produce from two hundred and forty pounds to that quantity ; or two hundred and seventy pounds on an average. (*Long's Jan.* vol. iii. p. 686. *§c.* and *Broune.*)

1482. *Redoutea*. Named after P. J. Redouté, a celebrated French botanical draughtsman, still living. His drawings are inferior to those of the Bauers as accurate representations of nature ; but they are generally tastefully arranged and please the eye, notwithstanding a coldness of coloring which often injures their effect.

1483. *Palavia*. In honor of Don Antonio Palau y Verdera, second professor of botany at Madrid, and author of an excellent translation of the Species Plantarum of Linnæus in Spanish.

1484. *Cristaria*. From *crista*, a crest, in allusion to the crested form of the capsules. A pretty plant, not very easily preserved. It answers better in a peat border than a pot, and is increased by division or seed.

1485. *Anoda*. Named by Cavanilles, from α , privative, and *nodus*, an articulation ; because the peduncles do not possess the joints which are found in *Sida*, from which the plants of this genus have been extracted.

1486. *Periptera*. So named from the resemblance of the flowers in form to a shuttlecock, $\pi\epsilon\rho\iota\tau\epsilon\rho\alpha$.

1487. *Sida*. A name of Theophrastus, said by some to have been applied to a Malvaceous plant ; but

History, Use, Propagation, Culture,

Adanson is of opinion, that our *Nymphæa* was the *Sida* of Theophrastus. The species are free-flowerers of no

- 9881 Leaves roundish cordate hairy above serrated, Pedicels subsolitary longer than petiole
 9882 Leaves roundish cordate bluntnish crenate softly velvety, Pedic. solitary 1-fl. longer than petiole
 9883 Leaves cordate serrate attenuated at end downy on the edge of the petiole and the nerves beneath
 9884 Leaves ovate cordate toothed smcw. angular bluntnish downy, Pedic. sol. 1-fl. a little shorter than petiole
 9885 Leaves cord, somewhat angular blunt serrate cren. downy on each side, Pedic. shorter than petiole 1-5-fl
 9886 Leaves ovate cordate acuminate toothed, Pedunc. 3-4-flowered very short
 9887 Leaves cordate ovate acuminate serrate smooth on each side, Peduncles many-fl.
 9888 Leaves ovate cordate toothed acuminate downy, Pedunc. loosely panicle capillary

**** *Leaves palmate, divided into 3-5-7-9 lobes.*

- 9889 Leaves cordate toothed 3-lobed; middle lobe acute long, Pedicels solitary nearly equal to the leaf
 9890 Leaves subpeltate 7-lobed: lobes lanceolate acuminate uninnatifid toothed, Peduncles many-fl.
 9891 Leaves subpeltate 5-lobed: lobes ovate acute toothed undivided, Peduncles about 1-flowered
 9892 Leaves palmate 5-lobed smooth: lobes oblong acuminate toothed, Peduncles many-fl.
 9893 Leaves palmate 7-lobed rough: lobes lanceolate cut-toothed, Pedunc. many-fl. bracteate corymbose

2. *Capsules 15-40, 1-seeded, bladderly.*

- 9894 Leaves oblong cordate toothed somewhat lobed, Pedicels solitary shorter than petiole
 9895 Lvs. cord. ovate acute toothed downy on each side, Petioles and pedicels hairy, Stip. setaceous spreading
 9896 Lvs. cord. roundish acumin. tooth. velvety, Petioles and branches with spreading hairs, Pedic. very short

3. *Capsules 5-10, many-seeded, often bladderly.*

* *Capsules 5-8.*

- 9897 Leaves cord. lanc. acuminate entire downy beneath, Pedicels divided slender longer than petiole
 β Leaves narrow rough above
 γ Leaves more cordate smooth and a little rugose above
 9898 Leaves subpeltate cordate ovate acuminate entire downy, Pedic. 1-fl. shorter than petiole
 9899 Leaves roundish cordate acuminate entire downy beneath, Panicle terminal racemose
 9900 Leaves cordate shortly acuminate subcrenate slightly downy and green on each side, Panicle leafless
 9901 Lvs. deeply cord. with a narr. base acumin. serrul. hairy above hoary beneath, Stips. broad-eared acumin.
 9902 Leaves cordate acuminate serrulate velvety on each side, Pedicels solitary 1-flowered
 9903 Leaves hoary cordate acuminate acutely crenate, Pedicels 1-fl. longer than petiole
 9904 Leaves roundish cordate toothed angular acuminate, Pedicels 4-fl. umbelled axillary

** *Capsules 9 or more.*

- 9905 Leaves roundish cordate acuminate crenate downy, Pedicels sol. longer than petiole
 9906 Leaves cordate acuminate crenate velvety; upper sessile, Pedicels sol. longer than petiole
 9907 Leaves round cordate acuminate crenate downy, Pedicels longer than petiole
 9908 Leaves roundish cordate acuminate toothed downy beneath, Pedicels longer than petiole
 9909 Leaves roundish cordate unequally toothed soft, Pedunc. 2-3-fl. shorter than petiole, Capsules acuminate
 9910 Leaves roundish cordate with a broad sinus acuminate toothed soft, Pedicels shorter than petiole
 9911 Leaves cordate oblong undivided downy, Pedicels shorter than leaf
 9912 Leaves roundish cordate acuminate toothed downy, Peduncles shorter than petiole
 9913 Leaves cordate ovate oblong toothed velvety on each side, Pedicels longer than petiole
 9914 Leaves roundish cordate acuminate toothed downy, Peduncles longer than leaves
 9915 Leaves roundish cordate acuminate unequally repand toothed downy, Peduncles longer than petiole
 9916 Leaves roundish cordate acuminate toothed velvety, Peduncles 2-flowered shorter than petiole
 9917 Leaves ovate orbicular reniform toothed hoary beneath, Pedicels longer than petiole
 9918 Leaves cordate somewhat lobed soft, Stipules reflexed, Pedicels erect 3 times as long as petiole
 9919 Leaves ovate cordate toothed trifid cuspidate, Pedicels twice as long as petiole
 9920 Leaves roundish cordate acuminate toothed hoary on each side, Pedicels length of petiole
 9921 Leaves cordate subpeltate 3-5-lobed unequally toothed villous, Pedicels 1-flowered longer than petiole

4. *Uncertain species.*

* *Leaves linear, oblong, ovate, or lanceolate.*

- 9922 Leaves linear lanceolate toothed villous beneath, Pedicels axillary 1-fl.
 9923 Leaves lanceolate very long entire hairy, Racemes terminal very short
 9924 Leaves broad lanceolate obtuse crenate entire at base 3-nerved; younger downy beneath
 9925 Middle leaves oblong blunt acutely crenate in front; upper lanceolate acute serrated in front
 9926 Leaves oblong lanceolate serrated entire at base smooth, Pedunc. axillary solitary longer than petiole
 9927 Leaves ovate acuminate 5-nerved scarcely toothletted; beneath and branches downy, Stipules filiform

** *Leaves cordate, undivided.*

- 9928 Leaves subcordate sessile serrate subvillous, Flowers axillary clustered
 9929 Stem warted, Leaves cordate lanceolate acuminate acutely crenate downy
 9930 Leaves cordate acuminate crenate toothletted, and stems green and downy, Pedic. axillary 1-fl.
 9931 Leaves cordate acuminate cut serrate, Peduncles solitary longer than petiole
 9932 Leaves cordate acuminate repand rarely crenate hoary, Panicle contracted bracteate
 9933 Leaves cordate acute crenate rugose and stems yellow with down, Flowers subsessile aggregate
 9934 Leaves cordate acuminate hoary beneath, Pedicels axillary 1-flowered longer than petiole

and *Miscellaneous Particulars.*

great beauty. They are increased by seeds, which they produce freely, or by cuttings in sand under a hand-glass.

History, Use, Propagation, Culture,

1488. *Lagunea*. Named after Andreas Laguna, a Spanish naturalist, who published, in 1543, a work upon plants. It may be treated like other tender annuals.

1489. *Ruizia*. In honor of Don Hippolito Ruiz, author of *Quinologia*, Madrid, 1792, and other works, and in conjunction with Pávon, of the famous Flora Peruviana. A plant of easy culture, but of little merit.

1490. *Carolinea*. Named by the younger Linnaeus, in honor of the Princess Sophia Caroline, of Baden; a name which, he says, will always be cherished by botanists. A splendid family, which thrive in loam; and large cuttings, well clothed with leaves, root in sand under a hand-glass.

1491. *Adansonia*. In honor of Michel Adanson, a famous French botanist, born in 1727, and author of various works, of which his voyage into Senegal, and *Familles des Plantes*, are the most remarkable. He was an eccentric man, but certainly far more learned for his time than many of his modern detractors. Monkeys'-bread, or Boabab, is considered the largest or rather broadest tree in the world. Several measured by Adanson were from sixty-five to seventy-eight feet in circumference, but not extraordinarily high. The trunks were from twelve to fifteen feet high, before they divided into many horizontal branches, which touched the ground at their extremities; these were from forty-five to fifty-five feet long, and were so large, that each branch was equal to a monstrous tree; and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to the sight, they measured one hundred and ten feet long, without including those parts of the roots which remained covered. It yields a fruit which resembles a gourd, and which serves for vessels of various uses; the bark furnishes a coarse thread, which they form into ropes, and into a cloth, with which the natives cover their middle from the girdle to the knees; the small leaves supply them with food in a time of scarcity, while the large ones are used for covering their houses, or, by burning, for the manufacture of good soap. At Sierra Leone this tree does not grow larger than an orchard apple-tree.

The ligneous part of this tree appears to be of little or no use as timber. In our stoves it grows in rich soil in heat, and cuttings root in sand, covered and plunged.

1492. *Bombax*. From *BoyaBoz*, one of the Greek names of the cotton; the seeds of the plants now so called are enveloped in a cottony substance. B. pentandrum bears oval fruit larger than a swan's egg, having a thick woody cover, which, when ripe, opens in five parts, and is full of a short dark cotton, inclosing many roundish seeds as large as small peas.

B. Ceiba has a spiny trunk, and is one of the tallest trees of both Indies; but the wood is very light, and not much valued, except for canoes. Their trunks are so large as, when hollowed, to make very large ones. In the West Indies they frequently carry from fifteen to twenty hogheads of sugar, and from six to twelve hundred weight each. When sawn into boards, and then well saturated with lime-water, the wood bears exposure to the weather many years; it is also formed into laths for roofs, curing-pots, and hoghead-heading. When the tree decays, it becomes a nest for the Macaca beetle, the caterpillar of which, gutted and fried, is esteemed by many persons one of the greatest delicacies. The down which is enclosed in the seed-vessels is seldom used, except by the poorer inhabitants to stuff pillows or chairs; and it is generally thought unwholesome to lie upon.

9935 Leaves cordate 3-lobed: lobes oval oblong acuminate toothed with a very narrow base

9936 Leaves of the flowering branches palmatifid; of the sterile palmate

9937 Leaves digitate, Filaments numerous forked united at base into a tube

9938 Leaflets 5-8 ovate-lanceolate acuminate

9939 Leaflets 7 elliptical-oblong acute at each end, Calyx truncate, Petals erect

9940 Leaflets 5-7 obovate oblong, Calyx sinuated, Petals erect spreading at base

9941 A tree with a very thick trunk with a diameter of 25 feet

9942 Anthers rectilinear, Leaflets 7, Corolla large woolly outside, Trunk prickly

9943 Anthers anfractuose, Leaflets entire, Trunk generally prickly

9944 Stem prickly, Leaves palmate, Leaflets 5, Fruit turbinate concave at end

9945 Stem prickly, Leaves palmate, Leaflets 7 entire acuminate, Fruit oblong blunt

9946 Leaves ovate-oblong, Calyxes turbinate, Column of stamens shorter than petals

9947 Pedicels axillary half as short as leaves, Leaves oblong coriaceous smooth serrated

9948 Fls. subsessile, Leaves obov. lanc. downy beneath subserrate membranous, Petals and sepals silky outside

9949 Flowers large white, Filaments purple, Anthers blue

9950 Leaves ovate acute, Flowers solitary subsessile

9951 Leaves elliptical oblong subrugose twice as broad as long

9952 Leaves lanceolate flat three times as broad as long

and Miscellaneous Particulars.

1493. *Myrodia*. From $\mu\upsilon\sigma\sigma$, myrrh, and $\sigma\sigma\mu\eta$, smell. A tree which emits an odor similar to myrrh. (Linn.)

1494. *Gordonia*. In memory of James Gordon, an eminent nurseryman at Mile-End, near London, a correspondent of Linnaeus and other eminent botanists, and the introducer and successful cultivator of many new plants. *G. Lasianthus* (woolly flower, from $\lambda\alpha\sigma\iota\sigma$ and $\alpha\nu\theta\epsilon\sigma$), the loblobly-bay, is said to grow naturally in water or very moist situations. Miller, on that account, was unsuccessful in keeping the plant. Gordon and Lee, who, as Ellis relates, (*Corres. with Linnaeus*) were better cultivators than Miller, were probably more successful. Sweet says, the species are hardy enough to bear our winters in the open air; but the young shoots often get injured, and the summer is not long enough to flower them in perfection; it is therefore better to treat them as greenhouse plants. Peat soil suits them best, and a little loam mixed with it: they are readily propagated by layers, or ripened cuttings may be struck in sand under a hand-glass. (*Bot Cult.* 139.)

1495. *Stuartia*. So named by Linnæus, in honor of the Marquis of Bute, in memory of whom there also exists another genus named *Butea*, by Roxburgh. The species are handsome shrubs, grow in peat soil, and are most readily increased by layers.

1496. *Camellia*. In honor of George Joseph Kamel, (or *Camellus*) a Jesuit. His *Syllabus Stirpium in Insula Luzone Philippinarum*, forms the appendix to the third volume of Ray's *History*. This is a remarkable genus, as at once furnishing the domestic drug tea, in universal use, and flowering trees and shrubs as universally admired. The seeds of all the species are crushed for oil, which is used like that of hemp or poppy in cookery.

C. Bohea and *viridis* are the species which chiefly furnish the tea; but *C. Sasanqua* is also used, and sometimes the leaves of the other species are taken, though that practice is rather to be considered in the light of adulteration. The tea districts of China extend from the twenty-seventh to the thirty-first degree of north latitude. According to the missionaries, it thrives in the more northern provinces; and from Kämpfer, it appears to be cultivated in Japan as far north as latitude 45°. It seems, according to Dr. Abel's observation, to succeed best on the sides of mountains, where there can be but little accumulation of vegetable mould. The soils from which he collected the best specimens consisted chiefly of sandstone, schistus, or granite. The plants are raised from seeds sown where they are to remain. Three or more are dropped into a hole four or five inches deep; these come up without further trouble, and require little culture, except that of removing weeds, till the plants are three years old. The more careful stir the soil, and some manure it; but the latter practice is seldom adopted. The third year the leaves are gathered, at three successive gatherings, in February, April and June, and so on till the bushes become stunted or tardy in their growth, which generally happens in from six to ten years. They are then cut in to encourage the production of fresh roots.

The gathering of the leaves is performed with care and selection. The leaves are plucked off one by one: at the first gathering only the unexpanded and tender are taken; at the second those that are full grown; and at the third the coarsest. The first forms what is called in Europe imperial tea; but as to the other

History, Use, Propagation, Culture,

names by which tea is known, the Chinese know nothing; and the compounds and names are supposed to be made and given by the merchants at Canton, who, from the great number of varieties brought to them, have an ample opportunity of doing so. Formerly it was thought that green tea was gathered exclusively from *C. viridis*; but that is now doubtful: though it is certain there is what is called the green tea district, and the black tea district; and the varieties grown in the one district differ from those grown in the other. Dr. Abel was told by competent persons, that either of the two plants will afford the black or green tea of the shops, but that the broad thin-leaved plant (*C. viridis*) is preferred for making the green tea.

The tea leaves being gathered, are cured in houses which contain from five to ten or twenty small furnaces, about three feet high, each having at the top a large flat iron pan. There is also a long low table covered with mats, on which the leaves are laid, and rolled by workmen, who sit round it: the iron pan being heated to a certain degree by a little fire made in the furnace underneath, a few pounds of the fresh-gathered leaves are put upon the pan; the fresh and juicy leaves crack when they touch the pan, and it is the business of the operator to shift them as quick as possible with his bare hands, till they become too hot to be easily endured. At this instant he takes off the leaves with a kind of shovel resembling a fan, and pours them on the mats before the rollers, who, taking small quantities at a time, roll them in the palm of their hands in one direction, while others are fanning them, that they may cool the more speedily, and retain their curl the longer. This process is repeated two or three times, or oftener, before the tea is put into the stores, in order that all the moisture of the leaves may be thoroughly dissipated, and their curl more completely preserved. On every repetition the pan is less heated, and the operation performed more closely and cautiously. The tea is then separated into the different kinds, and deposited in the store for domestic use or exportation.

The different sorts of black and green arise not merely from soil, situation, or the age of the leaf; but after winnowing the tea, the leaves are taken up in succession as they fall; those nearest the machine being the heaviest, are the gunpowder tea; the light dust the worst, being chiefly used by the lower classes. That which is brought down to Canton then undergoes a second roasting, winnowing, packing, &c., and many hundred wemen are employed for these purposes.

As more select sorts of tea, the blossoms of the *C. sasanqua* appear to be collected; the buds also appear to be gathered in some cases. By far the strongest tea which Dr. Abel tasted in China, was that called *yutien*, used on occasions of ceremony. It scarcely colored the water, and on examination was found to consist of buds and half expanded leaves of the plant.

As substitutes for tea used by the Chinese, may be mentioned a species of moss common to the mountains of Shan-tung, an infusion of ferns of different sorts, and Dr. Abel thinks the leaves of the common camellia and oil camellia may be added. Du Halde observes, that all the plants called tea by the Chinese, are not to be considered as the true tea plant; and Kempter asserts, that in Japan a species of Camellia, as well as the *Olea fragrans*, is used to give it a high flavor.

The oil-bearing Camellia, *C. oleifera*, is cultivated for its seeds, from which an oil is expressed, in very general use in the domestic economy of China. It grows best in a red sandy soil, attaining the height of six or eight feet, and producing a profusion of white blossoms and seeds. These seeds, as well as those of any of the other species, are reduced to a coarse powder, which is stewed or boiled in bags, and then pressed, when the oil is yielded. (*Dr. Abel's Nar. 176.*)

The culture of the tea Camellias in our greenhouses is very simple. The plants are very hardy, and may be preserved in a pit without fire-heat; they grow in loamy soil, or loam and peat well drained, and increase freely by layers, or cuttings of the young wood taken off when it begins to ripen, planted in sand, and covered with a hand-glass in a cool frame or pit.

C. japonica, in the groves and gardens of Japan, is a lofty tree, much admired for its fine form, rich clothing of shining deep green foliage, and elegant red or white flowers, single or double. It is equally admired in

9953 Leaves ovate-oblong bluntly serrated, Flowers terminal subsolitary, Petals orbiculate

9954 Leaves ovate acuminate acutely serrate, Flowers terminal subsolitary

and Miscellaneous Particulars

China as in Japan, and much cultivated in both countries. It is of frequent occurrence in Chinese paintings, with *Hibiscus* and *Chrysanthemum*, two of their great favorites. There are several varieties of *C. japonica* in China, most of which have been imported here, and their number considerably increased, and daily increasing, from seedlings raised in this country. The double white, double striped, and double Waratah, (from the central petals resembling those of the Waratah plant of New Holland, *Telopea speciosissima*), are considered the grandest and most marked varieties, and are also free-growers and flowerers; the pæony-flowered and fringed white, are also standard beauties; but all are much admired.

The single red *Camellia* is propagated by cuttings, layers, and seeds, for stocks; and on these the other sorts are generally inarched, and sometimes budded or grafted. The cuttings are formed of ripened or ripening shoots, taken off in August, cut smoothly across at a joint or bud, two or three of the lower leaves only taken off, and the cuttings then planted and made firm with a small dibber, in pans of sand or loam, or, by some cultivators, sand and peat, or sand alone. The pans are kept in a pit or cold frame, without being covered with glass, but shaded during powerful sunshine; and in the following spring such as are struck will begin to push, when they are to be placed in a gentle heat. In September or October following, the rooted plants will be fit to pot off; and in the second or third spring they may be used as stocks. Such is the practice in the London nurseries. Henderson, of Woodhall, near Edinburgh, puts in *Camellia* cuttings at any time of the year, excepting when they are making young wood. He puts fifty cuttings in a pot of sand eight inches in diameter, sets them in a cool place in the back of a vinery or peach-house for a month or six weeks, and then plunges them to the brim in a hot-bed where is a little bottom heat. A speedy mode of obtaining stocks is by planting stools in a pit devoted to that purpose, and laying them in autumn; the following autumn most of the layers will have produced roots, when they may be taken off and potted, and used as stocks in the succeeding spring. Inarching or grafting is performed early in spring, when the plants begin to grow; the chief care requisite is so to place and fix the pot containing the stock, as that it may not be disturbed during the connection of the scion with the parent plant. The graft being clayed over, is then covered with moss to prevent its cracking. When independent grafting is resorted to, the mode called side grafting is often used; but the operation of tonguing is generally omitted, as weakening the stock and unnecessary, with a view to prevent the scion from being blown off. A few seeds are sometimes obtained from the single red and semi-double *Camellias*, and from the single Waratah; these require two years to come up, but make the best stocks of any.

Before they are grafted they are often allowed to come into flower, in case some new variety should be produced; but the best cultivators, as Messrs. Loddiges, Sweet, and Mackay, regularly cross-impregnate the blossoms in Knight's manner, by cutting out the stamens before the anthers are mature, and when the stigma is in a proper state, dusting it with the pollen of the species or variety intended as the male parent.

C. Sasanqua seeds most readily, and is mostly employed as the female parent for raising new varieties. The plants, if well treated, flower in four or five years, and if nothing new is produced they still make excellent stocks.

Some cultivators grow the *Camellias* chiefly in peat. Messrs. Loddiges, who have the most numerous collection of this genus, formerly used loam, with a little sand and peat; and they are grown in a similar soil in Hammersmith nursery. Of late, Messrs. Loddiges find light loam alone to answer as well or better. In the Comte de Vandres garden at Bayswater, rotten dung is mixed with loam and peat. Sweet recommends sandy loam and peat. Henderson of Woodhall is one of the most successful growers of the *Camellia* in Scotland: his compost is as follows: take one part of light-brown mould, one part of river-sand, one part of peat-earth, one half part rotten leaves; mix them all well together, and when the *Camellias* require shifting, put some broken coal-char in the bottom of the pots, and some dry moss or hypnum over it. (*Caled. Mem.* iii. 316.)

Camellias have the best effect, and are grown to most advantage in a house entirely devoted to them. Such

History, Use, Propagation, Culture,

a house should be rather lofty, as the plants never look so well as when six or eight feet high, trained in a conic form, and clothed with branches from the root upwards. The plants should be raised near to the glass by means of a stage, which should be so contrived, that, as they advance in height, it may be lowered in proportion: only the very best crown or patent glass should be used; because it is found from experience, that the least inequality of surface or thickness of material, so operates on the sun's rays, as to concentrate them, and burn or produce blotches on the leaves of the plants. Every cultivator must have observed that leathery shining leaves, like those of the orange, myrtle, &c. are more or less subject to this solar injury; but the leaves of the Camellia are particularly so. Some nurserymen recommend a roof which will not admit much light; others the use of green glass; of an opaque roof, with glass in front only; or of a house facing the north. Our opinion is, that a light house facing the south, or, better still, glass on all sides, is essential to the perfect growth of the plants; and that all solar accidents may be avoided, or at least rendered of no consequence, by using the best glass, and placing the plants as near it as possible.

To grow the Camellia to a high degree of perfection, considerable care is requisite. The roots are very apt to get matted in the pot, and, by the space they occupy, so to compress the ball of mould, as after a time to render it impervious to water. Hence frequent attention should be had, to see that the water poured on the pots moistens all the earth, and does not escape by the sides of the pot, moistening only the web of fibres. When the plants are in flower and in a growing state, they require to be liberally watered, and also a degree of heat somewhat greater than is usually given to greenhouse plants. If this heat is not given in November and December, the plants will not expand their blossoms freely; and if both water and heat are not regularly applied after the blossoming season, vigorous shoots and flower-buds will not be produced. To form handsome plants, they should be trained with single stems to rods, and pruned so as to make them throw out side branches from every part of the stem: to encourage these, the plants should not be set close together on the stage. In summer they may either be set out of doors on a stratum of scoria, or on a pavement, in a sheltered but open situation; or the glass roof may be taken off. The hardier sorts, as the double red, blush, peony-flowered, &c. answer very well when planted in the bed or border of a conservatory, provided the roof or entire superstructure can be removed in summer to admit the full influence of the weather. When this cannot be done, the Camellia and most other plants are better in portable utensils, which admit both of examining their roots, and placing them in the open air, or in a greater degree of heat at pleasure. The single and double red Camellia will endure the open air when trained against a south wall, and protected by mats in winter; and there can be no doubt that in time these and other species will be more perfectly inured to our climate.

Henderson of Woodhall gives the following account of his mode of treating the Camellia. "The best time for a regular shifting of the Camellias is the month of February or beginning of March. After shifting all those that require it, put them into the peach-house or vinery, when there is a little heat; if there be no peach-house, vinery, nor pinery, set them in the warmest part of the greenhouse. They will soon begin to make young wood. From the time they begin to make their young shoots, till they have finished their growth, give them plenty of water. They may be kept in the vinery or peach-house till they have formed their flower-buds at the extremity and sides of the young growths, when a few of them may be removed to a colder place, say behind the stage of the greenhouse; for the Camellias are fond of being shaded during

and Miscellaneous Particulars.

strong sunshine. In three or four weeks after, a few more of the Camellias may be brought from the vinery or peach-house, and put into a cooler situation. This may be repeated three or four times, which will make as many different successions of flowering. Those that are wanted to come into flower early, may remain in the warm house till they are beginning to flower, when they should be taken to a cold place, say the coldest place of the greenhouse; then give them plenty of light only, and they will open their flowers well, and stand long. A Camellia cannot stand heat when in flower, indeed they seldom open their flowers fine when in heat, and, at all events, the flowers soon fall off. Those that are kept all the summer in the vinery, will come into flower by the first or middle of October, and a pretty large plant, having perhaps fifty or a hundred flower-buds, will continue in flower till the month of January. Those plants that are removed early from the vinery, will now be in flower, to succeed those that were in flower in October, and have now done flowering. These last should be immediately taken into the heat. They will make their young wood early, and they may remain in heat till they come into flower, which will perhaps be a month earlier next year. By attending to shifting the Camellia plants from the warm-house to the cold, a regular succession of flowers may thus be had from the first of October to the middle of July. I have even had them all the summer, but the flowers are best in the winter. Those produced in summer are far from being so fine, and do not stand half the time of those that come into flower in November, December, January, February, March and April. Camellias delight to be kept damp all the summer months, and a little shaded from the strong sun. Give them plenty of water while they are making their young shoots; they may also get a gentle sprinkling over the leaves once every week during the summer season, except when they are in flower. Camellias will stand a great deal of cold without being much injured, but they will not form many flower-buds without some artificial heat." (*Calcd. Mem. iii. 316.*)

1497. *Barringtonia*. In memory of the Hon. Daines Barrington, F. R. S., an active Fellow of the Society of Antiquaries, and author of several papers in their Transactions. A lofty tree, the handsomest in the equinoctial flora. It has thick shady bunches of long wedge-shaped coriaceous leaves, and large handsome purple and white flowers, which open at night, and fall at sunrise. They are succeeded by a reddish brown drupe, the seed of which mixed with the bait, inebriates fish in the same manner as *Cocculus indicus*. It grows on the sea shore and at the mouths of rivers, and is cultivated in the governor's garden at St. Helena. It is very rare in our stoves, though not difficult to manage. Sweet says, "a mixture of two-thirds loam and one-third peat, is a good soil for it. Cuttings taken off at a joint, when the wood is ripe, and put in a pot of sand under a hand-glass in moist heat, will strike root readily: none of the leaves should be taken off or shortened." (*Bot. Cult. 21.*)

1498. *Gustavia*. In memory of Gustavus III, king of Sweden, who presented a great collection of Indian plants to the elder Linnæus. A tree remarkable for its large white flowers, larger than those of the water-lily, but with a large naked bald receptacle between the corolla and the style. The flowers smell sweet, but the wood is extremely fetid. In Surinam it is used for hoops. In the stove it grows in sand and loam, and roots in sand under a hand-glass.

1499. *Careya*. Named after Dr. William Carey, the editor of Roxburgh's *Flora Indica*, and an English physician and botanist residing at Serampore. Beautiful Indian plants, with long red stamens.

CLASS XVII. — DIADELPHIA. STAMENS united in two separate parcels.

This class essentially requires, as its name implies, that the stamens should be united in two separate parcels. These may either be equal, each bearing more anthers than one, as in *Smithia*, *Eschynomene*, *Fumaria*, and others; or unequal, one parcel being reduced to a single stamen, and the other bearing several anthers, as in the greater number of genera included in the class. But besides the plants whose stamens are thus disposed, it has been the practice to admit other genera having papilionaceous flowers, but with their stamens united in one parcel only, such as *Platylobium*, *Bossia*, *Arachis*, and others. The propriety of this measure is extremely questionable. It has been before remarked in this work, that the value of an artificial arrangement of objects depends wholly upon the precision with which they are referred to those heads or divisions with the characters of which they agree. If this does not obtain, an artificial system ceases to be useful, and its only merit, that of facilitating the discovery of the name of a given object, cannot be said to exist. This principle is particularly applicable to the genera just mentioned. Their artificial character refers them to *Monadelphia*, but they are retained in *Diadelphia*, to which their artificial character does *not* refer them, because, as is alleged, of the natural relation which they bear to other genera in *Diadelphia*. If this reasoning, which is only applicable to an arrangement of plants according to their natural affinities, and which has no allowable reference to an artificial system, were to be admitted, it would follow that *Tamarindus*, actually included in *Monadelphia* by the most eminent Linnean botanists, and all the papilionaceous genera stationed in *Decandria*, should be referred hither also. With such objections attaching to the contrivance of this class, it is not easy to understand in what way it "does honor to the comprehensive powers of Linnæus's mind," as has been somewhere remarked by one of his most distinguished panegyrists.

The structure of the corolla of plants of this class is, for the most part, with the exception of *Fumaria* and its allies, what has been popularly termed papilionaceous; that is to say, it consists of five petals of different forms and direction, of which the upper, called the *vexillum* or standard, is larger than the rest, upon which it is incumbent; the two lateral, called the *alæ* or wings, are oblong, distinct, and parallel with the ovarium; and the two lower, called the *carina* or keel, are enclosed within the *alæ*, are also parallel with the ovarium, and cohere by their lower edges, so as together to form, as it were, one boat-shaped petal. To this common form of corolla there are, however, some exceptions, as in *Amorpha*, where the *alæ* and *carina* are absent, and in *Erythrina*, where the *alæ* are in some cases almost obliterated. In *Trifolium* the petals all cohere by their claws into an undivided tube.

With regard to the importance of *Diadelphous* plants as applicable to the purposes of mankind, they may be said to hold the very highest rank. All the numerous varieties of pulse, whether eaten by men or cattle, peas, beans, haricots, caravances, lentils, and others, are all produced by *Diadelphous* plants. The best of our artificial grasses, such as clover, nonesuch, cow-grass, lucerne, saintfoin, serradilla, &c. &c., belong to various *Diadelphous* genera. A large proportion of the class also consists of useful and ornamental trees and herbs, which will be noticed in their respective places.

Order 1. PENTANDRIA.  Stamens 5.

1500. *Monniera*. Cal. 5-parted, with the upper segment long. Cor. ringent. Stamens 2: upper with two anthers; lower with three. Caps. 5, 1-seeded.

1501. *Petalostemum*. Petals 4, between the stamens, all united into a slit tube. Vexillum none, but in its place a fifth petal. Legume surrounded by calyx, 1-seeded.

Order 2. HEXANDRIA.  Stamens 6.

1502. *Corydalis*. Pet. 4, 1-spurred at base. Pod 2-valved, compressed, many-seeded.

1503. *Cysticapos*. Petals 4, one gibbous at base. Capsule bladdery, many-seeded; the placentas connected by a membranous net work.

1504. *Diclytra*. Petals 4, two outer equally spurred or gibbous at base. Pod 2-valved, many-seeded.

1505. *Adumia*. Petals 4, united in a fungous monopetalous corolla, persistent, and with two protuberances at base. Pod 2-valved, many-seeded.

1506. *Sarcocapnos*. Petals 4, 1-spurred at base. Caps. 2-valved, not opening, 2-seeded. Valves 3-nerved, flattish.

1507. *Fumaria*. One petal gibbous or spurred at base. Cariopsis indehiscent, 1-seeded, not pointed with a style.

Order 3. OCTANDRIA.  Stamens 8.

1508. *Polygala*. Cal. of 5 leaves, two of them wing-shaped and colored. Caps. compressed, obcordate.

1509. *Muraltia*. Sepals 5, glumaceous, nearly equal. Petals 3, united, the middle bifid with blunt lobes. Ovary with 4 horns or tubercles, 2-valved, 2-celled.

1510. *Mundia*. Sepals 5, glumaceous, persistent, the two inner wing-shaped. Petals 3, scarcely united at base; the middle one cucullate, beardless. Stamens 7-8, somewhat villous, monadelphous at base, with a tube divided in front.

1511. *Securidaca*. Sepals 5, the two inner petaloid. Petals 5, united at base: three united into a 3-lobed keel; two oblong. Stamens 8, diadelphous.

Order 4. DECANDRIA.  Stamens 10.

1512. *Nissolia*. Cal. 5-toothed. Legume 1-seeded, ending in a ligulate wing.

1513. *Dalbergia*. Cal. absolutely 5-toothed. Legume leafy, flat, not opening. Seeds solitary or twin.

1514. *Pongamia*. Cal. colored, cyathiform, obliquely truncate, 5-toothed. Petals clawed. Vexillum spreading. *Alæ* and *carina* conniving. Legume substipitate, compressed, flat, rostrate, valvless, 1-2-seeded. Anthers ciliate, glandular at end.

1515. *Pterocarpus*. Cal. 5-toothed. Legume falcate, foliaceous, varicose, indehiscent, encompassed by a wing. Seeds a few, solitary.

1516. *Ecastaphyllum*. Cal. campanulate, sub-bilabiate: upper segment emarginate; lower trifid. Filaments equally diadelphous. Legume roundish, valvless, 1-seeded.

1517. *Geoffroya*. Cal. 5-fid. Drupe ovate. Kernel compressed.
 1518. *Dipteris*. Segm. of cal. 2, wing-shaped. Legume 1-celled, 1-seeded, coriaceous, 2-valved.
 1519. *Parivoa*. Cal. 3-4-fid. Vexillum ample. Alæ and carina O. Legume compressed, 1-seeded.
 1520. *Amerinum*. Cal. sub-bilabiate. Legume compressed, leafy, 2-valved, dehiscent. Some seeds, solitary.
 1521. *Erythrina*. Cal. bilabiate, $\frac{1}{2}$. Vexillum very long, lanceolate. Legume torulose.
 1522. *Butea*. Cal. sub-bilabiate. Vexillum very long, lanceolate. Legume compressed, membranous, one-seeded at end.
 1523. *Viborgia*. Cal. 5-toothed, with rounded recesses. Legume turgid, sulcate, winged.
 1524. *Piscidia*. Stigma acute. Legume with four wings.
 1525. *Platylobium*. Cal. bracteate, 2-lipped, upper lip round, large, bifid. Stam. all united. Legume stalked, compressed, winged at back, many-seeded.
 1526. *Borbonia*. Stigma emarginate. Calyx acuminate, spiny. Legume mucronate.
 1527. *Rafnia*. Cal. ringent : upper lip bifid ; lower spreading trifold ; the middle tooth narrowest. Legume lanceolate, compressed.
 1528. *Aspalathus*. Cal. 5-fid, upper segment largest. Legume ovate, blunt, about 2-seeded.
 1529. *Sarcophyllum*. Cal. campanulate, 5-parted, regular. Legume acinaciform, acute.
 1530. *Crotalaria*. Legume turgid, inflated, stalked. Filaments united with a dorsal fissure.
 1531. *Bossiaea*. Cal. 2-lipped, upper lip largest, half bifid, obtuse. Stam. all united. Legume plano-compressed, stalked, many-seeded, thickened at each edge. Seeds strophiolate.
 1532. *Scottia*. Cal. imbricated with bractes, 5-toothed, with nearly equal teeth. Vexillum complicate, shorter than alæ, which are as long as carina. Stam. all united. Legume stalked, compressed, thickened at each edge. Seeds 3-4, strophiolate.
 1533. *Templetonia*. Cal. bracteate, with 5 nearly equal teeth. Carina oblong. Stamens all united, with uniform anthers. Legume pedicellate, plano-compressed, many-seeded. Seeds strophiolate.
 1534. *Goodia*. Cal. with 2 nearly equal lips, upper half bifid, acute. Vexillum unfurled, large. Stamens all united. Legume stalked, compressed, about 2-seeded. Seeds strophiolate.
 1535. *Loddigesia*. Vexillum much shorter than alæ or carina.
 1536. *Hovea*. Cal. bilabiate, the upper lip half bifid, retuse. Stamens all united. Carina blunt. Legume sessile, roundish, ventricose, 2-seeded. Seeds strophiolate.
 1537. *Spartium*. Stigma longitudinal, villous above. Filaments adhering to ovary. Cal. lengthened at the base.
 1538. *Genista*. Cal. 2-lipped : upper one with 2 ; lower one with 3 teeth. Vexillum bent backwards from the rest of the flower.
 1539. *Lebeckia*. Cal. 5-parted, with acute segments and rounded recesses. Legume cylindrical, many-seeded.
 1540. *Ulex*. Cal. of 2 leaves, with a small scale at the base on each side. Legume turgid, scarcely longer than the calyx.
 1541. *Ononis*. Cal. 5-cleft, its divisions linear. Vexillum striated. Legume turgid, sessile. Filaments in one undivided set.
 1542. *Anthyllis*. Cal. inflated, 5-toothed, inclosing the small roundish 1-3-seeded legume.
 1543. *Arachis*. Cal. 2-lipped. Cor. resupinate. Filaments united. Legume gibbous, torulose, veiny, coriaceous.
 1544. *Lupinus*. Cal. 2-lipped. Anthers, 5 oblong, 5 round. Legume coriaceous, torulose, compressed.
 1545. *Amorpha*. Cal. campanulate, 5-fid. Vexillum ovate, concave. Alæ O. Carina O. Legume 2-seeded, falcate.
 1546. *Abrus*. Cal. obsolete 4-lobed, the upper broader. Filaments 9, united at base, opening at back. Stigma blunt. Seed spirally.
 1547. *Phaseolus*. Carina with the stamens and style twisted spirally.
 1548. *Teramnus*. Carina very small, inclosed in the calyx. Five alternate stamens fertile. Stigma sessile, capitate.
 1549. *Carpopogon*. Vexillum not callous. Flowers capitate. Pods short, broad, 1-seeded.
 1550. *Dolichos*. Vexillum with two calli at base, parallel, oblong, compressing the wings beneath.
 1551. *Stizolobium*. Cal. campanulate, 2-lipped : upper lip entire, erect ; lower trifold, with the middle segment longest. Vexillum ascending. Alæ dolabriform, lunate at base, the length of carina. Anthers 2-formed, hairy. Legume torose, 1-celled, with partitions. Seeds round, with a crested hilum.
 1552. *Glycine*. Cal. 2-lipped. Carina pushing back the vexillum with its end.
 1553. *Keneedia*. Cal. 2-lipped : upper emarginate ; lower trifold, equal. Vexillum reflexed, recurved. Alæ pressed to the carina. Carina remote. Stigma blunt. Legume oblong.
 1554. *Cyllista*. Cal. 4-fid, larger than cor. : upper segment bifid at end, or emarginate ; lower very large. Cor. persistent. Legume about 2-seeded.
 1555. *Galactia*. Cal. 4-toothed, with 2 bractes. Petals all oblong ; the vexillum broadest and incumbent upon the others. Stigma obtuse. Legume round. Seeds roundish.
 1556. *Clitoria*. Cor. resupinate, with a large spreading vexillum overshadowing the wings.
 1557. *Orobus*. Style linear, cylindrical, downy above. Cal. obtuse at the base, its upper segments deeper and shorter.
 1558. *Lathyrus*. Style plane, downy above, broader upwards. Cal. with its two upper segments shortest.
 1559. *Ochrus*. Cal. with the two upper segments conniving. Vexillum with two teeth at the sides. Style flat, villous above. Legume having a membranous wing upon the seed-bearing suture.
 1560. *Pisum*. Style triangular, keeled above, downy. Two upper segments of calyx shorter than the rest.
 1561. *Vicia*. Style bearded beneath the stigma.
 1562. *E. vum*. Stigma capitate, hairy all over on the outside.
 1563. *Ervilia*. Like *Vicia*, but the ovary is plaited in folds.
 1564. *Cicer*. Cal. 5-parted, length of cor ; four upper segments incumbent on the vexillum. Legume turgid, 2-seeded.
 1565. *Liparia*. Cal. 5-fid, with the lower segment long. Alæ 2-lobed below. Three teeth of the larger stamens shorter than the rest. Legume ovate.
 1566. *Cytisus*. Cal. 2-labiate, 2-3. Legume attenuated at base.
 1567. *Mullera*. Cal. 4-toothed. Loment moniliform, with fleshy 1-seeded globules cohering by a thread.
 1568. *Robinia*. Cal. 4-fid ; upper segment 2-parted. Legume gibbous, long. Leaves unequally pinnate.
 1569. *Caragana*. Cal. subcampanulate. Stigma smooth, truncate. Legume cylindrical. Leaves abruptly pinnate.
 1570. *Swainsonia*. Cal. 5-toothed. Vexillum unfurled, larger than the blunt carina. Stigma terminal. Style bearded lengthwise in front, not bearded at back. Legume turgid, not bladderly.
 1571. *Sutherlandia*. Cal. 5-toothed. Vexillum without callosities, folded back at edge, shorter than oblong carina. Stigma terminal. Style with a longitudinal beard behind, a transverse one before. Legume inflated, scariose.
 1572. *Lessertia*. Cal. half 5-fid. Vexillum unfurled. Carina blunt. Stigma capitate. Style bearded transversely at end in front, beardless behind. Legume scariose without valves (compressed or inflated).
 1573. *Colutea*. Cal. 5-toothed. Vexillum with two callosities, unfurled, larger than the blunt carina. Stigma lateral under the hooked end of the style, which is longitudinally bearded behind. Legume inflated, scarious.
 1574. *Glycyrrhiza*. Cal. bilabiate, 3-1. Legume ovate, compressed.
 1575. *Liquoritia*. Cal. tubular, equal, 5-parted. Vexillum erect, reflexed at sides. Alæ spreading. Carina bifid. Legume oblong, smooth, 3-4-seeded.

1576. *Coronilla*. Cal. 2-lipped, 2-3. Upper teeth connate. Vexillum scarcely longer than alæ. Loment round, jointed, straight.
 1577. *Hippocrepis*. Loment compressed, with many notches on one edge, curved.
 1578. *Orrhthopus*. Legume jointed, curved, cylindrical.
 1579. *Scorpiurus*. Loment intercepted by divisions, revolute, round.
 1580. *Smithia*. Stamens divided into two equal bundles. Legume jointed, plaited, included in the bifid calyx.
 1581. *Sesbania*. Cal. 5-toothed. Legume long (round or linear), 2-valved, many-celled, with transverse partitions.
 1582. *Æschynomene*. Stamens divided into two equal bundles. Legume jointed, straight, exserted. Cal. 2-parted, with toothed lips.
 1583. *Stylosanthes*. Cal. tubular, very long, bearing the corolla. Ovarium below the corolla. Loment one or two-jointed, hooked.
 1584. *Haltia*. Cal. 5-parted, regular. Legume 1-seeded, 2-valved.
 1585. *Lespedeza*. Cal. 5-parted, nearly equal. Carina transversely blunt. Legume lenticular, unarmed, 1-seeded.
 1586. *Flemingia*. Cal. 5-fid. Vexillum striated. Legume sessile, oval, turgid, 2-valved, 2-seeded. Seeds spherical.
 1587. *Zornia*. Cal. campanulate, 2-lipped. Cor. inferior. Vexillum cordate, revolute. Anthers alternately oblong and round. Legume jointed, hispid.
 1588. *Hedysarum*. Cal. 5-fid. Carina transversely blunt. Loment with 1-seeded compressed joints.
 1589. *Indigofera*. Cal. spreading. Carina with a spreading subulate spur on each side.
 1590. *Tephrosia*. Cal. with subulate nearly equal teeth. Stamens monadelphous. Legume compressed, subcoriaceous.

History, Use, Propagation, Culture,

1500. *Monnieria*. In memory of Monsieur Le Monnier, professor of botany in the garden of plants at Paris. He published, in 1745, "Observations sur les Plantes dangereuses des Pyrénées et du Roussillon."
 1501. *Petalostemum*. From *πταλον*, a petal, and *στημον*, a stamen; in allusion to the union of these two parts into a tube.
 1502. *Corydalis*. *Κορυδαλις* is an ancient Greek name for the Fumitory, from which genus this has been separated. Pretty little plants, well adapted for rock-work or growing on pots. They are easily cultivated and increased.

1591. *Galega*. Cal. with subulate nearly equal teeth. Legume with oblique streaks between the seeds.
 1592. *Phaca*. Cal. 5-toothed, two upper teeth most distant. Legume half 2-celled, inflated.
 1593. *Oxytropis*. Carina ending in a mucro. Legume 2-celled or half-2-celled, with the upper suture turned inwards.
 1594. *Astragalus*. Legume 2-celled, more or less gibbous, with the lower suture turned inwards. Carina blunt.
 1595. *Biserrula*. Legume 2-celled, flat, with a contrary dissepiment serrated on each edge.
 1596. *Dalea*. Alæ and carina adhering to the column of stamens. Stamens 5-10, united, without a separate filament. Legume 1-seeded.
 1597. *Psoralea*. Cal. the length of pod. Stamens diadelphous. Legume 1-seeded, subrostrate, valvless.
 1598. *Melilotus*. Cal. tubular, 5-toothed. Carina simple, shorter than alæ and vexillum. Legume longer than calyx, rugose.
 1599. *Lupinaster*. Cal. campanulate, 5-toothed, with setaceous teeth. Stigma uncinatè. Legume not knotted, round, many-seeded.
 1600. *Trifolium*. Legume (in general) shorter than the cal., 1 or many-seeded, indehiscent, deciduous. Flowers more or less capitate.
 1601. *Lotus*. Legume cylindrical, straight. Alæ of the cor. cohering by their upper edge. Filaments dilated upwards.
 1602. *Tetragonolobus*. The characters of *Lotus*, but the pod square with 4 wings.
 1603. *Trigonella*. Vexillum and alæ nearly equal, spreading, in the form of a tripetalous corolla.
 1604. *Dorycnium*. Cal. 5-toothed, 2-lipped. Filaments subulate. Stigma capitate. Legume turgid, 1 or 2-seeded.
 1605. *Medicago*. Legume falcate or spirally twisted, compressed, membranaceous.
 1606. *Hymenocarpus*. Like *Medicago*, but the legumes reniform, winged at edge.

PENTANDRIA.

9959 Stem dichotomous, Leaves ternate, Spike bifid

- 9960 Spike cylindrical stalked, Bractes longer than flower, Leaves in 3 pairs lanceolate
 9961 Spike cylindrical stalked, Bractes subulate length of calyx, Leaflets lanceolate
 9962 Spike cylindrical stalked, Bractes nearly as long as calyx, Leaves in 2 pairs linear
 9963 Heads with a scaly involucre, Calyxes plumose, Leaflets linear pointless

 9978 Spurs 2 short blunt, Scape naked simple few-fl. Leaves multifid

9979 The only species. — *Fumaria fungosa*, Hort.

and Miscellaneous Particulars.

1503. *Cysticapnos*. From *κυστις*, a bladder, and *καπνος*, fumitory. A genus divided from *Fumaria* on account of its bladder fruit.

1504. *Diclytra*. So named by Borchhausen, a German botanist, on account of the two spurs or pouches of the flower. Handsome herbaceous plants, frequently cultivated among choice collections of rare flowers. Their roots are impatient of cold and wet, and should therefore be planted in a warm dry border well exposed to the southern sun.

1505. *Adumia*. A name unexplained by its author, M. Rafinesque Schmalz. A tall climbing annual plant of little beauty in its flowers, but covering a large space in the course of a summer.

History, Use, Propagation, Culture.

1506. *Sarcocapnos*. From σαρκος, flesh, and καπνος, fumitory. So named by Decandolle on account of the fleshy substance of the leaves of the plants contrasted with those of other allied genera.

1507. *Fumaria*. From *fumus*, smoke; in allusion to the disagreeable smell of the plant. The French, with the same meaning, call it *Fumeterre*, whence our English word *Fumitory*. The species are handsome weeds. *F. officinalis* was formerly considered a valuable antiscorbutic, and much used in obstructions of the viscera.

1508. *Polygala*. From πολυ, much, and γαλα, milk. Dioscorides says, that the plant was believed to excite the lactal secretions in women. The species are handsome free-flowering plants. The greenhouse kinds are highly ornamental, and some of them continue in bloom all the winter: *P. stipulacea* all the year. They grow freely in sandy loam, or loam and peat; and are readily increased by cuttings of the young wood, in sand, under a bell-glass.

P. vulgaris was thought to possess something of the properties of *P. Senega*. Sir J. E. Smith found that an infusion of the herb taken in a morning, fasting, about a quarter of a pint daily, promoted expectoration, and was good in a catarrhus cough. He tried it at Montpellier by the advice of Professor Gouan with success, and has since known it useful. Foreign writers celebrate it as a grateful and nutritious food for cattle. According to the Swedish experiments, kine, sheep, and goats eat it, but swine refuse it.

P. Senega has a woolly, branched, contorted root, about half an inch thick, and covered with ash-colored

9980 Leaves with a branched stalk triternate, Segments ovate angular

9981 Pods round retuse, Pedicels of fruit erect twice as long as bractes, Racemes lax

9982 Pods globose, Pedicels of fruit recurved longer than bract, Racemes oblong

9983 Pods globose with a little point, Pedicels of fruit erect longer than bract

9984 Pods compressed oval smooth, Raceme spiked, Pedicels much shorter than bract

OCTANDRIA.

9985 Flowers crested spiked, Stem herbaceous branched erect, Leaves alternate subulate

9986 Fl. crested racem. Wings of cal. 3-nerved blunt longer than cor. Stems erect, Lvs. blunt: rad. obovate

9987 Fl. crested racem. Wings of cal. 3-nerved blunt length of cor. Stems procumb. Leaves linear-lanc. acute

9988 Fl. crested. Racem. Wings of cal. many-nerv. blunt mucron. short. than cor. Stems erect, Lvs. lin. lanc. acute

9989 Fl. crested term. in threes, Stems quite simple erect naked beneath, Leaves ovate

9990 Fl. crested, Racem. term. Wings of cal. cuspidate many-nerv. Stem erect shrubby, Lvs. lin. lanc. smooth

9991 Fl. crest. Appendage double, Racemes without bractes subterm. many-fl. Lvs. altern. obl. cuneate smooth

9992 Fl. crest. Racem. term. few-fl. Wings of cal. ovate acute many-nerved, Stem shrubby, Lvs. linear subulate

9993 Fl. crested somewhat umbelled, Leaves ovate fleshy

9994 Fl. crested racemose, Bractes 3-leaved, Leaves obovate oblong

9995 Fl. crested, Racemes few-fl. term. Keel falcate, Stem shrubby, Leaves obl. bluntish smooth

9996 Fl. crested, Stem shrubby, Leaves opposite ovate acute

9997 Fl. crested, Racem. terminal, Stem shrubby, Branches downy, Leaves cordate mucronate opposite

9998 Fl. crested whorled, Leaves cordate downy beneath

9999 Fl. beardless, Pedunc. terminal and axill. about 2-fl. Stem shrubby, Leaves obl. lanceolate acute

10000 Fl. crested, Branches downy, Leaves decussating coriaceous glaucous ovate downy beneath

10001 Fl. crest. Branches vill. Lvs. scattered lingulate smooth, Outer lobe of the petals of vexillum very short

10002 Fl. beardless lateral, Leaves solitary 3-cornered mucronate

10003 Fl. beardless axillary sessile, Leaves linear mucronate

10004 Fl. crested, Racemes axillary on long stalks, Stems erect branched upwards, Leaves linear acute

10005 Fl. beardless, Spike terminal filiform, Stem erect herbaceous quite simple, Leaves oblong lanceolate

10006 Fl. beardless, Racem. cylindr. capitate terminal, Stem simple, Leaves obl. lanc. acute

10007 Fl. beardless globose capitate terminal, Stem erect simple, Leaves linear bluntish

10008 Leaves ovate-lanceolate imbricated, Stem branched decumbent

10009 Flowers beardless, Pedunc. squarrose, Stem branched erect

10010 Flowers beardless distant, Leaves linear whorled, Stem branched

10011 Flowers beardless in headed spikes, Leaves in fours linear-lanceolate, Stem somewhat branched erect

10012 Fl. beardless lateral, Stem arborescent, Leaves 3-cornered mucronate spiny

10013 Fl. beardless, Peduncles solitary axillary, Leaves fascicled ovate mucronate ciliated at edge

10014 Fl. beardless lateral, Leaves in threes linear acute

10015 Fl. beardless sessile, Leaves round mucronate very close

10016 Leaves obovate or oval, Branches short spiny

10017 Branches a little downy, Leaves oval-obl. acute, Racemes lateral

and Miscellaneous Particulars.

bark. It is inodorous; the taste is at first sweetish and nauseous, but after being chewed for less than a minute, becomes pungent and hot, producing a very peculiar tingling sensation in the fauces. Medically, it is considered stimulating, expectorant, and diuretic, and in large doses emetic and cathartic: it increases absorption, and consequently augments the natural excretions, particularly that of urine, and frequently occasions a copious pytalism. It was introduced to the notice of physicians by Dr. Tennant, who, having discovered that it was the antidote employed by the Senegare Indians against the bite of the rattle-snake, and reasoning from the effects of the poison, and of the remedy in removing these, was induced to try it in pneumonic affections, and found it useful. On account of its stimulant properties, however, it can be employed in these complaints only after the resolution of the inflammation by bleeding and evacuations. It proves more directly useful in humoral asthma, chronic catarrh, and some kinds of dropsy. (*Thomson's London Dispensatory*, p. 450.)

1509. *Muraltia*. Named after John Von Muralt, a Swiss botanist, who lived in the commencement of the eighteenth century. Handsome bushes, of easy cultivation in a greenhouse, or even in a good pit.

1510. *Mundia*. So named, in allusion, we presume, to the neatness (*munditia*) of its appearance. No explanation of the word is given by its author. Pretty little Cape bushes, easily cultivated in a good pit.

1511. *Securidaca*. From *securis*, a hatchet, in allusion to the form of the end of the pod. It grows freely in light loam, or loam and peat; and cuttings root in sand covered with a glass.

History, Use, Propagation, Culture,

1512. *Nissolia*. In honor of William Nissolle, an industrious French botanist. He was a member of the academy of Montpellier, and author of some papers in its Transactions. He was born in 1647, and died in 1735. Cuttings root in sand, but not very readily.

1513. *Dalbergia*. Nicholas Dalberg was surgeon in ordinary to the king of Sweden, and published in 1755 a work upon the Metamorphoses of Plants. Another Dalberg, a pupil of Linnæus, travelled in Dutch Guiana, whence he communicated specimens to his preceptor. Ripened cuttings root in sand.

1514. *Pongamia*. An alteration of the vernacular name of the plant in India.

1515. *Pterocarpus*. From πτερον, a wing, and καρπος, fruit. Its pods have membranous wings. *P. santalinus* is a lofty tree, with alternate branches, and a bark resembling that of the common alder; it yields the true official red saunders wood, first detected by Koenig in India. It is brought home in billets, which are very heavy, and sink in water. Red saunders wood has an aromatic odor, and is nearly insipid. It is extremely hard, of a fine grain, takes a high polish, and a bright garnet red color, which deepens on exposure to the air. It yields its coloring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. (*Thomson's London Dispensatory*, 458.)

The sap yields one sort of *Sanguis draconis*. Many of the red Indian woods trasude a blood red juice through the clefts of the bark, which hardens into a red resin, not differing from *Sanguis draconis*, which, therefore, is collected from several trees, and from this among others. (*Linn. Suppl.*) This drug, however, is chiefly obtained from the *P. Draco*, and the fruit of *Calamus Rotang*.

In our stoves these plants thrive in light loamy soil; and cuttings, with their leaves untouched, will root in sand under a common hand-glass.

1516. *Ecastaphyllum*. From εκατος, every one, and φυλλον, a leaf; that is to say, a leaf which is always simple, and not compounded of several others, as those of neighbouring genera.

1517. *Geoffroya*. In honor of Etienne Francois Geoffroi, Memb. Acad. Par., Professor of botany at the Jardin du Roi, and a foreign member of the Royal Society of London. He was the author of several medical botanical works, especially of a *Materia Medica*. He was born in 1672, and died in 1731. A tree, branchy at top, with a smooth grey bark and pinnate leaves; and, what is remarkable in papilionaceous plants, a drupe for a fruit.

DECANDRIA.

- 10018 Stem shrubby twining, Leaves pinnated, Leaflets ovate acute smoothish
 10019 Leaves pinnated, Leaflets ovate-oblong emarginate
 10020 Leaves ternate and quinately, Leaflets oval acuminate smooth, Fl. racemose
- 10021 Leaves pinnated, Leaflets roundish emarginate, Fruit lanceolate
 10022 Leaves pinnated, Leaflets obl. obtuse, Branches and petioles downy
 10023 Leaves pinnated, Leaflets ellipt. emarginate smooth, Panicle terminal, Fruit lanceolate
- 10024 Leaves pinnated, Leaflets ovate acuminate smooth, Fruit ovate acute veinless
- 10025 Leaves pinnated, Leaflets elliptical emarginate, Stipules none, Panicle termin.
 10026 Leaves pinnated, Spines stipulary, Fruit lunate
 10027 Leaves ternate roundish blunt quite smooth, Petals crenate wavy
- 10028 Leaves simple cordate-ovate downy beneath
- 10029 Unarmed, Leaflets ovate-lanceolate
- 10030 Leaves alternate, Raceme terminal
- 10031 Leaves pinnated, Flowers smooth
- 10032 Unarmed, Leaves simple stalked alternate subcordate ovate, Racemes compound axillary and lateral
 10033 Leaves pinnated, Leaflets ovate acuminate, Stem arboreous
 10034 Spiny, Leaves subsessile aggregate obovate oblong, Peduncles 2-flowered
- 10035 Leaves ternate rhomboid smooth, Stem herbaceous unarmed, Calyxes fruncate
 10036 Leaves ternate smooth, Stem arboreous prickly, Calyxes campanulate truncate
 10037 Leaves ternate unarmed, Stem arboreous prickly, Calyxes truncate 5-toothed
 10038 Leaves ternate unarmed, Stem arboreous prickly, Calyxes spatheaceous
 10039 Leaves ternate unarmed lanceolate, Stem arboreous prickly, Calyxes bifid
 10040 Leaves ternate unarmed, Leaflets blunt, Stem arboreous prickly
 10041 Leaves ternate prickly, Stem arboreous prickly
 10042 Leaves ternate prickly beneath, Petioles unarmed, Stem prickly

and Miscellaneous Particulars.

This drupe is large, subovate, and incloses a woody nut. The bark, which has a mucilaginous sweetish taste and a disagreeable smell, was first noticed as a vermifuge by Peter Duguid; but Dr. Wright, who resided a long time at Jamaica, has communicated the fullest information concerning this tree. According to him, the bark is powerfully medicinal; and its anthelmintic effects have been established at Jamaica by long experience.

1518. *Dipterix*. From $\delta\iota\varsigma$, double, and $\pi\tau\epsilon\rho\upsilon\varsigma$, a wing, in allusion to the two appendages of the calyx. A tree much branched at top, with large alternate pinnate leaves, and racemes of flowers succeeded by almond-like fruits. The kernels of these are very fragrant, and are put by the Creoles into chests of clothes, in order to drive away insects, and communicate a grateful odor. They are in their own country called *Tonga*, and are the sweet-scented seed sold in shops under the corrupted name of *Tonquin* bean, for perfuming snuff and other substances. Ripened cuttings root in sand in moist heat.

1519. *Parivoa*. The name of the tree in Guiana. A very handsome tree.

1520. *Amerimnum*. One of the names given to the Houseleek by the Greeks. It is derived from α , private, and $\mu\epsilon\sigma\iota\mu\epsilon\nu\alpha$, care, because the plants require no attention. It is not easy to tell why the name was applied to this genus, which has nothing in common either with the Houseleek or its ancient name. *A. Ebenus* is common in the West Indies, and the wood is sent to Europe under the name of *American Ebony*. Though not the true ebony, yet being of a fine greenish-brown color, and polishing well, it is much coveted by the instrument makers, and is of a very hard durable nature. The flowers of *Amerimnum latifolium* are yellow, and smell like new hay. In our stoves the species may be treated like *Pterocarpus*.

1521. *Erythrina*. From $\epsilon\rho\upsilon\theta\rho\omicron\varsigma$, red; nearly all the species being remarkable for the brilliant scarlet color of their flowers. The species are small trees, prickly or unarmed, or else shrubs, sometimes almost herbaceous; leaves, as in *Dolichos*, ternate, stipulaceous, the petiolules jointed and awned, or glandular, very seldom simple; flowers in fascicles from the axils, or in spikes at the end of the stem and branches, often scarlet. (*Jussieu*.)

In our stoves they thrive well in a light loamy soil. "The best way to flower them," Sweet observes, "is to place them on a dry shelf in winter, when they have no leaves, and give them scarcely any water; when they show flower-buds, they may be plunged in a moist heat, which will make the flowers finer than they

History, Use, Propagation, Culture,

would be, if the plants stay out till they are in bloom. Cuttings taken off at a joint, and planted in sand, without being deprived of any of their leaves, strike root readily under a hand-glass in moist heat." (*Bot. Cult.* 54.)

1522. *Butea*. Named in honor of the late Earl of Bute, a munificent patron of botanical science. This splendid genus, though of free growth and easy propagation, is yet rare in British collections. From *B. frondosa* is obtained the *Gum lac* of commerce. Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or of alum and tartar, of a beautiful yellow color. The plant grows in loam and peat, and "cuttings should be taken off at a joint, and planted in a pot of sand, without being deprived of any of their leaves: one pot is enough under a hand-glass, as the leaves take up much room, and, if too confined, are apt to damp off. They should be plunged in a moist heat." (*Bot. Cult.* 50.)

1523. *Viborgia*; usually written *Wiborgia*, received its name after M. Eric Viborg, a learned and acute Danish botanist, author of several botanical treatises in his own language in the end of the eighteenth century. The species, like those of the four preceding genera, may be treated as *Scotia*.

1524. *Piscidia*. From *piscis*, a fish; the inhabitants of America use the bark as a fish poison. This tree has spreading branches and pinnate leaves, and is very common in Jamaica, where it is reckoned one of the best timber-trees in the island. The wood is very hard and resinous, and lasts almost equally in or out of water. It is of a light-brown color, coarse, cross-grained, and heavy. (*Brownæ*.) It makes excellent piles for wharfs. The stakes soon form a good live fence. The bark of the trunk is very astringent; a decoction of it stops the immoderate discharge of ulcers, especially when it is combined with the mangrove bark; it cures the mange in dogs, and would probably answer well for tanning leather. (*Long*, 824.) The bark of the root is used for the same purposes and with the same effects as the leaves and branches of Surinam poison; it is pounded and mixed with the water in some deep and convenient part of a river or creek, when ce it may spread itself;

- 10043 Leaves ternate, Petioles prickly glandular, Stem arboreous unarmed
 10044 Leaves ternate oblong oval blunt
- 10045 Branches downy, Leaflets roundish emarginate
 10046 Branches smooth, Leaflets obovate roundish blunt
- 10047 Leaflets and twiggy branches pubescent
- 10048 Leaves unequally pinnate, Leaflets ovate
- 10049 Leaves cordate ovate, Ovary hairy
 10050 Leaves lanceolate ovate, Ovary smooth
 10051 Leaves deltoid or hastate with spiny angles
- 10052 Leaves sublinear acute villous beneath, Heads terminal
 10053 Leaves lanceolate 3-nerved entire
 10054 Leaves lanceolate many-nerved entire
 10055 Leaves amplexicaul. entire netted
 10056 Leaves amplexicaul. wavy with a redexed mucro
 10057 Leaves cordate many-nerved entire
 10058 Leaves cordate many-nerved toothletted
 10059 Leaves ovate cordate acuminate pungent, Stem hirsute
 10060 Leaves rigid pointed pungent oblong dense
- 10061 Leaves ovate smooth, Branches angular, Peduncles 3 lateral 1-flowered
- 10062 Leaves fascicled 3-angular mucronate stiff hairy, Heads hairy
 10063 Leaves fascicled filiform silvery blunt, Racemes leafy, Flowers not hairy
 10064 Leaves fascicled subulate smooth, Pedunc. filiform twice as long as leaf
 10065 Leaves fascicled filiform blunt hairy, Flowers somewhat racemose
 10066 Leaves fascicled 3-cornered mucronate hairy, Flowers lateral
 10067 Leaves fascicled fleshy round smooth, Fl. lateral and terminal, Flowers smooth
 10068 Leaves fascicled fleshy round smooth setaceous at end, Fl. capitate terminal
 10069 Leaves fascicled scabrous somewhat hairy, Heads terminal
 10070 Leaves fascicled filiform mucronate smooth, Flowers lateral
 10071 Leaves fascicled 3-cornered mucronate smooth
 10072 Leaves linear downy imbricated, Heads terminal crowded
 10073 Leaves fascicled filiform lax hairy, Heads hairy
 10074 Leaves quinque sessile, Peduncles 1-flowered
 10075 Leaves ternate and fascicled ovate silky, Heads downy, Stem dichotomous
 10076 Leaves ternate and fascicled filiform silky, Fl. somewhat lateral, Vexillum naked
 10077 Leaves three 3-cornered smooth, Spikes ovate
 10078 Leaves ternate, Leaflets blunt, Branches spiny
 10079 Leaves fascicled fleshy round smooth, Flowers lateral without bractes, Branches twiggy

and Miscellaneous Particulars.

in a few minutes the fish that lie hid under the rocks or banks rise to the surface, where they float as if they were dead; most of the large ones recover after a time, but the smaller fry are destroyed. The eel is not intoxicated with common doses, though it is affected very sensibly; for the moment the particles spread where it lies, it moves off with great agility. Jacquin observes that this quality of intoxicating fish is found in many other American plants.

It is a very free grower in our stoves, but is seldom allowed to grow large enough to flower. Cuttings root in sand under a hand-glass.

1525. *Platylobium*. From *πλατυς*, broad, and *λοβος*, a pod, in allusion to the form of the pod. Handsome free-flowering plants, which grow in sandy loam and peat; and are increased by cuttings in sand under a hand-glass, or by seeds.

1526. *Borbonia*. In memory of Gaston Bourbon, Duke of Orleans, son of Henry IV. of France, a great lover and patron of botany. See *Gastonia*. Shrubs of easy culture and propagation.

1527. *Rafnia*. Named, according to Sir James Smith, after Mr. C. G. Rafn of Copenhagen, author of a Flora of Denmark and Holstein, published in 1796 and 1800, in two octavo volumes. A genus of Cape plants, separated from the Linnean *Crotalaria* and *Liparia*.

1528. *Aspalathus*. A native of the island *Aspalathus* on the coast of Lycia. It was a common practice with the ancients to fix the names of places upon certain plants, as *Cytisus*, *Lycium*, and others. It is not certain what plant the ancients intended by their *Aspalathus*. Shrubs and under-shrubs, with fasciculate linear leaves, and yellow flowers, all of which grow freely in a mixture of sandy loam and peat; and young cuttings, planted in sand under bell-glasses will strike root freely, if the glasses are wiped occasionally, otherwise they are liable to damp off. Some species ripen seeds freely, by which young plants are readily produced. (*Bot. Cult.* 140.)

History, Use, Propagation, Culture,

1529. *Sarcophyllum*. From σαρκ, flesh, and φλλον, a leaf. The leaves are thick and fleshy. A somewhat succulent plant, easily injured by over-watering; but otherwise not difficult to preserve or increase.

1530. *Crotalaria*. Κροταλον was the name of a noisy Greek musical instrument, similar to the cymbals of the present day. The pods of this genus are inflated, and rattle, when shaken, in a similar manner. The species are all of easy culture, mostly free-flowerers; but they are shabby plants under cultivation, and possess no good quality which can render them objects of interest or beauty.

1531. *Bossiaea*. Named by Ventenat, after M. Boissieu-Lamartinière, who accompanied the unfortunate La Pérouse in his voyage round the world. This beautiful genus, according to Sweet, "thrives best in an equal mixture of sandy loam and peat; if not very sandy, some sand must be added to it to have the plants in health. The pots must be well drained with broken potsherds, as nothing injures them more than too much

10080 The only species

- 10081 Leaves simple obl. lanceolate, Stipules lanceolate acuminate decurrent, Racemes opposite the leaves
 10082 Leaves simple lanc. ellipt. blunt downy beneath, Racemes opposite the leaves
 10083 Leaves very small ternate glaucous, Racemes few-flowered, Vexillum reflexed
 10084 Leaves simple lanc. villous, Upper stipules lanc. decurrent, Racemes opposite the leaves, Cal. villous
 10085 Branches winged upwards, Lower leaves obl. : upper lanc. acute hairy, Racemes lateral
 10086 Leaves simple lin. lanc. acute villous beneath, Flowers and pods inclosed in hairy calyx
 10087 Leaves simple long-lanc. Pods downy, Raceme terminal, Stem square
 10088 Leaves obl. lanceolate silky beneath, Fl. racemose, Bractes linear much shorter than pedicel
 10089 Leaves simple lanc. Upper stipules decurrent with 2 short teeth, Racemes opposite the leaves
 10090 Leaves lanceolate subsessile, Lower lip of cal. 3-parted beyond the middle, Stem virgate simple
 10091 Leaves simple lanc. subsessile, Pods smooth, Raceme terminal, Stem furrowed
 10092 Leaves lanceolate blunt hairy, Fl. terminal, Calyx hairy as long as corolla
 10093 Leaves lanceolate, Raceme terminal, Cal. very villous as long as corolla
 10094 Leaves simple ov. lanceolate silky ciliated, Standard large erect pointed
 10095 Leaves simple lanc. beneath, Pods silky, Raceme terminal, Stem furrowed
 10096 Leaves simple obl. cuneiform retuse, Raceme terminal
 10097 Leaves simple ovate retuse, Stipules lunate declinate, Raceme term. Branches square
 10098 Leaflets 3 oval acute, Hairs shining scattered, Racemes opposite the leaves
 10099 Leaflets 3 oval blunt with scattered hairs, Raceme terminal long, Keel shorter than vexillum
 10100 Leaves simple obovate oblong silky on each side, Pod 4-seeded length of calyx
 10101 Stems round striated, Leaves oval emarginate mucronate, Stipules lunate amplexical
 10102 Leaves simple lin.-lanceolate blunt hairy, Pedunc. terminal subsolitary, Stem branched diffuse
 10103 Leaves simple obl. blunt hairy, Stems prostrate herbaceous, Pedunc. 2-3-fl. axillary
 10104 Leaflets 3 oblong blunt mucronate with scattered hairs beneath, Raceme terminal, Calyxes silky
 10105 Leaves ternate, Leaflets oval-lanc. acute twice as long as villous petiole, Pods pendulous
 10106 Leaves obovate cuneate silky, Racemes term. Bractes and calyx colored
 10107 Leaves obl. blunt silky villous, Stipules linear subulate reflexed, Panic. terminal bracteate
 10108 Leaves ternate, Leaflets cuneiform emarginate silky beneath, Peduncles axillary solitary 1-flowered
 10109 Leaves ternate ovate acuminate smooth, Stipules none, Raceme terminal, Pods stalked pendulous
 10110 Leaves ternate obovate mucronate, Flowers corymbose, Stem shrubby
 10111 Leaves ternate, Leaflets obovate retuse, Racemes terminal
 10112 Leaves ternate, Leaflets linear lanceolate acute half as long again as petiole downy beneath
 10113 Leaves ternate on long stalks, Leaflets oval downy, Racemes axillary lax, Standard blunt
 10114 Leaves ternate obl. lanceolate acute silky beneath, Stipules lanceolate subulate, Pedunc. axill. 1-flowered
 10115 Leaves ternate obovate strigose beneath, Stipules lanceol. and bractes ovate reflexed, Racemes terminal
 10116 Leaves ternate obovate, Stipules leaf-like stalked, Racemes terminal, Pods stalked
 10117 Leaves ternate oval villous beneath, Racemes spiked, Keel downy at edge, Pods sessile hairy
 10118 Leaves ternate lanceolate smooth, Racemes terminal spiked
 10119 Leaves ternate lanc. hoary silky shorter than petiole, Raceme terminal
 10120 Leaves quinately

- 10121 Branches flat linear leafless, Denticulations flower-bearing, Keel naked, Calyx smooth
 10122 Branches flat linear leafless, Denticulations flower-bearing, Keel fringed, Calyx smooth
 10123 Branches leafy compressed, Leaves obovate and linear flat, Pod many-celled with spongy septa
 10124 Branches leafy compressed, Leaves linear with recurved edges, Pod 1-celled
 10125 Branches leafy filiform, Leaves oval smooth, Stipules shorter than petiole, Pod 1-celled
 10126 Branches leafy round, Stem erect much branched, Leaves ovate-lanc. rough above
 10127 Branches leafy spiny round, Leaves obovate cuneiform

10128 The only species

- 10129 Leaves green retuse
 10130 Leaves glaucous blunt

and Miscellaneous Particulars.

water. Cuttings, not too ripe, will strike root if planted in sand under a bell-glass, not too close together, as they are apt to damp; when rooted, they must be potted off in little pots and kept in a close frame, and hardened to the air by degrees." (*Bot. Cult.* 151.)

1532. *Scottia*. Named in memory of Robert Scott, M. D., formerly professor of botany at Dublin. A shrub found by Mr. Brown upon the south-west coast of New Holland. Young cuttings root in sand under a bell-glass.

1533. *Templetonia*. Named after John Templeton, Esq., of Orange Grove, near Belfast, a gentleman to whom the editor of the English Botany was under frequent obligations for Irish plants during the progress of that work.

History, Use, Propagation, Culture.

1534. *Goodia*. In memory of Peter Good, an industrious gardener employed by the Kew garden in collecting seeds in New Holland, where he died.

1535. *Loddigesia*. Named in compliment to Mr. Conrad Loddiges, a successful cultivator of plants, an assiduous collector, and a most worthy man, whose virtues are inherited by his sons.

1536. *Hovea*. In honor of Mr. Anthony Pantaleon Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew garden. He is still alive, and naturalized in England. Pretty plants, easily cultivated in sandy loam and peat, and rooted in sand under a hand-glass.

1537. *Spartium*. From *σπαστρον*, cordage; the earliest ropes were made of this and similar tough plants. The species are shrubs thick-set with verdant flexible rush-like twigs, which are very ornamental in winter, and generally profusely covered with shewy white or yellow odoriferous and mellifluous blossoms in summer. *S. juncum* is grown as a green food for sheep in the south of France, and there and in Spain it affords a thread from its fibres, which is sometimes wove into cloth, but more generally twisted into cordage. Bees are very fond of the flowers, as they are of those of most of the species.

S. monospermum, is a very handsome shrub, remarkable for its numerous snow-white flowers. Osbeck remarks, that it grows like willow-bushes along the shore of Spain, as far as the flying sands reach, where scarcely any other plant exists except the *Ononis repens*, or creeping Restharrow. The use of this shrub is very great in stopping the sand. The leaves and young branches are delicious food for goats. It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time. It serves to shelter hogs and goats against the scorching heat of the sun. The twigs are used for tying bundles; and all kinds of herbs that are brought to market are fastened together with them. Forskahl found it in Arabia; and Desfontaines in Barbary, on the sandy coast. The Spaniards call it *Retamas*, from the Arabic name *Retam*.

- 10131 Leaflets obovate and calyxes smooth, Pod varicose
 10132 Leaflets obovate cuneate and calyxes downy, Pod smooth

10133 The only species

- 10134 Leaves linear hairy beneath, Pods smooth
 10135 Leaves long linear; beneath veiny, Pods downy
 10136 Branches twiggly, Leaves lanc. mucronate downy beneath, Fl. axill. twin
 10137 Leaves elliptic oblong
 10138 Leaves lanc. somewhat rhomboid blunt at end mucronate, Peduncles axillary many-flowered

10139 Branches opposite round flowering at end, Leaves lanceolate

- 10140 Branches round striated, Racemes lateral few-fl. Flowers subaggregate, Leaves lanceolate silky
 10141 Branches round striated, Racemes lateral many-fl. Flowers remote, Leaves lanc. sessile a little hairy
 10142 Branches round striated, Fl. solitary axillary, Pods villous, Leaves lanceolate hairy
 10143 Branches round striated very close, Fl. terminal racemose, Vexillum smooth, Leaves lanc. silky
 10144 Branches round striated, Fl. axill. solitary subracemose, Standard and keel downy, Lvs. obl. lanc. silky
 10145 Branches round striated, Fl. axillary solitary, Leaves lanc. silky st' bræssile
 10146 Branches round striated, Fl. term. capitate, Leaves lin. lanc. silky
 10147 Branches round striated spreading spiny, Pedunc. axill. many-fl. Leaves obl. acute silky
 10148 Leaves lanc. silky beneath, Corolla silky, Branches erect round
 10149 Leaves ternate and simple silky, Twigs straight striated flowering on all sides
 10150 Leaves solitary and ternate linear lanceolate hoary, Branches hexangular flowering at the ends
 10151 Leaves ternate stalked obovate, Branches round striated, Lateral flowers twin nodding
 10152 Branches angular, Leaves simple lanceolate silky beneath, Fl. racemose, Pods hairy
 10153 Branches round with ten furrows, Flowers axillary solitary downy
 10154 Leaves ternate lanc. hairy stalked, Fl. lateral fascicled, Pods smooth, Branches round striated
 10155 Leaves ternate sessile linear silky beneath, Raceme terminal, Branches round furrowed
 10156 Leaves ternate and solitary oblong, Fl. axillary, Pods hairy at edge, Branches angular
 10157 Leaves ternate linear, Petioles dilated persistent, Racemes capitate term. Branches angl. opp. clustered
 10158 Leaves ternate and simple oblong mucronate, Raceme terminal, Branches striated round spiny
 10159 Leaves ternate obovate, Peduncles axillary, Cal. and pods smooth, Branches angular spiny

- 10160 Leaves tern. obl. downy beneath with spreading hairs, Pedunc. many-fl. terminal, Branches angular
 10161 Leaves ternate obovate downy with closely pressed hairs, Pedunc. many-fl. terminal, Branches angular
 10162 Leaves ternate obl. smooth, Racemes terminal, Cal. and pods glandular viscid, Branches round striated
 10163 Leaves ternate: upper simple, Branches triquetrous procumbent
 10164 Branches 2-edged membranous jointed, Leaves ovate lanceolate
 10165 Leaves lanceolate mucronate smooth, Branches 3-cornered ascending, Pods smooth
 10166 Leaves lanceolate smooth, Branches round striated erect, Pods smooth
 10167 Leaves lanceolate smooth, Branches equal round erect
 10168 Leaves oblong ovate and pods hairy, Branches round striated -
 10169 Quite smooth, Leaves not ciliated, Cor. 5 lines long, Calyx smooth

and Miscellaneous Particulars.

S. scoparium, though in some places a troublesome weed in old pastures, is a very ornamental shrub in garden scenery: it is also useful in agriculture, domestic economy, and medicine. It is sometimes used as winter food for sheep, frequently for thatching cottages and ricks, and as litter. Bees are fond of the flowers: the flower-buds, just before they become yellow, are pickled in the manner of capers: the branches are said to be capable of tanning leather, and of being manufactured into coarse cloth; when tender, they are mixed with hops in brewing: the old wood furnishes the cabinet-maker with a beautiful material for veneering. The twigs, when bruised, smell disagreeably, which perhaps may be one reason why our broom is generally rejected by cattle (*Curtis*); but they have also a nauseous bitter taste. The plant when burnt affords a tolerably pure alkaline salt. Broom tops are diuretic and cathartic; the seeds are said to be emetic. The effects of this plant have been very long known to the common people; and both Mead and Cullen found them useful in dropsy. The usual mode of exhibiting them is in the form of decoction, made by boiling the green tops in water. Speaking of this decoction, of which two table spoonfuls were given every hour till it operated by stool, Cullen says, "it seldom fails to operate both by stool and urine, and by repeated exhibition every day, or every second day, some dropsies have been cured." (*Thompson's London Dispensatory*, 514.)

1338. *Genista*. *Gen.* signifies, in Celtic, a small bush, whence also *Gânet*, French. The species are shrubs or undershrubs, some of them evergreen, and many with numerous flexible rush-like green twigs like the brooms. They are of easy culture and free flowerers. *G. tinctoria* is common in most parts of Europe, in unimproved pastures on dry gravelly soils. When cows feed on it, their milk, and the butter or cheese made from it, are said to be very bitter. A bright yellow color may be prepared from the flowers; and for wool that is to be dyed green with woad, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore

History, Use, Propagation, Culture,

has proved serviceable in dropsical cases. A salt prepared from the ashes is recommended in the same disorder.

G. triquetra is the handsomest hardy species: it is evergreen, and produces a vast profusion of bloom. 1539. *Lebeckia*. Named by Thunberg: possibly in honor of some forgotten botanist. Young cuttings root freely in sand under close cover.

1540. *Ulex*. A word of very obscure meaning. De Theis derives it from *ac*, a point in Celtic. *U. europæus*, *Jonc-marin*, Fr., is a beautiful evergreen shrub, which flowers freely, both when wild and cultivated, the greater part of the year. It abounds in some places, and there it is despised by the common people; but the greatest botanists have admired its deep green shoots and leaves, brilliant yellow flowers, and tufted picturesque shape. About Petersburg, it forms one of their most valuable greenhouse plants, flowering in winter. Linnæus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are wholly destitute of the furze bush, inasmuch that Dillenius was in a perfect extasy when he first saw our commons covered with its golden flowers. And Gerarde relates, that about Dantzic, Brunswick, and in Poland, there was not a branch of it growing, except some few plants and seeds that he sent, which were most curiously kept in their fairest gardens. As an agricultural plant the furze has been sown in several parts of the island as hedges; but excepting when it occupies a breadth of ten or twelve feet on a raised mound, it does not last long, getting naked below. Sown on a mound the sides may be cut, and the prunings used as fuel or as green food, and the fence thus rendered close at bottom and durable. It is sown in fields, and

- 10170 Leaves lanceolate silky, Branches striated round, Racemes 1-sided
- 10171 Leaves lanceolate acute, Pedunc. axill. 3 longer than leaves, Cor. smooth, Branches striated round
- 10172 Leaves lanceolate blunt silky beneath, Pedunc. axillary as long as leaf, Cor. silky, Branches angular
- 10173 Leaves lanceolate complicate, Pedunc. axill. very short, Cor. hairy, Stem warted striated procumbent
- 10174 Leaves lanceolate smooth subciliate, Pedunc. axillary, Cor. smooth, Branches 3-cornered procumbent
- 10175 Leaves lanceolate silky beneath, Fl. terminal somewhat racemose, Cor. silky, Branches erect round
- 10176 Spines simple or compound, Flowering branches unarmed, Leaves oblong smooth, Racemes leafy tern.
- 10177 Spines warted compound, Fl. branches unarmed, Lvs. lanc. hairy, Racemes tern. naked, Keel pubesc.
- 10178 Spines compound pungent, Leaves lanceolate villous, Racemes terminal subcapitate
- 10179 Stem leafless, Spines crossing each other
- 10180 Leaflets ternate obovate, Racemes short, Bractes linear under the flower

- 10181 Leaves simple linear filiform smooth, Flowers umbelled
- 10182 Leaves ternate silky, Leaves linear, Flowers racemose
- 10183 Leaves ternate villous, Raceme long terminal
- 10184 Leaves simple binate or ternate sessile lanceolate acute rough

- 10185 Teeth of cal. conniving, Bractes ovate loose
- 10186 Teeth of cal. distant, Bractes minute appressed

- 10187 Fl. solitary larger than leaflet, Lower leaves ternate lanceolate toothed at end, Branches spiny smooth
- 10188 Fl. twin axillary, Lower leaves ternate lanc. serrate, Branches spiny villous
- 10189 Fl. twin, Lower leaves ternate ellipt. serrate pubescent, Stem unarmed villous viscid
- 10190 Fl. solitary axill. Lower leaves ternate roundish serrate, Branches ascending spiny villous
- 10191 Fl. subsess. lateral, Leaves ternate obl. pubesc. Stipules lanc. toothletted, Cal. scarious longer than cor.
- 10192 Fl. sessile spiked, Bractes stipular ovate ventricose scarious imbricated
- 10193 Fl. subsess. lateral spiked, Leaves simple ovate blunt, Stipules dilated, Cal. larger than smooth corolla
- 10194 Fl. somewhat stalked axill. Lvs. simple obov. striated serrated, Stipules ovate toothed, Stem procumbent
- 10195 Pedunc. unarmed very short, Upper leaves simple, Stipules ovate lanc. entire
- 10196 Racemes straight, Leaves cuneiform, Pods nodding linear recurved
- 10197 Leaves ternate obovate, Pedunc. lateral 2-flowered
- 10198 Pedunc. unarmed 1-fl. Leaves ternate roundish crenate, Pods cernuous
- 10199 Pedunc. unarmed 1-fl. Leaves ternate cuneate, Stipules serrate, Stems prostrate
- 10200 Pedunc. 1-fl. awned, Leaves sessile ternate, Stipules sheathing toothed
- 10201 Pedunc. 1-fl. awned, Leaves tern. cuneate toothed at end villous viscid, Cal. larger than corolla
- 10202 Pedunc. 1-fl. awned length of leaves, Leaves simple oblong serrated viscid : lower ternate
- 10203 Pedunc. 2-fl. awned shorter than petiole, Leaves tern. oblong, Pods linear cernuous
- 10204 Pedunc. 1-fl. awned longer than leaf, Awns length of cor. Leaves ternate lanc. serrated at end
- 10225 Pedunc. 1-fl. awned longer than leaf, Leaves ternate viscid obl. toothed at end
- 10206 Pedunc. awned about 1-fl. Leaves all ternate channelled recurved wholly serrated

- 10207 Shrubby, Leaves tern. linear fleshy 3-toothed, Pedunc. 2-flowered
- 10208 Shrubby, Leaves tern. roundish wavy toothed viscid, Pedunc. 1-flower unarmed
- 10209 Shrubby, Leaves sessile ternate lanceolate serrated, Stipules sheathing, Pedunc. 3-flowered
- 10210 Shrubby, Leaves tern. ovate toothed, Cal. with 3 bractes, Pedunc. 3-flowered

- 10211 Herbaceous, Leaves quaternate-pinnate, Flowers lateral
- 10212 Herbaceous, Leaves pinnate unequal, Head double

and Miscellaneous Particulars.

allowed to grow three or four years, and then it is cut down for fuel or for heating ovens; but the most profitable application of furze, whether sown or grown wild, is that of using it as green food for cattle. For this purpose, the shoots should not be more than two years old, and they require to be passed between rollers to bruise the ligneous parts and the thorns. It has been tried in this way by a number of agriculturists, and found a highly nutritive food for horses, oxen, and kine. Though a hardy plant and enduring the sea breeze, yet it is frequently killed by severe winters. It is never found on wet-bottomed clays, but generally on dry rocky or stony soils. There is a very luxuriant variety called the Irish whin, and one with double flowers found a few years ago in Devonshire, and now in propagation by cuttings in the nurseries.

U. nanus greatly resembles the common species, but is smaller in all its parts. It flowers from August to January, which renders it valuable in shrubberies as a successor to the other.

1541. *Ononis*. From *ovos*, an ass, because asses only feed upon so prickly a plant. *O. spinosa*, *Arrête boeuf*, Fr., *Rest harrow*, Eng., was formerly very troublesome in corn fields, on account of its long ligneous roots obstructing the progress of the plough, and its thorny branches the harrow: but in all properly cultivated lands the plant has disappeared. It is frequent in aboriginal pastures on dry soils, and is eaten by cows, sheep, and goats, but not freely by horses. All the species are of easy culture, and the greenhouse kinds are readily increased by young cuttings under a bell-glass in sand.

1542. *Anthyllis*. From *ανθος*, a flower, and *ιουλος*, a beard. So called from the silky appearance of its heads of flowers; whence also one species is called *Barba Jovis*. *A. Vulneraria* is recommended as a herbage

History, Use, Propagation, Culture,

plant by some agricultural writers, as A. Young; and is by others confounded with Birdsfoot trefoil (*Lotus corniculata*, and major), and with the Liquorice-vetch (*Astragalus glycyphyllos*), to which, to a cursory observer, it bears considerable resemblance. Linnaeus observes, that in Oeland, where the soil is a red calcareous clay, the flowers of *Anthyllis vulneraria* are red; but that in Gothland, where the soil is white, the flowers also are white; ours are yellow.

A. *Barba Jovis* is a silvery looking bush, with white and hairy leaves, pale yellow flowers, and woolly pods. Like most of the Leguminosae, this genus seeds freely; but in default of seeds, increase may be effected by "young cuttings planted under a bell-glass in sand; which are not difficult to root: the glasses must be kept wiped, or the dew is apt to make them mouldy, which destroys them." (*Bot. Cult.* 135.)

1543. *Arachis*. *Araeos*, or *Aracidna*, is a name applied by Pliny to a plant which had neither stem nor leaves, but was all root. The moderns have applied it to a plant, the fruit of which is borne underground. The specific name *hypogæa* (*γρη γη*, below ground), is in allusion to the curious circumstance of the pods, as they increase in size, forcing themselves into the earth, where they ripen their seeds, thence called earth-nuts. The plant is generally cultivated in the warmer parts of North and South America, but is supposed to be originally from Africa. In South Carolina the seeds are used as chocolate; in the eastern countries as almonds, and in Cochin-China they furnish an oil used for lamps, and as a substitute for oil of olives. About Paris it is raised on hotbeds and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. It has also been brought to maturity in a stove in England, and proved very prolific. (See *Hort. Trans.* vol. v. p. 372.)

1544. *Lupinus*. Said to be derived from *lupus*, a wolf, because this plant devours, as it were, all the fertility

- 10213 Herbaceous, Leaves pinnated equal, Head terminal 1-sided, Flowers oblique
 10214 Herbaceous, Leaves pinnated equal silky, Spike peduncled ovate
 10215 Herbaceous, Leaves pinnated unequal, Head solitary stalked, Pods hooked blunt shorter than calyx
 10216 Herbaceous, Cauline leaves ternate: radical pinnate unequal trifid or simple
 10217 Herbaceous, Leaves pinnated unequal, Pedunc. lateral longer than leaf, Heads leafless
 10218 Shrubby, Leaves pinnated equal silky, Branches as long as globose many-flowered head
 10219 Shrubby, Leaves pinnated equal and ternate villous, Flowers spiked
 10220 Shrubby, Leaves pinnated: floral ternate
 10221 Shrubby, Leaves ternate unequal, Calyxes woolly lateral
 10222 Shrubby, Leaves ternate linear-cuneate somewhat stalked, Calyxes campanulate, Branches spiny
 10223 Shrubby, Petioles spiny, Leaves pinnated, Flowers axillary subsessile, Cal. inflated
 10224 Shrubby spiny, Leaves simple

10225 Leaves in fours cuneate rounded, Stipules undivided, Stem nearly smooth

- 10226 Cal. altern. without appendage: upper lip emarginate; lower entire
 10227 Cal. whorled without appendage: lower lip entire, Stem and leaves hairy
 10228 Cal. altern. without appendage: upper lip entire; lower 3-toothed
 10229 Cal. altern. with an appendage: upper lip entire; lower 3-toothed
 10230 Cal. half-whorled with an appendage: upper lip bifid; lower about 3-toothed
 10231 Cal. altern. with an appendage: upper lip 2-parted; lower 3-toothed
 10232 Leaves digitate, Cal. whorled without append. Upper lip emarg.; lower bifid, Pods 2-seeded
 10233 Cal. altern. with an appendage: upper lip half-bifid; lower obscurely 3-toothed
 10234 Cal. whorled with an appendage: upper lip 2-parted; lower entire
 10235 Cal. altern. with an appendage: upper lip 2-fid; lower entire, Leaflets linear-lanceolate flat
 10236 Cal. altern. with an appendage: upper lip 2-fid; lower subtrifid, Leaflets linear channelled
 10237 Cal. whorled with an appendage: upper lip 2-parted; lower 3-toothed
 10238 Cal. half-whorled with an appendage: upper lip 2-fid; lower undivided, Leaves simple obl. villous
 10239 Shrubby, Cal. whorled without appendage stalked: lips acute entire

10240 Teeth of calyx 4 blunt, one acuminate

- β Leaflets emarginate, Calyxes hoary
 10241 Smoothish, Leaves on short stalks blunt at each end, Spikes solitary short, Pods 1-seeded
 10242 Leaves on short stalks without a point obtuse smooth, Spikes long paniced downy
 10243 Hoary, Leaflets subsessile ovate-elliptical acute mucronate, Spikes paniced hoary
 10244 Said to be the same as *A. microphylla*
 10245 Ferruginous, Spikes simple clustered, Leaflets ovate-lanceolate downy mucronate

10246 The only species

- 10247 Raceme solitary shorter than leaves, Pedunc. 2, Bractes less than cal. spreading, Pods pendulous
 10248 Raceme solitary length of leaves, Pedunc. 2, Bractes less than cal. appressed, Pods pendulous
 10249 Pods scymetar-shaped somewhat lunate smooth
 10250 Vexillum of flowers revolute, Calyxes whole colored
 10251 Peduncles subcapitate, Seeds 4-cornered cylindrical powdery
 10252 Peduncles thicker than petiole capitate, Wings subfalcate deformed, Pods linear straight
 10253 Flowers capitate, Cal. bracteat, Vexill. short, Wings expanded very large, Leaflets deltoid oblong

and Miscellaneous Particulars.

of the soil: but this is a very doubtful explanation. The species are border flowers, in much esteem for their velvet-like leaves and fine large flowers. They are vigorous growing plants, and most of them would afford the agriculturist a considerable bulk of herbage.

L. albus is supposed to be the species that was cultivated for this purpose by the Romans; though *L. luteus* is what is at present grown in the fields in the south of Italy as human food. In the south of France, it is grown in poor dry extensive plains, as a meliorating crop to be ploughed in where no manure is to be had, and the ground is too sterile for clover or other better plants. (*Villars*.) The perennial and ligneous species may be increased by pieces of the root, but they all seed freely.

1545. *Amorpha*. From α , privative, and $\mu\omega\sigma\phi\eta$, form, in allusion to the deformity of the corolla, which has neither ala or carina. *A. fruticosa* was once used in Carolina as an indigo plant, but is now neglected. All the species are of easy cultivation, and increase by seeds or cuttings in sand.

1546. *Abrus*. From $\alpha\beta\rho\sigma$, elegant. The roots are used in the West Indies similarly to those of our liquorice, and the seeds are strung and worn as beads for ornaments, and also as rosaries, whence the specific name *preparatorius*. They are frequently thrown, with other West Indian seeds, on the north-west coast of Scotland. *Linnaeus* affirms, that they are very deleterious; but they are eaten in Egypt, though the hardest and most indigestible of the pulse tribe. In our stoves the plant requires a good deal of room and heat in order to flower freely. It is generally raised from seed, but cuttings will root in sand plunged in heat.

1547. *Phaseolus*. From *phascolus*, a little boat, which the pods may easily be supposed to resemble. *P. vulgaris* and *multiflorus*, *Haricot*, Fr., *Schminkbohne*, Ger., *Fagiolo*, Ital., are well known culinary legumes. The dwarf kidney bean is earlier than the other, and better adapted for forcing; but much the largest crop

History, Use, Propagation, Culture,

is produced by the twining species. Neither sorts can be safely planted in the open air before the end of April, or first week of May, and the leaves are blackened by the first frosts of autumn. But in a stove or pit, green pods of the dwarf kinds may be gathered all the winter, and with this advantage over forced productions of the fruit kind required to be ripened, that the pods are as good from plants in the stove in midwinter, as from those in the open garden in midsummer. The garden culture of both species is so easy and universally known, that we shall not occupy ourselves with details. Though in this country the green pods only are used, on the continent the ripened seeds are as much the object of culture. In Holland, the twiner is grown in every cottage garden for both purposes; and in France and Switzerland, it is grown chiefly for the ripened seeds; in the latter countries it grows on very poor dry soil. On the first blackening of the leaves with frost, the plants are pulled up, dried like tobacco leaves under the dripping eaves of the houses; and in winter threshed out for the seeds, to be boiled and eaten with cream or butter, stewed in haricots, or put in soups. According to the analysis of Einhoff, 3840 parts of kidney bean afforded 1805 parts of matter analogous to starch, 857 of vegeto-animal matter, and 799 parts of mucilage: from which it is to be inferred, that it is the most nourishing of all the legumes.

The perennial stove species thrive best in a light rich soil, and may be propagated readily from cuttings or from seed. *P. caracalla*, or *Snail-flower*, is a very curious species, and will grow and flower freely, if kept clear from the red spiders. This species was so named by the Portuguese, who first brought it from South America, in consequence of its hooded flower. *Caracalla* (from the Celtic words *car*, a head, and *cal*, a covering) was the name of a hooded dress much worn by the Gauls, and gave his nickname to the Emperor Marcus Aurelius Antoninus, who was accustomed to wear the dress.

- 10254 Flowers spiked, Cal. without bractes, Wings expanded larger, Leaflets ovate
 10255 Flowers loosely spiked, Wings the length of vexillum
 10256 Vexillum and keel spirally twisted together
 10257 Stem hairy, Lateral leaflets 3-lobed : terminal 5-parted, Segm. lanceol. Peduncles 3-fl. shorter than petiole
 10258 Stem smooth, Lateral leaf 2-lobed : terminal 3-lobed : segments ovate, Pedunc. 3-fl. longer than petiole
 10259 Stem smooth, Leaf blunt : lateral sinuose; terminal hastate 3-lobed, Peduncles longer than leaf spiked
 10260 Stem smooth, Bractes larger than calyx, Pods pendulous compressed rugose
 10261 Stem round, Flowers capitate, Pods cylindrical horizontal
 10262 Stem angular hispid, Pods pendulous hairy
 10263 Stem flexuose round hairy, Pods capitate hairy
 10264 Downy, Lower leaves rhomboid oval : upper 3-lobed, Heads on long stalks, Pods round subulate

 10265 Leaflets oblong acuminate, Peduncles elongated, Pods round subulate
 10266 Leaflets about 3-lobed, Lobes acuminate, Racemes axillary

 10267 Leaflets ovate-lanceolate downy

 10268 Leaflets ternate smooth, Flowers in heads, Calyxes hairy campanulate
 10269 Flowers imbricated

 10270 Pods ovate acinaciform, Seeds ovate with a hilum curved towards one end
 10271 Pods pendulous cylindrical torulose, Peduncles erect many-flowered
 10272 Pods capitate many cylindrical, Seeds rounded
 10273 Pods capitate subcylindrical with a recurved concave end
 10274 Pods capitate few cylindrical with a mucronate straight point
 10275 Pods racemose ensiform with 3 keels at back straight at point, Seeds with an arillus
 10276 Pods membranous quadrangular
 10277 Pods subcylindrical smooth very long
 10278 Pods racemose compressed hairy, Outer leaflets 2-lobed
 10279 Pods subracemose linear hairy, Leaflets ovate-lanceolate downy
 10280 Pods racemose compressed 4-seeded, Leaflets rhomboid
 10281 Pods racemose acinaciform 4-seeded, Leaflets rhomboid smooth
 10282 Leaves ovate downy, Flowers solitary, Seeds 2-horned
 10283 Leaves ovate acute rugose netted villous, Racemes few-flowered
 10284 Leaves smooth toothed with many angles
 10285 Stem smooth, Petioles downy, Wings of corolla spreading
 10286 Peduncles capitate, Pods straight linear
 10287 Flowers somewhat spiked, Pods subcylindrical smooth, Leaves roundish rhomboid blunt entire smooth
 10288 Pods acinaciform with 3 keels
 10289 Racemes axillary erect, Pods pendulous hispid about 2-seeded
 10290 Pods twin linear nearly erect
 10291 Stem smooth, Peduncles 2-flowered, Outer leaflets somewhat angular
 10292 Stem creeping, Leaflets roundish shining, Fl. racemose, Pods with 3 keels at back

 10293 Pods racemose hairy equal, Seeds surrounded by the nilum, Leaves smooth on each side
 10294 Pods racemose with transverse lamellæ hairy, Seeds surrounded by the hilum
 10295 Pods racemose : valves keeled hairy, Peduncles in threes

and Miscellaneous Particulars.

1548. *Teramnus*. So called by Browne, apparently in allusion to its delicately-shaped legume, *περαμνωτός* being used particularly to express the tenderness of eatable pulse; *απεραμνωτός* was a weed hostile to leguminous plants.

1549. *Carpopogon*. From *καρπός*, fruit, and *παργών*, a beard; the pods being bearded. Rapid growing climbers of the easiest culture.

1550. *Dolichos*. A name under which Dioscorides describes a plant supposed to have been the kidney bean of the moderns. The species are climbers, some of them to the height of the highest trees. The pods of most of them are eatable, but far inferior to the kidney bean. Some of them have tuberous roots which may be eaten. The seeds of *D. Soja* (*Soja*, Jap.), which are usually called *Miso* in Japan, are put into soups, and are the most common dish there, inasmuch that the Japanese frequently eat them three times a day. The *Soja* of the Japanese, which is preferred to the Kitjap of the Chinese, is prepared from these seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favorite dish made of these seeds, called *Tau hu* or *Tau hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome. (*Thumb.* and *Loureira*.)

The perennial kinds are easily increased by cuttings, and all the species seed freely. *D. purpureus* and *liguosus* have the handsomest flowers, but none of them can be considered of much beauty.

1551. *Stizolobium*. From *στίζω*, to prick, and *λόβος*, a pod. *S. urens* and *pruriens* produce on the outside of their pods the irritating substance used in medicine as a vermifuge, under the name of Cowhage. The species are twining shrubs of the West Indies, with long bunches of yellow scentless flowers. The seeds of *S. urens* are often seen in cabinets of curiosities: many qualities are attributed to them by the superstitious Crooles. The French settlers call them *Yeux bourrique*, asses' eyes. *S. pruriens* is considered a powerful diuretic.

History, Use, Propagation, Culture,

1552. *Glycine*. From γλυκος, sweet. G. monoica perfects its seeds under ground like *Arachis hypogæa*, *Trifolium subterraneum*, and *Lathyrus subterraneus*. They are all of easy culture, like their preceding and following allies. G. frutescens, and especially G. sinensis, are most beautiful hardy climbing shrubs, with long pendulous brauches of blue flowers, like the Laburnum.

1553. *Kennedia*. Named after Mr. Kennedy, a nurseryman of celebrity in the vicinity of London. Handsome conservatory climbers of the easiest culture.

1554. *Cylista*. From κυλισ, a calyx, that of the species so called being very large.

1555. *Galactia*. From γαλα, milk; the plant is milky in all its parts. A pretty flowering climber of easy culture in the soil indicated, and increased by cuttings in sand under a bell-glass.

1556. *Clitoria*. A name derived from an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower. C. Ternatea was first brought to Europe from Ternate, one of the Moluccæ Islands, which induced Tournefort to adopt Ternatea as a generic appellation, and it was continued by Linnaeus as a specific one.

- 10296 Leaves ternate ovate smooth, Racemes filiform about 3-fl. Flowers apetalous, Pods oblong 2-seeded
 10297 Leaves ternate ovate smooth, Stem hairy, Racemes pendulous, Fls. of stem with cor. of root apetalous
 10298 Leaves ternate, Leaflets linear lanceolate silky, Fl. axillary solitary, Pods 2-seeded
 10299 Leaves ternate, Leaf. oval hairy beneath, Pods subsolitary linear many-seeded, Style persistent straight
 10300 Leaves ternate hairy, Racemes lateral
 10301 Leaves ternate tomentose, Racemes axillary very short, Pods 2-seeded
 10302 Downy, Leaves simple reniform rounded rugose netted, Racemes few-flowered
 10303 Leaves ternate ovate acute hairy viscid, Peduncles jointed 1-2-fl. Pods oblong
 10304 Leaves tern. ovate rhomboid pubesc. beneath netted tomentose, Racemes axillary, Pods subpubescent
 10305 Leaves ternate ovate rhomboid beneath dotted with resin, Racemes longer than leaf
 10306 Leaves ternate, Flowers racemose, Pods tumid villous
 10307 Leaves ternate ovate somewhat hairy, Racemes axillary, Pods linear hooked at end
 10308 Leaves simple sagittate, Petioles winged, Stem twining shrubby
 10309 Leaves tern. roundish rhomboid smooth beneath dotted with resin, Racemes 1-sided longer than leaf
 10310 Leaves pinnate, Leaflets 5 oblong apiculate, Flowers 3 axillary
 10311 Leaves ternate villous beneath, Racemes terminal
 10312 Leaves pinnate, Leaflets 11 ovate lanceolate silky, Raceme terminal nodding lax many-flowered
 10313 Root tuberous, Lvs. pinn. Leaf. 5-7 ov. lanc. narrowed towards the end, Spikes dense shorter than leaves
 10314 Leaves pinnate, Leaflets 9 ovate downy, Racemes dense terminal with bractea, Pods coriaceous
- 10315 Leaves ternate, Leaflets ovate, Pedunc. about 3-fl. Pods very hairy
 10316 Leaves ternate, Leaflets obovate, Flowers capitate, Pods smoothish
 10317 Leaves ternate, Leaflets obovate villous, Pedunc. 1-2-fl. Keel longer than obl. wings, Stem prostrate
 10318 Leaves ternate, Leaflets ovate retuse netted, Racemes erect many-flowered
 10319 Leaves simple smooth netted subcordate at base, Flowers racemose
 10320 Leaves simple ovate, Racemes axillary few-flowered

- 10321 Cal. membranous, Upper segment bifid
 10322 Down rusty, Cal. half 5-fid, Bractes ovate acuminate, Cor. larger than cal.
 10323 Cal. scarious, Upper segment emarginate

- 10324 Leaves ternate, Raceme erect, Flowers pendulous

- 10325 Leaves quinate pinnate, Peduncles axillary 1-flowered
 10326 Leaves pinnate, Leaflets 5 round lanceolate or linear
 10327 Leaves ternate, Calyxes solitary campanulate
 10328 Leaves ternate, Calyxes twin campanulate
 10329 Leaves ternate, Calyxes cylindrical
 10330 Leaves ternate, Peduncles many-flowered, Ovary downy, Style villous
 10331 Leaves ternate, Leaflets ovate-oblong acuminate, Cal. campanulate shorter than ovate bractes
 10332 Leaves ternate, Leaflets mucronate glaucous beneath hairy, Cal. cylind. much larger than bractes

- 10333 Leaves conjugate sessile, Stipules toothed
 10334 Leaves pinnate in 4 or 5 pairs obl. glaucous beneath, Stipules half sagittate toothed at base
 10335 Leaves of 2 pairs linear subulate approximating, Stip. half-sagittate subulate 1-toothed at base
 10336 Leaves pinnate in 3 pairs ovate acuminate, Stipules half-sagittate entire, Stem simple
 10337 Leaves pinnate in 3 or 4 pairs lanceolate, Stipules half-sagittate entire, Stem winged
 10338 Leaves of 2 pairs linear-subulate downy, Stip. half-sagittate subulate nearly entire, Stem simple downy
 10339 Stem branched, Leaves in 2 pairs linear, Stipules half sagittate subulate
 10340 Leaves in 2 pairs ensiform stalked, Stipules simple, Stem simple
 10341 Leaves in 4 pairs lin. lanc. Stipules half-sagittate entire, Stem winged branched upwards
 10342 Leaves of 2 pairs lin-lanc. mucronate stalked nerved, Stipules half-sagittate toothed at base
 10343 Leaves conjugate stalked, Stipules entire, Plant covered with long hairs

and Miscellaneous Particulars.

1557. *Orobis*. From α_{24} , to excite, and β_{55} , an ox; that is to say, a food nourishing to cattle. Handsome plants, and free flowerers. *O. luteus* Haller considers as one of the handsomest of the papilionaceous tribe. *O. tuberosus*, according to Lightfoot, is in great esteem among the Highlanders of Scotland for the tubercles of the root; they dry and chew them in general to give a better relish to their liquor; they also affirm them to be good against most disorders of the thorax, and that by the use of them they are enabled to repel hunger and thirst for a long time. In Breadalbane and Ross-shire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavored and nutritive, and in times of scarcity have served as a substitute for bread. (*Lightfoot*.)

Boiled well, a fork will pass through them, and dried slightly and roasted, they are served up in Holland and Flanders in the manner of chestnuts, which they resemble in flavor. *Dickson* (*Hort. Trans.* ii. 359.) recommends cultivating them in a bed or border of light rich soil, paved at the depth of twenty inches, to prevent their roots from running down. Plant the tubers six inches apart, and three inches below the surface;

History, Use, Propagation, Culture,

the second year some will be fit to gather, and by taking only the largest, the bed will continue productive for several years, adding some fresh compost every year.

1538. *Lathyrus.* A name employed by Theophrastus to designate a leguminous plant. It is said by his commentator Bodæus a Stapel, to have been derived from *λα*, an augmentative particle, and *θηρ*, any thing which is exciting; and to have been applied to this plant in consequence of certain aphrodisiac qualities ascribed to it. *L. sativus*, *Geese*, Fr., is frequently sown in Switzerland for soiling horses. In several parts of the continent, a white light pleasant bread is made from the flour of this pulse, but it produced such dreadful effects in the last century, that the use of it was forbid by an edict of George, Duke of Wurtemberg, in 1671; and this not being observed, was enforced by two other edicts under his successor Leopold, in 1705, and 1714.

Mixed with wheat flour in half the quantity, it makes a very good bread, that appears to be harmless. But bread made with this flour only has brought on a most surprising rigidity of the limbs in those who have used it for a continuance; inasmuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden, without any previous pain; but sometimes they were preceded by a weakness and disagreeable sensation about the knees. Baths, both hot and cold, fomentations and ointments of various kinds have been tried without effect; inasmuch that it is regarded as incurable, and being neither very painful nor fatal, those who are seized with it usually submit to it with patience.

Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb, was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seed. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland, cattle feed on the herb without any harm. It would be worth enquiring, therefore, whether the soil may not contribute something to the ill qualities of the plant: and it is remarked that the seed from a strong, fat, moist soil, is much more deleterious than from a light dry one. (*Duvernoy.*)

Fabroni, from Florence, in 1786, says, that the government there has cautioned the peasants against the

and Miscellaneous Particulars.

use of *Lathyrus sativus*; swine having lost the use of their limbs, and become pitiable monsters by being fed on this pulse exclusively. The peasants, however, eat it boiled, or mixed with wheat flour, in the quantity of one-fourth, without any harm.

The poisonous *Lathyrus* from Barbary, is *L. semine punctato* of Casp. Bauhin, and seems to be only a variety; for in the crops of *L. sativus* in Italy, they find black seeds striped with white, as in the African seed. Fabroni suspects it to be a mule between *L. sativus* and *Cicera*, for the flower and seed partake of the characters of both; having a black seed marked with white; and a white banner with a red keel to the corolla. (*Fabroni's Letters in MSS. Banks.*)

L. odoratus is one of our most esteemed border annuals, and is extensively grown in pots for decorating chambers and windows. *L. tingitanus*, *articulatus*, and *annuus* are also sown as border annuals.

L. tuberosus produces tubers on the roots, like those of the earth nut (*Bunium bulbocastanum*); these are sold in the markets of Holland, like those of *Orobus tuberosus* and *Trapa natans*, and their flavor is highly esteemed.

L. latifolius is a very shewy plant for shrubberies, arbors, and trellis work, and yields a great quantity both of green fodder and seeds, which some botanists have suggested might be applied to agricultural purposes.

1559. *Ochrus*; *oxyges*, yellow, in allusion to the color of its flowers. A small annual plant with yellow flowers, native of hedges in the south of Europe.

1560. *Pisum*. From the Celtic *pis*, a pea. *P. sativum*, *Pois*, Fr., *Erbse*, Ger., and *Pisello*, Ital., is the most valuable of culinary legumes. Like most domestic plants of great antiquity, its native country is unknown, though it is commonly referred to the south of Europe. The varieties of the pea are numerous, and differ widely among themselves from the early frame, a low plant bearing only one white blossom on each footstalk, to the crown-bearing, having pink blossoms on a terminating corymb. The rouncival grows ten or twelve feet high, and the imperial not two feet. The sugar-pea has pods in which the inner film is wanting, or much less tough than usual, which admits of boiling the pods entire, and eating them in the same manner as kidney beans.

In the open garden, the pea is sown at intervals from January to the middle of July, and a succession of

History, Use, Propagation, Culture,

crops is thus obtained from the end of May to the beginning of November. By raising in hotbeds and transplanting, the first crop may be gathered in the beginning of May; and by raising and maturing in pits, peas may be gathered in April. The pea, however, does not force well, and requires extraordinary attention to giving air, otherwise the blossoms will not set. The culture of the pea is known to every countryman.

The grey pea, cultivated in agriculture, is by some considered as a species, though it is obviously a mere variety, not further removed from the frame pea than is the blue Prussian, or the crown pea. A dry soil and season is essential for a good crop, unless the plants can be supported by sticks like the garden crops. The seed is chiefly used for feeding pigs, and splitting for soup. In boiling split peas, some samples, without reference to variety, fall or moulder down freely into pulp, while others continue to maintain their form. The former are called boilers. This property of boiling depends on the soil; stiff land, or sandy land that has been limed or marled, uniformly produces peas that will not melt in boiling, no matter what the variety may be. Pease straw cut green and dried, is reckoned as nourishing as hay, and is considered as excellent for sheep. The produce of peas in flour is as three to two of the bulk in grain, and husked and split for soups as four to two. A thousand parts of pea flour afforded Sir H. Davy 57 1/4 parts of nutritive or soluble matter; viz. 501 of mucilage, or vegetable animal matter, 22 of sugar, 35 of gluten, and 16 of extract, or matter rendered insoluble during the operation.

P. maritimum has seeds of a bitterish disagreeable taste, but are reported nevertheless to have been eaten in times of scarcity. (Turner's Herbal.)

1561. *Vicia*. From *gwig*, Celtic; whence *βίσιον*, Greek, *vicia*, Latin, *vesce*, French, *vetch*, English, &c. *V. sylvatica* and *cracca*, where they occur in meadows, are considered valuable herbage plants. They yield great bulk of fodder, which is allowed to be very nutritive. Some have proposed to cultivate them alone, but Curtis observes, they would probably in that case choke themselves for want of support.

V. sativa, the winter and summer tare, fetch or vetch, is a valuable agricultural plant. Some consider the winter variety as a distinct species; but Professor Martyn proved, by cultivating both, that they were not

 10420 Pods subsess. subtern. torulose, Leaflets ovate entire, Petioles not cirrhous, Stip. sagittate toothed at base

and Miscellaneous Particulars.

even very distinct varieties. The winter variety is sown in September and October, and the summer at different periods, from February to June, for successional cuttings. The soil requires to be in a good heart, otherwise they will produce but a poor crop of herbage : on a good soil they will yield ten or twelve tons, which is found excellent for milch cows and working stock. The crop is seldom left to ripen its seeds, but when seeds are wanted ; the only use made of them being for sowing or feeding pigeons.

V. narbonensis and *serratifolia* are cultivated in Germany in the same manner as our tare. *Vicia sepium* has been recommended to be sown among clover for mowing.

V. Faba is a well known legume both of the garden and the field. The garden varieties are numerous ; the earliest is a small seeded variety, the Mazagan, and the largest the Windsor. Beans are planted at the various times in which pease are sown ; but the late sowings of this plant do not answer so well as those of the pea. When the ground is properly pulverised and in good heart, they succeed well when transplanted ; and where a first crop is injured by insects, if the stems are cut down to the ground during their flowering season, they will send up a succession of shoots, which will bear a crop. In this way, according to some, the bean may be rendered perennial, as it is certain the scarlet kidney bean may by merely protecting the roots from the frost.

The field bean, of which there is a larger and smaller sort, the latter called *ticks*, is sown in drills by a machine, so as to admit of horse hoeing, and otherwise ploughing or stirring between the rows. By this means a larger crop is produced, and the land cleaned and brought into a better state for a succeeding corn crop. Beans are excellent food for hard working horses, and for fattening hogs for bacon. The flower of beans and pease is more nutritive than that of oats, but less easy of digestion. A bushel of beans is supposed to yield fourteen pounds more of flour than a bushel of oats, and a bushel of pease eighteen pounds more, or, according to some, twenty pounds. A thousand parts of bean flour were found, by Sir H. Davey, to yield 570 parts of nutritive matter, of which 426 were mucilage or starch, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

History, Use, Propagation, Culture,

1562. *Ervum*. From *erw*, tilled land; in Celtic; to which this plant is a pest. *E. lens* (from *lentil*, Celtic), *Lentille*, Fr., *Lentze*, Ger., and *Lenticcia*, Ital., is a legume of the greatest antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria they are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journeys. There are three varieties of lentils cultivated in France and Germany; the small brown, which is the lightest flavored, and the best for haricots and soups; the yellowish, which is a little larger, and the next best; and the lentil of Provence, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grain as human food. A dry warm sandy soil is requisite for the lentil; it is sown rather later than the pea, at the rate of a bushel, or one and a half bushel, to the acre; in other respects its culture and harvesting are the same, and it ripens sooner. The produce of the lentil in grain is about a fourth less than that of the tare; and in straw it is not a third as much, the plants seldom growing above one and a half foot high. The straw is, however, very delicate and nourishing, and preferred for lambs and calves; and the grain, on the continent, sells at nearly double the price of pease. Einhoff obtained from 3840 parts of lentils, 1260 parts of starch, and 1433 of a matter analogous to animal matter.

1563. *Ervilia*. A word with the same meaning as *Ervum*. See that word.
 1564. *Cicer*. All authors agree in deriving the name from *κικυος*, force; on account of the eminent qualities the ancients attributed to it. It grows naturally in the South of Europe, and is cultivated there for the same purposes as the lentil, but it is too delicate for field culture in this country. It is called *Arietinum*, because the young seed bears a very curious resemblance to a ram's head.
 1565. *Liparia*. From *λιπαρος*, brilliant, in allusion to the surface of the leaves. "The species," Sweet observes, "thrive very well in a mixture of loam and peat, and do not require so much water as some other genera of the order. *L. villosa*, *vestita*, *sericea*, and some others, if they get too much water over their leaves

- 10421 Pedunc. 2-fl. Seeds compressed, Leaflets entire
 10422 Pedunc. about 2-fl. Pods smooth 4-seeded, Leaflets oblong truncate
 10423 Pedunc. many-fl. Pods hairy 2-seeded, Leaflets lin. blunt
 10424 Pedunc. 2-fl. awned, Pods smooth 2-seeded, Leaflets lin. lanceolate downy
 10425 Pedunc. awned shorter than leaf, Leaflets obl. truncate smooth, Stipules hastate
 10426 Pedunc. 1-fl. Seeds globose gibbous, Leaflets serrated
 10427 Flowers capitate, Leaves lanceolate nerved smooth
 10428 Flowers capitate: head erect, Leaves lanceolate smooth
 10429 Flowers capitate, Leaves lanceolate downy
 10430 Flowers capitate, Leaves ovate concave woolly beneath
 10431 Flowers spiked hairy, Leaves lanceolate, and angular stem smooth
 10432 Flowers fascicled, Leaves ovate villous downy
 10433 Flowers racemose, Leaves obovate oblong smooth, Stem hairy
 10434 Flowers somewhat spiked, Leaves ovate villous downy
 10435 Racemes simple pendulous, Leaflets ovate oblong, Pods hairy
 10436 Racemes simple pendulous, Leaflets ovate oblong rounded at base, Pods quite smooth
 10437 Racemes lateral erect, Branches round spreading, Leaflets ovate downy
 10438 Racemes terminal erect, Calyxes hairy: teeth minute, Leaflets ellipt. hairy
 10439 Racemes terminal erect, Calyxes villous: segments falcate, Leaf. obovate oblong
 10440 Racemes terminal erect, Calyxes and pods viscid, Leaflets oblong
 10441 Racemes erect, Calyx with a triple bractea, Floral leaves sessile
 10442 Racemes terminal 1-sided, Leaves pinnated hoary, Leaflets roundish elliptical
 10443 Racemes axillary erect, Leaflets sublanceolate downy: the middle one in a long stalk
 10444 Raceme term. 1-sided 4-fl. Leaflets obovate downy beneath, Calyxes deeply 3-parted
 10445 Pedunc. aggregate subterminal, Calyxes hairy trifid, Leaflets obov. mucronate hairy beneath
 10446 Flowers capitate, Branches straight round villous, Leaflets ovate ellipt. villous, Bract linear
 10447 Fl. in term. umbels, Stems erect, Leaflets lanc. strigose pubescent
 10448 Fl. umbelled term. Stems erect, Leaflets ellipt. smooth acute
 10449 Fl. axillary solitary stalked, Stems procumbent, Leaflets obovate, Pods linear repand
 10450 Fl. stalked sub-binate axillary, Stem decumbent, Leaflets obovate blunt
 10451 Pedunc. sub-binate axillary, Stems diffuse-erect, Leaflets oblong lanceolate
 10452 Stems stalked lateral about 3 erect, Stem declinate branched, Leaflets obovate mucronate
 10453 Flowers stalked axillary about 3, Calyxes campanulate, Leaflets obovate blunt hairy
 10454 Flowers stalked lateral about 4, Stem erect, Branches long, Cal. tubular, Leaflets obovate
 10455 Racemes term. erect, Leaflets obl. rhomboid blunt, Stipules rounded ovate oblique
 10456 Flowers in lateral umbels, Stems erect, Leaves ellipt. erect silky beneath, Calyxes woolly
 10457 Pedunc. about 3 term. Leaflets oblong lanceolate silky, Pods linear silky, Stems decumbent
 10458 Flowers umbelled terminal, Cal. 3-parted: lower tooth trifid, Leaflets rounded obovate, Stems ascending

and Miscellaneous Particulars.

will be killed. Very young tops, taken off for cuttings, and planted under a bell-glass, in sand, are not difficult to root. (*Bot. Cult.* 217.)

1566. *Cytisus*. Pliny says it was so called because found in *Cythus*, one of the Cyclades. The *Cytisus* of the ancients is believed to have been our *Medicago arborea*. A genus of ornamental trees and shrubs, of which the *Laburnum*, *Cytise des alpes*, Fr., *Bohnenbaum*, Ger., are well known and universally admired examples. There are two species of *Laburnum*, which are so much alike, that in most nurseries they are confounded together, or only one in cultivation. *C. alpinus* is the tree *Laburnum*, whose timber (the false ebony of the French) is much prized by cabinet-makers and turners, for its hardness, beauty of grain, and durability. The tree is frequently sown in plantations infested with hares and rabbits, who will touch no other tree so long as a twig of *laburnum* remains. "Though eaten to the ground in winter," as Boucher observes, "it will spring again next season, and thus afford a constant supply for these animals, so as to save the other trees till of a size to resist their attacks. The timber has been sold for upwards of half a sovereign per foot." It becomes most valuable in light loams and sandy soils.

C. wolgarius and *purpureus* are very handsome shrubs; and make a fine appearance when grafted on stocks of *laburnum* five or six feet in height.

C. cajan (an alteration of the Malay name, *Catjang*), *Pois d'Angola*, Fr., is frequently planted in the West India Islands, chiefly in rows as a fence to the sugar plantations, and will thrive on barren land. The seed is much eaten by poor people and negroes, and is esteemed a wholesome pulse. In the island of Martinico even the better sort of people hold it in estimation, and prefer it to the European pea. The chief use of it in Jamaica is for feeding pigeons, whence its name. The branches, with the ripe seed and leaves, are given to feed hogs, horses, and other cattle, which grow very fat on them. (*Sloane and Jacq. Obs.*)

History, Use, Propagation, Culture,

1567. *Mullera.* In honor of Otho Frederick Müller, a Dane, one of the editors of the *Flora Danica*. There have also lived four other Müllers, Germans, and botanists. The fruit is remarkable for its form, which is that of a necklace; a number of little balls being united by stalks, and not opening as in other leguminosæ, but always remaining closed. The flowers are pink, and the size of a bunch of Laburnum.

1568. *Robinia.* In memory of Jean Robin, herbarist to Henry IV. of France, author of *Histoire des Plantes*, &c., Paris, 1620. His son, Vespasian, was subdemonstrator at the *Jardin de Roi*, and was the first person who cultivated the *R. pseudacacia* in Europe.

R. pseudacacia is a thorny fast-growing tree, of middling stature, of no great beauty as a tree, but ornamental when young, and very well adapted for copse-wood and rough timber. The leaves come out late in spring, and fall off early in autumn, like those of the ash. The timber is much valued in North America, and said to be superior to that of the laburnum; "being close-grained, hard, and finely veined; and in America more valued by the cabinet-maker than any other native timber whatever. Pursh, in his *Flora*, asserts, that being nearly incorruptible, it is equally useful for posts and gates. We are informed by a friend, that gate-posts of this timber, on a property near Baltimore, have remained fresh for nearly a century. The finest pinnated leaves, and pendulous white odoriferous flowers, add greatly to its beauty. Its value is scarcely known in this country." (*Caled. Mem. ii. 414.*) It prefers a deep sandy soil, and rather sheltered situation; being very apt to throw up suckers from the running roots, and as it stoles freely, it seems peculiarly calculated for copse-woods. *Beatson (Com. to Board of Agr.)* has cultivated it in this way to great advantage.

In North America the use of the locust-tree has hitherto been confined to treils, on account of its scarcity, but were it as plentiful as oak, it would be applied for more purposes by the shipwright, such as knees, floor-timbers, and foot-hooks, being much superior to oak for its strength and duration, and, from the tree spreading into branches, affords full as large a proportion of crooks or compass timber as oak.

A cubic foot of acacia, in a dry state, weighs from 48 to 53 pounds avoirdupois. If we compare its toughness in an unseasoned condition with that of oak, it will not be more than 8-100 less. Its stiffness is equal to 99-100 of oak; and its strength nearly 96-100; but were it properly seasoned, it might, possibly, be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned acacia, two feet six inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoirdupois. Its medium cohesive force is about 11,500 pounds. (*Dict. of Archi.*)

10459 The only species

10460 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Stipules spiny, Pods smooth

10461 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Branches and pods viscid with glands

10462 Racemes with 2-fl. pedicels, Cal. truncate, Leaves pinnated with an odd one, Stem unarmed

10463 Petioles somewhat spiny, Leaflets lanceolate mucronate downy, Pedic. 1-flowered

10464 Racemes axillary few-flowered, Calyxes and branchlets finely bristly

10465 Racemes axillary, Leaves pinnate with an odd one, Stem hispid

10466 Pedunc. simple several, Leaves in 4 pairs, Petioles unarmed, Pods cylindrical

10467 Leaves about 4 pair; leaflets obovate, Peduncles twin shorter than flower

10468 Pedunc. simple, Leaves 4 stalked hoary terminated by a weak spine, Pods downy

10469 Pedunc. simple solitary, Leaves in about 8 pairs, Stipules spiny, Pods compressed

10470 Pedunc. simple, Leaves in many pairs downy, Petioles filiform spiny, Branches villous

10471 Pedunc. simple, Leaves in 2 pairs, Leaf. obl. lanc. silky, Stipules and petioles spiny

10472 Pedunc. simple, Leaves in 4 pairs, Leaf. cuneate smooth, Stipules and petioles spiny

10473 Pedunc. 3-fl. Leaves in 2 pairs silky, Petioles spiny persistent, Pods bladderly

10474 Pedunc. simple, Leaves in 2 pairs, Leaflets obovate shining, Stipules and petioles spiny

10475 Pedunc. simple, Leaves about 4 somewhat petiolated terminated by a weak spine

10476 Pedunc. simple, Leaves 4 sessile

10477 Stalk of pod longer than persistent filaments

10478 Stalk of pod shorter than persistent filaments

10479 Leaflets obl. blunt hoary beneath, Stem shrubby, Branches silky with down

10480 Leaflets linear emarginate smooth, Stem weak, Raceme axillary

10481 Leaflets linear emarginate hairy, Cal. without bractes with black hairs

10482 Leaf. obl. downy, Stem erect, Racemes terminal

10483 Leaflets in 7 pairs ovate acute smoothish, Racemes axillary subcapitate 1-sided

10484 Leaflets ellipt. retuse, Prominences of the standard short

10485 Leaflets obovate glaucous, Pedunc. about 6-flowered, Pods closed at end

10486 Leaf. obovate emarginate glauc. Prom. of standard blunt very small, Pods open at end

10487 Leaf. roundish ellipt. very blunt mucronate, Prom. of standard long ascending, Stem shrubby

and Miscellaneous Particulars.

R. hispida is a very handsome shrub, but it requires a sheltered situation, otherwise the branches are very liable to be shattered or blown off by high winds. In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventative is to graft on the root a little below the surface. Grafts in this manner are also much more certain of success.

R. viscosa resembles, in its leaves and flowers, the common acacia; but is, altogether, a much handsomer tree. 1569. *Caragana*. This genus has been confounded by Linnæus and his followers with *Robinia*. The name is derived from the appellation of the most common species in Tartary, where it is called among the Moguls, *Carachanâ*. *Altagana*, the name of another species, is in like manner a slight alteration of the Tartar name *Aldachanâ*.

C. spinosa, on account of the length and toughness of the branches, and its large stout thorns, is admirably adapted to form impenetrable hedges, and is sufficiently hardy to bear our climate. About Pekin, they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them. (*Pallas*.)

C. Halodendron is a handsome shrub, and grows in Siberia on dry naked salt-fields, and it is probably from the want of this principle in our garden soils, that it so seldom flowers here.

C. pygmaea is a weak low shrub, with a shining yellow bark, with wood of a deep bay, almost as hard as horn. *C. frutescens* is used by the Tartars for the same purposes as osiers, for which its tough shoots render it proper.

C. jubata is remarkable plant, its shoots always remaining covered by the persistent brown stipulae of the fallen leaves. It is extremely difficult to propagate, and is rarely even seen in this country. The most successful cultivators of it are Messrs. Loddiges and Son.

1570. *Swainsonia*. Named after the late Mr. Isaac Swainson, who had a botanic garden at Twickenham.

1571. *Sutherlandia*. In honor of Mr. James Sutherland, who published, in 1683, an 8vo. catalogue of the Physic Garden at Edinburgh. This and the former genus seed freely, and may also be readily increased by cuttings.

1572. *Lessertia*. Named by Decandolle in honor of M. Stephen Delessert, to whose mother Rousseau's Letters on Botany were addressed.

1573. *Colutea*. An ancient name of a bush with sweet-scented flowers; probably similar to the genus now

History, Use, Propagation, Culture,

so called. Shrubs with membranaceous inflated pods, free-growers and flowerers, well adapted to introduce in extensive shrubberies.

C. arborescens grows on Mount Vesuvius, even in the ascent to the crater, where there are scarcely any other plants. The leaves are recommended as answering all the purposes of senna, and Allioni has given particular directions for the preparation of them. A larger dose seems to be required to produce the same effect. The seeds, in a quantity of a drachm or two, excite vomiting. It is said by Haller and Ray to afford food grateful to cattle.

1574. *Glycyrrhiza*. From γλυκυσ, sweet, and ρίζα, a root; the sweet taste of the liquorice root is well known. But the species from which the name is derived now constitutes a different genus. See *Liquiritia*.

1575. *Liquoritia*. A Latinized appearance of our common English word *Liquorice*, which in its turn is said to be an alteration or corruption of the French word *Reglisse*, itself a corruption of *Glycyrrhiza*. So, at least, says De Theis. To others, however, it is appears more probable that the name alludes to the quantity of *liquor* or *liquid* which the roots contain, and which constitutes their great value.

L. officinalis is a deep-rooting perennial, which has long been much cultivated in Spain; and since Elizabeth's time has been grown in different parts of England. The soil should be a deep sandy loam, trenched by the spade or plough, or with the aid of both, to two and a half or three feet in depth, and manured, if necessary. The plants are procured from old plantations, and consist of the side-roots, which have eyes or buds. These may be taken off, either in autumn, when a crop of liquorice is taken up for use, and laid in earth till spring; or taken from a growing plantation, as wanted for planting. The planting season may be either October, or February and March. In general the latter is preferred. The plants are dibbled in, in rows three feet apart, and from eighteen inches to two feet in the row, according to the richness of the soil. The after-culture consists in horse-hoeing and deep stirring, in weeding, and in cutting over and carrying away the haulm every autumn, after it is completely withered. As the plants do not rise above a foot the first season, a crop of onions or beans is sometimes taken in the intervals. The plants must have three summers' growth, at the

- 10488 Pods echinate, Fl. capitate, Stipules lanc. Leaflets smooth oblong mucronate
 10489 Pods glandular echinate, Fl. racemose, Stipules withering, Leaf. oblong lanc. emarg. clammy beneath
 10490 Leaflets oblong acute silky, Pods racemose oblong hispid
 10491 Pods smooth moniliform, Raceme term. Stipules lanc. Leaf. obovate emarg. rough beneath
 10492 Pods hirsute, Leaf. obl. lanc. Flowers racemose

10493 Pods smooth, Stipules O, Leaflets ovate retuse clammy beneath

- 10494 Pedunc. about 3-fl. Claws of cor. three times as long as calyx, Stem angular
 10495 Leaves 5-nate and 3-nate linear lanceolate fleshy blunt
 10496 Leaflets about 9, Stipules nearly round
 10497 Leaflets 7 very blunt, Stipules lanceolate
 10498 Leaflets 6-10 pair more or less obovate and retuse, Pods very long curved upwards
 10499 Leaves 9 ellipt. : inner close to stem, Stipules opp. the leaves lanceolate
 10500 Procumbent, Leaf. 9 ovate, Stipule opp. the leaf emarg. Pods angular knotty
 10501 Leaflets 11 silky : the outer the largest
 10502 Leaflets several lanceolate smooth, Pods rounded erect
 10503 Leaflets 15 cuneate retuse, Pods rounded erect 5 together
 10504 Leaflets several obl. cuneate, Pods compressed ensiform
 10505 Leaflets 9 very blunt somewhat emarginate, Stipules round toothletted

- 10506 Pods sessile solitary erect
 10507 Pods stalked clustered circular : lobed on one edge
 10508 Pods stalked clustered smooth lobed on the outer edge, Leaves and cal. hairy
 10509 Pods stalked clustered arcuate rough sinuated on one side

- 10510 Leaves pinnated, Flowers capitate with a bractea, Pods roundish incurved
 10511 Leaves pinnated, Flowers capitate without a bractea, Pods round incurved

- 10512 Leaves pinnated, Flowers capitate with a bractea, Pods compressed recurved rugose
 10513 Leaves ternate subsessile : the odd one very large
 10514 Leaves ternate or quinate : the odd one largest, Stipules large membranous 2-toothed
 10515 Leaves pinnated, Pods rugose pendulous scarcely bowed, Joints compressed roundish

- 10516 Pedunc. 1-fl. Pods covered over with blunt scales
 10517 Pedunc. 2-fl. Pods bluntly aculeate outwardly
 10518 Pedunc. about 3-fl. Pods bearing outwardly distinct acute spines
 10519 Pedunc. about 4-fl. Pods bearing outwardly clustered acute spines

10520 Lips of calyx entire, Racemes stalked few-flowered

and Miscellaneous Particulars.

end of which the roots may be taken up by trenching over the ground. The roots are either immediately sold to the brewers' druggists, or to common druggists, or preserved, like carrots or potatoes, in sand, till wanted for use. They are used in medicine and porter-brewing.

1576. *Coronilla*. From *corona*, a crown. Its pretty flowers are disposed in little tufts like coronets. Handsome free-flowering shrubs, of easy culture. *C. valentina*, glauca, and *viminalis* are valuable as flowering in winter, and often all the summer. *C. argentea* bears a profusion of flowers, which have a strong sweet scent. The silvery color of this plant is occasioned by its growing on a poor dry soil; and if it is removed into better ground, it will take a glaucous color; and the contrary. *C. emerus* is a popular shrub of much beauty.

C. varia is a strong coarse-growing plant, and has been grown as an adjunct to clover, lucern, &c. Curtis says, it is bitter; but others have found horses and cows to eat it greedily.

1577. *Hippocrepis*. From *ἵππος*, an horse, and *κρηπίς*, a shoe; in allusion to the form of its pod. Pretty little annual plants, with bright yellow flowers.

1578. *Ornithopus*. From *οἰς*, a bird, and *πυς*, a foot. The pods are twisted and curved in such a manner as to resemble the claws of a small bird. Curious on account of their jointed pods, but not worth culture as plants of ornament. *O. sativus* is a most valuable agricultural plant. It was introduced for purposes of field culture about the year 1818, from Portugal, under the name of Serradilla. Sown upon the barren, light, sandy downs of Thetford, in Norfolk, it produced an abundant crop of most excellent fodder, where nothing else would grow. It is exceedingly like *O. scorpioides*, except that it arrives at the height of two feet instead of as many inches.

1579. *Scorpiurus*. From *σκορπιος*, a scorpion, and *ουρα*, a tail; on account of the twisted pod, which is very like the tail of some reptile.

1580. *Smithia*. In memory of Sir James Edward Smith, M. D., F. R. S., knight, president of the Linnean Society, possessor of the Linnean herbarium, and author of various elementary and other useful botanical works. These are inconspicuous worthless weeds, possessing little interest beyond their irritable foliage.

History, Use, Propagation, Culture,

1581. *Sesbania*. The Arabic name *Sesban*, a little Latinized. Most of these plants are ornamental. *S. grandiflora* is a beautiful plant; it grows in peat and loam, and cuttings root in sand under a hand-glass.

1582. *Æschynomene*. A name given by Pliny to a plant which withdrew its leaves from the contact of the hand. It is derived from *αἰσχνομα*, to be modest. One of the species of *Æschynomene* is sensitive, but it is not the plant of Pliny.

1583. *Stylosanthes*. From *στυλος*, a style, and *ανθος*, a flower: a flower with a very long style. Worthless tropical weeds.

1584. *Hallia*. Named after Birger Martin Hale, a pupil of Linnaeus, and the student under whose name the thesis called *Nectaria florum* stands in the *Amoenitates Academicæ*.

1585. *Lespedeza*. Named by Michaux, in honor of Lespedez, a governor of Florida, who protected that botanist in his botanical researches. Herbaceous, chiefly North American plants with little merit.

1586. *Flemingia*. Named after Dr. John Fleming, president of the East India Company's Medical Board at Bengal.

1587. *Zornia*. Supposed to have been named after Mr. John Zorn, an apothecary at Kempten, in Bavaria, author of a work called *Icones Plantarum Medicinalium*, in five volumes, octavo, between the years 1779 and 1784. There was also a Dr. Bartholomew Zorn, of Berlin, author of *Botanologia Medica*, 1714, &c. &c.

1588. *Hedysarum*. From *ἡδύς*, sweet, and *αρωμα*, smell; some the species have fragrant flowers. A

- 10521 Racemes about 3-fl. Leaf. obl. emarg. smooth, Pods filiform straight compressed
 10522 Racemes many-fl. Leaf. lin. blunt mucronate, Rachis of leaves smooth, Pods filiform round
 10523 Racemes few-fl. Leaf. linear blunt mucronate, Rachis of leaves prickly, Pods filiform round

 10530 Stem smooth, Pods smooth torose on one side and blunt, Leaflets blunt
- 10531 Leaves ovate lanc. smooth, Spikes many-fl. Bractes smooth mucronate, Stem downy
- 10532 Leaves lanc. mucronate smooth, Pedunc. 1-fl. the length of leaves
 10533 Leaves cordate obl. acute smooth, Pedunc. the length of leaves
 10534 Leaves cordate ovate convolute imbricated, Flowers axillary sessile
- 10535 Leaf. subovate villous beneath, Flowers in sessile fascicles, Stem shrubby
 10536 Leaf. oblong, Fascicles of flowers sessile numerous, Pods nearly naked acute
 10537 Leaf. somewhat lin. hairy beneath, Racemes axillary, Pods smooth length of calyx
 10538 Simple, Leaf. ellipt. Spikes capitate on short stalks axillary and terminal, Cal. vill. length of cor.
 10539 Branched villous, Leaf. round oval, Spikes axillary on long stalks, Cor. as long as calyx
 10540 Branched diffuse, Leaf. ellipt. blunt hairy beneath, Racemes short umbellèd
 10541 Leaves ternate ovate, Racemes oblong, Pods inflexed, Calyx hairy
- 10542 Stem subsimple upright, Leaf. broad lanc. smooth, Racemes axill. sol. length of petiole
 10543 Branched nearly upright, Leaf. ellipt. smooth, Petioles winged, Racemes panicled term. and axillary
 10544 Nearly erect, Leaf. broad-lanc. Racemes axillary clustered
 10545 Somewhat branched, Leaf. obovate, Petioles winged, Racemes clustered, Pods gland. viscid
 10546 Erect branched, Leaf. obovate cuneate, Racemes axill. on long stalks dichotomous
 10547 Leaves simple, Spikes like cones, Bractes cuculate foliaceous netted
- 10548 Leaves ternate large, Bractes numerous orbicular lined
 10549 Leaves binate ovate-lanc. Bractes ovate acute
- 10550 Leaves simple lanc. blunt, Stem spiny
 10551 Leaves simple lanc. acute, Stem unarmed, Stipules scarious
 10552 Leaves simple obovate roundish, Stipules scarious shorter than petiole, Pods smooth netted
 10553 Leaves simple cordate-roundish blunt smooth above downy beneath
 10554 Leaves simple ovate acute with stipules
 10555 Leaves simple cordate oblong stalked winged, Branches 3-cornered
 10556 Leaves simple ovate blunt
 10557 Leaves simple cordate oblong, Petioles simple, Stipules sheathing
 10558 Leaves simple cordate lanc. sagittate, Flowers solitary, Pedunc. capillary very long
 10559 Leaves simple and ternate intermediate 2-lobed: lobes spreading lanc. Joints of pod wavy plaited

and Miscellaneous Particulars.

numerous genus, not remarkable for beauty, but containing two curious species, the manna plant, and the turning *Hedysarum*; and one of considerable importance in European agriculture, the Saint-foin.

H. Alhagi is a thorny shrub, with lanceolate leaves, and coriaceous, subcylindric, and scarcely jointed pods. It is on this plant that *Manna Trunbergii* is found in Mesopotamia (*Russ. Aleppo*) and other eastern countries. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tinos; Tournefort also found it in many plains of Armenia and Georgia, and made a distinct genus of it, under the name of *Alhagi*, from the Arabic *Aghul* or *Al-gul*.

H. gyrans is a native of Bengal near the Ganges; and is called there *Burram Chadali*, or *Burram Chandali*. This is a wonderful plant, Linnæus observes, on account of its voluntary motion, which is not occasioned by any touch, irritation, or movement in the air, as in *Mimosa*, *Oxalis*, and *Dionea*; nor is it so evanescent as in *Amorpha*. No sooner had the plants raised from seed acquired their ternate leaves, than they began to be in motion this way and that; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order or direction; one leaflet frequently revolved, whilst the other on the same petiole was quiescent; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once: the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stove during the second year of its growth, and was not at rest even in winter. (*Suppl. Linn.*) Swartz observes, that the motion is irregular, and that it sometimes ceases entirely; that in a very hot day it is immovable, being agitated only in the evening, and that slowly. In our climate, the leaves, in

History, Use, Propagation, Culture,

general, only make a faint and feeble attempt towards the middle of the day at exerting their extraordinary faculty. (Shaw.)

This motion does not depend upon any external cause that we can trace, and we are not able to excite it by any art that we possess. It is not the action of the sun's rays, for this plant is fond of shade, and the leaves revolve well on rainy days, and during the night: exposed to too much wind or sun, it is quiet. Perhaps, says Linnæus, there may be some part in vegetables, as in animals, where the cause of motion resides.

H. coronarium, Sulla, or Saintfoin à bouquets, Fr., is an esteemed border biennial, and some speculative agriculturists recommend it for cultivation as a field plant. In Calabria it grows wild in great luxuriance, near four feet high, affording excellent nourishment to horses and mules, both green and made into hay: but it does not well bear the spring in the north of Italy: we may presume, therefore, that it will scarcely bear our climate well enough to answer the purposes of husbandry. Osbeck mentions, that he saw it brought into Cadiz in great bundles, as food for cattle.

H. Onobrychis, L'esparcet, Fr., Esparzette, Ger., and Cedrangolo, Ital., is a deep rooting perennial, with branching spreading stems, compound leaves, and shewy red flowers. It is a native of many parts of Europe, but never found but on dry warm chalky soils, where it is of great duration. It has been long cultivated in France, and in other parts of the continent, and as an agricultural plant, a good deal in England, in the chalky districts; and its peculiar value is, that it may be grown on soils unfit for being constantly under tillage, and which would yield little undergrass. This is owing to the long and descending roots of the saint-foin, which will penetrate and thrive in the fissures of rocky and chalky understrata. Its herbage is said to be equally suited for pasturage or for hay, and eaten green it is not so apt to swell or hove cattle as the clovers or lucern. Arthur Young says, that upon soils proper for this grass no farmer can sow too much of it, and in

 10604 Leaves pinnate obl. smooth, Petals nearly equal, Pods 1-seeded prickly, Teeth of crest lanceolate
 10605 Leaves pinnate, Racemes long, Pods inflexed

and Miscellaneous Particulars.

The Code of Agriculture, it is said to be "one of the most valuable herbage plants we owe to the bounty of providence."

The deeper the soil is stirred previously to sowing the better; the seed is generally put in broad cast, at the rate of three or four bushels the acre, and sometimes a little red clover is sown afterwards to produce a crop the second season, when the saint-foin plants are but small. When saint-foin is annually mown, it should be top-dressed with manure; but if only occasionally mown, the benefits derived from the grazing of sheep or cattle will, to a considerable extent, answer for surface dressings in a plant that derives a part of its nutriment from the subsoil. Saint-foin is highly nutritive, either cut green or made into hay. The produce, on a medium of soils and cultivation, may probably be estimated at from about one and a half to two tons the acre. And on the poorer and thinner staple sorts of land, it will perhaps seldom afford less than from a ton to a ton and a half on the acre. One thousand parts of saint-foin afforded Sir H. Davy thirty-nine of nutritive matter, which is the same as that afforded by the red and white clover.

The usual duration of saint-foin, in a profitable state, is from eight to ten years. It usually attains its perfect growth in about three years, and begins to decline towards the eighth or tenth on calcareous soils, and about the seventh and eighth on gravels. There are instances, however, of fields of saint-foin, which had been neglected and left to run into pasture, in which plants have been found upwards of fifty years from the time of sowing. It has been cultivated upwards of a century on the Cotswold hills, and there roots of it have been traced down into stone quarries from ten to twenty feet in length, and in Germany, Von Thier found them attain the length of sixteen feet. In general, the great enemy to the endurance of saint-foin, is the grass which accumulates, and forms a close turf on the surface, and thus chokes up the plant.

History, Use, Propagation, Culture,

1589. *Indigofera*. That is to say, a plant bearing *indigo*. The species are elegant little shrubs, free-flowerers, and of easy culture. Most of them will yield the dye, but those chiefly cultivated for this purpose are the 1. Anil (*Anyl*, Arab.), in the West Indies, and the 1. tinctoria, argentea, and some other species in the East Indies. The indigo is one of the most profitable articles of culture in Hindustan; because an immense extent of land is required to produce but a moderate bulk of the dye; because labor and land here are cheaper than any where else; and because the raising of the plant and its manufacture may be carried on without even the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise if the seed is deposited in dry soil, it heats, corrupts, and is lost. The crop being kept clear of weeds, is fit for cutting in two or three months, and this may be repeated in rainy seasons every six weeks. The plants must not be allowed to come into flower, as the leaves in that case become dry and hard, and the indigo produced is of less value; nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated and parted with its coloring matter; then the liquor is let off into another, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade. Before it is perfectly dry, it is cut in small pieces of an inch square; it is then packed in barrels, or sowed up in sacks for sale. Indigo was not extensively cultivated in India before the British settlements were formed there; its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity. The indigo is one of the most precarious of oriental crops; being liable to be destroyed by hail storms, which do comparatively little injury to the sugar-cane and other plants.

The indigo cultivated in the West Indies, thrives best in a free rich soil, and a warm situation, frequently refreshed with moisture. Having first chosen a proper piece of ground, and cleared it, hoe it into little

and Miscellaneous Particulars.

trenches, not above two inches, or two inches and a half in depth, not more than fourteen or fifteen inches asunder. In the bottom of these, at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot, they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate great quantities, only strew the seeds pretty thick in little shallow pits, hood up irregularly, but generally within four, five, or six inches of one another, and covered as before. Plants raised in this manner, are observed to answer as well, or rather better, than the others; but they require more care in the weeding. They grow to full perfection in two or three months, and are observed to answer best when cut in full blossom. The plants are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper. Seventeen negroes are sufficient to manage twenty acres of indigo; and one acre of rich land, well planted, will, with good seasons and proper management, yield five hundred pounds of indigo in twelve months, for the plant ratoons (i. e. it sends out stolones), and gives four or five crops a year; but must be replanted afterwards.

Indigo has long been cultivated in Spain, but is on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy, during the Buonaparte dynasty, but found not worth following for the same reason.

1590. *Tephrosia*. From *τεφρος*, ash-colored, in allusion to the color of the foliage. *T. toxicaria* is a spreading shrubby plant. The leaves and branches, well pounded, and thrown into a river or pond, very soon affect the water, and intoxicate the fish, so as to make them float on the surface, as if dead; and most of the large ones recover after a short time, but the greatest part of the small fry perish on these occasions. It has been introduced to Jamaica, and cultivated there, on account of its intoxicating qualities. (*Brown*)

1591. *Galaga*. A name of unexplained meaning. *Ruellius* says, it is the word *Glauz*, Italianized! *G. officinalis* was formerly accounted cordial and sudorific, but is now out of repute. The species are handsome border flowers.

History, Use, Propagation, Culture,

1592. *Phaca*. Φακη, or φακος, was the Greek name of the lentil; and was derived from φαγω, to eat. These are pretty herbaceous plants, with the habit of *Astragalus*.
 1593. *Oxytropis*. From οξυς, pointed, and τροπισ, a keel. A genus entirely resembling *Astragalus* in habit; but considered distinct by modern botanists.
 1594. *Astragalus*. This was a name given by the Greeks to one of their leguminous plants, but it is not known to which. The modern genus is composed of plants, the greater number of which are very orna-

10645 Erect hairy, Leaf, oval acute, Stip. lanc. Pods obl. cymbiform compressed
 10646 Erect undivided, Leaf, 11 obl. blunt subciliated, Pods oblong inflated
 10647 Erect branched downy, Leaf, in many pairs obl. lanc. blunt, Pods half ovate acute
 10648 Branched ascending, Leaf, about 17 lanc. : the odd one subsessile, Ala bifid
 10649 Branched ascending smooth, Leaf, about 11 lin.-lanc. : the odd one subsess. Pods obovate inflated erect
 10650 Caulescent procumb. Fl. pendulous racemose, Pods acute at each end hairy

10651 Stemless villous, Pods erect roundish-obl. villous acuminate with style half 2-celled
 10652 Stemless silky, Leaf, 19 lanc. ellipt. acute at each end, Spikes capitate
 10553 Stemless villous silky, Pods erect ovate cylindr. inflated 2-celled
 10554 Stemless, Leaf, lanc. silky, Scape longer than leaf and calyxes silky, Heads few-fl. cernuous

10655 Stemless, Calyx and pods villous, Leaf, lanc. acute, Stem decumbent
 10656 Stemless, Pods subulate hooked longer than leaf, Leaf, orbicordate
 10657 Stemless, Leaf, lanc. smooth, Scapes as long as leaves hairy, Flowers in obl. heads
 10658 Stemless, Leaf, cuneiform retuse subsessile, Pods smooth, Flowers nearly apetalous
 10659 Caulescent erect hairy, Leaf, lanc. acute, Spikes stalked longer than leaf, Pods subulate hairy
 10660 Caulescent erect hairy, Leaf, 3-pair lanc. acute, Stip. obl. acun. Spikes stalked longer than leaf
 10661 Caulescent ascending, Leaf, ovate lanc. deflexed hairy, Spikes stalked longer than leaf
 10662 Caulescent diffuse downy, Stipules united, Wings emarg. Peduncles as long as leaf

10663 Caulescent erect, Leaf, ellipt. stalked, Stip. lin. subulate, Pedunc. about 3-fl. axill. clustered
 10664 Caulescent erect, Leaf, roundish cordate sessile downy, Stip. ovate acuminate, Pedunc. 1-fl. axill.
 10665 Caulescent erect, Spikes cylindrical subsessile, Cal. and pods woolly
 10666 Caulescent erect, Heads of flowers stalked globose, Pods 4-seeded inclosed in woolly calyx
 10667 Caulescent erect, Heads of flowers sessile axill. short, Corolla larger than calyx
 10668 Caulescent erect, Heads globose, Pedunc. very long, Leaf, emarginate
 10669 Caulescent erect striated, Leaf, lin. lanc. smooth, Stip. lanc. Racemes longer than leaf
 10670 Caulescent erect panicled, Leaves of 2 or 3 pair linear cuneate retuse smooth, Racemes filiform
 10671 Caulescent erect shrubby, Leaves in 6 pairs lin. lanc. hoary, Racemes long spiked
 10672 Caulescent erect, Leaf, linear lanc. Spikes obl. stalked longer than leaf, Standard twice as long as ala
 10673 Caulescent erect rough, Leaf, lin. lanc. Spikes stalked longer than leaves straight, Pods 3-cornered
 10674 Caulescent erect straight smooth, Leaf, ellipt. blunt, Fl. racemose pendulous, Pods 3-cornered smooth
 10675 Caulescent erect straight smooth, Leaf, ellipt. blunt, Fl. racemose pendulous, Pods inflated rugose
 10676 Caulescent erect smooth, Leaf, lanc. acute, Racemes longer than leaf, Pods falc. acute pendulous
 10677 Caulescent erect, Peduncles as long as leaves, Leaflets 33-41, Pods about 3-cornered arcuate
 10678 Caulescent erect, Leaf, obl. downy, Spikes stalked, Bractes obl. length of calyx
 10679 Caulescent erect, Leaf, obl. downy beneath, Spikes stalked, Bractes lanc. length of peduncle
 10680 Caulescent diffuse, Pods subcylindrical mucronate, Leaf, naked beneath
 10681 Pedunc. as long as leaves, Leaf, 33-41 scarcely downy, Pods 3-cornered bowed nodding
 10682 Pedunc. as long as lvs. Leaf, smoothish obl. blunt mucro. Stip. lanc. Racemes stalked longer than leaf
 10683 Pedunc. as long as lvs. silky-white, Leaf, 21 ellipt. smooth above, Spikes subsessile, Pods fleshy
 10684 Pedunc. longer than leaf, Fl. erect closely spiked, Pods half 2-celled
 10685 Caulescent prostrate, Leaf, smooth ovate mucronate blunt, Stip. ovate-lanceolate
 10686 Caulescent erect spread. Leaf, ov. hairy, Stip. solitary opp. the lvs. 2-parted, Spikes stalked long. than leaf
 10687 Caulescent, Scapes 2-fl. Pods hooked subulate with 2-keels
 10688 Caulescent prostrate, Leaf, ellipt. cuneate emarg. Racemes few-fl. Peduncles longer than leaf
 10689 Caulescent procumbent, Leaf, cuneate emarg. Stip. ov. Racemes few-fl. stalked shorter than leaf
 10690 Caulescent erect, Leaf, obl. retuse, Fl. axill. sol. subsessile, Pods deeply channeled
 10691 Caulescent procumbent downy, Leaf, obovate emarg. Racemes stalked arcuate twisted
 10692 Caulscent procumb. Leaf, obl. blunt mucro. Spikes stalked few-fl. shorter than lvs. Pods obl. hooked at end
 10693 Caulscent diffuse, Heads stalked lateral, Pods straight subulate mucronate
 10694 Caulscent diffuse, Leaf, ellipt. emarg. Racemes few-fl. stalked shorter than leaf, Pods hooked
 10695 Stemless, Leaves ellipt. downy, Scapes racemose longer than leaf, Pods obovate the length of calyx
 10696 Caulscent, Leaflets oval-oblong or obovate smooth, Stipules very large leafy
 10697 Stem decumb. Leaf, obl. downy, Pedunc. axill. few-fl. Pods arcuate with elevated veins
 10698 Stemless, Leaf, subulate 4 whorled pilose, Scapes spiked longer than leaf, Lower flowers remote
 10699 Caulscent diffuse, Heads subsessile lateral, Pods erect subulate with a reflexed point
 10700 Caulscent diffuse, Pods subulate incurved smooth, Leaf, obovate
 10701 Caulscent procumb. Leaf, obl. retuse, Heads stalked shorter than leaf, Pods half ovate squamose at end
 10702 Caulscent procumb. Leaf, lin. narrowed at base, Heads subsessile, Pods half ovate reflexed downy

and Miscellaneous Particulars.

mental. *A. glycyphyllos* is the largest of the European species. The leaves are sweet, with a mixture of bitterness, and do not seem to be agreeable to cattle; at least the plant, in its wild state, is left untouched; otherwise it might have been desirable to cultivate it.

A. Tragacantha was formerly considered as the plant yielding the gum *Tragacanth* of commerce; but Olivier (*Voyage dans l'Empire Ottoman*, v. 342, pl. 44.) discovered that it was generally procured from *A. verus*. It is probable that both species, and perhaps some others, yield this gum. *A. verus* is a native of the north

History, Use, Propagation, Culture,

of Persia, flowering in July and August. It rises two or three feet only in height, on a stem about an inch in thickness; with many branches closely crowded together, and covered with imbricated scales and spines, formed from the petioles of the former year. The leaves, which scarcely exceed half an inch in length, are composed of six, seven, or eight pairs of opposite, villous, stiff, pointed leaflets; and the mid-rib is terminated with a sharp yellowish point. The flowers are small, yellow, and proceed from the axillæ of the leaves with cottony bractes. The calyx is five-toothed, and shorter than the corolla, which is papilionaceous. The gum exudes in summer, more or less copiously according to the heat of the weather, in tortuous filaments, which are allowed to dry on the plant before being collected. A large portion of the Tragacanth collected in Persia, is sent to India, Bagdad, Bassorah, and Russia. But what we receive is sent to Aleppo, whence it is exported, packed in cases.

Good gum Tragacanth is inodorous; impressing a very slightly bitter taste as it dissolves in the mouth. Its muclage differs from that of acacia gum, in being precipitated by the superacetate of lead, and oxy muriate of tin; and not by silicated potass (*Bostock. Nich. Journ. lvi. 30.*), or the oxysulphate of iron. Medically it is de-

- 10703 Caulесcent procumb. Leaf. obl. blunt, Spikes ov. stalked longer than leaf, Pods erect ovate channelled

 10748 Leaves tern. obovate emarg. Stem creeping, Flowers in umbels
 10749 Leaves tern. Leaf. ov.-lanc. Petioles downy smooth, Spikes capitate stalked axillary
 10750 Leaves tern. Leaf. ov.-lanc. acum. Petioles rough, Racemes axillary
 10751 Leaves ternate silky beneath, Pedunc. axillary about twice as long as leaves, Heads depressed involucred
 10752 Leaves tern. ovate, Petioles downy sulcate, Spikes capitate stalked axillary

and Miscellaneous Particulars.

mulcent, and may answer the purposes of the acacia gum; being even better adapted for allaying tickling cough, and sheathing the fauces in catarrhal affections, owing to its great viscosity. It is chiefly, however, employed for pharmaceutical purposes. (*Thomson's London Dispensary*, 187.) The seeds of *A. beticus* are roasted, ground, and used as a substitute for coffee in Hungary.

1595. *Biserrula*. From *bis*, twice, and *serrula*, a little saw. The pods are toothletted on each edge. Pelecinon was the name given by the Greeks to the plant called by the Latins *Securidaca*.

1596. *Dalea*. Named after Thomas Dale, an English botanist, who lived in the beginning of the last century. There was another Dale, an author of a Pharmacologia. These are pretty little plants, with the aspect of *Psoralea*.

1597. *Psoralea*. From *ψωραλεις*, warted, on account of the numerous little tubercles with which most of the species are covered. The species are chiefly low shrubs; some of them are ornamental, and all are of easy culture and propagation by young cuttings in sand or seeds, which they produce in abundance. *P. esculenta*, the bread-root of America, is cultivated in Missouri, and other parts of that country. In this climate it will

History, Use, Propagation, Culture,

grow in the open air, but requires the protection of a frame to produce abundant crops of roots, which are used like those of the potatoe in the countries where it is a native. (*Pursh. Amer. t. 22.*)

1598. *Melilotus*. From *Mel*, honey, and *Lotus*. These plants are similar to the *Lotus*, and are the favorite resort of bees. *M. officinalis* is the chief ingredient in flavoring the Gruyère cheese. This cheese no doubt owes its chief excellence to the mixture of herbs in the mountain pasturage which surrounds the valley of Gruyère, but partly also to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed.

1599. *Lupinaster*. That is to say, *Lupine-like*. A pretty little herbaceous plant, with bright flowers.

1600. *Trifolium*. A plant with three leaves; the *τριφυλλον*, of the Greeks, *trèfle*, of the French, and *trefoil*, of the English. This genus includes the two most valuable herbage plants adopted in European agriculture, the white and red clover. Notwithstanding all that has been said of the superiority of lucern to clover, and of the excellence of saint-foin, and various *Leguminosæ* of the pea kind, yet the red clover for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all other plants in these respects. The yellow clover, *T. procumbens*, and the cow or meadow clover, *T. medium*, are also in cultivation, but are far inferior to the others. The meadow clover is a useful addition to the white sort in laying down permanent pastures; the yellow grows on poor soils, but the herbage is not much liked by cattle. The soil best adapted for clover is a deep sandy loam, which is favorable to its long tap-roots: but it will grow in any soil, provided it be dry. So congenial is calcareous matter to clovers, that the mere strewing of lime on

 10784 Heads umbelled, Pods 4-seeded, Teeth of cal. nearly equal, Leaf. ovate-obl. emarg. serrulate
 10785 Heads umbelled stalked, Teeth of cal. subulate equal, Leaf. orbicord. serrate
 10786 Heads umbelled, Pods 4-seeded, Teeth of calyx equal, Leaf. obovate blunt serrated
 10787 Heads umbelled, Pods 4-seeded, Teeth of calyx nearly equal, Leaf. ovate obl. emarg. serrulate
 10788 Heads in globose umbels imbricated, Standards deflexed persistent, Pods 4-seeded
 10789 Heads umbelled, Scape naked, Pods 2-seeded pendulous, Leaves linear lanc.
 10790 Heads umbelled, Pods 2-seeded, Teeth of cal. unequal, Leaf. obovate blunt toothed
 10791 Heads villous 5-flowered, Central tuft reflexed rigid wrapping up the fruit
 10792 Heads villous globose, Upper calyxes without florets
 10793 Heads villous globose terminal solitary, Teeth of calyx setaceous longer than corolla
 10794 Heads villous globose terminal solitary, Teeth of calyx setaceous shorter than corolla
 10795 Heads subglobose hispid, Teeth of calyx subulate as long as cor. Leaf. obovate retuse
 10796 Spikes roundish ovate villous, Teeth of calyx unequal setaceous as long as corolla

and Miscellaneous Particulars.

some soils will call into action clover-seeds, which it would appear have lain dormant for ages. At least this appears the most obvious way of accounting for the well-known appearance of white clover in such cases.

The climate most suitable for the clovers, as of most plants natives of Europe, is one neither very hot nor very dry and cold. Most leguminous plants delight both in a dry soil and climate, and warm temperature; and the clover will be found to produce most seed under such circumstances; but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crops of clover herbage.

The time of sowing seeds is generally the spring, during the corn-seed time, or from February to May; but they may also be sown from August to October; and when they are sown by themselves, that is, unaccompanied by any corn crop, this will be found the best season, as the young plants are less liable to be dried up and impeded in their progress by the sun, than when sown alone in spring, and remaining tender and unshaded during the hot and dry weather of July.

The manner of sowing is almost always broad-cast. When sown with spring corn, clover and grass-seeds are usually put in immediately after the land has been pulverized by harrowing in the corn-seed, and are themselves covered by one course more of the harrows; or, if the corn is drilled, the small seeds are sown immediately before or after hand-hoeing; and the land is then finished by a course of the harrows.

In the operation of sowing, some consider it best to sow the clover and rye-grass separately, alleging that that the weight of the one seed and lightness of the other, are unfavorable to an equal distribution of both.

History, Use, Propagation, Culture,

The quantity of seed varies from eight to fourteen pounds per acre, according to the intention of the crop, the quantity of grass-seeds sown, &c. The after culture of clover and rye-grass consists chiefly of picking off any stones or rather hard bodies which may appear on the surface in the spring succeeding that in which it was sown, and cutting out by the roots any thistles, docks, or other large grown weeds. After this, the surface should be rolled once to smooth it for the scythe. This operation is best performed in the first dry weather of March. Some give a top-dressing of soot, gypsum, common lime, peat, or wood-ashes, at this time or earlier; gypsum has been particularly recommended as a top-dressing for clovers and the other herbage legumes, because as their ashes afford that substance in considerable quantities, it appears to be a necessary ingredient of their food.

The taking of the clover, or clover and rye-glass crop, is either by cutting green for soiling, by making into hay, or by pasturing. It is observed in *The Code of Agriculture*, that it is a most important point to ascertain, in what cases cutting or feeding is most beneficial. If fed, the land has the advantage of the dung and urine of the pasturing stock; but the dung being drop in irregular quantities, and in the heat of summer, when it is devoured by insects, loses much of its utility. If the dung arising from the herbage, whether consumed in soiling, or as hay, were applied to the land in one body and at the proper season, the operation would be more effectual. The smother of a thick crop, continued for any time upon the ground, greatly tends to promote its fertility; and it has been pretty uniformly found, after repeated trials, upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pastured by sheep.

The produce of clover-hay, without any mixture of rye-grass, on the best soils, is from two to three tons per acre, and in this state in the London market it generally sells twenty per cent. higher than meadow-hay, or

and Miscellaneous Particulars.

clover and rye-grass mixed. The weight of hay from clover and rye-grass varies according to the soil and the season, from one to three tons per English acre, as it is taken from the tramp-ricks; but after being stacked, and kept till spring, the weight is found to be diminished twenty-five or thirty per cent.

The value of clover and rye-grass hay, in comparison with the straw of beans or pease, may be in the proportion of three to two; and with the finest straw of corn crops, in the proportion of two to one. One acre of red or broad clover will go as far in feeding horses or black cattle, as three or four of natural grass. And when it is cut occasionally, and given to them fresh, it will probably go still much farther, as no part of it is lost by being trod down.

The saving of clover seed is attended by considerable labor and difficulty. Clover will not perfect its seeds, if saved for that purpose early in the year; therefore it is necessary to take off the first growth either by feeding or with the scythe, and to depend for the seed on those heads that are produced in the autumn.

The produce in seed may generally be from three to four or five bushels per acre, when perfectly clean, weighing from two to three hundred weight. But there is great uncertainty in the produce of clover-seed, from the lateness of the season at which it becomes ripe; and the fertility of the soil is considerably impaired by such a crop. Yet the high value of the seed is a great inducement to the saving of it, in favorable situations.

T. incarnatum is sometimes sown as a border flower.

1601. *Lotus. Lotus*, in Greek. There were three sorts of *Lotus* distinguished by the ancients; viz. their tree *lotus*, which was our *Zizyphus lotus*; the *marsh lotus*, which was our *Nymphæa lotus*; and the *herbaceous lotus*, which appears to have been the present genus.

The pods of *L. edulis* are still eaten in Candia, by the poorer inhabitants. *Lotus rectus* has by some been

History, Use, Propagation, Culture,

supposed the Cytisus of Virgil, but, as other contend, without sufficient foundation. *Lotus jacobæus* is a valuable greenhouse plant, as flowering all the year. *L.* major and *corniculatus* are very suitable to sow with white clover and cow-grass, in laying down lands to permanent pasture. Dr. Henderson has written a good deal in their favor; Miller is against them; but Sinclair, in his work on the British Grasses, found it a valuable ingredient in meadows, especially where the soil was rather moist. (See *Ency. of Agr.* p. iii. b. 6.) *Gebelia* is the Arabic name (*Gébéiie*) of the species to which it has been applied.

1602. *Tetragonolobus*. From *τετρας*, four, *γωνία*, an angle, and *λοβος*, a bean, in allusion to the four wings of the pods. *Tetragonolobus edulis* is now a popular border annual, on account of its curious pods; but it was formerly an esculent legume, these pods being used like those of the kidney bean, by the poor of Sicily and Spain.

1603. *Trigonella*. From *τρις*, three, and *γωνία*, an angle. The standard of the flower is flat, and the keel very small and narrow, which gives the flower a triangular appearance. *T. fenum-græcum*, a plant cultivated by the Romans, is still occasionally employed in the agriculture of the south of Europe. The seeds have a strong

 10860 Heads depressed many-fl. Pods spreading cylindr. Claws of carina linear
 10861 Heads depressed, Stems decumb. Legumes cylindr. spreading
 10862 Heads halved, Stem diffuse much branched, Leaves downy
 10863 Heads halved, Pods obl. compressed, Cal. as long as cor. Bractes 1-leaved
 10864 Pods straight cylindr. mucronate, Stems decumb. smooth, Pedunc. few-fl.

10865 Pods solitary, Leaves smooth, Bractes lanceolate
 10866 Pods solitary, Leaves procumb. Leaves downy beneath
 10867 Pods solitary, Bractes ovate, Intermediate leaflets somewhat toothed

10868 Pods in pairs, Bractes oblong ovate

10869 Pods stalked heaped obl. lin. straight, Leaf. obl. truncate mucronate
 10870 Pods stalked heaped pendulous oval compressed, Leaflets roundish
 10871 Pods stalked compressed ovate veiny, Leaf. cuneiform nearly entire smooth
 10872 Pods subsessile heaped erect straightish long linear, Pedunc. not awned
 10873 Pods stalked racemose hooked round, Pedunc. spiny longer than leaflet
 10874 Pods stalked heaped declinate subfalcate compressed, Pedunc. spiny very short
 10875 Pods stalked heaped declinate subfalcate, Pedunc. long somewhat spiny
 10876 Pods sessile heaped arcuate divaricating inclined short, Pedunc. mucronate unarmed
 10877 Pods sessile about 3 linear nearly erect, Leaves truncate cuneate pinnatifid toothed
 10878 Pods sessile straight nearly erect a little falcate acuminate
 10879 Racemes stalked, Common pedunc. longer than leaf, Pods linear falcate heaped pendulous
 10880 Pods sessile subsolitary subfalcate, Leaflets entire
 10881 Pods stalked longer than leaf, Leaves streaked
 10882 Pods stalked umbelled erect incurved, Leaf. cuneate serrate, Stem much branched
 10883 Pods about 4 arcuate erect, Pedunc. unarmed: when in flower as long as leaf, Leaf. cuneate
 10884 Pods about 6 arcuate erect wavy torulose, Pedunc. unarmed: when in fl. longer than leaf, Leaf. cuneate
 10885 Pods stalked heaped declinate falcate furrowed, Pedunc. awned longer than leaf
 10886 Pedunc. very short spiny, Pods short curved upwards
 10887 Pods subsessile nearly erect falcate acuminate downy, Stem spreading

10888 Leaf. linear lanc. acute, Teeth of calyx ovate

10889 Leaf. obate blunt, Teeth of calyx ovate

and Miscellaneous Particulars.

disagreeable smell, and an unctuous farinaceous taste, accompanied with a slight bitterishness. An ounce renders a pint of water thick and slimy. To rectified spirit, they give out the whole of their distinguishing smell and taste, and afterwards to water a strong flavorless mucilage. These seeds are never given internally, their principal use being in cataplasms and fomentations, for softening, maturing, and dispersing tumours; and in emollient gylsters. They were also an ingredient in the *oleum c mucilaginis*; but this has no longer a place in the pharmacopœia. (*Woodville* and *Lewis*.) They are used by grooms and farriers for horses. Fenu-greek has not been cultivated in any quantity for use in England, because it is an uncertain crop, occasioned by the inconstancy of our weather.

1604. *Dorycnium*. The Greek name of an herb, supposed to be the *Convolvulus Dorycnium* of the moderns. The plant now called by the name has no resemblance to that of the ancients. *D. hirsutum* is a beautiful half-hardy shrub, well deserving cultivation.

History, Use, Propagation, Culture,

1605. *Medicago*. A native of the country of the *Medes*, whence this plant was brought to Greece during the expedition of Darius. *M. arborea*, the *Cytisus* of the ancients, flowers great part of the year, and when sheltered is seldom destitute of flowers. In the open air it begins to flower in April, and continues till December. Those flowers which appear early in summer, will have the seeds ripe in August, or the beginning of September, and the others will ripen in succession. It grows in great plenty in Abruzzo, and many parts of the kingdom of Naples, where the goats feed upon it; and with their milk abundance of cheese is made there. It also abounds in several of the islands in the Archipelago, where the Turks use the wood to make handles for their sabres; and the caloyers, or Greek monks, form their beads of it. In old shrubs, the heart is of a dark color, and hard like ebony.

According to Miller, this shrub bids the fairest of any to be the *Cytisus* of Virgil, Columella, and the other ancient writers on husbandry; and being celebrated by them as an excellent fodder, has been recommended for cultivation here. But however useful it may be in Candia, Rhodes, Sicily, Abruzzo, and other dry warm countries, yet it will never thrive in England, (where we have also many plants of this leguminous tribe far more succulent than this,) so as to be of any real advantage; for in severe frost it is very subject to be destroyed, or at least so much damaged, as not to recover its former verdure before the middle or end of May; (and even after a mild winter, it will generally appear injured by our cold spring winds, even at that season; so that it cannot be of any use here for early spring fodder.) Besides, the shoots will not bear cutting above once in a summer, and then will not be of any considerable length: and the stems growing very woody, the cutting of it will be very troublesome. Upon the whole, therefore, it is not worth the trial; though in hot, dry, rocky countries, where few other plants will thrive, it may be cultivated to great advantage. But, however unfit *Tree Medick* may be for use as fodder in England, yet for the beauty of its hoary leaves, abiding all the year, together with its long continuance in flower, it deserves a place in every good garden and plantation, with shrubs of the same growth. (*Dict. in loco*, and *Martyn's Virgil*.)

M. sativa, *Poin de Bourgogne*, Fr., *Alfulfa*, Span., and *Lucerne*, Eng., (from the Languedoc patois *Lauserda*), is a deep rooting perennial plant, sending up numerous small and tall clover-like shoots, with blue or violet spikes of flowers. It is highly extolled by the Roman writers; it is also of unknown antiquity in old Spain, Italy, and the south of France; is much grown in Persia and Peru, and mown in both countries all the year round. It is mentioned by Hartlib, Blythe, and other early writers, and was tried by Lisle; but it excited little attention till after the publication of *Harte's Essays*, in 1757. But though it has been so much extolled, it has yet found no great reception in this country. If any good reason can be given for this, it is, that lucern is a less hardy plant than red clover, requires three or four years before it comes to its full growth, and is for these and other reasons ill adapted to enter into general rotations. When the climate and soil suit, perhaps, a field of it may be advantageously sown, adjoining the homestead, to afford early cutting or food for young or sick animals, for which it is said to be well adapted; but though it will produce good crops for eight or ten years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, we do not think it is ever likely to come into general culture.

There are no varieties of the lucern deserving the notice of a cultivator. What is called the yellow lucern, or Swiss lucern, is the *Medicago falcata*, a much more hardy and coarser plant, common in several parts of England, but not cultivated any where excepting in some poor soils in Switzerland.

and Miscellaneous Particulars.

The soil for lucern must be dry, friable, inclining to sand, and with a subsoil not inferior to the surface; unless the soil be good and deep, it is in vain to attempt to cultivate lucern.

† The preparation of the soil consists in deep ploughing and minute pulverisation; and, in our opinion, the shortest way to effect this, is to trench it over by the spade to two or three feet in depth, burying a good coat of manure in the middle, or at least one foot from the surface. This is the practice in Guernsey, where lucern is highly prized.

The climate for lucern, as we have already hinted, must be warm and dry; it has been grown in Scotland and Ireland, and might probably do well in the southern counties of the latter country, but in the former it has not been found to answer the commendations of its admirers.

The season most proper for sowing lucern, is as early as can be done in the spring months, as in this way the plants may be fully established before the season becomes too hot. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong, and fit to set out about the beginning of August.

The manner of sowing lucern is either broad-cast or in drills, and either with or without an accompanying crop of corn for the first year. Broad-cast, and a very thin crop of barley or other spring corn, is generally, and, in our opinion, very properly preferred.

The quantity of seed, when the broad-cast method is adopted, is said to be from fifteen to twenty pounds per acre, and from eight to twelve if drilled. The seed is paler, larger, and dearer than that of clover; it is generally imported from Holland, and great care should be had to procure it plump and perfectly new, as two years old seed does not come up freely. The same depth of covering as for clover will answer.

The after-culture of lucern, sown broad-cast, consists in harrowing, to destroy grass and other weeds; rolling, after the harrowing, to smooth the soil for the scythe, and such occasional top-dressings of manure as the state of the plants may seem to require.

The top-dressings given to lucern may be either of the saline or mixed manures. Ashes are greatly esteemed, and also gypsum and liquid manure of any kind.

The taking of lucern by mowing for soiling, or hay, or by tethering, hurdling, or pasturing, may be considered as the same as for clover. Lucern frequently attains a sufficient growth for the scythe towards the end of April, or beginning of the following month; and in soils that are favorable for its culture, will be in a state of readiness for a second cutting in the course of a month or six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season.

The application of lucern is also the same as of clover. The principal and most advantageous practice, in the application of lucern, is that of soiling horses, neat cattle and hogs; but as a dry fodder, it is also capable of affording much assistance, and as an early food for ewes and lambs, may be of great value in particular cases. All agree in extolling it as food for cows, whether in a green or dried state.

The produce of lucern, cut three times in a season, has been stated at from three to five and even eight tons per acre. In soiling, one acre is sufficient for three or four cows during the soiling season, and a quarter of an acre, if the soil be good, for all sorts of large stock, for the same period, or half an acre on a moderate soil.

The nutritive product of lucern, according to Sir H. Davy, is 2.3-tenths per cent., and is to that of the

History, Use, Propagation, Culture,

clovers and saintfoin as 23 to 29. This result does not very well agree with the superior nutritive powers attributed to lucern; and is one proof, among many, how little the analysis of the chemist agrees with the experience of the farmer.

To save seed, the lucern may be treated precisely as the red clover, and it is much easier threshed, the grains being contained in small pods, which easily separate under the flail, or a threshing machine, or clover mill.

M. lupulina, Hop-trefoil, sometimes called Shamrock, and in Norfolk Black Nonesuch, is cultivated occa-

sionally along with the perennial clovers, and sometimes confounded with the common yellow clover, which is an annual and much smaller plant. Its treatment is the same as that of white clover; but its herbage is little relished by cattle, and both it and the yellow clover are going fast out of repute.

M. scutellata and *intertexta* are sown as border flowers for the curiosity of their pods.

1606. *Hymenocarpus*. From *ἤμην*, a membrane, and *καρπος*, fruit, in allusion to the membranous texture of the pods. Little inconspicuous plants resembling *Trifolium*.

CLASS XVIII. — POLYADELPHIA. STAMENS united into several parcels.

ONE of the smallest of the Linnean classes, characterized by the cohesion of the filaments in several parcels. It almost wholly consists of plants remarkable either for their beauty or importance otherwise. From the *Theobroma* the nutritious substance which forms the basis of Chocolate is procured. *Melaleuca* and its allies are among the most elegant of New Holland plants. The genus *Symplocos* contains a plant useful as a dye. To *Citrus* belong the Orange, Lemon, Lime, and all their delicious varieties; and the *Loasa*, with which the class is here concluded, consists of some of the most ornamental and curious of our garden annuals. By some botanists this class is distributed among others, especially *Icosandria* and *Polyandria*.

Order 1. DECANDRIA.  Stamens 10 or 12.

1607. *Theobroma*. Cal. 5-leaved. Petals 5, fornicate. Nectary urceolate, with 5 horns. Filaments 5, each with 2 anthers. Style filiform. Stigma 5-parted. Caps. 5-celled, without valves. Seeds in a buttery pulp.
 1608. *Bubroma*. Cal. 3-leaved. Petals 5, 2-horned. Nect. campanulate, 5-fid. Filam. 5, attached to the outside of nectary; each with 3 anthers. Style simple. Capsule woody, warted, valveless, bored with 12 rows of holes.

History, Use, Propagation, Culture,

1607. *Theobroma*. From *Θεός*, God, and *βρωμα*, food, in allusion to the excellent nature of its produce. The Mexicans call the beverage obtained from it *Chocolatl*. (*Nieremb.*) T. Cacao is a tree which grows in a very handsome form to the height of twelve or sixteen feet; the trunk is upright, and about as high as a man before the head spreads out; the wood is light and of a white color; the bark brownish. Leaves lanceolate-oblong, bright green, quite entire; flowers small, reddish, inodorous. Fruits smooth, yellow, red, or of both colors, about three inches in diameter: rind fleshy, near half an inch in thickness, flesh-colored within: pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering to it only by filaments, which penetrate it and reach to the seeds. Hence it is known when the seeds are ripe, by the rattling of the capsule when it is shaken. The pulp has a sweet and not unpleasant taste, with a slight acidity; it is sucked and eaten raw by the natives. The seeds are about twenty-five in number: when fresh they are of a flesh-color; gathered before they are ripe, they preserve them in sugar, and thus they are very grateful to the palate: they quickly lose their power of vegetation, if taken out of the capsule; but kept in it, they preserve that power for a long time. The tree bears leaves, flowers, and fruit all the year through; but the usual seasons for gathering the fruit are June and December. In two years from the seed it is above three feet high, and spreads its branches, not more than five of which are suffered to remain: before its third year is complete it shows for fruit. A tree yields from two to three pounds of seeds annually. These seeds are remarkably nourishing, and agreeable to most people; which occasions them to be commonly kept in most houses in America, as a necessary part of the provisions of the family: they are generally ground or pounded very fine, a little annatto added, and made into paste: they are much charged with oil, but mix well with milk or water, and are formed into rolls of one pound each.

This simple preparation of chocolate is the most natural and the best. It is in daily use amongst most

1609. *Abroma*. Cal. 5-part. Petals 5, with saccate dilated claws Cup of stamens 10-fid ; with 5 segments, each bearing 3 anthers ; the other 5 petaloid. Styles 5. Caps. 5-celled, 5-winged, many-seeded.

Order 2. POLYANDRIA.  Stamens indefinite.

1610. *Melaleuca*. Parcels of stamens 5, opposite the petals, long ; anthers incumbent. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx which is grown to the branch.

1611. *Tristania*. Parcels of stamens 5, opposite the petals, and scarcely longer than they are ; anthers incumbent. Caps. 3-celled, many-seeded, united with the turbinated stalked tube of the calyx.

1612. *Calothamnus*. Parcels of stamens 4-5, opposite the petals (some either connate or sterile). Anthers inserted by the base, entire. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.

1613. *Beaufortia*. Parcels of stamens 5, opposite the petals. Anthers inserted by the base, bifid at the end, with deciduous lobes. Caps. 3-celled, 1-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.

1614. *Symplocos*. Cal. 5-fid, superior. Petals 5-8 ; cohering at the base in a tube. Stamens united to the corolla in 4 rows. Drupe dry, 5-celled.

1615. *Citrus*. Cal. 5-fid. Petals 5, oblong. Anthers 20 ; the filaments variously divided. Berry 9-celled.

1616. *Xanthochymus*. Cal. 5-leaved. Petals 5. Nectaries 5. Stamens united in 5 parcels. Apple 1-5-seeded.

1617. *Hyppericum*. Cal. 5-parted. Petals 5. Filaments many in 3 or 5 parcels. Capsule superior.

1618. *Ascyrum*. Cal. 4-leaved. Petals 4. Caps. 1-celled, 2-3-valved.

1619. *Loasa*. Cal. 5-leaved. Petals 5. Nectary 5-leaved. Caps. $\frac{1}{2}$ -inferior, 1-celled, $\frac{2}{3}$ -3-valved, many-seeded.

DECANDRIA.

10933 Leaves entire smooth

10934 Leaves acuminate repand-toothed downy beneath

10935 Leaves cordate ovate acute with unequal serratures

10936 Leaves 7-angled : floral ov.-lanc. acuminate somewhat toothed, Pedunc. axill. Branches unarmed

10937 Adult lvs. with simple and stellate hair beneath, Wings of caps. subtruncate at end, Branches mucricated

and Miscellaneous Particulars.

families in Jamaica, where the tree is largely cultivated, and affords a nutritious food for children, as well as adults. But as chocolate made abroad cannot by law be imported into this country, consequently all chocolate consumed in Britain ought to be made here. It is composed principally of the kernel of the cocoa, as above mentioned ; but the art is in very few hands : and we believe that a small portion of soap is added to most British chocolate, in order to cause it to froth when it is dissolved in hot water.

Cocoa is a simple preparation made in Britain, from the cocoa-nut, or from the shells of it, or from a mixture of both. It is considered much easier of digestion than chocolate, and very nourishing.

In our stoves *Theobromas* thrive in light rich soil, and cuttings root in sand under a hand-glass.

1608. *Bubroma*. In contradistinction to *Theobroma* ; from *bos*, an ox, and *βρωμα*, food, as if producing a substance fit only to be eaten by cattle. *Orme d'Amerique*, Fr. A wide spreading tree, not unlike the Elm, with oblong heart-shaped leaves, which sleep hanging quite down, whilst the petioles remain entirely stiff and straight. It grows in the lowlands of Jamaica, forming a very agreeable shade for the cattle, and supplying them with food in dry weather, when all the herbage is burned up or exhausted. The seeds are very mucilaginous, but otherwise agreeable to the palate. The wood is light, and so easily wrought, that it is generally used by coachmakers in all the side pieces. (*Browne*.) It is also frequently cut into staves for casks. A decoction of the inner bark is very glutinous, and very like that of the elm. In our stoves it thrives well in a loamy soil, and cuttings root freely in sand under a hand-glass.

1609. *Abroma*. Still named with reference to the two preceding genera, from *α*, privative, and *βρωμα*, food ; as if unfit for either gods or oxen. This, Sweet observes, "is a hardy stove genus, and easily managed ; the species flower freely at various seasons, and will grow in the common garden soil : but a mixture of good loam with a little peat is an excellent compost for them. They propagate freely by seeds and cuttings." (*Bot. Cult.* 10.)

History, Use, Propagation, Culture.

1610. *Melaleuca*. From *μειλας*, black, and *λευκος*, white: because the original tree has black wood and white branches. A beautiful Australasian genus, which grows and flowers freely in equal parts of sandy loam and peat, with common greenhouse treatment. "Some cultivators," Sweet observes, "grow them entirely in peat, in which they will grow very well for a time; but they will not be strong and healthy, nor flower so well as in a mixture. Ripened cuttings, not too old, will root freely in sand under a bell-glass" (*Bot. Cult.* 223.) The bark of *Melaleuca Leucadendron* is used by the Chinese as oakum, for making good the spaces between the timbers of their vessels. They also use it in the roofing their houses. From the same tree is obtained the Cajuputi oil, remarkable for its green color, its peppermint flavor, and turpentine smell. It is rarely to be procured in Europe in an unadulterated state. When pure it is one of the best preservatives of preparations of natural history, and is used externally with much success as a cure for rheumatic affections and pains in the joints.

1611. *Tristania*. From *τρις*, three, and *στειναι*, to stand; in allusion to the ternate disposition of the flowers and leaves. The species may be treated like *Melaleuca*, and are pretty little evergreen shrubs.

1612. *Calothamnus*. From *καλος*, beautiful, and *θαμνος*, a rod, in allusion to the splendid appearance of the branches covered with scarlet blossoms. The species are beautiful plants, and not difficult of culture or propagation in sand, and the air kept still and moderately moist by covering with a hand-glass.

 10972 Leaves ellipt. lanc. downy on each side corrugate veiny, Sepals acuminate

- 10973 Peti. somew. winged, Lvs. obl. acute toothed, Fl. 35-androus, Fruit obl. with a thin rind and very acid pulp
 10974 Petioles naked, Lvs. ov. rounded serrated, Fl. 30-androus, Fruit globose with a nipple and sweet pulp
 10975 Petioles nearly naked, Lvs. ov. obl. and acute, Fl. 20-androus, Fruit globose with a thin skin and sweet pulp
 10976 Peti. winged, Lvs. ellipt. acute crenulat. Fl. 20-androus, Fruit glob. with a thin rough skin and bitter pulp

and Miscellaneous Particulars.

1613. *Beaufortia*. So called in honor of Mary, Duchess of Beaufort, who died January 7, 1714, in the 85th year of her age. She had a fine collection of plants at Badmington, in Gloucestershire, during the life-time of her husband, Henry, first duke of Beaufort. Splendid plants, free-growers, and abundant flowerers, with common greenhouse treatment, in two-thirds peat, and one-third loam. Cuttings. Sweet found to answer best when "taken from nearly ripened wood, planted in sand, and covered with a bell-glass."

1614. *Symplocos*. From *συμπλοση*, connection; union. The petals are naturally five, but united at the base so as to seem but one. A tree with oblong fragrant shining leaves, and sweet-smelling flowers, succeeded by subsessile drupes. A decoction of the leaves is used in North America for dyeing linen and silk of a bright yellow color.

1615. *Citrus*. The meaning of this word has escaped the ingenuity of etymologists. An ancient genus, combining in its species many excellencies, handsome evergreen shining tree-like forms, most odoriferous flowers, and brilliant, fragrant, delicious fruits. It is one of the most striking of fruit-bearing trees, and must have attracted the notice of aboriginal man long before other fruits of less brilliancy, but of more nutriment or flavor. The golden apples of the heathens, and forbidden fruit of the Jews, are supposed to allude to this family, though it is remarkable that we have no authentic records of any species of *Citrus* having been known; certainly none were cultivated by the Romans. The citron was introduced into Europe from Media, under the name of *malus medica*, and was first cultivated in Italy by Palladius, in the second century. The orange

History, Use, Propagation, Culture,

is supposed to have been introduced into Italy in the fourteenth century, above a thousand years after the citron. In England, these trees have been cultivated since 1629. Parkinson, writing at that time, says, "the orange hath abiden with some extraordinary looking and tending, when neither citron nor lemon trees could be preserved any length of time." The orange trees he alludes to were those of Beddington, in Surrey, introduced from Italy by a knight of the noble family of the Carews (*Gibson's* edit. of *Camb. Brit.*), and the first that were brought into England; they were planted in the open ground and placed under a moveable cover during the winter months. It has been said that these trees were raised by Sir Francis Carew, from seeds brought to England by Sir Walter Raleigh: but as such trees would not have readily borne fruit, Professor Martyn thinks it much more likely that they were plants brought from Italy. Bradley says, they always bore fruit in great plenty and perfection; that they grew on the outside of a wall, not nailed against it, but at full liberty to spread; they were fourteen feet high, the girth of the stem twenty-nine inches, and the spreading of the branches one way nine feet, and twelve feet another. These trees, Evelyn informs us, were neglected in his time, during the minority of their owner, and finally entirely killed by the great frost in 1739-40; they were planted before 1595.

During the latter end of the seventeenth and beginning of the eighteenth centuries, the orange tree was a very fashionable article of growth in conservatories, when there were but few exotics of other sorts kept there. The plants were procured from Genoa, with stems generally from four to six feet in height; they were planted in large boxes, and were set out during summer to decorate the walks near the house, in the manner still practised at Versailles and the Thuilleries. About the middle of the eighteenth century, when a taste for botany and forcing exotic fruits became general, that for superb orange trees began to decline; many of these large trees have decayed through neglect; and those which are now to be found in the greater number of greenhouses, are generally dwarf plants bearing few fruit, and those of small size. In some places, however, are still to be found large and flourishing trees. Those at Smorgony, in Glamorganshire, are the largest in Britain; they are planted in the floor of an immense conservatory, and bear abundantly. It is said that the plants were procured from a wreck on the coast in that quarter, in the time of Henry VII.

At Nuneham, near Oxford, are some fine old trees, planted under a moveable case, sheltered by a north wall. In summer the case is removed, and the ground turfed over, so that the whole resembles a native orange grove. At Wormleybury, Hertfordshire, and Shipley Hall, in Derbyshire, are very fine large orange and lemon trees grown in borders and in boxes. (*Hort. Trans.* vol. ii. 295, and iv. 306.)

At the Wilderness, Kent, are three trees in boxes, not surpassed by any trees so grown in Europe.

At Woodhall, near Hamilton, trees of all the species of Citrus are trained against the back walls of forcing houses, in the manner of peaches, and produce large crops of fruit.

In the south of Devonshire, and particularly at Salcombe, one of the warmest spots in England, may be seen, in a few gardens, orange trees that have withstood the winter in the open air upwards of a hundred years. The fruit is as large and fine as any from Portugal. Trees raised from seed, and inoculated on the spot, are found to bear the cold better than trees imported.

The common character of the Citrus family is that of low evergreen trees, with ovate or oval-lanceolate, entire or serrated leaves. On the ungrafted trees are often axillary spines. The flowers appear in peduncles, axillary or terminating, and one or many-flowered. The fruits are large berries, round or oblong, and generally of a yellow color. The species seem best distinguished by the petiole, which in the orange and shaddock is winged; in the citron, lemon, and lime, naked. The form of the fruit, although not quite constant, may also serve for a distinction. In the orange and shaddock it is spherical, or rather an oblate spheroid, with a red or orange-colored rind; in the lime, spherical, with a pale rind; in the lemon, oblong, rough, with a nipple-like protuberance at the end; in the citron, oblong, with a very thick rind. The flowers of the citron and lemon have ten stamens, and those of the orange more. It is very difficult to determine what is a variety, and what is a species in this genus; many of the sorts in cultivation are by buds.

Dr. Sickler, who spent several years in Italy, and paid great attention to the kinds and culture of the orange, published in 1815, *Der Vollkommen Orangerie-Gartner* (The complete Orange Gardener), in which he describes above seventy sorts of Citrus.

Gallezio (*Traité du Genre Citrus*, &c. Savonna, 1818.) has given a synopsis of the forty principal sorts cultivated in Italy.

The most splendid work on oranges which has yet appeared is the *Histoire Naturelle des Orangers*, by Risso, of Nice, and Poiteau, of Versailles. (Paris, fol. 1818.) Here 169 sorts are described, and 105 of them figured, and their French and Italian culture given at great length. They are arranged as sweet oranges, of which they describe 42 sorts; bitter and sour oranges, 32 sorts; bergamots, 5 sorts; limes, 8 sorts; shaddocks, 6 sorts; limes, 12 sorts; lemons, 46 sorts; citrons, 17 sorts.

All the species of Citrus endure the open air at Nice, Genoa, and Naples; but at Florence and Milan, and often at Rome, they require protection during the winter, and are generally placed in conservatories and sheds. The largest conservatory in Italy is that of Prince Antonio Borghese, at Rome, which contains several select sorts of *agrumi*. The largest trees are at Sorrenta, Terracina, Gaeta, and Naples; but the most regular and garden-like culture of the orange, is in the orange-orchards at Nervi, Monaco, and other places in the neighbourhood of Genoa. At Nervi are also the orange nurseries which may be said to supply all Europe with trees; they are, in general, wretchedly cultivated, and the stocks inoculated in the most unscientific manner; but the fine climate, strong clay soil, and abundant manurings, supply in a great degree the nicer practices

10977 Petioles lin. very short, Lvs. ovate retuse, Flowers racemose

10978 Petioles sublinear straight, Branches ascending unarmed, Fruit depressed, Skin separated from flesh

10979 Petioles naked, Lvs. obl. acute, Fl. 40-androus, Fruit obl. rugose with acid pulp

10980 Petioles winged, Lvs. blunt emarg. Fruit very large with a thick skin

and Miscellaneous Particulars.

of gardening. There the names of varieties vary as much as those of gooseberries do in England; but from upwards of 180 names, not above 40 distinct sorts can be procured. Good plants of the Maltese and other varieties of orange may be procured from Malta; and some sorts also from Lisbon. From the nurseries at Paris about thirty sorts may be obtained, much smaller plants than those from the other places named, but more scientifically grafted or inoculated. The catalogues of London nurserymen enumerate above thirty varieties of oranges, twelve of lemons, and several varieties of the other species; the plants are partly Genoese, partly French, and partly propagated here.

The *C. aurantium*, the common orange; *orange*, Fr., *pomeranze*, Ger., and *arancio*, Ital., is a middle-sized evergreen tree, with a greenish-brown bark; and, in its wild state, with prickly branches. The fruit is nearly round, from two to three inches in diameter, and of a gold color. It is now cultivated in most countries of Europe; in the open air in Italy and Spain; and in conservatories or greenhouses in Britain and the north of Europe.

The two principal varieties are the sweet or China orange, the *orange douce* of the French, and *porto-gallo* or *poma de sino* of the Italians; and the bitter or Seville, the *bigarade* of the French, and *arancio volgare* of the Italians. The Maltese orange, distinguished by its red pulp, is also a noted and much-esteemed sort. The box-leaved, willow-leaved, and some others, are cultivated more as curious varieties than for their fruit.

C. Medica, the citron, *citron*, Fr., *citronier*, Ger., and *cedrate*, Ital., in its wild state grows to the height of about eight feet, erect and prickly, with long reclining branches. The leaves are ovate, oblong, alternate, serrate, smooth, pale green. The fruit or berry is half a foot in length, ovate, with a protuberance at the lip. There are two rinds, the outer thin, with innumerable miliary glands, full of a most fragrant oil; the inner thick, white, and fungous.

In China they have a variety of the *C. Medica*, of very considerable size, quite solid, with scarcely any pulp or cells, and divided at the end into five or more long round lobes, on which account it is called *Phat thu*, or finger-orange. The fruit is laid upon fine porcelain vessels in the sitting-rooms of the Chinese, for the sake of its agreeable perfume.

Dr. Sickler enumerates only about a dozen citrons and citronates as grown in Italy. The French nurseries have nearly twenty names in their lists. In England six are cultivated for sale.

C. Limonum, the lemon; *limon*, Fr., *limonier*, Ger., and *limone*, Ital., has the fruit less knobbed at the extremities, is rather longer and more irregular, and the skin is thinner than in the citron; the wood is more knotty, and the bark rougher.

Dr. Sickler enumerates twenty-eight varieties as grown in Italy. The French, according to Ville Hervé have eleven sorts; in the London nurseries are cultivated twelve.

C. Limetta, the lime, by some esteemed a variety of the *C. Medica*, *lime*, Fr., Ital., and Ger., grows to the height of about eight feet, with a crooked trunk, and many diffused branches, with prickles. The leaves are ovate lanceolate, almost quite entire. Berry an inch and a half in diameter, almost globular, with a protuberance at the top; the surface regular, shining, greenish-yellow, with a very odorous rind, enclosing a very acid juice.

The French have two sorts of lime; and, according to Dr. Sickler, the Italians have four varieties; five kinds are grown in the London nurseries.

C. decumana, the shaddock, *orange pampelmuse*, Fr., *arancio massimo*, Ital., is above the middle size, with spreading prickly branches. The leaves are ovate, subacute, seldom obtuse; the petioles are cordate, winged; the wings as broad as the leaves. The berry spheroidal, frequently retuse at each end, of an even surface, and greenish-yellow color; pulp red or white; juice sweet or acid; rind white, thick, fungous, and bitter. Thunberg says, the fruit in Japan grows to the size of a child's head, and Dr. Sickler states its weight as fourteen pounds, and its diameter as from seven to eight inches. It is a native of China and Japan, and was brought to the West Indies by Captain Shaddock, from whom it has derived its name.

The Italians, according to Dr. Sickler, have one, and the French, according to the *Nouveau Cours*, &c., four sorts. Four are grown in the English nurseries.

All the sorts may be propagated by seeds, cuttings, layers, and grafting, or inoculation.

The object of raising plants from seed is either to obtain new varieties or stocks for grafting. To attempt raising new varieties in Britain will in general be found a tedious process, as the trees do not even in Italy show fruit for six or eight years or more; and there is now in the botanic garden at Toulon, a large handsome tree, of twenty-five years' growth, which in 1819 had not blossomed. Shaddock stocks are the strongest, and next to these the citron. Budding and grafting are performed at the usual season; but these operations may be performed at any time when the sap is in motion.

Henderson, of Woodhall, a most superior cultivator of the Citrus tribe, considers cuttings as the quickest mode of getting plants, and has practised it for thirty-seven years past: his directions are as follows: "Take the strongest young shoots, and also a quantity of the two years old shoots; these may be cut into lengths from nine inches to eighteen inches. Take the leaves off the lower part of each cutting to the extent of about five inches, allowing the leaves above that to remain untouched: then cut right across, under an eye; and make a small incision in an angular direction on the bottom of the cutting. When the cuttings are thus prepared, take a pot, and fill it with sand; size the cuttings, so that the short ones may be all together, and those that are taller in a different pot. Then, with a small dibble, plant them about five inches deep in the sand, and give them a good watering overhead, to settle the sand about them. Let them stand a day or two

History, Use, Propagation, Culture,

in a shady place, and if a frame be ready with bottom heat, plunge the pots to the brim. Shade them well with a double mat, which may remain till they have struck root; when rooted, take the sand and cuttings out of the pot, and plant them into single pots, in the proper compost. Plunge the pots with the young plants again into a frame, and shade them for four or five weeks, or till they are taken with the pots; when they may be gradually exposed to the light. From various experiments, I found that pieces of two year old wood struck quite well; and in place, therefore, of putting in cuttings six or eight inches long, I have taken off cuttings from ten inches to two feet long, and struck them with equal success. Although I at first began to put in cuttings only in the month of August, I now put them in at any time of the year, except when the plants are making young wood. By giving them a gentle bottom heat, and covering them with a hand-glass, they will generally strike root in seven weeks or two months. The citron is most easily struck, and is the freest grower; I, therefore, frequently strike pieces eighteen inches long, and as soon as they are put into single pots, and taken with the pots, they are grafted with other sorts, which grow freely. I am not particular as to the time either of striking cuttings or of grafting." (Caled. Hort. Mem. iii. 308.)

At Genoa and Florence, citrus trees are grown in a strong yellow clay, which is richly manured; and this soil is considered by the first Italian gardeners as best suited to their natures.

The French gardeners, in preparing a compost for the orange-tree, endeavour to compensate for quantity by quality; because the pots or boxes in which the plants are placed ought always to be as small as possible, relatively to the size of the tree. The following is the composition recommended: to a fresh loam, which contains a third of clay, a third of sand, and a third of vegetable matter, and which has lain a long time in a heap, add an equal bulk of half-rotten cow-dung. The following year turn it over twice. The succeeding year mix it

and Miscellaneous Particulars.

with nearly one-half its bulk of decomposed horse dung. Turn it over twice or three times, and the winter before using add a twelfth-part of sheep dung, a twentieth of pigeon dung, and a twentieth of dried ordure.

Henderson, already mentioned, takes one part of light-brown mould from a piece of ground that has not been cropped nor manured for many years; one part of peat earth, such as is used for growing heaths; two parts of river sand, or pit sand, if it be free from mineral substances; and one part of rotted hot-bed dung, with one part of rotted leaves of trees, and mixes them all well together, so as to form a compost-soil of uniform quality. (*Calcd. Hort. Mem.* iii. 302.)

Though orange-trees will grow exceedingly well in large pots and boxes, yet to have them produce the finest crop of fruit they should be planted in the ground like peach-trees, and trained like them, or as standard cherries in a conservatory. The latter has by far the best effect, especially when the stems of the trees are seven or eight feet high, and the head forms a handsome cone; but the largest fruit is produced when the trees are planted against the back-wall trellis of a narrow house, and treated like peach-trees. Henderson grows his largest fruit in this manner, and we have seen them fully as large as any we ever saw at Genoa or Naples.

1616. *Xanthochymus*. From ξανθός, yellow, and χυμος, anything which exudes; in allusion to the color of the juice which flows from the ripe fruit when wounded, and which, being inspissated, yields a material for water-color painting which is as good as Gamboge. Handsome plants, of the usual culture in light loam, and propagated by cuttings in sand under a hand-glass.

1617. *Hypericum*. A name of unknown meaning. The species are chiefly under-shrubs, generally with dotted leaves, and almost, without exception, yellow flowers. The hardy species are useful for the fronts of

History, Use, Propagation, Culture,

shrubberies. *H. calycinum* soon spreads over a considerable surface, and being evergreen, and growing under the shade, it is well adapted for covering bare spots under trees, and at the base of walls where few plants will thrive.

H. Androsæmum; from *ανδρ*, a man, and *αιμα*, blood, because the fresh capsules, bruised between the fingers, give out a blood-colored juice, is called Tutsan from *Toutte-saine*, Fr., from its bruised capsules being formerly applied to fresh wounds.

H. perforatum was formerly used in external wounds and hæmorrhages as a balsamic, and was reputed to have other medical properties. The semi-transparent dots on the leaves are the receptacles of an essential oil. The flowers tinge spirits and oils of a fine purple color; and the dried plant, boiled with alum, dyes wool of a yellow color. The common people in France and Germany gather it with great ceremony on St. John's day, and

 11025 Stem round diffuse, Leaves lanceol. linear narrow at base revolute at edge, Calyx somewhat unequal

**Sepals toothed, or toothed glandular.*

- 11026 Styles 3, Cal. with (reddish) glandular serratures glabrous, Lvs. roundish pubesc. Stem rounded creeping
 11027 Stem downy round ascend. Lvs. ovate blunt somewhat amplexicaul. with black dots at edge, Cal. acuminate
 11028 Styles 3, Cal. with (black) glandular serratures, Stem erect rounded pubesc. Lvs. ov. slightly downy beneath
 11029 Stem round ascending, Leaves orbicular stalked, Calyx ovate blunt
 11030 Stem straight slightly wing. Lvs. ov.-lanc. subamplex. blunt. with pellucid dots, Anthers dotted with black
 11031 Stem round straight branched, Lvs. ellipt. lanc. acute glandular at edge with pellucid dots, Cal. lanc. acute
 11032 Stem round a little villous at end, Leaves amplexicaul. lanceol. acute generally reflexed, Panic. lax few-fl.
 11033 Styles 3, Cal. with (black) glandul. serratures, Stem erect, Lvs. cord. glab. amplexicaul. [dots beneath
 11034 Sty. 3, Corymbs term. Cal. fring. with long peduncul. glands, Stem erect round. Lvs. ov. with (black) scattered
 11035 Stem round ascending, Leaves amplexicaul. oblong bluntish with pellucid dots : upper sometimes toothed
 11036 Styles 3, Fis. paniculate-corymb. Cal. with glandul. serratures, Stem erect round, smooth, Lvs. ov. glabrous
 11037 Stem round purplish simple, Lvs. amplexicaul. ovate dotted with black at the edge, Cal. ov. acute ciliated

- 11038 Stem round, Leaves ovate blunt with a small petiole revolute at edge, Calyx ovate blunt [with black
 11039 Stem round slightly winged, Lvs. amplexicaul. subcord. ovate obl. blunt with pellucid dots, Anthers dotted
 11040 Stem with 2 angles decumbent at base, Lvs. linear-lanc. spreading blunt revolute at edge, Cal. ovate acute
 11041 Stem round ascending, Lvs. obl. lanc. bluntish narrowed at each end with pellucid dots, Cal. somewhat blunt
 11042 Stem round, Branches somewhat winged, Leaves in threes linear revolute at edge, Calyx very small blunt
 11043 Stem round ascending, Leaves whorled linear revolute at edge, Calyx linear somewhat blunt
 11044 Stem round tortuous minute, Leaves round acute clustered dotted glaucous very small

§ 5. *Sepals 5, entire, equal, like the leaves. Stamens 00. Styles 3-5. BRATHYS.*

- 11045 Stem round compressed at end, Leaves dense not dotted channelled revolute at edge, Cal. equal straight

- 11046 Stem small simple quadrangular, Leaves oval blunt fascicled, Pedicels 6 lines long reflexed
 11047 Stem round, Branches erect, Lvs. ovate linear blunt generally fascicled in the axilla, Inner sepals orbicular
 11048 Stem round, Leaves oblong linear blunt with 2 glands at base, Inner sepals somewhat orbicular
 11049 Stem winged straight, Leaves ovate ellipt. blunt glaucous, Inner sepals cordate orbicular
 11050 Stem dichotomous panicled, Leaves ovate cordate crisp, Corymb naked, Styles 3

- 11051 Sepals scarcely toothed reflexed as long as petals, in fruit reflexed and longer than the obovate capsule
 11052 Sepals toothed shorter than petals, in fruit erect and shorter than the pear-shaped capsule
 11053 Stem twining, Leaves bipinnatifid with narrow obtuse segments
 11054 Hispid, Leaves opposite and alternate cordate ovate lobed, Petals flattish, Flower very large

and Miscellaneous Particulars.

hang it in their windows as a charm against storms, thunder, and evil spirits ; mistaking the meaning of some medical writers, who have fancifully given this plant the name of *Fuga Dæmonum*, from a supposition that it was good in maniacal and hypochondriacal disorders. In Scotland it was formerly carried about as a charm against witchcraft and enchantment.

H. humifusum is one of the prettiest little plants of the genus, well adapted for growing in pots.

1618. *Ascyrum*. From α , privative, and $\sigma\upsilon\gamma\sigma\sigma$, roughness; that is to say, a smooth plant, *Linn.* Curious little plants, of the same culture as the *Hypericum*s.

1619. *Loasa*. A name applied to these plants by Adanson, but of unknown meaning. Stinging, mostly annual plants ; some of the species are handsome hardy annuals, remarkable for the beauty of their highly curious flowers. *L. volubilis* will not succeed in the open air.

CLASS XIX. — SYNGENESIA. STAMENS 5. ANTHERS united by their edges.

THIS is one of the most extensive and best defined of all the Linnæan classes. Its essential character depends, as its name indicates, (*syn*, together, and *genesis*, generation,) upon the adhesion of the antheræ or male organs of the flower into a single tube. It comprehends the whole of the Corymbifera, Cichoraceæ, and Cinarocephalæ of Jussieu; and, with the exception of Acicarpa, nothing else. The genera constituting the order Monogamia of Linnæus are excluded by Linnæan botanists of the present day.

In addition to the cohesion of the anthers, upon which this class immediately depends, it is further characterized by the flowers, commonly called florets, being clustered together in heads, and inserted upon a common receptacle, which is surrounded by an involucre, commonly, but very improperly, termed calyx. The few genera, such as *Kuhnia*, *Euxenia*, *Acicarpa*, &c., in which a union of anthers either does not exist at all, or in a very incomplete degree, are therefore retained in Syngenesia, because of their congruity in the structure of their inflorescence.

The real nature of the various constituent parts of syngenesious inflorescence being, from its complicated nature, very puzzling to the unlearned, and, as it would seem, to some professors also, it may be useful to explain briefly the analogy the various parts bear to the organs of other plants, and the terms employed in describing them.

The *Head* or *Capitulum* is a cluster of flowers of the nature of an umbel, inserted upon a common rachis, which, by contraction or incomplete development, assumes the form of a conical or flat body, out of which the flowers proceed, and which is called a receptacle. This is surrounded by the involucre. M. Cassini calls the head *Calathide*.

The *Involucre* is the most external part of the head. It consists of a more or less considerable number of scales or leaves, placed in a single row, either distinctly from each other, or united at their edges, in which case the involucre is called one-leaved; or placed in many rows, becoming gradually shorter as they are external, in which case they are called imbricated. If the external scales surround the internal at the base in a regular manner, then the involucre is said to be calyculate. The involucre was called *common calyx* by Linnæus, and has been more recently denominated a perianthium. M. Cassini names it *Periclinium*.

The *Receptacle* (Climanthium of Cassini) is a cellular fungous surface surrounded by the involucre, and bearing the florets. It is either columnar, conical, flat, or depressed; and naked, or covered with appendages called hairs or bristles, according to their nature, or paleæ, when they are dilated and have a glumaceous appearance. If naked, and merely scarred by the insertions of the florets, it is called dotted or punctulate; when the scars are more considerable and deeper, the receptacle is said to be scrobiculate; if the insertions are so deep as to appear to be divided by membranous partitions, it is cellular, or favose, or alveolate; if furnished with hairs, it is villose; if with paleæ, it is paleaceous or chaffy.

The *Paleæ* are of the same nature as bractæe, and exist in various degrees of development. Occasionally they are as large as the scales of the involucre, which they in that case closely resemble.

The flower, usually termed *Floret*, consists of two parts, the ovarium and the corolla, each with its appendages.

The *Ovarium* is always one-celled, but it occasionally has two additional obsolete cells, as in *Arctotis*. It is either naked, or covered with hairs in various degrees, occasionally becoming enveloped in fine wool, and it is surmounted by an organ named the pappus.

The *Pappus* has generally been esteemed a superior calyx, and it is the opinion of M. Cassini that it is analogous to the scales of the receptacle, and the leaves of the involucre.

The *Corolla* is placed on the top of the ovarium. It is either funnel-shaped, with a limb divided into four or five equal lobes, in which case the florets are denominated *tubular*; or it is split on one side, and spread open into the form of a strap, when the florets are called *ligulate*; or it is divided into two portions, of which one is unequal to the other; this form is called *bilabiate* or *two-lipped*. Bilabiate corollas may be either ligulate or fuscous, according to the species to which they belong. Occasionally the corolla appears to be absent.

The *Stamens* are attached to the orifice of the tube of the corolla, just below the limb. Their *filaments* are usually, but not always, distinct; their *anthers* are adherent by their edges, and furnished with a little membranous appendage at the tip, and sometimes with two spur-like processes at their base.

The *Style* is filiform, and either split at the summit into two linear spreading stigmas, or consists of a single piece from the base to the summit. The form and surface of the stigma, and the upper part of the style are subject to a great diversity of appearances, which are of the utmost importance in determining the affinities of the genera.

The *Florets* are either hermaphrodite, unisexual, or neuter. Upon these differences of sex the orders of Linnæus are founded.

In *Syngenesia æqualis* the florets are all hermaphrodites.

In *Syngenesia superflua*, those of the disk or centre are hermaphrodite, of the circumference or ray female, (and *superfluous*.)

In *Syngenesia frustranea*, those of the disk are hermaphrodite, of the ray neuter, (and *useless*.)

In *Syngenesia necessaria*, those of the disk are male, of the ray female, (and *necessary*.)

Syngenesia segregata is only characterized by the heads themselves being clustered and surrounded by a common involucre.

The genera of Syngenesia have always attracted much attention from systematic botanists, who have met with very unequal success in characterizing them. The older botanists comprised them all under a few general heads or names. Tournefort, with his usual happiness, pointed out a large proportion of the most natural genera. Vaillant established a considerable number. Linnæus, profiting by the labours of his predecessors, rejecting some genera, and dividing others, increased their number, and adapted them to his sexual system, in nearly the same order in which they exist at the present day. Jussieu, by applying to the genera the principles of his natural method, reduced them to an arrangement much superior in point both of facility and of natural affinity to that of his northern rival. But however meritorious the labours of these great systematists may have been, much remained to be effected, even among their own plants, by those who followed them. The indefatigable Gærtner, who worked upon the only satisfactory or philosophical principle, that of strict analysis, soon discovered that the combinations of Linnæus and Jussieu were often too vague and ill defined to accord with his notions of accurate subdivision. Hence many other genera arose. But since his days, the extent of Syngenesia has, like all other parts of botanical science, increased exceedingly, and has arrived in our days at a state little short of absolute confusion. Injudicious or superficial botanists, impressed with the fear of innovation, and with a pious reverence even for the errors of those who went before them, have from time to time crowded the genera of Jussieu and Linnæus with the most incongruous species, and so have rendered many of those which were originally pure and simple, heterogeneous masses of species. Much has been done by our learned countryman, Mr. Robert Brown, to reduce to order this class of individuals, and, as far as his published observations have extended, with the happiest success. In France, an ingenious and accurate observer, Mr. Henry Cassini, has undertaken a revision of the whole class, upon principles peculiar to himself; and it must be allowed, that what he has executed has given ample room for regret that he has not published more. Unfortunately, his observations are scattered over the face of many books, and are in no case in such a state of arrangement as to be extensively useful. It is hoped that a period will soon arrive when he, or at least some

of his countrymen, will place in one view the result of his labours, so as to enable the world to judge with more accuracy, both of their extent, and of their real importance in defining the limits of the genera and their orders. The style and stigma, which had been previously almost overlooked, have furnished M. Cassini with what appear to be beautiful distinguishing marks of his orders; and it is upon these organs that much of the peculiarity of his arrangement depends. In the mean while, till it can be ascertained what the ultimate division of Compositæ is likely to be, it has been considered more prudent in this work to indicate none of the divisions of either M. Cassini, or of his fellow-labourers in France or elsewhere.

In a popular point of view, Syngenesia may be considered interesting in a high degree. It abounds in plants of ornament, all of which are, without exception, of easy cultivation. It is not necessary to particularize the merits of the brilliant varieties of the Dahlia, or of the Chinese Chrysanthemum, which are the chief ornaments of every autumnal garden; nor to point out the beauty of the various tribes of Aster, Helianthus, Coreopsis, Xeranthemum, or Gnaphalium. These and an hundred others must be familiar to every lover of gardening. It is, however, worth remarking, that nearly all syngenesious plants are autumn flowers. In the tropics, many become trees of considerable dimensions; in temperate climates, they are mostly herbaceous or low bushes.

With regard to the qualities of syngenesious plants, considered economically or medicinally, it may be stated, that, whatever they may be, they consist in a bitter principle, and an oily secretion. But these vary in particular tribes. In some the bitter is combined with a resinous principle, by which its powers are increased in different degrees. In those plants in which the resin is found in small quantities only, and mixed with a bitter or astringent mucilage, tonic, stomachic, and febrifugal properties seem to be acquired, as in the camomile, the golden rod, the feverfew, and the Eupatorium perfoliatum; and the stimulant powers of these plants appear to increase in proportion as the resin is abundant. Some kinds are anthelmintic, as the wormwood and tansy; others are emmenagogue, as the feverfew, the yarrow, and various kinds of wormwoods. Certain species possess sudorific qualities, as the Eupatorium, the yarrow, the wormwood, and the marigold; others, again, are powerful diuretics, as Liatris; while stimulating powers exist in considerable activity in others, as in the Sneezewort and Arnica. The Spilanthus, Anthemis, Pyrethrum, and some others, excite salivation. The Eupatorium Ayapana of Brazil, and the Guaco of Peru, which is another species of Eupatorium, are most powerful alexiterics. According to the analysis of M. Braconnot, the wormwood owes its bitterness to an extremely bitter animalized matter, which forms a little less than one fifth of its weight; the same chemist also states that plant to contain a volatile oil, and an acid, apparently new, which is found in combination with potash. Before the perfect development of the leaves, the bitter principle is so much diluted with insipid mucilage, that the young shoots of some of the thistle tribe, the Cardoon for example, are used for culinary purposes; and it is probable, that it is owing to the small proportion which the bitter bears to the whole mass, that the receptacle of the artichoke, of the Onopordum, and of the cotton thistle, is found fit for food. The corollas of the Cardoon, and of many thistles, have the power of curdling milk. The juice of the lettuce and other cichoraceous plants is milky, bitter, astringent, and narcotic. In a wild state, the narcotic principle is so abundant, that the inspissated juice of *Lactuca virosa* has been used as a substitute for opium, and with much success. But under the effect of cultivation, the mucilage is so much more abundant than any other substance, that the same species often form well-known articles of wholesome and agreeable food. And, indeed, under any circumstances, wild or domesticated, the young shoots, when the narcotic principle is scarcely developed, are frequently eaten with safety; it is for the same reason, namely, the incomplete formation of the bitter principle, and the superabundance of mucilage, on account of the absence of light, that the blanched leaves of cardoons and chicory, and the white roots of the Scorzonera and the Salsafy, are capable of being eaten without inconvenience. The seeds of all syngenesious plants abound in oil, which is expressed from those of the *Madia* of Chili, the *Verbena sativa*, and the common sunflower. Owing to the difficulty of procuring this oil in a pure state, its virtues are not ascertained with much accuracy. They are generally believed to be slightly purgative and diaphoretic.

Order 1.

ÆQUALIS.

Flowers of the disk and ray all hermaphrodite.

1620. *Geopogon*. Receptacle setose-paleaceous. Invol. many-leaved, simple, or with bracteolæ. Pericarp of disk with branched pappus, of the ray with five awns.
1621. *Tragopogon*. Involucre simple, of many leaves. Receptacle naked. Pappus feathery, stipitate. Pericarp longitudinally striated.
1622. *Troximon*. Invol. oblong, conical, simple, or imbricated with unequal scales. Recept. naked, dotted. Pappus sessile, hairy.
1623. *Arnopogon*. Recept. naked. Pappus feathery, stipitate. Involucre 1-leaved, 8-parted, turbinate.
1624. *Podaspermum*. Recept. warted. Pericarp cylindrical on a long stalk. Leaves finely cut. Otherwise as *Scorzonera*.
1625. *Scorzonera*. Recept. naked. Pappus feathery, somewhat stalked. Invol. imbricated, with scales scarios at edge.
1626. *Picridium*. Invol. ventricose at base, imbricated with broadish scales, membranous at edge. Pappus sessile, villous, simple. Pericarp 4-cornered, warted across.
1627. *Sonchus*. Involucre imbricated, swelling at the base. Receptacle naked. Pappus simple, sessile.
1628. *Lactuca*. Involucre imbricated, cylindrical, its scales with a membranous margin. Receptacle naked. Pappus simple, stipitate.
1629. *Chondrilla*. Receptacle naked. Invol. with bracteolæ. Pappus simple, stalked. Florets in many rows. Pericarp mucronated.
1630. *Prenanthes*. Involucre with scales at the base. Receptacle naked. Pappus simple, sessile. Florets few.
1631. *Leontodon*. Involucre with scales that are frequently lax and flaccid. Receptacle naked. Pappus simple, stipitate.
1632. *Apargia*. Involucre imbricated with scales at the base. Receptacle naked, dotted. Pappus feathery, sessile, unequal.
1633. *Thrinia*. Recept. favose. Pappus of the ray membranous, multifid, of the disk stalked, feathery. Invol. with 8 angles and 8 leaves.
1634. *Picris*. Cal. double, the inner equal, the outer lax. Receptacle naked. Pappus feathery. Pericarp transversely striated.
1635. *Hieracium*. Involucre ovate, imbricated. Receptacle nearly naked, dotted. Pappus simple, sessile.
1636. *Longocris* has the characters of *Crepis*, but the pappus is stalked.
1637. *Berkhausia*. Invol. oblong in two rows, the outer much shorter than the inner. Recept. alveolate. Pappus of the centre stalked, of the circumference sessile or subsessile.
1638. *Crepis*. Involucre surrounded with deciduous scales, and at length swelling into protuberances. Receptacle roughish. Pappus sessile.
1639. *Helminthia*. Recept. naked. Invol. double: outer 8-leaved, equal; inner 5-leaved, as long as outer. Pericarp striated across. Pappus stalked, feathery.
1640. *Myosere*. Recept. paleaceous. Paleæ capillary. Invol. calcylated. Pappus hairy, sessile.
1641. *Tolpis*. Recept. favose. Invol. with bracteolæ, which are subulate, and as long as invol. Pappus of the ray toothed, of the disk with 2 or 4 awns.
1642. *Andryala*. Recept. villous. Invol. many-parted, nearly equal, rounded. Pappus simple, sessile.

1643. *Rothia*. Recept. villous, chaffy at edge. Invol. many-leaved, equal. Pappus hairy, of the disk sessile, of the ray none.
1644. *Krigia*. Recept. naked. Pappus membranous, 5-leaved, with 5 bristles between. Invol. many-leaved, simple.
1645. *Hyoseris*. Recept. naked. Invol. with bracteolæ. Pappus double: exterior capillary; interior paleaceous, awned.
1646. *Hedynnois*. Recept. naked. Invol. with bracteolæ. Pappus of disk double: outer obsolete, of many bristles; inner paleaceous, 5-leaved; of the ray a membranous toothletted margin.
1647. *Robertia*. Invol. many-leaved, equal. Recept. scaly. Pappus feathery, the hairs being slightly membranous at base.
1648. *Seriola*. Recept. paleaceous. Invol. simple. Pappus somewhat hairy.
1649. *Soldeuilla*. Invol. imbricated, in fruit ventricose at base, with scales conniving at end. Recept. paleaceous; paleæ very short, setose. Pappus O.
1650. *Hypocheeris*. Involucre oblong, imbricated. Receptacle chaffy. Pappus feathery, stipitate, or sessile.
1651. *Lapsana*. Involucre with scales at the base. Receptacle naked (its inner leaves equal, channelled, Sm.) Pericarpis destitute of pappus (deciduous).
1652. *Zacintha*. Recept. naked. Pericarpis of the ray incurved, of the disk straight. Pappus very short, somewhat feathery. Invol. with bracteolæ, which are membranous.
1653. *Rhagadiolus*. Recept. naked. Pericarpis arcuate, spreading. Pappus O. Invol. with bracteolæ.
1654. *Moscaria*. Invol. 6-leaved, equal. Recept. flat, paleaceous. External pericarpis with a short feathery pappus; central with none.
1655. *Catananche*. Recept. paleaceous. Invol. imbricated, scarious. Pappus paleaceous, 5-leaved; paleæ awned.
1656. *Triptilion*. Invol. imbricated, the exterior scales somewhat squarrose. Florets bilabiate: the upper lip 3-toothed; lower entire revolute. Recept. villous. Pappus with 3 feathery.
1657. *Cichorium*. Involucre surrounded with scales or smaller leaflets. Receptacle naked or slightly hairy. Pappus sessile, scaly, shorter than the pericarp.
1658. *Baccharis*. Invol. imbricated, scarious. Florets, one in the middle large tubular; the others 4-toothed, with a revolute bristle inserted in the mouth of the tube. Recept. pilose. Pappus feathery.
1659. *Scolymus*. Receptacle paleaceous. Invol. imbricated, spiny. Pappus O.
1660. *Arctium*. Involucre globose, each of its scales with an incurved hook at the extremity. Receptacle chaffy. Pappus simple.
1661. *Serratula*. Involucre cylindrical, imbricated with scales that are not spinous. Receptacle chaffy. Pappus roughish or feathery, rigid, persistent.
1662. *Saussurea*. Involucre imbricated, not spiny, outer scales acute, inner obtuse, membranous. Pappus feathery, in two rows, the exterior being shortest, the inner somewhat united at base.
1663. *Carduus*. Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, roughish.
1664. *Silybum*. Invol. ventricose, imbricated: outer leaves with appendages at end; inner cochleate. Recept. chaffy. Pappus linear, chaffy, deciduous.
1665. *Cnicus*. Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, feathery.
1666. *Onopordum*. Involucre swelling, its scales spreading, and spinous. Receptacle cellular. Pappus deciduous, rough.
1667. *Bevardia*. Invol. imbricated with linear unarmed scales. Recept. somewhat favose, naked. Pappus hairy, generally twisted spirally, persistent.
1668. *Cynara*. Recept. setose. Invol. dilated, imbricated; scales fleshy, emarginate, with a point. Pappus sessile, feathery.
1669. *Carlina*. Involucre swelling: the exterior scales with numerous spines; the inner ones colored, scarious.
1670. *Atractylis*. Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets of ray 5-toothed.
1671. *Acarna*. Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets flosculous.
1672. *Stokesia*. Recept. naked. Pappus with 4 bristles. Invol. leafy, somewhat imbricated. Heads radiated; florets of ray funnel-shaped, irregular.
1673. *Stobæa*. Invol. imbricated, with toothed spiny scales. Florets flosculous. Recept. hispid, favose. Pappus paleaceous.
1674. *Onobroma*. Invol. ventricose: outer scales large, herbaceous, spiny, acuminate; inner coriaceous, unarmed. Recept. paleaceous. Pappus setaceous, rigid, unequal.
1675. *Carthamus*. Recept. paleaceous, setose. Invol. ovate, imbricated; scales ovate, leafy at end. Pappus paleaceous, hairy, or none.
1676. *Cardopatum*. Invol. 6-8-fl. many-leaved, imbricated, the outer scales branched, spiny. Recept. paleaceous, with long fascioid paleæ. Pericarpis villous.
1677. *Stachelina*. Recept. with very short paleæ. Pappus feathery. Anthers awned at base. Invol. hemispherical, imbricated.
1678. *Palafoxia*. Invol. oblong, somewhat imbricated, 8 or many-leaved, many-flowered. Cor. flosculous, longer than calyx, with a 5-fid limb. Pappus chaffy. Receptacle naked. Fruit marginal, wrapped up in the involucre.
1679. *Pteronia*. Recept. paleaceous; paleæ many-parted. Pappus somewhat feathery. Invol. imbricated with keeled scales.
1680. *Vernonia*. Recept. naked. Invol. ovate, imbricated. Pappus double: outer paleaceous; inner capillary.
1681. *Ammobium*. Invol. imbricated, colored, radiant. Anthers with 2 bristles at the base. Chaffs of receptacle distinct. Pappus a toothed edge.
1682. *Liatris*. Recept. naked. Invol. oblong, imbricated. Pappus feathery.
1683. *Mikania*. Recept. naked. Invol. 4-6-leaved, equal, 4 or 6-flowered. Pappus hairy.
1684. *Sparganoporus*. Invol. subglobose, imbricated with unequal scales, recurved, spreading at end. Recept. naked. Pericarpis crowned with a somewhat cartilaginous cup.
1685. *Eupatorium*. Involucre imbricated, oblong. Florets few. Receptacle naked. Pappus rough.
1686. *Dumerilia*. Invol. many-parted, equal. Receptacle paleaceous. Florets bilabiate. Anthers spurred at base. Pappus feathery, sessile.
1687. *Ageratum*. Recept. naked. Pappus with 5 somewhat-awned paleæ. Invol. oblong in a double row. Corollas 4-5-fid.
1688. *Celestina*. Invol. cylind. many-leaved, imbricated. Recept. convex, naked. Florets all tubular. Stigmas very long, spreading. Pericarpis truncate, 5-cornered. Pappus a membranous rim.
1689. *Stevia*. Recept. naked. Pappus paleaceous. Invol. cylindrical in a single row.
1690. *Cephalophora*. Recept. naked, hemispherical. Pappus paleaceous, many-leaved. Invol. many-leaved, reflexed.
1691. *Amphirepis*. Invol. hemispherical, imbricated. Recept. flat, naked. Florets all tubular. Pericarpis cylindrical, naked. Pappus hairy, deciduous.
1692. *Hymenopappus*. Invol. many-leaved, spreading; scales ovate, colored. Recept. naked. Pappus many-leaved, paleaceous.
1693. *McLanthera*. Recept. paleaceous, convex. Invol. many-leaved, in a double row. Pappus of from 2 to 18 rough bristles. Pericarpis turbinate, angular.

1694. *Marshallia*. Recept. paleaceous. Pappus of 5 membranous acuminate paleæ. Invol. imbricated; scales somewhat lanceolate, incumbent.
1695. *Spilanthes*. Recept. paleaceous, conical. Pappus with 2 awns, one smaller than the other. Invol. nearly equal.
1696. *Salmea*. Recept. conical, paleaceous. Pappus with 2 awns. Pericarps depressed. Invol. imbricated.
1697. *Bidens*. Involucure of many leaves, with many foliaceous bracteas at the base. Receptacle plane, chaffy. Cor. sometimes radiant. Pericarps crowned with from 2-5 persistent awns, which are rough, with minute deflexed bristles.
1698. *Platypteris*. Invol. many-leaved, imbricated, squarrose. Recept. convex, paleaceous. Pericarps compressed, winged, with 2 awns at top.
1699. *Laqascea*. Invol. 1-leaved, tubular, 1-flowered, divided at end. Floret tubular, hermaphrodite. Pericarps linear, cuneate, compressed. Pappus a small fringed crown.
1700. *Lavenia*. Recept. naked. Pappus with 3 awns, glandular at end. Invol. ovate, somewhat imbricated.
1701. *Cacalia*. Recept. naked, Pappus pilose. Invol. cylindrical, oblong, at the base only with bracteolæ.
1702. *Kleinia*. Recept. naked. Pappus hairy. Invol. simple, equal, 5-leaved.
1703. *Ethulia*. Recept. naked. Pappus a very narrow rim. Invol. equal, in a double row.
1704. *Pigueria*. Recept. naked. Invol. equal, 4-leaved, 4-flowered, Pappus none. Pericarps pentagonal.
1705. *Chrysocoma*. Recept. naked. Pappus simple. Invol. hemispherical, imbricated. Style scarcely longer than florets.
1706. *Tarhonanthus*. Recept. villous. Pericarps enveloped in hair. Invol. 1-leaved, half 7-fid, turbinate.
1707. *Calea*. Recept. paleaceous. Pappus hairy. Invol. imbricated.
1708. *Isocarpha*. Recept. paleaceous conical, the outer paleæ forming the involucrum. Pappus O. Anthers not spurred at base. Stigmas with a long appendage.
1709. *Petrobium*. Recept. paleaceous, flattish. Invol. many-leaved, in 2 rows: outer row shortest. Pericarps angular. Pappus awned.
1710. *Neurotena*. Recept. paleaceous, flattish. Pappus capillary, toothletted, persistent. Invol. imbricated, leafy. Anthers awnless at the base.
1711. *Humca*. Recept. minute, glandular. Pappus none. Invol. loosely imbricated, membranous. Florets about 3, tubular. Anthers awned.
1712. *Cesulia*. Recept. paleaceous: paleæ enveloping the pericarps. Pappus O. Invol. 3-leaved.
1713. *Iroodia*. Recept. paleaceous. Pappus O. Invol. imbricated: inner scales radiant colored.
1714. *Santolina*. Recept. paleaceous. Pappus O. Invol. imbricated, hemispherical.
1715. *Otanthus*. Invol. hemispherical imbricated. Florets with 2 appendages at base. Recept. convex, paleaceous. Pappus O.
1716. *Calceate*. The same as *Calea*, but it has a radius of ligular female florets.
1717. *Athanasia*. Recept. paleaceous. Pappus paleaceous, very short. Invol. imbricated.
1718. *Balsanita*. Recept. naked. Pappus O. Invol. imbricated.
1719. *Pentzia*. Recept. naked. Pappus a membranous torn rim. Invol. imbricated, hemispherical.

SUPERFLUA.

§ Florets of the disk hermaphrodite: of the ray female.

1720. *Tanacetum*. Invol. hemispherical, imbricated. Recept. naked. Florets of the ray trifid, obsolete sometimes wanting. Pericarps crowned with a membranous margin or pappus.
1721. *Artemisia*. Invol. ovate or rounded, imbricated. Recept. naked (or downy, *Sm.*). Florets of the ray subulate. Pericarps crowned with a membranaceous pappus.
1722. *Gnaphalium*. Recept. naked. Pappus hairy or feathery. Invol. imbricated: marginal scales round, scarious, colored.
1723. *Leontopodium*. Heads sessile in the leaves. Invol. woolly. Florets 5-fid. Pappus pencilled or hairy. Otherwise *Guaphalium*.
1724. *Evax*. Heads surrounded by bracteæ. Invol. ovate, imbricated, with appressed acuminate scales. Florets of disk 4-toothed: of the ray not toothed. Recept. subulate, paleaceous. Pericarps of the female flowers without pappus.
1725. *Antennaria*. Recept. scrobiculate. Pappus capillary. Invol. imbricated, scarious, colored. Anthers spurred at base. Florets dioecious.
1726. *Metalasia*. Invol. cylindrical, radiant colored. Pappus deciduous, capillary, clavate. Florets few, hermaphrodite. Otherwise as *Gnaphalium*.
1727. *Astelma*. Recept. naked. Pappus feathery, sessile; rays connate at base. Invol. imbricated: with scarious scales, the interior of which are connivent.
1728. *Athrizia*. Heads radiant. Invol. obl. imbricated, awned, squarrose. Florets bilabiate. Pappus feathery. Recept. alveolate.
1729. *Xeranthemum*. Recept. paleaceous. Pappus paleaceous-setaceous. Invol. imbricated, radiated: with a colored ray.
1730. *Elichrysium*. Recept. naked. Pappus hairy or feathery. Invol. imbricated, radiated: ray colored.
1731. *Carpesium*. Recept. naked. Pappus O. Invol. imbricated, with the outer scales reflexed.
1732. *Baccharis*. Recept. naked. Pappus pilose. Invol. imbricated, cylindrical. Female florets mixed with the hermaphrodite ones.
1733. *Molina*. Invol. campanulate, imbricated. Pappus feathery. Recept. convex, naked, dotted. Flowers dioecious.
1734. *Coryza*. Invol. roundish, imbricated. Recept. naked. Florets of the ray 3 cleft. Pappus rough.
1735. *Madia*. Recept. naked. Pappus O. Invol. double: outer 8-10-leaved, equal, longer than the inner, which is many-leaved.
1736. *Erigeron*. Invol. imbricated. Recept. naked. Florets of the ray numerous, very narrow, mostly of a different color from the disk. Pappus simple.
1737. *Tussilago*. Invol. simple, equal, submembranaceous, swelling. Recept. naked. Pappus simple.
1738. *Senecio*. Invol. subcylindrical, equal, scaly below; the scales withered at the tip. Recept. naked. Pappus simple.
1739. *Aster*. Invol. imbricated, its lowermost scales spreading (except in *A. trifolium*). Recept. naked. Florets of the ray more than 10. Pappus simple.
1740. *Solidago*. Invol. imbricated, its scales connivent. Recept. naked. Florets of the ray (of the same colour as the disk) about 5. Pappus rough.
1741. *Cineraria*. Recept. naked. Pappus simple. Invol. simple, many-leaved, equal.
1742. *Calotis*. Recept. naked. Pericarps crowned with two opposite paleæ and 1-3-barbed awns. Invol. nearly equal, many-leaved, in a single or double row.
1743. *Kaulfussia*. Invol. simple: leaflets keeled. Recept. naked, convex. Pappus of the ray a minute fringed rim; of the disk stiff and feathery.
1744. *Inula*. Invol. imbricated. Recept. naked. Florets of the ray very numerous, linear. Anthers with 2 bristles at the base. Pappus simply composed of hairs.
1745. *Pulicaria*. Invol. roundish, imbricated: scales linear, acuminate. Recept. naked. Pappus compound: outer a membranous cup; inner setaceous. Pericarps uniform.
1746. *Grindelia*. Recept. naked. Pappus setaceous, deciduous. Invol. imbricated, hemispherical.

1747. *Podolepis*. Recept. naked. Pappus hairy. Invol. imbricated, scarious, hemispherical: scales unguiculate.
1748. *Chaetanthera*. Invol. many-leaved, ciliated. Florets of ray linear, 3-toothed, with a fine bifid spiral segment at the divisions. Anthers spurred at base. Recept. naked, flat. Pappus hairy.
1749. *Arnica*. Recept. naked. Pappus simple. Invol. with equal leaves. Florets of ray generally with 5 filaments without anthers.
1750. *Gerberia*. Florets bilabiate, those of the ray ligulate. Invol. imbricated, coriaceous. Recept. flat, naked. Pappus with long bearded paleæ.
1751. *Doronicum*. Scales of the invol. in 2 equal rows, longer than the disk. Recept. naked. Pericarps of the disk crowned with a simple pappus, those of the ray without a pappus.
1752. *Peydium*. Recept. naked. Pappus hairy. Florets 2-lipped.
1753. *Trigonotheca*. Recept. paleaceous. Pappus O. Invol. 1-leaved, 4-cornered, 4-parted.
1754. *Ximenesia*. Recept. paleaceous. Pappus O. Pericarps of ray naked, emarginate; of the disk winged. Invol. many-leaved, nearly equal.
1755. *Helonium*. Recept. naked, of the ray paleaceous. Pappus 5-awned. Invol. 1-leaved, many-parted. Florets of ray half-trifid.
1756. *Bellis*. Invol. hemispherical, its scales equal. Recept. naked, conical.
1757. *Bellium*. Recept. naked. Pericarps conical, with a paleaceous 8-leaved crown and awned pappus. Leaves of invol. equal.
1758. *Dahlia*. Recept. paleaceous. Pappus O. Invol. double: outer many-leaved; inner 1-leaved, 8-parted.
1759. *Babera*. Invol. double: outer many-leaved; inner 8-leaved. Recept. naked. Pappus hairy.
1760. *Tagetes*. Recept. naked. Pappus with 5 erect awns. Invol. simple, 1-leaved, 5-toothed, tubular. Florets of ray 5, persistent.
1761. *Heliospermum*. Recept. naked. Outer grains compressed with a membranous edge; inner oblong with two awns. Invol. double: outer 4-parted; inner many-leaved.
1762. *Schkuhria*. Recept. naked. Pappus paleaceous. Invol. 5-leaved. Florets of ray solitary.
1763. *Pectis*. Recept. naked. Pappus with 3 or 5 awns. Invol. 5-leaved. Florets of ray 5.
1764. *Longchampsia*. Differs from *Pectis* and *Leysera*, in having a double pappus, the exterior of which is edged, the inner feathery.
1765. *Leysera*. Recept. somewhat paleaceous. Pappus paleaceous: of the disk feathery. Invol. scarious.
1766. *Sclæa*. Invol. imbricated, ovate. Recept. naked. Pappus O. Female florets inconspicuous, mixed among the leaves of the involucre.
1767. *Rethania*. Recept. paleaceous. Pappus membranous, cylindrical, short. Invol. imbricated, scarious. Rays numerous.
1768. *Zimia*. Recept. paleaceous. Pappus with 2 erect awns. Invol. ovate, cylindrical, imbricated. Florets of ray 5, persistent, entire.
1769. *Chrysanthemum*. Invol. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pappus none.
1770. *Pyrethrum*. Recept. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pericarps crowned with a membranous margin.
1771. *Matricaria*. Invol. hemispherical or almost plane, imbricated with scales whose borders are membranous. Recept. naked, almost cylindrical. Pappus none.
1772. *Boltonia*. Recept. favose, hemispherical. Pappus toothed, awned, somewhat 2-horned. Rays numerous. Invol. imbricated.
1773. *Lidbeckia*. Recept. naked. Pappus O. Pericarps angular, with the lowest joint of style persistent. Rays numerous. Invol. many-parted.
1774. *Cenia*. Invol. in fruit turbinate, multifid. Florets of ray very numerous, short. Recept. naked. Pericarps compressed.
1775. *Cotula*. Recept. nearly naked. Pappus margined. Florets of disk 4-fid, of the ray scarcely any.
1776. *Gnauza*. Invol. imbricated, spreading. Marginal florets 3-toothed. Recept. hemispherical. Pericarps with a toothed edge at top.
1777. *Anacyclus*. Recept. paleaceous. Pappus emarginate. Pericarps with membranous edges.
1778. *Anthemis*. Invol. hemispherical, its scales nearly equal, their margins scarious. Recept. convex, chaffy. Pericarps crowned with a membranous border or pappus.
1779. *Centrospermum*. Invol. hemispherical, of many imbricated, round, scarious scales. Recept. naked. Pappus spiny. Outer pericarps cymbiform, smooth.
1780. *Sanvitalia*. Recept. paleaceous. Pericarps of ray with 3 awns: of the side naked, warted; of the disk winged. Invol. imbricated, flat.
1781. *Achillea*. Invol. ovate, imbricated, unequal. Recept. plane, chaffy. Florets of the ray 5-10, roundish, obcordate. Pericarps naked.
1782. *Tridax*. Invol. cylindrical, imbricated, with ovate oblong scales. Florets of ray 3-parted. Recept. paleaceous. Pappus hairy, simple.
1783. *Amellus*. Recept. paleaceous. Pappus simple. Invol. imbricated. Florets of ray undivided.
1784. *Starkea*. Recept. hirsute. Pappus sessile, hairy. Invol. imbricated.
1785. *Columella*. Invol. cylindrical, imbricated. Florets of ray undivided. Recept. naked, favose. Pappus a toothed edge.
1786. *Eclipta*. Recept. paleaceous. Pappus O. Florets of disk 4-fid.
1787. *Meyera*. Invol. 4-leaved, the 2 inner smallest. Recept. small, paleaceous, 2 paleæ enveloping the pericarp, keeled. Pappus O.
1788. *Chrysanthellum*. Invol. cylindrical, about as long as florets, scaly at base. Recept. paleaceous. Florets numerous, linear, 2-toothed, short, of the centre few, and generally abortive. Pericarps naked, roundish, furrowed, with an entire edge.
1789. *Stegsbeckia*. Recept. paleaceous. Pappus O. Outer invol. 5-leaved, inner spreading. Ray halved.
1790. *Verbesina*. Recept. paleaceous. Pappus awned. Invol. in one row. Florets of the ray about 5.
1791. *Synedrella*. Invol. generally of 2 leaves. Florets fuscous. Recept. obsolete, paleaceous: paleæ glumaceous; the outer ovate. Pericarps oval, flat, edged; the central dissimilar, 1-near, oblong, with 2 or 3 awns.
1792. *Gallinsoga*. Recept. paleaceous. Pappus many-leaved, paleaceous. Invol. imbricated.
1793. *Aenella*. Invol. simple, with a few somewhat leafy divisions. Recept. oblong, paleaceous. Heads radiant. Pericarps 4-cornered, truncate at end, naked.
1794. *Zaltzauia*. Invol. with distinct, somewhat ovate, equal segments. Head radiant. Recept. conical, paleaceous; paleæ membranous, trifid, involving the pericarps, which are 4-cornered and naked.
1795. *Pascalia*. Recept. paleaceous. Pericarps drupaceous. Pappus a toothed rim. Invol. imbricated.
1796. *Heliopsis*. Invol. imbricated, with ovate lined squamæ. Cor. of ray linear, large. Recept. paleaceous, conical, with lanceolate paleæ. Pericarps 4-cornered. Pappus O.
1797. *Bupththalmum*. Recept. paleaceous. Pappus an obsolete rim. Sides of pericarps, especially of the ray, edged.

Order 3.

FRUSTRANEA.

Florets of the disk fertile: of the ray sterile.

1798. *Helianthus*. Recept. paleaceous, flat. Pappus 2-leaved. Invol. imbricated, subsquarrose.
1799. *Gymnotoma*. Invol. hemispherical, loosely imbricated. Recept. convex, paleaceous. Central florets sterile; marginal radiant. Pappus O.

1800. *Rudbeckia*. Recept. paleaceous, conical. Pappus with a 4-toothed rim. Invol. with a double row of scales.
1801. *Galaridia*. Recept. paleaceous, hemispherical. Pappus paleaceous, many-leaved. Invol. imbricated, many-leaved, flat. Rays 3-parted.
1802. *Thilohnia*. Invol. many-leaved, cylindrical. Rays 3-toothed. Recept. paleaceous, convex. Pappus paleaceous, 5-leaved.
1803. *Cosmea*. Recept. paleaceous. Pericarps 4-cornered. Pappus with 2 or 3 awns. Invol. double, each 1-leaved, 8-parted.
1804. *Corcopsis*. Recept. paleaceous. Pericarps compressed, emarginate. Pappus with 2 horns. Invol. double, each many-leaved.
1805. *Simsia*. Invol. subcylindrical, nearly equal, with linear lanceolate incumbent scales. Recept. paleaceous. Pericarps flattish, somewhat edged, each edge awned.
1806. *Osmites*. Recept. paleaceous. Pappus obsolete. Florets of ray ligulate. Invol. imbricated scarious.
1807. *Eceltia*. Recept. paleaceous. Pappus O. Pericarps vertical, flat, with a ciliated edge. Invol. imbricated.
1808. *Sclerocarpus*. Recept. paleaceous. Pappus O. Invol. double, each 3-leaved.
1809. *Cultunia*. Recept. favose. Pericarps smooth. Pappus O. Invol. 1-leaved, covered with imbricated leaflets.
1810. *Berckheya*. Recept. favose. Pericarps villous. Pappus paleaceous (sometimes bristly-paleaceous, ciliated). Invol. 1-leaved, covered with imbricated leaflets.
1811. *Didelta*. Recept. favose, inclosing the pericarps. Pappus many-parted, setaceous, paleaceous, toothed. Invol. 1-leaved, covered with leaflets, the exterior very large.
1812. *Gorteria*. Recept. scrobiculate. Pappus a ciliated edge. Invol. 1-leaved, covered with imbricated leaflets, of the fruit indurated, connivent, deciduous.
1813. *Gazania*. Recept. naked, or alveolate. Pericarps very villous. Pappus hairy-paleaceous. Invol. 1-leaved, the tube naked, or covered with imbricated leaflets.
1814. *Cryptostemma*. Recept. favose. Pappus paleaceous, covered by the entangled wool of the pericarp. Invol. imbricated.
1815. *Arctotheca*. Recept. favose. Pappus O. Invol. imbricated.
1816. *Sphegogyne*. Recept. with distinct palææ. Pappus paleaceous, simple. Stigmas with a dilated truncated end. Invol. imbricated, the inner scales or all with a dilated scarious end.
1817. *Zoega*. Recept. setose. Pappus setaceous. Rays ligulate. Invol. imbricated.
1818. *Leuzea*. Invol. imbricated, spherical, not spiny. Recept. bristly. Pappus feathery, in many rows. Florets all hermaphrodite.
1819. *Centaurea*. Invol. scaly. Recept. bristly. Corollas of the ray infundibuliform, irregular, longer than those of the disk. Pappus simple.
1820. *Galactites*. Invol. imbricated, with somewhat squarrose spiny scales. Recept. favose. Pappus feathery, deciduous.
1821. *Wedelia*. Invol. 5-leaved, with broad leafy segments. Recept. paleaceous. Florets of the centre generally abortive, of the ray many, oval, 2-3-fid. Stigmas setaceous. Pappus stipitate, membranous, tooth-letted.

Order 4.

NECESSARIA.

Florets of the ray female fertile : of the disk male.

1822. *Milleria*. Recept. naked. Pappus O. Invol. of 3 valves. Ray halved.
1823. *Baltimora*. Recept. paleaceous. Pappus O. Invol. cylindrical, many-leaved. Ray 5-flowered.
1824. *Siphium*. Recept. paleaceous. Pappus with a 2 horned edge. Invol. squarrose.
1825. *Trixis*. Invol. imbricated. Cor. of ray 3-fid. Recept. paleaceous. Pappus O. Pericarps villous at end.
1826. *Polymania*. Recept. paleaceous. Pappus O. Invol. double: outer 4 or 5-leaved; inner 10-leaved, with common leaflets.
1827. *Chrysogonum*. Invol. 5-leaved. Recept. paleaceous. Pappus 1-leaved, 3-toothed. Pericarps with a little 4-leaved calyx.
1828. *Melampodium*. Recept. paleaceous, conical. Pappus 1-leaved, vulviform. Invol. 5-leaved.
1829. *Chaptalia*. Recept. naked. Pappus capillary. Florets of the ray in a double row, deformed; of the disk bilabiate.
1830. *Calendula*. Recept. naked. Pappus O. Invol. many-leaved, equal. Pericarps of the disk membranous.
1831. *Arctotis*. Recept. setose-alveolate. Pericarps half 2-celled, or 2-furrowed at the back. Pappus paleaceous. Invol. imbricated, with scales scarious at end.
1832. *Osteospermum*. Recept. naked. Pappus O. Invol. many-leaved. Pericarps globose, colored, bony.
1833. *Othonna*. Recept. naked. Pappus hairy. Invol. 1-leaved, many-cut.
1834. *Hippia*. Recept. naked. Pappus O. Pericarps with very broad edges, naked. Invol. hemispherical, somewhat imbricated. Florets of ray 10, obsoletely trifid.
1835. *Sotiva*. Invol. 7-leaved, leaflets with imbricated edges, the 3 outer largest. Ray none. Recept. very small, somewhat villous. Pericarps compressed, surrounded by a membrane, crowned by 2 prickles and the style.
1836. *Psiadia*. Recept. naked. Pappus hairy, sessile. Invol. imbricated, ovate. Florets of ray short.
1837. *Eriocephalus*. Recept. paleaceous. Pappus O. Invol. double: inner 1-leaved; outer 5-leaved.
1838. *Filago*. Recept. paleaceous. Pappus O. Invol. imbricated. Female florets mixed among the scales of involucre.
1839. *Micropus*. Recept. paleaceous. Pappus O. Invol. calcylate. Rays none. Female florets entwined in the scales of involucre.
1840. *Parthenium*. Recept. paleaceous, flat. Pericarps obovate, nearly naked. Invol. 5-leaved.
1841. *Iva*. Recept. pilose. Pericarps naked, blunt. Invol. 3-leaved. Florets of ray 5. Styles 2, long.
1842. *Acicapha*. Invol. 5-parted. Cor. all tubular. Recept. paleaceous, the palææ being united with the pericarps after flowering. Pappus O. Stamens half-separate.

Order 5.

SEGREGATA.

Each floret having its own peculiar involucre.

1843. *Elephantopus*. Invol. 4-flowered. Florets ligulate, hermaphrodite. Recept. naked. Pappus setaceous.
1844. *Edera*. Invol. many-flowered. Tubular florets hermaphrodite, and one or more female and ligulate. Recept. paleaceous. Pappus with many palææ.
1845. *Fluoceria*. Partial invol. 2-5-leaved, 2-5-flowered. Common invol. imbricated with unequal scales. Florets tubular, 1 often ligulate. Pappus O. Recept. naked.
1846. *Stabe*. Invol. 1-flowered. Floret tubular, hermaphrodite. Recept. naked. Pappus feathery.
1847. *Naunbergia*. Partial invol. 2-leaved, 1-flowered; common invol. leafy. Pappus O. Receptacle setose.

1848. *Cassinia*. Invol. 2-flowered, 4-leaved. Florets hermaphrodite. Pappus paleaceous, pencilled. Recept. naked.
 1849. *Sphæranthus*. Invol. 8-flowered. Florets tubular, hermaphrodite, and obsoletely femalé. Recept. scaly. Pappus O.
 1850. *Echinops*. Invol. 1-flowered. Florets tubular, hermaphrodite. Recept. setose. Pappus obsolete.
 1851. *Rolandra*. Florets fasciated in a head, with scales between. Invol. 2-valved, 1-flowered. Florets hermaphrodite. Pappus O.

History, Use, Propagation, Culture,

1620. *Geropogon*. So named from γέρον, an old man, and παγων, a beard; in allusion to the long silky beard of the seeds.
 1621. *Tragopogon*. From τραγος, a goat, and παγων, a beard; a name applied in the same way as Geropogon. *T. porrifolius*, or Salsafy, has a long tapering fleshy white root, which is used like carrots or parsneps, and cultivated in gardens for that purpose. The flavor of the root is mild and sweetish; dressed like asparagus, there is some resemblance in taste. It is occasionally grown in British gardens, and a good deal in those of France and Germany. It is raised and treated in all respects similarly to the carrot. *T. pratensis* answers equally well for culture as this species, and was formerly preferred to it.

1852. *Brotera*. Partial invol. 1-flowered, many-leaved, common 6-8-flowered, imbricated, many-leaved. Florets tubular, uniform. Recept. naked. Pericarp covered by the adhering involucre.

1853. *Gundelia*. Invol. O. Hollows of the recept. 5-flowered. Florets tubular, male and hermaphrodite. Recept. paleaceous. Pappus O.

1854. *Euxenia*. Invol. 1-leaved, 10-cleft, reflexed, two of the segments larger than the rest. Anthers distinct. Pappus none. Recept. chaffy.

ÆQUALIS.

11055 Leaves smooth

11056 Leaves hairy

11057 Involucrum with scales at the base

11058 Invol. 8-leaved as long as ray, and peduncles downy, Leaves linear straight

11059 Involucre 8-leaved longer than rays of corolla, Leaves entire straight smooth

11060 Invol. about as long as the cor. Leaves undivided glabrous acuminate channelled, Peduncles cylindrical

11061 Invol. 8-leaved as long as rays of cor. Leaves entire straight lanc. acuminate

11062 Invol. as long as rays of cor. Leaves entire sub-linear; those of the stem very wavy

11063 Invol. shorter than ray of cor. Leaves entire somewhat wavy

11064 Invol. longer than ray of cor. Lvs. entire straight, Pedunc. thickened upwards, Florets rounded at cud

11065 Woolly with down, Invol. shorter than ray of cor. Lvs. linear channelled: cauline revolute

11066 Invol. much longer than the cor. Leaves undivided straight, Peduncle thickened upwards

11067 Invol. 5-leaved longer than ray of cor. Leaves entire, Radical and peduncles villous at base

11068 Invol. half as long again as ray of cor. Stem and leaves villous

11069 Scape 1-fl. Leaves of invol. imbricated cuspidate, Leaves linear entire glaucous on each side

11070 Smooth glaucous, Stem erect 2-3-fid somewhat naked, Leaves smooth: radical sublyrate

11071 Invol. downy unarmed, Leaves runcinate toothed

11072 Invol. hispid aculeate, Leaves runcinate toothletted: cauline dilated at base

11073 Invol. hispid aculeate, Leaves entire: cauline obl. attenuated at base

11074 Lower leaves lyrate with obl. mucronate segments: upper pinnatifid

11075 Lower leaves pinnatifid: upper linear, Invol. smooth: lower scales spreading mucronate

11076 Lower leaves decursively pinnatifid lanc.: upper linear-lanceolate, Invol. before opening 8 angular

11077 Stem 1-flowered leafy, Leaves linear downy beneath, Root tuberous

11078 Leaves ovate nerved downy entire sessile

11079 Stem somewhat naked about 1-flowered, and scales of invol. woolly, Leaves obl. lanc. nerved flat

11080 Stem branched, Leaves amplexicaul. lanc. entire subserrulate at base

11081 Stem about 1-fl. leafy, Leaves lin. lanc. acuminate smooth nerved flat

11082 Stem about 1-fl. leafy ascending, Leaves lanc. ensif. smooth nerved flat, Ray longer than invol.

11083 Leaves lin. subul. channelled triquetrous, Stem branched

11084 Leaves lanc. lin. flat: cauline keeled linear, Stem 1-flowered

11085 Leaves lin. ensif. acum. rigid nerved keeled, Invol. villous leafy at base, Stem somewhat branched

11086 Leaves subulate entire, Pedunc. thickened, Stem villous at base

11087 Leaves lin. acum. keeled woolly at base, Stem branched, Invol. woolly, Fruit downy

11088 Leaves runcinate blunt smooth, Scape leafless branched, Peduncles thickened

11089 Stem leafy many-fl., and invol. downy, Lower leaves lanc. acuminate entire downy: upper lin. subulate

11090 Stem branched leafy at base, Leaves lanc. ensif. smooth nerved flat, Ray shorter than cal.

11091 Stem 1-fl. leafy at base, Leaves lin. lanc. wavy silky with down all over

11092 Stem leafy many-flowered erect, Leaves nerved filiform acuminate, Invol. and seeds woolly

11093 Leaves linear and 1-flowered, Stem hairy

and Miscellaneous Particulars.

1622. *Troximon*. So named by Gärtner, from *τρώξιμος*, eatable: but, as Sir James Smith observes, without much propriety.

1623. *Arnopogon*. So named from *αγρὸς αἶγος*, a lamb, and *πῶγων*, a beard: see *Geropogon*. This is the same genus as has been called by Scopoli and Willdenow, *Urospermum*.

1624. *Podospermum*. From *πῶς ποδος*, a foot, and *σπέρμα*, seed, on account of the long stalk of the fruit. Small herbaceous plants with the flowers of *Scorzonera*.

1625. *Scorzonera*. From *scorzon*, the Catalonian name of the viper. The plants are esteemed in Spain as a certain remedy for the bite of a viper; but it is believed that the slender tortuous form of the roots has

History, Use, Propagation, Culture,

given rise to this belief, rather than any quality inherent in the plant: for it is a rule to which there are few exceptions, that all plants used as food by man, possess very inactive qualities. If their action was powerful, they would be unfit for food.

Scorzonera hispanica is esteemed diuretic, stimulant, and sudorific. A drink is made from it for variola; and a distilled water is also prepared from it. It is also an esculent of occasional culture. The root is carrot-shaped, about the thickness of one's finger, tapering gradually to a fine point, and thus bearing some resemblance to the body of a viper. The outer rind being scraped off, the root is steeped in water, in order to abstract a part of its bitter flavor. It is then boiled or stewed in the manner of carrots or parsneps. The roots are fit for use in August, and continue good till the following spring. Its culture is the same as that of carrot or salsify.

1626. *Picridium*. A diminutive of *Picris*, which see. *Picridium sativum*, *Picridium cultivé*, Fr., is sown in the spring as a small salad, and, if not allowed to become too old before it is cut, is an excellent vegetable, with a pleasant delicate flavor, wholly devoid of the bitterness of endive, and of the insipidity of very young lettuces. *P. tingitanum* is a favorite border annual.

1627. *Sonchus*. *Σωνχος*, in Greek, said to be altered from *σωνφος*, hollow, or soft, in allusion to the soft feeble stem of the plants. *Sonchus oleraceus*, *Sow-thistle*, Eng., *Hasenkohl*, Ger., seems to have nearly the same properties as the Dandelion and Succory, but it is little regarded as a medicine. It is a favorite food with hares and rabbits; and is said to be eaten by goats, sheep and swine, but not to be relished by horses. The young tender leaves are in some countries boiled and eaten as greens: and it is even affirmed, that the tender

- 11094 Lower leaves linear : upper pinnatifid, Lobes remote linear
 11095 Leaves runcinate hispid, Stem about 2-f. somewhat leafy hispid
- 11096 Cauline leaves amplexicaul. obl. nearly entire : radical sublyrate runcinate, Scales of invol. appressed
- 11097 Leaves amplexicaul. obl. pinnatifid toothed, Invol. squarrose
 11098 Leaves scabrous, Scales of invol. membranous at edge ciliated
- 11099 Pedunc. subsol. term. naked, Leaves lanc. amplexicaul. undivided finely toothed backwards
 11100 Pedunc. branched somewhat scaly, Leaves lanc. runcinate, Stem shrubby
 11101 Pedunc. naked, Invol. smooth, Leaves pinn. Pinnæ lin. lanc. somewhat toothed
 11102 Pedunc. naked, Invol. turbin. smooth : lower scales reflexed at end, Leaves pinnatifid
 11103 Pedunc. naked, Inv. turbin. smooth : low. scales reflexed at end, Lvs. lyrate pinnatif. Corymb divaricating
 11104 Pedunc. naked and invol. smooth, Stem nearly naked, Radic. lvs. lyrate smooth on each side, Lobes triang.
 11105 Pedunc. and invol. hispid somewhat umbelled, Leaves runcinate sagittate at base [ovate
 11106 Peduncles and invol. hispid sub-umbellate, Leaves runcinate dentato-ciliate cord. at the base
 11107 Peduncles sub-tomentose umbellate, Involute glabrous, Lvs. runcinate dentato-ciliate amplexic. at base
 11108 Pedunc. downy umbell. Invol. hairy, Leaves bipinnatifid cordate sagittate at base
 11109 Pedunc. naked, Flowers paniced, Leaves runcinate
 11110 Peduncles and involucre hispid racemose, Leaves sublyrate, Terminal lobe deltoid very large
 11111 Pedunc. squarrose, Fl. racemose, Leaves runcinate acuminate smooth glabrous beneath
 11112 Pedunc. sub-squarrose, Fl. paniced, Leaves lyrate-runcinate toothletted stalked
 11113 Leaves sessile : lower cordate toothed ; upper hispid entire, Peduncles scaly
 11114 Pedunc. sub-squarrose, Fl. paniced, Radic. leaves sub-runcinate : cauline ovate acuminate stalked
 11115 Raceme comp. terminal, Leaves lanc. ensiform amplexicaul. toothed
 11116 Pedunc. squarrose, Fl. corymb. Leaves lanc. sessile : lower runcinate toothed ; upper entire
 11117 Pedunc. naked, Fl. in corymbose panicles, Leaves lanc. runcinate narrowed at base
 11118 Leaves pinnatifid with little white spiny teeth, Calyx slender
 11119 Pedunc. and invol. smooth a little downy, Leaves sub-runcinate spiny-toothed amplexicaul.
 11120 Pedunc. somewhat downy umbellate, Invol. smooth, Leaves pinnatif. toothed auricled cordate at base
 11121 Radic. leaves unequally pinnatifid : cauline linear lanc. toothed, Pedunc. long 1-flowered
 11122 Peduncles hirsute naked, Fl. paniced, Leaves lyrate cordate at base hairy beneath
 11123 Pedunc. scaly, Fl. racemose, Leaves runcinate acuminate, Stem paniced virgate

- 11124 Leaves rounded : cauline cordate, Stem corymbose
 11125 Leaves sinuate-crenate toothed wavy curled : radical with a hairy keel, Florets 5-parted
 11126 Lower leaves tripartite pinnatifid with obl. blunt segm. : upper cordate
 11127 Leaves runcinate tooth-ciliated blunt amplexicaul. sagittate : radical obovate, Stem paniced
 11128 Leaves smooth beneath : lower runcinate toothletted at base dilated and sagittate ; upper lanc. sagittate
 11129 Leaves smooth beneath : radical runcinate lyrate toothed ; upper runcinate pinnatifid
 11130 Leaves smooth beneath : lower runcinate entire amplexicaul. : upper lanceolate sessile
 11131 Leaves vertical prickly at keel acute at end sagittate at base runcinate pinnatifid
 11132 Leaves oblong toothed horizontal, their keel prickly, their apex obtuse
 11133 Leaves smooth beneath obl. lanc. ciliate-toothed sagittate at base
 11134 Leaves smooth beneath : lower oblong narrowed at base toothletted ; upper lanceolate entire
 11135 Leaves with a prickly keel : radical lanc. pinnatifid ; cauline linear entire sagittate
 11136 Leaves lacinate ensiform sessile unequally toothed
 11137 Leaves toothletted smooth : lower sinuated ; upper lanceolate sagittate acuminate, Pan. much branched

and Miscellaneous Particulars.

shoots of the smooth variety, boiled in the manner of spinach, are superior to any greens not in common use.

Nearly the same thing may be affirmed of *S. arvensis*, *palustris*, and other species.

Sonchus floridanus is used as a cure for the bite of the rattle-snake, in the same way as *Prenanthes serpentina*. It is called by the American settlers *Gall of the Earth*.

S. tenerrimus is eaten by the common people in Italy as a salad.

1628. *Lactuca*. From *lac*, milk, on account of the milky sap, which flows copiously when the plants are cut. Besides *Lactuca sativa*, the French cultivate as small salad both *L. quercina*, *palmata*, and *intybaea*, which are all excellently adapted for such a purpose. *L. sativa* is well known as furnishing among its numerous varieties the best vegetable of the salad kind grown in the open garden. Whoever has the command of lettuce, onions, and cucumbers, may well dispense with most other acetarous plants. It is questioned by some, whether the greater number of what are set down as species in this genus, are any thing more than variations of one type ; and, at all events, it is thought *L. virosa*, a poisonous plant, is the parent of our cultivated sorts ; which would not be more remarkable than the fact that the indigenous celery is one of our strongest poisons.

All the species of *Lactuca* abound in a milky juice, which is found to partake, in a considerable degree, of the qualities of opium. The production of this juice is lessened by culture, and especially by blanching. It is most abundant in plants in a wild state, and in both wild and cultivated lettuce during inflorescence. Of late years, this juice has been collected by incisions and scraping off the thickened juice, as in the collecting the opium of the poppy (See p. 461.), and an opium has been produced little inferior to that of the East. It is called

History, Use, Propagation, Culture.

Lactucarium, and was first brought into notice by Dr. Duncan, of Edinburgh, who finds it can be administered with effect in cases where poppy opium is inadmissible. Details of the process of collecting and preparing the article, will be found in the Caledonian Horticultural Memoirs. (Vol. i. 160-259, ii. 314, and iv. 153.)

The culture of lettuce as a salad plant is familiar to every one who has a garden. It is sown monthly, or oftener, throughout the year, in order to have a successional supply, and thinned out or transplanted to increase the size and succulency. The latter quality is greatly increased by watering in summer; and blanching, another desirable property, is promoted by tying up the leaves when the plant has attained about two-thirds of its usual size. Snails and slugs are very fond of this plant, and should either be watched and hand-picked, or the ground well watered with lime water, which effectually destroys them. The lettuce, unlike the cabbage and spinage, is a vegetable which can be grown to as great perfection in a warm as in a temperate climate, provided it be grown on rich soil, and abundantly supplied with water. Hence the lettuces of Paris, Rome, and Calcutta, are as large and tender as those of London and Amsterdam.

This genus is the type of the tribe *Lactuceæ* of M. Cassini. It differs essentially from all other tribes of *Compositæ*, in having a divided or ligulate corolla only, and from nearly all other tribes in its style, which can be compared to that of *Vernoniaeæ* only. The radiant head of flowers is a character common both to *Lactuceæ* and *Nassauvieæ*. The greater part of *Lactuceæ* are found in Europe, a smaller number in Asia and Africa, very few in America, and in the southern hemisphere none at all.

1629. *Chondrilla*. Derived from *χονδρος*, a lump. Dioscorides says, it bears on its stems little lumps of gummy matter. But Theophrastus speaks of the gummy or tubercled roots of his *Chondrilla*. The plant now so called is an inconspicuous perennial plant, of no recorded use.

1630. *Prenanthes*. From *πρεννός*, drooping, and *άνθος*, a flower. The heads of flowers of all the species are

- 11138 Leaves decurrent : lower pinnatifid toothed outwards ; upper linear, Stem branched
 11139 Lower leaves lanc. runcinate toothed narrowed at base and sessile : upper linear sagittate
 11140 Leaves runcinate pinnatifid unequally toothed : floral lanceolate, Flowers racemose
 11141 Radic. leaves pinnatif. toothed : cauline linear entire sagittate, Branches 1-flowered
 11142 Leaves all pinnatifid : segments linear toothed upwards, Fl. in corymbose panicles

- 11143 Radic. leaves runcinate : cauline linear entire
 11144 Radic. leaves runcinate : cauline undivided filiform, Stem and invol. smooth

- 11145 Invol. 5-fl. Leaves obl. lanc. amplexicaul. cordate denticulate glaucous beneath
 11146 Invol. many-fl. Leaves angular hastate toothed, Flowers nodding racemose paniced
 11147 Invol. 5-fl. Leaves 3-lobed stalked angular toothletted rough at edge, Racemes axillary, Fl. nodding
 11148 Stem paniced upwards, Leaves stalked cordate toothed ciliated, Panicle lax racemose
 11149 Leaves linear tooth-sinuated sessile, Stem shrubby much branched, Branches spiny
 11150 Florets 5, Leaves lyrate-pinnatifid and toothed, the terminal lobe with about 5 angles
 11151 Leaves pinnated, Leaf. linear filiform, Panicle corymbose stalked, Stem shrubby
 11152 Leaves pinnatifid pinnate with linear segments
 11153 Leaves pubesc. toothed, those on the stem subsagittate, Stem paniced corymb. Invol. pyramidal glabrous

- 11154 Outer scales of the involucre reflexed, Leaves runcinate glabrous toothed
 11155 Outer invol. spreading, Leaves runcinate scabrous, Segments round toothletted
 11156 Outer scales of the involucre erect appressed, Leaves sinuato-dentate nearly glabrous

- 11157 Outer invol. spreading, Scales ovate, Scape 1-fl. Leaves obov. blunthish toothed
 11158 Outer invol. spreading, Scales ovate-lanceol. Lvs. runcinate pinnatifid glabrous with lin. falc. distant lobes
 11159 Leaves pinnatifid to the nerve smooth, Leaves of invol. smooth reflexed

- 11160 Scape 1-fl. naked thickened and hairy upwards, Invol. hispid, Leaves lanc. obl. somewhat toothed
 11161 Scape 1-fl. squarrose thickened and somewhat hairy upwards, Invol. hispid, Leaves lanc. obl. smoothish
 11162 Scape 1-fl. naked and invol. smooth, Leaves lanc. runcinate-toothed smooth
 11163 Scape 1-fl. nearly naked upward and invol. hairy, Leaves lanc. toothed at base with a few forked hairs
 11164 Scape 1-fl. naked smooth. Scales of invol. acute hairy, Lvs. obov. runcin. hairy scabrous, Root tuberous
 11165 Scape 1-fl. nearly naked and calyx pubesc. Lvs. lanceol. acute somewhat toothed hozy, Hairs multifid
 11166 Scape single-flow. thickened upwards, Leaves glab. runcinato-dentate, Involucre very hairy
 11167 Scape branched scaly upwards, Lvs. lanc. toothed or pinnatif. sub-glab. Pedunc. swelling beneath invol.
 11168 Scape naked 1-fl. and invol. hairy, Lvs. runcinate pinnatifid hairy, Segm. recurved tooth. Hairs 3-forked
 11169 Scape single-flowered, Leaves dentate scabrous, Florets hairy at their orifice glandular at the tip
 11170 Stem leafy somewhat branched hairy, Invol. smooth, Leaves lanc. runcinate hairy, Hairs forked
 11171 Scape 1-fl. scaly thickened upwards and hairy, Invol. hispid, Leaves runcinate smooth
 11172 Scape naked 1-fl. glabrous, Invol. hairy, Leaves runcinate toothed scab. somewhat hairy, Hairs prostrate
 11173 Scape naked 1-fl. and invol. smoothish, Leaves pinnatifid-toothed hispid, Hairs simple subulate

and Miscellaneous Particulars.

nodding. *Prenanthes serpentina* grows to the height of two feet, bearing pale purple flowers. It is known by the inhabitants of Virginia and Carolina under the name of the Lion's Foot, and is in high esteem as a cure for the bite of the rattle-snake. The juice of the plant boiled in milk is taken inwardly, and steeped leaves, frequently changed, are applied to the wound. It must not be confounded with *Prenanthes rubicunda*, called False Lion's Foot, which is a less powerful plant.

Prenanthes virgata has a very fine effect in large plantations.

1631. *Leontodon*. So named from *λεων*, a lion, and *odus*, a tooth ; in reference to the deep tooth-like divisions of the leaves. The English name *Dandelion*, is a corruption of the French translation of this word, *Dent de lion* ; in German *Pfaffenröhlein* and *Dotterblume*. It has been recommended as a winter salad, blanched like Endive ; but it possesses too much bitter principle to render it fit for table under any management. *Dent de lion*, Fr. from its cut leaves, and *Piss-en-lit*, in French, and most other European languages, from its diuretic qualities. The tender leaves in spring, used in compound salads, are equal to those of Endive or Succory. The roots, which are fusiform, and abound in a milky juice, are eaten raw as a salad by the French, and boiled by the Germans, like Salsafy and Scorzonera. Dried and ground into powder, they afford a substitute for coffee, in all respects equal to that of Chicory roots. It is a difficult weed to extirpate, because every inch of root will form buds and fibres, and thus constitute a new plant. Swine are fond of it, and goats will eat it ; but sheep and cows dislike it, and by horses it is refused.

1632. *Asargia*. *Asargia* is the Greek name of a plant now unknown. It has been employed by Dalechamp and Scopoli for a species of *Hieracium*. At the present day it is given to a genus of weedy plants, with the appearance of *Leontodon*.

History, Use, Propagation, Culture,

1633. *Thrinacia*. From *Sevens*, a feather; in allusion to the feathery pappus of the seeds. Small uninteresting weeds of no value or beauty.

1634. *Picris*. From *πικρὸς*, bitter; a name given by the Greeks to some plant resembling Lettuce, on account of its bitterness. None of the species are remarkable for their qualities.

- 11174 Scape single-fl. Leaves dentate scab. Involucre nearly glab. Outer pericarps with a scaly pappus
 11175 Scape 1-fl. pilose, Invol. hoary naked, Leaves lanc. blunt toothed, Hairs forked
 11176 Scape 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

- 11177 Stem erect scabrous, Leaves amplexicaul. lanc. toothed, Fl. corymbose, Outer invol. lax
 11178 Stem ascending scabrous, Leaves obl. lanc. blunt sinuate pinnatifid, Pedunc. thickened
 11179 Leaves obl. lanc. nearly entire sessile, and invol. hispid, Hairs glochidate
 11180 Stem branched spreading leafy, Leaves amplexicaul. obl. repand hispid

§ 1. *Scape one-flowered, naked.*

- 11181 Scape 1-leaved, Invol. hairy, Leaves lanc. runcinate toothed subpubescent, Teeth recurved
 11182 Scape somewhat naked villous, Invol. very villous, Leaves lanc. entire acute villous
 11183 Scape 1-leaved downy upwards, Invol. cylindr. downy, Leaves lanc. toothletted
 11184 Leaves entire ovate downy beneath, Stolones creeping
 11185 Scape naked thickened upwards hairy, Invol. smooth, Leaves lanc. obl. somewhat toothed smooth
 11186 Scape nearly naked, Invol. hispid, Leaves lanc. spatulate runcinate-toothed smoothish

§ 2. *Scape many-flowered, naked.*

- 11187 Scape about 4-fl. naked, Leaves obl. blunt entire, Stolones creeping
 11188 Scape 1-leaved with about 6 fl. Fl. umb. Leaves lanc. acute entire, Stolones creeping
 11189 Scape leafy pilose at base, Fl. corymbose, Peduncles downy, Leaves lanc. acute nearly entire pilose
 11190 Scape leafy smoothish, Fl. in corymbose panicles, Pedunc. spreading, Invol. hairy
 11191 Scape leafy hispid, Fl. in corymbose panicles, Pedunc. clustered, Invol. hispid
 11192 Scape about 3-fl. 1-leaved hairy, Leaves lin. lanc. acute pilose
 11193 Scape somewhat naked branched about 3-fl. Pedunc. squarrose, Leaves lin. lanc. toothletted smooth
 11194 Scape about 2-fl. Peduncles long, Leaves spatulate lanc. entire pilose, Stolones creeping
 11195 Scape forked about 2-fl. and leafy at base, Leaves lanc. acute entire, Stolones O
 11196 Resembles *H. murorum*, but the stem is naked
 11197 Scape naked corymbose, Leaves lyrate runcinate hairy
 11198 Leaves ovate somewhat toothed, Scape naked racemose, Upper flowers opening first
 11199 Scape naked scabrous at base, Fl. in racemose corymbs, Leaves oblong blunt toothletted hairy
 11200 Scape leafy hispid, Fl. corymbose, Pedunc. clustered, Leaves obl. acutish pilose-hispid
 11201 Scape somewhat naked branched, Invol. with glandular hairs, Leaves oblong acute entire woolly
 11202 Scape naked branched, Invol. smooth, Leaves obovate acute entire ciliated, Veins colored
 11203 Scape leafy in corymbose panicles, Invol. pubescent, Radic. leaves entire obovate blunt ciliated

§ 3. *Stem leafy.*

A. *Leaves entire.*

- 11204 Stem erect, Leaves alternate lanc. naked toothed, Panicle capillary
 11205 Stem erect branched, Leaves lanc. sessile somewhat toothed; laticous narrowed at each end
 11206 Stem erect branched, Leaves lin. lanc. nearly entire narrowed at each end ciliated at base
 11207 Stem erect simple, Leaves lanc. cordate amplexicaul. toothletted downy, Fl. racemose corymbose
 11208 Stem erect few-fl. Cauline leaves lanc. acum. runcinate; radical obl. lanc. undivided
 11209 Stem erect pilose paniced, Leaves ovate oblong subcordate sessile remotely toothed entire at end
 11210 Stem erect hairy, Fl. subcorymbose, Cauline leaves oblong lanceolate stem-clasping; radical toothed
 11211 Stem erect villous, Lvs. pilose somewhat toothed; radic. obov.; caul. obl. half-amplexicaul. Inv. hirsute
 11212 Stem erect branched, Lvs. ovate cord. amplexicaul. toothed towards the base, Pedunc. and invol. hirsute
 11213 Stem erect simple furrowed smoothish, Rad. lvs. obl. deeply toothed at base; caul. hastate sagit. Inv. lax

- 11214 Stem erect paniced furrowed downy, Leaves rugose: upper lanceol. Invol. lax hispid
 11215 Stem ascending simple furrowed viscid, Leaves lanc. with recurved teeth, Involucre hispid
 11216 Stem erect branched hispid, Leaves lanc. toothed sessile narrowed at each end, Invol. lax hispid
 11217 Stem erect about 2-fl. Leaves pilose toothed; radical oblong; cauline lanc. sessile, Invol. villous
 11218 Stem cymose fistulous many-leaved, Leaves ovate-lanceolate toothed forwards
 11219 Stem cymose solid few-leaved, Leaves lanceolate broadly toothed forwards
 11220 Stem erect branched leafy, Leaves linear entire
 11221 Stem erect simple leafy 1-fl. Leaves ovate-lanc. toothletted sessile
 11222 Radic. leaves oblong and lanceolate bluntish narrowed at base toothletted woolly, Invol. hoary
 11223 Stem leafy erect simple, Leaves oblong villous somewhat toothed, Fl. paniced
 11224 Stem erect somewhat branched and lvs. villous: radic. obl. lanc. toothed; caul. ovate cord. amplexicaul.
 11225 Differs from *H. villosum* in having the involucre covered with dense short brown hairs
 11226 Radical lvs. lanc. narrowed into stalk: caul. sub-amplex. toothed backwards acute smooth, Inv. villous
 11227 Stem erect smooth below, Leaves sub-villous lanc. acute: radical toothletted, Invol. villous

and Miscellaneous Particulars.

1635. *Hieracium*. It was believed formerly, that birds of prey made use of the juice of this kind of plant to strengthen their vision; whence it was called *Hieracium*, from *iera*, a hawk; the French word *Epervière*, the English *Hawk-weed*, and the German *Habichtskraut*, all bear witness to the universal belief in this very strange opinion. An extensive genus of plants, many of which, especially *H. aurantiacum*, are objects

History, Use, Propagation, Culture,

deserving cultivation; others are of little interest; but all most difficult to distinguish or characterize. The species appear to intermix with the same facility as roses and willows.

Hieracium venosum, a very pretty plant, is called in America, *Poor Robin's Plantain*, and is believed to possess considerable medical powers.

1636. *Lagoservis*. From *λαγος*, a hare, and *σεισις*, a lettuce. Obscure weed-like plants.

- 11228 Near *H. villosum*, but the leaves are broader
 11229 Stem erect many-fl. Leaves lanc. toothed, Peduncles downy
 11230 Stem at base and lvs. here and there covered with hairs, Fls. smaller and inv. less vill. than in *H. villosum*
 11231 Stem erect many-fl. Leaves sessile ellipt. lanc. toothletted smoothish glaucous beneath
 11232 Radic. lvs. obl. narrowed at base acute: caul. sub-amplex. lanc. Pedunc. glandular, Inv. glandul. hairy
 11233 Stem erect strigose hispid, Leaves lanceolate nearly entire strigose hispid, Flowers corymbose
 11234 Stem pilose warted glandular upwards, Leaves sub-amplexicaul. oblong acute with long hairs beneath
 11235 Stem erect branched hoary, Leaves obov. obl. hoary toothed towards the base, Hairs feathery
 11236 Stem erect many-fl. Leaves amplexicaul. somewhat rough toothed at edge, Pedunc. downy

- 11237 Stem densely leafy, Leaves amplexicaul. 3 inches long $1\frac{1}{2}$ inch wide toothed hairy
 11238 Stem erect simple, Leaves ovate cordate amplexicaul. toothletted ciliated, Fl. paniced, Invol. smooth
 11239 Stem erect simple, Lvs. ovate-obl. smoothish acute sess. sub-amplex. toothed towards base, Fls. corymbose
 11240 Stem erect branched, Leaves obl. lanc. smooth stalked deeply toothed in the middle, Fl. paniced
 11241 Leaves narrowed at base sessile with long points toothed, Invol. downy hoary
 11242 Stem erect simple, Leaves linear somewhat toothed, Fl. in corymbose umbels
 11243 Leaves broader than in the last and less toothed, Stem few-flowered
 11244 Leaves mostly radical with long points toothletted hairy, Invol. hoary with long white and black hairs
 11245 Stem bracted shrubby, Leaves oblong toothed stalked, Peduncles sub-corymbose, Invol. downy

B. *Leaves sublyrate, lyrate, pinnatifid.*

- 11246 Stem erect few-fl. Peduncles and invol. pilose, Leaves oblong sub-pinnatifid at base
 11247 Stem naked few-fl. Pedunc. and invol. glandular downy blackish, Leaves oblong stalked toothed at base
 11248 Stem procumb. branch. at base few-fl. Ped. and invol. downy, Lvs. ovate unequal at base toothletted stalked
 11249 Stem erect leafy pilose simple, Fl. paniced, Leaves ovate deeply toothed at base
 11250 Stem simple, Leaves smooth obl. narrowed at base runcinate toothed: caul. amplexicaul. Invol. hispid
 11251 Stem simple, Cauline leaves lyrate runcinate amplexicaul. hairy, Fl. paniced, Invol. hispid
 11252 Stem erect paniced, Leaves ovate stalked deeply toothed at base, Flowers paniced
 11253 Stem simple, Leaves smooth: radical runcinate lyrate; cauline lanceolate, Invol. and pedunc. hispid
 11254 Leaves lanc. runcinate roughish, Flowers in umbels
 11255 Stem erect leafy simple smooth, Leaves sessile obl. acute finely toothed, Pedicels of panic. in bundles

- 11256 Leaves pinnatifid crenate, Scape naked few-flowered

- 11257 Leaves long lanceolate acute repand smooth, Fl. cylindrical, Outer invol. very small
 11258 Leaves runcin. toothed smooth, Scape naked many-fl. ascending, Invol. downy: outer scales appressed
 11259 Radic. leaves and lower cauline pinnated lyrate, Flowers corymbose, Invol. and pedunc. glandular
 11260 Leaves scabrous: radic. lyrate runcinate; cauline lanc. amplexicaul. toothed at base, Invol. downy
 11261 Lower lvs. runcin. pinnatifid: upper entire, Branches naked, Invol. downy with leaflets bristly at the back

- 11262 Leaves runcin. pinnatifid pilose scabrous, Stem paniced, Leaves of invol. keeled channelled downy
 11263 Leaves ovate cordate-sagittate amplex. toothed, Peduncles long 1-fl. Invol. hispid: outer membranous
 11264 Radic. leaves runcinate-lyrate: cauline amplexicaul. lanceol.; lower pinnatifid, Invol. hispid
 11265 Leaves runcinate pinnatifid scabrous sessile: upper lanceol. deeply cut at base, Invol. ovate angular
 11266 Leaves amplexicaul. pinnatifid hairy, Leaves of invol. downy hoary flat
 11267 Leaves amplexicaul.: lower obl. toothed; upper cut-toothed, Stem setose hispid, Inv. muricated in fruit
 11268 Setose hispid, Leaves runcinate auricled at base: upper lanc. sagitt. hastate, Invol. very hispid

- 11269 Leaves runcin. lyrate bluntly toothed, Scape naked many-fl. hispid, Lvs. of invol. membranous at edge
 11270 Hispid-scabrous, Leaves oblong amplexicaul. remotely toothed, Stem divaricating branched
 11271 Leaves rigid scabrous toothed: radic. obovate; caul. sagittate amplexicaul. Fl. in racemose panicles
 11272 Leaves hispid ovate obl. finely and deeply biserrate, Scape naked corymbose
 11273 Leaves smooth toothed: radical ovate-spatulate; cauline oblong sessile, Corymb terminal
 11274 Lvs. glab. runcin.: the upper ones linear-sagitt. amplex. Stem glab. Panic subcorymb. Inv. pubescent
 11275 Leaves lanc.: lower entire toothed smooth; cauline lanceolate amplex. Stem furrowed branched
 11276 Radic. leaves lanc. runcinate: cauline lanc. toothed at base sagittate, Panicles corymbose
 11277 Leaves hispid runcinate pinnatifid: upper sessile lanc. toothed prickly upon the keel
 11278 Leaves smooth: lower remotely toothed; upper nearly entire subsagittate, Invol. downy
 11279 Radic. leaves lyrate runcinate: cauline hastate lanceolate, Branches divaricating, Invol. downy
 11280 Leaves pinnatifid: segments linear; radical toothed; cauline entire, Stem paniced, Invol. downy
 11281 Leaves linear-filiform entire smooth, Pappus sessile

and Miscellaneous Particulars.

1637. *Borkhausia*. Named after Moritz Borkhausen, a German botanist, author of some useful works, especially upon the useful plants of Germany, published in one volume octavo, in 1790. Small annual plants, formerly referred to *Crepis*.

1638. *Crepis*. A name made use of by Pliny, to designate a plant of which he gives no description. The plants of this genus are common weeds of the hedges of Europe.

History, Use, Propagation, Culture,

1639. *Helminthia*. An abridgment of *Helminthotheca*, a name employed for this genus by Vaillant. It is derived from *ἕλμινς*, a worm, and *θησαυρ*, a case; in allusion to the corrugated seeds, which may be fancied to resemble bundles of little worms. The genus was united by Linnæus with *Picris*, but has been again separated by modern botanists.

1640. *Myoseris*. So named from *μῦς* *μῦς*, a mouse, and *στῆσις*, lettuce; a name invented for the purpose of maintaining a resemblance in nomenclature with *Hyoseris*, *Lagoseris*, and other similar plants.

1641. *Tolpis*. A name invented by Adanson, and supposed to have no meaning. Handsome annual flowers.

1642. *Andryala*. A name, the meaning of which has not been discovered. Rather pretty plants, natives of the south of Europe and north of Africa.

1643. *Rothia*. Named by Schreber, in honor of Dr. A. G. Roth, author of a *Flora Germanica*, in 1788, *Catalecta Botanica*, in 1797, and other works. It has been united with *Andryala* by Richard.

1644. *Krigia*. Named after Dr. Krieger, a German botanist, who accompanied Mr. Vernon to America in search of plants. See *Vernonia*. A pretty little North American plant, with grassy leaves and bright yellow neat flowers.

11282 *Involucrum* large prickly, Leaves repand

11283 Leaves runcinate pinnatifid : lobes oblong acute toothed spreading, Scape naked many-fl. smooth

11284 Leaves obl. toothed, Pedunc. 1-flowered

11285 Leaves lanc. oblong : lower sinuate-toothed, Pedunc. proliferous

11286 Leaves obl. linear scabrous toothed, Stem branched divaricating, Lower scales of invol. downy

11287 Leaves gland. downy : lower runcinate toothed ; upper ovate lanc. entire, Stem and pedunc. glandular

11288 Leaves downy pinnatifid, Invol. downy pilose, Hairs rigid

11289 Leaves pinnated linear downy

11290 Leaves pinnatifid lyrate, Flowers corymbose aggregate, Pedunc. and invol. hispid

11291 Leaves downy oblong : lower toothed, Stem branched, Branches 1-flowered

11292 Leaves ovate woolly : lower somewhat toothed, Corymb terminal, Pedunc. about 2-flowered

11293 Stem branched at base diffuse, Leaves downy ovate lanceolate amplexicaul. nearly entire

11294 Stem erect corymbose, Leaves somewhat downy linear sinuate-toothed sessile : upper entire

11295 Stem erect corymbose, Leaves downy sessile : lower obl. runcinate, Pedunc. gland. villous

11296 The only species

11297 Scapes 1-fl. naked, Leaves smooth lyrate runcinate toothed : term. lobe trifid

11298 Scapes 1-fl. naked, Leaves smooth lyrate runcinate somewhat fleshy : segm. angular imbricated

11299 Scapes 1-fl. naked thickened at end, Leaves lyrate pinnatifid toothed ciliated roughish

11300 Stem branched leafy diffuse, Leaves amplexicaul. oblong toothed scabrous ciliated at edge

11301 Scapes 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

11302 Stem diffuse branched, Leaves obl. toothed narrowed at base sessile, Scales of invol. in fruit smooth

11303 Stem diffuse branched, Lvs. obl. toothed narr. at base sess. Scales of invol. in fruit hairy

11304 Stem diffuse branched, Lvs. obl. toothed subcordate amplexicaul. Scales of invol. in fruit smooth

11305 Related to the last, but the leaves are deeply toothed with 3-forked hairs

11306 Leaves somewhat toothed, Hairs simple, Pedunc. very thick

11307 Stem erect branched, Lvs. obl. somew. toothed subcordate amplex. Scales of invol. in fruit alternately setose

11308 Stem erect paniced, Lvs. obl. hispid deeply toothed, Scales of invol. in fruit smooth muricated at the end

11309 The only species

11310 Smooth, Leaves obovate toothed

11311 Hispid, Leaves obovate somewhat toothed

11312 Stinging, Stem branched, Leaves toothed

11313 Radical leaves spatulate toothed pilose, Stem ascending smooth, Pappus stalked

11314 Hairy with very short stellate hairs and bristles, Lvs. lanc. entire, Pedunc. term. thickened upwards 1-fl.

11315 Stem simple leafy 1-fl. Leaves lanc. toothed

11316 Stem almost leafless solitary, Leaves ovate-oblong undivided toothed (spotted above)

and Miscellaneous Particulars.

1645. *Hyoseris*. From *ὅς υἴος*, a hog, and *σεις*, the Greek name of the Lettuce, or of a plant resembling it : hogs-lettuce, in allusion to the abominably fetid smell of the plant.

1646. *Hedypnois*. Under this name, a kind of wild endive, the medicinal qualities of which he much extols, is described by Pliny. Dalechamp, his commentator, derives the word from *ἡδύς*, sweet, and *πνέω*, to breathe, on account of a pleasant flavor communicated to other vegetables in cookery. But the modern genus, which consists of uninteresting weeds, has not been discovered to possess this quality.

1647. *Robertia*. Named by the authors of the Flore Française, after M. Robert, a Corsican botanist. A small weedy plant resembling Dandelion.

1648. *Seriola*. A diminutive of *σεις*, chicory. Small chicoraceous weeds of the south of Europe. S. Alliate is not, as its name would lead one to suspect, named from any smell of garlic which it possesses, but in honor of Prince Joseph Alliate, a Sicilian nobleman, and patron of Bivona Bernardi.

1649. *Soldevilla*. So named by Lagasca, apparently in honor of some botanist. A little Spanish weed with terminal solitary flowers.

1650. *Hypochaeris*. From *ὄρα*, for, and *χαιρος*, a pig ; *Porcelle*, Fr., for the same reason, viz., that pigs eat the roots with avidity. All the species are uninteresting weeds.

History, Use, Propagation, Culture,

1651. *Lapsana*. From *λαπαζω*, to purge. The *Lapsana*, says Pliny, gently relaxes the body. *L. communis* is called *nipple-wort*, in English, and *herbe aux mammelles*, Fr., having been formerly applied to the breasts of women to allay the irritation occasioned by nursing.

1652. *Zacintha*. A plant growing in the island of *Zacintha* or *Zante*. It was formerly included in *Lapsana*, under the name of *L. Zacintha*.

1653. *Rhagadiolus*. From *ραγας*, a slit; each division of the calyx being hollowed out in the middle so as to resemble a furrow, or little gutter.

1654. *Moscharia*. This plant gives out an agreeable smell of *musk*. An annual plant, with stem-clasping pinnatifid deeply cut leaves, found in sandy waste places in Chili, where it is commonly called *Almizelilla*.

1655. *Catananche*. Vaillant explains the meaning of this word, by deriving it from the two Greek words, *κατα*, and *αναγκη*, necessity; that is to say, a plant which compels admiration. What is certainly known of its origin is, that it was employed by Dioscorides to designate a plant used by the women of *Thessaly*, in philtres and love potions. The modern genus, which contains two or three species of ornamental border annuals, can have no reference to that of the ancients, one kind of which is believed to have been *Ornithopus compressus*, and another *Astragalus pugniformis*. John Bauhin calls *Lathyrus Nissolia* by the name of *Catananche leguminosa*.

1656. *Triptilion*. A genus instituted by the authors of the *Flora Peruviana*, and named from *τρεις*, three, and *πτελον*, a feather, on account of the three divisions of the pappus. The species mentioned above is a very pretty little annual, or rather biennial plant, flowering during all the winter months in any place whence frost is excluded, but it requires not to be kept too dry. There is a fine species in Chili, with bright blue flowers, but it has not been yet introduced. The inhabitants of South America employ the flowers of the different species as everlasting flowers, for which their dryness renders them very well adapted.

1657. *Cichorium*. In Greek *κιχωριον*. De Theis's remarks are upon this subject excellent. *Bodæus*, he observes, *Linnaeus*, and others, have derived this name from *κίον*, to come, and *χωριον*, the field; that is to say,

- 11317 Leaves toothed roughish, Invol. hispid, Pappus of disk stipitate plumose : of the ray sessile setose
 11318 Hispid, Calyxes hairy, Stem branched, Lvs. lanc. toothed,
 11319 Nearly glab. Invol. obl. imbricated, Stem branched somewhat leafy, Radical leaves dentato-sinuate
 11320 Stem branched leafless glab. Pedunc. with small scales, Lvs. runcinate obtuse scab.
 11321 Different from the last in having a smooth involucreum
- 11322 Stemless, Scape 1-fl. Leaves runcinate pinnatifid, Terminal lobe rhomboid
- 11323 Scape branched very thick and fistulose upwards, Leaves obovate oblong toothed
- 11324 Invol. of the fruit angular, Stem panicled, Pedunc. slender, Lvs. ovate petiolate angulato-dentate
 11325 Caulescens branched, Leaves ovate stalked doubly toothed
 11326 Caulescens branched, Lvs. angular-toothed : lower lyrate-pinnatifid, Pedunc. and invol. smooth
 11327 Caulescens panicled, Stem downy below, Radical leaves lyrate toothed : upper lanc. entire
- 11328 Rad. leaves lyrate acute, Cauline sagittate amplexicaul. toothed
- 11329 Fruit smooth spreading, Cauline leaves lanc. undivided
 11330 Fruit smooth spreading, Leaves lyrate
 11331 Fruit prickly spreading, Leaves linear lanc. entire
- 11332 Leaves amplexicaul. pinnatifid : segments deeply jagged
- 11333 Lower scales of invol. ovate mucronate, Leaves villous linear sub-bipinnatifid at base
 11334 Lower scales of invol. lanc. Leaves lanc. toothed 3-nerved
- 11335 Leaves cordate spiny
- 11336 Flowers sess. axill. in pairs, Leaves runcinate
 11337 Flowers axillary twin sessile, Leaves obovate toothed
 11338 Pedunc. axill. twin : one long 1-fl. ; the other very short about 4-fl. Flowers capitate
 11339 Pedunc. axill. twin : one long 1-fl. ; the other very short about 2-fl. Stem dichotomous, Rad. lvs. runcinate
 11340 Flowers axill. solitary, Stem dichotomous, Branches naked spiny, Lvs. lanc. runcinate toothed
- 11341 Leaves obovate mucronate cartilaginous, Flowers solitary
- 11342 Fl. solitary lateral sessile, Lvs. decurrent, Stem subsimple villous erect
 11343 Fl. solitary, Lvs. roughish smooth, Stem winged toothed
 11344 Fl. subaggregate, Lvs. scabrous with the middle rib below hairy interruptedly decurrent

and Miscellaneous Particulars.

it is a plant found wild in fields, — which grows every where : but this etymology is overstrained. It is much more natural to suppose that the Egyptians, who used this plant in great quantities, would have communicated to the Greeks, along with the manner of using it, the name by which it was known in Egypt, which appears from Forskahl to be *chikouryeh*. Pliny remarked, that the Egyptians made their chicory of much consequence, and it is very well known that, at the present day, chicory or similar plants constitute half the food of the common people in Egypt. In like manner, there can be little doubt that the specific terms *Endivia* and *Intybus*, are both derived from the Arabic name *hendibeh*.

The leaves of *Cichorium Intybus* are employed by the French under the name of *Barbe du Capucine*, as a kind of winter salad ; for which purpose the leaves are blanched like Endive. The most common method of cultivating the plant, is to sow the seed in drills in the end of July, and to keep the plants about six inches apart, and quite free from weeds. In the winter the roots are taken out of the ground and packed up in a warm cellar among earth, in layers, like bottles in a wine cellar, the crowns only of the roots being exposed. In a few days, young leaves are produced in great abundance, from the situation in which they are cultivated quite blanched, and, if not grown too rapidly, with an agreeable taste. There is also a variety of *C. Intybus*, called *Chichorie à café*, which is cultivated extensively in France for the sake of its roots, which are taken up in the winter season, cut into squares, dried artificially, and afterwards, being roasted, are ground along with their coffee, for which they serve as an adulteration. There are those, however, who assert, that it is to this admixture of Succory root that the superior flavor of the French to the English coffee is to be attributed.

1638. *Bacaxia*. Named by the authors of *Flora Peruviana*, in honor of George Bacas, professor of botany at Carthagena.

1639. *Scotymus*. The Greek name of a spiny plant, which appears to have been the modern artichoke. The word itself is derived from *σκαλος*, a spine. *S. hispanicus* has simple fusiform roots, soft and sweet like *Scorzonera*, and equally good to eat. The leaves and stalk also abound with a milky juice, and the people of Salamanca eat it in the same manner as Cardoons. The flowers are used for adulterating saffron.

History, Use, Propagation, Culture,

1660. *Arctium*. From *arctos*, a bear, (*arth*, Celtic); on account of the rough bristly fruit, which may be compared to the coarse hair of a bear. Lappa is derived from *lapp*, a hand, in Celtic, because it lays hold of every thing near it. The burdock is too familiar to every schoolboy to need illustration. It is equally common in Europe and Japan, by road sides and on ditch banks. Few quadrupeds, except the ass, will eat the plant; but birds feed on the seeds, and snails and caterpillars on the leaves. The stems, stripped of their rind before the flowers appear, may be eaten, either boiled or raw, with oil and vinegar. Withering says, a decoction of the roots is esteemed by some equal to that of Sarsaparilla. Burnt green, between the time of flowering and seeding, three pounds of the ashes produced sixteen ounces of very white alkaline salt, as good as the best potash.

1661. *Serratula*. A diminutive of *serra*, a saw; the leaves being edged with cutting teeth. Plants with the habit and qualities of thistles. *Serratula tinctoria* dyes cloth of a yellow colour.

1662. *Saussurea*. Named in honor of the celebrated Swiss philosopher Horace Benedict de Saussure, who, among his other acquirements, possessed a considerable knowledge in botany. He died in 1799, in the fifty-ninth year of his age.

1663. *Carduus*. This word appears to be derived from *ard*, a point, in Celtic, in allusion to the numerous

- 11345 Leaves cordate petiolate
 11346 Cauline leaves cordate stalked entire, Invol. cobwebbed downy
 11347 Invol. woolly: inner scales subulate somew. colored scarcely longer than outer, Racemes axill. panicled
- 11348 Leaves sharply serrate glab. pinnatifid: the terminal lobe the largest, Flowers in a small clust. umbel
 11349 Leaves serrated unequally pinnate of about 5-pairs, Pinnæ confluent, Pedunc. 1-f. Fl. rayed
 11350 Lvs. serrated unequally pinn. of about 2-pairs, Pinnæ confluent, Pedunc. 1-f. Inner scales of invol. long
 11351 Lvs. lin. lanc. hirsute revolute at edge, Stem 1-f. vill. Scales of invol. ov.-lanc. appressed [colored
 11352 Leaves lin. entire hirsute, Fl. terminal corymbose
 11353 Leaves lin. entire downy beneath revolute at edge, Corymb fastigiato
 11354 Leaves pinnatifid oblique acute smooth unarmed, Scales of invol. mucronate: inner scarious
 11355 Leaves pinnatifid: lobes distant, Stem nearly simple 1-flowered, Invol. globoso squarrose
 11356 Like *S. tinctoria*, but the lower leaves are oval and entire
 11357 Leaves pectinate-pinnatifid naked: segm. lin. unarmed; terminal ovate, Scales of invol. ov. mucronate
 11358 Invol. unarmed somewhat awned radiate, Leaves pinnatifid
 11359 Leaves ov. pinnatifid toothed unarmed hoary beneath: upper sess. Stem 1-f. Scales of invol. ov. unarmed
 11360 Leaves lin. entire downy beneath, Corymb nearly simple, Invol. obl. ovate downy
 11361 Invol. ovate: scales roundish scarious at edge, Leaves lanc. lower somewhat toothed at base
 11362 Stem somewhat downy, Lvs. obl. acute narrowed at base serrated, Fl. subsessile, Invol. unarmed
 11363 Lvs. downy beneath somewhat toothed: radical cord. stalked, Cauline lanc. decurrent, Invol. squarrose
- 11364 Invol. corymb. somewhat downy, Leaves fleshy smooth: radical lyrate hastate, Cauline hastate
 11365 Leaves villous beneath toothed: radic. ovate-lanc. Flowers terminal somewhat unbelled
 11366 Lvs. downy beneath toothed: radic. ovate-subcordate; cauline ovate-lanc. Fl. terminal somew. umbelled
- 11367 Leaves decurrent toothed spiny, Pedunc. naked very long 1-f. Invol. spiny inclining
 11368 Lvs. half decurrent obl. spiny-toothed somewhat fleshy smooth glauc. beneath, Pedunc. very long 1-f.
 11369 Leaves obl. decurrent sinuate spiny with white veins villous beneath, Fl. sessile clustered, Invol. cylind.
 11370 Leaves decurrent spinous, Fl. drooping, Scales of the invol. lanc. cottony: outer ones spreading
 11371 Leaves decurrent pinnatifid downy: segments palmate spiny, Flowers clustered
 11372 Leaves decurrent runcinate spiny, Pedunc. somewhat downy 1-f. Invol. ovate mucronate unarmed
 11373 Leaves decurrent sinuate spiny smooth, Pedunc. short subcorymbose downy
 11374 Leaves decurrent spiny glabrous, Pedunc. erect 1-f. unarmed
 11375 Lvs. decur. sinuated spinous, Invol. globoso nearly sess.: its scales lin. slightly recurved [lanc. erect
 11376 Lvs. decurrent sinuated spinous somew. cottony beneath, Invol. nearly cylind. clustered sess. their scales
 11377 Lvs. decurrent obl. sinuated spiny at edge downy beneath, Fl. stalked clustered terminal
 11378 Lvs. decurrent lanc. pinnatifid toothed spiny vill. beneath, Pedunc. 1-f. downy, Scales of invol. sub. spiny
 11379 Leaves half decurrent lanc. pinnatifid spiny downy beneath, Pedunc. scaly downy
 11380 Caul. lvs. half decurrent obl. undivided spiny toothed subvillous beneath: radic. pinnatifid at base
 11381 Leaves decurrent sinuated ciliated naked beneath, Fl. stalked heaped
 11382 Leaves half decurrent pinnatifid toothed spiny white with down beneath, Fl. subsessile term. clustered
 11383 Leaves half decurrent toothed sinuate spiny smooth, Flowers panicled
 11384 Leaves decurrent pinnatifid sinuated downy spiny, Pedunc. naked downy, Invol. deciduous
 11385 Lvs. downy beneath: upper finely decurrent lin. Stem 1-f. Scales of invol. lanc. mucron. downy
 11386 Lvs. decurrent deeply pinnatifid: segments toothed upwards spiny with setaceous cilia at end
 11387 Leaves half decurrent pinnatifid acuminate: segm. 2-lobed ciliated spiny, Pedunc. downy
 11388 Leaves half decurrent pinnatifid-serrate somew. spiny ciliated naked: radic. undivided, Pedunc. very long
 11389 Leaves adnate at base lanc. naked eroded ciliate-spiny unarmed [woolly
 11390 Leaves unarmed: radic. ovate toothed somewhat cut at base; cauline sessile pinnatifid linear
 11391 Leaves naked: radical obl. entire; cauline lanc. somewhat toothed, Scales of invol. ovate mucronate

and Miscellaneous Particulars.

points with which it is beset. *C. marianus*, the milk-thistle, derived its name from the Virgin Mary, some of whose milk is said to have fallen upon the leaves of the plant, and changed them to white. An extensive genus of rather handsome weeds. *C. Personata* is said to have been so called, because its ample leaves were formerly used as a mask (*persona*). Some of the gigantic species make handsome ornaments for the shrubbery, but the greatest number are nuisances to the husbandman; some on account of their deep vivacious roots, which cannot be eradicated without extreme difficulty; but the greater number because of their bulky herbage, and the extensive dissemination of their seeds by the wind.

The footstalks of the leaves of most or all of the species of this and the allied genera might be eaten in the manner of Cardoons, if similarly blanched. The dried flowers of *C. arabicus* and nutans will curdle milk. The seeds of all the species of *Serratula*, *Cnicus*, *Onopordum*, and similar genera, are greedily eaten by small birds, especially the finches.

The *Carduineæ* of *M. Cassini* differ from *Carlineæ* of the same author, in the filaments being hairy or papillose, from *Centauriæ* in the structure of ovarium and of pappus, and from *Echinopseæ*, to which they bear a general resemblance, by many very important characters. The species inhabit Europe, Asia, and Africa; there are scarcely any in America, and none in the southern hemisphere.

History, Use, Propagation, Culture,

1664. *Silybum*. A name under which Greek writers describe a plant not well known at present. Sprengel refers it to *S. marianum*. This plant was formerly cultivated, and the young leaves used in spring as a salad, or boiled as pot greens; the young stalks, peeled and soaked in water, to extract a part of their bitterness, were also eaten, and were said to be excellent. In the spring of the second year, the root is prepared like salsafy or skirret; and the receptacle of the flower is pulpy, and eats like that of the artichoke. In Apulia the whole plant is much used as fodder for cattle.

1665. *Cnicus*. This is a name under which Dioscorides describes a prickly rough plant; derived from *σνίξω*, to prick. It is now referred to a tribe of plants having such characters in an eminent degree. *Acarna* and *Erisithales* are both names by which the ancients distinguished plants, either the very same as those now so called, or very similar to them. The tender stalks of *C. palustris*, as of most of the species, being peeled, are eatable either raw or boiled. *C. arvensis* is well known as one of the most troublesome weeds in arable land. It is never found, however, in very sandy, gravelly, or peaty soils; but generally in such as are loamy and dry. An instance is given in the *Farmer's Magazine*, of the descending roots of this plant having been dug out of a quarry nineteen feet long; nor is it less remarkable for its horizontal roots. Mr. Curtis planted about two inches of a root in his garden in April, and by November following it had thrown out under ground stolons on every side, some of them eight feet long; some of these stolons had thrown up leaves five feet

 11395 Lvs. half decurrent somew. hoary lanc. ciliate spiny, Pedunc. naked downy solit. Scales of invol. appressed
 11396 Leaves decurrent lanc. hoary toothed spiny, Fl. aggregate involucreate, Invol. with pinnated spines
 11397 Lvs. decurrent lanc. smooth subrepand uneq. ciliated, Pedunc. naked downy alternate [lanc. spreading
 11398 Lvs. decurr. hispid pinnatif. their segm. generally 2-lobed spreading spinous, Invol. ov. toment. their scales
 11399 Lvs. amplexicaul. hispid pinnatif. : segm. 2-lobed spreading spiny vill. beneath, Invol. hemispher. sessile
 11400 Leaves sess. pinnatif. every other segm. pointing upwards spin. scabr. Involucres spherical woolly
 11402 Leaves sess. pinnatif. hairy downy beneath : segm. 2-lobed spreading spiny, Invol. globose with cobweb down
 11403 Leaves sess. obl. lanc. scabrous downy beneath toothed ciliated : radic. pinnatifid, Invol. bracteate ovate
 11404 Leaves sess. lanc. waved at the edge and unequally spin. pubesc. cottony beneath, Flowers mostly solitary
 11405 Lvs. amplexic. lanc. ciliato-dentate undivided or lacinated white and downy beneath, Fl. clustered
 11406 Lvs. subcordate amplexicaul. lanc. ciliated downy beneath : lower somewhat cut, Fl. mostly solitary
 11407 Lvs. lanc. sessile ciliated strigos beneath : radical sinuated, Scales of invol. recurved at end
 11408 Lvs. pinnatifid with strong spines somewhat downy beneath, Fl. sess. aggregate, Lvs. of invol. spiny
 11409 Lvs. half decurr. obl. sinuate toothed spiny hoary beneath, Heads close together with appressed scales
 11410 Leaves half decurrent lanc. entire ciliated, Pedunc. very long 1-fl. woolly
 11411 Very like *C. arvensis*, but the leaves are decurrent
 11412 Stem somew. downy, Lower lvs. sinuate-toothed with strong spines rough above finely downy beneath
 11413 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny downy beneath, Heads ov. glabrous spiny
 11414 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny downy beneath, Heads ov. cobwebbed with down
 11415 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny beneath naked subvillous, Heads ov. cobwebbed
 11416 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny naked beneath, Heads ov. glabrous
 11417 Lvs. amplexicaul. hispid pinnatifid prickly : segm. angular lobed spiny, Heads nodding cobwebbed
 11418 Stem branched many-fl. Heads terminal solitary spiny at base, Lvs. amplexicaul. sinuate toothed spiny
 11419 Leaves sess. pinnatifid hispid woolly beneath : segm. 2-lobed spreading spiny, Invol. ovate woolly
 11420 Leaves sess. lanc. cut-toothed : radical, pinnatifid, Scales of invol. ovate lanc. membranous at edge
 11421 Leaves ciliate spiny downy beneath : lower stalked obl. acum. subsinuate ; upper pinnatifid auricled
 11422 Like the last, but the leaves of involucrem are reflexed
 11423 Leaves obl. smooth serrulate with bristly ciliae blunt mucro. Stem corymbosae
 11424 Leaves unarmed sess. obl. toothed : radical undivided and pinnatifid, Invol. scarious villous
 11425 Leaves sess. pinnati. spin. Stem panicled, Invol. ovate, Scales appressed mucronated

- 11426 Leaves toothed ciliated naked : cauline amplexicaul. : lower and radical pinnatifid, Fl. clustered capitate
 11427 Leaves amplexicaul. ovate sublyrate ciliate serrate scabrous : radic. lyrate, Fl. clustered
 11428 Leaves amplexicaul. obl. lanc. toothed ciliate-spiny, Pedunc. 1-fl. Invol. bracteate
 11429 Leaves sess. pinnatifid : segm. cut serrate spiny at edge, Invol. bracteate : scales ovate appressed
 11430 Leaves cordate amplexicaul. ovate obl. toothed ciliated : radical obl. blunt ciliated sinuate
 11431 Leaves amplexicaul. cord. pinnatif. ciliate serr. Fl. terminal subracemose bracteate, Bractes colored ovate
 11432 Leaves amplexicaul. obl. pinnatif. toothed spiny hispid above downy beneath, Term. fl. sess. axill. stalked
 11433 Leaves amplexicaul. pinnatif. toothed spiny glabrous, Fl. term. aggreg. sess. surrounded by colored bractes
 11434 Leaves amplexicaul. pinnatifid ciliated, Pedunc. cernuous, Invol. glutinous : scales lanc. spreading
 11435 Leaves amplexic. pinnati.-downwards ciliated : pinnae lanc. 3-nerved ; upper confluent, Pedunc. cernuous
 11436 Leaves amplexicaul. pinnatifid ciliate-spiny : segm. 2-lobed toothed upwards at the base
 11437 Stemless, Invol. glabrous
 11438 Leaves sess. lanc. entire downy beneath with triple spines at the edge, Fl. axill. sessile
 11439 Leaves sess. lanc. downy beneath subrepand : lobes emarg. with 2 spines, Fl. stalked subcorymbosae

and Miscellaneous Particulars.

from the original root. The whole together, when dug up and washed, weighed four pounds. In the spring following, it again made its appearance, on or about where the small piece was originally planted. There were between fifty and sixty young plants, which must have sprung from fragments of the roots that had eluded the gardener's search, though he was particularly careful in extracting them. From these facts it may readily be conceived how difficult it is to eradicate this weed from arable land ; a naked fallow, with frequent and deep ploughing, will not accomplish it, unless the season is more than usually dry. Laying land down to grass, keeping it in that state seven or eight years, and during the whole time pulling up every shoot as soon as it appears, is found fully more effectual than a naked fallow. But the plant is so common by road sides, and seeds so abundantly, that it is hardly possible to effect its extermination. In common field lands, and others indifferently cultivated, it often forms the larger half of the produce, and formerly used to be pulled when beginning to come into flower, and given as food to horses and cows. Those who pull this weed require to be furnished with strong gloves, or thistle pinners. (*Encyc. of Agr.* § 2304.) Some English botanists seem doubtful if horses and cows will eat it ; but those who know any thing of the history of agriculture in Scotland will recollect, that before the introduction of naked fallows and turnips, it formed the *suppering* of housed cattle, during five or six weeks of every summer. The ashes of the plant yield a very pure vegetable alkali. *C. canus* has fleshy white roots like the skirret, and may be dressed and eaten

History, Use, Propagation, Culture.

in the same manner. *C. lanceolatus* is one of the most common and noxious weeds of the genus, chiefly on account of its great bulk, its numerous downy seeds, and the facility with which they are distributed by the wind: its dried flowers curdle milk. *C. helenioides*, used to be called the melancholy thistle, and was used by Quacks as a cure for madness. *C. Casaubona* is so named after Casaubona, herbarist to the Grand Duke of Tuscany, who sent the seed to John Bauhin. *C. syriacus* is spotted with white, as are a number of Egyptian plants. *C. oleraceus*, according to Schreber, is not eaten by cattle; but the Russians are said to boil the leaves in the spring, and eat them as coleworts. The tender stalks of *C. cernuus* are so used in Siberia.

1666. *Onopordum*. A name employed by Pliny for a plant which he describes too imperfectly to be recognized now. The virtues which he ascribes to it, and whence the name has been derived (*σνος* and *σπερμα*), certainly have no existence in the modern genus, which consists of noble thistle-like plants, that, if allowed plenty of room, form very magnificent specimens of annual vegetation. *O. acanthium* (from its leaves being like those of the *Acanthus*) was formerly used like the artichoke and Cardoon. The seeds of this plant, unlike those of other thistles, are strongly defended by the calyx, and are not subject to be blown about by winds. The whole plant is white, tomentose, and one of the most magnificent of the family.

1667. *Berardia*. So named by Villars, after M. Berard, a botanist of Grenoble.

1668. *Cynara*. Said to be derived from *κύων*, a dog, on account of the stiff hard spines of the involucrem, which resemble the teeth of a dog. The English word *Artichoke* is said to be derived from the Celtic *art*, a spine, and *chaulx*, a cabbage; but it must be confessed that the word is very like the Arabic name of the plant, *Carciojó* or *Kharchiof*. *C. scolymus* is a well known garden esculent. In some parts of France and Italy it is eaten raw in its wild state by the common people. According to Gerarde, it was introduced into this country from Italy, but is become, "by reason of the great moisture which our country is subject unto," greater and better than those of Italy; a circumstance not to be doubted, and applicable to many other plants of culture; for it is a fact, that art can in many cases surpass nature; always, however, working upon nature's principles. The artichoke is one of those plants the most patient of drought, and in this unusually dry and hot season (1825) was almost the only vegetable procurable in the neighbourhood of Paris, during three or four weeks in July and August. Once in the seventeenth century, and again about 1739, most of the artichokes in England were destroyed by frost, but replaced from France. There are three varieties in cultivation, the conical, French, or oval; the globe, which has a large dusky purplish head; and the dwarf globe, a prolific variety, which is smaller. The parts used are the lower part of the leaves of the calyx; the fleshy receptacles of the flower, freed from the bristles and seed down, vulgarly called the choke; and some-

11440 Leaves narr. pinnatifid downy beneath with strong spines, Fl. large solitary, Lvs. of invol. spiny recurved
 11441 Leaves sess. lanc. entire unarmed downy beneath, Spines axill. branched at base, Fl. axill. sessile

 11448 Scales of invol. much spreading as long as invol. Lvs. decurr. downy sinuated toothed spiny : radic. pinnate
 11449 Lower scales reflexed : upper much spreading, Lvs. decurrent downy sinuated toothed spiny
 11450 Invol. squarrose with cobwebbed down, Leaves stalked ovate angular downy beneath
 11451 Scales of invol. ovate-lanc. mucronate spreading, Lvs. decurrent downy subsinuate toothed spiny
 11452 Stem and leaves tomentose : radical pinnatifid ; cauline obl. adnate decurrent toothed spiny
 11453 Scales of invol. ovate mucronate appressed, Lvs. decurrent somewhat downy sinuate toothed spiny
 11454 Steml. Invol. glob. subsess. Scales of invol. lanc. spiny spreading, Lvs. stalked pinnatif. toothed spiny downy

11455 Stemless, Invol. obl. subsess. Scales of invol. obl. lanc. downy unarmed, Lvs. stalked roundish ovate

11456 Leaves somewhat spiny pinnate and undivided, Scales of invol. ovate
 11457 Leaves pinnatifid downy beneath spiny, Spines of the base of leaves and pinna connate at base
 11458 Leaves spiny : all pinnatifid, Scales of invol. ovate
 11459 Leaves spiny pinnatifid downy beneath, Scales of invol. subulate
 11460 Stemless, Leaves unarmed downy beneath pinnatifid : segm. cut-toothed, Scales of invol. lanc.
 11461 Stemless, Leaves pinnatifid spiny
 11462 Stemless, Leaves pinnate smoothish : segm. toothed spiny, Inner scales of invol. scarious at end

11463 Stemless, Leaves pinnatifid downy beneath : segm. toothed angular spiny
 11464 Stem simple 1-fl. Lvs. pinnatifid naked : segm. cut-toothed spiny
 11465 Stem simple 1-fl. longer than flower, Leaves deeply pinnatifid squarrose
 11466 Stem simple 1-fl. numerous aggregate, Leaves pinnatifid smooth : segm. pinnatifid spreading spiny
 11467 Stem subdiff. Middle flower sessile, Lvs. hoary lanc. toothed spiny
 11468 Stem many-fl. corymbose smoothish, Lvs. lanc. pinnatifid toothed smooth
 11469 Stem many-fl. corymb. pubesc. Leaves lanc. unequally spin. and sinuated downy beneath
 11470 Stem somewhat divided, Fl. axill. sess. Leaves lanc. toothed downy spiny pubescent
 11471 Stem many-fl. Leaves decurrent

and Miscellaneous Particulars.

times the tender central leafstalk in a blanched state like the Cardoon. Medicinally, the plant is reputed to be aperient, stomachic, and somewhat heating. It is said to dye a good yellow, and the flowers curdle milk.

The plant is propagated by suckers in March and April, and requires a light rich soil, well dunged, and pulverised to a good depth. The leaves being large, the plants are placed in rows at four feet distance, and two feet apart in the row. They will produce some heads the first season, a full crop the next, and, if well manured, will last for five or six years. The plants require to be covered a foot thick with litter during winter, which is removed, and the ground dressed in March and April. The heads will appear in the beginning of June.

When the artichoke is to be cultivated as Cardoon, the plants are to be cut over by the surface about midsummer ; in September they will have produced leaves about two feet high ; they are then bound close with a wreath of hay or straw, and earth drawn round them. The blanching will be perfected in a month or six weeks.

Baughin thought the Cardoon a hybrid from the common artichoke, to which it bears a great resemblance. The tender stalks of the inner leaves, rendered white and crisp by earthing up, are used for stewing, and for soups and salads during winter, like celery. It requires the same soil as the artichoke, to be planted at three or four feet apart in May, or sown where it is to remain in March. In September the leaves may be tied together and earthed up, and in October and November they will be blanched from one to three feet in length.

With the florets of *Cynara Cardunculus*, which the Portuguese call *Cardo do coalho*, milk was formerly coagulated by the people of Portugal, as it is by rennet in England.

1693. *Carlina*. Olivier de Serres says, this plant was named after the famous Charlemagne, whose army was cured of the plague by means of this plant. Linnaeus ascribes the name to the Emperor Charles V., whose army was relieved from the plague in Barbary in the same way. *C. caulis* has black woody roots an inch thick, the upper part of which, with the receptacle of the flower, when tender, may be eaten, but the root of the adult plant becomes acrimonious, and is recommended as an alexipharmic. It contains an acrid resinous principle, by which it stimulates the solids, dissolves the humours, and promotes perspiration. *C. vulgaris* is found all over Europe in dry barren soils. The flowers expand in dry, and close in moist weather, retaining this property a long time.

Upon this and a few other genera M. Cassini has founded a tribe, which he denominates *Carlineæ*, which although possessing no very precise characters of difference, is, he believes, distinct from both his *Centaureæ* and *Carduineæ*, from which it may always be distinguished by the perfect smoothness of the filaments. The species of *Carlineæ* are found in every part of the world.

History, Use, Propagation, Culture,

1670. *Atractylis*. Vaillant (*Mém. Acad. Sc.* 1718.) derives this from *ατρακτος*, a distaff, because the light stems were very fit to make spindles.

1671. *Acarna*. A name under which Theophrastus describes a plant resembling a thistle. Willdenow applied it to the present genus, which consists of thistle-like plants.

1672. *Stokesia*. Named in honor of Jonathan Stokes, M.D., well known as the coadjutor of Dr. Withering in his botanical arrangement of British plants. A perennial plant, with large handsome blue flowers.

1673. *Stobæa*. Named after Dr. Stobæus, of Lund, one of Linnæus's earliest patrons, and said to have been a practical naturalist.

1674. *Onobroma*. From *ovos*, an ass, and *βρωμα*, food, in allusion to the worthlessness of its herbage. Thistle-like plants of little beauty.

1675. *Carthamus*. From its Arabic name *qortom*, a word which signifies to paint, on account of the fine color yielded by the flowers. Tournefort, with little reason, derives it from the Greek *καθαρις*, to purge. The flowers of *Carthamus tinctorius* are used by the Chinese to give some of the fine rose, scarlet, purple, and violet colors to their silks. For this purpose, the flowers are thrown into an infusion of some alkali, and left to macerate; the colors are afterwards drawn out by the addition of lemon juice in various proportions, or of any other vegetable acid.

It is cultivated at present in many parts of Europe, and in the Levant, whence great quantities are annually imported into England for dyeing and painting. In Spain it is grown in gardens, as Marygolds are in England, to color soups, olives, and other dishes. The Jews in Poland are remarkably fond of it, and mix it with their bread, and most of their viands. According to Houghton, it was formerly cultivated in Gloucestershire, both for the flowers and seed. The common people took it for saffron, and used it in their puddings, cakes, and

11472 Stem and leaves smooth

11473 Stemless, Leaves pinnatifid, Outer leaves of invol. tricuspidate

11474 Stem branched, Leaves lanc. ciliate toothed downy, Outer leaves of invol. setaceous pinnatifid conniving
[larger than flower]

11475 The only species

11476 Leaves downy pinnatifid: pinnæ linear terminated by a spine

11477 Stem about 1-fl. Leaves ovate lanc. spiny-toothed

11478 Stem shrubby, Leaves sessile lanceolate downy beneath spiny-toothed, Branches 1-flowered

11479 Stem quite smooth, Leaves ovate entire spiny toothed, Fruit naked

11480 Stem woolly, Lower leaves pinnatifid toothed: upper amplexicaul. pinnatifid toothed spiny

11481 Stem smoothish, Invol. somewhat woolly, Lower leaves lyrate: upper half-amplexicaul.

11482 Radic. leaves pinnated: cauline pinnatifid, Stem 1-flowered

11483 Leaves unarmed: radical toothed; cauline pinnate

11484 Cauline leaves linear pinnated as long as plant

11485 Leaves ensiform sinuate toothed

11486 Spiny much branched with small blue flowers

11487 Leaves sessile linear toothletted downy beneath, Inner scales of invol. lanc. long

11488 Leaves stalked ellipt. blunt entire silky with down beneath

11489 Leaves lin. clustered very long revolute at edge hoary beneath, Branches downy

11490 The only species

11491 Leaves scattered and fascicled filiform ciliated, Leaves of invol. ciliated, Hairs of recept. clustered

11492 Lvs. scattered and fascicled filiform subciliate at base, Lvs. of invol. entire, Holes of recept. multipartite

11493 Leaves connate linear filiform glabrous, Scales of invol. ovate, Stem wavy, Fl. terminal in threes stalked

11494 Leaves ovate powdery downy, Scales of invol. ovate entire

11495 Leaves ovate smooth, Scales of invol. ovate mucronate membranous

11496 Leaves lanc. scabr. serrulate, Corymb fastigiata, Scales of invol. filiform at end

11497 Leaves ovate-lanc. serrate downy beneath, Corymb fastigiata, Scales of invol. ovate acuminata

11498 Stem simple, Lvs. many long and narrow lin. nearly entire, Corymb somewhat umbell. Scales of inv. stiff

11499 Leaves oblong acuminata serrate, Corymb fastigiata, Scales of invol. ovate acute [mucronate]

11500 Leaves linear-lanc. silky beneath downy on each side nearly entire, Flowers alternate 1-sided sessile

11501 Stem straight dichotomous upwards: branches flexuose, Heads in the forks of the branches sessile

and Miscellaneous Particulars.

bread; but by putting in too great a quantity they found it communicate a purgative quality, and gave up its use. It is still, however, used in this way by some pastrycooks. In Germany it is cultivated on light land well pulverised; it is sown in rows about eighteen inches distance, and afterwards thinned to three or four inches apart in the row: in September the plants begin to flower, and the field is then gone over once a week, for six or seven weeks, to gather the expanded florets, which are dried in a kiln in the same manner as true saffron. Turkeys and geese are said to feed greedily on the seed, and in a short time become very fat.

C. lanatus is used by the women of the south of France and Spain for distaffs, and hence it had the name of distaff thistle. The root of *C. carduncellus* is eaten in Africa.

1676. *Cardopatum*. A name of unknown meaning. A spiny branched plant with little blue flowers, formerly referred to *Carthamus*.

1677. *Stæhelinia*. One Benoit Stæhelin, a Swiss botanist, published, in 1730, an academical dissertation upon the *Filicula saxatilis* corniculata, and the *Equisetum*. These are pretty half-shrubby thread-leaved plants, mostly deserving cultivation.

1678. *Palafoxia*. Named by Lagasca, after the Spanish General Palafox, of whose merits as a botanist we are uninformed. A small perennial plant with the habit of *Stevia*.

1679. *Pteronia*. From *πτερον*, a wing; altered by Linnæus from the *Pterophorus* of Vaillant, a word which seems to allude to the feathery scales of the receptacle. A genus of humble rigid shrubs.

1680. *Vernonia*. Named after Mr. William Vernon, fellow of St. Peter's College, Cambridge, who travelled in North America in search of plants, and left behind him an Herbarium, which came into the hands of Sir Hans Sloane, and contributed to enrich the third volume of Ray's *Historia Plantarum*. *Vernoniæ* constitutes the twentieth of M. Cassini's subdivisions of *Compositæ*. They are distinguished from *Lactucæ* by

History, Use, Propagation, Culture,

their corolla, which is not ligulate, and from every other tribe by their style, which is absolutely the same as that of Lactuceæ. The greater part of Vernoniæ are found in America; a few in Asia and Africa, but none in Europe.

1681. *Ammobium*. From *αμμος*, sand, and *βιω*, to live, in allusion to the places where it grows. A pretty half-hardy New Holland herbaceous plant, with dry white involucreal scales, like a *Gnaphalium*.

1682. *Liatriis*. A word of unknown meaning. A genus of charming North American herbaceous plants. They should be taken out of the borders in the autumn, and preserved in pots till the succeeding spring. Of *Liatriis odoratissima*, the leaves when dry give out a very pleasant smell resembling Vanilla, and which lasts for years. It is called the Carolina Vanilla plant.

Liatriis squarrosa is a very handsome species, with large heads of most beautiful flowers of a rich purple. It and *L. scariosa* are known in North America under the name of rattlesnake's master. In case of being bitten by this reptile, the bruised bulbs of the plants are applied to the wound, while, at the same time, a decoction in milk is taken inwardly.

- 11502 Leaves oval blunt serrate-crenate: lower with a winged amplexicaul. stalk, Fl. subcorymbose
 11503 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed
 11504 Leaves ovate-lanc. narrowed at each end serrated roughish pubescent beneath, Fl. term. about 3
 11505 Leaves oblong wavy decurrent
 11506 Stem simple pubescent, Leaves very long linear nerved roughish at edge, Racemes few-fl. leafy
 11507 Stem simple pubescent, Lvs. lanc. narrowed at each end smooth rough at edge, Inv. squarrose at bottom
 11508 Stem simple pubescent, Leaves smooth: lower stalked broad-lanc. Invol. subglobose with scariosus scales
 11509 Stem simp. vill. Lvs. lin. subfalc. dott. rough, Spike somew. leafy, Pedic. short, Inner scales ligul. colored
 11510 Stem simple pubesc. Lvs. lin. pilose ciliated, Invol. racemose lax, Scales lin. obl. blunthish [mucronate
 11511 Slender all over hairy, Lvs. grassy, Spike few-fl. Inv. subsess. cylindr. few-fl. Scales round. at end abruptly
 11512 Stem simple smooth, Leaves lanc. smooth: upper lin. lanc. very small, Invol. spiked subsquarrose
 11513 Stem simple hirsute, Lvs. straight narrow-lin. downy, Spike long, Fl. closely cluster. Inv. appress. squarose
 11514 Stem simple tall, Lvs. lin. smooth ciliated at base nerved and dotted, Spike very long, Fl. sessile [at end
 11515 Quite smooth, Stem simple, Rad. leaves obl.: cauline amplexicaul. Panicle corymbose lax spreading
 11516 Dwarf, Leaves linear, Stem simple, Flowers spiked

- 11517 Stem climbing, Leaves ovate entire, Flowers spiked
 11518 Stem climbing, Leaves subcordate hastate toothed, Flowers in spikes
 11519 Stem climbing smooth, Lvs. cord. repand toothed acuminate with spreading unequal lobes, Fl. corymbose
 11520 Flowers sessile lateral
 11521 Flowers axillary sessile, Corollas all trifid

- 11522 Leaves lanc. veiny obsoletely serrate smooth, Invol. 4-fl. Stem shrubby
 11523 Stem paniced, Leaves smooth: lower pinnated, upper fasciated, all filiform
 11524 Leaves opp. subverticill. linear entire pubescent 3-nerved dotted: radical somewhat toothed
 11525 Leaves sessile amplexicaul. distinct ovate-lanc. rounded at base serrated smooth, Stem smoothish
 11526 Leaves sessile distinct ovate scabrous: upper coarsely serrated at base; uppermost entire
 11527 Leaves sessile distinct roundish cordate bluntly serrate veiny
 11528 Leaves subsessile lanceolate 3-nerved narrowed at each end downy: lower serrated in middle
 11529 Leaves stalked 3 or 4-nate ovate narrowed at each end serrated roughish
 11530 Leaves opposite subpetiolate tri-quinque-partite: their segments lanceol. deeply serrate
 11531 Leaves petiolate ternate and simple downy beneath unequally serrate, Stem smooth
 11532 Leaves stalked 4 or 5-nate ovate lanceolate serrate rugose veiny roughish, Stem hollow
 11533 Leaves stalked 4 or 5-nate ovate lanceolate unequally serrate downy beneath, Stem solid furrowed
 11534 Leaves stalked 4 or 5-nate ovate acuminate serrated scabrous on each side, Stem solid round
 11535 Leaves stalked 3 or 4-nate ovate-lanceol. cuneate at base unequally serrate smoothish, Stem solid smooth
 11536 Leaves connate perfoliate downy
 11537 Leaves stalked cordate ovate blunthish 3-nerved bluntly serrate, Fl. corymbose
 11538 Hispid, Leaves stalked cordate cut serrate, Panic. terminal, Invol. many-fl. subulate pungent
 11539 Leaves stalked ovate acute 3-nerved bluntly serrate glabrous, Stem paniced upwards, Fl. corymbose
 11540 Leaves stalked ovate acuminate 3-nerved unequally coarsely serrated smooth, Corymb many-fl. spreading
 11541 Leaves stalked triangular ovate serrated entire at end downy beneath, Corymb spreading term. sessile
 11542 Leaves narrow lanceol. 3-nerved subserrated, Invol. squarrose many-flowered
 11543 Leaves amplexicaul. lanc. acuminate rugose serrated, Flowers paniced clustered
 11544 Leaves stalked ovate acuminate unequally and bluntly crenated pubescent, Panicle contracted
 11545 Leaves stalked ovate acuminate toothed 3-nerved glabrous
 11546 Stem twining villous, Lvs. deltoid ovate acute 3-nerved soft beneath, Panicle term. trichotomous diffuse
 11547 Like *E. lamifolium*, but the flowers smaller and paniced

and Miscellaneous Particulars.

1683. *Mikania*. Named by Willdenow, after Professor Mikán, of Prague. Climbing tropical plants, one of which, *M. Guaca*, is employed in South American medicine as a powerful febrifuge.

1684. *Sparganophorus*. From *σπαραγγων*, a fillet, and *φερα*, to bear, because the seed is crowned with a membranous band or border.

1685. *Eupatorium*. This plant, says Pliny, derives its name from Eupator King of Pontus, who first used it in medicine. *Aya-pana* is the vernacular name of the species so called among the natives of the banks of the river Amazon. The tribe of Eupatoriæ is distinguished from Vernoniæ by its style. They are chiefly found in America, very few inhabit Asia, scarcely any Africa, and not one has been found in Europe.

The *Eupatorium perfoliatum* has some reputation as a medicinal plant. A dissertation upon the subject of its merits was published a few years since by an American physician, from which it appears that the virtues of the plant reside chiefly in the leaves, and that the most efficient mode of exhibiting it is by means of a simple decoction. The medical powers of *Eupatorium* are, as its sensible properties would seem to indicate, those of a tonic stimulant. Given in moderate quantities, either in substance, or in cold infusion or decoction, it promotes digestion, strengthens the viscera, and restores tone to the system. Like other vegetable bitters,

History, Use, Propagation, Culture,

if given in large quantities, especially in warm infusion or decoction, it proves emetic, sudorific, and aperient. Even in cold infusion, it tends to bring on diaphoresis. The plant is also stated to be an excellent remedy for the cure of intermittent fevers. When employed as a tonic, this plant may be taken in doses of twenty or thirty grains, or a teacup full may be used of the infusion rendered moderately bitter. When intended to act as an emetic, a strong decoction may be made from an ounce of the plant in a quart of water boiled to a pint. (Bigelow.)

1686. *Dumerilia*. Named after M. A. M. Constant Duméril, author of an Elementary Treatise upon Natural History, published in one volume octavo, at Paris, in 1804. Small half-shrubby South American plants, with firm hairy leaves.

1687. *Ageratum*. A name employed by Dioscorides, and probably applied by him to some plants similar to what we call properly "everlastings;" it is derived from *α*, privative, and *γεναι*, old age, because it never grows old; that is to say, always preserves its color.

1688. *Cælestina*. From *cælestis*, blue, in allusion to the color of the flowers.

1689. *Stevia*. Dedicated by Cavanilles to the memory of Peter James Esteve, a Spanish physician of the sixteenth century. He left behind him a dictionary of the plants natives of the kingdom of Valencia.

1690. *Cephalophora*. From *κεφαλη*, a head, and *φορεω*, to bear, its flowers being united in little heads.

1691. *Ampherephis*. From *ἀμφεσφης*, which signifies well covered, on account of the double involucre of the genus.

11548 Lvs. sessile distinct ovate scabrous veiny : lower doubly serrate ; upper subserrate, Stem panicled downy
 11549 Leaves stalked cordate acute subserrate villous beneath, Invol. 8-15-fl. Stem shrubby
 11550 Leaves stalked hastate triangular 3-nerved unequally serrate downy beneath, Panic. corymbose
 11551 Stem twining, Leaves reniform ovate acuminate serrate-toothed, Panicle axillary

11552 Leaves roundish 7-lobed : lobes crenate, Panicle corymbose terminal

11553 Leaves ovate subcordate, Stem hairy, Palææ of pappus awned toothletted
 11554 Leaves ovate cuneate at base, Stem pilose, Palææ of pappus lanceolate acute
 11555 Stem erect simple scabrous, Leaves cordate rugose unequally serrated
 11556 Hispid, Leaves cordate ovate crenate rugose, Corymb compound, Palææ of pappus lanceolate awned

11557 Leaves stalked ovate acute rounded at base serrated pilose above hairy beneath

11558 Leaves lanc. channelled narrowed into the footstalk 3-nerved, Corymb fastigiate
 11559 Leaves lanc. 3-nerved entire, Corymb fastigiate, Pappus paleaceous and awned
 11560 Leaves oblong ovate entire, Corymbs spreading, Pappus awned as long as corolla
 11561 Leaves lanc. narrowed at each end serrated in the middle, Corymb spreading, Pappus with 2 awns
 11562 Leaves lin. lanc. serrated at end, Corymbs fastigiate, Pappus paleaceous and awned
 11563 Leaves lanc. narrowed into the footstalk 3-nerved finely serrated at end, Corymbs fastigiate
 11564 Leaves ovate 3-nerved serrated cuneate and entire at the base, Pappus chaffy and awned
 11565 Leaves stalked digitate pedate entire, Pappus paleaceous. (*Florestina*, Cass.)
 11566 Leaves sessile narrowed at base rough with minute hairs, Pappus with 3 awns
 11567 Leaves 10 lines long 4 lines broad finely downy beneath, Flowers purple

11568 The only species

11569 Leaves of invol. foliaceous : inner ovate obl. rounded ; outer awned

11570 Hoary, Leaves sub-bipinnatifid, Flowers in compound corymbs

11571 Leaves 3-nerved ovate acuminate scabrous unequally toothed

11572 Flowers solitary stalked winged, Leaves oblong triple-nerved unequally serrated scabrous

11573 Leaves long-lanc. Leaves of invol. blunt, Palææ spatulate
 11574 Leaves lanc. oval acuminate 3-nerved, Palææ narrow linear

11575 Leaves lanceolate serrate, Stem erect
 11576 Leaves ovate repand : lower alternate, Stem branched ascending, Invol. many-leaved
 11577 Leaves ovate subcordate serrated, Stem branched diffuse

11578 Leaves opp. ovate-acumin. serrate, Pedunc. panicled, Heads ovate
 11579 Leaves opp. ovate-lanceolate entire downy, Pedunc. opp. diverging many-flowered

and Miscellaneous Particulars.

1692. *Hymenopappus*. From *ἕμην*, a membrane, and *πᾶππος*, pappus, in allusion to the membranous pappus of its seeds.

1693. *Melananthera*. From *μελας*, black, and *anthera*. A plant with black anthers, a very unusual character in this tribe of plants, the anthers of which are usually either white or yellow, according to the color of the corolla.

1694. *Marshallia*. Named after Henry Marshall, an Englishman, author of a sort of history of the trees and shrubs of North America, published in 1778.

1695. *Spilanthes*. From *σπίλος*, a spot, and *ἄστρος*, a flower, in allusion to the heads of flowers of the original species, which are yellow with a brown disk. Jacquin says he so called it, because the flowers are spotted with black points. *S. salivaria* is used by the natives of South America to relieve the tooth-ache by the salivation which it produces copiously. The flower-heads of *S. oleracea* are an excellent ingredient in salads, on account of their agreeable and lasting piquancy.

The leaves of *Spilanthes tinctoria* of Loureiro, which is said to be very similar to the *Abcedaria* figured by Rumphius, vol. ii. t. 65, give out when bruised a beautiful blue color, quite equal to indigo.

1696. *Salmea*. This name was originally given by Cavanilles to a genus related to *Aloe*, and was named after Prince Charles of Salm-Salm, a great promoter of botanical science. It was transferred to the genus which now bears the name by Professor Decandolle, in the appendix to his *Hortus Mounspeliensis*.

History, Use, Propagation, Culture,

1697. *Bidens*. So called because its seeds are surmounted with two teeth. Very worthless inconspicuous weeds.

1698. *Platypterus*. So called from *πλατυς*, broad, and *πτερον*, a wing, in allusion to the margin of the seeds. A small stove herbaceous plant of little merit.

1699. *Lagasca*. Named in honor of Don Mariño La Gasca, professor of botany at Madrid, an amiable man and excellent botanist. He is, at the time of writing this, residing in England, whither he has fled from the dangers of persecution in his own country.

1700. *Lavenia*. A name of unknown meaning, originating with Sherard. Small useless annuals, natives of the East and West Indies.

1701. *Cacalia*. A name applied by Dioscorides to a mountain plant with large whitish leaves. By some it is believed to have been what is now called *Cacalia alpina*. To Sprengel it appears to be the *Bupierium*

- 11580 Flowers discoid stalked, Outer invol. 3 times as long as flower, Lvs. ovate with 1 or 2 teeth on each side
 11581 Leaves tripartite, Leaflets lanceolate deeply serrated, Bristles of the pericarp 2-3
 11582 Fls. droop. Bracteas lanc. ent. (longer than inv.) Lvs. lanc. serrat. undivid. Bristles of pericarp about 4 erect
 11583 Flower radiant erect, Outer invol. longer than inner, Cauline leaves lanc. serrated : radical subternate
 11584 Fls. discoid, Outer invol. 6 times as long as flower, Leaflets ciliated at base, Lower lvs. pinn. : upper ternate
 11585 Fls. radiant, Outer invol. length of inner, Lower leaves pinnate : upper ternate, Leaflets ovate serrated
 11586 Fls. radiant, Outer invol. length of inner, Low. lvs. pinn. : upper tern. Leaf. ov. subcord. serr. uneq. at base
 11587 Fls. discoid, Outer inv. length of inner, Low. lvs. pinn. : upper tern. Term. leaf. twice as large as the rest
 11588 Flowers radiant, Outer invol. longer than inner, Leaves decussively pinnated serrated
 11589 Flowers subradiant, Outer invol. length of inner, Leaves bipinnate : leaflets lanc. pinnatifid
 11590 Fls. discoid, Outer inv. longer than flower, Lvs. scabr. toothed : low. roundish ov. : upp. tern. Stem hairy
 11591 Leaves bi-tripinnate : pinnæ linear acute channelled entire, Outer leaves of invol. blunt downy
 11592 Flowers radiant erect, Outer involucre longer than inner, Leaves lanc. stalked equally serrate
 11593 Leaves lanc. acute serrated subciliated, Outer involucre leafy
 11594 Flowers discoid, Outer invol. 3 times as long as flower, Cauline leaves ternate : lateral connate
 11595 Flowers discoid, Outer invol. longer than inner, Leaves ternate : leaflets 3-parted cut-toothed
 11596 Flowers radiant, Outer invol. length of inner, Leaves bipinnate, Leaflets cuneiform 3-toothed
 11597 Leaves lyrate-pinnated : pinnæ ovate acute serrated pubescent, Flowers panicled

11598 Leaves hoary toothed, Stem with 4 wings

- 11599 Leaves stalked ovate acuminate subrenate softly silky
 11600 Leaves on short stalks elliptical blunt obsoletely toothed rigid

11601 Stem branched erect, Leaves elliptical finely serrated

- 11602 Stem shrubby with cylindr. truncate papillæ, Leaves lanc. flat
 11603 Stem shrubby, Leaves ovate-oblong flat, Petioles with a triple line at base
 11604 Stem shrubby, Leaves lanc. flat, Flowers corymbose
 11605 Stem shrubby, Leaves compressed fleshy
 11606 Stem shrubby, Leaves roundish fleshy incurved, Pedunc. terminal 1-fl. naked
 11607 Stem shrubby, Leaves depressed fleshy
 11608 Stem shrubby, Leaves depressed fleshy woolly

- 11609 Stem shrubby, Leaves fleshy flat ternate, Leaflets 3-lobed
 11610 Stem suffruticose, Leaves ovate-lanc. toothed downy beneath
 11611 Shrubby downy, Leaves cordate ovate acute angular downy beneath : stalks with leafy appendages
 11612 Stem herbac. branched, Lvs. lanc. smooth toothed : of the stem amplexicaul. ; of the branches stalked
 11613 Leaves thickish villous : lower oval repand-toothed stalked ; upper sublyrate amplexicaul.
 11614 Stem herbaceous, Leaves amplexicaul. toothed : lower lyrate ; upper sagittate toothed
 11615 Leaves obl. lanceolate connate downy beneath, Racemes axillary
 11616 Radical leaves ovate spatulate : cauline entire amplexicaul. crenate edged
 11617 Stem herbaceous, Leaves sessile obl. lanc. serrated : at the base cuneate entire decurrent
 11618 Stem herbaceous, Leaves stalked 3-lobed hastate serrate, Flowers racemose nodding
 11619 Stem herbaceous, Lvs. stalked rhomboid hastate unequally toothed, Flowers corymbose spreading erect
 11620 Stem herbaceous, Leaves stalked hastate-sagittate serrated, Flowers corymbose erect
 11621 Stem herbaceous, Leaves stalked : radical cordate toothed ; cauline rhomboid with 2 teeth on each side
 11622 Stem herbaceous, Leaves stalked : radical cordate reniform repand toothed ; cauline oblong toothed
 11623 Stem herbaceous, Leaves stalked cordate toothed, Petioles naked, Corymbs fastigate, Invol. 5-flowered
 11624 Stem herbac. Leaves stalked cordate toothed hoary beneath, Petioles auricled at base, Corymbs fastigate
 11625 Stem twining, Leaves triangular sinuate-toothed
 11626 Stem herb. Rad. lvs. bipinnatifid : caul. pinn. Pinnæ toothed : upper confluent, Corymb comp. fastigate
 11627 Stem herbaceous, Leaves toothletted : lower stalked obovate ; upper obl. lanc. sagittate amplexicaul.

and Miscellaneous Particulars.

longifolium of the moderns. The species are nearly all objects of ornament. Some of them are remarkable for their fleshy awkward looking stems, others for their discolored leaves. The succulent kinds require to be grown in old rubbish, and to be treated as directed for Mesembryanthemums. The leaves of some species (*C. procumbens* and *sonchifolia*) are used as salad by the Chinese ; and those of *C. Ficoides* are sometimes pickled by the French.

C. Kleinia is called cabbage tree, from the resemblance which the stalks have to those of the cabbage ; and carnation tree, from the shape of the leaves and color of the flowers.

Upon *Cacalia alpina*, &c., M. Cassini has founded his genus *Adenostyles* and tribe of *Adenostyleæ* ; distinguished from *Senecioneæ*, to which *Cacalia* belongs, by the roughness of all the back of the two lobes of the style. But we do not find the division adopted by other botanists. M. Cassini himself suspects that *Adenostyleæ* may be united with *Tussilagineæ*.

History, Use, Propagation, Culture,

1702. *Kleinia*. Named after James Henry Klein, a German botanist, who published, in 1719, a dissertation upon the Juniper.

1703. *Ethulia*. A word formed by Linnæus without any explanation of its meaning. It is not easy to understand wherefore Vaillant's more ancient name of *Sparganophorus* should not have been adopted.

1704. *Piqueria*. So named by Cavanilles, in honor of Andreas Piqueria, a Spanish botanist, who published a translation of Hippocrates, in 1757.

1705. *Chrysocoma*. From χρυσος, gold, and ζομη, hair, in allusion to the tufts of yellow flowers with which the stems are terminated. The specific name *Comaurea* is a mere translation of the generic appellation. *Linosyris*, the name of another species, is so called from *linum*, flax, and *osyris*, an ancient name for a plant with long flexible branches and flax-like leaves, which is the character of *C. linosyris*; which, when handled, sends forth a very fine aromatic smell.

1706. *Tarchonanthus*. *Tarchon* is a name given by the Arabian physicians to the *Artemisia Dracunculus*, and is the root of our English word *Tarragon*. *Andros* signifies flower, and the word thus compounded may be Englished *Tarragon-flower*.

1707. *Calea*. Derived from καλος, beautiful. The species are ornamental shrubs of South America, with undivided leaves, and corymbose, terminal, or axillary heads of yellowish purple flowers. Mr. Brown's history

- 11628 Leaves obl. lanc. acute at each end nearly entire
 11629 Leaves elliptical blunt mucronate repand with pellucid dots
 11630 Leaves linear entire with pellucid dots, Stem suffruticose

- 11631 Flowers paniced
 11632 Leaves linear toothed decurrent, Pedunc. opposite the leaves 1-fl. Stem divaricating
 11633 Stem winged, Leaves lanc. acute serrated downy decurrent, Flowers corymbose

- 11634 Leaves opp. ovate-lanc. serrated 3-nerved, Invol. with 4 flowers

- 11635 Leaves linear straight smooth decurrent at back
 11636 Leaves linear recurved roughish, Flowers cernuous
 11637 Leaves linear straight ciliated, Branches pubescent
 11638 Leaves lanc. ovate recurved toothletted serrated, Peduncles pubescent
 11639 Leaves oblong tapered at base toothletted wavy
 11640 Leaves linear glabrous, Involucres lax
 11641 Leaves linear-lanceolate 3-nerved scabrous, Flowers corymbose, Invol. lax
 11642 Paniced, Leaves lanc. 3-nerved dotted naked
 11643 Leaves lanc. villous, Involucres contracted

- 11644 Leaves oblong entire downy beneath

- 11645 Flowers about 3 stalked, Leaves ovate-oblong subserrate stalked

- 11646 Corymbs heaped, Peduncles very long, Leaves lanc. Stem herbaceous

- 11647 Leaves opp. undivided, Panicle terminal brachiate

- 11648 Corymbs heaped, Leaves alternate: upper ovate-lanceolate; lower toothed hastate sinuate serrate

- 11649 Panicles very large erect diffuse capillary

- 11650 Leaves lanc. narrowed at base serrated alternate

- 11651 The only species

- 11652 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth blunt, Branches downy, Invol. pubescent
 11653 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth subulate much spreading, Branches downy
 11654 Pedunc. 1-fl. Leaves smooth toothed in 4 rows, Teeth subulate straight, Branches and invol. smooth
 11655 Pedunc. 1-fl. Leaves linear warted at edge: upper entire
 11656 Pedunc. 1-fl. Leaves bipinnate, Stems simple
 11657 Pedunc. 1-fl. Leaves bipinnate, Stems much branched villous
 11658 Like *Santolina alpina*, but segments of leaves are shorter and thicker

and Miscellaneous Particulars.

of this genus, in the twelfth volume of the Transactions of the Linnean Society, is a model of botanical erudition and acuteness, such as has been rarely seen in modern days.

1708. *Isocarpha*. From *isos*, equal, and *καρφη*, chaff, in allusion to the equality of the chaff of the receptacle and the leaves of the involucre. Herbs of South America, with opposite undivided leaves, and ovate terminal heads of whitish flowers.

1709. *Petrobium*. From *πετρος*, a stone, with reference, it is presumed, to the texture of the grains. A small tree, native of St. Helena, where it is called *white wood*.

1710. *Neuroleña*. From *νευρον*, a nerve, and *λαϊνος*, stony. An erect shrub of South America, with alternate, undivided, and lobed leaves, and terminal compound corymbs of yellow flowers.

1711. *Humea*. Named in honor of Sir Abraham Hume, Bart. of Wormleybury, in Hertfordshire, a gentleman whose whole life has been devoted to the protection and assistance of the arts and sciences, and especially of botany. A beautiful plant with immense capillary panicles of brilliant crimson flowers.

1712. *Cæsulia*. Meaning unknown. Little creeping weed-like plants, rooting at the joints.

1713. *Ixodia*. From *ἰξωδης*, viscid. A greenhouse shrub, native of the south coast of New Holland; flowering most part of the year.

1714. *Santolina*. Supposed to be a diminutive of *sancta*; a holy little herb; in allusion to some reputed virtues. A genus of slightly shrubby somewhat aromatic plants, with yellow discoid flowers.

History, Use, Propagation, Culture,

1715. *Otanthus*. From *ὄστρος*, an ear, and *ἀνθος*, a flower, in allusion to the appendages which are placed on each side of the base of the florets. An infusion of the leaves and stem is said to be employed successfully in the east in cases of stone and gravel.

1716. *Caleacte*. So called because it is the ornament of the sea coasts where it grows, and derived from *καλος*, beautiful, and *ακρη*, the sea shore.

1717. *Athanasia*. From *α*, privative, and *θανατος*, death; that is to say, a plant which does not perish. But the application of the word, as far as the present genus is concerned, is far from obvious.

1718. *Balsamita*. Derived from *βάλσαμον*, balm, in allusion to its strong balsamic smell. Ugly plants of no merit whatever. B. vulgaris has the English name *Costmary*, from the Greek *Κοσμος*, an aromatic shrub, and Mary; the Virgin Mary's costus: from its being put into ale, it has our old English name of *Alc-cost*. It is more aromatic and has a pleasanter smell than tansy, to which it is nearly allied.

1719. *Pentzia*. Named by Thunberg, after his pupil Charles John Pentz. A bushy branching hoary shrub, with little yellow flowers.

11659 Pedunc. corymbose, Leaves oblong blunt crenated densely woolly

11660 The only species

- 11661 Leaves ovate villous, Heads terminal subsessile
 11662 Leaves obov. lanc. blunt villous, Umbels terminal, Branches villous
 11663 Corymbs simple contracted, Leaves pinnatifid toothed
 11664 Corymbs compound, Leaves recurved: lower linear toothed; upper ovate serrate
 11665 Leaves cuneiform cut-trifid, Flowers in umbels
 11666 Leaves cuneiform: lower pinnatifid cut: upper 3 or 5-toothed, Flowers in umbels
 11667 Leaves linear tomentose, Panicle compound
 11668 Leaves linear filiform smooth, Flowers panicled
 11669 Leaves trifid with linear smooth segments, Flowers somewhat in umbels
 11670 Leaves pinnated: pinnæ linear smooth, Panicle decomposed
 11671 Leaves pinnated: pinnæ linear smooth, Panicle compound

- 11672 Stem herbaceous branched at base, Branches 1-fl. Leaves sessile lanc. serrated
 11673 Leaves obovate serrated sessile clustered, Flowers subcorymbose
 11674 Leaves ellipt. toothed: lower stalked; upper sessile auricled at base, Flowers corymbose
 11675 Radical leaves bipinnate: cauline many pinnated downy; pinnæ linear acute mucronate

11676 Corymbs simple, Leaves deltoid serrated at end

SUPERFLUA.

- 11677 Leaves lanceolate channelled, Raceme terminal fastigiata
 11678 Leaves pinnated: pinnæ linear toothed pubescent, Corymb fastigiata leafy at base
 11679 Leaves pinnated silky with down, Pinnæ lanc. somewhat toothed at end, Corymb terminal
 11680 Leaves bipinnatifid inciso-serrate

11681 Leaves pinnatifid: segm. lanceolate serrated, Corymb contracted, Invol. angular

- 11682 Leaves obovate blunt lobed small, Flowers panicled stalked
 11683 Leaves hoary: lower pinnated with palmate pinnæ; upper palmate sessile, Heads panicled simple
 11684 Cauline leaves pinnated smoothish: floral undivided linear, Panicle virgata, Heads glob. stalked nodding
 11685 Stem upright, Lower leaves bipinnate: upper pinnated capillary, Invol. downy hemispherical
 11686 Caul. lvs. pinnat. very smooth: floral undivided setaceous, Involucres downy, Heads glob. stalk. nodding
 11687 Stem upright, Leaves bipinnate capillary: floral simple, Invol. oblong
 11688 Leaves tripinnatifid silky cinereous, Leaflets linear, Heads globose, Flowers branched simple
 11689 Leaves bipinnatifid silky white, Leaflets lanc. linear, Heads globose, Flowers branched virgate
 11690 Stem quite simple, Leaves all palmate multifid white, Heads terminal clustered
 11691 Stem quite simple, Leaves all palmate multifid white, Lower heads stalked: upper sessile
 11692 Stem branched spreading, Leaves all bipinnate capillary, Invol. smooth hemispherical
 11693 Stem quite simple, Leaves all palmate multifid silky acute
 11694 Leaves hoary: lower cuneiform obtuse 3-lobed; upper linear blunt, Flowers globose stalked cernuous
 11695 Stem quite simple, Leaves hoary: radical palmate multifid; caul. pinnatifid; upper linear entire blunt
 11696 Stem quite simple, Leaves pectinate pinnatifid glabrous, Pinnæ linear filiform, Pedunc. 1-fl. axillary
 11697 Stem quite simple, Lvs. bipinnatifid subpub. beneath: segm. lin. lanc. acum. entire, Raceme naked term.
 11698 Cauline leaves pinnated linear smooth, Branches undivided, Spikes 1-sided reflexed
 11699 Cauline leaves innated setaceous smooth: radic. pinnated multifid silky, Stem erect, Branches divided

and Miscellaneous Particulars.

1730. *Tanacetum*. An alteration of *Athanasia*, which see. *Tanaisie*, Fr., *Tansy*, Eng., *Reinfahren*, Ger. The common Tansy has a strong aromatic smell, and an extremely bitter taste. It is stimulant and carminative; and its seeds are reckoned anthelmintic and sudorific. It is said to drive bugs away from a bed in which it is laid. A distilled water and a kind of stomachic bitter are prepared from it. The young leaves are shredded down and employed to give color and flavor to puddings; they are also used in omelets and cakes, and those of the curled variety for garnishing.

1721. *Artemisia*. Artemis was one of the names of Diana, the goddess of chastity. The plant is said to have been named after this goddess, on account of the purposes to which it was applied in bringing on precocious puberty. Pliny, however, informs us, that in his time, there was an opinion that the plant was named after Artemisia, the Queen of Mausolus, King of Caria.

A. *Abrotanum*, *Santonica*, *maritima*, and *Absinthium*, are included in the *Materia Medica*, but, according to Dr. Thomson, the latter species is the only one deserving to be retained. It is tonic, antispasmodic, and anthelmintic; and when externally applied, is discutient and antiseptic. It has been used with advantage in inter-

History, Use, Propagation, Culture,

mittents, gout, scurvy, and dropsy; and although modern practitioners will scarcely rely on its efficacy in these complaints, yet it is undoubtedly of some value as a stomachic. (*London Dispens.* p. 182.) The seed of wormwood is used by the rectifiers of British spirits, and the species is a good deal cultivated on dry soil near Mitcham, in Surrey, for that purpose. *A. vulgaris* is used in some parts of Sweden instead of hops, in order to increase the inebriating quality of malt liquor. The plant is readily eaten by cattle and sheep, and is found in our best natural pastures on dry soils. It is said to be stomachic and slightly stimulating.

The species called *Abrotanum*, *Garde-robe*, Fr., derives its name from *ab*, privative, and *cegoros*, mortal; on account of the great virtues attributed to it as a preservative of life; *Absinthium*, from *ab*, privative, and *ψύθος*, pleasure, i. e. unpleasant.

Dracunculus, *Tarragon*, Eng., *Estragon*, Fr., *Dragon*, Ger., and *Dragoncelia*, Ital., is said to have been so called on account of its tortuous roots, which may be likened to the sinuous tail of a dragon; but it is much

- 11700 Caul. lvs. pinnated setae. smooth : radic. pinnated with 3-fid hoary segm. Stem procumb. branched virgate
 11701 Leaves bipinnatifid downy beneath : segm. lanceolate blunt, Panic, 1-sided, Heads nodding
 11702 Cauline leaves pinnated or trifid filiform pubescent, Stem ascending somewhat divided
 11703 Cauline leaves pinnated smooth : pinnæ filiform remote very long, Heads globose erect sessile
 11704 Cauline lvs. pinnated smooth : lower and radic. 3-partite multifid, Stem panic. erect, Peduncles nodding
 11705 Cauline lvs. pinnated smooth somewhat fleshy : pinnæ simple or bifid lin. blunt, Heads obl. stalked erect
 11706 Cauline lvs. hoary pinnated linear filiform : floral undivided filiform, Heads roundish angular nodding
 11707 Leaves glaucous downy : lower pinnated, Pinnæ linear-lanceolate, Heads globose stalked nodding
 11708 Leaves multipartite hoary, Racemes erect 1-sided, Heads erect about 5-fl. Only one female floret or none
 11709 Leaves pilose triply-pinnatifid, Stem simple with a leafless panicle, Heads globose nodding
 11710 Leaves simply pinnate with some of the segments bifid subpalnate, Heads erect
 11711 Leaves hoary-silky : lower pinnated, Stem nearly erect much branched, Heads sessile ovate
 11712 Leaves downy pinnated : the uppermost undivided, Racemes drooping, Recept. naked, Flow. obl. sessile
 11713 Leaves downy pinnate : the uppermost undivided, Racemes drooping, Recept. naked, Flowers obl. sessile
 11714 Leaves hoary : radical bipinnate, Pinnæ close linear blunt : of the branches pinnated sessile
 11715 Leaves pinnated white with down, Fascicles of flowers bracteate, Heads downy
 11716 Leaves hoary : lower pinnated ; pinnæ linear 3-parted, Heads stalked roundish nodding
 11717 Leaves snow-white : cauline bipinnate linear filiform ; floral simple, Heads obl. sessile erect
 11718 Leaves hoary : radical pinnated ; pinnæ 3-parted linear-filiform, Heads obl. stalked nodding
 11719 Leaves subpubescent : cauline pinnated ; pinnæ linear acute, Heads globose stalked nodding
 11720 Leaves silky : cauline pinnate ; pinnæ 3-parted linear runcinate, Heads globose nodding
 11721 Leaves silky white, Pinnæ 3-parted linear acute, Heads roundish stalked cernuous
 11722 Cauline leaves pinnated or trifid linear, Stem erect paniced, Branchlets nodding 1-sided
 11723 Cauline lvs. hoary pinnated linear-filiform, Stem ascending branched paniced, Invol. roundish angular
 11724 Leaves downy beneath : cauline bipinnate, Leaflets linear, Heads roundish stalked nodding
 11725 Leaves smooth : lower tripinnate ; upper bipinnate, Leaflets linear acute, Heads globose stalked nodding
 11726 Leaves smooth triply pinnatifid, Stem straight, Heads roundish subsessile erect
 11727 Cauline leaves pinnated hoary white : pinnæ trifid linear, Stem erect, Invol. hoary, Heads globose
 11728 Leaves hoary : lower bipinnate, Pinnæ linear-filiform, Heads oblong sessile
 11729 Leaves smooth : radic. triply pinnate ; upper undivided linear, Heads roundish subsessile erect
 11730 Lvs. bi-tripinnatif. clothed with short silky down, Segments lanc. Heads hemispheric. droop. Recept. hairy
 11731 Lvs. somewhat hoary : caul. bipinnatifid ; floral trifid or lanc. Heads globose stalked nodding, Inv. scarious
 11732 Lvs. downy : lower decomposed ; upper simple, Panicle corymbose, Heads fasciated ovate hoary
 11733 Leaves pinnatifid : their segm. cut downy beneath, Heads somewhat racemed ovate, Recept. naked
 11734 Leaves downy beneath : caul. pinnatifid ; floral undivided linear, Heads sessile obl. erect, Invol. smooth
 11735 Leaves lanc. acuminate downy beneath somewhat toothed, Heads ovate subsessile erect
 11736 Leaves smooth lanc. acute : cauline trifid at end, Heads roundish stalked nodding
 11737 Leaves hoary lanceolate entire : radical cut ; floral oblong stalked nodding
 11738 Lvs. smooth lanc. narrowed at each end, Heads roundish stalked erect, Scales of invol. membr. at edge
 11739 Leaves smooth lanceolate narrowed at each end, Heads roundish stalked erect

- 11740 Leaves downy beneath scabrous above : radical stalked oblong ; cauline amplexicaul. wavy
 11741 Leaves sessile linear smooth above revolute at edge, Heads capitate, Pedunc. long
 11742 Leaves amplexicaul. ovate oblong 3-nerved woolly above, Corymb. stalked, Invol. cylindrical
 11743 Leaves amplexicaul. panduriform spatulate blunt downy, Corymb. and branches divaricating
 11744 Branches downy, Lvs. linear revolute at edge smooth above downy beneath, Leaves of invol. lanc. acute
 11745 Branches pubesc. Lvs. lanc. lin. acumin. smooth above finely downy beneath, Heads corymb. cylindrical
 11746 Tomentose, Leaves linear acute curved, Heads in capitate stalked corymb
 11747 Leaves lanc. sessile 3-nerved naked above woolly beneath, Corymb contracted-capitate
 11748 Leaves amplexicaul. spatulate downy acute, Corymb. term. Branches spreading
 11749 Leaves sessile lanc. Involucres white : lower scales brown
 11750 Leaves lin.-lanc. mucronate revolute at edge downy beneath, Heads sessile capitate terminal
 11751 Leaves lanc. mucronate revolute at edge downy beneath, Heads corymbose
 11752 Leaves obl. blunt downy, Corymb. fastigiate, Heads cylindrical
 11753 Leaves lin. spreading recurved scabrous above, Corymb. dense, Invol. cinereous at base
 11754 Leaves sessile linear, Outer involucre rough : inner flesh-colored
 11755 Leaves clustered roundish, Corymb. branched, Involucres downy outside
 11756 Leaves linear, Corymb compound, Branches virgate

and Miscellaneous Particulars.

more probable that the word is a corruption of *Tarchon*, the Arabic name of the plant. See *Tarchonanthus*. The leaves and points of the shoots are used as an ingredient in pickles. A simple infusion of the plant in vinegar makes a pleasant fish sauce ; it is eaten along with beef steaks, as horse-radish is with roast beef ; and is employed, both in Europe and Persia, to correct the coldness of salad herbs, and season soups and other compositions. The plant is of the easiest culture, but, like other species of the genus, dislikes a wet soil.

From the acrid leaves of *A. chinensis* the drug called Moxa is obtained ; a substance much in use among the Chinese as an actual cautery. For this purpose, the Moxa is laid upon the part affected and set on fire. The Cochinchinese, and also the Japanese, according to Kæmpfer, use *Artemisia vulgaris* for the same purpose, and it is said with great success, in removing tumours and rheumatic pains, or slight convulsions.

1722. *Gnaphaltum*. A word under which Dioscorides describes a plant with soft white leaves, which served the purpose of cotton. It agrees pretty well with the modern genus, which consists of very pretty, sometimes

History, Use, Propagation, Culture,

beautiful woolly leaved shrubs or herbs, all of the description called Everlasting, on account of the permanence of the colors and form of their dry flowers.

1723. *Leontopodium*. From *λεων*, a lion, and *πους*, a foot. The soft tufted silky heads have been compared to the foot of such an animal as a lion.

1724. *Evox*. A name, the meaning of which has not been explained. A little white annual weed.

1725. *Antennaria*. In allusion to the awns of the pappus, which resemble the *antenna* of some insect. A genus founded upon the Gnaphalium margaritaceum of Linnaeus. It consists of herbaceous plants, natives of Europe and North America, having the male and female flowers in distinct involucre, and on different individuals.

1726. *Metalsia*. Apparently so called from *μετα λασσα*, to change or alter: but the application of the name is not evident.

- 11757 Leaves sublanc. downy sessile, Corymbs altern. round, Heads globose
- 11758 Leaves broad-lanc. somewhat stalked coriaceous downy, Corymb. compound, Stem proliferous
- 11759 Much branched, Leaves lanc. acutish sessile, Inner scales of invol. yellow
- 11760 Leaves lanc. acute 3-nerved at base wavy pilose; beneath tomentose, Corymb contracted bracteate
- 11761 Leaves lin. lanc. hoary; radical blunt; cauline acute, Corymb compound, Pedunc. long
- 11762 Leaves lanc. 3-nerved smooth above, Raceme terminal, Stem branched below
- 11763 Leaves lanc. Corymb decompound, Stem branched below
- 11764 Leaves hoary downy blunt; radical spatulate lanc.; cauline lin.-lanc. Corymb compound
- 11765 Leaves linear long narrow downy replicate at edge, Corymb compound umbellate
- 11766 Leaves half amplexicaul. linear-lanc. subrepand downy on each side: lower blunt, Corymb clustered
- 11767 White with down, Lvs. lin.-lanc. undivided below, Heads clustered conical
- 11768 Leaves subspatulate downy naked at end membranous or subulate, Flowers paniced
- 11769 Leaves decurrent blunt mucronate downy on each side flat
- 11770 Leaves decurrent lanc. downy flat with a naked point
- 11771 Leaves white silky-downy linear-lanc. acute, Corymb compound
- 11772 Leaves amplexicaul. entire acute downy beneath, Stem branched
- 11773 Leaves subamplexicaul. lanc. Corymbs compound, Scales of invol. plaited
- 11774 Leaves sessile lingulate very downy, Inner scales of invol. subulate recurved
- 11775 Leaves lin. spatulate downy beneath, Stem erect simple, Heads sessile terminal and axillary
- 11776 Leaves lin. lanc. Invol. with white lanceolate rays
- 11777 Stem herbaceous diffuse, Lower scales of invol. subulate naked, Leaves subamplexicaul.

11778 Head terminal enveloped in woolly bractea

11779 Stem branched at base, Bractes obovate

- 11780 Leaves lin. mucronulate reflexed, Corymbs few-flowered simple or proliferous, Scales of invol. blunt
- 11781 Stem erect simple, Lvs. ellipt. mucronate amplexicaul. 3-nerved [elongated obtuse colored
- 11782 Shoots procumb. Stems simp. Corymbs crowded, Rad. lvs. spatulate, Fl. dioecious, Inner scales of invol.
- 11783 Stem simple, Rad. leaves lanc.: floral terminal aggregate sessile, Inner scales of invol. long
- 11784 Runners procumb. Rad. lvs. ov. nerved, Corymb contracted, Fl. dioecious, Inner scales of invol. long blunt
- 11785 Leaves lin. lanc. acuminate alternate, Stem branched upwards, Corymb fastigiate
- 11786 Leaves decurrent lanc. acute wavy downy beneath, Stem branched
- 11787 Leaves lin. lanc. acutish: smooth above; pubescent beneath, Corymbs terminal contracted

11788 Leaves small fascicled lin. subulate downy above, Flowers lateral

- 11789 Leaves sessile ovate close erect downy, Corymb sessile
- 11790 Leaves amplexicaul. ovate-oblong 3-nerved acute woolly beneath on each side

11791 The only species

- 11792 Scales of invol. blunt scarious: the inner ones of the ray lanc. blunt spreading
- 11793 Scales of invol. acute membranous at edge: the inner ones of the ray lanc. acute conniving
- 11794 Scales of invol. roundish scarious: the inner ones of the ray ovate acuminate erect

- 11795 Leaves sess. lanc. linear woolly acute: floral with a membrane at end, Branches 1-flowered
- 11796 Leaves sess. lanc. downy keeled spirally imbricated, Branches 1-flowered
- 11797 Leaves obl.-lanc. silky imbricated, Branches 1-flowered, Peduncles squarrose
- 11798 Leaves linear subulate erect imbricated, Peduncle scaly 1-flowered
- 11799 Leaves sessile lanc. obovate acute 3-nerved woolly, Branches 1-flowered
- 11800 Leaves lanc. white beneath silky recurved-spreading, Branches 1-fl. Peduncles nearly naked
- 11801 Leaves amplexicaul. ovate lanc. downy beneath tomentose at edge, Branches 3-flowered

and Miscellaneous Particulars.

1727. *Astelma*. From α , privative, and $\sigma\epsilon\lambda\mu\alpha$, a crown, in allusion to the construction of the fruit. Beautiful Cape shrubs with everlasting flowers.

1728. *Athrixia*. So called by Mr. Ker, we presume from α , without, and $\theta\epsilon\iota\zeta$, hair, in allusion to the absence of hairs upon the receptacle and the stignas of the ray. A pretty greenhouse shrub, with narrow lanceolate leaves, and bright crimson solitary heads of flowers.

1729. *Xeranthemum*. From $\xi\eta\epsilon\sigma$, dry, and $\alpha\nu\theta\omicron\varsigma$, a flower, on account of the dry nature of the leaves of the calyx, which retain their color and form for years. The species are popular annual flowers, of easy culture in light rich soil. They are valued for their properties of retaining their texture and color, when gathered and dried, in the manner of Gnaphalium, Elichrysum, and other genera of what are vulgarly called everlastings.

1730. *Elichrysum*. From $\eta\lambda\iota\omicron\varsigma$, the sun, and $\chi\epsilon\upsilon\sigma\omicron\varsigma$, gold, in allusion to the brilliant yellow color of the flowers. The species are much admired for the brilliancy of their flowers even in a dried state. *E. bracteatum* is the handsomest annual species, and should be raised on a hotbed, and afterwards transplanted into a warm situation.

History, Use, Propagation, Culture,

The woody species require a sandy peat soil, and to be struck in sand on a hotbed, but not covered with a bell-glass, as they are very apt to damp.

1731. *Carpesium*. Named from *καρπεσιον*, a bit of straw; the long dry leaves of the involucre resemble straws.

1732. *Baccharis*. A name given by the Greeks to an aromatic plant dedicated to Bacchus. The species now

- 11802 Leaves ob.ong downy imbricated, Branches 1-headed, Heads nodding
 11803 Diffuse proliferous, Leaves roundish ovate smooth convex closely imbricated, Heads sessile
 11804 Leaves obl. blunt imbricated, Branches 1-fl. Scales of invol. ovate
 11805 Leaves obl. silky recurved
 11806 Decumbent, Leaves lanc. silky somewhat recurved, Branchlets 1-flowered, Peduncles squarrose
 11807 Leaves acerose lin. keeled smooth appressed, Branches 1-fl. flowered sessile
 11808 Lvs. acerose lin. roundish downy above : lower spreading ; upper appressed, Branches 1-fl. Pedunc. scaly

- 11809 Leaves linear lanc. channelled amplexicaul : adult smooth, Branches woolly
 11810 Branches numerous very fine filiform, Leaves very small 3-cornered imbricated appressed
 11811 Leaves obl. lanc. narrowed at base silky, Peduncles naked 1-flowered terminal
 11812 Leaves wavy woolly reflexed at end, Heads small terminal few
 11813 Leaves amplexicaul. oblong revolute at edge woolly, Flowers terminal solitary shining

- 11814 Leaves linear-lanc. silky, Corymb simple terminal
 11815 Leaves lanc. acute at each end roughish, Peduncles 1-flowered long, Invol. bracteate

- 11816 Heads terminal solitary cernuous
 11817 Heads axill. subsolitary

- 11818 Leaves narr. linear entire, Panicle compound many-flowered, Invol. small
 11819 Leaves lanc. longitudinally toothed serrate
 11820 Leaves lanc. serrated with one or two teeth forwards
 11821 Leaves obovate emarginate crenate forwards
 11822 Leaves lanc. serrate at end subdecurrent downy beneath
 11823 Leaves obl. sessile toothed : teeth of the base deeper and stipule-like

- 11824 Leaves lanc. 3-nerved tooth-serrated, Corymbs terminal leafy

- 11825 Lvs. pubesc. ov.-lanc. serr. the upper ones ent. Stem herbaceous corymb. Scales of the invol. recurved leafy
 11826 Leaves sessile broad-lanc. acute serrated, Corymbs terminal fastigiate
 11827 Leaves ovate acute at each end toothed stalked pilose, Stem erect branched, Pedunc. many-headed
 11828 Leaves stalked ovate lanc. very acute toothletted, Corymbs term. and axillary shorter than leaf
 11829 Leaves ellipt. serrated villous beneath, Invol. subglobose, Leaves lanc. subulate, Branches spreading
 11830 Leaves oblong lanc. doubly toothed acute downy beneath rugose veined, Petioles toothed
 11831 Leaves spatulate oblong amplexicaul. serrated rugose
 11832 Leaves sess. lanc. obl. : lower obovate-obl. subserrated at end, Branches corymbose-fastigiate
 11833 Leaves ovate stalked entire obtuse downy, Pedunc. 1-fl. solitary term. axillary thickened
 11834 Leaves lanc. ovate reflexed serrated downy beneath, Flowers terminal heaped
 11835 Leaves ov. stalked crenate blunt downy rugose veiny, Pedunc. 1-fl. solitary terminal and axillary
 11836 Leaves sublyrate : cauline entire, Stem downy paniced, Invol. campanulate
 11837 Leaves toothed radical smoothish obovate : cauline obl. downy, Scales of invol. subulate
 11838 Leaves oval entire hirsute beneath
 11839 Leaves obl. spatulate tooth pilose, Heads paniced globose, Leaves of invol. subulate soft
 11840 Lvs. lanc. serrated at end scabrous at edge : lower obov. Heads heaped, Lvs. of invol. membranous at edge
 11841 Stem hairy, Leaves sessile oval blunt denticulate hairy, Panicle terminal contracted
 11842 Leaves lin. lanc. scabrous nearly entire revolute at edge, Stem paniced, Scales of invol. lax
 11843 Leaves lin. attenuate at base mucronate, Corymbs stalked contracted terminal
 11844 Leaves lin. nearly entire, Peduncles long 3-headed
 11845 Leaves lin. somewhat toothed, Peduncles very long 1-headed
 11846 Leaves spatulate somewhat toothed and stem downy, Pedunc. long 1-fl.
 11847 Leaves linear filiform and stems silky with down, Flowers paniced
 11848 Leaves cuneiform lin. blunt crenate toothletted smooth, Stem shrubby, Anthers with two setae
 11849 Leaves ovate stalked hoary beneath serrated, Corymb terminal compound
 11850 Leaves broad lanc. blunt serrulate downy scabrous, Heads clustered surrounded by bracts
 11851 Stem branched with spreading hairs, Leaves subamplexicaul. blunt coarsely serrated hairy
 11852 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bracts reflexed
 11853 Leaves ovate subcordate pilose viscid toothed auricled at base, Recept. foveose
 11854 Leaves decurrent ovate mucronate downy : lower serrated, Flowers corymbose
 11855 Leaves decurrent lin. lanc. serrulate downy beneath, Spike long terminal interrupted
 11856 Stem white with down, Leaves lanc. serrulate downy beneath, Heads terminal

11824

11826

11831

11848

and Miscellaneous Particulars.

called B. Dioscorides is supposed to have been the Baccharis of the Greeks. An extensive genus of shrubby plants, few of which are deserving of cultivation.

1733. *Molina*. Named after John Ignatius Molina, a Spaniard, who published, in 1782, a Natural History of Chili.

1734. *Conyza*. This plant was believed to have the property, when suspended in a room, of driving away

History, Use, Propagation, Culture,

gnats and fleas. From this imaginary property, its Greek name (from *zanzar* φ, a gnat), its Latin name, *pulicaria*, its English name, *flea-bane*, and its French name, *Herbe aux puces*, are all derived. Conyza marilandica gives out a strong smell of camphor.

1735. *Madia*. *Madi* is the name of the plant in Chili. Clammy weeds, only seen in botanical gardens.
 1736. *Erigeron*. A name synonymous with *senecio*, which is a translation of it. Named from *εg*, the spring, and *γενων*, an old man; because it becomes old in the beginning of the season. The name *Senecio* having been applied to another genus, the Greek term is preserved for this, which is related to it. E. viscosum is used to drive away fleas and gnats, probably from its strong scent, or, as some suppose, from the clammy juice of the leaves and stalks; hence the old name of Flea-bane, or Flea-wort.

1737. *Tussilago*. From *tussis*, a cough, for curing which the flowers are frequently employed at this day. Farfara is the name under which the Greeks designated the White Poplar, the leaves of which are like the modern T. Farfara.

T. Farfara is a certain indication of a clayey soil, and, according to Dr. Withering, is the first plant which vegetates in marle or lime stone rubble. The clayey part of the pestilential Maremmes of Tuscany, where scarcely any other plant will grow, is covered with common colts foot. The cotton of the leaves wrapped in a rag,

- 11857 Leaves ovate-lanc. entire hoary downy beneath, Corymb compound terminal
 11858 Leaves decurrent ellipt. crenate beneath, Heads capitate

- 11859 Leaves lanc. sessile viscid, Outer involucre 10-leaved
 11860 Leaves amplexicaul. lanc. viscid

- 11861 Leaves sublinear entire, Branches lateral many-flowered
 11862 Nearly stemless, Rad. leaves on long stalks triply 3-parted, cauline linear undivided
 11863 Stem panicle, Flowers subsolitary terminal, Leaves linear entire
 11864 Stem and flowers panicle hairy, Leaves lanc. ciliated
 11865 Lower leaves lanc. laciniate : cauline line-r, Heads racemose
 11866 Leaves scabrous : lower lanc. toothed in middle ; upper linear, Heads corymbose
 11867 Stem many-fl. Lvs. lanc. subserrate : cauline half amplexicaul. Florets of ray capillary the length of disk
 11868 Radical leaves oval-lanc. acute somewhat toothed, Stem nearly leafless simple long
 11869 Stem many-fl. pilose, Leaves obl. somew. toothed amplexicaul. Florets of ray capillary longer than disk
 11870 Rad. leaves obovate serrated : cauline lanc. entire, Stem about 2-fl. Ray longer than disk
 11871 Rad. leaves roundish ovate deeply toothed stalked : cauline lanc. toothed subserrated in middle
 11872 Stem few-fl. subvillosus, Leaves cuneiform lanc. Serratures 2 on each side
 11873 Branches spik'd, Scales of invol. long, Peduncles scaly, Leaves very long smooth sessile
 11874 Leaves entire bluntly mucronate : radical oblong stalked ; cauline cordate ovate sessile
 11875 Stem nearly naked, Rad. leaves spatulate smooth dotted : cauline linear, Heads corymbose
 11876 Leaves lanc. 3-nerved scabrous somewhat toothed sessile, Stem panicle, Ray shorter than disk
 11877 Pedunc. alternate (scarcely racemose) single-fl. Pappus as long as the florets of the ray, Lvs. lanc. obtuse
 11878 Stems with usually only one fl. Pappus much shorter than the florets of the ray, Lvs. lanceolate
 11879 Stem 1-flowered, Invol. pilose
 11880 Leaves ciliated glaucous clammy : radical with winged stalks and few teeth ; cauline sessile entire
 11881 Leaves pinnatifid ; segments of the cauline leaves linear entire ; of the radical lanc. somewhat toothed

- 11882 Scape 1-fl. naked, Head radiated nodding, Lvs. stalked obovate toothed sinuated at base downy beneath
 11883 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed smooth
 11884 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed downy beneath
 11885 Scape about 1-fl. nearly naked, Head discoid, Lvs. smooth reniform slightly 7-lobed
 11886 Scape single-fl. imbricated with scales, Lvs. cordate angular toothed downy beneath
 11887 Thyrus fastigiate, Heads radiant, Lvs. roundish cordate unequally toothed downy beneath
 11888 Thyrus fastigiate, Heads radiant, Lvs. roundish cordate equally toothed downy beneath
 11889 Thyrus fastigiate, Heads discoid, Lvs. orbicular cordate doubly and finely toothed
 11890 Thyrus oblong, Heads discoid, Lvs. obl. cordate unequally toothed white beneath : lobes spreading
 11891 Thyrus ovate-oblong, Lvs. cordate unequally toothed with the lobes approximate downy beneath
 11892 Thyrus oblong, Heads discoid, Lvs. obl. cordate unequally toothed snow-white beneath
 11893 Thyrus fastigiate, Heads obsoletely radiant, Lvs. roundish cordate half 7-lobed downy beneath

- 11894 Heads fuscous, Cor. naked, Invol. ventricose somewhat imbricated, Lvs. filiform lin. entire smooth
 11895 Heads fuscous, Cor. naked, Lvs. obl. amplexicaul. unequally and deeply toothed, Stem virgate
 11896 Heads fuscous, Cor. naked, Lvs. lyrate hairy : upper lanc. toothed
 11897 Heads fuscous, Cor. naked, Lvs. ellipt. tooth-serrated hairy, Peduncles long many-flowered
 11898 Heads fuscous, Cor. naked, Lvs. lyrate pilose on each side viscid
 11899 Heads fuscous, Cor. naked, Lvs. lanc. toothed scabrous, Flowering branches spreading
 11900 Heads fuscous, Cor. naked, Lvs. obl. lanc. finely serrated smooth, Heads corymbose
 11901 Heads fuscous, Cor. naked, Lvs. lyrate pinnatifid toothed, Scape nearly naked
 11902 Heads fuscous, Cor. naked, Lvs. obl. pinnatifid toothed acuminate stalked cuneate at base
 11903 Heads fuscous, Cor. naked, Lvs. pinnatifid : segm. lanc. acute cut, Stipules leafy subpalinate

and Miscellaneous Particulars.

dipped in a solution of saltpetre, and dried in the sun, makes an excellent tinder. The leaves are the basis of the British herb tobacco ; they have been regarded as expectorant from the earliest ages, having been smoked through a reed in the days of Dioscorides, with the view of relieving the chest from accumulated mucus in catarrh, asthma, and phthisis. At present, though it occupies a place in the *Materia Medica*, very little reliance is placed on its powers. (*London Disp.* p. 542.)

T. Petasites, from the Greek *πετασος*, a broad covering, in allusion to the leaves, which are larger than those of any British plant, and afford shelter from rain to poultry and other small animals. It is called *Butter bur*, in allusion to a former application, and *Pestilent-wort*, from its supposed efficacy in the plague. *T. hybrida* is by some considered, a variety of this species, as *T. alba* is of *T. paradoxa*. *T. fragrans* is valued in gardens as an early and fragrant flower ; like all the species, it is apt to run very much, and is therefore best kept in pots.

It is remarkable that no plant belonging to the tribe of *Tussilagineæ*, has been discovered with hermaphrodite flowers. They are distinguished from other tribes by their stigma, which occupies both surfaces of the lobes of the style. They are nearly all natives of Europe.

1738. *Senecio*. For the explanation of this word, see *Erigeron*. Most of these species are annual weeds, or

History, Use, Propagation, Culture,

rude gigantic yellow flowered autumnal perennials; *S. venustus* and *cincrascens*, however, are elegant plants with purple flowers. Of *S. elegans* there is a double flowered variety, common in green houses, and readily propagated by cuttings. *Senecio hieracifolius* is the pest of newly cleared ground in North America, as *S. vulgaris* is in Europe. It is known by the name of the Fire-weed. *Senecio vulgaris* is esteemed emollient and resolutive. It is employed in spitting of blood, in the form of a poultice, and against the gout and hæmorrhoids. It is given to horses suspected to be troubled with worms.

- 11904 Herb downy upwards, Lvs. sinuate toothed and pinnatifid, Heads clustered, Invol. cylindrical
 11905 Herb hirsute, Lvs. broad-lanc. sinuate-toothed and toothletted: teeth callous at end, Heads panicled
 11906 Leaves semiamplexicaul. pinnatifid toothed, Heads in clustered corymbs destitute of a ray
 11907 Heads fuscous, Cor. naked, Leaves subbipinnate stalked smooth, Invol. not withered
 11908 Heads radiant, Leaves half-amplex. pinnatifid, Segments linear acute toothed distant, Peduncles long
 11909 Heads fuscous, Cor. naked, Leaves obovate stalked cut-toothed, Pedunc. filiform 3-headed
 11910 Heads radiate, Ray revolute, Leaves stalked obl. sinuate, Pedunc. 3-headed, Invol. conical
 11911 Heads radiate, Ray revolute, Leaves amplexic. lin. lanc. pinnatifid, Scales of invol. sphacelate in part
 11912 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate-linear fleshy bluntly sinuated
 11913 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate toothed, Scales of invol. all unwithered
 11914 Heads radiate, Ray revolute, Leaves amplexicaul. obovate 3-lobed at end serrated
 11915 Heads radiate, Ray revolute, Leaves pinnatifid obovate downy revolute at edge, Panicle spreading
 11916 Leaves amplexicaul. cut toothed scabrous above downy beneath, Heads racemose
 11917 Ray revolute, Leaves pinnatifid and viscid, Scales of the involucre lax hairy
 11918 Ray revolute, Lvs. sess. pinnatifid lobed and toothed, Scales of invol. very short glab. Stem erect straight
 11919 Ray revolute, Leaves lyrate sinuate blunt stalked, Stem hirsute [Corymbosae
 11920 Ray revolute, Leaves amplexicaul. lanceolate blunt toothed entire
 11921 Heads radiate, Petiole amplexicaul. Peduncles 3 times as long as pinnate sinuated leaves
 11922 Heads radiate, Leaves amplexicaul. pinnatifid hirsute crisp-toothed, Stem woolly
 11923 Cor. radiant, Leaves pinnated multifid: segm. filiform smooth, Heads corymbosae
 11924 Cor. radiant, Lvs. amplexic. pinnatifid glabrous above: segm. angular toothed, Stem and invol. glabrous
 11925 Cor. radiant, Stem invol. and leaves glabrous, Leaves pinnatifid: segm. linear acute toothed
 11926 Cor. radiant, Leaves pilose viscid pinnatifid equal spreading, Rachis narrowed below

 11927 Cor. radiant, Leaves half-amplexicaul. pinnatifid: segm. linear subdentate distant
 11928 Cor. radiant, Stem simple nearly naked, Radical leaves stalked oblong toothed ciliated
 11929 Cor. radiant, Leaves pinnatifid toothed somewhat hairy, Stem erect
 11930 Cor. radiant, Leaves tomentose oblong toothed, Stem leafy 1-flowered
 11931 Cor. rad. Lvs. toment. on each side snow-white pinnatif. : segm. lin. blunt somew. tooth. Corymb contracted
 11932 Cor. radiant, Leaves pinnate multifid linear naked acute, Peduncles about 2-flowered
 11933 Cor. radiant, Leaves pinnate: pinnae lin.-subulate somewhat cut downy beneath, Stem somewhat hairy
 11934 Ray spreading, Leaves lyrate bipinnatifid divaric. toothed glabrous, Stem erect, Pericarp hairy
 11935 Ray spreading, Florets elliptical. Leaves lyrate serrated: lower obovate entire, Pericarp hairy
 11936 Cor. radiant, Rad. lvs. ovate-cordate serrated stalked: cauline pinnatifid toothed, Peduncles thickened
 11937 Cor. radiant, Lvs. lanc. lin. nearly serrated smoothish, Corymb contracted terminal stalked
 11938 Cor. radiant, Lvs. lanc. lin. toothed rigid scabrous, Corymbs terminal and axillary stalked
 11939 Cor. radiant, Lvs. lanc. lin. subtomtose glauc. finely toothletted or entire, Corymb contracted terminal
 11940 Cor. radiant, Leaves linear entire, Corymb squamosae, Stem herbaceous
 11941 Cor. radiant, Lvs. half-amplexicaul. lanc. finely serrate subvillous beneath, Corymb terminal spreading
 11942 Cor. radiant, Lvs. ovate lanc. serrated ciliated at edge sessile unequal at base
 11943 Ray spreading, Lvs. lanc. sharply serrated nearly glabrous, Corymbs of rather few flowers
 11944 Cor. radiant, Lvs. ovate-lanc. finely serrated smooth on each side subsessile
 11945 Cor. radiant, Outer scales of invol. subulate spreading, Lvs. subdecurrent obl. lanc. villous
 11946 Cor. radiant, Lvs. sess. obovate toothed at end glaucous: younger silky, Corymb compound terminal
 11947 Cor. radiant, Lvs. toothed: lower ovate decurrent in the stalk: upper cordate obl. amplexicaul.
 11948 Cor. radiant, Scales of invol. appressed, Lvs. subdecurrent villous beneath lanc. serrated
 11949 Cor. radiant, Outer scales of invol. spreading, Lvs. subdecurrent obl. lanc. glauc. serrate
 11950 Cor. radiant, Stem undivided about 1-fl. Lvs. undivided serrated: radical ovate villous beneath
 11951 Cor. radiant, Lvs. lanc. cordate at base amplexicaul. smooth finely serrated
 11952 Cor. radiant, Lvs. lin. scattered
 11953 Cor. radiant, Lvs. obovate fleshy somewhat toothed
 11954 Cor. radiant, Lvs. obl. sessile toothed downy beneath: upper amplexicaul. toothed only at base
 11955 Cor. radiant, Lvs. amplexicaul. spatulate repand eroded scabrous

§ 1. *Shrubby.*

- 11956 Leaves ovate subimbricated recurved serrate-ciliated, Heads terminal
 11957 Leaves ovate serrate spreading downy beneath, Heads terminal about 3
 11958 Leaves obl. lanc. sessile entire 3-nerved silky with down, Flowers terminal
 11959 Leaves stalked roundish ovate hairy with 1 or 2 teeth on each side, Peduncles 1-headed long terminal
 11960 Stem fluted, Leaves alternate stalked lanc. blistered repand-toothed downy beneath, Flowers panicled
 11961 Leaves ovate lanc. toothed silky beneath, Panicles compound axillary, Rays 3

and *Miscellaneous Particulars.*

The tribe of Senecioneæ is nearly related to Anthemideæ, and a portion of Inuleæ, from which the differences in the style are insufficient to distinguish them. They appear, however, to be sufficiently well characterized by their other floral organs. They are found in every part of the world, especially in the south of Africa. Humboldt has observed, that they are very numerous in the upper region of the Andes, just below the limits of eternal snow, where the sun has little influence, where hurricanes are incessant, and not a tree is able to rear its head.

1739. *Aster.* The flowers of all the species of *Aster* resemble little stars, on account of the numerous rays

History, Use, Propagation, Culture,

of their circumference. A very numerous genus of plants, commonly called in England, Christmas Daisies, in allusion to the late period of the year at which they blossom. They are not very ornamental, and yet their flowers are acceptable at a season when few others are to be seen in open air. The species are extremely

- 11962 Leaves linear acute not dotted somewhat hoary, Pedunc. term. solitary 1-ft. long
- 11963 Leaves linear filiform obtuse hairy, Invol. imbricated
- 11964 Leaves linear fleshy smooth dotted blunt, Pedunc. 1-headed, Invol. imbricated shorter than disk
- 11965 Leaves linear blunt glabrous dotted, Pedunc. 1-headed long, Invol. imbricated as long as disk
- 11966 Leaves linear filiform fascicled smooth dotted, Ligules entire
- 11967 Leaves linear scattered revolute at edge : prickly above ; downy beneath, Heads in racemose panicles
- 11968 Stem and leaves rough, Leaves dense linear reflexed, Flowering branches short racemose
- 11969 Leaves obl. narrowed at each end sess. Stem somew. climbing, Branches downy, Scales of invol. squarrose

§ 2. *Herbaceous.*

* *Leaves entire.*

- 11970 Leaves lin. lanc. 3-nerved dotted acute scabr. at edge, Ray about 5-fl. Invol. imbric. twice as short as disk
- 11971 Lvs. lin. lanc. obsol. 3-nerv. blunt scab. at edge, Hds. in sess. clust. Ray about 5-fl. Inv. imbr. short. than disk
- 11972 Lvs. cuneate obov. acute nervel. scab. on each side twisted spread. Inv. cylindr. imbr. with 2 bractes at base
- 11973 Lvs. lin. lanc. narr. at base nerveless roughish revolute at edge, Inv. lax imbr. Branches filiform 1-headed

- 11974 Lvs. lin. mucro. somew. keeled rigid scabrous at edge : cauline reflexed ; of the branches much spreading
- 11975 Lvs. many lin. mucron. nerveless not dotted keeled scabrous rigid, Branches fastigiate 1-headed
- 11976 Lvs. narrow lin. nerveless not dotted smooth erect, Branchlets term. nearly naked 1-headed
- 11977 Lvs. lin. nerveless dotted scabr. reflexed spreading, Branches corymb. fastigiate leafy, Invol. imbr. short
- 11978 Lvs. lin. lanc. hoary, Stem branched villous, Branchlets somew. 1-sided 1-headed, Invol. obl. lax imbricated
- 11979 Lvs. lin. lanc. narrowed at each end acum. Stem downy panicle erect, Branches few-headed, Inv. imbr.
- 11980 Very smth. with small fl. Stem panicle, Branch. many-head. Lvs. lin. subulate, Invol. cylindr. Ray minute
- 11981 Lvs. lin. lanc. narrow. both ways hispid at edge, Stem smth. branched erect, Branches 1-headed, Inv. imbr.
- 11982 Lvs. lin. glabrous : those of the branches very short, Branches panicle, Invol. cylindr. closely imbricated
- 11983 Lvs. lin. glab. : those of the branches subul. close together ; of the stem long. Invol. subsquarr. Leaf. acute
- 11984 Lvs. lin. glab. Stem much branched diffuse downy, Branchlets 1-sided, Inv. imbr. : scales obl. squarr. acute
- 11985 Lvs. ciliat. : caul. lin. lanc. nerv. : those of the br. very short lanc. 3-nerv. Stem branch. downy, Br. panic.
- 11986 Hoary, Lvs. lin. Panic. corymb. much branched leafy, Invol. imbr. very acute longer than disk. [at base
- 11987 Lvs. remote lin. amplexicaul. erect very smth. scabr. at edge, Pedunc. almost naked, Inv. squarr. with 2 lvs.
- 11988 Very smth. Lvs. subul. lin. somew. fleshy subreflex. Stem slender much branch. Branch. setaceous 1-head.
- 11989 Lvs. very numerous lin. blunt reflexed hispid at edge, Stem branch. diffus. smooth, Branches 1-headed
- 11990 Dwarf with creeping roots, Stems weak simple, Lvs. long lanc. smoothish, Invol. with lin. obl. blunt scales
- 11991 Lvs. very numerous ovate-acum. reflexed hispid at hedge, Stem branched hairy, Branches 1-headed
- 11992 Lvs. obl. lanc. silky sess. Stem slender decumbent loosely branched, Branchlets and branchlets 1-headed
- 11993 Lvs. obl. lanc. hoary on each side, Stem simple erect downy, Raceme terminal
- 11994 Cauline leaves amplexicaul. scabrous : of the branches small, Invol. imbricated : scales length of disk
- 11995 Hoary all over, Lvs. lanc. obl. acute at each end sess. revolute at end netted and 3-nerved beneath
- 11996 Smooth, Lvs. obl. ovate acuminate shortly stalked scabrous at edge, Panicles few-headed, Stem smooth
- 11997 Lvs. subrhomboid oval-lanc. acuminate at each end somew. stalked glabr. hispid at edge, Corymb diverging
- 11998 Lvs. lanc. narrowed at base acuminate scabrous at edge, Stem simple corymb. at end, Invol. loosely imbr.

- 11999 Lvs. lin. lanc. nearly entire smth. Stem smth. panicle at end, Invol. lanc. imbr. Scales acute spread, at end
- 12000 Lvs. lanc. somewhat amplexical. narrowed at end scabrous at edge, Stem erect hispid, Branchlets pilose
- 12001 Lvs. lin. lanc. pilose amplexicaul. auricled at base, Stem simple pilose straight, Heads sess. term. clustered

- 12002 Lvs. lin. lanc. amplexicaul. polished, Stem virgate panicle. Branches racemose, Inner scales of invol. colored

- 12003 Lvs. lin. rigid acute subamplexicaul. : those of the branches reflexed hispid at edge, Scales of invol. squarr.
- 12004 Lvs. lanc. cordate amplexicaul. downy beneath, Stem quite simple downy, Pan. term. lax few-headed
- 12005 Lvs. obl. lanc. ciliate cordate amplexicaul. scabrous on each side hairy, Stem branched hairy
- 12006 Stem 1-fl. Rad. lvs. lanc. spatulate : cauline lanc. Scales of invol. nearly equal lanc. bluntnish
- 12007 Stem 1-fl. Rad. lvs. spatulate : cauline lin.-lanc. Scales of invol. nearly equal linear acuminate
- 12008 Lvs. lin. remote 3-nerved acuminate dotted scabrous at edge, Branches corymb. fastigiate, Ray 10-fl.
- 12009 Lvs. lin. lanc. glabrous not dotted 3-nerved, Invol. imbricated twice as short as disk
- 12010 Lvs. lin. lanc. 3-nerved hoary on each side, Invol. twice as short as disk imbricated
- 12011 Lvs. lin. lanc. hispid at edge, Stem simple corymb. Scales of invol. lanc. blunt equal
- 12012 Lvs. obl. lanc. scabrous, Invol. imbr. subsquarrose : lvs. blunt ; inner membranous colored at edge
- 12013 Lvs. lin. lanc. sessile scabrous at edge, Stem panicle smooth, Invol. lax imbricated
- 12014 Lvs. lin. lanc. rarely toothed long smooth, Heads terminal, Invol. squarrose

** *Leaves lanceolate and ovate : lower serrate.*

- 12015 Lvs. ov.-obl. acute amplexicaul. cordate serrated smooth, Stem panicle smooth, Branches 1-2-headed
- 12016 Lvs. amplexicaul. spatulate lanc. acuminate serrated in middle cordate at base, Branches pilose
- 12017 Lvs. amplexic. lanc. : lower subserr. smooth ; of the branches lin. squarr. Invol. squarr. shorter than disk
- 12018 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Branches many-headed

and Miscellaneous Particulars.

difficult to distinguish : the most ornamental are *A. puniceus*, *Novæ Angliæ pulchellus*, and *macrophyllus*. *A. chinensis* is a well known border annual ; of which there are varieties of different colors, and semi-double, and double. It is raised on a hotbed, and transplanted into the open ground in April or May.

History, Use, Propagation, Culture,

Asteræe are chiefly characterized by their style, which, in its most complete state, is alone sufficient to distinguish them from every other tribe. They are found in every part of the world, but especially in North America and Africa.

1740. *Solidago*. From *solidari*, to unite, on account of the vulnerary qualities of the plants. The species are all autumnal coarse-looking herbaceous plants with yellow flowers; in the shrubbery they make a pretty

- 12019 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Scales of invol. shorter than disk
 12020 Lvs. subamplexicaul. : upper lanc. acumi. entire; lower lanc. narrowed at base serrated, Branchlets virgate
 12021 Lvs. subamplexicaul. remote obl. entire lucid; radic. subserrated, Invol. imbr. with cuneiform leaflets
 12022 Lvs. subamplexicaul. lanc. lower subserrate smooth, Stem simple paniced at end, Invol. closely imbricated
 12023 Lvs. amplexicaul. lanc. serrate roughish, Branches paniced, Invol. lax longer than disk
 12024 Lvs. obl. lanc. scabrous ciliated; lower ovate, Stem hispid, Branches 1-headed, Scales of invol. obl. imbr.
 12025 Lvs. subamplexicaul. lanc. : lower serrated, Stem smooth, Branches corymbose
 12026 Lvs. subamplexicaul. lanc. glabrous scabrous at edge : lower subserrated, Branches divided
 12027 Lvs. amplexicaul. narr. lanc. scabr. above lower subserr. Stem much branched, Invol. with spread. scales
 12028 Lvs. lanc. roughish somewhat amplexicaul. : lower serrate in the middle, Scales of invol. lax leafy
 12029 Lvs. obl. lanc. acuminate sessile smooth scabrous at edge : lower serrated, Branches corymbose smooth
 12030 Lvs. sessile serrated smooth spatulate lanc. narrowed at base and bent down towards each side
 12031 Lvs. subamplexicaul. obl. lanc. acuminate serrated smooth, Stem pyramidal, Racemes scarcely longer than lvs.
 12032 Lvs. ov. coarsely toothed stalked : cauline sessile cuneate at base, Stem hispid, Branches with single heads
 12033 Lvs. broad lanc. narrow, at base entire with a very long point, Stem simp. flexuose angul. Panic. corymb.
 12034 Lvs. obl. 3-nerved narrowed at base acute : upper sess. nearly entire; lower stalked serrated, Stem corymb.
 12035 Lvs. lanc. serrate acuminate rugose very rough, Stem erect angular simple
 12036 Lvs. sess. narrow lanc. serrated scabrous, Stem 1 or few-headed
 12037 Lvs. lanc. sess. serr. smooth, Branches virgate, Invol. imbricated, Stem round smooth
 12038 Lvs. sess. narrow lanc. : lower serrated in middle, Stem branched smooth recurved, Invol. lax imbricated
 12039 Lvs. lin. lanc. acumin. scabrous at edge : lower subserrated, Stem paniced, Branches 1-headed
 12040 Lvs. lin. lanc. acumin. scabrous at edge : lower subserrated; cauline reflexed, Stem lax paniced
 12041 Lvs. lanc. acumin. scabrous at edge : cauline serrated at end; those of the branches entire, Stem paniced
 12042 Lvs. lin. entire : radic. obl. subserrated, Stem much branched downy, Invol. loosely imbricated
 12043 Lvs. lanc. lin. sessile smooth : lower subserrate, Stem paniced smooth, Invol. imbricated
 12044 Lvs. lin. lanc. sessile entire smooth : lower lanc. subserrate, Stem branched diffuse smoothish
 12045 Lvs. lin. acuminate entire : lower lin. lanc. subserrate, Branches corymbose, Invol. imbricated
 12046 Lvs. lin. acuminate entire : radical obl. serr. Branches in corymbose panices, Invol. imbricated
 12047 Lvs. sess. lanc. serrated smooth, Invol. imbricated : leaflets acute, Stem rather villous
 12048 Lvs. ellipt.-lanc. serrated smooth : cauline lan.-lanc. long, Branches spreading, Invol. imbr. Stem pubesc.
 12049 Lvs. ellipt.-lanc. serrated smooth even-sized, Branches spreading, Invol. imbricated, Stem pubescent
 12050 Lvs. ellipt.-lanc. serr. smooth : those of the branches distant, Branches much spreading pendulous
 12051 Stem 1-fl. Lvs. ovate sessile scabrous, Scales of invol. nearly equal linear
 12052 Lvs. lin. lanc. entire blunt mucronate 3-nerved at base veiny, Stem simple corymbose downy
 12053 Lvs. filiform aculeate ciliate, Invol. hemispherical, Leaflets equal
 12054 Stem glabr. corymb. Lvs. lin.-lanc. fleshy obscurely 3-nerv. Scales of invol. lanc. membran. obt. imbricated
 12055 Leaves lanc. subamplexicaul. serrate pilose scabrous, Invol. lax : leaf. lanc. acuminate foliaceous hispid
 12056 Leaves scabr. : caul. obl. acute; radical obl. stalked, Scales of invol. obl. cuneate blunt subsquarrose
 12057 Leaves sessile obl. lanc. serrate : floral ciliated, Stem branched glabrous, Invol. closely imbricated
 12058 Lvs. obl. lanc. serrat. narr. at base, Stem hairy, Inv. imbric. nearly equal, Outer scales somcw. spreading

*** *Leaves cordate and ovate, serrate.*

- 12059 Leaves obl. cordate amplexicaul. entire, Petioles winged, Stem paniced hispid, Branchlets 1-sided
 12060 Leaves ovate-lanc. subserrated stalked smooth, Petioles naked, Stem much branched smooth, Invol. lax
 12061 Leaves cordate pilose beneath finely serrated stalked, Stem paniced smoothish, Panicle spreading
 12062 Leaves ov. finely serrated acumin. smoothish : lower cord. stalked, Branches hairy, Scales of invol. blunt
 12063 Leaves ovate stalked serrated scabrous : upper ovate cordate sessile, Stem branched diffuse, Scales acute
 12064 Leaves smooth : cauline ovate subcord. acuminate deeply serrated entire at end, Stem paniced smooth
 12065 Leaves ovate narrowed at base entire 5-nerved, Invol. lax squarrose, Ray very fine

§ 1. *Racemes 1-sided, Leaves 3-nerved.*

[exceeding disk

- 12066 Stem downy, Lvs. lanc. serrat. triple-ribb. rough, Clusters copious paniced unilateral recurv. Radius hardly
 12067 Leaves obl. 3-nerved subserrated, Racemes 1-sided, Ligule middling, Stem smooth, Peduncles downy
 12068 Stem villous erect, Lvs. lanc. serrated triple-ribbed rough villous beneath, Clusters spiked erect drooping
 before flowering, Radius short
 12069 Stem erect round very smooth, Leaves lin.-lanceol. smooth triple-ribbed serrated rough-edged, Clusters
 paniced unilateral, Stalks downy
 12070 Stem erect smooth, Lvs. lanc. smooth serrated rough edged obscurely triple-ribbed, Clusters paniced
 unilateral, Stalks hairy, Radius short
 12071 Stem erect smooth, Leaves lanc. somewhat triple-ribbed smooth rough-edged slightly serrated, Clusters
 paniced unilateral, Stalks smooth, Bract. fringed, Radius short
 12072 Stem erect vill. Lvs. lanc. somew. serrat. triple-ribbed rough reflexed, Clusters paniced slightly unilateral
 12073 Stem erect rather hairy, Lvs. lanc. obscurely triple-ribbed smooth rough-edged : the lower ones slightly
 serrated, Clusters paniced unilateral somewhat recurved

and *Miscellaneous Particulars.*

appearance among other coarse things, but there is not one of them which is worth a place in a choice collection of ornamental plants. The leaves of the *Solidago odora* have a delightfully fragrant odor, partaking of that of anise and Sassafras, but different from either. When subjected to distillation, a volatile oil, possessing the taste and aroma of the plant in a high degree, collects in the receiver. This oil apparently has its residence in the transparent cells which constitute the dotting of the leaves. The effects of the *S. odora* are

History, Use, Propagation, Culture,

aromatic, pleasant to the taste, gently stimulant, diaphoretic, and carminative. An essence made by dissolving the essential oil in proof spirit, is used in the eastern states as a remedy in complaints arising from flatulence, and as a vehicle for unpleasant medicines of various kinds. It has been employed successfully to allay vomit-

§ 2. *Racemes 1-sided. Leaves not 3-nerved.*

- 12074 Stem erect round hairy, Lvs. ov. rather ellipt. very rough rugged serrated without lateral ribs, Clusters panicked unilateral
 12075 Stem erect hairy, Lvs. lanc. the lower ones deeply serrated very rough rugose, Panicles unilateral
 12076 Stem erect hairy, Lvs. ovate-lanc. the lower ones closely serrated rugged very rough, Clusters panicked compound widely spreading unilateral
 12077 Stem erect vill. Lvs. lanc. rather soft serrated without lateral ribs, Clusters panicked unilateral
 12078 Stem erect hairy, Lvs. oblong pointed smooth above rugged and rough beneath, Clusters unilateral
 12079 Stem erect downy, Stem lvs. lanc. hisp. ent. : radic. ones somev. wedge-shap. serrat. Clust. panic. unilateral
 12080 Stem erect smooth angular, Lvs. ellipt. serrated smooth : the radic. ones obl.-spatulate, Clusters panicked unilateral spreading, Pedunc. downy
 12081 Stem erect striated smooth, Lvs. ellipt. pointed deeply serrated vill. beneath : radical ones obovate, Clusters panicked unilateral, Pedunc. villous, Rays short
 12082 Stem erect smooth, Lvs. smooth sharply and unequally serr. : those of the stem ellipt. ; radical ones ovate-obl. Clusters panicked unilateral, Rays elongate
 12083 Stem erect smooth, Lvs. lanc. smooth rough-edged : the lower ones serrated, Clusters panicked unilateral
 12084 Stem erect smooth, Lvs. ellipt. smooth serrated, Clusters panicked unilateral, Rays of a middling length
 12085 Stem erect downy, Lvs. lanc. serrated rough edged, Clusters elongated unilateral recurved panicked
 12086 Stem erect smth. Lvs. lin.-lanc. rather fleshy smth. entire rough-edg. Clust. panic. unilateral, Ped. roughish
 12087 Stem erect striated downy, Lvs. lin.-lanc. entire smooth rough-edged, Clust. panic. unilateral nearly simple

§ 3. *Racemes erect.*

- 12088 Smooth somewhat shrubby, Lvs. lanc. obtuse without ribs, Panicle compound many-fl. tuft of flowers erect, Invol. narr.-oblong with 5 flor. in the disk and 1 in the radius
 12089 Stem hairy, Lvs. ellipt. hairy : the lower ones serr. ; those on the fl.-branches entire numerous and small, Clusters erect, Scales of invol. obtuse
 12090 Stem erect villous, Lvs. ellipt. roughish stalked, Clusters erect, Rays twice the length of the invol.
 12091 Stem erect smth. Stem-lvs. lanc. entire smth. rough-edg. : radic. ones serrat. Clust. panic. erect, Ped. smth.
 12092 Stem smooth. furrowed much branched, Lvs. almost lin. ent. roughish nearly erect with 3 or 5 rough ribs, Rays not longer than the disk
 12093 Stem rough-angular branch. corymb. Lvs. spread. lin. very narr. slightly 3-ribb. rough with axilla tufts of smaller ones, Rays scarcely exceeding the disk
 12094 Stem nearly erect very smooth and even, Lvs. lanc. smooth with roughish edges and ribs, Clusters erect, Rays rather longer than the disk
 12095 Stem smooth panic. Lvs. lanc. serrat. smth. rough-edged, Branches racemose at the extremity, Rays long.
 12096 Stem panic. hairy, Lvs. lanc. rough on both sides : those of the stem serrat. ; of the branches ent. Clusters erect, Rays elongated
 12097 Stem branch. downy, Lvs. lanc. rough on both sides tapering 3-ribb. entire, Clusters erect, Rays elongated
 12098 Stem erect smth. Lvs. lanc. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly hairy, Radius twice the length of invol.
 12099 Stem oblique smooth, Lvs. lanc. somew. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly smooth, Rays longer than invol.
 12100 Stem erect slightly downy, Lvs. lin. lanc. smooth rough-edged tapering at the base : the lower ones somew. serrated, Clusters erect, Rays elongated
 12101 Stem rather vill. Lvs. lanc. veiny smooth entire somewhat stalked
 12102 Lower lvs. ov. pointed taper. unequally and sharply serr. smooth : those of the stem lanc. tapering at each end serr. nearly sess. Clusters axill. stalked leafy the length of the leaves
 12103 Stem zig-zag roundish smooth, Lvs. lanc. pointed serrated smooth nearly sess. Clust. axill. erect
 12104 Stem somew. zig-zag angular smooth, Lvs. ovate pointed strongly serrated smooth : tapering into a winged footstalk, Clusters axillary erect
 12105 Stem slightly zig-zag smooth angul. branch. Lvs. ov.-lanc. pointed densely serrated rather hairy beneath tapering into a wing. footstalk : upper ones ent. Clust. axill. erect the upper ones much long. than the lvs.
 12106 Stem smooth round erect, Lvs. lanc. serr. glabrous, Racemes axill. subglobose erect, Rays long
 12107 Cauline leaves lanc. : the lower ones ellipt. Racemes panicked erect crowded
 12108 Stem quite simple downy, Lvs. cuneiform lanc. downy, Racemes erect, Rays long
 12109 Stem a little villous, Lvs. sessile lanc. smooth ciliated : lower serrated at end, Rays long numerous
 12110 Stem quite simple pilose, Lvs. lanc. acute serrated smooth, Raceme term. simple erect, Rays long
 12111 Stem simple erect smooth, Lvs. lanc. serrated smooth tapering and elongated at the base, Clusters erect
 12112 Stem hairy round, Lvs. lanc. rather hairy beneath, Clusters erect, Rays elongated
 12113 Lvs. ov.-obl. rough like the corymbose stem with minute rigid hairs : the lowermost serrat. ; upper entire, [Clusters compact, Rays twice the length of the obtuse calyx

- 12114 Pedunc. branched, Lvs. reniform narrowed somewhat lobed downy, Petioles auricled at end
 12115 Pedunc. branched, Lvs. cordate 5-lobed toothed woolly, Petioles with appendages, Ray 3-flored

- 12116 Heads corymbose, Lvs. cordate somewhat angular downy beneath, Petioles auricled at base

and Miscellaneous Particulars.

ing, and to relieve spasmodic pains in the chest of a milder kind. The leaves are also used in some parts of the United States as an agreeable substitute for tea. (*Bigelow*.)

174. *Cineraria*. From *cincres*, in reference to the soft white down which clothes the lower, and

History, Use, Propagation, Culture.

often the upper surface of the leaves. *C. discolor*, *populifolia*, &c. are popular half-shrubby plants, well calculated for bearing the confined air of a sitting room. Most of the hardy herbaceous species are fine ornamental plants of easy culture. *C. lanata* and *amelloides* flower the greater part of the year; the former species is considered the handsomest of the genus; its petals exteriorly are of a most vivid purple, interiorly they are white.

1342. *Calotis*. The name has been derived from *zaldos*, beautiful, and *es wtos*, an ear, in allusion to the two membranous ear-shaped paleæ of the pappus. A pretty little New Holland herbaceous plant.

1743. *Kaulfussia*. Named after Dr. George Frederick Kaulfuss, professor of botany at Halle, a distinguished living Cryptogamic botanist. A small plant with bright blue flowers.

1744. *Inula*. The derivation of this word is uncertain. The Latins applied it to a plant which was eaten as

- 12117 Lvs. cordate angular downy beneath, Corymbs terminal paniced, Scales of invol. recurved at end
 12118 Heads corymbose, Lvs. cordate angular toothed purple beneath, Petioles winged auricled at base
 12119 Pedunc. about 1-headed, Branches corymb. Lvs. cord. angular toothed downy beneath, Petioles winged
 12120 Heads corymbose, Lvs. cordate subangular downy beneath, Petioles with many appendages at end
 12121 Heads subcorymbose, Lvs. roundish many-lobed smooth, Petioles auricled at base, Invol. calyculate
 12122 Heads cymose, Lvs. cordate angular downy beneath, Petioles simple
 12123 Leaves large round lobed downy and green on each side
 12124 Heads corymbose, Leaves oblong lanc. acuminate toothletted smooth white beneath
 12125 Lvs. cord. subangular smooth above downy beneath, Petioles with an appendage at top, Heads corymb.
 12126 Stem simple, Heads paniced, Lvs. smooth tooth. ; lower deltoid stalked : upper obl. lanc. amplexicaul.
 12127 Panicles axillary, Lvs. alternate stalked broad lanc. serrated smooth above hoary beneath [above
 12128 Heads corymb. Invol. hoary pubesc. Lvs. obl. pinnatif. at base : segm. somey. toothed shining and smooth
 12129 Raceme simple, Lvs. reniform toothletted, Petiole inflat. Stem simple leafy, Bractes in the midd. of stalk
 12130 Raceme simple, Lvs. cordate blunt toothletted smooth, Stem simple 1-leaved
 12131 Heads corymb. Lvs. cauline ov. acute finely serrated downy beneath : petioles winged at base ; radic. cord.
 12132 Raceme simple, Lvs. spatulate cordate entire smooth, Stem simple
 12133 Heads corymbose, Lvs. broad lanc. tooth-situated, Stem villous
 12134 Heads umbellate, Stem simple, Lvs. downy : radical ovate subcrenulate ; cauline lanc. entire
 12135 Heads in corymbose umbels, Stem simple, Lvs. somewhat toothed : radic. spatulate ; caul. obl. lanc.
 12136 Panicle few-headed, Stem simple, Lvs. all stalked cordate doubly toothed, Petioles toothed at base
 12137 Heads corymbose, Lvs. pinnated : term. pinnae large cordate cut-toothed ; lateral cuneate toothed at end
 12138 Heads paniced, Invol. downy, Lvs. pinnatifid : segments blunt about 3-lobed downy beneath
 12139 Heads paniced, Lvs. pinnatifid subvillous : segments sinuated, Stem herbaceous
 12140 Pedunc. 1-headed axillary, Lvs. linear subulate glabrous, Stem shrubby
 12141 Pedunc. 1-headed, Lvs. reniform somewhat angular, Petioles auricled at end or naked
 12142 Pedunc. 1-headed, Lvs. pinnatifid lobed acute viscid fleshy
 12143 Pedunc. 1-headed, Lvs. cordate roundish with 7 angles woolly beneath
 12144 Pedunc. 1-headed, Lvs. opposite ovate naked

12145 Leaves cuneate cut-toothed at end

12146 The only species

- 12147 Lvs. amplexic. somewhat toothed ovate rugged downy beneath, Scales of the involucre downy
 12148 Leaves amplexic. oblong entire hirsute, Stem pilose corymbose
 12149 Leaves amplexic. lanc. serrated at base pilose beneath, Stem corymbose villous
 12150 Leaves amplexic. cordate lanceolate wavy
 12151 Leaves amplexic. cordate lanc. quite smooth serrated, Stem corymbose smooth, Pedunc. 1-headed filiform
 12152 Leaves oval rigid sessile serrulate scabrous netted, Scales of invol. ovate reflexed
 12153 Leaves sessile reflexed at base lanc. serrated, Stem downy clammy, Peduncles axillary leafy
 12154 Leaves sessile lanc. lin. Stem pilose branched, Branches spreading 1-headed, Root tuberous

- 12155 Leaves lanc. recurved serrate scabrous, Branches angular, Lower heads tallest
 12156 Lvs. sess. obl. obsolete serrate : serratures glandular, Stem hairy 1-headed, Scales of invol. lanc. villous
 12157 Lvs. sess. obl. with cartilaginous teeth scabrous rigid, Stem corymbose, Scales of invol. blunt squarrose
 12158 Lvs. sessile lanc. bluntly serrated rigid pilose, Stem villous 1-headed, Scales of invol. lanceolate
 12159 Leaves ellipt. narrowed at base stalked pilose : lower toothed, Stem many-flowered
 12160 Leaves sessile oblong lanc. serrated downy beneath, Heads stalked about 4 in terminal umbels
 12161 Leaves lanc. acute serrulate hairy, Lvs. of invol. lanc. hairy outer reflexed
 12162 Leaves amplexicaul. toothed very hairy : radical ovate ; cauline lanceolate
 12163 Leaves sessile oblong lanc. attenuated at base obtuse entire mucronate with a gland, Pedunc. fi. if viscid
 12164 Leaves sessile obl. acute entire scabrous, Stem branched at top, Heads corymbose
 12165 Leaves sessile lin. acuminate nerved smooth scattered, Stem about 1-headed
 12166 Leaves linear fleshy generally 3-pointed
 12167 Leaves subserrate downy beneath : radical stalked ovate, Stem erect 1-flowered
 12168 Leaves lanc. hirsute entire, Stem 1-headed, Invol. short imbricated

and Miscellaneous Particulars.

a preserve with sugar. Inulæ in many respects resemble Anthemideæ, Senecioneæ, and Nassauviæ, especially in their style ; but they are perfectly well characterized by the peculiarities of their ovarium, pappus, stamens, and corolla. They are also related to Carlineæ. They are found in every part of the world, and especially in southern Africa ; almost all the Composite of the southern latitudes being referable to them.

1. *Helenium*, called *Elccampane*, from the officinal name *Enula campana*, is one of the largest of British herbaceous plants. It was formerly esteemed a tonic, and is still retained in the *Materia Medica*, though little used. Bruised and macerated in wine, with balls of ashes and whortle berries, it dyes a blue color. The young branches of *I. Crithmifolia* are frequently sold in the London markets for samphire, to which they bear some resemblance in appearance, but none in virtues.

History, Use, Propagation, Culture,

1745. *Pulicaria*. So named in allusion to its property of driving away fleas, *pulices*. See Conyza. *P. dysenterica* has its specific name from having cured certain Russian soldiers of the bloody flux. It is called by our old authors middle flea-bane, and was supposed by its smoke in burning to chase away fleas and other insects. Forskahl says, it is named in Arabic *Rara cjub*, or *Job's tears*, from a notion that Job used a decoction of this herb to cure his ulcers. Of course it was formerly recommended to cure the itch. *P. vulgaris* is also said to drive away fleas and gnats.

1746. *Grindelia*. A handsome genus of herbaceous plants, with neat foliage, and pretty yellow flowers. They are sometimes called *Donia*.

1747. *Podolepis*. From *πυς*, a foot, and *λεπίς*, a scale. The stalks of the flowers are covered with scales.

1748. *Chætanthera*. From *χαιτα*, hair, and *ανθηρα*, an anther, the anther being furnished with a hairy tuft.

1749. *Arnica*. This is said to be a corruption of *ptarmica*, derived from *πταίω*, to sneeze. The *Arnica montana* is a powerful sternutatory; in the Vosges it is even called *tabac* on that account. The whole plant has important medicinal properties; it is fortifying, diuretic, emmenagogue, vulnerary, antiseptic, resolutive, and sternutatory. The root powdered is employed in diarrhœa, dysentery, and quartan fevers; it is also applied outwardly to bad ulcers, and in cases of gangrene. The flour is used in asthenia, rheumatic pains,

- 12169 Leaves ovate-oblong decurrent toothed entire at end, Flowers corymbose clustered
 12170 Leaves sessile opp. linear lanc. entire dotted beneath, Pedunc. long 1-headed
 12171 Leaves lanceolate linear entire, Corymbs branched, Rays of flowers very short

- 12172 Leaves amplexicaul. oblong wavy villous, Stem erect paniced, Pedunc. 1-fl. opposite the leaves
 12173 Leaves oblong sessile, Pedunc. filiform, Invol. cylindrical
 12174 Leaves oblongo-cordate amplexic. rugged downy, Stem woolly paniced, Scales of involucre setaceous

- 12175 Leaves ovate-obl. serrated, Involucres viscid
 12176 Leaves sessile obl. lanceolate acute serrated at end not viscid
 12177 Leaves obl. amplexicaul. serrated, Scales of involucre filiform at end revolute squarrose
 12178 Stems simple, Lower leaves spatulate: upper linear-oblong serrated 1-nerved
 12179 Leaves oblong blunt half-amplexicaul. ciliate serrated, Leaves of invol. linear flat bristle-pointed

- 12180 Scales of invol. rugose blunt, Stem quite simple
 12181 Scales of invol. equal ovate acuminate, Stem nearly simple

- 12182 Leaves lanceolate ciliated

- 12183 Leaves ovate entire: cauline twin opposite
 12184 Leaves toothed, Teeth acuminate: radical stalked elliptical roundish; cauline alternate oblong
 12185 Leaves remotely toothed hirsute: radical stalked obl. narrowed at base; caul. alternate obl. lanceolate
 12186 Scape 1-headed naked, Leaves stalked obovate repand
 12187 Leaves somewhat toothed and hairy: radical stalked obl. rounded at base; caul. altern. obl. lanceolate

- 12188 Leaves obovate crenate smooth, Scape 1-headed

- 12189 Leaves cordate repando-dentate: radical ones petiolate; cauline ones amplexicaul.
 12190 Leaves remotely toothletted: upper oblong amplexicaul.; lower ovate stalked, Petioles winged auricled
 12191 Leaves toothletted: upper lanc. amplexicaul.; lower spatulate ovate; radical cordate stalked
 12192 Leaves toothed obov. amplexic.: radical obov. spatulate narrowed into the stalk, Stem simple 1-headed
 12193 Smooth, Radical leaves cordate deeply toothed; cauline oblong amplexicaul. Stem about 1-headed
 12194 Downy, Lower leaves stalked ovate with winged petioles: upper amplexicaul.; all toothed

- 12195 Leaves stalked or ovate toothed subsinuate at base downy beneath: the old ones quite smooth

- 12196 The only species

- 12197 The only species

- 12198 Leaves serrated quite smooth
 12199 Leaves serrated downy
 12200 Lower leaves pinnatifid: upper entire smooth, Florets of disk 4-toothed
 12201 Leaves lanceolate decurrent, Ray of corolla 4-parted

and Miscellaneous Particulars.

bruises, gutta serena, and paralysis of the bladder. The root is given in doses of six to twelve grains; the flowers of from three to four grains. Dr. Thomson observes, that in the hands of British practitioners it has not merited the eulogium of the French and German. (*Lond. Disp.* p. 169.)

1750. *Gerberia*. T. Gerber, a German naturalist, is only known as a traveller in Russia. A very pretty little greenhouse plant with neat purple flowers.

1751. *Doronicum*. Derived from the Arabic name *Doronigi*. *Pardalianches* is from *παρδος*, a tiger, and *αρχην*, to strangle; on account of the use said formerly to have been made of the plant for the purpose of destroying wild animals.

1752. *Perdicium*. A name given by Pliny to a plant of which the partridge, *perdrix*, is very fond. The plant is not now recognized.

1753. *Tetragonotheca*. From *τετρα*, four, *γωνια*, an angle, and *θηκη*, a capsule, in allusion to the four angles of the grains.

1754. *Ximenesia*. Named by the Abbé Cavanilles, after Joseph Ximenez, a Spanish apothecary, who is said to have attended to plants.

1755. *Helonium*. Named after the celebrated Helen, who is said to have availed herself of the cosmetic properties of the plant named after her. That is believed to be the modern *Inula Helenium*; the ancient name being unoccupied, it has been applied to this American genus, which resembles the other.

History, Use, Propagation, Culture,

1756. *Bellis*. So called from *bellus*, pretty. Every one knows the daisy.
 1757. *Bellium*. See *Bellis*, from which this genus differs chiefly in the pappus of the grains.
 1758. *Dahlia*. Named after Andrew Dahl, a Swedish botanist, and pupil of Linnæus. Continental botanists call the genus *Georgina*. This genus grows in Mexico, in sandy meadows, and till the peace of 1814 was more cultivated in France than in England: at present it is one of the most fashionable hardy plants. Though its leaves are coarse, resembling those of the common dwarf elder, yet the flowers are showy, and continue in beauty till late in autumn. The plants grow freely in any soil or situation; but the poorer the ground is, the smaller the size of the plant, and the earlier and more abundant the flowers. The single-flowered varieties of *D. superflua* are almost without end; the double varieties of both species are much less numerous. Any number of the former may be raised from seeds, which ripen in abundance, and if sown in February on artificial heat, and transplanted in the end of April, they will flower in the July or August following. The double varieties are increased by dividing the roots, or by grafting, or by cuttings; they may also be sometimes raised from seeds. A very general way in which both kinds are propagated is by cuttings. They may be either taken from the root-shoots in spring, or the tops of the young shoots early in summer; the lower end of each cutting should be cut smoothly off in the middle of a joint, and all the leaves left on, excepting those that would be buried in planting the cutting. If planted in sandy soil, on a gentle bottom heat, and covered with a hand-glass, they will soon strike root, and produce both flowers and tubers the same autumn. The double sorts are grafted on tubers of the single varieties much in the manner of whip-grafting, but without a tongue. There must be no buds on the tuber; cut off a slice from the upper part of it, in a sloping direction, and make, at the bottom of the part so cut, a ledge, whereon to rest the graft; next, cut the scion sloping to fit, it should contain two joints, and be cut so that one of these may be at the bottom of it to rest on the ledge; from that joint the scion will occasionally put forth roots; from the other the future stem will be formed. Having tied the graft, clay it as in common grafting; then put the root in fine mould, burying half the graft, and place the pot in a gentle moist heat under a glass. If this be done in March, the plant may be shifted into a larger pot in April, and planted out in the end of May.
 As the *Dahlia* is a bulky plant, it requires either to be grown in a very large pot, or in from three quarters to a yard and a half of surface. They look well in rows, or occurring singly in a shrubbery.
 The treatment of the *Dahlia* bears a considerable resemblance to that of the potato and the marvel of Peru; as soon as the frost has blackened the tops of these three plants, their roots require to be taken up, and

12221 Leaves linear sessile acute ciliated at base

12222 Stem filiform branched, Leaves woolly subulate filiform, Peduncles naked axillary 1-headed

and Miscellaneous Particulars.

kept in a dry place, where the frost cannot get at them till spring. About April they may be divided, and planted in the open air where they are to flower; or, what is more common planted in large pots, and forwarded in heat till the middle of May, when they may be turned out of the pots where they are finally to remain. In this case they will flower a month or six weeks earlier than by the other method, and will, in general, continue flowering till they are destroyed by frost. Some care is requisite to preserve the roots sufficiently moist and plump to maintain the living principle, and yet not to rot, shrivel, or freeze them. The safest mode is to plant them in pots or boxes of dry earth, and place them in a shed or cellar, or under an ample covering of litter thatched over.

1759. *Bæbera*. Bæber is said by Willdenow to have been a learned Russian botanist.

1760. *Tagetes*. Named after Tages, a Tuscan divinity, the son of Genius, and the grandson of Jupiter. *T. patula* is a tender annual, deservedly popular, from the brilliancy and variegation of its flowers: it is cultivated in Japan, China, and many parts of India, but does not appear to be indigenous of those countries. The varieties of *T. erecta* differ chiefly in the shades of the same color, but there are also double and quilled flowers. Both species are raised from seeds, upon a moderate hot-bed, in the beginning of April, and when they are three inches high, transplanted to where they are finally to remain. The varieties are very apt to degenerate, and can only be reproduced by the most careful selection and separation.

This genus serves for the basis of M. Cassini's *Tagetinae*, which do not appear to be at all distinct from *Heliantheæ*, from which they differ principally in the form of their ovarium. M. Cassini's principal motive for distinguishing them as a separate race, seems to have been his wish to reduce his tribe of *Heliantheæ*, which he finds too extensive. Nearly all the species are found in America.

1761. *Heterospermum*. From *ἕτερος*, various, and *σπέρμα*, seed; on account of the variable shape of the grains.

1762. *Schkuhria*. Named in honour of Christian Schkuhr, an acute German botanist, who has published some of the most accurate and useful, if not splendid, botanical works which the world has seen. It is to be regretted that their rarity makes them more generally unknown than they deserve to be.

1763. *Pectis*. From *pecten*, a comb, to which the teeth of the pappus may be compared.

1764. *Longchampsia*. So named after Doctor J. L. A. Loiseleur Deslongchamps, a French botanist, author of a useful *Flora Gallica*, in two small duodecimo volumes, published at Paris, the first in 1806, the second in 1807.

History, Use, Propagation, Culture,

1765. *Leysera*. So called in honor of Frederick William Leyser, a German, and author of a *Flora Halensis* in 1783.

1766. *Selloa*. Named after Mr. Sello, a German botanist, employed by the Prussian government in collecting materials for a natural history of Brazil. An uninteresting stove perennial plant, remarkable for having florets mixed among the leaves of the involucre.

1767. *Relhania*. In honor of the Rev. Richard Relhan, an English botanist, and author of a *Flora Cantabrigiensis*. The genus was named by L'Heritier. Plants of no beauty and easy culture.

1768. *Zinnia*. John Godfrey Zinn, a German, published, in 1757, a Catalogue of the Plants in the Garden of Gottingen, &c. Handsome border annuals, with persistent flowers, of the same culture as *Tagetes*.

1769. *Chrysanthemum*. From *χρυσος*, gold, and *ανθος*, a flower; because many of the kinds bear flowers of a yellow color. *Chrysantème*, Fr., *Goldblume*, Ger., and *Crisantero*, Ital. C. sinense is one of the handsomest of autumnal flowers, and of the easiest possible culture in any soil. It is a popular flower in China, whence all our numerous varieties have very recently been obtained, and chiefly through the exertions of the Horticultural Society. These are certainly a very great addition to the beauties of the flower garden in a dry autumn, and to the green-house or conservatory in the wet and foggy months of November and December, when scarcely any thing else is in flower. The plants are propagated by divisions, by suckers, and by cuttings;

- 12223 Leaves linear subulate ciliate rough, Scales of invol. lanceolate
 12224 Leaves filiform downy, Scales of invol. membranous reflexed
 12225 The only species
 12226 Leaves oblong acuminate nerveless recurved at end
 12227 Leaves linear somewhat pungent striated beneath, Heads sessile
 12228 Leaves linear villous, Pedunc. lateral shorter than leaf
 12229 Heads sessile, Leaves opp. cordate-lanceolate amplexicaul. sessile
 12230 Heads stalked, Leaves opp. ovate-lanceolate somewhat stalked
 12231 Heads stalked, Leaves whorled ovate-lanceolate stalked, Ray double
 12232 Heads stalked, Leaves opp. cordate ovate sessile amplexicaul. Stem hairy, Paleæ serrated
 12233 Heads stalked, Leaves opp. cordate lanceolate stalked, Ray linear-lanceolate reflexed
 12234 Leaves cordate sessile rough at edge, Grains of disk with 2 awns : of the ray awnless
 12235 Leaves smooth attenuated at base pinnatifid : segments cut
 12236 Leaves all cuneiform oblong finely serrated, Stem simple 1-headed erect
 12237 Heads sessile : lower linear lanceolate serrated ; upper spatulate
 12238 Leaves amplexic. obl. obt. cut pinnatifid at base ; radical ones obovate petiolat, Stem erect branched
 12239 Lower leaves stalked spatulate serrate : upper lin. lanc. serrated, Stem 1-headed
 12240 Leaves pinnated : pinnæ linear acute, Stem erect 1-headed
 12241 Leaves linear nearly entire, Stem quite simple
 12242 Lower leaves palmated : leaflets linear pinnatifid
 12243 Leaves bipinnate : pinnæ oblong serrated, Heads corymbose
 12244 Leaves bipinnate hoary : leaflets acute entire, Stem 1-headed simple
 12245 Radical leaves 3-parted cut-toothed : cauline cuneiform 3-parted blunt
 12246 Leaves bipinnated fleshy smooth, Scales of invol. keeled
 12247 Leaves bipinnated linear subulate smooth, Stem erect somewhat branched
 12248 Very near *C. leucanthemum*, but the lower leaves are more spatulate
 12249 Leaves amplexic. glaucous inciso-serrate above toothed at the base
 12250 Leaves lingulate blunt serrated, Scales of involucre equal
 12251 Leaves bipinnate serrated, Rays length of disk, Stem procumbent
 12252 Leaves pinnatifid acute broadest externally, Stem branched
 12253 Leaves flaccid stalked pinnatifid finely toothed : upper entire, Ray a little longer than flower
 12254 Leaves coriaceous stalked sinuate-pinnatifid toothed glaucous, Ray very long

| 33 Starry Purple | 44 Double White Indian |

and Miscellaneous Particulars.

as they are very apt, in every case, to throw up suckers, the latter mode is decidedly the best. The cuttings may be taken from the side branches at any season from April to September; taken off before the end of May, they will flower the succeeding autumn; those taken off afterwards will not flower till next year. Chrysanthemums are so very prolific in suckers, that they soon become unsightly plants, and produce small and degenerate blossoms, unless frequently renewed from cuttings. The Chinese are said to do this every year; they take off the cuttings in May, strike them as we do, and then put each plant in a very small pot, in which it flowers the succeeding autumn. The plants are thus kept in a dwarf state, and clothed with green foliage from the ground to the flower. In order that the blossoms may be strong, they leave only one or two flower-buds on the summit of each plant, and they remove all suckers and side shoots till the blossom is over. This mode is now generally adopted with us; but sometimes the plants are retained a second, or even a third year, in which case care is requisite to leave no more stems, and to have no more suckers growing at one time than the roots can support in a vigorous state. As under this management the stems attain a great height, they require to be supported by a rod, and adjusted so as to form a symmetrical figure by a nice application of black threads, or small copper wires.

Sometimes the Chrysanthemum is grown in beds or borders, in which case the plants should be taken up every year and their superfluous suckers removed; or, which is better, they should be totally renewed by cuttings.

History, Use, Propagation, Culture,

Though these plants will grow in any soil, yet when in small pots they require a rich loam, and are the better for being watered, as in China, with liquid manure. The different varieties are well described by Mr. Sabine, in the fourth and fifth volumes of the Horticultural Transactions.

1770. *Pyrethrum*. An ancient Greek name, applied to this plant from its supposed resemblance to the *πυρεθρον* of Dioscorides. That plant is believed to have been the Anthemis pyrethrum, or Pellitory of Spain, of the moderns, and to have received its name from the burning qualities of its root; *πυρ*, fire. All the plant of *Pyrethrum Parthenium* has a strong unpleasant smell, and a bitter taste. It is used externally, in the form of lotion and of poultice, and internally as an infusion for colic, hysterical affections, and weak digestion. There are some double-flowering varieties, which are very ornamental.

1771. *Matricaria*. So named on account of the use which is made of it in disorders of females. *Matricaire*, Fr., *Mutterkraut*, Ger., and *Matricaria*, Ital. It excites menstruation. *Chamomilla* is an alteration of the

- 12255 Leaves all cuneiform oblong bluntly serrated, Stem branched diffuse
- 12256 Leaves stalked serrated : lower roundish ; upper ovate, Stem 1-headed
- 12257 Leaves with very narrow segments, Petioles very short connate

- 12258 Leaves pinnatifid fleshy : segments linear entire, Pedunc. long corymbose
- 12259 Leaves trifid fleshy ; segments somewhat toothed linear blunt, Pedunc. long subcorymbose
- 12260 Leaves bipinnatifid linear acute, Pedunc. 1-headed terminal
- 12261 Leaves lanceolate serrated : radical oblong, Stem 1-headed
- 12262 Cauline leaves lanceolate deeply toothed : radical pinnatifid, Stem 1-headed
- 12263 Leaves pinnatifid : segments of the lower linear lanc. entire or bifid ; upper linear entire
- 12264 Leaves fleshy pinnatifid linear toothed : upper linear trifid
- 12265 Leaves pinnatifid : segments lanc. somewhat 3-toothed fleshy, Pappus unequally toothed
- 12266 Leaves pinnatifid : segm. lanc. deeply toothed somewhat fleshy : upper lin. toothed, Pappus uneq. toothed
- 12267 Leaves downy glaucous subsessile lyrate pinnatifid unequally toothed, Heads corymbose
- 12268 Leave pinnate powdery, Leaflets pinnatifid blunt toothed, Pedunc. corymbose, Pappus toothed
- 12269 Leaves woolly bipinnate, Pinnæ and pinnules obl. imbricated, Stem 1-headed, Invol. woolly
- 12270 Leaves bipinnate : pinnæ lin.-filiform 2 or 3-parted, Stem erect branched, Pappus 2-lobed
- 12271 Leaves pinnatifid : segm. lanc. finely serrated, Grains subulate, Pappus unequally toothed
- 12272 Leaves linear serrulate, Heads corymbose
- 12273 Leaves lanc. : lower serrated at end ; upper entire, Branches corymbose
- 12274 Leaves lanc. all deeply serrated, Stem erect branched at end
- 12275 Lower leaves pinnatifid toothed ; upper linear entire, Stem 1-headed
- 12276 Leaves ovate obl. serrated : radical stalked ; cauline sessile auricled at base, Heads corymbose
- 12277 Leaves hairy subsessile pinnatifid toothed blunt, Corymb terminal compound
- 12278 Leaves pinnated smooth : pinnæ once or twice pinnatifid with acute diverging segments, Invol. smooth

- 12279 Leaves bipinnate linear silky : pinnæ crossing, Pedunc. corymbose, Ray shorter than involucre
- 12280 Leaves pinnated, Pinnæ lanc. pinnatifid finely serrated : upper confluent, Pedunc. corymbose
- 12281 Lvs. petiol. flat bipinnate the segm. ovate cut, Pedunc. branch. corymb. Stem erect, Invol. hemispherical
[pubescent

- 12282 Leaves pinn. : pinnæ obl. obt. pinnatifid toothed ; upper confluent, Stem virgate, Heads corymbose
- 12283 Leaves bipinnate : leaflets linear subulate, Stem 1-headed
- 12284 Rad. leaves bipinnate : pinnæ linear pinnatifid ; cauline bipinnatifid, Heads corymbose
- 12285 Leaves sess. bipinnatifid with segm. capillary, Stem branched spreading, Pappus entire
- 12286 Leaves bipinnatifid the segm. linear fleshy awnless, Stem diffuse branched, Pappus lobed
- 12287 Leaves bipinnate linear blunt, Stem ascending somewhat corymbose, Ray length of invol.
- 12288 Leaves hoary bipinnate linear blunt, Stem simple, Pedunc. twin, Ray shorter than disk
- 12289 Leaves pinnatifid : pinnæ cut-toothed, Pedunc. long nearly naked 1-headed, Scales of invol. blunt

- 12290 Leaves triply pinnate, Scales of invol. acute
- 12291 Leaves glabrous bipinnatifid the segments capillary, Invol. nearly plane : its scales obtuse
- 12292 Leaves glabrous bipinnatifid : stem branched suffruticose
- 12293 Leaves pinn. somewhat fleshy, Pinnæ linear blunt, Scales of invol. blunt, Grains margined on one side

- 12294 Leaves all entire
- 12295 Lower leaves serrated

- 12296 Leaves pinnatifid glaucous beneath
- 12297 Leaves stalked 5-lobed

- 12298 Ray short white : red on the lower surface

- 12299 Leaves pinnate multifid dilated, Ray none
- 12300 Leaves lanc. lin. amplexicaul. pinnatifid toothed, Stem procumbent, Branches 1-headed

and Miscellaneous Particulars.

Greek *χαμαί μῆλον*, a dwarf-apple, which Pliny informs us was applied to the plant, on account of its smelling of apples, or rather quinces. It is remarkable, that the Spaniards call it *mancinilla*, which also means a little apple. The chamomilla of medicine is another plant. See Anthemis.

M. Chamomilla is supposed to possess the same qualities with the officinal chamomile (*Anthemis nobilis*), but in an inferior degree. Most of the species, and chiefly this one, are rejected by quadrupeds.

1772. *Boltonia*. Named after I. B. Bolton, an English botanist, who wrote a work upon the Ferns of Great Britain, and another upon the fungi growing about Halifax, published in 1788-9.

1773. *Lidbeckia*. E. G. Lidbeck, a German botanist, published some works upon agricultural matters.

1774. *Cenia*. From *κενός*, empty, in allusion to its inflated calyx.

1775. *Cotula*. A diminutive of *Cota*, an old name for some species of Anthemis, which this resembles in miniature.

History, Use, Propagation, Culture,

1776. *Grangea*. A genus of Adanson's. The meaning of the word is unknown.
 1777. *Anacyclus*. An abridgement of *Ananthocylus*, which was the name originally proposed by Vaillant, and which does not appear to have been altered for the better. He formed it from α , privative, $\alpha\nu\gamma\alpha\sigma$, a flower, and $\kappa\upsilon\lambda\lambda\omicron\varsigma$, a circle; on account of the rows of ovaries without flowers, which are placed in a circle round the disk.
 1778. *Anthemis*. From $\alpha\nu\gamma\alpha\sigma$, a flower, on account of the multitude of flowers with which the plants are covered. *A. nobilis* is in considerable repute, both in the popular and scientific *Materia Medica*. The flowers, which are the parts used, have a strong and fragrant smell, and a bitter aromatic taste; both are extracted by water and alcohol. The active principles appear to be bitter extractive, resin, and essential oil. Medicinally, the flowers are considered tonic, carminative, and slightly anodyne: yet when a strong infusion of them is taken in a tepid state, it proves powerfully emetic. Given in substance, united with opium and astringents, if the bowels be easily affected, they have been successfully used for the cure of intermittents; and the infusion, in combination with ginger, or other aromatics, and the alkalies, is an excellent stomachic in dyspepsia, cholera, gout, flatulent cholc, and chronic debility of the intestinal canal. The tepid strong infusion is a ready emetic, and is often employed to promote the operation of other emetics. By coction in water, the essential oil is

- 12301 Leaves lyrate pinnated, Flowers radiant
 12302 Leaves tripinnate : segment acute, Stem erect, Heads flosculose corymbose
 12303 Stem hirsute, Leaves lyrate pinnatifid hairy, Heads terminal hemispherical
- 12304 Leaves cuneiform smooth 3-toothed stalked, Heads axill. sessile
 12305 Leaves obl. cuneate repand-toothed stalked, Heads axill. sessile
 12306 Leaves obl. sinuate toothed downy, Stem branched procumbent, Pedunc. 1-headed opp. the leaves
 12307 Leaves obovate toothed cut at base stalked, Peduncles branched
- 12308 Leaves bipinnate, Leaflets oblong, Stem procumbent
 12309 Leaves bipinnate, Leaflets linear subulate flat, Stem ascending, Peduncle naked terminal
 12310 Leaves bipinnate roundish hoary with excavated dots
 12311 Leaves decomposed linear : segm. divided roundish acute, Heads flosculose
 12312 Leaves 3-pinnate, Pinn. linear-subulate downy, Stem branched divaricating, Pedunc. thick
 12313 Leaves bipinnate linear, Pedunc. inflated, Grains winged
- 12314 Leaves bipinnatifid : segm. somewhat toothed rigid, Paleæ oblong acuminate
 12315 Leaves bipinnatifid : segm. lin. subulate toothed, Paleæ round pungent dilated at base
 12316 Leaves bipinnatifid : segm. lanc. somewhat toothed ; lower teeth reflexed, Paleæ lanc. cuspidate
 12317 Leaves bipinnatifid dotted beneath : segm. lanc. entire, Grains naked, Stem herbaceous
 12318 Snow-white, Leaves pinnate : pinnæ 3 or 5-fid, Invol. downy, Stem erect
 12319 Leaves bipinnate : pinnæ linear, Stem erect and invol. downy, Inner scales sphacelate at end
 12320 Leaves sessile pinnatifid : segments toothed, Stem erect branched
 12321 Leaves pinnate : pinnæ linear entire subpubescent, Floral leaves simple, Branches 1-headed
 12322 Rad. leaves bipinnatifid toothed : cauline pinnatifid somewhat toothed
 12323 Leaves bipinnatifid stalked : segm. trifid oblong acute, Petioles sheathing, Sheaths toothed
 12324 Lvs. bipinn. the segm. lin. subul. a little downy, Scales of recept. membranous scarcely long. than the disk
 [entire pappus]
- 12325 Lvs. bipinnatif. their segments lin. lanc. pubesc. Recept. conical its scales lanc. Pericarps crowned with an
 12326 Recept. conical : paleæ obl. mucronate, Grains naked, Leaves bipinnate woolly
 12327 Leaves bipinnatif. glabrous their segm. subul. Receptacle conical its scales setaceous, Pappus O.
 12328 Recept. subconical, Paleæ obl. blunt, Grains naked, Lvs. bipinnate linear filiform 3-parted
 12329 Leaves pinnated downy : pinnæ linear trifid bluntish, Stem ascending, Pedunc. long naked downy
 12330 Leaves 3-pinnate : leaflets linear, Stem decumbent, Branches axillary 1-headed
 12331 Leaves hairy bipinnatifid : segments trifid lanc. linear, Stem nearly erect divided
 12332 Leaves bipinnatifid serrated downy beneath, Stem erect branched subcorymbose
 12333 Leaves bipinnate serrated smooth, Stem erect branched, Pappus membranous toothed cut on one side
 12334 Leaves pinnated : pinnæ linear 3-parted, Stem proliferous, Heads solitary axillary sessile
 12335 Leaves smooth pinnatifid : lobes cuneate trifid or cut, Heads solitary
 12336 Leaves bipinnatifid dotted beneath : segments entire, Crown of grains toothed
 12337 Leaves woolly bipinnate : pinnæ lanc. acute, Flowering branches corymbose, Recept. conical
 12338 Leaves stalked silky bipinnate : segm. linear acute, Invol. downy, Rays ovate
 12339 Leaves linear sessile pinnatifid : segm. entire, Stem erect branched
 12340 Leaves sessile pinnatifid : segm. linear subulate pectinate entire, Stem downy 1-headed
 12341 Leaves pinnated : pinnæ linear entire blunt, Stem downy 1-headed
 12342 Leaves pinnated revolute at edge : segm. lin. subul. subtrifid, Upper scales of invol. blunt with a membran. [edge]
- 12343 The only species, resembling a Calendula

12344 Stem procumbent, Leaves ovate entire

and Miscellaneous Particulars.

dissipated : chamomile flowers, therefore, ought never to be ordered in decoctions. Externally, they are used as fomentations in cholic, intestinal inflammation, and to phagedenic ulcers ; and their infusion is also found to be an useful addition to emollient anodyne gylsters in flatulent cholic, and in irritations of the rectum producing tenesmus. (*London Disp.* p. 158.) There is a double variety generally grown for the apothecaries ; it is more ornamental than the single, but much less efficacious as a medicine.

A. cotula is said by Linnæus to be a very grateful plant to toads ; to drive away fleas, and to annoy bees. It is a very common weed on soft rich soils and dunghills, and increases by seeds with amazing rapidity. The tribe of Anthemideæ, of which this genus is the example, are nearly related to Heliantheæ. In their style they resemble Inuleæ, Senecioneæ, and Nassauvieæ, but their floral organs are different. They inhabit Europe, Asia, and Africa, scarcely one has been found in America, or the southern parts of the world.

1779. *Centrospermum*. From *κεντρα*, a spur, and *σπερμα*, a seed, in allusion to the spiny points of the pappus. A small annual plant with the aspect of *Calendula*.

1780. *Sanvitalia*. Named by Lamarck without any explanation. A hardy annual plant, with flowers having a yellow ray and dark purple disk, like some species of *Rudbeckia*.

History, Use, Propagation, Culture,

1781. *Achillea*. Named after Achilles, a disciple of Chiron, and the first physician who used it in healing wounds. A. Ptarmica is called sneeze-wort, because the dried powder of the leaves snuffed up the nostrils provokes sneezing. In the spring, the young tender shoots were formerly put into salads, to correct the coldness of other herbs. There is a variety with double flowers, which is very ornamental, especially in pots. A. moschata, the *Genipi* of the Swiss, is an excellent sudorific, aromatic, and acrid, and is a grateful food to cattle.

- 12345 Leaves obl. linear blunt doubly serrulated downy ciliated, Stem villous
 12346 Leaves linear narrowed at base serrated and stem smooth [at end
 12347 Leaves lin. acute equally and finely serrulate smooth, Stem panicled, Corymbs few-headed, Palcæ bifid
 12348 Leaves linear lanc. acuminate sharply serrated
- 12349 Leaves lin. plane acuminate toothed: teeth emarginate transversely ciliated, Stem diffuse
 12350 Leaves obl. blunt serrated narrowed into the petiole fascicled glabrous, Corymb compound contracted
 12351 Leaves linear acuminate equally and finely serrated smooth: serratures of the base deepest, Palcæ entire
 12352 Leaves lanc. equally and finely serrated downy, Serratures of base deepest, Stem panicled, Palcæ entire
 12353 Leaves linear pectinate pinnatifid glabrous: segm. subserrated, Corymb compound
 12354 Leaves downy linear lanc. pinnatifid: segments deepest at base
 12355 Leaves downy pinnatifid smooth: segm. linear blunt: upper toothed at end, Corymb simple
 12356 Leaves pectinate pinnatifid smooth: segm. linear acute; lower 2-parted, Corymb simple
 12357 Leaves pectinate pinnatifid: segm. linear subulate entire, Corymb compound contracted, Stem downy
- 12358 Leaves pinnatifid: segm. obl. cuneate unequally toothed vertically bent, Corymbs simple
 12359 Leaves pinnated roundish pilose: pinnæ 3-parted toothed imbricated across, Corymbs simple
 12360 Leaves pinnat. somew. downy, Pinnæ 3-part. blunt entire transversely imbr. Ray scarcely long. than invol.
 12361 Leaves pinnated somewhat downy, Pinnæ 3-parted transverse distant: segm. 3-toothed, Stem branched
 12362 Leaves pinnated downy: pinnæ linear entire blunt; lowest longest, Cymes simple
 12363 Leaves pectinate pinnate smooth: pinnæ linear acuminate usually 3-parted
 12364 Leaves linear-lanc. acuminate unequally and finely biserrate villous beneath
 12365 Leaves downy pinnatifid: segm. lanc. serrated, Corymb compound
 12366 Stem downy, Leaves pinnated minutely cut acute rigid bent upwards with a downy nerve
 12367 Leaves pinnated: pinnæ long distant very narrow linear entire, Corymb compact branched
 12368 Cauline lvs. pinnatifid with entire segm.: radic. pinnatifid with 3-fid segm. Ray scarcely larger than invol.
 12369 Leaves pectinate pinnate smooth, Pinnæ linear blunthsh entire dotted
 12370 Leaves pinn. villous: pinnæ toothed linear; radical bipinnate, Stem quite simple
 12371 Leaves pinn. downy: pinnæ roundish 4-fid concave spreading, Stem branched at end
 12372 Leaves pinn. downy: pinnæ roundish bluntly toothed, Corymb compound
 12373 Leaves pinn. smooth: pinnæ lanc. cut-serrated; outer confluent, Corymb compound
 12374 Leaves bipinnate downy: pinnæ linear-lanc. toothed, Corymb simple, Peducles long
 12375 Leaves bipinnatifid hoary: segm. lin. lanc. serrated, Corymb compound globose, Flowers flosculous
 12376 Leaves bipinnatif. setaceous villous: segm. lanc. entire, Corymb compound contracted, Flowers flosculous
 12377 Leaves bipinnatifid pubescent: segm. linear lanc. unequal acute, Corymb compound
 12378 Leaves downy: cauline bipinnatifid with linear blunt segm.; radical bipinnate, Corymbs compound
 12379 Leaves bipinnatifid: segm. lanc. serrated, Corymb compound spreading
 12380 Leaves bipinnatifid: segm. lanc. cut-serrated, Rachis winged cut-serrated, Corymbs fastigiate compound
 12381 Leaves bipinnatifid villous: segm. lanc. blunt, Corymbs fastigiate compound
 12382 Leaves thrice pinnatifid: segm. lanc. acute, Corymbs compound fastigiate
 12383 Leaves bipinnate slightly hairy their segm. linear toothed acute, Stems furrowed
- 12384 Leaves pinnatifid downy beneath: segm. toothed, Stem branched fastigiate smooth
 12385 Leaves bipinnatifid downy: segm. lanc. entire, Corymb compound
 12386 Leaves bipinnatifid woolly: the segm. crowded linear acute, Corymbs repeatedly compound
 12387 Leaves subbipinnatifid: pinnæ of the base undivided: segm. lin. lanc. Corymb compound, Invol. cylindr.
 12388 Leaves bipinnatifid shorter than the intervals between them: segm. lin. entire, Corymbs comp. fastigiate
 12389 Leaves bipinnatifid: segm. lin. finely serrated, Rachis winged entire, Corymb compound fastigiate
 12390 Cauline leaves bipinnatifid: segm. lin. somew. toothed, Rachis winged toothed: radical thrice pinnatifid
 12391 Leaves bipinnate downy: pinnæ pinnatifid, Segments linear-subulate, Corymbs compound fastigiate
 12392 Leaves bipinnate pilose beneath: pinnæ linear entire, Corymb simple
 12393 Leaves bipinnate: leaflets linear setaceous mucronate very compact pilose, Corymbs compound fastigiate
 12394 Leaves bipinnate downy: pinnulæ very fine linear entire distant, Corymbs compound fastigiate

12395 The only species

- 12396 Leaves hoary linear lanc. opposite: those of the branches alternate
 12397 Very villous, Leaves sessile oblong acuminate entire, Heads axillary on short stalks
 12398 Hoary, Lvs. bipinnatifid cut-toothed, Segm. linear rigid mucronate, Heads lateral and terminal-clustered

and Miscellaneous Particulars.

1752. *Tridax*. From *τριδακνως*, cut into three pieces. The rays of the flower are divided in three.
 1783. *Amellus*. A name used by Virgil for a beautiful flower growing on the banks of the river *Mella*. The plant of Virgil is supposed to have been *Aster Amellus*.

History, Use, Propagation, Culture,

1784. *Starkea*. Named by Willdenow, after the Rev. Mr. Starke, of Gros Tchernia, in Silesia, who paid much attention to the Cryptogamous plants of that country. This genus was included by Linnæus in *Amellus*, from which Willdenow remarks that it differs in habit, and in its hairy receptacle.

1785. *Columella*. So called by Jacquin, after the celebrated Geoponic writer, Lucius Junius Moderatus Columella, a Spaniard, born forty-two years before Christ. A plant resembling *Amellus annua*. The flowers are yellow and sessile in the dichotomies of the branches. The *Columella* of Loureiro is a different thing.

1786. *Eclipta*. A translation of the Malay name *Wangi-wangi-maih*, which signifies an eclipse of the sun, to which the form and disposition of the radiated flower has been likened. Worthless weeds with white flowers.

1787. *Meyera*. Named after Gottlieb-Andrew Meyer, a German, who published, in 1694, a dissertation upon the *Sycomor*us of Scripture.

1788. *Chrysanthellum*. A diminutive of *Chrysanthemum*, which see.

1789. *Siegesbeckia*. Dr. John George Siegesbeck, a German physician, director of the garden at St. Petersburg, published in 1736, a catalogue of it under the title of *Flora* of St. Petersburg. There was also a *Botanosophia* from his pen in 1737.

12399 Leaves opp. 3-nerved downy beneath, Heads in umbels

12400 The only species

12401 Stem erect strigose, Leaves oblong lanc. sessile remotely serrated

12402 Stem prostrate strigose, Leaves obl. lanc. somewhat stalked subserrate somewhat wavy scabrous

12403 Stem erect, Leaves amplexicaul. ovate toothed

12404 Leaves alternate 3-parted toothed : radical oblong serrated, Stem creeping

12405 Leaves stalked ov. unequally toothed subtriangular at base somewhat cut, Outer invol. longer than inner

12406 Leaves sessile ovate toothed, Florets of disk 3-toothed triandrous

12407 Leaves alternate decurrent wavy blunt

12408 Leaves alternate lanc. subserrate, Corymb compound

12409 Leaves alternate deeply pinnatifid, Stem shrubby

12410 Leaves opposite ovate lanc. serrated acuminate at each end decurrent

12411 Stem winged, Lvs. lanc. acuminate somewhat stalked serrated, Heads corymbose, Cor. of ray lanceolate

12412 Leaves opposite ovate-lanc. serrated downy beneath

12413 Leaves opposite cordate-lanc. amplexicaul. remotely serrated, Invol. simple 5-leaved

12414 Leaves opposite obl. lanc. bluntish strigose serrated at end, Pedunc. 1-headed long, Invol. simple

12415 Leaves opposite ov. acuminate serrated 3-nerved hairy, Pedunc. winged 1-headed, Invol. simple

12416 Leaves opposite ov. acuminate serrated 3-nerved scabrous on each side, Pedunc. 1-headed axillary

12417 Leaves opposite ov. serrated 3-nerved, Heads axillary subsessile, Invol. simple, Stem trichotomous

12418 Leaves ovate 3-nerved serrated

12419 Leaves oblong lanceolate toothed 3-nerved : lower hastate 3-lobed

12420 Stem procumbent downy, Lvs. ovate entire, Pedunc. lateral, Ray shorter than disk

12421 Leaves ovate serrated 3-nerved downy beneath, Ray many-flowered

12422 Leaves ternate 3-lobed : lower opposite, Stem suffrutescent

12423 The only species

12424 Leaves opposite ovate serrated 3-nerved, Invol. leafy, Stem herbaceous

12425 Leaves opposite obovate hoary, Petioles with 2 teeth

12426 Leaves opposite lanceolate narrowed at base not toothed smooth

and Miscellaneous Particulars.

1790. *Verbesina*. A name with the same meaning as *Verbena*, which see. The *V. alata* resembles *Vervain* in the appearance of its foliage.

1791. *Synedrella*. A name of unknown meaning. A little worthless weed.

1792. *Galinsoga*. Named after after Mar. Ma. Galinsoga, first physician to the queen of Spain, and intendant of the garden of Madrid. One of the species, *G. trilobata*, is sometimes cultivated as a hardy annual. But it does not possess much merit.

1793. *Acnella*. From *acum*, a point, on account of the pricking taste of the foliage.

1794. *Zaluzania*. Apparently an alteration of *Zaluzianskia*, a name applied in error to *Marsilea trifolia*, and formed in honor of an obscure Polish botanist.

1795. *Pascalina*. A genus dedicated by Ortega to Didan Pascal, doctor of medicine, and a professor at Parma.

1796. *Heliopsis*. A name with the same meaning, and a genus with the same habit, as *Helianthus*, which see.

1797. *Bupththalmum*. From *βυς*, an ox, and *οφθαλμος*, an eye, in allusion to the broad open disk of the flowers. It is believed that the *Bupththalmum* of Pliny is a species of *Anthemis*.

History, Use, Propagation, Culture,

1798. *Helianthus*. From *ηλιος*, the sun, and *ανθος*, a flower. Nothing can be a more complete ideal representative of the sun, than the gigantic sun-flower, with its golden rays; it is dedicated with great propriety to the sun, which it never ceases to adore while the earth is illuminated by his light. When he sinks into the west, the flowers of *Helianthus* are turned towards him; and when he rises in the east, the flowers are again ready to be cherished by the first influence of his beams.

H. annuus is a well known border annual, which will grow in any soil. There are varieties with double flowers, the tubular florets being changed into ligular ones, like those in the ray. The whole plant, and particularly the flower, exudes a thin pellicud odorous resin, resembling venice turpentine. From the seeds an edible oil has been expressed, and they are also excellent food for domestic poultry. The flowers turning with the sun, is by some considered a popular error; Gerarde says he never could observe it; and Professor Martin has seen four flowers on the same stem pointing to the four cardinal points. *H. tuberosus*, *Topinambour*, Fr., *Erdapfel*, Ger., and *Girasole*, Ital., is called Jerusalem, from the corruption of the Italian word *Girasole*; and *Artichoke*, from the resemblance in flavor which the tubers have to the bottoms of artichokes. These tubers are in considerable esteem on the continent as a substitute for potatoes; and before the introduction of that vegetable, they were a good deal in use in this country. Their culture and treatment is the same as for that vegetable. *H. multiflorus* a showy autumnal flower.

- 12427 Leaves opposite close spatulate oblong silky, Scales of invol. setaceous hirsute
 12428 Leaves alternate obl. lanc. amplexicaul. entire hirsute, Invol. leafy mucronate
 12429 Invol. bluntly leafy sessile axillary, Leaves oblong blunt alternate nearly entire, Stem dichotomous
 12430 Invol. bluntly leafy stalked, Lvs. alternate spatulate, Stem herbaceous
 12431 Leaves alternate obl.-lanc. subserrate 3-nerved villous, Invol. naked, Stem herbaceous
 12432 Leaves alternate lanc. somewhat toothletted smooth, Invol. naked, Stem herbaceous
 12433 Leaves alternate : lower stalked cordate doubly serrated : upper sess. ovate serrated, Stems herbaceous

FRUSTRANEA.

- 12434 Leaves all cordate 3-nerved, Pedunc. thick, Heads cernuous
 12435 Leaves all cordate 3-nerved, Pedunc. evensized, Invol. leafy
 12436 Leaves cordate cuneate at base villous 3-nerved, Pedunc. thick fistular
 12437 Leaves ovate acuminate narrowed at base unequally serrate scabrous, Pedunc. filiform, Rays obovate
 12438 Leaves 3-nerved scabrous : lower cordate ; upper ovate, Ray many-fl. Scales of invol. lanceolate
 12439 Leaves 3-nerved scabrous : lower cordate-ovate ; upper ovate acum. alternate, Petioles ciliated at base
 12440 Stems slender about 1-headed, Leaves linear revolute at edge rough
 12441 Leaves ovate acuminate 3-nerved serrated scabrous above hoary beneath, Invol. squarrose
 12442 Leaves ovate acuminate 3-nerved closely serrated scabrous above : hoary and soft beneath
 12443 Lvs. ov. acum. remotely serrat. 3-nerv. scabr. Scales of invol. lanc. nearly equal subciliated, Rays 10 or 12
 12444 Lvs. lanc. acuminate scabr. serrated 3-nerved : upper entire, Scales of invol. lanc. ciliated, Stem procumb.
 12445 Lvs. ovate acuminate serrated 3-nerved scabrous beneath, Scales of invol. lin. lanc. ciliated at base
 12446 Lvs. altern. lanc. serr. scabr. 3-nerved narrow, at end stalked, Petioles ciliated, Scales of invol. lanc. ciliat.
 12447 Lvs. altern. lanc. serr. obsol. 3-nerv. narrow, at each end subsess. ciliat. at base, Scales of invol. lanc. cil.
 12448 Smooth, Stem panicled, Branches few-flowered at top, Lvs. sessile very long entire : lower serrated
